- (8) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

HEAT SHIELDS

DESCRIPTION

The catalytic converters have an integral heat shield attached to them and are not to be removed.

OPERATION

Heat shields are needed to protect both the car and the environment from the high temperatures developed in the vicinity of the catalytic converters.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system heat shields on cars if equipped. Light over spray near the edges is permitted. Application of coating will greatly reduce the efficiency of the heat shields resulting in excessive floor pan temperatures and objectionable fumes.

MUFFLER/FRONT RESONATOR ASSEMBLY

REMOVAL

- (1) Remove exhaust system (Refer to 11 - EXHAUST SYSTEM - REMOVAL).

(2) Loosen clamp and separate left rear resonator/pipe from muffler/front resonator assembly (Fig. 1) or (Fig. 2).

(3) **300M Special:** Remove nuts securing right rear resonator/pipe to muffler/front resonator assembly (Fig. 2).

INSTALLATION

(1) Install left rear resonator/pipe onto new muffler/front resonator (Fig. 1) or (Fig. 2), but do not tighten clamp until exhaust system is installed on vehicle.

(2) **300M Special:** Install right rear resonator/pipe onto new muffler/front resonator (Fig. 2), but do not tighten nuts until exhaust system is installed on vehicle.

(3) Install exhaust system (Refer to 11 - EXHAUST SYSTEM - INSTALLATION).

(4) Align exhaust components for proper clearance.

(5) Tighten all exhaust band clamps to 61 N·m (45 ft. lbs.).

(6) **300M Special:** Tighten right rear resonator/pipe nuts to 28 N·m (250 in. lbs.) (Fig. 2).

(7) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(8) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

RESONATOR - LEFT REAR

REMOVAL

(1) Remove the exhaust system (Refer to 11 - EXHAUST SYSTEM - REMOVAL).

(2) Loosen the clamp of the left rear resonator/pipe assembly (Fig. 1) or (Fig. 2).

(3) Remove the left rear resonator/pipe assembly.

INSTALLATION

(1) Install the left rear resonator/pipe assembly onto the muffler/front resonator assembly and loosely assemble the accompanying clamp (Fig. 1) or (Fig. 2).

(2) Install exhaust system (Refer to 11 - EXHAUST SYSTEM - INSTALLATION).

(3) Align exhaust components for proper clearance. Tighten all band clamps to 61 N·m (45 ft. lbs.).

(4) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(5) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

RESONATOR - RIGHT REAR (300M SPECIAL)

REMOVAL

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

- (1) Raise vehicle on hoist.
- (2) Apply penetrating oil to right rear resonator/pipe nuts (Fig. 2).

CAUTION: Do not use any tools to remove the isolators, remove by hand only. Soapy water or silicone-based spray may be used to assist removal.

Do Not use a petroleum-based lubricant on the isolators. This will damage the rubber material.

- (3) Remove the rubber isolator from the rear support bracket on body.
- (4) Remove right rear resonator/pipe nuts (Fig. 2).
- (5) Remove right rear resonator/pipe assembly.

INSTALLATION

- (1) Position right rear resonator/pipe assembly into mounting position. Loosely install attaching nuts (Fig. 2).
- (2) Install the rubber isolator to the rear support bracket on body.
- (3) Align right rear resonator/pipe for proper clearance. Tighten nuts to 28 N·m (250 in. lbs.).
- (4) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
- (5) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

FRONT BUMPER REINFORCEMENT

REMOVAL

- Remove front fascia.
- Remove end plugs in ends of bumper after removing screws in front of bumper.
- Remove attaching bolts from bumper reinforcement to adapter plate through ends of the bumper. (Fig. 1).
- If beam is damaged, the adapter plate to rail welds will have to be cut off

INSTALLATION

- Place reinforcement in position on front of vehicle.
- Install attaching bolts to inside of bumper reinforcement to adapter plates.
- Install end plugs in ends of bumper, using screws in front of the bumper.
- Install front fascia.

Fig. 1 FRONT BUMPER REINFORCEMENT

- 3-END CAP

FRONT FASCIA

REMOVAL

REMOVAL

- (1) Release hood latch and open hood.
- (2) Remove large rubber grommet (70 mm x 168 mm) from splash shield to gain access to fascia fasteners (Fig. 2).
- (3) Remove fasteners attaching fascia to the front fender and splash shield.
- (4) Remove the nuts on the fascia studs through the splash shield access holes on each side (Fig. 3).
- (5) Remove the fasteners attaching the fascia to the lower crossmember (Fig. 4).
- (6) Remove the fasteners attaching the fascia to the upper radiator closure panel (Fig. 4).
- (7) Disconnect wire connectors (fog lamps, parking/turn signal, side marker), if equipped (Fig. 5).
- (8) Remove fascia from vehicle.

Fig. 2 ACCESS RUBBER GROMMET

1 - ACCESS RUBBER GROMMET

REMOVAL - INTREPID

- (1) Release hood latch and open hood.
- (2) Remove push pin fasteners attaching bottom of fascia (air dam) to lower crossmember (Fig. 6).
- (3) Remove fasteners attaching fascia to splash shields (Fig. 7).
- (4) Remove push pin fasteners attaching the fascia to upper radiator closure panel.
- (5) Pull the sides of the fascia outwards to disengage fascia from drive pins then pull fascia forward.
- (6) Disconnect fog lamp wire connectors, if equipped.
- (7) Remove fascia from vehicle.

- 1 - FRONT FASCIA
- 2 - FOG LAMP CONNECTORS
- 3 - FRONT FENDER
- 4 - PUSH PIN FASTENER

INSTALLATION

INSTALLATION

- (1) Connect wire connectors.
- (2) Place fascia in position on vehicle, by fitting foam to bumper reinforcement. Use care not to scratch fender. Tape may be put on fender for protection.
- (3) Install the top center fasteners, to upper radiator closure panel.
- (4) Align fascia to bumper reinforcement.
- (5) Align the two fascia studs to the fender vertical attachments, at the same time align the fascia groove on the horizontal flange with the fender fasteners. Push fascia rearward to engage the fasteners.

- (6) Install nut on fascia stud through the splash shield access hole, on each side.
- (7) Install fasteners attaching fascia to the front fender and splash shield.
- (8) Install grommet.
- (9) Install the fasteners attaching the fascia to the lower crossmember.

INSTALLATION - INTREPID

- (1) Connect fog lamp wire connectors, if equipped.
- (2) Place fascia pin position on vehicle, by fitting foam to bumper beam.
- (3) Snap sides of fascia over drive pin fasteners on fenders.
- (4) Install fasteners to upper radiator closure.
- (5) Install fasteners attaching fascia to splash shields.
- (6) Install fasteners attaching bottom of fascia to lower crossmember.

REAR BUMPER

REMOVAL

- (1) Remove rear fascia.
- (2) Remove attaching bolts and nuts from attaching bracket to rails (Fig. 8).

80b1b32f

Fig. 8 REAR BUMPER REINFORCEMENT

- 1 - REAR BUMPER REINFORCEMENT

INSTALLATION

- (1) Place reinforcement in position on rear of vehicle.
- (2) Install bracket to rails attaching bolts and nuts.

REAR FASCIA

REMOVAL

- (1) Release deck lid latch and open deck lid.

REAR FASCIA (Continued)

(2) Partially remove trunk carpet to gain access to fascia attaching nuts and remove nuts.

(3) 300M only, remove both tail lamp housings to gain access to fascia attaching fasteners and remove attaching fasteners.

(4) Remove fasteners attaching fascia to rear quarter and splash shield.

(5) Remove upper push pins attaching the fascia to the body.

(6) Pull fascia with 30 pound force to disengage plastic clip and grommet that attaches the fascia to the quarter panel vertical flange one side at a time (Fig. 9).

(7) Disengage main wire connector from the body harness. The connector is on the left side of vehicle.

(8) Remove fascia from vehicle.

Fig. 9 REAR BUMPER FASCIA

INSTALLATION

(1) Connect main wire connector to the body harness connector.

(2) Place rear fascia in position on bumper reinforcement.

(3) Align the two fascia studs to the quarter panel vertical attachment, at the same time align the fascia key hole slot on the horizontal flange with the drive pin. Push fascia forward to engage the fasteners.

(4) Install push pins attaching top of fascia to body.

(5) 300M only, install nut on fascia stud and install tail lamp and fasteners under tail lamp.

(6) Install trunk carpet back in position.

(7) Install fasteners attaching fascia to rear quarter panel and splash shields.

REAR FASCIA - INTREPID

REMOVAL - INTREPID

(1) Open deck lid.

(2) Remove fasteners attaching fascia to rear quarter and splash shields.

(3) Remove fasteners attaching fascia to lower trunk panel.

(4) Pull sides of fascia outwards to disengage snaps to quarter panel attaching bracket (Fig. 10).

(5) Pull fascia rearward to expose license plate lamp wire connector. Disconnect wire harness connector. The connector is located on the left side of vehicle.

Fig. 10 REAR BUMPER FASCIA

1 - LOWER TRUNK OPENING
2 - REAR FASCIA

INSTALLATION - INTREPID

(1) Connect the license plate lamp wire connector to the body harness.

(2) Place rear fascia in position on vehicle, by fitting foam to bumper beam.

(3) Install center fastener to lower trunk panel.

(4) Snap sides of fascia between quarter panel and bracket.

(5) Install fasteners attaching fascia to rear quarter panel and splash shields.

(6) Install the remaining fasteners to lower trunk panel.

FRAME

SPECIFICATIONS

FRAME DIMENSIONS

Frame dimensions are listed in metric scale then converted to inch scale listed in parenthesis. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location. Vertical dimensions can be taken from the work surface to the locations indicated.

ENGINE CRADLE CROSSMEMBER

REMOVAL

CAUTION: VERIFY THAT VEHICLE IS PROPERLY SUPPORTED AND SECURED TO THE LIFTING DEVICE. VEHICLE CENTER OF GRAVITY WILL CHANGE WHEN HEAVY COMPONENTS ARE REMOVED CAUSING A HAZARDOUS CONDITION.

- (1) Release hood latch and open hood.
- (2) Remove nuts holding engine mounts to cradle.
- (3) Install a suitable engine support device.
- (4) Raise and support vehicle on safety stands.
- (5) Remove bolts holding transaxle crossmember to cradle.
- (6) Lower vehicle and lift engine and transaxle off cradle.
- (7) Raise and support vehicle on safety stands.
- (8) Disconnect sway bar links.
- (9) Remove bolts retaining suspension lower ball joints to spindles.
- (10) Separate lower control arm from spindle. Refer to Group 2, Suspension, for proper procedures.
- (11) Support cradle on a 10 cm by 10 cm by 90 cm (4 in. by 4 in. by 36 in.) wood beam and a jack.
- (12) Remove bolts holding cradle to body shell (Fig. 15).
- (13) Lower cradle away from body shell.

INSTALLATION

NOTE: If cradle replacement is required, transfer suspension components and jounce and bounce plates to replacement cradle.

- (1) Support cradle on wood beam and a jack.
- (2) Position cradle under body shell.

80b29fa6

- (3) Install bolts to hold cradle to body shell.
- (4) Connect lower control arms to spindles. Refer to Group 2, Suspension, for proper procedures.
- (5) Install bolts to retain suspension lower ball joints to spindles.
- (6) Connect sway bar links.
- (7) Lower vehicle and lower engine and transaxle onto cradle.
- (8) Raise vehicle.
- (9) Install bolts to hold transaxle crossmember to cradle.
- (10) Lower vehicle.
- (11) Remove engine support device.
- (12) Install nuts to hold engine mounts to cradle.
- (13) Align front suspension if necessary.

FRONT TOW EYE

REMOVAL

- (1) Unthread the front tow eye from the tow eye bracket (Fig. 16).
- (2) Remove the front tow eye.

FRONT TOW EYE (Continued)

80b5cbcb

Fig. 16 FRONT TOW EYE POSITION & ORIENTATION

- 1 - FRONT TOW EYE
2 - FRONT TOW EYE BRACKET

INSTALLATION

(1) Install the tow eye into the tow eye bracket. No torque specification is required, hand tighten only (Fig. 17).

80a9b31b

Fig. 17 FRONT TOW EYE INSTALLATION

- 1 - NO SPACE
2 - TOW EYE

FRONT TOW HOOK BRACKET

REMOVAL

(1) Unthread the front tow eye from the tow eye bracket (Fig. 16).

(2) Open hood and disconnect the negative battery cable remote terminal from the battery post.

(3) Hoist vehicle.

(4) Partially remove the front fascia to gain access to the windshield/headlamp washer reservoir. Refer to Body for the procedure.

(5) Remove the front tow eye bracket.

INSTALLATION

(1) Install the front tow eye bracket and fasteners. Torque bolts to 23 to 34 N·m (Fig. 16).

(2) Reinstall the front fascia as necessary. Refer to Body for procedure.

(3) Lower vehicle from the hoist.

(4) Install the tow eye into the tow eye bracket. No torque specification is required, hand tighten only (Fig. 17).

(5) Reconnect the negative battery cable at the remote battery post.

REAR CROSSMEMBER

DESCRIPTION

This vehicle is equipped with a aluminum alloy rear suspension crossmember that spans the distance between the rear frame rails (Fig. 18). It is isolated from the frame rails with the use of rubber isolator bushings. These bushings may be replaced separately.

The rear suspension crossmember has 4 rubber isolator bushings which are replaceable.

OPERATION

The purpose of the rear suspension crossmember is to support the lower end of the rear suspension through the use of four lateral links. Two lateral links are mounted on each end of the crossmember (Fig. 18).

REMOVAL

(1) Open the fuel filler door. Remove the 3 fuel filler neck attaching screws. Remove the fuel filler cap.

(2) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in the Lubrication and Maintenance section of this manual, for the required lifting procedure to be used for this vehicle.

(3) Remove both rear wheel and tire assemblies from the vehicle.

(4) Remove the nut and bolt attaching each of the 4 lateral links to the crossmember (Fig. 19). **The bolt for the left front lateral link may not be removed at this time. Remove the nut only. Once the crossmember is lowered, the bolt can**

REAR CROSSMEMBER (Continued)

80abfe8c

Fig. 18 REAR SUSPENSION CROSSMEMBER

1 - LATERAL LINKS

2 - REAR CROSSMEMBER ISOLATOR BUSHINGS

3 - LATERAL LINKS

be easily removed. (Fig. 19). Notice the forward attaching bolts face rearward.

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 19) to prevent damage to the fuel tank and or fuel tubes in case of an accident. The bolt attaching the left rear lateral link must be installed with the bolt pointing forward to prevent damage to the fuel filler tube.

(5) Remove the screw securing the brake tubes to the left stabilizer bar isolator bushing retainer.

(6) Remove the 4 bolts attaching both stabilizer bar isolator bushing retainers to the frame rails (the 2 rearward attaching bolts also attach the front corners of the rear suspension crossmember in place). Allow the stabilizer bar to hang down.

(7) Remove the parking brake cable tensioner from the intermediate parking brake cable. Refer to Base Brake System in Group 5 Brakes in this manual for the required service procedure.

(8) Remove the parking brake cable tensioner from the left rear parking brake cable. Refer to Base Brake System in Group 5 Brakes in this manual for the required service procedure.

(9) Remove the right rear parking brake cable from the intermediate parking brake cable. Refer to Base Brake System in Group 5 Brakes in this manual for the required service procedure.

80b30893

Fig. 19 LATERAL LINK ATTACHMENT TO CROSSMEMBER

1 - LATERAL LINKS

2 - LEFT FRONT LATERAL LINK BOLT

3 - LATERAL LINKS

(10) Remove the retainer clips securing both rear parking brake cables assemblies to the rear suspension crossmember (Fig. 20).

(11) Remove parking brake cables from crossmember.

(12) Remove nuts attaching both brake proportioning valves to the rear corners of the crossmember (Fig. 21).

REAR CROSSMEMBER (Continued)

Fig. 20 REAR PARKING BRAKE AND RETAINER CLIP (LEFT)

- 1 - CROSSMEMBER ATTACHING BOLT
- 2 - REAR FLEX HOSE
- 3 - BRAKE PROPORTIONING VALVE
- 4 - REAR CROSSMEMBER
- 5 - ATTACHING NUT

(13) Position a transmission jack under the muffler.

(14) Disconnect the hanger securing the exhaust resonator to the rear frame rail.

(15) Disconnect the hangers securing the exhaust muffler to the rear suspension crossmember. There is one hanger on each side of the muffler.

(16) Lower the transmission jack and muffler enough to allow for better access to the rear crossmember.

(17) Remove the screw securing the fuel filler neck to the left frame rail.

(18) Remove the final 2 bolts attaching the rear suspension crossmember to the frame rails. These are located at the rear corners of the crossmember (Fig. 21).

(19) Lower rear suspension crossmember as low as possible to allow for removal of lateral link attaching bolt at left front corner of crossmember.

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 19) to prevent damage to the fuel tank and or fuel tubes. Also, the bolt attaching the left rear lateral link must be installed with the bolt pointing forward to prevent damage to the fuel filler tube.

(20) Remove the link attaching bolt and link from the left front corner of the crossmember.

(21) Remove the rear suspension crossmember from the vehicle.

DISASSEMBLY

(1) Lay the crossmember right-side-up on a bench with the bushing to be removed hanging over the edge of the bench.

(2) Install cup, Special Tool 8173-1, in well of press, Special Tool C-4212F.

(3) Install Remover/Installer, Special Tool 8173-2, on end of the threaded push rod on Special Tool C-4212F.

(4) Install Special tool C-4212F with Special Tools 8173-1, and 8173-2, on bushing (Fig. 22).

(5) Turn the threaded rod, pushing bushing down through crossmember and into cup 8173-1.

(6) Remove special tools, and bushing

ASSEMBLY

(1) Clean bore in crossmember where bushing mounts.

(2) Thoroughly coat new bushing and crossmember bore with Mopar® Rubber Bushing Installation Lube.

(3) Place Installer, Special Tool C-8173-3, on top of crossmember bushing bore with inside taper end facing up. Locator lip on bottom of tool should align the tool with bushing bore.

(4) Coat the tapered bore of Special Tool C-8173-3 with Mopar® Rubber Bushing Installation Lube, then place the bushing in its tapered bore (Fig. 24).

(5) Install Special Tool 8173-4 in the cup, Special Tool 8173-1 (Fig. 23). Install cup, Special Tool 8173-1 into well of press, Special Tool C-4212F (Fig. 23).

(6) Install Remover/Installer, Special Tool 8173-2, on end of the threaded push rod on Special Tool C-4212F.

(7) Place special tools on crossmember and bushing (Fig. 24).

REAR CROSSMEMBER (Continued)

80b34e03

Fig. 22 BUSHING REMOVAL

- 1 - SPECIAL TOOL C-4212F
- 2 - REAR SUSPENSION CROSSMEMBER
- 3 - BUSHING
- 4 - SPECIAL TOOL 8173-1
- 5 - SPECIAL TOOL 8173-2

(8) Turn the threaded rod, pushing bushing down through Special tool 8173-3 and into place in the crossmember. Continue pushing the bushing until bottoms against Special Tool 8173-4.

(9) Remove special tools.

(10) Verify the bushing is properly centered in the crossmember bore and the outer bushing lips are not pinched.

INSTALLATION

(1) Install the rear suspension crossmember back into vehicle above muffler. Make sure that the brake tubes are properly routed above the crossmember as it is installed.

(2) Install the rear proportioning valve mounting brackets into mounting position at the rear corners of the crossmember (Fig. 21). Install the attaching nuts.

(3) Install Intermediate parking brake cable routing clip into place on left front of crossmember (Fig. 20).

(4) Reattach left forward lateral link to crossmember. Install mounting bolt through the front of the

80b34e04

Fig. 23 SPECIAL TOOLS

- 1 - SPECIAL TOOL 8173-1
- 2 - SPECIAL TOOL C-4212F
- 3 - SPECIAL TOOL 8173-4

crossmember mount towards the rear. Do not install and torque nut at this time.

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 19) to prevent damage to the fuel tank and or fuel tubes. Also, when installing the bolt attaching the left rear lateral link, install the bolt pointing forward to prevent damage to the fuel filler tube.

(5) Raise the crossmember up against the frame rails. Install, but do not fully tighten, the 2 bolts attaching the rear of the crossmember to the frame rails.

(6) Raise the exhaust into place. Reattach the 3 exhaust hangers previously removed from the muffler and resonator.

(7) Remove transmission jack supporting muffler and exhaust system.

(8) Reinstall the fuel filler neck attaching screw and secure the fuel filler neck to the left frame rail.

(9) Position the rear parking brake cables into crossmember alignment holes (Fig. 20).

REAR CROSSMEMBER (Continued)

**Fig. 24 BUSHING INSTALLATION**

- 1 - SPECIAL TOOL C-4212F
- 2 - SPECIAL TOOL 8173-2
- 3 - BUSHING
- 4 - SPECIAL TOOL 8173-3
- 5 - SPECIAL TOOL 8173-1

(10) Install the retainer clips securing both rear parking brake cables assemblies to the rear suspension crossmember (Fig. 20).

(11) Reconnect the right rear parking brake cable to the intermediate parking brake cable.

(12) Install the parking brake cable tensioner to the left rear parking brake cable.

(13) Install the parking brake cable tensioner to the intermediate parking brake cable. Refer to Base Brake System in Group 5 Brakes in this manual for the required service procedure to install and properly adjust the parking brakes.

(14) Install the 4 bolts attaching both stabilizer bar isolator bushing retainers to the frame rails (the

2 rearward attaching bolts attach the front corners of the rear suspension crossmember in place). Tighten the forward stabilizer bar isolator bushing retainer attaching bolts to 40 N·m (30 ft. lbs.). Tighten the 2 rearward stabilizer bar isolator bushing retainer attaching bolts (which also serve as the front crossmember attaching bolts) to 100 N·m (75 ft. lbs.).

(15) Tighten the rear suspension crossmember rear attaching bolts to 100 N·m (75 ft. lbs.).

(16) Install the screw securing the brake tubes to the left stabilizer bar isolator bushing retainer.

(17) Install the remaining 3 lateral links to the rear suspension crossmember. The forward lateral arm mounting bolts must point rearward, and the rearward lateral arm mounting bolts must point forward.

CAUTION: The bolts attaching the forward lateral links to the crossmember must be installed with the bolts pointing rearward (Fig. 19) to prevent damage to the fuel tank and or fuel tubes. The bolt attaching the left rear lateral link must be installed with the bolt pointing forward to prevent damage to the fuel filler tube.

(18) Install the lateral link attaching nuts, but DO NOT fully tighten at this time.

CAUTION: Tightening the lateral link attaching bolts at this time will cause the bushings contort at curb riding height, leading to premature failure of the bushings. Tighten bolts only when vehicle is at curb riding height.

(19) Install wheel and tire assemblies on vehicle.

(20) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).

(21) Lower vehicle to the ground.

(22) Install the 3 fuel filler neck attaching screws. Reinstall the fuel filler cap.

(23) Tighten all 4 lateral arm to crossmember attaching bolt and nut assemblies to 95 N·m (70 ft. lbs.).

(24) Check and reset rear wheel TOE to specifications if required.

REAR TOW EYE

REMOVAL

- (1) Hoist and support vehicle. Refer to Lubrication and Maintenance, for proper lifting procedure.
- (2) Remove bolts holding rear tow eye bracket to rear frame rail (Fig. 25).
- (3) Remove rear tow eye bracket from vehicle.

INSTALLATION

- (1) Position rear tow eye bracket on vehicle.
- (2) Install bolts to hold rear tow eye bracket to rear frame rail. Torque bolts to 48 N·m.
- (3) Lower vehicle.

Fig. 25 REAR TOW EYE ASSEMBLY

FUEL DELIVERY

DESCRIPTION

The front wheel drive car uses a plastic fuel tank located rear center of the vehicle.

The Fuel Delivery System consists of: the following items:

- Electric fuel pump module
- Fuel filter
- Tubes/lines/hoses
- Fuel injectors

The in-tank fuel pump module contains the fuel pump. The pump is serviced as part of the fuel pump module. Refer to Fuel Pump Module.

The fuel filter is replaceable only as part of the fuel pump module.

OPERATION

The fuel system provides fuel pressure by an in-tank pump module. The PCM controls the operation of the fuel system by providing battery voltage to the fuel pump through the fuel pump relay. The PCM requires only three inputs and a good ground to operate the fuel pump relay. The three inputs are:

- Ignition voltage
- Crankshaft Position (CKP) sensor
- Camshaft Position (CMP) sensor

DIAGNOSIS AND TESTING - FUEL DELIVERY SYSTEM

(Refer to Appropriate Diagnostic Information)

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE PROCEDURE

(1) Remove Fuel Pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.

(2) Start and run engine until it stalls.

(3) Attempt restarting engine until it will no longer run.

(4) Turn ignition key to OFF position.

(5) Return fuel pump relay to PDC.

(6) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB III® scan tool must be used to erase a DTC.

FLOW MANAGEMENT VALVE

DESCRIPTION

It is a plastic valve inline between the fuel tank and the EVAP canister.

OPERATION

The flow management valve meters the flow of fuel vapors to and from the EVAP canister during vehicle run, and refueling. Pressure from the tank during refueling opens the main port valve and allows vapors to the EVAP canister. During vehicle run the vapors are metered through an orifice to the EVAP canister. It also is a liquid separator to keep fuel out of the EVAP canister.

FUEL LEVEL SENDING UNIT /
SENSOR

DESCRIPTION

The fuel gauge level sending unit is attached to the side of fuel pump module. The level sensor is a variable resistor.

OPERATION

Its resistance changes with the amount of fuel in the tank. The float arm attached to the sensor moves as the fuel level changes.

The fuel level input is used as an input for OBD II. If the fuel level is below 15% or above 85% of total tank capacity several monitors are disabled. There are diagnostics for the level circuit open and shorted.

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

REMOVAL

Remove fuel pump module. Refer to Fuel Pump Module in this section.

(1) Depress the retaining tab and remove the fuel pump/level sensor connector from the bottom of the fuel pump module electrical connector (Fig. 1).

Fig. 1 Fuel Pump/Level Sensor Connector

- 1 - TAB
- 2 - FUEL PUMP/LEVEL SENSOR CONNECTOR
- 3 - BOTTOM OF FUEL PUMP MODULE ELECTRICAL CONNECTOR

(2) Remove wire terminal retaining clip from connector (Fig. 2). Note the location of terminals for the level sensor wires (Fig. 3).

(7) Install fuel pump module. Refer to Fuel Pump Module in this section.

FUEL LINES

DESCRIPTION - FUEL LINES/HOSES AND CLAMPS

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

STANDARD PROCEDURE - HOSES AND CLAMP

Inspect all hose connections (clamps and quick connect fittings) for completeness and leaks. Replace

**Fig. 6 STANDPIPE INSIDE OF MODULE**

- 1 - STANDPIPE
2 - LEVEL SENSOR WIRES

(2) Wrap wires into groove in back of level sensor (Fig. 7).

(3) While feeding wires into standpipe, slide level sensor up into installation channel until it snaps into place. Ensure tab at bottom of sensor locks in place.

(4) Install level sensor wires in connector. Push the wires up through the connector and then pull them down until they lock in place. Ensure signal and ground wires are installed in the correct position (Fig. 3).

(5) Install retaining clip on connector.

(6) Push fuel pump/level sensor connector up into bottom of fuel pump module electrical connector.

FUEL LINES (Continued)

cracked, scuffed, or swelled hoses. Replace hoses that rub against other vehicle components or show sign of wear.

Fuel injected vehicles use specially constructed hoses. When replacing hoses, only use hoses marked EFM/EFI.

When installing hoses, ensure that they are routed away from contact with other vehicle components that could rub against them and cause failure. Avoid contact with clamps or other components that cause abrasions or scuffing. Ensure that rubber hoses are properly routed and avoid heat sources.

The hose clamps have rolled edges to prevent the clamp from cutting into the hose. Only use clamps that are original equipment or equivalent. Other types of clamps may cut into the hoses and cause high pressure fuel leaks. Tighten hose clamps to 1 N·m (9 in. lbs.) torque.

Inspect all hose connections such as clamps, couplings and fittings to make sure they are secure and leaks are not present. The component should be replaced immediately if there is any evidence of degradation that could result in failure.

Never attempt to repair a plastic fuel line/tube. Replace as necessary.

Avoid contact of any fuel tubes/hoses with other vehicle components that could cause abrasions or scuffing. Be sure that the plastic fuel lines/tubes are properly routed to prevent pinching and to avoid heat sources.

FUEL PRESSURE REGULATOR

DESCRIPTION

A combination fuel filter and fuel pressure regulator is used on all gas powered engines. It is located on the side of the fuel pump module (Fig. 8) in the fuel tank.

It contains a diaphragm, calibrated springs and a fuel return valve.

OPERATION

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is calibrated to maintain fuel system operating pressure of approximately 400 kPa (58 psi) at the fuel injectors.

Fuel is supplied to the regulator by the electric fuel pump through an opening tube at the bottom of regulator.

The fuel pump module contains a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine (Fig. 8).

If fuel pressure at the pressure regulator exceeds approximately 58 psi, an internal diaphragm closes and excess fuel pressure is routed back into the tank

80faab0

Fig. 8 PRESSURE REGULATOR

through the pressure regulator. A separate fuel return line is not used with any gas powered engine.

FUEL PUMP

DESCRIPTION

The electric fuel pump is located in and is part of the fuel pump module. It is a positive displacement, gerotor type, immersible pump with a permanent magnet electric motor. The fuel pump module is suspended in fuel in the fuel tank.

OPERATION

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains a check valve. The valve, in the pump outlet, maintains pump pressure during engine off conditions, for a short while. It is normal for fuel pressure to drop to zero after cooldown. The fuel pump relay provides voltage to the fuel pump. The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 kPa \pm 34 kPa (58 psi \pm 5 psi).

NOTE: Checkvalve maintains volume of fuel in the rail and lines, not pressure.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module contains the fuel pump, fuel reservoir, level sensor, inlet strainer, and fuel pressure regulator.

OPERATION

The Chrysler fuel pump module is an in-tank unit with an integral fuel level sensor and pressure regulator. The pump is driven by a 12 volt DC motor any time the fuel pump relay is energized. Serviceable components on the module include:

- Inlet strainer
- Fuel level sensor
- Pressure regulator

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains two check valves. One valve relieves internal fuel pump pressure and regulates maximum pump output. The second valve, in the pump outlet, maintains pump pressure during engine off conditions.

The fuel systems use either a positive displacement, gerotor, with a permanent magnet electric motor. This fuel system does not contain the traditional fuel return lines. The regulator contains a calibrated spring which forces a diaphragm against the fuel filter return port. When pressure exceeds the calibrated amount, the diaphragm retracts, allowing excess pressure and fuel to vent into the tank.

The maximum deadhead pressure is approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 ± 34 kPa (58 ± 5 psi).

REMOVAL

(1) Release fuel pressure, Refer to Fuel System Pressure Release Procedure in the Fuel Delivery section.

(2) Remove Fuel Tank refer to the Fuel Tank Removal/Installation in this group.

WARNING: THE FUEL RESERVOIR OF THE FUEL PUMP MODULE DOES NOT EMPTY OUT WHEN THE TANK IS DRAINED. THE FUEL IN THE RESERVOIR WILL SPILL OUT WHEN THE MODULE IS REMOVED.

(3) Disconnect fuel line from fuel pump module by depressing quick connect retainers with thumb and fore finger.

(4) Slide fuel pump module electrical connector lock to unlock.

(5) Disconnect the electrical connection from the fuel pump module, by pushing down on connector retainer and pulling connector off of module.

(6) Use Special Tool #6856 to remove fuel pump module locknut (Fig. 9).

(7) Remove fuel pump and O-ring seal from tank. Discard old seal.

80ad62b0

Fig. 9 FUEL TANK LOCKNUT

- 1 - SPECIAL TOOL #6856
- 2 - LOCKING RING
- 3 - FUEL PUMP MODULE

INSTALLATION

(1) Wipe seal area of tank clean and place a new seal in position in the tank opening.

(2) Position fuel pump in the tank. Make sure the alignment tabs on the underside of the fuel pump module flange (Fig. 10) sits in the notches on the fuel tank (Fig. 11).

80faac27

Fig. 10 PUMP MODULE NOTCH

FUEL PUMP MODULE (Continued)

80faac3d

Fig. 11 FUEL TANK NOTCH LOCATOR

(3) Position the locknut over the fuel pump module.

(4) Tighten the locknut using Special Tool #6856 to 55 N·m (40.5 ft. lbs.).

CAUTION: Over tightening the pump lock ring may result in a leak.

- (5) Raise the fuel tank on the transmission stand.
- (6) Install fuel pump electrical connector into hole in the body.
- (7) Connect the purge and vent lines.
- (8) Raise tank into position and install tank straps.
- (9) Install the fuel filler tube and tighten the clamp.
- (10) Reposition the stabilizer bar and install bolts.
- (11) Lower vehicle.
- (12) Connect the fuel pump electrical connector that is in the rear seat.
- (13) Install the rear seat.
- (14) Connect the battery cable.
- (15) Fill fuel tank. Use the DRB III® scan tool to pressurize the fuel system. Check for leaks.

FUEL RAIL

DESCRIPTION

The fuel rail supplies the necessary fuel to each individual fuel injector and is mounted to the intake manifold.

OPERATION

The fuel pressure regulator is no longer mounted to the fuel rail on any engine. It is now located on

the fuel tank mounted fuel pump module. Refer to Fuel Filter/Fuel Pressure Regulator in the Fuel Delivery System section of this group for information. The fuel rail is not repairable.

REMOVAL - 2.7/3.5L

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL RAIL. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

- (1) Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.
- (2) Disconnect the negative battery cable.
- (3) Remove intake manifold plenum. Refer to the Engine section for information.
- (4) Remove intake manifold plenum mounting bolts. Lift Plenum up off of engine. Cover intake manifold to prevent foreign material from entering engine.
- (5) Disconnect fuel supply tube quick connect fitting at the rear of the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section.
- (6) If the injector connectors are not tagged with their cylinder number, tag them to identify the correct cylinder (Fig. 12).

80ad62b6

Fig. 12 Injector Electrical Connectors

- 1 - FUEL INJECTOR
- 2 - IGNITION COIL

- (7) Remove mounting bolts on both sides of fuel rail.
- (8) Lift fuel rail straight up off of cylinder head.
- (9) Remove retaining clips from fuel injectors at fuel rail.
- (10) Remove fuel injector from fuel rail.

FUEL RAIL (Continued)

INSTALLATION

INSTALLATION - 2.7L

- (1) Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.
- (2) Install retaining clips on fuel injectors.
- (3) Push injectors into fuel injector rail until clips are in the correct position.
- (4) Position fuel rail over cylinder heads, and push rail into place. Tighten fuel rail mounting bolts to 11 N·m (100 in. lbs.) torque.
- (5) Connect the fuel supply tube quick connect fitting to the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section.
- (6) Connect the electrical connectors to the fuel injectors.
- (7) Install intake manifold plenum. Refer to the Engine section for information.
- (8) Connect negative cable to battery.

INSTALLATION - 3.5L

- (1) Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.
- (2) Install retaining clips on fuel injectors.
- (3) Push injectors into fuel injector rail until clips are in the correct position.
- (4) Position fuel rail over cylinder heads, and push rail into place. Tighten fuel rail mounting bolts to 28 N·m (250 in. lbs.) torque.
- (5) Connect the fuel supply tube quick connect fitting to the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section.
- (6) Connect the electrical connectors to the fuel injectors.
- (7) Install intake manifold plenum. Refer to the Engine section for information.
- (8) Connect negative cable to battery.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module. The tank is made from High density Polyethylene (HDPE) material. If equipped with ORVR (Onboard Refueling Vapor Recovery) it has been added to the fuel tank to control refueling vapor emissions.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

All models are equipped with either one or two rollover valves mounted into the top of the fuel tank (or pump module).

An evaporation control system is connected to the rollover valve(s)/control valve (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/ORVR - OPERATION) to reduce emissions of fuel vapors into the atmosphere, when the tank is vented due to vapor expansion in the tank. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. In addition, fuel vapors produced during vehicle refueling are allowed to pass through the vent hoses/tubes to the charcoal canister(s) for temporary storage (prior to being drawn into the intake manifold). All models are equipped with a self-diagnosing system using a Natural Vacuum Leak Detection (NVLD). Refer to the Emission Control System for additional information.

INLET CHECK VALVE

All vehicles have an inlet check valve on the inside of the fuel tank at the filler inlet

The valve prevents fuel from splashing back on customer during vehicle refueling. The valve is a non-serviceable item.

REMOVAL

- (1) Release fuel pressure. Refer to Fuel System Pressure Release Procedure.
- (2) Disconnect battery cable (Fig. 13).

80ad62a3

Fig. 13 Battery Cable

- 1 - BATTERY CABLE
- 2 - SERVICE VACUUM SUPPLY TEE

FUEL TANK (Continued)

(3) Remove rear seat, refer to the Body section for more information.

(4) Disconnect fuel pump electrical connector (Fig. 14).

Fig. 14 Electrical Connector

(5) Raise vehicle and support.

NOTE: To drain fuel tank it is best to have less than 1/2 a tank of fuel.

(6) To drain fuel tank, place container under fuel filler tube at fuel tank. Loosen and remove fuel filler tube from fuel tank (Fig. 15). Stick siphon hose into tank at fuel filler tube connection, and drain fuel tank.

Fig. 15 Fuel Filler Tube

- 1 - FUEL FILLER TUBE

(8) Disconnect fuel and EVAP lines (Fig. 18).

(9) Position transmission jack under fuel tank assembly.

(10) Remove fuel tank straps bolts. Passenger side first.

(11) Lower fuel tank and remove the purge line and vent line.

FUEL TANK (Continued)

**Fig. 18 Fuel and EVAP Lines**

- 1 - EVAP LINES
- 2 - BRAKE LINES
- 3 - FUEL LINE

(12) Remove the wiring harness from the heat shield, if needed (Fig. 19).

**Fig. 19 HARNESS TAB ON HEAT SHIELD**

- 1 - Wiring Harness
- 2 - Heat Shield

- (13) Lower tank more and remove the wiring harness from fuel tank pin, if needed (Fig. 20).
- (14) Remove wiring harness from body.
- (15) Remove NVLD filter from mounting location.
- (16) Remove fuel tank (Fig. 21).

INSTALLATION

- (1) Raise the fuel tank on the transmission stand (Fig. 21).
- (2) Install fuel pump electrical connector into hole in the body.

**Fig. 20 HARNESS ON TANK PIN**

- 1 - Pin
- 2 - Wiring Harness

**Fig. 21 FUEL TANK**

- (3) Connect wiring harness to fuel tank pin, if removed (Fig. 20).
- (4) Connect wiring harness to heat shield, if removed (Fig. 19).
- (5) Connect the purge and vent lines (Fig. 18).
- (6) Raise tank into position and install tank straps.
- (7) Install the fuel filler tube and tighten the clamp (Fig. 15).
- (8) Reposition the stabilizer bar and install bolts.
- (9) Lower vehicle.
- (10) Connect the fuel pump electrical connector that is under the rear seat (Fig. 14).
- (11) Install the rear seat to the Body section for more information.
- (12) Connect the battery cable (Fig. 13).
- (13) Fill fuel tank. Use the DRB scan tool to pressurize the fuel system. Check for leaks.

FUEL TANK FILLER TUBE

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Drain fuel tank.
- (3) Remove 3 screws from filler neck to quarter panel.
- (4) Raise and support vehicle on host.
- (5) Loosen clamps at filler neck.
- (6) Remove filler neck.

INSTALLATION

- (1) Install filler neck to filler hose.
- (2) Tighten clamps.
- (3) Lower vehicle.
- (4) Install 3 screws to filler neck and quarter panel.
- (5) Fill tank and check for leaks.
- (6) Connect negative cable from battery.

Fig. 22 INLET STRAINER

- 1 - INLET STRAINER
2 - RETAINING CLIP
3 - FUEL LEVEL SENSOR

FUEL TANK VENT TUBE

REMOVAL

- (1) Perform fuel system pressure release.
- (2) Disconnect negative cable from battery.
- (3) Drain fuel tank.
- (4) Raise and support vehicle on host.
- (5) Lower fuel tank, refer to Fuel Tank Removal/Installation in this section.
- (6) Remove vent hose from top of tank.
- (7) Remove vent hose from fuel filler neck.

INSTALLATION

- (1) Install vent hose and tighten clamp.
- (2) Install fuel tank, refer to Fuel Tank Removal/Installation in this section.
- (3) Install vent hose to fuel filler neck and tighten clamp.
- (4) Lower vehicle.
- (5) Fill fuel tank and check for leaks.
- (6) Connect negative cable to battery.

INLET FILTER

REMOVAL

- (1) Remove fuel pump module. Refer to Fuel Pump Module Removal in this section.
- (2) Using a thin straight blade screwdriver, pry back the locking tabs on fuel pump reservoir and remove the strainer (Fig. 22).
- (3) Remove strainer O-ring from the fuel pump reservoir body.
- (4) Remove any contaminants in the fuel tank by washing the inside of the fuel tank.

INSTALLATION

- (1) Lubricate the strainer O-ring with clean engine oil.
- (2) Insert strainer O-ring into outlet of strainer so that it sits evenly on the step inside the outlet.
- (3) Push strainer onto the inlet of the fuel pump reservoir body. Make sure the locking tabs on the reservoir body lock over the locking tangs on the strainer.
- (4) Install fuel pump module. Refer to Fuel Pump Module Installation in this section.

QUICK CONNECT FITTING

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

REMOVAL

When disconnecting a quick-connect fitting, the retainer will remain on the fuel tube nipple.

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE DISCONNECTING A QUICK-CONNECT FITTINGS. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE.

- (1) Perform Fuel Pressure Release Procedure. Refer to the Fuel Pressure Release Procedure in this section.
- (2) Disconnect negative cable from battery or auxiliary jumper terminal.
- (3) Squeeze retainer tabs together and pull fuel tube/quick-connect fitting assembly off of fuel tube nipple. The retainer will remain on fuel tube.

QUICK CONNECT FITTING (Continued)

INSTALLATION

CAUTION: Never install a quick-connect fitting without the retainer being either on the fuel tube or already in the quick-connect fitting. In either case, ensure the retainer locks securely into the quick-connect fitting by firmly pulling on fuel tube and fitting to ensure it is secured.

(1) Using a clean lint free cloth, clean the fuel tube nipple and retainer.

(2) Prior to connecting the fitting to the fuel tube, coat the fuel tube nipple with clean engine oil.

(3) Push the quick-connect fitting over the fuel tube until the **retainer seats and a click is heard**.

(4) The plastic quick-connect fitting has windows in the sides of the casing. When the fitting completely attaches to the fuel tube, the retainer locking ears and the fuel tube shoulder are visible in the windows. If they are not visible, the retainer was not properly installed (Fig. 23). **Do not rely upon the audible click to confirm a secure connection.**

Fig. 23 Plastic Quick-Connect Fitting/Fuel Tube Connection

- 1 - WINDOW
- 2 - TAB (2)
- 3 - EAR
- 4 - SHOULDER (ON TUBE)

(5) Connect negative cable to battery or auxiliary jumper terminal.

CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) Relay remains energized for several minutes, until the test is stopped, or until the ignition switch is turned to the Off position.

(6) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

TWO-TAB TYPE FITTING

This type of fitting is equipped with tabs located on both sides of the fitting (Fig. 24). These tabs are sup-

plied for disconnecting the quick-connect fitting from component being serviced.

80a35405

Fig. 24 Typical Two-Tab Type Quick-Connect Fitting

- 1 - TAB(S)
- 2 - QUICK-CONNECT FITTING

CAUTION: The interior components (O-rings, spacers) of this type of quick-connect fitting are not serviced separately, but new plastic retainers are available. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

(4) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 24) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer. Pull fitting from fuel system component being serviced. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

(5) Inspect quick-connect fitting body and component for damage. Replace as necessary.

QUICK CONNECT FITTING (Continued)

CAUTION: When the quick-connect fitting was disconnected, the plastic retainer will remain on the component being serviced. If this retainer must be removed, very carefully release the retainer from the component with two small screwdrivers. After removal, inspect the retainer for cracks or any damage.

(6) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(7) Insert quick-connect fitting to component being serviced and into plastic retainer. When a connection is made, a click will be heard.

(8) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(9) Connect negative cable to battery or auxiliary jumper terminal.

(10) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

PLASTIC RETAINER RING TYPE FITTING

This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 25) usually black in color.

J9314-100

Fig. 25 Plastic Retainer Ring Type Fitting

- 1 - FUEL TUBE
- 2 - QUICK CONNECT FITTING
- 3 - PUSH
- 4 - PLASTIC RETAINER
- 5 - PUSH
- 6 - PUSH
- 7 - PUSH
- 8 - PUSH

CAUTION: The interior components (O-rings, spacers, retainers) of this type of quick-connect fitting are not serviced separately. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this section.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

(4) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 25). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(5) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(6) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(7) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(8) Insert quick-connect fitting into component being serviced until a click is felt.

(9) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(10) Connect negative battery cable to battery or auxiliary jumper terminal.

(11) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

FUEL INJECTION

OPERATION

OPERATION - INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

OPERATION - MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two different areas of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP modes the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP modes, except for heated oxygen

sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP modes the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

- (1) Engine coolant temperature must be over 35°F.
 - If the coolant is over 35°F the PCM will wait 38 seconds.
 - If the coolant is over 50°F the PCM will wait 15 seconds.
 - If the coolant is over 167°F the PCM will wait 3 seconds.
- (2) For other temperatures the PCM will interpolate the correct waiting time.
- (3) O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.
- (4) The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide Open Throttle
- Ignition switch OFF

(5) The engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle modes are OPEN LOOP modes. Under most operating conditions, the acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** are CLOSED LOOP modes.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately

FUEL INJECTION (Continued)

1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.

- The PCM energizes the injectors (on the 69° degree falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.

- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

- When the engine idles within ± 64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)

- Camshaft position
- Knock sensor
- Throttle position
- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.

FUEL INJECTION (Continued)

- All monitored components (refer to the Emission section for On-Board Diagnostics).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
 - Knock sensor
 - Manifold absolute pressure
 - Throttle position sensor
 - IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL CORRECTION or ADAPTIVE MEMORIES**DESCRIPTION**

In Open Loop, the PCM changes pulse width without feedback from the O2 Sensors. Once the engine warms up to approximately 30 to 35° F, the PCM goes into closed loop **Short Term Correction** and utilizes feedback from the O2 Sensors. Closed loop **Long Term Adaptive Memory** is maintained above 170° to 190° F unless the PCM senses wide open throttle. At that time the PCM returns to Open Loop operation.

OPERATION**Short Term**

The first fuel correction program that begins functioning is the short term fuel correction. This system corrects fuel delivery in direct proportion to the readings from the Upstream O2 Sensor.

The PCM monitors the air/fuel ratio by using the input voltage from the O2 Sensor. When the voltage reaches its preset high or low limit, the PCM begins to add or remove fuel until the sensor reaches its switch point. The short term corrections then begin.

The PCM makes a series of quick changes in the injector pulse-width until the O2 Sensor reaches its

FUEL INJECTION (Continued)

opposite preset limit or switch point. The process then repeats itself in the opposite direction.

Short term fuel correction will keep increasing or decreasing injector pulse-width based upon the upstream O₂ Sensor input. The maximum range of authority for short term memory is 25% (+/-) of base pulse-width. Short term is violated and is lost when ignition is turned OFF.

Long Term

The second fuel correction program is the long term adaptive memory. In order to maintain correct emission throughout all operating ranges of the engine, a cell structure based on engine rpm and load (MAP) is used.

Ther number of cells varies upon the driving conditions. Two cells are used only during idle, based upon TPS and Park/Neutral switch inputs. There may be two other cells used for deceleration, based on TPS, engine rpm, and vehicle speed. The other twelve cells represent a manifold pressure and an rpm range. Six of the cells are high rpm and the other six are low rpm. Each of these cells has a specific MAP voltage range Typical Adaptive Memory Fuel Cells.

As the engine enters one of these cells the PCM looks at the amount of short term correction being used. Because the goal is to keep short term at 0 (O₂ Sensor switching at 0.5 volt), long term will update in the same direction as short term correction was moving to bring the short term back to 0. Once short term is back at 0, this long term correction factor is stored in memory.

The values stored in long term adaptive memory are used for all operating conditions, including open loop and cold starting. However, the updating of the long term memory occurs after the engine has exceeded approximately 170°-190° F, with fuel control in closed loop and two minutes of engine run time. This is done to prevent any transitional temperature or start-up compensations from corrupting long term fuel correction.

Long term adaptive memory can change the pulse-width by as much as 25%, which means it can correct for all of short term. It is possible to have a problem that would drive long term to 25% and short term to another 25% for a total change of 50% away from base pulse-width calculation.

TYPICAL ADAPTIVE MEMORY FUEL CELLS

	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Idle	Decel
Vacuum	20	17	13	9	5	0		
Above 1,984 rpm	1	3	5	7	9	11	13 Drive	15
Below 1,984 rpm	0	2	4	6	8	10	12 Neutral	14
MAP volt =	0	1.4	2.0	2.6	3.3	3.9		

Fuel Correction Diagnostics

There are two fuel correction diagnostic routines:

- Fuel System Rich
- Fuel System Lean

A DTC is set and the MIL is illuminated if the PCM detects either of these conditions. This is determined based on total fuel correction, short term times long term.

PROGRAMMABLE COMMUNICATIONS INTERFACE (PCI) BUS**DESCRIPTION**

The Programmable Communication Interface Multiplex system (PCI Bus) consist of a single wire. The Body Control Module (BCM) acts as a splice to connect each module and the Data Link Connector

(DLC) together. Each module is wired in parallel to the data bus through its PCI chip set and uses its ground as the bus reference. The wiring is a minimum 20 gage wire.

OPERATION

Various modules exchange information through a communications port called the PCI Bus. The Powertrain Control Module (PCM) transmits the Malfunction Indicator Lamp (Check Engine) On/Off signal and engine RPM on the PCI Bus. The PCM receives the Air Conditioning select input, transaxle gear position inputs over the PCI Bus. The PCM also receives the air conditioning evaporator temperature signal from the PCI Bus.

The following components access or send information on the PCI Bus.

FUEL INJECTION (Continued)

- Instrument Panel
- Body Control Module
- Air Bag System Diagnostic Module
- Full ATC Display Head (if equipped)
- ABS Module
- Transmission Control Module
- Powertrain Control Module
- Travel Module
- SKIM

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major

system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) .

TORQUE MANAGEMENT

OPERATION

The PCM receives the torque management input from the transmission control module. The PCM receives the input when the transmission shifts gears. In response, the PCM shuts off a number of fuel injectors when the transmission shifts gears.

CRANKSHAFT POSITION SENSOR**DESCRIPTION**

The crankshaft sensor is located on the passengers side of the transmission housing, above the differential housing (Fig. 5). The bottom of the sensor is positioned next to the drive plate.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

80ad6293

Fig. 5 CRANKSHAFT POSITION SENSOR

- 1 - CRANKSHAFT POSITION SENSOR

CRANKSHAFT POSITION SENSOR (Continued)

OPERATION

Engine speed and crankshaft position are provided through the crankshaft position sensor. The sensor generates pulses that are the input sent to the powertrain control module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The crankshaft position sensor detects slots cut into the transmission driveplate extension. There are 3 sets of slots. Two sets contain 4 slots and one set contains 5 slots, for a total of 13 slots (Fig. 6). Basic timing is set by the position of the last slot in each group. Once the Powertrain Control Module (PCM) senses the last slot, it determines which piston will be next at TDC from the camshaft position sensor input. It may take the PCM one engine revolution to determine crankshaft position.

Fig. 6 TIMING SLOTS

1 - TORQUE CONVERTER DRIVE PLATE
2 - SLOTS

The PCM uses crankshaft position reference to determine injector sequence and ignition timing. Once the PCM determines crankshaft position, it begins energizing the injectors and coils in sequence.

The PCM uses the Crankshaft Position sensor to calculate the following:

- Engine rpm
- TDC number 1 and 4
- Ignition coil synchronization
- Injector synchronization
- Camshaft-to-crankshaft misalignment (Timing belt skipped 1 tooth or more diagnostic trouble code)

REMOVAL

The crankshaft sensor is located on the passengers side of the transmission housing, above the differen-

tial housing. The bottom of the sensor sits above the drive plate.

(1) Disconnect electrical connector from crankshaft position sensor.

(2) Remove sensor mounting screw. Remove sensor.

INSTALLATION

The crankshaft sensor is located on the passengers side of the transmission housing, above the differential housing. The bottom of the sensor sits above the drive plate.

(1) Install sensor and push sensor down until contact is made with the transmission case. While holding the sensor in this position, install and tighten the retaining bolt to 12 N·m (105 in. lbs.) torque.

(2) Connect electrical connector to crankshaft position sensor.

ENGINE SPEED SENSOR

DESCRIPTION

The PCM receives a signal from the TCM and the transaxle output speed sensor over the bus communication line to indicate vehicle speed on automatic transmission cars. On Manual transmission cars (if equipped) vehicle, a dedicated vehicle speed sensor is connected to the PCM.

OPERATION

The Transmission Control Module (TCM) supplies the road speed and distance traveled inputs to the PCM. From these inputs and the throttle position sensor input, the PCM determines when a deceleration condition occurs.

FUEL INJECTOR

DESCRIPTION

The injectors are positioned in the cylinder heads with the nozzle ends directly above the intake valve port (Fig. 8). The fuel injectors are electrical solenoids (Fig. 7).

OPERATION

The fuel injectors are 12 volt electrical solenoids (Fig. 9). The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a hollow cone or two streams. The spraying action atomizes the fuel, adding it to the air entering the

combustion chamber. Fuel injectors are not interchangeable between engines.

The PCM provides battery voltage to each injector through the ASD relay. Injector operation is controlled by a ground path provided for each injector by the PCM. Injector on-time (pulse-width) is variable, and is determined by the PCM processing all the data previously discussed to obtain the optimum injector pulse width for each operating condition. The pulse width is controlled by the duration of the ground path provided.

REMOVAL**REMOVAL - 2.7L**

- (1) Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.
- (2) Disconnect negative cable to battery.
- (3) Remove intake manifold plenum. Refer to the Engine section for information.
- (4) Remove intake manifold plenum mounting bolts. Lift Plenum up off of engine. Cover intake manifold to prevent foreign material from entering engine.
- (5) Disconnect fuel supply tube quick connect fittings at the rear of intake manifold. Refer to Quick Connect Fittings in the Fuel Delivery Section.
- (6) If the injector connectors are not tagged with their cylinder number, tag them to identify the correct cylinder
- (7) Remove electrical connectors from the fuel injectors.
- (8) Remove fuel rail mounting bolts.
- (9) Lift fuel rail straight up off of the cylinder head.
- (10) Remove retaining clips from fuel injectors at fuel rail.
- (11) Remove fuel injectors.
- (12) Repeat for remaining injectors.
- (13) Check injector O-ring for damage. If O-ring is damaged, it must be replaced. Replace the injector clip if it is damaged.

REMOVAL - 3.5L

- (1) Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.
- (2) Disconnect the negative battery cable.

FUEL INJECTOR (Continued)

(3) Remove intake manifold plenum. Refer to the Engine section for information.

(4) Remove intake manifold plenum mounting bolts. Lift Plenum up off of engine. Cover intake manifold to prevent foreign material from entering engine.

(5) Disconnect fuel supply tube quick connect fitting at the rear of the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section.

(6) If the injector connectors are not tagged with their cylinder number, tag them to identify the correct cylinder.

(7) Remove electrical connectors from the fuel injectors.

(8) Remove mounting bolts on both sides of fuel rail.

(9) Lift fuel rail straight up off of cylinder head.

(10) Remove retaining clips from fuel injectors at fuel rail.

(11) Remove fuel injectors.

INSTALLATION

INSTALLATION - 2.7L

(1) Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.

(2) Install fuel injectors.

(3) Install retaining clips on fuel injectors.

(4) Push injectors into fuel injector rail until clips are in the correct position.

(5) Position fuel rail over cylinder head, and push rail into place. Tighten fuel rail mounting bolts to 11 N·m (100 in. lbs.) torque.

(6) Connect fuel supply tube quick connect fittings at the rear of intake manifold. Refer to Quick Connect Fittings in the Fuel Delivery Section.

(7) Connect electrical connectors to fuel injectors.

(8) Install intake manifold plenum. Refer to the Engine section for information.

(9) Connect negative cable to battery.

INSTALLATION - 3.5L

(1) Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.

(2) Install retaining clips on fuel injectors.

(3) Push injectors into fuel injector rail until clips are in the correct position.

(4) Position fuel rail over cylinder head, and push rail into place. Tighten fuel rail mounting bolts to 28 N·m (250 in. lbs.) torque.

(5) Connect fuel supply tube quick connect fittings at the rear of the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section.

(6) Connect electrical connectors to fuel injectors.

(7) Install intake manifold plenum. Refer to the Engine section for information.

(8) Connect the battery cable.

FUEL PUMP RELAY

DESCRIPTION

The fuel pump relay is located in the PDC. The inside top of the PDC cover has a label showing relay and fuse location.

OPERATION

The fuel pump relay supplies battery voltage to the fuel pump. A buss bar in the Power Distribution Center (PDC) supplies voltage to the solenoid side and contact side of the relay. The fuel pump relay power circuit contains a fuse between the buss bar in the PDC and the relay. The fuse is located in the PDC. Refer to the Wiring Diagrams for circuit information.

The PCM controls the fuel pump relay by switching the ground path for the solenoid side of the relay on and off. The PCM turns the ground path off when the ignition switch is in the Off position. When the ignition switch is in the On position, the PCM energizes the fuel pump. If the crankshaft position sensor does not detect engine rotation, the PCM de-energizes the relay after approximately one second.

IDLE AIR CONTROL MOTOR

DESCRIPTION

The idle air control motor (IAC) attaches to the throttle body (Fig. 10). It is a liner solenoid valve.

80fa8433

Fig. 10 TPS & IDLE AIR CONTROL VALVE

1 - TPS
2 - IAC

IDLE AIR CONTROL MOTOR (Continued)

OPERATION

The PCM adjusts engine idle speed through the idle air control motor to compensate for engine load, coolant temperature or barometric pressure changes.

The throttle body has an air bypass passage that provides air for the engine during closed throttle idle. The idle air control motor pintle protrudes into the air bypass passage and regulates air flow through it.

The PCM adjusts engine idle speed by moving the IAC motor pintle in and out of the bypass passage. The adjustments are based on inputs the PCM receives. The inputs are from the throttle position sensor, crankshaft position sensor, coolant temperature sensor, MAP sensor, vehicle speed sensor and various switch operations (brake, park/neutral, air conditioning).

When engine rpm is above idle speed, the IAC is used for the following functions:

- Off-idle dashpot
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)

Target Idle

Target idle is determined by the following inputs:

- Gear position
- ECT Sensor
- Battery voltage
- Ambient/Battery Temperature Sensor
- VSS
- TPS
- MAP Sensor

REMOVAL

REMOVAL - 2.7L

- (1) Disconnect the negative battery cable.
- (2) Disconnect the IAC electrical connector.
- (3) Remove the IAC mounting screws.
- (4) Remove the IAC.

REMOVAL - 3.5L

- (1) Disconnect the negative battery cable.
- (2) Disconnect the air plenum.
- (3) Disconnect the electrical connector (Fig. 11).
- (4) Remove the mounting screw.
- (5) Remove the IAC.

INSTALLATION

INSTALLATION - 2.7L

- (1) Install the IAC to the throttle body.

80fa8433

- (3) Remove manifold tuning valve mounting screws. Remove tuning valve.

INSTALLATION - 3.5L

- (1) Install tuning valve. Tighten mounting screws to 11.9 N·m (105 in. lbs.) torque.
- (2) Install electrical connector.
- (3) Connect negative battery cable.

MAP SENSOR

DESCRIPTION

The MAP sensor mounts to the driver side of the intake manifold plenum (Fig. 14) or (Fig. 15).

OPERATION

The MAP serves as a PCM input, using a silicon based sensing unit, to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When MAP equals Barometric pressure, the pulse width will be at maximum.

Also like the cam and crank sensors, a 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0 — 15 psi the voltage changes 4.0V. The sensor is supplied a regu-

MAP SENSOR (Continued)

**Fig. 14 MAP SENSOR 2.7L**

1 - MAP SENSOR

**Fig. 15 MAP SENSOR 3.5L**

1 - MAP/AIR TEMPERATURE SENSOR

lated 4.8 to 5.1 volts to operate the sensor. Like the cam and crank sensors ground is provided through the sensor return circuit.

The MAP sensor input is the number one contributor to pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or is it in Denver at 5000 feet above sea level, because the air density changes with altitude. It will also help to correct for varying weather conditions. If a hurricane was coming through the pressure would be very, very low or there could be a real fair weather, high pressure area. This is important

because as air pressure changes the barometric pressure changes. Barometric pressure and altitude have a direct inverse correlation, as altitude goes up barometric pressure goes down. The first thing that happens as the ignition key is rolled on, before reaching the crank position, the PCM powers up, and looks at the MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure relative to altitude. Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key on. The difference between current and what it was at key on is manifold vacuum.

During key On (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring known good sensor in your work area.

As the altitude increases the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key On the barometric pressure needs to be updated. Any time the PCM sees Wide Open throttle, based upon TPS angle and RPM it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor to aid in calculating the following:

- Barometric pressure
- Engine load
- Manifold pressure
- Injector pulse-width
- Spark-advance programs
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As the pressures changes the diaphragm moves causing the element to deflect which stresses the silicone. When silicone is exposed to stress its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.5 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is 29.92 in Hg. For every 100 feet of altitude barometric pres-

MAP SENSOR (Continued)

sure drops .10 in. Hg. If a storm goes through it can either add, high pressure, or decrease, low pressure, from what should be present for that altitude. You should make a habit of knowing what the average pressure and corresponding barometric pressure is for your area. Always use the Diagnostic Test Procedures Manual for MAP sensor testing.

REMOVAL

REMOVAL - 2.7L

- (1) Remove the negative battery cable.
- (2) Disconnect the electrical connector from the MAP sensor (Fig. 16).
- (3) Remove bolt from sensor.

Fig. 16 MAP SENSOR - 2.7L

- (4) Remove sensor.

REMOVAL - 3.5L

- (1) Remove the negative battery cable.
- (2) Disconnect the electrical connector from the MAP sensor.
- (3) Remove bolts from sensor.
- (4) Remove sensor.

INSTALLATION

INSTALLATION - 2.7L

- (1) The sensor mounts onto intake manifold plenum (Fig. 17). Tighten screws to 4.5 N·m (40 in. lbs.) torque.
- (2) Attach electrical connector to sensor (Fig. 16).
- (3) Install the negative battery cable.

Fig. 17 MAP SENSOR O-RING

INSTALLATION - 3.5L

- (1) Bolt sensor to intake and tighten the bolts to 4 N·m (35 in. lbs.).
- (2) Attach electrical connector to sensor.
- (3) Install the negative battery cable.

O2 SENSOR

DESCRIPTION

The upstream oxygen sensor threads into the outlet flange of the exhaust manifold (Fig. 18) or (Fig. 19).

Fig. 18 Upstream Heated Oxygen Sensor 1/2

O2 SENSOR (Continued)

Fig. 19 Upstream Heated Oxygen Sensor 1/1

2 - O2 SENSOR

The downstream heated oxygen sensor threads into the outlet pipe at the rear of the catalytic converter (Fig. 20).

Fig. 20 Downstream Heated Oxygen Sensors—1/2 (R) 2/2 (L)

- 1 - OXYGEN SENSORS

OPERATION

For SBEC vehicles a single sensor ground is used for all 4 O2 sensors (6 Cyl.). A separate upstream and downstream grounds are used on the NGC vehicles (4 Cyl.).

As vehicles accumulate mileage, the catalytic converter deteriorates. The deterioration results in a

less efficient catalyst. To monitor catalytic converter deterioration, the fuel injection system uses two heated oxygen sensors. One sensor upstream of the catalytic converter, one downstream of the converter. The PCM compares the reading from the sensors to calculate the catalytic converter oxygen storage capacity and converter efficiency. Also, the PCM uses the upstream heated oxygen sensor input when adjusting injector pulse width.

When the catalytic converter efficiency drops below emission standards, the PCM stores a diagnostic trouble code and illuminates the malfunction indicator lamp (MIL).

The O2 sensors produce voltages from 0 to 1 volt (this voltage is offset by a constant 2.5 volts on NGC vehicles), depending upon the oxygen content of the exhaust gas. When a large amount of oxygen is present (caused by a lean air/fuel mixture, can be caused by misfire and exhaust leaks), the sensors produces a low voltage. When there is a lesser amount of oxygen present (caused by a rich air/fuel mixture, can be caused by internal engine problems) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation the PCM monitors the O2 sensors input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on pre-programmed (fixed) values and inputs from other sensors.

1.6L Siemens controller and SBEC controller - The Automatic Shutdown (ASD) relay supplies battery voltage to both the upstream and downstream heated oxygen sensors. The oxygen sensors are equipped with a heating element. The heating elements reduce the time required for the sensors to reach operating temperature. The PCM uses pulse width modulation to control the ground side of the heater to regulate the temperature on 4 cyl. upstream O2 heater only.

NGC Controller - Has a common ground for the heater in the O2S. 12 volts is supplied to the heater in the O2S by the NGC controller. Both the upstream and downstream O2 sensors for NGC are pulse width modulation (PWM).

O2 SENSOR (Continued)

UPSTREAM OXYGEN SENSOR

The input from the upstream heated oxygen sensor tells the PCM the oxygen content of the exhaust gas. Based on this input, the PCM fine tunes the air-fuel ratio by adjusting injector pulse width.

The sensor input switches from 0 to 1 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold (this is offset by 2.5 voltage on NGC vehicles). When a large amount of oxygen is present (caused by a lean air-fuel mixture), the sensor produces voltage as low as 0.1 volt. When there is a lesser amount of oxygen present (rich air-fuel mixture) the sensor produces a voltage as high as 1.0 volt. By monitoring the oxygen content and converting it to electrical voltage, the sensor acts as a rich-lean switch.

The heating element in the sensor provides heat to the sensor ceramic element. Heating the sensor allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop, the PCM adjusts injector pulse width based on the upstream heated oxygen sensor input along with other inputs. In Open Loop, the PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

DOWNSTREAM OXYGEN SENSOR

The downstream heated oxygen sensor input is used to detect catalytic converter deterioration. As the converter deteriorates, the input from the downstream sensor begins to match the upstream sensor input except for a slight time delay. By comparing the downstream heated oxygen sensor input to the input from the upstream sensor, the PCM calculates catalytic converter efficiency. Also used to establish the upstream O2 goal voltage (switching point).

REMOVAL

REMOVAL - UPSTREAM 1/1 or 2/1

The engines uses two heated oxygen sensors, one in each exhaust manifold.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

- (1) Remove the negative battery cable.
- (2) Disconnect the heated oxygen sensor electrical connector.
- (3) Use a socket such as Snap-On YA8875 or a crow foot wrench to remove oxygen sensor (Fig. 21).

Fig. 21 Upstream Heated Oxygen Sensor 1/1

- 1 - PROPORTIONAL PURGE SOLENOID
2 - O2 SENSOR

REMOVAL - DOWNSTREAM 1/2 or 2/2

The O2 sensors are located at the outlet ends of the catalytic converter (Fig. 22).

Fig. 22 Downstream Heated Oxygen Sensors—1/2 (R) 2/2 (L)

- 1 - OXYGEN SENSORS

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

- (1) Remove the negative battery cable.

O2 SENSOR (Continued)

- (2) Raise and support the vehicle.
- (3) Disconnect the wire connector from the O2 sensors.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

- (4) Remove the O2 sensors. Snap-On oxygen sensor wrench (number YA 8875) may be used for removal and installation.

INSTALLATION

INSTALLATION - UPSTREAM 1/1 or 2/1

The engines uses two heated oxygen sensors, one in each exhaust manifold.

- (1) After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. Tighten the sensor to 28 N-m (20 ft. lbs.) torque.
- (2) Connect the heated oxygen sensor electrical connector.

- (3) Install the negative battery cable.

INSTALLATION - DOWNSTREAM 1/2, 2/2

The O2 sensor are located at the outlet ends of the catalytic converter.

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to the threads of a new oxygen sensor.**

- (1) Install the O2 sensor. Tighten to 28 N-m (20 ft. lbs.) torque.
- (2) Connect the O2 sensor wire connector.
- (3) Lower the vehicle.
- (4) Install the negative battery cable.

SHORT RUNNER VALVE

DESCRIPTION

It is a electrical actuator attached to the intake manifold (Fig. 23).

OPERATION

The SRV (Fig. 23) system operates under WOT conditions above 5000 rpm to maximize engine performance. When actuated by the PCM, the SRV solenoid energizes, allowing mechanical linkage to redirect the intake air flow to six short runners. The PCM looks for a current spike when actuating the

Fig. 23 Short Runner Valve (SRV)

- 1 - INTAKE MANIFOLD
- 2 - SRV VALVE

solenoid. If the spike is not present, the PCM sets the DTC.

REMOVAL - 3.5L

- (1) Remove the negative battery cable.
- (2) Remove link.
- (3) Remove electrical connector.
- (4) Remove 3 bolts.
- (5) Remove valve (Fig. 24).

Fig. 24 SHORT RUNNER VALVE (SRV)

- 1 - INTAKE MANIFOLD
- 2 - SRV VALVE

SHORT RUNNER VALVE (Continued)

INSTALLATION - 3.5L

- (1) Install 3 bolts and tighten to 6.7 N·m (60 in. lbs.).
- (2) Install link.
- (3) Install electrical connector.
- (4) Install the negative battery cable.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold (Fig. 25) or (Fig. 26). Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

Fig. 25 Throttle Body 2.7L

- 1 - TPS SENSOR
- 2 - THROTTLE BODY
- 3 - PCV VALVE
- 4 - EGR TUBE

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

80fa8433

Fig. 26 Throttle Body 3.2/3.5L

- 1 - TPS
- 2 - IAC

REMOVAL

REMOVAL - 2.7L

- (1) Disconnect negative cable from battery
- (2) Disconnect air plenum from throttle body.
- (3) Hold throttle lever in wide open position. Remove throttle cable and speed control cables from throttle arm.
- (4) Remove throttle cable bracket.
- (5) Disconnect electrical connectors from throttle body.
- (6) Remove the throttle body support bracket from the bottom of the throttle body.
- (7) Remove 3 throttle body bolts.
- (8) Remove throttle body.
- (9) Clean mating surfaces.

REMOVAL - 3.5L

- (1) Disconnect negative cable from battery
- (2) Remove wiper arms.
- (3) Remove cowl screen.
- (4) Remove cowl plenum.
- (5) Disconnect air plenum from throttle body.
- (6) Remove throttle cable bracket.
- (7) Disconnect electrical connectors.
- (8) Disconnect top vacuum hose.
- (9) Remove the throttle body support bracket from the bottom of the throttle body.
- (10) Remove 3 throttle body bolts.
- (11) Hold throttle lever in wide open position. Remove throttle cable and speed control cables from throttle arm.
- (12) Clean mating surfaces.

THROTTLE BODY (Continued)

INSTALLATION

INSTALLATION - 2.7L

- (1) Install throttle body and bolts.
- (2) Tighten bolts to 11.9 N·m (105 in. lbs.) torque.
- (3) Install the throttle body support bracket to the bottom of the throttle body. Tighten the bolts to 27.1 N·m (20 ft. lbs.) torque.
- (4) Hold throttle lever in wide open throttle position. Install throttle cable and speed control cable.
- (5) Install throttle cable bracket and tighten bolts.
- (6) Install air plenum and tighten clamp.
- (7) Connect negative cable to battery.

INSTALLATION - 3.5L

- (1) Hold throttle lever in wide open throttle position. Install throttle cable and speed control cable.
- (2) Install throttle body and bolts.
- (3) Tighten bolts to 11.9 N·m (105 in. lbs.) torque.
- (4) Install the throttle body support bracket to the bottom of the throttle body. Tighten the bolts to 27.1 N·m (20 ft. lbs.) torque.
- (5) Install vacuum hose.
- (6) Install throttle cable bracket and tighten bolts.
- (7) Install air plenum and tighten clamp.
- (8) Install cowl plenum.
- (9) Install cowl screen.
- (10) Install wiper arms.
- (11) Connect negative cable to battery.

THROTTLE CONTROL CABLE

REMOVAL

- (1) Working from the engine compartment, hold the throttle body throttle lever in the wide open position. Pull the cable forward and slide it out of the throttle body cam.
- (2) From inside the vehicle, hold up the pedal and remove the cable retainer and throttle cable from the upper end of the pedal shaft (Fig. 1).
- (3) Remove retainer clip from throttle cable and grommet at dash panel (Fig. 2).
- (4) From the engine compartment, pull the throttle cable out of the dash panel grommet. The grommet should remain in the dash panel.
- (5) Remove the throttle cable from throttle bracket by carefully compressing both retaining ears simultaneously. Then gently pull the throttle cable from throttle bracket.

INSTALLATION

- (1) From the engine compartment, push the housing end fitting into the dash panel grommet.
- (2) Install the cable housing (throttle body end) into the cable mounting bracket on the engine.

(3) From inside the vehicle, hold up the pedal and install throttle cable and cable retainer in the upper end of the pedal shaft (Fig. 1).

(4) At the dash panel, install the cable retainer clip between the end of the throttle cable fitting and grommet (Fig. 2).

(5) From the engine compartment, rotate the throttle lever to wide open and install the throttle cable.

THROTTLE POSITION SENSOR

DESCRIPTION

The throttle position sensor mounts to the side of the throttle body (Fig. 27) or (Fig. 28). The sensor connects to the throttle blade shaft. The TPS is a variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage).

Fig. 27 THROTTLE POSITION SENSOR 2.7L ENGINE

- 1 - TPS SENSOR
- 2 - THROTTLE BODY
- 3 - PCV VALVE
- 4 - EGR TUBE

OPERATION

The signal represents throttle blade position. As the position of the throttle blade changes, the resistance of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the powertrain control module) represents throttle blade position. The TPS output voltage to the PCM varies from approximately 0.6 volt at minimum throttle opening (idle) to a maximum of 4.5 volts at wide open throttle.

Along with inputs from other sensors, the PCM uses the TPS input to determine current engine oper-

THROTTLE POSITION SENSOR (Continued)

80fa8433

Fig. 28 THROTTLE POSITION SENSOR 3.2/3.5L ENGINE

- 1 - TPS
2 - IAC

ating conditions. The PCM also adjusts fuel injector pulse width and ignition timing based on these inputs.

REMOVAL

REMOVAL - 2.7L

- (1) Remove the negative battery cable.
- (2) Disconnect the TPS electrical connector (Fig. 29).
- (3) Remove the TPS mounting screws.
- (4) Remove the TPS.

REMOVAL - 3.5L

- (1) Disconnect the negative battery cable.
- (2) Disconnect the air plenum.
- (3) Disconnect the TPS electrical connector (Fig. 28).
- (4) Remove the TPS mounting screws.
- (5) Remove the TPS.

INSTALLATION

INSTALLATION - 2.7L

(1) The throttle shaft end of the throttle body slides into a socket in the TPS. The socket has two tabs inside it. The throttle shaft rests against the tabs. When indexed correctly, the TPS can rotate clockwise a few degrees to line up the mounting screw holes with the screw holes in the throttle body.

80ae0e9f

Fig. 29 Throttle Position Sensor—2.7L Engine

- 1 - TPS SENSOR
2 - THROTTLE BODY
3 - PCV VALVE
4 - EGR TUBE

The TPS has slight tension when rotated into position. If it is difficult to rotate the TPS into position, install the sensor with the throttle shaft on the other side of the tabs in the socket. Tighten mounting screws to 5.1 N·m (45 in. lbs.) torque.

(2) After installing the TPS, the throttle plate should be closed. If the throttle plate is open, install the sensor on the other side of the tabs in the socket.

(3) Attach electrical connector to the TPS.

(4) Install the negative battery cable.

INSTALLATION - 3.5L

(1) The throttle shaft end of the throttle body slides into a socket in the TPS. The socket has two tabs inside it. The throttle shaft rests against the tabs. When indexed correctly, the TPS can rotate clockwise a few degrees to line up the mounting screw holes with the screw holes in the throttle body. The TPS has slight tension when rotated into position. If it is difficult to rotate the TPS into position, install the sensor with the throttle shaft on the other side of the tabs in the socket. Tighten mounting screws to 6.2 N·m (55 in. lbs.) torque.

(2) After installing the TPS, the throttle plate should be closed. If the throttle plate is open, install the sensor on the other side of the tabs in the socket.

(3) Attach electrical connector to the TPS.

(4) Install air plenum and tighten the clamp.

(5) Connect the negative battery cable.

STEERING

DESCRIPTION - POWER STEERING SYSTEM

This vehicle is available with 3 different types of power steering. They are standard, firm-feel, or speed-sensitive variable-effort (speed-proportional) power steering.

The firm-feel steering gear is physically the same as the standard gear used on some models. The difference is internal to the gear. The internal calibration gives the driver a more firm feel at the steering wheel. It is serviced the same as the standard steering gear.

The speed-sensitive variable-effort power steering system, better known as speed-proportional steering, is an electronically controlled, variable-effort type power steering system. The steering gear has an externally mounted control valve which in conjunction with mechanical components varies steering effort at different vehicle speeds. At low speeds lower steering effort is provided to allow ease in steering and parking. At higher speeds, higher effort is provided to give a more firm, responsive steering feel.

The power steering system consists of these major components:

- Power Steering Pump
- Power Steering Gear
- Power Steering Fluid Reservoir
- Power Steering Fluid Supply Hose
- Power Steering Fluid Pressure Hose
- Power Steering Fluid Return Hose
- Power Steering Fluid Cooler

For information on the fluid cooler, reservoir and hoses, refer to POWER STEERING PUMP in this section.

OPERATION - POWER STEERING SYSTEM

Turning of the steering wheel is converted into lateral (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth within the steering gear. This lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering is provided by a belt-driven rotary type pump. It directs fluid through power steering hoses to the power steering gear where it is used to assist the driver's turning effort.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

Refer to POWER STEERING GEAR for information on the operation of the speed-sensitive variable-effort power steering.

WARNING

WARNING: POWER STEERING FLUID, ENGINE COMPONENTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES OR DRIVE BELTS. DO NOT ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

CAUTION

CAUTION: During repair procedures requiring the power steering fluid hoses to be disconnected, cap all open ends of the hose connections. This will prevent the entry of foreign material into the components while the power steering hoses are disconnected.

STEERING (Continued)

CAUTION: If the vehicle is equipped with the Tire Pressure Monitoring (TPM) System, the tire/wheel assembly needs to be reinstalled in the same location it is removed from or the TPM System (sensors) will need to be retrained. Mark each tire/wheel assembly indicating location, prior to its removal. If the tire/wheel assemblies are switched, rotated or replaced, the TPM System needs to be retrained. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING FLOW AND PRESSURE TEST

ALL ENGINES

The following procedure is to be used to test the operation of the power steering system on this vehicle. This test will provide the flow rate of the power steering pump along with the maximum relief pressure. This test is to be performed any time a power steering system problem is present to determine if the power steering pump or power steering gear is not functioning properly. The following flow and pressure test is performed using the Power Steering Analyzer Kit, Special Tool 6815 (Fig. 1), hoses, Special Tools 6905 and 6959, and fittings from adapter kit, Special Tool 6893.

Fig. 1 Power Steering Analyzer With Hoses Installed

- 1 - OUTLET
- 2 - SPECIAL TOOL 6815
- 3 - INLET

(1) Assemble hoses on Power Steering Analyzer, Special Tool 6815, as shown. Install Pressure Hose, Special Tool 6905 (in 6893 kit), in the inlet fitting on Power Steering Analyzer. Install Pressure Hose, Special Tool 6713 (in 6815 kit) on Pressure Hose, Special Tool 6905. Install Pressure Hose, Special Tool 6959, in the outlet fitting on Power Steering Analyzer.

Install the following adapters from Adapter Set, Special Tool 6893 (Fig. 2), on the analyzer hose ends:

Fig. 2 Power Steering Analyzer Adapters 6893

- **2.7L engine** — Install Adapter Fitting, Special Tool 6844, on Pressure Hose, Special Tool 6713.
- **3.5L engine** — Install Adapter Fitting, Special Tool 6825, on Pressure Hose, Special Tool 6713.
- **All models** — Install Adapter Fitting, Special Tool 6826, on Pressure Hose, Special Tool 6959.

WARNING: TO PREVENT PERSONAL INJURY, SAFETY GOGGLES SHOULD BE WORN AT ALL TIMES WHEN PERFORMING ANY TEST PROCEDURES ON THE POWER STEERING PUMP OR POWER STEERING GEAR.

The following procedure is to be used to test the operation of the power steering system on the vehicle.

- (2) Check belt tension and adjust as necessary.

NOTE: On vehicles with 3.5 liter engines, it may be easier to access the power steering pump pressure fitting from the bottom of the vehicle engine compartment.

STEERING (Continued)

(3) Disconnect the power steering fluid pressure hose from the power steering pump (Fig. 3) (Fig. 4).

Fig. 3 Pressure Hose Connection To Power Steering Pump (2.7L Engine)

1 - POWER STEERING FLUID PRESSURE HOSE

Fig. 4 Pressure Hose Connection To Power Steering Pump (/3.5L Engine)

1 - POWER STEERING PUMP
2 - POWER STEERING FLUID PRESSURE HOSE

(4) **2.7L engine** — Connect Adapter Fitting, Special Tool 6844 (Fig. 5), attached to pressure hose from inlet (gauge end) of Power Steering Analyzer to the pressure fitting on the power steering pump.

Fig. 5 Analyzer Connected To Power Steering Pump (2.7L Engine)

1 - POWER STEERING FLUID PRESSURE HOSE

(5) **3.5L engine** — Connect Adapter Fitting, Special Tool 6825 , attached to pressure hose from inlet (gauge end) of Power Steering Analyzer to the pressure fitting on the power steering pump (Fig. 6).

Fig. 6 Analyzer Connected To Power Steering Pump (/3.5L Engine)

1 - POWER STEERING PRESSURE HOSE
2 - POWER STEERING PUMP

STEERING (Continued)

(6) Connect vehicle power steering fluid pressure hose to Adapter Fitting, Special Tool 6826, which should be already installed in the outlet hose (valve end) of Power Steering Analyzer.

(7) Completely open valve on Power Steering Analyzer.

(8) Start engine and let idle long enough to circulate power steering fluid through the analyzer and hoses, until the air is out of the fluid. Shut off engine.

(9) Check power steering fluid level and add fluid as necessary. Start engine again and let idle.

(10) Gauge should read below 862 kPa (125 psi), if above, inspect the hoses for restrictions and repair as necessary. The initial pressure should be in the range of 345-862 kPa (50-125 psi).

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

(11) Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

NOTE: Power steering pump maximum relief pressure is 8275 to 8975 kPa (1250 to 1350 psi.).

- Power steering pump pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.

- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

(12) Completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest recorded output pressure reading against one stop is not within 345 kPa (50 psi) of the highest recorded reading at the other stop, the steering gear is leaking internally and must be replaced.

DIAGNOSIS AND TESTING - STEERING DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover POWER STEERING NOISE, STEERING WHEEL FEEL, and POWER STEERING FLUID.

STEERING (Continued)

POWER STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONABLE HISS OR WHISTLE*	<ol style="list-style-type: none"> 1. Damaged or mispositioned steering column shaft/coupling dash panel seal. 2. Noisy valve in power steering gear. 	<ol style="list-style-type: none"> 1. Reposition or replace steering column shaft/coupling dash panel seal. 2. Replace power steering gear.
RATTLE OR CLUNK	<ol style="list-style-type: none"> 1. Power steering gear loose on front suspension crossmember. 2. Front suspension crossmember mounting fasteners loose at frame. 3. STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
WHINE OR GROWL (POWER STEERING PUMP)**	<ol style="list-style-type: none"> 1. Low fluid level. 2. Power steering hose touching vehicle body or frame. 3. Extreme wear of power steering pump internal components. 4. Loose power steering pump drive belt. 5. Extremely cold temperatures below -18°C (0°F). 	<ol style="list-style-type: none"> 1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid). 2. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing. Replace hose if damaged. 3. Replace power steering pump and flush system as necessary. 4. Check and adjust power steering pump drive belt to specifications. Replace belt if worn or glazed. 5. Noise is typical when starting vehicle in extremely cold temperature. Normal duration of noise at start-up is less than one minute. If noise persists for extended time, verify proper fluid level. If fluid is low, inspect for leaks.
SUCKING AIR SOUND	<ol style="list-style-type: none"> 1. Loose clamp on power steering fluid return hose. 2. Missing O-Ring on power steering hose connection. 3. Low power steering fluid level. 4. Air leak between power steering fluid reservoir and power steering pump. 	<ol style="list-style-type: none"> 1. Tighten or replace hose clamp. 2. Inspect connection and replace O-Ring as required. 3. Fill power steering fluid reservoir to proper level and check for leaks. 4. Replace power steering pump (with reservoir).
SQUEAK OR RUBBING SOUND	<ol style="list-style-type: none"> 1. Steering column shroud rubbing. 2. Steering column shaft rubbing. 3. Clockspring noisy. 4. Steering gear internally noisy. 	<ol style="list-style-type: none"> 1. Realign shrouds as necessary. 2. Move or realign item rubbing shaft. 3. Remove clockspring. Reinstall wheel. If noise is gone, replace clockspring. 4. Replace steering gear.
SCRUBBING OR KNOCKING NOISE.	<ol style="list-style-type: none"> 1. Incorrect tire or wheel size. 2. Interference between steering gear and other vehicle components. 3. Steering gear internal stops worn excessively allowing tires to be steered excessively far. 	<ol style="list-style-type: none"> 1. Replace incorrect size tire or wheel with size used as original equipment. 2. Check for bent or misaligned components and correct as necessary. 3. Replace steering gear.

* **NOTE:** There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high veloc-

ity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

** **NOTE:** Power steering pump growl results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.

Binding seat and bearing in front strut assembly. 8. Tight shaft bearing in steering column. 9. Excessive friction in steering column coupling. 10. Excessive friction in power steering gear.	1. Inflate tires to specified pressure. 2. Check and adjust wheel alignment as necessary. 3. Lubricate ball joints if ball joints are not a lubricated for life type of ball joint, then inspect ball joint for wear, replace lower control arm as necessary. If ball joint is a lubricated for life ball joint, replace lower control arm. 4. Realign steering column coupling joints. 5. Adjust steering column shrouds to eliminate rubbing condition. 6. Replace, reposition, or lubricate dash seal. 7. Replace seat and bearing in front strut assembly. 8. Replace the steering column. 9. Replace steering column coupling. 10. Replace power steering gear.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE STEERING WHEEL KICKBACK OR TOO MUCH STEERING WHEEL FREE PLAY.	<ol style="list-style-type: none"> 1. Air in the fluid of the power steering system. 2. Power steering gear loose on crossmember. 3. Power steering gear housing isolator bushings worn. 4. Steering column coupling or intermediate shaft worn, broken or loose. 5. Free play in steering column. 6. Worn lower control arm ball joints. 7. Loose steering knuckle-to-ball joint stud pinch bolt. 8. Front wheel bearing loose or worn. 9. Loose outer tie rod end. 10. Worn inner tie rod bushing. 11. Defective steering gear rotary valve. 	<ol style="list-style-type: none"> 1. Bleed air from system following the the power steering pump initial operation service procedure.* 2. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque. 3. Replace power steering gear housing isolator bushings. 4. Replace steering column coupling or intermediate shaft. 5. Check all components of the steering column and repair or replace as required. 6. Replace lower control arm as required. 7. Inspect pinch bolt, replace as necessary, and tighten to specified torque. 8. Replace hub and bearing or knuckle as necessary. 9. Replace outer tie rod end that has excessive free play. 10. Replace inner tie rod. 11. Replace power steering gear.

*** NOTE:** Steering shudder can be expected in new vehicles and vehicles with recent steering system repairs. Shudder should dissipate after the vehicle has been driven several weeks.

**** NOTE:** To evaluate this condition, it may be necessary to disconnect the coupling at the base of the steering column. Turn the steering wheel and feel or listen for internal rubbing in steering column. To avoid damaging the column clockspring, note the following. Before disconnecting coupling, place tires in the straight-ahead position and center steering wheel. Once disconnected, **DO NOT** rotate steering wheel more than one revolution in either direction and place steering wheel in original location before reconnecting coupling. If this position is lost, the steering column clockspring must be recentered following the procedure found within the procedure for steering column installation in the steering column section.

COLUMN

DESCRIPTION

This vehicle uses a tilt-type steering column (Fig. 1). Two styles are available, one is for floor shift vehicles and the other is for column shift vehicles.

The steering column used on this vehicle (Fig. 1), has been designed to be serviced as an assembly; less wiring, switches, clockspring, gear shift lever, shift ignition interlock, brake interlock solenoid (column shift only), shrouds and steering wheel. These components can be serviced without removing the steering column from the vehicle.

BRAKE TRANSMISSION SHIFT INTERLOCK SOLENOID

Column shift vehicles have a brake transmission shift interlock (BTSI) solenoid mounted on the steering column. The BTSI solenoid works in conjunction with the brake lamp switch and will not allow the steering column shift lever to be moved out of the PARK position without the brake pedal being applied. For Description And Operation, Diagnosis And Testing, and Removal And Installation information, refer to the Transaxle section in this service manual.

OPERATION

Turning of the steering wheel mounted to the column shaft, is transferred down the shaft, through the upper coupler and intermediate shaft to the power steering gear pinion shaft. The gear then moves the front strut assemblies steering the vehicle.

WARNING

WARNING: BEFORE BEGINNING ANY SERVICE PROCEDURES THAT INVOLVES REMOVING THE AIR BAG. REMOVE AND ISOLATE THE NEGATIVE (-) BATTERY CABLE (GROUND) FROM THE VEHICLE BATTERY. THIS IS THE ONLY SURE WAY TO DISABLE THE AIR BAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIR BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: WHEN AN UNDEPLOYED AIRBAG MODULE IS TO BE REMOVED FROM THE STEERING WHEEL, DISCONNECT BATTERY GROUND CABLE AND ISOLATE. ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR A MINIMUM OF TWO MINUTES, THEN BEGIN AIRBAG REMOVAL.

- 4 - STEERING COLUMN MOUNTING BRACKET
- 5 - STEERING COLUMN COUPLER
- 6 - STEERING COLUMN LOWER MOUNTING BRACKET

WARNING: THE AIR BAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIR BAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIR BAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIR BAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIR BAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS. BEFORE SERVICING A STEERING COLUMN EQUIPPED WITH AN AIR BAG, (Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING)

WARNING: WHEN HANDLING AN UNDEPLOYED AIRBAG MODULE DURING SERVICING OF THE STEERING COLUMN THE FOLLOWING PRECAUTIONS SHOULD BE OBSERVED. AT NO TIME SHOULD ANY SOURCE OF ELECTRICITY BE PERMITTED NEAR THE INFLATOR ON THE BACK OF THE AIRBAG MODULE. WHEN CARRYING A LIVE MODULE, THE TRIM COVER SHOULD BE POINTED AWAY FROM THE BODY TO MINIMIZE INJURY IF MODULE ACCIDENTLY DEPLOYS. IF AIRBAG MODULE IS PLACED ON A BENCH OR OTHER SURFACE, PLASTIC COVER SHOULD BE FACE UP TO MINIMIZE MOVEMENT IN CASE OF ACCIDENTAL DEPLOYMENT.

WARNING: SAFETY GOGGLES SHOULD BE WORN AT ALL TIMES WHEN WORKING ON STEERING COLUMNS.

COLUMN (Continued)

CAUTION

CAUTIONS

CAUTION: Disconnect the negative (ground) cable from the battery, before servicing any column component.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Damage will occur.

DIAGNOSIS AND TESTING - STEERING COLUMN

For diagnosis of conditions relating to the steering column, refer to the steering system diagnosis charts at the beginning of Steering.

The steering column **MUST** be replaced whenever any of the following conditions exist:

- Whenever a vehicle is involved in a collision which deploys the air bag, regardless of the extent of damage done to the vehicle.
- If a vehicle is involved in an impact of the vehicle's front suspension or undercarriage, which results in any type of damage to the front suspension cross-member.
- Under any conditions which result in the steering column assembly or steering column shaft receiving a force great enough to move the steering column or shaft forward or rearward in the vehicle.

REMOVAL - STEERING COLUMN

NOTE: This procedure is to be used when replacing the steering column. It is written to reflect that objective. If the column is to be removed as one assembly, or without removing the steering wheel, the steering wheel must be turned from the straight ahead position to the **RIGHT** 180° and locked in place. Lock the column in this position by removing the key from the key cylinder. This **MUST** be performed before the steering coupler to the gear is disconnected. This is done to prevent the chance of damaging the clockspring. When reconnecting the steering coupler to the intermediate shaft, verify the front wheels have not moved from their position when column was removed. If during column reinstallation, any doubt is present as to whether the clockspring is properly centered, the clockspring centering procedure in Installation Step Step 19 **MUST** be performed prior to connecting the steering coupler.

(1) Remove remote ground cable from ground stud on shock tower and isolate ground cable from vehicle by installing isolator on stud (Fig. 2).

Fig. 2 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

(2) Remove the fuse panel cover from the left end of the instrument panel (Fig. 3).

Fig. 3 Fuse Panel Cover

COLUMN (Continued)

(8) Before beginning removal of steering column assembly from vehicle, be sure front wheels of vehicle are in the STRAIGHT-AHEAD position.

CAUTION: When removing the steering wheel, use care not to damage the steering wheel finish. The wood grain on some steering wheels can be easily marred.

(9) Remove the speed control switches (Fig. 9) from the steering wheel. The speed control switches are mounted to the steering wheel by two screws (one screw, each switch) which are accessible from the back side of the steering wheel. Disconnect the wire connector from each switch.

80b2b42b

Fig. 9 Speed Control Switches

- 1 - STEERING WHEEL
- 2 - SPEED CONTROL SWITCHES

WARNING: WHEN AN UNDEPLOYED AIRBAG IS TO BE REMOVED FROM THE STEERING WHEEL, DISCONNECT BATTERY GROUND CABLE AND ISOLATE. ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR TWO MINUTES, THEN BEGIN AIRBAG REMOVAL.

WARNING: WHEN HANDLING AN UNDEPLOYED AIRBAG DURING SERVICE OF THE STEERING COLUMN, THE FOLLOWING PRECAUTIONS SHOULD BE OBSERVED. AT NO TIME SHOULD ANY SOURCE OF ELECTRICITY BE PERMITTED NEAR THE INFLATOR ON THE BACK OF THE AIRBAG MODULE. WHEN CARRYING A LIVE MODULE, THE TRIM COVER SHOULD BE POINTED AWAY FROM THE BODY TO MINIMIZE INJURY IF MODULE ACCIDENTLY DEPLOYS. IF AIRBAG MODULE IS PLACED ON A BENCH OR OTHER SURFACE, PLASTIC COVER SHOULD BE FACE UP TO MINIMIZE MOVEMENT IN CASE OF ACCIDENTAL DEPLOYMENT.

(10) Remove the 2 bolts attaching the driver air-bag to the steering wheel (Fig. 10).

(13) Remove the horn switch wire from the clockspring horn wire (Fig. 11).

(14) If optional audio control switches are present on the rear of the steering wheel, disconnect the 4-way connector between the clockspring and steering wheel wiring harness.

COLUMN (Continued)

(15) Remove the steering wheel attaching nut from the steering column shaft (Fig. 12).

Fig. 12 Steering Wheel Attaching Nut

- 1 - ATTACHING NUT
- 2 - STEERING WHEEL
- 3 - CLOCKSPRING

CAUTION: When installing wheel puller on steering wheel, be sure puller bolts are fully seated in the threaded holes in the steering wheel. If bolts are not fully seated in the threaded holes, threads may be stripped out when removing the steering wheel.

(16) Install puller on steering wheel as shown (Fig. 13).

Fig. 13 Puller Installed On Steering Wheel

- 1 - STEERING WHEEL PULLER
- 2 - STEERING WHEEL

CAUTION: Do not bump or hammer on steering wheel or steering column shaft when removing steering wheel from steering column.

(17) Remove steering wheel from steering column shaft.

NOTE: The upper shroud on this steering column is retained to the steering column by a snap fit to the lower shroud. When removing the upper shroud from the steering column lower shroud, **DO NOT** use a hard or sharp tool. This will damage the shrouds. If a tool must be used, use a soft tool such as a trim stick.

(18) Remove the steering column upper shroud from the steering column using the following procedure. First, on the right seam between the upper and lower shrouds, push in on seam at the forward end. When the upper shroud unsnaps, pull the upper shroud upward away from the lower. Repeat this procedure on the opposite side of the column to release the upper shroud from the lower. Remove the upper shroud from the steering column.

(19) Remove the tilt lever (Fig. 14) from the steering column.

Fig. 14 Tilt Lever

- 1 - TILT LEVER
- 2 - LOWER SHROUD

COLUMN (Continued)

(20) Remove the two screws attaching the lower shroud to the steering column (Fig. 15). Remove the lower shroud from the steering column.

- 3 - STEERING COLUMN

COLUMN (Continued)

(32) Remove the 2 steering column upper mounting bracket to support bracket nuts (Fig. 27). Then loosen the 2 bolts attaching the steering column lower mounting bracket to support bracket (Fig. 27).

Fig. 27 Steering Column Mounting

- 1 - MOUNTING NUTS
- 2 - STEERING COLUMN UPPER MOUNTING BRACKET
- 3 - STEERING COLUMN SUPPORT BRACKET
- 4 - STEERING COLUMN LOWER MOUNTING BRACKET
- 5 - MOUNTING BOLTS

(33) Remove the steering column from the support bracket by pulling it rearward, then out of the car.

INSTALLATION - STEERING COLUMN

(1) Install the steering column on the steering column support bracket. Loosely install the two steering column attaching nuts.

(2) Loosely tighten the two steering column upper mounting nuts (Fig. 27) to hold the steering column in place. Center the steering column in place, side to side, then install the two lower mounting bolts (Fig. 27). Then equally tighten both steering column upper mounting nuts until upper steering column mounting bracket is seated against support bracket. Tighten the four steering column bracket to support bracket fasteners to 12 N·m (105 in. lbs.), tightening the upper mounting nuts first, then the lower mounting bolts.

(3) Assemble the intermediate steering shaft to the steering column flex coupler (Fig. 26). Tighten the coupler pinch bolt nut to a torque of 27 N·m (240 in. lbs.). Be sure to install steering coupler pinch bolt retaining pin.

(4) Install the two air ducts under the steering column (Fig. 25).

(5) If the vehicle is equipped with a floor shifter, install the shifter/ignition interlock cable (Fig. 20) in the lock cylinder housing.

(6) Install the shift cable mounting bracket (Fig. 24) on the steering column. The shift cable mounting bracket is mounted to the steering column by the two mounting screws.

(7) If the vehicle is equipped with a steering column mounted shift lever, first verify that the shift lever is locked in the park position. Then, install the shift cable on the shifter mechanism (Fig. 28). The shift cable must be fully inserted onto the pin of the shifter mechanism.

Fig. 28 Installed Shift Cable

- 1 - SHIFTER MECHANISM
- 2 - PIN
- 3 - SHIFT CABLE

(8) If the vehicle is equipped with a steering column mounted shift lever, install the brake transmission interlock solenoid on the shift lever mechanism. To do so, perform the following:

(a) Align the flat inside the solenoid (Fig. 29) with the flat on the shift lever mounting stud.

Fig. 29 Flat Inside BTSI Solenoid

- 1 - GUIDES
- 2 - SOLENOID
- 3 - FLAT

COLUMN (Continued)

(b) Slide the solenoid completely onto the shift lever mounting stud aligning the plastic guide formed into the solenoid housing with the flange on the shift lever mechanism bracket (Fig. 30).

(c) Install the retainer clip until it snaps into place in the slot cut into the shift lever mounting stud (Fig. 31).

(d) Verify the solenoid is locked in place and will not slide off the mounting stud.

(e) Connect the wiring harness connector to the solenoid.

Fig. 30 Guide And Flange Alignment

- 1 - BRACKET FLANGE
- 2 - GUIDE

Fig. 31 Solenoid Retainer Clip Installation

- 1 - SOLENOID
- 2 - MOUNTING STUD
- 3 - RETAINER CLIP

(9) Install the ignition switch on the steering column. Install and securely tighten the 2 screws (Fig. 19) mounting the ignition switch to the steering column.

(10) If the vehicle is equipped with a steering column mounted shift lever and if a new ignition shift interlock cassette has been installed, the interlock system must be adjusted. Adjust the interlock system by pushing in on the adjustment tab until it stops (Fig. 32). The adjustment tab will click as it moves into position. Ensure the tab is fully depressed.

Fig. 32 Ignition Interlock Adjustment Tab

- 1 - LOCK CYLINDER HOUSING
- 2 - INTERLOCK CASSETTE
- 3 - ADJUSTMENT TAB

(11) Install the multi-function switch on the steering column. Install and securely tighten the two screws (Fig. 18) mounting the multi-function switch to the steering column. Install the clockspring wiring harness on the routing clip on the top of the multi-function switch.

(12) If the vehicle is equipped, clip the SKIM module over the key cylinder halo bezel and attach it to the steering column with its mounting screw. Connect the wiring harness to the module.

(13) Install the clockspring on the steering column. Install and securely tighten the two screws (Fig. 17) mounting the clockspring to the steering column.

(14) Install the wiring harness connectors (Fig. 16) on the clockspring.

(15) If removed, install the trim ring for the key cylinder on the lock cylinder housing.

(16) Install the lower shroud (Fig. 15) on the steering column. Install and securely tighten the 2 screws attaching the lower shroud to the steering column.

(17) Install the tilt lever (Fig. 14) on the steering column.

(18) Install the upper shroud on the steering column by snapping it onto the lower shroud.

COLUMN (Continued)

CAUTION: If any doubt is present as to whether the clockspring is properly centered, This clockspring centering procedure **MUST** be performed prior to installing steering wheel assembly. If clockspring is not centered it may be overextended, causing clockspring assembly to become inoperative. The yellow centering indicator must be present in the centering window of the clockspring and the arrow on the clockspring must be pointing at the drive pin.

(19) Center the clock spring using the following procedure.

- Depress the plastic locking pin to disengage clockspring locking mechanism.
- Keeping locking mechanism disengaged, rotate the clockspring rotor in the **CLOCKWISE DIRECTION** to the end of the travel. Do not apply excessive torque.
- From the end of clockwise travel, slowly rotate the rotor in the counterclockwise direction until yellow appears in the centering window of clockspring. When yellow appears in the centering window the arrow on the clockspring will be pointing at the drive pin on clock spring rotor.
- Engage the clockspring locking mechanism.

CAUTION: When installing the steering wheel, use care not to damage the steering wheel finish. The wood grain on some steering wheels can be easily marred.

CAUTION: Do not install steering wheel by driving it onto the shaft. Pull steering wheel down onto steering column shaft using **ONLY** the steering wheel retaining nut.

(20) Feed the clockspring wiring leads through the steering wheel (Fig. 12). Install steering wheel on shaft of steering column, making sure the master serration in the wheel hub and on the steering column shaft line up.

(21) Install steering wheel to steering column shaft retaining nut (Fig. 12) and tighten until the steering wheel is fully installed on the shaft. Tighten steering wheel retaining nut to a torque of 61 N·m (45 ft. lbs.).

(22) Turn the key cylinder to the unlock position, unlocking the steering column shaft.

(23) Connect the horn switch wiring lead from the clockspring to the driver airbag horn switch wiring lead (Fig. 11).

(24) Install the airbag electrical lead into connector on back of driver airbag (Fig. 11). **Be sure electrical connector from clockspring is securely latched into driver airbag connector.**

(25) If optional audio control switches are present on the rear of the steering wheel, connect the 4-way connector lead from the clockspring to the steering wheel wiring harness lead. Once connected, place the connector in back cover formation located at the 12 O'clock position.

CAUTION: The fasteners, screws, and bolts, originally used for the airbag components are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace only with correct fasteners provided in service packages or fasteners listed in the parts book.

NOTE: Make sure steering wheel and airbag module are in the right-side-up position before installing airbag module on steering wheel.

(26) Install the airbag module on steering wheel. Install only the two original or correct replacement airbag module attaching bolts (Fig. 10). Tighten the two airbag module attaching bolts to a torque of 8 N·m (75 in. lbs.).

(27) Connect the speed control wiring leads to the speed control switches.

(28) Install the speed control switches in the steering wheel (Fig. 9). Install the screws attaching the speed control switches to the steering wheel. Tighten the screws to a torque of 1.5 N·m (13 in. lbs.).

(29) Install the diagnostic connector on the reinforcement (Fig. 8).

(30) Install the reinforcement on the instrument panel (Fig. 7). Install the four bolts mounting the reinforcement to the instrument panel.

(31) Install the parking brake release cable on the parking brake release handle in the lower instrument panel cover (Fig. 6).

(32) Install the wiring harness connector on the trunk release switch in the lower instrument panel cover (Fig. 5).

(33) Install the lower instrument panel cover.

(34) Install the two screws behind the fuse panel cover attaching the lower instrument panel cover to the instrument panel (Fig. 4).

(35) Install the fuse panel cover on the left end of the instrument panel (Fig. 3).

CAUTION: When reconnecting the battery terminals on a vehicle that has had the airbag module removed, ensure that no occupants are in the vehicle, then perform the following procedure.

(36) Using the following procedure, reconnect the remote ground cable on the shock tower ground stud.

COLUMN (Continued)

- Connect DRBIII® scan tool to diagnostic connector below the column.
- Turn ignition key to ON position. Exit vehicle with the DRBIII® scan tool.
- Ensuring that there are no occupants in the vehicle, connect negative cable to negative post of the battery.
- Using the DRBIII® scan tool, read and record active fault codes. Also read and record any stored fault codes. Refer to Appropriate Body Diagnostic Information if any faults are found.
- Erase stored faults if there are no active fault codes. If problems remain, fault codes will not erase.
- From the passenger side of the vehicle, turn ignition key to OFF and then ON observing instrument cluster airbag lamp. It should go on for six to eight seconds, then go out. This will indicate that the airbag system is functioning normally.
- If airbag warning lamp fails to light, blinks on and off or goes on and stays on, there is an airbag system malfunction. Refer to Appropriate Body Diagnostic Information to diagnose the system malfunction.

(37) Test the operation of the horn, lights and any other functions that are steering column operated. If applicable, reset the radio and the clock.

(38) Road test vehicle to ensure proper operation of the steering system and the speed control system.

IGNITION SWITCH

REMOVAL

The ignition switch attaches to the lock cylinder housing on the end opposite the lock cylinder. For ignition switch terminal and circuit identification, refer to the Wiring Diagrams section.

- (1) Disconnect negative cable from battery.
- (2) Remove tilt lever attaching screw. Remove lever.
- (3) Remove upper and lower cover from steering column.
- (4) Remove Sentry Key Immobilizer Module (SKIM) if equipped. Refer to the Power Door Locks section for removal.
- (5) Remove multi-function switch.
- (6) Disconnect electrical connector from ignition switch (Fig. 33).
- (7) Remove Ignition switch mounting screws. Remove switch.

INSTALLATION

The ignition switch attaches to the lock cylinder housing on the end opposite the lock cylinder. For ignition switch terminal and circuit identification, refer to the Wiring Diagrams section.

- (1) A tab on the ignition switch indexes to a notch in the lock cylinder housing (Fig. 34). Also, a slot in the end of the ignition switch fits over the shaft in

Fig. 33 Ignition Switch Removal/Installation

- 1 - STEERING COLUMN
2 - IGNITION SWITCH

the end of the lock cylinder housing. Use the ignition key to rotate the lock cylinder to align the ignition switch with lock cylinder housing.

- (2) Install and tighten ignition switch mounting screws.
- (3) Attach electrical connector to ignition switch.
- (4) Install multi-function switch.
- (5) Install SKIM if equipped, refer to the Power Door Locks section for installation.
- (6) Install upper and lower cover on steering column.
- (7) Install tilt lever.
- (8) Connect negative cable to battery.

Fig. 34 Ignition Switch Alignment

- 1 - IGNITION SWITCH
2 - TAB
3 - NOTCH
4 - SHAFT

INTERMEDIATE SHAFT

DIAGNOSIS AND TESTING - STEERING COLUMN INTERMEDIATE SHAFT

The steering column (to steering gear) intermediate shaft has an integrated lower coupler with universal joint. The entire assembly **MUST** be replaced whenever any of the following conditions exist.

- Whenever a vehicle is involved in a collision which deploys the airbag, regardless of the extent of damage done to the vehicle.
- If a vehicle is involved in an impact of the vehicle's front suspension or undercarriage, which results in any type of damage to the front crossmember.
- Under any conditions which result in the steering column assembly or steering column shaft receiving a force great enough to move the steering column or shaft forward or rearward in the vehicle.

Inspect the intermediate shaft and integrated coupler for the following conditions:

- Seized bearing
- Loose bearing stake
- Bearing not seated properly

The steering column intermediate shaft **MUST** be replaced as an entire assembly if a problem condition is found.

KEY/LOCK CYLINDER

DESCRIPTION

The lock cylinder is inserted in the end of the housing opposite the ignition switch.

OPERATION

The ignition key rotates the cylinder to 5 different detents (Fig. 35) :

- Accessory
- Off (lock)
- Unlock
- On/Run
- Start

REMOVAL

The lock cylinder is inserted in the end of the housing opposite the ignition switch. The ignition key rotates the cylinder to 5 different detents:

- (1) Disconnect negative cable from battery.

938D-22

Fig. 35 IGNITION LOCK CYLINDER DETENTS

(2) Remove the tilt lever attaching screw. Remove lever.

(3) Remove the upper and lower covers from the steering column.

(4) Turn the ignition key to the run position. When ignition switch is in the run position, the lock cylinder retaining tab will depress.

(5) Depress tab and slide lock cylinder out of housing (Fig. 36).

Fig. 36 Lock Cylinder Removal

- 1 - TAB
- 2 - KEY IN RUN POSITION

KEY/LOCK CYLINDER (Continued)

INSTALLATION

The lock cylinder is inserted in the end of the housing opposite the ignition switch. The ignition key rotates the cylinder to 5 different detents:

(1) Install key in lock cylinder. Turn key to run position (retaining tab on lock cylinder can be depressed).

(2) The shaft at the end of the lock cylinder aligns with the socket in the end of the housing. To align the socket with the lock cylinder, ensure the socket is in the Run position (Fig. 37).

938D-7

Fig. 37 Socket in Lock Cylinder Housing

- 1 - LOCK CYLINDER HOUSING
2 - SOCKET IN RUN POSITION

(3) Align the lock cylinder with the grooves in the housing. Slide the lock cylinder into the housing until the tab sticks through the opening in the housing (Fig. 38).

938D-8

Fig. 38 Lock Cylinder Installation

- 1 - LOCK CYLINDER HOUSING
2 - LOCK CYLINDER
3 - TAB

(4) Turn key to Off position. Remove key.

(5) If the vehicle has column shift and a new lock cylinder was used, install and adjust a new interlock cassette. Refer to Ignition Interlock in this section. If the vehicle has a floor shift, adjust the interlock cable when the lock cylinder is replaced. Refer to the Floor Shift Interlock Adjustment procedure in the Transmission section..

(6) Install upper and lower cover on steering column.

(7) Install tilt lever.

(8) Connect negative cable to battery.

LOCK CYLINDER HOUSING

REMOVAL

(1) Disconnect remote battery ground cable at right strut tower and isolate.

(2) Remove tilt lever, upper and lower steering column shrouds. (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - REMOVAL)

(3) If equipped with Sentry Key Immobilizer System, remove SKIM. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/SENTRY KEY IMMOBILIZER MODULE - REMOVAL)

(4) Remove and discard shift interlock cassette.

(5) Remove nut securing wiring harness in place on left side of column.

(6) Remove two multifunction switch mounting screws (Fig. 39).

80b2b435

Fig. 39 Multi-Function Switch

- 1 - MULTIFUNCTION SWITCH
2 - MOUNTING SCREW
3 - WIRING HARNESS
4 - STEERING COLUMN
5 - MOUNTING SCREW

LOCK CYLINDER HOUSING (Continued)

(7) Lift off multifunction switch, then disconnect two wiring connectors and remove switch.

(8) Remove two torx-head screws securing ignition switch in place (Fig. 40). Remove switch from column, allow switch to hang by wiring harness.

Fig. 40 Ignition Switch Mounting Screws

- 1 - IGNITION SWITCH
- 2 - MOUNTING SCREW
- 3 - STEERING COLUMN
- 4 - MOUNTING SCREW
- 5 - MULTIFUNCTION SWITCH

(9) Remove two torx head screws securing lock cylinder housing to column (Fig. 41).

(10) Remove lock cylinder housing from steering column.

INSTALLATION

(1) Position new lock cylinder housing on steering column (Fig. 41).

NOTE: In order to correctly seat the lock cylinder housing to the steering column, the right side mounting screw (from drivers' in-vehicle position) must be seated and tightened first as outlined in the following steps.

(2) Install and tighten new right side mounting screw to 10 N·m (89 in. lbs.) torque.

(3) Install and tighten new left side mounting screw to 10 N·m (89 in. lbs.) torque.

Fig. 41 Lock Cylinder Housing Mounting

- 1 - SCREWS
- 2 - STEERING COLUMN
- 3 - LOCK CYLINDER HOUSING

(4) Install ignition switch. (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - INSTALLATION)

(5) Install multi-function switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - INSTALLATION)

(6) Attach wiring harness in place on left side of column using nut.

(7) Install a new shift interlock cassette. If the vehicle has a floor shift, reconnect and adjust the shift cable as necessary.

(8) If equipped with Sentry Key Immobilizer System, install SKIM. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/SENTRY KEY IMMOBILIZER MODULE - INSTALLATION)

(9) Install upper and lower steering column shrouds, and tilt lever. (Refer to 19 - STEERING/COLUMN/LOWER SHROUD - INSTALLATION)

(10) Connect remote battery ground cable to stud at right strut tower.

(11) Check operation of key cylinder, lock housing and ignition switch.

SHROUD - LOWER

REMOVAL

(1) Remove the fuse panel cover from the left end of the instrument panel (Fig. 42).

80b2b43b

Fig. 42 Fuse Panel Cover

- 1 - FUSE PANEL COVER
- 2 - INSTRUMENT PANEL

(2) Remove the 2 screws behind the fuse panel cover attaching the lower instrument panel cover to the instrument panel (Fig. 43).

80b2b43c

Fig. 43 Lower Instrument Panel Cover Mounting Screws

- 1 - MOUNTING SCREWS
- 2 - INSTRUMENT PANEL BRACKET
- 3 - LOWER INSTRUMENT PANEL COVER

(3) Remove the lower instrument panel cover. The lower instrument panel cover is attached with retaining clips along the top and right edge.

(4) Remove the wiring harness connector from the trunk release switch in the lower instrument panel cover (Fig. 44).

80b2b43e

Fig. 44 Trunk Release Wiring

- 1 - WIRING HARNESS CONNECTOR
- 2 - TRUNK RELEASE SWITCH
- 3 - LOWER INSTRUMENT PANEL COVER

(5) Remove the parking brake release cable from the park brake release handle in the lower instrument panel cover (Fig. 45). Lay the cover and handle out of the way.

80b2b43f

Fig. 45 Park Brake Release Cable

- 1 - PARK BRAKE RELEASE CABLE
- 2 - PARK BRAKE RELEASE HANDLE
- 3 - LOWER INSTRUMENT PANEL COVER

CAUTION: The upper shroud is retained to the steering column by a snap fit to the lower shroud. When removing the upper shroud from the lower shroud, **DO NOT** use a hard or sharp tool. This will damage the shrouds. If a tool must be used, use a soft tool such as a trim stick.

SHROUD - LOWER (Continued)

(6) Remove the upper shroud from the steering column using the following procedure:

(a) On the right side of the steering column, push in on seam between the upper and lower shrouds at the forward end (near instrument panel). The seam should snap open, releasing that side of the upper shroud.

(b) Once the shroud unsnaps, pull that side of the upper shroud upward away from the lower.

(c) Repeat this procedure on the opposite side of the column, then remove the upper shroud.

(7) Remove the screw fastening the tilt lever to the steering column (Fig. 46). Remove the lever.

Fig. 46 Tilt Lever, Upper And Lower Shrouds

- 1 - UPPER SHROUD
- 2 - TILT LEVER
- 3 - LOWER SHROUD

(8) Remove the two screws attaching the lower shroud to the steering column. Remove the lower shroud from the steering column.

INSTALLATION

(1) Install the lower shroud on the steering column (Fig. 46). Install the 2 screws attaching the lower shroud to the steering column.

(2) Install the tilt lever on the steering column and install the mounting screw (Fig. 46).

(3) Install the upper shroud on the steering column by snapping it onto the lower shroud. Make sure there are no gaps between the two shrouds once the upper shroud is installed.

(4) Install the parking brake release cable on the parking brake release handle in the lower instrument panel cover (Fig. 45).

(5) Connect the wiring harness to the trunk release switch in the lower instrument panel cover (Fig. 44).

(6) Install the lower instrument panel cover using the retaining clips along the top and right edge.

(7) Install the two screws behind the fuse panel cover attaching the lower instrument panel cover to the instrument panel (Fig. 43).

(8) Install the fuse panel cover on the left end of the instrument panel (Fig. 42).

SHROUD - UPPER

REMOVAL

CAUTION: The upper shroud is retained to the steering column by a snap fit to the lower shroud. When removing the upper shroud from the lower shroud, **DO NOT** use a hard or sharp tool. This will damage the shrouds. If a tool must be used, use a soft tool such as a trim stick.

(1) On the right side of the steering column, push in on seam between the upper and lower shrouds at the forward end (near instrument panel). The seam should snap open, releasing that side of the upper shroud.

(2) Once the shroud unsnaps, pull that side of the upper shroud upward away from the lower.

(3) Repeat this procedure on the opposite side of the column, then remove the upper shroud.

INSTALLATION

(1) Install the upper shroud on the steering column by snapping it onto the lower shroud.

(2) Make sure there are no gaps at the seam between the two shrouds.

STEERING COUPLING

DIAGNOSIS AND TESTING - STEERING COLUMN SHAFT UPPER COUPLER

If the steering column shaft upper coupler is diagnosed to be defective due to any of the following conditions: seized bearing, loose bearing stake or a bearing not fully seated in the yoke of the coupler assembly, the coupler can be serviced as a separate component of the steering column assembly.

REMOVAL

(1) Remove steering column assembly from vehicle. Refer to the Steering Column Removal.

(2) Install Puller, Special Tool 6831-A, through center of roll pin in flex coupler and install knurled nut (Fig. 47).

Fig. 47 Removing Roll Pin

- 1 - ROLL PIN
- 2 - KNURLED NUT
- 3 - FLEX COUPLER
- 4 - SPECIAL TOOL 6831-A
- 5 - STEERING COLUMN

(3) While holding hex on end threaded rod, tighten the nut on threaded rod of Puller, Special Tool 6831-A. This will pull the roll pin out of the coupler.

(4) Remove the coupler from the steering column shaft

INSTALLATION

(1) Start roll pin into coupler prior to installing coupler on steering column shaft. Install roll pin into coupler just far enough to square roll pin to hole in flex coupler. If roll pin is installed too far, coupler will not slide onto steering column shaft.

(2) Install coupler on steering shaft until correctly positioned to allow roll pin to be installed in coupler.

(3) Install Puller, Special Tool 6831-A, through center of roll pin and install knurled nut (Fig. 48).

80b2b444

Fig. 48 Tool Set-Up For Installing Roll Pin

- 1 - SPECIAL TOOL 6831-A
- 2 - ROLL PIN
- 3 - KNURLED NUT
- 4 - FLEX COUPLER

(4) Using Puller, Special Tool, 6831-A, (Fig. 48) install roll pin into the coupler until spring pin is fully installed through both sides of the coupler.

STEERING WHEEL

REMOVAL

(1) Place the front road wheels in the straight-ahead position, then:

(a) Rotate the steering wheel one-half turn (180 degrees) to the right (clockwise).

(b) Lock column in place with the ignition cylinder lock.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

(2) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(3) Wait two minutes for the reserve capacitor to discharge before removing non-deployed airbag.

CAUTION: When removing the steering wheel, use care not to damage the steering wheel finish. The wood grain on some steering wheels can be easily marred.

(4) Remove speed control switches and connectors.

(5) Remove the driver airbag attaching bolts on the front of the steering wheel.

(6) Lift driver airbag, disconnect the airbag and horn wire connectors, then remove airbag.

STEERING WHEEL (Continued)

(7) If optional audio control switches are present on the rear of the steering wheel, disconnect the 4-way connector between the clockspring and steering wheel wiring harness.

(8) Remove steering wheel retaining nut.

(9) Remove steering wheel with steering wheel puller. While removing steering wheel, take care to feed the wires gently through the opening in the steering wheel armature.

INSTALLATION

(1) Confirm that:

- The steering wheel position is a half turn (180 degrees) to the right (clockwise).
- The column is locked with the ignition cylinder lock.
- Check that the turn signal stalk is in the neutral position.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

CAUTION: When installing the steering wheel, use care not to damage the steering wheel finish. The wood grain on some steering wheels can be easily marred.

(2) Pull all wires through the larger opening of the hub area on the wheel. Install steering wheel ensuring the flats on hub align with the clockspring. Ensure leads do not get pinched under the steering wheel.

(3) Install retaining nut, and torque it to 61 N·m (45 ft.lbs.).

(4) Route speed control wires through the slots in the steering wheel back cover.

(5) Connect the horn lead wire and the airbag lead wire to the airbag module.

(6) If optional audio control switches are present on the rear of the steering wheel, connect the 4-way connector lead from the clockspring to the steering wheel wiring harness lead. Once connected, place the connector in back cover formation located at the 12 O'clock position.

(7) Install the drivers airbag and torque bolts to 8 N·m (75 in. lbs.).

(8) Connect the speed control wires to the switches and install switches. Torque screws to 1.5 N·m (13 in. lbs.).

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL AT THIS TIME. REFER TO ELECTRICAL, RESTRAINTS, AIRBAG SYSTEM TEST FOR PROCEDURE.

STEERING COLUMN GEAR SHIFT LEVER

REMOVAL

(1) Remove the fuse panel cover from the left end of the instrument panel (Fig. 49).

80b2b43b

Fig. 49 Fuse Panel Cover

- 1 - FUSE PANEL COVER
2 - INSTRUMENT PANEL

(2) Remove the 2 screws behind the fuse panel cover attaching the lower instrument panel cover to the instrument panel (Fig. 50).

80b2b43c

Fig. 50 Lower Instrument Panel Cover Mounting Screws

- 1 - MOUNTING SCREWS
2 - INSTRUMENT PANEL BRACKET
3 - LOWER INSTRUMENT PANEL COVER

(3) Remove the lower instrument panel cover. The lower instrument panel cover is attached by retaining clips along the top and right edge.

STEERING COLUMN GEAR SHIFT LEVER (Continued)

(4) Remove the tilt lever and the upper and lower steering column shrouds from steering column assembly (Fig. 51). Then remove center outlet bezel.

Fig. 51 Tilt Lever And Upper And Lower Shrouds

- 1 - UPPER SHROUD
- 2 - TILT LEVER
- 3 - LOWER SHROUD

(5) Remove the brake transmission shift interlock (BTSI) solenoid from the shift lever mechanism (Fig. 52). To do so, perform the following:

- (a) Disconnect the wiring harness connector from the solenoid.
- (b) Remove the retainer clip from the end of the solenoid (Fig. 53).
- (c) Slide the solenoid straight off the shift lever mounting stud.

Fig. 52 BTSI

- 1 - SHIFT LEVER BRACKET

- 3 - KEY CYLINDER

Fig. 53 Solenoid Retainer Clip

80be4649

- 1 - SOLENOID
- 2 - MOUNTING STUD
- 3 - RETAINER CLIP

(6) Remove the gear shift cable from the attaching pin on the shift lever assembly.

(7) Unlock shift cable adjuster.

(8) Remove the 3 Torx® head screws attaching the shift lever assembly to the steering column tilt housing (Fig. 54), then remove shift lever assembly from tilt housing and unhook the ignition interlock cable from shift lever assembly (Fig. 54).

9319-56

Fig. 54 Shift Lever Assembly Attachment

- 1 - SHIFTER ASSEMBLY
- 2 - CABLE
- 3 - INTERLOCK CASSETTE
- 4 - SHIFTER ASSEMBLY ATTACHING SCREWS
- 5 - TILT HOUSING

(9) Remove the interlock cassette from the steering column and discard it.

NOTE: A new interlock cassette must be installed when a new shift lever assembly is installed.

STEERING COLUMN GEAR SHIFT LEVER (Continued)

INSTALLATION

(1) Install new shift lever assembly on tilt housing of steering column. Install and securely tighten the 3 Torx® head screws attaching shift lever assembly to tilt housing.

(2) Install the gear shift cable onto the cable attaching pin on shift lever assembly.

(3) Lock the gear shift cable adjuster.

(4) Install the brake transmission interlock solenoid on the shift lever mechanism. To do so, perform the following:

(a) Align the flat inside the solenoid (Fig. 55) with the flat on the shift lever mounting stud.

(b) Slide the solenoid completely onto the shift lever mounting stud aligning the plastic guide formed into the solenoid housing with the flange on the shift lever mechanism bracket (Fig. 56).

(c) Install the retainer clip until it snaps into place in the slot cut into the shift lever mounting stud (Fig. 57).

(d) Verify the solenoid is locked in place and will not slide off the mounting stud.

(e) Connect the wiring harness connector to the solenoid.

Fig. 55 Flat Inside BTSI Solenoid

- 1 - GUIDES
- 2 - SOLENOID
- 3 - FLAT

(5) Install cable from the new ignition interlock cassette onto the interlock lever of the shift lever assembly (Fig. 54).

Fig. 56 Guide And Flange Alignment

- 1 - BRACKET FLANGE
- 2 - GUIDE

Fig. 57 Solenoid Retainer Clip Installation

- 1 - SOLENOID
- 2 - MOUNTING STUD
- 3 - RETAINER CLIP

(6) With the shift lever assembly in the PARK position and ignition key extracted from ignition switch, install the new interlock cassette into steering column. Be sure interlock cassette locking tab is securely latched.

STEERING COLUMN GEAR SHIFT LEVER (Continued)

(7) Adjust the ignition interlock system by pushing in on the adjustment tab until it stops (Fig. 58). The adjustment tab will click as it moves into position. Ensure the tab fully depressed.

Fig. 58 Ignition Interlock Adjustment Tab

- 1 - LOCK CYLINDER HOUSING

GEAR

DESCRIPTION

DESCRIPTION - POWER STEERING GEAR

This vehicle is equipped with a rack-and-pinion power steering gear (Fig. 1). The gear is a center-take-off type gear. Center-take-off means that the tie rods are connected to the steering gear via a rack guide located at the center of the gear.

The power steering gear is mounted on the cross-member behind the engine. The steering column intermediate shaft connects to the pinion shaft of the gear. The outer ends of the outer tie rods attach to steering arms on the suspension's front struts.

Three different power steering gears are available:

- A base gear
- A firm feel gear, and
- A speed proportional gear

The base gear and firm feel gear are serviced the same. The speed proportional steering gear is physically very similar to the standard gear except for the solenoid control valve extending from its housing. The solenoid control valve can be serviced separately. For information on the speed proportional power steering gear or its individual components, refer to Speed Proportional Steering Gear.

NOTE: The power steering gear should not be serviced or adjusted. If a malfunction or oil leak occurs, the complete steering gear needs to be replaced.

DESCRIPTION - SPEED PROPORTIONAL STEERING GEAR

Available on certain models of this vehicle is an electronically controlled, speed-sensitive, variable-effort rack and pinion power steering system. This system is better known as speed-proportional power steering.

The speed proportional power steering gear mounts in the same location as the standard power steering gear. It is mounted on the crossmember behind the engine. Externally, the main difference between a speed proportional power steering gear and a standard power steering gear is the presence of a solenoid control valve on the gear housing (Fig. 2).

GEAR (Continued)

OPERATION

OPERATION - POWER STEERING GEAR

Turning of the steering wheel is converted into lateral (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth located in the steering gear. This lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist is provided by a pump and is controlled by an open-center, rotary type control valve. It directs fluid to either side of the gear's integral steering rack piston. Depending on the rotation of the steering wheel, more fluid pressure is directed to one side of the rack piston compared to the other.

Road feel is controlled by the diameter of a torsion bar which initially steers the vehicle. As steering effort increases, as in a turn, the torsion bar twists causing relative rotary motion between the rotary valve body and valve spool. This movement restricts fluid flow to one side of the integral rack piston and redirects fluid behind the other side of the integral rack piston, building up hydraulic pressure, thus assisting in the turning effort.

OPERATION - SPEED PROPORTIONAL STEERING GEAR

The speed-proportional power steering system reduces the steering effort required by the driver for low speed driving and parking maneuvers. Also, at higher speeds, more steering effort is required providing a more firm, responsive feel to the steering system and driver.

With the engine running and the vehicle speed between 0 km/h (0 mph) and approximately 32 km/h (20 mph), minimum steering effort is required. Between approximately 32 km/h (20 mph) and 100 km/h (60 mph), power steering effort will gradually increase based upon vehicle speed. Above approximately 100 km/h (60 mph), maximum steering effort is provided by the speed proportional steering system.

Variable-effort power steering is provided by controlling power steering fluid pressure at the power steering gear. A solenoid control valve located on the steering gear (Fig. 2) is used to control power steering gear return fluid pressure. The pressure is controlled by varying the size of an orifice.

The variable-assist speed-proportional solenoid control valve is controlled by the Body Control Module (BCM). The BCM receives the vehicle speed signal sent from the Powertrain Control Module (PCM). Upon receiving the vehicle speed signal from the PCM, the BCM converts that speed signal into an electrical current usable by the solenoid control valve for controlling the variable effort of the power steering system.

REMOVAL - POWER STEERING GEAR

(1) Remove the battery ground cable from the ground stud on the shock tower and isolate the ground cable by installing the cable isolator on the ground stud (Fig. 3).

Fig. 3 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

(2) Position the front tires of the vehicle so that they are facing Straight-Ahead.

(3) Using a steering wheel holding clamp (Fig. 4), lock the steering wheel from rotating.

Fig. 4 Steering Wheel Lock Installed (Typical)

- 1 - STEERING WHEEL
- 2 - STEERING WHEEL CLAMP

GEAR (Continued)

CAUTION: Before removing the steering column coupler from the intermediated steering shaft be sure the steering wheel is locked from rotating (Fig. 4). If the steering wheel is allowed to rotate freely after it is disconnected from the intermediated shaft, the clockspring will be damaged and will need to be replaced.

(4) Remove the retaining pin and the coupler bolt from the steering column coupler (Fig. 5). Separate the intermediate steering shaft from the steering column coupler.

Fig. 5 Steering Column Coupler

- 1 - COUPLER
- 2 - PINCH BOLT
- 3 - STEERING COLUMN

(5) Raise the vehicle on a frame contact hoist until the front tires of the vehicle are just off the floor. See Hoisting in Lubrication and Maintenance.

(6) Remove caps from both wiper arms at the attachment to the pivots to expose the wiper arm attaching nut. Remove the nut attaching each wiper arm to its pivot (Fig. 6).

Fig. 6 Wiper Arm Attachment To Pivot

- 1 - WIPER ARMS
- 2 - ATTACHING NUT
- 3 - ATTACHING NUT

(7) Remove the wiper arms from the pivots. Wiper arms are removed from the pivots by rocking them back and force on the pivots until they can be pulled off the pivots.

(8) Remove the wiper module cover and cowl cover from the vehicle (Fig. 7).

Fig. 7 Wiper Module And Cowl Cover

- 1 - COWL COVER
- 2 - WIPER MODULE COVER

(9) Remove the eight bolts attaching the cowl reinforcement to the strut towers and the one bolt attaching the wiper module to the reinforcement (Fig. 8). Remove the reinforcement from the vehicle.

- 5 - RESONATOR
- 6 - IN-LINE RESONATOR

(11) If the steering gear being removed from the vehicle is a speed proportional steering gear, disconnect the wiring harness connector from the solenoid control valve electrical connector. The connector is located on the steering gear end cap below the brake master cylinder. (Fig. 10).

Fig. 10 Wiring Harness

- 1 - SPEED PROPORTIONAL STEERING SOLENOID CONNECTOR
- 2 - MASTER CYLINDER RESERVOIR

(12) Remove the two nuts mounting the master cylinder to the vacuum booster (Fig. 11).

Fig. 11 Master Cylinder To Vacuum Booster Mounting

- 1 - MOUNTING NUT
- 2 - MASTER CYLINDER
- 3 - MOUNTING NUT
- 4 - VACUUM BOOSTER

(13) Disconnect the brake fluid level switch connector on the side of the master cylinder fluid reservoir.

(14) Remove the master cylinder with the brake tubes connected from the power brake vacuum booster. Carefully position the master cylinder in an upright position on the left side valve cover of the engine.

CAUTION: Do not allow brake fluid to leak onto painted surfaces. Paint damage may occur.

(15) Remove the vacuum supply hose to the power brake vacuum booster at the check valve in the vacuum booster. Position the vacuum hose out of the way.

(16) Bend back the retaining tabs on the mounting plate for the tie rod to steering gear mounting bolts (Fig. 12).

Fig. 12 Tie Rod Attachment Bolt Retaining Tabs

- 2 - BOLTS
- 3 - MOUNTING PLATE
- 4 - WASHERS
- 5 - STEERING GEAR

NOTE: The following step should be done to prevent excessive spilling of power steering fluid when the power steering fluid lines are removed from the steering gear.

(18) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.

(19) Remove the power steering fluid pressure hose and return hose from the steering gear (Fig. 14).

Fig. 14 Power Steering Hose Connections At Steering Gear

GEAR (Continued)

NOTE: It may be necessary to loosen the two mounting bolts (Fig. 17) attaching the right mounting bracket to the steering gear in order to clear the air conditioning lines.

Fig. 17 Steering Gear Mounting Bracket

- 1 - MOUNTING BRACKET
- 2 - MOUNTING BOLTS
- 3 - STEERING GEAR

(22) Slide steering gear and intermediate shaft forward into the engine compartment to allow access to the roll pin retaining the intermediate shaft flex coupler to the steering gear shaft.

(23) Using roll pin Remover, Special Tool 6831A, remove roll pin from flex joint of intermediate shaft (Fig. 18). Roll pin is removed from coupler using following procedure:

- (a) Remove knurled nut from small end of tool.
- (b) Insert small end of Remover through center of roll pin, then install and hand tighten knurled nut.
- (c) Position sleeve of removal tool on flex joint as shown (Fig. 18).
- (d) While holding threaded shaft of tool from turning, tighten nut, pulling roll pin out of flex joint.

(24) Separate the intermediate steering shaft from the steering gear.

(25) Raise vehicle.

(26) Remove the right front tire/wheel.

(27) Remove the nut (Fig. 19) attaching the tie rod end to the steering arm on the right strut.

- 4 - C-3894A

(29) Remove the tie rod from the vehicle.

NOTE: If the vehicle is equipped with a 2.7 liter engine, rotate the front of the left front tire/wheel as far outward as possible (Fig. 21). This is necessary to have the required clearance to allow the removal of the steering gear from a vehicle with this engine application.

80b27d1a

Fig. 21 Required Tire Position

- 1 - LEFT FRONT TIRE

(30) Remove the steering gear from the vehicle using the following steps.

(a) Slide the end of the steering gear through the tie rod hole in the right side inner fender (Fig. 22). Steering gear needs to be slid through tie rod hole until about half of the steering gear is through the hole (Fig. 22).

80b27d1e

Fig. 22 Steering Gear Through Tie Rod Hole

- 1 - FENDER
- 2 - TIE ROD HOLE
- 3 - STEERING GEAR
- 4 - STRUT

(b) Lift the left end of the steering gear upward, with the steering gear positioned as shown, between the back of the engine and the front of the cowl (Fig. 23).

80b27d1f

Fig. 23 Steering Gear Positioned For Removal

- 1 - COWL
- 2 - ENGINE
- 3 - STEERING GEAR

(c) To remove the steering gear from the vehicle, pull the steering gear toward the passenger side of the vehicle out from between the cowl and the engine.

GEAR (Continued)

DISASSEMBLY - POWER STEERING GEAR (HOUSING BUSHINGS)

The power steering gear must be removed from the vehicle for the bushings to be serviced. Refer to REMOVAL in this section.

(1) Install the Receiver, Special Tool 8523-2, into the cup of the Ball Joint Press, Special Tool C-4212F, and tighten the set screw. Install the Driver, Special Tool 8523-1, on the tip of the Ball Joint Press screw drive.

(2) Place the power steering gear housing against the Receiver (Fig. 24). Tighten the screw drive until the Driver contacts the outer circumference of the bushing evenly (Fig. 24). Continue to tighten the screw drive until the bushing is pressed completely out of the steering gear housing.

Fig. 24 Removing Bushing

- 1 - POWER STEERING GEAR HOUSING
- 2 - BUSHINGS

(3) Back off the screw drive and remove the power steering gear from the Receiver.

(4) Repeat the above procedure on the other power steering gear housing bushing.

ASSEMBLY- POWER STEERING GEAR (HOUSING BUSHINGS)

(1) Install the Receiver, Special Tool 8523-2, into the cup of the Ball Joint Press, Special Tool C-4212F, and tighten the set screw. Install the Driver, Special Tool 8523-1, on the tip of the Ball Joint Press screw drive.

(2) Place the steering gear housing against the Receiver in a way that the Receiver does not come in contact with the support ribs on the gear housing (Fig. 25). Start the bushing in the bottom of the housing and tighten the screw drive until the Driver contacts the bushing retainer washer (Fig. 25). Slowly tighten the screw drive until the bushing bot-

toms in the recessed area of the steering gear housing.

Fig. 25 Installing Bushing

- 1 - SUPPORT RIBS
- 2 - POWER STEERING GEAR HOUSING
- 3 - BUSHINGS

(3) Back off the Ball Joint Press screw drive and remove the power steering gear from the press.

(4) Repeat the above procedure on the other power steering gear housing bushing.

INSTALLATION - POWER STEERING GEAR

NOTE: When the original or a replacement steering gear is being installed in vehicle, be sure the tie rod attachment at the steering gear is in the center of steering gear travel.

(1) Install the steering gear in the vehicle using the reverse sequence of the removal steps.

NOTE: If the vehicle is equipped with a 2.7 Liter engine, position the left front tire so it is facing straight forward.

(2) Install the right tie rod through the tie rod hole in the inner fender.

(3) Install the outer tie rod on the steering arm of the right strut. Install the tie rod to steering arm attaching nut (Fig. 19). Tighten the attaching nut to a torque of 37 N·m (27 ft. lbs.).

(4) Install the right side tire/wheel.

(5) Install and tighten wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(6) Lower the vehicle until the front tires are just clear of the floor.

(7) Install the intermediate steering shaft on the steering gear.

GEAR (Continued)

(8) Using roll pin Installer, Special Tool 6831A, install the roll pin in the flex joint of the intermediate shaft (Fig. 26). Roll pin is installed in coupler using the following procedure:

- (a) Remove knurled nut from small end of tool.
- (b) Insert small end of removal tool through center of roll pin and then install and hand tighten knurled nut.
- (c) Position sleeve of removal tool on flex joint as shown (Fig. 26).
- (d) While holding threaded shaft of tool from turning, tighten nut pulling roll pin into flex joint.
- (e) Center roll pin in flex joint. Do not over-install roll pin.

Fig. 26 Steering Coupler Roll Pin Installation

- 2 - FLEX JOINT
- 3 - KNURLED NUT
- 4 - ROLL PIN
- 5 - STEERING GEAR
- 6 - SLEEVE
- 7 - NUT
- 8 - SPECIAL TOOL 6831A

(9) Slide steering gear and intermediate shaft back into dash panel sealing boot. Align the steering gear mounting holes with its mounting holes in crossmember.

(10) Loosely install the bolts mounting the left side of the steering gear to the crossmember (Fig. 15).

CAUTION: Tightening the steering gear to crossmember mounting bolts to the proper torque is very important.

(11) Install the bolts mounting the right side mounting bracket for the steering gear to the crossmember (Fig. 16). Tighten the mounting bolts to a torque of 58 N·m (43 ft. lbs.).

(12) Tighten the bolts mounting the left side of the steering gear to the crossmember to a torque of 58 N·m (43 ft. lbs.).

(13) If previously loosened, tighten the bolts mounting the steering gear mounting bracket to the right side of the steering gear (Fig. 17) to a torque of 37 N·m (27 ft. lbs.).

CAUTION: Before installing tie rods on steering gear be sure the tie rod spacer block inside the steering gear bellows (boot) (Fig. 27) is correctly aligned with the bolt holes in the rack of the steering gear and the steering gear bellows.

80b27d2b

Fig. 27 Tie Rod Spacer Block

- 1 - STEERING GEAR BOOT
- 2 - SPACER BLOCK

(14) Attach power steering fluid pressure, and return lines into proper ports of the steering gear (Fig. 14). Tighten both power steering hose tube nuts to a torque of 47 N·m (35 ft. lbs.).

(15) If equipped with speed proportional steering, connect the wiring harness connector to the solenoid control valve electrical connector (Fig. 10).

GEAR (Continued)

(16) Align center take off on steering gear with the tie rod assemblies. Install tie rod attaching bolts and washers into steering gear assembly. **Be sure washers are installed between tie rods and steering gear (Fig. 28).** Tighten the tie rod to steering gear bolts to a torque of 100 N·m (74 ft. lbs.).

CAUTION: After tie rod attaching bolts are torqued, bend the retaining plate tabs against heads of the attaching bolts (Fig. 12).

Fig. 28 Tie Rod Attachment

- 1 - RETAINING TABS
- 2 - BOLTS
- 3 - RETAINING PLATE
- 4 - STEERING GEAR
- 5 - WASHER
- 6 - TIE RODS
- 7 - WASHER

(17) Install the vacuum hose for the power brake booster on intake manifold vacuum port. Install hose clamp on vacuum hose.

(18) Install the master cylinder on the power brake vacuum booster. Install the two nuts attaching the master cylinder to the booster. Tighten the master cylinder mounting nuts to a torque of 28 N·m (250 in. lbs.).

(19) Connect wire connector to the brake fluid level switch on the side of the master cylinder fluid reservoir.

(20) Install the in-line resonator and inlet hose (Fig. 9) on the throttle body and air inlet hose coming from the lid of the air cleaner housing.

(21) Install the cowl reinforcement on the vehicle (Fig. 8). Install the eight bolts attaching the reinforcement to the strut towers. Install the bolt attaching the wiper module to the reinforcement.

(22) Install the covers (Fig. 7) over the wiper module and the cowl. Install and securely tighten the attaching screws.

(23) Install the wiper arms (Fig. 6) on the pivots. Install and securely tighten the wiper arm to pivot attaching nuts. Install the caps on the wiper arms covering the pivot nuts.

(24) Install the intermediate shaft onto the steering column shaft. Install steering column coupler pinch bolt (Fig. 5) and tighten to a torque of 28 N·m (21 ft. lbs.). Install the pinch bolt nut retaining pin in pinch bolt.

(25) Remove the holding clamp from the steering wheel (Fig. 4).

(26) Install the battery ground cable onto the ground stud on the shock tower.

(27) Perform Power Steering Pump Initial Operation procedure to properly refill and bleed power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(28) Lower vehicle.

(29) Adjust front toe. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

SPEED PROPORTIONAL STEERING SOLENOID

DESCRIPTION - SOLENOID CONTROL VALVE

The solenoid control valve is mounted on the speed proportional power steering gear housing (Fig. 2).

OPERATION - SOLENOID CONTROL VALVE

Variable-effort power steering is provided by controlling power steering fluid pressure at the power steering gear. A solenoid control valve located on the steering gear (Fig. 2) is used to control power steering gear return fluid pressure. The pressure is controlled by varying the size of an orifice.

The variable-assist speed-proportional solenoid control valve is controlled by the Body Control Module (BCM). The BCM receives the vehicle speed signal sent from the Powertrain Control Module (PCM). Upon receiving the vehicle speed signal from the PCM, the BCM converts that speed signal into an electrical current usable by the solenoid control valve for controlling the variable effort of the power steering system.

The solenoid control valve is a serviceable component of the variable-effort, speed-proportional power steering gear assembly.

REMOVAL - SOLENOID CONTROL VALVE

(1) Disconnect the solenoid control valve electrical connector from the wiring harness at the power steering gear end cap below the brake master cylinder (Fig. 29).

(2) Unclip the connector from the gear end cap.

SPEED PROPORTIONAL STEERING SOLENOID (Continued)

**Fig. 29 Wiring Harness**

- 1 - SPEED PROPORTIONAL STEERING SOLENOID CONNECTOR
- 2 - MASTER CYLINDER RESERVOIR

(3) Remove the power steering pressure hose (Fig. 30) from the power steering gear.

**Fig. 30 Power Steering Hose Connections At Steering Gear**

- 1 - POWER STEERING FLUID RETURN HOSE
- 2 - STEERING GEAR
- 3 - MASTER CYLINDER FLUID RESERVOIR
- 4 - POWER STEERING FLUID PRESSURE HOSE

(4) Remove the power steering return hose (Fig. 30) from the power steering gear.

(5) Using a 1-5/16 inch crow foot (Fig. 31), loosen the solenoid control valve. Then, by hand, remove the solenoid control valve from the power steering gear.

**Fig. 31 Loosening Solenoid Control Valve**

- 1 - SOLENOID CONTROL VALVE
- 2 - RETURN HOSE
- 3 - 15/16 CROW FOOT
- 4 - STEERING GEAR

INSTALLATION - SOLENOID CONTROL VALVE

(1) Inspect the O-ring seals on the solenoid control valve to be sure they are not damaged. If the O-rings are not damaged, moisten the O-rings using **only** fresh clean Mopar Power Steering Fluid, or equivalent.

(2) Install the solenoid control valve into the steering gear by hand until it is fully seated into the steering gear.

(3) Using the 1-5/16 inch crow foot as shown (Fig. 32), tighten the solenoid control valve to a torque of 14 N·m (124 in. lbs.).

**Fig. 32 Torquing Solenoid Control Valve**

- 2 - STEERING GEAR
- 3 - POWER STEERING RETURN HOSE
- 4 - 15/16 CROW FOOT
- 5 - TORQUE WRENCH

SPEED PROPORTIONAL STEERING SOLENOID (Continued)

(4) Reconnect the power steering hoses at the gear (Fig. 30). Tighten both hose tube nuts to 31 N·m (275 in lbs.).

(5) Route the solenoid control valve wire harness over the top of the gear and clip it into place on the gear end cap.

(6) Connect the wiring harness connector. **Be sure the wiring harness connector seal is in good condition before installing the connector in the control module.**

(7) Road test vehicle, referring to the test indicated in the Appropriate Diagnostic Information, to confirm correct operation of the variable-assist speed-proportional power steering gear.

- 5 - STEERING GEAR

(15) Rotate the loose end of the mounting plate out of the way.

(16) Remove the tie rod assembly from the vehicle through the wheel opening.

(17) Loosen the pinch bolt at the outer to inner tie rod adjustment sleeve.

(18) Remove outer tie rod from adjustment sleeve and inner tie rod.

INSTALLATION - INNER TIE ROD

(1) Install the outer tie rod into the adjustment sleeve on the inner tie rod. Screw the tie rod in until the exposed thread length on the outer tie rod is equal to the exposed threads on the adjuster. Make sure no more than 20 mm thread length is exposed on either the tie rod or the adjuster sleeve (Fig. 42). **Do not tighten the adjustment pinch bolt at this time.**

CAUTION: When setting the front Toe on the vehicle, the maximum dimension of exposed threads allowed on the adjuster and outer tie rod cannot exceed the distance shown in (Fig. 42). If the maximum distance is exceeded, inadequate retention of either the adjuster or the outer tie rod can result. This condition can cause separation of the outer tie rod end from the inner tie rod. Ensure that adjustment sleeve pinch bolts are torqued to the required specification when Toe setting procedure is completed.

80b2a1ee

Fig. 42 Tie Rod Thread Engagement Requirements

- 1 - OUTER TIE ROD
- 2 - ADJUSTER
- 3 - PINCH BOLT
- 4 - INNER TIE ROD
- 5 - ALLOWABLE THREADS EXPOSED ON OUTER TIE ROD AND ADJUSTER IS A MAXIMUM OF 20 MILLIMETERS. REFER TO AREA INDICATED ABOVE ON THE OUTER TIE ROD AND ADJUSTER.

(2) Install the tie rod assembly through the tie rod hole in the wheel opening inner fender.

(3) Install the outer tie rod on the steering arm of the strut. Install the tie rod steering arm nut (Fig. 38). **Do not tighten the nut at this time.**

CAUTION: Before installing tie rod on steering gear be sure the tie rod spacer block inside the steering gear bellows (boot) is correctly aligned with the bolt holes in the rack of the steering gear and the steering gear bellows (Fig. 43).

80b27d2b

Fig. 43 Tie Rod Spacer Block

- 1 - STEERING GEAR BOOT
- 2 - SPACER BLOCK

TIE ROD - INNER (Continued)

(4) Align the inner tie rod with the mounting hole in the center take off on steering gear. Rotate the mounting plate into position over the tie rod. Install tie rod attaching bolt through tie rod and washer into steering gear. **Be sure washer is installed between tie rod and steering gear as shown (Fig. 44). Tighten both tie rod to steering gear bolts to a torque of 100 N·m (74 ft. lbs.).**

Fig. 44 Tie Rod Attachment

- 1 - RETAINING TABS
- 2 - BOLTS
- 3 - RETAINING PLATE
- 4 - STEERING GEAR
- 5 - WASHER
- 6 - TIE RODS
- 7 - WASHER

(5) Bend retaining tabs against heads of tie rod attaching bolts (Fig. 40).

(6) Place the front wheels in the straight-ahead position.

(7) Tighten the outer tie rod steering arm nut to a torque of 37 N·m (27 ft. lbs.).

(8) Install the wheel and tire assembly. Install and tighten wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(9) Lower the vehicle.

(10) Install the in-line resonator and inlet hose on the throttle body and air inlet hose coming from the lid of the air cleaner housing (Fig. 37).

(11) Install the reinforcement on the vehicle (Fig. 36). Install the 8 bolts attaching the reinforcement to the strut towers. Install the bolt attaching the wiper module to the reinforcement.

(12) Install the covers over the wiper module and the cowl (Fig. 35). Install and securely tighten the attaching screws.

(13) Install the wiper arms on the pivots (Fig. 34). Install and securely tighten the wiper arm to pivot

attaching nuts. Install the caps on the wiper arms covering the pivot nuts.

(14) Install the battery ground cable onto the ground stud on the shock tower and install nut.

(15) Adjust front toe. Refer to Wheel Alignment in Suspension.

TIE ROD - OUTER

DIAGNOSIS AND TESTING - OUTER TIE ROD SOCKET END PLAY

NOTE: When measuring tie rod socket end play, the total weight of the vehicle must be supported by the tires and suspension of the vehicle. Do not support the vehicle by other than a drive-on hoist or an alignment rack.

(1) Position the vehicle on a drive on hoist or an alignment rack so that the tires are supporting the total weight of the vehicle.

(2) Raise hoist or alignment rack so that the tie rod is positioned at eye level.

(3) Mount a dial indicator to the front strut assembly (Fig. 45).

(4) Install a U-bolt having an inside dimension of 2 inches and a length of 3 inches (minimum) on the tie rod end and steering arm of strut as shown in (Fig. 45). Hand tighten nuts on U-bolt enough to just hold U-bolt in place.

Fig. 45 Checking Tie Rod Socket

- 1 - DIAL INDICATOR
- 2 - DIAL INDICATOR MOUNT
- 3 - TIE ROD
- 4 - U-BOLT
- 5 - STEERING ARM
- 6 - FRONT STRUT
- 7 - TIRE

(5) Position dial indicator in center of tie rod as shown in (Fig. 45). Zero the dial indicator gauge.

TIE ROD - OUTER (Continued)

(6) Equally tighten both nuts on the U-bolt until a torque of 2.7 N·m (24 in. lbs.) is achieved on each nut.

(7) Note the tie rod socket end play. New ball joint end play should not be greater than 0.100 inches. Used ball joint end play should not be greater than 0.190. If end play for a ball joint in service (Used) is greater than the specification listed, the ball joint will require replacement.

REMOVAL - OUTER TIE ROD

(1) Raise vehicle on jackstands or centered on a frame contact hoist. See Hoisting in Lubrication and Maintenance.

(2) Remove tire and wheel assembly.

(3) Loosen the pinch bolt at the outer to inner tie rod adjustment sleeve (Fig. 46).

Fig. 46 Tie Rod Adjustment Sleeve Pinch Bolt

- 1 - OUTER TIE ROD
- 2 - ADJUSTMENT SLEEVE
- 3 - PINCH BOLT

(4) Remove the outer tie rod to strut steering arm attaching nut (Fig. 47).

(5) Remove the outer tie rod from the steering arm using Puller, Special Tool C-3894-A (Fig. 48).

(6) Remove outer tie rod from adjustment sleeve.

INSTALLATION - OUTER TIE ROD

(1) Install the outer tie rod into the adjustment sleeve. **Do not tighten the adjustment pinch bolt at this time.**

(2) Install the outer tie rod into the steering arm on front strut. Install tie rod to steering arm attaching nut (Fig. 47). Tighten the attaching nut a torque of 37 N·m (27 ft. lbs.).

(3) Install the tire and wheel assembly.

(4) Install and tighten the wheel mounting nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

Fig. 47 Tie Rod Nut

(5) Lower vehicle.

CAUTION: When setting the front Toe on the vehicle, the maximum dimension of exposed threads allowed on the adjuster and outer tie rod cannot exceed the distance shown in (Fig. 49). If the maximum distance is exceeded, inadequate retention of either the adjuster or the outer tie rod can result. This condition can cause separation of the outer tie rod end from the inner tie rod. Ensure that adjustment sleeve pinch bolts are torqued to the required specification when Toe setting procedure is completed.

TIE ROD - OUTER (Continued)

(6) Check the front wheel toe setting on vehicle and make required changes. **When making front wheel toe adjustments, be sure the maximum exposed thread requirements (Fig. 49) are not exceeded.**

80b2a1ee

Fig. 49 Tie Rod Thread Engagement Requirements

- 1 - OUTER TIE ROD
- 2 - ADJUSTER
- 3 - PINCH BOLT
- 4 - INNER TIE ROD
- 5 - ALLOWABLE THREADS EXPOSED ON OUTER TIE ROD AND ADJUSTER IS A MAXIMUM OF 20 MILLIMETERS. REFER TO AREA INDICATED ABOVE ON THE OUTER TIE ROD AND ADJUSTER.

CAUTION: When torquing the adjuster pinch bolt, the following procedure must be followed to ensure adequate retention of the adjuster is obtained. Not following this procedure, could result in the Toe Setting Adjustment changing and/or the separation of the outer tie rod from the inner tie rod.

(7) After completion of the tie rod end installation and the toe adjustment procedure, tighten adjuster pinch bolt (Fig. 49) to a torque of 38 N·m (28 ft. lbs.). Make sure the outer tie rod maintains correct perpendicular orientation while tightening the adjuster pinch bolt.

BUSHING - INNER TIE ROD

REMOVAL - INNER TIE ROD BUSHING

NOTE: When servicing inner tie rod bushings, replacement of both inner tie rod bushings is recommended.

(1) Remove the battery ground cable from the ground stud on the shock tower and isolate the ground cable by installing the cable isolator on the ground stud (Fig. 50).

80b243ab

Fig. 50 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR

(11) Turn the steering wheel all the way to the full-right position.

(12) Bend back the retaining tabs on the mounting plate for the tie rod to steering gear mounting bolts (Fig. 57).

Fig. 57 Tie Rod Attachment Bolt Retaining Tabs

- 1 - STEERING GEAR
- 2 - TIE RODS
- 3 - RETAINING TABS
- 4 - BOLTS
- 5 - PLATE

(13) Remove the bolt fastening the inner tie rod to the steering gear (Fig. 58). Be careful not to loose the washer behind the tie rod.

(14) Loosen the bolt fastening the opposite inner tie rod to the gear, but do not fully remove it.

Fig. 58 Tie Rod To Steering Gear Attaching Bolts

- 1 - TIE RODS
- 2 - BOLTS
- 3 - MOUNTING PLATE
- 4 - WASHERS
- 5 - STEERING GEAR

(15) Rotate the loose end of the mounting plate out of the way.

(16) Remove the tie rod assembly from the vehicle through the wheel opening.

(17) Mount Receiver, Special tool 8438-1, in a vise as shown (Fig. 59).

(18) Assemble Special Tool 8438 in the following manner to remove the bushing from the inner tie rod.

(a) Place the inner tie rod bushing end in the Receiver as shown (Fig. 59).

(b) Place Remover/Installer, Special Tool 8438-4, with the small end down on top of the bushing (Fig. 59).

(c) Insert Screw, Special Tool 8438-3, through the Remover/Installer and tie rod bushing, until it threads into the bottom of the Receiver.

(d) Using hand tools, tighten the Screw until it bottoms out. The bushing is now removed from the inner tie rod.

(19) Remove the Screw, then remove the Remover/Installer, tie rod and bushing from the Receiver.

INSTALLATION - INNER TIE ROD BUSHING

NOTE: When servicing inner tie rod bushings, replacement of bushings on both inner tie rods is recommended.

(1) Using Mopar® Silicone Spray Lubricant, spray bushing, inner tie rod end, and inside of Sizer, Special Tool 8438-2.

BUSHING - INNER TIE ROD (Continued)

809e20b8

Fig. 59 Special Tool 8438 Set Up For Removal

- 2 - INNER TIE ROD
- 3 - VISE
- 4 - 8438-1 (RECEIVER)
- 5 - BUSHING
- 6 - 8438-4 (REMOVER/INSTALLER)

CAUTION: Do not use petroleum based rubber bushing installation lubricant. Premature bushing failure may occur.

NOTE: The inner tie rod bushing is symmetrical. There is no designated top or bottom.

(2) Place NEW bushing in the bore of Sizer as shown (Fig. 60). Slide bushing all the way into the Sizer bore.

809e51a6

Fig. 60 Bushing Installation Into 8438-2 (Sizer)

(3) With the Receiver, Special Tool 8438-1, mounted in the vise as shown (Fig. 61), assemble the Special Tool 8438 in the following manner to install the new bushing.

(a) Place the inner tie rod end in Receiver as shown (Fig. 61).

(b) Place the Sizer (with bushing) on top of the tie rod bushing bore with the tapered end facing downward.

(c) Place Remover/Installer, Special Tool 8438-4, with the small end down on top of the bushing (Fig. 61).

(d) Insert Screw, Special Tool 8438-3, through the Remover/Installer, bushing (in Sizer) and tie rod, until it threads into the bottom of the Receiver.

(e) Using hand tools, tighten the Screw, pushing the bushing out of Sizer, into the inner tie rod end. Tighten the Screw until it bottoms in the tool. Do not overtighten.

809e51d0

- 6 - 8438-2 (SIZER)
- 7 - 8438-4 (REMOVER/INSTALLER)

BUSHING - INNER TIE ROD (Continued)

(4) Remove the Screw, Remover/Installer and Sizer, then remove the tie rod from the Receiver.

(5) Inspect the bushing. It will appear slightly off-center in the tie rod (Fig. 62). This is a normal condition.

Fig. 62 Correctly Installed Bushing

- 1 - INNER TIE ROD
2 - BUSHING OFF-CENTER

809e2874

NOTE: Before installing the tie rod assembly back in the vehicle, loosen the tie rod adjustment pinch bolt and verify the adjustment sleeve is freed-up. This will ease toe adjustment which must be set at the end of this procedure.

(6) Install the tie rod assembly through the tie rod hole in the wheel opening inner fender.

(7) Install the outer tie rod on the steering arm of the strut. Install the tie rod steering arm nut (Fig. 55). **Do not tighten the nut at this time.**

CAUTION: Before installing tie rod on steering gear be sure the tie rod spacer block inside the steering gear bellows (boot) is correctly aligned with the bolt holes in the rack of the steering gear and the steering gear bellows (Fig. 63).

(8) Align the inner tie rod with the mounting hole in the center take off on steering gear. Rotate the mounting plate into position over the tie rod. Install tie rod attaching bolt through tie rod and washer into steering gear. **Be sure washer is installed between tie rod and steering gear as shown (Fig. 64).**

NOTE: It is recommended that the opposite inner tie rod's bushing be removed and replaced at this time. Refer to Removal.

BUSHING - INNER TIE ROD (Continued)

(9) Tighten both tie rod to steering gear bolts to a torque of 100 N·m (74 ft. lbs.).

(10) Bend retaining tabs against heads of tie rod attaching bolts (Fig. 57).

(11) Place the front wheels in the straight-ahead position.

(12) Tighten the outer tie rod steering arm nut to a torque of 37 N·m (27 ft. lbs.).

(13) Install the wheel and tire assembly. Install and tighten wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(14) Lower the vehicle.

(15) Install the in-line resonator and inlet hose on the throttle body and air inlet hose coming from the lid of the air cleaner housing (Fig. 54).

(16) Install the reinforcement on the vehicle (Fig. 53). Install the eight bolts attaching the cowl reinforcement to the strut towers. Install the bolt attaching the wiper module to the reinforcement.

(17) Install the covers over the wiper module and the cowl (Fig. 52). Install and securely tighten the attaching screws.

(18) Install the wiper arms on the pivots (Fig. 51). Install and securely tighten the wiper arm to pivot attaching nuts. Install the caps on the wiper arms covering the pivot nuts.

(19) Install the battery ground cable onto the ground stud on the shock tower and install nut.

(20) Adjust front toe. Refer to Wheel Alignment in Suspension.

PUMP

DESCRIPTION

Hydraulic pressure for the operation of the power steering system is provided by a belt driven rotary power steering pump. The power steering pump is a constant flow rate and displacement vane type pump. Vehicles equipped with the 2.7 liter engine use a power steering pump that has an integral reservoir for the power steering fluid (Fig. 1). Vehicles equipped with the 3.5 liter engine use a power steering pump (Fig. 2) that has a remotely mounted reservoir for the power steering fluid.

Both power steering pumps mount to the front of the engine on the driver's side.

The service procedures for the power steering pump are limited to the areas and components listed below.

- Power steering fluid reservoirs, related components and attaching hardware.
- Power steering pump pulley.

No repair procedures are to be done on the internal components of the power steering pump. Repair of a

80b171d6

Fig. 1 Power Steering Pump (2.7L Engine)

- 2 - POWER STEERING PUMP PRESSURE FITTING
- 3 - POWER STEERING PUMP

power steering fluid leak from any area of the power steering pump is not allowed.

PUMP (Continued)

Fig. 2 Power Steering Pump (3.5L Engine)

- 1 - POWER STEERING PUMP
- 2 - PUMP PRESSURE FITTING
- 3 - FLUID SUPPLY FITTING

OPERATION

The Power steering pump operates as follows. A belt driven pulley turns a shaft which drives a rotor. Rectangular pumping vanes carried by the shaft driven rotor move the fluid from the intake to the cam ring pressure cavities. As the rotor begins to turn, centrifugal force throws the vanes against the inside surface of the cam ring to pickup residual oil. This oil is then forced into the high pressure area. As more oil is picked up by the vanes, the additional oil is forced into the cavities of the thrust plate through two crossover holes in the cam ring and pressure plate. The crossover holes empty into the high pressure area between the pressure plate and the housing end cover.

When the high pressure area of the power steering pump is filled with power steering fluid, the fluid flows under the vanes in the rotor slots, forcing the vanes to follow the inside oval surface of the cam ring. As the vanes reach the restricted area of the cam ring, oil is forced out from between the vanes. When excess oil flow is generated during high-speed operation, a regulated amount of oil returns to the pump intake side through a flow control valve. The flow control valve reduces the power required to drive the pump and holds down temperature build-up.

When steering conditions exceed maximum pressure requirements, such as turning the wheels against the stops, the pressure built up in the steering gear also exerts pressure on the spring end of the flow control valve. The end of the valve houses the pressure relief valve. High pressure lifts the relief

valve ball from its seat and allows oil to flow through a trigger orifice located in the outlet fitting. This reduces pressure on the spring end of the flow control valve which then opens and allows the oil to return to the intake side of the pump. This action limits maximum pressure output of the pump to a safe level.

Under normal power steering pump operating conditions, the pressure requirements of the pump are below maximum, causing the pressure relief valve to remain closed.

In the event of a power steering pump drive belt failure, manual steering control of the vehicle can still to be maintained. However, under these conditions, steering effort will significantly increase.

STANDARD PROCEDURE - POWER STEERING PUMP INITIAL OPERATION

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: Use only Mopar® ATF+4 Automatic Transmission Fluid (MS-9602). Do not overfill.

Wipe the power steering fluid reservoir and filler cap clean. Check the level of the power steering fluid in the reservoir. The power steering fluid level should be between MAX. COLD and MIN. COLD when the fluid is at a normal ambient temperature of approximately 32°C to 43°C (90°F to 110°F).

(1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two (2) minutes.

(2) Start the engine and let run for a few seconds. Then turn the engine off.

(3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

(4) Raise the front wheels off the ground.

(5) Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops for less than 2 seconds at a time.

(6) Add power steering fluid if necessary.

(7) Lower the vehicle and turn the steering wheel slowly from lock to lock.

(8) Stop the engine. Check the fluid level and refill as required.

(9) If the fluid is extremely foamy, allow the vehicle to stand a few minutes and repeat the above procedure.

(10) Lower the vehicle.

PUMP (Continued)

REMOVAL

REMOVAL - PUMP (2.7L ENGINE)

(1) Remove the battery ground cable from the ground stud on the shock tower and isolate the ground cable by installing the cable isolator on the ground stud (Fig. 3).

Fig. 3 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

NOTE: The following step should be done to prevent excessive spilling of power steering fluid when the power steering fluid lines are removed from the power steering pump.

(2) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.

CAUTION: When removing the power steering fluid supply hose from the nipple on the power steering fluid reservoir, do not use excessive force. The will result in the nipple being broken off of the power steering fluid reservoir.

(3) Remove the power steering fluid return hose from the power steering fluid reservoir (Fig. 4).

(4) Let power steering fluid drain from the power steering fluid reservoir and power steering pump.

(5) Install a cap on the open nipple of the power steering fluid reservoir to prevent power steering fluid from spilling when removing the power steering pump.

Fig. 4 Return Hose At Reservoir

- 1 - POWER STEERING FLUID RESERVOIR
- 2 - POWER STEERING FLUID PRESSURE HOSE
- 3 - POWER STEERING FLUID RETURN HOSE

(6) Remove the power steering fluid pressure hose from the pressure fitting on the power steering pump (Fig. 5).

Fig. 5 Pressure Hose At Pump

PUMP (Continued)

(7) Let remaining power steering fluid drain from the power steering pump.

(8) Loosen the lock-nut (Fig. 6) on the front of the pulley for the serpentine drive belt tensioner.

Fig. 6 Drive Belt Tensioner Lock-Nut And Adjustment Bolt

- 1 - PULLEY
- 2 - ADJUSTMENT BOLT
- 3 - POWER STEERING FLUID RESERVOIR
- 4 - DRIVE BELT
- 5 - LOCK-NUT

(9) Using the adjustment bolt (Fig. 6) remove the tension from the drive belt for the power steering pump.

(10) Remove the drive belt from the power steering pump pulley.

NOTE: Access for the power steering pump mounting bolts is through the holes in the face of the power steering pump pulley.

(11) Remove the 3 bolts attaching the power steering pump to the power steering pump mounting bracket.

NOTE: The following step must be performed to have the space necessary to remove the power steering pump from the mounting bracket.

(12) Insert a screwdriver between the power steering pump and the sleeve in the tensioner bracket (Fig. 7). Using the screwdriver push the sleeve forward in the tensioner bracket until it is flush with the back side of the tensioner bracket (Fig. 7).

(13) Remove the power steering pump, power steering fluid reservoir and pulley as an assembly from the engine. Power steering pump is removed from the top of the engine.

(14) Transfer the required parts from the removed power steering pump to the replacement power steer-

Fig. 7 Tensioner Bracket To Power Steering Pump Sleeve

- 1 - SCREWDRIVER
- 2 - POWER STEERING PUMP
- 3 - SLEEVE
- 4 - TENSIONER BRACKET

ing pump. See Disassembly and Assembly in this section.

REMOVAL - PUMP (3.5L ENGINE)

(1) Remove the battery ground cable from the ground stud on the shock tower and isolate the ground cable by installing the cable isolator on the ground stud (Fig. 8).

Fig. 8 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

NOTE: The following step should be done to prevent excessive spilling of power steering fluid when the power steering fluid lines are removed from the power steering pump.

PUMP (Continued)

(2) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.

(3) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove the power steering fluid supply hose (Fig. 9) from the supply fitting on the power steering pump.

Fig. 9 Power Steering Fluid Supply Hose At Power Steering Pump

- 1 - POWER STEERING FLUID SUPPLY HOSE
- 2 - POWER STEERING PUMP

(5) Let power steering fluid drain from the power steering fluid reservoir and power steering pump.

(6) Install a cap on the open nipple of the power steering fluid reservoir to prevent power steering fluid from spilling when removing the power steering pump.

(7) Remove the power steering fluid pressure hose (Fig. 10) from the pressure fitting on the power steering pump.

(8) Let remaining power steering fluid drain from the power steering pump.

(9) Loosen the lock-nut (Fig. 11) on the front of the pulley for the serpentine drive belt tensioner.

(10) Using the adjustment bolt (Fig. 11) remove the tension from the drive belt for the power steering pump.

(11) Remove the drive belt from the power steering pump pulley.

NOTE: Access for the power steering pump mounting bolts is through the holes in the face of the power steering pump pulley.

Fig. 10 Pressure Hose At Power Steering Pump

- 2 - POWER STEERING FLUID PRESSURE HOSE

Fig. 11 Drive Belt Tensioner Lock-Nut And Adjustment Bolt

- 1 - ADJUSTMENT BOLT
- 2 - POWER STEERING PUMP
- 3 - LOCK-NUT
- 4 - DRIVE BELT

(12) Remove the 3 bolts attaching the power steering pump to the power steering pump mounting bracket.

PUMP (Continued)

(13) Remove the power steering pump from the engine. The power steering pump and pulley are removed as an assembly from the engine. The power steering pump is removed from the bottom of the engine between the radiator lower support and the cradle (Fig. 12).

Fig. 12 Power Steering Pump Remove/Install

- 1 - RADIATOR LOWER SUPPORT
- 2 - POWER STEERING PUMP
- 3 - CRADLE

(14) Transfer the required parts from the removed power steering pump to the replacement power steering pump. See Disassembly and Assembly in this section.

DISASSEMBLY - PUMP (PULLEY)

CAUTION: When mounting the power steering pump in the vise do not clamp the pump in the vise by the body of the power steering pump.

(1) Mount the power steering pump in a vise using the mounting bosses for the power steering pump (Fig. 13).

NOTE: Do not press or hammer on the shaft of the power steering pump in an attempt to remove the pulley. This will damage the internal components of the power steering pump.

(2) Remove the power steering pump pulley from the power steering pump shaft using Puller, Special Tool C-4333 (Fig. 13).

ASSEMBLY - PUMP (PULLEY)

NOTE: Do not press or hammer on the shaft of the power steering pump in an attempt to install the pulley. This will damage the internal components of the power steering pump.

(1) Place the power steering pump pulley on the end of the power steering pump shaft. Make sure the pulley is installed squarely on the end of the shaft.

Fig. 13 Power Steering Pump Pulley Removal

- 1 - SPECIAL TOOL C-4333
- 2 - POWER STEERING PUMP PULLEY
- 3 - POWER STEERING PUMP

CAUTION: When installing the pulley on the power steering pump, Spacer, Special Tool 6936, **MUST** be used. The spacer provides for the correct pulley location on the power steering pump to provide correct accessory drive belt alignment. The alignment is critical in controlling accessory drive belt noise. It also prevents the pulley from contacting the power steering pump when it is installed, causing power steering pump or pulley damage.

(2) Install Spacer, Special Tool 6936, into the hub of the power steering pump pulley (Fig. 14).

Fig. 14 Spacer Installed In Power Steering Pump Pulley

- 1 - SPECIAL TOOL 6936
- 2 - POWER STEERING PUMP
- 3 - POWER STEERING PUMP PULLER

(3) Insert the Pulley Installer, Special Tool C-4063, (without adapters) through hole in spacer. Thread

PUMP (Continued)

the Installer into the end of the power steering pump shaft (Fig. 15). Tighten the installer into pump shaft.

(4) Holding the Pulley Installer with one wrench so it will not rotate, turn hex nut down threaded rod of installer pushing the pulley onto the shaft of the power steering pump (Fig. 15). Ensure that the tool and the pulley remain aligned with the pump shaft so pulley does not become cocked on shaft.

Fig. 15 Installing Power Steering Pump Pulley

- 1 - SPECIAL TOOL 6936
- 2 - POWER STEERING PUMP
- 3 - PULLEY
- 4 - SPECIAL TOOL C-4063

(5) Continue to push pulley onto shaft of power steering pump until Pulley Installer will no longer turn. This will ensure the spacer provided is fully seated against the front of the power steering pump shaft.

(6) Remove the Pulley Installer from the shaft of the power steering pump. Remove the Spacer from the hub of the power steering pump pulley.

(7) Verify the pulley turns properly on the pump shaft.

INSTALLATION

INSTALLATION - PUMP (2.7L ENGINE)

(1) Install the power steering pump back in the mounting bracket using the reverse sequence of its removal.

NOTE: The long mounting bolt for the power steering pump is installed in the location where the sleeve is in the tensioner bracket.

(2) Loosely install the 3 bolts mounting the power steering pump to the mounting bracket.

NOTE: When tightening the power steering pump mounting bolt going through the sleeve (Fig. 7) be

sure the sleeve is fully seated against the power steering pump.

(3) Tighten the power steering pump mounting bolts to a torque of 28 N·m (250 in. lbs.).

(4) Install the drive belt on the power steering pump pulley. Refer to Cooling for required installation and tensioning procedure.

(5) Securely tighten the lock-nut on the pulley of the drive belt tensioner (Fig. 6).

(6) Install the power steering pressure hose in the pressure fitting of the power steering pump (Fig. 5). Tighten the power steering fluid pressure hose tube nut to a torque of 47 N·m (35 ft. lbs.).

(7) Install the power steering fluid return hose on the power steering fluid reservoir. **When installing the hose clamp on the power steering fluid return hose be sure the clamp is installed past the upset bead on the nipple of the power steering fluid reservoir.**

(8) Connect the battery ground cable onto the ground stud located on the strut tower.

(9) Perform Power Steering Pump Initial Operation procedure to properly refill and bleed power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

INSTALLATION - PUMP (3.5L ENGINE)

(1) Install the power steering pump back in the mounting bracket using the reverse sequence of its removal (Fig. 12).

(2) Loosely install all 3 bolts mounting the power steering pump to the mounting bracket.

(3) Tighten the power steering pump mounting bolts to a torque of 28 N·m (250 in. lbs.).

(4) Install the drive belt on the power steering pump pulley. Refer to Cooling for required installation and tensioning procedure.

(5) Securely tighten the lock-nut on the pulley of the drive belt tensioner (Fig. 11).

(6) Install the power steering pressure hose on the pressure fitting of the power steering pump (Fig. 10). Tighten the power steering fluid pressure hose tube nut to a torque of 47 N·m (35 ft. lbs.).

(7) Install the power steering fluid supply hose onto the supply fitting on power steering pump (Fig. 9). **When installing the hose clamp on the power steering fluid return hose be sure the clamp is installed past the upset bead on the nipple of the power steering fluid reservoir.**

(8) Lower vehicle.

(9) Connect the battery ground cable onto the ground stud located on the strut tower.

(10) Perform Power Steering Pump Initial Operation procedure to properly refill and bleed power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

FLUID

STANDARD PROCEDURE - POWER STEERING
FLUID LEVEL CHECKING

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING PARTS.

Wipe off the power steering fluid reservoir so that it is free of dirt (Fig. 16) (Fig. 17). Check the fill level of the fluid in the reservoir according to the markings on the side of the reservoir. Measure the MAX. COLD/MIN. COLD fluid levels when the fluid is at normal ambient temperature, approximately 32°C to 43°C (90°F to 110°F). Add fluid as necessary and do not overfill.**Use only Mopar® ATF+4 Automatic Transmission Fluid in this power steering system.**

FLUID COOLER

DESCRIPTION

All models of this vehicle are equipped with a cooler for the power steering system fluid (Fig. 18). The power steering fluid cooler is located at the front of the vehicle. It is mounted to the radiator lower support just forward of the air-conditioning condenser and just rearward of the front fascia (Fig. 18). The cooler is positioned so it is in the air flow through the front fascia of the vehicle.

Fig. 18 Power Steering Fluid Cooler

- 1 - AIR-CONDITIONING CONDENSOR
- 2 - TRANSMISSION OIL COOLER
- 3 - POWER STEERING OIL COOLER

OPERATION

The purpose of the power steering fluid cooler is to keep the temperature of the power steering system fluid from rising to a level that would affect the performance of the power steering system.

The cooler used on this vehicle is referred to as a fluid-to-air type cooler. This means that the air flow across the tubes of the cooler is used to extract the

FLUID COOLER (Continued)

heat from the cooler which it has absorbed from the power steering fluid flowing through it. The cooler is placed in series with the power steering fluid return line, between the steering gear and the power steering fluid reservoir. This lowers the temperature of the power steering fluid prior to it entering the power steering fluid reservoir where it is resupplied to the power steering pump.

REMOVAL

(1) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.

(2) Raise vehicle using a frame contact type hoist or supported using jack stands. See Hoisting in Lubrication And Maintenance.

(3) 300M only - The front fascia will require removal to access the power steering cooler. See Frames and Bumpers.

(4) Remove the hose clamp from the lower hose at the power steering fluid cooler (Fig. 19). Remove the lower hose from the power steering fluid cooler. Drain remaining power steering fluid from the hoses and the power steering fluid cooler.

Fig. 19 Lower Hose At Power Steering Fluid Cooler

- 1 - POWER STEERING FLUID COOLER

- 2 - FASCIA
- 3 - NUT
- 4 - RADIATOR LOWER SUPPORT
- 5 - NUT
- 6 - AIR DAM

(8) Remove the power steering fluid cooler from the radiator lower crossmember.

INSTALLATION

(1) Install the power steering fluid cooler on the radiator lower crossmember.

(2) Install the 2 nuts (Fig. 22) attaching the power steering fluid cooler to the radiator lower crossmember. Tighten the attaching nuts to a torque of 10 N·m (89 in. lbs.).

(3) Install the air dam on the radiator lower support. Attach the air dam to the radiator lower support using **new** retaining clips.

(4) Install power steering fluid hoses (Fig. 20) and (Fig. 19) on the power steering fluid cooler. **Be sure**

FLUID COOLER (Continued)

hose clamps are installed on hose past the upset bead on the power steering cooler.

- (5) 300M only - Reinstall front fascia.
- (6) Lower the vehicle to a point where front tires are just off the ground.
- (7) Perform Power Steering Pump Initial Operation procedure (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

HOSES

DESCRIPTION

The power steering fluid hoses connect the components of the power steering system.

The power steering fluid supply hose (3.5L engine only) is a special rubber hose that connects the power steering fluid reservoir to the power steering pump. The hose is secured at each end using a standard adjustable clamp.

The power steering fluid pressure hose is a high pressure hose that connects the power steering pump to the gear. At both ends of the flexible hose portion are steel fittings. A tube nut fitting with an O-ring is used at each end to connect it to either the power steering pump or the gear.

The power steering fluid return hose is a special rubber hose that connects the power steering gear and the power steering fluid cooler, back to the fluid reservoir. A standard tube nut fitting with an O-ring is used to connect it to the power steering gear. The hose is secured to the cooler and reservoir using standard adjustable clamps.

OPERATION

The power steering fluid hoses transfer fluid from one power steering system component to the next.

REMOVAL - PRESSURE AND RETURN HOSES

- (1) Remove the battery ground cable from the ground stud on the shock tower and isolate the ground cable by installing the cable isolator on the ground stud (Fig. 23).
- (2) Position the front tires of the vehicle so that they are facing straight-ahead.
- (3) Raise the vehicle on a frame contact type hoist until the front tires of the vehicle are just off the floor. See Hoisting in the Lubrication and Maintenance section of this manual for the required lifting procedure to be used for this vehicle.
- (4) Remove caps from both wiper arms at the attachment to the pivots to expose the wiper arm attaching nuts. Remove the nut (Fig. 24) attaching each wiper arm to its pivot

Fig. 23 Correctly Isolated Remote Ground Cable

- 1 - CABLE ISOLATOR
- 2 - GROUND STUD
- 3 - GROUND CABLE

Fig. 24 Wiper Arm Attachment To Pivot

- 1 - WIPER ARMS

- 1 - AIR INLET HOSE
- 2 - THROTTLE BODY
- 3 - AIR INLET HOSE
- 4 - AIR CLEANER HOUSING LID
- 5 - RESONATOR
- 6 - IN-LINE RESONATOR

NOTE: When locking the steering wheel, the front tires of the vehicle are to be facing straight ahead.

(9) Using a steering wheel clamp (Fig. 28), lock the steering wheel from rotating.

80b243b0

Fig. 28 Steering Wheel Lock Installed (Typical)

- 1 - STEERING WHEEL
- 2 - STEERING WHEEL CLAMP

CAUTION: Before removing the steering column coupler from the intermediated steering shaft be sure the steering wheel is locked from rotating (Fig. 28). If the steering wheel is allowed to rotate freely after it is disconnected from the intermediated shaft, the clockspring will be damaged and will need to be replaced.

(10) Remove the retaining pin and the coupler bolt from the steering column coupler (Fig. 29). Separate the intermediate steering shaft from the steering column coupler.

80b5cb88

Fig. 29 Steering Column Coupler

(12) Remove the bolts, mounting plate and washers attaching the tie rods to the steering gear (Fig. 31). Lay the tie rods on top of the transaxle bell housing.

Fig. 31 Tie Rod To Steering Gear Attaching Bolts

- 1 - TIE RODS
- 2 - BOLTS
- 3 - MOUNTING PLATE
- 4 - WASHERS
- 5 - STEERING GEAR

NOTE: The following step should be done to prevent excessive spilling of power steering fluid when the power steering fluid lines are removed from the steering gear.

(13) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.

(14) Remove the 2 nuts mounting the master cylinder to the vacuum booster (Fig. 32).

Fig. 32 Master Cylinder To Vacuum Booster Mounting

- 1 - MOUNTING NUT
- 2 - MASTER CYLINDER
- 3 - MOUNTING NUT
- 4 - VACUUM BOOSTER

(15) Remove the master cylinder with the brake tubes connected, from the vacuum booster. Carefully position the master cylinder in an upright position on the left side valve cover of the engine.

(16) Remove the vacuum supply hose to the vacuum booster at the check valve in the vacuum booster. Position the vacuum hose out of the way.

(17) Remove the power steering fluid pressure hose and return hose from the steering gear (Fig. 33).

Fig. 33 Power Steering Hose Connections At Steering Gear

- 2 - FRAME RAIL
- 3 - POWER STEERING FLUID TUBES
- 4 - LEFT STRUT TOWER
- 5 - BOLTS
- 6 - ROUTING CLIPS

(22) Raise vehicle.

(23) 300M only — The front fascia will require removal to access the power steering cooler. See Frames and Bumpers.

(24) Remove the power steering fluid return hose from the power steering fluid cooler (Fig. 37). Let the remaining power steering fluid drain out of the return hose and the power steering fluid cooler.

Fig. 37 Power Steering Return Hose At Cooler

- 1 - POWER STEERING FLUID COOLER
- 2 - POWER STEERING FLUID RETURN HOSE
- 3 - AIR CONDITIONING CONDENSER

HOSES (Continued)

(25) Lower the vehicle.

(26) Remove the power steering fluid hoses from the vehicle. The power steering fluid hoses are removable from the back of the engine compartment (Fig. 38).

Fig. 38 Power Steering Hose Removal/Installation

1 - POWER STEERING FLUID HOSES

INSTALLATION - PRESSURE AND RETURN HOSES

(1) Install the power steering hoses into the vehicle using the reverse of the removal procedure.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Install the power steering fluid return hose on the power steering fluid cooler (Fig. 37). **Be sure the hose clamp is installed past the upset bead on the power steering fluid cooler.**

(4) 300M only — Reinstall front fascia.

(5) Lower the vehicle until the tires are just clear of the floor

(6) Install the power steering hoses onto the left frame rail by installing the routing clip bolts (Fig. 36). Tighten the bolts to 10 N·m (89 in. lbs.).

(7) Slide steering gear and intermediate shaft back into dash panel sealing boot. Align the steering gear mounting holes with its mounting holes in crossmember.

(8) Loosely install the bolts mounting the left side of the steering gear to the crossmember (Fig. 34).

CAUTION: Tightening the steering gear to crossmember mounting bolts to the proper torque is very important.

(9) Install the bolts mounting the right side mounting bracket for the steering gear to the crossmember (Fig. 35). Tighten the mounting bolts to a torque of 58 N·m (43 ft. lbs.).

(10) Tighten the bolts mounting the left side of the steering gear to the crossmember (Fig. 34) to a torque of 58 N·m (43 ft. lbs.).

(11) Attach power steering fluid, pressure and return lines into proper ports of the steering gear (Fig. 33). Tighten both power steering hose tube nuts to a torque of 47 N·m (35 ft. lbs.).

CAUTION: Before installing tie rods on steering gear be sure the tie rod spacer block inside the steering gear bellows (Fig. 39) is correctly aligned with the bolt holes in the rack of the steering gear and the steering gear bellows.

Fig. 39 Tie Rod Spacer Block

1 - STEERING GEAR BOOT
2 - SPACER BLOCK

HOSES (Continued)

(12) Align center take-off on steering gear with the tie rod assemblies. Install tie rod attaching bolts and washers into steering gear. **Be sure washers are installed between tie rods and steering gear (Fig. 40).** Tighten the tie rod-to-steering gear bolts to a torque of 100 N·m (74 ft. lbs.).

CAUTION: After tie rod attaching bolts are torqued, bend retaining plate tabs against heads of attaching bolts (Fig. 30).

Fig. 40 Tie Rod Attachment

- 1 - RETAINING TABS
- 2 - BOLTS
- 3 - RETAINING PLATE
- 4 - STEERING GEAR
- 5 - WASHER
- 6 - TIE RODS
- 7 - WASHER

(13) Install the vacuum hose for the vacuum booster on intake manifold vacuum port. Install hose clamp on vacuum hose.

(14) Install the master cylinder on the vacuum booster. Install the two nuts attaching the master cylinder to the vacuum booster. Tighten the master cylinder mounting nuts to a torque of 28 N·m (250 in. lbs.).

(15) Remove the clamp from the steering wheel (Fig. 28).

(16) Install the intermediate shaft onto the steering column shaft. Install steering column coupler pinch bolt (Fig. 29) and tighten to a torque of 28 N·m (21 ft. lbs.). Install the pinch bolt nut retaining pin in pinch bolt.

(17) Install the cowl reinforcement on the vehicle (Fig. 26). Install the eight bolts attaching the reinforcement to the strut towers. Install the bolt attaching the wiper module to the reinforcement.

(18) Install the in-line resonator and inlet hose on the throttle body and air let hose coming from the lid of the air cleaner housing (Fig. 27).

(19) Install the covers over the wiper module and the cowl (Fig. 25). Install and securely tighten the attaching screws.

(20) Install the wiper arms on the pivots (Fig. 24). Install and securely tighten the wiper arm to pivot attaching nuts. Install the caps on the wiper arms covering the pivot nuts.

(21) Install the battery ground cable onto the ground stud on the shock tower.

(22) Perform Power Steering Pump Initial Operation procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(23) Lower vehicle.

(24) Adjust front toe as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

RESERVOIR

DESCRIPTION

Vehicles equipped with the 2.7 liter engine use a power steering pump that has an integral reservoir (Fig. 1). Vehicles equipped with the 3.5 liter engine use a power steering pump that has a remotely mounted reservoir (Fig. 41).

Fig. 41 Power Steering Fluid Reservoir (3.5L Engine)

- 1 - SPEED CONTROL SERVO
- 2 - POWER STEERING FLUID RESERVOIR

OPERATION

The power steering fluid reservoir stores fluid for the power steering system.

RESERVOIR (Continued)

REMOVAL

REMOVAL - RESERVOIR (2.7L ENGINE)

The 2.7 liter engine uses a power steering fluid reservoir that is integral to the power steering pump. To replace the power steering fluid reservoir used on this power steering pump the power steering pump will need to be removed from the engine.

(1) Remove the power steering pump from the engine. (Refer to 19 - STEERING/PUMP - REMOVAL)

(2) Remove the 3 bolts (Fig. 42) mounting the power steering fluid reservoir to the power steering pump.

80b2a1e2

Fig. 42 Fluid Reservoir To Pump Mounting

- 1 - POWER STEERING FLUID RESERVOIR
- 2 - MOUNTING BOLTS
- 3 - POWER STEERING PUMP
- 4 - MOUNTING BOLT

(3) Separate the power steering fluid reservoir from the power steering pump (Fig. 43). The reservoir is separated from the power steering pump by pulling it straight out of the pump.

REMOVAL - RESERVOIR (3.5L ENGINE)

(1) Remove the cap and siphon as much fluid as possible out of the reservoir (Fig. 44).

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove the power steering return hose from the side of the power steering fluid reservoir. Remove

80b2a1e3

Fig. 43 Fluid Reservoir Removal/Installation

- 1 - POWER STEERING FLUID RESERVOIR
- 2 - POWER STEERING PUMP

80b2a1e6

Fig. 44 Power Steering Fluid Reservoir (3.5L Engine)

- 1 - SPEED CONTROL SERVO
- 2 - POWER STEERING FLUID RESERVOIR

the power steering fluid supply hose going to the power steering pump from the bottom of the power steering fluid reservoir. Let power steering fluid drain from hoses and reservoir.

(4) Lower the vehicle.

(5) Remove the power steering fluid reservoir from the mounting bracket by rotating the rear of the reservoir toward the engine and out of the bracket.

RESERVOIR (Continued)

INSTALLATION

INSTALLATION - RESERVOIR (2.7L ENGINE)

(1) Lubricate the O-ring seal on the power steering fluid reservoir (Fig. 45) with fresh clean power steering fluid.

Fig. 45 Reservoir O-Ring Seal

1 - POWER STEERING FLUID RESERVOIR
2 - O-RING

(2) Install the power steering fluid reservoir on the power steering pump (Fig. 43). The reservoir is installed on the pump by pressing the nipple of the reservoir straight into the pump without twisting or rotating the reservoir.

(3) Install and securely tighten the three bolts mounting the power steering fluid reservoir to the power steering pump. Tighten bolt on pulley side to 13 N·m (115 in. lbs.). Tighten bolts on rear to 24 N·m (212 in. lbs.).

(4) Install the power steering pump on the engine. (Refer to 19 - STEERING/PUMP - INSTALLATION)

INSTALLATION - RESERVOIR (3.5L ENGINE)

(1) Install the power steering fluid reservoir into the mounting bracket. Be sure the retaining tab on the bracket is holding the reservoir in the bracket. Fasten screw to 12 N·m (105 in. lbs.).

(2) Raise vehicle.

(3) Install the power steering return hose onto the nipple on the side of the power steering fluid reservoir. Install the power steering fluid supply hose going to the power steering pump, on the bottom nipple of the power steering fluid reservoir. Install the hose clamps, being sure they are past the hose retention beads on reservoir nipples.

(4) Lower vehicle.

(5) Fill the power steering pump reservoir to correct fluid level. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE)

(6) Start engine and turn steering wheel several times from stop to stop to bleed air from fluid in system. Stop engine, check fluid level and inspect system for leaks.

42LE AUTOMATIC TRANSAXLE

DESCRIPTION

The 42LE (Fig. 1) is a four-speed transaxle that is a conventional hydraulic/mechanical assembly with an integral differential, and is controlled with adaptive electronic controls and monitors. The hydraulic system of the transaxle consists of the transaxle fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transaxle consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly
- Integral differential assembly

Control of the transaxle is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Powertrain Control Module (PCM).

The PCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the PCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The PCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB scan tool.

TRANSAXLE IDENTIFICATION

The 42LE transaxle identification code is a series of digits printed on a bar-code label that is fixed to the transaxle case as shown in (Fig. 2).

For example, the identification code K 821 1125 1316 can be broken down as follows:

- K = Kokomo Transmission Plant
- 821 = Last three digits of the transaxle part number
- 1125 = Build date
- 1316 = Build sequence number

80ad086f

Fig. 2 Transaxle Identification Label

- 1 - INPUT SPEED SENSOR
- 2 - OUTPUT SPEED SENSOR
- 3 - IDENTIFICATION TAG

Depending on date of manufacture, some transaxles will utilize a new identification label located in the same location as shown in (Fig. 2). This label can be broken down as follows (Fig. 3):

If the tag is not legible or missing, the "PK" number, which is stamped into the transaxle case, can be referred to for identification. This number differs slightly in that it contains the entire transaxle part number, rather than the last three digits.

OPERATION

Transmission output is directed to an integral differential by a transfer gear system in the following input-to-output ratios:

First	2.84 : 1
Second	1.57 : 1
Third	1.00 : 1
Overdrive	0.69 : 1
Reverse	2.21 : 1

- 8 - LAST THREE OF P/N
- 9 - ALPHA
- 10 - TRANSAXLE PART NUMBER
- 11 - P=PART NUMBER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 42LE GENERAL DIAGNOSIS

CAUTION: Before attempting any repair on the 42LE Four Speed Automatic Transaxle, always check for proper shift linkage adjustment. Also check for diagnostic trouble codes with the DRB scan tool and the 42LE Transaxle Diagnostic Procedure Manual.

42LE automatic transaxle malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

When diagnosing a problem always begin with recording the complaint. The complaint should be defined as specific as possible. Include the following checks:

- Temperature at occurrence (cold, hot, both)

42LE AUTOMATIC TRANSAXLE (Continued)

- Dynamic conditions (acceleration, deceleration, upshift, cornering)
- Elements in use when condition occurs (what gear is transaxle in during condition)
- Road and weather conditions
- Any other useful diagnostic information.

After noting all conditions, check the easily accessible variables:

- Fluid level and condition
- Shift linkage adjustment
- Diagnostic trouble code inspection

Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem exists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transaxle cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transaxle in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse
P - PARK					X
R - REVERSE			X		X
N - NEUTRAL					X
OD - OVERDRIVE					
First	X				X
Second	X			X	
Direct	X	X			
Overdrive		X		X	
D - DRIVE*					
First	X				X
Second	X			X	
Direct	X	X			
L - LOW*					
First	X				X
Second	X			X	
Direct	X	X			

* Vehicle upshift and downshift speeds are increased when in these selector positions.

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot

be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

42LE AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TESTS

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most transaxle problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows front wheels to turn, and position tachometer so it can be read.

Using special adapters (L-4559), attach 300 psi gauge(s) (C-3293SP) to port(s) required for test being conducted.

Test port locations are shown in (Fig. 4).

Fig. 4 Pressure Taps

- 1 - TORQUE CONVERTER CLUTCH OFF
- 2 - TURBINE SPEED SENSOR
- 3 - OUTPUT SPEED SENSOR
- 4 - LOW/REVERSE
- 5 - REVERSE
- 6 - UNDERDRIVE
- 7 - TORQUE CONVERTER CLUTCH ON
- 8 - OVERDRIVE

TEST ONE-SELECTOR IN L (1st Gear)

NOTE: This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

- (1) Attach pressure gauge to the low/reverse clutch tap.
- (2) Move selector lever to the L position.
- (3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.
- (4) Low/reverse clutch pressure should read 115 to 145 psi.

TEST TWO-SELECTOR IN DRIVE (Second Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

- (1) Attach gauge to the underdrive clutch tap.
- (2) Move selector lever to the 3 position.
- (3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.
- (4) In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A-SELECTOR IN OD (Fourth Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

- (1) Attach gauge to the underdrive clutch tap.
- (2) Move selector lever to the OD position.
- (3) Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.
- (4) Underdrive clutch pressure should read below 5 psi. If not, than either the solenoid assembly or controller is at fault.

TEST THREE-SELECTOR IN OVERDRIVE (Third and Second Gear)

NOTE: This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

- (1) Attach gauge to the overdrive clutch tap.
- (2) Move selector lever to the OD position.
- (3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph.
- (4) Overdrive clutch pressure should read 74 to 95 psi.
- (5) Move selector lever to the 3 position and increase indicated vehicle speed to 30 mph.
- (6) The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

TEST FOUR-SELECTOR IN OD (Fourth Gear)

NOTE: This test checks the 2/4 clutch hydraulic circuit.

- (1) Attach gauge to the 2/4 clutch tap.
- (2) Move selector lever to the OD position.
- (3) Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in fourth gear.
- (4) The 2/4 clutch pressure should read 75 to 95 psi.

42LE AUTOMATIC TRANSAXLE (Continued)

TEST FIVE-SELECTOR IN OVERDRIVE (Fourth Gear, CC on)

NOTE: These tests check the torque converter clutch hydraulic circuit.

- (1) Attach gauge to the torque converter clutch off pressure tap.
- (2) Move selector lever to the overdrive position.
- (3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

- (4) Torque converter clutch off pressure should be less than 5 psi.
- (5) Now attach the gauge to the torque converter clutch on pressure tap.
- (6) Move selector to the overdrive position.
- (7) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph.
- (8) Verify the torque converter clutch is applied mode using the RPM display of the DRB scan tool.
- (9) Torque converter clutch on pressure should be 60-90 psi.

TEST SIX-SELECTOR IN REVERSE

NOTE: This test checks the reverse clutch hydraulic circuit.

- (1) Attach gauge to the reverse and low/reverse clutch tap.
- (2) Move selector lever to the reverse position.
- (3) Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.
- (4) Reverse and low/reverse clutch pressure should read 165 to 235 psi.

TEST RESULT INDICATIONS

- (1) If proper line pressure is found in any one test, the pump and pressure regulator are working properly.
- (2) Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.
- (3) Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.
- (4) If the overdrive clutch pressure is greater than 5 psi in Step 6 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.
- (5) If the underdrive clutch pressure is greater than 5 psi in Step 4 of Test Two-A, a defective solenoid/pressure switch assembly or controller is the cause.

ALL PRESSURE SPECIFICATIONS ARE PSI (ON HOIST, WITH FRONT WHEELS FREE TO TURN)

Gear Selector Position		Actual Gear	PRESSURE TAPS						
			Under-drive Clutch	Over-drive Clutch	Reverse Clutch	Torque Converter Clutch Off	Torque Converter Clutch On	2/4 Clutch	Low/ Reverse Clutch
PARK 0 mph	*	PARK	0-2	0-5	0-2	60-110	45-100	0-2	115-145
REVERSE 0 mph	*	REVERSE	0-2	0-7	165-235	50-100	35-85	0-2	165-235
NEUTRAL 0 mph	*	NEUTRAL	0-2	0-5	0-2	60-110	45-100	0-2	115-145
L 20 mph	#	FIRST	110-145	0-5	0-2	60-110	45-100	0-2	115-145
3 30 mph	#	SECOND	110-145	0-5	0-2	60-110	45-100	115-145	0-2
3 45 mph	#	DIRECT	75-95	75-95	0-2	60-90	45-80	0-2	0-2
OD 30 mph	#	OVERDRIVE	0-2	75-95	0-2	60-90	45-80	75-95	0-2
OD 50 mph	#	OVERDRIVE WITH TCC	0-2	75-95	0-2	0-5	60-95	75-95	0-2

* Engine Speed at 1500 rpm

CAUTION: Both front wheels must be turning at same speed.

42LE AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located by substituting air pressure for fluid pressure. The clutches may be tested by applying air pressure to their respective passages after the valve body has been removed. Use Special Tool 6599-1 and 6599-2 to perform test (Fig. 5).

Fig. 5 Air Pressure Test Plate

- 1 - AIR PRESSURE TEST PLATES
- 2 - 2/4 CLUTCH RETAINER HOLE

To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

Remove oil pan and valve body. See Valve body recondition.

Apply air pressure to the holes in the special tool, one at a time.

Listen for the clutch to apply. It will give a slight thud sound. If a large amount of air is heard escaping, the transaxle must be removed from vehicle, disassembled and all seals inspected.

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied

to the low/reverse or the 2/4 clutches. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch (Fig. 6). The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

Fig. 6 Testing Underdrive Clutch

- 1 - AIR PRESSURE TEST PLATE 6599-1
- 2 - AIR NOZZLE

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer. Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole passage. Look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

DIAGNOSIS AND TESTING - FLUID LEAKAGE

The 42LE is a dual sump transaxle. The transaxle uses both automatic transaxle fluid (ATF) for the main sump and hypoid gear lube for the differential sump. When diagnosing a leak, it is important to distinguish which type of fluid is leaking. Factory fill

42LE AUTOMATIC TRANSAXLE (Continued)

ATF is dyed red, while differential hypoid oil is brown in color and has a distinctive odor.

There are two seals at the boundary of the two sumps. There is a weep hole in the right side of the transaxle case (Fig. 7) which vents the area between the two seals. If oil is leaking from the weep hole, there is at least one seal leaking. Never plug the weep hole to correct a leaking condition. Plugging the weep hole could result in contaminating one or both transaxle sumps, low oil level, poor transaxle performance or transaxle failure. In order to correctly repair this type of leak the transaxle must be removed from the vehicle and both transfer shaft seals replaced.

Fig. 7 Weep Hole Location

- 1 - RIGHT EXHAUST PIPE
- 2 - TRANSAXLE CASE
- 3 - TRANSAXLE OIL PAN
- 4 - WEEP HOLE

FLUID LEAKAGE-TORQUE CONVERTER HOUSING AREA

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

- (1) Verify proper transmission fluid level.
- (2) Verify that the leak originates from the converter housing area and is transmission fluid.
- (3) Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (Fig. 8). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Fig. 8 Converter Housing Leak Paths

- 1 - PUMP SEAL
- 2 - PUMP VENT
- 3 - PUMP BOLT
- 4 - PUMP GASKET
- 5 - CONVERTER HOUSING
- 6 - CONVERTER
- 7 - REAR MAIN SEAL LEAK

Pump seal leaks tend to move along the drive hub and onto the rear of the converter (Fig. 8). Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing (Fig. 8).

TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (Fig. 9).
- Torque converter hub weld (Fig. 9).

Fig. 9 Converter Leak Points—Typical

- 1 - OUTSIDE DIAMETER WELD
- 2 - TORQUE CONVERTER HUB WELD
- 3 - STARTER RING GEAR
- 4 - LUG

42LE AUTOMATIC TRANSAXLE (Continued)

FLUID LEAKAGE—DIFFERENTIAL HOUSING AREA

The differential uses Mopar® 75w-90 Fuel Saving petroleum based hypoid gear lube. It can be distinguished from ATF by its brown color (ATF is dyed red). Also gear lube has a distinctive odor (hypoid smell).

(1) If it is suspected that the leakage is gear lube, check the differential for proper fluid level. High oil level can result in leakage from the differential vent.

CAUTION: A crushed vent baffle will cause oil to leak from vent hose.

(2) If fluid level is correct, add 1/4 to 1/2 ounce of leak detecting florescent dye to the differential.

(3) Clean the suspect area of the transaxle with solvent.

(4) Road test the vehicle until the leak reoccurs.

(5) Using a black light determine the source of the leak and repair as required.

(6) Do not add oil dye to both the ATF sump and the differential sump at the same time. This can cause confusion when trying to pinpoint a leak source.

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transaxle case and valve body can be repaired by the use of Heli-Coils, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil tap, or equivalent, and installing a Heli-Coil insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL**NOTE:**

When a transaxle failure has contaminated the fluid, the oil cooler(s) must be flushed (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE). The cooler bypass valve in the transaxle must be inspected and/or replaced also. The torque converter must also be replaced with an exchange unit. This will ensure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transaxle.

NOTE: If the Torque Converter is being replaced, it is necessary to restart the TCC Break-In Strategy. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL

MODULES/POWERTRAIN CONTROL MODULE - STANDARD PROCEDURE)

The transaxle can be removed **without** having to remove the engine.

- (1) Disconnect battery.
- (2) Remove wiper blades.
- (3) Remove right and left wiper module covers.
- (4) Remove steel cowl/strut support.

CAUTION: Be careful of sharp edges around cowl/wiper area.

- (5) Remove engine air inlet tube.
- (6) Remove transaxle harness connectors at cowl area.
- (7) Remove upper bell housing stud nuts from bell housing studs. Detach heater hose tube and throttle body support bracket.
- (8) Remove upper bell housing studs.
- (9) Lift vehicle on hoist.
- (10) Loosen clamps at intersection of rear exhaust system to front catalytic converter pipes.
- (11) Separate rear exhaust from left catalytic converter pipe and right extension pipe.
- (12) Remove rear exhaust system.
- (13) Remove nuts retaining exhaust pipes to transmission mount.
- (14) Loosen clamp at right extension at right catalytic converter. Remove right extension.
- (15) Disconnect crankshaft position sensor connector and remove sensor (Fig. 10). The sensor is located on the upper right side of the transaxle bell housing.

Fig. 10 Crankshaft Position Sensor Location

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - DIFFERENTIAL COVER

- (16) Remove dipstick tube.
- (17) Disconnect the gear selector cable from the transaxle.

42LE AUTOMATIC TRANSAXLE (Continued)

(18) Disconnect transmission range sensor connector. Disconnect input and output speed sensor connector.

(19) Disconnect and plug transaxle cooler lines at the transaxle.

(20) Remove lower control arm pinch bolts.

(21) Pry lower control arms down and out of steering knuckles.

CAUTION: Do not allow drive shaft or CV joint to hang freely. Internal joint damage may occur if allowed to hang freely.

CAUTION: Drive shaft retainer clips and seals located on the stub shafts must be replaced before reinstalling drive shafts.

(22) Using a pry bar, disconnect the inner tripod joints from the transaxle (Fig. 11).

Fig. 11 Half Shaft Removal

- 1 - TRANSAXLE DIFFERENTIAL
- 2 - DRIVE SHAFT
- 3 - PRY BAR

(23) Pull bottom of knuckles and drive shafts outward to allow clearance during transaxle removal. The drive shafts do not have to be completely removed from the vehicle. **Do not allow the inner tripod joints to hang unsupported or joint damage may occur.**

(24) Disconnect O2 sensor wiring and remove left catalytic converter pipe.

(25) Unbolt starter assembly. Do not disconnect wiring or completely remove the starter from the vehicle. Allow the starter to sit between the engine and the frame.

(26) Remove engine oil pan collar.

(27) Remove torque converter bolts. The torque converter is indexed to the flex plate. Mark the

torque converter location to ensure that the torque converter is reinstalled correctly.

CAUTION: The drive plate to torque converter bolts and the drive plate to crankshaft bolts must not be reused. Install new bolts whenever these bolts are removed.

(28) Place a transmission jack under the transaxle. Secure the transaxle to the jack.

(29) Raise transaxle slightly to relieve the weight on the rear transaxle mount.

NOTE: Bolts for the crossmember bridge are different lengths, side to side.

(30) Remove rear crossmember bridge bolts.

(31) Remove rear mount adapter plate mounting bolts.

(32) Remove the rear crossmember bridge, mount, and adapter plate as an assembly.

(33) Lower the rear of the transaxle to gain access to the bell housing bolts.

(34) Remove side bell housing bolts.

(35) Remove dipstick tube from transaxle. Be prepared to plug the dipstick hole when removing dipstick to prevent fluid from spilling out of the transaxle.

(36) Disconnect solenoid/pressure switch assembly connector at top of transaxle.

(37) The transaxle can now be lowered from the vehicle.

DISASSEMBLY

NOTE: If the transaxle is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the DRBIII® Scan Tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

Before disassembling transaxle, move the shift lever clockwise as far as it will go and then remove the shift lever.

NOTE: Tag all clutch pack assemblies, as they are removed, for reassembly identification.

CAUTION: Do not intermix clutch discs or plates as the unit might then fail.

(1) Measure input shaft end play using Tool 8266. Set up Tool 8266 and a dial indicator as shown in (Fig. 12). Move input shaft in and out to obtain end play reading. End play specifications are 0.13 to 0.64 mm (0.005 to 0.025 inch). Record indicator reading

42LE AUTOMATIC TRANSAXLE (Continued)

for reference when reassembling the transaxle. If endplay exceeds the specified range, the #4 thrust plate needs to be inspected and changed if necessary.

- 2 - MAIN SUMP VENT BAFFLE
- 3 - TRANSFER SHAFT NUT
- 4 - TRANSFER SHAFT
- 5 - VENT BAFFLE RETAINING SCREW
- 6 - OUTPUT SHAFT

CAUTION: Failure to grind and open stakes of the output shaft nut and transfer shaft nut will result in thread damage to the shafts during nut removal.

WARNING: WEAR SAFETY GOGGLES WHILE GRINDING STAKE NUTS.

(43) Using a die grinder or equivalent, grind the stakes in the shoulder of the shaft nuts as shown in (Fig. 58) (Fig. 59). Do not grind all the way through the nut and into the shaft. There are two stakes on each nut.

Fig. 58 Grinding Stakes

42LE AUTOMATIC TRANSAXLE (Continued)

(11) Install snap ring and remove compressor tool (Fig. 90).

Fig. 90 Install Snap Ring

- 1 - SNAP RING OPENING MUST BE BETWEEN SPRING LEVERS (AS SHOWN)
 2 - SNAP RING PLIERS
 3 - TOOL 6057

(12) Install rear carrier front bearing cone (Fig. 91).

Fig. 91 Install Rear Carrier Front Bearing Cone

- 1 - ARBOR PRESS
 2 - SPECIAL TOOL C-4171
 3 - SPECIAL TOOL 6052
 4 - REAR CARRIER

(13) Check output bearing preload. **Output bearing preload must be checked and/or adjusted if any of the following items have been replaced:**

- Output shaft (rear carrier assembly)
- Output shaft bearings
- Transaxle case

(a) **PRELOAD CHECK/SHIM SELECTION:**

Install rear output shaft bearing cone and special tool 6618A (Fig. 92).

(b) Install special tool 6618A (Fig. 93). Lightly tighten retaining screws. Screws should be below the plate surface, but do not snug screws.

(c) Turn case over on arbor press so that the plate is resting on the press base. **CAUTION: The output shaft will extend through the hole of tool 6618A. Ensure your press table has clearance for the output shaft.**

Fig. 92 Bearing Installation

- 1 - SPECIAL TOOL 6618-A
 2 - REAR OUTPUT SHAFT BEARING

Fig. 93 Special Tool Installed

- 1 - SPECIAL TOOL 6618-A

42LE AUTOMATIC TRANSAXLE (Continued)

(d) Install shim on output shaft (Fig. 94). Apply small amount of petrolatum onto the shim to hold it in place. Use the original shim as a starting point. If original shim is not available, use the thickest shim available. Refer to Output Shaft Rear Shim Chart for available sizes.

(e) Install output shaft/rear carrier into rear bearing. The shaft must be pressed into position. Use special tool MD-998911 (Disc) and C- 4171 and C4171-2 (Handle) to press shaft into rear bearing (Fig. 95).

(f) **Do not re-use old transfer shaft nut or output shaft nut because the removed stake weakens the nut flange.** Using special tools 6497 and 6498, install new output shaft nut. Do not reuse old output shaft nut. Tighten new output shaft nut to 271 N·m (200 ft. lbs.).

(g) Check the turning torque of the output shaft (Fig. 96). The shaft should have 1 to 8 in. lbs. of turning torque. If the turning torque is **higher than 8 in. lbs.**, install a thicker shim. If turning torque is **less than 1 in. lb.**, install a thinner shim. Make sure there is no end play.

9321-142

2 - #4 THRUST WASHER (FOUR TABS)

(39) **Determine proper #4 thrust plate thickness.**

- (a) Select the thinnest #4 thrust plate thickness.
(b) Install #4 thrust plate (Fig. 127) using petrolatum to hold into position.

80adac86

Fig. 127 No. 4 Thrust Plate

- 1 - OVERDRIVE SHAFT ASSEMBLY
2 - #4 THRUST PLATE (SELECT)
3 - PETROLATUM (FOR RETENTION)

42LE AUTOMATIC TRANSAXLE (Continued)

(c) Install input clutch assembly. Ensure the input clutch assembly is completely seated by viewing position through input speed sensor hole (Fig. 128). **If view through input speed sensor hole is not as shown in (Fig. 128), the input clutches assembly is not seated properly.**

Fig. 128 View Through Turbine Speed Sensor Hole

1 - TRANSAXLE COOLER LINE
2 - TURBINE SPEED SENSOR HOLE

(d) Remove the oil pump o-ring (Fig. 129) and install oil pump and gasket to transaxle. **Use screw-in dowels or phillips-head screwdrivers to align pump to case. Be sure to reinstall O-ring on oil pump after selecting the proper No. 4 thrust plate.**

(e) Measure the input shaft end play with the transaxle in the vertical position. This will ensure that the measurement will be accurate.

(f) Set up and measure endplay using End Play Set 8266 and Dial Indicator Set C3339 as shown in (Fig. 130).

Fig. 129 Remove Oil Pump O-Ring

1 - OIL PUMP ASSEMBLY
2 - O-RING

(g) Measure input shaft end play. **Input shaft end play must be .005 to .025 inch.** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch, which is within specifications.

(h) See chart to select the proper No. 4 thrust plate.

NO. 4 THRUST PLATE CHART

PART NUMBER	THICKNESS
3836237AB	1.73mm (0.068 in.)
4431666AB	1.80mm (0.071 in.)
3836238AB	1.96mm (0.077 in.)
4431667AB	2.03mm (0.080 in.)
3836239AB	2.16mm (0.085 in.)
4431668AB	2.24mm (0.088 in.)
3836240AB	2.39mm (0.094 in.)
4431669AB	2.46mm (0.097 in.)
3836241AB	2.62mm (0.103 in.)
4446670AB	2.67mm (0.105 in.)
4446671AB	2.90mm (0.114 in.)

(i) Remove oil pump, gasket, and input clutch assembly to gain access to and install proper #4 thrust plate.

CAUTION: If view through input speed sensor hole is not as shown in (Fig. 128), the input clutches assembly is not seated properly.

reading. End play specifications are 0.13 to 0.64 mm (0.005 to 0.025 inch). If not within specifications, make the necessary thrust plate adjustment.

INSTALLATION

NOTE: If the Torque Converter assembly is being replaced, it is necessary to restart the TCC Break-In Strategy. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - STANDARD PROCEDURE)

(1) When installing transaxle, reverse the removal procedure.

CAUTION: To prevent damage to the structural collar, hand tighten all fasteners. This will ensure that

80bdbd18

Fig. 149 Measure Input Shaft End Play Using Tool 8266—Typical

1 - TOOL 8266-8
2 - TOOL 8266-2
3 - TOOL C-3339

the collar is flush against transmission and oil pan before torquing to specifications.

(2) If the torque converter is being replaced, apply a light coating of grease to the crankshaft pilot hole.

(3) Inspect the drive plate for cracks before reinstalling transaxle. If any cracks are found replace the drive plate. Do not attempt to repair a cracked drive plate.

CAUTION: The bolts for the torque converter are a new short-headed design. Bolts from previous year vehicles cannot be used.

(4) Always use new torque converter to drive plate bolts.

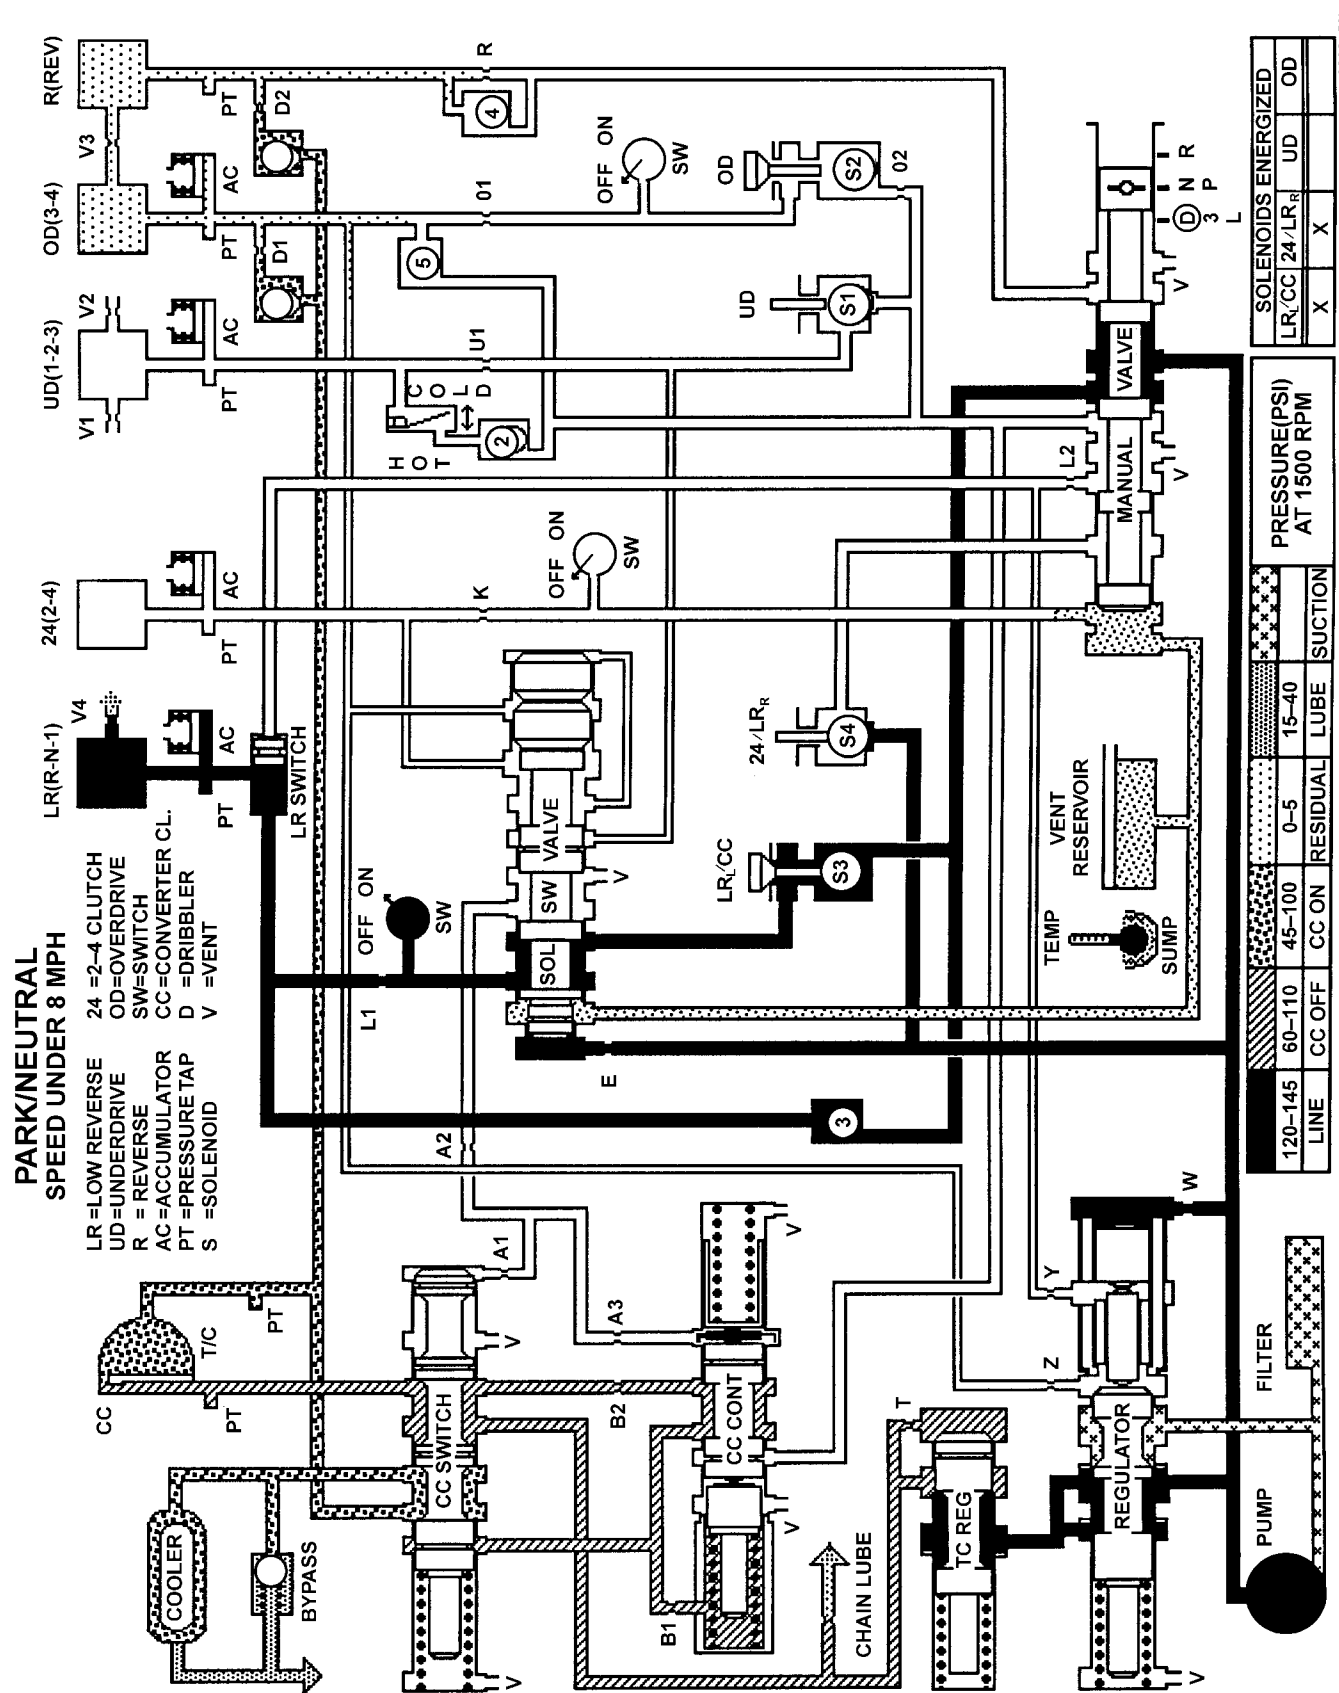

NOTE: If the transaxle assembly, PCM, solenoid pack or clutch plates have been replaced, perform the Quick Learn Procedure. This program will allow the transmission control module to compensate for any parts replaced in the electronic transaxle system.

(5) Check and/or adjust gearshift cable.

(6) Refill transaxle with Mopar ATF+4 (Automatic Transmission Fluid) Type 9602.

ACCUMULATOR

DESCRIPTION

The 42LE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator assembly typically consists of a piston, seals, return spring(s), and a cover or plug (Fig. 150).

80a77399

Fig. 150 Accumulator Assembly—Typical

- 1 - ACCUMULATOR PISTON (UNDERDRIVE)
- 2 - RETURN SPRINGS
- 3 - SEAL RING
- 4 - SEAL RING

The overdrive and underdrive accumulators are located within the transaxle case, and are retained by the valve body (Fig. 151).

The low reverse accumulator (Fig. 151) is also located within the transaxle case, but the assembly is retained by a cover and a snap-ring.

The 2/4 accumulator is located in the valve body. It is retained by a cover and retaining screws (Fig. 152).

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and spring(s). The intended result is a smooth, firm clutch application.

AUTOSTICK SWITCH

DESCRIPTION

Autostick is a driver-interactive transmission feature that offers manual gear shifting capability to provide you with more control. Autostick allows you to maximize engine braking, eliminate undersirable upshifts and downshifts, and improve overall vehicle performance. This system can also provide you with more control during passing, city driving, cold slippery conditions, mountain driving, trailer towing, and many other situations.

OPERATION

Autostick is a driver-interactive transaxle feature that offers manual gear shifting capability. When the shifter is moved into the Autostick position, the transaxle remains in whatever gear it was using before Autostick was activated. Moving the shifter to the left (towards the driver) causes a downshift and moving to the right (towards the passenger) causes an upshift. The instrument cluster will illuminate the selected gear. The vehicle can be launched in 1st, 2nd, or 3rd gear while in the Autostick mode. The speed control is operable in 3rd and 4th gear Auto-

stick mode. Speed control will be deactivated if the transaxle is shifted to 2nd gear. Shifting into OD position cancels the Autostick mode, and the transaxle resumes the OD shift schedule.

DEACTIVATION

The autostick feature will be deactivated if one of the following conditions occur:

- DTC P0706–Check Shifter Signal—usually accompanied by all PRNDL lights turning on in Park and Neutral. This will result in a DTC P0706 if three such errors are detected after any one “key-on”.
- DTC P0951–Autostick Input Circuit
- DTC P1797–Manual Shift Overheat–(Transmission oil temperature >275° F) or (Engine coolant temperature >255° F).

Acceptable powertrain temperature must be achieved to reactivate Autostick after a high temperature fault:

- Transmission Oil Temperature <255° F
- Engine Coolant Temperature <240° F

AUTOMATIC OVERRIDES

For safety, durability, and driveability, some shifts are executed automatically or prevented.

AUTOMATIC SHIFTS WILL OCCUR UNDER THE FOLLOWING CONDITIONS

TYPE OF SHIFT	APPROXIMATE SHIFT POINT	
	2.7L	3.5L
4-3 coast downshift	13 mph	13 mph
3-2 coast downshift	9 mph	9 mph
2-1 coast downshift	5 mph	5 mph
1-2 upshift	6300 engine rpm	6600 engine rpm
2-3 upshift	6300 engine rpm	6600 engine rpm
4-3 kickdown shift	13-47 mph w/sufficient throttle	13-47 mph w/sufficient throttle

MANUAL SHIFTS ARE NOT PERMITTED UNDER THE FOLLOWING CONDITIONS

TYPE OF SHIFT	APPROXIMATE SHIFT POINT
3-4 upshift	Below 15 mph
3-2 downshift	Above 74 mph @ closed throttle or 70 mph otherwise
2-1 downshift	Above 41 mph @ closed throttle or 38 mph otherwise

BEARINGS

ADJUSTMENTS

BEARING ADJUSTMENT PROCEDURES

Take extreme care when removing and installing bearing cups and cones. **Use only an arbor press for installation**, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat will give a false end play reading, while gauging for proper shims. Improperly seated bearing cup and cones are subject to low-mileage failure.

Bearing cups and cones should be replaced if they show signs of pitting or heat distress.

If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.

NOTE: Bearing end play and drag torque specifications must be maintained to avoid premature bearing failures.

Used (original) bearing may lose up to 50 percent of the original drag torque after break-in.

NOTE: All bearing adjustments must be made with no other component interference or gear intermesh, except the transfer gear bearing.

Oil all bearings before checking turning torque.

MASTER SHIM CHART

Use this chart (Fig. 153) as a reference guide when selecting the shims needed for the:

- Transfer Shaft
- Output Shaft
- Output Sprocket
- Pinion

DRIVING CLUTCHES

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 154). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

Fig. 154 Input Clutch Assembly

- 1 - INPUT SHAFT
- 2 - UNDERDRIVE CLUTCH
- 3 - OVERDRIVE CLUTCH
- 4 - REVERSE CLUTCH
- 5 - OVERDRIVE SHAFT
- 6 - UNDERDRIVE SHAFT

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

NOTE: (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FINAL DRIVE

DESCRIPTION

The 42LE differential is a conventional open design. It consists of a hypoid type ring and pinion set, and a differential case. The differential case consists of pinion and side gears, and a pinion shaft. The differential case is supported in the transaxle by tapered roller bearings (Fig. 155).

Fig. 155 Differential Assembly

- 1 - PINION GEAR
- 2 - RING GEAR
- 3 - SHORT STUB SHAFT
- 4 - DIFFERENTIAL CASE ASSEMBLY
- 5 - TRANSFER SHAFT

FINAL DRIVE (Continued)

OPERATION

The differential assembly is driven by the transfer shaft by way of the differential ring gear. The ring gear drives the differential case, and the case drives the driveshafts through the differential gears. The differential pinion and side gears are supported in the case by thrust washers and a pinion shaft. Differential pinion and side gears make it possible for front tires to rotate at different speeds while cornering.

DISASSEMBLY

The valve body and solenoid wiring connector must be removed from the transaxle in order to service the transaxle differential. The transfer shaft cannot be removed with the valve body in place. Remove the valve body assembly from the transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/VALVE BODY - REMOVAL)

(1) Remove transfer chain cover (Fig. 156).

80ad8407

Fig. 156 Remove Chain Cover

FINAL DRIVE (Continued)

(4) Remove output shaft sprocket snap ring and wave washer (Fig. 159).

Fig. 159 Remove Output Shaft Sprocket Snap Ring and Wave Washer

- 1 - WAVE WASHER
- 2 - SNAP RING

(5) Remove transfer shaft sprocket snap ring and wave washer (Fig. 160).

Fig. 160 Remove Transfer Shaft Sprocket Snap Ring and Wave Washer

- 1 - TRANSFER SHAFT
- 2 - WAVE WASHER
- 3 - SNAP RING
- 4 - SNAP RING
- 5 - WAVE WASHER

CAUTION: The chain sprockets have a slip fit onto their shafts. Apply only a slight amount of pressure to the chain spreader to release the chain pressure. If chain sprockets are not spread slightly removal or installation will be difficult. Overspreading of the chain sprocket will also make sprocket removal difficult.

(6) Install chain spreader 6550 and expand to facilitate sprocket and chain removal (Fig. 161).

Fig. 161 Install Chain Spreader

ASSEMBLY

ASSEMBLY / BEARING ADJUSTMENT PROCEDURE

The following steps will determine the correct shim thickness required to obtain proper pinion depth. All special tools described in this procedure must be used to obtain correct results.

CAUTION: Failure to adjust pinion depth correctly could cause gear noise or transaxle failure.

(1) Install front transfer shaft bearing cup (Fig. 188). The transfer shaft bearing cup must be installed before making pinion depth measurement. Use special tool 6494 to install bearing cup. There are no shims located behind this bearing cup.

CAUTION: The bearing cup is seated in the case correctly if there is no clearance between the bottom of the bearing cup and case. If a 0.001" or 0.002" feeler gauge does not fit, the bearing cup is completely seated into transaxle case.

(2) Install centering block (special tool 6549-2) into the transaxle case (Fig. 189). Screw centering block

9321-153

Fig. 188 Install Front Transfer Shaft

- 1 - SPECIAL TOOL 6494
- 2 - BEARING CUP
- 3 - SPECIAL TOOL 6494

into inner adjuster hole of case until it bottoms. The pegs on the special tool are only used for installation. Orientation with in the case is not required.

9321-154

Fig. 189 Installing Centering Block

- 1 - SPECIAL TOOL 6549-2
- 2 - TOOL INSTALLATION AND REMOVAL PEGS

FINAL DRIVE (Continued)

(3) Install new front bearing (actual bearing to be used during reassembly) onto gauge disc (special tool 6549-3) (Fig. 190).

Fig. 190 Gauge Disc and Bearing

- 1 - FRONT TRANSFER SHAFT BEARING
2 - SPECIAL TOOL 6549-3

(4) Install gauge disc and bearing into case using gauge disc rod Tool 6549-4 (Fig. 191).

Fig. 191 Installing Gauge Disc with

- 1 - FRONT TRANSFER SHAFT BEARING
2 - SPECIAL TOOL 6549-3

(5) Install centering disc (special tool 6494-2) onto gauge disc rod (Fig. 192).

(6) Install centering nut Tool 6549-5 as shown in (Fig. 193).

(7) Hand tighten centering nut until all play in the tool has been removed.

(8) Install dial indicator into locating block Tool 6549-1. Then screw extension rod onto dial indicator (Fig. 194).

Fig. 192 Disc Installation

- 1 - SPECIAL TOOL 6494-2

Fig. 193 Installing Centering Nut

- 1 - CENTERING NUT
2 - CENTERING DISC (6494-2)

Fig. 194 Dial indicator, Locating Block and Extension Rod

- 1 - EXTENSION ROD SPECIAL TOOL
2 - LOCATING BLOCK SPECIAL TOOL
3 - DIAL INDICATOR

FINAL DRIVE (Continued)

NOTE: The dial indicator used to make this measurement must have a face that shows 0-50-0 (Special Tool C-3339) readings (Fig. 195). All steps from this point forward will reflect this assumption. This will give you proper shim thickness.

9321-333

Fig. 195 0-50-0 Dial Indicator

1 - DIAL INDICATOR

(9) Before making a pinion depth measurement the dial indicator must be zeroed. This is done by placing the dial indicator in the zeroing fixture (special tool 6549-6). Then place the zeroing fixture on a flat surface. Adjust the dial face so the pointer on the dial indicator lines up with the zero (Fig. 196).

9321-351

Fig. 196 Zero Dial Indicator

1 - DIAL INDICATOR
2 - FLAT SURFACE
3 - ZEROING FIXTURE

(10) Compress the dial indicator slightly and insert dial indicator pin into centering block (Fig. 197).

9321-353

Fig. 197 Mounting Dial Indicator to Centering Block

1 - CENTERING BLOCK
2 - GAUGE DISC
3 - DIAL INDICATOR

(11) Pivot dial indicator back and forth (Fig. 198) on centering pin to obtain the shortest distance measurement. **This will be the lowest number reading on dial indicator.** Record the number obtained. Now rotate the gauge disc clockwise 1/3 of a turn and recheck readings. Record number obtained. Rotate the gauge disc another 1/3 of a turn clockwise and take another reading. Average the three readings. Record this pinion depth measurement. If the readings differ by more than two thousandths recheck gauge disc installation, it may have been installed slightly cocked.

9321-352

Fig. 198 Pivot Dial Indicator

1 - CENTERING BLOCK
2 - GAUGE DISC

FINAL DRIVE (Continued)

(12) To determine the required shim thickness, the pinion depth measurement must be adjusted. The pinion shim adjustment number is the first of seven digits ink stamped on the shank of the transfer shaft (Fig. 199). Using the adjustment factor chart, convert the adjustment number to the corresponding adjustment factor. Utilizing the pinion depth measurement obtained in Step 11, add or subtract the adjustment factor to calculate the required shim thickness. Refer to pinion head shim chart for shim selections. This is the shim that will be installed between the transfer shaft pinion head and the front transfer shaft bearing. Refer to the following examples for further explanation:

(13) Example 1 in (MM):

- Measured pinion shim depth: 0.789mm
- Adjustment number on transfer shaft: +2
- Adjustment factor (mm): -0.051mm
- Shim size needed: $0.789 - 0.051 = \mathbf{0.738mm}$

(14) Example 2 in (IN):

- Measured pinion shim depth: 0.032in
- Adjustment number on transfer shaft: -1
- Adjustment factor (in): +0.001
- Shim size needed: $0.032 + 0.001 = \mathbf{0.033in}$

ADJUSTMENT NUMBER	ADJUSTMENT FACTOR mm	ADJUSTMENT FACTOR in
3	-0.076	-0.003
2	-0.051	-0.002
1	-0.025	-0.001
0	0.000	0.000
-1	0.025	0.001
-2	0.051	0.002
-3	0.076	0.003

9421-72

ADJUSTMENT FACTOR CHART

(15) Remove dial indicator, gauge disc and centering block from transaxle.

(16) Install shim selected in Step 12 of this procedure onto the transfer shaft (Fig. 199).

FINAL DRIVE (Continued)

(17) Press front transfer shaft bearing onto transfer shaft (special tool 6052). The shim must be in place before pressing on bearing (Fig. 200).

Fig. 200 Bearing Installation

- 1 - ARBOR PRESS
- 2 - SPECIAL TOOL 6052
- 3 - FRONT TRANSFER SHAFT BEARING

(18) At this point the pinion depth has been determined and the shim has been installed onto the transfer shaft. Before the pinion is installed into the transaxle case, bearing preload must be determined for the differential bearings. The following steps must be performed before the pinion is installed.

(19) The following steps will determine how many foot pounds are required on the outer differential adjuster to obtain the correct turning torque.

CAUTION: Failure to set differential bearing preload correctly may cause bearing failure, gear noise and/or axle shaft seal failure.

(20) Remove outer adjuster with special tool 6503 (Fig. 201).

(21) Remove old stub shaft seals. Press inner adjuster seal out with special tool 6502B. Press outer adjuster seal out with special tool 6558.

(22) Install new stub shaft seals in both adjusters using special tool 6558 (Fig. 202).

NOTE: To remove inner and outer adjuster races, use Tool 6062-A. To install inner and outer adjuster races, use Tool 6522 and Tool C-4171.

Fig. 201 Outer Adjuster Removal

- 3 - PINION SHAFT
- 4 - DIFFERENTIAL CARRIER
- 5 - DIFFERENTIAL BEARING

FINAL DRIVE (Continued)

(4) Install side gear, stub shaft, and c-clip to differential support plate (Fig. 207).

9221-59

Fig. 207 Install Side Gear, Stub Shaft, and C-Clip

- 1 - SIDE GEAR
- 2 - STUB SHAFT
- 3 - "C" CLIP

CAUTION: Ring gear bolts are not reusable. When reassembling, use new bolts.

CAUTION: When assembling differential halves, line up notches on side of carrier.

(5) Assemble support plate to differential. Install ring gear and NEW bolts. Torque bolts to 95 N·m (70 ft. lbs.) (Fig. 208).

9221-56

Fig. 208 Install Ring Gear Bolts

- 1 - RING GEAR BOLTS
- 2 - RING GEAR

(25) Install differential assembly into the transaxle case (Fig. 209).

9321-167

Fig. 209 Differential Assembly Installation

- 1 - DIFFERENTIAL ASSEMBLY

(26) Install differential cover (Fig. 210). Do not apply silicone sealant at this time. All bolts should be installed and tightened.

9321-168

Fig. 210 Differential Cover Installation

- 1 - SIDE COVER

FINAL DRIVE (Continued)

(27) Install seal protector (special tool 6591) as shown in (Fig. 211). Apply a thin film of gear oil on the protector.

Fig. 211 Seal Protector

- 1 - SEAL PROTECTOR (6591)
- 2 - SIDE COVER

CAUTION: Lube threads and O-ring on adjuster before installing. Failure to do so will result in thread damage to the adjuster and transaxle case.

(28) Screw on outer adjuster and tighten adjuster down finger tight (Fig. 212).

Fig. 212 Outer Adjuster Installation

- 1 - O-RING
- 2 - OUTER ADJUSTER

(29) Insert special tool 6548 (Fig. 213). This tool will be used to check turning torque of the differential assembly.

CAUTION: Differential bearings must be seated before taking turning torque readings. This is done by rotating the differential three or four turns in both directions.

Fig. 213 Special Tool 6548

- 1 - SPECIAL TOOL 6548
- 2 - 1/4" EXTENSION
- 3 - TORQUE WRENCH

CAUTION: Turning torque of 19 to 23 in. lbs. can only be obtained when using new bearings. Do not attempt to obtain this turning torque with used bearings.

(30) Tighten outer adjuster with tool 6503 until 19 to 23 in. lbs. of turning torque is obtained on tool 6548. **Record how many foot pounds were required on the outer adjuster to obtain the correct turning torque (Fig. 214).** Record the foot pound reading. The reading that you are recording will be used in Step 54 of this procedure.

(31) Remove the differential cover, differential carrier assembly and inner adjuster.

(32) At this point the amount of torque required on the outer differential adjuster has been determined. The transfer shaft can now be installed into the transaxle case. Perform the following steps to install transfer shaft into transaxle case.

(33) Install transfer shaft into transaxle case (Fig. 215).

CAUTION: Bottom of support fixture must be flush with face of bell housing. If the support fixture is not flush, the seals and rear transfer shaft bearing cup will be pressed in cocked.

(34) Install transfer shaft support fixture (special tool 6595) (Fig. 216).

FINAL DRIVE (Continued)

9421-69

Transfer Shaft Rear Shim Chart

(42) Install rear transfer shaft cone. Press cone on transfer shaft using Tool 6560.

(43) Remove transfer shaft support fixture (special tool 6595).

CAUTION: Always use a new transfer shaft nut. Do not reuse old transfer shaft nut.

FINAL DRIVE (Continued)

(44) Install a new transfer shaft nut (Fig. 224). Tighten nut to 271 N·m (200 ft. lbs.). Use special tools 6497 holder and 6498 shaft socket to tighten nut.

Fig. 224 Transfer Shaft Nut Installation

- 1 - TORQUE WRENCH
- 2 - HOLDER (6497)
- 3 - SHAFT SOCKET (6498)

CAUTION: Failure to set the transfer shaft turning torque correctly may cause transfer shaft bearings or seals to fail. Be sure transfer shaft does not have end play. If end play exists, install a thinner preload shim.

(45) Check the turning torque of the transfer shaft using a torque wrench (Fig. 225). The turning torque should be 0.5 to 1.3 N·m (5 to 12 in. lbs.). If the turning torque is too high, install a thicker transfer shaft preload shim. If the turning torque is too low, install a thinner transfer shaft preload shim.

Fig. 225 Checking Turning Torque

- 1 - SOCKET (6498)
- 2 - TRANSFER SHAFT NUT
- 3 - IN. LBS. TORQUE WRENCH

CAUTION: A press and special tool 6589 must be used when staking the transfer shaft nut. Do not use a hammer and the special tool to stake nut. If a hammer is used; seal, bearing, and/or tool damage may result. Also the stake will not be seated against the shaft correctly. This will allow the nut to loosen.

(46) After the correct turning torque is obtained, use special tool 6589 to stake the new transfer shaft nut (Fig. 226) (Fig. 227). Be sure that the tool arms line up with slots in the transfer shaft. Use a press with the special tool to make the stakes in the nut.

Fig. 226 Staking New Nuts

- 1 - ARBOR PRESS
- 2 - STAKING TOOL (6589)

Fig. 227 Correctly Staked Nut

- 1 - BOTTOMED IN SLOT
- 2 - CORRECTLY STAKED NUT

FINAL DRIVE (Continued)

CAUTION: Failure to stake the transfer shaft nut correctly may allow the nut to loosen during transaxle operation. This will cause transaxle failure.

(47) At this point the transfer shaft, new oil seals, pinion depth and transfer shaft preload have been set. The following steps will set the backlash between the transfer shaft and the ring gear.

(48) Install vent baffle. Apply sealer as shown in (Fig. 228).

Fig. 228 Vent Baffle Installation

80dd7439

- 1 - NO SEALER ON THIS EDGE
- 2 - APPLY SEALER
- 3 - VENT BAFFLE

(49) Install new inner adjuster O-ring. Lube inner adjuster threads and O-ring. Then install inner adjuster flush with differential side of case.

(50) Install differential assembly (with ring gear attached) into transaxle case (Fig. 229).

(51) Transfer shaft to ring gear backlash should be 0.006" to 0.009" thousands of an inch. To get the backlash close enough to measure, perform the following steps. Hold the transfer shaft with one hand and rock the ring gear back and forth (Fig. 230). You should feel some backlash between the gears. If no backlash is felt use special tool 6502B to turn the inner adjuster so that it raises the differential assembly. This will increase backlash. If there is too much backlash, use special tool 6502B to turn the inner adjuster so that it lowers the differential assembly. This will decrease backlash. Recheck the backlash after each adjustment.

Fig. 229 Differential Assembly Installation

1 - DIFFERENTIAL ASSEMBLY

Fig. 230 Rocking Ring Gear Back and Forth

1 - DIFFERENTIAL ASSEMBLY

FINAL DRIVE (Continued)

(52) Apply a 1/8 inch bead of sealant to differential cover flange. Then install differential cover with sealant (Fig. 231) and tighten cover bolts.

Fig. 231 Differential Cover Installation

1 - SIDE COVER

(53) Install seal protector (special tool 6591) on shaft (Fig. 232).

Fig. 232 Seal Protector

1 - SEAL PROTECTOR (6591)
2 - SIDE COVER

CAUTION: Lube threads and O-ring on adjuster before installing. Failure to do so will result in thread damage to the adjuster and differential cover.

(54) Install outer adjuster with new O-ring (Fig. 233). Torque the outer adjuster (special tool 6503) to the torque reading recorded in Step 30. Then seat bearings by turning differential three or four revolutions in both directions. Tighten adjuster a second time to same torque recorded in Step 30. Again reseal bearings. Repeat this sequence until correct adjuster torque is maintained.

Fig. 233 Outer Adjuster Installation

1 - O-RING
2 - OUTER ADJUSTER

(55) To check and/or adjust backlash, remove the inspection plug from the top of the differential. Install dial indicator as shown in (Fig. 234). The tip of the dial indicator must be perpendicular against one of the ring gear teeth. Hold transfer shaft with locking pliers. Move ring gear back and forth with special tool 6548. Read the amount of backlash with dial indicator. Backlash should be 0.006" to 0.009" thousands of an inch.

Fig. 234 Dial Indicator Installation

1 - DIAL INDICATOR KIT C-3339
2 - ACCESS HOLE

FINAL DRIVE (Continued)

(56) If there is too much backlash, loosen the outer adjuster with special tool 6503. Then turn the inner adjuster so that it **moves away from the ring gear**. After adjusting the inner adjuster, retighten the outer adjuster to the torque recorded in Step 30. The inner adjuster should be turned in small increments.

(57) If there is not enough backlash, loosen the outer adjuster with special tool 6503. Then turn the inner adjuster so that it **moves towards the ring gear**. After adjusting the inner adjuster, retighten the outer adjuster to the torque recorded in Step 30. The inner adjuster should be turned in small increments.

(58) Once backlash is within specifications, recheck backlash in four spots on the ring gear 90 degrees apart. All four readings should be within specifications.

(59) Install inner and outer adjuster locking brackets.

(60) Install new inspection plug. Use a wooden block to tap inspection plug into place.

(61) Fill differential. It is easier to fill the differential prior to installing the transaxle back into the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/FLUID - STANDARD PROCEDURE)

to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82 C. or 180 F.), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator (Fig. 235). The fluid level should be in COLD region at 80° F fluid temperature. Adjust fluid level as necessary. Use only Mopar® ATF+4.

80d64ee0

Fig. 235 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL AND CONDITION CHECK

NOTE: The transmission and differential have separate oil sumps. The transmission sump requires automatic transmission fluid. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) for proper fluid required for this transaxle. The differential sump requires petroleum based hypoid gear lube. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) for proper fluid required for this differential.

TRANSMISSION SUMP

FLUID LEVEL CHECK

The transmission sump has a dipstick to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P Park and N Neutral positions. Place the selector lever in P Park

FLUID LEVEL CHECK USING DRB

NOTE: Engine and Transaxle should be at normal operating temperature before performing this procedure.

- (1) Start engine and apply parking brake.
- (2) Connect DRBIII® scan tool and select transmission.
- (3) Select sensors.
- (4) Read the transmission temperature value.
- (5) Compare the fluid temperature value with the chart.
- (6) Adjust transmission fluid level shown on the dipstick according to the chart (Fig. 236). Use only Mopar® ATF+4 Automatic Transmission Fluid (MS 9602).
- (7) Check transmission for leaks.

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transaxle has too much fluid, the gears churn up foam and cause the same conditions which occur with a low fluid level.

FLUID (Continued)

80de9ddc

Fig. 236 42LE Fluid Temperature Chart

1 - MAX. LEVEL

2 - MIN. LEVEL

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transaxle vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transaxle recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

Mopar® ATF+4 when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

DIFFERENTIAL SUMP

The differential sump is checked separately from the transmission. A fill plug located on the side of the transaxle must be removed to check fluid level. The fluid should be within 9 mm (.375 in.) of the bottom of the fill hole. The differential capacity is 0.95 liters (32 ounces). Adjust if needed. Use Mopar® Fuel Saving 75w-90 Petroleum Based Hypoid Gear Lubricant.

Inspect the differential area during engine oil changes for any leaks. If leakage is present, determine the source of the leak and repair as required. Remove the fill plug and verify the proper level. Adjust if needed. Use Mopar® Fuel Saving 75w-90 Petroleum Based Hypoid Gear Lubricant.

STANDARD PROCEDURE - FLUID/FILTER SERVICE

NOTE: Refer to the maintenance schedules, or the vehicle owner's manual, for the recommended maintenance (fluid/filter change) intervals for this transaxle.

FLUID (Continued)

NOTE: The 42LE Transaxle has separate transmission and differential fluid sumps. Only fluids of the type labeled Mopar® ATF+4 (Automatic Transmission Fluid) should be used in the transaxle sump. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

FLUID/FILTER SERVICE (RECOMMENDED)

(1) Raise vehicle on a hoist (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE). Place a drain container with a large opening, under transaxle oil pan.

(2) Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.

(3) Install a new filter and o-ring on bottom of the valve body and tighten retaining screws to 5 N·m (40 in. lbs.).

(4) Clean the oil pan and magnet. Reinstall pan using new Mopar Silicone Adhesive sealant. Tighten oil pan bolts to 19 N·m (165 in. lbs.).

(5) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) through the dipstick opening.

(6) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(7) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 237).

(8) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/FLUID - STANDARD PROCEDURE).

(9) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

DIPSTICK TUBE FLUID SUCTION METHOD

(1) When performing the fluid suction method, make sure the transaxle is at full operating temperature.

(2) To perform the dipstick tube fluid suction method, use a suitable fluid suction device (Vacula™ or equivalent).

(3) Insert the fluid suction line into the dipstick tube.

80d64ee0

Fig. 237 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

NOTE: Verify that the suction line is inserted to the lowest point of the transaxle oil pan. This will ensure complete evacuation of the fluid in the pan.

(4) Follow the manufacturers recommended procedure and evacuate the fluid from the transaxle.

(5) Remove the suction line from the dipstick tube.

(6) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) through the dipstick opening.

(7) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(8) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 237).

(9) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/FLUID - STANDARD PROCEDURE)

(10) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

STANDARD PROCEDURE - DIFFERENTIAL SUMP DRAIN AND REFILL

DRAIN

(1) Raise vehicle on hoist (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove differential drain plug located on the bottom of the differential housing. Allow the fluid to drain into an oil drain pan.

FLUID (Continued)

(3) Remove differential fill plug located on the differential side cover. This will assist the flow of fluid from the drain plug hole.

FILL

(1) Install drain plug into differential housing. Tighten drain plug to 7 N·m (60 in. lbs.)

(2) Fill differential with Mopar® Fuel Saving 75W-90 petroleum based hypoid gear lubricant. The fluid should be level with the bottom of the fill hole. The differential capacity is 0.95 liters (32 ounces).

CAUTION: Overfilling the differential can result in oil foaming and/or oil loss from the differential vent.

(3) Install differential fill plug. Tighten fill plug to 47 N·m (35 ft. lbs.).

GEAR SHIFT CABLE - COLUMN

REMOVAL

(1) Place vehicle in park, and turn ignition key to the "LOCK" position (Fig. 238).

Fig. 238 Ignition Key/Switch Positions

- 1 - ACC
- 2 - LOCK
- 3 - OFF
- 4 - ON/RUN
- 5 - START

(2) Remove under panel silencer/duct assembly (Fig. 239).

(3) Remove column cover screws (Fig. 240).

(4) Tilt column down and remove upper half of column cover (Fig. 241).

Fig. 239 Panel Removal/Installation

GEAR SHIFT CABLE - COLUMN (Continued)

(10) Unseat the cable grommet from the firewall (Fig. 247) and pull the shift cable from the interior of the vehicle.

(11) Raise vehicle on hoist and unbolt fill tube bracket. Rotate fill tube to gain access to the integrated shift cable clamp.

(12) Disconnect cable from routing bracket as shown in (Fig. 246).

(13) Remove shift cable retaining nut and slide cable assy. off of mounting stud (Fig. 247).

(14) Disconnect shifter cable from shift lever assembly at transaxle (Fig. 247).

(15) Remove cable from vehicle.

Fig. 246 Cable Routing Bracket

5 - NUT
6 - STUD

INSTALLATION

(1) Make sure transaxle shift lever is in "park." This is the most rearward position. Verify park sprag is fully engaged by rotating either a tire or an axle shaft.

(2) Position cable in vehicle and connect cable end to the transaxle shift lever (Fig. 247).

(3) Verify that the washer (Fig. 247) is still in place on the cable mounting stud. Install cable to transaxle and tighten nut to 28 N·m (250 in. lbs.).

(4) Rotate fill tube to original location. Install and tighten fill tube bracket bolt.

(5) Install cable "push pin" into bracket as shown in (Fig. 246).

(6) Route transaxle shift cable through hole in dash panel (Fig. 247) (Fig. 248).

(7) Lubricate cable grommet with a synthetic lubricant (or equivalent) and secure to hole. Verify that it is seated by pulling outward on cable.

(8) Install cable into throttle/gearshift cable bracket (Fig. 245).

(9) Inside the vehicle, route the gearshift between the left a/c duct and the left lower heat duct (Fig. 248) and up to the steering column.

(10) Tilt steering column all the way up and make sure shift lever is still in "park."

80b89915

Fig. 248 Shift Cable Routing

- 1 - LH A/C DUCT OUTLET
2 - LH LOWER HEAT DUCT
3 - GEARSHIFT CABLE

(11) Connect transaxle shift cable to shift cable conduit bracket and secure with new clip (Fig. 244).

GEAR SHIFT CABLE - COLUMN (Continued)

(12) Attach shift cable to attaching stud (pin) (Fig. 244) by snapping into place.

(13) Move the steering column to full tilt downward. Put the column shifter in park with key removed.

(14) Adjust cable by rotating the adjuster into lock position (Fig. 249). The adjuster will click when lock is fully adjusted.

Fig. 249 Shift Cable Adjuster Lock

80b04eea

- 1 - SHIFTER PIN
- 2 - CABLE ADJUSTER LOCK
- 3 - SHIFT CABLE

(15) Reinstall upper and lower steering column shrouds (Fig. 241) (Fig. 243). Then install underpanel silencer/duct.

(16) Check shifter for proper operation. It should operate smoothly without binding. The engine starter should crank in park or Neutral positions only.

ADJUSTMENTS

ADJUSTMENT

The gearshift cable should be adjusted if any of the following repairs or situations are encountered:

- Transaxle replacement.
- Valve body repair.
- Shift cable replacement.
- Column shifter replacement.
- When there is no cranking in Park or Neutral.

If the following conditions are encountered, the interlock cable is out of adjustment. Refer to Interlock Cable Adjustment procedure.

- When the transaxle can be shifted without the key in the ignition.
- If the key can be removed with the shifter in reverse.

• When the key cannot be removed with the shifter in the park position.

(1) Remove upper steering column shroud.

(2) Rotate cable adjuster into unlock position. Use a straight blade screwdriver to unlock adjuster (Fig. 250).

Fig. 250 Cable Lock Mechanism

9421-20

- 1 - CABLE ADJUSTER LOCK
- 2 - SCREWDRIVER
- 3 - SHIFT CABLE

(3) Make sure that the transaxle shift lever (at transaxle) is in the Park position. This is the most rearward position. Verify park sprag is fully engaged.

CAUTION: Park sprag must be engaged when adjusting linkage. Rock vehicle back and forth to ensure that park sprag is fully engaged.

(4) Tilt the steering column to the full down position.

(5) Place shifter in the park position with the key removed.

(6) Adjust by rotating adjuster into lock position (Fig. 251).

Fig. 251 Shift Cable Adjuster Lock

80b04eea

- 1 - SHIFTER PIN
- 2 - CABLE ADJUSTER LOCK
- 3 - SHIFT CABLE

(7) Reinstall upper steering column shroud.

(8) Check shifter for proper operation. It should operate smoothly without binding. The vehicle should crank in Park or Neutral only.

GEAR SHIFT CABLE - FLOOR

REMOVAL

(1) Using suitable size allen wrench, remove the shift handle retaining screw (Fig. 252).

Fig. 252 Shift Handle Retaining Screw

- 1 - GEARSHIFT KNOB
- 2 - HEX WRENCH

(2) Remove shift handle from shifter assy.
 (3) Remove console bezel from vehicle.
 (4) Loosen nut on shift cable adjust lever (Fig. 253).

Fig. 253 Shift Cable Adjust Lever Nut

- 1 - CONSOLE
- 2 - ACCESS HOLE
- 3 - SHIFTER HANDLE

(5) Remove retaining clip from shift cable conduit bracket (Fig. 254).

(6) Disconnect shifter cable from cable attach stud (pin) (Fig. 254).

Fig. 254 Floor Gearshift Cable Removal/Installation

- 1 - CUP
- 2 - CABLE
- 3 - CONDUIT BRACKET
- 4 - PIN

(7) Remove cable from center console routing. Leave flat on floor for ease of removal.

(8) Raise hood. Remove gearshift cable from throttle/gearshift cable bracket (Fig. 255)

Fig. 255 Throttle/Gearshift Cable Bracket

- 1 - CABLE BRACKET
- 2 - GEARSHIFT CABLE
- 3 - THROTTLE CABLE

(9) Unseat cable grommet at firewall and remove cable from interior of vehicle (Fig. 256).

Fig. 256 Gearshift Cable Removal

- 1 - CABLE
- 2 - FIREWALL
- 3 - WASHER
- 4 - SHIFT LEVER
- 5 - NUT
- 6 - STUD

(10) Raise vehicle on hoist and disconnect fill tube bracket from transaxle. Rotate fill tube to gain access to shift cable clamp.

(11) Remove cable from routing bracket (Fig. 257).

Fig. 257 Cable Routing Bracket

- 1 - BRACKET
- 2 - CABLE

(12) Remove cable-to-transaxle nut and slide cable off of stud (Fig. 256).

(13) Disconnect shifter cable from shift lever assembly at transaxle (Fig. 256).

(14) Remove cable from underneath vehicle.

INSTALLATION

(1) Make sure transaxle shift lever is in "Park." This is the most rearward position. Verify park sprag is fully engaged by rotating either a tire or an axle shaft.

(2) Position cable in vehicle and connect cable end to the transaxle shift lever (Fig. 256).

(3) Verify that the washer (Fig. 256) is still in place on the cable mounting stud. Install cable to transaxle and tighten nut to 28 N·m (250 in. lbs.).

(4) Rotate fill tube to original location. Install and tighten fill tube bracket bolt.

(5) Install cable "push pin" into bracket as shown in (Fig. 255).

(6) Route transaxle shift cable through hole in dash panel (Fig. 256) (Fig. 258).

(7) Lubricate cable grommet with a synthetic lubricant (or equivalent) and secure to hole. Verify that it is seated by gently pulling outward on cable.

(8) Install cable into throttle/gearshift cable bracket (Fig. 255).

(9) Inside the vehicle, route the gearshift cable between the left a/c duct and the left lower heat duct (Fig. 258) and towards the gearshift mechanism.

Fig. 258 Shift Cable Routing

- 1 - LH A/C DUCT OUTLET
- 2 - LH LOWER HEAT DUCT
- 3 - GEARSHIFT CABLE

(10) Route cable through hole in shifter conduit bracket and attach to cable attaching shift pin by snapping into place (Fig. 254).

GEAR SHIFT CABLE - FLOOR (Continued)

(11) Install a new clip onto the cable at the shifter bracket (Fig. 254).

(12) Tighten the adjuster nut (Fig. 253).

(13) Reinstall console bezel and shifter handle. Firmly press the shifter handle downward and tighten the screw (Fig. 252).

(14) Check shifter for proper operation. It should operate smoothly without binding. The starter should crank in Park or Neutral only.

ADJUSTMENTS

ADJUSTMENT

The gearshift cable should be adjusted if any of the following repairs or situations are encountered:

- Transaxle replacement.
- Valve body repair.
- Shift cable replacement.
- Floor shifter replacement
- When there is no cranking in park or neutral.

If the following conditions are encountered, the interlock cable is out of adjustment. Refer to Interlock Cable Adjustment procedure.

- When the transaxle can be shifted without the key in the ignition.
- If the key can be removed with the shifter in reverse.
- When the key cannot be removed with the shifter in the park position.

(1) Remove shifter handle and console bezel.

(2) Loosen nut on shifter cable adjuster (Fig. 259).

Fig. 259 Shift Cable Adjust Lever Nut

- 1 - CONSOLE
- 2 - ACCESS HOLE
- 3 - SHIFTER HANDLE

(3) Make sure that the transaxle shift lever (at transaxle) is in the Park position. This is the most rearward position. Verify park sprag is fully engaged.

CAUTION: Park sprag must be engaged when adjusting linkage. Rock vehicle back and forth to ensure that park sprag is fully engaged.

(4) Place shifter in park position.

(5) Place ignition in lock with key removed.

(6) Tighten adjuster nut at shifter to 225 in. lbs.

(7) Reinstall console bezel and shifter handle.

(8) Check shifter for proper operation. It should operate smoothly without binding. The vehicle should crank in Park or Neutral only.

HOLDING CLUTCHES

DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 and Low/Reverse clutches are considered holding clutches and are contained at the rear of the trans-axle case. (Fig. 260).

80be46c5

Fig. 260 2/4 and Low/Reverse Clutches

- 1 - FRONT PLANET CARRIER/REAR ANNULUS
- 2 - 2/4 CLUTCH
- 3 - L/R CLUTCH
- 4 - REAR PLANET CARRIER/FRONT ANNULUS
- 5 - REAR SUN GEAR
- 6 - FRONT SUN GEAR ASSEMBLY

HOLDING CLUTCHES (Continued)

OPERATION

NOTE: (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transaxle case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transaxle case.

INPUT CLUTCH ASSEMBLY

DISASSEMBLY

(1) Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).

(2) Tap down reverse clutch reaction plate to release pressure from snap ring (Fig. 261).

80afb64a

(16) Set up dial indicator on the UD clutch pack as shown in (Fig. 308).

80c07261

Fig. 308 Set Up Dial Indicator to Measure UD Clutch Clearance

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

(17) Using moderate pressure, press down and hold (near indicator) the UD clutch pack with screwdriver or suitable tool and zero dial indicator (Fig. 309). When releasing pressure on clutch pack, indicator reading should advance 0.005–0.010.

CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.

(18) Apply 30 psi (206 kPa) to the underdrive hose on Tool 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.

(19) Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94–1.50 mm (0.037–0.059 in.).**

(20) If necessary, select the proper reaction plate to achieve specifications:

INPUT CLUTCH ASSEMBLY (Continued)

- 3 - FLAT SNAP RING

(25) Measure OD clutch pack clearance. Set up dial indicator on top of the OD/Reverse reaction plate as shown in (Fig. 314).

80c07263

Fig. 314 Measure OD Clutch Pack Clearance

- 1 - DIAL INDICATOR
- 2 - OD/REVERSE PRESSURE PLATE

(26) Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Tool 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.

(27) Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

(28) Install reverse clutch pack (two fibers/one steel) (Fig. 315).

80afb637

Fig. 315 Install Reverse Clutch Pack

- 1 - REVERSE CLUTCH PLATE

Fig. 325 Install Overdrive Shaft Assembly

- 1 - OVERDRIVE SHAFT ASSEMBLY
- 2 - #3 THRUST PLATE
- 3 - #3 THRUST WASHER

(42) Reinstall overdrive and reverse clutch as shown (Fig. 326). **Rechecking these clutch clearances is not necessary.**

Fig. 326 Input Clutch Assembly

- 1 - INPUT CLUTCH ASSEMBLY
- 2 - OVERDRIVE SHAFT ASSEMBLY

OIL PUMP

DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transaxle case. The oil pump assembly (Fig. 327) consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

Fig. 327 Oil Pump Assembly

- 1 - PUMP HOUSING
- 2 - OUTER PUMP GEAR
- 3 - INNER PUMP GEAR
- 4 - REACTION SHAFT SUPPORT
- 5 - SEAL RINGS (4)
- 6 - REACTION SHAFT
- 7 - CRESCENT

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

OIL PUMP (Continued)

DISASSEMBLY

When disassembling the transaxle it is necessary to inspect the oil pump for wear and damage.

- (1) Remove the reaction shaft support bolts.
- (2) Remove reaction shaft support from pump housing (Fig. 328).

80b04ebc

Fig. 328 Reaction Shaft Support

- 1 - PUMP HOUSING
- 2 - REACTION SHAFT SUPPORT
- 3 - PUMP GEARS

- (3) Remove the pump gears (Fig. 329) and check for wear and damage on pump housing and gears.

80be46c4

Fig. 329 Oil Pump Assembly

- 1 - PUMP HOUSING
- 2 - OUTER PUMP GEAR
- 3 - INNER PUMP GEAR
- 4 - REACTION SHAFT SUPPORT
- 5 - SEAL RINGS (4)
- 6 - REACTION SHAFT
- 7 - CRESCENT

- (4) Re-install the gears and check clearances.
- (5) Measure the clearance between the outer gear and the pump pocket (Fig. 330). Clearance should be 0.089–0.202 mm (0.0035–0.0079 in.).

80b04ebb

Fig. 330 Measure Outer Gear to Pocket

- 1 - OUTER GEAR
- 2 - POCKET

- (6) Measure clearance between outer gear and crescent. Clearance should be 0.060–0.298 mm (0.0023–0.0117 in.).

- (7) Measure clearance between inner gear and crescent. Clearance should be 0.093–0.385 mm (0.0036–0.0151 in.).

- (8) Position an appropriate piece of Plastigage across both pump gears.

- (9) Align the Plastigage to a flat area on the reaction shaft support housing.

- (10) Install the reaction shaft to the pump housing. Tighten the bolts to 27 N·m (20 ft. lbs.).

- (11) Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.

- (12) Clearance between outer gear side and the reaction shaft support should be 0.020–0.046 mm (0.0008–0.0018 in.). Clearance between inner gear side and the reaction shaft support should be 0.020–0.046 mm (0.0008–0.0018 in.).

OIL PUMP (Continued)

ASSEMBLY

- (1) Assemble oil pump as shown in (Fig. 331)
- (2) Install and torque reaction shaft support-to-oil pump housing bolts to 28 N·m (20 ft. lbs.) torque.

Fig. 331 Oil Pump Assembly

- 6 - FRONT CARRIER REAR ANNULUS ASSEMBLY

CAUTION: The differential bearings and the differential adjusters must be reused in order to use this procedure. If any of the items listed above require replacement, this procedure cannot be used. Refer to Differential Recondition section of this manual.

(1) Remove transaxle from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - REMOVAL).

(2) Remove long stub shaft from transaxle (Fig. 333).

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transaxle case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft (Fig. 332).

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

SEAL - STUB SHAFT (LONG)

REMOVAL

If it has been diagnosed that the long stub shaft seal is leaking, the following procedure can be used to replace failed seal. This procedure will allow the replacement of the seals without having to set backlash and measure differential bearing turning torque.

9321-258

Fig. 333 Long Stub Shaft Removal

- 1 - LONG STUB SHAFT
- 2 - SPECIAL TOOL 8420A
- 3 - SLIDE HAMMER C-3752

SEAL - STUB SHAFT (LONG) (Continued)

To replace the long stub shaft bearing, install stub shaft in soft-jawed vise. Remove the stub shaft bearing C-clip (Fig. 334). Install bearing splitter onto the shaft. Install Special Tool # P-334 under the bearing. Using a shop press, remove the bearing from the stub shaft (Fig. 335).

To install the stub shaft bearing, position new bearing onto the stub shaft. Install stub shaft into shop press. Position Special Tool # 6558 above bearing. Press bearing onto shaft (Fig. 336).

(3) Index the inner differential adjuster with a cross hair as shown in (Fig. 337).

Fig. 337 Indexing Inner Adjuster

- 1 - INNER ADJUSTER
- 2 - ADJUSTER LOCK
- 3 - CROSS HAIR MARKS

SEAL - STUB SHAFT (LONG) (Continued)

CAUTION: If short stub shaft has corrosion, use caution when removing differential cover. Inspect seal and shaft for damage after removal of cover. Replace shaft and/or seal as required.

(4) Index outer adjuster (Fig. 338). Remove lock bracket and back out adjuster exactly one revolution. Then remove differential cover.

Fig. 338 Indexing Outer Adjuster

- 1 - INDEXING MARKS
- 2 - STUB SHAFT
- 3 - OUTER ADJUSTER
- 4 - ADJUSTER LOCK

(5) Remove The inner adjuster lock bracket. Then remove the inner adjuster.

CAUTION: Keep the inner adjuster for reinstallation.

INSTALLATION

(1) Lube inner adjuster threads with gear oil and reinstall to the cross haired index marks.

(2) Install the differential carrier. Then install stub shaft seal protector.

(3) Install the differential cover/outer adjuster assembly with sealant applied. Install and tighten differential cover bolts.

(4) Tighten the outer adjuster 3/4 of a turn. Seat bearings by turning differential carrier three or four turns in both directions. Finish tightening the adjuster 1/4 turn to its index mark (original location).

(5) Reinstall long stub shaft, fill differential with fluid and reinstall transaxle.

(6) After installing transaxle check transmission side fluid level.

SEAL - STUB SHAFT (SHORT)

REMOVAL

The following procedure can be used to replace the short stub shaft seal without having to remove the transaxle from the vehicle. If the adjuster or bearing located behind the adjuster require replacement, do not use this procedure.

- (1) Place vehicle in neutral and lift vehicle on hoist.
- (2) Remove short driveshaft.
- (3) Index the outer adjuster (Fig. 339).

Fig. 339 Indexing Outer Adjuster

- 1 - INDEXING MARKS
- 2 - STUB SHAFT
- 3 - OUTER ADJUSTER
- 4 - ADJUSTER LOCK

(4) Remove outer adjuster lock (Fig. 340).

Fig. 340 Outer Adjuster Lock Removal

- 1 - OIL SEAL
- 2 - OUTER ADJUSTER
- 3 - STUB SHAFT
- 4 - SOCKET
- 5 - ADJUSTER LOCK

SEAL - STUB SHAFT (SHORT) (Continued)

(5) Using special tool 6503 loosen outer adjuster, then retighten to the index mark using a torque wrench. Record the amount of torque required to return the index marks to their original location. Remove the adjuster.

(6) Use special tool 6558 to remove old seal and install new seal (Fig. 341).

9321-340

Fig. 341 Seal Removal and Installation

- 1 - ARBOR PRESS
- 2 - OUTER DIFFERENTIAL ADJUSTER
- 3 - O-RING
- 4 - SPECIAL TOOL 6558

(7) Inspect stub shaft for corrosion (Fig. 342). If corrosion exists, wrap stub shaft with wax paper and install seal protector over wax paper.

9321-296

Fig. 342 Stub Shaft Corrosion

- 1 - STUB SHAFT
- 2 - CORROSION AREA

INSTALLATION

(1) Lube O-ring, threads on adjuster, seal protector and seal lips with gear oil before installing.

(2) Install outer adjuster into transaxle case and tighten adjuster within 10 ft. lbs. of the torque reading recorded in step five.

(3) Rotate ring gear three or four revolutions in both directions to seat differential bearings.

(4) Continue tightening outer adjuster until index marks line up (original location).

(5) Install adjuster lock.

(6) Install new driveshaft retaining circlip and O-ring on stub shaft. Then reinstall driveshaft.

(7) Check fluid level in differential and adjust as required.

(8) Road test and recheck for leaks as required.

SEAL - TRANSFER SHAFT

REMOVAL

If it has been diagnosed that one or both of the transfer shaft seals are leaking, the following procedure can be used to replace failed seals. This procedure will allow the technician to replace the seals without having to set backlash and measure differential bearing turning torque.

CAUTION: The transfer shaft rear shim, bearing cups and cones, differential bearings and the differential adjusters must be reused to use this procedure. If any of the items listed above require replacement, refer to Differential Recondition section of this manual.

(1) Remove transaxle from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - REMOVAL).

(2) Remove valve body from transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/VALVE BODY - REMOVAL).

(3) Remove solenoid connector from transaxle case.

(4) Remove long stub shaft from transaxle (Fig. 343).

9321-258

Fig. 343 Long Stub Shaft Removal

- 1 - LONG STUB SHAFT
- 2 - SPECIAL TOOL 8420A
- 3 - SLIDE HAMMER C-3752

SEAL - TRANSFER SHAFT (Continued)

(5) Index the inner differential adjuster with a cross hair as shown in (Fig. 344).

Fig. 344 Indexing Inner Adjuster

- 1 - INNER ADJUSTER
- 2 - ADJUSTER LOCK
- 3 - CROSS HAIR MARKS

CAUTION: If short stub shaft has corrosion, use caution when removing differential cover. Inspect seal and shaft for damage after removal of cover. Replace shaft and/or seal as required.

(6) Index outer adjuster (Fig. 345). Remove lock bracket and back out adjuster exactly one revolution. Then remove differential cover.

(7) Remove The inner adjuster lock bracket. Then remove the inner adjuster.

CAUTION: Keep the inner adjuster for reinstallation.

(8) Remove the transfer shaft nut, rear cone, rear cup, oil baffle, rear shim, transfer shaft and transfer shaft seals. Refer to appropriate procedures within this section for detailed removal and installation procedures if required.

CAUTION: Keep rear shim and rear bearing cup cone for reinstallation.

Fig. 345 Indexing Outer Adjuster

- 1 - INDEXING MARKS
- 2 - STUB SHAFT
- 3 - OUTER ADJUSTER
- 4 - ADJUSTER LOCK

INSTALLATION

(1) Install transfer shaft, transfer shaft seals, oil baffle, rear cup, rear shim, rear cone and a new nut. Refer to appropriate procedures within this section for detailed removal and installation procedures if required.

(2) Install a new o-ring onto the inner adjuster.

(3) Lube inner adjuster threads and o-ring with gear oil and reinstall to the cross haired index marks.

(4) Reinstall the inner adjuster locking bracket.

(5) Install the differential carrier. Install stub shaft seal protector.

(6) Install the differential cover/outer adjuster assembly with Mopar Silicone Sealant applied. Install and tighten differential cover bolts.

(7) Tighten the outer adjuster 3/4 of a turn. Seat bearings by turning differential carrier three or four turns in both directions. Finish tightening the adjuster 1/4 turn to its index mark (original location).

(8) Reinstall the outer adjuster locking bracket.

SEAL - OIL PUMP

REMOVAL

The transaxle must be removed from the vehicle to replace this oil seal.

(1) Remove the transaxle from the vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - REMOVAL).

(2) Remove the torque converter from the transaxle bellhousing.

(3) Use special tool C-3981B to remove oil pump seal (Fig. 346).

Fig. 346 Oil Seal Removal

- 1 - SPECIAL TOOL C-3981B
2 - WRENCH

INSTALLATION

(1) Clean and inspect oil pump seal seat. Then install seal using special tool C-4193A (Fig. 347).

Fig. 347 Oil Seal Installation

- 1 - TRANSAXLE BELL HOUSING
2 - SPECIAL TOOL C-4193A
3 - LONG STUB SHAFT

(2) Clean and inspect torque converter hub. If nicks, scratches or hub wear are found, torque converter replacement will be required.

CAUTION: If the torque converter is being replaced, apply a light coating of grease to the crankshaft pilot hole. Also inspect the engine drive plate for cracks. If any cracks are found replace the drive plate. Do not attempt to repair a cracked drive plate. Always use new torque converter to drive plate bolts.

(3) Apply a light film of transmission oil to the torque converter hub and oil seal lips. Then install torque converter into transaxle. Be sure that the hub lugs mesh with the front pump lugs when installing.

(4) Reinstall the transaxle into the vehicle.

SHIFT INTERLOCK CABLE

REMOVAL

NOTE: Floor Shift Models

(1) Using suitable size allen wrench, remove the gearshift knob retaining screw (Fig. 348).

Fig. 348 Shift Handle Retaining Screw

- 1 - GEARSHIFT KNOB
2 - HEX WRENCH

(2) Remove gearshift knob from shifter assy.
(3) Remove console bezel from vehicle.

SHIFT INTERLOCK CABLE (Continued)

(4) Remove under panel silencer/duct assembly (Fig. 349).

(5) Remove column cover screws.

(6) Tilt column down and remove upper half of column cover.

(7) Tilt the column to the uppermost position and remove the tilt lever (Fig. 350).

Fig. 349 Panel Removal/Installation

1 - SILENCER/DUCT ASSEMBLY

Fig. 350 Tilt Lever Screw Removal/Installation

2 - TURN SIGNAL LEVER
3 - TILT LEVER
4 - SCREWDRIVER

(8) Remove the ignition key and remove lower column cover (Fig. 351).

Fig. 351 Lower Column Cover Removal/Installation

1 - LOWER COLUMN COVER

(9) Remove the interlock cable from the shifter housing. Slide the cable out of the groove in the interlock lever (Fig. 352).

Fig. 352 Interlock Cable Removal/Installation

1 - LOCKING CLIP
2 - INTERLOCK CABLE
3 - BRACKET
4 - SHIFTER ASSEMBLY

SHIFT INTERLOCK CABLE (Continued)

(10) Disconnect the BTSI solenoid connector.

(11) Depress the lock tab (Fig. 353) on the interlock cable and pull the cable out of the lock cylinder housing (Fig. 354).

Fig. 353 Interlock Cable Locking Tab

- 1 - TAB
- 2 - INTERLOCK CABLE
- 3 - LOCK CYLINDER HOUSING

Fig. 354 Interlock Cable Removal/Installation

- 1 - LOCK CYLINDER HOUSING
- 2 - INTERLOCK CABLE

(12) Remove interlock cable. Note cable routing so it can be installed in the same manner.

INSTALLATION

(1) Ensure ignition switch is in the "ON/RUN" position (Fig. 355).

(2) Route the interlock cable into position as previously removed.

(3) Slide the steering column end of the interlock cable into the lock cylinder housing until it snaps into place (Fig. 354).

(4) Connect BTSI solenoid connector.

(5) Turn the ignition key to the "LOCK" position (Fig. 355).

Fig. 355 Ignition Key/Switch Positions

- 1 - ACC
- 2 - LOCK
- 3 - OFF
- 4 - ON/RUN
- 5 - START

(6) Put the shifter in the PARK position.

(7) Slide the interlock cable core wire into the groove on the lever (Fig. 352). Ensure the cable end seats in the groove.

(8) Slip the cable into the shifter housing until it snaps into place.

(9) Ensure the shift lever remains in PARK. Move the ignition key to the "LOCK" position and remove the key. Tilt the steering column to the full UP position.

(10) If the interlock cable is being replaced, remove the lock pin. Allow the cable to adjust itself to the correct position. Tighten the locking clip (Fig. 352) by pushing it down.

(11) If the interlock cable is being re-used, the lock pin will not exist. Free adjustment by pulling outward on locking clip. The cable will index itself to the correct position. Tighten the locking clip by pushing it down.

(12) Insert the ignition key and verify the ignition interlock adjustment/operation. Refer to Description and Operation to determine intended operation. If adjustment is necessary, refer to Adjustments.

(13) Install the bezel on the shifter console.

(14) Install gearshift knob (Fig. 348).

(15) Install upper and lower covers from the steering column.

(16) Install tilt lever (Fig. 350).

(17) Install the lower silencer panel (Fig. 349).

SHIFT INTERLOCK CABLE (Continued)

ADJUSTMENTS

ADJUSTMENT - INTERLOCK CABLE

- (1) Remove the shifter handle.
- (2) Remove the console bezel.
- (3) Move the gear shifter to PARK and the ignition key to the LOCK position (Fig. 356).
- (4) If the interlock cable is being replaced, remove the pin to allow cable to "self adjust." Press locking clip (Fig. 357)by hand to secure adjustment.
- (5) If the interlock cable is not being replaced, the pin will not exist. Loosen the locking clip (Fig. 357) on the interlock cable to allow cable to "self adjust." Press locking clip (Fig. 357) by hand to secure adjustment.

Fig. 356 Ignition Key/Switch Positions

- 1 - ACC
- 2 - LOCK
- 3 - OFF
- 4 - ON/RUN
- 5 - START

Fig. 357 Interlock Cable Removal/Installation

- 1 - LOCKING CLIP
- 2 - INTERLOCK CABLE
- 3 - BRACKET
- 4 - SHIFTER ASSEMBLY

ACTION	EXPECTED RESPONSE
1. Turn key to the "OFF" position.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON/RUN" position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON/RUN" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the "LOCK" or "ACC" position.	4. Key cannot be returned to the "LOCK" or "ACC" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

- (6) Install the bezel on the shifter console.
- (7) Install shifter handle.

SHIFT INTERLOCK MECHANISM

REMOVAL

The interlock cassette slides into the housing behind the lock cylinder (Fig. 358). The cable at the rear of the cassette attaches to a locking arm on the shifter mechanism. **The column shift interlock system is only adjusted after installing a new cassette. It can't be adjusted more than once. If the system operates incorrectly, install and adjust a new interlock cassette.**

- (1) Depress the tab on the top of the cassette.
- (2) Slide the interlock cassette out of the housing.
- (3) Remove the cable from the locking arm on the shifter mechanism.

Fig. 358 Ignition Interlock Cassette-Column Shift

- 1 - RELEASE TAB
- 2 - LOCK CYLINDER
- 3 - INTERLOCK CASSETTE

INSTALLATION

The interlock cassette slides into the housing behind the lock cylinder (Fig. 358). The cable at the rear of the cassette attaches to a locking arm on the shifter mechanism. **The column shift interlock system is only adjusted after installing a new cassette. It can't be adjusted more than once. If the system operates incorrectly, install and adjust a new interlock cassette.**

- (1) Ensure the latch rotates freely on the shifter gate (Fig. 359).

Fig. 359 Latch and Shifter Gate

- 1 - LATCH
- 2 - SHIFTER GATE
- 3 - CASSETTE CABLE

- (2) With the shifter in Park and the key removed, install the cable over the hook on locking arm of the shifter mechanism.

- (3) Slide the cassette into the housing until it locks in place.

- (4) To adjust the interlock system, push the adjustment tab in until it stops (Fig. 360). The adjustment tab will click as it moves into position. Ensure the tab is fully depressed.

Fig. 360 Ignition Interlock Adjustment Tab

- 1 - LOCK CYLINDER HOUSING
- 2 - INTERLOCK CASSETTE
- 3 - ADJUSTMENT TAB

SHIFT INTERLOCK SOLENOID

REMOVAL

(1) Remove the fuse panel cover from the left end of the instrument panel (Fig. 361).

80b2b43b

Fig. 361 Fuse Panel Cover

- 1 - FUSE PANEL COVER
2 - INSTRUMENT PANEL

(2) Remove the two screws behind the fuse panel cover attaching the lower instrument panel cover to the instrument panel (Fig. 362).

80b2b43c

Fig. 362 Lower Instrument Panel Cover Mounting

- 1 - MOUNTING SCREWS
2 - INSTRUMENT PANEL BRACKET
3 - LOWER INSTRUMENT PANEL COVER

(3) Remove the lower instrument panel cover. The lower instrument panel cover is attached by retaining clips along the top and right edge.

NOTE: The upper shroud on this steering column is retained to the steering column by a snap fit to the lower shroud. When removing the upper shroud from the steering column lower shroud, **DO NOT** use a hard or sharp tool. This will damage the shrouds. If a tool must be used, use a soft tool such as a trim stick.

(4) Remove the steering column upper shroud from the steering column using the following procedure: First, on the right seam between the upper and lower shrouds, push in on seam at the forward end. When the upper shroud unsnaps, pull the upper shroud upward away from the lower. Repeat this procedure on the opposite side of the column to release the upper shroud from the lower. Remove the upper shroud from the steering column.

(5) Remove the tilt lever (Fig. 363) from the steering column.

80b2b431

Fig. 363 Tilt Lever

- 1 - TILT LEVER
2 - LOWER SHROUD

SHIFT INTERLOCK SOLENOID (Continued)

(6) Remove the 2 screws attaching the lower shroud to the steering column (Fig. 364). Remove the lower shroud from the steering column.

Fig. 364 Lower Shroud Attaching Screws

- 1 - LOWER SHROUD
2 - MOUNTING SCREWS

(7) Disconnect the wiring harness connector from the brake transmission shift interlock (BTSI) solenoid (Fig. 365).

Fig. 365 Solenoid Connector

- 1 - BTSI SOLENOID
2 - CONNECTOR

(8) Remove the retainer clip from the end of the BTSI solenoid (Fig. 366).

Fig. 366 Solenoid Retainer Clip

- 1 - SOLENOID
2 - MOUNTING STUD
3 - RETAINER CLIP

(9) Slide the BTSI solenoid straight off the shift lever mounting stud.

INSTALLATION

(1) Align the flat inside the brake transmission shift interlock (BTSI) solenoid (Fig. 367) with the flat on the shift lever mounting stud.

Fig. 367 Flat Inside BTSI Solenoid

- 1 - GUIDES
2 - SOLENOID
3 - FLAT

SHIFT INTERLOCK SOLENOID (Continued)

(2) Slide the solenoid completely onto the shift lever mounting stud aligning the plastic guide formed into the solenoid housing with the flange on the shift lever mechanism bracket (Fig. 368).

Fig. 368 Guide And Flange Alignment

- 1 - BRACKET FLANGE
- 2 - GUIDE

(3) Install the retainer clip until it snaps into place in the slot cut into the shift lever mounting stud (Fig. 369).

Fig. 369 Solenoid Retainer Clip Installation

- 1 - SOLENOID
- 2 - MOUNTING STUD
- 3 - RETAINER CLIP

(4) Verify the BTSI solenoid is locked in place and will not slide off the mounting stud.

(5) Connect the wiring harness connector to the BTSI solenoid.

(6) Verify the BTSI is operating properly. With the ignition on (engine not running) and the parking brake applied, try shifting the transmission shift lever out of the PARK position with and without the brake pedal being applied. The shift lever should only shift out of PARK with the brake pedal being depressed.

(7) Install the lower shroud (Fig. 364) on the steering column. Install and securely tighten the 2 screws attaching the lower shroud to the steering column.

(8) Install the tilt lever (Fig. 363) on the steering column.

(9) Install the upper shroud on the steering column by snapping it onto the lower shroud.

(10) Install the lower instrument panel cover.

(11) Install the two screws behind the fuse panel cover attaching the lower instrument panel cover to the instrument panel (Fig. 362).

(12) Install the fuse panel cover on the left end of the instrument panel (Fig. 361).

SHIFT INTERLOCK SYSTEM

DESCRIPTION

FLOOR

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a cable and solenoid operated system that prevents the transmission gear shifter from being moved out of PARK without a driver in place.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 370) and brake pedal positions.

Fig. 370 Ignition Key/Switch Positions

- 1 - ACC
- 2 - LOCK
- 3 - OFF
- 4 - ON/RUN
- 5 - START

SHIFT INTERLOCK SYSTEM (Continued)

COLUMN

Vehicles equipped with a column shifter utilize a brake transmission shift interlock (BTSI) solenoid, which prevents the transmission gear shifter from being moved out of PARK without a driver in place (Fig. 371).

Fig. 371 BTSI

- 1 - SHIFT LEVER BRACKET
- 2 - SOLENOID
- 3 - KEY CYLINDER

OPERATION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK or ACCESSORY position (Fig. 372). An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A magnetic holding device integral to the interlock cable is energized when the ignition is in the ON/RUN position. When the key is in the ON/RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

80b89922

Fig. 372 Ignition Key/Switch Positions

- 1 - ACC
- 2 - LOCK
- 3 - OFF
- 4 - ON/RUN
- 5 - START

ACTION	EXPECTED RESPONSE
1. Turn key to the "OFF" position.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON/RUN" position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON/RUN" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the "LOCK" or "ACC" position.	4. Key cannot be returned to the "LOCK" or "ACC" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

SHIFT INTERLOCK SYSTEM (Continued)

**DIAGNOSIS AND TESTING - BRAKE/
TRANSMISSION SHIFT INTERLOCK SYSTEM****FLOOR SHIFT MODELS**

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 373) and brake pedal positions.

80b89922

Fig. 373 Ignition Key/Switch Positions

- 1 - ACC
- 2 - LOCK
- 3 - OFF
- 4 - ON/RUN
- 5 - START

ACTION	EXPECTED RESPONSE
1. Turn key to the "OFF" position.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON/RUN" position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON/RUN" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the "LOCK" or "ACC" position.	4. Key cannot be returned to the "LOCK" or "ACC" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

If the floor shifter cannot be moved out of the PARK position, refer to Shifter Locked In Place below. If the shift lever can be shifted out of PARK without the brake pedal depressed, refer to Circuit Test below.

SHIFTER LOCKED IN PLACE

(1) Remove the instrument panel cover below the steering column, then remove the steering column shrouds to gain access to the brake transmission shift interlock (BTSI) solenoid. The solenoid is part of the interlock cable assembly.

(2) Disconnect the wire connector from the rear of the BTSI solenoid.

(3) Insert the ignition key and turn it to the ON position.

(4) With the brakes applied, try moving the shifter out of the PARK position.

- If the lever now moves freely in and out of PARK, perform the Circuit Test below.

- If the shift lever still does not move from the PARK position, remove the BTSI solenoid from the shift lever assembly.

If the shift lever now moves freely in and out of the park position, the BTSI solenoid is faulty and the interlock cable must be replaced. If the shift lever still does not move from the park position, the problem is in the shift lever assembly or the ignition interlock cassette.

CIRCUIT TEST

(1) Check the system fuse in the junction block (An open or blown fuse would allow the shift lever to be moved in and out of the PARK position without the brake pedal applied).

(2) Remove the instrument panel cover below the steering column, then remove the steering column shrouds to gain access to the brake transmission shift interlock (BTSI) solenoid.

(3) Disconnect the wire connector from the rear of the BTSI solenoid.

(4) Insert the ignition key and turn it to the ON position.

(5) Back-probe the wire connector's terminal number 2 with a test light. The test light should illuminate. If not, there is an open or short in the ignition feed circuit leading to the BTSI solenoid. Repair the open or short.

(6) Next, back-probe the wire connector with a test light, placing the test light in series between the two wires. At this point, the test light should illuminate. If not, there is an open in the ground circuit or brake lamp switch. Repair the open or replace brake lamp switch as necessary.

(7) Depress the brake pedal. The test light should go out. If it does not, there is a short in the ground circuit or brake lamp switch. Repair the short or replace brake lamp switch as necessary.

SHIFT INTERLOCK SYSTEM (Continued)

(8) Reconnect the wire connector to the solenoid.

If the circuit passes the above test and the shifter can still be moved freely in and out of PARK without the brake pedal depressed, replace the interlock cable.

COLUMN SHIFT MODELS

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 374) and brake pedal positions.

Fig. 374 Ignition Key/Switch Positions

- 1 - ACC
- 2 - LOCK
- 3 - OFF
- 4 - ON/RUN
- 5 - START

ACTION	EXPECTED RESPONSE
1. Turn key to the "OFF" position.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON/RUN" position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON/RUN" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the "LOCK" or "ACC" position.	4. Key cannot be returned to the "LOCK" or "ACC" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

If the floor shifter cannot be moved out of the PARK position, refer to Shifter Locked In Place below. If the shift lever can be shifted out of PARK without the brake pedal depressed, refer to Circuit Test below.

SHIFT LEVER LOCKED IN PLACE

(1) Remove the instrument panel cover below the steering column, then remove the steering column shrouds to gain access to the brake transmission shift interlock (BTSI) solenoid.

(2) Disconnect the wire connector from the rear of the BTSI solenoid.

(3) Insert the ignition key and turn it to the ON position.

(4) With the brakes applied, try shifting the transmission shift lever out of the PARK position.

- If the lever now moves freely in and out of PARK, perform the Circuit Test below.

- If the shift lever still does not move from the PARK position, remove the BTSI solenoid from the shift lever assembly.

If the shift lever now moves freely in and out of the park position, the BTSI solenoid is faulty and must be replaced. If the shift lever still does not move from the park position, the problem is in the shift lever assembly or the ignition interlock cassette.

CIRCUIT TEST

(1) Check the system fuse in the junction block (An open or blown fuse would allow the shift lever to be moved in and out of the PARK position without the brake pedal applied).

(2) Remove the instrument panel cover below the steering column, then remove the steering column shrouds to gain access to the brake transmission shift interlock (BTSI) solenoid.

(3) Disconnect the wire connector from the rear of the BTSI solenoid.

(4) Insert the ignition key and turn it to the ON position.

(5) Back-probe the wire connector's terminal number 2 with a test light. The test light should illuminate. If not, there is an open or short in the ignition feed circuit leading to the BTSI solenoid. Repair the open or short.

(6) Next, back-probe the wire connector with a test light, placing the test light in series between the two wires. At this point, the test light should illuminate. If not, there is an open in the ground circuit or brake lamp switch. Repair the open or replace brake lamp switch as necessary.

(7) Depress the brake pedal. The test light should go out. If it does not, there is a short in the ground circuit or brake lamp switch. Repair the short or replace brake lamp switch as necessary.

(8) Reconnect the wire connector to the solenoid.

SHIFT INTERLOCK SYSTEM (Continued)

If the circuit passes the above test and the shift lever can still be moved freely in and out of PARK without the brake pedal depressed, replace the BTSI solenoid.

SHIFT MECHANISM

REMOVAL

- (1) Remove shifter handle and console bezel.
- (2) If equipped with Autostick, disconnect the Autostick switch connector.
- (3) Loosen adjuster nut on shifter adjuster (Fig. 375).

Fig. 375 Shift Cable Adjust Lever Nut

- 1 - CONSOLE
- 2 - ACCESS HOLE
- 3 - SHIFTER HANDLE

(4) Disconnect shifter cable from shift pin (Fig. 376) and disconnect cable from shifter assembly bracket.

(5) Disconnect interlock cable from shifter base slot (Fig. 377). Be careful not to break tab on interlock cable conduit end fitting.

(6) Remove the five floor pan attaching nuts from the shifter base and shift cable bracket (Fig. 378).

(7) Remove shifter assembly from vehicle (Fig. 378).

INSTALLATION

- (1) Install shifter assembly (Fig. 378).
- (2) Install five shifter/cable bracket to floor pan nuts and tighten to 31 N·m (23 ft. lbs.).
- (3) Make sure shift lever and transaxle are in "Park."

CAUTION: Park sprag must be engaged when adjusting linkage. Rock vehicle back and forth to ensure that park sprag is fully engaged.

Fig. 376 Floor Gearshift Cable Removal/Installation

- 2 - CABLE
- 3 - CONDUIT BRACKET
- 4 - PIN

Fig. 377 Interlock Cable Removal/Installation

- 1 - LOCKING CLIP
- 2 - INTERLOCK CABLE
- 3 - BRACKET
- 4 - SHIFTER ASSEMBLY

(4) With the ignition in the lock position, attach shift cable eyelet to shift pin (Fig. 376).

(5) Install shift cable to shifter assembly bracket (Fig. 376).

(6) Slip interlock cable core wire into interlock adjustment lever groove (Fig. 377). Make sure the interlock cable slug is seated in the groove.

SHIFT MECHANISM (Continued)

**Fig. 378 Shifter Assembly Removal/Installation**

- 1 - NUT
2 - SHIFTER ASSEMBLY

(7) Slip interlock cable conduit end fitting into bracket and snap into place (Fig. 377).

(8) If equipped with Autostick, connect the Auto-stick connector.

(9) Adjust gear shift and interlock cables.

NOTE: Gearshift and interlock cables **MUST** be adjusted. Refer to the Adjustments section in this Group for the correct procedures.

SOLENOID/PRESSURE SWITCH ASSY

DESCRIPTION

The Solenoid/Pressure Switch Assembly (Fig. 379) is inside the transaxle and mounted to the valve body assembly. The assembly consists of four solenoids that control hydraulic pressure to the L/R, 2/4, OD, and UD friction elements (transaxle clutches), and the torque converter clutch. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the PCM. Likewise, the pressure switches can only be service by replacing the assembly.

**Fig. 379 Valve Body Assembly**

- 1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - TRS
3 - TRANSFER PLATE
4 - SEPARATOR PLATE
5 - VALVE BODY

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The PCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which allows fluid to pass through in their relaxed or "off" state. By design, this allows transaxle limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the pcm during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The PCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to

SOLENOID/PRESSURE SWITCH ASSY (Continued)

help the PCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the PCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL

OP = OPEN

CL = CLOSED

A Diagnostic Trouble Code (DTC) will set if the PCM senses any switch open or closed at the wrong time in a given gear.

The PCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the PCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

REMOVAL

NOTE: If the Solenoid/Pressure Switch Assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - STANDARD PROCEDURE)

- (1) Raise vehicle on hoist.
- (2) Remove valve body assembly from transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/VALVE BODY - REMOVAL)
- (3) Remove Solenoid/Pressure Switch Assembly retaining screws from solenoid (Fig. 380).
- (4) Remove Solenoid/Pressure Switch Assembly and screen from valve body (Fig. 381).

80b04ef1

2 - RETAINING SCREWS

80b04ef0

Fig. 381 Solenoid/Pressure Switch Assembly and Screen

- 1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - VALVE BODY
3 - SCREEN

INSTALLATION

NOTE: If the Solenoid/Pressure Switch assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - STANDARD PROCEDURE)

- (1) Install Solenoid/Pressure Switch Assembly and screen to the separator and transfer plates (Fig. 381).
- (2) Install and tighten retaining screws (Fig. 380) to 6 N·m (35 in. lbs.) torque.
- (3) Install valve body. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/VALVE BODY - INSTALLATION)

SPEED SENSOR - INPUT

DESCRIPTION

The Input Speed Sensor is a two-wire magnetic pickup device that generates AC signals as rotation occurs. It is threaded into the transaxle case (Fig. 382), sealed with an o-ring (Fig. 383), and is considered a primary input to the Powertrain Control Module (PCM).

Fig. 382 Transaxle Identification Label

- 1 - INPUT SPEED SENSOR
- 2 - OUTPUT SPEED SENSOR
- 3 - IDENTIFICATION TAG

Fig. 383 O-Ring Location

- 1 - INPUT SPEED SENSOR
- 2 - O-RING

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil (Fig. 384), an AC voltage is generated and sent to the PCM. The PCM interprets this information as input shaft rpm.

Fig. 384 Sensor Relation to Input Clutch

- 1 - INPUT SPEED SENSOR
- 2 - TRANSAXLE CASE
- 3 - INPUT CLUTCH HUB

The PCM compares the input speed signal with output speed signal to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The PCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

SPEED SENSOR - INPUT (Continued)

REMOVAL

(1) Disconnect the input speed sensor connector (Fig. 385).

Fig. 385 Speed Sensor/Connector Location

- 1 - MANUAL SHIFT LEVER
- 2 - OUTPUT SPEED SENSOR
- 3 - LONG STUB SHAFT
- 4 - INPUT SPEED SENSOR

(2) Unscrew and remove the input speed sensor.
 (3) Inspect the speed sensor o-ring and replace if necessary (Fig. 386).

Fig. 386 O-Ring Location

- 1 - INPUT SPEED SENSOR
- 2 - O-RING

INSTALLATION

(1) Verify o-ring is installed into position (Fig. 386).
 (2) Install and tighten input speed sensor to 27 N·m (20 ft. lbs.) torque.
 (3) Connect speed sensor connector (Fig. 385).
 (4) Connect battery negative cable.

SPEED SENSOR - OUTPUT

DESCRIPTION

The Output Speed Sensor is a two-wire magnetic pickup device that generates an AC voltage signal as rotation occurs. It is threaded into the transaxle case (Fig. 387), sealed with an o-ring (Fig. 388), and is considered a primary input to the Powertrain Control Module (PCM).

Fig. 387 Speed Sensor Location

- 1 - INPUT SPEED SENSOR
- 2 - OUTPUT SPEED SENSOR
- 3 - IDENTIFICATION TAG

Fig. 388 O-Ring Location

- 1 - OUTPUT SPEED SENSOR
- 2 - O-RING

SPEED SENSOR - OUTPUT (Continued)

OPERATION

The Output Speed Sensor provides information on how fast the output shaft is rotating. As the rear planetary carrier park pawl lugs pass by the sensor coil (Fig. 389), an AC voltage is generated and sent to the PCM. The PCM interprets this information as output shaft rpm.

Fig. 389 Sensor Relation to Planet Carrier Park Pawl Lugs

- 1 - OUTPUT SPEED SENSOR
- 2 - REAR PLANET CARRIER/OUTPUT SHAFT ASSEMBLY
- 3 - TRANSAXLE CASE

The PCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

VEHICLE SPEED SIGNAL

The vehicle speed signal is calculated from the Output Speed Sensor. The PCM converts the OSS signal into a roughly 8000 pulse per mile vehicle speed signal (using pinion factor information programmed into its memory), and sends it to the PCM. The PCM, in turn, sends the vehicle speed message across the PCI bus to the Instrument Cluster to display vehicle speed to the driver.

REMOVAL

- (1) Disconnect the output speed sensor connector (Fig. 390).
- (2) Unscrew and remove the output speed sensor.
- (3) Inspect the speed sensor o-ring and replace if necessary (Fig. 391).

Fig. 390 Speed Sensor/Connector Location

- 2 - OUTPUT SPEED SENSOR
- 3 - LONG STUB SHAFT
- 4 - INPUT SPEED SENSOR

Fig. 391 O-Ring Location

- 1 - OUTPUT SPEED SENSOR
- 2 - O-RING

INSTALLATION

- (1) Verify o-ring is installed into position (Fig. 391).
- (2) Install and tighten output speed sensor to 27 N·m (20 ft. lbs.) torque.
- (3) Connect speed sensor connector (Fig. 390).
- (4) Connect battery negative cable.

TORQUE CONVERTER

DESCRIPTION

The torque converter is located in the bellhousing area of the transaxle, between the engine and transaxle. The torque converter is a fluid coupling that transmits torque from the engine drive plate to the input shaft of the transaxle. The torque converter consists of four main components (Fig. 392):

- Impeller
- Turbine
- Stator
- Converter Clutch assembly

80be46a3

Fig. 392 Torque Converter Assembly

- 1 - TURBINE
- 2 - IMPELLER
- 3 - HUB
- 4 - STATOR
- 5 - CONVERTER CLUTCH DISC
- 6 - DRIVE PLATE

OPERATION

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

Torque is transmitted by fluid passing through curved vanes in both the impeller and turbine. Since

the coupling is produced by transmission fluid, the turbine can slip or turn slower than the impeller.

The stator contains a one-way overrunning clutch, which free-wheels when the impeller and turbine are rotating at the same speed. However, the stator stops when speed reduction or torque increase take place. When the stator stops, it changes the direction of the fluid leaving the turbine vanes. This directs fluid back into the impeller with greater force, resulting in torque multiplication.

The torque converter clutch is hydraulically operated and controlled by the TCM. It consists of a piston and a frictional disc that form a direct mechanical link between the impeller and turbine when slippage is inefficient or unnecessary.

The torque converter hub drives the transmission oil pump.

REMOVAL

NOTE: If torque converter assembly is being replaced, it is necessary to restart the TCC Break-In Strategy. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Remove transmission and torque converter from vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - REMOVAL).

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

NOTE: If torque converter is being replaced, it is necessary to restart the TCC Break-In Strategy. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if nec-

TORQUE CONVERTER (Continued)

essary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 393). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - INSTALLATION)

(9) Fill the transmission with the recommended fluid

Fig. 393 Checking Torque Converter Seating

- 1 - SCALE
2 - STRAIGHTEDGE

(10) If torque converter was replaced, it is necessary to reset the TCC Break-In Strategy. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

TRANSFER SYSTEM

INSPECTION

The need to replace the transfer chains because of excessive wear is unlikely. If chain length is suspected to be long, perform the following procedure to measure the chain length:

(1) Insert a screwdriver into the 18 mm hole with the screwdriver **ABOVE** the chains (Fig. 394).

Fig. 394 Screwdriver Placement

- 1 - OUTPUT SHAFT
2 - TRANSFER SHAFT

(2) Pry the chains down at the center of the chains.

(3) Butt a scale against the snubber and mark the scale at the bottom of the chains (Fig. 395).

Fig. 395 Chain Measurement

- 1 - SCALE

TRANSFER SYSTEM (Continued)

(4) Insert a screwdriver into the 18 mm hole with the screwdriver **BELOW** the chains (Fig. 396). An assistant may be needed to perform this step.

Fig. 396 Screwdriver Placement

- 1 - PRY TOOL
- 2 - CHAINS

(5) Pry the chains up at the center of the chain.
(6) Butt a scale against the snubber and place a second mark on the scale at the bottom of the chains (Fig. 397).

Fig. 397 Chains Measurement

- 1 - SCALE

(7) Measure the distance between the two marks placed on the scale (Fig. 398). If the two marks on the scale are more than one inch apart, replace the drive chains.

Fig. 398 Measuring Marks on Scale

- 1 - SCALE
- 2 - RULER
- 3 - MARKS PLACED ON SCALE

ADJUSTMENTS

DRIVE SPROCKET HEIGHT ADJUSTMENT PROCEDURE

A spacer beneath the output sprocket is used to position the output sprocket in line with the transfer sprocket. The sprocket must be within 0.015" of each other. In order to do this operation, install original spacer over the output shaft. If original spacer is not available, use the thickest available shim as a starting point. Refer to Output Sprocket Spacer Chart for available sizes. Then install the two sprockets without the chain.

OUTPUT SPROCKET SPACER CHART

2.64 - 2.84 mm	2.48 - 3.68 mm
2.85 - 3.05 mm	3.69 - 3.89 mm
3.06 - 3.26 mm	3.90 - 4.10 mm
3.27 - 3.47 mm	4.11 - 4.31 mm

TRANSFER SYSTEM (Continued)

The chain sprockets are not reversible. Check the height difference using a straight edge (special tool 6311 or equivalent) and a set of feeler gauges.

If the output sprocket is lower than transfer sprocket, add the amount measured to the shim that was installed (Fig. 399).

Fig. 399 Checking Sprocket Height

- 1 - STRAIGHT EDGE
- 2 - FEELER GAUGE

If the output sprocket is higher than transfer sprocket, subtract the amount measured to the shim that was installed (Fig. 400).

Fig. 400 Checking Sprocket Height

- 1 - STRAIGHT EDGE
- 2 - FEELER GAUGE

TRANSMISSION CONTROL RELAY

DESCRIPTION

The transmission control relay is located in the Power Distribution Center (PDC) on the left side of the engine compartment (Fig. 401).

Fig. 401 Transmission Control Relay Location

- 1 - TRANSMISSION CONTROL RELAY
- 2 - PDC
- 3 - TCM

OPERATION

The relay is supplied fused B+ voltage, energized by the PCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset (ignition key turned to the "run" position or after cranking engine), the PCM energizes the relay. Prior to this, the PCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the PCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) is mounted to the top of the valve body inside the transaxle and can only be serviced by removing the valve body assembly. The electrical connector extends through the transaxle case (Fig. 402).

Fig. 402 Valve Body Assembly

- 1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
- 2 - TRS
- 3 - TRANSFER PLATE
- 4 - SEPARATOR PLATE
- 5 - VALVE BODY

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM.

The TRS also has an integrated temperature sensor (thermistor) that communicates transaxle temperature to the PCM (Fig. 403).

OPERATION

The Transmission Range Sensor (TRS) (Fig. 402) communicates shift lever position (SLP) to the PCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the PCM receives from four sense circuits. The PCM interprets this information and determines the appropriate trans-axle gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and

80be46cc

Fig. 403 Transmission Temperature Sensor

- 1 - TRANSMISSION RANGE SENSOR
- 2 - TEMPERATURE SENSOR

three are recognized as “between gear” codes. This results in six codes which should never occur. These are called “invalid” codes. An invalid code will result in a DTC, and the PCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRS SWITCH STATES

SLP	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
OD	OP	OP	OP	CL
3 (AS)	OP	OP	CL	OP
L	CL	OP	CL	CL

TRANSMISSION TEMPERATURE SENSOR

The TRS has an integrated thermistor (Fig. 403) that the PCM uses to monitor the transmission’s sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the PCM requires this information to determine which shift schedule to operate in. The PCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission “overheat” condition exists. If the thermistor circuit fails, the PCM will revert to calculated oil temperature usage.

TRANSMISSION RANGE SENSOR (Continued)

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

REMOVAL

- (1) Disconnect the TRS connector.
- (2) Remove valve body assembly from vehicle. Refer to Valve Body removal and Installation in this group.
- (3) Remove the manual shaft seal (Fig. 404).

Fig. 404 Manual Shaft Seal - Typical

- 1 - SEAL
2 - MANUAL SHAFT

- (4) Remove manual shaft/TRS retaining screw (Fig. 405).
- (5) Slide TRS off of manual valve shaft.

INSTALLATION

- (1) Install the TRS to the manual shaft. Make sure TRS locating pin rests in manual valve bore slot.
- (2) Install the TRS/manual shaft retaining screw and torque to 5 N·m (45 in. lbs.) torque (Fig. 405).
- (3) Install the manual shaft seal (Fig. 404).
- (4) Install valve body to transaxle. Refer to Valve Body Removal and Installation in this group.

VALVE BODY

DESCRIPTION

The valve body assembly (Fig. 406) consists of a cast aluminum valve body, a separator plate, and

Fig. 405 Manual Shaft Retaining Screw

- 1 - SCREW
2 - TRS

transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches.

Also mounted to the valve body assembly are the solenoid/pressure switch assembly and the transmission range sensor (Fig. 406).

Fig. 406 Valve Body Assembly

- 1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - TRS
3 - TRANSFER PLATE
4 - SEPARATOR PLATE
5 - VALVE BODY

VALVE BODY (Continued)

The valves contained within the valve body include the following (Fig. 407):

- Regulator valve
- Solenoid switch valve
- Manual valve
- Converter clutch switch valve
- Converter clutch control valve
- Torque converter regulator valve
- Low/Reverse switch valve

In addition, the valve body also contains the thermal valve, #2, 3, 4 & 5 check balls and the 2/4 accumulator assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE/VALVE BODY - DISASSEMBLY).

OPERATION

NOTE: (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - SCHEMATICS AND DIAGRAMS) for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The regulator valve controls hydraulic pressure in the transaxle. It receives unregulated pressure from the pump, which works against spring tension to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as "line pressure."

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid. In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves.

MANUAL VALVE

The manual valve is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

80865f21

Fig. 407 Valve Body—Exploded

| 3 - L/R SWITCH VALVE | 7 - SOLENOID SWITCH VALVE |
| 4 - CONVERTER CLUTCH CONTROL VALVE | 8 - REGULATOR VALVE |

VALVE BODY (Continued)

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve is fed to the torque converter regulator valve. The pressure is then directed to the converter clutch switch valve and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve controls the back (on) side of the torque converter clutch. When the controller energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under these operating conditions.

REMOVAL

NOTE: If valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect the TRS wiring connector. The solenoid wiring connector can remain attached to the case.

(2) Disconnect the shift cable from the shift lever (at the transaxle).

(3) Move the shift lever clockwise as far as it will go. This should be one position past the L position. Then remove the shift lever.

(4) Remove transaxle pan bolts (Fig. 408).

80b04ef5

Fig. 408 Transaxle Oil Pan Bolts

- 1 - EXTENSION
- 2 - TRANSAXLE OIL PAN
- 3 - SOCKET

(5) Remove transaxle oil pan (Fig. 409). When reinstalling oil pan be sure that pan flange is clean and oil free. Apply a 1/8 inch bead of Mopar Silicone Sealer onto oil pan flange before installing.

VALVE BODY (Continued)

(17) Remove valves and springs as shown in (Fig. 431).

(18) Cleanliness through entire disassembly and assembly of the valve body cannot be overemphasized. When disassembling, each part should be washed in a suitable solvent, then dried by compressed air. **Do not wipe parts with shop towels.** All mating surfaces in the valve body are accurately machined; therefore, careful handling of all parts must be exercised to avoid nicks or burrs.

(1) Install valves and springs as shown in (Fig. 432).

(2) Install regulator valve spring retainer (Fig. 433).

(3) Install dual retainer plate using Tool 6301 (Fig. 434).

ASSEMBLY

NOTE: If the valve body assembly is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure using the DRBIII® Scan Tool. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - STANDARD PROCEDURE)

TIRES/WHEELS

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and force variation can cause vehicles to exhibit steering wheel vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise vehicle on a suitable hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as correct wheel weights. Aluminum wheels require unique wheel weights. They are designed to fit the contour of the wheel (Fig. 1).
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the rear face of the driver's door.

80b2b447

Fig. 1 Aluminum Wheel Weight

- 1 - TIRE
2 - WHEEL
3 - WHEEL WEIGHT

ROAD TEST

Road test vehicle on a smooth road for a least five miles to warm tires (remove any flat spots). Lightly place hands on steering wheel at the 10:00 and 2:00 positions while slowly sweeping up and down from 90 to 110 km/h (55 to 70 mph) where legal speed limits allow.

Observe the steering wheel for:

- Visual Nibble (oscillation: clockwise/counter-clockwise, usually due to tire imbalance)

- Visual Buzziness (high frequency, rapid vibration up and down)

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at speed; if vibration occurs or is enhanced, vibration is likely due to causes other than tire and wheel assemblies.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to causes other than tire and wheel assemblies.

For brake vibrations, (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).

For powertrain vibrations, (Refer to 3 - DIFFERENTIAL & DRIVELINE - DIAGNOSIS AND TESTING).

For tire and wheel assembly vibrations, continue with this diagnosis and testing procedure.

TIRE AND WHEEL BALANCE

(1) Balance the tire and wheel assemblies as necessary following the wheel balancer manufacturer's instructions and using the information listed in Standard Procedure - Tire And Wheel Balance. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)

(2) Road test the vehicle for at least 5 miles, following the format described in Road Test.

(3) If the vibration persists, continue with this diagnosis and testing procedure.

TIRE AND WHEEL RUNOUT/MATCH MOUNTING

(1) **System Radial Runout.** This on-the-vehicle system check will measure the radial runout including the hub, wheel and tire.

(a) Raise vehicle so tires clear floor. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(b) Apply masking tape around the circumference of the tire in the locations to be measured (Fig. 2). Do not overlap the tape.

(c) Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (Fig. 2) and rotate the tire and wheel. System radial runout should not exceed 0.76 mm (0.030 inch) with no tread "dips" or "steps." Tread "dips" and "steps" can be identified by spikes of the dial indicator gauge.

- Tread "dips"; Rapid decrease then increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.

- Tread "steps"; Rapid decrease or increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.

TIRES/WHEELS (Continued)

(d) If system runout is excessive, re-index the tire and wheel assembly on the hub. Remove assembly from vehicle and install it back on the hub two studs over from original mounting position. If re-indexing the tire and wheel assembly corrects or reduces system runout, check hub runout and repair as necessary (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).

(e) If system runout is still excessive, continue with this diagnosis and testing procedure.

Fig. 2 Radial Runout Measurement

- 1 - MASKING TAPE
- 2 - DIAL INDICATOR

(2) Tire and Wheel Assembly Radial Runout. This radial runout check is performed with the tire and wheel assembly off the vehicle.

(a) Remove tire and wheel assembly from vehicle and install it on a suitable wheel balancer.

(b) Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (Fig. 2) and rotate the tire and wheel. Radial runout should not exceed 0.76 mm (0.030 inch) with no tread "dips" or "steps." Tread "dips" and "steps" can be identified by spikes of the dial indicator gauge.

(c) If runout exceeds limits, mark the original location of the tire on the wheel at the valve stem (Fig. 3). Also, mark the tire and wheel to indicate the original high spot of the assembly and record the runout measurement.

(d) If runout exceeds limits, the tire will need to be dismounted from the wheel to verify wheel vs. tire contribution. Refer to Wheel Runout below.

J9322-3

Fig. 3 Marking Tire

- 1 - REFERENCE MARK
- 2 - EXAMPLE HIGH SPOT ON TIRE
- 3 - WHEEL
- 4 - VALVE STEM

(3) Lateral Runout. Lateral runout for the vehicle system as well as the tire and wheel assembly should be less than 0.76 mm (0.030 inch). The same procedure and theory described for radial runout can also be applied to identify and reduce lateral runout.

(4) Wheel Runout. This runout check is performed as follows:

(a) Dismount the tire from the wheel.

(b) Mount the wheel back on the wheel balancer.

(c) Measure radial runout of the wheel at the tire bead seat (Fig. 4). Runout should not exceed 0.254 mm (0.010 inch) for aluminum wheels and 0.508 mm (.020 inch) for steel wheels. Replace the wheel if it exceeds the limit.

(d) Measure lateral runout of the wheel at the tire bead seat (Fig. 5). Runout should not exceed 0.762 mm (0.030 inch) for all wheels. Replace the wheel if it exceeds the limit.

(5) Match Mounting. If the wheel runout is within specifications, tire and wheel assembly runout can be improved by re-indexing (match mounting) the tire to the wheel as described below.

(a) Remount the tire on the rim 180 degrees from its original location (Fig. 6). Ensure the tire bead is properly seated.

(b) Re-measure the total runout. Mark the tire at the high spot and record the measurement.

**Fig. 7 Remount Tire 90 Degrees In Direction of Arrow**

- 1 - 2ND HIGH SPOT ON TIRE
- 2 - 1ST HIGH SPOT ON TIRE

J9322-5

If runout is still excessive, perform the following:

- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the tire, replace the tire.
- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the wheel, the wheel may be out of specification. Refer to Wheel Runout above.
- If the new high spot is NOT within 102 mm (4.0 inch) of either high spot, draw an arrow on the tread

TIRES/WHEELS (Continued)

(6) Once back together, road test the vehicle for at least 5 miles, following the format described in Road Test. If vibration persists, and all components tested are within specification, the tires may have an excessive radial force condition. Radial force variation can only be checked as indicated below. If this equipment is not available, consult with the tire manufacturer.

RADIAL FORCE VARIATION

Radial Force Variation can be checked using the Hunter GSP 9700 Vibration Control System (Wheel Balancer) or equivalent, if available. This type of equipment helps to correct ride disturbances by reducing the radial force variation of an assembly through re-indexing of the tire to wheel.

The equipment manufacturer or DaimlerChrysler Corporation may supply reference values as guidelines. Radial force measurements above the reference value may not always result in a ride disturbance, nor do they automatically mean the assembly components are out of specification. Do not replace components based on radial force values alone. Balancing, runout diagnosis, re-indexing, and subjective road testing must be performed as outlined in previous sections of this diagnosis and testing procedure.

Use the Radial Force equipment to identify suspect assemblies and minimize the radial forces. After all suspect assemblies are optimized, reinstall the assemblies and road test the vehicle. If a disturbance still exists and all other vibration diagnostic procedures have been completed, replace one tire or one wheel at a time, starting with the assembly having the highest force variation. Be sure to minimize each new assembly. Road test the vehicle following each replacement. Continue this process until the disturbance is resolved.

NOTE: When using Radial Force equipment, it is critically important to set proper tire inflation pressure and ensure centering of the wheel on the equipment spindle.

RADIAL FORCE VARIATION REFERENCE
VALUES

DESCRIPTION	SPECIFICATION
Total Radial Force Variation (RFV)	Less Than 22 Lbs. ± 2 Lbs.
Radial First Harmonic (R1H)	Less Than 16 Lbs. ± 2 Lbs.
Radial Second Harmonic (R2H)	Less Than 12 Lbs. ± 2 Lbs.

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE AND WHEEL BALANCE

NOTE: Balance equipment must be calibrated and maintained per equipment manufacturer's specifications.

Wheel balancing can be accomplished with either on-vehicle or off-vehicle equipment.

NOTE: If using on-vehicle balancing equipment, on the driving axle, remove the opposite wheel and tire assembly.

It is recommended that a two-plane dynamic balancer be used when a wheel and tire assembly requires balancing. A static balancer should only be used when a two-plane balancer is not available.

Balance wheel and tire assemblies dynamically and statically to less than 0.25 (¼) ounce.

For static balancing, find location of heavy spot causing imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 8).

For dynamic balancing, the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (Fig. 9).

The aluminum wheels on this vehicle use a unique wheel weight (Fig. 10). This wheel weight is designed to fit the contoured surface of the wheel (Fig. 10). When balancing an aluminum wheel, this wheel weight must be used. Do not use any other type of wheel weight. It will not properly fit the contour of the wheel.

Always verify the Balance. When using off-vehicle equipment, rotate assembly 180 degrees on balance equipment to verify balance. Variation should not be more than 0.125 (⅛) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning.

If difficult to balance, break down the wheel and tire assembly and check for loose debris inside tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

2 - WHEEL
3 - WHEEL WEIGHT

STANDARD PROCEDURE - TIRE AND WHEEL MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. This technique is used to reduce runout in the wheel and tire assembly. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the wheel is identified with a label on the outside of the rim and a dot or line in the drop well area of the rim (inside where the tire mounts). If the outside label has been removed, the tire will have to be removed to locate the dot or line on the inside of the rim. The tire can then be match mounted to the tire.

Information on match mounting the tire to the wheel can be found in Tire and Wheel Runout/Match Mounting, items (2) through (5), within Diagnosis And Testing - Tire And Wheel Vibration. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

STANDARD PROCEDURE - TIRE AND WHEEL ROTATION

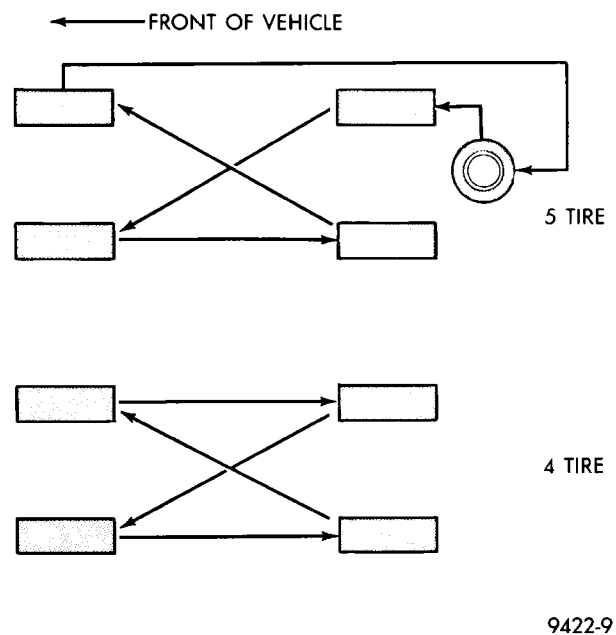

CAUTION: If the vehicle is equipped with the Tire Pressure Monitoring (TPM) System, the TPM System (sensors) will need to be retrained once the tire and wheel rotation process is completed. Anytime the tire/wheel assemblies are switched, rotated or replaced, the TPM System needs to be retrained. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

NON-DIRECTIONAL TREAD PATTERN TIRES

Tires on the front and rear axles operate at different loads and perform different functions. For these reasons, they wear at unequal rates, and tend to develop irregular wear patterns. These effects can be reduced by timely rotation of tires. The benefits of rotation are especially worthwhile. Rotation will increase tread life, help to maintain mud, snow, and wet traction levels, and contribute to a smooth, quiet ride.

The suggested rotation method is the forward-cross tire rotation method (Fig. 11). This method takes advantage of current tire industry practice which allows rotation of radial-ply tires. Other rotation methods may be used, but may not have all the benefits of the recommended method.

NOTE: Only the 4 tire rotation method may be used if the vehicle is equipped with a low mileage or temporary spare tire.

**Fig. 11 Forward-Cross Tire Rotation Method****DIRECTIONAL TREAD PATTERN TIRES**

Some vehicles are fitted with special high-performance tires having a directional tread pattern. These tires are designed to improve traction on wet pavement. To obtain the full benefits of this design, the tires must be installed so that they rotate in the correct direction. This is indicated by arrows on the tire sidewalls.

When wheels and tires are being installed, extra care is needed to ensure that this direction of rotation is maintained.

Refer to Owner's Manual for rotation schedule.

TIRES/WHEELS (Continued)

REMOVAL

REMOVAL - TIRE AND WHEEL ASSEMBLY
(ALUMINUM WHEEL)

CAUTION: If the vehicle is equipped with the Tire Pressure Monitoring (TPM) System, the tire/wheel assembly needs to be reinstalled in the same location it is removed from or the TPM System (sensors) will need to be retrained. Mark each tire/wheel assembly indicating location, prior to its removal. If the tire/wheel assemblies are switched, rotated or replaced, the TPM System needs to be retrained afterward. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

- (1) Raise the vehicle so the tire and wheel assembly clears ground level.
- (2) Remove the 5 wheel mounting nuts from the studs.
- (3) Remove the tire and wheel from the hub.

REMOVAL - TIRE AND WHEEL ASSEMBLY
(STEEL WHEEL)

- (1) Raise the vehicle so the tire and wheel assembly clears ground level.
- (2) Noting the location of the valve stem in relationship to the wheel mounting nuts, remove the three wheel mounting nuts securing the wheel cover to the wheel and hub (Fig. 12).

Fig. 12 Wheel Mounting Nuts Securing Wheel Cover

- 1 - VALVE STEM
2 - BOLT-ON WHEEL COVER
3 - NUTS SECURING WHEEL COVER

CAUTION: When removing the wheel cover, do not pry the wheel cover from the wheel. This can result in damage to the wheel cover. The wheel cover is removed by pulling it off the wheel by hand.

(3) Grasp the wheel cover at the edges in line with the remaining installed wheel mounting nuts and pull straight outward from the wheel. This will pop the wheel cover retaining tabs over the two remaining wheel nuts, removing the wheel cover from the vehicle.

(4) Remove the two remaining wheel mounting nuts from the hub's studs.

(5) Remove the wheel and tire from the hub.

DISASSEMBLY - TIRE AND WHEEL ASSEMBLY
WITH TPM

(Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - REMOVAL)

ASSEMBLY - TIRE AND WHEEL ASSEMBLY
WITH TPM

(Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - INSTALLATION)

INSTALLATION

INSTALLATION - TIRE AND WHEEL ASSEMBLY
(ALUMINUM WHEEL)

CAUTION: If the vehicle is equipped with the Tire Pressure Monitoring (TPM) System, the tire/wheel assembly needs to be reinstalled in the same location it is removed from or the TPM System (sensors) will need to be retrained. Mark each tire/wheel assembly indicating location, prior to its removal. If the tire/wheel assemblies are switched, rotated or replaced, the TPM System needs to be retrained afterward. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

NOTE: Never use oil or grease on studs or wheel mounting nuts.

(1) Position the tire and wheel assembly on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.

(2) Loosely install all 5 wheel mounting nuts. Lightly snug the wheel nuts, then progressively tighten them in the proper sequence (Fig. 13). Tighten wheel mounting nuts to 135 N·m (100 ft. lbs.).

(3) Lower the vehicle.

TIRES/WHEELS (Continued)

80c4f496

Fig. 13 Tightening Sequence**INSTALLATION - TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)**

NOTE: Never use oil or grease on studs or wheel mounting nuts.

(1) Position the tire and wheel assembly on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.

NOTE: Wheel mounting nuts must be installed on the studs as shown (Fig. 14) to allow proper installation of the wheel cover.

(2) Using the valve stem as an index placed at the 12 O'clock position, install and **lightly tighten** two wheel mounting nuts on the studs located at the 2 O'clock and 10 O'clock positions as shown (Fig. 14).

(3) Place the wheel cover on the wheel in the following fashion:

(a) Align the valve notch in the wheel cover with the valve stem on the wheel.

(b) At the same time, align the two holes in the wheel cover having the retaining tabs with the two installed wheel nuts (Fig. 15).

(c) Press in on center of wheel cover until wheel cover retaining tabs push past and engage rear of previously installed wheel mounting nuts (Fig. 15). This will hold the wheel cover in place.

80a336db

- 3 - WHEEL COVER

(4) Install and **lightly tighten** the three remaining wheel mounting nuts, securing the wheel cover in place (Fig. 12).

(5) Progressively tighten all five wheel mounting nuts in the proper sequence (Fig. 16). Tighten wheel nuts to a torque of 135 N·m (100 ft. lbs.).

(6) Lower the vehicle.

TIRES/WHEELS (Continued)

Fig. 16 Tightening Sequence

TIRE PRESSURE MONITORING (TPM)

DESCRIPTION

Some versions of this vehicle are equipped with a Tire Pressure Monitoring (TPM) system. It monitors air pressure in all five tires (includes **full-size** spare).

There is a sensor (transmitter) in each of the vehicle's five wheels. The system alerts the driver when tire pressure falls outside predetermined thresholds (pressure too low or too high). A message is then displayed on the Electronic Vehicle Information Center (EVIC) located in the overhead console. Tire air pressures in the four road wheels are displayed on the EVIC when chosen. Pressure in the spare tire, although monitored, is not displayed on the EVIC.

For further information, refer to the Owners Manual or the appropriate diagnostic information.

OPERATION

The Tire Pressure Monitoring (TPM) system uses wireless technology to monitor tire air pressure levels. Sensors, mounted to each road wheel as part of the valve stem, transmit tire pressure readings to a receiver located in the overhead console. These transmissions occur once every minute at speeds over 20 mph (32 km/h). The tire pressure status is shown on the Electronic Vehicle Information Center (EVIC) display upon demand. The Tire Pressure Monitoring system remains active even if it is not displayed in the EVIC.

If any road tire pressure has exceeded the low or high pressure threshold (refer to chart below), the TPM system will display a message on the EVIC and sound a chime. It will then go into the tire pressure display screen and flash the pressure value of the tire that is low or high. This will be displayed for the

rest of the ignition cycle, or until either the C/T, MENU, STEP or RESET button is pressed.

If a road tire is replaced by the spare, the TPM system will detect the swap automatically (after the ignition has been cycled) and display "SPARE SWAP DETECTED" along with a chime (This could take up to 10 minutes with the vehicle speed above 20 mph (32 km/h).

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle.

TPM THRESHOLD PRESSURES

DESCRIPTION	300M	300M SPECIAL
High Pressure Threshold	45 PSI (310 kPa)	45 PSI (310 kPa)
Placard Pressure (Cold)	30 PSI (207 kPa)	32 PSI (221 kPa)
Low Pressure Threshold	24 PSI (165 kPa)	26 PSI (179 kPa)

WARNING

WARNING: DO NOT USE THE EVIC DISPLAY TO MONITOR AIR PRESSURE CHANGES WHILE ADJUSTING AIR PRESSURE IN THE TIRES. THE TPM SYSTEM CANNOT BE EXPECTED TO FUNCTION AS A REAL TIME TIRE PRESSURE GAUGE. THERE CAN BE A DELAY BETWEEN THE INSTANT THE AIR PRESSURE IS ADJUSTED IN A TIRE AND WHEN THE SYSTEM UPDATES THE DISPLAY.

CAUTION

CAUTION: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

CAUTION: The use of tire sealants is strictly prohibited for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants can clog tire pressure sensors.

SENSOR - TPM

DESCRIPTION

On vehicles equipped with Tire Pressure Monitoring, one tire pressure sensor is mounted to each wheel (including spare) (Fig. 19). Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced. The serviceable components of the tire pressure sensor are:

- Sensor-To-Wheel Grommet
- Valve Stem Cap
- Valve Stem Core

Valve stem caps and cores are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different.

CAUTION: Do not use a standard valve stem cap or core in a tire pressure sensor. Always use the original equipment style sensor cap and core.

CAUTION: Do not try to install a tire pressure sensor in a steel wheel or aftermarket wheel. Use only in original style factory wheels.

OPERATION

Tire pressure sensors are battery operated. They transmit tire pressure data once every minute at speeds above 20 mph (32 km/h) or up to once every hour when stationary (parked). For additional information, refer to Appropriate Diagnostic Information.

CAUTION

CAUTION: The use of tire sealants is strictly prohibited for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants can clog tire pressure sensors.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Do not attempt to install a tire pressure sensor in a steel wheel or aftermarket wheel. Use tire pressure sensors in original style factory wheels only.

CAUTION: Do not reuse the original Sensor-To-Wheel Grommet when installing a pressure sensor. Always use a new grommet and properly torque the sensor nut to specifications. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - INSTALLATION)

DIAGNOSIS AND TESTING - TIRE PRESSURE SENSOR

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. **DO NOT** reduce this normal pressure build up.

If a fault in the system is detected, always check air pressure in the tires first with a known accurate air gauge and correct the inflation pressure as necessary. If any tire is low, inspect **all** tires.

NOTE: If a tire and wheel rotation is not followed by the retrain procedure, the system will not properly inform the driver with the correct vehicle location for a low or high pressure tire. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

If gauge-read pressure in the tires does not reflect the data on the EVIC, retrain the sensors, then reevaluate (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE). If the gauge-read readings at each tire still do not reflect the EVIC data, check the accuracy of the air gauge (What is the accuracy tolerance of the gauge being used?). If the gauge used is known to be accurate and one or more gauge readings still do not reflect the EVIC readings, but the remaining gauge readings do, replace the pressure sensor(s) at the suspect wheels. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - REMOVAL)

Refer to the appropriate diagnostic information for complete diagnosis of the Tire Pressure Monitoring System.

STANDARD PROCEDURE - TIRE PRESSURE SENSOR RETRAIN

WARNING: DEATH OR SERIOUS INJURY CAN OCCUR IF MAGNETICALLY SENSITIVE DEVICES ARE EXPOSED TO THE RELEARN MAGNET. MAGNETS CAN AFFECT PACEMAKERS.

SENSOR - TPM (Continued)

CAUTION: Never attempt to train more than one vehicle at a time. System is capable of reading tire pressure sensor transmissions from other nearby vehicles while in train mode.

Each time a wheel rotation or tire pressure sensor replacement occurs the tire pressure sensors must be retrained. This is necessary to inform the Electronic Vehicle Information Center (EVIC) that a sensor change was made and the new locations of the sensors. Retraining is accomplished through the EVIC used in conjunction with a Re-learn Magnet, Special Tool 8821.

NOTE: Use the following procedure to retrain all five (5) tire pressure sensors. No attempt should be made to retrain individual sensors.

- (1) Open decklid and remove spare tire stowage cover.
- (2) Retrieve Re-learn Magnet, Special Tool 8821.
- (3) Press MENU Button on EVIC until "RETRAIN TIRE SENSORS - NO" is displayed.
- (4) Press STEP button to select "YES".

NOTE: There is a 60 second timer for training the first sensor and a 30 second timer between training the remaining sensors. If either of these timers expire, the EVIC will abort the training procedure.

NOTE: If at any time the EVIC display reads "TRAINING ABORTED", move the vehicle ahead at least one foot and repeat the entire retraining procedure.

- (5) Press MENU button to start retraining. Display will read "TRAIN LEFT FRONT TIRE"

NOTE: The order for retraining all five sensors is:

- Left Front
- Right Front
- Right Rear
- Left Rear
- Spare

- (6) Starting at left front tire, place Re-learn Magnet over valve stem (Fig. 17). Within approximately 5 seconds, vehicle horn will chirp indicating training complete for that particular sensor. Remove the magnet.

- (7) Repeat step (6) on remaining sensors as indicated by EVIC until all five TPM sensors positions are trained.

- (8) Once EVIC displays "TRAINING COMPLETE", pressing either STEP, C/T, RESET or MENU button will exit training routine.

80ce7745

Fig. 17 Magnet Placement Over Valve Stem

- 1 - RE-LEARN MAGNET
2 - VALVE STEM

REMOVAL

- (1) Remove tire and wheel assembly from vehicle. (Refer to 22 - TIRES/WHEELS - REMOVAL)

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

- (2) Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:

(a) When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire.

(b) When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool at the valve stem $\pm 10^\circ$ (Fig. 18), then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads.

- (3) Using a thin wall socket, remove special nut retaining sensor to wheel (Fig. 19).

- (4) Remove sensor from wheel (Fig. 19).

SENSOR - TPM (Continued)

80ce6098

Fig. 19 Sensor Mounting To Wheel

- 1 - TIRE PRESSURE SENSOR
- 2 - WHEEL
- 3 - NUT

INSTALLATION

NOTE: Before reinstalling a tire pressure sensor, replace sealing grommet at base of valve stem.

(1) Wipe area clean where sensor sealing grommet contacts wheel. Make sure surface of wheel is not damaged.

(2) Install sensor in wheel as shown (Fig. 19). Do not attempt to mount sensor otherwise, damage may occur.

(3) Using a thin wall socket, install special sensor nut (Fig. 19). Tighten nut to 4 N·m (35 in. lbs.) torque.

CAUTION: Over-torquing the sensor nut by as little as 12 N·m (106 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function, however, the condition should be corrected immediately.

(4) Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

(a) Rotating Wheel Tire Changers- Once the wheel is mounted to the changer, position the sensor valve stem approximately 210° from the head of the changer in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire (Fig. 20). Use this procedure on both the upper and lower tire beads.

(b) Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem is located approximately 210° clockwise from the installation end of the mounting/dismounting tool once the tool is mounted for tire installation (Fig. 21). Make sure the sensor is clear of the lower bead breaker area to avoid damaging the sensor when the breaker rises (Fig. 21). Rotate the tool in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.

(5) Install wheel and tire assembly on vehicle. (Refer to 22 - TIRES/WHEELS - INSTALLATION)

(6) Retrain tire pressure sensors. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - STANDARD PROCEDURE)

TIRES

DESCRIPTION

DESCRIPTION - TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the Tire Identification chart to decipher the code. For example purposes, the tire size P225/60 R 16 97 T is used in the chart. An All Season type tire will also have either M + S, M & S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the side wall. The absence of an "XL" or "LL" marking infers a standard load tire.

TIRES (Continued)

16	WHEEL DIAMETER	SHOWN IN INCHES
97	LOAD INDEX	*
T	SPEED RATING	*

* **NOTE:** Consult the tire manufacturer regarding any questions on tire specifications or capabilities.

Fig. 22 Tire Aspect Ratio

- 1 - SECTIONAL WIDTH
2 - SECTIONAL HEIGHT

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

DESCRIPTION - RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 80 km/h (50 mph) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Antilock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

DESCRIPTION - REPLACEMENT TIRES

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

WARNING:: IN ORDER TO MAINTAIN THE SPEED CAPABILITY OF THE VEHICLE, REPLACEMENT TIRES MUST HAVE SPEED RATINGS EQUAL TO OR HIGHER THAN THOSE FITTED TO THE VEHICLE AS ORIGINAL EQUIPMENT. IF TIRES WITH LOWER SPEED RATINGS ARE FITTED, THE VEHICLE'S HANDLING MAY BE AFFECTED AND THE SPEED CAPABILITY OF THE VEHICLE MAY BE LOWERED TO THE MAXIMUM SPEED CAPABILITY OF THE REPLACEMENT TIRES. TO AVOID AN ACCIDENT RESULTING IN SEVERE OR FATAL INJURY, CONSULT THE TIRE MANUFACTURER IN REGARDS TO MAXIMUM SPEED RATINGS.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

TIRES (Continued)

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

DESCRIPTION - SPARE TIRE (TEMPORARY)

The compact temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the temporary spare tire. Refer to Owner's Manual for complete details.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - TIRE NOISE**

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING). For irregular tire wear, (Refer to 22 - TIRES/WHEELS/TIRES - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING - TIRE/VEHICLE LEAD

(Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - DIAGNOSIS AND TESTING)

DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

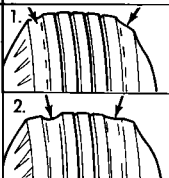

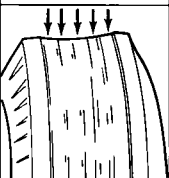

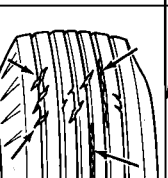

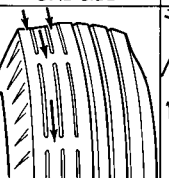

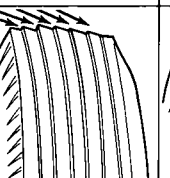

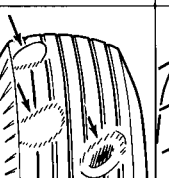

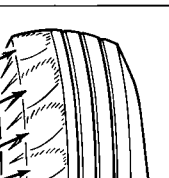

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 23).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 23).

DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 24).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT							
CAUSE	UNDER-INFLATION OR LACK OF ROTATION	OVER-INFLATION OR LACK OF ROTATION	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER	INCORRECT TOE	UNBALANCED WHEEL OR TIRE DEFECT*	LACK OF ROTATION OF TIRES OR WORN OR OUT-OF-ALIGNMENT SUSPENSION.
CORRECTION	ADJUST PRESSURE TO SPECIFICATIONS WHEN TIRES ARE COOL ROTATE TIRES			ADJUST CAMBER TO SPECIFICATIONS	ADJUST TOE-IN TO SPECIFICATIONS	DYNAMIC OR STATIC BALANCE WHEELS	ROTATE TIRES AND INSPECT SUSPENSION SEE GROUP 2

*HAVE TIRE INSPECTED FOR FURTHER USE.

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire Inflation Pressure Label provided with the vehicle (usually on the rear face of the driver's door).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING. THE TIRE CAN FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (Fig. 25).

J9222-1

Fig. 25 Under Inflation Wear

- 1 - THIN TIRE TREAD AREAS

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (Fig. 26).

J9222-2

Fig. 26 Over Inflation Wear

- 1 - THIN TIRE TREAD AREA

STANDARD PROCEDURE - TIRE PRESSURE FOR HIGH SPEED OPERATION

DaimlerChrysler Corporation advocates driving at safe speeds within posted speed limits. Speed capacity of a tire is a function of the tire speed rating, inflation pressure and vehicle axle weight. Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. Vehicles loaded to maximum capacity should

TIRES (Continued)

not be driven at continuous speeds over 120 km/h (75 mph). Never exceed the maximum speed capacity of the tire. For information on tire identification and speed ratings, (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION).

STANDARD PROCEDURE - TIRE LEAK REPAIRING

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 27). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and progressively tighten the 5 wheel nuts to a torque of 135 N·m (100 ft. lbs.).

J8922-6

Fig. 27 Tire Repair Area

1 - REPAIRABLE AREA

CLEANING - TIRES

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

WHEELS

DESCRIPTION

Original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

All models use steel or cast aluminum drop center wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps (Fig. 28).

J9022-3

Fig. 28 Safety Rim

- 1 - FLANGE
- 2 - RIDGE
- 3 - WELL

Initial inflation of the tires forces the bead over these raised sections. In case of air loss the raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

Cast aluminum wheels require special balance weights to fit on the rim flange of the wheel and special wheel clamps for the alignment equipment.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

Before installing a wheel, remove any buildup of corrosion on the wheel mounting surface.

WHEELS (Continued)

WARNING: INSTALLING WHEELS WITHOUT GOOD METAL-TO-METAL CONTACT COULD CAUSE LOOSENING OF WHEEL LUG NUTS. THIS COULD ADVERSELY AFFECT THE SAFETY AND HANDLING OF YOUR VEHICLE.

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE.

WARNING: REPLACEMENT WITH USED WHEELS IS NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

CLEANING - ALUMINUM WHEEL CARE

Chrome plated and painted aluminum wheels should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion.

Care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Any of the "DO NOT USE" items listed below WILL damage chrome plated and painted aluminum wheels.

DO NOT USE:

- any abrasive metal cleaner
- any abrasive cleaning pad or brush
- any cleaner that contains an acid (this will immediately react with and discolor the chromium surface)
- chrome polish (unless it is buffed off immediately after application)

- oven cleaner
- a car wash that uses carbide-tipped wheel cleaning brushes

SPECIFICATIONS**WHEEL***SPECIFICATIONS*

DESCRIPTION	SPECIFICATION

Wheel Mounting Stud Size	M12 x 1.5 mm

TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
TPM Sensor Mounting Nut	4	—	35
Wheel Mounting (Lug) Nut	135	100	—

WHEEL COVER**DESCRIPTION**

This vehicle uses a bolt-on type wheel cover (Fig. 29).

This bolt-on wheel cover cannot be removed from the wheel until three of the five wheel mounting nuts shown are removed (Fig. 29). The bolt-on wheel cover can then be removed with the remaining two wheel nuts tightened in place.

REMOVAL

(1) Noting the location of the valve stem in relationship to the wheel mounting nuts, remove the three wheel mounting nuts securing the wheel cover to the wheel and hub (Fig. 29).

CAUTION: When removing the wheel cover, do not pry the wheel cover from the wheel. This can result in damage to the wheel cover. The wheel cover is removed by pulling it off the wheel by hand.

(2) Grasp the wheel cover at the edges in line with the remaining installed wheel nuts and pull straight outward from the wheel. This will pop the wheel cover retaining tabs over the two remaining wheel nuts, removing the wheel cover from the wheel.

WHEEL COVER (Continued)

Fig. 29 Wheel Mounting Nuts Securing Wheel Cover

- 1 - VALVE STEM
- 2 - BOLT-ON WHEEL COVER
- 3 - NUTS SECURING WHEEL COVER

INSTALLATION

NOTE: Wheel mounting nuts must be installed on the studs as shown to allow installation of the wheel cover (Fig. 30).

Fig. 30 Two Wheel Mounting Nuts Installed

- 1 - VALVE STEM
- 2 - NUTS
- 3 - HUB
- 4 - WHEEL

(1) Place the wheel cover on the wheel in the following fashion:

(a) Align the valve notch in the wheel cover with the valve stem on the wheel.

(b) At the same time, align the two holes in the wheel cover having the retaining tabs with the two installed wheel nuts (Fig. 31).

(c) Press in on center of wheel cover until wheel cover retaining tabs push past and engage rear of previously installed wheel mounting nuts (Fig. 31). This will hold the wheel cover in place.

Fig. 31 Wheel Cover Installation Over Two Nuts

- 1 - RETAINING TABS
- 2 - VALVE STEM
- 3 - WHEEL COVER

(2) Install and **lightly tighten** the three remaining wheel mounting nuts, securing the wheel cover in place (Fig. 29).

(3) Tighten all five wheel mounting nuts in the proper sequence (Fig. 32). Tighten wheel nuts to a torque of 135 N·m (100 ft. lbs.).

Fig. 32 Tightening Sequence

WHEEL MOUNTING STUDS - FRONT

REMOVAL

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. See Hoisting in the Lubrication and Maintenance section.

(2) Remove the 2 guide pin bolts mounting the caliper assembly to the steering knuckle (Fig. 33). Remove the caliper from the front steering knuckle. Refer to Disc Brake Caliper in the Brake section for the caliper removal procedure.

Fig. 33 Caliper Guide Pin Bolts

- 1 - BRAKE LINE
- 2 - CALIPER GUIDE PIN BOLTS
- 3 - STEERING KNUCKLE
- 4 - BLEEDER SCREW
- 5 - CALIPER ASSEMBLY

(3) Remove rotor from hub by pulling it straight off wheel mounting studs (Fig. 34).

(4) Install a lug nut on the wheel stud to be removed from the hub and bearing assembly (Fig. 35) so the threads on stud are even with end of lug nut. Install Remover, Special Tool C-4150, on hub and bearing assembly flange and wheel stud (Fig. 35).

(5) Tighten down on special tool to push wheel stud out of the hub and bearing assembly. When shoulder of wheel stud is past flange, remove special tool from hub and bearing assembly. Remove lug nut from stud and remove wheel stud from flange.

Fig. 34 Brake Rotor

- 1 - HUB
- 2 - STEERING KNUCKLE

Fig. 35 Removing Wheel Stud From Hub And Bearing

- 1 - HUB/BEARING ASSEMBLY
- 2 - WHEEL STUD
- 3 - LUG NUT
- 4 - SPECIAL TOOL C-4150

WHEEL MOUNTING STUDS - FRONT (Continued)

INSTALLATION

(1) Install wheel stud into of hub and bearing assembly from the rear. Install washers on wheel stud, then install a wheel lug nut on stud with flat side of lug nut against washers (Fig. 36).

9402-71

Fig. 36 Installing Wheel Stud Into Hub And Bearing

- 1 - HUB/BEARING ASSEMBLY
- 2 - WHEEL LUG NUT
- 3 - WASHERS

(2) Tighten the wheel lug nut, pulling the wheel stud into the flange of the hub and bearing assembly. When the head of the stud is fully seated against the bearing flange, remove lug nut and washers from wheel stud.

(3) Install the rotor on the hub and bearing assembly (Fig. 34).

(4) Install disc brake caliper back over brake rotor and align with caliper mounting holes on steering knuckle. Refer to the Brake section for the caliper installation procedure. Install the caliper to steering knuckle guide pin bolts (Fig. 33) and tighten to a torque of 19 N·m (168 in. lbs.).

(5) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).

(6) Lower the vehicle to the ground.

WHEEL MOUNTING STUDS - REAR

REMOVAL

CAUTION: DO NOT hammer studs out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature bearing failure.

(1) Remove the hub and bearing from the vehicle. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

CAUTION: Take care to keep hub and bearing assembly from falling during stud removal. Damage to the hub and bearing could result.

(2) Position the hub and bearing assembly under a hydraulic press ram, supported by a 21 mm deep-well impact socket under the stud to be replaced (Fig. 37).

80b34e08

Fig. 37 Wheel Stud Removal

- 1 - HUB AND BEARING ASSEMBLY
- 2 - PRESS RAM
- 3 - 21mm IMPACT SOCKET

(3) Press the stud out of the hub flange and into the socket well.

(4) Remove the hub and bearing assembly from the press.

(5) Remove the stud from the socket.

WHEEL MOUNTING STUDS - REAR (Continued)

INSTALLATION

CAUTION: DO NOT hammer studs into the hub flange. If a stud is installed in such a manner, damage to the hub and bearing assembly may occur leading to premature bearing failure.

(1) Install wheel stud into stud hole in hub and bearing assembly.

(2) Position the hub and bearing assembly face down with stud pointing down into the well of the 21 mm socket. The hydraulic press ram must line up with the stud (Fig. 38).

(3) Press the stud into the hub flange until it bottoms.

(4) Remove the hub and bearing assembly from the press.

(5) Install the hub and bearing on the vehicle.
(Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)

BODY

DESCRIPTION - VEHICLE IDENTIFICATION

Throughout this group, references to the DaimlerChrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to Introduction Group of this manual for detailed information on vehicle identification. If a procedure is common to all vehicles covered in this manual, no reference will be made to a vehicle family code.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other compo-

nents. Damage to vehicle can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.

Always have a fire extinguisher ready for use when welding.

Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.

Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.

Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of

BODY (Continued)

the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

DIAGNOSIS AND TESTING - WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be

BODY (Continued)

noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **EYE PROTECTION SHOULD BE USED WHEN SERVICING COMPONENTS. PERSONAL INJURY CAN RESULT.**
- **USE AN OSHA APPROVED BREATHING MASK WHEN MIXING EPOXY, GRINDING, AND SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**
- **AVOID PROLONGED SKIN CONTACT WITH RESIN, PETROLEUM, OR ALCOHOL BASED SOLVENTS. PERSONAL INJURY CAN RESULT.**
- **DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

BODY (Continued)

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel (Fig. 1). To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

**Fig. 1 PANEL SECTIONING**

80b6fede

- 1 - EXISTING PANEL
- 2 - NEW PANEL
- 3 - PANEL ADHESIVE
- 4 - BONDING STRIP

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement

(Fig. 2) and (Fig. 3). Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair (Fig. 4). It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

Fig. 2 SOFTENED EDGES

- 1 - SOFTENED EDGES
- 2 - PANEL ADHESIVE
- 3 - BONDING STRIP

80b6fee0

Fig. 3 PANEL REINFORCEMENT

- 1 - PANEL ADHESIVE
- 2 - REINFORCEMENT

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used (Fig. 5).

- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.

BODY (Continued)

**Fig. 4 BEVELING ANGLE - 20 DEGREE**

• When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

**Fig. 5 FIBERGLASS TAPE****VISUAL INSPECTION**

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind (Fig. 7) (Fig. 6).

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of

**Fig. 6 DAMAGE COMPONENT**

1 - PUNCTURE

paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material (Fig. 7). Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

**Fig. 7 DAMAGED PANEL CUTOUT AND PATCH**

 2 - DAMAGED BODY PANEL
 3 - 4 MM (0.160 IN.) HOLES
 4 - PATCH CUT TO SIZE

BODY (Continued)

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

(1) Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required (Fig. 8).

(2) Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.

(3) Apply a liberal coat of adhesive over the reinforcement mesh (Fig. 8). If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.

(4) After patch has cured, peel waxed paper or plastic from the back of the patch.

(5) If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

Fig. 8 FABRICATED PANEL

- 1 - STRUCTURAL ADHESIVE
- 2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE
- 3 - WIDTH OF V-GROOVE
- 4 - WAXED PAPER

PANEL PATCH INSTALLATION

(1) Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.

(2) Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

(3) Using the pattern as a guide, cut the patch to size.

(4) Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.

(5) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole (Fig. 7).

(6) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.

(7) Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.

(8) Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.

(9) Mix enough adhesive to cover one side of all support squares.

(10) Apply adhesive to cover one side of all support squares.

(11) Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares (Fig. 9).

Fig. 9 SECURE SUPPORT SQUARES TO BODY PANEL

- 1 - SUPPORT SQUARES
- 2 - SCREWS
- 3 - DAMAGED BODY PANEL

(12) Position patch in cutout against support squares and adjust patch until the gap is equal along all sides (Fig. 10).

(13) Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

(14) Apply a coat of adhesive to the exposed ends of the support squares (Fig. 11).

(15) Install screws to hold the patch to support squares (Fig. 12). Tighten screws until patch surface is flush with panel surface.

(16) Allow adhesive to cure, and remove all screws.

(17) Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch (Fig. 13). With compressed air, blow dust from around patch.

(18) Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch (Fig. 14).

BODY (Continued)

(19) Mix enough adhesive to cover the entire patch area.

(20) Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair (Fig. 15).

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

STANDARD PROCEDURE - HEAT STAKING

- (1) Remove trim panel.
- (2) Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
- (3) Heat stake the components.

(a) If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(b) If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(4) Allow the repaired area to cool and verify the repair.

(5) Install trim panel.

SPECIFICATIONS**BODY LUBRICATION****LUBRICATION REQUIREMENTS**

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

LUBRICANT APPLICATION**DOOR LOCK CYLINDERS**

- (1) Apply a small amount of lubricant directly into the lock cylinder.
- (2) Apply a small amount of lubricant to the key.
- (3) Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

(4) Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.

(5) Wipe all lubricant from exterior of lock cylinder and key.

BODY (Continued)

ALL OTHER BODY MECHANISMS

- (1) Clean component as described above.
- (2) Apply specified lubricant to all pivoting and sliding contact areas of component.

INSTALLATION

- (1) Place latch in position on vehicle.
- (2) Connect decklid ajar switch connector on latch.
- (3) Connect power lock connector on latch solenoid.
- (4) Place decklid latch in position on decklid.
- (5) Install bolts to attach decklid latch to decklid.
- (6) Adjust decklid latch for proper decklid to quarter panel alignment and weatherstrip sealing.
- (7) Install fasteners to attach decklid lining or latch cover to rear of decklid.
- (8) Verify decklid latch operation.

LATCH STRIKER

REMOVAL

- (1) Open decklid.
- (2) Remove trunk liner as necessary.
- (3) Remove bolts attaching latch striker (Fig. 7).
- (4) Remove latch striker from vehicle.

Fig. 7 DECKLID LATCH STRIKER

- 1 - TRUNK LIP LATCH STRIKER
- 2 - TRUNK COMPARTMENT

INSTALLATION

- (1) Place latch striker in position.
- (2) Install bolts attaching latch striker.
- (3) Verify decklid operation and alignment.
- (4) Place decklid liner in position.

LOCK CYLINDER

REMOVAL

- (1) Open decklid.
- (2) Remove fasteners attaching decklid lining to rear of decklid.
- (3) Remove bolts attaching decklid latch to decklid (Fig. 4), (Fig. 5) or (Fig. 6).
- (4) Remove decklid latch from decklid.
- (5) Disconnect power lock connector from latch solenoid.
- (6) Disconnect decklid ajar switch connector from latch.
- (7) Remove latch from vehicle.
- (8) Remove decklid lock set.
- (9) Remove decklid lock cylinder.

INSTALLATION

- (1) Install decklid lock cylinder.
- (2) Install decklid lock set.
- (3) Place latch in position on vehicle.
- (4) Connect decklid ajar switch connector on latch.
- (5) Connect power lock connector on latch solenoid.
- (6) Place decklid latch in position on decklid.
- (7) Install bolts to attach decklid latch to decklid.

LOCK CYLINDER (Continued)

- (8) Adjust decklid latch for proper decklid to quarter panel alignment and weatherstrip sealing.
- (9) Install fasteners to attach decklid lining to rear of decklid.
- (10) Verify decklid latch operation.

EMERGENCY RELEASE CABLE

REMOVAL

- (1) Remove the decklid cover. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/COVER - REMOVAL)
- (2) Unclip cable and handle assembly (Fig. 8).

**Fig. 8 EMERGENCY RELEASE CABLE**

- 1 - RELEASE CABLE CLIP
2 - DECKLID LATCH

INSTALLATION

- (1) Clip emergency release cable onto the latch.
- (2) Install the decklid cover. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/COVER - INSTALLATION)

SLAM BUMPER

REMOVAL

- (1) Open decklid.
- (2) Pull slam bumper from decklid.
- (3) Remove slam bumper from decklid.

INSTALLATION

- (1) Place slam bumper in position on decklid.
- (2) Push slam bumper into decklid.
- (3) Verify decklid alignment.

SUPPORT CYLINDER

REMOVAL

- (1) Open decklid.
- (2) Support decklid with a suitable prop device.
- (3) Remove gas prop lock caps on each end (Fig. 9).
- (4) Remove gas prop from vehicle.

**Fig. 9 DECKLID GAS PROP**

- 1 - LOCK CAP
2 - DECKLID
3 - LOCK CAP
4 - GAS PROP

INSTALLATION

- (1) Place gas prop in position on vehicle.
- (2) Install the lock caps on the gas prop.
- (3) Verify decklid operation.

DOOR - FRONT

DESCRIPTION

The front and rear door on all LH models require the same basic service procedures regardless of door trim configuration. The art used in this section is typical and features only one of the current production models.

CHECK STRAP

REMOVAL

- (1) Place door glass in the full up position.
- (2) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (3) Remove watershield as necessary.
- (4) Remove bolts attaching check strap to door end frame and body.
- (5) Remove check strap from vehicle (Fig. 1).

Fig. 1 FRONT DOOR CHECK STRAP

- 1 - CHECK STRAP
2 - FRONT DOOR

INSTALLATION

- (1) Place check strap in position on vehicle.
- (2) Install bolts attaching check strap to door end frame and body.
- (3) Install watershield.
- (4) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

DOOR

REMOVAL

- (1) Open front door.
- (2) Mark location of hinge on door end frame.
- (3) Disengage clips attaching wire harness connector and boot to hinge pillar.
- (4) Remove connector from hinge pillar.
- (5) Disengage clip attaching wire connector together on hinge pillar side of the connector.
- (6) Remove door wire harness from instrument panel harness.
- (7) Remove bolts attaching check strap to body.
- (8) Support door on suitable lifting device.
- (9) Remove bolt and nut attaching lower hinge to door end frame (Fig. 2).

- (10) Steady door on lifting device and remove bolt and nut attaching upper hinge to door end frame.
- (11) Remove door from vehicle.

80b5cc83

Fig. 2 FRONT DOOR AND HINGE

- 1 - UPPER HINGE
2 - DOUBLE ENDED STUD
3 - FRONT DOOR
4 - CHECK STRAP
5 - DOOR WIRE HARNESS CONNECTOR
6 - DOUBLE ENDED STUD
7 - LOWER HINGE

INSTALLATION

- (1) Place door in position on vehicle.
- (2) Engage door onto stud on upper door hinge.
- (3) Steady door on lifting device and install bolt and nut attaching upper hinge to door end frame. Tighten the hinge bolt and nut to 28 N·m (21 ft. lbs.) torque. If the double ended stud is loosen or replaced tighten the stud to 14 N·m (10 ft. lbs.) torque.
- (4) Install bolt and nut attaching lower hinge to door end frame.
- (5) Verify door alignment and operation.
- (6) Connect door wire harness to instrument panel wire harness.
- (7) Attach check strap.
- (8) Align door to achieve equal spacing to surrounding body panels. Panels should be flush across all gaps. If door needs to be aligned (damages or hinge replacement) and can not be achieved, may be necessary to remove the double ended stud and replaced it with a bolt. This may allow extra movement to achieve the proper alignment.

DOOR GLASS

REMOVAL

- (1) Remove flag cover, door trim panel, water shield as necessary, and pull cup support bracket. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Connect power window switch and lower window 150 mm (6 in.) from full up position.
- (3) Loosen nuts attaching regulator roller channel to glass and lift plates.
- (4) Slide roller channel rearward to allow lift plate nuts to pass through key hole slots in channel (Fig. 3).
- (5) Remove glass from roller channel.
- (6) Raise glass upward and out of the opening at top of door.

80b2a201

Fig. 3 FRONT DOOR GLASS

- 1 - FRONT DOOR
- 2 - LIFT PLATE NUTS
- 3 - GLASS ROLLER CHANNEL

INSTALLATION

- (1) Lower glass into opening at top of door.
- (2) Place glass in position against roller channel.
- (3) Insert lift plate nuts into key hole slots in roller channel and slide channel forward to locked position.
- (4) Tighten nuts to attach regulator roller channel to glass and lift plates.
- (5) Install pull cup support bracket, water shield, door trim panel, and flag cover. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

ADJUSTMENTS

ADJUSTMENT

- (1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Remove watershield as necessary.
- (3) Loosen fastener attaching scissor channel to door panel at rear of access hole (Fig. 4).
- (4) Position glass in run weatherstrips to achieve smooth operation and proper fit.
- (5) Push glass aft and apply slight downward pressure on scissor channel and tighten screw.
- (6) Tighten all fasteners.
- (7) Install watershield.
- (8) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

80b2b422

Fig. 4 FRONT DOOR GLASS ADJUSTMENT

- 1 - DOOR GLASS ADJUSTMENT POINT
- 2 - FRONT DOOR
- 3 - SCISSOR CHANNEL

EXTERIOR HANDLE

REMOVAL

- (1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Remove water shield as necessary.
- (3) Remove door glass.
- (4) Disengage clips holding latch release link and lock link to door at latch.
- (5) Disconnect links from latch.
- (6) Remove screws attaching handle to door through access hole in door inner pane (Fig. 5).
- (7) Remove door handle from door.

80b29fda

Fig. 5 OUTSIDE FRONT DOOR HANDLE

- 1 - FRONT DOOR
2 - DOOR HANDLE

INSTALLATION

- (1) Place door handle in position on door.
- (2) Install screws attaching to handle to door.
- (3) Insert links into clips on latch.
- (4) Engage clips attaching latch release link and lock link to door latch.
- (5) Verify door latch handle operation.
- (6) Install door glass.
- (7) Install water shield.
- (8) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

HINGE

REMOVAL

REMOVAL

- (1) Mark location of hinge on hinge pillar.
- (2) Remove bolt and nut attaching hinge to front door.

- (3) Remove bolts attaching hinge to hinge pillar (Fig. 6).
- (4) Remove hinge from vehicle.

80b29ff2

Fig. 6 FRONT DOOR HINGES

- 1 - FRONT OPENING
2 - UPPER HINGE
3 - DOOR WIRE HARNESS CONNECTOR
4 - LOWER HINGE
5 - CHECK STRAP

REMOVAL - DOOR HINGE DOUBLE ENDED STUD

- (1) Remove door hinge.
- (2) To remove double ended stud, double nut stud and back stud out of door frame. If stud is broken, use locking pliers on the shoulder of the double ended stud and back stud out of door frame (Fig. 7).

80b3aff0

Fig. 7 DOOR HINGE DOUBLE ENDED STUD

- 1 - DOUBLE ENDED STUD
2 - NUT

HINGE (Continued)

INSTALLATION

INSTALLATION

- (1) Place hinge in position on vehicle.
- (2) Install bolt and nut attaching hinge to hinge pillar. Tighten the hinge bolt to 28 N·m (250 in lbs.) torque.
- (3) Install bolt and nut attaching hinge to front door. Tighten the hinge bolt and nut to 28 N·m (250 in lbs.) torque. If the double ended stub is removed or replaced tighten the stud to 14 N·m (120 in. lbs.) torque.
- (4) Verify door alignment and operation, adjust as necessary.

INSTALLATION - DOOR HINGE DOUBLE ENDED STUD

NOTE: Replacement hinge studs have thread sealer on threads. When reusing original studs, use Mopar® Lock and Seal Adhesive or equivalent on stud threads.

- (1) Install double ended stud into the door frame. Tighten the double ended stud to 14 N·m (120 in. lbs.) torque.
- (2) Install hinge. Tighten the hinge bolt and nut to 28 N·m (250 in lbs.) torque.
- (3) Verify door alignment and operation, adjust as necessary.

INSIDE HANDLE ACTUATOR BEZEL

REMOVAL

- (1) Remove the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Place door trim panel on a clean work surface.
- (3) Drill the heat stakes attaching handle to existing door handle bezel (Fig. 8).
- (4) Remove the door handle bezel from door trim panel.

INSTALLATION

- (1) Clean the back of trim panel of plastic fillings
- (2) Seat the new handle bezel into position.
- (3) Place the push nuts onto the handle bezel posts (Fig. 9).
- (4) Use a 10 mm socket to install the push nuts onto the posts. Wiggling side to side motion may be helpful. Ensure that push nuts all the way down to secure the handle bezel to the door trim panel.
- (5) Install the lock switch from the original handle bezel to the new door handle bezel.

810d3fc7

Fig. 8 FRONT DOOR HANDLE BEZEL

- 1 - USING A 21/64 DRILL BIT
- 2 - HEAT STAKES
- 3 - DOOR HANDLE BEZEL

- (6) Install the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

810d3fcb

Fig. 9 INSTALL PUSH NUTS

- 1 - 10 mm SOCKET
- 2 - DOOR HANDLE BEZEL
- 3 - PUSH NUT(S)

LATCH

REMOVAL

- (1) Close door glass.
- (2) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (3) Remove water shield as necessary.
- (4) Remove rear glass channel.
- (5) Disconnect lock button link from door latch.
- (6) Disconnect lock cylinder link from door latch.
- (7) Disconnect outside door handle link from door latch.
- (8) Remove screws holding door latch to door end frame (Fig. 10).
- (9) Remove latch from door.

Fig. 10 FRONT DOOR LATCH

- 1 - FRONT DOOR
2 - SCREWS
3 - DOOR LATCH

INSTALLATION

- (1) Place latch in position in door.
- (2) Install screws attaching door latch to door end frame.
- (3) Connect outside door handle link to door latch.
- (4) Connect lock cylinder link to door latch.
- (5) Connect door lock button link to door latch.
- (6) Install rear glass channel.
- (7) Verify latch operation.
- (8) Install watershield.
- (9) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

LATCH STRIKER

REMOVAL

- (1) Open front door.
- (2) Mark location of door latch striker on B-pillar to assist installation alignment.

- (3) Remove bolts holding striker to B-pillar (Fig. 11).
- (4) Remove door latch striker from vehicle.

80b2a1f1

Fig. 11 FRONT DOOR LATCH STRIKER

- 1 - B-PILLAR
2 - DOOR LATCH STRIKER

INSTALLATION

- (1) Place door latch striker in position on vehicle.
- (2) Install bolts attaching striker to B-pillar.
- (3) Verify alignment and operation of door, adjust as necessary.

LOCK CYLINDER

REMOVAL

- (1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Remove water shield, as necessary
- (3) Raise door glass.
- (4) Disengage clip holding lock link to lock cylinder.
- (5) Disconnect link from lock cylinder.
- (6) Disconnect clip attaching lock cylinder to door handle.
- (7) Pull lock cylinder from door handle (Fig. 12).

80b29fdt

Fig. 12 DOOR LOCK CYLINDER

- 1 - CLIP
2 - LOCK CYLINDER
3 - DOOR HANDLE

LOCK CYLINDER (Continued)

INSTALLATION

- (1) Push lock cylinder into socket on door handle.
- (2) Insert link into clip on lock cylinder.
- (3) Engage clip to fasten lock link to lock cylinder.
- (4) Verify lock operation.
- (5) Install watershield.
- (6) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

SIDE VIEW MIRROR FLAG

REMOVAL

- (1) Pull cover, release clips and remove (Fig. 13).
- (2) Remove the bolts and remove the bracket, if necessary.

809f8914

Fig. 13 MIRROR FLAG COVER W/O SPEAKER

- 1 - FRONT DOOR COVER W/O SPEAKER
- 2 - FRONT DOOR BRACKET

INSTALLATION

- (1) If previously removed, install the door bracket and bolts.
- (2) Install the cover and engage the clips (Fig. 13).

SIDE VIEW MIRROR FLAG

REMOVAL - WITH SPEAKER

- (1) Open the front door.
- (2) Remove fasteners attaching the front door flag enclosure cover to the door. Remove speaker from cover, if necessary (Fig. 14).

- (3) Remove fasteners attaching the front door flag enclosure plate to front door, if necessary.

809f871c

Fig. 14 MIRROR FLAG ENCLOSURE

- 1 - FRONT DOOR ENCLOSURE PLATE
- 2 - FRONT DOOR WITH SPEAKER COVER

INSTALLATION - WITH SPEAKER

- (1) Install fasteners attaching the front door flag enclosure plate to front door.
- (2) Install speaker to front door flag enclosure cover, if necessary.
- (3) Install fasteners attaching the front door flag enclosure cover to the door.

TRIM PANEL

REMOVAL

CAUTION: Do not pry on door trim panel, damage to trim panel will result.

- (1) Remove speaker flag and housing.
- (2) Remove speaker grille by inserting trim tool at the rear of the grille and disengaging tabs holding to trim panel. Remove grille (Fig. 15).
- (3) Open trim plug from the pull cup and remote bezel by inserting a small flat blade tool into the notch and lifting up.
- (4) Remove three screws from bottom of door.
- (5) Remove screw in pull cup.
- (6) Remove screw in remote bezel.
- (7) Remove two screws in the instrument panel interface area.

TRIM PANEL (Continued)

- (8) Remove three screws in the speaker area.

NOTE: Door trim clips are reusable up to three times, then should be replaced.

(9) Using a trim tool, disengage the two retainer clips at rear of panel from the door trim panel to the sheet metal inner panel.

(10) Raise trim panel up to disengage from the belt being careful to hold the panel securely.

CAUTION: Failure to hold the door trim panel before disengagement of the linkage will result in remote handle damage.

(11) Disconnect the linkage from the remote handle assembly (Fig. 16).

(12) Disconnect the power mirror switch.

(13) Disconnect the power door lock switch wire connector.

(14) Disconnect the power window switch wire connector.

(15) Disconnect the radio speaker wire connector.

(16) Disconnect wiring harness clips from trim panel.

(17) Disconnect the courtesy lamp, if equipped.

(18) Remove trim panel from vehicle.

809f95dd

Fig. 16 INNER FRONT DOOR TRIM PANEL - TYPICAL

Fig. 15 FRONT DOOR TRIM PANEL - TYPICAL

- 1 - REMOTE BEZEL
- 2 - I/P INTERFACE
- 3 - SCREWS
- 4 - SPEAKER GRILLE
- 5 - PULL CUP

INSTALLATION

- (1) Place door trim panel in position.
- (2) Install wire harness clips into door trim panel.
- (3) Connect the courtesy lamp, if equipped.

- (4) Connect the radio speaker wire connector.
- (5) Connect the power window switch wire connector.
- (6) Connect the power door lock switch wire connector.
- (7) Connect the power mirror switch wire connector.
- (8) Connect the linkage to the handle assembly.
- (9) Hook door trim panel over the sheet metal flange.
- (10) Insert the forward four way alignment guide into position. Insert the rearward two way alignment guide into position.
- (11) Engage rear retaining clips to attach door trim panel to inner sheet metal panel, up to three ratchet clicks.
- (12) Install three screws in the speaker area.
- (13) Install two screws in the instrument panel interface area.
- (14) Install screw in the remote bezel, and close trim plug.
- (15) Install screw in pull cup, and close trim plug.
- (16) Install three screws to the bottom of the door. Tighten all screws to 1.3 to 1.9 N-m (12 to 17 in. lbs.) torque.
- (17) Place speaker grille in position on trim panel.

TRIM PANEL - WOOD TRIM

REMOVAL - WOOD TRIM

- (1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Remove and discard the retainer clips (Fig. 17)
- (3) Remove the wood trim from the trim panel. (Fig. 18)

Fig. 17 WOOD TRIM CLIPS - TYPICAL

- 1 - RETAINER CLIPS
- 2 - TRIM PANEL

INSTALLATION - WOOD TRIM

- (1) Install wood trim into mounting hole of the trim panel (Fig. 18).
- (2) Install new retainer clips and seat fully (Fig. 17).
- (3) Install the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

809fba49

Fig. 18 WOOD TRIM - TYPICAL

- 1 - MOUNTING HOLES
- 2 - WOOD TRIM

WATERDAM

REMOVAL

- (1) Remove door trim panel.(Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Carefully remove by pulling water dam from door inner panel.
- (3) Pull watershield around umbrella clips in sheet metal inner panel.

INSTALLATION

- (1) Position watershield on door inner panel. Ensure that the water dam locator holes align and watershield is over the umbrella clips.
- (2) Press inward on areas with adhesive to attach dam to inner door. Ensure that the dam is sealed.
- (3) Install trim panel.(Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

WINDOW REGULATOR

REMOVAL

- (1) Remove flag cover, door trim panel, water shield as necessary, and pull cup support bracket. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Slide glass from regulator roller channel.
- (3) Disconnect power window motor wire connector.
- (4) Loosen bolt attaching regulator support brace to door panel.
- (5) Remove screw and bolt heads from keyhole slots in door panel.
- (6) Loosen bolts attaching regulator to door panel.
- (7) Remove regulator from door panel.
- (8) Slide regulator rearward and rotate forward end of roller channel through access hole in door panel (Fig. 19).

INSTALLATION

- (1) Insert roller channel through access hole in door panel.
- (2) Insert bolt heads on regulator through key hold slots in door panel.
- (3) Tighten bolts attaching regulator to door panel.
- (4) Tighten bolt to attach regulator support brace to door panel.
- (5) Tighten screw to attach regulator scissor channel to door panel.
- (6) Connect power window motor wire connector.
- (7) Lower door glass on to regulator roller channel.
- (8) Align glass and verify operation.
- (9) Install pull cup support bracket, water shield, door trim panel and flag cover.

DOORS - REAR

DESCRIPTION

The front and rear door on all LH models require the same basic service procedures regardless of door trim configuration. The art used in this section is typical and features only one of the current production models.

CHECK STRAP

REMOVAL

- (1) Raise door glass.
- (2) Remove door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (3) Remove watershield as necessary.
- (4) Remove bolt and nut attaching check strap to door end and body.
- (5) Remove check strap from vehicle (Fig. 1).

INSTALLATION

- (1) Place check strap in position on vehicle.
- (2) Install bolt and nut attaching check strap to door end and body.
- (3) Verify check strap operation.
- (4) Install watershield.

Fig. 1 REAR DOOR CHECK STRAP

- 1 - CHECK STRAP
- 2 - REAR DOOR

(5) Install door trim panel.(Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

DOOR

REMOVAL

- (1) Open rear door.
- (2) Mark location of hinge on door end frame.
- (3) Disengage clips holding wire harness connector and boot to hinge pillar.
- (4) Remove connector from hinge pillar.
- (5) Disengage clip attaching wire connector together on hinge pillar side of the connector.
- (6) Remove door wire harness from instrument panel harness.
- (7) Remove bolts attaching check strap to hinge pillar.
- (8) Support door on suitable lifting device.
- (9) Remove bolt and nut attaching lower hinge to door end frame (Fig. 2).
- (10) Steady door on lifting device and remove bolt and nut attaching upper hinge to door end frame.
- (11) Remove door from vehicle.

Fig. 2 REAR DOOR

- 1 - UPPER HINGE
- 2 - DOOR WIRE HARNESS CONNECTOR
- 3 - REAR DOOR
- 4 - CHECK STRAP
- 5 - LOWER HINGE

INSTALLATION

- (1) Place door in position on vehicle.
- (2) Engage door onto pin on upper door hinge.
- (3) Steady door on lifting device and install bolt and nut attaching upper hinge to door end frame. Tighten the hinge bolt and nut to 28 N·m (250 in. lbs.) torque. If the double ended stud is loosen or replaced tighten the stud to 14 N·m (120 in. lbs.) torque.
- (4) Install bolt and nut attaching lower hinge to door end frame.
- (5) Verify door alignment and operation.

(6) Connect door wire harness to instrument panel wire harness.

(7) Attach check strap.

(8) Align door to achieve equal spacing to surrounding body panels. Panels should be flush across all gaps. If door needs to be aligned (damages or hinge replacement) and can not be achieved, may be necessary to remove the double ended stud and replaced it with a bolt. This may allow extra movement to achieve the proper alignment.

DOOR GLASS

REMOVAL

- (1) Remove door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (2) Remove watershield as necessary.
- (3) Raise door glass to gain access to roller channel to glass fasteners through holes in inner door panel.
- (4) Loosen lift plate nuts attaching regulator roller channel to glass (Fig. 3).
- (5) Slide roller channel rearward to allow lift plate nuts to pass through key hole slots in channel.
- (6) Remove glass from roller channel.
- (7) Raise glass upward and out of the opening at top of door.

80b2a214

Fig. 3 REAR DOOR GLASS

- 1 - REAR DOOR
- 2 - LIFT PLATE NUTS
- 3 - GLASS ROLLER CHANNEL

INSTALLATION

- (1) Lower glass into opening at top of door.
- (2) Place glass in position against roller channel.
- (3) Insert lift plate nuts into key hole slots in roller channel and slide channel forward to locked position.
- (4) Tighten nuts to attach regulator roller channel to glass and lift plate.

DOOR GLASS (Continued)

- (5) Install upper trim retainer channel.
- (6) Install watershield.
- (7) Install door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

ADJUSTMENTS

ADJUSTMENT

- (1) Remove door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (2) Remove watershield as necessary.
- (3) Loosen fastener attaching scissor channel to door panel at rear of access hole (Fig. 4).
- (4) Position glass in run weatherstrips to achieve smooth operation and proper fit.
- (5) Push glass aft and apply slight downward pressure on scissor channel and tighten screw.
- (6) Tighten all fasteners.
- (7) Install watershield.
- (8) Install door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

**Fig. 4 REAR DOOR GLASS ADJUSTMENT**

- 1 - SCISSOR CHANNEL
- 2 - REAR DOOR
- 3 - DOOR GLASS ADJUSTMENT

HINGE

REMOVAL

- (1) Mark outline of hinge on B-pillar and door end frame.
- (2) Remove nut and bolt attaching hinge to B-pillar. Refer to Rear Door Removal procedure.
- (3) Remove nut and bolt attaching hinge to door end frame (Fig. 5).
- (4) Remove hinge from door.

**Fig. 5 REAR DOOR HINGE**

- 1 - B-PILLAR
- 2 - DOOR WIRE HARNESS CONNECTOR
- 3 - UPPER HINGE
- 4 - LOWER HINGE
- 5 - CHECK STRAP

INSTALLATION

- (1) Align hinge to marks on door end frame.
- (2) Place hinge in position on door.
- (3) Install nut and bolt attaching hinge to door end frame.
- (4) Align hinge to marks on B-pillar.
- (5) Install nut and bolt attaching hinge to B-pillar.
- (6) Verify door alignment and operation, adjust as necessary.

LATCH

REMOVAL

- (1) Close door glass.
- (2) Remove door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (3) Remove rear glass channel.
- (4) Disconnect lock button link from door latch.
- (5) Disconnect outside door handle link from door latch.
- (6) Remove screws attaching door latch to door end frame (Fig. 6).
- (7) Remove latch from door.

INSTALLATION

- (1) Place latch in position in door.
- (2) Install screws attaching door latch to door end frame.
- (3) Connect outside door handle link to door latch.
- (4) Connect lock button link to door latch.

LATCH (Continued)

80b34ede

Fig. 6 REAR DOOR LATCH

- 1 - TO LOCK BUTTON
- 2 - CLIPS
- 3 - WIRE CONNECT

- 4 - REAR DOOR LATCH
- 5 - TO DOOR HANDLE

- (5) Install rear glass channel.
- (6) Verify door latch operation.
- (7) Install door trim panel.(Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

LATCH STRIKER

REMOVAL

- (1) Open rear door.
- (2) Mark location of door latch striker on C-pillar to assist installation alignment.
- (3) Remove bolts holding striker to C-pillar (Fig. 7).
- (4) Remove door latch striker from vehicle.

80b2a228

Fig. 7 REAR DOOR LATCH STRIKER

INSTALLATION

- (1) Place door latch striker in position on vehicle.
- (2) Install bolts attaching striker to C-pillar.
- (3) Align striker to marked location on C-pillar and tighten bolts.
- (4) Verify alignment and operation of door, adjust as necessary.

- 1 - C-PILLAR
- 2 - DOOR LATCH STRIKER

TRIM PANEL

REMOVAL

CAUTION: Do not pry on door trim panel, damage to trim panel will result.

- (1) Open trim plug from the pull cup and remote bezel by inserting a small flat blade tool into the notch and lifting up.
- (2) Remove screw in the pull cup.
- (3) Remove screw in remote bezel.
- (4) Remove three screws from the bottom edge of door (Fig. 8).

NOTE: Clips are reusable up to three times.

- (5) Using a trim tool, disengage the retaining clips from the door trim panel to the sheet metal inner panel, two clips at the rear of panel and one at the front of the panel (Fig. 9).

- (6) Raise trim panel up over the door flange and being careful to hold the panel securely.

CAUTION: Failure to hold the door trim panel before disengagement of the linkage will result in remote handle damage.

- (7) Disconnect the remote linkage from the door remote handle.
- (8) Remove the wire connect from the rear door speaker, if equipped.
- (9) Disconnect power window switch wire connector.
- (10) Disconnect wiring harness clips from the trim panel.
- (11) Remove trim panel from door.

INSTALLATION

- (1) Place trim panel in position on door.
- (2) Connect the wiring harness clips to the trim panel.
- (3) Connect the power window switch wire harness connector.
- (4) Connect the rear door speaker wire connect.
- (5) Connect the remote handle linkage.
- (6) Hook the trim panel over the sheet metal flange.
- (7) Insert the forward four way alignment guide into position. Insert the rearward two way alignment guide into position.
- (8) Engage the three retaining clips to attach door trim panel to door sheet metal inner panel, up to three ratchet clicks.
- (9) Install three screws to the bottom of the door. Tighten all screws 1.3 to 1.9 N·m (12 to 17 in. lbs.) torque.

80b29fd3

Fig. 8 REAR DOOR TRIM PANEL - TYPICAL

- 1 - REMOTE BEZEL
- 2 - PULL CUP

80b29fd4

Fig. 9 REAR DOOR INNER TRIM PANEL - TYPICAL

- 1 - REAR DOOR SPEAKER
- 2 - POWER WINDOW SWITCH
- 3 - RETAINER CLIPS
- 4 - REFLECTOR

- (10) Install screw in the remote bezel and close the trim plug.

- (11) Install screw in pull cup, and close the trim plug.

TRIM PANEL - WOOD TRIM

REMOVAL - WOOD TRIM

- (1) Remove door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (2) Remove and discard the retainer clips (Fig. 10)
- (3) Remove the wood trim from the trim panel. (Fig. 11)

809fba45

Fig. 10 WOOD TRIM CLIPS - TYPICAL

- 1 - RETAINER CLIPS
2 - TRIM PANEL

INSTALLATION - WOOD TRIM

- (1) Install wood trim into mounting hole of the trim panel (Fig. 11).
- (2) Install new retainer clips and seat fully (Fig. 10).
- (3) Install the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

809fba49

Fig. 11 WOOD TRIM - TYPICAL

- 1 - MOUNTING HOLES
2 - WOOD TRIM

SAIL PANEL

REMOVAL

- (1) Open the rear door.
- (2) Using a trim stick, release clip attaching sail panel to the door.
- (3) Remove sail panel.

INSTALLATION

- (1) Position sail panel on door.
- (2) Press on sail panel to engage clips.

WINDOW REGULATOR

REMOVAL

- (1) Remove flag cover, door trim panel, water shield as necessary, and pull cup support bracket. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (2) Slide glass from regulator roller channel (Fig. 12).
- (3) Disconnect power window motor wire connector.
- (4) Loosen screw attaching regulator scissor channel to door panel.
- (5) Remove screw and bolt heads from keyhole slots in door panel.
- (6) Loosen bolt attaching regulator support brace to door panel.
- (7) Loosen bolts attaching regulator to door panel.
- (8) Remove regulator from door panel.
- (9) Slide regulator rearward and rotate forward end of roller channel through access hole in door panel.

80b2a215

Fig. 12 REAR DOOR WINDOW REGULATOR

- 1 - GLASS
- 2 - LIFT PLATES
- 3 - GLASS ROLLER CHANNEL
- 4 - WINDOW REGULATOR
- 5 - REAR DOOR

INSTALLATION

- (1) Insert roller channel through access hole in door panel.
- (2) Insert bolt and screw heads through key hole slots in door panel.
- (3) Tighten bolts attaching regulator to door panel.
- (4) Tighten bolt to attach regulator support brace to door panel.

- (5) Tighten screw to attach regulator scissor channel to door panel.
- (6) Connect power window motor wire connector.
- (7) Lower door glass on to regulator roller channel.
- (8) Align glass and verify operation.
- (9) Install pull cup support bracket, water shield, door trim panel and flag cover.

CABLE - REMOTE LOCK ACTUATOR

REMOVAL

- (1) Open the front door.
- (2) Loosen the actuator knob lock nut.
- (3) Remove the lock actuator knob and lock nut.
- (4) Remove the cable housing nut.
- (5) Remove the trim panel and watershield. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
- (6) Remove the support bracket screws.
- (7) Release the clip at the latch and disconnect the cable.
- (8) Remove support tie straps, if equipped.

INSTALLATION

- (1) Install the cable into the door and through the hole in the door shut face.
- (2) Install and tighten the cable nut.
- (3) Install the knob lock nut and the actuator knob.
- (4) Tighten the lock nut.
- (5) Attach the cable to the latch and engage the clip.
- (6) Install the support bracket screws and verify correct actuator operation.
- (7) Loosen the support bracket screws and adjust the cable if necessary.
- (8) Replace any support tie straps, if equipped.
- (9) Install the watershield and the trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

BODY SIDE MOLDINGS

REMOVAL

(1) Warm the effected stick on molding and body metal to approximately 38° C (100° F) using a suitable heat lamp or heat gun.

(2) Pull stick on molding from painted surface.

(3) Remove adhesive tape residue from painted surface of vehicle.

INSTALLATION

(1) If molding is to be reused, remove tape residue from molding. Clean back of molding with Mopar® Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of molding.

(2) Clean body surface with Mopar® Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.

(3) Apply a length of masking tape on the body, parallel to the top edge of the molding to use as a guide, if necessary. (Fig. 1)

(4) Remove protective cover from tape on back of molding. Apply molding to body below the masking tape guide.

(5) Remove masking tape guide and heat body and molding, see step one. Firmly press molding to body surface to assure adhesion.

9323-143

Fig. 1 BODY SIDE MOLDING

- 1 - PROTECTIVE COVER
- 2 - MASKING TAPE GUIDE
- 3 - MOLDINGS

COWL GRILLE AND SCREEN

REMOVAL

- (1) Release hood latch and open hood.
- (2) Remove wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)
- (3) Remove screws attaching cowl screen at the windshield and under hood (Fig. 2).
- (4) Remove cowl screen from vehicle.

80b27cbe

Fig. 2 COWL SCREEN

- 1 - PLENUM COWL SCREEN
- 2 - COWL SCREEN RIGHT
- 3 - COWL SCREEN LEFT

INSTALLATION

- (1) Place cowl screen in position on vehicle.
- (2) Install cowl screen screws, starting at fender moving inboard.
- (3) Install wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION)

EXTERIOR NAME PLATES

REMOVAL

REMOVAL - DOUBLE SIDED TAPE

- (1) Mark reference points before removing.
- (2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.
- (3) Using a nonmetallic prying device, such as a plastic or wood trim stick gently pry up at corners and remove.
- (4) Clean off all traces of adhesive or double sided tape from the panel with a general purpose adhesive remover.

REMOVAL - ADHESIVES

- (1) Mark reference points before removing.
- (2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.
- (3) With your fingernail lift up and peel away badging/tape from panel, using a heat gun as you go.
- (4) Clean off all traces of adhesive from the panel(s) with a general purpose adhesive remover.

INSTALLATION

INSTALLATION - DOUBLE SIDED TAPE

- (1) Clean panel surface with isopropyl alcohol.
- (2) Align badging to reference points.
- (3) Install and press securely to full adhesive contact
- (4) Clean away any reference points.

INSTALLATION - ADHESIVES

- (1) Clean panel surface with isopropyl alcohol.
- (2) Remove paper carrier and align badging/tape to reference points or adjacent panel.
- (3) Install and press securely, using a plastic spreader to eliminate all air bubbles.
- (4) Remove top protective carrier.
- (5) Clean away any reference points.

FRONT STRUT TOWER TO TOWER BRACE

REMOVAL

- (1) Open hood.
- (2) Remove the cowl screen.
- (3) Mark bolt locations on front strut tower to tower brace.
- (4) Remove attaching bolts from the brace (Fig. 3).
- (5) Remove front strut tower to tower brace from vehicle.
- (6) For replacement remove weatherstrip.

Fig. 3 COWL SUPPORT

- 1 - COWL SUPPORT
2 - WINDSHIELD
3 - SUPPORT FASTENERS

INSTALLATION

- (1) Place in position the front strut tower to tower brace.
- (2) Install front strut tower to tower brace attaching bolts. Check bolt alignment marks.
- (3) Tighten the bolts to 38 N·m (28 ft. lbs.) torque.
- (4) Install cowl screen.

GRILLE

REMOVAL

REMOVAL - CONCORDE

- (1) Open hood.
- (2) Remove fascia.
- (3) Remove two screws attaching foam.
- (4) Remove ten attaching grille clips.
- (5) Remove grille.

REMOVAL - 300 M - UPPER

- (1) Open hood.
- (2) Remove fascia.
- (3) Drill out rivets attaching cross bracket to grille.
- (4) Remove upper grille six attaching clips.
- (5) Remove grille.

REMOVAL - 300 M - LOWER

- (1) Open hood.
- (2) Remove fascia.
- (3) Remove two screws attaching foam.
- (4) Remove lower grille eight attaching clips.
- (5) Remove grille.

INSTALLATION

INSTALLATION - CONCORDE

- (1) Place grille into position on vehicle.
- (2) Install ten attaching grille clips.
- (3) Install two screws attaching foam.
- (4) Install fascia.
- (5) Close hood and check alignment of the grille.

INSTALLATION - 300 M - UPPER

- (1) Place grille into position on vehicle.
- (2) Install six attaching grille clips.
- (3) Install rivets attaching cross bracket to grille.
- (4) Install two screws attaching foam.
- (5) Install fascia.
- (6) Close hood and check alignment of the grille.

INSTALLATION - 300 M - LOWER

- (1) Place grille into position on vehicle.
- (2) Install eight attaching grille clips.
- (3) Install two screws attaching foam.
- (4) Install fascia.
- (5) Check alignment of the grille.

GRILLE OPENING REINFORCEMENT

REMOVAL

- (1) Open hood.
- (2) Mark bolt locations on the upper radiator closure panel.
- (3) Remove bolts attaching windshield washer bottle and speed control servo, if equipped (Fig. 4).
- (4) Remove headlamp jackscrews both sides.
- (5) Remove fasteners attaching upper bumper fascia.
- (6) Remove bolts attaching the forward edge of upper radiator closure panel.
- (7) Remove bolts attaching upper radiator closure panel.
- (8) Disconnect hood latch cable from hood latch.
- (9) Remove upper radiator closure panel from vehicle.
- (10) For replacement of upper radiator closure panel, remove hood latch, and any other hardware.

GRILLE OPENING REINFORCEMENT (Continued)

80b3afab

Fig. 4 UPPER RADIATOR CLOSURE

- 1 - ATTACHING BOLTS
2 - JACKSCREW
3 - FASTENERS

INSTALLATION

- (1) Place in position the upper radiator closure panel.
- (2) Connect hood latch cable to hood latch.
- (3) Install bolts attaching upper radiator closure panel. Check bolt alignment marks.
- (4) Install bolts attaching the forward edge of upper radiator closure panel.
- (5) Install fasteners attaching upper bumper fascia.
- (6) Install headlamp jackscrews both sides.
- (7) Check hood latch operation.

FRONT FENDER**REMOVAL**

- (1) Remove headlamp housing.
- (2) Remove splash shield to fascia plastic rivets.
- (3) Remove splash shield to sill cladding.
- (4) First remove fender bolt to lower cowl.
- (5) Next drill a 30 mm (1 1/16 in.) hole in the splash shield to access the upper cowl bolt. Remove bolt.
- (6) Then loosen fender bolt to upper cowl.
- (7) Pull fascia away from fender.
- (8) Remove bolts to lower radiator closure panel.
- (9) Support the hood and disconnect hood prop rod.
- (10) From inside engine compartment, remove bolts attaching fender to upper rail.
- (11) Remove fender from vehicle (Fig. 5).

80b76ecc

Fig. 5 FENDER

- 1 - FRONT FENDER
2 - TO UPPER RAIL
3 - TO RADIATOR CLOSURE PANEL
4 - TO LOWER COWL
5 - TO UPPER COWL

INSTALLATION

- (1) Place fender in position on vehicle.
- (2) From inside engine compartment, install bolts to attach fender to upper rail.
- (3) Connect hood prop rod and support the hood
- (4) Install fender bolts to lower radiator closure panel.
- (5) Place fascia into position.
- (6) Tighten fender bolt to the upper cowl. Use plug that come with fender to fill drilled hole in splash shield.
- (7) Install fender bolt to lower cowl.
- (8) Install splash shield plastic rivets to sill cladding.
- (9) Install splash shield plastic rivets to fascia.
- (10) Install headlamp assembly.
- (11) Check fender for flush and gap.

WHEELHOUSE SPLASH SHIELD

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Remove front wheel.
- (3) Remove strut assembly from vehicle. (Refer to 2 - SUSPENSION/FRONT/STRUT - REMOVAL)
- (4) Remove screws attaching speed sensor bracket (Fig. 6). Move bracket to access speed sensor wire connector.
- (5) Disconnect speed sensor wire connector.
- (6) Remove fasteners attaching splash shield to inner wheelhouse.
- (7) Remove splash shield from vehicle.

80b29f31

Fig. 6 WHEELHOUSE SPLASH SHIELD

- 1 - SPLASH SHIELD
2 - SPEED SENSOR BRACKET

INSTALLATION

- (1) Place splash shield into position.
- (2) Install fasteners to attach splash shield.
- (3) Connect speed sensor wire connector.
- (4) Install screws attaching speed sensor bracket.
- (5) Install strut assembly. (Refer to 2 - SUSPENSION/FRONT/STRUT - INSTALLATION)
- (6) Install front wheel.
- (7) Lower vehicle.

REAR WHEELHOUSE SPLASH SHIELD

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Remove rear wheel.
- (3) Remove fasteners attaching splash shield. (Fig. 7)
- (4) The shock tower area will have to be cut out of the splash shield. This will ease the removal or installation of the splash shield.
- (5) Remove splash shield from vehicle.

80b2b40d

Fig. 7 REAR WHEELHOUSE SPLASH SHIELD

- 1 - REAR WHEELHOUSE SPLASH SHIELD
2 - CUT LINE
3 - CUT LINE

INSTALLATION

- (1) Place splash shield in position on vehicle with the shock tower cut out.
- (2) Install fasteners to hold splash shield place.
- (3) Install rear wheel.
- (4) Lower vehicle.

SIDE VIEW MIRROR

REMOVAL

- (1) Remove side view mirror cover.
- (2) Remove the door trim panel.
- (3) Disconnect power window mirror motor wire connector, if so equipped.
- (4) Disengage power mirror wire connector.
- (5) Remove nuts attaching side view mirror to mirror flag.
- (6) Remove side view mirror from vehicle.

INSTALLATION

- (1) Position side view mirror to vehicle.
- (2) Install nuts attaching side view mirror to mirror flag.
- (3) Engage push pin fastener attaching power mirror wire connector to inner door panel, if so equipped.
- (4) Engage power mirror motor wire connector, if so equipped.
- (5) Install side view mirror cover.

SIDE VIEW MIRROR GLASS

REMOVAL

WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.

- (1) Carefully pull/pry the broken glass holder from the mirror assembly.
- (2) Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

INSTALLATION

CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

- (1) Position the new mirror glass holder to the mirror assembly.

NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

- (2) Align the mirror glass holder's attaching fingers to the mirror motor housing.

NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

- (3) Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

- (4) Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

HOOD

	page		page
HINGE		INSTALLATION	42
REMOVAL	40	LATCH RELEASE CABLE	
INSTALLATION	40	REMOVAL	42
HOOD		INSTALLATION	43
REMOVAL	41	SUPPORT CYLINDER	
INSTALLATION	41	REMOVAL	43
LATCH		INSTALLATION	43
REMOVAL	41		

HINGE

REMOVAL

- (1) Support hood on the side that requires hinge replacement.
- (2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation.
- (3) Remove the gas prop lock caps on the hinge side.
- (4) Remove the gas prop from the hinge.
- (5) Remove bolts attaching hood to hinge.
- (6) Remove bolts attaching hood hinge to vertical wall of load beam and remove hinge from vehicle (Fig. 1). To gain access to the lower left hood hinge the wiper motor assembly will have to be removed. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/FRONT WIPER MOTOR - REMOVAL)

INSTALLATION

- (1) If necessary, paint new hinge before installation.
- (2) Place hinge in position on vehicle.
- (3) Install bolts attaching hood hinge to vertical wall of load beam.
- (4) Install bolts attaching hood to hinge. When installing hood hinge, align all marks and secure bolts. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders. Hinge can be adjusted up or down by hinge to body attaching bolts to achieve proper hood height.
- (5) Align all marks and tighten bolts to 22.6 to 33.9 N·m (200 to 300 in. lbs.) torque. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders.
- (6) Place gas prop in position on vehicle.
- (7) Install the lock cap on the gas prop.

80b27ca6

Fig. 1 HOOD HINGE

- 1 - HOOD
- 2 - HOOD HINGE
- 3 - GAS PROP

- (8) Install wiper motor assembly.(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/FRONT WIPER MOTOR - INSTALLATION)
- (9) Remove support from under hood and verify hood operation.

HOOD

REMOVAL

- (1) Raise hood to full up position.
- (2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation.
- (3) Remove the top bolts attaching hood to hinge and loosen the bottom bolts until they can be removed by hand (Fig. 2).
- (4) With assistance from a helper at the opposite side of the vehicle to support the hood, remove bottom bolts attaching hood to hinge. Remove the hood from the vehicle.

Fig. 2 HOOD

- 1 - HOOD
- 2 - HOOD HINGE
- 3 - GAS PROP
- 4 - BOLTS

INSTALLATION

- (1) Place hood in position on vehicle. With assistance from a helper at the opposite side of the vehicle to support the hood, install bottom bolts attaching hood to hinge finger tight.
- (2) Install top bolts to attach hood to hinge finger tight. When installing hood, align all marks and secure bolts. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders.

- (3) Position bolts at marks and tighten bolts to 22.6 to 33.9 N·m (200 to 300 in. lbs.) torque. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders.
- (4) Verify hood operation and alignment.

LATCH

REMOVAL

- (1) Release hood latch and open hood.
- (2) Remove nuts attaching hood latch to cross-member (Fig. 3) or (Fig. 4).
- (3) Remove hood latch from crossmember.
- (4) Disconnect hood release cable from hood latch.

Fig. 3 HOOD LATCH - CONCORDE/300M

- 2 - HOOD RELEASE CABLE CLIPS
- 3 - NUTS
- 4 - HOOD LATCH

LATCH (Continued)

**Fig. 4 HOOD LATCH - INTREPID**

- 1 - HOOD BUMPER ADJUSTER
- 2 - HOOD LATCH
- 3 - RELEASE CABLE CLIP
- 4 - NUTS

INSTALLATION

- (1) Connect hood release cable to hood latch.
- (2) Place hood latch in position on crossmember.
- (3) Install nuts attaching hood latch to crossmember. Tighten nuts to 22.6 to 33.9 N·m (200 to 300 in. lbs.) torque.
- (4) Verify hood latch operation before closing hood.

LATCH RELEASE CABLE**REMOVAL**

- (1) Release hood latch by using the inside release, if still functioning. If not reach up through the bottom of the fascia opening and release the latch pawl lever.
- (2) Disconnect hood release cable ferrule and cable end from hood latch assembly (Fig. 5) or (Fig. 6).
- (3) Remove left cowl side trim panel.
- (4) Remove screws attaching hood latch release cable handle to the cowl side.

- (5) Remove left wheel splash shield.
- (6) Disengage release cable from routing clips.
- (7) Roll carpet back to expose cable.
- (8) Release taped on cable clip from dash liner (Fig. 7).
- (9) Release the rubber grommet from the dash panel. Pull cable through the dash panel access hole.
- (10) Remove cable from vehicle.

**Fig. 5 HOOD RELEASE CABLE - CONCORDE/300M**

**Fig. 7 HOOD RELEASE HANDLE**

80b27ca4

- 1 - RUBBER GROMMET
- 2 - SCREWS
- 3 - HOOD RELEASE HANDLE
- 4 - HOOD RELEASE CABLE

INSTALLATION

- (1) Place cable in position on vehicle.
- (2) Push cable through access hole in dash panel.
- (3) Install release cable rubber grommet into access hole in dash panel.
- (4) Install screws attaching hood latch release cable handle to the cowl side. Tighten screws to 2.3 to 3.4 N·m (20 to 30 in. lbs.) torque.
- (5) Install cable clips.
- (6) Place carpet into position.
- (7) Install left wheel splash shield.
- (8) Install left cowl side trim panel.
- (9) Connect hood release cable ferrule and cable end to hood latch.
- (10) Verify hood latch operation before closing hood.

SUPPORT CYLINDER**REMOVAL**

- (1) Open hood.
- (2) Support hood with a suitable prop device.
- (3) Remove gas prop lock caps on each end (Fig. 8).
- (4) Remove gas prop from vehicle.

80b2b414

Fig. 8 HOOD GAS PROP

- 1 - LOCK CAP
- 2 - GAS PROP
- 3 - LOCK CAP

INSTALLATION

- (1) Place gas prop in position on vehicle.
- (2) Install the lock caps on the gas prop.
- (3) Verify hood lid operation.

CLUSTER BEZEL

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 1).

(2) Remove the instrument panel left end cap.

(3) Remove steering column shroud cover.

(4) Tilt the steering column down into the lowest position.

(5) Remove one screw (Concorde/300M) to cluster bezel

(6) Remove the items to expose bezel mounting screws. Items vary depending on model.

(7) Remove two screws over upper cluster bezel in instrument panel brow area and all remaining attaching screws.

(8) Using a trim stick (special tool #C-4755), gently pry out on the instrument panel cluster bezel, disconnect headlamp switch connector, and remove.

INSTALLATION

(1) Connect headlamp switch connector. Place the cluster bezel into position and snap it into place firmly.

80b1b422

Fig. 1 NEGATIVE BATTERY CABLE REMOTE TERMINAL

- 1 - RIGHT STRUT TOWER
- 2 - AIR CLEANER INLET TUBE
- 3 - REMOTE TERMINAL

(2) Install the two screws over upper cluster bezel in instrument panel brow area and all remaining attaching screws.

CLUSTER BEZEL (Continued)

(3) Install the items covering the bezel mounting screws.

(4) Install the one screw (Concorde/300M) to cluster bezel

To service any instrument cluster component, the instrument cluster must be removed from the instrument panel. Use the following procedure:

(5) Tilt the steering column down into the highest position.

(6) Install the steering column shroud cover.

(7) Install the instrument panel left end cap.

(8) Connect the negative battery cable remote terminal to the remote battery post (Fig. 1).

DASH SILENCER

REMOVAL

(1) Remove all parts mounting through the dash silencer (Refer to 23 - BODY/INTERIOR/CROSS CAR BEAM - INSTALLATION), (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL), (Refer to 19 - STEERING/COLUMN - REMOVAL), (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PEDAL - REMOVAL), (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ACCELERATOR PEDAL - REMOVAL), (Refer to 23 - BODY/INTERIOR/CROSS CAR BEAM - REMOVAL) and etc.

(2) Feed electrical wires back through the silencer wiring pass through holes (Fig. 2).

(3) Remove fasteners attaching silencer to the dash and side cowls.

(4) Remove silencer from vehicle.

INSTALLATION

(1) Position silencer to dash panel and cowl panels (Fig. 2).

(2) Push retainers over previously installed studs on the dash panel.

(3) Attach silencer with push pins to the side cowl and clips to the top cowl/dash weld flange.

(4) Install all other parts removed (Refer to 23 - BODY/INTERIOR/CROSS CAR BEAM - INSTALLATION), (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ACCELERATOR PEDAL - INSTALLATION), (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PEDAL - INSTALLATION), (Refer to 19 - STEERING/COLUMN - INSTALLATION) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION), (Refer to 23 - BODY/INTERIOR/CROSS CAR BEAM - INSTALLATION) and etc.

80dbe655

Fig. 2 DASH SILENCER

1 - PUSH PINS
2 - CLIPS

3 - DASH STUDS
4 - SILENCER

GLOVE BOX

REMOVAL

- (1) Remove the four screws at bottom of glove box door.
- (2) Open the glove box door and slide sidewalls inboard to remove the door/box assembly from instrument panel.
- (3) Place the glove box on a cloth to protect the door surface.
- (4) Remove the nine screws from backside of the door.
- (5) Separate the inner and outer door.
- (6) Remove one screw to the latch.
- (7) Remove latch from outer door.

NOTE: If the glove box door is going to be left off for an extended period of time, the Ignition Off Draw (IOD) fuse should be pulled to maintain battery condition.

INSTALLATION

- (1) Install latch from outer door.
- (2) Install one screw to the latch.
- (3) Place the inner and outer door together.
- (4) Install the nine screws to the backside of the door.
- (5) Slide sidewalls inboard to install the door/box assembly into instrument panel.
- (6) Install the four screws at bottom of glove box door to instrument panel.

GLOVE BOX LATCH

REMOVAL

- (1) Remove the four screws at bottom of glove box door.
- (2) Open the glove box door and slide sidewalls inboard to remove the door/box assembly from instrument panel.
- (3) Place the glove box on a cloth to protect the door surface.
- (4) Remove the nine screws from backside of the door.
- (5) Separate the inner and outer door.
- (6) Remove one screw to the latch.
- (7) Remove latch from outer door.

NOTE: If the glove box door is going to be left off for an extended period of time, the Ignition Off Draw (IOD) fuse should be pulled to maintain battery condition.

INSTALLATION

- (1) Install latch from outer door.
- (2) Install one screw to the latch.
- (3) Place the inner and outer door together.
- (4) Install the nine screws to the backside of the door.
- (5) Slide sidewalls inboard to install the door/box assembly into instrument panel.
- (6) Install the four screws at bottom of glove box door to instrument panel.

INSTRUMENT PANEL ASSEMBLY

REMOVAL

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY INSTRUMENT PANEL OR COMPONENT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY. ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR 2 MINUTES.

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 1).

(2) Remove one Allen screw to shifter knob.

(3) Remove left and right instrument panel end covers.

NOTE: On 300M vehicles, the center bezel must be removed prior to the shifter bezel.

(4) 300M, remove center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(5) Using a trim stick (special tool #C-4755) or equivalent, gently pry up on shifter bezel.

(6) Disconnect two wire connectors, one illumination bulb socket, and remove.

(7) Remove two screws from lower instrument panel cover (outside end) and disconnect deck lid release switch wiring connector. Pull rearward on lower instrument panel cover releasing clips. Remove cable to brake release handle. Pull rearward and remove cover from vehicle.

(8) On six passenger vehicles, remove the lower floor bin and proceed with Step 14 (Refer to 23 - BODY/INSTRUMENT PANEL/STORAGE BIN - REMOVAL).

(9) On five passenger vehicles, use trim stick or equivalent to gently remove center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/STORAGE BIN - REMOVAL).

(10) Disconnect wire connectors to the HVAC control and traction control switch and remove bezel from vehicle.

(11) Remove two screws to left console side cover, pull outboard and remove from vehicle.

(12) Lower glove box door to floor by pinching sides together, towards each other. Remove two screws to right console side cover, pull outboard and remove from vehicle.

(13) Remove two front bracket screws and two screws inside console storage bin to remove console.

(14) Remove two nuts attaching center lower instrument panel to floor tunnel bracket (Fig. 3).

80db6cb4

Fig. 3 INSTRUMENT PANEL CENTER STACK RETAINER

1 - INSTRUMENT PANEL

2 - INSTRUMENT PANEL CENTER STACK RETAINER

(15) Remove four bolts to steel steering column reinforcement from bottom of lower instrument panel cover and disconnect 16-way Diagnostic Link Connector (DLC) from steel reinforcement (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

INSTRUMENT PANEL ASSEMBLY (Continued)

(16) Remove one screw to the steering column mounting plate (Fig. 4).

Fig. 4 STEERING COLUMN MOUNTING PLATE

1 -
INSTRUMENT PANEL
2 - STEERING COLUMN MOUNTING PLATE

(17) Remove one screw to left floor duct/silencer pad and remove from vehicle.

(18) Remove steering column from vehicle.

(a) Remove column shrouds.

(b) Disconnect shift interlock cable at ignition switch.

(c) Disconnect column wiring.

(d) Disconnect under column duct section and remove from vehicle.

(e) Disconnect and remove left panel A/C outlet duct.

(f) Remove four column mounting bolts at brake pedal support bracket.

(g) Lower steering column to floor.

(19) Disconnect two harness connectors to the HVAC housing, the Airbag Control Module (ACM), and two ground eyelets left of the floor tunnel near the bulkhead.

(20) Using a trim stick or equivalent, gently pry out on the left and right A-pillar trim moldings, and slide rearward to remove.

(21) Using a trim stick or equivalent, gently pry up on the instrument panel top cover and remove by gently pulling toward the rear of vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(22) Remove one screw retaining each left and right scuff plate. Using a trim stick or equivalent, gently pry up on left and right scuff plates and remove from vehicle.

(23) Remove three screws to right and left side cowl side kick panels and remove from vehicle (Fig. 5).

(24) Remove right side under dash silencer/pad.

(25) Disconnect the two right side harness connectors to radio antenna and amplifier DIN cable.

(26) Disconnect the left side harness connectors to junction block and Body Control Module (BCM).

(27) Remove eight remaining instrument panel retaining screws to body.

(28) Pull rearward on instrument panel.

(29) Make sure that all harnesses are free and clear from snagging.

(30) With the help of an assistant, remove instrument panel from vehicle and place on bench.

(31) If replacing instrument panel and pad assembly, transfer all parts to new assembly. Refer to (Fig. 6), (Fig. 7), and (Fig. 8).

9 - RADIO	18 - BEZEL, INSTRUMENT PANEL END CAP

INSTALLATION

(1) If replacing instrument panel and pad assembly, transfer all parts to new assembly (Fig. 6), (Fig. 7), and (Fig. 8).

(2) With the help of an assistant, place instrument panel into vehicle into the approximate mounting position (Fig. 5).

(3) Make sure that all harnesses are free and clear from snagging.

(4) Install eight instrument panel retaining screws to body.

(5) Connect the left side harness connectors to junction block and Body Control Module (BCM).

(6) Connect the two right side harness connectors to radio antenna and amplifier DIN cable.

(7) Install the right side under dash silencer/pad.

(8) Place the right and left cowl side kick panels into position and install the three retaining screws.

(9) Place the right and left scuff plates into position and firmly press them into place. Install the one screw retaining each left and right scuff plate.

(10) Place the instrument panel top cover into position and firmly snap into place (Fig. 5).

(11) Place the right and left A-pillar trim moldings into place starting from the rear and firmly snap into place.

(12) Connect the two harness connectors to the HVAC housing, the Airbag Control Module (ACM), and two ground eyelets left of the floor tunnel near the bulkhead.

(13) Install the steering column:

(a) Raise steering column into position at brake pedal support bracket.

(b) Install the four column mounting bolts at brake pedal support bracket.

(c) Place the left panel A/C outlet duct into position and firmly snap into place.

(d) Place the under column duct section into position and firmly snap into place.

(e) Connect column wiring.

(f) Connect shift interlock cable at ignition switch.

(g) Install the steering column shrouds.

(14) Install one screw attaching instrument panel to the steering column mounting plate (Fig. 4).

(15) Place the left floor duct/silencer pad into position and install the one retaining screw.

(16) Connect the 16-way Diagnostic Link Connector (DLC) to the steel reinforcement.

(17) Install the four bolts to steel reinforcement at the bottom of lower instrument panel cover.

(18) Install the two nuts attaching center lower instrument panel to floor tunnel bracket. On six passenger vehicles go to Step 25 (Fig. 3).

(19) Install the two front bracket screws and two screws inside console storage bin to console.

(20) Place the right console side cover into position and firmly snap into place. Install the two screws to right console side cover.

(21) Raise glove box door to by pinching sides together, towards each other.

(22) Place the left console side cover into position and firmly snap into place. Install the two screws to the left console side cover.

(23) Connect wire connectors to HVAC control and traction control switch.

(24) On five passenger vehicles, place instrument panel center bezel into position and firmly snap into place (Refer to 23 - BODY/INSTRUMENT PANEL/STORAGE BIN - INSTALLATION).

(25) On six passenger vehicles, install the lower floor bin (Refer to 23 - BODY/INSTRUMENT PANEL/STORAGE BIN - INSTALLATION).

(26) Connect decklid release switch wiring connector, install the cable to brake release handle. Place the left lower instrument panel cover into position and firmly snap into place. Install the two screws to the lower instrument panel cover (outside end).

(27) Connect two wire connectors and one illumination bulb socket.

(28) Place shifter bezel into position and firmly snap into place.

NOTE: On 300M vehicles, the shifter bezel must be installed prior to the center bezel being installed.

(29) Install left and right instrument panel end covers by placing into position and firmly snapping into place.

(30) Install the one Allen screw to shifter knob.

(31) Connect the negative battery cable remote terminal to the remote battery post (Fig. 1).

INSTRUMENT PANEL CENTER BEZEL

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 1).

(2) Remove ash receiver (if applicable).

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on center trim bezel. Disconnect wiring connectors to HVAC controls, cigar lighter/auxiliary power outlet and traction control switch (if equipped) (Fig. 9).

(4) Remove instrument panel center trim bezel.

NOTE: The traction control switch, HVAC control head and cigar lighter/auxiliary power outlet must be transferred to new bezel if being replaced.

Fig. 9 INSTRUMENT PANEL CENTER UPPER BEZEL

- 1 - INSTRUMENT PANEL
- 2 - INSTRUMENT PANEL BEZEL
- 3 - CONSOLE
- 4 - CONSOLE SIDE PANEL

INSTALLATION

(1) Connect wiring connectors to HVAC controls, cigar lighter/auxiliary power outlet and traction control switch (if equipped).

(2) Place the instrument panel center trim bezel into position and firmly snap into place (Fig. 9).

(3) Install the ash receiver (if equipped).

(4) Connect the negative battery cable remote terminal to the remote battery post (Fig. 1).

INSTRUMENT PANEL END CAP

REMOVAL

(1) Open the left door and pull on the access handle to disengage the end cap clips. Fuse diagram is

located inside the left end cap. Fuse Access is under the left end cap (Fig. 10).

(2) Open the right door and remove the right end cover by inserting a trim stick (special tool #C-4755), between cap and instrument panel to disengage clips.

80db6eb5

Fig. 10 INSTRUMENT PANEL END COVER

- 1 - INSTRUMENT PANEL END COVER
- 2 - INSTRUMENT PANEL

INSTALLATION

(1) Pull body mounted weatherstrip form fence along the side of the instrument panel.

(2) Align the end cap with the retaining slots in instrument panel and firmly snap into place (Fig. 10).

(3) Engage weatherstrip along the header and down the A-pillar.

(4) Verify weatherstrip sealing.

(5) Close door.

INSTRUMENT PANEL SILENCER

REMOVAL

(1) Remove the retaining screw to the instrument panel.

(2) Maneuver part and bracket off of the center floor distribution duct.

(3) Remove the silencer/duct.

INSTALLATION

(1) Install the silencer/duct.

(2) Maneuver part and bracket on to the center floor distribution duct.

(3) Install the retaining screw to the instrument panel.

INSTRUMENT PANEL TOP COVER

REMOVAL

(1) Using a trim stick (special tool #C-4755) or equivalent, pry out the left and right A-pillar moldings, slide rearward and remove (Fig. 11).

(2) Using a trim stick or equivalent, slip each end of the instrument panel top cover up to disengaging clips.

(3) Lift rear edge of the top cover using a trim stick along the rear edge of the instrument panel top cover.

(4) Slide the instrument panel top cover rearward to disengaging the eight clips.

(5) Remove the instrument panel top cover from vehicle.

Fig. 11 INSTRUMENT PANEL TOP COVER

1 - INSTRUMENT PANEL TOP COVER
2 - INSTRUMENT PANEL

INSTALLATION

(1) Place the instrument panel top cover into position over the slots for the retaining clips, slide forward and firmly snap into place (Fig. 11).

(2) Firmly push down on the rear of the instrument panel top cover to engage clips.

(3) Place the left and right A-pillar moldings into position over the retaining clip slots, slide forward and firmly snap into place.

UPPER RIGHT TRIM BEZEL(300M)

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 1).

(2) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on center instrument panel bezel.

(3) Open glove box and remove four screws along bottom edge of trim bezel.

(4) Remove one screw in center bezel area.

(5) Loosen the lower right edge of steering column cover, then loosen upper right corner of steering column cover.

(6) Using a trim stick or equivalent, gently pry bezel away from the instrument panel and disconnect the traction control switch connector.

(7) Remove upper right trim bezel from vehicle (Fig. 12).

80b5cb04

Fig. 12 UPPER RIGHT TRIM BEZEL

1 - TRACTION CONTROL SWITCH
2 - UPPER RIGHT TRIM BEZEL

INSTALLATION

(1) Position upper right trim bezel over slots in instrument panel and firmly snap into place. If equipped with traction control, connect connector.

(2) Tighten the lower right edge of steering column cover, then tighten upper right corner of steering column cover.

(3) Install the one screw in center bezel area.

(4) Install the four screws along bottom edge of trim bezel and close glove box.

(5) Position center instrument panel bezel over slots and firmly snap into place.

(6) Connect the negative battery cable remote terminal to the remote battery post (Fig. 1).

STORAGE BIN - 5 PASSENGER VEHICLES

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 1).
- (2) Remove ash receiver (if applicable).
- (3) Using a trim stick (special tool #C-4755), gently pry out on center trim bezel. Disconnect wiring connectors to HVAC controls, cigar lighter/auxiliary power outlet and traction control switch (if equipped).
- (4) Remove instrument panel center trim bezel.
- (5) Remove two retaining screws to the storage bin and remove.

INSTALLATION

- (1) Install the two retaining screws to the storage bin.
- (2) Install the instrument panel center trim bezel.
- (3) Connect wiring connectors to HVAC controls, cigar lighter/auxiliary power outlet and traction control switch (if equipped).
- (4) Firmly snap the center trim bezel into place.
- (5) Install the ash receiver (if applicable).
- (6) Connect the negative battery cable remote terminal to the remote battery post (Fig. 1).

STORAGE BIN - 6 PASSENGER VEHICLES

REMOVAL

- (1) Remove one screw and one push pin to the lower instrument panel (Fig. 13).
- (2) Pull rearward and remove the floor bin.

Fig. 13 CENTER FLOOR BIN

- 1 - INSTRUMENT PANEL
2 - INSTRUMENT PANEL FLOOR BIN

INSTALLATION

- (1) Place the instrument panel bin into position and firmly snap into place.
- (2) Install one screw and one push pin to the lower instrument panel.

STEERING COLUMN COVER

REMOVAL

- (1) Remove the left end cover.
- (2) Remove two screws attaching steering column cover (Fig. 14).
- (3) Pull rearward on steering column cover to release the retaining clips on the top and right edge.

Fig. 14 STEERING COLUMN COVER

- 1 - INSTRUMENT PANEL
2 - STEERING COLUMN COVER

INSTALLATION

- (1) Place steering column cover into position (Fig. 14).
- (2) Push on steering column cover till retaining clips lock into position.
- (3) Install two attaching screws to the side of the steering column cover.
- (4) Install end cover.

STEERING COLUMN COVER REINFORCEMENT

REMOVAL

(1) Remove steering column cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(2) Remove four bolts attaching steering column cover reinforcement (Fig. 15).

(3) Remove diagnostic connector from the steering column cover reinforcement.

(4) Remove steering column cover reinforcement from vehicle.

INSTALLATION

(1) Place steering column cover reinforcement in position.

(2) Connect diagnostic connector to the steering column cover reinforcement.

(3) Install the four bolts attaching steering column cover reinforcement (Fig. 15).

(4) Install steering column cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

A-PILLAR TRIM

REMOVAL

- (1) Remove instrument panel end cap.
- (2) Disengage clips attaching trim to A-pillar by pulling on trim (Fig. 1).
- (3) Slide A-pillar trim rearward, to disengaging from instrument panel top cover.
- (4) Remove A-pillar trim from vehicle.

Fig. 1 A-PILLAR TRIM

- 1 - A-PILLAR TRIM
2 - CLIPS

INSTALLATION

- (1) Slide A-pillar trim forward ensuring that the trim engages with the instrument panel top cover.
- (2) Engage clips to attach trim to A-pillar.
- (3) Install instrument panel end cap.

ASSIST HANDLE

REMOVAL

- (1) Pull and hold assist handle down.
- (2) Remove screws attaching assist handle to roof (Fig. 2).
- (3) Remove assist handle from vehicle.

INSTALLATION

- (1) Place assist handle in position on vehicle.
- (2) Install screws to attach assist handle to roof.

BODY VENT

REMOVAL

- (1) Open decklid.
- (2) Move trunk carpet to access the air exhauster in the right/left rear corner of the trunk (Fig. 3).

Fig. 2 FRONT ASSIST HANDLE

- 1 - ROOF
2 - HEADLINING
3 - ASSIST HANDLE

- (3) From inside trunk push the air exhauster outward to release clips.
- (4) Reach under fascia and pull air exhauster outward from trunk side panel.
- (5) Remove air exhauster from vehicle.

Fig. 3 AIR EXHAUSTER

- 1 - AIR EXHAUSTER
2 - REAR TRUNK FENCE
3 - TRUNK CARPET

INSTALLATION

- (1) Place air exhauster in position. Ensure that the locator tab is aligned.
- (2) Engage the upper half of the air exhauster then push the lower half in until the clips click into place.
- (3) Install trunk carpet into position.

B-PILLAR LOWER TRIM

REMOVAL

- (1) Remove seat belt height adjuster knob.
- (2) Remove upper B-pillar trim.
- (3) Remove bolt attaching seat belt to floor below B-pillar (Fig. 4).
- (4) Remove access door from above seat belt slot on B-pillar trim.
- (5) Disengage clips attaching lower trim to B-pillar.
- (6) Slide seat belt through the B-pillar trim.
- (7) Remove B-pillar trim from vehicle.

80b2a237

Fig. 4 B-PILLAR LOWER AND UPPER TRIM

- 1 - SHOULDER HARNESS ADJUSTER
- 2 - UPPER B-PILLAR TRIM
- 3 - CLIPS
- 4 - LOWER B-PILLAR TRIM
- 5 - B-PILLAR
- 6 - CLIP

INSTALLATION

- (1) Slide seat belt through the B-pillar trim.
- (2) Place B-pillar trim in position on vehicle.
- (3) Engage clips attaching lower trim to B-pillar.
- (4) Install access door above seat belt slot on B-pillar trim.
- (5) Install bolt attaching seat belt to floor below B-pillar.
- (6) Install upper B-pillar trim.
- (7) Install seat belt height adjuster knob.
- (8) Refit weatherstrip.

B-PILLAR UPPER TRIM

REMOVAL

- (1) Disengage shoulder belt turning loop cover.
- (2) Remove adjuster knob.
- (3) Remove bolt attaching turning loop to shoulder belt height adjuster.
- (4) Remove turning loop from adjuster.
- (5) Disengage clips attaching upper trim to B-pillar (Fig. 4).
- (6) Remove B-pillar trim from vehicle.

INSTALLATION

- (1) Place B-pillar trim in position on vehicle.
- (2) Engage clips attaching upper trim to B-pillar.
- (3) Place shoulder belt turning loop in position on adjuster.
- (4) Install adjuster knob.
- (5) Install bolt attaching turning loop to shoulder belt height adjuster.
- (6) Install shoulder belt turning loop cover.
- (7) Refit weatherstrip.

CROSS CAR BEAM

REMOVAL

- (1) Remove steering column and instrument panel from vehicle.
- (2) Remove fasteners attaching cross car beam to plenum in both locations (Fig. 5).
- (3) Remove left side fasteners attaching the cross car beam to cowl side panel.
- (4) Remove right side fasteners attaching the cross car beam to cowl side panel.
- (5) Remove cross car beam from vehicle.

INSTALLATION

- (1) Place cross car beam in position in vehicle.
- (2) Install right side fasteners attaching the cross car beam to cowl side panels.
- (3) Install left side fasteners attaching the cross car beam to cowl side panels.
- (4) Install fasteners to plenum in both locations.
- (5) Install steering column and instrument panel.

CROSS CAR BEAM (Continued)

80b3c995

Fig. 5 CROSS CAR BEAM

CARPETS

REMOVAL

- (1) Remove floor mats.
- (2) Remove door sill trim covers.
- (3) Remove cowl side trim covers.
- (4) Remove front seats.
- (5) Remove bolts attaching front seat belt lower anchors to floor below B-pillar trim panels.
- (6) Remove center console, if equipped.
- (7) Remove rear seat cushion.
- (8) Remove gas pedal bracket.
- (9) Remove carpet fasteners.
- (10) Remove carpet from vehicle (Fig. 6).

80b89939

INSTALLATION

- (1) Place carpet in proper position on floor of vehicle.
- (2) Install carpet fasteners.
- (3) Using double back tape or hook and loop, secure carpet strap behind the instrument panel center support bracket.
- (4) Install cowl side trim covers.
- (5) Install door sill trim covers.
- (6) Install rear seat cushion.
- (7) Install gas pedal bracket.

Fig. 6 FLOOR CARPET

- 1 - REAR SEAT HOLDDOWN CUPS
- 2 - FLOOR CARPET
- 3 - FLOOR

- (8) Install center console, if equipped.
- (9) Install bolts to attach seat belt lower anchors to floor below B-pillar trim panels.
- (10) Install front seats.
- (11) Install floor mats.

CENTER CONSOLE ARMREST LID ASSEMBLY

REMOVAL

- (1) Open armrest lid.
- (2) Remove lid attaching screws.
- (3) Remove lid from console.

INSTALLATION

- (1) Place lid in position.
- (2) Install screws attaching lid to console.
- (3) Check operation of lid.

CENTER CONSOLE BEZEL

REMOVAL

NOTE: The Transmission Range Indicator Lamp (electroluminescent) is not serviceable. Replace Floor Console Panel for replacement of the lamp.

- (1) Set park brake and place gear selector in neutral.
- (2) Remove instrument panel center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)

- (3) Loosen set screw attaching gear shift knob to gear shift.
- (4) Remove gear shift knob from gear shift.
- (5) Disengage clips attaching bezel to floor console (Fig. 7), or (Fig. 8).
- (6) Disconnect the power outlet, if equipped.
- (7) Disconnect the transmission range indicator illumination connector.
- (8) Remove bezel from vehicle.

INSTALLATION

- (1) Connect the transmission range indicator illumination connector.
- (2) Connect power outlet, if equipped.
- (3) Place bezel in position on vehicle.
- (4) Engage clips attaching bezel to floor console.
- (5) Install instrument panel center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION)
- (6) Push gear shift knob onto gear shift.
- (7) Tighten set screw attaching gear shift knob to gear shift.

CENTER CONSOLE BEZEL - WOOD TRIM

REMOVAL - WOOD TRIM

- (1) Remove the center console bezel. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE BEZEL - REMOVAL)
- (2) Remove the nuts (Fig. 9).
- (3) Remove the wood trim from the bezel (Fig. 10).

INSTALLATION - WOOD TRIM

- (1) Attach the wood trim to the bezel.

CAUTION: Do not over tighten the nuts or damage to the wood trim may occur.

- (2) Install the nuts.
- (3) Install the center console bezel. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE BEZEL - INSTALLATION)

809fb876

Fig. 10 WOOD TRIM MOUNTING

- 1 - CONSOLE BEZEL GENUINE WOOD TRIM

CENTER CONSOLE CUPHOLDER ASSEMBLY

REMOVAL - CONCORD

- (1) Remove shift knob.
- (2) Remove floor console shift bezel (Fig. 7).
- (3) Raise console armrest lid.
- (4) Remove screws at top and bottom of cup attaching assembly (Fig. 11).
- (5) Lift up and forward to remove assembly.

80b2a234

Fig. 11 FLOOR CONSOLE CUP HOLDER ASSEMBLY

- 1 - SCREWS
2 - ARMREST LID
3 - SCREW HOLES

INSTALLATION

- (1) Place cup attaching into floor console and align screw holes.
- (2) Install upper and lower screws.
- (3) Lower console armrest lid.
- (4) Install floor console shift bezel.
- (5) Install shift knob.

CENTER CONSOLE LID LATCH

REMOVAL

- (1) Open armrest lid.
- (2) Remove latch attaching screws.
- (3) Remove latch from console.

INSTALLATION

- (1) Place latch in position.
- (2) Install screws attaching latch to console.
- (3) Check operation of latch.

CENTER CONSOLE REAR BEZEL

REMOVAL

- (1) Disengage tabs on sides at bottom (Fig. 12)
- (2) Open arm rest lid and remove rear end cap attaching screws.
- (3) Remove rear bezel.

80b4fb06

Fig. 12 FLOOR CONSOLE END CAP

- 1 - FASTENERS
2 - LOCATOR PINS
3 - TABS

INSTALLATION

- (1) Align rear end cap in position on console.
- (2) Install rear end cap attaching screws.
- (3) Push forward at the bottom to lock tabs in position.

CENTER CONSOLE SIDE PANELS

REMOVAL

REMOVAL - CONCORD

- (1) Remove shift knob.
- (2) Remove floor console shift bezel (Fig. 7).
- (3) For right side panel, open the glove box door and remove side panel screws
- (4) For left side panel, remove steering column cover and side panel screws.
- (5) Disengage clips from floor console.
- (6) Remove floor console side panel(s).

REMOVAL

- (1) Remove shift knob.
- (2) Remove console shift bezel (Fig. 8).
- (3) To remove right side panel, open glove box and remove side panel attaching screws.
- (4) To remove left side panel, remove steering column cover and remove side panel attaching screws.
- (5) Disengage clips from center console.
- (6) Remove floor console side panel.

INSTALLATION

INSTALLATION - CONCORD

- (1) Place front floor console side panel in position on vehicle.
- (2) Press on the side panel to seat clips.
- (3) Install side panel(s) screws.
- (4) Install floor console shift bezel.
- (5) Install shift knob.

INSTALLATION

- (1) Place front floor console side panel in position on vehicle.
- (2) Press on the side panel to seat clips.
- (3) Install attaching screws.
- (4) Install floor console shift bezel.
- (5) Install shift knob.

DOOR SILL TRIM

REMOVAL

The door sills are attached with push pin fasteners.

- (1) Disengage fasteners attaching door sill trim to sill panel (Fig. 13).
- (2) Remove sill trim from vehicle.

Fig. 13 DOOR SILL TRIM

- 1 - FASTENERS
2 - DOOR SILL TRIM
3 - DOOR OPENING SILL

INSTALLATION

- (1) Place sill trim in position on vehicle.
- (2) Seat fasteners to attach door sill trim to sill panel.

FLOOR CONSOLE

REMOVAL

- (1) Remove shift knob.
- (2) Remove floor console shift bezel.
- (3) Remove side panels (Fig. 14), or (Fig. 15).
- (4) Disconnect the electrical connectors.
- (5) Remove fasteners attaching forward bracket to instrument panel.
- (6) Remove fasteners attaching bottom of console storage bin to rear mounting bracket (Fig. 16).
- (7) Remove floor console from vehicle.

FLOOR CONSOLE (Continued)

**Fig. 14 FRONT FLOOR CONSOLE SIDE PANELS - CONCORDE**

1 - INSTRUMENT PANEL
2 - FASTENERS

3 - CLIPS
4 - SIDE PANEL

80866b80

Fig. 15 FRONT FLOOR CONSOLE SIDE PANELS

3 - POWER OUTLET/CIGAR LIGHTER CONNECTORS
4 - TRANSMISSION RANGE INDICATOR ILLUMINATION CONNECTORS
5 - REAR END CAP
6 - FLOOR CONSOLE
7 - FRONT FLOOR CONSOLE PANEL

INSTALLATION

(1) If power tap wire harness was removed reattach the harness with tape, along the indicated markings.

(2) If previously removed, install the power outlet tap. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/CIGAR LIGHTER OUTLET - INSTALLATION)

(3) Place center console in position on vehicle.

(4) Install fasteners attaching forward bracket to instrument panel.

(5) Install fasteners attaching bottom of console storage bin to rear mounting bracket.

(6) Connect the electrical connectors.

(7) Install side panels.

(8) Install center console shift bezel.

(9) Install shift knob.

FLOOR CONSOLE (Continued)

**Fig. 16 FLOOR CONSOLE**

- 1 - CONSOLE BRACKET
- 2 - FASTENERS
- 3 - FLOOR CONSOLE

- 5 - SHIFTER ASSEMBLY

FRONT DOOR WINDOW FRAME MOLDING

REMOVAL

- (1) Remove flag trim, speaker, door trim panel, watershield as necessary, and mirror.
- (2) Remove door glass run weatherstrip as necessary to gain access to applique fasteners.
- (3) Remove screws attaching molding to window frame (Fig. 17).
- (4) Remove molding from door.

INSTALLATION

- (1) Place molding in position on door.
- (2) Install screws attaching molding to window frame.
- (3) Install door glass run weatherstrip.
- (4) Install the mirror, water shield, door trim panel, speaker and flag trim.

**Fig. 17 FRONT DOOR FRAME WINDOW**

- 1 - REMOVE SCREWS
- 2 - LOOSEN HALFWAY

HEADLINER

REMOVAL

- (1) Remove front passenger seat for ease of removal of headliner.
- (2) Remove right and left A-pillar trim panels.
- (3) Remove right and left sun visors. Do not remove sun visor retainers at this time.
- (4) Remove overhead console or front interior lights.

- (5) Disconnect wire harness along A-pillar and wire connector to the fuse panel.
- (6) Remove upper B-pillar trim panels.
- (7) Remove front and rear assist handles (if equipped).
- (8) Remove quarter trim upper panels partial, keeping belt attached.
- (9) Fully recline front seat.
- (10) Remove right and left sun visor retainers.

HEADLINER (Continued)

(11) Disengage rear headliner locating clip, using Headliner Clip Pliers, Special Tool C-6967.

(12) Pull headliner down, beginning from the rear. The back side of the headliner is glue bonded to the structural membrane and must be overcome.

NOTE: No special tools are required to release the membrane from the headliner. Pull down use hand force only to release the membrane.

(13) Remove headliner from vehicle through the rear door, using two people (Fig. 18).

(14) Ensure that the rear locator flexible clip is removed from the roof steel. Install rear locator flexible clip into the base located on the headliner before installing the headliner (Fig. 19).

Fig. 18 HEADLINER

1 - REAR CLIP
2 - MEMBRANE

INSTALLATION

NOTE: DO NOT remove headliner membrane from vehicle. No additional use of any additional adhesives is needed.

- (1) Place headliner in proper position in vehicle.
- (2) Engage the locator flexible clip to attach headliner to roof above rear window and press on the membrane to ensure contact.
- (3) Install upper right and left quarter trim panels.
- (4) Install front and rear assist handles (if equipped).
- (5) Install right and left sun visors and retainers.

Fig. 19 LOCATOR FLEXIBLE CLIP

1 - FLEXIBLE CLIP
2 - BASE
3 - HEADLINER

- (6) Install upper right and left B-pillar trim panels.
- (7) Install wire harness along A-pillar and connect wire connector to the fuse panel.
- (8) Install overhead console or front interior lights
- (9) Install right and left A-pillar trim panels.
- (10) Install seat, and return seats to up the right position.
- (11) Engage the hook and loop patch fasteners around the sun roof opening.

ROOF STRUCTURAL MEMBRANE

REMOVAL

- (1) Remove headliner.
- (2) Remove roof support membrane, using a Molding Removal Tool, 3-M p/n 08978.
- (3) Carefully pull down corner of roof structural membrane enough to insert molding removal tool between roof panel and adhesive. Activate air chisel, while keeping the blade at an angle, ensuring not to flex the roof panel. Evenly separate the adhesive strips from the roof panel until the structural membrane is removed.

NOTE: USE EXTREME CARE WHEN PULLING ON THE STRUCTURAL MEMBRANE, THE ROOF PANEL WILL DENT/DING/CREASE/FLEX AND CAUSE PERMANENT DAMAGE.

- (4) Using a razor blade scraper tool, scrape off remaining adhesive residue.

ROOF STRUCTURAL MEMBRANE (Continued)

INSTALLATION

(1) Place headliner in vehicle allowing it to rest in a down position on the seats.

(2) Outside of the vehicle, using the adhesive supplied, apply five 10 mm (0.39 inch) diameter beads of adhesive within the printed black lines or at the center of membrane strips for the length of the new structural membrane, stopping 38 mm (1.5 inches) before each end (Fig. 20).

NOTE: ADHESIVE MUST BE APPLIED UNIFORMLY IN 10 mm (0.39 INCHES) BEADS. TOO MUCH OR TOO LITTLE ADHESIVE WILL CAUSE ROOF PANEL TO WARP AS ADHESIVE CURES.

(3) Apply a 25 mm (1.0 inch) diameter hot glue spot to each location where the glue bond between the headliner and structural membrane had previously been broken free. This bond is not critical to performance but allows the membrane to remain in place while the headliner is installed.

(4) Place the structural membrane, adhesive side up, onto the headliner over the glue spots to attach the membrane to the headliner.

(5) Install headlining in proper position in vehicle.

NOTE: IT IS NOT NECESSARY TO APPLY LOCAL PRESSURE IN THE AREA OF THE STRUCTURAL MEMBRANE, THE SHAPE AND STIFFNESS OF THE HEADLINER WILL PROVIDE PROPER PRESSURE TO ALLOW THE ADHESIVE TO CURE PROPERLY.

Fig. 20 MEMBRANE STRIPS

- 1 - REAR CLIP
- 2 - WIRE HARNESS
- 3 - STRUCTURAL MEMBRANE

LOWER QUARTER TRIM

REMOVAL

- (1) Remove rear seat cushion and back.
- (2) Pull upper quarter trim from panel (Fig. 21).
- (3) Remove sill trim as necessary to clear quarter trim removal path.
- (4) Disengage clips attaching lower quarter trim to inner quarter trim from vehicle.
- (5) Remove quarter trim from vehicle.

80b2a238

Fig. 21 LOWER QUARTER TRIM

- 1 - UPPER QUARTER TRIM
- 2 - QUARTER PANEL
- 3 - LOWER QUARTER TRIM
- 4 - DOOR SILL TRIM

INSTALLATION

- (1) Place quarter trim in position on vehicle.
- (2) Engage clips attaching lower quarter trim to inner quarter panel.
- (3) Install upper quarter trim.
- (4) Install sill trim.
- (5) Install rear seat cushion and back.

REAR SHELF TRIM PANEL

REMOVAL

- (1) Remove seat cushion and back.
- (2) Remove quarter trim lower and upper trim panels.
- (3) Remove center seat belt anchor bolt.
- (4) Remove push pin fasteners.
- (5) Pull rear shelf trim panel away from rear glass to disengage clips (Fig. 22).
- (6) Disengage CHMSL wire connector, if equipped.
- (7) Feed center seat belt and bezel through rear shelf trim panel
- (8) Remove rear shelf trim panel from vehicle.

REAR SHELF TRIM PANEL (Continued)

**Fig. 22 PARCEL SHELF TRIM PANEL**

- 1 - REAR SHELF TRIM
- 2 - PUSH PIN FASTENER
- 3 - CLIP LOCATION

INSTALLATION

- (1) Place rear shelf trim panel in position in vehicle.
- (2) Feed center seat belt and bezel through rear trim panel.
- (3) Connect CHMSL wire connector.
- (4) Push parcel shelf trim rearward toward rear glass and engage clips.
- (5) Insert push pin fasteners into position.
- (6) Install quarter trim lower and upper panels.
- (7) Install center seat belt anchor bolt. Tighten to 40 N·m (29 ft. lbs.) torque.
- (8) Install seat back and cushion.

REAR VIEW MIRROR**REMOVAL**

- (1) If equipped, disconnect mirror harness connector.
- (2) Loosen the mirror base setscrew (Fig. 23).
- (3) Slide the mirror base upward and off the bracket.

INSTALLATION**INSTALLATION**

- (1) Position the mirror base at the bracket and slide it downward onto the support bracket (Fig. 23).
- (2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.
- (3) If equipped, connect mirror harness connector.

80b3c6eb

Fig. 23 REAR VIEW MIRROR

- 1 - CONNECTOR
- 2 - SCREW
- 3 - REAR VIEW MIRROR
- 4 - SUPPORT BUTTON
- 5 - WINDSHIELD

INSTALLATION - REARVIEW MIRROR SUPPORT BRACKET

- (1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
- (2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
- (3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
- (4) Apply accelerator to the surface on the bracket according to the following instructions:
 - (a) Crush the vial to saturate the felt applicator.
 - (b) Remove the paper sleeve.
 - (c) Apply accelerator to the contact surface on the bracket.
 - (d) Allow the accelerator to dry for five minutes.
 - (e) Do not touch the bracket contact surface after the accelerator has been applied.
- (5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
- (6) Install the bracket according to the following instructions:
 - (a) Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
 - (b) Apply an even coat of adhesive to the contact surface on the bracket.
 - (c) Align the bracket with the marked position on the windshield glass.

REAR VIEW MIRROR (Continued)

- (d) Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

(7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.

(8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

REAR SEAT GRAB HANDLE/
READING LAMP

REMOVAL

- (1) Pull down coat hook.
- (2) Remove screw attaching assist handle to roof from behind coat hook.
- (3) Pull and hold assist handle down.
- (4) Remove front screw attaching assist handle to roof (Fig. 24).
- (5) Remove assist handle from roof.
- (6) Disengage clips attaching reading lamp socket to back of assist handle base.
- (7) Disconnect reading lamp switch from slot on back of assist handle base.
- (8) Remove assist handle from vehicle.

Fig. 24 REAR ASSIST HANDLE AND READING LAMP

- 1 - COAT HOOK
- 2 - ASSIST HANDLE
- 3 - HEADLINING

INSTALLATION

- (1) Place assist handle in position on vehicle.
- (2) Connect reading lamp switch into slot on back of assist handle base.

- (3) Engage clips attaching reading lamp socket to back of assist handle base.

(4) Place assist handle in position on roof.

(5) Pull and hold assist handle down.

(6) Install front screw attaching assist handle to roof.

(7) Install screw behind coat hook attaching assist handle to roof.

SUN VISOR

REMOVAL

All vehicles with driver and passenger side air bags must have a colored coded five Bullet point air-bag warning label applied to the sun visor, verify label availability and ensure the label is installed.

(1) Remove screw attaching inboard visor retainer to over head. (Fig. 25).

(2) Remove screws attaching outboard visor pivot base to roof.

(3) Disconnect visor vanity lamp wire connector, if equipped.

(4) Remove visor from vehicle.

Fig. 25 SUN VISOR

- 1 - VISOR PIVOT BASE
- 2 - WIRE CONNECT
- 3 - RETAINER
- 4 - VISOR

INSTALLATION

All vehicles with driver and passenger side airbags must have a colored coded five bullet point airbag warning label applied to the sun visor, verify label availability and ensure the label is installed.

(1) Engage visor vanity lamp wire connector, if equipped.

(2) Place visor in position on header.

(3) Install screws attaching outboard visor pivot base to over head.

(4) Install screw attaching inboard visor retainer to over head.

TRUNK LINING

REMOVAL

- (1) Remove rear seat cushion and back.
- (2) Remove fasteners at forward edge along wheel-housing
- (3) Remove spare tire board, jack, and tire.
- (4) Remove fasteners at back panel and sides.
- (5) Remove carpet.

INSTALLATION

- (1) Fold carpet and load into position in the trunk.
- (2) Install fasteners at back and sides panel.
- (3) Install spare tire board, jack, and tire.
- (4) Install fasteners at forward edge along wheel-housing
- (5) Install rear seat back and cushion.

UPPER QUARTER TRIM

REMOVAL

- (1) Disengage clips attaching upper quarter trim to inner quarter panel (Fig. 21).

NOTE: Start at top forward area of trim and pull inboard.

- (2) Remove seat cushion.
- (3) Remove lower seat belt anchor nut.
- (4) Slide seat belt through trim panel.
- (5) Remove upper quarter trim from vehicle.

INSTALLATION

- (1) Slide belt through trim panel.
- (2) Place upper quarter trim in position on vehicle.
- (3) Engage clips attaching upper quarter trim to inner quarter panel.

NOTE: Start at lower attachments first and work up.

- (4) Install seat belt anchor nut.
- (5) Install seat cushion.

UNDER REAR SHELF SILENCER

REMOVAL

- (1) Remove fasteners attaching silencer to lower shelf sheet metal (Fig. 26).
- (2) Remove silencer from vehicle.

80dbec5

Fig. 26 UNDER REAR SHELF SILENCER

- 1 - UNDER SHELF SILENCER
- 2 - SHELF PANEL

INSTALLATION

- (1) Place silencer in position on vehicle (Fig. 26).
- (2) Install fasteners attaching silencer to the lower shelf sheet metal.

WHEELHOUSE SILENCER

REMOVAL

- (1) Remove rear seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
- (2) Remove lower quarter trim (Refer to 23 - BODY/INTERIOR/LOWER QUARTER TRIM - REMOVAL).
- (3) Remove front trunk push pin and fold trunk carpet down.
- (4) Remove fasteners attaching silencer to wheel house.
- (5) Remove silencer from vehicle (Fig. 27).

INSTALLATION

- (1) Place silencer into position on the wheel house (Fig. 27).
- (2) Install fasteners attaching silencer to wheel house.
- (3) Install lower quarter trim (Refer to 23 - BODY/INTERIOR/LOWER QUARTER TRIM - INSTALLATION).
- (4) Install rear seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clearcoat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION). The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The codes listed in the Color Code Chart are used for manufacturing purposes.

PAINT SURFACE TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch Up Paints and Clear Top Coat. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION).

WARNING: USE AN OSHA APPROVED RESPIRATOR AND SAFETY GLASSES WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

TOUCH UP PROCEDURE

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch up paint. Do not overlap touch up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch up paint to dry hard.

(5) On vehicles without clearcoat, the touch up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clearcoat, apply clear top coat to touch up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

Front seat rear outboard seat track to floor pan bolts	28	20	—
Front seat airbag module to seat back frame	7	—	62
Rear seat center seat belt retractor to shelf	60	44	—

FRONT ARMREST

REMOVAL - 50/50 SPLIT

- (1) Move the driver seat full forward and the passenger seat full rearward.
- (2) Open arm rest lid (Fig. 1).
- (3) Remove access retaining nut cover.
- (4) Remove arm rest retaining nut.
- (5) Slide arm rest off of bracket (Fig. 2).

INSTALLATION - 50/50 SPLIT

- (1) Slide arm rest on bracket.
- (2) Install arm rest nut. Tighten nut to 25 N·m (18 ft. lbs.) torque.
- (3) Install access retaining nut cover.
- (4) Reposition the seats.

Fig. 1 ARM REST ACCESS HOLE

- 1 - REMOVE ACCESS HOLE
- 2 - NUT
- 3 - ARM REST
- 4 - COVER

Fig. 2 ARM REST BRACKET

- 1 - ARMREST BRACKET

HEADREST

REMOVAL

REMOVAL

- (1) Lower head restraint slightly.
- (2) Insert a stiff wire into the hole on the right hand side head restraint sleeve/guide and push to release latch (Fig. 3).
- (3) At the same time, press the button on the head restraint sleeve/guide left hand side and pull upward to release the head restraint.
- (4) Remove head restraint from seat back.

Fig. 3 HEAD RESTRAINT REMOVAL

- 1 - SLEEVE GUIDE
- 2 - BUTTON
- 3 - STIFF WIRE

REMOVAL - AIRBAG EQUIPPED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Disconnect the remote negative battery cable.
- (2) If fully extended, lower head restraint slightly.
- (3) Insert a stiff wire into the hole on the right hand side head restraint sleeve/guide and push to release latch (Fig. 4).
- (4) At the same time, press the button on the head restraint sleeve/guide and pull upward to release the head restraint.
- (5) Remove head restraint from seat back.

Fig. 4 HEAD RESTRAINT REMOVAL

- 1 - SLEEVE GUIDE
- 2 - BUTTON
- 3 - STIFF WIRE

INSTALLATION

INSTALLATION

- (1) Place head restraint in position.
- (2) Push head restraint down into the lock position.
- (3) Raise head restraint to ensure it locks at the last stop.

INSTALLATION - AIRBAG EQUIPPED

- (1) Place head restraint in position.
- (2) Push head restraint down into the lock position.
- (3) Raise head restraint to ensure it locks at the last stop.
- (4) Connect the remote negative battery cable.

HEADREST SLEEVE - AIRBAG EQUIPPED

REMOVAL - AIRBAG EQUIPPED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Disconnect the remote negative battery cable.
- (2) Remove the head restraint from the seat back (Refer to 23 - BODY/SEATS/HEADREST - REMOVAL).
- (3) Remove the back panel from the seat back.
- (4) Disengage upper J-strap from seat back trim cover. (Fig. 5)
- (5) Working through the rear of seat back, depress the two head restraint guide sleeve retaining tabs and pull guide straight up and out of the seat back.

80bfe0cf

Fig. 5 TRIM COVER J-STRAP POSITION & ORIENTATION

- 1 - TRIM COVER J-STRAPS
- 2 - SEAT HEATER WIRE HARNESS
- 3 - SEAT AIRBAG WIRE HARNESS

INSTALLATION - AIRBAG EQUIPPED

NOTE: The head restraint guide sleeve equipped with height adjustment button is always installed on the left side of the seat back.

- (1) Install guides in seat back making sure they are snapped in place.
- (2) Install J-strap retainer.
- (3) Install the back panel on the seat back.
- (4) Install the head restraint on the seat back (Refer to 23 - BODY/SEATS/HEADREST - INSTALLATION).
- (5) Connect the remote negative battery cable.

FRONT SEAT

REMOVAL

REMOVAL

- (1) Position seat far enough forward to gain access to rear mount bolts on floor.
- (2) Remove bolts attaching rear of seat track to floor (Fig. 6).
- (3) Move seat rearward.
- (4) Remove bolts attaching front of the seat track to floor kick up.
- (5) Disconnect front seat wire harness connector from body harness connector, if equipped.
- (6) Remove front seat from vehicle.

80b89937

Fig. 6 FRONT SEAT REMOVAL

- 1 - FRONT BOLTS
- 2 - REAR BOLTS

FRONT SEAT (Continued)

REMOVAL - AIRBAG EQUIPPED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Position the seat far enough forward to allow removal of the rear retaining bolts.
- (2) Disconnect and isolate the remote negative battery cable (Fig. 7).
- (3) Remove bolts attaching rear of seat track to floor.
- (4) Remove bolts attaching front of the seat track to floor kick up (Fig. 8).
- (5) Tilt seat upward to access and disconnect the front seat wire harness connector from body harness connector.
- (6) Disconnect airbag wire harness connector by first sliding connector lock to the "unlocked" position, then depress connector retaining tab and pull straight apart.
- (7) Remove front seat from vehicle.

Fig. 7 NEGATIVE BATTERY CABLE REMOTE TERMINAL

- 1 - RIGHT STRUT TOWER
2 - AIR CLEANER INLET TUBE
3 - REMOTE TERMINAL

80b89937

Fig. 8 FRONT SEAT RETAINING BOLTS

- 1 - FRONT BOLTS
2 - REAR BOLTS

INSTALLATION

INSTALLATION

NOTE: Ensure that the seat tracks are rearward

- (1) Place front seat in position in vehicle.
- (2) Connect front seat wire harness connector to body harness connector.
- (3) Install bolts to attach front of seat track to the floor kick up. Tighten bolts to 61 N·m (45 ft. lbs.) torque.
- (4) Move seat forward and install bolts attaching rear of seat track to the floor. Tighten bolts to 61 N·m (45 ft. lbs.) torque.
- (5) Verify front seat operation.

INSTALLATION - AIRBAG EQUIPPED

- (1) Place front seat in position in vehicle.
- (2) Connect front seat wire harness connector to body harness connector.
- (3) Connect airbag wire harness connector. Be certain airbag connector is secure and locking tab is in the "locked" position before installing seat retaining bolts.
- (4) Install bolts attaching the front of seat track to the floor kick up. Tighten bolts to 61 N·m (45 ft. lbs.) torque.
- (5) Install bolts attaching rear of seat track to the floor. Tighten bolts to 61 N·m (45 ft. lbs.) torque.
- (6) Connect the remote negative battery cable.

FRONT SEAT (Continued)

- (7) Using the DRB III Scan Tool erase all DTC's and perform airbag system diagnostics.
- (8) Verify front seat operation.

FRONT SEAT BACK

REMOVAL

REMOVAL

- (1) Remove front seat from vehicle (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL).
- (2) Remove front seat cushion side shields (Refer to 23 - BODY/SEATS/SEAT SIDE SHIELD - REMOVAL).
- (3) Remove bolts attaching recliner to seat back cushion frame (Fig. 9).
- (4) Remove inboard and outboard pivot bolts (Fig. 10).
- (5) Disconnect any electrical connectors to the seat back, if equipped.
- (6) Remove seat back from seat cushion.

**Fig. 9 RECLINER ATTACHING BOLT**

- 1 - PIVOT BOLT
- 2 - RECLINER BOLT

REMOVAL - AIRBAG EQUIPPED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

**Fig. 10 REMOVE SEAT BACK**

- 1 - RECLINER BOLT HOLE
- 2 - SEAT BACK BOLT HOLE
- 3 - J-STRAP RETAINER

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Position seat forward enough to allow removal of the rear seat track to floor pan bolts.
- (2) Disconnect and isolate the remote negative battery cable (Fig. 11).
- (3) Remove the front seat from the vehicle. Refer to the procedure in this group.
- (4) Remove the front seat cushion side shields. Refer to the procedure in this group.
- (5) Disengage push pin and disconnect the yellow airbag wire harness connector located on the bottom of the seat cushion pan.
- (6) Disengage push pin and disconnect the heated seat element wire connector also located on the cushion pan.
- (7) Remove bolts attaching recliner to seat back cushion frame (Fig. 12).
- (8) Remove inboard and outboard pivot bolts connecting the seat cushion to the seat back.
- (9) Feed wire harnesses between the seat track and cushion pan and remove seat back from seat cushion.
- (10) Remove necessary components from seat back for reuse if possible. Refer to the procedures in this group.

INSTALLATION

INSTALLATION

NOTE: Do not reuse the recliner assembly attaching bolts.

FRONT SEAT BACK (Continued)

Fig. 11 NEGATIVE BATTERY CABLE REMOTE TERMINAL

- 1 - RIGHT STRUT TOWER
2 - AIR CLEANER INLET TUBE
3 - REMOTE TERMINAL

Fig. 12 RECLINER ATTACHING BOLTS

- 1 - RECLINER BOLT

- (1) Position seat back on cushion.
- (2) Connect electrical connectors to the seat back, if equipped.
- (3) Install inboard pivot bolt. Tighten bolts to 30 N·m (22 ft. lbs.) torque.
- (4) Install bolts attaching recliner to seat back frame. Tighten bolts to 8 N·m (71 in. lbs.) torque.
- (5) Install front seat cushion side shields (Refer to 23 - BODY/SEATS/SEAT SIDE SHIELD - INSTALLATION).
- (6) Install front seat in vehicle (Refer to 23 - BODY/SEATS/FRONT SEAT - INSTALLATION).

INSTALLATION - AIRBAG EQUIPPED

(1) Position the assembled seat back and feed wire harness down into lower seat cushion (Fig. 13). Be certain harness is routed along the leading edge of seat frame.

(2) Install inboard and outboard pivot bolts. Tighten bolt to 30 N·m (23 ft. lbs.) torque.

CAUTION: Do not reuse recliner assembly attaching bolts. Due to the nylon coating on these bolts they are not reusable.

(3) Install bolts attaching recliner to seat back frame (Fig. 12). Tighten bolts to 8 N·m (71 in. lbs.) torque.

(4) Connect airbag wire harness connector and secure push pin. Be certain connector is securely connected.

(5) Connect heated seat element connector and secure push pin.

(6) Install seat cushion side shields. Refer to the procedure in this group.

(7) Install seat in vehicle. Refer to the procedure in this group.

(8) Connect the negative battery cable.

(9) Using the DRB III Scan Tool erase all DTC's and perform airbag system diagnostics.

Fig. 13 SEAT BACK WIRE HARNESS

- 1 - FRONT SEAT BACK
2 - SEAT AIRBAG WIRE HARNESS
3 - FRONT SEAT CUSHION

FRONT SEAT BACK COVER

REMOVAL

REMOVAL

- (1) Remove head restraint (Refer to 23 - BODY/SEATS/ARMREST - FRONT - REMOVAL).
- (2) Remove front seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).
- (3) Remove lumbar support handle, if equipped.
- (4) Disengage the J-strap retainer (Fig. 10).
- (5) Roll cover upward to hog rings. Cut hog rings to free cover (Fig. 14).
- (6) Roll cover to top of cushion and remove head restraint sleeve guides.
- (7) Remove cover from seat back.

Fig. 14 FRONT SEAT BACK HOG RINGS

- 1 - SEAT COVER
2 - HOG RINGS
3 - BACK PAD

REMOVAL - AIRBAG EQUIPPED

CAUTION: DO NOT REPLACE A DEPLOYED AIRBAG. IF SEAT AIRBAG HAS BEEN DEPLOYED THE ENTIRE SEAT OR SEAT BACK MUST BE REPLACED.

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Disconnect and isolate the negative battery cable (Fig. 15).
- (2) Remove the front seat from the vehicle. Refer to the procedure in this group.
- (3) Remove the front seat head restraint. Refer to the procedure in this group.
- (4) Remove the front seat back panel. Refer to the procedure in this group.
- (5) Remove the head restraint guide sleeves from the seat back. Refer to the procedure in this group.
- (6) Remove the front seat cushion side shield. Refer to the procedure in this group.
- (7) Release all J-strap retaining clips (Fig. 16).
- (8) Remove the outboard recliner attaching bolt (Fig. 17). This will allow access to the seat back heating element wire harness.
- (9) Disconnect heating element wire connector.
- (10) Disconnect seat airbag module electrical connector at the module. Slide the yellow locking tab down to release lock function. Then depress the two retaining tangs (located on the sides of the connector) and pull straight out (Fig. 18).
- (11) Remove the seat airbag module retaining nuts and plastic shield, if equipped. Carefully slide module from nylon sleeve (Fig. 18).

CAUTION: During module removal, be certain not to tear nylon sleeve. This will adversely affect the function of the airbag system.

- (12) Remove seat back foam and cover from frame.
- (13) Disengage velcro from cover. With one hand, hold velcro that is glued to seat back foam. With the other hand, grasp opposite velcro strip and pull apart to separate. This will prevent tearing velcro out of seat back foam.
- (14) Pull cover up far enough to access the remaining three hog rings. Cut hog rings from cover.
- (15) Remove cover from seat back foam.

INSTALLATION

INSTALLATION

NOTE: Do not reuse the recliner assembly attaching bolts.

- (1) Position cover at the top of seat back.
- (2) Carefully roll cover down to the area that hog rings are to be installed.
- (3) Install hog rings.
- (4) Roll cover downward.
- (5) Engage the J-strap retainer
- (6) Install lumbar support handle, if equipped.
- (7) Install new head restraint sleeve guides.

FRONT SEAT BACK COVER (Continued)

Fig. 15 NEGATIVE BATTERY CABLE REMOTE TERMINAL

- 3 - REMOTE TERMINAL

Fig. 16 SEAT BACK J-STRAP POSITION & ORIENTATION

- 1 - TRIM COVER J-STRAPS
- 2 - SEAT HEATER WIRE HARNESS
- 3 - SEAT AIRBAG WIRE HARNESS

(8) Install front seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).

(9) Install head restraint (Refer to 23 - BODY/SEATS/ARMREST - FRONT - INSTALLATION).

(10) Check seat back operation.

Fig. 17 RECLINER PIVOT BOLT

- 1 - RECLINER BOLT

Fig. 18 AIRBAG MODULE INSTALLATION

- 1 - Airbag Module Nylon Sleeve
- 2 - Airbag Module
- 3 - Seat Back Frame

INSTALLATION - AIRBAG EQUIPPED

- (1) Position cover on seat back foam.
- (2) Carefully roll cover down to the area that hog rings are to be installed. Install hog rings.
- (3) Roll cover downward, fastening velcro as you go.
- (4) Position seat back foam and cover on frame.

CAUTION: Seat Airbag Module Must Be Installed IN Nylon Sleeve. Failure To Do So Will Adversely Affect Function Of Airbag System.

FRONT SEAT BACK COVER (Continued)

(5) Carefully slide the seat airbag module in nylon sleeve (Fig. 18), install retaining nuts and plastic shield if equipped (Fig. 19). Torque the nuts to 7 N·m (62 in. lbs.).

(6) Connect seat airbag module electrical connector (Fig. 16). Be certain yellow locking tab is in the locked position after connection is made. Upon connection completion, double check connection by trying to disconnect without releasing yellow lock. If connector cannot be removed connection is secure.

(7) Connect heating element wire connector.

(8) Install the outboard recliner attaching bolt (Fig. 17). Torque the bolt to 8 N·m (71 in. lbs.).

(9) Engage J-strap retaining clips.

(10) Install the front seat cushion side shield. Refer to the procedure in this group.

(11) Install the head restraint guide sleeves in the seat back. Refer to the procedure in this group.

(12) Install the front seat back panel. Refer to the procedure in this group.

(13) Install the front seat head restraint. Refer to the procedure in this group.

(14) Install the front seat in the vehicle. Refer to the procedure in this group.

(15) Connect the negative battery cable.

(16) Using the DRB III® Scan Tool erase all DTC's and perform airbag system diagnostics.

(17) Check trim cover fit and finish and verify seat operation.

80bfe0cd

Fig. 19 INSTALLING SEAT AIRBAG MODULE ON SEAT BACK FRAME

SEAT BACK PANEL

REMOVAL - AIRBAG EQUIPPED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

(1) Disconnect and isolate the remote negative battery cable.

(2) Using a flat bladed trim tool, insert between upper portion of seat back cover and seat back panel. Gently pry panel away from seat back to free push pins.

(3) Grasp the middle edge portion of back panel and push inboard while pulling sharply to release retaining tabs (Fig. 20).

(4) Remove back panel from seat back frame.

80bfe0eb

Fig. 20 BACK PANEL MOUNTING

- 1 - BACK PANEL RETAINING TABS
- 2 - BACK PANEL RETAINING PUSHINS

SEAT BACK PANEL (Continued)

INSTALLATION - AIRBAG EQUIPPED

CAUTION: Always install new push pins in the upper mounting location of back panel. Failure to do so could adversely affect the airbag system.

(1) Starting at the bottom, line up back panel retaining tabs and new push pins. Then push sharply to snap in place.

(2) Check back panel fit and finish. Run a finger down the sides of back panel to be certain panel fits tight to the rear of trim cover.

CAUTION: Be certain seat back panel is properly secured in place. Failure to do so could adversely affect the airbag system.

(3) Connect the negative battery cable.

FRONT SEAT CUSHION

REMOVAL

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

(1) Remove track and recliner assembly (Refer to 23 - BODY/SEATS/SEAT TRACK & RECLINER ASSEMBLY - REMOVAL).

(2) Remove front seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).

(3) Disconnect seat cushion heater element connector, if equipped.

(4) Disconnect wire harness fasteners from cushion frame (Fig. 21).

(5) Remove seat cushion (Fig. 22).

INSTALLATION

(1) Install wire harness fasteners to cushion frame (Fig. 21).

(2) Connect seat cushion heater element connector, if equipped.

(3) Install track and recliner assembly (Refer to 23 - BODY/SEATS/SEAT TRACK & RECLINER ASSEMBLY - INSTALLATION).

80b3af95

Fig. 21 FRONT SEAT CUSHION WIRE HARNESS

80b3af96

Fig. 22 FRONT SEAT CUSHION

1 - FRONT SEAT CUSHION

(4) Install front seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).

FRONT SEAT CUSHION COVER

REMOVAL - HEATED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

FRONT SEAT CUSHION COVER (Continued)

- (1) Remove track and recliner assembly (Refer to 23 - BODY/SEATS/SEAT TRACK & RECLINER ASSEMBLY - REMOVAL).
- (2) Disconnect seat cushion heater element harness connectors from seat pan.
- (3) Remove seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).
- (4) Disengage J-strap attaching seat cover from the seat cushion frame (Fig. 23).
- (5) Peel cover from foam and foam from frame access the hog rings (Fig. 24).
- (6) Cut hog rings attaching seat cover seat cushion.
- (7) Route seat function switches through access hole on outboard side of seat cushion.
- (8) Remove seat cushion cover from seat cushion.

Fig. 23 FRONT SEAT CUSHION J- STRAP

1 - J-STRAP

Fig. 24 SEAT CUSHION COVER

1 - SEAT COVER
2 - HOG RINGS

INSTALLATION - HEATED

- (1) Position seat cover on cushion. Ensure to reposition seat anti squeak sheet to frame, if equipped.
- (2) Route seat function switches through access hole on outboard side of seat cushion. (Fig. 25)
- (3) Align seat cover with cushion alignment indentations.
- (4) Engage seat cushion heater element connector.
- (5) Install hog rings.
- (6) Engage J-strap attaching seat cover to front of seat cushion frame.
- (7) Install seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).
- (8) Connect seat cushion heater element harness connectors from seat pan.
- (9) Install track and recliner assembly (Refer to 23 - BODY/SEATS/SEAT TRACK & RECLINER ASSEMBLY - INSTALLATION).

Fig. 25 SEAT CUSHION ALIGNMENT INDENTATIONS

1 - SEAT CUSHION
2 - ALIGNMENT INDENTATIONS
3 - HOOK AND LOOP FASTENER

SEAT SIDE SHIELD

REMOVAL

REMOVAL - NON AIRBAG

- (1) Remove front seat from vehicle (Refer to 23 - BODY/SEATS/Front SEAT - REMOVAL).
- (2) Remove screws attaching seat cushion side shield to the bottom and side of seat cushion (Fig. 26) and (Fig. 27).
- (3) Remove shield from seat
- (4) Disconnect switch wire connectors, if equipped.
- (5) Remove seat switches, if equipped.

Fig. 26 BOTTOM VIEW OF SIDE SHIELD AND TIGHTENING SEQUENCE

Fig. 27 SIDE VIEW OF SIDE SHIELD

1 - SIDESHIELD FASTENERS

REMOVAL - AIRBAG EQUIPPED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: IF EQUIPPED WITH AIRBAG, AFTER THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE DISCONNECTING OR REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Disconnect and isolate the remote negative battery cable.
- (2) Remove seat from vehicle. Refer to the procedure in this group.
- (3) Remove screws attaching seat cushion side shield to the bottom and side of seat cushion (Fig. 26) and (Fig. 27).
- (4) Remove shield from seat
- (5) Disconnect switch wire connectors, if equipped.
- (6) Remove seat switches, if equipped.

INSTALLATION

INSTALLATION - NON AIRBAG

- (1) Transfer seat switches, if equipped.
- (2) Connect switch wire connectors to cushion side shield, if equipped.
- (3) Place shield in position on seat cushion.
- (4) Install screws attaching seat cushion side shield. Tighten screws in sequence, refer to (Fig. 26).
- (5) Install front seat (Refer to 23 - BODY/SEATS/Front SEAT - INSTALLATION).

INSTALLATION - AIRBAG EQUIPPED

- (1) Transfer seat switches, if equipped.
- (2) Connect switch wire connectors to cushion side shield, if equipped.
- (3) Place shield in position on seat cushion.
- (4) Install screws attaching seat cushion side shield. Tighten screws in sequence, refer to (Fig. 26).
- (5) Install seat. Tighten front screws to 61 N·m (45 ft. lbs.) and the rear screws to 61 N·m (45 ft. lbs.) torque.
- (6) Connect the remote negative battery cable.

LUMBAR SUPPORT

REMOVAL

The front seat lumbar support is not service separately. The front seat back frame will need to be replaced.

SEAT TRACK & RECLINER ASSEMBLY

REMOVAL

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Remove seat cushion side shield (Refer to 23 - BODY/SEATS/SEAT SIDE SHIELD - REMOVAL).
- (2) Remove bolts attaching seat back recliner to seat back frame on each side of seat (Fig. 28).
- (3) Remove bolts attaching seat adjuster to cushion pan (Fig. 29).
- (4) Disconnect wire harness fasteners from cushion pan.
- (5) Remove seat adjuster from seat cushion.

Fig. 28 RECLINER PIVOT BOLT

1 - RECLINER BOLT

INSTALLATION

- (1) Place seat adjuster in position on seat cushion pan.
- (2) Connect wire harness fasteners to the cushion pan.
- (3) Install bolts attaching seat adjuster to cushion pad.
- (4) Install seat back.

80b3af9a

Fig. 29 FRONT SEAT TRACK - TYPICAL

1 - ATTACHING BOLTS

- (5) Install bolt attaching seat back recliner to seat back on each side of seat. Tighten bolt to 8 N·m (71 in. lbs.) torque.
- (6) Install the seat cushion side shields (Refer to 23 - BODY/SEATS/SEAT SIDE SHIELD - INSTALLATION).

REAR ARMREST

REMOVAL

REMOVAL - 60/40

- (1) Fold down 40 side rear seat back.
- (2) Remove arm rest bolt (Fig. 30).
- (3) Remove retaining C-clip.
- (4) Remove arm rest.

80b2b486

Fig. 30 REAR SEAT ARM REST - 60/40

1 - BOLT
2 - RETAINING C-CLIP

REAR ARMREST (Continued)

REMOVAL - REAR SKI/PASS

- (1) Remove rear seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL). (Fig. 31)
- (2) Remove silencer panel fasteners on the back of seat back (Fig. 32).
- (3) Remove silencer panel.
- (4) Remove fasteners attaching arm rest to seat back (Fig. 33).
- (5) Remove arm rest (Fig. 34).

**Fig. 31 ARM REST WITH SKI PASS**

- 1 - FASTENERS

80b3afa2

Fig. 34 ARM REST REMOVAL

- 1 - ARM REST WITH SKI PASS

- (4) Reposition the seats.

INSTALLATION - REAR SKI/PASS

- (1) Place arm rest into position.
- (2) Install fasteners attaching arm rest to seat back. Tighten fasteners to 5 N·m (45 in. lbs.) torque.
- (3) Install silencer fasteners. Use new fasteners.
- (4) Install seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).

INSTALLATION**INSTALLATION - 60/40**

- (1) Place arm rest in bracket.
- (2) Install arm rest bolt. Tighten to 12 N·m (9 ft. lbs.) torque.
- (3) Install retaining C-clip.

REAR SEAT BACK

REMOVAL

REMOVAL

- (1) Remove rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REAR - REMOVAL).
- (2) Remove inboard nuts attaching rear seat back and belts to floor and outboard bolts attaching seat back to floor (Fig. 35).
- (3) Pull bottom of seat back out to slide rear seat back mounts off studs. Push rear seat back upward to disengage hooks at top of seat back.
- (4) Remove rear seat back from vehicle.

80866609

Fig. 35 REAR SEAT BACK

- 1 - REAR SEAT BACK MOUNTS
- 2 - REAR SEAT BACK
- 3 - REAR SEAT BELTS

REMOVAL - 40 SECTION

- (1) Remove seat back collar assembly (Refer to 23 - BODY/SEATS/REAR SEAT BACK - COLLAR ASSEMBLY - REMOVAL). (Fig. 36)
- (2) Remove bolt attaching 40 section (Fig. 37).
- (3) Slide seat back 40 section off pin and remove from the collar assembly (Fig. 38).

REMOVAL - 60 SECTION

- (1) Remove seat back collar assembly (Refer to 23 - BODY/SEATS/REAR SEAT BACK COLLAR ASSEMBLY - REMOVAL).
- (2) Remove bolt attaching 40 seat section.
- (3) Remove the 40 seat section.
- (4) Remove bolt attaching 60 seat section (Fig. 39).
- (5) Slide seat back 60 seat section off pivot bracket and remove from the collar assembly.

REMOVAL - 60/40 SEAT COLLAR ASSEMBLY

- (1) Remove rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION REAR - REMOVAL).
- (2) Remove nuts attaching rear seat back collar assembly.
- (3) Remove rear seat back collar assembly.
- (4) Remove the 40 seat section from the rear seat back collar assembly.
- (5) Remove the 60 seat section from the rear seat back collar assembly (Fig. 40).

INSTALLATION

INSTALLATION

- (1) Place rear seat back in position in vehicle.
- (2) Engage hooks at top of seat back.

REAR SEAT BACK (Continued)

80b3afa8

Fig. 38 40 Section Pivot Pin

1 - PIN

80866697

Fig. 40 REAR SEAT BACK COLLAR

1 - PIVOT BRACKET

80b3afa9

Fig. 39 REAR SEAT BACK 60 SECTION

1 - ATTACHING BOLT

(3) Install inboard nuts and outboard bolts attaching rear seat back and belts to floor. Tighten to 40 N·m (29 ft. lbs.) torque.

(4) Install rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REAR - INSTALLATION).

INSTALLATION - 40 SECTION

(1) Place seat back 40 section on pin.

(2) Install bolt attaching 40 section seat back to collar section. Tighten bolt to 16 N·m (12 ft. lbs.) torque.

(3) Install seat back collar assembly (Refer to 23 - BODY/SEATS/REAR SEAT BACK - COLLAR ASSEMBLY - INSTALLATION).

INSTALLATION - 60 SECTION

(1) Install the 60 seat section on pivot bracket.

(2) Install bolt attaching 60 seat section. Tighten bolt to 16 N·m (12 ft. lbs.) torque.

(3) Install the 40 seat section on pin.

(4) Install bolt attaching 40 seat section. Tighten bolt to 16 N·m (12 ft. lbs.) torque.

(5) Install seat back collar assembly (Refer to 23 - BODY/SEATS/REAR SEAT BACK COLLAR ASSEMBLY - INSTALLATION).

INSTALLATION - 60/40 SEAT COLLAR ASSEMBLY

(1) Install the 60 seat section from the rear seat back collar assembly.

(2) Install the 40 seat section from the rear seat back collar assembly.

(3) Place the rear seat back collar assembly in position in vehicle.

(4) Install nuts and bolts attaching rear seat back collar assembly. Tighten nuts and bolts to 40 N·m (29 ft. lbs.) torque.

(5) Install the rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION REAR - INSTALLATION).

REAR SEAT BACK COVER

REMOVAL

- (1) Remove rear seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
- (2) Pull cover over edges of the foam.
- (3) Cut hog rings to free cover.
- (4) Remove rear seat back cover from seat back.

INSTALLATION

- (1) Position seat back cover on seat back.
- (2) Install hog ring on right side listing pocket of cover to foam, starting in the middle and lining up the die cuts in the listing pocket with the hog ring windows in the foam (three places).
- (3) Repeat for the left side listing pocket of cover.
- (4) Place cover seams in salvage trenches of foam.
- (5) Roll corners and edges of cover over foam.
- (6) Flip seat over making sure cover is pulled up over frame on all corners. Push top, bottom, inside, outside, corners of the foam into the cover and engage J-strap retainers.
- (7) Install rear seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

REAR SEAT CUSHION

REMOVAL

- (1) Pull upward at forward edge of cushion each retainer loop of the rear seat cushion to disengage retainer loops from cups in floor (Fig. 41).
- (2) Remove rear seat cushion from vehicle.

Fig. 41 REAR SEAT CUSHION

- 1 - RETAINER LOOP
- 2 - REAR SEAT BACK
- 3 - REAR SEAT CUSHION
- 4 - CUPS

INSTALLATION

- (1) Place rear seat cushion in position.
- (2) Engage retainer loops into cup on floor kick up.
- (3) Push downward at forward edge at each retainer loop of the rear seat cushion to engage retainers.

REAR SEAT CUSHION COVER

REMOVAL

- (1) Remove rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION REAR - REMOVAL).
- (2) Disengage the J-strap retainers (Fig. 42).
- (3) Cut hog rings to free cover (Fig. 43).
- (4) Remove seat cushion cover from seat cushion.

Fig. 42 REAR SEAT CUSHION COVER J-STRAPS

1 - J-STRAPS

Fig. 43 REAR SEAT CUSHION COVER HOG RING

1 - HOG RINGS

INSTALLATION

- (1) Position seat cushion cover on cushion.
- (2) Install hog rings to seat cover.
- (3) Engage the J-strap retainers.
- (4) Steam wrinkles from seat cushion, if necessary.
- (5) Install seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION REAR - INSTALLATION).

SEAT ADJUSTERS

REMOVAL - AIRBAG EQUIPPED

WARNING: DISCONNECT AND ISOLATE THE NEGATIVE BATTERY CABLE REMOTE TERMINAL BEFORE BEGINNING ANY FRONT SEAT REMOVAL OR INSTALLATION PROCEDURE. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: ONCE THE NEGATIVE CABLE IS DISCONNECTED WAIT FOR 2 MINUTES BEFORE REMOVING ANY AIRBAG SYSTEM COMPONENTS.

- (1) Disconnect and isolate the remote negative battery cable.
- (2) Remove the front seat back. Refer to the procedure in this group.
- (3) Remove bolts attaching seat adjuster to cushion pan (Fig. 44).
- (4) Disconnect wire harness from cushion pan.
- (5) Remove seat adjuster from seat cushion.

80b3af9a

Fig. 44 FRONT SEAT TRACK - TYPICAL

1 - ATTACHING BOLTS

INSTALLATION - AIRBAG EQUIPPED

- (1) Place seat adjuster in position on seat cushion pan.
- (2) Connect wire harness to the cushion pan.
- (3) Install bolts attaching seat adjuster to cushion pad.
- (4) Install seat back. Refer to the procedure in this group.
- (5) Install bolt to attach seat back recliner to seat back on each side of seat. Tighten bolt to 8 N·m (71 in. lbs.) torque.
- (6) Connect the negative battery cable.
- (7) Using the DRB III® Scan Tool erase all DTC's and perform airbag system diagnostics.

STATIONARY GLASS

TABLE OF CONTENTS

	page		page
STATIONARY GLASS		WINDSHIELD	
DESCRIPTION	97	DESCRIPTION	98
BACKLITE		REMOVAL	98
REMOVAL	97	INSTALLATION	99
INSTALLATION	97		

STATIONARY GLASS

DESCRIPTION

Windshields and selected stationary glass are structural members of the vehicle. The windshield glass is bonded to the windshield frame with urethane adhesive.

BACKLITE

REMOVAL

- (1) Remove upper quarter trim panel (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - REMOVAL).
- (2) Disconnect the wire connectors from rear window defogger, and rear window mounted radio antenna, if so equipped.

WARNING: WEAR EYE AND HAND PROTECTION WHEN HANDLING SAFETY GLASS. PERSONAL INJURY CAN RESULT.

CAUTION: Do not damage body or trim finish when cutting out glass or applying fence primer.

- (3) Cut the urethane around the perimeter of the rear window glass. Refer to Windshield section of this group for proper procedures.
- (4) Remove the rear window from the vehicle.

INSTALLATION

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

- (1) Clean inside of rear window with ammonia based glass cleaner and lint free cloth.
- (2) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of rear window encapsulation (not to the glass) and wipe with clean/dry lint free cloth until no streaks are visible.
- (3) Apply Glass Primer 25 mm (1 in.) wide around perimeter of rear window encapsulation (not to the glass). Allow at least three minutes drying time.
- (4) Using a razor knife, remove as much original urethane as possible. Do not damage paint on rear window fence.
- (5) Apply pinch weld primer 15 mm (.75 in.) wide around the rear window fence. Allow at least three minutes drying time.
- (6) Apply a 10 mm (0.4 in.) bead of urethane to the encapsulation (Fig. 1).
- (7) With the aid of a helper, position the rear window over the opening.
- (8) Slowly lower rear window glass to the roof fence opening and engage over the two flanges located on the roof fence. Guide the encapsulation into proper position as necessary. Push rear window inward untill flush to roof line and C-pillars (Intrepid).
- (9) Clean excess urethane from exterior with Mopar® Super Kleen or equivalent.
- (10) Connect rear window defogger wiring connector, and rear window mounted radio antenna connector, if so equipped.
- (11) Install upper quarter trim panel (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - INSTALLATION).
- (12) After urethane has cured, water test rear window to verify repair. Verify rear window defogger operation, (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER GRID - DIAGNOSIS AND TESTING).

BACKLITE (Continued)

80866543

Fig. 1 REAR WINDOW GLASS - TYPICAL

- 1 - REAR WINDOW GLASS
2 - MOLDING
3 - URETHANE

WINDSHIELD

DESCRIPTION

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.

URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.

DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.

BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

VAPORS THAT ARE EMITTED FROM THE URE-

THANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.

SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.

ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

OPERATION

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

REMOVAL

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

(1) Remove inside rear view mirror (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).

(2) Remove cowl cover (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - REMOVAL).

(3) Remove drip rail weatherstrips as necessary to gain access to screws holding windshield side moldings (Fig. 2). Pull outward on molding at the bottom of A-pillars using pliers.

(4) Cut urethane bonding from around windshield using a suitable sharp cold knife. A pneumatic cutting device can be used if available. (Fig. 3)

(5) Remove windshield from vehicle.

WINDSHIELD (Continued)

**Fig. 2 Windshield Moldings**

- 1 - MOLDING
- 2 - WINDSHIELD
- 3 - FOAM BLOCK
- 4 - COWL
- 5 - FENDER

**Fig. 3 Cut Urethane**

- 1 - COLD KNIFE
- 2 - WINDSHIELD

INSTALLATION

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

CAUTION: Open the left front door glass before installing windshield to avoid pressurizing the passenger compartment. If a door is slammed before urethane bonding is cured, water leaks can result. Allow the urethane at least 24 hours to cure before returning the vehicle to use.

To avoid stressing the replacement windshield, the urethane bonding material on the windshield fence should be smooth and consistent to the shape of

the replacement windshield. The support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

(1) Replace the center lower foam block with a new one to prevent a buzz, squeak or rattle condition.

(2) Place replacement windshield into position and center in the opening against the support spacers.

(3) Verify the glass lays evenly against the pinch weld fence at the sides, top and bottom of the replacement windshield. If not, the pinch weld fence must be formed to the shape of the new glass.

(4) Mark the glass at the support spacers with a grease pencil or pieces of masking tape and ink pen to use as a reference for installation (Fig. 4).

(5) Remove replacement windshield from windshield opening.

(6) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 5).

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(7) Clean inside of windshield with ammonia based glass cleaner and lint free cloth.

(8) Apply molding to top edge of windshield.

(9) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of windshield and wipe with clean/dry lint free cloth until no streaks are visible.

(10) Apply Glass Primer 25 mm (1 in.) wide around perimeter of windshield. Allow at least three minutes drying time.

(11) Using a razor knife, remove as much original urethane as possible. Do not damage paint on windshield fence.

(12) Apply pinch weld primer 15 mm (.75 in.) wide around the windshield fence. Allow at least three minutes drying time.

(13) Apply a 10 mm (0.4 in.) bead of urethane along center line of windshield fence.

(14) With the aid of a helper, position the windshield over the windshield opening. Align the reference marks at the bottom of the windshield to the support spacers.

(15) Slowly lower windshield glass to windshield opening fence. Guide the molding into proper position as necessary. Push windshield inward molding is flush to roof line and A-pillars (Fig. 6).

(16) Clean excess urethane from exterior with Mopar® Super Kleen or equivalent.

WINDSHIELD (Continued)

(17) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(18) Install A-pillar moldings (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(19) Install cowl cover (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - INSTALLATION).

(20) Install inside rear view support bracket (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(21) Install inside rear view mirror (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(22) After urethane has cured, remove tape strips and water test windshield to verify repair.

SUNROOF

DESCRIPTION

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

OPERATION

The sunroof is electrically operated from a two switches located on the windshield header, rearward of the map lamp. To operate the sunroof the ignition switch must be in the On/Run position. One switch (CLOSE) is a push button type and used too close the sunroof. Pressing and holding the CLOSE button, the sunroof will fully close. If the CLOSE button is released prior to the sunroof reaching the fully closed position, the sunroof will stop in that position. The other switch (OPEN/VENT) is a rocker type for opening and venting the sunroof. Pressing and releasing the OPEN button once the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. To open the sunroof from the vent position, push and hold the open button. The sunroof will not

express open until you have passed through the full closed position. The OPEN button may be released and the sunroof will continue to open in the express open feature. If the VENT button is pressed and held while the sunroof is in the open position, the sunroof will travel to the close position and then to the vent position. Releasing the button at anytime during the travel will cause the sunroof to stop at that current position.

DIAGNOSIS AND TESTING

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. Refer to Sunroof Diagnostic Chart for possible causes. If not, a common electrical problem may exist. Refer to Wiring Diagram Information, of this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp high current fuse (battery feed) located in the Power Distribution Center (PDC). Check the cover of the PDC for location of the fuse. The ten amp fuse (ignition feed) located in cavity 14 of the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at battery and ignition pins of the power sunroof express module wiring connector. Refer to Wiring Diagram Information, for circuit information. The controller will not operate at less than 10 volts. Check the ground at the sunroof express module.

SUNROOF (Continued)

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof fully closed. The sunroof module has a water management system. During washing high-pressure water may be forced between the glass panel seal and the roof opening. Normally this water will drain. However, when some type of drying blower system is

used, like those found in automatic car washes, the water may not have a chance to drain before the blower forces air between the seal and the roof opening. This causes the water to blow over the edge of the module and onto the headlining.

Refer to (Fig. 1) Sunroof Assembly for exploded view of the sunroof.

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof express module, drive motor, control switch, and body harness. Faulty power circuit between sunroof express module, drive motor, switch, and body harness. Faulty sunroof drive motor. Faulty sunroof express module. Faulty sunroof drive motor connector.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof express module. Faulty drive motor.
Sunroof vents, but does not open.	Binding linkage. Faulty circuit. Faulty switch. Faulty sunroof controller. Faulty drive motor.
Sunroof does not vent	Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof express module.
Sunroof water leak.	Drain tubes clogged or kinked. Glass panel improperly adjusted. Faulty glass panel seal.
Wind noise from sunroof.	Front of glass panel too high or rear too low. Glass panel not centered in opening. Faulty glass panel seal.
Rattles from open sunroof while driving	Loose or broken attaching hardware. Worn or broken mechanism.
Rattles from closed sunroof while driving	Loose or broken attaching hardware. Worn or broken mechanism

4 - DRAIN HOSE
5 - A-PILLAR

HOUSING ASSEMBLY

REMOVAL

- (1) Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
- (2) Disconnect the drain tubes from sunroof housing (Fig. 2).
- (3) Loosen fasteners attaching sunroof housing assembly.
- (4) With the aid of a helper, remove fasteners attaching sunroof housing assembly to roof panel.

INSTALLATION

- (1) With the Glass panel in the fully closed position.
- (2) With the aid of a helper, raise rear end of sunroof housing assembly and guide into position and start fasteners.
- (3) Tighten the fasteners attaching the sunroof module to roof panel. Tighten the fasteners to 8.5 to 9 N·m (75 to 80 in. lbs.) torque.
- (4) Connect the drain tubes to the sunroof housing.
- (5) With the aid of a helper move the headliner through the rear door into position.
- (6) Engage headliner rear locating clip.
- (7) Connect sunroof harness connector at the C-post.
- (8) Connect wire harness connector along A-post to fuse panel.
- (9) Connect mirror wiring connector.
- (10) Connect wire harness connector along A-post to fuse panel.
- (11) Connect battery negative cable.
- (12) Move both front seats into proper position.
- (13) Test sunroof operation, adjust as necessary.
- (14) Finish installing the headliner. Ensure that door weatherstrips are in position (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

DRIVE MOTOR

REMOVAL

NOTE:

The sunroof system is timed from the factory so that the motor shuts off automatically when the sunroof window reaches a certain position. Extreme care must be taken when removing the motor, timing may be thrown off causing possible damage to the sunroof system. Anytime the motor is removed from the sunroof assembly the sunroof glass panel must be in the **FULLY CLOSED POSITION** or the unit will be out of time. The drive motor cannot be reset to the park position after being removed. Refer to sunroof timing.

- (1) Move glass panel to the fully closed position.
- (2) Disconnect the control switch wire connector.
- (3) Remove headliner as necessary to gain access to sunroof drive motor (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
- (4) Disconnect the drive motor wire harness connectors (Fig. 3).

Fig. 3 SUNROOF DRIVE MOTOR AND EXPRESS MODULE

- 1 - EXPRESS MODULE
2 - SCREW

- (5) Remove drive motor fasteners and remove motor from the sunroof housing.

INSTALLATION

- (1) Ensure that the glass panel is in the fully closed position before mounting the motor. If motor fails with the window in the open position the sunroof glass panel timing will have to be timed. The new motor comes in the fully closed position and with a gage for setting cable timing. Refer to Sunroof Glass Panel Timing.
- (2) Place drive motor into position on the sunroof housing and install fasteners. (Fig. 3)
- (3) Set headliner into position.
- (4) Connect express module, drive motor, and control switch wire connectors.
- (5) Test sunroof operation, adjust as necessary.
- (6) Finish installing the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
- (7) Connect the control switch wire connector.

GLASS PANEL

REMOVAL

- (1) Slide sunshade rearward to the open position.
- (2) Move the glass panel to the fully closed position.
- (3) Remove the four attaching screws (Fig. 4).
- (4) Lift off glass panel and remove from vehicle.

Fig. 4 SUNROOF GLASS PANEL REMOVAL

1 - ATTACHING SCREW

INSTALLATION

- (1) Position glass panel, centered to opening.
- (2) Start the four attaching screws.
- (3) Tighten screws.
- (4) Verify sunroof operation and alignment. Check fit and adjust as necessary, refer to Sunroof Glass Panel Adjustment for proper procedures.

ADJUSTMENTS

ADJUSTMENT

- (1) Move the sunshade rearward to the open position.
- (2) Move the sunroof glass panel to the fully closed position.
- (3) Loosen the forward screws on each side enough to make the front adjustment.
- (4) Adjust the front of the sunroof glass panel 1 mm (1/32 inch) below the top surface of the roof panel.
- (5) Tighten the front two screws.

(6) Loosen the rear screws on each side enough to make the rear adjustment.

(7) Adjust the rear of the sunroof glass panel 1 mm (1/32 inch) above the top surface of the roof panel.

(8) Tighten the rear two screws.

(9) Check for proper fit. If not OK, repeat glass panel adjustment.

ADJUSTMENT - SUNROOF GLASS PANEL TIMING

Sunroof Drive Cable Timing

NOTE: A gage comes with the new motor.

(1) If the glass panel was not in the fully closed position, when the sunroof drive motor was removed, the sunroof glass panel needs to be timed, before the new motor is installed.

(2) Remove sunroof glass panel.

(3) Set gage into the track near the rear of the opening between the move driver slide and the bracket (Fig. 5).

(4) Move the driver slide forward or aft to get proper setting.

(5) Repeat the operation on the other side.

(6) Install sunroof drive motor.

80b34e19

Fig. 5 SUNROOF DRIVE CABLE TIMING

1 - MOVE DRIVER SLIDE FORWARD/AFT

HOUSING DRAIN HOSE

REMOVAL

FRONT HOSES

- (1) Move glass panel to the fully closed position.
- (2) Disconnect the control switch and wire connector.
- (3) Remove headliner as necessary (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
- (4) Remove side kick cowl panel.
- (5) Disconnect drain hose clips from body holes (Fig. 6) and/or (Fig. 7).
- (6) Drain any liquid from hose connection, if necessary.
- (7) Remove old hoses between trim and metal and replace with new.
- (8) Work the hose back and forth to loosen.
- (9) Attach the end of the old hose to the end of the new hose.
- (10) Pull the old hose down and through instrument panel dragging new hose with it, until end of new hose is near grommet on side cowl.
- (11) Remove drain grommet from sheet metal.
- (12) Remove old hose from new hose.

Fig. 6 FRONT

- 1 - A-PILLAR
2 - DRAIN HOSE
3 - GROMMET

REAR HOUSING HOSE

- (1) Move glass panel to the fully closed position.
- (2) Disconnect the control switch and wire connector.

Fig. 7 FRONT RIGHT

- 1 - DRAIN HOSE
2 - A-PILLAR
3 - GROMMET

- (3) Remove headliner as necessary (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

- (4) Remove rear shelf panel (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - REMOVAL).

- (5) Disconnect the end of the drain tube from the rubber grommet at the end of the drain tube closest to the rear window of the vehicle (Fig. 8).

- (6) Drain any liquid from hose connection, if necessary.

- (7) Disconnect the top end of the drain hose from the sunroof housing drain nipple.

- (8) Remove drain hose clips from the body holes.

INSTALLATION

FRONT HOSES

- (1) Insert end of new hose into drain grommet and replace grommet into sheet metal (Fig. 6) and/or (Fig. 7).

- (2) Attach hose upper clips into holes in sheet metal.

- (3) Engage upper flair end of hose into sunroof module drain nipple and secure with ratchet clamp.

REAR HOUSING HOSE

- (1) Using the proper drain hose (there is a right and left side rear hose) attach drain hose clips to body holes, with the flair at the top towards the sunroof nipple.

HOUSING DRAIN HOSE (Continued)

80b2b701

Fig. 8 REAR DRAIN HOSE

1 - DRAIN HOSE
2 - HOSE FASTENERS

3 - DRAIN GROMMET

(2) Connect top flair end of the drain hose to the sunroof housing drain nipple with the ratchet clamp (Fig. 8).

(3) Connect the lower end of the drain tube to the rubber grommet near the rear window of the vehicle.

(4) Connect the drain hose to the sunroof housing and test drainage.

(5) Install shelf panel, ensure not to pinch the rubber grommets (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - INSTALLATION).

(6) Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(7) Connect the control switch wire connector. Install control switch.

(8) Test for proper operation of the sunroof.

MODULE ASSEMBLY

REMOVAL

(1) Move the glass panel to the fully closed position.

(2) Lower headliner as necessary to gain access to the sunroof express module (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(3) Disconnect the express module wire harness connectors. (Fig. 3)

(4) Remove express module screw.

(5) Remove express module from the keyway by sliding module towards the center of the vehicle.

INSTALLATION

(1) Insert sunroof express module in the keyway located in the sunroof module and slide the module outward to lock it into position.

(2) Install the sunroof express module screw.

(3) Connect the wire connectors to the sunroof express module.

(4) Install the headliner into position (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(5) Test sunroof operation, adjust if necessary.

SUNSHADE

REMOVAL

(1) Open sunroof approximately 90% of the way.

(2) Push sunshade down until tabs clear glass.

(3) Move sunshade forward of glass panel.

(4) Using a flat blade tool, remove front guide blocks from track. By pushing block toward the center of the vehicle (Fig. 9).

(5) Slide the sunshade forward while lifting the front through the opening until the rear guide blocks are accessible.

CAUTION: Use care not to crease the sunshade when removing or installing.

(6) Disengage rear guide blocks from track.

SUNSHADE (Continued)

80b3afc1

Fig. 9 SUNSHADE GUIDE BLOCK

- 1 - GUIDE BLOCK
2 - GUIDE BLOCK SPRING

INSTALLATION

- (1) Install the sunshade from outside of the vehicle with the sunroof 90% open.
- (2) Put rear guide blocks into sunshade guide track.
- (3) Push sunshade back and down through the sunroof opening.
- (4) Using a flat blade tool, put front guide blocks into the sunshade track. By pushing the block towards the center of the vehicle.
- (5) Push sunshade back to the glass panel.
- (6) Push sunshade down until the sunshade clears the glass then move sunshade rearward behind the glass panel.

WIND DEFLECTOR**REMOVAL**

- (1) Open sunroof glass panel.
- (2) Push down one corner of the wind deflector and let the other corner rise up (Fig. 10).
- (3) Push the low corner towards the opposite side of the vehicle until tab on sunshade clears the body. Then raise the corner up.
- (4) Repeat the procedure to the other corner.
- (5) Lift wind deflector to 90% of the way.
- (6) Push the attaching ends of the deflector to the rear of the vehicle to disengage the deflector.

80b3afc2

Fig. 10 WIND DEFLECTOR

- 1 - WIND DEFLECTOR
2 - TAB

INSTALLATION

- (1) Place wind deflector at 90% in the vertical position to the sunroof. With the sunroof open.
- (2) Push ends of the deflector towards the front of the vehicle to engage ends.
- (3) Lower wind deflector to normal position.
- (4) Push one corner to the opposite side of the vehicle until tab clears vehicle body and lower deflector for that corner.
- (5) Push the side that was just installed completely down.
- (6) Push the opposite corner cross vehicle until tab clears the body. Then lower deflector to position.
- (7) Test sunroof operation.

REMOVAL	112		

DOOR OPENING WEATHERSTRIP

REMOVAL

- (1) Remove door opening sill plate (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
- (2) Pull body mounted weatherstrip from fence around door opening (Fig. 1).

80b2a1f7

Fig. 1 FRONT DOOR BODY MOUNTED WEATHERSTRIP

- 1 - FRONT DOOR OPENING
- 2 - FRONT DOOR BODY MOUNTED WEATHERSTRIP
- 3 - PINCH FLANGE

INSTALLATION

- (1) Position color dot on weatherstrip at the B-pillar upper corner.
- (2) Engage weatherstrip on the fence at upper B-pillar and work down the B-pillar.
- (3) Engage weatherstrip along the header and down the A-pillar.
- (4) Engage weatherstrip along the sill. There may be slack material work it to the front of the opening.
- (5) Verify weatherstrip sealing.

DRIP RAIL WEATHERSTRIP

REMOVAL

- (1) Open front and rear doors.
- (2) Remove fasteners attaching drip rail weatherstrip to body and fender tip. (Fig. 2).
- (3) Remove drip rail weatherstrip from vehicle.

DRIP RAIL WEATHERSTRIP (Continued)

Fig. 2 DRIP RAIL WEATHERSTRIP

- 1 - A-PILLAR
- 2 - WINDSHIELD
- 3 - FASTENERS
- 4 - DRIP RAIL WEATHER-STRIP
- 5 - FASTENERS

INSTALLATION

- (1) Place drip rail weatherstrip in position on vehicle.
- (2) Start position clip at the fender tip.
- (3) Press down till holes are align with fastener holes in the body.
- (4) Install fasteners to attach drip rail weatherstrip to roof rail.
- (5) Close doors and verify fit.

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

- (1) Remove door glass (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL).
- (2) Loosen side view mirror.
- (3) Pull weatherstrip from lower front channel above door latch.
- (4) Pull run weatherstrip from window frame channel (Fig. 3).

INSTALLATION

- (1) Clean butyl material from door flange area.
- (2) Place door run weatherstrip in position on window frame channel.
- (3) Push door run weatherstrip into window frame channel.
- (4) Push weatherstrip into lower front channel above door latch.
- (5) Install door glass (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION).
- (6) Tighten side view mirror.

Fig. 3 DOOR GLASS RUN WEATHERSTRIP

- 1 - FRONT DOOR MOLDING
- 2 - GLASS RUN WEATHERSTRIP
- 3 - REAR GLASS RUN CHANNEL

- 4 - FRONT DOOR
- 5 - FRONT GLASS RUN CHANNEL

FRONT DOOR MOUNTED WEATHERSTRIP

REMOVAL

- (1) Using a fork type prying tool, disengage push pin fasteners attaching weatherstrip to lower door (Fig. 4).
- (2) Remove weatherstrip from door.

80b2a1f6

Fig. 4 FRONT DOOR MOUNTED WEATHERSTRIP

- 1 - FRONT DOOR
2 - PUSH-IN FASTENERS

INSTALLATION

- (1) Place door mounted weatherstrip in position.
- (2) Engage push pin fasteners to attach weatherstrip to lower door.
- (3) Verify door alignment and seal

REAR DOOR BODY MOUNTED WEATHERSTRIP

REMOVAL

- (1) Remove door opening sill plate (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
- (2) Pull body mounted weatherstrip from fence around door opening (Fig. 5).

80b2a22f

Fig. 5 REAR DOOR BODY MOUNTED WEATHERSTRIP

- 1 - REAR DOOR OPENING
2 - REAR DOOR BODY MOUNTED WEATHERSTRIP
3 - PINCH FLANGE

INSTALLATION

- (1) Position color dot on weatherstrip at the B-pillar upper corner.
- (2) Engage weatherstrip on the fence at upper B-pillar and work down the B-pillar.
- (3) Engage weatherstrip along the header and down the C-pillar.
- (4) Engage weatherstrip along the sill. There may be slack material, work the slack material to the front of the opening.
- (5) Install the door opening sill plate (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).
- (6) Verify weatherstrip sealing.

REAR DOOR GLASS RUN WEATHERSTRIP

REMOVAL

- (1) Remove door glass (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - REMOVAL).
- (2) Pull weatherstrip from lower rear channel above door latch (Fig. 6).
- (3) Pull run weatherstrip from window frame channel.

INSTALLATION

- (1) Clean butyl material from door flange area.
- (2) Place door run weatherstrip in position on window frame channel.
- (3) Push door run weatherstrip in position on window frame channel.
- (4) Push weatherstrip into lower rear channel above door latch.
- (5) Install door glass (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION).

80b11ccf

Fig. 6 REAR DOOR GLASS RUN

1 - REAR DOOR MOLDING
2 - GLASS RUN
3 - REAR GLASS RUN CHANNEL

4 - REAR DOOR
5 - FRONT GLASS RUN CHANNEL

REAR DOOR MOUNTED WEATHERSTRIP

REMOVAL

- (1) Using a fork type prying tool, disengage push in fasteners attaching weatherstrip to lower door.
- (2) Remove body mounted weatherstrip from pinch weld around door opening (Fig. 7).

80b5751a

Fig. 7 REAR DOOR MOUNTED WEATHERSTRIP

- 1 - REAR DOOR OPENING
- 2 - REAR DOOR MOUNTED WEATHERSTRIP
- 3 - SEAL INSERT
- 4 - PAINT DOT
- 5 - PINCH FLANGE

INSTALLATION

- (1) Place door mount weatherstrip in position on door with the paint dot in the upper corner of the B-pillar.
- (2) Install push pin fasteners to attach door mounted weatherstrip to lower door.
- (3) Verify door alignment and seal.

TRUNK OPENING WEATHERSTRIP

REMOVAL

- (1) Open decklid.
- (2) Pull decklid weatherstrip from decklid opening fence (Fig. 8).
- (3) Remove weatherstrip from vehicle.

80b2b415

Fig. 8 DECKLID WEATHERSTRIP - TYPICAL

- 1 - TRUNK LID WEATHERSTRIP

INSTALLATION

- (1) Place weatherstrip in position on vehicle.
- (2) Push decklid weatherstrip onto decklid opening fence with molded joint at striker location.
- (3) Verify decklid operation and sealing.

This diagram illustrates the W2 welding operation on the rear fuselage. It shows a perspective view of the aircraft's rear section, including the fuselage, wings, and tail. A dashed line outlines the area to be welded. Four arrows originate from a point labeled 'W2' at the bottom center, pointing to four specific locations marked with '+' signs on the dashed outline. A label 'W2 - WELDING OF 2' is located in the bottom right corner. An arrow labeled 'FWD' points towards the left, indicating the forward direction.

HEATING & AIR CONDITIONING

DESCRIPTION - ENGINE COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the HVAC system, the engine cooling system must be properly maintained. Refer to Cooling for more information-(Refer to 7 - COOLING - OPERATION).

The use of a bug screen is not recommended. Any obstructions in front of the radiator or condenser can reduce the performance of the A/C and/or engine cooling system.

WARNING: DO NOT OPEN COOLING SYSTEM WHEN HOT AS PERSONAL INJURY OR DAMAGE TO VEHICLE MAY RESULT.

OPERATION - ENGINE COOLING SYSTEM REQUIREMENTS

The engine cooling system is designed to develop internal pressure of 97 to 123 kPa (14 to 18 psi). Wait 15 minutes (after the engine is shut off), or until safe temperature and pressure is attained, before opening the cooling system. Refer to Cooling(Refer to 7 - COOLING - OPERATION). Coolant temperature can be checked using the scan tool (DRBIII®).

When additional coolant is needed, it should be added to the coolant pressure bottle. Use only 50/50 mix of Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (orange in color), or the equivalent and distilled water. This coolant must not be mixed with

other (green in color) coolants. If this occurs, a reduction in the extended service interval will result. Refer to Lubrication and Maintenance for service schedules(Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

CAUTION: Do not add additional inhibitors, anti-rust products, or soluble oil (sold as “water pump lubricants”). These products may not be compatible with the engine coolant.

Refer to Cooling for cooling system procedures(Refer to 7 - COOLING - STANDARD PROCEDURE).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST

The air conditioning system is designed to remove heat and humidity from the air entering the passenger compartment. The evaporator, located in the HVAC unit, is cooled to temperatures near the freezing point. As warm damp air passes over the fins in the evaporator, moisture in the air condenses to water, dehumidifying the air. High humidity reduces the evaporator's ability to cool the air. During periods of high heat and humidity, an air conditioning system will be less effective. With the a/c heater control set to RECIRC, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, A/C performance levels rise.

HEATING & AIR CONDITIONING (Continued)

PERFORMANCE TEST PROCEDURE

Before performing the following procedure, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING). Air temperature in test room and in vehicle must be 21° C (70°F) minimum for this test.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

- (1) Connect a tachometer and manifold gauge set or an A/C Charging/Recycling Station.
- (2) Set controls:

MTC (Manual Temperature Control) System:

- A/C ON
- Panel Recirculation
- Temperature to full cold
- High blower

ATC (Automatic Temperature Control) System:

- Rotate blower knob to high position (full clockwise)

- Set temperature to the LO position
- Push panel mode button
- Push RECIRC (Recirculation) button (A/C and RECIRC symbols should be lit)

NOTE: The word **MANUAL** should appear in the ATC display, confirming that the system is set manually.

(3) Start engine and hold at 1000 rpm with A/C clutch engaged.

(4) Engine should be warmed up with doors and windows closed.

(5) Insert a thermometer in the left center A/C outlet and operate the engine for five minutes. The A/C clutch may cycle depending on ambient conditions.

(6) **With the A/C clutch engaged**, compare the discharge air temperature to the A/C Performance Temperature table.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

AMBIENT TEMPERATURE	21°C (70°F)	26.5°C (80°F)	32.5°C (90°F)	37°C (100°F)	43°C (110°F)
MAXIMUM ALLOWABLE AIR TEMPERATURE AT CENTER LEFT PANEL OUTLET	6°C (42°F)	7°C (45°F)	10°C (50°F)	12°C (54°F)	15°C (59°F)
COMPRESSOR DISCHARGE PRESSURE	1379–1585 kPa (200–230 psi)	1448–1723 kPa (210–250 psi)	1654–1930 kPa (240–280 psi)	1930–2206 kPa (280–320 psi)	2206–2516 kPa (320–365 psi)
COMPRESSOR SUCTION PRESSURE	103–172 kPa (15–25 psi)	139–208 kPa (20–30 psi)	172–241 kPa (25–35 psi)	208–276 kPa (30–40 psi)	241–310 kPa (35–45 psi)

DIAGNOSIS AND TESTING - HEATER PERFORMANCE TEST

PRE-DIAGNOSTIC PREPARATIONS

Check the coolant level, drive belt tension, vacuum line connections, electrical connections, radiator air flow and fan operation. Start engine and allow to warm up to normal temperature.

WARNING: DO NOT REMOVE RADIATOR CAP WHEN ENGINE IS HOT, SEVERE PERSONAL INJURY CAN RESULT.

If vehicle has been run recently, wait until engine is cool before removing cap. Squeeze the radiator

hose to check temperature, and for pressure in the system. If the hose is very firm, allow time to cool down. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT: TEST AND ACTION

Engine coolant is provided to the heater system by two 19 mm (3/4 inch inside diameter) heater hoses. With engine idling at normal running temperature, set the control to maximum heat, floor, and high blower setting. Using a test thermometer, check the air temperature coming from the floor outlets. Refer to Temperature Reference Table.

HEATING & AIR CONDITIONING (Continued)

TEMPERATURE REFERENCE TABLE

Ambient Temp.		Minimum Floor	Outlet Temp.
Celsius	Fahrenheit	Celsius	Fahrenheit
15.5°	60°	62.2°	144°
21.1°	70°	63.8°	147°
26.6°	80°	65.5°	150°
32.2°	90°	67.2°	153°

If the floor outlet air temperature is insufficient, refer to Cooling for specifications (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). Both heater hoses should be HOT to the touch (coolant return hose should be slightly cooler than the supply hose). If coolant return hose is much cooler than the supply hose, locate and repair engine coolant flow obstruction in heater system.

POSSIBLE LOCATIONS OR CAUSE OF OBSTRUCTED COOLANT FLOW

- (1) Pinched or kinked heater hoses.
- (2) Improper heater hose routing.
- (3) Plugged heater hoses or supply and return ports at cooling system connections, refer to Cooling.
- (4) Plugged heater core.
- (5) Air locked heater core.
- (6) If coolant flow is verified and outlet temperature is insufficient, a mechanical problem may exist.

POSSIBLE LOCATION OR CAUSE OF INSUFFICIENT HEAT

- (1) Obstructed cowl air intake.
- (2) Obstructed heater system outlets.
- (3) Blend door not functioning properly.
- (4) Low coolant level
- (5) Air locked heater core or air in cooling system

TEMPERATURE CONTROL

If temperature cannot be adjusted with the TEMP knob/button on the control panel, the following could require service:

- (1) Blend door binding.
- (2) Faulty blend door actuator.
- (3) Improper engine coolant temperature.
- (4) Faulty A/C Heater Control. (Refer to Appropriate Diagnostic Information)

DIAGNOSIS AND TESTING - SELF DIAGNOSTICS**DIAGNOSTIC TROUBLE CODES (DTC's)**

Both the Automatic Temperature Control (ATC) and the Manual Temperature Control (MTC) systems are controlled by the Body Control Module (BCM). Both systems can be diagnosed by the DRBIII® scan tool or the vehicles own control head display. Refer to the DRBIII® menu for checking Diagnostic Trouble Codes (DTC's). Note that there are three DTC tables. The ATC and MTC DTC table contain faults that are common to both the ATC and the MTC system. The same diagnosis can be used for both systems. The DTC's cover operation of the climate control unit actuators, doors, evaporator temperature sensor, ambient temperature sensor and the A/C refrigerant system. The MTC DTC table covers Fault Codes that are for the MTC Control Head and wiring and are not used on an ATC system. The ATC DTC table has DTC's for ATC Head Communications, In-Car Temperature Sensor and Sun Sensor which are not in a MTC system.

Some conditions of low battery voltage or extremely cold weather can generate a DTC for the climate control system actuators, evaporator probe, in-car temperature sensor (ATC), or ambient temperature sensor, even in a properly operating system. It is recommended that all the DTC's be checked as follows to assure a part is faulty.

Climate Control Sensor DTC Check

- (1) Clear the DTC.
- (2) Operate the HVAC system with the engine running for a minimum of 30 seconds.
- (3) Check for DTC's.
- (4) Perform diagnostics if the DTC appears again. (Refer to Appropriate Diagnostic Information)

Climate Control Actuator Check.

- (1) Clear the DTC.
- (2) Perform HVAC system calibration. (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - HVAC SYSTEM CALIBRATION)
- (3) Perform diagnostics if the DTC appears again. (Refer to Appropriate Diagnostic Information)

If a DTC does not appear when using the procedures above, check the history of the vehicle for a low battery condition, or ambient temperatures below 40°F. Removing connections without disconnecting the battery may also generate a DTC on a good part. The battery should always be disconnected when servicing electrical parts.

27	ATC IN-CAR SENSOR FAILURE
34	ENGINE TEMPERATURE MESSAGE NOT RECEIVED
36	ATC CONTROL COMMUNICATION FAILURE

TROUBLE CODES FROM THE ATC HEAD

The trouble codes can be checked with the ATC control if a DRBIII® scan tool is not available. The control head can only be placed into the diagnostic mode while the engine is running and the vehicle is not moving. Set the control to a 75° F setting (so there is no confusion with the 23-51 Diagnostic Trouble Codes (DTC's) (Fig. 1).

To place the system into its diagnostic mode, press and hold the Floor, Mix and Defrost buttons (at the same time). The ATC head display will begin to blink. Release the Floor, Mix and Defrost buttons. Once the control head enters the diagnostic mode, the display on the control head will continue to blink. This occurs until it completes its tests and climate control unit door/actuator calibrations. Then it will display any diagnostic trouble codes that are present in the BCM. If there are no diagnostic trouble codes, the system will return to its normal operation as indicated by the temperature symbol (C or F). Diagnostic trouble codes related to the ATC and climate control unit will appear on the display in numerical form. The diagnostic trouble codes are stored in the BCM and can range between 23 and 51. The ATC control can only show one diagnostic trouble code at a time. Under certain circumstances, more than one diagnostic trouble code could be in the memory. To scroll through any additional diagnostic trouble codes, press the Panel Mode button on the ATC control. **It is important that no other knob or button is pushed until all codes are read. Pushing any button except Panel Mode or turning a knob will end the diagnostic test without showing the rest of the trouble codes. There also may be other trouble codes stored in the BCM not related to the Climate Control System. These codes can only be found using the DRBIII® scan tool.**

HEATING & AIR CONDITIONING (Continued)

80b34db0

Fig. 1 ENTERING SELF-DIAGNOSTIC MODE

1 - PRESS BUTTONS SIMULTANEOUSLY

TROUBLE CODES FROM THE MTC HEAD

The trouble codes can be checked with the MTC head and the Odometer Display of the Mechanical Instrument Cluster if a DRBIII® scan tool is not available. The MTC Head can only be placed into the diagnostic mode while the engine is running and the vehicle is not moving. To place the system into its diagnostic mode, adjust the MTC to the following settings: (Fig. 2)

- (1) The engine must be running with vehicle not moving.
- (2) The Fan Speed set to any speed except OFF.
- (3) The Temperature Knob in full cold (full counterclockwise position).
- (4) The mode knob must be placed in defrost position (full clockwise position).
- (5) The A/C button can be ON or OFF.
- (6) Press and hold the EBL button until the Mechanical Instrument Cluster Odometer display indicates an "AC00". The body control module (BCM) will chime once and the MTC A/C button LED will begin blinking.
- (7) Release the EBL button and wait until the MTC A/C button LED stops blinking. This means that the error check and climate control unit door calibration is complete.

80b34db1

Fig. 2 MTC CONTROL HEAD

Diagnostic trouble codes related to the MTC head and the climate control unit will appear on the odometer display in numerical form after the letters "AC". The diagnostic trouble codes are stored in the BCM and can range between 23 and 51. The odometer display will return to normal operation if no trouble codes are found. If a problem is found, then the odometer will display the letters "A/C" followed by the trouble code number. The odometer display can only show one diagnostic trouble code at a time. Under certain circumstances, more than one diagnostic trouble code could be in the memory. To scroll through any additional diagnostic trouble codes, press the A/C button on the MTC head. The BCM will beep each time the A/C button is pushed. Continue pushing the A/C button and recording the trouble code numbers until the odometer returns to normal operation (note the letters AC will disappear). **It is important that no other knob or button is pushed until all codes are read. Pushing any button except the A/C button or turning a knob will end the diagnostic test without showing the rest of the trouble codes. There also may be other trouble codes stored in the BCM not related to the Climate Control System. These codes can only be found using the DRBIII® scan tool.**

ERASING DIAGNOSTIC TROUBLE CODES (DTC's)

Diagnostic trouble codes can be cleared from the memory two ways:

- The DRBIII® scan tool
- Power to the BCM can be disconnected for ten minutes by disconnecting the battery negative remote cable.

If the scan tool is to be used, refer to the Appropriate Diagnostic Information.

CAUTION: Fault code 26 can be created if the in-car sensor thermistor is disconnected while the BCM is operating. This can happen by disconnecting connectors from the BCM or the ATC Control Head when the battery is connected (even if the ignition switch is OFF). To correct, clear the fault code 26 from the BCM.

DIAGNOSIS AND TESTING - ERRATIC OPERATION OF HVAC SYSTEM

Erratic operation of the A/C and heater systems including:

- Lack of cold air
- Lack of hot air
- Unrequested mode change (ATC only)
- No control of mode or temperature control or tapping blend door noise

HEATING & AIR CONDITIONING (Continued)

These symptoms may be accompanied by the following Diagnostic Fault Codes (DTC's):

- Blend door feedback
- Blend door stall
- A/C Control Mode door input shorted to battery
- In-car temp sensor failure
- ATC messages not received
- Mode door stall

Check for the presence of DTC's with the DRB III®. If the symptoms and or DTC's listed above are present, perform the following Repair Procedure:

With the vehicle at room temperature 10 to 27° C (50 to 80° F), pull the M-1 fuse for five minutes to erase any DTC's. Replace the fuse and start the vehicle to recalibrate the HVAC system. Operate the vehicle and A/C heater system to verify that symptoms and or DTC's are gone. If tapping noise or blend stall/feedback DTC's re-occur, additional diagnosis will be required.

STANDARD PROCEDURE - HVAC SYSTEM CALIBRATION

This procedure may be performed on both the ATC and MTC systems.

- (1) Start engine and let run.
- (2) If the vehicle has an ATC system, turn the control head on.
- (3) Set the temperature controls to the full cold position for two minutes.
- (4) Set the temperature controls to the full heat position for five minutes.

SPECIFICATIONS

A/C APPLICATION TABLE-ATC

Item	Description	Notes
Vehicle	LH - Intrepid, Concorde, 300M, LHS	Automatic Temperature Control (ATC)
System	R134a w/expansion valve

A/C COMPRESSOR CLUTCH

DESCRIPTION

The compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate. The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is retained with a bolt. These components provide the means to engage and disengage the compressor from the engine serpentine accessory drive belt.

OPERATION

When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the a/c heater control head (ATC or MTC), the evaporator temperature sensor, the a/c pressure transducer, the compressor clutch relay, and the Powertrain Control Module (PCM). The PCM

A/C COMPRESSOR CLUTCH (Continued)

may delay compressor clutch engagement for up to thirty seconds. Refer to Electronic Control Modules for more information on the PCM controls.

DIAGNOSIS AND TESTING - COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). The battery must be fully-charged before performing the following tests. Refer to Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) In A/C, mix, defrost and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within 0.2 volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within 0.2 volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRBIII® scan tool and (Refer to Appropriate Diagnostic Information) for testing of the compressor clutch circuit. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the Power Distribution Center (PDC)
- A/C heater control head
- Compressor clutch relay
- A/C pressure transducer
- Evaporator temperature sensor
- Powertrain Control Module (PCM).

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is approximately 2.2 amperes with the electrical system voltage at 11.5 to 12.5 volts. This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is four amperes or more, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

STANDARD PROCEDURE**INSPECTION**

Examine the friction surfaces of the clutch pulley and the front plate for wear. The pulley and front plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for oil. Remove the felt from the front cover. If the felt is saturated with oil, the shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

STANDARD PROCEDURE - A/C COMPRESSOR CLUTCH BREAK- IN

After new clutch installation, cycle the A/C clutch 20 times (5 seconds ON and 5 seconds OFF). During this procedure, set the system to the A/C mode, engine rpm at 1500-2000, and high blower speed. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher clutch torque capability.

NOTE: Excessive clutch gap will result in clutch slippage or non-engagement.

REMOVAL

The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement. The compressor clutch can be serviced in the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Unplug the compressor clutch coil wire harness connector.

(4) Remove the bolts that secure the compressor to the mounting bracket.

(5) Remove the compressor from the mounting bracket. Support the compressor in the engine compartment while servicing the clutch.

(6) Remove the compressor shaft bolt (Fig. 1). A band type oil filter removal tool can be placed around the clutch plate to aid in bolt removal.

(7) Tap the clutch plate with a plastic hammer and remove clutch plate and shim(s) (Fig. 2).

CAUTION: Do not use screwdrivers between the clutch plate assembly and pulley to remove front plate as this may damage the front plate assembly.

A/C COMPRESSOR CLUTCH (Continued)

(8) Remove pulley retaining snap ring with Snap Ring Pliers (C-4574), and slide pulley assembly off of compressor (Fig. 3).

Fig. 1 COMPRESSOR SHAFT BOLT AND CLUTCH PLATE

(10) Remove snap ring retaining field coil onto compressor housing (Fig. 4). Slide field coil off of compressor housing.

Fig. 4 CLUTCH COIL SNAP RING

- 1 - SNAP RING PLIERS
- 2 - CLUTCH COIL
- 3 - SNAP RING
- 4 - COMPRESSOR

A/C COMPRESSOR CLUTCH (Continued)

INSTALLATION

(1) Align pin in back of field coil with hole in compressor end housing, and position field coil into place. Make sure that lead wires are properly routed, and fasten the diode and coil wire bracket with retaining screw.

(2) Install field coil retaining snap ring with Snap Ring Pliers (C- 4574). Press snap ring to make sure it is properly seated in the groove.

NOTE: The bevel side of the snap ring must be outward. Also both eyelets must be to the right or left of the pin on the compressor.

CAUTION: If snap ring is not fully seated it will vibrate out, resulting in a clutch failure and severe damage to the front face of the compressor. Do not mar the pulley frictional surface.

(3) Install pulley assembly to compressor. If necessary, tap gently with a block of wood on the friction surface (Fig. 5).

(4) Install pulley assembly retaining snap ring (bevel side outward) with Snap Ring Pliers (C-4574). Press the snap ring to make sure it is properly seated in the groove.

NOTE: The bevel side of the snap ring must be facing outward.

(5) If the original front plate assembly and pulley assembly are to be reused, the old shim(s) can be used. If not, place a trial stack of shims, 2.54 mm (0.10 in.) thick, on the shaft against the shoulder.

(6) Install front plate assembly onto shaft.

(7) If installing a new front plate and/or pulley assembly, the gap between front plate and pulley face must be checked. Use the following procedure:

(a) Attach a dial indicator to front plate so that movement of the plate can be measured.

(b) With the dial indicator zeroed on the front plate, energize the clutch and record the amount of movement.

(c) The readings should be 0.35 to 0.65 mm (0.014 to 0.026 in.). If proper reading is not obtained, add or subtract shims until desired reading is obtained.

(8) Install compressor shaft bolt. Tighten to 17.5 ± 2 N·m (155 ± 20 in. lbs.).

NOTE: Shims may compress after tightening shaft nut. Check air gap in four or more places to verify if air gap is still correct. Spin pulley for final check.

9324-62

Fig. 5 INSTALLING PULLEY ASSEMBLY

1 - PULLEY ASSEMBLY
2 - WOOD BLOCK

(9) Install the accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

A/C COMPRESSOR CLUTCH RELAY

DESCRIPTION

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

OPERATION

The a/c compressor clutch relay is a electromechanical device that switches battery current to the a/c compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the a/c heater control (Manual Temperature Control, or Automatic Temperature Control), the Body Control Module (BCM), and the a/c pressure transducer.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

A/C COMPRESSOR CLUTCH RELAY (Continued)

DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH RELAY**RELAY TEST**

The compressor clutch relay (Fig. 6) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see Relay Circuit Test in the Diagnosis and Testing section of this group. If not OK, replace the faulty relay.

87A - NORMALLY CLOSED

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal cavity (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the compressor

clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM wire harness connector C (gray) at all times. If not OK, repair the open circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 7).

80ae0e99

Fig. 7 POWER DISTRIBUTION CENTER (PDC)

1 - POWER DISTRIBUTION CENTER COVER
2 - POWER DISTRIBUTION CENTER

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug the compressor clutch relay from the PDC.

INSTALLATION

(1) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

A/C HEATER CONTROL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the ash receiver assembly, if necessary.
- (3) Remove the instrument panel center trim bezel and remove the two electrical connectors from the back of the control head and traction control switch (if equipped) (Fig. 8) and (Fig. 9).

Fig. 8 INSTRUMENT PANEL CENTER TRIM BEZEL REMOVE/INSTALL

- (4) From the back of the center trim bezel, remove the six retaining screws from the a/c heater control head and remove from the bezel.

80b27c5e

Fig. 9 A/C HEATER CONTROL REMOVE/INSTALL

1 - RETAINING SCREWS

INSTALLATION

- (1) Place the control into place on the back of the instrument panel center bezel and install the six retaining screws to the a/c heater control.
- (2) Connect the two electrical connectors to the back of the control head and traction control switch (if equipped).
- (3) Install the instrument panel center bezel.
- (4) Install the ash receiver assembly, if necessary.
- (5) Connect the negative battery cable remote terminal to the remote battery post.
- (6) To allow the BCM to learn the new control head, perform HVAC system calibration. (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - HVAC SYSTEM CALIBRATION)

A/C PRESSURE TRANSDUCER

REMOVAL

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Fig. 10).
- (2) Disconnect the wire harness connector from the a/c pressure transducer.

CAUTION: A slight release of pressure trapped in the fitting may be experienced. It is not necessary to discharge the refrigerant system.

- (3) Remove the transducer with a counterclockwise rotation using a 14 mm open-end wrench.

A/C PRESSURE TRANSDUCER (Continued)

Fig. 10 NEGATIVE BATTERY CABLE REMOTE TERMINAL

- 1 - RIGHT STRUT TOWER
- 2 - AIR CLEANER INLET TUBE
- 3 - REMOTE TERMINAL

INSTALLATION

- (1) Install the a/c pressure transducer on the discharge line fitting and tighten to 6 N·m (50 in. lbs.).
- (2) Plug in the wire harness connector to the a/c pressure transducer.
- (3) Connect the battery negative cable to the remote battery post.

AMBIENT TEMP SENSOR**REMOVAL**

The ambient air temperature sensor is located on the inside of the right front bumper beam (Fig. 11). This sensor will inform the ATC system of the ambient temperature outside the vehicle. This sensor is used by the ATC system to adjust blower speed, temperature offsets, evaporator temperatures and mode control.

- (1) Remove sensor mounting screw.
- (2) Disconnect sensor wiring connector.

INSTALLATION

- (1) Connect the sensor wiring harness connector.
- (2) Install the sensor fastener screw and tighten to 2.2 N·m (20 in. lbs.).

Fig. 11 AMBIENT TEMPERATURE SENSOR LOCATION

- 1 - AMBIENT TEMPERATURE SENSOR
- 2 - FRONT FASCIA
- 3 - POWER STEERING COOLER

POWER MODULE**DESCRIPTION**

The blower motor power module is only used in vehicles equipped with Automatic Temperature Control (ATC). It is located on the lower right side of the HVAC unit housing, and is controlled by the Body Control Module (BCM).

OPERATION

The power module receives pulse width modulated (PWM) signals from the BCM. The power module varies voltage to the blower motor for different blower speeds based on the ATC software. There are 14 selectable speeds, while the Auto mode provides 256 variations.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

POWER MODULE (Continued)

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).
- (2) Remove lower right underpanel silencer/duct.
- (3) Disconnect wiring connector to the power module.
- (4) Remove the power module retaining screws.
- (5) Pull the power module out of HVAC housing.

INSTALLATION

- (1) Install the power module in the HVAC housing.
- (2) Install the two screws that secure the power module to the HVAC housing and tighten to 2.2 N·m (20 in. lbs.).
- (3) Plug in the harness connector to the power module.
- (4) Install the lower right underpanel silencer/duct.
- (5) Connect the negative battery cable remote terminal to the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

BLOWER MOTOR RESISTOR BLOCK

DESCRIPTION

Vehicles with manual air conditioning (non-ATC) systems will have a blower motor resistor block. The resistor block is mounted to the lower right side of the HVAC housing in the passenger compartment, where it can be accessed for service.

The blower motor resistor has multiple resistor wires, each of which will change the resistance in the blower motor ground path to change the blower motor speed. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected blower motor speed.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

With the blower motor switch in the lowest speed position the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR BLOCK

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Unplug the wire harness connector from the blower motor resistor.
- (3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).
- (2) Remove lower right underpanel silencer/duct.
- (3) Disconnect wiring connector to the blower motor resistor.

BLOWER MOTOR RESISTOR BLOCK (Continued)

(4) Remove the blower motor resistor retaining screws.

(5) Remove the blower motor resistor from the HVAC housing.

INSTALLATION

(1) Install the blower motor resistor in the HVAC housing.

(2) Install the two screws that secure the blower motor resistor to the HVAC housing and tighten to 2.2 N·m (20 in. lbs.).

(3) Plug in the harness connector to the blower motor resistor.

(4) Install the lower right underpanel silencer/duct.

(5) Connect the negative battery cable remote terminal to the remote battery post (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

EVAPORATOR TEMPERATURE SENSOR**DESCRIPTION**

The evaporator temperature sensor is a temperature sensing element located at the coldest point on the face of the evaporator. The evaporator temperature sensor prevents condensate water on the evaporator coil from freezing which can block airflow. The probe is a thermistor inside a metal tube which is wedged between the evaporator fins. The metal tube is tightly held by the evaporator fins so that the thermistor in the tube will detect the temperature of the evaporator. The thermistor will change resistance as the temperature changes.

OPERATION

The Body Control Module (BCM) will send a Programmable Communications Interface (PCI) bus message to the Powertrain Control Module (PCM), which will check engine, coolant temperature, and refrigerant pressure temperature before turning ON the A/C Compressor Clutch. Turning ON the A/C Compressor Clutch will allow the system to cool the evaporator. The BCM will send a message to the PCM when the evaporator temperature becomes too cold. The PCM will then turn OFF the A/C Compressor Clutch, before evaporator freeze up occurs. The DRBIII® scan tool can be used to monitor this operation. The temperature set point at which the clutch is turned OFF varies with the outside ambient temperature. The temperature at which the clutch is turned ON is pre-set to 2° F above the OFF setpoint mentioned above. Refer to Evaporator Temperature Sensor Set point table and (Fig. 12) for the correct setpoint.

80b34d5f

Fig. 12 EVAPORATOR TEMPERATURE SENSOR SET POINT

EVAPORATOR TEMPERATURE SENSOR SET POINT	
AMBIENT TEMPERATURE SENSOR READING °F (°C)	A/C CLUTCH OFF EVAPORATOR TEMPERATURE SET POINT °F (°C)
185 (85)	31 (-0.5)
100 (37.7)	31 (-0.5)
77 (25)	34 (1.1)
60 (15.5)	35 (1.6)
-70 (-56.6)	36 (2.2)

REMOVAL

(1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).

(2) Remove the right under panel silencer.

(3) Disconnect the wiring connector for the evaporator probe.

(4) At the center of the HVAC housing, locate the evaporator probe access plate. Using a flat blade pry tool, pull back on the locking tab. Twist the access plate counter clockwise one-quarter turn, and push the plate inside the HVAC housing (Fig. 13).

(5) Orient the plate in such a way that allows it to be pulled through the mounting hole, and remove it.

(6) Pull the evaporator probe out of evaporator core.

INSTALLATION

The new probe must not go into the same hole (in the evaporator coil) that the old probe was removed.

(1) The evaporator is manufactured with three holes for probe insertion. Insert the probe in the uppermost hole.

(2) Insert the access plate inside the HVAC housing and orientate it so that the locking tab is one-

EVAPORATOR TEMPERATURE SENSOR (Continued)

Fig. 13 EVAPORATOR PROBE NEEDLE

1 - EVAPORATOR PROBE

quarter turn clockwise to where the tab snaps into the HVAC case detent. Note that the plate will be flush with the outside of the HVAC housing.

(3) Turn the plate one-quarter turn counter clockwise to seat the locking tab in the HVAC case detent.

(4) Connect the wiring harness connector for the evaporator probe.

(5) Install the right under panel silencer.

(6) Connect the negative battery cable remote terminal to the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

IN-CAR TEMPERATURE SENSOR

DESCRIPTION

The Automatic Temperature Control (ATC) in-car temperature sensor returns electrical signals to the Body Control Module (BCM). The in-car temperature sensor is used on ATC equipped vehicles only. The in-car temperature sensor is made up of two parts. One part is the in-car sensor aspirator motor assembly, and the second part is a temperature thermistor. The in-car sensor aspirator motor assembly attaches to the back of the ATC Control head (Fig. 14). This assembly has a small fan and a motor which draws air through the intake on the front of the ATC control. The in-car sensor thermistor is located inside of the ATC Control Head. The in-car sensor aspirator motor is part of the ATC Control and not a separate serviceable part. The ATC Control must be replaced if there is a fault relating to the motor. The in-car temperature sensor thermistor is part of the ATC Control and not a separate serviceable part. One must replace the ATC Control if the ATC self-diag-

nostics indicates a fault code. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - SELF DIAGNOSTICS)

Fig. 14 ATC IN-CAR TEMPERATURE SENSOR

1 - ATC IN-CAR TEMPERATURE SENSOR

OPERATION

Air drawn from the passenger compartment by the in-car sensor aspirator motor assembly, and flows over the thermistor. The in-car sensor thermistor changes resistance with air temperature. The BCM measures this resistance and calculates the temperature of the air drawn into the ATC Control. The ATC system then makes adjustments to maintain the optimum passenger compartment comfort. Refer to the ATC In-Car Sensor Aspirator Motor Operation table for when the ATC Sensor is operating.

IN-CAR SENSOR ASPIRATOR MOTOR OPERATION	
CONDITION	MOTOR OPERATION
IGNITION SWITCH IS ON	MOTOR ALWAYS OPERATES, EVEN WHEN ATC CONTROL HEAD "OFF" BUTTON IS PUSHED
VEHICLE IS DRIVEN, THEN THE IGNITION SWITCH IS TURNED OFF	MOTOR TURNS OFF WHEN THE IGNITION SWITCH IS TURNED OFF
VEHICLE DOOR IS OPENED, AND LEFT OPEN, WITHOUT TURNING ON THE IGNITION SWITCH	MOTOR WILL TURN ON, AND THEN TURN OFF APPROXIMATELY 2 MINUTES FROM THE TIME THE DOOR WAS OPENED
VEHICLE DOOR IS OPENED, AND THEN CLOSED, WITHOUT TURNING ON THE IGNITION SWITCH	MOTOR WILL TURN ON, AND THEN TURN OFF APPROXIMATELY 2 MINUTES AFTER THE DOOR WAS CLOSED

IN-CAR TEMPERATURE SENSOR (Continued)

DIAGNOSIS AND TESTING - IN-CAR SENSOR ASPIRATOR MOTOR

(1) Perform air flow test to check the aspirator motor assembly.

(a) Turn ignition to the ON position and push the OFF button to stop the ATC system airflow. This will make it easier to observe paper in step b.

(b) Place a small piece of newspaper in front of the aspirator motor opening on the ATC control. If the paper sticks to the opening, the in-car sensor aspirator motor is operating properly. The piece of paper should be only large enough to cover the grille opening (Fig. 15).

80b1b454

Fig. 15 ATC IN-CAR TEMPERATURE SENSOR

1 - GRILLE OPENING

(2) Check if the electrical connection and connector are OK.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

If the ATC in-car temperature sensor (fault 26) is verified to be bad, or if there is a problem with the in-car sensor aspirator motor, then the ATC control must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

BLEND DOOR ACTUATOR**DESCRIPTION**

The blend door actuator is an electric motor which mechanically positions the blend door. A potentiometer in the actuator allows the BCM (for both manual and ATC systems) to know the exact position of the blend door at all times. The blend door actuator is not serviceable and must be replaced if found to be defective.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).

(2) Remove the left and right underpanel silencer/ducts.

(3) Remove the two screws from the actuator which are accessible from the right side of the center stack (Fig. 16).

(4) Remove one screw from actuator on the left side.

(5) Pull the actuator straight down from shaft and disconnect the electrical connection. Upon removal, note the shaft position of the actuator, because the shaft on this motor is keyed. When installing a new actuator, its shaft must be positioned in the same location.

INSTALLATION

(1) Connect the wire harness connector to the blend door actuator.

(2) Install the blend door actuator on the HVAC housing, making sure its keyed shaft is positioned properly.

(3) Install the three fastener screws and tighten to 2.2 N·m (20 in. lbs.).

(4) Install the left and right underpanel silencer/ducts.

BLEND DOOR ACTUATOR (Continued)

- 6 - HVAC PLENUM CONNECTOR

(5) Connect the negative battery cable remote terminal to the remote battery post (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

MODE DOOR ACTUATOR

DESCRIPTION

The mode door actuator is an electric motor. It mechanically positions the panel/bi-level door and the floor/defrost door. This actuator contains a potentiometer which allows the BCM (for both manual and ATC systems) to know the exact position of the mode doors at all times. The mode door actuator is not serviceable and must be replaced if found to be defective.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS

IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).

(2) Remove the left and right underpanel ducts.

(3) Remove the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL). Refer to Body for the procedures.

(4) Remove the center floor heat adaptor duct.

(5) Remove the rear seat heat forward adaptor duct.

(6) Loosen the center support bracket and pry rearward to gain access to the actuator.

(7) Remove the actuator retaining screws. Then pull the actuator straight down. Upon removal, note the shaft position of the actuator, because the shaft on this motor is keyed. When installing a new actuator, its shaft must be positioned in the same location (Fig. 17).

80b2b46e

Fig. 17 MODE DOOR ACTUATOR LOCATION

- 3 - EVAPORATOR TEMPERATURE SENSOR
- 4 - BLOWER MOTOR RESISTOR BLOCK/POWER MODULE
- 5 - BLEND DOOR ACTUATOR
- 6 - HVAC PLENUM CONNECTOR

(8) Remove the electrical connection on the actuator.

MODE DOOR ACTUATOR (Continued)

INSTALLATION

(1) Connect the wire harness connector to the mode door actuator.

(2) Install the mode door actuator on the HVAC housing, making sure its keyed shaft is positioned properly.

(3) Install the three fastener screws and tighten to 2.2 N·m (20 in. lbs.).

(4) Reposition the center support bracket and install fastener. Refer to Body for the procedures.

(5) Install the rear seat heat forward adaptor duct.

(6) Install the center floor heat adaptor duct.

(7) Install the floor console(Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(8) Install the left and right underpanel ducts.

(9) Connect the negative battery cable remote terminal to the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

80b2b46e

RECIRCULATION DOOR ACTUATOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The recirculation door actuator is located on the right side of the heater housing (Fig. 18).

(1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Remove the instrument panel(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

Fig. 18 RECIRCULATION DOOR ACTUATOR LOCATION

- 1 - MODE DOOR ACTUATOR
- 2 - RECIRCULATION DOOR ACTUATOR
- 3 - EVAPORATOR TEMPERATURE SENSOR
- 4 - BLOWER MOTOR RESISTOR BLOCK/POWER MODULE
- 5 - BLEND DOOR ACTUATOR
- 6 - HVAC PLENUM CONNECTOR

(3) Remove the actuator retaining screws. Pull the actuator straight off the recirculation door shaft. Upon removal, note the shaft position of the actuator, because the shaft on this motor is keyed. When installing a new actuator, its shaft must be positioned in the same location.

(4) Disconnect the electrical connection.

(5) Remove the recirculation door actuator from vehicle.

INSTALLATION

(1) Connect the wire harness connector to the recirculation door actuator.

(2) Install the recirculation door actuator on the HVAC housing, making sure its keyed shaft is positioned properly.

(3) Install the three fastener screws and tighten to 2.2 N·m (20 in. lbs.).

(4) Install the instrument panel(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Connect the negative battery cable remote terminal to the remote battery post.

SUN SENSOR

DESCRIPTION

The sun sensor is only used on vehicles equipped with Automatic Temperature Control (ATC). The sensor is mounted on the top of the instrument panel below the instrument panel top cover (Fig. 19).

80b1b451

Fig. 19 ATC SUN SENSOR

OPERATION

The sun sensor is not a thermistor type sensor but rather a photo diode. For this reason the sun sensor responds to sun light intensity rather than temperature. It is used to aid in determining proper mode door position, temperature door position and blower speed. The sun sensor is also used to sense day/night conditions for automatic headlight control if so equipped, and has an LED indicator for the vehicle security system.

The sun sensor is not serviceable and must be replaced if found to be defective.

DIAGNOSIS AND TESTING - SUN SENSOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The sun sensor is located so the sun hits the sensor in the same way that it hits the driver and the passenger. It is important that the area in front of the sensor be unobstructed. Check that the following items are not in the way of the sun sensor.

- Windshield wipers that are adjusted too high.
- Stickers on the windshield that are directly in front of the sensor.
- Top cover which is not properly installed. The sun sensor should be 1/4 inch. above the top cover.
- Caps or papers which might cover the sensor.

Some ATC equipped vehicles may exhibit a lack of passenger comfort in sunny weather such as in the early afternoon. Verify that the ATC system is functioning properly. Inspect the location of the sun sensor. The sun sensor must protrude approximately 1/4 inch above the instrument panel top cover to insure proper operation. If the sensor does not protrude 1/4 inch, perform the following procedure:

- Confirm that the top cover is properly installed
- Remove the top cover
- Remove fasteners from sun sensor
- Install one 1/4-20 nut per fastener under the sun sensor so that it is shimmed higher
- Reinstall the sun sensor. Do not overtighten screw. If a longer screw is required, use 8-15x1 inch.

Refer to the proper Diagnostic Information for the electrical test.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the instrument panel top cover(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
- (3) Remove the two Sun Sensor mounting screws.
- (4) Lift the sensor out of the instrument panel and disconnect the wiring.
- (5) Remove the sensor from the vehicle.

SUN SENSOR (Continued)

INSTALLATION

(1) Connect the wiring harness connector to the sensor and position in the vehicle.

(2) Install the two sensor fasteners.

(3) Install the instrument panel top cover(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

(4) Connect the negative battery cable remote terminal to the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

CAUTION: The sun sensor must protrude approximately 1/4 inch above the instrument panel top cover. This will ensure proper operation.

If the sensor does not protrude 1/4 inch, perform the following procedure:

- Confirm that the top cover is properly installed
- Remove the top cover
- Remove fasteners from sun sensor
- Install one 1/4-20 nut per fastener under the sun sensor so that it is shimmed higher
- Reinstall the sun sensor. Do not overtighten screw. If a longer screw is required, use 8-15x1 inch.

DISTRIBUTION

DESCRIPTION

DESCRIPTION - HVAC SYSTEM AIRFLOW

The system draws outside air through the cowl opening at the base of the windshield. Then it goes into the plenum chamber above the HVAC unit housing and passes through the evaporator. At this point airflow can be directed either through or around the heater core.

DESCRIPTION - HVAC FORCED
RECIRCULATION

The Body Control Module (BCM) receives a Programmable Communications Interface (PCI) bus message from the Powertrain Control Module (PCM) with the feedback from the A/C Pressure Transducer. The BCM will force the system into the Recirculation mode, reducing the A/C refrigerant pressure under these extreme conditions. The reduced operating pressure offers improved A/C system performance and reduced wear on A/C components.

OPERATION - HVAC SYSTEM AIRFLOW

Airflow temperature can be adjusted by the blend door with the TEMP control on the a/c heater control. After the air passes the blend door, the air flow is then directed from the PANEL, BI-LEVEL (panel and floor), and FLOOR-DEFROST outlets. Air flow velocity can be adjusted with the blower speed selector switch on the a/c heater control.

Ambient air intake can be shut off by closing the recirculation door. This will recirculate the air that is already inside the vehicle. See owners manual for recirculation operation.

BLOWER MOTOR

DESCRIPTION

The blower motor and blower wheel are located in the passenger side end of the HVAC housing, below the glove box module. The blower motor controls the velocity of the air flowing through the HVAC housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and blower wheel can be serviced from the passenger compartment side of the housing.

OPERATION

The blower motor will only operate when the ignition switch is in the On position, and the a/c heater mode control switch is in any position, except off. The blower motor circuit is protected by a fuse in the junction block. On models with the standard manual temperature control system, the blower motor speed is controlled by regulating the battery feed through the blower motor switch and the blower motor resistor. On models with Automatic Temperature Control (ATC) system, the blower motor speed is controlled by using a linear blower controller with a pulse width modulation input. The blower motor power module adjusts the battery feed voltage to the blower motor, based upon an input from the blower motor switch, through the ATC control module. Pulse width modulation of blower power allows the blower to operate at any speed from stationary, to full speed.

The blower motor and blower motor wheel cannot be repaired, and if faulty or damaged, they must be replaced. The blower motor and blower wheel are not serviced separately and must be replaced as an assembly.

BLOWER MOTOR (Continued)

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).
- (2) Remove the lower right under panel duct.
- (3) Remove the blower motor connector from the blower motor resistor block/power module.
- (4) Squeeze the blower motor wiring grommet and push the grommet through the blower motor housing cover.
- (5) Remove the blower motor housing cover.
- (6) Remove the blower motor retaining screws.
- (7) Lower the blower motor from housing.

INSTALLATION

- (1) Install the blower motor in the HVAC housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Install the blower motor housing cover.
- (3) Position the blower motor wiring grommet in the blower motor housing cover.
- (4) Connect the blower motor harness connector to the blower motor resistor block/power module.
- (5) Install the lower right under panel duct.
- (6) Connect the negative battery cable remote terminal to the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

HVAC HOUSING

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE,

THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS IN THE FRONT OF PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

- (1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post(Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).
- (2) Remove the instrument panel from vehicle(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
- (3) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)
- (4) Drain the engine cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
- (5) Remove the air cleaner hose and air distribution duct from the engine.
- (6) Remove the spring type heater hose fasteners at the dash panel and remove the hoses from heater core. Plug the heater core inlet and outlet tubes to prevent anti-freeze from spilling on the vehicle interior during removal. If an appropriate plug cannot be found pull back carpet and use caution when removing the HVAC housing. Keep the heater tubes elevated to prevent spillage of coolant.
- (7) Remove one nut at expansion valve retaining both A/C lines to expansion valve. After removing the lines cap the expansion valve openings and the A/C hose openings. This will prevent any dirt or moisture from entering the refrigerant system during servicing.

CAUTION: The lubricant used in this air conditioning system absorbs moisture readily (similar to brake fluid). Do not leave any portion of the system open for extended periods of time.

- (8) Remove the three retaining nuts from the studs. These studs project through the dash panel into the engine compartment.
- (9) Remove two screws to the defrost duct and remove.
- (10) Remove two nuts, and two screws attaching the HVAC housing to the dash panel.

HVAC HOUSING (Continued)

- (11) Remove four nuts retaining the rear seat heat duct, and remove.
- (12) Remove the rear seat heat duct elbow push pin fastener.
- (13) Disconnect the HVAC harness connector.
- (14) Gently pull the HVAC unit housing rearward from the dash panel, being careful not to spill any coolant into the passenger compartment.

DISASSEMBLY

- (1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)
- (2) Place HVAC housing on a workbench.
- (3) Remove the heater core retaining screws. Pull back on the retaining tabs and remove the heater core from the housing.
- (4) Remove the recirculation door actuator wiring. Remove the actuator from the recirculation housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - REMOVAL)
- (5) Remove the lower distribution housing.
- (6) Remove the mode door actuator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL)
- (7) Remove the blend door actuator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/BLEND DOOR ACTUATOR - REMOVAL)
- (8) Remove the recirculation housing screws and clip.
- (9) Remove the blower motor wiring at the blower motor resistor block/power module.
- (10) Squeeze the blower motor wiring grommet and push the grommet through the blower motor cover.
- (11) Remove the blower motor cover.
- (12) Remove the blower motor retaining screws and remove the motor.
- (13) Remove the blower motor resistor block/power module.
- (14) Remove the evaporator temperature probe. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/EVAPORATOR TEMPERATURE SENSOR - REMOVAL)
- (15) Remove the vent door seal from the HVAC housing.
- (16) Remove the evaporator seal from the HVAC housing.
- (17) Remove the upper housing screws and clips.
- (18) Separate the upper half of the HVAC housing from the lower half.
- (19) Remove the evaporator assembly from the lower housing.
- (20) Remove the blend door from the lower housing.

- (21) Using a flat blade screwdriver, pinch in the retaining tab at the base of the vent door. Pull up on door and remove it from the HVAC housing.
- (22) Remove the mode door actuating cam.
- (23) Remove the screw at defrost door actuating arm. Remove the defrost door link from the arm.
- (24) Remove the defrost door arm from the lower HVAC housing.
- (25) Remove the link and defrost door from the HVAC housing.
- (26) Remove the vent door actuating arm from the lower HVAC housing.

ASSEMBLY

- (1) Install the vent door actuating arm to the lower HVAC housing.
- (2) Install the defrost door link to the defrost door.
- (3) Install the defrost door and link into the HVAC housing.
- (4) Install the defrost door actuating arm and retaining screw to the HVAC housing.
- (5) Install the defrost door link to the actuating arm.
- (6) Line up the slots to the pegs on the mode door cam, and install the mode door cam.
- (7) Turn the HVAC housing over and snap in the vent door to the vent door arm.
- (8) Install the blend door in the HVAC housing.
- (9) Install the evaporator into the lower HVAC housing.
- (10) Install the upper housing onto the lower housing.
- (11) Install the screws that secure the two housing halves to each other and tighten to 2.2 N·m (20 in. lbs.).
- (12) Install the evaporator and vent door seals on the HVAC housing.
- (13) Insert the evaporator temperature sensor in the evaporator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/EVAPORATOR TEMPERATURE SENSOR - INSTALLATION) **If the same evaporator is being used, the new probe must not go into the same hole (in the evaporator coil) that the old probe was removed.** The evaporator is manufactured with three holes for probe insertion. Insert the probe in the uppermost hole. If a new evaporator is installed, place the evaporator probe in the same location as on the previous evaporator.
- (14) Install the wiring at the evaporator temperature probe.
- (15) Install the blower motor resistor block/power module.
- (16) Install the blower motor in the HVAC housing. Install the blower motor mounting screws and tighten to 2.2 N·m (20 in. lbs.).

HVAC HOUSING (Continued)

(17) Thread the blower motor wiring through the blower motor cover, and install the blower motor housing cover.

(18) Seat the blower motor wiring grommet in the blower motor housing cover.

(19) Install the blower motor wiring to the blower motor resistor.

(20) Position the recirculation housing to the HVAC housing. Install the retaining screws and clip.

(21) Install the blend door actuator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ BLEND DOOR ACTUATOR - INSTALLATION)

(22) Install the mode door actuator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ MODE DOOR ACTUATOR - INSTALLATION)

(23) Install the lower distribution housing.

(24) Install the recirculation door actuator and wiring. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - INSTALLATION)

(25) Install heater core in the HVAC housing. Tighten the retaining screws to 2.2 N·m (20 in. lbs.).

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

(1) Position the HVAC housing to the dash panel. Be certain that the evaporator condensate drain tube and the mounting studs are inserted into their correct mounting holes.

(2) Connect the HVAC harness connector.

(3) Install the rear seat heat duct elbow push pin fastener.

(4) Position the rear seat heat duct and install the four retainer nuts. Tighten to 2.2 N·m (20 in. lbs.).

(5) Install the two nuts, and two screws attaching the HVAC housing to the dash panel. Tighten to 4.5 N·m (40 in. lbs.).

(6) Position the defrost duct and install the two retainer screws. Tighten to 2.2 N·m (20 in. lbs.).

(7) Install the nuts on the HVAC housing mounting studs on the engine compartment side of the dash panel. Tighten to 7 N·m (60 in. lbs.).

(8) Unplug or remove the tape from liquid and suction lines, and the expansion valve. Connect the lines to the expansion valve and tighten the retaining nut to 23 N·m (17 ft. lbs.).

(9) Install the heater hoses to the heater core and install the spring type hose fasteners and fill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(10) Install the air cleaner hose and air distribution duct (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).

(11) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(12) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(13) Install the instrument panel in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(14) Connect the negative battery cable remote terminal to the remote battery post (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

**INSTRUMENT PANEL
DEMISTER DUCTS****DESCRIPTION**

The side window demisters direct air from the heater assembly through the outlets located on the top corners of the instrument panel, to the side windows.

OPERATION

Side window demisting is performed when the mode selector is on FLOOR, DEFROST, MIX OR BI-LEVEL setting.

PLUMBING

DESCRIPTION - REFRIGERANT LINE

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning system components. A barrier hose design with a nylon tube, which is sandwiched between rubber layers, is used for the R-134a air conditioning system on this vehicle. This nylon tube helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the

refrigerant hoses are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold (Whenever possible).

PLUMBING (Continued)

OPERATION - REFRIGERANT LINE

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled with other components of the HVAC system with peanut-block style fittings. A stat-O seal type flat steel gasket with a captured compressible O-ring, is used to mate plumbing lines with A/C components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

WARNING

WARNING: WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM EYE CONTACT WITH REFRIGERANT. IF EYE CONTACT IS MADE, SEEK MEDICAL ATTENTION IMMEDIATELY.

DO NOT EXPOSE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC TYPE LEAK DETECTOR IS RECOMMENDED.

LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION.

THE EVAPORATION RATE OF REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH REFRIGERANT. R-134a SERVICE EQUIPMENT OR VEHICLE A/C SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR.

SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. SEEK MEDICAL ATTENTION IMMEDIATELY IF SWALLOWED OR INHALED. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL.

KEEP OUT OF REACH OF CHILDREN AND PETS. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT RUNNING TEMPERATURE. PERSONAL INJURY CAN RESULT.

CAUTION**REFRIGERANT SYSTEM PRECAUTIONS**

CAUTION:: The system must be completely empty before opening any fitting or connection in the refrigeration system. Open fittings with caution even after the system has been emptied. If any pressure is noticed as a fitting is loosened, retighten fitting and evacuate the system again.

A good rule for the flexible hose lines is to keep the radius of all bends at least 10 times the diameter of the hose. Sharper bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 3 inches (80 mm) from the exhaust manifold. Inspect all flexible hose lines to make sure they are in good condition and properly routed.

The use of correct wrenches when making connections is very important. Improper wrenches or improper use of wrenches can damage the fittings. The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities.

When opening a refrigeration system, have everything you will need to repair the system ready. This will minimize the amount of time the system must be opened. Cap or plug all lines and fittings as soon as they are opened. This will help prevent the entrance of dirt and moisture. All new lines and components should be capped or sealed until they are ready to be used.

All tools, including the refrigerant dispensing manifold, the manifold gauge set, and test hoses should be kept clean and dry.

REFRIGERANT SYSTEM HOSES/LINES/TUBES/ PRECAUTIONS

Kinks in the refrigerant tubing or sharp bends in the refrigerant hose lines will greatly reduce the capacity of the entire system.

High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all connections are pressure tight. Dirt and moisture can enter the system when it is opened for repair or replacement of lines or components. The

PLUMBING (Continued)

refrigerant oil will absorb moisture readily out of the air. This moisture will convert into acids within a closed system.

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

If the refrigerant system is empty or low in refrigerant charge, a leak at any line fitting or component seal is likely. A review of the fittings, lines and components for oily residue is an indication of the leak location. To detect a leak in the refrigerant system, perform one of the following procedures as indicated by the symptoms.

EMPTY REFRIGERANT SYSTEM LEAK TEST

(1) Evacuate the refrigerant system (minimum evacuation time of 15 min.) to the lowest degree of vacuum possible (approx. 28 in Hg.). (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) Determine if the system holds a vacuum for at least 15 minutes after pump is off. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed with this procedure.

(2) Prepare a .284 Kg. (10 oz.) refrigerant charge to be injected into the system.

(3) Connect and dispense .284 Kg. (10 oz.) of refrigerant into the evacuated refrigerant system.

(4) Proceed to Step 2 of Low Refrigerant Level Leak Test.

LOW REFRIGERANT LEVEL LEAK TEST

(1) Determine if there is any (R-134a) refrigerant in the system.

(2) Position the vehicle in a wind free work area. This will aid in detecting small leaks.

(3) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run for five minutes with the system set to the following:

- Transaxle in Park
- Engine Idling
- A/C Controls Set in 100 percent outside air (Recirculation position)
- Blower switch in the high A/C position
- A/C in the ON position
- Open all windows

CAUTION: A leak detector designed for R-12 refrigerant may not detect leaks in a R-134a refrigerant system. Check specifications on leak detector.

(4) Shut off the vehicle and wait 2 to 7 minutes. Then use an Electronic Leak Detector that is designed to detect R-134a type refrigerant and search for leaks. Fittings, lines, or components that appear to be oily usually indicates a refrigerant leak. To inspect the evaporator core for leaks, insert the leak detector probe into the drain tube opening or a heat duct.

NOTE: If leak is not detected but known to exist, further diagnosis may be necessary using a refrigerant dye and the recovery machine. Refer to recovery machine instructions for proper dye injection procedures.

STANDARD PROCEDURE**STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT**

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used. Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 1). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

LOW PRESSURE GAUGE HOSE The low pressure hose (Blue with Black stripe) attaches to the suction service port. This port is located on the suction line between the accumulator outlet and the compressor.

PLUMBING (Continued)

Fig. 1 MANIFOLD GAUGE SET - TYPICAL

- 1 - HIGH PRESSURE GAUGE
- 2 - VALVE
- 3 - VACUUM/REFRIGERANT HOSE (YELLOW W/ BLACK STRIPE)
- 4 - HIGH PRESSURE HOSE (RED W/ BLACK STRIPE)
- 5 - LOW PRESSURE HOSE (BLUE W/ BLACK STRIPE)
- 6 - VALVE
- 7 - LOW PRESSURE GAUGE

HIGH PRESSURE GAUGE HOSE The high pressure hose (Red with Black stripe) attaches to the discharge service port. This port is located on the discharge line between the compressor and the condenser inlet.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

STANDARD PROCEDURE - REFRIGERANT RECOVERY

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the compressor.

If a compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Connect a suitable charging station, refrigerant recovery machine, or a manifold gauge set with vacuum pump (Fig. 2).

(2) Open suction and discharge valves and start vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge, to eliminate all moisture in system. When suction gauge reads -88 kPa (-26 in. Hg) vacuum or greater for 45 minutes, close all valves and turn off vacuum pump. **If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected.** If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.

(3) Close all valves. Turn off and disconnect the vacuum pump.

(4) The refrigerant system is prepared to be charged with refrigerant.

PLUMBING (Continued)

STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

After the refrigerant system has been tested for leaks and evacuated, a refrigerant charge can be injected into the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

SPECIFICATIONS

CHARGE CAPACITY

NOTE: Always refer to the vehicle's underhood HVAC Specification label for the correct charge specifications.

A/C COMPRESSOR

DESCRIPTION

The air conditioning system uses a Nippondenso 10PA17 ten cylinder, double-acting swash plate-type compressor on all models. This compressor has a fixed displacement of 170 cubic centimeters (10.374 cubic inches), and has both the suction and discharge ports located on the cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor. This compressor uses an aluminum swash plate, teflon coated pistons and aluminum cylinder walls. One-way check valves are used to regulate refrigerant flow through the compressor.

CAUTION: A 10PA17 R-12 compressor looks identical to a 10PA17 R134a and will bolt up to this vehicle. It is extremely important that a R-134a compressor is identified prior to using compressor in question. Check tag located on compressor for model number.

OPERATION

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley and clutch coil are available for service.

DIAGNOSIS AND TESTING - COMPRESSOR NOISE

Excessive noise that occurs when the air-conditioning is being used may be caused by:

- Loose Bolts
- Mounting Brackets
- Loose Compressor Clutch
- Excessive High Refrigerant Operating Pressure

Verify the following before compressor repair is performed:

- (1) Compressor drive belt condition
- (2) Proper refrigerant charge
- (3) Thermal expansion valve (TXV) operating correctly
- (4) Head pressure is normal

A/C COMPRESSOR (Continued)

REMOVAL

The A/C compressor may be unbolted and repositioned without discharging the refrigerant system. Discharging is not necessary if removing the compressor clutch/coil assembly, engine, cylinder head, or alternator.

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

- (1) Disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Loosen and remove the drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (3) Disconnect the compressor clutch wire lead.
- (4) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)
- (5) Remove the refrigerant lines from the compressor.
- (6) If system is going to be left open, plug or cap the open lines.
- (7) Remove compressor attaching bolts (Fig. 3) and (Fig. 4).

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

A/C COMPRESSOR (Continued)

(1) Position the a/c compressor in the vehicle and install the attaching bolts. Torque the a/c compressor mounting bolts to 28 N·m (21 ft. lbs.)

(2) Remove the plug or cap from the opened refrigerant line fittings. Install new O-rings and lubricate with refrigerant oil. Install the suction line and discharge line fittings to the manifold on the a/c compressor. Tighten the fasteners to 23 N·m (17 ft. lbs.).

(3) Install the drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Connect the a/c compressor clutch coil wire lead.

(5) Connect the negative battery cable remote terminal from the remote battery post.

(6) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(7) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

A/C CONDENSER

REMOVAL

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

The condenser is located between the radiator and the front bumper. The condenser can be serviced without having to drain the cooling system or remove the radiator.

(1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the retainers for the upper radiator core support and place aside (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(4) Undo the auxiliary transmission cooler hose fittings (Do not open the fittings at the Cooler) (Fig. 5) or (Fig. 6).

(5) Remove the screw and retainer bracket for the auxiliary transmission cooler lines.

(6) Remove the discharge line fastener at condenser.

(7) Remove the liquid line fastener at condenser.

809de636

Fig. 6 A/C CONDENSER TO RADIATOR - 3.2/3.5L & 2.7L W/AUTO STICK

- 1 - TRANS COOLER LINE BRACKET SCREW
2 - SCREW - CONDENSER TO RADIATOR
3 - TRANS COOLER
4 - SCREW - CONDENSER TO RADIATOR

(8) Remove two screws retaining the condenser to the radiator.

(9) Separate the condenser from the radiator.

A/C CONDENSER (Continued)

(10) Remove the condenser (with auxiliary transmission cooler attached) from the vehicle.

(11) Cut the auxiliary transmission cooler retaining straps.

NOTE: The new condenser will include new retaining straps for the auxiliary transmission cooler attachment to new condenser assembly.

CAUTION: Avoid bending or breaking condenser inlet tube when lifting radiator/condenser assembly from the vehicle.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold (Whenever possible).

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Install the auxiliary transmission cooler in the same position on the condenser with new retaining straps.

(2) Install the condenser in the vehicle.

(3) Install the two screws retaining the condenser to the radiator. Tighten the screws to 10.5 N·m (95 in. lbs.).

NOTE: Always install NEW O-rings and lubricate with refrigerant oil.

(4) Connect the liquid line to the condenser inlet. Tighten the retaining nut to 23 N·m (17 ft. lbs.).

(5) Connect the discharge line to the condenser outlet. Tighten the retaining nut to 23 N·m (17 ft. lbs.).

(6) Install the retainer bracket and screw for the auxiliary transmission cooler lines.

(7) Connect the auxiliary transmission cooler hose fittings.

(8) Install the upper radiator core support (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(9) Connect the negative battery cable remote terminal to the remote battery post.

(10) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(11) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

A/C DISCHARGE LINE

REMOVAL

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

(1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Disconnect the a/c pressure transducer wire harness (Fig. 7) and (Fig. 8).

(4) Remove the a/c pressure transducer. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - REMOVAL)

(5) Disconnect the discharge line at the compressor using an M10 Hex wrench for 2.7L, and a 6 mm allen wrench for 3.2/3.5L.

CAUTION: Cap all lines that are not being replaced and cap the expansion valve tubes.

(6) Disconnect the discharge line at the A/C condenser using an M10 Hex wrench.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold (Whenever possible).

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

NOTE: Replace all O-rings and lubricate each with ND-8 PAG oil before installation of component.

(1) Connect the discharge line at the A/C condenser. Tighten retainer bolt to 23 N·m (17 ft. lbs.).

(2) Connect the discharge line at the compressor. Tighten retainer bolt to 23 N·m (17 ft. lbs.).

(3) Install the a/c pressure transducer. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - INSTALLATION)

(4) Plug the harness connector into the a/c pressure transducer.

(5) Connect the negative battery cable remote terminal to the remote battery post.

(6) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(7) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

LIQUID LINE

REMOVAL

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

(1) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Remove the engine air inlet tube and the air distribution duct on vehicles equipped with 3.2/3.5 L engines.

(3) Remove the a/c line to the expansion valve fastener using a M10 Hex wrench. Remove the suction line block from the expansion valve, cap the line and swing it out of the way.

CAUTION: Cap off all lines that are not being replaced. Cap/plug the expansion valve and condenser fittings.

LIQUID LINE (Continued)

(4) Disconnect the liquid line fastener at the receiver/drier (the short receiver/drier to evaporator line may be removed at this step).

(5) Disconnect receiver/drier bracket fastener and separate the bracket from the strut panel (there are two hidden plastic fasteners to pry out).

(6) Disconnect the liquid line fastener at the condenser (M10 Hex).

NOTE: The radiator upper crossmember must be removed to access the liquid line fastener. Refer to **Body** for the procedures.

(7) Remove the liquid line mounting clamp fastener located near the service port (Fig. 9).

- 6 - RECEIVER/DRIER AND BRACKET

(8) Disconnect the liquid line fastener at the receiver/drier. Remove the liquid line from the vehicle. Cap off all fittings to prevent moisture from entering the refrigerant system.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the

flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

- (1) Place the liquid line in the vehicle.
- (2) Install the liquid line fitting to the receiver/drier. Tighten the fastener to 13.6 N·m (10 ft. lbs.).
- (3) Install the liquid line mounting clamp fastener located near the service port. Tighten the fastener to 6.8 N·m (5 ft. lbs.).
- (4) Install the liquid line fastener at the condenser. Tighten the fastener to 23 N·m (17 ft. lbs.).
- (5) Connect the receiver/drier bracket fastener and the bracket to the strut panel.
- (6) Install the the short receiver/drier to evaporator line. Tighten the fastener to 13.6 N·m (10 ft. lbs.).
- (7) Connect the a/c line to the expansion valve. Tighten the retaining bolt to 8 N·m (6 ft. lbs.).
- (8) Install the engine air inlet tube and the air distribution duct on vehicles equipped with 3.2/3.5 L engines (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).
- (9) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)
- (10) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

SUCTION LINE

REMOVAL

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

- (1) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)
- (2) Remove one M13 nut holding the suction line to the expansion valve (Fig. 10) and (Fig. 11).

(5) Remove the line by pulling the rear end of the line up out of the vehicle with the compressor end following through the tie-rod area.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Position the suction line in the vehicle.

(2) Install the suction line fitting to the manifold on the compressor. Tighten the mounting bolt to 23 N·m (17 ft. lbs.). On a 2.7L, tighten the mid-line retaining nut and frame rail screw to 7 N·m (5 ft. lbs.).

(3) Install the engine air inlet tube and air distribution duct (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).

(4) Connect the suction line to the expansion valve. Tighten the retaining nut to 8 N·m (6 ft. lbs.).

(5) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(6) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

A/C EVAPORATOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT

DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

The HVAC housing must be removed from the vehicle when replacing the evaporator.

(1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Remove the HVAC housing from vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(3) Remove the recirculation door actuator (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - REMOVAL).

(4) Remove the recirculation door and housing.

(5) Remove the upper HVAC housing retaining screws (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).

(6) At the center of the HVAC housing, locate the evaporator probe access plate. Using a flat blade pry tool, pull back on the locking tab. Twist the access plate counter clockwise one-quarter turn, and push the plate inside the HVAC housing.

(7) Remove the upper half of the HVAC housing.

(8) Lift the evaporator out of the lower housing.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

A/C EVAPORATOR (Continued)

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Transfer the evaporator probe to the new evaporator. Place the evaporator probe in the same location as on the previous evaporator (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/EVAPORATOR TEMPERATURE SENSOR - INSTALLATION).

(2) Place the evaporator in the lower HVAC housing.

(3) Insert the access plate inside the HVAC housing and orientate it so that the locking tab is one-quarter turn clockwise to where the tab snaps into the HVAC case detent. Note that the plate will be flush with the outside of the HVAC housing.

(4) Turn the plate one-quarter turn counter-clockwise to seat the locking tab in the HVAC case detent.

(5) Place the top half of the HVAC housing on the lower half. Tighten fasteners to 2.2 N·m (20 in. lbs.) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY).

(6) Install the recirculation door and housing on the HVAC housing and tighten the screws to 2.2 N·m (20 in. lbs.).

(7) Install the recirculation door actuator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - INSTALLATION)

(8) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

(9) Evacuate the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(10) Charge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

A/C EXPANSION VALVE

DESCRIPTION

The "H valve" type thermal expansion valve (TXV) is located at the point where the refrigerant lines join the a/c evaporator on the engine compartment side of the dash panel.

The expansion valve is a factory calibrated unit and cannot be adjusted or repaired. If faulty or damaged, the expansion valve must be replaced.

OPERATION

High-pressure, high temperature liquid refrigerant from the liquid line passes through the expansion valve orifice, converting it into a low-pressure, low-temperature mixture of liquid and gas before it enters the evaporator coil. A temperature sensor in the expansion valve control head monitors the temperature of the refrigerant leaving the evaporator coil through the suction line, and adjusts the orifice size at the liquid line to let the proper amount of refrigerant into the evaporator coil to meet the vehicle cooling requirements. Controlling the refrigerant flow through the evaporator ensures that none of the refrigerant leaving the evaporator is still in a liquid state, which could damage the compressor.

DIAGNOSIS AND TESTING - A/C EXPANSION VALVE

The expansion valve can fail in three different positions (open, closed or restricted). **Note, that in each case, it is defective and requires replacement.**

In an Open Position: this will result in a noisy compressor or no cooling. The cause can be a broken spring, broken ball or excessive moisture in the A/C system. If the spring or ball are found to be defective, replace the expansion valve. If excessive moisture is found in the A/C system, recycle the refrigerant.

In a Closed Position: There will be low suction pressure and no cooling. This may be caused by a failed power dome or excessive moisture in the A/C system. If the power dome on the expansion valve is found to be defective replace the expansion valve. If excessive moisture is found recycle the refrigerant.

A Restricted Orifice: There will be low suction pressure and no cooling. This may be caused by debris in the refrigerant system. If debris is believed to be the cause, recycle the refrigerant and replace the expansion valve and filter/drier.

REMOVAL

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

(1) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Remove the engine air inlet tube and the air distribution duct on vehicles equipped with 3.2/3.5 L engine (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).

A/C EXPANSION VALVE (Continued)

- (3) Remove one nut to the a/c lines at the expansion valve.
- (4) Loosen the bolt at the receiver/drier to pivot the lines away from the expansion valve.
- (5) Plug or cap the open end of the refrigerant lines.
- (6) Gently pull the a/c line out of the expansion valve.
- (7) Remove two #30 torx bolts retaining the expansion valve to the a/c evaporator.
- (8) Remove the expansion valve from the vehicle.

CAUTION: Always install new O-rings when replacing the a/c expansion valve.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold (whenever possible).

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

NOTE: Always install new seals or gaskets when replacing the expansion valve. Failure to do so could result in an A/C refrigerant leak.

- (1) Install the a/c expansion valve on the a/c evaporator. Tighten the fasteners to 7 N·m (5 ft. lbs.).
- (2) Connect the lines to the expansion valve and tighten the retaining nut to 8 N·m (6 ft. lbs.).
- (3) Tighten the bolt at the receiver/drier to 13.6 N·m (10 ft. lbs.).
- (4) Install the engine air inlet tube and the air distribution duct on vehicles equipped with 3.2/3.5 L engine (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).

(5) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(6) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

HEATER CORE

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

The HVAC housing must be removed from the vehicle to service the heater core.

- (1) Open the hood and disconnect the negative battery cable remote terminal from the remote battery post.
- (2) Remove the HVAC unit housing from vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)
- (3) With the HVAC housing out of the vehicle, remove (2) screws retaining the heater core. Then pull the heater core out of the HVAC housing.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

- (1) Install the heater core in the HVAC housing. Tighten the retaining screws to 2.2 N·m (20 in. lbs.).

HEATER CORE (Continued)

(2) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

(3) Connect the negative battery cable remote terminal to the remote battery post.

RECEIVER / DRIER

DESCRIPTION

The receiver/drier is located in the engine compartment near the dash panel on the passenger side of the vehicle. The receiver/drier incorporates a sight glass for visual diagnosis of the refrigerant system.

OPERATION

High-pressure liquid refrigerant from the condenser flows into the receiver/drier. A drying agent, called a desiccant, is used to remove any traces of moisture from the refrigerant system. The receiver/drier also performs a filtering action to prevent foreign material in the refrigerant from contaminating the expansion valve. In addition, during periods of high demand air conditioner operation, the receiver/drier acts as a reservoir to store surplus refrigerant.

The A/C refrigerant must be removed from the system before removing the receiver/drier using a refrigerant recovery machine. Replace the receiver/drier if an A/C system is left open for an extended period of time.

The receiver/drier cannot be repaired and, if faulty, must be replaced.

REMOVAL

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

(1) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE -REFRIGERANT RECOVERY)

(2) Remove the engine air inlet tube and the air distribution duct on vehicles equipped with 3.2/3.5 liter engine(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).

(3) Remove one 8mm hex bolt to the receiver/drier bracket.

(4) Remove the nut retaining the a/c lines to the expansion valve.

(5) Gently pry the receiver/drier bracket out of the strut tower.

(6) Remove one a/c line at the receiver/drier (from the condenser).

(7) Remove the receiver/drier from vehicle.

(8) Remove the small line from the receiver/drier to the expansion valve to install on the new receiver/drier.

NOTE: Always install new O-rings when replacing filter/drier.

(9) Plug or cap liquid line fittings while system is open to prevent moisture intrusion.

INSTALLATION

WARNING: REVIEW THE WARNINGS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold (whenever possible).

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

NOTE: Upon installation, loosely fit all parts and lines together before individually tightening them to prevent damage.

NOTE: Always install new O-rings and lubricate with the proper refrigerant before installation.

(1) Install the small line from the receiver/drier to expansion valve on the new receiver/drier.

(2) Install the receiver/drier in the vehicle.

(3) Install the a/c line at the receiver/drier. Tighten the fastener to 13.6 N·m (10 ft. lbs.).

(4) Install the receiver/drier bracket in the strut tower.

(5) Install the nut retaining the a/c line to the expansion valve. Tighten to 8 N·m (6 ft. lbs.).

(6) Install the bolt to the receiver/drier bracket.

(7) Install the engine air inlet tube and the air distribution duct on vehicles equipped with 3.2/3.5 L engine(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).

RECEIVER / DRIER (Continued)

(8) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(9) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

REFRIGERANT OIL

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The 10PA17 compressor used in this vehicle is designed to use an

ND8 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

It is important to have the correct amount of lubricant in the a/c system to ensure proper lubrication of the compressor. Too little lubricant will result in damage to the compressor. Too much lubricant will reduce the cooling capacity of the system and consequently result in higher discharge air temperatures.

The lubricant used in the compressor is polyalkylene glycol PAG lubricant. Only the refrigerant lubricant approved for use with this vehicle (ND8 PAG oil) should be used to service the system. Do not use any other lubricant. The lubricant container should be kept tightly capped until it is ready for use. Refrigerant lubricant will quickly absorb any moisture it comes in contact with.

It is not necessary to check or add lubricant unless it has been lost. Lubricant loss at the leak point will be evident by the presence of a wet, shiny surface around the leak. The surface will also over time accumulate dust and dirt in the area of the leak and appear as an isolated dirty area.

REFRIGERANT OIL LEVEL CHECK

When an air conditioning system is first assembled, all components (except the compressor) are refrigerant oil free. After the system has been charged with (R-134a) refrigerant and operated, the oil in the compressor is dispersed through the lines and components. The evaporator, condenser, and receiver/drier will retain a significant amount of oil. Refer to the A/C Component Refrigerant Oil Capacities table. When a component is replaced, the specified amount of refrigerant oil must be added. When the compressor is replaced, the amount of oil that is retained in the rest of the system must be drained from the replacement compressor. The oil capacity of the system, minus the amount of oil still in the

REFRIGERANT OIL (Continued)

remaining components (refer to the oil capacity chart below) can be measured and poured into the suction port of the compressor. When a line or component has ruptured and oil has escaped, the receiver/drier must be replaced along with the ruptured part.

Example: On an A/C system the evaporator retains 60 ml. (2 oz.). The condenser retains 30 ml. (1 oz.) of oil, and system capacity may be 150 ml. (5.00 oz.) of oil.

150 ml. minus 90 ml. equals 60 ml. (2.00 oz.).

A/C COMPONENT REFRIGERANT OIL CAPACITIES

COMPONENT NAME	ml.	oz.
Total Air Conditioning System	150 ml.	5.00 oz.
Condenser	30 ml.	1.00 oz.
Evaporator	59 ml.	2.00 oz.
Receiver/Drier	30 ml.	1.00 oz.
Line Blown	44 ml.	1.50 oz.
Compressor	Drain and measure the oil from the old compressor. See text.	

CAUTION: The refrigerant oil used in a R-134a A/C system is unique. Use only oils which were designed to work with R-134a refrigerant. The oil designated for this vehicle is ND 8 PAG (polyalkylene glycol).

VERIFY REFRIGERANT ND8 LUBRICANT LEVEL

(1) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Disconnect the refrigerant lines from the a/c compressor. Cap the open lines to prevent moisture from entering the system.

(3) Remove the compressor from the vehicle.

(4) From the suction and discharge ports on top of the compressor, drain the lubricant from the compressor.

(5) Add the system capacity minus the capacity of the components that have not been replaced. Refer to the A/C Component Refrigerant Oil Capacities chart above. Add lubricant through the suction and discharge ports on compressor. This is not to exceed 150 ml. (5.00 oz.) in total.

(6) Install the compressor and connect the refrigerant lines. Then evacuate and charge refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) (Refer to 24 - HEATING & AIR CONDITIONING/

PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(7) Most reclaim/recycling equipment will measure the lubricant being removed. This amount of lubricant should be added back to the system. If a new compressor is being installed, drain lubricant from old compressor, measure the amount drained and discard old lubricant. Drain the lubricant from the new compressor into a clean container. Return the amount of lubricant measured from the old compressor, plus the amount reclaimed from the system back into the new compressor.

SERVICE PORT VALVE CORE

REMOVAL

The 3.2 / 3.5L service port valve cores are located on the top of the manifold (High Side) and front side of the manifold (Low Side) (Fig. 14). The 2.7L service port valve ports are located on the A/C liquid line (high side) and suction line (low side).

(1) Remove the valve caps. Recover the refrigerant. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Using a standard valve core tool, remove the valve core. **Be careful to prevent any dirt/debris from entering the valve core opening or getting on the replacement valve core.**

CAUTION: A valve that is not fully seated can lead to damage to the valve during evacuation and charge. This can result in system refrigerant discharge while uncoupling the charge adapters.

- 2 - A/C SERVICE PORTS
- 3 - COMPRESSOR MANIFOLD
- 4 - A/C DRIVE BELT
- 5 - COMPRESSOR WIRE CONNECTOR

SERVICE PORT VALVE CORE (Continued)

INSTALLATION

NOTE: When assembling the new valve core into the fitting, the core should be oiled with clean ND8 PAG compressor oil.

- (1) Install the new valve core into the fitting.
- (2) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

- (3) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

- (4) Install the valve caps.

EMISSIONS CONTROL

DESCRIPTION

DESCRIPTION - MONITORED COMPONENT

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks as well as continuity tests (opens/shorts). Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

The following is a list of the monitored components:

- Catalyst Monitor
- Comprehensive Components
- EGR (if equipped)
- Fuel Control (rich/lean)
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor

- Purge
- Misfire
- Natural Vacuum Leak Detection (NVL D)

COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

- (1) Circuit Continuity
 - Open
 - Shorted high
 - Shorted to ground
- (2) Rationality or Proper Functioning
 - Inputs tested for rationality
 - Outputs tested for functionality

NOTE: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply. All will set a DTC and illuminate the MIL in 1-trip.

Input Rationality—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the input signal is compared against other inputs and information to see if it makes sense under the current conditions.

EMISSIONS CONTROL (Continued)

PCM sensor inputs that are checked for rationality include:

- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S) (slow response)
- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Ambient/Battery Temperature Sensors
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Natural Vacuum Leak Detection (NVLD)
- P/N Switch
- Trans Controls

Output Functionality—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:

- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Idle Air Control
- Purge Solenoid
- EGR Solenoid
- Radiator Fan Control
- Trans Controls

OXYGEN SENSOR (O2S) MONITOR

DESCRIPTION—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean condition, misfire or exhaust leak, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to

remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR, Catalyst and Fuel Monitors, and purge.

The O2S may fail in any or all of the following manners:

- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

Slow Response Rate (Big Slope)—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called 'Big Slope'. The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

Reduced Output Voltage (Half Cycle)—The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Many times the condition is only temporary and the sensor will recover. Under normal conditions the voltage signal surpasses the threshold, and a counter is incremented by one. This is called the Half Cycle Counter.

Heater Performance—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

OPERATION—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and a Freeze Frame is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Signal Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

Enabling Conditions—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time

EMISSIONS CONTROL (Continued)

- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear (automatic only)
- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Ambient air temperature
- Barometric pressure
- Engine RPM within acceptable range of desired idle

- Closed throttle speed

Pending Conditions—The Task Manager typically does not run the Oxygen Sensor Signal Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor
- Engine Coolant Temperature Sensor
- Throttle Position Sensor
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- Idle Air Control Motor
- EVAP Electrical
- EGR Solenoid Electrical
- Intake Air Temperature
- 5 Volt Feed

Conflict—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress
- Ethanol content learn is taking place and the ethanol used once flag is set

Suspend—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if any of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

OXYGEN SENSOR HEATER MONITOR (NGC)

DESCRIPTION—If the Oxygen sensor (O2S) DTC as well as a O2S heater DTC is present, the O2S Heater DTC MUST be repaired first. After the O2S Heater is repaired, verify that the sensor circuit is operating correctly.

The voltage reading taken from the O2S are very temperature sensitive. The readings taken from the O2S are not accurate below 300 degrees C. Heating the O2S is done to allow the engine controller to shift

to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly. Starting with the introduction on the NGC module the strategy for checking the heater circuit has changed. The heater resistance is checked by the NGC almost immediately after the engine is started. The same O2S heater return pin used to read the heater resistance is capable of detecting an open circuit, a shorted high or shorted low condition.

OXYGEN SENSOR HEATER MONITOR (SBEC)

DESCRIPTION—If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The heater element itself is not tested directly. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects. The resistance is normally between 100 ohms and 4.5 megaohms. When oxygen sensor temperature increases, the resistance in the internal circuit decreases. The PCM sends a 5 volts biased signal through the oxygen sensors to ground this monitoring circuit. As the temperature increases, resistance decreases and the PCM detects a lower voltage at the reference signal. Inversely, as the temperature decreases, the resistance increases and the PCM detects a higher voltage at the reference signal. The O2S circuit is monitored for a drop in voltage.

OPERATION—The Oxygen Sensor Heater Monitor begins after the ignition has been turned OFF and the O2 sensors have cooled. The PCM sends a 5 volt bias to the oxygen sensor every 1.6 seconds. The PCM keeps it biased for 35 ms each time. As the sensor cools down, the resistance increases and the PCM reads the increase in voltage. Once voltage has increased to a predetermined amount, higher than when the test started, the oxygen sensor is cool enough to test heater operation.

When the oxygen sensor is cool enough, the PCM energizes the ASD relay. Voltage to the O2 sensor begins to increase the temperature. As the sensor temperature increases, the internal resistance decreases. The PCM continues biasing the 5 volt signal to the sensor. Each time the signal is biased, the PCM reads a voltage decrease. When the PCM

EMISSIONS CONTROL (Continued)

detects a voltage decrease of a predetermined value for several biased pulses, the test passes.

The heater elements are tested each time the engine is turned OFF if all the enabling conditions are met. If the monitor fails, the PCM stores a maturing fault and a Freeze Frame is entered. If two consecutive tests fail, a DTC is stored. Because the ignition is OFF, the MIL is illuminated at the beginning of the next key cycle, after the 2nd failure.

Enabling Conditions—The following conditions must be met for the PCM to run the oxygen sensor heater test:

- Engine run time of at least 5.1 minutes
- Key OFF power down
- Battery voltage of at least 10 volts
- Sufficient Oxygen Sensor cool down

Pending Conditions—There are not conditions or situations that prompt conflict or suspension of testing. The oxygen sensor heater test is not run pending resolution of MIL illumination due to oxygen sensor failure.

Suspend—There are no conditions which exist for suspending the Heater Monitor.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a high oxygen condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

Monitor Operation—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O2 switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O2 sensor switches is divided by the number of Front O2 sensor switches to determine the switching ratio.

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor is enabled to run another test during that trip. When the test fails three times, the counter increments to three, a malfunction is entered, and a Freeze Frame is stored. When the counter increments to three during the next trip, the code is matured and the MIL is illuminated. If the test passes the first, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 80% of the upstream rate (60% for manual transmissions). The failure percentages are 90% and 70% respectively.

EMISSIONS CONTROL (Continued)

Enabling Conditions—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time
- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Accumulated throttle position sensor
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

Pending Conditions—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All TPS faults
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality
- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Idle Air Control (IAC) motor functionality
- Vehicle Speed Sensor
- Brake switch
- Intake air temperature

Conflict—The catalyst monitor does not run if any of the following are conditions are present:

- EGR Monitor in progress
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds
- Low fuel level
- Low ambient air temperature
- Ethanol content learn is taking place and the ethanol used once flag is set

Suspend—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Upstream Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

DESCRIPTION - VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

DESCRIPTION - TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 40°F in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 160°F
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1-good trip.

OPERATION - NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or mis-

EMISSIONS CONTROL (Continued)

fire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also see misfire detection.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O₂ content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O₂S fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM

to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, including when diagnostics are performed.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a DRBIII® scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

OXYGEN SENSOR (O₂S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O₂S. The O₂S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust.

EMISSIONS CONTROL (Continued)

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt (voltages are offset by 2.5 volts on NGC vehicles). A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

EGR MONITOR (if equipped)

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic converter damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction

EMISSIONS CONTROL (Continued)

tion occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O₂S's) to monitor the efficiency of the converter. The dual O₂S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O₂S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O₂S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O₂S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O₂S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O₂S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O₂S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O₂S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O₂S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

NATURAL VACUUM LEAK DETECTION (NVLD) (if equipped)

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020" (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the "Gas Law". This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

The NVLD seals the canister vent during engine off conditions. If the EVAP system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1" H₂O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies (described below), utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1" H₂O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3" to 6" H₂O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum

EMISSIONS CONTROL (Continued)

as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will "blow off" at about 0.5" H₂O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to "breathe" during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

DESCRIPTION - HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

OPERATION

OPERATION - SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the DRBIII® scan tool to erase all DTC's and extinguish the MIL.

Technicians can display stored DTC's. Refer to Diagnostic Trouble Codes (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWER-TRAIN CONTROL MODULE - DESCRIPTION). For obtaining the DTC information, use the Data Link Connector with the DRBIII® scan tool (Fig. 1).

80b27cd6

Fig. 1 Data Link Connector

EMISSIONS CONTROL (Continued)

DRB III® STATE DISPLAY TEST MODE**OPERATION**

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus

an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

EVAPORATIVE EMISSIONS

OPERATION - EVAPORATION CONTROL SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes to an activated carbon filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions (Fig. 1).

All engines use a proportional purge solenoid system. The PCM controls vapor flow by operating the purge solenoid. Refer to Proportional Purge Solenoid in this section.

NOTE: The evaporative system uses specially manufactured hoses. If they need replacement, only use fuel resistant hose. Also the hoses must be able to pass an Ozone compliance test.

NOTE: For more information on Onboard Refueling Vapor Recovery (ORVR), refer to the Fuel Delivery section.

EVAP/PURGE SOLENOID

DESCRIPTION

All vehicles use a proportional purge solenoid. The solenoid regulates the rate of vapor flow from the EVAP canister to the throttle body. The PCM operates the solenoid.

OPERATION

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged.

The proportional purge solenoid operates at a frequency of 200 hz and is controlled by an engine controller circuit that senses the current being applied to the proportional purge solenoid (Fig. 2) and then

adjusts that current to achieve the desired purge flow. The proportional purge solenoid controls the purge rate of fuel vapors from the vapor canister and fuel tank to the engine intake manifold.

REMOVAL

The solenoid attaches to a bracket near the air cleaner. The solenoid will not operate unless it is installed correctly.

- (1) Disconnect electrical connector from solenoid.
- (2) Disconnect vacuum tubes from solenoid.
- (3) Remove solenoid from bracket.

INSTALLATION

The solenoid attaches to a bracket near the air cleaner. The solenoid will not operate unless it is installed correctly.

- (2) Connect vacuum tube to solenoid.
- (3) Connect electrical connector to solenoid.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel fill cap is threaded/quarter turn onto the end of the fuel filler tube. Its purpose is to retain vapors and fuel in the fuel tank.

OPERATION

The fuel filler cap incorporates a two-way relief valve that is closed to atmosphere during normal operating conditions. The relief valve is calibrated to open when a pressure of 17 kPa (2.5 psi) or vacuum of 2 kPa (0.6 in. Hg) occurs in the fuel tank. When the pressure or vacuum is relieved, the valve returns to the normally closed position.

CAUTION: Remove the fuel filler cap to release fuel tank pressure before disconnecting any fuel system component.

NATURAL VAC LEAK DETECTION ASSY

DESCRIPTION

The natural Vacuum Leak detection (NVLD) system is mounted on top of the EVAP canister (Fig. 3) that is mounted on the fuel tank.

**Fig. 3 NVLD ASSEMBLY**

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove fuel tank, refer to the Fuel Delivery section for Fuel Tank Removal.
- (3) Disconnect the electrical connector from the NVLD assembly.
- (4) Disconnect the hoses from the NVLD assembly (Fig. 5).
- (5) Lift tab on NVLD assembly (Fig. 4) and twist the assembly counterclockwise and pull up to remove from EVAP canister (Fig. 5).
- (6) Remove O-ring from EVAP canister (Fig. 6).

- (3) Connect the hoses to the NVLD assembly.
- (4) Connect the electrical connector to the NVLD assembly.
- (5) Install fuel tank, refer to the Fuel Delivery section for Fuel Tank Installation.
- (6) Connect the negative battery cable.

ORVR**DESCRIPTION**

Onboard Refueling Vapor Recovery (ORVR) System Schematic and components (Fig. 7).

OPERATION

The emission control principle used in the ORVR system is that the fuel flowing into the filler tube (approx. 1" I.D.) creates an aspiration effect which draws air into the fill tube. During refueling, the fuel tank is vented to the vapor canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapors flow is metered by the purge solenoid so that there is no or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve to the vapor canister. Vapor is absorbed in the canister until vapor flow in the lines stops, either following shut-off or by having the fuel level in the tank rise high enough to close the control valve. The control valve contains a float that rises to seal the large diameter vent path to the canister. At this point in the fueling of the vehicle, the tank pressure increase, the check valve closes (preventing tank fuel from spitting back at the operator), and fuel then rises up the filler tube to shut-off the dispensing nozzle.

| 11 - NATURAL VACUUM LEAD DETECTION (NVLD) | |

If the engine is shut-off while the On-Board diagnostics test is running, low level tank pressure can be trapped in the fuel tank and fuel can not be added to the tank until the pressure is relieved. This is due to the leak detection pump closing the vapor outlet from the top of the tank and the one-way check valve not allowing the tank to vent through the fill tube to atmosphere. Therefore, when fuel is added, it will back-up in the fill tube and shut off the dispensing nozzle. The pressure can be eliminated in two ways: 1. Vehicle purge must be activated and for a long enough period to eliminate the pressure. 2. Removing the fuel cap and allowing enough time for the system to vent thru the recirculation tube.

PCV HOSE

DESCRIPTION

The PCV system has a heat exchanger in the PCV hose that works with the cooling system of the vehicle (Fig. 8) or (Fig. 9).

REMOVAL

- (1) Drain the Cooling system, refer to the Cooling system for more information.
- (2) Remove hose from PCV valve.
- (3) Remove hose from valve cover.
- (4) Remove the 2 heater hoses from heat exchanger in PCV hose.

PCV HOSE (Continued)

Fig. 8 PCV - 2.7L

Fig. 9 PCV - 3.2/3.5L

INSTALLATION

- (1) Install heater hoses to heat exchanger and tighten clamps.
- (2) Install hose to PCV valve.
- (3) Install hose to valve cover.
- (4) Fill coolant system, refer to the Cooling system for more information.

PCV VALVE

DESCRIPTION

The PCV valve contains a spring loaded plunger. The plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum (Fig. 10) or (Fig. 11).

Fig. 10 PCV Valve -2.7L

- 1 - PCV VALVE
- 2 - THROTTLE BODY
- 3 - EGR TUBE

Fig. 11 PCV Valve—3.2/3.5L

- 1 - THROTTLE BODY
- 2 - PCV VALVE

PCV VALVE (Continued)

OPERATION

When the engine is not operating or during an engine backfire, the spring forces the plunger back against the seat. This prevents vapors from flowing through the valve (Fig. 12).

Fig. 12 Engine Off or Engine Backfire No Vapor Flow

When the engine is at idle or cruising, high manifold vacuum is present. At these times manifold vacuum is able to completely compress the spring and pull the plunger to the top of the valve (Fig. 13). In this position there is minimal vapor flow through the valve.

Fig. 13 High Intake Manifold Vacuum Minimal Vapor Flow

During periods of moderate intake manifold vacuum the plunger is only pulled part way back from the inlet. This results in maximum vapor flow through the valve (Fig. 14).

Fig. 14 Moderate Intake Manifold Vacuum Maximum Vapor Flow

DIAGNOSIS AND TESTING - PCV SYSTEM

WARNING: APPLY PARKING BRAKE AND/OR BLOCK WHEELS BEFORE PERFORMING ANY TEST OR ADJUSTMENT WITH THE ENGINE OPERATING.

(1) With engine idling, remove the hose from the PCV valve. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. A strong vacuum should also be felt when a finger is placed over the valve inlet.

(2) Install hose on PCV valve. Remove the make-up air hose from the air plenum at the rear of the engine. Hold a piece of stiff paper (parts tag) loosely over the end of the make-up air hose.

(3) After allowing approximately one minute for crankcase pressure to reduce, the paper should draw up against the hose with noticeable force. If the engine does not draw the paper against the grommet after installing a new valve, replace the PCV valve hose.

(4) Turn the engine off. Remove the PCV valve from intake manifold. The valve should rattle when shaken.

(5) Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.** If the valve rattles, apply a light coating of Loctite® Pipe Sealant With Teflon to the threads. Thread the PCV valve into the manifold plenum and tighten to 7 N·m (60 in. lbs.) torque.

VAPOR CANISTER

OPERATION

All vehicles use a maintenance free, evaporative (EVAP) canister. Fuel tank vapors vent into the canister. The canister temporarily holds the fuel vapors until intake manifold vacuum draws them into the combustion chamber. The Powertrain Control Module (PCM) purges the canister through the proportional purge solenoid. The PCM purges the canister at predetermined intervals and engine conditions.

Purge Free Cells

Purge-free memory cells are used to identify the fuel vapor content of the evaporative canister. Since the evaporative canister is not purged 100% of the time, the PCM stores information about the evaporative canister's vapor content in a memory cell.

The purge-free cells are constructed similar to certain purge-normal cells. The purge-free cells can be monitored by the DRB III® Scan Tool. The only difference between the purge-free cells and normal adaptive cells is that in purge-free, the purge is completely turned off. This gives the PCM the ability to compare purge and purge-free operation.

VAPOR CANISTER (Continued)

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove the fuel tank, refer to the fuel tank removal in this section
- (3) Disconnect the EVAP hoses from the EVAP canister and the electrical connector (Fig. 15).

EGR VALVE

DESCRIPTION

The EGR valve consists of three major components. First there is the pintle, valve seat, and housing which contains and regulates the gas flow. Second there is the armature, return spring, and solenoid coil to provide the operating force to regulate the flow by changing the pintle position. The solenoid coil assembly is in parallel with a diode and connects to the two connectors in the connector assembly. The third major component which senses pintle position and is connected to the three connectors in the electrical connector.

OPERATION

The exhaust gas recirculation flow is determined by the engine controller. For a given set of conditions, the engine controller knows the ideal exhaust gas recirculation flow to optimize NOx and fuel economy as a function of the pintle position. Pintle position is obtained from the position sensor. The engine controller adjusts the duty cycle of 128 Hz power supplied to the solenoid coil to obtain the correct position.

REMOVAL

REMOVAL - 2.7L

The EGR valve attaches to the rear of the right cylinder head.

- (1) Disconnect negative battery cable.

(4) Remove EGR tube mounting screws at exhaust manifold.

INSTALLATION

INSTALLATION - 2.7L UPPER TUBE

The EGR tube attaches to the intake manifold plenum on both sides of the throttle body and the EGR valve (Fig. 6).

(1) inspect rubber silicone seals on intake manifold end of EGR tube.

EGR TUBE - 2.7L (Continued)

80ab889b

Fig. 6 EGR TUBE - 2.7L

(2) Install upper tube into the intake manifold, being careful that the silicone rubber seals are correctly installed and undamaged..

(3) Install new gasket between the EGR valve and tube and install bolts.

(4) Tighten the EGR upper tube to intake manifold plenum screws to 11 N·m (95 in. lbs.) torque.

(5) Tighten the EGR upper tube to EGR valve bolts to 11 N·m (95 in. lbs.) torque.

(6) Install the throttle cable bracket to intake manifold.

(7) Install air inlet tube and resonator.

(8) Connect negative battery cable.

INSTALLATION - 2.7L LOWER TUBE

(1) Install new gasket between the EGR valve and tube and loosely install bolts.

(2) Install new gasket between the exhaust manifold and tube and loosely install bolts.

(3) Tighten the EGR tube to EGR valve bolts to 11 N·m (95 in. lbs.) torque.

(4) Tighten the EGR tube to exhaust manifold bolts to 31 N·m (275 in. lbs.) torque.

(5) Install air inlet tube and resonator and bracket.

(6) Connect negative battery cable.

EGR TUBE - 3.5L**REMOVAL - 3.5L**

The EGR tube attaches to the bottom of the intake manifold plenum beside the throttle body (Fig. 8).

(1) Disconnect negative battery cable.

(2) Remove air inlet tube and resonator.

(3) Remove EGR tube mounting clips at intake manifold plenum (Fig. 7).

80b6b220

Fig. 7 EGR Tube Clips

- 1 - EGR VALVE
- 2 - EGR TUBE
- 3 - CLIP

(4) Loosen transmission to throttle body bracket (Fig. 8). Remove 2 nuts and 1 bolt and remove bracket off of studs.

80b6b223

Fig. 8 Bracket and EGR Tube

- 1 - EGR TUBE
- 2 - BRACKET
- 3 - EGR VALVE

(5) Remove EGR tube mounting screws at EGR valve.

When removing EGR upper tube assembly being careful not to drop the silicone rubber seals in the intake manifold. Clean gasket surfaces on the EGR valve. Note that any loose dirt can lodge between the pintle and the seat and cause valve leakage that will give a rough idle and depressed manifold vacuum.

(6) Remove EGR tube.

EGR TUBE - 3.5L (Continued)

INSTALLATION - 3.5L

The EGR tube attaches to the bottom of the intake manifold plenum beside the throttle body (Fig. 8).

(1) Install rubber silicone seals on intake manifold end of EGR tube, being careful to be sure silicone rubber seals is correctly installed and undamaged.

(2) Using a new gasket, loosely install the EGR tube into the intake manifold and loosely install EGR tube to EGR valve.

(3) Tighten the EGR tube to EGR valve screws to 11 N·m (95 in. lbs.) torque.

(4) Install clips for the EGR tube to intake manifold plenum (Fig. 9).

(5) Install transmission to throttle body bracket.

(6) Install air inlet tube and resonator.

(7) Connect negative battery cable.

Fig. 9 EGR tube Seal

TASK MANAGER		OPERATION	24
DESCRIPTION	24		

TASK MANAGER

DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the “Task Manager”.

OPERATION

The Task Manager determines when tests happen and when functions occur. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as ‘two trip monitors.’ Other tests that turn the MIL lamp on after a single failure are known as ‘one trip monitors.’ A trip is defined as ‘start the vehicle and operate it to meet the criteria necessary to run the given monitor.’

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

• Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

• Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the catalyst Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

• Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the catalyst monitor, the Task Manager may still run the catalyst Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the catalyst system is actually failing or if an Oxygen Sensor is failing.

TASK MANAGER (Continued)

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a good trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third good trip) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 — Non-emissions related trouble codes.
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire. (MIL Off)
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire. (MIL Off)
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault. (MIL On)
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire. Catalyst damage misfire is a 2 trip MIL. The MIL flashes on the first trip when catalyst damage misfire levels are present. (MIL On)

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip

counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ± 375 RPM and load is within $\pm 20\%$ of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRBIII®. Erasing the DTC with the DRBIII® erases all OBD II information. The DRBIII® automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Global Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRBIII®)

- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

Global Good Trip

To increment a Global Good Trip, the Oxygen sensor and Catalyst efficiency monitors must have run and passed, and 2 minutes of engine run time.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold

- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

TASK MANAGER (Continued)

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Alternate Good Trip

Alternate Good Trips are used in place of Global Good Trips for Comprehensive Components and Major Monitors. If the Task Manager cannot run a Global Good Trip because a component fault is stopping the monitor from running, it will attempt to count an Alternate Good Trip.

The Task Manager counts an Alternate Good Trip for Comprehensive components when the following conditions are met:

- Two minutes of engine run time, idle or driving
- No other faults occur

The Task Manager counts an Alternate Good Trip for a Major Monitor when the monitor runs and passes. Only the Major Monitor that failed needs to pass to count an Alternate Good Trip.

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRBIII®. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRBIII®; or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** —

An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.

- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.

- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.

- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).

TASK MANAGER (Continued)

- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **200 Rev Counter** — Counts 0–100 720 degree cycles.

- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.

- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.

- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

DRIVE - DESCRIPTION, FINAL	21-73	ELEMENT - INSTALLATION, WIPER		PROCEDURE	9-11
DRIVE - DISASSEMBLY, FINAL	21-74	BLADE	8R-20	ENGINE MOUNTING - DESCRIPTION	9-57
DRIVE - OPERATION, ACCESSORY	7-13	ELEMENT - OPERATION, HEATED SEAT	8G-15	ENGINE MOUNTING - INSPECTION	9-58
DRIVE - OPERATION, FINAL	21-74	ELEMENT - REMOVAL, AIR CLEANER	9-22	ENGINE OIL AND FILTER CHANGE -	
DRIVE BELT - DIAGNOSIS AND TESTING,		ELEMENT - REMOVAL, HEATED SEAT	8G-16	STANDARD PROCEDURE	9-62
ACCESSORY	7-13	ELEMENT - REMOVAL, WIPER BLADE	8R-20	ENGINE OIL AND LUBRICANTS -	
DRIVE BELTS - 2.7L - CLEANING	7-14	E-MARK LABEL - DESCRIPTION	Intro-10	DESCRIPTION	0-1
DRIVE BELTS - 2.7L - INSPECTION	7-14	EMERGENCY RELEASE CABLE -		ENGINE OIL LEAK INSPECTION -	
DRIVE BELTS - 2.7L - INSTALLATION	7-15	INSTALLATION	23-16	DIAGNOSIS AND TESTING	9-60
DRIVE BELTS - 2.7L - REMOVAL	7-14	EMERGENCY RELEASE CABLE -		ENGINE OIL LEVEL CHECK - STANDARD	
DRIVE BELTS - 3.5L - CLEANING	7-16	REMOVAL	23-16	PROCEDURE	9-62
DRIVE BELTS - 3.5L - INSPECTION	7-16	EMISSION CONTROL INFORMATION		ENGINE OIL PRESSURE - DIAGNOSIS	
DRIVE BELTS - 3.5L - INSTALLATION	7-17	LABEL - DESCRIPTION, VEHICLE	25-5	AND TESTING, CHECKING	9-61
DRIVE BELTS - 3.5L - REMOVAL	7-16	END CAP - INSTALLATION, INSTRUMENT		ENGINE, SPECIAL TOOLS - 3.5L	9-19
DRIVE MOTOR - INSTALLATION	23-105	PANEL	23-56	ENGINE, SPECIFICATIONS - 3.5L	9-15
DRIVE MOTOR - REMOVAL	23-105	END CAP - REMOVAL, INSTRUMENT		ENGINE SPEED SENSOR - DESCRIPTION	14-23
		PANEL	23-56	ENGINE SPEED SENSOR - OPERATION	14-23

Description	Group-Page	Description	Group-Page	Description	Group-Page
ENTRY - DESCRIPTION, ILLUMINATED	8L-49	EXPORT - DIAGNOSIS AND TESTING, HEADLAMP WASHER	8R-9	FASTENER TORQUE, SPECIFICATIONS - FRONT SUSPENSION	2-3
ENTRY - DIAGNOSIS AND TESTING, ILLUMINATED	8L-50	EXPORT - DIAGNOSIS AND TESTING, REAR FOG LAMP	8L-37	FASTENER TORQUE, SPECIFICATIONS - POWER STEERING	19-10
ENTRY - OPERATION, ILLUMINATED	8L-49	EXPORT - DIAGNOSIS AND TESTING, SIDE REPEATER LAMP	8L-38	FASTENER TORQUE, SPECIFICATIONS - REAR SUSPENSION	2-33
ENTRY MODULE - INSTALLATION, REMOTE KEYLESS	8N-6	EXPORT - INSTALLATION, FRONT POSITION LAMP	8L-15	FASTENER TORQUE, SPECIFICATIONS - STEERING COLUMN	19-11
ENTRY MODULE - REMOVAL, REMOTE KEYLESS	8N-6	EXPORT - INSTALLATION, HEADLAMP LEVELING SWITCH	8L-26	FASTENER USAGE - DESCRIPTION	Intro-5
ENTRY TRANSMITTER - DIAGNOSIS AND TESTING, KEYLESS	8N-5	EXPORT - INSTALLATION, HEADLAMP WASHER HOSES	8R-13	FEED CIRCUIT RESISTANCE TEST - DIAGNOSIS AND TESTING	8F-26
EQUIPMENT - STANDARD PROCEDURE, REFRIGERANT SYSTEM SERVICE	24-29	EXPORT - INSTALLATION, HEADLAMP WASHER NOZZLE	8R-14	FENDER - INSTALLATION, FRONT	23-37
EQUIPPED - INSTALLATION, AIRBAG	23-80, 23-81, 23-82, 23-84, 23-86, 23-88, 23-90, 23-96	EXPORT - INSTALLATION, HEADLAMP WASHER PUMP	8R-15	FENDER - REMOVAL, FRONT	23-37

CAUTION

ALL SERVICE AND REBUILDING INSTRUCTIONS CONTAINED HEREIN ARE APPLICABLE TO, AND FOR THE CONVENIENCE OF, THE AUTOMOTIVE TRADE ONLY. All test and repair procedures on components or assemblies in non-automotive applications should be repaired in accordance with instructions supplied by the manufacturer of the total product.

Proper service and repair is important to the safe, reliable, operation of all motor vehicles. The service procedures recommended and described in this publication were developed for professional service personnel and are effective methods for performing vehicle repair. Following these procedures will help assure efficient economical vehicle performance and service reliability. Some of these service procedures require the use of special tools designed for specific procedures. These special tools should be used when recommended throughout this publication.

Special attention should be exercised when working with spring or tension loaded fasteners and devices such as E-Clips, Circlips, Snap rings, etc., as careless removal may cause personal injury. Always wear safety goggles whenever working on vehicles or vehicle components.

It is important to note that this publication contains various **Cautions** and **Warnings**. These should be carefully read in order to minimize the risk of personal injury, or the possibility that improper service methods may damage the vehicle or render it unsafe. It is important to note that these **Cautions** and **Warnings** cover only the situations and procedures DaimlerChrysler Corporation has encountered and recommended. DaimlerChrysler Corporation could not possibly know, evaluate, and advise the service trade of all conceivable ways that service may be performed, or of the possible hazards of each. Consequently, DaimlerChrysler Corporation has not undertaken any such broad service review. Accordingly, anyone who uses a service procedure, or tool, that is not recommended in this publication must assure oneself thoroughly that neither personal safety, nor vehicle safety, be jeopardized by the service methods they select.

For other Service and Owner Manuals for Chrysler, Plymouth, Dodge, Dodge Truck, and Jeep® vehicles, Call (800) 890-4038 or FAX (440) 572-0815 to place an order. Or, visit our website at techauthority.daimlerchrysler.com. Tech Authority Online at our website offers you service information on a subscription basis.

FOREWORD

The information contained in this service manual has been prepared for the professional automotive technician involved in daily repair operations. Information describing the operation and use of standard and optional equipment is included in the Owner's Manual provided with the vehicle.

Information in this manual is divided into groups. These groups contain description, operation, diagnosis, testing, adjustments, removal, installation, disassembly, and assembly procedures for the systems and components. To assist in locating a group title page, use the Group Tab Locator on the following page. The solid bar after the group title is aligned to a solid tab on the first page of each group. The first page of the group has a contents section that lists major topics within the group. If you are not sure which Group contains the information you need, look up the Component/System in the alphabetical index located in the rear of this manual.

A Service Manual Comment form is included at the rear of this manual. Use the form to provide DaimlerChrysler Corporation with your comments and suggestions.

Tightening torques are provided as a specific value throughout this manual. This value represents the midpoint of the acceptable engineering torque range for a given fastener application. These torque values are intended for use in service assembly and installation procedures using the correct OEM fasteners. When replacing fasteners, always use the same type (part number) fastener as removed.

DaimlerChrysler Corporation reserves the right to change testing procedures, specifications, diagnosis, repair methods, or vehicle wiring at any time without prior notice or incurring obligation.
