Symptom:**P0845-2/4 HYDRAULIC PRESSURE TEST FAILURE**

When Monitored and Set Condition:**P0845-2/4 HYDRAULIC PRESSURE TEST FAILURE**

When Monitored: In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed greater than 1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to identify the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets.

POSSIBLE CAUSES
LOSS OF PRIME P0944 PRESENT
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
2/4 PRESSURE SWITCH SENSE CIRCUIT OPEN
2/4 PRESSURE SWITCH CIRCUIT SHORT TO GROUND
INTERNAL TRANSMISSION
2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY

10	<p>Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All
11	<p>The conditions necessary to set the DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. Were there any problems found?</p> <p>Yes → Repair as necessary. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:**P0884-POWER UP AT SPEED****When Monitored and Set Condition:****P0884-POWER UP AT SPEED**

When Monitored: When the Transmission Control Module initially powers up. Note: the Transmission Control Module is integrated with Powertrain Control Module. The Transmission Control Module has separate powers and grounds specifically to its portion of the PCM.

Set Condition: This DTC will set if the TCM powers up and senses the vehicle in a valid forward gear (no PRNDL DTCs) with a output speed above 800 RPM (approximately 32Km/h or 20 MPH).

POSSIBLE CAUSES

P0884 POWER UP AT SPEED

TEST	ACTION	APPLICABILITY
1	<p>This DTC is set when the PCM is initialized while the vehicle is moving down the road in a valid forward gear. This is usually a momentarily loss of power to the Transmission portion of the PCM.</p> <p>CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS.</p> <p>NOTE: Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.</p> <p>Check all of the Fused B+, Fused Ignition Switch Output, and Ground circuits related to the PCM for an intermittent open or short to ground.</p> <p>Perform a wiggle test on all wiring and connectors pertaining to the PCM while looking for shorts and open circuits.</p> <p>With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Repair as necessary.</p> <p>Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:**P0888-RELAY OUTPUT ALWAYS OFF****When Monitored and Set Condition:****P0888-RELAY OUTPUT ALWAYS OFF**

When Monitored: Continuously

Set Condition: This DTC is set when less than 3 volts are present at the Transmission Control Relay output circuits at the Transmission Control Module (TCM) when the TCM is energizing the relay. Note: Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.

POSSIBLE CAUSES

FUSED B+ CIRCUIT OPEN

TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN

TRANSMISSION CONTROL RELAY CONTROL CIRCUIT OPEN

TRANSMISSION CONTROL RELAY GROUND CIRCUIT OPEN

TRANSMISSION CONTROL RELAY STUCK OPEN

TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO GROUND

TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO GROUND

POWERTRAIN CONTROL MODULE

INTERMITTENT WIRING AND CONNECTORS

P0944-LOSS OF PRIME — Continued

TEST	ACTION	APPLICABILITY
2	<p>Place the gear selector in park. Start the engine. NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps. The Transmission must be at operating temperature prior to checking pressure. A cold Transmission will give higher readings. Place the Transmission in Reverse. With the DRBIII®, observe the Transmission Pressure Switch states. Are any of the Pressure Switches closed?</p> <p>Yes → Go To 3 No → Go To 5</p>	All
3	<p>The conditions necessary to set this DTC are not present at this time. Test drive the vehicle. Allow the Transmission to shift through all gears and ranges. Did you experience a delayed engagement and/or a no drive condition?</p> <p>Yes → Go To 5 No → Go To 4</p>	All
4	<p>The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorted and open circuits. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. Were there any problems found?</p> <p>Yes → Repair as necessary. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.</p>	All
5	<p>With the DRBIII®, perform a Shift Lever Position test. Follow the instructions on the DRBIII®. Did the Shift Lever Position Test pass?</p> <p>Yes → Go To 6 No → Refer to symptom list and perform test for DTC P0706. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All
6	<p>Remove and inspect the Transmission Oil Pan and Transmission Oil Filter per the Service Information. Does the Transmission Oil Pan contain excessive debris and/or is the Oil Filter plugged?</p> <p>Yes → Repair the cause of the plugged Transmission Oil Filter. Refer to the Service Information for the proper repair procedure. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7</p>	All

P0944-LOSS OF PRIME — Continued

TEST	ACTION	APPLICABILITY
7	If there are no possible causes remaining, view repair. Repair Replace the Transmission Oil Pump per the Service Information. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:**P0952-AUTOSTICK INPUT CIRCUIT LOW****When Monitored and Set Condition:****P0952-AUTOSTICK INPUT CIRCUIT LOW**

When Monitored: Whenever the engine is running.

Set Condition: The transmission is not in the Autostick position and the upshift or downshift is reporting closed - below 0.3 volts or if both switches are reported closed at the same time.

POSSIBLE CAUSES

AUTOSTICK® SWITCH

AUTOSTICK® DOWNSHIFT SENSE CIRCUIT SHORT TO GROUND

AUTOSTICK® UPSHIFT SENSE CIRCUIT SHORT TO GROUND

POWERTRAIN CONTROL MODULE

INTERMITTENT WIRING AND CONNECTORS

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, Check the STARTS SINCE SET counter for P0951. Note: This counter only applies to the last DTC set. Is the Starts Since Set counter set at 0?</p> <p>Yes → Go To 2</p> <p>No → Go To 6</p>	All
2	<p>Turn the ignition off to the lock position. Disconnect the AutoStick® Switch harness connector. Note: Check connectors - Clean/repair as necessary. Ignition on, engine not running. Measure the voltage of both the AutoStick® Upshift and Downshift sense circuits. Is the voltage above 5.0 volts on both circuits?</p> <p>Yes → Replace the AutoStick® Switch per the Service Information. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All

P0952-AUTOSTICK INPUT CIRCUIT LOW — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the AutoStick® Switch harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance between ground and the AutoStick® Downshift Sense circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the AutoStick® Downshift Sense circuit for a short to ground. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the AutoStick® Switch harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance between ground and the AutoStick® Upshift Sense circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the AutoStick® Upshift Sense circuit for a short to ground. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Ignition on, engine not running. With the DRBIII® display the AutoStick® Switch status. Shift into AutoStick®. Push the shift lever to the right several times to actuate the AutoStick® Upshift Switch and then to the left several times to actuate the AutoStick® Downshift Switch. Do both AutoStick® Upshift and Downshift Switch states toggle?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Powertrain Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:**P0992-2-4/OD HYDRAULIC PRESSURE TEST FAILURE****When Monitored and Set Condition:****P0992-2-4/OD HYDRAULIC PRESSURE TEST FAILURE**

When Monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed >1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to identify the correct pressure switch closes. If the pressure switch does not close 2 times, the DTC sets.

POSSIBLE CAUSES

CONDITION P0992 PRESENT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.</p> <p>NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.</p> <p>With the DRBIII®, read Engine DTC's. Check and repair all Engine DTC's prior to performing any transmission symptom diagnostics.</p> <p>With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures.</p> <p>NOTE: Diagnose 1 Trip Failures as a fully matured DTC.</p> <p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.</p> <p>Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal.</p> <p>For Gear Ratio DTC's, check and record all CVI's.</p> <p>Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.</p> <p>NOTE: Verify flash level of Powertrain Control Module. Some problems are corrected by software upgrades to the Transmission and Engine software.</p> <p>NOTE: Check for applicable TSB's related to the problem.</p> <p>Perform this procedure prior to Symptom diagnosis.</p> <p>Continue Go To 2</p>	All

P0992-2-4/OD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>NOTE: The vehicle must be driven to set this DTC. The transmission must be warm or hot with the Engine RPM above 1000 RPM.</p> <p>This DTC is an indication of both the 2/4 and the O/D Hydraulic Pressure Switch DTCs present.</p> <p>Perform diagnostics for both P0870 and P0845 to determine which switch is failing. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Refer to the Transmission category and perform the symptoms for P0845 and P0870.</p> <p>Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:**P1652-SERIAL COMMUNICATION LINK MALFUNCTION****When Monitored and Set Condition:****P1652-SERIAL COMMUNICATION LINK MALFUNCTION**

When Monitored: Continuously with engine running.

Set Condition: The DTC sets in approximately 20 seconds if no BUS messages are received by the TCM. Note: Due to the integration of the Powertrain and Transmission Control Modules, bus communication between the modules is internal.

POSSIBLE CAUSES

ENGINE COMMUNICATION DTCS PRESENT

POWERTRAIN CONTROL MODULE

INTERMITTENT WIRING AND CONNECTORS

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read Engine DTC's. Are there any Engine Communication DTC's present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII®, erase Transmission DTC's. Start the Engine in Park. With the DRBIII®, read Transmission DTCs. NOTE: The Engine must run for at least 20 seconds to reset this DTC. Did the DTC reset after the engine was started? Yes → Go To 3 No → Go To 4	All
3	Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits. If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.	All

P1652-SERIAL COMMUNICATION LINK MALFUNCTION — Continued

TEST	ACTION	APPLICABILITY
4	<p>The conditions necessary to set the DTC are not present at this time. Make sure to check for any Communication DTCs or customer concerns of possible bus problems. This includes any other controllers on the bus on this vehicle. If there is a bus problem refer to the Communication Category for diagnosis. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. Were there any problems found?</p> <p>Yes → Repair as necessary. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:**P1684-BATTERY WAS DISCONNECTED****When Monitored and Set Condition:****P1684-BATTERY WAS DISCONNECTED**

When Monitored: Whenever the ignition is in the Run/Start position.

Set Condition: This DTC is set whenever the Transmission Control Module (TCM) is disconnected from battery power (B+) or ground. It will also be set during the DRBIII® Quick Battery Disconnect procedure. Note: Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.

POSSIBLE CAUSES

BATTERY WAS DISCONNECTED
 PCM WAS REPLACED OR DISCONNECTED
 QUICK LEARN WAS PERFORMED
 FUSED B+ CIRCUIT TO TCM OPEN
 GROUND CIRCUIT OPEN
 INTERMITTENT WIRING AND CONNECTORS

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Low fluid level can be the cause of many transmission problems. P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — **Continued**

TEST	ACTION	APPLICABILITY
2	<p>With the DRBIII®, check for other transmission DTC's Is the DTC P0841 present also?</p> <p>Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>With the DRBIII®, Check the STARTS SINCE SET counter for P1776. NOTE: This counter only applies to the last DTC set. Is the STARTS SINCE SET counter 2 or less?</p> <p>Yes → Go To 4</p> <p>No → Go To 11</p>	All
4	<p>Turn the ignition off to the lock position. CAUTION: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter. Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A. Ignition on, engine not running. With the Transmission Simulator, turn the Pressure Switch selector switch to L/R. With the DRBIII® monitor the L/R Pressure Switch State while pressing the Pressure Switch Test button on the Transmission Simulator. Did the Pressure Switch state change from open to closed when test button was pressed?</p> <p>Yes → Go To 5</p> <p>No → Go To 6</p>	All
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Repair Internal Transmission as necessary. Inspect the Solenoid Switch Valve per the Service Information and repair or replace as necessary. If no problems are found, replace the Transmission Solenoid/Pressure Switch Assembly. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay. Note: Check connectors - Clean/repair as necessary. Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. NOTE: The Test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery. Does the test light illuminate brightly?</p> <p>Yes → Go To 7</p> <p>No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — **Continued**

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the L/R Pressure Switch Sense circuit from the Pinout Box to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the L/R Pressure Switch Sense circuit for an open. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance between ground and the L/R Pressure Switch Sense circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the L/R Pressure Switch Sense circuit for a short to ground. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 9</p>	All
9	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit. Ignition on, engine not running. Measure the voltage of the L/R Pressure Switch Sense circuit. Is the voltage above 0.5 volt?</p> <p>Yes → Repair the L/R Pressure Switch Sense circuit for a short to voltage. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Go To 10</p>	All

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — Continued

TEST	ACTION	APPLICABILITY
10	<p>Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR.</p> <p>Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All
11	<p>The conditions necessary to set this DTC are not present at this time. Test Drive and verify if the transmission is launching in 2nd gear and/or no TCC engagement. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. Are there 2nd gear launches and/or no TCC engagement?</p> <p>Yes → Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid Pressure Switch Assembly.</p> <p>Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All

Symptom:**P1790-FAULT IMMEDIATELY AFTER SHIFT****When Monitored and Set Condition:****P1790-FAULT IMMEDIATELY AFTER SHIFT**

When Monitored: After a speed ratio error is stored.

Set Condition: This DTC is set if the associated speed ratio DTC is stored within 1.3 seconds after a shift.

POSSIBLE CAUSES**FAULT AFTER SHIFT**

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.</p> <p>NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.</p> <p>With the DRBIII®, read Engine DTC's. Check and repair all Engine DTC's prior to performing any transmission symptom diagnostics.</p> <p>With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures.</p> <p>NOTE: Diagnose 1 Trip Failures as a fully matured DTC.</p> <p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.</p> <p>Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal.</p> <p>For Gear Ratio DTC's, check and record all CVI's.</p> <p>Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.</p> <p>NOTE: Verify flash level of Powertrain Control Module. Some problems are corrected by software upgrades to the Transmission and Engine software.</p> <p>NOTE: Check for applicable TSB's related to the problem.</p> <p>Perform this procedure prior to Symptom diagnosis.</p> <p>Continue Go To 2</p>	All
2	<p>This test is set along with a gear ratio DTC. Perform the appropriate test for the Gear Ratio DTC stored.</p> <p>NOTE: Check 1 trip failures if there are no gear ratio DTCs current.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Refer to the Transmission category and perform the appropriate symptom.</p> <p>Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:**P1793-TRD LINK COMMUNICATION ERROR****When Monitored and Set Condition:****P1793-TRD LINK COMMUNICATION ERROR**

When Monitored: The Transmission Control Module (TCM) pulses the 12 volt TRD signal from the Powertrain Control Module (PCM) to ground, during torque managed shifts with the throttle angle above 54 degrees. The TRD system is also tested whenever the vehicle is stopped and the engine speed is at idle.

Set Condition: This DTC is set when the Transmission Control Module (TCM) sends two subsequent torque reduction messages to the Powertrain Control Module (PCM) and does not receive a confirmation from the PCM. Note: Due to the integration of the Powertrain and Transmission Control Modules, bus communication between the modules is internal.

POSSIBLE CAUSES

POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Due to the integration of the Engine and Transmission controllers into one module, the TRD bus messages are sent over a internal bus circuit. View repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:**P1794-SPEED SENSOR GROUND ERROR****When Monitored and Set Condition:****P1794-SPEED SENSOR GROUND ERROR**

When Monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set Condition: After a PCM reset in neutral and Input/Output Ratio equals a ratio of 2.50 to 1.0 ± 50.0 RPM.

POSSIBLE CAUSES

SPEED SENSOR GROUND CIRCUIT OPEN

POWERTRAIN CONTROL MODULE

INTERMITTENT WIRING AND CONNECTORS

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.</p> <p>NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.</p> <p>With the DRBIII®, read Engine DTC's. Check and repair all Engine DTC's prior to performing any transmission symptom diagnostics.</p> <p>With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures.</p> <p>NOTE: Diagnose 1 Trip Failures as a fully matured DTC.</p> <p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.</p> <p>Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal.</p> <p>For Gear Ratio DTC's, check and record all CVI's.</p> <p>Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.</p> <p>NOTE: Verify flash level of Powertrain Control Module. Some problems are corrected by software upgrades to the Transmission and Engine software.</p> <p>NOTE: Check for applicable TSB's related to the problem.</p> <p>Perform this procedure prior to Symptom diagnosis.</p> <p>Continue</p> <p>Go To 2</p>	All

P1794-SPEED SENSOR GROUND ERROR — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off to the lock position. Remove the Starter Relay. CAUTION: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter. Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A. Ignition on, engine not running. With the Transmission Simulator, set the "Input/Output Speed" switch to "ON" and the rotary switch to the "3000/1250" position. With the DRBIII®, monitor the Input and Output Speed Sensor readings. Does the Input Speed read 3000 RPM and the Output Speed read 1250 RPM, \pm 50 RPM?</p> <p>Yes → Go To 3 No → Go To 4</p>	All
3	<p>The conditions necessary to set the DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorted and open circuits. With the DRBIII®, check the EATX EVENT DATA to help identify the conditions in which the DTC was set. Were there any problems found?</p> <p>Yes → Repair as necessary. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.</p>	All
4	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the Input and Output Speed Sensor harness connectors. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the Speed Sensor Ground circuit from the appropriate terminal of special tool #8815 to the Input and Output Speed Sensor harness connectors. Is the resistance above 5.0 ohms on either circuit?</p> <p>Yes → Repair the Speed Sensor Ground circuit for an open. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5</p>	All
5	<p>Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:

P1797-MANUAL SHIFT OVERHEAT

When Monitored and Set Condition:

P1797-MANUAL SHIFT OVERHEAT

When Monitored: Whenever the engine is running and transmission is in the AutoStick® mode.

Set Condition: If the Engine Temperature exceeds 123° C or 255° F, or the Transmission Temperature exceeds 135° C or 275° F while in AutoStick® mode. Note: Aggressive driving or driving in low for extended periods of time in AutoStick® mode will set this DTC.

POSSIBLE CAUSES

MANUAL SHIFT OVERHEAT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.</p> <p>NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.</p> <p>With the DRBIII®, read Engine DTC's. Check and repair all Engine DTC's prior to performing any transmission symptom diagnostics.</p> <p>With the DRBIII®, read Transmission DTC's. Symptom:

***BACKUP LAMPS COME ON WHILE SHIFTER IS NOT IN REVERSE POSITION**

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS BACKUP SUPPLY CIRCUIT SHORT TO VOLTAGE TRANSMISSION RANGE SENSOR

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. Firmly apply brakes. Place the Shift Lever in the position which causes the Backup Lamps to come on at the wrong time. Do the Backup Lamps come on while the shifter is not in Reverse? Yes → Go To 2 No → Go To 5	All
2	Ignition on, engine not running. Place the shift lever in a position that causes the Backup Lamps to come on when they should not. Disconnect the TRS harness connector. NOTE: This will cause a DTC P0706 and possibly other DTC's to be stored in the PCM. They must be erased before returning the vehicle to the customer. Did the Backup Lamps go out when the TRS harness connector was disconnected? Yes → Go To 3 No → Go To 4	All
3	If there are no possible causes remaining, view repair. Repair Replace Transmission Range Sensor per the Service Information.	All
4	Turn the ignition off to the lock position. Disconnect the TRS harness connector. Ignition on, engine not running. Measure the voltage of the Backup Light Supply circuit in the TRS harness connector. Is the voltage above 0.5 volt? Yes → Repair the Backup Lights Supply circuit for a short to voltage. No → Test Complete.	All
5	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. No → Test Complete.	All

Symptom:***BACKUP LAMPS INOPERATIVE****POSSIBLE CAUSES**

OPEN BACKUP LAMP BULB(S)
 BACKUP LAMP GROUND CIRCUIT OPEN
 BACKUP LAMP SUPPLY CIRCUIT OPEN
 FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
 TRANSMISSION RANGE SENSOR
 INTERMITTENT BACKUP LAMPS

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. Place foot firmly on brake pedal. Place the shift lever in the reverse position. Do either of the back-up lamps work?</p> <p>Yes → Go To 2 No → Go To 3</p>	All
2	<p>If one backup lamp works, the problem must be in the bulb or the wiring to the one that doesn't work. Check the bulb, Backup Lamp Supply circuit and the Ground circuit to the one that does not work. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorted and open circuits. View repair options.</p> <p>Repair Repair as necessary.</p>	All
3	<p>Turn the ignition off to the lock position. Remove the Starter Relay. CAUTION: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter. Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A. Ignition on, engine not running. Press the "Reverse Light Test" button on the Transmission Simulator while observing the Back-up Lamps. Do either of the Back-up Lamps come on?</p> <p>Yes → Replace the Transmission Range Sensor per the Service Information. No → Go To 4</p>	All
4	<p>Remove both Backup Lamp bulbs. NOTE: Check the Backup Lamp Sockets and Clean/repair as necessary. Measure the resistance of the Backup Lamp bulbs. Is the resistance above 5.0 ohms on either bulb?</p> <p>Yes → Replace the Backup Lamp bulb(s). Verify the bulbs illuminate with the Transmission Simulator. No → Go To 5</p>	All

***BACKUP LAMPS INOPERATIVE — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off to the lock position. Disconnect the TRS harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit in the TRS harness connector. NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery. Does the test light illuminate brightly?</p> <p>Yes → Go To 6</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. If the fuse is open make sure to check for a short to ground.</p>	All
6	<p>Turn the ignition off to the lock position. Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A. Remove the Backup Lamp bulb(s). Ignition on, engine not running. Note: Check connectors - Clean/repair as necessary. Using a 12-volt test light connected to ground, check the Backup Lamp Supply circuit in both Backup Lamp sockets while pressing the Reverse Light Test button on the Transmission Simulator. Does the test light illuminate brightly on either Backup Lamp Bulb socket?</p> <p>Yes → Repair the Backup Lamp Ground circuit for an open.</p> <p>No → Repair the Backup Lamp Supply circuit for an open.</p>	All

Symptom:***CHECKING PARK/NEUTRAL SWITCH OPERATION**

POSSIBLE CAUSES		
P/N POSITION SWITCH SENSE CIRCUIT OPEN		
P/N POSITION SWITCH SENSE CIRCUIT SHORT TO GROUND		
TRANSMISSION RANGE SENSOR		
POWERTRAIN CONTROL MODULE		

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, monitor the Park/Neutral Position Switch input state. Move the gear selector through all gear positions, Park to 1 and back to Park. Did the DRBIII® display show P/N and D/R in the correct gear positions? Yes → Test Complete. No → Go To 2	All
2	Turn the ignition off to the lock position. Disconnect the PCM harness connectors. Disconnect the TRS harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the P/N Position Switch Sense circuit from the appropriate terminal of special tool #8815 to the Transmission Range Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the P/N Position Switch Sense circuit for an open.	All
3	Turn the ignition off to the lock position. Disconnect the PCM harness connectors. Disconnect the TRS harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance between ground and the P/N Position Switch Sense circuit. Is the resistance above 100 kohms? Yes → Go To 4 No → Repair the P/N Position Switch Sense circuit for a short to ground.	All

***CHECKING PARK/NEUTRAL SWITCH OPERATION — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connectors. Move the Gear selector through all gear positions, from Park to 1st and back. While moving the gear selector through each gear, measure the resistance between ground and the P/N Position Switch Sense circuit in the appropriate terminal of special tool #8815. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Did the resistance change from above 10.0 ohms to below 10.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Replace the Transmission Range Sensor per the Service Information.</p>	All
5	<p>Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module per the Service Information.</p>	All

Symptom:***NO MANUAL AUTOSTICK OPERATION****POSSIBLE CAUSES**

AUTOSTICK® DOWNSHIFT SENSE CIRCUIT OPEN

AUTOSTICK® GROUND CIRCUIT OPEN

AUTOSTICK® UPSHIFT SENSE CIRCUIT OPEN

FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

PCM - AUTOSTICK®

TEST	ACTION	APPLICABILITY
1	Turn the ignition off to the lock position. Disconnect the AutoStick® Switch harness connector. Note: Check connectors - Clean/repair as necessary. Ignition on, engine not running. Measure the voltage of the Fused Ignition Switch Output circuit in the AutoStick® Switch harness connector. Is the voltage above 10.0 volts? Yes → Go To 2 No → Repair the Fused Ignition Switch Output circuit for an open.	All
2	Turn the ignition off to the lock position. Disconnect the AutoStick® Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance between ground and the AutoStick® Ground circuit at the AutoStick® harness connector. Is the resistance above 5.0 ohms? Yes → Repair the AutoStick® Ground circuit for an open. No → Go To 3	All
3	Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the AutoStick® Switch harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the Upshift Sense circuit between the Pinout Box and the AutoStick® Switch harness connector. Is the resistance above 5.0 ohms? Yes → Repair the AutoStick® Upshift Sense circuit for an open. No → Go To 4	All

***NO MANUAL AUTOSTICK OPERATION — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the AutoStick® Switch harness connector. Note: Check connectors - Clean/repair as necessary. CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER SPECIAL TOOL #8815 TO PERFORM DIAGNOSIS. Measure the resistance of the Downshift Sense circuit between the Pinout Box and the AutoStick® Switch harness connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the AutoStick® Downshift Sense circuit for an open.</p> <p>No → Go To 5</p>	All
5	<p>Ignition on, engine not running. With the DRBIII® monitor the AutoStick® Switch status. Firmly apply the brake and shift into AutoStick®. Push the shift lever to the right several times to actuate the AutoStick® Upshift Switch and then to the left several times to actuate the AutoStick® Downshift Switch. Do both AutoStick® Upshift and Downshift Switch states toggle?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Powertrain Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR.</p>	All

Symptom:***PRNDL FAULT CLEARING PROCEDURE****POSSIBLE CAUSES**

PRNDL FAULT CLEARING PROCEDURE

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII®, erase Transmission DTCs. Cycle the ignition off, then start the vehicle. Firmly apply the brakes and shift into Overdrive. NOTE: Vehicle must remain in Overdrive for at least 3.0 seconds. With the brakes firmly applied, shift slowly through all gears (PRNDL) as least three times, pausing momentarily in each gear. NOTE: If all the PRNDL lights box individually then the error was cleared. Shift into park and turn the ignition off to the lock position. Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. Does the DTC P0706 reset, or do all the PRNDL indicators remain boxed in park or neutral?</p> <p>Yes → Return to the symptom list and perform diagnostics for P0706 CHECK SHIFTER SIGNAL. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p> <p>No → Test Complete. Perform 42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1.</p>	All

Symptom:***TRANSMISSION NOISY WITH NO DTC'S PRESENT****POSSIBLE CAUSES**

INTERNAL TRANSMISSION PROBLEM - NOISY

INTERNAL TRANSMISSION PROBLEM - NOISY WHILE STANDING STILL

TEST	ACTION	APPLICABILITY
1	<p>Check and adjust the oil level per the Service Information before continuing. Place vehicle on hoist. Run vehicle on hoist under conditions necessary to duplicate the noise. CAUTION: BE SURE TO KEEP HANDS AND FEET CLEAR OF ROTATING WHEELS. Using Chassis Ears or other suitable device, verify that the noise is coming from the transmission. Is the noise coming from the transmission?</p> <p>Yes → Go To 2 No → Test Complete.</p>	All
2	<p>With the shift lever in neutral, raise the engine speed and listen to the noise. NOTE: THE RADIO MUST BE TURNED OFF. Alternator noise can come through the speakers and be misinterpreted as Transmission Pump Whine. This can happen even with the volume turned down. Does the noise get louder or change pitch while the engine speed is changing?</p> <p>Yes → Go To 3 No → Go To 4</p>	All
3	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Repair internal transmission problem as necessary. Inspect all of the transmission components for signs of wear. If no problems found, replace the Transmission Oil pump.</p>	All
4	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Repair internal transmission problem as necessary. Inspect all of the transmission components for signs of wear. Pay particular attention to bearings, pinion gears, etc. Repair or replace as necessary.</p>	All

Symptom:***TRANSMISSION SHIFTS EARLY WITH NO DTC'S****POSSIBLE CAUSES**

VEHICLE BUS PROBLEMS

CHECK FOR INTERMITTENT WIRING & CONNECTORS

COLD TRANSMISSION

TEST	ACTION	APPLICABILITY
1	<p>Using the DRBIII®, check all other Modules for signs of a PCI bus problem such as bus related DTC's and/or communication problems. Check and diagnose all 1 trip failures as a hard code. Although it takes two occurrences of a missed TRD link message to set the DTC P1793, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Do any of the other modules show signs of a bus problem?</p> <p>Yes → Refer to the Communication category and perform the appropriate diagnostics.</p> <p>No → Go To 2</p>	All
2	<p>The conditions necessary to set the DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Although it takes two occurrences of a missed TRD link message to set the DTC P1793, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Were there any problems found?</p> <p>Yes → Repair as necessary.</p> <p>No → Go To 3</p>	All
3	<p>If the transmission shifts too early when the transmission is cold, this is a normal condition. The software is designed to protect the transmission from high torque and/or high RPM shifts during cold operation. Did the problem occur when the transmission temperature was cold?</p> <p>Yes → This is a normal condition. The software is designed to protect the transmission from high torque and/or high RPM shifts during cold operation.</p> <p>No → Test Complete.</p>	All

Symptom:***TRANSMISSION SIMULATOR 8333 WILL NOT POWER UP****POSSIBLE CAUSES**

TRANSMISSION SIMULATOR WILL NOT POWER UP

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Make sure to check for any Transmission Control Relay DTCs. or conditions. A stuck open Transmission Control Relay can cause the Transmission Simulator to not Power up.</p> <p>NOTE: If the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A will not power up make sure to check all connectors and the ground cable for proper installation.</p> <p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Check and repair these symptoms before having the Transmission Simulator repaired.</p>	All

Verification Tests

42LE (NGC) TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
<p>1. NOTE: After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed. Refer to the Powertrain Category.</p> <p>2. Connect the DRBIII® to the Data Link Connector (DLC).</p> <p>3. Reconnect any disconnected components.</p> <p>4. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's.</p> <p>5. Perform *PRNDL FAULT CLEARING PROCEDURE after completion of repairs for P0706 CHECK SHIFTER SIGNAL.</p> <p>6. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C or 110° F.</p> <p>7. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure.</p> <p>8. NOTE: If the Transmission Control Module or Torque Converter has been replaced or if the Transmission has been repaired or replaced it is necessary to perform the DRBIII® Quick Learn Procedure and reset the "Pinion Factor"</p> <p>9. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees.</p> <p>10. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.</p> <p>11. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC is repaired.</p> <p>12. If equipped with AutoStick®, upshift and downshift several times using the AutoStick® feature during the road test.</p> <p>13. NOTE: Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.</p> <p>14. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test, return to the Symptom list and perform the appropriate symptom.</p> <p>15. NOTE: Erase P0700 DTC in the PCM to turn the MIL light off after making transmission repairs.</p> <p>Were there any Diagnostic Trouble Codes set during the road test?</p> <p>Yes → Repair is not complete, refer to the appropriate symptom.</p> <p>No → Repair is complete.</p>	All

DIAGNOSTIC TEST PROCEDURES — TELL US!

DaimlerChrysler Corporation is constantly working to provide the technician the best diagnostic manuals possible. Your comments and recommendations regarding the diagnostic manuals and procedures are appreciated.

To best understand your suggestion, please complete the form giving us as much detail as possible.

BODY CODE PLATES

DESCRIPTION

LOCATION AND DECODING

The Body Code Plate (Fig. 1) is located in the engine compartment on the battery tray front side (Fig. 2). There are seven lines of information on the body code plate. Lines 4, 5, 6, and 7 are not used to define service information. Information reads from left to right, starting with line 3 in the center of the plate to line 1 at the bottom of the plate.

Vehicle Identification Number

- (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE IDENTIFICATION NUMBER - DESCRIPTION) for proper breakdown of VIN code.

IF TWO BODY CODE PLATES ARE REQUIRED

The last code shown on either plate will be followed by END. When two plates are required, the last code space on the first plate will indicate (CTD)

When a second plate is required, the first four spaces of each line will not be used due to overlap of the plates.

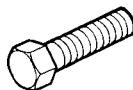

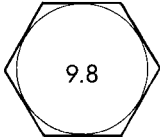

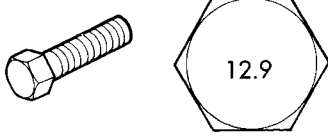

FASTENER IDENTIFICATION**DESCRIPTION**

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts (Fig. 3) and (Fig. 4).

Fig. 4 FASTENER STRENGTH

FASTENER USAGE

DESCRIPTION

DESCRIPTION - FASTENER USAGE

WARNING: USE OF AN INCORRECT FASTENER MAY RESULT IN COMPONENT DAMAGE OR PERSONAL INJURY.

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

DESCRIPTION - THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

INTERNATIONAL SYMBOLS

DESCRIPTION

The graphic symbols illustrated in the following International Control and Display Symbols Chart (Fig. 5) are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

Fig. 7 TORQUE SPECIFICATIONS

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

The Vehicle Identification Number (VIN) is located on the upper left corner of the upper plenum, near the left windshield pillar (Fig. 8). The VIN consists of 17 characters in a combination of letters and numbers that provide specific information about the vehicle. Refer to VIN Code Breakdown table for decoding information.

VEHICLE IDENTIFICATION NUMBER (Continued)

VIN CHECK DIGIT

DESCRIPTION

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

VEHICLE SAFETY CERTIFICATION LABEL

DESCRIPTION

A vehicle safety certification label is attached to the rear shutface of the driver's door (Fig. 9). This label indicates date of manufacture (month and year), Gross Vehicle Weight Rating (GVWR), Gross Axle Weight Rating (GAWR) front, Gross Axle Weight Rating (GAWR) rear and the Vehicle Identification Number (VIN). The Month, Day and Hour of manufacture is also included.

All communications or inquiries regarding the vehicle should include the Month-Day-Hour and Vehicle Identification Number.

MFD BY	DAIMLER CHRYSLER CORPORATION	DATE OF MFR	1-96 C	GVWR	2268 KG (5000 LB)

VECI LABEL

DESCRIPTION

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

MANUFACTURER PLATE

DESCRIPTION

The Manufacturer Plate (Fig. 11) is located in the engine compartment on the passenger side rear corner of the hood. The plate contains five lines of information:

1. Vehicle Identification Number (VIN)
2. Gross Vehicle Mass (GVM)
3. Gross Train Mass (GTM)
4. Gross Front Axle Rating (GFAR)
5. Gross Rear Axle Rating (GRAR)

FLUID TYPES

DESCRIPTION

DESCRIPTION - ENGINE OIL AND LUBRICANTS

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

FLUID TYPES (Continued)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified (GF-3). Mopar® provides engine oils, meeting Material Standard MS-6395, that meet or exceed this requirement.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 2).

80990199

Fig. 2 TEMPERATURE/ENGINE OIL VISCOSITY

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans (Fig. 3).

This symbol means that the oil has been certified by the American Petroleum Institute (API). Daimler-Chrysler only recommend API Certified (GF-3) engine oils that meet the requirements of Material Standard MS-6395. Use Mopar® or an equivalent oil meeting the specification MS-6395.

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

9400-9

Fig. 3 API SYMBOL

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.

- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.

- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

LUBRICANTS AND GREASES

Lubricating grease is rated for quality and usage by the NLGI. All approved products have the NLGI symbol (Fig. 4) on the label. At the bottom NLGI symbol is the usage and quality identification letters. Wheel bearing lubricant is identified by the letter "G". Chassis lubricant is identified by the latter "L". The letter following the usage letter indicates the

FLUID TYPES (Continued)

quality of the lubricant. The following symbols indicate the highest quality.

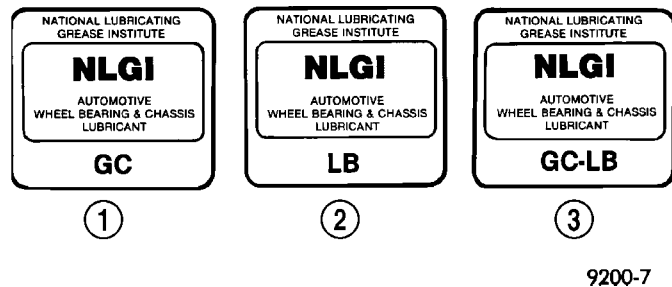

Fig. 4 NLGI SYMBOL

- 1 - WHEEL BEARINGS
- 2 - CHASSIS LUBRICATION
- 3 - CHASSIS AND WHEEL BEARINGS

SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate sections in this manual for the correct application of these lubricants.

DESCRIPTION - ENGINE COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DESCRIPTION - AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to the maintenance schedules for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: For fluid level checking procedures, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/FLUID - STANDARD PROCEDURE).

NOTE: The 42LE transaxle has separate transmission and differential oil sumps, each requiring different fluids.

TRANSMISSION FLUID

Mopar® ATF+4 is required in this transaxle. Substitute fluids can induce torque converter clutch shudder.

Mopar® ATF+4 when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also

FLUID TYPES (Continued)

has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used**. The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

DESCRIPTION - DIFFERENTIAL LUBRICANT

NOTE: Refer to the Owner’s Manual for the recommended differential lubricant change intervals for this transaxle.

NOTE: Refer to 42LE TRANSAXLE SERVICE PROCEDURES for fluid level checking procedures.

NOTE: The 42LE transaxle has separate transmission and differential oil sumps, each requiring different fluids.

42LE DIFFERENTIAL LUBRICANT

The differential sump should be filled with Mopar® 80W-90 hypoid gear lubricant. Synthetic gear lubricants should be avoided.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those lubricants listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used**. The use of transmission “sealers” should also be avoided, since they

may adversely affect the integrity of transmission seals.

DESCRIPTION - FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The uses of midgrade, octane rating of 89, gasoline is recommended for the 3.5L H.O. engine. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as “reformulated” gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly support the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

FLUID TYPES (Continued)

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasoline free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

FLUID CAPACITIES

SPECIFICATIONS - FLUID CAPACITIES

DESCRIPTION	SPECIFICATION
Fuel Tank	64 L (17 gal.)
Engine Oil*	4.7 L (5.0 qts.)
Cooling System - 2.7L**	10.0 L (10.5 qts.)
Cooling System - 3.5L**	10.5 L (11.0 qts.)

FLUID FILL/CHECK LOCATIONS

DESCRIPTION

The fluid check/fill point locations are located in each applicable service manual section.

LUBRICATION POINTS

DESCRIPTION

Lubrication point locations are located in each applicable Sections.

MAINTENANCE SCHEDULES

DESCRIPTION

DESCRIPTION

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule “B”. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C). ◇
- Trailer towing. ◇
- Taxi, police, or delivery service (commercial service). ◇
- Off-road or desert operation.

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the “Maintenance Schedules” section of this manual.

NOTE: Most vehicles are operated under the conditions listed for Schedule “B”.

Second is Schedule “A”. It is for vehicles that are not operated under any of the conditions listed under Schedule “B”.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

NOTE: Under no circumstances should oil change intervals exceed 6000 miles (10 000 km) or 6 months whichever comes first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant bottle, brake master cylinder and transmission, add as needed.
- Check all lights and all other electrical items for correct operation.
- Check rubber seals on each side of the radiator for proper fit.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints and front and rear suspension components.
- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.
- Rotate the tires at each oil change interval shown on Schedule “A” 6,000 miles (10 000 km) or every other interval shown on Schedule “B” 6,000 miles (10 000 km).

MAINTENANCE SCHEDULES (Continued)

SCHEDULE "B"

Follow schedule "B" if you usually operate your vehicle under one or more of the following conditions. Change the automatic transmission fluid and filter every 60,000 miles (96 000 km) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C). ◇

- Trailer towing. ◇
- Taxi, police or delivery service (commercial services). ◇
- Off-road or desert operation.
- **If equipped for and operating with E-85 (ethanol) fuel.**

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule "B" of the "Maintenance Schedules" section of this manual.

* This maintenance is recommended by the manufacturer to the owner but is not required to maintain the emissions warranty.

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

DESCRIPTION - EXPORT

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule "A". It is for vehicles that are not operated under any of the conditions listed under Schedule "B".

Second is Schedule "B". It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C). ◇
- Trailer towing. ◇
- Taxi, police, or delivery service (commercial service). ◇
- Off-road or desert operation.
- **If equipped for and operating with E-85 (ethanol) fuel.**

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3

months, whichever comes first and follow schedule "B" of the "Maintenance Schedules" section of this manual.

NOTE: Most vehicles are operated under the conditions listed for Schedule "B".

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

NOTE: Under no circumstances should oil change intervals exceed 6000 miles (10 000 km) or 6 months whichever comes first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant bottle, brake master cylinder and transmission, add as needed.
- Check all lights and all other electrical items for correct operation.
- Check rubber seals on each side of the radiator for proper fit.

MAINTENANCE SCHEDULES (Continued)

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints and front and rear suspension components.

- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.
- Rotate the tires at each oil change interval shown on Schedule "A" 6,000 miles (10 000 km) or every other interval shown on Schedule "B" 6,000 miles (10 000 km).

SCHEDULE "A"

Kilometers (Miles) [Months]	12 000 (7,500) [6]	24 000 (15,000) [12]	36 000 (22,500) [18]	48 000 (30,000) [24]	60 000 (37,500) [30]	72 000 (45,000) [36]
Change engine oil and engine oil filter.	X	X	X	X	X	X
Inspect the air cleaner filter and replace if required.*	X	X	X		X	X
Replace the air cleaner filter .*				X		
Adjust the drive belt tension.				X		
Inspect the front and rear brake linings and rotors.			X			X

Kilometers (Miles) [Months]	84 000 (52,500) [42]	96 000 (60,000) [48]	100 000 (67,500) [54]	120 000 (75,000) [60]	132 000 (82,500) [66]	140 000 (90,000) [72]
Change engine oil and engine oil filter.	X	X	X	X	X	X
Inspect the air cleaner filter and replace if required.*	X		X	X	X	
Replace the air cleaner filter .*		X				X
Replace the drive belts.		X				
Adjust drive belt tension.						X
Inspect the front and rear brake linings and rotors.			X			X
Flush and replace engine coolant at 60 months or 160,000 km.				X		
Check and replace, if necessary, the PCV valve . *		X				X

Kilometers (Miles) [Months]	156 000 (97,500) [78]	168 000 (105,000) [84]
Change engine oil and engine oil filter.	X	X
Inspect the air cleaner filter and replace if required.*	X	X
Replace the spark plugs .		X
Flush and replace the engine coolant at 60 months or 160,000 km.		X

* This maintenance is recommended by the manufacturer to the owner but is not required to maintain the emissions warranty.

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

MAINTENANCE SCHEDULES (Continued)

SCHEDULE "B"

Follow schedule "B" if you usually operate your vehicle under one or more of the following conditions. Change the automatic transmission fluid and filter every 60,000 miles (96 000 km) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).

• More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C). ◇

• Trailer towing. ◇

• Taxi, police or delivery service (commercial services). ◇

• Off-road or desert operation.

• **If equipped for and operating with E-85 (ethanol) fuel.**

If **ANY** of these apply to you, change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first, and follow the maintenance recommendations in "Maintenance Schedule B."

Kilometers (Miles)	5 000 (3,000)	10 000 (6,000)	14 000 (9,000)	19 000 (12,000)	24 000 (15,000)	29 000 (18,000)

* This maintenance is recommended by the manufacturer to the owner but is not required to maintain the emissions warranty.

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

HOISTING

STANDARD PROCEDURE - HOISTING

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

WARNING: THE HOISTING AND JACK LIFTING POINTS PROVIDED ARE FOR A COMPLETE VEHICLE. WHEN THE ENGINE OR REAR SUSPENSION IS REMOVED FROM A VEHICLE, THE CENTER OF GRAVITY IS ALTERED MAKING SOME HOISTING CONDITIONS UNSTABLE. PROPERLY SUPPORT OR SECURE VEHICLE TO HOISTING DEVICE WHEN THESE CONDITIONS EXIST.

CAUTION: Do not position hoisting device on suspension components, damage to vehicle can result.

For proper hoisting and jacking points, refer to (Fig. 5).

80b1b34a

Fig. 5 HOISTING AND JACKING POINTS

JUMP STARTING

STANDARD PROCEDURE - JUMP STARTING

WARNING:

REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS.

DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.

DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS YELLOW OR BRIGHT COLOR.

A BATTERY GENERATES HYDROGEN GAS WHICH IS FLAMMABLE AND EXPLOSIVE. KEEP OPEN FLAME OR SPARKS AWAY FROM THE BATTERY.

DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE. ,

DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS.

TAKE CARE TO AVOID THE RADIATOR COOLING FAN WHENEVER THE HOOD IS RAISED. THE FAN CAN START AT ANYTIME THE IGNITION SWITCH IS ON. YOU CAN BE HURT BY THE FAN.

BATTERY FLUID IS A CORROSIVE ACID SOLUTION: DO NOT ALLOW BATTERY FLUID TO CONTACT EYES, SKIN, OR CLOTHING. IF ACID SPLASHES IN EYES OR ON SKIN, FLUSH THE CONTAMINATED AREA IMMEDIATELY WITH LARGE QUANTITIES OF WATER.

CAUTION:

Do not attempt to push or tow the vehicle to start it. The vehicle cannot be started this way. Pushing with another vehicle may damage the transaxle or the rear of the vehicle.

If the vehicle has a discharged battery, booster cables may be used to obtain a start from another vehicle. This type of start can be dangerous if done improperly, so follow the procedure carefully.

NOTE:

The battery is stored in a compartment in front of the tire in the right front fender and is accessible through the engine compartment.

TO JUMP START A DISABLED VEHICLE:

If the indicator is dark or shows a green dot, proceed as follows:

(1) Wear eye protection and remove metallic jewelry worn on hands or wrists to avoid injury by accidental arcing of battery current.

JUMP STARTING (Continued)

(2) When using another vehicle as a booster source, park the booster vehicle within cable reach without allow vehicles to touch.

(3) Turn off all accessories, set the parking brake, place the automatic transmission in PARK, and turn the ignition OFF in both vehicles.

(4) Connect one end of the positive jumper cable to the positive jump start attachment of the booster battery. Connect the other end of the cable to the positive jump start attachment of the discharged battery (Fig. 6).

(5) Connect one end of the negative jumper cable to the negative jump start attachment of the booster battery. Connect the other end of the cable to the negative jump start attachment of the discharged battery (Fig. 7). Ensure that the jump cable clamps have good connections.

(6) Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will over-heat and could fail.

(7) When removing the jumper cables:

- Disconnect jumper cable negative clamp from the disabled vehicle.
- Disconnect the jumper cable negative clamp from the booster battery start attachment.
- Disconnect jumper cable positive clamp from disabled battery start attachment.
- Disconnect jumper cable positive clamp from booster battery start attachment.

Fig. 6 POSITIVE JUMPER START ATTACHMENT

- 1 - ATTACHMENT CAP
2 - JUMPER START ATTACHMENT

Fig. 7 NEGATIVE JUMPER START ATTACHMENT

- 1 - NEGATIVE JUMPER START ATTACHMENT
2 - ATTACHMENT

TOWING

STANDARD PROCEDURE - TOWING

WARNING:

- Do NOT tow vehicle with front wheels on the ground. The transaxle can be damaged.
- Secure loose and protruding parts from a disabled vehicle.
- Always use a safety chain system that is independent of the lifting and towing equipment.
- Do not allow any of the towing equipment to contact the fuel tank of the vehicle being towed.
- Do not go under the vehicle while it is lifted by the towing equipment.
- Do not allow passengers to ride in a vehicle being towed.
- Always observe all state and local laws pertaining to warning signals, night illumination, speed, etc.
- Do not attempt a towing operation that could jeopardize the operator, bystanders or other motorists.
- Do not exceed a towing speed of 48 km/h (30 mph).
- Avoid towing distances of more than 24 km (15 miles), whenever possible.
- Never attach tow chains or a tow sling to the bumper, steering linkage, or constant velocity joints.

RECOMMENDED TOWING EQUIPMENT

To avoid damage to bumper fascia and air dams use of a wheel lift or flat bed towing device (Fig. 8) is recommended. When using a wheel lift towing device,

TOWING (Continued)

be sure the rear end of disabled vehicle has at least 100 mm (4 inches) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed :

- 13 degrees for Intrepid
- 12 degrees for Concorde and 300M
- Additional ramping may be required.

9100-17

Fig. 8 RECOMMENDED TOWING DEVICES

1 - WHEEL LIFT
2 - FLAT BED

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until lifted wheels are a minimum 100 mm (4 in) from the ground. Be sure there is adequate ground clearance at the opposite end of the vehicle, especially when towing over rough terrain or steep rises in the road. If necessary, remove the wheels from the lifted end of the vehicle and lower the vehicle closer to the ground, to increase the ground clearance at the opposite end of the vehicle. Install lug nuts on wheel attaching studs to retain braking discs.

TIE DOWN LOCATIONS FOR FLAT BED TOWING

There are two reinforced elongated holes on each side of the vehicle designed to serve as hold down locations. These locations can safely hold the vehicle to the towing device using T or R hooks.

- Bottom of the forward torque box between the front frame rail and the rocker panel.
- Bottom of the rearward torque box forward of the rear wheel.

FRONT TOWING PROCEDURES

CAUTION: Do Not tow vehicle from the front with sling type towing device. Damage to bumper fascia will result.

Always tow vehicle with front wheels off the ground as shown (Fig. 9).

9300-12

Fig. 9 TOWING

Use a flat bed towing device when wheel lift towing device is not available.

REAR TOWING PROCEDURES

CAUTION: Do not tow vehicle with the rear end lifted.

If damage to the vehicle prevents front towing, use a flat bed towing device.

CAUTION: Do not push the vehicle with another vehicle as damage to the bumper fascia and trans-axle can result.

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until lifted wheels are a minimum 100 mm (4 in) from the ground. Be sure there is adequate ground clearance at the opposite end of the vehicle, especially when towing over rough terrain or steep rises in the road. If necessary, remove the wheels from the lifted end of the vehicle and lower the vehicle closer to the ground, to increase the ground clearance at the opposite end of the vehicle. Install lug nuts on wheel attaching studs to retain braking discs.

TIE DOWN LOCATIONS FOR FLAT BED TOWING

There are two reinforced elongated holes on each side of the vehicle designed to serve as hold down locations. These locations can safely hold the vehicle to the towing device using T or R hooks.

- Bottom of the forward torque box between the front frame rail and the rocker panel.
- Bottom of the rearward torque box forward of the rear wheel.

FRONT SUSPENSION

DESCRIPTION - FRONT SUSPENSION

This vehicle uses a MacPherson strut type front suspension design (Fig. 1).

The front suspension includes the following components:

- Strut assembly
- Steering knuckle
- Hub and bearing
- Lower control arm and ball joint
- Tension strut
- Stabilizer bar

OPERATION - FRONT SUSPENSION

The front suspension allows each front wheel on a vehicle to adapt to different road surfaces and conditions without affecting the control of the vehicle. Each side of the front suspension is allowed to move independently from the other. Both sides of the front

suspension are allowed to pivot so the vehicle can be steered in the direction preferred. Steering of the vehicle is provided through a rack and pinion steering gear that is connected to a fixed steering arm on each front strut.

WARNING

WARNING: DO NOT REMOVE THE STRUT ASSEMBLY'S SHAFT NUT AT ANY TIME UNLESS THE COIL SPRING HAS BEEN PROPERLY COMPRESSED FOLLOWING THE PROCEDURE LISTED IN STRUT ASSEMBLY DISASSEMBLY OR ASSEMBLY IN THIS SECTION.

80bceaa6

FRONT SUSPENSION (Continued)

CAUTION

CAUTION: Only frame contact hoisting equipment can be used on this vehicle. All vehicles have a fully independent rear suspension. The vehicles cannot be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used, damage to rear suspension components will occur.

CAUTION: If the vehicle is equipped with the Tire Pressure Monitoring (TPM) System, the tire/wheel assembly needs to be reinstalled in the same location it is removed from or the TPM System (sensors) will need to be retrained. Mark each tire/wheel assembly indicating location, prior to its removal. If the tire/wheel assemblies are switched, rotated or replaced, the TPM System needs to be retrained. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

CAUTION: At no time when servicing a vehicle, can a sheet metal screw, bolt or other metal fastener be installed in the shock tower to take the place of an original plastic clip. Also, NO holes can be drilled into the front shock tower in the area shown (Fig. 2), for the installation of any metal fasteners into the shock tower. Because of the minimum clearance in this area, installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring.

Fig. 2 Strut Tower To Coil Spring Minimum Clearance Area (Typical)

- 1 - SHOCK TOWER
2 - COIL SPRING
3 - NO SHEET METAL SCREWS, BOLTS, OR ANY OTHER METAL FASTENERS ARE TO BE INSTALLED INTO SHOCK TOWER IN THIS AREA. ALSO, NO HOLES ARE TO BE DRILLED INTO SHOCK TOWER IN THIS SAME AREA.

HUB / BEARING

DESCRIPTION

The front wheel bearing and front wheel hub of this vehicle are a hub and bearing unit type assembly. This unit combines the front wheel mounting hub (flange) and the front wheel bearing into a sealed one piece unit. The hub and bearing is mounted to the center of the steering knuckle and is retained by three mounting bolts accessible from the rear of the steering knuckle. The hub flange has five wheel mounting studs.

The wheel mounting studs used to mount the tire and wheel to the vehicle are the only replaceable components of the hub and bearing assembly. Otherwise, the hub and bearing is serviced only as a complete assembly.

OPERATION

The hub and bearing has internal bearings that allow the hub to rotate with the driveshaft and tire and wheel. The five wheel mounting studs mount the tire and wheel, and brake rotor to the vehicle.

DIAGNOSIS AND TESTING - HUB AND BEARING (FRONT)

The front hub bearing is designed for the life of the vehicle and requires no type of periodic maintenance. The following procedure may be used for diagnosing the condition of the front hub bearing.

With the wheel, disc brake caliper, and brake rotor removed, rotate the wheel hub. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the hub bearing exhibits any of these conditions during diagnosis, the hub and bearing will require replacement. The bearing is not serviceable.

Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease weepage from the hub bearing is considered normal and should not require replacement of the hub and bearing.

To check for excessive hub runout, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).

REMOVAL - HUB AND BEARING (FRONT)

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the front wheel and tire assembly from the vehicle.

HUB / BEARING (Continued)

(3) Remove the 2 guide pin bolts mounting the caliper assembly to the steering knuckle (Fig. 3). Remove the caliper from the front steering knuckle. Refer to Disc Brake Caliper in Brakes.

- 1 - HUB/BEARING ASSEMBLY
- 2 - NUT

(6) Remove the 3 hub and bearing to steering knuckle attaching bolts (Fig. 6).

Fig. 6 Hub And Bearing Assembly Retaining Bolts

- 1 - STEERING KNUCKLE
- 2 - HUB/BEARING ATTACHING BOLTS
- 3 - HALF SHAFT

CAUTION: When removing hub and bearing assembly from steering knuckle, be careful not to damage the flinger disc (Fig. 9) on hub and bearing assembly. If flinger disc becomes damaged, hub and bearing assembly **MUST** not be used and **MUST** be replaced with a new hub and bearing assembly.

(7) Remove hub and bearing assembly from steering knuckle by sliding it straight out of steering knuckle and off end of stub axle (Fig. 7). If hub and bearing assembly will not slide out of knuckle, insert

HUB / BEARING (Continued)

a pry bar between hub and bearing assembly and steering knuckle (Fig. 8) and gently pry hub and bearing from knuckle. If stub shaft is frozen to hub and bearing assembly, tap end of stub shaft with soft face hammer to free it from hub and bearing spline.

- 3 - FLINGER
- 4 - DO NOT ALLOW FLINGER TO BE BENT OR DAMAGED DURING REMOVAL OF HUB/BEARING OR C/V JOINT
- 5 - HUB/BEARING ASSEMBLY

INSTALLATION - HUB AND BEARING (FRONT)

CAUTION: Hub and bearing assembly mounting surfaces on steering knuckle and driveshaft (Fig. 10) must be smooth and completely free of foreign material or nicks.

9302-104

Fig. 8 Prying Hub And

- 1 - INSERT PRY BAR HERE
- 2 - PRY BAR
- 3 - KNUCKLE
- 4 - HUB/BEARING ASSEMBLY

CAUTION: If metal seal (Fig. 9) on hub and bearing assembly is seized to steering knuckle and becomes dislodged on hub and bearing assembly during bearing removal. The hub and bearing assembly **MUST** not be reused and **MUST** be replaced with a new hub and bearing assembly.

9402-70

Fig. 10 Hub And Bearing Mounting Surfaces

- 1 - BE SURE THESE SURFACES ARE CLEAN AND FREE OF KNICKS BEFORE INSTALLING BEARINGS
- 2 - STEERING KNUCKLE
- 3 - STUB AXLE

HUB / BEARING (Continued)

CAUTION: When installing hub and bearing assembly into steering knuckle, be careful not to damage the flinger disc (Fig. 9) on hub and bearing assembly. If flinger disc becomes damaged, hub and bearing assembly **MUST** not be used and **MUST** be replaced with a new hub and bearing assembly.

(1) Install hub and bearing assembly onto stub shaft and into steering knuckle until squarely seated on face of steering knuckle

(2) Install the 3 hub and bearing assembly to steering knuckle attaching bolts (Fig. 6). Equally tighten all 3 mounting bolts until hub and bearing assembly is squarely seated against front of steering knuckle. Then tighten the 3 hub and bearing assembly mounting bolts to a torque of 110 N·m (80 ft. lbs.)

CAUTION: The hub and bearing axle retaining nut (Fig. 5) is a prevailing torque nut and cannot be reused. A **NEW** retaining nut **MUST** be used when assembled.

(3) Install a **NEW** hub and bearing axle retaining nut on the stub shaft (Fig. 5). **Do not torque the hub nut at this time.**

(4) Install the brake rotor on the hub and bearing assembly (Fig. 4).

(5) Install front brake caliper back over braking disc and align with caliper mounting holes on steering knuckle and install the caliper to steering knuckle guide pin bolts (Fig. 3). Refer to Disc Brake Caliper in Brakes.

(6) With vehicle brakes applied, tighten the hub and bearing axle retaining nut to 142 N·m (105 ft. lbs.).

(7) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(8) Lower the vehicle to the ground.

(9) Check the wheel alignment toe setting on the vehicle and reset if not within specifications.

KNUCKLE

DESCRIPTION - STEERING KNUCKLE

The steering knuckle is a single casting with legs machined for attachment to the front strut assembly and lower control arm ball joint (Fig. 1). The steering knuckle also has machined abutments on the casting to support and align the front brake caliper. The knuckle also holds the hub and bearing, and supports the driveshaft. The hub and bearing is positioned through the center of the knuckle. The driveshaft

outer constant velocity (C/V) stub shaft is splined to the center of the hub.

OPERATION - STEERING KNUCKLE

The steering knuckle provides for steering control of the vehicle, supports the brake caliper and absorbs the loads exerted during vehicle braking. It also supports the front (driving) hub and bearing and drive-shaft stub axle assembly.

The steering knuckle pivots with the strut assembly on the lower control arm ball joint, allowing the vehicle to be steered.

DIAGNOSIS AND TESTING - STEERING KNUCKLE

The steering knuckle (Fig. 11) is not a serviceable component. Do not attempt to straighten or repair the knuckle in any way. If it is determined that the knuckle is bent or damaged, replace the knuckle.

KNUCKLE (Continued)

REMOVAL - STEERING KNUCKLE

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in the Lubrication and Maintenance section.

(2) Remove the front wheel and tire assembly from the vehicle.

(3) Remove the front caliper assembly from the front steering knuckle assembly (Fig. 12). Refer to Front Disc Brake Service in the Brake Section of this service manual for caliper removal procedure.

Fig. 12 Disc Brake Caliper Mounting

- 2 - CALIPER GUIDE PIN BOLTS
- 3 - STEERING KNUCKLE
- 4 - BLEEDER SCREW
- 5 - CALIPER ASSEMBLY

(4) Remove front rotor from hub (Fig. 13).

(5) Remove screw attaching wheel speed sensor head to steering knuckle. **Speed sensor head should be removed from steering knuckle, to avoid damage to speed sensor by outer C/V joint when hub and bearing is removed.**

(6) Carefully, remove sensor head from steering knuckle. If the sensor has seized, due to corrosion, **DO NOT USE PLIERS ON SENSOR HEAD.** Use a hammer and punch (Fig. 14) to tap edge of sensor ear, rocking sensor side to side until free.

(7) Remove the hub and bearing to stub axle retaining nut (Fig. 15).

(8) Remove the 3 steering knuckle to hub and bearing assembly attaching bolts (Fig. 16).

CAUTION: If metal seal (Fig. 17) on hub and bearing assembly is seized to steering knuckle and becomes dislodged on hub and bearing assembly during bearing removal the hub and bearing assembly **MUST** not be reused and **MUST** be replaced with a new hub and bearing assembly. Also if flinger disc (Fig. 17) becomes damaged (bent or dented) during removal, hub and bearing assembly must be replaced with a new hub and bearing assembly.

2 - SEAL
3 - FLINGER
4 - DO NOT ALLOW FLINGER TO BE BENT OR DAMAGED DURING REMOVAL OF HUB/BEARING OR C/V JOINT
5 - HUB/BEARING ASSEMBLY

(9) Remove hub and bearing assembly from steering knuckle. It is removed by sliding it straight out of steering knuckle and off end of stub axle (Fig. 18). If hub and bearing assembly will not slide out of knuckle, insert a pry bar between hub and bearing assembly and steering knuckle (Fig. 19) and gently pry hub and bearing from knuckle. If stub shaft is frozen to hub and bearing assembly tap end of stub shaft with soft face hammer to free it from hub and bearing spline.

(10) Remove the ball joint stud to steering knuckle attaching nut and bolt (Fig. 20).

CAUTION: When lower control arm is separated from steering knuckle, do not let ball joint seal hit up against steering knuckle. If ball joint seal hits steering knuckle, seal damage may occur. If ball joint seal becomes torn, replace seal before assembling lower control arm to knuckle.

- 3 - KNUCKLE
- 4 - HUB/BEARING ASSEMBLY

(11) Carefully insert a pry bar between lower control arm and steering knuckle (Fig. 21). Push down on pry bar to separate ball joint stud from steering knuckle (Fig. 21).

CAUTION: The strut assembly to steering knuckle bolts are serrated where they go through strut assembly and steering knuckle. When removing bolts, turn nuts off bolts **DO NOT TURN BOLTS IN STEERING KNUCKLE**. If bolts are turned damage to steering knuckle will result.

(12) Remove the strut assembly to steering knuckle attaching bolts (Fig. 22).

(13) Remove the steering knuckle from the vehicle.

**Fig. 21 Separating Ball Joint From Steering Knuckle**

- 1 - STEERING KNUCKLE
- 2 - BALL JOINT STUD
- 3 - PRY BAR
- 4 - LOWER CONTROL ARM

INSTALLATION - STEERING KNUCKLE

(1) Install steering knuckle on ball joint stud. Install steering knuckle to lower ball joint attaching bolt and nut into steering knuckle (Fig. 20). Tighten the attaching bolt to a torque of 55 N·m (40 ft. lbs.).

(2) Position steering knuckle into strut assembly.

CAUTION: The strut assembly to steering knuckle bolts are serrated where they go through strut assembly and steering knuckle. When installing bolts, turn nuts onto bolts **DO NOT TURN BOLTS IN STEERING KNUCKLE**. If bolts are turned damage to steering knuckle will result.

KNUCKLE (Continued)

Fig. 22 Strut To Steering Knuckle Attaching Bolts

- 1 - STRUT ASSEMBLY
- 2 - NUTS
- 3 - STRUT ASSEMBLY TO STEERING KNUCKLE ATTACHING BOLTS
- 4 - STEERING KNUCKLE

(3) Install the strut assembly to steering knuckle attaching bolts (Fig. 22). Install nuts on attaching bolts (Fig. 22). Tighten the strut clevis to steering knuckle attaching bolt nuts to a torque of 203 N·m (150 ft. lbs.).

CAUTION: Hub and bearing assembly mounting surfaces on steering knuckle and halfshaft (Fig. 23) must be smooth and completely free of foreign material or nicks.

Fig. 23 Hub And Bearing Assembly Mounting Surfaces

- 1 - BE SURE THESE SURFACES ARE CLEAN AND FREE OF KNICKS BEFORE INSTALLING BEARINGS
- 2 - STEERING KNUCKLE
- 3 - STUB AXLE

CAUTION: When installing hub and bearing assembly into steering knuckle, be careful not to damage the flinger disc (Fig. 17) on hub and bearing assembly. If flinger disc becomes damaged, hub and bearing assembly **MUST** not be used and **MUST** be replaced with a new hub and bearing assembly.

(4) Install hub and bearing assembly onto stub shaft and into steering knuckle until squarely seated on face of steering knuckle.

(5) Install the 3 steering knuckle to hub and bearing assembly attaching bolts (Fig. 16). Equally tighten all 3 mounting bolts until hub and bearing assembly is squarely seated against front of steering knuckle. Then tighten all 3 hub and bearing assembly mounting bolts to a torque of 110 N·m (80 ft. lbs.).

CAUTION: The hub and bearing axle retaining nut (Fig. 15) is a prevailing torque nut and cannot be reused. A **NEW** retaining nut **MUST** be used.

(6) Install a **NEW** hub and bearing axle retaining nut on the stub shaft (Fig. 15). **Do not torque the hub nut at this time.**

(7) Coat speed sensor head with High Temperature Multipurpose E.P. Grease before installing into the steering knuckle. Install speed sensor head into steering knuckle. Install screw and tighten to a torque of 7 N·m (60 in. lbs.).

(8) Install the brake rotor back on the hub and bearing assembly (Fig. 13).

(9) Install front brake caliper on steering knuckle. Refer to Disc Brake Caliper in Brakes. Install the caliper to steering knuckle attaching bolts (Fig. 12) and tighten them to a torque of 22 N·m (192 in. lbs.).

(10) Apply the brakes, then tighten the axle retaining nut to a torque of 142 N·m (105 ft. lbs.).

(11) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(12) Lower vehicle to the ground.

LOWER BALL JOINT

DESCRIPTION

The ball joint is an integral part of the control arm and has a non-tapered stud with a notch for clamp (pinch) bolt installation. The stud is clamped and locked into the steering knuckle leg using a clamp (pinch) bolt.

LOWER BALL JOINT (Continued)

The ball joint used in the lower control arm of this vehicle is a sealed-for-life ball joint and requires no maintenance lubrication. The ball joint cannot be serviced separately from the lower control arm. If the ball joint is determined to be defective it will require replacement of the complete lower control arm. Refer to DIAGNOSIS AND TESTING in this section for proper testing of the ball joint.

NOTE: The ball joint does not require any type of additional lubrication for the life of the vehicle. No attempt should be made to ever add any lubrication to the lower ball joint.

OPERATION

The ball joint is a pivotal joint on the lower control arm that allows the knuckle to move up and down, and turn with ease.

DIAGNOSIS AND TESTING - BALL JOINT

Raise front of vehicle using jack stands or a frame contact hoist until front suspension is in full rebound and tires are not in contact with the ground. Grasp tire at top and bottom, and apply in and out force on the wheel and tire. While applying force to the tire, look for any movement between the lower ball joint and lower control arm. If any movement is evident, the lower ball joint is worn and the lower control arm requires replacement. The ball joint is not serviced separately.

LOWER CONTROL ARM

DESCRIPTION

The lower control arm is a steel forging with 2 rubber bushings and a ball joint (Fig. 1). The bushing isolating the lower control arm from the front cradle/crossmember is a metal encased pivot bushing. The bushing isolating the lower control arm from the tension strut is a solid rubber bushing. The lower control arm is bolted to the cradle/crossmember using a bolt through the center of the pivot bushing. The tension strut is fastened through the center of the tension strut bushing and lower control arm. The lower control arm ball joint connects to the steering knuckle.

OPERATION

The lower control arm supports the lower end of the steering knuckle and allows for the up and down movement of the suspension during the jounce and rebound travel.

DIAGNOSIS AND TESTING - LOWER CONTROL ARM

Inspect the lower control arm for signs of damage from contact with the ground or road debris. If the lower control arm shows any sign of damage, inspect the lower control arm to see if it is bent.

The only serviceable components of the lower control arm are the pivot bushing and the tension strut bushing. The lower control arm is serviced as a complete assembly otherwise. **Do not attempt to repair or straighten a broken or bent lower control arm. It must be replaced.**

REMOVAL - LOWER CONTROL ARM

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the wheel and tire assembly from the vehicle.

(3) Remove the ball joint stud to steering knuckle attaching nut and bolt (Fig. 24).

Fig. 24 Control Arm To Steering Knuckle

- 1 - LOWER CONTROL ARM
- 2 - BALL JOINT STUD
- 3 - CLAMP NUT AND BOLT

CAUTION: Pulling steering knuckle out from vehicle after releasing from ball joint can separate inner C/V joint. See Driveshafts.

CAUTION: When lower control arm is separated from steering knuckle, do not let ball joint seal hit up against steering knuckle. If ball joint seal hits steering knuckle, seal damage may occur. If ball joint seal becomes torn, replace seal before assembling lower control arm to knuckle.

LOWER CONTROL ARM (Continued)

(4) Carefully insert a pry bar between lower control arm and steering knuckle (Fig. 25). Push down on pry bar to separate ball joint stud from steering knuckle (Fig. 25).

Fig. 25 Separating Ball Joint From Steering Knuckle

- 1 - STEERING KNUCKLE
- 2 - BALL JOINT STUD
- 3 - PRY BAR
- 4 - LOWER CONTROL ARM

(5) Remove tension strut to cradle attaching nut and washer from end of tension strut (Fig. 26). When removing tension strut nut, keep strut from turning by holding tension strut at flat using an open end wrench (Fig. 26). **Discard tension strut to cradle retaining nut. A NEW tension strut to cradle nut must be used when installing tension strut.**

Fig. 26 Tension Strut To Cradle Mounting

- 5 - LOWER CONTROL ARM

DISASSEMBLY

DISASSEMBLY - LOWER CONTROL ARM (PIVOT BUSHING)

(1) Remove lower control arm and tension strut as an assembly from the vehicle.

(2) Separate the tension strut from the lower control arm assembly.

(3) Position lower control arm in arbor press with large end of pivot bushing inside Receiver, Special Tool MB-990799, as shown (Fig. 30). Position Remover, Special Tool 6644-2, on top of pivot bushing (Fig. 30).

(4) Using the arbor press, press the lower control arm pivot bushing out of lower control arm.

(5) Remove the pressed out lower control arm pivot bushing from the Receiver and discard.

DISASSEMBLY - LOWER CONTROL ARM (TENSION STRUT BUSHING)

(1) Remove lower control arm and tension strut as an assembly from the vehicle. See Lower Control Arm/Removal in this section.

(2) Separate the tension strut from the lower control arm assembly.

(3) Position lower control arm in arbor press with tension strut bushing inside Receiver, Special Tool MB-990799, as shown (Fig. 31). Position Remover, Special Tool 6644-4, on top of tension strut bushing (Fig. 31).

9302-18

Fig. 31 Removing Lower Control Arm Tension Strut Bushing

- 1 - ARBOR PRESS RAM
- 2 - SPECIAL TOOL 6644-4
- 3 - SPECIAL TOOL MB990799
- 4 - TENSION STRUT BUSHING
- 5 - LOWER CONTROL ARM

(4) Lower the arbor press ram, pressing Remover, Special Tool 6644-4, down through the tension strut bushing until the arbor press can push it no farther. This action will cut the bushing into two pieces.

(5) Remove lower control arm from arbor press. Remove pieces of tension strut and Remover, Special Tool 6644-4, from lower control arm.

LOWER CONTROL ARM (Continued)

ASSEMBLY

ASSEMBLY - LOWER CONTROL ARM (PIVOT BUSHING)

(1) Position the lower control arm so it is supported by Receiver, Special Tool MB-990799, as shown (Fig. 32).

(2) Place new pivot bushing in lower control arm so it is square with the bushing hole. Position Installer, Special Tool 6644-1, on top of pivot bushing, with pivot bushing setting in recessed area of Installer (Fig. 32).

9302-16

Fig. 32 Installing Lower Control Arm Pivot Bushing

- 1 - ARBOR PRESS RAM
- 2 - SPECIAL TOOL 6644-1
- 3 - SPECIAL TOOL MB990799
- 4 - PIVOT BUSHING
- 5 - TENSION STRUT BUSHING
- 6 - LOWER CONTROL ARM

(3) Press pivot bushing into lower control arm until Installer, Special Tool 6644-1, squarely bottoms against surface of lower control arm (Fig. 33). At that point, the bushing is installed to the correct position in control arm.

(4) Attach tension strut to lower control arm and install on car as an assembly. See Lower Control Arm/Installation.

ASSEMBLY - LOWER CONTROL ARM (TENSION STRUT BUSHING)

(1) Thoroughly lubricate the replacement tension strut bushing, lower control arm and Installer, Special Tool 6644-3, using Mopar® Rubber Bushing Installation Lube, or an equivalent.

(2) By hand, install tension strut bushing into large end of Installer, Special Tool 6644-3. Press bushing into installer as far as it will go by hand.

9302-17

Fig. 33 Pivot Bushing

- 1 - SPECIAL TOOL 6644-1
- 2 - SPECIAL TOOL MB990799
- 3 - PRESS PIVOT BUSHING INTO LOWER CONTROL ARM UNTIL INSTALLER TOUCHES THIS SURFACE OF CONTROL ARM

(3) Position lower control arm in arbor press, so tension strut hole in lower control arm is centered on Receiver, Special Tool MB-990799 (Fig. 34). Position Installer, Special Tool 6644-3 (with previously installed bushing) inside of tension strut bushing hole in lower control arm (Fig. 34). Position Installer, Special Tool 6644-2 on top of tension strut bushing (Fig. 34).

9302-19

Fig. 34 Installing Tension Strut Bushing Into Lower Control Arm

- 1 - ARBOR PRESS
- 2 - SPECIAL TOOL 6644-2
- 3 - LOWER CONTROL ARM
- 4 - SPECIAL TOOL 6644-3
- 5 - SPECIAL TOOL MB990799

LOWER CONTROL ARM (Continued)

(4) Using the arbor press, press the tension strut bushing into the lower control arm. As the bushing is being pressed into the control arm a pop noise will be heard. When the pop is heard, Installer, Special Tool 6644-3, will move slightly up off the control arm. At this time, remove the control arm assembly from the arbor press and pull Special Tool 6644-3 off the tension strut bushing in the control arm. Tension strut bushing is now installed.

(5) Attach tension strut to lower control arm and install lower control arm and tension strut as an assembly back on the vehicle. See Lower Control Arm/Installation.

INSTALLATION - LOWER CONTROL ARM

(1) Position tension strut in lower control arm as shown (Fig. 35). Make sure the word FRONT which is stamped in tension strut, is positioned away from control arm.

9302-14

Fig. 35 Lower Control Arm And Tension Strut

- 1 - BALL JOINT STUD
- 2 - BALL JOINT SEAL
- 3 - LOWER CONTROL ARM TENSION STRUT BUSHING

- 5 - TENSION STRUT
- 6 - TENSION STRUT TO CRADLE ISOLATOR BUSHING
- 7 - LOWER CONTROL ARM
- 8 - LOWER CONTROL ARM PIVOT BUSHING
- 9 - WORD "FRONT" STAMPED IN CONTROL ARM HERE

(2) Install the washer and a **NEW** retaining nut on the end of the tension strut at the control arm. Place an open end wrench on flat of tension strut to keep it from turning tension whilst tightening retaining nut. Tighten retaining nut to a torque of 130 N·m (95 ft. lbs.).

(3) Install the lower control arm and tension strut assembly on the engine/suspension cradle in the following manner. Install tension strut and isolator bushing end into cradle first, then install lower control arm pivot bushing end into bracket on cradle (Fig. 28).

(4) Install the lower control arm to cradle bracket attaching pivot bolt and nut (Fig. 27). **Do not tighten the lower control arm to cradle bracket attaching bolt at this time.**

(5) Install washer on end of tension strut (Fig. 26). Install a **NEW** tension strut to cradle bracket nut, on tension strut (Fig. 26). Tighten the tension strut to cradle bracket retaining nut to a torque of 130 N·m (95 ft. lbs.). When torquing tension strut nut, keep tension strut from turning by holding tension strut at flat using an open end wrench (Fig. 26).

CAUTION: Pulling steering knuckle out from vehicle after releasing from ball joint can separate inner C/V joint. See Driveshafts.

CAUTION: When ball joint stud is installed into steering knuckle, do not let ball joint seal hit up against steering knuckle. If ball joint seal hits steering knuckle, seal damage may occur. If ball joint seal becomes torn, replace seal before assembling lower control arm to knuckle.

(6) Install lower ball joint stud into steering knuckle. Install steering knuckle to lower ball joint stud, clamp bolt and nut into steering knuckle (Fig. 24). Tighten the clamping bolt to a torque of 55 N·m (40 ft. lbs.).

(7) Install the wheel and tire assembly.

(8) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).

(9) Lower vehicle so the suspension is supporting vehicles weight (control arm at design height). Tighten the lower control arm pivot bushing to cradle bracket attaching bolt (Fig. 27) to a torque of 142 N·m (105 ft. lbs.).

STABILIZER BAR

DESCRIPTION

The stabilizer bar interconnects both front struts of the vehicle and is attached to the front cradle/crossmember (Fig. 1).

Attachment of the stabilizer bar to the front cradle/crossmember is through 2 rubber-isolator cushion bushings and retainers. A double ball jointed stabilizer bar link is used to attach each end of the stabilizer bar to the front strut assemblies. All parts of the stabilizer bar are replaceable as individual components.

The stabilizer bar to front cradle cushion bushings are slit for easy removal and installation. The slit

STABILIZER BAR (Continued)

must be positioned toward the front of the vehicle when the stabilizer bar is installed.

OPERATION

Jounce and rebound movements affecting one wheel are partially transmitted to the opposite wheel of the vehicle through the stabilizer bar. This helps to minimize the body roll of the vehicle during suspension movement.

DIAGNOSIS AND TESTING - STABILIZER BAR (FRONT)

Inspect for broken or distorted retainers and bushings. If bushing replacement is required, bushing can be removed by opening slit in bushing and removing bushing from around stabilizer bar. The stabilizer bar to cradle assembly bushings, should be positioned on stabilizer bar, so slit in bushing is positioned toward the front of the vehicle when the stabilizer bar is installed (Fig. 36).

Fig. 36 Stabilizer

- 2 - SLIT
- 3 - FRONT OF CAR
- 4 - SLIT
- 5 - ISOLATOR BUSHINGS
- 6 - RETAINERS

REMOVAL - STABILIZER BAR (FRONT)

(1) Remove the 4 strut assembly upper mount to strut tower mounting nut and washer assemblies securing the right front strut in place (Fig. 37).

(2) Raise vehicle on jack stands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(3) Remove right front wheel and tire assembly from the vehicle.

Fig. 37 Strut Assembly Upper Mounting

- 1 - SHOCK TOWER
- 2 - STRUT ASSEMBLY MOUNTING NUTS

(4) Remove the right stabilizer bar link nut at the strut assembly. Remove the link from the strut assembly (Fig. 38).

Fig. 38 Stabilizer Bar Link At Strut

- 1 - NUT
- 2 - OUTER TIE ROD
- 3 - NUT
- 4 - STEERING ARM
- 5 - STRUT ASSEMBLY

(5) Remove the left stabilizer bar link nut at the stabilizer bar (Fig. 39). Remove the link from the stabilizer bar.

(6) Loosen, but do not remove, the right outer tie rod end to strut arm attaching nut. Release right outer tie rod end from right strut steering arm using Puller, Special Tool C-3894A (Fig. 40), then remove nut and tie rod from the steering arm.

STABILIZER BAR (Continued)

- 3 - CRADLE ASSEMBLY
- 4 - STABILIZER BAR

(12) Remove the bolts attaching each of the 2 stabilizer bushing retainers to the cradle assembly (Fig. 45).

(13) Remove both stabilizer bar isolator bushing retainers and bushings from stabilizer bar (Fig. 45).

(14) Position a transmission jack under the body of the engine oil pan (Fig. 46). Use a wood block as a buffer between the jack and the engine oil pan in order to avoid damage to the pan (Fig. 46). Carefully raise the jack until the motor mounts clear the cradle assembly. It may be necessary to raise the jack further.

Fig. 46 Jack Positioning Below Engine Oil Pan

- 1 - TRANSAXLE
- 2 - RIGHT FRONT MOTOR MOUNT STUD
- 3 - CRADLE ASSEMBLY
- 4 - ENGINE OIL PAN
- 5 - WOOD BLOCK
- 6 - JACK
- 7 - STABILIZER BAR

(15) Remove the stabilizer bar out the right side by rotating it, taking advantage of the removed structural collar area between the engine and transaxle assembly. Remove the stabilizer bar out the right wheel opening by routing it in front of the right halfshaft then behind the right knuckle (Fig. 47).

STABILIZER BAR (Continued)

CAUTION: Be careful not to pull knuckle outward, thus stretching halfshaft and possibly separating inner C/V joint. See Driveshafts. Keep knuckle in upright position.

Fig. 47 Stabilizer Bar Removal/Installation

- 1 - STABILIZER BAR
- 2 - HALFSHAFT
- 3 - KNUCKLE

INSTALLATION - STABILIZER BAR (FRONT)

(1) Install stabilizer bar by reversing the manner in which it was removed (Fig. 47). Rotate the bar the opposite direction used when removed and move it into mounting position.

CAUTION: Be careful not to pull knuckle outward, thus stretching halfshaft and possibly separating inner C/V joint. See Driveshafts. Keep knuckle in upright position.

(2) Lower the jack supporting the engine, guiding the motor mount studs into place in the cradle assembly (Fig. 46).

(3) Install the 4 engine motor mount to cradle assembly attaching nuts (Fig. 44). Tighten the 4 nuts to a torque of 61 N·m (45 ft. lbs.).

(4) Install the structural collar to the engine oil pan and the transaxle. The structural collar should be installed using the following sequence:

- Position collar onto engine oil pan and transaxle (Fig. 43).
- Install the 2 center collar bolts to oil pan bolts. Tighten bolts initially to 3 N·m (30 in. lbs.).
- Install collar to transmission bolts and tighten to 61 N·m (45 ft. lbs.).
- Install the remaining collar to engine oil pan bolts, starting with the center bolts and working outwards, tighten collar to oil pan bolts to 61 N·m (45 ft. lbs.).

(5) Install stabilizer bar isolator bushings onto stabilizer bar with slits facing forward and flat side facing downward. **The stabilizer bar to cradle assembly bushings must be positioned on the stabilizer bar so the slit in the bushing is positioned toward front of vehicle (Fig. 48).**

Fig. 48 Stabilizer Bar Isolator Bushing

- 1 - STABILIZER BAR
- 2 - STABILIZER BAR ISOLATOR BUSHING
- 3 - CRADLE ASSEMBLY
- 4 - FRONT OF CAR
- 5 - SLIT

(6) Install the isolator bushing retainers onto the stabilizer bar isolator bushings (Fig. 45).

CAUTION: When stabilizer bar is installed, position stabilizer bar so lower part of stabilizer bar is centered in the middle of the cradle assembly. Failure to do this may cause stabilizer bar to come in contact with other suspension components.

(7) Align the stabilizer bar bushing retainers with the mounting holes in the cradle assembly. Install and tighten the 4 stabilizer bar bushing retainer to cradle assembly attaching bolts to 61 N·m (45 ft. lbs.). (Fig. 45).

(8) Install left side stabilizer bar attaching link to left end of stabilizer bar (Fig. 39). Install attaching nut and tighten to 95 N·m (70 ft. lbs.).

(9) Install right front strut assembly into shock tower. Install the 4 strut assembly upper mount to shock tower attaching nuts (Fig. 37). Tighten the 4 strut mount to strut tower attaching nuts to a torque of 45 N·m (33 ft. lbs.) torque.

(10) Position steering knuckle into strut assembly.

STABILIZER BAR (Continued)

CAUTION: The strut assembly to steering knuckle bolts are serrated were they go through strut assembly and steering knuckle. When installing bolts, turn nuts onto bolts **DO NOT TURN BOLTS IN STEERING KNUCKLE**. If bolts are turned damage to steering knuckle will result.

(11) Install the strut assembly to steering knuckle attaching bolts (Fig. 42). Install nuts on attaching bolts. Tighten the strut assembly to steering knuckle attaching bolt nuts to a torque of 203 N·m (150 ft. lbs.).

(12) If the vehicle is equipped with antilock brakes. Install the front speed sensor cable routing bracket onto the front strut assembly (Fig. 41).

(13) Install outer tie rod on strut assembly. Install tie rod attaching nut (Fig. 38). Tighten the tie rod attaching nut to a torque of 37 N·m (27 ft. lbs.).

(14) Install stabilizer bar link on strut (Fig. 38). Tighten the stabilizer link attaching nut to a torque of 95 N·m (70 ft. lbs.).

(15) Install the right front wheel and tire assembly.

(16) Tighten the wheel mounting nuts in proper sequence until all nuts are torqued to half specification. Repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(17) Lower vehicle to the ground.

STABILIZER BAR BUSHINGS

REMOVAL - STABILIZER BAR BUSHING (FRONT)

(1) Raise vehicle on jack stands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the 2 bolts attaching each of the 2 stabilizer bushing retainers and bushings to the cradle assembly (Fig. 49).

(3) Remove the stabilizer bar isolator bushing retainers from the isolator bushings.

(4) Inspect for broken or distorted retainers and bushings. If bushing replacement is required, the bushing can be removed by opening the slit in the bushing and removing the bushing from around stabilizer bar. **The stabilizer bar to cradle assembly bushings must be positioned on the stabilizer bar so the slit in the bushing is positioned toward front of vehicle** (Fig. 50).

INSTALLATION - STABILIZER BAR BUSHING (FRONT)

(1) Install bushings onto stabilizer bar with slits facing forward and flat side facing downward. **The stabilizer bar to cradle assembly bushings must**

Fig. 49 Stabilizer Bar Isolator Bushing Attachment To Cradle

(3) Align the stabilizer bar bushing retainers with the mounting holes in the cradle assembly (Fig. 49).

(4) Install and torque the 4 stabilizer bar bushing retainer to cradle assembly attaching bolts (2 each retainer) to 61 N·m (45 ft. lbs.).

(5) Lower vehicle to the ground.

STRUT

DESCRIPTION - STRUT ASSEMBLY (FRONT)

The front strut and suspension of the vehicle is supported by coil springs positioned around the struts (Fig. 1). The springs are contained between an upper seat, located just below the upper strut mount and a lower spring seat on the strut housing. A steering arm is permanently attached to each strut making it side specific.

The top of each strut assembly is bolted to the upper fender reinforcement (strut tower) through a rubber isolated mount.

The bottom of the strut assembly attaches to the top of the steering knuckle with two serrated through-bolts and prevailing torque nuts.

Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service.

The components of the strut assembly listed below are serviceable if found to be defective (Fig. 52):

- Strut shaft retainer nut
- Upper mount
- Seat and bearing
- Dust shield

- Jounce bumper
- Jounce bumper cup
- Coil spring
- Upper spring isolator
- Lower spring isolator
- Strut

**Fig. 52 Strut Assembly Components**

- 6 - JOUNCE BUMPER
- 7 - COIL SPRING
- 8 - UPPER SPRING ISOLATOR
- 9 - UPPER MOUNT

OPERATION - STRUT ASSEMBLY (FRONT)

The strut assembly cushions the ride of the vehicle, controlling vibration, jounce and rebound of the suspension.

The coil spring controls ride quality and maintains proper ride height.

The spring isolators isolate the coil spring at the top and bottom from coming into metal-to-metal contact with the upper mounting seat and the strut.

The jounce bumper limits suspension travel and metal-to-metal contact under full jounce condition.

The strut dampens jounce and rebound motions of the coil spring and suspension.

STRUT (Continued)

DIAGNOSIS AND TESTING - STRUT ASSEMBLY (FRONT)

- (1) Inspect for damaged or broken coil springs.
- (2) Inspect for torn or damaged strut assembly dust boots.
- (3) Lift dust boot and inspect strut assembly for evidence of fluid running from the upper end of fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the strut rod and strut shaft seal is not unusual and does not affect performance of the strut assembly. Also inspect jounce bumpers for signs of damage or deterioration.
- (4) Inspect the upper strut mount assembly. Make sure the correct mount is on the correct side of the vehicle. Looking down at the top of the upper mount, 2 tabs can be seen, (Fig. 53) and (Fig. 54), down inside the mount center well. The positioning of these tabs is critical to vehicle ride and sound. **DO NOT install a right mount on the left front strut or a left mount on a right front strut.** If the strut is off the vehicle, a rectangular hole can be seen on the edge of the mount mounting surface (Fig. 53) and (Fig. 54). This is always in the 10 o'clock position when observing rubber tab positioning, whether a left or right mount is being observed.

80b34e0e

Fig. 54 Right Front Strut Upper Mount

- 1 - NOTCH
- 2 - STEERING ARM
- 3 - OUTBOARD STRUT COIL SPRING SEAT
- 4 - RUBBER TABS

Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. Be sure that the springs meet the correct load rating for the vehicle and its specific options.

REMOVAL - STRUT ASSEMBLY (FRONT)

WARNING: DO NOT REMOVE THE STRUT ASSEMBLY'S SHAFT NUT AT ANY TIME UNLESS THE COIL SPRING HAS BEEN PROPERLY COMPRESSED FOLLOWING THE PROCEDURE LISTED IN STRUT ASSEMBLY DISASSEMBLY IN THIS SECTION.

- (1) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in Lubrication and Maintenance.
- (2) Remove front tire and wheel assembly from the vehicle.
- (3) Remove the stabilizer bar link nut at the strut assembly. Remove the link from the strut assembly (Fig. 55).
- (4) Loosen, but do not remove, the outer tie rod end to strut arm attaching nut (Fig. 56). Release outer tie rod end from steering arm using Puller, Special Tool C-3894A (Fig. 56), then remove nut and tie rod from the steering arm.

80b34e0d

- 1 - BRAKE LINE
- 2 - CALIPER GUIDE PIN BOLTS
- 3 - STEERING KNUCKLE
- 4 - BLEEDER SCREW
- 5 - CALIPER ASSEMBLY

STRUT (Continued)

(7) Remove brake caliper assembly from steering knuckle and brake rotor. Refer to the Brakes. Support caliper assembly by hanging it from frame of vehicle with wire or some other method (Fig. 59). Do not let caliper assembly hang by brake hose.

Fig. 59 Caliper Supported

- 1 - WIRE HANGER
- 2 - FLEXIBLE BRAKE HOSE
- 3 - BRAKING DISC
- 4 - CALIPER ASSEMBLY
- 5 - STEERING KNUCKLE

(8) Remove brake rotor from hub.

CAUTION: The strut assembly to steering knuckle bolts are serrated were they go through strut assembly and steering knuckle. When removing bolts, turn nuts off bolts **DO NOT TURN BOLTS IN STEERING KNUCKLE**. If bolts are turned damage to steering knuckle will result.

(9) Remove the 2 strut assembly to steering knuckle attaching bolts (Fig. 60).

(10) Remove the 4 strut assembly upper mount to strut tower mounting nut and washer assemblies (Fig. 61).

(11) Remove the strut assembly from the vehicle.

(12) For disassembly of the strut assembly, refer to Disassembly.

Fig. 60 Strut To Steering Knuckle Attaching Bolts

- 3 - STRUT MOUNT

DISASSEMBLY - STRUT ASSEMBLY (FRONT)

The Strut assembly must be removed from the vehicle for it to be disassembled and assembled. Refer to Removal in this section.

For the disassembly and assembly of the strut assembly, use strut spring compressor, Pentastar Service Equipment (PSE) tool W-7200, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

STRUT (Continued)

WARNING: DO NOT REMOVE THE STRUT ASSEMBLY'S SHAFT NUT AT ANY TIME UNLESS THE COIL SPRING HAS BEEN PROPERLY COMPRESSED FOLLOWING THE PROCEDURE LISTED HERE.

(1) If both struts are being serviced at the same time, mark the coil spring and strut assembly according to which side of the vehicle the strut was removed from, and which strut the coil spring was removed from.

(2) Position the strut assembly in the strut coil spring compressor following the manufacturers instructions (Fig. 62). The strut clevis bracket should be positioned outward. It will be necessary to turn the strut assembly so the steering arm will clear the compressor arm. Position the upper and lower hooks on the coil spring, then place a clamp on the lower end of the coil spring, so the strut is held in place once the strut shaft nut is removed (Fig. 62).

Fig. 62 Strut Assembly In Compressor

- 1 - HOOKS
- 2 - STRUT ASSEMBLY
- 3 - CLAMP
- 4 - COIL SPRING

WARNING: DO NOT REMOVE THE STRUT SHAFT NUT BEFORE THE COIL SPRING IS COMPRESSED. THE COIL SPRING IS HELD UNDER PRESSURE AND MUST BE COMPRESSED, REMOVING SPRING TENSION FROM THE UPPER MOUNT AND PIVOT BEARING, BEFORE THE SHAFT NUT IS REMOVED.

(3) Compress the coil spring until all coil spring tension is removed from the upper mount.

(4) Install Strut Nut Socket, Special Tool 6864, on the strut shaft retaining nut (Fig. 63). Next, install a socket on the hex on the end of the strut shaft. While holding the strut shaft from turning, remove the nut from the strut shaft.

Fig. 63 Shaft Nut Removal/Installation

- 1 - SPRING COMPRESSOR
- 2 - SPECIAL TOOL 6864
- 3 - UPPER MOUNT

(5) Remove the upper mount from the strut shaft.

(6) Remove the clamp from the bottom of the coil spring and remove the strut out through the bottom of the coil spring.

NOTE: If the seat and bearing, upper spring isolator, dust boot, or coil spring need to be serviced, proceed with the next step, otherwise, proceed with step 9.

NOTE: Before removal of the seat and bearing from the spring, note the flat on the inboard side of the seat and bearing outer perimeter. This must align with the inboard side of the strut (or rear of the clevis bracket) on reassembly. Also note the coil spring ending at the stop built into the seat and upper isolator.

(7) Remove the seat and bearing, upper spring isolator and dust shield as an assembly from the top of the coil spring by pulling them straight up. They can be separated once removed from the vehicle. The

STRUT (Continued)

jounce bumper cup may also come off when the assembly is removed. Check inside the dust shield.

NOTE: Before releasing the tension on the coil spring, note the position of the coil end on the upper end of the coil spring. When reinstalled, it must be positioned in the same spot for proper alignment of the seat and bearing, and the strut.

(8) Release the tension from the coil spring by backing off the compressor drive fully. Push back the compressor hooks and remove the coil spring.

(9) Remove the jounce bumper cup and jounce bumper from the strut shaft by pulling each straight up and off the strut shaft (Fig. 64). If the jounce bumper cup is not present, check inside the dust shield. It may have stayed inside the dust shield.

Fig. 64 Strut Assembly Components

- 1 - SEAT AND BEARING
- 2 - DUST SHIELD
- 3 - CUP
- 4 - LOWER SPRING ISOLATOR
- 5 - STRUT
- 6 - JOUNCE BUMPER
- 7 - COIL SPRING
- 8 - UPPER SPRING ISOLATOR
- 9 - UPPER MOUNT

(10) Remove the lower spring isolator from the lower spring seat on the strut (Fig. 65).

(11) Inspect the strut assembly components for the following and replace as necessary:

- Inspect the strut for any condition of shaft binding over the full stroke of the shaft.

Fig. 65 Lower Spring Isolator

- 1 - LOWER SPRING ISOLATOR
- 2 - LOWER SPRING SEAT

- Inspect the jounce bumper for cracks and signs of deterioration.
- Check the upper mount for cracks and distortion and its retaining studs for any sign of damage.
- Check the upper seat and bearing for cracks and distortion.
- Check for binding of the seat and bearing pivot bearing.
- Inspect the dust shield for rips and deterioration.
- Inspect the upper and lower spring isolators for material deterioration.
- Inspect the coil spring for any sign of damage to the coating.

ASSEMBLY - STRUT ASSEMBLY (FRONT)

For the disassembly and assembly of the strut assembly, use strut spring compressor, Pentastar Service Equipment (PSE) tool W-7200, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

NOTE: If the coil spring has been removed from the spring compressor, proceed with the next step, otherwise, proceed with step 5.

(1) Place the coil spring in the compressor following the manufacturers instructions (Fig. 62). Before compressing the spring, rotate the spring to the position noted in the note between steps 7 and 8.

(2) If disassembled, reinstall the upper spring isolator and dust shield on seat and bearing. Match the step in the isolator with the step in the seat and bearing.

(3) Install the seat and bearing (with dust shield attached) on top of the coil spring. Position the step

STRUT (Continued)

built into the seat and upper spring isolator against the coil end of the coil spring.

(4) Install the lower spring isolator on the lower spring seat of the strut (Fig. 65). The tabs on the isolator will align it on the strut spring seat. They straddle the expanded area of the lower spring seat on the strut.

(5) Install the jounce bumper on the strut shaft. The jounce bumper is to be installed with the smaller end pointing downward toward the lower seat (Fig. 64).

(6) Install the jounce bumper cup (Fig. 64) on the strut shaft. The cupped side goes on first.

(7) Install the strut through the bottom of the coil spring until the lower spring seat contacts the lower end of the coil spring. The inboard side of the strut (or rear of the clevis bracket) should align with the flat on the inboard side of the seat and bearing outer perimeter. Install the clamp on the lower end of the coil spring and strut, so the strut is held in place (Fig. 62).

CAUTION: Before installing the upper mount, make sure the correct upper mount is being installed on the strut. **DO NOT** install a right mount on a left front strut or a left mount on a right front strut. Incorrect mount installation may cause poor vehicle ride and steering feel, and excessive front end noise. A lead or drift condition may also be the result. Left and right mounts look similar, but are different from one another. Looking down at the top of the upper mount, 2 tabs can be seen, (Fig. 66) and (Fig. 67), down inside the mount center well. A rectangular hole can be seen on the edge of the mount mounting surface (Fig. 66) and (Fig. 67). This is always in the 10 o'clock position when observing rubber tab positioning, whether a left or right mount is being observed. Once this hole is located in the 10 o'clock position, the tabs should be in the positions as shown (Fig. 66) and (Fig. 67). The right upper mount should also have a white dot painted on its mounting face.

(8) Install the strut upper mount over the strut shaft and onto the top of the seat and bearing. Loosely install the retaining nut on the strut shaft.

(9) Install Strut Nut Socket (on the end of a torque wrench), Special Tool 6864, on the strut shaft retaining nut (Fig. 63). Next, install a socket on the hex on the end of the strut shaft. While holding the strut shaft from turning, tighten the strut shaft retaining nut to a torque of 94 N·m (70 ft. lbs.).

(10) Slowly release the tension from the coil spring by backing off the compressor drive fully. As the tension is relieved, make sure the upper mount and seat and bearing align properly. Verify the upper mount does not bind.

80b34e0d

Fig. 66 Left

- 1 - NOTCH

80b34e0e

Fig. 67 Right Front Strut Upper Mount

- 1 - NOTCH
- 2 - STEERING ARM
- 3 - OUTBOARD STRUT COIL SPRING SEAT
- 4 - RUBBER TABS

(11) Remove the clamp from the lower end of the coil spring and strut. Push back the spring compressor upper and lower hooks, then remove the strut assembly from the spring compressor.

(12) Install the strut assembly on the vehicle. Refer to INSTALLATION in this section.

INSTALLATION - STRUT ASSEMBLY (FRONT)

(1) Install front strut assembly into shock tower. Install the 4 strut assembly upper mount to shock tower attaching nuts (Fig. 61). Tighten the 4 strut mount to strut tower attaching nuts to a torque of 37 N·m (28 ft. lbs.) torque.

(2) Position steering knuckle into strut assembly.

STRUT (Continued)

CAUTION: The strut assembly to steering knuckle bolts are serrated were they go through strut assembly and steering knuckle. When installing bolts, turn nuts onto bolts **DO NOT TURN BOLTS IN STEERING KNUCKLE**. If bolts are turned damage to steering knuckle will result.

(3) Install the strut assembly to steering knuckle attaching bolts (Fig. 60). Install nuts on attaching bolts. Tighten the strut assembly clevis to steering knuckle attaching bolt nuts to a torque of 203 N·m (150 ft. lbs.).

(4) Install braking disc back on front hub and bearing assembly. Install front brake caliper assembly on steering knuckle. Install the 2 caliper assembly to steering knuckle attaching bolts (Fig. 58). Tighten the caliper assembly guide pin bolts to a torque of 19 N·m (192 in. lbs.).

(5) If the vehicle is equipped with antilock brakes. Install the front speed sensor cable routing bracket onto the front strut assembly (Fig. 57).

(6) Install outer tie rod on strut assembly. Install tie rod attaching nut. Tighten the tie rod attaching nut to a torque of 37 N·m (27 ft. lbs.).

(7) Install stabilizer bar link on strut (Fig. 55). Tighten the stabilizer link attaching nut to a torque of 95 N·m (70 ft. lbs.).

(8) Install the wheel and tire assembly.

(9) Tighten the wheel mounting nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(10) Lower vehicle.

TENSION STRUT

DESCRIPTION

This vehicle uses a steel tension strut on each side of the vehicle's front suspension, between the lower control arm and front suspension cradle/crossmember (Fig. 1). The strut has rubber isolator bushings, retainer washers and nuts at each end where it mounts.

OPERATION

The tension strut controls longitudinal (fore-and-aft) movement of each front wheel and the front suspension. Controlling the longitudinal movement helps reduce harshness when the wheel hits sudden irregularities in the road surface.

The tension strut's rubber isolator bushings isolate suspension noise from the body of the vehicle.

REMOVAL - TENSION STRUT

The tension strut is removed from the vehicle with the lower control arm, then separated. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL)

INSTALLATION - TENSION STRUT

The tension strut is attached to the lower control arm, then the two are installed together. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION)

TENSION STRUT CRADLE BUSHING

REMOVAL - TENSION STRUT CRADLE BUSHING

(1) Remove lower control arm and tension strut as an assembly from the vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL)

(2) Remove the tension strut cradle bushing half and sleeve from the tension strut (Fig. 68).

Fig. 68 Bushing Installed On Tension Strut

- 4 - TENSION STRUT
- 5 - RETAINING WASHERS
- 6 - TENSION STRUT TO LOWER CONTROL ARM BUSHING
- 7 - NUT

TENSION STRUT CRADLE BUSHING (Continued)

(3) Remove the remaining tension strut cradle bushing halve from the engine cradle assembly (Fig. 69).

Fig. 69 Bushing In Cradle

- 1 - CRADLE ISOLATOR BUSHING
- 2 - CRADLE
- 3 - TENSION STRUT TO CRADLE ISOLATOR BUSHING

INSTALLATION - TENSION STRUT CRADLE BUSHING

(1) Install tension strut cradle isolator bushing halve into front side of cradle mounting hole, until squarely seated against cradle (Fig. 69).

(2) Install isolator bushing halve on tension strut until it is seated against retaining washer as shown (Fig. 68).

(3) Reinstall the tension strut and lower control arm as an assembly back in the vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION)

REAR SUSPENSION

DESCRIPTION - REAR SUSPENSION

The rear suspension used on this vehicle is a fully independent rear suspension (Fig. 1).

Each side of the rear suspension consists of these major components:

- Strut assembly
- Spindle
- Hub and bearing
- Two lateral links
- Trailing arm
- Stabilizer bar

OPERATION - REAR SUSPENSION

The rear suspension allows each rear wheel on the vehicle to adapt to different road surfaces and conditions without affecting the control of the vehicle. Each side of the suspension is allowed to move independently from the other.

CAUTION

CAUTION: Only frame contact or wheel lift hoisting equipment can be used on vehicles having a fully independent rear suspension. Vehicles with independent rear suspension can not be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used damage to rear suspension components will occur.

- 3 - REAR SUSPENSION CROSSMEMBER BUSHING
- 4 - LATERAL LINKS

- 5 - HUB AND BEARING
- 6 - STABILIZER BAR
- 7 - TRAILING ARM
- 8 - SPINDLE

CAUTION: If the vehicle is equipped with the Tire Pressure Monitoring (TPM) System, the tire/wheel assembly needs to be reinstalled in the same location it is removed from or the TPM System (sensors) will need to be retrained. Mark each tire/wheel assembly indicating location, prior to its removal. If the tire/wheel assemblies are switched, rotated or replaced, the TPM System needs to be retrained. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

CAUTION: If a rear suspension component becomes bent, damaged or fails, no attempt should be made to straighten or repair it. Always replace with a new component.

HUB / BEARING

DESCRIPTION

The rear wheel bearing and rear wheel hub of this vehicle are a one piece sealed unit or hub and bearing unit type assembly. The hub and bearing is mounted to the center of the spindle using a retaining nut (Fig. 1). It has five wheel mounting studs on the hub flange.

The wheel mounting studs used to mount the tire and wheel to the vehicle are the only replaceable components of the hub and bearing assembly. Otherwise, the hub and bearing is serviced only as a complete assembly.

CAUTION: If a vehicle is equipped with antilock brakes, the tone wheel for the rear wheel speed sensor is pressed onto the hub and bearing.

OPERATION

The hub and bearing has internal bearings that allow the hub to rotate with the tire and wheel. The five wheel mounting studs mount the tire and wheel, and disc brake rotor to the vehicle.

DIAGNOSIS AND TESTING - HUB AND BEARING (REAR)

The rear hub and bearing assembly is designed for the life of the vehicle and should require no maintenance. The following procedure may be used for evaluation of bearing condition.

With wheel and brake drum removed, rotate flanged outer ring of hub. Excessive roughness, lateral play or resistance to rotation may indicate dirt intrusion or bearing failure. If the rear wheel bearings exhibit these conditions during inspection, the hub and bearing assembly should be replaced.

Damaged bearing seals and resulting excessive grease loss may also require bearing replacement. Moderate grease loss from bearing is considered normal and should not require replacement of the hub and bearing assembly.

REMOVAL - HUB AND BEARING (REAR)

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the rear wheel and tire assembly from the vehicle.

(3) Remove the rear caliper assembly from the adapter. Refer to Disc Brake Caliper in Brakes. After removing caliper assembly, store caliper by hanging it from frame of vehicle (Fig. 2). Do not let weight of rear caliper assembly hang from flexible brake hose.

(4) Remove rear brake rotor from hub.

HUB / BEARING (Continued)

**Fig. 2 Storing Caliper**

- 1 - FLEX HOSE
- 2 - STRUT
- 3 - WIRE HANGER
- 4 - CALIPER ASSEMBLY

(5) Remove rear hub and bearing assembly cotter pin and nut retainer (Fig. 3). Remove the hub and bearing retaining nut and washer from the spindle (Fig. 3). Remove hub and bearing assembly from spindle.

**Fig. 3 Hub And Bearing Retaining Nut and Washer**

- 1 - HUB RETAINING NUT
- 2 - NUT RETAINER
- 3 - COTTER PIN
- 4 - SPINDLE

INSTALLATION - HUB AND BEARING (REAR)

(1) Install the rear hub and bearing assembly on the rear spindle. Install hub and bearing assembly retaining washer and nut on spindle (Fig. 3). Tighten the hub and bearing retaining nut to a torque of 168 N·m (124 ft. lbs.). Install the nut retainer and cotter pin.

(2) Install the rear brake rotor on the hub.

(3) Carefully place rear brake caliper over rotor and install on adapter. Refer to Disc Brake Caliper in Brakes.

(4) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(5) Lower vehicle to the ground.

LATERAL LINK**DESCRIPTION**

There are two tubular lateral links on each side of the rear suspension (Fig. 1). The lateral links have rubber isolator bushings at each end. They are attached to the rear suspension crossmember, and the spindle using a bolt and nut assembly at each end. The rear lateral link incorporates a threaded wheel alignment toe adjustment sleeve.

OPERATION

The lateral movement of the rear spindle is controlled by the lateral links connecting the front and rear centerline of the spindle to the rear suspension crossmember. The threaded adjustment sleeve of the rear link allows for setting rear wheel alignment toe adjustment.

DIAGNOSIS AND TESTING - LATERAL LINKS

Inspect the lateral link isolator bushings and sleeves for signs of damage or deterioration. If the lateral link isolator bushings or sleeves are damaged or are deteriorated, replacement of the lateral link assembly will be required. The isolator bushings are not serviceable as a separate component of the lateral link assembly.

Inspect the lateral links for signs of contact with the ground or road debris which has bent or caused other damage to the lateral link assembly. If the lateral link is bent or damaged, the lateral link will require replacement. **Do not attempt to repair or straighten a lateral link.**

LATERAL LINK (Continued)

REMOVAL - LATERAL LINKS

The left forward lateral link requires a more involved removal and installation procedure in order to remove the attaching bolt at the crossmember. See separate procedures below for the proper lateral link service procedure.

LEFT FORWARD LATERAL LINK

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove left rear wheel and tire assembly from the vehicle.

(3) Remove the nut and bolt attaching the left lateral links to the spindle (Fig. 4).

Fig. 4 Lateral Link Attachment To Spindle

- 1 - SPINDLE
- 2 - LATERAL LINKS
- 3 - LATERAL LINK ATTACHING BOLT HEAD
- 4 - STRUT ASSEMBLY
- 5 - STABILIZER BAR ATTACHING LINK
- 6 - BRAKE CALIPER
- 7 - LATERAL LINK ATTACHING BOLT NUT

(4) Remove the nut attaching the left forward lateral link to the rear suspension crossmember. **The bolt for the left front lateral link may not be removed at this time. Remove the nut only. Once the crossmember is lowered, the bolt can be easily removed.** Notice the forward link attaching bolt faces rearward.

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 5) to prevent damage to the fuel tank and or fuel tubes. Also, the left rear lateral arm attaching bolt to the crossmember is to be installed pointing forward to prevent possible damage to the fuel filler tube.

Fig. 5 Lateral Link Attachment To Crossmember

- 1 - CROSSMEMBER
- 2 - EXHAUST MUFFLER
- 3 - ATTACHING BOLT
- 4 - LEFT FORWARD LATERAL LINK

(5) Remove the screw securing the brake tubes to the left stabilizer bar isolator bushing retainer.

(6) Remove the 4 bolts attaching both stabilizer bar isolator bushing retainers to the frame rails (the 2 rearward attaching bolts also attach the front corners of the rear suspension crossmember in place). Allow the stabilizer bar to hang down out of the way.

(7) Remove the screw securing the fuel filler neck to the left frame rail.

(8) Position a transmission jack under the fuel tank.

(9) Remove the attaching bolts securing both fuel tank mounting straps. First, remove the right, then the left attaching bolt. Allow the straps to hang down.

(10) Lower the transmission jack and fuel tank just enough to allow for removal of the lateral link attaching bolt at the crossmember.

(11) Remove the left forward lateral link from the crossmember.

LEFT REAR AND BOTH RIGHT LATERAL LINKS

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove rear wheel and tire assembly from the vehicle.

(3) Remove the nut and bolt attaching the left lateral links to the spindle (Fig. 4).

(4) Remove the nut and bolt attaching the lateral link to the rear suspension crossmember. Note the direction in which the lateral arm attaching bolt is installed.

LATERAL LINK (Continued)

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 5) to prevent damage to the fuel tank and or fuel tubes. Also, the left rear lateral arm attaching bolt to the crossmember is to be installed pointing forward to prevent possible damage to the fuel filler tube.

- (5) Remove the lateral link from the crossmember.

INSTALLATION - LATERAL LINKS

The left forward lateral link requires a more involved removal and installation procedure in order to remove the attaching bolt at the crossmember. See separate procedures below for the proper lateral link service procedure.

LEFT FORWARD LATERAL LINK

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 5) to prevent damage to the fuel tank and or fuel tubes. Also, the left rear lateral arm attaching bolt to the crossmember is to be installed pointing forward to prevent possible damage to the fuel filler tube.

- (1) Attach the left forward lateral link to crossmember. Install mounting bolt through the front of the crossmember mount towards the rear. Install the lateral link attaching nut, but DO NOT fully tighten at this time.

CAUTION: Tightening the lateral link attaching bolt at this point will cause the bushing to contort when the vehicle is at curb riding height, thus contributing to premature failure of the lateral link bushings.

- (2) Raise the fuel tank up into mounting position.
- (3) Reattach the fuel tank straps, securing the fuel tank in place.
- (4) Remove transmission jack supporting the fuel tank.
- (5) Reinstall the fuel filler neck attaching screw and secure the fuel filler neck to the left frame rail.
- (6) Install the 4 bolts attaching both stabilizer bar isolator bushing retainers to the frame rails (the 2 rearward attaching bolts attach the front corners of the rear suspension crossmember in place). Tighten the forward stabilizer bar isolator bushing retainer attaching bolts to 40 N·m (30 ft. lbs.). Tighten the 2 rearward stabilizer bar isolator bushing retainer attaching bolts (which also serve as the front crossmember attaching bolts) to 100 N·m (75 ft. lbs.).
- (7) Install the screw securing the brake tubes to the left stabilizer bar isolator bushing retainer.

- (8) Install the lateral links on the spindle. Install, but DO NOT fully tighten the attaching bolt and nut at this time (Fig. 4).

CAUTION: Tightening the lateral link attaching bolt at this point will cause the bushing to contort when the vehicle is at curb riding height, thus contributing to premature failure of the lateral link bushings.

- (9) Install rear wheel and tire assembly on vehicle.
- (10) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).
- (11) Lower vehicle to the ground.
- (12) Tighten lateral arm to crossmember attaching bolt 95 N·m (70 ft. lbs.).
- (13) Tighten lateral arm to spindle attaching bolt 135 N·m (100 ft. lbs.).
- (14) Check and reset rear wheel toe to specifications if required.

LEFT REAR AND BOTH RIGHT LATERAL LINKS

- (1) Attach the lateral link to crossmember. Rear lateral link attachment bolts should be installed from the rear and point forward. Forward lateral link attachment bolts should be installed from the front and point rearward.

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 5) to prevent damage to the fuel tank and or fuel tubes. Also, the left rear lateral arm attaching bolt to the crossmember is to be installed pointing forward to prevent possible damage to the fuel filler tube.

- (2) Install the attaching nut, but DO NOT tighten at this time.

CAUTION: Tightening the lateral link attaching bolt at this point will cause the bushing to contort when the vehicle is at curb riding height, thus contributing to premature failure of the lateral link bushings.

- (3) Install the lateral links on the spindle. Install, but DO NOT fully tighten the attaching bolt and nut at this time (Fig. 4).
- (4) Install rear wheel and tire assembly on vehicle.
- (5) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).
- (6) Lower vehicle to the ground.
- (7) Tighten lateral arm to crossmember attaching bolt and nut to 95 N·m (70 ft. lbs.).

LATERAL LINK (Continued)

(8) Tighten lateral arm to spindle attaching bolt and nut to 135 N·m (100 ft. lbs.).

(9) Check and reset rear wheel toe to specifications if required.

SPINDLE

DESCRIPTION

A forged rear spindle is mounted to each side of the rear suspension (Fig. 1). The top attaches to the rear strut assembly. Two lateral links leading from the rear suspension crossmember are mounted to the forward and rearward ends of the spindle centerline. A trailing arm leading from the frame rail connects to the bottom of the spindle.

OPERATION

The spindle moves up and down with the tire and wheel under jounce and rebound conditions. The lateral links control lateral movement of the spindle while the trailing arm controls fore-and-aft movement.

The spindle acts as a mount for the rear hub and bearing, tire and wheel, and rear brakes.

DIAGNOSIS AND TESTING - SPINDLE

The rear suspension spindle is not a repairable component of the rear suspension. If it is determined that the spindle is broken or bent when servicing the vehicle, no attempt is to be made to repair or to straighten the spindle. **THE SPINDLE MUST BE REPLACED IF FOUND TO BE DAMAGED IN ANY WAY.**

REMOVAL - SPINDLE

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the rear wheel and tire assembly from the vehicle.

(3) Remove the rear caliper assembly from the adapter. Refer to Brakes/Disc Brake Caliper. After removing caliper assembly store caliper by hanging it from frame of vehicle (Fig. 6). Do not let weight of rear caliper assembly hang from flexible brake hose. If vehicle is equipped with rear drum brakes, remove the brake flex hose bracket from the support plate and wheel cylinder.

(4) Remove rear braking disc from hub.

Fig. 6 Storing Caliper

- 1 - FLEX HOSE
- 2 - STRUT
- 3 - WIRE HANGER
- 4 - CALIPER ASSEMBLY

(5) Remove rear hub and bearing assembly cotter pin and nut retainer (Fig. 7). Remove the hub and bearing retaining nut and washer from the spindle (Fig. 7). Then remove hub and bearing assembly from spindle.

Fig. 7 Hub And Bearing Retaining Nut and Washer

- 1 - HUB RETAINING NUT
- 2 - NUT RETAINER
- 3 - COTTER PIN
- 4 - SPINDLE

SPINDLE (Continued)

(6) If vehicle is equipped with antilock brakes, remove the speed sensor head from the rear disc brake adapter (Fig. 8).

80b3083c

- 3 - FRONT LATERAL LINK
- 4 - SPINDLE

(10) Remove the pinch bolt from the spindle (Fig. 12).

CAUTION: When inserting center punch into rear spindle, use care so point of center punch does not puncture strut assembly.

(11) Insert a center punch into the hole on the spindle (Fig. 13). Center punch must be tapped into the hole in the spindle until jammed into place. This will spread the spindle casting allowing it to be removed from strut assembly.

- 3 - CENTER PUNCH
- 4 - HOLE
- 5 - SPINDLE

(12) Using a hammer and a brass drift punch, tap on top surface of spindle (Fig. 14), driving it off the end of the strut assembly.

INSTALLATION - SPINDLE

(1) Install the spindle on the strut assembly. Push or tap spindle assembly onto strut until notch in spindle is tightly seated against locating tap on strut assembly (Fig. 12). Then remove center punch from hole in spindle. Install the pinch bolt in the spindle (Fig. 12). Tighten the pinch bolt to a torque of 53 N·m (40 ft. lbs.).

(2) Install the lateral links on the spindle (Fig. 11). Install, but do not fully tighten attaching bolt at this time.

(3) Install bolt attaching trailing arm to trailing arm bracket on bottom of spindle (Fig. 10). Do not fully tighten attaching bolt at this time.

(4) Install the disc brake adapter back on the spindle. Install the 4 bolts attaching the disc brake adapter to the rear spindle (Fig. 9). Tighten the disc brake adapter mounting bolts to a torque of 115 N·m (85 ft. lbs.).

(5) If vehicle is equipped with antilock brakes, install the speed sensor head into the rear disc brake adapter (Fig. 8). Tighten the speed sensor head attaching bolt to a torque of 7 N·m (60 in. lbs.).

(6) Install the rear hub and bearing assembly on the rear spindle. Install hub and bearing assembly retaining washer and nut on spindle (Fig. 7). Tighten the hub and bearing retaining nut to a torque of 168 N·m (124 ft. lbs.).

(7) Install the rear brake disc on the hub.

(8) Carefully place rear brake caliper over rotor and install on adapter. Tighten the caliper assembly to adapter mounting bolts to a torque of 22 N·m (192 in. lbs.). Refer to Rear Disc Brakes in Group 5 Brakes in this service manual for required caliper installation procedure.

(9) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).

(10) Lower vehicle to the ground.

SPINDLE (Continued)

(11) Tighten the lateral links to spindle attaching bolt to a torque of 135 N·m (100 ft. lbs.).

(12) Tighten the trailing arm to spindle bracket attaching bolt to a torque of 100 N·m (75 ft. lbs.).

(13) Check and reset rear wheel toe to specifications if required. Refer to Wheel Alignment.

STABILIZER BAR

DESCRIPTION

The stabilizer bar interconnects both rear strut assemblies and is attached to the rear frame rails of the vehicle (Fig. 1).

Attachment of the stabilizer bar to the rear frame rails of the vehicle is through 2 rubber-isolator bushings and bushing retainers. Stabilizer bar to strut assembly attachment is done utilizing a rubber-isolated stabilizer bar attaching link. All parts of the stabilizer bar are replaceable as individual components.

The stabilizer bar to frame rail bushings are slit for easy removal and installation. The slit must be positioned toward the front of the vehicle when the stabilizer bar is installed.

OPERATION

Jounce and rebound movements affecting one wheel are partially transmitted to the opposite wheel of the vehicle through the stabilizer bar. This helps to minimize the body roll of the vehicle during suspension movement.

DIAGNOSIS AND TESTING - STABILIZER BAR (REAR)

Inspect the stabilizer bar for damage or bending. Inspect for broken or distorted stabilizer bar bushings, bushing retainers, and worn or damaged stabilizer bar to strut attaching links. Verify all fastener bolts are properly tightened.

Inspect the bushings and sleeves on the stabilizer bar links for damage or deterioration. Inspect the links lower ball stud for excessive looseness and damage. Inspect the stabilizer bar link to ensure it is not bent or broken. If any of these conditions are present when inspecting the links, replace the stabilizer bar links as required.

REMOVAL - STABILIZER BAR (REAR)

(1) Raise vehicle on jack stands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Install a thin wrench on the hex of the attaching link stud to keep the stud from turning in the link. Next, remove the nut from the stabilizer bar to strut assembly attaching link stud at the stabilizer

bar (Fig. 15). Remove the link from the stabilizer bar. Repeat this procedure on the other side of the vehicle for the other attaching link.

STABILIZER BAR (Continued)

member in place). Remove the stabilizer bar from the vehicle.

(5) Mount the stabilizer bar in a soft jawed vise with one of the two bushings mount just above the vise jaws.

(6) Carefully pry back the retainer tabs on the wider end of the upper bushing retainer away from the lower half.

(7) Using a hammer and a brass drift punch, tap the upper half of the bushing retainer assembly forward, off of the lower half and bushing (Fig. 17).

Fig. 17 Bushing Retainer Removal

- 1 - STABILIZER BAR
- 2 - UPPER RETAINER HALF
- 3 - BRASS DRIFT PUNCH
- 4 - RELEASED RETAINER TABS
- 5 - LOWER RETAINER HALF
- 6 - SOFT JAWED VISE

(8) Remove the lower half of the bushing retainer from the bushing.

(9) Remove the bushing from the stabilizer bar. **Make note that the slit in the bushing points toward the front of the vehicle.**

(10) Remove the stabilizer bar from the vise, and repeat the preceding 5 steps to remove the second bushing from the other side of the stabilizer bar.

INSTALLATION - STABILIZER BAR (REAR)

NOTE: Inspect the bushings and retainers for cracks and distortion. If any signs appear, these pieces should be replaced.

(1) Install the bushings onto the stabilizer bar. **Make sure that the slit in the bushing points toward the front of the vehicle.**

(2) Mount the stabilizer bar in the soft jawed vise with the bushing just above the top of the vise jaws.

(3) Install the lower half of the retainer onto the bushing with the elongated mounting hole towards the front of the vehicle.

(4) Install the upper half of the retainer onto the lower half. This is done by tapping the upper half, starting with the large end, onto the lower half with a hammer and brass drift punch (Fig. 18). Tap the upper retainer half on until the mounting holes line up with the ones in the lower half.

Fig. 18 Bushing Retainer Installation

- 1 - RETAINER TABS
- 2 - LOWER RETAINER HALF
- 3 - STABILIZER BAR
- 4 - RETAINER TABS
- 5 - ELONGATED MOUNTING HOLE
- 6 - SOFT JAWED VISE
- 7 - UPPER RETAINER HALF
- 8 - BRASS DRIFT PUNCH

(5) Using a pair of pliers, bend the retainer tabs on the upper retainer half around the lower retainer half, securing the two halves together.

(6) Remove the stabilizer bar from the vise, and repeat the preceding 5 steps to install the second bushing and retainer on the other side of the stabilizer bar.

(7) Position the rear stabilizer bar in position between the frame rails. Install the 4 bolts attaching both stabilizer bar isolator bushing retainers to the frame rails (Fig. 16) (the 2 rearward attaching bolts attach the front corners of the rear suspension crossmember in place). Tighten the forward stabilizer bar isolator bushing retainer attaching bolts to 40 N·m (30 ft. lbs.). Tighten the 2 rearward stabilizer bar isolator bushing retainer attaching bolts (which also serve as the forward rear crossmember attaching bolts) to 100 N·m (75 ft. lbs.).

(8) Install the screw securing the brake tubes to the left stabilizer bar isolator bushing retainer (Fig. 16).

(9) Install both stabilizer bar attaching links onto stabilizer bar (Fig. 15). Install both stabilizer link to stabilizer bar attaching nuts (Fig. 15). Tighten the stabilizer link to stabilizer bar attaching nuts to a torque of 95 N·m (70 ft. lbs.) using a crow foot

STABILIZER BAR (Continued)

wrench and torque wrench in place of the wrench on the attaching nut. **Be sure to use a wrench to hold the link stud in place while tightening each attaching nut.**

(10) Lower vehicle to the ground.

STRUT

DESCRIPTION - STRUT ASSEMBLY (REAR)

The rear strut assemblies support the weight of the vehicle using coil springs positioned around the struts (Fig. 1). The coil springs are contained between the upper mount of the strut assembly and a lower spring seat on the body of the strut assembly.

The top of each strut assembly is bolted to the top of the inner fender through the rubber isolated upper mount.

The bottom of the strut assembly attaches to the spindle. Strut attachment to the spindle is accomplished using a split collar on the rear spindle. The collar uses a pinch bolt to retain the spindle to the strut.

The rear coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. Coil springs come in a various rates; be sure the correct spring is in use.

The components of the strut assembly listed below are serviceable if found to be defective (Fig. 19).

- Strut shaft retainer nut
- Upper mount
- Dust shield
- Jounce bumper
- Coil spring
- Upper spring isolator
- Lower spring isolator
- Strut (damper)

OPERATION - STRUT ASSEMBLY (REAR)

The rear strut assemblies support the weight of the vehicle. They cushion the ride of the vehicle, controlling vibration, jounce and rebound of the suspension.

The coil spring controls ride quality and maintains ride height.

The jounce bumper limits suspension travel and metal-to-metal contact under full jounce.

The strut dampens jounce and rebound motions of the coil spring and suspension.

DIAGNOSIS AND TESTING - STRUT ASSEMBLY (REAR)

(1) Inspect for damaged or broken coil springs (Fig. 19).

80b3083b

Fig. 19 Strut Assembly

- 1 - UPPER STRUT MOUNT
- 2 - UPPER SPRING ISOLATOR
- 3 - DUST BOOT
- 4 - LOWER SPRING ISOLATOR
- 5 - STRUT ASSEMBLY
- 6 - COIL SPRING

(2) Inspect for torn or damaged strut assembly dust boots (Fig. 19).

(3) Inspect for damaged upper and lower spring isolators (Fig. 19).

(4) Lift dust boot and inspect strut assembly for evidence of fluid running from the upper end of fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the strut rod and strut shaft seal is not unusual and does not affect performance of the strut assembly. Also inspect jounce bumpers inside dust boot for signs of damage or deterioration.

(5) Verify correct struts and coil springs are installed on vehicle.

Coil springs are rated separately for each side of vehicle depending on optional equipment and type of service.

NOTE: If the coils springs require replacement, be sure that the springs being replaced, are replaced with springs meeting the correct load and spring rate for the vehicle.

Replacement of the coil spring requires removal and disassembly of the strut assembly. (Refer to 2 - SUSPENSION/REAR/STRUT - REMOVAL)

STRUT (Continued)

REMOVAL - STRUT ASSEMBLY (REAR)

NOTE: When removing rear strut assembly from vehicle, access to the 3 rear strut assembly-to-strut tower attaching nuts is through the passenger compartment of the vehicle.

- (1) Remove the rear seat cushion from the interior of the car. Refer to Body/Seats.
- (2) Remove the rear seat back assembly. Refer to Body/Seats.
- (3) Remove both upper quarter trim panels from the rear of the vehicle interior. Refer to Body/Interior.
- (4) Remove both lower quarter trim panels from the rear of the vehicle interior. Refer to Body/Interior.
- (5) Remove the rear parcel shelf trim panel from the vehicle interior. Refer to Body/Interior.

NOTE: The speaker should be removed from the vehicle with the mounting plate attached

- (6) Remove the 4 screws securing the rear speaker and mounting plate in place for the side of the vehicle requiring repair. Unplug the wiring from the speaker, then remove the speaker and mounting plate from the vehicle.
- (7) Raise vehicle on jack stands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.
- (8) Remove the rear wheel and tire assembly from the vehicle.
- (9) Remove the rear caliper assembly from the adapter. Refer to Brakes/Disc Brake Caliper. After removing the caliper assembly, store the caliper by hanging it from the underside of the vehicle (Fig. 20). Do not let the rear caliper assembly hang by flexible brake hose.
- (10) If loose on wheel mounting studs, remove rear brake rotor from hub.
- (11) If the vehicle is equipped with antilock brakes, remove the wheel speed sensor from the disc brake caliper adapter by removing the bolt, then the sensor (Fig. 21).
- (12) Remove the lateral links from the spindle (Fig. 22). This requires the removal of one long bolt attaching both links to the spindle (Fig. 22).
- (13) Install a thin wrench on the hex of the stabilizer bar attaching link stud to keep the stud from turning in the link. Next, remove the nut from the stabilizer bar attaching link stud at the stabilizer bar (Fig. 23). Remove the link from the stabilizer bar.

- 3 - SPINDLE
- 4 - CENTER PUNCH
- 5 - HIT SPINDLE HERE
- 6 - LATERAL LINK

(18) Lower vehicle enough to access rear passenger compartment.

NOTE: When removing rear strut assembly from vehicle, access to the 3 rear strut assembly-to-strut tower attaching nuts is through the passenger compartment of the vehicle.

(19) Mark the location of the 3 strut assembly-to-rear strut tower attaching nuts (Fig. 27).

(20) Remove the 3 strut assembly-to-rear strut tower attaching nuts (Fig. 27), then remove strut assembly from vehicle.

80b30892

Fig. 27 Strut Assembly Attaching Nuts

- 1 - FRONT OF CAR
- 2 - ATTACHING NUTS
- 3 - MOUNTING STUDS
- 4 - STRUT ASSEMBLY
- 5 - SPEAKER OPENING

(21) Remove the nut, washers and rubber isolators securing the stabilizer bar link to the strut.

(22) For disassembly of the strut assembly, refer to Disassembly.

DISASSEMBLY - STRUT ASSEMBLY (REAR)

The Strut assembly must be removed from the vehicle for it to be disassembled and assembled. Refer to Removal.

(1) If both struts are being serviced at the same time, mark the coil spring and strut assembly according to which side of the vehicle the strut was removed from, and which strut the coil spring was removed from.

WARNING: DO NOT INSTALL THE COIL SPRING COMPRESSOR HOOKS ON THE COIL SPRING IN AN AREA OF THE SPRING COVERED BY A SLEEVE. IF THE SLEEVE MOVES WHEN COMPRESSING THE SPRING, THE SPRING COULD MOVE RESULTING IN PERSONAL INJURY.

CAUTION: When installing the spring compressor's hooks on the coil spring, do not position the hooks of the spring compressor on the sleeve of the coil spring. Positioning the spring compressor on the sleeve could cause the sleeve to dislodge from the coil spring when it is compressed. This would result in the required replacement of the coil spring.

(2) Position the strut assembly in the strut coil spring compressor following the manufacturers instructions. Position the strut assembly so the out-board side of the strut is outward away from the compressor. Grasp the upper and lower coils of the spring with the upper and lower hooks of the compressor. Place a clamp on the lower end of the coil spring, so the strut is held in place once the strut shaft nut is removed. Compress the coil spring until all load is removed from the upper strut mount.

(3) Install Strut Shaft Socket, Special Tool 6864, on the strut shaft nut. Use a deep well socket inserted into the opening of tool 6864 to keep strut shaft from turning. With the spring compressed, remove the nut from the strut shaft.

(4) Remove the strut upper mount assembly, upper spring isolator, dust shield, and jounce bumper. The jounce bumper should come off with the dust shield. The dust shield and upper spring isolator can be removed from the upper mount if necessary.

(5) Remove the clamp and remove the strut out from the bottom of the coil spring.

(6) Remove the lower spring isolator from the strut coil spring seat.

(7) Inspect the strut assembly components for the following and replace as necessary:

STRUT (Continued)

- Inspect the strut for any condition of shaft binding over the full stroke of the shaft.
- Inspect the strut shaft for loss of charge.
- Inspect the jounce bumper for cracks and signs of deterioration.
- Check the upper mount for cracks and distortion and its retaining studs for any sign of damage.
- Inspect the dust shield for rips and deterioration.
- Inspect the upper and lower spring isolators for material deterioration.
- Inspect the coil spring for any sign of damage to the coating.

NOTE: Before releasing the tension on the coil spring, note the position of the coil end on the upper end of the coil spring. When reinstalled, position it in the same spot for ease of alignment of the upper mount, coil spring and the strut.

(8) If the coil spring needs to be removed from the compressor, release the tension from the coil spring by backing off the compressor drive fully. Push back the compressor hooks and remove the coil spring.

ASSEMBLY - STRUT ASSEMBLY (REAR)

WARNING: DO NOT INSTALL THE COIL SPRING COMPRESSOR HOOKS ON THE COIL SPRING IN AN AREA OF THE SPRING COVERED BY A SLEEVE. IF THE SLEEVE MOVES WHEN COMpressing THE SPRING, THE SPRING COULD MOVE RESULTING IN PERSONAL INJURY.

CAUTION: Positioning the spring compressor hooks on the coil spring sleeve could cause the sleeve to dislodge from the coil spring when it is compressed. A dislodged sleeve requires replacement of the coil spring.

NOTE: Make sure all components are free of dirt and debris before assembly, especially around the mounting surfaces.

NOTE: If the coil spring has been removed from the spring compressor, proceed with the next step, otherwise, proceed with step 2.

(1) Place the coil spring in the compressor following the manufacturer's instructions. The coil spring must be installed so the sleeve on the spring is towards the upper end of assembly. Before compressing the spring, rotate the spring to the position noted in disassembly for ease of strut assembly components.

(2) Install the lower spring isolator on strut matching the step in the isolator to the step in the strut lower spring seat.

(3) Install the strut through the bottom of the coil spring until the lower spring seat contacts the lower end of the coil spring. Align the lower coil spring end with the step in the strut lower spring seat. Install the clamp on the lower end of the coil spring and strut, so the strut is held in place.

(4) Install the jounce bumper into the dust shield from the bottom (Fig. 28). The jounce bumper should snap into position at the top end of the dust shield.

80b31f4c

Fig. 28 Jounce Bumper Installed Into Dust Shield

- 1 - TOP OF DUST SHIELD
2 - DUST SHIELD
3 - JOUNCE BUMPER

(5) Install the dust shield and jounce bumper into position in bottom of upper strut mount. Dust shield should snap into position. Once correctly installed, the dust boot should be able to be rotated within the mount without coming loose.

(6) Install the upper strut mount, dust shield and jounce bumper onto the strut shaft. Position the mount so its center rear mounting stud is aligned with the stabilizer bar attaching link bracket that is on the inboard side of the strut.

(7) Install the upper strut mount to strut shaft nut on the strut shaft. Install Strut Shaft Socket, Special Tool 6864, on strut shaft nut. Use a deep well socket inserted into the opening of tool 6864 to keep strut shaft from turning. Tighten the strut shaft nut to a torque of 75 N·m (55 ft. lbs.).

(8) Slowly release the tension from the coil spring by backing off the compressor drive fully. As the tension is relieved, make sure the upper mount, spring, and strut align properly.

(9) Remove the clamp from the lower end of the coil spring and strut. Push back the spring compressor upper and lower hooks, then remove the strut assembly from the spring compressor.

STRUT (Continued)

(10) Install the strut assembly back into the vehicle. Refer to Installation.

INSTALLATION - STRUT ASSEMBLY (REAR)

(1) Install the nut, washers, and rubber isolators securing the stabilizer bar attaching link to the strut.

(2) Position the strut assembly back in the vehicle with the 3 studs on the strut mount through the holes in the strut tower. Install the 3 strut mount to body attaching nuts onto mounting studs (Fig. 27). Tighten the 3 strut mount attaching nuts to a torque of 25 N·m (19 ft. lbs.).

(3) Raise vehicle back up to working height for reconnecting lower strut.

(4) Install spindle onto bottom of the strut assembly. Push or tap spindle assembly onto lower end of strut, until notch in spindle is tightly seated against locating tab on strut assembly (Fig. 29). Then remove center punch from hole in spindle. Install spindle to strut assembly pinch bolt into spindle (Fig. 29). Tighten spindle to strut assembly pinch bolt to 53 N·m (40 ft. lbs.).

Fig. 29 Spindle Attachment To Strut

- 1 - STRUT ASSEMBLY
- 2 - SPINDLE
- 3 - PINCH BOLT
- 4 - LOCATING TAB
- 5 - NOTCH

(5) Install the lateral links on the spindle (Fig. 22). Install, but **DO NOT** fully tighten lateral links to spindle attaching bolt at this time.

CAUTION: Tightening lateral link attaching bolt to spindle at this time will contort the bushing at curb height and lead to bushing failure. This bolt is to be tightened only when the vehicle is at curb riding height.

(6) Install stabilizer bar link onto stabilizer bar (Fig. 23). Install stabilizer link to stabilizer bar

attaching nut (Fig. 23). Tighten the stabilizer link to stabilizer bar attaching nut to a torque of 95 N·m (70 ft. lbs.) using a crow foot wrench and torque wrench in place of the wrench on the attaching nut. **Be sure to use a wrench to hold the link stud in place while tightening attaching nut.**

(7) Install rear wheel speed sensor into brake caliper adapter. Install head attaching bolt (Fig. 21) and tighten to 7 N·m (60 in. lbs.).

(8) Install rear braking disc on hub. Carefully install rear brake caliper over braking disc and install on adapter. Tighten rear caliper assembly to adapter mounting bolts to 22 N·m (192 in. lbs.).

(9) Install wheel and tire assembly on vehicle. Then torque all wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat tightening sequence to full specified torque of 129 N·m (95 ft. lbs.).

(10) Lower vehicle to the ground.

(11) With the weight of the vehicle on the tires, tighten lateral link to spindle attaching bolt to 135 N·m (100 ft. lbs.).

(12) Reconnect the radio speaker wiring to the rear speaker. Install rear radio speaker and mounting bracket using 4 screws.

(13) Install both lower quarter and upper quarter trim panels. Refer to Body/Interior.

(14) Install the rear seat back, and seat cushion. Refer to Body/Seats.

(15) Check and reset rear wheel toe to specifications if required. Refer to Wheel Alignment.

TRAILING ARM/LINK**DESCRIPTION - TRAILING ARM**

There is one trailing arm on each side of the vehicle (Fig. 1). It spans from the spindle forward to the frame rail and rear torque box. The trailing arm attaches to the rear spindle through a bracket which is bolted to the bottom of the spindle. The trailing arm attaches to the body using a bracket attached to the frame rail and rear torque box. The trailing arm has rubber isolator bushings at each end to isolate suspension noise from the body of the vehicle.

OPERATION - TRAILING ARM

The purpose of the trailing arm is to control the fore-and-aft movement of the spindle.

DIAGNOSIS AND TESTING - TRAILING ARM

Inspect the trailing arm and trailing arm bushings for signs of deterioration and or damage. If the trailing arm bushings are deteriorated or the trailing arm is damaged in any way, replacement of the trailing arm will be required.

TRAILING ARM/LINK (Continued)

Inspect the trailing arm for signs of contact with the ground or road debris which has bent or caused other damage to the trailing arm. If the trailing arm is bent or damaged the trailing arm will require replacement. **Do not attempt to repair or straighten a trailing arm.**

REMOVAL - TRAILING ARM

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove the rear wheel and tire assembly from the vehicle.

(3) Remove the bolt attaching the trailing arm to the bracket on the bottom of the spindle (Fig. 30).

Fig. 30 Trailing Arm To Bracket Bolt

- 1 - SPINDLE
- 2 - TRAILING ARM BRACKET
- 3 - TRAILING ARM
- 4 - BOLT

(4) Remove the 4 bolts attaching the arm forward mounting bracket to the frame rail and rear torque box (Fig. 31).

(5) Remove the trailing arm and forward mounting bracket from vehicle.

(6) Remove the bolt attaching the trailing arm to the mounting bracket.

INSTALLATION - TRAILING ARM

CAUTION: When the trailing arm is installed to its mounting bracket, it is important to set an offset angle of 5 degrees before tightening the attaching bolt. Otherwise, the bushing will be contorted when the vehicle is at normal riding height. This angle cannot be set once the trailing arm and bracket are installed on the vehicle.

Fig. 31 Mounting Bracket Attachment

- 1 - TRAILING ARM
- 2 - FRAME RAIL
- 3 - ATTACHING BOLTS
- 4 - MOUNTING BRACKET
- 5 - TORQUE BOX

(1) Install the trailing arm to the mounting bracket so the length-wise opening in the arm points downward. Align the plane of the arm at a 5 degree angle to the mounting bracket, mounting surface (to the vehicle) (Fig. 32). This can be accomplished by using a simple magnetic base protractor (Fig. 32). Verify the mounting bracket is level, then rotate the trailing arm until 5 degrees is measured (Fig. 32). **This angle is important to set, so the bushing is not contorted when the vehicle is at normal riding height.. Tighten the attaching bolt and nut to a torque of 100 N·m (75 ft. lbs.). This bolt cannot be tightened once mounted on the vehicle.**

Fig. 32 Trailing Arm Mounting Angle

- 1 - EQUAL DISTANCES
- 2 - MOUNTING BRACKET
- 3 - PROTRACTOR
- 4 - TRAILING ARM

(2) Position the trailing arm and forward mounting bracket into the vehicle. Attach to frame rail and torque box with the 4 attaching bolts (Fig. 31). Tighten the attaching bolts to 60 N·m (45 ft. lbs.).

TRAILING ARM/LINK (Continued)

(3) Install bolt attaching trailing arm to trailing arm bracket on bottom of spindle (Fig. 30). Do not fully tighten attaching bolt at this time.

(4) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(5) Lower vehicle to the ground.

(6) Tighten the trailing arm to spindle bracket attaching bolt to a torque of 100 N·m (75 ft. lbs.).

(7) Check and reset rear wheel toe to specifications if required. Refer to Wheel Alignment.

WHEEL ALIGNMENT

DESCRIPTION - WHEEL ALIGNMENT

Vehicle wheel alignment is the positioning of all interrelated front and rear suspension angles. These angles affect the handling and steering of the vehicle when it is in motion. Proper wheel alignment is essential for efficient steering, good directional stability, and proper tire wear.

The method of checking a vehicle's front and rear wheel alignment varies depending on the manufacturer and type of equipment used. The manufacturer's instructions should always be followed to ensure accuracy of the alignment, except when DaimlerChrysler Corporation's wheel alignment specifications differ.

On this vehicle, the suspension angles that can be adjusted are as follows:

Front

- Camber
- Toe

Rear

- Toe

Check the wheel alignment and make all wheel alignment adjustments with the vehicle standing at its proper curb height specification. Curb height is the normal riding height of the vehicle. It is measured from a certain point on the vehicle to the ground or a designated area while the vehicle is sitting on a flat, level surface. Refer to Curb Height Measurement in this section for additional information.

Typical wheel alignment angles and measurements are described in the following paragraphs.

CAMBER

Camber is the inward or outward tilt of the top of the tire and wheel assembly (Fig. 1). Camber is measured in degrees of angle relative to a true vertical line. Camber is a tire wearing angle.

- Excessive negative camber will cause tread wear at the inside of the tire.
- Excessive positive camber will cause tread wear on the outside of the tire.

Fig. 1 Camber

80c41ee3

- 1 - WHEELS TILTED OUT AT TOP
2 - WHEELS TILTED IN AT TOP

WHEEL ALIGNMENT (Continued)

CROSS CAMBER

Cross camber is the difference between left and right camber. To achieve the cross camber reading, subtract the right side camber reading from the left. For example, if the left camber is $+0.3^\circ$ and the right camber is 0.0° , the cross camber would be $+0.3^\circ$.

CASTER

Caster is the forward or rearward tilt of the steering knuckle in reference to the position of the upper and lower ball joints. Caster is measured in degrees of angle relative to a true vertical center line. This line is viewed from the side of the tire and wheel assembly (Fig. 2).

- Forward tilt (upper ball joint ahead of lower) results in a negative caster angle.
- Rearward tilt (upper ball joint trailing lower) results in a positive caster angle.

Although caster does not affect tire wear, a caster imbalance between the two front wheels may cause the vehicle to lead to the side with the least positive caster.

**POSITIVE CASTER****NEGATIVE CASTER***Fig. 2 Caster***CROSS CASTER**

Cross caster is the difference between left and right caster.

TOE

Toe is the inward or outward angle of the wheels as viewed from above the vehicle (Fig. 3).

- Toe-in is produced when the front edges of the wheels on the same axle are closer together than the rear edges.

- Toe-out is produced when the front edges of the wheels on the same axle are farther apart than the rear edges.

Toe-in and toe-out can occur at the front wheels and the rear wheels.

Toe is measured in degrees or inches. The measurement identifies the amount that the front of the wheels point inward (toe-in) or outward (toe-out). Toe is measured at the spindle height. Zero toe means the front and rear edges of the wheels on the same axle are equally distant.

*Fig. 3 Toe*

- 1 - TOE-IN
2 - TOE-OUT

80c41ee4

80c41ee2

WHEEL ALIGNMENT (Continued)

TOE-OUT ON TURNS

Toe-out on turns is the relative positioning of the front wheels while steering through a turn (Fig. 4). This compensates for each front wheel's turning radius. As the vehicle encounters a turn, the out-board wheel must travel in a larger radius circle than the in-board wheel. The steering system is designed to make each wheel follow its particular radius circle. To accomplish this, the front wheels must progressively toe outward as the steering is turned from center. This eliminates tire scrubbing and undue tire wear when steering a vehicle through a turn.

80c41ee1

Fig. 4 Toe-Out On Turns

1 - TOE-OUT ON TURNS

DYNAMIC TOE PATTERN

Dynamic toe pattern is the inward and outward toe movement of the front and rear tires through the suspension's jounce and rebound travel. As the vehicle's suspension moves up and down, the toe pattern varies. Toe pattern is critical in controlling the directional stability of the vehicle while in motion. Front and rear dynamic toe pattern is preset by the factory at the time the vehicle is assembled.

It is not necessary to check or adjust front or rear dynamic toe pattern when doing a normal wheel alignment. The only time dynamic toe pattern needs to be checked or adjusted is if the frame of the vehicle has been damaged.

STEERING AXIS INCLINATION (S. A. I.)

Steering axis inclination is the angle between a true vertical line starting at the center of the tire at the road contact point and a line drawn through the center of the upper ball joint (or strut) and the lower ball joint (Fig. 5). S.A.I. is built into the vehicle and is not an adjustable angle. If S.A.I. is not within specifications, a bent or damaged suspension component may be the cause.

80c0711e

Fig. 5 S.A.I. and I.A.

- 1 - S.A.I.
- 2 - CAMBER
- 3 - I.A.

INCLUDED ANGLE (I. A.)

Included angle is the sum of the S.A.I. angle plus or minus the camber angle, depending on whether or not the wheel has positive or negative camber (Fig. 5). If camber is positive, add the camber angle to the S.A.I. angle. If camber is negative, subtract the camber angle from the S.A.I. angle. Included angle is not adjustable, but can be used to diagnose a frame misalignment or bent suspension component (spindle, strut).

WHEEL ALIGNMENT (Continued)

THRUST ANGLE

Thrust angle is the averaged direction the rear wheels are pointing in relation to the vehicle's center line (Fig. 6). The presence of negative or positive thrust angle causes the rear tires to track improperly to the left or right of the front tires (dog tracking).

- Negative thrust angle means the rear tires are tracking to the left of the front tires.
- Positive thrust angle means the rear tires are tracking to the right of the front tires.

Improper tracking can cause undue tire wear, a lead or pull and a crooked steering wheel. Excessive thrust angle can usually be corrected by adjusting the rear wheel toe so that each wheel has one-half of the total toe measurement.

WHEEL ALIGNMENT (Continued)

DIAGNOSIS AND TESTING - VEHICLE LEAD/PULL

To assure correct diagnosis, it is important to follow the steps outlined below in the order shown. Road test the vehicle before and after each step to verify that the lead condition has been corrected. When evaluating a vehicle, always drive the same road in both directions to get a feel for the effect of road crown and cross wind. A neutral vehicle will exhibit a small amount of drift on both right and left crowned roads (normal crown sensitivity). A vehicle with pronounced lead/pull may have one or more of the following conditions:

(1) **UNEQUAL TIRE PRESSURE.** Adjust tire pressure to the pressure stated on door placard. Make sure the tire pressure is equal on all four tires and evaluate the car. Also verify that the tire size and type are correct and match each other. If the car still has a lead condition go to step (2).

(2) **TIRE CONICITY.** Excessive tire conicity is one of the more frequent causes of vehicle lead. Cross-switch the front tires and evaluate the car. If the car still leads in the same direction or gets worse, return the front tires to their original position, then go to step (3).

(3) **SUSPENSION ALIGNMENT.** Check and record the wheel alignment settings including caster. Non-symmetrical front caster or camber can sometimes cause a lead condition or can be used to fix a lead condition. To bias the front suspension caster and camber alignment settings to correct or minimize a lead condition, perform the Vehicle Lead/Pull Alignment Bias repair procedure (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE). If the car still leads after the alignment bias procedure, go to step (4) or (5) accordingly.

(4) **STEERING GEAR VALVE IMBALANCE.** Steering gear valve imbalance can sometimes cause a vehicle lead. Although there is no quick test or measurement that can be performed to verify a good or bad steering gear valve, generally the steering efforts will feel much lighter in the lead direction and heavier in the opposite direction with an unbalanced valve. Replace the steering gear only as a "last resort" to solve the problem. To replace the steering gear, (Refer to 19 - STEERING/GEAR - REMOVAL).

STANDARD PROCEDURE**STANDARD PROCEDURE - VEHICLE LEAD/PULL ALIGNMENT BIAS**

This procedure is designed to be used in conjunction with Diagnosis And Testing - Vehicle Lead/Pull (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - DIAGNOSIS AND TESTING).

Proceed with the Caster Bias procedure before attempting the Camber Bias procedure.

CASTER BIAS

On a vehicle that leads left, create more caster on the left than on the right. On a right lead vehicle, the procedure is opposite. Try to get at least 0.8 degree of cross caster, but do not exceed the maximum specification of 1.0 degree.

(1) Loosen the four engine cradle to frame bolts. Rotate the cradle forward on the side that you need to increase the caster.

(2) Tighten the engine cradle to frame bolts to 163 N·m (120 ft. lbs.).

(3) Center the steering wheel and set toe (toe must be reset before doing another caster sweep to ensure accuracy).

(4) Verify that the lead is corrected. If vehicle still leads, continue with the Camber Bias procedure.

CAMBER BIAS

On a vehicle that leads left, create either more negative camber on the left or more positive camber on the right. On a right lead vehicle, the procedure is opposite. To minimize uneven tire wear, try to achieve the same amount of camber bias on each side. For example, if the car leads left, compensate by setting the front left camber to -0.3 degrees and front right camber to +0.3 degrees. Do not exceed cross camber maximum specification of 0.7 degree, or individual camber specification of -0.6 to +0.6 degrees.

(1) Raise the front of the vehicle until the front suspension is not supporting the weight of the vehicle and tires are clearing the floor. Remove the preferred wheel and tire assembly.

(2) Remove one of the strut clevis to knuckle bolts and loosely assemble a reduced shank bolt and nut (Available through the Mopar® Parts system) in its place. Loosen the other strut clevis to knuckle bolt to provide for adjustment. In severe cases where a wide range of adjustment is required, two reduced shank bolts should be used per knuckle. Repeat the procedure to the other side strut clevis as necessary.

(3) Install the wheel and tire assembly. Lower the vehicle until the full weight of the vehicle is resting on the suspension.

(4) Adjust the front camber to the preferred setting by physically pushing in or pulling out the top of the wheel and tire assembly as required. When the camber is correct, tighten both strut clevis to knuckle bolts to 203 N·m (150 ft. lbs.). Set front toe to specifications.

WHEEL ALIGNMENT (Continued)

STANDARD PROCEDURE - WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to ensure proper alignment.

(1) Verify that the fuel tank is full of fuel. If the tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment angles.

(2) The passenger and luggage compartments of the vehicle should be free of any load that is not factory equipment.

(3) Check the tires on the vehicle. All tires must be the same size and in good condition with approximately the same amount of tread wear. Inflate all the tires to the recommended air pressure.

(4) Check the front wheel and tire assemblies for excessive radial runout.

(5) Inspect lower ball joints and all steering linkage for looseness, binding, wear or damage. Repair as necessary.

(6) Check suspension fasteners for proper torque and retighten as necessary.

(7) Inspect all suspension component rubber bushings for signs of wear or deterioration. Replace any faulty bushings or components before aligning the vehicle.

(8) Check the vehicle's curb height to verify it is within specifications. Refer to Curb Height Measurement.

WHEEL ALIGNMENT SETUP

(1) Position the vehicle on an alignment rack.

(2) Install all required alignment equipment on the vehicle, per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced. Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

(3) Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. Refer to Specifications.

(4) If the rear alignment is out of specification, adjust it first, before proceeding to the front. Rear camber and caster are not adjustable. If rear camber is out of specification, check for damaged or bent rear suspension components.

REAR WHEEL TOE ADJUSTMENT

(1) Loosen lateral link, adjustment link jam nuts (Fig. 7). Rotate adjustment links as required to set rear wheel Toe to specifications. **Do not exceed the maximum length dimensions of the lateral links shown in (Fig. 8). Both dimensions must be checked to ensure they do not exceed maximums allowed.**

Fig. 7 Rear Wheel Toe Adjustment

- 1 - ADJUSTMENT LINK
- 2 - JAM NUTS
- 3 - SPINDLE
- 4 - LATERAL LINKS

CAUTION: When setting rear toe-in on vehicle, the maximum lengths of the adjustable lateral link at the locations shown in (Fig. 8) must not be exceeded. If these maximum lengths are exceeded, inadequate retention of adjustment link to the inner and outer link may result. Ensure that the adjustment sleeve jam nuts are torqued to the required specifications when the Toe setting procedure is completed.

9302-78

Fig. 8 Lateral Link Maximum Length Dimensions

- 1 - 380mm (MAX)
- 2 - 90mm (MAX)

WHEEL ALIGNMENT (Continued)

(2) Tighten lateral link, adjustment link lock-nuts to 88 N·m (65 ft. lbs.) torque.

(3) Proceed to set the front wheel alignment. If front camber and caster readings are within required specifications, proceed to Front Wheel Toe Adjustment. If not, refer to the following procedure to correct camber.

CAMBER AND CASTER

Front wheel Camber and Caster settings on this vehicle are determined at the time the vehicle is designed. This is done by determining the precise mounting location of the vehicle's suspension components throughout the design and assembly processes of the vehicle. This is called a Net-Build vehicle and results in no normal requirement for adjustment of the Camber and Caster after a vehicle is built, or when servicing the suspension components. Thus, Camber and Caster are not normally considered an adjustable specification when performing an alignment on this vehicle. Though Camber and Caster are not adjustable, they should be checked during the alignment procedure to ensure they meet the manufacturers specifications.

If camber and caster do not meet required specifications, the vehicles suspension components should be inspected for any signs of damage or bending. **This inspection must be done before performing the camber setting procedure.**

If a vehicle has a drift or lead condition, the front camber can be adjusted using the following camber adjustment procedure. For diagnosis of a lead/pull condition, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - DIAGNOSIS AND TESTING).

CAUTION: Do not attempt to adjust the vehicles Caster or Camber by heating, bending or modifying the vehicle's front suspension components.

FRONT CAMBER ADJUSTMENT

There are camber adjustment bolts and nuts available to allow front suspension camber adjustment in the event the vehicle pulls even though the camber is within specifications. This procedure involves replacing the original strut clevis to knuckle attachment bolts with special undersized bolts.

(1) Raise the front of vehicle by the frame until the tires are not supporting the weight of the vehicle.

(2) Remove the tire and wheel assembly from the location on the vehicle requiring camber adjustment.

CAUTION: When removing the strut to knuckle bolts from the strut clevis bracket, do not allow knuckle to pull away, putting a strain on the brake flex hose.

CAUTION: The bolts attaching the strut to the steering knuckle are serrated in the area where they go through the steering knuckle and strut. When removing, do not turn the bolts in the steering knuckle. If bolts are turned in the steering knuckle, damage to the steering knuckle will result.

(3) Remove the nuts from the bolts attaching the strut to the knuckle (Fig. 9). Tap the bolts out of the knuckle.

Fig. 9 Strut To Steering Knuckle Attaching Bolts

- 1 - STRUT ASSEMBLY
- 2 - NUTS
- 3 - STRUT ASSEMBLY TO STEERING KNUCKLE ATTACHING BOLTS
- 4 - STEERING KNUCKLE

(4) Loosely install the camber adjustment bolts and nuts attaching the strut to the steering knuckle. The bolts should be installed so the nuts are towards the front of the vehicle.

(5) Install the tire and wheel assembly.

(6) If necessary, repeat steps 2 through 5 to the other side of the vehicle.

(7) Lower the vehicle.

(8) Jounce the front and rear of vehicle.

(9) Adjust the front camber to the preferred setting by pushing in or pulling outward on the top of the wheel and tire as required. When camber is correct, tighten the upper and lower strut to knuckle camber adjustment bolts to a torque of 203 N·m (150 ft. lbs.).

(10) Proceed to Front Wheel Toe Adjustment and adjust front wheel toe as necessary.

FRONT WHEEL TOE ADJUSTMENT

(1) Center steering wheel and hold it in place using a steering wheel clamp.

(2) Loosen the tie rod adjustment pinch bolt. Rotate the adjustment sleeve to align toe to specifications (Fig. 10).

WHEEL ALIGNMENT (Continued)

**Fig. 10 Front Wheel Toe Adjustment Location**

- 1 - ADJUSTMENT TOOL
- 2 - ADJUSTMENT PINCH BOLT
- 3 - TIE ROD END

CAUTION: When setting toe on vehicle, the maximum dimension of exposed threads allowed on inner and outer tie rod cannot exceed the distance shown (Fig. 11). If the maximum distance is exceeded, inadequate retention of either inner or outer tie rod may result. Ensure that adjustment pinch bolt is torqued to required specification when Toe setting procedure is completed.

**Fig. 11 Tie Rod Thread Engagement Requirements**

- 1 - OUTER TIE ROD
- 2 - ADJUSTER
- 3 - PINCH BOLT
- 4 - INNER TIE ROD
- 5 - ALLOWABLE THREADS EXPOSED ON OUTER TIE ROD AND ADJUSTER IS A MAXIMUM OF 20 MILLIMETERS. REFER TO AREA INDICATED ABOVE ON THE OUTER TIE ROD AND ADJUSTER.

CAUTION: When torquing adjustment pinch bolt, the following procedure must be followed to ensure adequate retention of the adjustment sleeve. Not following this procedure, could result in the Toe Setting Adjustment changing and/or loosening of the inner or outer tie rod ends.

NOTE: Use an appropriate tool on neck area of outer tie rod to maintain the correct perpendicular orientation of the tie rod end stud within the tie rod end.

(3) After completion of toe adjustment procedure, tighten tie rod pinch bolt (Fig. 11) to a torque of 38 N·m (28 ft. lbs.).

(1) Road test the vehicle after the initial wheel alignment has been performed. If vehicle still drifts or leads, repeat the front wheel alignment procedure and adjust the camber to bias the cross camber setting opposite of the direction in which the vehicle has the tendency to lead. For example, if the vehicle leads left, compensate by setting left front camber to 0.0° and right front camber up to +0.6°, allowing both sides to remain within camber specifications. The cross camber is still at 0.6° which is within the allowed alignment specification.

STANDARD PROCEDURE - CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If measurement is not within specifications, inspect vehicle for bent or weak suspension components. Compare parts tag on suspect coil spring(s) to parts book and vehicle sales code, checking for a match. Once removed from vehicle, compare coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

(1) Measure from the inboard edge of the wheel opening fender lip directly above the wheel center (spindle), to the floor or alignment rack surface.

(2) When measuring, maximum left-to-right differential is not to exceed 20 mm (0.79 in.).

(3) Compare measurements to specifications listed in the following chart.

WHEEL ALIGNMENT (Continued)

CURB HEIGHT SPECIFICATIONS

VEHICLE	FRONT	REAR
CONCORDE/300M	739 mm \pm 20 mm	754 mm \pm 20 mm
	29.09 in. \pm 0.79 in.	29.68 in. \pm 0.79 in.
INTREPID	729 mm \pm 20 mm	735 mm \pm 20 mm
	28.70 in. \pm 0.79 in.	28.93 in. \pm 0.79 in.

SPECIFICATIONS

WHEEL ALIGNMENT

NOTE: All specifications are given in degrees.

NOTE: All wheel alignments are to be set with the vehicle at curb height. Refer to CURB HEIGHT MEASUREMENT.

FRONT WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER	0.00°	-0.60° to +0.60°
Cross Camber (Maximum Side-To-Side Difference)	0.00°	0.70°
CASTER	+3.00°	+2.00° to +4.00°
Cross Caster (Maximum Side-To-Side Difference)	0.00°	1.00°
TOTAL TOE*	0.00°	-0.20° to +0.20°
REAR WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER	-0.20°	-0.70° to +0.30°
TOTAL TOE*	+0.10°	-0.20° to +0.40°
THRUST ANGLE	0.00°	-0.15° to +0.15°
NOTE: *TOTAL TOE is the sum of both the left and right wheel toe settings. TOTAL TOE must be equally split between each front wheel to ensure the steering wheel is centered after setting toe. Positive (+) is Toe-in, Negative (-) is Toe-out.

HALFSHAFT

DESCRIPTION

The front halfshaft assemblies are flexible assemblies consisting of an inner and outer flexible joint connected by an solid shaft (Fig. 1) (Fig. 2). Trans-axle packaging and location requires the use of unequal length halfshafts, with the left shaft being longer than the right.

The inner joints are of a tripod design (Fig. 2), and allow for axial and angular movement to accommodate for shifting of powertrain and suspension components. The inner joints incorporate a female spline which install over the transaxle stub shafts.

The outer joints are of a Rzeppa design (Fig. 2), and only offer angular flexibility. The outer joints incorporate a male spline, which connect to the wheel hub/bearing. The outer joint is fastened to the hub to ensure that there is no axial movement (end-play).

Both inner and outer joints utilize flexible “boots” (Fig. 1) (Fig. 2) which maintain grease within the joints, protect the joints from the environment/elements, and facilitate the axial and angular movement of the joints. The inner joint boots are constructed of silicone rubber. The outer boots are made of Hytrel plastic.

NOTE: When halfshaft boots are replaced be sure boots of the correct material are used.

OPERATION

Halfshaft assemblies are designed to transmit power from the transaxle to the front wheels, while allowing for powertrain and suspension flex.

DIAGNOSIS AND TESTING - DRIVELINE

HALFSHAFT VISUAL INSPECTION

(1) Check for grease in the vicinity of the inboard tripod joint and outboard C/V joint; this is a sign of inner or outer joint seal boot or seal boot clamp damage.

(2) A light film of grease may appear on the inner tripod joint seal boot; this is considered normal and should not require replacement of the seal boot. All inner tripod joint seal boots are made of silicone rubber; which will allow the weeping (sweating) of the joint lubricant to pass through it while in operation.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

(1) Damaged outer C/V or inner tripod joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.

(2) Noise may also be caused by another component of the vehicle coming in contact with the halfshafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

(1) A torn seal boot on the inner or outer joint of the halfshaft assembly.

(2) A loose or missing clamp on the inner or outer joint of the halfshaft assembly.

(3) A damaged or worn halfshaft C/V joint.

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

(1) A worn or damaged halfshaft inner tripod joint.

(2) A sticking tripod joint spider assembly (inner tripod joint only).

(3) Improper wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

(1) Foreign material (mud, snow, etc.) packed on the backside of the wheel(s).

(2) Out of balance front tires or wheels. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)

(3) Improper tire and/or wheel runout. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

HALFSHAFT (Continued)

REMOVAL

(1) Raise vehicle on jackstands or centered on a frame contact type hoist.

(2) Remove the front wheel and tire assembly from the vehicle.

(3) Remove the front caliper assembly from the front steering knuckle assembly (Fig. 3).

Fig. 3 Disc Brake Caliper Mounting

- 1 - BRAKE LINE
- 2 - CALIPER GUIDE PIN BOLTS
- 3 - STEERING KNUCKLE
- 4 - BLEEDER SCREW
- 5 - CALIPER ASSEMBLY

(4) Remove front braking disk (rotor) from hub, by pulling it straight off wheel mounting studs (Fig. 4).

(5) Remove the speed sensor cable routing bracket from the strut assembly (Fig. 5).

(6) Remove the hub and bearing-to-stub axle retaining nut (Fig. 6).

(7) Dislodge inner tripod joint from stub shaft retaining snap ring on transaxle assembly (Fig. 7). Inner tripod joint is dislodged from stub shaft retaining snap ring, by inserting a pry bar between transaxle case and inner tripod joint and prying on tripod joint. **Only disengage the inner tripod joint from the retaining snap ring. Do not attempt to remove the inner tripod joint from the transmission stub shaft at this time.**

CAUTION: The strut assembly to steering knuckle bolts are serrated where they go through strut assembly and steering knuckle. When removing bolts, turn nuts off bolts. **DO NOT TURN BOLTS IN STEERING KNUCKLE.** If bolts are turned, damage to steering knuckle will result.

(8) Remove the strut assembly to steering knuckle attaching bolts (Fig. 8).

(9) Remove the top of the steering knuckle from the strut assembly.

- 2 - INNER TRIPOD JOINT
- 3 - PRY BAR
- 4 - TRANSAXLE

(11) Remove driveshaft inner tripod joint from transaxle stub shaft. **When removing driveshaft, do not pull on interconnecting shaft to remove inner tripod joint from stub shaft. Removal in this manner will separate the spider assembly from the tripod joint housing. Grasp inner tripod joint (Fig. 10) and interconnecting shaft and pull on both pieces at the same time.**

INSTALLATION

CAUTION: The inboard tripod joint retaining circlip and O-ring seal (Fig. 11) on the transaxle stub shaft are not re-usable. Whenever the inboard tripod joint is removed from the stub shaft, the retaining circlip

9302-7

- 3 - INNER TRIPOD JOINT

9302-50

Fig. 11 Tripod Joint Retaining Circlip And O-Ring Seal

- 1 - O-RING SEAL
- 2 - STUB SHAFT
- 3 - RETAINING CIR CLIP

(1) Replace O-ring seal and tripod joint retaining circlip (Fig. 11) on the transaxle stub shaft.

(2) Evenly apply a bead of grease, such as Mopar Multi-Purpose Lubricant or an equivalent, around spline of inner tripod joint (Fig. 12) where the O-ring seats against tripod joint. This will spread grease onto stub shaft during tripod joint installation preventing corrosion and help to seal the O-ring.

(3) Install driveshaft through hole in splash shield. Grasp inner tripod joint in one hand and interconnecting shaft in the other. Align inner tripod joint spline with stub shaft spline on transaxle (Fig. 13). Use a rocking motion with the inner tripod joint, to get it past the circlip on the transaxle stub shaft.

9402-74

Fig. 12 Grease Applied To Inner Tripod Joint Housing Spline

- 2 - INNER TRIPOD JOINT HOUSING

9302-49

Fig. 13 Inner Tripod Joint Installation On Stub Shaft

- 1 - TRANSAXLE
- 2 - TRANSMISSION STUB SHAFT
- 3 - INNER TRIPOD JOINT

(4) Continue pushing tripod joint onto transaxle stub shaft until it stops moving. The O-ring seal on the stub should not be visible when inner tripod joint is fully installed on stub shaft. **To check that inner tripod joint retaining circlip is locked into tripod joint, grasp inner tripod joint and pull on it by hand. If circlip is locked into tripod joint, tripod joint will not move on stub shaft.**

CAUTION: When installing outer C/V joint into the hub and bearing assembly, do not allow the flinger disk on hub and bearing assembly to become damaged. Damage to the flinger disk can cause dirt and water intrusion into bearing and premature bearing failure.

HALFSHAFT (Continued)

(5) Hold outer C/V joint assembly with one hand. Grasp steering knuckle with other hand and rotate it out and to the rear of the vehicle. Install outer C/V joint into the hub and bearing assembly (Fig. 14).

Fig. 14 Outer C/V Joint Installation Into Hub and Bearing

- 1 - STRUT ASSEMBLY
- 2 - OUTER C/V JOINT
- 3 - HUB/BEARING ASSEMBLY
- 4 - FLINGER DISK
- 5 - STEERING KNUCKLE

(6) Install the top of the steering knuckle into the strut assembly. Align the steering knuckle to strut assembly mounting holes.

CAUTION: The strut assembly to steering knuckle bolts are serrated where they go through strut assembly and steering knuckle. When installing bolts, turn nuts onto bolts. **DO NOT TURN BOLTS IN STEERING KNUCKLE.** If bolts are turned, damage to steering knuckle will result.

(7) Install the strut assembly to steering knuckle attaching bolts. Install nuts on attaching bolts (Fig. 15). Tighten the strut assembly to steering knuckle bolt nuts to 210 N·m (155 ft. lbs.). **TURN NUTS ON BOLTS. DO NOT TURN BOLTS.**

CAUTION: The hub and bearing assembly to stub shaft retaining nut is a prevailing torque nut and can not be re-used. A **NEW** retaining nut **MUST** be used when assembled.

Fig. 15 Strut Assembly to Steering Knuckle Attaching Bolts

- 1 - STRUT ASSEMBLY
- 2 - NUTS
- 3 - STRUT ASSEMBLY TO STEERING KNUCKLE ATTACHING BOLTS
- 4 - STEERING KNUCKLE

(8) Install a **NEW** retaining nut (Fig. 16). **Tighten, but do not torque the hub nut at this time.**

Fig. 16 Hub And Bearing To Stub Axle Retaining Nut

- 1 - HUB/BEARING ASSEMBLY
- 2 - NUT

(9) Install speed sensor cable routing bracket on front strut assembly. Install and securely tighten routing bracket screw.

(10) Install the braking disk on the hub and bearing assembly (Fig. 17).

(11) Install front brake caliper over braking disc and align with caliper mounting holes on steering knuckle (Fig. 18). Install the caliper to steering knuckle bolts. Tighten bolts to 22 N·m (192 in. lbs.).

HALFSHAFT (Continued)

**Fig. 17 Installing Brake Rotor**

**Fig. 18 Disc Brake Caliper Mounting**

- 1 - BRAKE SHOES
- 2 - STEERING KNUCKLE
- 3 - BRAKING DISC
- 4 - CALIPER ASSEMBLY
- 5 - MACHINED ABUTMENT

(12) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence (Fig. 19), until all nuts are tightened to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

**Fig. 19 Tightening Wheel Nuts**

(13) Lower vehicle to the ground.

CAUTION: When tightening hub and bearing assembly to stub shaft retaining nut, do not exceed the maximum torque of 142 N·m (105 ft. lbs.). If the maximum torque is exceeded this may result in a failure of the driveshaft.

(14) Apply the vehicle's brakes to keep vehicle from moving. Tighten the **NEW** stub shaft to hub and bearing assembly retaining nut to 142 N·m (105 ft. lbs.) (Fig. 20).

SPECIAL TOOLS

DRIVELINE

*Boot Clamp Installer C-4975A*

CV BOOT-INNER

REMOVAL

To remove sealing boots from halfshafts for replacement, the halfshaft assemblies must be removed from the vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL) (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

(1) Remove the halfshaft requiring boot replacement from the vehicle.

(2) Remove large boot clamp which retains inner tripod joint sealing boot to tripod joint housing (Fig. 21) and discard. Remove small clamp which retains inner tripod joint sealing boot to interconnecting shaft and discard. Remove the sealing boot from the tripod housing and slide it down the interconnecting shaft.

CAUTION: When removing the spider joint from the tripod joint housing. Hold the rollers in place on the spider trunions to prevent the rollers and needle bearings from falling away.

9302-52

Fig. 21 Inner Tripod Joint Sealing Boot Clamps

- 1 - SMALL CLAMP
- 2 - SEALING BOOT
- 3 - LARGE CLAMP
- 4 - INTERCONNECTING SHAFT
- 5 - INNER TRIPOD JOINT

(3) Slide the interconnecting shaft and spider assembly out of the tripod joint housing (Fig. 22).

(4) Remove snap ring which retains spider assembly to interconnecting shaft (Fig. 23). Then remove the spider assembly from interconnecting shaft. If spider assembly will not come off interconnecting shaft by hand, it can be removed by tapping the end of the spider body with a brass drift. **Do not hit the outer tripod bearings in an attempt to remove spider assembly from interconnecting shaft.**

(5) Slide failed sealing boot off the interconnecting shaft.

(6) Thoroughly clean and inspect spider assembly, tripod joint housing and interconnecting shaft for any signs of excessive wear. **If any parts show signs of excessive wear, the halfshaft assembly will require replacement. Component parts of the assemblies are not serviceable.**

CV BOOT-INNER (Continued)

- 5 - INTERCONNECTING SHAFT

INSTALLATION

NOTE: The inner tripod joint sealing boots are made of silicone rubber which is soft and pliable. The replacement sealing boot **MUST BE** the same type of material as the sealing boot which was removed.

(1) Slide inner tripod joint seal boot retaining clamp, onto interconnecting shaft. Then slide replacement inner tripod joint sealing boot onto the interconnecting shaft. **Inner tripod joint seal boot MUST be positioned on interconnecting shaft, so only the thinnest (sight) groove on interconnecting shaft is visible (Fig. 24).**

Fig. 24 Seal Boot Correctly Positioned On Interconnecting Shaft

- 1 - SEALING BOOT
- 2 - INTERCONNECTING SHAFT THINNEST GROOVE
- 3 - INTERCONNECTING SHAFT
- 4 - BOOT CLAMP

(2) Install the spider assembly onto the interconnecting shaft. Spider assembly must be installed on interconnecting shaft far enough to fully install the retaining snap ring. If spider assembly will not fully install on interconnecting shaft by hand, it can be installed by tapping the spider body with a brass drift. **Do not hit the outer tripod bearings in an attempt to install spider assembly on interconnecting shaft.**

(3) Install the spider assembly to interconnecting shaft retaining snap ring into groove on end of interconnecting shaft (Fig. 25). Verify the snap ring is fully seated into groove on interconnecting shaft.

(4) Distribute 1/2 the amount of grease provided in the seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into tripod housing. Put the remaining amount into the sealing boot.

(5) Slide the spider assembly and the interconnecting shaft into the tripod joint housing (Fig. 26).

CV BOOT-INNER (Continued)

- 3 - TRIPOD JOINT HOUSING

(6) Install inner tripod joint seal boot to interconnecting shaft clamp evenly on sealing boot.

(7) Clamp sealing boot onto interconnecting shaft using Crimper, Special Tool C-4975 and the following procedure. Place crimping tool C-4975 over bridge of clamp (Fig. 27). Tighten nut on crimping tool C-4975 until jaws on tool are closed completely together, face to face (Fig. 28).

Fig. 28 Sealing Boot Retaining Clamp Installed

- 1 - SEALING BOOT
- 2 - SPECIAL TOOL C-4975
- 3 - CLAMP BRIDGE

CAUTION: Seal must not be dimpled, stretched or out of shape in any way. If seal is NOT shaped correctly, equalize pressure in seal and shape it by hand.

(8) Position the sealing boot into the tripod housing retaining groove (Fig. 29). Install seal boot retaining clamp evenly on sealing boot.

(9) Clamp sealing boot onto tripod housing using Crimper, Special Tool C-4975 and the following procedure. Place crimping tool C-4975 over bridge of clamp. Tighten nut on crimping tool C-4975 until jaws on tool are closed completely together, face to face.

CV BOOT-INNER (Continued)

CV BOOT-OUTER

REMOVAL

To remove sealing boots from halfshafts for replacement, the halfshaft assemblies must be removed from the vehicle.

(1) Remove the halfshaft requiring boot replacement from the vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL) (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

(2) Remove large boot clamp, retaining C/V joint sealing boot, to C/V joint housing (Fig. 30) and discard. Remove small clamp which retains outer C/V joint sealing boot to interconnecting shaft and discard. Remove sealing boot from outer C/V joint housing and slide it down interconnecting shaft.

(3) Wipe away grease to expose outer C/V joint to interconnecting shaft retaining ring. Spread ears apart on C/V joint assembly to interconnecting shaft retaining snap ring (Fig. 31). Slide outer C/V joint assembly off end of interconnecting shaft.

(4) Slide failed sealing boot off interconnecting shaft.

(5) Thoroughly clean and inspect outer C/V joint assembly and interconnecting joint for any signs of excessive wear. **If any parts show signs of excessive wear, the halfshaft assembly will require replacement. Component parts of the halfshaft assemblies are not serviceable.**

5 - INTERCONNECTING SHAFT

CV BOOT-OUTER (Continued)

INSTALLATION

(1) Slide a new seal boot to interconnecting shaft retaining clamp, onto the interconnecting shaft. Then slide the replacement outer C/V joint assembly sealing boot onto the interconnecting shaft.

(2) Install outer C/V joint assembly onto interconnecting shaft. Joint is installed on interconnecting shaft, by pushing interconnecting shaft into outer C/V joint, until retaining snap ring is seated in groove on interconnecting shaft (Fig. 32). Verify the snap ring is fully seated into groove on interconnecting shaft.

Fig. 32 Outer C/V Joint Installed On Interconnecting Shaft

- 1 - INTERCONNECTING SHAFT
- 2 - RETAINING SNAP RING
- 3 - OUTER C/V JOINT ASSEMBLY

(3) Distribute 1/2 the amount of grease provided in seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into outer C/V joint assembly housing. Put the remaining amount into the sealing boot.

(4) Install outer C/V joint seal boot retaining clamp, onto interconnecting shaft. Install replacement outer C/V joint sealing boot onto interconnecting shaft. **Outer C/V joint seal boot MUST be positioned on interconnecting shaft, so only the thinnest (sight) groove on interconnecting shaft is visible (Fig. 33).**

(5) Clamp sealing boot on interconnecting shaft using Crimper, Special Tool C-4975 and the following procedure. Place crimping tool C-4975 over bridge of clamp (Fig. 34). Tighten nut on crimping tool C-4975 until jaws on tool are closed completely together, face to face (Fig. 35).

BRAKES - BASE BRAKE SYSTEM

DESCRIPTION - BASE BRAKES

The base brake system consists of the following components:

- Brake pedal
- Master cylinder
- Power brake booster
- Brake tubes and hoses
- Proportioning valves (2)
- Disc brakes (front and rear)
- Brake lamp switch
- Brake fluid level switch
- Parking brake

All brakes are power assist type through the use of a vacuum operated power brake booster.

The hydraulic brake system is diagonally split on both the non-antilock and antilock braking systems. This means the left front and right rear brakes are on one hydraulic circuit from the master cylinder and the right front and left rear are on the other.

Front disc brakes control the braking of the front wheels; rear braking is controlled by rear disc brakes.

Vehicles equipped with the optional antilock brake system (ABS) (with and without traction control) use a system designated Mark 20i. This system shares most base brake hardware used on vehicles without ABS. All components differing from the base brake hardware are described in detail in the Antilock Brake System section.

The parking brake on this vehicle is pedal-operated.

For more information on the description of any individual base brake component, refer to that component elsewhere in this section. For information on the brake lamp switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - DESCRIPTION)

OPERATION - BASE BRAKES

When a vehicle needs to be stopped, the driver applies the brake pedal. The brake pedal pushes the input rod of the power brake booster into the booster. The booster uses vacuum to ease pedal effort as force is transferred through the booster to the master cylinder. The booster's output rod pushes in the master cylinder's primary and secondary pistons applying hydraulic pressure through the chassis brake tubes, junction block, and proportioning valves to the brakes at each tire and wheel assembly.

The pedal-operated parking brake operates in the following manner. When applied, the parking brake

lever pulls on cables that actuate parking brake shoes at each rear wheel.

For more information on the operation of any individual base brake component, refer to that component elsewhere in this section.

WARNING

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

CAUTION

CAUTION: Use only Mopar® brake fluid or an equivalent from a tightly sealed container. Brake fluid must conform to DOT 3 specifications. Do not use petroleum-based fluid because seal damage in the brake system will result.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.

CAUTION: During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.

BRAKES - BASE BRAKE SYSTEM (Continued)

CAUTION: When handling the brake rotor and caliper, be careful to avoid damaging the brake rotor and caliper, and scratching or nicking the brake shoe lining.

CAUTION: If the vehicle is equipped with the Tire Pressure Monitoring (TPM) System, the tire/wheel assembly needs to be reinstalled in the same location it is removed from or the TPM System (sensors) will need to be retrained. Mark each tire/wheel assembly indicating location, prior to its removal. If the tire/wheel assemblies are switched, rotated or replaced, the TPM System needs to be retrained. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

STANDARD PROCEDURE - BASE BRAKE BLEEDING

CAUTION: Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

NOTE: For bleeding this vehicles antilock brake hydraulic system, Refer to Antilock Brake System Bleeding.

NOTE: Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

NOTE: Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure

adequate removal of all trapped air from the brake hydraulic system.

- Left rear wheel
- Right front wheel
- Right rear wheel
- Left front wheel

The base brake system can be bled using the pressure method or the manual method. Both methods are presented in this text.

PRESSURE BLEEDING METHOD

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

(1) Remove filler cap from the top of fluid reservoir on master cylinder.

(2) Install Adapter, Special Tool 8224, in the caps place on the reservoir (Fig. 1).

Fig. 1 Pressure Bleeding Adapter Mounted On Fluid Reservoir

- 1 - SPECIAL TOOL 8224
2 - MASTER CYLINDER FLUID RESERVOIR

(3) Attach Bleeder Tank, Special Tool C-3496-B, or equivalent, to Special Tool 8224. Pressurize the system following the pressure bleeder manufacturer's instructions.

(4) Remove rubber dust caps from all 4 bleeder screws.

BRAKES - BASE BRAKE SYSTEM (Continued)

(5) Starting at the first wheel circuit as listed earlier, attach a clear hose to the bleeder screw at that wheel's brake caliper or wheel cylinder and feed the other end of the hose into a clear jar containing enough fresh brake fluid to submerge the end of the hose (Fig. 2).

9305-3

Fig. 2 Proper Method for Purging Air From Brake

- 1 - CLEAR HOSE
- 2 - BRAKE CALIPER
- 3 - BLEEDER SCREW
- 4 - CLEAN BRAKE FLUID

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw (Fig. 3). If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

(6) Open bleeder screw (Fig. 2) at least one full turn or more to obtain an adequate flow of brake fluid.

(7) After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose and jar, close the bleeder screw.

(8) Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.

(9) Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Rebleed the brake system as necessary.

(10) Reinstall all 4 bleeder screw dust caps.

(11) Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

RH955

Fig. 3 Trapped Air in Brake Line

1 - TRAPPED AIR

MANUAL BLEEDING METHOD

NOTE: To bleed the base brake system manually, an assistant's help is required.

(1) Remove rubber duct caps from all 4 bleeder screws.

(2) Attach a clear hose to the bleeder screw at one wheel and feed the other end of the hose into a clear jar containing fresh brake fluid (Fig. 2).

(3) Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw (Fig. 3). If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

(4) While the pedal is being held down, open the bleeder screw at least 1 full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.

(5) Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.

(6) Repeat steps (1) through (5) until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir, to ensure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

BRAKES - BASE BRAKE SYSTEM (Continued)

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

(7) Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.

(8) Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Rebleed the brake system as necessary.

(9) Reinstall all 4 bleeder screw dust caps.

(10) Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

BRAKE FLUID LEVEL SWITCH

DESCRIPTION

The brake fluid level switch used on this vehicle's master cylinder is internal to the master cylinder fluid reservoir (Fig. 4). The vehicle wiring harness has a connector which plugs directly into the brake fluid reservoir.

Fig. 4 Master Cylinder

- 1 - BOOSTER
- 2 - MASTER CYLINDER
- 3 - MASTER CYLINDER FLUID RESERVOIR
- 4 - FLUID LEVEL FULL MARK
- 5 - FLUID LEVEL SWITCH

The brake fluid level switch in the brake fluid reservoir is not a repairable item. If the switch is found to be defective the entire brake fluid reservoir must be replaced.

OPERATION

The purpose of the brake fluid level switch is to provide the driver with early warning that brake fluid in the master cylinder is below a normal level.

As the fluid drops below the designed level, the switch closes completing the red BRAKE warning indicator lamp circuit. This will illuminate the red BRAKE warning indicator lamp located in the instrument cluster. At this time, the master cylinder fluid reservoir should be checked and filled to the full mark with DOT 3 brake fluid. **If the brake fluid level has dropped in the brake fluid reservoir, the entire brake hydraulic system should be checked for evidence of a leak.**

HYDRAULIC/MECHANICAL

DESCRIPTION

DESCRIPTION - FRONT DISC BRAKES

The front disc brake assembly used on this vehicle consists of the following components:

- Disc brake caliper
- Brake Shoes (pads/linings)
- Caliper abutment rail shims
- Brake Rotor

The floating double pin single piston calipers (Fig. 5) used on this vehicle are mounted directly to the steering knuckles and use no adapter. The caliper is mounted to the steering knuckle using bushings, sleeves and two thru-bolts which thread directly into the steering knuckle (Fig. 6).

The caliper is a one piece casting with the inboard side containing a single piston cylinder bore. The front disc brake caliper phenolic piston is 60 mm (2.36 inch) in diameter.

There are two brake shoes (pads) mounted to the brake caliper (Fig. 5). One brake shoe mounts on each side of a brake rotor. The brake shoe lining material used has been specifically formulated to meet the braking requirements of the vehicle. An audible wear indicator is mounted on the outboard brake shoe.

Rail shims are mounted above and below the brake pads (when installed) on the machined caliper abutment rails of the knuckle.

The brake rotor is mounted on the hub and bearing. The rotor is made of iron and is vented to help cool it during brake applications.

Vehicles equipped with standard four-wheel-disc brakes utilize a conventional internally-vented hat style rotor. Internally-vented refers to the fact that the inner most diameter of the braking disc vents to the rear of the rotor (Fig. 7).

Vehicles equipped with performance four-wheel-disc brakes utilize an inverted-hat style rotor. This rotor is externally vented meaning the inner most diameter of the braking disc vents to the front (or face) of the rotor (Fig. 7).

Although there are two different style brake rotors depending on brake packages, they are serviced in the same manner.

HYDRAULIC/MECHANICAL (Continued)

DESCRIPTION - REAR DISC BRAKES

The rear disc brakes are similar to front disc brakes, however, there are several distinctive features that require different service procedures. This single piston, floating caliper rear disc brake assembly includes (Fig. 8):

- Disc brake caliper
- Brake shoes (pads/linings)
- Brake rotor
- Disc brake caliper adapter

This vehicle is equipped with a caliper assembly that has a 36 mm (1.42 in.) piston.

The caliper assembly on all applications floats on rubber bushings using internal metal sleeves which are attached to the adapter using threaded guide pin bolts (Fig. 8).

The adapter and disc shield are mounted to the rear suspension knuckles of vehicle. The adapter is used to mount the brake shoes and actuating cables for the parking brake system. The adapter also mounts the rear caliper assembly to the vehicle. The adapter has two machined abutments which are used to position and align the caliper and brake shoes for movement inboard and outboard.

This vehicle uses a 14 inch solid non-vented rear disc brake rotor (Fig. 8). It is a drum-in-hat style. It serves a dual purpose. The braking disc area of the rotor functions as a normal brake rotor for disc brakes. The center section of the rotor has a built-in brake drum that is used by the parking brakes. Refer to Parking Brake for more information.

HYDRAULIC/MECHANICAL (Continued)

OPERATION

OPERATION - FRONT DISC BRAKES

Two machined abutments on the steering knuckle (Fig. 6) position and align the caliper fore-and-aft. The guide pin bolts, sleeves, and bushings control the side-to-side movement of the caliper.

Although there are different disc brake systems available, they operate and are serviced in the same manner.

A square-cut rubber piston seal is located in a machined groove in the cylinder bore. This provides a hydraulic seal between the piston and the cylinder wall (Fig. 9). The piston seal is designed to pull the piston back into the bore of the caliper when the brake pedal is released. This, along with the brake shoe retractor clips, maintains the proper brake shoe to rotor clearance.

A molded rubber dust boot is installed in a groove in the cylinder bore and the piston, keeping contamination from the cylinder wall and the piston (Fig. 9).

The brake shoe lining material rides against the brake rotors braking surface. When the brakes are applied, the shoes apply pressure against the rotor, thus slowing the vehicle.

As brake shoe linings wear, master cylinder reservoir brake fluid level will go down. If brake fluid has been added to the reservoir, overflow may occur if the piston is pushed back into the recessed position.

An audible wear indicator (Fig. 5) is mounted on the outboard pad of the front disc brake assemblies. Upon contact with the brake rotor, this indicator emits a sound, signaling that brake shoes may need inspection or replacement.

OPERATION - REAR DISC BRAKES

Rear disc brakes operate similarly to front disc brakes. Refer to Front Disc Brakes for additional information.

DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM

NOTE: There are three diagnosis charts following that cover the **RED BRAKE WARNING LAMP**, **BRAKE NOISE** and **OTHER BRAKE CONDITIONS**.

RED BRAKE WARNING LAMP

CONDITION	POSSIBLE CAUSES	CORRECTION
RED BRAKE WARNING LAMP ON	<ul style="list-style-type: none"> 1. Parking brake lever not fully released. 2. Parking brake warning lamp switch on parking brake lever. 3. Brake fluid level low in reservoir. 4. Brake fluid level switch. 5. Mechanical instrument cluster (MIC) problem. 	<ul style="list-style-type: none"> 1. Release parking brake lever. 2. Inspect and replace switch as necessary. 3. Fill reservoir. Check entire system for leaks. Repair or replace as required. 4. Disconnect switch wiring connector. If lamp goes out, replace switch. 5. Refer to Chassis Diagnostic Procedures manual.

HYDRAULIC/MECHANICAL (Continued)

BRAKE NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC BRAKE CHIRP	<ol style="list-style-type: none"> Excessive brake rotor runout. Lack of lubricant on brake caliper slides. 	<ol style="list-style-type: none"> Follow brake rotor diagnosis and testing. Correct as necessary. Lubricate brake caliper slides.
DISC BRAKE RATTLE OR CLUNK	<ol style="list-style-type: none"> Broken or missing anti-rattle spring clips or rail shims on shoes. Caliper guide pins loose. 	<ol style="list-style-type: none"> Replace brake shoes, spring clips or rail shims as applicable. Tighten guide pins.
DISC BRAKE SQUEAK AT LOW SPEED (WHILE APPLYING LIGHT BRAKE PEDAL EFFORT)	<ol style="list-style-type: none"> Brake shoe linings. 	<ol style="list-style-type: none"> Replace brake shoes.
SCRAPING (METAL-TO-METAL).	<ol style="list-style-type: none"> Foreign object interference with brakes. Brake shoes worn out. 	<ol style="list-style-type: none"> Inspect brakes and remove foreign object. Replace brake shoes. Inspect rotors. Reface or replace as necessary.

OTHER BRAKE CONDITIONS

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKES CHATTER	<ol style="list-style-type: none"> Disc brake rotor has excessive thickness variation. 	<ol style="list-style-type: none"> Isolate condition as rear or front. Reface or replace brake rotors as necessary.
BRAKES DRAG (FRONT OR ALL)	<ol style="list-style-type: none"> Contaminated brake fluid. Binding caliper pins or bushings. Binding master cylinder. Binding brake pedal. 	<ol style="list-style-type: none"> Check for swollen seals. Replace all system components containing rubber. Replace pins and bushings Replace master cylinder. Replace brake pedal.
BRAKES DRAG (REAR ONLY)	<ol style="list-style-type: none"> Parking brake cables binding or froze up. Parking brake cable return spring not returning shoes. Obstruction inside the center console preventing full return of the parking brake cables. 	<ol style="list-style-type: none"> Check cable routing. Replace cables as necessary. Replace cables as necessary. Remove console and remove obstruction.
BRAKES GRAB	<ol style="list-style-type: none"> Contaminated brake shoe linings. Improper power brake booster assist. 	<ol style="list-style-type: none"> Inspect and clean, or replace shoes. Repair source of contamination. Refer to Power Brake Booster in the diagnosis and testing section.
EXCESSIVE PEDAL EFFORT	<ol style="list-style-type: none"> Obstruction of brake pedal. Low power brake booster assist. Glazed brake linings. 	<ol style="list-style-type: none"> Inspect, remove or move obstruction. Refer to power brake booster in the diagnosis and testing section. Reface or replace brake rotors as necessary. Replace brake shoes.

HYDRAULIC/MECHANICAL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Brake shoe lining transfer to brake rotor.	4. Reface or replace brake rotors as necessary. Replace brake shoes.
EXCESSIVE PEDAL TRAVEL (VEHICLE STOPS OK)	1. Air in brake lines.	1. Bleed brakes.
EXCESSIVE PEDAL TRAVEL (PEDAL GOES TO FLOOR - CAN'T SKID WHEELS)	1. Power brake booster runout (vacuum assist).	1. Check booster vacuum hose and engine tune for adequate vacuum supply. Refer to power brake booster in the diagnosis and testing section.
EXCESSIVE PEDAL TRAVEL (ONE FRONT WHEEL LOCKS UP DURING HARD BRAKING)	1. One of the two hydraulic circuits to the front brakes is malfunctioning.	1. Inspect system for leaks. Check master cylinder for internal malfunction.
PEDAL PULSATES/SURGES DURING BRAKING	1. Disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake rotors as necessary.
PEDAL IS SPONGY	1. Air in brake lines. 2. Power brake booster runout (vacuum assist).	1. Bleed brakes. 2. Check booster vacuum hose and engine tune for adequate vacuum supply. Refer to power brake booster in the diagnosis and testing section.
PREMATURE REAR WHEEL LOCKUP	1. Contaminated brake shoe linings. 2. Inoperative proportioning valve. 3. Improper power brake booster assist.	1. Inspect and clean, or replace shoes. Repair source of contamination. 2. Test proportioning valves following procedure listed in diagnosis and testing section. Replace valves as necessary. 3. Refer to power brake booster in the diagnosis and testing section.
STOP LAMPS STAY ON	1. Brake lamp switch out of adjustment. 2. Brake pedal binding. 3. Obstruction in pedal linkage. 4. Power Brake Booster not allowing pedal to return completely.	1. Adjust brake lamp switch. 2. Inspect and replace as necessary. 3. Remove obstruction. 4. Replace power brake booster.
VEHICLE PULLS TO RIGHT OR LEFT ON BRAKING	1. Frozen brake caliper piston. 2. Contaminated brake shoe lining. 3. Pinched brake lines. 4. Leaking piston seal. 5. Suspension problem.	1. Replace frozen piston or caliper. Bleed brakes. 2. Inspect and clean, or replace shoes. Repair source of contamination. 3. Replace pinched line. 4. Replace piston seal or brake caliper. 5. Refer to the Suspension group.
PARKING BRAKE - EXCESSIVE LEVER TRAVEL	1. Rear parking brake shoes out of adjustment.	1. Adjust rear parking brake shoes.

BRAKE LINES

DESCRIPTION - BRAKE TUBES AND HOSES

The chassis brake tubes are steel with a corrosion resistant coating applied to the external surfaces. The flex hoses are made of reinforced rubber.

All available brake systems on this vehicle use the same type of brake line fittings and tubing flares. The brake line fittings used are double-wall ISO style tubing flares and fittings at all tubing joint locations. Only the outlets of the proportioning valves and the rear flex hoses threading into them have non-ISO style flares (ABS and early production Non-ABS vehicles only). They utilize double-inverted style flares. Refer to (Fig. 10) for specific joint locations and tube fitting size.

Brake hose connections at disc brake calipers are made using banjo fittings permanently attached to the end of the hose. Banjo bolts with internal passageways for fluid flow connect the hose to the caliper. Copper washers are used to seal the banjo fittings and bolts at the caliper and must be replaced when the connection is broken.

OPERATION - BRAKE TUBES AND HOSES

The purpose of the chassis brake tubes and flex hoses is to transfer the pressurized brake fluid developed by the master cylinder to the wheel brakes of the vehicle. The flex hoses are made of rubber to allow for the movement of the vehicle's steering and suspension.

INSPECTION - BRAKE TUBES AND HOSES

Flexible rubber hose is used at both front and rear brakes. Inspection of brake hoses should be performed whenever the brake system is serviced and every 7,500 miles or 12 months, whichever comes first (every engine oil change). Inspect hydraulic brake hoses for severe surface cracking, scuffing, worn spots or physical damage. If the fabric casing of the rubber hose becomes exposed due to cracks or abrasions in the rubber hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

The steel brake tubing should be inspected periodically for evidence of corrosion, physical damage or contact with moving or hot components of the vehicle.

REMOVAL

REMOVAL - FRONT DISC BRAKE SHOES

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove front wheel and tire assemblies from vehicle.

(3) Remove the two caliper guide pin bolts (Fig. 11).

Fig. 11 Caliper Guide Pin Bolts

- 1 - CALIPER ASSEMBLY
- 2 - GUIDE PIN BOLT
- 3 - GUIDE PIN BOLT
- 4 - STEERING KNUCKLE

NOTE: Note the positioning of the two rail shims between the knuckle's machined abutments and the brake shoes.

(4) Remove caliper assembly from steering knuckle. Proceed by first rotating top of caliper away from steering knuckle, then lifting caliper off bottom machined abutment on steering knuckle (Fig. 12). Take care not to lose the two rail shims.

(5) Hang the caliper off to the side using wire or bungee cord (Fig. 13). Do not allow the caliper to be supported by the flexible brake hose. Damage to the flexible brake hose may result.

(7) Pull inboard brake shoe away from piston until retaining clip is free from cavity in piston (Fig. 15).

Fig. 15 Inboard Brake Shoe

- 1 - PISTON
- 2 - BRAKE SHOE
- 3 - CALIPER ASSEMBLY

(8) Repeat steps (3) through (7) on opposite side of vehicle to remove that side's brake shoes.

REMOVAL - FRONT DISC BRAKE SHOES (EXPORT)

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove both front wheel and tire assemblies from vehicle.

(3) Remove the two caliper guide pin bolts (Fig. 11).

(4) Remove caliper assembly from steering knuckle. Proceed by first rotating top of caliper away from steering knuckle and then lifting caliper off bottom machined abutment on steering knuckle (Fig. 12).

(5) Hang the caliper off to the side using wire or bungee cord (Fig. 13). Do not allow the caliper to be supported by the flexible brake hose. Damage to the flexible brake hose may result.

(6) Remove outboard brake shoe by prying the shoe retaining clip over raised area on caliper. Then slide the brake shoe off the caliper (Fig. 14).

(7) Pull inboard brake shoe away from piston until retaining clip is free from cavity in piston (Fig. 15).

(8) Repeat steps (3) through (7) on opposite side of vehicle to remove that side's brake shoes.

CLEANING - DISC BRAKE SHOES

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

BRAKE PADS/SHOES - FRONT (Continued)

INSPECTION - DISC BRAKE SHOES

Visually inspect brake shoes (pads) for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators on the shoes (if equipped) and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake shoes from the calipers.

Measure each brake shoe. The combined brake shoe and its lining material thickness should be measured at its thinnest point.

- For front disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.95 mm (5/16 inch), they should be replaced.

- For rear disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.

- Typically, if front shoes are worn out, both fronts and rears need to be replaced. Make sure to check rears.

Replace **both** disc brake shoes (inboard and outboard) on each caliper. It is necessary to replace the shoes on the opposite side of the vehicle as well as the shoes failing inspection.

If the brake shoe assemblies do not require replacement, be sure to reinstall the brake shoes in the original position they were removed from.

INSTALLATION

INSTALLATION - FRONT DISC BRAKE SHOES

(1) Completely retract caliper piston back into piston bore of caliper assembly.

(2) Lubricate both steering knuckle abutments with a liberal amount of Mopar® Brake Grease For Caliper Slides Lubricant, or equivalent.

(3) Remove the protective paper from the noise suppression gasket on both the inner and outer brake shoe assemblies (if equipped).

NOTE: The inboard and outboard brake shoes are not common, refer to (Fig. 16) for inboard and outboard brake shoe assembly identification.

NOTE: When installing inboard brake shoe into caliper piston, be sure brake shoe is positioned squarely against the face of the caliper piston.

(4) Install the new inboard brake shoe assembly into the caliper piston by firmly pressing it into bore of caliper piston with thumbs (Fig. 15).

(5) Slide the new outboard brake shoe assembly onto the caliper assembly (Fig. 17).

(6) Install one rail shim on each machined abutment where it will contact the brake shoes. Make

Fig. 16 Inboard And Outboard Shoes

- 1 - INBOARD BRAKE SHOE
2 - WEAR INDICATOR
3 - OUTBOARD BRAKE SHOE

Fig. 17 Installing Outboard Brake Shoe Assembly

- 1 - BRAKE SHOE ASSEMBLY
2 - BRAKE CALIPER

sure the alignment tabs on the shims are positioned toward the abutments.

(7) Carefully position caliper and brake shoes over rotor by reversing the removal procedure (Fig. 12).

CAUTION: When being installed, extreme caution should be taken not to crosstread the caliper guide pin bolts.

(8) Install the caliper guide pin bolts (Fig. 11). Tighten guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(9) Repeat the preceding steps on the opposite side of the vehicle, installing the brake shoes on that side of the vehicle.

(10) Install the wheel and tire assemblies.

BRAKE PADS/SHOES - FRONT (Continued)

(11) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(12) Lower vehicle.

CAUTION: After performing any service to the vehicle brake system, be sure to obtain a firm brake pedal before moving vehicle.

(13) Pump the brake pedal several times to ensure the vehicle has a firm brake pedal to adequately stop vehicle.

(14) Check and adjust the brake fluid level as necessary.

(15) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

INSTALLATION - FRONT DISC BRAKE SHOES (EXPORT)

(1) Completely retract caliper piston back into piston bore of caliper assembly.

(2) Lubricate both steering knuckle abutments with a liberal amount of Mopar® Brake Grease For Caliper Slides Lubricant, or equivalent.

(3) Remove the protective paper from the noise suppression gasket on both the inner and outer brake shoe assemblies (if equipped).

NOTE: The inboard and outboard brake shoes are not common, refer to (Fig. 16) for inboard and outboard brake shoe assembly identification.

NOTE: When installing inboard brake shoe into caliper piston, be sure brake shoe is positioned squarely against the face of the caliper piston.

(4) Install the new inboard brake shoe assembly into the caliper piston by firmly pressing it into bore of caliper piston with thumbs (Fig. 15).

(5) Slide the new outboard brake shoe assembly onto the caliper assembly (Fig. 17).

(6) Carefully position caliper and brake shoes over rotor by reversing the removal procedure (Fig. 12).

CAUTION: When being installed, extreme caution should be taken not to crossthread the caliper guide pin bolts.

(7) Install the caliper guide pin bolts (Fig. 11). Tighten guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(8) Repeat the preceding steps on the opposite side of the vehicle, installing the brake shoes on that side of the vehicle.

(9) Install the wheel and tire assemblies.

(10) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(11) Lower vehicle.

CAUTION: After performing any service to the vehicle brake system, be sure to obtain a firm brake pedal before moving vehicle.

(12) Pump the brake pedal several times to ensure the vehicle has a firm brake pedal to adequately stop vehicle.

(13) Check and adjust the brake fluid level as necessary.

(14) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

BRAKE PADS/SHOES - REAR

REMOVAL - REAR DISC BRAKE SHOES

(1) Raise vehicle on jackstands or centered on a hoist. See Hoisting in the Lubrication and Maintenance section of this manual.

(2) Remove rear wheel and tire assemblies from vehicle.

(3) Remove the 2 caliper assembly to adapter guide pin bolts (Fig. 18).

Fig. 18 Caliper Guide Pin Bolts

- 1 - CALIPER ASSEMBLY
- 2 - ADAPTER
- 3 - CALIPER ASSEMBLY ATTACHING BOLT
- 4 - CALIPER ASSEMBLY ATTACHING BOLT

BRAKE PADS/SHOES - REAR (Continued)

(4) Remove caliper from adapter using the following procedure. First rotate top of caliper away from adapter. Then lift caliper assembly off bottom abutment of adapter to remove it from the vehicle (Fig. 19).

Fig. 19 Removing / Installing Caliper

- 1 - ADAPTER
- 2 - BRAKING DISC
- 3 - CALIPER ASSEMBLY
- 4 - ADAPTER ABUTMENT

(5) Support caliper assembly firmly from rear strut to prevent weight of caliper from damaging the flexible brake hose (Fig. 20).

Fig. 20 Storing Caliper

- 1 - FLEX HOSE
- 2 - STRUT
- 3 - WIRE HANGER
- 4 - CALIPER ASSEMBLY

(6) Remove the rear rotor from the hub by pulling it straight off the wheel mounting studs (Fig. 21).

- 2 - RETAINING CLIP

BRAKE PADS/SHOES - REAR (Continued)

(8) Pull inboard brake shoe away from piston, until the retaining clip is free from the cavity in the piston (Fig. 23).

Fig. 23 Removing / Installing Inboard Brake Shoe

- 1 - RETAINING CLIP
2 - INBOARD SHOE

CLEANING - DISC BRAKE SHOES

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

INSPECTION - DISC BRAKE SHOES

Visually inspect brake shoes (pads) for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the

wear indicators on the shoes (if equipped) and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake shoes from the calipers.

Measure each brake shoe. The combined brake shoe and its lining material thickness should be measured at its thinnest point.

- For front disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.95 mm (5/16 inch), they should be replaced.
- For rear disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.
- Typically, if front shoes are worn out, both fronts and rears need to be replaced. Make sure to check rears.

Replace **both** disc brake shoes (inboard and outboard) on each caliper. It is necessary to replace the shoes on the opposite side of the vehicle as well as the shoes failing inspection.

If the brake shoe assemblies do not require replacement, be sure to reinstall the brake shoes in the original position they were removed from.

INSTALLATION - REAR DISC BRAKE SHOES

NOTE: Step 1 below is only required when installing a caliper after new brake shoes have been installed.

- (1) Completely retract caliper piston back into piston bore of caliper assembly.
- (2) Lubricate both adapter abutments with a liberal amount of Mopar® Multipurpose Lubricant, or equivalent.
- (3) Install the rear rotor on the hub, making sure it is squarely seated on the face of the hub (Fig. 21).
- (4) Remove the protective paper from the noise suppression gasket on both the inner and outer brake shoe assemblies (if equipped).
- (5) Install the new inboard brake shoe assembly into the caliper piston by firmly pressing into piston bore with thumbs. Be sure inboard brake shoe assembly is positioned squarely against the face of the caliper piston (Fig. 23).
- (6) Slide the new outboard brake shoe assembly onto the caliper assembly (Fig. 22).

CAUTION: Use care when installing the caliper assembly onto the adapter, so the caliper guide pin bushings do not get damaged by the mounting bosses.

- (7) Carefully lower caliper and brake shoes over rotor and onto adapter, reversing the removal procedure (Fig. 19).

BRAKE PADS/SHOES - REAR (Continued)

CAUTION: When installing the caliper guide pin bolts extreme caution should be taken not to cross thread the guide pin bolts.

(8) Install the caliper guide pin bolts. Tighten the guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(9) Install the wheel and tire assembly.

(10) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(11) Remove jackstands or lower hoist.

CAUTION: Before moving vehicle, pump the brake pedal several times to insure the vehicle has a firm brake pedal to adequately stop the vehicle.

(12) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

Fig. 24 Caliper Guide Pin Bolts

DISC BRAKE CALIPER - FRONT

REMOVAL

REMOVAL - FRONT CALIPER

(1) Using a brake pedal holding tool, depress brake pedal past its first 1 inch of travel and secure in this position. This will isolate the master cylinder reservoir from the brake hydraulic system, not allowing the brake fluid to drain out of the reservoir.

(2) Raise vehicle on jackstands or centered on a hoist. See Hoisting in Lubrication and Maintenance.

(3) Remove front wheel and tire assembly from vehicle.

(4) Remove the banjo bolt connecting the brake flex hose to the caliper. There will be two washers (one on each side of the flex hose fitting) that will come off at the same time.

NOTE: Note the positioning of the two rail shims between the knuckle's machined abutments and the brake shoes.

(5) Remove the two caliper guide pin bolts (Fig. 24).

(6) Remove caliper assembly from steering knuckle. Proceed by first rotating top of caliper away from steering knuckle, then lifting caliper off bottom machined abutment on steering knuckle (Fig. 25). Take care not to lose the two rail shims.

Fig. 25 Caliper Removal/Installation

- 1 - BRAKE SHOES
- 2 - STEERING KNUCKLE
- 3 - BRAKING DISC
- 4 - CALIPER ASSEMBLY
- 5 - MACHINED ABUTMENT

DISC BRAKE CALIPER - FRONT (Continued)

(7) If required, remove rotor from hub by pulling it straight off wheel mounting studs (Fig. 26).

Fig. 26 Brake Rotor

- 1 - HUB
- 2 - STEERING KNUCKLE
- 3 - BRAKE ROTOR (DISC)
- 4 - WHEEL MOUNTING STUD

REMOVAL - FRONT CALIPER (EXPORT)

(1) Using a brake pedal holding tool, depress brake pedal past its first 1 inch of travel and secure in this position. This will isolate the master cylinder reservoir from the brake hydraulic system, not allowing the brake fluid to drain out of the reservoir.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove front wheel and tire assembly from vehicle.

(4) Remove the banjo bolt connecting the brake flex hose to the caliper. There will be two washers (one on each side of the flex hose fitting) that will come off at the same time.

(5) Remove the two caliper guide pin bolts (Fig. 24).

(6) Remove caliper assembly from steering knuckle. Proceed by first rotating top of caliper away from steering knuckle and then lifting caliper off bottom machined abutment on steering knuckle (Fig. 25).

(7) If required, remove rotor from hub by pulling it straight off wheel mounting studs (Fig. 26).

DISASSEMBLY

DISASSEMBLY - CALIPER GUIDE PIN BUSHINGS

Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING or INSPECTION in this section.

(1) With one hand, push the guide pin bushing sleeve towards the back of the caliper, and at the same time, pull the sleeve out the back of the caliper and bushing (Fig. 27).

Fig. 27 Removing Sleeve From Bushing

- 1 - CALIPER
- 2 - SLEEVE
- 3 - BUSHING

(2) Using your fingers, collapse one side of the rubber guide pin bushing. Pull the guide pin bushing out the other side of the brake caliper mounting boss (Fig. 28).

DISASSEMBLY - CALIPER PISTON AND SEAL

WARNING: UNDER NO CONDITION SHOULD HIGH PRESSURE AIR EVER BE USED TO REMOVE A PISTON FROM A CALIPER BORE. PERSONAL INJURY COULD RESULT FROM SUCH A PRACTICE.

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING AND INSPECTION in this section.

DISC BRAKE CALIPER - FRONT (Continued)

9105-58

Fig. 28 Removing Bushing From Caliper

- 1 - CALIPER
2 - BUSHING

NOTE: The safest way to remove the piston from the caliper bore is to use the hydraulic pressure of the vehicle's brake system.

(1) Following the removal procedure in DISC BRAKE SHOES found in this section, remove the caliper from the brake rotor and hang the assembly on a wire hook away from rotor and body of the vehicle so brake fluid cannot get on these components. Remove the brake shoes, and place a small piece of wood between the piston and caliper fingers.

(2) Carefully depress the brake pedal to hydraulically push piston out of its bore. Once completed, apply and hold down the brake pedal to any position beyond the first inch of pedal travel using a brake pedal holding tool. This will prevent the fluid in the master cylinder reservoir from completely draining out.

(3) Disconnect the brake fluid flex hose from the caliper assembly and remove it from the vehicle.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

(4) Mount the caliper in a vise equipped with protective jaws.

(5) Remove the piston dust boot from the caliper and discard (Fig. 29).

NOTE: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

PR781A

Fig. 29 Removing Caliper/Piston Dust Boot

- 1 - CALIPER
2 - SCREWDRIVER
3 - BOOT

(6) Using a soft tool such as a plastic trim stick, work the piston seal out of its groove in caliper piston bore (Fig. 30). Discard the old seal.

PR782A

Fig. 30 Removing Piston Seal

- 1 - PLASTIC TRIM STICK
2 - CALIPER
3 - PISTON SEAL GROOVE
4 - PISTON SEAL

DISC BRAKE CALIPER - FRONT (Continued)

(7) Clean the piston bore and drilled passage ways using alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.

(8) Inspect the piston bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth. Bores that have deep scratches or scoring should be honed. Use Caliper Hone, Special Tool C-4095 or equivalent, to hone the bore. Do not over-hone the bore. Do not increase the diameter of the bore more than 0.0254 mm (0.001 inch) (Fig. 31). If the bore does not clean up within this specification, a new caliper housing should be installed.

9105-41

Fig. 31 Honing Brake Caliper Piston Bore

- 1 - CALIPER
- 2 - CALIPER BORE
- 3 - SPECIAL TOOL C-4095

NOTE: During the honing procedure, coat the stones and bore with brake fluid. After honing the bore, carefully clean the seal and boot grooves with a stiff non-metallic rotary brush. Use extreme care in cleaning the caliper after honing. Remove all dirt and grit by flushing the caliper bore with fresh clean brake fluid; wipe it dry with a clean, lint free cloth and then clean it a second time.

(9) Inspect the caliper piston for pitting, scratches, or any physical damage. Replace the piston if there is evidence of scratches, pitting or physical damage.

CLEANING - CALIPER

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION - CALIPER

Inspect the disc brake caliper for the following:

- Brake fluid leaks in and around boot area and inboard lining
 - Ruptures, brittleness or damage to the piston dust boot
 - Damaged, dry or brittle guide pin dust boots
- If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

DISC BRAKE CALIPER - FRONT (Continued)

ASSEMBLY

ASSEMBLY - CALIPER GUIDE PIN BUSHINGS

(1) Fold the guide pin bushing in half lengthwise at the solid middle section (Fig. 32).

9205-192

Fig. 32 Folded Caliper Guide Pin Bushing

1 - CALIPER GUIDE PIN BUSHING

NOTE: To avoid damage to the bushing, do not use a sharp object to install the guide pin bushing.

(2) Insert the folded bushing into the caliper mounting boss using your fingers (Fig. 33).

9105-59

Fig. 33 Installing Caliper Guide Pin Bushing

1 - CALIPER
2 - BUSHING

(3) Unfold the bushing using your fingers or a wooden dowel until the bushing is fully seated into the caliper housing. The bushing flanges should be seated evenly on both sides of the bushing hole (Fig. 34).

9205-193

Fig. 34 Bushing Correctly Installed In Caliper

1 - BUSHING
2 - CALIPER
3 - BE SURE BOTH BUSHING FLANGES ARE FULLY SEATED AROUND CALIPER BUSHING BORES.

(4) Lubricate the inside surfaces of the bushing using Mopar® Dielectric Grease or an equivalent.

DISC BRAKE CALIPER - FRONT (Continued)

(5) Install the guide pin sleeve into one end of bushing until the seal area of bushing is past the seal groove in the sleeve (Fig. 35).

Fig. 35 Installing Sleeve In Bushing 9105-60

- 1 - CALIPER
- 2 - SLEEVE
- 3 - BUSHING

(6) Holding the convoluted boot on the opposite end of the bushing, push the steel sleeve through the bushing until the bushing boot is fully seated into the seal groove on that end of sleeve (Fig. 35). Install the other end bushing boot into the groove on that end of the bushing sleeve.

(7) Verify both ends of the bushing are seated in the sleeve grooves (Fig. 36). When the sleeve is seated properly into the bushing, the sleeve/bushing can be held between your fingers and easily slid back and forth without the bushing unseating from the sleeve groove.

ASSEMBLY - CALIPER PISTON AND SEAL

NOTE: Never use an old piston seal.

(1) Dip the new piston seal in clean brake fluid and install it in the groove of the caliper bore. The seal should be started at one area of the groove and gently worked around and into the groove (Fig. 37) using only your clean fingers to seat it.

(2) Coat the new piston boot with clean brake fluid leaving a generous amount inside the boot.

(3) Position the dust boot over the piston after coating it with brake fluid.

9205-194

Fig. 36 Correctly Installed Guide Pin Sleeve And Bushing

- 1 - CALIPER
- 2 - BUSHING
- 3 - SLEEVE

PR785

Fig. 37 Installing New Piston Seal

- 1 - CALIPER
- 2 - PISTON SEAL
- 3 - SEAL GROOVE

CAUTION: Force applied to the piston to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

DISC BRAKE CALIPER - FRONT (Continued)

(4) Install piston into caliper bore pushing it past the piston seal until it bottoms in the caliper bore (Fig. 38).

Fig. 38 Installing Piston Into Caliper Bore

- 1 - BOOT
- 2 - PISTON
- 3 - CALIPER

(5) Position the dust boot into the counterbore of the caliper assembly piston bore.

(6) Using a hammer and Installer, Special Tool C-4689 or C-4842 (depending on piston size), and Handle, Special Tool C-4171, drive the boot into the counterbore of the caliper as necessary (Fig. 39).

(7) Reinstall the caliper on the vehicle and bleed the brakes as necessary. Refer to Installation in this section.

INSTALLATION

INSTALLATION - FRONT CALIPER

CAUTION: Use care when installing the caliper assembly on the steering knuckle, so seals on caliper guide pin bushings do not get damaged by the steering knuckle bosses.

(1) Completely retract the caliper piston back into the piston bore of the caliper.

(2) If removed, install brake rotor on hub (Fig. 26).

(3) Lubricate both machined knuckle abutments with a liberal amount of Mopar® Brake Grease For Caliper Slides Lubricant, or equivalent.

(4) Install one rail shim on each machined abutment where it will contact the brake shoes. Make sure the alignment tabs on the shims are positioned toward the abutments.

Fig. 39 Installing Dust Boot

- 1 - HAMMER
- 2 - SPECIAL TOOL C-4171
- 3 - SPECIAL TOOL C-4689 or C-4842
- 4 - CALIPER

(5) Carefully position caliper and brake shoes over rotor by reversing removal procedure (Fig. 25).

CAUTION: When being installed, extreme caution should be taken not to crossthread the caliper guide pin bolts.

(6) Install the caliper guide pin bolts. Tighten guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(7) Install the banjo bolt connecting the flex hose to the caliper. One washer should be installed on each side of the flex hose fitting before installing the banjo bolt. Tighten banjo bolt to a torque of 48 N·m (35 ft. lbs.).

(8) Install the wheel and tire assembly.

(9) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(10) Lower vehicle.

CAUTION: After performing any service to the vehicle brake system, be sure to obtain a firm brake pedal before moving vehicle.

(11) Remove the brake pedal holding tool.

(12) Bleed the base brakes. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)

DISC BRAKE CALIPER - FRONT (Continued)

(13) Road test the vehicle and make several stops to wear off any foreign material off the brakes and to seat the brake shoe linings.

INSTALLATION - FRONT CALIPER (EXPORT)

CAUTION: Use care when installing the caliper assembly on the steering knuckle, so seals on caliper guide pin bushings do not get damaged by the steering knuckle bosses.

(1) Completely retract the caliper piston back into the piston bore of the caliper.

(2) If removed, install brake rotor on hub (Fig. 26).

(3) Lubricate both machined knuckle abutments with a liberal amount of Mopar® Brake Grease For Caliper Slides Lubricant, or equivalent.

(4) Carefully position caliper and brake shoes over rotor by reversing removal procedure (Fig. 25).

CAUTION: When being installed, extreme caution should be taken not to crossthread the caliper guide pin bolts.

(5) Install the caliper guide pin bolts. Tighten guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(6) Install the banjo bolt connecting the flex hose to the caliper. One washer should be installed on each side of the flex hose fitting before installing the banjo bolt. Tighten banjo bolt to a torque of 48 N·m (35 ft. lbs.).

(7) Install the wheel and tire assembly.

(8) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(9) Lower vehicle.

CAUTION: After performing any service to the vehicle brake system, be sure to obtain a firm brake pedal before moving vehicle.

(10) Remove the brake pedal holding tool.

(11) Bleed the base brakes. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(12) Road test the vehicle and make several stops to wear off any foreign material off the brakes and to seat the brake shoe linings.

DISC BRAKE CALIPER - REAR

REMOVAL- REAR CALIPER

(1) Raise vehicle on jackstands or centered on a hoist. See Hoisting in the Lubrication and Maintenance section of this manual.

(2) Remove rear wheel and tire assemblies from vehicle.

(3) Remove the 2 caliper assembly to adapter guide pin bolts (Fig. 40).

Fig. 40 Removing Caliper Guide Pin Bolts

DISASSEMBLY

DISASSEMBLY - CALIPER GUIDE PIN BUSHINGS

Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING or INSPECTION in this section.

(1) With one hand, push the guide pin bushing sleeve towards the back of the caliper, and at the same time, pull the sleeve out the back of the caliper and bushing (Fig. 44).

Fig. 44 Removing Sleeve From Bushing

- 1 - CALIPER
- 2 - SLEEVE
- 3 - BUSHING

DISC BRAKE CALIPER - REAR (Continued)

(2) Using your fingers, collapse one side of the rubber guide pin bushing. Pull the guide pin bushing out the other side of the brake caliper mounting boss (Fig. 45).

9105-58

Fig. 45 Removing Bushing From Caliper

1 - CALIPER
2 - BUSHING

DISASSEMBLY - CALIPER PISTON AND SEAL

WARNING: UNDER NO CONDITION SHOULD HIGH PRESSURE AIR EVER BE USED TO REMOVE A PISTON FROM A CALIPER BORE. PERSONAL INJURY COULD RESULT FROM SUCH A PRACTICE.

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to **CLEANING AND INSPECTION** in this section.

NOTE: The safest way to remove the piston from the caliper bore is to use the hydraulic pressure of the vehicle's brake system.

(1) Following the removal procedure in DISC BRAKE SHOES found in this section, remove the caliper from the brake rotor and hang the assembly on a wire hook away from rotor and body of the vehicle so brake fluid cannot get on these components. Remove the brake shoes, and place a small piece of wood between the piston and caliper fingers.

(2) Carefully depress the brake pedal to hydraulically push piston out of its bore. Once completed, apply and hold down the brake pedal to any position

beyond the first inch of pedal travel using a brake pedal holding tool. This will prevent the fluid in the master cylinder reservoir from completely draining out.

(3) Disconnect the brake fluid flex hose from the caliper assembly and remove it from the vehicle.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

(4) Mount the caliper in a vise equipped with protective jaws.

(5) Remove the piston dust boot from the caliper and discard (Fig. 46).

PR781A

Fig. 46 Removing Caliper/Piston Dust Boot

1 - CALIPER
2 - SCREWDRIVER
3 - BOOT

NOTE: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

(6) Using a soft tool such as a plastic trim stick, work the piston seal out of its groove in caliper piston bore (Fig. 47). Discard the old seal.

(7) Clean the piston bore and drilled passage ways using alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.

(8) Inspect the piston bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth. Bores that have deep scratches or scoring should be honed. Use Caliper Hone, Special

DISC BRAKE CALIPER - REAR (Continued)

**Fig. 47 Removing Piston Seal**

- 1 - PLASTIC TRIM STICK
- 2 - CALIPER
- 3 - PISTON SEAL GROOVE
- 4 - PISTON SEAL

Tool C-4095 or equivalent, to hone the bore. Do not over-hone the bore. Do not increase the diameter of the bore more than 0.0254 mm (0.001 inch) (Fig. 48). If the bore does not clean up within this specification, a new caliper housing should be installed.

NOTE: During the honing procedure, coat the stones and bore with brake fluid. After honing the bore, carefully clean the seal and boot grooves with a stiff non-metallic rotary brush. Use extreme care in cleaning the caliper after honing. Remove all dirt and grit by flushing the caliper bore with fresh clean brake fluid; wipe it dry with a clean, lint free cloth and then clean it a second time.

(9) Inspect the caliper piston for pitting, scratches, or any physical damage. Replace the piston if there is evidence of scratches, pitting or physical damage.

CLEANING - CALIPER

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE

**Fig. 48 Honing Brake Caliper Piston Bore**

- 1 - CALIPER
- 2 - CALIPER BORE
- 3 - SPECIAL TOOL C-4095

PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION - CALIPER

Inspect the disc brake caliper for the following:

- Brake fluid leaks in and around boot area and inboard lining
 - Ruptures, brittleness or damage to the piston dust boot
 - Damaged, dry or brittle guide pin dust boots
- If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

DISC BRAKE CALIPER - REAR (Continued)

ASSEMBLY

ASSEMBLY - CALIPER GUIDE PIN BUSHINGS

(1) Fold the guide pin bushing in half lengthwise at the solid middle section (Fig. 49).

9205-192

Fig. 49 Folded Caliper Guide Pin Bushing

1 - CALIPER GUIDE PIN BUSHING

NOTE: To avoid damage to the bushing, do not use a sharp object to install the guide pin bushing.

(2) Insert the folded bushing into the caliper mounting boss using your fingers (Fig. 50).

9105-59

Fig. 50 Installing Caliper Guide Pin Bushing

1 - CALIPER
2 - BUSHING

(3) Unfold the bushing using your fingers or a wooden dowel until the bushing is fully seated into the caliper housing. The bushing flanges should be seated evenly on both sides of the bushing hole (Fig. 51).

9205-193

Fig. 51 Bushing Correctly Installed In Caliper

1 - BUSHING
2 - CALIPER
3 - BE SURE BOTH BUSHING FLANGES ARE FULLY SEATED AROUND CALIPER BUSHING BORES.

(4) Lubricate the inside surfaces of the bushing using Mopar® Dielectric Grease or an equivalent.

DISC BRAKE CALIPER - REAR (Continued)

(5) Install the guide pin sleeve into one end of bushing until the seal area of bushing is past the seal groove in the sleeve (Fig. 52).

Fig. 52 Installing Sleeve In Bushing

- 1 - CALIPER
- 2 - SLEEVE
- 3 - BUSHING

(6) Holding the convoluted boot on the opposite end of the bushing, push the steel sleeve through the bushing until the bushing boot is fully seated into the seal groove on that end of sleeve (Fig. 52). Install the other end bushing boot into the groove on that end of the bushing sleeve.

(7) Verify both ends of the bushing are seated in the sleeve grooves (Fig. 53). When the sleeve is seated properly into the bushing, the sleeve/bushing can be held between your fingers and easily slid back and forth without the bushing unseating from the sleeve groove.

ASSEMBLY - CALIPER PISTON AND SEAL

NOTE: Never use an old piston seal.

(1) Dip the new piston seal in clean brake fluid and install it in the groove of the caliper bore. The seal should be started at one area of the groove and gently worked around and into the groove (Fig. 54) using only your clean fingers to seat it.

(2) Coat the new piston boot with clean brake fluid leaving a generous amount inside the boot.

(3) Position the dust boot over the piston after coating it with brake fluid.

Fig. 53 Correctly Installed Guide Pin Sleeve And Bushing

- 1 - CALIPER
- 2 - BUSHING
- 3 - SLEEVE

Fig. 54 Installing New Piston Seal

- 1 - CALIPER
- 2 - PISTON SEAL
- 3 - SEAL GROOVE

CAUTION: Force applied to the piston to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

DISC BRAKE CALIPER - REAR (Continued)

(4) Install piston into caliper bore pushing it past the piston seal until it bottoms in the caliper bore (Fig. 55).

Fig. 55 Installing Piston Into Caliper Bore

- 1 - BOOT
- 2 - PISTON
- 3 - CALIPER

(5) Position the dust boot into the counterbore of the caliper assembly piston bore.

(6) Using a hammer and Installer, Special Tool C-4689 or C-4842 (depending on piston size), and Handle, Special Tool C-4171, drive the boot into the counterbore of the caliper as necessary (Fig. 56).

(7) Reinstall the caliper on the vehicle and bleed the brakes as necessary. Refer to Installation in this section.

INSTALLATION- REAR CALIPER

NOTE: Step 1 below is only required when installing the disc brake caliper after new brake shoes have been installed.

(1) Completely retract caliper piston back into piston bore of caliper assembly.

(2) Lubricate both adapter abutments with a liberal amount of Mopar® Multipurpose Lubricant, or equivalent.

(3) Install the rear rotor on the hub, making sure it is squarely seated on the face of the hub (Fig. 43).

CAUTION: Use care when installing the caliper assembly onto the adapter, so the caliper guide pin bushings do not get damaged by the mounting bosses.

Fig. 56 Installing Dust Boot

- 1 - HAMMER
- 2 - SPECIAL TOOL C-4171
- 3 - SPECIAL TOOL C-4689 or C-4842
- 4 - CALIPER

(4) Carefully lower caliper and brake shoes over rotor and onto the adapter using the reverse procedure for removal (Fig. 41).

CAUTION: When installing guide pin bolts extreme caution should be taken not to crosstread the caliper guide pin bolts.

(5) Install the caliper guide pin bolts. Tighten the guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(6) Install the wheel and tire assembly.

(7) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(8) Remove jackstands or lower hoist.

CAUTION: Before moving vehicle, pump the brake pedal several times to insure the vehicle has a firm brake pedal to adequately stop vehicle.

(9) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

FLUID

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

STANDARD PROCEDURE - BRAKE FLUID LEVEL CHECK

Check master cylinder reservoir brake fluid level a minimum of twice a year.

Master cylinder fluid reservoirs for both standard and antilock brake systems are marked with a FULL fill line indicating the reservoirs proper fluid level (Fig. 57).

NOTE: When filling brake fluid reservoir, use only Mopar® brake fluid or an equivalent stored in a tightly sealed container. Brake fluid must conform to DOT 3 specifications. Do not use brake fluid with a lower boiling point than DOT 3, as brake failure could result during prolonged hard braking. Do not use petroleum-based fluid because seal damage in the brake system will result.

If necessary, add brake fluid to reservoir, bringing brake fluid level to the FULL fill line shown on fluid reservoir (Fig. 57).

The master cylinder brake fluid reservoir used on this vehicle includes a brake fluid level switch. The brake fluid level sensor location is in the body of the brake fluid reservoir (Fig. 57). In the event of low brake fluid level in the brake fluid reservoir, the RED brake warning indicator lamp in the instrument cluster will turn on.

SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use

Fig. 57 Master Cylinder Fluid Level

- 1 - BOOSTER
- 2 - MASTER CYLINDER
- 3 - MASTER CYLINDER FLUID RESERVOIR
- 4 - FLUID LEVEL FULL MARK
- 5 - FLUID LEVEL SWITCH

only Mopar® brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids include items such as engine oil, transmission fluid, power steering fluid, etc.

BRAKE JUNCTION BLOCK

DESCRIPTION

A junction block is used on vehicles that are not equipped with antilock brakes (ABS). The junction block is located in front of the driver's side front tire behind the front fascia (Fig. 63). The junction block mounts in the same location as the ABS integrated control unit (ICU) does on vehicles with ABS.

It has six threaded ports to which the brake tubes connect. Two are for the brake tubes coming from the master cylinder. The remaining four ports are for the brake tubes going to each brake assembly. The valve is permanently mounted to a bracket which fastens to the engine cradle crossmember.

BRAKE JUNCTION BLOCK (Continued)

Later production junction blocks have the proportioning valves for the rear brakes mounted in them. One valve is mounted in each end (Fig. 58). The proportioning valves are not serviced separately from the junction block. Vehicles with this type junction block no longer have proportioning valves mounted at the rear brake flex hoses.

Fig. 58 Junction Block With Proportioning Valves

- 1 - JUNCTION BLOCK
- 2 - PROPORTIONING VALVE (LEFT REAR)
- 3 - BRACKET
- 4 - PROPORTIONING VALVE (RIGHT REAR)

OPERATION

The junction block distributes the brake fluid coming from the master cylinder primary and secondary ports to the four brake tubes leading to the brakes. Since the junction block mounts in the same location as the ABS integrated control unit (ICU), it allows for the common use of brake tubes on the vehicle whether it is equipped with or without ABS.

Later applications of the junction block include two proportioning valves. Placed in the fluid flow passages leading to the rear brake tube ports, they balance front-to-rear braking. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/PROPORTIONING VALVE - OPERATION)

REMOVAL

(1) Disconnect and isolate the negative battery connection at the right front strut tower.

(2) Using a brake pedal holding tool such as shown (Fig. 59), depress brake pedal past its first 1 inch of travel and secure in this position. This will isolate the master cylinder reservoir from the brake hydraulic system, not allowing the brake fluid to drain out of the reservoir.

Fig. 59 Brake Pedal Holding Tool Installed

- 2 - THROTTLE PEDAL
- 3 - BRAKE PEDAL HOLDING TOOL
- 4 - STEERING WHEEL
- 5 - DRIVER'S SEAT
- 6 - BRAKE PEDAL

(3) Remove screw fastening the speed control servo to the upper radiator closure panel (Fig. 60).

(4) Remove screw fastening the washer filler tube to the upper radiator closure panel (Fig. 60).

Fig. 60 Servo And Filler Tube Fasteners

- 1 - SPEED CONTROL SERVO
- 2 - WINDSHIELD WASHER FILLER TUBE
- 3 - SCREW
- 4 - SCREW

BRAKE JUNCTION BLOCK (Continued)

(5) Remove nut and screw securing transmission control module to vehicle (Fig. 61).

80c07331

**Fig. 61 Transmission Control Module (TCM)—
Removal/Installation**

- 1 - RADIATOR UPPER SUPPORT
- 2 - TCM

(6) Lift the transmission control module (with speed control servo attached) from its mount leaving its wiring harness attached. Move it off to the side toward the engine making sure not to strain the wires and speed control servo cable.

(7) Clean any debris away from the fittings on top of the junction block.

(8) Remove the two brake tubes coming from the primary and secondary master cylinder ports at the junction block (Fig. 62).

(9) Remove the four chassis brake tubes going to each brake, mounted across the front top of the junction block (Fig. 62).

(10) There are two bolts fastening the junction block and mounting bracket to the engine cradle crossmember. Remove the outboard bolt fastening the mounting bracket to the engine cradle crossmember.

(11) Raise the vehicle. See hoisting in Lubrication and Maintenance.

(12) Loosen, but do not remove, the remaining mounting bolt fastening the junction block mounting bracket to the engine cradle crossmember (Fig. 63).

(13) Pivot the junction block and bracket forward on the remaining mounting bolt and remove the junction block and bracket from the vehicle.

INSTALLATION

(1) If not already installed, install, but do not tighten, the one bolt in the junction block bracket (Fig. 63).

(2) Install the junction block with mounting bracket onto the engine cradle crossmember guiding

80a63e8f

Fig. 62 Junction Block Fitting Identification

- 3 - LEFT FRONT TIRE
- 4 - REMAINING MOUNTING BOLT

the installed bolt into the slot in the engine cradle crossmember.

(3) Align the remaining mounting bolt hole in the junction block bracket with its mounting hole in the engine crossmember and install, but do not tighten, the remaining mounting bolt.

(4) Tighten the first mounting bolt (installed in engine cradle crossmember slot) (Fig. 63) to 26 N·m (230 in. lbs.) torque with the aid of a crow foot wrench.

(5) Lower the vehicle to the ground.

BRAKE JUNCTION BLOCK (Continued)

(6) Tighten the remaining junction block bracket-to-engine cradle crossmember mounting bolt to 26 N·m (230 in. lbs.) torque.

(7) Install the four chassis brake tubes (going to each brake) to the junction block (Fig. 62). Tighten the tube fittings to 17 N·m (145 in. lbs.) torque with the aid of a crow foot wrench.

(8) Install the two brake tubes coming from the primary and secondary master cylinder ports to the top rear corners of the junction block (Fig. 62). Tighten the tube fittings to 17 N·m (145 in. lbs.) torque with the aid of a crow foot wrench.

(9) Install the transmission control module (with speed control servo attached) in its normal position (Fig. 61). Install the nut and screw securing it in place

(10) Install the transmission control module mounting nut and screw securing it in place. Tighten the screw to 6 N·m (45 in. lbs.). Tighten the nut to 12 N·m (107 in. lbs.) torque.

(11) Install the screw attaching the washer filler tube to the upper radiator closure panel (Fig. 60).

(12) Install the screw attaching the speed control servo to the upper radiator closure panel (Fig. 60).

(13) Remove the brake pedal holding tool.

(14) Bleed the base brake system. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)

MASTER CYLINDER

DESCRIPTION

There are two different master cylinders used on this vehicle. A center-port master cylinder is used on ABS and Traction Control vehicles. A conventional vent-port master cylinder is used on vehicles without ABS. Both master cylinders appear the same externally except for the size of their outlet ports. The ABS master cylinder has outlet ports differing in size; the primary port is machined to accept a 12 mm tube nut, while the secondary port is machined for a 10 mm tube nut. Both the primary and secondary ports on a non-ABS master cylinder are machined to accept 12 mm tube nuts.

The master cylinder is mounted to the face of the power brake booster on the left side of the dash (Fig. 64). It has the brake fluid reservoir mounted on top and the brake fluid level switch is mounted in the side of that reservoir.

OPERATION

When the brake pedal is pressed, the master cylinder primary and secondary pistons apply brake pressure through the chassis brake tubes and proportioning valves to each brake assembly. The

Fig. 64 Master Cylinder

- 1 - BOOSTER
- 2 - MASTER CYLINDER
- 3 - MASTER CYLINDER FLUID RESERVOIR
- 4 - FLUID LEVEL FULL MARK
- 5 - FLUID LEVEL SWITCH

brake fluid reservoir supplies the brake hydraulic system with the necessary fluid to operate properly.

The primary and secondary outlet tubes of the master cylinder are connected to a junction block on non-ABS equipped vehicles. The tube from the master cylinder primary outlet port connects to the inboard port of the junction block, and the tube from the secondary outlet port connects to the outboard port of the junction block. The inboard port of the junction block supplies the right front and left rear brakes. The outboard port of the junction block supplies the left front and right rear brakes.

On vehicles equipped with Antilock Brakes (with or without Traction Control), the master cylinder primary outlet port outlet tube connects to the inboard port of the ICU, and the secondary outlet port outlet tube connects to the outboard port of the ICU.

The master cylinder reservoir cap diaphragm is slit to allow atmospheric pressure to equalize on both sides of the diaphragm.

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

CAUTION: When clamping the master cylinder in a vise for bleeding, carefully tighten the vise just enough to hold the master cylinder from moving. Excessive pressure can damage the master cylinder.

- (1) Clamp master cylinder in a vise.

MASTER CYLINDER (Continued)

NOTE: The master cylinder outlet ports use ISO style flares and metric threads. Special Tool Package 8822 includes ISO style flare adapters with metric threads to be used in conjunction with Bleeder Tubes, Special Tool Package 8358.

(2) Attach special tools for bleeding master cylinder in the following fashion:

(a) **For non-ABS master cylinders**, thread one Adapter, Special Tool 8822-2, into each outlet port. Tighten Adapters to 17 N·m (145 in. lbs.) torque.

(b) **For ABS master cylinders**, thread one Adapter, Special Tools 8822-2, into the primary outlet port and one Adapter, Special Tool 8822-1, into the secondary outlet port. Tighten Adapters to 17 N·m (145 in. lbs.) torque.

(c) Thread one Bleeder Tube, Special Tool 8358-1, into each Adapter. Tighten each tube to 17 N·m (145 in. lbs.) torque. Flex bleeder tubes and place open ends into mouth of fluid reservoir as far down as possible (Fig. 65).

Fig. 65 Master Cylinder Set Up For Bleeding

- 1 - BLEEDER TUBES 8358
- 2 - NON-ABS - ADAPTER 8822-1; ABS - ADAPTER 8822-2
- 3 - ADAPTER 8822-2
- 4 - WOODEN DOWEL

NOTE: Make sure open ends of bleeder tubes stay below surface of brake fluid once reservoir is filled to proper level to avoid ingesting air while bleeding.

(3) Fill reservoir with Mopar® Brake Fluid or equivalent conforming to DOT 3 specifications. Make sure fluid level is above tips of bleeder tubes in reservoir.

(4) Using a wooden dowel as a pushrod (Fig. 65), slowly depress master cylinder pistons, then release pressure, allowing pistons to return to released position. Repeat several times until all air bubbles are expelled. Make sure fluid level stays above tips of bleeder tubes in reservoir while bleeding.

(5) Remove bleeding tubes. Plug outlets and install filler cap.

(6) Remove master cylinder from vise and install on power brake booster. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

REMOVAL

(1) Disconnect brake fluid level switch wire connector on the side of the master cylinder reservoir.

(2) Disconnect primary and secondary brake tubes from master cylinder housing. Install plugs at brake tube outlets.

(3) Remove the 2 nuts attaching the master cylinder to the power brake vacuum booster (Fig. 66).

Fig. 66 Master Cylinder Mounting

- 1 - MASTER CYLINDER MOUNTING NUTS
- 2 - POWER BRAKE BOOSTER
- 3 - MASTER CYLINDER

(4) Slide master cylinder straight out from the booster.

MASTER CYLINDER (Continued)

DISASSEMBLY

(1) Remove the master cylinder from the power brake booster. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL)

(2) Using an appropriate cleaner such as Mopar® Brake Parts Cleaner, clean the master cylinder housing and brake fluid reservoir.

(3) Remove the filler cap and empty all brake fluid from reservoir.

(4) Clamp the master cylinder in vise.

(5) Remove the 2 fluid reservoir to master cylinder retaining pins (Fig. 67).

Fig. 67 Reservoir Retaining Pins

- 1 - BRAKE FLUID RESERVOIR
- 2 - DRIFT
- 3 - RETAINING PIN
- 4 - MASTER CYLINDER

NOTE: Do not pry off fluid reservoir using a tool, damage to reservoir may result.

(6) Remove reservoir from master cylinder by pulling upward on the reservoir while rock it from side-to-side (Fig. 68).

(7) Remove the master cylinder housing-to-reservoir grommets (Fig. 69).

(8) For reassembly, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - ASSEMBLY).

ASSEMBLY

(1) Install new housing-to-reservoir grommets in master cylinder housing (Fig. 69).

(2) Lubricate brake fluid reservoir-to-grommet mounting area with clean brake fluid. Place reservoir in position over grommets. Seat reservoir into sealing grommets using a rocking motion while pushing down on reservoir.

(3) Make sure bottom of reservoir touches the top of both sealing grommets.

Fig. 68 Removing Reservoir

- 1 - FLUID RESERVOIR
- 2 - MASTER CYLINDER
- 3 - SEALING GROMMETS

Fig. 69 Reservoir Sealing Grommets

- 1 - RESERVOIR SEALING GROMMETS
- 2 - MASTER CYLINDER

(4) Install the 2 fluid reservoir to master cylinder retaining pins (Fig. 67).

(5) Bleed and install master cylinder on vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - STANDARD PROCEDURE)

INSTALLATION

CAUTION: If the master cylinder is being replaced or has been repaired, the master cylinder must be bled before installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - STANDARD PROCEDURE)

(1) Install master cylinder on studs of power brake vacuum booster, aligning the booster push rod with master cylinder piston.

(2) Install the master cylinder mounting nuts (Fig. 66). Tighten the nuts to a torque of 28 N·m (250 in. lbs.).

(3) Connect brake tubes to master cylinder primary and secondary ports. Tighten fittings to 17 N·m (145 in. lbs.) torque.

MASTER CYLINDER (Continued)

- (4) Reconnect brake fluid level switch.
- (5) Check and adjust brake fluid level as necessary using Mopar® Brake Fluid or equivalent.

CAUTION: It will be necessary to bleed the entire base hydraulic system if the brake system has been open to air for an excessive amount of time or air is present in the lines.

PEDAL

DESCRIPTION

A suspended type brake pedal is used on this vehicle (Fig. 70). The pedal pivots on a shaft mounted in the pedal support bracket under the instrument panel. The pedal also connects to the power brake booster input rod. The pedal ratio is 3.44:1.

OPERATION

When the brake pedal is depressed, it pushes in on the power brake booster input rod applying the brakes. At the same time, it allows the brake lamp switch's plunger to extend, thus applying the brake lamps.

REMOVAL

(1) Disconnect and isolate the remote ground battery cable from the ground stud on the right strut tower.

(2) Remove the brake lamp switch from its bracket (Fig. 70). The brake lamp switch is removed by depressing and holding the brake pedal while rotating brake lamp switch in a counterclockwise direction approximately 30 degrees. Pull the switch rearward and remove it from its mounting bracket.

(3) Remove the retaining clip from the brake pedal pin securing the power brake booster to the pedal using following procedure (Fig. 71). Position a small screwdriver between the center tang on the retaining clip and the brake pedal pin. Rotate blade of screwdriver enough so center tang on retaining clip can pass over end of brake pedal pin, then pull retaining clip off brake pedal pin.

(4) Remove the booster input rod from the brake pedal pin.

(5) Remove the nut from the brake pedal pivot shaft (Fig. 70). The pivot shaft has a flat on it to hold while the nut is removed.

(6) Remove the brake pedal pivot shaft from the brake pedal and pedal mounting bracket.

(7) Remove the brake pedal with bushings from mounting bracket (Fig. 70).

NOTE: The bushings can be easily removed from the pedal by pulling them straight out each side.

Fig. 70 Brake Pedal

- 1 - BUSHINGS
- 2 - BRAKE PEDAL
- 3 - BRAKE LAMP SWITCH
- 4 - PIVOT SHAFT

Fig. 71 Brake Pedal Retaining Clip

- 1 - BRAKE PEDAL
- 2 - INPUT ROD
- 3 - SCREWDRIVER
- 4 - RETAINING CLIP
- 5 - BRAKE PEDAL PIN

INSTALLATION

(1) Make sure the pedal has a properly installed bushing on each side of the pedal (Fig. 70).

(2) Lubricate the brake pedal pivot shaft and brake pedal bushings using Mopar Lubriplate or an equivalent.

(3) Install the brake pedal in the pedal bracket (Fig. 70). Align the hole in brake pedal with the pivot shaft holes in the pedal bracket.

(4) Install the brake pedal shaft (Fig. 70).

PEDAL (Continued)

(5) Install the nut on the end of the brake pedal pivot shaft. Tighten the nut to a torque of 34 N·m (25 ft. lbs.).

(6) Install the power brake booster input rod on the brake pedal pin.

CAUTION: When installing the retaining clip on the brake pedal pin, a **NEW** retaining clip must be used to ensure the retention of the power brake booster input rod.

(7) Install a **new** retaining clip (Fig. 71) on the brake pedal pin.

(8) Using Mopar Lubriplate or an equivalent, lightly lubricate the surface of the brake pedal striker where the plunger of the brake lamp switch contacts it.

NOTE: Prior to installing the brake lamp switch into its bracket, the plunger must be moved to its fully extended position using the procedure in Step 9.

(9) Hold brake lamp switch firmly in one hand. Using other hand, pull outward on the plunger of the brake lamp switch until it has ratcheted out to its fully extended position.

(10) Install the brake lamp switch in the brake pedal bracket (Fig. 70). Install it using the following procedure. Depress the brake pedal as far down as possible. Then while holding brake pedal down, align the index key on switch with notch in square hole of mounting bracket. When the switch is fully installed into the bracket, rotate the switch in a clockwise direction approximately 30 degrees until it locks into place.

CAUTION: Do not use excessive force when pulling back on brake pedal to adjust the brake lamp switch. If too much force is used, damage to the brake lamp switch or striker can result.

(11) Gently release/pull back the brake pedal until it stops moving. This will cause the switch plunger to ratchet back to its correctly adjusted position.

(12) Connect the remote ground cable to the ground stud on the right front strut tower.

(13) Check the operation of the brakes and brake lamp switch.

POWER BRAKE BOOSTER

DESCRIPTION

The power brake booster assembly mounts on the engine side of the dash panel. It is externally connected to the brake pedal by an input push rod extending out the rear of the booster (Fig. 72). The master cylinder is bolted to the front of the power brake booster assembly.

9205-258

Fig. 72 Power Brake Booster

- 2 - OUTPUT ROD
- 3 - POWER BRAKE BOOSTER ASSEMBLY
- 4 - INPUT ROD
- 5 - MASTER CYLINDER MOUNTING STUDS (2)
- 6 - POWER BOOSTER ASSEMBLY TO DASH PANEL MOUNTING STUDS (4)

A vacuum check valve is mounted on the power brake booster body. A vacuum line connects the booster (check valve) to the intake manifold. Depending on the engine combination, different vacuum hose routings are required.

POWER BRAKE BOOSTER (Continued)

The power brake booster can be identified by the tag attached to the body of the booster assembly (Fig. 73). This tag contains the following information:

- the production part number
- the date it was built
- who manufactured it

NOTE: The power brake booster assembly is not a repairable part and must be replaced as a complete unit if it is found to be faulty in any way. The power booster vacuum check valve is not repairable but can be replaced as an assembly.

Fig. 73 Power Brake Booster Identification

- 1 - VACUUM CHECK VALVE
 2 - MASTER CYLINDER PUSH ROD
 3 - POWER BRAKE BOOSTER ASSEMBLY
 4 - MASTER CYLINDER MOUNTING STUDS
 5 - PART IDENTIFICATION TAG

OPERATION

The purpose of the power brake booster is to reduce the amount of force required by the driver (foot-pedal pressure) to obtain the required hydraulic pressure in the brake system to stop the vehicle. This vehicle utilizes a Bosch power brake booster to accomplish this task in all brake applications.

The power brake booster is vacuum operated. The vacuum is supplied from the intake manifold on the engine through the vacuum hose and power brake booster check valve (Fig. 72).

As the brake pedal is pressed, the power brake booster's input rod moves forward. This opens and closes valves in the power brake booster, creating a vacuum on one side of a diaphragm and allowing atmospheric pressure to enter on the other. This difference in pressure forces the output rod of the power booster out against

the primary piston of the master cylinder. As the pistons in the master cylinder move forward this creates the hydraulic pressure in the brake system.

DIAGNOSIS AND TESTING - POWER BRAKE BOOSTER

BASIC TEST

(1) With engine off, depress and release the brake pedal several times to purge all vacuum from the power brake booster.

(2) Depress and hold the pedal with light effort (15 to 25 lbs. pressure), then start the engine.

The pedal should fall slightly, then hold. Less effort should be needed to apply the pedal at this time. If the pedal fell as indicated, perform the VACUUM LEAK TEST listed after the BASIC TEST. If the pedal did not fall, continue on with this BASIC TEST.

(3) Disconnect the vacuum hose on the side of the vacuum check valve that leads to the speed control, then connect a vacuum gauge to the open vacuum port on the valve.

(4) Start the engine.

(5) When the engine is at warm operating temperature, allow it to idle and check the vacuum at the gauge.

If the vacuum supply is 12 inches Hg (40.5 kPa) or more, the power brake booster is defective and must be replaced. If the vacuum supply is below 12 inches, continue on with this BASIC TEST.

(6) Shut off the engine.

(7) Connect the vacuum gauge to the vacuum reference port on the engine intake manifold.

(8) Start the engine and observe the vacuum gauge.

If the vacuum is still low, check the engine tune and repair as necessary. If the vacuum is above 12 inches, the hose or check to the booster has a restriction or leak.

Once an adequate vacuum supply is obtained, repeat the BASIC TEST.

VACUUM LEAK TEST

(1) Disconnect the vacuum hose on the side of the power brake booster vacuum check valve that leads to the speed control, then connect a vacuum gauge to the open vacuum port on the valve.

(2) Remove the remaining hose on the vacuum check valve that is not the vacuum supply hose coming from the intake manifold. Cap off the open port on the check valve.

(3) Start the engine.

(4) Allow the engine to warm up to normal operating temperature and engine idle.

(5) Using vacuum line pliers, close off the vacuum supply hose near the booster and observe the vacuum gauge.

POWER BRAKE BOOSTER (Continued)

If the vacuum drop exceeds 1.0 inch Hg (3.3 kPa) in one minute, repeat the above steps to confirm the reading. The vacuum loss should be less than 1.0 inch Hg in one minute time span. If the loss is more than 1.0 inch Hg, replace the power brake booster. If it is not, continue on with this test.

(6) Remove the pliers from the hose temporarily.

(7) Apply light effort (approximately 15 lbs. of force) to the brake pedal and hold the pedal steady. Do not move the pedal once the pressure is applied or the test results may vary.

(8) Have an assistant reattach the pliers to the vacuum supply hose.

(9) Allow 5 seconds for stabilization, then observe the vacuum gauge.

If the vacuum drop exceeds 3.0 inches Hg (10 kPa) in 15 seconds, repeat the above steps to confirm the reading. The vacuum loss should be less than 3.0 inches Hg in 15 seconds time span. If the loss is more than 3.0 inches Hg, replace the power brake booster. If it is not, the booster is not defective.

REMOVAL - POWER BRAKE BOOSTER

(1) Remove the battery ground cable from the ground stud on the right strut tower. Then, correctly isolate the ground cable by installing the cable isolator on the ground stud (Fig. 74).

Fig. 74 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

(2) Remove caps from both wiper arms at the attachment to the pivots to expose the wiper arm attaching nut. Remove the nut attaching each wiper arm to its pivot (Fig. 75).

(3) Remove the wiper arms from the pivots. Wiper arms are removed from the pivots by rocking them back and force on the pivots until they can be pulled off the pivots.

Fig. 75 Wiper Arm Attachment To Pivot

- 1 - WIPER ARMS
- 2 - ATTACHING NUT
- 3 - ATTACHING NUT

(4) Remove the wiper module cover and cowl cover (Fig. 76) from the vehicle.

Fig. 76 Wiper Module And Cowl Cover

- 1 - COWL COVER
- 2 - WIPER MODULE COVER

(5) Remove the 8 bolts, attaching the reinforcement (Fig. 77) to the strut towers and the 1 bolt (Fig. 77) attaching the wiper module to the reinforcement. Remove the reinforcement from the vehicle.

Fig. 77 Reinforcement Attachment To Vehicle

- 1 - RIGHT STRUT TOWER

- 3 - LEFT STRUT TOWER
- 4 - ATTACHING BOLTS
- 5 - ATTACHING BOLT
- 6 - REINFORCEMENT
- 7 - ATTACHING BOLTS

POWER BRAKE BOOSTER (Continued)

(6) Disconnect the wire connector from the brake fluid level sensor on the right side of the master cylinder reservoir.

(7) Remove the 2 nuts (Fig. 78) attaching the master cylinder to the vacuum booster.

Fig. 78 Master Cylinder Mounting

- 1 - MASTER CYLINDER MOUNTING NUTS
- 2 - POWER BRAKE BOOSTER
- 3 - MASTER CYLINDER

(8) Carefully slide master cylinder off vacuum booster with brake lines attached, and position it backwards, on top of left engine cylinder head cover (Fig. 79).

Fig. 79 Master Cylinder Positioning

- 1 - BOOSTER
- 2 - MASTER CYLINDER
- 3 - ENGINE CYLINDER HEAD COVER

(9) Disconnect vacuum hose from power brake booster check valve. **DO NOT REMOVE CHECK VALVE FROM POWER BRAKE BOOSTER.**

(10) From under instrument panel, position a small screwdriver between the center tang on the power brake booster input rod to brake pedal pin retaining clip.

(11) Rotate screwdriver enough to allow retainer clip center tang to pass over end of brake pedal pin and pull retainer clip off pin. **Discard retainer clip it is not to be reused, replace only with a new retainer clip.**

(12) Remove the four nuts that attach the power brake booster to the vehicle dash panel. Nuts are accessible from under the dash panel in the area of the steering column and pedal bracket.

(13) Rotate the windshield wiper motor crank lever until the crank lever points in the 12 o'clock position (Fig. 80).

Fig. 80 Wiper Crank Lever Positioning

- 1 - WIPER MOTOR CRANK LEVER
- 2 - BRAKE BOOSTER

(14) Slide the power brake booster out of the dash panel and remove from vehicle.

CAUTION: Do not attempt to disassemble the power brake vacuum booster. It is serviced **ONLY** as a complete assembly.

INSTALLATION - POWER BRAKE BOOSTER

(1) Position power brake vacuum booster on dash panel.

(2) Install and tighten the 4 power brake booster to dash panel mounting nuts to 28 N·m (250 in. lbs.) torque.

(3) Using lubriplate or equivalent, coat the bearing surface of brake pedal pin.

(4) Connect booster input rod to brake pedal pin and install a **NEW** retainer clip. **Use only a new retainer clip DO NOT USE the old clip.**

NOTE: Before installing master cylinder, reposition under hood wiring harness above master cylinder mounting studs, in front of booster (Fig. 79).

(5) Carefully position master cylinder on booster. Position wire harness routing bracket onto right master cylinder mounting stud.

POWER BRAKE BOOSTER (Continued)

(6) Install and tighten the 2 master cylinder to booster mounting nuts (Fig. 78) to 28 N·m (250 in. lbs.) torque.

(7) Reconnect brake fluid level sensor connector.

(8) Connect all vacuum hoses onto the booster vacuum check valve.

(9) Check brake lamp switch operation.

(10) Install the wiper module reinforcement on the vehicle (Fig. 77). Install the 8 bolts, attaching the reinforcement to the strut towers. Install the bolt attaching the wiper module to the reinforcement.

(11) Install the covers over the wiper module and the cowl (Fig. 76). Install and securely tighten the attaching screws.

(12) Reconnect the battery ground cable to the ground stud on the shock tower.

(13) Turn windshield wipers ON, then OFF, in order to park wipers in the proper position before installing wiper arms.

(14) Install the wiper arms on the pivots (Fig. 75). Install and securely tighten the wiper arm to pivot attaching nuts. Install the caps on the wiper arms covering the pivot nuts.

(15) Verify proper operation of the power brake booster and brake system.

PROPORTIONING VALVE

DESCRIPTION

Two proportioning valves are used on each vehicle without antilock brakes. One valve is used for each rear brake hydraulic circuit. The proportioning valves that are located in the junction block (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/JUNCTION BLOCK - DESCRIPTION). The valves are not serviceable and must be replaced as part of the junction block.

OPERATION

Proportioning valves balance front to rear braking by controlling (at a given ratio) brake hydraulic pressure to the rear brakes above a preset level (split point). On light pedal applications equal brake pressure is transmitted to both the front and rear brakes. On heavier pedal applications, through the use of proportioning valves, the pressure transmitted to the rear will be lower than the front brakes. This prevents premature rear wheel skid.

If hydraulic pressure is lost in one-half of the diagonally split brake hydraulic system, the operation of the proportioning valve in the remaining half is not affected.

DIAGNOSIS AND TESTING - PROPORTIONING VALVE

Vehicles without Antilock Brakes have two proportioning valves. One proportioning valve controls the right rear brake, and the other proportioning valve controls the left rear brake. The proportioning valves are located in the junction block. Vehicle's with ABS do not have proportioning valves to test, they use Electronic Variable Brake Proportioning which is built into the Integrated Control Unit (ICU).

If premature wheel skid occurs on a hard brake application, it could be an indication that a malfunction has occurred with one of the two rear brake proportioning valves. Test the valve that controls the side of the vehicle on which the skid occurs. Both proportioning valves have the same pressure specifications and are tested in the same way.

(1) If the left rear proportioning valve is suspect, disconnect the tube nut fitting at the master cylinder primary port (port closest to power brake booster). Install Adapter, Special Tool 8494-2, in its place on the master cylinder.

(2) If the right rear proportioning valve is suspect, disconnect the tube nut fitting at the master cylinder secondary port (port furthest from power brake booster). Install Adapter, Special Tool 8494-2, in its place on the master cylinder.

(3) Connect primary brake tube to Adapter.

(4) Install a Pressure Gauge, Special Tool C-4007-A, to the Adapter.

(5) Tighten all tube nut fittings to 17 N·m (145 in. lbs.) torque.

(6) Remove screw fastening the speed control servo to the upper radiator closure panel (Fig. 81).

(7) Remove screw fastening the washer filler tube to the upper radiator closure panel (Fig. 81).

Fig. 81 Servo And Filler Tube Fasteners

- 1 - SPEED CONTROL SERVO
- 2 - WINDSHIELD WASHER FILLER TUBE
- 3 - SCREW
- 4 - SCREW

PROPORTIONING VALVE (Continued)

(8) Remove nut and screw securing transmission control module to vehicle (Fig. 82).

Fig. 82 Transmission Control Module (TCM)—Removal/Installation

- 1 - RADIATOR UPPER SUPPORT
2 - TCM

(9) Lift the transmission control module (with speed control servo attached) from its mount leaving its wiring harness attached. Move it off to the side toward the engine making sure not to strain the wires and speed control servo cable.

(10) Clean any debris away from the fittings on top of the junction block.

(11) Using the following figure, remove the chassis brake tube leading to either the left rear or right rear brake at the junction block (Fig. 83).

Fig. 83 Junction Block Fitting Identification

- 1 - FROM MASTER CYLINDER PRIMARY
2 - FROM MASTER CYLINDER SECONDARY
3 - TO LEFT FRONT BRAKE
4 - TO RIGHT REAR BRAKE
5 - TO LEFT REAR BRAKE
6 - TO RIGHT FRONT BRAKE

(12) If the left rear proportioning valve is suspect, install Adapter, Special Tool 8494-3, in its place on the junction block.

(13) If the right rear proportioning valve is suspect, install Adapter, Special Tool 8494-4, in its place on the junction block.

(14) Install a Pressure Gauge, Special Tool C-4007-A, to the Adapter.

(15) Tighten all tube nut fittings to 17 N·m (145 in. lbs.) torque.

(16) Bleed any air out of the system. This includes bleeding the air from the hose between the pressure test fitting and pressure gauge, which is done at the pressure gauge.

(17) With the aid of a helper, apply pressure to the brake pedal until reading on proportioning valve inlet gauge (at master cylinder) is at the pressure shown on the chart at the end of this procedure. Then check the pressure reading on the proportioning valve outlet gauge (at junction block outlet to rear brake). If proportioning valve outlet pressure does not agree with value shown on the chart (once inlet pressure shown on chart is obtained), replace the junction block (with internal proportioning valves) (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/JUNCTION BLOCK - REMOVAL). If pressure is within specifications, do not replace proportioning valve and perform the following steps.

(18) Remove the Pressure Gauge and Adapter, Special Tool 8494-3 or 8494-4, from junction block.

(19) Reinstall the chassis brake tube to the junction block port. Tighten tube nut fitting to 17 N·m (145 in. lbs.) torque.

(20) Install the transmission control module (with speed control servo attached) in its normal position (Fig. 82). Install the nut and screw securing it in place.

(21) Install the transmission control module mounting nut and screw securing it in place. Tighten the screw to 6 N·m (45 in. lbs.). Tighten the nut to 12 N·m (107 in. lbs.) torque.

(22) Install the screw attaching the washer filler tube to the upper radiator closure panel (Fig. 81).

(23) Install the screw attaching the speed control servo to the upper radiator closure panel (Fig. 81).

(24) Remove the Pressure Gauge and Adapter from master cylinder.

(25) Install the brake tube to the master cylinder primary or secondary port. Tighten the tube nut to a torque of 17 N·m (145 in. lbs.).

(26) Bleed the affected brake line. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)

PROPORTIONING VALVE (Continued)

(27) If no problem is found with the proportioning valves, check the rear wheel brake shoe linings for contamination or for replacement brake shoes not

meeting OEM brake lining material specifications. These conditions can also cause premature rear wheel skid.

PROPORTIONING VALVE APPLICATIONS AND PRESSURE SPECIFICATIONS

Sales Code	Brake System Type	Split Point	Slope	Identification	Inlet Pressure	Outlet Pressure
All	All Disc/Disc	400 psi	0.34	Bar Code Label	1000 psi	525-625 psi

ROTOR

DIAGNOSIS AND TESTING - BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be checked and inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE)

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when lin-

ings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Minimum thickness specifications are cast on the rotor's unmachined surface (Fig. 84). Limits can also be found in the table at the end of this brake rotor information.

80aa4b6a

Fig. 84 Minimum Thickness Markings (Typical)

- 1 - ROTOR MINIMUM THICKNESS MARKING
- 2 - ROTOR

ROTOR (Continued)

ROTOR THICKNESS VARIATION

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor at 12 equal points around the rotor braking surface with a micrometer at a radius approximately 25 mm (1 inch) from edge of rotor (Fig. 85). If thickness measurements vary by more than 0.013 mm (0.0005 inch), the rotor should refaced or replaced. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE)

Fig. 85 Checking Rotor Thickness

1 - MICROMETER

ROTOR RUNOUT

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the rotor. (The hub and rotor runouts are separable). To measure rotor runout on the vehicle, first remove the tire and wheel assembly. Reinstall the wheel mounting nuts on the studs, tightening the rotor to the hub. Mount the Dial Indicator, Special Tool C-3339, with Mounting Adaptor, Special Tool SP-1910 on steering arm. The dial indicator plunger should contact braking surface of rotor approximately 25 mm (one inch) from outer edge of rotor (Fig. 86). Check lateral runout on both sides of the rotor, marking the low and high spots on both. Runout limits can be found in the table at the end of this brake rotor information.

Fig. 86 Checking Rotor Runout

- 1 - SPECIAL TOOL SP-1910
- 2 - 25mm (1 INCH) FROM EDGE
- 3 - DISC SURFACE
- 4 - SPECIAL TOOL C-3339

If runout is in excess of the specification, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor and the one wheel stud closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed (Fig. 87).

Fig. 87 Marking Rotor and Wheel Stud

1 - CHALK MARK

Remove the rotor from the hub.

ROTOR (Continued)

NOTE: Clean the hub face surface before checking runout. This provides a clean surface to get an accurate indicator reading.

Mount Dial Indicator, Special Tool C-3339, and Mounting Adaptor, Special Tool SP-1910, to the steering knuckle. Position the indicator stem so it contacts the hub face near the outer diameter. Care must be taken to position stem outside of the stud circle, but inside of the chamfer on the hub rim (Fig. 88).

Fig. 88 Checking Hub Runout

- 1 - HUB SURFACE
- 2 - SPECIAL TOOL C-3339
- 3 - SPECIAL TOOL SP-1910

9105-44

Hub runout should not exceed 0.03 mm (0.0012 inch). If runout exceeds this specification, the hub must be replaced. Refer to SUSPENSION for the hub and bearing removal and installation procedure.

If the hub runout does not exceed this specification, install the rotor back on the hub, aligning the chalk marks on the rotor with a wheel mounting stud, two studs apart from the original stud (Fig. 89). Tighten nuts in the proper sequence and torque to specifications.

RN201

Fig. 89 Index Rotor And Wheel Stud

- 1 - CHALK MARK

Recheck brake rotor runout to see if the runout is now within specifications.

If runout is not within specifications, reface or replace the brake rotor. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE)

BRAKE ROTOR LIMITS

Braking Rotor	Rotor Thickness	Minimum Rotor Thickness	Rotor Thickness Variation	Rotor Run Out*	Rotor Micro Finish
Front Rotor	25.87–26.13 mm 1.019 -1.029 in.	24.4 mm 0.960 in.	0.013 mm 0.0005 in.	0.08 mm 0.003 in.	15-80 RMS
Rear Rotor	11.63–12.13 mm 0.458 -0.478 in.	10.4 mm 0.409 in.	0.013 mm 0.0005 in.	0.08 mm 0.003 in.	15-80 RMS
* TIR Total Indicator Reading (Measured On Vehicle)					

ROTOR (Continued)

STANDARD PROCEDURE - BRAKE ROTOR MACHINING

NOTE: Refacing of the rotor is not required each time the brake pads are replaced.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (Fig. 90), or replaced.

80b5743f

Fig. 90 Hub Mounted On-Car Brake Lathe

1 - ON-CAR BRAKE LATHE

The use of a hub-mounted on-car brake lathe is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

NOTE: All rotors have markings for minimum allowable thickness cast on an un-machined surface of the rotor (Fig. 91) or (Fig. 92).

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

9405-48

Fig. 91 Front Rotor Thickness Markings

1 - BRAKING DISC MINIMUM THICKNESS MARKING
2 - BRAKING DISC

9305-21

Fig. 92 Rear Rotor Thickness Markings

1 - BRAKING DISC MINIMUM THICKNESS MARKING
2 - PARK BRAKE DRUM MAXIMUM DIAMETER MARKING

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits **MUST BE MAINTAINED**. Extreme care in the operation of rotor turning equipment is required.

ROTOR (Continued)

BRAKE ROTOR REFINISHING LIMITS

Braking Rotor	Rotor Thickness	Minimum Rotor Thickness	Rotor Thickness Variation	Rotor Run Out*	Rotor Micro Finish
Front Rotor	25.87–26.13 mm 1.019 -1.029 in.	24.4 mm .960 in.	.013 mm .0005 in.	.08 mm .003 in.	15-80 RMS

ROTOR (Continued)

INSTALLATION

INSTALLATION - BRAKE ROTOR (FRONT)

(1) Install brake rotor over the wheel mounting studs onto hub (Fig. 93).

(2) Install disc brake caliper and shoes following the procedure found in Brake Pads/Shoes. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ BRAKE PADS/SHOES - INSTALLATION)

(3) Pump the brake pedal several times to ensure the vehicle has a firm brake pedal to adequately stop vehicle.

(4) Check and adjust brake fluid level as necessary.

INSTALLATION - BRAKE ROTOR (REAR)

(1) Install brake rotor over the wheel mounting studs onto hub (Fig. 94).

(2) Install disc brake caliper and shoes following the procedure found in Brake Pads/Shoes. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ BRAKE PADS/SHOES - INSTALLATION)

(3) Adjust parking brake shoes as necessary.

(4) Pump the brake pedal several times to ensure the vehicle has a firm brake pedal to adequately stop vehicle.

(5) Check and adjust brake fluid level as necessary.

PARKING BRAKE

DESCRIPTION

The parking brake mechanism on vehicles equipped with rear disc brakes consists of a small duo-servo brake which is mounted to the disc brake caliper adapter. The hat (center) section (Fig. 95) of the rear rotor serves as the braking surface (drum) for the parking brakes.

The parking brake shoes are mechanically operated by an internal lever connected to a flexible steel (rear) cable. There are two rear cables, one for each rear wheel parking brake. The rear cables are joined at an equalizer bracket (and cable tensioner) which is attached to the intermediate cable. The opposite end of the intermediate cable is attached to the front cable which leads to the foot operated lever mounted inside the passenger compartment.

OPERATION

When the parking brake (foot) lever is pressed, the cables are pulled, thus actuating the parking brake shoes. The shoes expand outward against the drum section of the rear disc brake rotor.

Fig. 95 Drum-In-Hat Braking Disc

1 - REAR BRAKING DISK ROTOR

2 - HAT SECTION OF REAR BRAKING DISC (PARKING BRAKE BRAKING SURFACE)

ADJUSTMENTS

ADJUSTMENT - PARKING BRAKE

NOTE: Tension adjustment is only necessary when the tensioner, or a cable has been replaced or disconnected for service. When adjustment is necessary, perform adjustment only as described in the following procedure. This is necessary to avoid faulty park brake operation.

- (1) Raise vehicle.
- (2) Fully back off cable tensioner adjusting nut at equalizer to create slack in cables.
- (3) Remove rear wheel/tire assemblies. Remove brake calipers and rotors.
- (4) Verify park brakes are in good condition and operating properly.
- (5) Verify park brake cables operate freely and are not binding, or seized.
- (6) Check park brake shoe adjustment.
- (7) Reinstall rotors and make sure rotors turn freely.
- (8) Reinstall brake calipers. Tighten guide pin bolts to 41 n·m (30 ft.lbs.).
- (9) Reinstall wheel/tire assemblies after brake shoe adjustment is complete.
- (10) Lower vehicle enough for access to park brake foot pedal. Fully apply park brakes.

PARKING BRAKE (Continued)

NOTE: Leave park brakes applied until adjustment is complete.

- (11) Raise vehicle again.
- (12) Mark tensioner rod 6.35 mm (1/4 in.) from edge of tensioner bracket (Fig. 96).
- (13) Tighten adjusting nut at equalizer until mark on tensioner rod moves into alignment with tensioner bracket.

CAUTION: Do not loosen, or tighten the tensioner adjusting nut for any reason after completing adjustment.

- (14) Lower vehicle until rear wheels are 15-20 cm (6-8 in.) off shop floor.
- (15) Release park brake foot pedal and verify that rear wheels rotate freely without drag. Verify pedal returns to fully released position.
- (16) Lower the vehicle.

PARKING BRAKE CABLE TENSIONER

REMOVAL

- (1) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in Lubrication and Maintenance.
- (2) Remove the park brake tensioner adjuster nut (Fig. 97), releasing the tensioner from the equalizer bracket to the intermediate cable.
- (3) Disconnect the connector and remove the park brake tensioner from the left rear parking brake cable (Fig. 97).

- 6 - INTERMEDIATE PARK BRAKE CABLE
- 7 - FUEL TANK
- 8 - BRACKET
- 9 - LEFT REAR CABLE CONNECTOR

- (4) Remove the park brake tensioner with its isolator from the vehicle.

INSTALLATION

- (1) Mark tensioner rod 6.35 mm (1/4 in.) from edge of tensioner bracket (Fig. 98).

80b34e06

Fig. 98 ADJUSTMENT MARK ON CABLE TENSION

- 1 - MEASURE
- 2 - TENSIONER
- 3 - TENSIONER ISOLATOR
- 4 - THREADED ROD
- 5 - PLACE MARK HERE
- 6 - BRAKE CABLE CONNECTOR

- (2) Install the park brake tensioner, with its isolator, in the vehicle, with the threaded adjustment stud pointed towards the right side of the vehicle (Fig. 97).

- (3) Connect the left rear park brake cable to the cable connector on the tensioner (Fig. 97).

- (4) Attach the threaded end of the tensioner to the equalizer bracket (Fig. 97), and install a new adjuster nut. Do not tighten at this time.

PARKING BRAKE CABLE TENSIONER (Continued)

(5) Verify the rear park brake shoes are properly adjusted.

(6) Lower vehicle enough for access to park brake foot pedal. Fully apply park brakes.

NOTE: Leave park brakes applied until adjustment is complete.

(7) Raise vehicle again.

(8) Tighten adjusting nut at equalizer (Fig. 97) until mark on tensioner rod (Fig. 98) moves into alignment with edge of tensioner bracket.

CAUTION: Do not loosen, or tighten the tensioner adjusting nut for any reason after completing adjustment.

(9) Lower vehicle until rear wheels are 15-20 cm (6-8 in.) off shop floor.

(10) Release park brake foot pedal and verify that rear wheels rotate freely without drag. Verify pedal returns to the fully released position.

(11) Lower vehicle to the ground.

PARKING BRAKE CABLE - FRONT

REMOVAL - FRONT CABLE

The front parking brake cable is serviced with the parking brake lever. (Refer to 5 - BRAKES - BASE/PARKING BRAKE/LEVER - REMOVAL)

INSTALLATION - FRONT CABLE

The front parking brake cable is serviced with the parking brake lever. (Refer to 5 - BRAKES - BASE/PARKING BRAKE/LEVER - INSTALLATION)

PARKING BRAKE CABLE - INTERMEDIATE

REMOVAL - INTERMEDIATE CABLE

(1) Raise the vehicle using a frame contact type hoist or correctly supported on jackstands. See Hoisting in Lubrication and Maintenance.

(2) Loosen the park brake cable tensioner adjuster nut until tension is removed from cables.

(3) Disconnect the cable connector between the front and intermediate cable.

(4) Remove the bolt attaching the intermediate cable retainer to the body torque box (Fig. 99).

(5) Remove the intermediate cable from the body torque box (Fig. 99).

(6) Remove the connector from the intermediate cable at the right rear park brake cable.

(7) Remove the intermediate cable from the tensioner bracket using the box end of a 1/2 inch wrench.

(8) Release the latch on the routing clip for the intermediate cable, mounted above the left rear cable retainer clip, on rear suspension crossmember.

(9) Remove the intermediate park brake cable.

INSTALLATION - INTERMEDIATE CABLE

(1) Install the intermediate park brake cable.

NOTE: When guiding the cable towards the front of the rear crossmember from the left side, make sure the cable is routed between the rear suspension crossmember and the frame rail crossing below the rear park brake cable. It should also be routed below the brake tubes at this point.

(2) Install the intermediate cable to the tensioner bracket by snapping it into place.

(3) Reinstall retainer clip on top of left side of crossmember, around intermediate cable and into place.

(4) Connect the intermediate cable to the right rear cable connector.

(5) Install the intermediate cable through the hole in the body torque box (Fig. 99). Install the bolt attaching the intermediate cable retainer to the body torque box.

(6) Connect the intermediate cable to the front cable connector.

(7) Adjust parking brake. (Refer to 5 - BRAKES - BASE/PARKING BRAKE - ADJUSTMENTS)

(8) Lower the vehicle.

PARKING BRAKE CABLE - REAR

REMOVAL - REAR CABLE

NOTE: This procedure can be used to remove either rear parking brake cable.

(1) Raise vehicle using a frame contact type hoist or correctly jack and support the vehicle using jack stands. See Hoisting in Lubrication And Maintenance.

(2) Loose the park brake cable tensioner nut until tension is removed from cables.

(3) **Left rear cable only** - Remove the rear cable from the connector at the park brake cable tensioner.

(4) **Right rear cable only** - Remove the rear cable from the connector at the intermediate cable.

(5) Remove the retainer clip securing the preferred rear park brake cable to the crossmember (Fig. 100).

Fig. 100 Left Rear Parking Brake

- 1 - INTERMEDIATE PARKING BRAKE CABLE
- 2 - CLIP
- 3 - FUEL TANK
- 4 - MUFFLER
- 5 - REAR PARKING BRAKE CABLE

(6) Lower the vehicle enough to have rear brakes at good working height.

(7) Remove the rear wheel and tire assembly from the side of the vehicle requiring service to the park brake cable.

(8) Remove the rear disc brake caliper from the adapter and rotor. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL)

(9) Remove the rear brake rotor from the rear hub/bearing assembly.

(10) Remove the parking brake shoes from the disc brake adapter. (Refer to 5 - BRAKES - BASE/PARKING BRAKE/SHOES - REMOVAL)

(11) Remove the park brake actuator lever from the rear park brake cable.

(12) Using a screwdriver, carefully compress the retainer tabs securing the rear park brake cable to the disc brake adapter.

(13) Remove the rear parking brake cable from the disc brake adapter and vehicle.

INSTALLATION - REAR CABLE

NOTE: This procedure can be used to install either rear parking brake cable.

(1) Install the rear parking brake cable by routing the leading end above the intermediate cable, then, between the frame, crossmember, and stabilizer bar.

(2) Install the other end of the cable into the disc brake adapter, allowing the retainer tabs to lock into place in the adapter.

(3) Install the park brake actuator lever onto the end of the rear park brake cable behind the spring.

(4) Install the parking brake shoes. (Refer to 5 - BRAKES - BASE/PARKING BRAKE/SHOES - INSTALLATION)

(5) Install the rear disc brake rotor on the hub/bearing.

(6) Install the brake caliper on the rotor and adapter. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION)

(7) Install the caliper guide pin bolts and tighten to 41 N·m (30 ft. lbs.).

(8) Install the tire and wheel assembly. Tighten wheel mounting nuts to 135 N·m (100 ft. lbs.).

(9) Raise the vehicle back up.

(10) Install the rear park brake cable into the rear suspension crossmember mounting hole.

(11) Install a new retainer clip, on the end of the cable housing, to secure it in place.

(12) **Left rear cable only** - Connect the left rear park brake cable to the connector on the park brake cable tensioner.

(13) **Right rear cable only** - Connect the right rear park brake cable to the connector on the intermediate park brake cable.

(14) When repairs are complete, adjust parking brake shoes, then adjust parking brake tensioner. (Refer to 5 - BRAKES - BASE/PARKING BRAKE - ADJUSTMENTS)

PARKING BRAKE LEVER

REMOVAL - PARKING BRAKE LEVER AND CABLE

NOTE: The parking brake lever assembly on this vehicle is serviced with the front cable installed on it. They should be removed, replaced, and installed as an assembly.

(1) Remove remote ground cable from ground stud on shock tower. Then correctly isolate ground cable from vehicle by installing isolator on stud (Fig. 101).

Fig. 101 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

(2) Raise the vehicle using a frame contact type hoist or correctly supported on jackstands. See Hoisting in Lubrication and Maintenance.

(3) Loosen the park brake tensioner adjuster nut, in front of the rear crossmember, until tension is removed from cables.

(4) Disconnect the cable connector between the front and intermediate cable.

(5) Lower the vehicle to the ground.

(6) Remove the driver's door opening sill cover.

(7) Remove the driver's side kick panel.

(8) Remove the fuse panel cover from the left end of the instrument panel (Fig. 102).

Fig. 102 Fuse Panel Cover

- 1 - FUSE PANEL COVER
- 2 - INSTRUMENT PANEL

(9) Remove the 2 screws behind the fuse panel cover attaching the lower instrument panel cover to the instrument panel mounting bracket (Fig. 103).

(12) Remove the park brake release cable from the park brake release handle in the lower instrument panel cover (Fig. 105).

80b2b43f

Fig. 105 Park Brake Release Cable

- 1 - PARK BRAKE RELEASE CABLE
- 2 - PARK BRAKE RELEASE HANDLE
- 3 - LOWER INSTRUMENT PANEL COVER

(13) Remove the 4 bolts mounting the reinforcement to the instrument panel (Fig. 106). Remove the reinforcement from the instrument panel. Remove the diagnostic connector from the reinforcement.

(14) Remove the lower A/C duct below the steering column. It is secured with 1 screw.

80b2b440

Fig. 106 Reinforcement Panel

- 1 - REINFORCEMENT PANEL
- 2 - MOUNTING BOLTS

(15) Remove the 2 lower mounting screws securing fuse junction block bracket to instrument panel end housing (Fig. 107).

80b3089f

Fig. 107 Fuse Junction Block

- 1 - DOME LAMP WIRING HARNESS CONNECTOR
- 2 - FUSE JUNCTION BLOCK
- 3 - LOWER MOUNTING SCREWS

(16) Remove the 2 screws securing fuse junction block upper edge to the instrument panel bracket. These screws are installed from above the right side of the fuse junction block and mount to the left.

(17) Remove the dome lamp wiring harness connector from the fuse junction block (Fig. 107).

(18) Move fuse junction block as far down and to the right as possible without causing damage to the harness or fuse junction block.

(19) Remove left rear door opening sill cover.

(20) Remove front seat belt anchor bolt at base of left B-pillar.

PARKING BRAKE LEVER (Continued)

(21) Pull back floor carpeting on left side of passenger compartment to reveal front park brake cable.

(22) Remove the screw securing the foot rest to the floor. Remove the foot rest.

(23) Remove the 2 screws securing the front park brake cable retainer bracket to the rear floor pan (Fig. 108).

Fig. 108 Front Park Brake Cable At Rear Floor Pan

- 1 - REAR SEAT CUSHION
- 2 - B-PILLAR
- 3 - ROUTING BRACKET SCREW
- 4 - FRONT PARK BRAKE CABLE
- 5 - FLOOR PLAN
- 6 - RETAINER BRACKET SCREWS

(24) Remove 2 routing bracket screws securing front park brake cable to left side of the passenger compartment floor. One screw is at the base of the B-pillar by the seat belt anchor bolt (Fig. 108), and the other is below the park brake lever assembly on the floor pan (Fig. 109).

(25) Remove the rear bolt, and loosen the 2 front nuts on studs, securing the parking brake lever assembly in place.

(26) Lower the parking brake lever assembly enough to gain access to the warning lamp ground wire connector. Remove the brake warning light ground wire from the switch on the park brake lever assembly.

(27) Continue to move parking brake lever, with front park brake cable attached, downward, and remove both from vehicle together.

INSTALLATION - PARKING BRAKE LEVER AND CABLE

(1) Install the parking brake lever, with front cable, back in vehicle by first running the front cable, starting from front to the rear, along the left side of passenger compartment. Guide it into the hole at the rear of the floor pan.

Fig. 109 Front Park Brake Cable Attachment At Front Floor Pan

- 1 - TO PARK BRAKE LEVER
- 2 - ROUTING BRACKET SCREW
- 3 - FLOOR PLAN
- 4 - DOOR SILL
- 5 - WIRE HARNESS
- 6 - FRONT PARK BRAKE CABLE

(2) Guiding the lever assembly up past the fuse junction block, position the park brake release cable into place. Also, reinstall the brake warning lamp wire, through access hole in lever assembly, onto switch.

(3) Position the lever assembly in its mounting place. Install the rear mounting bolt and tighten it to a torque of 27 N·m (19 ft. lbs.). Tighten the 2 mounting nuts to a torque of 27 N·m (19 ft. lbs.).

(4) Ensure that the park brake cable is properly routed and install the two routing bracket screws.

(5) Install the 2 screws securing the front park brake cable retainer bracket to the rear floor pan.

(6) Install the foot rest, securing it in place with its one mounting screw.

(7) Reposition the carpeting in place.

(8) Reinstall the front seat belt anchor bolt at the base of the B-pillar.

(9) Reinstall the rear door opening sill cover.

(10) Reposition the fuse junction block in place, and install the two lower, then, the two upper mounting screws.

(11) Reinstall the lower A/C duct in place.

(12) Install the diagnostic connector to the instrument panel steel reinforcement. Reinstall the steel reinforcement to the instrument panel.

(13) Connect the park brake release cable to the release handle.

(14) Reconnect the trunk release harness connector to the release switch.

(15) Reinstall the lower instrument panel cover below the steering column. Reinstall the 2 screws securing the lower instrument panel cover behind the fuse panel cover.

PARKING BRAKE LEVER (Continued)

- (16) Reinstall the fuse panel cover on left side of instrument panel.
- (17) Reinstall driver's side kick panel
- (18) Reinstall driver's door opening sill cover
- (19) Raise the vehicle up.
- (20) Reconnect the cable connector between the front and intermediate cables.
- (21) Adjust parking brake. (Refer to 5 - BRAKES - BASE/PARKING BRAKE - ADJUSTMENTS)
- (22) Lower the vehicle.

PARKING BRAKE SHOES

REMOVAL - PARKING BRAKE SHOES

- (1) Remove rear disc brake caliper assembly from adapter and rotor. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL)
- (2) Remove rear rotor from rear hub.
- (3) Remove dust cap from rear hub.
- (4) Remove the cotter pin, nut retainer, wave washer and rear hub/bearing assembly retaining nut and washer from the rear spindle.
- (5) Remove rear hub and bearing assembly from rear spindle.
- (6) Remove rear brake shoe assembly hold down clip.
- (7) Turn brake shoe adjuster wheel until adjuster is at shortest length.
- (8) Remove adjuster assembly from the parking brake shoe assemblies.
- (9) Remove lower shoe to shoe spring.
- (10) Pull rear brake shoe assembly away from anchor, then remove rear brake shoe and upper spring.
- (11) Remove front brake shoe hold-down clip, then remove front brake shoe assembly.

INSTALLATION - PARKING BRAKE SHOES

- (1) Install front brake shoe and hold down clip.
- (2) Install rear brake shoe and the upper brake shoe to shoe return spring.
- (3) Pull rear brake shoe over anchor block until properly located on adapter.
- (4) Install the lower shoe to shoe return spring.
- (5) Install brake shoe adjuster assembly with star wheel rearward.
- (6) Install rear brake shoe hold down clip.
- (7) Adjust brake shoes to a diameter to 171 mm (6.75 inch).
- (8) Install rear hub and bearing assembly on spindle.
- (9) Install hub and bearing assembly washer and retaining nut. Torque the hub and bearing assembly retaining nut to 168 N·m (124 ft. lbs.).
- (10) Install the wave washer, retaining nut and cotter pin.
- (11) Install hub and bearing assembly dust cap.
- (12) Install rear brake rotor.
- (13) Install rear disc brake caliper on the adapter. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION)
- (14) Install wheel and tire assemblies. Tighten wheel mounting nuts to 135 N·m (100 ft.lbs.).

BRAKES - ANTILOCK BRAKE SYSTEM

DESCRIPTION

DESCRIPTION - ANTILOCK BRAKES

This section covers the physical and operational descriptions and the on-car service procedures for vehicles equipped with the Mark 20e Antilock Brake System and the Mark 20e Antilock Brake System with traction control.

The purpose of this four-channel design antilock brake system is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This

allows the driver to retain greater control of the vehicle during braking.

This system features ABS Plus and Electronic Variable Brake Proportioning (EVBP). (Refer to 5 - BRAKES - ABS - ABS PLUS - DESCRIPTION)(Refer to 5 - BRAKES - ABS - ELECTRONIC VARIABLE BRAKE PROPORTIONING - DESCRIPTION)

For information on traction control equipped vehicles, (Refer to 5 - BRAKES - ABS - TRACTION CONTROL - DESCRIPTION).

DESCRIPTION - ABS PLUS

There is an ABS Plus function built into the ABS CAB. ABS Plus is a brake-on stability enhancement. It is designed to help maintain the directional stability of the vehicle during braking. There are no additional external components required for this function.

BRAKES - ANTILOCK BRAKE SYSTEM (Continued)

DESCRIPTION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use electronic variable brake proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

DESCRIPTION - TRACTION CONTROL

Traction control reduces wheel slip and maintains traction at the driving wheels at speeds below 56 km/h (35 mph) when road surfaces are wet or snow covered. The traction control system reduces wheel slip by braking the wheel that is losing traction.

OPERATION**OPERATION - ANTILOCK BRAKES**

There are a few performance characteristics of the Mark 20e Antilock Brake System that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 5–8 km/h (3–5 mph). If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation and each wheel receives its own separate electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS stop, the brakes hydraulic system is still diagonally split. However, the brake system pressure is further split into four control channels. During antilock operation of the vehicle's brake system, the front wheels are controlled independently and are on two separate control channels, and the

rear wheels are controlled together for better vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the controller antilock brake (CAB).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 5–7 km/h (3–4 mph). There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 5 km/h (3 mph) or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25–30 percent. This means that the wheel rolling velocity is 25–30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP CYCLE

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning indicator lamp will also be on for up to 5 seconds after the ignition is turned on. These conditions occur as part of ABS self-diagnosis check. The popping sound is a result of brief activation of the solenoids in the integrated control unit.

BRAKES - ANTILOCK BRAKE SYSTEM (Continued)

DRIVE-OFF CYCLE

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 25–40 km/h (15–25 mph). This is caused by brief activation of the ABS pump/motor and is a normal function of ABS as part of the self-diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE warning indicator lamp, nor the amber ABS warning indicator lamp, illuminate and no fault codes are stored in the CAB.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a DRBIII® scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged tone wheels; incorrect tone wheels; damaged steering knuckle wheel speed sensor mounting bosses; loose wheel speed sensor mounting bolts; excessive tone wheel runout; or an excessively large tone wheel-to-wheel speed sensor air gap. Give special attention to these components when diagnosing a vehicle exhibiting premature ABS cycling.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

OPERATION - ABS PLUS

When the brake pedal is depressed far enough to actuate the brake lamp switch, the CAB monitors and compares the speeds of the front (driving) wheels. It senses vehicle speed, brake application, and detects vehicle cornering and applies the brakes selectively to stabilize the vehicle.

OPERATION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the hydraulic control unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At

the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the outlet valve and draining through the inlet valve check valve. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

OPERATION - TRACTION CONTROL

The traction control system monitors wheel speed. During acceleration, if the CAB detects front (drive) wheel slip and the brakes are not applied, the system enters traction control mode. Traction control operation proceeds in the following order:

- (1) Close the normally open isolator valves.
- (2) Start the pump/motor and supply volume and pressure to the front (drive) hydraulic circuit. (The pump/motor runs continuously during traction control operation.)
- (3) Open and close the build and decay valves to maintain minimum wheel slip and maximum traction.

The cycling of the build and decay valves during traction control is similar to that during antilock braking, except the valves work to control wheel spin by applying the brakes, whereas the ABS function is to control wheel skid by releasing the brakes.

HYDRAULIC SHUTTLE VALVES

Two hydraulic shuttle valves allow pressure and volume to return to the master cylinder reservoir when not consumed by the build and decay valves. These valves are necessary because the pump/motor supplies more volume than the system requires.

If the brakes are applied at anytime during a traction control cycle, the brake lamp switch triggers the CAB to switch off traction control.

TRACTION CONTROL FUNCTION LAMPS

The traction control function lamp illuminates during a traction control cycle, displaying TRAC ON.

The traction control system is enabled at each ignition cycle. It may be turned off by depressing the traction control switch button. The traction control function lamp (TRAC OFF) illuminates immediately upon depressing the button.

If the CAB calculates that the brake temperatures are high, the traction control system becomes inoperative until a time-out period has elapsed. During this "thermo-protection mode," the traction control function lamp illuminates TRAC OFF; note that no trouble code is registered.

In the event that a system fault occurs thus illuminating the amber ABS warning lamp, the TRAC OFF lamp will also illuminate.

BRAKES - ANTILOCK BRAKE SYSTEM (Continued)

CAUTION

CAUTIONS

The ABS uses an electronic control module, the CAB. This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the CAB circuits.

CAUTION: In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.

CAUTION: These circuits should only be tested using a high impedance multi-meter or the DRBIII® scan tool as described in this section. Power should never be removed or applied to any control module with the ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: The CAB 24-way connector should never be connected or disconnected with the ignition switch in the ON position.

CAUTION: This vehicle utilizes active wheel speed sensors. Do not apply voltage to wheel speed sensors at any time.

CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of aftermarket electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, etc.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

CAUTION: When performing any service procedure on a vehicle equipped with ABS, do not apply a 12-volt power source to the ground circuit of the pump motor in the HCU. Doing this will damage the pump motor and will require replacement of the entire HCU.

CAUTION: An attempt to remove or disconnect certain system components may result in improper system operation. Only those components with approved removal and installation procedures in this manual should be serviced.

CAUTION: If welding work is to be performed on the vehicle, using an electric arc welder, the CAB connector should be disconnected during the welding operation.

CAUTION: Many components of the ABS System are not serviceable and must be replaced as an assembly. Do not disassemble any component which is not designed to be serviced.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle. Failure to raise a vehicle from the recommended locations could result in lifting a vehicle by the hydraulic control unit mounting bracket. Lifting a vehicle by the hydraulic control unit mounting bracket will result in damage to the mounting bracket and the hydraulic control unit.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surface, wash off with water immediately.

DIAGNOSIS AND TESTING - INSPECTION AND ROAD TEST

- (1) Visually inspect the ABS for damaged or disconnected components and connectors.
- (2) Verify the brake lamps are operational. If they are not, repair them prior to continuing.
- (3) Connect the DRBIII® scan tool to the Data Link Connector located under the instrument panel to the left of the steering column (Fig. 1). If the DRBIII® does not power-up, check the power and ground supplies to the connector.
- (4) Turn the ignition key to the ON position. Select ANTILOCK BRAKES.
- (5) Read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate chassis diagnostic information.

NOTE: Diagnostic trouble codes (DTCs) are kept in the controller's memory until either erased by the technician using the DRBIII®, or erased automatically after 3500 miles. DTCs are retained by the controller even if the ignition is turned off or the battery is disconnected. More than one DTC can be stored at a time. When accessed, the number of occurrences and the DTC that is stored are displayed.

If no problems are observed, it will be necessary to road test the vehicle.

Many ABS conditions judged to be a problem by the driver may be normal operating conditions. See Antilock Brake System - Operation to become familiarized with the normal characteristics of this antilock brake system.

- 3 - DATA LINK CONNECTOR
- 4 - PARKING BRAKE

WARNING: CONDITIONS THAT RESULT IN TURNING ON THE RED BRAKE WARNING INDICATOR LAMP MAY INDICATE REDUCED BRAKING ABILITY.

Before road testing a brake complaint vehicle, note whether the red BRAKE warning indicator lamp, amber ABS warning indicator lamp, or both are turned on.

If it is the red BRAKE warning indicator, there is a brake hydraulic problem that must be corrected before driving the vehicle. Refer to the Base Brake System - Diagnosis And Testing. If the MIC determines the amber ABS warning indicator is not functioning, it will illuminate the red BRAKE warning indicator.

If the amber ABS warning indicator is on, road test the vehicle as described below. While the amber ABS warning indicator is on, the ABS is not functional. The ability to stop the car using the base brake system should not be affected.

If both the red BRAKE and the amber ABS warning indicators are illuminated, there is possibility that there is an ABS problem. For some failures the ABS unit will discontinue ABS as well as EVBP and illuminate both the red BRAKE and the amber ABS warning indicators. **Braking ability may be reduced.** Before road testing, read DTC's and refer to the Appropriate Diagnostic Information. Also, the MIC will illuminate both the red BRAKE and the amber ABS warning indicators if the ABS CAB is not communicating on the BUS.

(6) Turn the key to the OFF position and then back to the ON position. Note whether the amber ABS warning lamp continues to stay on.

(7) If the amber ABS warning indicator lamp stays on, shift into gear and drive the car to a speed of approximately 25 km/h (15 mph) to complete the ABS Start-Up and Drive-Off Cycles (see Antilock Brake System - Operation). If at this time the amber ABS warning indicator lamp stays on, refer to the Appropriate Diagnostic Information.

(8) If the amber ABS warning indicator lamp goes out at any time, drive the vehicle a short distance. Accelerate the vehicle to a speed of at least 64 km/h (40 mph). Bring the vehicle to a complete stop, braking hard enough to cause the ABS to cycle. Repeat this action several times. Using the DRBIII®, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the Appropriate Diagnostic Information.

STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS though, particularly the ICU (HCU), should only need to be bled when the HCU is replaced or removed from the vehicle. The ABS must always be bled anytime it is suspected that the HCU has ingested air. Under most circumstances that require the bleeding of the brakes hydraulic system, only the base brake hydraulic system needs to be bled.

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

(1) Make sure all hydraulic fluid lines are installed and properly torqued.

(2) Connect the DRBIII® scan tool to the Data Link Connector. The connector is located under the lower steering column cover to the left of the steering column.

(3) Using the DRBIII®, check to make sure the CAB does not have any fault codes stored. If it does, clear them using the DRBIII®.

WARNING: WHEN BLEEDING THE BRAKE SYSTEM WEAR SAFETY GLASSES. A CLEAR BLEED TUBE MUST BE ATTACHED TO THE BLEEDER SCREWS AND SUBMERGED IN A CLEAR CONTAINER FILLED PART WAY WITH CLEAN BRAKE FLUID. DIRECT THE FLOW OF BRAKE FLUID AWAY FROM YOURSELF AND THE PAINTED SURFACES OF THE VEHICLE. BRAKE FLUID AT HIGH PRESSURE MAY COME OUT OF THE BLEEDER SCREWS WHEN OPENED.

BRAKES - ANTILOCK BRAKE SYSTEM (Continued)

(4) Bleed the base brake system using the standard pressure or manual bleeding procedure. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)

(5) Using the DRBIII®, select ANTILOCK BRAKES, followed by MISCELLANEOUS, then BLEED BRAKES. Follow the instructions displayed. When the scan tool displays TEST COMPLETED, disconnect the scan tool and proceed.

(6) Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.

(7) Fill the master cylinder reservoir to the full level.

(8) Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

FRONT WHEEL SPEED SENSOR

DESCRIPTION

This system uses two-wire wheel speed sensors known as active wheel speed sensors. One wheel speed sensor (WSS) and one tone wheel is located at each front and rear wheel. Each front wheel speed sensor is attached to a boss in the steering knuckle (Fig. 2). The front tone wheel is part of the outboard constant velocity joint.

Fig. 2 Front Wheel Speed Sensor

- 1 - WHEEL SPEED SENSOR
- 2 - CV BOOT
- 3 - TONE WHEEL
- 4 - ROTOR

OPERATION

The CAB sends 12 volts to power an Integrated Circuit (IC) in the sensor. The IC supplies a constant 7 mA power supply to the CAB. The relationship of the tooth on the tone wheel to the permanent magnet in the sensor, signals the IC to enable a second 7 mA power supply. The output of the sensor, sent to the CAB, is a DC voltage signal with changing voltage and current levels. The ground for the IC and the current sense circuit is provided by the CAB.

When a valley of the tone wheel is aligned with the sensor, the voltage signal is approximately 0.8 volts and a constant 7 mA current is sent to the CAB. As the tone wheel rotates, the tooth shifts the magnetic field and the IC enables a second 7 mA current source. The CAB senses a voltage signal of approximately 1.6 volts and 14 mA. The CAB measures the amperage of the digital signal for each wheel. The resulting signal is interpreted by the ABS CAB as the wheel speed.

FRONT WHEEL SPEED SENSOR (Continued)

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the tire and wheel assembly from the vehicle.

(3) Remove bolt securing the speed sensor cable routing bracket (Fig. 3) to the strut assembly.

Fig. 3 Speed Sensor Cable Routing Bracket

- 1 - STRUT ASSEMBLY
- 2 - ROUTING BRACKET
- 3 - SCREW
- 4 - SPEED SENSOR CABLE

(4) Remove retainer, holding the speed sensor sealing grommet, from the inner fender. pull the grommet out, then unplug the speed sensor cable from the vehicle wiring harness

(5) Remove bolt attaching speed sensor to steering knuckle. Carefully remove speed sensor head from steering knuckle. If sensor is seized in place by corrosion, tap the edge of the sensor ear with a hammer and brass punch (Fig. 4), working it side to side.

CAUTION: If speed sensor head locating pin has seized to the steering knuckle, do not attempt to remove speed sensor head by grasping with pliers and turning. This will damage the speed sensor head. Use only the following procedure.

INSTALLATION

CAUTION: Proper installation of wheel speed sensor cables is critical to continued system operation. Be sure that cables are installed in retainers. Failure to install cables in retainers as shown in this section may result in contact with moving parts and/or over extension of cables, resulting in an open circuit.

Fig. 4 Speed Sensor Head Removal

- 1 - SENSOR EAR
- 2 - PUNCH
- 3 - SPEED SENSOR HEAD

(1) Connect the wheel speed sensor cable connector to the vehicle wiring harness.

(2) Install the speed sensor cable assembly grommet into the front inner fender. Install speed sensor cable grommet and retainer bracket on the inner fender of the vehicle and install and securely tighten attaching bolt.

CAUTION: When installing the wheel speed sensor cable routing bracket on the strut, the speed sensor cable must be looped upward as shown (Fig. 3). If speed sensor cable is not routed in this direction it may rub, damaging the speed sensor cable.

(3) Install the speed sensor cable routing bracket on the steering knuckle. Install and tighten routing bracket mounting bolt to a torque of 12 N·m (105 in. lbs.)

(4) Apply a small amount of High Temperature Multipurpose grease to the sensor head before installation. Install speed sensor head on steering knuckle. Install the speed sensor head attaching screw and tighten to a torque of 7 N·m (60 in. lbs.).

(5) Install the wheel and tire assembly on vehicle.

(6) Lower the vehicle to the ground.

(7) Road test vehicle to ensure proper operation of the base and ABS systems.

REAR WHEEL SPEED SENSOR

DESCRIPTION

This system uses two-wire wheel speed sensors known as active wheel speed sensors. One wheel speed sensor (WSS) and one tone wheel are located at each front and rear wheel. The rear wheel speed sensor on rear disc brake applications is mounted to the rear disc brake adapter (Fig. 5). The rear tone wheel is an integral part of the rear wheel hub and bearing.

Fig. 5 Rear Wheel Speed Sensor

- 1 - PARKING BRAKE CABLE
- 2 - BACKING PLATE
- 3 - REAR WHEEL SPEED SENSOR
- 4 - REAR STRUT

OPERATION

The CAB sends 12 volts to power an Integrated Circuit (IC) in the sensor. The IC supplies a constant 7 mA power supply to the CAB. The relationship of the tooth on the tone wheel to the permanent magnet in the sensor, signals the IC to enable a second 7 mA power supply. The output of the sensor, sent to the CAB, is a DC voltage signal with changing voltage and current levels. The ground for the IC and the current sense circuit is provided by the CAB.

When a valley of the tone wheel is aligned with the sensor, the voltage signal is approximately 0.8 volts and a constant 7 mA current is sent to the CAB. As the tone wheel rotates, the tooth shifts the magnetic field and the IC enables a second 7 mA current source. The CAB senses a voltage signal of approximately 1.6 volts and 14 mA. The CAB measures the amperage of the digital signal for each wheel. The resulting signal is interpreted by the ABS CAB as the wheel speed.

REMOVAL

NOTE: When removing rear wheel speed sensor from vehicle, access to the wire harness connector is through the passenger compartment of the vehicle.

(1) Remove the rear seat cushion, and the rear seat back, from the interior of the car. Refer to Seats in the Body section of this manual for the required procedure to be used for this vehicle.

(2) Disconnect the wheel speed sensor cable from the wire harness.

(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove the rear wheel and tire assembly from the vehicle.

(5) Remove the grommet from the floor pan, along with the end of the cable that fastens to the wire harness.

(6) Remove the sensor cable from the routing bracket attached to the strut tower flange.

(7) Remove the wheel speed sensor head and routing bracket from the disc brake caliper adapter by removing the bolt, then the sensor (Fig. 6).

Fig. 6 Wheel Speed Sensor At Adapter

- 1 - STABILIZER BAR LINK
- 2 - STABILIZER BAR
- 3 - LATERAL LINK
- 4 - BOLT
- 5 - WHEEL SPEED SENSOR
- 6 - STRUT ASSEMBLY
- 7 - NUT

INSTALLATION

(1) Install rear wheel speed sensor and routing bracket into brake caliper adapter. Install head attaching bolt (Fig. 6) and tighten to 7 N·m (60 in. lbs.).

(2) Install the sensor cable to the routing bracket attached to the strut tower flange.

REAR WHEEL SPEED SENSOR (Continued)

(3) Guide the cable through the hole in the floor pan and install the grommet.

(4) Install wheel and tire assembly on vehicle. Then torque all wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat tightening sequence to full specified torque of 129 N·m (95 ft. lbs.).

(5) Lower vehicle to the ground.

(6) Connect the sensor cable to the wiring harness.

(7) Reinstall the rear seat back and seat cushion.

(8) Road test vehicle to ensure proper operation of the base and ABS systems.

TONE WHEEL

DESCRIPTION

The tone wheel is used in conjunction with the wheel speed sensors. (Refer to 5 - BRAKES - ABS/ELECTRICAL/FRONT WHEEL SPEED SENSOR - DESCRIPTION) or (Refer to 5 - BRAKES - ABS/ELECTRICAL/REAR WHEEL SPEED SENSOR - DESCRIPTION)

OPERATION

The tone wheel is used in conjunction with the wheel speed sensors. (Refer to 5 - BRAKES - ABS/ELECTRICAL/FRONT WHEEL SPEED SENSOR - OPERATION) or (Refer to 5 - BRAKES - ABS/ELECTRICAL/REAR WHEEL SPEED SENSOR - OPERATION)

INSPECTION

Tone wheels can cause erratic wheel speed sensor signals. Inspect tone wheels for the following possible causes.

- missing, chipped, or broken teeth
- contact with the wheel speed sensor
- wheel speed sensor to tone wheel alignment
- wheel speed sensor to tone wheel clearance
- excessive tone wheel runout
- tone wheel loose on its mounting surface

If a front tone wheel is found to need replacement, the drive shaft must be replaced. No attempt should be made to replace just the tone wheel. Refer to DIFFERENTIAL AND DRIVELINE for removal and installation.

If a rear tone wheel is found to need replacement, the rear hub and bearing must be replaced. No attempt should be made to replace just the tone wheel. Refer to SUSPENSION for removal and installation.

If wheel speed sensor to tone wheel contact is evident, determine the cause and correct it before replacing the wheel speed sensor or tone wheel.

Check the gap between the speed sensor head and the tone wheel to ensure it is within specifications. Refer to SPECIFICATIONS in this section.

Excessive wheel speed sensor runout can cause erratic wheel speed sensor signals. Refer to SPECIFICATIONS in this section for the maximum allowed tone wheel runout. If tone wheel runout is excessive, determine if it is caused by a defect in the driveshaft assembly or hub and bearing. Replace as necessary.

Tone wheels are pressed onto their mounting surfaces and should not rotate independently from the mounting surface. Replacement of the front driveshaft or rear hub and bearing is necessary.

TRACTION CONTROL SWITCH

REMOVAL

The traction control switch is located in the upper right trim bezel on the instrument panel. The upper right trim bezel must be removed to service the switch. Refer to Upper Right Trim Bezel Removal and Installation.

(1) With the bezel removed, press the tabs in at both sides of the switch and remove the switch from the bezel.

INSTALLATION

(1) Position the switch over the hole in the upper right bezel, push through hole and firmly snap into place.

(2) Install the upper right trim bezel. Refer to Body, Instrument Panel, Upper Right Trim Bezel, Installation.

HYDRAULIC/MECHANICAL

OPERATION - HYDRAULIC CIRCUITS AND VALVES

The hydraulic fluid control valves within the HCU control the flow of pressurized brake fluid to the wheel brakes during the different modes of ABS braking. The following paragraphs explain how this works. For purposes of explanation only, it is assumed that only the right front wheel is experiencing antilock braking; the following diagrams show only the right front wheel in an antilock braking operation.

HYDRAULIC/MECHANICAL (Continued)

NORMAL BRAKING HYDRAULIC CIRCUIT AND SOLENOID VALVE FUNCTION (ABS WITHOUT TRACTION CONTROL)

The hydraulic diagram (Fig. 7) shows the vehicle in the normal braking mode of the base brake hydraulic system. The diagram shows no wheel spin or slip occurring relative to the speed of the vehicle. The driver is applying the brake pedal which builds pressure in the brake hydraulic system to engage the brakes and stop the vehicle.

Fig. 7 Normal Braking Hydraulic Circuit (W/O Traction Control)

| 2 - PUMP PISTON | 7 - NORMALLY OPEN VALVE (OFF) |
| 3 - PUMP MOTOR (OFF) | 8 - MASTER CYLINDER PRESSURE |
| 4 - LOW PRESSURE ACCUMULATOR | 9 - FROM MASTER CYLINDER |
| 5 - NORMALLY CLOSED VALVE (OFF) | 10 - NOISE DAMPER CHAMBER |

HYDRAULIC/MECHANICAL (Continued)

ABS HYDRAULIC CIRCUIT AND SOLENOID VALVE FUNCTION (ABS WITHOUT TRACTION CONTROL)

The hydraulic diagram (Fig. 8) shows the vehicle in the ABS braking mode. The diagram shows one wheel is slipping because the driver is attempting to stop the vehicle at a faster rate than is allowed by the surface on which the tires are riding.

- The normally open and normally closed valves modulate (build/decay) the brake hydraulic pressure as required.

- The pump/motor is switched on so that the brake fluid from the low pressure accumulators is returned to the master cylinder circuits.

- The brake fluid is routed to either the master cylinder or the wheel brake depending on the position of the normally open valve.

80a89436

HYDRAULIC/MECHANICAL (Continued)

**NORMAL BRAKING HYDRAULIC CIRCUIT,
SOLENOID VALVE, AND SHUTTLE VALVE
FUNCTION (ABS WITH TRACTION CONTROL)**

The hydraulic diagram (Fig. 9) shows a vehicle with traction control in the normal braking mode. The diagram shows no wheel spin or slip occurring relative to the speed of the vehicle. The driver is applying the brake pedal which builds pressure in the brake hydraulic system to engage the brakes and stop the vehicle. The hydraulic shuttle valve closes with every brake pedal application so pressure is not created at the inlet to the pump/motor.

80a89438

Fig. 9 ABS With Traction Control - Normal Braking Hydraulic Circuit

| 5 - LOW PRESSURE ACCUMULATOR | 12 - MASTER CYLINDER PRESSURE |
| 6 - NORMALLY CLOSED VALVE (OFF) | 13 - NOISE DAMPER CHAMBER |
| 7 - TO RIGHT FRONT WHEEL | |

HYDRAULIC/MECHANICAL (Continued)

ABS BRAKING HYDRAULIC CIRCUIT, SOLENOID VALVE, AND SHUTTLE VALVE FUNCTION (ABS WITH TRACTION CONTROL)

The hydraulic diagram (Fig. 10) shows the vehicle in the ABS braking mode. The diagram shows one wheel is slipping because the driver is attempting to stop the vehicle at a faster rate than is allowed by the surface on which the tires are riding.

- The hydraulic shuttle valve closes upon brake application so that the pump/motor cannot siphon brake fluid from the master cylinder.

- The normally open and normally closed valves modulate (build/decay) the brake hydraulic pressure as required.

- The pump/motor is switched on so that the brake fluid from the low pressure accumulators is returned to the master cylinder circuits.

- The brake fluid is routed to either the master cylinder or the wheel brake depending on the position of the normally open valve.

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

The hydraulic control unit (HCU) is mounted to the CAB as part of the ICU (Fig. 12). The ICU is located in front of the driver's side front tire, behind the inner fender splash shield. The HCU controls the flow of brake fluid to the brakes using a series of valves and accumulators. A pump/motor is mounted on the HCU to supply build pressure to the brakes during an ABS stop.

The HCU on a vehicle equipped with traction control has a valve block that is approximately one inch longer than a HCU on a vehicle that is equipped with ABS only in order to incorporate the additional valves.

For more information, refer to the ICU. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DESCRIPTION)

OPERATION

The operation of the HCU's hydraulic circuits can be found in Hydraulic Circuits And Valve Operation. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL - OPERATION)

The following topics explain how the different components within the HCU operate.

VALVES AND SOLENOIDS

The valve block contains four inlet valves and four outlet valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring-loaded in the closed position during normal braking. The fluid is allowed to flow from the master cylinder to the wheel brakes.

During an ABS stop, these valves cycle to maintain the proper slip ratio for each wheel. The inlet valve closes preventing further pressure increase and the outlet valve opens to provide a path from the wheel brake to the HCU accumulators and pump/motor. This releases (decays) pressure from the wheel brake, thus releasing the wheel from excessive slippage. Once the wheel is no longer slipping, the outlet valve is closed and the inlet valve is opened to reapply (build) pressure.

For information on the valves used with the traction control system, (Refer to 5 - BRAKES - ABS - TRACTION CONTROL - OPERATION).

BRAKE FLUID ACCUMULATORS

There are two fluid accumulators in the HCU, one for the primary hydraulic circuit and one for the secondary hydraulic circuit. Each hydraulic circuit uses a 5 cc accumulator.

The fluid accumulators temporarily store brake fluid that is removed from the wheel brakes during an ABS cycle. This stored fluid is used by the pump/motor to provide build pressure for the brake hydraulic system. When the antilock stop is complete, the accumulators are drained by the pump/motor.

PUMP/MOTOR

There are two pump assemblies in the HCU, one for the primary hydraulic circuit and one for the secondary hydraulic circuit. Both pumps are driven by a common electric motor (Fig. 12). This DC-type motor is integral to the HCU and is controlled by the CAB.

The pump/motor provides the extra amount of brake fluid needed during antilock braking. Brake fluid is released to the accumulators when the outlet valve is opened during an antilock stop. The pump mechanism consists of two opposing pistons operated by an eccentric camshaft. In operation, one piston draws fluid from the accumulators, and the opposing piston pumps fluid to the master cylinder circuits. When the antilock stop is complete, the pump/motor drains the accumulators.

The CAB may turn on the pump/motor when an antilock stop is detected. The pump/motor continues to run during the antilock stop and is turned off after the stop is complete. Under some conditions, the pump/motor runs to drain the accumulators during the next drive-off.

The pump/motor is not a serviceable item; if it requires replacement, the HCU must be replaced.

REMOVAL - HCU

To remove the HCU, the ICU must be removed from the vehicle and disassembled. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - REMOVAL)

INSTALLATION - HCU

To install the HCU, it must be attached to the CAB, forming the ICU. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - ASSEMBLY)

ICU (INTEGRATED CONTROL UNIT)

DESCRIPTION

The hydraulic control unit (HCU) and the controller antilock brake (CAB) used with this antilock brake system are combined (integrated) into one unit, which is called the integrated control unit (ICU) (Fig. 12). The ICU is located in front of the driver's side front tire (Fig. 13), behind the inner fender splash shield.

80b5c8ba

Fig. 12 Integrated Control Unit (ICU)

- 1 - PUMP/MOTOR
- 2 - HCU
- 3 - PUMP/MOTOR WIRING CONNECTOR
- 4 - CAB

Two different ICU's (HCU and CAB) are used on this vehicle depending on whether or not the vehicle is equipped with traction control. The HCU on a vehicle equipped with traction control has a valve block that is approximately one inch longer than a HCU on a vehicle that is equipped with ABS only.

The ABS-only ICU consists of the following components: the CAB, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), valve block, fluid accumulators, a pump, and an electric motor.

The ABS-with traction control ICU consists of the following components: the CAB, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), two traction control (ASR) valves, two hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric motor.

The replaceable components of the ICU are the HCU and the CAB. No attempt should be made to service any individual components of the HCU or CAB.

80b29f2f

Fig. 13 Integrated Control Unit (HCU And CAB) Location

- 1 - ENGINE CRADLE
- 2 - HCU
- 3 - CONTROLLER ANTILOCK BRAKE (CAB)
- 4 - BOTTOM OF WINDSHIELD WASHER RESERVOIR
- 5 - LEFT FRONT TIRE

OPERATION

For information of the ICU, refer to these individual components of the ICU:

- CONTROLLER ANTILOCK BRAKE (CAB) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/CONTROLLER ANTILOCK BRAKE - OPERATION)

- HYDRAULIC CONTROL UNIT (HCU) (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - OPERATION)

For information on the ICU's hydraulic circuits, refer to HYDRAULIC CIRCUITS AND VALVE OPERATION. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL - OPERATION)

ICU (INTEGRATED CONTROL UNIT) (Continued)

REMOVAL - ICU

(1) Remove the remote ground cable from the ground stud on the right strut tower.

(2) Correctly isolate remote ground cable when servicing vehicle by installing the ground cable insulator on the strut tower ground stud as shown in (Fig. 14) and installing the nut on the stud. **This will prevent accidental grounding of the remote ground cable.**

Fig. 14 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

(3) Using a brake pedal positioning tool such as shown in (Fig. 15) depress brake pedal past its first 1 inch of travel and hold in this position. This will isolate the master cylinder reservoir from the brake hydraulic system, not allowing the brake fluid to drain out of the reservoir.

(4) Remove the bolt and 2 nuts securing the speed control servo to vehicle. Disconnect the wire harness connector from speed control servo. Leaving the cable attached to the speed control servo, move it aside, out of the way.

(5) Remove the screw attaching the washer bottle filler neck to the vehicle. Move neck to the side without loosening the filler tube (Fig. 16).

(6) Remove the nut and bolt holding the transmission controller and bracket to vehicle (Fig. 16). Lift transmission controller up and move away from mounting position.

(7) Using Mopar® Brake Parts Cleaner or an equivalent, thoroughly clean all surfaces of the HCU. Also, thoroughly clean all brake tube to HCU connections.

Fig. 15 Brake Pedal Holding Tool Installed

ICU (INTEGRATED CONTROL UNIT) (Continued)

(8) Remove the primary and secondary brake tubes coming from the master cylinder, at the HCU, using a crow foot wrench (Fig. 17).

Fig. 17 Brake Tube Fittings

- 1 - CROW FOOT WRENCH
- 2 - PRIMARY AND SECONDARY BRAKE TUBES FROM MASTER CYLINDER
- 3 - CHASSIS BRAKE TUBES

(9) Remove the chassis brake tubes at the HCU (Fig. 17), using a crow foot wrench.

CAUTION: Do not apply a 12-volt power source to any terminals of the 24-way HCU connector when disconnected from the CAB.

(10) Disconnect the 24-way wiring harness connector from the CAB using the following procedure. Grasp the lock on the 24-way connector (Fig. 18), and pull it up from the connector as far as possible. This will unlock and raise the 24-way connector out of the socket on the CAB.

(11) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(12) Remove the left front tire and wheel assembly.

(13) Remove fasteners securing the inner fender splash shield in place. Move the splash shield out of the way.

(14) Remove the 3 bolts attaching the ICU to the mounting bracket.

(15) Remove the ICU from its mounting bracket. Then, remove the ICU from the vehicle by pulling it out around the left side of the mounting bracket, then through the wheel well.

NOTE: To separate the CAB from the HCU, (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DISASSEMBLY)

Fig. 18 24-way CAB Connector Lock

- 1 - 24-WAY CAB CONNECTOR
- 2 - CONNECTOR LOCK

DISASSEMBLY - ICU

NOTE: To replace the hydraulic control unit (HCU) or the controller antilock brake (CAB) on this vehicle, the entire integrated control unit (ICU) needs to be removed from the vehicle. The CAB can then be separated from the HCU. Do not attempt to replace the CAB with the ICU mounted in the vehicle.

(1) Remove the ICU from the vehicle. Refer to REMOVAL.

(2) Disconnect the pump/motor wiring harness from the CAB (Fig. 19).

Fig. 19 Integrated Control Unit (ICU)

- 1 - PUMP/MOTOR
- 2 - HCU
- 3 - PUMP/MOTOR WIRING CONNECTOR
- 4 - CAB

ICU (INTEGRATED CONTROL UNIT) (Continued)

(3) Remove the 4 bolts (Fig. 20) attaching the CAB to the HCU.

Fig. 20 CAB Attaching Bolts

- 1 - MOUNTING BOLTS
- 2 - CAB
- 3 - HCU VALVE BLOCK

(4) Remove the CAB from the HCU (Fig. 21).

Fig. 21 Remove/Install CAB

- 1 - CAB
- 2 - HCU VALVES
- 3 - HCU VALVE BLOCK

ASSEMBLY - ICU

- (1) Install the CAB (Fig. 21) on the HCU.
- (2) Install the 4 bolts mounting the CAB (Fig. 20) to the HCU. Tighten the CAB mounting bolts to a torque of 2 N·m (17 in. lbs.).
- (3) Plug the pump/motor wiring harness into the CAB (Fig. 19).
- (4) Install the ICU in the vehicle. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/ICU

(INTEGRATED CONTROL UNIT) - INSTALLATION)

INSTALLATION - ICU

- (1) Install the ICU back in the vehicle and attach it to its mounting bracket. Tighten the 3 ICU mounting bolts to 11 N·m (97 in. lbs.).
- (2) Reinstall the inner fender splash shield.
- (3) Reinstall the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
- (4) Lower the vehicle.

CAUTION: Before installing the 24-way connector in the CAB be sure that the seal is properly installed in the connector.

(5) Install the 24-way connector into the socket on the CAB. The connector is installed using the following procedure. Position the 24-way connector in the socket on the CAB and carefully push it onto CAB as far as it will go. When connector is fully seated into the CAB socket push in the connector lock (Fig. 18) as far as it will go. This will pull the 24-way connector into the socket on the CAB and lock it in the installed position.

(6) Install the 4 chassis brake tubes on the HCU (Fig. 17). Tighten the chassis brake tubes to 17 N·m (145 in. lbs.).

(7) Install the primary and secondary brake lines from the master cylinder on the HCU (Fig. 17). Tighten the primary and secondary brake tubes to 17 N·m (145 in. lbs.).

(8) Reinstall the transmission controller (Fig. 16).

(9) Reattach the washer bottle filler neck to the radiator support.

(10) Reinstall the speed control servo to its mounting studs and radiator support.

(11) Remove brake pedal positioning tool.

(12) Install the remote ground cable onto the ground stud located on left shock tower. Install the remote ground cable attaching nut and tighten to a torque of 28 N·m (250 in. lbs.).

NOTE: The ICU may need to be initialized using the DRBIII® scan tool after installation.

(13) Bleed the base brakes and the ABS brakes hydraulic system. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(14) Road test vehicle to ensure proper operation of the base and ABS systems.

COOLING

DESCRIPTION - ENGINE COOLING SYSTEM

The engine cooling system consists of a cooling module, pressure cap, coolant bottle, thermostat (inlet type), coolant, plumbing, and a water pump to circulate the coolant (Fig. 1). The engine cooling module consist of a radiator, electric radiator fan motors, shroud, internal transmission oil cooler, internal engine oil cooler (if equipped), air conditioning condenser, and a auxiliary transmission oil cooler (if equipped).

OPERATION - ENGINE COOLING SYSTEM

CAUTION: The cooling system is designed to function with a 50/50 mixture of Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) or equivalent, and distilled water. Higher concentrations may result in poor cooling performance and premature water pump seal failure. This antifreeze/coolant may not be mixed or substituted with any other type.

- When Engine is cold: Thermostat is closed, cooling system has no flow through the radiator. The coolant flows through the engine, heater core, coolant bottle and an internal engine by-pass.
 - When Engine is warm: Thermostat is open, coolant flows through the radiator, heater core, coolant bottle and by-pass.
- The cooling systems primary purpose is to maintain engine temperature in a range that will provide satisfactory engine performance and emission levels under all expected driving conditions. It also provides hot coolant for heater, and cooling for automatic transmission fluid. It does this by transferring heat from engine metal to coolant, moving this heated coolant to the radiator, and then transferring this heat to the ambient air.
- The coolant flow circuit is shown in (Fig. 1).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC).	<ol style="list-style-type: none"> 1. During cold weather operation with the heater blower in the high position, the gauge reading may drop slightly. Fluctuation is also influenced by loads, outside temperature, and cycling of the air conditioning system. 2. Temperature gauge or engine sending unit sensor defective or shorted. Also, corroded or loose wiring in this circuit. 3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running). 4. Gauge reading high after restarting a warmed-up (hot) engine. 5. Coolant level low (air will build up in the cooling system causing the thermostat to open late). 6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing thermostat to open late. 7. Water pump impeller loose on shaft. 8. Air leak on the suction side of water pump allows air to build up in cooling system causing thermostat to open late. 	<ol style="list-style-type: none"> 1. A normal condition. No correction is necessary. 2. Check operation of gauge and repair if necessary. Refer to INSTRUMENT PANEL AND SYSTEMS. 3. A normal condition. No correction is necessary. Gauge reading should return to normal range after vehicle is driven. 4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation. 5. Check and correct coolant leaks. Refer to Testing Cooling System for Leaks in this section. 6. (a) Check for cylinder head gasket leaks with a commercially available block leak tester. Repair as necessary. (b) Check for coolant in engine oil. Inspect for white steam emitting from exhaust system. Repair as necessary. 7. Check water pump and replace as necessary. Refer to Water Pump Removal in this section. 8. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK.	<ol style="list-style-type: none"> 1. Pressure relief valve in radiator cap is defective, or was not properly seated. 2. Incorrect cap was installed. 3. Incorrect coolant mixture. 4. System overfilled. 	<ol style="list-style-type: none"> 1. Check condition of radiator cap and cap seal. Refer to Pressure Cap in this group. Replace cap as necessary. 2. Replace cap as necessary. 3. Make sure a 50% by volume mixture of coolant is used. 4. Ensure cold coolant level is between MIN and MAX marks on coolant bottle.

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT.	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING - COOLING SYSTEM LEAK TESTING)
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM) GAUGE MAY NOT BE READING HIGH.	1. Engine overheating. 2. Freeze point of coolant not correct. Mixture too concentrated or too diluted. 3. Wrong cooling system pressure cap.	1. Check reason for overheating and repair as necessary. 2. Check freeze point of the coolant. (Refer to 7 - COOLING/ENGINE/COOLANT - DIAGNOSIS AND TESTING) Adjust the ethylene glycol to water ratio as required. 3. Install correct pressure cap.
HOSE(S) COLLAPSE AS ENGINE COOLS DOWN.	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant bottle system.	1. (a) Pressure cap relief valve stuck. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - INSPECTION) Replace as necessary. (b) Hose between the pressure and overflow container is plugged. Clean vent and repair as necessary. (c) Vent at coolant reserve/overflow container is plugged. Clean vent and repair as necessary. (d) Reserve/overflow container is internally blocked. Clean and repair as necessary
ELECTRIC RADIATOR FAN RUNS ALL THE TIME.	1. Fan relay, Powertrain Control Module (PCM) or engine coolant temperature sensor possibly defective. 2. Check for low coolant level. 3. A/C pressure transducer defective.	1. (Refer to Appropriate Diagnostic Information) Repair as necessary. 2. Repair as necessary. 3. (Refer to Appropriate Diagnostic Information) Repair as necessary.
NOISY RADIATOR FAN.	1. Fan blade loose. 2. Fan blade striking a surrounding object. 3. Air obstructions at radiator or A/C condenser. 4. Electric fan motor defective.	1. Replace radiator fan assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) 2. Locate point of fan blade contact and repair/replace as necessary. 3. Remove obstructions and/or clean debris. 4. Replace radiator fan assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED).	<ol style="list-style-type: none"> 1. Radiator and/or A/C condenser is restricted, obstructed or dirty (insects, leaves, etc.). 2. Electrical radiator fan not operating when A/C is operated. 3. Engine is overheating (heat may be transferred from radiator to A/C condenser. High underhood temperatures due to engine overheating may also transfer heat to A/C components. 4. All models are equipped with air seals at the radiator and/or A/C condenser. If these seals are missing or damaged, not enough air flow will be pulled through the radiator and A/C condenser. 	<ol style="list-style-type: none"> 1. Remove restriction and/or clean as necessary. 2. (Refer to Appropriate Diagnostic Information) Repair as necessary. 3. Correct overheating condition. 4. Check for missing or damaged air seals and repair as necessary.
INADEQUATE HEATER PERFORMANCE.	<ol style="list-style-type: none"> 1. Has a diagnostic trouble code (DTC) been set? 2. Low Coolant level. 3. Air Trapped in heater core. 4. Obstructions in heater hose fitting at engine or at heater core. 5. Heater hose kinked or obstructed. 6. Thermostat possibly stuck open. 7. Water pump is not pumping coolant to heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly. 	<ol style="list-style-type: none"> 1. (Refer to Appropriate Diagnostic Information) Repair as necessary. 2. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING) Repair as necessary. 3. Improper coolant fill procedure. (Refer to 7 - COOLING - STANDARD PROCEDURE) 4. Remove heater hoses at both ends and check for obstructions. Repair as necessary. 5. Locate kinked or obstructed area. Repair as necessary. 6. (Refer to 7 - COOLING/ENGINE/ ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING) 7. (Refer to 7 - COOLING/ENGINE/ WATER PUMP - DIAGNOSIS AND TESTING)
HEAT ODOR	<ol style="list-style-type: none"> 1. Various heat shields are used at certain driveline components. One or more of these shields may be missing. 2. Is the temperature gauge reading above the normal range? 	<ol style="list-style-type: none"> 1. Locate missing shields and replace or repair as necessary. 2. Refer to Temperature Gauge Reads High in these Diagnosis Charts.

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Radiator fan operating incorrectly. 4. Has undercoating been applied to any unnecessary component? 5. Engine may be running rich, causing the catalytic converter to overheat	3. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - DIAGNOSIS AND TESTING) Repair as necessary. 4. Clean undercoating as necessary. 5. (Refer to Appropriate Diagnostic Information)
POOR DRIVEABILITY (THERMOSTAT POSSIBLY STUCK OPEN). GAUGE MAY BE READING LOW.	1. For proper driveability, clean vehicle emissions and prevention of buildup of engine oil sludge, the thermostat must be operating properly. Has a diagnostic trouble code been set?	1. (Refer to Appropriate Diagnostic Information) Replace thermostat if necessary
STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILL AREA WHEN WEATHER IS WET, ENGINE WARMED UP AND RUNNING WITH VEHICLE STATIONARY, OR JUST SHUT OFF. TEMPERATURE GAUGE IS NORMAL.	1. During wet weather, moisture (snow, ice, rain, or condensation) on the radiator will evaporate when the thermostat opens. The thermostat opening allows heated coolant into the radiator. When the moisture contacts the hot radiator, steam may be emitted. this usually occurs in cold weather with no fan or air flow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. Check the freeze point of the coolant. (Refer to 7 - COOLING/ENGINE/COOLANT - DIAGNOSIS AND TESTING) Adjust the ethylene glycol-to-water ratio as necessary and service according to maintenance schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)
COOLANT LEVEL CHANGES IN COOLANT BOTTLE. TEMPERATURE GAUGE IS IN NORMAL RANGE.	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. The coolant level will also drop as the system removes air from a recent filling.	1. A normal condition. No repair is necessary.

DIAGNOSIS AND TESTING - COOLING SYSTEM LEAK

With engine not running, wipe the coolant bottle neck sealing seat clean.

Attach a radiator pressure tester to the coolant bottle, as shown in (Fig. 2) and apply 104 kPa (15 psi) pressure. If the pressure drops more than 2 psi in 2 minutes inspect all points for external leaks.

All hoses, radiator and heater, should be moved while at 15 psi since some leaks occur while driving due to engine rock, etc.

If the cooling system will not pressurize easily and there is no coolant leaks, the cooling system is only partially filled. (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM FILL)

If there are no external leaks after the gauge dial shows a drop in pressure, detach the tester. Start engine and run the engine to normal operating tem-

COOLING (Continued)

80b34dde

Fig. 2 PRESSURE TESTING COOLING SYSTEM

perature in order to open the thermostat and allow the coolant to expand. Reattach the tester. If the needle on the dial fluctuates it indicates a combustion leak, usually a head gasket leak.

WARNING: WITH TOOL IN PLACE PRESSURE BUILDS UP FAST. ANY EXCESSIVE AMOUNT OF PRESSURE BUILT UP BY CONTINUOUS ENGINE OPERATION MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

If the needle on the dial does not fluctuate, race the engine a few times. If an abnormal amount of coolant or steam is emitted from the tail pipe, it may indicate a faulty head gasket, cracked engine block or cylinder head.

There may be internal leaks which can be determined by removing the oil dipstick. If water globules appear intermixed with the oil it will indicate an internal leak in the engine. If there is an internal leak, the engine must be disassembled for repair.

DIAGNOSIS AND TESTING - COOLING SYSTEM AERATION

Low coolant level in a cross flow radiator will equalize in both tanks with engine off. With engine at running and at operating temperature, the high pressure inlet tank runs full and the low pressure outlet tank drops. If this level drops below the top of the transmission oil cooler, aeration will occur drawing air into the water pump resulting in the following:

- High reading shown on the temperature gauge.
- Loss of coolant flow through the heater core.
- Corrosion in the cooling system.
- Transmission oil will become hotter.
- Water pump seal may run dry, increasing the risk of premature seal failure.

- Combustion gas leaks into the coolant can also cause the above problems.

DIAGNOSIS AND TESTING - COOLING SYSTEM DEAERATION

As air is removed from the cooling system, it gathers in the coolant bottle. This pressure is released into the atmosphere through the pressure valve located in the pressure cap when pressure reaches 96 - 124 kPa (14 - 18 psi). This air is replaced with coolant from the coolant bottle, when the system is allowed to cool.

NOTE: Deaeration does not occur at engine idle—higher engine speeds are required. Normal driving will deaerate cooling system.

To effectively deaerate the system, multiple thermal cycles of the system may be required.

STANDARD PROCEDURE**STANDARD PROCEDURE - COOLANT LEVEL CHECK**

NOTE: Do not remove coolant bottle pressure cap for routine coolant level inspections.

The coolant bottle provides a quick visual method for determining the coolant level without removing the pressure cap. With the engine cold, the level of the coolant in the coolant bottle (Fig. 3) should be between the MIN and MAX lines on the bottle.

80b1b337

Fig. 3 COOLANT BOTTLE COLD FILL LEVEL

1 - COOLANT PRESSURE BOTTLE

COOLING (Continued)

STANDARD PROCEDURE - COOLING SYSTEM DRAINING

When servicing the cooling system, it is essential that coolant does not drip on the drive belts or pulleys. If necessary, shield the belts with shop towels before working on the cooling system. If coolant contacts the belts or pulleys, flush both with clean water.

WARNING: DO NOT REMOVE HOSE CLAMPS OR HOSES, CYLINDER BLOCK DRAIN PLUGS, COOLANT BOTTLE CAP, OR OPEN THE RADIATOR DRAINCOCK, WHEN THE SYSTEM IS HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

The radiator draincock that is located at the lower right side of radiator (Fig. 4). The draincock stem is closed in the horizontal position, pointing to 3:00 o'clock. Draining takes place through the cooling module's lower right side insulator. **Do Not Use pliers to open draincock.**

CAUTION: Do not pull outward on the draincock flange while opening. Damage to the draincock body and O-ring seal may occur

(1) To open the draincock to the minimum drain position, turn the draincock stem counterclockwise to the 12:00 o'clock position. For the maximum drain position, turn draincock stem counterclockwise 180 degrees to the 9:00 o'clock position.

(2) Remove coolant pressure bottle cap and open the bleed valve.

(3) Remove the cylinder block drain plug(s) located below each exhaust manifold.

Most service drains are about 80 percent of capacity because not all coolant is drained from system. For capacity specifications, (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS - FLUID CAPACITIES)

CAUTION: The cooling system normally operates at 97-124 kPa (14-18 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

STANDARD PROCEDURE - COOLING SYSTEM FILLING

WARNING: MAKE SURE ENGINE COOLING SYSTEM IS COOL BEFORE REMOVING PRESSURE CAP OR ANY HOSE. SEVERE PERSONAL INJURY MAY RESULT FROM ESCAPING HOT COOLANT. THE COOLING SYSTEM IS PRESSURIZED WHEN HOT.

80b1b455

Fig. 4 RADIATOR DRAINCOCK LOCATION

- 1 - DRAINCOCK STEM
- 2 - INSULATOR
- 3 - DRAIN
- 4 - DRAIN HOLE

CAUTION: Do not use well water, or suspect water supply in cooling system. Use only a 50/50 mixture of the specified ethylene glycol type antifreeze/coolant and distilled water. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

NOTE: COOLING SYSTEM FILL PROCEDURE IS CRITICAL TO OVERALL COOLING SYSTEM PERFORMANCE.

(1) Close radiator draincock by turning the stem clockwise to the 3:00 o'clock position. **Hand tighten only.**

(2) Install engine block drain plugs, if removed.

WARNING: WHEN INSTALLING DRAIN HOSE TO AIR BLEED VALVE, ROUTE HOSE AWAY FROM ACCESSORY DRIVE BELTS, ACCESSORY DRIVE PULLEYS, AND ELECTRIC COOLING FAN MOTORS.

(3) Attach one end of a 6.35 mm (0.250 in.) ID clear hose that is approximately 1200 mm (48 in.) long, to the bleed valve.

- **Bleed Valve Location (2.7L):** Located on the water outlet connector at the front of engine (Fig. 5).

- **Bleed Valve Location (3.5L):** Located on the lower intake manifold, left of center and below the upper intake plenum (Fig. 5).

(4) Route hose away from the accessory drive belt, drive pulleys and electric cooling fan. Place the other end of hose into a clean container. The hose will prevent coolant from contacting the accessory drive belt when bleeding the system during the refilling operation (Fig. 5).

COOLING (Continued)

80b1b33a

Fig. 5 COOLING SYSTEM BLEEDING

- 1 - 2.7L ENGINE
- 2 - 3.5L ENGINE
- 3 - BLEED VALVE
- 4 - TO COOLANT CONTAINER
- 5 - SPECIAL TOOL 8195

- 6 - COOLANT CONTAINER
- 7 - HOSE
- 8 - TO COOLANT CONTAINER
- 9 - BLEED VALVE

COOLING (Continued)

NOTE: IT IS IMPERATIVE THAT THE COOLING SYSTEM AIR BLEED VALVE BE OPENED BEFORE ANY COOLANT IS ADDED TO THE COOLING SYSTEM. FAILURE TO OPEN THE BLEED VALVE FIRST WILL RESULT IN AN INCOMPLETE FILL OF THE SYSTEM.

- (5) Open the cooling system bleed valve (Fig. 5).
- (6) Attach Special Tool 8195, Filling Aid Funnel to pressure bottle filler neck (Fig. 6).
- (7) Use the supplied clip to pinch overflow hose that connects between the two chambers of the coolant bottle (Fig. 6).

Fig. 6 SPECIAL TOOL 8195

- 1 - SPECIAL TOOL 8195
- 2 - PRESSURE BOTTLE
- 3 - PINCH OVERFLOW HOSE

CAUTION: Do not mix coolants. If coolant is used other than specified, a reduction in corrosion protection will occur.

- (8) Pour a 50/50 mix of Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula and distilled water into the larger section of Filling Aid Funnel (the smaller section of funnel is to allow air to escape). For system capacity, (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS - FLUID CAPACITIES).

- (9) Slowly fill the cooling system until a steady stream of coolant flows from the hose attached to the bleed valve (Fig. 5).

- (10) Close the bleed valve and continue filling system to the top of the Filling Funnel.

- (11) Remove clip from overflow hose (Fig. 6).

- (12) Allow the coolant in Filling Funnel to drain into overflow chamber of the pressure bottle.

- (13) Remove Special Tool 8195, Filling Aid Funnel. Install cap on coolant pressure bottle.

- (14) Remove hose from bleed valve.

- (15) Start engine and run until it reaches operating temperature.

NOTE: The engine cooling system will push any remaining air into the coolant bottle within about an hour of normal driving. As a result, a drop in coolant level in the pressure bottle may occur. If the engine cooling system overheats and pushes coolant into the overflow side of the coolant bottle, this coolant will be sucked back into the cooling system ONLY IF THE PRESSURE CAP IS LEFT ON THE BOTTLE. Removing the pressure cap breaks the vacuum path between the two bottle sections and the coolant will not return to cooling system.

- (16) Shut off engine allow it to cool down. This permits coolant to be drawn into the pressure chamber.

- (17) With engine COLD, observe coolant level in pressure chamber. Coolant level should be within MIN and MAX marks. Adjust coolant level as necessary.

NOTE: The coolant bottle has two chambers. Coolant will normally only be in the inboard (smaller) of the two. The outboard chamber is only to recover coolant in the event of an overheat or after a recent service fill. The outboard chamber should normally be empty. If there is coolant in the overflow side of the coolant bottle (after several warm/cold cycles of the engine) and coolant level is within MIN and MAX marks, disconnect the end of the overflow hose at the fill neck and lower it into a clean container. Allow coolant to drain into the container until emptied. Reconnect overflow hose to fill neck.

COOLING (Continued)

**STANDARD PROCEDURE - ADDING
ADDITIONAL COOLANT**

CAUTION: Do not use well water, or suspect water supply in cooling system. Use only a 50/50 mixture of the specified ethylene glycol type antifreeze/coolant and distilled water. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

When additional coolant is needed, it should be added to the coolant pressure bottle.

For coolant service schedules (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

WARNING: DO NOT OPEN COOLING SYSTEM WHEN HOT AND UNDER PRESSURE BECAUSE PERSONAL INJURY AND SERIOUS BURNS FROM COOLANT CAN OCCUR. ALLOW ENGINE TO COOL BEFORE SERVICING COOLING SYSTEM.

(1) Try squeezing the radiator upper hose to determine if the system is still pressurized.

(2) Place a shop towel over the pressure cap and turn to the first stop. Wait to see if any pressure is released. When no pressure is released, press down on the cap and turn to the second stop. Remove cap (Fig. 7).

NOTE: If the coolant pressure bottle is completely empty, (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM FILLING).

(3) If there is some coolant in coolant pressure bottle, slowly fill coolant pressure bottle.

ACCESSORY DRIVE

DESCRIPTION

The accessory drive system on 2.7L and 3.5L engines utilizes two different belts. A conventional V-belt drives the air conditioning compressor on 3.5L engines, a Poly-V belt on the 2.7L engine. A Poly-V

belt drives the generator and power steering pump on all engines.

OPERATION

The accessory drive belts provide the link between the engine crankshaft and the engine driven accessories.

DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELT

CONDITION	POSSIBLE CAUSE	CORRECTION
INSUFFICIENT ACCESSORY OUTPUT DUE TO BELT SLIPPAGE	1. Belt too loose. 2. Belt excessively glazed or worn.	1. Adjust belt tension. 2. Replace and tighten as specified.
BELT SQUEAL WHEN ACCELERATING ENGINE	1. Belts too loose. 2. Belts glazed.	1. Adjust belt tension. 2. Replace belts.
BELT CHIRP AT IDLE	1. Belts too loose. 2. Foreign material imbedded in belt. 3. Non-uniform belt. 4. Misaligned pulley(s). 5. Non-uniform groove or eccentric pulley.	1. Adjust belt tension. 2. Replace belt. 3. Replace belt. 4. Align accessories. 5. Replace pulley(s).
BELT ROLLED OVER IN GROOVE OR BELT JUMPS OFF	1. Broken cord in belt. 2. Belt too loose, or too tight. 3. Misaligned pulleys. 4. Non-uniform grooves or eccentric pulley.	1. Replace belt. 2. Adjust belt tension. 3. Align accessories. 4. Replace pulley(s).

DRIVE BELTS - 2.7L

REMOVAL

GENERATOR/POWER STEERING BELT

- (1) Loosen tensioner pulley locking nut (Fig. 1).
- (2) Loosen belt adjusting bolt (Fig. 1).
- (3) Remove generator/power steering belt.

Fig. 1 ACCESSORY DRIVE BELTS

- 1 - A/C DRIVE BELT
- 2 - LOCKING NUT
- 3 - GENERATOR/POWER STEERING DRIVE BELT
- 4 - ADJUSTING BOLT

AIR CONDITIONING BELT

NOTE: The A/C drive belt self tensioner is **NOT** a dynamic tensioner. After adjustment the tensioner bracket bolts are tightened. The torsion spring is no longer responsible for tensioning the A/C belt. The torsion spring is only used for initial belt tensioning.

(1) Remove generator/power steering belt to gain access to A/C belt. Refer to GENERATOR/POWER STEERING BELT for procedure.

(2) Loosen **BUT DO NOT REMOVE** tensioner locking bolt and pivot bolt (Fig. 2).

(3) Insert 1/2" drive breaker bar into square opening on belt tensioner. Rotate tensioner counterclockwise until belt can be removed from pulleys (Fig. 2).

(4) Slowly rotate tensioner clockwise to relieve spring load.

CLEANING

Clean all foreign debris from belt pulley grooves. The belt pulleys must be free of oil, grease, and coolants before installing the drive belt.

Fig. 2 AIR CONDITIONING DRIVE BELT

- 1 - 1/2" DRIVE BREAKER BAR
- 2 - TENSIONER
- 3 - PIVOT BOLT
- 4 - LOCKING BOLT

INSPECTION

Belt replacement under any or all of the following conditions is required:

- Excessive wear
- Frayed cords
- Severe glazing

Poly-V Belt system may develop minor cracks across the ribbed side (due to reverse bending). These minor cracks are considered normal and acceptable. Parallel cracks are not (Fig. 3).

NOTE: Do not use any type of belt dressing or restorer on Poly-V Belts.

DRIVE BELTS - 2.7L (Continued)

**Fig. 3 Drive Belt Wear Pattern**

- 1 - NORMAL CRACKS - BELT OK
2 - NOT NORMAL CRACKS - REPLACE BELT

INSTALLATION**AIR CONDITIONING BELT - NEW**

WARNING: DO NOT REMOVE A/C BELT TENSIONER LOCKING BOLT WITHOUT FIRST HOLDING THE TENSIONER WITH A 1/2" DRIVE BREAKER BAR, AS PERSONAL INJURY COULD RESULT.

NOTE: Verify that torsion spring position is in the new belt position before installing a NEW belt (Fig. 4). If torsion spring is not in the new belt position, follow steps 1–7 to change the tensioner spring from the USED belt position to the NEW belt position.

(1) Insert a 1/2" drive breaker bar into the square opening on the tensioner. Hold counterclockwise pressure on tensioner while removing the locking bolt (Fig. 2).

(2) Carefully release spring load of the torsion spring on the tensioner.

(3) Remove pivot bolt, tensioner, and spring from front timing cover.

(4) Insert spring arm into the NEW belt position on the tensioner (Fig. 4).

(5) Install torsion spring, tensioner, and pivot bolt.

(6) Install pivot bolt. Tighten only finger tight, at this time.

(7) Using a 1/2" drive breaker bar, apply counterclockwise pressure until locking bolt can be installed.

(8) Install the NEW belt by rotating the tensioner counterclockwise until the NEW belt can be installed on pulleys. See (Fig. 5) for belt routing.

(9) Release tensioner and remove breaker bar. Belt is automatically adjusted with the tensioner's torsion spring.

(10) Tighten tensioner locking bolt and pivot bolt to 28 N·m (250 in. lbs.) (Fig. 2).

(11) Install generator/power steering belt. Refer to GENERATOR/POWER STEERING BELT INSTALLATION for procedure.

**Fig. 4 Air Conditioning Belt Tensioner Spring Position**

- 1 - TENSIONER
2 - TORSION SPRING
3 - NEW BELT POSITION
4 - USED BELT POSITION

AIR CONDITIONING BELT - USED

NOTE: A "used belt" is considered having more than 500 miles of service use.

NOTE: Perform steps 1–7 to change the tensioner spring from the NEW belt position, to the USED belt position.

(1) Insert a 1/2" drive breaker bar into the square opening on tensioner. Hold counterclockwise pressure on tensioner, while removing tensioner locking bolt (Fig. 2).

(2) Carefully release the tension of spring on tensioner.

DRIVE BELTS - 2.7L (Continued)

(3) Remove pivot bolt, tensioner, and spring from front cover.

(4) Insert spring into the USED belt position on tensioner bracket (Fig. 4).

(5) Install spring, tensioner bracket, and pivot bolt.

(6) Install pivot bolt. Tighten only finger tight, at this time.

(7) Using a 1/2" drive breaker bar, apply counterclockwise pressure until locking bolt can be installed.

(8) Install the USED belt by rotating tensioner counterclockwise until belt can be installed on pulleys. See (Fig. 5) for belt routing.

(9) Release tensioner and remove breaker bar. Belt is automatically adjusted with the tensioner's torsion spring.

(10) Tighten tensioner locking bolt and pivot bolt to 28 N·m (250 in. lbs.) (Fig. 2).

(11) Install generator/power steering belt. Refer to GENERATOR/POWER STEERING BELT INSTALLATION for procedure.

80b1b329

Fig. 5 BELT ROUTING - 2.7L

- 1 - IDLER
2 - IDLER
3 - GENERATOR

GENERATOR/POWER STEERING BELT INSTALLATION

(1) Install generator/power steering belt on pulleys.

(2) Tighten belt adjusting bolt to proper belt tension (Fig. 1). (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - ADJUSTMENTS)

(3) Tighten tensioner locking nut (Fig. 1).

ADJUSTMENTS - BELT TENSION

Use belt tension gauge, Special Tool 7198 for conventional V-belts and Poly-V belts. For Special Tool identification, (Refer to 7 - COOLING - SPECIAL TOOLS).

Adjust the belt tension for **NEW** or **USED** belt tension applications. Refer to BELT TENSION CHART—2.7/3.5L ENGINES.

BELT TENSION CHART—2.7/3.5L ENGINES

POLY-V BELT	GAUGE
Generator/Power Steering Belt (all engines)	New Belt: 836 ±44 N (190 ±10 lbs.)
	Used Belt: 534 N (120 lbs.)
V-BELT	GAUGE
Air Conditioning Belt (3.5L only)	New Belt: 667 ±44 N (160 ±10 lbs.)
	Used Belt: 534 N (120 lbs.)

DRIVE BELTS - 3.5L

REMOVAL

GENERATOR/POWER STEERING BELT

The Poly-V generator/power steering belt has an adjustable tensioner pulley located on the front timing belt cover.

- (1) Loosen tensioner pulley locking nut.
- (2) Raise vehicle on hoist.
- (3) Remove the two (2) push clips attaching lower air shield to engine cradle. Remove air shield.
- (4) Loosen tensioner adjusting bolt until the belt can be removed.

AIR CONDITIONING BELT

(1) Remove generator/power steering drive belt to gain access to the air conditioning drive belt. Refer to GENERATOR/POWER STEERING BELT for procedure.

(2) To remove air conditioning drive belt, first loosen the tensioner pulley lock nut, then loosen the adjusting screw to the tensioner pulley assembly until the belt can be removed (Fig. 6).

CLEANING

Clean all foreign debris from belt pulley grooves. The belt pulleys must be free of oil, grease, and coolants before installing the drive belt.

INSPECTION

Belt replacement under any or all of the following conditions is required:

- Excessive wear
- Frayed cords
- Severe glazing

Poly-V Belt system may develop minor cracks across the ribbed side (due to reverse bending). These minor cracks are considered normal and acceptable. Parallel cracks are not (Fig. 7).

DRIVE BELTS - 3.5L (Continued)

Fig. 6 ACCESSORY DRIVE BELTS

- 1 - V-BELT
- 2 - POLY-V BELT
- 3 - LOCKING NUT
- 4 - ADJUSTING BOLT
- 5 - ADJUSTING BOLT
- 6 - LOCKING NUT

NOTE: Do not use any type of belt dressing or restorer on Poly-V Belts.

Fig. 7 Drive Belt Wear Pattern

- 1 - NORMAL CRACKS - BELT OK
- 2 - NOT NORMAL CRACKS - REPLACE BELT

INSTALLATION

NOTE: Use Special Tool 7198, Belt Tension Gauge to obtain proper tension on accessory drive belts. For Special Tool identification, (Refer to 7 - COOLING - SPECIAL TOOLS). For accessory drive belt tension specifications, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - ADJUSTMENTS).

AIR CONDITIONING BELT

(1) Install air conditioning belt over drive pulleys. Tighten the tensioner adjusting bolt (Fig. 6) until the belt is at specified tension using a Belt Tension Gauge (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - ADJUSTMENTS). Tighten tensioner pulley locking nut to 54 N·m (40 ft. lbs.) (Fig. 6).

(2) Install generator/power steering drive belt and adjust to specified tension. Refer to GENERATOR/POWER STEERING BELT for procedure.

GENERATOR/POWER STEERING BELT

The Poly-V generator/power steering belt has an adjustable tensioner pulley located on the front timing belt cover.

(1) Install generator/power steering belt.

(2) Tighten adjusting bolt until the specified tension is obtained (Fig. 6) (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - ADJUSTMENTS).

(3) Install lower air shield and attaching push clips.

(4) Lower vehicle.

(5) Tighten tensioner pulley locking nut to 54 N·m (40 ft. lbs.) (Fig. 6).

ADJUSTMENTS - BELT TENSION

Use belt tension gauge, Special Tool 7198 for conventional V-belts and Poly-V belts. For Special Tool identification, (Refer to 7 - COOLING - SPECIAL TOOLS).

Adjust the belt tension for **NEW** or **USED** belt tension applications. Refer to BELT TENSION CHART—2.7/3.5L ENGINES.

BELT TENSION CHART—2.7/3.5L ENGINES

ENGINE

CLEANING

Drain cooling system and refill with clean water. Refer to drain and fill procedures in this section. Run engine with radiator cap installed until upper radia-

tor hose is hot. Stop engine and drain water from system. If water is dirty; fill, run, and drain system again, until water runs clear. Refill cooling system with a 50/50 mixture of the recommended ethylene glycol and distilled water (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

ENGINE (Continued)

INSPECTION

After performing a cleaning/flush procedure, inspect all hoses, clamps and connections for deterioration and leaks. Inspect radiator and heater core for leaks.

COOLANT

DESCRIPTION - ENGINE COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer (Special Tool 8286)(Refer to 7 - COOLING - SPECIAL TOOLS) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant—corrosion protection will be severely reduced.

STANDARD PROCEDURE - COOLANT SERVICE

For engine coolant recommended service schedule, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

COOLANT OUTLET CONNECTOR - 2.7L

REMOVAL

WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- (1) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (2) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
- (3) Remove screws attaching heater tube to outlet connector.
- (4) Disengage tube from outlet connector only enough for connector removal.
- (5) Remove bolts attaching water outlet connector (Fig. 1).
- (6) Remove outlet connector.

80b6b22a

Fig. 1 Coolant Outlet Connector - 2.7L

- 1 - BOLT (2)
- 2 - BOLT (2)
- 3 - COOLANT OUTLET CONNECTOR

INSTALLATION

- (1) Clean sealing surfaces. Inspect gaskets for tears and cuts. Replace as necessary.
- (2) Install outlet connector and tighten bolts to 12 N·m (105 in. lbs.) (Fig. 1).
- (3) Inspect and replace heater supply tube O-ring as necessary.

- (4) Lubricate O-ring and insert heater tube assembly into outlet connector. Tighten screws to 3 N·m (30 in. lbs.).

- (5) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

- (6) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

COOLANT RECOVERY PRESSURE CONTAINER

DESCRIPTION

The coolant bottle consists of a pressure chamber and a overflow chamber (Fig. 2) that is mounted in the engine compartment (Fig. 3). The overflow hose connects the pressure chamber to the overflow chamber.

NOTE: Coolant will normally be in the pressure chamber side of the coolant bottle. The overflow chamber should normally be empty

80b34dea

Fig. 2 COOLANT PRESSURE/RECOVERY BOTTLE

- 1 - PRESSURE CAP
- 2 - OVERFLOW CHAMBER
- 3 - OVERFLOW HOSE
- 4 - PRESSURE CHAMBER

OPERATION

The pressure chamber keeps the coolant free of trapped air, provides a volume for expansion and contraction, and provides a convenient and safe method for checking and adjusting coolant level at atmospheric pressure. It also provides some reserve coolant to cover minor leaks, evaporation or boiling losses. The overflow chamber allows coolant recovery in case of an overheat.

COOLANT RECOVERY PRESSURE CONTAINER (Continued)

**Fig. 3 COOLANT BOTTLE LOCATION**

- 1 - COOLANT RECOVERY PRESSURE BOTTLE
2 - PRESSURE CAP

**Fig. 4 ENGINE BLOCK HEATER**

- 1 - BLOCK HEATER
2 - ENGINE — RIGHT SIDE

ENGINE BLOCK HEATER

DESCRIPTION

The engine block heater is mounted in the cylinder block, near the right rear corner (Fig. 4). The block heater is a dry cylinder type design and is powered by 110 volt AC. **The power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds and become damaged.**

OPERATION

When power is applied (110 volt AC) to the block heater, the heating element transfers heat through the aluminum engine block and into the coolant without directly penetrating the cooling system.

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with an ohmmeter or 12-volt test light.

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Detach power cord plug from heater (Fig. 4).
- (3) Remove block heater attaching screw located below heater terminals.
- (4) Remove block heater from cylinder block.

INSTALLATION

- (1) Thoroughly clean cylinder block heater cavity.
- (2) Insert heater assembly into block such that mounting hole is located below heater terminals.
- (3) Install mounting screw and tighten to 12 N·m (105 in. lbs.).
- (4) Attach power cord to heater.

CAUTION: To prevent damage, the power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds.

- (5) Lower vehicle.

ENGINE COOLANT TEMPERATURE SENSOR

DESCRIPTION

The engine coolant temperature sensor threads into the coolant system (Fig. 5) or (Fig. 6).

**Fig. 5 ENGINE COOLANT TEMPERATURE SENSOR - 2.7L**

- 1 - ENGINE COOLANT TEMPERATURE SENSOR
2 - CAMSHAFT POSITION SENSOR

ENGINE COOLANT TEMPERATURE SENSOR (Continued)

Fig. 6 ENGINE COOLANT TEMPERATURE SENSOR - 3.5L

- 1 - CAMSHAFT POSITION SENSOR
2 - ENGINE COOLANT TEMPERATURE SENSOR

OPERATION

The sensor provides an input to the Powertrain Control Module (PCM). As coolant temperature varies, the sensor resistance changes, resulting in a different input voltage to the PCM.

When the engine is cold, the PCM will demand slightly richer air-fuel mixtures and higher idle speeds until normal operating temperatures are reached.

The engine coolant sensor input also determines operation of the low and high speed cooling fans.

REMOVAL

- (1) Disconnect negative cable from remote jumper terminal.
- (2) With the engine cold, disconnect coolant sensor electrical connector (Fig. 5) or (Fig. 6).
- (3) Remove sensor.

INSTALLATION

- (1) Install engine coolant temperature sensor (Fig. 5) or (Fig. 6). Tighten sensor to 28 N·m (20 ft. lbs.) torque.
- (2) Attach electrical connector to sensor.
- (3) Connect negative cable to remote jumper terminal.

ENGINE COOLANT THERMOSTAT

DESCRIPTION

The thermostat on the 2.7L and 3.5L engines are located on the lower left side of engine, near the front (Fig. 7) and (Fig. 8). The thermostat on both engines are on the inlet side of the water pump. The thermostats have an air bleed located in the thermostat flange. The air bleed allows internal trapped air during cooling system filling to be released.

Fig. 7 THERMOSTAT AND HOUSING - 2.7L

- 1 - THERMOSTAT AND GASKET
2 - THERMOSTAT HOUSING/COOLANT INLET

OPERATION

The engine cooling thermostat is a wax pellet driven, reverse poppet type. The thermostat is located in the inlet side of the engine to provide fast warm up and to optimize a consistent temperature in the engine. The thermostat is designed to prevent leakage through it and to guarantee a minimum engine operating temperature of 82°C (180°F). They also automatically reach wide open at a temperature of approximately 95°C (203°F) so they do not restrict flow to the radiator as temperature of the coolant rises in hot weather to around 104°C (220°F). Above 102°C (215°F) the coolant temperature is controlled by the radiator, fan, and ambient temperature, not the thermostat.

ENGINE COOLANT THERMOSTAT (Continued)

**Fig. 8 THERMOSTAT AND HOUSING - 3.5L**

- 1 - THERMOSTAT HOUSING/COOLANT INLET
- 2 - THERMOSTAT
- 3 - GASKET

DIAGNOSIS AND TESTING - ENGINE COOLANT THERMOSTAT

The thermostat is operated by a wax filled container (pellet) which is sealed so that when heated to a predetermined temperature, the wax expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

The open too soon type failure mode is included in the on-board diagnosis. The check engine light will not be lit by an open too soon condition. If it has failed open, a DTC diagnostic trouble code will be set. Do not change a thermostat for lack of heat by gauge or heater performance, unless a code is present, (Refer to 7 - COOLING - DIAGNOSIS AND TESTING) for other probable causes. Failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this condition.

ENGINE COOLANT THERMOSTAT - 2.7L**REMOVAL**

(1) Disconnect negative cable from remote jumper terminal.

WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove the engine oil dipstick and tube. To prevent coolant from entering engine, cover the dipstick tube opening in crankcase with a suitable plug.

(4) Raise vehicle on hoist.

(5) Support the engine and remove the left engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/LEFT MOUNT - REMOVAL).

(6) Remove generator support strut.

(7) Disconnect generator electrical connector.

(8) Remove the transaxle dipstick tube bracket attaching bolt.

(9) Remove the lower heater hose tube bracket bolt.

(10) Remove the lower heater hose from thermostat housing.

(11) Remove radiator lower hose from thermostat housing.

(12) Remove thermostat housing bolts (Fig. 9).

(13) Remove thermostat and housing.

**Fig. 9 Thermostat and Housing - 2.7L**

- 1 - THERMOSTAT AND GASKET
- 2 - THERMOSTAT HOUSING/COOLANT INLET

ENGINE COOLANT THERMOSTAT - 2.7L (Continued)

INSTALLATION

- (1) Clean gasket sealing surfaces.

NOTE: Install thermostat with the bleed valve located at the 12 o'clock position.

- (2) Install thermostat and gasket into the thermostat housing.

- (3) Install thermostat and housing to cylinder block. Tighten attaching bolts to 12 N·m (105 in. lbs.) (Fig. 9).

- (4) Connect the heater return and radiator lower hoses to the thermostat housing. Install hose clamps.

- (5) Install the heater hose tube bracket.

- (6) Install the transaxle dipstick tube bracket attaching bolt.

- (7) Install the generator support strut.

- (8) Connect the generator electrical connector.

- (9) Install the left engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/LEFT MOUNT - INSTALLATION).

- (10) Lower vehicle.

- (11) Inspect and replace dipstick O-ring as necessary. Install the engine oil dipstick and tube.

- (12) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

- (13) Connect negative cable to remote jumper terminal.

NOTE: The OEM thermostat is staked in place at the factory. To ensure proper seating of replacement thermostat, carefully remove the bulged metal from the thermostat housing using a suitable hand held grinder. It is not necessary to restake the replacement thermostat into the thermostat housing.

Fig. 10 Thermostat and Housing - 3.5L

- 1 - THERMOSTAT HOUSING/COOLANT INLET
- 2 - THERMOSTAT
- 3 - GASKET

ENGINE COOLANT THERMOSTAT - 3.5L

REMOVAL

WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- (1) Disconnect negative cable from remote jumper terminal.

- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

- (3) Raise vehicle on hoist.

- (4) Disconnect electrical connectors from engine oil and power steering pressure switches.

- (5) Disconnect radiator and heater hoses from thermostat housing.

- (6) Remove thermostat housing bolts (Fig. 10).

- (7) Remove housing, thermostat, and gasket.

INSTALLATION

NOTE: The OEM thermostat is staked in place at the factory. To ensure proper seating of replacement thermostat, carefully remove the bulged metal from the thermostat housing using a suitable hand held grinder. It is not necessary to restake the replacement thermostat into the thermostat housing.

- (1) Clean gasket sealing surfaces.

- (2) Install thermostat and gasket into thermostat housing. For ease of installation, install bolts in housing for thermostat and gasket retention.

- (3) Install thermostat and housing to cylinder block (Fig. 10). Tighten bolts to 12 N·m (105 in. lbs.).

- (4) Connect heater and radiator hoses and install hose clamps.

- (5) Connect electrical connectors to engine oil and power steering pressure switches.

- (6) Lower vehicle and connect negative cable to remote jumper terminal.

- (7) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

- (8) Connect negative cable to remote jumper terminal.

HEATER SUPPLY TUBE - 2.7L

REMOVAL

WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- (1) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- (2) Remove radiator upper crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)
- (3) Remove radiator upper hose at tube.
- (4) Remove heater hose from heater tube at rear of engine.
- (5) Disconnect heater tube from retaining clip at rear of engine.
- (6) Disconnect electrical connector from coolant temperature sensor.
- (7) Remove screws attaching heater tube to outlet connector (Fig. 11).
- (8) Disengage heater tube from outlet connector (Fig. 11). To remove heater tube, move forward until the tube clears cylinder heads.

INSTALLATION

- (1) Inspect heater tube O-ring. Replace as necessary.
- (2) Lubricate O-ring with a silicone type grease such as Mopar® Dielectric Grease.
- (3) Install the heater tube by inserting tube in-between cylinder heads. Insert tube into water outlet housing (Fig. 11).
- (4) Attach heater tube to the retaining clip at rear of engine.
- (5) Install attaching screws and tighten to 3 N·m (30 in. lbs.).
- (6) Install radiator upper and heater hoses to heater tube.
- (7) Connect electrical connector to coolant temperature sensor.
- (8) Install radiator upper crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)
- (9) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

Fig. 11 Heater Supply Tube - Removal/Installation

- 1 - OUTLET CONNECTOR
- 2 - SCREW (2)
- 3 - HEATER TUBE
- 4 - O-RING

HEATER SUPPLY TUBE - 3.5L

REMOVAL

WARNING: DO NOT REMOVE PRESSURE CAP WITH SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- (1) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- (2) Remove upper and lower intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
- (3) Position lower intake manifold upside down on bench and remove the tube retaining bolt (Fig. 12).
- (4) Remove tube from manifold and discard O-ring.

HEATER SUPPLY TUBE - 3.5L (Continued)

**Fig. 12 Heater Supply Tube - 3.2/3.5L**

- 1 - COOLANT TEMPERATURE SENSOR
- 2 - O-RING
- 3 - BOLT
- 4 - HEATER SUPPLY TUBE
- 5 - BOLT

INSTALLATION

- (1) Clean heater tube sealing surfaces.
- (2) Inspect heater tube O-ring. Replace as necessary.
- (3) Lubricate O-ring with a silicone type grease such as Mopar® Dielectric Grease.
- (4) Install O-ring on heater tube (Fig. 12).
- (5) Install heater tube on manifold.
- (6) Install retaining bolts and tighten to 12 N·m (105 in. lbs.) (Fig. 12).
- (7) Install lower and upper intake manifolds. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
- (8) Refill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

HOSE CLAMPS**DESCRIPTION**

The cooling system utilizes both worm drive and spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp. To identify size of spring hose clamps, the size in millimeters has been stamped on each clamp (Fig. 13). Refer to HOSE CLAMP USAGE CHART for proper size and location of hose clamps.

**Fig. 13 Spring Clamp Size Location**

80b76ee

1 - SPRING CLAMP SIZE LOCATION

HOSE CLAMP USAGE CHART

SPRING CLAMP LOCATION		2.7L	3.5L
Upper Radiator Hose	@ engine	39 mm	47 mm
	@ radiator	39 mm	39 mm
Lower Radiator Hose	@ engine	40 mm	39 mm
	@ radiator	39 mm	39 mm
Heater Hoses	3/4"	27 mm	27 mm
	3/8"	17 mm	17 mm

OPERATION

The worm type hose clamp uses a specified torque value to maintain proper tension on a hose connection.

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, use Special Tool 6094 or equivalent, constant tension clamp pliers (Fig. 14) to compress the hose clamp.

**Fig. 14 HOSE CLAMP TOOL**

J9207-36

- 1 - HOSE CLAMP TOOL 6094

RADIATOR

REMOVAL

NOTE: It is not necessary to discharge air conditioning system when removing the radiator.

(1) Disconnect negative cable from remote jumper terminal.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK PLUG OR THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(3) Remove radiator upper crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

(4) Remove upper and lower coolant hoses from the radiator.

(5) Disconnect transmission hoses from cooler and plug (Fig. 15).

(6) Disconnect engine oil cooler lines (if equipped) (Fig. 15).

80b1b302

Fig. 16 RADIATOR FAN

- 1 - ELECTRICAL CONNECTOR
- 2 - FASTENERS
- 3 - CLIPS

(9) Remove the air conditioning condenser attaching screws located at the front of the radiator (Fig. 17) or (Fig. 18).

(10) Remove fastener attaching transmission cooler line bracket to left side of radiator (Fig. 17) or (Fig. 18).

80b34d48

Fig. 15 RADIATOR

RADIATOR (Continued)

Fig. 18 A/C CONDENSER TO RADIATOR - 2.7L w/o AUTO STICK

- 1 - TRANSMISSION OIL COOLER LINE MOUNTING BRACKET
2 - A/C CONDENSER TO RADIATOR MOUNTING SCREWS

(11) Lift condenser upward enough to disengage upper mounting clips. Allow condenser to rest on lower radiator crossmember. It is not necessary to discharge the air conditioning system.

(12) Radiator can now be lifted from engine compartment. **Care should be taken not to damage radiator cooling fins or water tubes during removal.**

CLEANING

Clean radiator fins are necessary for good heat transfer. The radiator and air conditioning fins should be cleaned when an accumulation of debris has occurred. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

INSTALLATION

(1) Position radiator into engine compartment. Seat the radiator assembly lower rubber isolators into the mounting holes in radiator lower support (Fig. 15).

(2) Attach air conditioning condenser to mounting clips on radiator. Install mounting screws and tighten to 5 N·m (45 in. lbs.) (Fig. 17) or (Fig. 18).

(3) Install the radiator lower hose and clamp.

(4) Install the transmission cooler line bracket and attaching fastener (Fig. 17) or (Fig. 18). Connect automatic transmission hoses and torque hose clamps to 3 N·m (28 in. lbs.).

(5) Install the radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(6) Connect radiator fan motor electrical connector.

(7) Connect engine oil cooler lines (if equipped). Torque lines to 18 N·m (160 in. lbs.).

(8) Install the radiator upper hose. Align hose so it does not interfere with the accessory drive belt or engine. Position hose clamp so it will not interfere with the hood.

(9) Install the radiator upper support crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(10) Connect negative cable to remote jumper terminal.

(11) Fill cooling system with coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(12) Operate engine until it reaches normal operating temperature. Check cooling system and automatic transmission for correct fluid levels.

RADIATOR DRAINCOCK

REMOVAL

WARNING: DO NOT REMOVE THE CYLINDER BLOCK PLUG OR THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

CAUTION: Use of pliers on draincock is not recommended. Damage may occur to part. Draincock should not be removed unless leakage is observed.

(1) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(2) Turn the draincock stem counterclockwise 180 degrees to the 9:00 o'clock position.

(3) With the stem at the 9:00 o'clock position, pull the draincock assembly from the radiator tank (Fig. 19).

INSTALLATION

(1) Inspect the draincock body and O-ring for damage. Replace as necessary.

RADIATOR DRAINCOCK (Continued)

80b34ddc

Fig. 19 DRAINCOCK

1 - DRAINCOCK ASSEMBLY

(2) Position the draincock assembly horizontally to the tank opening with the manufactures identification mark facing down.

(3) Push the draincock assembly into the tank opening while rotating clockwise until it snaps into place.

(4) Close the draincock stem by turning clockwise until it stops at the horizontal position.

(5) Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

PRESSURE CAP

DESCRIPTION

The cooling system cap is located on the coolant pressure bottle. The cap construction includes; stainless steel swivel top, rubber seals and retainer, main spring, and a spring loaded valve (Fig. 20).

OPERATION

The pressure cap allows the cooling system to operate at higher than atmospheric pressure which raises the coolant boiling point, thus allowing increased radiator cooling capacity. The pressure cap releases pressure at some point within a range of 110 kPa \pm 14 kPa (16 psi \pm 2 psi) (Fig. 20).

A spring-loaded vent valve in the center of the cap allows the system to pressurize and depressurize without creating a vacuum. If the valve is stuck open, coolant will escape to the overflow hose. There is also a gasket in the cap to seal to the top of the filler neck.

CAUTION: Use only the pressure cap specified for this vehicle. Use of other pressure caps can lead to coolant loss and overheating.

80ac6a1e

Fig. 20 PRESSURE CAP

- 1 - MAIN SPRING
- 2 - GASKET RETAINER
- 3 - STAINLESS STEEL SWIVEL TOP
- 4 - RUBBER SEALS
- 5 - SPRING LOADED VALVE
- 6 - COOLANT PRESSURE BOTTLE
- 7 - FILLER NECK
- 8 - OVERFLOW NIPPLE

INSPECTION

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT 15 MINUTES BEFORE REMOVING CAP. THEN PLACE A SHOP TOWEL OVER THE CAP AND WITHOUT PUSHING DOWN ROTATE IT COUNTERCLOCKWISE TO THE FIRST STOP. ALLOW FLUIDS TO ESCAPE THROUGH THE OVERFLOW TUBE AND WHEN THE SYSTEM STOPS PUSHING OUT COOLANT AND STEAM AND PRESSURE DROPS, REMOVE THE CAP COMPLETELY. SQUEEZING THE RADIATOR INLET HOSE WITH A SHOP TOWEL (TO CHECK PRESSURE) BEFORE AND AFTER TURNING TO THE FIRST STOP IS RECOMMENDED.

WARNING: THE WARNING WORDS DO NOT OPEN HOT ON THE COOLANT BOTTLE PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE COOLANT BOTTLE PRESSURE CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT AND/OR UNDER PRESSURE.

The pressure cap upper gasket (seal) pressure relief can be checked by removing cap. Attach a suitable Cooling System Tester such as Tool 7700 to the cap and pump air into the cap. Pressure cap upper gasket should relieve at 124 kPa (18 psi) and hold pressure at 110 kPa (16 psi) minimum.

Remove the pressure tester and hold the cap in hand, **right side up** (Fig. 21). The vent valve at the bottom of the cap should not open. If the rubber gas-

PRESSURE CAP (Continued)

- 2 - GASKET RETAINER
- 3 - STAINLESS STEEL SWIVEL TOP
- 4 - RUBBER SEALS
- 5 - SPRING LOADED VALVE
- 6 - COOLANT PRESSURE BOTTLE
- 7 - FILLER NECK
- 8 - OVERFLOW NIPPLE

ket has swollen and prevents the valve from closing, replace the cap.

Hold the cap in hand **upside down**. If any light can be seen between vent valve and rubber gasket, replace cap.

There is no need to remove the pressure cap at any time **except** for the following purposes:

- Checking and adjust antifreeze freeze point.
- Refilling system with new coolant.
- Conducting service procedures.
- Checking for vacuum leaks.

RADIATOR FAN

DESCRIPTION

The radiator fan assembly includes two electric motors, a motor support, and a one piece shroud. The assembly is fastened to the radiator by screws with square nuts and retaining clips (Fig. 22).

OPERATION

The cooling system fans will operate at two speeds and are simultaneously activated. The dual fan system improves engine cooling and air conditioning performance in hot weather and severe driving conditions, while reducing fan noise and power consumption.

The cooling fans will operate based on inputs to the Powertrain Control Module (PCM). When fan operation is determined necessary, the PCM provides a ground to the fan relay control circuit.

80b1b302

Fig. 22 RADIATOR FAN

- 1 - ELECTRICAL CONNECTOR
- 2 - FASTENERS
- 3 - CLIPS

The inputs provided to the PCM that influence fan operation are:

- Coolant Temperature Sensor
- Intake Air Temperature Sensor
- Output Speed Sensor
- Transmission Oil Temperature Sensor
- A/C Pressure Transducer

For more information (Refer to 7 - COOLING/ENGINE/RADIATOR FAN RELAY - OPERATION).

DIAGNOSIS AND TESTING - RADIATOR FAN CONTROL

Radiator fan control can be accomplished five ways. A pressure transducer on the air conditioning compressor discharge line sends a signal to the Powertrain Control Module (PCM) which will activate both fans if necessary. In addition to this control, the fans are turned on based on coolant temperature sensor, intake air temperature sensor, output speed sensor, and transmission oil temperature sensor output to the PCM. The PCM switches the fans on through the fan relays.

The PCM provides fan control for the following conditions:

- Regardless of coolant temperature the fan will not run during cranking until the engine starts.
- Fans will run in accordance with the specifications listed in the following operation charts.

For additional circuit and diagnostic information (Refer to Appropriate Wiring and Diagnostic Information).

REMOVAL

(1) Remove radiator upper crossmember (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL).

(2) Disconnect radiator fan motor electrical connector.

(3) Partially drain cooling system below the level of the upper radiator hose.

(4) Disconnect upper radiator hose from radiator.

(5) Remove radiator fan attaching fasteners and upper clip (Fig. 23).

(6) Remove radiator fan by lifting upward to clear radiator.

INSTALLATION

(1) Install radiator fan.

(2) Install upper clip and fasteners (Fig. 23).

(3) Connect upper radiator hose to radiator.

(4) Connect fan motor electrical connector (Fig. 23).

(5) Install radiator upper crossmember (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION).

(6) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM FILLING).

RADIATOR FAN RELAY

DESCRIPTION

The HI/LO and HI radiator fan relays are located in the Power Distribution Center (PDC) near the coolant recovery pressure container (Fig. 24). A decal on the inside of the PDC covers shows the location of each relay and fuse contained in the PDC. It is an ISO relay.

RADIATOR FAN RELAY (Continued)

- 2 - RADIATOR FAN MOTOR NO. 2
- 3 - RADIATOR FAN RELAY NO. 2
- 4 - RADIATOR FAN RELAY NO. 1
- 5 - RADIATOR FAN MOTOR NO. 1

OPERATION

2.7L BASE

The cooling system uses two fans. Both fans operate at two different speeds, low and high. Depending on engine coolant temperature and A/C system high side pressure, the fans operate at either low or high speed. The PCM controls radiator fan speed by grounding the coil side of either the HI/LO fan relay or the HI fan relay. The ignition switch supplies voltage to the coil sides of the relay. When the PCM grounds the coil side of the relay, the contacts close and the battery supplies power to the fans. Refer to WIRING DIAGRAMS.

EXCEPT 2.7L BASE

The cooling system uses two fans. Both fans operate at two different speeds, low and high. Depending on engine coolant temperature and A/C system high side pressure, the fans operate at either low or high speed. The PCM controls radiator fan speed by grounding the coil side of either the HI/LO fan relay or the HI fan relay. Low speed radiator fan function is achieved by running both fan motors in a series circuit. High speed radiator fan function is achieved by running both fan motors in a parallel circuit. Refer to WIRING DIAGRAMS.

WATER PUMP

DIAGNOSIS AND TESTING - WATER PUMP

A quick test to determine water pump operation is to check for proper heater system performance (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING). A defective pump will not circulate heated coolant through the heater hoses. For additional diagnosis, (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). For water pump inspection, (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSPECTION).

WATER PUMP - 2.7L

DESCRIPTION

The 2.7L pump has a die cast aluminum housing and a plastic swept vane impeller. It bolts directly to the cylinder block, behind the timing chain cover (Fig. 26). The water pump is driven by the back side of the engine primary timing chain.

REMOVAL

The water pump on all models can be replaced without discharging the air conditioning system.

WATER PUMP - 2.7L (Continued)

**Fig. 26 WATER PUMP - 2.7L ENGINE**

- 1 - WATER PUMP BODY
- 2 - IMPELLER
- 3 - GASKET

NOTE: It is normal for the water pump to weep a small amount of coolant from the primary weep hole (black stain at weep passage). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident from the primary weep passage (Fig. 28) and (Fig. 29). This indicates a shaft seal failure and pump must be replaced. Coolant may leak from the secondary weep passage and fill the valley of the engine (Fig. 28) and (Fig. 30). If this condition is found, clean the primary weep passage of debris. Be sure to perform a thorough analysis before replacing water pump.

WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN RESULT.

- (1) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- (2) Remove radiator upper crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)
- (3) Remove radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
- (4) Remove accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

NOTE: The water pump is driven by the primary timing chain.

- (5) Remove the timing chain and all chain guides- (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

- (6) Remove bolts attaching water pump to block (Fig. 27).

- (7) Remove water pump and gasket.

**Fig. 27 WATER PUMP - 2.7L**

- 1 - WATER PUMP
- 2 - BOLTS
- 3 - BOLTS

INSPECTION - 2.7L

Inspect and replace the water pump if it has any of the following defects:

- (1) Damage or cracks on the pump body.
- (2) Coolant leaks: If the shaft seal is leaking, this will be evident by traces of thick deposits of dried glycol running down from the pump primary weep passage (Fig. 28) and (Fig. 29). A thin black stain below the pump primary weep hole/passageway is considered normal operation.
- (3) Coolant leaks: If the pump primary weep passage is plugged, coolant may come from the secondary weep passage and collect in the valley of the engine. The coolant will eventually run out the back side of the engine (Fig. 28) and (Fig. 30). Leakage from the secondary weep passage may give false indications that core plug(s) may be leaking on the back side of the engine block. If this condition is found, clean the primary weep passage of debris.
- (4) Impeller rubs inside of cylinder block.
- (5) Excessively loose or rough turning bearing.

WATER PUMP - 2.7L (Continued)

NOTE: It is normal for the water pump to weep a small amount of coolant from the primary weep hole (black stain at weep passage). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident from the primary weep passage (Fig. 28) and (Fig. 29). This indicates a shaft seal failure and pump must be replaced. Coolant may leak from the secondary weep passage and fill the valley of the engine (Fig. 28) and (Fig. 30). If this condition is found, clean the primary weep passage of debris. Be sure to perform a thorough analysis before replacing water pump.

Fig. 28 Water Pump Weep Passages - 2.7L

- 1 - PRIMARY WEEP PASSAGE
- 2 - SECONDARY WEEP PASSAGE

INSTALLATION

- (1) Clean all sealing surfaces.
- (2) Install water pump and gasket. Tighten mounting bolts to 12 N·m (105 in. lbs.).
- (3) Install timing chain guides and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
- (4) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- (5) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
- (6) Install the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

Fig. 29 Primary Water Pump Weep Passage - 2.7L

- (7) Install the radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION) and
- (8) Install the radiator upper crossmember (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION).
- (9) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

WATER PUMP - 3.5L

DESCRIPTION

The 3.5L water pump has a die cast aluminum housing and a plastic swept vane impeller. It bolts directly to the right rear timing belt cover using an O-ring for sealing (Fig. 32). The water pump is driven by the engine timing belt.

REMOVAL

The water pump on all models can be replaced without discharging the air conditioning system.

WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

NOTE: It is normal for the water pump to weep a small amount of coolant from the weep hole (black stain on water pump body). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident on water pump body from the weep hole (shaft seal failure). Be sure to perform a thorough analysis before replacing water pump.

(1) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(2) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

NOTE: The water pump is driven by the timing belt.

(3) Remove engine timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(4) Remove water pump mounting bolts (Fig. 31). Note position of longer bolt for proper re-installation.

(5) Remove water pump body from engine (Fig. 31).

Fig. 31 WATER PUMP - 3.5L ENGINE

- 1 - SCREWS
- 2 - WATER PUMP BODY

INSPECTION

Inspect and replace the water pump if it has any of the following defects:

- (1) Damage or cracks on the pump body.
- (2) Coolant leaks; if the seal is leaking, this will be evident by traces of thick deposits of dried glycol running down the pump body and components below. A thin black stain below pump weep hole/passage is considered normal operation.
- (3) Impeller rubs inside of the rear timing belt cover.
- (4) Excessively loose or rough turning bearing.

NOTE: It is normal for the water pump to weep a small amount of coolant from the weep hole (black stain on water pump body). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident on water pump body. This indicates a shaft seal failure and pump must be replaced. Be sure to perform a thorough analysis before replacing water pump.

WATER PUMP - 3.5L (Continued)

INSTALLATION

- (1) Clean all O-ring surfaces on pump and cover.
- (2) Apply Mopar® Dielectric Grease or the equivalent silicone grease to the O-ring to facilitate assembly. Install new O-ring on water pump (Fig. 32).

80b1b457

Fig. 32 WATER PUMP - 3.5L

- 1 - O-RING
- 2 - IMPELLER
- 3 - WATER PUMP BODY

- (3) Position water pump to engine.
- (4) Install mounting bolts and tighten to 12 N·m (105 in. lbs.).
- (5) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).
- (6) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (7) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

TRANSMISSION OIL COOLER

DESCRIPTION

The transmission oil cooler circuit consists of a series connected internal cooler mounted inside the left radiator tank and an external oil cooler mounted to the front of the air conditioning condenser (Fig. 1).

OPERATION

Transmission oil is supplied to the internal (in-tank) transmission cooler (Fig. 1). The oil is then routed to the external cooler mounted to the front side of the A/C condenser. Oil is then returned to the transmission from the external oil cooler (Fig. 1).

Fig. 1 TRANSMISSION OIL COOLER

- 4 - TRANSMISSION OIL RETURN LINE
- 5 - TRANSMISSION OIL SUPPLY LINE TO IN-TANK OIL COOLER
- 6 - EXTERNAL TRANSMISSION OIL COOLER

TRANSMISSION OIL COOLER (Continued)

REMOVAL

The in-tank transmission oil cooler is serviced with the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

For removal of external trans cooler perform the following procedures:

- (1) Disconnect negative cable from remote jumper terminal.
- (2) Remove the radiator upper support (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL).
- (3) Raise vehicle on hoist.
- (4) Remove right and left front wheels.
- (5) Remove front fascia (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (6) Disconnect the hoses connecting to the external cooler.
- (7) Remove the radiator side air shields.
- (8) Remove the screw attaching the cooler line support bracket and remove the bracket.
- (9) Cut-off the cooler to condenser attaching straps (Fig. 2).
- (10) Remove the transmission oil cooler and lines (Fig. 2).

Fig. 2 TRANSMISSION OIL COOLER

- 1 - COOLER LINE FITTINGS - 19 N-m (170 in. lbs.)
 2 - COOLER RETAINING STRAPS

CLEANING

Check the external cooler for debris on the cooling fin surfaces. Clean as necessary.

INSPECTION

Inspect all hoses, tubes, clamps and connections for leaks, cracks, or damage. Replace as necessary. Use only approved transmission oil cooler hoses that are molded to fit the space available.

Inspect external coolers for leaks, loose mounts, or damage. Replace as necessary.

INSTALLATION

For in-tank transmission oil cooler installation (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

For external trans oil cooler installation, perform the following procedures:

- (1) Remove the bolts attaching the A/C condenser to the radiator (Fig. 3).
- (2) Lift A/C condenser up to disengage from upper retainers on radiator.

Fig. 3 A/C CONDENSER TO RADIATOR

- 1 - TRANSMISSION OIL COOLER LINE MOUNTING BRACKET
 2 - A/C CONDENSER TO RADIATOR MOUNTING SCREWS

TRANSMISSION OIL COOLER (Continued)

(3) Reposition the A/C condenser to allow access to condenser rear surface.

(4) Remove the previously cut-off cooler retaining straps.

(5) Position and install the new retaining straps in the same locations on the condenser.

(6) Reposition A/C condenser on the radiator upper retainers.

(7) Install the A/C condenser mounting bolts and tighten to 5 N·m (45 in. lbs.) (Fig. 3).

(8) Install the foam pads on the retaining straps

(9) Position the transmission oil cooler on A/C condenser by guiding the retaining straps through the cooler mounting holes (Fig. 2).

(10) Position the external cooler lines to the side of radiator. Install support bracket and screw (Fig. 4).

(11) Install the retaining strap locks and tighten to secure the cooler to the condenser. Trim off the excess strap material.

(12) Connect the cooler hoses to cooler lines and tighten hose clamps to 3 N·m (28 in. lbs.).

(13) Install radiator side air shields.

(14) Install the front fascia (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front Fascia - Installation).

(15) Install the front wheels

(16) Install the radiator upper support (Refer to 23 - Body/Exterior/Grille Opening Reinforcement - Installation).

(17) Connect negative cable cable to remote jumper terminal.

Fig. 4 A/C CONDENSER TO RADIATOR

- 1 - TRANS COOLER LINE BRACKET SCREW
- 2 - SCREW - CONDENSER TO RADIATOR
- 3 - TRANS COOLER
- 4 - SCREW - CONDENSER TO RADIATOR

(18) Start engine and check transmission oil level. Adjust level as necessary.

TRANSMISSION OIL COOLER LINES

REMOVAL

- (1) Loosen hose clamps at radiator connections and remove cooler hoses (Fig. 5).
- (2) Remove lines from transmission.
- (3) Remove lines from supports.

INSPECTION

Inspect all cooler lines and clamps. Replace as necessary.

INSTALLATION

- (1) Position cooler lines and connect to transmission. Torque flare nuts at transmission to 30 N·m (260 in. lbs.).
- (2) Connect cooler lines to supports.
- (3) Connect cooler hoses to radiator (Fig. 5). Tighten hose clamps to 3 N·m (28 in. lbs.).
- (4) Start engine and check transmission fluid level. Adjust as necessary.

AUDIO SYSTEM

DESCRIPTION

An audio system is standard factory-installed equipment on this model unless the radio delete option is specified. Several combinations of radio receivers are offered on this model. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

A optional navigation radio (RB1) is available on this vehicle. With this system, the operator has the option of choosing a street address, point of interest, trip itinerary and other features outlined in the operator's manual.

The audio system includes the following components:

- Antenna
- Antenna - satellite radio (if equipped)
- Multiplexer (if equipped)
- Radio noise suppression components
- Radio receiver
- Satellite receiver module (if equipped)
- Speakers

AUDIO SYSTEM (Continued)

Certain functions and features of the audio system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communication Interface (PCI) bus network. The data bus network allows the sharing of sensor information. For diagnosis of these electronic modules or of the data bus network, the use of a DRB III® scan tool and the proper Diagnostic Procedures manual are recommended.

Refer to the appropriate wiring information in this service manual for complete standard and premium audio system circuit diagrams. The wiring information includes proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The optional navigation radio system receives GPS signals from up to eight satellites to display the position and direction of the vehicle. Map information is supplied through a DVD-ROM. An electronic gyroscope and the vehicle's speed sensor enable the system to display the present vehicle position even in locations where GPS signals may be blocked.

When a destination is selected, the navigation system uses information from the map to quickly calculate a route. As the vehicle is driven along the chosen route, the operator is guided with pictorial displays

and voice prompts. For complete operating instructions, refer to the manual included with the vehicle.

The audio system components operate on battery current received through a fuse in the Junction Block (JB) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the On or Accessory positions.

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

AUDIO SYSTEM DIAGNOSIS TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AUDIO	1. Fuse faulty.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required.
	2. Radio connector faulty.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring faulty.	3. Check for shorted or open wires. Repair wiring, if required.
	4. Radio ground faulty.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio faulty.	5. Refer to appropriate Diagnostic Service Manual.
	6. Speakers faulty.	6. Replace speaker as necessary.

AUDIO SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO SATELLITE RADIO AUDIO (PERFORM ALL DIAGNOSIS OUTDOORS)	1. Subscription service has expired (with subscription expired, one channel is still available)	1. Contact satellite radio provider.
	2. Items on roof blocking satellite antenna.	2. Remove or reposition items to allow clear space around antenna.
	3. Frayed, broken or faulty antenna cable.	3. Replace satellite antenna cable.
NO RADIO DISPLAY	1. Fuse faulty.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required.
	2. Radio connector faulty.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring faulty.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground faulty.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio faulty.	5. Refer to appropriate Diagnostic Service Manual.
CLOCK WILL NOT KEEP SET TIME	1. Fuse faulty.	1. Check Ignition-Off Draw (IOD) fuse in the Junction Block (JB). Replace fuse, if required.
	2. Radio connector faulty.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring faulty.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground faulty.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio faulty.	5. Refer to appropriate Diagnostic Service Manual.
POOR RADIO RECEPTION	1. Antenna faulty.	1. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - DIAGNOSIS AND TESTING).
	2. Radio ground faulty.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	3. Radio noise suppression faulty.	3. Repair or replace ground strap as necessary.
	4. Radio faulty.	4. Refer to appropriate Diagnostic Service Manual.
NO/POOR TAPE OPERATION	1. Faulty tape.	1. Insert known good tape and test operation.
	2. Foreign objects behind tape door.	2. Remove foreign objects and test operation.
	3. Dirty cassette tape head.	3. Clean head with Mopar Cassette Head Cleaner.
	4. Faulty tape deck.	4. Exchange or replace radio, if required.

AUDIO SYSTEM (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO COMPACT DISC OPERATION	1. Faulty CD.	1. Insert known good CD and test operation.
	2. Foreign material on CD.	2. Clean CD and test operation.
	3. Condensation on CD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Faulty CD player.	4. Refer to appropriate Diagnostic Service Manual.

AMPLIFIER

DESCRIPTION

MIDLINE AND INFINITY I SYSTEM

The amplifier is located in the right front cowl panel.

INFINITY II SYSTEM

The amplifier is located beneath the trunk liner covering the right quarter inner panel.

OPERATION

For specific operation of each individual system, refer to the vehicles owners manual, Audio System Operation Manual.

When the radio system is ON, and all or some speakers are not operating or have a noise distortion refer to the diagnostic tests. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

MIDLINE/INFINITY I SYSTEM

- (1) Disconnect and isolate the negative battery cable.
- (2) Remove right under panel silencer/duct.
- (3) Remove mounting fastener to remote amplifier (Fig. 1).
- (4) Pull amplifier inboard and then pull downward to remove from upper retaining clips.
- (5) Disconnect two wiring connectors.
- (6) Remove remote amplifier from vehicle.

INFINITY II SYSTEM

- (1) Disconnect and isolate the negative battery cable.
- (2) Inside trunk, pull the trunk liner aside (right quarter panel passenger side).

Fig. 1 Midline/Infinity Remote Amplifier Location

- 1 - HVAC UNIT
2 - REMOTE AMPLIFIER
3 - RECIRCULATION AIR MOTOR

- (3) Remove three retaining screws (Fig. 2).
- (4) Disconnect two wire connectors.
- (5) Remove remote amplifier from vehicle.

INSTALLATION

MIDLINE/INFINITY I SYSTEM

- (1) Install the remote amplifier into vehicle.
- (2) Connect two wiring connectors.
- (3) Push the amplifier upward and then outboard to install into upper retaining clips.
- (4) Install mounting fastener to remote amplifier.
- (5) Install right under panel silencer/duct.
- (6) Connect the negative battery cable.

INFINITY II SYSTEM

- (1) Install remote amplifier into vehicle.
- (2) Connect two wire connectors.
- (3) Install three retaining screws.
- (4) Install the trunk liner (right quarter panel passenger side).

AMPLIFIER (Continued)

**Fig. 2 Infinity II Remote Amplifier Location**

- 1 - RIGHT DECKLID SUPPORT
2 - RETAINING SCREWS
3 - RIGHT INNER FENDER WELL

- (5) Connect the negative battery cable.

ANTENNA BODY & CABLE

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Inside trunk, pull passenger side trunk liner aside.
- (3) Unplug antenna lead from base of antenna mast.
- (4) Remove antenna mast by unscrewing mast from antenna body.
- (5) Remove screw from mounting bracket.
- (6) Pull antenna body down through the rubber grommet.

INSTALLATION

- (1) Push antenna body up through the rubber grommet in the quarter panel.
- (2) Install the screw to the mounting bracket.
- (3) Install antenna mast. Tighten to 2 N·m (15 in. lbs.). **Ensure that the antenna mast is fully seated on antenna base and that there is no gap between the mast and base.**
- (4) Plug antenna lead into the antenna base.

- (5) Install the passenger side trunk liner.
- (6) Connect the battery negative cable.

ANTENNA - SATELLITE RADIO

DESCRIPTION

The satellite radio antenna is secured by adhesive foam and two retainers which protrude through a hole in the roof panel. Two wires from the antenna are connected to the body harness above the headliner.

OPERATION

The satellite radio antenna receives signals from orbiting satellites and sends these signals to the satellite receiver module. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Lower the rear portion of the headliner as necessary to access underside of antenna (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
- (3) A adhesive removal tool can be created by using a 18 to 24 inch piece of nylon cord wrapped around two handles. (Fig. 3). Using the removal tool, guide the nylon cord under the dust seal on the forward side of the antenna. Grab the handles and work the cord through the adhesive. Continue this for 360° around the antenna.

**Fig. 3 ANTENNA REMOVAL**

- 1 - SATELLITE ANTENNA
2 - NYLON CORD
3 - WOODEN DOWEL ROD

- (4) Disconnect the wire harness connectors from the antenna.

ANTENNA - SATELLITE RADIO (Continued)

(5) From inside the vehicle, and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.

(6) Remove any remaining adhesive with isopropyl alcohol and a lint free cloth. If original antenna is being reinstalled, remove adhesive from antenna mounting surface.

INSTALLATION

(1) If original antenna is being installed, remove backing from adhesive and apply to antenna base.

(2) Remove backing from the adhesive on the antenna.

(3) Insert wire harness through hole in roof panel. Press antenna into position until both retainers snap into place.

(4) Connect wire harness connectors to antenna.

(5) Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(6) Connect battery negative cable.

ANTENNA - NAVIGATION RADIO

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).

(3) Disconnect antenna from radio. Remove tape securing antenna to air duct, and remove antenna.

INSTALLATION

(1) Secure antenna to air duct.

(2) Connect antenna to radio.

(3) Install radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).

(4) Connect battery negative cable.

ANTENNA CABLE - SATELLITE RADIO

DESCRIPTION

The satellite radio antenna connects the roof mounted antenna to the satellite receiver module. It has two connectors at each end and is routed above the headliner, then down the right side of the vehicle floor below the carpet.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Lower the rear portion of the headliner as necessary to access the underside of the satellite antenna (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(3) Remove the lower quarter trim panel (Refer to 23 - BODY/INTERIOR/LOWER QUARTER TRIM - REMOVAL).

(4) Remove the front and rear door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(5) Push carpet back to access body harness.

(6) Detach the antenna cable from the body harness (Fig. 4). Disconnect wire harness connectors at each end of the cable.

80f83cae

Fig. 4 ANTENNA CABLE - SATELLITE RADIO

1 - SATELLITE RECEIVER MODULE
2 - SATELLITE RADIO ANTENNA CABLE

INSTALLATION

(1) Secure the antenna cable to the body harness. Connect the wire harness connectors at each end of the antenna cable.

(2) Install the front and rear door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(3) Install the lower quarter trim (Refer to 23 - BODY/INTERIOR/LOWER QUARTER TRIM - INSTALLATION).

(4) Install the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(5) Connect the battery negative cable.

CD CHANGER

DESCRIPTION

The 6 Disc In-Dash CD Changer (if equipped) is located in the existing cubby bin. It is a cartridge-less changer controlled by the radio and allows the occupants to load up to six discs, one at a time.

OPERATION

Due to its compact design, the CD changer can only carry out one operation at a time. For example, you can not load a new disc while playing another at the same time. Each operation happens sequentially.

The radio unit provides control over all features of the CD changer with the exception of the CD load and eject functions, which are controlled by buttons located on the front of the CD changer. All features you would expect, such as Disc Up/Down, Track Up/Down, Random and Scan are controlled by the radio, which also displays all relevant CD changer information on the radio display.

The CD changer contains a Load/Eject button and an indicator light for each of the six disc positions. The individual light indicates whether a CD is currently loaded in that particular chamber of the CD changer. Pressing the individual Load/Eject button for a particular chamber will eject a disc currently present in that chamber. If the chamber is currently empty, actuating the Load/Eject button will position that chamber to receive and load a new disc in that chamber.

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove ash receiver (if applicable).
- (3) Using a trim stick (special tool #C-4755), gently pry out on center trim bezel. Disconnect wiring connectors to HVAC controls, cigar lighter/auxiliary power outlet and traction control switch.
- (4) Remove instrument panel center trim bezel.
- (5) Remove two retaining screws to in-dash CD changer.
- (6) Pull CD changer out of instrument panel, disconnect wiring and remove from vehicle.

INSTALLATION

- (1) Connect wiring and install CD changer into instrument panel. Make sure the rubber bumper engages into the instrument panel.
- (2) Install two retaining screws to in-dash CD changer.
- (3) Install instrument panel center trim bezel.
- (4) Connect wiring connectors to HVAC controls, cigar lighter/auxiliary power outlet and traction control switch.

- (5) Place center trim bezel into position and snap into place.
- (6) Install ash receiver (if applicable).
- (7) Connect the negative battery cable remote terminal to the remote battery post.

MULTIPLEXER

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
- (3) Remove mounting fasteners (Fig. 5).

Fig. 5 MULTIPLEXER

- 1 - RADIO
2 - MULTIPLEXER
3 - CD CHANGER

- (4) Disconnect wire harness connectors and remove multiplexer.

INSTALLATION

- (1) Connect wire harness connectors and place multiplexer into position.
- (2) Install mounting fasteners.
- (3) Install radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
- (4) Connect battery negative cable.

RADIO

DESCRIPTION

Available factory-installed radio receivers for this model include:

- AM/FM/cassette/CD (RAZ sales code)
- AM/FM/cassette with CD changer control feature (RBB sales code)

RADIO (Continued)

- AM/FM/CD with CD changer control (RBK sales code)
- AM/FM/cassette/CD with CD changer control (RAD, RBT or RBY sales code) - export only
- AM/FM/DVD with GPS navigation (RB1 sales code)

All factory-installed radio receivers can communicate on the Programmable Communications Interface (PCI) data bus network. All factory-installed receivers are stereo Electronically Tuned Radios (ETR) and include an electronic digital clock function.

These radio receivers can only be serviced by an authorized radio repair station. See the latest Warranty Policies and Procedures manual for a current listing of authorized radio repair stations.

OPERATION

The radio receiver operates on ignition switched battery current that is available only when the ignition switch is in the On or Accessory positions. The electronic digital clock function of the radio operates on fused battery current supplied through the IOD fuse, regardless of the ignition switch position.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove instrument panel center trim bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
- (3) Remove four radio mounting screws.
- (4) Pull radio from panel and disconnect wiring from radio.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

- (5) Disconnect the antenna cable by pulling the locking antenna connector away from the radio (Fig. 6).
- (6) Remove radio from vehicle.

INSTALLATION

- (1) Place radio near instrument panel opening.
- (2) Connect wiring and antenna lead to radio and slide into place.
- (3) Install four radio mounting screws.

80c910dd

Fig. 6 ANTENNA TO RADIO

- 1 - RADIO
- 2 - LOCKING ANTENNA CONNECTOR
- 3 - INSTRUMENT PANEL ANTENNA CABLE

(4) Install instrument panel center trim bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

- (5) Connect the battery negative cable.

RADIO NOISE SUPPRESSION
GROUND STRAP

DESCRIPTION

Some components used on the vehicles are equipped with a capacitor to suppress radio frequency interference/static.

Ground straps are mounted from the engine to each shock tower and from the body to the muffler. The ground straps should be securely tightened to assure good metal to metal contact.

OPERATION

Capacitors are mounted in various locations internal to the generator, instrument cluster and windshield wiper motor.

Ground straps conduct very small high frequency electrical signals to ground and require clean large surface area contact.

REAR WINDOW ANTENNA

REMOVAL

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF REAR WINDOW GLASS INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE REAR WINDOW GLASS MAY NOT PERFORM PROPERLY IN AN ACCIDENT. BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

CAUTION: Open the left front door glass before installing the rear window to avoid pressurizing the passenger compartment if a door is slammed before the urethane bonding is fully cured. Water leaks can result

(1) Remove upper quarter trim panel (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - REMOVAL).

(2) Disconnect the wire connectors from rear window defogger, and rear window mounted radio antenna, if so equipped.

(3) Remove rear window (Refer to 23 - BODY/STATIONARY GLASS/BACKLITE - REMOVAL).

INSTALLATION

(1) Install rear window (Refer to 23 - BODY/STATIONARY GLASS/BACKLITE - INSTALLATION).

(2) Connect rear window defogger wiring connector, and rear window mounted radio antenna connector.

(3) Install upper quarter trim panel (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - INSTALLATION).

REAR WINDOW ANTENNA MODULE

DESCRIPTION

The integrated rear window antenna incorporates the rear window defogger and a electronic module to receive radio signals. The module is located in the right C-pillar behind the trim panel (Fig. 7).

80b27c18

Fig. 7 Rear Defogger/Antenna Module

- 1 - TO RADIO
- 2 - TO BACKLITE
- 3 - REAR DEFOGGER/ANTENNA MODULE
- 4 - REAR SEAT

OPERATION

The AM and FM signals are received via isolated unheated lines along the top of the rear window.

NOTE: If aftermarket window shading is added, it cannot be of the metallic type. Metallic type window shading can cause poor radio reception.

NOTE: If an accessory cellular phone glass mount antenna is installed, it should only be installed so as to avoid contact with any of the rear glass grid lines.

DIAGNOSIS AND TESTING - REAR WINDOW ANTENNA MODULE

NOTE: Due to a capacitor integral with the coaxial cable, the coax cable can not be tested. The continuity test between the center pin of the coax to the antenna does not apply. An ohm meter check to the center pin of the coaxial cable will falsely indicate an open circuit. The coaxial shield to ground test can be performed. Verify coaxial cable performance by using a known good cable.

REAR WINDOW ANTENNA MODULE (Continued)

Before performing any antenna service procedures, verify that Rear Window Defogger is operating properly (Fig. 8) and (Fig. 9). If no, repair as necessary. (Refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING). Any repairs to either the AM or FM grid should be preformed as in Electrically Heated Systems, Grid Line and Terminal Repair.

Fig. 8 Rear Window Antenna Module

- 1 - TO FM/DEFOGGER GRID LINES
- 2 - RADIO COAX CONNECTOR
- 3 - 12 VOLT FEED TO REAR WINDOW DEFOGGER
- 4 - 12 VOLT FEED TO MODULE
- 5 - TO AM GRID LINES

Fig. 9 Rear Window Grid Lines and Module

- 1 - B+ FOR AMPLIFIER
- 2 - B+ FOR REAR WINDOW DEFOGGER
- 3 - AM
- 4 - FM & REAR WINDOW DEFOGGER
- 5 - RADIO COAX

(1) Check that the rear window adhesive does not come in contact with any portion of the grid lines or bus bars. There should be a minimum of 2 mm gap between adhesive and the grid lines or bus bars. If not OK, repair as necessary. If OK, go to Step 2.

(2) Check for proper radio coaxial cable connections at the radio and rear window antenna module. If not OK, repair as necessary. If OK, go to Step 3.

(3) Loss of reception on only one band (AM or FM) may indicate a continuity problem on the rear window grids. Test the grid lines with an ohmmeter. If not OK, repair grid lines as necessary. If OK, go to Step 5.

(4) Reception degradation when the rear window defogger is actuated may indicate discontinuity in the heated grid lines.

(5) Turn the radio and rear window defogger ON position. Using a voltmeter, test for battery voltage at the X60 and C15 circuit terminals of the rear window antenna module wire harness connector (Fig. 8). If not OK, check fuses, if fuses are OK, repair wire harness as necessary. Refer to Wiring Diagrams for circuit information.

(6) Ensure that the rear window defogger ground wire with integral coil in the C-pillar has a good ground. If not OK, repair as necessary. If OK, go to Step 7.

CAUTION:

Rear Window Defogger must be in the OFF position

(7) Quick check of the module:

- Place the ignition switch in the ACC position with the radio in the ON position on a appropriate station (AM/FM).

- Tune to a AM station

- Using a grounded jumper wire, momentarily short the AM lead to the grid lines (Fig. 9).

- There should be an audible CRACKLE through the speakers indicating circuit continuity.

- Tune to a FM station

- Using a grounded jumper wire, momentarily short the FM lead to the grid lines (Fig. 9).

- There should be an audible CRACKLE through the speakers indicating circuit continuity.

If not OK, go to Step 8. If OK, go to Step 9.

(8) Using a ohmmeter, check continuity between the module wire connector and:

- — AM grid lines.

- — FM/rear window antenna grid lines.

If not OK, repair as necessary. (Refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING). If OK, go to Step 9.

(9) If neither AM or FM can be received, use a known good radio and verify. If not OK, use a known good antenna module and verify. If OK, either exchange radio or replace antenna module.

REAR WINDOW ANTENNA MODULE (Continued)

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove right upper quarter trim panel. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - REMOVAL).
- (3) Remove the attaching screw from module.
- (4) Disconnect wire connectors and radio antenna coaxial cable (Fig. 8).
- (5) Remove module from vehicle.

INSTALLATION

- (1) Install module from vehicle.
- (2) Connect wire connectors and radio antenna coaxial cable (Fig. 8).
- (3) Install the attaching screw to module.
- (4) Install right upper quarter trim panel. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - INSTALLATION).
- (5) Connect the negative battery cable remote terminal to the remote battery post.

80ba7791

Fig. 10 REMOTE RADIO SWITCHES

- 1 - PRESET ADVANCE
- 2 - SEEK
- 3 - MODE ADVANCE
- 4 - VOLUME

REMOTE SWITCHES

DESCRIPTION

Remote radio control switches are rocker-type switch units (Fig. 10) are mounted in the upper spoke covers of the rear (instrument panel side) steering wheel trim cover. The switch unit on the left side is the seek switch and has seek up, seek down, and preset station advance switch functions. The switch unit on the right side is the volume control switch and has volume up, volume down, and mode advance switch functions.

The two remote radio switch units are each retained in a mounting hole located on opposite sides of the rear steering wheel trim cover by four integral snap features. A plastic bracket on the back of each switch unit provides additional support for the unit by extending towards the center of the steering wheel where it is clamped between the steering wheel armature and the steering wheel rear trim cover mounting boss by the trim cover mounting screw.

The two remote radio switch units share a common steering wheel wire harness with the vehicle speed control switches. The steering wheel wire harness is connected to the instrument panel wire harness through the clockspring.

OPERATION

The six switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the Body Control Module (BCM) through the clockspring. The

BCM sends a five volt reference signal to both switch units on one circuit, and senses the status of all of the switches by reading the voltage drop on a second circuit.

When the BCM senses an input (voltage drop) from any one of the remote radio switches, it sends the proper switch status messages on the Programmable Communication Interface (PCI) data bus network to the radio receiver. The electronic circuitry within the radio receiver is programmed to respond to these remote radio switch status messages by adjusting the radio settings as requested. For diagnosis of the BCM or the PCI data bus, the use of a DRB III scan tool and the proper Body Diagnostic Procedures manual are recommended.

For more information on the features and control functions for each of the remote radio switches, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING - REMOTE SWITCHES

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOTE SWITCHES (Continued)

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. Remove the remote radio switch(es) (Fig. 11) from the steering wheel.

80ba7793

Fig. 11 REMOTE RADIO SWITCHES

- 1 - BLACK (LEFT) SWITCH
2 - WHITE (RIGHT) SWITCH

(2) Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch Test table. If the remote radio switch resistances check OK, go to Step 3. If not OK, replace the faulty switch.

REMOTE RADIO SWITCH TEST

Switch	Switch Position	Resistance
Right (White)	Volume Up	1.210 Kilohms
Right (White)	Volume Down	3.010 Kilohms
Right (White)	Mode Advance	0.0511 Kilohms

Switch	Switch Position	Resistance
Left (Black)	Seek Up	0.261 Kilohms
Left (Black)	Seek Down	0.681 Kilohms
Left (Black)	Pre-Set Station Advance	0.162 Kilohms

(3) Reconnect the battery negative cable. Turn the ignition switch to the ON position. Check for 5 volts at the radio control mux circuit cavities of the steering wheel wire harness connectors for both remote radio switches. If OK, go to Step 4. If not OK, repair the open or shorted radio control mux circuit to the Body Control Module (BCM) as required.

(4) Disconnect and isolate the battery negative cable. Disconnect the 22-way instrument panel wire harness connector from the BCM. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted remote radio switch ground circuit to the BCM as required.

(5) Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and the 22-way instrument panel wire harness connector for the BCM. There should be continuity. If OK, refer to the proper Body Diagnostic Procedures manual to test the BCM and the PCI data bus. If not OK, repair the open remote radio switch ground circuit as required.

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

REMOTE SWITCHES (Continued)

(2) Remove the driver side airbag module from the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(3) Remove the speed control switch located on the same side of the steering wheel as the remote radio switch that is being serviced. (Refer to 8 - ELECTRICAL/SPEED CONTROL/SWITCH - REMOVAL).

(4) Disconnect the steering wheel wire harness connector from the connector receptacle of the remote radio switch (Fig. 12).

80ba7794

Fig. 12 REMOTE RADIO SWITCHES - REMOVE/INSTALL - TYPICAL

- 1 - STEERING WHEEL
- 2 - SPEED CONTROL SWITCH
- 3 - SCREW
- 4 - DRIVER SIDE AIRBAG MODULE
- 5 - REMOTE RADIO SWITCH
- 6 - REAR TRIM COVER

(5) From the inside of the steering wheel rear trim cover, press firmly and evenly outward on the back of the switch to disengage the four snap features that secure the switch to the inside of the mounting hole.

(6) From the outside of the steering wheel rear trim cover, remove the remote radio switch from the trim cover mounting hole.

INSTALLATION

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the remote radio switch to the mounting hole on the outside of the steering wheel rear trim cover. Be certain that the connector receptacle is oriented toward the bottom of the switch and pointed toward the center of the steering wheel.

(2) Press firmly and evenly on the remote radio switch until each of the switch snap features is fully engaged in the mounting hole of the steering wheel rear trim cover.

(3) Reconnect the steering wheel wire harness connector to the connector receptacle of the remote radio switch.

(4) Install the speed control switch located on the same side of the steering wheel as the remote radio switch. (Refer to 8 - ELECTRICAL/SPEED CONTROL/SWITCH - INSTALLATION).

(5) Install the driver side airbag module to the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

(6) Connect the battery negative cable.

SATELLITE RECEIVER MODULE

DESCRIPTION

The satellite receiver module is located in the right front cowl area behind the trim panel.

OPERATION

The satellite receiver module receives signals from the roof mounted antenna and processes this information before it is sent to the radio. The module operates on both battery and accessory feed circuits and will operate with the ignition key in the run or accessory position only.

SATELLITE RECEIVER MODULE (Continued)

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove instrument panel silencer (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
- (3) Remove mounting fasteners (Fig. 13).

**Fig. 13 SATELLITE RECEIVER MODULE**

- 1 - SATELLITE RECEIVER MODULE
2 - FRONT PASSENGER DOOR

- (4) Pull satellite receiver module inboard, and then downward to remove from upper retaining clips.
- (5) Disconnect wiring harness connectors.
- (6) Remove satellite receiver module from vehicle.

INSTALLATION

- (1) Install the satellite receiver module to the vehicle.
- (2) Connect the wire harness connectors.
- (3) Push the module upward, and then outboard to install into upper retaining clips.
- (4) Install mounting fasteners.
- (5) Install instrument panel silencer (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
- (6) Connect the battery negative cable.

SPEAKER**DESCRIPTION**

There are four different system combinations available on the LH models. They are a Base, Midline, Infinity I, and Infinity II system.

BASE SYSTEM

The Base System includes:

- Two 6.5 inch round, full-range speakers in the front doors.

- Two 6 x 9-inch, full-range speakers mounted in the rear shelf panel.

MIDLINE SYSTEM

The Midline System includes:

- A compact 120 watt power amplifier with four output channels.
- Two 2.5 inch, round single-cone speakers in the lower front corners of the front door windows.
- Two 6.5 inch, round single-cone speakers in the front doors.
- Two 6 x 9-inch, full range speakers mounted in the rear shelf panel.

INFINITY I SYSTEM

The Infinity I System includes:

- A 240 watt Infinity power amplifier with six output channels
- One 2.5 inch, round single-cone, spatial imaging speaker in the center of the instrument panel.
- Two 2.5 inch round, single cone, spatial imaging speakers in the lower corners of the front door windows.
- Two 6.5 inch, round single-cone speakers in the front doors.
- Two 6 x 9-inch, single-cone speakers mounted in the rear shelf panel.

INFINITY II SYSTEM

The Infinity II System includes:

- A 360 watt power amplifier with nine output channels, one for each speaker location.
- One 2.5 inch, round single-cone, spatial imaging speaker in the center of the instrument panel.
- Two 2.5 inch round, single cone, spatial imaging speakers in the lower corners of the front door windows.
- Two 6.5 inch, round single-cone speakers in the front doors.
- Two 6 x 9-inch, single-cone speakers mounted in the rear shelf panel.
- Two 2.5 inch, round speakers mounted in the rear doors.

OPERATION

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current to flow through the voice coil. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

SPEAKER (Continued)

DIAGNOSIS AND TESTING - SPEAKER

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

(1) If all speakers are inoperative, check the radio fuses in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check the amplifier fuse (if equipped) in the junction block. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(3) Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.

(4) Turn the radio receiver OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with an amplifier, remove the radio receiver. If vehicle is equipped with an amplifier, disconnect wire harness connector at output side of amplifier. Go to Step 5.

(5) Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the wire harness connector for continuity to ground. There should be no continuity. If OK, go to

Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.

(6) Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

REMOVAL

FRONT DOOR - LOWER

(1) Disconnect and isolate the battery negative cable.

(2) Open drivers door.

(3) Using a trim stick (special tool #C-4755), carefully pry speaker grille away from door trim panel (Fig. 14).

(4) Remove three speaker retaining screws.

(5) Pull speaker away from door and disconnect wiring.

Fig. 14 Front Door Speakers

1 - INFINITY SPEAKERS
2 - DOOR SPEAKER

FRONT DOOR - UPPER

(1) Disconnect and isolate the battery negative cable.

(2) Open drivers door.

(3) Remove two speaker enclosure attachment screws holding the enclosure ring and grill to the door.

(4) Remove two speaker retaining screws.

SPEAKER (Continued)

(5) Pull speaker away from door and disconnect wiring.

INSTRUMENT PANEL

(1) Disconnect and isolate the battery negative cable.

(2) Remove instrument panel top cover.

(3) Remove two retaining screws to center speaker and disconnect wiring connector.

(4) Remove speaker from vehicle.

REAR DOOR

(1) Disconnect and isolate the battery negative cable.

(2) Open rear door.

(3) Using a trim stick (special tool #C-4755), carefully pry speaker grille away from door trim panel (Fig. 15).

Fig. 15 Rear Door Speaker

1 - DOOR SPEAKER

(4) Remove two speaker retaining screws.
(5) Pull speaker away from door and disconnect wiring.

REAR SHELF

(1) Disconnect and isolate the battery negative cable.

(2) Remove the rear shelf trim panel. (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - REMOVAL).

(3) Remove four retaining screws.

(4) Remove speaker and disconnect wire connector.

INSTALLATION

FRONT DOOR - LOWER

(1) Connect wiring and place speaker in door speaker opening.

(2) Install three speaker retaining screws.

(3) Place speaker grille into place and firmly press into place.

(4) Connect battery negative cable.

FRONT DOOR - UPPER

(1) Connect wiring and place speaker in door speaker opening.

(2) Install two speaker retaining screws.

(3) Install two speaker enclosure attachment screws holding the enclosure ring and grill to the door.

(4) Connect battery negative cable.

INSTRUMENT PANEL

(1) Place speaker into position on instrument panel.

(2) connect wiring connector, install two retaining screws to center speaker.

(3) Install instrument panel top cover.

(4) Connect battery negative cable.

REAR DOOR

(1) Connect wiring and place speaker in door speaker opening.

(2) Install two speaker retaining screws.

(3) Place speaker grille into place and firmly snap into place on the door trim panel.

(4) Connect battery negative cable.

REAR SHELF

(1) Connect wire connector and place speaker into speaker opening.

CAUTION: Be sure that the wiring connectors are facing forward when installed.

(2) Install the four retaining screws.

(3) Install the rear shelf trim panel.

(4) Connect battery negative cable.

CHIME/BUZZER

CHIME/BUZZER

DESCRIPTION

The Chime/Buzzer Warning System includes the following:

- **Exterior Lamps On chime** - An audible chime indicates the exterior lamps were left on with the driver door open and the key in the ignition in the OFF position.
- **Fasten Seat Belts chime** - A warning lamp on the instrument panel, and an audible chime are used as the fasten seat belt warning/reminder when the key is first turned to the RUN/START position.
- **Key In Ignition chime** - An audible chime that indicates the ignition key is in the ignition lock cylinder with the driver door open and ignition OFF.

OPERATION

When using the DRB III® scan tool, refer to the proper Body Diagnostic Procedures Manual. Refer to Wiring Diagrams for circuit information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CHIME CONDITIONS

- No tone when ignition switch is turned on and drivers seat belt is unbuckled and fully retracted.**
- (1) Check driver's seat belt retractor switch for a ground when belt is unbuckled.
 - (2) Use a DRB III® scan tool to perform PCI bus diagnostics on the Body Control Module (BCM) for battery, ignition and seat belt switch input.
 - (3) Use a DRB III® scan tool to perform actuator diagnostics on BCM chime.
 - (4) Check for battery feed at terminal J1-7 and ignition feed at terminal J1-5 of the BCM connector.
 - (5) Check for tone in any other function.

- No fasten seat belt lamp when ignition switch is turned on.**
- (1) Use DRB III® scan tool to perform PCI bus diagnostics on BCM for battery and ignition switch input
 - (2) Check for burned out bulb.
 - (3) Using the DRB III® scan tool, do the actuator test on cluster. Refer to proper Body Diagnostic Procedures Manual.
 - (4) Check for battery feed at terminal J1-7 of the BCM connector.
 - (5) Check for ignition feed at terminal J1-5 of the BCM connector.

- Fasten seat belt lamp or tone continue for more than 10 seconds after seat belts are fastened and ignition ON.**
- (1) Use DRB III® scan tool to perform PCI bus diagnostics on BCM for battery and ignition switch input.
 - (2) Inspect the BCM connectors and wires for proper connection.

- No tone when headlamps are on, ignition switch is OFF and driver's door is open.**
- (1) Using a DRB III® scan tool, check drivers door ajar switch for good ground when driver's door is open.
 - (2) Use DRB III® scan tool to perform PCI bus diagnostics on BCM for battery, ignition switch input, headlamp switch and driver's door input and Chime Output Test.
 - (3) Inspect BCM connectors and wires for proper connection.
 - (4) Check for battery feed at terminal J1-7 of BCM connector.
 - (5) Check headlamp switch.

CHIME/BUZZER (Continued)

No tone when key is left in ignition. Ignition switch is in the OFF position and driver's door is open.

(1) Using a DRB III® scan tool, check drivers door ajar switch for good ground when driver's door is open.

(2) Use DRB III® scan tool to perform PCI bus diagnostics on BCM for battery, ignition switch input, key-in-switch and driver's door input and Chime Output Test.

(3) Inspect BCM connectors and wires for proper connection.

(4) Check for battery feed at terminal J1-7 of BCM connector.

(5) Check key-in switch.

Chimes continue when headlamps are turned off and/or key is removed from ignition.

(1) Use DRB III® scan tool to perform PCI bus diagnostics on BCM for headlamp or key-in-ignition inputs.

(2) Check wiring for a grounded condition between key-in switch and BCM.

(3) Inspect the BCM connectors and wires for proper connection.

NOTE: Refer to Electrical, Electronic Control Modules, Body Control Module, Removal and Installation for service of the BCM.

DIAGNOSIS AND TESTING - EXTERIOR LAMPS ON

To test the headlamps left on function, remove the ignition key, turn exterior lamps on with driver's door open. Chime should sound until headlamps are turned off or drivers door is closed.

Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Switch, Removal and Installation for service procedures.

DIAGNOSIS AND TESTING - FASTEN SEAT BELTS

To test the fasten seat belt function, start with the ignition switch in the OFF position. Turn the ignition switch to the ON position with the driver's seat belt unbuckled. The seat belt warning lamp will stay lit until the belt is moved sufficiently to buckle the belt. If the belt is not buckled, the light will not go out.

Refer to Electrical, Restraints, Seat Belt Buckle, Removal and Installation for service procedures.

DIAGNOSIS AND TESTING - KEY IN IGNITION

To test the key in ignition function, the ignition switch must be in the OFF position with key in the ignition switch. The driver's door must be open. The chime should sound until key is removed from the ignition switch or the drivers door is closed.

The Key-in Ignition switch is built into the ignition switch assembly. Should the Key-in switch require service, the ignition switch assembly must be replaced. Refer to Electrical, Ignition Control for service procedures.

CLOCK

CLOCK

DESCRIPTION

Fig. 1 ANALOG CLOCK

- 1 - SET BUTTONS
- 2 - ANALOG CLOCK

The clock is of analog type (Fig. 1), mounted in the instrument panel center air distribution bezel.

OPERATION

Refer to the Owner's Manual for setting instructions.

REMOVAL

- (1) Open hood.
- (2) Disconnect and isolate the negative battery remote cable.
- (3) Using a trim stick (special tool #C-4755), gently pry out instrument panel air distribution outlet bezel that retains the analog clock.

- (4) Disconnect the one wire connector to the clock.
- (5) Remove bezel from vehicle.
- (6) On the bench, remove two retaining screws to analog clock and remove from bezel (Fig. 2).

Fig. 2 ANALOG CLOCK REMOVAL

- 1 - WIRE HARNESS CONNECTOR
- 2 - CLOCK LAMP
- 3 - RETAINING SCREWS

INSTALLATION

- (1) On the bench, place the clock into place on the bezel and install the two retaining screws to analog clock (Fig. 2).
- (2) Connect the one wire connector to the clock.
- (3) Place bezel into place and firmly snap into place.
- (4) Connect and isolate the negative battery remote cable to the remote terminal.
- (5) Close hood.

ELECTRONIC CONTROL MODULES

STANDARD PROCEDURE - PCM/SKIM PROGRAMMING

NOTE: Before replacing the PCM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal component failures (i.e. relay and solenoids) and shorted circuits (i.e. pull-ups, drivers and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

When a PCM (SBEC) and the SKIM are replaced at the same time perform the following steps in order:

- (1) Program the new PCM (SBEC)

- (2) Program the new SKIM
- (3) Replace all ignition keys and program them to the new SKIM.

PROGRAMMING THE PCM (SBEC)

The SKIS Secret Key is an ID code that is unique to each SKIM. This code is programmed and stored in the SKIM, PCM and transponder chip (ignition keys). When replacing the PCM it is necessary to program the secret key into the new PCM using the DRB III. Perform the following steps to program the secret key into the PCM.

- (1) Turn the ignition switch on (transmission in park/neutral).
- (2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.
- (3) Select PCM REPLACED (GAS ENGINE).
- (4) Enter secured access mode by entering the vehicle four-digit PIN.
- (5) Select ENTER to update PCM VIN.

ELECTRONIC CONTROL MODULES (Continued)

NOTE: If three attempts are made to enter secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).

(6) Press ENTER to transfer the secret key (the SKIM will send the secret key to the PCM).

(7) Press Page Back to get to the Select System menu and select ENGINE, MISCELLANEOUS, and SRI MEMORY CHECK.

(8) The DRB III will ask, Is odometer reading between XX and XX? Select the YES or NO button on the DRB III. If NO is selected, the DRB III will read, Enter odometer Reading<From I.P. odometer>. Enter the odometer reading from the Instrument Panel and press ENTER.

PROGRAMMING THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).

(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.

(3) Select PCM REPLACED (GAS ENGINE).

(4) Program the vehicle four-digit PIN into SKIM.

(5) Select COUNTRY CODE and enter the correct country.

NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKIM, the SKIM must be replaced.

(6) Select YES to update VIN (the SKIM will learn the VIN from the PCM).

(7) Press ENTER to transfer the secret key (the PCM will send the secret key to the SKIM).

(8) Program ignition keys to SKIM.

NOTE: If the PCM and the SKIM are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new SKIM.

PROGRAMMING IGNITION KEYS TO THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).

(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.

(3) Select PROGRAM IGNITION KEY'S.

(4) Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A maximum of eight keys can be learned to each SKIM. Once a key is learned to a SKIM it (the key) cannot be transferred to another vehicle.

If ignition key programming is unsuccessful, the DRB III will display one of the following messages:

Programming Not Attempted - The DRB III attempts to read the programmed key status and there are no keys programmed into SKIM memory.

Programming Key Failed (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

- faulty ignition key transponder
- ignition key is programmed to another vehicle.

8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

(5) Obtain ignition keys to be programmed from customer (8 keys maximum).

(6) Using the DRB III, erase all ignition keys by selecting MISCELLANEOUS and ERASE ALL CURRENT IGN. KEYS.

(7) Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

BODY CONTROL MODULE

DESCRIPTION

The Body Control Module (BCM) is concealed below the driver side end of the instrument panel in the passenger compartment, where it is secured to the dash panel side of the Junction Block (JB).

The BCM utilizes integrated circuitry and information carried on the Programmable Communications Interface (PCI) data bus network along with many hard wired inputs to monitor many sensor and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the BCM allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the PCI data bus.

OPERATION

The Body Control Module (BCM) is designed to control and integrate many of the electronic features and functions of the vehicle. The microprocessor-based BCM hardware and software monitors many hard wired switch and sensor inputs as well as those resources it shares with other electronic modules in the vehicle through its communication over the PCI data bus network. The internal programming and all of these inputs allow the BCM microprocessor to determine the tasks it needs to perform and their priorities, as well as both the standard and optional features that it should provide. The BCM programming then performs those tasks and provides those features through both PCI data bus communication

BODY CONTROL MODULE (Continued)

with other electronic modules and through hard wired low current outputs to a number of relays. These relays provide the BCM with the ability to control numerous high current accessory systems in the vehicle.

The BCM monitors its own internal circuitry as well as many of its input and output circuits, and will store a Diagnostic Trouble Code (DTC) in electronic memory for any failure it detects. These DTCs can be retrieved and diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

(1) Remove the Junction Block/BCM from the vehicle. Refer to Power Distribution Systems, Junction Block, Removal and Installation.

(2) Remove the four BCM attaching screws from the Junction Block.

(3) Disconnect BCM from the Junction Block.

NOTE: The Remote Keyless Entry (RKE) module is attached to the BCM with three screws. This must be transferred (if equipped) to the new BCM.

NOTE: If the BCM is replaced, the Vehicle Theft / Security System (VTSS (if equipped) must be enabled in the new BCM via the DRB III® scan tool in order to start the vehicle.

INSTALLATION

(1) Connect the BCM to the Junction Block.

(2) Install the four BCM attaching screws to the Junction Block.

(3) Install the Junction Block/BCM into the vehicle. Refer to Power Distribution Systems, Junction Block, Removal and Installation.

COMMUNICATION

DESCRIPTION

The DaimlerChrysler Programmable Communication Interface (PCI) data bus system is a single wire multiplex system used for vehicle communications on many DaimlerChrysler Corporation vehicles. Multiplexing is a system that enables the transmission of several messages over a single channel or circuit. All DaimlerChrysler vehicles use this principle for communication between various microprocessor-based electronic control modules. The PCI data bus exceeds the Society of Automotive Engineers (SAE) J1850 Standard for Class B Multiplexing.

Many of the electronic control modules in a vehicle require information from the same sensing device. In the past, if information from one sensing device was

required by several controllers, a wire from each controller needed to be connected in parallel to that sensor. In addition, each controller utilizing analog sensors required an Analog/Digital (A/D) converter in order to "read" these sensor inputs. Multiplexing reduces wire harness complexity, sensor current loads and controller hardware because each sensing device is connected to only one controller, which reads and distributes the sensor information to the other controllers over the data bus. Also, because each controller on the data bus can access the controller sensor inputs to every other controller on the data bus, more function and feature capabilities are possible.

In addition to reducing wire harness complexity, component sensor current loads and controller hardware, multiplexing offers a diagnostic advantage. A multiplex system allows the information flowing between controllers to be monitored using a diagnostic scan tool. The DaimlerChrysler system allows an electronic control module to broadcast message data out onto the bus where all other electronic control modules can "hear" the messages that are being sent. When a module hears a message on the data bus that it requires, it relays that message to its microprocessor. Each module ignores the messages on the data bus that are being sent to other electronic control modules.

OPERATION

Data exchange between modules is achieved by serial transmission of encoded data over a single wire broadcast network. The wire colors used for the PCI data bus circuits are yellow with a violet tracer, or violet with a yellow tracer, depending upon the application. The PCI data bus messages are carried over the bus in the form of Variable Pulse Width Modulated (VPWM) signals. The PCI data bus speed is an average 10.4 Kilo-bits per second (Kbps). By comparison, the prior two-wire Chrysler Collision Detection (CCD) data bus system is designed to run at 7.8125 Kbps.

The voltage network used to transmit messages requires biasing and termination. Each module on the PCI data bus system provides its own biasing and termination. Each module (also referred to as a node) terminates the bus through a terminating resistor and a terminating capacitor. There are two types of nodes on the bus. The dominant node terminates the bus through a 1 KW resistor and a 3300 pF capacitor. The Powertrain Control Module (PCM) is the only dominant node for the PCI data bus system. A standard node terminates the bus through an 11 KW resistor and a 330 pF capacitor.

The modules bias the bus when transmitting a message. The PCI bus uses low and high voltage lev-

COMMUNICATION (Continued)

els to generate signals. Low voltage is around zero volts and the high voltage is about seven and one-half volts. The low and high voltage levels are generated by means of variable-pulse width modulation to form signals of varying length. The Variable Pulse Width Modulation (VPWM) used in PCI bus messaging is a method in which both the state of the bus and the width of the pulse are used to encode bit information. A "zero" bit is defined as a short low pulse or a long high pulse. A "one" bit is defined as a long low pulse or a short high pulse. A low (passive) state on the bus does not necessarily mean a zero bit. It also depends upon pulse width. If the width is short, it stands for a zero bit. If the width is long, it stands for a one bit. Similarly, a high (active) state does not necessarily mean a one bit. This too depends upon pulse width. If the width is short, it stands for a one bit. If the width is long, it stands for a zero bit.

In the case where there are successive zero or one data bits, both the state of the bus and the width of the pulse are changed alternately. This encoding scheme is used for two reasons. First, this ensures that only one symbol per transition and one transition per symbol exists. On each transition, every transmitting module must decode the symbol on the bus and begin timing of the next symbol. Since timing of the next symbol begins with the last transition detected on the bus, all of the modules are re-synchronized with each symbol. This ensures that there are no accumulated timing errors during PCI data bus communication.

The second reason for this encoding scheme is to guarantee that the zero bit is the dominant bit on the bus. When two modules are transmitting simultaneously on the bus, there must be some form of arbitration to determine which module will gain control. A data collision occurs when two modules are transmitting different messages at the same time. When a module is transmitting on the bus, it is reading the bus at the same time to ensure message integrity. When a collision is detected, the module that transmitted the one bit stops sending messages over the bus until the bus becomes idle.

Each module is capable of transmitting and receiving data simultaneously. The typical PCI bus message has the following four components:

- **Message Header** - One to three bytes in length. The header contains information identifying the message type and length, message priority, target module(s) and sending module.
- **Data Byte(s)** - This is the actual message that is being sent.
- **Cyclic Redundancy Check (CRC) Byte** - This byte is used to detect errors during a message transmission.

- **In-Frame Response (IFR) byte(s)** - If a response is required from the target module(s), it can be sent during this frame. This function is described in greater detail in the following paragraph.

The IFR consists of one or more bytes, which are transmitted during a message. If the sending module requires information to be received immediately, the target module(s) can send data over the bus during the original message. This allows the sending module to receive time-critical information without having to wait for the target module to access the bus. After the IFR is received, the sending module broadcasts an End of Frame (EOF) message and releases control of the bus.

The PCI data bus can be monitored using the DRBIII® scan tool. It is possible, however, for the bus to pass all DRBIII® tests and still be faulty if the voltage parameters are all within the specified range and false messages are being sent.

CONTROLLER ANTILOCK BRAKE

DESCRIPTION

The controller antilock brake (CAB) is a microprocessor-based device which monitors the antilock brake system (ABS) during normal braking and controls it when the vehicle is in an ABS stop. The CAB is mounted to the HCU as part of the integrated control unit (ICU) (Fig. 1). The CAB uses a 24-way electrical connector on the vehicle wiring harness. The power source for the CAB is through the ignition switch in the RUN or ON position. The CAB is on the PCI bus.

80ada520

Fig. 1 INTEGRATED CONTROL UNIT (TYPICAL)

- 1 - PUMP/MOTOR
- 2 - HCU
- 3 - PUMP/MOTOR CONNECTOR
- 4 - CAB

CONTROLLER ANTILOCK BRAKE (Continued)

OPERATION

The primary functions of the controller antilock brake (CAB) are to:

- Monitor the antilock brake system for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in an ABS mode.
- Store diagnostic information.
- Provide communication to the DRBIII® scan tool while in diagnostic mode.
- Illuminate the ABS and BRAKE (with loss of EVBP) warning indicator lamps.
- (With traction control only) Illuminate the TRAC ON lamp in the message center on the instrument panel when a traction control event occurs.
- (with traction control only) Illuminate the TRAC OFF lamp when the amber ABS warning indicator lamp illuminates.

The CAB constantly monitors the antilock brake system for proper operation. If the CAB detects a fault, it will turn on the amber ABS warning indicator lamp and disable the antilock braking system. The normal base braking system will remain operational.

NOTE: If the vehicle is equipped with traction control, the TRAC OFF lamp will illuminate anytime the amber ABS warning indicator lamp illuminates.

The CAB continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the CAB commands the CAB command coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The CAB continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

The CAB contains a self-diagnostic program that monitors the antilock brake system for system faults. When a fault is detected, the amber ABS warning indicator lamp is turned on and the fault diagnostic trouble code (DTC) is then stored in a diagnostic program memory. These DTC's will remain in the CAB memory even after the ignition has been turned off. The DTC's can be read and cleared from the CAB memory by a technician using the DRBIII® scan tool. If not cleared with a DRBIII® scan tool, the DTC will be automatically cleared from the CAB memory after the identical fault has not been seen during the next 3,500 miles.

CAB INPUTS

- Wheel speed sensors (four)
- Brake lamp switch
- Ignition switch
- System and pump voltage
- Ground
- Traction control OFF switch (via BUS) (if equipped)
- Diagnostic communication (PCI)

CAB OUTPUTS

- Amber ABS warning indicator lamp actuation (via BUS)
- Instrument cluster (MIC) communication (PCI)
- Traction control lamps (if equipped)
- Diagnostic communication (PCI, via BUS)

REMOVAL

To remove the CAB, the ICU must be removed from the vehicle and disassembled. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - REMOVAL)

INSTALLATION

To install the CAB, it must be attached to the HCU, forming the ICU. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - ASSEMBLY)

DATA LINK CONNECTOR

DESCRIPTION

The data link connector is located inside the vehicle, below instrument panel next to the center column (Fig. 2).

80b27cd6

Fig. 2 DATA LINK CONNECTOR

DATA LINK CONNECTOR (Continued)

OPERATION

The data link connector (diagnostic connector) links the DRB scan tool with the Powertrain Control Module (PCM). Refer to On-Board Diagnostics in the General Diagnosis section of this group.

MEMORY HEATED SEAT/
MIRROR MODULE

DESCRIPTION

**Fig. 3 Memory Heated Seat/Mirror Module (MHSMM)
Location**

- 1 - MEMORY HEATED SEAT/MIRROR MODULE
- 2 - RECLINER MOTOR
- 3 - SEAT HEATER 4-WAY CONNECTOR
- 4 - SEAT BACK HEATER 2-WAY CONNECTOR
- 5 - REAR RISER
- 6 - FRONT RISER
- 7 - HORIZONTAL MOTOR

A Memory Heated Seat/Mirror Module (MHSMM) is used on vehicles that are equipped with the heated seat system option. The module is used to control all of the driver side seat/mirror memory functions and both the driver and passenger heated seat functions. The memory heated seat/mirror module contains a central processing unit and interfaces with the Programmable Communications Interface (PCI) data bus network. Refer to the **Heated Seats** section of this manual for more information on the heated seat system.

The module is packaged in a black molded plastic case which is mounted under the forward edge of the driver side front seat cushion (Fig. 3). This location makes it somewhat difficult to remove because it sits between the power seat track and the seat cushion frame. However, it can be removed without having to remove the driver's seat, refer to the procedure in this section for detailed instructions.

For diagnosis of the MHSMM or the PCI data bus, a DRB III® scan tool and the Service/Diagnostic Procedures manual are recommended. The Memory Heated Seat/Mirror Module cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The Memory Heated Seat/Mirror Module controls the heated seat and memory seat, mirror systems. However different, these two systems share some software programmed into the module. Refer to the following text which explains how the two different systems are controlled by the memory heated seat/mirror module.

HEATED SEAT SYSTEM OPERATION

The Memory Heated Seat/Mirror Module receives hard wired inputs from the heated seat switches and the heated seat sensors located, on each of the front seats. The programmed software in the MHSMM allows it to know the temperature of the seat by a resistance reading generated from the seat cushion element mounted thermistor (Heated Seat Temperature Sensor). When a heated seat switch is depressed the module will power the appropriate heating element until the correct preset temperature is achieved. Refer to heated seat switch, element and sensor descriptions for additional information.

MEMORY SEAT/MIRROR SYSTEM OPERATION

The Memory Heated Seat/Mirror Module receives hard wired inputs from the memory seat switch and the potentiometers, mounted on each of the driver power seat track motors and both side view mirrors. The programmed software in the MHSMM allows it to know where the seat/mirror is located in its designed travel by a resistance reading generated from the seat track or mirror mounted potentiometer. This way, when the memory switch is depressed the module will power the seat track or mirror motors until the correct preset location is achieved. The MHSMM will prevent the seat memory recall function from being initiated if the transmission gear selector lever is not in the Park or Neutral positions, or if the vehicle is moving. These inputs are monitored over the PCI data bus circuit.

DIAGNOSIS AND TESTING - MEMORY HEATED
SEAT/MIRROR MODULE

In order to obtain conclusive testing of the memory heated seat/mirror module, the Programmable Communications Interface (PCI) data bus circuit and any components that provide inputs to the module must be checked.

MEMORY HEATED SEAT/MIRROR MODULE (Continued)

The most reliable, efficient, and accurate means to diagnose the module requires the use of a DRB III® scan tool and the Service and Body Diagnostic Procedures Manuals. The DRB III® scan tool can provide vital information to the technician trying to find a problem with the module. Diagnostic logic software is built into the memory heated seat/mirror module to help the person trying to locate the problem by the most efficient means possible. Anytime a problem is suspected, a DRB III® scan tool should be obtained and used to retrieve any stored fault codes in the memory heated seat/mirror module. If diagnostic fault codes are present in the module, record them on a piece of paper immediately before proceeding any further. Then, use these fault codes to identify the problem by verifying the fault code. Example, If the module records "DRIVER SEAT HEAT OUTPUT OPEN" fault, locate the diagnostic procedure for this code in the appropriate Body Diagnostic Procedures Manual and follow the flow chart until the specific problem is located and resolved. Once the problem is corrected, erase the stored fault code using the DRB III® scan tool and verify correct heated seat system operation. If the heated seat system appears to be functioning correctly, verify that there are no other stored codes in the module and return the vehicle to service.

If the fault code could not be verified, such as not finding anything wrong when following the diagnostic flow chart in the Body Diagnostic Procedures Manual. This is a good indication that a INTERMITTENT problem may be present. You must then attempt to find the intermittent problem, such as moving the heating element within the seat while testing continuity or wiggling the wire harness's/electrical connectors under the seat while testing continuity. Always, eliminate all other potential problems before attempting to replace the memory heated seat module.

For complete circuit wiring diagrams, refer to **Wiring**.

WARNING: REFER TO THE RESTRAINTS SECTION OF THIS MANUAL BEFORE ATTEMPTING ANY SEAT, STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

PRELIMINARY TEST

Before testing the individual components in the heated seat system, check the following:

(1) Using the DRB III® scan tool, check the memory heated seat/mirror module (MHSMM) for any stored fault codes. Record these codes on paper for reference and resolve using the appropriate Body Diagnostic Procedures Manual.

(2) Check the vehicles battery open-circuit voltage and charging system performance. If the vehicles electrical system is defective or weak it may not be supplying sufficient energy to operate the system in question.

(3) Test each of the circuits from the heated seat switch, elements, and sensors to the MHSMM. Repair any shorts or open circuits as required.

REMOVAL

(1) Position the drivers seat as far upward and rearward as possible.

(2) Open hood, disconnect and isolate the negative battery cable remote terminal from the remote battery post.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(3) Remove the two module attaching screws (Fig. 4).

Fig. 4 Memory Heated Seat/Mirror Module (MHSMM) Location

MEMORY HEATED SEAT/MIRROR MODULE (Continued)

- (4) Disconnect the module electrical connectors.
- (5) Remove the module from drivers seat.

INSTALLATION

- (1) Position the module under the drivers seat.
- (2) Connect the module electrical connectors.
- (3) Install the two module attaching screws.
- (4) Connect the negative battery cable remote terminal.
- (5) Position the drivers seat in its original position.
- (6) Verify correct system operation.

POWERTRAIN CONTROL MODULE**DESCRIPTION****DESCRIPTION**

The Powertrain Control Module (PCM) is a digital computer containing a microprocessor (Fig. 5). The PCM receives input signals from various switches and sensors referred to as Powertrain Control Module Inputs. Based on these inputs, the PCM adjusts various engine, transmission, and vehicle operations through devices referred to as Powertrain Control Module Outputs.

Fig. 5 Powertrain Control Module (PCM)

- 1 - PDC
2 - SPEED CONTROL SERVO
3 - POWERTRAIN CONTROL MODULE

NOTE: PCM Inputs:

- Air Conditioning Pressure Transducer
- ASD Relay
- Battery Voltage
- Brake Switch Status
- Camshaft Position Sensor
- Crankshaft Position Sensor
- Distance Sensor
- EGR Position Feedback
- Engine Coolant Temperature Sensor
- Heated Oxygen Sensors
- Ignition sense
- Intake Air Temperature Sensor
- Knock Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Natural Vacuum Leak Detection
- PCI Bus
- Power Steering Pressure Switch
- Proportional Purge Sense
- SCI Receive
- Speed Control
- Throttle Position Sensor
- Torque Management Input (Integral to PCM)
- Transmission Control Relay (Switched B+)
- Transmission Range Sensor (TRS)
- Transmission Pressure Switches (L/R, 2/4, OD)
- Transmission Temperature Sensor (Integral to TRS)
- Transmission Input Shaft Speed Sensor
- Transmission Output Shaft Speed Sensor
- TRS Hall Effect Switch (Autostick)
- Vehicle Speed (From Transmission)

NOTE: PCM Outputs:

- Air Conditioning Clutch Relay
- Automatic Shut Down (ASD) and Fuel Pump Relays
- Data Link Connector (PCI and SCI Transmit)
- Double Start Override
- EGR Solenoid
- Fuel Injectors
- Generator Field
- High Speed Fan Relay
- Idle Air Control Motor
- Ignition Coils
- Low Speed Fan Relay
- MTV Actuator
- Natural Vacuum Leak Detection
- Proportional Purge Solenoid
- SRV Valve

POWERTRAIN CONTROL MODULE (Continued)

- Speed Control Relay
- Speed Control Vent Relay
- Speed Control Vacuum Relay
- Transmission Autostick Display (To Cluster)
- Transmission Control Relay
- Transmission PRNDL Position (To Cluster)
- Transmission Solenoids (L/R, 2/4, OD and UD)
- Transmission Torque Reduction Request (Internal to PCM)
- Transmission Temperature (Internal to PCM)
- Vehicle Speed (Internal to PCM)
- 5 Volt Output

Based on inputs it receives, the powertrain control module (PCM) adjusts fuel injector pulse width, idle speed, ignition timing, and canister purge operation. The PCM also determines the appropriate transmission shift schedule and shift points, depending on the present operating conditions and driver demand. The PCM regulates the cooling fans, air conditioning and speed control systems. The PCM changes generator charge rate by adjusting the generator field.

The PCM adjusts injector pulse width (air-fuel ratio) based on the following inputs.

- Battery Voltage
- Intake Air Temperature Sensor
- EGR valve position (if equipped)
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- EVAP Purge Valve Position
- Exhaust Gas Oxygen Content (heated oxygen sensors)
- Manifold Absolute Pressure
- Throttle Position

The PCM adjusts engine idle speed through the idle air control motor based on the following inputs:

- Brake Switch
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Park/Neutral (transmission gear selection)
- Transaxle Gear Engagement
- Throttle Position
- Vehicle Speed (from Transmission)

The PCM adjusts ignition timing based on the following inputs.

- Intake Air Temperature
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Knock Sensor
- Manifold Absolute Pressure
- Park/Neutral (transmission gear selection)
- Transaxle Gear Engagement
- Throttle Position

In addition to monitoring inputs and controlling outputs, the PCM has other important transmission related responsibilities and functions:

- Storing and maintaining Clutch Volume Indices (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with DRB III scan tool)

The automatic shut down (ASD) and fuel pump relays are mounted externally, but turned on and off by the powertrain control module.

The camshaft and crankshaft signals are sent to the powertrain control module. If the PCM does not receive both signals within approximately two second of engine cranking, it deactivates the ASD and fuel pump relays. When these relays are deactivated, power is shut off to the fuel injectors, ignition coils, fuel pump and the heating element in each oxygen sensor.

The PCM contains a voltage converter that changes battery voltage to a regulated 5.0 volts. The 5.0 volts power the camshaft position sensor, crankshaft position sensor, vehicle speed sensor, engine coolant temperature sensor, intake air temperature sensor, manifold absolute pressure sensor, and throttle position sensor.

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage in new PCM. Use the DRB scan tool to change the mileage in the PCM. Refer to the appropriate Powertrain Diagnostic Manual and the DRB scan tool.

TRANSMISSION CONTROL

CLUTCH VOLUME INDEX (CVI)

An important function of the PCM is to monitor Clutch Volume Index (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The PCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the PCM that represents input shaft rpm. The Output Speed Sensor provides the PCM with output shaft speed information.

By comparing the two inputs, the PCM can determine transaxle gear position. This is important to the CVI calculation because the PCM determines CVIs by monitoring how long it takes for a gear change to occur (Fig. 6).

Gear ratios can be determined by using the DRB Scan Tool and reading the Input/Output Speed Sensor values in the "Monitors" display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

POWERTRAIN CONTROL MODULE (Continued)

**Fig. 6 Example of CVI Calculation**

- 1 - OUTPUT SPEED SENSOR
- 2 - OUTPUT SHAFT
- 3 - CLUTCH PACK
- 4 - SEPARATOR PLATE
- 5 - FRICTION DISCS
- 6 - INPUT SHAFT
- 7 - INPUT SPEED SENSOR
- 8 - PISTON AND SEAL

80fa8ea0

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the PCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the PCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly (broken return springs, out of position snap rings, excessive clutch pack clearance, improper assembly, etc.) can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

CLUTCH VOLUMES				
Clutch	When Updated			Proper Clutch Volume
	Shift Sequence	Oil Temperature	Throttle Angle	
L/R	2-1 or 3-1 coast downshift	> 70°	< 5°	35 to 83
2/4	1-2 shift	> 110°	5 - 54°	20 to 77
OD	2-3 shift			48 to 150
UD	4-3 or 4-2 shift		> 5°	24 to 70

TRANSMISSION CONTROL**SHIFT SCHEDULES**

The PCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position

- Engine load
- Fluid temperature
- Software level

As driving conditions change, the PCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

POWERTRAIN CONTROL MODULE (Continued)

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature at start-up below -16° F	Park, Reverse, Neutral and 2nd gear only (prevents shifting which may fail a clutch with frequent shifts)
Cold	Oil temperature at start-up above -12° F and below 36° F	<ul style="list-style-type: none"> – Delayed 2-3 upshift (approximately 22-31 mph) – Delayed 3-4 upshift (45-53 mph) – Early 4-3 coastdown shift (approximately 30 mph) – Early 3-2 coastdown shift (approximately 17 mph) – High speed 4-2, 3-2, 2-1 kickdown shifts are prevented – No EMCC
Warm	Oil temperature at start-up above 36° F and below 80 degree F	<ul style="list-style-type: none"> – Normal operation (upshift, kickdowns, and coastdowns) – No EMCC
Hot	Oil temperature at start-up above 80° F	<ul style="list-style-type: none"> – Normal operation (upshift, kickdowns, and coastdowns) – Full EMCC, no PEMCC except to engage FEMCC (except at closed throttle at speeds above 70-83 mph)
Overheat	Oil temperature above 240° F or engine coolant temperature above 244° F	<ul style="list-style-type: none"> – Delayed 2-3 upshift (25-32 mph) – Delayed 3-4 upshift (41-48 mph) – 3rd gear FEMCC from 30-48 mph – 3rd gear PEMCC from 27-31 mph
Super Overheat	Oil temperature above 260° F	<ul style="list-style-type: none"> – All "Overheat" shift schedule features apply – 2nd gear PEMCC above 22 mph – Above 22 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

OPERATION - SENSOR RETURN - PCM INPUT

The sensor return circuit provides a low electrical noise ground reference for all of the systems sensors. The sensor return circuit connects to internal ground circuits within the Powertrain Control Module (PCM).

**OPERATION - DATA BUS COMMUNICATION
RECEIVE - PCM INPUT**

The PCM uses the SCI communication bus to pre-form engine diagnostics and flash operations. The transmission side of the PCM uses the SCI communication bus to flash new software. However, diagnostics is performed via the vehicles J1850 bus for the transmission side of the PCM.

OPERATION - IGNITION SENSE - PCM INPUT

The ignition sense input informs the Powertrain Control Module (PCM) that the ignition switch is in the crank or run position.

POWERTRAIN CONTROL MODULE (Continued)

OPERATION - PCM GROUND

Ground is provided through multiple pins of the PCM connector. There five different ground pins. There are engine power grounds and trans power grounds.

The power grounds are used to control the ground side of any relay, solenoid, ignition coil or injector.

The NGC case is shielded to prevent RFI and EMI. The PCM case is grounded and must be firmly attached to a good, clean body ground.

Internally all grounds are connected together. For EMI and RFI protection the case is also grounded separately from the ground pins.

OPERATION - 5 VOLT SUPPLY - PCM OUTPUT

The PCM supplies 5 volts to the following sensors:

- A/C pressure transducer
- Engine coolant temperature sensor
- Manifold absolute pressure sensor
- Throttle position sensor
- Linear EGR solenoid
- Battery temperature
- Knock sensor
- Crankshaft position sensor
- Camshaft position sensor

STANDARD PROCEDURE

STANDARD PROCEDURE - OBTAINING DIAGNOSTIC TROUBLE CODES

BULB CHECK

Key on: Bulb illuminated until vehicle starts, as long as all once per trip (readiness) monitors completed. If monitors have **not** been completed, then: Key on: bulb check for about 5 to 8 seconds, lamp then flashes if once per trip (readiness) monitors have **not** been completed until vehicle is started, then MIL is extinguished.

OBTAINING DTC'S USING DRB SCAN TOOL

(1) Connect the DRB scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

(2) Turn the ignition switch on and access the "Read Fault" screen.

(3) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

(4) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

STANDARD PROCEDURE - PINION FACTOR PROCEDURE

The vehicle speed readings for the speedometer are taken from the output speed sensor. The PCM must be calibrated to the different combinations of equipment available. Pinion Factor allows the technician to set the Powertrain Control Module initial setting so that the speedometer readings will be correct.

This procedure must be performed if the Powertrain Control Module has been replaced. Failure to perform this procedure will result in an inoperative speedometer.

To properly read or reset the Pinion Factor, it is necessary to use a DRB scan tool. Perform the following steps with the DRB scan tool to read or reset the Pinion Factor:

- (1) Plug the DRB scan tool into the data link connector located under the instrument panel.
- (2) Select the Transmission menu.
- (3) Select the Miscellaneous menu.
- (4) Select Pinion Factor. Then follow the instructions on the DRB scan tool screen.

STANDARD PROCEDURE - TRANSAXLE QUICK LEARN PROCEDURE

The quick learn procedure requires the use of the DRB scan tool. This program allows the electronic transaxle system to recalibrate itself. This will provide the best possible transaxle operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transaxle Assembly Replacement
- Powertrain Control Module Replacement
- Solenoid/Pressure Switch Assembly Replacement
- Clutch and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay in neutral until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the DRB indicates the procedure is complete
- The calculated oil temperature must be above 60° and below 200°

(1) Plug the DRB scan tool into the data link connector. The connector is located under the instrument panel.

- (2) Go to the Transmission screen.
- (3) Go to the Miscellaneous screen.

POWERTRAIN CONTROL MODULE (Continued)

(4) Select Quick Learn Procedure. Follow the instructions of the DRB to perform the Quick Learn Procedure.

REMOVAL

USE THE DRBIII® SCAN TOOL TO REPROGRAM THE NEW PCM WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage and vehicle identification number (VIN) in the new PCM. Use the DRBIII® scan tool to change the mileage and VIN in the PCM. If this step is not done a diagnostic trouble code (DTC) may be set and SKIM must be done or car will not start if it is a SKIM equipped car. If a SKIM car you must do a secret key transfer also. Refer to the appropriate Powertrain Diagnostic Manual and the DRBIII® scan tool.

To avoid possible voltage spike damage to PCM, ignition key must be off, and the negative battery cable must be disconnected before unplugging the PCM connectors. Note radio programs.

- (1) Unbolt the washer bottle filler neck and reposition.
- (2) Disconnect the 4 PCM electrical connector.
- (3) Reposition wiring harness out of the way (Fig. 7).

**Fig. 7 NGC CONNECTORS**

- (4) Remove the 3 fasteners from PCM mounting (Fig. 8).

**NGC CONTROLLER LOCATION****Fig. 8 NGC MOUNTING**

POWERTRAIN CONTROL MODULE (Continued)

- (5) Remove PCM (Fig. 9).

Fig. 9 NGC CONTROLLER

INSTALLATION

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage and vehicle identification number (VIN) in the new PCM. Use the DRBIII® scan tool to change the millage and VIN in the PCM. If this step is not done a diagnostic trouble code (DTC) may be set and SKIM must be done or car will not start if it is a SKIM equipped car. If a SKIM car you must do a secret key transfer also. Refer to the appropriate Powertrain Diagnostic Manual and the DRBIII® scan tool.

- (1) Install PCM. Tighten bolt to 4 N·m (35 in. lbs.) torque (Fig. 8).
- (2) Reposition wiring harness.
- (3) Connect the 4 PCM electrical connector (Fig. 7).
- (4) Reposition the washer bottle filler neck and install the bolt.
- (5) Connect negative battery cable and reprogram radio and clock.
- (6) Using DRBIII® scan tool, program mileage and vehicle identification number (VIN) into PCM. Refer to the DRBIII® scan tool and the appropriate Powertrain Diagnostic Manual.

SENTRY KEY IMMOBILIZER MODULE

DESCRIPTION

80b5cb78

Fig. 10 SENTRY KEY IMMOBILIZER MODULE

The Sentry Key Immobilizer Module (SKIM) (Fig. 10) contains a Radio Frequency (RF) transceiver and a central processing unit, which includes the Sentry Key Immobilizer System (SKIS) program logic. The SKIS programming enables the SKIM to program and retain in memory the codes of at least two, but no more than eight electronically coded Sentry Key transponders. The SKIS programming also enables the SKIM to communicate over the Programmable Communication Interface (PCI) bus network with the Powertrain Control Module (PCM), and/or the DRB III® scan tool.

OPERATION

The SKIM transmits and receives RF signals through a tuned antenna enclosed within a molded plastic ring formation that is integral to the SKIM housing. When the SKIM is properly installed on the steering column, the antenna ring is oriented around the circumference of the ignition lock cylinder housing (Fig. 11). This antenna ring must be located within eight millimeters (0.31 inches) of the Sentry Key in order to ensure proper RF communication between the SKIM and the Sentry Key transponder.

For added system security, each SKIM is programmed with a unique "Secret Key" code and a security code. The SKIM keeps the "Secret Key" code in memory and sends the code over the PCI bus to the PCM, which also keeps this code in its memory. The SKIM also sends the "Secret Key" code to each of the programmed Sentry Key transponders. The security code is used by the assembly plant to access the SKIS for initialization, or by the dealer technician to access the system for service. The SKIM also stores in its memory the Vehicle Identification Number (VIN), which it learns through a PCI bus message from the PCM during initialization.

SENTRY KEY IMMOBILIZER MODULE (Continued)

Fig. 11 SENTRY KEY IMMOBILIZER MODULE LOCATION

- 1 - STEERING WHEEL
- 2 - IGNITION KEY CYLINDER
- 3 - STEERING COLUMN
- 4 - SENTRY KEY IMMOBILIZER MODULE

The SKIM and the PCM both use software that includes a rolling code algorithm strategy, which helps to reduce the possibility of unauthorized SKIS disarming. The rolling code algorithm ensures security by preventing an override of the SKIS through the unauthorized substitution of the SKIM or the PCM. However, the use of this strategy also means that replacement of either the SKIM or the PCM units will require a system initialization procedure to restore system operation.

When the ignition switch is turned to the ON or START positions, the SKIM transmits an RF signal to excite the Sentry Key transponder. The SKIM then listens for a return RF signal from the transponder of the Sentry Key that is inserted in the ignition lock cylinder. If the SKIM receives an RF signal with valid "Secret Key" and transponder identification codes, the SKIM sends a "valid key" message to the PCM over the PCI bus. If the SKIM receives an invalid RF signal or no response, it sends "invalid key" messages to the PCM. The PCM will enable or disable engine operation based upon the status of the SKIM messages.

The SKIM also sends messages to the BCM which controls the VTSS indicator LED. The SKIM sends messages to the BCM to turn the LED on for about three seconds when the ignition switch is turned to the ON position as a bulb test. After completion of the bulb test, the SKIM sends bus messages to keep the LED off for a duration of about one second. Then the SKIM sends messages to turn the LED on or off based upon the results of the SKIS self-tests. If the VTSS indicator LED comes on and stays on after the bulb test, it indicates that the SKIM has detected a

system malfunction and/or that the SKIS has become inoperative.

If the SKIM detects an invalid key when the ignition switch is turned to the ON position, it sends messages to flash the VTSS indicator LED. The SKIM can also send messages to flash the LED and to generate a single audible chime tone. These functions serve as an indication to the customer that the SKIS has been placed in its "Customer Learn" programming mode. See Sentry Key Immobilizer System Transponder Programming in this section for more information on the "Customer Learn" programming mode.

For diagnosis or initialization of the SKIM and the PCM, a DRB III® scan tool and the proper Body Diagnostic Procedures Manual are required. The SKIM cannot be repaired and, if faulty or damaged, the unit must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO ELECTRICAL, RESTRAINTS, WARNINGS, BEFORE ATTEMPTING COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 12).

80b1b422

Fig. 12 NEGATIVE BATTERY CABLE REMOTE TERMINAL

- 1 - RIGHT STRUT TOWER
- 2 - AIR CLEANER INLET TUBE
- 3 - REMOTE TERMINAL

- (2) Remove knee blocker.

SENTRY KEY IMMOBILIZER MODULE (Continued)

(3) Remove the steering column upper and lower shrouds.

(4) Disengage the steering column wire harness from the Sentry Key Immobilizer Module (SKIM).

(5) Remove the one screw securing the SKIM to the bottom of the steering column.

(6) Slide the SKIM away from the steering column to clear the SKIM antenna ring from around the ignition switch lock cylinder housing (Fig. 11).

(7) Remove the SKIM from the vehicle.

INSTALLATION

NOTE: If the SKIM is replaced with a new unit, a DRB III® scan tool and the proper Body Diagnostic Procedures Manual **MUST** be used to initialize the

new SKIM and to program at least two Sentry Key transponders.

(1) Slide the SKIM toward the steering column making sure the SKIM antenna ring is around the ignition cylinder housing (Fig. 11).

(2) Install the one screw securing the SKIM to the bottom of the steering column.

(3) Engage the steering column wire harness to the Sentry Key Immobilizer Module (SKIM).

(4) Install the steering column upper and lower shrouds.

(5) Install knee blocker.

(6) Connect the negative battery cable remote terminal onto the remote battery post (Fig. 12).

BATTERY SYSTEM

DESCRIPTION

A single 12-volt battery is standard factory-installed equipment on this model. All of the components of the battery system are located in the front of the vehicle, just in front of the right front wheel and tire assembly. The battery system for this vehicle covers the following related components, which are

covered in further detail later in this section of the service manual:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negatively charged battery terminal posts to the vehicle electrical system.
- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray in the engine compartment.

BATTERY SYSTEM (Continued)

- **Battery Heater Blanket** - The battery heater blanket is used to improve battery cold start ability.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules and/or jump starting procedure, refer to the Lubrication and Maintenance section of this manual or the owners manual. The battery must be fully-charged before any battery system diagnosis or testing procedures can be performed.

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of

the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliamperage ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to Charging System for the proper charging system on-board diagnostic test procedures.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery system tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro 420 battery tester.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is faulty.	2. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Charge the faulty battery, as required.
	4. The battery terminal connections are loose or corroded.	4. Refer to Battery Cables for the proper battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. Refer to Battery System Specifications for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is faulty.	6. Determine the battery cranking capacity using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Replace the faulty battery, as required.
	7. The starting system is faulty.	7. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. Refer to Battery System Specifications for the proper specifications. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. Refer to Battery Cable for the proper cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is excessive.	3. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the faulty electrical system, as required.
	4. The battery is faulty.	4. Test the battery using the Micro 420 battery tester. Refer to Standard Procedures for additional test procedures. Replace the faulty battery, as required.
	5. The starting system is faulty.	5. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	6. The charging system is faulty.	6. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw systems in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is faulty.	1. Test the battery using the Micro 420 battery tester.. Charge or replace the faulty battery, as required.

ABNORMAL BATTERY DISCHARGING

Any of the following conditions can result in abnormal battery discharging:

1. A faulty or incorrect charging system component. Refer to Charging System for charging system diagnosis and testing procedures.

2. A faulty or incorrect battery. Use Micro 420 tester and refer to Battery System for additional battery diagnosis and testing procedures.

3. A faulty circuit or component causing excessive ignition-off draw.

4. Electrical loads that exceed the output of the charging system. This can be due to equipment

installed after manufacture, or repeated short trip use.

5. A faulty or incorrect starting system component. Refer to Starting System for the proper starting system diagnosis and testing procedures.

6. Corroded or loose battery posts and/or terminal clamps.

7. Slow driving speeds (heavy traffic conditions) or prolonged idling, with high-amperage draw systems in use.

CLEANING

The following information details the recommended cleaning procedures for the battery and related com-

BATTERY SYSTEM (Continued)

ponents. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Clean the battery cable terminals of all corrosion. Remove any corrosion using a wire brush or cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

(2) Clean the battery tray and battery holddown hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

(3) If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film (Fig. 1). Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to Battery System Specifications for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

Fig. 1 Battery Cleaning - Typical

- 1 - CLEANING BRUSH
- 2 - WARM WATER AND BAKING SODA SOLUTION
- 3 - BATTERY

(4) If equipped, clean the battery heater blanket with a sodium bicarbonate (baking soda) and warm

water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.

(5) Clean any corrosion from the battery terminals with a wire brush or terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Inspect the battery cable terminals for damage. Replace any battery cable that has a damaged or deformed terminal.

(2) Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.

(3) If equipped, slide the heater blanket off of the battery case. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminals for looseness. Batteries with damaged cases or loose terminals must be replaced.

(4) If equipped, inspect the battery heater blanket for tears, cracks, deformation or other damage. Replace any battery heater blanket that has been damaged.

(5) Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to Standard Procedures for the proper battery built-in indicator test procedures. Also refer to Standard Procedures for the proper battery charging procedures.

SPECIFICATIONS

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.

- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much cur-

BATTERY SYSTEM (Continued)

rent (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.

• **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with

the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.

• **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.

BATTERY CLASSIFICATIONS & RATINGS					
Part Number	BCI Group Size Classification	Cold Cranking Amperage	Reserve Capacity	Ampere - Hours	Load Test Amperage
N/A	N/A	500	110 Minutes	60	250
N/A	N/A	600	120 Minutes	60	300

Micro 420 Battery Tester

BATTERY

DESCRIPTION

Maintenance-free batteries have non-removable battery vent caps (Fig. 2). Water cannot be added to this battery. Under normal service the composition of this battery reduces gassing and water loss at normal charge rates. If the battery electrolyte level becomes low, this battery must be replaced.

BATTERY (Continued)

The battery is a device used to store electrical energy potential in a chemical form. When an electrical load is applied to the battery terminals, an electrochemical reaction occurs within the battery. This reaction causes the battery to discharge electrical current.

The battery is made up of six individual cells that are connected in series. Each cell contains positive charged plate groups made of lead oxide, and negatively charged plate groups made of sponge lead. The dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the

plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING - BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. Refer to Battery System Cleaning for the proper cleaning procedures, and Battery System Inspection for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro 420 battery tester.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the Micro 420 or load test, is faulty and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

BATTERY (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - USING MICRO 420
BATTERY TESTER

Fig. 3 Micro 420 Battery Tester

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: ALWAYS WEAR APPROPRIATE EYE PROTECTION AND USE EXTREME CAUTION WHEN WORKING WITH BATTERIES.

BATTERY TESTING

(1) If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.

(2) If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position is at the battery terminal.** If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.

(3) Connect the tester (Fig. 3) to the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (-).

(4) Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.

(5) If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

(6) While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

STANDARD PROCEDURE - BATTERY
CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.4 volts or above.
- Battery passes Load Test multiple times.

BATTERY (Continued)

WARNING: NEVER EXCEED TWENTY AMPERES WHEN CHARGING A COLD (-1° C [30° F] OR LOWER) BATTERY. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.4 volts or greater, perform a load test to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

(1) Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt (Fig. 4). If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.

898A-12

Fig. 4 Voltmeter - Typical

(2) Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

(3) Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the bat-

BATTERY (Continued)

tery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.

- **Temperature** - A longer time will be needed to charge a battery at -18°C (0°F) than at 27°C (80°F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).

- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.

- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21°C (70°F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

STANDARD PROCEDURE - OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

(1) Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.

(2) Disconnect and isolate both battery cables, negative cable first.

(3) Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage (Fig. 5).

898A-7

Fig. 5 Testing Open-Circuit Voltage - Typical

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

BATTERY (Continued)

STANDARD PROCEDURE - IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Junction Block (JB). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

(1) Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliamperes	N/A
Central Timer Module (CTM)	No	4.75 milliamperes (max.)	N/A
Powertrain Control Module (PCM)	No	0.95 milliamperes	N/A
ElectroMechanical Instrument Cluster (EMIC)	No	0.44 milliamperes	N/A
Combination Flasher	No	0.08 milliamperes	N/A

(2) Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.

(3) Disconnect the battery negative cable.

(4) Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the

battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

(5) After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information in

BATTERY (Continued)

this service manual for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to Charging System for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliamperage scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliamperage scale selected, or the multi-meter may be damaged.

(6) Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

REMOVAL

The battery is accessible without removing the right front wheel and tire assembly..

(1) Verify that the ignition switch and all accessories are OFF.

(2) Turn the steering wheel to the full right position.

(3) Disconnect and isolate the negative battery cable remote terminal from the remote battery post.

WARNING: NEVER GET UNDER A LIFTED VEHICLE IF NOT SUPPORTED PROPERLY ON SAFETY STANDS.

(4) Remove the air cleaner housing. Refer to the index for the location of the procedure.

(5) Remove battery splash shield. Refer to the Body section of the service manual for the procedure.

(6) Disconnect the heater blanket cord, if equipped.

(7) Remove the two short bolts from the battery hold down and remove the hold down.

(8) Disconnect the positive battery cable from the battery.

(9) Slide the battery toward rear of vehicle.

(10) Disconnect the negative battery cable from the battery.

(11) Remove battery from vehicle.

INSTALLATION

(1) Position the battery in the battery tray.

(2) Connect the positive and negative battery cables. Torque to 16 N·m (150 in. lbs.).

(3) Connect the heater blanket cord, if equipped.

(4) Install the battery hold down and install the hold down bolt. Torque to 16 N·m (150 in. lbs.).

(5) Install battery splash shield. Refer to the Body section for the procedure.

(6) Install the air cleaner housing.

(7) Connect the negative battery cable.

BATTERY HOLDDOWN**DESCRIPTION**

The battery holddown includes two bolts and a holddown bracket. The battery holddown bracket consists of a formed steel bracket with holes on each end.

When installing a battery into the battery tray, it is important that the holddown hardware is properly installed and that the fasteners are tightened to the proper specifications. Improper holddown fastener tightness, whether too loose or too tight, can result in damage to the battery, the vehicle, or both. Refer to Battery Holddown for the proper installation procedure, including the proper holddown fastener torque specifications.

OPERATION

The battery holddown secures the battery in the battery tray. This holddown is designed to prevent battery movement during the most extreme vehicle operation conditions. Periodic removal and lubrication of the battery holddown hardware is recommended to prevent hardware seizure at a later date.

CAUTION: Never operate a vehicle without a battery holddown device properly installed. Damage to the vehicle, components and battery could result.

REMOVAL

(1) Verify that the ignition switch and all accessories are OFF.

(2) Turn the steering wheel to the full right position.

(3) Disconnect and isolate the negative battery cable remote terminal from the remote battery post.

BATTERY HOLDDOWN (Continued)

(4) Remove the air cleaner housing. Refer to the index for the location of the procedure.

(5) Remove battery splash shield. Refer to the Body section of the service manual for the procedure.

(6) Remove the two short bolts from the battery hold down and remove the hold down.

INSTALLATION

(1) Install the battery hold down and install the hold down bolt. Torque to 16 N·m (150 in. lbs.).

(2) Install battery splash shield. Refer to the Body section for the procedure.

(3) Install the air cleaner housing.

BATTERY CABLES

DESCRIPTION

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a side post battery terminal made of soft lead that is die cast onto one end of the battery cable wire. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification of the battery positive terminal. The battery negative cable wires have a black insulating jacket to provide visual identification of the battery negative terminal.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to the appropriate wiring information in this service manual for the location of the proper battery cable wire harness diagrams. The wiring information also includes proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection

of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

The battery positive cable terminal clamp is die cast onto the ends of two wires. One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Power Distribution Center (PDC), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp is also die cast onto the ends of two wires. One wire has an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a stud on the right side of the engine cylinder block. The other wire has an eyelet terminal that connects the battery negative cable to the vehicle body through a ground screw on the right front fender inner shield, near the battery.

DIAGNOSIS AND TESTING - BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

BATTERY CABLES (Continued)

• The battery is fully-charged and load tested. Refer to Standard Procedures for the proper battery charging and load test procedures.

• Fully engage the parking brake.
• If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.

• Verify that all lamps and accessories are turned off.

• To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Power Distribution Center (PDC), in the engine compartment. See the fuse and relay layout label affixed to the underside of the PDC cover for ASD relay identification and location.

(1) Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp (Fig. 6). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

80660062

Fig. 6 Test Battery Negative Connection Resistance - Typical

1 - VOLTMETER
2 - BATTERY

(2) Connect the positive lead of the voltmeter to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp (Fig. 7). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection

between the battery positive cable terminal clamp and the battery positive terminal post.

80660061

Fig. 7 Test Battery Positive Connection Resistance - Typical

1 - VOLTMETER
2 - BATTERY

(3) Connect the voltmeter to measure between the battery positive cable terminal clamp and the starter solenoid B(+) terminal stud (Fig. 8). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

898A-20

Fig. 8 Test Battery Positive Cable Resistance - Typical

BATTERY CABLES (Continued)

(4) Connect the voltmeter to measure between the battery negative cable terminal clamp and a good clean ground on the engine block (Fig. 9). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

Fig. 9 Test Ground Circuit Resistance - Typical

- 1 - VOLTMETER
- 2 - BATTERY
- 3 - ENGINE GROUND

REMOVAL

- (1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
- (2) Disconnect and isolate the remote battery negative cable terminal.
- (3) Remove the battery from the vehicle. Refer to the procedure in this group.
- (4) One at a time, trace the battery cable retaining pushpins, fasteners and routing clips until the cables are free from the vehicle.
- (5) Remove the battery cables from the engine compartment.

INSTALLATION

- (1) Position the battery cables in the engine compartment.
- (2) One at a time, install the battery cable retaining pushpins, fasteners and routing clips until the cables are installed exactly where they were in the vehicle.
- (3) Install the battery in the vehicle. Refer to the procedure in this group.
- (4) Connect the remote battery negative cable terminal.

BATTERY TRAY

DESCRIPTION

The battery is placed in a steel tray located in the right front corner of the vehicle. The battery tray is permanently attached to the front end sheet metal and cannot be removed from the vehicle. Refer to Charging System for information on the battery temperature sensor. Refer to Battery Hold down for more information on hold down hardware.

OPERATION

The battery tray provides a secure mounting location and supports the battery. On some vehicles, the battery tray also provides the anchor point/s for the battery holddown hardware. The battery tray and the battery holddown hardware combine to secure and stabilize the battery in the engine compartment, which prevents battery movement during vehicle operation. Unrestrained battery movement during vehicle operation could result in damage to the vehicle, the battery, or both.

BATTERY HEATER BLANKET

DESCRIPTION

Fig. 10 LH Heater Blanket

A heater blanket (Fig. 10) is used to improve the battery cold-start ability. This blanket operates on 110 volt AC current and is used with Alaska and Canada cold weather packages.

BATTERY HEATER BLANKET (Continued)

The heater blanket cannot be adjusted or repaired. If the blanket is faulty or damaged it must be replaced.

OPERATION

The temperature of the battery can affect battery performance. Only DAIMLERCHRYSLER approved battery blanket/block heater combination should be used. The battery blanket heater is designed to provide optimum charging system performance in very cold ambient temperatures below -17.8°C (0°F).

DIAGNOSIS AND TESTING - BATTERY HEATER BLANKET

(1) Remove the battery heater blanket from the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/THERMAL GUARD - REMOVAL).

(2) Clean the battery heater blanket with baking soda solution and wipe dry.

(3) Inspect blanket for cuts, abrasion or other damage. If heater is damaged replace.

(4) Position the heater flat and re-connect the blanket heater to the vehicles electrical system.

(5) Connect the 110 volt AC power cord to 110 volt source for a maximum of 3 minutes.

(6) Disconnect the 110 volt power cord.

(7) Immediately feel the heater blanket on the inside, it should be warm to the touch. If warm the heater is OK, if not OK proceed.

(8) Disconnect the heater blanket from the vehicles electrical system. Using an Ohmmeter, connect the leads across the two wire terminals coming from the heater blanket. A resistance value of 220 to 280 ohms should be present. If not replace the blanket. If OK proceed.

(9) Ensure that the 110 volt AC power cord is supplying voltage to the heater blanket. If OK replace the heater blanket. If not verify the 110 volt AC power from another source. Inspect the power cord for damage and replace if necessary.

REMOVAL

(1) Remove the battery and the battery heater blanket from the battery tray as a unit (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(2) Carefully slide the heater blanket straight off the battery case (Fig. 10).

INSTALLATION

(1) Clean and inspect the battery heater blanket.

(2) Install the battery heater blanket on the battery case.

(3) Install the battery and the battery heater blanket into the battery tray as a unit (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

CHARGING

DESCRIPTION - CHARGING SYSTEM

- The charging system consists of:
- Generator
 - Decoupler Pulley (If equipped)
 - Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
 - Ignition switch (refer to the Ignition System section for information)
 - Battery (refer to the Battery section for information)
 - Ambient Air Temperature (If equipped)
 - Inlet Air Temperature (calculated battery temperature)(If equipped)
 - Voltmeter (refer to the Instrument Cluster section for information if equipped)
 - Wiring harness and connections (refer to the Wiring section for information)
 - Accessory drive belt (refer to the Cooling section for more information)
 - Battery Temperature sensor (if equipped)

OPERATION - CHARGING SYSTEM

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. The ASD relay is energized when the PCM grounds the ASD control circuit. This voltage is connected through the PCM or IPM (intelligent power module) (if equipped) and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The generator is driven by the engine through a serpentine belt and pulley or decoupler pulley arrangement.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

An Ambient air temperature sensor is mounted on the bumper used to calculate the temperature near the battery. This temperature data, along with data from monitored line voltage (battery voltage sense circuit), is used by the PCM to vary the battery charging rate. This is done by cycling the feed path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly to maintain system voltage at the targeted system voltage based on battery temperature.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects and illuminate the (MIL) lamp. Refer to On-Board Diagnostics in the Electronic Control Modules(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) section for more DTC information.

The Charging system “Battery” light indicates problems with the charging system (voltage too high/low, generator failure, etc.). If an extreme condition is indicated, the lamp will be illuminated. The signal to activate the lamp is sent via the PCI bus circuits. The lamp is located on the instrument panel. Refer to the Instrument Cluster section for additional information.

CHARGING (Continued)

The PCM uses the inlet air temperature sensor or ambient temperature sensor to control the charge system voltage. This temperature, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. The system voltage is higher at cold temperatures and is gradually reduced as the calculated battery temperature increases.

The ambient temperature sensor is used to control the battery voltage based upon ambient temperature (approximation of battery temperature). The PCM maintains the optimal output of the generator by monitoring battery voltage and controlling it to a range of 13.5 - 14.7 volts based on battery temperature.

DIAGNOSIS AND TESTING - ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 40 good trip if the problem does not occur again.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the DRBIII® scan tool. Refer to the appropriate Powertrain Diagnostic Procedures manual for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The DRBIII® Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE)
- loose generator belt.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the DRBIII® scan tool. Perform the following inspections before attaching the scan tool.

(1) Inspect the battery condition. Refer to the Battery section (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING) for procedures.

(2) Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.

(3) Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) or IPM (if equipped) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.

(4) Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications (Refer to 8 - ELECTRICAL/CHARGING - SPECIFICATIONS).

(5) Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications (Refer to 7 - COOLING/ACCESSORY DRIVE - SPECIFICATIONS).

(6) Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.

(7) Inspect automatic belt tensioner (if equipped). Refer to the Cooling System for more information.

(8) Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

Generator Pivot bolt Bolt 8 mm	54	40	-

GENERATOR

DESCRIPTION

The generator is belt-driven by the engine. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced. The generator produces DC voltage.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil.

The Y type stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicles electrical system through the generator, battery, and ground terminals.

Noise emitting from the generator may be caused by:

- Worn, loose or defective bearings
- Loose or defective drive pulley
- Incorrect, worn, damaged or misadjusted drive belt
- Loose mounting bolts
- Misaligned drive pulley
- Defective stator or diode
- Damaged internal fins

GENERATOR (Continued)

REMOVAL

REMOVAL - 2.7L

- (1) Disconnect negative battery cable.
- (2) Raise and support vehicle.
- (3) Remove lower plastic splash shield (Fig. 1).

**Fig. 1 GENERATOR 2.7L**

- (4) Remove transmission cooler and reposition cooler out of the way.
- (5) Remove lower radiator crossmember support and position a jackstand under radiator for support.
- (6) Loosen adjusting T-bolt, but do not remove.
- (7) Loosen pivot bolt, but do not remove.
- (8) Remove the generator drive belt. Refer to the Cooling System section.
- (9) Disconnect the generator field circuit plug.
- (10) Remove the B+ terminal nut and wire.
- (11) Remove pivot bolt, being careful not to lose spacer.
- (12) Remove generator.

REMOVAL - 3.5L

- (1) Disconnect negative battery cable (Fig. 2).

**Fig. 2 GENERATOR 3.2L/3.5L**

- (2) Loosen lower mounting bolt do not remove.
- (3) Remove the upper radiator support and relocate.
- (4) Loosen the lower mounting bolt, but do not remove
- (5) Loosen pivot bolt, but do not remove.
- (6) Loosen belt adjustment bolt.
- (7) Remove the generator drive belt. Refer to the Cooling System section.
- (8) Remove lower mounting bolt.
- (9) Disconnect the generator field circuit plug.
- (10) Remove the B+ terminal nut and wire.
- (11) Remove pivot bolt.
- (12) Remove generator.

GENERATOR (Continued)

INSTALLATION

INSTALLATION - 2.7L

- (1) Install generator.
- (2) Install pivot bolt, leave loose.
- (3) Connect the generator field circuit plug.
- (4) Install the B+ terminal nut and wire and tighten to 9.8 N·m (85 ±15 in. lbs.).
- (5) Install the generator drive belt. Refer to the Cooling System section.
- (6) Adjusting T-bolt and tighten belt.
- (7) Remove jackstand from under radiator and install lower radiator crossmember support.
- (8) Reposition transmission cooler and tighten fasteners.
- (9) Install lower plastic splash shield.
- (10) Lower vehicle.
- (11) Connect negative battery cable.

Tighten all fasteners to the proper torque. Refer to the Torque Specifications chart in this section.

INSTALLATION - 3.5L

- (1) Install generator.
- (2) Install the pivot bolt.
- (3) Install the lower mounting bolt.
- (4) Connect the B+ wire and tighten nut and tighten to 9.8 N·m (85 ±15 in. lbs.).
- (5) Connect the generator field circuit connector.
- (6) Install generator drive belt. Refer to the Cooling System section.
- (7) Tighten the pivot bolt.
- (8) Tighten the lower mounting bolt.
- (9) Install the upper radiator support and tighten bolts.
- (10) Connect the negative battery cable. Tighten all fasteners to the proper torque. Refer to the Torque Specifications chart in this section.

VOLTAGE REGULATOR

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated within the PCM on the NGC vehicles, to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage at the PDC and calculated battery temperature or inlet air temperature sensor (refer to Inlet Air Temperature Sensor, if equipped, for more information). It then determines a target charging voltage. If sensed battery voltage is lower than the target voltage, the PCM feeds the field winding until sensed battery voltage is at the target voltage. A circuit in the PCM cycles the feed side of the generator field at 250 times per second (250Hz), but has the capability to feed the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 20% is used by the PCM in order to have some generator output. Also refer to Charging System Operation for additional information.

STARTING

DESCRIPTION

- The starting system consists of:
- Starter relay
 - Starter motor (including an integral starter solenoid)
- Other components to be considered as part of starting system are:
- Battery
 - Battery cables
 - Ignition switch and key lock cylinder
 - Clutch pedal position switch (manual transmission)
 - Park/neutral position switch (automatic transmission)
 - Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere

ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

OPERATION

These components form two separate circuits. A high amperage circuit that feeds the starter motor up to 300+ amps, and a control circuit that operates on less than 20 amps.

The PCM controls a double start over-ride safety that does not allow the starter to be engaged if the engine is already running.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

STARTING (Continued)

INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the Battery section for more information.

- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.

- **Transmission Range Sensor or Park/Neutral Switch** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.

- **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.

- **Starter Motor** - Visually inspect the starter motor for indications of physical damage and loose or corroded wire harness connections.

- **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.

- **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.

- **Power Distribution Center (PDC)** - Visually inspect the B+ connections at the PDC for physical damage and loose or corroded harness connections.

STARTING (Continued)

DIAGNOSIS AND TESTING - CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral

Position switch with automatic transmissions

- Ignition switch
- Battery
- All related wiring and connections
- Powertrain Control Module (PCM)

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

• To disable ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for the proper relay location.

STARTER SOLENOID

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK POSITION WITH THE PARKING BRAKE APPLIED.

(1) Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests.

(2) Perform Starter Solenoid test BEFORE performing the starter relay test.

(3) Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.

(4) Locate and remove the starter relay from the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location.

(5) Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.

(a) If engine cranks, starter/starter solenoid is good. Go to the Starter Relay Test.

(b) If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to starter solenoid and from the battery positive terminal to starter post for loose or corroded connections. Particularly at starter terminals.

(c) Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter. Inspect the ring gear teeth.

STARTER RELAY

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK/NEUTRAL POSITION WITH THE PARKING BRAKE APPLIED.

RELAY TEST

The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

Remove the starter relay from the PDC as described in this group to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery B+ lead to terminals 85 and a ground lead to terminal 86 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.

Starter Relay Pinout

STARTING (Continued)

**Starter Relay Pinout**

CAV	FUNCTION
30	B (+)
85	IGNITION SWITCH OUTPUT
86	PCM-CONTROLLED GROUND
87	STARTER RELAY OUTPUT
87A	NO CONNECT

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to Step 4. If not OK, repair the open circuit to the starter solenoid as required.

(4) The coil battery terminal (85) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to Step 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the Ignition Switch Test procedure in this group.

(5) The coil ground terminal (86) is connected to the electromagnet in the relay. It is grounded by the PCM if the conditions are right to start the car. For automatic trans. cars the PCM must see Park Neutral switch low and near zero engine speed (rpm). For manual trans. cars the PCM only needs to see

near zero engine speed (rpm) and low clutch interlock input and see near zero engine speed (rpm). To diagnose the Park Neutral switch of the trans range sensor refer to the transaxle section. Check for continuity to ground while the ignition switch is in the start position and if equipped the clutch pedal depressed. If not OK and the vehicle has an automatic trans. verify Park Neutral switch operation. If that checks OK check for continuity between PCM and the terminal 86. Repair open circuit as required. Also check the clutch interlock switch operation if equipped with a manual transmission. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the Transaxle section for more information.

If equipped with Clutch Interlock/Upstop Switch, refer to Diagnosis and Testing in the Clutch section.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the Ignition Section or Wiring Diagrams for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to the Battery section for procedures.

ALL RELATED WIRING AND CONNECTORS

Refer to Wiring Diagrams for more information.

DIAGNOSIS AND TESTING - FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

CAUTION: Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

(1) To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.

(2) Gain access to battery terminals.

(3) With all wiring harnesses and components properly connected, perform the following:

(a) Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the

STARTING (Continued)

ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.

(b) Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.

(c) Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading is still above 0.2 volt after correcting poor contacts, replace ground cable.

(4) Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.

(a) Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is

still above 0.2 volt after correcting poor contacts, replace battery positive cable.

(b) If resistance tests do not detect feed circuit failures, replace the starter motor.

STARTER MOTOR

DESCRIPTION

DESCRIPTION - 2.7L

The Melco is a permanent magnet starter motor.

DESCRIPTION - 3.5L

The Nippondenso is a reduction gear-field coil starter motor.

OPERATION

OPERATION - 2.7L

A planetary gear train transmits power between starter motor and pinion shaft. The fields have permanent magnets.

OPERATION - 3.5L

Power is applied to the coil windings which causes the pinion to rotate the ring gear mounted on the drive plate.

REMOVAL

(1) Disconnect and isolate the battery negative remote cable from remote ground post (Fig. 1).

to the Connector Positive Assurance (CPA) wiring connector.

(6) Position jack stand beneath engine and slightly lift to relieve pressure from left engine mount.

(7) Remove three left engine mount mounting bolts from engine block.

(8) Jack engine up slightly to give more room to maneuver starter assembly.

(9) Slide rear of starter motor out between catalyst and engine mount.

(10) Disconnect posi-lock starter solenoid connector.

(11) Remove the starter from vehicle.

INSTALLATION

- (1) Connect battery positive feed wire to starter.
- (2) Connect posi-lock starter solenoid connector.
- (3) Jack engine up slightly to give more room to maneuver starter assembly.
- (4) Install the starter.
- (5) Install three bolts attaching starter to engine (Fig. 2). Tighten all fasteners to the proper torque. Refer to the Torque Specifications chart in this section.
- (6) Install three left engine mount mounting bolts to engine block.
- (7) Install starter solenoid assembly from transmission housing. Position the starter to gain access to the Connector Positive Assurance (CPA) wiring connector.
- (8) Lower vehicle.
- (9) Connect the battery negative cable (Fig. 1).

STARTER MOTOR RELAY

DESCRIPTION

The Starter Relay is a micro relay located in the Power Distribution Center (PDC), positioned in the left front corner of the engine compartment.

OPERATION

As battery power is applied to the relay from the ignition switch, battery power is applied to the starter motor through the relay to the starter solenoid.

DIAGNOSIS AND TESTING - STARTER RELAY

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK POSITION/NEUTRAL WITH THE PARKING BRAKE APPLIED

The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

Remove the starter relay from the PDC as described in this group to perform the following tests. Refer to Starter Relay Chart for terminal numbers and locations.

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery B+ lead to terminals 86 and a ground lead to terminal 85 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, refer to Starter Relay Circuit Test procedure. If not OK, replace the faulty relay.

STARTER RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the ener-

STARTER RELAY CHART

gized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to Step 4. If not OK, repair the open circuit to the starter solenoid as required.

(4) The coil battery terminal (86) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position. Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position, and no voltage when the ignition switch is released to the On position. If OK, go to Step 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, refer to the Ignition Switch Test procedure in this group.

(5) The coil ground terminal (85) is connected to the electromagnet in the relay. The relay is grounded through Pin 8 of the PCM, when the gear selector lever is in the Park or Neutral position. Check for continuity to ground at the cavity for relay terminal 85, when the gear selector lever is in the Park or Neutral position. If not OK, check for an open circuit to Pin 8 of the PCM and from Pin 76 of the PCM to transmission range sensor. Repair as necessary. If both circuits are OK, refer to the Transmission Range Sensor Test in Transaxle. If the Transmission Range Sensor test OK, and all other tests are OK, replace the PCM.

REMOVAL

The relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for relay location.

STARTER SOLENOID

DESCRIPTION

The Starter Solenoid is mounted directly to the Starter Motor, mounted on the left side of the engine.

OPERATION

The Starter Solenoid is a switching device used to activate the high amperage starter motor circuit from a low amperage control circuit.

DIAGNOSIS AND TESTING - STARTER SOLENOID

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK POSITION WITH THE PARKING BRAKE APPLIED

(1) Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests.

(2) Perform Starter Solenoid test BEFORE performing the starter relay test.

(3) Raise the vehicle.

(4) Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.

(5) Lower the vehicle.

(6) Locate and remove the starter relay from the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location.

(7) Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.

(a) If engine cranks, starter/starter solenoid is good. Go to the Starter Relay Test.

(b) If engine does not or solenoid chatters, check wiring and connectors from starter relay to starter solenoid for loose or corroded connections. Particularly at starter terminals.

(c) Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter.

HEATED GLASS

DESCRIPTION - WINDOW DEFOGGER

The Rear Window Defogger electrical system involves the operation of the Manual Temperature Control (MTC) or Automatic Temperature Control (ATC) head, the Body Control Module (BCM), and the rear window defogger relay and wiring. The system consists of a rear glass with two vertical bus bars and a series of electrically connected grid lines fired on the inside surface. The Body Control Module (BCM) operates a relay located in the right side trunk area on all models (Fig. 1).

Vehicles with Rear Window Antenna refer to Audio Systems.
Vehicles equipped with an electrically heated rear window defogger also have a 90 amp generator.

- 3 - GROUND CONNECTOR
- 4 - REAR WINDOW GRID LINE STRUCTURE
- 5 - POINT B
- 6 - MIDPOINT C (TYPICAL)
- 7 - POINT A
- 8 - POWER CONNECTOR

OPERATION - WINDOW DEFOGGER

The passenger can push the Rear Window Defogger button on the MTC or ATC head to defog the rear glass (Fig. 2). The system will only operate when the ignition switch is in the run position. Once the Rear Window Defogger button is pushed, the button indicator will light and the system will operate for a period of time and then automatically turn off. Refer to the owner's manual for operation of the MTC or ATC system.

Fig. 2 ATC CONTROL HEAD

When the rear window defogger relay is ON, current is directed to the rear defogger grid lines. The heated grid lines heat the rear glass to clear the surface of fog or frost.

Circuit protection is provided by a fusible link, located in the charging circuit, for the heated grid circuit and by a fuse for the relay control circuit.

The MTC or the ATC head sends a signal to the BCM, which indicates to the BCM that the operator wants the rear window grid to heat. An output wire from the BCM connects to the coil of the rear window defogger relay. The other side of the coil is connected to a fuse. The BCM turns on the relay by connecting the output line of the BCM to vehicle ground. The relay contacts will then close supplying vehicle power to the rear window defogger grid.

CAUTION: Grid lines can be damaged or scraped off with sharp instruments, care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WINDOW DEFOGGER

Electrically Heated Rear Window Defogger operation can be easily checked in three steps:

(1) Use ATC or MTC self diagnostics, or the DRB III® scan tool to check fault codes and control button operation. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - SELF DIAGNOSTICS) Note, this does not check the EBL system. There are no fault codes that can check for the EBL grid, relay, or wiring. Refer to steps 2 and 3 for system tests.

(2) Perform a system test with a voltmeter. (Refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING - SYSTEM TEST)

(3) Check the voltages at the rear grid relay. (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER RELAY - DIAGNOSIS AND TESTING)

DIAGNOSIS AND TESTING - SYSTEM TEST

(1) Start the engine. With the engine running, push the Rear Window Defogger button on the ATC or MTC head. The button LED indicator should light. If the EBL indicator does not light on the **MTC HEAD**, then there may be a wiring problem. This may also indicate that the BCM will not complete the circuit to ground that is required to energize the EBL relay coil (non-ATC vehicles only). (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER RELAY - DIAGNOSIS AND TESTING) On ATC vehicles, the LED indicator may light when

HEATED GLASS (Continued)

the BCM failed to complete the circuit to ground required to energize the EBL relay coil (Fig. 3).

(2) Using a DC voltmeter with a 0-15 volt range, connect the negative lead to a known good vehicle electrical ground.

(3) Touch the positive bus bar and check voltage. The voltage should be above 11 volts. Push the Rear Window Defogger button to turn off the indicator. The measured voltage should be 0 volts. If these voltages are correct then the problem is with the Rear Window Grid or Grid ground electrical connection. (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER GRID - DIAGNOSIS AND TESTING) If there is no voltage to the rear window defogger grid when the system is ON, (Refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING - FUSE AND ELECTRICAL SHORT TEST).

Fig. 3 REAR WINDOW DEFOGGER SYSTEM SCHEMATIC

- 1 - BCM AND BUTTON LED RELAY CONTROL LINE (MANUAL TEMPERATURE CONTROL ONLY)
- 2 - VEHICLE VOLTAGE SUPPLY
- 3 - GROUND CONNECTOR
- 4 - REAR WINDOW GRID LINE STRUCTURE
- 5 - POINT B
- 6 - MIDPOINT C (TYPICAL)
- 7 - POINT A
- 8 - POWER CONNECTOR

DIAGNOSIS AND TESTING - FUSE AND ELECTRICAL SHORT TEST

- (1) Stop the engine.
- (2) Check the fuse supplying power to the rear glass grid relay. If the fuse is good, (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW

DEFOGGER RELAY - DIAGNOSIS AND TESTING). If the fuse is open, then go to Step 3.

(3) Locate the ground lug that connects the negative lead of the rear window grid to ground. Remove the screw holding the ground lug and isolate it from any vehicle ground.

(4) Connect one lead of an ohmmeter to the negative ground lug of the rear window grid (with the lug still not connected to a vehicle ground), and check the resistance to a known good vehicle ground. If the ohmmeter indicates less than 10 ohms, then the rear window defogger grid is shorting to the vehicle ground, then go to Step 5. If the ohmmeter indicates more than 100 ohms of resistance, then go to Step 6.

(5) Disconnect the rear window defogger grid voltage feed wire from the vehicle harness. If the ohmmeter still indicates less than 10 ohms, then the rear window defogger grid is shorting to the vehicle ground and must be replaced. If the ohmmeter indicates more than 100 ohms of resistance with the grid voltage feed wire disconnected, then go to Step 6.

(6) There is a problem with the circuits that connect to the rear window defogger relay. Refer to the appropriate wiring information for circuit descriptions. Check wiring with an ohmmeter to verify proper wiring connections to the rear window defogger relay. If no problems are found, then replace the fuse and try running the system.

REAR WINDOW DEFOGGER GRID

DIAGNOSIS AND TESTING - REAR WINDOW DEFOGGER GRID

The horizontal grid line and vertical bus bar line is printed and fired on the inside surface of the rear window glass. These comprise an electrical circuit. The electrically conductive lines are composed of a silver ceramic material which when fired on glass becomes bonded to the glass and is highly resistant to abrasion. It is possible, however, that a break may occur in an individual grid line resulting in no current flow through the line. To detect breaks in grid lines, the following procedure is required:

(1) Stop the engine. Connect the negative lead of a 0-25 volt range voltmeter to a known good vehicle electrical ground.

(2) Start the engine and push the rear window defogger button to turn on the system.

(3) Touch the ground side (point B) of the Rear Window Defogger Grid (Fig. 4). The voltage measured should be below 1 volt. If the voltage is greater than 1 volt then check the voltage on each grid line at the Mid-Point with the positive lead. If the voltage is not approximately 6 volts or half the voltage mea-

REAR WINDOW DEFOGGER GRID (Continued)

sured on the positive rear window grid bus bar, then the grid line is bad. The break in the grid can be found by moving the probe along the line until the voltage changes. The area where the voltage changes is where the open circuit is.

Fig. 4 GRID LINE TEST

- 5 - GROUND B
- 6 - VOLTMETER
- 7 - REAR SHELF
- 8 - CHMSL TRIM COVER

STANDARD PROCEDURE - REAR WINDOW DEFOGGER GRID REPAIR

The repair of the grid lines or the terminal is possible using the Mopar® Repair Package or equivalent.

(1) Mask the repair area so conductive epoxy can be extended onto the line or the bus bar (Fig. 5).

Fig. 5 GRID LINE REPAIR

- 1 - BREAK
- 2 - GRID LINE
- 3 - MASKING TAPE

(2) Follow the instructions in the repair kit for preparing the damaged area.

(3) Remove the package separator clamp and mix the plastic conductive epoxy thoroughly. Fold in half and cut the center corner to dispense the epoxy.

(4) For grid line repair, mark off the area to be repaired with masking tape or a template (Fig. 5).

(5) Apply conductive epoxy through the slit in the masking tape. Overlap both ends of the break by 19 mm (3/4 inch).

(6) For a terminal or pigtail replacement, mask adjacent areas so the epoxy can be extended onto the line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal was fastened and to the adjacent line.

(7) Apply a thin layer of conductive epoxy on the terminal and place terminal on desired location. To prevent the terminal from moving while the epoxy is curing, it must be wedged or clamped.

(8) Carefully remove the masking tape from the grid line.

CAUTION: Do not allow the glass surface to exceed 204°C (400°F), glass may fracture.

(9) Allow epoxy to cure 24 hours at room temperature or use a heat gun with a 260°-371°C (500°-700°F) range for 15 minutes. Hold the gun approximately 254 mm (10 inches) from the repaired area.

(10) After the conductive epoxy is properly cured remove the wedge from the terminal and check the rear window defogger operation. Do not attach the connectors until curing is complete.

WARNING: REPAIR KIT MAY CAUSE SKIN OR EYE IRRITATION. CONTAINS EPOXY RESIN AND AMINE TYPE HARDENER, HARMFUL IF SWALLOWED. AVOID CONTACT WITH SKIN AND EYES. FOR SKIN, WASH AFFECTED AREAS WITH SOAP AND WATER. DO NOT TAKE INTERNALLY. IF TAKEN INTERNALLY, INDUCE VOMITING; CALL A PHYSICIAN IMMEDIATELY. IF IN CONTACT WITH EYES, FLUSH WITH PLENTY OF WATER. USE WITH ADEQUATE VENTILATION. DO NOT USE NEAR FIRE OR FLAME. CONTENTS CONTAIN 3 PERCENT FLAMMABLE SOLVENTS.

KEEP OUT OF REACH OF CHILDREN.

REAR WINDOW DEFOGGER RELAY

DESCRIPTION

The rear window defogger relay is an electromechanical device that switches fused battery current to the rear glass heating grid and the Light-Emitting Diode (LED) indicator of the rear window defogger switch, when the Body Control Module (BCM) rear window defogger timer and logic circuitry grounds the relay coil. The rear window defogger relay is located in the right rear trunk area behind the carpeting.

The rear window defogger relay is a International Standards Organization (ISO) relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The rear window defogger relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed)

relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor or diode is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

DIAGNOSIS AND TESTING - REAR WINDOW DEFOGGER RELAY

(1) Stop the engine. Connect the negative lead of a 0-15 volt range voltmeter to a known good vehicle electrical ground.

(2) Reconnect rear window grid connections if disconnected for the Fuse and Electrical Short Test. Start the engine check the voltages present at the rear window defogger relay and rear window defogger grid (Fig. 3). Refer to the Rear Window Defogger Relay Test table for diagnosis.

REAR WINDOW DEFOGGER RELAY TEST

REMOVAL

(1) Disconnect the battery negative remote cable from the remote ground post (Fig. 6).

80b1b422

**Fig. 6 NEGATIVE BATTERY CABLE REMOTE
TERMINAL**

- 1 - RIGHT STRUT TOWER
- 2 - AIR CLEANER INLET TUBE
- 3 - REMOTE TERMINAL

(2) Open the trunk. Remove the carpeting fasteners from the right rear panel and pull the trunk carpeting away.

(3) Remove the relay fastener screw and unplug the relay.

(4) Remove the relay from vehicle.

INSTALLATION

(1) Plug the relay into the wire harness connector.

(2) Install the relay fastener screw.

(3) Place the carpet back into position and install the fasteners.

(4) Connect the negative battery cable to the remote ground post.

(5) Test the rear window defogger system for proper operation.

REAR WINDOW DEFOGGER SWITCH

DESCRIPTION

The rear window defogger switch is integral to the a/c heater control, which is located in the instrument panel center bezel.

The rear window defogger switch and the rear window defogger switch LED indicator cannot be repaired and, if faulty or damaged, the entire a/c heater control must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

OPERATION

On Manual Temperature Control systems when the rear window defogger switch push button is depressed, it provides a hard wired signal by momentarily closing the rear window defogger switch sense circuit which is monitored by the BCM. On Automatic Temperature Control (ATC) systems, when the defogger switch is depressed, the ATC head sends a switch status message to the BCM over the Programmable Communications Interface (PCI) data bus network. A Light Emitting Diode (LED) in the push button for the rear window defogger switch illuminates to indicate when the rear window defogger system is turned on. Each time the BCM rear window defogger timer and logic circuitry sees another request, it toggles a control output to the rear window defogger relay. Energizing the rear window defogger relay provides electrical current to the rear window defogger grid and to the LED indicator in the switch, which lights to indicate when the defogger system is turned on. A dedicated fuse in the junction block protects the rear window defogger relay output circuit to the LED indicator.

DIAGNOSIS AND TESTING - REAR WINDOW DEFOGGER SWITCH

For instructions on how to use the DRB III® scan tool or the a/c heater control self-diagnostics to test the control, (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - SELF DIAGNOSTICS). The problem is not with the a/c heater control if no trouble codes are found. The next step should be to check the rest of the system after the MTC or ATC head is checked.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

HEATED MIRRORS

TABLE OF CONTENTS

	page		page
HEATED MIRRORS		DIAGNOSIS AND TESTING - HEATED	
DESCRIPTION	8	MIRRORS	8

HEATED MIRRORS

DESCRIPTION

Electrically heated outside rear view mirrors are optional equipment on this model. Heated mirrors are available with Memory Mirrors and Rear Window Defogger only. These mirrors feature an electric heating grid located behind the mirror glass of each power operated outside rear view mirror. These heating grids consist of a single resistor wire routed in a grid-like pattern and captured between two thin sheets of plastic. When electrical current is passed through the resistor wire, it produces enough heat energy to clear the outside mirror glass of ice, snow or fog. Battery current is directed to the outside mirror heating grid only when the rear window defogger switch is in the On position.

If the outside mirror heating grids and the rear window heating grid are all inoperative, (Refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING - WINDOW DEFOGGER). If the outside mirror heating grids are inoperative, but the rear window heating grid is operating as designed, (Refer to 8 - ELECTRICAL/HEATED MIRRORS - DIAGNOSIS AND TESTING) for diagnosis of the outside mirror heating grids.

The heating grid behind each outside mirror glass cannot be repaired and, if faulty or damaged, the entire power mirror unit must be replaced. Refer to Power Mirrors for the procedures.

DIAGNOSIS AND TESTING - HEATED MIRRORS

- (1) Check the heated mirror fuse and repair as necessary. This fuse is located in line with the Rear Window Defogger Relay under the right rear panel carpeting in the trunk.
- (2) Using an ohmmeter, check Pin 1 of the mirror motor harness connector for continuity to ground. If OK, go to Step 3. If not OK, repair as necessary. Refer to the appropriate wiring information for proper Pin location.
- (3) Activate the rear window defogger switch, use a voltmeter and check Pin 3 for battery voltage.
 - (a) If OK, go to Step 4. If not OK, go to step b.
 - (b) Check rear window defogger switch. (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER SWITCH - DIAGNOSIS AND TESTING) If OK, go to step c. If not OK, repair as necessary.
 - (c) If no voltage repair wire as necessary. Refer to the appropriate wiring information.
- (4) Remove mirror glass and check wires. If wires are OK, replace mirror glass. If not OK, repair as necessary or replace mirror.

HEATED SEAT SYSTEM

DESCRIPTION

Individually controlled, electrically heated front seats are available as a factory-installed option on some LH models. Vehicles with this option can be visually identified by the leather trim seats and the two separate heated seat switches mounted in the seat cushion side shields. The heated seat system allows the front seat driver and passenger to select from two different levels of electrical seat heating, or no seat heating to suit their individual comfort requirements. The heated seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle, one for each front seat back and one for each front seat cushion. The heating elements are integral to the individual front seat and seat back trim covers and cannot be removed once installed at the factory. On some models, replacement seat heating elements/sensor are available, without having to replace the entire seat cushion or trim cover. Refer to heated seat element later in this section for additional information.
- **Memory Heated Seat/Mirror Module** - also referred to as the MHSMM, this module contains the solid state electronic control and diagnostic logic circuitry for the heated seat and memory seat/mirror systems. One module is used per vehicle and is

mounted under the drivers front seat cushion. Refer to the Electronic Control Modules section for additional memory heated seat/mirror module information.

- **Heated Seat Sensors** - Two heated seat sensors are used per vehicle, one for each front seat cushion. The sensors are integral to the individual front seat cushion heating elements and cannot be removed once installed at the factory. Refer to heated seat sensor later in this section for additional information.
- **Heated Seat Switches** - Two heated seat switches are used per vehicle. One switch is mounted in each of the front seat cushion side shields. Each switch includes two Light-Emitting Diode (LED) HI/LO indicator lamps and an incandescent back lighting bulb. Refer to the appropriate heated seat switch later in this section for additional information.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

HEATED SEAT SYSTEM (Continued)

The heated seat system also relies upon resources shared with other components in the vehicle over the Programmable Communications Interface (PCI) data bus network. The PCI data bus network allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of the heated seat system or of the PCI data bus network, the use of a DRB III® scan tool and the proper Diagnostic Procedures manual are recommended.

Following are general descriptions and operations of the major components in the heated seat system. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the heated seat system. Refer to **Wiring** for the location of complete heated seat system wiring diagrams.

OPERATION

The heated seat system will only operate when the ignition switch is in the On position, and the surface temperature at the front seat heating element sensors are below the designed temperature set points of the system. The heated seat system will not operate in ambient temperatures greater than about 41° C (105° F). The heating elements, sensors and the heated seat switches are hard wired to the Memory Heated Seat/Mirror Module (MHSMM).

The MHSMM contains the control logic for the heated seat system. The module responds to the heated seat switch status, ignition switch status, and the seat heating element sensor inputs by controlling the output to the front seat heating elements through integral solid-state relays.

When a seat heater is turned on, the heated seat sensor located in the seat cushion heating element provides the module with an input (low-voltage) indicating the surface temperature of the seat cushion. If the surface temperature is below the temperature set point for the selected Low or High heated seat switch position, the module energizes the integral solid-state relay, which supplies battery current to the heating elements in the seat cushion and seat back. When the sensor input indicates the correct temperature set point has been achieved, the module de-energizes the solid-state relay. The module will continue to cycle the solid-state relay as needed to maintain the temperature set point. The Low heat position set point is about 36° C (97° F), and the High heat position set point is about 41° C (105° F).

The module and the heated seat elements operate on non-switched battery current supplied through the power seat circuit breaker in the junction block. The

module will automatically turn off the heating elements if it detects an open or a HI/LOW short in the sensor circuit, or a open or LOW short in the heating element circuit.

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

In order to obtain conclusive testing of the heated seat system, the Programmable Communications Interface (PCI) data bus circuit must be checked.

The most reliable, efficient, and accurate means to diagnose the heated seat system requires the use of a DRB III® scan tool and the Service and Body Diagnostic Procedures Manuals. The DRB III® scan tool can provide vital information to the technician trying to find a problem with the heated seat system. Diagnostic logic is built into the memory heated seat/mirror module to help the person trying to locate the problem by the most efficient means possible. Anytime a problem is suspected, a DRB III® scan tool must be obtained and used to retrieve any stored fault codes in the memory heated seat/mirror module. If diagnostic fault codes are present in the module, record them on a piece of paper immediately before proceeding any further. Then, use these fault codes to identify the problem by verifying the fault code. Example, If the module records "DRIVER SEAT HEAT OUTPUT OPEN" fault, locate the diagnostic procedure for this code in the appropriate Body Diagnostic Procedures Manual and follow the flow chart until the specific problem is located and resolved. Once the problem is thought to be corrected, erase the stored fault code using the DRB III® scan tool and verify correct system operation. If the heated seat system is functioning correctly, verify that there are no other stored codes in the module and return the vehicle to service.

If the fault code could not be verified, such as not finding anything wrong when following the diagnostic flow chart in the Body Diagnostic Procedures Manual. This is a good indication that a INTERMITTENT problem may be present. You must than attempt to find the intermittent problem, such as moving the heating element within the seat while testing continuity or wiggling the wire harness's/electrical connectors under the seat while testing continuity. Always, eliminate all other potential problems before attempting to replace the memory heated seat/mirror module.

For complete circuit wiring diagrams, refer to **Wiring**.

HEATED SEAT SYSTEM (Continued)

WARNING: REFER TO THE RESTRAINTS SECTION OF THIS MANUAL BEFORE ATTEMPTING ANY SEAT, STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

PRELIMINARY TEST

Before testing the individual components in the heated seat system, check the following:

- Using the DRB III® scan tool, check the memory heated seat/mirror module (MHSMM) for any stored fault codes. Record these codes on paper for reference and resolve using the appropriate Body Diagnostic Procedures Manual.
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicles electrical system is defective or weak it may not be supplying sufficient energy to operate the heated seat system.
- If the heated seat switch backlighting does not light with the ignition switch in the On position, check the fused ignition switch fuse in the junction block and the G300 ground splice. If OK, refer to **Heated Seat Switch Diagnosis and Testing** in this section. If not OK, repair the shorted circuit or component as required and replace the faulty fuse or repair the open ground circuit as required.
- If the heated seat switch HI/LO LED indicators do not light with the ignition switch in the On position and the heated seat switch in the Low or High position, check the fused ignition switch fuse in the junction block. If OK, refer to **Heated Seat Switch Diagnosis and Testing** in this section. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
- If the heated seat switch HI/LO LED indicators light, but the heating elements do not heat, check circuit breaker #2 in the junction block. If OK, refer to **Heated Seat Element Diagnosis and Testing** in this section. If not OK, replace the faulty circuit breaker.

DRIVER HEATED SEAT SWITCH

DESCRIPTION

The heated seat switches are located on the out-board seat cushion side shield of the driver and passenger front seats.

The momentary, bidirectional rocker-type heated seat switch (Fig. 1) provides a resistor-multiplexed

Fig. 1 Heated Seat Switch

- 1 - HEATED SEAT SWITCH HOUSING
2 - LIGHT EMITTING DIODE (LED) INDICATOR LAMPS

signal to the Memory Heated Seat/Mirror Module (MHSMM) via a hard-wired mux circuit. Each switch has a center neutral position and momentary Low and High positions so that both the driver and the front seat passenger can select a preferred level of seat heating. Each heated seat switch contains two Light-Emitting Diode (LED) indicator lamps, which indicate the selected mode of the seat heater (HI/LO). Each switch also contains a incandescent bulb, which provides dimmer controlled back lighting of the switch when the headlamps or park lamps are on.

The two LED indicator lamps and the incandescent bulb in each heated seat switch cannot be repaired or replaced. If the LED indicator lamps or back lighting bulb are faulty or damaged, the complete heated seat switch must be replaced.

OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch rocker to its momentary High or Low position provides a hard-wired resistance signal to the Memory Heated Seat/Mirror Module (MHSMM). This signal tells the module to energize the heated seat element of the selected seat and maintain the requested temperature setting. If the heated seat switch is depressed to a different position (LO or HI) than the currently selected state, the module will change states to sup-

DRIVER HEATED SEAT SWITCH (Continued)

port the new selection. If a heated seat switch is depressed a second time, the module interprets the second input as a request to turn the seat heater “OFF”.

The HI and LO LED indicator lamps in the heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. The ground side of each indicator lamp is controlled by the memory heated seat/mirror module. One side of the incandescent back lighting bulb is connected to ground at all times. The other side of the incandescent bulb is connected to the fused panel lamps dimmer switch signal circuit. These bulbs are energized when the park lamps or headlamps are turned on, and their illumination intensity is controlled by the panel lamps dimmer switch.

DIAGNOSIS AND TESTING - DRIVER HEATED SEAT SWITCH

Inspect the Heated Seat Switch for apparent damage or sticking/binding condition, replace if necessary. Refer to Heated Seat Switch Removal and Installation. For circuit description and diagrams, refer to Wiring.

(1) Remove the heated seat switch from its mounting location. Refer to Heated Seat Switch Removal and Installation.

(2) Using an ohm meter, check the ground circuit cavity of the heated seat switch electrical connector for a good continuity to ground. If OK, go to Step 3. If not OK, repair the open ground circuit as required.

(3) Turn the ignition switch to the RUN position. Using an volt meter, check the 12v (B+) circuit cavity of the heated seat switch electrical connector for 12v. If OK, go to Step 4. If not OK, repair the open or shorted 12v B+ circuit as required.

(4) Turn the ignition switch OFF. Using an ohm meter, check the continuity between pin 4 and pin 6 of the heated seat switch, while in its neutral, LO and HI positions. Measure the resistance between the two pins and compare with the chart below (Fig. 2). If the readings do not correspond to those in the Heated Seat Switch Continuity table, replace the heated seat switch.

(3) Working from the underside of the switch, gently rock the switch back and forth out of its mounting location.

(4) Disconnect the heated seat switch electrical connector and remove the switch.

INSTALLATION

- (1) Connect the heated seat switch electrical connector
- (2) Push the heated seat switch into its mounting location.
- (3) Install the appropriate seat cushion side shield. Refer to the Body section of this manual for the procedure.
- (4) Connect the remote negative battery cable.

PASSENGER HEATED SEAT SWITCH

DESCRIPTION

The heated seat switches are located on the out-board seat cushion side shield of the driver and passenger front seats.

The momentary, bidirectional rocker-type heated seat switch (Fig. 4) provides a resistor-multiplexed signal to the Memory Heated Seat/Mirror Module (MHSM) via a hard-wired mux circuit. Each switch has a center neutral position and momentary Low and High positions so that both the driver and the front seat passenger can select a preferred level of seat heating. Each heated seat switch contains two Light-Emitting Diode (LED) indicator lamps, which indicate the selected mode of the seat heater (HI/LO). Each switch also contains an incandescent bulb, which provides dimmer controlled back lighting of the switch when the headlamps or park lamps are on.

The two LED indicator lamps and the incandescent bulb in each heated seat switch cannot be repaired or replaced. If the LED indicator lamps or back lighting

Fig. 4 Heated Seat Switch

- 1 - HEATED SEAT SWITCH HOUSING
- 2 - LIGHT EMITTING DIODE (LED) INDICATOR LAMPS

bulb are faulty or damaged, the complete heated seat switch must be replaced.

OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch rocker to its momentary High or Low position provides a hard-wired resistance signal to the Memory Heated Seat/Mirror Module (MHSM). This signal tells the module to energize the heated seat element of the selected seat and maintain the requested temperature setting. If the heated seat switch is depressed to a different position (LO or HI) than the currently selected state, the module will change states to support the new selection. If a heated seat switch is depressed a second time, the module interprets the second input as a request to turn the seat heater "OFF".

The HI and LO LED indicator lamps in the heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. The ground side of each indicator lamp is controlled by the memory heated seat/mirror module. One side of the incandescent back lighting bulb is connected to ground at all times. The other side of the incandescent bulb is connected to the fused panel lamps dimmer switch signal circuit. These bulbs are energized when the park

PASSENGER HEATED SEAT SWITCH (Continued)

lamps or headlamps are turned on, and their illumination intensity is controlled by the panel lamps dimmer switch.

DIAGNOSIS AND TESTING - PASSENGER HEATED SEAT SWITCH

Inspect the Heated Seat Switch for apparent damage or sticking/binding condition, replace if necessary. Refer to Heated Seat Switch Removal and Installation. For circuit description and diagrams, refer to Wiring.

(1) Remove the heated seat switch from its mounting location. Refer to Heated Seat Switch Removal and Installation.

(2) Using an ohm meter, check the ground circuit cavity of the heated seat switch electrical connector for a good continuity to ground. If OK, go to Step 3. If not OK, repair the open ground circuit as required.

(3) Turn the ignition switch to the RUN position. Using an volt meter, check the 12v (B+) circuit cavity of the heated seat switch electrical connector for 12v. If OK, go to Step 4. If not OK, repair the open or shorted 12v B+ circuit as required.

(4) Turn the ignition switch OFF. Using an ohm meter, check the continuity between pin 4 and pin 6 of the heated seat switch, while in its neutral, LO and HI position. Measure the resistance between the two pins and compare with the chart below (Fig. 5). If the readings do not correspond to those in the Heated Seat Switch Continuity table, replace the heated seat switch.

- (2) Push the heated seat switch into its mounting location.
- (3) Install the appropriate seat cushion side shield. Refer to the Body section of this manual for the procedure.
- (4) Connect the remote negative battery cable.

HEATED SEAT ELEMENT

DESCRIPTION

80c91d10

Fig. 7 Heated Seat Element – Typical

- 1 - SEAT BACK WIRE HARNESS
- 2 - HEATED SEAT WIRE HARNESS CONNECTOR
- 3 - HEATED SEAT CUSHION ELEMENT

The heated seat element is the component which produces the heat felt in the front seats. The heated seat system includes four seat heating elements. Two elements are located in each front seat, one for the seat cushion (Fig. 7) and the other for the seat back. These individual heating elements are electrically connected in series with the Memory Heated Seat/Mirror Module. With the elements electrically connected in this way, if a break anywhere in the heating element circuit occurs, neither the seat cushion or seat back heating element will function. The heating elements are made of carbon fiber, which provides a strong and dependable design. Refer to Heated Seat Element Diagnosing and Testing for detailed diagnostic procedures.

A heated seat sensor is integral to the individual heated seat cushion elements. The heated seat sensor cannot be replaced separately. If a problem is found with the sensor the complete heated seat element must be replaced. On some models, this can also include the leather trim cover. Refer to Heated Seat Sensor in this section for more information.

Some LH models have the heating elements stuck to the seat cushion foam, while others have the element permanently sewn into the seat cushion/back leather trim covers. The heated seat elements and

temperature sensor cannot be adjusted or repaired and, if faulty or damaged, the heated seat element must be replaced.

OPERATION

The heated seat elements resist the flow of electrical current. When battery current is passed through the elements, the energy lost by the resistance of the elements is released in the form of heat. The heated seat temperature sensor is a NTC thermistor. When the temperature of the seat cushion cover rises, the resistance of the sensor decreases. The Memory Heated Seat/Mirror Module supplies five volts to one side of each sensor, and monitors the voltage drop through the sensor on a signal/return circuit. The Memory Heated Seat/Mirror Module uses this temperature sensor input to monitor the temperature of the seat, and regulates the current flow to the heated seat elements accordingly.

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT

The following procedure will check the heated seat elements as well as the related seat wire harness and connectors. This way, if there is a fault with the seat wire harness leading to the heated seat element or connector(s) it can also be detected. Without checking the heated seat element in this way, a fault with the seat wire harness or connector(s) would not be detected.

The heated seat elements in the seat cushion and seat back are connected in series with each other and the controlling module. With the system wired this way, if an open or fault occurs the entire seat may not heat, even though the open may only be in the seat cushion element.

Over time, the heated seat element may degrade and require replacement. The memory heated seat/mirror module should detect a fault before the element completely fails. Always use the appropriate scan tool (DRB III®) to check the module for any stored fault codes prior to any testing of the individual heated seat components.

NOTE: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.

HEATED SEAT ELEMENT (Continued)

DRIVER SEAT ELEMENT

(1) Remove the driver front seat retaining fasteners (Refer to 23 - BODY/SEATS/SEAT - REMOVAL). Do not disconnect the seat electrical connectors, simply lay the seat back so you can access the underside of the seat cushion pan.

(2) Remove the screws holding the Memory Heated Seat/Mirror Module to the seat cushion pan. Unclip the module wire harness to access the module electrical connectors.

(3) Backprobe the module electrical connector, Do not disconnect. Check for continuity between cavity #12 of the module C3 wire harness connector and the ground connection under the carpet, near the center of the seat. If less than 7 ohms, go to Step 4, If NOT, replace the faulty heated seat element or repair the wire harness as required.

(4) Check the continuity between cavity #12 and the seat cushion frame. Continuity should NOT be present, If OK, drivers seat element is OK at this time, If NOT OK, trace the element/wire harness until the short is found.

PASSENGER SEAT ELEMENT

(1) Remove the driver front seat retaining fasteners (Refer to 23 - BODY/SEATS/SEAT - REMOVAL). Do not disconnect the seat electrical connectors, simply lay the seat back, so you can access the underside of the seat cushion pan.

(2) Remove the screws holding the Memory Heated Seat/Mirror Module to the seat cushion pan. Unclip the module wire harness to access the module electrical connectors.

(3) Backprobe the module electrical connector, Do not disconnect. Check for continuity between cavity #6 of the module C3 wire harness connector and the ground connection under the carpet, near the center of the seat. If less than 7 ohms, go to Step 4, If NOT, replace the faulty heated seat element or repair the wire harness as required.

(4) Check the continuity between cavity #6 and the seat cushion frame. Continuity should NOT be present, If OK, passenger seat element is OK at this time, If NOT OK, trace the element/wire harness until the short is found.

CAUTION: Be certain to properly re-attach the Memory Heated Seat/Mirror Module and wire harness under the seat cushion pan. Failure to do so could result in the wire harness coming in contact with the moving components under the seat, and future problems.

REMOVAL

Some LH models have heating elements that cannot be replaced without replacing the entire leather seat trim cover. Consult the Mopar parts catalog for specific part numbers.

Do not remove the original heating element from the seat or seat back cushion/trim covers. The original element is permanently attached and cannot be removed without permanent damage. Models with replaceable heating elements are designed to be applied directly over the original heating elements.

(1) Disconnect and isolate the negative battery cable.

(2) Remove the appropriate seat cushion or seat back trim cover. Refer to the Body section of the service manual for the procedures.

(3) Disconnect the inoperative heated seat cushion or seat back element electrical connectors.

(4) Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

INSTALLATION

(1) Peel off the adhesive backing on the back of the replacement heating element and stick directly on the foam cushion or on top of original heating element.

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

(2) Connect the new heating element electrical connectors (Fig. 8).

(3) Connect the negative battery cable.

(4) Verify heated seat system operation.

(5) Install the appropriate seat cushion or seat back trim cover. Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the trim cover.

HEATED SEAT ELEMENT (Continued)

80c91d10

Fig. 8 Heated Seat Cushion Element Installed - Typical

- 1 - SEAT BACK WIRE HARNESS
- 2 - HEATED SEAT WIRE HARNESS CONNECTOR
- 3 - HEATED SEAT CUSHION ELEMENT

HEATED SEAT SENSOR

DESCRIPTION

Two heated seat sensors are used per vehicle. One is located in each front seat cushion heating element. Refer to Heated Seat Element in this section for more information. The heated seat temperature sensors are Negative Temperature Coefficient (NTC) thermistors that are permanently attached to the individual cushion heating elements.

The heated seat sensors cannot be repaired or adjusted and if found to be faulty, the complete heated seat cushion element must be replaced.

OPERATION

When the temperature of the heated seat element rises, the resistance of the heated seat sensor decreases. The memory heated seat/mirror module supplies five volts to one side of each sensor, and monitors the voltage drop through the sensor on a return circuit. The module uses this temperature sensor input to monitor the temperature of the seat, and regulates the current flow to the seat heating elements accordingly.

DIAGNOSIS AND TESTING - HEATED SEAT SENSOR

For complete circuit diagrams, refer to the **WIRING** section of this manual.

(1) Obtain a DRB III® scan tool, if a DRB scan tool is not available a accurate voltmeter will also work.

(2) If using a DRB III®, navigate through the following path on the DRB display screen, Body/Memory Seat Module/Sensor Display. Under Sensor Display you will find RT Seat Temp Volts – and LT Seat Temp Volts, compare the voltage reading with the table shown. If the voltage is not within specification, replace the heated seat element.

(3) If using a voltmeter, backprobe the sensor return signal circuit at the module and compare the voltage reading with the table shown. Refer to heated seat element diagnosis and testing for additional instructions. If the voltage is not within specification, replace the heated seat element.

TEMP	LO SET POINT	HI SET POINT	COLD SEAT
RT/LT SEAT TEMP VOLTS ±5%	2.35 volts	3.14 volts	1.37 volts

* In reference to the table above, the LO/HI Set Point is the point at which the voltage will stabilize. As the temperature of the seat cushion rises the voltage on the return signal circuit or seat temp volts should also steadily rise until the set point is reached. Once the heat level or set point is reached, the memory heated seat/mirror module will toggle the heating elements ON/OFF to maintain the set point or temperature. The cold seat specification is measured with the vehicle stabilized in a 65°F shop or garage.

Keep in mind that the seat temp voltage or return signal voltage is monitored on the PCI DATA BUS circuit and should set a diagnostic trouble code if shorted hi/lo or open. Always check for any stored trouble codes in the memory heated seat/mirror module before attempting any service or diagnostics of the system. Also, never erase stored trouble codes until the problem has been identified, this way you can keep a record of your progress.

HORN SYSTEM

DESCRIPTION

A dual-note electric horn system is standard factory-installed equipment on this model. The horn circuit consists of a horn switch, horn relay, and horns.

OPERATION

The horn circuit feed is from the fuse to the horn relay in the Junction Block. When the horn switch is depressed, it completes the ground circuit. Then the horn relay coil closes a set of contacts which allows current to flow to the horns.

DIAGNOSIS AND TESTING - HORN SYSTEM

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE

AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: Continuous sounding of horns will cause horn to fail.

Check fuse 18 in the Junction Block and fuse L in the Power Distribution Center. Refer to Horn System Test table.

HORN SYSTEM TEST

CONDITION	POSSIBLE CAUSE	CORRECTION
HORN SOUNDS CONTINUOUSLY. NOTE: IMMEDIATELY UNPLUG HORN AND RELAY IN THE JUNCTION BLOCK	1. FAULTY HORN RELAY.	1. REFER TO HORN RELAY TEST.
	2. HORN CONTROL CIRCUIT TO RELAY SHORTED TO GROUND.	2. CHECK HORN RELAY TERMINAL 7 IN JUNCTION BLOCK FOR CONTINUITY TO GROUND INDICATES: A. WIRING HARNESS SHORTED TO GROUND. B. FIND THE SHORT AND REPAIR AS NECESSARY.

HORN SYSTEM (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION

	4. PINCHED HORN SWITCH WIRE UNDER DRIVER AIRBAG MODULE.	4. REPLACE DRIVER AIRBAG MODULE.
	5. FAULTY HORN SWITCH	5. REPLACE DRIVER AIRBAG MODULE.
HORN SOUND INTERMITTENTLY AS THE STEERING WHEEL IS TURNED.	1. HORN RELAY CONTROL CIRCUIT 3 IS SHORTED TO GROUND INSIDE STEERING WHEEL.	1. REMOVE DRIVER AIRBAG MODULE AND CHECK FOR RUBBING OR LOOSE WIRE/CONNECTOR, REPAIR AS NECESSARY.
	2. PINCHED HORN SWITCH WIRE UNDER DRIVER AIRBAG MODULE.	2. REPLACE DRIVER AIRBAG MODULE.
	3. FAULTY HORN SWITCH.	3. REPLACE DRIVER AIRBAG MODULE.
HORN DOES NOT SOUND	1. CHECK FUSE 18 IN THE JUNCTION BLOCK.	1. REPLACE FUSE IF BLOWN AS REPAIR AS NECESSARY.
	2. NO VOLTAGE AT HORN RELAY TERMINALS 1 & 2 AND FUSE IS OK.	2. NO VOLTAGE, REPLACE JUNCTION BLOCK OR REPAIR AS NECESSARY.
	3. OPEN CIRCUIT FROM TERMINAL 7 OF THE RELAY TO HORN SWITCH X3 CIRCUIT.	3. REPAIR CIRCUIT AS NECESSARY.
	4. FAULTY OR DAMAGED HORN.	4. VOLTAGE AT HORN WHEN HORN SWITCH IS PRESSED, REPLACE HORN.
	5. FAULTY HORN SWITCH	5. REPLACE DRIVER AIRBAG MODULE.
FUSE BLOWS WHEN HORN IS BLOWN	1. SHORT CIRCUIT IN HORN OR HORN WIRING	1. REMOVE HORN RELAY, CHECK FOR SHORTED HORN OR HORN WIRING. DISCONNECT HORN WIRE HARNESS TO ISOLATE SHORT AND REPAIR AS NECESSARY.
FUSE BLOWS WITHOUT BLOWING HORN	1. SHORT CIRCUIT	1. REMOVE RELAY, INSTALL NEW FUSE, IF FUSE DOES NOT BLOW REPLACE HORN RELAY. IF FUSE BLOWS WITH RELAY REMOVED, CHECK FOR SHORT TO GROUND WITH OHMMETER BETWEEN TERMINALS 1 & 2 AND THE FUSE TERMINAL. REPAIR AS NECESSARY.
NOTE: FOR WIRING REPAIRS REFER TO GROUP 8W, WIRE DIAGRAMS.		

HORN

DIAGNOSIS AND TESTING - HORN

- (1) Disconnect wire connector at each horn.
- (2) Using a voltmeter, connect one lead to body ground and the other lead to the horn relay output pin of the horn connector (Fig. 1).

HORN CONNECTOR PIN CALL-OUT

PIN #	CIRCUIT NAME
1	GROUND
2	HORN RELAY OUTPUT

80b6f054

Fig. 1 HORN CONNECTOR

The right horn is grounded on the front outboard side of the right frame rail. The left horn is grounded on the left front fender apron.

- (3) When the horn switch is depressed, battery voltage should be present. Repeat for the other horn.
- (4) If no voltage, repair as necessary. If battery voltage is present, go to next step.
- (5) Using an ohmmeter, test the negative terminal of the connector for continuity to ground. Repeat for the other horn.
- (6) If no ground, repair as necessary.
- (7) If wires test OK and horn(s) does not sound, replace horn(s).

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Disconnect wire connector.
- (3) Remove the horn bracket mounting bolt and remove horn.

NOTE: Do not disconnect horn from horn bracket.

INSTALLATION

- (1) Position both horns and the mounting bracket onto the vehicle as a unit.
- (2) Install and tighten the screw that secures the horn mounting bracket to vehicle. Tighten the screw to 11.3 N·m (100 in. lbs.).
- (3) Connect the wire connector.
- (4) Connect the battery negative cable.

HORN RELAY

DIAGNOSIS AND TESTING - HORN RELAY

- (1) Remove horn relay.
- (2) Using ohmmeter, test between relay connector terminals 85 to 86 for 75 ± 8 ohms resistance. If resistance not OK, replace relay (Fig. 2).

- 87 - NORMALLY OPEN
- 87A - NORMALLY CLOSED

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Open the driver's door and remove the left instrument panel end cover.
- (3) Remove the horn relay (Fig. 3).

INSTALLATION

- (1) Insert the horn relay.
- (2) Install the left instrument panel end cover.
- (3) Reconnect the battery negative cable remote terminal.

IGNITION CONTROL

DESCRIPTION - IGNITION SYSTEM

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The distributorless ignition system used on these engines is referred to as the Direct Ignition System (DIS). The system's three main components are the coils, crankshaft position sensor, and camshaft position sensor. If equipped with the coil on plug ignition

system it utilizes an ignition coil for every cylinder, it is mounted directly over the each spark plug.

OPERATION - IGNITION SYSTEM

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate pulses that are inputs to the PCM. The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft & camshaft position. For a description of both sensors, refer to Camshaft Position Sensor and Crankshaft Position Sensor.

AUTO SHUT DOWN RELAY

DESCRIPTION

The relay is located in the Power Distribution Center (PDC) (Fig. 1). For the location of the relay within the PDC, refer to the PDC cover for location. Check electrical terminals for corrosion and repair as necessary.

80ae0e99

Fig. 1 Power Distribution Center (PDC)

- 1 - PDC COVER
- 2 - PDC

OPERATION

The ASD sense circuit (SBEC vehicles) or the engine switched battery (NGC vehicles) informs the PCM when the ASD relay energizes. A 12 volt signal at this input indicates to the PCM that the ASD has been activated. This input is also used to power certain drivers on NGC vehicles.

When energized, the ASD relay on SBEC vehicles supplies battery voltage to the fuel injectors, ignition coils and the heating element in each oxygen sensor.

When energized, the ASD relay on NGC vehicles provides power to operate the injectors, ignition coil, generator field, O2 sensor heaters (both upstream and downstream), evaporative purge solenoid, EGR solenoid (if equipped) wastegate solenoid (if equipped), and NVLD solenoid (if equipped).

For both SBEC and NGC vehicles, the ASD relay also provides a sense circuit to the PCM for diagnostic purposes. If the PCM does not receive 12 volts from this input after grounding the control side of the ASD relay, it sets a Diagnostic Trouble Code (DTC). The PCM energizes the ASD any time there is an engine speed that exceeds a predetermined value (typically about 50 rpm). The ASD relay can also be energized after the engine has been turned off to perform an O2 sensor heater test, if vehicle is equipped with OBD II diagnostics.

As mentioned earlier, the PCM energizes the ASD relay during an O2 sensor heater test. This test is performed only after the engine has been shut off for SBEC vehicles. On NGC vehicles it checks the O2 heater upon vehicle start. The PCM still operates internally to perform several checks, including monitoring the O2 sensor heaters.

CAMSHAFT POSITION SENSOR

DESCRIPTION

The camshaft position sensor is mounted in the front of the head on 2.7L (Fig. 2) or belt cover on the 3.5L (Fig. 3). It is a hall effect device.

80b1b46b

Fig. 2 Camshaft Position Sensor - 2.7L

- 2 - CAMSHAFT POSITION SENSOR

CAMSHAFT POSITION SENSOR (Continued)

80ae82c5

**Fig. 3 CAMSHAFT POSITION SENSOR LOCATION
3.5L**

1 - CAMSHAFT SENSOR

OPERATION

The camshaft position sensor contains a hall effect device that provide cylinder identification to the Powertrain Control Module (PCM) (Fig. 4) or (Fig. 5). The sensor generates pulses as groups of notches on the camshaft sprocket pass underneath it. The PCM keeps track of crankshaft rotation and identifies each cylinder by the pulses generated by the notches on the camshaft sprocket.

When metal aligns with the sensor, voltage goes low (less than 0.3 volts). When a notch aligns with the sensor, voltage spikes high (5.0 volts). As a group of notches pass under the sensor, the voltage switches from low (metal) to high (notch) then back to low. The number of notches determine the amount of pulses. If available, an oscilloscope or DRBIII® PEP Module can display the square wave patterns of each timing event.

REMOVAL

REMOVAL - 2.7L

The camshaft position sensor is mounted in the front of the head.

- (1) Disconnect electrical connector from sensor.
- (2) Remove camshaft position sensor screw.
- (3) Without pulling on the connector, pull the sensor out of the chain case cover.

REMOVAL - 3.5L

The camshaft position sensor is installed in the timing belt housing cover above the left camshaft sprocket.

Fig. 4 Camshaft Position Sensor 2.7L

80b1b356

Fig. 5 Camshaft Position Sensor 3.5L

- (1) Disconnect the negative battery cable.
- (2) Loosen the upper intake plenum, refer to the Intake System section.
- (3) Disconnect electrical connector from sensor.
- (4) Remove camshaft position sensor screw.
- (5) Pull sensor up out of the timing belt housing cover.

INSTALLATION

INSTALLATION - 2.7L

The camshaft position sensor is mounted in the front of the head.

- (1) Install sensor in the chain case cover and push sensor in until contact is made with the boss on the head. While holding the sensor in this position,

CAMSHAFT POSITION SENSOR (Continued)

install and tighten the retaining bolt to 12 N·m (105 in. lbs.) torque.

(2) Attach electrical connector to sensor.

INSTALLATION - 3.5L

The camshaft position sensor is installed in the timing belt housing cover above the left camshaft sprocket.

If the removed sensor is reinstalled, completely remove the old spacer from the sensor face. Attach a NEW SPACER to the face of the sensor before installation. If installing a new sensor, confirm that the paper spacer is attached to the face (Fig. 6).

Fig. 6 Paper Spacer 3.5L

- 1 - CAMSHAFT POSITION SENSOR
2 - PAPER SPACER

(1) Install sensor in the timing belt housing and push sensor down until contact is made with the camshaft sprocket. While holding the sensor in this position, install and tighten the retaining bolt to 12 N·m (105 in. lbs.) torque.

(2) Attach electrical connector to sensor.

(3) Install the upper intake plenum, refer to the Intake System section.

(4) Connect the negative battery cable.

IGNITION COIL

DESCRIPTION

The engines are equipped with a coil on plug ignition system (Fig. 7) or (Fig. 8). Each cylinder has a dedicated coil that sits atop each plug. No secondary wires are required and connection from the coil to plug is made with a boot that is attached to the coil. The combination of the coil, boot, and fasteners is known as the ignition coil assembly. The Powertrain Control Module (PCM) determines which coil to charge and fire at the correct time.

Fig. 7 Ignition Coil - 2.7L

Fig. 8 Ignition Coil - 3.5L

OPERATION

The Auto Shutdown (ASD) relay provides battery voltage to the ignition coil. The PCM provides a ground contact (circuit) for energizing the coil. When the PCM breaks the contact, the energy in the coil primary transfers to the secondary causing the spark. The PCM will de-energize the ASD relay if it does not receive the crankshaft position sensor and camshaft position sensor inputs. For limp home capability, the engine can run on crankshaft sensor or camshaft sensor. Refer to Auto Shutdown (ASD) Relay—PCM Output, in this section for relay operation.

IGNITION COIL (Continued)

The coil's low primary resistance (0.4 - 0.6 ohm) allows the PCM to fully charge the coil for each firing. There is a coil capacitor added to each bank of cylinders for the 2.7L and the left bank of the 3.5L for radio noise suppression (Fig. 9).

80b31f5b

Fig. 9 COIL CAPACITOR

1 - IGNITION COIL CAPACITOR

REMOVAL

- (1) Prior to removing the ignition coils, spray compressed air around the coil area and spark plug.
- (2) Remove electrical connector from ignition coil.
- On 3.5L engines, it is necessary to loosen the screws by alternating back and forth. Do not lose the spacers under the coil when loosening the screws.
- (3) Remove 2 fasteners from ignition coil assembly.
- (4) Remove ignition coil assembly.

INSTALLATION

- (1) Install ignition coil assembly for spark plug.
- (2) Install coil screws and tighten: 2.7L engine to 6.2 N·m (55 in. lbs.), 3.5L engines to 6.7 N·m (60 in. lbs.).
- (3) Connect the electrical connector.

IGNITION COIL CAPACITOR**DESCRIPTION**

The Auto Shutdown (ASD) relay provides battery voltage to the ignition coil. The PCM provides a ground contact (circuit) for energizing the coil. When the PCM breaks the contact, the energy in the coil primary transfers to the secondary causing the spark. The PCM will de-energize the ASD relay if it does not receive the crankshaft position sensor and camshaft position sensor inputs. For limp home capa-

bility, the engine can run on crankshaft sensor or camshaft sensor. Refer to Auto Shutdown (ASD) Relay—PCM Output, in this section for relay operation.

The coil's low primary resistance (0.4 - 0.6 ohm) allows the PCM to fully charge the coil for each firing. There is a coil capacitor for radio noise suppression (Fig. 10).

80b31f5b

Fig. 10 COIL CAPACITOR

1 - IGNITION COIL CAPACITOR

REMOVAL

- (1) Remove the negative battery cable.
- (2) Disconnect the electrical connector (Fig. 11).
- (3) Remove nut and capacitor.

80b31f5b

Fig. 11 COIL CAPACITOR

1 - IGNITION COIL CAPACITOR

IGNITION COIL CAPACITOR (Continued)

INSTALLATION

- (1) Install capacitor and tighten nut.
- (2) Attach electrical connector to capacitor.
- (3) Install the negative battery cable.

KNOCK SENSOR

DESCRIPTION

The knock sensor threads into the cylinder block. The knock sensor is designed to detect engine vibration that is caused by detonation.

OPERATION

When the knock sensor detects a knock in one of the cylinders, it sends an input signal to the PCM. In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives as an input the knock sensor voltage signal. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except WOT. The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening affects knock sensor performance, possibly causing improper spark control.

REMOVAL

The sensors screws into the cylinder block, directly below the intake manifold.

(1) Remove intake manifold plenum refer to the Engine section.

(2) **2.7L** Remove the passenger side cylinder head, refer to the Engine section.

(3) Disconnect electrical connector from knock sensor (Fig. 12) or (Fig. 13).

Fig. 12 KNOCK SENSOR 2.7 L

1 - KNOCK SENSOR

Fig. 13 KNOCK SENSOR 3.5 L

1 - CYLINDER BLOCK
2 - KNOCK SENSOR

(4) Use a crows foot socket to remove the knock sensors.

KNOCK SENSOR (Continued)

INSTALLATION

The sensors screws into the cylinder block, directly below the intake manifold.

(1) Install knock sensor. Tighten knock sensor to 10 N·m (7 ft. lbs.) torque. **Over or under tightening effects knock sensor performance resulting in possible improper spark control.**

(2) **2.7L** Install the passenger side cylinder head, refer to the Engine section.

(3) Attach electrical connector to knock sensor.

(4) Install intake manifold plenum. Refer to the Engine section.

SPARK PLUG

DESCRIPTION - PLATINUM PLUGS

The V6 engines use platinum resistor spark plugs. They have resistance values of 6,000 to 20,000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications, Refer to the Specifications section.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

When the spark plugs use a single or double platinum tips and they have a recommended service life of 100,000 miles for normal driving conditions per schedule A in this manual. The spark plugs have a recommended service life of 75,000 miles for severe driving conditions per schedule B in this manual. A thin platinum pad is welded to both or just the center electrode end(s) as shown in (Fig. 14). Extreme care must be used to prevent spark plug cross threading, mis-gapping (Fig. 15) and ceramic insulator damage during plug removal and installation.

Fig. 14 Platinum Pads

- 1 - APPLY ANTI-SEIZE COMPOUND HERE ONLY
2 - PLATINUM SPARK SURFACE

8008a54c

CAUTION: Cleaning of the platinum plug may damage the platinum tip.

803f5851

Fig. 15 Setting Spark Plug Electrode Gap

1 - TAPER GAUGE

REMOVAL

Always remove the ignition coil assembly by grasping at the spark plug boot, turning the assembly 1/2 turn and pulling straight back in a steady motion.

(1) Prior to removing the spark plug, spray compressed air around the coil area and spark plug.

(2) Remove electrical connector from ignition coil.

On 3.5L engines, it is necessary to loosen the screws by alternating back and forth. Do not lose the spacers under the coil when loosening the screws.

(3) Remove 2 fasteners from ignition coil.

(4) Remove ignition coil assembly.

(5) Remove the spark plug using a quality socket with a rubber or foam insert.

(6) Inspect the spark plug condition.

INSTALLATION

Always remove the ignition coil assembly by grasping at the spark plug boot, turning the assembly 1/2 turn and pulling straight back in a steady motion.

(1) To avoid cross threading, start the spark plug into the cylinder head by hand.

(2) 3.5L engines tighten spark plugs to 28 N·m (20 ft. lbs.) torque, 2.7L engine tighten spark plugs to 17.6 N·m (13 ft. lbs.).

(3) Install ignition coil assembly onto spark plug.

(4) Install coil screws and tighten: 2.7L engine to 6.2 N·m (55 in. lbs.), 3.5L engines to 6.7 N·m (60 in. lbs.).

(5) Connect the electrical connector.

INSTRUMENT CLUSTER

DESCRIPTION

The mechanical instrument cluster is an electro-mechanical module which receives most of its information via the Programmable Communication Interface (PCI) bus.

There are three types of clusters (Fig. 1) and (Fig. 2).

80b1b448

Fig. 1 CLUSTER - INTREPID/CONCORDE

The Instrument Cluster for the Intrepid and Concorde (Fig. 1) are almost identical. The gauge and warning lamp location and functionality are identical. The difference being, the Intrepid has white gauges with black numbers, and the Concorde has black gauges with white numbers and chrome rings around the gauges.

- Speedometer
- Tachometer
- Odometer/trip odometer

Fig. 2 CLUSTER - 300M

- Electronic transmission range
- The warning and information indicators include the following:
- Check Engine
 - Airbag
 - Charging system
 - Low oil pressure
 - High temperature
 - Low fuel
 - Seat belt
 - Cruise
 - Brake/park brake
 - High beam
 - Turn signals
 - Door Ajar
 - Decklid Ajar
 - ABS (optional)
 - Traction Control Active (if equipped)
 - Traction Control Off (if equipped)
 - Low Washer Fluid

INSTRUMENT CLUSTER (Continued)

OPERATION

The gauges are the magnetic air-core type. When the ignition switch is OFF, the gauge pointers should rest at or below the low graduation.

DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

As a quick diagnosis, the cluster will perform a functional check of the odometer display, transmission range display and warning indicators after the ignition is switched to RUN/START. If the cluster is not receiving any PCI bus messages, the cluster will appear non-functional and "no bus" will appear in the odometer display.

A self-test of the cluster can also be initiated by pressing and holding the odometer reset button and switching the ignition from lock to unlock. The cluster will then step through several displays for functional verification.

If the cluster is not functioning properly, refer to the proper Body Diagnostic Procedures Manual.

If the cluster is not receiving PCI bus messages, refer to the pre-diagnostic test described in Body Diagnostic Procedures Manual.

In order to diagnose the instrument cluster functions, a DRB III® scan tool and the proper Body Diagnostic Procedures Manual are required.

If the diagnostic procedure determines that a replacement of an instrument cluster component is required, refer to Cluster and Bezel Removal and Installation in this section.

REMOVAL

To service any instrument cluster component, the instrument cluster must be removed from the instrument panel. Use the following procedure:

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the instrument panel left end cap.
- (3) Remove steering column shroud cover.
- (4) Tilt the steering column down into the lowest position.
- (5) Remove one screw (Limited/300M) to cluster bezel
- (6) Remove the items to expose bezel mounting screws. Items vary depending on model.
- (7) Remove two screws over upper cluster bezel in instrument panel brow area and all remaining

attaching screws (four on Intrepid, Limited, and 300M, and five on Concorde).

(8) Using a trim stick (special tool #C-4755), gently pry out on the instrument panel cluster bezel, disconnect headlamp switch connector, and remove.

(9) Remove the instrument cluster screws.

NOTE: Tilt steering wheel down to gain access for instrument cluster removal.

(10) Remove the instrument cluster from panel. The instrument panel wiring harness connectors are self-aligning, mounted directly to the rear panel. A force of approximately 9 kilograms (30 lbs.) will be required to disengage the cluster from the connectors and upper clips.

INSTALLATION

NOTE: Tilt steering wheel down to gain access for instrument cluster installation.

(1) Install the instrument cluster into instrument panel. The instrument panel wiring harness connectors are self-aligning, mounted directly to the rear panel. A force of approximately 9 kilograms (30 lbs.) will be required to engage the cluster to the connectors and upper clips.

(2) Install the instrument cluster screws.

(3) Connect headlamp switch connector. Place the cluster bezel into position and snap it into place firmly.

(4) Install the two screws over upper cluster bezel in instrument panel brow area and all remaining attaching screws (four on Intrepid, Limited, and 300M, and five on Concorde).

(5) Install the items covering the bezel mounting screws.

(6) Install the one screw (Limited/300M) to cluster bezel.

(7) Tilt the steering column down into the lowest position.

(8) Install the steering column shroud cover.

(9) Install the instrument panel left end cap.

(10) Connect the negative battery cable remote terminal to the remote battery post.

ANTI-LOCK BRAKE SYSTEM INDICATOR

DESCRIPTION

The amber Anti-Lock Brake System (ABS) warning indicator lamp is located on the instrument panel in the instrument cluster.

OPERATION

When the ignition key is turned to the ON position, the amber ABS warning indicator lamp is lit until the Controller Anti-Lock Brakes (CAB) completes it's self-tests and turns off the indicator lamp (approximately 4 seconds). The amber ABS warning indicator lamp will illuminate when the CAB detects a condition that results in the shutdown of ABS function or when the instrument cluster does not receive messages from the CAB. The CAB sends a message across the PCI bus circuit that informs the instrument cluster to turn on the amber ABS warning indicator lamp.

NOTE: If the vehicle is equipped with traction control, the TRAC OFF indicator lamp will illuminate anytime the amber ABS warning indicator lamp is on.

Under most conditions, when the amber ABS warning indicator lamp is on, only the ABS function of the brake system is affected; the base brake system and the ability to stop the vehicle are not affected.

INSTRUMENT CLUSTER MASK/LENS

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the instrument panel left end cap.
- (3) Remove steering column shroud cover.
- (4) Tilt the steering column down into the lowest position.
- (5) Remove one screw (Limited/300M) to cluster bezel
- (6) Remove the items to expose bezel mounting screws. Items vary depending on model.
- (7) Remove two screws over upper cluster bezel in instrument panel brow area and all remaining attaching screws (four on Intrepid, Limited, and 300M, and five on Concorde).
- (8) Using a trim stick (special tool #C-4755), gently pry out on the instrument panel cluster bezel, disconnect headlamp switch connector, and remove.
- (9) Remove the instrument cluster screws.

NOTE: Tilt steering wheel down to gain access for instrument cluster removal.

- (10) Remove the instrument cluster from panel. The instrument panel wiring harness connectors are self-aligning, mounted directly to the rear panel. A force of approximately 9 kilograms (30 lbs.) will be required to disengage the cluster from the connectors and upper clips.
- (11) Remove two screws to mask/lens (Fig. 3).

80b243be

Fig. 3 INSTRUMENT CLUSTER MASK/LENS RETAINING SCREWS

Fig. 4 CLUSTER MASK/LENS RETAINING TABS - TOP

- 1 - MASK/LENS RETAINING TABS

- (13) Separate mask/lens from instrument cluster and remove.

INSTRUMENT CLUSTER MASK/LENS (Continued)

INSTALLATION

- (1) Align mask/lens with instrument cluster and snap into place (Fig. 4).
- (2) Snap seven retaining tabs holding mask/lens into place.
- (3) Install the two screws to mask/lens (Fig. 3).

NOTE: Tilt steering wheel down to gain access for instrument cluster installation.

(4) Install the instrument cluster into instrument panel. The instrument panel wiring harness connectors are self-aligning, mounted directly to the rear panel. A force of approximately 9 kilograms (30 lbs.) will be required to engage the cluster to the connectors and upper clips.

(5) Install the instrument cluster screws.

(6) Connect headlamp switch connector. Place the cluster bezel into position and snap it into place firmly.

(7) Install the two screws over upper cluster bezel in instrument panel brow area and all remaining attaching screws (four on Intrepid, Limited, and 300M, and five on Concorde).

(8) Install the items covering the bezel mounting screws.

(9) Install the one screw (Limited/300M) to cluster bezel

To service any instrument cluster component, the instrument cluster must be removed from the instrument panel. Use the following procedure:

- (10) Tilt the steering column down into the highest position.
- (11) Install the steering column shroud cover.
- (12) Install the instrument panel left end cap.
- (13) Connect the negative battery cable remote terminal to the remote battery post.

ODOMETER

REMOVAL

The instrument cluster must be removed for Odometer service. Refer to Instrument Cluster Removal and Installation.

On **Intrepid, Concorde, and 300M** models, the odometer and PRNDL are one assembly retained by three screws.

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove instrument cluster from vehicle. Refer to Instrument Cluster Removal and Installation.
- (3) Remove five cluster back cover retaining screws and remove the cover.
- (4) Unplug connectors from printed circuit board.

(5) Remove cluster mask/lens from instrument cluster. Refer to Mask/Lens Removal and Installation.

(6) Remove two screws to Vacuum Fluorescent (VF) display Odometer and remove from cluster.

INSTALLATION

(1) Install the two screws to Vacuum Fluorescent (VF) display.

(2) Install the cluster mask/lens on to the instrument cluster. Refer to Mask/Lens Removal and Installation.

(3) Install connectors to the printed circuit board.

(4) Install the five cluster back cover retaining screws.

(5) Install the instrument cluster in vehicle. Refer to Instrument Cluster Removal and Installation.

(6) Connect the negative battery cable remote terminal to the remote battery post.

RED BRAKE WARNING INDICATOR

DESCRIPTION

The red BRAKE warning indicator lamp is located on the instrument panel in the instrument cluster.

OPERATION

The red BRAKE warning indicator lamp is supplied 12-volt ignition feed anytime the ignition switch is on. The indicator lamp is then illuminated by completing the ground circuit either through the parking brake warning switch mounted on the parking brake lever, the brake fluid level switch mounted in the master cylinder reservoir, or the ignition switch when in the CRANK position.

TACHOMETER

DESCRIPTION

Refer to Electrical, Instrument Cluster, Description for more information.

OPERATION

The tachometer receives its information across the PCI Bus from the Body Control Module (BCM). Information on engine RPM is transmitted from the Powertrain Control Module (PCM) across the PCI Bus to the BCM. The BCM calculates the position of the tachometer pointer based on the input from the PCM and adjusts the position of the gauge pointer to the necessary position. This signal is sent over the PCI Bus to the instrument cluster.

TRANSMISSION RANGE INDICATOR (PRNDL)

DESCRIPTION

The shift position indicator is located in the instrument cluster. It indicates the position of the manual valve lever by illuminating an LED located under the P, R, N, D, 3, or L (or Autostick) gear symbol.

OPERATION

The Transmission Range Sensor (TRS) sends a signal to the Powertrain Control Module (PCM) regarding the position of the manual valve lever. The PCM converts this signal into a Shift Lever Position (SLP) and sends the information to the Body Control Module (BCM) and the instrument cluster.

DIAGNOSIS AND TESTING - TRANSMISSION RANGE INDICATOR

The transmission range sensor (on the valve body) sends a signal to the PCM on the position of the transaxle manual valve lever. The PCM receives the switch signal and processes the data. The PCM sends the Shift Lever Position (SLP) information to the BCM via the communication bus. The BCM then outlines the appropriate transmission range indicator in the instrument cluster.

If a problem arises with the transmission range indicator, refer to TRANSMISSION RANGE INDICATOR TEST, and the proper Body Diagnostic Procedures manual if the problem still exists.

To replace the transmission range indicator (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE BEZEL - REMOVAL).

TRANSMISSION RANGE INDICATOR TEST

CONDITION	POSSIBLE CAUSE
ALL PRND3L (PRND1234 if Autostick equipped) DISPLAY LIGHTS "ON" IN P&N GEAR POSITIONS	Check wiring and connectors
	Faulty TRS
	Faulty manual lever
ALL DISPLAY LIGHTS "ON" IN ALL GEAR POSITIONS	Check wiring & connectors
	Faulty trans. range sensor
	Faulty manual lever
	Communication bus malfunction

CONDITION	POSSIBLE CAUSE
ALL DISPLAY LIGHTS "OFF"	Normal transient condition between P&R and R&N gear positions
	Check shift lever linkage
	BCM malfunction
	Check wiring and connectors
	Faulty instrument cluster
ALL DISPLAY LIGHTS "OFF" ACCOMPANIED BY A "NO BUS" MESSAGE	Communication bus malfunction
DISPLAY LIGHTS OUT OF SEQUENCE WITH SHIFT LEVER	Check wiring and connectors
	Faulty TRS
	Faulty manual lever
	Communication bus malfunction

TRIP ODOMETER RESET KNOB

REMOVAL

The instrument cluster must be removed for Trip Reset Knob service.

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Remove instrument cluster from vehicle. Refer to Electrical, Instrument Cluster Removal.

(3) Remove five cluster back cover retaining screws and remove the cover.

(4) Remove nine screws to Printed Circuit Board and remove.

(5) Gently pull Trip Reset Knob from the instrument cluster housing and remove.

INSTALLATION

(1) Gently put Trip Odometer Reset Knob into the mask/lens.

(2) Install the nine screws to Printed Circuit Board.

(3) Install the five cluster back cover retaining screws.

(4) Install the instrument cluster. Refer to Electrical, Instrument Cluster Installation.

(5) Connect the negative battery cable remote terminal to the remote battery post.

DESCRIPTION

DESCRIPTION - POLICE

There are three pair of twisted 18-gauge wires from the interior-to-front bumper beam area to be used for the auxiliary flashers, siren, speaker, or control circuit usage. The twisted pairs are taped back to the wire harness right by the wire feed to the ambient temperature sensor behind the front fascia, in front of the condenser, just to the passenger side of the vehicle centerline. All police vehicle wiring (additional circuits added) is taped back to the wire harness with green tape for identification. Refer to Wiring Diagrams for location and circuit description.

The police package includes a Wig Wag (alternating flashing of the vehicle high beam headlamps) connector underneath the instrument panel. This connector is hard wired to the front high beam headlamps and is intended for use with an aftermarket lighting control module. Refer to Wiring Diagrams for location and circuit description.

DESCRIPTION - TURN SIGNAL & HAZARD WARNING SYSTEM

The turn signal and hazard warning system includes the following major components:

- Combination Flasher
- Hazard Warning Switch
- Turn Signal Cancel Cam
- Turn Signal Indicators
- Turn Signal Lamps
- Turn Signal Switch

SUPPLEMENTAL INDICATORS - 300M SPECIAL

The 300M Special has an added feature to the turn signal system. Mounted on the outside of the left and right power outside mirrors are supplemental indicators. These are intended for additional indication to alert other drivers to see when the vehicle is turning or changing lanes.

These supplemental indicators are an integral part of the outside power mirror assembly and cannot be serviced separately. If found to be faulty or defective, the entire power outside mirror must be replaced. These indicators are LED's and contain resistors internally to maintain proper operating voltage. The secondary indicators are spliced directly into the turn signal circuit.

OPERATION - TURN SIGNAL & HAZARD WARNING SYSTEM

The turn signal system operates on battery voltage received on a fused ignition switch output (RUN-ACC) circuit so that the turn signals will only operate with the ignition switch in the ON or ACCESSORY positions. The hazard warning system operates on non-switched battery voltage received on a fused B(+) circuit so that the hazard warning remains operational regardless of the ignition switch position. When the turn signal system is activated, the turn signal switch and the combination flasher will cause the selected turn signal indicator, front park/turn signal lamp, and rear tail/stop/turn signal lamp to flash ON and OFF. When the hazard warning system is activated, the hazard warning switch and the combination flasher will cause both the right side and the left side turn signal indicators, front park/turn signal lamps, and rear tail/stop/turn signal lamps to flash ON and OFF.

SUPPLEMENTAL INDICATORS - 300M SPECIAL

When the multi-function switch requests a left or right turn, the voltage is sent to the front and rear turn signals as well as the corresponding supplemental indicator. For diagnosis of the supplemental indicators, (Refer to 8 - ELECTRICAL/POWER MIRRORS - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING - TURN SIGNAL & HAZARD WARNING SYSTEM

When diagnosing the turn signal and hazard warning circuits, remember that high generator output can burn out bulbs rapidly and repeatedly. If this is a problem on the vehicle being diagnosed, be certain to diagnose and repair the charging system as required. If the problem being diagnosed is related to a failure of the turn signals to automatically cancel following completion of a turn, inspect the multi-function switch for a faulty or damaged cancel actuator and inspect the turn signal cancel cam on the clock spring for damaged lobes or improper installation.

(1) Turn the ignition switch to the ON position. Actuate the turn signal switch or the hazard warning switch. Observe the turn signal indicator(s) in the instrument cluster. If the flash rate is very high, check for a turn signal bulb that is not lit or is very dimly lit. Repair the circuits to that lamp or replace the faulty bulb, as required. If the turn signal indicator(s) fail to light, go to Step 2.

(2) Turn the ignition switch to the OFF position. Check the fused ignition switch output (RUN-ACC) fuse in the Junction Block (JB) and the fused B(+) fuse in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).

LAMPS/LIGHTING - EXTERIOR (Continued)

(3) Check for battery voltage at the fused B(+) fuse in the PDC. If OK, go to Step 4. If not OK, repair the open B(+) circuit between the PDC and the battery as required.

(4) Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (RUN-ACC) fuse in the JB. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (RUN-ACC) circuit between the JB and the ignition switch as required.

(5) Turn the ignition switch to the OFF position. Disconnect and isolate the battery negative cable. Remove the combination flasher from the rear of the multi-function switch and replace it with a known good unit. Reconnect the battery negative cable. Test the operation of the turn signal and hazard warning systems. If OK, discard the faulty combination flasher. If not OK, remove the test flasher and go to Step 6.

(6) Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (RUN-ACC) circuit in the rear of the multi-function switch for the combination flasher. If OK, go to Step 7. If not OK, repair the open fused ignition switch output (RUN-ACC) circuit between the combination flasher and the fused ignition switch output (RUN-ACC) fuse in the JB as required.

(7) Turn the ignition switch to the OFF position. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector for the combination flasher. If OK, go to Step 8. If not OK, repair the open fused B(+) circuit between the combination flasher and the fused B(+) fuse in the PDC as required.

(8) Disconnect the instrument panel wire harness connector for the multi-function switch. Check for continuity between the hazard flasher signal circuit in the instrument panel wire harness connector and the instrument panel wire harness connector for the multi-function switch. There should be continuity. If OK, go to Step 9. If not OK, repair the open hazard flasher signal circuit between the combination flasher and the multi-function switch as required.

(9) Check for continuity between the right turn switch sense circuit in the instrument panel wire harness connector and the instrument panel wire harness connector for the multi-function switch. Repeat this check between the left turn switch sense circuit cavities. If OK, go to Step 10. If not OK, repair the open right and/or left turn switch sense circuit(s) between the combination flasher and the multi-function switch as required.

(10) Check for continuity between the right and/or left turn signal circuit in the instrument panel wire harness connector for the combination flasher and the individual turn signal lamps. There should be

continuity. If OK, test the multi-function switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING). If not OK, repair the open right and/or left turn signal circuit(s) between the combination flasher and the turn signal lamp(s) as required.

SPECIFICATIONS

EXTERIOR LAMPS

CAUTION: Do not use bulbs other than those listed in the Bulb Application Table. Damage to lamp can result.

Do not touch halogen bulbs with fingers or other oily surfaces. Bulb life will be reduced.

BACK UP LAMP

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws holding back up lamp unit to bumper.
- (3) Separate back up lamp unit from bumper.
- (4) Rotate lamp socket counterclockwise one quarter turn.
- (5) Pull lamp socket from back of lamp unit.
- (6) Pull lamp from lamp socket.

INSTALLATION

- (1) Push lamp into lamp socket.
- (2) Push lamp socket into back of lamp unit.
- (3) Rotate lamp socket clockwise one quarter turn until it stops.
- (4) Position back up lamp unit into opening on bumper.
- (5) Install screws to hold back up lamp unit to bumper.
- (6) Connect the battery negative cable.

BACK UP LAMP UNIT

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws holding back up lamp unit to rear bumper.
- (3) Disconnect the wire connector.
- (4) Separate lamp unit from vehicle.

INSTALLATION

- (1) Connect the one wire connector.
- (2) Place back up lamp unit into opening in bumper on vehicle.
- (3) Install screws to hold back up lamp unit to rear bumper.
- (4) Connect the battery negative cable.

BRAKE LAMP SWITCH

DESCRIPTION

The brake lamp switch is located under the instrument panel at the brake pedal arm (Fig. 1). This switch contains three internal switches controlling various functions of the vehicle, one of them controls operation of the vehicle's brake lamps. Other functions of the internal switches include speed control deactivation and brake sense for the ABS and the brake transmission shift interlock.

Fig. 1 BRAKE LAMP SWITCH

- 1 - STEERING COLUMN COUPLER
- 2 - BRAKE PEDAL
- 3 - SWITCH

OPERATION

The brake lamp switch has three internal switches used for various functions. Among these are:

- Brake lamp actuation

BRAKE LAMP SWITCH (Continued)

- Speed control deactivation, and
- Brake sense for ABS and brake transmission shift interlock

When the brake pedal is in the released position, the plunger on the outside of the brake lamp switch is pushed inward by the brake pedal. In this position, the electrical contacts for one internal switch are open while the electrical contacts for other two internal switches are closed.

When the brake pedal is pressed, the plunger on the outside of the brake lamp switch extends outward. This action closes the electrical contacts for the one internal switch and opens the contacts for the remaining two switches within the brake lamp switch. The internal switch which closes when the brake pedal is pressed completes the circuit to the brake lamps at the rear of the vehicle, thus allowing illumination of the brake lamps and the center-high-mounted stop lamp (CHMSL).

DIAGNOSIS AND TESTING - BRAKE LAMP SWITCH

NOTE: Before proceeding with this diagnostic test, verify the adjustment of the brake lamp switch to rule out misadjustment. Refer to **ADJUSTMENTS**.

If the electrical circuit has been tested and the brake lamp switch is suspected of being faulty, it can be tested using the following method.

(1) Remove the switch from the vehicle. Refer to **REMOVAL** for the proper procedure.

(2) With the switch in the released position (plunger extended), use an ohmmeter to test each of the three internal switches as shown (Fig. 2). You should achieve the results as listed in the figure.

80bfe180

Fig. 2 SWITCH TEST - RELEASED

(3) Gently push the plunger on the brake lamp switch in until it stops.

(4) With the switch in the depressed position (plunger pushed in), use an ohmmeter to test each of the three internal switches as shown (Fig. 3). You should achieve the results as listed in the figure.

80bfe18*

Fig. 3 SWITCH TEST - DEPRESSED POSITION

If you do not achieve the results as listed in both figures, the switch is faulty and must be replaced.

(5) Install the switch in the vehicle. Refer to **INSTALLATION** for the proper procedure.

REMOVAL

- (1) Depress and hold the brake pedal.
- (2) Remove the brake switch from its bracket (Fig. 4). To do so, rotate the brake lamp switch in a counterclockwise direction approximately 30 degrees from its proper mounting position. Pull the switch rearward and remove it from its mounting bracket.

(3) Disconnect the wiring harness connector from switch.

INSTALLATION

NOTE: Prior to installing the brake lamp switch into its bracket, the plunger must be moved to its fully extended position using the procedure in Step 1.

(1) Hold the brake lamp switch firmly in one hand. Using your other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.

(2) Connect the wiring harness connector to the brake lamp switch.

BRAKE LAMP SWITCH (Continued)

**Fig. 4 BRAKE PEDAL AND BRAKE LAMP SWITCH**

- 1 - BUSHINGS
- 2 - BRAKE PEDAL
- 3 - BRAKE LAMP SWITCH
- 4 - PIVOT SHAFT

(3) Mount the brake lamp switch into the bracket as follows: Depress the brake pedal as far down as possible. Install the switch in its bracket by aligning the index key on switch with the notch in the square mounting hole of the mounting bracket (Fig. 4). Once the switch is fully seated, rotate the switch clockwise approximately 30° to lock the switch into the bracket.

CAUTION: Do not use excessive force when pulling back on the brake pedal to adjust the brake lamp switch. If too much force is used, damage to the brake lamp switch or striker can result.

(4) Gently pull back on brake pedal until the pedal stops moving. This will cause the switch plunger to ratchet backward to the correct position.

(5) Check for proper operation of the brake lamps and speed control.

ADJUSTMENTS

ADJUSTMENT - BRAKE LAMP SWITCH

- (1) Depress and hold the brake pedal.
- (2) Remove the brake switch from its bracket (Fig. 4). To do so, rotate the brake lamp switch in a counterclockwise direction approximately 30 degrees from its proper mounting position. Pull the switch rearward and remove it from its mounting bracket.
- (3) Hold the brake lamp switch firmly in one hand. Using your other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.

(4) Mount the brake lamp switch into the bracket as follows: Depress the brake pedal as far down as possible. Install the switch in its bracket by aligning the index key on switch with the notch in the square mounting hole of the mounting bracket (Fig. 4). Once the switch is fully seated, rotate the switch clockwise approximately 30° to lock the switch into the bracket.

CAUTION: Do not use excessive force when pulling back on the brake pedal to adjust the brake lamp switch. If too much force is used, damage to the brake lamp switch or striker can result.

(5) Gently pull back on brake pedal until the pedal stops moving. This will cause the switch plunger to ratchet backward to the correct position.

(6) Check for proper operation of the brake lamps and speed control.

CENTER HIGH MOUNTED STOP LAMP

REMOVAL

CONCORDE

- (1) Open hood, disconnect and isolate the battery negative cable.
- (2) Release decklid latch and open decklid.
- (3) From under rear shelf panel, disconnect the lamp socket from the CHMSL housing (Fig. 5).
- (4) Remove bulb from the socket.

**Fig. 5 CHMSL - REAR SHELF**

- 1 - CHMSL HOUSING

INTREPID

- (1) Open hood, disconnect and isolate the battery negative cable.
- (2) Release decklid latch and open decklid.
- (3) Remove decklid cover.

CENTER HIGH MOUNTED STOP LAMP (Continued)

- (4) Disconnect lamp socket from housing (Fig. 6).
- (5) Remove bulb from socket.

- (3) Connect CHMSL wire connector to body harness.
- (4) Verify CHMSL operation.
- (5) Install decklid cover.

300M

- (1) Place CHMSL in position on decklid.
- (2) Install fasteners attaching CHMSL to decklid.
- (3) Connect CHMSL wire connector to body harness.
- (4) Verify CHMSL operation.
- (5) Install decklid cover.

COMBINATION FLASHER**DESCRIPTION**

The Combination Flasher, also referred to as the combo-flasher, is mounted to the in-line bracket which is located to the right of the Junction Block. The flasher can be removed by pulling in a rearward direction. The left under panel silencer duct must be removed to access the flasher. The combo-flasher is black in color for ease of identification.

OPERATION

The Turn Signal and Hazard Warning Flasher is combined into one unit called a Combination Flasher (Combo-Flasher). The combo-flasher controls the flashing of the hazard warning system and the turn signal system. An inoperative bulb or incomplete turn signal circuit will result in an increase in flasher speed.

DIAGNOSIS AND TESTING - COMBINATION FLASHER

(Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING) and the COMBINATION FLASHER DIAGNOSIS table.

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 9).

80b1b422

COMBINATION FLASHER (Continued)

(2) Remove the left instrument panel silencer. Refer to Body, Instrument Panel Silencer, Removal.

(3) The flasher can be removed by pulling in a rearward direction.

INSTALLATION

(1) Install the flasher by firmly pushing it into place.

(2) Install the left instrument panel silencer. Refer to Body, Instrument Panel Silencer, Installation.

(3) Connect the negative battery cable remote terminal to the remote battery post (Fig. 9).

DAYTIME RUNNING LAMP MODULE**DESCRIPTION**

On vehicles equipped with Daytime Running Lamps (DRL) (Canada only), they are controlled by the Daytime Running Lamp Module. The DRL module is attached to the Junction Block. The Junction Block is located on the left side of the instrument panel.

OPERATION

The DRL allows the high beam headlamps to illuminate at reduced power when the ignition switch is in the RUN position with the high and low beam headlamp switches in the OFF position. The Park Brake must be released and the Brake Fluid Level switch must be in the OPEN position to allow the headlamps to operate in DRL mode. The daytime running lamps will go out when the headlamp switch is turned ON. The passing light feature will flash bright high beams while the daytime running lamps are activated.

DIAGNOSIS AND TESTING - DAYTIME RUNNING LAMP MODULE

The Daytime Running Lamp Module (DRL Module) is controlled by inputs received from the ignition switch and High or Low Beam Headlamp relays, Park Brake switch, and the Brake Fluid Level switch. Refer to Wiring Diagrams, for component location and circuit information and the proper Body Diagnostic Procedures manual.

DECKLID/TRUNK LAMP**REMOVAL**

(1) Open hood, disconnect and isolate the battery negative cable.

(2) Remove lens from lamp from the rear shelf (Fig. 10).

(3) Pull bulb from socket.

80b27c57

Fig. 10 Trunk Lamp Bulb

- 1 - BULB
- 2 - TRUNK LAMP SOCKET
- 3 - REAR SHELF
- 4 - LENS

INSTALLATION

(1) Insert bulb into socket.

(2) Install lamp lens.

(3) Connect the battery negative cable and close hood.

FOG LAMP**DIAGNOSIS AND TESTING - FOG LAMP**

When a vehicle experiences problems with the fog lamp system, verify the condition of:

- Battery connections
- Charging system
- Fog lamp bulbs
- Headlamp switch
- Body Control Module
- Wire connectors

Refer to Wiring Diagrams, for component locations and circuit information.

FOG LAMP (Continued)

CONCORDE

- (1) Remove fog lamp housing screw in front fascia and pull lamp housing from the front fascia.
- (2) Disconnect wire connector from fog lamp socket (Fig. 13).
- (3) Rotate socket and pull bulb/socket from lamp housing.

FOG LAMP (Continued)

INSTALLATION

INTREPID/300M

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result.

- (1) Connect wire connector to fog lamp wire harness.
- (2) Cover exposed terminal with teflon coated sleeve.
- (3) Insert bulb into lamp housing.
- (4) Hinge wire clip over bulb base.
- (5) Engage wire clip to hold bulb in fog lamp.
- (6) Install rear cover to fog lamp housing.
- (7) Verify fog lamp operation and alignment.
- (8) Install fog lamp housing screw to the front fascia.

CONCORDE

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result.

- (1) Install socket into fog lamp housing and rotate to the lock position.
- (2) Connect wire connector to the socket.
- (3) Verify fog lamp operation and alignment.
- (4) Install fog lamp housing into fascia.
- (5) Install fog lamp screw to the front fascia

FOG LAMP UNIT

STANDARD PROCEDURE - FOG LAMP UNIT ALIGNMENT

Prepare an alignment screen (Fig. 14). Refer to Electrical, Lamps/Lighting - Exterior, Headlamp, Adjustments for Alignment Screen Preparation. A properly aligned fog lamp will project a pattern on the alignment screen 100 mm (4 in.) below the fog lamp center line and straight ahead. To adjust fog lamp alignment, rotate the alignment screw (Fig. 15), (Fig. 16) or (Fig. 17).

- (4) Connect the battery negative cable and close hood.

FOG LAMP UNIT (Continued)

(5) Verify fog lamp operation and alignment. Refer to Electrical, Exterior Lamps/Lighting, Fog Lamp, Adjustments.

FRONT POSITION LAMP - EXPORT

DESCRIPTION

Fig. 21 FRONT POSITION LAMP - EXPORT

- 1 - FRONT POSITION LAMP SOCKET
2 - HEADLAMP MODULE

All vehicles are equipped with front position lamps. One front position lamp is incorporated into each of the headlamp modules (Fig. 21). These lamps utilize a clear lens and clear bulb and function in the same way that Parking Lamps do on other market built vehicles (U.S., Canada). The front position lamp is built in to the headlamp and therefore doesn't require its own lamp housing.

OPERATION

The front position lamps are turned on or off with the headlamp switch. These lamps function in the same way that the parking lamps do on other market built vehicles. (U.S., Canada). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - FRONT POSITION LAMP - EXPORT

The following test is designed to diagnosis a faulty front position lamp. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

NOTE: Battery must be completely charged (12v) prior to testing. It may also be necessary to install battery charger on the vehicles electrical system when performing this test. Refer to the Battery section of the service manual for detailed information.

(1) Remove the front position lamp bulb and check for burned out condition, replace bulb if necessary.

(2) If bulb appears OK, reinstall the bulb in its socket and rotate the left side multi-function switch one detent position and check for lamp operation. If lamp is still inoperative proceed to step #3.

(3) Remove lamp bulb and check for proper power (12v) and ground connections in lamp socket. If power and/or ground connections are not present, trace wire until open or short is found.

REMOVAL

(1) Remove the headlamp module from the vehicle (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(2) Twist and remove the front position lamp socket from the headlamp module.

(3) Pull the front position lamp bulb straight from its socket (Fig. 22).

INSTALLATION

(1) Install the front position lamp bulb in lamp socket.

(2) Verify lamp operation.

(3) Install front position lamp socket in the headlamp module.

(4) Install the headlamp module in the vehicle (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

FRONT POSITION LAMP - EXPORT (Continued)

**Fig. 22 FRONT POSITION LAMP BULB**

- 1 - FRONT POSITION LAMP BULB
2 - FRONT POSITION LAMP SOCKET

HEADLAMP

DESCRIPTION

HEADLAMP SYSTEM

The headlamp system is controlled completely by the Body Control Module (BCM). The BCM controls the Park lamps, Headlamps, and Front Fog Lamps using relays located in the Junction Block. Three wires are connected between the headlamp switch and the BCM. The first wire contains information regarding the position of the headlamp switch (Off, Automatic Headlamps, Automatic Headlamp switch fog, Park with Fog, Head, or Head with Fog Lamps). The second wire contains information regarding the position of the dimmer switch (Dome Lamp, Daytime Brightness, or Dimming Level). The third wire is a dedicated signal return (ground) wire.

AUTO HEADLAMP SYSTEM

The Automatic Headlamp system turns the instrumentation and exterior illumination lamps ON when the ambient light levels are low and OFF when light levels are high.

HEADLAMPS ON WITH WIPERS

For vehicles equipped with the Automatic Headlamp System, the instrumentation and exterior illumination lamps will be turned ON when the headlamp switch is in the AUTO position and the

windshield wipers have been in the intermittent, low or high mode of operation for more than ten seconds. When the windshield wipers are turned OFF the Body Control Module will determine if the instrumentation and exterior illumination lamps should remain ON based upon the current ambient light level.

LAMP SYSTEMS

Vehicles use lighting on the interior and exterior of the vehicle for illuminating and indicating purposes. Lighting circuits are protected by fuses or circuit breakers. Lighting circuits require an overload protected power source, on/off device, lamps and body ground to operate properly. Plastic lamp sockets require a wire in the harness to supply body ground to the lamp socket. Lamp sockets that are exposed to moisture should be coated with Mopar® Multi purpose Grease or equivalent to avoid corrosion. If a socket has become corroded, clean socket and bulb base with abrasive fiber sanding pad or metallic bristle brush. Replace sockets and bulbs that are deformed from corrosion that could prevent a continuous body ground.

Wire connectors can make intermittent contact or become corroded. Before coupling wire connectors, inspect the terminals inside the connector. Male terminals should not be bent or disengaged from the insulator. Female terminals should not be sprung open or disengaged from the insulator. Bent and sprung terminals can be repaired using needle nose pliers and pick tool. Corroded terminals appear chalky or green. Corroded terminals should be replaced to avoid recurrence of the problem symptoms. Wire connector terminals should be coated with Mopar® Multi purpose Grease or equivalent to avoid corrosion.

Begin electrical system failure diagnosis by testing related fuses and circuit breakers in the fuse block and engine compartment. Verify that bulbs are in good condition and test continuity of the circuit ground. Refer to Wiring Diagrams, for component location and circuit information.

HIGH INTENSITY DISCHARGE HEADLAMPS - 300M SPECIAL

This vehicle is equipped with **High Intensity Discharge Headlamps (HID)**. The HID type lamp is used in place of the conventional halogen low beam lamp. High beam lamps remain the same halogen type.

There are three components in the HID system (Fig. 23), the ballast module (attached to the bottom of the headlamp unit), the igniter (plugs into the ballast module), and the lamp itself (part of the igniter assembly and only replaceable with the igniter).

HEADLAMP (Continued)

80edd53b

Fig. 23 HID SYSTEM COMPONENTS

- 1 - IGNITER/LAMP ASSEMBLY W/WATER SHIELD
- 2 - BALLAST MODULE
- 3 - IGNITER/LAMP ASSEMBLY CONNECTOR
- 4 - B+ AND B- SUPPLY TO BALLAST MODULE

HID lamps get their name from the intense white light produced by the electrical discharge. The light produced by the HID lamps appears as a white color as opposed to the yellow color of the standard halogen lamps.

HID lighting provides about three times the light output of standard halogen lamps while using less energy. The lamps are also designed to last 10 times longer than standard halogen lamps.

OPERATION**HEADLAMP SYSTEM**

The headlamp system will default to the headlamps ON position when the ignition switch is ON, or when an open/short circuit failure occurs on the headlamp switch input. The system will return to normal operation when the open or short is repaired. A fault will be reported by the BCM when a failure occurs on the dimmer or headlamp switch input.

The dimmer system will default to Daytime Brightness when an open or a short occurs on the dimmer switch input.

The BCM will turn OFF the exterior lamps if they are left ON with the ignition switch OFF for more than ten minutes. This feature prevents the vehicle battery from being discharged when the vehicle lights have been left ON.

AUTO HEADLAMP SYSTEM

Automatic headlamps are controlled by the Body Control Module (BCM). With the headlamp switch in the AUTO position (Automatic mode). The BCM will control the headlamp, parking, side marker, tail and instrumentation lamps based on ambient light levels. Ambient light levels are monitored by the BCM using the automatic temperature control system Sun Sensor, located on the top of the instrument panel cover. Ambient light readings are averaged to limit cycling the lamps ON and OFF when passing through areas with varying light levels. The automatic headlamps will only function when the engine is running. When the headlamp switch is in the AUTO position, the Headlamp Time Delay system will function when the ignition is switched OFF.

HIGH INTENSITY DISCHARGE HEADLAMPS - 300M SPECIAL

High Intensity Discharge Headlamps (HID) rely on an electrical charge to ignite xenon gas contained in a sealed beam lamp. The HID lamps are similar in operation to common vapor filled street (halogen) lamps. Instead of using a filament to produce light, the gas inside the lamp is ignited by creating an arc between two electrodes.

The color of the light source is classified as its color temperature. As the color temperature increases, the color of the light moves from yellow to white to blue-white. The light produced by the HID lamps appears as a white color as opposed to the yellow color of the standard (halogen) lamps. HID lamps provide light as a higher color temperature than standard halogen lamps.

For the color temperature of different lamp types, refer to the COLOR TEMPERATURE table. As a point of reference, typical sunlight at noon has a color temperature of 4977° C (8990° F).

COLOR TEMPERATURE

LAMP	TEMPERATURE
INCANDESCENT LAMPS	2527° C (4580° F)
HALOGEN LAMPS	2927° C (5300° F)
HID LAMPS	3827° C (6920° F)

There are three components to each of the HID headlamps (Fig. 23):

- **Ballast Module** - The 12 volt Direct Current (DC) power supplied by the low beam relay is converted to Alternating Current (AC) power by the ballast module (Fig. 24). Each lamp requires its own ballast. The ballast converts and steps up the low beam relay output to 800 volts AC, and supplies the lamp assembly via a cable connected to the igniter.

HEADLAMP (Continued)

• **Igniter** - The lamp assembly contains an igniter (Fig. 25) that controls the voltage applied to the lamp electrodes. The igniter uses the voltage supplied by the ballast and momentarily steps up the voltage to 25,000 volts to start the lamp. Once ignited, it will reduce the voltage to 85 volts.

• **Lamp** - The lamp (Fig. 25) contains electrodes and xenon gas. The lamp takes about 10-15 seconds of warm-up time to reach full operation. The light appears blue during warm-up and then turns to white.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP

When a vehicle experiences problems with the headlamp system, verify the condition of:

- Battery connections
- Charging system
- Headlamp bulbs
- Head lamp relay
- High beam dimmer switch
- Headlamp switch
- Body Control Module
- Wire connectors

Refer to Wiring Diagrams, for component locations and circuit information.

HEADLAMP (Continued)

Replace dimmer switch.

DIAGNOSIS AND TESTING - HIGH INTENSITY DISCHARGE HEADLAMPS - 300M SPECIAL

The High Intensity Discharge (HID) headlamps are supplied B+ voltage and ground by the same connector used to power the normal halogen low beam lamp. The low beam system is different from there forward. The ballast module is mounted to the bottom of the headlamp unit (Fig. 23). The ballast module has internal circuit protection to prevent module damage in case of an open or shorted circuit. If the module senses a short or open circuit condition, it will not operate the lamp/igniter.

The headlamp unit assembly must be removed to perform the following tests (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(1) Inspect lamp/igniter assembly for a burned out lamp. If lamp is burned out it will appear black or smoky, similar to a normal halogen bulb. If lamp looks OK, go to Step 2.

(2) Check for B+ battery voltage at the two pin connector going into the ballast module. Refer to Wiring Diagrams for connector location. If battery voltage and a good ground are present, go to Step 3. If B+ voltage and a good ground are not present, refer to Wiring Diagrams for circuit and connector locations to find short or open circuit.

(3) Plug in a known good ballast module and check for lamp operation. If lamp lights, replace ballast module. If lamp still fails to light, replace lamp/igniter assembly.

HEADLAMP (Continued)

REMOVAL

CONCORDE/300M

NOTE: Headlamp lens fogging is a normal condition and does not require service unless excessive or continual. Moisture will vent from tubes or vents located on the back of the lamp.

(1) Remove headlamp unit. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit, Removal.

(2) Rotate retaining ring (High beam or Low beam) and pull lamp socket from headlamp housing (Fig. 26).

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result.

(3) Remove bulb from lamp wiring connector.

Fig. 26 HEADLAMP REMOVAL

- 4 - LAMP SOCKET

HIGH INTENSITY DISCHARGE HEADLAMPS - 300M SPECIAL

IGNITER/LAMP ASSEMBLY

(1) Remove headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(2) Disconnect the igniter assembly connector from the ballast module (Fig. 23).

(3) Remove three screws to the rubber shield retaining ring (Fig. 27).

(4) Pull up on rubber water shield and pull back over igniter wire (Fig. 27).

80edd5fe

Fig. 27 HID IGNITER/LAMP ASSEMBLY

- 1 - IGNITER/LAMP ASSEMBLY W/WATER SHIELD
- 2 - RETAINING SCREWS
- 3 - WATER SHIELD RETAINING RING
- 4 - BALLAST MODULE
- 5 - IGNITER/LAMP ASSEMBLY WIRE TO BALLAST MODULE

(5) Release the spring retainer to the igniter/lamp assembly.

(6) Pull assembly straight out of headlamp unit.

The igniter and lamp are an assembly and will be replaced as such. The water shield will also come with a new assembly.

BALLAST MODULE

(1) Remove headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(2) Disconnect the igniter/lamp assembly connector from ballast module (Fig. 28).

(3) Remove the three retaining screws to the ballast module (Fig. 28).

INTREPID

NOTE: Headlamp lens fogging is a normal condition and does not require service unless excessive or continual. Moisture will vent from tubes or vents located on the back of the lamp.

(1) Release hood latch and open hood.

(2) Disconnect and isolate the battery negative cable.

(3) Remove jackscrews attaching headlamp unit to crossmember and remove to access the lamp(s).

- 2 - PARKING AND TURN SIGNAL
- 3 - HIGH BEAM

INSTALLATION**CONCORDE/300M**

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result.

- (1) Install the headlamp wiring connector.
- (2) Place lamp into socket and rotate retaining ring (High beam or Low beam) to headlamp housing.
- (3) Install the headlamp unit. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit, Installation.

HIGH INTENSITY DISCHARGE HEADLAMPS - 300M SPECIAL**IGNITER/LAMP ASSEMBLY**

The igniter and lamp are an assembly and will be replaced as such. The water shield will also come with a new assembly.

- (1) Place assembly straight into the headlamp unit.
- (2) Install the spring retainer onto the igniter/lamp assembly.
- (3) Start the rubber water shield in the groove, making sure it is positioned properly and then press down on the edge to fully seat the lip in the retaining groove.
- (4) Position the retaining ring over the water shield and install. Remove three screws.
- (5) Connect the igniter assembly connector into the ballast module.
- (6) Install the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

BALLAST MODULE

- (1) Install the three retaining screws to the ballast module.
- (2) Connect the igniter/lamp connector to the ballast module.
- (3) Install the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

INTREPID

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result.

- (1) Rotate bulb (High beam or Low beam) and push into headlamp unit.
- (2) Connect wire connector to the back of lamp socket (Fig. 29).

HEADLAMP (Continued)

- (3) Install the jackscrews attaching headlamp unit to crossmember.
- (4) Connect the battery negative cable.
- (5) Close the hood.

HEADLAMP DELAY

DESCRIPTION

The Headlamp Time Delay system is controlled by the Body Control Module (BCM) through the headlamp relay.

OPERATION

The headlamp time delay system is activated by turning the headlamps ON (high or low beam) while the engine is running, turning the ignition switch OFF, and then turning the headlamp switch OFF within 45 seconds. The system will not activate if more than 45 seconds elapse between ignition switch OFF and headlamp switch OFF. The BCM will allow the headlamps to remain ON for 90 seconds before they automatically turn off. Refer to the Owner's Manual for more information.

HEADLAMP LEVELING MOTOR
- EXPORT

DESCRIPTION

HEADLAMP LEVELING SYSTEM

The Remote Headlamp Leveling System allows the driver to adjust the headlamp beam pattern from the interior of the vehicle to compensate for passenger or cargo load. Only the vertical axis of the headlamp beam can be adjusted.

A headlamp leveling switch is located on the instrument panel and controls the headlamp leveling motors/modules found on the headlamp modules. The Leveling switch has three settings 0-2, 0 being the lowest, 2 being the highest headlight beam vertical setting.

NOTE: When performing a headlamp beam pattern alignment on a vehicle equipped with headlamp lev-

eling, be certain the headlamp leveling switch is in the "0" position before starting. Failure to do so will result in an incorrect headlamp alignment.

HEADLAMP LEVELING MOTOR

Vehicles equipped with the remote headlamp leveling system, utilize headlamp leveling motors. Two leveling motors are used per vehicle, one for each headlamp. These leveling motors are attached to the rear of the headlamp modules. They can be described as a small semi-square shaped module with a electrical connector attached to one side. Due to vehicle design these motors can only be serviced or accessed by removing the headlamp from the vehicle.

OPERATION

HEADLAMP LEVELING SYSTEM

Moving the headlamp leveling switch control knob will adjust the voltage (rheostat) sent to the headlamp leveling motors. This signals the headlamp leveling motors to move and adjust the vertical headlamp beam pattern accordingly. The headlamp switch must be "ON" in order for the leveling system to function. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

HEADLAMP LEVELING MOTOR

The headlamp leveling motors move the headlamp and beam pattern according to the signal received from the headlamp leveling switch. With the vehicles headlamps "ON" a signal voltage is sent from the headlamp leveling switch and received at each of the headlamp leveling motors. This signal voltage (typically 2 – 9 volts) tells the headlamp leveling motors where to position the headlamps. The headlamp leveling motors are attached to the headlamps with a pushrod snapped into the rear of headlamp reflector mechanism.

HEADLAMP LEVELING MOTOR - EXPORT (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP
LEVELING MOTOR - EXPORT

HEADLAMP LEVELING MOTOR DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE MOTOR DOES NOT OPERATE.	<ol style="list-style-type: none"> 1. Poor electrical connection at motor. 2. No voltage at motor. 3. No ground at motor. 4. Defective motor. 	<ol style="list-style-type: none"> 1. Check for proper electrical connection at motor. 2. Repair no voltage condition. Refer to Wiring Diagrams. 3. Repair no ground condition. Refer to Wiring Diagrams. 4. Replace leveling motor.
BOTH MOTORS DO NOT OPERATE.	<ol style="list-style-type: none"> 1. No voltage at or from headlamp leveling switch. 2. No voltage at leveling motors. 3. No ground at leveling motors. 4. Both motors defective. 	<ol style="list-style-type: none"> 1. Repair no voltage condition. Check for proper headlamp leveling switch operation. 2. Repair no voltage condition. Refer to Wiring Diagrams. 3. Repair no ground condition. Refer to Wiring Diagrams. 4. Replace both motors.

DIAGNOSIS AND TESTING - HEADLAMP
LEVELING SYSTEM - EXPORT

NOTE: The battery must be completely charged (12v) prior to testing. It may also be necessary to install a battery charger on the vehicles electrical system when performing this test. Refer to the Electrical, Battery System for detailed information.

(1) Rotate the headlamp switch (low beam) to the ON position.

(2) Disconnect the headlamp wire harness jumper electrical connector. This connector can be accessed by opening the bulb access panel, found in the appropriate front wheel well splash shield.

(3) Check PIN #1 for battery voltage. If not present, trace the circuit until the open or short is found.

(4) Check PIN #2 for ground. If not present, trace the circuit until the open or short is found.

(5) Check PIN #3 for headlamp leveling sense voltage (2.83 - 8.60v). If not present, trace circuit until open or short is found.

(6) If no open or short is found and the headlamp leveling system is still inoperative, replace the headlamp leveling motor (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(7) If testing is still inconclusive, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP LEVELING SWITCH - DIAGNOSIS AND TESTING) for further tests.

REMOVAL

(1) Remove the headlamp assembly from the vehicle (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(2) Disconnect the headlamp leveling motor wire connector.

(3) Place the headlamp assembly on a bench with a protective surface under the lens to prevent damage.

(4) Grasp the leveling motor and rotate approximately 45 degrees to unlatch it from the lamp housing.

(5) Using an appropriate prying tool, place the edge of tool between leveling motor gasket and headlamp assembly. Pry the leveling motor up and out.

NOTE: Significant force will be required to unsnap the leveling motor pushrod from the headlamp reflector mechanism.

CAUTION: Be certain not to damage the lamp housing sealing surface.

HEADLAMP LEVELING MOTOR - EXPORT (Continued)

INSTALLATION

(1) Be certain the replacement motor matches the configuration of the motor removed.

(2) Line up lugs on new motor with the corresponding openings on the headlamp housing making sure the ball stud on the motor lines up with ball stud receptacle on the lamp assembly. The receptacle can be moved by grasping the rubber boot area of the outboard lamp and moving by hand. Rotate the motor back into position to secure in place.

(3) Push down on outboard lamp until leveling motor ball stud snaps into place. Ensure that the ball stud is fully seated.

(4) Connect the headlamp leveling motor wire connector.

(5) Install the headlamp assembly on the vehicle (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

(6) Verify headlamp leveling motor operation.

(7) Check the headlamps for proper alignment. Align the headlamps if required (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - STANDARD PROCEDURE).

NOTE: Headlamps must be aligned with the headlamp leveling switch in the "0" position

HEADLAMP LEVELING SWITCH - EXPORT

DESCRIPTION

The Headlamp Leveling Switch is located next to the headlamp switch (Fig. 30) and is the primary controller of the headlamp leveling system. The leveling switch has three settings 0-2, "0" being the lowest, "2" being the highest headlight beam vertical setting.

OPERATION

With the rotation of the headlamp leveling switch control knob, voltage is adjusted at the headlamp leveling switch (rheostat). This signals the headlamp leveling motors (headlamp module mounted) to adjust the vertical headlamp beam pattern accordingly. The headlamps must be "ON" in order for the leveling system to function. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - HEADLAMP LEVELING SWITCH - EXPORT

(1) Disconnect and isolate the battery negative battery cable remote terminal.

(2) Remove the headlamp leveling switch from the instrument panel (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - REMOVAL).

(3) Disconnect the headlamp leveling switch electrical connector.

(4) Using an Ohm meter and the table below, check the resistance between the switch connector pins 1&2.

(5) If the test results are **NOT** as indicated in the HEADLAMP LEVELING SWITCH CONTINUITY table, replace the switch. If the test results **ARE** as indicated HEADLAMP LEVELING SWITCH CONTINUITY table, the switch is OK at this time. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - DIAGNOSIS AND TESTING).

HEADLAMP LEVELING SWITCH CONTINUITY

SWITCH POSITION	RESISTANCE BETWEEN PINS 1&2
0	0.752Ω
1	0.564Ω
2	348.8Ω

80b5748b

Fig. 30 HEADLAMP LEVELING SWITCH - EXPORT

HEADLAMP LEVELING SWITCH - EXPORT (Continued)

REMOVAL

The headlamp leveling switch is integrated into the headlamp switch. If the headlamp leveling switch proves faulty the entire headlamp switch must be replaced. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - REMOVAL).

INSTALLATION

The headlamp leveling switch is integrated into the headlamp switch. If the headlamp leveling switch proves faulty the entire headlamp switch must be replaced. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - INSTALLATION)

HEADLAMP SWITCH

DESCRIPTION - POLICE

This vehicle is equipped with a stealth mode. During periods of surveillance, the headlamp switch may be placed in the “A” position or Approach mode (Fig. 31). In this position, all exterior lighting (Daytime Running Lamps - if equipped) will be cancelled.

NOTE: On Canadian vehicles, the Daytime Running Lamps will not be disabled. These must stay operable due to Canadian federal regulations.

By pulling out on the switch (toward the driver) the lamps will be in Apprehend mode (Fig. 31). In this mode, all M2 circuit interior illumination, except for PRNDL, odometer, cluster back lighting, and vehicle critical warning indicators will be cancelled. The cluster back lighting, PRNDL, and odometer will go to a minimum dimming level.

The Body Control Module (BCM) must be flashed with a special police package for the stealth mode to work. A security provision may require the unique engine controller to broadcast a code to allow the BCM to be flashed with the police package program.

OPERATION - POLICE

APPROACH MODE

To place the vehicle's lighting system into Approach mode, turn the switch counterclockwise to the A on the headlamp switch (Fig. 31).

APPREHEND MODE

To place the vehicle's lighting system into Apprehend mode, turn the switch counterclockwise to the A on the headlamp switch and pull out (toward the driver) on the selector knob (Fig. 31).

80eac61d

Fig. 31 HEADLAMP SWITCH - POLICE

- 1 - APPROACH MODE (APPREHEND MODE - PULLED OUT)
- 2 - OFF
- 3 - HEADLAMPS
- 4 - PARKING LAMPS

DIAGNOSIS AND TESTING - HEADLAMP SWITCH

Using an ohmmeter, test for resistance values between the terminals of the switch as shown in the HEADLAMP SWITCH RESISTANCE table and (Fig. 32).

HEADLAMP SWITCH RESISTANCE

POSITION	TERMINALS	RESISTANCE
OFF	6 & 12	3600 Ω - 5400 Ω
PARK LAMP ON	6 & 12	44.65 Ω - 49.35 Ω
PARK LAMP W/FRONT FOG	6 & 12	115 Ω ± 5%
HEADLAMP ON	6 & 12	209.2 Ω - 231 Ω
HEADLAMP W/FRONT FOG	6 & 12	690 Ω ± 5%
AUTO	6 & 12	370.5 Ω - 409.5 Ω
AUTO W/FRONT FOG	6 & 12	1390 Ω ± 5%
RHEOSTAT (THUMBWHEEL) DIM POSITION	6 & 3	180 Ω - 1870 Ω (POT)
RHEOSTAT (THUMBWHEEL) BRIGHT POSITION (FUNERAL MODE)	6 & 3	2280 Ω - 2520 Ω
DOME LAMP	6 & 3	3230 Ω - 3570 Ω

HEADLAMP SWITCH (Continued)

80b6b17e

Fig. 32 HEADLAMP SWITCH CONNECTOR**REMOVAL**

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the left end cover, left instrument panel trim cover, and the cluster bezel. Refer to the various Removal and Installation procedures in this section.
- (3) Remove the three screws retaining headlamp switch to cluster bezel.
- (4) Remove headlamp switch from bezel.
- (5) Twist out lamp sockets are serviceable at this time. Ensure that the switch is seated against the pad.

INSTALLATION

- (1) Install the headlamp switch into bezel.
- (2) Install the three screws retaining headlamp switch to cluster bezel.
- (3) Install the left end cover, left instrument panel trim cover, and the cluster bezel. Refer to Instrument Panel, Removal and Installation.
- (4) Connect the negative battery cable remote terminal to the remote battery post.

HEADLAMP UNIT**STANDARD PROCEDURE****STANDARD PROCEDURE - HEADLAMP UNIT ALIGNMENT****HEADLAMP UNIT ALIGNMENT PREPARATION**

The vehicle headlamp units are equipped with a bubble level to aid up/down headlamp unit alignment. The bubble level is used to assist headlamp unit alignment when compensating for vehicle ride height changes due to heavy luggage compartment

loads or vehicle ride height changes. The vehicle should always be on a level surface when headlamp unit alignments are checked or changed. Headlamp unit alignment should always be first attempted by using the bubble level.

The bubble levels cannot be calibrated. The bubble level adjustments are set by the manufacturer. Horizontal alignment does not ordinarily have to be changed except in the case of body damage or tampering.

(1) Verify headlamp dimmer switch and high beam indicator operation.

(2) Inspect and correct damaged or defective components that could interfere with proper headlamp alignment.

(3) Verify proper tire inflation.

(4) Clean headlamp lenses.

(5) Verify that luggage area is not heavily loaded.

(6) Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

ALIGNMENT SCREEN PREPARATION

(1) Position vehicle on a level surface perpendicular to a flat wall 7.62 meters (25 ft.) away from front of headlamp lens.

(2) If necessary, tape a line on the floor 7.62 meters (25 ft.) away from and parallel to the wall.

(3) From the floor up 1.27 meters (5 ft.), tape a line on the wall at the center line of the vehicle. Sight along the center line of the vehicle (from rear of vehicle forward) to verify accuracy of the line placement.

(4) Rock vehicle side-to-side three times to allow suspension to stabilize.

(5) Jounce front suspension three times by pushing downward on front bumper and releasing.

(6) Measure the distance from the center of the headlamp bulbs to the floor, or refer to HEADLAMP UNIT ALIGNMENT MEASUREMENT TABLE. Transfer measurement to the alignment screen (with tape). Use this line for up/down (vertical) adjustment reference. Individual vehicles may vary.

(7) Measure distance from the center line of the vehicle to the center of the headlamp bulbs, or refer to the HEADLAMP UNIT ALIGNMENT MEASUREMENT TABLE. Transfer measurements to screen (with tape) to each side of vehicle center line (Fig. 33).

NOTE: There are reference marks on the lens to assist in locating the lamp centers.

HEADLAMP UNIT (Continued)

HEADLAMP UNIT ALIGNMENT MEASUREMENT TABLE

MODEL	LOW BEAM CENTERLINE TO GROUND		DISTANCE BETWEEN CENTERS (LOW BEAM)	
CONCORDE	25.0 in.	635.4 mm	54.2 in.	1376 mm
INTREPID	25.7 in.	652.4 mm	52.4 in.	1330 mm
LHS	25.0 in.	635.4 mm	49.3 in.	1254.5 mm
300M	24.8 in.	629.3	52.7 in.	1338.5 mm

Fig. 33 HEADLAMP UNIT ALIGNMENT SCREEN

- 1 - LOW BEAM CENTER LINE TO GROUND

2 - FRONT OF HEADLAMP

3 - 7.26 METERS (25 ft.)
- 4 - PREFERRED CUT OFF LOCATION ± 2 INS.

5 - CENTER OF VEHICLE

6 - CENTER OF HEADLAMP

HEADLAMP UNIT ADJUSTMENT

The low beam hot spot cut off should be within 2 inches above/below the horizontal center line, and to the right of the vertical center line (Fig. 33). This puts the low beam hot spot in the lower right quadrant of the aiming screen. Occasional stray filament images should be disregarded while verifying aim. Verify the vertical adjustment by checking the high beams to ensure they are centered within ± 2 inches relative to the horizontal center line. The low beams should be shielded when checking high beams. Do

NOT cover the headlamp(s) for extended periods, as the heat may damage them. To adjust headlamp alignment, rotate the alignment screws to achieve the specified pattern.

HEADLAMP UNIT (Continued)

STANDARD PROCEDURE - HEADLAMP UNIT ALIGNMENT - EXPORT**VEHICLE PREPARATION FOR HEADLAMP UNIT ALIGNMENT**

- (1) Verify the headlamp switch is in the low beam setting.
- (2) If the vehicle is equipped with a headlamp leveling system, be certain the headlamp leveling switch is in the "0" position.
- (3) Correct defective components that could hinder proper headlamp alignment.
- (4) Verify proper tire inflation.
- (5) Clean headlamp lenses.
- (6) Verify that luggage area is loaded as the vehicle is routinely used.
- (7) Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

ALIGNMENT SCREEN PREPARATION FOR HEADLAMP UNIT ALIGNMENT

- (1) Position vehicle on a level surface perpendicular to a flat wall 10 meters (32.8 ft) away from front of headlamp lens.
- (2) If necessary, tape a line on the floor 10 meters (32.8 ft) away from and parallel to the wall.
- (3) Place 75 kg in the drivers seat to simulate the ride height of the vehicle when driven.
- (4) Measure from the floor up 1.27 meters (5 ft) and tape a line on the wall at the centerline of the vehicle (Fig. 34). Sight along the centerline of the vehicle (from rear of vehicle forward) to verify accuracy of the line placement.
- (5) Rock vehicle side-to-side three times to allow suspension to stabilize.
- (6) Jounce front suspension three times by pushing downward on front bumper and releasing.
- (7) Measure the distance from the center of headlamp lens to the floor. Transfer measurement to the alignment screen (with tape). Use this line for up/down adjustment reference (this should be 623 mm (24.5 in.)).
- (8) Place a tape line 100 mm (4 in.) below and parallel to the center of headlamp line (Fig. 34).
- (9) Measure distance from the centerline of the vehicle to the center of each headlamp unit being aligned. Transfer measurements to screen (with tape) to each side of vehicle centerline. Use these lines for left/right adjustment reference (this should be 1338.5 mm (52.7 in.)).

HEADLAMP UNIT ADJUSTMENT

A properly aimed low beam headlamp will project a high intensity light pattern on the screen with the horizontal cut-off line aligned with the tape line 100 mm (4 in.) below the headlamp centerline (Fig. 34). The intersection of the horizontal and 15 degree cut-off lines in the projected pattern should align to the intersection of the headlamp centerline vertical tape line and the tape line 100 mm (4 in.) below the headlamp horizontal centerline.

NOTE: The vehicles low beam headlamps must be ON during the headlamp alignment procedure. The high beam pattern will be correct when the low beams are aligned properly.

NOTE: The headlamp leveling switch must be in the "0" position. Failure to do so will result in improperly adjusted headlamps.

To adjust headlamp unit alignment, rotate alignment screws to achieve the specified low beam hot spot pattern (Fig. 34).

REMOVAL

NOTE: Some moisture accumulation inside a vented headlamp unit is normal. Moisture will vent from tubes or vents located on the back of the unit. This normal condition will appear as a fogging on the inside of the headlamp lens (similar to the fog that sometimes appears on the inside of the windshield). This moisture may be removed by activating the headlamps on high beam for 15 minutes. If water droplets larger than 1 mm in size have accumulated on the inside of the headlamp lens, the headlamp unit should be replaced.

CONCORDE/300M

- (1) Release hood latch and open hood.
- (2) Disconnect and isolate the battery negative remote cable.
- (3) Remove the one bolt retaining the washer bottle filler neck and move aside.
- (4) Remove the two bolts retaining the speed control servo and move aside.
- (5) Remove fasteners to upper radiator crossmember:
 - Two jack screws on each side.
 - Three crossmember retaining bolts on each side.
 - Three push pin fasteners across top of grille.

HEADLAMP UNIT (Continued)

- 4 - FRONT OF HEADLAMP

- 5 - 10 METERS (32.8 FT.)
- 6 - HORIZONTAL CUT-OFF LINE
- 7 - 100 MM

• Gently pry back grille and remove the two bolts to front crossmember. This will allow you to move the crossmember forward, pivoting at the radiator grille, to access the headlamp unit.

NOTE: Once the crossmember is loose, take care not to scratch the fenders.

(6) Maneuver the headlamp unit to remove from behind fascia. Gentle prying of fascia may be needed to clear it enough to remove the headlamp unit.

(7) Disconnect the lamp connectors and transfer lamps if replacing unit.

INTREPID

- (1) Release hood latch and open hood.
- (2) Disconnect and isolate the battery negative cable.
- (3) Remove jackscrews attaching headlamp to body (Fig. 35).
- (4) Remove headlamp from body.
- (5) Disconnect wire connector from headlamp and parking, side marker, and turn signal lamps.
- (6) Remove headlamp housing from vehicle.

**Fig. 35 HEADLAMP UNIT - INTREPID**

- 2 - HEADLAMP HOUSING
- 3 - BODY WIRE CONNECTOR

HEADLAMP UNIT (Continued)

INSTALLATION

CONCORDE/300M

CAUTION: Do not touch the glass of halogen lamps with fingers or other possibly oily surface, reduced bulb life will result.

NOTE: If replacing complete headlamp unit, transfer lamps to new unit.

- (1) Connect the lamp connectors.
- (2) Maneuver the headlamp unit to under the crossmember and behind fascia. Gentle prying of fascia may be needed to clear it enough to install the headlamp unit.

NOTE: Be careful not to scratch the fenders while the crossmember is loose.

- (3) Install fasteners to upper radiator crossmember:
 - Gently pry back grille and install the two bolts to front crossmember.
 - Two jack screws on each side.
 - Three push pin fasteners across top of grille.
 - Three crossmember retaining bolts on each side.
- (4) Install the two bolts retaining the speed control servo.
- (5) Install the one bolt retaining the washer bottle filler neck.
- (6) Connect and the battery negative remote cable.
- (7) Verify headlamp operation and alignment.
- (8) Close hood and check alignment of hood that it is flush with the fenders.

INTREPID

NOTE: Headlamp lens fogging is a normal condition and does not require service unless excessive or continual. Moisture will vent from tubes or vents located on the back of the lamp.

- (1) Place headlamp unit in position on vehicle.
- (2) Connect wire connectors to headlamp, parking, side marker, and turn signal lamps.
- (3) Place headlamp unit in position on body.
- (4) Install screws to attach headlamp unit to body.

- (5) Connect the battery negative remote cable and close hood.
- (6) Verify headlamp operation and alignment.

LICENSE PLATE LAMP

REMOVAL

- (1) Remove screws attaching license plate lamp to rear bumper fascia.
- (2) Remove license plate lamp from rear bumper fascia.
- (3) Remove socket from lamp (Fig. 36).
- (4) Pull bulb from socket.

Fig. 36 LICENSE PLATE LAMP

(4) Verify park and front side marker lamp operation.

MARKER LAMP UNIT - CONCORDE

REMOVAL

- (1) Loosen fascia as necessary to access lamp.
- (2) Remove bulb socket from lamp.
- (3) Disconnect fasteners attaching side marker lamp to fascia (Fig. 38).
- (4) Remove attaching fasteners.
- (5) Remove lamp unit from vehicle.

INSTALLATION

- (1) Place lamp in position on fascia.
- (2) Install lamp fasteners.
- (3) Install bulb socket in lamp.
- (4) Connect wire harness connector.
- (5) Verify lamp operation.
- (6) Attach fascia to vehicle.

MULTI-FUNCTION SWITCH

DESCRIPTION**MULTI-FUNCTION SWITCH**

80b2b40c

Fig. 39 MULTI-FUNCTION SWITCH

- 1 - WINDSHIELD WASHER BUTTON
2 - CONTROL STALK (BEAM SELECT)
3 - HAZARD WARNING BUTTON
4 - MULTI-FUNCTION SWITCH
5 - WINDSHIELD WIPER CONTROL

The turn signals are part of the multi-function switch (Fig. 39) which contains:

- Electrical circuitry for turn signals.

MULTI-FUNCTION SWITCH (Continued)

- Hazard warning switch.
 - Headlamp beam select switch.
 - Headlamp optical horn.
 - Windshield wiper switch.
 - Pulse wipe and windshield washer switching.
- The integrated switch assembly is mounted to the left hand side of the steering column.

HAZARD WARNING SYSTEM

The hazard warning system is actuated by a push button located on the top of the steering column between the steering wheel and the instrument panel (Fig. 39). The hazard switch is identified with a double triangle on top of the button.

OPERATION

MULTI-FUNCTION SWITCH

When the driver wishes to signal his intentions to change direction of travel, he moves the lever upward to cause the right signals to flash and downward to cause the left signals to flash. After completion of a turn the system is deactivated automatically. As the steering wheel returns to the straight ahead position, a canceling cam molded to the clock spring mechanism comes in contact with the cancel actuator on the turn signal multi-function switch assembly. The cam lobe, pushing on the cancel actuator, returns the switch to the off position.

If only momentary signaling such as indication of a lane change is desired, the switch is actuated to a left or right intermediate detent position. In this position the signal lamps flash as described above, but the switch returns to the OFF position as soon as the lever is released.

When the system is activated, one of two indicator lamps mounted in the instrument cluster flashes in unison with the turn signal lamps, indicating to the driver that the system is operating.

HAZARD WARNING SYSTEM

Push and release the button to turn the hazard function ON or OFF. The button will move out from the steering column in the ON position and will remain in toward the column in the OFF position.

DIAGNOSIS AND TESTING - MULTI-FUNCTION SWITCH

The multi-function switch contains electrical circuitry for turn signal, hazard warning, headlamp beam select, headlamp optical horn, windshield wiper, pulse wipe, and windshield washer switching. Refer to Electrical, Wipers/Washers, Description and Operation for wiper and washer functions. This integrated switch assembly is mounted to the left hand side of the steering column. Should any function of the switch fail, the entire switch assembly must be replaced. Refer to the COMBINATION FLASHER DIAGNOSIS table.

To test the switch, the switch must first be removed. Refer to Multi-function Switch Removal and Installation. Using an ohmmeter, test for continuity (no resistance) between the terminals of the switch as shown in the TURN SIGNAL AND HAZARD SWITCH CONTINUITY table, BEAM SELECT SWITCH CONTINUITY table, (Fig. 40), and (Fig. 41).

COMBINATION FLASHER DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
SYSTEM DOES NOT FLASH ON ONE SIDE, INDICATOR LAMP FLASHES AT DOUBLE NORMAL RATE.	1. FAULTY EXTERNAL LAMP. 2. POOR GROUND AT LAMP. 3. OPEN CIRCUIT IN WIRING TO EXTERNAL LAMP.	1. REPLACE LAMP. 2. CHECK AND/OR REPLACE WIRING. 3. REPLACE WIRING HARNESS. CHECK CONNECTIONS.
INDICATOR LAMP FLASHES AT DOUBLE NORMAL RATE. EXTERNAL LAMP-DIM AND FLASHES RAPIDLY OR NO FLASH.	1. LOOSE OR CORRODED EXTERNAL LAMP CONNECTION. 2. POOR GROUND CIRCUIT AT EXTERNAL LAMP.	1. REPLACE SOCKET/HARNESS. 2. REPLACE WIRING HARNESS. CHECK CONNECTORS.

MULTI-FUNCTION SWITCH (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING MALFUNCTION/SYSTEM DOES NOT FLASH.	<ol style="list-style-type: none"> 1. FAULTY FUSE. 2. FAULTY FLASHER UNIT. 3. OPEN CIRCUIT IN FEED WIRE TO SWITCH. 4. FAULTY CONTACT IN SWITCH. 5. REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove tilt lever.
- (3) Remove both upper and lower steering column shrouds. Refer to Body, Instrument Panel, Steering Column Shrouds, Removal.
- (4) Remove multi-function switch mounting screws and connectors (Fig. 42).

INSTALLATION

- (1) Install the multi-function switch connectors and mounting screws (Fig. 42).
- (2) Tighten multi-function switch retaining screws to 17 in. lbs. (2 N·m) torque.
- (3) Install both upper and lower steering column shrouds. Refer to Body, Instrument Panel, Steering Column Shrouds, Installation.

MULTI-FUNCTION SWITCH (Continued)

- 4 - STEERING COLUMN
- 5 - MOUNTING SCREW

- (4) Install the tilt lever.
- (5) Connect the negative battery cable remote terminal to the remote battery post.

PARK/TURN SIGNAL LAMP

REMOVAL

INTREPID

- (1) Open Hood, disconnect and isolate the battery negative cable.
- (2) Remove headlamp.
- (3) Rotate and pull socket from lamp housing.
- (4) Pull bulb from socket (Fig. 43).

300M

- (1) Open Hood, disconnect and isolate the battery negative cable.
- (2) Reach under the fascia and remove the socket from the lamp housing (Fig. 44).
- (3) Rotate and pull socket from lamp housing.
- (4) Pull bulb from socket.

CONCORDE

- (1) Remove headlamp housing from vehicle.
- (2) Disconnect wire connector from back of lamp socket(s).
- (3) Rotate socket and pull lamp socket from headlamp housing.
- (4) Remove bulb from lamp socket.

80b34e30

- 3 - HIGH BEAM BULB

80b1b424

Fig. 44 PARKING, SIDE MARKER, AND TURN SIGNAL LAMP BULB - 300M

- 1 - BULB
- 2 - SOCKET

INSTALLATION

INTREPID

- (1) Push bulb into socket (Fig. 43).
- (2) Install the lamp socket into lamp housing.
- (3) Install the lamp housing.
- (4) Install the jack screws attaching headlamp to crossmember.
- (5) Connect the negative battery cable and close hood.

PARK/TURN SIGNAL LAMP (Continued)

300M

- (1) Push bulb into socket (Fig. 44). Rotate socket.
- (2) Reach under the fascia and place the socket into the lamp housing and rotate to lock.
- (3) Connect the battery negative cable and close hood.

CONCORDE

- (1) Push bulb into lamp socket.
- (2) Place lamp socket into headlamp housing and rotate to the lock position.
- (3) Connect wire connector to lamp socket(s).
- (4) Verify headlamp operation.
- (5) Install headlamp housing.
- (6) Verify headlamp operation and alignment.

REAR FOG LAMP - EXPORT

DESCRIPTION

80c070d8

Fig. 45 TAIL LAMP BULBS

- 1 - REAR TURN SIGNAL LAMP
- 2 - REAR TAIL LAMP
- 3 - REAR STOP LAMP
- 4 - REAR FOG LAMP
- 5 - BACK-UP LAMP
- 6 - TAIL LAMP ASSEMBLY

Some vehicles are equipped with rear fog lamps (Fig. 45). The rear fog lamp is integrated into the tail lamp assembly. If the rear fog lamp proves faulty the entire tail lamp must be replaced. Rear fog lamps utilize a red lens and clear bulb.

Rear fog lamps are standard equipment in certain parts of the world where excessive fog is experienced on a regular basis.

OPERATION

The rear fog lamps are turned ON and OFF with the rear fog lamp switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FOG LAMP SWITCH - OPERATION) and Wiring Diagrams.

DIAGNOSIS AND TESTING - REAR FOG LAMP - EXPORT

NOTE: Battery must be completely charged (12v) prior to testing. It may also be necessary to install battery charger on the vehicles electrical system when performing this test. Refer to the Battery section of the service manual for detailed information.

- (1) Remove the rear fog lamp bulb and check for burned out condition, replace bulb if necessary.
- (2) If bulb appears OK, reinstall the bulb in its socket and turn fog lamps ON and check for proper operation. If lamp is still inoperative proceed to Step 3.
- (3) Remove lamp bulb and check for proper power (12v) and ground connections in lamp socket. If power and/or ground connections are not present, trace wire until open or short is found.

REMOVAL

- (1) Remove the tail lamp from the vehicle.
- (2) Rotate the rear fog lamp socket one-third turn and pull from lamp housing (Fig. 45).
- (3) Pull the rear fog lamp bulb straight from its socket.

INSTALLATION

- (1) Install the rear fog lamp bulb and socket in the lamp housing (Fig. 45).
- (2) Verify lamp operation.
- (3) Install the tail lamp assembly in the vehicle.

REAR FOG LAMP SWITCH - EXPORT

DESCRIPTION

Vehicles equipped with rear fog lamps utilize a rear fog lamp switch. This switch is located next to the headlamp switch on (Fig. 46). The rear fog lamp switch is the primary controller of the rear fog lamps.

REAR FOG LAMP SWITCH - EXPORT (Continued)

80b5748b

Fig. 46 REAR FOG LAMP SWITCH**OPERATION**

With the rotation of the rear fog lamp switch, voltage is sent through the rear fog lamp switch. This illuminates the rear fog lamp or lamps. The headlamps must be "on" in order for the rear fog lamp/s to function. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

The rear fog lamp switch is integrated into the headlamp switch on LH models. If the rear fog lamp switch proves faulty the entire headlamp switch must be replaced. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - REMOVAL).

INSTALLATION

The rear fog lamp switch is integrated into the headlamp switch on LH models. If the rear fog lamp switch proves faulty the entire headlamp switch must be replaced. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - INSTALLATION).

SIDE REPEATER LAMP - EXPORT**DESCRIPTION**

80acd006

Fig. 47 SIDE REPEATER LAMP

- 1 - SIDE REPEATER LAMP RETAINING TABS
- 2 - SIDE REPEATER LAMP HOUSING
- 3 - FENDER

One Side Repeater Lamp can be found on each side of the vehicle just behind the front wheel (Fig. 47). The side repeater lamp utilizes an amber colored housing and clear bulb.

OPERATION

The side repeater lamps are turned ON or OFF with the turn signal lamps. These lamps are controlled by the steering column mounted multi-function switch.

DIAGNOSIS AND TESTING - SIDE REPEATER LAMP - EXPORT

(1) Remove the suspect side repeater lamp bulb and check for burned out condition. Replace bulb if necessary.

(2) If the bulb appears to be OK, reinstall the bulb in its socket and rotate the ignition switch to the ON position. Turn the appropriate turn signal lamp ON and check for lamp operation. If lamp is still inoperative proceed to Step 3.

(3) Remove the suspect side repeater lamp bulb and check for power (12v) and ground connections in lamp socket. If either are not present, trace wire until open or short is found.

REMOVAL

- (1) Open front door.

SIDE REPEATER LAMP - EXPORT (Continued)

(2) Reach up behind the side repeater lamp and depress the two lamp unit retaining tabs. Remove the lamp unit from the fender opening.

(3) Rotate the side repeater lamp unit counter-clockwise and remove the lamp socket from the lamp unit (Fig. 48).

Fig. 48 SIDE REPEATER LAMP/HOUSING

- 1 - BULB SOCKET
2 - SIDE REPEATER LAMP UNIT

(4) Pull the lamp bulb straight from its socket.

INSTALLATION

(1) Install the side repeater lamp bulb in the socket.

(2) Verify lamp operation.

(3) Install the side repeater lamp socket into the lamp unit.

(4) Install the side repeater lamp in the front fender. Be certain lamp unit is secure in fender.

SIDE REPEATER LAMP UNIT - EXPORT

REMOVAL

(1) Working in the appropriate front wheel well, remove the rear most fasteners from the front wheelhouse liner.

(2) Reach up behind the side repeater lamp and depress the two lamp housing retaining tabs (Fig. 48). Remove the side repeater lamp unit from the fender opening.

(3) Rotate the side repeater lamp unit counter-clockwise and remove the lamp socket from the lamp unit (Fig. 48).

INSTALLATION

(1) Install the side repeater lamp socket into the lamp unit.

(2) Install the side repeater lamp in the front fender (Fig. 48). Be certain lamp is secure within the fender.

(3) Install the front wheelhouse liner.

(4) Verify lamp operation.

SPOT LAMP - POLICE

REMOVAL

(1) Remove the PDC cover and pull either the X or Y fuse, depending on which spot lamp is being serviced.

(2) Raise the spot lamp from the stowed to the operating position.

(3) Support the spot lamp sealed beam in position.

(4) Remove the screws retaining the bezel to the spot lamp head assembly (Fig. 49).

80ea533d

Fig. 49 SPOT LAMP RETAINING SCREWS - REMOVE/INSTALL

- 1 - SPOT LAMP HEAD ASSEMBLY BEZEL RETAINING SCREWS
2 - SPOT LAMP

(5) Remove the bezel from the spot lamp head assembly.

(6) Tilt the sealed beam away from the spot lamp head assembly.

(7) Disconnect the electrical connector to the spot lamp head assembly.

(8) Remove the bulb from the lamp housing by moving the hold downs.

(9) Remove bulb from lamp.

INSTALLATION

(1) Position bulb into spot lamp assembly.

(2) Install the hold downs.

SPOT LAMP - POLICE (Continued)

- (3) Connect the electrical connector to the spot lamp head assembly.
- (4) Tilt the sealed beam toward the spot lamp head assembly.
- (5) Install the bezel to the spot lamp head assembly.
- (6) Install the screws retaining the bezel to the spot lamp head assembly (Fig. 49) and tighten to 2 N·m (18 in. lbs.).
- (7) Lower the spot lamp from the operating to stowed position.
- (8) Install the fuse and PDC cover.
- (9) Verify system and vehicle operation.

SPOT LAMP ASSEMBLY - POLICE

DESCRIPTION

This vehicle may be equipped with up to two spot lamp assemblies, attached to the A-Pillars (Fig. 50). The spot lamp assembly switch is located on the handle (Fig. 51), just above the rotating handle grip.

Fig. 50 SPOT LAMP ASSEMBLY LOCATION

Fig. 51 SPOT LAMP ASSEMBLY

Each spot lamp assembly contains a 100 watt halogen bulb. The spot lamp assemblies are fused individually and powered hot at all times. There are three fuses in the Power Distribution Center (PDC) that control the spot lamp assemblies:

- Fuse F - IP ACC3/SPOT LPS - 50 amp
 - Fuse X - SPOT LP LT - 20 amp
 - Fuse Y - SPOT LP RT/UNDERHOOD - 20 amp
- The parts available for service are:
- Complete spot lamp assembly.
 - H3 100 watt halogen bulb.
 - Inside control handle w/switch.

OPERATION

Use this switch to turn the spot lamp assembly ON and OFF. Rotate and twist the handle to adjust the position of the spot lamp assembly (Fig. 52).

Fig. 52 SPOT LAMP ASSEMBLY OPERATION

1 - ON/OFF SWITCH

DIAGNOSIS AND TESTING - SPOT LAMP ASSEMBLY - POLICE

IF SPOT LAMP DOES NOT LIGHT

(1) If both spot lamps are inoperative, check fuse F (spot lamp master). Refer to Wiring Diagrams for fuse locations. If fuses are OK, refer to Step 4. If fuse(s) are faulty, replace as necessary.

(2) If the left spot lamp is inoperative, check fuse X. If fuse is OK, refer to Step 4. If fuse is faulty, replace as necessary. If fuse blows again, find short to ground. Refer to Wiring Diagrams for circuit information.

(3) If the right spot lamp is inoperative, check fuse Y. If fuse is OK, refer to Step 4. If fuse is faulty, replace as necessary. If fuse blows again, find short to ground. Refer to Wiring Diagrams for circuit information.

SPOT LAMP ASSEMBLY - POLICE (Continued)

(4) Check for B+ power at the spot lamp bulb with switch turned ON (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/SPOT LAMP - REMOVAL). If there is B+ power at the spot lamp bulb connector, replace bulb. If there is not B+ power present, refer to Step 5.

(5) If there is not B+ power present at the spot lamp with the switch turned on, check circuit for an open. Possibly the connector in the A-pillar. Refer to Wiring Diagrams for circuit information.

(6) If there is B+ power at the spot lamp connector, and no B+ power at the spot lamp bulb, then the switch is defective within the spot lamp assembly and the entire unit must be replaced. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/SPOT LAMP - REMOVAL).

(7) If lamp still does not light, remove the handle (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/SPOT LAMP - REMOVAL), and check the contact on the shaft end of the head assembly into the handle to make sure the contact is not damaged.

80ea4e99

Fig. 53 SPOT LAMP ASSEMBLY ELECTRICAL CONNECTOR

IF SPOT LAMP IS HARD TO TURN

(1) Check that the head housing clamping screw creates just enough drag to hold the spot lamp head in position in windy conditions. Extreme drag will require more force on the handle to move the spot lamp head and cause damage.

REMOVAL

CAUTION: Make sure that fuse F (master spot lamp feed) or either fuse X or Y (left or right spot lamp feed) are removed from the Power Distribution Center (PDC) before performing service on the spot lamps.

(1) Remove the fuse cover and pull either the X or Y fuse, depending on which spot lamp is being serviced.

(2) Raise the spot lamp from the stowed to the operating position.

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the A-pillar trim to release it. This will allow access to the spot lamp electrical connector.

(4) Remove the instrument panel end cap.

(5) Disconnect the spot lamp electrical connector (located behind the instrument panel endcap) (Fig. 53).

(6) Loosen, but do not remove the bolt retaining the handle to the outer tube (Fig. 54).

NOTE: Do not remove the bolt all the way.

80ea4e9d

Fig. 54 SPOT LAMP ASSEMBLY HANDLE RETAINING BOLT - LOOSEN/TIGHTEN

1 - SPOT LAMP HANDLE RETAINING BOLT

(7) Using a plastic tipped hammer, gently tap the head of the handle retaining bolt (Fig. 54) and the opposing wedge nut.

(8) Remove the handle from the outer tube.

(9) Remove the A-pillar trim from the spot lamp outer tube.

CAUTION: Support the head of the spot lamp while loosening the head assembly clamp screw.

SPOT LAMP ASSEMBLY - POLICE (Continued)

(10) Loosen the clamp screw at the base of the spot lamp head assembly (Fig. 55).

80ea4ec3

Fig. 55 SPOT LAMP HEAD ASSEMBLY

1 - SPOT LAMP HEAD CLAMP SCREW

(11) Carefully remove the spot lamp head with the intermediate and inner shafts from the outer tube and mounting bracket (Fig. 56).

80ea4ec9

Fig. 56 SPOT LAMP HEAD ASSEMBLY - REMOVE/INSTALL

(12) Remove the screws retaining the spot lamp mounting bracket to the A-pillar (Fig. 57).

(13) Remove the spot lamp outer tube and mounting bracket from the A-pillar (Fig. 57).

80ea4ece

Fig. 57 SPOT LAMP MOUNTING BRACKET - REMOVE/INSTALL

INSTALLATION

CAUTION: Make sure that fuse F (master spot lamp feed) or either fuse X or Y (left or right spot lamp feed) are removed from the Power Distribution Center (PDC) before performing service on the spot lamps.

(1) Install the spot lamp outer tube and mounting bracket to the A-pillar (Fig. 57).

(2) Install the screws retaining the spot lamp mounting bracket to the A-pillar (Fig. 57) and tighten to 33 N·m (29 in. lbs.).

(3) Carefully lift the edge of the secondary door seal along the windshield pillar to expose the spot lamp outer tube and apply a small amount of clear silicone sealer to the base of the outer tube.

(4) Carefully install the spot lamp head with the intermediate and inner shafts to the outer tube and mounting bracket until the head assembly bottoms out on the outer tube (Fig. 56).

(5) Tighten the clamp screw at the base of the spot lamp head assembly in small increments while testing the effort required to rotate the spot lamp between the stowed and operating positions. Stop tightening the clamp screw when the spot lamp can maintain any desired position (Fig. 55).

(6) Position the A-pillar trim to the spot lamp outer tube.

CAUTION: Support the head of the spot lamp while tightening the head assembly clamp screw. Maintain an operating or vertical position.

(7) Install the handle to the outer tube.

SPOT LAMP ASSEMBLY - POLICE (Continued)

(a) Position the spot lamp handle in the operating (downward close to vertical) position to the outer tube.

(b) There are two detent positions to which the handle must line up and engage. Rotate the knob of the handle and the handle base to aid in engaging each of the detents. Using the wedge nut opening on the handle for visual aid, rotate the handle as necessary while installing, in order to bring the flat detent on the intermediate shaft into view along the bottom of the opening.

(8) Tighten the bolt retaining the handle to the outer tube (Fig. 54) and tighten to 6.5 N·m (58 in. lbs.).

(9) Connect the spot lamp electrical connector (Fig. 53).

(10) Install the instrument panel endcap.

(11) Install the A-pillar trim.

(12) Install the X or Y fuse, depending on which spot lamp is being serviced.

(13) Inspect the operation of the spot lamp to ensure that the range of movement is correct.

- Using the handle, rotate the spot lamp from the operating position to the stowed position and back. Ensure that the lamp will maintain the desired position. The stowed position should be just above the windshield and the operating position should be vertical to slightly outboard.

- Using the knob of the handle, rotate the head of the spot lamp around on its axis. The spot lamp must rotate 360 degrees on its axis.

(14) If the spot lamp head does not rotate 360 degrees on its axis, or if excessive effort is required to rotate the lamp head on its axis, perform the following:

(a) Remove the handle and inspect for damage to the inner shaft and the gears in the handle. Repair or replace as necessary.

(b) If no damage is present to the inner shaft or the gears in the handle, reinstall the handle and reinspect the operation of the lamp.

(c) If the spot lamp head still does not properly rotate 360 degrees on its axis, remove the cover from the end of the spot lamp head assembly and inspect for damage to the gears in the head assembly. Repair or replace as necessary.

(15) Lower the spot lamp to the stowed position.

TAIL LAMP

REMOVAL

- (1) Release decklid latch and open decklid.
- (2) Remove trunk lining from rear closure panel as necessary to gain access to tail lamp fasteners.
- (3) Remove nuts attaching tail lamp to rear closure panel.
- (4) Remove tail lamp from rear closure panel.
- (5) Remove socket(s) from tail lamp unit (Fig. 58), (Fig. 59), and (Fig. 60).
- (6) Pull lamp from socket.

80b34e1e

Fig. 58 TAIL LAMP - CONCORDE

- 1 - SOCKET
2 - BULB

80b1b428

Fig. 59 TAIL LAMP - INTREPID

- 1 - BODY WIRE HARNESS CONNECTOR

INSTALLATION

- (1) Push lamp into socket.
- (2) Install socket(s) in tail lamp unit.
- (3) Place tail lamp unit in position on rear closure panel.
- (4) Install nuts attaching tail lamp unit to rear closure panel.
- (5) Install trunk lining.

TAIL LAMP (Continued)

80b34e2f

Fig. 60 TAIL LAMP - 300M

(6) Connect the battery negative cable and close hood.

(7) Verify lamp operation.

TAIL LAMP UNIT

REMOVAL

- (1) Release decklid latch and open decklid.
- (2) Remove fasteners attaching trunk lining to lower rear trunk panel.
- (3) Move the trunk lining to access the tail lamp unit fasteners.
- (4) Remove nuts attaching tail lamp unit to lower trunk and quarter panel (Fig. 61), (Fig. 62) and (Fig. 60).
- (5) Remove tail lamp unit from vehicle.
- (6) Disconnect tail lamp unit wire connector from body wire harness.

80b34e1f

Fig. 61 TAIL LAMP - CONCORDE

- 1 - PLASTIC HEX NUT (4)
2 - TAIL LAMP UNIT

80b1b429

Fig. 62 TAIL LAMP - INTREPID

INSTALLATION

- (1) Connect tail lamp unit wire connector to body wire harness.
- (2) Place tail lamp unit in position on vehicle.
- (3) Install nuts to attach tail lamp unit to lower trunk and quarter panel.
- (4) Place trunk lining in position on lower trunk panel.
- (5) Install fasteners to attach trunk lining to lower rear trunk panel.
- (6) Verify lamp operation.

TURN SIGNAL LAMP UNIT - CONCORDE/300M

REMOVAL

- (1) Open hood, disconnect and isolate the battery negative cable.
- (2) Remove headlamp unit to access lamp housing.
- (3) Rotate and pull socket from lamp unit.
- (4) Disconnect fastener attaching lamp unit to fascia (Fig. 63).
- (5) Remove lamp unit from vehicle.

INSTALLATION

- (1) Place lamp unit in position on fascia.
- (2) Install lamp unit fastener.
- (3) Install bulb socket in lamp unit.
- (4) Connect the battery negative cable.
- (5) Verify lamp operation.
- (6) Install headlamp unit.
- (7) Close hood.

TURN SIGNAL LAMP UNIT - CONCORDE/300M (Continued)

80b34e2e

80add414

Fig. 65 UNDERHOOD LAMP

- 1 - BULB
- 2 - DEPRESS TERMINAL INWARD
- 3 - BULB WIRE LOOP
- 4 - LAMP BASE

INSTALLATION

- (1) Engage the replacement bulb wire loop to terminal closest to lamp base wire connector.
- (2) Depress the opposite terminal inward and engage the remaining bulb wire loop.
- (3) Position the lamp lens on the lamp base and press into place.
- (4) Connect the battery negative remote cable or reinsert fuse Y in the PDC.
- (5) Verify system and vehicle operation.

UNDERHOOD LAMP UNIT - POLICE

REMOVAL

- (1) Open hood, disconnect and isolate the battery negative remote terminal or pull fuse Y in the PDC.
- (2) Disconnect the wire harness connector from lamp unit.
- (3) Remove the push-pin fastener attaching underhood lamp unit to inner hood panel (Fig. 66).
- (4) Remove the underhood lamp unit from the vehicle.

UNDERHOOD LAMP UNIT - POLICE (Continued)

**Fig. 66 UNDERHOOD LAMP UNIT LOCATION -
TYPICAL - POLICE**

- 1 - CONNECTOR
2 - UNDERHOOD LAMP UNIT

INSTALLATION

- (1) Position the underhood lamp unit on the hood inner panel.
- (2) Install the push-pin fastener attaching the lamp unit base to the inner hood panel.
- (3) Install the lamp unit and press into place.
- (4) Connect the wire harness connector.
- (5) Connect the battery negative remote cable or reinsert fuse Y in the PDC.
- (6) Verify system and vehicle operation.
- (7) Close hood.

LAMPS/LIGHTING - INTERIOR

SPECIFICATIONS

INTERIOR LAMPS

DIMMER CONTROLLED INTERIOR LAMPS

Service procedures for most of the lamps in the instrument panel, Instrument cluster and switches are located in Electrical, Instrument Cluster. Some components have lamps that can only be serviced by an Authorized Service Center (ASC) after the component is removed from the vehicle. Contact local dealer for location of nearest ASC.

DIMMER CONTROLLED LAMP APPLICATION TABLE

RADIO	ASC
ANALOG CLOCK	A9625

INDICATOR LAMPS

Service procedures for most of the lamps in the instrument cluster are located in Electrical, Instrument Cluster.

CAUTION: Do not use bulbs other than those listed in the Bulb Application Table. Damage to lamp can result.

CAUTION: Do not touch halogen bulbs with fingers or other oily surfaces. Bulb life will be reduced.

CLUSTER LAMPS

REMOVAL

To service instrument cluster lamps, the cluster must be removed from the instrument panel (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

Refer to (Fig. 1), (Fig. 2), and (Fig. 3) for cluster lamp locations.

The illumination/indicator lamps that ARE replaceable are called out on the back cover of the instrument cluster. All other indicators are Light Emitting Diodes (LED's), and are serviced with the cluster assembly. If a LED is non-functional, the entire instrument cluster must be replaced. Refer to the INDICATORS - BULBS table for applications.

INSTALLATION

(Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

COURTESY LAMP

DESCRIPTION

The Body Control Module (BCM) illuminates the courtesy lamps whenever a door is opened. When the last door is closed, the BCM “fades-to-OFF” the courtesy lamps in five seconds if not in illuminated entry mode. If a door is left ajar, the courtesy lamps remain on for a maximum of 15 minutes when the ignition switch is OFF. After 15 minutes, the BCM “fades-to-OFF” the courtesy lamps.

GLOVE BOX LAMP

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Open the glove box door, using a trim stick (special tool #C-4755) or equivalent, gently pry out on the glove box lamp/switch assembly from upper right hand corner of opening.
- (3) Pull defective bulb out of lamp socket.

INSTALLATION

- (1) Push replacement bulb into the lamp socket.
- (2) Place glove box lamp/switch assembly into position, firmly snap into place, and close the glove box door.
- (3) Connect the negative battery cable remote terminal to the remote battery post.

GLOVE BOX LAMP SWITCH

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 9).
- (2) Open the glove box door, using a trim stick (special tool #C-4755) or equivalent, gently pry out on the glove box lamp/switch assembly from upper right hand corner of opening (Fig. 4).
- (3) Disconnect the wire connector.

INSTALLATION

- (1) Connect the electrical connector to the new glove box lamp/switch.
- (2) Place glove box lamp/switch assembly into position, firmly snap into place (Fig. 4), and close the glove box door.
- (3) Connect the negative battery cable remote terminal to the remote battery post.

Fig. 4 Glove Box Lamp/Switch

1 - GLOVE BOX LAMP

ILLUMINATED ENTRY

DESCRIPTION

The Illuminated Entry System is available on vehicles equipped with the Remote Keyless Entry (RKE) system. The Illuminated Entry System turns ON the courtesy lamps when the remote keyless entry system is activated.

OPERATION

The Remote Keyless Entry Module and the Body Control Module (BCM) are used to control the system. Courtesy lamps will turn on for 30 seconds and “fade-to-OFF” over a five second period.

The Illuminated Entry System also turns ON the courtesy lamps when a door is opened. The courtesy lamps will remain ON while the door is open, then “fade-to-OFF” 30 seconds after the last door is closed.

The courtesy lamps will “fade-to-OFF” immediately when the ignition is switched to ON.

The Illuminated Entry System cannot be activated during the 30 second period after the ignition switch is turned OFF except by using the RKE transmitter. If a door is opened and closed during this 30 second period, the system will function as previously described.

The courtesy lamps will “fade-to-OFF” immediately if the RKE lock function is actuated with all the doors closed.

ILLUMINATED ENTRY (Continued)

DIAGNOSIS AND TESTING - ILLUMINATED ENTRY

When testing the system, all doors must be closed to prevent courtesy lamps from lighting. Verify that remote keyless entry system is operating properly before testing illuminated entry circuits. The body controller uses input from the remote keyless entry system to switch ON the courtesy lamps.

Refer to Wiring Diagrams, for component location and circuit information. Refer to the proper Body Diagnostic Procedures manual for complete diagnostic information.

TRANSMISSION RANGE INDICATOR ILLUMINATION**DESCRIPTION**

The floor console mounted Transmission Range Indicator Lamp display utilizes electroluminescent technology as the light source. The only diagnostics that should be performed is to check for the presence of 12 volts on the mating wire harness connector. The electroluminescent lamp requires a 120 volt AC signal that is provided by a power converter included in the assembly. Because of a potential shock hazard, diagnostics testing of the electroluminescent lamp and power converter should be avoided. The module is not serviceable. Refer to Body, Floor Console Shift Bezel Removal and Installation.

OVERHEAD CONSOLE

DESCRIPTION

The overhead consoles on LH models can include the Electronic Vehicle Information Center (EVIC) system (Fig. 2) or the Overhead Travel Information System (OTIS) (Fig. 1). All overhead consoles are equipped with two reading and courtesy lamps. Vehicles equipped with a power sunroof, will have the sunroof control switch located between the two reading and courtesy lamps. The overhead console is mounted with one screw and two snap clips to a molded plastic retainer bracket located above the headliner.

OPERATION

Refer to the vehicle Owner’s Manual for specific operation of each overhead console and its systems.

DIAGNOSIS AND TESTING - OVERHEAD CONSOLE

The most reliable, efficient, and accurate means to diagnose the overhead console or related system requires the use of a DRB III® scan tool and the Service and Body Diagnostic Procedures Manuals. The DRB III® scan tool can provide vital information to the technician trying to find a problem with a overhead console component. Diagnostic logic is built into the overhead console mounted module to help the person trying to locate the problem by the most efficient means possible. Anytime a problem is suspected, a DRB III® scan tool must be obtained and used to retrieve any stored fault codes in the module. If diagnostic fault codes are present in the module, record them on a piece of paper immediately before proceeding any further. Then, use these fault codes to identify the problem by verifying the fault code.

OVERHEAD CONSOLE (Continued)

809bd6fe

Fig. 1 Overhead Console Without Universal Transmitter

809bd700

Fig. 2 Overhead Console With Universal Transmitter

Example, If the module records **"TIRE PRESSURE N/A"** fault, locate the diagnostic procedure for this code in the appropriate Body Diagnostic Procedures Manual and follow the flow chart until the specific problem is located and resolved. Once the problem is thought to be corrected, erase the stored fault code using the DRB III® scan tool and verify correct system operation. If the tire pressure monitoring system is functioning correctly, verify that there are no other stored codes in the module and return the vehicle to service.

If the fault code could not be verified, such as not finding anything wrong when following the diagnostic flow chart in the Body Diagnostic Procedures Manual. This is a good indication that a **INTERMIT-**

TENT problem may be present. You must then attempt to find the intermittent problem, such as running a tire pressure monitoring system self test. Refer to the Tires/Wheels section for more information. Always, eliminate all other potential problems before attempting to replace the module.

TESTING VOLTAGE AND GROUND SUPPLY TO OVERHEAD CONSOLE

(1) Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL) Disconnect the overhead console electrical connector. Check the fused B(+) circuit in the overhead console electrical connector. If OK, go to Step 2. If not OK, repair the open circuit or component as required. Refer to the Wiring section for detailed schematics.

(2) Check the IGN RUN B(+) circuit in the overhead console electrical connector. If OK, go to Step 3. If not OK, repair the open IGN RUN B(+) circuit as required.

(3) Check the Ground circuit in the overhead console electrical connector. If OK, go to Step 4. If not OK, repair the open ground circuit as required.

(4) If the tire pressure monitoring system is not operating properly, refer to the Tires/Wheels section for more information on the tire pressure monitoring system.

NOTE: If the compass functions, but accuracy is suspect, it may be necessary to perform a variation adjustment. This procedure allows the compass unit to accommodate variations in the earth's magnetic field strength, based on geographic location. Refer to Compass Variation Adjustment in the Standard Procedures section of this group.

NOTE: If the compass reading displays dashes, and only **"CAL"** appears in the display, demagnetizing may be necessary to remove excessive residual magnetic fields from the vehicle. Refer to Compass Demagnetizing in the Standard Procedures section of this group.

STANDARD PROCEDURE

STANDARD PROCEDURE - MODULE LAMP REPLACEMENT

(1) Remove the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(2) Using a flat blade screwdriver twist out socket/lamp (Fig. 3).

(3) Replace lamp(s) as necessary.

OVERHEAD CONSOLE (Continued)

**Fig. 3 Top of Overhead Console**

- 1 - OVERHEAD CONSOLE HOUSING
 2 - EVIC MODULE
 3 - ILLUMINATION LAMPS
 4 - SCREWS (4)

STANDARD PROCEDURE - COURTESY LAMP REPLACEMENT

- (1) Open hood, disconnect and isolate the negative battery cable.
- (2) Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
- (3) Remove the lamp and socket assembly from the overhead console.
- (4) Remove the lamp bulb by pulling it straight out of its socket.

STANDARD PROCEDURE - MODULE LENS REPLACEMENT

- (1) Remove the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
- (2) Remove the electronics module from the overhead console. Refer to the procedure in this section.
- (3) Unsnap the lens from the module and replace lens as necessary.

STANDARD PROCEDURE - COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not use magnetic tools when servicing the overhead console.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or out of calibration, perform the following calibration procedure. Also, new service replacement Electronic Vehicle Information Center (EVIC) modules must have their compass calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

NOTE: Whenever an EVIC module is replaced, the variance number must also be reset. Refer to Compass Variation Adjustment in this group.

Calibrate the compass manually as follows:

- (1) Turn the ignition switch to the On position. If the compass/temperature data is not currently being displayed, momentarily depress and release the C/T push button to reach the compass/temperature display.
- (2) Depress the Reset push button and hold the button down until "CAL" appears in the display. This takes about ten seconds, and appears about five seconds after "VARIANCE = XX" is displayed.
- (3) Release the Reset push button.
- (4) Drive the vehicle on a level surface, away from large metal objects and power lines, through one complete circle at between five and eight kilometers-per-hour (three and five miles-per-hour) in not less than 20 seconds. The "CAL" message will disappear from the display to indicate that the compass is now calibrated.

NOTE: If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the unit is faulty. Repeat the calibration procedure one more time.

NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.

STANDARD PROCEDURE - COMPASS DEMAGNETIZING

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the overhead console forward mounting screw and the roof panel above the overhead console. Equivalent units must be rated as

OVERHEAD CONSOLE (Continued)

continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel and the overhead console forward mounting screw, proceed as follows:

(1) Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.

(2) Connect the degaussing tool (Fig. 4) to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.

Fig. 4 Degaussing Tool 6029

(3) Slowly approach the head of the overhead console forward mounting screw with the degaussing tool connected.

(4) Contact the head of the screw with the plastic coated tip of the degaussing tool for about two seconds.

(5) With the degaussing tool still energized, slowly back it away from the screw. When the tip of the tool is at least 61 centimeters (2 feet) from the screw head, disconnect the tool.

(6) Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header (Fig. 5). The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.

(7) Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.

(8) Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.

(9) Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.

(10) With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.

J908E-27

Fig. 5 Roof Demagnetizing Pattern

(11) Calibrate the compass and adjust the compass variance (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - STANDARD PROCEDURE).

STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance setting may need to be changed.

To set the compass variance:

(1) Using the Variance Settings map, find your geographic location and note the zone number (Fig. 6).

(2) Turn the ignition switch to the On position. If the compass/temperature data is not currently being displayed, momentarily depress and release the C/T push button to reach the compass/temperature display.

(3) Depress the Reset push button and hold the button down until "VARIANCE = XX" appears in the display. This takes about five seconds.

OVERHEAD CONSOLE (Continued)

80a13863

Fig. 6 Variance Settings

(4) Release the Reset push button. "VARIANCE =XX" will remain in the display. "XX" equals the current variance zone setting.

(5) Momentarily depress and release the Step push button to step through the zone numbers, until the zone number for your geographic location appears in the display.

(6) Momentarily depress and release the Reset push button to enter the displayed zone number into the EVIC module memory.

(7) Confirm that the correct directions are now indicated by the compass.

STANDARD PROCEDURE - ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING

EVIC PROGRAMMING MODE

The Electronic Vehicle Information Center (EVIC) provides the vehicle operator with a user interface, which allows the selection of several optional customer programmable electronic features to suit individual preferences. The EVIC must be placed into its programming mode in order to view or change the programmable features. To enter the EVIC programming mode and to view or change the selected programmable features options, proceed as follows:

(1) Turn the ignition switch to the On position.

(2) Depress and release the Menu push button. The first item in the programmable features menu list will appear in the EVIC display.

(3) Momentarily depress and release the Menu push button to step through the programmable features list. Each programmable feature and its currently selected option will appear on the EVIC display in the sequence shown in the Programmable Features list that follows.

(4) Momentarily depress and release the Step push button to step through the available options for the programmable feature being displayed.

(5) The option that last appears in the display with a programmable feature before exiting the programming mode, becomes the newly selected programmable feature option.

(6) The EVIC exits the programming mode and returns to its normal operating mode when the C/T push button is depressed or when the end of the programmable features menu list is reached, whichever occurs first.

PROGRAMMABLE FEATURES

- **LANGUAGE?** - The options include English, Francaise, Deutsch, Italiana, or Espanol. The default is English. All EVIC display nomenclature, including the trip computer functions, warning messages and the programmable features appear in the selected language.

OVERHEAD CONSOLE (Continued)

- **DISPLAY U.S. OR METRIC?** - The options include U.S. and M. The default is U.S. This feature toggles the trip computer temperature, fuel economy and odometer display readings between U.S. and metric units of measure. It also changes the odometer display in the instrument cluster.

- **AUTO DOOR LOCKS?** - The options include Yes and No. The default is Yes. When Yes is selected, all doors lock automatically when vehicle speed reaches 25 kilometers-per-hour (15 miles-per-hour). If YES is selected, a second programmable feature appears, **AUTO UNLOCK ON EXIT?** - The options again include Yes and No. The default is No. When Yes is selected, following each Auto Door Lock event all doors will automatically unlock when the driver door is opened, if the vehicle is stopped and the transmission gear selector is in Park or Neutral. The Auto Door Unlock event will only occur once following each Auto Door Lock event.

- **REMOTE UNLOCK** - The options include Driver Door 1st and All Doors. The default is Driver Door 1st. When Driver Door 1st is selected, only the driver door unlocks when the Unlock button of the Remote Keyless Entry (RKE) transmitter is depressed once. The Unlock button of the RKE transmitter must be depressed twice to unlock all doors. When All Doors is selected, all doors unlock when the Unlock button of the RKE transmitter is depressed once.

- **REMOTE LINKED TO MEMORY?** - This programmable feature only applies to vehicles equipped with the optional memory / heated system. The options include Yes and No. The default is No. When Yes is selected, the memory system will recall the Driver 1 or Driver 2 memory settings assigned to the RKE transmitter being used to unlock the vehicle. When No is selected, the memory system will only recall memory settings when the Driver 1 or Driver 2 push buttons of the memory switch on the driver side front door trim panel are depressed.

- **SOUND HORN ON LOCK?** - The options include Yes and No. The default is No. When Yes is selected, a short horn chirp will provide an audible confirmation when the RKE receiver recognizes a valid Lock signal from an RKE transmitter. When No is selected, no horn chirp will occur with the RKE Lock event. This feature may be selected independent of the **FLASH LIGHTS WITH LOCKS?** programmable feature.

- **FLASH LIGHTS WITH LOCKS?** - The options include Yes and No. The default is Yes. When Yes is selected, a single flash of the hazard warning lamps will provide an optical confirmation when the RKE receiver recognizes a valid Lock signal from an RKE transmitter, and two flashes of the same lamps will occur when the RKE receiver recognizes a valid

Unlock signal from an RKE transmitter. When No is selected, no lamp flash will occur with the RKE Lock or Unlock event. This feature may be selected independent of the **SOUND HORN ON LOCK?** programmable feature.

- **HEADLAMP DELAY** = - The options include Off, 30 Sec, 60 Sec, and 90 Sec. The default is 90 Sec. When a time interval is selected, the headlamps will remain on for that length of time when the headlamps are turned off after the ignition is turned off, or if the Auto mode is selected on vehicles with the Auto Headlamps option. When Off is selected, the headlamp delay feature is disabled.

- **HEADLAMPS ON WITH WIPERS?** - This programmable feature only applies to vehicles equipped with the optional Auto Headlamps. The options include Yes and No. The default is No. When Yes is selected, the headlamps will turn on automatically when the windshield wipers are turned on. The headlamps will turn off when the wipers are turned off, as long as the headlamp switch is in the Auto or Off positions. When No is selected, the headlamps will only turn on if manually selected or if the Auto mode is selected and the outside ambient light levels dictate that they should be on.

- **SERVICE INTERVAL** = - The options include from 3200 to 9600 kilometers in 800 kilometer increments (2000 to 6000 miles in 500 mile increments). The default is 9600 kilometers (6000 miles). The selected distance becomes the interval at which the Perform Service warning message will be displayed by the EVIC. If a new distance is selected, a second programmable feature appears, **RESET SERVICE DISTANCE?** - The options include No and Yes. The default is Yes. When Yes is selected, the accumulated distance since the last previous Perform Service warning message will be reset to zero because the service interval has been changed. When No is selected, the distance until the next Perform Service warning message is reduced by the accumulated distance since the last previous message.

- **EASY EXIT SEAT** - This programmable feature only applies to vehicles equipped with the optional memory / heated system. The options include Yes and No. The default is No. When Yes is selected, the driver seat moves rearward about 55 millimeters (two inches) or to the farthest rearward position, whichever comes first, when the key is removed from the ignition switch lock cylinder. This provides additional ease for exiting from the vehicle. The seat will automatically return to the memory system setting position when the Driver 1 or Driver 2 button of the memory switch on the door panel is depressed or, if the **REMOTE LINKED TO MEMORY** programmable feature is enabled, when the RKE Unlock button is depressed. While not automatic, an easy entry fea-

OVERHEAD CONSOLE (Continued)

ture can be obtained by enabling the **EASY EXIT SEAT** feature and disabling the **REMOTE LINKED TO MEMORY** feature. Then the **EASY EXIT SEAT** feature will move the seat back, but the RKE unlock event will not reposition the seat. Thus, the seat remains positioned for easy entry, and the memory switch on the door panel can be depressed after entering the vehicle to return the seat to the desired memory position.

- **SIDE VIEW MIRROR TILT** - This programmable feature only applies to vehicles equipped with the optional memory / heated system. The options include Enable and Disable. The default is Disable. When Enable is selected, both side view mirrors will move straight downward anytime the MHSM module detects a reverse gear indication from the cluster. This feature is designed to allow the driver to see directly behind the rear wheels before backing up.

- **TRAIN REMOTE** - When this feature is selected the driver can choose to train up to four remote keyless entry transmitters. The options include Yes and No. The default is No. When Yes is selected and the MENU button is pressed the EVIC will display "PRESS REMOTE LOCK & UNLOCK THEN PRESS UNLOCK", followed by a chime to indicate the training sequence can commence. You have approximately 30 seconds to train up to four transmitters, after each transmitter is trained a chime will sound indicating that the training was successful. If remote link to memory is "YES", the first transmitter trained will be associated with memory setting 1 and the second transmitter trained will be associated with memory setting 2. Additional transmitters will not be associated with a memory setting. When you have finished training the transmitters, press the menu button again and the EVIC will display "TRAIN DONE "X" TRAINED. If no transmitters are trained within approx. 30 seconds the EVIC will display "TRAIN TIMEOUT".

- **RETRAIN TIRE SENSORS** - This programmable feature only applies to vehicles equipped with the optional Tire Pressure Monitoring System. The options include Yes and No. The default is No. When Yes is selected, and the menu button is depressed, the EVIC will enter the training mode starting with the left front tire.

REMOVAL - OVERHEAD CONSOLE

(1) Disconnect and isolate the remote negative battery cable.

(2) Remove the overhead console retaining screw, located in the front of console near the windshield.

(3) Using your fingertips, grasp the sides of the overhead console and pull straight down evenly to disengage the two snap clips at the rear of the unit.

(4) Lower the overhead console far enough to access the wire harness connectors.

(5) Disconnect the control module, courtesy lamps and if equipped, the power sunroof switch electrical connectors.

(6) Remove the overhead console assembly from the vehicle.

INSTALLATION

(1) Position the overhead console in the vehicle and connect the wire harness connectors.

(2) Connect the control module, courtesy lamps and if equipped, the power sunroof switch electrical connector.

(3) Using your fingertips, grasp the sides of the overhead console and push straight up evenly to engage the two snap clips at the rear of the unit.

(4) Install the overhead console retaining screw, located in the front of console near the windshield. Torque the screw to 1.2 N·m (10 in. lbs.).

(5) Connect the remote negative battery cable.

SPECIAL TOOLS

Degaussing Tool 6029

Radio Frequency Detector #9001

COMPASS/MINI-TRIP COMPUTER

DESCRIPTION

The Compass Mini-Trip Computer (CMTC) is a module located within the overhead console. This module displays the following information:

- Compass/Temperature
- Average Fuel Economy
- Distance to Empty
- Trip Odometer
- Elapsed Time
- Miles to Service
- Tire Pressure Display (if equipped)
- Blank Screen

When the vehicle is first turned "ON" the Compass Mini-Trip Computer blanks the display for a half second, then illuminates all segments of the vacuum fluorescent display (VFD) at full brightness for one and a half seconds. The Compass Mini-Trip Computer module will then display whatever was being viewed when the ignition was last turned "OFF".

Compass Mini-Trip Computer may also be integrated with the Universal Transmitter. If so, your Compass Mini-Trip Computer module will have three buttons centered together between the outer four buttons. Refer to the photo in Overhead Console description.

OPERATION

The Compass Mini-Trip Computer (CMTC) and push buttons will only operate when the ignition is in the ON position. The CMTC will show the last display when the ignition was turned OFF. The four buttons used to operate Compass Mini-Trip Computer are labeled STEP, C/T, US/M and RESET.

STEP BUTTON

Pressing the STEP button selects one of the following 4 displays:

- Average fuel economy
- Distance to empty
- Trip odometer
- Elapsed time

C/T (COMPASS/TEMPERATURE) BUTTON

Pressing the C/T button selects the current Compass heading or current Temperature display.

US/M (ENGLISH/METRIC MEASUREMENT) BUTTON

Pressing the US/M button switches the display units in English or Metric readings.

RESET BUTTON

Pressing the RESET button resets the function currently on the display, provided that function can be reset. The functions which can be reset are Average fuel economy, Trip odometer and Elapsed time. The RESET button is also used to set the variance and/or calibrate the compass. Refer to the Variance Procedure and Calibration Procedure in this section.

DIAGNOSIS AND TESTING - COMPASS MINI-TRIP COMPUTER

TEMPERATURE

The Compass Mini-Trip Computer (CMTC) receives Programmable Communications Interface bus (PCI bus) messages from the Body Control Module for all displayed information except the compass display. If a dash (-) is displayed, the Compass Mini-Trip Computer is not receiving a PCI bus message from the BCM. To check out the PCI bus line and the BCM use the DRB III® scan tool and proper Body Diagnostic Procedure Manual.

If Compass Mini-Trip Computer displays a temperature reading more than 54° C (130° F). Check for a short circuit between the temperature sensor and the BCM.

If Compass Mini-Trip Computer displays a temperature reading less than -40° C (-67° F). Check for an open circuit between the temperature sensor and the BCM.

AVERAGE FUEL ECONOMY

Compass Mini-Trip Computer receives average fuel economy information from the BCM over the PCI bus line. If Compass Mini-Trip Computer displays -- instead of an average fuel economy value, it is not receiving a PCI bus message for the average fuel economy from the BCM. To check out the PCI bus line and the BCM use the DRB III® scan tool.

DISTANCE TO EMPTY

Compass Mini-Trip Computer receives distance to empty information from the BCM over the PCI bus line. If Compass Mini-Trip Computer displays a dash (-) instead of a distance to empty value, it is not receiving a PCI bus message for the distance to empty from the BCM. To check out the PCI bus line and the BCM use the DRB III® scan tool.

COMPASS/MINI-TRIP COMPUTER (Continued)

TRIP ODOMETER

Compass Mini-Trip Computer receives trip odometer information from the Cluster over the PCI bus line. If Compass Mini-Trip Computer displays dashes -- instead of the trip odometer value, it is not receiving a PCI bus message for the trip odometer from the Cluster. To check out the PCI bus line and the BCM, use the DRB III® scan tool.

ELAPSED TIME

Compass Mini-Trip Computer receives a PCI bus message containing elapsed time information. If Compass Mini-Trip Computer displays dashes --- instead of the elapsed time, it is not receiving a PCI bus message for the elapsed time from the BCM. To check out the PCI bus line and the BCM, use the DRB III® scan tool.

COMPASS DISPLAY

To display the vehicle direction, the Compass Mini-Trip Computer processes information from a sensor internal to the module. The Compass Mini-Trip Computer is self-calibrating and requires only variance adjustments dependent upon location. The Compass Mini-Trip Computer displays the label CAL whenever the compass is in the fast calibration mode.

If all three of the following conditions listed below occur, the vehicle must be demagnetized.

- Compass portion of the display is blank
- Temperature portion of the display is OK
- The label CAL is illuminated

If demagnetizing the vehicle is needed, refer to the demagnetizing procedure in this section. After demagnetizing, to calibrate the compass refer to Calibration Procedure and to set the variance refer to Variance Procedure, both within this section. If the compass portion of the display is still blank, replace the Compass Mini-Trip Computer.

COMPASS MINI-TRIP COMPUTER - SELF DIAGNOSTIC TEST

(1) With the ignition switch in the OFF position simultaneously press the C/T and STEP buttons and hold.

(2) Turn ignition switch ON, then release C/T and STEP buttons.

(3) Compass Mini-Trip Computer lights all segments on the VFD for 2-4 seconds. Check for segments that are not illuminated.

(4) If Compass Mini-Trip Computer displays PASS, the module is OK.

(5) If Compass Mini-Trip Computer displays FAIL, replace the module.

(6) If Compass Mini-Trip Computer displays bUS, check for an open or a short in the PCI bus communication circuit.

(7) Press the C/T or the STEP button to exit self-test.

REMOVAL

(1) Remove overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(2) Remove mounting screws and release the map lamp wire connector from the Compass Mini-Trip Computer (Fig. 7).

Fig. 7 Compass Mini-Trip Computer Retaining Screws

- 1 - ILLUMINATION LAMPS
2 - CMTc RETAINING SCREWS

(3) Remove the Compass Mini-Trip Computer from overhead console.

INSTALLATION

(1) Position the Compass Mini-Trip Computer and install the retaining screws.

(2) Connect the Compass Mini-Trip Computer electrical connector. Make sure the wire that was clipped into the module housing is properly clipped into the new module before the overhead console is placed back into the headliner.

(3) Install the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

ELECTRONIC VEHICLE INFO CENTER

DESCRIPTION

The Electronic Vehicle Information Center (EVIC) is located in the overhead console on models equipped with this option. The EVIC module features a large Vacuum Fluorescent Display (VFD) screen for displaying information, and back-lit push button function switches labeled C/T (compass/temperature), RESET, STEP, and MENU.

The EVIC module contains a central processing unit and interfaces with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) data bus network. The PCI data bus network allows the sharing of sensor information. This helps to reduce wire harness complexity, reduce internal controller hardware, and reduce component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities.

The EVIC includes the following display options:

- **Compass and temperature** - provides the outside temperature and one of eight compass readings to indicate the direction the vehicle is facing.
- **Average fuel economy** - shows the average fuel economy since the last trip computer reset.
- **Distance to empty** - shows the estimated distance that can be travelled with the fuel remaining in the fuel tank. This estimated distance is computed using the average miles-per-gallon from the last 30 gallons of fuel used.
- **Trip odometer** - shows the distance travelled since the last trip computer reset.
- **Elapsed time** - shows the accumulated ignition-on time since the last trip computer reset.
- **Distance to service** - shows the distance remaining until the next scheduled service interval.
- **Tire Pressure** - shows tire pressure in each road tire.
- **Blank screen** - the EVIC compass/temperature/trip computer VFD is turned off.

The EVIC "Menu" push button provides the vehicle operator with a user interface, which allows the selection of several optional customer programmable electronic features to suit individual preferences. Refer to **ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING** in the Service Procedures section of this group for more information on the customer programmable feature options.

If the vehicle is equipped with the optional Universal Transmitter, the EVIC will also display messages and an icon indicating when the Universal Transmitter is being trained, which of the three transmitter

buttons is transmitting, and when the transceiver is cleared.

If the vehicle is equipped with the optional **Tire Pressure Monitoring System**, the EVIC will also display messages and an icon indicating when the tire air pressure falls below a given set-point, and which of the five tires is transmitting the low pressure warning, and when the condition is cleared. Refer to the Tires/Wheels section of this manual for complete Tire Pressure Monitoring System description. Refer to this section of the service manual for EVIC modules function description for the Tire Pressure Monitoring.

NOTE: Some 300M vehicles use a different recommended tire pressure (tire specified). For this reason, anytime a EVIC module is removed or replaced a DRB III® scan tool must be used to set/verify that the correct tire pressure set-point is programmed in the EVIC module. Failure to do so could result in incorrect tire pressure monitoring set points.

Data input for all EVIC functions, including VFD dimming level, is received through PCI data bus messages. The EVIC module uses its internal programming and all of its data inputs to calculate and display the requested data. If the data displayed is incorrect, perform the self-diagnostic tests as described in this group. If these tests prove inconclusive, the use of a DRB III® scan tool and the proper Diagnostic Procedures manual are recommended for further testing of the EVIC module and the PCI data bus.

The EVIC module cannot be repaired, and is available for service only as a unit. This unit includes the push button switches and the plastic module. If any of these components is faulty or damaged, the complete EVIC module must be replaced. The incandescent bulbs used for EVIC push button back-lighting and the lens are available for service replacement.

DESCRIPTION - COMPASS

While in the compass/temperature mode, the compass will display the direction in which the vehicle is pointed using the eight major compass headings (Examples: north is N, northeast is NE). The self-calibrating compass unit requires no adjusting in normal use. The only calibration that may prove necessary is to drive the vehicle in three complete circles at 5 to 8 kilometers-per-hour (3 to 5 miles-per-hour), on level ground, in not less than forty-eight seconds. This will reorient the compass unit to its vehicle.

The compass unit also will compensate for magnetism the body of the vehicle may acquire during normal use. However, avoid placing anything magnetic directly on the roof of the vehicle. Magnetic mounts

ELECTRONIC VEHICLE INFO CENTER (Continued)

for an antenna, a repair order hat, or a funeral procession flag can exceed the compensating ability of the compass unit if placed on the roof panel. Magnetic bit drivers used on the fasteners that hold the overhead console assembly to the roof header can also affect compass operation. If the vehicle roof should become magnetized, the demagnetizing and calibration procedures found in this group may be required to restore proper compass operation.

DESCRIPTION - TEMPERATURE

The temperature displays the outside ambient temperature in whole degrees. The temperature display can be toggled from Fahrenheit to Celsius by selecting the desired U.S./Metric option from the customer programmable features as described in **ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING** in the Service Procedures section of this group. The displayed temperature is not an instant reading of conditions, but an average temperature. It may take the thermometer display several minutes to respond to a major temperature change, such as driving out of a heated garage into winter temperatures.

When the ignition switch is turned to the Off position, the last displayed temperature reading stays in the Body Control Module (BCM) unit memory. When the ignition switch is turned to the On position again, the EVIC will display the memory temperature for one minute; then update the display to the current average temperature reading within five minutes.

The temperature function is supported by an ambient temperature sensor. The sensor is mounted outside the passenger compartment near the front and center of the vehicle, and is hard wired to the Body Control Module (BCM). The BCM sends temperature status messages to the EVIC module over the PCI data bus network. The ambient temperature sensor is available as a separate service item.

OPERATION

The EVIC is wired to both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the On position. When the ignition switch is turned to the On position, the EVIC module VFD will return to the last function being displayed before the ignition was turned to the Off position.

The compass/temperature display is the normal EVIC display. With the ignition switch in the On position, momentarily depressing and releasing the C/T (compass/temperature) push button switch will cause the EVIC to return to the compass/temperature/trip computer display mode from any other

mode. While in the compass/temperature/trip computer display mode, momentarily depressing and releasing the Step push button will step through the available trip computer display options.

The EVIC trip computer features several functions that can be reset. The functions that can be reset are: average fuel economy, trip odometer and elapsed time. With the ignition switch in the On position and with one of the functions of the trip computer that can be reset currently displayed, depressing the Reset push button twice within three seconds will perform a global reset, and all of the trip computer information that can be reset will be reset to zero. With the ignition switch in the On position and the function that is to be reset currently displayed, momentarily depressing and releasing the Reset push button once will perform a local reset, and only the value of the displayed function will be reset to zero. A global or local reset will only occur if the function currently displayed is a function that can be reset. The distance to service function can also be reset using the local reset method, but it will reset back to the Service Interval distance that is set in the EVIC programmable features mode. Refer to **ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING** in the Service Procedures section of this group for more information on setting the Service Interval.

For more information on the features, control functions and setting procedures for the EVIC module, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING - ELECTRONIC VEHICLE INFORMATION CENTER

If the problem with the EVIC is an inaccurate or scrambled display, refer to **Self-Diagnostic Test** in the Diagnosis and Testing section of this group. If the problem with the EVIC is incorrect Vacuum Fluorescent Display (VFD) dimming levels, use a DRB scan tool and the proper Diagnostic Procedures manual to test for the correct dimming message inputs being received from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus. If the problem is a no-display condition, use the following procedures. For complete circuit diagrams, refer to **Overhead Console** in Wiring Diagrams.

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the fused B(+) fuse in the PDC as required.

ELECTRONIC VEHICLE INFO CENTER (Continued)

(3) Check the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 4. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(4) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run/start) circuit to the ignition switch as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the overhead console. Check for continuity between the ground circuit cavity of the roof wire harness connector for the EVIC module and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the roof wire harness connector for the EVIC module. If OK, go to Step 7. If not OK, repair the open fused B(+) circuit to the fused B(+) fuse in the junction block as required.

(7) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the roof wire harness connector for the EVIC module. If OK, refer to **Self-Diagnostic Test** in the Diagnosis and Testing section of this group for further diagnosis of the EVIC module and the PCI data bus. If not OK, repair the open fused ignition switch output (run/start) circuit to the fuse in the junction block as required.

SELF-DIAGNOSTIC TEST

A self-diagnostic test is used to determine that the EVIC module is operating properly, and that all PCI data bus messages are being received for initial operation. Initiate the self-diagnostic test as follows:

(1) With the ignition switch in the Off position, simultaneously depress and hold the **C/T button** and the **Reset button**.

(2) Turn the ignition switch to the On position.

(3) Continue to hold both buttons depressed until the EVIC software version information is displayed, then release both buttons.

(4) Following completion of these tests, the EVIC module will display one of the following messages:

- **PASS SELF TEST** - Momentarily depress and release the Reset button to return to the compass/temperature/trip computer display mode. The EVIC module is working properly.

- **FAILED SELF TEST** - The EVIC module has an internal failure. The EVIC module is faulty and must be replaced.

- **NOT RECEIVING J1850 MESSAGE** - The EVIC module is not receiving proper message input through the PCI data bus. This can result from one or more faulty electronic modules in the vehicle, or from a faulty PCI data bus. The use of a DRB scan tool and the proper Diagnostic Procedures manual are required for further diagnosis.

NOTE: If the compass functions, but accuracy is suspect, it may be necessary to perform a variation adjustment. This procedure allows the compass unit to accommodate variations in the earth's magnetic field strength, based on geographic location. Refer to **Compass Variation Adjustment** in the Service Procedures section of this group.

NOTE: If the compass reading displays a blank, and only "CAL" appears in the display, demagnetizing may be necessary to remove excessive residual magnetic fields from the vehicle. Refer to **Compass Demagnetizing** in the Service Procedures section of this group.

STANDARD PROCEDURE - TIRE PRESSURE SYSTEM TEST

The following test can be used to verify two functions. One, that the tire pressure sensors are transmitting properly and two, the EVIC module is receiving these transmissions accordingly.

(1) Retrain the tire sensors (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE). The tire sensors must be retrained in order to set the proper transmitting time cycle (twice a minute), failure to retrain the sensors will cause a much slower transmitting time cycle (once a minute).

(2) Using the STEP button on the overhead console, scroll to the blank display, then press the RESET button for five seconds, a beep will sound indicating the start of this test. The vehicle icon and transmission counters will now be displayed, (same display as individual tire pressure except counters replace tire pressure values).

(3) Upon entering the test mode, the EVIC will clear the sensor counter and each time a sensor signal for a road tire is received, the EVIC will update the counter value (vehicle must be driven at 25 mph to transmit). The counter values should all read close to the same value (± 5), except for the spare tire counter. If any of the road tires display a difference of more than five, this is a sign of a problem. Replace the appropriate tire sensor and retest the system. This test will continue until any of the overhead console buttons are pressed or the ignition is turned off.

ELECTRONIC VEHICLE INFO CENTER (Continued)

NOTE: Pressing the RESET button during the test will sound a beep and reset all the counter values back to zero.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(3) Remove the four screws that secure the Electronic Vehicle Information Center (EVIC) module to the overhead console housing (Fig. 8).

Fig. 8 Electronic Vehicle Information Center (EVIC) Module

- 1 - OVERHEAD CONSOLE HOUSING
- 2 - EVIC MODULE
- 3 - VFD ILLUMINATION LAMPS
- 4 - SCREWS

(4) Remove the EVIC module from the overhead console housing.

NOTE: If the EVIC module is being replaced, the tire pressure monitoring system must be programmed. Refer to the tires/wheels section of this manual for detailed instructions.

INSTALLATION

(1) Position the EVIC module onto the overhead console housing.

(2) Install and tighten the four screws that secure the EVIC module to the overhead console housing. Tighten the screws to 0.9 N·m (8 in. lbs.).

(3) Install the overhead console onto the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

(4) Reconnect the battery negative cable.

NOTE: If a new compass mini-trip computer has been installed, the compass will have to be calibrated and the variance set. Refer to compass variation adjustment and compass calibration in the service procedures section of this group for the procedures.

NOTE: If the evic module is being replaced, the tire pressure monitoring system must be programmed. Refer to the tires/wheels section of this manual for detailed instructions.

NOTE: Some 300m vehicles use a different recommended tire pressure (tire specified). For this reason, anytime a evic module is removed or replaced a DRB III® scan tool must be used to set/verify that the correct tire pressure set-point is programmed in the evic module. Failure to do so could result in incorrect tire pressure monitoring set points.

UNIVERSAL TRANSMITTER**DESCRIPTION**

On some LH models a Universal Transmitter is standard factory-installed equipment. The universal transmitter transceiver is integral to the Electronic Vehicle Information Center (EVIC), which is located in the overhead console. The only visible component of the universal transmitter are the three transmitter push buttons centered between the four EVIC push buttons located just rearward of the EVIC display screen in the overhead console. The three universal transmitter push buttons are identified with one, two or three light indicators so that they be easily identified by sight.

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 288 to 410 MegaHertz (MHz) frequency range for remote operation. The universal transmitter is capable of operating systems using either rolling code or non-rolling code technology.

UNIVERSAL TRANSMITTER (Continued)

The EVIC module displays messages and a small house-shaped icon with one, two or three dots corresponding to the three transmitter buttons to indicate the status of the universal transmitter. The EVIC messages are:

- **Cleared Channels** - Indicates that all of the transmitter codes stored in the universal transmitter have been successfully cleared.
- **Training** - Indicates that the universal transmitter is in its transmitter learning mode.
- **Trained** - Indicates that the universal transmitter has successfully acquired a new transmitter code.
- **Transmit** - Indicates that a trained universal transmitter button has been depressed and that the universal transmitter is transmitting.

The universal transmitter cannot be repaired, and is available for service only as a unit with the EVIC module. This unit includes the push button switches and the plastic module. If any of these components is faulty or damaged, the complete EVIC module must be replaced.

OPERATION

The universal transmitter operates on a non-switched source of battery current so the unit will remain functional, regardless of the ignition switch position. For more information on the features, programming procedures and operation of the universal transmitter, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING - UNIVERSAL TRANSMITTER

If the Universal Transmitter is inoperative, but the Electronic Vehicle Information Center (EVIC) is operating normally, see the owner's manual in the vehicle glove box for instructions on training the Transmitter. Retrain the Transmitter with a known good transmitter as instructed in the owner's manual and test the Transmitter operation again. If the unit is still inoperative, test the universal transmitter with Radio Frequency Detector special tool (Fig. 9). If both the Transmitter and the EVIC module are inoperative, refer to **Electronic Vehicle Information Center Diagnosis and Testing** in this group for further diagnosis. For complete circuit diagrams, refer to **Wiring Diagrams**, as described below:

(1) Turn the Radio Frequency (RF) Detector ON. A "chirp" will sound and the green power LED will light. If the green LED does not light, replace the battery.

(2) Hold the RF detector within one inch of the TRAINED universal transmitter and press any of the transmitters buttons.

(3) The red signal detection LEDs will light and the tool will beep if a radio signal is detected. Repeat this test three times.

801230cb

Fig. 9 Radio Frequency Detector

- 1 - SIGNAL DETECTION LED'S
- 2 - POWER LED
- 3 - ON/OFF SWITCH
- 4 - 9V BATTERY

STANDARD PROCEDURE

STANDARD PROCEDURE - ERASING UNIVERSAL TRANSMITTER CODES

To erase the universal transmitter codes, simply hold down the two outside buttons until the red LED begins to flash.

NOTE: Individual channels cannot be erased. Erasing the transmitter codes will erase ALL programmed codes.

STANDARD PROCEDURE - SETTING UNIVERSAL TRANSMITTER CODES

- (1) Turn off the engine.
- (2) Erase the factory test codes by pressing the two outside buttons. Release the buttons when the red light begins to flash (about 20 seconds).
- (3) Choose one of the three buttons to train. Place the hand-held transmitter within one inch of the universal transmitter and push the buttons on both transmitters. The red light on the universal transmitter will begin to flash slowly.

UNIVERSAL TRANSMITTER (Continued)

(4) When the red light on the universal transmitter begins to flash rapidly (this may take as long as 60 seconds), release both buttons. Your universal transmitter is now "trained". To train the other buttons, repeat Step 3 and Step 4. Be sure to keep your hand-held transmitter in case you need to retrain the universal transmitter.

AMBIENT TEMPERATURE SENSOR

DESCRIPTION

Fig. 10 Ambient Temperature Sensor

Ambient air temperature is monitored by the Electronic Vehicle Information Center (EVIC) through ambient temperature messages received from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus network. The PCM receives a hard wired input from the ambient temperature sensor (Fig. 10). The ambient temperature sensor is a variable resistor mounted to a bracket that is secured with a screw to the right side of the headlamp mounting module grille opening, behind the radiator grille and in front of the engine compartment.

Refer to **Powertrain Control Module** in Electronic Control Modules for more information. For complete circuit diagrams, refer to the appropriate wiring information. The ambient temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal sent to it by the Powertrain Control Module (PCM). The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the PCM. Based upon the resistance in the sensor, the PCM senses a specific voltage on the temperature sensor signal circuit, which it is programmed to correspond to a specific temperature.

The PCM then sends the proper ambient temperature messages to the EVIC over the PCI data bus.

The thermometer function is supported by the ambient temperature sensor, a wiring circuit, the Powertrain Control Module (PCM), the Programmable Communications Interface (PCI) data bus, and a portion of the Electronic Vehicle Information Center (EVIC) module. If any portion of the ambient temperature sensor circuit fails, the PCM will self-diagnose the circuit.

DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR

(1) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor wire harness connector.

(2) Measure the resistance of the ambient temperature sensor. At room temperature (approx. 68°F), the sensor resistance should be between 9-11 Kilo-ohms (9000-11000 ohms). The sensor resistance should read between these two values. If OK, the sensor is OK at this time. If not OK, replace the faulty ambient temperature sensor.

REMOVAL

(1) Open hood, disconnect and isolate the negative battery cable remote terminal from the remote battery post (Fig. 11).

80b1b422

Fig. 11 Negative Battery Cable Remote Terminal

- 1 - RIGHT STRUT TOWER
- 2 - AIR CLEANER INLET TUBE
- 3 - REMOTE TERMINAL

(2) Raise and support the vehicle on safety stands.
(3) From behind front bumper fascia, remove the screw attaching the ambient temperature sensor to radiator closure panel.

AMBIENT TEMPERATURE SENSOR (Continued)

INSTALLATION

(1) Connect the ambient temperature sensor electrical connector.

(2) Install the ambient temperature sensor retaining screw.

(3) Connect the negative battery cable.

POWER LOCKS

DESCRIPTION

POWER DOOR LOCKS

All doors can be locked or unlocked electrically by operating the switch on either front door panels. When the door lock switch is activated the Body Control Module (BCM) actuates the door lock relay.

All doors can be locked or unlocked mechanically and independently with their respective locking knobs. On police vehicles, the rear doors must be locked or unlocked using the knob located in the front portion of each rear door panel. These are accessible only when the front doors are open.

The right and left front door can be locked or unlocked mechanically from the outside with the key

or all locks can be remotely locked or unlocked with the Remote Keyless Entry (RKE) transmitter. All doors can be locked/unlocked from the front doors via the Central Locking System. The front doors can also be unlocked by actuation of the inside remote door handle.

The deck lid can be unlatched by either depressing the push switch from inside the car, manually by key from outside or by depressing the remote keyless entry deck lid release button. This feature is customer programmable. The customer has a choice of immediate release or press and hold release for deck lid opening. The vehicle is shipped in the press and hold release mode.

On police vehicles, while the headlamp switch is either in “approach” or “apprehend” mode, the Panic, RKE lamp flash for lock and RKE horn chirp will not operate.

POWER LOCKS (Continued)

NOTE: The Power Door Lock Motor is not serviced separately. It is part of the door latch assembly. Refer to Body, Door - Front, Front Door Latch, or Body, Door - Rear, Rear Door Latch, Removal and Installation.

CENTRAL LOCKING

The Central Locking System is part of the Vehicle Theft Security System (VTSS).

CHILD PROTECTION LOCK

The child protection locks are on the rear doors only.

DOOR LOCK INHIBIT

The Door Lock Inhibit prevents the vehicle from being locked with the key in the ignition.

REMOTE KEYLESS ENTRY

80b30822

Fig. 1 REMOTE KEYLESS ENTRY TRANSMITTER

1 - BATTERIES

The system allows locking and unlocking of vehicle door(s), deck lid release, and panic by remote control using a hand held radio frequency transmitter (Fig. 1). The vehicle must be in PARK before the trunk lid can be unlatched with the transmitter.

The receiver may receive signals from up to four transmitters. Each transmitter has its own code, and the code is programmed and stored into receiver memory. If a transmitter is replaced or additional transmitters are added, the codes for all units have to be reprogrammed into the receiver memory. If a receiver module is replaced, the transmitter codes must be stored in the new receiver memory.

HORN CHIRP TOGGLE

Once the transmitters have been programmed, the horn chirp can be enabled/disabled by sending the horn chirp toggle operation code to the Body Control Module (BCM). Refer to the Owners Manual for programming procedures.

OPERATION

POWER DOOR LOCKS

The Body Control Module (BCM) actuates the power door lock relays when a door lock switch is activated. If the door lock switch is pressed for longer than eight consecutive seconds, the BCM will de-energize the door lock relay.

The system includes an Automatic Door Locking feature. **The vehicle is shipped with the system enabled.** When the system is disabled the door locks will work by use of the door lock switches and the Remote Keyless Entry System only. When the Automatic Door Lock System is enabled the BCM will automatically lock all the doors when all of the conditions below are met:

- All doors are closed.
- The vehicle speed exceeds 15 ± 1 mph.
- The throttle position sensor tip-in is greater than 10 ± 2 degrees.

The DRB III® scan tool is used to enable/disable the automatic door lock system. Refer to the proper Body Diagnostic Procedures Manual. They are also customer programmable. Refer to Owners Manual for customer programming procedures.

The BCM will automatically re-lock all doors if the above conditions are met and if any of the doors become ajar and then closes again.

The power lock motors are also equipped with a thermal protection system which prevents the motors from burning out. The motors may chatter if they are continuously activated.

CENTRAL LOCKING

Using the key, turn the driver's door cylinder lock to the lock position, all doors will lock. This feature operates differently on each door. Turn the key in the driver's door to the unlock position once will unlock the driver's door only. Turning the key a second time to the unlock position within five seconds of the first time will unlock all the doors.

The lock/unlock operation will arm/disarm the VTSS and will also activate/cancel the illuminated entry feature.

POWER LOCKS (Continued)

CHILD PROTECTION LOCK

The lock when engaged, will disable the inside door handle from opening the door. The lock is part of the latch/lock assembly. The lock is engaged by moving a lever that is located on the rearward inside edge of the door.

DOOR LOCK INHIBIT

With the key in the ignition switch and the driver's door open, the Body Control Module (BCM) will ignore the command to lock the power door locks.

Once the key is removed, or the driver's door is closed, the BCM will allow the power door locks to lock.

REMOTE KEYLESS ENTRY

The transmitter has four buttons for operation. They are LOCK, UNLOCK, DECK LID RELEASE, and PANIC.

- The UNLOCK button will unlock the driver's door and enable illuminated entry. Pushing and releasing the button once will unlock the driver's door. Pushing and releasing the button two times, within a five second interval, will unlock all doors.

- Upon pressing the LOCK button, the horn will sound a short CHIRP (if enabled) and flash the park lamps (if enabled) to notify that the all door lock signal was received and set. Illuminated entry is cancelled and the interior lamps are faded to off.

- Pushing and releasing the DECK LID RELEASE button (immediate release or press and hold release) within a two second interval, will slightly ajar the deck lid.

- Pushing and holding the PANIC button will cause the panic alarm to sound for three minutes, until the panic button is pressed and held a second time, or the vehicle reaches a speed of 15 mph.

The receiver is capable of retaining a Vehicle Access Code (VAC) even when power is removed.

Each Remote Keyless Entry (RKE) module must have at least one and no more than four transmitters.

HORN CHIRP TOGGLE

This can be done using a DRB III® scan tool or by the customer. The horn chirp will enter the opposite state of its current programmed state by receiving this operation code. The BCM is responsible for keeping track of the horn chirp status.

DIAGNOSIS AND TESTING - POWER LOCKS

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a DRBIII® scan tool and the proper Diagnostic Procedures manual.

STANDARD PROCEDURE - TOGGING CUSTOMER PREFERENCES**DECK LID RELEASE TOGGLE**

Deck lid release toggle is programmed to immediate release or press and hold release by continually pressing the unlock button for a minimum of 4 seconds to a maximum of 10 seconds. Within the 4-10 second range, the deck lid release button is depressed. Both buttons are then released.

HORN CHIRP TOGGLE

Once the transmitters have been programmed, the horn chirp can be enabled/disabled by sending the horn chirp toggle operation code to the Body Control Module (BCM). This can be done by pressing and holding the RKE Lock button for over four seconds. While pressing the Lock button, press the Unlock button. The horn chirp will enter the opposite state of its current programmed state by receiving this operation code. The BCM is responsible for monitoring of the horn chirp status.

DECK LID RELEASE SOLENOID**DIAGNOSIS AND TESTING - DECK LID RELEASE**

For vehicles equipped with electric deck lid release.

- (1) Confirm motor lead wire is connected and 10 volts or more are available at solenoid.

- (2) Provide proper ground through latch mounting screws.

- (3) Remove latch and examine plunger. Plunger should spring back when pressed.

- (4) Insure that solenoid plunger travel is adequate approximately 16 mm (5/8 inch).

REMOVAL

- (1) Disconnect and isolate the negative battery cable remote terminal from the remote battery post.

- (2) Raise deck lid to the full up position.

- (3) Remove latch cover attaching screws then remove cover.

- (4) Remove two mounting motor screws and remote key cable retainers then remove motor.

DECK LID RELEASE SOLENOID (Continued)

INSTALLATION

- (1) Install the two mounting motor screws and remote key cable retainers and motor.
- (2) Install the cover and latch cover attaching screws.
- (3) Connect and isolate the negative battery cable remote terminal onto the remote battery post.
- (4) Close the deck lid.

DECK LID RELEASE SWITCH

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove left lower instrument panel cover. Refer to Body, Instrument Panel, Instrument Panel and Pad Assembly, Removal and Installation.
- (3) Pinch four tabs around side of decklid release switch on the rear side of the left lower instrument panel cover, and push switch through opening.

INSTALLATION

- (1) push switch through opening and firmly snap into place on the left lower instrument panel cover.
- (2) Install the left lower instrument panel cover. Refer to Body, Instrument Panel, Instrument Panel and Pad Assembly, Removal and Installation.
- (3) Connect the negative battery cable remote terminal to the remote battery post.

DOOR CYLINDER LOCK SWITCH

REMOVAL

- (1) Open hood, disconnect and isolate the negative battery cable remote terminal from the remote battery post.
- (2) Refer to Body, Door - Front, for door trim and water shield Removal.
- (3) Disconnect the wiring clip and pigtail wire connector (Fig. 2).
- (4) Remove the Door Cylinder Lock Switch from door lock cylinder.

INSTALLATION

- (1) Install the Door Cylinder Lock Switch onto the door lock cylinder.
- (2) Connect the wiring clip and pigtail wire connector (Fig. 2).
- (3) Refer to Body, Door - Front, for Door Trim and Water Shield Installation.
- (4) Connect the negative battery cable remote terminal onto the remote battery post.

DOOR LOCK MOTOR

DIAGNOSIS AND TESTING - DOOR LOCK MOTOR

Make certain battery is in normal condition before circuits are tested.

To determine which motor is faulty, check each individual door for electrical lock and unlock or disconnect the motor connectors one at a time, while operating the door lock switch. In the event that none of the motors work, the problem maybe caused by a shorted motor, a bad switch, or a bad relay. Disconnecting a defective motor will allow the others to work.

To test an individual door lock motor, disconnect the electrical connector from the motor. To lock the door, connect a 12 volt power source to the positive pin of the lock motor and a ground wire to the other pin (Fig. 3). To unlock the door reverse the wire connections at the motor pin terminals. If these results are NOT obtained, replace the motor.

DOOR LOCK SWITCH

DIAGNOSIS AND TESTING - DOOR LOCK SWITCH

VOLTAGE

The following wiring test sequence determines whether or not voltage is continuous through the body harness to switch.

- (1) Remove left side switch from door trim panel.

DOOR LOCK SWITCH (Continued)

Fig. 3 DOOR LOCK MOTOR/LATCH

- 1 - PASSENGER SIDE CONNECTOR
- 2 - + TO LOCK
- 3 - DRIVER SIDE CONNECTOR

(2) Carefully separate multiple terminal block on wiring harness from switch body.

(3) Connect one lead of test light to a ground terminal:

- Touch other test light lead to battery feed B+ terminal.
- If test light comes on, the wiring circuit between the battery and switch is functional.
- If test light does not come on, check fuse 13 in the Junction Block for a blown fuse. Refer to Wiring Diagrams for circuit information.

DOOR LOCK SWITCH

Remove the switch from its mounting location. Using an ohmmeter, refer to Door Lock Switch Continuity table to determine if the continuity is correct in the LOCK and UNLOCK switch positions. If these results are not obtained, replace the switch.

DOOR LOCK SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
LOCK	1 AND 4	2700 Ω \pm 10%
UNLOCK	1 AND 4	620 Ω \pm 10%

KEYLESS ENTRY TRANSMITTER

DIAGNOSIS AND TESTING - KEYLESS ENTRY TRANSMITTER

Using special tool 9001, first test to ensure that the transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for Asian transmitters and 30.5 centimeters (12 inches) for all others. To test, position the transmitter as shown (Fig. 4). Press any transmitter button, then test each button individually. The tool will beep if a radio signal strength that lights five or more LED's is detected. Repeat this test three times. If transmitter fails any of the test, refer to the Diagnostic Procedures manual.

80f156c6

Fig. 4 RKE TRANSMITTER DIAGNOSIS

STANDARD PROCEDURE - TRANSMITTER PROGRAMMING

The Remote Keyless Entry (RKE) Transmitter(s) can be programmed with the use of the DRB III® scan tool, or by the customer.

PROGRAMMING TRANSMITTER WITH THE DRB III® SCAN TOOL

For procedures on programming the transmitter(s) with the DRB III® scan tool, refer to the proper Body Diagnostic Procedures Manual.

PROGRAMMING BY CUSTOMER

For a customer to be able to program RKE transmitters themselves, at least one RKE transmitter must be programmed already. This procedure is to add additional transmitters. If all transmitters are lost, the DRB III® scan tool must be used to program the new transmitter(s).

KEYLESS ENTRY TRANSMITTER (Continued)

Transmitter programming by the customer is done by continually pressing the unlock button, on a programmed fob, for a minimum of 4 seconds to a maximum of 10 seconds with the ignition switch ON. Within the 4-10 second range, the panic button is depressed. Both buttons are then released.

The BCM will chime indicating you have entered program mode. To program RKE transmitters, press and hold the RKE Lock and Unlock buttons simultaneously for three seconds, then press the Unlock button. Verify the BCM chimes after each transmitter is programmed. To exit program mode, turn off ignition or wait 32 seconds. The BCM will chime again.

SPECIFICATIONS

TRANSMITTER

BATTERY

The transmitter has two 3 volt batteries, which can be removed and replaced without special tools. Insert a dime in the side slot of the transmitter and twist. the halves should separate and the batteries are stacked on top of each other. The batteries are available at local retail stores. Recommended batteries are Panasonic CR 2016 or equivalent. Battery life is about two years (Fig. 1).

RANGE

Operation range is within 12 meters (40 ft.) of the module/receiver.

REMOTE KEYLESS ENTRY MODULE

REMOVAL

The Remote Keyless Entry (RKE) Module is located between the junction block and body control module. Refer to Electrical, Electronic Control Modules, Body Control Module, Removal.

(1) Disconnect and isolate the battery negative cable.

(2) With the junction block/BCM removed, separate the two by removing the four retaining screws.

(3) Unsnap the RKE module from the BCM.

INSTALLATION

(1) Place module into position on BCM and snap the RKE Module into place.

(2) Attach the junction block/BCM and install the four retaining screws.

(3) Connect battery negative cable.

Install the BCM. Refer to Electrical, Electronic Control Modules, Body Control Module, Installation.

NOTE: The RKE transmitters must be reprogrammed to the new RKE module.

POWER MIRRORS

DESCRIPTION	9	INSTALLATION	10
OPERATION	9	SIDEVIEW MIRROR	
DIAGNOSIS AND TESTING - AUTOMATIC DAY/NIGHT INSIDE MIRROR	9	REMOVAL	10

POWER MIRRORS

DESCRIPTION

AUTOMATIC DAY/NIGHT MIRROR

The automatic day/night mirror system is able to automatically change the reflectance of the inside rear view mirror in order to reduce the glare of headlamps approaching the vehicle from the rear. The automatic day/night rear view mirror receives battery current through a fuse in the junction block only when the ignition switch is in the ON position.

OUTSIDE REAR VIEW MIRROR

The power operated outside rear view mirrors allow the driver to adjust both outside mirrors electrically from the driver side front seat position by operating a switch on the driver side front door trim panel.

OPERATION

AUTOMATIC DAY/NIGHT MIRROR

A switch located on the bottom of the automatic day/night mirror housing allows the vehicle operator to select whether the automatic dimming feature is operational. When the automatic day/night mirror is turned on, the mirror switch is lighted by an integral Light-Emitting Diode (LED). The mirror will automatically disable its self-dimming feature whenever the vehicle is being driven in reverse.

Refer to the owner's manual for more information on the features, use and operation of the automatic day/night mirror system.

OUTSIDE REAR VIEW MIRROR

The power mirrors receive a non-switched battery feed through a fuse in the junction block so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING - POWER MIRRORS

WIRING VOLTAGE TEST

The following wiring test determines whether or not voltage is continuous through the body harness to switch.

- (1) Remove the power mirror switch.
- (2) Disconnect wire harness connector from back of power mirror switch.
- (3) Connect the clip end of a 12 volt test light to Pin 11 in the mirror switch harness connector. Touch the test light probe to Pin 9.

If the test light illuminates, the wiring circuit between the battery and switch is OK.

If the lamp does not illuminate, first check fuse in the Junction Block (JB). If circuit breaker is OK, then check for a broken wire.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

SIDE REPEATER LAMP TEST

Some vehicles are equipped with side repeater lamps integral to the sideview mirror. If the LED's within the mirror do not operate and the other within the system do, proceed with the side repeater lamp test. Refer to the appropriate wiring information. The wiring information includes wiring dia-

POWER MIRRORS (Continued)

grams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

- (1) Remove the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Disconnect wire harness connector from mirror.
- (3) Turn the ignition to the ON position and actuate the turn signal on the appropriate side.
- (4) Using a 12-volt test light, check for voltage at pin 12 (left side) or pin 8 (right side) while turn signals are functioning.
- (5) Check for ground at pin 1.

If the test light does not illuminate, check for a broken or shorted wire.

If the test light illuminates, the wiring circuit between the turn signal switch and the mirror wire harness connector is OK. Replace the mirror assembly.

POWER MIRROR MOTOR TEST

If the power mirror switch is receiving proper current and ground and mirrors do not operate, proceed with power mirror motor test. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

- (1) Remove the power mirror switch.
- (2) Disconnect wire harness connector to power mirror switch (Fig. 1).
- (3) Using two jumper wires:
 - Connect one to a 12 volt source
 - Connect the other to a good body ground
 - Refer to the Mirror Motor Test Chart for proper wire connections at the switch connector
- (4) If results shown in table are not obtained, check for open or shorted circuit. Replace mirror assembly as necessary.

AUTOMATIC DAY / NIGHT MIRROR

DESCRIPTION

The automatic day/night mirror uses a thin layer of electrochromic material between two pieces of conductive glass to make up the face of the mirror. When the mirror switch is in the On position, two photocell sensors are used by the mirror circuitry to monitor external light levels and adjust the reflectance of the mirror.

OPERATION

The ambient photocell sensor is located on the forward-facing (windshield side) of the rear view mirror housing, and detects the ambient light levels outside of the vehicle. The headlamp photocell sensor is located inside the rear view mirror housing behind the mirror glass and faces rearward, to detect the level of the light being received at the rear window side of the mirror. When the circuitry of the automatic day/night mirror detects that the difference between the two light levels is too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), it begins to darken the mirror.

The automatic day/night mirror circuitry also monitors the transmission using an input from the backup lamp circuit. The mirror circuitry is programmed to automatically disable its self-dimming feature whenever it senses that the transmission backup lamp circuit is energized.

The automatic day/night mirror is a completely self-contained unit and cannot be repaired. If faulty or damaged, the entire mirror assembly must be replaced.

DIAGNOSIS AND TESTING - AUTOMATIC DAY/NIGHT INSIDE MIRROR

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Check the fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fuse in the junction

block. If OK, go to Step 3. If not OK, repair the open circuit to the ignition switch as required.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the automatic day/night mirror. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the junction block as required.

(4) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the circuit to ground as required.

(5) Connect the battery negative cable. Turn the ignition switch to the On position. Set the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to Step 6. If not OK, repair the open circuit as required.

(6) Turn the ignition switch to the Off position. Disconnect the battery negative cable. Plug in the automatic day/night mirror wire harness connector. Connect the battery negative cable. Turn the ignition switch to the On position. Place the transmission gear selector lever in the Neutral position. Place the mirror switch in the On (the LED in the mirror switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

NOTE: The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.

(7) Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. If OK, go to Step 8. If not OK, replace the faulty automatic day/night mirror unit.

(8) With the mirror glass darkened, place the transmission gear selector lever in the Reverse position. The mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror unit.

POWER MIRROR SWITCH

DESCRIPTION

The mirror switch on the door trim panel operates both the outside rear view mirrors. On vehicles equipped with Memory/Heated Seats, the Memory Heated Seat Mirror Module (MHSMM) activates the drivers side mirror motor in recall mode.

OPERATION

Position sensing potentiometers are built into the drivers side mirror vertical and horizontal motor assembly. These potentiometers provide a sense voltage to the MHSMM that indicates where the actual location of the mirror is. If a memory position is set, the values of the potentiometers at that location are stored in memory.

DIAGNOSIS AND TESTING - POWER MIRROR SWITCH

- (1) Remove power mirror switch.
- (2) Disconnect wire harness connector from back of power mirror switch.
- (3) Using an ohmmeter, test for continuity between the terminals of the switch (Fig. 2) as shown in the Mirror Switch Test table.
- (4) If test results are not obtained as shown in the Mirror Switch Test table, replace the switch.

POWER SEATS

DESCRIPTION

DESCRIPTION - POWER SEAT SYSTEM

The power seat system option allows the driver and front seat passenger to electrically adjust their seating positions for optimum control and comfort using the power seat switches located on the out-board seat cushion side shield of each front seat.

A driver side eight-way power seat is standard on highline models and optional on others. This option includes a six-way adjustable seat cushion track and a two-way power seat back. The eight-way power seat is also available with the heated seat and memory seat system that automatically positions the power seat for two different drivers. Refer to **Heated Seat System** for more information on the heated seat option. Refer to **Memory System** in the Memory System section of this group for more information on the memory system.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The power seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Power Seat Track** - Two power seat tracks are used per vehicle. One seat track is used for each front seat. Depending on the seat track, four-way or eight-way power, the track may be equipped with up to four electric motors. Refer to power seat track later in this section for additional information.

POWER SEATS (Continued)

- **Power Seat Recliner** - Two power seat recliners are used per vehicle. One seat recliner is used for each front seat. The power seat recliner replaces the manual seat recliner found on low-line LH vehicles. Refer to power seat recliner later in this section for additional information.

- **Power Seat Switches** - Two power seat switches are used per vehicle. One seat switch is used for each front seat. Each switch is mounted in the appropriate seat cushion side shield. Refer to the appropriate power seat switch later in this section for additional information.

Refer to Wiring Diagrams for complete circuit diagrams. Following are general descriptions and operations for the major components in the power seat and memory seat systems.

DESCRIPTION - MEMORY SEAT SYSTEM

An electronic memory seat system is available on some LH models. The memory system is able to store and recall all driver side power seat positions, and the drivers side view mirror positions. The system can be set for two different drivers. On vehicles with a factory installed radio connected to the Programmable Communications Interface (PCI) data bus network, the memory system is also able to store and recall up to twenty radio station presets (ten AM and ten FM), also for two drivers. The memory system also will store and recall the last station listened to for each driver, even if it is not one of the twenty preset stations.

The memory system will automatically recall all of these settings when a button of the memory switch is depressed, or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter (if enabled). If the vehicle has more than two drivers the RKE transmitter recall of memory features can be disabled. This is a customer programmable feature of the overhead console. Refer to the Overhead Console section of this manual for additional information.

The memory system also has a easy exit feature that will move the driver seat rearward 55 millimeters or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is a customer programmable feature of the overhead console. Refer to the Overhead Console section of this manual for additional information.

A Memory Heated Seat Mirror Module (MHSMM) is used to control and integrate the many electronic functions and features included in the memory seat/mirror and heated seat systems.

The memory system includes the following components:

- **Memory Heated Seat Mirror Module (MHSMM)** - This module contains the solid state electronic control and diagnostic logic circuitry for the heated seat and memory seat/mirror systems. One module is used per vehicle and is mounted under the drivers front seat cushion. Refer to the Electronic Control Module section of this manual for additional information.

- **Memory Set/Selector Switch** - One switch is used per vehicle and is mounted in the drivers seat cushion side shield. Refer to the Memory Set Switch later in this section of this manual for additional information.

- **Position Potentiometers - Drivers Mirror** - The potentiometer is permanently installed on the drivers side view mirror motor. This potentiometer is used to provide a reference signal to the memory heated seat mirror module, letting the module know the exact position of the mirror.

- **Position Potentiometers - Seat Track** - These potentiometers are permanently installed in each of the power seat track motors. They are used to provide a reference signal to the memory heated seat mirror module, letting the module know the exact position of the seat cushion and recliner. Refer to Power Seat Track later in this section of the manual for additional information.

- **RKE Transmitter** - The RKE transmitter is attached to the key ring supplied with the vehicle. This device is used to recall preset memory positions as well as other features. Refer to the Power Locks section of this manual for additional information.

- **Radio Receiver** - The radio is also part of the memory system and if the radio is PCI data bus capable, multiple radio station presets can be programmed into the memory system also. Refer to the Audio section of this manual for additional information.

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) data bus network. The PCI data bus network allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of these electronic modules or of the PCI data bus network, the use of a DRB® scan tool and the proper Diagnostic Procedures manual are recommended.

POWER SEATS (Continued)

Other vehicle equipped electronic modules that may affect memory system operation are as follows:

- **Body Control Module (BCM)** - Refer to **Body Control Module** in Electronic Control Modules for more information.
- **Electronic Vehicle Information Center (EVIC)** - Refer to **Electronic Vehicle Information Center** in Overhead Console for more information.
- **Powertrain Control Module (PCM)** - Refer to **Powertrain Control Module** in Electronic Control Modules for more information.

Refer to **Heated Seat System** for more information on the heated seat system.

Refer to **Wiring** for complete circuit diagrams. Following are general descriptions and operations of the major components in the power/memory seat systems.

OPERATION

OPERATION - POWER SEAT SYSTEM

The power seat system receives battery current through a 40 amp fuse in the Power Distribution Center (PDC) and a 20 amp circuit breaker in the junction block so that the power seats remain operational, regardless of the ignition switch position. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the power seat system.

OPERATION - MEMORY SEAT SYSTEM

The Memory Heated Seat/Mirror Module receives hard wired inputs from the memory set/position switch and the potentiometers, mounted on each of the driver power seat track motors and the driver side view mirror motor. The programmed software in the module allows it to know where the seat/mirror is located in its designed travel by a resistance reading generated from the seat track or mirror mounted potentiometer. This way, when the memory switch is depressed the module will power the seat track or mirror motors until the correct preset location is achieved. The module will prevent the seat memory recall function from being initiated, if the transmission gear selector lever is not in the Park or Neutral positions, or if the vehicle is moving. These inputs are monitored over the PCI data bus circuit by the MHSM.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the memory seat system. Refer to **Electronic Vehicle Information Center** in Overhead Console Systems for information on the EVIC.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEATS

The following tests will help to diagnose the hard wired components and circuits of the power seat system. However, if the vehicle is also equipped with the optional memory system, these tests may not prove conclusive in the diagnosis of the driver side power seat. In order to obtain conclusive testing of the driver side power seat with the memory system option, the Programmable Communications Interface (PCI) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.7v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperational.

The most reliable, efficient, and accurate means to diagnose the driver side power seat with the memory system option requires the use of a DRB III® scan tool and the proper Diagnostic Procedures manual. The DRB III® scan tool can provide confirmation that the PCI data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the PCI data bus, and that the memory system is receiving the proper hard wired inputs and relaying the proper hard wired outputs to perform its driver side power seat functions.

Before any testing of the power seat system is attempted, the battery should be fully-charged. For complete circuit diagrams, refer to **Power Seat** in the Contents of Wiring Diagrams.

With the dome lamp on, apply the power seat switch in the direction of the failure. If the dome lamp dims, the seat may be jamming. Check under and behind the seat for binding or obstructions. If

POWER SEATS (Continued)

the dome lamp does not dim, proceed with testing of the individual components and circuits.

TESTING VOLTAGE TO SEAT

The following test will determine whether or not voltage is continuous through the body harness to the seat switch.

(1) Remove the front seat cushion side shield from the seat to be tested. Refer to Body for the procedure.

(2) Using a voltmeter, connect the ground lead to Pin 5 and positive lead to Pin 1 of the seat switch connector. If battery voltage is present circuit is OK. If no voltage is present check circuit breaker and repair as necessary.

TESTING CIRCUIT BREAKER

Find correct circuit breaker in junction/fuse block. Pull out slightly but be sure that circuit breaker terminals still contact terminals in fuse block. Connect ground wire of voltmeter to a good ground. With probe of voltmeter positive wire, check both terminals of circuit breaker for battery voltage. If only one terminal checks at battery voltage, circuit breaker is defective and must be replaced. If neither terminal shows battery voltage, check for open or shorted circuit to circuit breaker.

DIAGNOSIS AND TESTING - MEMORY SEAT SYSTEM

In order to obtain conclusive testing of the memory system, the Programmable Communications Interface (PCI) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked.

The most reliable, efficient, and accurate means to diagnose the memory system requires the use of a DRB III® scan tool and the proper Diagnostic Procedures manual. The DRB III® scan tool can provide confirmation that the PCI data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the PCI data bus, and that the memory system is receiving the proper hard wired inputs and relaying the proper hard wired outputs to perform its functions.

STANDARD PROCEDURE - MEMORY SYSTEM PROGRAMMING

The Memory Heated Seat Mirror Module (MHSM) interfaces with the RKE via the Programmable Communication Interface (PCI) bus. The proper procedure of setting and recalling a memory position using the RKE is as follows:

(1) Press memory switch 1 and release to recall memory position 1.

(2) Adjust the seat, recliner, set radio station presets and side view mirrors to the desired position.

(3) Press momentarily and release memory switch S.

(4) Press momentarily and release memory switch 1 or 2.

(5) Press and release the **LOCK** button on one of the RKE transmitters. Do NOT press any switch for 10 seconds.

To program the second driver's position, repeat the above procedure using memory switch 2. The second RKE transmitter can be programmed in the same fashion.

NOTE: The module will abort a recall if the transmission is moved out of park or if any seat movement is activated whether manually or by memory recall.

To recall either of the programmed positions momentarily press and release either memory selector switch 1 or 2. If using RKE, just press and release the UNLOCK button on the proper transmitter for either position 1 or 2.

A recall is possible any time the vehicle transmission is in PARK. This condition is monitored by the MHSM.

MEMORY SET SWITCH

DESCRIPTION

80b5cb1c

Fig. 1 Memory and Heated Seat Switches

- 1 - MEMORY SET SWITCH ASSEMBLY
- 2 - MEMORY SET BUTTON
- 3 - HEATED SEAT SWITCH
- 4 - LED'S
- 5 - MEMORY POSITION SELECT BUTTONS

The memory set/selector switch is mounted on the drivers seat cushion side shield (Fig. 1), within easy reach of the driver. This switch is used to set new and recall preset memory positions of seat, seat recliner, and the side view mirrors.

The memory set switch cannot be repaired or adjusted. If one switch is damaged or faulty, the entire memory set switch must be replaced.

MEMORY SET SWITCH (Continued)

OPERATION

When the memory set/selector switch is depressed, a resistance signal is sent to the memory heated seat mirror module via hard wired connections. The module then receives this hard-wired input and applies power to move the power seat track or side view mirrors according to the preset position. When the memory system is in "set" mode a chime will be generated by the body control module.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the memory switch.

DIAGNOSIS AND TESTING - MEMORY SET SWITCH

For complete circuit diagrams, refer to **Wiring Diagrams**.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the driver side front seat side shield. Refer to Body for the procedure.

(3) Disconnect the memory switch wire harness connector from the memory switch.

(4) Use an ohmmeter to test for continuity between the memory switch terminals.

(5) Connect one end of the ohmmeter to pin #3. While holding the memory 1 button check for continuity with pin #6. If not OK, replace the faulty memory switch.

(6) Connect one end of the ohmmeter to pin #3. While holding the memory 2 button check for continuity with pin #4. If not OK, replace the faulty memory switch.

(7) Connect one end of the ohmmeter to pin #3. While holding the memory S button check for continuity with pin #5. If not OK, replace the faulty memory switch.

(8) If OK, refer to **Memory System Diagnosis and Testing** in this group. If not OK, replace the faulty memory switch.

REMOVAL

(1) Disconnect and isolate the negative battery cable remote terminal from the remote battery post.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD

RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(2) Remove the drivers seat cushion side shield from the seat (Fig. 2). Refer to the Body section for the procedure.

80b5cb1b

Fig. 2 Memory, Power and Heated Seat Switch Locations

- 1 - HEATED SEAT SWITCH
- 2 - POWER SEAT SWITCH
- 3 - SEAT CUSHION SIDE SHIELD
- 4 - MEMORY SET SWITCH

(3) From the bottom, disengage the memory set switch by gently rock through the opening.

INSTALLATION

(1) Install the switch in the seat cushion side shield.

(2) Install the seat cushion side shield. Refer to the Body section for the procedure.

(3) Connect the negative battery cable remote terminal.

DRIVER POWER SEAT SWITCH

DESCRIPTION

Vehicles equipped with power seats utilize a eight-way driver power seat switch. This eight-way power seat switch features two knobs ganged together on the outboard seat cushion side shield.

The switch is secured to the back of the seat cushion side shield with two screws. However, the control knobs for the eight-way power seat switch unit must be removed before the seat switch can be removed from the side shield.

The power seat switch cannot be repaired. If one switch is damaged or faulty, the entire power seat switch assembly must be replaced.

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direc-

DRIVER POWER SEAT SWITCH (Continued)

tion until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged. See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

DIAGNOSIS AND TESTING - DRIVER POWER SEAT SWITCH

(1) Remove the power seat switch. Refer to the procedure in this section.

(2) Using an ohmmeter, check pin #1 of the power seat switch connector for continuity to ground. It should be present, If OK go to Step 3 , If NOT OK repair the open ground circuit as required.

(3) Using an voltmeter, check pin #5 of the power seat switch connector for approx. 12v. It should be present, If OK go to Step 4 , If NOT OK repair the open voltage supply circuit as required.

(4) Using an ohmmeter, verify the Seat Switch Continuity Test table, using the seat switch connector (Fig. 3). If there is no continuity at any of the switch positions, replace the power seat switch.

- (5) Remove switch attaching screws.
- (6) Remove switch from cushion side shield

INSTALLATION

- (1) Position the switch and install the switch attaching screws.
- (2) Install the knobs on the switch.
- (3) Connect wiring electrical connector on switch.
- (4) Install the seat cushion side shield. Refer to the Body section for the procedure.
- (5) Connect the negative battery cable remote terminal on the remote battery post.

PASSENGER POWER SEAT SWITCH

DESCRIPTION

Vehicles equipped with power seats utilize a eight/four-way passenger power seat switch. This eight/four-way power seat switch features two knobs ganged together on the outboard seat cushion side shield. Vehicles equipped with the eight-way, incorporate a power rear seat riser motor. Vehicles with the six-way do not.

The switch is secured to the back of the seat cushion side shield with two screws. However, the control knobs for the power seat switch must be removed before the seat switch can be removed from the side shield.

The power seat switch cannot be repaired. If one switch is damaged or faulty, the entire power seat switch assembly must be replaced.

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged. See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

DIAGNOSIS AND TESTING - PASSENGER POWER SEAT SWITCH

(1) Remove the power seat switch, refer to the Switch Removal and Installation procedures in this section.

(2) Using an ohmmeter, check pin #1 of the power seat switch connector for continuity to ground. It should be present, If OK go to Step 3 , If NOT OK repair the open ground circuit as required.

(3) Using an voltmeter, check pin #5 of the power seat switch connector for approx. 12v. It should be

PASSENGER POWER SEAT SWITCH (Continued)

present, If OK go to Step 4 , If NOT OK repair the open voltage supply circuit as required.

(4) Using an ohmmeter, perform the Seat Switch Continuity Test table using (Fig. 6). If there is no continuity at any of the switch positions, replace the power seat switch.

Fig. 6 Seat Switch Pin Call-Out

PASSENGER SEAT SWITCH TEST

SWITCH POSITION	CONTINUITY BETWEEN PINS
	PASSENGER
OFF	PIN 5 & 4 PIN 5 & 3 PIN 5 & 2 PIN 5 & 10 PIN 5 & 9 PIN 5 & 8 PIN 5 & 7 PIN 5 & 6

REMOVAL

(1) Open hood, disconnect and isolate the negative battery cable remote terminal from the remote battery post.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(2) Remove seat cushion side shield (Fig. 7). Refer to the Body section for the procedure.

Fig. 7 Power Seat Switch and Seat Side Shield

- (3) Disconnect wiring from switch.
- (4) Remove knobs from the switch (Fig. 8).
- (5) Remove switch attaching screws.
- (6) Remove switch from cushion side shield

INSTALLATION

- (1) Position the switch and install the switch attaching screws.
- (2) Install the knobs on the switch.
- (3) Connect wiring electrical connector on switch.
- (4) Install the seat cushion side shield. Refer to the Body section for the procedure.
- (5) Connect the negative battery cable remote terminal on the remote battery post.

PASSENGER POWER SEAT SWITCH (Continued)

Fig. 8 Removing Switch Control Knobs - Typical
POWER SEAT TRACK

DESCRIPTION

The eight/four-way power seat options include a single electrically operated power seat track located under each front bucket seat. The power seat track unit replaces the standard equipment manual seat tracks. The lower half of the power seat track is secured at the front with two bolts to the floor panel seat cross member, and at the rear with two bolts to the floor panel. Four nuts secure the bottom of the seat cushion frame to four studs on the upper half of the power seat track unit.

The power seat track unit cannot be repaired, and is serviced only as a complete unit. If any component in this unit is faulty or damaged, the entire power seat track unit must be replaced.

OPERATION

The power seat track unit includes two/three reversible electric motors that are secured to the upper half of the track unit. Each motor moves the seat adjuster through a combination of worm-drive gearboxes and screw-type drive units. Each of the driver side power seat track motors used on models equipped with the optional memory system, also has a position potentiometer integral to the motor assembly, which electronically monitors the motor position.

The front and rear (if equipped) of the seat are operated by two separate vertical adjustment motors. These motors can be operated independently of each other, tilting the entire seat assembly forward or rearward; or, they can be operated in unison by selecting the proper power seat switch functions, which will raise or lower the entire seat assembly. The third motor is the horizontal adjustment motor, which moves the seat track in the forward and rearward directions.

DIAGNOSIS AND TESTING - POWER SEAT TRACK

- (1) Remove power seat switch from seat. Refer to the procedure in this section.
- (2) Disconnect wire harness connector.
- (3) Check Pin 1 for battery voltage and Pin 5 for ground.
- (4) To test the seat motors and verify proper seat responses, refer to (Fig. 9) and the Seat Motor Test table. Using two jumper wires, connect one to a battery supply and the second to a ground. Connect the other ends to the seat wire harness connector as described in the Seat Motor Test table.

REMOVAL

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEATBACK MOUNTED AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the appropriate front seat from the vehicle. Refer to the Body section for the procedure.
- (2) Remove two seat back mounting bolts and also remove two seat back recliner bolts (Fig. 10).
- (3) Remove four seat track mounting bolts from cushion pan.
- (4) Remove the seat track from seat.

REMOVAL	22		

POWER WINDOWS

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows, and to lock out the individual switches on the passenger doors from operation. On police vehicles, the rear window switches are inoperable. The power window system receives battery feed through a circuit breaker in the junction block, only when the ignition switch is in the On position.

The power window system includes the power window switches on each door trim panel, the circuit breaker in the junction block, and the power window motors inside each door. For service of mechanical components, (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL) or (Refer to 23 - BODY/DOORS - REAR - REMOVAL).

OPERATION

Front and rear door window lift motors are of the permanent magnet type. A battery positive and negative connection to either of the two motor terminals will cause the motor to rotate in one direction. Reversing current through these same two connections will cause the motor to rotate in the opposite direction.

Each individual motor is grounded through the master switch.

DIAGNOSIS AND TESTING - POWER WINDOWS

WIRING VOLTAGE TEST

The following circuit test sequence determines whether or not voltage is continuous through the body harness to switch.

- (1) Remove the driver door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL) for proper procedures.
- (2) Carefully separate wiring harness connector from switch body.
- (3) Using a voltmeter, connect the ground lead to the Pin 10 of the wiring harness connector.
- (4) Using the positive lead, check Pin 1 of the harness connector for battery voltage. If OK, go to Window Switch Test below. If not OK, check 20 amp circuit breaker in the Junction Block, if the circuit breaker is OK, repair wire as necessary. For wiring, specific connector type and location, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

POWER WINDOW MOTOR TEST

- (1) Remove door trim panel, (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL) or (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
- (2) Connect positive (+) lead from a test battery to either of the two motor terminals.

POWER WINDOWS (Continued)

(3) Connect negative (-) lead from test battery to remaining motor terminal.

(4) The motor should now rotate in one direction to either move window up or down.

(a) If window happens to already be in full UP position and motor is connected so as to move it in UP direction no movement will be observed.

(b) Likewise, motor connected to move window in DOWN direction no movement will be observed if window is already in full DOWN position.

(c) Reverse battery leads in Step 1 and Step 2 and window should now move. If window does not move, remove motor. (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - REMOVAL).

(5) If window moved completely up or down, the test leads should be reversed one more time to complete a full window travel inspection.

(6) If window does not move, check to make sure that it is free.

(7) It is necessary that the window be free to slide up and down in the glass channels. If the window is not free to move up and down, the window lift motor will not be able to move the glass.

(8) To determine if the glass is free is to disconnect the regulator from the glass lift plate. Remove the two attaching screws, and slide the window up and down by hand.

WINDOW MOTOR

REMOVAL

(1) Move the window to the full-up position, if possible.

(2) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(3) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL) or (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).

(4) Remove window regulator. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL) or (Refer to 23 - BODY/DOORS - REAR - REMOVAL).

WARNING:

FAILURE TO CLAMP THE SECTOR GEAR TO THE MOUNTING PLATE WHEN REMOVING THE MOTOR CAN RESULT IN INJURY.

(5) Disconnect wiring connector from motor.

(6) Secure the sector gear and mounting plate with a C clamp or similar clamping tool. This will prevent a sudden and forceful movement of the regulator when the motor is removed.

(7) Remove three mounting screws that hold motor gearbox to regulator (Fig. 1).

(8) Remove motor from regulator.

Fig. 1 Motor Removal

- 1 - CLAMP REGULATOR TO SECTOR GEAR
2 - MOTOR MOUNTING SCREWS

INSTALLATION

(1) Install new motor on regulator by positioning motor gearbox so that it engages regulator sector teeth.

(2) A slight rotational or rocking movement may be necessary to bring three motor gearbox screw holes into proper position.

(3) Install three gearbox screws and one tie down bracket screw, if applicable. Tighten to 5.6 to 8 N·m (50 to 70 in. lbs.) torque.

(4) Install regulator. Using the switch, test operation of motor.

(5) Install trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION) or (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

(6) Connect the negative battery cable remote terminal to the remote battery post.

WINDOW SWITCH

DIAGNOSIS AND TESTING - WINDOW SWITCH

For switch testing, remove the switch from its mounting, refer to Switch Removal. Using an ohmmeter, refer to Window Switch Continuity Charts to determine if continuity is correct (Fig. 2) and (Fig. 3). If the results are not obtained, replace the switch.

The master window switch has an Auto-Down feature. Actuation of the master switch to the second down detent position will move the drivers side window completely down. The electronic switch will automatically disconnect the motor approximately 1 second after the window bottoms out. Failure of the electronic switch to detect stall current, will cause the switch to disconnect after approximately 15 seconds of operation. The auto down function can be canceled by any movement of the switch.

REMOVAL

MASTER SWITCH

INTREPID AND CONCORDE

- Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- Remove driver's door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- Remove three mounting screws.
- Remove switch and disconnect wire connector.

LHS and 300M

- Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- Using a trim stick (special tool #C-4755) or equivalent, gently pry up on switch trim bezel and lift up and out of trim panel.
- Disconnect wire connector from rear of switch and remove switch from vehicle.

PASSENGER SWITCH

- Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- Remove passenger door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- Disconnect switch wire connector.
- Remove switch from bezel and vehicle.

WINDOW SWITCH (Continued)

REAR DOOR SWITCHES

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Open rear door.
- (3) Using a trim stick (special tool #C-4755), gently pry up on rear edge of switch pushing forward as you pry up on switch bezel.
- (4) Pull switch up and out of rear door trim panel.
- (5) Using a trim stick, gently pry out on retaining tabs on side of switch connector and pull connector from switch.
- (6) Remove switch from vehicle.

INSTALLATION

MASTER SWITCH

INTREPID AND CONCORDE

- (1) Install switch and wire connector.
- (2) Install three mounting screws.
- (3) Install drivers door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

- (4) Connect negative battery cable remote terminal.

LHS and 300M

- (1) Install wire connector to switch.
- (2) Install switch to trim panel.
- (3) Connect negative battery cable remote terminal.

PASSENGER SWITCH

- (1) Install switch and wire connector.
- (2) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
- (3) Connect negative battery cable remote terminal.

REAR DOOR SWITCHES

- (1) Install connector to switch.
- (2) Insert switch into door trim panel.
- (3) Connect negative battery cable remote terminal.

RESTRAINTS

DESCRIPTION - SIDE IMPACT AIRBAG SYSTEM

Vehicles equipped with the Side Impact Airbag System utilize an airbag mounted to the outer part of each front seat back frame (Fig. 1). This system is designed to protect occupants in the event of a side impact collision.

OPERATION - SIDE IMPACT AIRBAG SYSTEM

The Side Impact Airbag Control Module (SIACM) controls the seat back mounted airbags. If the SIACM determines the impact is severe enough, the appropriate airbag will inflate, tearing open the front seat back trim cover protecting the passengers. Once a seat back mounted airbag has been deployed, the complete seat back assembly and all damaged parts must be replaced.

WARNING

WARNING

WARNING: THIS SYSTEM IS A SENSITIVE, COMPLEX ELECTRONIC UNIT. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE REMOTE CABLE BEFORE BEGINNING AIRBAG SYSTEM COMPONENT REMOVAL OR INSTALLATION PROCEDURES. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY. ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR TWO MINUTES BEFORE REMOVING AIRBAG COMPONENTS.

DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A SOLID SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED AND COULD RESULT IN PERSONAL INJURY. WHEN CARRYING OR HANDLING AN UNDEPLOYED AIRBAG, THE TRIM SIDE OF THE AIRBAG SHOULD BE POINTING AWAY FROM THE BODY TO MINIMIZE POSSIBILITY OF INJURY IF ACCIDENTAL DEPLOYMENT OCCURS.

REPLACE AIRBAG SYSTEM COMPONENTS WITH MOPAR® REPLACEMENT PARTS. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION.

WEAR SAFETY GLASSES, RUBBER GLOVES, AND LONG SLEEVED CLOTHING WHEN CLEANING POWDER RESIDUE FROM THE VEHICLE AFTER AN AIRBAG DEPLOYMENT. SODIUM HYDROXIDE POWDER RESIDUE EMITTED FROM A DEPLOYED AIR-

BAG CAN CAUSE SKIN IRRITATION. FLUSH AFFECTED AREA WITH COOL WATER IF IRRITATION IS EXPERIENCED. IF NASAL OR THROAT IRRITATION IS EXPERIENCED, EXIT THE VEHICLE FOR FRESH AIR UNTIL THE IRRITATION CEASES. IF IRRITATION CONTINUES, SEE A PHYSICIAN.

DO NOT USE A REPLACEMENT AIRBAG THAT IS NOT IN THE ORIGINAL PACKAGING, IMPROPER DEPLOYMENT AND PERSONAL INJURY CAN RESULT.

THE FACTORY INSTALLED FASTENERS, SCREWS AND BOLTS USED TO FASTEN AIRBAG COMPONENTS HAVE A SPECIAL COATING AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. DO NOT USE SUBSTITUTE FASTENERS, USE ONLY ORIGINAL EQUIPMENT FASTENERS LISTED IN THE PARTS CATALOG WHEN FASTENER REPLACEMENT IS REQUIRED.

AIRBAGS SHOULD BE STORED IN A COOL, DRY PLACE, AWAY FROM EXCESSIVE HEAT AND STATIC ELECTRICAL ACTIVITY WITH THE FABRIC AIRBAG FACING UP. IF NOT, A PREMATURE DEPLOYMENT CAN RESULT.

IF THE DRIVER/PASSENGER AIRBAG IS DEFECTIVE AND DEPLOYED, REFER TO CHRYSLER CORPORATION'S CURRENT RETURN LIST FOR PROPER HANDLING PROCEDURES.

CAUTION:

Deployed and Nondeployed Air Bags may or may not have live pyrotechnic material within the air bag inflator. Do not dispose of Driver and Passenger Airbags unless you are sure of complete deployment. Please refer to the Hazardous Substance Control System for Proper Disposal. Dispose of deployed air bags in a manner consistent with state, provincial, local, and federal regulations.

WARNING: DURING, AND FOLLOWING, ANY CHILD RESTRAINT ANCHOR SERVICE, DUE TO IMPACT EVENT OR VEHICLE REPAIR, CAREFULLY INSPECT ALL MOUNTING HARDWARE, TETHER STRAPS AND ANCHORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. IF A CHILD RESTRAINT ANCHOR IS FOUND DAMAGED IN ANY WAY, THE ANCHOR MUST BE REPLACED.

DIAGNOSIS AND TESTING - AIRBAG SYSTEM

(1) With the battery negative remote cable disconnected, connect the DRB III® scan tool to the Data Link connector.

(2) Turn the ignition key to the ON position. Exit vehicle with the scan tool.

(3) After checking that no one is inside the vehicle, connect the battery negative remote terminal.

(4) Read and record the **ACTIVE** Diagnostic Trouble Code (DTC) data.

(5) Read and record any **STORED** DTC's.

(6) Refer to the proper Body Diagnostic Procedures manual if any DTC's are found in Step 4 and Step 5.

(7) If the airbag warning lamp either fails to light, or goes ON and stays ON, there is a system malfunction. To test the airbag warning lamp (bulb) operation in the cluster, refer to Electrical, Instrument Cluster, Diagnosis and Testing - Instrument Cluster. Refer to the proper Body Diagnostic Procedures manual for any other system problems.

- 5 - 8 INCHES
- 6 - SEAT AIRBAG CUSHION
- 7 - CENTER CONSOLE

STANDARD PROCEDURE**STANDARD PROCEDURE - HANDLING AIRBAGS****DEPLOYED AIRBAG**

The vehicle interior may contain a very small amount of sodium hydroxide powder, a by-product of airbag deployment. Sodium hydroxide powder can irritate the skin, eyes, nose and throat. Wear safety glasses, rubber gloves, and long sleeved clothing when cleaning any of the powder residue from the vehicle.

If you find that the cleanup is irritating your skin, run cool water over the affected area. Also, if you experience nasal or throat irritation, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.

UNDEPLOYED AIRBAG

The airbags must be stored in its original special container until used for service. At no time should a source of electricity be permitted near the inflator on the back of an airbag module. When carrying or handling an undeployed airbag module, the trim side of the airbag should be pointing away from the body to minimize possibility of injury if accidental deployment occurs. Do not place undeployed airbag face down on a solid surface, the airbag will propel into the air if accidental deployment occurs.

STANDARD PROCEDURE - SERVICE AFTER AN AIRBAG DEPLOYMENT**DRIVER AIRBAG**

After a Driver Airbag has been deployed due to a collision, the following **MUST** be replaced:

- Driver Airbag
- Clock Spring Assembly
- Steering Wheel
- Complete Steering Column Assembly with Lower Steering Column Coupler

All other airbag and vehicle components should be closely inspected following any airbag deployment, and should be replaced when visible damage is incurred.

PASSENGER AIRBAG

After a Passenger Airbag has been deployed due to a collision, the following **MUST** be replaced:

- Passenger Airbag
- Instrument Panel and Pad Assembly

All other airbag and vehicle components should be closely inspected following any airbag deployment, and should be replaced when visible damage is incurred.

SEAT AIRBAG

After a Seat Airbag has been deployed due to a collision, the following **MUST** be replaced:

- Complete Seat Back Assembly

All other airbag and vehicle components should be closely inspected following any airbag deployment, and should be replaced when visible damage is incurred.

RESTRAINTS (Continued)

SEAT BELTS AND RETRACTORS

All seat belts should be closely inspected for cuts, tears, fraying, or damage in any way following any frontal impact or airbag deployment. The seat belts are to be replaced when visible damage is incurred. Inspect the Lower Anchors and Tether for Children (LATCH) child restraint anchors for damage after an impact event and replace as needed.

CLEAN UP PROCEDURE

Roll or fold the airbag towards its mounting point (i.e. instrument panel, steering wheel, or seat back). Then tape the ripped cover over the deployed airbag.

Use a vacuum cleaner to remove any residual powder from the vehicle interior. Work from the outside in to avoid kneeling or sitting in a contaminated area. Vacuum the heater and A/C outlets as well (Fig. 7). If the heater or air conditioner was in RECIRC mode at time of airbag deployment, operate blower motor on low speed and vacuum powder residue expelled from the heater and A/C outlets. Multiple vacuum cleaning may be necessary to decontaminate the interior of the vehicle.

Fig. 7 VACUUM HEATER AND A/C OUTLETS - TYPICAL

CHILD RESTRAINT ANCHOR**DESCRIPTION**

Vehicles manufactured for sale in the North American market are equipped with a Lower Anchors and Tether for Children, or LATCH child restraint anchorage system. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position. The rear seat in these models are equipped with a fixed-position child restraint upper tether anchor and child restraint lower anchors for the two outboard seating positions only. Vehicles manufactured for sale outside of North America are equipped with a fixed-position child restraint upper tether anchor for both the cen-

ter and the two outboard seating positions, but does not have the child restraint lower anchors.

Vehicles manufactured for sale in North America also have two lower anchors for each rear outboard seating position (Fig. 8) and three fixed-position child restraint upper tether anchors. These lower anchors are mounted on a bracket and secured to the floor pan. They are each accessed from the front of their respective seats, at each side where the seat back meets the seat cushion. These lower anchors cannot be adjusted or repaired and, if faulty or damaged, they must be replaced as a unit with their mounting bracket.

Fig. 8 CHILD RESTRAINT LOWER ANCHORS SECOND ROW - LOCATION - TYPICAL

OPERATION

See the owner's manual in the vehicle glove box for more information on the proper use of all of the factory-installed child restraint anchors.

REMOVAL

WARNING: DURING, AND FOLLOWING, ANY CHILD RESTRAINT ANCHOR SERVICE, DUE TO IMPACT EVENT OR VEHICLE REPAIR, CAREFULLY INSPECT ALL MOUNTING HARDWARE, TETHER STRAPS AND ANCHORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. IF A CHILD RESTRAINT ANCHOR IS FOUND DAMAGED IN ANY WAY, THE ANCHOR MUST BE REPLACED.

- (1) Remove the lower seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).
- (2) Remove two nuts to LATCH bracket.
- (3) Remove bracket from vehicle.

CHILD RESTRAINT ANCHOR (Continued)

INSTALLATION

WARNING: DURING, AND FOLLOWING, ANY CHILD RESTRAINT ANCHOR SERVICE, DUE TO IMPACT EVENT OR VEHICLE REPAIR, CAREFULLY INSPECT ALL MOUNTING HARDWARE, TETHER STRAPS AND ANCHORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. IF A CHILD RESTRAINT ANCHOR IS FOUND DAMAGED IN ANY WAY, THE ANCHOR MUST BE REPLACED.

(1) Place LATCH bracket on studs and install retaining nuts. Torque nuts to 40 N·m (350 in. lbs.).

(2) Install the rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).

CHILD TETHER CUP

REMOVAL

(1) Remove the rear shelf trim panel from vehicle.

(2) Turn the shelf panel over so that the bottom side is upward to access the Child Tether Cup locks.

(3) With a trim stick (special tool #C-4733) or equivalent, push attachment locks toward the center of the cup to release the Child Tether Cup from the rear shelf panel.

(4) Remove the Child Tether Cup.

INSTALLATION

(1) Place the Child Tether Cup into position on top of the rear shelf trim panel.

(2) Press rearward until cup engages into the rear shelf trim panel.

(3) Push the front of cup down into the rear shelf trim panel.

(4) Install the rear shelf panel.

CHILD TETHER CUP COVER

REMOVAL

(1) Open the Child Tether Cup Cover to the full open position.

(2) Push cover towards the rear of the vehicle until the cover detaches from the cup.

INSTALLATION

(1) Place the Child Tether Cup cover into position on top of the rear shelf trim panel.

(2) Push downward on the Child Tether Cup Cover until it locks into position (you will hear it click into place).

CLOCK SPRING

DESCRIPTION

80b2b434

Fig. 9 CLOCK SPRING LOCATION

- 1 - CLOCK SPRING
2 - MOUNTING SCREWS

The clock spring is mounted to the steering column behind the steering wheel (Fig. 9). The clock spring is used to maintain a continuous electrical circuit between the wiring harness and the:

- Driver's airbag
- Speed control switches
- Horn switch
- BCM - Remote Radio Switches (optional)

OPERATION

The clock spring consists of a flat, ribbon like, electrically conductive tape which winds and unwinds with the steering wheel rotation.

STANDARD PROCEDURE - CLOCK SPRING CENTERING

If the rotating tape within the clock spring is not positioned properly with the steering wheel and the front wheels, the clock spring may fail during use. The following procedure **MUST BE USED** to center the clock spring if:

- The clock spring is not known to be properly positioned.
- The front wheels were moved with the steering wheel off.

• The steering wheel was moved from the half turn (180 degrees) to the right (clockwise) position.

(1) Remove steering wheel. Refer to Steering, Column, Steering Wheel Removal and Installation.

(2) After removal, depress the plastic locking pin to disengage locking mechanism.

CLOCK SPRING (Continued)

(3) Keeping locking mechanism disengaged, rotate the clock spring rotor until a yellow dot appears in centering window and black arrow lines up with drive pin.

(4) Reinstall steering wheel upside down with wheels turned 180° clockwise.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, AIRBAG SYSTEM TEST FOR PROCEDURE.

REMOVAL

(1) Place the front road wheels in the straight ahead position then:

- Rotate the steering wheel half turn (180 degrees) to the right (clockwise).
- Lock column with ignition lock cylinder.

(2) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(3) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.

(4) Remove speed control switch mounting screws, from the back of the steering wheel, and disconnect the wire connectors. If equipped with remote radio switches, the speed control switches can remain attached to the wire connectors.

(5) Remove the Driver Airbag attaching bolts.

(6) Lift airbag out of steering wheel and disconnect the airbag and horn wire connectors. If equipped with remote radio switches, disconnect the 4-way connector between the clock spring and the steering wheel wiring harness.

(7) Remove the steering wheel (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).

(8) Remove the tilt lever (Fig. 10) from the steering column (if equipped).

NOTE: The upper shroud on this steering column is retained to the steering column by a snap fit to the lower shroud. When removing the upper shroud from the steering column lower shroud, **DO NOT** use a hard or sharp tool. This will damage the shrouds. If a tool must be used, use a soft tool such as a trim stick (special tool #C-4755) or equivalent.

Fig. 10 TILT LEVER - REMOVE/INSTALL

- 1 - TILT LEVER
2 - LOWER SHROUD

(9) Remove the steering column upper shroud from the steering column using the following procedure. First, on the right seam between the upper and lower shrouds, push in on seam at the forward end. When the upper shroud unsnaps, pull the upper shroud upward away from the lower. Repeat this procedure on the opposite side of the column to release the upper shroud from the lower. Remove the upper shroud from the steering column.

(10) Remove the two screws attaching the lower shroud to the steering column (Fig. 11). Remove the lower shroud from the steering column.

Fig. 11 LOWER SHROUD ATTACHING SCREWS

- 1 - LOWER SHROUD
2 - MOUNTING SCREWS

(11) Disconnect the 2-way and 4-way connectors between the clock spring and the instrument panel wiring harness at the base of the clock spring.

CLOCK SPRING (Continued)

(12) Remove two mounting screws and pull clock spring assembly from steering shaft. The clock spring cannot be repaired, and must be replaced if faulty.

INSTALLATION

(1) Confirm that:

- The steering wheel position is a half turn (180°) to the right (clockwise).
- The column is locked with the ignition cylinder lock.
- Locate the clock spring on the steering shaft and push down on the rotor until the clock spring is fully seated on the steering column.

• Fasten clock spring to steering column using the two mounting screws and torque screws to 2.7 N·m (24 in. lbs.).

(2) Connect the clock spring to the instrument panel harness, ensure wiring is properly routed. Check that the connectors, locking tabs are properly engaged.

(3) Install steering column shrouds. Be sure all wires are inside of shrouds.

(4) Install the tilt wheel release lever, if equipped.

(5) Pull all wires through the large opening of the hub area on the steering wheel. Install steering wheel ensuring the flats on hub align with the clock spring. Tighten steering wheel nut to 61 N·m (45 ft. lbs.) torque. Ensure leads do not get pinched under the steering wheel (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).

(6) Unlock the steering column with the ignition lock cylinder. Return the steering wheel to the upright position (180° counterclockwise).

(7) Route speed control wires under and behind the airbag mounting tabs.

(a) If equipped with remote radio switches, connect the 4-way harness connector between the steering wheel and the clock spring. Push the 4-way connector into docking tab at the 12 o'clock position of the steering wheel back cover.

(8) Connect the horn lead wire and the airbag lead wire to the airbag module.

(9) Install the airbag and torque bolts to 7-9 N·m (65-85 in. lbs.) torque.

(10) Connect the speed control wires to the switches and install switches. Torque screws to 1.5 N·m (13 in. lbs.) torque.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

DRIVER AIRBAG

DESCRIPTION

Fig. 12 AIRBAG COMPONENT LOCATION

- 1 - DRIVER AIRBAG
- 2 - PASSENGER AIRBAG
- 3 - OCCUPANT RESTRAINT CONTROLLER (ORC)
- 4 - KNEE BLOCKER

The driver airbag protective trim cover is the most visible part of the driver airbag. The driver airbag is mounted directly to the steering wheel (Fig. 12). Located under the airbag trim cover are the horn switch, the folded airbag cushion, and the airbag cushion supporting components. The resistive membrane-type horn switch is secured beneath a plastic tray that is mounted to the back side of the driver airbag trim cover.

The driver airbag cannot be repaired, and must be replaced if deployed. The driver airbag trim cover/horn switch are serviced separately from the driver airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG TRIM COVER - REMOVAL).

OPERATION

The driver airbag includes a stamped metal housing to which the cushion and an inflator unit are attached and sealed. The inflator assembly is mounted to studs on the back of the airbag housing. The inflator seals the hole in the airbag cushion so it can discharge the gas it produces directly into the cushion when supplied with the proper electrical signal. Following an airbag deployment, the airbag cushion quickly deflates by venting this gas towards the instrument panel.

DRIVER AIRBAG (Continued)

The protective trim cover is fitted to the front of the airbag and forms a decorative cover in the center of the steering wheel. The inside of the trim cover has locking blocks molded into it that engage a lip on the airbag nylon housing. Upon airbag deployment, the trim cover will split at predetermined breakout lines, then fold back out of the way along with the horn switch and tray unit.

REMOVAL

When removing a deployed airbag, rubber gloves, eye protection and long sleeved shirt should be worn, as there may be deposits on the surface which could irritate the skin and eyes.

When removing a Driver Airbag for any reason the following procedures must be followed:

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.
- (3) Remove speed control switch screws from steering wheel back cover, remove switches and disconnect the wires.
 - (a) If equipped with remote radio switches, it is not necessary to disconnect the speed control switches.
- (4) Remove two bolts retaining Driver Airbag.
- (5) Lift airbag and disconnect airbag and horn wire connectors.
- (6) Remove Driver Airbag from vehicle.

WARNING: WHEN REPLACING A DEPLOYED DRIVER AIRBAG, THE CLOCK SPRING MUST ALSO BE REPLACED (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCK SPRING - REMOVAL).

INSTALLATION

- (1) Connect clock spring, horn and airbag wiring connectors to the airbag. Make airbag connection by pressing straight in on the connector. The connector should be fully seated to assure positive connection. Check that the wires are not pinched during installation.
- (2) Install the airbag screws and tighten to 7 to 9 N·m (65 to 85 in. lbs.) torque.
- (3) Connect the wire connectors to the speed control switches and install switches. Tighten speed control screws to 1.5 N·m (13 in. lbs).

- (a) If equipped with remote radio switches, only the 4-way connector between the steering wheel and wire harness and the clock spring needs to be connected. Dock the 4-way connector in the tab at the 12 o'clock position of the steering wheel back cover.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

DRIVER AIRBAG TRIM COVER

REMOVAL

To replace the Driver Airbag Trim Cover, you must first remove the driver airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

- (1) Remove the plastic wire retainer that captures the horn feed pigtail (Fig. 13) or (Fig. 14).
- (2) Remove the four nuts that secure the retainer bracket to the airbag housing studs.
- (3) Disengage the six trim cover locking blocks from the lip around the outside edge of the driver airbag housing and remove the housing from the cover (Fig. 15).
- (4) Remove the trim cover retainer bracket from the horn ground wire. The trim cover retainer bracket will be reused with the new trim cover (Fig. 16).

INSTALLATION

- (1) Move horn switch feed wire and horn switch ground wire out of the way, to avoid being trapped.
- (2) Place inflator, driver airbag housing, and airbag (as one unit) in the driver airbag trim cover. Make sure that neither horn wire is trapped between the airbag housing and the trim cover locking blocks.
- (3) Engage the upper and lower trim cover locking blocks with the lip of the driver airbag housing. Then engage the locking blocks on each side of the trim cover with the lips of the housing (Fig. 15) and (Fig. 17).

WARNING: BE CERTAIN THAT EACH OF THE LOCKING BLOCKS IS FULLY ENGAGED ON THE LIP OF THE AIRBAG HOUSING.

DRIVER AIRBAG TRIM COVER (Continued)

DRIVER AIRBAG TRIM COVER (Continued)

80a0f19f

Fig. 17 DRIVER AIRBAG TRIM COVER HOUSING CUT-AWAY

- 1 - LIP
- 2 - DRIVER AIRBAG TRIM COVER
- 3 - DRIVER AIRBAG HOUSING
- 4 - LOCKING BLOCK

(4) Install the trim cover retainer bracket to the horn ground wire and place over the airbag housing studs.

WARNING: BE CERTAIN THAT THE TABS ON THE RETAINER ARE ENGAGED IN THE RETAINER SLOTS OF THE TRIM COVER LOCKING BLOCKS (Fig. 15).

(5) Install and tighten the nuts that secure the trim cover retainers to the airbag housing studs. Torque nuts to 10 N·m (90 in. lbs.).

For airbags with a blade style horn switch feed wire:

(6) Route the horn switch feed wire between the inflator housing and the upper airbag housing stud (Fig. 13).

For airbags with connector style horn switch feed wire:

(7) Install plastic wire retainer on the two side studs (Fig. 14).

(8) Install the driver airbag onto the steering wheel (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

FRONT SEAT BELT & RETRACTOR

REMOVAL

WARNING: INSPECT THE CONDITION OF THE SHOULDER/LAP BELT. REPLACE THE RETRACTOR IF THE BELT IS CUT, FRAYED, TORN, OR DAMAGED IN ANY WAY.

(1) If necessary, move the front seat all the way forward for access.

(2) Remove the turning loop adjuster knob.

(3) Detach the turning loop cover from the upper anchor bolt.

(4) Remove the upper anchor bolt (Fig. 18).

8099c4ac

Fig. 18 FRONT SEAT BELT RETRACTOR

- 1 - FRONT SEAT BELT RETRACTOR
- 2 - TURNING LOOP ADJUSTER
- 3 - B-PILLAR UPPER
- 4 - TURNING LOOP ADJUSTER KNOB
- 5 - UPPER SEAT BELT ANCHOR BOLT
- 6 - LOWER SEAT BELT ANCHOR BOLT

(5) Remove the B-pillar upper trim.

(6) Remove the lower anchor bolt.

(7) Remove the B-pillar lower trim panel.

(8) Disconnect the retractor wire harness connector (driver side only).

(9) Remove the retractor from the vehicle.

FRONT SEAT BELT & RETRACTOR (Continued)

INSTALLATION

WARNING: INSPECT THE CONDITION OF THE SHOULDER/LAP BELT. REPLACE THE RETRACTOR IF THE BELT IS CUT, FRAYED, TORN, OR DAMAGED IN ANY WAY.

- (1) Position the retractor in the vehicle.
- (2) Connect the retractor wire harness connector (driver side only).
- (3) Install the lower B-pillar trim.
- (4) Install the retractor anchor bolt. Tighten to 40 N·m (30 ft. lbs.) torque.
- (5) Anchor bolt must go through the webbing anchor plate and retractor bracket.
- (6) Route the belt webbing through the access slots in the B-pillar upper trim.
- (7) Install the B-pillar upper trim.
- (8) Install the upper anchor bolt. Tighten to 40 N·m (30 ft. lbs.) torque.
- (9) Close the turning loop covers.
- (10) Install the turning loop adjuster knob.
- (11) Slide cover over bolt and anchor plate.

IMPACT SENSOR**DESCRIPTION**

The Airbag System is a supplemental safety device designed to help protect the driver and passenger from serious injury, caused by a frontal impact of the vehicle.

The Occupant Restraint Controller's (ORC) internal impact sensor provides verification of the direction and severity of an impact. The sensor is mounted within the ORC.

OPERATION

The Occupant Restraint Controller (ORC) uses data collected from its internal accelerometers to discriminate the direction and severity of an impact. The ORC will activate power stages internal to the module in order to deploy the driver and passenger side airbags once a predetermined threshold has been exceeded. The ORC is calibrated for a particular vehicle family and uses an advanced software algorithm to discriminate the severity and direction of any vehicle event.

OCCUPANT RESTRAINT CONTROLLER**DESCRIPTION**

The Occupant Restraint Controller (ORC) is also sometimes referred to as the Airbag Control Module (ACM). The ORC contains the accelerometer and energy reserve capacitor. The ORC is mounted on the tunnel floor pan, forward of the center console.

OPERATION

The accelerometer is located inside the ORC. The accelerometer provides confirmation of a crash, discriminating severity. The ORC monitors the system to determine the system readiness. The ORC may store sufficient energy to deploy the airbags for only two minutes after the battery is disconnected. The ORC contains on-board diagnostics, and will illuminate the AIRBAG warning lamp on the cluster when a fault occurs. The warning equipment is tested for a few seconds every time the vehicle is started.

OCCUPANT RESTRAINT CONTROLLER - 5 PASSENGER VEHICLES**REMOVAL**

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.

NOTE: If working on a Concorde, the Instrument Panel must be removed. Refer to Body, Instrument Panel for Removal and Installation. Then go to Step 11.

- (3) Remove one screw to shift knob.
- (4) Remove two screws to shifter bezel.
- (5) Disconnect power outlet connector and remove bezel from vehicle.
- (6) Remove left instrument panel end cap covering the junction block.
- (7) Remove two screws to steering column cover then pull toward rear of vehicle to disengage clips.
- (8) Open glove box door. Continue to pull down on the door until the glove box drops and you see the screws in the upper and lower left corner or the glove box bin.
- (9) Pull the right console side panel off.
- (10) Remove two screws to left console side panel and pull off.

OCCUPANT RESTRAINT CONTROLLER - 5 PASSENGER VEHICLES (Continued)

(11) With the ORC now exposed, slide the red Connector Position Assurance (CPA) tab out. Press down on the locking latch and disconnect the ORC 23-way connector.

(12) Remove the two side module mounting screws on the drivers side.

(13) Loosen the top screw on the drivers side.

(14) Lift up the module and slide out the ORC.

NOTE: If the ORC cannot be lifted out, the passenger side screw needs some additional loosening.

(15) Remove the ORC from vehicle.

INSTALLATION

WARNING: THE ORC IS A SAFETY MODULE AND FAILURE TO INSTALL AND SECURE IT PROPERLY, COULD CAUSE THE MODULE TO POSSIBLY MALFUNCTION AND CAUSE PERSONAL INJURY.

(1) Position the ORC (arrow pointing forward in vehicle) on the ORC mounting bracket. The mounting bosses on the controller will correctly position the ORC on the bracket. Attach the ORC to the bracket with the three screws supplied and torque to 88 to 124 in. lbs. (10 to 14 N-m).

CAUTION: USE SUPPLIED SCREWS ONLY.

(2) Tighten the top screw on the drivers side.

(3) Install the two side ORC mounting screws on the drivers side.

(4) Connect ORC 23-way connector and slide the red Connector Position Assurance (CPA) tab in.

NOTE: If working on a Concorde, the Instrument Panel must be installed. Refer to Body, Instrument Panel for Installation and then go to Electrical, Restraints, Diagnosis and Testing - Airbag System.

(5) Install left console side panel and two retaining screws.

(6) Install the right console side panel.

(7) Install the screws in the upper and lower left corner or the glove box bin.

(8) Close the glove box door.

(9) Install the steering wheel cover and the two screws to steering column cover.

(10) Install the left instrument panel end cover covering the junction block.

(11) Connect power outlet connector and install the center bezel into vehicle.

(12) Install the two screws to shifter bezel.

(13) Install the one screw to shift knob.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

OCCUPANT RESTRAINT CONTROLLER - 6 PASSENGER VEHICLES**REMOVAL**

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.

(3) Open glove box door and release side tabs and swing down.

NOTE: If working on a Concorde, the Instrument Panel must be removed. Refer to Body, Instrument Panel, for Removal. Then go to Step 11.

(4) Remove the left endcap at the junction block.

(5) Remove two screws to steering column cover then pull toward rear of vehicle to disengage clips.

(6) Open glove box door. Continue to pull down on the door until the glove box drops and you see the screws in the upper and lower left corner or the glove box bin.

(7) Remove the instrument panel center bezel. The temperature control module, power outlet and traction control switch will pop out with the center bezel.

(8) Disconnect the connectors at center bezel.

(9) Remove four screws to Chin bezel. Two on the right side and two on the left side of vehicle.

(10) Remove one screw and one push fastener retaining floor bin.

(11) With the ORC now exposed, slide the red Connector Position Assurance (CPA) tab out. Press down on the locking latch and disconnect the ORC 23-way connector.

(12) Remove the two side module mounting screws on the drivers side.

(13) Loosen the top screw on the drivers side.

(14) Lift up the module and slide out the ORC.

NOTE: If the ORC cannot be lifted out, the passenger side screw needs some additional loosening.

(15) Remove the ORC from vehicle.

OCCUPANT RESTRAINT CONTROLLER - 6 PASSENGER VEHICLES (Continued)

INSTALLATION

WARNING: THE ORC IS A SAFETY MODULE. FAILURE TO INSTALL AND SECURE IT PROPERLY COULD CAUSE THE MODULE TO MALFUNCTION AND CAUSE PERSONAL INJURY.

(1) Position the ORC (arrow pointing forward in vehicle) on the ORC mounting bracket. The mounting bosses on the controller will correctly position the ORC on the bracket. Attach the ORC to the bracket with the three screws supplied and torque to 88 to 124 in. lbs. (10 to 14 N·m).

CAUTION: Use supplied screws only.

- (2) Tighten the top screw on the drivers side.
- (3) Install the two side module mounting screws on the drivers side.
- (4) Connect the ORC 23-way connector. Slide the red Connector Position Assurance (CPA) tab in.

NOTE: If working on a Concorde, the Instrument Panel must be installed. Refer to Body, Instrument Panel, for Installation and then go to Electrical, Restraints, Diagnosis and Testing - Airbag System.

- (5) Install the one screw and one push fastener retaining the floor bin.
- (6) Install the four screws to Chin bezel. Two on the right side and two on the left side of vehicle.
- (7) Connect the connectors at center bezel.
- (8) Install the instrument panel center bezel.
- (9) Install the screws in the upper and lower left corner or the glove box bin. Close the glove box door.
- (10) Install the two screws to steering column cover.
- (11) Install the left end cover at the junction block.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

PASSENGER AIRBAG

DESCRIPTION

WARNING: NEVER DISASSEMBLE THE PASSENGER AIRBAG, THE PASSENGER AIRBAG HAS NO SERVICEABLE PARTS.

The Passenger Airbag is located beneath the instrument panel and pad assembly (Fig. 19). The airbag is mounted to a bracket (welded to the floor pan) with three screws.

Fig. 19 AIRBAG COMPONENT LOCATION

- 1 - DRIVER AIRBAG
- 2 - PASSENGER AIRBAG
- 3 - OCCUPANT RESTRAINT CONTROLLER (ORC)
- 4 - KNEE BLOCKER

The instrument panel top cover/pad is the most visible part of the passenger airbag system. Located under the instrument panel top pad are the airbag door, the passenger airbag cushion and the airbag cushion supporting components.

The passenger airbag includes an extruded housing within which the cushion and inflator are mounted and sealed. Two stamped metal brackets, one on each end of the housing, enclose the cushion and inflator and also serve as the mounting brackets for the airbag.

Following a passenger airbag deployment, the passenger airbag and instrument panel must be replaced. The passenger airbag cannot be repaired, and must be replaced if deployed or in any way damaged.

OPERATION

The passenger inflator assembly is within the airbag housing. The inflator seals the hole in the airbag cushion so it can discharge the gas it produces directly into the cushion when supplied with the proper electrical signal. Following an airbag deployment, the airbag cushion quickly deflates by venting this gas through the discrete vent holes used on each end panel of the airbag cushion.

The passenger airbag is secured with screws to the instrument panel beneath the instrument panel top pad and above the glove box opening. The instrument panel top pad above the glove box opening conceals the airbag door and a predetermined hinge line beneath its decorative cover. Upon airbag deployment, the top pad will bend at the hinge line and the door will fold back out of the way onto the top of the instrument panel.

PASSENGER AIRBAG (Continued)

REMOVAL

NON DEPLOYED AIRBAG

Use this procedure when removing an airbag for any reason **OTHER THAN DEPLOYMENT**.

The instrument panel must be **PARTIALLY** removed for Passenger Airbag service. Refer to Body, Instrument Panel for graphics of complete instrument panel.

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.

(3) Remove the four screws that attach the glove box door to the instrument panel and remove the glove box door.

(4) Remove right instrument panel end cap.

(5) If equipped with center console:

- Remove the gearshift handle set screw and then remove the gear shift handle.

- Remove the console shifter bezel.

- Remove the right console side trim panel.

(6) Accessing through the glove box door, remove five screws to the glove box close - out assembly (20 in. lbs. torque) (Fig. 20).

Fig. 20 GLOVE BOX CLOSE - OUT TO REINFORCEMENT

1 - GLOVE BOX CLOSE-OUT ATTACHING SCREWS

(7) Remove the left and right A-pillar trim moldings.

(8) Remove the left instrument panel end cap.

(9) Remove the left lower instrument panel trim cover. Disconnect the hood release cable and decklid release electrical connector. Remove and set panel aside.

(10) Remove the left knee blocker.

(11) Remove the instrument panel center bezel. Disconnect the heater - A/C control unit and traction control switch (if equipped) electrical connectors.

(12) If equipped with console, remove the left instrument panel side cover.

(13) If not equipped with center console, remove the center lower instrument panel floor bin.

(14) Remove the two center instrument panel lower attaching nuts.

(15) Remove the left (driver's) side air distribution ducts.

(16) Disconnect the brake switch electrical connector.

(17) Remove the bulkhead connector mounting screw.

NOTE: It is not necessary to disconnect the bulkhead connector.

(18) Disconnect the Occupant Restraint Controller (ORC) electrical connector.

(19) Disconnect the two center instrument panel ground eyelets on the left side of the floor tunnel.

(20) Remove the four steering column nuts and lower the steering column to the floor.

(21) Remove the three lower left instrument panel mounting bolts.

(22) Remove the three upper left instrument panel mounting bolts.

(23) Disconnect the instrument panel to body harness electrical connector.

(24) Disconnect the radio antenna connector.

(25) Remove the three lower right instrument panel mounting bolts.

(26) Remove the three upper right instrument panel mounting bolts.

(27) Pull the right side of the instrument panel back and set on right (passenger side) seat to access the passenger airbag module.

NOTE: The instrument panel does not have to be removed any more than this for passenger airbag service.

(28) Remove four screws to the right demister duct (20 in. lbs. torque).

(29) Remove two screws to the right distribution duct assembly (20 in. lbs. torque).

(30) Disconnect the yellow wire harness connector from the airbag assembly and the three push pin fasteners.

(31) Remove the right and left pencil strut to Passenger Airbag screws (45 in. lbs. torque) (Fig. 21).

(32) Disconnect the instrument panel wiring harness from the airbag reinforcement bracket.

(33) Remove four 10 mm hex head screws to the deployment door reinforcement - two screws per side (75 in. lbs. torque.) (Fig. 21)

(34) Remove five screws from the passenger airbag assembly to retainer (20 in. lbs. torque) (Fig. 21).

PASSENGER AIRBAG (Continued)

**Fig. 21 INSTRUMENT PANEL AND PAD ASSEMBLY**

- 1 - STEP #32
2 SCREWS PER SIDE
2 - STEP #33
5 SCREWS
3 - STEP #30
1 SCREW PER SIDE

(35) Remove the airbag assembly from the instrument panel retainer.

(36) Remove four screws to the reinforcement brace on the old airbag (20 in. lbs. torque) (Fig. 22).

**Fig. 22 REINFORCEMENT TO PASSENGER AIRBAG**

- 1 - RETAINING SCREWS

DEPLOYED AIRBAG

The instrument panel **MUST** be removed for **DEPLOYED** Passenger Airbag service.

WARNING: THE PASSENGER AIRBAG AND INSTRUMENT PANEL ASSEMBLY MUST BE REPLACED AFTER A PASSENGER AIRBAG DEPLOYMENT.

When removing a deployed airbag: rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the surface which could irritate the skin and eyes.

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.

(3) Roll or fold the passenger airbag towards the instrument panel surface and tuck into instrument panel into module area. Then tape the ripped instrument panel pad over the deployed airbag.

(4) Remove instrument panel and pad assembly. Refer to Body, Instrument Panel for Removal and Installation.

(5) Remove Passenger Airbag. Refer to Electrical, Restraints, Passenger Airbag Removal and Installation for a Non-Deployed Airbag.

INSTALLATION**NON DEPLOYED AIRBAG**

(1) Install the four screws to the reinforcement brace on the airbag. Torque screws to 2 N·m (20 in. lbs.) (Fig. 22).

(2) Install the airbag assembly into the instrument panel retainer.

(3) Install the five screws attaching the passenger airbag assembly to retainer. Torque screws to 2 N·m (20 in. lbs.) (Fig. 21).

(4) Install the four 10 mm hex head screws to the deployment door reinforcement - two screws per side. Torque screws to 8.5 N·m (75 in. lbs.) (Fig. 21)

(5) Connect the instrument panel wiring harness to the airbag reinforcement bracket.

(6) Install the right and left pencil strut to Passenger Airbag screws. Torque screws to 5 N·m (45 in. lbs.) (Fig. 21).

(7) Connect the yellow wire harness connector to the airbag assembly and the three push pin fasteners. Align the connector, then firmly press straight in, being careful not to damage pins on airbag.

(8) Install the two screws to the right distribution duct assembly. Torque screws to 2 N·m (20 in. lbs.).

(9) Install the four screws to the right demister duct. Torque screws to 2 N·m (20 in. lbs.).

(10) Lift instrument panel assembly off of passenger seat and into position on the dash panel.

(11) Install the three upper right instrument panel mounting bolts.

(12) Install the three lower right instrument panel mounting bolts.

(13) Connect the radio antenna connector.

(14) Connect the instrument panel to body harness electrical connector.

(15) Install the three upper left instrument panel mounting bolts.

(16) Install the three lower left instrument panel mounting bolts.

PASSENGER AIRBAG (Continued)

- (17) Lift the steering column into position and install the four steering column nuts.
- (18) Connect the two center instrument panel ground eyelets on the left side of the floor tunnel.
- (19) Connect the Occupant Restraint Controller (ORC) electrical connector.
- (20) Install the bulkhead connector mounting screw.
- (21) Connect the brake switch electrical connector.
- (22) Install the left (driver's) side air distribution ducts.
- (23) Install the two center instrument panel lower attaching nuts.
- (24) If not equipped with center console, install the center lower instrument panel floor bin.
- (25) If equipped with console, install the left instrument panel side cover.
- (26) Connect the heater - A/C control unit and traction control switch (if equipped) electrical connectors and install the instrument panel center bezel.
- (27) Install the left knee blocker.
- (28) Connect the hood release cable and decklid release electrical connector. Install the left lower instrument panel trim cover.
- (29) Install the left instrument panel end cover.
- (30) Install the left and right A-pillar trim moldings.
- (31) Accessing through the glove box door, install five screws to the glove box close - out assembly. Torque screws to 2.3 N·m (20 in. lbs.) (Fig. 20).
- (32) If equipped with center console:
 - Install the right console side trim panel.
 - Install the console shifter bezel.
 - Install the gearshift handle and set screw.
- (33) Install the right instrument panel end cover.
- (34) Install the four screws that attach the glove box door to the instrument panel and install the glove box door.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

DEPLOYED AIRBAG

- (1) Transfer all instrument panel components which are not damaged to NEW instrument panel and pad assembly. Tighten screws to 2.3 N·m (20 in. lbs.) torque.
- (2) Install the four screws to the airbag reinforcement brace on the airbag. Torque screws to 2 N·m (20 in. lbs.) (Fig. 22).
- (3) Install the airbag assembly into the instrument panel retainer.

- (4) Install the five screws attaching the passenger airbag assembly to retainer. Torque screws to 2 N·m (20 in. lbs.) (Fig. 21).

- (5) Install the four 10 mm hex head screws to the deployment door reinforcement - two screws per side. Torque screws to 8.5 N·m (75 in. lbs.) (Fig. 21)

- (6) Connect the **NEW** instrument panel wiring harness to the airbag reinforcement bracket.

- (7) Install the right and left pencil strut to Passenger Airbag screws. Torque screws to 5 N·m (45 in. lbs.) (Fig. 21).

- (8) Connect the yellow wire harness connector to the airbag assembly and the three push pin fasteners. Align the connector, then firmly press straight in, being careful not to damage pins on airbag.

- (9) Install the two screws to the right distribution duct assembly. Torque screws to 2 N·m (20 in. lbs.).

- (10) Install the four screws to the right demister duct. Torque screws to 2 N·m (20 in. lbs.)

Install the instrument panel. Refer to Body, Instrument Panel, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

REAR SEAT BELT & RETRACTOR

REMOVAL

WARNING: INSPECT THE CONDITION OF THE SHOULDER/LAP BELT. REPLACE THE RETRACTOR IF THE BELT IS CUT, FRAYED, TORN, OR DAMAGED IN ANY WAY.

- (1) Remove the seat cushion and back.
- (2) Remove the upper quarter trim panel.
- (3) Remove the lower quarter trim panel.
- (4) Remove the nut attaching the lower seat belt anchor to the floor.
- (5) Remove the turning loop bolt.
- (6) Remove the bolt attaching the seat belt retractor to the quarter panel. (Fig. 23).
- (7) Remove the seat belt retractor from the vehicle.

INSTALLATION

WARNING: INSPECT THE CONDITION OF THE SHOULDER/LAP BELT. REPLACE THE RETRACTOR IF THE BELT IS CUT, FRAYED, TORN, OR DAMAGED IN ANY WAY.

- (1) Place belt in position in the vehicle.

REAR SEAT BELT & RETRACTOR (Continued)

80b2b3ee

Fig. 23 REAR SEAT BELT RETRACTOR

- 1 - TURNING LOOP
- 2 - REAR SEAT BELT RETRACTOR
- 3 - SEAT BACK
- 4 - ANCHOR NUT

(2) Install the bolt to attach the seat belt retractor to the quarter panel.

(3) Install the turning loop.

(4) Route the anchor end of the seat belt through the upper quarter trim opening. Tighten to 40 N·m (30 ft. lbs.).

(5) Install the nut to attach the lower seat belt anchor to the floor. Tighten nut to 40 N·m (30 ft. lbs.) torque.

(6) Install the lower quarter trim panel.

(7) Install the upper quarter trim panels.

(8) Install the seat back and cushion.

REAR SEAT BELT & RETRACTOR - CENTER

REMOVAL

WARNING: INSPECT THE CONDITION OF THE SHOULDER/LAP BELT. REPLACE THE RETRACTOR IF THE BELT IS CUT, FRAYED, TORN, OR DAMAGED IN ANY WAY.

- (1) Remove the rear shelf trim panel.
- (2) Remove the bolt attaching the center rear seat belt retractor to the rear shelf (Fig. 24).
- (3) Remove the center rear seat belt retractor assembly from the vehicle.

80bfe172

Fig. 24 REAR SEAT BELT RETRACTOR - CENTER

- 1 - CENTER REAR SEAT BELT RETRACTOR
- 2 - REAR SHELF
- 3 - REAR SPEAKER LOCATIONS

INSTALLATION

WARNING: INSPECT THE CONDITION OF THE SHOULDER/LAP BELT. REPLACE THE RETRACTOR IF THE BELT IS CUT, FRAYED, TORN, OR DAMAGED IN ANY WAY.

(1) Install the center rear seat belt retractor assembly on the rear shelf. Torque the bolt to 40 N·m (30 ft. lbs.).

(2) Install the rear shelf trim panel.

WARNING: THE REAR SEAT BACK RETAINING NUT ALSO SERVES AS THE CENTER SEAT BELT ANCHOR (Fig. 25). BE CERTAIN TO TORQUE THIS NUT TO 40 N·m (30 ft. lbs.).

(3) Install the rear seat back. Be certain rear seat belts are properly routed to avoid twisted or tangled belts and/or buckles (Fig. 25).

SEAT AIRBAG

DESCRIPTION

80bfe0dc

Fig. 26 SEAT AIRBAG - TYPICAL

The side impact airbag system Seat Airbags are located in the outboard side of the front seat backs (Fig. 1). One in each front seat. The seat airbag inflator assembly is within the airbag housing (Fig. 26). Each airbag is mounted to the seat back frame (Fig. 1).

OPERATION

Only the Side Impact Airbag Control Module (SIACM) can deploy the side airbags. When supplied with the proper electrical signal the seat airbag inflator will produce a gas and discharge the bag directly between the occupant and the side of the vehicle, protecting the occupant. Upon deployment, the seat back trim cover will tear open and allow the side airbag to fully inflate and quickly deflate.

REMOVAL

WARNING: DO NOT REPLACE A DEPLOYED AIRBAG. IF SEAT AIRBAG HAS BEEN DEPLOYED, THE ENTIRE SEAT BACK AND ALL DAMAGED PARTS MUST BE REPLACED.

DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

ONCE THE BATTERY NEGATIVE CABLE IS DISCONNECTED, WAIT 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENT.

(1) Position the front seat in the full forward position.

(2) Disconnect and isolate the battery negative cable remote terminal.

(3) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.

(4) Remove the plastic back panel from the seat back (Fig. 27). Refer to Body, Seats, Seat Back, Removal.

(5) With seat back on bench, disengage the seat back trim cover J-strap from the upper, lower and airbag side of seat back.

(6) Disconnect the side airbag electrical connector. Slide yellow locking tab down to unlock. Then with two fingers, push the two side retaining tabs in and pull the connector straight from airbag.

(7) Remove the side airbag retaining nuts.

(8) Grasp the upper airbag side of the seat back trim cover and pull trim cover and cushion over top of seat back frame. This will allow room to remove side airbag without damaging the trim cover or cushion.

(9) Working between the seat back trim cover/cushion and frame, carefully unhook the airbag studs from the nylon sleeve and slide the airbag out of sleeve. Be careful not to tear the nylon sleeve as this will affect functionality of the airbag.

SEAT AIRBAG (Continued)

80ble0ea

Fig. 27 FRONT SEAT BACK PANEL

1 - FRONT SEAT BACK PANEL

WARNING: BE CERTAIN NOT TO TEAR THE SEAT AIRBAG NYLON SLEEVE DURING REMOVAL. IF THIS OCCURS, THE SEAT BACK TRIM COVER MUST BE REPLACED.

INSTALLATION

WARNING: DO NOT REPLACE A DEPLOYED AIRBAG. IF SEAT AIRBAG HAS BEEN DEPLOYED, THE ENTIRE SEAT BACK AND ALL DAMAGED PARTS MUST BE REPLACED.

NOTE: THE AIRBAG CONNECTOR MUST FACE DOWN (TOWARD SEAT CUSHION) AFTER INSTALLATION.

(1) Carefully slide the seat airbag into the nylon sleeve until the mounting studs line up with the holes provided in nylon sleeve. Be careful not to tear nylon sleeve as this will affect the functionality of the side airbag system.

WARNING: THE AIRBAG MUST BE INSIDE THE NYLON SLEEVE BEFORE INSTALLING THE RETAINING NUTS. FAILURE TO DO SO WILL ADVERSELY AFFECT THE FUNCTIONALITY OF THE SIDE AIRBAG SYSTEM.

(2) Pull airbag and nylon sleeve assembly up, to line up mounting studs and mistake proofing pin with holes provided in seat back frame mounting

bracket. Install airbag retaining nuts. Torque to 10.7 ± 1 N·m (94.7 in. lbs.).

(3) Position the upper seat back trim cover and cushion over the seat back frame.

(4) Connect the side airbag electrical connector. After the initial connector is installed, be certain the yellow locking tab is in the upper "LOCKED" position. Check to be certain the connector cannot be removed once the yellow locking tab is positioned.

(5) Position the seat back trim cover and install the seat back trim cover J-straps on the upper, lower, and airbag side of seat back frame.

CAUTION: Always install new push pins when installing the seat back plastic panel.

(6) Install the plastic back panel on the seat back. Be sure to use new push pins in the upper mounting location of the back cover. Refer to Body, Seats, Seat Back, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

SEAT AIRBAG WIRING HARNESS**REMOVAL**

WARNING: DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE REMOTE TERMINAL BEFORE BEGINNING ANY SEAT AIRBAG REMOVAL. THIS WILL DISABLE THE SIDE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL SIDE AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY. ONCE THE BATTERY NEGATIVE CABLE IS DISCONNECTED AND ISOLATED, WAIT 2 MINUTES BEFORE REMOVING ANY SIDE AIRBAG SYSTEM COMPONENT.

(1) Disconnect and isolate the battery negative battery cable remote terminal.

(2) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.

(3) Remove the left front seat from the vehicle and place on a bench. Refer to Body, Seats, Front Seat, Removal.

(4) Remove plastic back panel from the seat back. Refer to Body, Seats, Front Seat Back Cover, Removal.

SEAT AIRBAG WIRING HARNESS (Continued)

(5) Disengage seat back trim cover J-strap from the upper, lower and airbag side of seat back.

(6) Disconnect the side airbag electrical connector. Slide yellow locking tab down to unlock. Then with two fingers, push two side retaining tabs in and pull connector straight from side airbag.

(7) Remove the front seat cushion side shield. Refer to Body, Seats, Front Seat Cushion Side Shield, Removal.

(8) Disengage push pin and remove the wire harness (Fig. 28) and (Fig. 29) from the seat assembly.

Fig. 28 SEAT AIRBAG WIRE HARNESS LOCATION

- 1 - SEAT TRACK RETAINING BOLTS
- 2 - SEAT AIRBAG WIRE HARNESS
- 3 - SEAT AIRBAG WIRE HARNESS CONNECTOR
- 4 - CUSHION PAN

INSTALLATION

(1) Install the airbag wire harness in the seat. Be certain the wire harness routing is correct. The harness should follow the leading edge of the seat back frame down into the lower seat cushion. Once inserted in lower cushion, the harness is positioned between the cushion pan and the seat track, and held in place with push pins.

(2) Connect the side airbag electrical connector. After connector is installed be certain the yellow locking tab is in the upper "LOCKED" position. Check to be certain that the connector cannot be removed once yellow locking tab is positioned.

(3) Install the seat back trim cover J-straps on the upper, lower, and airbag side of the seat back frame.

Fig. 29 SEAT AIRBAG WIRING HARNESS

- 1 - YELLOW CONNECTOR LOCK
- 2 - TO AIRBAG MODULE
- 3 - TO BODY HARNESS

CAUTION: Always install new push pins when installing the seat back plastic panel.

(4) Install the plastic back panel on the seat back. Install new push pins in the upper mounting location of the back cover. Refer to Body, Seats, Front Seat Back Cover, Installation.

(5) Install the front seat cushion side shield. Refer to Body, Seats, Front Seat Cushion Side Shield, Installation.

WARNING: BE CERTAIN PLASTIC BACK COVER IS SECURELY INSTALLED ON THE SEAT BACK. FAILURE TO DO SO WILL ADVERSELY AFFECT THE FUNCTIONALITY OF THE SIDE AIRBAG SYSTEM.

(6) Install the left front seat in the vehicle. Refer to Body, Seats, Front Seat, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

SEAT BELT BUCKLE - REAR SEAT

REMOVAL

- (1) Remove the rear seat cushion.
- (2) Remove the seat belt anchor nut (Fig. 30).

Fig. 30 REAR SEAT BELT BUCKLE

- 1 - REAR SEAT BACK
- 2 - SEAT BELT BUCKLES
- 3 - ANCHOR

- (3) Remove the seat belt buckle from stud on floor.

INSTALLATION

- (1) Place the seat belt buckle anchor over stud on floor.
- (2) Install the rear seat belt anchor nut. Tighten to 40 N·m (30 ft. lbs.) torque.
- (3) Install the rear seat cushion.

SEAT BELT BUCKLE - FRONT SEAT CENTER OCCUPIED - CONCORDE/INTREPID

REMOVAL

- (1) Move or remove the front seat as necessary to gain access to seat belt buckle anchor bolt.
- (2) Remove the bolt attaching buckle and reinforcement to front seat track (Fig. 31).

Fig. 31 FRONT SEAT CENTER OCCUPIED BELT BUCKLE - REMOVE/INSTALL

- 1 - FRONT SEAT TRACK
- 2 - FRONT SEAT BELT BUCKLE

- (3) Remove the seat belt buckle from vehicle.

INSTALLATION

- (1) Place the seat belt buckle in position in the vehicle.
- (2) Install the buckle attaching bolt and reinforcement to the front seat track or floor. Tighten bolt to 40 N·m (30 ft. lbs.) torque.
- (3) Install the front seat, if it was removed.

SIDE IMPACT AIRBAG CONTROL MODULE

DESCRIPTION

80be4675

Fig. 32 SIACM POSITION/ORIENTATION

- 1 - VEHICLE BODY B-PILLAR
- 2 - SIDE IMPACT AIRBAG CONTROL MODULE (S.I.A.C.M.)
- 3 - S.I.A.C.M. ELECTRICAL CONNECTOR
- 4 - SEAT BELT RETRACTOR ASSEMBLY
- 5 - S.I.A.C.M. RETAINING SCREWS

Vehicles equipped with side impact airbags use two Side Impact Airbag Control Modules (SIACM). One is located on each respective side body B-pillar (Fig. 32).

OPERATION

Each Side Impact Airbag Control Module (SIACM) serves as the impact sensor for its seat mounted airbag. The right side SIACM controls the right seat airbag (Fig. 33). The left side SIACM controls the left seat airbag (Fig. 33). Each SIACM contains two accelerometers, both accelerometers must agree in order to deploy the side airbag. In the event of a side impact the appropriate SIACM will send a electronic signal to its airbag, deploying the airbag. The SIACM communicates with the occupant restraint controller via the PCI bus circuit.

REMOVAL

- (1) Disconnect and isolate the battery negative cable remote terminal.
- (2) Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components.
- (3) Remove the lower B-pillar trim from the appropriate side of the vehicle. Refer to Body, Interior, B-Pillar Lower Trim, Removal.
- (4) Disconnect the side impact airbag control module electrical connector (Fig. 32).
- (5) Remove the SIACM retaining screws and remove the module from the vehicle (Fig. 32).

SIDE IMPACT AIRBAG CONTROL MODULE (Continued)

80bdod76

 2 - VEHICLE BODY B-PILLAR
 3 - RIGHT SEAT AIRBAG MODULE

4 - LEFT SEAT AIRBAG MODULE
 5 - LEFT SIDE IMPACT AIRBAG CONTROL MODULE (SIACM)
 6 - OCCUPANT RESTRAINT CONTROLLER

INSTALLATION

(1) Position the SIACM in B-pillar and install the retaining screws (Fig. 32). Torque the screws to 12 N·m (105 in. lbs.).

(2) Connect the SIACM electrical connector (Fig. 32).

(3) Install the lower B-pillar trim. Refer to Body, Interior, B-Pillar Lower Trim, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

SPEED CONTROL

DESCRIPTION

The speed control system is electronically controlled and vacuum operated. The electronic control is integrated into the Powertrain Control Module. The controls are located on the steering wheel. The ON/OFF, and SET buttons are located on the left side of the airbag module. The RESUME/ACCEL, CANCEL and COAST buttons are located on the right side of the airbag module (Fig. 1).

Fig. 1 SPEED CONTROL SWITCHES - Typical

The system is designed to operate at speeds above 30 mph (48 km/h).

WARNING: THE USE OF SPEED CONTROL IS NOT RECOMMENDED WHEN DRIVING CONDITIONS DO NOT PERMIT MAINTAINING A CONSTANT SPEED, SUCH AS IN HEAVY TRAFFIC OR ON ROADS THAT ARE WINDING, ICY, SNOW COVERED, OR SLIPPERY.

OPERATION

OPERATION

When speed control is activated by depressing the ON switch, the PCM allows a set speed to be stored in RAM for speed control. To store a set speed, depress and release the SET switch while the vehicle is moving at a speed between 30 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral (ATX) or 1st/2nd gear (MTX). The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch.
- Depressing the clutch pedal
- Operating in 1st or 2nd gear (autostick, if equipped)

SPEED CONTROL (Continued)

NOTE: Turning the system off by depressing the OFF switch or turning off the ignition switch will erase the set speed stored in the PCM.

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- An indication of Park or Neutral
- A rapid increase rpm (indicates that the clutch has been disengaged)
- Excessive engine rpm (indicates that the transmission may be in a low gear)
- The speed signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low)
- The speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)
- If the actual speed is greater than 20 mph over the set speed.
- Autostick shifts into 1st or 2nd gear (autostick, if equipped)

Once the speed control has been disengaged, depressing the RESUME switch when speed is greater than 20 mph allows the vehicle to resume control to the target speed that was stored in the PCM.

While the speed control is engaged, the driver can increase the vehicle speed by depressing the ACCEL switch. The new target speed is stored in the PCM when the ACCEL switch is released. The PCM also has a "tap-up" feature in which target speed increases by 2 mph for each momentary switch activation of the ACCEL switch. The PCM also provides a means to decelerate to a new lower target speed without disengaging speed control. Depress and hold the COAST switch until the desired speed is reached, then release the switch.

The PCM also has a "Tap Down" feature in which target speed decreases at 1 mph for each momentary switch activation of the coast switch.

OPERATION - INTERACTIVE SPEED CONTROL (4 Speed EATX Only)

Interactive means that communication between the PCM and the TCM is taking place. Interactive speed control avoids unnecessary shifting for smoother, quieter operation and when downshifts are required, makes the shifts smoother.

CLIMBING A GRADE

DESCRIPTION

When climbing a grade the interactive speed control tries to maintain the set speed by increasing the

throttle opening, while inhibiting/delaying downshifts.

OPERATION

If opening the throttle alone cannot maintain the set speed and the vehicle speed drops more than three mph below the set speed, the transmission will downshift to third gear. If the vehicle continues to lose speed, by more than 6 mph, the transmission will downshift again to maintain the set speed. After the vehicle encounters a less-steep grade, or has crested the grade (reduced the load on the powertrain) and can maintain the set speed at a reduced throttle position, the transmission will upshift, as appropriate, until the set speed can be maintained in Overdrive.

GRADE HUNTING

DESCRIPTION

All vehicles equipped with a four speed automatic transmission have a grade hunting feature for the 2nd to 3rd gear upshift and the 3rd to Overdrive upshift.

OPERATION

The PCM identifies the powertrain loading conditions and selects the proper gear to maintain the current vehicle speed. Under moderate loading conditions the transaxle will stay in 3rd gear until the top of the grade is reached or the powertrain loading is reduced.

If powertrain loading is severe, the transaxle may shift into 2nd gear and remain there until powertrain loading is reduced, then a 2nd to 3rd gear upshift will be scheduled. Grade hunting features always operate regardless of whether or not the interactive speed control is engaged. **If the interactive speed control is not engaged and powertrain loading is not reduced, the driver may have to completely lift off of the throttle before an upshift will occur.** If the driver does lift off the throttle to induce an upshift under these conditions, vehicle speed will reduce and the Overdrive to 3rd and 3rd to 2nd gear downshifts will reoccur when the throttle is reapplied. If grade hunting is repeatedly induced by the driver, transaxle damage may result.

AUTOMATIC SPEED CONTROL OVERSPEED REDUCTION

DESCRIPTION

Transmission control software includes an automatic speed control overspeed reduction feature. This maintains vehicle speed at the selected set point when descending a grade.

SPEED CONTROL (Continued)

OPERATION

The Powertrain Control Module (PCM) first senses that the speed control is set. If the set speed is exceeded by more than 4 mph (6.5 km/hr) and the throttle is closed, the PCM causes the transaxle to downshift to THIRD gear. After downshifting, the automatic speed control resumes normal operation. To ensure that an upshift is appropriate after the set speed is reached, the PCM waits until the speed control system opens the throttle at least 6 degrees before upshifting to OVERDRIVE again.

If the driver applies the brakes, canceling automatic speed control operation with the transaxle still in THIRD gear, the PCM maintains this gear until the driver opens the throttle at least 6 degrees to avoid an inappropriate upshift. The upshift is also delayed for 2.5 seconds after reaching the 6 degrees throttle opening in anticipation that the driver might open the throttle enough to require THIRD gear. This will avoid unnecessary and disturbing transmission cycling. If the automatic speed control RESUME feature is used after braking, the upshift is delayed until the set speed is achieved to reduce cycling and provide better response.

DIAGNOSIS AND TESTING - ROAD TEST

Perform a vehicle road test to verify reports of speed control system malfunction. The road test should include attention to the speedometer. Speedometer operation should be smooth and without flutter at all speeds.

Flutter in the speedometer indicates a problem which might cause surging in the speed control sys-

tem. The cause of any speedometer problems should be corrected before proceeding. Refer to the Instrument Cluster for speedometer diagnosis.

If a road test verifies an inoperative system, and the speedometer operates properly, check for:

- A Diagnostic Trouble Code (DTC). If a DTC exists, conduct tests per the Powertrain Diagnostic Procedures manual.
- A misadjusted brake (stop) lamp switch. This could also cause an intermittent problem.
- Loose or corroded electrical connections at the servo. Corrosion should be removed from electrical terminals and a light coating of Mopar Multipurpose Grease, or equivalent, applied.
- Leaking vacuum reservoir.
- Loose or leaking vacuum hoses or connections.
- Defective one-way vacuum check valve.
- Secure attachment at both ends of the speed control servo cable.
- Smooth operation of throttle linkage and throttle body air valve.
- Conduct electrical test at PCM.
- Failed speed control servo. Do the servo vacuum test.

CAUTION: When test probing for voltage or continuity at electrical connectors, care must be taken not to damage connector, terminals or seals. If these components are damaged, intermittent or complete system failure may occur.

SPECIFICATIONS - TORQUE

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Vacuum Reservoir Screws	12	8.8	106.2

Servo Mounting Bracket Bolts	14	10.3	123.9
Servo Mounting Nuts	6.7	—	60

CABLE

DESCRIPTION

The speed control servo cable is connected between the speed control vacuum servo diaphragm and the throttle body control linkage.

OPERATION

This cable causes the throttle control linkage to open or close the throttle valve in response to movement of the vacuum servo diaphragm.

REMOVAL

REMOVAL - 2.7L

- (1) Disconnect the negative battery cable.
- (2) Remove speed control cable from throttle cam by sliding clasp out hole used for throttle cable.
- (3) Compress the retaining tabs on the cable and slide cable out of bracket.
- (4) Remove 2 nuts and 1 bolt from servo bracket.
- (5) Disconnect electrical connectors and vacuum hose.
- (6) Remove two nuts attaching speed control cable and mounting bracket to servo.
- (7) Pull cable away from servo to expose retaining clip and remove clip attaching cable to servo.
- (8) Remove servo mounting bracket.

REMOVAL - 3.5L

- (1) Disconnect the negative battery cable.
- (2) Remove throttle cable bracket from intake manifold.
- (3) Remove speed control cable from throttle cam by sliding clasp out hole used for throttle cable.
- (4) Remove the throttle cable (with retaining tab) and then slide cable speed control cable out from bracket.
- (5) Remove one bolt and two nuts from servo bracket.
- (6) Disconnect electrical connectors and vacuum hose.
- (7) Remove two nuts attaching mounting bracket and speed control cable to servo.
- (8) Pull cable away from servo to expose retaining clip and remove clip attaching cable to servo.
- (9) Remove servo mounting bracket.

INSTALLATION

INSTALLATION - 2.7L

- (1) Slide cable into throttle cable bracket and engage retaining tabs.

- (2) Rotate the throttle cam forward to the wide open position and install speed control cable clasp (Fig. 2).
- (3) Rotate the throttle cam forward to the wide open position and install throttle cable clasp.
- (4) Install retaining clip to cable at servo.
- (5) Insert servo studs through holes in the mounting bracket and speed control cable.
- (6) Install nuts, tighten to 6.7 N·m (60 in. lbs.).
- (7) Connect vacuum hose to servo.
- (8) Connect electrical connector.
- (9) Install servo and bracket and tighten nuts and bolt.
- (10) Connect negative battery cable.

Fig. 2 Disconnecting Throttle Cable—Typical

- 1 - TABS
2 - CABLE CLASP

INSTALLATION - 3.5L

- (1) Slide speed control cable into bracket and with locator positioned into notch in bracket, then slide throttle cable into bracket and engage retaining tab.
- (2) Rotate the throttle cam forward to the wide open position and install speed control cable clasp (Fig. 2).
- (3) Rotate the throttle cam forward to the wide open position and install throttle cable clasp.
- (4) Install throttle cable bracket and tighten bolts.
- (5) Route cable through bracket and install retaining clip to cable at servo.
- (6) Insert servo studs through holes in mounting bracket and speed control cable.
- (7) Install nuts, tighten to 6.7 N·m (60 in. lbs.).
- (8) Connect vacuum hose to servo.
- (9) Connect electrical connector.
- (10) Install servo and bracket and tighten bolts.
- (11) Connect negative battery cable.

SERVO

DESCRIPTION

The servo unit consists of a solenoid valve body, and a vacuum chamber. The solenoid valve body contains three solenoids:

- Vacuum
- Vent
- Dump

The vacuum chamber contains a diaphragm with a cable attached to control the throttle linkage.

OPERATION

The PCM controls the solenoid valve body. The solenoid valve body controls the application and release of vacuum to the diaphragm of the vacuum servo. The servo unit cannot be repaired and is serviced only as a complete assembly.

Power is supplied to the servo by the PCM through the brake switch. The PCM controls the ground path for the vacuum and vent solenoids.

The dump solenoid is energized anytime it receives power. If power to the dump solenoid is interrupted, the solenoid dumps vacuum in the servo. This provides a safety backup to the vent and vacuum solenoids.

The vacuum and vent solenoids must be grounded by the PCM to operate. When the PCM grounds the vacuum servo solenoid, the solenoid allows vacuum to enter the servo and pull open the throttle plate using the cable. When the PCM breaks the ground, the solenoid closes and no more vacuum is allowed to enter the servo. The PCM also operates the vent solenoid via ground. The vent solenoid opens and closes a passage to bleed or hold vacuum in the servo as required.

The PCM cycles the vacuum and vent solenoids to maintain the set speed, or to accelerate and decelerate the vehicle. To increase throttle opening, the PCM grounds the vacuum and vent solenoids. To decrease throttle opening, the PCM removes the grounds from the vacuum and vent solenoids.

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove three bolts from servo bracket.
- (3) Disconnect electrical connectors and vacuum hose.
- (4) Remove two nuts attaching speed control cable and mounting bracket to servo.
- (5) Remove servo mounting bracket.
- (6) Pull cable away from servo to expose retaining clip and remove clip attaching cable to servo.

INSTALLATION

(1) With throttle in full open position align hole in speed control cable sleeve with hole in servo pin and install retaining clip.

- (2) Connect vacuum hose to servo.
- (3) Connect electrical connector.
- (4) Insert servo studs through holes in speed control cable and mounting bracket.
- (5) Install nuts, tighten to 6.7 N·m (60 in. lbs.).
- (6) Install servo and bracket and tighten bolt and nuts.
- (7) Connect negative battery cable.

SWITCH

DESCRIPTION

There are two separate switch pods that operate the speed control system and are located on the steering wheel.

OPERATION

The speed control system has five separate resistive switches that provide a single multiplexed (MUX) voltage inputs to the PCM. The switch names are: ON, OFF, SET, COAST, RESUME, ACCEL, TAP-UP, COAST, and CANCEL. Based on conditions when the buttons are pushed (and released), the five voltages ranges provided to the PCM result in the following functions: ON, OFF, SET, COAST, RESUME, ACCEL, TAP-UP, TAP-DOWN, COAST, and CANCEL. Refer to the Speed Control Section for more information.

Also the PCM receives an input from the brake switch to sense whether the brake pedal has been depressed. When the PCM receives the brake depressed input, it turns off power to the speed control servo and disengages speed control. Also the power to the servo is supplied through the brake switch, which opens the circuit when the brake pedal is depressed.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

REMOVAL

The speed control switch is mounted in the steering wheel and wired through the clock spring device under the airbag module.

WARNING: IF REMOVAL OF AIRBAG MODULE IS NECESSARY, REFER TO THE RESTRAINT SYSTEMS SECTION FOR MORE INFORMATION.

- (1) Remove the negative battery cable.
- (2) Turn off ignition.

SWITCH (Continued)

- (3) Remove two screws from side of the switch.
- (4) Rock switch away from airbag and steering wheel.
- (5) Disconnect two-way electrical connector.
- (6) Repeat for the other switch.

INSTALLATION

- (1) Connect two-way electrical connector.
- (2) Install switch.
- (3) Install two screws into the side of the switch.
- (4) Repeat for the other switch.
- (5) Install the negative battery cable.

VACUUM RESERVOIR**DESCRIPTION**

The vacuum reservoir is located in the engine compartment. It is made of plastic.

OPERATION

The reservoir stores engine vacuum. Manifold vacuum is supplied from the brake booster check valve. The speed control vacuum supply hose has a check valve at the source (brake booster) to maintain the

highest available vacuum level in the servo, reservoir and vacuum hoses. When engine vacuum drops, as in climbing a grade while driving, the reservoir supplies the vacuum needed to maintain proper speed control operation. The vacuum reservoir cannot be repaired and must be replaced if faulty.

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove the Powertrain Control Module (PCM) refer to the Fuel Injection System section.
- (3) Remove and reposition coolant reservoir.
- (4) Remove PDC and bracket.
- (5) Remove vacuum reservoir.
- (6) Disconnect vacuum hose

INSTALLATION

- (1) Connect vacuum hose.
- (2) Install vacuum reservoir and tighten fasteners.
- (3) Install PDC and bracket and tighten fasteners.
- (4) Install coolant reservoir.
- (5) Install PCM refer to the Fuel Injection System section.
- (6) Connect the negative battery cable.

VEHICLE THEFT SECURITY

DESCRIPTION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is designed to protect against whole vehicle theft. The system monitors vehicle doors, deck lid key cylinder, and ignition action for unauthorized operation. The alarm activates:

- Sounding of the horn
- Flashing of the park and tail lamps
- Flashing of the headlamps
- An engine kill feature (without SKIS)

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by preventing the engine from operating. The components of this system are the Sentry Key Immobilizer Module (SKIM) (Fig. 1), Body Control Module (BCM), Sentry Key transponder, VTSS indicator LED, and the Powertrain Control Module (PCM).

The SKIM is installed on the steering column near the ignition lock cylinder. The transponder is located under the molded rubber cap on the head of the ignition key. The VTSS indicator LED is located in the instrument panel top cover.

TRIGGERING THE VTSS

Any of the following actions will trigger the system:

- (1) Opening any door.
- (2) Removing the deck lid lock cylinder.
- (3) Turning the ignition to the ON position.

Fig. 1 SENTRY KEY IMMOBILIZER MODULE LOCATION

- 1 - STEERING WHEEL
- 2 - IGNITION KEY CYLINDER
- 3 - STEERING COLUMN
- 4 - SENTRY KEY IMMOBILIZER MODULE

Using the power door switch or the keyless transmitter will arm the system.

CAUTION: The VTSS indicator LED will trigger and engine will continue to run if the vehicle is equipped with SKIS and the proper key is used to start the vehicle. This condition will occur if the VTSS has been triggered.

VEHICLE THEFT SECURITY (Continued)

NOTE: The ignition switch can be turned to the accessory position without triggering alarm system.

OPERATION**VEHICLE THEFT SECURITY SYSTEM**

Upon failure of proper VTSS/SKIM communication to the PCM, the PCM will shut off fuel after two seconds of run time. The engine will not re-crank on the key cycle that the failure occurred, a full key down sequence must be performed for the engine to crank again. After six consecutive fuel shut-offs, the engine will no longer crank on subsequent key cycles. The failure must be corrected and a valid communication process between the BCM (VTSS), or SKIM, and the PCM must occur for the engine to crank and start again.

The electronics for the VTSS are part of the Body Control Module (BCM). The system is armed when the vehicle is locked using the:

- Power door lock switches
- Remote Keyless Entry transmitter.
- Door Cylinder Lock Switches.

For vehicles equipped with SKIS, the doors do not have to be locked to enable the fuel shut off feature.

After the vehicle is locked and the last door is closed, the set LED indicator in the top cover will flash quickly for 16 seconds, indicating that arming is in progress. If no monitored systems are activated during this period, the system will arm. After 16 seconds the indicator LED will continue to flash at a slower rate.

This indicates that the system is armed. If the deck lid key cylinder switch is not sensed by the system, the indicator LED will remain lit during the arming process, although the system will still arm. If the indicator LED does not illuminate at all upon door closing it indicates that the system is not arming.

Passive disarming occurs upon normal vehicle entry by unlocking either door with the ignition key/remote transmitter. This disarming will also halt the alarm once it has been activated.

A tamper alert exists to notify the driver that the VTSS had been activated. This alert consists of 3 horn pulses when the vehicle is disarmed.

NOTE: The VTSS will not arm by pushing down the door lock mechanism. This will manually override the system.

For Door Cylinder Lock Switch Removal and Installation, refer to Electrical, Power Locks, Door Cylinder Lock Switch.

SENTRY KEY IMMOBILIZER SYSTEM

The SKIS includes two valid Sentry Key transponders from the factory. These two Sentry Keys can be used to program additional non-coded blank Sentry Keys. These blank keys can be cut to match a valid ignition key, but the engine will not start unless the key transponder is also programmed to the vehicle. The SKIS will recognize no more than eight valid Sentry Key transponders at any one time.

The SKIS performs a self-test each time the ignition switch is turned to the ON position, and will store Diagnostic Trouble Codes (DTC's) if a system malfunction is detected. The SKIS can be diagnosed, and any stored DTC can be retrieved using a DRB III® scan tool as described in the proper Body Diagnostic Procedures Manual.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - SENTRY KEY IMMOBILIZER SYSTEM**

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS, WARNINGS, BEFORE ATTEMPTING COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: The following tests may not prove conclusive in the diagnosis of this system. The most reliable, efficient, and accurate means to diagnose the Sentry Key Immobilizer System involves the use of a DRB III® scan tool. Refer to the proper Body Diagnostic Procedures Manual.

The Sentry Key Immobilizer System (SKIS) and the Programmable Communication Interface (PCI) bus network should be diagnosed using a DRB III® scan tool. The DRB III® will allow confirmation that the PCI bus is functional, that the Sentry Key Immobilizer Module (SKIM) is placing the proper messages on the PCI bus, and that the Powertrain Control Module (PCM) is receiving the PCI bus messages. Refer to the proper Body Diagnostic Procedures Manual, and Wiring Diagrams for complete circuit descriptions and diagrams.

(1) Check the fuses in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

VEHICLE THEFT SECURITY (Continued)

(2) Disconnect and isolate the battery negative remote cable from the remote terminal. Unplug the wire harness connector at the SKIM. Check for continuity between the ground circuit cavity of the SKIM wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) Connect the battery negative remote cable. Check for battery voltage at the fused B(+) circuit cavity of the SKIM wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the fuse in the junction block as required.

(4) Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the SKIM wire harness connector. If OK, use a DRB III® scan tool and the proper Body Diagnostic Procedures Manual to complete the diagnosis of the SKIS. If not OK, repair the open circuit to the fuse in the junction block as required.

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

Using a DRB III® scan tool and the proper Body Diagnostic Procedures manual, each switch input can be checked using this method.

For complaints about the Theft Alarm going off on it's own, use the DRB III® scan tool and select "Theft Alarm", "VTSS" then "Monitor Display" and read the "Alarm Tripped By" status.

DECKLID SECURITY SWITCH

REMOVAL

(1) Open hood, disconnect and isolate the negative battery cable remote terminal from the remote battery post.

(2) Refer to Body, Deck Lid, Deck Lid Latch Removal.

(3) Disconnect connector and remove deck lid lock cylinder from bracket (Fig. 2), (Fig. 3), and (Fig. 4).

INSTALLATION

(1) Connect connector and install the deck lid lock cylinder onto bracket (Fig. 2), (Fig. 3), and (Fig. 4).

(2) Refer to Body, Deck Lid, Deck Lid Latch, Installation.

SKIS INDICATOR LAMP

DESCRIPTION

The Sentry Key Immobilizer System (SKIS) uses the Vehicle Theft Security System (VTSS) indicator LED to give an indication when the SKIS is faulty or when the vehicle has been immobilized due to the use of an invalid ignition key. The LED is controlled by the BCM based upon messages received from the Sentry Key Immobilizer Module (SKIM). The VTSS/SKIS indicator LED is hard wired directly to the BCM.

OPERATION

The SKIM sends messages to the BCM to turn the LED on for about three seconds when the ignition switch is turned to the ON position as a bulb test. After completion of the bulb test, the SKIM sends bus messages to the BCM to keep the LED off for a duration of about one second. Then the SKIM sends messages to the BCM to turn the LED on or off based upon the results of the SKIS self-tests. If the VTSS indicator LED comes on and stays on after the bulb test, it indicates that the SKIM has detected a system malfunction and/or that the SKIS has become inoperative. If the SKIM detects an invalid key when the ignition switch is turned to the ON position, it

sends messages to the BCM to flash the VTSS indicator LED.

The SKIM can also send messages to the BCM to flash the LED and to generate a single audible chime tone. These functions serve as an indication to the customer that the SKIS has been placed in its "Customer Learn" programming mode. See Sentry Key Immobilizer System Transponder Programming in this section for more information on the "Customer Learn" programming mode.

The VTSS indicator LED is housed in the Automatic Temperature Control (ATC) Sun Sensor located in the instrument panel top cover. Refer to Group 8E - Instrument Panel and Systems for service of ATC Sun Sensor. If the VTSS indicator LED comes on and stays on after the bulb test function, diagnosis of the SKIS should be performed with a DRB III® scan tool and the proper Body Diagnostic Procedures Manual.

TRANSPONDER KEY

DESCRIPTION

80b5cb75

Fig. 5 TRANSPONDER KEY

- 1 - MOLDED CAP
- 2 - TRANSPONDER
- 3 - MOLDED CAP REMOVED
- 4 - SENTRY KEY

The Sentry Key Immobilizer System (SKIS) uses a transponder that is integral to each of two ignition keys (Fig. 5) that are supplied with the vehicle when it is shipped from the factory. The transponder chip is insulated within a nylon mount inserted in the head of the key, and invisible beneath a molded rubber cap.

TRANSPONDER KEY (Continued)

OPERATION

Each Sentry Key transponder has a unique transponder identification code programmed into it by the manufacturer. The Sentry Key Immobilizer Module (SKIM) has a unique "Secret Key" code programmed into it by the manufacturer. When a Sentry Key transponder is programmed into the memory of the SKIM, the SKIM learns the transponder identification code from the transponder, and the transponder learns the "Secret Key" code from the SKIM. Each of these codes is stored within the transponder and in the nonvolatile memory of the SKIM. Therefore, blank keys for the SKIS must be programmed by and into the SKIM, in addition to being cut to match the mechanical coding of the ignition lock cylinder. See Sentry Key Immobilizer System Transponder Programming in this section for more information.

The Sentry Key transponder is within the range of the SKIM transceiver antenna ring when it is inserted in the ignition lock cylinder. When the ignition switch is turned to the START or ON positions, the SKIM transceiver issues a Radio Frequency (RF) signal that excites the transponder chip. The transponder chip responds by issuing an RF signal containing its transponder identification code and the "Secret Key" code. The SKIM transceiver compares the transponder codes with the codes stored in its memory to determine whether a valid key is in the ignition lock cylinder.

The Sentry Key transponder cannot be repaired and, if faulty or damaged, it must be replaced.

STANDARD PROCEDURE - TRANSPONDER PROGRAMMING

Two programmed sentry key transponders are included with the Sentry Key Immobilizer System (SKIS) when it is shipped from the factory. The Sentry Key Immobilizer Module (SKIM) can be programmed to recognize up to six additional transponders, for a total of eight Sentry Keys. The following "Customer Learn" programming procedure for the programming of additional transponders requires access to at least two of the valid Sentry Keys. If two valid Sentry Keys are not available, Sentry Key programming will require the use of a DRB III® scan tool and the proper Body Diagnostic Procedures Manual.

CUSTOMER LEARN

(1) Obtain the additional Sentry Key transponder blank(s) that are to be programmed for the vehicle. Cut the additional Sentry Key transponder blanks to match the ignition lock cylinder mechanical key codes.

(2) Insert one of the two valid Sentry Key transponders into the ignition switch and turn the ignition switch to the ON position.

(3) After the ignition switch has been in the ON position for about three seconds, but no more than fifteen seconds, cycle the ignition switch back to the OFF position. Replace the first valid Sentry Key in the ignition lock cylinder with the second valid Sentry Key and turn the ignition switch back to the ON position. Both operations must be performed within 15 seconds.

(4) About ten seconds after the completion of Step 3, the VTSS indicator LED will start to flash and a single audible chime tone will sound to indicate that the system has entered the "Customer Learn" programming mode.

(5) Within about fifty seconds of entering the "Customer Learn" programming mode, turn the ignition switch to the OFF position, replace the valid Sentry Key with a blank Sentry Key transponder, and turn the ignition switch back to the ON position.

(6) About ten seconds after the completion of Step 5, a single audible chime tone will sound and the VTSS indicator LED will stop flashing and stay on solid for about three seconds to indicate that the blank Sentry Key transponder has been successfully programmed. The SKIS will immediately return to normal system operation following exit from the "Customer Learn" programming mode.

(7) Go back to Step 2 and repeat this process for each additional Sentry Key transponder blank to be programmed.

If any of the above steps is not completed in the proper sequence, or within the allotted time, the SKIS will automatically exit the "Customer Learn" programming mode. The SKIS will also automatically exit the "Customer Learn" programming mode if it sees a non-blank Sentry Key transponder when it should see a blank, if it has already programmed eight valid Sentry Keys, or if the ignition switch is turned to the OFF position for more than about fifty seconds.

VTSS INDICATOR**DESCRIPTION**

The Sentry Key Immobilizer System (SKIS) uses the Vehicle Theft Security System (VTSS) indicator LED to give an indication when the SKIS is faulty or when the vehicle has been immobilized due to the use of an invalid ignition key. The LED is controlled by the BCM based upon messages received from the Sentry Key Immobilizer Module (SKIM). The VTSS/SKIS indicator LED is hard wired directly to the BCM.

VTSS INDICATOR (Continued)

OPERATION

The SKIM sends messages to the BCM to turn the LED on for about three seconds when the ignition switch is turned to the ON position as a bulb test. After completion of the bulb test, the SKIM sends bus messages to the BCM to keep the LED off for a duration of about one second. Then the SKIM sends messages to the BCM to turn the LED on or off based upon the results of the SKIS self-tests. If the VTSS indicator LED comes on and stays on after the bulb test, it indicates that the SKIM has detected a system malfunction and/or that the SKIS has become inoperative. If the SKIM detects an invalid key when the ignition switch is turned to the ON position, it sends messages to the BCM to flash the VTSS indicator LED.

The SKIM can also send messages to the BCM to flash the LED and to generate a single audible chime

tone. These functions serve as an indication to the customer that the SKIS has been placed in its "Customer Learn" programming mode. See Sentry Key Immobilizer System Transponder Programming in this section for more information on the "Customer Learn" programming mode.

The VTSS indicator LED is housed in the Automatic Temperature Control (ATC) Sun Sensor located in the instrument panel top cover. Refer to Group 8E - Instrument Panel and Systems for service of ATC Sun Sensor. If the VTSS indicator LED comes on and stays on after the bulb test function, diagnosis of the SKIS should be performed with a DRB III® scan tool and the proper Body Diagnostic Procedures Manual.

WIPERS/WASHERS

DESCRIPTION

WIPER SYSTEM

Fig. 1 WIPER/WASHER SWITCH

- 1 - WINDSHIELD WASHER BUTTON
- 2 - CONTROL STALK (BEAM SELECT)
- 3 - HAZARD WARNING BUTTON
- 4 - MULTI-FUNCTION SWITCH
- 5 - WINDSHIELD WIPER CONTROL

The windshield wiper system is controlled by a switch located on the multi-function switch stalk (Fig. 1). The multi-function switch is located on the steering column behind the steering wheel.

WASHER SYSTEM

All models are equipped with electric operated windshield washer pumps. The electric pump assembly is mounted with a grommet directly to the reservoir.

The windshield washer system is controlled by a switch located on the multi-function switch stalk (Fig. 1). The multi-function switch is located on the steering column behind the steering wheel.

OPERATION

WIPER SYSTEM

The windshield wipers will operate when the ignition switch is in the ACCESSORY or IGNITION ON position. The windshield wipers will return to the parked position when the ignition switch is turned to the OFF position. Fuses, located in the Junction Block and Power Distribution Center protects the circuitry of the wiper system and the vehicle.

The wiper motor has permanent magnet fields. The speeds are determined by current flow to the appropriate set of brushes.

The intermittent wiper system, in addition to low and high speed, has a delay mode. The delay mode has a range of 1/2 to 18 seconds. The wiper delay times will double to a range of 1 to 36 seconds when the vehicle speed is less than 10 mph. The delay is controlled by a variable resistor in the wiper switch and the Body Control Module (BCM). The BCM controls the timing for the wiper ON/OFF, as well as the wiper HI/LO relay.

The wiper system completes the wipe cycle when the switch is turned OFF. The blades park in the lowest portion of the wipe pattern.

When using the DRB III® scan tool, refer to the proper Body Diagnostic Procedures Manual for Diagnosis and Testing.

WASHER SYSTEM

The wash function can be accessed in the OFF position of the wiper control switch. Wash switch must be pressed for at least 0.5 second to get the wipe after wash. Holding the wash button depressed when the switch is in the OFF position will operate the wipers and washer motor pump continuously until the washer button is released. Releasing the button will stop the washer pump but the wipers will complete the current wipe cycle, followed by an average of two more wipe cycles (± 1) before the wipers park and the module turns off. If the wash switch is pressed momentarily with the wipers in the OFF or INTERMITTENT position, a pulse wipe cycle consisting of two wipes will occur.

Fluid is gravity fed from the reservoir to the motor. The fluid is forced by the pump through rubber hoses to the hood mounted nozzles which direct the fluid streams to the windshield. The one way flow check valves are located in each hood nozzle. The purpose of the check valves is to improve fluid flow response time and to prevent excessive washer fluid staining the surface of the hood. The hood mounted nozzles distribute washer fluid on the surface of the windshield. The pump and reservoir are serviced as separate assemblies.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTERMITTENT WIPERS

The intermittent wiper function is controlled by the Body Control Module (BCM), located in the left side of the instrument panel, attached to the Junction Block (Fig. 2). If the Body Control Module is determined to be the problem, refer to Electrical, Electronic Control Modules, Body Control Module, Removal.

WIPERS/WASHERS (Continued)

**Fig. 2 Body Control Module**

1 - JUNCTION BLOCK/BCM

DIAGNOSIS AND TESTING - WINDSHIELD WASHERS

Whenever a windshield washer malfunction occurs, first verify that the windshield washer wire harness is properly connected to all connectors before starting normal diagnosis and repair procedures. Refer to Windshield Washer Test table.

WINDSHIELD WASHER TEST

CONDITION	POSSIBLE CAUSE	CORRECTION
WASHER POWER FEED FUSE OPEN.	1. JUNCTION BLOCK FUSE #5 BLOWN.	1. CHECK FUSE #5. REPLACE IF NOT OK.
BLOWN FUSE WHEN WASHER SWITCH IS DEPRESSED.	1. SHORT IN WIPER/WASHER SWITCH. 2. SHORT IN MOTOR POWER CIRCUIT. 3. SHORT IN WASHER MOTOR.	1. DEFECTIVE WASHER SWITCH. REFER TO WIPE/WASHER SWITCH DIAGNOSTIC PROCEDURES. 2. SHORT OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 3. CONNECT AN OHMMETER ACROSS WASHER MOTOR TERMINALS #1 AND #2 AND CHECK FOR A SHORT CIRCUIT. IF NOT OK, REPLACE WASHER MOTOR.

WIPERS/WASHERS (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
WASHER SYSTEM WILL NOT FLOW WASHER FLUID.	<ol style="list-style-type: none"> 1. NO WASHER FLUID IN RESERVOIR. 2. JUNCTION BLOCK FUSE #5 BLOWN. 3. WASHER HOSE NOT FLOWING FLUID. 4. MOTOR CONNECTOR LOOSE. 5. MOTOR CONNECTOR TERMINALS BENT. 6. OPEN POWER CIRCUIT TO SWITCH. 7. OPEN OR DEFECTIVE WIPER/WASHER SWITCH. 8. OPEN POWER CIRCUIT TO MOTOR. 9. OPEN OR DEFECTIVE MOTOR GROUND CIRCUIT. 10. OPEN CIRCUIT IN MOTOR. 11. SEIZED MOTOR BEARINGS. 	<ol style="list-style-type: none"> 1. FILL RESERVOIR. 2. SHORT CIRCUIT BETWEEN JUNCTION BLOCK FUSE #5 AND WIPER SWITCH TERMINAL #1. SHORT IN WIPER SWITCH. IF NOT OK, REPAIR CIRCUIT OR REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES. 3. ASSURE WASHER HOSE IS NOT PINCHED, LOOSE, BROKEN, OR DISCONNECTED. IF NOT OK, PROPERLY ROUTE OR REPAIR WASHER HOSE. 4. PROPERLY SEAT CONNECTOR TO MOTOR. 5. REPAIR TERMINALS AND PROPERLY SEAT CONNECTOR TO MOTOR. 6. OPEN OR DEFECTIVE CIRCUIT BETWEEN JUNCTION BLOCK FUSE #5 AND WASHER SWITCH CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 7. CONNECT AN OHMMETER ACROSS WIPER/WASHER SWITCH TERMINAL #1 AND #2 AND DEPRESS WASHER BUTTON AND CHECK FOR CONTINUITY. IF NOT OK, REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES. 8. OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 9. OPEN OR DEFECTIVE CIRCUIT BETWEEN WASHER MOTOR CONNECTOR GROUND TERMINAL #2 AND LEFT HEADLAMP GROUND #5 OR ENGINE GROUND #1 OR 2. 10. CHECK FOR AN OPEN CIRCUIT ON MOTOR BETWEEN POWER TERMINAL #1 AND GROUND TERMINAL #2. IF NOT OK, REPLACE WASHER MOTOR. 11. APPLY DIRECT BATTERY VOLTAGE TO MOTOR TERMINALS. IF MOTOR DOES NOT RUN, REPLACE MOTOR.

WIPERS/WASHERS (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
HOOD NOZZLE WILL NOT FLOW.	1. FROZEN NOZZLE. 2. NOZZLE HOSE NOT FLOWING. 3. NOZZLE OR NOZZLE HOSE PLUGGED BY CONTAMINATION. 4. DEFECTIVE NOZZLE CHECK VALVE.	1. DE-ICE NOZZLE BY ALLOWING TIME FOR UNDERHOOD ENGINE HEAT TO THAW NOZZLE. IF NOT OK, MOVE VEHICLE INTO HEATED AREA. ASSURE WASHER FLUID IS PROPERLY BLENDED FOR AMBIENT OUTSIDE TEMPERATURES. 2. ASSURE NOZZLE HOSE IS NOT PINCHED, LOOSE, BROKEN, OR DISCONNECTED. IF NOT OK, PROPERLY ROUTE OR REPAIR NOZZLE HOSE. 3. CLEAN NOZZLE OR NOZZLE HOSE OF CONTAMINATION. DETERMINE SOURCE OF CONTAMINATION. INSPECT RESERVOIR FOR EXCESSIVE CONTAMINATION. CLEAN SYSTEM AS REQUIRED. 4. REPLACE HOOD NOZZLE.
WASHER FLUID OUTPUT IS LOW.	1. PARTIALLY PINCHED HOSE. 2. REVERSE POLARITY TO PUMP.	1. ASSURE WASHER HOSE IS NOT PARTIALLY PINCHED. IF NOT OK, PROPERLY ROUTE HOSE. 2. CHECK FOR CROSSED CIRCUIT TO PUMP. IF NOT OK, REPAIR CIRCUIT.
HOOD NOZZLE STREAM OVERSHOOTS WINDSHIELD.	1. NOZZLE NOT SEATED IN HOOD.	1. ASSURE NOZZLE IS SNAPPED IN PLACE.
WIPER WILL NOT CYCLE WHEN WASHER SWITCH IS DEPRESSED.	1. OPEN OR DEFECTIVE WASHER SYSTEM CONTROL CIRCUIT. 2. DEFECTIVE BODY CONTROL MODULE (BCM).	1. OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND BCM #C2 BLACK CONNECTOR TERMINAL #7. IF NOT OK REPAIR CIRCUIT. 2. REFER TO BCM DIAGNOSTIC PROCEDURES.
WASHER OPERATES INTERMITTENTLY.	1. INTERMITTENT OPEN OR DEFECTIVE WASHER MOTOR POWER CIRCUIT. 2. INTERMITTENT OPEN TO MOTOR GROUND. 3. INTERMITTENT OPEN IN WASHER SWITCH. 4. DEFECTIVE WASHER MOTOR.	1. INTERMITTENT OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 2. INTERMITTENT OPEN BETWEEN MOTOR CONNECTOR TERMINAL #2 AND LEFT HEADLAMP GROUND #5 OR ENGINE GROUND #1 OR 2. 3. REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES. 4. REPLACE WASHER MOTOR.

WIPERS/WASHERS (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
WASHER FLUID LEVEL INDICATOR INOPERATIVE.	1. LOOSE FLUID LEVEL SENSOR CONNECTOR. 2. OPEN POWER CIRCUIT TO SWITCH. 3. OPEN GROUND CIRCUIT. 4. DEFECTIVE INSTRUMENT CLUSTER 5. FLUID LEVEL SENSOR SWITCH OPEN OR DEFECTIVE.	1. PROPERLY SEAT CONNECTOR TO SWITCH. 2. OPEN OR DEFECTIVE CIRCUIT BETWEEN INSTRUMENT CLUSTER CONNECTOR TERMINAL #B4 AND LOW FLUID LEVEL SENSOR CONNECTOR TERMINAL. IF NOT OK, REPAIR CIRCUIT. 3. OPEN OR DEFECTIVE CIRCUIT BETWEEN FLUID LEVEL SENSOR CONNECTOR AND LEFT HEADLAMP GROUND #5 OR ENGINE GROUND #1 OR 2. 4. REFER TO INSTRUMENT CLUSTER DIAGNOSTIC PROCEDURES. 5. CONNECT AND OHMMETER TO SWITCH TERMINALS TO CHECK FOR COMPLETE CIRCUIT. CYCLE SWITCH FLOAT BACK AND FORTH BY FILLING AND DEPLETING RESERVOIR OF WASHER FLUID TO CHECK FOR PROPER SWITCH FUNCTION. IF NOT OK, REPLACE SWITCH.
LEAKING WASHER FLUID.	1. FILLER TUBE LEAKING. 2. FILLER TUBE OUT OR DAMAGED. 3. PUMP OR SENSOR GROMMET DEFECTIVE. 4. LEAKING OR DEFECTIVE RESERVOIR BODY.	1. ASSURE FILLER TUBE IS NOT LOOSE OR DISCONNECTED. IF NOT OK, PROPERLY SEAT FILLER TUBE. 2. REPLACE FILLER TUBE. 3. REPLACE PUMP OR SENSOR GROMMET. 4. REPLACE RESERVOIR BODY.

DIAGNOSIS AND TESTING - WIPER SYSTEM CONDITIONS

The following is a list of general wiper motor system problems and tests that are to be performed to locate the faulty part, and the corrective action to be taken. When installing harness connector to motor connector on vehicle, assure motor terminals are not bent causing an open circuit to motor.

MOTOR WILL NOT RUN IN ANY SWITCH POSITION

(1) Check fuse 5, in the Junction Block and fuse M in the Power Distribution Center and. Refer to Wiring Diagrams for pin call outs.

(a) If fuse(s) are good, go to Step 2.

(b) If fuse(s) are defective replace, and check motor operation in all switch positions.

(c) If motor is still inoperative and the fuse does not blow, go to Step 2.

(d) If replacement fuse blows, go to Step 11.

(2) Disconnect motor wire harness connector.

(3) Check the wiper motor low speed. Using two jumper wires, connect one jumper wire between the battery positive jump start terminal and Pin 2 on the wiper motor connector. Connect the other jumper wire to ground and Pin 5 on the wiper motor connector. Check the wiper motor high speed, connect the positive jumper wire to Pin 1 on the wiper motor connector. Connect the negative jumper wire to Pin 5 on the wiper motor connector.

(a) If motor runs, go to Step 4.

(b) If motor does not run, high or low speed replace the wiper motor.

(4) Using an ohmmeter, check for good ground at Pin 5 of the wiper motor wire harness connector. If not OK, repair the ground circuit as necessary. If OK, go to Step 5.

WIPERS/WASHERS (Continued)

(5) Place the wiper switch in the ON position. Using a voltmeter, check for battery voltage at terminal D and A of the intermittent wiper relay in the Power Distribution Center. If no voltage check fuse M. If OK, go to Step 6. If not OK, repair as necessary.

(6) Using an ohmmeter, check from terminal D of the HI-LO wiper relay to Pin 1 of the motor wire connector for continuity. Check from terminal E of the HI-LO wiper relay to Pin 2 of the motor wire connector for continuity. If OK, go to Step 7. If not repair as necessary.

(7) Using an ohmmeter, check for continuity between the HI-LO wiper relay and the intermittent wiper relay. Check from terminal B of the HI-LO wiper relay to terminal B of the intermittent wiper relay. If OK, check for faulty relays and go to Step 8. If not repair as necessary.

(8) Disconnect the C3 bone 12-way connector from the BCM.

(9) Using an ohmmeter, check for continuity from terminal 4 of the BCM C3 24-way, black connector to the terminal C of the intermittent wiper relay. If OK, go to Step 10. If not repair as necessary.

(10) Using a voltmeter, connect positive lead to terminal 8 of the BCM C2 black 24-way connector and negative lead to ground. Turn ignition switch to the ON position. Slowly move the wiper switch from OFF position through each position to HIGH.

(a) If voltage increases from zero to approximately 10 volts in the HIGH position, replace BCM. If no voltage, go to Step b.

(b) Using an ohmmeter, check for continuity from terminal 3 of wiper switch connector to terminal 8 of the BCM C2 black 24-way connector. If no continuity, repair circuit. If OK, go to Step c.

(c) Using a voltmeter, connect positive lead to terminal 1 of the wiper switch connector. If ignition voltage is present, replace the wiper switch. If no voltage, check continuity from fuse 5 to terminal 1 of the wiper switch connector. Repair circuit as necessary.

(11) Disconnect motor connector and replace fuse 5 from the Junction Block.

(a) If fuse does not blow, go to Step 2.

(b) If fuse blows, wiper control circuit is at fault, repair as necessary, refer to Wiring Diagrams.

MOTOR RUNS SLOWLY AT ALL SPEEDS

(1) Disconnect the wire harness from the wiper motor. Remove wiper arms and blades. Disconnect motor drive link from motor. Connect an amp meter between battery negative jump start terminal and Pin 5 on the wiper motor connector. Connect battery positive wire to Pin 2 on the wiper motor connector.

When replacing motor crank nut tighten to 15-20 N·m (130-177 in. lbs.) torque.

(a) If average amp meter reading is more than 10 amps with a hot motor and dry windshield, replace motor.

(b) If motor runs and average ammeter reading is less than 10 amps, go to Step 2.

(2) Check to see if wiper linkage or pivots are binding or caught.

MOTOR WILL RUN AT HIGH SPEED, BUT NOT MOVE AT LOW SPEED. MOTOR WILL RUN AT LOW SPEED, BUT WILL NOT MOVE AT HIGH SPEED

(1) Disconnect motor connector.

(2) If motor will not run on low speed, connect a jumper wire between battery positive jump start terminal and Pin 2 on the wiper motor connector. Connect a second jumper wire between ground and Pin 5 on the wiper motor wire harness connector.

(a) If motor runs, go to Step 3.

(b) If motor does not run, replace the motor.

(3) If motor will not run on high speed, connect a jumper wire between battery positive terminal and Pin 1. Connect a second jumper wire between ground and Pin 5 of the motor connector.

(a) If motor runs, go to Step 4.

(b) If motor does not run, replace the motor.

(4) If wipers will not run at low speed, using an ohmmeter, check for open circuit. Check between terminal E of the HI-LO wiper relay to Pin 2 of the wiper motor wire harness connector for continuity. If OK, go to Step 5. If not repair circuit as necessary.

(5) If wiper will not run at the high speed, using an ohmmeter, check for an open circuit. Check between terminal D of the HI-LO wiper relay and Pin 2 of the wiper motor wire harness connector for continuity. If OK, go to Step 6. If not repair circuit as necessary.

(6) Check for faulty HI-LO wiper relay.

WIPERS RUN AT HIGH SPEED WITH SWITCH IN LOW SPEED POSITION. WIPERS OPERATE IN INTERMITTENT MODE, BUT EACH WIPE IS AT HIGH SPEED.

(1) Disconnect motor connector.

(2) Using two jumper wires, connect one between the battery positive jump start terminal and Pin 2 on the wiper motor connector. Connect the second lead between ground and Pin 5 on the wiper motor connector. If motor runs at low speed, go to Step 3. If motor runs at high speed, replace the motor.

WIPERS/WASHERS (Continued)

(3) Check for faulty HI-LO wiper relay. Check for crossed wires in harness from HI-LO relay to motor.

(4) Disconnect C3 bone 12-way connector from the BCM and remove the HI/LO wiper relay.

(5) Using an ohmmeter, check terminal 12 of the C3 bone 12-way connector for short to ground.

(6) If continuity to ground is present, repair as necessary. If no continuity to ground, replace the BCM.

WIPERS RUN AT LOW SPEED WITH SWITCH IN HIGH SPEED POSITION

(1) Check for faulty HI-LO wiper relay.

(2) Using an ohmmeter, check for open circuit between terminal C of the HI-LO wiper relay and terminal 12 of the BCM 33 bone 12-way connector. If OK, go to Step 3. If not OK, repair as necessary.

(3) Check wiper switch.

(4) Check for binding linkage

(5) Refer to MOTOR RUNS SLOWLY AT ALL SPEEDS.

MOTOR WILL KEEP RUNNING WITH SWITCH IN OFF POSITION.

(1) Check wiper motor wiring harness for shorts between the low speed motor feed terminal 2 or high speed motor feed terminal 1 and battery or ignition.

(2) Check for faulty wiper ON/OFF or HI/LO relay.

(3) Check circuit from ON/OFF relay terminal C to HI/LO relay terminal B for short to battery or ignition.

(4) Disconnect the C3 bone 12-way connector from the BCM. Check circuit from terminal 4 of C3 bone 12-way connector to terminal C of the ON/OFF wiper relay for short to ground.

(5) Check circuit from terminal 3 of C2 bone 24-way connector to Pin 4 of the wiper motor harness connector for an open. If open circuit, repair as necessary.

(6) Using a voltmeter, connect positive lead to terminal 8 of the C2 black 24-way connector. Connect negative lead to ground. If voltmeter reads greater than 0 volts, check wiper switch and wiring.

(7) Using a voltmeter, connect positive lead to terminal 8 of the C3 black 12-way connector.

(a) If voltmeter reads 10 to 15 volts, check the circuit for short to battery or ignition.

(b) If the voltmeter reads 0 volts, replace the BCM.

WIPER WILL RUN CONTINUOUSLY WITH SWITCH IN THE INTERMITTENT POSITION. WHEN COLUMN SWITCH IS TURNED OFF, WIPERS STOP WHEREVER THEY ARE, WITHOUT RETURNING TO PARK POSITION.

(1) Using an ohmmeter, check for ground at Pin 4 on the wiper motor connector. If grounded, replace motor.

(2) Using an ohmmeter, with the wiper motor in the PARK position, check for continuity between Pin 5 and Pin 4 on the wiper motor connector. If continuous continuity, go to Step 3. If not OK, replace motor.

(3) Disconnect the wiper motor wire harness connector and the BCM C3 bone 12-way connector. Check for continuity between Pin 1 of the wiper motor wire harness connector and terminal 3 of the BCM C3 bone 12-way connector. If no continuity, repair as necessary. If continuity is OK, test the wiper motor.

WIPERS DO NOT RUN WHEN WASHER MOTOR IS ENGAGED

(1) Disconnect the C2 black 24-way connector from the BCM.

(2) Using a voltmeter, connect positive lead to terminal 7 of the C2 black 24-way connector and the negative lead to ground.

(3) Engage the washer switch so that the washer motor runs continuously.

(a) If the voltage is zero, check the wiring between the washer switch terminal 2 and the BCM and repair as necessary.

(b) If the battery voltage is shown, replace the BCM.

HEADLAMP WASHERS - EXPORT**DESCRIPTION**

Headlamp washers are available as a factory-installed option on this model. The headlamp washers on this vehicle work in conjunction with the windshield washers. The headlamp washers are enabled with the headlamps "ON" and the windshield washers activated. With the windshield washers activated the headlamp washers will spray for a preset amount of time controlled by a relay.

HEADLAMP WASHERS - EXPORT (Continued)

OPERATION

The headlamp washer system utilizes a separate high pressure pump that is attached to the windshield washer reservoir. The headlamp washer pump feeds four nozzles that are mounted behind the front fascia of the vehicle. The nozzle bodies have a telescopic action that will extend the nozzles in front of the headlamp assembly. During the telescopic action, doors in the fascia will open to allow the nozzles to advance into the proper spray position. These nozzles spray the headlamps when the system is activated.

DIAGNOSIS AND TESTING - HEADLAMP WASHER - EXPORT

Whenever a headlamp washer malfunction occurs, first verify that the windshield washer wire harness is properly connected to all connectors before starting normal diagnosis and repair procedures. Refer to Windshield/Headlamp Washer Test table.

WINDSHIELD/HEADLAMP WASHER TEST

CONDITION	POSSIBLE CAUSE	CORRECTION
WASHER POWER FEED FUSE OPEN.	1. JUNCTION BLOCK FUSE #5 BLOWN.	1. CHECK FUSE #5. REPLACE IF NOT OK.
BLOWN FUSE WHEN WASHER SWITCH IS DEPRESSED.	1. SHORT IN WIPER/WASHER SWITCH. 2. SHORT IN MOTOR POWER CIRCUIT. 3. SHORT IN WASHER MOTOR.	1. DEFECTIVE WASHER SWITCH. REFER TO WIPE/WASHER SWITCH DIAGNOSTIC PROCEDURES. 2. SHORT OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 3. REPLACE WASHER MOTOR.

HEADLAMP WASHERS - EXPORT (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
WASHER SYSTEM WILL NOT FLOW WASHER FLUID.	1. JUNCTION BLOCK FUSE #5 BLOWN. 2. MOTOR CONNECTOR LOOSE. 3. MOTOR CONNECTOR TERMINALS BENT. 4. OPEN POWER CIRCUIT TO SWITCH. 5. OPEN OR DEFECTIVE WIPER/WASHER SWITCH. 6. OPEN POWER CIRCUIT TO MOTOR. 7. OPEN OR DEFECTIVE MOTOR GROUND CIRCUIT. 8. OPEN CIRCUIT IN MOTOR. 9. SEIZED MOTOR BEARINGS. 10. PINCHED WASHER HOSE.	1. SHORT CIRCUIT BETWEEN JUNCTION BLOCK FUSE #5 AND WIPER SWITCH TERMINAL #1. SHORT IN WIPER SWITCH. IF NOT OK, REPAIR CIRCUIT OR REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES. 2. PROPERLY SEAT CONNECTOR TO MOTOR. 3. REPAIR TERMINALS AND PROPERLY SEAT CONNECTOR TO MOTOR. 4. OPEN OR DEFECTIVE CIRCUIT BETWEEN JUNCTION BLOCK FUSE #5 AND WASHER SWITCH CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 5. REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES. 6. OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 7. OPEN OR DEFECTIVE CIRCUIT BETWEEN WASHER MOTOR CONNECTOR GROUND TERMINAL #2 AND LEFT HEADLAMP GROUND #5 OR ENGINE GROUND #1 OR #2. 8. CHECK FOR AN OPEN CIRCUIT ON MOTOR BETWEEN POWER TERMINAL #1 AND GROUND TERMINAL #2. IF NOT OK, REPLACE WASHER MOTOR. 9. APPLY DIRECT BATTERY VOLTAGE TO MOTOR TERMINALS. IF MOTOR DOES NOT RUN, REPLACE MOTOR. 10. ASSURE WASHER HOSE IS NOT PINCHED. IF NOT OK, PROPERLY ROUTE WASHER HOSE.
HOOD NOZZLE WILL NOT FLOW.	1. PINCHED NOZZLE HOSE. 2. PLUGGED NOZZLE OR NOZZLE HOSE BY CONTAMINATION. 3. DEFECTIVE NOZZLE CHECK VALVE.	1. ASSURE NOZZLE HOSE IS NOT PINCHED, LOOSE, BROKEN, OR DISCONNECTED. IF NOT OK, PROPERLY ROUTE OR REPAIR NOZZLE HOSE. 2. CLEAN NOZZLE OR NOZZLE HOSE OF CONTAMINATION. DETERMINE SOURCE OF CONTAMINATION. INSPECT RESERVOIR FOR EXCESSIVE CONTAMINATION. CLEAN SYSTEM AS REQUIRED. 3. REPLACE HOOD NOZZLE.
1. ASSURE NOZZLE IS SNAPPED IN PLACE.	1. NOZZLE NOT SEATED IN HOOD.	1. ASSURE NOZZLE IS SNAPPED IN PLACE.

HEADLAMP WASHERS - EXPORT (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
WIPER WILL NOT CYCLE WHEN WASHER SWITCH IS DEPRESSED.	1. OPEN OR DEFECTIVE WASHER SYSTEM CONTROL CIRCUIT. 2. DEFECTIVE BODY CONTROL MODULE (BCM).	1. OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND BCM #C2 BLACK CONNECTOR TERMINAL #7. IF NOT OK REPAIR CIRCUIT. 2. REFER TO BCM DIAGNOSTIC PROCEDURES.
WASHER FLUID LEVEL INDICATOR INOPERATIVE.	1. LOOSE FLUID LEVEL SENSOR CONNECTOR. 2. FLUID LEVEL SENSOR SWITCH OPEN OR DEFECTIVE.	1. PROPERLY SEAT CONNECTOR TO SWITCH. 2. ASSURE SENSOR FLOAT SWITCH IS CLOSED (DOWN POSITION). APPLY OHMMETER TO SWITCH TO CHECK FOR COMPLETE CIRCUIT. IF NOT OK, REPLACE SWITCH.

HEADLAMP WASHERS - EXPORT (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
HEADLAMP WASHER SYSTEM WILL NOT FLOW WASHER FLUID.	1. NO WASHER FLUID IN RESERVOIR. 2. JUNCTION BLOCK FUSE #5 BLOWN. 3. HEADLAMP WASHER HOSE NOT FLOWING FLUID. 4. MOTOR CONNECTOR LOOSE. 5. MOTOR CONNECTOR TERMINALS BENT. 6. OPEN POWER CIRCUIT TO SWITCH. 7. OPEN OR DEFECTIVE WIPER/WASHER SWITCH. 8. OPEN POWER CIRCUIT TO MOTOR. 9. OPEN OR DEFECTIVE MOTOR GROUND CIRCUIT. 10. SHORT IN WIPER SWITCH. IF NOT OK, REPAIR CIRCUIT OR REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES. 3. ASSURE WASHER HOSE IS NOT PINCHED, LOOSE, BROKEN, OR DISCONNECTED. IF NOT OK, PROPERLY ROUTE OR REPAIR WASHER HOSE. 4. PROPERLY SEAT CONNECTOR TO MOTOR. 5. REPAIR TERMINALS AND PROPERLY SEAT CONNECTOR TO MOTOR. 6. OPEN OR DEFECTIVE CIRCUIT BETWEEN JUNCTION BLOCK FUSE #5 AND WASHER SWITCH CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 7. CONNECT AN OHMMETER ACROSS WIPER/WASHER SWITCH TERMINAL #1 AND #2 AND DEPRESS WASHER BUTTON AND CHECK FOR CONTINUITY. IF NOT OK, REFER TO WIPER/WASHER SWITCH DIAGNOSTIC PROCEDURES. 8. OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER/WASHER SWITCH CONNECTOR TERMINAL #2 AND MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 9. OPEN OR DEFECTIVE CIRCUIT BETWEEN WASHER MOTOR CONNECTOR GROUND TERMINAL #2 AND LEFT HEADLAMP GROUND #5 OR ENGINE GROUND #1 OR 2. 10. CHECK FOR AN OPEN CIRCUIT ON MOTOR BETWEEN POWER TERMINAL #1 AND GROUND TERMINAL #2. IF NOT OK, REPLACE WASHER MOTOR. 11. APPLY DIRECT BATTERY VOLTAGE TO MOTOR TERMINALS. IF MOTOR DOES NOT RUN, REPLACE MOTOR. 12. REPLACE THE HEADLAMP WASHER RELAY.
ONE HEADLAMP WASHER NOZZLE WILL NOT FLOW WASHER FLUID.	1. HEADLAMP WASHER HOSE NOT FLOWING FLUID. 2. PLUGGED HEADLAMP WASHER NOZZLE.	1. REPAIR OR REPLACE THE HEADLAMP WASHER HOSE. 2. REPLACE HEADLAMP WASHER NOZZLE.

HEADLAMP WASHERS - EXPORT (Continued)

STANDARD PROCEDURE - HEADLAMP WASHER SYSTEM PRIMING - EXPORT

The headlamp washer system may lose its prime when the system is serviced. The following procedure must be used to prime the headlamp washer system. A DRB III® scan tool must be used for this priming procedure.

Do not allow washer fluid to spray on hot engine with the hood up.

Do not stand near the headlamp washer nozzles when actuating the headlamp washer system. The washer fluid comes out of the nozzles at high pressure.

- (1) Connect a DRB III® scan tool.
- (2) Go to the "BODY" menu.
- (3) Go to the "ACTUATOR" menu.
- (4) Actuate the "HEADLAMP WASHER" actuator until the headlamp washer system is properly primed.

Do not actuate the headlamp washers longer than 4 seconds at a time. Allow pump to cool prior to next attempt. Damage to the headlamp washer pump may occur.

Fig. 3 LEFT SIDE HEADLAMP WASHER HOSE

- 1 - HEADLAMP WASHER HOSE QUICK DISCONNECT
- 2 - HEADLAMP WASHER HOSE
- 3 - WINDSHIELD/HEADLAMP WASHER RESERVOIR

HEADLAMP WASHER HOSES - EXPORT**REMOVAL**

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Hoist vehicle.
- (3) Remove the front fascia. Refer to Body for Removal procedures.
- (4) Disconnect the headlamp washer hoses at the quick disconnect connectors (Fig. 3) and (Fig. 4).
- (5) Remove the headlamp washer hoses from the radiator closure panel.

INSTALLATION

- (1) Install the headlamp washer hoses to the radiator closure panel.
- (2) Connect the headlamp washer hoses quick disconnect connectors (Fig. 3) and (Fig. 4).
- (3) Reinstall the front fascia. Refer to Body for Installation procedures.
- (4) Lower vehicle from hoist.
- (5) Refill the washer fluid.
- (6) Reconnect the negative battery cable remote terminal.

80b4fa72

Fig. 4 RIGHT SIDE HEADLAMP WASHER HOSE

- 1 - HEADLAMP WASHER NOZZLE
- 2 - HEADLAMP WASHER HOSE QUICK DISCONNECT

HEADLAMP WASHER NOZZLE - EXPORT

REMOVAL

- (1) Hoist vehicle.
- (2) Partially remove the front fascia to gain access to the headlamp assembly. Refer to Body for Removal procedures.
- (3) Remove the headlamp assembly. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit, Removal.
- (4) Remove the headlamp washer nozzle retaining screws and remove the nozzle from the headlamp assembly (Fig. 5).

80b57465

Fig. 5 HEADLAMP WASHER NOZZLE

- 1 - HEADLAMP WASHER NOZZLE
2 - HEADLAMP WASHER NOZZLE RETAINING SCREWS
3 - HEADLAMP ASSEMBLY

INSTALLATION

- (1) Place the headlamp washer nozzle in position on the headlamp assembly.
- (2) Install the headlamp washer nozzle retaining screws. Torque to 0.7 to 1.3 N·m.
- (3) Reinstall the headlamp assembly. Electrical, Lamps/Lighting - Exterior, Headlamp Unit, Installation.
- (4) Reinstall the front fascia as necessary. Refer to Body for Installation procedures.
- (5) Lower vehicle from hoist.
- (6) Refill the washer fluid.
- (7) Prime the headlamp washer system. Refer to the Electrical, Wipers/Washers, Headlamp Washers,

Standard Procedures - Headlamp Washer System Priming.

HEADLAMP WASHER PUMP - EXPORT

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the battery post.
- (2) Hoist vehicle.
- (3) Drain washer fluid into a clean container.
- (4) Partially remove the front fascia to gain access to the windshield/headlamp washer pump. Refer to Body for Removal procedures.
- (5) Remove the four windshield/headlamp washer reservoir mounting bolts.
- (6) Pull the reservoir away from body to gain access to the headlamp washer pump (Fig. 6).

80b5748c

Fig. 6 HEADLAMP WASHER PUMP

- 1 - WINDSHIELD/HEADLAMP WASHER RESERVOIR
2 - HEADLAMP WASHER PUMP

- (7) Disconnect the headlamp washer pump electrical connector and the headlamp washer pump hose.
- (8) Pull the headlamp washer pump from the reservoir.

HEADLAMP WASHER PUMP - EXPORT (Continued)

INSTALLATION

- (1) Install the headlamp washer motor in the windshield/headlamp washer pump.
- (2) Connect the headlamp washer pump hose and electrical connector.
- (3) Install the reservoir retaining bolts. Torque bolts to 5 to 7 N·m.
- (4) Reinstall the front fascia as necessary. Refer to Body for Installation procedures.
- (5) Lower vehicle from hoist.
- (6) Refill the windshield/headlamp washer reservoir.
- (7) Reconnect the negative battery cable remote terminal.
- (8) Prime the headlamp washer system. Refer to the Electrical, Wipers/Washers, Headlamp Washers, Standard Procedures - Headlamp Washer System Priming.

WASHER FLUID LEVEL SWITCH**REMOVAL**

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Hoist vehicle.
- (3) Remove front fascia as necessary (left side only and use a 2x4 to prop left edge of fascia away from body). Refer to Body for Removal.
- (4) Disconnect the wire connector from the reservoir fluid level sensor.
- (5) Gently pry sensor away from reservoir and out of grommet. Care must be taken not to puncture reservoir (Fig. 8).
- (6) Remove rubber grommet from reservoir and throw away.

INSTALLATION

NOTE: Use a new mounting grommet when installing a new sensor assembly.

Assure "flat" of sensor is aligned under the "ridge" of reservoir and that sensor connector is facing down in the fully seated position.

- (1) Install new rubber grommet into reservoir.
- (2) Carefully install sensor into reservoir and grommet. Care must be taken not to puncture reservoir or grommet (Fig. 8).
- (3) Connect the wire connector to the reservoir fluid level sensor.
- (4) Install the front fascia as necessary. Refer to Body for Installation.
- (5) Lower vehicle from hoist.

- (6) Connect the negative battery cable remote terminal to the remote battery post.

WASHER FLUID LEVEL SWITCH - INTREPID**REMOVAL**

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the Washer Reservoir. Refer to Electrical, Wipers and Washers, Washer Reservoir, Removal.
- (3) Gently pry sensor away from reservoir and out of grommet. Care must be taken not to puncture reservoir (Fig. 8).
- (4) Remove rubber grommet from reservoir and throw away.

INSTALLATION

NOTE: Use a new mounting grommet when installing a new sensor assembly.

Assure "flat" of sensor is aligned under the "ridge" of reservoir and that sensor connector is facing down in the fully seated position.

- (1) Install new rubber grommet into reservoir.
- (2) Carefully install sensor into reservoir and grommet. Care must be taken not to puncture reservoir or grommet (Fig. 8).
- (3) Connect the wire connector to the reservoir fluid level sensor.
- (4) Install the Washer Reservoir. Refer to Electrical, Wipers and Washers, Washer Reservoir, Installation.
- (5) Connect the negative battery cable remote terminal to the remote battery post.

WASHER HOSES**REMOVAL**

- (1) Remove left headlamp unit. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit, Removal.
- (2) Remove underhood silencer pad clips only along left rear of hood.
- (3) Carefully pull silencer pad away from hood.
- (4) Disconnect "Y" connector from hood.
- (5) Disconnect right and left hood nozzle hoses at "Y" connector.
- (6) Disconnect hose clips from hood, tower to tower beam, and fender beam.
- (7) Disconnect washer hose from top of reservoir and from washer pump discharge port.
- (8) Carefully pull washer hose up through engine compartment.

WASHER HOSES (Continued)

INSTALLATION

- (1) Route washer hose up through engine compartment.
- (2) Connect washer hose to top of reservoir and to washer pump discharge port.
- (3) Connect hose clips to hood, tower to tower beam, and fender beam.
- (4) Connect right and left hood nozzle hoses at "Y" connector.
- (5) Connect "Y" connector to hood.
- (6) install the underhood silencer pad clips along left rear of hood.
- (7) Install the left headlamp unit. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit, Installation.

Be sure to test and check system for leaks and pinched or kinked hoses.

WASHER NOZZLE**REMOVAL**

- (1) Using a plastic body filler spreader or equivalent (credit card), gently place it underneath the front of the washer nozzle. Be careful not to damage the hood seal underneath the nozzle.
- (2) Rock the nozzle back and forth slightly to release it from the hood panel.
- (3) Pull the nozzle out of the hood panel far enough to disconnect the hose.

INSTALLATION

- (1) Connect washer hose and position nozzle over opening in hood and firmly snap into place.
- After connecting hose, check for proper system function and to assure leak free connections by actuating the washer system switch from inside of vehicle.

WASHER PUMP MOTOR**REMOVAL**

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Hoist vehicle.
- (3) Remove front fascia as necessary (left side only and use a 2x4 to prop left edge of fascia away from body). Refer to Body for Removal.
- (4) Disconnect the wire connectors from the reservoir pump.
- (5) Gently pry pump away from reservoir and out of grommet. Care must be taken not to puncture reservoir (Fig. 8).
- (6) Remove rubber grommet from reservoir and throw away.

INSTALLATION

- (1) Install new rubber grommet in reservoir.
- (2) Carefully install pump motor into reservoir. Care must be taken not to puncture reservoir (Fig. 8).
- (3) Connect the wire connectors to the reservoir pump.
- (4) Install the front fascia as necessary (left side only and use a 2x4 to prop left edge of fascia away from body). Refer to Body for Installation.
- (5) Lower vehicle from hoist.
- (6) Connect the negative battery cable remote terminal to the remote battery post.

WASHER PUMP MOTOR - INTREPID**REMOVAL**

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the left headlamp assembly and set aside. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit (Intrepid), Removal.
- (3) Remove the four retaining bolts to the washer reservoir (Fig. 7).
- (4) Disconnect the pump and sensor wire connectors.
- (5) Disconnect the washer hose.
- (6) Disconnect the washer filler hose.
- (7) Pivot the inboard side of the reservoir forward and lift out of vehicle.
- (8) Carefully pull the pump out of the reservoir (Fig. 8).

NOTE: When replacing the pump, make sure to use a new grommet for proper sealing and to avoid leaks.

INSTALLATION

NOTE: When replacing the pump, make sure to use a new grommet for proper sealing and to avoid leaks.

- (1) Install the new pump grommet (Fig. 8).
- (2) Position pump motor over grommet and firmly snap into place.
- (3) Place reservoir into position in engine compartment, pivot the inboard side of the reservoir rearward.
- (4) Connect the washer filler hose.
- (5) Connect the washer hose.
- (6) Connect the pump and sensor wire connectors.

WASHER PUMP MOTOR - INTREPID (Continued)

(7) Install the four retaining bolts to the washer reservoir (Fig. 7).

(8) Install the left headlamp assembly. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit (Intrepid), Installation.

(9) Connect the negative battery cable remote terminal to the remote battery post.

WASHER RESERVOIR

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Hoist vehicle.

(3) Remove front fascia as necessary (left side only and use a 2x4 to prop left edge of fascia away from body). Refer to Body for Removal.

(4) Disconnect the wire connectors from the reservoir pump and float sensor.

(5) Disconnect the washer hose and block the liquid outlet to prevent the liquid from running out of the reservoir.

(6) Reach up behind the washer reservoir and pull the filler tube off the rear of the reservoir.

(7) Remove four mounting bolts to washer reservoir (Fig. 7).

Fig. 7 WASHER RESERVOIR REMOVAL

- 1 - WASHER RESERVOIR FILLER TUBE
- 2 - WASHER RESERVOIR

(8) Remove washer reservoir from vehicle.

(9) Transfer fluid level sensor, pump, and washer fluid to new reservoir (Fig. 8).

Fig. 8 WASHER RESERVOIR

- 1 - RETAINING BOLTS
- 2 - WASHER RESERVOIR
- 3 - FLUID LEVEL SENSOR
- 4 - WASHER FLUID PUMP

INSTALLATION

(1) Transfer fluid level sensor, pump, and washer fluid to new reservoir (Fig. 8).

(2) Place washer reservoir into vehicle into the mounting position.

(3) Install the four mounting bolts to the washer reservoir (Fig. 7).

(4) Reach up behind the washer reservoir and place the filler tube onto the rear of the reservoir.

(5) Connect the washer hose to the washer pump outlet.

(6) Connect the wire connectors to the reservoir pump and float sensor.

(7) Install the front fascia as necessary (left side only and use a 2x4 to prop left edge of fascia away from body). Refer to Body for Installation.

(8) Lower vehicle from hoist.

(9) Connect the negative battery cable remote terminal to the remote battery post.

WASHER RESERVOIR - INTREPID

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the left headlamp assembly and set aside. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit (Intrepid), Removal.
- (3) Remove the four retaining bolts to the washer reservoir (Fig. 7).
- (4) Disconnect the pump and sensor wire connectors.
- (5) Disconnect the washer hose.
- (6) Disconnect the washer filler hose.
- (7) Pivot the inboard side of the reservoir forward and lift out of vehicle.
- (8) If replacing the reservoir, you must transfer the pump and sensor to the new reservoir (Fig. 8).

NOTE: When transferring pump and sensor, make sure to use a new grommet for proper sealing and to avoid leaks.

INSTALLATION

NOTE: When transferring pump and sensor, make sure to use a new grommet for proper sealing and to avoid leaks.

- (1) If replacing the reservoir, you must transfer the pump and sensor to the new reservoir (Fig. 8).
- (2) Place reservoir into position in engine compartment, pivot the inboard side of the reservoir rearward.
- (3) Connect the washer filler hose.
- (4) Connect the washer hose.
- (5) Connect the pump and sensor wire connectors.
- (6) Install the four retaining bolts to the washer reservoir (Fig. 7).
- (7) Install the left headlamp assembly. Refer to Electrical, Lamps/Lighting - Exterior, Headlamp Unit (Intrepid), Installation.
- (8) Connect the negative battery cable remote terminal to the remote battery post.

WASHER RESERVOIR FILLER TUBE

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Hoist vehicle.
- (3) Remove front fascia as necessary (left side only and use a 2x4 to prop left edge of fascia away from body). Refer to Body for Removal.
- (4) Reach up behind the washer reservoir and pull the filler tube off the rear of the reservoir.
- (5) Remove one screw attaching washer reservoir filler tube to upper radiator support (Fig. 9).
- (6) Pull filler tube and hose up through left fender and remove.

80b2b471

Fig. 9 WASHER RESERVOIR FILLER TUBE

- 1 - SPEED CONTROL SERVO
- 2 - WASHER RESERVOIR FILLER TUBE

INSTALLATION

- (1) Place filler tube in engine compartment and route through left fender.
- (2) Install the one screw attaching washer reservoir filler tube to upper radiator support (Fig. 9).
- (3) Reach up behind the washer reservoir and install the filler tube on the rear of the reservoir.
- (4) Install the front fascia as necessary (left side only and use a 2x4 to prop left edge of fascia away from body). Refer to Body for Installation.
- (5) Lower vehicle off hoist.
- (6) Connect the negative battery cable remote terminal to the remote battery post.

WIPER ARMS

STANDARD PROCEDURE - WIPER ARM ALIGNMENT

The wiper system does not have an indexing feature designed into the arm and blade assembly. The arms and blades are positioned to "TIC" marks on the windshield and secured. This design allows for a tighter fit between wiper arm and pivot shaft.

- (1) Cycle the wiper motor into the PARK position.

CAUTION: After cycling the wipers, turn the wiper switch and the ignition switch to OFF.

- (2) Check drivers side blade tip position is on or between two "TIC" marks on the windshield. Check that passenger side blade edge is on or near one "TIC" mark on windshield.

- (3) If requirements are not met, check for and repair as necessary:

- bent arm or blades
- loose or worn wiper module links
- loose wiper module
- defective module mounting grommets
- defective wiper parking system
- etc.

- (4) Position arm and blade to "TIC" marks on windshield as described above and secure the wiper arm retaining nuts.

- (5) Operate system and verify proper operation. If problem still exists, refer to Electrical, Wipers and Washers, Diagnosis and Testing - Wiper System Conditions.

REMOVAL

- (1) Cycle the wiper arm/blades into PARK position and turn ignition OFF.

- (2) Using a trim stick (special tool #C-4755) or equivalent, gently pry up on the wiper arm retaining nut cap and remove.

- (3) Remove the retaining nut from the wiper arm pivot.

- (4) Lift wiper arm to raise blade off glass and remove the arm from the pivot using a rocking motion and remove from vehicle.

INSTALLATION

- (1) Place the wiper arm on wiper pivot.
- (2) Install the retaining nut to the wiper arm pivot.
- (3) Install the wiper arm retaining nut cap.
- (4) Cycle the wiper arm/blades to make sure the arms are positions correctly.

Refer to Electrical, Wipers and Washers, Wiper Arms, Standard Procedures for adjustments if necessary.

WIPER BLADES

DESCRIPTION

The wiper blades are a rubber element with a steel vertebrae that are mounted on the end of the windshield wiper arm and sweep across the front windshield to clear it of water, snow, and debris.

OPERATION

When the wiper blade rubber element is exposed to the weather for a long period of time, it tends to lose wiping ability. Periodic cleaning of the wiper blade element is suggested to remove the accumulation of salt and road film. The wiper blades, arms, and windshield should be cleaned with a sponge or cloth and a mild detergent or non-abrasive cleaner. If the blades continue to streak or smear, they should be replaced. The driver blade element is 600 mm in length and the passenger blade element is 550 mm in length.

REMOVAL

- (1) Lift wiper arm to raise blade off glass.

- (2) Remove blade assembly from arm by pushing release tab under arm tip and slide blade away from arm tip (Fig. 10) and (Fig. 11). The vertebra is curved on the right blade only. Install with the curve matching the shape of the windshield.

- (3) Gently place wiper arm tip on glass surface.

Fig. 10 WIPER BLADE AND ELEMENT

- 1 - ARM RELEASE TAB
- 2 - VERTABRA
- 3 - RUBBER ELEMENT

INSTALLATION

- (1) Lift wiper arm tip off glass and snap blade and element onto wiper arm (Fig. 11). The vertebra is curved on the right blade only. Install with the curve matching the shape of the windshield.

- (2) Lower wiper arm to glass.

WIPER BLADES (Continued)

**Fig. 11 REMOVE BLADE FROM ARM**

1 - RELEASE TAB

WIPER BLADE ELEMENT

REMOVAL

- (1) Remove wiping element from blade assembly by grasping and pulling stopper of blade element out of end claw together with vertebra (metal rails).
- (2) Remove wiping element and vertebra by sliding them out of claws.
- (3) Remove vertebra from wiping element (Fig. 12).

**Fig. 12 WIPER BLADE AND ELEMENT**

- 1 - CLAW
- 2 - TO GRASP AND PULL
- 3 - CHANNEL
- 4 - RUBBER ELEMENT
- 5 - VERTABRA

INSTALLATION

- (1) Install the vertebra onto the wiping element (Fig. 12).
- (2) Install the wiping element and vertebra into the blade assembly by sliding them into the claws.

NOTE: Install right blade element vertebra to match the shape of the windshield. Install vertebra with curve down. Install left blade element vertebra flat.

- (3) Check that blade element and vertebra are through all the claws and the final claw is locked in the stopper. Assure element locked end is closest to wiper system pivot.

WIPER LINKAGE

REMOVAL

There are two serviceable link assemblies in the wiper module (Fig. 13). The Master Link connects the motor output crank to the driver side pivot. The Slave link connects the driver side pivot to the passenger side pivot. To service these links, remove the wiper module from the vehicle.

The wiper module mounting grommets can be serviced anytime the module is removed from the vehicle. Replace module mounting grommets if they are broken, cracked, deteriorated, or defective.

**Fig. 13 WIPER LINK ARMS**

- 1 - MASTER LINK ARM
- 2 - SLAVE LINK ARM
- 3 - WINDSHIELD WIPER FRAME ASSEMBLY

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

- (2) Remove wiper module from vehicle. Refer to Electrical, Wipers and Washers, Wiper Module Removal.

- (3) Disconnect wiper module slave link from pivot levers by carefully using a ball and socket wedge. Do not damage ball and socket or seal when using wedge.

- (4) Disconnect wiper module master link from pivot lever and motor crank by carefully using a ball and socket wedge. Do not damage ball and socket or seal when using wedge.

- (5) Remove module linkage mounting grommets.

NOTE: Grommet eyelet may need to be removed from rubber isolator on rear inboard and forward outboard mounting grommets only during disassembly.

- (6) Remove "U" nut from body (if necessary).

INSTALLATION

NOTE: Grommet eyelet may have been removed from rubber isolator on rear inboard and forward outboard mounting grommets during disassembly. Install if removed.

WIPER LINKAGE (Continued)

- (1) Install "U" nut to body (if necessary).
- (2) Install the module linkage mounting grommets.

NOTE: When assembling master link or slave link to module frame, use channel locks wrapped in cloth to prevent damage to ball and socket joint. Apply light pressure to assemble socket to ball.

(3) Connect the wiper module master link to the pivot lever and motor crank by carefully snapping together. Do not damage ball and socket or seal.

(4) Connect wiper module slave link to pivot levers by carefully snapping together. Do not damage ball and socket or seal.

(5) Install the wiper module into the vehicle. Refer to Electrical, Wipers and Washers, Wiper Module Installation.

(6) Connect the negative battery cable remote terminal to the remote battery post.

WIPER MODULE

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Remove driver and passenger side wiper arms. Refer to Electrical, Wipers and Washers, Wiper Arm Removal.

(3) Remove nine screws to cowl screen panel. Refer to Body for Removal.

(4) Remove wiper module mounting bolt located on top of the tower to tower beam.

(5) Remove eight bolts to Tower to Tower (crosscar) support (Fig. 14). Refer to Body for Removal.

Fig. 14 TOWER TO TOWER SUPPORT REMOVAL

- 1 - TOWER TO TOWER SUPPORT
- 2 - RETAINING BOLTS

(6) Remove three retaining bolts to windshield wiper module (Fig. 15).

(7) Lift wiper module away from vehicle body.

(8) Disconnect one wire connector.

(9) Remove windshield wiper module from vehicle.

Fig. 15 WIPER MODULE RETAINING BOLTS

- 1 - RETAINING BOLTS
- 2 - WIPER MOTOR CONNECTOR

(10) If replacing module, transfer wiper module grommets to new module assembly (Fig. 16).

Fig. 16 WIPER FRAME GROMMETS

- 1 - GROMMETS

(11) Remove one nut to crank arm and remove from motor (Fig. 17).

(12) Remove three retaining bolts from wiper motor (Fig. 17).

(13) Remove wiper motor from wiper module assembly. Install onto new wiper module assembly. Refer to Electrical, Wipers and Washers, Wiper Motor, Removal.

INSTALLATION

(1) Install the wiper motor onto the wiper module assembly. Refer to Electrical, Wipers and Washers, Wiper Motor, Removal.

(2) Install the three retaining bolts to the wiper motor (Fig. 17).

(3) Install the crank arm and install the one nut to crank arm (Fig. 17).

NOTE: If replacing module, transfer wiper module grommets to new module assembly (Fig. 16).

(4) Install the windshield wiper module into vehicle.

WIPER MODULE (Continued)

(5) Start rear outboard screw first, rear inboard screw second, and forward outboard screw last.

(6) Start all module mounting screws and bolt by hand before torquing to specifications.

(7) Connect one wire connector.

(8) Install the three retaining bolts to windshield wiper module (Fig. 15).

(9) Install the eight bolts to Tower to Tower (cross-car) support (Fig. 14). Refer to Body for Removal.

(10) Install the wiper module mounting bolt located on top of the tower to tower beam.

(11) Install the nine screws to cowl screen panel. Refer to Body for Removal.

(12) Assure wiper module pivots are in "PARK" position cycling the switch "ON" and "OFF" with engine off prior to installing arms and blades.

(13) Install the driver and passenger side wiper arms. Refer to Electrical, Wipers and Washers, Wiper Arm Removal.

(14) Connect the negative battery cable remote terminal to the remote battery post.

WIPER MOTOR

DIAGNOSIS AND TESTING - WIPER MOTOR

Whenever a wiper motor malfunction occurs, disconnect motor wire harness and clean the terminals. Ensure the wire harness is properly connected before starting diagnosis and repair procedures. Refer to Wiper Motor Test table.

CAUTION: Keep hands clear when cycling the wiper motor within the wiper module.

WIPER MOTOR TEST

CONDITION	POSSIBLE CAUSE	CORRECTION
WIPER OPERATES IN LOW SPEED OR INTERMITTENT ONLY.	1. HI/LO RELAY DEFECTIVE. 2. OPEN OR DEFECTIVE CONTROL CIRCUIT IN BCM. 3. DEFECTIVE WIPER SWITCH. 4. OPEN HIGH SPEED CIRCUIT. 5. DEFECTIVE MOTOR.	1. CHECK HI/LO RELAY WITH KNOWN GOOD RELAY. IF NOT OK, REPLACE HI/LO RELAY. 2. OPEN OR DEFECTIVE CIRCUIT BETWEEN HI/LO RELAY CAVITY "C" AND BCM CONNECTOR TERMINAL #12C. DEFECTIVE BCM. IF NOT OK, REPAIR CIRCUIT OR REFER TO BCM DIAGNOSTIC PROCEDURES. 3. REFER TO WIPER SWITCH DIAGNOSTIC PROCEDURES. 4. OPEN OR DEFECTIVE CIRCUIT BETWEEN HI/LO RELAY CAVITY "D" AND WIPER MOTOR CONNECTOR TERMINAL #1. IF NOT OK, REPAIR CIRCUIT. 5. APPLY BATTERY JUMPER OVER TO WIPER TERMINAL #1 AND GROUND TERMINAL #5. IF NOT OK, REPLACE MOTOR.
WIPER OPERATES IN INTERMITTENT MODE ONLY.	1. DEFECTIVE WIPER SWITCH.	1. REFER TO WIPER SWITCH DIAGNOSTIC PROCEDURES.

WIPER MOTOR (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
WIPER OPERATES IN HIGH SPEED ONLY.	1. DEFECTIVE HI/LO RELAY. 2. DEFECTIVE CONTROL CIRCUIT TO BCM. 3. DEFECTIVE BCM. 4. OPEN LOW SPEED CIRCUIT. 5. DEFECTIVE MOTOR.	1. CHECK WIPER HI/LO RELAY WITH KNOWN GOOD RELAY. REPLACE IF NOT OK. 2. CONTINUOUS SHORT BETWEEN HI/LO RELAY CAVITY "C" AND BCM CONNECTOR TERMINAL #12C. IF NOT OK, REPAIR CIRCUIT. 3. REFER TO BCM DIAGNOSTIC PROCEDURES. 4. OPEN OR DEFECTIVE CIRCUIT BETWEEN HI/LO RELAY CAVITY "E" AND WIPER MOTOR CONNECTOR TERMINAL #2. IF NOT OK, REPAIR CIRCUIT. 5. APPLY BATTERY JUMPER POWER TO WIPER TERMINAL #2 AND GROUND TERMINAL #5. IF NOT OK, REPLACE MOTOR.
WIPER OPERATION SWITCHES BETWEEN LOW AND HIGH SPEED OPERATION.	1. DEFECTIVE CONTROL CIRCUIT TO BCM. 2. DEFECTIVE BCM.	1. INTERMITTENT SHORT BETWEEN HI/LO RELAY CAVITY "C" AND BCM CONNECTOR TERMINAL #12C, IF NOT OK, REPAIR CIRCUIT. 2. REFER TO BCM DIAGNOSTIC PROCEDURES.
WIPER WILL NOT PARK.	1. OPEN WIPER MOTOR PARK CIRCUIT. 2. DEFECTIVE BCM. 3. DEFECTIVE WIPER MOTOR.	1. OPEN OR DEFECTIVE CIRCUIT BETWEEN WIPER MOTOR CONNECTOR TERMINAL #4 AND BCM TERMINAL #3C. IF NOT OK, REPAIR CIRCUIT. 2. REFER TO BCM DIAGNOSTIC PROCEDURES. 3. APPLY BATTERY JUMPER POWER TO WIPER TERMINAL #2 (LOW SPEED) AND GROUND TERMINAL #5 (COMMON GROUND). POSITION AN OHMMETER ACROSS MOTOR PARK TERMINAL #4 AND COMMON GROUND. THE OHMMETER MUST INDICATE ONE SHORT, ONCE EVERY MOTOR REVOLUTION. OR WITH MOTOR IN "PARK" POSITION, CHECK FOR CONTINUITY BETWEEN MOTOR TERMINAL #4 AND 5. IF NOT OK, REPLACE MOTOR.
WIPER WILL NOT RUM TO PARK AFTER IGNITION OFF.	1. DEFECTIVE BCM.	1. REFER TO BCM DIAGNOSTIC PROCEDURES.
WIPER RUNS THRU PARK POSITION ON WINDSHIELD.	1. DEFECTIVE ON/OFF RELAY. 2. OPEN ON/OFF RELAY GROUND CIRCUIT.	1. CHECK WIPER ON/OFF RELAY WITH KNOWN GOOD RELAY. IF NOT OK, REPLACE RELAY. 2. OPEN OR DEFECTIVE CIRCUIT BETWEEN ON/OFF RELAY CAVITY "E" AND LEFT HEADLAMP GROUND #5 OR ENGINE GROUND #1 OR 2.

REMOVAL

The Wiper Module Assembly must be removed to service the wiper motor.

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove wiper module. Refer to Electrical, Wipers and Washers, Wiper Module Removal.
- (3) Disconnect wiper module master link from motor crank by carefully using a ball and socket wedge. Do not damage ball and socket or seal when using wedge.
- (4) Remove three retaining bolts from the wiper motor (Fig. 17).
- (5) Remove wiper motor from wiper module.

INSTALLATION

- (1) Place wiper motor in position onto wiper module.
- (2) Install the three retaining bolts to the wiper motor (Fig. 17).
- (3) Connect the wiper module master link to the motor crank by carefully snapping together. Do not damage ball and socket or seal.
- (4) Install the wiper module. Refer to Electrical, Wipers and Washers, Wiper Module Installation.
- (5) Connect the negative battery cable remote terminal to the remote battery post.

WIPER SWITCH

DIAGNOSIS AND TESTING - WIPER SWITCH

To test the multi-function/wiper switch, first disconnect the switch wires from the body wiring in the steering column (Fig. 18). Using an ohmmeter, test for continuity between the terminals of the switch, as indicated in the following continuity table. The identity of each terminal is shown in (Fig. 19).

For test purposes, the first position is the OFF position, the next six positions are for the DELAY wipe. LOW is the next detent position and HIGH is the full counterclockwise detent position.

In any wiper switch position, if the control stalk end cap is depressed, the washer circuit will be completed.

WIRING DIAGRAM
INFORMATION

DESCRIPTION

DESCRIPTION - HOW TO USE WIRING
DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicle wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

WIRING DIAGRAM INFORMATION (Continued)

DIAGRAMS ARE ARRANGED WITH THE POWER B+ SIDE OF THE CIRCUIT NEAR THE TOP OF THE PAGE, AND THE GROUND SIDE OF THE CIRCUIT NEAR THE BOTTOM OF THE PAGE.

The System shown here is an **EXAMPLE ONLY**. It does not represent the actual circuit shown in the **WIRING DIAGRAM SECTION**.

Fig. 1 WIRING DIAGRAM EXAMPLE 1

WIRING DIAGRAM INFORMATION (Continued)

DESCRIPTION - CIRCUIT FUNCTIONS

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)
H	OPEN
I	NOT USED
J	OPEN
K	POWERTRAIN CONTROL MODULE
L	EXTERIOR LIGHTING

S	SUSPENSION/STEERING
T	TRANSMISSION/TRANSAXLE/TRANSFER CASE
U	OPEN
V	SPEED CONTROL, WIPER/WASHER
W	OPEN
X	AUDIO SYSTEMS
Y	OPEN
Z	GROUND

DESCRIPTION - SECTION IDENTIFICATION AND INFORMATION

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in Group 30, so it is shown there complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in Section 8W-70 show the entire splice and provide references to other sections the splices serves. Section 8W-70 only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

Section 8W-80 shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram pages.

WIRING SECTION CHART

GROUP	TOPIC
8W-01 thru 8W-09	General information and Diagram Overview
8W-10 thru 8W-19	Main Sources of Power and Vehicle Grounding
8W-20 thru 8W-29	Starting and Charging
8W-30 thru 8W-39	Powertrain/Drivetrain Systems
8W-40 thru 8W-49	Body Electrical items and A/C
8W-50 thru 8W-59	Exterior Lighting, Wipers and Trailer Tow
8W-60 thru 8W-69	Power Accessories
8W-70	Splice Information
8W-80	Connector Pin Outs
8W-91	Connector, Ground and Splice Locations

WIRING DIAGRAM INFORMATION (Continued)

DESCRIPTION - CONNECTOR, GROUND AND SPLICE INFORMATION

CAUTION: Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.

IDENTIFICATION

In-line connectors are identified by a number, as follows:

- In-line connectors located in the engine compartment are C100 series numbers
- In-line connectors located in the Instrument Panel area are C200 series numbers.
- In-line connectors located in the body are C300 series numbers.
- Jumper harness connectors are C400 series numbers.
- Grounds and ground connectors are identified with a "G" and follow the same series numbering as the in-line connectors.
- Splices are identified with an "S" and follow the same series numbering as the in-line connectors.
- Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

LOCATIONS

Section 8W-91 contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts in section 8W-91 reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

WARNING**WARNINGS - GENERAL**

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.

WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.

WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.

WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.

WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.

WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.

WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.

WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.

WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND AVOID LOOSE CLOTHING.

DIAGNOSIS AND TESTING - WIRING HARNESS**TROUBLESHOOTING TOOLS**

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.

- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

WIRING DIAGRAM INFORMATION (Continued)

- Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

- Probing Tools - These tools are used for probing terminals in connectors (Fig. 5). Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

Fig. 5 PROBING TOOL

948W-233

- 1 - SPECIAL TOOL 6801
2 - PROBING END

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-

factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

- (1) Verify the problem.
- (2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.
- (3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
- (4) Isolate the problem area.
- (5) Repair the problem area.
- (6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

STANDARD PROCEDURE

STANDARD PROCEDURE - ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

All ESD sensitive components are solid state and a symbol (Fig. 6) is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

- (1) Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
- (2) Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.
- (3) When using a voltmeter, be sure to connect the ground lead first.
- (4) Do not remove the part from its protective packing until it is time to install the part.
- (5) Before removing the part from its package, ground the package to a known good ground on the vehicle.

Fig. 6 ELECTROSTATIC DISCHARGE SYMBOL

80ce3d47

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING OF VOLTAGE POTENTIAL

- (1) Connect the ground lead of a voltmeter to a known good ground (Fig. 7).
- (2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

**Fig. 7 TESTING FOR VOLTAGE POTENTIAL****STANDARD PROCEDURE - TESTING FOR CONTINUITY**

- (1) Remove the fuse for the circuit being checked or, disconnect the battery.
- (2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 8).
- (3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

**Fig. 8 TESTING FOR CONTINUITY**

1 - FUSE REMOVED FROM CIRCUIT

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

- (1) Remove the fuse and disconnect all items involved with the fuse.
- (2) Connect a test light or a voltmeter across the terminals of the fuse.
- (3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.
- (4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

- (1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
- (2) Replace the blown fuse.
- (3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
- (4) Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

- (1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 9).
- (2) Connect the other lead of the voltmeter to the other side of the switch, component or circuit.
- (3) Operate the item.
- (4) The voltmeter will show the difference in voltage between the two points.

**Fig. 9 TESTING FOR VOLTAGE DROP****SPECIAL TOOLS****WIRING/TERMINAL****PROBING TOOL PACKAGE 6807****TERMINAL PICK TOOL SET 6680**

TERMINAL REMOVING TOOLS 6932 AND 8638**TERMINAL REMOVING TOOL 6934**

CONNECTOR

REMOVAL

- (1) Disconnect battery.
- (2) Release Connector Lock (Fig. 10).
- (3) Disconnect the connector being repaired from its mating half/component.
- (4) Remove the dress cover (if applicable) (Fig. 10).

Fig. 10 REMOVAL OF DRESS COVER

- 1 - DRESS COVER
2 - CONNECTOR LOCK
3 - CONNECTOR

(5) Release the Secondary Terminal Lock, if required (Fig. 11).

(6) Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector (Fig. 12).

INSTALLATION

(1) Insert the removed terminal in the same cavity on the repair connector.

(2) Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

(3) When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.

(4) Replace dress cover (if applicable).

(5) Connect connector to its mating half/component.

(6) Connect battery and test all affected systems.

DIODE

REMOVAL

- (1) Disconnect the battery.
- (2) Locate the diode in the harness, and remove the protective covering.
- (3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 13).

948W-197

Fig. 13 DIODE IDENTIFICATION

- 1 - CURRENT FLOW
2 - BAND AROUND DIODE INDICATES CURRENT FLOW
3 - DIODE AS SHOWN IN THE DIAGRAMS

INSTALLATION

- (1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.
- (2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 13).
- (3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**
- (4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.
- (5) Re-connect the battery and test affected systems.

TERMINAL

REMOVAL

- (1) Follow steps for removing terminals described in the connector removal section.
- (2) Cut the wire 6 inches from the back of the connector.

INSTALLATION

- (1) Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.
- (2) Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
- (3) Splice the repair wire to the wire harness (see wire splicing procedure).
- (4) Insert the repaired wire into the connector.
- (5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
- (6) Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
- (7) Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

(1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.

(2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.

(3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 14).

Fig. 14 SPLICE BAND

1 - SPLICE BAND

(4) Using crimping tool, Mopar p/n 05019912AA, crimp the splice clip and wires together (Fig. 15).

Fig. 15 CRIMPING TOOL

1 - CRIMPING TOOL

(5) Solder the connection together using rosin core type solder only (Fig. 16).

CAUTION: DO NOT USE ACID CORE SOLDER.

Fig. 16 SOLDER SPLICE

1 - SOLDER
2 - SPLICE BAND
3 - SOLDERING IRON

(6) Center the heat shrink tubing over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant comes out of both ends of the tubing (Fig. 17).

Underhood Lamp (Police Package)	8W-80-100
Washer Fluid Level Sensor	8W-80-100
Windshield Washer Pump Motor	8W-80-100
Windshield Wiper Motor	8W-80-100

A/C COMPRESSOR
CLUTCH

A/C COMPRESSOR CLUTCH - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	C2 14DB/BK	A/C CLUTCH RELAY OUTPUT
2	Z1 14BK	GROUND

A/C PRESSURE
TRANSDUCER

A/C PRESSURE TRANSDUCER - GRAY 4 WAY

CAV	CIRCUIT	FUNCTION
1	K4 20BK/LB	SENSOR GROUND
2	K6 20VT/WT	5 VOLT SUPPLY
3	C18 20DB	A/C PRESSURE SIGNAL
4	-	-

AIRBAG
CONTROL
MODULE
(ORC)

AIRBAG CONTROL MODULE (ORC) - YELLOW/RED 23 WAY

CAV	CIRCUIT	FUNCTION
1	-	-
2	-	-
3	-	-
4	-	-
5	R42 18BK/YL	PASSENGER SQUIB 1 LINE 1

21	D25 20VT/YL	PCI BUS (ORC)
22	-	-
23	-	-

AMBIENT TEMPERATURE SENSOR - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	K25 20VT/LG	AAT SIGNAL
2	K4 20BK/LB	SENSOR GROUND

ANALOG CLOCK (LTD/300M) - NATURAL 4 WAY		
CAV	CIRCUIT	FUNCTION
1	M1 20PK	FUSED B(+)
2	Z2 20BK/LG	GROUND
3	E2 20OR	PANEL LAMPS DRIVER
4	-	-

AUTOMATIC DAY/NIGHT MIRROR (PREMIUM) - BLACK 7 WAY		
CAV	CIRCUIT	FUNCTION
1	G5 20BK/DB	FUSED IGNITION SWITCH OUTPUT (RUN-START)
2	Z2 20BK/LG	GROUND
3	L1 20VT/BK	BACK-UP LAMP FEED
4	P112 18BK/TN	AUTO DAY NIGHT MIRROR (+)
5	P114 18BK/YL	AUTO DAY NIGHT MIRROR (-)
6	-	-
7	-	-

AUTOMATIC TEMPERATURE CONTROL HEAD - BLACK 12 WAY		
CAV	CIRCUIT	FUNCTION
1	Z2 20BK/LG	GROUND
2	D25 20VT/YL	PCI BUS (ATC)
3	Z1 20BK	GROUND
4	E2 20OR	PANEL LAMPS DRIVER
5	-	-
6	-	-
7	C10 22RD/TN	IN-CAR TEMPERATURE SENSOR SIGNAL (ATC)
8	C57 20DB/GY	SENSOR GROUND
9	-	-
10	F20 20WT	FUSED IGNITION SWITCH OUTPUT (RUN)
11	C9 22YL/DG	ASPIRATOR MOTOR DRIVER
12	M1 20PK	FUSED B(+)

AUTOSTICK
SWITCH
(DODGE/300M)

AUTOSTICK SWITCH (DODGE/300M) - NATURAL 4 WAY		
CAV	CIRCUIT	FUNCTION
1	T44 20YL/LB	AUTOSTICK DOWNSHIFT SWITCH SENSE
2	T5 20LG/RD	AUTOSTICK UPSHIFT SWITCH SIGNAL
3	Z1 20BK	GROUND
4	F11 20RD/WT	FUSED IGNITION SWITCH OUTPUT (OFF-RUN-START)

BLEND DOOR
ACTUATOR

BLEND DOOR ACTUATOR - BLACK 5 WAY		
CAV	CIRCUIT	FUNCTION
1	C33 22DB/RD	BLEND AIR DOOR DRIVER
2	C57 22DB/GY	SENSOR GROUND
3	C36 22RD/WT	BLEND DOOR FEEDBACK SIGNAL
4	C26 22PK/DB	5 VOLT SUPPLY
5	C34 22BR/WT	COMMON DOOR DRIVER

BLOWER MOTOR
POWER MODULE
(ATC)

BLOWER MOTOR POWER MODULE (ATC) - BLACK 4 WAY		
CAV	CIRCUIT	FUNCTION
1	-	-
2	Z1 12BK	GROUND
3	C56 22RD/LG	BLOWER MOTOR CONTROL
4	C1 12DG	FUSED IGNITION SWITCH OUTPUT (RUN)

BLOWER MOTOR
RESISTOR BLOCK

BLOWER MOTOR RESISTOR BLOCK - BLACK 6 WAY		
CAV	CIRCUIT	FUNCTION
1	C7 12BK/TN	HIGH BLOWER MOTOR DRIVER
2	C6 16LB	M2 BLOWER MOTOR DRIVER
3	-	-
4	C1 12DG	FUSED IGNITION SWITCH OUTPUT (RUN)
5	C4 18TN	LOW BLOWER MOTOR DRIVER
6	C5 16LG	M1 BLOWER MOTOR DRIVER

BODY CONTROL MODULE C1 - GRAY 14 WAY

CAV	CIRCUIT	FUNCTION
1	P1 20BK/WT	DECKLID RELEASE SWITCH OUTPUT
2	C32 22GY/DB	RECIRCULATION DOOR DRIVER
3	C33 22DB/RD	BLEND AIR DOOR DRIVER
4	D25 20VT/YL	PCI BUS (ATC)
5	D25 20VT/YL	PCI BUS (RADIO)
6	F13 20DB	FUSED IGNITION SWITCH OUPUT (RUN-ACC)
7	C7 16BK/TN (MTC)	HIGH BLOWER MOTOR DRIVER
8	C57 20DB/GY	SENSOR GROUND
9	C35 22DG/YL	MODE DOOR DRIVER
10	C34 22BR/WT	COMMON DOOR DRIVER
11	D25 20VT/YL	PCI BUS (ORC)
12	D25 20VT/YL	PCI BUS (SKIM)
13	D25 20VT/YL	PCI BUS (MIC)
14	D25 20VT/YL	PCI BUS (DLC)

BODY CONTROL MODULE C2 - BLACK 24 WAY

CAV	CIRCUIT	FUNCTION
1	C36 22RD/WT	BLEND DOOR FEEDBACK SIGNAL
2	G52 20YL	HEADLAMP SWITCH MUX
3	X20 20GY/WT	RADIO CONTROL MUX
4	D19 20VT/OR	SCI RECEIVE (TCM)
5	C9 22YL/DG (ATC)	ASPIRATOR MOTOR DRIVER
6	C56 22RD/LG (ATC)	BLOWER MOTOR CONTROL
7	V10 20BR	FRONT WASHER PUMP MOTOR CONTROL
8	V52 20DG/RD	FRONT WIPER MUX SWITCH SIGNAL
9	C37 22YL/WT	MODE DOOR FEEDBACK SIGNAL
10	C38 20DB (EXCEPT BASE)	SUN SENSOR SIGNAL
11	L99 20GY/BK (POLICE PACKAGE)	FUSED B(+)
12	C82 20YL/OR (MTC)	TEMPERATURE SELECT
13	E17 20YL/BK (POLICE PACKAGE/EX-PORT)	PARK LAMP RELAY OUTPUT
14	C48 20VT/PK (MTC)	A/C LED INDICATOR SIGNAL
15	C26 22PK/DB	5 VOLT SUPPLY
16	X920 20GY/OR	RADIO CONTROL MUX RETURN
17	P58 20WT	RKE EXTERNAL ANTENNA
18	P158 20BK	RKE EXTERNAL ANTENNA
19	L80 20WT	HEADLAMP SWITCH RETURN
20	C12 22LG/BK	EVAPORATOR TEMPERATURE SENSOR SIGNAL
21	E19 20RD	PANEL LAMPS DIMMER SIGNAL
22	C10 22RD/TN (ATC)	IN-CAR TEMPERATURE SENSOR SIGNAL (ATC)
22	C58 22RD/TN (MTC)	A/C MODE SWITCH MUX
23	G69 22BK/OR	VTSS INDICATOR DRIVER
24	G26 22LB	KEY-IN IGNITION SWITCH SENSE

BODY CONTROL MODULE C3 - NATURAL 12 WAY

CAV	CIRCUIT	FUNCTION
1	D25 18VT/YL	PCI BUS (PCM)
2	D25 18VT/YL (ABS)	PCI BUS (CAB)
3	V55 20TN/RD	FRONT WIPER PARK SWITCH SENSE
4	V14 20RD/VT	FRONT WIPER ON/OFF RELAY CONTROL
5	Z1 18BK (EXCEPT EXPORT)	12 VOLT
6	-	-
7	-	-
8	-	-
9	V58 20BR/YL (EXPORT)	HEADLAMP WASHER RELAY CONTROL
10	-	-

TABLE OF CONTENTS

page

CONNECTOR/GROUND/SPLICE LOCATION

DESCRIPTION 1

**CONNECTOR/GROUND/SPLICE
LOCATION****DESCRIPTION**

This section provides illustrations identifying connector, ground, and splice locations in the vehicle. Connector, ground, and splice indexes are provided.

Use the wiring diagrams in each section for connector, ground, and splice identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

CONNECTORS

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
A/C Compressor Clutch	BK	Top of Compressor	8, 9
A/C Compressor Clutch Relay	—	In the Power Distribution Center	N/S
A/C Pressure Transducer (2.7L)	GY	Right Front Engine Compartment	1, 2
A/C Pressure Transducer (3.5L)	GY	Right Front Engine Compartment	2, 3
Accessory No. 1 (Police)	—	Behind center of front bumper	6
Accessory No. 2 (Police)	—	Behind Park Brake Lever	20
Airbag Control Module (ORC)	YL/RD	Lower Center of Instrument Panel	12
Ambient Temperature Sensor	BK	Front Grille Area	1
Analog Clock	NAT	At Clock	N/S
Antenna Coax		Right Side C Pillar	28, 35
Automatic Day/Night Mirror	BK	At Mirror	N/S
Auto Shut Down Relay	—	In the Power Distribution Center	N/S
Automatic Temperature Control Head	BK	Center of Instrument Panel	12
Autostick Switch	NAT	Center Console	21
Auxiliary Lighting	LG	At Left C Pillar, Behind Shoulder Belt Anchor	29
Auxiliary Lighting Cap	LG	At Left C Pillar, Behind Shoulder Belt Anchor	29
Battery Negative	BK	Top of Battery	2
Battery Positive	RD	Top of Battery	2
Blend Door Actuator	BK	Right Side of HVAC	13
Blower Motor Power Module	BK	Center of HVAC	13
Blower Motor Resistor Block	BK	Center of HVAC	13
Body Control Module C1	GY	Left Side of Instrument Panel	11
Body Control Module C2	BK	Left Side of Instrument Panel	11

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/NUMBER	COLOR	LOCATION	FIG.
Body Control Module C3	NAT	Left Side of Instrument Panel	N/S
Body Control Module C4	BL	Left Side of Instrument Panel	23
Brake Fluid Level Switch	BK	At Master Cylinder	7
Brake Lamp Switch	GY	Top of Brake Pedal	N/S
Brake Transmission Shift Interlock Solenoid	WT	At Steering Column	11
C101	BK	Left Front of Engine	7, 8, 9, 10
C103	GN	Left Side Instrument Panel	11, 23
C104	OR	Left Side Instrument Panel	11, 23
C105	YL	Left Side Instrument Panel	23
C106	NAT	Left Side Instrument Panel	23
C107	LTGY	Rear of Engine	10

POWER DISTRIBUTION

DESCRIPTION

All of the electrical current distributed throughout this vehicle (except for police package wiring used with rear fuse block) is directed through the standard equipment Power Distribution Center (PDC). The molded plastic PDC housing is located in the left front corner of the engine compartment, just in front of the coolant reservoir bottle. The PDC housing has a molded plastic cover. The PDC cover is easily removed for service access and has a convenient fuse and relay layout label affixed to the inside surface of the cover to ensure proper component identification. The PDC housing is secured in the engine compartment by one screw to the rear of the PDC and two clips on the front side. A small molded plastic protective cover on the front right side of the engine compartment is unsnapped to access the battery/generator cable input connection studs.

Included in the police package is an additional rear fuse block and remote rear power post.

The rear fuse block is located in the right corner of the trunk behind the trunk trim panel. The rear fuse block houses 2 relays and three fuses. The wiring is routed to an area just below the instrument panel in a six cavity connector to provide three fused ignition feeds. Three fused battery feeds in the PDC also are provided to the center stack area of the instrument panel within the same six cavity connector.

Only the police package has both fused ignition and battery circuits below the instrument panel. Special service vehicles have only the three fused battery circuits in the six cavity connector.

The remote rear power post is located in the right corner of the trunk side panel.

CAUTION: DO NOT USE THE REMOTE REAR POWER POST AS A REMOTE JUMP POST. SERIOUS DAMAGE CAN OCCUR. REFER TO LUBRICATION AND MAINTENANCE, JUMP STARTING FOR PROPER JUMP STARTING PROCEDURES.

The rear fuse block and the remote power post are serviced as part of the body harness.

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, centralized and convenient to access distribution of the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, comfort and convenience systems. At the same time, these systems were designed to provide centralized locations for conducting diagnosis of faulty circuits, and for sourcing the additional current requirements of many aftermarket vehicle accessory and convenience items.

These power distribution systems also incorporate various types of circuit control and protection features, including:

- Fuses
- Fuse cartridges
- Fusible links
- Automatic resetting circuit breakers
- Relays
- Flashers
- Timers
- Circuit splice blocks.

The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)

POWER DISTRIBUTION (Continued)

- Junction Block (JB)
- Accessory power outlet.

NOTE: DO NOT ATTEMPT TO SWAP POWER DISTRIBUTION CENTERS (PDC) FROM ONE VEHICLE TO ANOTHER. MOST OF THESE ASSEMBLIES ARE VEHICLE FEATURE SPECIFIC AND THEREFORE NOT INTERCHANGEABLE. ALWAYS USE THE CORRECT PART NUMBERED ASSEMBLY WHEN DIAGNOSING OR REPLACING A PDC.

STANDARD PROCEDURE - CIGAR LIGHTER/POWER OUTLET CUSTOMER PREFERENCE

This vehicle was delivered with the Cigar Lighter/Power Outlet activated only when the ignition is ON. To convert the lighter/outlet to operate with the ignition OFF, perform the following:

- Remove the left instrument panel end cap from the left end of the instrument panel.
- Remove fuse #6 in the upper right of the junction block (Fig. 1) from its "IGN" position.

80c070c2

Fig. 1 Cigar Lighter/Power Outlet Customer Preference Fuse Location

1 - FUSE #6

- Move the fuse slightly right and insert it in the fuse #6 "BAT" location in the junction block.
- Reinstall the left instrument panel end cap.

CAUTION:

• Many accessories that can be plugged in draw power from the vehicle's battery, even when not in use (i.e. cellular phones, etc.). Eventually, if plugged in long enough, the vehicle's battery will discharge sufficiently to degrade battery life and/or prevent engine starting.

• Accessories that draw higher power (i.e. coolers, vacuum cleaners, lights, etc.), will degrade the battery even more quickly. Only use these intermittently and with greater caution.

• After the use of high power draw accessories, or long periods of the vehicle not being started (with accessories still plugged in), the vehicle must be driven a sufficient length of time to allow the generator to recharge the vehicle's battery.

CIGAR LIGHTER/POWER OUTLET

DESCRIPTION

The power feed to the Cigar Lighter/Power Outlet can be HOT (12v - B+) with the ignition ON, or HOT (12v - B+) with the ignition OFF.

OPERATION

To change the operating mode of the Cigar Lighter/Power Outlet, (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION - STANDARD PROCEDURE).

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Look inside and note position of the retaining bosses (Fig. 2).

80a8ea4d

Fig. 2 Cigar Lighter / Power Outlet Base Removal

- 1 - RETAINING BOSSES-ENGAGE PLIERS HERE
- 2 - PARTIALLY REMOVED
- 3 - EXTERNAL SNAP-RING PLIERS
- 4 - PULL BASE OUT-THROUGH MOUNTING RING

CIGAR LIGHTER/POWER OUTLET (Continued)

(3) Using external snap ring pliers with 90 degree tips. Insert pliers with tips against bosses and squeeze forcing bosses out of base.

(4) Pull out the base through mounting ring by gently rocking pliers. A tool can be made to do the same. Refer to (Fig. 3).

Fig. 3 Tool For Cigar Lighter / Power Outlet Removal

- 1 - 2.5MM (3/32 INS.)
 2 - WELD
 3 - 100MM (4 INS.)
 4 - 22.25 TO 22.45MM (7/8 TO 57/64 INS.)

- (5) Disconnect the base wires.
 (6) Set base aside and remove base mount ring.

INSTALLATION

- (1) Install base mount ring.
 (2) Connect the base wires.
 (3) Firmly snap base into position inside of instrument panel.
 (4) Connect the negative battery cable remote terminal to the remote battery post.

IOD FUSE

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Junction Block when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the junction block as part of the preparation procedures performed just prior to new vehicle delivery.

The left end of the instrument panel cover has a snap-fit fuse access panel that can be removed to provide service access to the fuses in the junction block. An adhesive-backed fuse layout map is secured to the instrument panel side of the access panel to ensure proper fuse identification. The IOD fuse is a 15 ampere mini blade-type fuse, located in fuse cavity # 19.

CIRCUITS INCLUDED WITH IOD FUSE

- Cluster
- Body Control Module
- Diagnostic Connector
- Map Lamps
- Glove Box Lamp
- Courtesy Lamps
- Compass Mini-Trip Computer
- Radio

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from JB fuse cavity #19 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged.

REMOVAL

The Ignition-Off Draw (IOD) fuse is disconnected from Junction Block fuse cavity # 19 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

- (1) Turn the ignition switch to the Off position.

IOD FUSE (Continued)

- (2) Remove the fuse access panel by unsnapping it from the outboard end of the instrument panel.
- (3) Grasp the outer tabs of the IOD fuse in cavity # 19 of the Junction Block between the thumb and forefinger and pull the unit firmly outward.
- (4) Install the fuse access panel by snapping it onto the outboard end of the instrument panel.

INSTALLATION

- (1) Turn the ignition switch to the Off position.
- (2) Press the IOD fuse into fuse cavity # 19 of the junction block.
- (3) Install the fuse access panel by snapping it onto the left outboard end of the instrument panel.

JUNCTION BLOCK

DESCRIPTION

Fig. 4 Junction Block Location

1 - JUNCTION BLOCK/BCM

An electrical Junction Block (JB) is located in the left endcap of the instrument panel (Fig. 4). The JB combines the functions previously provided by a separate fuseblock module and relay center. It also serves to simplify and centralize numerous electrical components, as well as to distribute electrical current to many of the accessory systems in the vehicle. It eliminates the need for numerous splice connections and serves in place of a bulkhead connector between many of the engine compartment, instrument panel, and body wire harnesses.

The JB is positioned on a mounting bracket up and under the left instrument panel. It is secured by four screws. The JB is concealed behind the left instrument panel endcap. The left instrument panel endcap is a snap-fit fuse access cover that conceals the JB fuses. The left instrument panel endcap must be removed to access components other than the fuses in the JB.

OPERATION

All of the current entering and leaving the JB does so through wire harnesses, which are connected to the JB through integral connector receptacles molded into the JB housing. The JB houses blade-type fuses, blade-type automatic resetting circuit breakers, full International Standards Organization (ISO) relays, and ISO micro-relays. Internal connection of all the JB circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The fuses, circuit breakers, relays, and are available for service replacement. The JB unit cannot be repaired and is only serviced as an assembly. If any internal circuit or the JB housing is faulty or damaged, the entire Junction Block assembly must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The Junction Block and Body Control Module (BCM) are attached to each other. After removal, they can be separated. The Junction Block/BCM assemblies are located on the driver's side of the vehicle.

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Open the front driver's door and remove left end cap.

(3) Remove two screws from lower instrument panel cover (outside end). Pull rearward on lower instrument panel cover releasing clips. Disconnect decklid release switch wiring, cable to hood release, and remove cover from vehicle.

JUNCTION BLOCK (Continued)

- (4) Remove left knee blocker.
- (5) Remove under column ducts.
- (6) Remove Junction Block/BCM four mounting screws.
- (7) Remove wire harness connectors from Junction Block/BCM.
- (8) Remove Junction Block/BCM.
- (9) Disconnect BCM wire connectors and RKE antenna connector.
- (10) Remove Junction Block/BCM from vehicle.

INSTALLATION

- (1) Install Junction Block/BCM to vehicle.
- (2) Connect BCM wire connectors and RKE antenna connector.
- (3) Install Junction Block/BCM.
- (4) Install wire harness connectors to Junction Block/BCM.
- (5) Install four mounting screws.
- (6) Install under column ducts.
- (7) Install left knee blocker.
- (8) Connect cable to hood release, decklid release switch wiring, and install two screws to lower instrument panel.
- (9) Install left end cap.
- (10) Connect the negative battery cable remote terminal to the remote battery post.

POWER DISTRIBUTION CENTER

DESCRIPTION

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Power Distribution Center (PDC) (Fig. 5). The molded plastic PDC housing is located in the left front corner of the engine compartment, just in front of the coolant reservoir bottle. The PDC housing has a molded plastic cover. The PDC cover is easily removed for service access and has a convenient fuse and relay layout label affixed to the inside surface of the cover to ensure proper component identification. The PDC housing is secured in the engine compartment by one screw to the rear of the PDC and two clips on the front side. A small molded plastic protective cover on the front right side of the engine compartment is unsnapped to access the battery/generator cable input connection studs.

OPERATION

All of the PDC outputs are through the integral engine compartment wire harness, which exits from the front of the PDC housing.

All of the current from the battery/generator cable connection enters the PDC that is secured with nuts

Fig. 5 Power Distribution Center Location

- 1 - POWER DISTRIBUTION CENTER
- 2 - LEFT FRONT FENDER
- 3 - LEFT FRONT HEADLAMP

just inside the left end of the PDC housing. The PDC houses up to fourteen maxi-fuse cartridges, which replace all in-line fusible links. The PDC also houses up to six blade-type fuses, up to four full International Standards Organization (ISO) relays, and up to seven ISO micro-relays. Internal connection of all the PDC circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The fusible link, fuse cartridges, fuses and relays are available for service replacement. The PDC unit cannot be repaired and is only serviced as a unit with the engine compartment wire harness. If the PDC is faulty or damaged, the engine compartment wire harness assembly must be replaced.

REMOVAL

The Power Distribution Center (PDC) is serviced as a unit with the engine compartment wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and engine compartment wire harness unit must be replaced.

- (1) Disconnect and isolate the battery negative remote cable.

- (2) Disconnect each of the engine compartment wire harness connectors. (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS

POWER DISTRIBUTION CENTER (Continued)

AND TESTING) for more information on the locations of the affected connectors.

(3) Remove the fasteners that secure each of the engine compartment wire harness ground eyelets to the vehicle body and chassis components. (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING) for more information on the ground eyelet locations.

(4) Disengage each of the retainers that secure the engine compartment wire harness to the vehicle body and chassis components. (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING) for more information on the retainer locations.

(5) Remove one PDC mounting screw and disengage the PDC housing by pushing the locking tabs in on the PDC base. The mounting bracket blades are retained by a snap fit in the PDC mounting slots.

(6) Remove the PDC and the engine compartment wire harness from the engine compartment as a unit.

INSTALLATION

The Power Distribution Center (PDC) is serviced as a unit with the engine compartment wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and engine compartment wire harness unit must be replaced.

NOTE: If the power distribution center (PDC) is being replaced with a new unit, be certain to transfer each of the fuses, fuse cartridges, fusible links and relays from the old power distribution center to the proper cavities of the new power distribution center. Refer to Electrical, Wiring Diagram Informa-

tion for the proper power distribution center cavity assignments.

(1) Position the PDC over the mounting bracket in the engine compartment.

(2) Align the PDC mounting slots with the blades on the PDC mounting bracket.

(3) Push down firmly and evenly on the PDC housing until it snaps into place on the PDC mounting bracket.

(4) Route the engine compartment wire harness from the PDC through the engine compartment, engaging each of the harness retainers to the mounting provisions in the vehicle body and chassis components. Make sure to make clip attachment into the rail located behind the PDC. (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING) for more information on the harness routing and retainer locations.

(5) Install and tighten the fasteners that secure each of the engine compartment wire harness ground eyelets to the vehicle body and chassis components. (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING) for more information on the ground eyelet locations.

(6) Reconnect each of the engine compartment wire harness connectors. (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING) for more information on the locations of the affected connectors.

(7) Torque nut retaining positive battery cable at PDC to 96 - 141 N·m (85 - 130 in. lbs.).

(8) Reconnect the battery negative remote cable.

ENGINE 3.5L

DESCRIPTION

The 3.5 Liter (214 Cubic Inches) 60 degree V-6 engines is a single overhead camshaft design with hydraulic lifters and four valves per cylinder (Fig. 1). The engine does not have provisions for a free wheeling valve train.

The cylinders are numbered from front to rear, with the right bank odd numbered, and the left bank even numbered (Fig. 2). The firing order is 1-2-3-4-5-6.

The engine identification number is located on the rear of engine block just below the cylinder head (Fig. 3).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Hydraulic Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE 3.5L (Continued)

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES	<ol style="list-style-type: none"> 1. High or low oil level in crankcase. 2. Thin or diluted oil. 3. Thick oil 4. Low oil pressure. 5. Dirt in tappets/lash adjusters. 6. Worn rocker arms. 7. Worn tappets/lash adjusters. 8. Worn valve guides. 9. Excessive runout of valve seats on valve faces. 10. Missing adjuster pivot. 	<ol style="list-style-type: none"> 1. Check and correct engine oil level. 2. Change oil to correct viscosity. 3. (a.) Change oil and filter. (b.) Run engine to operating temperature. (c.) Change oil and filter again. 4. Check and correct engine oil level. 5. Replace rocker arm/hydraulic lash adjuster assembly. 6. Inspect oil supply to rocker arms. 7. Install new rocker arm/hydraulic lash adjuster assembly. 8. Ream guides and install new valves with oversize stems. 9. Grind valve seats and valves. 10. Replace rocker arm/hydraulic lash adjuster assembly.
CONNECTING ROD NOISE	<ol style="list-style-type: none"> 1. Insufficient oil supply. 2. Low oil pressure. 3. Thick / Thin or diluted oil. 4. Excessive bearing clearance. 5. ENGINE LOSS OF POWER	<ol style="list-style-type: none"> 1. Dirty or incorrectly gapped plugs. 2. Contamination in fuel system. 3. Faulty fuel pump. 4. Incorrect valve timing. 5. Leaking cylinder head gasket. 6. Low compression. 7. Burned, warped, or pitted valves. 8. Plugged or restricted exhaust system. 9. Faulty coil(s). 	<ol style="list-style-type: none"> 1. Set gap as needed or replace plug(s). 2. Clean system and replace fuel filter. 3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information) 4. Correct valve timing as needed. 5. Replace cylinder head gasket. 6. Test compression of each cylinder. 7. Replace valves. 8. Check exhaust system restriction. Replace parts, as necessary. 9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	<ol style="list-style-type: none"> 1. Dirty or incorrectly gapped spark plugs. 2. Contamination in Fuel System. 3. Burned, warped, or pitted valves. 4. Faulty coil(s). 	<ol style="list-style-type: none"> 1. Set gap as needed or replace plug(s). 2. Clean fuel system and replace fuel filter. 3. Replace valves. 4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	<ol style="list-style-type: none"> 1. Dirty or incorrect spark plug gap. 2. Faulty coil(s). 3. Dirty fuel injector(s). 4. Contamination in fuel system. 	<ol style="list-style-type: none"> 1. Set gap as needed or replace plug(s). 2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information) Test and replace as necessary. (Refer to Appropriate Diagnostic Information) 4. Clean system and replace fuel filter.

ENGINE 3.5L (Continued)

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

- (1) Check engine oil level and add oil if necessary.
- (2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.
- (3) Disconnect and remove all ignition coils from spark plugs.
- (4) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
- (5) Be sure throttle blade is fully open during the compression check.
- (6) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
- (7) Crank engine until maximum pressure is reached on gage. Record this pressure as #1 cylinder pressure.
- (8) Repeat the previous step for all remaining cylinders.
- (9) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
- (10) If one or more cylinders have abnormally low compression pressures, repeat the compression test.
- (11) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).

- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

STANDARD PROCEDURE**STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS**

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a

ENGINE 3.5L (Continued)

specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed-plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant

may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 4)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 4)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 4)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

STANDARD PROCEDURE - REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

ENGINE 3.5L (Continued)

Fig. 4 Proper Tool Usage For Surface Preparation

- 1 - ABRASIVE PAD
- 2 - 3M ROLOC™ BRISTLE DISC
- 3 - PLASTIC/WOOD SCRAPER

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

STANDARD PROCEDURE - HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.

(2) Remove negative battery cable.

(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)

(7) Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

- (8) Install new spark plugs.
- (9) Drain engine oil and remove oil filter.
- (10) Install a new oil filter.
- (11) Fill engine with specified amount of approved oil.
- (12) Connect negative battery cable.
- (13) Start engine and check for any leaks.

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 5).

Fig. 5 Core Hole Plug Removal

- 1 - CYLINDER BLOCK
- 2 - REMOVE PLUG WITH PLIERS
- 3 - STRIKE HERE WITH HAMMER
- 4 - DRIFT PUNCH
- 5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

ENGINE 3.5L (Continued)

STANDARD PROCEDURE - MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(2) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 6). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.

Fig. 6 Plastigage Placed in Lower Shell—Typical

1 - PLASTIGAGE

(3) Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

(4) Install the proper crankshaft bearings to achieve the specified bearing clearances.

REMOVAL - ENGINE ASSEMBLY

(1) Release fuel pressure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect negative cable at right strut tower (Fig. 7).

Fig. 7 NEGATIVE CABLE REMOTE TERMINAL

1 - RIGHT STRUT TOWER
2 - BATTERY NEGATIVE CABLE

(3) Mark hood position at hinges and remove hood. (Refer to 23 - BODY/HOOD/HOOD - REMOVAL)

(4) Remove both wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)

(5) Remove both right and left cowl screens. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - REMOVAL)

(6) Remove strut tower brace. (Refer to 23 - BODY/EXTERIOR/FRONT STRUT TOWER TO TOWER BRACE - REMOVAL)

(7) Remove air cleaner assembly with air inlet hose (Fig. 8).

(8) Remove upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

(9) Disconnect hood release cable from hood latch.

(10) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(11) Remove radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

(12) Remove accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

ENGINE 3.5L (Continued)

**Fig. 8 AIR CLEANER WITH INLET HOSE**

- 1 - AIR CLEANER ASSEMBLY WITH AIR INLET HOSE
2 - THROTTLE BODY

- (13) Disconnect upper radiator hose at engine.
- (14) Disconnect lower radiator hose at radiator.
- (15) Disconnect engine oil and transmission cooler lines at radiator.
- (16) Remove power steering line bracket at left side of radiator.
- (17) Remove fasteners attaching air conditioning condenser to radiator.
- (18) Remove radiator. (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL)
- (19) Remove generator. (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL)
- (20) Remove power steering pump mounting bolts and set pump aside (Do not disconnect lines). (Refer to 19 - STEERING/PUMP - REMOVAL)
- (21) Remove air conditioning compressor mounting bolts and set aside (Do not disconnect lines).
- (22) Loosen and remove V-Band clamp at right exhaust manifold.
- (23) Remove front and rear support bracket fasteners attaching right side catalytic converter down pipe.
- (24) Disconnect fuel line. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)
- (25) Disconnect throttle and speed control cables from bracket. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL)
- (26) Disconnect coolant hoses at coolant recovery/pressure container.

- (27) Disconnect all vacuum hoses.
- (28) Disconnect ground straps at both cylinder heads.

CAUTION: Upper Intake manifold is a composite design. Therefore, manifold should be removed before lifting engine or damage to the manifold could occur.

- (29) Remove upper intake manifold and cover intake manifold openings with tape. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
- (30) Disconnect heater hoses.
- (31) Remove rear throttle body support bracket.
- (32) Remove fastener for water pipe at transmission to block bolt.
- (33) Remove four upper transmission to block bolts.
- (34) Disconnect all electrical connections.
- (35) Hoist vehicle.
- (36) Drain engine oil.
- (37) Remove structural collar and mark flex plate to torque converter position.
- (38) Remove bolts holding torque converter to flex plate.
- (39) Disconnect both transmission oil cooler line brackets from engine.
- (40) Loosen and remove left exhaust manifold V-Band clamp.
- (41) For starter removal, loosen the left converter exhaust pipe band clamp and exhaust pipe support bracket at transaxle.
- (42) Remove starter. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
- (43) Remove left engine mount bolts.
- (44) Remove right engine mount bolts.
- (45) Remove crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL)
- (46) Remove two lower transmission to block bolts.
- (47) Lower vehicle.
- (48) Attach lifting device to engine.
- (49) Insert floor jack with small block of wood under transmission pan to support transmission.
- (50) Hoist engine from engine compartment.

INSTALLATION - ENGINE ASSEMBLY

- (1) Attach lifting device and lower engine into engine compartment.
- (2) Align engine mounts and install fasteners but **do not tighten** until all mounting bolts have been installed.
- (3) Install transmission case to engine block tighten bolts to 102 N·m (75 ft. lbs.).
- (4) Remove engine lifting device.
- (5) Raise vehicle.

ENGINE 3.5L (Continued)

(6) Tighten engine mount fastener to 61 N·m (45 ft. lbs.).

(7) Align flex plate to torque converter and install mounting bolts. Tighten bolts to 75 N·m (55 ft. lbs.).

(8) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(9) Install starter. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(10) Install new V-Band clamp at left side exhaust manifold to catalytic converter. Tighten V-Band clamp to 11 N·m (100 in. lbs.).

(11) Install left side catalytic converter down pipe support fastener at transaxle. Tighten fastener to 47 N·m (35 ft. lbs.).

(12) Tighten the left converter down pipe band clamp.

(13) Install the transmission oil cooler lines bracket to engine.

(14) Install structural collar/cover. (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION)

(15) Lower vehicle.

(16) Connect all electrical connections.

(17) Install four upper transmission to block bolts tighten to 102 N·m (75 ft. lbs.).

(18) Install water pipe and retaining fasteners to the transaxle/cylinder block double-ended bolts.

(19) Install rear throttle body support bracket.

(20) Connect heater hoses.

(21) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(22) Connect ground straps at both cylinder heads.

(23) Connect all vacuum hoses.

(24) Connect coolant hoses at coolant recovery/pressure container.

(25) Connect throttle and speed control cables to bracket and throttle arm. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION)

(26) Connect fuel line. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)

(27) Install new V-Band clamp at right exhaust manifold. Tighten V-Band clamp to 11 N·m (100 in. lbs.).

(28) Install and tighten right side catalytic converter down pipe support bracket fastener at trans-axle mount.

(29) Install air conditioning compressor and tighten fasteners to 28 N·m (250 in. lbs.).

(30) Install power steering pump and tighten fasteners to 28 N·m (250 in. lbs.).

(31) Install generator. (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION)

(32) Install radiator. (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION)

(33) Attach air conditioning condenser to radiator.

(34) Install power steering line bracket to radiator.

(35) Connect engine oil and transmission cooler lines to radiator.

(36) Install lower radiator hose.

(37) Install upper radiator hose.

(38) Install accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) .

(39) Install radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(40) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(41) Fill engine with proper amount of oil.

(42) Connect hood release cable to hood latch and install upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(43) Install air cleaner and air inlet hose.

(44) Install strut tower brace. (Refer to 23 - BODY/EXTERIOR/FRONT STRUT TOWER TO TOWER BRACE - INSTALLATION)

(45) Install both cowl covers. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - INSTALLATION)

(46) Install both wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION)

(47) Install hood. (Refer to 23 - BODY/HOOD/HOOD - INSTALLATION)

(48) Connect negative cable.

- (2) Install new filter element (Fig. 9).
- (3) Place lid over air cleaner housing.

CYLINDER HEAD

DESCRIPTION

The aluminum alloy cylinder heads feature cross-flow type intake and exhaust ports. Valve guides and seat inserts are powdered metal. Valves are arranged in a "V", with each camshaft on center. To improve combustion speed the chambers are a compact spherical design with a squish area of approximately 30 percent of the piston top area. The cylinder heads are common to either cylinder bank by reversing the direction of installation.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

(1) Perform fuel pressure release procedure **before attempting any repairs..** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect negative cable from remote battery jumper terminal.

(3) Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(4) Remove crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(5) Remove front timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(6) Remove camshaft sprockets. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(7) Remove upper and lower intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(8) Remove V-Band clamp(s) at exhaust manifold to catalytic converter pipe connection.

NOTE: Do not reuse V-Band Clamp.

(9) Remove rear timing belt cover to cylinder head fasteners (Fig. 10). Remove the rear covers.

(10) The right side rear timing belt cover has O-rings to seal the water pump passages to cylinder block (Fig. 11). Do not reuse O-rings.

(11) Remove cylinder head bolts in REVERSE of tightening sequence (Fig. 15).

(12) Remove cylinder head(s).

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE).

Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

(1) Before cleaning, check for leaks, damage and cracks.

(2) Clean cylinder head and oil passages.

(3) Check cylinder head for flatness (Fig. 12).

(4) Cylinder head must be flat within:

- Standard dimension = less than 0.05 mm (0.002 inch.)
- Service Limit = 0.2 mm (0.008 inch.)
- Grinding Limit = Maximum of 0.2 mm (0.008 inch.) is permitted.

CAUTION: 0.20 mm (0.008 in.) MAX is a combined total dimension of the stock removal limit from cylinder head and block top surface (Deck) together.

9309-140

Fig. 12 Checking Cylinder Head Flatness**INSTALLATION**

The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced (Fig. 13).

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced.

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

(1) Clean sealing surfaces of cylinder head and block.

CYLINDER HEAD (Continued)

Fig. 13 Checking Bolts for Stretching (Necking)

- 1 - STRETCHED BOLT
- 2 - THREADS ARE NOT STRAIGHT ON LINE
- 3 - THREADS ARE STRAIGHT ON LINE
- 4 - UNSTRETCHED BOLT

Fig. 14 Cylinder Head Gasket Identification

CAUTION: Ensure that the correct head gaskets are used and are oriented correctly on cylinder block. The 3.5L engine head gaskets have perfectly round combustion sealing rings. The 3.2L engine does NOT have perfectly round combustion sealing rings.

(2) Install head gasket over locating dowels. Ensure the gasket is installed on the correct side of engine (Fig. 14).

(3) Install cylinder head over locating dowels.

(4) Before installing the bolts, lubricate the threads with engine oil.

(5) Tighten the cylinder head bolts in the sequence shown in (Fig. 15). Using the 4 step torque-turn method, tighten according to the following torque values:

- Step 1: All to 61 N·m (45 ft. lbs.)
- Step 2: All to 88 N·m (65 ft. lbs.)
- Step 3: All (again) to 88 N·m (65 ft. lbs.)
- Step 4: + 90° Turn **Do not use a torque wrench for this step.**

(6) Bolt torque after 90° turn should be over 122 N·m (90 ft. lbs.) in the tightening direction. If not, replace the bolt.

Fig. 15 Cylinder Head Bolt Tightening Sequence

(7) Clean right rear timing belt cover O-ring sealing surfaces and grooves (Fig. 11). Lubricate new O-rings with Mopar® Dielectric Grease or equivalent to facilitate assembly.

(8) Install rear timing belt covers (Fig. 10) and (Fig. 11). Tighten bolts to specified torque:

- M10—54 N·m (40 ft. lbs.)
- M8—28 N·m (20 ft. lbs.)
- M6—12 N·m (105 in. lbs.)

(9) Install camshaft sprockets and timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(10) Install front timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(11) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

(12) Install upper and lower intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(13) Connect catalytic converter to exhaust manifold using a new V-band clamp(s). Tighten clamp to 10 N·m (100 in. lbs.).

(14) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

(15) Connect negative cable to remote jumper terminal

CAMSHAFT OIL SEAL(S)

REMOVAL

(1) Remove camshaft sprocket(s). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(2) Use Special Tool C-3981B to remove camshaft oil seal (Fig. 16).

Fig. 16 Camshaft Oil Seal - Removal

1 - SPECIAL TOOL C-3981B

INSTALLATION

(1) Apply light coat of engine oil to the camshaft oil seal lip.

(2) Install the oil seal using Special Tool 6788 Seal Protector Sleeve (Fig. 17) and Seal Installer 6052 (Fig. 18).

(3) Install camshaft sprocket(s). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

CAMSHAFT(S)

DESCRIPTION

A single overhead camshaft per cylinder head provides valve actuation. The left camshaft accommodates a cam sensor pick-up wheel and is therefore longer. Each camshaft is supported by four bearing journals. Thrust for each camshaft is taken at a thrust plate attached to the rear of each cylinder head. Right and left camshaft driving sprockets are not interchangeable because of the cam sensor pick-up wheel on the left sprocket. Camshaft bearing lubrication is provided via oil feed passage through each rocker shaft pedestal dowel.

Fig. 17 Camshaft Oil Seal Protector Sleeve

1 - SPECIAL TOOL 6788

Fig. 18 Camshaft Oil Seal - Installation

1 - SPECIAL TOOL 6052

OPERATION

The camshaft is driven by the crankshaft via drive sprockets and belt. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE - MEASURING CAMSHAFT END PLAY

(1) Oil camshaft journals and install camshaft **WITHOUT** rocker arms. Install rear cam caps and tighten screws to specified torque.

(2) Using a suitable tool, move camshaft as far rearward as it will go.

(3) Zero dial indicator (Fig. 19).

(4) Move camshaft as far forward as it will go.

(5) Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).

CAMSHAFT(S) (Continued)

(6) If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

9509-115

Fig. 19 Camshaft End Play - Typical

REMOVAL

Camshafts are removed from the rear of each cylinder head. The cylinder head must be removed.

(1) Remove camshaft sprocket(s). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(2) Remove cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)

(3) Mark the rocker arm and shaft assembly before removal. Remove the rocker arm and shaft assembly from the head. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL)

(4) Remove the rear camshaft cover and O-ring from head.

CAUTION: Be careful not to nick or scratch the journals when removing the camshaft.

(5) Carefully remove the camshaft from the rear of the cylinder head (Fig. 20).

CLEANING

Clean camshaft with a suitable solvent.

INSPECTION

(1) Inspect camshaft bearing journals for damage and binding (Fig. 21). If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

(2) Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

80b171f4

Fig. 20 Cylinder Head, Camshaft, and Rocker Arms

- 1 - SPARK PLUG TUBE
- 2 - ROCKER ARM ASSEMBLY
- 3 - CAMSHAFT
- 4 - SEAL

(3) Measure the lobe actual wear (Fig. 21) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

80b574d7

Fig. 21 Camshaft Inspection

- 1 - ACTUAL WEAR
- 2 - LEFT CAMSHAFT
- 3 - RIGHT CAMSHAFT
- 4 - BEARING JOURNAL
- 5 - LOBE

INSTALLATION

(1) Lubricate camshaft bearing journals and camshaft lobes with clean engine oil and install camshaft into cylinder head (Fig. 20).

CAMSHAFT(S) (Continued)

(2) Install cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)

(3) Install the rocker arm assembly. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION)

(4) Install camshaft sprockets and timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

CYLINDER HEAD COVER(S)

REMOVAL

WARNING: DO NOT START OR RUN ENGINE WITH CYLINDER HEAD COVER REMOVED FROM THE ENGINE. DAMAGE OR PERSONAL INJURY MAY OCCUR.

- (1) Remove air cleaner assembly.
- (2) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
- (3) Cover lower intake manifold with a suitable cover during service.
- (4) Disconnect electrical connectors and remove ignition coils (Fig. 23).
- (5) Remove nuts attaching wire harness to cylinder head cover (Fig. 22). Move harness for cover removal clearance.

Fig. 22 WIRE HARNESS RETAINING NUTS

- 1 - NUTS
2 - WIRE HARNESS

(6) For right cylinder head cover removal perform the following:

- (a) Remove A/C compressor belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
- (b) Remove A/C compressor mounting bolts.
- (c) Move compressor aside for cylinder head cover clearance.

(7) Remove cylinder head cover bolts and remove cover (Fig. 24).

2 - BOLTS (8)

INSTALLATION

(1) Clean cylinder head and cover mating surfaces. Inspect and replace gasket and seals as necessary (Fig. 25).

(2) To replace spark plug tube seals:

(a) Using a suitable pry tool, carefully remove tube seals.

(b) Position new seal with the part number on seal facing cylinder head cover.

(c) Install seals using Special Tool MD-998306 (Fig. 26).

(3) Install cylinder head cover bolts and tighten to 12 N·m (105 in. lbs.) (Fig. 24).

CYLINDER HEAD COVER(S) (Continued)

2 - SPARK PLUG TUBE SEALS

80be46e8

Fig. 26 Spark Plug Tube Seal Installation

- 1 - SPECIAL TOOL MD-998306
2 - SPARK PLUG TUBE SEAL

(4) For right cylinder head cover installation perform the following:

- (a) Position A/C compressor on bracket and install mounting bolts.
- (b) Install A/C compressor belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
- (5) Position wire harness on cylinder head cover and install retaining nuts (Fig. 22).
- (6) Install ignition coils and connect all electrical connectors (Fig. 23).
- (7) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
- (8) Install air cleaner assembly.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

Valves are made of highly heat-resistant steel and are chrome plated to prevent stem scuffing. The intake valve is a one-piece forging, while the exhaust valve has a forged head with a welded stem for lock groove hardenability. The four valves (two intake and two exhaust) employ a three-groove lock design to help facilitate valve rotation.

STANDARD PROCEDURE - VALVE AND VALVE SEAT REFACING

The valve face and valve seat angles are shown in (Fig. 28).

VALVES

9309-144

Fig. 27 Intake and Exhaust Valves

- 1 - MARGIN
2 - FACE
3 - STEM
4 - VALVE SPRING RETAINER LOCK GROOVES

(1) Inspect the remaining margin after the valves are refaced (Fig. 27). (Refer to 9 - ENGINE - SPECIFICATIONS)

VALVE SEATS

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using dial indicator. Total runout should not exceed 0.051 mm (0.002 inch.) total indicator reading.

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 28 Valve Face and Seat**

- 1 - SEAT WIDTH
- 2 - FACE ANGLE
- 3 - SEAT ANGLE
- 4 - SEAT CONTACT AREA

(3) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to top edge of valve face, then lower valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of valve face, then raise valve seat with a 65 degree stone.

NOTE: Valve seats which are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise cylinder head must be replaced.

(4) When seat is properly positioned the width of the intake seats should be 0.75 to 1.25 mm (0.0296 to 0.0493 in.) and exhaust seats should be 1.25 to 1.75 mm (0.049 to 0.069 in.) (Fig. 28).

VALVE AND SPRING INSTALLED HEIGHT

(1) Coat valve stems with clean engine oil and insert them in cylinder head.

(2) If valves or seats have been refaced, check valve tip height (A) (Fig. 29). If valve tip height is greater than 43.65 mm (1.7185 in.) intake or 45.98 mm (1.8102 in.) exhaust, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.

(3) Install valve seal/spring seat assembly over valve guides on all valve stems (Fig. 31). Ensure that the garter spring is intact around the top of the rubber seal.

(4) Place valve spring (color-coded end facing up (Fig. 30)) and valve retainer into position on spring seat (Fig. 31).

(5) Compress valve springs with valve spring compressor C-3422-D and adapter 6526 (Refer to 9 - ENGINE - SPECIAL TOOLS), install locks and release tool.

80570e02

Fig. 29 Checking Valve Tip Height and Valve Spring Installed Height

- 1 - SPRING RETAINER
- 2 - GARTER SPRING
- 3 - VALVE SPRING SEAT TOP
- 4 - CYLINDER HEAD SURFACE

(6) If valves and/or seats are refaced, measure the installed height of springs (B) (Fig. 29). Measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

80be4660

Fig. 30 Valve Spring Identification

- 1 - YELLOW DYE
- 2 - ORANGE DYE

REMOVAL

(1) Remove valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - REMOVAL)

(2) Before removing valve, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves to insure installation in original location.

(3) Remove valve(s) from cylinder head.

INTAKE/EXHAUST VALVES & SEATS (Continued)

9309-150

Fig. 31 Valve Seal and Spring - Installation

- 1 - VALVE
- 2 - VALVE RETAINING LOCKS
- 3 - VALVE SPRING RETAINER
- 4 - VALVE SPRING
- 5 - VALVE SEAL AND VALVE SPRING SEAT ASSEMBLY

CLEANING

(1) Clean all valves thoroughly and discard burned, warped and cracked valves.

INSPECTION**INSPECTION - VALVES**

(1) Measure valve stems for wear (Fig. 32) approximately 60 mm (2.36 in.) below the valve lock grooves.

(2) Compare measurement to specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: Valve stems are chrome plated and should not be polished (Fig. 32).

INSPECTION - VALVE GUIDES

(1) Measure valve stem-to-guide clearance as follows:

(2) Install valve into cylinder head so it is 15 mm (0.590 inch.) off the valve seat. A small piece of hose may be used to hold valve in place.

(3) Attach dial indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 33).

(4) Move valve to and from the indicator.

(5) Note dial indicator reading and compare to engine specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

9309-144

Fig. 32 Intake and Exhaust Valves

- 1 - MARGIN
- 2 - FACE
- 3 - STEM
- 4 - VALVE SPRING RETAINER LOCK GROOVES

NOTE: Replace cylinder head if stem-to-guide clearance exceeds specifications, or if guide is loose in cylinder head.

**Fig. 33 Measuring Valve Guide Wear****INSTALLATION**

(1) Coat valve stems with clean engine oil and insert them in cylinder head.

(2) If valves or seats have been reground, check valve tip height (A) (Fig. 34). If valve tip height is greater than 43.65 mm (1.7185 in.) intake or 45.98 mm (1.8102 in.) exhaust, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.

(3) Install valve stem seals and valve springs. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - INSTALLATION) (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

ROCKER ARM / ADJUSTER ASSEMBLY

DESCRIPTION

DESCRIPTION - ROCKER ARM

Rocker arms are made of light weight permanent mold aluminum alloy with a roller type follower operating against the camshaft (Fig. 35). The valve actuating end of the rocker arms are machined to retain hydraulic lash adjusters, eliminating the need for manual valve lash adjustment.

DESCRIPTION - ROCKER ARM SHAFTS

The rocker arm shafts (Fig. 36) are tubular steel and are supported by several forged aluminum alloy pedestals, which are fastened to the cylinder head. Four shafts are used, one for each intake and exhaust rocker arm bank on each cylinder head. The shafts are hollow to provide a duct for lubricating oil flow from the cylinder head to the valve mechanisms. One hollow dowel per pedestal is used to locate the pedestal to the cylinder head, orient the exhaust rocker shaft, and serve as a cam bearing oil feed passage.

HYDRAULIC LASH ADJUSTER:

Fig. 35 Rocker Arm Assembly

- 1 - RETAINER
- 2 - SWIVEL PAD
- 3 - ROLLER

80ae845c

Fig. 36 Rocker Arms and Shafts

DIAGNOSIS AND TESTING

LASH ADJUSTER (TAPPET) NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of a NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to the following chart indicating possible lash adjuster (tappet) noise sources and possible sources that could lead to a misdiagnosis.

Refer to Lash Adjuster (Tappet) Noise Chart for Possible Causes and Correction of a lash adjuster (tappet) type noise.

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

POSSIBLE NOISE SOURCES	POSSIBLE NOISE MISDIAGNOSIS SOURCES
Spongy/soft/aerated lash adjusters. Missing lash adjuster swivel contact pads. Intake rocker-to-camshaft bearing journal contact. Rocker arm bind-up. Intake rocker arm-to-spark plug tube contact. Excessive cam end play. Broken valve spring. Broken/loose camshaft sprocket bolt. Incomplete cam lobe machining. Cracked lash adjuster cartridge body.	SRV valve axle chatter. Exhaust rocker arm-to-cylinder head cover contact. Piston pin bore fit. Timing drive hydraulic tensioner tick. Accessory drive belt deterioration. Piston-to-bore clearance knock. Crankshaft bearing noise.

LASH ADJUSTER (TAPPET) NOISE CHART

POSSIBLE CAUSES	CORRECTION
1. Engine oil level—too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct engine oil level.
2. Insufficient running time after rebuilding cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in lash adjuster (after 1 hour run time).	3. See below: (a) Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) Before proceeding, perform Lash Adjuster Bleeding procedure. (c) If lash adjuster(s) are still spongy, replace with new adjuster/rocker arm assembly*.
4. Low oil pressure	4. See below: (a) Check and correct engine oil level. (b) Check engine oil pressure. (c) Check for excessive bearing clearance and correct. (d) Check for worn oil pump.
5. Oil passage to cylinder head(s) plugged with debris.	5. Check cylinder head oil passages and cylinder head gasket restrictor for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Ream guide(s) and replace valve(s) with oversize valves and seal(s).
7. Air injected into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary.
8. Collapsed lash adjuster due to debris injection.	8. Clean debris from engine and replace lash adjuster/rocker assembly*.
9. Intake rocker arm roller clevis ear(s) contacting camshaft bearing journal(s) on side.	9. Inspect camshaft end play and all valve train components for wear. Replace as necessary.
*Lash adjusters are serviced with the rocker arms—do not disassemble.	

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

STANDARD PROCEDURE - HYDRAULIC LASH ADJUSTER BLEEDING

Use this procedure to manually bleed aerated oil from the lash adjuster and remove sponginess.

(1) Run the engine, bringing it to operating temperature in order to freshly pressurize and warm the valvetrain system oil supply.

(2) Remove cylinder head cover(s).

(3) Ensure the rocker arm is positioned on the base circle of the cam (Fig. 37). Rotate engine as necessary.

(4) For intake rocker arm positions:

(a) Adjust Special Tool 8351 Release Probe's gauge pin to extend approximately 20 mm (0.787 in.). Then, carefully insert the release probe gauge pin into the lash adjuster service access hole (Fig. 38).

CAUTION: If probe tip breaks off within the lash adjuster, replace the affected rocker arm.

(b) Gently unseat lash adjuster's internal check ball.

(c) While the internal check ball is held unseated, press the rocker arm into the valve tip, allowing the lash adjuster to fully collapse. Hold this fully collapsed position for about one second, or longer.

(d) Slowly release the rocker arm, thereby allowing the lash adjuster to extend, which in turn refills the high pressure chamber with non-aerated oil.

(e) Remove probe to allow check ball to seat.

(f) Recheck for sponginess. If the lash adjuster sponginess is not completely or nearly eliminated, then repeat procedure.

(g) If the spongy condition cannot be removed, replace effected rocker arm(s).

(5) For exhaust rocker arm positions:

(a) Adjust Special Tool 8351 Release Probe gauge pin to extend approximately 20 mm (0.787 in.). Then, using two release probes, carefully insert gauge pins into the lash adjuster service access holes (Fig. 38).

CAUTION: If probe tip breaks off within the lash adjuster, replace the affected rocker arm.

(b) Gently unseat BOTH lash adjuster's internal check ball at the same time.

(c) While the internal check ball is held unseated, press the rocker arm into the valve tip, allowing the lash adjuster to fully collapse. Hold this fully collapsed position for about one second, or longer.

(d) Slowly release the rocker arm, thereby allowing the lash adjuster to extend, which in turn refills the high pressure chamber with non-aerated oil.

(e) Remove probes to allow check balls to seat.

(f) Recheck for sponginess. If the lash adjuster sponginess is not completely or nearly eliminated, then repeat procedure.

(g) If the spongy condition cannot be removed, replace effected rocker arm(s).

(6) Install cylinder head cover(s).

80b8983b

Fig. 37 Rocker Arm Positioned On Base Circle Of Camshaft

1 - CAMSHAFT BASE CIRCLE
2 - HIGH-PRESSURE CHAMBER

REMOVAL

CAUTION: The rocker arm shafts are hollow and are used as lubrication oil passages. The rocker arm and shaft assembly on the RIGHT side of the engine has an oil passage hole from the cylinder head to the third rocker shaft support. The rocker arm shaft assembly on the LEFT side of the engine has an oil passage hole from the cylinder head to the second rocker shaft support.

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

**Fig. 38 Purging Air From Lash Adjuster**

- 2 - OIL AIR RELIEF SERVICE ACCESS HOLE
- 3 - ROCKER ARM ASSY
- 4 - INTERNAL CHECK BALL
- 5 - VALVE TIP
- 6 - HYDRAULIC LASH ADJUSTER WITHIN ROCKER ARM

(1) Remove cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(2) Identify the rocker arm assembly and rocker arms before disassembly (Fig. 39).

(3) Remove rocker arm assembly bolts.

(4) Remove rocker arm assembly.

NOTE: To prevent air ingestion into lash adjusters, avoid turning rocker arm assembly upside down.

CAUTION: Do not allow rocker arm assembly to rest on lash adjusters, as damage may occur to lash adjusters and/or plastic retainers.

**Fig. 39 Rocker Arms and Shafts****DISASSEMBLY**

(1) Remove rocker arm and shafts. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL)

(2) Remove dowel pin using a 4 mm screw, nut, spacer, and washer installed into the pin (Fig. 40). Thread the screw into the pin, then loosen the nut on the screw. This will pull the dowel out of the shaft support. Do not reuse dowel pins. Remove the rocker arms and pedestals in order.

**Fig. 40 Rocker Arms and Shaft - Disassembly**

- 1 - 4mm SCREW AND NUT
- 2 - 4mm SCREW AND NUT
- 3 - WASHER
- 4 - SPACER
- 5 - DOWEL
- 6 - DOWEL
- 7 - SPACER
- 8 - WASHER

(3) Check the rocker arm mounting portion of the shafts for wear or damage. Replace if damaged or heavily worn.

(4) Check shaft oil holes for clogging with small wire, clean as required.

INSPECTION

The rocker arm shafts are hollow and are used as lubrication oil ducts. The rocker arm and shaft assembly on the **right** side of the engine has an oil passage hole from the cylinder head located at the third rocker shaft support pedestal. The rocker arm and shaft assembly on the **left** side of the engine has an oil passage hole from the cylinder head located at the second rocker shaft support pedestal.

NOTE: To prevent air ingestion into lash adjusters, avoid turning rocker arm assembly upside down.

CAUTION: Do not allow rocker arm assembly to rest on lash adjusters, as damage may occur to lash adjuster and plastic retainer.

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

Fig. 41 Rocker Arms and Shafts

The intake and exhaust rocker arms are different. They should be identified before disassembling the assembly (Fig. 41).

Check rocker arms for wear or damage (Fig. 42):

- Roller scuffing or wear
- Shaft bore scuffing or wear
- Swivel pad on lash adjuster missing or broken
- Rocker arm showing signs of fatigue or cracking
- Roller axle protruding from arm

Replace assembly as necessary if any rocker arms shows signs of wear.

CAUTION: Do Not remove lash adjuster from rocker arm assembly. Damage to the adjuster and rocker arm will result.

Fig. 42 Rocker Arm Assembly

- 1 - RETAINER
- 2 - SWIVEL PAD
- 3 - ROLLER

ASSEMBLY

CAUTION: New dowel pins must be installed when reassembling.

(1) Install the rocker arms, and pedestals onto the shaft.

(2) Install dowel pins (Fig. 43). Dowel pins pass through the pedestal into the exhaust rocker shafts. Dowel pins should be pressed in until they bottom-out against the rocker shaft in the pedestal.

Fig. 43 Assemble Rocker Arms and Shaft

- 1 - HYDRAULIC LASH ADJUSTERS
- 2 - DOWEL PIN
- 3 - PEDESTAL
- 4 - ROLLER

(3) Install rocker arm and shafts. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION)

INSTALLATION

NOTE: Rocker arm and shaft assembly can be installed either prior to or after (preferred) cylinder head installation.

(1) Rotate camshafts to the position shown in (Fig. 44). With the camshafts in these positions the lobes are in a neutral position (no load to the valve). This will allow the rocker arm shaft assembly to be tightened into position with little or no valve spring load on it.

(2) Install the rocker arm and shaft assembly making sure that the identification marks face toward the front of engine for left head and toward the rear of the engine for right head.

(3) Tighten rocker arm/shaft assembly bolts in sequence to 31 N·m (275 in. lbs.) (Fig. 45).

(4) Install cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

**Fig. 44 Camshaft Sprockets Neutral Position****Fig. 45 Rocker Arm and Shaft Assembly Tightening Sequence**

SPARK PLUG TUBE

REMOVAL

- (1) Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
- (2) Using suitable locking pliers, remove the tube from the cylinder head (Fig. 46) and discard tube.
- (3) Clean area around spark plug with Mopar® Parts Cleaner or equivalent.

INSTALLATION

- (1) Apply Mopar® Stud and Bearing Mount to a new tube approximately 1 mm (0.039 in.) from the end of tube, in a 3 mm (0.118 in.) wide area.
- (2) Install sealer end of tube into the cylinder head. Then carefully install the tube using a hardwood block and mallet. Install the tube until it is seated into the bottom of the bore.
- (3) For spark plug tube seal replacement, (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

**Fig. 46 Servicing Spark Plug Tubes**

- 1 - SPARK PLUG TUBE
- 2 - LOCKING PLIERS

- (4) Install cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

VALVE STEM SEALS

REMOVAL

- (1) Remove valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - REMOVAL)
- (2) Remove valve stem seals by using a valve stem seal tool (Fig. 47).

**Fig. 47 Valve Stem Seal - Removal**

- 1 - VALVE SEAL TOOL
- 2 - VALVE STEM

INSTALLATION

- (1) The valve stem seal/valve spring seat should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide. When installing the valve retainer locks, compress the spring **only enough** to install the locks.

VALVE STEM SEALS (Continued)

CAUTION: Do not remove garter spring around the seal at the top of the valve stem seal (Fig. 48).

(2) Install valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

80570e02

Fig. 48 Checking Valve Tip Height and Valve Spring Installed Height

- 1 - SPRING RETAINER
- 2 - GARTER SPRING
- 3 - VALVE SPRING SEAT TOP
- 4 - CYLINDER HEAD SURFACE

VALVE SPRINGS

DESCRIPTION

The valve springs are made from chrome silicon alloy wire and incorporate a "bee-hive" design. Valve spring retainers and locks are common from valve-to-valve. The valve spring seat is integral with the valve stem oil seal, which incorporates a garter spring to maintain consistent lubrication control to the valve stem.

The valve springs are unique for intake compared to exhaust. Both have different lengths and are wound in opposite directions. The valve springs are color coded, intake spring is right hand coil direction with orange dye on the top coils, and the exhaust spring is left hand coil direction with a yellow dye on the top coils (Fig. 49).

REMOVAL

REMOVAL - CYLINDER HEAD OFF

(1) Using Special Tool C-3422-D (valve spring compressor) with Adapter 6526 compress valve spring and remove valve retaining locks. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

80be4660

Fig. 49 Valve Spring Identification

- 1 - YELLOW DYE
- 2 - ORANGE DYE

(2) Slowly release valve spring compressor. Remove valve spring retainer and valve spring.

(3) Remove valve stem seal assembly (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL).

REMOVAL - CYLINDER HEAD ON

(1) Perform fuel system pressure release procedure **before attempting any repairs**. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect negative cable from battery.

(3) Remove air cleaner housing and hose assembly.

(4) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(5) Remove cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(6) Remove rocker arm and shaft assembly. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL)

(7) Remove spark plugs. (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL)

(8) Rotate the crankshaft clockwise, until the number 1 piston is at TDC (Top Dead Center) on the compression stroke.

(9) With air hose attached to spark plug adapter installed in number 1 spark plug hole, apply 620.5 to 689 kPa (90 to 100 psi) air pressure. This is to hold valves into place while servicing components.

(10) Using Tool MD 998772A with adapter 6527 or equivalent, compress valve spring and remove valve locks, retainer, and valve spring.

(11) Remove valve stem seal, if required. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL)

(12) Follow the same procedure on the remaining 5 cylinders using the firing sequence 1-2-3-4-5-6. **Make**

VALVE SPRINGS (Continued)

sure piston is at TDC in each cylinder of the valve spring that is being removed.

(13) Remove spark plug adapter tool.

INSPECTION

When valves have been removed for inspection, reconditioning or replacement, valve springs should be tested (Fig. 50). **As an example;** the compression length of the spring to be tested is 38.00 mm (1.496 in.). Turn table of Tool C-647 until surface is in line with the 38.00 mm (1.496 inches.) mark on the threaded stud and the zero mark on the front. Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain specified height and allowable tensions (Refer to 9 - ENGINE - SPECIFICATIONS). Replace springs that do not meet specifications.

Fig. 50 Testing Valve Spring

1 - SPECIAL TOOL C-647

INSTALLATION

INSTALLATION - CYLINDER HEAD OFF

- (1) Install valves if removed.
- (2) Install valve stem seal/spring seat assembly over valve guides on all valve stems (Fig. 52). Ensure that the garter spring is intact around the top of the rubber seal.
- (3) Place valve spring (color-coded end facing up) and valve retainer into position.
- (4) Compress valve spring with valve spring compressor. Install locks and release tool. **If valves and/or seats are reground, measure the installed height of springs (B) (Fig. 51), make sure measurements are taken from top of**

spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

80570e02

VALVE SPRINGS (Continued)

INSTALLATION - CYLINDER HEAD ON

(1) Compress valve spring using Special Tool MD 998772A with Adaptor 6527 only enough to install retainer and locks.

(2) After installing locks, release tension on valve spring and verify proper installation.

(3) Remove Special Tool MD 998772A.

(4) Install rocker arm and shaft assembly. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION)

(5) Install cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

(6) Install spark plugs. (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - INSTALLATION)

(7) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(8) Connect negative cable.

ENGINE BLOCK

DESCRIPTION

The cylinder block (Fig. 53) is made of heat treated aluminum with cast-in-place iron liners. The block is a closed deck design with the right bank forward. To provide high rigidity and improved NVH, the block has cast-in contours and ribs, along with powdered metal 6 bolt main caps (4 vertical, 2 horizontal), with a die cast aluminum structural beam windage tray mounted to the main caps.

STANDARD PROCEDURE - CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

80bdbd82

Fig. 53 ENGINE BLOCK AND CRANKSHAFT

- 1 - MAIN CAP BOLT - VERTICAL
- 2 - MAIN CAP
- 3 - MAIN BEARING - LOWER
- 4 - MAIN BEARING - UPPER

- 5 - CYLINDER BLOCK
- 6 - MAIN CAP BOLT - HORIZONTAL
- 7 - CRANKSHAFT THRUST WASHER
- 8 - CRANKSHAFT

ENGINE BLOCK (Continued)

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40–60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 54).

808a6311

Fig. 54 Cylinder Bore Cross-Hatch Pattern

- 1 - CROSS-HATCH PATTERN
2 - 40°–60°

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 55) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

Fig. 55 Checking Cylinder Bore Size

Measure the cylinder bore at three levels in directions A and B (Fig. 55). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - CONNECTING RODS AND BEARINGS

CONNECTING ROD BEARINGS

The bearing caps are not interchangeable and should be marked at removal to insure correct assembly.

The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Install cap with the tangs on the same side as the rod.

Fit all rods on one bank until complete.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.015 mm (0.0006 in.). Bearings are available in standard, 0.025 mm (0.001 in.), and 0.254 mm (0.010 in.) undersizes. **Install the bearings in pairs. Do not use a new bearing half with an old bearing half. Do not file the rods or bearing caps.**

(1) For measuring main bearing clearance and connecting rod bearing clearance use plastigage (Fig. 56). For more information on using plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE). Refer to Engine Specifications for bearing clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: The rod bearing bolts should be examined before reuse. If the threads are necked down the bolts must be replaced (Fig. 57).

Fig. 56 CHECKING CONNECTING ROD BEARING

CONNECTING ROD BOLTS

(1) Examine connecting rod bolts for stretching. Stretching can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced.

Fig. 57 CHECK FOR STRETCHED BOLTS

- 1 - STRETCHED BOLT
- 2 - THREADS ARE NOT STRAIGHT ON LINE
- 3 - THREADS ARE STRAIGHT ON LINE
- 4 - UNSTRETCHED BOLT

(2) Before installing the nuts the threads should be oiled with engine oil.

(3) Install nuts on each bolt finger tight. Then alternately torque each nut to assemble the cap properly.

(4) Tighten the connecting rod cap nuts to specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

CONNECTING ROD SIDE CLEARANCE

(1) Mount a dial indicator to a stationary point on engine. Locate probe perpendicular to and resting against the connecting rod cap being checked. Move connecting rod all the way to rear of its travel. Zero the dial indicator. Move connecting rod forward to limit of travel and read the dial indicator (Fig. 58). Compare measurement to specification listed in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Repeat procedure for each connecting rod. Turn crankshaft for connecting rod accessibility.

CRANKSHAFT

DESCRIPTION

The crankshaft (Fig. 53) is constructed of a forged micro alloy steel. A six throw, nine counterweight crankshaft is supported by four select fit main bearings with number two serving as the thrust washer location. The six separate connecting rod throws are an even-firing design which reduces torque fluctuations while a torsional vibration damper is used to control torsion caused vibration of the crankshaft. Rubber lipped seals are used at front and rear. The front seal is retained in the oil pump case and the rear seal is retained in a block-mounted housing.

CRANKSHAFT (Continued)

80add41a

Fig. 58 CONNECTING ROD SIDE CLEARANCE STANDARD PROCEDURE - CRANKSHAFT END PLAY

- (1) Using Dial Indicator C-3339 and Mounting Post L-4438, attach to front of engine, locating probe perpendicular on nose of crankshaft (Fig. 59).
- (2) Move crankshaft all the way to the rear of its travel.
- (3) Zero the dial indicator.
- (4) Move crankshaft all the way to the front and read the dial indicator. Refer to Engine Specifications.

80b1b316

Fig. 59 Checking Crankshaft End Play

REMOVAL

- (1) Remove engine from vehicle. (Refer to 9 - ENGINE - REMOVAL)
- (2) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
- (3) Remove oil pickup tube.
- (4) Remove crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)
- (5) Remove idler pulley for accessory drive belt.
- (6) Remove front lower timing belt cover.

- (7) Remove front main timing belt cover.
- (8) Remove front left side timing belt cover.
- (9) Remove timing belt tensioner and timing belt.
- (10) Remove crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
- (11) Tap dowel pin out of crankshaft.
- (12) Remove oil pump assembly.
- (13) Remove crankshaft rear oil seal retainer. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - REMOVAL)
- (14) Remove connecting rod bearing caps. Connecting rod bearing caps are not interchangeable and should be marked before removal to insure correct assembly (Fig. 60).
- (15) Remove main bearing caps. Main bearing caps are not interchangeable and are marked to insure correct assembly (Fig. 61).
- (16) Remove crankshaft from cylinder block (Fig. 62).

NOTE: Before installing crankshaft, refer to Fitting Main Bearings and Installation of Connecting Rod Bearings. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE)

9009-74

**Fig. 60 CONNECTING ROD TO CYLINDER
IDENTIFICATION**

1 - CYLINDER NUMBER

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring. Limits of taper or out-of-round on any crankshaft journals should be held to 0.015 mm (0.0006 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of Number 2 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

CRANKSHAFT (Continued)

**Fig. 61 MAIN BEARING CAP IDENTIFICATION**

CAUTION: With a forged steel crankshaft it is important that the final paper or cloth polish after any journal regrind be in the same direction as normal rotation in the engine.

INSTALLATION

CAUTION: Main bearings are select fit. (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE)

(1) Install crankshaft main bearings (Fig. 63). (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)

(2) Install the crankshaft to cylinder block. (Fig. 62)

(3) Move crankshaft forward to limit of travel. Lubricate and install the front thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface (Fig. 64).

(4) Move crankshaft rearward to limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

80b0d82

CRANKSHAFT (Continued)

**Fig. 63 Main Bearing Identification****Fig. 64 Thrust Washer Installation**

1 - FRONT THRUST WASHER

(5) Lubricate lower main bearings with clean engine oil.

NOTE: Lubricate main bearing cap bolts with engine oil before installation.

(6) Install each main cap and tighten bolts finger tight.

The main bearing cap bolts must be tightened in the proper sequence. First the inner main cap bolts, secondly the windage tray bolts, lastly the main cap tie (horizontal) bolts.

(7) Install the inside main bearing cap bolts and tighten to 20 N·m + 1/4 turn (15 ft. lbs. + 1/4 turn).

(8) Measure crankshaft end play. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE)

(9) Install connecting rods and measure side clearance. (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE)

(10) Install windage tray. Lubricate bolts with engine oil and tighten to 27 N·m + 1/4 turn (20 ft. lbs. + 1/4 turn).

(11) Install the main cap tie (horizontal) bolts and tighten to 28 N·m (250 in. lbs.).

(12) Install rear crankshaft oil seal retainer and oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - INSTALLATION) (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)

(13) Install oil pump assembly. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION)

(14) Install dowel pin in crankshaft. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION)

(15) Install crankshaft sprocket. Refer to Front Crankshaft Oil Seal Removal and Installation for procedure.

(16) Install camshaft sprockets and timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(17) Install timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(18) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

(19) Install idler pulley for accessory drive belt.

(20) Install oil pickup tube and tighten bolt to 28 N·m (250 in. lbs.).

(21) Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

(22) Install engine assembly. (Refer to 9 - ENGINE - INSTALLATION)

(23) Fill engine crankcase with proper amount of oil.

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING FITTING

The main bearings are a "select fit" to achieve proper oil clearances. For main bearing selection, the block and crankshaft have grade identification marks.

CRANKSHAFT MAIN BEARINGS (Continued)

The marks for the cylinder block main bore grade are located on the left side pan rail, just rear of the left engine mount bracket (Fig. 65). These grade marks (1, 2, or 3) are read left to right, corresponding to main bore 1, 2, 3, 4.

The grade marks for the crankshaft are located on the rearmost crankshaft counter weight as shown in (Fig. 66). The crankshaft journal grade marks (A, B, or C) are read left to right, corresponding with journal number 1, 2, 3, 4.

Refer to the MAIN BEARING SELECTION CHART—3.2/3.5L to properly select the main bearings. For an example, if the main bore grade is 3 and the journal grade is B, the proper select fit bearing would be a (2) +0.003 mm (+0.0002 in.).

NOTE: Service main bearings have a number from (1–5) marked in ink on the bearing surface (Fig. 67). For verification, refer to the MAIN BEARING SELECTION CHART—3.2/3.5L for number to size identification.

The upper main bearing has a oil feed hole and a center groove to allow lubrication of the main journal and must be properly positioned in the block.

REMOVAL

Bearing caps are not interchangeable and are marked to insure correct assembly (Fig. 68). Upper and lower bearing halves are NOT interchangeable.

(1) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(2) Remove oil pick-up tube and windage tray.

(3) Identify bearing caps before removal (Fig. 68).

(4) Remove bearing caps one at a time. Remove upper half of bearing by inserting Special Main Bearing Tool C-3059 (Fig. 69) into the oil hole of crankshaft.

(5) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

Fig. 68 Main Bearing Cap Identification

Fig. 69 Removing and Installing Upper Main Bearing With Special Tool C- 3059

- 1 - SPECIAL TOOL C-3059
- 2 - BEARING
- 3 - SPECIAL TOOL C-3059
- 4 - BEARING

INSTALLATION

Bearing caps are not interchangeable and are marked to insure correct assembly. Upper and lower bearing halves are NOT interchangeable (Fig. 70).

2 PIECE THRUST WASHER (UPPER ONLY)

Fig. 70 Main Bearing Cap Identification

CAUTION: Main bearings are select fit. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)

NOTE: Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened.

CRANKSHAFT MAIN BEARINGS (Continued)

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

- (1) Lubricate main bearing with clean engine oil.
- (2) Start bearing in place, and insert Main Bearing Tool C-3059 into oil hole of crankshaft (Fig. 69).
- (3) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Special Main Bearing Tool C-3059.

NOTE: Lubricate main bearing cap bolts with engine oil before installation.

- (4) Lubricate and install lower bearing half and main cap. Tighten bolts finger tight.
- (5) For installing thrust washers at the No. 2 main bearing location, use the following procedure:
 - (a) Move crankshaft forward to limit of travel. Lubricate and install the front thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface (Fig. 71).
 - (b) Move crankshaft rearward to limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

Fig. 71 Thrust Washer Installation

1 - FRONT THRUST WASHER

The main bearing cap bolts must be tightened in the proper sequence. First the inner main cap bolts, secondly the windage tray bolts, lastly the main cap tie (horizontal) bolts.

- (6) Install each main bearing cap and tighten inner bolts finger tight.
- (7) Tighten inner main bearing cap bolts to 20 N-m + 1/4 turn (15 ft. lbs. + 1/4 turn).

(8) Measure crankshaft end play. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE)

(9) Install windage tray. Lubricate bolts with engine oil and tighten to 27 N-m + 1/4 turn (20 ft. lbs. + 1/4 turn).

(10) Install the main cap tie (horizontal) bolts and tighten to 28 N-m (250 in. lbs.).

(11) Install oil pick-up tube.

(12) Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

(13) Fill engine crankcase with proper oil to correct level.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Remove the crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(2) Tap the dowel pin out of the crankshaft (Fig. 72).

Fig. 72 Crankshaft Dowel Pin - Removal/Installation

1 - PIN PUNCH
2 - DOWEL

(3) Remove crankshaft seal using Special Tool 6341A (Fig. 73).

CAUTION: Do not nick shaft seal surface or seal bore.

CRANKSHAFT OIL SEAL - FRONT (Continued)

(4) Shaft seal lip surface must be free of varnish, dirt or nicks. Polish with 400 grit paper if necessary.

Fig. 73 REMOVING CRANKSHAFT OIL SEAL WITH SPECIAL TOOL

1 - SPECIAL TOOL 6341A

INSTALLATION

(1) Install crankshaft seal using Special Tool 6342 (Fig. 74).

Fig. 74 INSTALLING CRANKSHAFT OIL SEAL WITH SPECIAL TOOL

1 - SPECIAL TOOL 6342

(2) Install the dowel pin into the crankshaft to 1.2 mm (0.047 in.) protrusion (Fig. 72).

(3) Install the crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

CRANKSHAFT OIL SEAL - REAR

REMOVAL

(1) Remove transaxle from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - REMOVAL)

(2) Remove drive plate.

(3) Insert a 3/16" wide flat bladed screwdriver between the dust lip and the metal case of the crankshaft seal. Angle the screwdriver (Fig. 75) through the dust lip against the metal case of the seal. Pry out seal.

CAUTION: Do not allow the screwdriver blade to contact the crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

806dc1b1

- 5 - PRY IN THIS DIRECTION
- 6 - CRANKSHAFT
- 7 - SCREWDRIVER
- 8 - REAR CRANKSHAFT SEAL DUST LIP
- 9 - SCREWDRIVER

INSTALLATION

CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), clean surface using 400 grit sand paper to prevent seal damage during installation.

CRANKSHAFT OIL SEAL - REAR (Continued)

(1) Place Special Tool 6926-1 Guide on crankshaft (Fig. 76). This is a pilot tool with a magnetic base.

(2) Position seal over pilot tool. Assure that lip of seal is facing towards the crankshaft during installation. The pilot tool remains on crankshaft during seal installation.

(3) Using Special Tool 6926-2 Installer, and C-4171 Handle (Fig. 76), drive seal into the retainer housing until seal is flush with housing surface.

(4) Install drive plate and transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - INSTALLATION)

Fig. 76 Crankshaft Rear Seal - Installation

CRANKSHAFT REAR OIL SEAL RETAINER

REMOVAL

(1) Remove crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL)

(2) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(3) Remove seal retainer attaching screws.

(4) Remove seal retainer (Fig. 77).

NOTE: Seal retainer gasket is bonded to the retainer and must be replaced as an assembly.

Fig. 77 Oil Seal Retainer

- 1 - SCREWS (7)
- 2 - SEAL RETAINER

INSTALLATION

(1) Clean all sealing surfaces. Replace retainer assembly if gasket is torn or damaged.

(2) Install seal retainer to block, but do not tighten attaching screws at this time.

NOTE: The following steps must be performed to prevent oil leaks at sealing joints.

(3) Attach Special Tools 8225 to pan rail using the oil pan fasteners (Fig. 78).

NOTE: Make sure the marking "3.2/3.5L" on Special Tools 8225, is facing towards the cylinder block pan rail surface (notch on tool is towards the seal retainer).

(4) While applying firm pressure to the seal retainer against Special Tools 8225 (Fig. 78), tighten seal retainer screws to 12 N·m (105 in. lbs.).

(5) Install crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)

(6) Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

**Fig. 78 Rear Crankshaft Seal Retainer Alignment**

- 1 - SEAL RETAINER

FLEX PLATE

REMOVAL

- (1) Remove the transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - REMOVAL)
- (2) Remove flex plate attaching bolts.
- (3) Remove the flex plate (Fig. 79).

INSTALLATION

- (1) Position flex plate with backing plate on the crankshaft (Fig. 79).
- (2) Apply Mopar® Lock & Seal Adhesive to the flex plate bolts.
- (3) Install flex plate bolts (Fig. 79). Tighten bolts to 95 N·m (70 ft. lbs.).
- (4) Install the transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - INSTALLATION)

**Fig. 79 FLEX PLATE**

PISTON & CONNECTING ROD
DESCRIPTION

NOTE: Valve reliefs were removed from the pistons for the 2003MY. It is possible when ordering a service piston/rod assembly that valve reliefs are present. These may be used in the engine, and will not affect engine operation.

The pistons are made of a high strength aluminum alloy. Top land height has been decreased to reduce emissions. Piston skirts are coated with a solid lubricant for scuff resistance. Connecting rod is forged steel with a squirt hole and attaches to the piston with a full floating pin retained by lock rings.

STANDARD PROCEDURE - FITTING PISTONS

The pistons are machined to two different weight specifications and matched to rods based on weight. All piston and rod assemblies weigh the same to maintain engine balance.

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin at size location shown in (Fig. 80). Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line (Refer to 9 - ENGINE - SPECIFICATIONS). **Pistons and cylinder bores should be measured at normal room temperature, 70°F (21°C).**

REMOVAL

- (1) Remove the cylinder heads (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)

PISTON & CONNECTING ROD (Continued)

**Fig. 80 Piston Measurements**

(2) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(3) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so that each connecting rod is centered in cylinder bore.**

(4) Inspect connecting rods and connecting rod caps for cylinder identification. Identify them if necessary (Fig. 81).

**Fig. 81 Connecting Rod to Cylinder Identification**

1 - CYLINDER NUMBER

(5) Remove connecting rod cap. Install protectors on connecting rod bolts (Fig. 82). Push each piston and rod assembly out of cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

(6) After removal, install bearing cap on the mating rod.

**Fig. 82 Connecting Rod Guides and Crankshaft Protectors**

1 - COVER ROD BOLTS WITH A SUITABLE COVERING WHEN REMOVING OR INSTALLING PISTON ASSEMBLY

INSTALLATION

(1) Install the piston rings. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - INSTALLATION)

NOTE: The connecting rod bearing cap bolts must be examined before reuse. If the threads are necked down, the bolts must be replaced.

(2) Check connecting rod bolts for necking by holding a scale or straight edge against the threads. If all threads do not contact the scale, the bolt must be replaced (Fig. 83).

**Fig. 83 Check for Stretched Bolts**

- 1 - STRETCHED BOLT
- 2 - THREADS ARE NOT STRAIGHT ON LINE
- 3 - THREADS ARE STRAIGHT ON LINE
- 4 - UNSTRETCHED BOLT

PISTON & CONNECTING ROD (Continued)

(3) Before installing pistons and connecting rod assemblies into the bore, ensure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 84).

RR09B48

Fig. 84 Piston Ring End Gap Position

- 1 - SIDE RAIL UPPER
- 2 - NO. 1 RING GAP
- 3 - PISTON PIN
- 4 - SIDE RAIL LOWER
- 5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

(4) Immerse the piston head and rings in clean engine oil, slide the ring compressor over the piston and tighten with the special wrench (Fig. 85). **Ensure position of rings does not change during this operation.**

Fig. 85 Piston - Installation

(5) Install connecting rod bolt protectors on rod bolts (Fig. 82).

(6) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

CAUTION: Do Not interchange piston assemblies cylinder-to-cylinder or bank-to-bank.

NOTE: Valve reliefs were removed from the pistons for the 2003MY. It is possible when ordering a service piston/rod assembly that valve reliefs are present. These may be used in the engine, and will not affect engine operation.

(7) The arrow on top of piston must be pointing toward front of engine (Fig. 86) and oil squirt hole on connecting rod faces the major thrust (right) side of the cylinder bore (Fig. 87).

Fig. 86 Piston Orientation

- 1 - ARROW FACES FRONT OF ENGINE

(8) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(9) Install rod caps. Install nuts on cleaned and oiled rod bolts and tighten nuts to 54 N·m (40 ft. lbs.) Plus 1/4 turn.

(10) Install the cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)

(11) Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

PISTON & CONNECTING ROD (Continued)

80b09a63

Fig. 87 Piston and Connecting Rod Positioning (Front View of Engine)

1 - MAJOR THRUST SIDE OF PISTON

2 - OIL SQUIRT HOLE

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore. Check gap with feeler gauge (Fig. 88). For clearance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

(2) Check piston ring to groove clearance: (Fig. 89). For clearance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

9309-157

Fig. 88 Check Gap on Piston Rings

1 - FEELER GAUGE

PISTON RINGS (Continued)

9309-159

Fig. 89 Measuring Piston Ring Side Clearance

1 - FEELER GAUGE

REMOVAL

- (1) Remove piston and connecting rod. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL)
- (2) Remove No. 1 and No.2 piston rings from piston using a ring expander tool (Fig. 92).
- (3) Remove upper oil ring side rail (Fig. 90).
- (4) Remove lower oil ring side rail (Fig. 90).
- (5) Remove oil ring expander (Fig. 90).

INSTALLATION

(1) Measure clearance of piston rings to the cylinder bore and piston. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE)

The No. 1 and No. 2 piston rings have a different cross section. Insure that the No. 2 ring is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston (Fig. 90).

CAUTION: Install piston rings in the following order:

- Oil ring expander.
 - Upper oil ring side rail.
 - Lower oil ring side rail.
 - No. 2 Intermediate piston ring.
 - No. 1 Upper piston ring.
- (2) Install oil ring expander.

(3) Install the side rail by placing one end between the piston ring groove and the expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander during this step (Fig. 91).**

Fig. 91 SIDE RAIL - INSTALLATION

1 - SIDE RAIL END

PISTON RINGS (Continued)

Fig. 92 UPPER AND INTERMEDIATE RINGS

(4) Install upper side rail first and then the lower side rail.

The No. 1 and No. 2 piston rings have a different cross section. Insure that the No. 2 ring is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston (Fig. 90).

(5) Install No. 2 piston ring and then No. 1 piston ring (Fig. 92).

(6) Position piston ring end gaps as shown in (Fig. 93).

(7) Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

Fig. 93 PISTON RING END GAP POSITION

STRUCTURAL COLLAR / COVER

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove bolts attaching structural collar to oil pan and transmission housing (Fig. 94).
- (3) Remove collar (Fig. 94).

Fig. 94 Structural Collar

- 1 - BOLT-HORIZONTAL
- 2 - BOLT-VERTICAL
- 3 - STRUCTURAL COLLAR

INSTALLATION

CAUTION: The collar must be tighten using this service procedure, as damage to collar and/or oil pan may occur.

(1) Install structural collar (Fig. 94) using the following tightening sequence:

- a. Install the **vertical** collar to oil pan bolts. Torque bolts initially to 1.1 N·m (10 in. lbs.).
- b. Install the **horizontal** collar to transmission bolts and torque to 55 N·m (40 ft. lbs.).
- c. Starting with the center vertical bolts and working outward, final torque bolts to 55 N·m (40 ft. lbs.).

(2) Lower vehicle.

VIBRATION DAMPER

REMOVAL

- (1) Disconnect negative cable at right strut tower.
- (2) Remove upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)
- (3) Remove radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

VIBRATION DAMPER (Continued)

(4) Remove the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(5) Use Special Tool 8191 to hold crankshaft damper while removing center bolt (Fig. 95).

(6) Use Special Tool 1023 puller, and insert C-4685-C2, remove crankshaft damper (Fig. 96).

Fig. 95 Crankshaft Damper Center Bolt - Removal and Installation

- 1 - SPECIAL TOOL 8191
- 2 - CRANKSHAFT DAMPER

Fig. 96 CRANKSHAFT DAMPER - REMOVAL

- 1 - SPECIAL TOOL 1023
- 2 - SPECIAL TOOL C-4685-C2 INSERT

INSTALLATION

(1) Install crankshaft damper using Special Tools C-4685-C1 (5.9 in.) Bolt, with Nut and Thrust Bear-

ing from 6792, and 6792-1 Installer (Fig. 97). Install center bolt and tighten to 115 N-m (85 ft. lbs.) (Fig. 95).

Fig. 97 CRANKSHAFT DAMPER - INSTALLATION

- 1 - SPECIAL TOOL 6792-1
- 2 - SPECIAL TOOL C-4685-C1

(2) Install accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(3) Install radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(4) Install upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(5) Connect negative cable.

ENGINE MOUNTING

DESCRIPTION

The engine mounting system consist of three mounts; two hydro-type mounts are attached to the right and left side of the engine block, and one molded rubber type rear mount is attached to the transaxle (Fig. 99). All three mounts attach to the suspension crossmember/engine cradle.

The engine hydro-type mounts contain a liquid that is encased in a solid rubber housing.

ENGINE MOUNTING (Continued)

INSPECTION

Engine hydro-mounts may show surface cracks. This will not effect performance and mount should not be replaced. Only replace the engine hydro-mounts when leaking fluid.

LEFT MOUNT

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove the isolator attaching nuts from top of the mounting bracket (Fig. 98).
- (3) Support the engine with a jack and a block of wood across the full width of the oil pan.
- (4) Remove the lower attaching nuts from the bottom of the isolator to the frame (Fig. 98).
- (5) Raise engine carefully with jack enough to remove the isolator with heat shield from its mount.

INSTALLATION

- (1) Install isolator mount with heat shield onto the frame.
- (2) Lower the engine onto the isolator mount.
- (3) Remove jack from vehicle.
- (4) Tighten the isolator to frame nuts to 61 N·m (45 ft. lbs.) (Fig. 98).
- (5) Install the upper attaching nuts to mount and tighten to 61 N·m (45 ft. lbs.) (Fig. 98).
- (6) Lower vehicle.

- 9 - NUT

REAR MOUNT

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Support transaxle with a jack.
- (3) Remove isolator nuts from the mount to transaxle mount bracket (Fig. 99).
- (4) Remove rear mount isolator bolts to crossmember and remove mount (Fig. 99).

INSTALLATION

- (1) Position isolator onto crossmember.
- (2) Install bolts attaching isolator to crossmember and tighten to 33 N·m (250 in. lbs.) (Fig. 99).
- (3) Lower transaxle onto isolator.
- (4) Install isolator nuts and tighten to 61 N·m (45 ft. lbs.) (Fig. 99).
- (5) Lower vehicle.

RIGHT MOUNT

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove the isolator attaching nuts from top of the mounting bracket (Fig. 99).
- (3) Support the engine with a jack and a block of wood across the full width of the oil pan.
- (4) Remove the lower attaching nuts from the bottom of the isolator to the frame (Fig. 99).
- (5) Raise engine carefully with jack enough to remove the isolator with heat shield from its mount.

INSTALLATION

- (1) Install isolator mount with heat shield onto the frame.
- (2) Lower the engine onto the isolator mount.
- (3) Remove jack from vehicle.
- (4) Tighten the isolator to frame nuts to 61 N·m (45 ft. lbs.) (Fig. 99).
- (5) Install the upper attaching nuts to mount and tighten to 61 N·m (45 ft. lbs.) (Fig. 99).
- (6) Lower vehicle.

LUBRICATION

DESCRIPTION

System is a full-flow filtration, pressure feed type. The oil pump body is mounted to the engine block. The pump inner rotor is driven by the crankshaft. A windage tray, increases power by minimizing oil windage at high engine RPM. For increased oil cooling, an oil-to-coolant oil cooler is used. This cooler is mounted inside the radiator tank.

OPERATION

Engine oil stored in the oil pan is drawn in and discharged by a gerotor type oil pump. The oil pump is directly coupled to the crankshaft. Oil pressure is regulated by a relief valve. The oil is fed through an oil filter and to the crankshaft journals from the oil gallery in the cylinder block. This gallery also feeds oil under pressure to the cylinder heads. Oil flows through each cylinder heads oil passage to the rocker shafts. Oil then feeds the camshaft journals, rocker arms, and hydraulic lash adjusters (Fig. 100).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

- 13 - CYLINDER BLOCK OIL GALLERY
- 14 - CYLINDER HEAD GASKET
- 15 - HEAD BOLT HOLE
- 16 - INTAKE ROCKER SHAFT

LUBRICATION (Continued)

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

- Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
- Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
- Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

- If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is

present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

DIAGNOSIS AND TESTING - CHECKING
ENGINE OIL PRESSURE

(1) Remove the oil pressure switch. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL)

(2) Install oil pressure test gauge assembly, Special Tools C-3292 with 8406 adaptor.

(3) Start engine and monitor gauge readings.

CAUTION: If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM

(4) Oil Pressure (engine at operating temperature): **Curb Idle** 34.5 kPa (5 psi) minimum **3000 RPM** 300–724 kPa (45–105 psi).

(5) If oil pressure is 0 at idle. Shut off engine, check for pressure relief valve stuck open or a clogged oil pickup screen.

(6) Install oil pressure switch after testing is completed. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION)

OIL

DESCRIPTION

For engine oil type and capacity (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL)

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading (Fig. 101). Add only when the level is at or below the ADD mark.

Fig. 101 ENGINE OIL FILL AND DIPSTICK LOCATIONS

- 1 - ENGINE OIL FILL
- 2 - ENGINE OIL DIPSTICK

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL

PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

TO CHANGE ENGINE OIL

- (1) Run engine until achieving normal operating temperature.
- (2) Position the vehicle on a level surface and turn engine off.
- (3) Hoist and support vehicle on safety stands. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
- (4) Remove oil fill cap.
- (5) Place a suitable drain pan under crankcase drain.
- (6) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
- (7) Remove oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL)
- (8) Install drain plug in crankcase.
- (9) Install new oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION)
- (10) Lower vehicle and fill crankcase with specified type and amount of engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL) (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
- (11) Install oil fill cap.
- (12) Start engine and inspect for leaks.
- (13) Stop engine and inspect oil level.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING above.

OIL COOLER & LINES

DESCRIPTION

Depending on vehicle options, some models use an engine oil cooler that is mounted inside the right radiator tank. An oil cooler pressure control valve is used to control flow to the cooler (Fig. 102).

OPERATION

Engine oil travels from the control valve through the supply line and into the cooler. The control valve allows engine oil flow when pressure is above

OIL COOLER & LINES (Continued)

138–207 kPa (20–30 psi) and an internal orifice limits oil flow to a maximum of 11.3 LPM (3 GPM). The engine oil exits the cooler through the oil return line and is returned to the engine oil pan (Fig. 102).

REMOVAL

ENGINE OIL COOLER

(1) The engine oil cooler is serviced with the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

COOLER LINES

- (1) Disconnect cooler lines at radiator (Fig. 102).
- (2) Disconnect lines at the pressure control valve and oil pan fitting (Fig. 102).
- (3) Disconnect lines for support retainer and isolator.
- (4) Remove lines.

PRESSURE CONTROL VALVE

- (1) Disconnect oil pressure switch connector (Fig. 102).
- (2) Disconnect cooler supply line for valve.

- (3) Remove valve from engine block by unscrewing fitting.

INSTALLATION

ENGINE OIL COOLER

(1) Install radiator assembly (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION). Tighten lines to radiator fittings to 18 N·m (160 in. lbs.) (Fig. 102).

COOLER LINES

- (1) Position cooler lines and connect lines to radiator fittings. Tighten lines to radiator fittings to 18 N·m (160 in. lbs.) (Fig. 102).
- (2) Connect lines to pressure control valve and oil pan fitting. Tighten lines to 30 N·m (260 in. lbs.) (Fig. 102).
- (3) Connect lines to support retainer and isolator.

PRESSURE CONTROL VALVE

- (1) For installation of a NEW control valve:
 - (a) Install fitting into block. Tighten fitting to 30 N·m (260 in. lbs.).

80be47b0

OIL COOLER & LINES (Continued)

- (b) Position control valve to fitting. Push line into fitting until it locks in place. Ensure proper connection is made by pulling in-and-out on valve.
- (2) For installation of original control valve:
 - (a) Install pressure control valve to engine block. Tighten fitting to 30 N·m (260 in. lbs.).
 - (3) Connect oil cooler supply line. Tighten to 30 N·m (260 in. lbs.) (Fig. 102).
 - (4) Connect oil pressure switch connector.

OIL FILTER

REMOVAL

NOTE: When servicing the oil filter, avoid deforming the filter can. Install the remove/install tool band strap against the base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

- (1) Using a suitable oil filter wrench, unscrew filter from base and discard (Fig. 103).

Fig. 103 OIL FILTER

1 - OIL FILTER

INSTALLATION

- (1) Wipe base clean, then inspect gasket contact surface.
- (2) Lubricate gasket of new filter with clean engine oil.
- (3) Install and tighten filter to 16 N·m (12 ft. lbs.) of torque after gasket contacts base (Fig. 103). Use filter wrench if necessary.
- (4) Start engine and check for leaks.

OIL PAN

REMOVAL

- (1) Disconnect negative cable from remote jumper terminal.
- (2) Remove dipstick and tube.
- (3) Raise vehicle on hoist and drain engine oil.
- (4) Remove structural collar from rear of oil pan and transmission housing (Fig. 104).

Fig. 104 STRUCTURAL COLLAR

- 1 - BOLT-HORIZONTAL
- 2 - BOLT-VERTICAL
- 3 - STRUCTURAL COLLAR

- (5) Disconnect engine oil cooler line from pan.
- (6) Disconnect transmission oil cooler line clips.
- (7) Remove oil pan (Fig. 105).
- (8) Remove oil pan gasket.
- (9) Clean oil pan and all gasket surfaces.

OIL PAN (Continued)

**Fig. 105 OIL PAN**

- 1 - GASKET
- 2 - OIL PAN
- 3 - BOLT-M6
- 4 - NUT-M6

- 5 - BOLT-M8
- 6 - BOLT-M8
- 7 - BOLT-M6

INSTALLATION

(1) Apply a 1/8 inch bead of Mopar® Engine RTV GEN II at the parting line of the oil pump housing and the rear seal retainer (Fig. 106).

(2) Install oil pan gasket to the engine block.

(3) Install pan and attaching fasteners (Fig. 105).

(4) Install the structural collar (Fig. 104), using the follow procedure:

(a) Install the **vertical** collar to oil pan bolts. Pre-torque bolts to 1.1 N·m (10 in. lbs.).

(b) Install the **horizontal** collar to transmission bolts and tighten to 55 N·m (40 ft. lbs.).

(c) Starting with center vertical bolts and working outward, final torque all bolts to 55 N·m (40 ft. lbs.).

(5) Lower vehicle and install dipstick and tube.

(6) Fill engine crankcase with proper oil to correct level.

(7) Connect negative cable.

**Fig. 106 OIL PAN SEALING**

80b1b315

OIL PRESSURE RELIEF VALVE

REMOVAL

(1) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(2) To remove the relief valve, proceed as follows:

(a) Remove the cotter pin that retains the retainer cap.

(b) Drill a 3.175 mm (1/8 inch.) hole into the relief valve retainer cap

(c) Insert a self-threading sheet metal screw into cap.

(d) Using a suitable slide hammer tool, remove retainer cap. Discard retainer cap

(e) Remove spring and relief valve (Fig. 107).

Fig. 107 Oil Pressure Relief Valve

- 1 - RELIEF VALVE
- 2 - SPRING
- 3 - RETAINER CAP
- 4 - COTTER PIN

INSPECTION

(1) Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

(2) The relief valve spring has a free length of approximately 49.5 mm (1.95 in.) it should test between 101–110 N (23–25 lbs.) when compressed to 34 mm (1.34 in.). Replace spring that fails to meet specifications.

INSTALLATION

(1) Lubricate relief valve with oil.

CAUTION: The pressure relief valve must be installed as shown in (Fig. 107), or engine damage may occur.

(2) Install valve, spring and retainer cap (Fig. 107).

(3) Install new cotter pin.

(4) Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

OIL PRESSURE SWITCH

DESCRIPTION

The engine oil pressure switch is located on the lower left front side of the engine (Fig. 108). It screws into the engine oil cooler adapter fitting that is installed into the engine main oil gallery. The normally closed switch provides an input through a single wire to the low pressure indicator light on the instrument cluster.

OPERATION

The oil pressure switch provides a ground for the instrument cluster low oil pressure indicator light. The switch receives oil pressure input from the engine main oil gallery. When engine oil pressure is greater than 27.5 Kpa (4 psi), the switch contacts open, providing a open circuit to the low pressure indicator light. For wiring circuits and diagnostic information, (Refer to Appropriate Wiring/Diagnostic Information).

REMOVAL

(1) Raise vehicle on hoist.

(2) Position an oil collecting container under switch location.

(3) Disconnect electrical connector (Fig. 108).

(4) Hold oil cooler fitting with a wrench.

(5) Unscrew oil pressure switch from fitting (Fig. 108).

INSTALLATION

(1) Apply Mopar® Thread Sealant to the switch threads.

(2) Install oil pressure switch to fitting (Fig. 108).

(3) Hold oil cooler fitting with a wrench and tighten oil pressure switch.

(4) Connect electrical connector (Fig. 108).

(5) Lower vehicle.

(6) Start engine and check for leaks.

(7) Check engine oil level and adjust as necessary.

OIL PRESSURE SWITCH (Continued)

**Fig. 108 OIL PRESSURE SWITCH**

- 1 - OIL PRESSURE SWITCH
- 2 - OIL COOLER FITTING
- 3 - ELECTRICAL CONNECTOR

OIL PUMP

REMOVAL

It is necessary to remove the oil pump body to service the oil pump rotors.

The oil pump pressure relief valve can be serviced by removing the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE RELIEF VALVE - REMOVAL)

- (1) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- (2) Remove the radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
- (3) Remove the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
- (4) Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
- (5) Remove the crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
- (6) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
- (7) Remove the oil pickup tube.
- (8) Remove the oil pump fasteners. Remove pump and gasket from engine (Fig. 109).

80b34e4a

Fig. 109 OIL PUMP - REMOVAL/INSTALLATION

- 1 - OIL PUMP
- 2 - GASKET

DISASSEMBLY

- (1) To remove the relief valve, proceed as follows:
- (2) Remove cotter pin. Drill a 3.175 mm (1/8 inch.) hole into the relief valve retainer cap and insert a self-threading sheet metal screw into cap.
- (3) Clamp screw into a vise and while supporting oil pump body, remove cap by tapping oil pump body using a soft hammer. Discard retainer cap and remove spring and relief valve (Fig. 110).

9309-182

Fig. 110 Oil Pressure Relief Valve

- 1 - RELIEF VALVE
- 2 - SPRING
- 3 - RETAINER CAP
- 4 - COTTER PIN

- (4) Remove oil pump cover screws, and lift off cover.
- (5) Remove pump rotors.
- (6) Wash all parts in a suitable solvent and inspect carefully for damage or wear (Fig. 111).

OIL PUMP (Continued)

**Fig. 111 Oil Pump**

- 1 - OIL PUMP BODY
- 2 - OIL PUMP OUTER ROTOR
- 3 - SCREWS
- 4 - OIL PUMP COVER
- 5 - OIL PUMP INNER ROTOR

CLEANING

- (1) Clean all parts thoroughly in a suitable solvent.

INSPECTION

- (1) Disassemble oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - DISASSEMBLY)
- (2) Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. Replace pump cover if scratched or grooved.
- (3) Lay a straightedge across the pump cover surface (Fig. 112). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

**Fig. 112 Checking Oil Pump Cover Flatness**

- 1 - STRAIGHT EDGE
- 2 - FEELER GAUGE
- 3 - OIL PUMP COVER

- (4) Measure thickness and diameter of outer rotor. If outer rotor thickness measures 14.299 mm (0.563 in.) or less (Fig. 113), or if the diameter is 79.78 mm (3.141 inches.) or less, replace outer rotor.

**Fig. 113 Measuring Outer Rotor Thickness****Fig. 114 Measuring Inner Rotor Thickness**

- (5) If inner rotor measures 14.299 mm (0.563 in.) or less replace inner rotor (Fig. 114).
- (6) Slide outer rotor into body, press to one side with fingers and measure clearance between rotor and body (Fig. 115). If measurement is 0.39 mm (0.015 inch.) or more, replace body only if outer rotor is in specifications.
- (7) Install inner rotor into body. If clearance between inner and outer rotors (Fig. 116) is 0.20 mm (0.008 inch.) or more, replace both rotors.
- (8) Place a straightedge across the face of the body, between bolt holes. If a feeler gauge of 0.077 mm (0.003 in.) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 117) **ONLY** if rotors are in specs.
- (9) Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

Fig. 118 Oil Pressure Relief Valve

- 1 - RELIEF VALVE
- 2 - SPRING
- 3 - RETAINER CAP
- 4 - COTTER PIN

(10) The relief valve spring (Fig. 118) has a free length of approximately 49.5 mm (1.95 in.) it should test between 101–110 N (23–25 lbs.) when compressed to 34 mm (1–11/32 in.). Replace spring that fails to meet specifications.

(11) Assemble oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - ASSEMBLY)

ASSEMBLY

(1) Assemble oil pump using new parts as required.

(2) Tighten cover screws to 12 N·m (105 in. lbs.) (Fig. 111).

(3) Prime oil pump before installation by filling rotor cavity with engine oil.

(4) If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

OIL PUMP (Continued)

INSTALLATION

- (1) Prime oil pump before installation by filling rotor cavity with engine oil.
- (2) Install oil pump and gasket carefully over the crankshaft. Position pump onto block and tighten bolts to 28 N·m (250 in. lbs.)
- (3) Install new O-ring on oil pickup tube.
- (4) Install oil pickup tube.
- (5) Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)
- (6) Install crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)
- (7) Install timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)
- (8) Install the timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)
- (9) Install the crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)
- (10) Install the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
- (11) Install the radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)
- (12) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- (13) Fill engine crankcase with proper oil to the correct level.

The aluminum lower intake manifold attaches to each cylinder head and uses a gasket for sealing (Fig. 120). The manifold coolant passage allows coolant to flow between cylinder heads. An attached steel tube, allows coolant flow to the heater.

80c071b2

Fig. 119 UPPER INTAKE MANIFOLD

- 1 - INTAKE MANIFOLD-UPPER
2 - BOLT

INTAKE MANIFOLD**DESCRIPTION**

The composite upper intake manifold is a cross-flow type with long runners to improve air charge inertia (Fig. 119). An active Short Runner Valve (SRV) opens during certain operating conditions to improve top end performance. A Manifold Tuning Valve (MTV) connects the plenums at specific engine speeds to maximize low RPM torque without reducing high RPM power.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water (Spray Bottle) at the suspected leak area.
- (3) If engine RPM'S change, the area of the suspected leak has been found.
- (4) Repair as required.

INTAKE MANIFOLD - UPPER

REMOVAL

- (1) Disconnect negative cable from remote jumper terminal.
- (2) Disconnect the Inlet Air Temperature (IAT) Sensor connector. Remove air cleaner housing and inlet hose (Fig. 121).
- (3) Remove throttle and speed control cables from throttle arm and bracket (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL).
- (4) Disconnect electrical connectors from the following sensors and actuators:
 - Short Runner Valve (SRV)(If Equipped)
 - Manifold Tuning Valve (MTV)(If Equipped)
 - Throttle Position Sensor (TPS)
 - Idle Air Control (IAC)
 - Manifold Absolute Pressure (MAP)

INTAKE MANIFOLD - UPPER (Continued)

**Fig. 121 AIR CLEANER WITH INLET HOSE**

- 1 - AIR CLEANER ASSEMBLY WITH AIR INLET HOSE
2 - THROTTLE BODY

(5) Disconnect vacuum hoses from the following:

- Speed Control Reservoir
- Positive Crankcase Ventilation (PCV) Valve
- Proportional Purge Solenoid
- Power Brake Booster

(6) Remove right side (Fig. 122) and left side (Fig. 123) intake manifold supports.

**Fig. 122 INTAKE MANIFOLD SUPPORT - RIGHT**

- 1 - SUPPORT BRACKET

**Fig. 123 INTAKE MANIFOLD SUPPORT - LEFT**

(7) Remove support brackets at intake manifold front corners and at MTV (Fig. 124).

**Fig. 124 INTAKE MANIFOLD SUPPORTS - FRONT**

- 1 - SUPPORT BRACKETS

(8) Loosen upper fastener attaching throttle body to support bracket.

(9) Remove bolts attaching intake manifold and remove manifold (Fig. 125).

INTAKE MANIFOLD - UPPER (Continued)

**Fig. 125 UPPER INTAKE MANIFOLD**

1 - INTAKE MANIFOLD-UPPER
2 - BOLT

INSPECTION

Check manifold for:

- Damage and cracks
- Gasket surface damage or warpage
- Damaged or clogged EGR ports

If the manifold exhibits any damaged or warped conditions, replace the manifold. Clean EGR ports as necessary.

INSTALLATION

- (1) Clean and inspect gasket sealing surfaces.

NOTE: Intake gaskets can be reused, provided they are free of cuts or tears.

- (2) Inspect gasket for cuts or tears. Replace gaskets as necessary.

- (3) Install intake manifold (Fig. 125) and hand start all attaching bolts.

- (4) Tighten bolts gradually in sequence shown in (Fig. 126) until a torque of 12 N·m (105 in. lbs.) is obtained.

**Fig. 126 UPPER INTAKE MANIFOLD TIGHTENING**

- (5) Install right side (Fig. 122) and left side (Fig. 123) intake manifold supports.

- (6) Install manifold support brackets at front corners and at MTV (Fig. 124).

- (7) Tighten fastener attaching throttle body to support bracket.

- (8) Connect vacuum lines to the following:

- Speed Control Reservoir
- Positive Crankcase Ventilation (PCV) Valve
- Proportional Purge Solenoid
- Power Brake Booster

- (9) Connect electrical connectors to the following:

- Short Runner Valve (SRV)(If Equipped)
- Manifold Tuning Valve (MTV)(If Equipped)
- Throttle Position Sensor (TPS)
- Idle Air Control (IAC)
- Manifold Absolute Pressure (MAP)

- (10) Install throttle and speed control cables to bracket and throttle arm (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION).

- (11) Install air cleaner housing and inlet hose (Fig. 121). Connect Inlet Air Temperature (IAT) Sensor connector.

- (12) Connect negative cable to remote jumper terminal.

INTAKE MANIFOLD - LOWER

REMOVAL

- (1) Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
- (2) Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- (3) Disconnect the radiator upper hose from the coolant outlet at front of manifold.
- (4) Remove the upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
- (5) Disconnect the electrical connectors to fuel injectors and coolant temperature sensor.
- (6) Disconnect heater and coolant bottle supply hoses from coolant tube at rear of intake manifold (Fig. 127).

Fig. 127 HEATER SUPPLY HOSE CONNECTIONS

- 1 - HEATER SUPPLY HOSE
2 - COOLANT BOTTLE SUPPLY HOSE

- (7) Disconnect the fuel supply hose from fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)
- (8) Remove the screw attaching the fuel rail support bracket to the throttle body support bracket.
- (9) Remove the bolts attaching fuel rail.
- (10) Remove fuel rail and injectors as an assembly.
- (11) Remove bolts attaching lower intake and remove intake manifold (Fig. 128).

INSPECTION

Check manifold for:

- Damage and cracks
- Gasket surface damage or warpage
- Damaged fuel injector ports

If the manifold exhibits any of these conditions, replace the manifold.

INSTALLATION

- (1) Clean all sealing surfaces.

NOTE: Gaskets can be reused provided they are free of tears or cuts.

- (2) Inspect gaskets for tears or cuts. Replace as necessary.
- (3) Position gaskets and intake manifold on cylinder head surfaces.
- (4) Install fuel rail with injectors.
- (5) Install intake manifold bolts and gradually tighten in sequence shown in (Fig. 129) until a torque of 28 N·m (250 in. lbs.) is obtained.
- (6) Install screw attaching fuel rail support bracket to the throttle body support bracket.
- (7) Connect fuel supply hose to fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)
- (8) Connect heater and coolant bottle supply hoses to coolant tube at rear of intake manifold (Fig. 127).
- (9) Connect electrical connectors to fuel injectors and coolant temperature sensor.
- (10) Install the upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
- (11) Connect the radiator upper hose to the coolant outlet at front of lower manifold.
- (12) Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

EXHAUST MANIFOLD - RIGHT

REMOVAL

- (1) Disconnect negative cable from remote jumper terminal.
- (2) Raise vehicle on hoist.
- (3) Remove the exhaust system. (Refer to 11 - EXHAUST SYSTEM - REMOVAL)
- (4) Loosen converter pipe support attaching bolt at transaxle mount.
- (5) Loosen the A/C belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
- (6) Lower vehicle.
- (7) Remove air cleaner housing and air inlet tube.
- (8) Loosen and remove V-Band clamp at exhaust manifold connector.

EXHAUST MANIFOLD - RIGHT (Continued)

NOTE: Do not reuse V-Band clamp.

- (9) Remove the A/C compressor attaching bolts and set compressor aside.
- (10) Remove engine oil dipstick tube.
- (11) Remove the A/C compressor bracket.
- (12) Disconnect oxygen sensor electrical connector and remove sensor.
- (13) Remove heat shield attaching bolts and remove heat shields (Fig. 130).
- (14) Remove the exhaust manifold attaching bolts (Fig. 131).
- (15) Remove the exhaust manifold and gasket (Fig. 131).

Fig. 131 EXHAUST MANIFOLD - RIGHT SIDE

- 1 - GASKET
- 2 - BOLT - EXHAUST MANIFOLD
- 3 - EXHAUST MANIFOLD

INSPECTION

- (1) Inspect exhaust manifolds for damage or cracks.
- (2) Check manifold flatness.
- (3) Inspect the exhaust manifold gasket for obvious discoloration or distortion.
- (4) Check distortion of the cylinder head mounting surface with a straightedge and thickness gauge.

INSTALLATION

- (1) Install exhaust manifold and gasket. Tighten bolts starting at the center working outward to 23 N·m (200 in. lbs.) (Fig. 131).
- (2) Install heat shields and tighten attaching bolts to 12 N·m (105 in. lbs.) (Fig. 130).
- (3) Install oxygen sensor to manifold and connect electrical connector.
- (4) Install the A/C compressor mounting bracket.
- (5) Install engine oil dipstick tube.
- (6) Install the A/C compressor and drive belt. For belt installation procedure, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (7) Install a new V-Band clamp and tighten to 11 N·m (100 in. lbs.).
- (8) Raise vehicle on hoist.
- (9) Install the exhaust system. (Refer to 11 - EXHAUST SYSTEM - INSTALLATION)
- (10) Install and/or tighten nut attaching converter pipe support to transaxle mount to 47 N·m (35 ft. lbs.).
- (11) Lower the vehicle.
- (12) Install air cleaner housing and air inlet tube.
- (13) Connect negative cable.

EXHAUST MANIFOLD - LEFT

REMOVAL

- (1) Disconnect negative cable from remote jumper terminal.
- (2) Raise the vehicle on hoist.
- (3) Remove the exhaust system. (Refer to 11 - EXHAUST SYSTEM - REMOVAL)
- (4) Loosen converter pipe support attaching bolt at transaxle mount.
- (5) Lower the vehicle.
- (6) Loosen and remove the V-Band clamp at exhaust manifold connector.

NOTE: Do not reuse V-Band clamp.

- (7) Remove electrical connector harness bracket.
- (8) Disconnect oxygen sensor electrical connector and remove sensor from manifold.
- (9) Remove heat shield attaching bolts and remove heat shield (Fig. 132).
- (10) Remove exhaust manifold attaching bolts (Fig. 132).
- (11) Remove exhaust manifold and gasket (Fig. 132).

809e510e

Fig. 132 EXHAUST MANIFOLD

- 1 - BOLT - HEAT SHIELD
- 2 - HEAT SHIELD
- 3 - GASKET
- 4 - EXHAUST MANIFOLD
- 5 - BOLT - EXHAUST MANIFOLD
- 6 - HEAT SHIELD

INSPECTION

- (1) Inspect exhaust manifolds for damage or cracks.
- (2) Check manifold flatness.
- (3) Inspect the exhaust manifold gasket for obvious discoloration or distortion.
- (4) Check distortion of the cylinder head mounting surface with a straightedge and thickness gauge.

INSTALLATION

- (1) Install the exhaust manifold and gasket. Tighten bolts starting at the center working outward to 23 N·m (200 in. lbs.) (Fig. 132).
- (2) Install heat shields and tighten bolts to 12 N·m (105 in. lbs.) (Fig. 132).
- (3) Install oxygen sensor to manifold and connect electrical connector.
- (4) Attach electrical connector bracket to brace.
- (5) Install a new V-Band clamp and tighten to 11 N·m (100 In. lbs.).
- (6) Raise vehicle on hoist.
- (7) Install and/or tighten nut attaching converter pipe support to transaxle mount to 47 N·m (35 ft. lbs.).
- (8) Install the exhaust system. (Refer to 11 - EXHAUST SYSTEM - INSTALLATION)
- (9) Lower vehicle and connect negative cable.

VALVE TIMING

DESCRIPTION

The timing drive system (Fig. 133) has been designed to provide quiet performance and reliability to support a **NON** free-wheeling engine.

The timing drive components include a crankshaft sprocket, camshaft sprockets, tensioner pulley, hydraulic tensioner and a timing belt. The water pump is driven by the back side of the timing belt. The right and left camshaft sprockets are not interchangeable because of the cam sensor pick-up wheel on the left sprocket.

VALVE TIMING (Continued)

STANDARD PROCEDURE - VALVE TIMING VERIFICATION

(1) Refer to Camshaft Sprocket Removal procedure for verification of valve timing (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

TIMING BELT COVER(S) - FRONT**REMOVAL**

(1) Disconnect negative cable from remote jumper terminal.

(2) Remove upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

(3) Remove the radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

(4) Remove the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(5) Remove crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

TIMING BELT COVER(S) - FRONT (Continued)

(6) Remove the lower belt cover located behind the crankshaft vibration damper (Fig. 135).

(7) Remove the A/C belt guide/lift bracket (Fig. 134).

Fig. 134 A/C BELT GUIDE/LIFT BRACKET

- 1 - A/C BELT GUIDE/LIFT BRACKET
2 - NUT

(8) Remove the stamped steel cover (Fig. 135). **Do not remove the sealer on the cover, it is reusable (Fig. 136).** If some sealer is missing use Mopar® Engine RTV GEN II to replace the missing sealer.

(9) Remove the left cast cover (Fig. 135).

Fig. 135 TIMING BELT COVERS

- 1 - RIGHT SIDE COVER (STAMPED)
2 - LEFT SIDE COVER (CAST)
3 - LOWER COVER

INSTALLATION

(1) Install the left cast cover (Fig. 135) and generator/power steering belt tensioner pulley and bracket.

Fig. 136 TIMING BELT COVER SEALER

- 1 - SEALER

- (2) Install the right stamped steel cover (Fig. 135).
(3) Install A/C belt guide/lift bracket (Fig. 134).
(4) Install the lower cover (Fig. 135).
(5) Install the crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)
(6) Install the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
(7) Install the radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)
(8) Install upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)
(9) Connect negative cable to remote jumper terminal.

TIMING BELT COVER(S) - REAR

REMOVAL

- (1) Remove camshaft sprocket(s). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
(2) Remove rear timing belt cover bolts (Fig. 137).
(3) Remove the rear cover(s).

NOTE: The right side rear timing belt cover has O-rings to seal the water pump passages to cylinder block (Fig. 139). Do not reuse the O-rings.

INSTALLATION

- (1) Inspect the rear cover foam seals for damage or wear (Fig. 138). Replace as necessary.

TIMING BELT COVER(S) - REAR (Continued)

80b4fafa

Fig. 137 Rear Timing Belt Cover Bolts

6 - BOLT

(5) Install camshaft sprockets and reassemble all components. (Refer to 9 - ENGINE/VALVE TIMING/

TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

TIMING BELT TENSIONER & PULLEY

REMOVAL

REMOVAL - TENSIONER PULLEY ASSEMBLY

(1) Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL - TIMING BELT)

(2) Remove the timing belt tensioner pulley and bracket assembly by unscrewing the pivot bolt from the oil pump housing (Fig. 142).

REMOVAL - TENSIONER

(1) For timing belt tensioner removal procedure (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL - TIMING BELT)

INSPECTION

INSPECTION - TENSIONER PULLEY ASSEMBLY

NOTE: The tensioner pulley, bracket, and pivot bolt is serviced as an assembly.

(1) Inspect pulley for free movement (Fig. 142). Replace if pulley is loose, seized, or rough turning

(2) Inspect pulley bearing and seal (Fig. 142). Replace if damaged.

(3) Inspect pivot bolt for free movement in tensioner bracket (Fig. 142). Replace assembly if seized or excessive looseness.

INSPECTION - TENSIONER

(1) Inspect hydraulic tensioner for fluid loss around the plunger seal (Fig. 143). Replace tensioner if leaking.

INSTALLATION

INSTALLATION - TENSIONER PULLEY ASSEMBLY

(1) Install the timing belt tensioner pulley assembly (Fig. 142). Tighten the pivot bolt to 61 N·m (45 ft. lbs.).

(2) Install the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION - TIMING BELT)

TIMING BELT TENSIONER & PULLEY (Continued)

809a2b68

Fig. 142 TENSIONER PULLEY ASSEMBLY

- 1 - TENSIONER PULLEY
- 2 - PIVOT BOLT
- 3 - TENSIONER BRACKET

INSTALLATION - TENSIONER

(1) For timing belt tensioner installation procedure (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION - TIMING BELT).

TIMING BELT AND SPROCKETS**REMOVAL****REMOVAL - TIMING BELT**

CAUTION: The following procedure can only be used when the camshaft sprockets **HAVE NOT BEEN LOOSENED** or removed from the camshafts. Once the camshaft sprockets are loosened, an engine timing procedure is required. This procedure is detailed in the Camshaft Removal and Installation procedures (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

CAUTION: The 3.2/3.5L are **NOT** freewheeling engines. Therefore, care should be taken not to rotate the camshafts or crankshaft with the timing belt removed.

809a2b76

Fig. 143 TIMING BELT TENSIONER

- 1 - PLUNGER (EXTENDED POSITION)
- 2 - TENSIONER HOUSING

(1) Disconnect negative cable from remote jumper terminal.

(2) Remove radiator upper crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL)

(3) Remove the radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

(4) Remove the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(5) Remove the crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(6) Remove the front timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(7) Mark belt running direction, if timing belt is to be reused.

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

(8) Rotate engine clockwise until crankshaft mark aligns with the TDC mark on oil pump housing and the camshaft sprocket timing marks are between the marks on the rear covers (Fig. 144).

TIMING BELT AND SPROCKETS (Continued)

CAUTION: Align the camshaft sprockets between the marks on rear belt covers before timing belt removal or damage to valve and/or pistons could occur.

(9) Using a ink or paint marker; mark the exact position of the camshaft sprocket timing mark relative to the two timing marks on the rear timing cover.

Fig. 144 Engine Timing

- 1 - ALIGN CAMSHAFT SPROCKET TIMING MARK BETWEEN MARKS ON REAR TIMING BELT COVER
- 2 - CRANKSHAFT AT TDC

(10) Remove the timing belt tensioner (Fig. 145) and remove timing belt.

TIMING BELT TENSIONER

CAUTION: Compress the tensioner slowly, as damage to tensioner could result.

(11) When tensioner is removed from the engine it is necessary to compress the plunger into the tensioner body.

CAUTION: Index the tensioner in the vise the same way it is installed on the engine. This ensures proper pin orientation when tensioner is installed on the engine.

(a) Place the tensioner into a vise and SLOWLY compress the plunger (Fig. 146). Total bleed down of tensioner should take about 5 minutes.

(b) When plunger is compressed into the tensioner body install a pin through the body and plunger to retain plunger in place until tensioner is installed.

Fig. 145 TIMING BELT SYSTEM

- 1 - REAR TIMING BELT COVERS
- 2 - WATER PUMP
- 3 - TDC INDICATOR
- 4 - BELT TENSIONER
- 5 - TENSIONER PULLEY

Fig. 146 Compressing Timing Belt Tensioner

- 1 - VISE
- 2 - LOCKING PIN

REMOVAL - CAMSHAFT SPROCKETS

CAUTION: The 3.2/3.5L engines are NOT a free-wheeling design. Therefore, care should be taken not to rotate the camshafts or crankshaft with the timing belt removed.

TIMING BELT AND SPROCKETS (Continued)

CAUTION: When camshaft sprocket bolts are loosened or removed, the camshafts must be re-timed to the engine. Also, the camshaft sprocket bolts must NOT be reused.

(1) Remove front timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(2) Position crankshaft sprocket to the TDC mark on the oil pump housing by turning crankshaft in the clockwise direction (Fig. 147).

Fig. 147 Camshaft Sprocket Timing Marks

- 1 - ALIGN CAMSHAFT SPROCKET TIMING MARK BETWEEN MARKS ON REAR TIMING BELT COVER
- 2 - CRANKSHAFT AT TDC

(3) Install a dial indicator in number 1 cylinder to check TDC of the piston (Fig. 148). Rotate the crankshaft until the piston is at exactly TDC.

(4) Remove camshaft retainer/thrust plates from rear of cylinder heads. To access the right side plate, remove the EGR valve. (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - REMOVAL)

NOTE: Special Tool 6642 is interchangeable between cylinder banks.

(5) Install Special Tools 6642 Camshaft Alignment tools to the rear of each cylinder head by inserting pin on the alignment tool to the pilot hole on the camshaft. Attach tools using the retainer plate bolts. (Fig. 149).

NOTE: If the alignment tools do not properly line-up to install attaching bolts, first remove the timing belt tensioner, then slowly rotate camshaft with a wrench until bolts can be installed.

80b27c60

Fig. 148 Dial Indicator

Fig. 149 Camshaft Alignment Holding Tools

- 1 - LEFT CAMSHAFT PILOT HOLE
- 2 - RIGHT CAMSHAFT PILOT HOLE
- 3 - CAMSHAFT ALIGNMENT SPECIAL TOOLS 6642

(6) Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(7) Hold camshaft sprocket with 36 mm (1 7/16 in.) box end wrench.

TIMING BELT AND SPROCKETS (Continued)

(8) Loosen and remove bolt and washer. To remove the camshaft sprocket bolts with engine in the vehicle, it may be necessary to lift the engine to allow bolt removal clearance. The right bolt is 213 mm (8 3/8 in.) long and the left bolt is 255 mm (10.0 in.) long.

NOTE: Each sprocket has a "D" shaped hole that allows it to rotate several degrees in each direction on its shaft. This design requires the crankshaft-to-camshaft to be properly timed to ensure proper engine performance.

(9) Remove the camshaft sprockets.

REMOVAL - CRANKSHAFT SPROCKET

(1) Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(2) Remove crankshaft sprocket using Special Tool L-4407-A (Fig. 150).

Fig. 150 Crankshaft Sprocket - Removal

1 - SPECIAL TOOL L-4407-A

INSPECTION - TIMING BELT

(1) Remove timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(2) Inspect both sides of the timing belt. Replace belt if any of the following conditions exist (Fig. 151):

- (a) Hardening of back rubber back side is glossy without resilience and leaves no indent when pressed with fingernail.
- (b) Cracks on rubber back.
- (c) Cracks or peeling of canvas.
- (d) Cracks on rib root.
- (e) Cracks on belt sides.
- (f) Missing teeth.
- (g) Abnormal wear of belt sides. The sides are normal if they are sharp as if cut by a knife.

(h) Vehicle mileage or time at component maintenance requirement. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

(3) If none of the above conditions are seen on the belt, the belt cover can be installed.

NOTE: If belt requires replacing, ensure the proper length belt is used.

INSTALLATION

INSTALLATION - TIMING BELT

CAUTION: This procedure can only be used when the camshaft sprockets HAVE NOT BEEN LOOSENED or removed from the camshafts.

CAUTION: If camshafts have moved from the timing marks, always rotate camshaft towards the direction nearest to the timing marks (DO NOT TURN CAMSHAFTS A FULL REVOLUTION OR DAMAGE to valves and/or pistons could result).

(1) Align the crankshaft sprocket with the TDC mark on oil pump cover (Fig. 152).

TIMING BELT AND SPROCKETS (Continued)

(2) Align the camshaft sprockets (to reference mark made upon removal) between the marks on the rear covers (Fig. 144).

(3) Install the timing belt starting at the crankshaft sprocket going in a counterclockwise direction (Fig. 152). Install the belt around the last sprocket. Maintain tension on the belt as it is positioned around the tensioner pulley.

(4) Holding the tensioner pulley against the belt, install the tensioner into the housing and tighten to 28 N·m (250 in. lbs.). Each camshaft sprocket mark should still fall between the cover marks.

(5) When tensioner is in place pull retaining pin to allow the tensioner to extend to the pulley bracket.

(6) Rotate crankshaft sprocket 2 revolutions and check the timing marks on the camshafts and crankshaft. The marks should line up within their respective locations (Fig. 152). If marks do not line up, repeat procedure.

Fig. 152 TIMING BELT - INSTALLATION

- 1 - ALIGN CAMSHAFTS WITH TIMING MARKS
- 2 - INSTALL TENSIONER LOOSE
- 3 - CRANKSHAFT AT TDC

(7) Install the front timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(8) Install the crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

(9) Install the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(10) Install the radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(11) Install upper radiator crossmember. (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION)

(12) Connect negative cable to remote jumper terminal.

INSTALLATION - CAMSHAFT SPROCKETS

CAUTION: The camshaft sprockets are not interchangeable from side to side (Fig. 153).

Fig. 153 CAMSHAFT SPROCKETS

1 - DIS PICKUP SLOTS

(1) Install camshaft sprockets onto the camshafts. Install **NEW** sprocket attaching bolts into place. The 255 mm (10 in.) bolt is to be installed in the left camshaft and the 213 mm (8 3/8 in.) bolt is to be installed into the right camshaft. **Do not tighten the bolts; tightened at later step.** Camshaft sprocket mark should be positioned between the marks on the cover at both sprockets (Fig. 154).

(2) Install the timing belt starting first at the crankshaft sprocket, then to remaining components in a counterclockwise direction (Fig. 155).

(3) Install the belt around the last sprocket. Maintain tension on the belt as it is positioned around the tensioner pulley. Each camshaft sprockets mark should still fall between the cover marks (Fig. 155).

NOTE: For timing belt tensioner reset procedure, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - TIMING BELT - REMOVAL).

TIMING BELT AND SPROCKETS (Continued)

**Fig. 154 Camshaft Sprocket Timing Marks**

- 1 - ALIGN CAMSHAFT SPROCKET TIMING MARK BETWEEN MARKS ON REAR TIMING BELT COVER
2 - CRANKSHAFT AT TDC

**Fig. 155 TIMING BELT - INSTALLATION**

- 1 - ALIGN CAMSHAFTS WITH TIMING MARKS
2 - INSTALL TENSIONER LOOSE
3 - CRANKSHAFT AT TDC

(4) Hold the tensioner pulley against the belt and install the reset (pinned) timing belt tensioner into the housing. Tighten attaching bolts to 28 N·m (250 in. lbs.).

(5) Remove tensioner retaining pin to allow the tensioner to extend to the pulley bracket.

(6) Using a dial indicator, position the number 1 piston at TDC (Fig. 156).

(7) Hold the camshaft sprocket hex with a 36 mm (1 7/16 in.) wrench and tighten the camshaft bolts to the following:

- Right side = 102 N·m (75 ft. lbs.) +90° turn

- Left side = 115 N·m (85 ft. lbs.) +90° turn

**Fig. 156 Dial Indicator**

- (8) Remove dial indicator and install spark plug.
(9) Remove Special Tools 6642.
(10) Install cam retainer/thrust plates and O-rings (Fig. 157). Tighten bolts to 28 N·m (250 in. lbs.).

**Fig. 157 CAMSHAFT THRUST PLATE**

- 1 - CAMSHAFT THRUST PLATE
2 - BOLT
3 - O-RING

(11) Install timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(12) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

TIMING BELT AND SPROCKETS (Continued)

(13) Install accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(14) Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

INSTALLATION - CRANKSHAFT SPROCKET

CAUTION: To ensure proper installation depth of crankshaft sprocket, Special Tool 6641 must be used.

(1) Install crankshaft sprocket using Special Tools 6641 and C-4685-C1 (Fig. 158).

(2) Install timing belt. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

Fig. 158 CRANKSHAFT SPROCKET INSTALLATION

EXHAUST SYSTEM

DESCRIPTION

The exhaust system (Fig. 1) or (Fig. 2) consists of two front close coupled catalytic converters. Both converters attach directly to the exhaust manifold using a V-Band clamp. The exhaust down pipes exit the converters and connect into the front resonator. The front resonator, intermediate pipe, and muffler are one single module. The rear resonator and tailpipe connect to the muffler outlet. The 300M Special has both a left and right rear resonator. The upstream oxygen sensors are located in each exhaust manifold. The downstream oxygen sensors are located at the rear of each catalytic converter.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EXHAUST SYSTEM

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST NOISE (UNDER HOOD)	1. Exhaust manifold cracked or broken. 2. Manifold to cylinder head leak. 3. EGR tube to manifold gasket leakage. 4. EGR Valve to EGR tube gasket leakage. 5. Exhaust to manifold leak. 6. Pipe and shell noise from front exhaust pipe.	1. Replace manifold. 2. Tighten manifold and/or replace gasket. 3. Tighten fasteners or replace gasket. 4. Tighten fasteners or replace gasket. 5. Tighten or replace V-Band Clamp. 6. Characteristic of single wall pipe.
EXCESSIVE EXHAUST NOISE	1. Leak at exhaust pipe joints. 2. Burned or rusted out muffler assembly or exhaust pipe. 3. Burned or rusted out resonator(s). 4. Restriction in exhaust system. 5. Converter material in muffler or resonators.	1. Tighten clamps at leaking joints. 2. Replace exhaust module, rear resonator/tailpipe assembly or exhaust pipe with catalytic converter assembly. 3. Replace resonator assembly. 4. Remove restriction if possible, or replace components as necessary. 5. Replace muffler, resonators and converter assemblies. Check fuel injection and ignition systems for proper operation.

DIAGNOSIS AND TESTING - EXHAUST SYSTEM
RESTRICTION CHECK

Exhaust system restriction can be checked by measuring back pressure using the DRB III® and PEP module pressure tester.

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

(1) Disconnect and remove the upstream (before catalytic converter) oxygen sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O₂ SENSOR - REMOVAL)

(2) Install the Exhaust Back Pressure Fitting Adaptor CH8519.

(3) Connect the Low Pressure Sensor (15 psi) CH7063 to the back pressure fitting.

(4) Following the PEP module instruction manual, connect all required cables to the DRB III® and PEP module. Select the available menu options on the DRBIII® display screen for using the digital pressure gauge function.

(5) Apply the park brake and start the engine.

(6) With transmission in Park or Neutral, raise engine speed to 2000 RPM. Monitor the pressure readings on the DRBIII®. Back pressure should not exceed specified limit. Refer to specification in table below EXHAUST BACK PRESSURE LIMITS.

NOTE: For applications with dual catalytic converters, repeat test on opposite converter using the previous steps.

EXHAUST SYSTEM (Continued)

(7) If pressure exceeds maximum limits, inspect exhaust system for restricted component. For further catalytic converter inspection procedures, (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSPECTION). Replace component(s) as necessary.

EXHAUST BACK PRESSURE LIMITS

Exhaust Back Pressure Limit (Max)	
Vehicle in Park/Neutral (no load) @2000 RPM	3.45 Kpa (0.5 psi)

REMOVAL - EXHAUST SYSTEM

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

It is easier to service the exhaust system module components (Fig. 1) or (Fig. 2), when system is removed from the vehicle.

- (1) Raise vehicle on hoist.
- (2) Apply penetrating oil and loosen band clamps at resonator connector.
- (3) Remove screw attaching exhaust system ground strap to left rear resonator.
- (4) Separate exhaust module at front resonator from the converter downpipes.

CAUTION: At this time, the exhaust system is held by only isolators. Support the exhaust system underneath the front resonator and the muffler while the isolators are being removed. Do not use any tools to remove the isolators, remove by hand only. Soapy water or silicone-based spray may be used to assist removal. Do Not use a petroleum-based lubricant on the isolators. This will damage the rubber material.

- (5) Support exhaust system with jack stand.
- (6) Remove the rubber isolators from the rear suspension crossmember and support brackets on body (Fig. 3) and (Fig. 4).
- (7) Lower exhaust system and lay on the ground.

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts be used for the following reasons:

80b1b35a

Fig. 3 Rubber Isolator Hanger to Body Support

- 1 - SUPPORT BRACKET
- 2 - ISOLATOR
- 3 - RESONATOR/PIPE

- To ensure proper alignment with other parts in the system.
- Provide acceptable exhaust noise levels and does not change exhaust system back pressure that could affect emissions and performance.

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

NOTE: Slip joint band clamps are spot welded to exhaust system. If a band clamp must be replaced, the spot weld must be ground off.

INSTALLATION - EXHAUST SYSTEM

- (1) Install and loose assemble the front resonator to the converter pipes.
- (2) Place the exhaust system on two supports (one on side of muffler, one behind the resonator). Connect the system to the converter pipes.
- (3) Install the system's rubber isolators onto the support brackets (Fig. 3) and (Fig. 4).
- (4) Install exhaust system ground strap.
- (5) Visually inspect the isolators. They should be straight when viewing from front to back of the vehicle. Working from the front of system, align each

EXHAUST SYSTEM (Continued)

80ae83e0

1 - SUPPORTS
2 - MUFFLER

3 - ISOLATORS

component to maintain position and proper clearance with underbody parts.

(6) Tighten band clamps to 61 N·m (45 ft. lbs.).

(7) Lower the vehicle.

(8) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(9) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, isolators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

(1) Loosen clamps and support brackets.

(2) Align the exhaust system starting at the front, working rearward.

(3) Tighten all clamps and brackets once alignment and clearances are achieved.

CATALYTIC CONVERTER(S)

DESCRIPTION

The close coupled, three-way catalytic converter inlets are connected to the exhaust manifolds by the use of V-Band clamps (Fig. 5). The left and right side converter outlet pipe connects to the exhaust system (Fig. 5).

OPERATION

The three-way catalytic converter simultaneously converts three exhaust emissions into harmless gases. Specifically, HC and CO emissions are con-

80f7ed66

Fig. 5 Catalytic Converters

- 1 - V-BAND CLAMPS
- 2 - RIGHT CATALYTIC CONVERTER
- 3 - LEFT CATALYTIC CONVERTER

verted into water (H₂O) and carbon dioxide (CO₂). Oxides of Nitrogen (NO_x) are converted into elemental Nitrogen (N) and water. The three-way catalyst is most efficient in converting HC, CO and NO_x at the stoichiometric air fuel ratio of 14.7:1.

The oxygen content in a catalyst is important for efficient conversion of exhaust gases. When a high oxygen content (lean) air/fuel ratio is present for an extended period, oxygen content in a catalyst can reach a maximum. When a rich air/fuel ratio is present for an extended period, the oxygen content in the catalyst can become totally depleted. When this occurs, the catalyst fails to convert the gases. This is known as catalyst "punch through."

Catalyst operation is dependent on its ability to store and release the oxygen needed to complete the emissions-reducing chemical reactions. As a catalyst deteriorates, its ability to store oxygen is reduced. Since the catalyst's ability to store oxygen is somewhat related to proper operation, oxygen storage can be used as an indicator of catalyst performance. Refer to the appropriate Powertrain Diagnostic Procedure for diagnosis of a catalyst related Diagnostic Trouble Code (DTC).

The combustion reaction caused by the catalyst releases additional heat in the exhaust system, causing temperature increases in the area of the reactor under severe operating conditions. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency. **Do not** remove spark

CATALYTIC CONVERTER(S) (Continued)

plug wires from plugs or by any other means short out cylinders, if exhaust system is equipped with a catalytic converter. Failure of the catalytic converter can occur due to temperature increases caused by unburned fuel passing through the converter. This deterioration of the catalyst core can result in excessively high emission levels, noise complaints, and exhaust restrictions.

The use of catalysts also involves some non-automotive problems. Unleaded gasoline must be used to avoid poisoning the catalyst core. Do not allow engine to operate above 1200 RPM in neutral for extended periods over 5 minutes. This condition may result in excessive exhaust system/floor pan temperatures because of no air movement under the vehicle.

CAUTION: Due to exterior physical similarities of some catalytic converters with pipe assemblies, extreme care should be taken with replacement parts. There are internal converter differences required in some parts of the country (particularly vehicles built for States with strict emission requirements).

INSPECTION

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

Check catalytic converter for a flow restriction. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

CATALYTIC CONVERTER - RIGHT

REMOVAL - RIGHT SIDE

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

- (1) Disconnect negative battery cable at remote jumper terminal located at right strut tower.
- (2) Raise vehicle on hoist.
- (3) Remove exhaust system (Refer to 11 - EXHAUST SYSTEM - REMOVAL).
- (4) Lower vehicle.
- (5) Disconnect Inlet Air Temperature (IAT) Sensor connector.
- (6) Loosen hose clamp for throttle body air inlet hose.
- (7) Disconnect make up air hose from right cylinder head cover.
- (8) Remove air cleaner assembly with air inlet hose (Fig. 6).

80a95404

Fig. 6 Air Cleaner with Inlet Hose

- 1 - AIR CLEANER ASSEMBLY WITH AIR INLET HOSE
2 - THROTTLE BODY

CATALYTIC CONVERTER - RIGHT (Continued)

(9) Disconnect ground strap at right frame rail/shock tower area.

(10) Remove air cleaner resonator support bracket from right cylinder head.

(11) Disconnect downstream oxygen sensor connector and remove sensor from converter pipe (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O₂ SENSOR - REMOVAL).

(12) Loosen and remove V-Band clamp at exhaust manifold (Fig. 5).

NOTE: Do not reuse V-Band clamp.

(13) Raise vehicle on hoist.

(14) Remove nut attaching right catalytic converter hanger bracket to transaxle bracket (Fig. 5).

(15) Support front of engine cradle on both sides with suitable jack stands (Fig. 7).

(16) Support transmission oil pan with suitable transmission jack (Fig. 7).

(17) Loosen front engine cradle bolts two to three turns (Fig. 8).

(18) Remove rear engine cradle bolts (Fig. 8).

(19) Lower the rear of the engine cradle 76 mm (3 in.) with the transmission jack to allow removal of catalytic converter from engine compartment.

80f934c6

Fig. 8 Engine Cradle

1 - SUPPORT FRONT OF CRADLE WITH JACK STANDS

2 - SUPPORT TRANSMISSION WITH JACK

CATALYTIC CONVERTER - RIGHT (Continued)

NOTE: To allow enough clearance for catalytic converter removal, remove hanger bracket from hanger (Fig. 9). The use of a helper under the vehicle to guide the catalytic converter will ease removal operation.

(20) Remove catalytic converter by twisting/turning while pulling up from **TOP SIDE** of engine compartment.

80F89764

Fig. 9 Converter Hanger and Bracket

1 - HANGER BRACKET
2 - HANGER

INSTALLATION - RIGHT SIDE

NOTE: To allow enough clearance for catalytic converter installation, remove hanger bracket from hanger (Fig. 9).

NOTE: Do not reuse V-Band clamp.

(1) Position a **NEW** V-Band clamp onto the exhaust manifold outlet. **DO NOT** latch the clamp's T-bolt at this time (Fig. 5).

NOTE: The use of a helper under the vehicle to guide the catalytic converter will ease installation operation.

(2) Install catalytic converter from **TOP SIDE** of engine compartment. If necessary, stretch open the V-Band clamp to allow the converter to engage the manifold outlet.

- (3) Latch the V-Band clamp T-bolt.
- (4) Install hanger bracket onto hanger (Fig. 9).
- (5) Hand start nut attaching right catalytic converter hanger bracket to transaxle bracket (Fig. 5).
- (6) Raise engine cradle with transmission jack until cradle contacts vehicle body. Install rear cradle bolts. Torque rear cradle bolts to 102 N·m (75 ft.

lbs.). Torque front cradle bolts to 109 N·m (80 ft. lbs.) (Fig. 8).

- (7) Remove jack stands and transmission jack.
- (8) Lower vehicle.

NOTE: Check for proper alignment and clearance to underbody and engine compartment components before tightening clamps.

- (9) Tighten V-Band clamp to 11 N·m (100 in. lbs.).
- (10) Install downstream oxygen sensor and connect electrical connector (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O₂ SENSOR - INSTALLATION).
- (11) Install air cleaner resonator support bracket to right cylinder head.
- (12) Connect ground strap at right frame rail/shock tower area.
- (13) Install air cleaner assembly with air inlet hose (Fig. 6).
- (14) Connect make up air hose to right cylinder head cover.
- (15) Tighten hose clamp for throttle body air inlet hose.
- (16) Connect Inlet Air Temperature (IAT) Sensor connector.
- (17) Raise vehicle on hoist.
- (18) Torque nut attaching right catalytic converter hanger bracket to transaxle bracket to 47 N·m (35 ft. lbs.) (Fig. 5).
- (19) Install exhaust system (Refer to 11 - EXHAUST SYSTEM - INSTALLATION).
- (20) Lower vehicle.
- (21) Connect negative battery cable.
- (22) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
- (23) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

CATALYTIC CONVERTER - LEFT

REMOVAL - LEFT SIDE

(1) Loosen and remove V-Band clamp at exhaust manifold joint (Fig. 5).

NOTE: Do not reuse V-Band clamp.

- (2) Hoist vehicle.
- (3) Remove exhaust system (Refer to 11 - EXHAUST SYSTEM - REMOVAL).
- (4) Disconnect downstream oxygen sensor electrical connector and remove sensor from converter pipe (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O₂ SENSOR - REMOVAL).

CATALYTIC CONVERTER - LEFT (Continued)

(5) Loosen or remove nut attaching left pipe to transaxle bracket (Fig. 5).

CAUTION: Care should be taken when removing converter not to damage driveshaft boot.

(6) Remove converter from below vehicle.

INSTALLATION - LEFT SIDE

- (1) Install converter.
- (2) Attach a NEW V-Band clamp and tighten to 11 N·m (100 in. lbs.) (Fig. 5).
- (3) Install and/or tighten nut attaching pipe to transaxle bracket to 47 N·m (35 ft. lbs.) (Fig. 5).
- (4) Install downstream oxygen sensor and connect electrical connector (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O₂ SENSOR - INSTALLATION).
- (5) Install exhaust system (Refer to 11 - EXHAUST SYSTEM - INSTALLATION).
- (6) Lower vehicle.
- (7) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
