NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions and graphics needed to diagnose **2003 LH body system problems**. The diagnostics in this manual are based on the failure, condition or symptom being present at the time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate module; i.e., if the DRBIII® shows a “no response” or “Bus +/- Signal Open” condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.
All component location views are in section 8.0.
All connector pinouts are in section 9.0.
All schematics are in section 10.0.
An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and installation procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carry over systems may be enhanced. **READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE DIAGNOSTIC TROUBLE CODE.** It is recommended that you review the entire manual to become familiar with all the new and changed diagnostic procedures.

This book reflects many suggested changes from readers of past issues. After using this book, if you have any comments or suggestions, please fill out the form in the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers all 2003 Chrysler Concorde, Dodge Intrepid, Chrysler LHS and 300M models.

1.2 SIX STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the body system is done in six basic steps:

- verification of complaint
- verification of any related symptoms

- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

1.3 FUSES AND LIGHT BULBS

When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

When replacing HALOGEN bulbs, do not touch the new bulb with your fingers. Oil contamination will severely shorten bulb life. If the bulb comes in contact with an oily surface, clean the bulb with rubbing alcohol.

2.0 IDENTIFICATION OF SYSTEM

The vehicle systems that are part of the “body” system are:

- Airbag System
- Audio
- Chimes
- Climate Control Systems (Automatic and Manual)
- Door Ajar
- Electrically Heated Systems
- Exterior Lighting
- Instrument Cluster
- Interior Lighting
- Memory System
- Overhead Console
- Power Door Locks
- Remote Keyless Entry
- Speed Proportional Steering
- Vehicle Communications
- Vehicle Theft Security System
- Wiper/Washer

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

The body system on the 2003 LH consists of a combination of modules that communicate over the PCI bus (Programmable Communication Interface multiplex system). Through the PCI bus, informa-

GENERAL INFORMATION

tion about the operation of vehicle components and circuits is relayed quickly to the appropriate module(s). All modules receive all the information transmitted on the bus even though a module may not require all information to perform its function. It will only respond to messages “addressed” to it through a binary coding process. This method of data transmission significantly reduces the complexity of the wiring in the vehicle and the size of wiring harnesses. All of the information about the functioning of all the systems is organized, controlled, and communicated by the PCI bus, which is described in the Vehicle Communication section of this general information.

Always begin by reading the diagnostic trouble codes using the DRB. Next, look for the symptom in the Diagnostic Information and Procedures section of the Table Of Content located in the front of the book. This will direct you to the specific test(s) that must be performed.

Important Note:

If the Powertrain Control Module has been changed and the correct VIN and mileage have not been programmed, a DTC will be set in the Airbag module. In addition, if the vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable starting. Refer to the 2003 LH Powertrain Diagnostic Manual for more information. Erase codes in all modules.

3.1 AIRBAG SYSTEM

The Airbag System is equipped with a new type of Airbag Control Module (ACM) called an Occupant Restraint Controller (ORC). The ACM is secured to a bracket on the floor panel transmission tunnel below the instrument panel inside the vehicle. The ACM mounting bracket also serves as the instrument panel center support. The ACM contains a microprocessor, the impact sensor, and energy storage capacitors. The microprocessor contains the airbag system logic. The airbag system logic includes On-Board Diagnostics ACM capability, and communicates with the instrument cluster circuitry on the Programmable Communication Interface (PCI) data bus to control the airbag indicator lamp. The microprocessor in the ACM monitors the impact sensor signal and the airbag system electrical circuits to determine the system readiness. If the ACM detects a monitored system fault, it sends messages to the Mechanical Instrument Cluster (MIC) over the PCI data bus to turn on the airbag warning lamp. A pre-programmed decision algorithm in the ACM microprocessor determines when the deceleration rate is severe enough to require airbag system protection. When the programmed conditions are met, the ACM sends an electrical signal to deploy the airbag system components. The

impact sensor is an accelerometer that senses the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. The impact sensor is calibrated for the specific vehicle, and is only serviced as a unit with the ACM. The ACM also contains an energy-storage capacitor. This capacitor stores enough electrical energy to deploy the airbags, for two minutes following a battery disconnect or failure during an impact. The purpose of the capacitor is to provide airbag system protection in severe secondary impact if the initial impact has damaged or disconnected the battery, but not severe enough to deploy the airbags. The ACM cannot be repaired or adjusted and, if damaged or faulty, it must be replaced

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN OCCUPANT RESTRAINT CONTROLLER IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT.

The airbag warning lamp is the only point at which the customer can observe “symptoms” of a system malfunction. Whenever the ignition key is turned to the “run” or “start” position, the MIC performs a lamp check by turning the AIRBAG warning lamp on for 6-8 seconds. If the lamp remains off, it means that the ACM has checked the system and found it to be free of discernible malfunctions. If the lamp remains on, there could be an active fault in the ACM system or the MIC lamp circuit may be internally shorted to ground.

3.1.1 DRIVER AIRBAG (DAB)

The airbag protective trim cover is the most visible part of the driver side airbag system. The airbag is mounted directly to the steering wheel.

Located under the trim cover are the horn switch, the airbag cushion, and the airbag cushion supporting components. The airbag includes a housing to which the cushion and inflator are attached and sealed. The airbag cannot be repaired, and must be replaced if deployed or in any way damaged. The inflator assembly is mounted to the back of the airbag module. The inflator seals the hole in the airbag cushion so it can discharge the gas it produces directly into the cushion when supplied with the proper electrical signal. The protective trim cover is fitted to the front of the airbag module and forms a decorative cover in the center of the steering wheel. Upon airbag deployment, this cover will split at a predetermined breakout line.

THE AIRBAG MODULE INFLATOR ASSEMBLY CONTAINS SODIUM AZIDE AND POTASSIUM NITRATE. THESE MATERIALS ARE POISONOUS AND EXTREMELY FLAMMABLE. CONTACT WITH ACID, WATER, OR HEAVY METALS MAY PRODUCE HARMFUL AND IRRITATING GASES (SODIUM HYDROXIDE IS FORMED IN THE PRESENCE OF MOISTURE) OR COMBUSTIBLE COMPOUNDS. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200° F).

3.1.2 CLOCKSPrING

The clockspring is mounted on the steering column behind the steering wheel. This assembly consists of a plastic housing which contains a flat, ribbon-like, electrically conductive tape that winds and unwinds with the steering wheel rotation. The clockspring is used to maintain a continuous electrical circuit between the instrument panel wire harness and the driver side airbag module, the horn switch, and the vehicle speed control switches on vehicles that are so equipped. The clockspring must be properly centered when it is installed on the steering column following any service removal, or it will be damaged. The clockspring cannot be repaired it must be replaced.

3.1.3 PASSENGER AIRBAG (PAB)

The airbag door in the instrument panel top cover above the glove box is the most visible part of the passenger side airbag system. Located under the airbag door is the airbag cushion and its supporting components. The airbag includes a housing to which the cushion and inflator are attached and sealed. The airbag cannot be repaired, and must be replaced if deployed or in any way damaged. The inflator assembly is mounted to the back of the airbag module. The inflator includes a small canister of highly compressed argon gas. The inflator

seals the hole in the airbag cushion so it can discharge the compressed gas it contains directly into the cushion when supplied with the proper electrical signal. The airbag door has a living hinge at the top, which is secured to the instrument panel top cover. The door also has predetermined breakout lines concealed beneath its decorative cover. Upon airbag deployment, the airbag door will split at the breakout lines and the door will pivot out of the way.

WARNING: THE PASSENGER AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO OVER 2500 PSI. DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG.

3.1.4 SIDE IMPACT AIRBAG CONTROL MODULES (SIACM)

The 2003 LH uses two identical side impact airbag control modules (SIACM) that share the same part number. They are located on the left and right B-post with the connector pointed forward. For proper PCI bus operation each SIACM must have a unique module identification. To provide the unique module identification the SIACM software looks for a ground on cavity # 5. If cavity # 5 is grounded the SIACM communicates as a left SIACM otherwise it communicates as a right SIACM. The SIACM perform self diagnostics and circuit tests to determine if the system is functioning properly. If the test find a problem the SIACM will set both active and stored diagnostic trouble codes. If a DTC is active the SIACM will request

that the airbag warning lamp be turned on. The results of the system test are transmitted on the PCI Bus to the ACM once each second or on change in lamp state. If the warning lamp status message from either SIACM contains a lamp on request the ACM will set an active DTC. At the same time as the DTC is set the ACM sends a PCI Bus message to the mechanical instrument cluster (MIC) requesting the airbag warning lamp be turned on. Observe all ACM warning and caution statements when servicing or handling the SIACM. SIACM are not repairable and must be replaced if they are dropped.

3.1.5 SEAT AIRBAG

The Left and Right seat airbags are located in the outboard end of the front seat backs. The airbag contains a bag, an inflator (a small canister of highly compressed argon gas) and a mounting bracket. The seat airbag cannot be repaired and must be replaced if deployed or in any way damaged. When supplied with the proper electrical signal the inflator seals the hole in the airbag cushion so it can discharge the compressed gas it contains directly into the cushion. Upon deployment, the seat back trim cover will tear open and allow the seat airbag to fully deploy between the seat and the door.

Note: It will be necessary to remove the seat back trim to gain access to the seat airbag module connector when diagnosing the seat airbag system.

THE SEAT AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO OVER 2500 PSI. DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG.

3.1.6 SPECIAL TOOLS

Some airbag diagnostic test use special tools, 8310 and 8443 airbag load tool, for testing squib circuits. The load tools contain fixed resistive loads, jumpers and adapters. The fixed loads are connected to cables and mounted in a storage case. The cables can be directly connected to some airbag system connectors. Jumpers are used to convert the load tool cable connectors to the other airbag system connectors. The adapters are connected to the module harness connector to open shorting clips and protect the connector terminal during testing. When using the load tool follow all of the safety procedures in the service information for disconnecting airbag system components. Inspect the wiring, connector and terminals for damage or misalignment. Substitute the airbag load tool in place of a Driver or Passenger Airbag, seat airbag, clockspring, or seat belt tensioner (use a jumper if needed). Then follow all of the safety procedures in the service information for connecting airbag system components. Read the module active DTC's. If the module reports NO ACTIVE DTC's the defective component has been removed from the system and should be replaced. If the DTC is still active, continue this process until all component in the circuit have been tested. Then disconnect the module connector and connect the matching adapter to the module connector. With all airbags disconnected and the adapter installed the squib wiring can be tested for open or shorted conditions.

3.1.7 DIAGNOSTIC TROUBLE CODES

Airbag diagnostic trouble codes consist of active and stored codes. If more than one code exists, diagnostic priority should be given to the active codes.

Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of the trouble codes. It is not necessary to perform all of the tests in this book to diagnose an individual code.

Active diagnostic trouble codes for the airbag system are not permanent and will change the moment the reason for the code is corrected. In certain test procedures within this manual, diagnostic trouble codes are used as a diagnostic tool.

3.1.7.1 ACTIVE CODES

The code becomes active as soon as the malfunction is detected or key-off, whichever occurs first. An active trouble code indicates an on-going malfunction. This means that the malfunction is currently there every time the airbag control module checks that circuit/function. It is impossible to erase

an active code; active codes automatically erase by themselves when the reason for the code has been corrected.

With the exception of the warning lamp trouble codes or malfunctions, when a malfunction is detected, the airbag lamp remains lit for a minimum of 12 seconds or as long as the malfunction is present.

An "Interrogate Right SIACM or Interrogate Left SIACM" diagnostic trouble code indicates an active trouble code in the respective module.

3.1.7.2 STORED CODES

Airbag codes are automatically stored in the ACM's memory as soon as the malfunction is detected. A "stored" code indicates there was an active code present at some time. However, the code currently may not be present as an active code, although another active code could be.

When a trouble code occurs, the airbag warning lamp illuminates for 12 seconds minimum (even if the problem existed for less than 12 seconds). The code is stored, along with the time in minutes it was active, and the number of times the ignition has been cycled since the problem was last detected. The minimum time shown for any code will be one minute, even if the code was actually present for less than one minute. Thus, the time shown for a code that was present for two minutes 13 seconds, for example, would be three minutes.

If a malfunction is detected a diagnostic trouble code is stored and will remain stored as long as the malfunction exists. When and if the malfunction ceases to exist, an ignition cycle count will be initiated for that code. If the ignition cycle count reaches 100 without a reoccurrence of the same malfunction, the diagnostic trouble code is erased and that ignition cycle counter is reset to zero. If the malfunction reoccurs before the count reaches 100, then the ignition cycle counter will be reset and the diagnostic trouble code will continue to be a stored code.

Maintain a safe distance from all airbags while performing the following inspection. If a malfunction is not active while performing a diagnostic test procedure, the active code diagnostic test will not locate the source of the problem. In this case, the stored code can indicate an area to inspect.

If no obvious problems are found, erase stored codes, and with the ignition "on" wiggle the wire harness and connectors, rotate the steering wheel from stop to stop. Recheck for codes periodically as you work through the system. This procedure may uncover a malfunction that is difficult to locate.

3.2 AUDIO SYSTEM

There are radio systems available that communicate on the PCI bus. They use the bus for three reasons. First is to communicate trouble codes, second is to control the remote radio switches located on the back of the steering wheel, and third is for use with the driver memory selection system. The radio stores two sets of station presets and can be recalled by pressing the optional memory select button (located on the drivers door). The midline will have 6 speakers and a 120 watt external amplifier. The Infinity I will have 7 speakers and a 240 watt external amplifier or with a indash 4-disk CD Player. The Infinity II will have 9 speakers and a 360 watt external amplifier with a indash 4-disk CD Player.

When troubleshooting output shorts or "output" error messages, the following applies:

On radios with out an external amplifier, the term output refers to the path between the radio and the speaker. This type of circuit can be monitored all the way through the speaker connections by the radio assembly. When the radio displays a shorted output DTC with this type of system, the speaker, radio, or wiring could be at fault.

On radios with an external amplifier, the term "output" refers to the circuit between the radio connector and the amplifier. The radio is capable of monitoring only this portion and can tell nothing about the circuit between the amplifier and the speakers. Consequently, a shorted output DTC on this type of system would only refer to this circuit. A faulty speaker could not cause this DTC.

These radios can be controlled via remote radio switches (optional). These switches are located on the back side of the steering wheel. They control volume, preset bank selection, seek and scan functions.

These functions are inputs to the body controller and can be read with the DRBIII® under "body" systems, sensor displays. The switches are a multiplexed signal to the BCM. The remote radio control circuit is a five volt line that is pulled to ground through different value resistors built into the switches. This causes a voltage drop to be seen by the body controller and it sends a specific message to the radio on the PCI bus line. The radio then responds to the message.

This circuit is fairly simple to troubleshoot. The circuit must be complete from the switches in the steering wheel to the BCM. The ground must be complete so that the switches can cause the voltage drop for the BCM to see. The circuit passes through the clockspring so continuity through this device must be verified.

The new in-dash CD-changer is designed to fit into the existing cubby bin in the center stack. This

GENERAL INFORMATION

new cartridge-less CD-changer is controlled by your radio, and allows you to individually load up to four discs at one time. However, due to its compact design, the CD-changer can only carry out one operation at a time. For example, you can not load a new disc while playing another at the same time. Each operation happens sequentially.

The radio unit installed with your system provides control over all features of the CD-changer with the exception of the CD load and eject functions, which are controlled by buttons located on the front of the CD-changer. The radio also supplies the power, ground, PCI Bus, left and right speaker output thru a single DIN cable. All features you would expect, such as Disc Up/Down, Track Up/Down, Random and Scan are controlled by the radio, which also displays all relevant CD-changer information on the radio display.

The CD-changer contains a Load/Eject button and an indicator light for each of the four disc positions. The individual light indicates whether a CD is currently loaded in that particular chamber of the CD-changer. Pressing the individual Load/Eject button for a particular chamber will eject a disc currently present in that chamber. If the chamber is currently empty, actuating the Load/Eject button will position that chamber to receive and load a new disc in that chamber.

3.3 BODY CONTROL MODULE

The body control module (BCM) supplies vehicle occupants with visual and audible information and controls various vehicle functions. To provide and receive information, the module is interfaced to the vehicle's serial bus communications network (the Programmable Communication Interface or PCI bus). This network consists of the powertrain control module (PCM), the memory heat seat/mirror module (MHSM), sentry key immobilizer module (SKIM), the electro/mechanical instrument cluster (MIC), the optional overhead travel information system (OTIS), airbag control module (ORC), optional antilock brakes (ABS), the radio and remote CD-player, optional left and rightside impact airbag control modules (SIACM), and the optional automatic temperature control (ATC) head. The (BCM) is operational when battery power is supplied to the module, ignition switch power is needed for ignition switched functions.

The body control module provides the following features:

Automatic headlamp and fog lamp
A/C switch status/evaporator temperature status
BCM diagnostic support
Central lock and unlock (VTSS only)
Chime
Climate Control (Automatic and Manual) system support
Door ajar switch status
Door Lock Inhibit (key in ignition or headlamps/park lamps on)
Electronic Odometer Support
Fog Lamp Control
Headlamp multiplexing control
Headlamp, Park & tail lamps with battery save feature
Headlamp Time Delay
Illuminated Entry with "fade to off"
Interior lighting with battery save feature
Mechanical Instrument Cluster (fuel level, dim data, odometer & warning chime) support
Memory system (LHS and 300M)
Overhead travel information system
Power door lock multiplexing control
Rear Window Defogger Control
Remote Keyless Entry with Panic Mode
Remote power deck lid release
Remote radio control
Rolling door lock control (customer programmable)
Sentry key immobilizer
Speed proportional steering
Vehicle Theft Security System
Wiper Control (speed sensitive with return to park)

The BCM receives information over the PCI Bus from the PCM in order to support certain features. The required information is as follows:

- Engine RPM
- Engine Temperature
- Injector on Time and Distance Pulses
- Vehicle Speed
- Charging System Failure, Engine Temperature Limp-In, VTSS Arming Status
- Engine Model
- "Check Engine" lamp status

The BCM provides the PCM with information on the A/C switch status and the VTSS status.

The LH has several customer programmable features which can be disabled or enabled by the customer.

GENERAL INFORMATION

FEATURE	DEFAULT	PROGRAMMING METHOD	FEEDBACK
Rolling Door Locks	Enabled	<p>Close all doors</p> <p>Place vehicle key in the ignition and cycle between off and run four times ending in the off position</p> <p>Customer depresses the driver power door lock switch to lock the doors</p> <p>Body Controller will toggle the enable/disable state of rolling locks</p>	BCM provides a single chime to indicate completion of the programming
RKE-Horn Chirp	Enabled	<p>Continually press the lock button for a minimum of 4 seconds to a maximum of 10 seconds</p> <p>Within the 4-10 second range, press the unlock button while continuing to press the lock button</p> <p>Release both buttons</p> <p>Body Controller will toggle on/off state of horn chirp feature</p>	None
RKE-Rear Release Toggle	Press Twice	<p>Continually press the unlock button for a minimum of 4 seconds to a maximum of 10 seconds</p> <p>Within the 4-10 second range, press the rear release button while continuing to press the unlock buttons</p> <p>Release both buttons</p> <p>RKE will toggle state of one press/two press rear release</p>	
RKE Program New FOB (Using an already programmed FOB)	Not Applicable	<p>Turn vehicle ignition switch on. With programmed FOB continually press the unlock button for a minimum of 4 seconds to a maximum of 10 seconds</p> <p>Within the 4-10 second range, press the panic button while continuing to press the unlock button</p> <p>Release both buttons</p> <p>Press any button of FOB(s) to be Learned. (Note: RKE system erases all FOBs when program mode is entered So any existing FOBs must also be Programmed.</p>	<p>BCM will sound a second chime when programming mode is started</p> <p>BCM will sound a second chime after each FOB has been learned, a 32 second time out period has elapsed, or the vehicle ignition has been turned off</p> <p>Turn off ignition or wait for 32 seconds to exit programming mode</p>

GENERAL INFORMATION

3.4 CHIME SYSTEM

The chime system is comprised of an audible chime located internal to the BCM; and is dependent on various inputs to the BCM to operate. These inputs include key-in ignition switch, exterior lamps, seat belt switch, and requests from the MIC to chime when some indicators are turned on.

3.5 DOOR AJAR SYSTEM

The door ajar state is used as an input for various control modules on the vehicle. The DRBIII® will display the state of the door ajar switches in Inputs/Outputs. It's important to note, that when a door is closed, the switch state on the DRBIII® will show OPEN, and when the door is open, the switch state will show CLOSED. During diagnosis, if a door is closed and the DRBIII® displays the switch state as CLOSED, it indicates a shorted door ajar circuit. If the door is open and the DRBIII® displays the switch state as OPEN, it indicates an open door ajar circuit.

3.6 CLIMATE CONTROL SYSTEMS

3.6.1 AUTOMATIC TEMPERATURE CONTROL (ATC)

The body control module (BCM) provides automatic temperature control support both through PCI bus communications and through processing inputs to determine control for actuators and the blower motor. The BCM interfaces with the ATC control head over the PCI bus. Information on button activation, blower setting, and temperature setting are supplied to the BCM. In turn, the BCM supplies the ATC control head with mode information and indication lamp status. The BCM controls blower motor speed by providing a varying duty cycle of a fixed frequency output (pulse width modulation). There are 14 distinct blower speeds, plus a blower off signal. The body control module also controls the HVAC mode, temperature (blend air), and recirculation doors. This system is either fully automatic or fully manual control (no semi-automatic functions); however, the temperature blend door control is always automatically controlled based on sensor reading and comfort setting. The in-car sensor and the aspirator motor are now housed in the ATC control head.

3.6.2 MANUAL TEMPERATURE CONTROL

The body control module interfaces with the a/c-heater control head via hardwired circuits. Information for the temperature setting is supplied to the body control module via a potentiometer. The

rear defogger switch, A/C switch and the mode setting is supplied via a resistive multiplexed circuit. The system on/off status is supplied by a dedicated circuit. The BCM drives the A/C and rear defogger indicator lamps via hardwire to the A/C-heater control head.

3.6.3 HVAC BLEND, MODE, AND RECIRCULATION DOOR OPERATION

The trouble codes that indicate a stall failure or a feedback signal failure work together to show what is wrong with the HVAC system. The stall trouble codes mean that the body control module cannot force an actuator to the end of the HVAC unit door. Internal problems in the body control module will set other short-related codes. Having only stall trouble codes indicates that there is a problem with an open or short circuit in the wiring, a bad actuator, a bad HVAC unit door or connecting linkage. It is important that the operation of the HVAC door be checked if an actuator is removed. This can be checked by rotating each unit door shaft to confirm that the door will stop at both ends of travel. The actuator itself has no stops. It must have the HVAC unit door to stop travel to pass a stall test.

A feedback signal failure can occur on the blend or mode door. The body control module monitors the feedback signal to check the position of the actuator. The body control module not only checks the level of the signal but also how much the voltage changes.

A feedback failure can occur if there is a short or open circuit in the wiring, a bad actuator, a bad body control module, a bad HVAC unit door or connecting linkage. The easiest way to diagnose this is to use the DRB to actuate the blend or mode door. Note that the feedback voltage of the actuator should smoothly change as the actuator is moved. A sudden change in the feedback voltage to a 5.0-volt or a 0.0-volt level indicates the actuator is bad. A fixed feedback voltage that is less than 5.0 volts or greater than 0.0 volts without a stall failure, or a short failure indicates that the actuator, the HVAC unit door, or a connecting mechanical linkage is jammed thereby preventing movement. A feedback signal voltage that stays on 5.0 volts or 0.0 volts indicates a wiring or body control module problem. The feedback voltage should always be less than 5.0 volts and greater than 0.0 volts.

The feedback trouble code can also occur from lack of actuator travel. This can be checked by confirming that the feedback signal smoothly changes when the actuator is moved with the DRB. If the signal is OK, the door travel is not correct. The actuator must be removed and the HVAC unit door mechanically checked for proper operation. Typical problems that prevent door movement in-

clude screws dropped in the HVAC unit or warped doors. Replace any part that is found defective.

3.6.4 REAR WINDOW DEFOGGER

When the BCM receives a rear defogger request from the climate control head (either ATC or manual) the BCM will activate the rear window defogger relay for 15 minutes. If the BCM receives another rear defogger request while the relay is still activated, the relay will be de-activated. If the relay is allowed to time out (full 15 minutes), further requests during the same ignition on period will cause the BCM to activate the relay for 7.5 minutes

3.7 EXTERIOR LIGHTING SYSTEM

3.7.1 EXTERIOR LIGHTING BATTERY SAVER

The BCM monitors the status of and controls the park lamp, head lamp and fog lamp relay's. If any exterior lamps are left on after the ignition is turned off, the BCM will turn them off after 10 minutes.

3.7.2 HEADLAMP DELAY

The headlamp time delay operates when the ignition switch is turned off while the headlamps are still on, and the headlamps are then turned off within 45 seconds after the ignition is off. This will provide a 90-second time delay before turning off the headlamps.

3.7.3 HEADLAMP SWITCH

The headlight switch on LH vehicles use a multiplexed (MUX) circuit to the BCM. The BCM will then control the park lamp, head lamp and fog lamp relay's based on this input.

3.7.4 FOG LAMP CONTROL

The body control module controls the operation of the fog lamp relay which controls the fog lamps. The fog lamps can only be on if the park or low beam headlamps are on. If the high beams are turned on, the fog lamps will automatically be turned off.

3.7.5 AUTO HEADLAMPS

The headlamps and park/tail lamps will be activated by the BCM when the headlamp switch is in the auto mode. To activate the auto headlamps the BCM requires that: (1) the headlamp switch is in the 'A' position, (2) the engine is running, and (3) the light level sensed through the sun load sensor falls below the calibrated level.

3.8 INTERIOR LIGHTING

3.8.1 COURTESY LAMP CONTROL

The body controller has direct control over the majority of the vehicle's courtesy lamps. The body computer will illuminate the courtesy lamps under any of the following conditions:

- 1) Any door is ajar.
- 2) The courtesy lamp switch on the instrument panel is closed.
- 3) A Remote Keyless entry unlock message is received. If the interior lamps are left on after the ignition is turned off, the BCM will turn them off after 1 hour or until either the dome lamp switch or door ajar switch changes state.

3.8.2 ILLUMINATED ENTRY

Illuminated entry will be initiated when the customer enters the vehicle by unlocking the doors with the key fob, or with the key if the vehicle is equipped with vehicle theft alarm. Upon exiting the vehicle, if the lock button is pressed with a door open, illuminated entry will cancel when the door closes. If the doors are closed and the ignition switch is turned on, the illuminated entry also cancels.

3.9 MECHANICAL INSTRUMENT CLUSTER

The instrument cluster displays four gauges, a vacuum fluorescent (VF) odometer, a VF PRNDL and up to (18) indicators. One reset button is used to switch the display from trip to total. Holding the button when the display is in the trip mode will reset the trip mileage. The cluster also supplies the power for the panel illumination. Most of the information that is displayed is received over the PCI bus from several modules.

With ignition in "lock", the cluster will wake up and display the door ajar and odometer display when a door is opened. The cluster will also wake up to control the panel illumination. In "off" (unlock) the PRNDL and several indicators will be functional but all gauges will not function. On transition from "off" (unlock) to run, the cluster will perform a check of all micro-controlled indicators, the odometer and the PRNDL for approx. 2 seconds. Other bulb checks with longer bulb check duration will be performed based on bus messages from other modules. If the cluster receives no PCI bus messages for (20) seconds after the transition to "run", the cluster will display "no bus" in the odometer.

A self test can be initiated by holding down the odometer reset button and switching the ignition from "lock" to "off" (unlock). This test will activate

GENERAL INFORMATION

the gauges, turn on the indicator lights along with the odometer and PRNDL segments.

3.10 MEMORY SYSTEM

The memory system consists of power left front seat, power mirror(s) and radio presets. The memory heated seat/mirror module (MHSMM) also includes the heated seat function. The module is located under the left front seat and receives input from: left manual 8-way seat switch, left seat position sensors, memory switch, both heated seat switches, both heated seat negative temperature coefficients (NTC's) thermistors), PCI bus circuits, and the power mirror sensors. The module uses these inputs to perform the following functions: position the drivers memory seat, exterior mirror(s), actuate the drivers and passenger heated seat heater and send the memory location over the PCI bus.

When a memory button is pressed (either # 1 or # 2) on the memory switch the MHSMM sends a message to the BCM which in turn sends a recall message to the MHSMM and the PCI radio. They will in turn position the drivers seat and sideview mirror(s) along with setting the radio presets. If the drivers seat or exterior mirror(s) are inoperative from their own respected switches, use the service information and schematic to diagnose the problem. This manual addresses the memory problems only and it is assumed there is not a basic component failure.

3.10.1 POWER SEAT

The memory power seat provides the driver with 2 position settings for the left seat. Each power seat motor is connected to the MHSMM with two circuits. Each circuit is switched between battery and ground. By alternating the circuits the MHSMM controls the movement of the motors based on input from the power seat switch or through memory recall.

Each motor contains a potentiometer to monitor the seat position. To monitor the position of the motor, the MHSMM sends out a 5-volt reference on the sensor supply circuit. The sensor is grounded back to the module on a common ground circuit. Based on the position of the sensor, the MHSMM monitors the voltage change through the sensor on a separate signal circuit.

The MHSMM stores the input value of each of the four seat potentiometers in memory when the system is requested. The driver can initiate memory recall, using either the seat mounted memory switch or the RKE transmitter. When initiated, the MHSMM adjusts the four seat motors to match the memorized seat position data.

For safety, the memory seat recall is disabled by the MHSMM when the vehicle is out of park position. Any obstruction to seat movement over a 2 second delay will cause the seat to stop moving in which case a stalled motor would be detected by the MHSMM which would then flag a trouble code and the corresponding seat output would be deactivated. However, if the object obstructing the seat is removed, the seat will function normally again.

3.10.2 MEMORY SEAT GLIDE

The intent of this feature is to allow for easier entry and exit to the vehicle by moving the seat rearward a short distance when the operator turns the ignition off. The seat returns to its original position when the operator returns and turns on the ignition or extends the seat belt. If any seat movement is initiated, whether manual or by memory recall, after the ignition has been turned off, that will cancel any ensuing glide to enter movement until the next ignition cycle.

This feature can be enabled/disabled by the owner by holding the memory set button and simultaneously pressing the horizontal rearward switch. To reinstate the feature, repeat the process. This can also be done using the DRB which will also inform as to which state it is in.

3.10.3 GUARD BANDS

The module provides guard bands which prevent the seat track from hitting the hard limits of the given seat axis during manual power seat operation. The guard band values for each hard limit are stored in EEPROM. The guard band can be bypassed by running the seat to the end of its travel and then releasing the switch and pressing it again. The seat will move a short distance further. Once the seat is past the guard band it can be stored in memory, but if recall is initiated the seat will move to the guard bands and no further.

3.10.4 MEMORY MIRROR

NOTE: Some vehicles may only be equipped with a driver side memory mirror.

If equipped each outside mirror will have a vertical and a horizontal position sensor. The MHSMM provides a 5-volt reference to each position sensor. The sensors share a common ground circuit. The MHSMM monitors the position of the mirror(s) by measuring the voltage of each signal. When a memory position is set, the MHSMM monitors and stores the position of the outside mirror. The MHSMM adjusts the mirror(s) to the appropriate positions when a memory recall message is received from the RKE or is requested from the memory switch.

The power mirror switch during non-memory operation operates the mirror(s) independently of the MHSMM.

3.10.5 HEATED SEATS

The controls for the heated seats are located on the side of each seat. The system offers two seat temperature settings of approximately 98.6 F (LO) and approximately 107.6 F (HI).

As the temperature in the seat rises, the Negative Temperature Coefficient (NTC) resistance decreases and the voltage reading detected by the MHSMM increases. The seat heater output is deactivated once the voltage reading reaches its upper threshold for either setting, high or low.

As the temperature decreases, the voltage reading decreases until the lower threshold is reached for either setting high or low. At this point the seat heat output is activated once again and this cycle repeats itself as long as the seat heat request is on. The thresholds for low and high settings are pre-programmed into the MHSMM memory.

The heated seat switch contain resistors pulled up to ignition which are processed by the MHSMM as voltage readings indicating desired heat setting high or low.

3.11 COMPASS/MINI-TRIP COMPUTER OR ELECTRONIC VEHICLE INFORMATION CENTER

The Compass/Mini-Trip Computer (CMTC) or Electronic Vehicle Information Center (EVIC) is located in the overhead console. The CMTC or EVIC supplements the standard vehicle instrumentation. The CMTC and EVIC use a vacuum fluorescent (VF) display to supply the vehicle operator with a compass heading, outdoor temperature, average fuel economy, distance to empty, instantaneous fuel economy, trip odometer, elapsed ignition on time, distance to service, warning messages, and service messages.

The difference between a CMTC and an EVIC is that only the EVIC provides additional memory and feature programming. The EVIC is capable of displaying memory system messages when the vehicle is equipped with memory systems. The EVIC also provides the interface to enable and disable vehicle programmable features when the vehicle is equipped with certain features. If equipped, the EVIC is also available with an integrated Universal Garage Door Opener (UGDO) known as HomeLink®. Also if equipped, the EVIC is available with a Tire Pressure Monitoring (TPM) System.

Both the CMTC and EVIC function buttons are labeled C/T, RESET, STEP, and MENU. The three UGDO buttons are labeled with dots to indicate the channel number.

The BCM supplies most of the information displayed by the CMTC/EVIC. Display information, except for the internal compass function, is received over the PCI bus. The CMTC/EVIC sends and receives data over the PCI bus, communicating with the BCM and PCM. Tire Pressure Monitoring System information is received by the EVIC in the form of radio transmissions. The tire pressure sensors are mounted to the vehicle wheels. For complete information, refer to the Tire Pressure Monitoring System section in this publication.

VEHICLE INFORMATION DISPLAY

The CMTC/EVIC provides the following functions:

- Compass direction
- Outside temperature
- Elapsed ignition on time
- Distance to empty
- Average fuel economy
- Trip odometer
- Distance to service
- Driver alert messages:
 - TURN SIGNAL ON (with vehicle graphic)
 - PERFORM SERVICE
 - DOOR OPEN (individual or multiple doors, with graphic)
 - WASHER FLUID LOW (with graphic)
 - RKE FOB BATTERY LOW
 - LAMP OUT

An audible chime or chimes will accompany any displayed warning messages. Chime requests with an OPEN message are dependent upon vehicle speed.

The CMTC/EVIC will not display information for any of the screens for which it did not receive the proper PCI bus data. Refer to the symptom list in the Overhead Console section for problems related to the CMTC/EVIC.

The CMTC/EVIC receives the following messages from the Body Control Module (BCM):

- Verification of US/Metric status
- VF display dimming brightness and exterior lamp status
- Elapsed Ignition On Time data
- Fuel Economy
- Distance to Empty
- Outside Temperature
- Distance to service

GENERAL INFORMATION

- Driver warning messages

The CMTC/EVIC receives the following messages from the Powertrain Control Module (PCM):

- Trip Odometer data
- Vehicle Speed

The CMTC/EVIC transmits the following messages to the BCM:

- Status Request: Beep, Reset, US/M Toggle
- Current Display

STEP BUTTON

The STEP Button can be used in one of the following three ways:

1. To sequentially select one of seven displays or blank display in the following order:
 - Average Fuel Economy
 - Distance to Empty
 - Trip Odometer
 - Time Elapsed
 - Distance to Service Message
 - Individual Tire Pressure (When equipped with TPM.)
 - Off (Blank)
2. To set the magnetic variance zone when VARIANCE = X ($X = 1 - 15$) is indicated in the VF Display.
3. To select the displayed programmable feature setting. (When equipped.)

MENU BUTTON

Use the MENU button to sequentially step the EVIC through the programmable features.

Use the MENU button to enter the Tire Pressure Monitoring (TPM) Training Procedure.

RESET BUTTON

The RESET Button has two different functions:

1. To clear the trip functions that may be reset
2. To enter and exit the diagnostic mode

Pressing the RESET button once will clear the trip function that is currently being displayed (except Distance to Service) and the CMTC/EVIC will send a PCI bus beep request to the BCM. If the RESET button is pressed again within 3 seconds, the CMTC/EVIC will reset ALL of the trip functions and an additional beep request is sent to the BCM. The trip functions that may be reset are:

- Average Fuel Economy
- Trip Odometer
- Elapsed Time

A reset will only occur if one of the trip functions that may be reset is currently being displayed. Pressing the RESET button for more than three (3) seconds resets the Distance to Service function while the Distance to Service message is being displayed. The CMTC/EVIC module will send a beep request to the BCM.

Simultaneously pressing the RESET button and the C/T button while turning the ignition from Off to On will enter the CMTC/EVIC into the self-diagnostic mode.

COMPASS/TEMPERATURE (C/T) BUTTON

Actuating the Compass/Temperature Button (C/T) will cause the CMTC/EVIC to display the compass and temperature information. This function will operate from another traveler display or from the programmable feature mode.

3.11.1 TRAVELER DISPLAY FUNCTIONS

Using the STEP button will change the CMTC/EVIC between modes of operation and display the appropriate information according to data received from the PCI Bus.

COMPASS/TEMPERATURE

The CMTC/EVIC simultaneously displays the compass reading and the outside temperature. Outside temperature information is received via the PCI bus from the PCM.

The CMTC/EVIC module internally senses and calculates the compass direction.

COMPASS OPERATION

Upon ignition on, if the calibration information stored in the CMTC/EVIC memory is within the normal range, the CMTC/EVIC will perform in slow Auto-Cal mode. In slow Auto-Cal mode, the CMTC/EVIC continuously compensates for the slowly changing magnetic field of the vehicle. The compass module detects changes in the vehicle magnetism and makes appropriate internal corrections to ensure proper displayed direction.

However, if the calibration information stored in the CMTC/EVIC memory is not within the normal range at ignition on, the CMTC/EVIC will enter fast Auto-Cal. CAL is displayed along with the temperature.

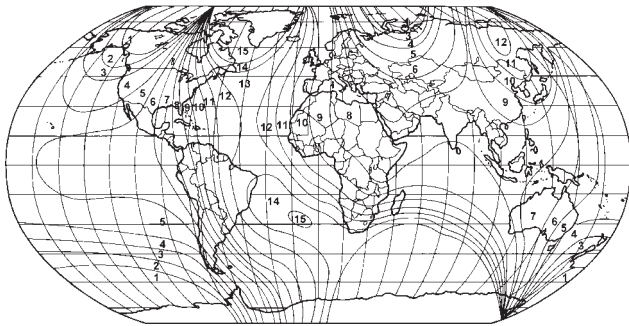

Auto activation of the fast Auto-Cal mode will also occur when the CMTC/EVIC is subjected to high magnetic field strength levels, which cause all compass readings to be erroneous for a continuous period of five (5) minutes. During fast Auto-Cal, CAL will be displayed along with the temperature.

Fast Auto-Cal can also be performed manually, by pressing and holding the RESET button for 10 seconds during the Compass/Temperature display mode.

3.11.2 SETTING MAGNETIC ZONE VARIANCE

Variance is the difference between magnetic North and geographic North. For proper compass function, the correct variance zone must be set. Refer to the Zone Variance map for the correct zone. Follow these steps to check or change the variance zone:

- The ignition switch must be in the On position and the CMTC/EVIC display must not be blank.
- If the compass/temperature data is not currently being displayed, momentarily press and release the C/T button to display compass/temp information.
- Press and hold the RESET button until VARIANCE = XX is displayed. The CMTC/EVIC will display the variance zone stored in memory and the word VARIANCE.
- Use the STEP button to select the proper variance zone number, 1 through 15.
- After selecting the proper zone number, momentarily press and release the RESET button. The variance zone is then stored in the memory and the CMTC/EVIC returns to normal operation.

80M13953

3.11.3 COMPASS CALIBRATION

The compass module has 2 types of auto-calibration; slow-cal and fast-cal. Slow-cal ensures that during normal vehicle operation the compass performs auto-calibration functions to keep the compass sensors in their proper operating range. Whenever the ignition is On and the CMTC/EVIC receives PCI bus data indicating that engine RPM is greater than zero, auto-calibration is performed continuously.

If the calibration information stored in the compass module memory is not within the normal range after a power-up cycle, the compass will display CAL. The CMTC/EVIC will enter into the fast-cal mode until calibration is complete.

To enter the compass into Manual Calibration mode, perform the following steps:

- Drive the vehicle to an area away from any large metal objects or overhead power lines.
- Ensure that the proper variance zone is selected. See "Setting Magnetic Zone Variance."
- The ignition switch must be in the On position and the CMTC/EVIC display must not be blank.
- Press the C/T button to view the Compass/Temperature display.
- Press and hold the RESET button until CAL is displayed, then release the button.
- Drive slowly, less than 5 MPH (8KPH) in at least 1 complete 360 degree circle.
- CAL will remain illuminated to alert the driver that the compass is in the calibration mode.
- After calibration is complete, CAL will turn off.

If the compass appears blank, unable to be calibrated, or the compass displays false indications, the vehicle must be demagnetized. Refer to Compass Demagnetizing Procedure in the Service Manual.

3.11.4 DIAGNOSIS AND TESTING

SELF-CHECK DIAGNOSTICS

The CMTC/EVIC is capable of performing a diagnostic self check on its internal functions. CMTC/EVIC diagnostics may be performed using a DRBIII® or by using the following procedure:

1. With the ignition switch in the OFF position, depress and hold the RESET and the C/T buttons.
2. Turn the ignition switch to the ON position.
3. Continue to hold both buttons until the software versions are displayed, then release the buttons.
4. All of the VFD segments will illuminate for 2-4 seconds. Check for segments that do not illuminate or illuminate all the time.
5. When the self-check is complete the EVIC will display one of the following messages:
 - PASS SELF TEST
 - FAILED SELF TEST
 - NOT RECEIVING J1850 MESSAGE
6. To exit the self-check mode, depress the RESET button or cycle the ignition switch and the CMTC/EVIC will return to normal operation.

If a Communication fault is displayed, refer to the symptom list. If a FAILED is displayed, the CMTC/EVIC must be replaced.

3.11.5 AMBIENT TEMPERATURE SENSOR

The ambient air temperature is monitored by the PCM and displayed by the CMTC/EVIC. The PCM receives a hardwire input from the ambient temperature sensor (ATS).

The ATS is a variable resistor that operates on a 5-volt reference signal circuit hardwired from the PCM. The resistance in the ATS changes as the outside temperature rises or falls. The BCM senses the change in reference voltage through the ATS resistor. Based on the resistance of the ATS, the PCM is programmed to correspond to a specific temperature. The PCM stores and filters the ambient temperature data and transmits this data to the CMTC/EVIC via the PCI Bus. The ATS cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

AMBIENT TEMPERATURE SENSOR FAULT CODES

The outside temperature function is supported by the ambient temperature sensor (ATS), a signal and ground circuit hardwired to the PCM, and the CMTC/EVIC display.

If the CMTC/EVIC display indicates 54°C (130°F) or the ATS sense circuit is shorted to ground, the temp display will be 54°C (130°F) to indicate a SHORT circuit condition.

If the CMTC/EVIC display indicates -40°C (-40°F) or the ATS sense circuit is open, the temp display will be -40°C (-40°F) to indicate an OPEN circuit condition.

If there is an OPEN or SHORT circuit condition, it must be repaired before the CMTC/EVIC VFD can be tested.

The ATS is supported by the PCM. Ambient Temperature Sensor DTCs will be recorded in the PCM. The ATS can be diagnosed using the following Sensor Test. Test the ATS circuits using the diagnostics in the Powertrain Diagnostic Procedures Manual. If the CMTC/EVIC passes the self test, and the ATS, the circuits, and PCI bus communications are confirmed to be OK, but the CMTC/EVIC temperature display is inoperative or incorrect, replace the PCM.

AMBIENT TEMPERATURE SENSOR TEST

1. Turn the ignition OFF.
2. Disconnect the ATS harness connector.
3. Measure the resistance of the ATS using the following min/max values:
 - 0° C (32° F) Sensor Resistance = 29.33 - 35.99 Kilohms
 - 10° C (50° F) Sensor Resistance = 17.99 - 21.81 Kilohms

- 20° C (68° F) Sensor Resistance = 11.37 - 13.61 Kilohms
- 25° C (77° F) Sensor Resistance = 9.12 - 10.86 Kilohms
- 30° C (86° F) Sensor Resistance = 7.37 - 8.75 Kilohms
- 40° C (104° F) Sensor Resistance = 4.90 - 5.75 Kilohms

The sensor resistance should read between these min/max values. If the resistance values are not OK, replace the Sensor.

3.11.6 HOMELINK® UNIVERSAL TRANSMITTER

If equipped, the HomeLink® Universal Transmitter is integrated into the overhead console. For added security it will operate home security systems that use coded signals known generically as *Rolling Codes*. The overhead console display provides visual feedback to the driver, indicating which HomeLink® transmitter channel button is being pressed. The HomeLink® can learn and store up to three separate transmitter radio frequency codes to operate garage door openers, security gates, and security lighting. The HomeLink® buttons are marked with one, two, or three dots. For complete information, refer to Universal Transmitter in the Service Manual or the Owner's Manual.

3.12 TIRE PRESSURE MONITORING SYSTEM

If equipped with the Tire Pressure Monitoring System, each of the vehicle's five wheels will have a valve stem with a pressure sensor and radio transmitter built in. Signals from the tire pressure sensors are received and interpreted by the Electronic Vehicle Information Center (EVIC).

A sensor in a mounted wheel will broadcast its detected pressure once per minute when the vehicle is moving faster than 40 km/h (25 mph). The spare tire sensor will broadcast once every hour. Each sensor's broadcast is uniquely coded so that the EVIC can determine location. The individual tire pressures can be displayed graphically on the EVIC.

NOTE: The spare tire is only monitored when equipped with the 5-Tire TPM System.

3.12.1 TRAINING THE EVIC

The EVIC can be trained to recognize the source locations of pressure sensor signals. The training procedure is given below:

1. Locate "RETRAIN TIRE SENSORS" on the EVIC menu.

When this mode is enabled by selecting "YES", the EVIC will initiate the following procedure.

2. A display will prompt the user to: "TRAIN LEFT FRONT TIRE". At this point the user must set the left front tire sensor to learn mode by positioning a magnet (Relearn Magnet special tool 8821) over the valve stem for at least 5 seconds. The Remote Tire Pressure Monitor (RTPM) in the front left tire will transmit a message indicating to the EVIC that it is in learn mode. When the EVIC has received this message and is assured that it has learned an ID, the EVIC will request a horn chirp via a bus message and then display the next train request. Note: There is a 60 second timer for learning the first tire location and a 30 second timer between the remaining tires. If any of these timers expire the EVIC will abort the training procedure.
3. The EVIC will request the initiation of a training sequence for each tire, one-by-one in a clockwise direction around the vehicle (Left Front, Right Front, Right Rear, Left Rear and Spare). The EVIC will allow 30 seconds (60 seconds for the first tire) from the beginning of the train request display to the receipt of a unique learn ID message from the RTPM. If, during a training session, a 60 or 30 second timer expires before a unique learn sensor ID is received or the vehicle is not in park, the EVIC will keep the previous set of trained IDs and will display "TRAINING ABORTED" until a button is pressed. Any IDs learned during the current session will be discarded. The EVIC will not store one ID for multiple locations.

NOTE: The spare tire is only monitored when equipped with the 5-Tire TPM System.

4. 4.) Once all four (or five) tires are successfully trained, the previous set of stored IDs will be replaced by the new IDs, and the EVIC will display, "TRAINING COMPLETE" until a button is pressed.

If the vehicle is equipped with the Homelink feature and a Homelink button is pressed at any time during the training procedure, the EVIC module will immediately exit the training procedure, discard any IDs learned in the current session and perform the Homelink function. After the button is released, the module will display "RETRAIN TIRE SENSORS? NO".

The training procedure can be stopped at any time by pressing the C/T, STEP, RESET or MENU button. When any of these buttons are pressed the EVIC will display "TRAINING ABORTED."

Once training is complete, the EVIC can determine when the spare wheel has been mounted on the vehicle. The spare wheel sensor/transmitter is expected to transmit once per hour. If the sensor/transmitter ID for the spare wheel is received at a shorter interval, the EVIC will request a chime and display "SPARE SWAP DETECTED" for five seconds.

NOTE: The spare tire message is only available when equipped with the 5-Tire TPM System.

3.12.2 PRESSURE THRESHOLDS

The EVIC will monitor the tire pressure signals from the four (or five) tire sensors and determine if any tire has gone below the low pressure threshold or raised above the high pressure threshold. Refer to the table below.

LOW TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
On	172 kPa (25 PSI)
Off	193 kPa (28 PSI)
HIGH TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
On	310 kPa (45 PSI)
Off	276 kPa (40 PSI)

3.12.3 CRITICAL AND NON-CRITICAL PRESSURE ALERTS

A critical alert will be triggered when a tire pressure has gone below or above a set threshold pressure. Depending on what the condition is, the EVIC will request a chime and then display a LOW PRESSURE or HIGH PRESSURE message indicating the appropriate location.

The alert message will display for three seconds and then switch to the tire pressure trip screen. The tire pressure for the tire that has exceeded its threshold will blink at one second intervals on the graphic display. The blinking pressure will continue for the rest of the ignition cycle or until an EVIC button is pressed. If the display is removed without correcting the condition, it will reappear without a chime after 60 seconds to warn the driver of the low/high pressure condition.

A non-critical alert will be triggered when low or high pressure threshold has been exceeded in the spare tire. The "SPARE LOW PRESSURE" or "SPARE HIGH PRESSURE" alert will be displayed for 60 seconds during each ignition ON cycle. If the

GENERAL INFORMATION

pressure threshold is exceeded while the ignition is OFF, the alert will be delayed 8-10 seconds after ignition ON.

NOTE: The spare tire is only monitored when equipped with the 5-Tire TPM System.

3.12.4 SYSTEM FAULTS

NOTE: The Remote Tire Pressure Monitors (RTPM) are not internally serviceable. For a Sensor Failure or Low Battery fault, the RTPM must be replaced.

There are four conditions which will cause a Tire Pressure Monitoring System fault to be set. All fault codes are associated with a specific wheel location.

1. If the EVIC detects a non-transmitting Sensor/Transmitter in a road wheel for ten consecutive minutes with vehicle speed above 25 MPH (40 kph), it will:
 - a. Store an active fault code.
 - b. Request a chime.
 - c. Display "TIRE SENSOR BAD / MISSING".
 - d. Display a dashed line at the wheel location on the graphic display if the display is activated.

When the EVIC detects:

2. A low pressure sensor battery status,
3. All five sensors transmitting at a shorter than expected interval or,
4. No valid pressure sensor ID from the spare tire for 20 consecutive ignition cycles spaced at least one hour apart, it will:
 - a. Store an active fault code.
 - b. Request a chime.
 - c. Display "TIRE SENSOR BAD / MISSING".

Use the DRBIII® Input/Output function to further isolate the specific concern.

The DRBIII® can be queried to determine the Sensor/Transmitter status:

- "Invalid Pressure" - The Sensor/Transmitter is reporting a negative pressure or a pressure above 434 kPa (63 psi).
- "Low Batt" - The Sensor/Transmitter has reported a low battery status for seven consecutive ignition cycles.
- "Trained" - The Sensor/Transmitter ID code is recognized by the EVIC.
- "Active" - The vehicle is moving at 40 km/h (25 mph) and/or the Sensor/Transmitter is "awake" and transmitting as expected by the EVIC.

3.12.5 SPARE WHEEL AUTO-LOCATE (5-TIRE TPM SYSTEM ONLY)

If the spare tire is mounted on the vehicle, the EVIC will detect the move and determine from the

sensor transmit intervals, which wheels are mounted and which one is now the spare. The spare tire sensor/transmitter transmits once per hour. The sensor/transmitters in the mounted wheels transmit once per minute when the vehicle is moving at 40 km/h (25 mph).

3.12.6 REMOVE MAGNET FROM SPARE (5-TIRE TPM SYSTEM ONLY)

A magnet is used to initiate a sensor ID transmission. In the EVIC training procedure, the spare wheel is the last in the sequence. If the magnet is left on the wheel, the sensor/transmitter will continue its ID transmission. If the EVIC detects 20 transmissions from the spare wheel in 60 seconds and the vehicle speed is above 40 km/h (25 mph), it will:

- request a chime.
- display "REMOVE MAGNET FROM SPARE" for 60 seconds per ignition-ON cycle. 1.6 Tire Pressure Unavailable

The EVIC can detect high radio noise interference. When the noise level is too high to distinguish a transmission from a sensor/transmitter, it will:

- display "TIRE PRESSURE UNAVAILABLE" for 5 seconds.
- request a chime
- switch back to previous screen.

3.12.7 TIRE PRESSURE NOW AVAILABLE

If the "TIRE PRESSURE UNAVAILABLE" message was displayed because of radio noise interference, the EVIC will:

- display "TIRE PRESSURE NOW AVAILABLE" for 5 seconds.
- request a chime when the noise level no longer interferes with sensor/transmitter transmissions.

3.12.8 DIAGNOSING AND CLEARING SYSTEM FAULTS

All Tire Pressure Monitoring System Faults are specific to one location. If a "LOW BATTERY" fault is detected, the "TIRE SENSOR BAD / MISSING" message will be displayed. The appropriate sensor/transmitter can then be replaced.

If a single sensor/transmitter cannot be detected by the EVIC, replace that sensor transmitter. If none of the sensors/transmitters can be detected, refer to symptoms in the EVIC section.

3.12.9 SYSTEM TEST

A test of the Tire Pressure Monitoring System can be initiated in the EVIC. The test sequence is as follows:

1. Scroll to the blank display by pressing the STEP button.
2. Press and hold the RESET button for five seconds.
3. The EVIC will emit a beep to indicate the start of the test.
4. The EVIC will clear the sensor signal counters
5. The vehicle icon will be displayed with transmission counters at each corner. (Same display as for pressures but with counters in place of pressures.)
6. Drive the vehicle at speeds above 40 km/h (25 mph) for 10 minutes.
7. The counters will increase by one each time a sensor signal is received by the EVIC (approximately 1/min from each wheel except the spare).
8. The test will continue until any EVIC button is pressed or until the ignition is cycled to OFF.

3.13 POWER DOOR LOCK SYSTEM

The door lock switches provide a variable amount of voltage through the multiplexed (MUX) circuit to the BCM. Depending upon that input and various conditions that must be met (i.e. door lock inhibit, etc.), the BCM will determine the action to be taken and activate the proper relay for approximately 250 to 350 msec. If the vehicle is equipped with the vehicle theft security system it will have the central locking feature which locks and unlocks all doors from the cylinder lock switches. These switches are on separate multiplexed circuits to the BCM and have trouble codes relating to each of them.

RKE Remote Keyless Entry - This feature allows locking and unlocking of the vehicle door(s) by remote control using a hand-held transmitter (sometimes referred to as a fob) to activate a radio receiver (RKE module). This module plugs into the body control module which is directly connected to the junction block. With this feature RKE can be added to a non-equipped vehicle by installing a module. If the vehicle is equipped with the vehicle theft security system, RKE will also arm and disarm that system. A 4-button transmitter is used which provides lock, unlock, decklid release and panic features. Decklid release is only operable while the vehicle is in the park position. The module is capable of retaining up to 4 transmitter codes. Rolling code, which increases security, is also included in this system. If the transmitter goes out of synchronization it is easily put back in by pressing

the lock button when the transmitter is within range. An external antenna has been added which plugs into the module to provide greater range. RKE will also turn on the interior lamps when a valid unlock command is received and will extinguish the interior lamps when a lock command is received and all doors are closed.

On a vehicle equipped with the memory system, when the unlock button on a specified transmitter (either #1 or #2) is pressed the BCM will send a recall message to both the MHSMM and the PCI radio. They will in turn position the driver seat and both mirrors along with setting the radio presets.

Door Lock Inhibit - When the key is in the ignition and the driver front door is open, all door lock switches are disabled. The unlock switches are still functional. This protects against locking the vehicle with the keys still in the ignition.

Automatic (rolling) Door Locks - This feature can be enabled or disabled by using either the DRBIII® or the customer programmable method. When enabled, all doors will lock when the vehicle reaches a speed of 15 mph (24 kmh) and all doors are closed. If a door is opened and the vehicle slows to below 15 mph (24 kmh), the locks will operate again once all doors are closed and the speed is above 15 mph (24 kmh).

Decklid Release - Decklid release is a function of the body control module. Trouble codes are provided to assist in the diagnosis of this system.

Customer programmable features are: Horn chirp, one or two press decklid release, programming a new transmitter (using a previously programmed transmitter) and rolling door locks.

3.14 SENTRY KEY IMMOBILIZER SYSTEM (SKIS)

The SKIS is an immobilizer system designed to prevent unauthorized vehicle operation. The system consists of a Sentry Key Immobilizer Module (SKIM) and ignition key(s) called Sentry Key(s) which are equipped with a transponder chip. The SKIM communicates over the Programmable Communication Interface multiplex system (PCI) bus network to the Body Control Module (BCM), Powertrain Control Module (PCM), and/or the DRB scan tool. For programming the Sentry Key Transponder and other technical information refer to Powertrain information.

3.15 SPEED PROPORTIONAL STEERING (IF EQUIPPED)

The Speed Proportional Steering automatically adjusts steering effort based on the vehicle speed. The amount of effort required to turn the steering wheel is determined by a 500-Hz Pulse Width

GENERAL INFORMATION

Modulated (PWM) output signal. The desired duty cycle of the PWM is selected from a calibration table internal to the Body Control Module (BCM).

To obtain the desired solenoid current the duty cycle of the solenoid can be compensated according to a current measuring feedback circuit. The speed proportional steering system is always active with the ignition on.

The 500Hz PWM output signal is capable of generating a duty cycle from 0% (full off - minimum steering assist) to approximately 50% duty cycle (full on - maximum steering assist) in small increments. The duty cycle is determined by vehicle speed and is continuously modified by solenoid current feedback information. With the engine running and vehicle speed between 0 km/h (0 mph) and approximately 32 km/h (20 mph) the duty cycle will be about 50%. Between approximately 32 km/h (20 mph) and 100 km/h (60 mph) the duty cycle will gradually decrease to 0% based upon vehicle speed. Above approximately 100 km/h (60 mph) there is no assist provided by the speed proportional steering system. Maximum solenoid current will be limited to one amp but the system operates at about 0.5 amp. Speed Proportional Steering Solenoid resistance is 5.7-6.3 ohms at 20° C (68° F).

The Speed Proportional Steering System can detect three failure modes relating to the Speed Proportional Steering PWM driver located in the BCM. If any DTC is set, the solenoid is shut off, unless the condition goes away before approximately 10 seconds. Once the DTC is set, the solenoid will remain off for the remainder of the ignition cycle.

1. An open or shorted to ground circuit fault is detected by monitoring the feedback circuit. If the BCM detects that the feedback circuit has zero current when the software indicates the solenoid circuit should have current, the DTC will be set. This test is performed every 250 milliseconds.
2. A short to voltage fault is detected by monitoring the feedback circuit. The DTC will be set when the BCM has sensed that there was current on the solenoid feedback circuit when the solenoid was turned off.
3. An over temperature or thermal shutdown DTC will be set by default if the internal diagnostic pin of the solenoid driver is at a low level, but the feedback measurement does not show a high PWM output current.

3.16 VEHICLE COMMUNICATION

The Programmable Communication Interface or PCI Bus is a single wire multiplexed network capable of supporting binary encoded messages shared between multiple modules. The PCI bus circuit is

identified as D25. The modules are wired in parallel. Connections are made through the BCM. The BCM acts as a splice to connect each module and the Data Link Connector (DLC) together. The following modules are used on 2003 LH:

- Airbag Control Module
- Left Side Impact Airbag Control Module
- Right Side Impact Airbag Control Module
- Controller Antilock Brake
- Powertrain Control Module - Next Generation Controller (NGC)
- Radio (If equipped)
- CD Changer (If equipped)
- Overhead Travel Information System (If equipped)
- Memory Heated Seat and Memory Mirror (If equipped)
- Automatic Temperature Control (If equipped)
- Body Control Module
- Sentry Key Immobilizer Module (If equipped)
- Mechanical Instrument Cluster

Each module provides its own bias and termination in order to transmit and receive messages. The bus voltage is at zero volts when no modules are transmitting and is pulled up to about seven and a half volts when modules are transmitting.

The bus messages are transmitted at a rate averaging 10800 bits per second. Since there is only voltage present when the modules transmit and the message length is only about 500 milliseconds, it is ineffective to try and measure the bus activity with a conventional voltmeter. The preferred method is to use the DRBIII® lab scope. The 12v square wave selection on the 20-volt scale provides a good view of the bus activity. Voltage on the bus should pulse between zero and about seven and half volts. Refer to the following figure for some typical displays.

The PCI Bus failure modes are broken down into two categories. Complete PCI Bus Communication Failure and individual module to response. Causes of a complete PCI Bus Communication Failure include a short to ground or battery on the PCI circuit. Individual module no response can be caused by an open circuit at the BCM or at the module, or an open battery or ground circuit to the affected module.

Symptoms of a complete PCI Bus Communication Failure would include but are not limited to:

- All gauges on the EMIC stay at zero
- All telltales on EMIC illuminate
- EMIC backlighting at full intensity
- No response received from any module on the PCI bus (except PCM)

- No start (if equipped with Sentry Key Immobilizer)

Symptoms of Individual module failure could include any one or more of the above. The difference would be that at least one or more modules would respond to the DRBIII®.

Diagnosis starts with symptom identification. If a complete PCI Bus Communication Failure is suspected, begin by identifying which modules the vehicle is equipped with and then attempt to get a response from the modules with the DRBIII®. If any modules are responding, the failure is not related to the total bus, but can be caused by one or more modules PCI circuit or power supply and ground circuits. The DRBIII® may display "BUS +/- SIGNALS OPEN" OR "NO RESPONSE" to indicate a communication problem. These same messages will be displayed if the vehicle is not equipped with that particular module. The CCD error message is a default used by the DRBIII® and in no way indicates whether or not the PCI bus is operational. The message is only an indication that a module is either not responding or the vehicle is not equipped.

NOTE: Communication over the bus is essential to the proper operation of the vehicles on-board diagnostic systems and the DRBIII®. Problems with the operation of the bus or DRBIII® must be corrected before proceeding with diagnostic testing. If there is a problem, refer to the Communications category of this manual.

80bdbcf6

GENERAL INFORMATION

NOTE: For 2003 model year, some vehicles will integrate the Transmission Control Module and Powertrain Control Module into a single control module. This new module is the Next Generation Controller for DaimlerChrysler and will be referred to as the Powertrain Control Module (PCM). The Transmission Control System is part of the Powertrain Control Module.

New Diagnostic procedures and New DTC numbers are some of the changes you will see which reflect the new combined module technology. The PCM will have four color coded connectors C1 through C4, (C1-BLK, C2-GRAY, C3-WHITE, C4-GREEN), each PCM connector will have 38 pins each. Two new tools are used for probing and repairing the New PCM connectors. A New tool to release the pins from the PCM connectors Miller #3638 is introduced, you must use the Miller tool #3638 to release the connector pins or harness and connector damage will occur. Also a New tool for probing connectors Miller #8815 is introduced, you must use the Miller tool #8815 to probe the PCM pins or harness and connector damage will occur. There is also a new Verification test and module replacement procedure for the PCM.

3.16.1 BUS FAILURE MESSAGE

Odometer Displays "No Bus" - The Mechanical Instrument Cluster (MIC) cannot communicate over the bus and does not know why.

3.17 VEHICLE THEFT SECURITY SYSTEM

This passive system is designed to protect against vehicle theft. The vehicle theft security system (VTSS) is part of the body control module (BCM), which monitors vehicle doors and the ignition for unauthorized operation. The alarm activates by sounding the horn, flashing the headlamps, park and tail lamps, and the VTSS indicator lamp. Passive arming occurs upon normal vehicle exit by turning the ignition off, opening the driver's door, locking the doors with the power lock, and closing the driver's door or locking the doors with RKE. Manual arming occurs by using the key to lock the doors after closing them. The indicator lamp on the dash will flash for 15 seconds, showing that arming is in progress. If no monitored systems are activated during this period, the system will arm and the indicator will flash at a slow rate. If the indicator lamp remains steadily lit during the arming process, this can indicate a possible loss of communi-

cation with the PCM or loss of trunk knock out switch. When something triggers the alarm, the system will signal the headlamps, park lamps, and horn for about 3 minutes.

For complaints about the Theft Alarm going off on it's own use the DRBIII® and select "BCM" then "Input/Output" and read the "Last VTSS cause" status.

Tamper Alert - The VTSS indicator lamp will flash twice quickly to indicate a tamper condition has occurred.

Manual Override - The system will not arm if the doors are locked using the manual lock control (by hand) or if the locks are actuated by an inside occupant after the door is closed.

To verify the system, proceed as follows:

1. Open the driver's door.
2. Remove the ignition key (but keep it in hand).
3. Lock the doors with the power lock switch or the RKE.
4. Close the driver's door.

NOTE: After the doors are closed, locking the doors with RKE will also arm the system.

NOTE: If the VTSS indicator lamp flashed, the system is operational and verified. If not, there may be a problem with the system.

Arming/Disarming - Active arming occurs when the remote keyless entry transmitter is used to lock the vehicle doors, whether the doors are open or closed. If one or more doors are open, the arming sequence is completed only after all doors are closed.

Passive disarming occurs upon normal vehicle entry (unlocking front door with the key). This disarming also will halt the alarm once it has been activated.

Active disarming occurs when the remote keyless entry transmitter is used to unlock the vehicle doors. This disarming also will halt the alarm once it has been activated.

NOTE: A Powertrain Control Module from a vehicle equipped with a vehicle theft security system cannot be used in a vehicle that is not equipped with a vehicle theft security system. If the VTSS indicator lamp comes on after ignition ON and stays on, the PCI bus communication with the Powertrain Control Module possibly has been lost.

3.18 WIPER SYSTEM

The wiper system provides the driver with the normal wiper (low and high speeds), intermittent wipe, wipe after wash, headlamp washers and pulse wipe functions. The driver selects the wiper function via the resistive multiplexed stalk switch mounted on the steering column. The BCM uses

input signal from the wiper stalk switch, wiper motor park switch, and the washer switch to control the wipe system. The Body Control Module (BCM) then controls the relays and timing functions to provide the driver selected features.

3.18.1 SYSTEM FEATURES

Speed Sensitive Intermittent Wipe Mode

There are 6 individual delay times with a minimum delay of 1/2 second to a maximum of 18 seconds. When the vehicle speed is under 10 MPH (6 KMH), the delay time is doubled providing a range of 1 second to 36 seconds.

Pulse Wipe

When the wiper is in the off position and the driver presses the wash button for more than 62 milliseconds, but less than 1/2 second, 2 wipe cycle in low speed mode will be provided.

Park after Ignition Off

Because the wiper relays are powered from the battery the BCM can run the wipers to park after the ignition is turned off.

Wipe after Wash

When the driver presses the wash button for over 1/2 second and then releases it, the wiper will continue to run for 2 additional wipe cycles.

The wiper system utilizes the BCM to control the on/off and hi/low relays for low and hi speed wiper functions, intermittent wiper delay as the switch position changes, pulse wipe, wipe after wash mode, and wiper motor park functions. The BCM uses the vehicle speed input to double the usual delay time below 10 MPH (6 KMH).

3.19 USING THE DRBIII®

Refer to the DRBIII® user guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII® functions.

3.20 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages: user-requested WARM Boot or User -Requested COLD Boot. If the DRBIII® should display any other error message, record the entire display and call the STAR Center for information and assistance. This is a sample of such an error message display:

```
ver:2.14
date: 26 Jul 93
file: key_iff.cc
date: Jul26 1993
line: 548
err: Oxi
User-Requested COLD boot
```

Press MORE to switch between this display and the application screen.
Press F4 when done noting information.

3.21 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®. Check for proper grounds at DLC cavities 4 and 5.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of a faulty cable or vehicle wiring.

3.22 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

80b57566

4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest

GENERAL INFORMATION

information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUSE SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheel before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as rings, watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a body system problem, it is important to follow approved procedures where applicable. These procedures can be found in this General Information Section or in the service manual procedures. Following these procedures is very important to safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the body system are intended to be serviced as an assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and functions for the measurement. Do not try voltage or current measurement that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WRANINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion. Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complains will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

WARNING: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRBIII®.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box)
Jumper wires
Ohmmeter
Voltmeter
Sentry Key Tester
Test Light

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom List:

ACCELEROMETER 1
ACCELEROMETER 2
INTERNAL 1
INTERNAL 2
OUTPUT DRIVER 1
OUTPUT DRIVER 2
STORED ENERGY FIRING 1

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be INTERNAL MODULE TEST.

When Monitored and Set Condition:

ACCELEROMETER 1

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

ACCELEROMETER 2

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

INTERNAL 1

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

INTERNAL 2

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

OUTPUT DRIVER 1

When Monitored: With the ignition on the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

OUTPUT DRIVER 2

When Monitored: With the ignition on the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

INTERNAL MODULE TEST — Continued**STORED ENERGY FIRING 1**

When Monitored: With the ignition on the ACM on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the ACM identifies an out of range internal circuit.

POSSIBLE CAUSES

AIRBAG CONTROL MODULE - ACM

LEFT SIDE IMPACT AIRBAG CONTROL MODULE - LSIACM

RIGHT SIDE IMPACT AIRBAG CONTROL MODULE - RSIACM

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. Ensure the battery is fully charged. WARNING: IF THE MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. From the list below, select the appropriate module reporting this diagnostic trouble code. SELECT ONE:</p> <p>ACM - ACTIVE or STORED DTC WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>LEFT SIACM - ACTIVE or STORED DTC WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Left Side Impact Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>RIGHT SIACM - ACTIVE or STORED DTC WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Right Side Impact Airbag Control Module in accordance with Service information. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All

Symptom List:

AIRBAG WARNING INDICATOR OPEN
AIRBAG WARNING INDICATOR SHORT

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **AIRBAG WARNING INDICATOR TEST**.

When Monitored and Set Condition:

AIRBAG WARNING INDICATOR OPEN

When Monitored: With ignition on the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, upon lamp state change, or in response to the ACM lamp message.

Set Condition: This DTC will set immediately if the indicator status is OPEN .

AIRBAG WARNING INDICATOR SHORT

When Monitored: With ignition on the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, upon lamp state change, or in response to the ACM lamp message.

Set Condition: This DTC will set immediately if the indicator status is SHORT.

POSSIBLE CAUSES

MIC, COMMUNICATION FAILURE
WARNING INDICATOR
ACM, WARNING INDICATOR
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.	All

AIRBAG WARNING INDICATOR TEST — Continued

TEST	ACTION	APPLICABILITY
2	<p>With the DRBIII®, ensure PCI Bus communications with the Instrument Cluster. Is the Instrument Cluster communicating on the PCI Bus?</p> <p>Yes → Go To 3</p> <p>No → Refer to category COMMUNICATION CATEGORY and select the related symptom INSTRUMENT CLUSTER BUS +/- SIGNAL OPEN. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>With the DRBIII® select PASSIVE RESTRAINTS, AIRBAG and MONITOR DISPLAY. Using the DRBIII®, read the WARNING LAMP MONITOR screen. Select the LAMP STATUS displayed on the DRB monitors screen. Does the DRBIII® show the LAMP STATUS: OK?</p> <p>YES Go To 4</p> <p>NO Replace Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. If there are no possible causes remaining, view repair.</p> <p>Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
5	<p>NOTE: Ensure the battery is fully charged. With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions. Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. NOTE: Check connectors - Clean and repair as necessary. You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ?</p> <p>Yes → Select appropriate symptom from Symptom List.</p> <p>No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom: CALIBRATION MISMATCH

When Monitored and Set Condition:

CALIBRATION MISMATCH

When Monitored: With ignition on, the ACM monitors the PCI Bus for the VIN message containing the body style. Note: The VIN message should match the vehicle VIN plate.

Set Condition: If the Body style stored in ACM does not exactly match the vehicle body style indicated by the PCM for 2 consecutive VIN messages, then the fault shall be set.

POSSIBLE CAUSES

PCM, PCI COMMUNICATION FAILURE
COMPARE VEHICLE IDENTIFICATION NUMBERS
ORC CALIBRATION MISMATCH
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the battery is fully charged. Turn the ignition on. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ACTIVE or STORED DTC:</p> <p>ACM - ACTIVE DTC Go To 2</p> <p>ACM - STORED DTC Go To 5</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All
2	<p>Turn the ignition on. Connect the DRB to the data link connector and select PASSIVE RESTRAINTS, AIRBAG, SYSTEM TEST. With the DRBIII®, read the system test. Does the DRB show PCM Active on the Bus:?</p> <p>Yes → Go To 3</p> <p>No → Refer to category COMMUNICATION CATEGORY and select the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All

CALIBRATION MISMATCH — Continued

TEST	ACTION	APPLICABILITY
3	<p>With the DRB select ENGINE MISCELLANEOUS, select MISC FUNCTION, and then CHECK VIN to read the Vehicle Identification Number in the Powertrain Control Module.</p> <p>Compare the VIN displayed on the DRB screen and the Vehicle VIN plate. Does the VIN plate and the PCM VIN match?</p> <p>Yes → Go To 4</p> <p>No → Replace the Powertrain Control Module and program with the correct vehicle identification number. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
4	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
5	<p>NOTE: Ensure the battery is fully charged.</p> <p>With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system.</p> <p>NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.</p> <p>Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>You have just attempted to simulate the condition that initially set the trouble code message.</p> <p>The following additional checks may assist you in identifying a possible intermittent problem:</p> <ul style="list-style-type: none"> - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. <p>Did the DTC become active ?</p> <p>Yes → Select appropriate symptom from Symptom List.</p> <p>No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom: CLUSTER MESSAGE MISMATCH

When Monitored and Set Condition:

CLUSTER MESSAGE MISMATCH

When Monitored: After the MIC bulb test is completed, the ACM compares the Lamp Request by ACM, On or Off, and the Lamp on by MIC, On or Off, PCI Bus messages. Each message is transmitted one time per second or when a change in the lamp state occur.

Set Condition: If the Lamp Request by ACM, On or Off, and the Lamp on by MIC, On or Off, messages do not match for 10 seconds, the code will set.

POSSIBLE CAUSES

MIC DIAGNOSTIC CODES
CLUSTER MESSAGE MISMATCH
STORED CODE OR INTERMITTENT CONDITION
ACM, CLUSTER MESSAGE MISMATCH
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.	All
2	With the DRBIII®, read the MIC DTCs. Does the DRBIII® display any active Diagnostic Codes? Yes → Refer to symptom list for problems related to Instrument Cluster. No → Go To 3	All

CLUSTER MESSAGE MISMATCH — Continued

TEST	ACTION	APPLICABILITY
3	<p>With the DRBIII® select PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY and WARNING LAMP STATUS. Cycle the ignition key and observe the LAMP ON BY MIC and LAMP REQ BY ACM monitors after the 6 to 8 second indicator test. Does the LAMP ON BY MIC and LAMP REQ BY ACM monitors match?</p> <p>YES Go To 4</p> <p>NO Replace Mechanical Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. If there are no possible causes remaining, view repair.</p> <p>Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
5	<p>NOTE: Ensure the battery is fully charged. With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions. Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. NOTE: Check connectors - Clean and repair as necessary. You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ?</p> <p>Yes → Select appropriate symptom from Symptom List.</p> <p>No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom: CONFIGURATION ERROR

When Monitored and Set Condition:

CONFIGURATION ERROR

When Monitored: With ignition on the Side Impact Airbag Control Module monitors the unused squib terminals for the a valid squib circuit resistance.

Set Condition: When the SIACM detects a valid squib circuit resistance across the unused terminals.

POSSIBLE CAUSES

SELECT MODULE REPORTING DTC
MISS WIRED LEFT SIACM CONNECTOR
MISS WIRED RIGHT SIACM CONNECTOR
LEFT SIDE IMPACT AIRBAG CONTROL MODULE - LSIACM
RIGHT SIDE IMPACT AIRBAG CONTROL MODULE - LSIACM
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. NOTE: Ensure that the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ONE:</p> <p>LEFT SIACM - ACTIVE DTC Go To 2</p> <p>LEFT SIACM - STORED DTC Go To 4</p> <p>RIGHT SIACM - ACTIVE DTC Go To 3</p> <p>RIGHT SIACM - STORED DTC Go To 4</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All

Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. <p>Did the DTC become active ?</p> <p>Yes → Select appropriate symptom from Symptom List.</p> <p>No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom:

INTERROGATE RIGHT SIACM

When Monitored and Set Condition:

INTERROGATE RIGHT SIACM

When Monitored: With ignition on, the ACM monitors the PCI Bus for a Right SIACM status message containing the airbag warning indicator On - OFF request. The status message is sent to the ACM once each second or upon any change in the active DTCs.

Set Condition: The Code will set, if the ACM receives an Lamp On status message from the Right SIACM. **NOTE:** This indicates that there is an active diagnostic trouble code in the Right SIACM.

POSSIBLE CAUSES

INTERROGATE RIGHT SIACM
NO ACTIVE RIGHT SIACM DTCS
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure that the battery is fully charged. Ensure the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ACTIVE or STORED DTC:</p> <p>ACM - ACTIVE DTC Go To 2</p> <p>ACM - STORED DTC Go To 4</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All
2	<p>Turn the ignition on. With the DRBIII® read the Right SIACM active DTCs. Did the DRBIII® show any active DTCs?</p> <p>Yes → Refer to symptom list for problems related to Right SIACM. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All

INTERROGATE RIGHT SIACM — Continued

Symptom:

LOSS OF IGNITION RUN - START

When Monitored and Set Condition:

LOSS OF IGNITION RUN - START

When Monitored: With the ignition in the Run or Start position the module monitors the Run - Start circuit for proper system voltage.

Set Condition: The code will set, if the voltage on the Run - Start circuit drops below approximately 6.0 volts for the ACM or 6.7 volts for the SIACM.

POSSIBLE CAUSES

AIRBAG SYSTEM COMPONENT SHORTED TO GROUND
 IGNITION SWITCH RUN-START CIRCUIT OPEN
 FUSED IGNITION SWITCH OUTPUT RUN-START CIRCUIT OPEN
 ACM, FUSED IGNITION OUTPUT RUN-START CIRCUIT OPEN
 MODULE RUN - START SHORTED TO GROUND
 RSIACM, LOW IGNITION RUN - START VOLTAGE
 LSIACM - LOW IGNITION RUN - START VOLTAGE
 STORED CODE OR INTERMITTENT CONDITION
 ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. NOTE: Ensure that the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. From the list below, select the appropriate module and DTC type for the this diagnostic trouble code. SELECT ONE:</p> <p>ACM - ACTIVE DTC Go To 2</p> <p>ACM - STORED DTC Go To 6</p> <p>LEFT SIACM - ACTIVE DTC Go To 7</p> <p>RIGHT SIACM - ACTIVE DTC Go To 8</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All

LOSS OF IGNITION RUN - START — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn ignition off. Remove and inspect the Airbag Run-Start Fuse. NOTE: Check connectors - Clean and repair as necessary. Is the Fuse open?</p> <p>Yes → Go To 3</p> <p>No → Go To 4</p>	All
3	<p>WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Measure the resistance of the Fused Ignition Switch Output Run-Start circuit between the Airbag Run-Start Fuse and ground. While monitoring the ohmmeter, disconnect each airbag system component on the Run - Start circuit one at a time. NOTE: Refer to the service information and system schematics to identify component(s) on the run - start circuit. Is the resistance above 10K ohms:</p> <p>Yes - after removing a component? Replace the shorted airbag system component in accordance with Service Instructions and replace the airbag Run - Start fuse. WARNING: IF THE MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No - after all components are removed? Repair the Fused Ignition Run - Start circuit shorted to ground and replace Airbag Run-Start Fuse. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition on. Measure the voltage of the Ignition Switch Output circuit between the Airbag Run-Start Fuse and ground. Is the voltage above approximately 6.0 volts?</p> <p>Yes → Go To 5</p> <p>No → Repair the open Ignition Switch Output Run-Start circuit. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
5	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Disconnect the Airbag Control Module connector. NOTE: Check connectors - Clean and repair as necessary. Reinstall the previously removed Airbag Run-Start Fuse. WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY. Measure the voltage of the Fused Ignition Switch Output Run-Start Circuit between the Airbag Control Module connector ground. Is the voltage above approximately 6.0 volts?</p> <p>Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Repair open Fused Ignition Switch Output Run-Start circuit. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All

LOSS OF IGNITION RUN - START — Continued

TEST	ACTION	APPLICABILITY
6	<p>NOTE: Ensure the battery is fully charged.</p> <p>With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.</p> <p>Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. NOTE: Check connectors - Clean and repair as necessary.</p> <p>You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem:</p> <ul style="list-style-type: none"> - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. <p>Did the DTC become active ?</p> <p style="padding-left: 40px;">Yes → Select appropriate symptom from Symptom List.</p> <p style="padding-left: 40px;">No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All
7	<p>WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>If there are no possible causes remaining, view repair.</p> <p style="padding-left: 40px;">Repair</p> <p style="padding-left: 80px;">Replace the Left Side Impact Airbag Control Module in accordance with Service Instructions. Symptom:

MODULE NOT CONFIGURED FOR SAB

When Monitored and Set Condition:

MODULE NOT CONFIGURED FOR SAB

When Monitored: With ignition on, the ORC monitors the PCI Bus for a message containing an "A" in the 4 th position of the VIN. This character identifies the type of safety equipment and should match the VIN. The PCM transmits the VIN every 3.5 seconds.

Set Condition: The code will set, if the ORC detects a Side Impact Airbag Module active on the PCI Bus and the 4 th character of the VIN message is not an "A".

POSSIBLE CAUSES

PCM, PCI COMMUNICATION FAILURE
 CHECK PCM VIN
 ACM, NOT CONFIGURED FOR SIDE AIRBAGS
 STORED CODE OR INTERMITTENT CONDITION
 ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.	All
2	Connect the DRB to the data link connector and select PASSIVE RESTRAINTS, AIRBAG, SYSTEM TEST With the DRBIII®, read the PCM Active on the Bus Does the DRB show PCM Active on the Bus?: Yes → Go To 3 No → Refer to category COMMUNICATION and select the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.	All

MODULE NOT CONFIGURED FOR SAB — Continued

TEST	ACTION	APPLICABILITY
3	<p>With the DRB read the Vehicle Identification Number in the Powertrain Control Module. Compare the VIN displayed on the DRB screen and the Vehicle VIN plate. Does the VIN plate and the PCM VIN match?</p> <p>Yes → Go To 4</p> <p>No → Replace the Powertrain Control Module and program with the correct vehicle identification number. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
4	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
5	<p>NOTE: Ensure the battery is fully charged. With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions. Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. NOTE: Check connectors - Clean and repair as necessary. You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ?</p> <p>Yes → Select appropriate symptom from Symptom List.</p> <p>No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom:

NO CLUSTER MESSAGE

When Monitored and Set Condition:

NO CLUSTER MESSAGE

When Monitored: With ignition on, the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, lamp state change, or in response to the ACM message.

Set Condition: If the MIC message is not received for 10 consecutive seconds, the code will set.

POSSIBLE CAUSES

MIC, COMMUNICATION FAILURE

ACM, NO CLUSTER MESSAGES

STORED CODE OR INTERMITTENT CONDITION

ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY

Symptom: NO RIGHT SIACM MESSAGE

When Monitored and Set Condition:

NO RIGHT SIACM MESSAGE

When Monitored: With ignition on, the ACM monitors the PCI Bus for the Right Side Impact Airbag Control Module status message. The Right SIACM transmits the status message to the ACM at 1 - second intervals.

Set Condition: If the ACM fails to see the Right SIACM status message on the PCI Bus for 10 seconds the code will set.

POSSIBLE CAUSES

NO RIGHT SIACM MESSAGE
ACM, NO RIGHT SIACM MESSAGE
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the battery is fully charged. Turn the ignition on. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ACTIVE or STORED DTC:</p> <p>ACM - ACTIVE DTC Go To 2</p> <p>ACM - STORED DTC Go To 4</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All
2	<p>With the DRBIII® select SIDE AIRBAG and the RIGHT SIDE AIRBAG from the DRBIII® menu. Does the DRBIII® show NO RESPONSE or BUS +/- SIGNAL OPEN?</p> <p>Yes → Refer to the COMMUNICATION category for the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All

Symptom:
SEAT SQUIB SHORT TO BATTERY

When Monitored and Set Condition:

SEAT SQUIB SHORT TO BATTERY

When Monitored: When the ignition is on, the SIACM monitors the voltage of the Seat Squib circuits.

Set Condition: When the SIACM detects high voltage on the Seat Squib circuits.

POSSIBLE CAUSES

SEAT AIRBAG SHORT TO BATTERY
 SEAT SQUIB 1 LINE 1 OR LINE 2 SHORTED TO BATTERY
 SIACM, SEAT SQUIB SHORT TO BATTERY
 STORED CODE OR INTERMITTENT CONDITION
 ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ONE: LEFT SIACM - ACTIVE DTC Go To 2 LEFT SIACM - STORED DTC Go To 4 RIGHT SIACM - ACTIVE DTC Go To 2 RIGHT SIACM - STORED DTC Go To 4 NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.	All

SEAT SQUIB SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
2	<p>WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: DO NOT PLACE AN INTACT UNDEPLOYED SEAT BACK PADDED SIDE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Seat Airbag connector.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>Connect the appropriate Load Tool to the Seat Airbag connector.</p> <p>WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.</p> <p>With the DRBIII®, read SIACM active DTC's.</p> <p>Does the DRBIII® display SEAT SQUIB SHORT TO BATTERY?</p> <p>Yes → Go To 3</p> <p>No → Replace Seat Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
3	<p>WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: DO NOT PLACE AN INTACT UNDEPLOYED SEAT BACK PADDED SIDE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Airbag Load Tool Jumper.</p> <p>Disconnect the Side Impact Airbag Control Module connector.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>Connect the appropriate Load Tool SIACM adaptor to the SIACM connector.</p> <p>WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.</p> <p>Measure the voltage of the Seat Squib 1 Line 1 and Line 2 circuits between the Seat Airbag connector and ground.</p> <p>Is any voltage present on either circuit?</p> <p>Yes → Repair Seat Squib 1 Line 1 or Line 2 shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Replace the Side Impact Airbag Control Module in accordance with Service Instructions. WARNING: IF THE SIDE IMPACT AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All

SEAT SQUIB SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
4	<p>NOTE: Ensure the battery is fully charged.</p> <p>With the DRBIII®, record and erase all DTCs from all modules.</p> <p>All active codes must be resolved before diagnosing any stored codes.</p> <p>Maintain a safe distance from all airbags while performing the following steps.</p> <p>With the DRBIII® monitor active codes as you work through the system.</p> <p>NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.</p> <p>Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>You have just attempted to simulate the condition that initially set the trouble code message.</p> <p>The following additional checks may assist you in identifying a possible intermittent problem:</p> <ul style="list-style-type: none"> - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. <p>Did the DTC become active ?</p> <p style="padding-left: 40px;">Yes → Select appropriate symptom from Symptom List.</p> <p style="padding-left: 40px;">No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom: SEAT SQUIB SHORT TO GROUND

When Monitored and Set Condition:

SEAT SQUIB SHORT TO GROUND

When Monitored: When the ignition is on, the SIACM monitors the resistance of the Seat Squib circuits.

Set Condition: When the SIACM detects a short to ground on the Seat Squib circuits.

POSSIBLE CAUSES

SEAT AIRBAG SHORT TO GROUND
SEAT SQUIB 1 LINE 1 OR LINE 2 SHORTED TO GROUND
SIACM, SEAT SQUIB SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	<p>Ensure the battery is fully charged. Turn the ignition on. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. Symptom:

VEHICLE BODY STYLE UNKNOWN

When Monitored and Set Condition:

VEHICLE BODY STYLE UNKNOWN

When Monitored: When the ignition is on, the ACM monitors the PCI Bus for the VIN message containing the vehicle body style from the Powertrain Control Module. The PCM transmits the VIN message every 14 seconds.

Set Condition: With ignition on, If the ACM does not receive 2 consecutive matching (vehicle Body Style) VIN messages on the bus the code will set.

POSSIBLE CAUSES

PCM, PCI COMMUNICATION FAILURE
 VEHICLE BODY STYLE UNKNOWN
 ACM, VEHICLE BODY STYLE UNKNOWN
 STORED CODE OR INTERMITTENT CONDITION
 ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM. SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.	All
2	Connect the DRBIII® to the data link connector and select PASSIVE RESTRAINTS, AIRBAG, SYSTEM TEST. With the DRBIII®, read the PCM Active on the Bus:. Does the DRB show PCM ACTIVE ON THE BUS:? Yes → Go To 3 No → Refer to category COMMUNICATION CATEGORY and select the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.	All

VEHICLE BODY STYLE UNKNOWN — Continued

TEST	ACTION	APPLICABILITY
3	<p>With the DRB select ENGINE, MISCELLANEOUS, SELECT MISC FUNCTION, and then CHECK VIN to read the Vehicle Identification Number in the Powertrain Control Module.</p> <p>Compare the VIN displayed on the DRB screen and the Vehicle VIN plate. Does the VIN plate and the PCM VIN match?</p> <p>Yes → Go To 4</p> <p>No → Replace the Powertrain Control Module and program with the correct vehicle identification number. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
4	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All
5	<p>NOTE: Ensure the battery is fully charged.</p> <p>With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system.</p> <p>NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.</p> <p>Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>You have just attempted to simulate the condition that initially set the trouble code message.</p> <p>The following additional checks may assist you in identifying a possible intermittent problem:</p> <ul style="list-style-type: none"> - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. <p>Did the DTC become active ?</p> <p>Yes → Select appropriate symptom from Symptom List.</p> <p>No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom:***AIRBAG INDICATOR ON WITHOUT ACM TROUBLE CODES****POSSIBLE CAUSES**

AIRBAG INDICATOR ON WITHOUT ACM TROUBLE CODES

INSTRUMENT CLUSTER PROBLEMS

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. Make sure that all active DTC's have been repaired before performing this procedure. With the DRBIII® select PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY, WARNING LAMP STATUS and read the WARNING LAMP STATUS. Does the DRBIII® show LAMP REQ BY ACM: ON?</p> <p>Yes → WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Refer to INSTRUMENT CLUSTER CATEGORY symptom list for problems related to Instrument Cluster. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All

Symptom:

ALL OUTPUTS SHORT

When Monitored and Set Condition:

ALL OUTPUTS SHORT

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES

DETERMINE FAULT

SPEAKER SECTION OF POWER AMPLIFIER

(+) CIRCUIT SHORTED TO GROUND

(-) CIRCUIT SHORTED TO GROUND

SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER

SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 3 No → Replace the Power Amplifier in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

ALL OUTPUTS SHORT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (+) circuit in the Radio C1 connector. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (-) circuit in the Radio C1 connector. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit in the radio C1 connector. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

CASSETTE PLAYER INOP

CD MECHANICAL FAILURE

- *AM/FM SWITCH INOPERATIVE**
- *ANY STATION PRESET SWITCH INOPERATIVE**
- *BALANCE INOPERATIVE**
- *CD EJECT SWITCH INOPERATIVE**
- *EQUALIZER INOPERATIVE**
- *FADER INOPERATIVE**
- *FF/RW SWITCH INOPERATIVE**
- *HOUR/MINUTE SWITCHES INOPERATIVE**
- *PAUSE/PLAY SWITCH INOPERATIVE**
- *PWR SWITCH INOPERATIVE**
- *SCAN SWITCH INOPERATIVE**
- *SEEK SWITCH INOPERATIVE**
- *SET SWITCH INOPERATIVE**
- *TAPE EJECT SWITCH INOPERATIVE**
- *TIME SWITCH INOPERATIVE**
- *TUNE SWITCH INOPERATIVE**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **CASSETTE PLAYER INOP**.

When Monitored and Set Condition:

CASSETTE PLAYER INOP

When Monitored: Continuously with the ignition and radio turned on.

Set Condition: The code will set if the radio detects a internal cassette failure.

CD MECHANICAL FAILURE

When Monitored: Continuously with the ignition and CD player turned on.

Set Condition: The code will set if the radio detects a CD mechanical failure.

POSSIBLE CAUSES

INTERNAL FAILURE

CASSETTE PLAYER INOP — Continued

TEST	ACTION	APPLICABILITY
1	NOTE: If a DTC is set, erase the DTC and attempt to reset the DTC. If DTC resets, follow this test. This is an internal radio failure. View repair Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:**CD CHANGER MECHANICAL FAILURE**

When Monitored and Set Condition:**CD CHANGER MECHANICAL FAILURE**

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if the CD Changer detects a mechanical failure.

POSSIBLE CAUSES

INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	NOTE: Erase DTC and attempt to reset. If DTC resets, follow this test. This is an internal CD Changer failure. View repair Repair Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CD CHANGER READ FAILURE

When Monitored and Set Condition:

CD CHANGER READ FAILURE

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if a CD that is not formatted as a music CD is installed in the CD Changer.

POSSIBLE CAUSES

CD CHANGER READ FAILURE

TEST	ACTION	APPLICABILITY
1	Replace the problem CD with a good, clean, unscratched, music CD. Turn the radio on and select the good CD. With the DRBIII®, read DTC's. Does the DRBIII® display CD CHANGER READ FAILURE? Yes → Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD CHANGER TEMPERATURE HIGH

When Monitored and Set Condition:

CD CHANGER TEMPERATURE HIGH

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if the temperature inside the CD Changer is above +65° C (+145° F).

POSSIBLE CAUSES

HIGH TEMPERATURE FAILURE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, erase the audio DTC's.</p> <p>Start the engine and allow the engine to reach normal operating temperature.</p> <p>If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize.</p> <p>The CD Changer will operate between -23° C and 65° C (-10° F and +145° F).</p> <p>With the DRBIII®, read DTC's.</p> <p>Does the DRBIII® display CD CHANGER TEMPERATURE HIGH?</p> <p>Yes → Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:
CD PLAY FAILURE

When Monitored and Set Condition:

CD PLAY FAILURE

When Monitored: Continuously with the ignition and the radio CD player turned on.

Set Condition: The code will set if a CD that is not formatted as a music CD or is scratched, dirty so the radio can not play the CD.

POSSIBLE CAUSES

CD PLAY FAILURE

TEST	ACTION	APPLICABILITY
1	Replace the problem CD with a good, clean, unscratched, music CD. Turn the radio CD player on. With the DRBIII®, read DTC's. Does the DRBIII® display CD PLAY FAILURE? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD READ FAILURE

When Monitored and Set Condition:**CD READ FAILURE**

When Monitored: Continuously with the ignition and the radio CD player turned on.

Set Condition: The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

POSSIBLE CAUSES

CD READ FAILURE

TEST	ACTION	APPLICABILITY
1	Replace the problem CD with a good, clean, unscratched, music CD. Turn the radio CD player on. With the DRBIII®, read DTC's. Does the DRBIII® display CD READ FAILURE? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD TEMPERATURE HIGH

When Monitored and Set Condition:

CD TEMPERATURE HIGH

When Monitored: Continuously with the ignition and the radio CD player turned on.

Set Condition: The code will set if the temperature inside the radio CD player is above +70° C (+156° F).

POSSIBLE CAUSES

HIGH TEMPERATURE FAILURE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, erase the audio DTC's. Start the engine and allow the engine to reach normal operating temperature. If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize. The radio CD player will operate between -23° C and 70° C (-10° F and +156° F). With the DRBIII®, read DTC's. Does the DRBIII® display CD TEMPERATURE HIGH?</p> <p>Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:

LOW VOLTAGE LEVEL

When Monitored and Set Condition:

LOW VOLTAGE LEVEL

When Monitored:

Set Condition: The radio detects lower than normal voltage.

POSSIBLE CAUSES

CHECK CHARGING SYSTEM

CHECK VOLTAGE LEVEL AT RADIO

RADIO

TEST	ACTION	APPLICABILITY
1	<p>Check the charging system in accordance with the service information. Is the charging system operating properly?</p> <p>Yes → Go To 2</p> <p>No → Refer to the appropriate service information and repair as necessary. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition off. Disconnect the Radio harness connector. Start the engine. Measure the voltage of each Fused B+ circuit and the Fused Ignition Switch Output circuit. Is the voltage above or approximately 14 volts for each measurement?</p> <p>Yes → Go To 3</p> <p>No → Repair the circuit for high resistance. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Note: Reconnect all previously disconnected components. Turn the ignition and Radio on. With the DRBIII®, erase the audio DTC's. Start the engine. With the DRBIII®, read the audio DTC's. Did this DTC reset?</p> <p>Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:
NO ANTENNA CONNECTION

When Monitored and Set Condition:

NO ANTENNA CONNECTION

When Monitored: With the ignition on and the radio in seek up/down mode.

Set Condition: With the radio in seek or scan mode for two minutes and the radio does not detect an antenna connection or does not receive a radio station signal.

POSSIBLE CAUSES

BAD ANTENNA CONNECTION
 FIXED MAST ANTENNA
 RADIO - NO ANTENNA CONNECTION - FIXED MAST
 BAD POWER AMPLIFIER CONNECTIONS
 REAR WINDOW DEFOGGER/ANTENNA MODULE
 REAR WINDOW DEFOGGER ANTENNA (GRID)
 RADIO 12V OUTPUT OPEN
 POOR CASE GROUND CONNECTION
 RADIO - NO ANTENNA CONNECTION

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the radio antenna coax connector. Inspect the radio antenna coax connection. Was the antenna coax connection clean and tight? Yes → Go To 2 No → Repair bad antenna connection as needed. Perform BODY VERIFICATION TEST - VER 1.	All
2	Inspect the vehicle to identify the type of antenna. Is this vehicle equipped with a Fixed Mast Antenna? Yes → Go To 3 No → Go To 4	All
3	Refer to Audio System and use the Service Information to test the Fixed Mast Antenna. Is the Fixed Mast Antenna ok? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Refer to Audio System and perform the antenna ohmmeter test in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

NO ANTENNA CONNECTION — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Inspect the Power Amplifier connections. Are the connections clean and tight? Yes → Go To 5 No → Repair as needed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Refer to Audio System and use the service information to test the Rear Window Defogger/Antenna Module. Was the Rear Window Defogger/Antenna Module ok? Yes → Go To 6 No → Replace the Rear Window Defogger/Antenna Module. Perform BODY VERIFICATION TEST - VER 1.	All
6	Refer to Audio System and use the service information to test the Rear Window Defogger Antenna (Grid). Is the Rear Window Defogger Antenna (Grid) ok? Yes → Go To 7 No → Repair or replace the Rear Window Defogger Antenna (Grid) as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
7	Disconnect the Rear Window Defogger/Antenna Module harness connector. Turn the ignition and Radio on. Measure the voltage of the Radio 12V Output circuit. Is the voltage above 10.0 volts? Yes → Go To 8 No → Repair the Radio 12V Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the Rear Window Defogger/Antenna Module harness connector. Measure the resistance between ground and case ground. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the case ground connection. If ok, replace the Rear Window Defogger/Antenna Module. Perform BODY VERIFICATION TEST - VER 1.	All
9	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

POWER AMP SHUTDOWN

When Monitored and Set Condition:

POWER AMP SHUTDOWN

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES

DETERMINE FAULT

SPEAKER SECTION OF POWER AMPLIFIER

(+) CIRCUIT SHORTED TO GROUND

(-) CIRCUIT SHORTED TO GROUND

SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER

SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 3 No → Replace the Power Amplifier in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

POWER AMP SHUTDOWN — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (+) circuit in the Radio C1 connector. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (-) circuit in the Radio C1 connector. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit in the radio C1 connector. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
REMOTE RADIO SWITCH OPEN

When Monitored and Set Condition:

REMOTE RADIO SWITCH OPEN

When Monitored: Continuously.

Set Condition: The BCM senses voltage above 4.82 volts on its radio control mux input.

POSSIBLE CAUSES

OPEN CLOCKSPrING
 OPEN RADIO CONTROL MUX CIRCUIT
 OPEN RADIO CONTROL MUX RETURN CIRCUIT
 BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Clockspring C1 harness connector. Turn the ignition on. Connect a jumper wire between cavity 4 and cavity 5 at the Clockspring C1 connector. With the DRB, enter Body Computer then Sensors and monitor the Radio Control SW voltage. Is the voltage approximately 0.0 volts? Yes → Check the circuits between the clockspring connector and the splice for an open. If ok, replace the Clockspring. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Clockspring C1 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Radio Control MUX circuit between the BCM C2 connector and the Clockspring C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Radio Control MUX circuit for an open between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1.	All

REMOTE RADIO SWITCH OPEN — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Clockspring C1 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Radio Control MUX Return circuit between the BCM C2 connector and the Clockspring C1 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the Radio Control MUX Return circuit for an open between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**REMOTE RADIO SWITCH SHORTED TO GROUND****When Monitored and Set Condition:****REMOTE RADIO SWITCH SHORTED TO GROUND**

When Monitored: Continuously.

Set Condition: The code will set if the BCM detects a stuck switch or a short to ground on the Radio Control MUX circuit for more than 20 seconds.

POSSIBLE CAUSES

LEFT REMOTE RADIO SWITCH SHORTED TO GROUND
 RIGHT REMOTE RADIO SWITCH SHORTED TO GROUND
 RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND AT THE SWITCH
 RADIO CONTROL MUX CIRCUIT SHORTED TO THE RETURN CIRCUIT AT THE SWITCH
 CLOCKSPring SHORTED TO GROUND
 RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND
 RADIO CONTROL MUX CKT SHORTED TO THE RADIO CONTROL MUX RETURN CKT
 BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.</p> <p>CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidentally deployed.</p> <p>Remove the Driver Airbag Module. Disconnect the Left Remote Radio Switch harness connector. Turn the ignition on, reconnect the battery. With the DRBIII®, enter Body Computer then Sensors and monitor the Radio Control SW voltage. Is the voltage approximately 5.0 volts?</p> <p>Yes → Replace the Left Remote Radio Switch in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All

REMOTE RADIO SWITCH SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
2	<p>WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.</p> <p>CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidentally deployed.</p> <p>Remove the Driver Airbag Module.</p> <p>Disconnect the Right Remote Radio Switch harness connector.</p> <p>Turn the ignition on, reconnect the battery.</p> <p>With the DRBIII®, enter Body Computer then Sensors and monitor the Radio Control SW voltage.</p> <p>Is the voltage approximately 5.0 volts?</p> <p>Yes → Replace the Right Remote Radio Switch in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off.</p> <p>Disconnect the Clockspring C3 harness connector.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, enter Body Computer then Sensors and monitor the Radio Control SW voltage.</p> <p>Is the voltage approximately 5.0 volts?</p> <p>Yes → Go To 4</p> <p>No → Go To 5</p>	All
4	<p>Turn the ignition off.</p> <p>Disconnect the Clockspring C3 harness connector.</p> <p>NOTE: Ensure both remote radio switches are disconnected.</p> <p>Measure the resistance between ground and the Radio Control MUX circuit at the clockspring C3 harness connector.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Radio Control MUX circuit for a short to ground between the clockspring and the remote radio switches. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Radio Control MUX circuit for a short to the Radio Control MUX Return circuit between the clockspring and the remote radio switches. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off.</p> <p>Disconnect the Clockspring C1 harness connector.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, enter Body Computer then Sensors and monitor the Radio Control SW voltage.</p> <p>Is the voltage approximately 5.0 volts?</p> <p>Yes → Replace the Clockspring in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All

REMOTE RADIO SWITCH SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the Clockspring C1 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between ground and the Radio Control MUX circuit. Is the resistance below 5.0 ohms? Yes → Repair the Radio Control MUX circuit for a short to ground between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off. Disconnect the Clockspring C1 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between the Radio Control MUX circuit and the Radio Control MUX Return circuit. Is the resistance below 5.0 ohms? Yes → Repair the Radio Control MUX circuit for a short to the Radio Control MUX Return circuit between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

***NO SOUND FROM ALL SPEAKERS**

POSSIBLE CAUSES
INTERMITTENT SHORT - FUSE #18 OR #19
FUSED B+ CIRCUIT SHORT TO GROUND
INTERMITTENT SHORT - FUSE #4
RADIO - FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED
FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
OPEN FUSED B+ CIRCUIT TO RADIO
OPEN FUSED IGNITION SWITCH OUTPUT CKT TO RADIO
OPEN RADIO GROUND CIRCUIT
OPEN FUSED B+ CIRCUIT TO POWER AMPLIFIER
OPEN GROUND CIRCUIT TO POWER AMPLIFIER
OPEN RADIO 12V OUTPUT CIRCUIT TO AMPLIFIER
RADIO 12V OUTPUT CIRCUIT SHORTED TO GROUND
RADIO (NO SPEAKER OUTPUT)
RADIO (NO RADIO 12V OUTPUT)
POWER AMPLIFIER (NO OUTPUT)

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect fuse #18 and #19 in the Junction Block. Is either fuse open? Yes → Go To 2 No → Go To 3	All
2	Replace fuse #18 or #19 in the Junction Block. Turn the radio on. Remove and inspect fuse #18 or #19 in the Junction Block. Is either fuse open? Yes → Refer to the wiring diagrams located in the service information to help isolate a short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Replace fuse #18 or #19 in the Junction Block. Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground condition. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Remove and inspect fuse #4 in the Junction Block. Is the fuse open? Yes → Go To 4 No → Go To 6	All

***NO SOUND FROM ALL SPEAKERS — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Replace fuse #4 in the Junction Block. Turn the ignition on. Turn the radio on. Turn the ignition off. Remove and inspect fuse #4 in the Junction Block. Is the fuse open? Yes → Go To 5 No → Replace fuse #4 in the Junction Block. Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground condition. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Radio C1 harness connector. Replace fuse #4 in the Junction Block. Cycle the ignition switch from on to off. Remove and inspect fuse #4 in the Junction Block. Is the fuse open? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the Radio C1 harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 7 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Radio C1 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 8 No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the Radio C1 harness connector. NOTE: If the radio is case grounded, ensure good continuity to ground is present. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 9 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

***NO SOUND FROM ALL SPEAKERS — Continued**

TEST	ACTION	APPLICABILITY
9	<p>NOTE: If vehicle is not equipped with a power amplifier, answer yes to the question. Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Using a 12-volt test light connected to ground, probe both Fused B+ circuits. Is the test light illuminated for both circuits?</p> <p>Yes → Go To 10</p> <p>No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
10	<p>NOTE: If vehicle is not equipped with a power amplifier, answer yes to the question. Turn the ignition off. Disconnect the Power Amplifier C2 harness connector. Using a 12-volt test light connected to 12-volts, probe both Ground circuits. Is the test light illuminated for both circuits?</p> <p>Yes → Go To 11</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
11	<p>NOTE: If vehicle is not equipped with a power amplifier, answer yes to the question. Turn the ignition off. Disconnect the Radio C1 harness connector. Disconnect the Power Amplifier C2 harness connector. Measure the resistance of the Radio 12V Output circuit between the Radio connector and the Power Amplifier connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 12</p> <p>No → Repair the Radio 12V Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
12	<p>NOTE: If vehicle is not equipped with a power amplifier, answer no to the question. Turn the ignition off. Disconnect the Radio C1 harness connector. Disconnect the Power Amplifier C2 harness connector. NOTE: If vehicle is equipped with a rear window defogger/antenna module, it will be necessary to disconnect the module before continuing. Measure the resistance between ground and the Radio 12V Output circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Radio 12V Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 13</p>	All

***NO SOUND FROM ALL SPEAKERS — Continued**

TEST	ACTION	APPLICABILITY
13	<p>NOTE: If vehicle is not equipped with a power amplifier, answer no to the question.</p> <p>While back probing, measure the voltage of any speaker (+) circuit in the Radio C1 connector.</p> <p>Turn the ignition and radio on.</p> <p>Is the voltage approximately 5.5 volts?</p> <p>Yes → Go To 14</p> <p>No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
14	<p>Turn the ignition off.</p> <p>Disconnect the Power Amplifier C2 harness connector.</p> <p>Turn the ignition and Radio on.</p> <p>Measure the voltage of the Radio 12V Output circuit in the Power Amplifier connector.</p> <p>Is the voltage above 10.0 volts?</p> <p>Yes → Replace the Power Amplifier in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***ONE REMOTE RADIO SWITCH INOPERATIVE****POSSIBLE CAUSES**

OPEN RADIO CONTROL MUX CIRCUIT AT THE SWITCH

OPEN RADIO CONTROL MUX RETURN CIRCUIT AT THE SWITCH

REMOTE RADIO SWITCH

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If any DTCs are set, diagnose the DTC before continuing. WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding. CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidentally deployed.</p> <p>Remove the Driver Airbag Module. Disconnect both remote radio switch harness connectors. Turn the ignition on, reconnect the battery. Measure the voltage of the Radio Control MUX circuit at the inoperative remote radio switch. Is the voltage approximately 5.0 volts?</p> <p>Yes → Go To 2</p> <p>No → Repair the Radio Control MUX circuit for an open between the inoperative switch and the splice. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>NOTE: If any DTCs are set, diagnose the DTC before continuing. WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding. CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidentally deployed.</p> <p>Remove the Driver Airbag Module. Disconnect both remote radio switch harness connectors. Disconnect the Clockspring C3 harness connector. Measure the resistance of the Radio Control MUX Return circuit between the inoperative remote radio switch and the Clockspring C3 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Repair the Radio Control MUX Return circuit for an open between the inoperative switch and the clockspring. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***REMOTE RADIO SWITCHES INOPERATIVE WITH IGNITION ON****POSSIBLE CAUSES**

INTERMITTENT SHORT - FUSE #5

FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND

OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect fuse #5 in the Junction Block. Is the fuse open? Yes → Go To 2 No → Go To 3	All
2	Replace fuse #5 in the Junction Block. Turn the ignition on. Remove and inspect fuse #5 in the Junction Block. Is the fuse open? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Refer to the wiring diagrams located in the service information to help isolate the short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Replace fuse #5 in the Junction Block. Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground condition. Perform BODY VERIFICATION TEST - VER 1.	All
3	NOTE: Ensure fuse #5 is installed in the Junction Block. Turn the ignition off. Disconnect the BCM C1 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***CHIME INOPERATIVE****POSSIBLE CAUSES**

ACTUATE CHIME WITH DRBIII®

BODY CONTROL MODULE - CHIME INOPERATIVE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. Close the doors. With the DRBIII®, actuate the Chime. Does the chime sound when actuated by the DRB?</p> <p>Yes → If the chime operates as it should, check for other reasons that the chime is being inoperative. Refer to symptom list for related problems. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***CHIME SOUNDS WITH DRIVER DOOR OPEN KEY REMOVED****POSSIBLE CAUSES**

KEY-IN IGN SW STATUS
 KEY-IN IGNITION SWITCH SHORTED
 KEY-IN IGNITION SW SENSE SHORT TO GROUND
 BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the exterior lamps turn on and off properly and are off before continuing this test. With the DRB III select: Body Computer, Input Output. Read the Key-In Ign Sw. Remove the key from the ignition switch. Does the DRB III show Key-In Ign OPEN?</p> <p>Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Disconnect the Ignition Switch connector. Did the chime turn off?</p> <p>Yes → Check the Ignition Lock Cylinder for damage. If OK replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn ignition off. Disconnect the Ignition Switch connector. Disconnect the Body Control Module C2 connector. Measure the resistance of the Key-in Ignition Switch Sense circuit to ground at the Ignition Switch connector. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the Key-In Ignition Switch Sense wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***KEY IN IGNITION AND DRIVER'S DOOR OPEN CHIME INOPERATIVE**

POSSIBLE CAUSES
OBSERVE THE KEY-IN IGNITION SWITCH STATUS KEY-IN IGNITION SWITCH OPEN KEY-IN IGNITION SWITCH GROUND CIRCUIT OPEN KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN BODY CONTROL MODULE - INCORRECT KEY-IN IGNITION SWITCH STATUS

TEST	ACTION	APPLICABILITY
1	<p>The driver's door ajar switch must be operational for the result of this test to be valid. NOTE: Ensure that the Key is still in the Ignition Switch. With the DRBIII® enter Body Computer Input Outputs and read the Key-In Ign Sw. Does the DRB display: KEY-IN IGN SW: CLOSED?</p> <p>Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Ignition Switch harness connector. Turn all lights off. Measure the resistance between ground and the ground circuit in the ignition switch harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Connect the ignition switch connector if disconnected. Turn the ignition on. With the ignition switch connector connected, back jumper the Key-In Ignition Switch Sense circuit to ground at the ignition switch connector. With the DRBIII®, enter Body Computer Input/Outputs and observe the Key-In Ign Sw status. Does the DRBIII display Key-In Ign SW: Closed?</p> <p>Yes → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All

KEY IN IGNITION AND DRIVER'S DOOR OPEN CHIME INOPERATIVE*— Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Ignition Switch harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Key-In Ignition Switch Sense circuit between the ignition switch connector and the Body Control Module C2 connector . Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Key-In Ignition Switch Sense circuit for an open Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***VEHICLE SPEED WARNING CHIME PROBLEM****POSSIBLE CAUSES**

INCORRECT COUNTRY CODE PROGRAMMED IN THE BODY CONTROL MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Note: The high speed warning chime is for Gulf Coast Countries only. With the DRBIII® in Miscellaneous check the Body Control Module country code setting. Is the country code correct?</p> <p>Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Program the correct country code setting. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
ATC MESSAGES NOT RECEIVED

When Monitored and Set Condition:

ATC MESSAGES NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Automatic Temperature Control (ATC) module for at least 18 seconds.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE AUTOMATIC TEMPERATURE CONTROL MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Automatic Temp Control. Was the DRB able to I/D or communicate with the ATC? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
BATTERY POWER TO MODULE DISCONNECTED
When Monitored and Set Condition:
BATTERY POWER TO MODULE DISCONNECTED

When Monitored: With the ignition on.

Set Condition: The BCM receives ignition on voltage, but no battery power feed.

POSSIBLE CAUSES

VERIFYING ACTIVE DTC

FUSED B+ CIRCUIT - JUNCTION BLOCK

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset?</p> <p>Yes → Go To 2</p> <p>No → No problem found at this time. Use the wiring diagrams located in the service information to help isolate a possible intermittent wiring problem. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition off. NOTE: Ensure Junction Block fuse #19 is not open. Remove the BCM from the Junction Block. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the Junction Block Body Control Module connector cavity 7. Is the test light illuminated?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
EATX BUS COMMUNICATION FAILURE

When Monitored and Set Condition:

EATX BUS COMMUNICATION FAILURE

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Powertrain Control Module (Transmission information) for at least 18 seconds.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE TRANSMISSION
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Transmission. Was the DRB able to I/D or communicate with the transmission? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom: EEPROM CHECKSUM FAILURE

When Monitored and Set Condition:

EEPROM CHECKSUM FAILURE

When Monitored: Continuously.

Set Condition: The BCM fails EEPROM checksum test.

POSSIBLE CAUSES

EEPROM CHECKSUM FAILURE

TEST	ACTION	APPLICABILITY
1	<p>Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:
HEAD STATUS RX FAILURE

When Monitored and Set Condition:

HEAD STATUS RX FAILURE

When Monitored: With the ignition on.

Set Condition: The BCM does not detect the correct voltage on the fused ignition switch input.

POSSIBLE CAUSES

FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
INTERMITTENT SHORT TO GROUND
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect Fuse #14 from the Junction Block. Is the fuse open? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Replace Fuse #14 in the Junction Block. Turn the ignition on. Inspect Fuse #14 in the Junction Block. Is the fuse open? Yes → Refer to the wiring diagrams located in the service information to help isolate the short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground condition. Perform BODY VERIFICATION TEST - VER 1.	All

HEAD STATUS RX FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Reinstall the fuse in the Junction Block. Remove the Body Control Module from the Junction Block. NOTE: Ensure all of the Junction Block connectors are completely connected before continuing. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit in the Junction Block Body Control Module connector cavity 5. Is the voltage above 10.0 volts?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**INTERNAL BASE/PREM SELECT CIRCUIT****When Monitored and Set Condition:****INTERNAL BASE/PREM SELECT CIRCUIT**

When Monitored: With the ignition on.

Set Condition: Invalid base/premium select reading internal to the module.

POSSIBLE CAUSES

INTERNAL BASE/PREM SELECT CIRCUIT

TEST	ACTION	APPLICABILITY
1	<p>Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:

MHSMM MESSAGES NOT RECEIVED

When Monitored and Set Condition:

MHSMM MESSAGES NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Memory Heated Seat/Mirror Module (MHSMM) for at least 18 seconds.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE MEMORY HEATED SEAT/MIRROR MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Memory Seat Module. Was the DRB able to I/D or communicate with the MHSMM? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
MIC MESSAGES NOT RECEIVED

When Monitored and Set Condition:

MIC MESSAGES NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Instrument Cluster (MIC) for at least 14 seconds.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE INSTRUMENT CLUSTER (MIC)
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Electro/Mech Cluster. Was the DRB able to I/D or communicate with the Instrument Cluster (MIC)? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

NO PCI MESSAGES FROM CD CHANGER

When Monitored and Set Condition:

NO PCI MESSAGES FROM CD CHANGER

When Monitored: With the ignition on and the radio on.

Set Condition: If the DRB interrogates the CD changer and does not receive the proper response from the CD changer.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE RADIO

CD CHANGER (DIN) CABLE

CD CHANGER PCI BUS CIRCUIT OPEN

IGNITION SWITCH OUTPUT CIRCUIT OPEN

RADIO GROUND CKT OPEN

CD CHANGER

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition and Radio on. With the DRB, attempt to communicate with the Radio. Was the DRB able to I/D or communicate with the Radio?</p> <p>Yes → Go To 2</p> <p>No → Refer to the symptom list for problems related to no communication with the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition off. Disconnect the Radio C2 connector (DIN cable) from the Radio and the CD Changer. Visually inspect the cable for damage. In the next step check for open wires in the DIN cable. Measure the resistance of each DIN cable circuit between the Radio C2 connector (DIN cable) and the CD Changer DIN cable connector. In the next step check for wires shorted to the DIN cable metal connectors. Measure the resistance between each Radio C2 connector (DIN cable) circuit and the Radio Din cable metal connector. Is the DIN cable circuits shorted together or open?</p> <p>Yes → Replace the CD Changer (DIN) cable. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All

NO PCI MESSAGES FROM CD CHANGER — Continued

TEST	ACTION	APPLICABILITY
3	<p>Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Disconnect the CD Changer harness connector (DIN cable). Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the CD Changer DIN Cable connector. Reconnect the Radio C2 (DIN Cable) harness connector. Turn the ignition on. Turn the Radio on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts?</p> <p>Yes → Go To 4</p> <p>No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Disconnect the CD Changer harness connector (DIN cable). Turn the ignition on. Turn the Radio on. Using a 12-volt test light connected to ground, probe the ignition switch output circuit in the CD Changer DIN Cable connector. Is the test light illuminated?</p> <p>Yes → Go To 5</p> <p>No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Disconnect the CD Changer harness connector (DIN cable). Using a 12-volt test light connected to 12-volts, probe each CD Changer ground circuit in the CD Changer connector (DIN cable). Is the test light illuminated for each circuit?</p> <p>Yes → Go To 6</p> <p>No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom: OTIS MESSAGES NOT RECEIVED

When Monitored and Set Condition:

OTIS MESSAGES NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Overhead Travel Information System (OTIS) for at least 14 seconds.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE OTIS
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then OTIS. Was the DRB able to I/D or communicate with the OTIS? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
POST FAILURE

When Monitored and Set Condition:

POST FAILURE

When Monitored: At battery connect.

Set Condition: The BCM fails ROM checksum test.

POSSIBLE CAUSES

POST FAILURE

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

SBEC BUS COMMUNICATION FAILURE

When Monitored and Set Condition:

SBEC BUS COMMUNICATION FAILURE

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Powertrain Control Module (PCM) for at least 12 seconds.

POSSIBLE CAUSES

VERIFYING ACTIVE DTC
SBEC BUS COMMUNICATION FAILURE
ATTEMPT TO COMMUNICATE WITH THE PCM
POWERTRAIN CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset?</p> <p>Yes → Go To 2</p> <p>No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent open or shorted wiring condition. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition on. With the DRB, enter Body Computer, System Tests then PCM Monitor. Does the DRB display: PCM is active on BUS?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition on. With the DRB, attempt to communicate with the PCM. Was the DRB able to communicate with the PCM?</p> <p>Yes → Go To 4</p> <p>No → Refer to the communication category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.</p>	All

SBEC BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the PCM harness connectors. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Pinout Box. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts?</p> <p>Yes → Replace the Powertrain Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the PCM harness connectors. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit from the BCM C3 harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom: SKIM MESSAGES NOT RECEIVED

When Monitored and Set Condition:

SKIM MESSAGES NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Sentry Key Immobilizer Module (SKIM) for at least 12 seconds.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE SENTRY KEY IMMOBILIZER MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the SKIM. Was the DRB able to I/D or communicate with the SKIM? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Set Probe to x10.</p> <p>Press F2 again when complete.</p> <p>Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the appropriate terminal of special tool #8815.</p> <p>Turn the ignition on.</p> <p>Observe the voltage display on the DRB Lab Scope.</p> <p>Does the voltage pulse from 0 to approximately 7.5 volts?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the service information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off.</p> <p>Disconnect the PCM harness connectors.</p> <p>CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS.</p> <p>Disconnect the BCM C3 harness connector.</p> <p>Measure the resistance of the PCI Bus circuit from the BCM C3 harness connector to the appropriate terminal of special tool #8815.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform 41TE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Repair the PCI Bus circuit for an open. Perform 41TE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:
***ODOMETER DISPLAYS NO BUS**
POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH OTHER MODULES

ATTEMPT TO COMMUNICATE WITH THE INSTRUMENT CLUSTER

INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® attempt to communicate with Controller Antilock Brake module. With the DRBIII® attempt to communicate with Airbag Control Module. With the DRBIII® attempt to communicate with Body Control Module. Was the DRBIII® able to I/D or communicate with each module?</p> <p>Yes → Go To 2</p> <p>No → Refer to the Communication category and perform the symptom PCI Bus Communication Failure. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition on. NOTE: Ensure the DRB can communicate with the PCM and BCM before continuing, if not refer to the appropriate symptom. With the DRB, enter, Body then Electro/Mech Cluster. Was the DRB able to I/D or communicate with the Instrument Cluster?</p> <p>Yes → Replace the Instrument Cluster in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

*PCI BUS COMMUNICATION FAILURE

POSSIBLE CAUSES
<p>WIRING HARNESS INTERMITTENT</p> <p>OPEN PCI BUS CIRCUIT AT THE DATA LINK CONNECTOR (DLC)</p> <p>HIGH VOLTAGE ON THE PCI BUS CIRCUITS AT THE BCM CONNECTORS</p> <p>MODULE (PCI BUS SHORT TO VOLTAGE)</p> <p>PCI BUS CIRCUIT SHORTED TO VOLTAGE</p> <p>LOW RESISTANCE TO GROUND ON THE PCI BUS CIRCUITS AT THE BCM CONNECTORS</p> <p>MODULE (PCI BUS SHORT TO GROUND)</p> <p>PCI BUS CIRCUIT SHORTED TO GROUND</p>

TEST	ACTION	APPLICABILITY
1	<p>Note: Determine which modules this vehicle is equipped with before beginning.</p> <p>Note: When attempting to communicate with any of the modules on this vehicle, the DRB will display 1 of 2 different communication errors: a NO RESPONSE message or a BUS +/- SIGNALS OPEN message.</p> <p>Turn the ignition on.</p> <p>Using the DRB, attempt to communicate with the following control modules:</p> <p>Body Control Module (BCM)</p> <p>Instrument Cluster (MIC)</p> <p>Controller Antilock Brake (CAB)</p> <p>Was the DRB able to communicate with one or more Module(s)?</p> <p>Yes → Go To 2</p> <p>No → Go To 3</p>	All
2	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: If the DRB can not communicate with a single module, refer to the category list for the related symptom.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

***PCI BUS COMMUNICATION FAILURE — Continued**

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the BCM C1 harness connector. Disconnect the DRB from the Data Link Connector (DLC). Measure the resistance of the PCI Bus circuit between the Data Link Connector (DLC) and the BCM C1 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>NOTE: Reconnect the BCM C1 harness connector. Turn the ignition on. Measure the voltage of the PCI Bus circuit at the Data Link Connector (DLC). Is the voltage above 7.0 volts?</p> <p>Yes → Go To 5</p> <p>No → Go To 7</p>	All
5	<p>Note: Determine which modules this vehicle is equipped with before beginning. Turn the ignition off. Disconnect the BCM harness connectors and remove the Body Control Module from the Junction Block. Turn the ignition on. Measure the voltage of each PCI Bus circuit at the BCM C1, C3, C4 connectors and at the Junction Block Body Control Module connector cavity 10. Is the voltage steadily above 7.0 volts for any measurement?</p> <p>Yes → Go To 6</p> <p>No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the module that corresponds to the PCI Bus circuit that measured steadily above 7.0 volts. Turn the ignition on. NOTE: If the PCI Bus circuit for the Memory Heated Seat/Mirror Module was above 7.0 volts and is equipped with side airbags, disconnect each module one at a time. NOTE: If the PCI Bus circuit for the Radio was above 7.0 volts and is equipped with CD Changer, disconnect the CD Changer before the Radio. Measure the voltage of the PCI Bus circuit that previously measured above 7.0 volts. Is the voltage steadily above 7.0 volts with the module disconnected?</p> <p>Yes → Repair the PCI Bus circuit that measured over 7.0 volts for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the module that caused the short to voltage on the PCI Bus circuit. Perform BODY VERIFICATION TEST - VER 1.</p>	All

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	<p>Note: Determine which modules this vehicle is equipped with before beginning.</p> <p>Turn the ignition off.</p> <p>Disconnect the negative battery cable.</p> <p>Disconnect the BCM harness connectors and remove the Body Control Module from the Junction Block.</p> <p>Measure the resistance between ground and each of the PCI Bus circuits at the BCM C1, C3, C4 connectors and at the Junction Block Body Control Module connector cavity 10.</p> <p>Is the resistance below 1000.0 ohms for any of the measurements?</p> <p>Yes → Go To 8</p> <p>No → Replace the Body Control Module in accordance with the service information.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Turn the ignition off.</p> <p>Disconnect the negative battery cable.</p> <p>Disconnect the module that corresponds to the PCI Bus circuit that resistance measured below 1000.0 ohms.</p> <p>NOTE: If the PCI Bus circuit for the Memory Heated Seat/Mirror Module was below 1000.0 ohms and is equipped with side airbags, disconnect each module one at a time.</p> <p>NOTE: If the PCI Bus circuit for the Radio was below 1000.0 ohms and is equipped with a CD Changer, disconnect the CD Changer before the Radio.</p> <p>Measure the resistance between ground and the PCI Bus circuit that previously measured below 1000.0 ohms.</p> <p>Is the resistance below 1000.0 ohms with the module disconnected?</p> <p>Yes → Repair the PCI Bus circuit that resistance measured below 1000.0 ohms for a short to ground.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the module that caused the short to ground on the PCI Bus circuit.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***DRIVER DOOR AJAR CKT OPEN****POSSIBLE CAUSES**

OPEN DRIVER DOOR AJAR SWITCH GROUND CKT

OPEN DRIVER DOOR AJAR SWITCH SENSE CKT

OPEN DRIVER DOOR LOCK MOTOR/AJAR SWITCH

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Driver Door Lock Motor/Ajar switch connector. Using a 12-volt Test Light connected to 12-volts, check the Driver Door Ajar Switch Ground circuit. Does the light illuminate? Yes → Go To 2 No → Repair the Driver Door Ajar Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Driver Door Lock Motor/Ajar Switch connector. Connect a jumper wire between Driver Door Ajar Switch Sense circuit and the Driver Door Ajar Switch Ground circuit. With the DRBIII® in Inputs/Outputs, read the DR DOOR AJAR SW state. Does the DRBIII® display DR DOOR AJAR SW: Closed? Yes → Replace the Driver Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the BCM C4 connector. Disconnect the Driver Door Lock Motor/Ajar Switch connector. Measure the resistance of the Driver Door Ajar Switch Sense circuit between the BCM connector and the Driver Door Lock Motor/Ajar Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Driver Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***DRIVER DOOR AJAR CKT STG****POSSIBLE CAUSES**

DRIVER DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND

DRIVER DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® in Inputs/Outputs, read the DR DOOR AJAR SW state. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the DR DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN?</p> <p>Yes → Replace the Driver Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Disconnect the BCM C4 connector. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Driver Door Ajar Switch Sense circuit. Does the Test Light illuminate?</p> <p>Yes → Repair the Driver Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***LEFT REAR DOOR AJAR CKT OPEN****POSSIBLE CAUSES**

GROUND CKT OPEN

LEFT REAR DOOR AJAR SWITCH SENSE CKT OPEN

LEFT REAR DOOR LOCK MOTOR/AJAR SWITCH OPEN

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Left Rear Door Ajar Switch Ground circuit. Does the test light illuminate? Yes → Go To 2 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Connect a jumper wire between the Left Rear Door Ajar Switch Sense circuit and the Left Rear Door Ajar Switch Ground circuit. With the DRBIII® in Inputs/Outputs, read the LR DOOR AJAR SW state. Does the DRBIII® display LR DOOR AJAR SW: Closed? Yes → Go To 3 No → Replace the Left Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Disconnect the BCM C4 harness connector. Measure the resistance of the Left Rear Door Ajar Switch Sense circuit between the Left Rear Door Lock Motor/Ajar Switch connector and the BCM C4 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Left Rear Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***LEFT REAR DOOR AJAR CKT STG****POSSIBLE CAUSES**

LEFT REAR DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND

LEFT REAR DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the LR DOOR AJAR SW state. Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the LR DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Left Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the BCM C4 harness connector. Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Left Rear Door Ajar Switch Sense circuit. Does the Test Light illuminate? Yes → Repair the Left Rear Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***PASS DOOR AJAR CKT OPEN****POSSIBLE CAUSES**

OPEN PASSENGER DOOR AJAR SWITCH GROUND CKT

OPEN PASSENGER DOOR AJAR SWITCH SENSE CKT

OPEN PASSENGER DOOR LOCK MOTOR/AJAR SWITCH

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Passenger Door Lock Motor/Ajar switch connector Using a 12-volt Test Light connected to 12-volts, check the Passenger Door Ajar Switch Ground circuit. Does the light illuminate? Yes → Go To 2 No → Repair the Passenger Door Ajar Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Door Lock Motor/Ajar Switch connector. Connect a jumper wire between Passenger Door Ajar Switch Sense circuit and the Passenger Door Ajar Switch Ground circuit. With the DRBIII® in Inputs/Outputs, read the PASS DOOR AJAR SW state. Does the DRBIII® display PASS DOOR AJAR SW: Closed? Yes → Replace the Passenger Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the BCM C4 connector. Disconnect the Passenger Door Lock Motor/Ajar Switch connector. Measure the resistance of the Passenger Door Ajar Switch Sense circuit between the BCM connector and the Passenger Door Lock Motor/Ajar Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Passenger Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***PASS DOOR AJAR CKT STG****POSSIBLE CAUSES**

1	<p>With the DRBIII® in Inputs/Outputs, read the PASS DOOR AJAR SW state. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the PASS DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN?</p> <p>Yes → Replace the Passenger Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Disconnect the BCM C4 connector. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Passenger Door Ajar Switch Sense circuit. Does the Test Light illuminate?</p> <p>Yes → Repair the Passenger Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***RIGHT REAR DOOR AJAR CKT OPEN****POSSIBLE CAUSES**

OPEN RIGHT REAR DOOR AJAR SWITCH GROUND CKT

OPEN RIGHT REAR DOOR AJAR SWITCH SENSE CKT

OPEN RIGHT REAR DOOR LOCK MOTOR/AJAR SWITCH

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Right Rear Door Lock Motor/Ajar switch connector. Using a 12-volt Test Light connected to 12-volts, check the Right Rear Door Ajar Switch Ground circuit. Does the light illuminate? Yes → Go To 2 No → Repair the Right Rear Door Ajar Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Door Lock Motor/Ajar Switch connector. Connect a jumper wire between the Right Rear Door Ajar Switch Sense circuit and the Right Rear Door Ajar Switch Ground circuit. With the DRBIII® in Inputs/Outputs, read the RR DOOR AJAR SW state. Does the DRBIII® display RR DOOR AJAR SW: Closed? Yes → Replace the Right Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the BCM C4 connector. Disconnect the Right Rear Door Lock Motor/Ajar Switch connector. Measure the resistance of the Right Rear Door Ajar Switch Sense circuit between the BCM connector and the Right Rear Door Lock Motor/Ajar Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Right Rear Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***RIGHT REAR DOOR AJAR CKT STG****POSSIBLE CAUSES**

RIGHT REAR DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND

RIGHT REAR DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® in Inputs/Outputs, read the RR DOOR AJAR SW state. Disconnect the Right Rear Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the RR DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN?</p> <p>Yes → Replace the Right Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Disconnect the BCM C4 connector. Disconnect the Right Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Right Rear Door Ajar Switch Sense circuit. Does the Test Light illuminate?</p> <p>Yes → Repair the Right Rear Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**DRIVER HEATED SEAT SWITCH OPEN/SHORTED TO GROUND****When Monitored and Set Condition:****DRIVER HEATED SEAT SWITCH OPEN/SHORTED TO GROUND**

When Monitored: Ignition on.

Set Condition: If the switch is open or grounded the MHSMM will have a loss of switch feed back and this code will set immediately. Once the condition is resolved the switch will return to it's normal operation. Note: This DTC can also be set when the ignition switch is cycled with the IOD fuse removed.

POSSIBLE CAUSES

FUSED IGNITION SWITCH OUTPUT ST-RUN OPEN
 DRIVER HEATED SEAT SWITCH
 DRIVER SEAT HEATER SWITCH MUX CIRCUIT OPEN
 DRIVER SEAT HEATER SWITCH MUX CIRCUIT SHORT TO GROUND
 ERASE AND READ MHSMM DTC
 MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Does the DRBIII® display any communication DTCs in the Memory Heated Seat Mirror Module also? Yes → Go To 2 No → Go To 3	All
2	With the DRBIII®, erase MHSMM DTC's. Start the engine and let it run for one minute while operating the heated seat switch. With the DRBIII®, read MHSMM DTC's. Did the Driver Heated Seat Switch Open-Shorted to Ground trouble code reset? Yes → Go To 4 No → The condition required to set the DTC is not present at this time. Check for intermittent problems. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Driver Heated switch connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit. Is the voltage above 10.0 volts? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit for an open. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

DRIVER HEATED SEAT SWITCH OPEN/SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the voltage between the Driver Seat Heater Switch Mux circuit and ground. Is the voltage above 10.0 volts? Yes → Replace the Memory Heated Seat Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 5	All
5	Disconnect the Driver Heated Seat Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the resistance of the Driver Seat Heater Switch Mux circuit between the MHSMM connector and the Driver Heated Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open Driver Seat Heater Switch Mux wire. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
6	Disconnect the Driver Heated Seat Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the resistance of the Driver Seat Heater Switch Mux circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Driver Seat Heater Switch Mux wire for a short to ground. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Driver Heated Seat Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom List:

DRIVER HEATED SEAT SWITCH STUCK IN HIGH STATE
DRIVER HEATED SEAT SWITCH STUCK IN LOW STATE

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **DRIVER HEATED SEAT SWITCH STUCK IN HIGH STATE**.

When Monitored and Set Condition:**DRIVER HEATED SEAT SWITCH STUCK IN HIGH STATE**

When Monitored: Ignition on.

Set Condition: If the switch is stuck active for 30 seconds this code will set and the MHSMM will ignore the input until it's state has changed. The code will remain in the module memory for 20 key cycles.

DRIVER HEATED SEAT SWITCH STUCK IN LOW STATE

When Monitored: Ignition on.

Set Condition: If the switch is stuck active for 30 seconds this code will set and the MHSMM will ignore the input until it's state has changed. The code will remain in the module memory for 20 key cycles.

POSSIBLE CAUSES

DRIVER HEATED SEAT SWITCH

DRIVER SEAT HEATER SWITCH MUX CIRCUIT SHORT TO VOLTAGE

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Driver Heated Seat Switch connector. With the DRBIII®, erase DTC's. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display Driver Heated Seat Switch Open Shorted to Ground trouble code appear? Yes → Replace the Driver Heated Seat Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All

DRIVER HEATED SEAT SWITCH STUCK IN HIGH STATE — Continued

TEST	ACTION	APPLICABILITY
2	Disconnect the Driver Heated Seat Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the voltage between the Driver Seat Heater Switch Mux circuit and ground. Is there any voltage present? Yes → Repair the Driver Seat Heater Switch Mux wire for a short to voltage. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:
DRIVER SEAT HEAT OUTPUT OPEN

When Monitored and Set Condition:

DRIVER SEAT HEAT OUTPUT OPEN

When Monitored: Ignition on, during the heated seat operation.

Set Condition: This code is set immediately after the Memory Heated Seat/Mirror Module loses the seat heat element output.

POSSIBLE CAUSES

DRIVER SEAT HEATER B+ DRIVER WIRE OPEN
 HEATED SEAT DRIVER CIRCUIT OPEN
 DRIVER SEAT HEATER GROUND CKT
 DRIVER HEATED SEAT CUSHION OPEN
 DRIVER SEAT BACK HEATER OPEN
 DRIVER SEAT HEATER SYSTEM OPEN

TEST	ACTION	APPLICABILITY
1	<p>Turn ignition off. NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat. Disconnect the Memory Heated Seat Mirror Module C3 connector. Measure the total resistance of the Driver Seat Heater Circuit by connecting one lead of the ohmmeter to the Driver Seat Heater B+ Driver CKT in the MHSMM C3 connector and the other to ground. Is the resistance below 8.5 ohms?</p> <p>Yes → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn ignition off. NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat. Disconnect the Driver Heated Seat Cushion 4-way connector. Disconnect the Memory Heated Seat Mirror Module C3 connector. Measure the resistance of the Driver Seat Heater B+ Driver circuit between the MHSMM C3 connector and the Driver Heated Seat Cushion connector, harness side. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Repair the open Driver Seat Heater B+ Driver wire. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All

DRIVER SEAT HEAT OUTPUT OPEN — Continued

TEST	ACTION	APPLICABILITY
3	<p>NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.</p> <p>Disconnect the Driver Heated Seat Back 2-way connector.</p> <p>Disconnect the Driver Heated Seat Cushion 4-way connector.</p> <p>Measure the resistance of the Heated Seat Driver circuit between the Driver Heated Seat Back harness side connector and the Driver Heated Seat Cushion 4-way harness side connector.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the open Heated Seat Driver circuit. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All
4	<p>NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.</p> <p>Disconnect the Driver Heated Seat Back 2-way connector.</p> <p>Measure the resistance of the Ground circuit in the Driver Heated Seat Back connector (harness side) to body ground.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the open ground circuit. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All
5	<p>NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.</p> <p>Disconnect the Driver Heated Seat Cushion 4-way connector.</p> <p>Measure the resistance of the seat cushion heater by connecting one lead to the Heated Seat Driver terminal and the other to the Seat Heater B+ Driver terminal in the Heated Seat Cushion 4 way Cushion Side connector.</p> <p>Is the resistance below 2.5 ohms?</p> <p>Yes → Go To 6</p> <p>No → Replace the Driver Heated Seat Cushion. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All
6	<p>NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.</p> <p>Disconnect the Driver Heated Seat Back 2-way connector.</p> <p>Measure the resistance of the SEAT BACK HEATER ELEMENT by connecting one lead to the Heated Seat Driver terminal and the other to the Ground terminal in the Heated Seat Back Side connector.</p> <p>Is the resistance below 2.5 ohms?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Driver Heated Seat Back. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All

Symptom:**DRIVER SEAT HEAT OUTPUT SHORT TO GND****When Monitored and Set Condition:****DRIVER SEAT HEAT OUTPUT SHORT TO GND**

When Monitored: Ignition on, during the heated seat operation.

Set Condition: This code is set immediately after the Heated Seat Module detects an output shorted to ground.

POSSIBLE CAUSES

HEATED SEAT DRIVER CIRCUIT SHORT TO GROUND
 DRIVER SEAT BACK HEATER SHORT GROUND
 DRIVER HEATED SEAT CUSHION SHORT TO GROUND
 DRIVER SEAT HEATER B+ DRIVER WIRE SHORT TO GROUND
 MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.</p> <p>Disconnect the Driver Heated Seat Cushion 4-way connector.</p> <p>With the DRBIII®, erase DTC's.</p> <p>Turn the ignition off, wait 20 seconds, then turn ignition on.</p> <p>Turn the Driver Seat Heater on.</p> <p>Using the DRBIII select: Body Memory Seat Module Read DTC's</p> <p>Does the DRBIII® still show the Driver Seat Heat Output Short to Gnd trouble code?</p> <p>Yes → Go To 2</p> <p>No → Go To 4</p>	All
2	<p>Turn ignition off.</p> <p>NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.</p> <p>Disconnect the Driver Heated Seat Cushion 4-way connector.</p> <p>Disconnect the Memory Heated Seat Mirror Module C3 connector.</p> <p>Measure the resistance of the Driver Seat Heater B+ Driver circuit to ground.</p> <p>Is the resistance below 1000.0 ohms?</p> <p>Yes → Repair the Driver Seat Heater B+ Driver wire for a short to ground.. Symptom:**PASSENGER HEATED SEAT SWITCH OPEN/SHORTED TO GROUND**

When Monitored and Set Condition:**PASSENGER HEATED SEAT SWITCH OPEN/SHORTED TO GROUND**

When Monitored: Ignition on.

Set Condition: If the switch is open or grounded the MHSMM will have a loss of switch feed back and this code will set immediately. Once the condition is resolved the switch will return to it's normal operation. Note: This DTC can also be set when the ignition switch is cycled with the IOD fuse removed.

POSSIBLE CAUSES

FUSED IGNITION SWITCH OUTPUT ST-RUN OPEN
PASSENGER SEAT HEATER SWITCH MUX CIRCUIT OPEN
ERASE AND READ MHSMM DTC
PASSENGER HEATED SEAT SWITCH
PASSENGER SEAT HEATER SWITCH MUX CIRCUIT SHORT TO GROUND
MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Does the DRBIII® display any communication DTCs in the Memory Heated Seat Mirror Module also? Yes → Go To 2 No → Go To 3	All
2	With the DRBIII®, erase MHSMM DTC's. Start the engine and let it run for one minute while operating the heated seat switch. With the DRBIII®, read MHSMM DTC's. Did the Passenger Heated Seat Switch Open-Shorted to Ground trouble code reset? Yes → Go To 3 No → The condition required to set the DTC is not present at this time. Check for intermittent problems. Note: If IOD fuse was removed and ignition cycled this DTC may set. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

PASSENGER HEATED SEAT SWITCH OPEN/SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Passenger Heated switch connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All
4	<p>Reconnect any previously disconnected components. Disconnect the Memory Heated Seat Mirror Module C1 connector. Turn the ignition on. Measure the voltage between the Passenger Seat Heater Switch Mux circuit and ground. Is the voltage above 10.0 volts?</p> <p>Yes → Replace the Memory Heated Seat Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Disconnect the Passenger Heated Seat Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the resistance of the Passenger Seat Heater Switch Mux circuit between the MHSMM connector and the Passenger Heated Seat Switch connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the open Passenger Seat Heater Switch Mux wire. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All
6	<p>Disconnect the Passenger Heated Seat Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the resistance of the Passenger Seat Heater Switch Mux circuit to ground. Is the resistance below 1000.0 ohms?</p> <p>Yes → Repair the Passenger Seat Heater Switch Mux wire for a short to ground. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Passenger Heated Seat Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All

Symptom List:

PASSENGER HEATED SEAT SWITCH STUCK IN HIGH STATE
PASSENGER HEATED SEAT SWITCH STUCK IN LOW STATE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **PASSENGER HEATED SEAT SWITCH STUCK IN HIGH STATE**.

When Monitored and Set Condition:**PASSENGER HEATED SEAT SWITCH STUCK IN HIGH STATE**

When Monitored: Ignition on.

Set Condition: If the switch is stuck active for 30 seconds this code will set and the MHSMM will ignore the input until it's state has changed. The code will remain in the module memory for 20 key cycles.

PASSENGER HEATED SEAT SWITCH STUCK IN LOW STATE

When Monitored: Ignition on.

Set Condition: If the switch is stuck active for 30 seconds this code will set and the MHSMM will ignore the input until it's state has changed. The code will remain in the module memory for 20 key cycles.

POSSIBLE CAUSES

PASSENGER HEATED SEAT SWITCH

PASSENGER SEAT HEATER SWITCH MUX CIRCUIT SHORT TO VOLTAGE

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Passenger Heated Seat Switch connector. With the DRBIII®, erase DTC's. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display Passenger Heated Seat Switch Open Shorted to Ground trouble code appear? Yes → Replace the Passenger Heated Seat Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All

PASSENGER HEATED SEAT SWITCH STUCK IN HIGH STATE — Continued

TEST	ACTION	APPLICABILITY
2	Disconnect the Passenger Heated Seat Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the voltage between the Passenger Seat Heater Switch Mux circuit and ground. Is there any voltage present? Yes → Repair the Passenger Seat Heater Switch Mux wire for a short to voltage. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:**PASSENGER SEAT HEAT OUTPUT OPEN****When Monitored and Set Condition:****PASSENGER SEAT HEAT OUTPUT OPEN**

When Monitored: Ignition on, during the heated seat operation.

Set Condition: This condition is set immediately after the Memory Heated Seat/Mirror Module loses the seat heat element output.

POSSIBLE CAUSES

PASSENGER SEAT HEATER GROUND CIRCUIT OPEN

HEATED SEAT DRIVER CIRCUIT OPEN

PASSENGER SEAT HEATER B+ DRIVER WIRE OPEN

PASSENGER HEATED SEAT CUSHION OPEN

PASSENGER SEAT BACK HEATER OPEN

PASSENGER SEAT HEATER SYSTEM OPEN

TEST	ACTION	APPLICABILITY
1	<p>Turn ignition off. NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the drivers seat and the Seat Heater connectors are at the rear of each seat. Disconnect the Memory Heated Seat Mirror Module C3 connector. Measure the total resistance of the Passenger Seat Heater Circuit by connecting one lead of the ohmmeter to the Passenger Seat Heater B+ Driver circuit and the other to ground. Is the resistance below 8.5 ohms?</p> <p>Yes → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn ignition off. NOTE: Raise the seat to the highest position to gain access to the connectors. The MHSMM is located at the front of the drivers seat and the Seat Heater connectors are at the rear of each seat. Disconnect the Passenger Heated Seat Back 2-way (green) connector. Measure the resistance of the Passenger Seat Heater Ground circuit between the Heated Seat Back connector and ground, harness side. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Repair the open Passenger Seat Heater Ground circuit. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All

PASSENGER SEAT HEAT OUTPUT OPEN — Continued

Symptom:***HEATED SEATS INOPERATIVE DUE TO KEY-IN IGNITION SWITCH INPUT****POSSIBLE CAUSES**

OBSERVE THE KEY-IN IGNITION SWITCH STATUS
IGNITION SWITCH OPEN
KEY-IN IGNITION SWITCH GROUND CIRCUIT OPEN
KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN
BCM-INCORRECT KEY-IN IGNITION SWITCH STATUS

TEST	ACTION	APPLICABILITY
1	<p>Note: Ensure that the Key is still in the Ignition Switch. With the DRBIII® enter Body Computer then Input Output and read the Key-In Ignition Switch status. Does the DRB display: KEY-IN IGN: CLOSED ?</p> <p>Yes → Test complete. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Ignition Switch harness connector. Connect a jumper between the Key-In Ignition Switch Sense circuit and Ground circuit. With the DRBIII® enter Body Computer then Input Output and observe the Key-In Ignition Switch status. Does the DRBIII display KEY-IN IGN: CLOSED?</p> <p>Yes → Replace the Ignition Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off. Disconnect the Ignition Switch harness connector. Turn all lights off. Measure the resistance between ground and the ground circuit in the ignition switch connector. Is the resistance below 5.0 ohms ?</p> <p>Yes → Go To 4</p> <p>No → Repair the ground circuit for an open. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All

***HEATED SEATS INOPERATIVE DUE TO KEY-IN IGNITION SWITCH INPUT — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Ignition Switch harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Key-In Ignition Switch Sense circuit between the ignition switch connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Key-In Ignition Switch Sense circuit for an open. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace and program the Body Control Module in accordance with the Service Information. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:***REAR WINDOW DEFOGGER INOPERATIVE MANUAL AIR CONDITIONING****POSSIBLE CAUSES**

REAR DEFOG OPERATES OK
DEFOGGER GRID GROUND CIRCUIT OPEN
REAR WINDOW DEFOGGER GRID OPEN
REAR WINDOW DEFOGGER RELAY-OPEN
REAR DEFOGGER RELAY OUTPUT CKT OPEN
REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT OPEN
REAR WINDOW DEFOGGER RELAY OUTPUT SHORT TO GROUND
FUSED (B+) SHORT TO GROUND
FUSED B+ CIRCUIT OPEN
CONTROL HEAD - REAR DEFOGGER SWITCH
BODY CONTROL MODULE - REAR DEFOGGER RELAY CONTROL OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® in Sensors read the Mode SW MUX voltage. Push and hold the Rear Window Defogger Switch and observe the DRB. Does the DRBIII® display Mode SW MUX approximately .25 volts? Yes → Go To 2 No → Replace the Control Head. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
2	Measure the resistance of the Defogger Grid ground circuit from the left end of the glass grid to ground.. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Ground circuit. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
3	Turn the ignition on. Press the Rear Window Defogger Switch On. Using a 12-volt Test Light connected to ground, probe the Rear Defogger Relay Output circuit at the right side of the grid. Did the test light illuminate? Yes → Repair the open Rear Window Defogger Grid. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 4	All

***REAR WINDOW DEFOGGER INOPERATIVE MANUAL AIR CONDITIONING — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Remove the Rear Window Defogger Relay located in the right side of trunk. Measure the voltage between both Fused B(+) circuits and ground. Is the voltage above 10.0 volts on both Fused B(+) circuits?</p> <p>Yes → Go To 5</p> <p>No → Go To 9</p>	All
5	<p>Remove the Rear Window Defogger Relay located in the right side of trunk. Connect a jumper wire between Rear Window Defogger Relay Output circuit and Fused B+ in the relay connector. Note: Do not leave the jumper connected for a long period of time. Measure the voltage between the Rear Window Defogger Relay Output circuit at the right side of the window grid and ground. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 6</p> <p>No → Repair the open Rear Defogger Relay Output circuit between the relay connector and the rear defogger grid. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All
6	<p>Remove the Rear Window Defogger Relay located in the right side of trunk. Connect a test light between the Fused B+ and the Rear Window Defogger Relay Control circuits in the relay connector. Press the Rear Window Defogger Switch on and observe the test light. Does the test light illuminate when the switch is on?</p> <p>Yes → Replace the Rear Window Defogger Relay. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the Body Control Module C4 connector. Remove the Rear Window Defogger Relay located in the right side of trunk. Note: Check connectors - Clean/repair as necessary. Connect a jumper wire between the Rear Window Defogger Relay Control circuit in the BCM C4 connector and ground. Measure the resistance between the Rear Window Defogger Relay Control circuit in the relay connector and ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the open Rear Window Defogger Relay Control Circuit. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All
8	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All

MULTIFUNCTION SWITCH

TEST	ACTION	APPLICABILITY
1	Turn the Headlamps on. Gain access to the High Beam Headlamp Relay in the junction block. Cycle the high beam switch on the multifunction switch and listen to or feel the High Beam Relay for a click. Does the relay click? Yes → Go To 2 No → Go To 4	All
2	Remove the High Beam Relay. Measure the voltage of the Fused B+ circuit at the High Beam relay connector. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the open fused B+ circuit from PDC fuse C. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the High Beam Relay from the junction block. Connect a jumper wire between the Fused B+circuit and the High Beam Relay Output circuit. Did the High Beam Headlamps come on? Yes → Replace the High Beam Relay. Perform BODY VERIFICATION TEST - VER 1. No → Repair the High Beam Relay Output circuit from the junction block to the headlamps. Perform BODY VERIFICATION TEST - VER 1.	All

***HIGH BEAM HEADLAMPS WILL NOT TURN ON — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Check fuse 11 in the junction block. Is fuse 11 open?</p> <p>Yes → Go To 5</p> <p>No → Go To 7</p>	All
5	<p>Remove fuse 11 Disconnect the Multifunction Switch connector. Measure the resistance of the Fused Low Beam Relay Output circuit to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Fused Low Beam Relay output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Remove the High Beam Relay from the junction block. Disconnect the Multifunction Switch connector. Measure the resistance of the Switched High Beam Relay Control circuit to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Switched High Beam Relay Control circuit for a short to ground and replace the fuse. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the High Beam Relay. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Remove the High Beam Relay from the junction block. Measure the resistance of the ground circuit in the relay connector. Is the resistance below 0.5 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the open ground to the junction block. Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Disconnect the Multifunction Switch connector. Turn the headlamps on. Measure the voltage of the Fused Low Beam Relay Output circuit in the multifunction switch connector. If there are no possible causes remaining, view repair.</p> <p>Yes → Replace the High Beam Relay. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 9</p>	All
9	<p>Disconnect the Multifunction Switch connector. Turn the headlamps on. Measure the voltage of the Fused Low Beam Relay Output circuit in the multifunction switch connector. If there are no possible causes remaining, view repair.</p> <p>Yes → Go To 10</p> <p>No → Repair the open Fused Low Beam Relay Output circuit from fuse 11. Perform BODY VERIFICATION TEST - VER 1.</p>	All

EXTERIOR LIGHTING

***HIGH BEAM HEADLAMPS WILL NOT TURN ON — Continued**

TEST	ACTION	APPLICABILITY
10	<p>Disconnect the Multifunction Switch connector. Turn the headlamps on. Ensure the High Beam Relay is installed. Connect a jumper wire between the Fused Low Beam Relay Output and the Switched High Beam Relay Control circuits in the multifunction switch connector. Did the High Beam Headlamps come on?</p> <p>Yes → Repair the open Switched High Beam Relay Control circuit. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***LOW BEAM HEADLAMPS WILL NOT TURN OFF****POSSIBLE CAUSES**

HEADLAMP SWITCH

LOW BEAM RELAY OUTPUT SHORT TO BATTERY

BODY CONTROL MODULE

JUNCTION BLOCK

LOW BEAM RELAY

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® read Body Control Module DTCs. If the DTC Headlamp Switch Input Failure is present, return to the Symptom List and select the repair for that symptom.</p> <p>Turn the headlamp switch to the off position.</p> <p>With the DRBIII®, read the Headlamp Switch Voltage.</p> <p>Does the DRBIII® display Headlamp Switch Voltage between 4.3 and 4.8 Volts?</p> <p>Yes → Go To 2</p> <p>No → Replace the Headlamp Switch.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Remove the Low Beam Relay from the junction block.</p> <p>Did the Low Beams turn off?</p> <p>Yes → Go To 3</p> <p>No → Repair the Low Beam Relay Output circuit for a short to battery.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Substitute a known good relay in place of the Low Beam Relay.</p> <p>Does the system operate normally?</p> <p>Yes → Replace the Low Beam Relay</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off.</p> <p>Remove the Low Beam Headlamp Relay.</p> <p>Remove the Body Control Module from the junction block.</p> <p>Measure the resistance of the Low Beam Relay Control circuit to all other junction block Body Control Module 20 way internal connector terminals and ground.</p> <p>Is the resistance below 100.0 ohms on ANY of the measurements?</p> <p>Yes → Replace the Junction Block</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

EXTERIOR LIGHTING

Symptom:

***LOW BEAM HEADLAMPS WILL NOT TURN ON**

POSSIBLE CAUSES

HEADLAMP SWITCH
JUNCTION BLOCK
LOW BEAM HEADLAMP RELAY
LOW BEAM RELAY
LOW BEAM HEADLAMP RELAY
JUNCTION BLOCK
BODY CONTROL MODULE
OPEN FUSED B+ TO JUNCTION BLOCK
B+ CIRCUIT FUSE
FUSED B+ CIRCUIT SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the Headlamps on. With the DRBIII® read the Headlamp Switch voltage. Does the DRBIII® display Headlamp Switch voltage between 1.4 and 1.8 volts? Yes → Go To 2 No → Replace the Headlamp Switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII® actuate the Headlamp Relay. Listen to or touch the Low Beam Relay. Does the relay click during actuation? Yes → Go To 3 No → Go To 5	All
3	Remove the Low Beam Relay. Measure the voltage of the Fused B+ circuit in the Low Beam Relay. Is the voltage above 10.0 volts? Yes → Go To 4 No → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1.	All
4	Remove the Low Beam Headlamp Relay from the junction block. Ensure fuses 10 and 12 are OK and are installed in the junction block. Connect a jumper wire between the Fused B+ and the Low Beam Relay Output terminals in the relay connector. Did the low beam headlamps come on? Yes → Replace the Low Beam Relay. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open in the Low Beam Relay Output circuit to the headlamps. Perform BODY VERIFICATION TEST - VER 1.	All

***LOW BEAM HEADLAMPS WILL NOT TURN ON — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Remove the Low Beam Headlamp Relay. Measure the voltage of the Fused B+ circuit in the Low Beam Relay. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 6 No → Go To 8</p>	All
6	<p>Remove the Low Beam Relay from the junction block. Connect a 12 volt test light between the Low Beam Relay Control circuit, and the Fused B+ circuit in the Low Beam Relay connector. With the DRBIII® actuate the Headlamp Relay. Did the test light flash during actuation?</p> <p>Yes → Replace the Low Beam Headlamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7</p>	All
7	<p>Turn the ignition off. Remove the Low Beam Relay from the junction block. Remove the Body Control Module from the junction block. Measure the resistance of the Low Beam Relay Control circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Remove and test the PDC Fuse D. Is the Fuse open?</p> <p>Yes → Go To 9 No → Repair the open Fused B+ circuit between the Low Beam Headlamp Relay connector in the junction block and the PDC Fuse D connector. Perform BODY VERIFICATION TEST - VER 1.</p>	All
9	<p>Remove Fuse D from the PDC Measure the resistance of the Fused B+ circuit in the fuse connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Fused B+ circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the fuse and retest the system. Perform BODY VERIFICATION TEST - VER 1.</p>	All

EXTERIOR LIGHTING

Symptom:

***PARK LAMPS WILL NOT TURN OFF**

POSSIBLE CAUSES

HEADLAMP SWITCH

PARK LAMP OUTPUT SHORT TO VOLTAGE

BODY CONTROL MODULE

PARK LAMP RELAY

TEST	ACTION	APPLICABILITY
1	Turn the headlamp switch to the OFF position. With the DRBIII®, read the Headlamp Switch Voltage. Does the DRBIII® display Headlamp Switch Voltage within 4.5 volts? Yes → Go To 2 No → Replace the Headlamp Switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	Remove the Park Lamp Relay from the junction block. Did the Park Lamps turn off? Yes → Go To 3 No → Repair the Parklamp Relay output circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the Park Lamp Relay to begin this test. Reinstall the Park Lamp Relay and listen for or feel for the relay to click. Did the relay click? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Parklamp Relay Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***PARK LAMPS WILL NOT TURN ON****POSSIBLE CAUSES**

OPEN FUSED B+ CIRCUIT

BODY CONTROL MODULE

PARK LAMP RELAY OUTPUT CIRCUIT SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the Headlamp Switch to the PARK position. With the DRBIII®, read the Headlamp Switch voltage. Is the voltage approximately 0.5 volts? Yes → Go To 2 No → Replace the Headlamp Switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, actuate the Park Lamp Relay. Listen to or touch the Park Lamp Relay. Did the relay click during the actuation? Yes → Go To 3 No → Go To 5	All
3	Remove the Park Lamp Relay from the junction block. Connect a jumper wire between the Fused B+ circuit cavity 54,87 and the Park Lamp Relay Output circuit cavity 55,30 in the relay connector. Did the Park Lamps come on? Yes → Go To 4 No → Repair the Park Lamp Relay Output circuit to the park lamps. Perform BODY VERIFICATION TEST - VER 1.	All

EXTERIOR LIGHTING

*PARK LAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
4	<p>Remove the Park Lamp Relay. Measure the voltage of the Fused B+ circuit in the Park Lamp Relay cavity 54,87. Is the voltage above 10.0 volts?</p> <p>Yes → Replace the Park Lamp Relay. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Remove the Park Lamp Relay. Measure the voltage of the Fused B+ circuit in the Park Lamp Relay Control circuit cavity 53,85. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 6</p> <p>No → Go To 8</p>	All
6	<p>Remove the Park Lamp Relay from the junction block. Connect a 12 volt test light between the Park Lamp Relay Control circuit cavity 52,86 and the Fused B+ circuit cavity 53,85 in the Park Lamp Relay connector. With the DRBIII®, actuate the Park Lamp Relay. Did the test light flash during actuation?</p> <p>Yes → Replace the Park Lamp Relay. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Remove the Park Lamp Relay from the junction block. Remove the Body Control Module from the junction block. Measure the resistance between the Park Lamp Relay Control circuit from the relay cavity 52,86 to the junction block Body Control Module connector terminal 16. Is the resistance below 0.5 ohms?</p> <p>Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Check junction block fuse 7 Is fuse 7 open?</p> <p>Yes → Go To 9</p> <p>No → Repair the open Fused B+ circuit from the PDC. Perform BODY VERIFICATION TEST - VER 1.</p>	All
9	<p>Measure the resistance of the Fused B+ circuit from cavity 53,85 in the junction block connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 10</p>	All

***PARK LAMPS WILL NOT TURN ON — Continued**

TEST	ACTION	APPLICABILITY
10	Remove the Park Lamp Relay from the junction block. Measure the resistance of the Park Lamp Relay Output circuit from the relay cavity 55,30 to ground. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Replace the fuse and recheck the system. Perform BODY VERIFICATION TEST - VER 1.	All
11	Remove the Park Lamp Relay from the junction block. Remove the Body Control Module from the junction block. Measure the resistance of the Park Lamp Relay Output circuit from relay cavity 55,30 to ground. Is the resistance below 5.0 ohms? Yes → Repair the Park Lamp Relay Output circuit for a short to ground and replace the fuse. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

A/C CONTROL A/C SWITCH FAILURE (MANUAL A/C)

When Monitored and Set Condition:

A/C CONTROL A/C SWITCH FAILURE (MANUAL A/C)

When Monitored: With the ignition on.

Set Condition: The BCM detects the A/C switch stuck in the depressed position for at least 30 seconds.

POSSIBLE CAUSES

CONTROL HEAD - SHORT TO GROUND
 MODE SWITCH MUX CIRCUIT SHORT TO GROUND
 MODE SWITCH MUX CIRCUIT SHORT TO SENSOR GROUND
 BODY CONTROL MODULE - MODE SWITCH MUX SHORT TO GROUND
 CONTROL HEAD - BUTTON STICKS
 CONTROL HEAD - MODE MUX INCORRECT
 CONTROL HEAD - OPEN SWITCH
 CONTROL HEAD SWITCHES OKAY

TEST	ACTION	APPLICABILITY
1	Put the control switch in the Recirc/Bi-Level (full left) position. With the DRBIII®, erase Body Computer DTC's. With the DRBIII®, read the Mode Switch MUX voltage. Is the voltage below 0.5 volts? Yes → Go To 2 No → Go To 6	All
2	Disconnect the Manual Temp Control Head C1 harness connector. With the DRBIII®, read the Mode Switch MUX voltage. Does the DRBIII® display Mode Switch MUX: 4.8 volts or greater? Yes → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Mode Switch MUX circuit. Is the resistance below 100.0 ohms? Yes → Repair the Mode Switch MUX circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

A/C CONTROL A/C SWITCH FAILURE (MANUAL A/C) — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Disconnect the Body Control Module C1 harness connector. Measure the resistance between the Sensor Ground circuit and the Mode Switch MUX circuit in the Manual Temp Control Head C1 connector. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the Mode Switch MUX circuit for a short to the Sensor Ground circuit. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Press and release the Rear Defogger and the A/C select buttons on the control head several times. Does either of the buttons seem to stick at times?</p> <p>Yes → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Put the control switch in the Recirc/Bi-Level (full left) position. Ensure the A/C and the Rear Defogger switches are off. Turn the ignition on. With the DRBIII®, read the Mode Switch MUX voltage. Is the voltage approximately 4.2 to 4.5 volts?</p> <p>Yes → Go To 8</p> <p>No → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>With the DRBIII®, read the Mode Switch MUX voltage. Press and hold the A/C button and observe the DRB voltage (should be approximately 0.45 volts). Press and hold the Rear Defogger button and observe the DRB voltage (should be approximately 0.25 volts). Were the voltage readings correct when the switches were pressed?</p> <p>Yes → There is no problem at this time with the Control Head Switches. Retry the system and recheck for DTC's. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**A/C CONTROL BLEND DOOR INPUT OPEN OR SHORTED TO GROUND (MANUAL A/C)**

When Monitored and Set Condition:**A/C CONTROL BLEND DOOR INPUT OPEN OR SHORTED TO GROUND (MANUAL A/C)**

When Monitored: With the ignition on.

Set Condition: The BCM detects an abnormally low voltage (below 1.0 volts) on its blend request input.

POSSIBLE CAUSES

FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
TEMPERATURE SELECT CKT SHORTED TO GROUND
TEMPERATURE SELECT CKT SHORTED TO SENSOR GROUND
TEMPERATURE SELECT CIRCUIT OPEN
CONTROL HEAD - TEMP SELECT OPEN/SHORT
BODY CONTROL MODULE - TEMP SELECT OPEN/SHORT

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase Body Controller DTC's. Disconnect the Manual Temp Control Head C1 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 2 No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Temperature Select circuit. Is the resistance below 100.0 ohms? Yes → Repair the Temperature Select circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

A/C CONTROL BLEND DOOR INPUT OPEN OR SHORTED TO GROUND (MANUAL A/C) — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Disconnect the Body Control Module C1 harness connector. Measure the resistance between the Sensor Ground circuit and the Temperature Select circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the Temperature Select circuit for a short to the Sensor Ground circuit. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Temperature Select circuit between the BCM C2 connector and the Manual Temp Control Head C1 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Temperature Select circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Reconnect the Manual Temp Control Head C1 harness connector. Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the Temperature Select circuit in the BCM C2 connector. Move the temperature control from cold to hot and observe the voltmeter. Does the voltage change smoothly from approximately 1.0 volts (full cold) to 10.0 volts (full hot)?</p> <p>Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

**A/C CONTROL BLEND DOOR INPUT SHORTED TO BATTERY
(MANUAL A/C)**

When Monitored and Set Condition:

A/C CONTROL BLEND DOOR INPUT SHORTED TO BATTERY (MANUAL A/C)

When Monitored: With the ignition on.

Set Condition: The BCM detects an abnormally high voltage on its blend request input.

POSSIBLE CAUSES

CONTROL HEAD - SHORT TO VOLTAGE

TEMPERATURE SELECT CKT SHORTED TO VOLTAGE

BODY CONTROL MODULE - TEMPERATURE SELECT SHORT TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase Body Controller DTC's. Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Turn the ignition on. Measure the voltage of the Temperature Select circuit. Is the voltage above 0.3 volts? Yes → Go To 2 No → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the Temperature Select circuit. Is there any voltage present? Yes → Repair the Temperature Select circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom: ATC A/C SWITCH FAILURE

When Monitored and Set Condition:

ATC A/C SWITCH FAILURE

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed?</p> <p>Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
ATC AUTO SWITCH FAILURE

When Monitored and Set Condition:

ATC AUTO SWITCH FAILURE

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ATC BILEVEL SWITCH FAILURE

When Monitored and Set Condition:**ATC BILEVEL SWITCH FAILURE**

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ATC DEFROST SWITCH FAILURE

When Monitored and Set Condition:

ATC DEFROST SWITCH FAILURE

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ATC EBL SWITCH FAILURE

When Monitored and Set Condition:**ATC EBL SWITCH FAILURE**

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ATC FLOOR SWITCH FAILURE

When Monitored and Set Condition:

ATC FLOOR SWITCH FAILURE

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ATC MIX SWITCH FAILURE

When Monitored and Set Condition:**ATC MIX SWITCH FAILURE**

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ATC OFF SWITCH FAILURE

When Monitored and Set Condition:

ATC OFF SWITCH FAILURE

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ATC PANEL SWITCH FAILURE

When Monitored and Set Condition:**ATC PANEL SWITCH FAILURE**

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:**ATC RECIRCULATION SWITCH FAILURE****When Monitored and Set Condition:****ATC RECIRCULATION SWITCH FAILURE**

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:**ATC TEMPERATURE DOWN SWITCH FAILURE**

When Monitored and Set Condition:**ATC TEMPERATURE DOWN SWITCH FAILURE**

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:**ATC TEMPERATURE UP SWITCH FAILURE****When Monitored and Set Condition:****ATC TEMPERATURE UP SWITCH FAILURE**

When Monitored: With the ignition on.

Set Condition: The BCM interfaces with the ATC head over the PCI Bus. If an ATC switch is held in the closed position for longer than 5 to 10 minutes, a switch failed code will be set.

POSSIBLE CAUSES

ATC HEAD SWITCH STUCK

ATC HEAD - ERASE DTC- RESET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB select Automatic Temp Control, Input/output and observe the switch state. Do any of the switch states read Closed? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Using the DRB, erase the trouble code and Reset Module (under miscellaneous). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

BLEND DOOR FEEDBACK FAILURE

When Monitored and Set Condition:

BLEND DOOR FEEDBACK FAILURE

When Monitored: Continuously.

Set Condition: The BCM detects a loss of signal on the mode feedback and/or blend feedback inputs.

POSSIBLE CAUSES

5 VOLT SUPPLY CIRCUIT SHORT TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
5 VOLT SUPPLY CIRCUIT SHORT TO SENSOR GROUND
BLEND DOOR ACTUATOR SHORTED TO SENSOR GROUND
MODE DOOR ACTUATOR SHORTED TO SENSOR GROUND
5 VOLT SUPPLY CIRCUIT SHORT TO SENSOR GROUND
BLEND DOOR FEEDBACK SIGNAL CIRCUIT SHORT TO BATTERY
COMMON DOOR DRIVER WIRE OPEN
BLEND AIR DOOR DRIVER WIRE OPEN
BODY CONTROL MODULE-COMMON DOOR DRIVER
BODY CONTROL MODULE-BLEND DOOR DRIVER
BLEND DOOR ACTUATOR
SENSOR GROUND WIRE OPEN
BODY CONTROL MODULE
BLEND DOOR FEEDBACK SIGNAL CIRCUIT SHORT TO GROUND
BLEND DOOR FEEDBACK SIGNAL CIRCUIT OPEN
BLEND DOOR FEEDBACK SIGNAL CIRCUIT SHORT TO SENSOR GROUND
BODY CONTROL MODULE - FEEDBACK SIGNAL OPEN/SHORTED
BLEND DOOR ACTUATOR
5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
BODY CONTROL MODULE- 5 VOLTS SUPPLY HIGH

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	<p>Gain access to the C202 (manual A/C) or C203 (ATC) in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Turn the ignition on. While backprobing measure the voltage of the 5 volt supply circuit (cavity #6) in the inline connector. What voltage is present?</p> <p>Zero volts. Go To 2</p> <p>4.5 to 5.5 Volts Go To 7</p> <p>Over 5.5 Volts Go To 19</p>	All
2	<p>Turn the ignition off. Disconnect the C202 (manual A/C) or C203 (ATC) in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the 5 volt supply circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the 5 volt supply circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Disconnect the C202 (manual A/C) or C203 (ATC) in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the 5 volt supply wire between the BCM connector and the inline (C202/3) connector (I/P harness side). Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the 5 volt supply circuit for an open. Calibration must be performed after repair/replacement is completed. 12	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
HEAD STATUS RX FAILURE

POSSIBLE CAUSES

CHECK BCM CODES

AUTOMATIC TEMPERATURE CONTROL HEAD

HARNESS/INTERMITTENT WIRING

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the BCM DTCs. Is the Head Status RX Failure code set? Yes → Refer to the communications category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, erase the ATC Head DTCs. Cycle the ignition switch from off to on. With the DRBIII®, read the ATC Head DTCs. Is the Head Status RX Failure code set? Yes → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent wiring problem. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:**IN CAR TEMP SENSOR FAILURE (ATC ASPIRATOR FAILURE)**

When Monitored and Set Condition:**IN CAR TEMP SENSOR FAILURE (ATC ASPIRATOR FAILURE)**

When Monitored: With the ignition on.

Set Condition: The BCM detects an abnormally high voltage (above 4.8 volts) or an abnormally low voltage (below 0.31 volts) on the in-car temperature sensor signal.

POSSIBLE CAUSES
FUSED B(+) CIRCUIT OPEN
ASPIRATOR MOTOR DRIVER CIRCUIT SHORT TO BATTERY
ASPIRATOR MOTOR DRIVER CIRCUIT OPEN
ATC HEAD - OPEN ASPIRATOR MOTOR
BODY CONTROL MODULE - ASPIRATOR DRIVER OPEN
ASPIRATOR MOTOR DRIVER CIRCUIT SHORT TO GROUND
BCM-ASPIRATOR STAYS RUNNING
IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO BATTERY
IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO SENSOR GROUND
IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
BODY CONTROL MODULE - OPEN IN-CAR TEMP SENSOR SIGNAL
ATC HEAD - IN-CAR SENSOR CODE
SYSTEM IS OPERATIONAL AT THIS TIME
SENSOR GROUND CIRCUIT OPEN
BODY CONTROL MODULE - OPEN SENSOR GROUND

IN CAR TEMP SENSOR FAILURE (ATC ASPIRATOR FAILURE) — Continued

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. Completely cover the aspirator inlet (below blower switch) with a piece of tissue paper. Note: The tissue paper should hold in place because of the air drawn in from the aspirator. Turn the ignition off. Stay in the vehicle, close all doors and ensure courtesy lamps are off. Wait three minutes. Open and close the driver door and observe the aspirator motor. The motor should run for approximately 30 seconds after the courtesy lamps have faded out and then stop. Disconnect the ATC Head harness connector. Turn the ignition on. Measure the voltage of the In-Car Temperature Sensor Signal circuit. The voltage should be between 4.5 volts and 5.2 volts. Select the appropriate findings.</p> <p style="padding-left: 40px;">Aspirator never ran. Go To 2</p> <p style="padding-left: 40px;">Aspirator timer inop when door opened. Go To 6</p> <p style="padding-left: 40px;">In-Car Temp Sense above 5.3 volts. Repair the In-Car Temperature Sensor Signal circuit for a short to voltage. If the circuit is okay, replace the BCM. Perform BODY VERIFICATION TEST - VER 1.</p> <p style="padding-left: 40px;">In-Car Temp Sense below 4.5 volts. Go To 7</p> <p style="padding-left: 40px;">None of the above. Go To 10</p>	All
2	<p>Turn the ignition off. Disconnect the ATC Head harness connector. Turn the ignition on. Measure the voltage of the Fused B(+) circuit. Is the voltage above 10.0 volts?</p> <p style="padding-left: 40px;">Yes → Go To 3</p> <p style="padding-left: 40px;">No → Repair the Fused B(+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition off. Disconnect the ATC Head harness connector. Turn the ignition on. Measure the voltage of the Aspirator Motor Driver circuit. Is the voltage above 10.0 volts?</p> <p style="padding-left: 40px;">Yes → Repair the Aspirator Motor Driver circuit for a short to voltage. If the circuit is okay, replace the BCM. Perform BODY VERIFICATION TEST - VER 1.</p> <p style="padding-left: 40px;">No → Go To 4</p>	All

IN CAR TEMP SENSOR FAILURE (ATC ASPIRATOR FAILURE) — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the ATC Head harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Aspirator Motor Driver circuit between the BCM C2 connector and the ATC Head connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Aspirator Motor Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Ensure the ATC Head is connected at this time. Disconnect the Body Control Module C2 harness connector. Connect a jumper wire between the Aspirator Motor Driver circuit and ground. Check the operation of the aspirator motor fan. Is the aspirator motor running?</p> <p>Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Automatic Temperature Control Head. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Note: Ensure the courtesy lamps operate properly from the drivers door before proceeding. If not, refer to the Interior Lighting category for the related symptom(s). Note: This path is for the aspirator continuing to run with the key off and the doors closed. Disconnect the Body Control Module C2 harness connector. Did the aspirator motor stop running?</p> <p>Yes → Replace the Body Control Module (aspirator motor driver grounded). Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Aspirator Motor Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the ATC Head harness connector. Measure the resistance between ground and the In-Car Temperature Sensor Signal circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the In-Car Temperature Sensor Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All

IN CAR TEMP SENSOR FAILURE (ATC ASPIRATOR FAILURE) — Continued

Symptom:

*MANUAL A/C BLOWER MOTOR INOPERATIVE

POSSIBLE CAUSES
<p>JUNCTION BLOCK FUSE #23</p> <p>FUSED IGNITION SWITCH OUTPUT CKT SHORTED TO GROUND</p> <p>BLOWER MOTOR - SHORT TO GROUND</p> <p>FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN TO RESISTOR</p> <p>FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN TO MOTOR</p> <p>BLOWER MOTOR OPEN</p> <p>BLOWER MOTOR INOPERATIVE</p> <p>GROUND CIRCUIT OPEN</p> <p>HEAD- MOTOR DRIVER OPEN</p> <p>BLOWER MOTOR DRIVER CIRCUIT OPEN</p> <p>RESISTOR-OPEN HI BLOWER MOTOR DRIVER</p>

TEST	ACTION	APPLICABILITY
1	<p>Remove and inspect Fuse #23 from the Junction Block.</p> <p>Is the fuse open?</p> <p>Yes → Go To 2</p> <p>No → Go To 4</p>	All
2	<p>Turn the ignition off.</p> <p>Replace Fuse #23 in the Junction Block.</p> <p>Turn the ignition on.</p> <p>Turn the blower on and operate it in all speeds and modes.</p> <p>Does the blower motor operate properly without blowing the fuse?</p> <p>Yes → Check the Fused Ignition Switch Output circuit for an intermittent short to ground. Refer to the wiring diagrams located in the service information.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off.</p> <p>Turn the Blower Motor Switch off.</p> <p>Disconnect the Blower Motor 2-way harness connector.</p> <p>Measure the resistance between ground and the Fused Ignition Switch Output circuit (the DG or DB/YL wire in the blower motor 2-way connector).</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Check the Blower Motor Resistor Block for resistance to ground. If ok, repair the Fused Ignition Switch Output circuit for a short to ground and replace the fuse.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Blower Motor and fuse.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

***MANUAL A/C BLOWER MOTOR INOPERATIVE — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Ensure Junction Block Fuse #23 is installed before proceeding. Turn the Blower Motor Switch off. Disconnect the Blower Motor Resistor Block harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 5</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Reconnect the Blower Motor Resistor Block harness connector. Turn the ignition on. While backprobing, measure the voltage of the Fused Ignition Switch Output ckt at the Blower Motor 2-way connector (DG or DB/YL circuit). Is the voltage above 10.0 volts?</p> <p>Yes → Go To 6</p> <p>No → Replace the Blower Motor Resistor Block. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the Blower Motor Switch off. Turn the ignition on. While backprobing, measure the voltage of the Blower Motor Driver circuit at the Blower Motor 2-way connector (BK or BK/TN circuit). Is the voltage above 10.0 volts?</p> <p>Yes → Go To 7</p> <p>No → Replace the Blower Motor. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the Blower Motor Switch off. Turn the ignition on. Backprobe a jumper wire between ground and the Blower Motor Driver ckt at the Blower Motor 2-way connector (BK or BK/TN circuit). Did the blower motor run on high speed?</p> <p>Yes → Go To 8</p> <p>No → Replace the Blower Motor. Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Disconnect the Manual Temp Control Head C2 harness connector. Connect a jumper wire between the High Blower Motor Driver circuit and ground in the Control Head C2 connector. Turn the ignition on. Did the blower motor run on high speed?</p> <p>Yes → Go To 9</p> <p>No → Go To 10</p>	All

***MANUAL A/C BLOWER MOTOR INOPERATIVE — Continued**

TEST	ACTION	APPLICABILITY
9	<p>Turn the ignition off. Disconnect the Manual Temp Control Head C2 harness connector. Measure the resistance between ground and the Ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
10	<p>Turn the ignition off. Disconnect the Manual Temp Control Head C2 harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the resistance of the High Blower Motor Driver circuit between the Control Head C2 connector and the Blower Motor Resistor Block connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Blower Motor Resistor Block. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the High Blower Motor Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***MANUAL A/C BLOWER MOTOR SPEEDS INCORRECT****POSSIBLE CAUSES**

CONTROL HEAD - BLOWER SPEEDS INCORRECT

BLOWER MOTOR DRIVER CIRCUIT OPEN

BLOWER MOTOR RESISTOR - OPEN SPEED

TEST	ACTION	APPLICABILITY
1	Disconnect the Manual Temperature Control Head C2 harness connector. Turn the ignition on. Measure the voltage between each of the Blower Motor Driver circuits (cavities 2, 3, 7, and 10). Is the voltage above 10.0 volts on each of the circuits? Yes → Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Turn the Blower Switch to the off position. Disconnect the Manual Temperature Control Head C2 harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the resistance of each of the 4 Blower Motor Driver circuits between the resistor block connector and the Control Head connector. Is the resistance below 5.0 ohms on each of the circuits? Yes → Go To 3 No → Repair the Blower Motor Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	If there are no possible causes remaining, view repair. Repair Replace the Blower Motor Resistor Block. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***MANUAL A/C CONTROL HEAD ILLUMINATION****POSSIBLE CAUSES**

GROUND CIRCUIT OPEN

PANEL LAMPS DRIVER CIRCUIT OPEN

CONTROL HEAD - LAMPS INOPERATIVE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Ensure all lights are off (trip driver door latch if necessary to shut courtesy lamps off). Measure the resistance between ground and the Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Note: Ensure the panel lamps operate properly on the instrument cluster before proceeding. If not, refer to symptom list for problems related to Instrument Cluster. Turn the ignition off. Disconnect the Manual Temp Control Head C1 harness connector. Turn the Park Lamps on. Measure the voltage of the Panel Lamps Driver circuit. Rotate the Dimmer Switch Thumb Wheel and observe the voltage change. Does the voltage range from below 3.5 volts to above 9.0 volts when the switch is rotated? Yes → Go To 3 No → Repair the Panel Lamps Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	If there are no possible causes remaining, view repair. Repair Check the bulbs. If Okay, replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***MANUAL A/C CONTROL HEAD SWITCH INOPERATIVE****POSSIBLE CAUSES**

CONTROL HEAD - OPEN SWITCH

CONTROL HEAD SWITCHES OKAY

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII®, read the Mode Switch MUX voltage. Press and hold the A/C button and observe the DRB voltage (should be approximately 0.45 volts). Press and hold the Rear Defogger button and observe the DRB voltage (should be approximately 0.25 volts). Which switch failed?</p> <p>A/C Button Switch Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.</p> <p>EBL Button Switch Replace the Control Head. Perform BODY VERIFICATION TEST - VER 1.</p> <p>Both Passed There is no problem at this time with the Control Head Switches. Retry the system and recheck for DTC's. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***MANUAL A/C SYSTEM TEST****POSSIBLE CAUSES**

MANUAL A/C SYSTEM TEST

TEST	ACTION	APPLICABILITY
1	<p>Ensure there is vehicle communications with the Body Control Module and the Powertrain Control Module before proceeding. If not, refer to the communication category for the related symptom.</p> <p>With the DRBIII®, read Engine DTC's. If any climate control related DTC's are present, refer to the appropriate category for the related symptoms.</p> <p>With the DRBIII®, read Body DTC's. If any climate control related codes are present, continue to the next step. If no codes are present, recalibrate the doors and recheck the system.</p> <p>Record and erase the code(s).</p> <p>Turn the blower on, set the temperature control at mid position, start the engine and with the DRB Read DTC's.</p> <p>If no code appears, slowly turn the temperature control from cold to hot, then back to cold while observing the DRB. If a code appears, refer to the Heating and A/C category for the related symptom.</p> <p>If a code still does not appear, turn the mode switch to each position, waiting 20 seconds between each one. Momentarily press the A/C and Rear Defog buttons. Upon seeing the first code appear, stop and perform the appropriate test.</p> <p>NOTE: If multiple codes appear, repair any that relate to a short circuit first. If a short to battery code is set, all 4 Output Shorted to Battery codes will appear. It will then be necessary to isolate each circuit to determine which is at fault.</p> <p>If DTC's have appeared, refer to the Heating and A/C category and select the appropriate symptom.</p> <p>If no codes have appeared, press Repair.</p> <p>Repair</p> <p>Re calibrate the doors, reset the BCM and recheck the climate control system performance.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***MODE DOOR INOPERATIVE****POSSIBLE CAUSES**

ATC HEAD MODE DOOR BUTTONS OPEN
 MODE DOOR INOPERABLE PRE TEST
 MODE DOOR ACTUATOR CHECK
 COMMON DOOR DRIVER CIRCUIT OPEN
 MODE DOOR DRIVER CIRCUIT OPEN
 BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Disregard this test step if this vehicle is NOT equipped with Automatic Temp Control. With the DRBIII®, enter Automatic Temperature Control then Inputs/Outputs. Press and hold each switch (except Temp) and observe the switch state on the DRB. Do the switch states change from Open to Closed when each switch is pressed.</p> <p>Yes → Go To 2</p> <p>No → Replace the Automatic Temperature Control Head. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Note: It is very easy for this system to set trouble codes (any connector disconnected, any small bind in a door, etc.). Because of this, it is advisable to perform a System Test before proceeding to prevent a wrong repair. Symptom:**BCM - DIMMING LEVEL SWITCH FAILURE****When Monitored and Set Condition:****BCM - DIMMING LEVEL SWITCH FAILURE**

When Monitored: Continuously.

Set Condition: The BCM detects an open or short circuit condition for 10 seconds on the Panel Lamps Dimmer Signal circuit.

POSSIBLE CAUSES

CHECKING DIMMING SWITCH POSITIONS

HEADLAMP SWITCH - OPEN

HEADLAMP SWITCH - SHORTED

OPEN HEADLAMP SWITCH RETURN CIRCUIT

PANEL LAMP DIMMER SIGNAL CIRCUIT SHORTED TO GROUND

BCM - HEADLAMP RETURN CIRCUIT OPEN

MEASURE THE VOLTAGE OF THE PANEL LAMP DIMMER SIGNAL CIRCUIT

MEASURE THE VOLTAGE OF THE PANEL LAMP DIMMER SIGNAL CIRCUIT

OPEN PANEL LAMP DIMMER SIGNAL CIRCUIT

PANEL LAMP DIMMER SIGNAL CIRCUIT SHORTED TO THE HEADLAMP SWITCH RETURN CIRCUIT

PANEL LAMP DIMMER SIGNAL CIRCUIT SHORTED TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, select Body Computer then Sensors and observe the dimming level voltage. Is the voltage between 0.4 and 10.2 volts? Yes → Go To 2 No → Go To 3	All

BCM - DIMMING LEVEL SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition on. With the DRB, select Body Computer then Sensors. Read the Dimming Level Volts. Set the Panel Dimmer Switch in the Low position then slowly move the switch to the Hi position, then Funeral Mode position, then to the Dome position. NOTE: The voltage should increase from approximately 0.6 volts in Low to 5.5 volts in Hi. NOTE: Funeral mode voltage should be approximately 7.2 volts and Dome mode should be approximately 9.4 volts. Does the dimmer level volts display correct voltage for the corresponding position as described?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Headlamp Switch. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition on. With the DRB, select Body Computer then Sensors and observe the dimming level voltage. Is the voltage above 10.2 volts?</p> <p>Yes → Go To 4</p> <p>No → Go To 9</p>	All
4	<p>Turn the ignition off. Disconnect the Headlamp Switch harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Headlamp Switch Return circuit between the Headlamp Switch connector and the BCM C2 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Headlamp Switch Return circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Disconnect the Headlamp Switch harness connector. Disconnect the BCM "C2" harness connector. Measure the resistance of the Panel Lamp Dimmer Signal circuit between the Headlamp Switch connector and the BCM "C2" connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the Panel Lamp Dimmer Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the Headlamp Switch harness connector. Disconnect the BCM "C2" harness connector. Turn the ignition on. Using a 12-volt Test Light connected to ground, probe the Panel Lamp Dimmer Signal circuit. Is the test light illuminated?</p> <p>Yes → Repair the Panel Lamp Dimmer Signal circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All

BCM - DIMMING LEVEL SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the Headlamp Switch harness connector. Turn the ignition on. Measure the voltage of the Panel Lamp Dimmer Signal circuit. Is the voltage above 10.0 volts? Yes → Go To 8 No → Replace and program the BCM in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the Headlamp Switch harness connector. Turn the ignition on. Connect a jumper wire between the Panel Lamps Dimmer Signal and the Headlamp Switch Return circuit at the Headlamp Switch harness connector. With the DRB, select Body Computer then Sensors and read the dimming level voltage. Is the voltage below 1.0 volt? Yes → Replace the Headlamp Switch. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the BCM in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Disconnect the Headlamp Switch harness connector. Disconnect the BCM "C2" harness connector. Measure the resistance between ground and the Panel Lamp Dimmer Signal circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Panel Lamp Dimmer Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off. Disconnect the Headlamp Switch harness connector. Disconnect the BCM "C2" harness connector. Measure the resistance between the Panel Lamp Dimmer Signal circuit and the Headlamp Switch Return circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Panel Lamp Dimmer Signal circuit for a short to the Headlamp Switch Return circuit. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All

BCM - DIMMING LEVEL SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
11	<p>Turn the ignition off. Disconnect the Headlamp Switch harness connector. Turn the ignition on. Measure the voltage of the Panel Lamp Dimmer Signal circuit. 5	<p>Turn the ignition on. With the DRB, enter "Body Computer" then "Sensors" and observe the fuel level voltage. Is the voltage above 9.0 volts?</p> <p>Yes → Repair the Fuel Level Sensor Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom List:

NO MESSAGES FROM ABS
NO MESSAGES FROM AECM
NO MESSAGES FROM BCM
NO MESSAGES FROM EATX
NO MESSAGES FROM PCM

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be NO MESSAGES FROM ABS.

When Monitored and Set Condition:**NO MESSAGES FROM ABS**

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster does not receive an ABS message for 10 seconds.

NO MESSAGES FROM AECM

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster does not receive an AECM message for 5 seconds.

NO MESSAGES FROM BCM

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster does not receive a BCM message for 5 seconds.

NO MESSAGES FROM EATX

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster does not receive an EATX message for 10 seconds.

NO MESSAGES FROM PCM

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster does not receive a PCM message for 20 seconds.

POSSIBLE CAUSES

BUS MESSAGE NOT RECEIVED DTC PRESENT
INSTRUMENT CLUSTER
INTERMITTENT CONDITION

NO MESSAGES FROM ABS — Continued

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, attempt to communicate with the module that corresponds to the DTC that is set.</p> <p>Was the DRBIII® able to I/D or communicate with the Module in question?</p> <p>Yes → Go To 2</p> <p>No → Refer to Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>NOTE: If this is an active DTC, answer yes to the question.</p> <p>With the DRBIII®, erase DTCs.</p> <p>Cycle the ignition, wait approximately 1 minute.</p> <p>With the DRBIII®, read DTCs.</p> <p>Did the DTC reset?</p> <p>Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***AIRBAG WARNING INDICATOR NOT OPERATING PROPERLY****POSSIBLE CAUSES**

AIRBAG TROUBLE CODES

OTHER INSTRUMENT CLUSTER DTC'S

PERFORM INSTRUMENT CLUSTER SELF TEST

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Note: The DRB must be able to communicate with the airbag module prior to performing this test. With the DRB, read airbag DTC's. Are there any airbag DTC's present? Yes → Refer to the Airbag category for the related symptom(s). No → Go To 2	All
2	Turn the ignition on. With the DRB, read Instrument Cluster DTC's. Are there any Instrument Cluster DTC's present? Yes → Refer to the Instrument Cluster category for the related symptom(s). No → Go To 3	All
3	Turn the ignition off then on. This will start the bulb test. Did the airbag warning indicator illuminate for 5 to 10 seconds? Yes → Test Complete. No → Replace the Instrument Cluster in accordance with the Service Information.	All

INSTRUMENT CLUSTER

Symptom:

*ALL GAUGES INOPERATIVE

FUSED B(+) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
INSTRUMENT CLUSTER GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Diagnose and repair any BCM, PCM, or Communication DTC's before proceeding with this test.</p> <p>NOTE: If the cluster does not receive any PCI bus information, all gauge pointers will move to lowest indication and all warning indicators will illuminate.</p> <p>Turn the ignition off. Perform the Instrument Cluster self-test. Press and hold the Trip Reset button. Turn the ignition on. Observe the cluster during the self-test. All gauge pointers should pause briefly at the calibration points. Did the gauges operate properly during the self-test?</p> <p>Yes → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness connectors and terminals. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Instrument Cluster C1 harness connector. Measure the voltage between the Fused B(+) circuit and ground. Is the voltage above 10.5 volts?</p> <p>Yes → Go To 3</p> <p>No → Repair the fused B(+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition off. Disconnect the Instrument Cluster C1 harness connector. Turn the ignition on. Measure the voltage between the Fused Ignition Switch Output circuit and ground. Is the voltage above 10.5 volts?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***ALL GAUGES INOPERATIVE — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Instrument Cluster C1 harness connector. Measure the resistance between ground and the Instrument Cluster Ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Instrument Cluster Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

INSTRUMENT CLUSTER

Symptom:

*BRAKE WARNING INDICATOR INOPERATIVE

POSSIBLE CAUSES
PARK BRAKE SWITCH
RED BRAKE WARNING INDICATOR DRIVER CIRCUIT OPEN - PARK BRAKE SWITCH TO J/BLOCK
RED BRAKE WARNING INDICATOR DRIVER CIRCUIT OPEN - MIC TO J/BLOCK
BRAKE FLUID LEVEL SWITCH
BRAKE FLUID LEVEL SWITCH GROUND CIRCUIT OPEN
RED BRAKE WARNING INDICATOR CIRCUIT OPEN - BRAKE FLUID LEVEL SWITCH TO J/BLOCK
INTERMITTENT CONDITION
JUNCTION BLOCK
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on and observe the BRAKE indicator during the bulb check. Did the BRAKE indicator illuminate during the bulb check? Yes → Go To 2 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	NOTE: Diagnose and repair any MIC, ABS, or Communication DTC's before proceeding with this test. Is the Brake Warning Indicator only inoperative while using the Park Brake? Yes → Go To 3 No → Go To 5	All
3	Disconnect the Park Brake Switch harness connector. Connect a jumper wire between the Red Brake Warning Indicator Driver circuit and ground. Turn the ignition on. Observe the BRAKE indicator. Did the BRAKE indicator illuminate? Yes → Replace the Park Brake Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

***BRAKE WARNING INDICATOR INOPERATIVE — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Park Brake Switch harness connector. Disconnect the Junction Block C7 harness connector. Measure the resistance of the Red Brake Warning Indicator circuit. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the Red Brake Warning Indicator circuit for an open between the Park Brake Switch and the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
5	<p>Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Connect a jumper wire between cavity A and cavity B. Turn the ignition on. Did the BRAKE indicator illuminate?</p> <p>Yes → Replace the Brake Fluid Level Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Measure the resistance between ground and the Brake Fluid Level Switch Ground circuit. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the Brake Fluid Level Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Disconnect the Junction Block C10 harness connector. Measure the resistance of the Red Brake Warning Indicator circuit between the Switch connector and the Junction Block C10 connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the Red Brake Warning Indicator Switch circuit for an open between the Fluid Level Switch and the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the appropriate Junction Block harness connectors. Using the wiring diagram/schematic as a guide, measure the resistance of the Red Brake Warning Indicator circuit through the Junction Block. Is the resistance above 5 ohms?</p> <p>Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 9</p>	All

*BRAKE WARNING INDICATOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
9	<p>Turn the ignition off. Disconnect the Junction Block C3 harness connector. Disconnect the Instrument Cluster C2 harness connector. Measure the resistance of the Red Brake Warning Indicator Driver circuit between the Junction Block C3 harness connector and the Instrument Cluster C2 harness connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the Red Brake Warning Indicator Driver circuit for an open between the Instrument Cluster and the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness connectors and terminals. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***CHARGING INDICATOR NOT OPERATING PROPERLY****POSSIBLE CAUSES**

INSTRUMENT CLUSTER

CHECK THE CHARGING SYSTEM OPERATION

ENGINE TROUBLE CODES

PERFORM INSTRUMENT CLUSTER SELF TEST

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the ENGINE DTC's. Are there any PCM DTC's present? Yes → Refer to the Driveability category for the related symptom(s) involving the charging system. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off then on. This will start the bulb test. Did the charging indicator illuminate for 3 to 10 seconds? Yes → Go To 3 No → Replace the Instrument cluster. Perform BODY VERIFICATION TEST - VER 1.	All
3	Check the charging system operation. Follow the Service Information procedure. Is the charging system operating properly? Yes → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1. No → Refer to service information for the related symptom(s) regarding the charging system. Perform BODY VERIFICATION TEST - VER 1.	All

INSTRUMENT CLUSTER

Symptom:

***CHECK ENGINE INDICATOR NOT OPERATING PROPERLY**

POSSIBLE CAUSES

INSTRUMENT CLUSTER

ENGINE TROUBLE CODES

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read engine DTC's. Are there any PCM DTC's present? Yes → Refer to the Driveability category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

***CLUSTER AND PANEL ILLUMINATION PROBLEMS**

POSSIBLE CAUSES
CHECKING FOR INSTRUMENT CLUSTER DTC
CHECKING THE PANEL LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND
INSTRUMENT CLUSTER
PANEL LAMP DRIVER CIRCUIT SHORTED TO GROUND
PANEL LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
CHECKING FOR A SHORT TO GROUND
CHECKING FOR A SHORT TO VOLTAGE
OBSERVE THE DIMMING LEVEL VOLTAGE
ATTEMPT TO COMMUNICATE WITH THE INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRB, select Body then Electro/Mech Cluster (MIC). Was the DRB able to I/D or communicate with the Instrument Cluster?</p> <p>Yes → Go To 2</p> <p>No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition on. Note: Check the Instrument Cluster (MIC) for any DTCs. With the DRB, select Body Computer then Sensors and observe the dimming level voltage. Rotate the dimmer switch to the low position, then to the high position and observe the dimming level voltage Does the dimming level voltage change between approximately 0.2 and 3.0 volts?</p> <p>Yes → Go To 3</p> <p>No → Refer to symptom list for problems related to the Dimming Level Switch Failure DTC. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the park lamps on. Rotate the dimmer switch to the low position, then to the high position and observe the panel lamps. Do the panel lamps stay at full intensity with the dimmer switch in any position?</p> <p>Yes → Go To 4</p> <p>No → Go To 6</p>	All

*CLUSTER AND PANEL ILLUMINATION PROBLEMS — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the park lamps on. Ensure the ignition key is off while disconnecting the following Modules/Components. Disconnect the following Modules/Components one at a time in an orderly manner (be sure to turn the ignition off before disconnecting any Module). After the disconnection, rotate the dimmer switch to the low position, then to the high position and observe the panel lamps. Disconnect the Ash Receiver Lamp harness connector if equipped. Disconnect the Clock harness connector if equipped. Disconnect the PRND3L Illumination harness connector if equipped. Disconnect the Radio C2 harness connector if equipped. Disconnect the Traction Control Switch harness connector if equipped. Disconnect the Headlamp Switch harness connector. Disconnect the Automatic/Manual Temperature Control Module harness connector. Did the panel lamps function properly after disconnecting any one module/component?</p> <p>Yes → Replace the module/component that was most recently disconnected when the panel lamps functioned properly. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Instrument Cluster C1 harness connector. Turn the ignition on. Measure the voltage of the Panel Lamp Driver circuit in the Instrument Cluster C1 harness connector. Is the voltage above 10.0 volts?</p> <p>Yes → Repair the Panel Lamp Driver circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition on. With the DRB, read Instrument Cluster DTC's. Is the Panel Lamps Driver Output Circuit Shorted DTC set?</p> <p>Yes → Go To 7</p> <p>No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Disconnect the Instrument Cluster C1 harness connector. Measure the resistance between ground and the Panel Lamps Driver circuit Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***CLUSTER AND PANEL ILLUMINATION PROBLEMS — Continued**

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Ensure the ignition key is off while disconnecting the following Modules/Components. Disconnect the following Modules/Components one at a time in an orderly manner (be sure to turn the ignition off before disconnecting any Module). After the disconnection, measure the resistance between ground and the Panel Lamp Driver circuit. Disconnect the Ash Receiver Lamp harness connector if equipped. Disconnect the Clock harness connector if equipped. Disconnect the PRND3L Illumination harness connector if equipped. Disconnect the Radio C2 harness connector if equipped. Disconnect the Traction Control Switch harness connector if equipped. Disconnect the Headlamp Switch harness connector. Disconnect the Automatic/Manual Temperature Control Module harness connector. Did the resistance increase to above 10.0 ohms after disconnecting any one module/component?</p> <p>Yes → Replace the module/component that was most recently disconnected when the resistance increased to above 10.0 ohms. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Panel Lamp Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p>	All

INSTRUMENT CLUSTER

Symptom:

*CRUISE ON INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
INSTRUMENT CLUSTER
ATTEMPT TO COMMUNICATE WITH THE PCM
CHECK THE OPERATION OF THE SPEED CONTROL SYSTEM
DEFECTIVE BULB OR SOCKET
ENGINE TROUBLE CODES

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition off then on. This will start the bulb test. Did the cruise on indicator illuminate for 3 to 10 seconds?</p> <p>Yes → Go To 2</p> <p>No → Go To 4</p>	All
2	<p>Turn the ignition on. With the DRB, read engine DTC's. Are there any PCM DTC's present?</p> <p>Yes → Refer to the Driveability category for the related symptom(s) involving the speed control system. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Drive vehicle, turn the speed control system on. Does the speed control system operate properly?</p> <p>Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Refer to the Driveability category for the related symptom(s) involving the speed control system. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition on. With the DRB, select Body, Body Computer, System Test then PCM Monitor. Is the PCM active on the bus?</p> <p>Yes → Go To 5</p> <p>No → Refer to the Communications category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Remove and inspect the cruise on bulb and socket. Is there a problem with the bulb or socket?</p> <p>Yes → Repair or replace the defective bulb or socket as needed. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***DECKLID AJAR INDICATOR NOT OPERATING PROPERLY****POSSIBLE CAUSES**

DECKLID AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND

DECKLID RELEASE SOLENOID/AJAR SWITCH SHORTED TO GROUND

INSTRUMENT CLUSTER

OPEN DECKLID AJAR SWITCH SENSE CIRCUIT

OPEN DECKLID AND OBSERVE THE DECKLID AJAR INDICATOR

OPEN DECKLID RELEASE SOLENOID/AJAR SWITCH

OPEN FUSED B+ CIRCUIT

TEST	ACTION	APPLICABILITY
1	<p>Ensure the decklid is properly aligned and fully closed. Turn the ignition on. Is the decklid ajar indicator illuminated?</p> <p>Yes → Go To 2</p> <p>No → Go To 4</p>	All
2	<p>Note: Only perform this test if the decklid ajar indicator is on at all times. Turn the ignition off. Disconnect the decklid release solenoid/ajar switch harness connector. Observe the decklid ajar indicator. Is the decklid ajar indicator illuminated?</p> <p>Yes → Go To 3</p> <p>No → Replace the decklid release solenoid/ajar switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Note: Only perform this test if the decklid ajar indicator is on at all times. Turn the ignition off. Disconnect the decklid release solenoid/ajar switch harness connector. Disconnect the Instrument Cluster "C2" harness connector. Measure the resistance between ground and the decklid ajar switch sense circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the decklid ajar switch sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

*DECKLID AJAR INDICATOR NOT OPERATING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
4	<p>Open the decklid and observe the decklid ajar indicator. Is the decklid ajar indicator illuminated?</p> <p>Yes → The decklid ajar indicator is operating properly at this time, check for a intermittent wiring condition. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the decklid release solenoid/ajar switch harness connector. Connect a jumper wire between the decklid ajar switch sense circuit and ground. With the jumper wire connected to ground, monitor the decklid ajar indicator. Is the decklid ajar indicator illuminated?</p> <p>Yes → Replace the decklid release solenoid/ajar switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the decklid release solenoid/ajar switch harness connector. Disconnect the Instrument Cluster C2 harness connector. Measure the resistance of the decklid ajar switch sense circuit between the decklid release solenoid/ajar switch connector and the Instrument Cluster "C2" connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the decklid ajar switch sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Disconnect the Instrument Cluster C1 harness connector. Measure the voltage of the Fused B+ circuit (cavity 3). Is the voltage above 10.0 volts?</p> <p>Yes → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***DOOR AJAR INDICATOR NOT OPERATING PROPERLY**

POSSIBLE CAUSES
CHECK THE DOOR AJAR STATES INSTRUMENT CLUSTER PERFORM INSTRUMENT CLUSTER SELF TEST CHECK THE DOOR AJAR STATES INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>Close all doors. Turn the ignition off then on. This will start the bulb test. Did the door ajar indicator illuminate for 3 to 10 seconds?</p> <p>Yes → Go To 2</p> <p>No → Replace the Instrument cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>With all the doors closed, monitor the door ajar indicator. Does the door ajar indicator stay on with all the doors closed?</p> <p>Yes → Go To 3</p> <p>No → Go To 4</p>	All
3	<p>Close all doors. With the DRB, select Body, Body Computer then Inputs/Outputs and read both door ajar states. Does the DRB display both door ajar states "Open"?</p> <p>Yes → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Refer to the Interior Lighting category for the related symptom(s) regarding the door ajar switches. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Open both driver and passenger doors. With the DRB, select Body, Body Computer then Inputs/Outputs and read both door ajar states. Does the DRB display both door ajar states "Closed"?</p> <p>Yes → Go To 5</p> <p>No → Refer to the Interior Lighting category for the related symptom(s) regarding the door ajar switches. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>With the doors open, is the door ajar indicator on?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All

INSTRUMENT CLUSTER

Symptom:

***ENGINE COOLANT TEMPERATURE INDICATOR NOT OPERATING PROPERLY**

POSSIBLE CAUSES

CHECKING TEMPERATURE GAUGE
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Start the engine and allow the engine to reach operating temperature. Does the engine temperature gauge operate properly? Yes → Go To 2 No → Refer to symptom list for problems related to engine coolant temperature gauge. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off, then on. This will start the bulb test. Did the engine coolant temperature indicator illuminate for 3 to 10 seconds then turn off? Yes → Test Complete. No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***FUEL GAUGE NOT OPERATING PROPERLY****POSSIBLE CAUSES**

BODY CONTROL MODULE
 INSTRUMENT CLUSTER
 INSTRUMENT CLUSTER
 VISUAL CONDITION NOT GOOD
 CHECK FOR FUEL LEVEL SENDING UNIT RELATED BCM DTCS
 DETERMINE IF FULL GAUGE IS INACCURATE
 FUEL GAUGE DISPLAYS EMPTY
 FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
 OBSERVE THE FUEL GAUGE
 INSPECT THE FUEL PUMP MODULE AND THE FUEL TANK
 INSTRUMENT CLUSTER SELF TEST

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, select BODY, BODY COMPUTER, then read DTCS. Is the Fuel Level Sending Unit Failure DTC set? Yes → Refer to symptom list for problems related to fuel level sending unit failure DTC. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition to the Lock position. During the self test all gauges should move from their lowest calibration point to their highest calibration point then back down to its lowest. Calibration points for the Fuel Gauge: E, 1/4, 1/2, F, 1/2, 1/4, E. While holding the Trip/Reset button down on the Instrument Cluster, turn the ignition forward one position (Unlock/Off position) to start the MIC self test, then release the button. Did the Fuel Gauge pass the self test? Yes → Go To 3 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

*FUEL GAUGE NOT OPERATING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
3	<p>NOTE: Make sure the Fuel Tank is not empty before proceeding.</p> <p>Turn the ignition on. Observe the Fuel Gauge. What does the Fuel Gauge display?</p> <p>Empty at all times Go To 4</p> <p>Between empty and full Go To 5</p> <p>Full at all times Go To 7</p>	All
4	<p>Turn the ignition off. Gain access to the body harness connector C308 by removing the rear seat cushion. Disconnect the C308 harness connector. Turn the ignition on. Connect a jumper wire between ground and the Fuel Level Sensor Signal circuit. With the jumper wire connected to ground, observe the Fuel Gauge. Does the Fuel Gauge display FULL?</p> <p>Yes → Remove the Fuel Pump Module from the Fuel Tank. Inspect for a stuck float arm. If OK, replace the Fuel Pump Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Disconnect the BCM C4 harness connector.</p> <p>Note: To perform this test, add or remove 5 gallons of fuel and take a measurement, then repeat and take another measurement.</p> <p>Measure the resistance between ground and the Fuel Level Sensor Signal circuit. Match the resistance to these specifications (float arm height in mm): 151.4mm (sensor full stop) - 60+/-10 ohms, 141.0mm (stop on gauge) - 130+/-15 ohms, 105.8mm (3/4 position) - 340+/-30 ohms. Continued: match the resistance to these specifications: 74.5mm (1/2 position) - 550+/-30 ohms, 43.0mm (1/4 position) - 760+/-30 ohms, 11.1mm (empty on gauge) - 920+/-30 ohms, 1.4mm (sensor empty stop) - 1050+/-10 ohms. Does the resistance of the Fuel Pump Module match the resistance specifications both times?</p> <p>Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All

***FUEL GAUGE NOT OPERATING PROPERLY — Continued**

TEST	ACTION	APPLICABILITY
6	<p>Turn the ignition off. Remove the Fuel Tank from the vehicle. Remove the Fuel Pump Module from the Fuel Tank. Inspect the Fuel Pump Module for a bent or sticking arm and the Fuel Tank for any foreign materials. Is the Fuel Tank and Fuel Pump Module visual condition good?</p> <p>Yes → Replace the Fuel Pump Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair or replace as necessary. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Gain access to the body harness connector C308 by removing the rear seat cushion. Disconnect the C308 harness connector. Turn the ignition on. With the DRB, select BODY, BODY COMPUTER, then SENSORS and observe the fuel level voltage. Is the voltage above 9.0 volts?</p> <p>Yes → Go To 8</p> <p>No → Go To 9</p>	All
8	<p>Turn the ignition on. With the C308 harness connector disconnected, observe the Fuel Gauge. Did the Fuel Gauge drop to empty?</p> <p>Yes → Check the Fuel Pump Module Jumper harness between the C308 and the Fuel Pump Module. If OK, replace the Fuel Pump Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All
9	<p>Turn the ignition off. Disconnect the BCM C4 harness connector. Measure the resistance between ground and the Fuel Level Sensor Signal circuit. Is the resistance above 100 kohms?</p> <p>Yes → Replace the BCM. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Fuel Level Sensor Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p>	All

INSTRUMENT CLUSTER

Symptom:

***LOW FUEL INDICATOR NOT OPERATING PROPERLY**

POSSIBLE CAUSES

CHECK THE FUEL GAUGE OPERATION

PERFORM INSTRUMENT CLUSTER SELF TEST

TEST	ACTION	APPLICABILITY
1	Start the engine and observe the Fuel Gauge. Does the Fuel Gauge operate properly? Yes → Go To 2 No → Refer to symptom list for problems related to the Fuel Gauge. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off then on. This will start the bulb test. Did the Low Fuel Indicator illuminate for 3 to 10 seconds then turn off? Yes → Test Complete. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

WASHER FLUID LEVEL SENSOR

WASHER FLUID LEVEL SENSOR

WASHER FLUID SWITCH SENSE CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Check the level of the washer fluid reservoir. Is the washer fluid reservoir full? Yes → Go To 2 No → Add washer fluid as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
2	Did the low washer fluid indicator fail to turn on when the reservoir was low? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off then on. This will start the bulb test. Did the low washer indicator illuminate for 3 to 10 seconds? Yes → Go To 4 No → Replace the Instrument cluster. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the washer fluid level sensor harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 10.0 ohms? Yes → Go To 5 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

***LOW WASHER FLUID INDICATOR NOT OPERATING PROPERLY — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Disconnect the washer fluid level sensor harness connector. Disconnect the Instrument Cluster "C2" harness connector. Measure the resistance of the washer fluid switch sense circuit between the washer fluid level sensor connector and the Instrument Cluster "C2" connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the washer fluid switch sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the washer fluid level sensor harness connector. Turn the ignition on. Connect a jumper wire between the washer fluid switch sense circuit and the ground circuit. With the DRB, select Body, Electro/Mech Cluster (MIC) then Inputs/Outputs and observe the washer fluid switch status. Does the DRB display Wash Fluid: Closed?</p> <p>Yes → Replace the washer fluid level sensor. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Note: Perform this test if the low washer fluid indicator is on all the time. Turn the ignition off. Disconnect the washer fluid level sensor harness connector. Turn the ignition on and wait one minute. Monitor the low washer fluid indicator. Did the low washer fluid indicator turn off.</p> <p>Yes → Replace the washer fluid level sensor. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
8	<p>Note: Perform this test if the low washer fluid indicator is on all the time. Turn the ignition off. Disconnect the washer fluid level sensor harness connector. Disconnect the Instrument Cluster C2 harness connector. Measure the resistance between ground and the washer fluid switch sense circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the washer fluid switch sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***ODOMETER NOT OPERATING PROPERLY****POSSIBLE CAUSES**

ATTEMPT TO COMMUNICATE WITH THE INSTRUMENT CLUSTER

ATTEMPT TO COMMUNICATE WITH THE TCM

OBSERVE THE INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, select Body then Electro/Mech Cluster (MIC). Was the DRB able to I/D or communicate with the Instrument Cluster? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRB, select Transmission. Was the DRB able to I/D or communicate with the TCM? Yes → Go To 3 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. While observing the odometer turn the ignition to the run position. Did all odometer segments illuminated? Yes → Test Complete. No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All

INSTRUMENT CLUSTER

Symptom:

***OIL PRESSURE WARNING INDICATOR NOT OPERATING PROPERLY**

POSSIBLE CAUSES

INSTRUMENT CLUSTER - SENSE CIRCUIT SHORTED TO GROUND
ENGINE OIL PRESSURE LESS THAN 27.6 KPA (4 PSI) COLD
OIL PRESSURE SWITCH - OPEN
OIL PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
ENGINE OIL PRESSURE LESS THAN 27.6 KPA (4 PSI) WARM
OIL PRESSURE SWITCH SENSE CIRCUIT OPEN
INSTRUMENT CLUSTER - SENSE CIRCUIT OPEN
OIL PRESSURE SWITCH - SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	NOTE: Ensure the oil level is within specifications before continuing. Turn the ignition on. Observe the Oil Pressure Warning Indicator. Is the Oil Pressure Warning Indicator on? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Engine Oil Pressure Switch harness connector. Turn the ignition on. Observe the Oil Pressure Warning Indicator. Is the Oil Pressure Warning Indicator off? Yes → Go To 3 No → Go To 6	All
3	Turn the ignition off. Remove the Engine Oil Pressure Switch. Install a mechanical oil pressure gauge in place of the Engine Oil Pressure Switch. Start and idle the engine. Read the mechanical oil pressure gauge. Is the gauge reading 27.6 kPa (4.0 PSI) or greater at idle? Yes → Go To 4 No → Refer to the Service Information for the related symptom(s) regarding low engine oil pressure. Perform BODY VERIFICATION TEST - VER 1.	All

***OIL PRESSURE WARNING INDICATOR NOT OPERATING PROPERLY**

— Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Remove the Engine Oil Pressure Switch. Install a mechanical oil pressure gauge in place of the Engine Oil Pressure Switch. Start and idle the engine. Allow the engine to reach normal operating temperature. Read the mechanical oil pressure gauge. Is the gauge reading 27.6 kPa (4.0 PSI) or greater at idle?</p> <p>Yes → Go To 5</p> <p>No → Refer to the Service Information for the related symptom(s) regarding low engine oil pressure. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Engine Oil Pressure Switch. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the Engine Oil Pressure Switch harness connector. Disconnect the Instrument Cluster C2 harness connector. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Oil Pressure Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Disconnect the Engine Oil Pressure Switch harness connector. Connect a jumper wire between ground and the Oil Pressure Switch Sense circuit. Turn the ignition on. Is the Oil Pressure Warning Indicator on?</p> <p>Yes → Replace the Engine Oil Pressure Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the Engine Oil Pressure Switch harness connector. Disconnect the Instrument Cluster C2 harness connector. Measure the resistance of the Oil Pressure Switch Sense circuit between the Engine Oil Pressure Switch harness connector and the Instrument Cluster C2 harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the Oil Pressure Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

INSTRUMENT CLUSTER

***OIL PRESSURE WARNING INDICATOR NOT OPERATING PROPERLY**

— Continued

TEST	ACTION	APPLICABILITY
9	If there are no possible causes remaining, view repair. Repair Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***PRND3L INDICATOR MALFUNCTION****POSSIBLE CAUSES**

INSTRUMENT CLUSTER

ATTEMPT TO COMMUNICATE WITH THE INSTRUMENT CLUSTER

MONITOR THE PRND3L INDICATORS WHILE SHIFTING GEARS

OBSERVE THE PRND3L LAMPS WITH THE IGNITION ON

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, select Body then Electro/Mech Cluster (MIC). Was the DRB able to I/D or communicate with the Instrument Cluster? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	Observe the PRND3L lamps while cycling the ignition from off to on. Note: This should turn on all PRND3L indicators at the same time. Did all the PRND3L indicators illuminate? Yes → Go To 3 No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition on. With the DRB, select Transmission, Monitor Display, Shift Lever then SLP and monitor the shift lever status. Note: Engage the parking brake. Move the gear shift lever through all the different positions. Does the SLP reading match the state of the transmission gear? Yes → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1. No → Refer to symptom list for problems related to the Transaxle. Perform BODY VERIFICATION TEST - VER 1.	All

INSTRUMENT CLUSTER

Symptom:

*SEAT BELT INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
BODY CONTROL MODULE (SEATBELT SWITCH SENSE CIRCUIT SHORTED TO GROUND)
CHECK THE SEATBELT SWITCH STATUS
PERFORM INSTRUMENT CLUSTER SELF TEST
SEATBELT SWITCH SENSE CIRCUIT SHORTED TO GROUND
SEATBELT SWITCH SHORTED TO GROUND
WIRING HARNESS INTERMITTENT DEFECT
BODY CONTROL MODULE (OPEN SEATBELT SWITCH SENSE CIRCUIT)
CHECK THE SEATBELT SWITCH STATUS
OPEN GROUND CIRCUIT
OPEN SEATBELT SWITCH
SEATBELT SWITCH SENSE CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition off then on. This will start the bulb test. Is the seatbelt indicator illuminated? Yes → Go To 2 No → Replace the Instrument cluster.	All
2	Turn the ignition on. Buckle the driver's seatbelt and monitor the seatbelt indicator. Did the seatbelt indicator turn off? Yes → Go To 3 No → Go To 9	All
3	Turn the ignition on and wait 10 seconds. Unbuckle the seatbelt and observe the seatbelt indicator. Did the seatbelt indicator turn on? Yes → Go To 4 No → Go To 5	All
4	Turn the ignition off. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any problems found? Yes → The seatbelt indicator is operational. Check wiring harness/ connectors as necessary. No → Test Complete.	All

***SEAT BELT INDICATOR NOT OPERATING PROPERLY — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Unbuckle the driver's seatbelt. Turn the ignition on. With the DRB, select Body Computer then Inputs/Outputs and observe the seatbelt switch state. Does the DRB display Seatbelt Switch: Closed?</p> <p>Yes → Replace the Instrument Cluster.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the seatbelt switch harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the ground circuit for an open.</p>	All
7	<p>Turn the ignition off. Disconnect the seatbelt switch harness connector. Connect a jumper wire between the seatbelt switch sense circuit and the ground circuit. With the DRB, select Body Computer then Inputs/Outputs and observe the seatbelt switch state. Does the DRB display Seatbelt Switch: Closed?</p> <p>Yes → Replace the seatbelt switch.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the seatbelt switch harness connector. Disconnect the BCM C4 harness connector. Measure the resistance of the seatbelt switch sense circuit between the seatbelt switch connector and the BCM "C4" connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace and program the BCM in accordance with the Service Information.</p> <p>No → Repair the seatbelt switch sense circuit for an open.</p>	All
9	<p>Buckle the driver's seatbelt. Turn the ignition on. With the DRB, select Body Computer then Inputs/Outputs and observe the seatbelt switch state. Does the DRB display Seatbelt Switch: Open?</p> <p>Yes → Replace the Instrument Cluster.</p> <p>No → Go To 10</p>	All
10	<p>Disconnect the seatbelt switch harness connector. With the DRB, select Body Computer then Inputs/Outputs and observe the seatbelt switch state. Does the DRB display Seatbelt Switch: Open?</p> <p>Yes → Replace the seatbelt switch.</p> <p>No → Go To 11</p>	All

***SEAT BELT INDICATOR NOT OPERATING PROPERLY — Continued**

TEST	ACTION	APPLICABILITY
11	Turn the ignition off. Disconnect the seatbelt switch harness connector. Disconnect the BCM C4 harness connector. Measure the resistance between ground and the seatbelt switch sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the seatbelt switch sense circuit for a short to ground. No → Replace and program the BCM in accordance with the Service Information.	All

Symptom:***SPEEDOMETER GAUGE NOT OPERATING PROPERLY****POSSIBLE CAUSES**

ATTEMPT TO COMMUNICATE WITH THE PCM

ENGINE TROUBLE CODES

INSTRUMENT CLUSTER SELF TEST

OBSERVE THE VEHICLE SPEED DISPLAY IN THE PCM

OBSERVE THE VEHICLE SPEED DISPLAY IN THE INSTRUMENT CLUSTER

POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, select Body, Body Computer, System Test then PCM Monitor. Is the PCM active on bus? Yes → Go To 2 No → Refer to the Communications category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. During the self test all gauges should move from their lowest calibration point to their highest calibration point then back down to its lowest. Calibration points for the Speedometer: 0 MPH (0 KM/H), 20 MPH (40 KM/H) , 60 MPH (100 KM/H), 120 MPH (210 KM/H), 60 MPH (100 KM/H), 20 MPH (40 KM/H), 0 MPH (0 KM/H). While holding the trip/reset button down on the instrument cluster, turn the ignition forward one position (unlock/off position) to start the MIC self test, release the button. Did the Speedometer pass the self test? Yes → Go To 3 No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRB read ENGINE DTC's. Are there any engine DTC's present? Yes → Refer to symptom list for problems related to DRIVABILITY. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*SPEEDOMETER GAUGE NOT OPERATING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
4	<p>Raise all four wheels off the ground and properly support the vehicle. Start the engine. Note: If the vehicle is equipped with traction control, the traction control must be disabled. With the DRB, enter Engine then Sensors and observe the vehicle speed display. Place the gear shift lever in drive and observe the vehicle speed while accelerating. Does the DRB display vehicle speed increasing proportionally as you accelerate?</p> <p>Yes → Go To 5</p> <p>No → Refer to the Driveability category for the related symptom(s) to the vehicle speed sensor. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Raise all four wheels off the ground and properly support the vehicle. Start the engine. Note: If the vehicle is equipped with traction control, the traction control must be disabled. With the DRB, select Body, Electro/Mech Cluster (MIC), Monitor Display then Engine Info and observe the vehicle speed display. Place the gear shift lever in drive and observe the vehicle speed while accelerating. Does the DRB display vehicle speed increasing proportionally as you accelerate?</p> <p>Yes → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace and program the PCM in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

COURTESY LAMP OUTPUT SHORT TO BATTERY

When Monitored and Set Condition:

COURTESY LAMP OUTPUT SHORT TO BATTERY

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: The BCM has detected a short to battery on the Courtesy Lamp Driver circuit for 5 seconds.

POSSIBLE CAUSES

SHORTED BULB

COURTESY LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE

BODY CONTROL MODULE

COURTESY LAMPS DRIVER CIRCUIT SHORTED TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Whenever a step is completed, cycle the ignition key off then on to see if the problem is isolated. This will clear the code and allow the remaining courtesy lamps to light.</p> <p>Disconnect the Junction Block C11 Headliner Harness Connector from the front of the junction block.</p> <p>Cycle the ignition switch off than back on.</p> <p>Did the remaining courtesy lamps, door lamps come on?</p> <p>Yes → Go To 2</p> <p>No → Go To 3</p>	All
2	<p>Ensure the Junction Block C11 Headliner Harness connector on the front of the junction block is connected before proceeding.</p> <p>Turn on all overhead, map and rear rearing lamps by their own individual switches. This will disconnect each lamp from the Courtesy Lamp Driver Circuit.</p> <p>Did any lamp fail to light when it was turned on by it's own switch?</p> <p>Yes → Replace the shorted courtesy lamp bulb. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Courtesy Lamp Driver circuit in the headliner harness for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p>	All

COURTESY LAMP OUTPUT SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off.</p> <p>Disconnect the Junction Block C11 Headliner Harness Connector from the front of the junction block.</p> <p>Remove the Body Control Module from the junction block.</p> <p>Measure the voltage of the Courtesy Lamps Driver circuit at the driver door courtesy lamp socket. One contact will have battery voltage but the courtesy lamps driver circuit should not.</p> <p>Is there any voltage on the Courtesy Lamps Driver Circuit?</p> <p>Yes → Repair the Courtesy Lamps Driver Circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom List:

***COURT LMPS INOP**

***COURTESY LAMPS INOPERATIVE FROM DRIVERS DOOR**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be ***COURT LMPS INOP**.

POSSIBLE CAUSES

COURTESY LAMPS INOPERATIVE FROM DRIVER DOOR

TEST	ACTION	APPLICABILITY
1	<p>If this condition still exists, proceed with diagnosis.</p> <p>For this condition: Refer to symptom DRIVER DOOR AJAR CIRCUIT OPEN in the DOOR AJAR category.</p>	All

INTERIOR LIGHTING

Symptom:

*COURTESY LAMPS INOPERATIVE - ALL LAMPS

POSSIBLE CAUSES
FUSE 19 OPEN
JUNCTION BLOCK
BODY CONTROL MODULE
COURTESY LAMPS DRIVER CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Gain access to the junction block C11 Headliner Harness connector but do not disconnect. While backprobing, measure the voltage of the Fused B+ circuit. Is the voltage above 10.0 volts? Yes → Go To 2 No → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1.	All
2	Check Junction Block Fuse 19 Is Fuse 19 open? Yes → Replace the open fuse. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Backprobe a jumper wire from the Courtesy Lamps Driver circuit in the Junction Block C11 connector to ground. Did the overhead courtesy lamps come on? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open Courtesy Lamp Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

***COURTESY LAMPS INOPERATIVE - DOOR LAMPS**

POSSIBLE CAUSES

OPEN FUSED B+ CIRCUIT

COURTESY LAMP DRIVER CIRCUIT OPEN

JUNCTION BLOCK

TEST	ACTION	APPLICABILITY
1	<p>Remove the lens from the driver door courtesy lamp. Measure the voltage of the Fused B+ circuit at the bulb. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 2</p> <p>No → Repair the open Fused B+ circuit. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>NOTE: Ensure the overhead lamps are operational before proceeding. This test is for the door courtesy lamps being inoperable only. Disconnect the Junction Block C6 connector on the rear of the junction block. Connect a jumper wire from the Courtesy Lamps Driver circuit in the Junction Block C6 connector to ground. Did the door courtesy lamps come on?</p> <p>Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the open Courtesy Lamps Driver circuit from the door lamp to the junction block. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

*COURTESY LAMPS INOPERATIVE - OVERHEAD LAMPS

POSSIBLE CAUSES
JUNCTION BLOCK OPEN
COURTESY LAMP DRIVER CIRCUIT OPEN
FUSE 19 OPEN
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>Gain access to the Junction Block C11 Headliner Harness connector but do not disconnect.</p> <p>While backprobing, measure the voltage of the Fused B+ circuit.</p> <p>Is the voltage above 10.0 volts?</p> <p>Yes → Go To 2</p> <p>No → Replace the Junction Block.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Check Junction Block Fuse 19</p> <p>Is Fuse 19 open?</p> <p>Yes → Replace the open fuse.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Backprobe a jumper wire from the Courtesy Lamps Driver circuit in the Junction Block C11 connector to ground.</p> <p>Did the overhead courtesy lamps come on?</p> <p>Yes → The condition that caused the symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the open Courtesy Lamps Driver circuit.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***COURTESY LAMPS INOPERATIVE FROM DOME LAMP SWITCH ONLY**

POSSIBLE CAUSES

HEADLAMP SWITCH DIMMER

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Ensure all doors are closed and the courtesy lamp switch is turned off. With the DRBIII®, read the Courtesy Lamp status. Rotate the Courtesy Switch to the ON position. Does the DRBIII® display: Courtesy Lamps ON?</p> <p>Yes → Replace the Headlamp Switch Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***COURTESY LAMPS INOPERATIVE FROM LEFT REAR DOOR****POSSIBLE CAUSES**

COURTESY LAMPS INOPERATIVE FROM LEFT REAR DOOR

TEST	ACTION	APPLICABILITY
1	If this condition still exists, proceed with diagnosis. For this condition: Refer to symptom LEFT REAR DOOR AJAR CIRCUIT OPEN in the DOOR AJAR category.	All

Symptom:

***COURTESY LAMPS INOPERATIVE FROM PASSENGER DOOR**

POSSIBLE CAUSES

COURTESY LAMPS INOPERATIVE FROM PASSENGER DOOR

TEST	ACTION	APPLICABILITY
1	<p>If this condition still exists, proceed with diagnosis.</p> <p>For this condition: Refer to symptom PASSENGER DOOR AJAR CIRCUIT OPEN in the DOOR AJAR category.</p>	All

Symptom:***COURTESY LAMPS INOPERATIVE FROM RIGHT REAR DOOR****POSSIBLE CAUSES****COURTESY LAMPS INOPERATIVE FROM RIGHT REAR DOOR**

TEST	ACTION	APPLICABILITY
1	If this condition still exists, proceed with diagnosis. For this condition: Refer to symptom RIGHT REAR DOOR AJAR CIRCUIT OPEN in the DOOR AJAR category.	All

Symptom:

***COURTESY LAMPS STAY ON AT ALL TIMES**

POSSIBLE CAUSES
<p>COURTESY LAMPS DRIVER HEADLINER CIRCUIT SHORT TO GROUND</p> <p>COURTESY LAMPS DRIVER CIRCUIT BODY HARNESS SHORT TO GROUND</p> <p>DOOR LOCK MOTOR/AJAR SWITCH</p> <p>SHORTED DOOR AJAR SWITCH SENSE CIRCUIT</p> <p>SHORTED DRIVER DOOR AJAR SWITCH SENSE CIRCUIT</p> <p>DRIVER DOOR LOCK MOTOR/AJAR SWITCH</p> <p>BODY CONTROL MODULE</p>

TEST	ACTION	APPLICABILITY
1	<p>Close the driver door.</p> <p>With the DRBIII® select: Body,Body Computer,Input/Output</p> <p>Read the: Dr Door Ajar Switch- state.</p> <p>Does the DRBIII® show: OPEN?</p> <p>Yes → Go To 2</p> <p>No → Go To 7</p>	All
2	<p>Close all the passenger doors.</p> <p>With the DRBIII® select: Body, Body Controller, Input/Output</p> <p>Read the: Door Ajar Switch - state.</p> <p>Does the DRBIII® show: OPEN?</p> <p>Yes → Go To 3</p> <p>No → Go To 5</p>	All
3	<p>Ensure that the Courtesy Lamps Switch is off.</p> <p>Close all the passenger doors.</p> <p>Close the Driver Door Lock Latch Assembly, for the door ajar switch to open.</p> <p>Disconnect the Junction Block C11 connector from the front of the junction block.</p> <p>Observe the Door Courtesy Lamps.</p> <p>Did the Door Courtesy Lamps turn off?</p> <p>Yes → Repair the Courtesy Lamps Driver circuit in the headliner harness for a short to ground.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All

*COURTESY LAMPS STAY ON AT ALL TIMES — Continued

TEST	ACTION	APPLICABILITY
4	<p>Ensure the Courtesy Lamp Switch is off. Close all the passenger doors. Close the Driver Door Lock Latch Assembly. Disconnect the Junction Block C11 connector from the front of the junction block. Observe the Door Courtesy Lamps. Did the Door Courtesy Lamps turn off?</p> <p>Yes → Repair the Courtesy Lamps Driver circuit in the Body Harness for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Close all the passenger doors. With the DRBIII® select: Body, Body Computer, Input/Output Read the: Door Ajar Switch - state Gain access to and disconnect each passenger Door Lock Motor/Ajar switch and observe the DRBIII®. When disconnecting each switch, did the DRBIII® change states to read: Door Ajar Sw - OPEN?</p> <p>Yes → Replace the applicable Door Lock Motor /Ajar switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Disconnect the Body Control Module C4 connector. Gain access to and disconnect all passenger Door Lock Motor/Ajar switch connectors. Measure the resistance of each passenger Door Ajar Switch Sense circuits in the Body Control Module C4 connector to ground. Is the resistance below 1000.0 ohms in any of the passenger Door Ajar Switch Sense circuits?</p> <p>Yes → Using the schematic, determine which door ajar switch sense circuit is shorted to ground and repair as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Remove the driver inner door panel. Disconnect the Driver Door Lock Motor/Ajar Switch connector Disconnect the Body Control Module C4 connector. Measure the resistance of the Driver Door Ajar Switch Sense circuit at the Body Control Module C4 connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Driver Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All

***COURTESY LAMPS STAY ON AT ALL TIMES — Continued**

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the Body Control Module C4 connector. Ensure the Driver Door Lock Motor/Ajar Switch is connected. Ensure the door latch is in the latched position during this test. Measure the resistance of the Driver Door Ajar Switch Sense circuit in the Body Control Module C4 connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Driver Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom: CHARGING VOLTAGE HIGH MESSAGE

When Monitored and Set Condition:

CHARGING VOLTAGE HIGH MESSAGE

When Monitored: With the engine running.

Set Condition: When the Memory Heated Seat Mirror Module receives a high charging system voltage message over the PCI Bus.

POSSIBLE CAUSES

PCM TROUBLE CODES
STORED CODE COMMUNICATION PROBLEMS
MEMORY HEATED SEAT MIRROR MODULE
INTERMITTENT PROBLEM

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII® read Engine DTCs. Are there any related Charging System DTC's set in the Powertrain Control Module? Yes → Refer to the POWERTRAIN symptom list for related CHARGING SYSTEM diagnostic trouble codes. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII®, erase the DTC from Memory Heated Seat Mirror Module. Turn the ignition switch to the Off position then start the engine and let run for one minute. With the DRB check for the same DTC to reset in the MHSM. Did the same DTC reset? Yes → Go To 3 No → Test complete. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

CHARGING VOLTAGE HIGH MESSAGE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Note: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any technical service bulletins that may apply.</p> <p>Were any problems found?</p> <p>No → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>Yes → Repair as necessary. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p>	All

Symptom: CHARGING VOLTAGE LOW MESSAGE

When Monitored and Set Condition:

CHARGING VOLTAGE LOW MESSAGE

When Monitored: With the engine running.

Set Condition: When the Memory Heated Seat Mirror Module receives a low charging system voltage message over the PCI Bus.

POSSIBLE CAUSES

PCM TROUBLE CODES
STORED CODE COMMUNICATION PROBLEMS
MEMORY HEATED SEAT MIRROR MODULE
INTERMITTENT PROBLEM

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII® read Engine DTCs. Are there any Charging System DTC's set in the Powertrain Control Module? Yes → Refer to POWERTRAIN symptom list for related CHARGING SYSTEM diagnostic trouble codes. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII®, erase the DTC from Memory Heated Seat Mirror Module. Turn the ignition switch to the Off position then start the engine and let run for one minute. With the DRB check for the same DTC to reset in the MHSM. Did the same DTC reset? Yes → Go To 3 No → Test complete. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

CHARGING VOLTAGE LOW MESSAGE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Note: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any technical service bulletins that may apply.</p> <p>Were any problems found?</p> <p>No → Replace the Memory Heated Seat Mirror Module. Symptom:

DRIVER MIRROR HORIZONTAL SENSOR OUT OF RANGE HIGH

When Monitored and Set Condition:

DRIVER MIRROR HORIZONTAL SENSOR OUT OF RANGE HIGH

When Monitored: Ignition on.

Set Condition: This code is set when the mirror sensor feedback to the MHSMM is greater than the mirror out of range high value stored in EEPROM.

POSSIBLE CAUSES

DRIVER MIRROR HORIZONTAL POSITION SIGNAL WIRE SHORT TO VOLTAGE

DRIVER MEMORY MIRROR

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Memory Heated Seat Mirror Module C1 connector. Turn the ignition on. Measure the voltage of the Driver Mirror Horizontal Position Signal circuit. Is the voltage above 4.5 volts? Yes → Go To 2 No → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
2	Disconnect the Memory Heated Seat Mirror Module C1 connector. Disconnect the Driver Power Mirror connector. Turn the ignition on. Measure the voltage of the Driver Horizontal Position Signal circuit in the driver power mirror harness side connector. Is there any voltage present? Yes → Repair the Driver Mirror Horizontal Position Signal wire for a short to voltage. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Driver Memory Mirror. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:**DRIVER MIRROR HORIZONTAL SENSOR OUT OF RANGE LOW****When Monitored and Set Condition:****DRIVER MIRROR HORIZONTAL SENSOR OUT OF RANGE LOW**

When Monitored: Ignition on.

Set Condition: This code is set when the mirror sensor feedback to the MHSMM is less than the mirror out of range low value stored in EEPROM.

POSSIBLE CAUSES

MHSMM 5 VOLT SUPPLY

5 VOLT SUPPLY TO MIRROR

DRIVER MIRROR 5 VOLT SUPPLY OPEN

DRIVER MIRROR HORIZONTAL POSITION SIGNAL WIRE OPEN

DRIVER MIRROR HORIZONTAL POSITION SIGNAL WIRE SHORT TO GROUND

MIRROR HORIZONTAL CIRCUIT CHECK

DRIVER MEMORY MIRROR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Memory Heated Seat Mirror Module C1 connector. Turn the ignition on. Measure the voltage of the Driver Mirror Horizontal Position Signal circuit in the Memory Heat Seat Mirror Module C1 connector. Is the voltage between 4.5 and 5.0 volts? Yes → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Memory Heated Seat Mirror Module C1 connector. Disconnect the Driver Power Mirror connector. Measure the resistance of the Driver Mirror Horizontal Position Signal circuit between the driver power mirror harness side connector and the MHSMM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Driver Mirror Horizontal Position Signal wire for an open. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

DRIVER MIRROR HORIZONTAL SENSOR OUT OF RANGE LOW — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Memory Heated Seat Mirror Module C1 connector. Disconnect the Driver Power Mirror connector. Measure the resistance of the Driver Mirror Horizontal Position Signal circuit to ground at the driver power mirror harness side connector. Is the resistance below 1000.0 ohms?</p> <p>Yes → Repair the Driver Mirror Horizontal Position Signal wire for a short to ground. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the Driver Power Mirror connector. Turn the ignition on. Measure the voltage of the 5 volt supply circuit in the driver power mirror harness side connector. Is the voltage between 4.5 and 5.0 volts?</p> <p>Yes → Replace the Driver Memory Mirror. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Driver Power Mirror connector. Disconnect the MHSMM C2 harness connector. Measure the resistance of the Driver Mirror Sensor 5 volt supply circuit between the driver power mirror harness side connector and the MHSMM C2 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.</p> <p>No → Repair the Driver Mirror Horizontal Position Signal wire for an open. Symptom:**DRIVER MIRROR VERTICAL SENSOR OUT OF RANGE HIGH****When Monitored and Set Condition:****DRIVER MIRROR VERTICAL SENSOR OUT OF RANGE HIGH**

When Monitored: Ignition on.

Set Condition: This code is set when the mirror sensor feedback to the MHSMM is greater than the mirror out of range high value stored in EEPROM.

POSSIBLE CAUSES

DRIVER MIRROR VERTICAL POSITION SIGNAL WIRE SHORT TO VOLTAGE

DRIVER MEMORY MIRROR

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Memory Heated Seat Mirror Module C1 connector. Turn the ignition on. Measure the voltage of the Driver Mirror Vertical Position Signal circuit. Is the voltage above 4.5 volts? Yes → Go To 2 No → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
2	Disconnect the Memory Heated Seat Mirror Module C1 connector. Disconnect the Driver Power Mirror connector. Turn the ignition on. Measure the voltage of the Driver Vertical Position Signal circuit in the driver power mirror harness side connector. Is there any voltage present? Yes → Repair the Driver Mirror Vertical Position Signal wire for a short to voltage. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Driver Memory Mirror. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:

DRIVER MIRROR VERTICAL SENSOR OUT OF RANGE LOW

When Monitored and Set Condition:

DRIVER MIRROR VERTICAL SENSOR OUT OF RANGE LOW

When Monitored: Ignition on.

Set Condition: This code is set when the mirror sensor feedback to the MHSMM is less than the mirror out of range low value stored in EEPROM.

POSSIBLE CAUSES

MHSMM 5 VOLT SUPPLY

5 VOLT SUPPLY TO MIRROR

DRIVER MIRROR 5 VOLT SUPPLY OPEN

DRIVER MIRROR VERTICAL POSITION SIGNAL WIRE OPEN

DRIVER MIRROR VERTICAL POSITION SIGNAL WIRE SHORT TO GROUND

MIRROR VERTICAL CIRCUIT CHECK

DRIVER MEMORY MIRROR

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition off. Disconnect the Memory Heated Seat Mirror Module C1 connector. Turn the ignition on. Symptom:
EEPROM REFRESH FAILURE

When Monitored and Set Condition:

EEPROM REFRESH FAILURE

When Monitored: With the ignition in the on position.

Set Condition: The Memory Heated Seat Mirror Module has a internal EEPROM failure.

POSSIBLE CAUSES
EEPROM REFRESH FAILURE

TEST	ACTION	APPLICABILITY
1	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:**FRONT RISER DOWN POSITION STUCK****When Monitored and Set Condition:****FRONT RISER DOWN POSITION STUCK**

When Monitored: Ignition On.

Set Condition: If the seat switch is active for 30 seconds, this code will set and the MHSMM will ignore the input until the state has changed. Once the stuck condition is removed, the seat will resume to normal operation. Code will remain for 20 ignition cycles.

POSSIBLE CAUSES

SEAT FRONT DOWN SWITCH SENSE WIRE SHORT TO VOLTAGE
 DRIVER POWER SEAT SWITCH
 MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Power Seat Switch connector. Measure the voltage of the Seat Front Down Switch Sense circuit. Is there any voltage present? Yes → Go To 2 No → Replace the Power Seat Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
2	Disconnect the Power Seat Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Turn the ignition on. Measure the voltage of the Seat Front Down Switch Sense circuit to ground.. Is there any voltage present? Yes → Repair the Seat Front Down Switch Sense wire for a short to voltage. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

MEMORY SEAT

Symptom:

FRONT RISER SENSOR OUT OF RANGE HIGH

When Monitored and Set Condition:

FRONT RISER SENSOR OUT OF RANGE HIGH

When Monitored: Ignition on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value higher than the Memory Seat Module has stored in EEPROM.

POSSIBLE CAUSES

SEAT SENSOR GROUND WIRE OPEN
FRONT RISER SENSOR SIGNAL SHORT TO MOTOR
FRONT RISER POS SIGNAL CKT SHORT TO VOLTAGE
FRONT RISER SENSOR HIGH
SEAT SENSOR 5 VOLT SUPPLY SHORT TO BATTERY
MEMORY HEATED SEAT MIRROR MODULE
MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Disconnect the Driver Power Seat Front Riser Sensor connector. Measure the resistance of the Seat Position Sensor Ground circuit at the driver power seat front riser connector. Is the resistance below 5.0 ohms? No → Go To 2 Yes → Go To 4	All
2	Turn ignition off. Disconnect the Memory Heated Seat Mirror Module C2 connector. Disconnect the Driver Power Seat Front Riser Sensor connector. Measure the resistance of the Seat Position Sensor Ground wire between the MHSMM connector and the sensor connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Seat Sensor Ground Wire. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
3	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

FRONT RISER SENSOR OUT OF RANGE HIGH — Continued

Symptom: MEMORY POSITION #1 STUCK

When Monitored and Set Condition:

MEMORY POSITION #1 STUCK

When Monitored: Ignition on.

Set Condition: If the switch is active for 30 seconds the MHSMM will ignore the input until the state has changed. Once the stuck position is removed the seat will return to normal operation. The code will remain in memory for 20 ignition cycles.

POSSIBLE CAUSES

MEMORY POSITION 1 SWITCH SENSE CIRCUIT SHORT TO GROUND

MEMORY SET SWITCH

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Memory Set Switch connector. With the DRBIII® read the Mem Pos 1 Sw status. Does the DRBIII® display Open? Yes → Replace the Memory Set Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Memory Set Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the resistance of the Memory Position 1 Switch Sense circuit to ground. Is the resistance below 1000.0 - 1K ohms? Yes → Repair the Memory Position 1 Switch Sense circuit for a short to ground. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:
MEMORY POSITION #2 STUCK

When Monitored and Set Condition:

MEMORY POSITION #2 STUCK

When Monitored: Ignition on.

Set Condition: If the switch is active for 30 seconds the MHSMM will ignore the input until the state has changed. Once the stuck position is removed the seat will return to normal operation. The code will remain in memory for 20 ignition cycles.

POSSIBLE CAUSES

MEMORY POSITION 2 SWITCH SENSE CIRCUIT SHORT TO GROUND

MEMORY SET SWITCH

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Memory Set Switch connector. With the DRBIII® read the Mem Pos 2 Sw status. Does the DRBIII® display Open? Yes → Replace the Memory Set Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Memory Set Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the resistance of the Memory Position 2 Switch Sense circuit to ground. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the Memory Position 2 Switch Sense circuit for a short to ground. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom: MEMORY SET "S" POSITION STUCK

When Monitored and Set Condition:

MEMORY SET "S" POSITION STUCK

When Monitored: Ignition on.

Set Condition: If the switch is active for 30 seconds the MHSMM will ignore the input until the state has changed. Once the stuck position is removed the seat will return to normal operation. The code will remain in memory for 20 ignition cycles.

POSSIBLE CAUSES

MEMORY SET SWITCH SENSE CIRCUIT SHORT TO GROUND

MEMORY SET SWITCH

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Memory Set Switch connector. With the DRBIII® read the Mem Set Sw status. Does the DRBIII® display Open? Yes → Replace the Memory Set Switch. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Memory Set Switch connector. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the resistance of the Memory Set Switch Sense circuit to ground. Is the resistance below 1000 ohms? Yes → Repair the Memory Set Switch Sense circuit for a short to ground. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:**PASSENGER MIRROR HORIZONTAL SENSOR OUT OF RANGE HIGH (IF EQUIPPED)****When Monitored and Set Condition:****PASSENGER MIRROR HORIZONTAL SENSOR OUT OF RANGE HIGH (IF EQUIPPED)**

When Monitored: Ignition on.

Set Condition: This code is set when the mirror sensor feedback to the MHSMM is greater than the mirror out of range high value stored in EEPROM.

POSSIBLE CAUSES

PASSENGER MIRROR HORIZONTAL POSITION SIGNAL WIRE SHORT TO VOLTAGE

PASSENGER MEMORY MIRROR

MEMORY HEATED SEAT MIRROR MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Disconnect the Memory Heated Seat Mirror Module C1 connector. Measure the voltage of the Passenger Mirror Horizontal Position Signal circuit. Is the voltage above 4.5 volts? Yes → Go To 2 No → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All
2	Disconnect the Memory Heated Seat Mirror Module C1 connector. Disconnect the Passenger Power Mirror connector. Turn the ignition on. Measure the voltage of the Passenger Horizontal Position Signal circuit in the passenger power mirror harness side connector. Is there any voltage present? Yes → Repair the Passenger Mirror Horizontal Position Signal wire for a short to voltage. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair If there are no possible causes remaining, replace the Passenger Memory Mirror. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:

PASSENGER MIRROR HORIZONTAL SENSOR OUT OF RANGE LOW (IF EQUIPPED)

When Monitored and Set Condition:

PASSENGER MIRROR HORIZONTAL SENSOR OUT OF RANGE LOW (IF EQUIPPED)

When Monitored: Ignition on.

Set Condition: This code is set when the mirror sensor feedback to the MHSMM is less than the mirror out of range low value stored in EEPROM.

POSSIBLE CAUSES

MHSMM 5 VOLT SUPPLY
 5 VOLT SUPPLY TO MIRROR
 MIRROR HORIZONTAL CIRCUIT CHECK
 PASSENGER MIRROR 5 VOLT SUPPLY OPEN
 PASSENGER MIRROR HORIZONTAL POSITION SIGNAL WIRE OPEN
 PASSENGER MIRROR HORIZONTAL POSITION SIGNAL WIRE SHORT TO GROUND
 PASSENGER MEMORY MIRROR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Memory Heated Seat Mirror Module C1 connector. Turn the ignition on. Measure the voltage of the Passenger Mirror Horizontal Position Signal circuit in the Memory Heat Seat Mirror Module C1 connector. Is the voltage between 4.5 and 5.0 volts? Yes → Replace the Memory Heated Seat Mirror Module. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Memory Heated Seat Mirror Module C1 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance of the Passenger Mirror Horizontal Position Signal circuit between the passenger power mirror harness side connector and the MHSMM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Passenger Mirror Horizontal Position Signal wire for an open. Perform MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1.	All

Symptom:
BUS MESSAGES MISSING

When Monitored and Set Condition:

BUS MESSAGES MISSING

When Monitored: With the ignition on, while the EVIC is performing a series of tests on the microprocessor, compass coil, and internal circuitry.

Set Condition: The code will be set, if during the self test the EVIC does not receive PCI bus messages from the BCM, MIC or PCM.

POSSIBLE CAUSES

BCM COMMUNICATION FAILURE
 PCM COMMUNICATION FAILURE
 MIC COMMUNICATION FAILURE
 OVERHEAD - BUS MESSAGES MISSING

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII®, select BODY, BODY COMPUTER Is there a response from the Body Computer? Yes → Go To 2 No → Refer to symptom BUS (+) BUS (-) SIGNALS OPEN FROM BCM in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn ignition on. With the DRBIII®, select BODY, BODY COMPUTER, SYSTEM TEST. Does the DRB display PCM ACTIVE ON THE BUS? Yes → Go To 3 No → Refer to symptom NO RESPONSE FROM PCM (PCI BUS) in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition on. With the DRBIII®, select BODY, ELECTRO/MECH CLUSTER. Is there a response from the Mechanical Instrument Cluster? Yes → Go To 4 No → Refer to symptom BUS (+) BUS (-) SIGNALS OPEN FROM MIC in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Overhead Console. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

CMTC INTERNAL FAILURE

EVIC INTERNAL FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **CMTC INTERNAL FAILURE**.

When Monitored and Set Condition:

CMTC INTERNAL FAILURE

When Monitored: When a SELF TEST command is received from the DRBIII, the CMTC performs a series of tests on the microprocessor, compass coil and internal circuitry.

Set Condition: The code will be set, if during the self test the CMTC detects a problem with the microprocessor, compass coil or the internal circuitry.

EVIC INTERNAL FAILURE

When Monitored: When a SELF TEST command is received from the DRBIII, the EVIC performs a series of tests on the microprocessor, compass coil and internal circuitry.

Set Condition: The code will be set, if during the self test the EVIC detects a problem with the microprocessor, compass coil or the internal circuitry.

POSSIBLE CAUSES
CMTC / EVIC INTERNAL FAILURE

Repair Instructions:

CMTC / EVIC INTERNAL FAILURE

When the trouble code FAILED SELF TEST is displayed, replace the CMTC or EVIC as required. If the vehicle is equipped with TPM, the EVIC must be retrained.

Perform BODY VERIFICATION TEST - VER 1.

Symptom:
COMPASS TEST FAILURE

POSSIBLE CAUSES

ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	<p>Perform the EVIC self test. Turn the ignition off. Depress and hold the RESET and C/T buttons while turning the ignition on. NOTE: This test may also be performed using the DRBIII®. Does the EVIC or DRBIII® display "FAILED SELF TEST"?</p> <p>Yes → Replace the EVIC in accordance with the Service Information. If the vehicle is equipped with TPM, the EVIC must be retrained. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:
DEMAGNETIZE COMPASS**POSSIBLE CAUSES**

DEMAGNETIZE COMPASS

TEST	ACTION	APPLICABILITY
1	<p>NOTE: A blank compass display indicates that vehicle demagnetizing is required.</p> <p>NOTE: After demagnetizing, the vehicle will enter Auto Fast-Cal when the ignition is turned on.</p> <p>NOTE: Ensure that the correct compass variance is stored in the compass memory. See "Setting Compass Variance" in the Service Information.</p> <p>Refer to the Service Information for the Demagnetizing Procedure.</p> <p>View repair for Verification Test.</p> <p>Repair</p> <p>When the Demagnetizing Procedure is complete perform the Verification Test.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
NO BCM MESSAGES RECEIVED

POSSIBLE CAUSES

INTERMITTENT CONDITION
 NO RESPONSE - PCI BUS - BCM
 COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, erase DTCs. Turn the ignition on. With the DRBIII®, read DTCs. Does the DRBIII® display NO BCM MESSAGES RECEIVED?</p> <p>Yes → Go To 2</p> <p>No → The conditions necessary to set this code are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the BCM and the Overhead Travel Information Center connector. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>With the DRBIII®, select: "Body Computer", Does the DRBIII® display BUS (+) BUS (-) SIGNALS OPEN?</p> <p>Yes → Refer to symptom BUS (+) BUS (-) SIGNALS OPEN FROM BCM in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the CMTC in accordance with the Service Information. If the vehicle is equipped with TPM, the EVIC must be retrained. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
NO PCM MESSAGES RECEIVED

POSSIBLE CAUSES
INTERMITTENT CONDITION NO RESPONSE - PCI BUS - PCM COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, erase DTCs. Start the engine. With the DRBIII®, read DTCs. Does the DRBIII® display NO PCM MESSAGES RECEIVED?</p> <p>Yes → Go To 2</p> <p>No → The conditions necessary to set this code are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PCM and the Overhead Travel Information Center connector.. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>With the DRBIII® select Body Computer, System Test, then PCM Monitor. Does the DRBIII® display PCM ACTIVE ON THE BUS?</p> <p>Yes → Replace the CMTC in accordance with the Service Information. If the vehicle is equipped with TPM, the EVIC must be retrained. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Refer to symptom NO RESPONSE FROM PCM in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**SET COMPASS VARIANCE AS PER SERVICE INFORMATION****POSSIBLE CAUSES**

SET COMPASS VARIANCE

TEST	ACTION	APPLICABILITY
1	Refer to the Service Information for the Compass Variance procedure. View repair for the Verification Test. Repair When the Compass Variance procedure is complete perform the Verification Test. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

- *DISPLAY SEGMENTS FAIL TO ILLUMINATE**
- *DISTANCE TO EMPTY INOPERATIVE OR WRONG**
- *ELAPSED TIME INOPERATIVE OR WRONG**
- *MILEAGE AND DISTANCE FUNCTIONS**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ***DISPLAY SEGMENTS FAIL TO ILLUMINATE**.

POSSIBLE CAUSES

COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Diagnose and repair any BCM, PCM, MIC, or Communication DTCs before proceeding.</p> <p>NOTE: Diagnose and repair any conditions affecting injector pulse, pinion factor, and tire size or inflation before proceeding with this test.</p> <p>If all the possible causes above are operating correctly, view repair.</p> <p>Repair</p> <p>Replace the Compass/Mini-Trip Computer in accordance with the Service Information. If the vehicle is equipped with TPM, the EVIC must be retrained.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***EVIC INOPERATIVE****POSSIBLE CAUSES**

FUSED B(+) CIRCUIT OPEN

FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

GROUND CIRCUIT OPEN

ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Diagnose and repair any BCM, PCM, or COMMUNICATION DTCs before proceeding.</p> <p>Turn the ignition off.</p> <p>Disconnect the Overhead Console harness connector.</p> <p>Measure the voltage between the Fused B+ circuit and ground.</p> <p>Is the voltage above 10.5 volts?</p> <p>Yes → Go To 2</p> <p>No → Repair the Fused B+ circuit for an open.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition off.</p> <p>Disconnect the Overhead Console harness connector.</p> <p>Turn the ignition on.</p> <p>Measure the voltage between the Fused Ignition Switch Output circuit and ground.</p> <p>Is the voltage below 10.5 volts?</p> <p>Yes → Repair the Fused Ignition Switch Output circuit for an open.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off.</p> <p>Disconnect the Overhead Console harness connector.</p> <p>Measure the resistance between ground and the EVIC ground circuit.</p> <p>Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the Ground circuit for an open.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the EVIC in accordance with the Service Information. If the vehicle is equipped with TPM, the EVIC must be retrained.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

*EVIC SELF TEST

POSSIBLE CAUSES

BUS MESSAGES MISSING

FAILED SELF TEST

EVIC SELF TEST

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, select "Body", "EVIC", "System Test" and then "Self Test". This test will verify internal functions of the EVIC module. Test Failures (if any) will be displayed following the test. Press any DRBIII key to start the EVIC self test. Select the test results.</p> <p>TEST FAILURE: FAILED SELF TEST Refer to EVIC INTERNAL FAILURE for the related symptom(S).</p> <p>TEST FAILURE: BUS MESSAGES MISSING Refer to BUS MESSAGES MISSING for the related symptom(S).</p> <p>TEST SUCCESSFUL Self test complete with no problem found.</p>	All

Symptom:***OTIS SCREEN DISPLAYS FAIL****POSSIBLE CAUSES**

OTIS SCREEN DISPLAYS "FAIL"

TEST	ACTION	APPLICABILITY
1	Verify the problem still exists. Using the DRBIII, select "Auto Self Test" and observe the OTIS screen. Does the OTIS screen display "FAIL"? Yes → Replace the Overhead Travel Information System Module. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

***TEMPERATURE DISPLAY INOPERATIVE OR WRONG**

POSSIBLE CAUSES

AMBIENT TEMPERATURE SENSOR DTC IN PCM
COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure that the CMTC is communicating on the PCI Bus before proceeding with this test.</p> <p>NOTE: The Ambient Temperature Sensor is hardwired to the PCM. Ambient temperature information is transmitted to the CMTC via the PCI Bus.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read PCM DTCs.</p> <p>Does the DRBIII® display any Ambient Temperature Sensor DTCs?</p> <p>Yes → Refer to Driveability-NGC for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Compass/Mini-Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**DECKLID RELEASE SOLENOID OUTPUT FAILURE****When Monitored and Set Condition:****DECKLID RELEASE SOLENOID OUTPUT FAILURE**

When Monitored: During decklid release solenoid actuation.

Set Condition: The BCM detects a short or a open on the decklid release control.

POSSIBLE CAUSES

CHECKING DTC PRIORITY

GROUND CIRCUIT OPEN

DECKLID RELEASE CONTROL CIRCUIT SHORTED TO VOLTAGE

DECKLID RELEASE SOLENOID OPEN

DECKLID RELEASE CONTROL CIRCUIT SHORTED TO GROUND

DECKLID RELEASE CONTROL CIRCUIT OPEN

BODY CONTROL MODULE - DECKLID CONTROL CIRCUIT SHORT TO VOLTAGE

BODY CONTROL MODULE - DECKLID RELEASE CONTROL INOPERABLE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII, erase DTC's. Press the decklid release switch several times. With the DRBIII, read DTC's. Did this DTC reset?</p> <p>Yes → Go To 2</p> <p>No → Visually inspect the related wiring harness looking for any chafed, pierced, pinched, or frayed wires. Also check the related connectors looking for any bent, pushed out, or corroded terminals. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Turn the ignition on. Using a 12-volt Test Light connected to ground, check the Decklid Release Control circuit. Is the test light illuminated?</p> <p>Yes → Go To 3</p> <p>No → Go To 5</p>	All

DECKLID RELEASE SOLENOID OUTPUT FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Remove the Body Control Module from the Junction Block Turn the ignition on. Measure the voltage of the Decklid Release Control circuit in the Decklid Release Solenoid connector. Is there any voltage present?</p> <p>Yes → Repair the Decklid Release Control circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Connect a 12-volt Test Light between the decklid release control ckt and the ground circuit (cavs 1 and 3). Press the decklid release switch and observe the test light. Did the test light illuminate when the switch was pressed?</p> <p>Yes → Replace the Decklid Release Solenoid. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Remove the Body Control Module from the Junction Block. Measure the resistance between ground and the Decklid Release Control circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Decklid Release Control circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All

DECKLID RELEASE SOLENOID OUTPUT FAILURE — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Remove the Body Control Module from the Junction Block. Measure the resistance of the Decklid Release Control circuit between the Decklid Release Solenoid/Ajar Switch connector and the Junction Block Body Control Module connector (cavity 8). Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the Decklid Release Control circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
9	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**DECKLID RELEASE SWITCH FAILURE****When Monitored and Set Condition:****DECKLID RELEASE SWITCH FAILURE**

When Monitored: Continuously.

Set Condition: The BCM monitors voltage present on the decklid release switch output circuit. If voltage is present for over 30 seconds, this DTC will set.

POSSIBLE CAUSES

CHECKING DTC PRIORITY

DEFECTIVE DECKLID RELEASE SWITCH

DECKLID RELEASE SWITCH OUTPUT CIRCUIT SHORTED TO VOLTAGE

BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII, erase DTC's. Cycle the ignition switch from off to on and wait at least 30 seconds. With the DRBIII, read DTC's. Did this DTC reset?</p> <p>Yes → Go To 2</p> <p>No → Visually inspect the related wiring harness looking for any chafed, pierced, pinched, or frayed wires. Also check the related connectors looking for any bent, pushed out, or corroded terminals. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Disconnect the Decklid Release Switch harness connector. With the DRBIII, erase DTC's. Cycle the ignition switch from off to on and wait at least 30 seconds. With the DRBIII, read DTC's. Did this DTC reset?</p> <p>Yes → Go To 3</p> <p>No → Replace the Decklid Release Switch. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition off. Disconnect the Decklid Release Switch harness connector. Disconnect the BCM "C1" harness connector. Turn the ignition on. Measure the voltage of the Decklid Release Switch Output circuit. Is there any voltage present?</p> <p>Yes → Repair the Decklid Release Switch Output circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All

DECKLID RELEASE SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

DRIVER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE

When Monitored and Set Condition:

DRIVER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE

When Monitored: Continuously

Set Condition: The BCM detects a signal on the input for over 10 seconds.

POSSIBLE CAUSES

CHECKING DTC PRIORITY

BINDING DRIVER CYLINDER LOCK SWITCH

DRIVER CYLINDER LOCK SWITCH SHORTED TO VOLTAGE

DRIVER CYLINDER LOCK SWITCH MUX CIRCUIT SHORTED TO VOLTAGE

BODY CONTROL MODULE - DRIVER CYLINDER LOCK SWITCH FAILURE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, erase DTC's. Insert the key in the Driver Cylinder Lock Switch and rotate the key to the lock and unlock positions several times. With the DRBIII®, read DTC's. Did this DTC reset?</p> <p>Yes → Go To 2</p> <p>No → Visually inspect the related wiring harness looking for any chafed, pierced, pinched, or frayed wires. Also check the related connectors looking for any bent, pushed out, or corroded terminals. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Insert the key in the Driver Cylinder Lock Switch and rotate the key to the lock and unlock positions. Does the key bind in any position?</p> <p>Yes → Repair or replace the Driver Cylinder Lock Switch as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Disconnect the Driver Cylinder Lock Switch harness connector. Turn the ignition on. With the DRBIII, enter "Body Computer" then "Sensors" and observe the Dr Door Disarm SW voltage Is there any voltage present?</p> <p>Yes → Go To 4</p> <p>No → Replace the Driver Cylinder Lock Switch. Perform BODY VERIFICATION TEST - VER 1.</p>	All

DRIVER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Driver Cylinder Lock Switch harness connector. Disconnect the BCM "C4" harness connector. Turn the ignition on. Measure the voltage of the Driver Cylinder Lock Switch Mux circuit. Is there any voltage present? Yes → Repair the Driver Cylinder Lock Switch Mux circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom: RKE FOB BATTERY LOW

When Monitored and Set Condition:

RKE FOB BATTERY LOW

When Monitored: Anytime an RKE message is received from the transmitter.

Set Condition: RKE receiver detects an RKE FOB battery low signal (less than 3 volts) for 5 consecutive button presses.

POSSIBLE CAUSES

BATTERIES LOW

TRANSMITTER - LOW VOLTAGE OUTPUT

TEST	ACTION	APPLICABILITY
1	<p>To determine which transmitter set the code, press any button on each transmitter. If a chime in the BCM is heard when a button is pressed, that is the problem transmitter.</p> <p>Test the voltage of each battery in the problem transmitter..</p> <p>Is the voltage at or above 3.0 in each battery?</p> <p>Yes → Replace the RKE Transmitter. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the batteries. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**RKE PROGRAM MODE ENTERED WITHOUT PROGRAM REQUEST****When Monitored and Set Condition:****RKE PROGRAM MODE ENTERED WITHOUT PROGRAM REQUEST**

When Monitored: Continuously.

Set Condition: The BCM receives an indication from the RKE module that it has entered program mode without the BCM requesting so.

POSSIBLE CAUSES

RKE PROGRAM MODE ENTERED WITHOUT PROGRAM REQUEST

TEST	ACTION	APPLICABILITY
1	<p>Note: This DTC will only set if the BCM receives an indication from the RKE module that it has entered program mode without the BCM requesting so.</p> <p>Replace the Remote Keyless Entry Module and program a transmitter..</p> <p>With the DRBIII, clear DTCs.</p> <p>Operate the Door Locks several times with the RKE transmitter.</p> <p>With the DRBIII®, read DTC's.</p> <p>Did this DTC reset?</p> <p>Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:**RKE UNABLE TO ENTER PROGRAM MODE**

When Monitored and Set Condition:**RKE UNABLE TO ENTER PROGRAM MODE**

When Monitored: While attempting to program RKE.

Set Condition: Lack of response from the RKE module while attempting to put it in program mode.

POSSIBLE CAUSES

RKE UNABLE TO ENTER PROGRAM MODE

TEST	ACTION	APPLICABILITY
1	<p>Note: This DTC will only set when attempting to enter the program RKE mode.</p> <p>Replace the Remote Keyless Entry Module.</p> <p>With the DRB, Clear DTC's</p> <p>With the DRB, attempt to enter the RKE program mode.</p> <p>With the DRB, check DTC's.</p> <p>Did this DTC reset?</p> <p>Yes → Replace the Body Control Module.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:

***ALL DOORS FAILING TO LOCK AND UNLOCK FROM ANY SWITCH**

POSSIBLE CAUSES

OPEN CIRCUIT BREAKER #2

OBSERVE THE DOOR LOCK SWITCH VOLTAGE STATUS WITH SWITCH IN THE LOCK POSITION

FUSED B(+) OPEN CIRCUIT OPEN FROM PDC

FUSED B(+) TO RELAY COIL CIRCUIT OPEN FROM PDC FUSE

PASSENGER POWER DOOR LOCK SWITCH-SHORTED TO VOLTAGE

RELAY GROUND CIRCUIT OPEN

DOOR LOCK RELAY-OPEN/SHORTED COIL

DOOR LOCK RELAY-SHORTED TERMINALS

FUSED B+ CKT OPEN

DOOR LOCK AND UNLOCK RELAYS GROUND OPEN

PASSENGER DOOR SWITCH MUX CKT SHORTED TO VOLTAGE

PASSENGER DOOR SW MUX CIRCUIT SHORTED TO GROUND

DRIVER POWER DOOR LOCK SWITCH-SHORTED TO VOLTAGE

LOCK OR UNLOCK RELAY OUTPUT CIRCUIT OPEN

PASSENGER DOOR LOCK SWITCH SHORTED TO GROUND

DRIVER DOOR SWITCH MUX CIRCUIT SHORTED TO GROUND

DRIVER DOOR SWITCH MUX CKT SHORTED TO VOLTAGE

DRIVER DOOR LOCK SWITCH SHORTED TO GROUND

JUNCTION BLOCK-LOCK RELAY CONTROL CKT OPEN

BODY CONTROL MODULE - LOCK RELAY CONTROL OPEN

BODY CONTROL MODULE -CONTROL SHORT TO VOLTAGE

BODY CONTROL MODULE- CONTROL SHORTED

TEST	ACTION	APPLICABILITY
1	Lower the drivers window. Remove the ignition key. Unlock all doors. With the DRBIII®, actuate the Door Lock Relay. Do the doors lock during the actuation test? Yes → Go To 2 No → Go To 15	All

***ALL DOORS FAILING TO LOCK AND UNLOCK FROM ANY SWITCH — Continued**

TEST	ACTION	APPLICABILITY
2	<p>With the DRB, observe the Door Lock Switch Voltage. Is the voltage above 0.2 volts?</p> <p>Yes → Go To 3</p> <p>No → Go To 8</p>	All
3	<p>Disconnect the Passenger Power Door Lock harness connector. With the DRB enter "Body Computer" then "Sensors" and observe the Door Lock Switch Voltage. Is the voltage above 0.2 volts?</p> <p>Yes → Go To 4</p> <p>No → Replace the Passenger Power Door Lock Switch. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Disconnect the Passenger Power Door Lock Switch harness connector. Disconnect the BCM "C4" harness connector. Turn the ignition on. Measure the voltage of the Passenger Door Switch MUX circuit. Is the voltage above 0.2 volts?</p> <p>Yes → Repair the Passenger Door Switch MUX ckt for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All

Symptom:

*AUTOMATIC (ROLLING) DOOR LOCKS INOPERATIVE

POSSIBLE CAUSES		
CHECK THE DOOR AJAR SWITCH STATUS WITH THE DRB CHECK FOR PCM DTC'S WITH THE DRB ENABLE AUTO DOOR LOCKS BODY CONTROL MODULE		
TEST	ACTION	APPLICABILITY
1	Ensure all doors are closed. With the DRBIII, enter "Body Computer" then "Input/Output" and observe all of the Door Ajar states. Does the DRBIII display CLOSED for any door ajar state? Yes → Refer to symptom for the appropriate DOOR AJAR CIRCUIT SHORTED in the DOOR AJAR category. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII read "Engine" DTC's. Does the DRBIII display any TPS or VSS related DTC's? Yes → Refer to symptom list for problems related to DRIVEABILITY. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII, enter "Body Computer" then "Miscellaneous" and observe the auto door lock status. Does the DRBIII display AUTO DOOR LOCKS: ENABLED Yes → Go To 4 No → With the DRBIII, enable the Auto Door Locks. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***DECKLID RELEASE INOPERATIVE****POSSIBLE CAUSES**

GROUND CIRCUIT OPEN
 DECKLID RELEASE SOLENOID OPEN
 FUSED B+ CIRCUIT OPEN
 DECKLID RELEASE SWITCH OPEN
 DECKLID RELEASE SWITCH OUTPUT CIRCUIT OPEN
 DECKLID RELEASE CONTROL CIRCUIT OPEN
 BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Connect a 12-volt Test Light between the decklid release control ckt and the ground circuit (cavs 1 and 3). Press the decklid release switch and observe the test light. Did the test light illuminate when the switch was pressed? Yes → Replace the Decklid Release Solenoid. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Decklid Release Switch harness connector. Using a 12-volt test light connected to ground, check the Fused B(+) circuit. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*DECKLID RELEASE INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	<p>Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Connect a 12-volt Test Light between the decklid release control ckt and the ground circuit (cavs 1 and 3). Disconnect the Decklid Release Switch harness connector. Connect a jumper wire between the Fused B+ circuit and the Decklid Release Switch Output circuit on the Decklid Release Switch harness connector. Observe the test light with the jumper wire connected. Is the test light illuminated brightly?</p> <p>Yes → Replace the Decklid Release Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Decklid Release Switch harness connector. Disconnect the BCM "C1" harness connector. Measure the resistance of the Decklid Release Switch Output circuit between the BCM "C1" connector and the Decklid Release Switch connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the Decklid Release Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Remove the Body Control Module from the Junction Block. Measure the resistance of the Decklid Release Control circuit between the Decklid Release Solenoid/Ajar Switch connector and the Junction Block Body Control Module connector (cavity 8). Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the Decklid Release Control circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***DOOR LOCK INHIBIT INOPERATIVE****POSSIBLE CAUSES**

CHECK THE DRIVER DOOR AJAR SWITCH STATUS

OBSERVE THE KEY-IN IGNITION SWITCH STATUS

IGNITION SWITCH OPEN

KEY-IN IGNITION SWITCH GROUND CIRCUIT OPEN

KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN

BODY CONTROL MODULE - INCORRECT KEY-IN IGNITION SWITCH STATUS

TEST	ACTION	APPLICABILITY
1	<p>Open the Driver's front door. With the DRBIII, enter "Body Computer" then "Input/Output" and observe the Driver Door Ajar status. Does the DRBIII display DRDOOR AJAR: CLOSED?</p> <p>Yes → Go To 2</p> <p>No → Refer to symptom DRIVER DOOR AJAR OPEN CIRCUIT in the DOOR AJAR category. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>NOTE: Ensure that the Key is still in the Ignition Switch. With the DRBIII, enter "Body Computer" then "Input/Output" and read the Key-In Ignition Switch status. Does the DRB display: KEY-IN IGN: CLOSED ?</p> <p>Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off. Disconnect the Ignition Switch harness connector. Connect a jumper between the Key-In Ignition Switch Sense circuit and Ground circuit. With the DRBIII, enter "Body Computer" then "Input/Output" and observe the Key-In Ignition Switch status. Does the DRBIII display KEY-IN IGN: CLOSED?</p> <p>Yes → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All

***DOOR LOCK INHIBIT INOPERATIVE — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Ignition Switch harness connector. Turn all lights off. Measure the resistance between ground and the ground circuit in the ignition switch connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Ignition Switch harness connector. Disconnect the Body Control Module "C2" harness connector. Measure the resistance of the Key-In Ignition Switch Sense circuit between the ignition switch connector and the BCM "C2" connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Key-In Ignition Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***DRIVER DOOR FAILS TO LOCK FROM ANY SWITCH****POSSIBLE CAUSES**

DRIVER DOOR UNLOCK RELAY GROUND CIRCUIT OPEN

DRIVER DOOR UNLOCK RELAY

TEST	ACTION	APPLICABILITY
1	<p>Remove the Driver Door Unlock Relay from the Junction Block. Measure the resistance between ground and the Ground circuit in the Driver Door Unlock Relay connector (cavity 79). Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Driver Door Unlock Relay. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***DRIVER DOOR FAILS TO UNLOCK FROM ANY SWITCH**

POSSIBLE CAUSES

DRIVER DOOR UNLOCK RELAY FUSED B(+) OPEN

RELAY CONTROL CIRCUIT CHECK

JUNCTION BLOCK - DRIVER DOOR UNLOCK RELAY CONTROL CKT OPEN

BODY CONTROL MODULE - DRIVER DOOR UNLOCK RELAY DRIVER OPEN

TEST	ACTION	APPLICABILITY
1	<p>Remove the Driver Door Unlock Relay from the Junction Block. Using a 12-volt test light connected to ground, check both Fused B(+) circuits in the Driver Door Unlock Relay connector (cavities 87 and 88). Does the test light illuminate brightly in both connectors?</p> <p>Yes → Go To 2</p> <p>No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Remove the Driver Door Unlock Relay from the Junction Block. Connect a 12-volt Test Light between cavities 88 and 90 in the Driver Door Unlock Relay connector. Using the DRBIII, enter "Body Computer" then "Actuator Tests" and actuate the Drv Door Unlock Relay. Does the test light flash on and off as the relay is actuated?</p> <p>Yes → Replace the Driver Door Unlock Relay. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off. Remove the Driver Door Unlock Relay from the Junction Block. Remove the Body Control Module from the Junction Block. Measure the resistance of the Driver Door Unlock Relay Control circuit between the Driver Door Unlock Relay connector cavity 90 and Junction Block Body Control Module connector cavity 13. Is the resistance below 1.0 ohm?</p> <p>Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***ONE DOOR FAILS TO LOCK AND UNLOCK FROM ANY SWITCH****POSSIBLE CAUSES**

DOOR LOCK MOTOR - OPEN
 LOCK RELAY OUTPUT CIRCUIT OPEN
 DRIVER DOOR LOCK MOTOR - OPEN
 DRIVER UNLOCK RELAY OUTPUT CIRCUIT OPEN
 LOCK RELAY OUTPUT CIRCUIT OPEN
 UNLOCK RELAY OUTPUT CIRCUIT OPEN
 DRIVER DOOR UNLOCK RELAY OPEN

TEST	ACTION	APPLICABILITY
1	<p>Operate the door locks to determine which door lock is not operating properly. Is there a problem with the Driver Door Lock?</p> <p>Yes → Go To 2</p> <p>No → Go To 6</p>	All
2	<p>NOTE: This test is for a motor that is completely inoperative. If the motor either locks OR unlocks refer to symptom list for problems related to DRIVER DOOR FAILING TO-.</p> <p>Disconnect the Driver Door Lock Motor/Ajar Switch connector. Connect a 12-volt Test Light between the Driver Door Unlock Relay Output and the Door Lock Relay Output circuits in the door lock motor connector. Press the Door Lock Switch in the Lock and Unlock positions and observe the test light. Does the Test Light flash on and off as the switch is pressed?</p> <p>Yes → Replace the Driver Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Disconnect the Driver Door Lock Motor/Ajar Switch connector. Remove the Door Lock Relay in the Junction Block. Measure the resistance of the Lock Relay Output circuit between the Lock Relay Output connector and the Driver Door Lock Motor connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the Lock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***ONE DOOR FAILS TO LOCK AND UNLOCK FROM ANY SWITCH — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Disconnect the Driver Door Lock Motor/Ajar Switch connector. Remove the Driver Door Unlock Relay in the Junction Block. Measure the resistance of the Driver Door Unlock Relay Output circuit between the Driver Door Unlock Relay connector and the Driver Door Lock Motor connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Driver Door Unlock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Driver Door Unlock Relay - carrier open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Disconnect the Door Lock Motor/Ajar Switch connector. Connect a 12-volt Test Light between the Unlock Relay Output and the Lock Relay Output circuits in the door lock motor connector. Press the Door Lock Switch in the Lock and Unlock positions and observe the test light. Does the Test Light flash on and off as the switch is pressed?</p> <p>Yes → Replace the Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Disconnect the appropriate Door Lock Motor/Ajar Switch connector. Using a 12-volt test light connected to ground, check the Lock Relay Output circuit. With the DRBIII®, actuate the Door Lock Relay and observe the Test Light. Did the Test Light flash as the relay was actuated?</p> <p>Yes → Go To 8</p> <p>No → Repair the Lock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Disconnect the appropriate Door Lock Motor/Ajar Switch connector. Using a 12-volt test light connected to ground, check the Unlock Relay Output circuit. With the DRBIII®, actuate the Door Unlock Relay and observe the Test Light. Did the Test Light flash as the relay was actuated?</p> <p>Yes → Test Complete.</p> <p>No → Repair the Unlock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***REMOTE KEYLESS ENTRY PROBLEM****POSSIBLE CAUSES**

RKE DTC'S PRESENT
 TEST TRANSMITTER WITH TESTER
 RKE TRANSMITTER NOT PROGRAMMED
 TESTING THE REMOTE KEYLESS ENTRY MODULE
 REPLACE TRANSMITTER
 RKE MODULE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, read DTCs. Are there any RKE related codes present?</p> <p>Yes → Refer to symptom list for problems related to POWER DOOR LOCKS/RKE. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Do you have access to the Miller Special Tool "9001 RF DETECTOR"?</p> <p>Yes → Go To 3</p> <p>No → Go To 5</p>	All
3	<p>Using the 9001 RF Detector, follow the instructions on the back of the tester and test the transmitter several times. Does the signal strength display "STRONG"?</p> <p>Yes → Go To 4</p> <p>No → Replace the transmitter. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>With the DRBIII® select BODY, BODY COMPUTER, MISCELLANEOUS, then PROGRAM RKE. Follow instructions on the screen. Exit PROGRAM RKE. Try the Door Locks using the Transmitter. Did the Door Locks respond properly to the Transmitter commands ?</p> <p>Yes → Repair complete. Using the DRBIII®, program all other Transmitters used with this Vehicle. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Remote Keyless Entry Module and reprogram all transmitters used with this vehicle. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***REMOTE KEYLESS ENTRY PROBLEM — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Secure a known good transmitter from another JR or LH vehicle.</p> <p>With the DRBIII, enter BODY, BODY COMPUTER, MISCELLANEOUS then PROGRAM RKE and follow the instructions to program the substitute transmitter.</p> <p>NOTE: If the RKE module will not go into programming mode, replace the RKE module and continue testing.</p> <p>With the DRBIII, enter BODY, BODY COMPUTER, MISCELLANEOUS then RKE FOB TEST and follow the instructions on the DRB.</p> <p>Did the substitute RKE Transmitter respond correctly?</p> <p>No → Replace the Remote Keyless Entry (RKE) Module and reprogram all vehicle transmitters following the instructions on the DRBIII. Perform BODY VERIFICATION TEST - VER 1.</p> <p>Yes → Replace the RKE transmitter and reprogram all others used with this vehicle.. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***RKE HORN CHIRP INOPERATIVE****POSSIBLE CAUSES**

CHECK THE HORN OPERATION

CHECK THE RKE HORN CHIRP STATUS

JUNCTION BLOCK-HORN RELAY CONTROL CIRCUIT OPEN

BODY CONTROL MODULE - HORN RELAY CONTROL OPEN

TEST	ACTION	APPLICABILITY
1	Press the horn button on the steering wheel. Does the horn sound? Yes → Go To 2 No → Refer to the Service Information for Horn system diagnosis. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII, enter "Body Computer", "Miscellaneous" then "RKE Horn Chirp" and observe the horn chirp status. Does the DRBIII display HORN CHIRP: DISABLED? Yes → With the DRBIII, enable the Horn Chirp. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Remove the Body Control Module from the Junction Block. Momentarily connect a jumper wire between ground and the Horn Relay Control circuit (cavity 18 of the Junction Block - Body Control Module connector). Did the horn sound? Yes → Go To 4 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

SPEED PRO STEERING

Symptom:

SPEED PRO STEERING CKT SHORT TO VOLTAGE

When Monitored and Set Condition:

SPEED PRO STEERING CKT SHORT TO VOLTAGE

When Monitored: With ignition on.

Set Condition: BCM detects current flowing through the speed pro steering solenoid even though it is attempting to drive it.

POSSIBLE CAUSES

SPEED PRO STEERING SOLENOID (-) CIRCUIT SHORT TO VOLTAGE
SPEED PRO STEERING SOLENOID (+) CIRCUIT SHORT TO VOLTAGE
SPEED PRO STEERING SOLENOID (+) CIRCUIT SHORTED TO (-) CIRCUIT
OPEN/SHORTED SPEED PRO STEERING SOLENOID
SPEED PROPORTIONAL STEERING CHECK SHORT VOLTAGE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Start the engine. While turning the Steering Wheel, monitor the amount of force it takes to turn the Steering Wheel. With the DRBIII®, de-activate the Speed Pro Steering Solenoid for 15 seconds. Again turn the Steering Wheel and monitor the amount of force it takes to turn the Steering Wheel. Was the Steering Wheel harder to turn with the Speed Pro Steering Solenoid de-activated?</p> <p>Yes → System is operating properly at this time. Erase DTC, inspect the wiring and connectors and repair as necessary. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Measure the resistance of the Speed Pro Steering Solenoid. Is the resistance between 5.7 and 6.3 ohms at 20 C (68° F)?</p> <p>Yes → Go To 3</p> <p>No → Replace the Speed Pro Steering Solenoid. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p>	All

SPEED PRO STEERING CKT SHORT TO VOLTAGE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Start the engine. Measure the voltage of the Speed Pro Steering Solenoid (+) circuit in the Speed Pro Steering Solenoid harness connector. Is there any voltage present?</p> <p>Yes → Repair the Seed Pro Steering Solenoid (+) circuit for a short to voltage. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Start the engine. Measure the voltage of the Speed Pro Steering Solenoid (-) circuit in the Speed Pro Steering Solenoid harness connector. Is there any voltage present?</p> <p>Yes → Repair the Speed Pro Steering Solenoid (-) circuit for a short to voltage and replace the Body Control Module (BCM will be damaged). Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Remove the Body Control Module from the Junction Block. Measure the resistance of the Speed Pro Steering Solenoid (+) circuit to the Speed Pro Steering Solenoid (-) circuit in the Junction Block BCM Internal connector. Is the resistance below 100.0 ohms</p> <p>Yes → Repair the Speed Pro Steering Solenoid (+) circuit for a short to the Speed Pro Steering Solenoid (-) circuit. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

SPEED PRO STEERING

Symptom:

SPEED PRO STEERING SOLENOID CKT OPEN/SHORTED TO GROUND

When Monitored and Set Condition:

SPEED PRO STEERING SOLENOID CKT OPEN/SHORTED TO GROUND

When Monitored: With ignition on.

Set Condition: BCM detects no current flowing through the speed pro steering solenoid when it attempts to drive it.

POSSIBLE CAUSES

SPEED PRO STEERING SOLENOID (-) CIRCUIT OPEN
SPEED PRO STEERING SOLENOID (-) CIRCUIT SHORT GROUND
SPEED PRO STEERING SOLENOID (+) CIRCUIT OPEN
SPEED PRO STEERING SOLENOID (+) CIRCUIT SHORT GROUND
SPEED PRO STEERING SOLENOID (+) CIRCUIT SHORT TO (-) CIRCUIT
OPEN/SHORTED SPEED PRO STEERING SOLENOID
SPEED PROPORTIONAL STEERING CHECK OPEN/SHORT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Start the engine. While turning the Steering Wheel, monitor the amount of force it takes to turn the Steering Wheel With the DRBIII®, de-activate the Speed Pro Steering Solenoid for 15 seconds. Again turn the steering wheel and monitor the amount of force it takes to turn the Steering Wheel. Was the Steering Wheel harder to turn while the Speed Pro Steering Solenoid was de-activated?</p> <p>Yes → System is operating properly at this time. Erase the DTC, inspect the wiring and connectors and repair as necessary. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Measure the resistance of the Speed Pro Steering Solenoid. Is the resistance between 5.7 and 6.3 ohms at 20 C (68° F)?</p> <p>Yes → Go To 3</p> <p>No → Replace the Speed Pro Steering Solenoid. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p>	All

SPEED PRO STEERING SOLENOID CKT OPEN/SHORTED TO GROUND

— Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Measure the resistance between ground and the Speed Pro Steering Solenoid (+) circuit in the Speed Pro Steering Solenoid harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the Speed Pro Steering (+) circuit for a short to ground. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Measure the resistance between ground and the Speed Pro Steering Solenoid (-) circuit in the Speed Pro Steering Solenoid harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the Speed Pro Steering (-) circuit for a short to ground. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Remove the Body Control Module from the Junction Block. Measure the resistance of the Speed Pro Steering Solenoid (-) circuit between the Junction Block BCM connector and the Speed Pro Steering Solenoid harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the open Speed Pro Steering Solenoid (-) circuit. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Remove the Body Control Module from the Junction Block. Measure the resistance of the Speed Pro Steering Solenoid (+) circuit to the Speed Pro Steering Solenoid (-) circuit in the Junction Block BCM Internal connector. Is the resistance below 100.0 ohms</p> <p>Yes → Repair the Speed Pro Steering Solenoid (+) circuit for a short to the Speed Pro Steering Solenoid (-) circuit. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All

SPEED PRO STEERING SOLENOID CKT OPEN/SHORTED TO GROUND

— Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Remove the Body Control Module from the Junction Block. Measure the resistance of the Speed Pro Steering Solenoid (+) circuit between the Junction Block BCM connector and the Speed Pro Steering Solenoid connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the open Speed Pro Steering Solenoid (+) circuit. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p>	All
8	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**SPEED PRO STEERING SOLENOID OVER-TEMPERATURE****When Monitored and Set Condition:****SPEED PRO STEERING SOLENOID OVER-TEMPERATURE**

When Monitored: With ignition on.

Set Condition: BCM detects an over temperature condition on its Speed Proportional Output Driver.

POSSIBLE CAUSES

SPEED PRO STEERING SOLENOID INTERMITTENT WIRING SHORT TO GROUND
 OPEN/SHORTED SPEED PRO STEERING SOLENOID
 SPEED PROPORTIONAL STEERING CHECK SOLENOID OVER-TEMPERATURE
 BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Start the engine. While turning the Steering Wheel, monitor the amount of force it takes to turn the Steering Wheel. With the DRBIII®, de-activate the Speed Pro Steering Solenoid for 15 seconds. Again turn the Steering Wheel and monitor the amount of force it takes to turn the Steering Wheel. Was the Steering Wheel harder to turn while the Speed Pro Steering Solenoid was de-activated?</p> <p>Yes → System is operating properly at this time. Erase the DTC, inspect the wiring and connectors and repair as necessary. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Speed Pro Steering Solenoid harness connector. Measure the resistance of the Speed Pro Steering Solenoid. Is the resistance between 5.7 and 6.3 ohms at 20 C (68° F)?</p> <p>Yes → Go To 3</p> <p>No → Replace the Speed Pro Steering Solenoid. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p>	All

SPEED PRO STEERING SOLENOID OVER-TEMPERATURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors from the BCM to the Speed Pro Steering Solenoid. Check for chafed, pinched, open or shorted wiring. Were there any problems found?</p> <p>Yes → Repair the Speed Pro Steering Solenoid wiring and/or connectors as necessary. Perform SPEED PRO STEERING VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom List:

LF SENSOR BATTERY LOW
LF TIRE PRESSURE SENSOR FAILURE
LR SENSOR BATTERY LOW
LR TIRE PRESSURE SENSOR FAILURE
RF SENSOR BATTERY LOW
RF TIRE PRESSURE SENSOR FAILURE
RR SENSOR BATTERY LOW
RR TIRE PRESSURE SENSOR FAILURE
SPARE TIRE PRESSURE SENSOR FAILURE
SPARE TIRE SENSOR BATTERY LOW

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be LF SENSOR BATTERY LOW.

When Monitored and Set Condition:

LF SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the LF Sensor/Transmitter.

LF TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the LF Sensor/Transmitter.

LR SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the LR Sensor/Transmitter.

LR TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the LR Sensor/Transmitter.

RF SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the RF Sensor/Transmitter.

TIRE PRESSURE MONITORING

LF SENSOR BATTERY LOW — Continued

RF TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the RF Sensor/Transmitter.

RR SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the RR Sensor/Transmitter.

RR TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the RR Sensor/Transmitter.

SPARE TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the Spare Tire Sensor/Transmitter.

SPARE TIRE SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the Spare Tire Sensor/Transmitter.

POSSIBLE CAUSES

EVIC INTERNAL FAULT

SENSOR/TRANSMITTER INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Using the procedure in the System Description, retrain the EVIC With the DRBIII®, record and erase DTC's. Drive the vehicle for 10 minutes over 25 mph. With the DRBIII®, read DTC's. Does the DRBIII® display SENSOR FAILURE or SENSOR LOW BATTERY? Yes → Replace the indicated Tire Pressure Sensor/Transmitter. Perform TIRE PRESSURE VERIFICATION TEST. No → Go To 2	All

LF SENSOR BATTERY LOW — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition on. Observe the EVIC display. Does the EVIC display TIRE SENSOR BAD/MISSING? Yes → Replace the EVIC in accordance with the Service Information. Perform TIRE PRESSURE VERIFICATION TEST. No → Test Complete.	All

VEHICLE THEFT/SECURITY

Symptom:

***ALARM TRIPS ON ITS OWN**

POSSIBLE CAUSES

LAST VTSS CAUSE

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® in Inputs/Outputs, read the Last VTSS Cause state. Were there any causes displayed?</p> <p>Yes → Check for a possible intermittent condition with the circuit indicated by the DRBIII®.</p> <p>No → Go To 2</p>	All
2	<p>NOTE: The condition that caused the alarm is not present at this time. The following list may help to indentify the cause of the intermittent condition. Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect related wiring harnesses. Look for chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Look for loose connections, broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Test Complete.</p>	All

Symptom:

***DRIVER DOOR KEY FAILS TO ARM OR TO DISARM VTSS**

POSSIBLE CAUSES
FUSED B+ OPEN
DRIVER CYLINDER LOCK SWITCH MUX CIRCUIT SHORTED TO GROUND
DRIVER CYLINDER LOCK SWITCH MUX CIRCUIT OPEN
DRIVER CYLINDER LOCK SWITCH
BCM--VTSS WON'T ARM OR DISARM WITH DOOR KEY

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® in Sensors, read the DRV DOOR ARM/DISARM SW voltage. Note: The voltage measurements are not the same for the driver and passenger lock cylinders. Rotate the Key in the Driver Cylinder Lock to the lock and unlock positions. Does the DRBIII® display 3.5-4.5 volts in the lock position and 6.0-7.0 volts in the unlock position</p> <p>Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Go To 2</p>	All
2	<p>Disconnect the Driver Cylinder Lock Switch harness connector Using a 12-volt test light connected to ground, check the Fused B+ circuit. Does the test light illuminate?</p> <p>Yes → Go To 3</p> <p>No → Repair the Driver Cylinder Lock Switch Fused B+ circuit for an open. Perform VTSS VERIFICATION TEST - 1A.</p>	All
3	<p>Disconnect the Body Control Module C4 harness connector. Disconnect the Driver Cylinder Lock Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Driver Cylinder Lock Switch MUX circuit. Does the test light illuminate?</p> <p>Yes → Repair the Driver Cylinder Lock Switch MUX circuit for a short to ground. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Go To 4</p>	All
4	<p>Disconnect the Body Control Module C4 harness connector. Disconnect the Driver Cylinder Lock Switch harness connector. Measure the resistance of the Driver Cylinder Lock Switch MUX circuit between the Driver Cylinder Lock Switch connector and the BCM C4 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Driver Cylinder Lock Switch in accordance with the Service Information. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Repair the Driver Cylinder Lock Switch MUX circuit for an open. Perform VTSS VERIFICATION TEST - 1A.</p>	All

Symptom:

***HAZARD LAMPS FAIL TO FLASH**

POSSIBLE CAUSES

VERIFY HAZARD OPERATION

BCM -- HAZARDS INOPERATIVE WITH VTSS ALARM TRIPPED

TEST	ACTION	APPLICABILITY
1	Turn on the Hazard Lamps on. Do the Hazard Lamps operate properly? Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Check and diagnose related Body Control Module Diagnostic Trouble Codes. If no DTCs are present, refer to the Service Information.	All

Symptom:***HEADLAMP/PARK LAMPS FAIL TO FLASH WITH ALARM TRIPPED****POSSIBLE CAUSES**

VERIFY LOW BEAM OPERATION

BCM -- HEADLAMPS FAIL TO FLASH WHEN VTSS IS IN ALARM

TEST	ACTION	APPLICABILITY
1	Turn the Low Beam Headlamps on. Do the Low Beam Headlamps operate properly? Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom LOW BEAM HEADLAMPS WILL NOT TURN ON in the EXTERIOR LIGHTING category.	All

Symptom:

***HORN FAILS TO SOUND WITH ALARM TRIPPED**

POSSIBLE CAUSES

CHECK HORN OPERATION

JUNCTION BLOCK - OPEN HORN RELAY CONTROL CIRCUIT

BODY CONTROL MODULE-OPEN HORN RELAY CONTROL CIRCUIT

TEST	ACTION	APPLICABILITY
1	<p>Push the Horn Button on the Steering Wheel. Does the Horn operate properly?</p> <p>Yes → Go To 2</p> <p>No → Check for and diagnose related Body Control Module Diagnostic Trouble Codes. If there are no DTCs present, refer to the Service Information to diagnose the horn system.</p>	All
2	<p>Remove the BCM from the junction block. Using a 12-volt test light connected to 12-volts, probe the Horn Relay Control circuit at the J/B side of the Junction Block-to-Body Control Module connector. While monitoring the test light, press the horn button on the steering wheel. Did the test light illuminate when the horn button was pressed?</p> <p>Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Replace the Junction Block in accordance with the Service Information. Perform VTSS VERIFICATION TEST - 1A.</p>	All

Symptom:***VTSS DOES NOT TRIP FROM DRIVERS DOOR****POSSIBLE CAUSES**

BCM-NO VTSS TRIP FROM DRIVER DOOR

CHECK DRBIII® FOR DRIVER DOOR AJAR RESPONSE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the DRVR DOOR AJAR SW status. Open the driver door. Does the DRBIII® display CLOSED? Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom DRIVER DOOR AJAR CKT OPEN in the DOOR AJAR category.	All

Symptom:

***VTSS DOES NOT TRIP FROM LEFT REAR DOOR**

POSSIBLE CAUSES

CHECK DRBIII® FOR LEFT REAR DOOR AJAR RESPONSE

BCM-NO VTSS TRIP FROM LEFT REAR DOOR

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, read the LR DOOR AJAR SW status. Open the left rear door. Does the DRBIII® display CLOSED?</p> <p>Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Refer to symptom LEFT REAR DOOR AJAR CKT OPEN in the DOOR AJAR category.</p>	All

Symptom:***VTSS DOES NOT TRIP FROM PASSENGER FRONT DOOR****POSSIBLE CAUSES**

CHECK DRBIII® FOR PASSENGER DOOR AJAR RESPONSE

BCM-NO VTSS TRIP FROM PASSENGER DOOR

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the PASS DOOR AJAR SW status. Open the passenger door. Does the DRBIII® display CLOSED? Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom PASSENGER DOOR AJAR CKT OPEN in the DOOR AJAR category.	All

Symptom:

***VTSS DOES NOT TRIP FROM RIGHT REAR DOOR**

POSSIBLE CAUSES

CHECK DRBIII® FOR RIGHT REAR DOOR AJAR RESPONSE

BCM-NO VTSS TRIP FROM RIGHT REAR DOOR

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, read the RR DOOR AJAR SW status. Open the right rear door. Does the DRBIII® display CLOSED?</p> <p>Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Refer to symptom RIGHT REAR DOOR AJAR CKT OPEN in the DOOR AJAR category.</p>	All

Symptom:***VTSS DOES NOT TRIP WITH TRUNK KNOCKOUT SWITCH****POSSIBLE CAUSES**

DECKLID SECURITY SWITCH SENSE CIRCUIT SHORT TO GROUND

BCM -- NO ALARM FROM TRUNK KNOCKOUT SWITCH

TEST	ACTION	APPLICABILITY
1	Disconnect the BCM C4 harness connector. Disconnect the Trunk Knockout Switch harness connector. Using a 12-volt test light connected to 12-volts, check the Decklid Security Switch Sense circuit. Does the test light illuminate? Yes → Repair the Decklid Security Switch Sense circuit for a short to ground. Perform VTSS VERIFICATION TEST - 1A. No → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:

*VTSS INDICATOR INOPERATIVE

POSSIBLE CAUSES
OPEN VTSS INDICATOR FUSED B(+) SUPPLY
OPEN VTSS LED
VTSS INDICATOR DRIVER CIRCUIT OPEN
BODY CONTROL MODULE--OPEN INTERNAL VTSS DRIVER

TEST	ACTION	APPLICABILITY
1	<p>Disconnect the Sun Sensor/VTSS LED harness connector. Measure the voltage of the Fused B+ circuit. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 2</p> <p>No → Repair the VTSS Fused B+ circuit for an open. Perform VTSS VERIFICATION TEST - 1A.</p>	All
2	<p>Disconnect the Sun Sensor VTSS/LED harness connector. Connect a voltmeter positive probe to a 12.0 volt supply and connect the ground probe to the VTSS Indicator Driver circuit at the Sun Sensor/VTSS LED connector. Turn the ignition on. With the DRB in Vehicle Theft, actuate the VTSS Indicator lamp. Is the voltage above 10.0 volts when the VTSS Indicator lamp is actuated?</p> <p>Yes → Replace the Sun Sensor/VTSS LED assembly. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Go To 3</p>	All
3	<p>Disconnect the Sun Sensor/ VTSS LED harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the VTSS Indicator Driver circuit between the Sun Sensor/VTSS LED connector and the BCM C2 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Repair the VTSS Indicator Driver circuit for an open. Perform VTSS VERIFICATION TEST - 1A.</p>	All

Symptom:***VTSS WILL NOT ARM****POSSIBLE CAUSES**

CHECK THE VTSS STATUS

CHECK THE BCM FOR DTCS

BODY CONTROL MODULE - NO ALARM OUTPUT

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, check that the Theft Alarm is enabled. Was the Theft Alarm enabled?</p> <p>Yes → Go To 2</p> <p>No → With the DRBIII®, enable the Vehicle Theft Security System (VTSS). Perform VTSS VERIFICATION TEST - 1A.</p>	All
2	<p>With the DRBIII®, read the active DTC's. Are any VTSS related DTC's present?</p> <p>Yes → Refer to the Symptom List and diagnose the appropriate symptom. Perform VTSS VERIFICATION TEST - 1A.</p> <p>No → Replace and program the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.</p>	All

WINDSHIELD WIPER & WASHER

Symptom:

WIPER PARK SWITCH FAILURE/WIPERS RUN CONTINUOUSLY

When Monitored and Set Condition:

WIPER PARK SWITCH FAILURE/WIPERS RUN CONTINUOUSLY

When Monitored: The ignition must be in the run position and battery voltage supplied to the BCM on the Fused B(+) circuit.

Set Condition: The code will set if the BCM does not detect a low to high voltage transition on the Wiper Park Switch Sense circuit within 8 seconds after energizing the wiper relay On/Off relay.

POSSIBLE CAUSES

WIPER PARK SWITCH OPERATION

WIPER PARK SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

WIPER PARK SWITCH SENSE CIRCUIT OPEN

WIPER PARK SWITCH SENSE CIRCUIT SHORT TO GROUND

GROUND CIRCUIT OPEN

WIPER MOTOR OPERATION

BCM

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII®, erase BCM DTC's. Cycle the ignition off and then on. Turn the windshield wiper switch to each intermittent position, then low and high speed positions. Turn the windshield wiper switch to the off position. With the DRBIII®, read BCM DTC's. Does the DRB display WIPER PARK SWITCH FAILURE?</p> <p>Yes → Go To 2</p> <p>No → At this time the condition to set the code is not present. Inspect the related wiring harness and connectors, repair as necessary. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the BCM C3 harness connector. Turn the ignition on. Measure the voltage of the Wiper Park Switch Sense circuit in the Windshield Wiper Motor harness connector. Is there any voltage present?</p> <p>Yes → Repair the Wiper Park Switch Sense circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All

WIPER PARK SWITCH FAILURE/WIPERS RUN CONTINUOUSLY — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the Wiper Park Switch Sense circuit between the BCM C3 harness connector and the Wiper Motor harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the Wiper Park Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the BCM C3 harness connector. Measure the resistance between ground and the Wiper Park Switch Sense circuit in the BCM C3 harness connector. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the Wiper Park Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. NOTE: Ensure the ignition switch, all lights and accessories are turned off. Using a 12-volt test light connected to 12-volts, probe the Ground circuit in the Windshield Wiper Motor harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 6</p> <p>No → Repair the Wiper Motor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the wiper park switch state. Connect one end of a jumper wire to the wiper park switch sense circuit at the windshield wiper motor harness connector. While observing the DRBIII®, connect the other end of the jumper wire to ground for several seconds, then disconnect the jumper wire from ground. Did the wiper park switch input change state when connected to ground then disconnected from ground?</p> <p>Yes → Replace the Wiper Motor. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

WINDSHIELD WIPER & WASHER

Symptom:

*HEADLAMP WASHERS NOT OPERATING PROPERLY

POSSIBLE CAUSES
EXTERIOR LIGHTING SYSTEM NOT OPERATING PROPERLY
WINDSHIELD WIPER/WASHER SYSTEM NOT OPERATING PROPERLY
FUSED B+ CIRCUIT(S) OPEN
HEADLAMP WASHER RELAY
HEADLAMP WASHER PUMP MOTOR
HEADLAMP WASHER RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE
HEADLAMP WASHER RELAY OUTPUT CIRCUIT SHORTED TO GROUND
HEADLAMP WASHER RELAY OUTPUT CIRCUIT OPEN
HEADLAMP WASHER PUMP MOTOR GROUND CIRCUIT OPEN
HEADLAMP WASHER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
HEADLAMP WASHER RELAY CONTROL CIRCUIT SHORTED TO GROUND
HEADLAMP WASHER RELAY CONTROL CIRCUIT OPEN
BCM - RELAY CONTROL OPEN

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The exterior lighting must be working properly for the Headlamp Washer Pump Motor to operate properly.</p> <p>Turn the ignition on.</p> <p>Turn on the park lamps, fog lamps, low beam headlamps and high beam headlamps and note the operation of the appropriate lamps when selected.</p> <p>Do the appropriate lamps operate properly when turned on?</p> <p>Yes → Go To 2</p> <p>No → Refer to the Exterior Lighting category in the Symptom List for the related symptom(s).</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition on.</p> <p>Turn the low speed windshield wipers on.</p> <p>Push and release the wash button on the Multi-function Switch.</p> <p>Did the windshield wipers and washers operate properly?</p> <p>Yes → Go To 3</p> <p>No → Refer to the Windshield Wiper & Washer category for the related symptom(s).</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

***HEADLAMP WASHERS NOT OPERATING PROPERLY — Continued**

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Remove the Headlamp Washer Relay from the PDC. Using a 12-volt test light connected to ground, check both Fused B(+) circuits in the Headlamp Washer Relay connector. Is the test light on for both circuits?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused B(+) circuit(s) for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Install a substitute relay in place of the Headlamp Washer Relay. Turn the ignition on. With the DRBIII®, actuate the Headlamp Washer Relay. Did the Headlamp Washers operate?</p> <p>Yes → Replace the Headlamp Washer Relay. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Headlamp Washer Pump Motor harness connector. Connect a 12-volt test light between the Headlamp Washer Pump Motor harness connector cavities. With the DRBIII®, actuate the Headlamp Washer Relay. Does the test light cycle on and off during actuation?</p> <p>Yes → Replace the Headlamp Washer Pump Motor. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Remove the Headlamp Washer Relay from the PDC. Turn the ignition on. Measure the voltage of the Headlamp Washer Relay Output circuit in the Headlamp Washer Relay connector. Is the voltage above 1.0 volt?</p> <p>Yes → Repair the Headlamp Washer Relay Output circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Remove the Headlamp Washer Relay from the PDC. Disconnect the Headlamp Washer Pump Motor harness connector. Measure the resistance between ground and the Headlamp Washer Relay Output circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the Headlamp Washer Relay Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p>	All

*HEADLAMP WASHERS NOT OPERATING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Remove the Headlamp Washer Relay from the PDC. Disconnect the Headlamp Washer Pump Motor harness connector. Measure the resistance of the Headlamp Washer Relay Output circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the Headlamp Washer Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
9	<p>Turn the ignition off. Disconnect the Headlamp Washer Pump Motor harness connector. Using a 12-volt test light connected to 12-volts, check the Ground circuit in the Headlamp Washer Pump Motor harness connector. Is the test light on?</p> <p>Yes → Go To 10</p> <p>No → Repair the Headlamp Washer Pump Motor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
10	<p>Turn the ignition off. Remove the Headlamp Washer Relay from the PDC. Disconnect the BCM C3 harness connector. Turn the ignition on. Measure the voltage of the Headlamp Washer Relay Control circuit. Is the voltage above 1.0 volt?</p> <p>Yes → Repair the Headlamp Washer Relay Control circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 11</p>	All
11	<p>Turn the ignition off. Remove the Headlamp Washer Relay from the PDC. Disconnect the BCM C3 harness connector. Measure the resistance between ground and the Headlamp Washer Relay Control circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 12</p> <p>No → Repair the Headlamp Washer Relay Control circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p>	All
12	<p>Turn the ignition off. Remove the Headlamp Washer Relay from the PDC. Disconnect the BCM C3 harness connector. Measure the resistance of the Headlamp Washer Relay Control circuit between the BCM C3 harness connector and the Headlamp Washer Relay connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 13</p> <p>No → Repair the Headlamp Washer Relay Control circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***HEADLAMP WASHERS NOT OPERATING PROPERLY — Continued**

TEST	ACTION	APPLICABILITY
13	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module (BCM). Perform BODY VERIFICATION TEST - VER 1.	All

WINDSHIELD WIPER & WASHER

Symptom:

*WASHER, INOPERATIVE

POSSIBLE CAUSES

IGNITION SWITCH OUTPUT RUN/ACC CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT RUN/ACC SHORT TO GROUND
WASHER PUMP MOTOR CONTROL CIRCUIT SHORT TO GROUND
WASHER PUMP SWITCH INTERNALLY SHORTED
WASHER PUMP SHORTED
FUSED IGNITION SWITCH OUTPUT RUN/ACC CIRCUIT OPEN
GROUND CIRCUIT OPEN
WASHER PUMP CONTROL SWITCH OUTPUT CIRCUIT OPEN
WASHER PUMP SWITCH OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Using a 12-volt test light connected to ground, probe the Ignition Switch Output ACC/RUN circuit in the junction block fuse #5 connector. Does the test light illuminate brightly? Yes → Go To 2 No → Repair the open Ignition Switch Output Run/Acc circuit . Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect junction block fuse #5. Is the fuse open? Yes → Go To 3 No → Go To 7 Note: Reinstall the fuse if it is not open.	All
3	Turn the ignition off. Disconnect the Multi-Function Switch harness connector. Remove junction block fuse #5. Measure the resistance between ground and the fused ignition switch output ACC/RUN circuit. Is the resistance below 100.0 ohms? Yes → Repair the Fused Ignition Switch Output Run/ACC circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

***WASHER, INOPERATIVE — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Washer Pump harness connector. Disconnect the BCM C2 harness connector. Disconnect the Multi-Function Switch harness connector. Measure the resistance between ground and the Washer Pump Control Switch Output circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair Washer Pump Control Switch Output circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Multi-Function Switch harness connector. Remove the Multi-Function Switch from the Steering Column. Ensure that the washer switch is in the off position. Measure the resistance of the Multi-Function Switch between terminal 1 and each of the remaining six terminals in the 7-way connector (component side). Is the resistance below 100.0 ohms for any of the measurements?</p> <p>Yes → Replace the Right Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Windshield Washer Pump Motor. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Disconnect the Multi-Function Switch harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the fused ignition switch output circuit. Does the test light illuminate?</p> <p>Yes → Go To 8</p> <p>No → Repair the Fused Ignition Switch Output Run/Acc for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Turn the ignition off. Disconnect the Washer Pump harness connector. Using a 12-volt test light connected to 12-volts, probe the washer pump ground circuit. WINDSHIELD WIPER & WASHER

*WASHER, INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
9	<p>Turn the ignition off. Disconnect the Windshield Washer Pump Motor harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Washer Pump Motor Control Output circuit at the Windshield Washer Pump Motor harness connector. Monitor the test light while pressing and releasing the washer switch. Does the test light turn on and off while pressing and releasing the washer switch?</p> <p>Yes → Go To 10</p> <p>No → Repair the Washer Pump Motor Control Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
10	<p>Turn the ignition off. Disconnect the Multi-Function Switch harness connector. Remove the Multi-Function Switch from the steering column. Measure the resistance of the Multi-Function Switch between terminals 1 and 2. Monitor the ohmmeter while pushing and releasing the washer switch. Note: The resistance reading should change from above 100.0 ohms when the washer switch is released to below 5.0 ohms when the switch is pressed. Did the resistance readings change from above 100.0 ohms to below 5.0 ohms as described in Note?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***WASHER, RUNS ALL THE TIME WITH IGNITION ON****POSSIBLE CAUSES**

WASHER PUMP MOTOR CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE

WASHER PUMP SWITCH SHORT TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	<p>Ensure that the washer switch is in the off position. Turn the ignition on. Disconnect the Multi-Function Switch harness connector. Does the wiper and washers stop working when the multi-function switch is disconnected?</p> <p>Yes → Go To 2</p> <p>No → Repair Washer Pump Motor Control Output circuit short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Ensure that the windshield washer switch is in the off position. Turn the ignition on. Disconnect the Multi-Function Switch harness connector. Did the wiper and washers stop working when the multi-function switch is disconnected?</p> <p>Yes → Replace the Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

WINDSHIELD WIPER & WASHER

Symptom:

***WIPER, NOT WORKING IN THE LOW SPEED**

POSSIBLE CAUSES

WIPER HIGH/LOW RELAY

WIPER HIGH/LOW RELAY CONTROL CIRCUIT SHORTED TO GROUND

MULTI-FUNCTION SWITCH LOW SWITCH OPEN

FUSED B(+) CIRCUIT OPEN

LOW SPEED OUTPUT CIRCUIT OPEN

WIPER MOTOR

BCM

TEST	ACTION	APPLICABILITY
1	Remove the Wiper High/Low Relay. Connect a jumper wire between the Fused B(+) circuit and the Wiper Low Speed Output circuit. Observe windshield wiper operation. Are the windshield wipers operating at low speed? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Install a substitute relay in place of the Wiper High/Low Relay. Turn the ignition on. Turn the Multi-Function Switch to the low wiper setting, then to the high wiper setting. Observe wiper operation for each setting. Do the low speed and high speed wipers operate correctly? Yes → Replace the Wiper HIGH/LOW Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Multi-Function Switch harness connector and remove the Multi-Function Switch from the steering column. Set the multi-function switch to the low speed position. Measure the resistance between terminals 1 and 3 of the Multi-Function Switch connector (component side). Is the resistance between 980.0 and 1060.0 ohms? Yes → Go To 4 No → Replace the Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1.	All

***WIPER, NOT WORKING IN THE LOW SPEED — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Remove the Wiper High/Low Relay from the PDC. Disconnect the BCM C3 harness connector. Measure the resistance between ground and the Wiper High/Low Relay Control circuit. Is the resistance below 100.0 ohms? Yes → Repair the Wiper High/Low Relay Control circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	If there are no possible causes, view repair Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
6	Remove the Wiper High/Low Relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused B(+) circuit. Does the test light illuminate? Yes → Go To 7 No → Repair the Fused B(+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Remove the Wiper High/Low Relay from the PDC. Disconnect the Wiper Motor harness connector. Measure the resistance of the Low Speed Output circuit between the wiper motor and the PDC High/Low Relay connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the Low Speed Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
8	If there are no possible causes, view repair Repair Replace the Wiper Motor. Perform BODY VERIFICATION TEST - VER 1.	All

WINDSHIELD WIPER & WASHER

Symptom:

*WIPER, ERRATIC OPERATION IN INTERMITTENT SPEEDS

POSSIBLE CAUSES
WIPER ON/OFF RELAY
WIPER PARK SWITCH SENSE CIRCUIT OPEN
WIPER PARK SWITCH SENSE CIRCUIT SHORT TO GROUND
WIPER MOTOR
BCM

TEST	ACTION	APPLICABILITY
1	Install a substitute relay in place of the Wiper On/Off Relay. Turn the ignition on. Turn the wipers on. Does the system operate correctly? Yes → Replace the Wiper On/Off Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the Wiper Park Switch Sense circuit between the BCM C3 harness connector and the Wiper Motor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Wiper Park Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the BCM C3 harness connector. Measure the resistance between ground and the Wiper Park Switch Sense circuit. Is the resistance below 100.0 ohms? Yes → Repair the Wiper Park Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

***WIPER, ERRATIC OPERATION IN INTERMITTENT SPEEDS — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Turn the ignition on. With the DRBIII® in Inputs/Outputs, monitor the wiper park switch state. Connect one end of a jumper wire to the Wiper Park Switch Sense circuit at the Windshield Wiper Motor harness connector. While observing the DRBIII®, hold the other end to ground for several seconds. Did wiper park switch input change state when connected to ground then disconnected from ground?</p> <p>Yes → Replace the Wiper Motor. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

WINDSHIELD WIPER & WASHER

Symptom:

***WIPER, NO WIPE AFTER WASH**

POSSIBLE CAUSES

WIPER OPERATION

WASHER PUMP CONTROL SWITCH OUTPUT CIRCUIT OPEN

BCM

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. Turn the wiper switch to each intermittent position, then to the low speed and high speed positions. NOTE: Observe wiper operation when selecting each speed of operation. Do the wipers operate correctly at all selected speeds?</p> <p>Yes → Go To 2</p> <p>No → Refer to the Wiper category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition off. Disconnect the BCM C2 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Washer Pump Control Switch Output circuit at the BCM C2 harness connector. Monitor the test light while pressing and releasing the washer switch. Does the test light flash on and off while pressing and releasing the washer switch?</p> <p>Yes → Go To 3</p> <p>No → Repair the Washer Pump Control Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>If there are no possible causes remaining, view repair</p> <p>Repair</p> <p>Replace the BCM. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:***WIPER, NOT WORKING AT ALL****POSSIBLE CAUSES**

WIPER MUX CIRCUIT SHORTED TO VOLTAGE
 FUSED B(+) CIRCUIT
 FUSED B(+) CIRCUIT OPEN

WINDSHIELD WIPER & WASHER

*WIPER, NOT WORKING AT ALL — Continued

TEST	ACTION	APPLICABILITY
13	<p>Turn the ignition off. Disconnect the multi-function switch harness connector. Turn the ignition on. With the DRBIII®, read the intermittent wiper switch volts. Using a 12-volt test light connected to 12-volts, momentarily connect and disconnect the test light to the wiper mux switch signal circuit at the multi-function switch harness connector. Does the DRBIII® show intermittent wiper switch volts change from 0.0 volts to above 10.0 volts?</p> <p>Yes → Replace the Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All
14	<p>Remove the Wiper On/Off Relay from the PDC. Using a 12-volt test light connected to ground, probe both Fused B(+) circuits in the PDC. Does the test light illuminate brightly at each terminal?</p> <p>Yes → Go To 15</p> <p>No → Repair the Fused B(+) circuit(s) for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
15	<p>Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. NOTE: Ensure the ignition, all lights and accessories are turned off for at least 30 seconds. Using a 12-volt test light connected to 12-volts, probe the Ground circuit at the windshield wiper motor harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 16</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
16	<p>Turn the ignition off. Install a substitute relay in place of the Wiper High/Low Relay Turn the ignition on. Turn the Multi-Function Switch to the low wiper setting, then to the high wiper setting. Observe wiper operation for each setting. Do the low speed and high speed wipers operate correctly?</p> <p>Yes → Replace the Wiper High/Low Relay. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 17</p>	All
17	<p>Turn the ignition off. Remove the Wiper High/Low Relay from the PDC. Remove the Wiper On/Off Relay from the PDC. Measure the resistance of the Common circuit between ground in the PDC. Is the resistance below 10.0 ohms?</p> <p>Yes → Repair the Common Circuit for a shorted to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 18</p>	All

***WIPER, NOT WORKING AT ALL — Continued**

TEST	ACTION	APPLICABILITY
18	Turn the ignition off. Remove the wiper High/Low Relay from the PDC. Remove the wiper On/Off Relay from the PDC. Measure the resistance of the Common circuit between the High/Low Relay and the On/Off relay in the PDC. Is the resistance below 10.0 ohms? Yes → Go To 19 No → Repair the Common circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
19	Turn the ignition on. Disconnect the Windshield Wiper Motor harness connector. Turn the wiper switch to the low speed position. Using a 12-volt test light connected to ground, probe the low speed output circuit at the wiper motor harness connector. Does the test light illuminate brightly? Yes → Replace the Wiper Motor. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

WINDSHIELD WIPER & WASHER

Symptom:

***WIPER, NOT WORKING IN THE HIGH SPEED**

POSSIBLE CAUSES
WIPER HIGH/LOW RELAY MULTI-FUNCTION SWITCH HIGH SWITCH OPEN WIPER HIGH/LOW RELAY CONTROL CKT SHORT TO VOLTAGE WIPER HIGH/LOW RELAY CONTROL CIRCUIT OPEN FUSED B(+) CKT OPEN HIGH SPEED OUTPUT CIRCUIT OPEN HIGH SPEED OUTPUT SHORTED TO GROUND BCM WIPER MOTOR- HI SPEED RELAY

TEST	ACTION	APPLICABILITY
1	Remove the Wiper High/Low Relay. Connect a jumper wire between the Fused B(+) circuit and the Wiper High Speed output circuit. Observe windshield wiper operation. Are the windshield wipers operating at high speed? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Install a substitute relay in place of the Wiper High/Low Relay. Turn the ignition on. Turn the multi-function switch to the low wiper setting, then to the high wiper setting. Observe wiper operation for each setting. Do the low speed and high speed wipers operate correctly? Yes → Replace the Wiper High/Low Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Multi-Function Switch harness connector and remove the Multi-Function Switch from the steering column. Set the Multi-Function Switch to the high speed position. Measure the resistance between terminals 1 and 3 in the Multi-Function Switch connector (component side). Is the resistance between 480.0 and 540.0 ohms? Yes → Go To 4 No → Replace the Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1.	All

***WIPER, NOT WORKING IN THE HIGH SPEED — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Remove the Wiper High/Low Relay from the PDC. Disconnect the BCM C3 harness connector. Turn the ignition on. Measure the voltage of the Wiper High/Low Relay Control circuit. Is there any voltage present?</p> <p>Yes → Repair the Wiper High/Low Relay Control circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Remove the Wiper High/Low Relay from the PDC. Disconnect the BCM C3 harness connector. Measure the resistance of the Wiper High/Low Relay Control circuit between the PDC connector and the BCM C3 harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the Wiper High/Low Relay Control circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>If there are no possible causes, view repair</p> <p>Repair</p> <p>Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All
7	<p>Remove the Wiper High/Low Relay from the PDC. Using a 12-volt test light connected to ground, probe the fused B(+) circuit in the PDC. Does the test light illuminate brightly?</p> <p>Yes → Go To 8</p> <p>No → Repair the Fused B(+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Turn the ignition off. Remove the Wiper High/Low Relay. Disconnect the Wiper Motor harness connector. Connect a jumper wire between the Wiper High Speed Output circuit at the wiper harness connector and ground. Using a 12-volt test light connected to 12-volts, probe the High Speed Output circuit at the Wiper High/Low Relay connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 9</p> <p>No → Repair the High Speed Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

WINDSHIELD WIPER & WASHER

***WIPER, NOT WORKING IN THE HIGH SPEED — Continued**

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Remove the Wiper High/Low Relay. Disconnect the Wiper Motor harness connector. Measure the resistance between ground and the Wiper High Speed Output circuit. Is the resistance below 100.0 ohms? Yes → Repair the High Speed Output circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Wiper Motor. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***WIPER, RUNS ALL THE TIME WITH IGNITION ON****POSSIBLE CAUSES**

WIPER ON/OFF RELAY

WIPER ON/OFF RELAY CONTROL CIRCUIT SHORTED TO GROUND

LOW SPEED OUTPUT CIRCUIT SHORTED TO VOLTAGE

HIGH SPEED OUTPUT CIRCUIT SHORTED TO VOLTAGE

COMMON CIRCUIT SHORTED TO VOLTAGE

BCM

TEST	ACTION	APPLICABILITY
1	Install a substitute relay in place of the Wiper On/Off Relay. Do the Wipers operate correctly? Yes → Replace the Wiper On/Off Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Remove the Wiper On/Off Relay from the PDC. Disconnect the BCM C3 harness connector. Measure the resistance between ground and the Wiper On/Off Relay Control circuit. Is the resistance below 100.0 ohms? Yes → Repair the Wiper On/Off Relay Control circuit for a shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Remove the Wiper High/Low Relay. Disconnect the Wiper Motor harness connector. Turn the ignition on. Measure the voltage of the Low Speed Output circuit at the PDC. Is there any voltage present? Yes → Repair the Low Speed Output circuit for a shorted to battery. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Wiper High/Low Relay from the PDC. Disconnect the Wiper Motor harness connector. Turn the ignition on. Measure the voltage of the Wiper High Speed Output circuit at the PDC High/Low Relay connector. Is there any voltage present? Yes → Repair the High Speed Output circuit for a shorted to battery. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

WINDSHIELD WIPER & WASHER

***WIPER, RUNS ALL THE TIME WITH IGNITION ON — Continued**

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Remove the Wiper On/Off and High/Low Relays. Turn the ignition on. Measure the voltage of the Common circuit at the Wiper High/Low Relay connector in the PDC. Is the voltage above 10.0 volts? Yes → Repair the Common Circuit shorted to battery voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Verification Tests

41TE (NGC) TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
<p>1. NOTE: After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed. Refer to the Powertrain Category.</p> <p>2. Connect the DRBIII® to the Data Link Connector (DLC).</p> <p>3. Reconnect any disconnected components.</p> <p>4. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's.</p> <p>5. Perform *PRNDL FAULT CLEARING PROCEDURE after completion of repairs for P0706 CHECK SHIFTER SIGNAL.</p> <p>6. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C or 110° F.</p> <p>7. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure.</p> <p>8. NOTE: If the Transmission Control Module or Torque Converter has been replaced or if the Transmission has been repaired or replaced it is necessary to perform the DRBIII® Quick Learn Procedure and reset the "Pinion Factor"</p> <p>9. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees.</p> <p>10. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.</p> <p>11. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC is repaired.</p> <p>12. If equipped with AutoStick®, upshift and downshift several times using the AutoStick® feature during the road test.</p> <p>13. NOTE: Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.</p> <p>14. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test, return to the Symptom list and perform the appropriate symptom.</p> <p>15. NOTE: Erase P0700 DTC in the PCM to turn the MIL light off after making transmission repairs.</p> <p>Were there any Diagnostic Trouble Codes set during the road test?</p> <p>Yes → Repair is not complete, refer to the appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

ABS VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Turn the ignition off. 2. Connect all previously disconnected components and connectors. 3. Ensure all accessories are turned off and the battery is fully charged. 4. Ensure that the Ignition is on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. 6. If any Diagnostic Trouble Codes are present, return to Symptom list and troubleshoot new or recurring symptom. 7. NOTE: For Sensor Signal and Pump Motor faults, the CAB must sense all 4 wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. 8. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops. 9. Caution: Ensure braking capability is available before road testing. 10. Again, with the DRBIII® read DTC's. If any DTC's are present, return to Symptom list. 11. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete. <p>Are any DTC's present or is the original concern still present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

AIRBAG VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery. 2. WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY. 3. Connect the DRBIII® to the Data Link Connector - use the most current software available. 4. Use the DRBIII® and erase the stored codes in all airbag system modules. 5. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On. 6. Wait one minute, and read active codes and if there are none present read the stored codes. 7. Note: If equipped with Airbag On-Off switch, read the DTC's in all switch positions. 8. Note: Read the DTC's in all airbag system related modules. 9. If the DRBIII® shows any active or stored codes, return to the Symptom list and follow path specified for that trouble code. If no active or stored codes are present, the repair is complete. <p>Are any DTC's present or is the original condition still present?</p> <p>YES Repair is not complete, refer to appropriate symptom list.</p> <p>NO Repair is complete.</p>	All

Verification Tests — Continued

BODY VERIFICATION TEST - VER 1	APPLICABILITY
<p>1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.</p> <p>2. NOTE: If the SKIM or PCM was replaced, refer to the service information for proper programming procedures.</p> <p>3. If the Body Control Module was replaced, turn the ignition on for 15 seconds (to allow the new BCM to learn VIN) or engine may not start (if VTSS equipped). If the vehicle is equipped with VTSS, use the DRBIII® and enable VTSS.</p> <p>4. Program all RKE transmitters and other options as necessary.</p> <p>5. If any repairs were made to the HVAC System, either disconnect the battery or remove JB Fuse #19 for five minutes to calibrate the HVAC doors.</p> <p>6. Ensure that all accessories are turned off and the battery is fully charged.</p> <p>7. With the DRBIII®, record and erase all DTC's from ALL modules. Start and run the engine for 2 minutes. Operate all functions of the system that caused the original concern.</p> <p>8. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII®, read DTC's from ALL modules.</p> <p>Are any DTC's present or is the original condition still present?</p> <p>Yes → Repair is not complete, refer to the appropriate symptom.</p> <p>No → Repair is complete.</p>	All

MEMORY HEATED SYSTEM VERIFICATION TEST - VER 1	APPLICABILITY
<p>1. Reconnect all previously disconnected components and connectors.</p> <p>2. If any Memory Heated Seat Memory Module Trouble Codes are present, erase at this time.</p> <p>3. If the Memory Seat Module was replaced, use the DRBIII and Reset Guard Bands.</p> <p>4. With the Memory Switch on the Driver's Door, program the Driver's Seat #1 Button to a desired position and Driver #2 Button to a different position.</p> <p>5. Remove the Ignition Key and close all Doors to allow the Body Control Module to time out, about 30 seconds.</p> <p>6. Verify that both Memory positions can be recalled from the RKE transmitter and the Memory Switch on the Driver's Door.</p> <p>7. Turn the ignition on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning.</p> <p>8. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules.</p> <p>Are any DTC's present or is the original complaint still present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all components related to the repair are connected properly.</p> <p>5. Inspect the engine oil for fuel contamination. Replace the oil and filter as necessary.</p> <p>6. Attempt to start the engine.</p> <p>7. If the No Start condition is still present, refer to the symptom list and perform the diagnostic testing as necessary. refer to and Technical Service Bulletins that may apply.</p> <p>8. Run the engine for one warm-up cycle to verify operation.</p> <p>9. With the DRBIII®, confirm that no DTCs or Secondary Indicators are present and that all components are functioning properly.</p> <p>10. If a DTC is present, refer to the appropriate category and select the corresponding symptom. Are any DTCs present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

SKIS VERIFICATION	APPLICABILITY
<p>1. Reconnect all previously disconnected components and connectors.</p> <p>2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997).</p> <p>3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKIM will Lock Out the DRB III for 1 hour.</p> <p>4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary.</p> <p>5. With the DRB III, select Theft Alarm, SKIM and Miscellaneous. Then select desired procedure and follow the steps that will be displayed.</p> <p>6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM.</p> <p>7. NOTE: Prior to returning vehicle to the costumer, perform a module scan to be sure that all DTC's are erased. Erase any DTC's that are found.</p> <p>8. With the DRB III erase all DTC's. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle.</p> <p>9. With the DRB III, read the SKIM DTC's. Are there any SKIM DTC's?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

SPEED PRO STEERING VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Connect all previously disconnected components and connectors. 2. With the DRBIII®, erase DTC's. 3. Cycle the ignition switch from off to on. 4. With the DRBIII®, read DTC's. If any DTCs are present return to the Symptom List and perform the appropriate diagnostic procedure. If no DTCs are present, road test the vehicle for at least 15 minutes performing several steering maneuvers. 5. Again with the DRBIII®, read DTC's. If any DTCs are present select the appropriate symptom from the Symptom List and perform the appropriate diagnostic procedure. 6. If no DTCs are present and the customers complaint cannot be duplicated, the repair is complete. <p>Were there any DTCs set during the road test?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All
TIRE PRESSURE VERIFICATION TEST	APPLICABILITY
<ol style="list-style-type: none"> 1. Perform the EVIC training as instructed in the System Description. 2. Using the DRBIII® or the EVIC RESET button, set the EVIC to Diagnostics mode (blank screen). <p>3. NOTE: Set the EVIC as follows:</p> <ol style="list-style-type: none"> 4. Press and hold the EVIC RESET button for five seconds (EVIC will beep). 5. Set the EVIC to display BLOCK COUNTERS. <p>6. NOTE: A vehicle graphic will display showing counters at wheel locations.</p> <ol style="list-style-type: none"> 7. Drive the vehicle at 40 km/h (25 mph) for at least 2 minutes. 8. Observe that the counters increment at least 3 sensor/transmitter receptions for each wheel. <p>Can the EVIC be trained and do the counters show Sensor/Transmitter receptions?</p> <p>Yes → Repair is complete.</p> <p>No → Refer to Diagnosing System Faults in the Description and Operation for this system.</p>	All
VTSS VERIFICATION TEST - 1A	APPLICABILITY
<ol style="list-style-type: none"> 1. Ensure all doors and the decklid are closed. 2. Open the driver door. 3. Remove the ignition key (but keep in hand). 4. Lock the doors with RKE transmitter. 5. Close the driver door. 6. - If the VTSS Indicator Lamp flashes rapidly and after approximately 15 seconds changes to a slower flash, the system is operational. 7. - If the Indicator fails to flash as described, there is a problem with the system. Select the Identifying VTSS symptom from the Symptom List to troubleshoot. <p>Are any DTC's present or is the original complaint still present?</p> <p>Yes → Repair is not complete, refer to the appropriate symptom.</p> <p>No → Repair is complete.</p>	All

NOTE:

The 2004 LH is a combined Powertrain Control Module and Transmission Control Module in a single control module. This new module is the Next Generation Controller 1 (NGC1) for DaimlerChrysler and will be referred to as the Powertrain Control Module (PCM).

New Diagnostics procedures and New DTC numbers are some of the changes you will see which reflect the new combined module technology. The PCM will have four color coded connectors C1 through C4, (C1-BLK, C2-ORANGE, C3-WHITE, C4-GREEN), each PCM connector will have 38 pins each. Two new tools are introduced to help in diagnosing and repairing the new PCM terminals and harness connectors. The Miller #3638 terminal removal pick is introduced, you must use the Miller #3638 tool to release the connector terminals or harness and connector damage will occur. Also, the Miller #8815 Pinout Box is introduced, you must use the Miller #8815 tool to probe the PCM terminals or terminal damage will occur. There is also a new Verification test and module replacement procedure for the new PCM.

1.0 INTRODUCTION

The procedures contained in this manual include specifications, instructions, and graphics needed to diagnose the PCM Powertrain System. The diagnostics in this manual are based on the failure condition or symptom being present at time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate modules; ie., if the DRBIII® displays a No Response condition, you must diagnose this first before proceeding.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All system schematics are in Section 10.0.

An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service information for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. READ THIS DIAGNOSTIC INFORMATION BEFORE TRYING TO DIAGNOSE A VEHICLE CODE. It is recommended that you review the entire diagnostic information to become familiar with all new and changed diagnostic procedures.

If you have any comments or recommendations after reviewing the diagnostic information, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers the 2004 LH vehicle equipped with the 2.7L and 3.5L engines.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the powertrain control module (PCM) is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The Powertrain Control Module (PCM) monitors and controls:

- Fuel System
- Idle Air Control System
- Ignition System
- Charging System
- Speed Control System
- Cooling system

GENERAL INFORMATION

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

These Sequential Fuel Injection (SFI) engine systems have the latest in technical advances. The OBDII/Euro Stage III OBD diagnostics incorporated with the Powertrain Control Module (PCM) are intended to assist the field technician in repairing vehicle problems by the quickest means.

3.2 FUNCTIONAL OPERATION

3.2.1 FUEL CONTROL

The PCM controls the air/fuel ratio of the engine by varying fuel injector on time. Mass air flow is calculated using the speed density method using engine speed, manifold absolute pressure, and air temperature change.

Different fuel calculation strategies are used depending on the operational state of the engine. During crank mode, a longer pulse width fuel pulse is delivered followed by fuel pulses determined by a crank time strategy. Cold engine operation is determined via an open loop strategy until the O₂ sensors have reached operating temperature. At this point, the strategy enters a closed loop mode where fuel requirements are based upon the state of the O₂ sensors, engine speed, MAP, throttle position, air temperature, battery voltage, and coolant temperature.

3.2.2 ON-BOARD DIAGNOSTICS

The PCM has been programmed to monitor many different circuits of the fuel injection system. This monitoring is called on-board diagnosis.

Certain criteria, or arming conditions, must be met for a trouble code to be entered into the PCM memory. The criteria may be a range of: engine rpm, engine temperature, and/or input voltage to the PCM. If a problem is sensed with a monitored circuit, and all of the criteria or arming conditions are met, then a trouble code will be stored in the PCM.

It is possible that a trouble code for a monitored circuit may not be entered into the PCM memory

even though a malfunction has occurred. This may happen because one of the trouble code criteria have not been met.

The PCM compares input signal voltages from each input device with specifications (the established high and low limits of the range) that are programmed into it for that device. If the input voltage is not within specifications and other trouble code criteria are met, a trouble code will be stored in the PCM memory.

The On Board Diagnostics have evolved to the second Generation of Diagnostics referred to as OBDII/Euro Stage III OBD. These OBDII/Euro Stage III OBD Diagnostics control the functions necessary to meet the requirements of California OBDII, Federal OBD regulation and European regulation. These requirements specify the inclusion of a Malfunction Indicator Light (MIL) located on the instrument panel. The purpose of the MIL is to inform the vehicle operator in the event of a malfunction of any emission system or component.

MIL Lamp Strategy

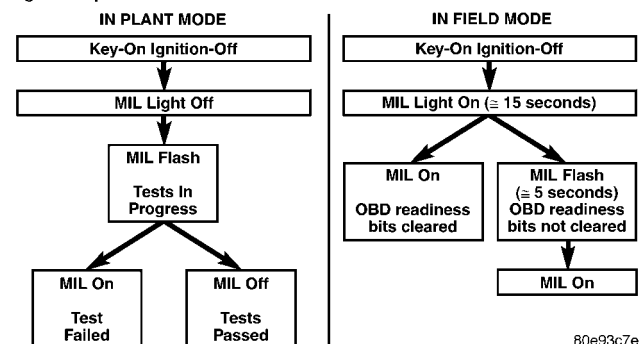

I/M Readiness OK to test = **Key On Engine OFF**

– MIL Lamp will remain on until the vehicle is started or Ignition is turned off.

I/M not ready for testing = **Key On Engine OFF**

– MIL Lamp on solid for (15) seconds then MIL Lamp will flash on/off for (5) seconds then it will remain on until the vehicle is started or the Ignition is turned off.

In order to meet mandated regulations, a new feature has been added to engine control modules for 2002 to provide an OBDII I/M (In-Field Inspection & Maintenance) readiness indicator. When the engine controller is in in-field mode, turning the key on with the engine off will activate the MIL light for approximately 15 seconds. After this time, if the vehicle is ready for I/M testing the MIL light will remain fully illuminated. If the vehicle is not ready, the MIL light will blink for approximately 5 seconds and then remain on until the first engine crank or the key is turned off. This differs from the previous behavior of the MIL light, which was only activated with a failure in the system. For in-plant mode, the MIL light will function as in previous model years. Below are diagrams of how the MIL light will operate.

GENERAL INFORMATION

OBD II MONITOR RUN PROCESS – NGC VEHICLES

The following procedure has been established to assist Technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

NOTE:

A. Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. NVLD Monitor runs after key off.
B. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

Monitor Preliminary Checks:

1. Plug a DRB III® into the vehicle's DLC.
2. Turn the ignition, KEY ON – ENGINE OFF. Watch for MIL lamp illumination during the bulb check. MIL lamp must have illuminated, if not, repair MIL lamp.
3. On the DRB III® Select #1 DRB III Standalone.
4. Select #1 1998-2002 Diagnostics
5. Select #1 Engine
6. Select #2 DTCs and Related Functions
7. Select #1 Read DTCs
 - * Verify that No Emissions Related DTCs are Present.
 - * If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
 - * The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.
8. Return to Engine Select Function Menu and Select #9, OBD II Monitors.
9. Select #3 CARB Readiness Status.

Do all the CARB Readiness Status Locations read **YES?**

***YES**, then all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.

***NO**, then the following procedure needs to be followed to run/complete all available monitors.

NOTE:

A. Only the monitors, which are not YES in the CARB Readiness Status, need to be completed.

B. Specific criteria need to be met for each monitor. Each monitor has a Pre-Test screen to assist in running the monitor.

For additional information, refer to the Chrysler Corporation Technical Training Workbook titled On Board Diagnostics: OBDII/EOBD, part number 81-699-01050.

The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.

A. Natural Vacuum Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight – parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. For the monitor run conditions select the EVAP MON PRE-TEST in the DRBIII®, OBD II Monitors Menu. The Purge monitor will run if the small leak test reports a pass.

Criteria for NVLD monitor

- 1) Engine off time greater than @ one hour
- 2) Fuel Level between 15% and 85%
- 3) Start Up ECT and IAT within 10° C (18° F).
- 4) Vehicle started and run until Purge Monitor reports a result.

NOTE If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. **DO NOT** use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

B. Catalyst / O2 Monitor

With NGC, Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (< 50 mph) for a few minutes. Some trucks run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria. For the monitor run conditions, select the BANK 1 CAT MON PRE-TEST in the DRB III®, OBD II Monitors Menu.

C. EGR Monitor

The EGR monitor now runs in a closed throttle decel or at idle on a warm vehicle. However, it is necessary to maintain the TPS, Map and RPM ranges to allow the monitor to complete itself. For the monitor run conditions, select the EGR PRE-TEST in the DRB III®, OBD II Monitors Menu.

D. O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down. For the monitor run conditions, select the O2S HEATER MON PRE-TEST in the DRB III®, OBD II Monitors Menu.

3.2.3 OTHER CONTROLS

CHARGING SYSTEM

The charging system is turned on when the engine is started. The Generator field is control by the PCM using a 12-volt high-side driver and a body ground circuit. The Generator output voltage is determined by the PCM. When more system voltage is needed, the PCM will apply a longer duty cycle using the 12-volt high-side drive and shortens duty cycle or none at all when less voltage is needed.

SPEED CONTROL SYSTEM

The PCM controls vehicle speed by operation of the speed control servo vacuum and vent solenoids. Energizing the vacuum solenoid applies vacuum to the servo to increase throttle position. Operation of the vent solenoid slowly releases the vacuum allowing throttle position to decrease. A special vacuum dump solenoid allows immediate release of the throttle during speed control operation.

Speed control may be cancelled by braking, driver input using the speed control switches, shifting into neutral, excessive engine speed (wheels spinning), or turning the ignition off.

NOTE: If two speed control switches are selected simultaneously, the PCM will detect an illegal switch operation and turn the speed control off.

O2 SENSOR

The O2 system with ignition on and engine off has a normalized O2 voltage of around 5 volts as displayed on the DRBIII or measured with a high impedance voltmeter. As the O2 sensor starts generating a signal the voltage will move towards 2.5 volts. The voltage will typically vary between 2.5 volts and 3.5 volts on a normal running engine. The goal voltage is also typically between 2.5 and 3.5 volts. This implies that the 0-volt through 1-volt range that you are used to is still valid, only it is

shifted up by a 2.5 volt offset. This 2.5 volt supply is being delivered through the sensor return line.

NATURAL VACUUM LEAK DETECTION (NVLD)

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Powertrain Control Module (PCM) or Next Generation Controller (NGC) starting in 2002 M.Y. This new system replaces the leak detection pump as the method of evaporative system leak detection. The current CARB requirement is to detect a leak equivalent to a 0.020" (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the "Gas Law". This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure.

In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

THE NVLD UTILIZES THE GAS LAW PRINCIPLES

A vent valve seals the canister vent during engine off conditions. If the vapor system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1" H2O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the PCM. The PCM, via appropriate logic strategies (described below), utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

THE NVLD DEVICE AND HOW IT FUNCTIONS

The NVLD Assembly is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD Assembly is mounted on top of the canister outlet for the LH.

The normally open vacuum switch will close with about 1" H2O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed

GENERAL INFORMATION

check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3" to 6" H₂O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative. The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the NVLD Assembly is a diaphragm that will open the seal with pressure in the evaporative system. The seal will be opened at about 0.5" H₂O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to "breathe" during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The NVLD Assembly itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The PCM utilizes a high-side driver to energize and duty-cycle the solenoid.

THE PCM'S ROLE IN NVLD DIAGNOSIS:

The integral part of the diagnostic system that makes engine-off leak detection possible is a special circuit in the PCM controller. After the vehicle is turned off, a special part of the controller stays alive and monitors for an NVLD switch closure. This circuit within the PCM is very specific in its function and consumes very little power. If a switch closure is detected, it will log the event and time from key-off, and then power down. This information will be processed at the next key cycle.

NVLD LEAK DETECTION

Small Leak Test (Passive)

If, after a specified delay after key off (perhaps 5 minutes), the switch closes or is closed, the test will be pass, indicating that there is no leak. The PCM records the switch closure. The NVLD circuit in the PCM will shut down for the remainder of that particular engine off (soak) period. When the engine

is started, the switch closure is recorded as a "Pass," and the timers that are recording accumulated time are reset.

This diagnostic test can take at least a week to mature a leak fault. A week has been chosen for this because the vehicle will have been exposed to the largest possible drive scenarios before a decision is made (most vehicles should see both daily work and weekend driving cycles). This also satisfies CARB's stated goal of getting 3 MIL illuminations within a month for 0.020" (0.5 mm) leak detection diagnostic.

The diagnostics will log engine run time and engine off time to determine when a week has elapsed. There is a limit on the total amount of run time that is applied to the one-week timer. There is also a limit on the total soak time that will be allowed to be applied to the one-week timer. There will be a limit on the amount of accrued run time during one specific drive that can be applied to the one-week timer.

The enabling criteria to run this monitor are:

- Fuel level less than 85%
- Ambient temperature greater than 40 °F (4.4 °C)

Rationality Tests

1. The rationality check of the switch, solenoid and seal will be performed as follows:
 - At key-on, the NVLD solenoid will be energized to vent any vacuum that may be trapped in the evaporative system from the previous soak. This should result in an open switch condition.
 - The solenoid will be de-energized (to seal the system) at the point where purge begins. The system / NVLD component rationality passes for that drive cycle if the switch closes after purge begins.
 - The solenoid is then re-energized for the remainder of the drive cycle.
 - If the switch events are not seen in a certain period of time, the rationality check will have failed (2 trip rule).

2. Purge Flow:

The above rationality check is considered sufficient to confirm purge solenoid function and conformance with the purge flow test requirement. The Purge Flow Monitor is passed based on switch activity when purge is turned on or based on a rich fuel control shift when purge is turned on.

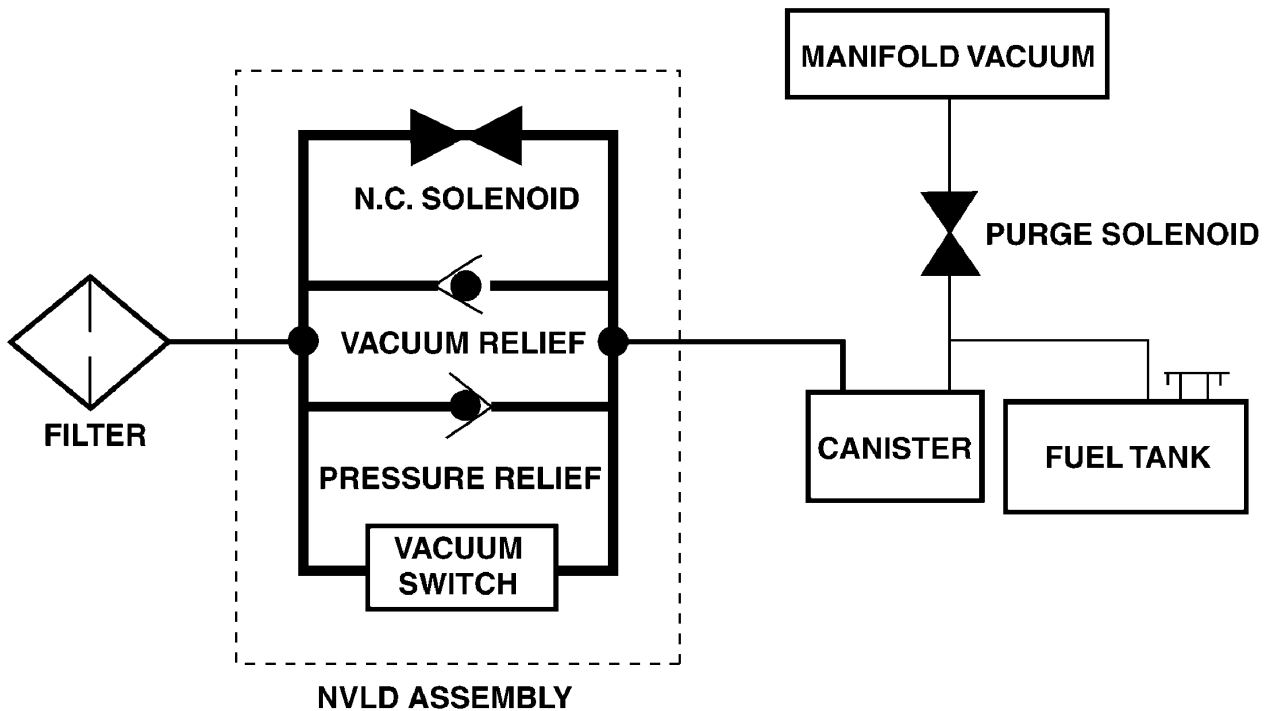

Medium and Large Leak Test (Intrusive)

NOTE: This intrusive test will only be run if the Small Leak (passive) test fails, or is inconclusive (the switch does not close)

Enabling Conditions:

- 40 °F to 90 °F

- Engine temperature at startup within 10 °F of the ambient temperature
- Fuel level less than 85%
The intrusive Medium and Large leak are conducted as follows:
- De-energize the NVLD solenoid to seal the canister vent.
- Activate purge shortly after closed loop. Pull the tank vacuum past the vacuum switch point (1" H2O vacuum) of the NVLD for a specific time while tracking the standard purge flow rate.
- Turn purge off and determine how long it takes to decay the tank vacuum and reopen the switch. Determine the leak size from the time it took to reopen the switch. Note: Fuel level is an important determining factor.
- If the switch does not close, a more aggressive purge flow will be applied to determine if it is a very large leak, missing fuel cap, problem with the NVLD device, purge flow problem, etc...

NATURAL VACUUM LEAK DETECTION SYSTEM

80dceb8e

FIGURE 1

NVLD ASSEMBLY INTERNAL SCHEMATIC

NVLD Switch Closure happens at 1" H₂O (Water) Vacuum (+ - 12% when new). Vacuum draws the Diaphragm up closing the Switch.

- **PRESSURE RELIEF:** The Poppet Valve is spring loaded closed (up). It opens at 1" H₂O Pressure. Pressure from the Purge Canister (EVAP System) enters the top of the diaphragm chamber via an internal communication passage. Pressure then pushes the Diaphragm down unseating the Poppet Valve allow the EVAP pressure to exit to the Vent Filter.
- **VACUUM RELIEF:** The Poppet Valve is spring loaded closed (up). The Poppet Valve begins to open at 3" - 4" H₂O Vacuum, and is completely open at 6" H₂O (flows 70 Liters per Minute). Vacuum acts on the bottom of the Poppet Valve & draws it down to open the Purge Canister (EVAP System) to the Vent Filter.

NVLD Solenoid has a Resistance of 8 Ohms (+ - 0.5 Ohm) at 68 Degrees F. When Energized, it pulls the Pintle down thus opening the Poppet Valve and connects the Purge Canister with the Vent Filter (Atmosphere).

FIGURE 2

80dceb68

3.2.4 PCM OPERATING MODES

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for wide open throttle. There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two types of engine control operation: **open loop** and **closed loop**.

In **open loop** operation, the PCM receives input signals and responds according to preset programming. Inputs from the heated oxygen sensors are not monitored.

In **closed loop** operation, the PCM monitors the inputs from the heated oxygen sensors. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio of 14.7 parts air to 1 part fuel. By monitoring the exhaust oxygen content through the oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve the lowest emission levels while maintaining optimum fuel economy.

The engine start-up (crank), engine warm-up, and wide open throttle modes are open loop modes. Under most operating conditions, closed loop modes occur with the engine at operating temperature.

3.2.5 NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems, and conditions even though they could have malfunctions that result in driveability problems. A diagnostic code may not be displayed for the following conditions. However, problems with these systems may cause a diagnostic code to be displayed for other systems. For example, a fuel pressure problem will not register a diagnostic code directly, but could cause a rich or lean condition. This could cause an oxygen sensor, fuel system, or misfire monitor trouble code to be stored in the PCM.

Engine Timing – The PCM cannot detect an incorrectly indexed timing chain, camshaft sprocket, or crankshaft sprocket. The PCM also cannot detect an incorrectly indexed distributor.(*)

Fuel Pressure – Fuel pressure is controlled by the fuel pressure regulator. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line filter, or a pinched fuel supply.(*)

Fuel Injectors – The PCM cannot detect if a fuel injector is clogged, the pintle is sticking, or the wrong injectors are installed.(*)

Fuel Requirements – Poor quality gasoline can cause problems such as hard starting, stalling, and stumble. Use of methanol-gasoline blends may re-

sult in starting and driveability problems. See individual symptoms and their definitions in Section 6.0 (Glossary of Terms).

PCM Grounds – The PCM cannot detect a poor system ground. However, a diagnostic trouble code may be stored in the PCM as a result of this condition.

Throttle Body Air Flow – The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.(*)

Exhaust System – The PCM cannot detect a plugged, restricted, or leaking exhaust system.(*)

Cylinder Compression – The PCM cannot detect uneven, low, or high engine cylinder compression.(*)

Excessive Oil Consumption – Although the PCM monitors the exhaust stream oxygen content through the oxygen sensor when the system is in a closed loop, it cannot determine excessive oil consumption.

NOTE: Any of these conditions could result in a rich or lean condition causing an oxygen sensor TROUBLE CODE to be stored in the PCM, or the vehicle may exhibit one or more of the driveability symptoms listed in the Table of Contents.

3.2.6 SKIS OVERVIEW

The Sentry Key Immobilizer System (SKIS) is designed to prevent unauthorized vehicle operation. The system consists of a Sentry Key Immobilizer Module (SKIM), ignition key(s) equipped with a transponder chip and PCM. When the ignition switch is turned on, the SKIM interrogates the ignition key. If the ignition key is Valid or Invalid, the SKIM sends a PCI Bus message to the PCM indicating ignition key status. Upon receiving this message the PCM will terminate engine operation, or allow the engine to continue to operate.

3.2.7 SKIM ON-BOARD DIAGNOSTICS

The SKIM has been programmed to transmit and monitor many different coded messages as well as PCI Bus messages. This monitoring is called On Board Diagnosis.

Certain criteria must be met for a diagnostic trouble code to be entered into the SKIM memory. The criteria may be a range of; Input voltage, PCI Bus message, or coded messages to the SKIM. If all of the criteria for monitoring a circuit or function are met and a fault is sensed, a diagnostic trouble code will be stored in the SKIM memory.

3.2.8 SKIS OPERATION

When ignition power is supplied to the SKIM, the SKIM performs an internal self-test. After the self-test is completed, the SKIM energizes the antenna (this activates the transponder chip) and sends a challenge to the transponder chip. The transponder chip responds to the challenge by generating an encrypted response message using the following:

Secret Key - This is an electronically stored value (identification number) that is unique to each SKIS. The secret key is stored in the SKIM, PCM and all ignition key transponders.

Challenge - This is a random number that is generated by the SKIM at each ignition key cycle.

The secret key and challenge are the two variables used in the algorithm that produces the encrypted response message. The transponder uses the crypto algorithm to receive, decode and respond to the message sent by the SKIM. After responding to the coded message, the transponder sends a transponder I.D. message to the SKIM. The SKIM compares the transponder I.D. to the available valid key codes in the SKIM memory (8 key maximum at any one time). After validating the key ignition the SKIM sends a PCI Bus message called a Seed Request to the engine controller then waits for a PCM response. If the PCM does not respond, the SKIM will send the seed request again. After three failed attempts the SKIM will stop sending the seed request and store a trouble code. If the PCM sends a seed response, the SKIM sends a valid/invalid key message to the PCM. This is an encrypted message that is generated using the following:

VIN - Vehicle Identification Number

Seed - This is a random number that is generated by the PCM at each ignition key cycle.

The VIN and seed are the two variables used in the rolling code algorithm that encrypts the valid/invalid key message. The PCM uses the rolling code algorithm to receive, decode and respond to the valid/invalid key message sent by the SKIM. After sending the valid/invalid key message the SKIM waits 3.5 seconds for a PCM status message from the PCM. If the PCM does not respond with a valid key message to the SKIM, a fault is detected and a trouble code is stored.

The SKIS incorporates a VTSS LED located on the instrument panel upper cover. The LED receives switched ignition voltage and is hardwired to the body control module. The LED is actuated when the SKIM sends a PCI Bus message to the body controller requesting the LED on. The body controller then provides the ground for the LED. The SKIM will request VTSS LED operation for the following:

- bulb checks at ignition on

- to alert the vehicle operator to a SKIS malfunction
- customer key programming mode

For all faults except transponder faults and VTSS LED remains on steady. In the event of a transponder fault the LED flashes at a rate of 1 Hz (once per second). If a fault is present the LED will remain on or flashing for the complete ignition cycle. If a fault is stored in SKIM memory which prevents the system from operating properly, the PCM will allow the engine to start and run (for 2 seconds) up to six times. After the sixth attempt, the PCM disables the starter relay until the fault is corrected.

3.2.9 PROGRAMMING THE POWERTRAIN CONTROL MODULE

Important Note: Before replacing the PCM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal failure to components (i.e. 12-volt pull-ups, drivers and ground sensors). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

NOTE: If the PCM and the SKIM are replaced at the same time, program the VIN into the PCM first. All vehicle keys will then need to be replaced and programmed to the new SKIM.

The SKIS Secret Key is an I.D. code that is unique to each SKIS. This code is programmed and stored in the SKIM, engine controller and transponder chip (ignition key). When replacing the PCM it is necessary to program the secret key into the PCM.

NOTE: After replacing the PCM, you must reprogram pinion factor.

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select THEFT ALARM, SKIM then MISCELLANEOUS.
3. Select PCM REPLACED.
4. Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: If three attempts are made to enter the secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the run position for one hour then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).

5. Press ENTER to transfer the secret key (the SKIM will send the secret key to the PCM).

3.2.10 PROGRAMMING THE SENTRY KEY IMMOBILIZER MODULE

NOTE: If the PCM and the SKIM are replaced at the same time, program the VIN into the PCM first. All vehicle keys will then need to be replaced and programmed to the new SKIM.

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select THEFT ALARM, SKIM then MISCELLANEOUS.
3. Select SKIM MODULE REPLACEMENT (GASOLINE).
4. Program the vehicle four-digit PIN into the SKIM.
5. Select COUNTRY CODE and enter the correct country.

NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKIM, the SKIM must be replaced.

6. Select UPDATE VIN (the SKIM will learn the VIN from the PCM).
7. Press ENTER to transfer the VIN (the PCM will send the VIN to the SKIM).
8. The DRBIII® will ask if you want to transfer the secret key. Select ENTER to transfer secret key from the PCM. This will ensure the current vehicle ignition keys will still operate the SKIS system.

3.2.11 PROGRAMMING THE IGNITION KEYS TO THE SENTRY KEY IMMOBILIZER MODULE

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select THEFT ALARM, SKIM, then MISCELLANEOUS.

3. Select PROGRAM IGNITION KEYS.
4. Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A maximum of eight keys can be learned to each SKIM AT ONE TIME. Once a key is learned to a SKIM it (the key) cannot be transferred to another vehicle.

If ignition key programming is unsuccessful, the DRBIII® will display one of the following messages:
Programming Not Attempted - The DRBIII® attempts to read the programmed key status and there are no keys programmed in the SKIM memory.

Programming Key Failed - (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

- faulty ignition key transponder
- ignition key is programmed to another vehicle.

8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

1. Obtain ignition keys to be programmed from customer (8 keys maximum)
2. Using the DRBIII®, erase all ignition keys by selecting MISCELLANEOUS and ERASE ALL CURRENT IGN. KEYS
3. Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

3.3 DIAGNOSTIC TROUBLE CODES

Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of trouble codes as well as no trouble code problems. It is not necessary to perform all of the tests in this book to diagnose an individual code.

Always begin by reading the diagnostic trouble codes using the DRBIII®.

3.3.1 HARD CODE

A diagnostic trouble code that comes back within one cycle of the ignition key is a hard code. This means that the defect is there every time the powertrain control module checks that circuit or function. Procedures in this manual verify if the DTC is a hard code at the beginning of each test. When it is not a hard code, an intermittent test must be performed.

DTC's that are for OBDII/Euro Stage III OBD monitors will not set with just the ignition key on. Comparing these to non-emission DTC's, they will seem like an intermittent. These DTC's require a set of parameters to be performed (The DRBIII®

GENERAL INFORMATION

pre-test screens will help with this for MONITOR DTC's), this is called a TRIP. All OBDII/Euro Stage III OBD DTCs will be set after one or in some cases two trip failures, and the MIL will be turned on. These DTC's require three successful, no failures, TRIPS to extinguish the MIL, followed by 40 warm-up cycles to erase the DTC. For further explanation of TRIPS, Pre-test screens, Warm-up cycles, and the use of the DRBIII®, refer to the On Board Diagnostic training booklet #81-699-97094.

3.3.2 INTERMITTENT CODE

A diagnostic trouble code that is not there every time the PCM checks the circuit is an intermittent DTC. Most intermittent DTC's are caused by wiring or connector problems. Defects that come and go like this are the most difficult to diagnose; they must be looked for under specific conditions that cause them. The following checks may assist you in identifying a possible intermittent problem:

- Visually inspect related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Visually inspect the related harnesses. Look for chafed, pierced, or partially broken wire.
- Refer to any technical service bulletins that may apply.
- Use the DRBIII® data recorder or co-pilot.

3.3.3 STARTS SINCE SET COUNTER

The start since set counter counts the number of times the vehicle has been started since codes were last set, erased, or the battery was disconnected. The reset counter will count up to 255 start counts.

The number of starts helps determine when the trouble code actually happened. This is recorded by the PCM and can be viewed on the DRBIII® as STARTS since set.

When there are no trouble codes stored in memory, the DRBIII® will display NO DTC's Detected and the reset counter will show STARTS since clear = XXX.

3.3.4 DISTANCE SINCE MI SET

The Euro Stage III OBD directive requires that the distance traveled by the vehicle while the MI is activated must be available at any instant through the serial port on the standard data link connector. This feature works as follows:

1. If the MI is illuminated due to a fault, the distance count is updated (i.e. it is counting).
2. If there is a stale MI fault (i.e. the fault is still frozen in memory but the MI has been extinguished due to 3 good trips), the distance count is held (i.e. frozen).

3. If the distance count is being held due to (Item 2.) and the fault is cleared, the distance is cleared (set to zero).
4. If the distance count is being held due to (Item 2.) and another MI occurs, the distance count is reset (to) and begins updating anew.
5. If a fault occurs while the MI is already illuminated due to a previous fault (the distance count is updating), then the distance count continues to update w/out interruption.
6. If the MI is flashing due to active misfire and there is an active fault (i.e. matured fault for which 3 good trips have not occurred), the distance count behaves as the MI in ON.
7. If the MI is flashing due to active misfire and there is no active fault (i.e. the MI is flashing for a 1 malf.), the distance count behaves as if the MI is off (because it is not yet a matured fault).
8. The distance count is cleared whenever the fault is cleared. (Via 40 warm up cycles, or via scan tool).

3.4 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading DTC's, erasing DTC's, and other DRBIII® functions.

3.5 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot or User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the Star Center for information and assistance. This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot
```

Press MORE to switch between this display
and the application screen.
Press F4 when done noting information.

3.5.1 DRBIII® DOES NOT POWER UP

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link

connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, and inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition

4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially

important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a powertrain system problem, it is important to follow approved procedures where applicable. These procedures can be found in service manual procedures. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB ASSEMBLIES

Some components of the powertrain system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

Follow the vehicle manufacturer's service specifications at all times.

- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

GENERAL INFORMATION

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS AND CAUTIONS

4.3.1 ROAD TEST WARNINGS

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read the DRBIII® screen while in motion. Do not hang the DRBIII® from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

4.3.2 VEHICLE DAMAGE CAUTIONS

Before disconnecting any control module, make sure the ignition is off. Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second DTC could be set, making diagnosis of the original problem more difficult.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box) scan tool
Evaporative System Diagnostic Kit #6917
fuel filler adapter #8382
fuel pressure adapter (C-6631) or #6539
fuel pressure kit (C-4799-B) or #5069
fuel release hose (C-4799-1)
Min Air flow fitting #6714
Pinout Box (Miller #8815)
jumper wires
ohmmeter
oscilloscope
vacuum gauge
voltmeter

12 volt test light minimum 25 ohms resistance with probe #6801

CAUTION: A 12 volt test light should not be used for the following circuits, damage to the powertrain controller will occur.

- 5 Volt Supply
- 8 Volt Supply
- J1850 PCI Bus
- CCD Bus
- CKP Sensor Signal
- CMP Sensor Signal
- Vehicle Speed Sensor Signal
- O2 Sensor Signal

6.0 GLOSSARY OF TERMS

ABS	anti-lock brake system	LDP	leak detection pump
backfire, popback	fuel ignites in either the intake or the exhaust system	MAP	manifold absolute pressure sensor
CKP	crank position sensor	MIL	malfunction indicator lamp
CMP	camshaft position sensor	MTV	manifold tuning valve
cuts out, misses	a steady pulsation or the inability of the engine to maintain a consistent rpm	NGC	next generation controller
DLC	data link connector (previously called engine diagnostic connector)	O2S	oxygen sensor
detonation, spark knock	a mild to severe ping, especially under loaded engine conditions	PCI	programmable communication interface
ECT	engine coolant temperature sensor	PCM	powertrain control module
EGR	exhaust gas recirculation valve and system	PCV	positive crankcase ventilation
generator	previously called alternator	PEP	peripheral expansion port
hard start	The engine takes longer than usual to start, even though it is able to crank normally.	poor fuel economy	There is significantly less fuel mileage than other vehicles of the same design and configuration
hesitation, sag, stumble	There is a momentary lack of response when the throttle is opened. This can occur at all vehicle speeds. If it is severe enough, the engine may stall.	rough, unstable, or erratic idle stalling	The engine runs unevenly at idle and causes the engine to shake if it is severe enough. The engine idle rpm may vary (called hunting). This condition may cause stalling if it is severe enough.
IAT	intake/inlet air temperature sensor	SBEC	single board engine controller
IAC	idle air control motor	SKIM	sentry key immobilizer module
JTEC	Combined engine and transmission control module	SKIS	sentry key immobilizer system
lack of power, sluggish	The engine has less than expected power, with little or no increase in vehicle speed when the throttle is opened.	start & stall	The engine starts but immediately dies.
		surge	engine rpm fluctuation without corresponding change in throttle position sensor
		TPS	throttle position sensor
		TRS	transmission range sensor
		VSS	vehicle speed sensor/signal

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the BCM C1 harness connector. Disconnect the DRB from the Data Link Connector (DLC). Measure the resistance of the PCI Bus circuit between the Data Link Connector (DLC) and the BCM C1 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>NOTE: Reconnect the BCM C1 harness connector. Turn the ignition on. Measure the voltage of the PCI Bus circuit at the Data Link Connector (DLC). Is the voltage above 7.0 volts?</p> <p>Yes → Go To 5</p> <p>No → Go To 7</p>	All
5	<p>Note: Determine which modules this vehicle is equipped with before beginning. Turn the ignition off. Disconnect the BCM harness connectors and remove the Body Control Module from the Junction Block. Turn the ignition on. Measure the voltage of each PCI Bus circuit at the BCM C1, C3, C4 connectors and at the Junction Block Body Control Module connector cavity 10. Is the voltage steadily above 7.0 volts for any measurement?</p> <p>Yes → Go To 6</p> <p>No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the module that corresponds to the PCI Bus circuit that measured steadily above 7.0 volts. Turn the ignition on. NOTE: If the PCI Bus circuit for the Memory Heated Seat/Mirror Module was above 7.0 volts and is equipped with side airbags, disconnect each module one at a time. NOTE: If the PCI Bus circuit for the Radio was above 7.0 volts and is equipped with CD Changer, disconnect the CD Changer before the Radio. Measure the voltage of the PCI Bus circuit that previously measured above 7.0 volts. Is the voltage steadily above 7.0 volts with the module disconnected?</p> <p>Yes → Repair the PCI Bus circuit that measured over 7.0 volts for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the module that caused the short to voltage on the PCI Bus circuit. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***PCI BUS COMMUNICATION FAILURE — Continued**

TEST	ACTION	APPLICABILITY
7	<p>Note: Determine which modules this vehicle is equipped with before beginning.</p> <p>Turn the ignition off.</p> <p>Disconnect the negative battery cable.</p> <p>Disconnect the BCM harness connectors and remove the Body Control Module from the Junction Block.</p> <p>Measure the resistance between ground and each of the PCI Bus circuits at the BCM C1, C3, C4 connectors and at the Junction Block Body Control Module connector cavity 10.</p> <p>Is the resistance below 1000.0 ohms for any of the measurements?</p> <p>Yes → Go To 8</p> <p>No → Replace the Body Control Module in accordance with the service information.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
8	<p>Turn the ignition off.</p> <p>Disconnect the negative battery cable.</p> <p>Disconnect the module that corresponds to the PCI Bus circuit that resistance measured below 1000.0 ohms.</p> <p>NOTE: If the PCI Bus circuit for the Memory Heated Seat/Mirror Module was below 1000.0 ohms and is equipped with side airbags, disconnect each module one at a time.</p> <p>NOTE: If the PCI Bus circuit for the Radio was below 1000.0 ohms and is equipped with a CD Changer, disconnect the CD Changer before the Radio.</p> <p>Measure the resistance between ground and the PCI Bus circuit that previously measured below 1000.0 ohms.</p> <p>Is the resistance below 1000.0 ohms with the module disconnected?</p> <p>Yes → Repair the PCI Bus circuit that resistance measured below 1000.0 ohms for a short to ground.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the module that caused the short to ground on the PCI Bus circuit.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom: INTERMITTENT CONDITION

POSSIBLE CAUSES

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>Refer to any Technical Service Bulletins (TSBs) that may apply.</p> <p>Review the DRB Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.</p> <p>With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wire harness. Look for parameter values to change and/or a DTC to set.</p> <p>Visually inspect the related wire harness. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.</p> <p>CAUTION: NEVER PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS.</p> <p>Inspect and clean all PCM, engine, and chassis grounds.</p> <p>If numerous trouble codes were set, use a wire schematic to help you find any common ground or supply circuits.</p> <p>For any Relay DTCs, actuate the Relay with the DRBIII® and wiggle the related wire harness to try to interrupt the actuation.</p> <p>For intermittent Evaporative Emission trouble codes perform a visual and physical inspection of the related parts including hoses and the Fuel cap.</p> <p>A co-pilot, data recording, and/or lab scope should be used to help diagnose intermittent conditions.</p> <p>Use the DRBIII® to perform a System Test if one applies to failing component.</p> <p>Were any problems found during the above inspections?</p> <p>Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Test Complete.</p>	All

Symptom:**P0016-CRANKSHAFT/CAMSHAFT TIMING MISALIGNMENT****When Monitored and Set Condition:****P0016-CRANKSHAFT/CAMSHAFT TIMING MISALIGNMENT**

When Monitored: Engine cranking and Engine running

Set Condition: Powertrain Control Module detects an error when the camshaft position is out of phase with the crankshaft position.

POSSIBLE CAUSES

INTERMITTENT CONDITION

CHECKING INTERMITTENT CMP SIGNAL WITH LAB

CMP WIRE HARNESS INSPECTION

TONE WHEEL/PULSE RING INSPECTION

CKP WIRE HARNESS INSPECTION

TONE WHEEL/PULSE RING INSPECTION

INTERMITTENT CKP SIGNAL

CAMSHAFT POSITION SENSOR

CRANKSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	<p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. With the DRBIII®, erase DTCs. Start the engine and run until operating temp is reached. (Closed Loop) If the DTC does not reset it may be necessary to take the vehicle on a test drive. Does the DTC reset?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

1	<p>NOTE: Diagnose any TP Sensor or MAP Sensor component DTCs before continuing.</p> <p>NOTE: If the P0501 - No Vehicle Speed Signal is set along with this DTC, refer to the P0501 diagnostics before continuing.</p> <p>NOTE: The throttle plate and linkage must be free from binding and carbon build up.</p> <p>NOTE: Ensure the throttle plate is at the idle position.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>NOTE: This code is enabled on engines with a plastic intake manifold and is intended to shut down the engine if a large crack occurs.</p> <p>NOTE: A large vacuum leak is most likely the cause of this DTC.</p> <p>Inspect the Intake Manifold for leaks and cracks. Inspect the Power Brake Booster for any vacuum leaks. Inspect the PCV system for proper operation or any vacuum leaks. Were any vacuum leaks found?</p> <p>Yes → Repair the vacuum leak as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All
3	<p>Start the engine. With the DRBIII®, monitor the MAP Sensor voltage. Snap the throttle. Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at WOT?</p> <p>Yes → Go To 4</p> <p>No → Go To 12</p>	All
4	<p>Ignition on, engine not running. With the DRBIII®, monitor the TP Sensor voltage while slowly depressing the throttle pedal from the idle position to the wide open throttle position. Does the voltage start approximately at 0.8 volts and go above 3.5 volts with a smooth transition?</p> <p>Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All

P0068-MANIFOLD PRESSURE/THROTTLE POSITION CORRELATION - HIGH FLOW/VACUUM LEAK — Continued

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K6) 5 Volt Supply circuit from the TP Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the TP Sensor (K6) 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
6	<p>Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the (K6) 5 Volt Supply circuit at the TP Sensor harness connector. Is the resistance above 100k ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the (K6) 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
7	<p>Turn the ignition off. Disconnect the TP Sensor harness connector. With the DRBIII®, monitor the TP Sensor voltage. Ignition on, engine not running. Connect a jumper wire between the (K22) TP Signal circuit and the (K4) Sensor ground circuit . Does the TP Sensor voltage change from approximately 4.9 volts to below 0.5 of a volt?</p> <p>Yes → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K22) TP Signal circuit from the TP Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the (K22) TP Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom List:

P0070-AMBIENT TEMP SENSOR STUCK

P0071-AMBIENT TEMP SENSOR PERFORMANCE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **P0070-AMBIENT TEMP SENSOR STUCK**.

When Monitored and Set Condition:

P0070-AMBIENT TEMP SENSOR STUCK

When Monitored: Engine Running.

Set Condition: After 4 warm-up cycles, the PCM did not see a 2°C (6°F) change in the Ambient Temperature Sensor voltage within 200 miles . Two Trip Fault

P0071-AMBIENT TEMP SENSOR PERFORMANCE

When Monitored: Engine off time is greater than 480 minutes. Ambient temperature is greater than -23°C(-10°F).

Set Condition: After a calibrated amount of cool down time, the PCM compares the ECT Sensor, IAT Sensor and the Ambient Air Temperature Sensor values. If the Ambient Air Temperature Sensor value is not within a calibrated temperature amount of the other two temperature sensors an error is detected. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

(K25) AAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

AMBIENT AIR TEMPERATURE SENSOR VOLTAGE BELOW 1.0 VOLT

(K25) AAT SIGNAL CIRCUIT OPEN

(K4) SENSOR GROUND CIRCUIT OPEN

(K25) AAT SIGNAL CIRCUIT SHORTED TO GROUND

(K25) AAT SIGNAL CIRCUIT SHORTED TO (K4) SENSOR GROUND

PCM LOW

PCM HIGH

P0070-AMBIENT TEMP SENSOR STUCK — Continued

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>NOTE: Visually inspect both the component and the PCM connectors. Look for damage, partially broken wires and backed out or corroded terminals Turn the ignition off. Disconnect the Ambient Air Temp Sensor harness connector. Ignition on, engine not running. Measure the voltage of the (K25) AAT Signal circuit in the Ambient Air Temperature Sensor harness connector. Is the voltage above 5.2 volts?</p> <p>Yes → Repair the short to battery voltage in the (K25) AAT Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off. Disconnect the Ambient Air Temperature Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the Ambient Air Temperature Sensor voltage. Is the voltage above 4.9 volts?</p> <p>Yes → Go To 4</p> <p>No → Go To 7</p>	All
4	<p>Turn the ignition off. Disconnect the Ambient Air Temperature Sensor harness connector. Using a jumper wire, jumper across the Ambient Air Temperature Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the Ambient Air Temperature voltage. Is the voltage below 1.0 volt?</p> <p>Yes → Replace the Ambient Air Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All

Symptom:

P0106-MAP SENSOR PERFORMANCE

When Monitored and Set Condition:

P0106-MAP SENSOR PERFORMANCE

When Monitored: With engine speed greater than 64 RPM idle and closed throttle.

Set Condition: Too small of a difference is seen between barometric and MAP pressure with ignition on (engine running) and manifold vacuum for 2.80 seconds.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

(K6) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

(K6) 5 VOLT SUPPLY CIRCUIT OPEN

MAP SENSOR INTERNAL FAILURE

(K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND

(K1) MAP SIGNAL CIRCUIT SHORTED TO (K4) SENSOR GROUND CIRCUIT

MAP (K6) 5 VOLT SUPPLY CIRCUIT OPEN

MAP SENSOR VACUUM PORT

MAP SENSOR

PCM (K6) 5 VOLT SUPPLY CIRCUIT

PCM (K1) MAP SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If a MAP high or Low DTC set along with P0106, diagnose the High or Low DTC first before continuing.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Ignition on, engine not running. With the DRBIII®, read the MAP Sensor voltage. Is the voltage below 3.19 volts?</p> <p>Yes → Go To 3</p> <p>No → Go To 11</p>	All

P0106-MAP SENSOR PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Ignition on, engine not running. Measure the voltage of the (K6) 5 Volt Supply circuit in the MAP Sensor harness connector. Is the voltage between 4.5 to 5.2 volts?</p> <p>Yes → Go To 4</p> <p>No → Go To 8</p>	All
4	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. With the DRBIII®, monitor the MAP Sensor voltage. Ignition on, engine not running. Is the voltage between 4.75 and 5.2 volts?</p> <p>Yes → Inspect the MAP sensor and the intake for any restrictions, repair as necessary. If OK, replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Symptom:

P0108-MAP SENSOR HIGH

When Monitored and Set Condition:

P0108-MAP SENSOR HIGH

When Monitored: Engine speed between 600 to 3500 RPM. TP sensor voltage less than 1.2 volts for greater than 1.7 seconds. Battery voltage greater than 10 volts

Set Condition: The MAP sensor signal voltage is greater than 4.92 volts. One trip Fault.

POSSIBLE CAUSES

MAP SENSOR VOLTAGE ABOVE 4.9 VOLTS

(K1) MAP SIGNAL CIRCUIT SHORTED TO (K6) 5 VOLT SUPPLY CIRCUIT

(K1) MAP SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

MAP SENSOR INTERNAL FAILURE

(K1) MAP SIGNAL CIRCUIT OPEN

(K4) SENSOR GROUND CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	<p>Start the engine. With the DRBIII®, read the MAP Sensor voltage. Is the voltage above 4.9 volts?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the (K1) MAP Signal circuit and the (K6) 5 Volt Supply circuit in the MAP Sensor harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the (K1) MAP Signal circuit for a short to the (K6) 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All

P0108-MAP SENSOR HIGH — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Ignition on, engine not running. Measure the voltage of the (K1) MAP Signal circuit in the MAP Sensor harness connector. Is the voltage above 5.2 volts?</p> <p>Yes → Repair the short to battery voltage in the (K1) MAP Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Connect a jumper wire between the (K1) MAP Sensor Signal circuit and the (K4) Sensor ground circuit. With the DRBIII®, monitor the MAP Sensor voltage. Ignition on, engine not running. Is the voltage below 1.0 volt?</p> <p>Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. Symptom List:

P0110-INTAKE AIR TEMPERATURE SENSOR STUCK

P0111-INTAKE AIR TEMPERATURE SENSOR PERFORMANCE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P0110-INTAKE AIR TEMPERATURE SENSOR STUCK.

When Monitored and Set Condition:

P0110-INTAKE AIR TEMPERATURE SENSOR STUCK

When Monitored: Engine Running.

Set Condition: After 4 warm-up cycles, the PCM did not see a 2°C (6°F) change in the IAT Sensor voltage within 200 miles . Two Trip Fault

P0111-INTAKE AIR TEMPERATURE SENSOR PERFORMANCE

When Monitored: Engine off time is greater than 480 minutes. Ambient temperature is greater than -23°C (-10°F).

Set Condition: After a calibrated amount of cool down time, the PCM compares the ECT Sensor, IAT Sensor and the Ambient Air Temperature Sensor values. If the IAT Sensor value is not within calibrated temperature amount of the other two temperature sensors an error is detected. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

(K21) IAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

IAT SENSOR VOLTAGE BELOW 1.0 VOLTS

(K21) IAT SIGNAL CIRCUIT OPEN

(K4) SENSOR GROUND CIRCUIT OPEN

(K21) IAT SIGNAL SHORTED TO GROUND

(K21) IAT SIGNAL CIRCUIT SHORTED TO (K4) SENSOR GROUND

PCM HIGH

PCM LOW

P0110-INTAKE AIR TEMPERATURE SENSOR STUCK — Continued

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Turn the ignition off. Disconnect the IAT Sensor harness connector. NOTE: Visually inspect both the component and the PCM connectors. Look for damaged, partially broken wires, and backed out or corroded terminals. Ignition on, engine not running. Measure the voltage on the (K21) IAT Signal circuit in the IAT Sensor harness connector. Is the voltage above 5.2 volts?</p> <p>Yes → Repair the short to battery voltage in the (K21) IAT Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off. Disconnect the IAT Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the IAT Sensor voltage. Is the voltage above 4.9 volts?</p> <p>Yes → Go To 4</p> <p>No → Go To 7</p>	All
4	<p>Turn the ignition off. Disconnect the IAT Sensor harness connector. Using a jumper wire, jumper across the IAT Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the IAT Sensor voltage. Is the voltage below 1.0 volt?</p> <p>Yes → Replace the IAT Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the IAT Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Repair as necessary.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:

P0122-THROTTLE POSITION SENSOR #1 LOW

When Monitored and Set Condition:

P0122-THROTTLE POSITION SENSOR #1 LOW

When Monitored: With the ignition on. Battery voltage greater than 10 volts.

Set Condition: Throttle Position Sensor voltage at the PCM is less than 0.0978 of a volt.
One Trip Fault.

POSSIBLE CAUSES

THROTTLE POSITION SENSOR SWEEP

INTERMITTENT CONDITION

(K6) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

(K6) 5 VOLT SUPPLY CIRCUIT OPEN

TP SENSOR INTERNAL FAILURE

(K22) TP SIGNAL CIRCUIT SHORTED TO GROUND

(K22) TP SIGNAL CIRCUIT SHORTED TO (K4) SENSOR GROUND CIRCUIT

PCM (K6) 5 VOLT SUPPLY CIRCUIT

PCM (K22) TP SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read the Throttle Position Sensor voltage. Is the voltage below 0.2 of a volt? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. Disconnect the TP Sensor harness connector. Ignition on, engine not running. Measure the voltage of the (K6) 5 Volt Supply circuit in the TP Sensor harness connector. Is the voltage between 4.5 to 5.2 volts? Yes → Go To 3 No → Go To 7	All

P0122-THROTTLE POSITION SENSOR #1 LOW — Continued

Symptom:

P0125-INSUFFICIENT COOLANT TEMP FOR CLOSED-LOOP FUEL CONTROL

When Monitored and Set Condition:

P0125-INSUFFICIENT COOLANT TEMP FOR CLOSED-LOOP FUEL CONTROL

When Monitored: With battery voltage greater than 10.4 volts, after engine is started.

Set Condition: The engine temperature does not enable closed loop. Failure time depends on start-up coolant temperature and ambient temperature. (i.e. 2 minutes for a start temp of 10°C (50°F) or up to 10 minutes for a vehicle with a start-up temp of -28°C (19°F). Two Trip Fault.

POSSIBLE CAUSES

LOW COOLANT LEVEL

THERMOSTAT OPERATION

ENGINE COOLANT TEMPERATURE SENSOR

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If a Engine Coolant Temperature (ECT) DTC is set along with this code, diagnose the ECT DTC first.</p> <p>NOTE: Inspect the ECT terminals and related PCM terminals. Ensure the terminals are free from corrosion and damage.</p> <p>NOTE: The best way to diagnose this DTC is to allow the vehicle to sit overnight outside in order to have a totally cold soaked engine.</p> <p>Note: Extremely cold outside ambient temperatures may have caused this DTC to set.</p> <p>WARNING: Never open the cooling system when the engine is hot. The system is under pressure. Extreme burns or scalding may result. Allow the engine to cool before opening the cooling system.</p> <p>Check the coolant system to make sure that the coolant is in good condition and at the proper level.</p> <p>Is the coolant level and condition OK?</p> <p>Yes → Go To 2</p> <p>No → Inspect the vehicle for a coolant leak and add the necessary amount of coolant.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0125-INSUFFICIENT COOLANT TEMP FOR CLOSED-LOOP FUEL CONTROL — Continued

TEST	ACTION	APPLICABILITY
2	<p>NOTE: This test works best if performed on a cold engine (cold soak). Ignition on, engine not running. With the DRBIII®, read the ECT Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached. Start the Engine. During engine warm-up, monitor the ECT Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82°C (180°F). Also monitor the actual coolant temperature with a thermometer. NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the ECT Deg in the DRB sensor should stay relatively close to each other. Using the appropriate service information, determine the proper opening temperature of the thermostat. Did the thermostat open at the proper temperature?</p> <p>Yes → Go To 3</p> <p>No → Replace the thermostat. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
3	<p>Ignition on, engine not running. With the DRBIII®, read the ECT Sensor temperature value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached. Start the Engine. During engine warm-up, monitor the ECT Deg value. NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the ECT Sensor Temperature in the DRBIII® sensors should stay relatively close to each other. Is the thermometer reading relatively close to the DRBIII® ECT Sensor reading?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:

P0128-THERMOSTAT RATIONALITY

When Monitored and Set Condition:

P0128-THERMOSTAT RATIONALITY

When Monitored: The engine running.

Set Condition: The PCM predicts a coolant temperature value that it will compare to the actual coolant temperature. If the two coolant temperature values are not within 10°C (18°F) of each other an error is detected. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
 LOW COOLANT LEVEL
 OTHER POSSIBLE CAUSES
 SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
 THERMOSTAT OPERATION
 TEMPERATURE SENSOR VOLTAGE BELOW 1.0 VOLT
 SIGNAL CIRCUIT OPEN
 SENSOR GROUND CIRCUIT OPEN
 SIGNAL CIRCUIT SHORTED TO GROUND
 SIGNAL CIRCUIT SHORTED TO SENSOR GROUND
 PCM LOW
 PCM HIGH

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If any ECT, AAT, CMP or CKP sensor DTCs have set along with P0128, diagnose them first before continuing.</p> <p>NOTE: Ensure that Pinion Factor has been programmed correctly into the PCM.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

8	Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the Temperature Sensor voltage. Is the voltage above 4.6 volts? Yes → Go To 9 No → Go To 12	All
9	Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Using a jumper wire, jumper across the Temperature Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the Temperature voltage. Is the voltage below 1.0 volt? Yes → Replace the applicable Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 10	All
10	Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the Signal circuit from the Temperature Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Repair the open in the Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
11	Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the Sensor ground circuit from the Ambient Air Temperature Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms? Yes → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Repair the open in the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom List:

P0131-O2 SENSOR 1/1 VOLTAGE LOW

P0137-O2 SENSOR 1/2 VOLTAGE LOW

P0151-O2 SENSOR 2/1 VOLTAGE LOW

P0157-O2 SENSOR 2/2 VOLTAGE LOW

**Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P0131-O2 SENSOR 1/1 VOLTAGE LOW.**

When Monitored and Set Condition:

P0131-O2 SENSOR 1/1 VOLTAGE LOW

When Monitored: Engine Running for less than 30 seconds. O2 Sensor Heater Temperature less than 376°C (705°F) Battery voltage greater than 10.99 volts.

Set Condition: The oxygen sensor signal voltage is below 1.5 volts for 3 seconds. One trip Fault.

P0137-O2 SENSOR 1/2 VOLTAGE LOW

When Monitored: Engine Running for less than 30 seconds. O2 Sensor Heater Temperature less than 376°C (705°F) Battery voltage greater than 10.99 volts.

Set Condition: The oxygen sensor signal voltage is below 1.5 volts for 3 seconds. One trip Fault.

P0151-O2 SENSOR 2/1 VOLTAGE LOW

When Monitored: Engine Running for less than 30 seconds. O2 Sensor Heater Temperature less than 376°C (705°F) Battery voltage greater than 10.99 volts.

Set Condition: The oxygen sensor signal voltage is below 1.5 volts for 3 seconds. One trip Fault.

P0157-O2 SENSOR 2/2 VOLTAGE LOW

When Monitored: Engine Running for less than 30 seconds. O2 Sensor Heater Temperature less than 376°C (705°F) Battery voltage greater than 10.99 volts.

Set Condition: The oxygen sensor signal voltage is below 1.5 volts for 3 seconds. One trip Fault.

Symptom List:

P0133-O2 SENSOR 1/1 SLOW RESPONSE

P0139-O2 SENSOR 1/2 SLOW RESPONSE

P0153-O2 SENSOR 2/1 SLOW RESPONSE

P0159-O2 SENSOR 2/2 SLOW RESPONSE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0133-O2 SENSOR 1/1 SLOW RESPONSE.

When Monitored and Set Condition:

P0133-O2 SENSOR 1/1 SLOW RESPONSE

When Monitored: Start and drive vehicle greater than 20 MPH and less than 55 MPH. Throttle open for a minimum 120 seconds. Coolant Temp greater than 70°C (158°F). Catalytic Converter Temperature greater than 600°C (1112°F)

Set Condition: The O2 sensor voltage switches less than 16 times for a 3.5L or 11 times for 2.7L or less from rich to lean within 20 second during monitoring. Two Trip Fault.

P0139-O2 SENSOR 1/2 SLOW RESPONSE

When Monitored: Start and drive vehicle greater than 20 MPH and less than 60 MPH. Throttle open for a minimum 120 seconds. Coolant Temp greater than 70°C (158°F). RPM between 1200 to 2000. Vacuum between 56Kpa to 28 Kpa.

Set Condition: The O2 sensor voltage does not switch properly from lean to rich during monitoring. Two Trip Fault.

P0153-O2 SENSOR 2/1 SLOW RESPONSE

When Monitored: Start and drive vehicle greater than 20 MPH and less than 55 MPH. Throttle open for a minimum 120 seconds. Coolant Temp greater than 70°C (158°F). Catalytic Converter Temperature greater than 600°C

Set Condition: The O2 sensor voltage switches only 16 times for a 3.5L or 11 times for 2.7L or less from lean to rich within 20 second during monitoring. Two Trip Fault.

P0159-O2 SENSOR 2/2 SLOW RESPONSE

When Monitored: Start and drive vehicle greater than 20 MPH and less than 55 MPH. Throttle open for a minimum 120 seconds. Coolant Temp greater than 70°C (158°F). Catalytic Converter Temperature greater than 600°C

Set Condition: The O2 sensor voltage switches properly from lean to rich during monitoring. Two Trip Fault.

6	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, terminal push out. Repair as necessary.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom List:

P0171-FUEL SYSTEM 1/1 LEAN

P0174-FUEL SYSTEM 2/1 LEAN

**Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P0171-FUEL SYSTEM 1/1 LEAN.**

When Monitored and Set Condition:

P0171-FUEL SYSTEM 1/1 LEAN

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above (-7°C)20°F, altitude below 8500 ft and fuel level greater than 15%.

Set Condition: If the PCM multiplies short term compensation by long term adaptive and a certain percentage is exceeded for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

P0174-FUEL SYSTEM 2/1 LEAN

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above (-7°C)20°F, altitude below 8500 ft and fuel level greater than 15%.

Set Condition: If the PCM multiplies short term compensation by long term adaptive and a certain percentage is exceeded for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
O2 SENSOR
O2 SIGNAL CIRCUIT
O2 RETURN CIRCUIT
O2 SENSOR HEATER OPERATION
THROTTLE POSITION SENSOR SWEEP
MAP SENSOR OPERATION
ECT SENSOR OPERATION
ENGINE MECHANICAL PROBLEM
FUEL CONTAMINATION/EXHAUST LEAK

P0171-FUEL SYSTEM 1/1 LEAN — Continued

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.</p> <p>NOTE: Diagnose any Misfire DTC(s) first, if set along with the fuel system DTC.</p> <p>Ignition on, engine not running.</p> <p>With the DRBIII®, read DTCs and record the related Freeze Frame data.</p> <p>Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Install a fuel pressure gauge.</p> <p>Ignition on, engine not running.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).</p> <p>Turn the ignition off.</p> <p>Choose a conclusion that best matches your fuel pressure reading.</p> <p>Within Specification Go To 3</p> <p>Below Specification Go To 12</p> <p>Caution: Stop All Actuations.</p>	All
3	<p>NOTE: If one of the O2 Sensors Signal or Return circuits are shorted to ground or voltage, all the other O2 Sensor voltage readings will be affected.</p> <p>NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.</p> <p>Start the engine.</p> <p>Allow the engine to reach normal operating temperature.</p> <p>With the DRBIII®, read the O2 Sensor voltage.</p> <p>Is the voltage switching between 2.5 and 3.4 volts?</p> <p>Yes → Go To 4</p> <p>No → Go To 9</p>	All
4	<p>Turn the ignition off.</p> <p>NOTE: Allow the O2 Sensor to cool down before continuing the test. The O2 voltage should stabilize at 5.0 volts. Raising the hood may help in reducing under hood temps.</p> <p>Ignition on, engine not running.</p> <p>With the DRBIII®, actuate the O2 Heater Test.</p> <p>With the DRBIII®, monitor O2 Sensor voltage for at least 2 minutes.</p> <p>Does the voltage stay above 4.5 volts?</p> <p>Yes → Replace the O2 Sensor.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All

P0171-FUEL SYSTEM 1/1 LEAN — Continued

TEST	ACTION	APPLICABILITY
5	<p>Ignition on, engine not running. With the DRBIII®, read the TP Sensor voltage. While monitoring the DRBIII®, slowly open and close the throttle. Does the voltage increase and decrease smoothly?</p> <p>Yes → Go To 6</p> <p>No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
6	<p>Turn the ignition off. Connect a Vacuum Gauge to a Manifold Vacuum source. Start the engine. Allow the engine to idle. Note: If engine will not idle, maintain a constant RPM above idle. With the DRBIII® in Sensors, read the MAP Sensor vacuum value. Is the DRBIII® reading within 1" of the Vacuum Gauge reading?</p> <p>Yes → Go To 7</p> <p>No → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
7	<p>Note: For this test to be valid, the thermostat must be operating correctly. Note: This test works best if performed on a cold engine (cold soak) Ignition on, engine not running. With the DRBIII®, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached. Start the Engine. During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82°C (180°F). The value should reach at least 82°C (180°F). Did the ECT value increase with a smooth transition and did it reach at least 82°C?</p> <p>Yes → Go To 8</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
8	<p>Check for any of the following conditions/mechanical problems. AIR INDUCTION SYSTEM - must be free from leaks. ENGINE VACUUM - must be at least 13 inches in neutral ENGINE VALVE TIMING - must be within specifications ENGINE COMPRESSION - must be within specifications ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks. ENGINE PCV SYSTEM - must flow freely TORQUE CONVERTER STALL SPEED - must be within specifications POWER BRAKE BOOSTER - no internal vacuum leaks FUEL - must be free of contamination FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector Are there any engine mechanical problems?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Test Complete.</p>	All

P0171-FUEL SYSTEM 1/1 LEAN — Continued

TEST	ACTION	APPLICABILITY
9	<p>Ignition on, engine not running. Disconnect the O2 Sensor harness connector. With the DRBIII®, monitor the O2 Sensor voltage. The O2 Sensor voltage should read 5.0 volts on the DRBIII® with the connector disconnected. Using a jumper wire, jump across the O2 Sensor harness connector from the O2 Signal circuit to the O2 Return circuit at the O2 Sensor harness connector. NOTE: The voltage should drop from 5.0 volts to 2.5 volts with the jumper wire in place. Did the O2 Sensor volts change from 5.0 volts to 2.5 volts?</p> <p>Yes → Replace the O2 Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 10</p>	All
10	<p>Turn the ignition off. Disconnect the O2 Sensor harness connector. Ignition on, engine not running. With the DRBIII®, monitor the O2 Sensor voltage. Is the voltage above 4.8 volts?</p> <p>Yes → Go To 11</p> <p>No → Check the O2 Signal circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
11	<p>Turn the ignition off. Disconnect the O2 Sensor harness connector. Ignition on, engine not running. Measure the voltage on the O2 Return circuit in the O2 Sensor harness connector. Is the voltage at 2.5 volts?</p> <p>Yes → Check the fuel system for contaminates. Also, check the exhaust system for any leaks. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Check the O2 Return circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0171-FUEL SYSTEM 1/1 LEAN — Continued

TEST	ACTION	APPLICABILITY
12	<p>Turn the ignition off.</p> <p>Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16 fuel line adapter tool #6539 between the disconnected fuel line and the fuel pump module.</p> <p>Attach a fuel pressure test gauge to the T fitting on the tool #6539</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).</p> <p>Is the fuel pressure within specification?</p> <p>Yes → Repair or replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 13</p> <p>Caution: Stop All Actuations.</p>	All
13	<p>Turn the ignition off.</p> <p>Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.</p> <p>Is the Fuel Inlet Strainer plugged?</p> <p>Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 14</p>	All
14	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Fuel Pump Module.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom List:**P0172-FUEL SYSTEM 1/1 RICH****P0175-FUEL SYSTEM 2/1 RICH**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **P0172-FUEL SYSTEM 1/1 RICH**.

When Monitored and Set Condition:**P0172-FUEL SYSTEM 1/1 RICH**

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above (-7°C)20°F and altitude below 8500 ft.

Set Condition: If the PCM multiplies short term compensation by long term adaptive as well as a purge fuel multiplier and the result is below a certain value for 30 seconds over two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

P0175-FUEL SYSTEM 2/1 RICH

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above (-7°C)20° and altitude below 8500 ft.

Set Condition: If the PCM multiplies short term compensation by long term adaptive as well as a purge fuel multiplier and the result is below a certain value for 30 seconds over two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
O2 SENSOR HEATER OPERATION
O2 SENSOR
EVAP PURGE SOLENOID OPERATION
O2 SIGNAL CIRCUIT
O2 RETURN CIRCUIT
MAP SENSOR OPERATION
ECT SENSOR OPERATION
ENGINE MECHANICAL PROBLEM
FUEL FILTER/PRESSURE REGULATOR
PCM

Symptom List:

P0201-FUEL INJECTOR #1
P0202-FUEL INJECTOR #2
P0203-FUEL INJECTOR #3
P0204-FUEL INJECTOR #4
P0205-FUEL INJECTOR #5
P0206-FUEL INJECTOR #6

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P0201-FUEL INJECTOR #1.

When Monitored and Set Condition:

P0201-FUEL INJECTOR #1

When Monitored: With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off. One Trip Fault.

P0202-FUEL INJECTOR #2

When Monitored: With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off. One Trip Fault.

P0203-FUEL INJECTOR #3

When Monitored: With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off. One Trip Fault.

P0204-FUEL INJECTOR #4

When Monitored: With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off. One Trip Fault.

P0205-FUEL INJECTOR #5

When Monitored: With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off. One Trip Fault.

P0206-FUEL INJECTOR #6

When Monitored: With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off. One Trip Fault.

P0201-FUEL INJECTOR #1 — Continued

POSSIBLE CAUSES	
GOOD TRIP EQUAL TO ZERO (F42) ASD RELAY OUTPUT CIRCUIT FUEL INJECTOR INJECTOR CONTROL CIRCUIT OPEN INJECTOR CONTROL CIRCUIT SHORTED TO GROUND PCM	

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
2	Turn the ignition off. Disconnect the Fuel Injector harness connector. Ignition on, engine not running. With the DRBIII®, actuate the ASD Relay. Using a 12-volt test light connected to ground, backprobe the (F42) ASD Relay Output circuit at the Fuel Injector harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the open or high resistance in the (F42) ASD Relay Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
3	Turn the ignition off. Disconnect the Fuel Injector harness connector. Ignition on, engine not running. Using a 12-volt test light connected to 12-volts, backprobe the Injector Control circuit. With the DRBIII®, actuate the Fuel Injector. Does the test light blink/flicker? Yes → Replace the Fuel Injector. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 4	All

FUEL PUMP MODULE
CHECKING FUEL LEAK DOWN
FUEL INJECTOR OPERATION
ASD RELAY OUTPUT CIRCUIT (INJECTOR)
FUEL INJECTOR
INJECTOR CONTROL CIRCUIT
PCM (IGNITION SYSTEM)
PCM

P0300-MULTIPLE CYLINDER MISFIRE — Continued

TEST	ACTION	APPLICABILITY
1	<p>Read and record the FREEZE FRAME DATA. Select OBD II MONITORS. Read and record the MIS-FIRE SIMILAR CONDITIONS WINDOW DATA.</p> <p>With these screens, attempt to duplicate the condition(s) that has set this DTC. When the vehicle is operating in the SIMILAR CONDITIONS WINDOW, refer to the WHICH CYLINDER IS MISFIRING screen.</p> <p>Observe the WHICH CYLINDER IS MISFIRING screen for at least one minute.</p> <p>Is there a misfire present?</p> <p>Yes → Go To 2</p> <p>No → Go To 17</p>	All
2	<p>NOTE: Reviewing the vehicle repair history may aid in the repair of the misfire condition.</p> <p>Visually and physically inspect the engine for any of the following conditions.</p> <ul style="list-style-type: none"> - Worn serpentine belt - Binding Engine-Driven accessories. - Misaligned water pump, P/S pump and A/C compressor pulleys - Improper CKP sensor mounting - Poor connector/terminal to component connection. i.e., CKP sensor, Fuel Injector, Ign coil, etc. - Vacuum leaks - Restricted Air Induction system <p>NOTE: Read the CKP SYNC state on the DRB. If the CKP SYNC does not indicate IN SYNC, perform the Crankshaft Position Sensor Circuit chart.</p> <p>NOTE: Ensure the powers and grounds for the PCM are operating properly.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off.</p> <p>Disconnect the Ignition Coil harness connector.</p> <p>Remove the Ignition Coil.</p> <p>NOTE Before continuing, inspect the Ignition Coil for the following conditions. If a problem is found, replace the Ignition Coil. Damage or Carbon Tracking on the Coil or the spark plug insulator boot.</p> <p>Install a spark tester to the Ignition Coil.</p> <p>Reconnect the Ignition Coil harness connector to the Ignition Coil.</p> <p>While cranking the engine, observe the spark coming from the spark tester.</p> <p>NOTE: A crisp blue spark should be generated that is able to jump the gap of the spark tester.</p> <p>Is good spark present?</p> <p>Yes → Go To 4</p> <p>No → Go To 14</p>	All

P0300-MULTIPLE CYLINDER MISFIRE — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Remove the Spark Plug. Inspect the Spark Plug for the following conditions.</p> <ul style="list-style-type: none"> - Cracks - Carbon Tracking - Foreign Material - Gap size out of specifications - Loose or broke electrode <p>NOTE: Lightly tap the bottom of the spark plug on a solid surface. The electrode in the spark plug should not move. Were any of the above condition present?</p> <p style="padding-left: 40px;">Yes → Replace the Spark Plug. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p style="padding-left: 40px;">No → Go To 5</p>	All
5	<p>Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Install a fuel pressure gauge. Start the engine and observe the fuel pressure reading. NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi). Choose a conclusion that best matches your fuel pressure reading.</p> <p style="padding-left: 40px;">Within Specification Go To 6</p> <p style="padding-left: 40px;">Below Specification Go To 12</p> <p style="padding-left: 40px;">Above Specification Replace the fuel filter/pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
6	<p>NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair /replace as necessary. Turn the ignition off. WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Install special 5/16 fuel line adapter tool #6539. Attach a fuel pressure test gauge to the T fitting on the tool #6539 Start the engine and allow the fuel system to reach maximum pressure. Turn the ignition off. NOTE: Fuel specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi). Using special tool #C4390, Hose Clamp Pliers, slowly clamp off the rubber hose on the Fuel Pressure adapter between the fuel pressure gauge and the fuel pump module. Monitor the fuel pressure gauge for a minimum of 5 minutes. NOTE: The pressure should not fall below 241 KPa (35 psi) Does the fuel pressure gauge fall below the above specification?</p> <p style="padding-left: 40px;">Yes → Replace the leaking Injector(s). Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p style="padding-left: 40px;">No → Go To 7</p>	All

P0300-MULTIPLE CYLINDER MISFIRE — Continued

TEST	ACTION	APPLICABILITY
7	<p>Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>CAUTION: After each actuation of the Fuel Injector, start the engine to clear the cylinder of fuel. Failure to do so could cause engine damage.</p> <p>Install a Fuel Pressure Gauge to the fuel rail.</p> <p>Start the engine and allow the fuel pressure to reach maximum pressure.</p> <p>Turn the engine off, leaving the ignition on.</p> <p>Using the DRBIII®, actuate the Fuel Injector for the cylinder that indicated the misfire.</p> <p>Monitor the fuel pressure gauge.</p> <p>Does the fuel pressure gauge indicate a drop in fuel pressure?</p> <p>Yes → Go To 8</p> <p>No → Go To 9</p>	All
8	<p>Check for any of the following conditions/mechanical problems.</p> <p>ENGINE VACUUM - must be at least 13 inches in neutral</p> <p>ENGINE VALVE TIMING - must be within specifications</p> <p>ENGINE COMPRESSION - must be within specifications</p> <p>ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.</p> <p>ENGINE PCV SYSTEM - must flow freely</p> <p>TORQUE CONVERTER STALL SPEED - must be within specifications</p> <p>POWER BRAKE BOOSTER - no internal vacuum leaks</p> <p>FUEL - must be free of contamination</p> <p>Are there any engine mechanical problems?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 17</p>	All

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Remove the Crankshaft Position Sensor. Inspect the Tone Wheel/Flex Plate slots for damage, foreign material, or excessive movement. Were any problems found? Yes → Repair or replace the Tone Wheel/Flex Plate as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 4	All
4	If there are no possible causes remaining, view repair. Repair Replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom:**P0325-KNOCK SENSOR #1 CIRCUIT****When Monitored and Set Condition:****P0325-KNOCK SENSOR #1 CIRCUIT**

When Monitored: With the ignition on and the engine running.

Set Condition: The Knock Sensor circuit voltage falls below a minimum value at idle or deceleration. The minimum value is from a look-up table internal to the PCM and is based on engine rpm. DTC also sets if sensor output goes above 5.0 volts. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

(K42) KS SIGNAL CIRCUIT SHORTED TO VOLTAGE

(K42) KS SIGNAL CIRCUIT SHORTED TO GROUND

(K42) KS SIGNAL CIRCUIT OPEN

(K42) KS SIGNAL CIRCUIT SHORTED TO (K45) KS RETURN CIRCUIT

(K45) KS RETURN CIRCUIT OPEN

KNOCK SENSOR

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
2	Turn the ignition off. Disconnect the Knock Sensor harness connector. Measure the voltage of the (K42) KS Signal circuit in the Knock Sensor harness connector. Is the voltage above 2.0 volts? Yes → Repair the short to voltage in the (K42) KS Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 3	All

P0325-KNOCK SENSOR #1 CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Knock Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the (K42) KS Signal circuit at the Knock Sensor harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to ground in the (K42) KS Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the Knock Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K42) KS Signal circuit from the Knock Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the open in the (K42) KS Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
5	<p>Turn the ignition off. Disconnect the Knock Sensor harness connector. Measure the resistance between the (K42) KS Signal circuit and the (K45) KS Return circuit in the Knock Sensor harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the (K42) KS Signal circuit for a short to (K45) KS Return circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the Knock Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K45) KS Return circuit from the Knock Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the open in the (K45) KS Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0325-KNOCK SENSOR #1 CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Replace the Knock Sensor. Ignition on, engine not running. With the DRBIII®, erase DTC. Attempt to operate the vehicle using the information noted in the Freeze Frame. With the DRBIII®, read DTC's. Does the DRBIII® display the DTC that was previously erased?</p> <p>Yes → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Test Complete.</p>	All

Symptom:

P0335-CRANKSHAFT POSITION SENSOR CIRCUIT

When Monitored and Set Condition:

P0335-CRANKSHAFT POSITION SENSOR CIRCUIT

When Monitored: Engine cranking.

Set Condition: No CKP signal is present during engine cranking, and at least 8 camshaft position sensor signals have occurred.

POSSIBLE CAUSES

CHECKING INTERMITTENT CMP SIGNAL WITH LAB
 INTERMITTENT CKP SIGNAL
 (K6) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
 (K6) 5 VOLT SUPPLY CIRCUIT OPEN
 (K6) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
 (K24) CKP SIGNAL CIRCUIT SHORTED GROUND
 (K24) CKP SIGNAL CIRCUIT OPEN
 (K24) CKP SIGNAL CIRCUIT SHORTED TO VOLTAGE

P0339-CRANKSHAFT POSITION SENSOR INTERMITTENT — Continued

TEST	ACTION	APPLICABILITY
10	Turn the ignition off. Disconnect the CKP Sensor connector. Ignition on, engine not running. Measure the voltage on the (K24) CKP Signal circuit. Wiggle the related wire harness while taking this measurement. Does the voltage ever increase above 5.5 volts? Yes → Repair the short to B+ voltage in the (K24) CKP Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 11	All
11	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the CKP Sensor harness connector. Measure the resistance between the (K6) 5 Volt Supply circuit and the (K24) CKP signal circuit at the CKP Sensor harness connector. Wiggle the related wire harness while taking this measurement. Is the resistance below 5.0 ohms? Yes → Repair the short to the (K6) 5 Volt Supply circuit in the (K24) CKP Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 12	All
12	NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, review repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom:**P0340-CAMSHAFT POSITION SENSOR CIRCUIT****When Monitored and Set Condition:****P0340-CAMSHAFT POSITION SENSOR CIRCUIT**

When Monitored: Engine cranking/running. Battery voltage greater than 10 volts.

Set Condition: At least 5 seconds or 2.5 engine revolutions have elapsed with crankshaft position sensor signals present but no camshaft position sensor signal. One Trip Fault.

POSSIBLE CAUSES

INTERMITTENT CRANKSHAFT POSITION SENSOR SIGNAL
 INTERMITTENT CAMSHAFT POSITION SENSOR SIGNAL
 (K6) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
 (K6) 5 VOLT SUPPLY CIRCUIT OPEN
 (K6) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
 (K44) CMP SIGNAL CIRCUIT SHORTED GROUND
 (K44) CMP SIGNAL CIRCUIT OPEN
 (K44) CMP SIGNAL CIRCUIT SHORTED TO VOLTAGE
 (K44) CMP SIGNAL SHORTED TO (K6) 5 VOLT SUPPLY CIRCUIT
 (K4) SENSOR GROUND CIRCUIT OPEN
 PCM - (K6) 5 VOLT SUPPLY
 PCM - (K44) CMP SIGNAL
 CAMSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, read the CMP SYNC State. Does the DRBIII® display the CMP SYNC State IN SYNC? Yes → Go To 2 No → Go To 4	All

Symptom:

P0344-CAMSHAFT POSITION SENSOR INTERMITTENT

When Monitored and Set Condition:

P0344-CAMSHAFT POSITION SENSOR INTERMITTENT

When Monitored: Engine running or Cranking.

Set Condition: When the failure counter reaches 20. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
 WIRING HARNESS INSPECTION
 (K6) 5 VOLT SUPPLY CIRCUIT OPEN OR SHORTED TO GROUND
 TONE WHEEL/PULSE RING INSPECTION
 CHECKING CKP SIGNAL WITH THE DRBIII® LAB
 CAMSHAFT POSITION SENSOR
 (K44) CMP SIGNAL CIRCUIT OPEN
 (K44) CMP SIGNAL CIRCUIT SHORT TO GROUND
 (K44) CMP SIGNAL CIRCUIT SHORTED TO B+
 (K44) CMP SIGNAL CIRCUIT SHORT TO (K6) 5 VOLTS
 PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
2	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the (K44) CMP Signal circuit in the CMP harness connector. WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING. Ignition on, engine not running. Observe the lab scope screen. Start the engine. Observe the lab scope screen. Are there any irregular or missing signals? Yes → Go To 3 No → Go To 8	All

Symptom List:

P0351-IGNITION COIL #1 CIRCUIT
P0352-IGNITION COIL #2 CIRCUIT
P0353-IGNITION COIL #3 CIRCUIT
P0354-IGNITION COIL #4 CIRCUIT
P0355-IGNITION COIL #5 CIRCUIT
P0356-IGNITION COIL #6 CIRCUIT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0351-IGNITION COIL #1 CIRCUIT.

When Monitored and Set Condition:

P0351-IGNITION COIL #1 CIRCUIT

When Monitored: With battery voltage greater than 11 volts. Engine running. Engine RPM less than 8160. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set. One Trip Fault.

P0352-IGNITION COIL #2 CIRCUIT

When Monitored: With battery voltage greater than 11 volts. Engine running. Engine RPM less than 8160. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set. One trip Fault.

P0353-IGNITION COIL #3 CIRCUIT

When Monitored: With battery voltage greater than 11 volts. Engine running. Engine RPM less than 8160. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set. One Trip Fault.

P0354-IGNITION COIL #4 CIRCUIT

When Monitored: With battery voltage greater than 11 volts. Engine running. Engine RPM less than 8160. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set. One Trip Fault.

P0351-IGNITION COIL #1 CIRCUIT — Continued**P0355-IGNITION COIL #5 CIRCUIT**

When Monitored: With battery voltage greater than 11 volts. Engine running. Engine RPM less than 8160. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set. One Trip Fault.

P0356-IGNITION COIL #6 CIRCUIT

When Monitored: With battery voltage greater than 11 volts. Engine running. Engine RPM less than 8160. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP COUNTER = 0
 ASD RELAY OUTPUT CIRCUIT OPEN
 CAPACITOR(S) SHORTED TO GROUND
 ASD OUTPUT CIRCUIT SHORTED TO GROUND
 COIL ON PLUG
 COIL CONTROL CIRCUIT SHORTED TO GROUND
 COIL CONTROL CIRCUIT OPEN
 PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

P0351-IGNITION COIL #1 CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off. Disconnect the coil on plug harness connector. Ignition on, engine not running. With the DRBIII®, actuate the ASD Relay. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit at the Coil on plug harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 3 No → Go To 7</p> <p>Stop All Actuations</p>	All
3	<p>Turn the ignition off. Disconnect the coil on plug harness connector. Note: The following resistance measurement should be taken at 70-80 degrees F. Measure the primary resistance of the Coil on plug. Is the resistance between 0.6 and 0.9 of an ohm?</p> <p>Yes → Go To 4 No → Replace the coil on plug. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
4	<p>Turn the ignition off. Disconnect the Coil on plug harness connector. Disconnect the PCM harness connector(s). Measure the resistance between the Coil Control circuit and ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the short to ground in the Coil Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Coil on plug harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the Coil Control circuit from the Coil on plug connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6 No → Repair the open Coil Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
6	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, review repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0351-IGNITION COIL #1 CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Disconnect the Ignition Coil harness connector. Remove the ASD Relay from the PDC. Measure the resistance of the ASD Relay Output circuit between the ASD Relay connector and the Ignition Coil harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the open in the ASD Relay Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
8	<p>NOTE: Repeat the following test for both capacitors NOTE: The Capacitors are attached to the side of each valve cover. Turn the ignition off. Disconnect the Capacitor harness connector. Install a good INJ/COIL fuse. With the DRBIII®, actuate the ASD Relay. NOTE: If the above test result is an open fuse for both capacitor tests, the problem is a short to ground in the ASD Relay Output circuit. Repair the short to ground in the ASD Relay Output circuit and refer to VER-5 Is the INJ/COIL fuse OK for both capacitor tests?</p> <p>Yes → Replace the Capacitor(s) Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Repair the ASD Output circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:

P0401 - EGR SYSTEM PERFORMANCE

When Monitored and Set Condition:

P0401 - EGR SYSTEM PERFORMANCE

When Monitored: During engine decel, 26 to 4 MPH. Engine Coolant Temp greater than 70°C (158°F). Engine run time greater than 120 seconds.

Set Condition: The PCM monitors engine roughness. During decel, the EGR is opened and the PCM monitors engine then monitors engine roughness with the valve open. If an increase of engine roughness is not present, an error is detected. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
 EGR VALVE OPEN AT IDLE
 EGR VALVE ASSEMBLY INSPECTION
 EGR SOLENOID ASSEMBLY
 EGR SOLENOID GROUND CIRCUIT OPEN
 EGR SOLENOID CONTROL CKT SHORT TO GND
 EGR SOLENOID CONTROL CKT SHORTED TO VOLTAGE
 EGR SOLENOID CONTROL CKT OPEN
 PCM - EGR OPEN
 PCM - EGR CLOSED

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
2	NOTE: If the vehicle is running rough at idle (DRBIII® not actuating) follow the yes path to continue. Turn the ignition on. Turn all accessories off. Start the engine. Allow the engine to reach normal operating temperature. With the DRB, enter Engine System Test, then EGR System Test. Actuate the FLOW function in the EGR System Test. Did the engine run rough or stall? Yes → Go To 3 No → Go To 7	All

P0401 - EGR SYSTEM PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the EGR Solenoid Assembly harness connector. Start engine. Attempt to allow the engine to idle. Does the engine run rough or stall?</p> <p>Yes → Inspect the EGR tube assembly. If OK, replace the EGR valve. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 4</p>	All
4	<p>Inspect the EGR Assembly for the following. Gasket(s) for leaking Damage and/or holes in the EGR tube(s) Carbon build up on or near the EGR pintle and passage ways. Obstruction in the EGR tubes Were any problem found?</p> <p>Yes → Repair or replace the EGR Assembly as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Measure the voltage on the EGR Solenoid Control circuit in the EGR Solenoid connector. Is the voltage above 1.0 volt?</p> <p>Yes → Repair the short to voltage in the EGR solenoid control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 6</p>	All
6	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
7	<p>Turn the ignition on. Turn all accessories off. Disconnect the EGR Solenoid harness connector. Using a 12-volt Test Light, jumper across the EGR Solenoid harness connector. With the DRB, actuate the EGR solenoid. Does the 12-volt test light flash on and off?</p> <p>Yes → Inspect the tube(s) for obstructions and damage, repair as necessary. If OK, replace the EGR Solenoid Assembly. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 8</p>	All

P0401 - EGR SYSTEM PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the EGR Solenoid harness connector. Using a 12-volt test light connected to battery voltage, probe the EGR Solenoid ground circuit in the EGR Solenoid harness connector. Does the 12-volt test light illuminate brightly?</p> <p>Yes → Go To 9</p> <p>No → Repair the open in the EGR Solenoid ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
9	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance between ground and the EGR Solenoid Control circuit at the EGR Solenoid harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to ground in the EGR Solenoid Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 10</p>	All
10	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the EGR Solenoid Control circuit from the EGR Solenoid harness connector to the appropriate terminal of special tool # 8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 11</p> <p>No → Repair the open in the EGR solenoid control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
11	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All

Symptom:**P0403 - EGR CONTROL CIRCUIT****When Monitored and Set Condition:****P0403 - EGR CONTROL CIRCUIT**

When Monitored: Engine running. Battery voltage greater than 10 volts.

Set Condition: The EGR solenoid control circuit is not in the expected state when requested to operate by the PCM. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

EGR SOLENOID ASSEMBLY

EGR SOLENOID GROUND CIRCUIT OPEN

EGR SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

EGR SOLENOID CONTROL CIRCUIT SHORT TO GND

EGR SOLENOID CONTROL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT

EGR SOLENOID CONTROL CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
2	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Turn all accessories off. Using a 12 volt Test Light connected to the EGR Solenoid ground circuit, probe the EGR Solenoid Control circuit. With the DRB, actuate the EGR solenoid. Does the 12-volt test light flash on and off? Yes → Replace the EGR Solenoid Assembly. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

Symptom List:

P0420-CATALYTIC 1/1 EFFICIENCY

P0432-CATALYTIC 2/1 EFFICIENCY

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be **P0420-CATALYTIC 1/1 EFFICIENCY**.

When Monitored and Set Condition:

P0420-CATALYTIC 1/1 EFFICIENCY

When Monitored: Engine Run time greater than 90 seconds. Engine Coolant greater than 70°C (158°F) Vehicle speed greater than 20 MPH and less than 55 MPH. Engine Speed greater than 1216 RPM and less than 1952 RPM.

Set Condition: As catalyst efficiency deteriorates, the switch rate of the downstream O2 sensor approaches that of the upstream O2 sensor. If at any point during the test the switch ratio reaches a predetermined value a counter is incremented by one. One Trip Fault.

P0432-CATALYTIC 2/1 EFFICIENCY

When Monitored: Engine Run time greater than 90 seconds. Engine Coolant greater than 70°C (158°F) Vehicle speed greater than 20 MPH and less than 55 MPH. Engine Speed greater than 1216 RPM and less than 1952 RPM.

Set Condition: As catalyst efficiency deteriorates, the switch rate of the downstream O2 sensor approaches that of the upstream O2 sensor. If at any point during the test the switch ratio reaches a predetermined value a counter is incremented by one. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

VISUALLY INSPECT CATALYTIC CONVERTER

EXHAUST LEAK

ENGINE MECHANICAL CONDITION

AGING O2 SENSOR

CATALYTIC CONVERTER

P0420-CATALYTIC 1/1 EFFICIENCY — Continued

TEST	ACTION	APPLICABILITY
1	<p>NOTE: A new rear O2 Sensor along with an aging front O2 Sensor may cause the DTC to set. Review the repair history of the vehicle before continuing.</p> <p>NOTE: If an O2 Sensor or Fuel System Lean DTC(s) is set along with the Catalytic Converter Efficiency DTC, diagnose the O2 Sensor DTC(s) before continuing.</p> <p>NOTE: Check for contaminates that may have damaged the O2 Sensor and Catalytic Converter: contaminated fuel, unapproved silicone, oil and coolant, repair necessary.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Inspect the Catalytic Converter for the following damage. Damaged Catalytic Converter, dent and holes. Severe discoloration caused by overheating the Catalytic Converter. Catalytic Converter broke internally. Leaking Catalytic Converter. Were any problems found?</p> <p>Yes → Replace the Catalytic Converter. Repair the condition that may have caused the failure. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All
3	<p>Start the engine. Inspect the exhaust for leaks between the engine and the O2 Sensor. Inspect the exhaust for leaks between the engine and the appropriate rear O2 Sensor. Are there any exhaust leaks?</p> <p>Yes → Repair or replace the leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>Check the exhaust for excessive smoke caused by an internal problem in the engine. Is a engine mechanical condition present?</p> <p>Yes → Repair the engine mechanical condition as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>A new rear O2 Sensor along with an aging front O2 Sensor may cause the DTC to set. Review the vehicles repair history. Has the rear O2 Sensor been replaced without replacing the front O2 Sensor?</p> <p>Yes → Replace the Front O2 Sensor as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair Replace the Catalytic Converter. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:

P0440-GENERAL EVAP SYSTEM FAILURE

When Monitored and Set Condition:

P0440-GENERAL EVAP SYSTEM FAILURE

When Monitored: Engine Running. Fuel Level greater than 12%. Ambient Temperature between 4°C and 32°C (39°F and 89°F)

Set Condition: The PCM does not see the NVLD switch close during the medium/large leak test. The PCM will then increase the vacuum supply to the EVAP system by increasing flow through the EVAP Purge valve. If the switch does not close with an increase in vacuum, an error is detected. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
 VISUAL AND PHYSICAL INSPECTION
 EVAP PURGE SOLENOID VACUUM SUPPLY INSPECTION
 EVAP PURGE SOLENOID STUCK CLOSED
 NVLD SWITCH OPERATION
 (Z1) GROUND CIRCUIT OPEN
 NVLD ASSEMBLY
 (K107) NVLD SWITCH SIGNAL CIRCUIT OPEN
 EVAPORATIVE EMISSION LEAK DETECTION
 PCM
 PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If any of the following DTCs are set (P0443, P0452, P0453, P0498 or P0499) diagnose them first before continuing with P0440.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0440-GENERAL EVAP SYSTEM FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Perform a visual and physical inspection of the entire Evaporative Emission system. Check for the following conditions:</p> <ul style="list-style-type: none"> - Hoses disconnected or left off - Holes or cracks - Loose seal points - Evidence of damaged components - Incorrect routing of hoses and tubes - Fuel Cap left off or bad gasket seal <p>Were any of the above conditions found?</p> <p style="padding-left: 40px;">Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p style="padding-left: 40px;">No → Go To 3</p>	All
3	<p>Turn the ignition off. Carefully inspect the Evap Purge Solenoid vacuum supply hose for proper routing. Check for a pinched or plugged hose from the throttle body to the Purge Solenoid. Ensure the vacuum port at the throttle body is free from any blockage. Were any problems found?</p> <p style="padding-left: 40px;">Yes → Repair the vacuum supply, hose/tube as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p style="padding-left: 40px;">No → Go To 4</p>	All
4	<p>Disconnect the vacuum supply hoses from the EVAP Purge Solenoid. Using a hand vacuum pump, apply 10 in Hg to the "CAN" side of the EVAP Purge Solenoid. Ignition on, engine not running. Observe the vacuum gauge. With the DRBIII®, actuate the EVAP Purge Solenoid . Does the vacuum drop when the solenoid is actuated?</p> <p style="padding-left: 40px;">Yes → Go To 5</p> <p style="padding-left: 40px;">No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
5	<p>Reconnect all vacuum hose. Start the engine. Allow the engine to idle. Using the DRBIII, perform the NVLD FORCED MONITOR TEST. Monitor the NVLD Switch state. NOTE: As the test runs, the NVLD Switch should go from an OPEN state to CLOSED. After the vacuum is released from the EVAP system the Switch state will return to OPEN. Did the NVLD Switch operate as described above?</p> <p style="padding-left: 40px;">Yes → Refer to the INTERMITTENT CONDITION Symptom (Diagnostic Procedure). Perform the POWERTRAIN VERIFICATION TEST VER - 5.</p> <p style="padding-left: 40px;">No → Go To 6</p>	All

P0440-GENERAL EVAP SYSTEM FAILURE — Continued

TEST	ACTION	APPLICABILITY
6	<p>To continue testing you will need Miller Tool #8404 Evaporative Emission Leak Detector (EELD).</p> <p>WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.</p> <p>NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.</p> <p>Connect the red power lead of EELD to the battery positive terminal and the black ground lead to battery negative terminal.</p> <p>NOTE: See Charts and Graph support material EELD Calibration Setup for an example.</p> <p>Block the vent hose of the EVAP Canister.</p> <p>Connect shop air to the EELD.</p> <p>Set the smoke/air control switch to AIR.</p> <p>Insert the tester's AIR supply tip (clear hose) into the .040 orifice on the tester's control panel.</p> <p>Press the remote smoke/air start button.</p> <p>Position the red flag on the air flow meter so it is aligned with the indicator ball.</p> <p>When the calibration is complete, release the remote button. The EELD is now calibrated the flow meter in liters per minute.</p> <p>Install the service port adapter #8404-14 on the vehicle's service port (if equipped) or install the #8404-ADP service adapter in the NVLD filter line.</p> <p>Connect the Air supply hose from the EELD to the service port.</p> <p>Press the remote button to activate AIR flow.</p> <p>NOTE: Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve, this may indicate high flow and will require 4 to 5 minutes to fill.</p> <p>Compare the flow meter indicator ball reading to the red flag.</p> <p>ABOVE the red flag indicates a leak present.</p> <p>BELOW the red flag indicates a sealed system.</p> <p>Is the indicator ball above the red flag?</p> <p>Yes → Go To 7</p> <p>No → Go To 8</p>	All

P0440-GENERAL EVAP SYSTEM FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	<p>NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.</p> <p>To continue testing, you will need Miller Tool #8404 Evaporative Emissions Leak Detector (EELD).</p> <p>Remove the Air supply hose from the service port.</p> <p>Connect the SMOKE supply tip (black hose) to the service port.</p> <p>Set the smoke/air control switch to SMOKE.</p> <p>NOTE: The flow meter indicator ball will not move at this point.</p> <p>Press the remote smoke/air start button.</p> <p>NOTE: Ensure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.</p> <p>NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.</p> <p>While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.</p> <p>If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that are left behind by the smoke. The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.</p> <p>NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke or dye may or may not be visual. Introducing smoke into the filtered side of the canister may assist in locating the leak.</p> <p>Was a leak found?</p> <p>Yes → Repair or replace the leaking component as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6 - NGC.</p> <p>No → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
8	<p>Turn the ignition off.</p> <p>Disconnect the NVLD electrical harness connector.</p> <p>Check connectors - Clean/repair as necessary.</p> <p>Using a jumper wire, jumper across the (K107) NVLD Switch Sense circuit and the (Z1) Ground circuit in the NVLD electrical harness connector.</p> <p>Monitor the NVLD Switch state on the DRBIII®.</p> <p>Does the Switch change from OPEN to CLOSED.</p> <p>Yes → Replace the NVLD Assembly. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 9</p>	All

P0440-GENERAL EVAP SYSTEM FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Disconnect the NVLD electrical harness connector. Measure the resistance between the (Z1) Ground circuit and ground. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the open in the (Z1) Ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
10	Turn the ignition off. Disconnect the NVLD electrical harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K107) NVLD Switch Signal circuit from the NVLD electrical harness connector to the appropriate terminal of the special tool #8815. Is the resistance below 5.0 ohms? Yes → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Repair the open in the (K107) NVLD Switch Signal Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom:**P0441-EVAP PURGE SYSTEM PERFORMANCE****When Monitored and Set Condition:****P0441-EVAP PURGE SYSTEM PERFORMANCE**

When Monitored: Cold start test. Engine Running. Small Leak Test Passed.

Set Condition: The PCM activates the EVAP Purge solenoid gradually increases to maximum flow. During flow, the PCM looks for the NVLD switch to close. If the PCM does not see the NVLD switch close at maximum flow an error is detected. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

INTERMITTENT CONDITION

CHECKING EVAP PURGE SOLENOID FUNCTIONALITY

EVAP PURGE SOLENOID VACUUM SUPPLY

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If any of the following DTCs are set (P0443, P0452, P0453, P0498 or P0499) diagnose them first before continuing with P0441.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>NOTE: After disconnecting the Evap Purge vacuum connections, inspect the lines and solenoid for any signs of contamination or foreign materials.</p> <p>Using a hand vacuum pump, apply 10 in Hg to "CAN" side of the EVAP Purge Solenoid. Ignition on, engine not running. Observe the vacuum gauge. With the DRBIII®, actuate the EVAP Purge Solenoid . Does the vacuum drop when the solenoid is actuated?</p> <p>Yes → Go To 3</p> <p>No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0441-EVAP PURGE SYSTEM PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Carefully inspect the Evap Purge Solenoid vacuum supply hose for proper routing. Check for a pinched or plugged hose from the throttle body to the Purge Solenoid. Inspect the vacuum port at the throttle body for any damage or plugging. Were any problems found?</p> <p>Yes → Repair the vacuum supply hose/tube as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom List:**P0442-EVAP SYSTEM MEDIUM LEAK****P0455-EVAP SYSTEM LARGE LEAK**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be **P0442-EVAP SYSTEM MEDIUM LEAK**.

When Monitored and Set Condition:**P0442-EVAP SYSTEM MEDIUM LEAK**

When Monitored: Engine Running. Cold start test. Fuel Level greater than 12%. Ambient Temperature between 4°C and 32°C (39°F and 89°F) Close Loop fuel system. Test runs when small leak test is maturing.

Set Condition: The PCM activates the EVAP Purge Solenoid to pull the EVAP system into a vacuum to close the NVLD switch. Once the NVLD switch is closed, the PCM turns the EVAP Purge solenoid off to seal the EVAP system. If the NVLD switch reopens before the calibrated amount of time for a Medium leak an error is detected. Two Trip Fault.

P0455-EVAP SYSTEM LARGE LEAK

When Monitored: Engine Running. Cold start test. Fuel Level greater than 12%. Ambient Temperature between 4°C and 32°C (39°F and 89°F) Close Loop fuel system. Test runs when small leak test is maturing.

Set Condition: The PCM activates the EVAP Purge Solenoid to pull the EVAP system into a vacuum to close the NVLD switch. Once the NVLD switch is closed, the PCM turns the EVAP Purge solenoid off to seal the EVAP system. If the NVLD switch reopens before the calibrated amount of time for a Large leak an error is detected. Two Trip Fault.

POSSIBLE CAUSES

INTERMITTENT CONDITION

VISUAL AND PHYSICAL INSPECTION

EVAPORATIVE EMISSION LEAK DETECTION

EVAP PURGE SOLENOID OPERATION

NVLD SWITCH OPERATION

P0442-EVAP SYSTEM MEDIUM LEAK — Continued

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Since a hot vehicle can conceal a leak, it is best to perform this test at room temperature.</p> <p>NOTE: A loose gas cap could have caused this DTC to set. Make sure gas cap is tight and in good condition. Ensure the gas cap meets OEM specifications.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Go To 7</p>	All
2	<p>Perform a visual and physical inspection of the entire Evaporative Emission system. Check for the follow conditions:</p> <ul style="list-style-type: none"> - Holes or cracks - Loose seal points - Evidence of damaged components - Incorrect routing of hoses and tubes - Fuel Cap gasket seal <p>Were any of the above conditions found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6 - NGC.</p> <p>No → Go To 3</p>	All

P0442-EVAP SYSTEM MEDIUM LEAK — Continued

TEST	ACTION	APPLICABILITY
3	<p>To continue testing you will need Miller Tool #8404 Evaporative Emission Leak Detector (EELD).</p> <p>WARNING: Keep lighted cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.</p> <p>NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.</p> <p>Connect the red power lead of the EELD to the battery positive terminal and the black ground lead to battery negative terminal.</p> <p>NOTE: See Charts and Graph support material EELD Calibration Setup for an example.</p> <p>Block the vent hose of the EVAP Canister.</p> <p>Connect shop air to the EELD.</p> <p>Set the smoke/air control switch to AIR.</p> <p>Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).</p> <p>Press the remote smoke/air start button.</p> <p>Position the red flag on the air flow meter so it is aligned with the indicator ball.</p> <p>When the calibration is complete, release the remote button. The EELD is now calibrated the flow meter in liters per minute to the size leak indicated by the DTC set in the PCM.</p> <p>Install the service port adapter #8404-14 on the vehicle's service port (if equipped) or install the #8404-ADP service adapter in the NVLD filter line.</p> <p>Connect the Air supply hose from the EELD to the service port.</p> <p>Press the remote button to activate AIR flow.</p> <p>NOTE: Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill</p> <p>Compare the flow meter indicator ball reading to the red flag.</p> <p>ABOVE the red flag indicates a leak present.</p> <p>BELOW the red flag indicates a sealed system.</p> <p>Is the indicator ball above the red flag?</p> <p>Yes → Go To 4</p> <p>No → Go To 7</p>	All

P0442-EVAP SYSTEM MEDIUM LEAK — Continued

TEST	ACTION	APPLICABILITY
4	<p>NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.</p> <p>To continue testing, you will need Miller Tool #8404 Evaporative Emissions Leak Detector (EELD).</p> <p>Remove the Air supply hose from the service port.</p> <p>Connect the SMOKE supply tip (black hose) to the service port.</p> <p>Set the smoke/air control switch to SMOKE.</p> <p>NOTE: The flow meter indicator ball will not move in the smoke mode.</p> <p>Press the remote smoke/air start button.</p> <p>NOTE: Ensure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.</p> <p>NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.</p> <p>While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.</p> <p>If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke. The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.</p> <p>NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke may not be as thick. Introducing smoke into the filtered side of the canister may assist in locating the leak.</p> <p>Was a leak found?</p> <p>Yes → Repair or replace the leaking component as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>NOTE: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister. This may indicate a faulty rollover valve. Replace/repair as necessary.</p> <p>Turn the ignition off.</p> <p>Disconnect the vacuum hoses at the Evap Purge Solenoid.</p> <p>Using a hand vacuum pump, apply 10 in Hg to the "CAN" of the EVAP Purge Solenoid.</p> <p>NOTE: Monitor the vacuum gauge for at least 15 seconds.</p> <p>Does the EVAP Purge Solenoid hold vacuum?</p> <p>Yes → Go To 6</p> <p>No → Replace the Evap Purge Solenoid. EVAPORATIVE EMISSION LEAK DETECTION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The difference in ambient temperature, outside temp VS shop temp, may conceal a leak, it is best to perform this test after the vehicle's temperature has stabilized in the work area.</p> <p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2 No → Go To 4</p>	All
2	<p>Perform a visual and physical inspection of the entire Evaporative Emission system. Check for the following conditions:</p> <ul style="list-style-type: none"> - Holes or cracks - Loose seal points - Evidence of damaged components - Incorrect routing of hoses and tubes - Fuel Cap gasket seal <p>Were any of the above conditions found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All

P0456-EVAP SYSTEM SMALL LEAK — Continued

TEST	ACTION	APPLICABILITY
3	<p>NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.</p> <p>Use the Miller Tool #8404 Evaporative Emissions Leak Detector (EELD). Connect the SMOKE supply tip (black hose) to the service port, (if equipped), or install the #8404-ADP service adapter in the NVLD filter line. Set the smoke/air control switch to SMOKE. Block the vent hose of the EVAP Canister. NOTE: The flow meter indicator ball will not move at this point. Press the remote smoke/air start button. NOTE: Ensure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap. NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary. While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke. If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that are left behind by the smoke. The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light. NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke or dye may or may not be visual. Introducing smoke into the filtered side of the canister may assist in locating the leak. Was a leak found?</p> <p>Yes → Repair or replace the leaking component as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. NOTE: A loose gas cap could have caused this DTC to set. Make sure gas cap is tight and in good condition. Ensure the gas cap meets OEM specifications. Perform a visual and physical inspection of the entire Evaporative Emission system. Check for the following conditions:</p> <ul style="list-style-type: none"> - Holes or cracks - Loose seal points - Evidence of damaged components - Incorrect routing of hoses and tubes - Fuel Cap gasket seal <p>Were any of the above conditions found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Test Complete.</p>	All

Symptom:

P0461-FUEL LEVEL SENSOR #1 PERFORMANCE

When Monitored and Set Condition:

P0461-FUEL LEVEL SENSOR #1 PERFORMANCE

When Monitored: TEST #1: With the ignition on, the fuel level is compared to the previous key down after a 20 second delay. TEST #2: The PCM monitor the fuel level at ignition on.

Set Condition: TEST #1: If the PCM does not see a difference in fuel level of greater than 0.1 volt the test will fail. TEST #2: If the PCM does not see a change in the fuel level of .1765 over a set amount of miles the test will fail. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

VISUALLY INSPECT FUEL TANK

(G4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO GROUND

(G4) FUEL LEVEL SIGNAL CIRCUIT OPEN

(Z2) GROUND CIRCUIT OPEN

INTERNAL INSPECTION OF THE FUEL TANK

FUEL LEVEL SENSOR

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Diagnose P0462 or P0463 first, if set along with P0461. NOTE: Inspect the Fuel Pump Module harness connector for any corrosion or damage. Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Visually inspect the Fuel Tank for damage that may restrict the Fuel Sending Unit float from moving. Is the Fuel Tank OK?</p> <p>Yes → Go To 3</p> <p>No → Replace the Fuel Tank as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0461-FUEL LEVEL SENSOR #1 PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Measure the resistance between ground and the (G4) Fuel Level Signal circuit at the Fuel Pump Module harness connector. Is the resistance below 100 ohms? Yes → Repair the short to ground in the (G4) Fuel Level Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 4	All
4	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Disconnect the BCM harness connector. Measure the resistance of the (G4) Fuel Level Signal circuit from the Fuel Pump Module harness connector to the BCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open in the (G4) Fuel Level Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
5	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Measure the resistance of the (Z2) Ground circuit from the Fuel Pump Module harness connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open in the (Z2) Ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
6	WARNING: The fuel system is under a constant pressure even with the engine off. Before opening the fuel system the fuel pressure must be release. Relieve the fuel pressure in accordance with the service information. Remove the Fuel Tank in accordance with the Service Information. Remove the Fuel Pump Module. Visually inspect the inside of the Fuel Tank for any obstructions or deformities. Inspect the Fuel Pump Module Float arm for damage. Were any problems found? Yes → Repair or replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Fuel Level Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom List:

P0462-FUEL LEVEL SENSOR #1 LOW

P0463-FUEL LEVEL SENSOR #1 HIGH

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **P0462-FUEL LEVEL SENSOR #1 LOW**.

When Monitored and Set Condition:

P0462-FUEL LEVEL SENSOR #1 LOW

When Monitored: Ignition on and battery voltage above 10.4 volts.

Set Condition: The fuel level sensor signal voltage goes below 0.1961 volts for more than 5 seconds. One Trip Fault.

P0463-FUEL LEVEL SENSOR #1 HIGH

When Monitored: Ignition on and battery voltage above 10.4 volts.

Set Condition: The fuel level sensor signal voltage at the PCM goes above 4.7 volts for more than 5 seconds. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Refer to the Instrument Cluster Category and perform the appropriate symptoms. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom:**P0480-LOW SPEED FAN CONTROL RELAY CIRCUIT****When Monitored and Set Condition:****P0480-LOW SPEED FAN CONTROL RELAY CIRCUIT**

When Monitored: With the ignition on. Battery voltage greater than 10 volts.

Set Condition: An open or shorted circuit is detected in the radiator fan relay control circuit. One Trip Fault.

POSSIBLE CAUSES

LOW SPEED RADIATOR FAN RELAY OPERATION

(A16) FUSED B+ FEED CIRCUITS

LOW SPEED RADIATOR FAN RELAY RESISTANCE

(C24) LOW SPEED RAD FAN RELAY CONTROL CIRCUIT OPEN

(C24) LOW SPEED RAD FAN RELAY CONTROL CIRCUIT SHORT TO GROUND

PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, actuate the Radiator Fan Relay. Is the Low Speed Radiator Fan Relay operating? Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 2	All
2	Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Ignition on, engine not running. Measure the voltage of the (A16) Fused B+ Feed circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 3 No → Repair the (A16) Fused B+ Output circuit. Inspect the related fuse and repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

P0480-LOW SPEED FAN CONTROL RELAY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Measure the resistance of the Low Speed Radiator Fan Relay between the Fused Ignition Switch Output terminal and the Low Speed Rad Fan Relay Control terminal. Is the resistance between 60 to 85 ohms?</p> <p>Yes → Go To 4</p> <p>No → Replace the Low Speed Radiator Fan Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
4	<p>Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (C24) Low Speed Rad Fan Relay Control circuit from the PDC to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the open in the (C24) Low Speed Rad Fan Relay Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
5	<p>Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance between ground and the (C24) Low Speed Rad Fan Control circuit at the PDC. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to ground in the (C24) Low Speed Rad Fan Relay Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:**P0481-HIGH SPEED FAN CONTROL RELAY CIRCUIT****When Monitored and Set Condition:****P0481-HIGH SPEED FAN CONTROL RELAY CIRCUIT**

When Monitored: With the ignition on. Battery voltage greater than 10 volts.

Set Condition: An open or shorted circuit is detected in the radiator fan relay control circuit. One trip Fault.

POSSIBLE CAUSES

HIGH SPEED RADIATOR FAN RELAY OPERATION

(A16) FUSED IGNITION SWITCH OUTPUT CIRCUIT

HIGH SPEED RADIATOR FAN RELAY RESISTANCE

(C27) HIGH SPEED RAD FAN RELAY CONTROL CIRCUIT OPEN

(C27) HIGH SPEED RAD FAN RELAY CONTROL CIRCUIT SHORT TO GROUND

PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the High Speed Radiator Fan Relay. Is the High Speed Radiator Fan Relay operating? Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → Go To 2	All
2	Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Turn the ignition on. Measure the voltage of the (A16) Fused Ignition Switch Output circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 3 No → Repair the (A16) Fused Ignition Switch Output circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

P0481-HIGH SPEED FAN CONTROL RELAY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Measure the resistance of the High Speed Radiator Fan Relay between the Fused Ignition Switch Output terminal and the High Speed Rad Fan Relay Control terminal. Is the resistance between 60 to 85 ohms?</p> <p>Yes → Go To 4</p> <p>No → Replace the High Speed Radiator Fan Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
4	<p>Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (C27) High Speed Rad Fan Relay Control circuit from the PDC to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the open in the (C27) High Speed Rad Fan Relay Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
5	<p>Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance between ground and the (C27) High Speed Rad Fan Relay Control circuit in the PDC. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the short to ground in the (C27) High Speed Rad Fan Relay Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:**P0498-NVLD CANISTER VENT VALVE SOLENOID CIRCUIT LOW****When Monitored and Set Condition:****P0498-NVLD CANISTER VENT VALVE SOLENOID CIRCUIT LOW**

When Monitored: Engine Running.

Set Condition: The PCM detects a short in the NVLD Canister vent solenoid circuits. One trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

NVLD SOLENOID

(K106) NVLD SOLENOID CONTROL CIRCUIT SHORT TO GROUND

PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
2	Turn the ignition off. Disconnect the NVLD electrical harness connector. Measure the resistance of the NVLD Solenoid coil. Is the resistance between 7.5 to 8.5 ohms? Yes → Go To 3 No → Replace the NVLD Assembly. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
3	Turn the ignition off. Disconnect the NVLD electrical harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the (K106) NVLD Sol Control circuit at the NVLD electrical harness connector. Is the resistance below 5.0 ohms? Yes → Repair the short to ground in the (K106) NVLD Solenoid Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom:

P0499-NVLD CANISTER VENT VALVE SOLENOID CIRCUIT HIGH

When Monitored and Set Condition:

P0499-NVLD CANISTER VENT VALVE SOLENOID CIRCUIT HIGH

When Monitored: Engine Running.

Set Condition: The PCM detects an open in the NVLD Canister vent solenoid circuits.
One trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

NVLD SOLENOID

(K106) NVLD SOL CONTROL CIRCUIT SHORT TO BATTERY VOLTAGE

(K106) NVLD SOL CONTROL CIRCUIT OPEN

(Z1) GROUND CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Symptom:

P0501-VEHICLE SPEED SENSOR #1 PERFORMANCE

When Monitored and Set Condition:

P0501-VEHICLE SPEED SENSOR #1 PERFORMANCE

When Monitored: Engine running. Transmission not in park or neutral. Brakes not applied. Engine run time greater than 10 seconds. Engine RPM above idle.

Set Condition: The PCM does not see vehicle speed signal from the transmission control side of the PCM. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
TRANSMISSION DTC(S)
PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure that the Pinion Factor has been programmed and the correct tire size has been programmed in before continuing.</p> <p>Ignition on, engine not running. With the DRBIII®, read PCM DTCs and record the related Freeze Frame data. Is the Good Trip displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Turn the ignition on. With the DRBIII®, check the Transmission DTCs. Are there any Transmission DTCs present?</p> <p>Yes → Refer to the appropriate Transmission DTC in the Transmission category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Replace and program the Powertrain Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom List:**P0506-IDLE SPEED LOW PERFORMANCE****P0507-IDLE SPEED HIGH PERFORMANCE****P0519-IDLE SPEED PERFORMANCE**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0506-IDLE SPEED LOW PERFORMANCE.

When Monitored and Set Condition:**P0506-IDLE SPEED LOW PERFORMANCE**

When Monitored: Engine Running. During an idle condition.

Set Condition: If the engine RPM does not come within a calibratable low limit of the target idle speed, a failure timer will increment. When the appropriate failure timer reaches its maximum threshold without sign of RPM trending towards control, a soft fail is generated. When a calibratable number of the soft fails is reached, a I trip fault is set. When two 1 trip faults occur in a row, a the DTC is set and the MIL illuminates.

P0507-IDLE SPEED HIGH PERFORMANCE

When Monitored: Engine Running. During an idle condition.

Set Condition: If the engine RPM does not come within a calibratable high limit of the target idle speed, a failure timer will increment. When the appropriate failure timer reaches its maximum threshold without sign of RPM trending towards control, a soft fail is generated. When a calibratable number of the soft fails is reached, a I trip fault is set. When two 1 trip faults occur in a row, a the DTC is set and the MIL illuminates.

P0519-IDLE SPEED PERFORMANCE

When Monitored: With the engine idling and the transmission in drive, if automatic. There must not be a MAP sensor trouble code or a Throttle Position Sensor trouble code.

Set Condition: The engine idle is not within 200 rpm above or 100 rpm below the target idle for 50 seconds. Two trip fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

IAC MOTOR PASSAGES

VACUUM LEAKS

AIR INDUCTION SYSTEM

THROTTLE BODY AND THROTTLE LINKAGE

P0506-IDLE SPEED LOW PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
2	<p>Turn the ignition off. Remove the IAC Motor. Inspect the IAC Motor and passages for any obstructions or damage to motor. Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All
3	<p>Start the engine. Inspect the vehicle for external vacuum leaks. Inspect the engine for internal vacuum leaks. Were any vacuum leaks found?</p> <p>Yes → Repair the vacuum leak as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>Inspect the Air Induction System for the following problems. Restrictions: Dirty Air Cleaner, Foreign material trapped in the air intake tube, etc. Leaks: Air Intake tube connection, Air Cleaner housing, etc. Were any problems found?</p> <p>Yes → Repair or replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Inspect the throttle body plate carbon build up or other restrictions. Inspect the throttle linkage for binding and smooth operation. Ensure the throttle plate is resting on the stop at idle. Were any problems found?</p> <p>Yes → Repair or replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Test Complete.</p>	All

Symptom:**P0508-IAC VALVE SENSE CIRCUIT LOW****When Monitored and Set Condition:****P0508-IAC VALVE SENSE CIRCUIT LOW**

When Monitored: Engine running. Battery voltage greater than 10 volts.

Set Condition: The IAC sense circuit is less than 175 mA. One Trip Fault.

2	<p>Turn the ignition off. Disconnect the IAC Motor harness connector. With the DRBIII®, monitor the IAC Current. Turn the ignition on. Does the DRBIII® display IAC Current at 0mA?</p> <p>Yes → Replace the IAC Motor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 3</p>	All

P0509-IAC VALVE SENSE CIRCUIT HIGH — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the IAC Motor harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Measure the voltage of the (K60) IAC Signal circuit in the IAC Motor harness connector. Is the voltage above 0.5 of a volt?</p> <p>Yes → Repair the short to voltage in the (K60) IAC Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the IAC Motor harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Measure the voltage of the (K39) IAC Motor Driver circuit in the IAC Motor harness connector. Is the voltage above 0.5 of a volt?</p> <p>Yes → Repair the short to voltage in the (K39) IAC Motor Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the IAC Motor harness connector. Measure the resistance across the IAC Motor harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the (K60) IAC Motor Signal circuit short to the (K39) IAC Motor Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:
P0513-INVALID SKIM KEY

When Monitored and Set Condition:

P0513-INVALID SKIM KEY

When Monitored: Ignition on.

Set Condition: The PCM detects an invalid SKIM key.

POSSIBLE CAUSES	
INCORRECT VIN IN PCM INVALID SKIM KEY NOT PRESENT NO COMMUNICATION WITH SKIM NO VIN PROGRAMMED IN THE PCM PCM SKIM TROUBLE CODES SET	

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the PCM DTCs. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	With the DRBIII®, attempt to communicate with the SKIM. Turn the ignition on. Can the DRBIII® communicate with the SKIM? Yes → Go To 3 No → Refer to the No Communication category. Perform SKIS VERIFICATION.	All
3	Turn the ignition on. With the DRBIII®, check for SKIM DTCs. Are any DTCs present in the SKIM? Yes → Refer to SKIM category for the related symptom(s). Perform SKIS VERIFICATION. No → Go To 4	All
4	Turn the ignition on. With the DRBIII®, display the VIN that is programmed in the PCM. Has a VIN been programmed into the PCM? Yes → Go To 5 No → Program the correct VIN into the PCM and retest. Perform SKIS VERIFICATION.	All

P0513-INVALID SKIM KEY — Continued

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition on. With the DRBIII®, display the VIN that is programmed in the PCM. Was the correct VIN programmed into the PCM?</p> <p>Yes → Go To 6</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p>	All
6	<p>Turn the ignition off. Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Turn the ignition on. With the DRBIII®, erase all SKIM and PCM DTCs. Attempt to start and idle the engine. With the DRBIII®, read the PCM DTCs. Does the DRBIII® display this code?</p> <p>Yes → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All
7	<p>NOTE: You must obtain the SKIM pin number. NOTE: This DTC could have been set if the SKIM harness connector was disconnected, or if the SKIM was replaced recently. NOTE: All keys that the customer uses for this vehicle must be tested to verify they are operating properly.</p> <p>Turn the ignition on. Verify the correct VIN is programmed into the PCM and SKIM. Turn the ignition off. With the next customer key turn the ignition key on and crank the engine to start. With the DRBIII®, read the PCM DTCs. Look for P0513. Is the Good Trip Counter for DTC P0513 displayed and equal to 0?</p> <p>Yes → Replace the Ignition Key. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p> <p>NOTE: If this DTC cannot be reset, it could have been an actual theft attempt.</p>	All

Symptom:

P0532-A/C PRESSURE SENSOR LOW

When Monitored and Set Condition:

P0532-A/C PRESSURE SENSOR LOW

When Monitored: The engine running. The A/C relay energized.

Set Condition: The A/C pressure sensor signal voltage at the PCM goes below 0.58 volts for 2.6 seconds. One Trip Fault.

POSSIBLE CAUSES

A/C PRESSURE SENSOR VOLTAGE BELOW 0.6 VOLTS

(K7) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

(K7) 5 VOLT SUPPLY CIRCUIT OPEN

A/C PRESSURE SENSOR INTERNAL FAILURE

(C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND

(C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO (K4) SENSOR GROUND CIRCUIT

PCM (K7) 5 VOLT SUPPLY CIRCUIT

PCM A/C PRESSURE SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the A/C refrigerant System is properly charged per the Service Information.</p> <p>Start the engine. With the DRBIII®, read the A/C Pressure Sensor voltage. Is the voltage below 0.6 of a volt?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All
2	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Turn the ignition on. Measure the voltage of the (K7) 5 Volt Supply circuit in the A/C Pressure Sensor harness connector. Is the voltage between 4.5 to 5.2 volts?</p> <p>Yes → Go To 3</p> <p>No → Go To 7</p>	All

P0532-A/C PRESSURE SENSOR LOW — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. With the DRBIII®, monitor the A/C Pressure Sensor voltage. Turn the ignition on. Is the voltage above 0.6 of a volt?</p> <p>Yes → Replace the A/C Pressure Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the (C18) A/C Pressure Signal circuit in the A/C Pressure Sensor harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to ground in the (C18) A/C Pressure Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the (C18) A/C Pressure Sensor Signal circuit and the (K4) Sensor ground circuit in the A/C Pressure Sensor harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to the (K4) Sensor ground circuit in the (C18) A/C Pressure Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All
7	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the (K7) 5 Volt Supply circuit in the A/C Pressure Sensor harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to ground in the (K7) 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Go To 8</p>	All

P0532-A/C PRESSURE SENSOR LOW — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K7) 5 Volt Supply circuit from the A/C Pressure Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the open in the (K7) 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All
9	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All

Symptom:
P0533-A/C PRESSURE SENSOR HIGH

When Monitored and Set Condition:

P0533-A/C PRESSURE SENSOR HIGH

When Monitored: The engine running. The A/C relay energized.

Set Condition: The A/C pressure sensor signal at the PCM goes above 4.92 volts. One trip Fault.

POSSIBLE CAUSES

A/C PRESSURE SENSOR VOLTAGE ABOVE 4.6 VOLTS

(C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO (K7) 5 VOLT SUPPLY CIRCUIT

(C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

A/C PRESSURE SENSOR INTERNAL FAILURE

(C18) A/C PRESSURE SIGNAL CIRCUIT OPEN

(K4) SENSOR GROUND CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the A/C refrigerant System is properly charged per the Service Information.</p> <p>Start the engine. With the DRBIII®, read the A/C Pressure Sensor voltage. Is the voltage above 4.6 volts?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All
2	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the (C18) A/C Pressure Signal circuit and the (K7) 5 Volt Supply circuit in the A/C Pressure Sensor harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the (C18) A/C Pressure Signal circuit for a short to the (K7) 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Go To 3</p>	All

P0533-A/C PRESSURE SENSOR HIGH — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Turn the ignition on. Measure the voltage on the (C18) A/C Pressure Sensor Signal circuit at the A/C Pressure Sensor harness connector. Is the voltage above 5.2 volts?</p> <p>Yes → Repair the (C18) A/C Pressure Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Connect a jumper wire between the (C18) A/C Pressure Signal circuit and the (K4) Sensor ground circuit. With the DRBIII®, monitor the A/C Pressure Sensor voltage. Turn the ignition on. Is the voltage below 1.0 volt?</p> <p>Yes → Replace the A/C Pressure Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (C18) A/C Pressure Sensor Signal circuit from the A/C Pressure Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the (C18) A/C Pressure Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All
6	<p>Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K4) Sensor ground circuit from the A/C Pressure Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the (K4) Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All

Symptom:

P0562-BATTERY VOLTAGE LOW

When Monitored and Set Condition:

P0562-BATTERY VOLTAGE LOW

When Monitored: Engine Running. RPM greater than 1152.

Set Condition: The battery sensed voltage is 1 volt below the charging goal for 13.47 seconds. The PCM senses the battery voltage turns off the field driver and senses the battery voltage again. If the voltages are the same, the code is set. One trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

B+ CIRCUIT HIGH RESISTANCE

GENERATOR GROUND HIGH RESISTANCE

GENERATOR OPERATION

(Z1) GENERATOR FIELD GROUND CIRCUIT OPEN

(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND

(K20) GEN FIELD CONTROL CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.</p> <p>NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.</p> <p>Turn the ignition off.</p> <p>NOTE: Ensure the generator drive belt is in good operating condition.</p> <p>NOTE: Inspect the fuses in the PDC. If a fuse is found to be open use the wiring diagram/schematic as a guide, inspect the wiring and connectors for damage.</p> <p>Ignition on, engine not running.</p> <p>With the DRBIII®, read DTCs and record the related Freeze Frame data.</p> <p>Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.</p>	All

P0562-BATTERY VOLTAGE LOW — Continued

TEST	ACTION	APPLICABILITY
2	<p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>Ignition on, engine not running.</p> <p>NOTE: Ensure all wires are clear of the engine's moving parts.</p> <p>Measure the voltage between the Generator B+ Terminal and the Battery+ Post.</p> <p>Start the engine.</p> <p>Is the voltage above 0.4 of a volt?</p> <p>Yes → Repair the B+ circuit for high resistance between the Generator and Battery. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.</p> <p>No → Go To 3</p>	All

Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the (V37) S/C Switch Signal circuit short to (K4) Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Speed Control On/Off Switch harness connector. Disconnect the Speed Control Resume/Accel Switch harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance between ground and the (V37) S/C Switch Signal circuit to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the short to ground in the (V37) S/C Switch Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>NOTE: Before continuing, disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p>	All

Symptom:

P0581-SPEED CONTROL SWITCH #1 HIGH

When Monitored and Set Condition:

P0581-SPEED CONTROL SWITCH #1 HIGH

When Monitored: With the ignition key on. Battery voltage above 10 volts.

Set Condition: The PCM detects an open or short to voltage in the Speed Control Switch Signal circuit. One Trip Fault.

POSSIBLE CAUSES

SPEED CONTROL SWITCH VOLTAGE HIGH
 SPEED CONTROL SWITCHES
 (V37) S/C SWITCH SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
 (K4) SENSOR GROUND OPEN
 PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Do not press any of the Speed Control Switch buttons. Ignition on, engine not running. With the DRBIII®, read the Speed Control voltage. Is the Speed Control voltage above 4.8 volt?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p>	All
2	<p>Turn the ignition off. Remove the Speed Control Switches from the steering wheel. Measure the resistance across each Speed Control Switch. Monitor the ohmmeter while pressing each function button on each switch. Resume/Accel - 15,400 ohms Cancel - 909 +/- 9 ohms Decel (Coast) - 2940 +/- 30 ohms On/Off - 0 ohms Set - 6650 +/- 66 ohms Does the function on the Speed Control Switches have the correct ohm value?</p> <p>Yes → Go To 3</p> <p>No → Replace the Speed Control Switch that had the incorrect resistance value. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p>	All

P0581-SPEED CONTROL SWITCH #1 HIGH — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Speed Control On/Off Switch harness connector. Disconnect the Speed Control Resume/Accel Switch harness connector. Disconnect the PCM harness connector. Measure the voltage of the (V37) S/C Switch Signal circuit at the Speed Control harness connector. Is the is the voltage above 5.0 volts?</p> <p>Yes → Repair the (V37) S/C Switch Signal circuit shorted to the battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p> <p>No → Go To 4</p>	All
4	<p>NOTE: The measurement must be taken from both Speed Control Switch harness connector. Turn the ignition off. Disconnect the Speed Control On/Off Switch harness connector. Disconnect the Speed Control Resume/Accel Switch harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K4) Sensor Ground circuit from the Speed Control harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms for both measurement?</p> <p>Yes → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p> <p>No → Repair the (K4) Sensor Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p>	All

Symptom:

P0582-SPEED CONTROL VACUUM SOLENOID CIRCUIT

When Monitored and Set Condition:

P0582-SPEED CONTROL VACUUM SOLENOID CIRCUIT

When Monitored: Ignition on. Speed Control active.

Set Condition: The PCM detects an open or short to voltage in the Speed Control Vacuum Control circuit. One Trip Fault.

POSSIBLE CAUSES

SPEED CONTROL SOLENOID OPERATION

SPEED CONTROL VACUUM SOLENOID

(V36) S/C VACUUM SOL CONTROL CIRCUIT SHORTED TO GROUND

(V36) S/C VACUUM SOL CONTROL CIRCUIT OPEN

PCM (VACUUM SOLENOID)

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. With the DRBIII®, actuate the Speed Control Vacuum Solenoid and note operation. Does the Speed Control Vacuum Solenoid actuate properly?</p> <p>Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Speed Control Servo harness connector. Ignition on, engine not running. With the DRBIII®, actuate the Speed Control Vacuum Solenoid. Using a 12-volt test light connected to ground, probe the S/C Vacuum Control circuit. Does the test light illuminate brightly and flash?</p> <p>Yes → Replace the Speed Control Servo. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p> <p>No → Go To 3</p>	All

P0582-SPEED CONTROL VACUUM SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (V36) S/C Vacuum Sol Control circuit from the Speed Control Servo harness connector to the appropriate terminal of special tool # 8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the open/high resistance in the (V36) S/C Vacuum Sol Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p>	All
4	<p>Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the (V36) S/C Vacuum Solenoid Control circuit at the Speed Control Servo harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to ground in the (V36) S/C Vacuum Sol Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Symptom List:**P0600-SERIAL COMMUNICATION LINK****P0601-INTERNAL MEMORY CHECKSUM INVALID**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **P0600-SERIAL COMMUNICATION LINK**.

When Monitored and Set Condition:**P0600-SERIAL COMMUNICATION LINK**

When Monitored: With the ignition on.

Set Condition: Internal Bus communication failure between the Engine and Transmission processors.

P0601-INTERNAL MEMORY CHECKSUM INVALID

When Monitored: With the ignition on.

Set Condition: Internal checksum for software failed, does not match calculated value.

POSSIBLE CAUSES

PCM INTERNAL OR SPI

TEST	ACTION	APPLICABILITY
1	<p>The Powertrain Control Module is reporting internal errors, view repair to continue.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:

P0622-GENERATOR FIELD CONTROL CIRCUIT

When Monitored and Set Condition:

P0622-GENERATOR FIELD CONTROL CIRCUIT

When Monitored: With the ignition on. Engine running.

Set Condition: When the PCM tries to regulate the generator field with no result during monitoring. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

GENERATOR OPERATION

(Z1) GEN FIELD GROUND CIRCUIT OPEN

(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND

(K20) GEN FIELD CONTROL CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Generator Field harness connector. Using a 12-volt test light, jumper it across the Generator Field harness connector. Ignition on, engine not running. With the DRBIII®, actuate the Generator Field Driver circuit. Does the test light illuminate brightly and flash on and off?</p> <p>Yes → Replace the Generator. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.</p> <p>No → Go To 3</p>	All

P0622-GENERATOR FIELD CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Generator Field harness connector. Using a 12-volt test connected to battery voltage, probe the (Z1) Gen Ground circuit in the Generator Field harness connector. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the open in the (Z1) Gen Field Ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.	All
4	Turn the ignition off. Disconnect the Generator Field harness connector. Disconnect the PCM harness connector. Measure the voltage on the (K20) Gen Field Control circuit in the Generator Field harness connector. Is the voltage above 1.0 volts? Yes → Repair the short to voltage in the (K20) Gen Field Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC. No → Go To 5	All
5	Turn the ignition on. Disconnect the Generator Field harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the (K20) Gen Field Control circuit in the Generator Field harness connector. Is the resistance below 100 ohms? Yes → Repair the (K20) Gen Field Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC. No → Go To 6	All
6	Turn the ignition off. Disconnect the Generator Field harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the (K20) Gen Field Control circuit from the Generator Field harness connector to the appropriate terminal of the special tool #8815. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open in the (K20) Gen Field Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.	All
7	NOTE: Before continuing, check the PCM connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.	All

Symptom:

P0627-FUEL PUMP RELAY CIRCUIT

When Monitored and Set Condition:

P0627-FUEL PUMP RELAY CIRCUIT

When Monitored: With the ignition on. Battery voltage greater than 10.4 volts.

Set Condition: An open or shorted condition is detected in the fuel pump relay control circuit. One Trip Fault.

POSSIBLE CAUSES

FUEL PUMP RELAY OPERATION

(A14) FUSED IGNITION SWITCH OUTPUT CIRCUIT

FUEL PUMP RELAY RESISTANCE

(K31) FUEL PUMP RELAY CONTROL CIRCUIT OPEN

(K31) FUEL PUMP RELAY CONTROL CIRCUIT SHORT TO GROUND

PCM

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, actuate the Fuel Pump Relay. Is the Fuel Pump Relay operating?</p> <p>Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Ignition on, engine not running. Measure the voltage of the (A14) Fused Ignition Switch Output circuit in the PDC. Is the voltage above 11.0 volts?</p> <p>Yes → Go To 3</p> <p>No → Repair the (A14) Fused Ignition Switch Output circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
3	<p>Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Measure the resistance of the Fuel Pump Relay between the Fused Ignition Switch Output terminal and the Fuel Pump Relay Control terminal. Is the resistance between 70 to 95 ohms?</p> <p>Yes → Go To 4</p> <p>No → Replace the Fuel Pump Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P0627-FUEL PUMP RELAY CIRCUIT — Continued

Symptom:

P0630-VIN NOT PROGRAMMED IN PCM

When Monitored and Set Condition:

P0630-VIN NOT PROGRAMMED IN PCM

When Monitored: Ignition on.

Set Condition: The VIN has not been programmed into the PCM.

POSSIBLE CAUSES

PROGRAMMING VIN INTO PCM

VERIFY PCM PROGRAMMING

PCM

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, erase DTCs. Using the DRBIII®, program VIN into the PCM. Start the engine. NOTE: If the engine will not start, crank the engine over for 15 seconds. Crank at least 2 times with the ignition switch returning to the off position each time. Allow the engine to reach normal operating temperature. With the DRBIII®, read DTCs. Does the DTC reset?</p> <p>Yes → Go To 2</p> <p>No → The VIN has been successfully programmed into the PCM. Test is complete. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
2	<p>NOTE: The ignition switch must be left in the off position for a minimum of 10 seconds. Cycle the ignition switch to the off position and then back to run. Attempt to program the PCM with the applicable information. Start the vehicle and allow it to reach normal operating temperatures. With the DRBIII®, read DTCs. Does the DTC reset?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → The VIN has been successfully programmed into the PCM. Test is complete. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:**P0632-ODOMETER NOT PROGRAMMED IN PCM****When Monitored and Set Condition:****P0632-ODOMETER NOT PROGRAMMED IN PCM**

When Monitored: Ignition on.

Set Condition: The mileage has not been programmed into the PCM.

POSSIBLE CAUSES

PROGRAMMING MILEAGE INTO PCM

VERIFY PCM PROGRAMMING

PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, erase DTCs. Using the DRBIII®, program the mileage into the PCM. Start the engine. Allow the engine to reach normal operating temperature. With the DRBIII®, read DTCs. Does the DTC reset? Yes → Go To 2 No → The mileage has been successfully programmed into the PCM. Test is complete. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	NOTE: The ignition switch must be left in the off position for a minimum of 10 seconds. Cycle the ignition switch to the off position and then back to run. Attempt to program the PCM with the applicable information. Start the vehicle and allow it to reach normal operating temperatures. With the DRBIII®, read DTCs. Does the DTC reset? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → The mileage has been successfully programmed into the PCM. Test is complete. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:

P0633-SKIM KEY NOT PROGRAMMED IN PCM

When Monitored and Set Condition:

P0633-SKIM KEY NOT PROGRAMMED IN PCM

When Monitored: Ignition on.

Set Condition: The SKIM Key information has not been programmed into the PCM.

POSSIBLE CAUSES

PROGRAMMING SKIM KEY INTO PCM

VERIFY PCM PROGRAMMING

PCM

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, erase DTCs. Using the DRBIII®, program the SKIM Key information into the PCM. Start the engine. NOTE: If the engine will not start, crank the engine over for 15 seconds. Crank at least 2 times with the ignition switch returning to the off position each time. Allow the engine to reach normal operating temperature. With the DRBIII®, read DTCs. Does the DTC reset?</p> <p>Yes → Go To 2</p> <p>No → The SKIM KEY information has been successfully programmed into the PCM. Test is complete. Perform SKIS VERIFICATION.</p>	All
2	<p>NOTE: The ignition switch must be left in the off position for a minimum of 10 seconds. Cycle the ignition switch to the off position and then back to run. Attempt to program the PCM with the applicable information. Start the vehicle and allow it to reach normal operating temperatures. With the DRBIII®, read DTCs. Does the DTC reset?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All

Symptom:**P0660-MANIFOLD TUNE VALVE SOLENOID CIRCUIT****When Monitored and Set Condition:****P0660-MANIFOLD TUNE VALVE SOLENOID CIRCUIT**

When Monitored: With the ignition on. ASD Relay energized. Battery voltage greater than 10 volts.

Set Condition: The PCM senses the MTV is not at the desired state. One Trip Fault.

POSSIBLE CAUSES

INTERMITTENT CONDITION

MANIFOLD TUNE VALVE SOLENOID OPERATION

MTV SOLENOID GROUND CIRCUIT OPEN

MTV SOLENOID CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

MTV SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

MTV SOLENOID CONTROL CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the Manifold Tune Valve Solenoid harness connector. Turn the ignition on Using a 12-volt test light, connect one end to the MTV Solenoid ground circuit and the other end to the MTV Solenoid Control circuit in the MTV harness connector. With the DRBIII®, actuate the MTV Solenoid. Does the 12-volt test light flash on and off? Yes → Replace the Manifold Tune Valve Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the MTV Solenoid harness connector. Using a 12-volt test light connected to battery voltage, probe the MTV Solenoid ground circuit in the MTV Solenoid harness connector. Does the 12-volt test light illuminate brightly? Yes → Go To 4 No → Repair the open in the MTV Solenoid ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0660-MANIFOLD TUNE VALVE SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the MTV Solenoid harness connector. Turn the ignition on. Measure the voltage on the MTV Solenoid Control circuit in the MTV Solenoid harness connector. Does the voltmeter indicate voltage present? Yes → Repair the MTV Solenoid Control circuit short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the MTV Solenoid harness connector. Measure the resistance between ground and the MTV Solenoid Control circuit at the MTV Solenoid harness connector. Is the resistance below 100 ohms? Yes → Repair the short to ground in the MTV Solenoid Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the MTV Solenoid harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the MTV Solenoid Control circuit from the MTV Solenoid harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open in the MTV Solenoid Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0660-MANIFOLD TUNE VALVE SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
8	<p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wire harness. Look for parameter values to change and/or a DTC to set.</p> <p>Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set.</p> <p>Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Test Complete.</p>	All

Symptom:

P0685-ASD RELAY CONTROL CIRCUIT

When Monitored and Set Condition:

P0685-ASD RELAY CONTROL CIRCUIT

When Monitored: With ignition on. Battery voltage above 10 volts.

Set Condition: An open or shorted condition is detected in the ASD relay control circuit.
One trip Fault.

POSSIBLE CAUSES

ASD OPERATION

(A14) FUSED B+ CIRCUIT

ASD RELAY RESISTANCE

(K51) ASD RELAY CONTROL CIRCUIT OPEN

(K51) ASD RELAY CONTROL CIRCUIT SHORT TO GROUND

PCM

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, actuate the ASD Relay. Is the ASD Relay operating?</p> <p>Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Remove the ASD Relay from the PDC. Ignition on, engine not running. Measure the voltage of the (A14) Fused B+ circuits in the PDC. Is the voltage above 11.0 volts?</p> <p>Yes → Go To 3</p> <p>No → Repair the (A14) Fused B+ circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
3	<p>Turn the ignition off. Remove the ASD Relay from the PDC. Measure the resistance of the ASD Relay between the Fused B+ terminal and the ASD Relay Control terminal. Is the resistance between 60 to 85 ohms?</p> <p>Yes → Go To 4</p> <p>No → Replace the ASD Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Perform POWERTRAIN VERIFICATION TEST VER - 4 - NGC.</p>	All

Symptom:**P0850-PARK/NEUTRAL SWITCH PERFORMANCE****When Monitored and Set Condition:****P0850-PARK/NEUTRAL SWITCH PERFORMANCE**

When Monitored: Continuously with the transmission in Park, Neutral, or Drive and NOT in Limp-in mode.

Set Condition: The PCM detects an incorrect Park/Neutral switch state for a given mode of vehicle operation. Two Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO
TRANSMISSION DTC(S)
PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. NOTE: Before continuing, ensure that communication can be established with the TCM. If the DRBIII® can not communicate with the TCM refer to the Communication Category and preform the appropriate symptom. With the DRBIII®, read PCM DTCs and record the related Freeze Frame data. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
2	Turn the ignition on. With the DRBIII®, check the Transmission DTCs. Are there any Transmission DTCs present? Yes → Refer to the appropriate Transmission DTC in the Transmission category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC. No → NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Replace and program the Powertrain Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

Symptom:

P1115-GENERAL TEMP SENSOR PERFORMANCE

When Monitored and Set Condition:

P1115-GENERAL TEMP SENSOR PERFORMANCE

When Monitored: Engine off time is greater than 480 minutes. Ambient temperature is greater than -23°C (-10°F).

Set Condition: After a calibrated amount of cool down time, the PCM compares the ECT Sensor, IAT Sensor and the Ambient Air Temperature Sensor values. If the (AAT and IAT), (AAT and ECT) and (ECT and IAT) are all less than a calibrated value, then the DTC will set.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

OTHER POSSIBLE CAUSES

SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

TEMPERATURE SENSOR VOLTAGE BELOW 1.0 VOLT

SIGNAL CIRCUIT OPEN

SENSOR GROUND CIRCUIT OPEN

SIGNAL CIRCUIT SHORTED TO GROUND

SIGNAL CIRCUIT SHORTED TO SENSOR GROUND

PCM LOW

PCM HIGH

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Due to the fact that the PCM compares the IAT, AAT and ECT sensors to see if they are within a calibrated temp of one another, the use of a block heater can cause false readings for the PCM. Check with the customer to see if they use a block heater.</p> <p>Ignition on, engine not running.</p> <p>NOTE: It is possible that more then one temperature sensor caused this DTC to set. After a repair has been made the remaining temperature sensors must be checked using the DRB temperature probe.</p> <p>With the DRBIII®, read DTCs and record the related Freeze Frame data.</p> <p>Is the Good Trip displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

P1115-GENERAL TEMP SENSOR PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition on.</p> <p>With the DRBIII®, read and record the AAT Sensor Temperature value</p> <p>Using the DRB Temperature Probe #CH7050, measure the ambient air temperature near the AAT sensor.</p> <p>Is the AAT Sensor value with -15°C (5°F) of the temperature probe reading?</p> <p>Yes → Go To 3</p> <p>No → Go To 6</p>	All
3	<p>Turn the ignition on.</p> <p>With the DRBIII®, read and record the IAT Sensor Temperature value</p> <p>Remove the IAT sensor.</p> <p>Using the DRB Temperature Probe #CH7050, measure the temperature inside the IAT sensor opening.</p> <p>Is the IAT Sensor value within -15°C (5°F) of the temperature probe reading?</p> <p>Yes → Go To 4</p> <p>No → Go To 6</p>	All
4	<p>WARNING: MAKE SURE THE ENGINE COOLING SYSTEM IS COOL BEFORE REMOVING THE PRESSURE CAP OR ANY HOSE. SEVERE PERSONAL INJURY MAY RESULT FROM ESCAPING HOT COOLANT. THE COOLING SYSTEM IS PRESSURIZED WHEN HOT.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read and record the ECT Sensor Temperature value</p> <p>Using the DRB Temperature Probe #CH7050, measure the engine coolant temperature.</p> <p>Is the ECT Sensor value with -15°C (5°F) of the temperature probe reading?</p> <p>Yes → Go To 5</p> <p>No → Go To 6</p>	All
5	<p>Inspect the Temperature sensors for any physical damage.</p> <p>Inspect the engine coolant. Ensure the coolant is at the proper level. Refer to the Service Information COOLING.</p> <p>Ensure the Temperature sensors are properly mounted.</p> <p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>Refer to any Technical Service Bulletins (TSBs) that may apply.</p> <p>With the engine running at normal operating temperature, monitor the Temperature sensor parameters while wiggling the wire harness. Look for parameter values to change.</p> <p>Visually inspect the related wire harness. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.</p> <p>CAUTION: NEVER PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS.</p> <p>Inspect and clean all PCM, engine, and chassis grounds.</p> <p>Were any problems found during the above inspections?</p> <p>Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Test Complete.</p>	All

P1115-GENERAL TEMP SENSOR PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
6	<p>NOTE: Visually inspect both the component and the PCM connectors. Look for damage, partially broken wires and backed out or corroded terminals</p> <p>Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Ignition on, engine not running. Measure the voltage of the Signal circuit in the applicable Temperature Sensor harness connector. Is the voltage above 5.2 volts?</p> <p>Yes → Repair the short to battery voltage in the Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the Temperature Sensor voltage. Is the voltage above 4.6 volts?</p> <p>Yes → Go To 8</p> <p>No → Go To 11</p>	All
8	<p>Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Using a jumper wire, jumper across the Temperature Sensor harness connector. Ignition on, engine not running. With the DRBIII®, read the Temperature voltage. Is the voltage below 1.0 volt?</p> <p>Yes → Replace the applicable Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 9</p>	All
9	<p>Turn the ignition off. Disconnect the applicable Temperature Sensor harness connector. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the Signal circuit from the Temperature Sensor harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 10</p> <p>No → Repair the open in the Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom:

P1602-PCM NOT PROGRAMMED

When Monitored and Set Condition:

P1602-PCM NOT PROGRAMMED

When Monitored: Ignition on.

Set Condition: The PCM has not been programmed.

POSSIBLE CAUSES

PCM NOT PROGRAMMED
 VERIFY PCM PROGRAMMING
 PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, erase DTCs. With the DRBIII® program the PCM. Start the engine. Allow the engine to reach normal operating temperature. With the DRBIII®, read DTCs. Does the DTC reset? Yes → Go To 2 No → The PCM has been successfully programmed. Test is complete. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	NOTE: The ignition switch must be left in the off position for a minimum of 10 seconds. Cycle the ignition switch to the off position and then back to run. Attempt to program the PCM. Start the vehicle and allow it to reach normal operating temperatures. With the DRBIII®, read DTCs. Does the DTC reset? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → The PCM has been successfully programmed into the PCM. Test is complete. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom List:**P1603-PCM INTERNAL DUAL-PORT RAM COMMUNICATION****P1604-PCM INTERNAL DUAL-PORT RAM READ/WRITE INTEGRITY FAILURE****P1607-PCM INTERNAL SHUTDOWN TIMER RATIONALITY**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be **P1603-PCM INTERNAL DUAL-PORT RAM COMMUNICATION**.

When Monitored and Set Condition:**P1607-PCM INTERNAL SHUTDOWN TIMER RATIONALITY**

When Monitored: During cold start.

Set Condition: Compares shut down time to coolant temperature.

POSSIBLE CAUSES

FUSED IGNITION SWITCH OUTPUT (OFF-RUN-START)

PCM INTERNAL FAULTURE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition off. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Turn the ignition to run. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Off-Run-Start) cavity C1-12 circuit at the appropriate terminal of the special tool #8815. NOTE: If the test light illuminates, wiggle the wiring harness to ensure that the problem is not an intermittent wiring problem. Does the test light illuminate brightly?</p> <p>Yes → Replace the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Check all related fuses. Repair the Fused Ignition Switch Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:

P1681-NO FUEL LEVEL BUS MESSAGE

When Monitored and Set Condition:

P1681-NO FUEL LEVEL BUS MESSAGE

When Monitored: Ignition on.

Set Condition: No fuel level BUS messages received by the PCM for 20 seconds.

POSSIBLE CAUSES

DTC RESET
 COMMUNICATE WITH BCM
 FUEL LEVEL BUS MESSAGE
 PCI BUS CIRCUIT OPEN FROM PCM TO BCM
 BCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If a fuel level circuit or performance DTC is set along with P1681, diagnose the circuit/performance DTC before continuing.</p> <p>Turn the ignition on. With the DRBIII®, erase DTCs. Start the engine on and off several times. Leave the engine running for at least 20 second each time. With the DRBIII®, read DTCs. Does the DTC reset?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
2	<p>Ignition on, engine not running. With the DRBIII®, attempt to communicate with the BCM. Can communication be established with the BCM?</p> <p>Yes → Go To 3</p> <p>No → Refer to the Communication Category and perform the appropriate symptom related to no communication with BCM. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
3	<p>Turn the ignition on. Using the DRBIII®, read the Fuel Level parameter in the PCM. Does the DRBIII® display a fuel level value?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 4</p>	All

P1681-NO FUEL LEVEL BUS MESSAGE — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the BCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the PCI Bus circuit from the BCM harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace BCM in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Repair the PCI Bus circuit between the PCM and the BCM for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:
P1686-NO SKIM BUS MESSAGES

When Monitored and Set Condition:

P1686-NO SKIM BUS MESSAGES

When Monitored: Ignition on or Engine Running.

Set Condition: No BUS messages are received from the SKIM for 20 seconds.

POSSIBLE CAUSES
<p>INTERMITTENT CONDITION</p> <p>PCI BUS CIRCUIT OPEN FROM PCM TO SKIM</p> <p>LOSS OF SKIM COMMUNICATION</p> <p>SKIM/PCM</p>

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on.</p> <p>With the DRBIII®, read the DTCs and record the related Freeze Frame data.</p> <p>Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Go To 5</p>	All
2	<p>Turn the ignition on.</p> <p>With the DRB III, attempt to communicate with the SKIM.</p> <p>NOTE: This test will indicate if the Bus is operational from the DLC to the SKIM.</p> <p>Was the DRB III able to communicate with the SKIM?</p> <p>Yes → Go To 3</p> <p>No → Refer to symptom BUS +/- SIGNAL OPEN FROM SKIM in the COMMUNICATION category.</p> <p>Perform SKIS VERIFICATION.</p>	All
3	<p>Turn the ignition off.</p> <p>Disconnect the PCM harness connectors.</p> <p>Disconnect the SKIM harness connector.</p> <p>CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS.</p> <p>Measure the resistance of the PCI Bus circuit from the SKIM harness connector to the appropriate terminal of special tool #8815.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the PCI Bus circuit between the PCM and the SKIM for an open.</p> <p>Perform SKIS VERIFICATION.</p>	All

P1686-NO SKIM BUS MESSAGES — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Replace the Sentry Key Immobilizer Module in accordance with the Service Information. Turn the ignition on. Display and erase all PCM and SKIM DTCs. Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle. With the DRB, display PCM DTCs. Does the DRB display the same DTC?</p> <p>Yes → Replace and program the PCM in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All
5	<p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running and at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wire harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present?</p> <p>Yes → Repair as necessary. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom:

P1687-NO CLUSTER BUS MESSAGE

When Monitored and Set Condition:

P1687-NO CLUSTER BUS MESSAGE

When Monitored: Engine Running.

Set Condition: No BUS messages received from the MIC (Instrument Cluster) for 20 seconds.

POSSIBLE CAUSES

DTC RESET
COMMUNICATE WITH CLUSTER
INSTRUMENT CLUSTER OPERATION
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTCs. Start the engine on and off several times. Leave the engine running for at least 20 second each time. With the DRBIII®, read DTCs. Does the DTC reset? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Ignition on, engine not running. With the DRBIII®, attempt to communicate with the Instrument cluster. Can communication be established with the Instrument Cluster? Yes → Go To 3 No → Refer to the Communication Category and perform the appropriate symptom related to no communication with cluster. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Start the engine Allow the engine to idle. Is the correct engine speed display (Tachometer) in the instrument cluster? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Refer to the Instrument Category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
P1695-NO BODY BUS MESSAGES

When Monitored and Set Condition:

P1695-NO BODY BUS MESSAGES

When Monitored: Engine running. Battery voltage greater than 10.0 volts.

Set Condition: No BUS messages recieved from the BCM for 20 seconds.

POSSIBLE CAUSES

DTC RESET
 COMMUNICATE WITH BCM
 PCI BUS CIRCUIT OPEN
 PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTCs. Start the engine on and off several times. Leave the engine running for at least 20 second each time. With the DRBIII®, read DTC's. Does the DTC reset? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition on. With the DRBIII®, attempt to communicate with the BCM. Can communication be established with the BCM? Yes → Go To 3 No → Refer to the Communication Category and perform the appropriate symptom related to no communication with BCM. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

P1695-NO BODY BUS MESSAGES — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the PCM harness connector Disconnect the BCM harness connector. NOTE: Inspect the PCI Bus terminal at both the PCM connectors and the BCM connectors. Check for corrosion, damage or terminal push out. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the PCI BUS circuit between the Special Tool #8815 and the BCM harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Repair the PCI BUS circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom List:**P1696-EEPROM MEMORY WRITE DENIED/INVALID****P1697-EMR (SRI) MILEAGE NOT STORED**

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **P1696-EEPROM MEMORY WRITE DENIED/INVALID**.

When Monitored and Set Condition:**P1696-EEPROM MEMORY WRITE DENIED/INVALID**

When Monitored: With the ignition on continuous.

Set Condition: An attempt to program/write to the internal EEPROM failed. Also checks at power down.

P1697-EMR (SRI) MILEAGE NOT STORED

When Monitored: With the ignition on continuous.

Set Condition: An attempt to program/write to the internal EEPROM failed, Also checks at power down.

POSSIBLE CAUSES

DRB DISPLAYS WRITE FAILURE
 DRB DISPLAYS WRITE REFUSED 2ND TIME
 DRB DISPLAYS SRI MILEAGE INVALID
 COMPARE SRI MILEAGE WITH ODOMETER

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, perform the SRI Memory Test. Does the DRBIII® display Write Failure? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 2	All
2	With the DRBIII®, perform the SRI Memory Test. Does the DRBIII® display Write Refused? Yes → Go To 3 No → Go To 4	All

P1696-EEPROM MEMORY WRITE DENIED/INVALID — Continued

TEST	ACTION	APPLICABILITY
3	<p>With the DRBIII®, perform the SRI Memory Test a second time. NOTE: Retest the SRI Memory two more times. Does the DRBIII® display Write Refused again?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Test Complete.</p>	All
4	<p>With the DRBIII®, perform the SRI Memory Test. Does the DRBIII® display SRI Mileage Invalid?</p> <p>Yes → Update the mileage and retest the SRI Memory. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 5</p>	All
5	<p>Compare the SRI Mileage stored with the Instrument Panel Odometer. Is the mileage within the specified range displayed on the DRBIII®?</p> <p>Yes → Test Complete.</p> <p>No → Update the mileage and retest the SRI Memory. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:**P1698-NO TRANSMISSION BUS MESSAGE****When Monitored and Set Condition:****P1698-NO TRANSMISSION BUS MESSAGE**

When Monitored: Equipped with automatic transmission. Engine Running Battery voltage greater than 10 volts.

Set Condition: No bus messages received from the TCM for 20 seconds, two trips required.

POSSIBLE CAUSES

PCI BUS UNABLE TO COMMUNICATE WITH DRBIII®
 (F12) FUSED IGNITION SWITCH OUTPUT (OFF-RUN-START)
 INTERMITTENT CONDITION
 PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If P1603 or P1604 are set along with this DTC, diagnose them first before continuing with P1698.</p> <p>NOTE: Before continuing, inspect all fuses and ensure that all power and ground circuits are operating properly.</p> <p>NOTE: Check all powers and grounds to the PCM before continuing.</p> <p>Turn the ignition on. With the DRBIII®, erase DTCs. Start the engine, allow the engine to run for at least 20 seconds with the gear selector in Drive. Repeat at least 2 times. With the DRBIII®, read DTC's. Does the DTC reset?</p> <p>Yes → Go To 2</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

P1698-NO TRANSMISSION BUS MESSAGE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Turn the ignition to run. Using a 12-volt test light connected to ground, probe the (F12) Fused Ignition Switch Output (Off-Run-Start) cavity C1-12 circuit at the appropriate terminal of the special tool #8815. NOTE: If the test light illuminates, wiggle the wiring harness to ensure that the problem is not an intermittent wiring problem. Does the test light illuminate brightly?</p> <p>Yes → Go To 3</p> <p>No → Check all related fuses. Repair the (F12) Fused Ignition Switch Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
3	<p>Note: Determine which modules this vehicle is equipped with before beginning. Note: When attempting to communicate with any of the modules on this vehicle, the DRB will display 1 of 2 different communication errors: a NO RESPONSE message or a BUS +/- SIGNALS OPEN message. Turn the ignition on. Using the DRB, attempt to communicate with the following control modules: Body Control Module (BCM) Instrument Cluster (MIC) Controller Antilock Brake (CAB) Was the DRB able to communicate with one or more Module(s)?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Refer to the Communication category and perform the PCI BUS COMMUNICATION FAILURE symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:**P2008-SHORT RUNNER SOLENOID CIRCUIT****When Monitored and Set Condition:****P2008-SHORT RUNNER SOLENOID CIRCUIT**

When Monitored: The Engine running. ASD Relay is energized.

Set Condition: The PCM senses the SRV is not at the desired state. One Trip Fault.

POSSIBLE CAUSES

GOOD TRIP EQUAL TO ZERO

SHORT RUNNER VALVE SOLENOID OPERATION

ASD RELAY OUTPUT CIRCUIT

SRV CONTROL CIRCUIT SHORTED TO ASD RELAY OUTPUT CIRCUIT

SRV CONTROL CIRCUIT SHORTED TO GROUND

SRV CONTROL CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All
2	Turn the ignition off. Disconnect the Short Runner Valve Solenoid harness connector. Turn the ignition on. Using a 12-volt test light, connect one end to the ASD Relay Output circuit and the other end to the SRV Solenoid Control circuit. With the DRBIII®, actuate the SRV Solenoid. Does the 12-volt test light flash on and off. No → Go To 3 Yes → Replace the Short Runner Valve Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.	All

P2008-SHORT RUNNER SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the SRV Solenoid harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit. With the DRBIII®, actuate the SRV Solenoid. Does the 12-volt test light illuminate?</p> <p>Yes → Go To 4</p> <p>No → Repair the ASD Relay circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
4	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the SRV Solenoid harness connector. Measure the resistance between the SRV Control circuit and ASD Relay Output circuit in the SRV Solenoid connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the SRV Control circuit short to the ASD Relay Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the SRV Solenoid harness connector. Measure the resistance between ground and the SRV Control circuit at the SRV Solenoid harness connector. Is the resistance below 100 ohms?</p> <p>Yes → Repair the short to ground in the SRV Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the SRV Solenoid harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the SRV Control circuit from the SRV Solenoid harness connector to the appropriate terminal of special tool #8815. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the open in the SRV Control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All
7	<p>NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5 - NGC.</p>	All

Symptom List:

P2305-IGNITION COIL #2 SECONDARY CIRCUIT - INSUFFICIENT IONIZATION

P2308-IGNITION COIL #3 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

P2311-IGNITION COIL #4 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

P2314-IGNITION COIL #5 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

P2317-IGNITION COIL #6 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P2302-IGNITION COIL #1 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION.

When Monitored and Set Condition:

P2302-IGNITION COIL #1 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION

When Monitored: Engine Running.

Set Condition: If PCM detects that the secondary ignition burn time is incorrect or not present an error is detected. One Trip Fault.

P2305-IGNITION COIL #2 SECONDARY CIRCUIT - INSUFFICIENT IONIZATION

When Monitored: Engine Running.

Set Condition: If PCM detects that the secondary ignition burn time is incorrect or not present an error is detected. One Trip Fault

P2308-IGNITION COIL #3 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

When Monitored: Engine running.

Set Condition: If PCM detects that the secondary ignition burn time is incorrect or not present an error is detected. One Trip Fault

P2311-IGNITION COIL #4 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

When Monitored: Engine running.

Set Condition: If PCM detects that the secondary ignition burn time is incorrect or not present an error is detected. One Trip Fault

P2302-IGNITION COIL #1 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION — Continued

P2314-IGNITION COIL #5 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

When Monitored: Engine running.

Set Condition: If PCM detects that the secondary ignition burn time is incorrect or not present an error is detected. One Trip Fault

P2317-IGNITION COIL #6 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

When Monitored: Engine running.

Set Condition: If PCM detects that the secondary ignition burn time is incorrect or not present an error is detected. One Trip Fault

POSSIBLE CAUSES

INTERMITTENT CONDITION
SPARK PLUG
IGNITION COIL OPERATION
IGNITION COIL

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII®, read DTCs and record the related Freeze Frame data. Is the Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Go To 3</p>	All
2	<p>Turn the ignition off. Disconnect the Ignition Coil harness connector. Remove the ignition coil. NOTE: Before continuing inspect the Ignition Coil for damage or carbon tracking coil or the spark plug insulator boot. If a problem is found, replace the ignition coil. Install a spark tester to the Ignition Coil. Reconnect the Ignition Coil harness connector to the Ignition Coil. While cranking the engine observe the spark coming from the spark tester. NOTE: The Ignition Coil should generate a crisp blue spark that is able to jumper the gap of the spark tester. Does the Ignition Coil generate a good spark.</p> <p>Yes → Replace the Spark Plug. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Replace the Ignition Coil. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All

P2302-IGNITION COIL #1 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Remove the Spark Plug. Inspect the Spark Plug for the following conditions.</p> <ul style="list-style-type: none"> - Cracks - Carbon Tracking - Foreign Material - Gap size out of specifications - Loose or broke electrode <p>NOTE: Lightly tap the bottom of the spark plug on a solid surface. The electrode in the spark plug should not move.</p> <p>Were any of the above condition present?</p> <p>Yes → Replace the Spark Plug. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All

Symptom:

P2503-CHARGING SYSTEM VOLTAGE LOW

When Monitored and Set Condition:

P2503-CHARGING SYSTEM VOLTAGE LOW

When Monitored: The engine running. The engine speed greater than 1157 RPM.

Set Condition: The battery sensed voltage is 1 volt below the charging goal for 13.47 seconds. The PCM senses the battery voltage, turns off the field driver and senses the battery voltage again. If the voltages are the same, the code is set.

POSSIBLE CAUSES

CHARGING VOLTAGE BELOW 15.1 VOLTS

(A11) B+ CIRCUIT HIGH RESISTANCE

GENERATOR GROUND HIGH RESISTANCE

GENERATOR OPERATION

(Z1) GEN FIELD GROUND CIRCUIT OPEN

(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND

(K20) GEN FIELD CONTROL CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.</p> <p>Turn the ignition off.</p> <p>NOTE: The battery must be fully charged.</p> <p>NOTE: The Generator belt tension and condition must be checked before continuing.</p> <p>Start the engine.</p> <p>Allow the idle to stabilize.</p> <p>With the DRBIII®, read the Target Charging Voltage.</p> <p>Is the Target Charging Voltage above 15.1 volts?</p> <p>Yes → Refer to the INTERMITTENT CONDITION symptom in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 3 - NGC.</p> <p>No → Go To 2</p>	All

5	<p>Turn the ignition off. Disconnect the A/C Clutch Relay from the PDC. Disconnect the A/C Clutch harness connector. Measure the resistance of the (C3) A/C Clutch Relay Output circuit between the PDC and the A/C Clutch harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the A/C Clutch Relay. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p> <p>No → Repair the (C3) A/C Clutch Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2 - NGC.</p>	All

Symptom List:

ANTENNA FAILURE
COP FAILURE
EEPROM FAILURE
INTERNAL FAULT
RAM FAILURE
SERIAL LINK INTERNAL FAULT
STACK OVERFLOW FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be ANTENNA FAILURE.

When Monitored and Set Condition:

ANTENNA FAILURE

When Monitored: Every 250 milliseconds with the ignition on.

Set Condition: The SKIM's microcontroller determines that an antenna circuit fault has occurred for 2.0 consecutive seconds.

COP FAILURE

When Monitored: With the ignition on.

Set Condition: The COP timer is not reset by the micro controller every 65.5 milliseconds.

EEPROM FAILURE

When Monitored: With the ignition on.

Set Condition: When the value written to EEPROM memory does not equal the value read back after the write operation.

INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM has detected a fault during an internal self test.

RAM FAILURE

When Monitored: With the ignition on.

Set Condition: The RAM fails a test that checks the RAM's ability to retain memory.

SERIAL LINK INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM fails an internal J1850 communication self test.

STACK OVERFLOW FAILURE

When Monitored: With the ignition on.

Set Condition: The micro controller has exceeded its stack space limit.

ANTENNA FAILURE — Continued

POSSIBLE CAUSES
SKIM INTERNAL DTC FAILURE

TEST	ACTION	APPLICABILITY
1	<p>Note: This trouble code indicates an internal SKIM fault.</p> <p>With the DRBIII®, read and record the SKIM DTCs and then erase the SKIM DTCs. Perform 10 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.</p> <p>With the DRBIII®, read the SKIM DTCs.</p> <p>Did the same SKIM DTC return?</p> <p>Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:

PCM STATUS FAILURE
SERIAL LINK EXTERNAL FAULT

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **PCM STATUS FAILURE**.

When Monitored and Set Condition:

PCM STATUS FAILURE

When Monitored: With the ignition on.

Set Condition: This DTC exists when a PCM STATUS message was not received from the PCM for at least 20.0 consecutive seconds.

SERIAL LINK EXTERNAL FAULT

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM reset, or during SECRET KEY transfers to the PCM.

Set Condition: When the SKIM does not receive an expected PCI BUS message transmission acknowledgement from the PCM after 3 transmit attempts.

POSSIBLE CAUSES

INTERMITTENT WIRING HARNESS PROBLEM

WIRING HARNESS INSPECTION

SKIM/PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the PCM has proper power and ground connections before continuing.</p> <p>With the DRBIII®, read and record the SKIM DTCs then erase the SKIM DTCs.</p> <p>Turn the ignition off.</p> <p>Wait 2 minutes.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read the SKIM DTCs.</p> <p>Does the DRBIII® display the DTC that was previously erased?</p> <p>Yes → Go To 2</p> <p>No → Go To 4</p>	All

PCM STATUS FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off.</p> <p>NOTE: Visually inspect the related wiring harness and CCD/PCI Bus (whichever applicable) circuits. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair as necessary. Perform SKIS VERIFICATION.</p> <p>No → Go To 3</p>	All
3	<p>NOTE: Before proceeding it will be necessary to obtain the SKIM PIN.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, display and erase all PCM and SKIM DTC's.</p> <p>Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.</p> <p>With the DRBIII®, read the SKIM DTCs.</p> <p>Does the code appear?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All
4	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:

**ROLLING CODE FAILURE
VIN MISMATCH**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **ROLLING CODE FAILURE**.

When Monitored and Set Condition:

ROLLING CODE FAILURE

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

Set Condition: When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

VIN MISMATCH

When Monitored: With the ignition on.

Set Condition: When the VIN received from the PCM does not match the VIN stored in the SKIM's EEPROM.

POSSIBLE CAUSES

VERIFYING PCM VIN
REPLACE SKIM AND CHECK DTC'S
INTERMITTENT WIRING HARNESS PROBLEM
PCM

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on and wait 2 minutes. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased? Yes → Go To 2 No → Go To 4	All

ROLLING CODE FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition on. With the DRBIII®, select Engine system from the main menu. Display and record the Vehicle Identification Number. NOTE: Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct vehicle VIN before continuing. Does the VIN recorded from the PCM match the VIN of the vehicle?</p> <p>Yes → Go To 3</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p>	All
3	<p>Turn the ignition off. Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Turn the ignition on. With the DRBIII®, display and clear all PCM and SKIM DTC's. Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle. With the DRBIII®, check for SKIM DTCs. Does the DRBIII® display the same DTC?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → The repair is complete. Perform SKIS VERIFICATION.</p>	All
4	<p>Turn the ignition off. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any Technical Service Bulletins (TSB) that may apply. Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:

TRANSPONDER COMMUNICATION FAILURE

TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

TRANSPONDER ID MISMATCH

TRANSPONDER RESPONSE MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be **TRANSPONDER COMMUNICATION FAILURE**.

When Monitored and Set Condition:

TRANSPONDER COMMUNICATION FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the SKIM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When 5 consecutive transponder signal transmissions are sent to the SKIM with the correct message format but with invalid data.

TRANSPONDER ID MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder ID read by the SKIM does not match any of the transponder ID's stored in the SKIM's memory.

TRANSPONDER RESPONSE MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder's crypto algorithm result fails to match the SKIM's result.

POSSIBLE CAUSES

CHECKING MULTIPLE KEY OPERATION

SKIM

INTERMITTENT WIRING HARNESS PROBLEM

REPLACE IGNITION KEY

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, read and record the SKIM DTCs. With the DRBIII®, erase the SKIM DTCs. NOTE: Perform the following test several times to ensure the DTC is current. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased?</p> <p>Yes → Go To 2 No → Go To 7</p>	All
2	<p>Are there multiple vehicle ignition keys available?</p> <p>Yes → Go To 3 No → Go To 4</p>	All
3	<p>NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys one at a time. With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Is the DTC present for all ignition keys?</p> <p>Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → Replace the ignition key(s) that cause the SKIM DTC. Perform SKIS VERIFICATION.</p>	All
4	<p>With the DRBIII®, attempt to reprogram the ignition keys to the SKIM. With the DRBIII®, erase the SKIM DTCs. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DTC set again?</p> <p>Yes → Go To 5 No → Test Complete.</p>	All
5	<p>Replace the ignition key with a new key. With the DRBIII®, program the new ignition key to the SKIM. With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DTC set again?</p> <p>Yes → Go To 6 No → Test Complete.</p>	All

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information.</p> <p>Perform SKIS VERIFICATION.</p>	All

5	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16 fuel line adapter tool #6539 between the disconnected fuel line and the fuel pump module.</p> <p>Attach a fuel pressure test gauge to the T fitting on the tool #6539</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).</p> <p>Is the fuel pressure within specification now?</p> <p>Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 6</p> <p>Caution: Stop All Actuations.</p>	All
6	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.</p> <p>Is the Fuel Inlet Strainer plugged?</p> <p>Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
7	<p>The following items need to be checked as a possible cause for a no start condition. Refer to any Technical Service Bulletins that may apply to the symptom.</p> <p>The spark plugs must be free from fuel, oil, coolant and/or any foreign material or deposits.</p> <p>The fuel must be free from contamination.</p> <p>The exhaust may be free from restrictions.</p> <p>The engine compression must be within specifications.</p> <p>The engine valve timing must be within specifications.</p> <p>The engine must be free from vacuum leaks.</p> <p>Were any of the above conditions found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Test Complete.</p>	All

*ENGINE CRANKS DOES NOT START — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the fuel pump module harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. Using a 12 volt test light connected to ground, probe the Fuel Pump Relay Output circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 9</p> <p>No → Go To 11</p> <p>Caution: Stop All Actuations.</p>	All
9	<p>Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Note: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities - Clean/repair as necessary. Using a test light connected to battery voltage, probe the Fuel Pump ground circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 10</p> <p>No → Repair the open/high resistance in the fuel pump ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
10	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
11	<p>Turn the ignition off. Remove the Fuel Pump Relay from the PDC. With a 12 volt test light connected to ground, probe the Fuel Pump Relay Fused B+ circuit at the PDC. Does the test light illuminate?</p> <p>Yes → Go To 12</p> <p>No → Repair the Fuel Pump Relay Fused B+ circuit. Check for open fuse in the PDC. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
12	<p>Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Disconnect the Fuel Pump Module harness connector. NOTE: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities Measure the resistance of the Fuel Pump Relay Output circuit from the relay connector to the fuel pump module connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Fuel Pump Relay. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Repair the open fuel pump relay output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:***NO CRANK CONDITION**

POSSIBLE CAUSES	
REPAIR MECHANICAL CONDITION	
TRANSMISSION RANGE SENSOR	
BATTERY CIRCUIT RESISTANCE TOO HIGH	
IGNITION SWITCH OUTPUT CIRCUIT OPEN	
STARTER RELAY CONTROL CIRCUIT OPEN	
STARTER RELAY OUTPUT CIRCUIT OPEN	
FUSED B(+) CIRCUIT OPEN	
FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT OPEN	
STARTER	
STARTER MOTOR RELAY	
STARTER RELAY	

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Check all PCM powers and grounds before continuing. NOTE: Ensure that SKIS is operating properly. Check the SKIM for DTC. If a SKIM DTC(s) is present diagnose them first before continuing. WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>Turn the engine over by hand to ensure the engine is not seized. Is the engine able to turn over?</p> <p>Yes → Go To 2</p> <p>No → Repair the mechanical condition preventing the starter motor from cranking. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
2	<p>Turn the ignition off. Disconnect the PCM harness connectors. Move the Gear selector through all gear positions, from Park to 1st and back. While moving the gear selector through each gear, measure the resistance between ground and the P/N Position Switch Sense circuit. Did the resistance change from above 10.0 ohms to below 10.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Replace the Transmission Range Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
3	<p>Turn the ignition off. Check the Battery Cables for high resistance using the service information procedure. Did either Battery Cable have a voltage drop greater than 0.2 volt?</p> <p>Yes → Repair the Battery circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 4</p>	All

*NO CRANK CONDITION — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the PCM harness connector. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Turn the ignition to the Start position. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Start) circuit in the appropriate terminal of special tool #8815. Does the test light illuminate brightly?</p> <p>Yes → Go To 5</p> <p>No → Repair the Fused Ignition Switch (Start) circuit for an open or high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
5	<p>Turn ignition off. Remove the Starter Relay from PDC. WARNING: The Parking Brake must be on and the Transmission must be in park for a vehicle equipped with an automatic transmission. Warning: The engine may be cranked in the next step. Keep away from moving engine parts. Briefly connect a jumper wire between Starter Relay B+ circuit and the Starter Relay Output Circuits. Did the Starter Motor crank the engine?</p> <p>Yes → Go To 6</p> <p>No → Go To 9</p>	All
6	<p>Turn the ignition off. Remove the Starter Relay from the PDC. Turn the ignition on. Using a 12-volt test light, probe the Ignition Switch Output circuit in the Starter Relay connector. While observing 12-volt test light, hold ignition key in the start position. Does the test light illuminate brightly?</p> <p>Yes → Go To 7</p> <p>No → Repair the Ignition Switch Output circuit for an open or high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
7	<p>Turn the ignition off. Remove the Starter Relay from the PDC. Disconnect the PCM harness connector. Measure the Starter Relay Control circuit between the Relay terminal and the PCM harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the Starter Relay Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

***NO CRANK CONDITION — Continued**

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Install a substitute a Relay in the of the Starter Motor Relay. Attempt to start the vehicle. Does the engine crank over? Yes → Replace the Starter Motor Relay. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
9	Turn ignition off. Remove the Starter Relay from the PDC. Disconnect the Starter Relay Output connector from the Starter Solenoid. Measure the resistance of the Starter Relay Output circuit between the Relay and the Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair Starter Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
10	Turn the ignition off. Remove the Starter Relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused B+ circuit at the Starter Relay terminal. Does the test light illuminate brightly? Yes → Go To 11 No → Repair the Fused B(+) Circuit for an open or high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
11	If there are no other possible causes remaining, review repair. Repair Replace the Starter. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:

***NO RESPONSE FROM PCM WITH A NO START CONDITION**

POSSIBLE CAUSES
PCM FUSED B+ CIRCUIT
PCM FUSED IGNITION SWITCH OUTPUT CIRCUIT
PCM GROUND CIRCUITS
PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The DRBIII® and cable must be operating properly for the results of this test to be valid.</p> <p>NOTE: Ensure the ignition switch was on when trying to communicate with the PCM.</p> <p>Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to ground, probe the PCM Fused B+ circuit in the PCM harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 2</p> <p>No → Repair the Fused B+ circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
2	<p>Turn the ignition off. Disconnect the PCM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the PCM Fused Ignition Switch Output circuit in the PCM harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 3</p> <p>No → Repair the Ignition Switch Output circuit Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
3	<p>Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to battery voltage, probe all the PCM ground circuits in the PCM harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 4</p> <p>No → Repair the PCM ground circuits. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
4	<p>If there is no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:***START AND STALL CONDITION**

POSSIBLE CAUSES
CHECKING DTCS
CHECKING SKIM DTCS
FUEL PRESSURE OUT OF SPECS
TP SENSOR SWEEP
TP SENSOR VOLTAGE GREATER THAN 0.92 VOLTS WITH THROTTLE CLOSED
ECT SENSOR OPERATION
OTHER POSSIBLE CAUSES FOR START & STALL
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Are any DTCs present? Yes → Refer to the Driveability Category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 2	All
2	Turn the ignition on. NOTE: If you are unable to communicate with the SKIM, refer to the Communication Category and perform the appropriate symptom. With the DRBIII®, read the SKIM codes. Are there any SKIM DTCs? Yes → Refer to the Vehicle Theft category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 3	All

*START AND STALL CONDITION — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Install a fuel pressure gauge.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).</p> <p>Choose a conclusion that best matches your fuel pressure reading.</p> <p style="padding-left: 40px;">Below Specification Go To 4</p> <p style="padding-left: 40px;">Within Specification Go To 6</p> <p style="padding-left: 40px;">Above Specification Replace the fuel filter/fuel pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>Caution: Stop All Actuations.</p>	All
4	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.</p> <p>Install special 5/16 fuel line adapter tool #6539 between the disconnected fuel line and the fuel pump module.</p> <p>Attach a fuel pressure test gauge to the T fitting on the tool #6539</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).</p> <p>Is the fuel pressure within specification now?</p> <p style="padding-left: 40px;">Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p style="padding-left: 40px;">No → Go To 5</p> <p>Caution: Stop All Actuations.</p>	All
5	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.</p> <p>Is the Fuel Inlet Strainer plugged?</p> <p style="padding-left: 40px;">Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p style="padding-left: 40px;">No → Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

***START AND STALL CONDITION — Continued**

TEST	ACTION	APPLICABILITY
6	<p>Turn the ignition on. With the DRBIII®, read TPS VOLTS. While monitoring the DRBIII®, slowly open and close the Throttle. Is the voltage change smooth?</p> <p>Yes → Go To 7</p> <p>No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
7	<p>Turn the ignition on. With the DRBIII®, read Throttle Position voltage. Throttle must be against stop. Is the voltage 0.92 or less with the Throttle closed?</p> <p>Yes → Go To 8</p> <p>No → Check for a binding throttle condition. If OK, replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
8	<p>Note: For this test to be valid, the thermostat must be operating correctly. Note: This test works best if performed on a cold engine (cold soaked). NOTE: If the vehicle was allow to sit over night with no engine start, coolant temperature should be near ambient temperatures.</p> <p>Turn the ignition on. With the DRBIII®, read the Engine Coolant Temperature value. Note: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.</p> <p>Start the engine. During engine warm-up, monitor the Engine Coolant Temperature value. The temperature value change should be a smooth transition from start up to normal operating temp 82° C (180° F). The value should reach at least 82° C (180° F). Did the Engine Temperature value increase smoothly and did it reach at least 82° C (180° F)?</p> <p>Yes → Go To 9</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
9	<p>The following additional items should be checked as a possible cause for a start and stall condition. Refer to any Technical Service Bulletins (TSB's) that may apply to the symptom. Fuel must be free of contamination. The exhaust system must be free of any restrictions. The engine compression must be within specifications. The engine valve timing must be within specifications. The engine must be free from vacuum leaks. The throttle body must be free of carbon buildup and dirt. Do any of the above conditions exist?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Test Complete.</p>	All

Verification Tests

BODY VERIFICATION TEST - VER 1	APPLICABILITY
<p>1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.</p> <p>2. NOTE: If the SKIM or PCM was replaced, refer to the service information for proper programming procedures.</p> <p>3. If the Body Control Module was replaced, turn the ignition on for 15 seconds (to allow the new BCM to learn VIN) or engine may not start (if VTSS equipped). If the vehicle is equipped with VTSS, use the DRBIII® and enable VTSS.</p> <p>4. Program all RKE transmitters and other options as necessary.</p> <p>5. If any repairs were made to the HVAC System, either disconnect the battery or remove JB Fuse #19 for five minutes to calibrate the HVAC doors.</p> <p>6. Ensure that all accessories are turned off and the battery is fully charged.</p> <p>7. With the DRBIII®, record and erase all DTC's from ALL modules. Start and run the engine for 2 minutes. Operate all functions of the system that caused the original concern.</p> <p>8. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII®, read DTC's from ALL modules.</p> <p>Are any DTC's present or is the original condition still present?</p> <p>Yes → Repair is not complete, refer to the appropriate symptom.</p> <p>No → Repair is complete.</p>	All

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all components related to the repair are connected properly.</p> <p>5. Inspect the engine oil for fuel contamination. Replace the oil and filter as necessary.</p> <p>6. Attempt to start the engine.</p> <p>7. If the No Start condition is still present, refer to the symptom list and perform the diagnostic testing as necessary. refer to any Technical Service Bulletins that may apply.</p> <p>8. Run the engine for one warm-up cycle to verify operation.</p> <p>9. With the DRBIII®, confirm that no DTCs or Secondary Indicators are present and that all components are functioning properly.</p> <p>10. If a DTC is present, refer to the appropriate category and select the corresponding symptom.</p> <p>Are any DTCs present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all components related to the repair are connected properly.</p> <p>5. Inspect the engine oil for fuel contamination. Replace the oil and filter as necessary.</p> <p>6. Attempt to start the engine.</p> <p>7. If the No Start condition is still present, refer to the symptom list and perform the diagnostic testing as necessary. refer to and Technical Service Bulletins that may apply.</p> <p>8. Run the engine for one warm-up cycle to verify operation.</p> <p>9. With the DRBIII®, confirm that no DTCs or Secondary Indicators are present and that all components are functioning properly.</p> <p>10. If a DTC is present, refer to the appropriate category and select the corresponding symptom.</p> <p>Are any DTCs present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

POWERTRAIN VERIFICATION TEST VER - 2 - NGC	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all components related to the repair are connected properly.</p> <p>5. With the DRBIII®, clear DTCs and Reset Memory all engine values.</p> <p>6. Run the engine for one warm-up cycle to verify proper operation.</p> <p>7. Road test the vehicle. Use all accessories that may be related to this repair.</p> <p>8. With the DRBIII®, confirm that no DTC's or Secondary Indicators are present and that all components are functioning properly.</p> <p>9. If this test is being performed after a No Trouble Code test, verify the symptom is no longer present.</p> <p>10. If the symptom is still present, or any other symptom or DTC is present refer to the appropriate category and perform the corresponding symptom.</p> <p>11. Refer to any Technical Service Bulletins that may apply.</p> <p>12. If there are no DTCs present and all components are functional properly, the repair is complete.</p> <p>Are any DTCs present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 3 - NGC	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all components related to the repair are connected properly.</p> <p>5. With the DRBIII®, clear DTCs.</p> <p>6. Perform generator output test. Refer to the appropriate service information as necessary.</p> <p>7. Start the engine and set engine speed to 2000 RPM for at least thirty seconds.</p> <p>8. Cycle the ignition key off and on.</p> <p>9. With the DRBIII®, read the DTCs. If the DTC returns, or any other symptom or DTC is present, refer to the appropriate category and perform the corresponding symptom.</p> <p>10. If there are no DTCs present and all components are functioning properly, the repair is complete.</p> <p>Are any DTCs present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 4 - NGC	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all engine components are properly installed and connected.</p> <p>5. Connect the DRBIII® to the data link connector and erase all codes.</p> <p>6. Turn the speed control ON (if equipped, cruise light will be on).</p> <p>7. Press and release the SET Switch. If the speed control did not engage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>8. Press and hold the RESUME/ACCEL Switch. If the vehicle speed did not increase by at least 2 mph, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>9. Press and hold the COAST switch. The vehicle speed should decrease. If it did not decrease, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>10. Using caution, press and release the brake pedal. If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>11. Bring the vehicle speed back up to 35 MPH.</p> <p>12. Press the RESUME/ACCEL switch. If the speed control did not resume the previously set speed, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>13. Hold down the SET switch. If the vehicle did not decelerate, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>14. Ensure vehicle speed is greater than 35 mph and release the SET Switch. If vehicle did not adjust and set a new vehicle speed, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>15. Press and release the CANCEL switch. If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>16. Bring the vehicle speed back up above 35 mph and engage speed control.</p> <p>17. Turn the Speed Control Off. (Cruise light will be off). If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>18. If the vehicle successfully passed all of the previous tests, the speed control system is now functioning as designed. The repair is now complete.</p> <p>Did the Speed Control pass the above test?</p> <p>Yes → Repair is complete.</p> <p>No → Repair is not complete, refer to appropriate symptom.</p>	<p>All</p>

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 5	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.</p> <p>5. Connect the DRBIII® to the data link connector.</p> <p>6. Ensure the fuel tank has at least a quarter tank of fuel. Turn off all accessories.</p> <p>7. If a Comprehensive Component DTC was repaired, perform steps 5 - 8. If a Major OBDII Monitor DTC was repaired skip those steps and continue verification.</p> <p>8. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes.</p> <p>9. If the Good Trip counter changed to one or more and there are no new DTC's, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®.</p> <p>10. If the repaired DTC has reset, the repair is not complete. Check for any related TSB's or flash updates and return to the Symptom list.</p> <p>11. If another DTC has set, return to the Symptom List and follow the path specified for that DTC.</p> <p>12. With the DRBIII®, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running).</p> <p>13. If the monitor ran, and the Good Trip counter changed to one or more, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®.</p> <p>14. If the repaired OBDII trouble code has reset or was seen in the monitor while on the road test, the repair is not complete. Check for any related technical service bulletins or flash updates and return to Symptom List.</p> <p>15. If another DTC has set, return to the Symptom List and follow the path specified for that DTC.</p> <p>Are any DTCs present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 5 - NGC	APPLICABILITY
<p>1. NOTE: After completing the Powertrain Verification Test the Transmission Verification Test must be performed.</p> <p>2. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM.</p> <p>3. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.</p> <p>4. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.</p> <p>5. Connect the DRBIII® to the data link connector.</p> <p>6. Ensure the fuel tank has at least a quarter tank of fuel. Turn off all accessories.</p> <p>7. If a Comprehensive Component DTC was repaired, perform steps 5 - 8. If a Major OBDII Monitor DTC was repaired skip those steps and continue verification.</p> <p>8. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes.</p> <p>9. If the Good Trip counter changed to one or more and there are no new DTC's, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®.</p> <p>10. If the repaired DTC has reset, the repair is not complete. Check for any related TSB's or flash updates and return to the Symptom list.</p> <p>11. If another DTC has set, return to the Symptom List and follow the path specified for that DTC.</p> <p>12. With the DRBIII®, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running).</p> <p>13. If the monitor ran, and the Good Trip counter changed to one or more, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®.</p> <p>14. If the repaired OBDII trouble code has reset or was seen in the monitor while on the road test, the repair is not complete. Check for any related technical service bulletins or flash updates and return to Symptom List.</p> <p>15. If another DTC has set, return to the Symptom List and follow the path specified for that DTC.</p> <p>Are any DTCs present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	<p>All</p>

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 6 - NGC	APPLICABILITY
<ol style="list-style-type: none"> 1. Install the Miller Tool #8404 Evaporative Emission Leak Detector (EELD). according to the instructions in the pervious DTC table. 2. Set the smoke/air control switch to AIR. 3. Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size). 4. Press the remote smoke/air start button. 5. Position the red flag on the air flow meter so it is aligned with the indicator ball. 6. When the calibration is complete, release the remote button. The EELD is now calibrated the flow meter in liters per minute to the size leak indicated by the DTC set in the PCM. 7. Install the service port adapter #8404-14 on the vehicle's service port. 8. Connect the Air supply hose from the EELD to the service port. 9. Press the remote button to activate AIR flow. 10. NOTE: Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill. 11. Compare the flow meter indicator ball reading to the red flag. 12. ABOVE the red flag indicates a leak present. 13. BELOW the red flag indicates a sealed system. 14. If the indicator ball shows a leak present, perform the smoke test indicated in the previous test and identify the leak and repair. Perform this verification test when the repair is complete. Did the indicator ball indicate the a leak is present?? <p>Yes → Repeat the DTC test to identify the leak and repair.</p> <p>No → Repair is complete.</p> 	All

SKIS VERIFICATION	APPLICABILITY
<ol style="list-style-type: none"> 1. Reconnect all previously disconnected components and connectors. 2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997). 3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKIM will Lock Out the DRB III for 1 hour. 4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary. 5. With the DRB III, select Theft Alarm, SKIM and Miscellaneous. Then select desired procedure and follow the steps that will be displayed. 6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM. 7. NOTE: Prior to returning vehicle to the costumer, perform a module scan to be sure that all DTC's are erased. Erase any DTC's that are found. 8. With the DRB III erase all DTC's. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle. 9. With the DRB III, read the SKIM DTC's. Are there any SKIM DTC's? <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p> 	All

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions, and graphics needed to diagnose **2004 LH body system problems** involving navigation and satellite radios. The diagnostics in this manual are based on the failure, condition or symptom being present at the time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate module; i.e., if the DRBIII® shows a “no response” or “Bus +/- Signal Open” condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.
All component location views are in section 8.0.
All connector pinouts are in section 9.0.
All schematics are in section 10.0.

An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and installation procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carry over systems may be enhanced. **READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE DIAGNOSTIC TROUBLE CODE.** It is recommended that you review the entire manual to become familiar with all the new and changed diagnostic procedures.

This book reflects many suggested changes from readers of past issues. After using this book, if you have any comments or suggestions, please fill out the form in the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This manual is designed as a supplement to be used along with the 2003 300M, Intrepid and Concorde Body diagnostic manual, 81-270-03007.

1.2 SIX STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the body system is done in six basic steps:

- verification of complaint

- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The vehicle systems that are part of the “body” system that are covered in this supplement are:

- Navigation Radio
- Satellite Radio (SDARS)

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 NAVIGATION RADIO

The optional navigation radio system receives GPS signals from up to eight satellites to display the position and direction of the vehicle. Map information is supplied through a DVD-ROM. An electronic gyrosensor and the vehicle's speed sensor enable the system to display the present vehicle position even in locations where GPS signals may be blocked.

When a destination is selected, the navigation system uses information from the map to quickly calculate a route. As the vehicle is driven along the chosen route, the operator is guided with pictorial displays and voice prompts. For complete operating instructions, refer to the manual included with the vehicle.

3.2 SATELLITE RADIO (SDARS)

To use the satellite radio, the radio must be in satellite mode. The satellite antenna must have an unobstructed view of the satellite. The vehicle must be outside to receive proper reception. Poor reception may be experienced in large down town areas where tall buildings are present. The satellite network is still under development, and this could be the cause of poor reception in certain areas. Use a known good system to verify network performance in these areas.

Once in satellite mode, the radio head is used to change stations. The Radio must be in Satellite mode to communicate to the Satellite Receiver Module with the DRBIII®. The Radio head communicates to the Satellite Receiver Module via the PCI bus and the private Audio bus. The Audio bus

GENERAL INFORMATION

functions just like the PCI bus, but its use is restricted to the Radio and the Satellite Receiver Module.

The Satellite Receiver Module processes signals it receives from the satellite antenna. That information is then sent to the Radio where it is pro-

cessed and sent out to the speakers. The Satellite Receiver Module has the ability to detect and store fault code information, which may be retrieved with the DRBIII®. Refer to the service manual for additional information on the SDAR system and its related components.

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:**ANTENNA HARDWARE FAILURE - SDARS****When Monitored and Set Condition:****ANTENNA HARDWARE FAILURE - SDARS**

When Monitored: With radio turned on.

Set Condition: If the antenna is connected, and the antenna has an internal failure.

POSSIBLE CAUSES

INTERNAL ANTENNA FAILURE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition off.</p> <p>NOTE: Disconnect the Satellite Receiver harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.</p> <p>NOTE: Disconnect the Satellite Receiver Antenna connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.</p> <p>Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.</p> <p>Check the Antenna assembly for physical damage.</p> <p>If there are no other possible causes, view repair.</p> <p>Repair</p> <p>Replace Antenna in accordance with service information.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
ANTENNA NOT CONNECTED - SDARS

When Monitored and Set Condition:

ANTENNA NOT CONNECTED - SDARS

When Monitored: With the radio turned on.

Set Condition: When either of the antenna cables is not connected.

POSSIBLE CAUSES

SATELLITE SIGNAL CIRCUIT OPEN
 TERR SIGNAL OPEN
 TERR SIGNAL CIRCUIT SHORTED TO GROUND
 SATELLITE SIGNAL CIRCUIT SHORTED TO GROUND
 ANTENNA INTERNAL FAILURE
 SATELLITE RECEIVER MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Satellite Receiver Antenna connector. Disconnect the Satellite Receiver Module harness connectors. Measure the resistance of the TERR Signal circuit between the Satellite Receiver Antenna connector and the Satellite Receiver Module connector. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Repair the TERR Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Satellite Receiver Antenna connector. Disconnect the Satellite Receiver Module harness connectors. Measure the resistance between ground and the TERR Signal circuit. Is the resistance below 5.0 ohms? Yes → Repair the TERR Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Satellite Receiver Antenna connector. Disconnect the Satellite Receiver Module harness connectors. Measure the resistance of the Satellite Signal circuit between the Satellite Receiver Antenna connector and the Satellite Receiver Module connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Satellite Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

ANTENNA NOT CONNECTED - SDARS — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Satellite Receiver Antenna connector. Disconnect the Satellite Receiver Module harness connectors. Measure the resistance between ground and the Satellite Signal circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Satellite Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Check the antenna for physical damage. Disconnect the Satellite Receiver Antenna connector. Disconnect the Satellite Receiver Module harness connectors. NOTE: Check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits. Replace the Satellite Receiver Antenna in accordance with the service information. Turn the ignition and the radio on and place the radio in Satellite mode. Does the DTC return?</p> <p>Yes → Go To 6</p> <p>No → Repair is complete. Perform BODY VERIFICATION TEST - VER 1.</p>	All
6	<p>NOTE: Disconnect the Satellite Receiver Module harness connectors and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Satellite Receiver Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
BUS BUSY - SDARS

When Monitored and Set Condition:

BUS BUSY - SDARS

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: Anytime the module detects a short to battery on the PCI Bus circuit.

POSSIBLE CAUSES

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: For this code to be active, the DRB will not be able to communicate with any modules on the vehicle (except the PCM).</p> <p>NOTE: Clear the code. If this code continues to set and the DRB can still communicate with the module, it will be necessary to replace the module.</p> <p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running at normal operating temperature, wiggle the wiring harnesses. This is to try and duplicate the complete bus failure condition. Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:
BUS LOW - SDARS

When Monitored and Set Condition:

BUS LOW - SDARS

When Monitored: With the ignition in the run position, and the IOD fuse installed.

Set Condition: Anytime the module detects a short to ground on the PCI Bus circuit.

POSSIBLE CAUSES

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: For this code to be active, the DRB will not be able to communicate with any modules on the vehicle (except the PCM).</p> <p>NOTE: Clear the code. If this code continues to set and the DRB can still communicate with the module, it will be necessary to replace the module.</p> <p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running at normal operating temperature, wiggle the wiring harnesses. This is to try and duplicate the complete bus failure condition. Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:
GPS ANTENNA NOT CONNECTED

When Monitored and Set Condition:

GPS ANTENNA NOT CONNECTED

When Monitored: With the ignition on and the radio in navigation mode.

Set Condition: The radio does not detect a GPS antenna connection.

POSSIBLE CAUSES

BAD ANTENNA CONNECTION

ANTENNA

RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the GPS Antenna connector. Inspect the GPS Antenna connection. Was the Antenna connection clean and tight? Yes → Go To 2 No → Repair Antenna connection as needed. Perform BODY VERIFICATION TEST - VER 1.	All
2	Refer to the Audio System in the service information and test the Antenna in accordance with the service procedure. Is the Antenna ok? Yes → Go To 3 No → Repair or replace the Antenna assembly as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
3	NOTE: Reconnect all previously disconnected components. NOTE: Move vehicle outside approximately 30ft from any structure. Turn the ignition and Radio on. With the DRBIII®, erase the audio DTC's and operate the navigation system. With the DRBIII®, read the audio DTC's. Did this DTC reset? Yes → Replace the Radio in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
INTERNAL FAILURE - SDARS

When Monitored and Set Condition:**INTERNAL FAILURE - SDARS**

When Monitored: Ignition key in accessory or run position.

Set Condition: Internal bus communication failure between processors.

POSSIBLE CAUSES

INTERNAL SDARS FAILURE

TEST	ACTION	APPLICABILITY
1	The Satellite Receiver Module is reporting internal errors, view repair to continue. Repair Replace the Satellite Receiver Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:**INTERNAL RECEIVER FAILURE - SDARS****When Monitored and Set Condition:****INTERNAL RECEIVER FAILURE - SDARS**

When Monitored: Ignition key in accessory or run position.

Set Condition: Internal failure is detected.

POSSIBLE CAUSES

INTERNAL RECEIVER FAILURE

TEST	ACTION	APPLICABILITY
1	<p>The Satellite Receiver Module is reporting internal errors, view repair to continue.</p> <p>Repair</p> <p>Replace the Satellite Receiver Module in accordance with the service information.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

LOSS OF COMMUNICATION ON PRIVATE BUS - SDARS

When Monitored and Set Condition:

LOSS OF COMMUNICATION ON PRIVATE BUS - SDARS

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The radio does not receive any messages from the Satellite Receiver for at least 12 seconds.

POSSIBLE CAUSES

AUDIO BUS 2 SHORT TO GROUND

AUDIO BUS 2 OPEN

AUDIO BUS 2 SHORT TO VOLTAGE

AUDIO BUS 1 OPEN

AUDIO BUS 1 SHORT TO GROUND

AUDIO BUS 1 SHORT TO VOLTAGE

RADIO INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Satellite Receiver Module harness connectors. Disconnect the Satellite Radio Multiplexer harness connectors. Measure the resistance between ground and the Audio Bus 2 circuit. Is the resistance below 100 ohms? Yes → Repair the Audio Bus 2 circuit for a short to ground between the Satellite Receiver Module and the Multiplexer. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Satellite Receiver Module harness connectors. Disconnect the Satellite Radio Multiplexer harness connectors. Measure the resistance of the Audio Bus 2 circuit between the Satellite Receiver Module and the Multiplexer. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Audio Bus 2 circuit for an open between the Satellite Receiver Module and the Multiplexer. Perform BODY VERIFICATION TEST - VER 1.	All

LOSS OF COMMUNICATION ON PRIVATE BUS - SDARS — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Satellite Receiver Module harness connectors. Disconnect the Satellite Radio Multiplexer harness connectors. Turn the ignition on. Measure the voltage of the Audio Bus 2 circuit. Is the voltage above 2 volts? Yes → Repair the Audio Bus 2 circuit for a short to voltage between the Satellite Receiver Module and the Multiplexer. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Satellite Radio Multiplexer harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and the Audio Bus 1 circuit. Is the resistance below 100 ohms? Yes → Repair the Audio Bus 1 circuit for a short to ground between the Radio and the Multiplexer. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Radio harness connector. Disconnect the Satellite Radio Multiplexer harness connectors. Measure the resistance of the Audio Bus 1 circuit between the Radio and the Multiplexer. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Audio Bus 1 circuit for an open between the Radio and the Multiplexer. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the Radio harness connector. Disconnect the Satellite Radio Multiplexer harness connectors. Turn the ignition on. Measure the voltage of the Audio Bus 1 circuit. Is the voltage above 2 volts? Yes → Repair the Audio Bus 1 circuit for a short to voltage between the Radio and the Multiplexer. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All

LOSS OF COMMUNICATION ON PRIVATE BUS - SDARS — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off.</p> <p>NOTE: Disconnect the Satellite Receiver Module harness connectors and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.</p> <p>NOTE: Disconnect the Satellite Radio Multiplexer harness connectors and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.</p> <p>NOTE: Disconnect the Radio harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.</p> <p>Using the schematics as a guide, inspect the wire harness and connectors, repair as necessary. Pay particular attention to all Power and Ground circuits.</p> <p>Replace the Satellite Radio Multiplexer in accordance with the service information.</p> <p>Reconnect harness connectors and start the engine.</p> <p>Attempt to reset the DTC.</p> <p>Does the DTC reset?</p> <p>Yes → Go To 8</p> <p>No → Test Complete.</p>	All
8	<p>Replace the Satellite Receiver Module in accordance with the service information.</p> <p>Start the vehicle and operate the Satellite Radio.</p> <p>Attempt to reset the DTC.</p> <p>Does the DTC reset?</p> <p>Yes → Go To 9</p> <p>No → Test Complete.</p>	All
9	<p>If there are no other possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Radio in accordance with the service information.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
NO COMMUNICATION WITH BCM

When Monitored and Set Condition:

NO COMMUNICATION WITH BCM

When Monitored: With the ignition on.

Set Condition: When the radio fails it's phase 1 recovery stage.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE BODY CONTROL MODULE (BCM)
 RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the BCM. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Radio in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

NO COMMUNICATION WITH CD/DVD CHANGER

When Monitored and Set Condition:

NO COMMUNICATION WITH CD/DVD CHANGER

When Monitored: With the ignition on.

Set Condition: Anytime the module detects a communication problem with the CD Changer.

POSSIBLE CAUSES

CD CHANGER WIRING HARNESS
 CD CHANGER PCI BUS CIRCUIT OPEN
 IGNITION SWITCH OUTPUT CIRCUIT OPEN
 RADIO GROUND CKT OPEN
 CD CHANGER

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Radio C2 harness connector. Disconnect the CD Changer harness connector. Visually inspect the connectors for damage. NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. This device is a pass through for the CD Changer circuits, if equipped with SDARS. Check for open circuits in the wiring harness between the Radio and the CD Changer. Measure the resistance of the each circuit between the Radio C2 connector and the CD Changer connector. Check for shorted circuits in the wiring harness between the Radio and the CD Changer. Measure the resistance between each circuit at the Radio C2 connector. Are any of the circuits shorted together or open? Yes → Replace/repair the CD Changer wiring harness. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All

NO COMMUNICATION WITH CD/DVD CHANGER — Continued

TEST	ACTION	APPLICABILITY
2	<p>Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Press F2 again when complete. Disconnect the CD Changer harness connector. NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. This device is a pass through for the CD Changer circuits, if equipped with SDARS. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the CD Changer connector. Reconnect the Radio C2 harness connector. Turn the ignition on. Turn the Radio and CD Changer on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts?</p> <p>Yes → Go To 3</p> <p>No → Repair the PCI Bus circuit for an open. If OK, replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition off. Disconnect the CD Changer harness connector. Turn the ignition on. Turn the Radio and the CD Changer on. NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. This device is a pass through for the CD Changer circuits, if equipped with SDARS. Using a 12-volt test light connected to ground, probe the ignition switch output circuit in the CD Changer connector. Is the test light illuminated?</p> <p>Yes → Go To 4</p> <p>No → Replace the Radio in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Disconnect the CD Changer harness connector. NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. This device is a pass through for the CD Changer circuits, if equipped with SDARS. Using a 12-volt test light connected to 12-volts, probe each CD Changer ground circuit in the CD Changer connector. Is the test light illuminated for each circuit?</p> <p>Yes → Replace the CD Changer in accordance with the service information Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the Radio in accordance with the service information Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
NO COMMUNICATION WITH SDARS

When Monitored and Set Condition:

NO COMMUNICATION WITH SDARS

When Monitored: With the ignition on.

Set Condition: When the radio fails it's phase 1 recovery stage.

POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE SATELLITE RADIO RECEIVER MODULE
 RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on and place the Radio in Satellite mode. With the DRB, attempt to communicate with the Satellite Radio Receiver Module. Was the DRB able to I/D or communicate with the module? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on. Turn the Radio on and place the Radio in Satellite mode and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Radio in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:**NO J1850 (PCI BUS) COMMUNICATION (NO PCI TRANSMISSION)****When Monitored and Set Condition:****NO J1850 (PCI BUS) COMMUNICATION (NO PCI TRANSMISSION)**

When Monitored: With the ignition on.

Set Condition: Anytime the module detects a communication problem on the PCI Bus circuit.

POSSIBLE CAUSES

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: For this code to be active, the DRB will not be able to communicate with any modules on the vehicle (except the PCM).</p> <p>NOTE: Clear the code. If this code continues to set and the DRB can still communicate with the module, it will be necessary to replace the module.</p> <p>WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running at normal operating temperature, wiggle the wiring harnesses. This is to try and duplicate the complete bus failure condition. Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:***INOP NO FAULT CODES - SDARS****POSSIBLE CAUSES**

SDARS SUBSCRIPTION
 FUSED B+ CIRCUIT
 FUSED IGNITION SWITCH OUTPUT
 GROUND CIRCUIT OPEN
 SATELLITE RECEIVER MODULE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII®, read the SDARS subscription status. Does the subscription status read "subscribed?"</p> <p>Yes → Go To 2</p> <p>No → Customer has not subscribed to this feature. No repair at this time. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>NOTE: Diagnose and repair any DTCs before continuing. Disconnect the Satellite Receiver Module harness connectors. Turn the ignition on and the radio on. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Does the test light illuminate brightly?</p> <p>Yes → Go To 3</p> <p>No → Repair the Fused B+ circuit for an open. Check related fuses, if fuse is open, repair short to ground. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Disconnect the Satellite Receiver Module harness connectors. Turn the ignition and the radio on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Does the test light illuminate brightly?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Disconnect the Satellite Receiver Module harness connectors. Using a 12-volt test light connected to 12-volts, probe the Ground circuit. Does the test light illuminate brightly?</p> <p>Yes → Go To 5</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***INOP NO FAULT CODES - SDARS — Continued**

TEST	ACTION	APPLICABILITY
5	If there are no other possible causes remaining, view repair. Repair Replace Satellite Receiver Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:***POOR RECEPTION - SDARS****POSSIBLE CAUSES**

*POOR SDARS RECEPTION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: At times SDARS reception will better than FM radio, and other times FM radio reception will be better than SDARS.</p> <p>NOTE: The Satellite Radio system is still under development and there are areas where reception may be lost.</p> <p>NOTE: To check SDARS reception, vehicle must be outside the shop.</p> <p>NOTE: The SDARS antenna must be free of damage and not be covered by any objects.</p> <p>NOTE: Large buildings in downtown areas can block the satellite signal and cause poor reception.</p> <p>NOTE: Check DTC's and record them. Repair any DTC's prior to continuing with test.</p> <p>Inspect SDARS antenna for damage.</p> <p>Drive vehicle outside of shop and attempt to verify poor reception complaint.</p> <p>Verify good reception in your area with know good SDARS system.</p> <p>Is there any physical damage to the SDARS antenna?</p> <p>Yes → Replace SDARS antenna.</p> <p>No → Test Complete.</p>	All

Symptom:

***NO RESPONSE FROM SATELLITE RADIO RECEIVER MODULE**

POSSIBLE CAUSES
SDARS WIRING HARNESS
PCI BUS CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
RADIO GROUND CKT OPEN
SATELLITE RADIO RECEIVER MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the DRBIII® can communicate with the Radio, if not refer to the appropriate symptom.</p> <p>Turn the ignition off.</p> <p>Disconnect the Radio C2 harness connector.</p> <p>Disconnect the Satellite Radio Receiver Module harness connector.</p> <p>Visually inspect the connectors for damage.</p> <p>Check for open circuits in the wiring harness between the Radio and the Satellite Radio Receiver Module.</p> <p>Measure the resistance of the each circuit between the Radio C2 connector and the Satellite Radio Receiver Module connector.</p> <p>Check for shorted circuits in the wiring harness between the Radio and the Satellite Radio Receiver Module.</p> <p>Measure the resistance between each circuit at the Radio C2 connector.</p> <p>NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. TEST	ACTION	APPLICABILITY
2	<p>Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Press F2 again when complete. Disconnect the Satellite Radio Receiver Module harness connector. NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. This device is a pass through for the satellite radio receiver module circuits. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Satellite Radio Receiver Module connector. Reconnect the Radio C2 harness connector. Turn the ignition on. Turn the Radio on and place the radio in the Satellite mode. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts?</p> <p>Yes → Go To 3</p> <p>No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition off. Disconnect the Satellite Radio Receiver Module harness connector. NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. This device is a pass through for the satellite radio receiver module circuits. Turn the ignition on. Turn the Radio on and place the radio in the Satellite mode. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated?</p> <p>Yes → Go To 4</p> <p>No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Disconnect the Satellite Radio Receiver Module harness connector. NOTE: If vehicle is equipped with a satellite radio multiplexer, check connectors. This device is a pass through for the satellite radio receiver module circuits. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated?</p> <p>Yes → Replace the Satellite Radio Receiver Module in accordance with the service information Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the ground circuit for an open. If OK, replace the radio. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Verification Tests

BODY VERIFICATION TEST - VER 1	APPLICABILITY
<p>1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.</p> <p>2. NOTE: If the SKIM or PCM was replaced, refer to the service information for proper programming procedures.</p> <p>3. If the Body Control Module was replaced, turn the ignition on for 15 seconds (to allow the new BCM to learn VIN) or engine may not start (if VTSS equipped). If the vehicle is equipped with VTSS, use the DRBIII® and enable VTSS.</p> <p>4. Program all RKE transmitters and other options as necessary.</p> <p>5. If any repairs were made to the HVAC System, either disconnect the battery or remove JB Fuse #19 for five minutes to calibrate the HVAC doors.</p> <p>6. Ensure that all accessories are turned off and the battery is fully charged.</p> <p>7. With the DRBIII®, record and erase all DTC's from ALL modules. Start and run the engine for 2 minutes. Operate all functions of the system that caused the original concern.</p> <p>8. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII®, read DTC's from ALL modules.</p> <p>Are any DTC's present or is the original condition still present?</p> <p>Yes → Repair is not complete, refer to the appropriate symptom.</p> <p>No → Repair is complete.</p>	All

NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, and graphics needed to diagnose the 2004 300M, Intrepid, and Concorde Teves Mark20e Antilock Braking System (ABS) and the Mark20e with Traction Control. The diagnostics in this manual are based on the failure condition or symptom being present at time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the CAB. If the DRBIII® displays a "No Response" condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All schematics are in Section 10.0.

An asterisk (*) placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. **READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE CODE.** It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedure manual covers the antilock braking system (ABS) and traction control system found on: Chrysler Concord, 300M and Dodge Intrepid.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the controller antilock brake module is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis

- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

Vehicles equipped with the Teves Mark20e antilock brake system can be identified by the presence of the controller antilock brake module located along with HCU. The CAB and HCU are behind the left front bumper on the left side of the engine cradle.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 TEVES MARK20e SYSTEM DESCRIPTION

The controller antilock brake module is used to monitor wheel speeds and to modulate (control) hydraulic pressure in each brake channel. The modulated hydraulic pressure is used to prevent wheel lock-up during braking.

The Teves Mark20e system uses a diagonal split hydraulic brake system. In the standard brake mode the master cylinder primary circuit supplies pressure to the right front and left rear wheel brakes, and the secondary master cylinder circuit supplies pressure to the left front and right rear wheel brakes.

All vehicles equipped with ABS use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking when brakes are applied in the partial braking range.

During an antilock stop the Mark20e system uses four-channel operation. This means that during antilock operation each wheel brake is independently controlled. By using a separate hydraulic channel for each wheel, the system is able to retain directional stability and steering control while applying maximum braking. The system provides maximum braking even when road conditions vary.

GENERAL INFORMATION

3.2 TRACTION CONTROL SYSTEM (TCS) DESCRIPTION (IF EQUIPPED)

The Traction Control System is available on this vehicle. The main purpose of traction control is to reduce wheel slip and maintain traction at the driven wheels when road surfaces are wet or snow covered. The traction control system reduces wheel slip by braking the wheel that is losing traction. The system is designed to operate at speeds below 56 km/h (35 mph).

The controller antilock brake (CAB) monitors wheel speed. If during acceleration the CAB detects front (drive) wheel slip and the brakes are not applied, it will enter traction control mode. The CAB performs the traction control function in the following sequence:

1. Closes the (normally open) isolation valves.
2. Starts pump/motor to supply volume/pressure to front hydraulic circuits (pump runs continuously during traction control).
3. Opens and closes build and decay valves to maintain minimum wheel slip and maximum traction.

The cycling of the build and decay valves works similarly to ABS except that they work to control wheel spin by applying brakes. ABS function is to control wheel skid by releasing brakes.

Two pressure relief valves allow pressure/volume to return to the reservoir when not consumed by the build/decay cycles. These are required because the pump supplies more volume than the system requires.

If at any time the brakes are applied during a traction control cycle, the brake switch will trigger the CAB to switch off the traction control.

The traction control system will be enabled at each ignition cycle. It may be turned off by depressing the traction control switch. The traction control system function lamp will illuminate "TRAC OFF" immediately upon depressing the traction control switch button. The lamp will display "TRAC ON" during a traction control cycle. If the controller calculates that the brake temperatures are high, the traction control system will become inoperative until a time-out period has elapsed. When in this thermo protection mode, the traction control "TRAC OFF" lamp will illuminate; however, a fault will not be registered.

3.3 SYSTEM COMPONENTS

- controller antilock brake (CAB)
- vacuum booster
- master cylinder

- ABS integrated control unit hydraulic control unit (HCU), valve block assembly: 8 valve solenoids (4 inlet valves, 4 outlet valves, 2 accumulators) 1 motor, 2 pumps.
- ABS integrated control unit with traction control same as above but has 10 valve solenoids. 2 valves are isolation valves.
- 4 wheel speed sensor/tone wheel assemblies
- ABS warning indicator
- fuses and wiring harness
- fluid reservoir

3.3.1 ABS AND BRAKE WARNING INDICATORS

The amber ABS warning indicator is located in the instrument cluster. It is used to inform the driver that the antilock function has been turned off. The ABS warning indicator is indirectly controlled by the CAB. The CAB will send a message across the PCI Bus that informs the instrument cluster to turn the ABS warning indicator ON or OFF. If the 24-way CAB connector is not connected, the instrument cluster will not receive a message from the CAB via the PCI BUS circuit. The instrument cluster will then turn on the ABS warning indicator.

The ABS Warning Indicator will remain lit during every key cycle until a circuit or component fault is repaired and the CAB no longer detects the fault. After repair of a sensor signal fault or a pump motor fault, the CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator.

The Instrument Cluster will illuminate the ABS Warning Indicator if it loses communication with the CAB.

The red BRAKE warning indicator is also located in the instrument cluster. It can be activated in several ways. Application of the parking brake or a low fluid signal from the fluid level switch located in the master cylinder reservoir will cause the indicator to come on. The status of the red BRAKE warning indicator is not monitored by the CAB.

3.3.2 CONTROLLER ANTILOCK BRAKE (CAB)

The Controller Antilock Brake (CAB) is a microprocessor-based device that monitors wheel speeds and controls the antilock functions. The CAB contains two microprocessors that receive identical sensor signals and then independently process the information. The results are then compared to make sure that they agree. Otherwise, the CAB will turn off the antilock and turn on the ABS amber warning indicator.

The primary functions of the CAB are to:

- detect wheel locking tendencies
- control fluid pressure modulation to the brakes during an antilock stop
- monitor the system for proper operation
- provide communication to the DRBIII® while in diagnostic mode
- store diagnostic information in non-volatile memory

The CAB continuously monitors the speed of each wheel. When a wheel locking tendency is detected, the CAB will command the appropriate valve to modulate brake fluid pressure in its hydraulic unit. Brake pedal position is maintained during an antilock stop by being a closed system with the use of 2 accumulators. The CAB continues to control pressure in individual hydraulic circuits until a wheel locking tendency is no longer present. The CAB turns on the pump motor during an antilock stop.

The antilock brake system is constantly monitored by the CAB for proper operation. If the CAB detects a system malfunction, it can disable the antilock system and turn on the ABS warning indicator. If the antilock function is disabled, the system will revert to standard base brake system operation.

The CAB inputs include the following:

- diagnostic communication
- four wheel speed sensors
- ignition switch
- fused B+
- brake lamp switch
- traction control switch (if equipped)

The CAB outputs include the following:

- ABS warning indicator actuation
- valve actuation
- diagnostic communication
- traction control lamp illumination (if equipped)

3.3.3 HYDRAULIC CONTROL UNIT

The hydraulic control unit (HCU) contains the valve block assembly, and pump/motor assembly.

Valve Block Assembly: The valve block assembly contains valves with four inlet valves and four outlet valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring loaded in the closed position. During an antilock stop, these valves are cycled to maintain the proper slip ratio for each wheel. The CAB monitors wheel speeds. If the CAB detects a wheel deceleration that is disproportionate to the other wheels, it will close the inlet valve to that wheel. This prevents any

increase in fluid pressure. If the wheel continues to decelerate disproportionately, the CAB opens the outlet valve for that wheel to release fluid pressure from that channel. The released fluid is routed to the accumulators. When the wheel speed is no longer disproportionate to the other wheels, the inlet valve will return to its normally open position and the outlet valve will return to the normally closed position. On LH Bodies which are equipped with a traction control system, there are two additional valves that isolate the master cylinder and rear wheels. During a traction control situation the brakes are applied at a slipping drive wheel to reduce wheel slippage.

Pump Motor Assembly: The pump motor assembly provides the extra amount of fluid needed during antilock braking. The pump is supplied fluid that is released to the accumulators when the outlet valve is opened during an antilock stop. The pump is also used to drain the accumulator circuits after the antilock stop is complete. The pump is operated by an integral electric motor. This motor is controlled by the CAB. The CAB may turn on the pump motor when an antilock stop is required. The pump continues to run during the antilock stop and is turned off after the stop is complete. Under some conditions, the pump/motor will run to drain the accumulators during the next drive off. The CAB monitors the pump/motor operation internally.

3.3.4 SWITCHES / SENSORS

Master Cylinder: All vehicles including Traction control vehicles use a dual center port master cylinder.

A fluid level switch is located in the master cylinder fluid reservoir. The switch closes when a low fluid level is detected. The fluid level switch turns on the brake warning indicator by grounding the indicator circuit. This switch does not disable the ABS system.

Wheel Speed Sensors and Tone Wheels: One active Wheel Speed Sensor (WSS) is located at each wheel and sends a small DC voltage signal to the Controller Antilock Brake (CAB). The CAB sends 12 volts down to the sensor. The sensor has an internal magneto resistance bridge that alters the voltage and amperage of the signal circuit. This voltage and amperage is changed by magnetic induction when a toothed sensor ring (tone wheel) passes by a stationary magnetic sensor (wheel speed sensor). The CAB measures the voltage and amperage of the DC signals for each wheel.

The front wheel speed sensor is attached to a boss in the steering knuckle. The tone wheel is an integral part of the front axle shaft. On LH Bodies the rear sensors are mounted to the rear brake backing plates or rear disc adapters. The rear tone wheels are pressed on the rear hub. The wheel

GENERAL INFORMATION

speed sensor air gap is not adjustable. Refer to Service Manual for wheel speed sensor air gap and resistance specifications.

The four wheel speed sensors are serviced individually. The front tone wheels are serviced as an assembly with the outer C.V. joint housing. The rear tone wheels are serviced as an assembly.

Correct antilock system operation is dependent on accurate wheel speed signals from the wheel speed sensors. The vehicle's wheels and tires should all be the same size and type to generate accurate signals. In addition, the tires should be inflated to the recommended pressures for optimum system operation. Variation in wheel and tires size or significant variations in inflation pressure can produce inaccurate wheel speed signals; however, the system will continue to function when using the correct factory mini-spare.

3.3.5 SYSTEM INITIALIZATION

System initialization starts when the key is turned to "run". At this point, the CAB performs a complete self-check of all electrical components in the antilock systems.

Between 8-17 km/h (5-10 mph), a dynamic test is performed. This will momentarily cycle the inlet and outlet valves, check wheel speed sensor circuitry and run the pump motor at 25 km/h (15 mph), the CAB will try to test the pump motor. If the brake pedal is depressed the test will be run at 40 km/h (24 mph) regardless of brake switch state. If, during the dynamic test, the brake pedal is depressed the driver may feel the test through brake pedal pulsations. This is a normal condition.

If any component exhibits a trouble condition during system initialization or dynamic check, the CAB will illuminate the ABS warning indicator and TRAC OFF indicator (if equipped).

3.3.6 DIAGNOSTIC MODE

To enter diagnostic mode, a vehicle speed must be below 10 km/h (6 mph) and no ABS/TCS condition present. If vehicle speed is not below 10 km/h (6 mph), a "No Response" message could be displayed by the DRBIII®. The following are characteristics of diagnostic mode:

- The amber ABS warning indicator will blink rapidly. If a hard trouble code, such as CAB Power Feed Circuit Failure code is present, the indicator will be illuminated without blinking until the trouble condition is cleared.
- Antilock operation is disabled.
- Valve actuation with the DRBIII® is disabled when the vehicle speed is above 8 km/h (5 mph). If valve actuation is attempted above 8

km/h (5 mph), a "No Response" message will be displayed on the DRBIII®.

3.4 DIAGNOSTIC TROUBLE CODES

The Controller Antilock Brake may report any of several Diagnostic Trouble Codes (DTC)s. For a list of the DTC's diagnosed in this manual, refer to the Table of Contents.

3.5 FREEZE FRAME

Freeze Frame takes a "snapshot" of specific vehicle information the instant an ABS failure is recognized and stores this information into the CAB memory. This information can be accessed using the DRBIII to help diagnose the fault. Freeze Frame will capture the first time failure or only a new failure that occurs during the current ignition cycle.

3.6 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot or User-Requested COLD Boot

This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err:0x1
User-Requested COLD Boot

Press MORE to switch between this display
and the application screen.
Press F4 when done noting information.
```

3.6.1 DRBIII® DOES NOT POWER UP

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.6.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

3.7 TIRE PRESSURE MONITORING SYSTEM

If equipped with the Tire Pressure Monitoring System, each of the vehicle's five wheels will have a valve stem with a pressure sensor and radio transmitter built in. Signals from the tire pressure sensors are received and interpreted by the Electronic Vehicle Information Center (EVIC).

A sensor in a mounted wheel will broadcast its detected pressure once per minute when the vehicle is moving faster than 40 km/h (25 mph). The spare tire sensor will broadcast once every hour. Each sensor's broadcast is uniquely coded so that the EVIC can determine location. The individual tire pressures can be displayed graphically on the EVIC.

NOTE: The spare tire is only monitored when equipped with the 5-Tire TPM System.

3.7.1 TRAINING THE EVIC

The EVIC can be trained to recognize the source locations of pressure sensor signals. The training procedure is given below:

1. Locate "RETRAIN TIRE SENSORS" on the EVIC menu.
When this mode is enabled by selecting "YES", the EVIC will initiate the following procedure.
2. A display will prompt the user to: "TRAIN LEFT FRONT TIRE". At this point the user must set the left front tire sensor to learn mode by positioning a magnet (Relearn Magnet special tool 8821) over the valve stem for at least 5 seconds. The Remote Tire Pressure Monitor (RTPM) in the front left tire will transmit a message indicating to the EVIC that it is in learn mode. When the EVIC has received this message and is

assured that it has learned an ID, the EVIC will request a horn chirp via a bus message and then display the next train request.

Note: There is a 60 second timer for learning the first tire location and a 30 second timer between the remaining tires. If any of these timers expire the EVIC will abort the training procedure.

3. The EVIC will request the initiation of a training sequence for each tire, one-by-one in a clockwise direction around the vehicle (Left Front, Right Front, Right Rear, Left Rear and Spare). The EVIC will allow 30 seconds (**60 seconds for the first tire**) from the beginning of the train request display to the receipt of a unique learn ID message from the RTPM. If, during a training session, a 60 or 30 second timer expires before a unique learn sensor ID is received or the vehicle is not in park, the EVIC will keep the previous set of trained IDs and will display "TRAINING ABORTED" until a button is pressed. Any IDs learned during the current session will be discarded. The EVIC will not store one ID for multiple locations.

NOTE: The spare tire is only monitored when equipped with the 5-Tire TPM System.

4. Once all four (or five) tires are successfully trained, the previous set of stored IDs will be replaced by the new IDs, and the EVIC will display, "TRAINING COMPLETE" until a button is pressed.

If the vehicle is equipped with the Homelink feature and a Homelink button is pressed at any time during the training procedure, the EVIC module will immediately exit the training procedure, discard any IDs learned in the current session and perform the Homelink function. After the button is released, the module will display "RETRAIN TIRE SENSORS? NO".

The training procedure can be stopped at any time by pressing the C/T, STEP, RESET or MENU button. When any of these buttons are pressed the EVIC will display "TRAINING ABORTED."

Once training is complete, the EVIC can determine when the spare wheel has been mounted on the vehicle. The spare wheel sensor/transmitter is expected to transmit once per hour. If the sensor/transmitter ID for the spare wheel is received at a shorter interval, the EVIC will request a chime and display "SPARE SWAP DETECTED" for five seconds.

NOTE: The spare tire message is only available when equipped with the 5-Tire TPM System.

GENERAL INFORMATION

3.7.2 PRESSURE THRESHOLDS

The EVIC will monitor the tire pressure signals from the four (or five) tire sensors and determine if any tire has gone below the low pressure threshold or raised above the high pressure threshold. Refer to the table below.

LOW TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
On	172 kPa (25 PSI)
Off	193 kPa (28 PSI)

HIGH TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
On	310 kPa (45 PSI)
Off	276 kPa (40 PSI)

3.7.2.1 CRITICAL AND NON-CRITICAL PRESSURE ALERTS

A critical alert will be triggered when a tire pressure has gone below or above a set threshold pressure. Depending on what the condition is, the EVIC will request a chime and then display a LOW PRESSURE or HIGH PRESSURE message indicating the appropriate location. The alert message will display for three seconds and then switch to the tire pressure trip screen. The tire pressure for the tire that has exceeded its threshold will blink at one second intervals on the graphic display. The blinking pressure will continue for the rest of the ignition cycle or until an EVIC button is pressed. If the display is removed without correcting the condition, it will reappear without a chime after 60 seconds to warn the driver of the low/high pressure condition. A non-critical alert will be triggered when low or high pressure threshold has been exceeded in the spare tire. The "SPARE LOW PRESSURE" or "SPARE HIGH PRESSURE" alert will be displayed for 60 seconds during each ignition ON cycle. If the pressure threshold is exceeded while the ignition is OFF, the alert will be delayed 8-10 seconds after ignition ON.

NOTE: The spare tire is only monitored when equipped with the 5-Tire TPM System.

3.7.3 SYSTEM FAULTS

NOTE: The Remote Tire Pressure Monitors (RTPM) are not internally serviceable. For a Sensor Failure or Low Battery fault, the RTPM must be replaced.

There are four conditions which will cause a Tire Pressure Monitoring System fault to be set. All fault codes are associated with a specific wheel location.

1. If the EVIC detects a non-transmitting Sensor/Transmitter in a road wheel for ten consecutive minutes with vehicle speed above 25 MPH (40 kph), it will:
 - a. Store an active fault code.
 - b. Request a chime.
 - c. Display "TIRE SENSOR BAD / MISSING".
 - d. Display a dashed line at the wheel location on the graphic display if the display is activated.

When the EVIC detects:

2. A low pressure sensor battery status,
3. All five sensors transmitting at a shorter than expected interval or,
4. No valid pressure sensor ID from the spare tire for 20 consecutive ignition cycles spaced at least one hour apart, it will:
 - a. Store an active fault code.
 - b. Request a chime.
 - c. Display "TIRE SENSOR BAD / MISSING".Use the DRBIII® Input/Output function to further isolate the specific concern.

The DRBIII® can be queried to determine the Sensor/Transmitter status:

- "Invalid Pressure" - The Sensor/Transmitter is reporting a negative pressure or a pressure above 434 kPa (63 psi).
- "Low Batt" - The Sensor/Transmitter has reported a low battery status for seven consecutive ignition cycles.
- "Trained" - The Sensor/Transmitter ID code is recognized by the EVIC.
- "Active" - The vehicle is moving at 40 km/h (25 mph) and/or the Sensor/Transmitter is "awake" and transmitting as expected by the EVIC.

3.7.4 SPARE WHEEL AUTO-LOCATE (5-TIRE TPM SYSTEM ONLY)

If the spare tire is mounted on the vehicle, the EVIC will detect the move and determine from the sensor transmit intervals, which wheels are mounted and which one is now the spare. The spare tire sensor/transmitter transmits once per hour. The sensor/transmitters in the mounted wheels transmit once per minute when the vehicle is moving at 40 km/h (25 mph).

3.7.5 REMOVE MAGNET FROM SPARE (5-TIRE TPM SYSTEM ONLY)

A magnet is used to initiate a sensor ID transmission. In the EVIC training procedure, the spare wheel is the last in the sequence. If the magnet is

left on the wheel, the sensor/transmitter will continue its ID transmission. If the EVIC detects 20 transmissions from the spare wheel in 60 seconds and the vehicle speed is above 40 km/h (25 mph), it will:

- request a chime.
- display “REMOVE MAGNET FROM SPARE” for 60 seconds per ignition-ON cycle.

3.7.6 TIRE PRESSURE UNAVAILABLE

The EVIC can detect high radio noise interference. When the noise level is too high to distinguish a transmission from a sensor/transmitter, it will:

- display “TIRE PRESSURE UNAVAILABLE” for 5 seconds.
- request a chime
- switch back to previous screen.

3.7.7 TIRE PRESSURE NOW AVAILABLE

If the “TIRE PRESSURE UNAVAILABLE” message was displayed because of radio noise interference, the EVIC will:

- display “TIRE PRESSURE NOW AVAILABLE” for 5 seconds.
- request a chime when the noise level no longer interferes with sensor/transmitter transmissions.

3.7.8 DIAGNOSING AND CLEARING SYSTEM FAULTS

All Tire Pressure Monitoring System Faults are specific to one location. If a “LOW BATTERY” fault is detected, the “TIRE SENSOR BAD / MISSING” message will be displayed. The appropriate sensor/transmitter can then be replaced.

If a single sensor/transmitter cannot be detected by the EVIC, replace that sensor transmitter. If none of the sensors/transmitters can be detected, refer to symptoms in the EVIC section.

3.7.9 SYSTEM TEST

A test of the Tire Pressure Monitoring System can be initiated in the EVIC. The test sequence is as follows:

1. Scroll to the blank display by pressing the STEP button.
2. Press and hold the RESET button for five seconds.
3. The EVIC will emit a beep to indicate the start of the test.
4. The EVIC will clear the sensor signal counters

5. The vehicle icon will be displayed with transmission counters at each corner. (Same display as for pressures but with counters in place of pressures.)
6. Drive the vehicle at speeds above 40 km/h (25 mph) for 10 minutes.
7. The counters will increase by one each time a sensor signal is received by the EVIC (approximately 1/min from each wheel except the spare).
8. The test will continue until any EVIC button is pressed or until the ignition is cycled to OFF.

4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheel before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as rings, watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a chassis system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service manual. Following these procedures is very important to safety of individuals performing diagnostic tests.

GENERAL INFORMATION

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the chassis system are intended to be serviced as an assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRB MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and functions for the measurement. Do not try voltage or current measurement that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 -1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.

- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complains will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

WARNING: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRB.

4.4 DIAGNOSIS

1. Your diagnostic test procedure must begin with a thorough visual inspection of the ABS system for damaged components or disconnected connec-

- tors. The brake lamps must be operational, and if they are not, repair them prior to continuing.
2. Connect the DRBIII® to the data link connector, which is located under the dash to the left of the steering column. If the DRBIII® does not power up, check the power and ground supplies to the connector.
3. Turn the ignition on. Select “Antilock Brakes”. If the DRBIII® displays “No Response” condition you must diagnose that first.
4. Read and record all ABS Diagnostic Trouble Codes (DTC’s). If the “CAB Power Feed Circuit” diagnostic trouble code is present, it must be repaired prior to addressing other DTC’s. If any additional DTC’s are present, proceed to the appropriate test by locating the matching test in the Table of Contents and begin to diagnose the symptom.
5. If there are no diagnostic trouble codes present, identify the customer complaint, select “Inputs/Outputs” and read the brake switch input as you press and release the brake pedal. If the display does not match the state of the pedal, perform the proper test by locating the matching test in the Table of Contents and begin to diagnose the symptom. If a problem exists with the yellow “ABS” warning indicator or the red “Brake” indicator, perform the proper test by locating the matching test in the Table of Contents and begin to diagnose the symptom. On LH read the traction control switch input as you press and release the switch. If the display does not match the state of the indicator, locate the matching test in the Table of Contents and begin to diagnose the symptom.
6. If no other problems are found, it will be necessary to road test the vehicle. Perform several antilock stops from above 50 Km/h (30 mph) and then repeat step 4. If any diagnostic trouble codes are present, proceed to the appropriate test.
7. The following conditions should be considered “NORMAL” operation, and no repairs should be attempted to correct them.
 - Brake pedal feedback during an ABS stop (clicking, vibrating)
 - Clicking, groaning or buzzing at 25 Km/h (15 mph) or 40 Km/h (24 mph) (drive off self test)
 - Groaning noise during an ABS stop
 - Slight brake pedal drop and pop noise when ignition is initially turned on
 - Brake pedal ratcheting down at the end of an ABS stop.

8. If the complaint is ABS “cycling” at the end of a stop at low speeds, it may be caused by a marginal wheel speed sensor signal. The sensor air gap, tone wheel condition, and/or brakes hanging up are possible causes of this condition.
9. After a road test and no problems were found, refer to any Technical Service Bulletins that may apply.

5.0 Required tools and equipment

DRBIII® (diagnostic read-out box)
 jumper wires
 ohmmeter
 voltmeter
 test light

6.0 Glossary of Terms

ABS	antilock brake system
CAB	controller antilock brake
DC	direct current
DLC	data link connector
DRB	diagnostic read-out box
EVBP	electronic variable brake proportioning
HCU	hydraulic control unit
JBLK	junction block
LF	left front
LR	left rear

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom: **BUS SYSTEM COMMUNICATION FAILURE**

When Monitored and Set Condition:

BUS SYSTEM COMMUNICATION FAILURE

When Monitored: Ignition ON, continuously.

Set Condition: When the CAB does not receive a message from the instrument cluster for 10 seconds.

POSSIBLE CAUSES

INTERMITTENT CONDITION

ELECTRO-MECHANICAL INSTRUMENT CLUSTER DTC PRESENT

BUS CIRCUIT OPEN

CAB - INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. With the DRBIII®, read Freeze Frame information. With the DRBIII®, erase DTCs. Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTCs. Does the DRBIII® display BUS SYSTEM COMMUNICATION FAILURE? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, read EMIC DTCs. Does the DRBIII® display NO MESSAGES FROM ABS? Yes → Refer to symptom NO MESSAGES FROM ABS in the BODY/ INSTRUMENT CLUSTER category. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

BUS SYSTEM COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the negative (-) battery cable. Disconnect the CAB harness connector. NOTE: check connector - Clean/repair as necessary. Measure the resistance of the Bus circuit between the CAB connector and the Data Link Connector (DLC). Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Repair the Bus circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any problems found?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

BRAKES (CAB)

Symptom: CAB INTERNAL FAILURE

When Monitored and Set Condition:

CAB INTERNAL FAILURE

When Monitored: Ignition on. The CAB monitors the Fused B(+) circuit at all times for proper system voltage.

Set Condition: If the Fused B(+) voltage is missing when the CAB detects that an internal main driver is not "on", the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES

INTERMITTENT DTC
DAMAGED CAB/CAB HARNESS CONNECTOR
CAB - GROUND CIRCUIT OPEN
ABS VALVE FUSED B(+) CIRCUIT OPEN
ABS PUMP FUSED B(+) CIRCUIT OPEN
CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. With the DRBIII®, erase DTCs. Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTCs. Does the DRBIII® display CAB INTERNAL FAILURE? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the CAB harness connector. Inspect the CAB/CAB harness connector for damage. Is there any broken, bent, pushed out, corroded or spread terminals? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

CAB INTERNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the CAB harness connector. Using a 12-volt test light connected to 12-volts, probe the CAB harness connector ground circuits. Did the test light illuminate?</p> <p>Yes → Go To 4</p> <p>No → Repair the CAB Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Using a 12-volt test light connected to ground, probe the ABS Valve Fused B(+) circuit at the CAB harness connector. Did the test light illuminate?</p> <p>Yes → Go To 5</p> <p>No → Repair the ABS Valve Fused B(+) circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Using a 12-volt test light connected to ground, probe the ABS Pump Fused B(+) circuit at the CAB harness connector. Did the test light illuminate?</p> <p>Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Repair the ABS Pump Fused B(+) circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom: CLUSTER LAMP FAILURE

When Monitored and Set Condition:

CLUSTER LAMP FAILURE

When Monitored: Key ON. After Key-ON bulb check

Set Condition: When the instrument cluster informs the CAB that the cluster cannot turn on the ABS Lamp.

POSSIBLE CAUSES

INSTRUMENT CLUSTER OR ABS DTC PRESENT

INSTRUMENT CLUSTER

CAB--NO DTC SIGNAL TO THE INSTRUMENT CLUSTER

CAB -- PERMANENT FAULT SIGNAL

CAB--NO KEY-ON BULB CHECK SIGNAL

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Are there any Instrument Cluster or ABS DTCs present? Yes → Refer to the appropriate category for the related symptom(s). Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Perform the Key-on Bulb Check. Does the ABS Warning Indicator light and then go out after a few seconds? Yes → Go To 3 No. Light remains after bulb check. Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No. Indicator never comes on. Go To 4	All

CLUSTER LAMP FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>NOTE: The DRBIII® communication with the CAB must be operational for the result of this test to be valid.</p> <p>Turn the ignition off. Remove ABS Valve fuse. Perform the Key-on Bulb Check. Does the ABS Indicator remain on after the bulb check?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All
4	<p>NOTE: The following steps will initiate the Instrument Cluster self test.</p> <p>Turn the ignition off. Press and hold the odometer reset button. Turn the ignition to RUN. Observe the Instrument Cluster indicators. Release the odometer reset button. Did the ABS Indicator illuminate during the Instrument Cluster self test?</p> <p>Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom: **INCORRECT TONE WHEEL FAILURE**

When Monitored and Set Condition:

INCORRECT TONE WHEEL FAILURE

When Monitored: Ignition ON. Vehicle speed above 40 km/h (25 mph) for 2 minutes.

Set Condition: When the CAB detects an unexpected wheel speed condition caused by a tire size that does not meet vehicle specification.

POSSIBLE CAUSES

INCORRECT TIRES ON VEHICLE

INCORRECT TONE WHEEL ON VEHICLE

TEST	ACTION	APPLICABILITY
1	Inspect the tire sizes on the vehicle. Is a smaller than production tire, mini spare, or two mini spares installed on both front wheels? Yes → Replace the incorrect tire(s) size with production size tire(s). Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Count the number of tone wheel teeth on both of the front driveshafts. Does one or both tone wheel(s) have (56 or 40) teeth? Yes → Replace the front driveshaft(s) with the incorrect number of tone wheel teeth. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom List:

LEFT FRONT SENSOR CIRCUIT FAILURE
LEFT REAR SENSOR CIRCUIT FAILURE
RIGHT FRONT SENSOR CIRCUIT FAILURE
RIGHT REAR SENSOR CIRCUIT FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **LEFT FRONT SENSOR CIRCUIT FAILURE**.

When Monitored and Set Condition:**LEFT FRONT SENSOR CIRCUIT FAILURE**

When Monitored: Ignition on. The CAB monitors the wheel speed circuit continuously.

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

LEFT REAR SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit continuously.

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

RIGHT FRONT SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit continuously.

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

RIGHT REAR SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit continuously.

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

POSSIBLE CAUSES

INTERMITTENT CONDITION

WHEEL SPEED SENSOR OR CONNECTOR DAMAGE

WHEEL SPEED SENSOR SIGNAL CIRCUIT FAULT

WHEEL SPEED SENSOR 12 VOLT SUPPLY CIRCUIT SHORT TO GROUND

WHEEL SPEED SENSOR 12 VOLT SUPPLY CIRCUIT OPEN

WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND

WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN

LEFT FRONT SENSOR CIRCUIT FAILURE — Continued

POSSIBLE CAUSES
CAB - 12 VOLT SUPPLY CIRCUIT FAULT
CAB - SIGNAL CIRCUIT FAULT
WHEEL SPEED SENSOR 12 VOLT SUPPLY SHORT TO GROUND
WHEEL SPEED SENSOR SIGNAL CIRCUIT INOPERATIVE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on.</p> <p>With the DRBIII®, read DTCs.</p> <p>With the DRBIII®, read the Freeze Frame information.</p> <p>With the DRBIII®, erase DTCs.</p> <p>Turn the ignition off.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read DTCs.</p> <p>NOTE: The CAB must sense all four wheels at 25km/h (15 mph) before it will extinguish the ABS indicators.</p> <p>Does the DRBIII® display SENSOR CIRCUIT FAILURE?</p> <p>Yes → Go To 2</p> <p>No → Go To 13</p>	All
2	<p>Turn the ignition off.</p> <p>Inspect the CAB connector, affected Wheel Speed Sensor, and affected Wheel Speed Sensor connector.</p> <p>Is the affected Wheel Speed Sensor or any of the connectors damaged?</p> <p>Yes → Repair as necessary.</p> <p>Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition off.</p> <p>Disconnect the affected Wheel Speed Sensor connector.</p> <p>Note: Check connector - Clean/repair as necessary.</p> <p>Turn the ignition on.</p> <p>Measure the voltage between affected Wheel Speed Sensor 12 Volt Supply circuit and ground.</p> <p>Is the voltage above 10 volts?</p> <p>Yes → Go To 6</p> <p>No → Go To 4</p>	All

LEFT FRONT SENSOR CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Disconnect the CAB harness connector. Disconnect the affected Wheel Speed Sensor connector. Connect a jumper wire between affected Wheel Speed Sensor 12 Volt Supply circuit and ground. Using a 12-volt test light connected to 12-volts, probe the affected Wheel Speed Sensor 12 Volt Supply circuit. Does the test light illuminate?</p> <p>Yes → Go To 6</p> <p>No → Repair the affected Wheel Speed Sensor 12 Volt Supply circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the affected Wheel Speed Sensor connector. NOTE: Check connector - Clean/repair as necessary. Turn the ignition on. Measure the voltage between affected Wheel Speed Sensor Signal circuit and ground. Is the voltage above 1 volt?</p> <p>Yes → Repair the affected Wheel Speed Sensor Signal circuit for a short to voltage. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the CAB harness connector. Disconnect the affected Wheel Speed Sensor connector. Using a 12-volt test light connected to 12-volts, probe the affected Wheel Speed Sensor Signal circuit. Does the test light illuminate?</p> <p>Yes → Repair the affected Wheel Speed Sensor Signal circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the CAB harness connector. Disconnect the affected Wheel Speed Sensor connector. Connect a jumper wire between affected Wheel Speed Sensor Signal circuit and ground. Using a 12-volt test light connected to 12-volts, probe the affected Wheel Speed Sensor Signal circuit. Does the test light illuminate?</p> <p>Yes → Go To 9</p> <p>No → Repair the affected Wheel Speed Sensor Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

LEFT FRONT SENSOR CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	<p>Turn the ignition off. Remove the CAB harness strain relief to access wires. Reconnect the CAB harness connector. Turn the ignition on. Measure the voltage between affected Wheel Speed Sensor 12 Volt Supply circuit and ground. Is the voltage above 10 volts?</p> <p>Yes → Go To 10</p> <p>No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All
10	<p>Turn the ignition off. Remove the CAB harness strain relief to access wires. Reconnect the CAB harness connector. Turn the ignition on. Measure the voltage between affected Wheel Speed Sensor 12 Volt Supply circuit and affected Wheel Speed Sensor Signal circuit. Is the voltage above 10 volts?</p> <p>Yes → Go To 11</p> <p>No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All
11	<p>Turn the ignition off. Reconnect ALL affected Wheel Speed Sensor circuit connectors. Disconnect the affected Wheel Speed Sensor connector. Turn the ignition on. Measure the voltage of the affected Wheel Speed Sensor 12 Volt Supply circuit in the affected Wheel Speed Sensor connector while reconnecting the sensor connector. Did the affected Wheel Speed Sensor 12 Volt Supply circuit drop voltage to 0 DC volts?</p> <p>Yes → Replace the affected Wheel Speed Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 12</p>	All
12	<p>Turn the ignition off. Reconnect ALL affected Wheel Speed Sensor circuit connectors. Turn the ignition on. Measure the DC voltage of the Wheel Speed Sensor Signal circuit in the affected Wheel Speed Sensor connector. Slowly rotate the wheel. Does the DC voltage toggle between 1.6 volts to .8 volts?</p> <p>Yes → Go To 13</p> <p>No → Replace the affected Wheel Speed Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All

LEFT FRONT SENSOR CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
13	<p>Turn the ignition off.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Refer to any Hotline letters or Technical Service Bulletins that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom List:

LEFT FRONT WHEEL SPEED SIGNAL FAILURE
LEFT REAR WHEEL SPEED SIGNAL FAILURE
RIGHT FRONT WHEEL SPEED SIGNAL FAILURE
RIGHT REAR WHEEL SPEED SIGNAL FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be LEFT FRONT WHEEL SPEED SIGNAL FAILURE.

When Monitored and Set Condition:

LEFT FRONT WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked and verified at drive off and continuously thereafter.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

LEFT REAR WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked and verified at drive off and continuously thereafter.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

RIGHT FRONT WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked and verified at drive off and continuously thereafter.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

RIGHT REAR WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked and verified at drive off and continuously thereafter.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

LEFT FRONT WHEEL SPEED SIGNAL FAILURE — Continued

POSSIBLE CAUSES	
WHEEL SPEED SIGNAL FAILURE DTC PRESENT	
AFFECTED WHEEL SPEED SENSOR SIGNAL INOPERATIVE	
AFFECTED WHEEL SPEED SENSOR CONNECTOR DAMAGED	
AFFECTED WHEEL SPEED SENSOR TONE WHEEL DAMAGED	
AFFECTED WHEEL SPEED SENSOR AIR GAP FAULT	
WHEEL BEARING FAULT	
BRAKE LINING FAULT	
AFFECTED WHEEL SPEED SENSOR CIRCUIT ELECTRICAL FAULT	

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII®, read DTCs. With the DRBIII®, read Freeze Frame information. NOTE: The CAB must sense ALL 4 wheels at 25 km/h (15 mph) before it will extinguish the ABS indicators. Does the DRBIII® display WHEEL SPEED/SIGNAL FAILURE and SENSOR CIRCUIT FAILURE?</p> <p>Yes → Refer to the affected Wheel Speed SENSOR CIRCUIT FAILURE for the related symptom(s). Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition on. With the DRBIII® in Sensors, monitor ALL the Wheel Speed Sensor Signals while an assistant drives the vehicle. Slowly accelerate as straight as possible from a stop to 24 km/h (15 mph). Is the affected Wheel Speed Signal showing 0 km/h (0 mph)?</p> <p>Yes → Go To 3</p> <p>No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wiring harness. Refer to any Technical Service Bulletins(TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform ABS VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition off. Inspect the CAB connector, affected Wheel Speed Sensor, and affected Wheel Speed Sensor connector. Is the Wheel Speed Sensor or any connector damaged?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All

LEFT FRONT WHEEL SPEED SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn ignition off. Inspect the affected Tone Wheel for damaged, missing teeth, cracks, or looseness NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked. Is the affected Tone Wheel OK?</p> <p>Yes → Go To 5</p> <p>No → Replace the Tone Wheel in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Using a Feeler Gauge, measure the affected Wheel Speed Sensor Air Gap. NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications. Is the Air Gap OK?</p> <p>Yes → Go To 6</p> <p>No → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Inspect the wheel bearings for excessive runout or clearance. NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications. Is the bearing clearance OK ?</p> <p>Yes → Go To 7</p> <p>No → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Visually inspect brakes for locking up due to lining contamination or overheating. Inspect all Components for defects which may cause a Signal DTC to set. Is any Component Damaged?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Refer to symptom SENSOR CIRCUIT FAILURE for further diagnostics. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:

PUMP CIRCUIT FAILURE

When Monitored and Set Condition:

PUMP CIRCUIT FAILURE

When Monitored: Ignition on. The CAB commands the pump on at 20 km/h (12 mph) to check its operation, if the brake switch is not applied. If the brake is applied, the test will run at 40 km/h (25 mph).

Set Condition: The DTC is stored when the CAB detects: 1) Improper voltage decay after the pump was turned off. 2) Pump not energized by the CAB, but voltage is present for 3.5 seconds. 3) Pump is turned on by the CAB, but without sufficient voltage to operate it.

POSSIBLE CAUSES

CAB - PUMP MOTOR RUNNING CONTINUOUSLY
 ABS PUMP FUSE
 ABS PUMP MOTOR INTERMITTENT DTC
 DAMAGED CAB/CAB HARNESS CONNECTOR
 ABS PUMP FUSED B(+) CIRCUIT INTERMITTENT SHORT TO GROUND
 ABS PUMP FUSED B(+) CIRCUIT SHORT TO GROUND
 CAB - INTERNAL FAULT
 ABS PUMP MOTOR INOPERATIVE
 ABS PUMP MOTOR OPEN
 ABS PUMP MOTOR B(+) CIRCUIT OPEN
 ABS PUMP MOTOR GROUND CIRCUIT OPEN
 CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Turn the ignition on. Monitor the ABS Pump Motor for continuous operation. NOTE: The CAB must sense ALL wheels at 25 km/h (15 mph) before it will extinguish the ABS indicators. Is the ABS Pump Motor running continuously? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All

PUMP CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTCs. With the DRBIII®, erase DTCs. Turn the ignition off. Turn the ignition on. With the DRBIII®, actuate the ABS Pump Motor. Did the ABS Pump Motor operate?</p> <p>Yes → Go To 3 No → Go To 4</p>	All
3	<p>Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Make sure the Pump Motor connector is secure. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.</p>	All
4	<p>Turn the ignition off. Remove and inspect the ABS Pump fuse. Is the ABS Pump fuse open?</p> <p>Yes → Go To 5 No → Go To 8</p>	All
5	<p>Turn the ignition off. Visually inspect the ABS Pump Fused B(+) circuit in the wiring harness. Look for any sign of an intermittent short to ground. Is the wiring harness OK?</p> <p>Yes → Go To 6 No → Repair the ABS Pump Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the CAB harness connector. Check connectors - Clean/repair as necessary. Using a 12-volt test light connected to 12-volts, probe the ABS Pump Fused B(+) circuit fuse terminal. Does the test light illuminate?</p> <p>Yes → Repair the ABS Pump Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1. No → Go To 7</p>	All

PUMP CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Reconnect the CAB harness connector. Using a 12-volt test light connected to 12-volts, probe the ABS Pump Fused B(+) circuit fuse terminal. Does the test light illuminate?</p> <p>Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the ABS Pump fuse. If the fuse is open make sure to check for a short to ground. Perform ABS VERIFICATION TEST - VER 1.</p>	All
8	<p>Turn the ignition off. Disconnect the CAB harness connector. Inspect the CAB and CAB harness connector for damage. Is there any broken, bent, pushed out, corroded, or spread terminals?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 9</p>	All
9	<p>Turn the ignition off. Reinstall the ABS Pump fuse. Disconnect the ABS Pump Motor connector. Check connectors - Clean/repair as necessary. Connect a 10 gauge 40 amp fused jumper wire between the ABS Pump Fused B(+) terminal in the CAB harness connector to the ABS Pump Motor connector RED wired terminal. Connect a 10 gauge jumper wire between the Ground circuit terminal in the CAB harness connector to the ABS Pump Motor connector BLACK wired terminal. Did the ABS Pump Motor operate?</p> <p>Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 10</p>	All
10	<p>Turn the ignition off. Disconnect the ABS Pump Motor connector. Check connectors - Clean/repair as necessary. Connect a 10 gauge 40 amp fused jumper wire between the ABS Pump Motor connector RED wired terminal and an alternate 40 amp capable B(+) source. Connect a 10 gauge jumper wire between the ABS Pump Motor connector BLACK wired terminal and ground Did the ABS Pump Motor operate?</p> <p>Yes → Go To 11</p> <p>No → Replace the Hydraulic Control Unit in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All

PUMP CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
11	<p>Turn the ignition off. Disconnect the ABS Pump Motor connector. Check connectors - Clean/repair as necessary. Connect a 10 gauge 40 amp fused jumper wire between the ABS Pump Fused B(+) terminal in the CAB harness connector to the ABS Pump Motor connector RED wired terminal. Connect a 10 gauge jumper wire between the ABS Pump Motor connector BLACK wired terminal and ground. Did the ABS Pump Motor operate?</p> <p>Yes → Repair the ABS Pump Motor Fused B(+) circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Repair the ABS Pump Motor Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:
SYSTEM OVER VOLTAGE

When Monitored and Set Condition:

SYSTEM OVER VOLTAGE

When Monitored: Ignition on. The CAB monitors the Fused B(+) circuit at all times for proper system voltage.

Set Condition: If the voltage is above 16.5 volts, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES

INTERMITTENT DTC
 BATTERY CHARGER CONNECTED
 FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT HIGH
 DAMAGED CAB/CAB HARNESS CONNECTOR
 CAB - GROUND CIRCUIT OPEN
 CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Start the engine. With the DRBIII®, read DTC's. Does the DRBIII® display SYSTEM OVER VOLTAGE? Yes → Go To 2 No → Go To 7	All
2	Is a battery charger connected to the vehicle? Yes → Ensure the battery is fully charged. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

SYSTEM OVER VOLTAGE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the CAB connector. Note: Check connector - Clean/repair as necessary. Start the engine. Raise engine speed above 1,800 RPM's Measure the voltage between Fused Ignition Switch Output (RUN) circuit and ground. Is the voltage above 16.5 volts ?</p> <p>Yes → Refer to appropriate service information for Charging System testing and repair. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the CAB connector. Note: Check connector - Clean/repair as necessary. Inspect the CAB and CAB harness connector for damage. Is there any broken, bent, pushed out, corroded, or spread terminals?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the CAB connector. Note: Check connector - Clean/repair as necessary. Using a 12-volt test light connected to 12-volts, probe the Ground circuits. Does the test light illuminate?</p> <p>Yes → Go To 6</p> <p>No → Repair the Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Reconnect the CAB harness connector. Turn the ignition on. With the DRBIII® in Sensors, read the ignition voltage. Does the DRBIII® display ignition voltage above 16 volts?</p> <p>Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All

SYSTEM OVER VOLTAGE — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Refer to any Hotline letters or Technical Service Bulletins that may apply.</p> <p>Ensure the battery is fully charged.</p> <p>Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.</p> <p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.</p> <p>Were any problems found?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom: SYSTEM UNDER VOLTAGE

When Monitored and Set Condition:

SYSTEM UNDER VOLTAGE

When Monitored: Ignition on. The CAB monitors the Fused Ignition Switch Output circuit voltage above 10 km/h (6 mph) for proper system voltage.

Set Condition: If the voltage is below 9.5 volts, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES

INTERMITTENT DTC
DAMAGED CAB/CAB HARNESS CONNECTOR
RUNNING BATTERY VOLTAGE LOW
CAB - GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN
CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Start the engine. Drive the vehicle above 16 km/h (10 mph) for at least 20 seconds. Stop the vehicle With the DRBIII®, read DTC's. Does the DRBIII® display SYSTEM UNDER VOLTAGE ? Yes → Go To 2 No → Go To 6	All
2	Engine Running. Measure the battery voltage. Is the battery voltage below 10 volts? Yes → Refer to appropriate service information for charging system testing and repair. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

SYSTEM UNDER VOLTAGE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the CAB harness connector. Inspect the CAB and CAB harness connector for damage. Is there any broken, bent, pushed out, corroded, or spread terminals? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the CAB harness connector. Using a 12-volt test light connected to 12-volts, probe the Ground circuits. Does the test light illuminate? Yes → Go To 5 No → Repair the Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (RUN) circuit. Does the test light illuminate? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Repair the Fused Ignition Switch Output (RUN) circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Ensure the battery is fully charged. Inspect the vehicle for aftermarket accessories that may exceed the Generator System output. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom: VALVE POWER FEED FAILURE

When Monitored and Set Condition:

VALVE POWER FEED FAILURE

When Monitored: Ignition on. The CAB monitors its internal microprocessors for correct operation.

Set Condition: If the CAB detects an internal fault, the DTC is set.

POSSIBLE CAUSES

INTERMITTENT DTC
ABS VALVE FUSE
ABS VALVE FUSED B(+) SUPPLY CIRCUIT OPEN
ABS VALVE FUSED B(+) CIRCUIT OPEN
ABS VALVE FUSED B(+) CIRCUIT INTERMITTENT SHORT TO GROUND
ABS VALVE FUSED B(+) CIRCUIT SHORT TO GROUND
DAMAGED CAB/CAB HARNESS CONNECTOR
CAB - GROUND CIRCUIT OPEN
CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display VALVE POWER FEED FAILURE? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. Remove and Inspect the ABS Valve fuse. Is the ABS Valve fuse open? Yes → Go To 3 No → Go To 6	All

VALVE POWER FEED FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Visually inspect the ABS Valve Fused B(+) circuit in the wiring harness. Look for any sign of an intermittent short to ground. Is the wiring harness OK?</p> <p>Yes → Go To 4</p> <p>No → Repair the ABS Valve Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Disconnect the CAB harness connector. Note: Check connector - Clean/repair as necessary. Using a test light connected to 12 volts, probe the ABS Valve Fused B(+) circuit fuse terminal. Did the test light illuminate?</p> <p>Yes → Repair the ABS Valve Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Reconnect the CAB harness connector. NOTE: The CAB harness connector must be reconnected for the results of this test to be valid. Using a test light connected to 12 volts, probe the ABS Valve Fused B(+) circuit fuse terminal. Did the test light illuminate?</p> <p>Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the ABS Valve Fused B(+) fuse. If the fuse is open make sure to check for a short to ground. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Disconnect the CAB harness connector. Inspect the CAB and CAB harness connector for damage. Is there any broken, bent, pushed out, corroded or spread terminals?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Using a 12-volt test light connected to ground, probe the B(+) supply at the ABS Valve fuse terminal. Did the test light illuminate?</p> <p>Yes → Go To 8</p> <p>No → Repair the ABS Valve Fused B(+) supply circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

VALVE POWER FEED FAILURE — Continued

TEST	ACTION	APPLICABILITY
8	Reinstall the ABS Valve fuse. Disconnect the CAB harness connector. Using a 12-volt test light connected to ground, probe the ABS Valve Fused B(+) circuit at the CAB harness connector. Did the test light illuminate? Yes → Go To 9 No → Repair the ABS Valve Fused B(+) circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Using a 12-volt test light connected to 12-volts, probe the ground circuits at the CAB harness connector. Did the test light illuminate? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Repair the CAB Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
10	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:***BRAKE LAMP SWITCH INOPERATIVE****POSSIBLE CAUSES**

CHECK BRAKE LAMP SWITCH OUTPUT

BRAKE LAMP SWITCH B+ OPEN

BRAKE LAMP SWITCH OPEN

BRAKE LAMP SWITCH OUTPUT CIRCUIT SHORT OR OPEN

CAB -- INTERNAL OPEN

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® in Inputs/Outputs, read the Brake Lamp Switch state. Press and release the brake pedal. Does the DRBIII® display PRESSED and RELEASED?</p> <p>Yes → The Brake Lamp Switch is OK. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Disconnect the Brake Lamp Switch harness connector. Using a 12-volt test light connected to ground, check the Brake Lamp Switch Fused B+ circuit. Does the test light illuminate brightly ?</p> <p>Yes → Go To 3</p> <p>No → Repair the Brake Lamp Switch Fused B+ circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
3	<p>Disconnect the Brake Lamp Switch harness connector. Connect a jumper wire between the Brake Lamp Switch B+ and Brake Lamp Switch Output circuits. With the DRBIII® in Inputs/Outputs, read the Brake Lamp Switch state. Does the DRBIII® display PRESSED?</p> <p>Yes → Replace the Brake Lamp Switch in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Disconnect the CAB harness connector. Disconnect the Brake Lamp Switch harness connector. Check the Brake Lamp Switch Output circuit for a short to voltage and for an open. Is the Brake Lamp Switch Output circuit shorted or open?</p> <p>Yes → Repair the Brake Lamp Switch Output circuit for a short to voltage or an open. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All

BRAKES (CAB)

Symptom:

***TRAC OFF INDICATOR NEVER/ALWAYS ON**

POSSIBLE CAUSES

INSTRUMENT CLUSTER FAILS BULB CHECK

TRAC OFF SWITCH GROUND OPEN

TRAC OFF SWITCH INOPERATIVE

CHECK TRAC OFF SWITCH

TRAC OFF SWITCH SENSE CIRCUIT SHORT TO B+, GROUND OR OPEN

INSTRUMENT CLUSTER INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	<p>Note: If any DTC's are present, they must be repaired prior to performing this test.</p> <p>Turn the ignition off. Turn the ignition on. Observe the TRAC OFF indicator. Did the TRAC OFF indicator come on for several seconds then go out?</p> <p>Yes → Go To 2</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the headlamps ON. Depress the TRAC OFF switch. Does the TRAC OFF switch button illuminate?</p> <p>Yes → Go To 3</p> <p>No → Go To 5</p>	All
3	<p>Turn the ignition off. Disconnect the TRAC OFF Switch harness connector. Turn the ignition on. Connect and disconnect a jumper wire between TRAC OFF Switch Ground and TRAC OFF Switch Sense circuits. Does the TRAC OFF Indicator light and then go out?</p> <p>Yes → Replace the TRAC OFF switch. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All

***TRAC OFF INDICATOR NEVER/ALWAYS ON — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the TRAC OFF Switch harness connector. Disconnect the CAB harness connector. Check the TRAC OFF Switch Sense circuit for short to B+ or ground and for an open. Is the Sense circuit shorted or open? Yes → Repair the TRAC OFF Switch Sense circuit for a short to battery, ground or for an open. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
5	Disconnect the TRAC OFF switch harness connector. Using a 12-volt test light connected to 12-volts, check the TRAC OFF Switch Ground circuit. Does the test light illuminate? Yes → Replace the TRAC OFF Switch. Perform ABS VERIFICATION TEST - VER 1. No → Repair the TRAC OFF Switch Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

BRAKES (CAB)

Symptom:

***TRAC ON INDICATOR NEVER/ALWAYS ON**

POSSIBLE CAUSES
<p>FAILS KEY-ON BULB TEST</p> <p>CHECK TRACTION CONTROL OPERATION</p> <p>RECHECK TRAC ON INDICATOR</p> <p>CAB - NO TRAC ON INDICATOR</p>

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The DRBIII® must be able to communicate with the CAB prior to performing this test.</p> <p>Note: If any CAB DTC's are present, they must be repaired prior to performing this test.</p> <p>Perform the KEY-ON bulb test.</p> <p>Did the Trac On indicator illuminate and then go out?</p> <p>Yes → Go To 2</p> <p>No → Refer to INSTRUMENT CLUSTER for the related symptom(s). Perform ABS VERIFICATION TEST - VER 1.</p>	All
2	<p>Make sure the Traction Control system has not been deactivated with the TRAC OFF switch.</p> <p>NOTE: The purpose of this test is to determine if the Traction Control system is operating.</p> <p>With the DRBIII® in Inputs/Outputs, read the ABS Pump Motor voltage state.</p> <p>Accelerate sufficient to cause drive wheel slip.</p> <p>Does the DRBIII® display approximately 9 volts?</p> <p>Yes → Go To 3</p> <p>No → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All
3	<p>Replace the Instrument Cluster in accordance with the Service Information.</p> <p>Make sure the Traction Control system has not been deactivated with the TRAC OFF switch.</p> <p>NOTE: The purpose of this test is to determine if replacing the Instrument Cluster has corrected the problem.</p> <p>Accelerate sufficient to cause drive wheel slip.</p> <p>Does the TRAC ON indicator illuminate during Traction Control activation?</p> <p>Yes → Repair is complete. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:

***NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE**

POSSIBLE CAUSES
NO RESPONSE FROM CAB REPLACE FUSE #17 FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND GROUND CIRCUIT OPEN OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT CONTROLLER ANTILOCK BRAKE (CAB) MODULE PCI BUS CIRCUIT OPEN BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Note: As soon as one or more module communicates with the DRB, answer the question. With the DRB, attempt to communicate with the Airbag Control Module. With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with either of the modules? Yes → Go To 2 No → Refer to the Communications category and perform the symptom PCI Bus Communication Failure. Perform ABS VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect fuse #17 in the junction block. Is the fuse open? Yes → Go To 3 No → Go To 4	All
3	Turn the ignition off. Replace Fuse #17 in the junction block. Turn the ignition on. Remove and inspect fuse #17 in the junction block. Is the fuse open? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Refer to the wiring diagrams located in the service information to help isolate the short to ground condition. Perform ABS VERIFICATION TEST - VER 1. No → Check the Fused Ignition Switch Output circuit for an intermittent short to ground, refer to the wiring diagrams located in the service information. Perform ABS VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the CAB harness connector. Using a 12-volt test light connected to 12-volts, probe both ground circuits. Is the test light illuminated for both circuits?</p> <p>Yes → Go To 5</p> <p>No → Repair the ground circuit(s) for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. NOTE: Ensure fuse #17 is installed in the junction block. Disconnect the CAB harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated?</p> <p>Yes → Go To 6</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary. Disconnect the CAB harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the CAB connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts?</p> <p>Yes → Replace the Controller Antilock Brake (CAB) in accordance with the service information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All

***NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE — Continued**

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Disconnect the CAB harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit between the CAB connector and the BCM C3 connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Body Control Module in accordance with the service information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Repair the PCI Bus circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Verification Tests

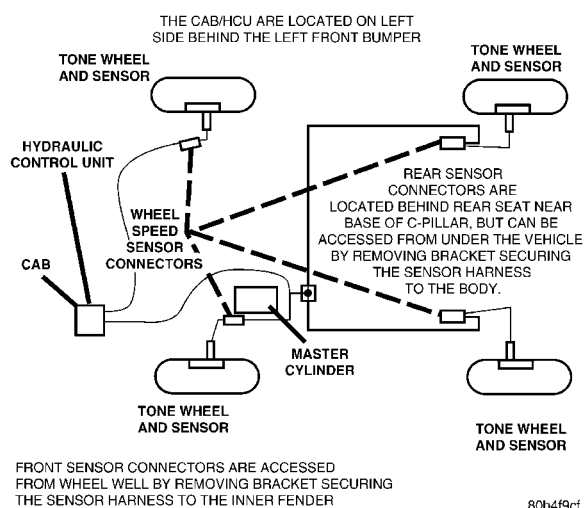

ABS VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Turn the ignition off. 2. Connect all previously disconnected components and connectors. 3. Ensure all accessories are turned off and the battery is fully charged. 4. Ensure that the Ignition is on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. 6. If any Diagnostic Trouble Codes are present, return to Symptom list and troubleshoot new or recurring symptom. 7. NOTE: For Sensor Signal and Pump Motor faults, the CAB must sense all 4 wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. 8. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops. 9. Caution: Ensure braking capability is available before road testing. 10. Again, with the DRBIII® read DTC's. If any DTC's are present, return to Symptom list. 11. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete. <p>Are any DTC's present or is the original concern still present?</p> <p style="padding-left: 40px;">Yes → Repair is not complete, refer to appropriate symptom.</p> <p style="padding-left: 40px;">No → Repair is complete.</p>	All

1.0 INTRODUCTION

NOTE:

The 2004 model year, LH, 300M, Intrepid and Concorde vehicles will integrate the Transmission Control Module and Powertrain Control Module into a single control module. This new module is called the Next Generation Controller (NGC) for DaimlerChrysler and will be referred to as the Powertrain Control Module (PCM). The Transmission Control System is part of the Powertrain Control Module. New Diagnostics procedures and New DTC's are some of the changes you will see which reflect the new combined module technology. The PCM will have four color coded connectors, C1 through C4, (C1-BLK, C2-GRAY, C3-WHITE, C4-GREEN), each PCM connector will have 38 pins each. Two new tools are used for probing and repairing the New PCM connectors. A New tool to release the pins from the PCM connectors Miller Tool #3638 is introduced, you must use the Miller Tool #3638 tool to release the connector pins or harness and connector damage will occur. Also a New tool for probing connectors Miller Tool #8815 is introduced, you must use the Miller tool #8815 tool to probe the PCM pins or harness and connector damage will occur. There are also new Verification tests and module replacement procedures for the new PCM.

The procedures contained in this manual include all of the specifications, instructions, and graphics needed to diagnose 42LE Electronic Automatic Transmission problems. The diagnostics in this manual are based on the failure condition or symptom being present at the time of diagnosis.

When repairs are required, refer to the appropriate volume of the service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added and/or carryover systems may be enhanced. READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE TROUBLE CODE. It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

This book reflects many suggested changes from readers of past issues. After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers all 2004 LH equipped with a 42LE Transmission.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the 42LE electronic Transmission is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

Visual identification of vehicles equipped with a 4 speed transmission, the Solenoid/Pressure Switch Assembly is located on the passenger side, The Transmission Range Sensor, Input Speed Sensor and Output Speed Sensor are located on the drivers side of the transmission. Refer to the Service Information for transmission ID tag descriptions.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

The 42LE electronic Transmission is a conventional Transmission in that it uses hydraulically applied clutches to shift a planetary gear train. However, the electronic control system replaces many of the mechanical and hydraulic components used in conventional transmission valve bodies.

3.2 FUNCTIONAL OPERATION

The 42LE electronic Transmission has a fully adaptive control system. The system performs it's functions based on continuous real-time sensor feedback information. The control system automatically adapts to changes in engine performance and friction element variations to provide consistent shift quality. The control system ensures that clutch operation during upshifting and downshifting is more responsive without increased harshness.

The Powertrain Control Module (PCM) continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the PCM stores a diagnostic trouble code. Some of these codes cause the Transmission to go into Limp-in or default mode. While in this mode, electrical power is taken away from the Transmission via the PCM, de-energizing the trans-

GENERAL INFORMATION

mission control relay, and taking power from the solenoid pack. When this happens, the only Transmission mechanical functions are:

Park and Neutral
Reverse
Second Gear

No upshifts or downshifts are possible. The position of the manual valve alone allows the three ranges that are available. Although vehicle performance is seriously degraded while in this mode, it allows the owner to drive the vehicle in for service.

Once the DRBIII® is in the EATX portion of the diagnostic program, it constantly monitors the PCM to see if the system is in Limp-in mode. If the Transmission is in Limp-in mode, the DRBIII® will flash the red LED.

3.2.1 AUTOSTICK FEATURE (IF APPLICABLE)

This feature allows the driver to manually shift the Transmission when the shift lever is pulled into the AutoStick position. When in AutoStick mode, the instrument cluster displays the current gear.

3.2.2 TRANSMISSION OPERATION AND SHIFT SCHEDULING AT VARIOUS OIL TEMPERATURES

The transmission covered in this manual has unique shift schedules depending on the temperature of the transmission oil. The shift schedule is modified to extend the life of the transmission while operating under extreme conditions.

The oil temperature is measured with a Temperature Sensor on the 42LE transmission. The Temperature Sensor is an integral component of the Transmission Range Sensor (TRS). If the Temperature Sensor is faulty, the transmission will default to a calculated oil temperature. Oil temperature will then be calculated through a complex heat transfer equation using engine coolant temperature, battery/ambient temperature, and engine off time from the Body Control Module (BCM). These inputs are received from the PCI bus periodically and used to initialize the oil temperature at start up. Once the engine is started, the TCM updates the transmission oil temperature based on torque converter slip speed, vehicle speed, gear, and engine coolant temperature to determine an estimated oil temperature during vehicle operation. Vehicles using calculated oil temperature track oil temperature reasonably accurate during normal operation. However, if a transmission is overfilled, a transmission oil cooler becomes restricted, or if a customer drives aggressively in low gear, the calculated oil temperature will be inaccurate. Consequently the shift schedule selected may be inappropriate for the

current conditions. The key highlights of the various shift schedules are as follows:

Extreme Cold: Oil temperature at start up below 26.6°C (-16°F)

- > Goes to Cold schedule above -24°C (-12°F) oil temperature
- > Park, Reverse, Neutral and 2nd gear only (prevents shifting which may fail a clutch with frequent shifts)

Cold: Oil temperature at start up above -24°C (-12°F) and below 2.2°C (36°F)

- > Goes to Warm schedule above 4.4°C (40°F) oil temperature
- > Delayed 2-3 upshift approximately 35-50 Km/h (22 - 31 MPH)
- > Delayed 3-4 upshift 72-85 Km/h (45-53 MPH)
- > Early 4-3 coastdown shift approximately 48 Km/h (30 MPH)
- > Early 3-2 coastdown shift approximately 27 Km/h (17 MPH)
- > High speed 4-2, 3-2, 2-1 kickdown shifts are prevented
- > No EMCC

Warm: Oil temperature at start up above 2.2°C (36°F) and below 27°C (80°F)

- > Goes to a Hot schedule above 27°C (80°F) oil temperature
- > Normal operation (upshifts, kickdowns, and coastdowns)
- > No EMCC

Hot: Oil temperature at start up above 27°C (80°F)

- > Goes to a Overheat schedule above 115°C (240°F) oil temperature
- > Normal operation (upshifts, kickdowns, and coastdowns)
- > Full EMCC, No PEMCC except to engage FEMCC, except at closed throttle at speeds above 113-133 Km/h (70 - 83 MPH)

Overheat: Oil temperature above 115°C (240°F) or engine coolant temperature above 118°C (244°F)

- > Goes to a Hot below 110°C (230°F) oil temperature or a Super Overheat above 115°C (240°F) oil temperature
- > Delayed 2-3 upshift 40-51 Km/h (25-32 MPH)
- > Delayed 3-4 upshift 66-77 Km/h (41-48 MPH)
- > 3rd gear FEMCC from 48-77 Km/h (30-48 MPH)
- > 3rd gear PEMCC from 43-50 Km/h (27-31 MPH)

Super Overheat: Oil temperature above 127°C (260°F)

- > Goes back to a Overheat below 115°C (240°F) oil temperature
- > All a Overheat shift schedules features apply

- > 2nd gear PEMCC above 35 Km/h (22 MPH)
- > Above 35 Km/h (22 MPH) the torque converter will not unlock unless the throttle is closed (i.e. at 80 Km/h (50 MPH) a 4th FEMCC to 3rd FEMCC shift will be made during a part throttle kickdown or a 4th FEMCC to 2nd PEMCC shift will be made at wide open throttle) or if a wide open throttle 2nd PEMCC to 1 kickdown is made.

Causes for operation in the wrong temperature shift schedule:

Extreme Cold or Cold shift schedule at start up:

- > Temperature Sensor circuit.
- > Overheat or Super Overheat shift schedule after extended operation:
- > Operation in city traffic or stop and go traffic
- > Engine idle speed too high
- > Aggressive driving in low gear
- > Trailer towing in OD gear position (use 3 position (or A/S 3rd) if frequent shifting occurs)
- > Cooling system failure causing engine to operate over 110°C (230°F)
- > Engine coolant temperature stays low too long
 - If engine coolant temperature drops below 65°C (150°F), the transmission will disengage EMCC. Extended operation with the EMCC disengaged will cause the transmission to overheat.
- > Brake switch issue will cause the EMCC to disengage. Extended operation with the EMCC disengaged will cause the transmission to overheat.
- > Transmission fluid overfilled
- > Transmission cooler or cooler lines restricted
- > Transmission Temperature Sensor circuit

3.3 DIAGNOSTIC TROUBLE CODES

Diagnostic trouble codes (DTC's) are codes stored by the Powertrain Control Module (PCM) that help us diagnose Transmission problems. They are viewed using the DRBIII® scan tool.

Always begin by performing a visual inspection of the wiring, connectors, cooler lines and the transmission. Any obvious wiring problems or leaks should be repaired prior to performing any diagnostic test procedures. Some engine driveability problems can be misinterpreted as a transmission problem. Ensure that the engine is running properly and that no engine DTC's are present that could cause a transmission complaint.

If there is a communication bus problem, trouble codes will not be accessible until the problem is

fixed. The DRBIII® will display an appropriate message. The following is a possible list of causes for a bus problem:

- open or short to ground/battery in PCI bus circuit.
- internal failure of any module or component on the bus

Each diagnostic trouble code is diagnosed by following a specific testing sequence. The diagnostic test procedures contain step-by-step instructions for determining the cause of a transmission diagnostic trouble code. Possible sources of the code are checked and eliminated one by one. It is not necessary to perform all of the tests in this book to diagnose an individual code. These tests are based on the problem being present at the time that the test is run.

All testing should be done with a fully charged battery.

If the PCM records a DTC that will adversely affect vehicle emissions, it will request (via the communication bus) that the PCM illuminate the Malfunction Indicator Lamp (MIL). Although these DTC's will be stored in the PCM immediately as a 1 trip failure, it may take up to five minutes of accumulated trouble confirmation to set the DTC and illuminate the MIL. Three consecutive successful OBDII (EURO STAGE III OBD) trips or clearing the DTC's with a diagnostic tool (DRBIII® or equivalent) is required to extinguish the MIL. When the transmission control system requests that the engine controller illuminate the MIL, the PCM sets a DTC P0700 (\$89) to alert the technician that there are DTC's stored in the transmission control system. P0700 must also be erased in the PCM in order to extinguish the MIL.

3.3.1 HARD CODE

Any Diagnostic Trouble Code (DTC) that is set whenever the system or component is monitored is a HARD code. This means that the problem is there every time the PCM checks that system or component. Some codes will set immediately at start up and others will require a road test under specific conditions. It must be determined if a code is repeatable (Hard) or intermittent before attempting diagnosis.

3.3.2 ONE TRIP FAILURES

A One Trip Failure, when read from the PCM, is a hard OBDII (EURO STAGE III OBD) code that has not matured for the full 5 minutes. This applies to codes that will only set after 5 minutes of substituted gear operation.

3.3.3 INTERMITTENT CODE

A diagnostic trouble code that is not there every time the TCM checks the circuit or function is an intermittent code. Some intermittent codes are caused by wiring or connector problems. However intermittent codes speed ratio codes are usually caused by intermittent hydraulic seal leakage in the clutch and/or accumulator circuits. Problems that come and go like this are the most difficult to diagnose, they must be looked for under the specific conditions that cause them.

3.3.4 STARTS SINCE SET COUNTER

For the most recent code, the Starts Since Set counter counts the number of times the vehicle has started since it was last set. The counter will count up to 255 starts. Note that this code only applies to the last or most recent code set.

When there are no diagnostic trouble codes stored in memory, the DRBIII® will display NO DTC's PRESENT and the reset counter will show "STARTS SINCE CLEAR = XXX"

The number of starts helps determine if the diagnostic trouble code is hard or intermittent.

- If the count is less than 3, the code is usually a hard code.
- If the count is greater than 3, it is considered an intermittent code. This means that the engine has been started most of the time without the code recurring.

3.3.5 TROUBLE CODE ERASURE

A Diagnostic trouble code will be cleared from PCM memory if it has not reset for 40 warm-up cycles.

A warm-up cycle is defined as sufficient vehicle operation such that the coolant temperature has

risen by at least 22°C (40°F) from engine starting and reaches a minimum temperature of 71°C (160°F).

The Malfunction Indicator Lamp (MIL) will turn off after 3 good trips or when the DTC's are cleared from the PCM.

3.3.6 EATX DTC EVENT DATA

EATX DTC EVENT DATA can be used as a diagnostic aid when experiencing Electronic Transmissions with intermittent problems. When a Diagnostic Trouble Code (DTC) is set, the vehicles EATX inputs are stored in the controller memory and are retrievable with the DRBIII®. This information can be helpful when a DTC can not be duplicated.

The EATX DTC EVENT DATA is located in the DRBIII®, under the Transmission system menu, in the sub-screen Miscellaneous. It is a good practice to document the EATX DTC EVENT DATA before beginning any diagnostic or service procedure.

A thorough understanding of how the transmission works is beneficial in order to interpret the data correctly. These skills are necessary in order to avoid an incorrect diagnosis.

A MASTERTECH video and reference book was produced in January 2002 that explains many of the features of the EATX DTC EVENT DATA with several examples on how to interpret the information and suggested training material to help understand all the specifics.

EATX DTC EVENT DATA can only be erased by:

1. Disconnecting the battery.
2. Performing a DRBIII® QUICK LEARN procedure.
3. Reprogramming the EATX/NGC controller.

Erasing Transmission DTCs does not clear the EATX DTC EVENT DATA.

3.3.7 LIST OF DIAGNOSTIC TROUBLE CODES (DETAILED DESCRIPTIONS FOLLOW LIST)

The TCM may report any of the following DTC's.				
DTC	P-Code	Name of Code	Limp-in	MIL
11	P0613	Internal TCM	Yes	Yes
12	P1684	Battery was disconnected	No	No
13	P0613	Internal TCM	Yes	Yes
14	P0891	Transmission Relay always on	Yes	Yes
15	P0888	Relay output always off	Yes	Yes
16	P0605	Internal TCM	Yes	Yes
17	P0604	Internal TCM	Yes	Yes
18	P0725	Engine speed sensor circuit	Yes	Yes
19	P1694	Bus communication with engine module	No	No
20	P0890	Switched battery	Yes	Yes
21	P0871	OD pressure switch sense circuit	Yes	Yes-1
22	P0846	2/4 pressure switch sense circuit	Yes	Yes
24	P0841	LR pressure switch sense circuit	Yes	Yes
28	P0706	Check shifter signal	No	No
29	P0124	Throttle Position Sensor/APPS intermittent	No	Yes-3
2A	P0122	Throttle Position Sensor /APPS low	No	Yes-3
2B	P0123	Throttle Position Sensor /APPS high	No	Yes-3
31	P0870	OD hydraulic pressure test failure	Yes	Yes
32	P0845	2/4 hydraulic pressure test failure	Yes	Yes
33	P0992	2-4/OD hydraulic pressure test failure	Yes	Yes
35	P0944	Loss of prime	No	No
36	P1790	Fault immediately after shift	No	No
37	P1775	Solenoid switch valve latched in TCC position	No	Yes
38	P0740	Torque converter clutch control circuit	No	Yes
41	P0750	LR Solenoid circuit	Yes	Yes
42	P0755	2/4 Solenoid circuit	Yes	Yes
43	P0760	OD Solenoid circuit	Yes	Yes
44	P0765	UD Solenoid circuit	Yes	Yes
45	P0613	Internal TCM	No	No
47	P1776	Solenoid switch valve latched in LR position	Yes	Yes
50	P0736	Gear ratio error in reverse	Yes	Yes
51	P0731	Gear ratio error in 1st	Yes	Yes
52	P0732	Gear ratio error in 2nd	Yes	Yes
53	P0733	Gear ratio error in 3rd	Yes	Yes
54	P0734	Gear ratio error in 4th	Yes	Yes
56	P0715	Input speed sensor error	Yes	Yes
57	P0720	Output speed sensor error	Yes	Yes
58	P1794	Speed sensor ground error	Yes	Yes
69	P0952	AutoStick input circuit low	No	No
71	P1797	Manual shift overheat	No	No
73	P0897	Worn out/burnt Transmission fluid	No	No
75	P0218	High temperature operation activated	No	No
7A	P0711	Transmission temperature sensor performance	No	No
7B	P0712	Transmission temperature sensor low	No	No
7C	P0713	Transmission temperature sensor high	No	No
7D	P0714	Transmission temperature sensor intermittent	No	No
76	P0884	Power up at speed	No	No
77	P1687	No communication with the MIC	No	No

GENERAL INFORMATION

The TCM may report any of the following DTC's.				
DTC	P-Code	Name of Code	Limp-in	MIL
78	P1652	Serial communication link malfunction	No	No-2
79	P0562	Low battery voltage	Yes	<u>Yes</u>

Notes:

P1xxx DTC's will set the MIL only after 10 seconds of vehicle operation.

1 - The Mil will be lit only if DTC P0706 is also present

2 - The MIL will be lit by the engine controller

3 - The MIL will be lit only if the engine controller is not calibrated for throttle substitution.

Yes (underlined) indicates that this DTC can take up to five minutes of problem identification before illuminating the MIL.

3.3.8 DTC DESCRIPTIONS

Name of code: P0613 (11, 13, 45, 94) - Internal Controller

When monitored: Whenever the key is in the Run or Run/Start position.

Set condition: This code is set whenever Powertrain Control Module (PCM) senses an internal error.

Theory of operation: The PCM is constantly monitoring it's internal processor. If an internal problem is detected, this DTC will be set. This DTC can also be set by a bad ground to the PCM and/or Trans Control Relay.

Transmission Effects: The MIL will illuminate (this DTC can take up to five minutes of problem identification before illuminating the MIL) and the transmission system will default to the Immediate Shutdown routine.

Possible causes:

- > PCM ground circuit.
- > Relay ground circuit.
- > PCM

Name of code: P1684(12) - Battery was Disconnected (Informational code Only)

When monitored: Whenever the key is in the Run/Start position.

Set condition: This code is set whenever the PCM is disconnected from battery power (B+) or ground. It will also be set during the DRBIII® Battery Disconnect procedure.

Theory of operation: A battery backed RAM (Random Access Memory) is used to maintain some learned values. When the battery B(+) is disconnected, the memory is lost. When the B(+) is restored, this memory loss is detected by the PCM. The code is set and the learned values are initialized to known constants or previously learned values from EEPROM (Electronic Erasable Programmable Read Only Memory). This results in the initialization of some parameters.

Transmission Effects: Loss of trouble code data. Immediate Limp-in mode if power is lost while

operating the vehicle. Normal operation is resumed if the power is restored during the same key start.

Possible causes:

- > Battery voltage removed from PCM
- > PCM disconnected
- > Dead Battery
- > Low battery voltage during cranking
- > Battery Disconnect by DRBIII® or MDS
- > Bad PCM ground circuit.

Name of code: P0891(14) - Transmission Relay Always On

When monitored: Ignition key is turned from off position to run position and/or ignition key is turned from crank position to run position.

Set condition: This code is set if the PCM senses greater than 3 volts at the Trans Relay Output (switched battery) terminal of the PCM prior to the PCM energizing the relay.

Theory of operation: The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the PCM. It is referred to as the Trans Relay Output circuit or switched battery.

Transmission Effects: The MIL will illuminate and the transmission system defaults to Logical Limp-in mode. Logical Limp-in mode results in the same modes of operation as Limp-in. Since the relay is stuck "on", the PCM can not open the relay, and the PCM shifts to 2nd gear.

Possible causes:

- > Relay (welded contacts)
- > Short to battery in 12-volt supply and/or Transmission Control Relay Output circuit(s)
- > Short to voltage
- > PCM connector problems
- > PCM

Name of code: P0888(15) - Relay Output Always Off

When monitored: Continuously

Set condition: This code is set when less than 3 volts are present at the Trans Relay Output (switched battery) terminals at the PCM when the PCM is energizing the relay.

Theory of operation: The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the PCM. It is referred to as the Trans Relay Output circuit or switched battery.

After a controller reset (ignition key turned to the run position or after cranking engine), the controller energizes the relay. Prior to this the PCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After the relay is energized, the PCM monitors the terminals to verify that the voltage is greater than 3 volts.

Transmission Effects: The MIL illuminates and the transmission system defaults to Limp-in mode.

Possible causes:

- > Relay failure (intermittent relay function caused by oxidized or contaminated relay contacts)
- > Short to ground or open circuit in the Transmission Control Relay circuit(s)
- > PCM connector problem
- > PCM

Name of code: P0725(18) - Engine Speed Sensor Circuit

NOTE: This code is not a Transmission Input Speed Sensor DTC

When monitored: Whenever the engine is running.

Set condition: This code is set when the engine speed sensed by the Transmission Control System is less than 390 RPM or greater than 8000 RPM for more than 2.0 seconds.

Theory of operation: The PCM uses a new dual port RAM internal to the controller to send the Crank Sensor signal to the Transmission Control System. If the PCM interprets this signal to be out of range when the engine is running the code is set.

Transmission Effects: The MIL illuminates and the transmission system defaults to Limp-in mode.

Possible causes:

- > Engine DTC (engine rpm related) present
- > PCM

Name of code: P1694(19) - Bus Communication with Engine Module

When monitored: Continuously with key on.

Set condition: If no PCI bus messages are received from the Powertrain Control Module (PCM) for 10 seconds.

Theory of operation: The Transmission Control System communicates with the engine control system using the PCI bus. It relies on certain information to function properly. The Transmission Control System continuously monitors the PCI bus to check for messages broadcast from the engine control system.

Transmission Effects: Delayed 3-4 shifts. No EMCC and early 3-4 shifts for a few minutes after engine is started.

Possible causes:

- > Open or shorted PCI bus circuit
- > PCM

Name of code: P0890(20) - Switched Battery

When monitored: Ignition key is turned from off position to run position and/or ignition key is turned from crank position to run position.

Set condition: This code is set if the PCM senses voltage on any of the pressure switch inputs prior to the PCM energizing the relay.

Theory of operation: The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the PCM. It is referred to as the Trans Relay Output circuit or a switched battery.

Immediately after a controller reset (ignition key turned to the run position or after cranking engine), the PCM verifies that the relay contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the Solenoid Pack pressure switches is checked. There should be no voltage on the pressure switches at this time. The PCM will then activate the relay.

Transmission Effects: The MIL illuminates and the transmission system defaults to Limp-in mode.

Possible causes:

- > Short to battery on one or more pressure switch sense circuits
- > PCM connector problems
- > PCM

Name of code: P0871(21) - OD Pressure Switch Sense Circuit

When monitored: Whenever the engine is running.

Set condition: This code is set if the OD pressure switch is open or closed at the wrong time in a given gear (see chart below).

Theory of operation: The Transmission system uses three pressure switches to monitor the fluid

GENERAL INFORMATION

pressure in the LR, 2/4, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown below.

PRESSURE SWITCH STATES

SWITCHES	R	N	1ST	2ND	3RD	4TH
L/R	OPEN	CLOSED	CLOSED	OPEN	OPEN	OPEN
2/4	OPEN	OPEN	OPEN	CLOSED	OPEN	CLOSED
O/D	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED

80d9d3b5

Transmission Effects: Normal operation will be experienced if no other codes are present. PCM will ignore the code. Limp-in condition will only occur if code P0871(21) is present with a code P0706(28).

Possible causes:

- > If code P0944(35) is present, ignore code P0871(21) and perform code P0944 diagnostic procedures
- > OD pressure switch sense circuit open or shorted to ground between PCM and solenoid pack
- > OD pressure switch sense circuit shorted to battery
- > Solenoid pack
- > Loose valve body bolts
- > Plugged filter - internal transmission or torque converter failure
- > PCM

Name of code: P0846(22) - 2/4 Pressure Switch Sense Circuit

When monitored: Whenever the engine is running.

Set condition: This code is set if the 2/4 pressure switch is open or closed at the wrong time in a given gear (see chart below).

Theory of operation: The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear as shown below.

Transmission Effects: If the 2/4 pressure switch is identified as closed in P or N, the code will immediately be set and normal operation will be allowed for that given key start. If the problem is identified for 3 successive key starts, the transmission will go into Limp-in mode.

If the 2/4 pressure switch is identified as being closed in 1st or 3rd gear and was not identified as being closed in P or N, then 2nd gear or 4th gear will be substituted for 1st or 3rd gear depending on

PRESSURE SWITCH STATES

SWITCHES	R	N	1ST	2ND	3RD	4TH
L/R	OPEN	CLOSED	CLOSED	OPEN	OPEN	OPEN
2/4	OPEN	OPEN	OPEN	CLOSED	OPEN	CLOSED
O/D	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED

80d9d3b5

throttle angle and vehicle speed. A short period of time after the gear substitution, the transmission will return to normal operating mode. If the transmission is shifted back into 1st or 3rd gear through normal operation, and the 2/4 pressure switch remains closed, 2nd or 4th gear will be substituted briefly and then resume normal operation. If four gear substitutions occur in a given key start, the transmission will go into Limp-in mode.

If the 2/4 pressure switch is open (indicating no 2/4 clutch pressure) in 2nd or 4th gear, the PCM sets code P0846(22) and continues with normal operation. The transmission will only go into Limp-in mode if a code P0706(28) is also present. If no 2/4 clutch pressure is present a gear ratio code P0732(52) or P0734(54) will be set and cause the limp-in condition.

Possible causes:

- > If code P0944(35) is present, ignore code P0846(22) and perform code P0944 diagnostic procedures
- > 2/4 pressure switch sense circuit open or shorted to ground between PCM and solenoid pack
- > 2/4 pressure switch sense circuit shorted to battery
- > Solenoid pack
- > Transmission overheated - Excessive regulator valve leakage in valve body causing high line pressure which results in 2/4 solenoid blow-off in 1st or 3rd gear. May require new valve body if it happens only when hot.
- > Loose valve body bolts
- > Plugged filter - internal transmission or torque converter failure
- > PCM

Name of code: P0841(24) - LR Pressure Switch Sense Circuit

When monitored: Whenever the engine is running.

Set condition: This code is set if the LR pressure switch is either open or closed at the wrong time in a given gear.

Theory of operation: The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear as shown below.

PRESSURE SWITCH STATES

SWITCHES	R	N	1ST	2ND	3RD	4TH
L/R	OPEN	CLOSED	CLOSED	OPEN	OPEN	OPEN
2/4	OPEN	OPEN	OPEN	CLOSED	OPEN	CLOSED
O/D	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED

80d9d3b5

Transmission Effects: If a set condition is identified, 1st gear and torque converter lock-up (EMCC) will be inhibited. The vehicle will launch in 2nd gear and shift normally through the gears without allowing EMCC. If during the same key start, the set condition is no longer valid, the transmission will return to normal operation (1st and EMCC available). Limp-in will not occur unless code P0841(24) is accompanied by a code P0706(28) and the MIL will illuminate after 5 minutes of substituted operation.

Possible causes:

- > If code P0944(35) is present, ignore code P0841(24) and perform code P0944(35) diagnostic procedures
- > LR pressure switch sense circuit open or shorted to ground between PCM and solenoid pack
- > LR pressure switch sense circuit shorted to battery
- > Solenoid pack
- > Valve body - solenoid switch valve stuck in LU position. May be accompanied by a code P1775(37)
- > Loose valve body bolts
- > Plugged filter - internal transmission or torque converter failure
- > PCM

Name of code: P0706(28) - Check Shifter Signal

When Monitored: Continuously with the key on.

Set Condition: 3 occurrences in one key start of an invalid PRNDL code which lasts for more than 0.1 second.

Theory of Operation: The C1 through C4 (T1, T3, T41, and T42) sense circuits communicate the shift lever position to the PCM. Each circuit is terminated at the transmission with a switch. Each switch can be either open or closed, depend-

ing on the shift lever position. The PCM can decode this information and determine the shift lever position. Each shift lever position has a certain combination of switches which will be open and closed, this is called a PRNDL code. There are 4 switches, therefore: there are many possible combinations of open and closed switches (codes). However, there are only 9 valid codes (8 for AutoStick), one for each gear position and three recognized between gear codes. The remainder of the codes should never occur, these are called invalid codes. The following chart shows the normal switch states for each shift lever position.

TRS	Park	T1	Rev	T2	N	T2	OD	T3	3/AS	T3	L
T1 (C4)	OP	OP	OP	CL	CL	CL	CL	CL	OP	CL	CL
T3 (C3)	CL	CL	OP	OP	OP	OP	OP	CL	CL	CL	CL
T41 (C1)	CL	OP	OP	OP	CL	OP	OP	OP	OP	OP	OP
T42 (C2)	CL	CL	CL	CL	CL	CL	OP	OP	OP	OP	CL

The following are DRBIII® reported Shift Lever Error Codes (chart)

SHIFT LEVER ERROR CODES
REPORTED BY THE DRBIII®

ERROR CODE	SWITCH STUCK	POSITION
1	T1/C4 STUCK	OPEN
2	T1/C4 STUCK	CLOSED
3	T3/C3 STUCK	OPEN
4	T3/C3 STUCK	CLOSED
5	T42/C2 STUCK	OPEN
6	T24/C2 STUCK	CLOSED
7	T41/C1 STUCK	OPEN
8	T41/C1 STUCK	CLOSED

80ccf2de

Transmission Effects and possible causes:
Scenario 1) - All PRNDL lights stay illuminated indefinitely in Park following a Key start.

- > Wrong Part Number PCM for application
- > TRS connector not plugged in
- > C1 through C4 (T1, T3, T41, or T42) circuits are open, shorted to ground, or shorted to 12 volts.
- > PCI bus failure (Open or shorted resulting in no communication to BCM or Cluster)
- > TRS
- > PCM
- > BCM

Scenario 2) - "P" is indicated following a key start but all PRNDL lights illuminate in "N" following a shift from "R" to "N". If PRNDL lights illuminate in "N" and shifter is moved directly into "3" or "L" position without pausing in "OD", then the "OD" position shift schedule and electronic display will

GENERAL INFORMATION

indicate "OD" until the shifter is shifted into the "OD" position and held for at least 3 seconds.

- > Worn Manual Lever (Rooster Comb). Check for heavy wearing of TRS switch contacts
- > Intermittent C1 through C4 (T1, T3, T41 or T42) circuits. Check for corrosion, terminal push-outs or spread terminals at PCM or TRS switch 10-way connector
- > TRS
- > PCM
- > BCM

Scenario 3) - If an invalid code happens while operating in the "3" or "L" position, the "3" or "L" shift schedule and electronic display will be frozen (regardless of whether "OD", "3" or "L" is selected). The display will be frozen until the shifter is moved to the "N" position (all PRNDL lights will illuminate) and then back to the "OD" position. The "N" and "OD" position must be held for at least 3 seconds in each position to resume the normal "OD" shift schedule and electronic display.

- > Intermittent C1 through C4 (T1, T3, T41 or T42) circuits. Check for corrosion, terminal push-outs or spread terminals at PCM and/or TRS connector
- > TRS
- > PCM
- > BCM

These same symptoms may occur without the code P0706(28) getting set. It is possible that the invalid code that was sensed by the PCM only occurred once or twice during the given ignition key start and/or did not last for longer than 0.1 second.

Name of code: P0124(29) - Throttle Position Sensor/APPS Intermittent

Name of code: P0122(2A) - Throttle Position Sensor /APPS Low

Name of code: P0123(2B) - Throttle Position Sensor /APPS High

When monitored: Whenever the key is on or the engine is running. Engine speed > 500 rpm

Set condition:

P0124 - Throttle angle change > 5° in 7 milliseconds the Fault set time milliseconds 0.448 seconds

P0122 - Throttle angle < 6° the Fault Set Time: 0.448 seconds

P0123 - Throttle angle > 120.6° the Fault Set Time: 0.448 seconds

Theory of operation: The transmission controller receives the throttle position signal and its ground from the Throttle Position Sensor (TPS). The TPS has a 5 volt pull up supplied by the engine controller. The throttle signal is checked for out-of-range as well as intermittency (excessive signal

changes). The engine controller transmits the throttle value via the Dual Port RAM. Most engine controllers can synthesize the throttle value if the throttle position sensor signal is lost. If a throttle error is detected by the transmission controller and the throttle value is available via the Dual Port RAM, the Dual Port RAM throttle value will be used and normal operation will continue, however a throttle fault code will be set. If a throttle error is detected and the throttle value is not available via the Dual Port RAM, normal operation will be discontinued, a throttle fault code will be set, and the MIL will be turned on after 5 min. of substituted operation.

Transmission Effects:

- If throttle value available via the Dual Port RAM
-No effect.
- If throttle value not available via the Dual Port RAM
A default throttle value is used.
Torque converter lock-up inhibited.
4th gear inhibited.
Limited shift schedule.
MIL on after 5 min. of substituted operation.

• Possible causes:

- > Wiring problem
- > TPS
- > PCM

Name of code: P0870(31) - OD Hydraulic Pressure Test Failure

P0845(32) - 2/4 Hydraulic Pressure Test Failure

P0992(33) - 2-4/OD Hydraulic Pressure Test Failure

When monitored: In 1st, 2nd, or 3rd gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set condition: Immediately after a shift into 1st, 2nd, or 3rd gear, with engine speed above 1000 RPM, the PCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate pressure switch closes. If the pressure switch does not close it is tested again. If the switch does not close the second time, the appropriate code is set.

Theory of operation: The Transmission Control System tests the OD and 2/4 pressure switches when they are off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test verifies that the switches are operational. The PCM verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is retested, If it fails the second test, the code is set.

Transmission Effects: The MIL illuminates and the transmission system defaults to Limp-in mode.

Possible causes:

- > Pressure switch sense circuit shorted to battery between PCM and solenoid pack.
- > Low line pressure
- > Solenoid Pack

PRESSURE SWITCH STATES

SWITCHES	R	N	1ST	2ND	3RD	4TH
L/R	OPEN	CLOSED	CLOSED	OPEN	OPEN	OPEN
2/4	OPEN	OPEN	OPEN	CLOSED	OPEN	CLOSED
O/D	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED

80d9d3b5

Name of code: Name of code: P0944(35) - Loss Of Prime

When monitored: If the transmission is slipping in any forward gear and the pressure switches are not indicating pressure, a loss of prime test is run.

Set condition: If the transmission begins to slip in any forward gear, and the pressure switch or switches that should be closed for a given gear are open, a loss of prime test begins. All available elements (in 1st gear LR, 2/4 and OD, in 2nd, 3rd, and 4th gear 2/4 and OD) are turned on by the PCM to see if pump prime exists. The code is set if none of the pressure switches respond. The PCM will continue to run the loss of prime test until pump pressure returns.

Theory of operation: The loss of prime test is used to prevent transmission faults, which can be caused by a lack of pump prime.

Transmission Effects: Vehicle will not move or transmission slips. Normal operation will continue if pump prime returns.

Possible causes:

- > Low transmission fluid level
- > PRNDL indicates a valid OD code in the hydraulic reverse position
- > Transmission fluid filter clogged or damaged
- > Transmission fluid filter improperly installed (Bolts loose or O-ring missing)
- > Oil pump - If a customer has a problem when the transmission is cold. Where someone shifts to reverse, reverse is engaged, and then shifts to OD and does not get OD (gets a neutral condition), and then can not get reverse or OD for 3-20 seconds, replace the oil pump. High side clearance in the oil pump will set a code 35. The pump will prime upon start-up, but as the torque converter purges air (drain down) the air will leak across the inner rotor into the pump suction

port and cause a loss of prime right after the shift into OD. After 3 - 20 seconds, pump prime will return and normal operation will continue. The pump should be replaced only after all other possible causes above have been checked and verified.

Name of code: P1790(36) - Fault Immediately After Shift

When monitored: After a gear ratio error is stored.

Set condition: This code is set if the associated gear ratio code is stored within 1.3 seconds after a shift.

Theory of operation: This code will only be stored along with a 50 series code. If this code is set, it indicates the problem is mechanical in nature. When this code exists, diagnosing the transmission should be based on the associated gear ratio code and primarily mechanical causes should be considered.

Transmission Effects: None

Possible causes:

- > Mechanical causes as listed under associated gear ratio code.

Name of code: P1775(37) - Solenoid Switch Valve Latched in TCC Position

When monitored: During an attempted shift into 1st gear.

Set condition: This code is set if three unsuccessful attempts are made to get into 1st gear in one given key start.

Theory of operation: The solenoid switch valve (SSV) controls the direction of the transmission fluid when the LR/TCC solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the LR clutch circuit. In 2nd, 3rd, and 4th, it will be in the upshifted position and directs the fluid into the torque converter clutch (TCC).

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The LR pressure switch is monitored to confirm SSV movement. If movement is not confirmed (the LR pressure switch does not close), 2nd gear is substituted for 1st.

Transmission Effects: Transmission will have no 1st gear (2nd gear will be substituted), and no EMCC operation and the MIL will illuminate after 5 minutes of substituted operation

Possible causes:

- > PRNDL indicates a valid OD code in the hydraulic reverse position
- > Valve body - Solenoid valve stuck in TCC position
- > High idle speed

GENERAL INFORMATION

- > Solenoid malfunction - LR pressure switch will not close
- > LR Pressure Switch Sense circuit shorted to battery

Name of code: P0740(38) - Torque Converter Clutch Control Circuit

When monitored: During Electronically Modulated Converter Clutch (EMCC)

Set condition:

a) The transmission must be in EMCC, with the input speed greater than 1750 RPM. The TCC/LR solenoid must achieve it's maximum duty cycle and still not be able to pull the engine speed within 60 RPM of input speed.

b) If the transmission is in FEMCC and the engine can slip the TCC by more than 100 RPM (Engine speed - Input speed) for 10 seconds.

The code will be set if one of these event happens three times at a throttle angle less than 30 degrees.

Theory of operation: When in 2nd, 3rd, or 4th gear, the torque converter clutch (TCC) can be locked when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the LR/TCC solenoid until the torque converter slip difference (difference between engine and turbine speed) is within 60 RPM. Then the LR/TCC solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

Transmission Effects: EMCC will still be available after code is set. MIL will illuminate after 5 minutes of accumulated slip in FEMCC. The transmission will attempt normal operation (not in Limp-in) even after the MIL is illuminated.

Possible causes:

- > Worn pump bushing and/or failed torque converter - both should be replaced during a rebuild with code P0740(38) present
- > Solenoid pack.

Name of code: P0750(41) - LR Solenoid Circuit

P0755(42) - 2/4 Solenoid Circuit

P0760(43) - OD Solenoid Circuit

P0765(44) - UD Solenoid Circuit

When monitored: Ignition key is turned from off position to run position and/or ignition key is turned from crank position to run position, then every 10 seconds thereafter, or when a gear ratio or pressure switch error DTC is detected.

Set condition: All four solenoids are tested for continuity continuously immediately upon start up and during vehicle operation. For solenoids that are currently energized, power is momentarily interrupted, then reenergized. For solenoids that are not currently energized, the solenoid is momentarily energized, then deenergized. Under both

situations, if an inductive spike is not sensed by the PCM during the continuity check, it is retested twice. If it fails the test the third time, the appropriate code is set.

SOLENOID APPLICATION CHART

GEAR	UD	OD	REV	2/4	LR
PARK					X
REVERSE			X		X
NEUTRAL					X
1ST	X				X
2ND	X			X	
3RD	X	X			
4TH		X		X	

80ccf4c0

Theory of operation: Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on it's current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate code being set.

Transmission Effects: The MIL will illuminate and the transmission goes into neutral if code is set above 35 Km/h (22 MPH), Limp-in mode when vehicle speed is below 35 Km/h (22 MPH).

Possible causes:

- > Open or shorted solenoid circuit(s) between PCM and solenoid pack.
- > Open ground circuit.
- > PCM connector problems.
- > Solenoid pack connector problem.
- > Solenoid Pack.
- > PCM

Name of code: P1776(47) - Solenoid Switch Valve Latched in LR Position

When monitored: Continuously when doing partial or full EMCC (PEMCC or FEMCC)

Set condition: If the transmission senses the LR pressure switch closing while performing PEMCC or FEMCC. This code will be set after two unsuccessful attempts to perform PEMCC or FEMCC.

Theory of operation: The solenoid switch valve (SSV) controls the direction of the transmission fluid when the LR/TCC solenoid is energized. SSV will be in the downshifted position in 1st gear, thus

directing the fluid to the LR clutch circuits. In 2nd, 3rd, and 4th, the SSV will be in the upshifted position and directs the fluid into the torque converter clutch (TCC).

When doing PEMCC or FEMCC, the LR pressure switch should indicate no pressure if the SSV is in the TCC position. If the LR pressure switch indicates pressure while in PEMCC or FEMCC, EMCC operation is aborted and inhibited to avoid inadvertent application of the LR clutch. Partial EMCC will be attempted if the LR pressure switch does not indicate pressure. A second detection of LR pressure results in setting the code.

Transmission Effects: At speeds above 72 Km/h (45 MPH), EMCC is inhibited. Once speed falls below 72 Km/h (45 MPH), the transmission will go into Limp-in mode and the MIL will illuminate after 5 minutes of substituted operation.

Possible causes:

- > Valve body - Solenoid valve stuck in LR position
- > Intermittent short to ground or open circuit in LR Pressure Switch Sense circuit (with code 24 only)
- > Solenoid pack (with code P0841(24) only)
- > PCM (with code P0841(24) only)

Name of code: P0736(50) - Gear Ratio Error in Reverse

P0731(51) - Gear Ratio Error in 1st

P0732(52) - Gear Ratio Error in 2nd

P0733(53) - Gear Ratio Error in 3rd

P0734(54) - Gear Ratio Error in 4th

P0715(56) - Input Speed Sensor Error

P0720(57) - Output Speed Sensor Error

P1794(58) - Speed Sensor Ground Error

When monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set condition: This code is set if the gear ratio is not correct for a period of time.

- Codes 50 through 54 sets if the ratio of the input RPM (Nt) to the output RPM (No) does not match the given gear ratio.
- Code 56 sets if there is an excessive change in input RPM in any gear
- Code 57 sets if there is an excessive change in output RPM in any gear
- Code 58 sets after a TCM reset in neutral and Nt/No equals a ratio of input to output of 2.50

A hard code sets within 3 seconds, an intermittent code sets within 15 seconds.

Theory of operation: The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through

the following checks:

- 1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (codes 50 through 54).
- 2) An excessive change in input or output speeds indicating signal intermittent will result in codes 56 and/or 57 being set.
- 3) After a PCM reset in neutral, observing erratic output and input speed sensor signals indicates a loss of the common speed sensors ground. This sets a code 58.

Transmission Effects: The transmission will not go into Limp-in mode until three gear ratio error events occur in a given key start also the MIL will illuminate after 5 minutes of substituted operation. This allows for intermittent problems to correct themselves without opening the relay. However, if a gear ratio error develops, a code is always set, but if the condition corrects itself the transmission will continue without requiring the ignition key to be cycled on and off. Many different events could occur given the range of failures possible for codes 50 through 58. The following are a few examples:

- Codes 51, 52, 53, 54, 56, and 57 at speeds above 72 Km/h (45 MPH) - The appropriate code is set, EMCC is aborted and current gear is maintained. If while still traveling above 72 Km/h (45 MPH), the gear ratio becomes valid again, EMCC will reengage and normal operation will resume. If the gear ratio becomes intermittent and recovers three times in a given key start, the current gear will be maintained and EMCC inhibited, then the transmission will go into Limp-in mode if throttle is applied below 72 Km/h (45 MPH) or at 35 Km/h (22 MPH) with closed throttle.
- Codes 51, 52, 53, 54, 56, and 57 at speeds between 35 and 72 Km/h (22 and 45 MPH) - If one of these codes is set between 35 and 72 Km/h (22 and 45 MPH), the current gear will be maintained until the gear ratio problem corrects itself. If throttle is applied, the trans will go to 2nd gear. If this happens and the gear ratio problem goes away, normal operation will resume. If three gear ratio problems are identified in a given key start, the current gear will be frozen until throttle is applied. The transmission will then go into Limp-in mode with throttle applied at speeds between 35 and 72 Km/h (22 and 45 MPH)
- Codes 51, 52, 53, 54, 56, and 57 at speeds below 35 Km/h (22 MPH) - If a gear ratio problem is identified below 35 Km/h (22 MPH), the transmission will immediately substitute second gear for the current gear. If the gear ratio problem goes away, normal

GENERAL INFORMATION

operation will resume. If three gear ratio problems are identified in a given key start, the transmission will go into Limp-in mode.

Possible causes:

Code P0736(50) - Excludes geartrain failures which should be obvious upon disassembly

- > If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first
- > Valve body - #1 ball check or LR switch valve sticking - may also set code P0731(51)
- > Speed sensor or associated wiring - may also set codes P0731(51), P0715(56), or P0720(57)
- > Failed or slipping LR clutch - may also set code P0731(51)
 - LR seal leakage (Intermittent no drive or reverse)
 - Sticky LR accumulator seals (Intermittent no drive or reverse)
- > Failed reverse clutch (hard code)
 - OD/Rev lip seal leakage
 - Worn reaction shaft support seal rings
 - Snap ring out of position

Code P0731(51) - Excludes geartrain failures which should be obvious upon disassembly

- > If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first
- > Valve body - #1 checkball or LR switch valve sticking - may also set code P0736(56) or have no Reverse
- > Speed sensor or associated wiring - may also set codes P0736(50), P0715(56), or P0720(57)
- > Failed or intermittent slipping UD clutch - may also set P0732(52), or P0733(53)
 - UD seal leakage (intermittent)
 - Worn input clutch hub bushing (hard code at heavy throttle)
 - Sticky UD accumulator seals (intermittent)
 - Worn reaction shaft support seal rings (hard code at heavy throttle)
 - Solenoid pack (UD pressure in 4th gear)
- > Failed or slipping LR clutch - may also set code P0736(56) or have no Reverse
 - LR seal leakage (Intermittent)
 - Sticky LR accumulator seals (Intermittent)

Code P0732(52) - Excludes geartrain failures which should be obvious upon disassembly

- > If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first
- > Failed or slipping 2/4 clutch - may also set code P0734(54)
 - 2/4 seal leakage (intermittent)

- Sticky accumulator seals (intermittent)

- > Failed or intermittent slipping UD clutch - may also set code P0731(51) and/or P0733(53)

- UD seal leakage (intermittent)
- Worn input clutch hub bushing (hard code at heavy throttle)
- Sticky UD accumulator seals (intermittent)
- Worn reaction shaft support seal rings (hard code at heavy throttle)
- Solenoid pack (UD pressure in 4th gear)

Code P0733(53) - Excludes geartrain failures which should be obvious upon disassembly

- > If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first
- > Failed or slipping OD clutch - may also set code P0734(54)
 - OD and Reverse inner and outer lip seal leakage (usually hard code)
 - Sticky OD accumulator seals (intermittent)
 - Worn reaction shaft support seal rings (hard code at heavy throttle)
 - Broken OD/UD tapered snap ring - (hard code at heavy throttle)
- > Failed or intermittent slipping UD clutch - may also set code P0731(51) and/or P0732(52)
 - UD seal leakage (intermittent)
 - Worn input clutch hub bushing (hard code at heavy throttle)
 - Sticky UD accumulator seals (intermittent)
 - Worn reaction shaft support seal rings (hard code at heavy throttle)
 - Solenoid pack (UD pressure in 4th gear)

Code P0734(54) - Excludes geartrain failures which should be obvious upon disassembly

- > If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first
- > Failed or slipping OD clutch - may also set code P0733(53)
 - OD and Reverse inner and outer lip seal leakage (usually hard code)
 - Sticky OD accumulator seals (intermittent)
 - Worn reaction shaft support seal rings (hard code at heavy throttle)
 - Broken OD/UD tapered snap ring - (hard code at heavy throttle)
- > Failed or slipping 2/4 clutch - may also set code P0732(52)
 - 2/4 seal leakage (intermittent)
 - Sticky accumulator seals (intermittent)

Codes P0715(56) and P0720(57)

- > Failed input or output speed sensor (intermittent or hard code)
 - > Shorted or open wiring between PCM and speed sensor(s) (intermittent)
 - > Connector problems at PCM connector and/or speed sensor connector
- Code P1794(58)

- > Open or shorted speed sensor ground (speed sensor ground is different from chassis ground)
- > Open or shorted Temperature Sensor wiring to TRS
- > TRS - Will also set code P1799(74)
- > PCM

Name of code: P0952(69)- AutoStick Sensor Circuit Low (If equipped)

When monitored: Whenever the engine is running.

Set condition:

- 1) The transmission shift lever is not in AutoStick and either the upshift or downshift switch is closed.
- 2) Upshift and downshift switches closed at the same time.

Theory of operation: In the AutoStick Mode (manual shift mode), upshifts and downshifts are actuated manually. Shift requests are detected by monitoring the upshift and downshift switches. The PCM monitors the above set conditions. A set condition will be tolerated for up to 15 seconds before setting a code.

Transmission Effects: The OD position shift schedule is substituted while operating in the AutoStick gear selector position. No Limp-in mode occurs.

Possible causes:

- > Wiring or connector problems
- > AutoStick switch failure
- > PCM

Name of code: P1797(71)- Manual Shift Overheat

When monitored: Whenever the engine is running.

Set condition:

- 1) If the engine temperature exceeds 124 C (255°F) while operating in AutoStick mode.
- 2) If the transmission temperature exceeds 135°C (275°F) while in AutoStick mode

Theory of operation: Transmission and engine temperatures are monitored during vehicle operation. If conditions occur causing the engine or transmission to overheat, the AutoStick mode will be canceled, and a code will be set.

Transmission Effects: The 3 position shift schedule that is used in non-AutoStick applications is

substituted while operating in the AutoStick gear selector position. No Limp-in mode occurs.

Possible causes:

- > Engine overheat - refer to service information for diagnosis and repair
- > Transmission Overheat
 - Restricted transmission cooling system
 - Transmission fluid overfilled
 - Radiator fan not functioning properly
 - Extended driving in low gear

NOTE: Strenuous driving conditions may cause the vehicle to overheat. If the driver operates in or initiates AutoStick with an overheated vehicle, the code will be set.

Name of code: P0897(73) - Worn Out/Burnt Transmission Fluid

When monitored: At every Fully Electronically Modulated Converter Clutch (FEMCC) to Partial Electronically Modulated Converter Clutch (PEMCC) transition miles when A/C compressor clutch is being cycled.

Set condition: The code will be set if vehicle shudder is detected 20 times when the A/C clutch is cycled.

Theory of operation: While in 3rd or 4th gear FEMCC and just before the A/C clutch engages, the Engine Control System requests the Transmission Control System to momentarily establish PEMCC operation. If vehicle shudder is detected during the FEMCC to PEMCC transition, a counter is incremented. If the count reaches 20, the trouble code is set. The driver may then notice harsh bumps when the A/C clutch is being cycled, but vehicle shudder will be eliminated. After 35 OBDII (EURO STAGE III OBD) warm-up starts or if the code is cleared, PEMCC will be reactivated to see if shudder is still present. If one shudder event occurs, the code will be reset. Clearing the code and running battery disconnect with the DRBIII® is the only way to reset the shudder counter from 20 back to zero.

Transmission Effects: This code does not cause the transmission to go into Limp-in mode. However, once the code is set, FEMCC to PEMCC operation before the A/C clutch engagement will be disabled for 35 OBDII (EURO STAGE III OBD) warm up starts.

Possible causes:

- > Degraded transmission fluid
- > Wheels severely out of alignment
- > Internal torque converter problem

Name of code: P0218(75) - High Temperature Operation Activated.

When monitored: Whenever the engine is running.

GENERAL INFORMATION

Set condition: Immediately once the Overheat Shift Schedule is activated.

Theory of operation: If the transmission oil temperature rises above 115°C (240°F), the overheat shift schedule is activated refer to Transmission Operation as a function of Transmission Oil Temperature and the code is set. The DTC is an information code only and is being set to aid the technician in determining root cause of a customer driveability issue. The code is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler should be added to the vehicle if the customer regularly drives in a manner that overheats the transmission. Extended operation above 115°C (240°F) will reduce the durability of the transmission and should be avoided. Correcting the cooling system malfunction or installing an additional transmission oil cooler will improve transmission durability especially for customers who operate in city/construction stop and go traffic, tow trailers regularly, drive aggressively in low gear or drive regularly in mountainous areas.

Transmission effects: Information only code. - Overheat shift schedule was activated, no Limp-in condition occurs. 2nd gear partial EMCC above 40 Km/h (25 MPH), 3rd gear EMCC from 45-69 Km/h (28-43 MPH), delayed 3-4 upshift at 69 Km/h (43 MPH), early 4-3 coastdown at 66 Km/h (41 MPH), EMCC operation under all conditions above 40 Km/h (25 MPH) except at closed throttle or 1st gear.

Possible causes:

- Transmission Overfilled with Oil
- Engine cooling fan failure
- Engine thermostat stuck closed
- Radiator corroded or packed with dirt
- Transmission Oil Cooler Plugged
- Customer driving pattern requires additional transmission cooling

Name of code: P0884(76) - Power Up at Speed

When monitored: When PCM (transmission control module) initially powers-up.

Set condition: If the PCM powers up while in the "Drive" position and the vehicle is going above 32 Km/h (20 MPH), the code is set.

Theory of Operation: If a vehicle loses power to the PCM, the vehicle will go to the 2nd gear mode since there is no power available to control the transmission solenoids. However if power is restored, the PCM will power-up and normal operation will be restored. This DTC identifies that power to the PCM was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 Km/h (20 MPH). If

someone shifts to Neutral and cycles the ignition key and quickly shifts to "Drive" while moving before the PCM comes out of its START ROUTINE, the DTC can be set. Therefore it is critical that this DTC diagnosis repair procedure should only be used if the vehicle is experiencing intermittent 2nd gear operation and subsequently a return to normal operation during normal driving.

Transmission Effects: No Limp-in condition. The DTC is for information only when trying to diagnosis intermittent 2nd gear operation and subsequently a return to normal operation.

Possible causes:

- No Problem if vehicle is started in "neutral" at speeds above 32 Km/h (20 MPH) and shifted quickly to "Drive" before TCM comes out of the START ROUTINE.

FOR INTERMITTENT 2ND GEAR OPERATION AND THEN A SUBSEQUENT RETURN TO NORMAL OPERATION WITHOUT CYCLING THE IGNITION KEY

- Intermittent Direct Battery connection between PCM and battery.
- Intermittent Fused Ignition Switch Output between PCM and ignition switch.
- Intermittent Ground to PCM.

Name of code: P1687(77) - No Communication with the MIC

When monitored: Continuously with key on.

Set condition: If no PCI bus messages are received from the Mechanical Instrument Cluster (MIC) for 25 seconds.

Theory of operation: The Transmission Control System communicates with the MIC using the PCI bus. It relies on certain information to function properly. The Transmission Control System continuously monitors the PCI bus to check for messages broadcast from the Engine Control System.

Transmission effects: Possible improper PCM AutoStick configuration.

Possible causes:

- > Open or shorted PCI bus circuit from MIC
- > MIC
- > PCM

Name of code: P1652(78) - Serial Communication Link Malfunction

When monitored: Continuously with key on.

Set condition: If no PCI bus messages are received by the Transmission Control System for 10 seconds.

Theory of operation: The Transmission Control System communicates with the other modules in the vehicle using the PCI bus. It relies on certain information to function properly. The PCM continuously monitors the PCI bus to check for messages broadcast from the certain modules.

Transmission Effects: Possible improper PCM AutoStick configuration and delayed 3-4 shifts. No EMCC and early 3-4 shifts for a few minutes after engine is started.

Possible causes:

- > Open or shorted PCI bus circuit from BCM
- > PCM

Name of code: P0562(79) Low Battery Voltage

When monitored: Continuously with engine running and Transmission Relay energized.

Set condition: If the battery voltage of the Transmission Control Relay Output Sense circuit(s) to the PCM is less than 10.0 volts for the period of 15 seconds. The DTC will also set if the direct battery voltage sensed in the PCM is less than 6.5v for 200ms or where Transmission Control Relay Output Sense circuit (switched battery) is less than 7.2v for 200ms. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM.

Theory of operation: The Transmission system requires sufficient battery voltage in order to energize the transmission solenoids. The PCM continuously monitors the voltage available to the solenoids.

Transmission effects: At speeds above 72 Km/h (45 MPH) the transmission system will default to neutral. Below 72 Km/h (45 MPH) the transmission system will default to Limp-in mode and the MIL will illuminate after 5 minutes of substituted operation. Manual gear selection of Park, Reverse, Neutral and Second will be available.

Possible causes:

- > Charging system problem
- > Poor/High resistance connection between PCM and Battery/Alternator
- > PCM high resistance or poor connection
- > PCM ground high resistance or poor connection
- > High resistance in Transmission Control Relay contacts
- > PCM

Name of code: P0711(7A) - Transmission temperature sensor performance

When monitored: Every 7 milliseconds with the engine running and no loss of prime DTC set.

Set condition: A temperature reading of 80°F is not reached in the specified period of time

Theory of operation: The temperature sensor (thermistor) is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter lock-up, and when and if some diagnostics are run. A failed temperature sensor could affect the OBD II diagnostics, therefore when a fault is detected in

the temperature sensor circuit, transmission temperature will be based on a calculated temperature value.

Transmission Effects: When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible causes:

- > Temperature sensor
- > Temperature sensor wiring circuit.
- > Internal controller

Name of code: P0712(7B) - Transmission temperature sensor low

When monitored: Every 7 milliseconds with the engine running and no loss of prime DTC set.

Set condition: Sensor output voltage less than 0.078v.

Theory of operation: The temperature sensor (thermistor) is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter lock-up, and when and if some diagnostics are run. A failed temperature sensor could affect the OBD II diagnostics, therefore when a fault is detected in the temperature sensor circuit, transmission temperature will be based on a calculated temperature value.

Transmission effects: When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible causes:

- > Temperature sensor
- > Temperature sensor wiring circuit.
- > Internal controller

Name of code: P0713(7C) - Transmission temperature sensor high

When monitored: Every 7 milliseconds with the engine running and no loss of prime DTC set.

Set condition: Sensor output voltage greater than 4.94v.

Theory of operation: The temperature sensor (thermistor) is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter lock-up, and when and if some diagnostics are run. A failed temperature sensor could affect the OBD II diagnostics, therefore when a fault is detected in the temperature sensor circuit, transmission temperature will be based on a calculated temperature value.

Transmission effects: When the fault is set, calculated temperature is substituted for mea-

GENERAL INFORMATION

sured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible causes:

- > Temperature sensor
- > Temperature sensor wiring circuit.
- > Internal controller

Name of code: P0714(7D) - Transmission temperature sensor intermittent

When monitored: Every 7 milliseconds with the engine running and no loss of prime DTC set.

Set condition: Temperature reading change greater than maximum change allowed per loop.

Theory of operation: The temperature sensor (thermistor) is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter lock-up, and when and if some diagnostics are run. A failed temperature sensor could affect the OBD II diagnostics, therefore when a fault is detected in the temperature sensor circuit, transmission temperature will be based on a calculated temperature value.

Transmission effects: When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible causes:

- > Temperature sensor
- > Temperature sensor wiring circuit.
- > Internal controller

3.3.9 QUICK LEARN

The Quick Learn function customizes adaptive parameters of the PCM to the transmission characteristics of a vehicle. This gives the customer improved "as received" shift quality compared to the initial parameters stored in the PCM.

Notes about Quick Learn Features

The nature of the Quick Learn function requires that certain features must be taken into consideration.

- > Quick Learn should generally not be used as a repair procedure unless directed by a repair or diagnostic procedure. If the transmission system is exhibiting a problem that you think is caused by an invalid CVI, you should try to relearn the value by performing the appropriate driving maneuvers. In most cases, if quick learn makes a vehicle shift better, the vehicle will return with the same problem.
- > Before performing Quick Learn, it is imperative that the vehicle be shifted into OD with

the engine running and the oil level set to the correct level. This step will purge air from the clutch circuits to prevent erroneous clutch volume values which could cause poor initial shift quality.

- > If an unused PCM is installed on a vehicle with a HOT engine, Quick Learn will cause the PCM to report a cold calculated oil temperature. This requires monitoring the calculated oil temperature using the DRBIII®. If the temperature is below 15°C (60°F), the transmission must be run at idle or driven in gear until it goes above 15°C (60°F). If the temperature is above 93°C (200°F), the transmission must cool to below 93°C (200°F).
- > First gear is engaged in overdrive after Quick Learn is completed. Place the vehicle in park after performing Quick Learn.

The Quick Learn function should be performed:

- Upon installation of a new service PCM
- After replacement or rebuild of internal transmission components or the torque converter
- If one or more of the clutch volumes indexes (CVIS) contain skewed readings because of abnormal conditions.

To perform the Quick Learn procedure, the following conditions must be met.

- It is imperative that the vehicle be shifted into OD with the engine running and the oil level set to the correct level. This step will purge the air in the clutch circuits to prevent erroneous clutch volume values, which could cause poor initial shift quality.
- The brakes must be applied.
- The engine must be idling.
- The throttle angle (TP sensor) must be less than 3 degrees.
- The shift lever position must stay in neutral until prompted to shift into OD.
- The shift lever must stay in OD after the "Shift to Overdrive" prompt until the DRBIII® indicates the procedure is complete.
- The oil temperature must be between 15°C (60°F) and 93°C (200°F).

NOTE: The above conditions must be maintained during the procedure to keep the procedure from being aborted.

The Quick Learn procedure is performed with the DRBIII® by selecting "Transmission" system then "Miscellaneous" functions, then "Quick Learn". Follow the procedure instructions displayed on the DRBIII®.

3.3.10 CLUTCH VOLUMES

The LR clutch volume is updated when doing a 2-1 or 3-1 coast down shift. The transmission temperature must be between 21-49°C (70-120°F). The clutch volume should be between 35 and 83.

The 2/4 clutch volume is updated when doing a 1-2 shift. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 20 and 77.

The OD clutch volume is updated when doing a 2-3 shift. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 40 and 150.

The UD clutch volume is updated when doing a 4-3 or 4-2 shift. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 24 and 70.

3.3.11 ELECTRONIC PINION FACTOR (IF APPLICABLE)

Using the following steps, the pinion factor can be checked and/or reset using the DRBIII®:

1. Select Transmission system, then Miscellaneous functions, then Pinion Factor. The DRBIII® will display the current tire size.
2. If the tire size is incorrect, press the Enter key and then select the correct size.
3. Press the Page Back key to exit the reset procedure.

Notes About Electronic Pinion Factor Features

The nature of the electronic pinion factor requires that certain features must be taken into consideration.

- > If no pinion factor is stored in an installed PCM, the vehicle speedometer will not operate, engine speed will be limited to 2300 RPM, and catalyst damage may occur.
- > Selecting a wrong tire size will cause the speedometer to be inaccurate and will also cause any speed related features to operate improperly.

NOTE: After replacing the PCM, you must reprogram pinion factor

3.4 USING THE DRBIII®

Refer to the DRBIII® users guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII® functions.

80b57566

3.5 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot
- User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the S.T.A.R. Center.

3.5.1 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage. A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of faulty cable or vehicle wiring. For a blank screen, refer to the appropriate Body Diagnostic manual.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

GENERAL INFORMATION

3.6 TRANSMISSION SIMULATOR (MILLER TOOL # 8333) AND ELECTRONIC TRANSMISSION ADAPTER KIT (MILLER TOOL #8333-1A)

NOTE: Remove the starter Relay when using the transmission simulator

- Failure to remove the Starter Relay can cause a PCM - No Response condition.
- The removal of the Starter Relay will also prevent the engine from starting in gear.
- The Transmission Simulator will not accurately diagnose intermittent faults.

The transmission simulator, simply put, is an electronic device that simulates the electronic functions of any EATX or NGC controlled transmission. The Simulators basic function is to aid the technician in determining if an internal transmission problem exists or if the problem resides in the vehicle wiring or control module. It is only useful for electrical problems. It will not aid in the diagnosis of a failed mechanical component, but it can tell you that the control module and wiring are working properly and that the problem is internal.

The ignition switch should be in the lock position before attempting to install the simulator. Follow all instructions included with the simulator. If the feedback from the simulator is in doubt, you can verify it's operation by installing it on a known good vehicle. A "known good vehicle" would be defined as a vehicle that does not set any DTC's and drives and shifts as expected.

One important point to remember is that the Simulator receives it's power from the Trans Relay Output circuit. If the transmission system is in Limp-in (Relay open), the simulator will not operate. This is not really an indication of a problem, but an additional symptom. If the simulator does not power up ("P" led lit), this is an indication that the problem is still present with the simulator hooked up. This indicates that the problem is in the wiring or control module and not the transmission.

Miller Tool # 8333-1A consists of the adapter cables and overlay necessary to adapt the simulator to TE/AE/LE/RLE transmissions.

4.0 DISCLAIMERS, SAFETY, AND WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest

information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles: the parking brake does not hold the drive wheels.

Some operations in this manual require that hydraulic tubes, hoses, and fittings, disconnected for inspection or testing purposes. These systems, when fully charged, contain fluid at high pressure.

Before disconnecting any hydraulic tubes, hoses, and fittings, be sure that the system is fully depressurized.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a Transmission system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service information. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic DTC's or error messages may occur. It is extremely important that accurate shift lever position data is available to the PCM. The accuracy of any DTC found in memory is doubtful unless the Shift Lever Test, performed on the DRBIII® Scan Tool, passes without failure.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the Transmission system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or

improper system operation. Only those components with approved repair and installation procedures in the service information should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table.

FUNCTION	INPUT LIMIT
Volts	0 - 500 volts peak AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

*Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measured voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.

- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "lock" position. Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation: this will damage the wire and eventually cause the wire to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second DTC could be set, making diagnosis of the original problem more difficult.

When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic DTC or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read the DRBIII® screen while in motion. Do not hang the DRBIII® from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

Road testing is an essential step in the diagnostic process that must not be overlooked. Along with the diagnostic information obtained from the DRBIII® Scan Tool and the original customer concern, the road test helps verify the problem was current and any repairs performed, fixed the vehicle correctly. Always operate and observe the vehicle under actual driving conditions.

Just as important as the road test is, there are preliminary inspections that should be performed prior to the road test. Always check the fluid level and condition before taking the vehicle on a road test. Determine if an incorrect fluid type is being

GENERAL INFORMATION

used, improper fluid will result in erratic transmission operation. Some of the conditions of incorrect fluid level are as follows:

- Delayed engagement
- Poor shifting or erratic shifting
- Excessive noise
- Overheating

The next step is to verify that the shifter is correctly adjusted. If the shifter is incorrectly adjusted, a number of complaints can result.

The PCM monitors the Shift Lever Position (SLP) Sensor continuously. If the shifter is incorrectly adjusted, the PCM will sense a shift lever position that is not correct for the gear chosen by the driver. This may cause a DTC to be set.

The following complaints may also be the result of an incorrectly adjusted or worn shifter:

- Delayed clutch engagement
- Erratic shifts
- Vehicle will drive in neutral
- Engine will not crank in park or neutral
- Shifter will be able to be moved without the key in the ignition
- Not able to remove the ignition key in park
- Parking pawl will not engage properly

The shifter should also be adjusted when replacing the Transmission, repairing the valve body, or when repairing any component between the shift lever and the Transmission.

Some questions to ask yourself when performing the road test are as follows:

- Is the complaint or concern what you think the problem is, based on the drivers description of the problem?
- Is the Transmission operating normally, or is there a real problem?
- When does the problem occur?
- Is the problem only in one gear range?
- What temperature does the problem occur?
- Does the vehicle have to sit over night for the problem to occur?
- Does the transmission go into Limp-in mode?

4.3.3 ELECTRONIC PINION FACTOR WARNINGS (IF APPLICABLE)

The pinion factor must be set when replacing the PCM.

NOTE: The pinion factor is a fixed number and cannot be changed or updated in some vehicle applications. If the pinion factor is not set or incorrectly set, any speed related functions will not operate correctly i.e. speedometer, speed control, rolling door locks, other control modules will be affected that depend on speed information.

4.3.4 BULLETINS AND RECALLS

Always perform all Safety Recalls and Technical Service Bulletins that are applicable to the problem.

5.0 REQUIRED TOOLS AND EQUIPMENT

- > Terminal Remover (Miller #3638)
- > DRBIII® (diagnostic read-out box) – Must be at latest release level.
- > Transmission Simulator (Miller # 8333)
- > Electronic Transmission Adapter Kit (Miller # 8333-1A)
- > Jumper wires
- > Test Light (minimum of 25 ohms of resistance)
- > Ohmmeter
- > Voltmeter
- > Pressure gauge (0-300 PSI)
- > Diagnostic Pin Out Box (Miller #8815)

6.0 GLOSSARY OF TERMS

6.1 ACRONYMS

BCM	-Body Control Module
CKT	-Circuit
CVI	-Clutch Volume Index
DLC	-Data Link Connector
DRBIII®	-Diagnostic Readout Box
DTC	-Diagnostic Trouble Code
EATX	-Electronic Automatic Transmission
EMCC	-Electronically Modulated Converter Clutch
FCM	-Front Control Module (part of the IPM system)
IOD	-Ignition off-draw
IPM	-Integrated Power Module
IRT	-Intelligent Recovery Timer
ISS	-Input Speed Sensor
LED	-Light Emitting Diode

LR	-Low/reverse Clutch or Pressure Switch
LU	-Lockup
MIC	-Mechanical Instrument Cluster
MIL	-Malfunction Indicator Lamp
NGC	-Next Generation Controller
OBDII	-On Board Diagnostics
OD	-Overdrive Clutch or Pressure Switch
OSS	-Output Speed Sensor
PCM	-Powertrain Control Module
PEMCC	-Partial Electronically Modulated Converter Clutch
PLU	-Partial Lockup
REV	-Reverse Clutch
SLPK	-Solenoid Pack
SSV	-Solenoid Switch Valve
SW	-Switch
TCC	-Torque Converter Clutch
TCM	-Transmission Control Module
TP	-Throttle Position
TRD	-Torque Reduction
TRS	-Transmission Range Sensor
UD	-Underdrive Clutch
2/4	-2nd and 4th gear Clutch or Pressure Switch

6.2 DEFINITIONS

OBDII (EURO STAGE III OBD) Trip - A vehicle start and drive cycle such that all once per trip diagnostic monitors have run.

Key Start - A vehicle start and run cycle of at least 20 seconds.

Warm-up Cycle - A vehicle start and run cycle such that the engine coolant must rise to at least 71°C (160°F) and must rise by at least 4.4°C (40°F) from initial start up. To count as a warm-up cycle, no DTC may occur during the cycle.

This image shows a full page of white paper with horizontal grey ruling lines. The word "NOTES" is printed at the top center in a bold, black, sans-serif font. Below the title, there are approximately 28 evenly spaced horizontal lines extending across the width of the page, providing space for writing.

4	<p>This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints. This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint. The customer driving patterns may indicate the need for an additional transmission oil cooler. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. View repair options.</p> <p>Repair</p> <p>Repair the cause of transmission overheating per the Service Information. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:

P0562-LOW BATTERY VOLTAGE

When Monitored and Set Condition:

P0562-LOW BATTERY VOLTAGE

When Monitored: With the engine running and the PCM has closed the Transmission Control Relay.

Set Condition: If the battery voltage of the Transmission Control Relay Output Sense circuit(s) to the PCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5v for 200ms or where Transmission Control Relay Output circuits is less than 7.2v for 200ms.

POSSIBLE CAUSES

RELATED CHARGING SYSTEM DTC'S

GROUND CIRCUIT OPEN OR HIGH RESISTANCE

FUSED B+ CIRCUIT TO PCM HIGH RESISTANCE

TRANSMISSION CONTROL RELAY OUTPUT TO TCM OPEN OR HIGH RESISTANCE

TRANSMISSION CONTROL RELAY

POWERTRAIN CONTROL MODULE

INTERMITTENT WIRING AND CONNECTORS

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Low fluid level can be the cause of many transmission problems. 3	<p>With the DRBIII®, perform the 4th gear clutch test. Follow the instructions on the DRBIII®. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds. CAUTION: Do not overheat the transmission. Did the clutch test pass - Input Speed remain at zero?</p> <p>Yes → Go To 4</p> <p>No → Go To 5</p>	All
4	<p>The conditions to set this DTC are not current at this time. Check the gearshift linkage adjustment. Gear ratio DTC's can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the clutch test and still sets gear ratio DTC's, check the Speed Sensors for proper operation. Remove the Starter Relay. CAUTION: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A. This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. Were there any problems found?</p> <p>Yes → Repair as necessary. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All
5	<p>With the DRBIII®, read Transmission DTC's. Are the DTC's P0870 and/or P0871 present also?</p> <p>Yes → Replace the Solenoid/Pressure Switch Assembly per the Service Information. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All

P0734-GEAR RATIO ERROR IN 4TH — Continued

TEST	ACTION	APPLICABILITY
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Repair internal transmission per the Service Information. Check all of the components related to the OD and 2/4 clutches. Inspect the Oil Pump and repair or replace per the Service Information. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:**P0736-GEAR RATIO ERROR IN REVERSE****When Monitored and Set Condition:****P0736-GEAR RATIO ERROR IN REVERSE**

When Monitored: The Transmission gear ratio is monitored continuously while the Transmission is in gear.

Set Condition: If the ratio of the Input RPM to the Output RPM does not match the current gear ratio.

PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance between ground and the OD Solenoid Control circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the OD Solenoid Control circuit for a short to ground. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay. Note: Check connectors - Clean/repair as necessary. Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the voltage of the OD Solenoid Control circuit. Is the voltage above 0.5 volts?</p> <p>Yes → Repair the OD Solenoid Control circuit for a short to voltage. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 9</p>	All
9	<p>Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay. Note: Check connectors - Clean/repair as necessary. Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery. Does the test light illuminate brightly?</p> <p>Yes → Go To 10</p> <p>No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

P0760-OD SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
10	<p>Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR.</p> <p>Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All
11	<p>The conditions necessary to set the DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. Were there any problems found?</p> <p>Yes → Repair as necessary. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:
P0765-UD SOLENOID CIRCUIT

When Monitored and Set Condition:

P0765-UD SOLENOID CIRCUIT

When Monitored: Initially at power-up, then every 10 seconds thereafter. They will also be tested immediately after a gear ratio or pressure switch error is detected.

Set Condition: Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

POSSIBLE CAUSES

RELATED RELAY DTC'S PRESENT
 UD SOLENOID CONTROL CIRCUIT OPEN
 UD SOLENOID CONTROL CIRCUIT SHORT TO GROUND
 UD SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
 UD SOLENOID
 INTERMITTENT WIRING AND CONNECTORS

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.</p> <p>NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.</p> <p>With the DRBIII®, read Engine DTC's. Check and repair all Engine DTC's prior to performing any transmission symptom diagnostics.</p> <p>With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures.</p> <p>NOTE: Diagnose 1 Trip Failures as a fully matured DTC.</p> <p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.</p> <p>Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal.</p> <p>For Gear Ratio DTC's, check and record all CVI's.</p> <p>Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.</p> <p>NOTE: Verify flash level of Powertrain Control Module. Some problems are corrected by software upgrades to the Transmission and Engine software.</p> <p>NOTE: Check for applicable TSB's related to the problem.</p> <p>Perform this procedure prior to Symptom diagnosis.</p> <p>Continue Go To 2</p>	All

P0765-UD SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	<p>With the DRBIII®, read Transmission DTC's Are there any Transmission Control Relay DTC's present also?</p> <p>Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>With the DRBIII®, Check the STARTS SINCE SET counter for P0765. NOTE: This counter only applies to the last DTC set. Is the STARTS SINCE SET counter set at 0?</p> <p>Yes → Go To 4</p> <p>No → Go To 9</p>	All
4	<p>Turn the ignition off to the lock position. Remove the Starter Relay. CAUTION: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter. Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A. Ignition on, engine not running. Monitor the UD Solenoid LED on the Transmission Simulator. With the DRBIII®, actuate the UD Solenoid. Did the UD Solenoid LED on the Transmission Simulator blink on and off?</p> <p>Yes → Go To 5</p> <p>No → Go To 6</p>	All
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the UD Solenoid Control circuit from the appropriate terminal of special tool #8815 to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the UD Solenoid Control circuit for an open. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
