DESCRIPTION AND OPERATION

FOUR WHEEL DRIVE (4WD) SYSTEMS

The All-Wheel Drive (AWD) system consists of the following:

- Power Transfer Unit (PTU)
- Rear driveshaft
- 4X4 control module (coupling device control module) (located behind the RH side instrument panel)
- Rear axle with coupling device

Torque from the engine is transferred through the transaxle to the PTU. This torque is transferred from the driveshaft to the rear axle, which drives the rear halfshafts. The AWD system, referred to as an Active Torque Coupling (ATC) system, is always active and requires no driver input.

The AWD system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is delivered to the front wheels. If wheel slip between the front and rear wheels is detected, or if the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels to prevent or control wheel slip.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, and the PTU-transaxle compression seal. No internal components are serviced. There should be no need to remove the PTU cover. If any of the internal geared components, bearings, case cover or shafts are worn or damaged, a new PTU must be installed.

DIAGNOSTIC TESTS

FOUR WHEEL DRIVE (4WD) SYSTEMS - ALL WHEEL DRIVE (AWD)

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2574-A	Flex Probe Kit	105-R025C
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Principles of Operation

The vehicle is equipped with a four wheel drive (4WD) system, **also referred to as active torque control coupling (ATCC) or intelligent torque control coupling (ITCC)** , that is always active and requires no driver input. The system has no mode select switch. The system combines transparent all-surface operation with all wheel drive (AWD), and is capable of handling all road conditions, including street and highway driving as well as off-road and winter driving.

The system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected, or if the vehicle is under heavy acceleration (high-throttle position), the AWD system increases torque to the rear wheels to prevent or control wheel slip.

The system consists of a power transfer unit (PTU), 4X4 control module, rear axle and a solenoid-actuated ATCC device. The module varies the torque sent to the rear wheels by controlling the current sent to the clutch located inside the rear axle.

The 4X4 control module also provides the brake system with its current clutch duty cycle and whether or not the brake system may take command of the clutch duty cycle.

NOTE: **The ATCC solenoid is not repairable. If a new component is required, the ATCC solenoid and rear axle are installed as an assembly. Refer to <u>REAR DRIVE AXLE/DIFFERENTIAL</u> article.**

The PTU is a gearbox that attaches to the transaxle. The RH intermediate shaft passes through the PTU and engages the differential side gear as in normal front wheel drive (FWD) applications. The transaxle differential drives the PTU. The PTU then drives the driveshaft at all times. The driveshaft drives one half of the rear axle clutch pack. The other half of the rear axle clutch pack drives the rear axle ring and pinion.

The active, on-demand AWD system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate amount of current to send to the ATCC solenoid that delivers the desired torque to the rear wheels. Specific inputs to the 4X4 control module are:

- Accelerator pedal position via the high-speed controller area network (HS-CAN)
- Transaxle range from the PCM via the HS-CAN
- Brake system status from the ABS module via the HS-CAN
- Wheel speed from all 4 wheels from the ABS module via the HS-CAN

4X4 control module outputs are:

- Solid-state clutch (pulse-width modulated signal) to the ATCC solenoid
- Percent of torque transfer commanded signal to the ABS module via the HS-CAN
- Torque request available signal to the ABS module via the HS-CAN

Heat Protection Mode - During very extreme off-road operation, the AWD system utilizes a heat protection mode to protect the active torque control coupling (ATCC) solenoid (part of rear axle) from damage. If the system detects an overheat condition, it enters a locked mode. If the heat in the system continues to rise once in the locked mode, the 4X4 control module disables the ATCC solenoid. Allow the system to cool down at least 10 minutes with the ignition switch in the ON position.

Inspection and Verification

1. Verify the customer concern.
2. Inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Active torque control coupling (ATCC) solenoid (part of rear axle)
• Power transfer unit (PTU)
• Rear drive unit (RDU)
• Halfshafts and CV joints
• Driveshaft and U-joints
• Fluid leaks
• Wheel/tire size and brand
• Matching tire size and brand
• Tire pressure
	• Smart junction box (SJB) fuse(s):
	  ○ 11 (10A)
	  ○ 35 (10A)
	• 4X4 control module
	• Wiring harness
	• Connector(s)
	• Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: **Make sure to use the latest scan tool software release.**

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: **The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.**

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the DTCs and carry out the self-test diagnostics for the 4X4 control module.

9. If the DTCs retrieved are related to the concern, go to the 4X4 Control Module DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **SYMPTOM CHART - FOUR WHEEL DRIVE (4WD) SYSTEMS** table.

DTC Charts

4X4 CONTROL MODULE DTC CHART

DTC	Description	Possible Causes	Source	Action
B1317	Battery Voltage High	• Generator	4X4 Control Module	Go to **Pinpoint Test B** .
B1318	Battery Voltage Low	• Blown fuse (B+) • Intermittent open on power circuit • 4X4 control module connector	4X4 Control Module	CHECK smart junction box (SJB) fuses 11 (10A) and 35 (10A). If fuses are OK, go to **Pinpoint Test B** .
B1342	ECU is Faulted	• Microprocessor or internal memory fault	4X4 Control Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**.
B2900	VIN Mismatch	• Incorrect VIN codes received from PCM	4X4 Control Module	CHECK the PCM configuration. REFER to **MODULE CONFIGURATION** article.
P1635	Tire/Axle Out of Acceptable Range	• Incorrect size tire installed on vehicle • Wheel speed sensor failure • Flat or under-inflated tire	4X4 Control Module	Go to **Pinpoint Test G** .
P1824	4-Wheel Drive Clutch Relay Circuit Failure	• Short to ground on active torque control coupling (ATCC) solenoid (part of rear axle) high circuit • 4X4 control module failure	4X4 Control Module	CHECK SJB fuse 11 (10A). If the fuse is OK, go to **Pinpoint Test E** .
P1825	4-Wheel Drive	• 4X4 control	4X4 Control	CHECK SJB fuses 11 (10A)

	Clutch Relay Open Circuit	module harness connector • Open in ATCC solenoid (part of rear axle) low circuit • Open in ATCC solenoid high circuit • Short to ground on ATCC solenoid low circuit • Short to ground on ATCC solenoid high circuit • Open coil inside ATCC solenoid • Short to voltage in ATCC solenoid low circuit • 4X4 control module failure	Module	and 35 (10A). If the fuses are OK, go to **Pinpoint Test E** .
U0100	Lost Communication with ECM/PCM	• Controller area network (CAN) bus fault • No data received by 4X4 control module from PCM	4X4 Control Module	Go to **Pinpoint Test D** .
U0121	Lost Communication with Anti-lock Brake System (ABS) Control Module	• CAN bus fault • No data received by 4X4 control module from ABS control module	4X4 Control Module	Go to **Pinpoint Test D** .
U0155	Lost Communication with Instrument Cluster (IC) Control Module	• High-speed controller area network (HS-CAN) fault • No data received from the IC by the 4X4 control module	4X4 Control Module	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the lost communication with the IC.
U0401	Invalid Data Received From	• Invalid data	4X4 Control Module	REFER to **INTRODUCTION -**

	ECM/PCM A	received from PCM • Data out of range		**GASOLINE ENGINES** article to diagnose the accelerator position, engine coolant or keep alive memory fault.
U0415	Invalid Data Received From Anti-lock Brake System (ABS) Control Module	• Invalid data received from ABS module • Data out of range	4X4 Control Module	Go to **Pinpoint Test C** .
U2050	No Application Present	• Application software is not present • Application software update failed • 4X4 control module failed	4X4 Control Module	CONFIGURE the 4X4 control module. REFER to **MODULE CONFIGURATION** article to CARRY OUT programmable module installation (PMI). CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2050 is retrieved again, INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**. REPEAT the self-test.
U2051	One or More Calibration Files Missing/Corrupt	• Calibration software not present • Calibration software update failed • 4X4 control module failed	4X4 Control Module	CONFIGURE the 4X4 control module. REFER to **MODULE CONFIGURATION** article to CARRY OUT PMI. CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2050 is retrieved again, INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**. REPEAT the self-test.

Symptom Chart - Four Wheel Drive (4WD) System

SYMPTOM CHART - FOUR WHEEL DRIVE (4WD) SYSTEM

Condition	Possible Sources	Action

• The concern is unverifiable; no DTCs present	• The concern description is inaccurate	• CARRY OUT the All Wheel Drive (AWD) System Functional Test. Go to **Pinpoint Test A** .
• The power transfer unit (PTU) makes noise	• Tire inflation pressure • Tire and wheel size	• MAKE SURE all tires and wheels are the same size and brand and the inflation pressures are correct.
	• Fluid level	• FILL with the correct type and amount of lubricant. REFER to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.
	• Internal components	• OPERATE the vehicle in all gears. If there is noise in the transaxle in NEUTRAL, or in some gears and not in others, REMOVE and REPAIR the transaxle. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article. If there is noise in all gears, INSTALL a new PTU. REFER to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.
• 4X4 control module battery voltage is high or low	• Concern with voltage regulator or generator • Smart junction box (SJB) fuse 11 (10A) • SJB fuse 35 (10A) • Intermittent open power circuit • 4X4 control module internal relay failure	• Go to **Pinpoint Test B** .
• 4X4 control module received no/invalid data from PCM	• Invalid data received from PCM • Data out of range	• REFER to **INTRODUCTION - GASOLINE ENGINES** article to diagnose the accelerator position, engine coolant or keep alive memory fault.
• 4X4 control module received no/invalid data from ABS module	• Invalid data received from the ABS module • Data out of range	• Go to **Pinpoint Test C** .
• High-speed controller	• HS-CAN bus fault	• Go to **Pinpoint Test D** .

area network (HS-CAN) communications bus fault	• PCM fault • ABS fault • Instrument cluster (IC) fault • 4X4 control module	
• Vehicle has no or inadequate torque at rear wheels	• Rear axle	• REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• PTU mechanical failure	• REFER to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.

	• Wheels/tires
	• Active torque control coupling (ATCC) solenoid (part of rear axle)
	• SJB fuse(s):
	  • 11 (10A)
	  • 35 (10A)
	• 4X4 control module
		• Go to **Pinpoint Test G** .

	• Circuitry	• Go to **Pinpoint Test E** .
• Vehicle binds in a turn or resists turning/pulsates or shudders in a straight line	• Wheels/tires	• REFER to **WHEELS AND TIRES** article.
	• Brake system	• REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article.
	• Wheel bearings	• REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
	• Halfshafts	• REFER to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.
	• Wheel speed sensor(s)	• REFER to **VEHICLE DYNAMIC SYSTEMS** article.
	• ABS module	• REFER to **VEHICLE DYNAMIC SYSTEMS** article.
	• 4X4 control module • ATCC solenoid	• Go to **Pinpoint Test F** .

	(part of rear axle) • Circuitry	
• Tire/axle out of acceptable operating range	• Wheels/tires • Wheel speed sensors • ABS module • 4X4 control module	• Go to **Pinpoint Test G** .

Pinpoint Tests

Pinpoint Test A: All Wheel Drive (AWD) System Functional Test

Refer to appropriate SYSTEM WIRING DIAGRAMS article for All Wheel Drive (AWD) schematic and connector information.

Normal Operation

The all wheel drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is delivered to the front wheels. If wheel slip between the front and rear wheels is detected, or if the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels to prevent or control wheel slip.

This pinpoint test is intended to diagnose the following:

- An AWD system concern without on-demand or continuous DTCs present.

PINPOINT TEST A: AWD SYSTEM FUNCTIONAL TEST

NOTE: **This test must be carried out on a hard surface in an area without traffic.**

NOTE: **Carry out Inspection and Verification as outlined before carrying out this pinpoint test.**

A1 CHECK FOR WRENCH LIGHT PROVE-OUT

- Turn the ignition to the ON position and observe the wrench light.
- **Does the wrench light illuminate for 3 seconds and then turn OFF?**

  YES : Go to A2.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article for further diagnosis of the instrument cluster (IC).

A2 CHECK FOR ACTIVE TORQUE CONTROL COUPLING (ATCC) SOLENOID (PART OF REAR AXLE) LOCK

- Drive the vehicle on a dry, hard surface in turns while applying the accelerator pedal.

- **Is driveline wind-up present in turns?**

  YES : With the ignition switch in ON position, allow the ATCC solenoid to cool down for at least 10 minutes and repeat the test. CHECK for wind-up again. If no wind-up is found, go to A3; if still present, go to **Pinpoint Test F** .

  NO : Go to A3.

A3 CHECK FOR VALID ACCELERATOR PEDAL POSITION MONITORING THE ACCELERATOR PEDAL POSITION (AP) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor the AP PID while pressing the accelerator pedal.
- **Does the accelerator pedal position match the AP PID percent value?**

  YES : Go to A4.

  NO : REFER to the INTRODUCTION - GASOLINE ENGINES article to diagnose the accelerator pedal position sensor concern.

A4 CHECK 4X4 CONTROL MODULE WHEEL SPEED SENSOR PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs:
  - Left Front Wheel Speed Sensor (LF_WSPD)
  - Left Rear Wheel Speed Sensor (LR_WSPD)
  - Right Front Wheel Speed Sensor (RF_WSPD)
  - Right Rear Wheel Speed Sensor (RR_WSPD)
- **Are all 4 wheel speeds within 3 km/h (1.8 mph) of each other?**

  YES : Go to A5.

  NO : Go to **Pinpoint Test G** .

A5 CHECK VEHICLE ACCELERATION IN A STRAIGHT LINE

- Carry out 3 accelerations from 0-48 km/h (0-30 mph) in a straight line (one each with low, medium and full accelerator pedal application).
- **Does the vehicle pulsate or shudder while accelerating?**

  YES : Go to **Pinpoint Test F** .

  NO : Go to A6.

A6 CHECK VEHICLE TURNING ABILITY

- Drive the vehicle in a fully locked turn, on dry pavement, at 8 km/h (5 mph).
- **Does the vehicle bind in the turn or resist turning?**

  YES : Go to **Pinpoint Test F** .

  NO : Go to A7.

A7 CHECK FOR TORQUE AT REAR WHEELS USING PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Using the scan tool, command CLCH_SOL to energize the ATCC solenoid to a constant 100% applied.

- Drive the vehicle in a fully locked turn, on dry pavement, at 8 km/h (5 mph).
- **Does the vehicle bind in the turn or resist turning?**

  YES : End the active command. The concern cannot be duplicated at this time. RETURN the vehicle to the customer.

  NO : End the active command. CHECK that the driveshaft rotates when the transaxle is in gear. If yes, go to **Pinpoint Test E** . If no, CHECK the PTU. REFER to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.

Pinpoint Test B: 4X4 Control Module Battery Voltage is High or Low

Refer to appropriate SYSTEM WIRING DIAGRAMS article for All Wheel Drive (AWD) schematic and connector information.

Normal Operation

If the 4X4 control module observes an overpower or underpower voltage condition, DTCs are set and the 4X4 control module may not allow 4WD operation.

- DTC B1317 Battery Voltage High - When the 4X4 control module detects battery voltage greater than 16 volts for at least 10 seconds or ignition run/start voltage greater than 16 volts for at least one second, this DTC is set.
- DTC B1318 Battery Voltage Low - When the 4X4 control module detects battery voltage less than 9 volts for at least 10 seconds or ignition run/start voltage less than 9 volts for at least one second with the engine running at 1,500 RPM or greater, this DTC is set.

This pinpoint test is intended to diagnose the following:

- Fuses
- Charging/battery system
- 4X4 control module
- Wiring, terminals or connectors

PINPOINT TEST B: 4X4 CONTROL MODULE BATTERY VOLTAGE IS HIGH OR LOW

NOTE: **Carry out Inspection and Verification as outlined before carrying out this pinpoint test.**

B1 CHECK FOR HIGH BATTERY VOLTAGE MONITORING THE MODULE SUPPLY VOLTAGE (VBAT_4X4) PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor the battery voltage VBAT_4X4 PID.
- **Is the battery voltage greater than 16 volts?**

YES : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article for diagnosis of the battery and charging system.

NO : Go to B2.

B2 CHECK FOR LOW VOLTAGE MONITORING THE MODULE SUPPLY VOLTAGE (VBAT_4X4) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor the battery voltage VBAT_4X4 PID.
- **Is the battery voltage less than 9 volts?**

YES : Go to B4.

NO : Go to B3.

B3 CHECK FOR A BLOWN FUSE

- Check the following smart junction box (SJB) fuses:
  - 11 (10A).
  - 35 (10A).
- **Are the fuses open?**

YES : INSTALL a new fuse(s). CLEAR the DTCs. REPEAT the self-test.

NO : Go to B4.

B4 CHECK FOR CORRECT VOLTAGE AT THE BATTERY

- Measure the voltage between the battery positive terminal and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to B5.

NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article for diagnosis of the battery and charging system.

B5 CHECK CIRCUIT GD140 (BK/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: 4X4 Control Module C281
- Measure the resistance between 4X4 control module C281-15, circuit GD140 (BK/GN), harness side and ground.

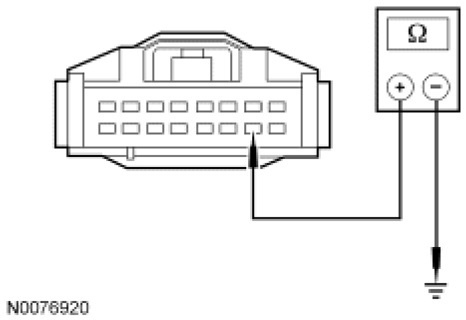

Fig. 1: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Repeat this measurement while wiggling the harness.
- **Is the resistance less than 5 ohms?**

  YES : Go to B6.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B6 CHECK POWER TO THE 4X4 CONTROL MODULE

- Key in ON position.

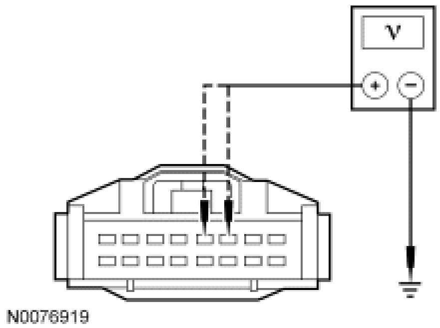

Fig. 2: Checking 4X4 Control Module Power Circuits
Courtesy of FORD MOTOR CO.

- Measure the voltage between 4X4 control module C281-6, circuit SBP11 (BU/RD), harness side and ground; and between 4X4 control module C281-5, circuit CBP35 (YE/GY), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to B7.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B7 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect the 4X4 control module.
- Check the harness and component side connectors for:
  - corrosion.
  - pushed-out/bent pins.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: 4X4 Control Module Received No/Invalid Data From ABS Module

Refer to appropriate SYSTEM WIRING DIAGRAMS article for All Wheel Drive (AWD) schematic and

connector information.

Normal Operation

The on-demand four wheel drive (4WD) system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate duty cycle to send to the active torque control coupling (ATCC) (part of rear axle) solenoid that delivers the desired torque to the rear wheels. Specific inputs to the 4X4 control module are: accelerator pedal position output from the PCM, transmission range from the PCM, brake system status and all 4 wheel speeds from the ABS module. Communication between the 4X4 control module and other modules is obtained through the high-speed controller area network (HS-CAN). If the 4X4 control module loses communication with, or receives invalid data from any of the necessary modules, DTCs are set and the 4X4 control module may not allow 4WD operation.

- DTC U0415 Invalid Data Received from Anti-lock Brake System (ABS) Control Module - When the 4X4 control module receives invalid HS-CAN bus data or invalid wheel speed(s) from the ABS module for more than 30 seconds, this DTC is set.

This pinpoint test is intended to diagnose the following:

- ABS module

PINPOINT TEST C: 4X4 CONTROL MODULE RECEIVED NO/INVALID DATA FROM ABS MODULE

NOTE:	**This test must be carried out on a hard surface in an area without traffic.**

NOTE:	**Carry out Inspection and Verification as outlined before carrying out this pinpoint test.**

C1 CHECK FOR ABS MODULE DTCs

- Key in ON position.
- Carry out the ABS module self-test.
- Review the results of the ABS module self-test.
- **Are any DTCs present?**

  YES : REFER to **VEHICLE DYNAMIC SYSTEMS** article for further diagnosis of the ABS.

  NO : Go to C2.

C2 CHECK WHEEL SPEED SENSORS PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- While driving the vehicle at 32 km/h (20 mph), monitor the following wheel speed sensor PIDs:
  - Left Front Wheel Speed Sensor (LF_WSPD)
  - Left Rear Wheel Speed Sensor (LR_WSPD)
  - Right Front Wheel Speed Sensor (RF_WSPD)
  - Right Rear Wheel Speed Sensor (RR_WSPD)

- **Do the 4 wheel speed sensors match the speedometer and are they within 3 km/h (1.8 mph) of each other?**

  YES : The system is operating correctly at this time. CLEAR the DTCs. REPEAT the self-test.

  NO : REFER to **VEHICLE DYNAMIC SYSTEMS** article for further diagnosis of the ABS.

Pinpoint Test D: High-Speed Controller Area Network (HS-CAN) Communications Bus Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article for All Wheel Drive (AWD) schematic and connector information.

Normal Operation

The on-demand four wheel drive (4WD) system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate duty cycle to send to the active torque control coupling (ATCC) solenoid (part of rear axle) that delivers the desired torque to the rear wheels. Specific inputs to the 4X4 control module are: accelerator pedal position output from the PCM, transmission range from the PCM, brake system status and all 4 wheel speeds from the ABS module. Communication between the 4X4 control module and other modules is obtained through the high-speed controller area network (HS-CAN). If the 4X4 control module loses communication with, or receives invalid data from any of the necessary modules, DTCs are set and the 4X4 control module may not allow 4WD operation.

- DTC U0100 Lost Communication with ECM/PCM - When the 4X4 control module detects a missing HS-CAN bus message from the PCM for at least 5 seconds, this DTC is set.
- DTC U0121 Lost Communication with Anti-lock Brake System (ABS) Control Module - When the 4X4 control module detects a missing HS-CAN bus message from the ABS module for at least 5 seconds, this DTC is set.

This pinpoint test is intended to diagnose the following:

- 4X4 control module
- PCM
- ABS module
- Wiring, terminals or connectors

PINPOINT TEST D: HIGH-SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATIONS BUS FAULT

NOTE:	**Carry out Inspection and Verification as outlined before carrying out this pinpoint test.**

D1 CHECK HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE 4X4 CONTROL MODULE FOR AN OPEN

- Key in OFF position.

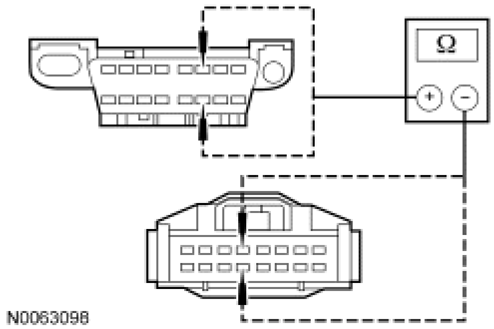

Fig. 3: Checking High Speed Can Circuits Between DLC And 4X4 Control Module For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-4, circuit VDB04 (WH/BU), harness side and DLC C251-6, circuit VDB04 (WH/BU), harness side; and between 4X4 control module C281-12, circuit VDB05 (WH), harness side and DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to D2.

  NO : REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. CARRY OUT the Network Test.

D2 CHECK HS-CAN CIRCUITS FOR A SHORT TO GROUND

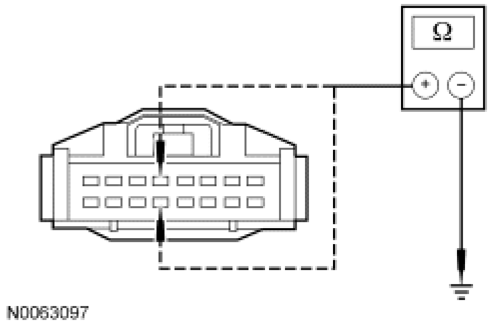

Fig. 4: Checking High Speed CAN Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-4, circuit VDB04 (WH/BU), harness side and ground; and between 4X4 control module C281-12, circuit VDB05 (WH), harness side and ground.
- **Are the resistances greater than 5,000 ohms?**

  YES : Go to D3.

  NO : REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. CARRY OUT the Network Test.

D3 CHECK RESISTANCE BETWEEN HS-CAN CIRCUITS

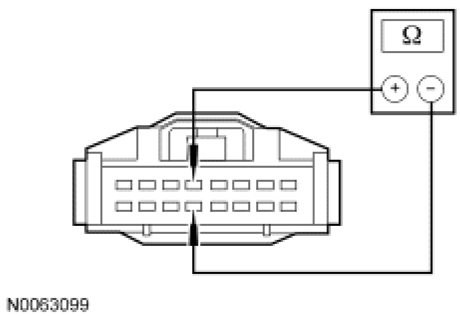

Fig. 5: Checking Resistance Between High Speed CAN Circuits
Courtesy of FORD MOTOR CO.

NOTE:	**The PCM and the instrument cluster (IC) must be connected and operating correctly to obtain the correct resistance between the HS-CAN circuits.**

- Measure the resistance between 4X4 control module C281-4, circuit VDB04 (WH/BU) harness side and 4X4 control module C281-12, circuit VDB05 (WH) harness side.
- **Is the resistance 60 ohms (± 5 ohms)?**

  YES : Go to D4.

  NO : REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. CARRY OUT the Network Test.

D4 CHECK FOR DTCs U0100 AND U0121 SET TOGETHER

- Key in ON position.
- Carry out the 4X4 control module self-test.
- Review the results of the 4X4 control module self-test.
- **Are DTCs U0100 and U0121 set together?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to continue diagnosis of the communications network.

  NO : Go to D5.

D5 CHECK FOR DTC U0100

- Refer to the results of the 4X4 control module self-test.
- **Is DTC U0100 set?**

  YES : The PCM is not sending any data to the 4X4 control module. REFER to **MODULE COMMUNICATIONS NETWORK** article to for additional PCM diagnosis.

  NO : Go to D6.

D6 CHECK FOR DTC U0121

- Refer to the results of the 4X4 control module self-test.
- **Is DTC U0121 set?**

  YES : The ABS module is not sending any data to the 4X4 control module. REFER to **MODULE COMMUNICATIONS NETWORK** article for additional ABS module diagnosis.

NO : Go to D7.

D7 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Key in OFF position.
- Disconnect the 4X4 control module.
- Check the harness and component side connectors for:
  - corrosion.
  - pushed-out/bent pins.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: Vehicle Has No or Inadequate Torque at Rear Wheels

Refer to appropriate SYSTEM WIRING DIAGRAMS article for All Wheel Drive (AWD) schematic and connector information.

Normal Operation

The on-demand four wheel drive (4WD) system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate duty cycle to send to the active torque control coupling (ATCC) solenoid (part of rear axle) that delivers the desired torque to the rear wheels. If the 4X4 control module loses communication with, or receives invalid data from any of the necessary modules, DTCs are set and the 4X4 control module may not allow 4WD operation.

- DTC P1824 4-Wheel Drive Clutch Relay Circuit Failure - When the 4X4 control module detects a short to ground on the ATCC solenoid feedback circuit, this DTC is set.
- DTC P1825 4-Wheel Drive Clutch Relay Open Circuit - When the 4X4 control module detects an open or short to ground on the ATCC solenoid command or feedback circuit for more than 2 seconds, this DTC is set.

This pinpoint test is intended to diagnose the following:

- Tire/axle out of range
- ATCC solenoid (part of rear axle)
- 4X4 control module
- Power transfer unit (PTU)
- Wiring, terminals or connectors

PINPOINT TEST E: VEHICLE HAS NO OR INADEQUATE TORQUE AT REAR WHEELS

NOTE: **Carry out Inspection and Verification as outlined before carrying out this pinpoint test.**

E1 CHECK FOR 4X4 CONTROL MODULE DTCs

- Key in ON position.
- Carry out the 4X4 control module self-test.
- **Are any DTCs received?**

  YES : For DTC P1824 or P1825, go to E5.

  For all other DTCs, REFER to the 4X4 Control Module DTC Chart in this service information.

  NO : Go to E2.

E2 CHECK HIGH-SPEED CONTROLLER AREA NETWORK (HS-CAN) CIRCUITS BETWEEN DATA LINK CONNECTOR (DLC) AND 4X4 CONTROL MODULE FOR AN OPEN

- Key in OFF position.
- Disconnect: 4X4 Control Module C281

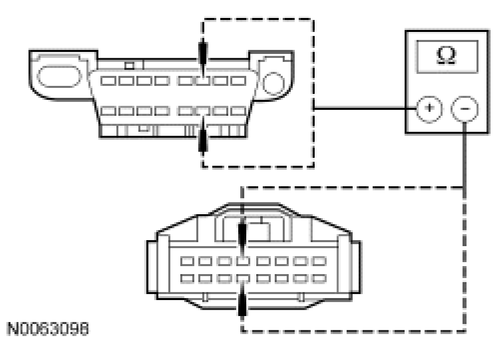

Fig. 6: Checking High Speed Can Circuits Between DLC And 4X4 Control Module For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-4, circuit VDB04 (WH/BU), harness side and DLC C251-6, circuit VDB04 (WH/BU), harness side; and between 4X4 control module C281-12, circuit VDB05 (WH), harness side and DLC C251-14, circuit VDB05 (WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to E3.

  NO : REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. CARRY OUT the Network Test.

E3 CHECK HS-CAN CIRCUITS FOR A SHORT TO GROUND

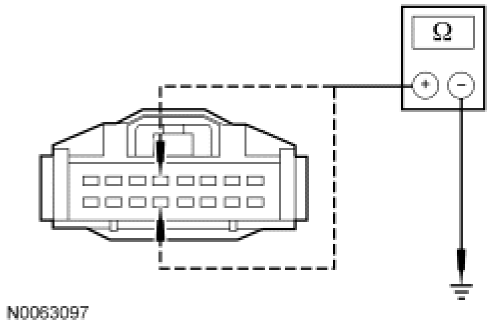

Fig. 7: Checking High Speed CAN Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-4, circuit VDB04 (WH/BU), harness side and ground; and between 4X4 control module C281-12, circuit VDB05 (WH), harness side and ground.
- **Are the resistances greater than 5,000 ohms?**

  YES : Go to E4.

  NO : REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. CARRY OUT the Network Test.

E4 CHECK RESISTANCE BETWEEN HS-CAN CIRCUITS

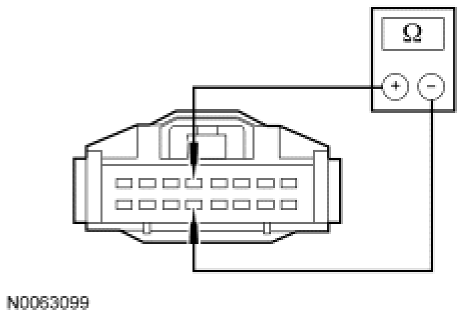

Fig. 8: Checking Resistance Between High Speed CAN Circuits
Courtesy of FORD MOTOR CO.

NOTE:	**The PCM and the instrument cluster (IC) must be connected and operating correctly to obtain the correct resistance between the HS-CAN circuits.**

- Measure the resistance between 4X4 control module C281-4, circuit VDB04 (WH/BU) harness side and 4X4 control module C281-12, circuit VDB05 (WH) harness side.
- **Is the resistance 60 ohms (± 5 ohms)?**

  YES : Go to E5.

  NO : REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. CARRY OUT the Network Test.

E5 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR A SHORT TO GROUND WITH ATCC SOLENOID (PART OF REAR AXLE) CONNECTED

- Key in OFF position.
- Disconnect: 4X4 Control Module C281

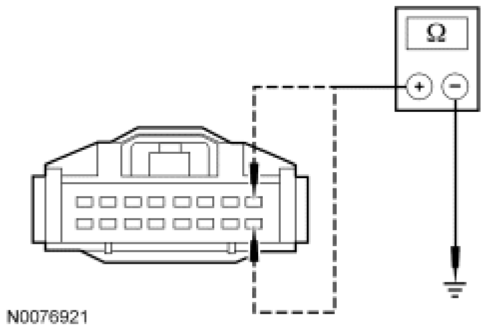

Fig. 9: Checking Circuits CCF21 (VT/WH) & RCF21 (WH/VT) For A Short To Ground With ATC Solenoid Connected
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-8, circuit CCF21 (VT/WH), harness side and ground; and between 4X4 control module C281-16, circuit RCF21 (WH/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E8.

  NO : Go to E6.

E6 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR A SHORT TO GROUND WITH C4004 DISCONNECTED

- Disconnect: ATCC Solenoid Jumper Harness C4004

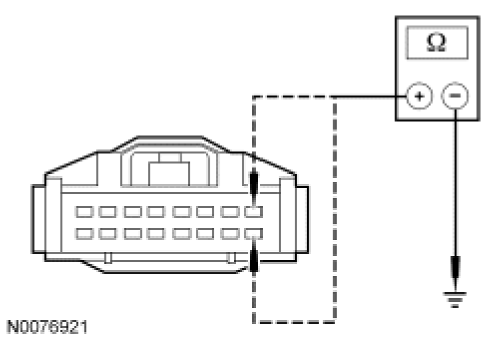

Fig. 10: Checking Circuits CCF21 (VT/WH) & RCF21 (WH/VT) For A Short To Ground With ATC Solenoid Connected
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-8, circuit CCF21 (VT/WH), harness side and ground; and between 4X4 control module C281-16, circuit RCF21 (WH/VT), harness side and

ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E7.

  NO : REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.

E7 CHECKING THE ATCC SOLENOID JUMPER HARNESS WIRES

NOTE: **The active torque control coupling (ATCC) solenoid jumper harness must be secured to prevent damage to the wiring.**

- Disconnect: ATCC Solenoid C4347
- Inspect the ATCC solenoid jumper harness for damage.
- **Is the ATCC solenoid jumper harness damaged?**

  YES : REPAIR or INSTALL a new ATCC solenoid jumper harness. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new rear axle assembly. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. CLEAR the DTCs. REPEAT the self-test.

E8 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR AN OPEN WITH ATCC SOLENOID CONNECTED

- Connect: ATCC Solenoid C4347 and ATCC Solenoid Jumper Harness C4004

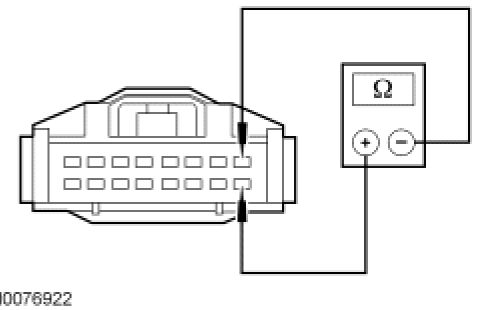

Fig. 11: Checking Circuits CCF21 (VT/WH) & RCF21 (WH/VT) For An Open With ATC Solenoid Connected
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-8, circuit CCF21 (VT/WH), harness side and 4X4 control module C281-16, circuit RCF21 (WH/VT), harness side.
- **Is the resistance less than 10 ohms?**

  YES : Go to E11.

  NO : Go to E9.

E9 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR AN OPEN AT C4004

- Disconnect: ATCC Solenoid Jumper Harness C4004

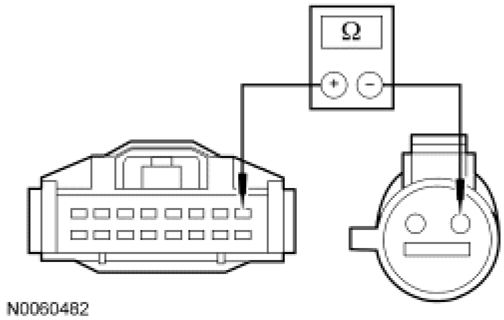

Fig. 12: Measuring Resistance Between 4X4 Control Module C281-8, Circuit CCF21 (VT/WH) & ATCC solenoid jumper harness C4004-1, circuit CCF21 (VT/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-8, circuit CCF21 (VT/WH), harness side and ATCC solenoid jumper harness C4004-1, circuit CCF21 (VT/WH).
- Repeat this measurement while wiggling the harness.

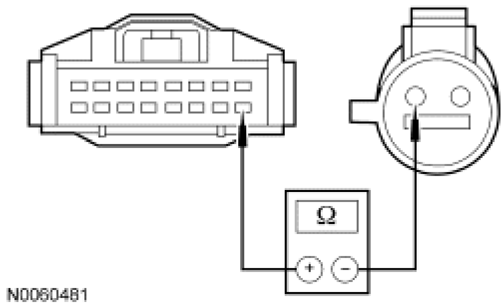

Fig. 13: Measuring Resistance Between 4X4 Control Module C281-16, Circuit RCF21 (WH/VT) & ATCC Solenoid Jumper Harness C4004-2, Circuit RCF21 (WH/VT)
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-16, circuit RCF21 (WH/VT), harness side and ATCC solenoid jumper harness C4004-2, circuit RCF21 (WH/VT), harness side.
- Repeat this measurement while wiggling the harness.
- **Are the resistances less than 5 ohms?**

  YES : Go to E10.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E10 CHECK THE ATCC SOLENOID CIRCUIT FOR AN INTERNAL OPEN

NOTE:	**The active torque control coupling (ATCC) solenoid jumper harness must be secured to prevent damage to the wiring.**

- Disconnect: ATCC Solenoid C4347

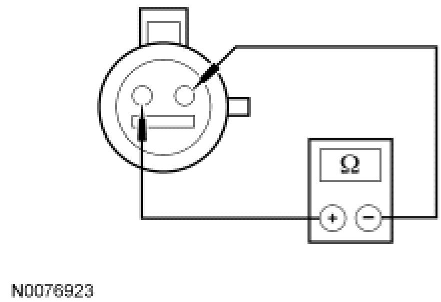

Fig. 14: Checking ATC Solenoid Circuit For An Internal Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between ATCC solenoid C4347-1, circuit CCF21 (VT/WH), component side and ATCC solenoid C4347-2, circuit RCF21 (WH/VT), component side.
- Repeat this measurement while wiggling the harness.
- **Is the resistance less than 10 ohms?**

  YES : REPAIR or INSTALL a new ATCC solenoid jumper harness. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new rear axle assembly. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. CLEAR the DTCs. REPEAT the self-test.

E11 CHECK CIRCUIT GD140 (BK/GN) FOR AN OPEN

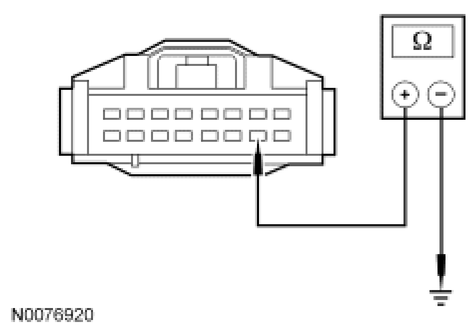

Fig. 15: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between 4X4 control module C281-15, circuit GD140 (BK/GN), harness side and ground.
- Repeat this measurement while wiggling the harness.
- **Is the resistance less than 5 ohms?**

  YES : Go to E12.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

E12 CHECK THE 4X4 CONTROL MODULE POWER CIRCUITS

- Key in ON position.

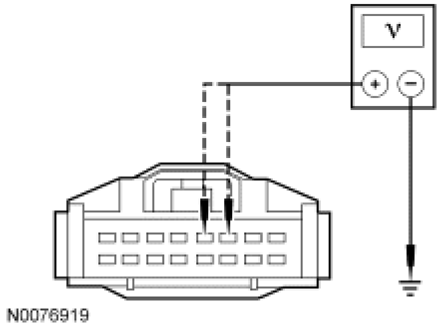

Fig. 16: Checking 4X4 Control Module Power Circuits
Courtesy of FORD MOTOR CO.

- Measure the voltage between 4X4 control module C281-6, circuit SBP11 (BU/RD), harness side and ground; and between 4X4 control module C281-5, circuit CBP35 (YE/GY), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to E13.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E13 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect: 4X4 Control Module C281
- Check the harness and component side connectors for:
  - corrosion.
  - pushed-out/bent pins.
- Check the ATCC solenoid jumper harness between the 4X4 control module and the ATCC solenoid, located on the rear subframe.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: Vehicle Binds in a Turn or Resists Turning/Pulsates or Shudders in a Straight Line

Refer to appropriate SYSTEM WIRING DIAGRAMS article for All Wheel Drive (AWD) schematic and connector information.

Normal Operation

The all wheel drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels.

This pinpoint test is intended to diagnose the following:

- Rear axle
- Wheels/tires
- PCM
- ABS module
- 4X4 control module
- Circuitry

PINPOINT TEST F: VEHICLE BINDS IN A TURN OR RESISTS TURNING/PULSATES OR SHUDDERS IN A STRAIGHT LINE

NOTE:	**Carry out Inspection and Verification as outlined before carrying out this pinpoint test.**

F1 CHECK FOR TORQUE AT THE REAR WHEELS

- Key in OFF position.
- Disconnect: Active Torque Control Coupling (ATCC) Solenoid (Part of Rear Axle) C4347
- Drive the vehicle in a straight line on dry pavement.
- **Is a pulsation or shudder still present?**

  YES : REFER to **DRIVELINE SYSTEM - GENERAL INFORMATION** article for additional axle diagnosis.

  NO : Go to F2.

F2 CHECK TO SEE IF THE ATCC SOLENOID IS BEING COMMANDED ON MONITORING 4WD CLUTCH PWM STATUS (4WDCPWMST) PID

- Key in OFF position.
- Connect: ATCC Solenoid C4347
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor the 4WDCPWMST PID.
- Drive the vehicle no faster than 8 km/h (5 mph) in tight turns on dry pavement while monitoring the ATCC solenoid duty cycle.
- **Is the duty cycle greater than 20%?**

  YES : Go to F3.

  NO : Go to **Pinpoint Test G** .

F3 CHECK FOR THE CORRECT WHEEL SPEEDS USING THE WHEEL SPEED SENSORS PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module

- While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs:
  - Left Front Wheel Speed Sensor (LF_WSPD)
  - Left Rear Wheel Speed Sensor (LR_WSPD)
  - Right Front Wheel Speed Sensor (RF_WSPD)
  - Right Rear Wheel Speed Sensor (RR_WSPD)
- **Are all 4 wheel speeds within 3 km/h (1.8 mph) of each other?**

  YES : Go to F4.

  NO : Go to **Pinpoint Test G** .

F4 CHECK FOR VALID ACCELERATOR PEDAL POSITION MONITORING ACCELERATOR PEDAL POSITION (AP) PID

- Key ON, engine OFF (KOEO).
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- Monitor AP PID while pressing/releasing the accelerator pedal.
- **Does the accelerator position match the PID percent value?**

  YES : Go to F5.

  NO : REFER to the **INTRODUCTION - GASOLINE ENGINES** article to diagnose the engine control system.

F5 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect the 4X4 control module.
- Check the harness and component side connectors for:
  - corrosion.
  - pushed-out/bent pins.
- Check the ATCC solenoid jumper harness between the 4X4 control module and the ATCC solenoid, located on the rear subframe.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: Tire/Axle Out of Acceptable Operating Range

Refer to appropriate SYSTEM WIRING DIAGRAMS article for All Wheel Drive (AWD) schematic and connector information.

Normal Operation

The all wheel drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels.

- DTC P1635 Tire/Axle Out of Acceptable Range - When the 4X4 control module detects inappropriate mini spare or road wheels/tires (greater than 5% at one wheel) installed, this DTC is set.

This pinpoint test is intended to diagnose the following:

- Wheels/tires
- Wheel speed sensors
- ABS module
- 4X4 control module

PINPOINT TEST G: TIRE/AXLE OUT OF ACCEPTABLE OPERATING RANGE

NOTE:	**This test must be carried out on a hard surface in an area without traffic.**

NOTE:	**Carry out Inspection and Verification as outlined before carrying out this pinpoint test.**

G1 CHECK THE RECENT TIRE USAGE

- Check with customer about recent tire usage or installation.
- **Has a tire been installed on the vehicle recently that was not originally supplied with the vehicle?**

  YES : INFORM the customer to only use tires of the type supplied with the vehicle. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to G2.

G2 CHECK TIRE SIZE AND BRAND

- Check the tire size and the brand of tire.
- **Are all 4 tires the same size and brand?**

  YES : Go to G3.

  NO : INSTALL tires that are the same size and brand. INFORM the customer to only use the same size tires and brand. CLEAR the DTCs. REPEAT the self-test.

G3 CHECK TIRE AIR PRESSURES

- Check the air pressure in all 4 tires.
- **Are all 4 tires at the recommended air pressure?**

  YES : Go to G4.

  NO : ADJUST the tire air pressures. CLEAR the DTCs. REPEAT the self-test. INFORM the customer to maintain the correct tire air pressure.

G4 CHECK FOR CORRECT WHEEL SPEEDS

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - 4X4 Control Module
- While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs:
  - Left Front Wheel Speed Sensor (LF_WSPD)
  - Left Rear Wheel Speed Sensor (LR_WSPD)
  - Right Front Wheel Speed Sensor (RF_WSPD)
  - Right Rear Wheel Speed Sensor (RR_WSPD)
- **Are all 4 wheel speeds within 3 km/h (1.8 mph) of each other?**

  YES : Go to G5.

  NO : The ABS module is sending invalid wheel speed data to the 4X4 control module. REFER to **VEHICLE DYNAMIC SYSTEMS** article for additional ABS module diagnosis.

G5 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION

- Disconnect: 4X4 Control Module C281
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect the 4X4 control module and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new 4X4 control module. REFER to **4X4 CONTROL MODULE**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

REMOVAL AND INSTALLATION

4X4 CONTROL MODULE

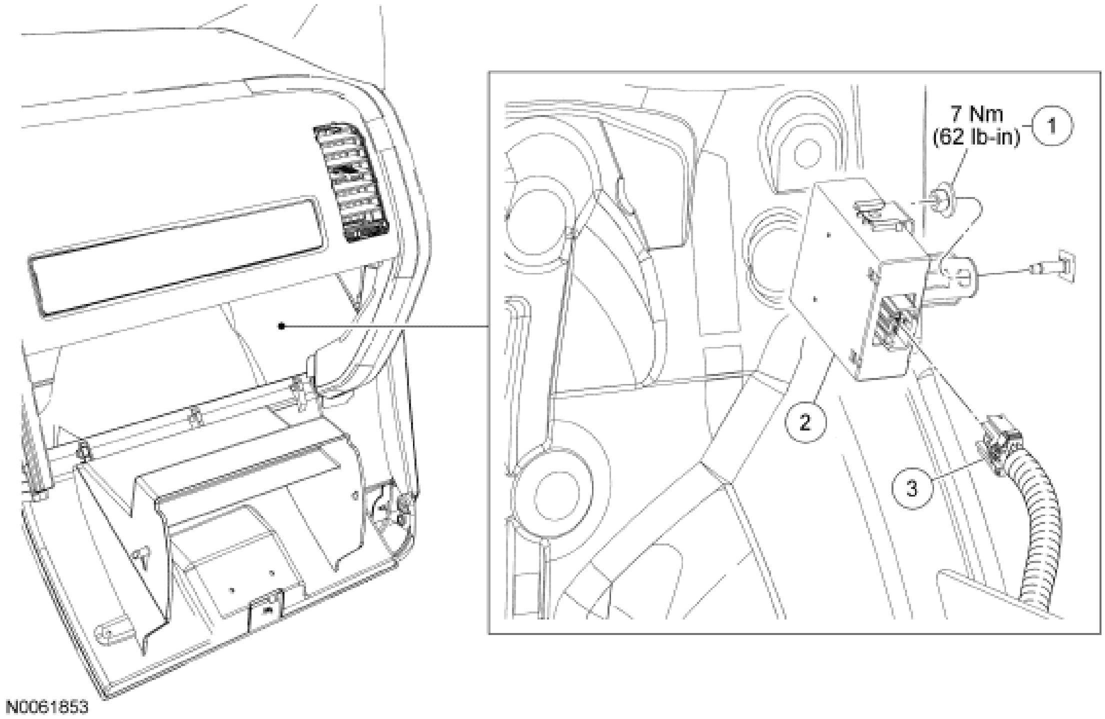

Fig. 17: Exploded View Of 4X4 Control Module With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N621906-S424	4X4 control module nut
2	7E453	4X4 control module and bracket
3	-	Electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

1. From below the RH side instrument panel, remove the hush panel.
2. Disconnect the 4X4 control module harness connector.
3. Remove the 4X4 control module nut.
   - To install, tighten to 7 N.m (62 lb-in).
4. Remove the 4X4 control module and bracket.
5. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

ANTI-LOCK CONTROL

ABS With Roll Stability Control (RSC) And Traction Control

The ABS with roll stability control (RSC) and traction control consists of the following components:

- Hydraulic control unit (HCU)
- ABS module (also controls the RSC system and traction control system)
- Stability/traction control switch
- Steering angle sensor module (SASM)
- Stability control sensor cluster (contains the accelerometer[s], roll rate sensor and yaw rate sensor)
- Front wheel speed sensors
- Front wheel speed sensor tone rings (integral to the halfshafts)
- Rear wheel speed sensors
- Rear wheel speed sensor tone rings are:
  - integral to the halfshaft on all wheel drive [AWD] vehicles.
  - integral to the wheel hub and bearing assembly on front wheel drive [FWD] vehicles.

- Brake pressure transducer (integral to the HCU)
- Brake fluid level switch

The ABS prevents wheel lock-up by monitoring the wheel speed sensors and actuating the valves in the HCU which modulates the brake pressure to the brake calipers. By preventing the wheels from locking up, the driver is able to maintain steering control and stop in the shortest possible distance under most conditions. The traction control system utilizes the same components as the ABS to prevent wheel spin and help maintain vehicle control during acceleration. The RSC system utilizes the same components as the ABS and the traction control systems and also monitors the steering wheel rotation sensor and the stability control sensor cluster to assist in stabilizing the vehicle during abrupt maneuvers.

The front wheel speed sensor tone rings are integral to the front halfshafts. Refer to **FRONT DRIVE HALFSHAFTS** article.

On AWD vehicles, the rear wheel speed sensor tone rings are integral to the rear halfshafts. Refer to **REAR DRIVE HALFSHAFTS** article.

On FWD vehicles, the rear wheel speed sensor tone rings are integral to the wheel hub and bearing assembly. Refer to **REAR SUSPENSION** article.

DIAGNOSTIC TESTS

ANTI-LOCK CONTROL

Special Tools

Illustration	Tool Name	Tool Number

	Vehicle Communication Module (VCM) and Integrated Diagnostic	

 ST2834-A	System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

Standard ABS

The standard ABS module manages anti-lock braking to maintain vehicle control during deceleration.

When the ignition switch is in the RUN position, the ABS module does a preliminary electrical check and, at approximately 20 km/h (12 mph), the hydraulic pump motor is turned on for approximately 1/2 second. During this time a buzzing or humming noise may be heard and a vibration maybe felt in the brake pedal. This is a normal condition. Any malfunction of the ABS disables the stability assist and the ABS warning indicator illuminates. However, the power-assist braking system functions normally.

The ABS module monitors and compares the rotational speed of each wheel. Wheel speeds are measured by the wheel speed sensor, which electrically senses each tooth of the sensor ring as it passes through the magnetic field of the sensor. When the ABS module detects an impending wheel lock, the ABS module commands the hydraulic pump motor on and commands the hydraulic control unit (HCU) to open and close the appropriate solenoid valves to modulate the brake pressure to the individual brake caliper(s). Once the affected wheel(s) return to the desired speed, the ABS module commands the HCU to return the solenoid valves to their normal position and normal base brake operation is restored.

In extreme cold conditions (temperature less than -25°C [-13°F]), the ABS module will briefly operate the hydraulic pump motor when the accelerator is pressed. This is done to warm the brake fluid.

Electronic Brake Distribution (EBD)

On initial application of the brake pedal, full pressure is applied to the rear brakes. The ABS module then uses wheel speed input to calculate an estimated rate of deceleration. Once vehicle deceleration exceeds a predetermined threshold, the ABS module closes the appropriate isolation valves in the Hydraulic Control Unit (HCU) to hold the rear brake pressure constant while allowing the front brake pressure to build. This creates a balanced braking condition between the front and rear wheels and minimizes the chance of rear wheel lockup during hard braking. As the vehicle decelerates, the valves are opened to increase the rear brake pressure in proportion to the front brake pressure.

A slight bump sensation may be felt in the brake pedal when Electronic Brake Distribution (EBD) is active.

If ABS is disabled due to DTCs being present in the ABS module, EBD will continue to function unless the DTCs are for wheel speed sensors or the HCU. When EBD is disabled, the ABS warning indicator and (if equipped) the Electronic Stability Control (ESC) warning indicator will be illuminated.

ABS with Traction Control, Electronic Stability Control (ESC) and Roll Stability Control (RSC)

The ABS module with traction control and roll stability control (RSC) performs the same functions as the standard ABS module. It also performs additional functions specific to traction control and RSC.

Traction Control

When the drive wheels lose traction and begin to spin, with vehicle speed under 100 km/h (62 mph), the ABS module commands the hydraulic pump motor on and commands the HCU to open and close the appropriate solenoid valves to modulate the brake pressure to the brake caliper(s) while simultaneously sending a request to the PCM over the high-speed controller area network (HS-CAN) bus to reduce engine torque to maintain vehicle traction. The PCM accomplishes this by minor incremental timing changes and fewer fuel injector pulses until the ABS module ends the request. The request ends when the driven wheel speed returns to the desired speed. After the vehicle speed exceeds 100 km/h (62 mph), the traction control is accomplished only through the PCM torque control.

Electronic Stability Control (ESC)

The electronic stability control (ESC) system constantly monitors the vehicle motion relative to the intended course. This is done by using sensors to compare the steering input and the yaw rate sensor with that of the actual vehicle motion. The ESC system monitors information from the throttle position (TP) sensor, the steering angle sensor module (SASM) (steering wheel angle and rate of change) and a yaw rate sensor (integral to the stability control sensor cluster) that measures changes in vehicle direction. If the ESC system determines from all these inputs that the vehicle is unable to travel in the intended direction, the system adjusts the brake torque at specific wheels in response to direct measurement of the vehicle motion and reduces engine torque to allow the vehicle to follow the intended course.

When the ESC system activates, any of the following can occur:

- A rumble or grinding sound much like ABS or traction control
- A small deceleration or a reduction in the acceleration of the vehicle
- The ESC indicator flashes
- If the driver's foot is on the brake pedal, a vibration will be felt in the pedal much like ABS

Roll Stability Control (RSC)

The roll stability control (RSC) system constantly monitors the vehicle motion relative to the intended course. This is done by using sensors to compare the steering input and brake application with that of the actual vehicle motion. The system does not activate when the vehicle is traveling in reverse; however, the standard ABS and traction control continue to function as usual. The RSC system monitors information from the wheel speed sensors, the TP sensor, the steering angle sensor module (SASM) (steering wheel angle and rate of change) and a roll-rate sensor (integral to the stability control sensor cluster) that measures changes in vehicle motion. If the RSC system determines from all these inputs that conditions exist for a potential roll-over event, the system adjusts the brake torque at specific wheels in response to direct measurement of the vehicle roll motion and reduces engine torque to make the vehicle more stable. By adjusting brake torque, the system can reduce the cornering forces and, therefore, the total roll moment acting on the vehicle.

When the RSC system activates, any of the following can occur:

- A rumble or grinding sound much like ABS or traction control
- A small deceleration or a reduction in the acceleration of the vehicle
- The RSC indicator flashes
- If the driver's foot is on the brake pedal, a vibration will be felt in the pedal much like ABS
- If the event is severe enough and the driver's foot is not on the brake, the brake pedal will move to apply higher brake forces. A whooshing sound can also be heard from under the instrument panel in an event this severe

Some drivers may notice a slight movement of the brake pedal when the system checks itself. The brake pedal moves when an active test of the brake booster is run. During this test a small amount of pressure is generated at the master cylinder, but no pressure is generated in the brake calipers.

Stability/Traction Control Switch

The stability/traction control switch is hard wired to the instrument cluster module. The instrument cluster module communicates the stability/traction control switch status to the ABS module via the HS-CAN bus.

The stability/traction control switch allows the driver to control use of the stability control/traction assist system. This is independent of the ABS function, which cannot be switched OFF by the driver. The stability control/traction assist system status is indicated by a light in the stability/traction control switch. When the stability/traction control switch is set to OFF, the system is disabled below 60 km/h (37 mph). The system will automatically restore to full functionality every time the vehicle speed exceeds 70 km/h (43 mph) or when the ignition switch is turned to the OFF position and back to the ON position. However, the stability/traction control switch OFF indicator remains illuminated until the switch is pressed. The ABS function continues to work as designed unless the yellow ABS warning indicator is also illuminated. Normal braking function always occurs, unless the red brake warning indicator is illuminated.

Stability Control Sensor Cluster

The stability control sensor cluster consists of the yaw rate sensor, roll-rate sensor, lateral accelerometer and longitudinal accelerometer. The lateral accelerometer measures the acceleration which corresponds to the force involved when the vehicle slides sideways. This acceleration has 2 forms. The first is the centrifugal acceleration which is generated when the vehicle travels around in a circle. The second is the acceleration due to gravity. On level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor measures some lateral acceleration due to gravity even though the vehicle is not moving.

The longitudinal accelerometer measures the acceleration corresponding to the force involved when the vehicle moves forward and rearward in the horizontal plane, along the centerline of the front and rear wheels.

The yaw rate sensor measures the relative vehicle motion about the vertical axis through its center of gravity.

The roll-rate sensor measures the rate of rotation along the front to rear horizontal axis.

Steering Angle Sensor Module (SASM)

The steering angle sensor module (SASM) measures the rate of rotation of the steering wheel by monitoring the steering wheel rotation ring as it passes through the sensor gap. The SASM uses the HS-CAN bus to transmit information to the ABS module about whether the steering wheel is being turned left or right and how far it is being turned.

ABS Module Configuration

A new ABS module must be configured after installation. Refer to Programmable Module Installation in **MODULE CONFIGURATION** article. If installing a new ABS module with RSC, the module must also be calibrated.

ABS Module Calibration

NOTE: The installation of a new stability control sensor cluster does not require ABS module calibration.

The ABS module must be calibrated if any of the following is occurring or have occurred:

- A new ABS module has been installed.
- A new HCU has been installed.
- A new steering wheel rotation sensor has been installed.
- The ABS warning indicator in the instrument cluster flashes once every 2 seconds.

Follow the scan tool directions for ABS module calibration. The ABS module should be configured before it is calibrated. Calibration is required for the ABS module to learn the "at rest" or "zero" position of the stability control components. If a DTC is set for any stability control component, the DTC must be cleared before carrying out the calibration procedure. The ESC warning indicator will flash after clearing the DTCs that are associated with the stability control system. If a DTC is retrieved after calibration, refer to the **ABS MODULE DTC CHART** .

Stability Control Sensor Cluster Calibration

When a new stability control sensor cluster is installed, the cluster must be calibrated. Follow the scan tool instructions for the calibration procedure. When carrying out the cluster calibration, the vehicle must be on a level surface, must not be moving and the ignition switch must be in the RUN position.

Inspection And Verification

1. Verify the customer concern by applying the brakes under different conditions.
2. Verify the base brake system operates correctly by pressing and releasing the brake pedal with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to **EXTERIOR LIGHTING** article. If the stoplamps operate correctly, proceed to the next step.
3. Verify the base brake system operates correctly. If any concerns are present, address them before continuing with any ABS concerns. Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article. If the base brake system operates correctly, proceed to the next step.

4. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Base brake system
• Brake booster vacuum hose
• Brake fluid level
• Hydraulic control unit (HCU)
• Steering components, suspension components and tire size
• Steering angle sensor module (SASM)
• Tire pressure
• Tire size or mismatched tires
• Wheel and tire sizes
	• ABS module
	• Battery junction box (BJB) fuse(s):
	  ○ 15 (40A)
	  ○ 50 (10A)
	  ○ 57 (40A)
	  ○ 71 (10A)
	• Brake fluid level switch
	• Brake on/off (BOO) switch
	• Smart junction box (SJB) fuse(s):
	  ○ 34 (5A)
	  ○ 35 (10A)
	• Wiring, terminals or connectors
	• Stability control sensor cluster
	• Stability/traction control switch
	• Wheel speed sensor

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

6. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

7. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.

8. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
9. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
10. Clear the continuous DTCs and carry out the self-test diagnostics for the ABS module, the instrument cluster and the steering angle sensor module.
11. If the DTCs retrieved are related to the concern, go to the **ABS MODULE DTC CHART** , the Steering Angle Sensor Module DTC Chart and/or the Instrument Cluster Module DTC Chart. For all other DTCs, refer to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.
12. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

ABS MODULE DTC CHART

DTC	Description	Source	Action
B1317	Battery Voltage High	ABS Module	**NOTE:** **Battery voltage above 16 volts will cause DTC B1317 to set. Verify battery and charging system condition prior to diagnosing this DTC.** Go to **Pinpoint Test A** .
B1318	Battery Voltage Low	ABS Module	**NOTE:** **Battery voltage below 10 volts will cause DTC B1318 to set. Verify battery and charging system condition prior to diagnosing this DTC.** Go to **Pinpoint Test A** .
B1342	ECU is Faulted	ABS Module	**NOTE:** **If other DTCs are present, REPAIR them before installing a new component.** CLEAR the DTCs. CARRY OUT the ABS module self-test. RETRIEVE the DTCs. If DTC B1342 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT

			the self-test with the brake pedal not applied.
B211B	Satellite ECU is Faulted	ABS Module	CHECK for water intrusion into stability control sensor cluster connector C3037. REPAIR as necessary. If OK, INSTALL a new sensor cluster. REFER to **Stability Control Sensor Cluster**. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
B2477	Module Configuration Failure	ABS Module	CONFIGURE the ABS module. REFER to **MODULE CONFIGURATION** article. CLEAR the DTCs. REPEAT the self-test. If DTC B2477 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. REPEAT the self-test.
C1095	ABS Hydraulic Pump Motor Circuit Failure	ABS Module	Go to **Pinpoint Test B** .
C1096	ABS Hydraulic Pump Motor Circuit Open	ABS Module	Go to **Pinpoint Test B** .
C1115	ABS Power Relay Output Short Circuit to Battery	ABS Module	**NOTE:** **If other DTCs are present, REPAIR them before installing a new component.** CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs.If DTC C1115 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1140	Hydraulic Base Brake Failure	ABS Module	The ABS module receives brake fluid level information from the instrument cluster over the high-speed controller area network (HS-CAN) bus. The instrument cluster receives the brake fluid information from the smart junction box (SJB) over the medium-speed controller area network (MS-CAN) bus. This DTC indicates that a low fluid level condition exists or there is an issue with the brake fluid level switch, wiring, instrument cluster or HS-CAN bus. If there are other HS-CAN bus DTCs present, REFER to **MODULE**

			COMMUNICATIONS NETWORK article to diagnose the HS-CAN bus. If there are no HS-CAN bus DTCs present, VERIFY that the brake fluid is at the correct level and ADJUST as necessary. If the brake fluid level is OK, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article to diagnose the red brake warning indicator and the brake fluid level switch.
C1145	Speed Wheel Sensor RF Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1155	Speed Wheel Sensor LF Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1165	Speed Wheel Sensor RR Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1175	Speed Wheel Sensor LR Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1185	ABS Power Relay Output Circuit Failure	ABS Module	**NOTE:** **If other DTCs are present, REPAIR them before installing a new component.** CLEAR all DTCs. RETRIEVE DTCs. If DTC C1185 is retrieve again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1194	ABS Outlet Valve Coil LF Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1194 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1194 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
			CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT

C1198	ABS Inlet Valve Coil LF Circuit Failure	ABS Module	at least one ABS stop. RETRIEVE the DTCs. If C1198 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1198 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1210	ABS Outlet Valve Coil RF Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1210 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1210 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1214	ABS Inlet Valve Coil RF Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1214 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1214 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1222	Speed Wheel Mismatch	ABS Module	Go to **Pinpoint Test D** .
C1233	Speed Wheel LF Input Signal Missing	ABS Module	Go to **Pinpoint Test D** .
C1234	Speed Wheel RF Input Signal Missing	ABS Module	Go to **Pinpoint Test D** .
C1235	Speed Wheel RR Input Signal Missing	ABS Module	Go to **Pinpoint Test D** .
C1236	Speed Wheel LR Input Signal Missing	ABS Module	Go to **Pinpoint Test D** .

C1242	ABS Outlet Valve Coil LR Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1242 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1242 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1246	ABS Outlet Valve Coil RR Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1246 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1246 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1250	ABS Inlet Valve Coil LR Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1250 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1250 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1254	ABS Inlet Valve Coil RR Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1254 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1254 is retrieved again, INSTALL a new ABS module. REFER to

			Anti-Lock Brake System (ABS) Module. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1278	Steering Wheel Angle 1 and 2 Signal Faulted	ABS Module	Go to **Pinpoint Test E** .
C1279	Yaw Rate Sensor Circuit Failure	ABS Module	Go to **Pinpoint Test F** .
C1280	Yaw Rate Sensor Signal Fault	ABS Module	Go to **Pinpoint Test F** .
C1281	Lateral Accelerometer Circuit Failure	ABS Module	Go to **Pinpoint Test F** .
C1282	Lateral Accelerometer Signal Fault	ABS Module	Go to **Pinpoint Test F** .
C1288	Brake Pressure Transducer Main/Primary Input Circuit Failure	ABS Module	Go to **Pinpoint Test G** .
C1329	ABS Outlet Valve Coil RF Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1330	ABS Outlet Valve Coil LR Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1331	ABS Outlet Valve Coil RR Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT

			the self-test with the brake pedal not applied.
C1332	ABS Outlet Valve Coil LF Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1333	ABS Inlet Valve Coil LR Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1334	ABS Inlet Valve Coil LF Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1335	ABS Inlet Valve Coil RF Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1336	ABS Inlet Valve Coil RR Circuit Excessive	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**.

	Temperature		CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1404	Traction Control Valve Rear Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1404 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1404 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1410	Traction Control Valve LF Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1410 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1410 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1446	Brake Switch Circuit Failure	ABS Module	Go to **Pinpoint Test H** .
C1516	Roll Rate Sensor Signal Fault	ABS Module	Go to **Pinpoint Test F** .
C1517	Roll Rate Sensor Circuit Fault	ABS Module	Go to **Pinpoint Test F** .
C1527	Traction Control Rear Valve Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
			CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs.

C1528	Traction Control LF Valve Circuit Excessive Temperature	ABS Module	If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1530	Dynamic Stability Control RF Valve Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1531	Dynamic Stability Control LF Valve Circuit Excessive Temperature	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1730	Reference Voltage Out of Range (+5 V)	ABS Module	If any other DTCs are present, REPAIR those DTCs first. CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE DTCs. If the DTC is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1957	Dynamic Stability Control Valve RF Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1957 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1957 is retrieved again, INSTALL a new ABS module. REFER to

			Anti-Lock Brake System (ABS) Module. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1958	Stability Assist Control Valve LF Circuit Failure	ABS Module	CLEAR all DTCs. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE the DTCs. If C1958 is retrieved again along with one or more other ABS valve coil DTCs, go to **Pinpoint Test A** . If **only** DTC C1958 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
C1963	Stability Control Inhibit Warning	ABS Module	**NOTE:** **REPAIR all other DTCs prior to diagnosing this DTC.** This DTC is for information only. CLEAR all DTCs. INSPECT the stability control sensor cluster mounting surface for damage and foreign material. REPAIR or CLEAN as necessary. INSPECT the stability control sensor cluster for correct installation. REFER to **Stability Control Sensor Cluster**.
C1991	Module Calibration Failure	ABS Module	**NOTE:** **If other DTCs are present, REPAIR them before diagnosing DTC C1991.** Go to **Pinpoint Test I** .
C2769	Longitudinal Acceleration Sensor Electrical Failure	ABS Module	Go to **Pinpoint Test F** .
C2770	Longitudinal Acceleration Sensor Plausibility Failure	ABS Module	Go to **Pinpoint Test F** .
U0073	Control Module Communication Bus Off	ABS Module	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN bus.
U0115	Lost Communication with ECM/PCM - Secondary	ABS Module	REPAIR all other DTCs first. If DTC U0115 is still present, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN bus.
			REPAIR all other DTCs first. If DTC U0126

U0126	Lost Communication with Steering Angle Sensor Module	ABS Module	is still present, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN bus.
U0155	Lost Communication with Instrument Panel Cluster	ABS Module	REPAIR all other DTCs first. If DTC U0155 is still present, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN bus.
U1901	CAN Network #2 Comm Bus Fault - Receive Error	ABS Module	**NOTE:** **If other DTCs are present, REPAIR them before diagnosing DTC U1901.** Go to **Pinpoint Test J** .
U2050	No Application Present	ABS Module	CONFIGURE the ABS module. REFER to **MODULE CONFIGURATION** article. CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2050 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTC. REPEAT the self-test.
U2051	One or More Calibration Files Missing or Corrupt	ABS Module	CALIBRATE the ABS module, follow the directions on the scan tool. CLEAR the DTCs. CARRY OUT the ABS module self-test. RETRIEVE and RECORD any DTCs. If DTC U2051 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTC. REPEAT the self-test.

STEERING ANGLE SENSOR MODULE (SASM) DTC CHART

DTC	Description	Source	Action
B1317	Battery Voltage High	Steering Angle Sensor Module (SASM)	**NOTE:** **Battery voltage above 16 volts will cause DTC B1317 to set. Verify battery and charging system condition prior to diagnosing this DTC.** Go to **Pinpoint Test L** .
B1318	Battery Voltage Low	SASM	**NOTE:** **Battery voltage below 10 volts will cause DTC B1318 to set. Verify battery and charging system condition prior to diagnosing this DTC.** Go to **Pinpoint Test L** .

B1342	ECU is Faulted	SASM	**NOTE:** **If other DTCs are present, REPAIR them before installing a new component.** CLEAR the DTCs. CARRY OUT the SASM self-test. RETRIEVE the DTCs. If DTC B1342 is retrieved again, INSTALL a new SASM. REFER to **Steering Angle Sensor Module (SASM)**. CLEAR the DTCs. REPEAT the self-test.
U0155	Lost Communication with Instrument Panel Cluster	SASM	REPAIR all other DTCs first. If DTC U0155 is still present, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN bus.
U2050	No Application Present	SASM	CONFIGURE the SASM. REFER to Programmable Module Installation in **MODULE CONFIGURATION** article. CLEAR the DTCs. CARRY OUT the SASM self-test. If DTC U2050 is retrieved again, INSTALL a new SASM. REFER to **Steering Angle Sensor Module (SASM)**. CLEAR the DTC. REPEAT the self-test.

INSTRUMENT CLUSTER DTC CHART

DTC	Description	Source	Action
C1093	Traction Control Disable Switch Circuit Failure	Instrument Cluster	Go to **Pinpoint Test K** .
-	All Other Instrument Cluster Module DTCs	Instrument Cluster	REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the ABS module	• Fuse • Wiring, terminals or connectors • ABS module	• REFER to **MODULE CONFIGURATION** article to diagnose the no communication concern.
• The red brake warning indicator is always/never	• Wiring, terminals or connectors • Brake fluid level	• RETRIEVE all DTCs and REFER to the **ABS MODULE DTC CHART** . If no DTCs are present, REFER to Diagnosis and Testing in

on	• Instrument cluster • ABS module	**INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article.
• The yellow ABS warning indicator is always/never on	• Instrument cluster • Brake fluid level • Wiring, terminals or connectors • ABS module	• RETRIEVE all DTCs and REFER to the **ABS MODULE DTC CHART** . If no DTCs are present, REFER to Diagnosis and Testing in **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article.
• The traction assist indicator is never/always on	• Instrument cluster • Wiring, terminals or connectors • Traction control switch	• RETRIEVE all DTCs and REFER to the **ABS MODULE DTC CHART** . If no DTCs are present, REFER to Diagnosis and Testing in **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article.
• ABS false activation, ABS too sensitive, ABS activates on normal stop	• Front wheel speed sensor tone rings • Chafed wire insulation or pinched wire • Rear wheel speed sensor, excessive variance in air gap between wheel speed sensor and sensor tone ring • Open or shorted wheel speed sensor circuit • Rear wheel speed sensor tone rings • Wheel speed sensor	• INSPECT both front wheel speed sensor tone rings for damaged teeth. INSTALL new as necessary. • INSPECT the wiring harness from the front wheel speed sensor knuckle to the frame and from the rear axle to the frame. REPAIR or INSTALL new as necessary. • INSPECT both rear wheel speed sensor tone rings for damaged teeth. INSTALL new as necessary. • Go to **Pinpoint Test C** . • INSPECT the rear wheel speed sensor tone rings. INSTALL new as necessary. • Go to **Pinpoint Test D** .
• The traction control system cannot be disabled	• Instrument cluster • Circuitry • Traction control switch	• Go to **Pinpoint Test K** .

Pinpoint Tests

Pinpoint Test A: DTCs B1317 and B1318 - Battery Voltage High/Low

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The operating voltage required to operate the ABS module, hydraulic valves and pump motor is between 10 and 16 volts.

Fused ignition voltage is supplied to the ABS module from battery junction box (BJB) fuse 50 (10A) along circuit CBB50 (YE/OG). Fused battery voltage is supplied to the ABS module from BJB fuse 57 (40A) along circuit SBB57 (RD) and BJB fuse 15 (40A) along circuit SBB15 (WH/RD). Ground is provided for the ABS module along circuit GD121 (BK/YE).

- DTC B1317 Battery Voltage High - If the voltage supplied to the ABS module exceeds 16 volts during the ABS module self-test or normal operation, with vehicle speed greater than 5 km/h (3 mph), DTC B1317 will be set.
- DTC B1318 Battery Voltage Low - If the voltage supplied to the ABS module falls below 10 volts during the ABS module self-test or normal operation, with vehicle speed greater than 5 km/h (3 mph), DTC B1318 will be set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Charging system
- ABS module

PINPOINT TEST A: DTCs B1317 AND B1318 - BATTERY VOLTAGE HIGH/LOW

NOTE:	**Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

A1 CHECK FOR RETURNING DTCs

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Clear ABS Module DTCs
- Enter the following diagnostic mode on the diagnostic tool: Self-Test ABS Module
- Carry out the ABS module self-test. Retrieve and record all ABS module DTCs.
- **Are DTCs B1317 or 1318 present?**

  YES : Go to A2.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to continue diagnosis of the charging system.

A2 CHECK THE BATTERY VOLTAGE

- Measure the voltage between the positive and negative battery terminals with key ON engine OFF (KOEO) and with the engine running.
- **Is the battery voltage between 10 and 13 volts with KOEO and between 13 and 17 volts with the engine running?**

  YES : Go to A3.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to continue diagnosis of the charging system.

A3 CHECK THE ABS HARNESS AND MODULE FOR WATER INTRUSION

NOTE: The battery and battery tray need to be removed to access the ABS module connector.

- Key in OFF position.
- Disconnect: ABS Module C135
- Inspect the ABS module connector and module for water intrusion.
- **Is there any evidence of water entry?**

  YES : CLEAN the connector and dry it with low pressure compressed air. INSPECT for evidence of water entry and REPAIR as necessary. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : Go to A4.

A4 CHECK THE ABS MODULE POWER CIRCUITS FOR AN OPEN

- Disconnect: BJB Fuse 15 (40A)
- Disconnect: BJB Fuse 50 (10A)
- Disconnect: BJB Fuse 57 (40A)

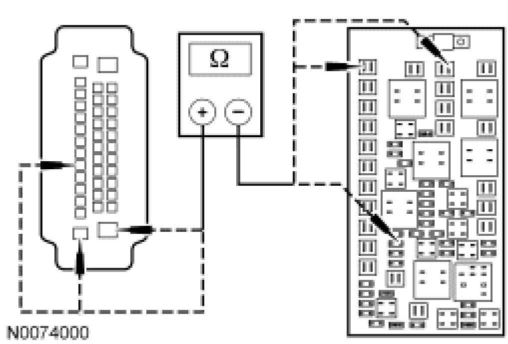

Fig. 1: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:
  - ABS module C135-1, circuit SBB15 (WH/RD), harness side and BJB fuse 15 (40A), circuit SBB15 (WH/RD), output side.

  - ABS module C135-25, circuit SBB57 (RD), harness side and BJB fuse 57 (40A), circuit SBB57 (RD), output side.
  - ABS module C135-30, circuit CBB50 (YE/OG), harness side and BJB fuse 50 (10A), circuit CBB50 (YE/OG), output side.
- **Are the resistances less than 5 ohms?**

  YES : Go to A5.

  NO : VERIFY BJB fuses 50 (10A), 57 (40A) and 15 (40A) are OK. If OK, REPAIR the affected circuit(s). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

A5 CHECK THE ABS MODULE GROUND CIRCUITS FOR AN OPEN

- Key in OFF position.

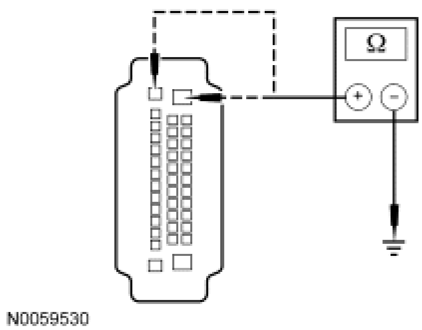

Fig. 2: Measuring Resistance Between Ground & ABS Module C135-13 & C135-38, Circuit GD121 (BK/YE)
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and:
  - ABS module C135-13, circuit GD121 (BK/YE), harness side.
  - ABS module C135-38, circuit GD121 (BK/YE), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to A6.

  NO : REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

A6 CHECK FOR CORRECT ABS MODULE OPERATION

- Check ABS module C135 for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS C135
- Make sure the ABS connector seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

Pinpoint Test B: DTCs C1095 and C1096 - ABS Hydraulic Pump Motor Circuit Failure/Open

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

Fused battery voltage for hydraulic pump motor operation is supplied to the ABS module from battery junction box (BJB) fuse 15 (40A) along circuit SBB15 (WH/RD). Ground is provided for the ABS module along circuit GD121 (BK/YE).

When the ignition key is turned to the ON position, the ABS module commands the HCU pump on for 100 ms (±6 ms) and is then commanded off. After 6 ms, the ABS module will read the voltage that is being generated by the HCU pump. If the voltage indicates the motor is spinning at less than 500 RPM, there may be a locked motor. If this condition is detected 4 times, DTC C1095 is set. The pump motor is checked for an open circuit 2 seconds after the most recent successful pump motor off command. If the pump motor feedback remains greater than 0.75 volt for more than 50 ms (±6 ms) after these conditions have been met, DTC C1096 is set.

- DTC C1095 ABS Hydraulic Pump Motor Circuit Failure - If a short to voltage or ground is detected, if a locked up pump motor is detected or if there is an internal failure of the ABS module, DTC C1095 will be set.
- DTC C1096 ABS Hydraulic Pump Motor Circuit Open - If a short to voltage, a short to ground or an open is detected or if there is an internal failure of the ABS module, DTC C1095 will be set.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- HCU
- ABS module

PINPOINT TEST B: DTCs C1095 AND C1096 - ABS HYDRAULIC PUMP MOTOR CIRCUIT FAILURE/OPEN

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

B1 CHECK THE ABS PUMP MOTOR

- Key in ON position.
- **Is the ABS pump motor running all the time?**

  YES : INSTALL a new ABS module and hydraulic control unit (HCU). REFER to **Anti-Lock Brake System (ABS) Module** and **Hydraulic Control Unit (HCU)**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : Go to B2.

B2 CHECK ABS MODULE PUMP MOTOR OUTPUT COMMAND (PUMP_MTR)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger ABS Module
- Toggle the PUMP_MTR output command ON.
- **Does the ABS pump motor run for approximately 2 seconds?**

  YES : TOGGLE the output command OFF. CLEAR the DTCs. CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) above 32 km/h (20 mph).

  If the yellow ABS warning indicator does not illuminate, the system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs.

  If DTC C1096 is retrieved, go to B6.

  If DTC C1095 is retrieved, INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : TOGGLE the output command OFF. Go to B3.

B3 CHECK THE ABS HARNESS AND MODULE FOR WATER INTRUSION

NOTE: **The battery and battery tray need to be removed to access the ABS module connector.**

- Key in OFF position.
- Disconnect: ABS Module C135
- Inspect the ABS module connector and module for water intrusion.
- **Is there any evidence of water entry?**

  YES : CLEAN the connector and dry it with low pressure compressed air. INSPECT for evidence of water entry and REPAIR as necessary. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : Go to B4.

B4 CHECK CIRCUIT SBB15 (WH/RD) FOR AN OPEN

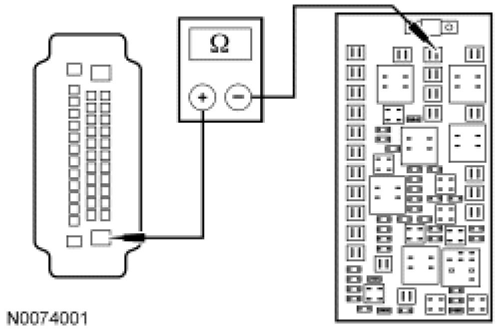

Fig. 3: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ABS module C135-1, circuit SBB15 (WH/RD), harness side and BJB fuse 15 (40A), circuit SBB15 (WH/RD), output side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B5.

  NO : VERIFY BJB fuse 15 (40A) is OK. If OK, REPAIR circuit SBB15 (WH/RD). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

B5 CHECK CIRCUIT GD121 (BK/YE) FOR AN OPEN

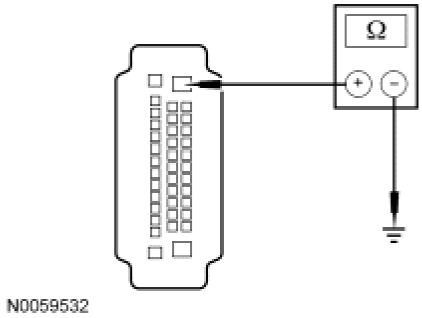

Fig. 4: Measuring Resistance Between ABS Module C135-13, Circuit GD121 (BK/YE), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ABS module C135-13, circuit GD121 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. CLEAR the DTCs. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

B6 CHECK FOR CORRECT ABS MODULE OPERATION

- Check ABS module C135 for:

    - corrosion.
    - pushed-out pins.
    - spread terminals.
- Connect: ABS C135
- Make sure the ABS connector seats correctly.
- Clear the DTCs.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

Pinpoint Test C: DTCs C1145, C1155, C1165 and C1175 - Wheel Speed Sensor Input Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensors generate a square wave signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition is turned to the RUN position, the ABS module carries out a self-test to determine if the sensors are functional. Voltage is supplied to the active wheel speed sensors from the ABS module. The wheel speed sensor ground is supplied by the ABS module.

Wheel speed sensor DTCs will automatically clear when a successful test drive is carried out. A successful test drive should include speeds above 32 km/h (20 mph) and at least one ABS stop.

DTC Description	Fault Trigger Condition
• DTC C1145 RF Wheel Speed Sensor Input Circuit Failure • DTC C1155 LF Wheel Speed Sensor Input Circuit Failure • DTC C1165 RR Wheel Speed Sensor Input Circuit Failure • DTC C1175 LR Wheel Speed Sensor Input Circuit Failure	If during the ABS module on-demand self test or during normal operation, if the ABS module detects an open, short to ground or voltage or a defective wheel speed sensor input circuit, the appropriate DTC will be set. These DTCs are usually set by a damaged sensor or a circuit fault.

This pinpoint test is intended to diagnose the following:

- Connector water intrusion
- Wiring, terminals or connectors
- Wheel speed sensor tone ring
- Wheel speed sensors
- ABS module

PINPOINT TEST C: DTCs C1145, C1155, C1165 AND C1175 - WHEEL SPEED SENSOR INPUT CIRCUIT FAILURE

NOTE: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

C1 CHECK THE ABS HARNESS AND MODULE FOR WATER INTRUSION

NOTE: The battery and battery tray need to be removed to access the ABS module connector.

- Key in OFF position.
- Disconnect: ABS Module C135
- Inspect the ABS module connector and module for water intrusion.
- **Is there any evidence of water entry?**

  YES : CLEAN the connector and dry it with low pressure compressed air. INSPECT for evidence of water entry and REPAIR as necessary. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : If the active wheel speed sensor tool is available, go to C2. If the active wheel speed sensor tool is not available, go to C4.

C2 CHECK THE ABS MODULE OUTPUT USING THE SPECIAL TOOL

NOTE: The front wheel speed sensor connectors are located behind the fender splash shields.

- Connect: ABS Module C135
- Disconnect: Suspect Wheel Speed Sensor
- Connect the special tool to the wheel speed sensor connectors.
- Key in ON position.
- Select the correct system polarity on the special tool and turn the special tool power switch to the ON position.
- **Is the module output LED illuminated?**

  YES : Go to C3.

NO : Go to C6.

C3 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE SPECIAL TOOL

- Raise the suspect wheel until it can spin freely. Refer to **JACKING AND LIFTING** article.
- While monitoring the special tool, slowly spin the suspect wheel.
- **Is the current level LED illuminated green and do the sensor output LEDs illuminate and flash?**

  YES : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : If the current level LED is illuminated green and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front** or **Wheel Speed Sensor - Rear**. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  If the current level LED is illuminated green and the sensor output LEDs illuminate green but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If the tone ring is OK, INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front** or **Wheel Speed Sensor - Rear**. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

C4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

NOTE: Both circuits must be checked for each DTC.

NOTE: The battery must be connected to carry out this test.

NOTE: The front wheel speed sensor connectors are located behind the fender splash shields.

- Disconnect: Suspect Wheel Speed Sensor
- Key in ON position.
- **For DTC C1145** , measure the voltage between ground and:
  - ABS module C135-3, circuit VCA05 (GY/VT), harness side.
  - ABS module C135-4, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the voltage between ground and:
  - ABS module C135-27, circuit VCA03 (VT/WH), harness side.
  - ABS module C135-28, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the voltage between ground and:
  - ABS module C135-10, circuit RCA20 (BN), harness side.
  - ABS module C135-11, circuit VCA06 (WH/OG), harness side.
- **For DTC C1175** , measure the voltage between ground and:

    - ABS module C135-35, circuit RCA18 (BN/GN), harness side.
    - ABS module C135-36, circuit VCA04 (BU/OG), harness side.
- **Is any voltage present?**

  YES : REPAIR the affected circuit(s). TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : Go to C5.

C5 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND

NOTE: Both circuits must be checked for each DTC.

- Key in OFF position.
- **For DTC C1145** , measure the resistance between ground and:
    - ABS module C135-3, circuit VCA05 (GY/VT), harness side.
    - ABS module C135-4, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the resistance between ground and:
    - ABS module C135-27, circuit VCA03 (VT/WH), harness side.
    - ABS module C135-28, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the resistance between ground and:
    - ABS module C135-10, circuit RCA20 (BN), harness side.
    - ABS module C135-11, circuit VCA06 (WH/OG), harness side.
- **For DTC C1175** , measure the resistance between ground and:
    - ABS module C135-35, circuit RCA18 (BN/GN), harness side.
    - ABS module C135-36, circuit VCA04 (BU/OG), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to C6.

  NO : REPAIR the affected circuit(s). TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

C6 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

- Disconnect: ABS Module C135
- Disconnect: Suspect Wheel Speed Sensor
- **For DTC C1145** , measure the resistance between:
    - ABS module C135-3, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side.
    - ABS module C135-4, circuit RCA19 (VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the resistance between:

  - ABS module C135-27, circuit VCA03 (VT/WH), harness side LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side.
  - ABS module C135-28, circuit RCA17 (YE), harness side LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the resistance between:
  - ABS module C135-10, circuit RCA20 (BN), harness side and RR wheel speed sensor C426-2, circuit RCA20 (BN), harness side.
  - ABS module C135-11, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit VCA06 (WH/OG), harness side.
- **For DTC C1175** , measure the resistance between:
  - ABS module C135-35, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.
  - ABS module C135-36, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to C7.

  NO : REPAIR the affected circuit(s). TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

C7 CHECK FOR WHEEL SPEED SENSOR CIRCUITS SHORTED TOGETHER

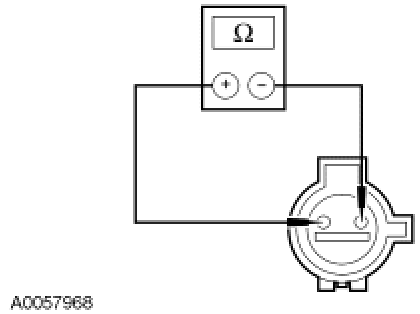

Fig. 5: Checking Circuits For Short
Courtesy of FORD MOTOR CO.

- Measure the resistance between the suspect wheel speed sensor pins, harness side, with the meter in the 10 megaohm range.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to C8.

  NO : REPAIR the affected circuit(s). TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

C8 CHECK THE ABS MODULE OUTPUT

- Connect: ABS Module C135
- Key in ON position.

- Measure the voltage between the suspect wheel speed sensor pins, harness side.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front** or **Wheel Speed Sensor - Rear**. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : Go to C9.

C9 CHECK FOR CORRECT ABS MODULE OPERATION

- Key in OFF position.
- Disconnect: ABS C135
- Check the connector for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS C135
- Make sure the ABS connector seats correctly.
- Test drive the vehicle above 32 km/h (20 mph), carry out at least one ABS stop and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

Pinpoint Test D: DTCs C1222, C1233, C1234, C1235 and C1236 - Wheel Speed Sensor Input Signal Missing/Mismatch

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensors generate a square wave signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition is turned to the RUN position, the ABS module carries out a self-test to determine if the sensors are functional. Voltage is supplied to the active wheel speed sensors from the ABS module. The wheel speed sensor ground is supplied by the ABS module.

Wheel speed sensor DTCs will automatically clear when a successful test drive is carried out. A successful test drive should include speeds above 32 km/h (20 mph) and at least one ABS stop.

DTC Description	Fault Trigger Condition
• DTC C1222 Wheel Speed Mismatch	When the vehicle speed exceeds 20 km/h (12 mph), if the ABS module detects a difference between wheel speed sensor signals, DTC C1222 will be set. DTC C1222 can also be set by damaged tone rings, mismatched wheel and/or tire sizes or driving the vehicle on one or more deflated tires
• DTC C1233 LF Wheel Speed Sensor Signal Fault • DTC C1234 RF Wheel Speed Sensor Signal Fault • DTC C1235 RR Wheel Speed Sensor Signal Fault • DTC C1236 LR Wheel Speed Sensor Signal Fault	When the vehicle speed exceeds 20 km/h (12 mph), if the ABS module does not receive a signal from the wheel speed sensor, the appropriate DTC will be set. These DTCs can also be set by an excessive wheel speed sensor-to-tone ring air gap or a damaged tone ring

This pinpoint test is intended to diagnose the following:

- Mismatched tire sizes
- Wheel speed sensor tone ring
- Wheel speed sensor
- ABS module

PINPOINT TEST D: DTCs C1222, C1233, C1234, C1235 AND C1236 - WHEEL SPEED SENSOR INPUT SIGNAL MISSING/MISMATCH

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

D1 RETRIEVE ABS MODULE DTCs

- Connect the diagnostic tool.
- Key in ON position.
- Retrieve and record all ABS module DTCs.
- **Are DTCs C1145, C1155, C1165 or C1175 present?**

  YES : Go to **Pinpoint Test C** .

  NO : Go to D2.

D2 CHECK THE ABS HARNESS AND MODULE FOR WATER INTRUSION

NOTE: **The battery and battery tray need to be removed to access the ABS module connector.**

- Key in OFF position.

- Disconnect: ABS Module C135
- Inspect the ABS module connector and module for water intrusion.
- **Is there any evidence of water entry?**

  YES : CLEAN the connector and dry it out with low pressure compressed air. INSPECT for evidence of water entry and repair as necessary. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : Use the DTCs recorded in the previous step.

  For DTC C1222 Go to D7. For DTCs C1233, C1234, C1235 and C1236, if the active wheel speed sensor tool is available, go to D3. If the active wheel speed sensor tool is not available, go to D6. For all other DTCs, Go to the **ABS MODULE DTC CHART** .

D3 CHECK THE ABS MODULE OUTPUT USING THE SPECIAL TOOL

NOTE: The front wheel speed sensor connectors are located behind the fender splash shields.

- Connect: ABS Module C135
- Disconnect: Suspect Wheel Speed Sensor
- Connect the special tool to the wheel speed sensor connectors.
- Key in ON position.
- Select the correct system polarity on the special tool and turn the special tool power switch to the ON position.
- **Is the module output LED illuminated?**

  YES : Go to D5.

  NO : Go to D4.

D4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

- Key in OFF position.
- Disconnect: ABS Module C135
- **For DTC C1233** : measure the resistance between:
  - ABS module C135-27, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side.
  - ABS module C135-28, circuit RCA17 (YE), harness side and LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side.
- **For DTC C1234** : measure the resistance between:
  - ABS module C135-3, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side.
  - ABS module C135-4, circuit RCA19 (VT), harness side and RF wheel speed sensor C160-2,

circuit RCA19 (VT), harness side.

- **For DTC C1235** : measure the resistance between:
    - ABS module C135-10, circuit RCA20 (BN), harness side and RR wheel speed sensor C426-2, circuit RCA20 (BN), harness side.
    - ABS module C135-11, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit VCA06 (WH/OG), harness side.
- **For DTC C1236** : measure the resistance between:
    - ABS module C135-35, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.
    - ABS module C135-36, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to D8.

  NO : REPAIR the affected circuit(s). TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

D5 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE SPECIAL TOOL

- Raise the suspect wheel until it can spin freely. Refer to **JACKING AND LIFTING** article.
- While monitoring the special tool, slowly spin the suspect wheel.
- **Is the current level LED illuminated green and do the sensor output LEDs illuminate and flash?**

  YES : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : If the current level LED is illuminated green and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front** or **Wheel Speed Sensor - Rear**. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  If the current level LED is illuminated green and the sensor output LEDs illuminate green but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If the tone ring is OK, INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front** or **Wheel Speed Sensor - Rear**. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

D6 CHECK THE WHEEL SPEED SENSOR OUTPUT

NOTE: **The front wheel speed sensor connectors are located behind the fender splash shields.**

NOTE: **The battery must be connected to carry out this test.**

- Connect: ABS Module C135

- Disconnect: Suspect Wheel Speed Sensor

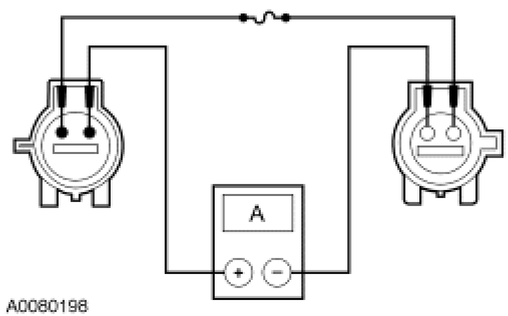

Fig. 6: Checking Wheel Speed Sensor Output
Courtesy of FORD MOTOR CO.

- **For DTC C1233** :
  - connect a fused (5A) jumper wire between LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150 pin-1, component side.
  - connect the automotive meter between LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side and LF wheel speed sensor C150 pin-2, component side.
- **For DTC C1234** :
  - connect a fused (5A) jumper wire between RF wheel speed sensor C160-1, circuit VCA05 (GN/VT), harness side and RF wheel speed sensor C160 pin-1, component side.
  - connect the automotive meter between RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side and RF wheel speed sensor C160 pin-2, component side.
- **For DTC C1235** :
  - connect a fused (5A) jumper wire between RR wheel speed sensor C426-1, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C420 pin-1, component side.
  - connect the automotive meter between RR wheel speed sensor C426-2, circuit RCA20 (BN), harness side and RR wheel speed sensor C420 pin-2, component side.
- **For DTC C1236** :
  - connect a fused (5A) jumper wire between LF wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side and LF wheel speed sensor C440 pin-1, component side.
  - connect the automotive meter between LF wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side and LF wheel speed sensor C440 pin-2, component side.
- Key in ON position.
- Measure the current while slightly rotating the wheel, using incremental turns.
- **Does the wheel speed sensor output switch between the low state (4 to 8 mA) and the high state (12 to 16 mA)?**

  YES : Go to D7.

  NO : INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front** or **Wheel Speed Sensor - Rear**. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

D7 CHECK FOR CORRECT TIRE SIZE AND AIR PRESSURE

- Make sure all tire sizes are correct and matching.
- Make sure all tire pressures are correct.
- Clear the DTCs, drive the vehicle and carry out the self-test.
- **Is DTC C1222 still present?**

  YES : Go to D8.

  NO : The system is operating correctly at this time. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

D8 CHECK THE ABS MODULE ELECTRICAL CONNECTOR

- Key in OFF position.
- Disconnect: ABS C135
- Check the connector for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS C135
- Make sure the ABS connector seats correctly.
- Test drive the vehicle above 32 km/h (20 mph), carry out at least one ABS stop and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop.

Pinpoint Test E: DTC C1278 - Steering Wheel Angle 1 and 2 Circuit Faulted

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The steering angle sensor module (SASM) (also known as the steering angle sensor module) monitors the steering wheel position when the slotted-wheel in the sensor passes through the optical field of the sensor.

Fused ignition voltage is supplied to the SASM from smart junction box (SJB) fuse 34 (5A) along circuit CBP34 (VT/BN). Ground for the sensor is provided along circuit GD115 (BK/GY). The steering wheel angle (in degrees) is sent to the ABS module along the high-speed controller area network (HS-CAN) bus, circuits VDB04 (WH/BU) and VDB05 (WH).

- DTC C1278 Steering Wheel Angle 1 and 2 Circuit Faulted - If during normal operation or the ABS module on-demand self test, the ABS module does not receive the steering wheel rotation sensor input or if the input received does not agree with the input from other sensors, DTC C1278 will be set. Also, a loss of sensor power or ground will cause DTC C1278 to set.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- SASM

PINPOINT TEST E: DTCs C1277 AND C1278 - STEERING WHEEL ANGLE 1 AND 2 CIRCUIT FAILURE/FAULTED

NOTE:	**Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE:	**Overtightening of the steering angle sensor module (SASM) fasteners may deform or damage the sensor housing, possibly resulting in faulty operation.**

NOTE:	**Make sure that the SASM is mounted securely to the column with 2 fasteners. A loose sensor or missing fastener may result in incorrect sensor operation. Make sure that the sensor connector is mated securely to the harness connector. Before proceeding with electrical testing, make sure that the vehicle battery is fully charged.**

E1 CARRY OUT THE CALIBRATION PROCEDURE

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ABS Module Calibration
- Carry out the ABS module calibration procedure following the scan tool directions.
- Test drive the vehicle.
- Retrieve and record any ABS module DTCs.
- **Are any DTCs retrieved or does the calibration procedure indicate a fault?**

  YES : If DTC C1277 or C1278 is retrieved or the calibration procedure indicates a fault, go to E2.

  If any other DTCs are retrieved, go to the **ABS MODULE DTC CHART** .

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

E2 MONITOR THE SASM PID (SWA POS)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger ABS Module
- Monitor the SWA POS PID while rotating the steering wheel clockwise and counterclockwise very slowly.
- **Does the PID move in intervals of 1 degree?**

  YES : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : Go to E3.

E3 CHECK THE VOLTAGE TO THE SASM

- Key in OFF position.
- Disconnect: SASM C226
- Key in ON position.

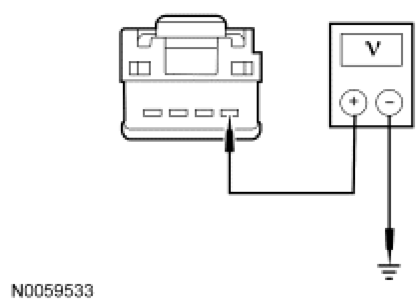

Fig. 7: Measuring Voltage Between Steering Angle Sensor C222-1, CBP34 (VT/BN), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SASM C226-1, circuit CBP34 (VT/BN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to E4.

  NO : VERIFY SJB fuse 34 (5A) are OK. If OK, REPAIR circuit CBP34 (VT/BN).

  CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

E4 CHECK CIRCUIT GD115 (BK/GY) FOR AN OPEN

- Key in OFF position.

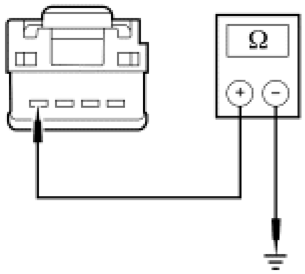

Fig. 8: Measuring Resistance Between Steering Angle Sensor C222-4, GD115 (BK/GY), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between SASM C226-4, circuit GD115 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E5.

  NO : REPAIR circuit GD115 (BK/GY). CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

E5 CHECK CIRCUITS VDB04 (WH/BU) AND VDB05 (WH) FOR A SHORT TO VOLTAGE

- Key in ON position.

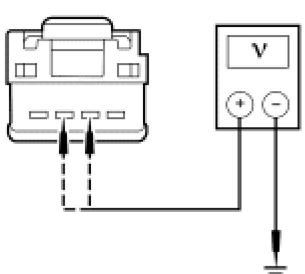

Fig. 9: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and:
  - SASM C226-3, circuit VDB04 (WH/BU), harness side.
  - SASM C226-2, circuit VDB05 (WH), harness side.
- **Are the voltages greater than 6 volts?**

  YES : REPAIR the affected circuit(s). CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : Go to E6.

E6 CHECK CIRCUITS VDB04 (WH/BU) AND VDB05 (WH) FOR A SHORT TO GROUND

- Key in OFF position.

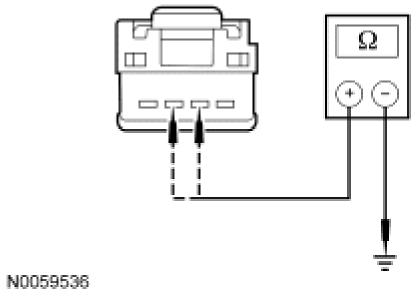

Fig. 10: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and:
  - SASM C226-3, circuit VDB04 (WH/BU), harness side.
  - SASM C226-2, circuit VDB05 (WH), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E7.

  NO : REPAIR the affected circuit(s). CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

E7 CHECK CIRCUITS VDB04 (WH/BU) AND VDB05 (WH) FOR AN OPEN

NOTE:	**The battery and battery tray need to be removed to access the ABS module connector.**

- Disconnect: ABS Module C135

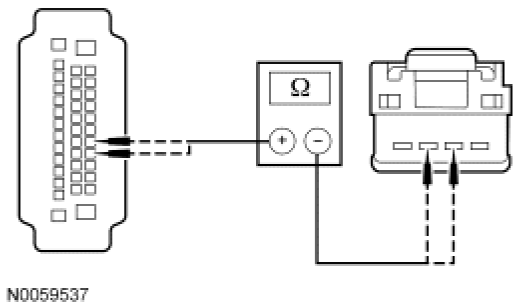

Fig. 11: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

- ABS module C135-5, circuit VDB04 (WH/BU), harness side and SASM C226-3, circuit VDB04 (WH/BU), harness side.
- ABS module C135-6, circuit VDB05 (WH), harness side and SASM C226-2, circuit VDB05 (WH), harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to E8.

  NO : REPAIR the affected circuit(s). CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

E8 CHECK CIRCUITS VDB04 (WH/BU) AND VDB05 (WH) FOR A SHORT TOGETHER

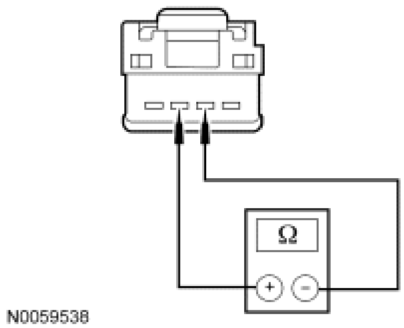

Fig. 12: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between SASM C226-3, circuit VDB04 (WH/BU), harness side and SASM C226-2, circuit VDB05 (WH), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new SASM. REFER to **Steering Angle Sensor Module (SASM)**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : REPAIR the affected circuit(s). CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

Pinpoint Test F: DTC C1279, C1280, C1281, C1282, C1516, C1517, C2769, C2770 - Stability Control Sensor Cluster Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The accelerometer (lateral and longitudinal) and the yaw rate sensor are contained in the stability control sensor cluster. The sensor cluster measures the vehicle acceleration and yaw rate, then sends the signal along a secondary high-speed controller area network (HS-CAN2) bus to the ABS module, circuits VCA23 (BU/WH) and VCA24 (GN/OG). Fused ignition voltage is supplied to the sensor cluster by smart junction box (SJB) fuse 35 (10A) along circuit CBP35 (YE/GY). Ground for the sensor cluster is provided along circuit GD151 (BK/GN).

DTC Description	Fault Trigger Conditions
• DTC C1279 Yaw Rate Sensor Circuit Failure • DTC C1281 Lateral Accelerometer Circuit Failure • DTC C1517 Roll Rate Sensor Circuit Failure • DTC C2769 Longitudinal Acceleration Sensor Electrical Failure	If, during normal operation or the ABS module on-demand self test the ABS module detects an open circuit, a short to voltage or a short to ground on one or both of the HS-CAN2 bus circuits, the appropriate DTC will be set. Also, a failure of the sensor cluster will cause the appropriate DTC to set.
• DTC C1280 Yaw Rate Sensor Signal Fault • DTC C1282 Lateral Accelerometer Signal Fault • DTC C1516 Roll Rate Sensor Signal Fault • DTC C2770 Longitudinal Acceleration Sensor Plausibility Failure	If, during normal operation the ABS module does not receive the sensor cluster input, or if the input received does not agree with the input from other sensors, the appropriate DTC will be set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stability control sensor cluster

PINPOINT TEST F: DTC C1279, C1280, C1281, C1282, C1516, C1517, C2769, C2770 - STABILITY CONTROL SENSOR CLUSTER FAULT

NOTE:	**Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**
NOTE:	**The yaw rate sensor, roll-rate sensor, lateral accelerometer and longitudinal accelerometer are integral to the stability control sensor cluster.**
NOTE:	**Make sure the vehicle is sitting on level ground, at a complete standstill and is not on a hoist before calibrating the stability control sensor cluster.**
NOTE:	**Make sure the vehicle is sitting on level ground, at a complete standstill and is not on a hoist before carrying out this pinpoint test. Any vehicle movement will result in false values for this test.**

F1 CARRY OUT THE CALIBRATION PROCEDURE

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ABS Module Calibration
- Carry out the ABS module calibration procedure following the scan tool directions.
- Test drive the vehicle.
- Retrieve and record any ABS module DTCs.
- **Are any DTCs retrieved or does the calibration procedure indicate a fault?**

  YES : Go to F2.

  NO : The system is operating correctly. The condition may have been caused by an incomplete or inaccurate stability control sensor cluster calibration.

F2 CHECK THE SENSOR CLUSTER MOUNTING AND MOUNTING SURFACE

NOTE:	**The sensor cluster is located on the RH side of the vehicle, under the rear seat.**

- Key in OFF position.
- Inspect the sensor cluster mounting and make sure that the nuts are fully seated and tightened correctly. Inspect the mounting surface for damage, corrosion or dirt.
- **Were the sensor cluster nuts tightened incorrectly or a significant amount of corrosion or dirt found or the mounting surface damaged?**

  YES : CLEAN and TIGHTEN the nuts to correct specification. CLEAN or REPAIR the mounting surface as necessary. CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

  NO : Go to F3.

F3 CHECK THE VOLTAGE TO THE SENSOR CLUSTER

- Disconnect: Stability Control Sensor Cluster C3037
- Key in ON position.

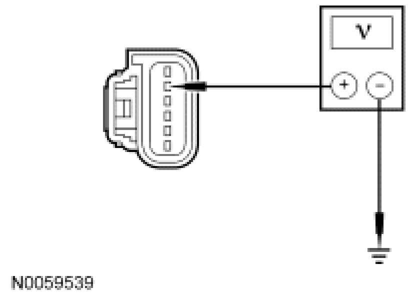

Fig. 13: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the sensor cluster C3037-2, circuit CBP35 (YE/GY), harness side and ground.

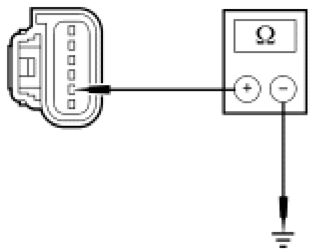
- **Is the voltage greater than 10 volts?**

  YES : Go to F4.

  NO : VERIFY SJB fuse 35 (10A) is OK. If OK, REPAIR circuit CBP35 (YE/GY). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

F4 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN

- Key in OFF position.



N0059540

Fig. 14: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the sensor cluster C3037-5, circuit GD151 (BK/GN), harness side and ground.
- **Is the resistance less than 5 ohms?**

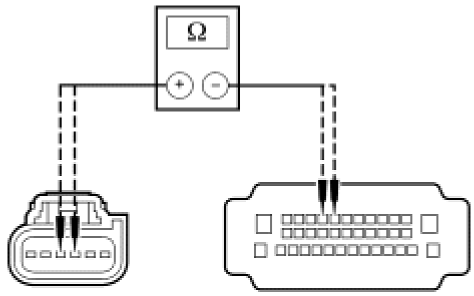
  YES : Go to F5.

  NO : REPAIR circuit GD151 (BK/GN). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

F5 CHECK CIRCUITS VCA23 (BU/WH) AND VCA24 (GN/OG) FOR AN OPEN

NOTE:	**The battery and battery tray need to be removed to access the ABS module connector.**

- Disconnect: ABS Module C135



N0059541

Fig. 15: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:
  - ABS module C135-8, circuit VCA23 (BU/WH), harness side and stability control sensor cluster C3037-3, circuit VCA23 (BU/WH), harness side.
  - ABS module C135-9, circuit VCA24 (GN/OG), harness side and stability control sensor cluster C3037-4, circuit VCA24 (GN/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to F6.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

F6 CHECK CIRCUITS VCA23 (BU/WH) AND VCA24 (GN/OG) FOR A SHORT TO GROUND

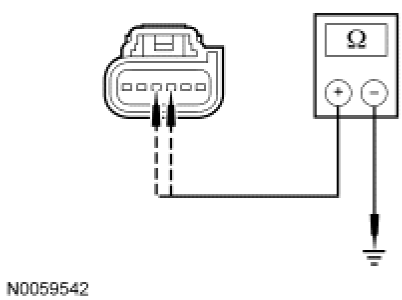


Fig. 16: Measuring Resistance Between Ground & Stability Control Sensor Cluster C3037-3 & C3037-4
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and:
  - stability control sensor cluster C3037-3, circuit VCA23 (BU/WH), harness side.
  - stability control sensor cluster C3037-4, circuit VCA24 (GN/OG), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F7.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

F7 CHECK CIRCUITS VCA23 (BU/WH) AND VCA24 (GN/OG) FOR A SHORT TO VOLTAGE

NOTE: The battery must be connected to carry out this test.

- Key in ON position.

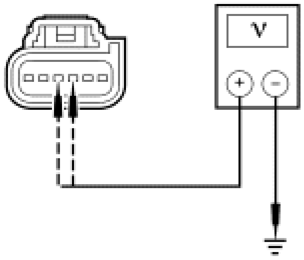

Fig. 17: Measuring Voltage Between Ground & Stability Control Sensor Cluster C3037-3 & C3037-4
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and:
  - stability control sensor cluster C3037-3, circuit VCA23 (BU/WH), harness side.
  - stability control sensor cluster C3037-4, circuit VCA24 (GN/OG), harness side.
- **Is any voltage present?**

  YES : REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

  NO : INSTALL a new sensor cluster. REFER to **Stability Control Sensor Cluster**. CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

Pinpoint Test G: DTC C1288 - Pressure Transducer Main/Primary Input Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module monitors the brake pressure transducer in combination with other brake inputs; wheel speed sensors, stoplamp switch from the PCM over the High Speed Controller Area Network (HS-CAN) bus, lateral accelerometer from the sensor cluster. The pressure transducer signal is used by the ABS module for various diagnostic routines as well as to determine system functionality. The pressure transducer is located inside the Hydraulic Control Unit (HCU) and can be monitored via the master cylinder pressure (MC_PRESS) PID. The PID should correlate closely with system hydraulic pressure. When the vehicle is at rest without input from the brake pedal, this PID value should be at or close to 0 kPa (0 psi). However, due to factors such as vehicle age or minor discrepancies in manufacturing, PID readings may have some variability. If the transducer signal reads above 620 kPa (90 psi) when other inputs indicate the system should not be pressurized, DTC C1288 will be set. If the transducer requires service, a new HCU must be installed.

- DTC C1288 Pressure Transducer Main/Primary Input Circuit Failure - If during the ABS module self-test or normal operation the ABS module detects an open, a short to voltage or a short to ground in the transducer, DTC C1288 will be set. Also, if the transducer input does not match the information received from other sources, DTC C1288 will be set.

This pinpoint test is intended to diagnose the following:

- Brake pedal binding
- Air in the brake hydraulic system
- Fluid leak in the brake hydraulic system
- High-speed controller area network (HS-CAN) bus
- Brake on/off (BOO) switch
- HCU

PINPOINT TEST G: DTC C1288 - PRESSURE TRANSDUCER MAIN/PRIMARY INPUT CIRCUIT FAILURE

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

G1 CHECK FOR ACTIVE DTCs

- Connect the diagnostic tool.
- Key in ON position.
- Using the scan tool, clear the ABS module DTCs.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test ABS Module
- Retrieve and record any ABS module DTCs.
- **Is DTC C1288 present?**

  YES : Go to G2.

  For all other ABS module DTCs, go to the **ABS MODULE DTC CHART** .

  NO : The system is operating correctly at this time. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE and RECORD any DTCs.

G2 CHECK THE MASTER CYLINDER AND PEDAL FOR CORRECT OPERATION

- Press and release the brake pedal.
- **Does the brake pedal smoothly travel to the stop and then return automatically when released?**

  YES : Go to G3.

  NO : INSPECT the brake pedal and master cylinder for obstructions and foreign material that may cause a binding condition. REPAIR or INSTALL new as necessary. CLEAR the DTCs. REPEAT the self-test.

G3 CHECK FOR AIR IN THE BRAKE HYDRAULIC SYSTEM

- Select PARK.
- Start the engine.
- Press and release the brake pedal several times.
- **Does the brake pedal move smoothly and evenly through the length of it's travel?**

YES : Go to G4.

NO : REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article to continue diagnosis of the brake hydraulic system.

G4 CHECK FOR FLUID LEAKS IN THE BRAKE HYDRAULIC SYSTEM

- Visually inspect the brake hydraulic system for brake fluid leaks.
- **Are any leaks found?**

YES : REPAIR as necessary. BLEED the brake system, REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article. CLEAR the DTCs. REPEAT the self-test.

NO : Go to G5.

G5 MONITOR THE ABS MODULE BRAKE ON/OFF (BOO_ABS) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger PCM
- Monitor the BOO_ABS PID while pressing and releasing the brake pedal.
- **Does the PID agree with the brake pedal position?**

YES : Go to G7.

NO : Go to G6.

G6 MONITOR THE PCM BRAKE ON/OFF (BOO) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger PCM
- Monitor the BOO PID while pressing and releasing the brake pedal.
- **Does the PID agree with the brake pedal position?**

YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN bus.

NO : REFER to **EXTERIOR LIGHTING** article to continue diagnosis of the BOO switch.

G7 MONITOR THE ABS MODULE MASTER CYLINDER (MC_PRESS) PRESSURE PID

- Firmly press and release the brake pedal while monitoring the ABS module MC_PRESS PID.
- **Does the PID increase with increased brake pedal pressure and decrease with decreased brake pedal pressure?**

YES : The system is operating correctly at this time. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE and RECORD any DTCs.

NO : INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

Pinpoint Test H: DTC C1446 - Brake Switch Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Instrument Cluster for schematic and connector information.

Normal Operation

The ABS module monitors brake pedal position in combination with other brake inputs; wheel speed sensors, brake pressure transducer, lateral accelerometer from the sensor cluster. The pedal position signal is used by the ABS module for various diagnostic routines as well as to determine system functionality. The Brake Pedal Position (BPP) switch is located inside the stoplamp switch and can be monitored via the brake on/off (BOO_ABS) PID and should match the actual brake pedal position. The ABS module receives the BPP switch information from the PCM over the High Speed Controller Area Network (HS-CAN) bus.

- DTC C1446 Brake Switch Circuit Failure - If the brake pedal switch status from the PCM is not received by the ABS module due to a failure of the BPP switch or the HS-CAN bus, the ABS module will set DTC C1446. The ABS module uses a pressure transducer inside the Hydraulic Control Unit (HCU) to verify the brake pedal switch status message from the PCM. When the vehicle is at rest without input from the brake pedal, the pressure transducer value should be at or close to 0 kPa (0 psi). However, due to factors such as vehicle age or minor discrepancies in manufacturing, readings may have some variability.

Possible Causes

- Wiring, terminals or connectors
- BPP switch
- HCU
- ABS module

PINPOINT TEST H: DTC C1446 - BRAKE SWITCH CIRCUIT FAILURE

H1 CHECK THE RED BRAKE WARNING INDICATOR

- Observe the red brake warning indicator while turning the ignition switch from OFF to RUN.
- Key in ON position.
- **Does the indicator illuminate for a short time and then go out?**

  YES : Go to H2.

  NO : If the red brake warning indicator remains illuminated or does not illuminate at all, go to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article to diagnose the red brake warning indicator.

H2 CHECK THE ABS MODULE MASTER CYLINDER PRESSURE (MC_PRES) PID

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - ABS Module
- Monitor the MC_PRESS PID **without** pressing the brake pedal.
- **Does the PID display 0 kPa (0 psi)?**

  YES : Go to H3.

  NO : Go to **Pinpoint Test G** .

H3 CHECK FOR COMMUNICATION DTCs

- Review the DTCs retrieved and recorded during Inspection and Verification.
- **Are DTCs U0073 or U0115 present?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-

CAN bus.

NO : Go to H4.

H4 MONITOR THE ABS MODULE BRAKE ON/OFF (BOO) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - ABS Module
- Monitor the BOO PID, while pressing and releasing the brake pedal.
- **Does the PID agree with the brake pedal position?**

  YES : The system is operating correctly at this time. TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. RETRIEVE and RECORD any DTCs.

  NO : Go to H5.

H5 MONITOR THE PCM BRAKE PEDAL POSITION (BOO) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - PCM
- Monitor the BOO PID, while pressing and releasing the brake pedal.
- **Does the PID agree with the brake pedal position?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to continue diagnosis of the HS-CAN bus.

  NO : REFER to **EXTERIOR LIGHTING** article to continue diagnosis of the stoplamps.

Pinpoint Test I: DTC C1991 - Module Calibration Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module must be calibrated whenever a component specific to the roll stability control (RSC) system is disconnected or a new component is installed.

- DTC C1991 Module Calibration Failure - If the calibration procedure does not finish or if the ABS module looses the calibration information, DTC C1991 will be set.

This pinpoint test is intended to diagnose the following:

- ABS module
- Stability control sensor cluster
- Steering angle sensor module (SASM)

PINPOINT TEST I: DTC C1991 - MODULE CALIBRATION FAILURE

NOTE:	**The RSC indicator flashes when a system calibration is required. Calibration is required after certain DTCs are cleared.**
NOTE:	**Make sure the vehicle is not on a hoist and is sitting on level ground before**

carrying out ABS module calibration.

I1 CHECK FOR DTCs

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test ABS Module
- Retrieve and record any ABS module DTCs.
- **Are other DTCs retrieved along with C1991?**

  YES : Go to the **ABS MODULE DTC CHART** .

  Some of the pinpoint tests recommend ABS module calibration prior to any further diagnostics. In this case, go to I2.

  NO : Go to I2.

I2 CALIBRATE THE ABS MODULE

- Enter the following diagnostic mode on the diagnostic tool: ABS Module Calibration
- Carry out the ABS module calibration per the scan tool instructions.
- **Does the calibration complete for all of the RSC sensors, and does the RSC indicator stop flashing and turn off?**

  YES : Go to I3.

  NO : Go to I4.

  Some concerns cause the calibration not to complete. If sent here from another pinpoint test, return to that pinpoint test for further diagnostics.

I3 CLEAR DTC C1991

- Enter the following diagnostic mode on the diagnostic tool: Clear ABS Module DTCs
- Using the scan tool, clear the DTC.
- **Does the DTC clear?**

  YES : TEST DRIVE the vehicle above 32 km/h (20 mph) and CARRY OUT at least one ABS stop. REPEAT the self-test.

  If sent here from another pinpoint test, return to that pinpoint test for further diagnostics.

  NO : Go to I4.

I4 MONITOR THE ABS MODULE SASM (SWA POS) PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger ABS Module
- Monitor the SWA POS PID while rotating the steering wheel clockwise and counterclockwise very slowly.
- **Does the PID move in intervals of 1 degree?**

YES : Go to **Pinpoint Test F** .

NO : Go to **Pinpoint Test E** .

Pinpoint Test J: DTC U1901 - CAN Network #2 Communication Bus Fault - Receive Error

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module communicates with the stability control sensor cluster along the secondary high-speed controller area network (HS-CAN2) bus, circuits VCA23 (BU/WH) and VCA24 (GN/OG).

- DTC U1901 CAN Network #2 Communication Bus Fault - Receive Error - If the ABS module does not receive an expected message from the stability control sensor cluster or the message received does not agree with other sensor inputs, DTC U1901 will be set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stability control sensor cluster
- ABS module

PINPOINT TEST J: DTC U1901 - CAN NETWORK #2 COMMUNICATION BUS FAULT- RECEIVE ERROR

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

J1 CHECK CIRCUITS VCA23 (BU/WH) AND VCA24 (GN/OG) FOR A SHORT TO VOLTAGE

NOTE: **The battery and battery tray need to be removed to access the ABS module connector.**

NOTE: **The battery must be connected to carry out this test.**

- Key in OFF position.
- Disconnect: ABS Module C135
- Disconnect: Stability Control Sensor Cluster C3037
- Key in ON position.

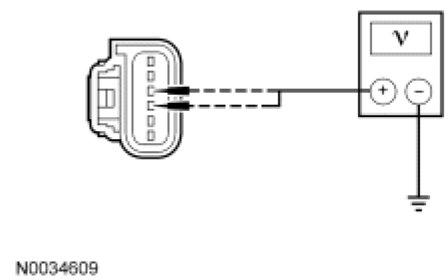

Fig. 18: Checking Circuits For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and:
  - stability control sensor cluster C3037-3, circuit VCA23 (BU/WH), harness side.
  - stability control sensor cluster C3037-4, circuit VCA24 (GN/OG), harness side.
- **Is any voltage present?**

  YES : Go to J2.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

J2 CHECK CIRCUITS VCA23 (BU/WH) AND VCA24 (GN/OG) FOR A SHORT TO GROUND

- Key in OFF position.

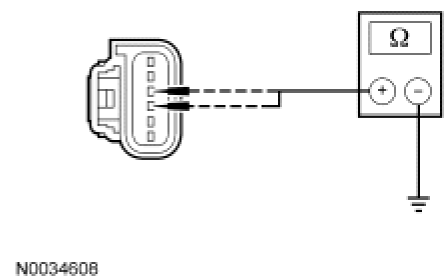

Fig. 19: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and:
  - stability control sensor cluster C3037-3, circuit VCA23 (BU/WH), harness side.
  - stability control sensor cluster C3037-4, circuit VCA24 (GN/OG), harness side.
- **Is the resistances greater than 10,000 ohms?**

  YES : Go to J3.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

J3 CHECK CIRCUITS VCA23 (BU/WH) AND VCA24 (GN/OG) FOR AN OPEN

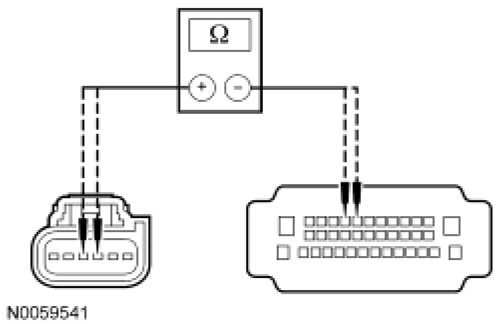

Fig. 20: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:
  - stability control sensor cluster C3037-3, circuit VCA23 (BU/WH), harness side and ABS module C135-8, circuit VCA23 (BU/WH), harness side.
  - stability control sensor cluster C3037-4, circuit VCA24 (GN/OG), harness side and ABS module C135-9, circuit VCA24 (GN/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to J4.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

J4 CHECK CIRCUITS VCA23 (BU/WH) AND VCA24 (GN/OG) FOR A SHORT TOGETHER

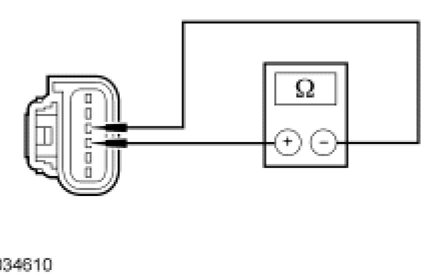

Fig. 21: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between stability control sensor cluster C3037-3, circuit VCA23 (BU/WH), harness side and stability control sensor cluster C3037-4, circuit VCA24 (GN/OG), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to J5.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

J5 CHECK THE SENSOR CLUSTER MODULE

- Install a known good sensor cluster. Refer to **Stability Control Sensor Cluster**.
- Connect: ABS Module C135
- Carry out the ABS module self-test. Retrieve and record any ABS module DTCs.
- **Was DTC U1901 retrieved?**

  YES : INSTALL the original sensor cluster. INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied

  NO : Fault corrected. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

Pinpoint Test K: The Traction Control System Cannot Be Disabled

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Instrument Cluster for schematic and connector information.

Normal Operation

The traction control switch is hard wired to the instrument cluster, traction control system status is indicated by an indicator in the instrument cluster. When the driver deactivates the traction assist system, the instrument cluster sends a message to the PCM and the ABS module over the high-speed controller area network (HS-CAN) bus. The traction assist system will remain deactivated until the driver pushes the switch again or until the ignition switch is cycled.

The instrument cluster sends a reference voltage to the stability/traction control switch along circuit CCA15 (YE/GY). When the switch is pressed, the reference voltage is momentarily grounded through the switch along circuit GD116 (BK/VT).

- DTC C1093 Traction Control Disable Switch Circuit Failure - DTC C1093 will be set if the stability/traction control switch is pressed for more than 2 minutes during normal operation, is pressed at all during the instrument cluster on-demand self test or if there is an open circuit, a short to voltage or a short.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Traction control switch
- Instrument cluster

PINPOINT TEST K: THE TRACTION CONTROL SYSTEM CANNOT BE DISABLED

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

K1 CHECK CIRCUIT CCA15 (YE/GY) FOR VOLTAGE

- Disconnect: Traction Control Switch C2355
- Key in ON position.

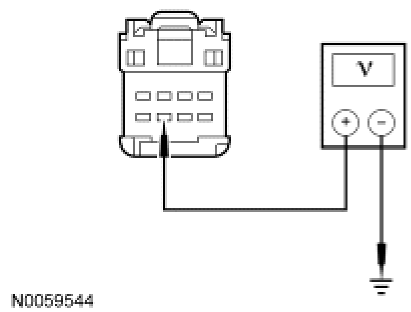

Fig. 22: Measuring Voltage Between Stability/Traction Control Switch C202-7, Circuit CCA15 (YE/GY)
Courtesy of FORD MOTOR CO.

- Measure the voltage between stability/traction control switch C2355-7, circuit CCA15 (YE/GY), harness side.
- **Is the voltage greater than 9.5 volts?**

  YES : Go to K2.

  NO : Go to K4.

K2 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.

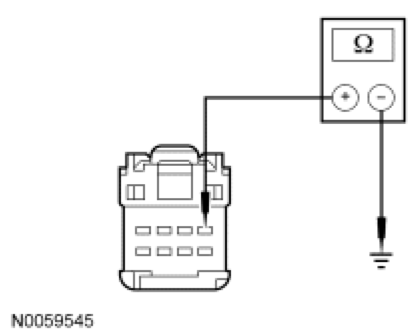

Fig. 23: Measuring Resistance Between Stability/Traction Control Switch C202-1, Circuit GD116 (BK/VT)
Courtesy of FORD MOTOR CO.

- Measure the resistance between stability/traction control switch C2355-1, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to K3.

  NO : REPAIR circuit GD116 (BK/VT). CLEAR the DTCs. TEST the system for normal operation.

K3 ISOLATE THE STABILITY/TRACTION CONTROL SWITCH

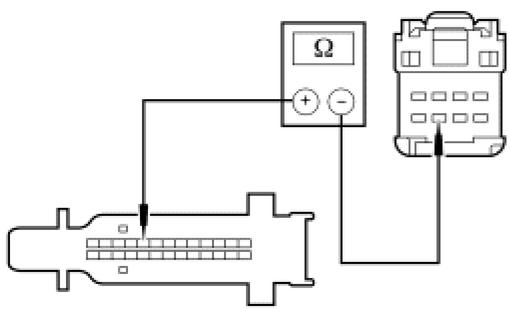
- Measure the resistance between stability/traction control switch C2355 pin-7, component side and pin-1, component side while pressing and releasing the switch.
- **Is the resistance less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**

  YES : Go to K6.

  NO : INSTALL a new stability/traction control switch. REFER to **Stability/Traction Control Switch**. CLEAR the DTCs. TEST the system for normal operation.

K4 CHECK CIRCUIT CCA15 (YE/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Instrument Cluster C220



N0059546

Fig. 24: Measuring Resistance Between Stability/Traction Control Switch C202-7, CCA15 (YE/GY) & Instrument Cluster C220-22
Courtesy of FORD MOTOR CO.

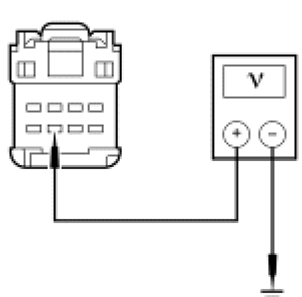
- Measure the resistance between stability/traction control switch C2355-7, CCA15 (YE/GY), harness side and instrument cluster C220-22, circuit CCA15 (YE/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to K5.

  NO : REPAIR circuit CCA15 (YE/GY). CLEAR the DTCs. TEST the system for normal operation.

K5 CHECK CIRCUIT CCA15 (YE/GY) FOR A SHORT TO VOLTAGE

- Key in ON position.



N0059547

Fig. 25: Measuring Voltage Between Stability/Traction Control Switch C202-7, CCA15 (YE/GY) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between stability/traction control switch C2355-7, CCA15 (YE/GY), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CCA15 (YE/GY). CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to K6.

K6 CHECK THE INSTRUMENT CLUSTER ELECTRICAL CONNECTOR

- Check instrument cluster C220 for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: Instrument Cluster C220
- Make sure the instrument cluster connector seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article. CLEAR the DTCs. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

Pinpoint Test L: DTCs B1317 and B1318 - Battery Voltage High/Low

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The voltage range required to operate the steering angle sensor module (SASM) is 8-16 volts.

Fused ignition voltage is supplied to the SASM from smart junction box (SJB) fuse 34 (5A) along circuit CBP34 (VT/BN), ground is provided along circuit GD115 (BK/GY). The module communicates with other modules along the high-speed controller area network (HS-CAN) bus, circuits VDB05 (WH) and VDB04 (WH/BU).

- DTC B1317 Battery Voltage High - If the battery voltage is higher than 16 volts for more than 100 ms, DTC B1317 will be set.
- DTC B1318 Battery Voltage Low - If the battery voltage is lower than 8 volts for more than 100 ms,

DTC B1317 will be set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SASM
- Charging system

PINPOINT TEST L: DTCs B1317 AND B1318 - BATTERY VOLTAGE HIGH/LOW

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

L1 CHECK FOR RETURNING DTCs

- Connect the diagnostic tool.
- Key in ON position.
- Carry out the SASM self-test. Retrieve and record all SASM DTCs.
- **Are DTCs B1317 or 1318 present?**

  YES : Go to L2.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to continue diagnosis of the charging system.

L2 CHECK THE BATTERY VOLTAGE

- Measure the voltage between the positive and negative battery terminals with the key ON and the engine OFF (KOEO) and with the engine running.
- **Is the battery voltage between 10 and 13 volts with KOEO and between 13 and 17 volts with the engine running?**

  YES : Go to L3.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to continue diagnosis of the charging system.

L3 CHECK THE VOLTAGE TO THE SASM

- Key in OFF position.
- Disconnect: SASM C222
- Key in ON position.

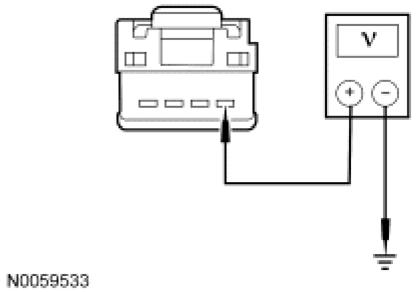


Fig. 26: Measuring Voltage Between Steering Angle Sensor C222-1, CBP34 (VT/BN), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SASM C222-1, CBP34 (VT/BN), harness side and ground.
- **Is the voltage greater 10 volts?**

  YES : Go to L4.

  NO : VERIFY SJB fuses 34 (5A) is OK. If OK, REPAIR circuit CBP34 (VT/BN). CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

L4 CHECK THE CIRCUIT GD115 (BK/GY) FOR AN OPEN

- Key in OFF position.

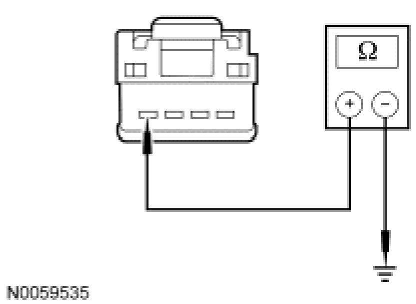

Fig. 27: Measuring Resistance Between Steering Angle Sensor C222-4, GD115 (BK/GY), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between SASM C222-4, GD115 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to L5.

  NO : REPAIR circuit GD115 (BK/GY). CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

L5 CHECK THE ELECTRICAL CONNECTOR SASM

- Check SASM C222 for:

    - corrosion.
    - pushed-out pins.
    - spread terminals.
- Connect: SASM C222
- Make sure the ABS connector seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SASM. REFER to **Steering Angle Sensor Module (SASM)**. CALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

REMOVAL AND INSTALLATION

HYDRAULIC CONTROL UNIT (HCU)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

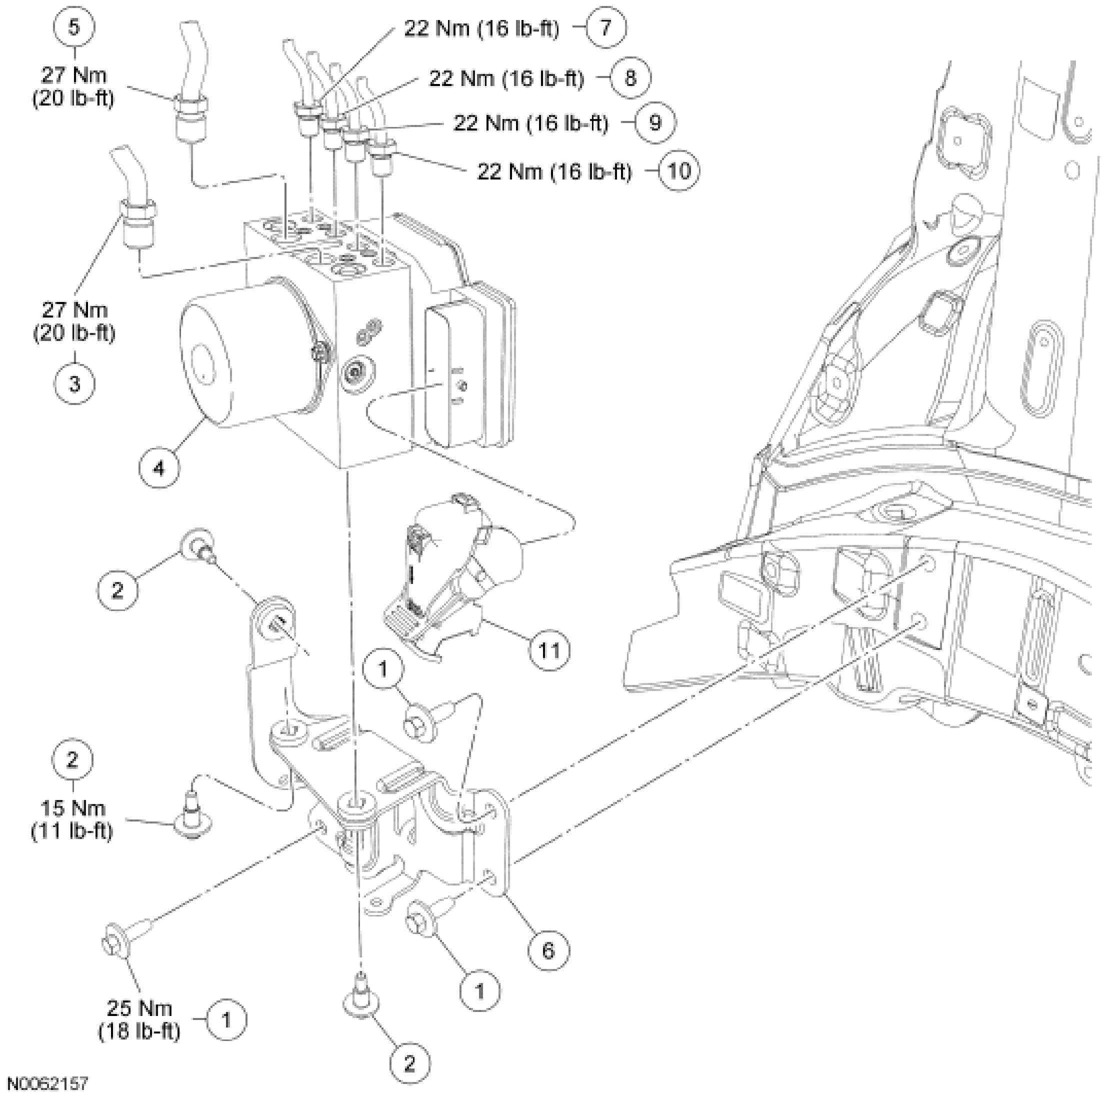

Fig. 28: Exploded View Of Hydraulic Control Unit (HCU) With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W707402	Hydraulic control unit (HCU) bracket-to-frame bolts (3 required)
2	-	HCU bracket-to-HCU bolts (3 required) (part of 2C286)
3	2286	Master cylinder rear brake tube
4	2C286	HCU
5	2A335	Master cylinder front brake tube
6	2C304	HCU bracket
7	2263	RF brake caliper brake tube
8	2C293	RR brake caliper brake tube

9	2C294	LR brake caliper brake tube
10	2264	LF brake caliper brake tube
11	-	ABS module electrical connector (part of 14290)

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

NOTE: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the air cleaner outlet tube and the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.
2. Remove the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.
3. Disconnect the ABS module electrical connector.
4. Disconnect the 6 brake tube fittings.
   - To install, tighten the brake master cylinder tubes to 27 Nm (20 lb-ft).
   - To install, tighten the remaining tubes to 22 Nm (16 lb-ft).
5. Remove the 3 hydraulic control unit (HCU) bracket-to-frame bolts and the HCU.
   - To install, tighten to 25 Nm (18 lb-ft).
6. Remove the 3 HCU bracket-to-HCU bolts and separate the HCU from the bracket.
   - To install, tighten to 15 Nm (11 lb-ft).

   NOTE: Make sure the HCU and ABS module are clean and free of any brake fluid or foreign material before separating the components.

7. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

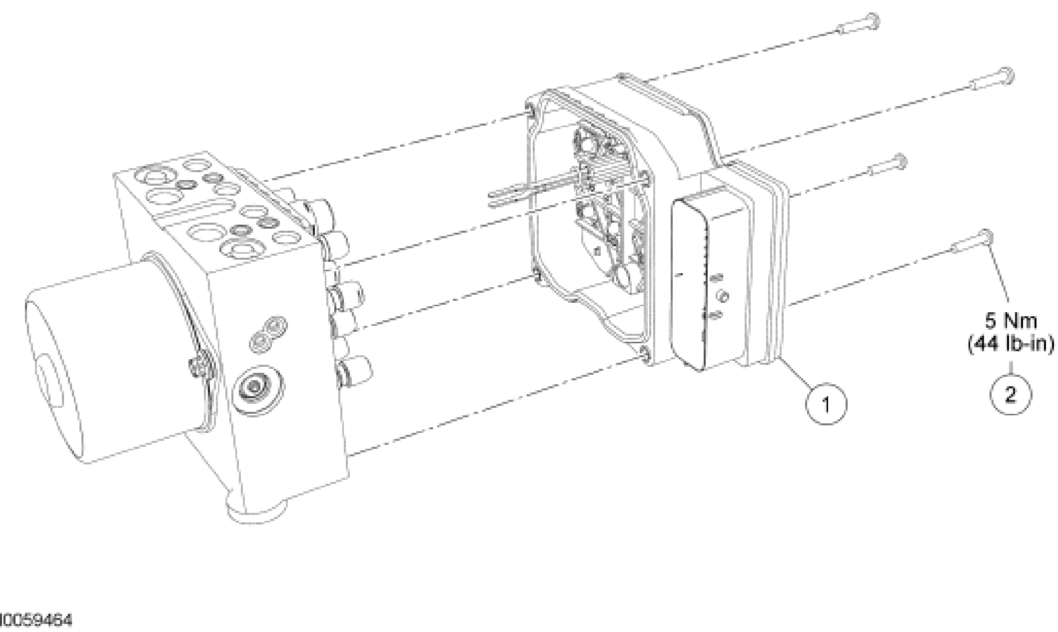

Fig. 29: Exploded View Of Anti-Lock Brake System (ABS) Module With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2C219	ABS module
2	-	ABS module screw (4 required) (part of 2C219)

REMOVAL AND INSTALLATION

NOTE: **Electronic modules are sensitive to electrical charges. The anti-lock brake system (ABS) module can be damaged if exposed to these charges.**

NOTE: **Do not allow any brake fluid or foreign material to enter the mating side of the anti-lock brake system (ABS) module or damage to the solenoids can occur.**

1. Remove the hydraulic control unit (HCU). For additional information, refer to **Hydraulic Control Unit (HCU)**.
2. Remove the 4 ABS module screws and the ABS module.
   - To install, tighten to 5 Nm (44 lb-in).

NOTE: **Visually inspect the ABS module terminals for damage before installation.**

3. To install, reverse the removal procedure.

WHEEL SPEED SENSOR - FRONT

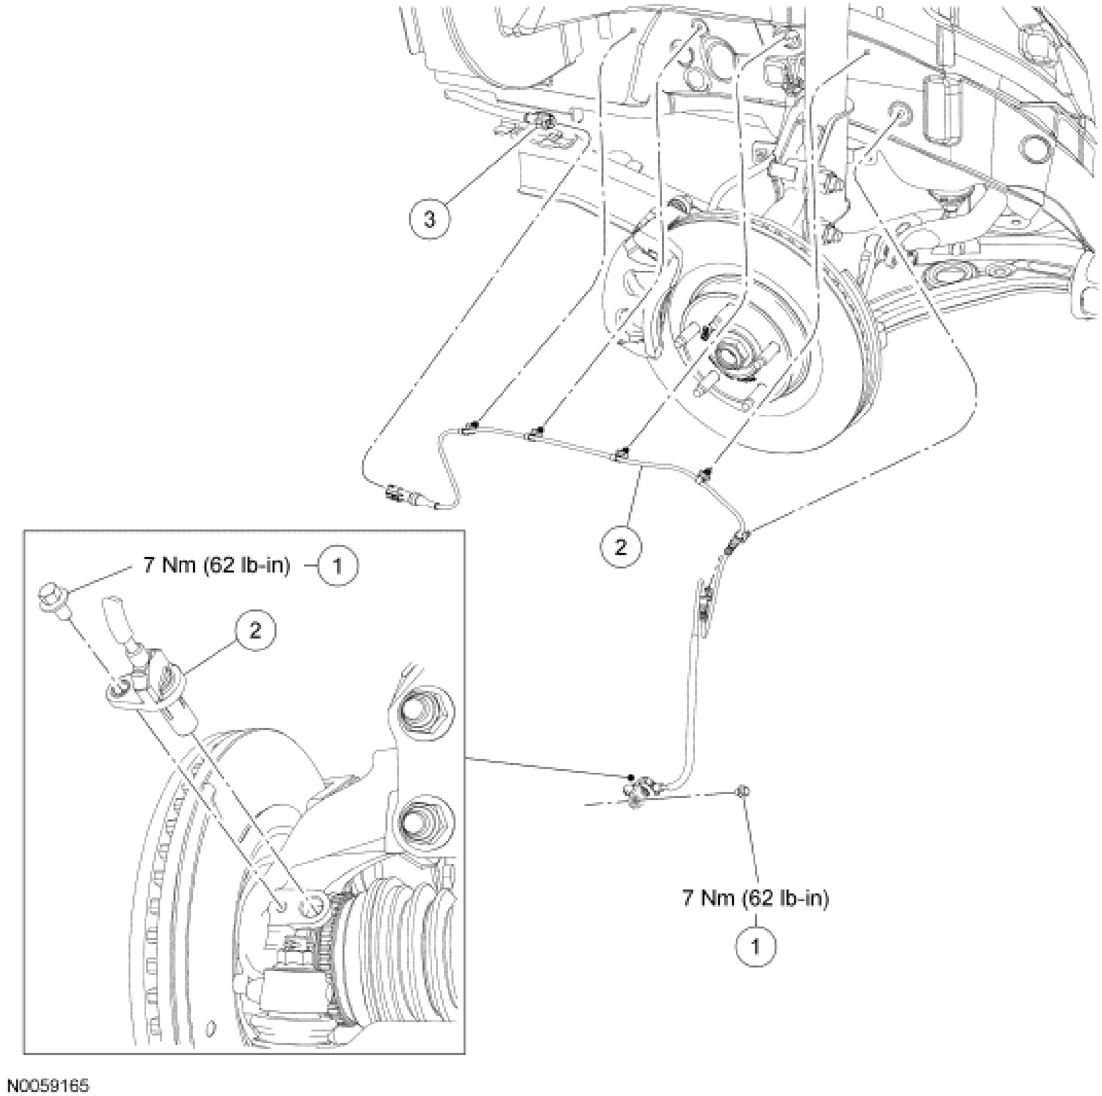

Fig. 30: Exploded View Of Front Wheel Speed Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500010	Wheel speed sensor bolt
2	2C204 RH/2C205 LH	Wheel speed sensor
3	-	Wheel speed sensor electrical connector (part of 14290)

REMOVAL AND INSTALLATION

1. Remove the wheel and tire. For additional information, refer to **WHEELS & TIRES** article.
2. Remove the retainers and position the fender splash shield aside.
3. Disconnect the wheel speed sensor electrical connector.
4. Disconnect the 6 pushpin fasteners.
5. Remove the front wheel speed sensor bolt and the wheel speed sensor.
    - To install, tighten to 7 Nm (62 lb-in).

NOTE: The wheel speed sensor harness must be routed as shown or damage to the harness during vehicle jounce and rebound can occur.

6. To install, reverse the removal procedure.

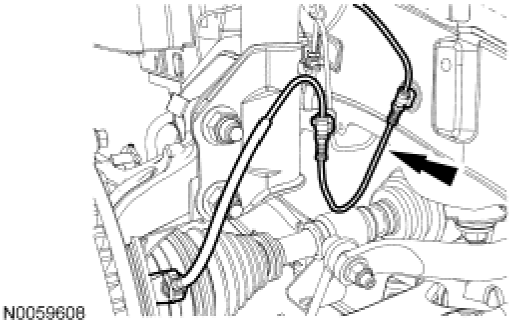

Fig. 31: Identifying Wheel Speed Sensor Harness
Courtesy of FORD MOTOR CO.

WHEEL SPEED SENSOR - REAR

NOTE: All wheel drive (AWD) shown, front wheel drive (FWD) similar.

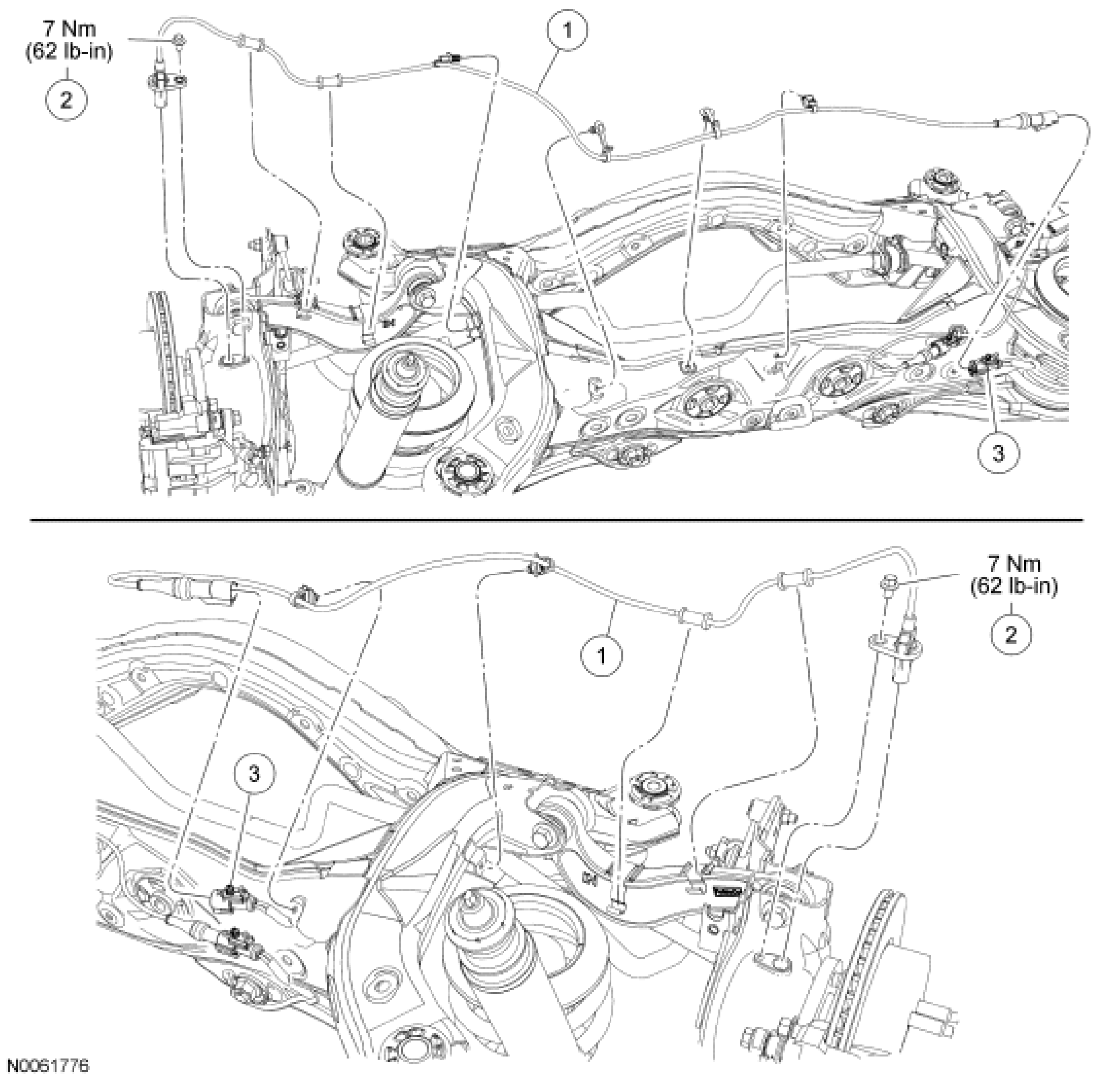

Fig. 32: Exploded View Of Rear Wheel Speed Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2C190	Wheel speed sensor
2	W500010	Wheel speed sensor bolt
3	-	Wheel speed sensor electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

1. Remove the wheel and tire. For additional information, refer to **WHEELS & TIRES** article.
2. Disconnect the wheel speed sensor electrical connector.

NOTE: It is not necessary to remove the harness routing brackets.

3. Disconnect the wheel speed sensor harness from the brackets.
4. Disconnect the pushpin fasteners.
5. Remove the wheel speed sensor bolt and the wheel speed sensor.
    - To install, tighten to 7 Nm (62 lb-in).
6. To install, reverse the removal procedure.

STABILITY CONTROL SENSOR CLUSTER

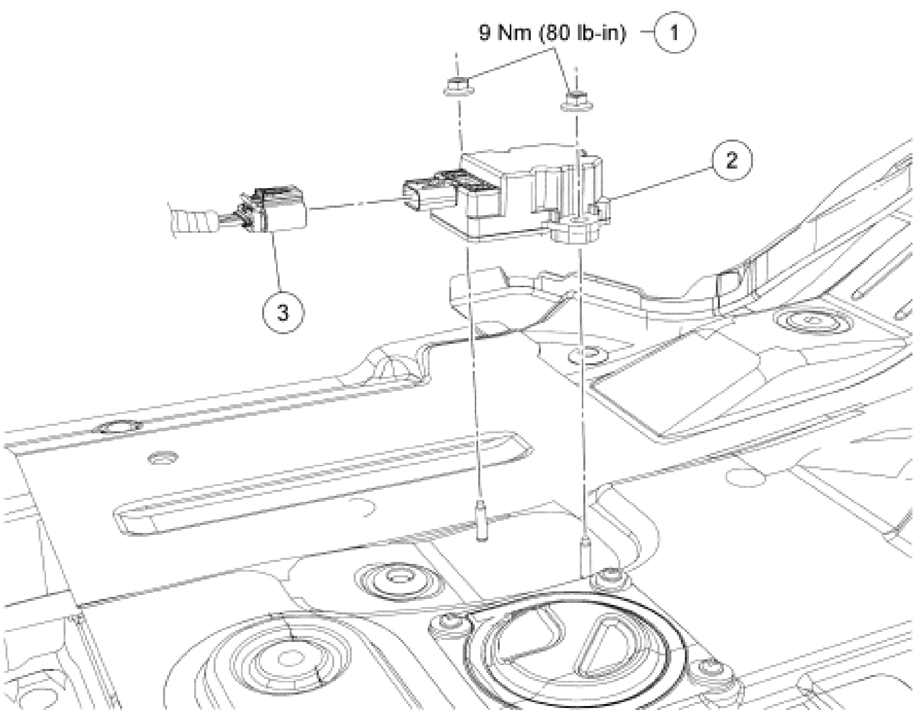

Fig. 33: Exploded View Of Stability Control Sensor Cluster With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W707142	Stability control sensor cluster nuts (2 required)
2	3C187	Stability control sensor cluster
3	-	Stability control sensor cluster electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

NOTE: When installing a new stability control sensor cluster, the sensor cluster must be calibrated. Follow the scan tool directions for the calibration procedures.

NOTE: The sensor is located on the RH side of the vehicle, under the rear seat.

1. Remove the rear seat. For additional information, refer to **SEATING** article.
2. Remove the right rear scuff plate. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.
    - Position the carpet aside.
3. Disconnect the stability control sensor cluster electrical connector.
4. Remove the 2 stability control sensor cluster nuts and the stability control sensor cluster.
    - To install, tighten to 9 Nm (80 lb-in).
5. To install, reverse the removal procedure.

STABILITY/TRACTION CONTROL SWITCH

REMOVAL AND INSTALLATION

NOTE: Edge shown, MKX similar.

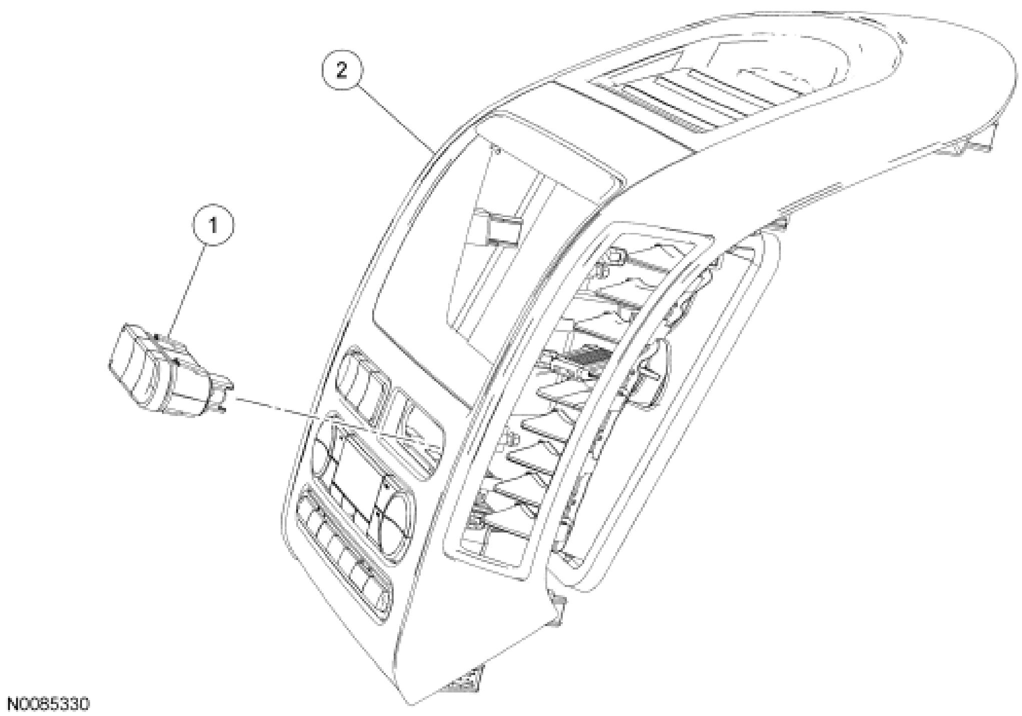

Fig. 34: Identifying Stability/Traction Control Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13D730	Stability/traction control switch
2	7804302	Instrument panel center finish panel

NOTE: **The ignition switch must be in the OFF position if disconnecting the Passenger Air Bag Deactivation (PAD) indicator electrical connector. Otherwise, a DTC will be set in the Restraints Control Module (RCM) memory and must be cleared before releasing the vehicle.**

1. Turn the ignition OFF and wait at least one minute.
2. Remove the instrument panel center finish panel. For additional information, refer to **INSTRUMENT PANEL & CONSOLE** article.
3. Depress the 4 tabs and remove the stability/traction control switch from the instrument panel center finish panel.

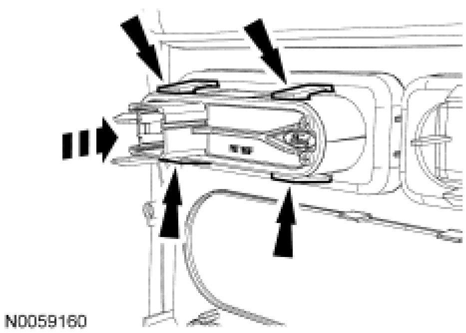

Fig. 35: Depressing Tabs & Removing Stability/Traction Control Switch From Instrument Panel Center Finish Panel
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

STEERING ANGLE SENSOR MODULE (SASM)

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

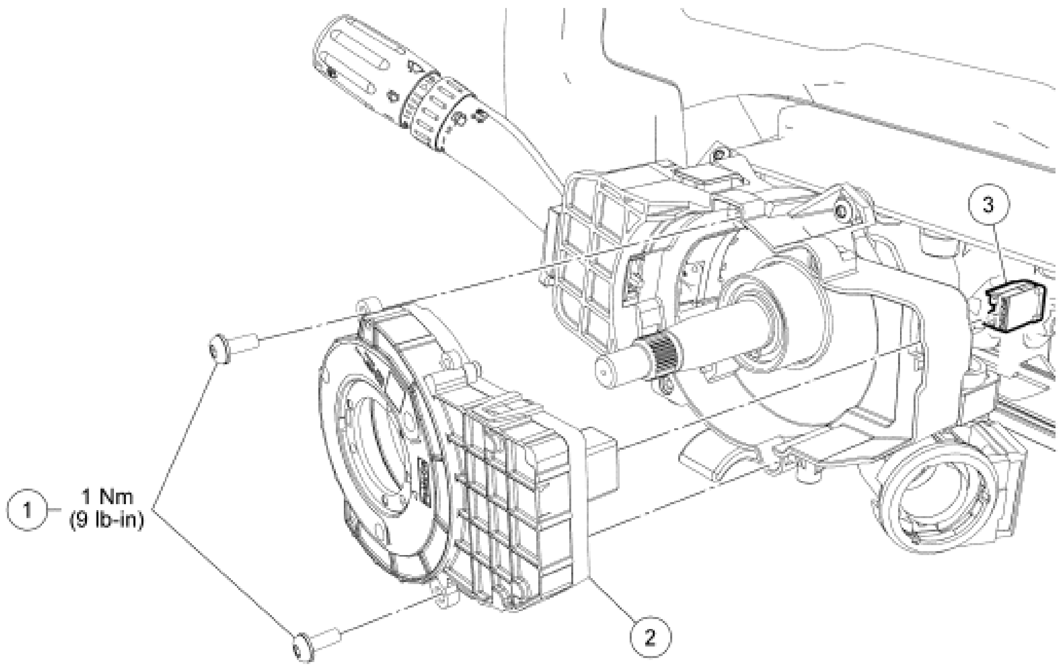

Fig. 36: Exploded View Of Steering Wheel Rotation Sensor With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Steering angle sensor module (SASM) bolts (2 required) (part of 13D774)
2	3F818	SASM
3	-	SASM electrical connector (part of 14401)

REMOVAL

1. Remove the clockspring. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
2. Remove the 2 steering angle sensor module (SASM) bolts.
3. Disconnect the SASM electrical connector and remove the steering wheel rotation sensor.

INSTALLATION

1. If the arrow on the SASM ring and the arrow on the sensor housing are misaligned and/or the straight ahead position of the sensor is not known, follow these steps to align the sensor prior to installing the sensor:
    1. Orient the front wheels in the straight-ahead position.
    2. Connect the SASM electrical connector.

3. Connect the battery negative cable. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.
4. Carefully rotate the sensor clockwise until it stops.
5. Rotate the sensor counter-clockwise 2-1/2 turns.
6. Using the scan tool, read the SASM position PID (SWA POS). The PID should read approximately 0 degrees. If not, repeat the procedure.
7. Disconnect the battery negative cable. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.
8. Disconnect the SASM electrical connector.

NOTE: Slight rotation of the SASM ring is allowed to align the 2 arrows.

2. Make sure the sensor ring arrow is lined up with the SASM housing arrow as shown and position the sensor into the multi-function switch housing.

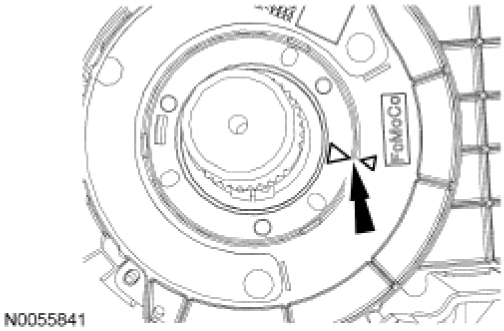

Fig. 37: Making Sure Sensor Ring Arrow Is Lined Up With Absolute Steering Angle Sensor Housing Arrow
Courtesy of FORD MOTOR CO.

3. Connect the SASM electrical connector.
4. Remove the 2 SASM bolts.
   - Tighten to 1 Nm (9 lb-in).
5. Install the clockspring. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
   - If the SASM was aligned using the scan tool, DTCs will be present in the restrains control module (RCM). Using the scan tool, clear the DTCs in the RCM.

2008 ENGINE PERFORMANCE

Acceleration Control - Edge & MKX

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Accelerator pedal and sensor assembly mounting nuts	7	62

DESCRIPTION AND OPERATION

ACCELERATION CONTROL

The acceleration controls consist of an accelerator pedal and sensor assembly.

The engine management system electronically operates the accelerator of the engine in response to accelerator pedal movements initiated by the driver. In the event of a system failure, the engine management system provides a "limp home" mode which allows the vehicle to be driven with limited performance.

DIAGNOSTIC TESTS

ACCELERATION CONTROL

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

ACCELERATOR PEDAL AND BRACKET

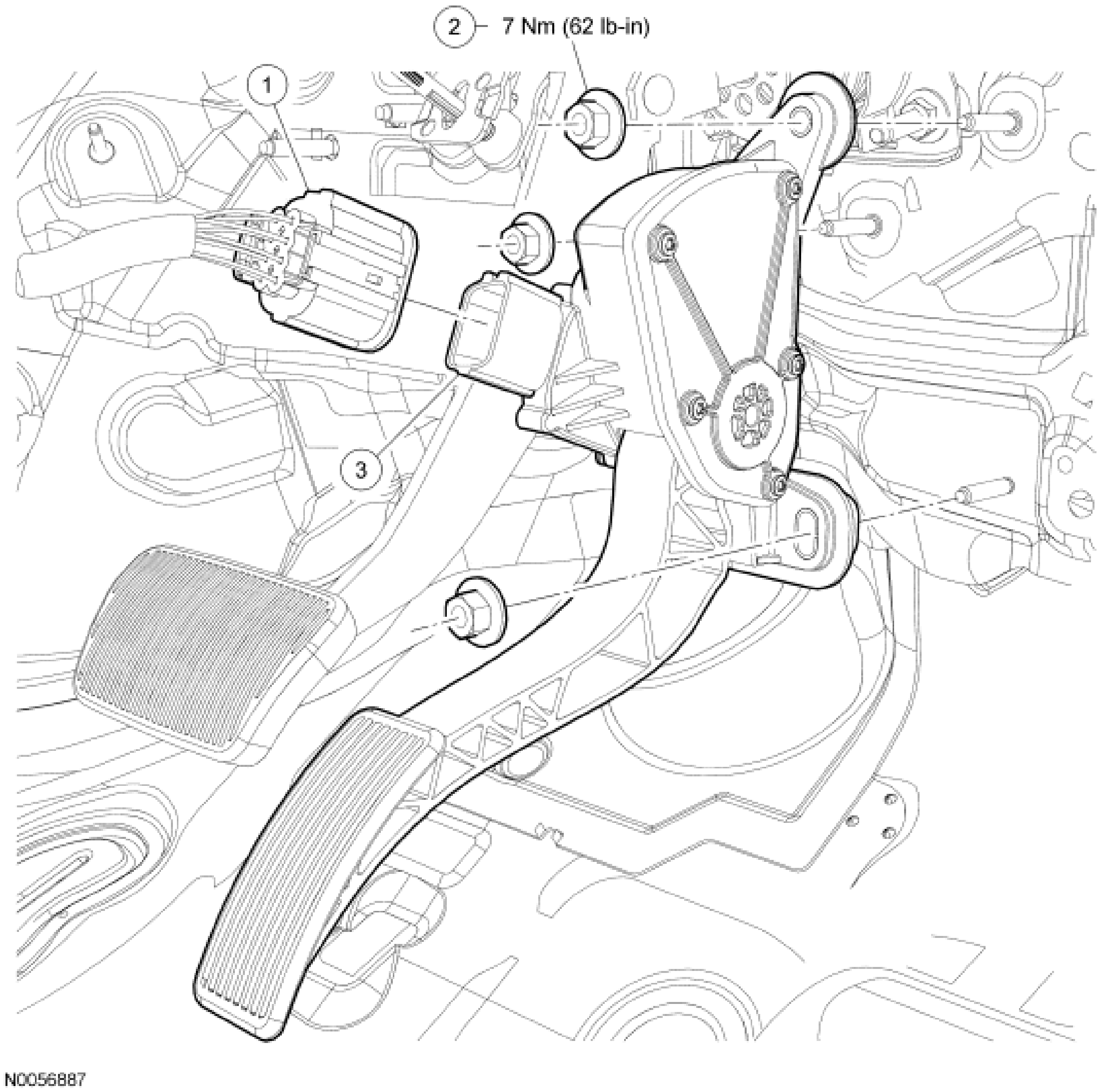

Fig. 1: Exploded View Of Accelerator Pedal & Bracket With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Accelerator pedal sensor electrical connector (part of 14290)
2	90907	Accelerator pedal nut (3 required)
3	9F836	Accelerator pedal and sensor assembly

REMOVAL AND INSTALLATION

NOTE: Release the safety lock tab mechanism on the accelerator pedal sensor electrical connector prior to disconnecting.

1. Disconnect the accelerator pedal sensor electrical connector.
2. Remove the 3 nuts and the accelerator pedal and sensor assembly.
   - To install, tighten to 7 Nm (62 lb-in).
3. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

AIR BAG AND SAFETY BELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

The air bag supplemental restraint system (SRS) is designed to provide increased collision protection for front seat and second row outboard occupants in addition to that provided by the 3-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantage of the SRS.

This vehicle contains dual-stage deployment (advanced restraint system) driver and front passenger air bag modules. These vehicles are also equipped with driver and front passenger safety belt retractor pretensioners as well as safety canopies. These canopies deploy from the A-pillar to the C-pillar during a side impact or if a rollover condition is detected. Vehicles with safety canopies are also equipped with seat side air bag modules in the front seats. Seat side air bag modules deploy from the outboard front seat backrest during a side impact. A unique restraints control module (RCM) that detects a potential rollover condition is another standard feature.

In addition, there are 2 front impact severity sensors mounted to the hood latch bracket, 2 first row side impact sensors mounted near the base of the B-pillar and 2 second row impact sensors mounted near the base of the C-pillar. A seat position sensor mounted to the driver seat and a usage detection switch is added to the front driver and passenger outboard buckles.

Vehicles are also equipped with an occupant classification sensor (OCS) system mounted to the front passenger seat track assembly. The weight of any occupant or object on the front passenger seat is electronically communicated to the occupant classification system module (OCSM). The RCM uses this information in determining if the passenger air bag module or passenger seat side air bag module is to be deployed in the event of a deployable collision.

The OCS system includes 4 OCS weight sensor bolts, OCSM and a passenger air bag deactivation (PAD) indicator lamp.

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Components

This vehicle is equipped with following SRS components:

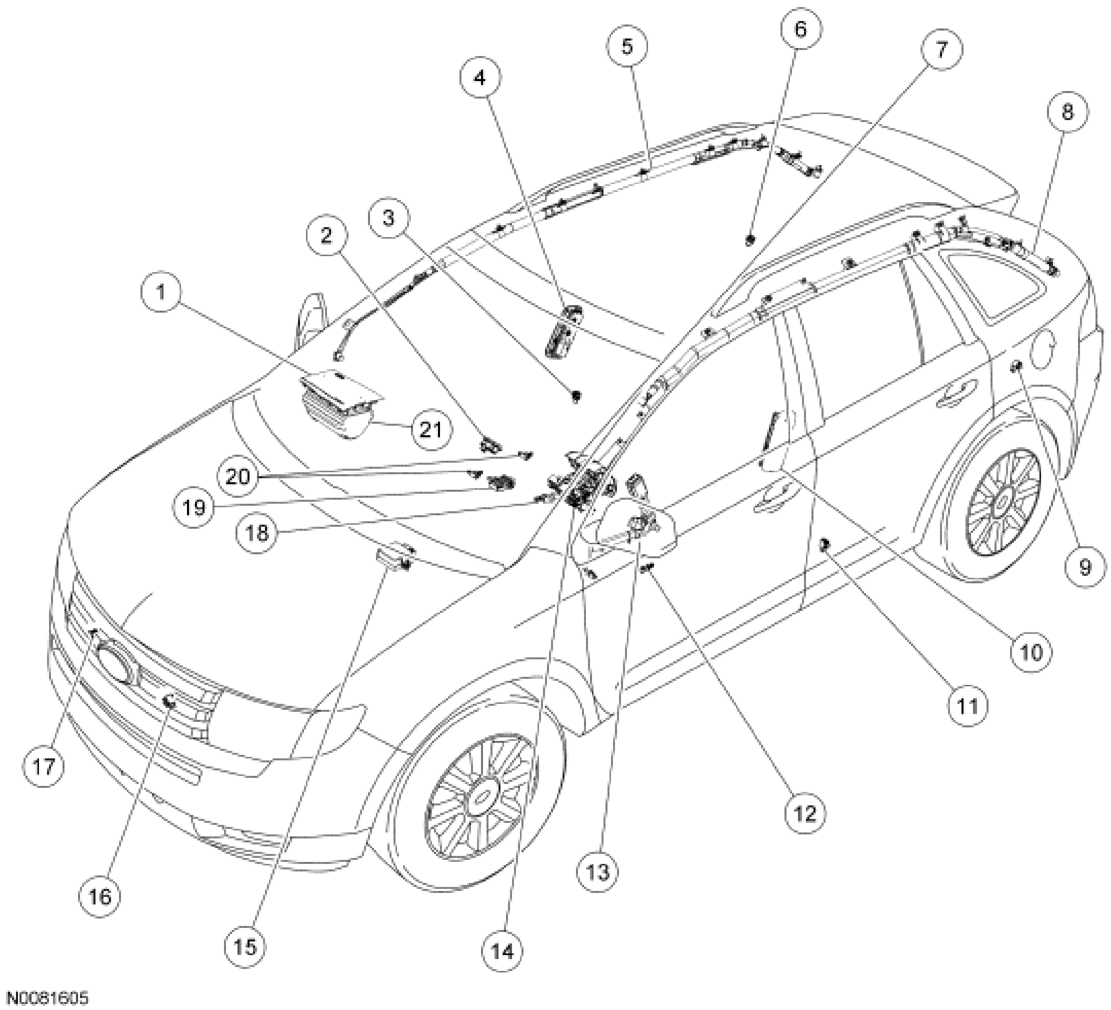

Fig. 1: Identifying Supplemental Restraint System (SRS) Components

13	61203	Driver safety belt buckle (includes safety belt buckle switch)
14	14A664	Clockspring
15	14B321	Restraints control module (RCM)
16	14B006	Driver/center front impact severity sensor
17	14B006	Passenger front impact severity sensor
18	61202	Passenger safety belt buckle (includes safety belt buckle switch)
19	14B422	Occupant classification system module (OCSM)
20	-	Occupant classification weight sensor bolts (2 shown in illustration) (4 required)
21	044A74	Passenger air bag module assembly

DIAGNOSTIC TESTS

AIR BAG AND SAFETY BELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

Special Tools

Illustration	Tool Name	Tool Number
	Flex Probe Kit	105-R025C or equivalent

 ST2574-A		
 ST1137-A	FLUKE 73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Principles of Operation

The supplemental restraint system (SRS) consists of a driver and passenger air bag module, safety belt retractor pretensioners and safety canopies (containing an inflator/squib or gas generator and an air bag), impact sensors, a restraints control module (RCM), a clockspring, an air bag warning indicator, occupant classification sensor (OCS) system and a passenger air bag deactivation (PAD) indicator lamp. These components are all interconnected by a wiring harness and powered by the vehicle's battery. The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the SRS in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after the battery ground cable is disconnected. If a SRS fault exists, the air bag warning indicator will illuminate and remain illuminated for the rest of the key cycle. In addition to the self-test at start up, the RCM continuously monitors all of its external and internal circuitry for faults.

In a frontal collision, the impact sensors located in the front of the vehicle detect the sudden deceleration and send an electrical signal to the RCM. The RCM uses the information from the impact sensors and the OCS system in the deployment determination. If the RCM determines that deployment is required, the RCM sends voltage and current to the squib(s) causing the solid chemical propellant to undergo a rapid chemical reaction. This controlled reaction produces harmless nitrogen gas that fills the air bag(s)/safety canopies and/or activates the safety belt pretensioners to remove slack from the safety belt(s).

The RCM communicates through the data link connector (DLC) the current and historical DTCs on the high-speed controller area network (HS-CAN). The RCM also communicates over the HS-CAN to the instrument cluster (IC) module, PCM and the occupant classification system module (OCSM).

Air Bag Warning Indicator

The air bag warning indicator:

- is located in the instrument cluster (IC) module.

- lamp and circuitry prove out is a function of the IC module. The IC module will prove out the air bag warning indicator by lighting the air bag warning indicator for 6 seconds and then turn off.
- will flash and/or illuminate based on the message the IC module receives from the RCM.
- will illuminate if the IC module does not receive a message from the RCM.

Air Bag Module Second Stage Deployment Check

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

- For information on driver air bag module and/or passenger air bag module remote deployment, refer to **Pyrotechnic Device Disposal**.

Clockspring

The clockspring:

- is mounted on the steering column, behind the steering wheel.
- allows for continuous electrical connections between the driver air bag module and the restraints control module (RCM) when the steering wheel is turned.

Driver Air Bag Module

The driver air bag module:

- is installed as an assembly.
- is mounted in the center of the steering wheel.
- cannot be interchanged between Edge and MKX vehicles.

High-Speed Controller Area Network (HS-CAN)

This vehicle utilizes a communication system called a high-speed controller area network (HS-CAN). The HS-CAN consists of a twisted pair of wires connected to the following:

- ABS module
- Instrument cluster (IC) module
- PCM
- Transmission control module (TCM)
- Restraints control module (RCM)
- Occupant classification system module (OCSM)
- Air suspension (vehicle dynamics module [VDM]) (if equipped)

- Data link connector (DLC)

The HS-CAN circuits use a bias voltage of approximately 2.5 volts, one is a positive 2.5 volts while the other is a negative 2.5 volts. The HS-CAN also uses 2 terminating resistors, one contained within the PCM, the other in the IC module. The terminating resistors are not serviced separately. The terminating resistors have a value of 120 ohms each, for a normal operating system total of 60 ohms. The HS-CAN may operate with only one terminating resistor and may communicate some messages to some of the control modules with only one circuit functioning. Refer to **MODULE COMMUNICATIONS NETWORK** article.

Impact Sensors

WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

For this vehicle line, the supplemental restraint system (SRS) uses 6 satellite sensors in addition to the restraints control module (RCM). The RCM is mounted to the center tunnel beneath the console. All vehicles have 2 front impact severity sensors located in the front-center area of the vehicle, behind the grille mounted on the hood latch bracket. The first row impact sensors are mounted behind the trim panel near the floor on the B-pillar, the second row sensors are located on each C-pillar. Mounting orientation is critical for correct operation of all impact sensors.

Loops/Squibs

All deployable devices contain an initiating device called a squib. The squib is part of the deployment loop. Air bag/safety canopy modules can contain more than one squib, some vehicles may have up to 4 squibs in one air bag module. Squibs are often referred to as loops during the diagnostic process.

Occupant Classification Sensor (OCS) System

The occupant classification sensor (OCS) system is found only on the front passenger seat. The front passenger OCS system is comprised of the following: 4 OCS weight sensor bolts that are mounted to each corner of the seat track and an occupant classification system module (OCSM) which is mounted to the electrical bracket underneath the seat cushion pan. All the components that make up the OCS system are all serviced separately. The weight of any occupant or object on the front passenger seat is electronically communicated to the OCSM. The RCM uses this information in determining if the passenger air bag module or passenger seat side air bag module is to be deployed in the event of a deployable collision.

The OCSM will inform the restraints control module (RCM), via a high-speed controller area network (HS-CAN), of the weight of any occupant or object on the front passenger seat.

The OCSM monitors the OCS system for faults and communicates on-demand and continuous DTCs via the data link connector (DLC) with the use of a scan tool.

The OCS system is also used for operation of the passenger Belt-Minder®. For information on the passenger Belt-Minder® feature, refer to **SAFETY BELT SYSTEM** article. To deactivate or reactivate the passenger Belt-Minder® feature, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article or the Owner's Literature.

When the front passenger seat is removed for service, the Zero Seat Weight Test must be carried out after the installation of the front passenger seat. When an OCS system component is installed new, the System Reset must be carried out after the installation of the front passenger seat. The Zero Seat Weight Test and/or System Reset must be carried out only as instructed to do so in the appropriate service information. For information on the Zero Seat Weight Test and/or System Reset, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test** or **Occupant Classification Sensor (OCS) System Reset**.

In the event of a deployable crash, a new passenger seat track with OCS weight sensor bolts must be installed. **DTC B1231 must be cleared before carrying out Occupant Classification Sensor (OCS) System Reset.** Refer to **Occupant Classification Sensor - Manual Seat Track** or **Occupant Classification Sensor - Power Seat Track**.

Passenger Air Bag Deactivation (PAD) Indicator

The passenger air bag deactivation (PAD) indicator is a visual indicator used to inform the front seat occupants of the passenger air bag deactivation state. The PAD indicator is a stand-alone lamp installed into the vehicle instrument panel in a position visible to each front seat occupant.

The restraints control module (RCM) controls the state of the PAD indicator through a direct hardwire connection, based on information provided by the occupant classification sensor (OCS) system. The PAD indicator illuminates to indicate the passenger air bag module is disabled. An exemption to this is when the front passenger seat is determined to be empty and the passenger safety belt is unbuckled, therefore indication of a deactivated passenger air bag module is not necessary. In all other cases, the PAD indicator is unlit when the passenger air bag module is enabled.

When the ignition switch is in the ON position, the PAD indicator prove-out period is initiated by the RCM. The RCM briefly activates the PAD indicator to prove-out the indicator function and verify to the front occupants correct functional operation of the PAD indicator.

When the OCSM detects a fault that causes DTC B2290 and/or B1013 to set on-demand in the OCS system, the OCSM sends a message to the RCM. Upon receiving the fault message from the OCSM, the RCM disables the passenger air bag module, illuminates the PAD indicator indicating the passenger air bag module is disabled and sends a message to the instrument cluster (IC) module to illuminate the air bag warning indicator. The passenger air bag module will remain disabled until the cause for the on-demand DTC has been corrected.

The following table indicates the passenger air bag status and the PAD indicator status based the size of the front outboard passenger occupant.

PASSENGER AIR BAG AND PAD INDICATOR STATUS

Occupant Size	Passenger Safety Belt Buckle Status	Pass. Air Bag Status	PAD Ind. Status
None	Unbuckled	Disabled	Unlit

None	Buckled	Disabled	Lit
Infant or Small Child	Buckled/Unbuckled	Disabled	Lit
Adult Sized	Buckled/Unbuckled	Enabled	Unlit

Passenger Air Bag Module

The passenger air bag module:

- is installed as an assembly.
- is mounted in the passenger side of the instrument panel.
- cannot be interchanged between Edge and MKX vehicles.

Restraints Control Module (RCM)

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

NOTE: **Prior to removal of the restraints control module (RCM) module, it is necessary to upload module configuration information to the scan tool. This information needs to be downloaded into the new RCM module once installed. Refer to <u>MODULE CONFIGURATION</u> article. Failure to follow these instructions may result in incorrect operation of the supplemental restraint system (SRS) and may cause system failure.**

NOTE: **When installing a new restraints control module (RCM), always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.**

The RCM carries out the following functions:

- deploys the air bag(s)/safety canopies in the event of a deployable collision.
- activates the safety belt retractor pretensioners to remove slack from the safety belt in the event of a deployable collision.
- monitors the supplemental restraint system (SRS) for faults.

- sends a message to the instrument cluster (IC) module to illuminate the air bag warning indicator if a fault is detected.
- communicates through the data link connector (DLC) the current or historical DTCs.

The RCM monitors the SRS for possible faults. If a fault is detected, the RCM will request illumination of the air bag warning indicator.

When the ignition is cycled (turned OFF and then ON), the IC module will prove out the air bag warning indicator by lighting for 6 seconds and then turn off. If a current SRS fault exists, the RCM requests illumination of the air bag warning indicator and will remain illuminated for the rest of the key cycle. During that same key cycle, some faults that recover (Loss of Communication with the PCM), the RCM will send a request to the IC module to turn the air bag warning indicator off **IF** no other fault is present. The RCM will also communicate the on-demand (current) and continuous (historical) DTCs through the DLC, to the scan tool. If the RCM requests illumination of the air bag warning indicator and the air bag warning indicator does not function, the IC module will automatically activate an audible chime. The chime is a series of 5 sets of 5 tone bursts. If the chime is heard, the SRS and the air bag warning indicator require repair.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the air bags in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after power and/or ground has been removed from the RCM.

Safety Belt Buckle Switches

As part of the supplemental restraint system (SRS), the driver and front passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belts are connected or disconnected. The RCM uses this information in determining the deployment of the dual-stage driver and passenger air bag modules.

Safety Belt Pretensioners

As part of the supplemental restraint system (SRS), the driver and front passenger safety belt retractors are equipped with pretensioners. The safety belt retractor pretensioners remove excess slack from the safety belt webbing. The pretensioners are activated by the restraints control module (RCM) when the module detects a collision exceeding a programmed limit.

Safety Canopy Module

Vehicles are equipped with safety canopies for protection during side impacts or rollovers.

Safety canopies require a specific headliner. The word AIRBAG will appear on the headliner where it meets each B-pillar trim panel.

The safety canopy module:

- is installed as an assembly.
- is mounted above the headliner.

- attaches from the A-pillar frame to the C-pillar frame.
- is standard equipment.
- cannot be interchanged from side-to-side.

Seat Track Position Sensor

The seat track position sensor is mounted to a bracket attached to the inboard side of the driver seat track. The seat track position sensor informs the restraints control module (RCM) of the driver seat position. The RCM uses this information in determining the deployment of the dual-stage driver air bag module.

Side Air Bag Module

NOTE: **References to side air bag modules refer to the seat side air bag module, not to the steering wheel or instrument panel mounted air bag components of the supplemental restraint system (SRS).**

A side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a safety canopy module.

The side air bag module:

- will deploy upon receiving a flow of current from the restraints control module (RCM), initiated by the side impact sensor and internal RCM circuitry.
- is installed as an assembly.
- is mounted in the driver or passenger seat backrest.
- is used in conjunction with a safety canopy module.

Secondary Air Bag Warning (Chime)

The secondary air bag warning, is an audible tone controlled by the instrument cluster (IC) module. If a fault is detected with the air bag warning indicator a DTC will be stored in memory of the IC module. Upon receiving the message from the restraints control module (RCM) that a supplemental restraint system (SRS) fault has been detected, the IC module will sound the secondary air bag warning chime in a pattern of 5 sets of 5 beeps.

Diagnostic Instructions

The symptom chart can be used to help locate supplemental restraint system (SRS) concerns if no DTCs are retrieved and the listed symptoms are observed. Whether or not the listed symptoms are observed, always carry out the following:

1. Run the Self Test to determine what on-demand and continuous memory DTCs are being sensed by the restraints control module (RCM) and occupant classification system module (OCSM).
2. Retrieve all SRS DTCs and fault PIDs stored in the RCM and OCSM memory.
3. If on-demand DTCs are different than continuous memory DTCs, always diagnose the on-demand DTCs first.

A DTC can indicate several concerns. The DTCs are to assist in system diagnosis and are not to be considered definitive. Always refer to the pinpoint test corresponding to the DTC to determine where the concern lies and to repair the concern correctly.

Diagnostic Test Options

Scan tool options:

- Self Test/On-Demand
- Self Test/Continuous Memory and Clear DTCs

Refer to the manufacturer's literature for the scan tool being used for correct scan tool test options.

Self Test/On-Demand

The on-demand Self Test option is used to verify that no electrical concerns exist with the air bag supplemental restraint system (SRS). Upon entering the self-test, the restraints control module (RCM) and the occupant classification system module (OCSM) will make an electrical check of each electrical component in the system. If a concern is detected, a DTC is displayed on the scan tool with a brief description of the DTC. The self-test should always be carried out after any repair to verify that the repair was successful.

To run the on-demand Self Test, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select Self-Test.
5. Select RCM or OCSM.
6. The module will run the self-test and display on-demand (reflecting hard system concerns) and continuous memory (historic) DTCs on the scan tool.

Self Test/Continuous Memory and Clear DTCs

During vehicle operation, the restraints control module (RCM) and the occupant classification system module (OCSM) will detect and store on-demand (reflecting hard system concerns) and continuous memory (historic) DTCs. The DTC strategy employed by the RCM incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern may exist for up to one minute in the system before the RCM will detect it. For the RCM to determine that a concern no longer exists, the concern must be absent for up to one minute. The actual detection time-outs vary with each DTC. DTCs can be retrieved with a scan tool using the Self Test option. All DTCs stored in the RCM and OCSM will be displayed on the scan tool along with a brief description of the DTC. If no DTCs are present, the scan tool will display a SYSTEM PASSED message. This option can also be used to clear DTCs from the RCM and OCSM memory, as long as the concern no longer exists.

Once 75 hours of operation have been recorded by the RCM/OCSM since the concern was last detected, all continuous memory DTCs will automatically be removed from memory.

To retrieve or clear DTCs, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select Self Test.
5. Select RCM or OCSM (selecting Restraints retrieves DTCs from both modules).

NOTE: **Before proceeding with the clearing operation, make note of the DTCs displayed. Once cleared, continuous DTCs cannot be retrieved.**

6. All DTCs will be displayed on the screen.
7. Clear the DTCs. After clearing the DTCs, cycle the ignition OFF, then ON.
   - Continuous memory DTCs that have been cleared will **not** reoccur as "continuous memory" in the same key cycle. Only new DTCs which were **not** present before clearing can occur as "continuous memory" after clearing.

Occupant Classification Sensor (OCS) System Zero Seat Weight Test

The Zero Seat Weight Test verifies the occupant classification sensor (OCS) measures zero weight for an empty seat. It is necessary to carry out the Zero Seat Weight Test any time the front passenger seat is serviced or removed from the vehicle or as directed in the service information procedures. Refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.

Occupant Classification Sensor (OCS) System Reset

The System Reset active command resets the zero point of the occupant classification sensor (OCS) system.

The System Reset active command should only be carried out if a new OCS component is installed or as directed by service information .

DataLogger PID/Data

The DataLogger PID/Data option allows the scan tool operator to read the state of several PIDs to aid in diagnosing the system. PIDs are real time measurements of parameters, such as voltages and resistances, calculated by the restraints control module (RCM) or the occupant classification system module (OCSM) and sent to the scan tool for display. Many of the PIDs supported by the modules are calculated periodically and are, therefore, not true real time readings.

To retrieve PIDs, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.

3. Follow the manufacturer's instructions for the scan tool being used.
4. Select DataLogger.
5. Select RCM or OCSM.

Active Commands

System Reset

System Reset active command sets the zero set point or rezeros the occupant classification sensor (OCS). Refer to **Occupant Classification Sensor (OCS) System Reset**.

Zero Seat Weight Test

The Zero Seat Weight Test verifies the OCS measures zero weight for an empty seat. Refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.

Instrument Cluster (IC) Module

These commands allow the technician to verify the operation of instrument cluster (IC) module components and subsystems.

Lamp Fault Codes (LFCs)

This vehicle supports lamp fault codes (LFCs) **only** when the restraints control module (RCM) is in plant mode. A new RCM installed to a vehicle will be in plant mode until:

- programmable module installation (PMI) has been carried out.
- the RCM sees a fault-free supplemental restraint system (SRS) (no DTCs present).

If a LFC is present after completing PMI, a fault is present in the SRS and on-demand DTCs must be retrieved and diagnosed.

Diagnosing Customer Concerns With On-Demand DTCs

NOTE:	**Most supplemental restraint system (SRS) diagnostic procedures will require depowering and repowering of the SRS. Depowering and repowering requires disconnecting of the battery and removal of the restraints control module (RCM) fuse. This reduces the risk of accidental deployment of SRS components while diagnostic procedures are being carried out.**

If the air bag warning indicator is reported ON by the customer when the vehicle comes in for service, connect the scan tool and follow the Diagnostic Instruction procedures in this service information to identify the concern.

Once the DTC is known, read the Normal Operation of the pinpoint test for the DTC involved.

Using the scan tool with the use of PIDs and active command(s) may be of assistance in diagnosing the concern.

- Follow the depowering procedure as directed in **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
  - components.
  - connectors.
  - splices and wiring harnesses.
  - insulation on conductors.

Diagnosing Customer Concerns With Continuous Memory DTCs

If the air bag warning indicator was reported ON by the customer but is not present when the vehicle comes in for service, follow the Diagnostic Instruction procedures in this service information to identify the intermittent DTC.

Once the DTC is known, read the Normal Operation of the pinpoint test for the DTC involved.

- Follow the depowering procedure as directed in **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
  - components.
  - connectors.
  - splices and wiring harnesses.
  - insulation on conductors.

Refer to the Possible Causes section of the pinpoint test for the DTC involved, which lists the common concerns that relate to the DTC. Concerns are listed according to priority.

Fault PIDs

There are 2 types of fault PIDs that can be reported by the restraints control module (RCM). The first type, considered conventional, has only one level of fault reporting and identifies a specific concern for a given component and points to a particular diagnostic path, example: DTC B1317 (Battery Voltage High).

The second type uses a process within the software of the controller that maps the byte and bit to name a specific device and fault condition. This process is called Bit-mapping and referred to as fault PIDs in the diagnosis of the vehicle. This type does not identify the specific concern or component on the first level of fault reporting, Example: DTC B2293 (Restraint System - Airbag Fault). DTC B2293 can have up to 28 specific on-demand fault PIDs (areas of concern) associated with this DTC.

Those associated fault PIDs are an extension of the information provided by the DTC and are identified by the same DTC number. A scan tool must be used to view DTCs and their fault PIDs. Once a scan tool has retrieved a DTC, use the scan tool to view the fault PIDs. In the diagnostic path, other types of PIDs are sometimes used to determine the root cause (example: resistance or voltage PIDs).

When viewing of fault PIDs has been carried out, the scan tool can display the PIDs associated with that DTC, including the status or state that exists (on-demand [active] DTC) or existed (continuous memory [historic]) DTC. Refer to the manufacturer instructions for the scan tool being used on how to view fault PIDs.

Prove Out Procedure

Turn the ignition switch from the OFF to the ON position and visually monitor the air bag warning indicator with all supplemental restraint system (SRS) components connected. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will:

- fail to light.
- remain lit continuously.
- flash.

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the restraints control module (RCM) to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

Supplemental Restraint System (SRS) Reconnect Checklist

The checklist below should be completed following diagnosis or repair of any air bag system concern:

- All in-seat harness connectors connected?
- All air bag modules connected?
- Occupant classification system module (OCSM) connected?
- All OCS weight sensor bolts connected?
- Safety canopy modules connected?
- Safety belt pretensioner connectors connected?
- All sensors (front and side impact sensors) connected?
- Restraints control module (RCM) connected?
- RCM fuse installed?
- Battery connected?

Air Bag Module Second Stage Deployment Check

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure to make sure the second stage has been deployed.

- For information on driver or passenger air bag module remote deployment, refer to **Pyrotechnic Device Disposal**.

Glossary

Disconnect the Component

Disconnect the component means to disconnect the component vehicle harness connector, not to remove the component. Do not reconnect a disconnected component unless instructed to do so.

Deactivate the Supplemental Restraint System (SRS)

Deactivate the SRS means to carry out a deactivation procedure. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.

Depower the SRS

Depower the SRS means to disconnect the battery and remove the restraints control module (RCM) fuse. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

Deployment Loop

The deployment loop is made up of the RCM, deployable device, air bag(s), safety belt pretensioners (safety canopies, deployable steering columns, load limiting retractor, adaptive tether, adaptive vent, if equipped) and associated circuits.

Install a New Component

Install a new component means to remove the existing component and install a new authorized part obtained from Ford Customer Service Division.

Prove Out the SRS

Prove out the SRS means to turn the ignition switch from the OFF to the ON position and visually monitor the air bag warning indicator with all SRS components connected. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will either fail to light or remain lit continuously. The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

Reactivate the SRS

Reactivate the SRS means to carry out the reactivation procedure. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.

Reconnect the SRS

Reconnect the SRS means to reconnect all system components. Refer to **Supplemental Restraint System (SRS) Reconnect Checklist**.

Repower the SRS

Repower the SRS means, turn the ignition ON, install the RCM fuse and connect the battery ground cable. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

Secondary Air Bag Warning

The secondary air bag warning is an audible fault format that consists of 5 sets of 5 tone bursts, with each set of 5 tone bursts separated by a 5-second quiet period. One tone burst cycle will consist of one-second ON and one-second OFF. The tone pattern will repeat periodically until the problem and warning light are repaired.

Squib

A squib (igniter) is a device designed to convert electrical energy to the heat energy necessary to deploy a pyrotechnic restraints system device.

Verify the System

Verify the system means to prove out the SRS with all restraint system components in place.

Inspection and Verification

1. Verify the customer concern by checking the air bag warning indicator in the instrument cluster. Prove Out the System. Refer to step 4 under **Repowering Procedure**.
2. Visually inspect for obvious signs of mechanical or electrical damage. Do not disconnect electrical connectors until directed to do so within the pinpoint test.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged restraints control module (RCM) or loose mounting • Damaged front impact severity sensor(s) or loose mounting • Damaged side impact sensor(s) or loose mounting	• Open smart junction box (SJB) fuse 46 (7.5A) • Damaged wiring harness

• Damaged or disconnected passenger air bag deactivation (PAD) indicator • Damaged front passenger seat track assembly • Damaged occupant classification sensor (OCS) weight sensor bolt(s) or loose mounting	• Loose, damaged or corroded connectors • Circuitry open/shorted • Damaged shorting bars • Loose, damaged or pinched passenger seat wire harness

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record on-demand and continuous memory DTCs from the RCM and OCSM.
8. If the DTCs retrieved are related to the concern, go to Supplemental Restraint System (SRS) DTC Chart.

For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.

9. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

The DTCs can be retrieved from the restraints control module (RCM) and the occupant classification system module (OCSM) with a scan tool via the data link connector (DLC).

RESTRAINTS CONTROL MODULE (RCM) DTC CHART

DTC[a]	Description	Retrieved From	Action To Take
Continuous lamp	The Air Bag Warning Indicator is Illuminated Continuously	Restraints control module (RCM)	Go to **Pinpoint Test A** .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Air bag warning indicator is illuminated continuously	• Fuse • DTC • Wiring, terminals or connectors • Faulty data link connector (DLC) • Restraint control module (RCM)	• Go to **Pinpoint Test A** .
• Air bag warning indicator	• RCM not	• CARRY OUT programmable module installation (PMI). REFER to **MODULE CONFIGURATION** article. If the air bag warning indicator

flashing at 5 Hz rate	configured	is flashing or has a continuous light after carrying out PMI, REFER to **DTC Charts** to diagnose the concern.
• Audible tone - DTCs retrieved	• SRS fault and air bag warning indicator fault	• REFER to **DTC Charts** .
• No communication with the restraints control module (RCM)	• Fuse • Circuitry • Scan tool • RCM	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication concern.
• No communication with the occupant classification system module (OCSM)	• Fuse • Circuitry • Scan tool • OCSM	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication concern.

Pinpoint Test - Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Pinpoint Test A: The Air Bag Warning Indicator is Illuminated Continuously

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

During normal operation, the instrument cluster (IC) module will illuminate the air bag indicator continuously for 6 seconds after the ignition switch is placed to the RUN or ON position. If the supplemental restraint system (SRS) is fault free, the air bag warning indicator will turn off and remain off. If a fault is detected in the SRS, the air bag warning indicator will illuminate and remain illuminated for the rest of the key cycle. The restraints control module (RCM) will communicate to the IC module via the high-speed controller area network (HS-CAN). The IC module will illuminate the air bag indicator based on messaging from the RCM or if there is no communication between the RCM and IC module.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- IC module
- RCM

PINPOINT TEST A: THE AIR BAG WARNING INDICATOR IS ILLUMINATED CONTINUOUSLY

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in**

the accidental deployment of the safety canopy and cause serious personal injury or death.

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Were any continuous memory or on-demand DTCs retrieved?**

  YES : If on-demand or continuous memory DTCs were retrieved, go to the **DTC Charts** for diagnostic direction.

  Do not clear any DTCs until all DTCs have been resolved.

  NO : If the RCM **does** communicate with the scan tool, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article to diagnose the IC module concern.

  If the RCM **does not** communicate with the scan tool, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication concern.

  Do not clear any DTCs until all DTCs have been resolved.

Pinpoint Test B: DTC B1342 - ECU (OCSM) is Faulted

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The occupant classification sensor (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The occupant classification system module (OCSM) monitors internal circuity, hardware and the 4 OCS weight sensor bolts and external circuitry for faults. If the OCSM detects a fault with the internal circuitry, internal hardware, sensor(s) or external circuitry, it will store DTC B1342 in memory and send a message to the restraints control module (RCM). A short to ground on any one of the sensor reference voltage circuits or an open on 3 or more of the sensor reference voltage circuits may set this DTC. The RCM will store DTC B2290 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

Fault PIDs[a]	Description	Fault Trigger Condition
1342_27_OD and 1342_27_CM	Memory Fault	When the OCSM senses a internal hardware failure, a fault will be indicated.
1342_28_OD and 1342_28_CM	Microcontroller Internal Fault	When the OCSM senses a internal failure, a fault will be indicated.
1342_29_OD and 1342_29_CM	Satellite ASIC Fault	When the OCSM senses a internal hardware failure, a fault will be indicated.
1342_30_OD and 1342_30_CM	Power Supply Internal Fault	When the OCSM senses a failure with the internal power supply, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B1342. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B1342.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Incorrectly wired OCS weight sensors
- OCS system component

PINPOINT TEST B: DTC B1342 - ECU IS FAULTED (OCS)

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of**

serious personal injury or death.

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

B1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B1342 Fault PIDs
- **Do any OCSM on-demand B1342 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to B2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to B8.

B2 CHECK THE SEAT WIRING AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Carry out a thorough visual inspection of the OCS system wiring, terminals and connectors and the related seat wiring harness and body wiring harness terminals and connectors.
- **Were any wire problems noted?**

  YES : REPAIR the seat connectors and wiring as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to B9.

NO : Using the fault PIDs recorded in step B1, go to the appropriate pinpoint test step.

For 1342_30_OD (Power Supply Internal Fault), go to B3.

For 1342_28_OD (Microcontroller Internal Fault), 1342_29_OD (Satellite ASIC Fault) or 1342_27_OD (Memory Fault), INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM) - Manual Seat Track** or **Occupant Classification System Module (OCSM) - Power Seat Track**. Go to B9.

B3 CHECK THE OCS WEIGHT SENSOR BOLT CIRCUITS FOR A SHORT TO GROUND

- Disconnect: OCS Weight Sensor Bolt C3324, C3325, C3330 and C3331
- Disconnect: OCSM C3159

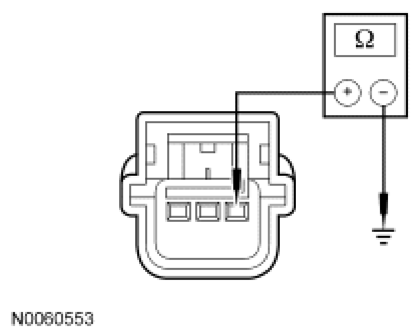

Fig. 2: Measuring Resistance Between OCS Weight Sensor Bolt 1 C3324-1 & Bolt 2 C3325-1, CR140 (YE/GN) & CR141 (BN/YE)
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 1 C3324-1, circuit CR140 (YE/GN), harness side and ground; between OCS weight sensor bolt 2 C3325-1, circuit CR141 (BN/YE), harness side and ground; between OCS weight sensor bolt 3 C3330-1, circuit CR153 (GN/WH), harness side and ground; and between OCS weight sensor bolt 4 C3331-1, circuit CR154 (VT/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to B4.

  NO : REPAIR circuit CR140 (YE/GN), circuit CR141 (BN/YE), circuit CR153 (GN/WH) or circuit CR154 (VT/OG). Go to B9.

B4 CHECK FOR A SHORT BETWEEN THE OCS WEIGHT SENSOR BOLT CIRCUITS

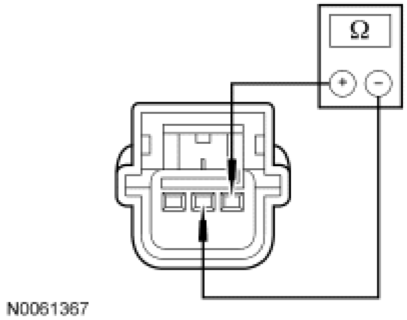

Fig. 3: Measuring Resistance Between OCS Weight Sensor Bolt 1 C3324-1 & Bolt 2 C3325-1, CR140 (YE/GN) & CR141 (BN/YE)
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor:
  - bolt 1 C3324-1, circuit CR140 (YE/GN), harness side and C3324-2, circuit RR140 (GN/OG), harness side; and
  - bolt 2 C3325-1, circuit CR141 (BN/YE), harness side and C3325-2, circuit RR141 (VT/BN), harness side; and
  - bolt 3 C3330-1, circuit CR153 (GN/WH), harness side and C3330-2, circuit RR153 (GY/BU), harness side; and
  - bolt 4 C3331-1, circuit CR154 (VT/OG), harness side and C3331-2, circuit RR154 (VT/WH), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to B5.

  NO : REPAIR circuits CR140 (YE/GN) and RR140 (GN/OG), CR141 (BN/YE) and RR141 (VT/BN), CR153 (GN/WH) and RR153 (GY/BU) or CR154 (VT/OG) and RR154 (VT/WH). Go to B9.

B5 CHECK THE OCS WEIGHT SENSOR BOLT CIRCUITS FOR AN OPEN

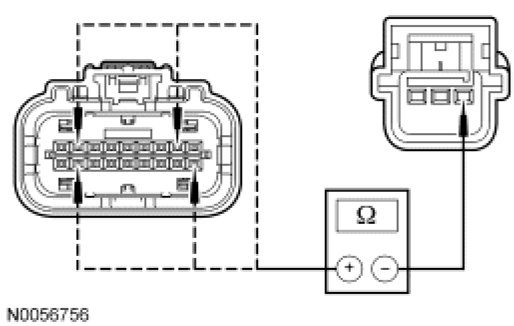

Fig. 4: Measuring Resistance Between OCS Weight Sensor Bolt 1 C3324-1 & Bolt 2 C3325-1, CR140 (YE/GN) & CR141 (BN/YE)
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor:

- bolt 1 C3324-1, circuit CR140 (YE/GN), harness side and OCSM C3159-2, circuit CR140 (YE/GN), harness side; and
- bolt 2 C3325-1, circuit CR141 (BN/YE), harness side and OCSM C3159-10, circuit CR141 (BN/YE), harness side; and
- bolt 3 C3330-1, circuit CR153 (GN/WH), harness side and OCSM C3159-8, circuit CR153 (GN/WH), harness side; and
- bolt 4 C3331-1, circuit CR154 (VT/OG), harness side and OCSM C3159-17, circuit CR154 (VT/OG), harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to B6.

  NO : REPAIR circuit CR140 (YE/GN), circuit CR141 (BN/YE), circuit CR153 (GN/WH) or circuit CR154 (VT/OG). Go to B9.

B6 CHECK CIRCUITS CR140 (YE/GN), CR141 (BN/YE), CR153 (GN/WH) AND CR154 (VT/OG) FOR A SHORT TO VOLTAGE

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

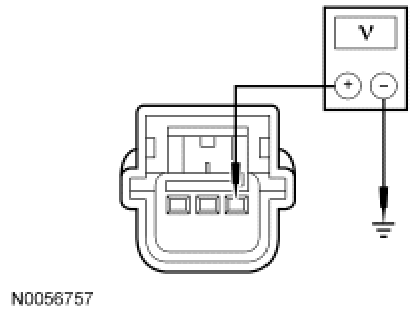

Fig. 5: Measuring Voltage Between OCS Weight Sensor Bolt 1 C3324-1 & Bolt 2 C3325-1, CR140 (YE/GN) & CR141 (BN/YE)
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor:
  - bolt 1 C3324-1, circuit CR140 (YE/GN), harness side and ground; and
  - bolt 2 C3325-1, circuit CR141 (BN/YE), harness side and ground; and
  - bolt 3 C3330-1, circuit CR153 (GN/WH), harness side and ground; and
  - bolt 4 C3331-1, circuit CR154 (VT/OG), harness side and ground.
- **Are the voltages less than 0.2 volt?**

  YES : Go to B7.

  NO : REPAIR circuit CR140 (YE/GN), circuit CR141 (BN/YE), circuit CR153 (GN/WH) or circuit CR154 (VT/OG). Go to B9.

B7 CONFIRM THE OCS MODULE FAULT

NOTE: **Make sure all restraint system sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: OCSM C3159
- Connect: OCS Weight Sensor Bolt Electrical Connectors
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B1342 Fault PIDs
  - Refer to PID list in Normal Operation to view B1342 fault PIDs.
- **Do any OCSM on-demand B1342 fault PIDs indicate a fault?**

  YES : INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM) - Manual Seat Track** or **Occupant Classification System Module (OCSM) - Power Seat Track**. Go to B9.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to B8.

B8 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Carry out a thorough visual inspection of the OCS system wiring, terminals and connectors and the related seat wiring harness and body wiring harness terminals and connectors.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B1342 Fault PIDs
  - Refer to PID list in Normal Operation to view B1342 fault PIDs.
- **Does the original OCSM on-demand DTC B1342 fault PID indicate a fault?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to B2.

  NO : CHECK for causes of intermittent open or short to ground on circuit CR140 (YE/GN), circuit CR141 (BN/YE), circuit CR153 (GN/WH) or circuit CR154 (VT/OG). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS**

components should only be installed when directed to do so in the pinpoint test. REPAIR any intermittent wiring, terminal or connector concerns found. Go to B9.

B9 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

> WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
    - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test C: DTC B1868 - Lamp Air Bag Warning Indicator Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

During normal operation, the air bag warning indicator will illuminate continuously for approximately 6 seconds and then go out after the ignition switch is placed in the ON position and no air bag fault exists. Control of the air bag warning indicator is a function of the instrument cluster (IC) module based on information it receives from the restraints control module (RCM) over the high-speed controller area network (HS-CAN). The default mode for the air bag warning indicator is on. The RCM sends a message to the IC module to turn the indicator off if no air bag fault exists. If the RCM detects a problem with the supplemental restraints system (SRS) it will send a message to the IC module to turn the air bag warning indicator on.

If the IC module detects a problem with the air bag warning indicator, it will send a fault message to the RCM and the RCM will store DTC B1868 in memory.

- DTC B1868 Lamp Air Bag Warning Indicator Circuit Failure - If the RCM receives a message from the IC module of an air bag warning indicator failure, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- IC module

- RCM

PINPOINT TEST C: DTC B1868 - LAMP AIR BAG WARNING INDICATOR CIRCUIT FAILURE

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

C1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was on-demand DTC B1868 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to C2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. CHECK the IC module for

DTCs and REPAIR as needed. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article. Go to C4.

C2 CHECK FOR IC MODULE ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - IC Module - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Were any continuous memory or on-demand self test DTCs retrieved?**

  YES : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article to diagnosis IC module concerns. Go to C4.

  NO : If the IC module **does** communicate with the scan tool, go to C3.

  If the IC module **does not** communicate with the scan tool, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN concern. Go to C4.

C3 CHECK THE IC MODULE

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - IC Module - Active Command - All_Lamp
- **Does the air bag warning indicator turn on and off when using the active command?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to C4.

  NO : INSTALL a new IC module. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article. Go to C4.

C4 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

  WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test D: DTC B1884 - PAD Warning Lamp Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and

connector information.

Normal Operation

When the ignition is in the ON position, the passenger air bag deactivation (PAD) indicator prove-out period is initiated by the restraints control module (RCM). The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

If the RCM detects an open or short to ground on the PAD indicator circuit, it will store DTC B1884 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B1884 PAD Warning Lamp Circuit Failure - If the RCM detects an open circuit or short to ground on the PAD indicator circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAD indicator
- RCM

PINPOINT TEST D: DTC B1884 - PAD WARNING LAMP CIRCUIT FAILURE

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough**

inspection and verification before proceeding with the pinpoint test.

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

D1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was on-demand DTC B1884 retrieved?**

  YES : If the PAD indicator **does** illuminate, go to D2.

  If the PAD indicator **does not** illuminate, go to D4.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to D8.

D2 CHECK CIRCUIT CR116 (GN/WH) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: PAD Indicator C2355

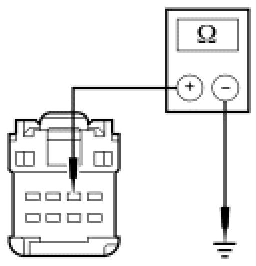

Fig. 6: Measuring Resistance Between PAD Indicator C2355-2, Circuit CR116 (GN/WH) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between PAD indicator C2355-2, circuit CR116 (GN/WH), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to D7.

  NO : Go to D3.

D3 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

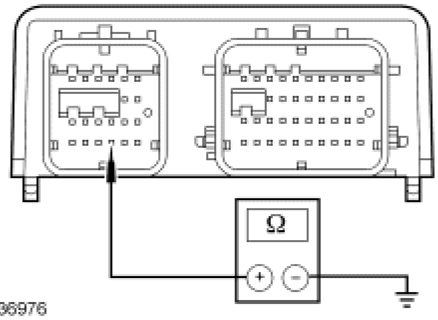

Fig. 7: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 19, component side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuit CR116 (GN/WH). Go to D9.

  NO : Go to D7.

D4 CHECK CIRCUIT CR116 (GN/WH) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect: PAD Indicator C2355

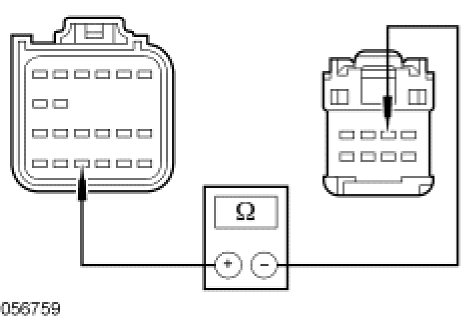

Fig. 8: Measuring Resistance Between PAD Indicator C2355-2, Circuit CR116 (GN/WH) & RCM C310A-19
Courtesy of FORD MOTOR CO.

- Measure the resistance between PAD indicator C2355-2, circuit CR116 (GN/WH), harness side and RCM C310a-19, circuit CR116 (GN/WH), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to D5.

NO : REPAIR circuit CR116 (GN/WH). Go to D9.

D5 CHECK CIRCUIT CBP46 (WH/BU) FOR AN OPEN

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

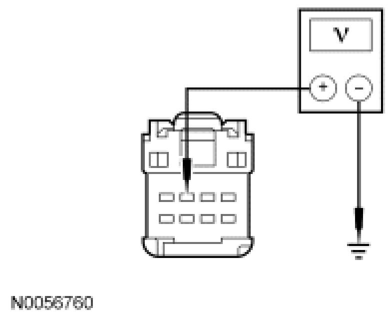

Fig. 9: Measuring Voltage Between PAD Indicator C2355-3, Circuit CBP46 (WH/BU) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between PAD indicator C2355-3, circuit CBP46 (WH/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to D6.

  NO : REPAIR circuit CBP46 (WH/BU). Go to D9.

D6 CHECK THE PAD INDICATOR LAMP

- Key in OFF position.
- Deactivate the SRS. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.
- Connect: PAD Indicator C2355
- Key in ON position.

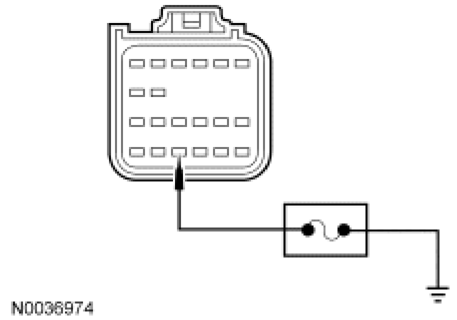

Fig. 10: Checking PAD Indicator Lamp
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between RCM C310a-19, circuit CR116 (GN/WH), harness side and ground.
- **Does the PAD indicator illuminate?**

  YES : Go to D7.

  NO : INSTALL a new PAD indicator. REFER to **Passenger Air Bag Deactivation (PAD) Indicator**. Go to D9.

D7 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: PAD Indicator C2355 (if previously disconnected)
- Connect: RCM C310a and C310b (if previously disconnected)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was on-demand DTC B1884 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to D9.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to D8.

D8 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was on-demand DTC B1884 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to D2.

  NO : CHECK for causes of intermittent open or short to ground on circuit CR116 (GN/WH). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to D9.

D9 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
  - If previously directed to deactivate the SRS, reactivate the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test E: DTC B1890 - PAD Warning Lamp Circuit Short to Battery

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

When the ignition is in the ON position, the passenger air bag deactivation (PAD) indicator prove-out period is initiated by the restraints control module (RCM). The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

If the RCM detects a short to battery on the PAD indicator circuit, it will store DTC B1890 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B1890 PAD Warning Lamp Circuit Short to Battery - If the RCM detects a short to battery on the PAD indicator circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAD indicator
- RCM

PINPOINT TEST E: DTC B1890 - PAD WARNING LAMP CIRCUIT SHORT TO BATTERY

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

E1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was on-demand DTC B1890 retrieved?**

  YES : Go to E2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to E4.

E2 CHECK CIRCUIT CR116 (GN/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and**

Repowering.

- Disconnect: PAD Indicator C2355
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

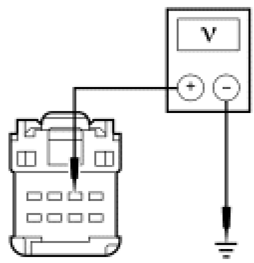

Fig. 11: Measuring Voltage Between PAD Indicator C2355-2, Circuit CR116 (GN/WH) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between PAD indicator C2355-2, circuit CR116 (GN/WH), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to E3.

  NO : REPAIR circuit CR116 (GN/WH). Go to E5.

E3 CHECK THE RCM

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs

NOTE: **DTC B1884 should be retrieved when carrying out the on-demand self**

test due to an open on circuit CR116 (GN/WH). DTC B1890 should not be retrieved at this time.

- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the PAD indicator disconnected, a circuit failure fault would normally be retrieved.
- **Did the PAD warning lamp on-demand DTC change from indicating B1890 to B1884?**

  YES : INSTALL a new PAD indicator. Go to E5.

  NO : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to E5.

E4 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was on-demand DTC B1890 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to E2.

  NO : CHECK for causes of intermittent short to battery on circuit CR116 (GN/WH). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to E5.

E5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test F: DTC B2290 - Occupant Classification System Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

NOTE: **DTC B2290 reported by the restraint control module (RCM) is informational only and indicates the presence of a fault in the occupant classification system module (OCSM). Refer to DTC Charts when DTC B2290 is reported by the RCM for diagnostic instructions.**

NOTE: **The following pinpoint test must only be used to diagnose DTC B2290 when reported by the OCSM.**

Normal Operation

The occupant classification sensor (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The OCSM monitors the 4 OCS weight sensor bolts and circuity for faults. If the OCSM detects a fault with the sensor(s) or circuitry, it will store DTC B2290 in memory and send a message to the RCM. The RCM will store DTC B2290 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

Fault PIDs[a]	Description	Fault Trigger Condition
2290_0_OD and 2290_0_CM	Passenger Seat OCS Sensor No. 4 Circuit Short to Battery	When the OCSM senses a short to voltage on the OCS weight sensor bolt No. 4 circuits, a fault will be indicated.
2290_1_OD and 2290_1_CM	Passenger Seat OCS Sensor No. 4 Circuit Short to Ground	When the OCSM senses a short to ground on the OCS weight sensor bolt No. 4 circuits, a fault will be indicated.
2290_2_OD and 2290_2_CM	Passenger Seat OCS Sensor No. 4 Comm. Fault/Open	When the OCSM senses a communication fault or open circuits on the OCS weight sensor bolt No. 4, a fault will be indicated.
2290_3_OD and 2290_3_CM	Passenger Seat OCS Sensor No. 4 Internal Fault	When the OCSM senses a internal fault with the OCS weight sensor bolt No. 4, a fault will be indicated.
2290_4_OD and 2290_4_CM	Passenger Seat OCS Sensor No. 3 Circuit Short to Battery	When the OCSM senses a short to voltage on the OCS weight sensor bolt No. 3 circuits, a fault will be indicated.
2290_5_OD and 2290_5_CM	Passenger Seat OCS Sensor No. 3 Circuit Short to Ground	When the OCSM senses a short to ground on the OCS weight sensor bolt No. 3 circuits, a fault will be indicated.
	Passenger Seat OCS Sensor	When the OCSM senses a communication fault or open circuits

2290_6_OD and 2290_6_CM	No. 3 Comm. Fault/Open	on the OCS weight sensor bolt No. 3, a fault will be indicated.
2290_7_OD and 2290_7_CM	Passenger Seat OCS Sensor No. 3 Internal Fault	When the OCSM senses a internal fault with the OCS weight sensor bolt No. 3, a fault will be indicated.
2290_8_OD and 2290_8_CM	Passenger Seat OCS Sensor No.2 Circuit Short to Battery	When the OCSM senses a short to voltage on the OCS weight sensor bolt No. 2 circuits, a fault will be indicated.
2290_9_OD and 2290_9_CM	Passenger Seat OCS Sensor No.2 Circuit Short to Ground	When the OCSM senses a short to ground on the OCS weight sensor bolt No. 2 circuits, a fault will be indicated.
2290_10_OD and 2290_10_CM	Passenger Seat OCS Sensor No.2 Comm. Fault/Open	When the OCSM senses a communication fault or open circuits on the OCS weight sensor bolt No. 2, a fault will be indicated.
2290_11_OD and 2290_11_CM	Passenger Seat OCS Sensor No.2 Internal Fault	When the OCSM senses a internal fault with the OCS weight sensor bolt No. 2, a fault will be indicated.
2290_12_OD and 2290_12_CM	Passenger Seat OCS Sensor No.1 Circuit Short to Battery	When the OCSM senses a short to voltage on the OCS weight sensor bolt No. 1 circuits, a fault will be indicated.
2290_13_OD and 2290_13_CM	Passenger Seat OCS Sensor No.1 Circuit Short to Ground	When the OCSM senses a short to ground on the OCS weight sensor bolt No. 1 circuits, a fault will be indicated.
2290_14_OD and 2290_14_CM	Passenger Seat OCS Sensor No.1 Comm. Fault/Open	When the OCSM senses a communication fault or open circuits on the OCS weight sensor bolt No. 1 circuits, a fault will be indicated.
2290_15_OD and 2290_15_CM	Passenger Seat OCS Sensor No.1 Internal Fault	When the OCSM senses a internal fault with the OCS weight sensor bolt No. 1 circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2290. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2290.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- OCS system component

PINPOINT TEST F: DTC B2290 - OCCUPANT CLASSIFICATION SYSTEM FAULT

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

F1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
  - Refer to PID list in Normal Operation to view B2290 fault PIDs.
- **Do any OCSM on-demand DTC B2290 fault PIDs indicate a fault?**

YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to F2.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to F36.

F2 CHECK THE SEAT WIRING AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Carry out a thorough visual inspection of the OCS system wiring, terminals and connectors and the related seat wiring harness and body wiring harness terminals and connectors.
- **Were any problems noted?**

  YES : REPAIR the seat connectors and wiring as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to F37.

  NO : Using the fault PIDs recorded in step F1, go to the appropriate pinpoint test step.

  For 2290_3_OD (Passenger Seat OCS Sensor No. 4 Internal Fault), 2290_7_OD (Passenger Seat OCS Sensor No. 3 Internal Fault), 2290_11_OD (Passenger Seat OCS Sensor No.2 Internal Fault) or 2290_15_OD (Passenger Seat OCS Sensor No.1 Internal Fault), INSTALL a new OCS weight sensor bolt. REFER to **Occupant Classification Sensor - Manual Seat Track** or **Occupant Classification Sensor - Power Seat Track**.

  For 2290_14_OD (Passenger Seat OCS Sensor No.1 Comm. Fault/Open), go to F3.

  For 2290_13_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Ground), go to F7.

  For 2290_12_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Battery), go to F9.

  For 2290_10_OD (Passenger Seat OCS Sensor No.2 Comm. Fault/Open), go to F11.

  For 2290_9_OD (Passenger Seat OCS Sensor No.2 Circuit Short to Ground), go to F15.

  For 2290_8_OD (Passenger Seat OCS Sensor No.2 Circuit Short to Battery), go to F17.

  For 2290_6_OD (Passenger Seat OCS Sensor No. 3 Comm. Fault/Open), go to F19.

  For 2290_5_OD (Passenger Seat OCS Sensor No. 3 Circuit Short to Ground), go to F23.

  For 2290_4_OD (Passenger Seat OCS Sensor No. 3 Circuit Short to Battery), go to F25.

  For 2290_2_OD (Passenger Seat OCS Sensor No. 4 Comm. Fault/Open), go to F27.

  For 2290_1_OD (Passenger Seat OCS Sensor No. 4 Circuit Short to Ground), go to F31.

For 2290_0_OD (Passenger Seat OCS Sensor No. 4 Circuit Short to Battery), go to F33.

F3 CHECK CIRCUITS CR140 (YE/GN), VR211 (WH/BN) AND RR140 (GN/OG) FOR AN OPEN

- Disconnect: OCSM C3159
- Disconnect: OCS Weight Sensor Bolt 1 C3324

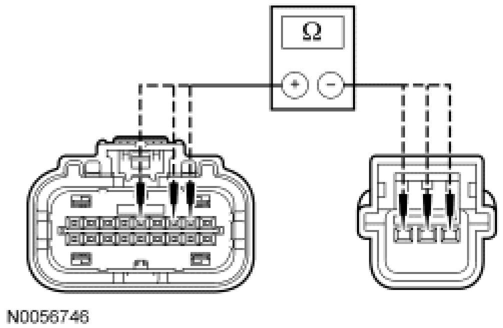

Fig. 12: Measuring Resistance Between OCSM C3159-5, Circuit VR211 (WH/BN) & OCS Weight Sensor Bolt 1 C3324-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-5, circuit VR211 (WH/BN), harness side and OCS weight sensor bolt 1 C3324-3, circuit VR211 (WH/BN), harness side; between OCSM C3159-2, circuit CR140 (YE/GN), harness side and OCS weight sensor bolt 1 C3324-1, circuit CR140 (YE/GN), harness side; and between OCSM C3159-5, circuit RR140 (GN/OG), harness side and OCS weight sensor bolt 1 C3324-2, circuit RR140 (GN/OG), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to F4.

  NO : REPAIR circuit CR140 (YE/GN), circuit VR211 (WH/BN) or circuit RR140 (GN/OG). Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to F37.

F4 CHECK FOR A SHORT BETWEEN CIRCUITS CR140 (YE/GN), VR211 (WH/BN) AND RR140 (GN/OG)

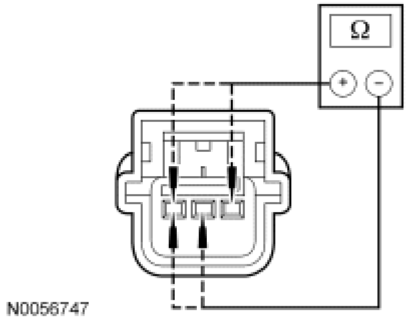

Fig. 13: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 1:
  - C3324-1, circuit CR140 (YE/GN), harness side and C3324-3, circuit VR211 (WH/BN), harness side.
  - C3324-1, circuit CR140 (YE/GN), harness side and C3324-2, circuit RR140 (GN/OG), harness side.
  - C3324-3, circuit VR211 (WH/BN), harness side and C3324-2, circuit RR140 (GN/OG), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F5.

  NO : REPAIR the affected circuits, circuits CR140 (YE/GN), VR211 (WH/BN) and/or RR140 (GN/OG). Go to F37.

F5 CHECK CIRCUIT VR211 (WH/BN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

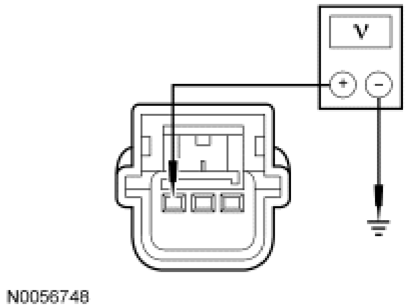

Fig. 14: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 1 C3324-3, circuit VR211 (WH/BN), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to F6.

  NO : REPAIR circuit VR211 (WH/BN). Go to F37.

F6 CHECK CIRCUIT VR211 (WH/BN) FOR A SHORT TO GROUND

- Key in OFF position.

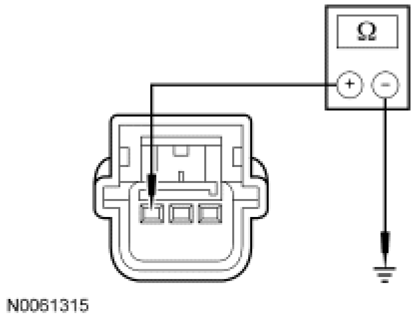

Fig. 15: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 1 C3324-3, circuit VR211 (WH/BN), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : INSTALL a new OCS weight sensor bolt 1. REFER to **Occupant Classification Sensor - Manual Seat Track** or **Occupant Classification Sensor - Power Seat Track**. Go to F37.

  NO : REPAIR circuit VR211 (WH/BN). Go to F37.

F7 CHECK CIRCUIT VR211 (WH/BN) FOR A SHORT TO GROUND AND A SHORT TO CIRCUIT RR140 (GN/OG)

- Disconnect: OCS Weight Sensor Bolt 1 C3324
- Disconnect: OCSM C3159

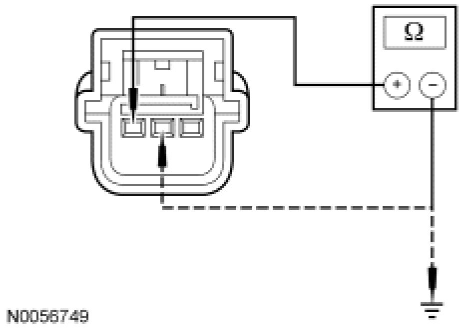

Fig. 16: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 1 C3324-3, circuit VR211 (WH/BN), harness side and ground; and between OCS weight sensor bolt 1 C3324-3, circuit VR211 (WH/BN), harness side and C3324-2, circuit RR140 (GN/OG), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F8.

  NO : REPAIR circuit VR211 (WH/BN) and/or circuit RR140 (GN/OG). Go to F37.

F8 CHECK CIRCUIT CR140 (YE/GN) FOR AN OPEN

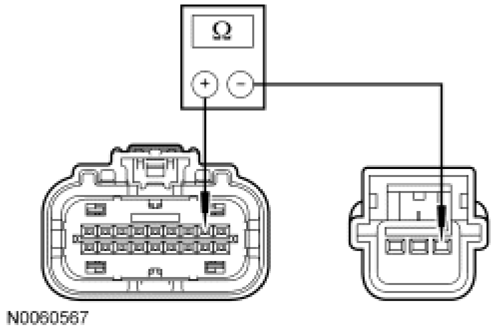

Fig. 17: Measuring Resistance Between OCS Weight Sensor Bolt 1 C3324-1, Circuit CR140 (YE/GN) & OCSM C3159-2
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 1 C3324-1, circuit CR140 (YE/GN), harness side and OCSM C3159-2, circuit CR140 (YE/GN), harness side.
- **Is the resistances less than 5 ohms?**

  YES : Go to F35.

  NO : REPAIR circuit CR140 (YE/GN). Go to F37.

F9 CHECK CIRCUIT RR140 (GN/OG) FOR AN OPEN

- Disconnect: OCS Weight Sensor Bolt 1 C3324

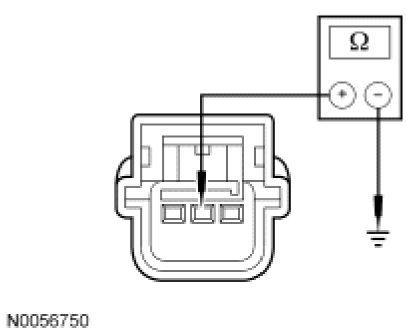

Fig. 18: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 1 C3324-2, circuit RR140 (GN/OG), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F10.

  NO : REPAIR circuit RR140 (GN/OG). Go to F37.

F10 CHECK CIRCUIT VR211 (WH/BN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Disconnect: OCSM C3159
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint**

System (SRS) Depowering and Repowering.

- Key in ON position.

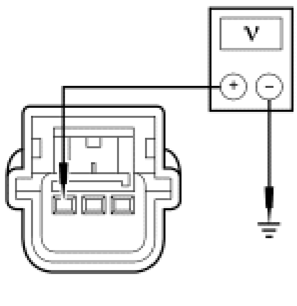

Fig. 19: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 1 C3324-3, circuit VR211 (WH/BN), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to F35.

  NO : REPAIR circuit VR211 (WH/BN). Go to F37.

F11 CHECK CIRCUITS CR141 (BN/YE), VR212 (YE/GN) AND RR141 (VT/BN) FOR AN OPEN

- Disconnect: OCSM C3159
- Disconnect: OCS Weight Sensor Bolt 2 C3325

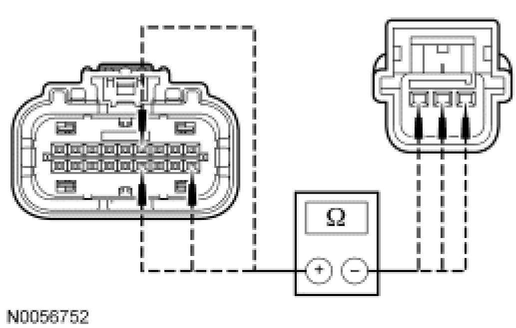

Fig. 20: Measuring Resistance Between OCSM C3159-4, Circuit VR212 (YE/GN) & OCS Sensor 2 C3325-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-4, circuit VR212 (YE/GN), harness side and OCS sensor 2 C3325-3, circuit VR212 (YE/GN), harness side; between OCSM C3159-10, circuit CR141 (BN/YE), harness side and OCS sensor 2 C3325-1, circuit CR141 (BN/YE), harness side; and between OCSM C3159-13, circuit RR141 (VT/BN), harness side and OCS sensor 2 C3325-2, circuit RR141 (VT/BN), harness side.
- **Are the resistances less than 0.5 ohm?**

YES : Go to F12.

NO : REPAIR circuit CR141 (BN/YE), circuit VR212 (YE/GN) or circuit RR141 (VT/BN). Go to F37.

F12 CHECK FOR A SHORT BETWEEN CIRCUITS CR141 (BN/YE), VR212 (YE/GN) AND RR141 (VT/BN)

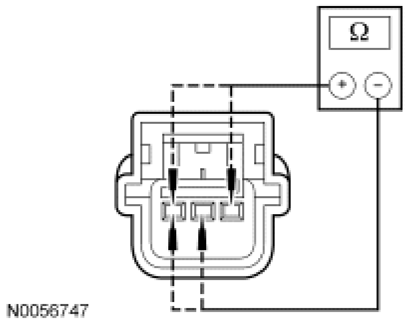

Fig. 21: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 2:
    - C3325-1, circuit CR141 (BN/YE), harness side and C3325-3, circuit VR212 (YE/GN), harness side.
    - C3325-1, circuit CR141 (BN/YE), harness side and C3325-2, circuit RR141 (VT/BN), harness side.
    - C3325-3, circuit VR212 (YE/GN), harness side and C3325-2, circuit RR141 (VT/BN), harness side.
- **Are the resistances greater than 10,0000 ohms?**

  YES : Go to F13.

  NO : REPAIR the affected circuits, circuits CR141 (BN/YE), VR212 (YE/GN) and/or RR141 (VT/BN). Go to F37.

F13 CHECK CIRCUIT VR212 (YE/GN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

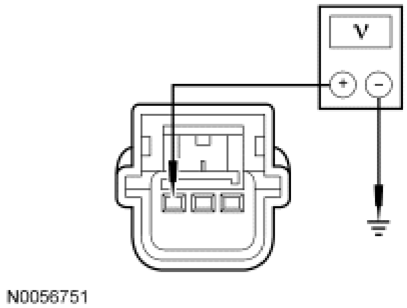

Fig. 22: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 2 C3325-3, circuit VR212 (YE/GN), harness side and ground.
- **Is the voltage less than 0.2 volt?**

YES : Go to F14.

NO : REPAIR circuit VR212 (YE/GN). Go to F37.

F14 CHECK CIRCUIT VR212 (YE/GN) FOR A SHORT TO GROUND

- Key in OFF position.

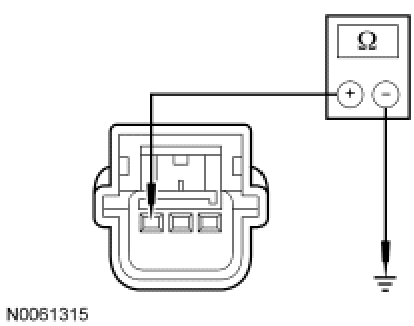

Fig. 23: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 2 C3325-3, circuit VR212 (YE/GN), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

YES : INSTALL a new OCS weight sensor bolt 2. REFER to **Occupant Classification Sensor - Manual Seat Track** or **Occupant Classification Sensor - Power Seat Track**. Go to F37.

NO : REPAIR circuit VR212 (YE/GN). Go to F37.

F15 CHECK CIRCUIT VR212 (YE/GN) FOR A SHORT TO GROUND AND A SHORT TO CIRCUIT RR141 (VT/BN)

- Disconnect: OCS Weight Sensor Bolt 2 C3325
- Disconnect: OCSM C3159

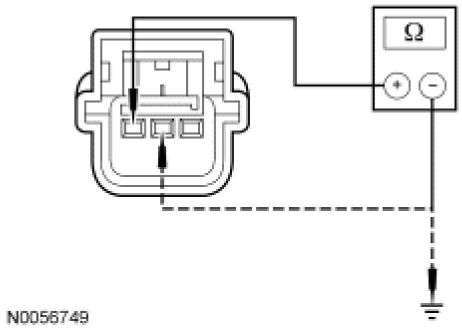

Fig. 24: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 2 C3325-3, circuit VR212 (YE/GN), harness side and ground; and between OCS weight sensor bolt 2 C3325-3, circuit VR212 (YE/GN), harness side and C3325-2, circuit RR141 (VT/BN), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F16.

  NO : REPAIR circuits VR212 (YE/GN) and RR141 (VT/BN). Go to F37.

F16 CHECK CIRCUIT CR141 (BN/YE) FOR AN OPEN

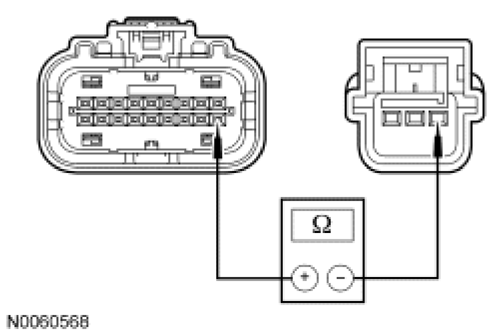

Fig. 25: Measuring Resistance Between OCS Weight Sensor Bolt 2 C3325-1, Circuit CR141 (BN/YE) & OCSM C3159-10
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 2 C3325-1, circuit CR141 (BN/YE), and OCSM C3159-10, circuit CR141 (BN/YE), harness side.
- **Is the resistances less than 5 ohms?**

  YES : Go to F35.

  NO : REPAIR circuit CR141 (BN/YE). Go to F37.

F17 CHECK CIRCUIT RR141 (VT/BN) FOR AN OPEN

- Disconnect: OCS Weight Sensor Bolt 2 C3325

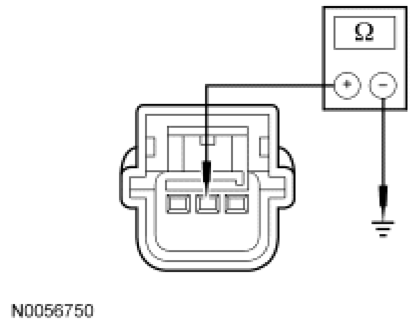

Fig. 26: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 2 C3325-2, circuit RR141 (VT/BN), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F18.

  NO : REPAIR circuit RR141 (VT/BN). Go to F37.

F18 CHECK CIRCUIT VR212 (YE/GN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Disconnect: OCSM C3159
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

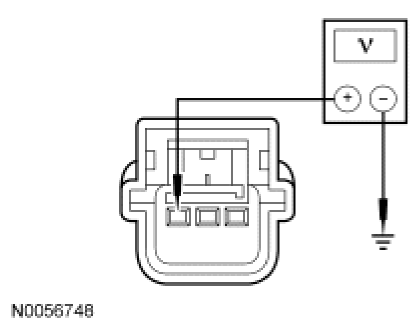

Fig. 27: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 2 C3325-3, circuit VR212 (YE/GN), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to F35.

  NO : REPAIR circuit VR212 (YE/GN). Go to F37.

F19 CHECK CIRCUITS CR153 (GN/WH), VR226 (YE/GY) AND RR153 (GY/BU) FOR AN

OPEN

- Disconnect: OCSM C3159
- Disconnect: OCS Weight Sensor Bolt 3 C3330

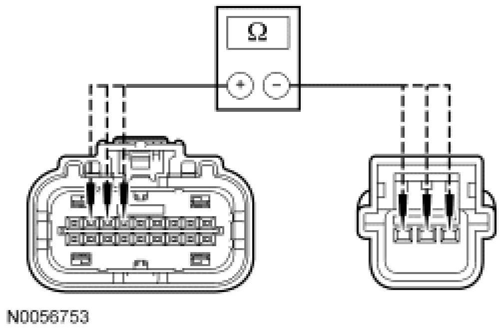

Fig. 28: Measuring Resistance Between OCSM C3159-7, Circuit VR226 (YE/GY) & OCS Weight Sensor Bolt 3 C3330-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-7, circuit VR226 (YE/GY), harness side and OCS weight sensor bolt 3 C3330-3, circuit VR226 (YE/GY), harness side; between OCSM C3159-8, circuit CR153 (GN/WH), harness side and OCS sensor 3 C3330-1, circuit CR153 (GN/WH), harness side; and between OCSM C3159-6, circuit RR153 (GY/BU), harness side and OCS sensor 3 C3330-2, circuit RR153 (GY/BU), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to F20.

  NO : REPAIR circuits CR153 (GN/WH), VR226 (YE/GY) or RR153 (GY/BU). Go to F37.

F20 CHECK FOR A SHORT BETWEEN CIRCUITS CR153 (GN/WH), VR226 (YE/GY) AND RR153 (GY/BU)

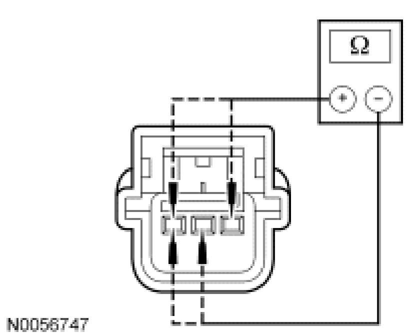

Fig. 29: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 3:
  - C3330-1, circuit CR153 (GN/WH), harness side and C3330-3, circuit VR226 (YE/GY), harness side.

  - C3330-1, circuit CR153 (GN/WH), harness side and C3330-2, circuit RR153 (GY/BU), harness side.
  - C3330-3, circuit VR226 (YE/GY), harness side and C3330-2, circuit RR153 (GY/BU), harness side.
- **Are the resistances greater than 10,0000 ohms?**

  YES : Go to F21.

  NO : REPAIR the affected circuits, circuits CR153 (GN/WH), VR226 (YE/GY) and/or RR153 (GY/BU). Go to F37.

F21 CHECK CIRCUIT VR226 (YE/GY) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

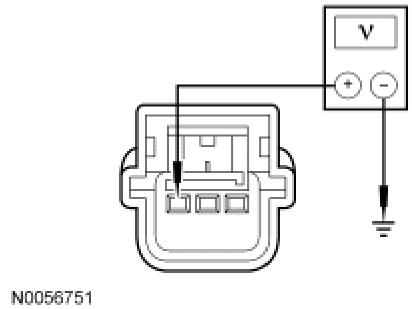

Fig. 30: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 3 C3330-3, circuit VR226 (YE/GY), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to F22.

  NO : REPAIR circuit VR226 (YE/GY). Go to F37.

F22 CHECK CIRCUIT VR226 (YE/GY) FOR A SHORT TO GROUND

- Key in OFF position.

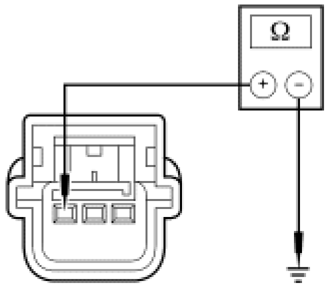

Fig. 31: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 3 C3330-3, circuit VR226 (YE/GY), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : INSTALL a new OCS weight sensor bolt 3. REFER to **Occupant Classification Sensor - Manual Seat Track** or **Occupant Classification Sensor - Power Seat Track**. Go to F37.

  NO : REPAIR circuit VR226 (YE/GY). Go to F37.

F23 CHECK CIRCUIT VR226 (YE/GY) FOR A SHORT TO GROUND AND A SHORT TO CIRCUIT RR153 (GY/BU)

- Disconnect: OCS Weight Sensor Bolt 3 C3330
- Disconnect: OCSM C3159

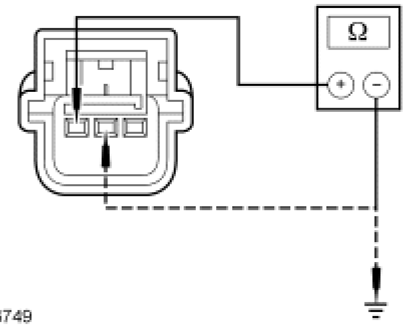

Fig. 32: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 3 C3330-3, circuit VR226 (YE/GY), harness side and ground; and between OCS weight sensor bolt 3 C3330-3, circuit VR226 (YE/GY), harness side and C3291-2, circuit RR153 (GY/BU), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F24.

  NO : REPAIR circuits VR226 (YE/GY) and/or RR153 (GY/BU). Go to F37.

F24 CHECK CIRCUIT CR153 (GN/WH) FOR AN OPEN

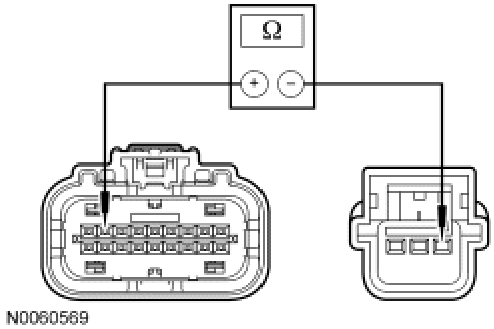

Fig. 33: Measuring Resistance Between OCS Weight Sensor Bolt 3 C3330-1, Circuit CR153 (GN/WH) & OCSM C3159-8
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 3 C3330-1, circuit CR153 (GN/WH), harness side and OCSM C3159-8, circuit CR153 (GN/WH), harness side.
- **Is the resistances less than 5 ohms?**

  YES : Go to F35.

  NO : REPAIR circuit CR153 (GN/WH). Go to F37.

F25 CHECK CIRCUIT RR153 (GY/BU) FOR AN OPEN

- Disconnect: OCS Weight Sensor Bolt 3 C3330

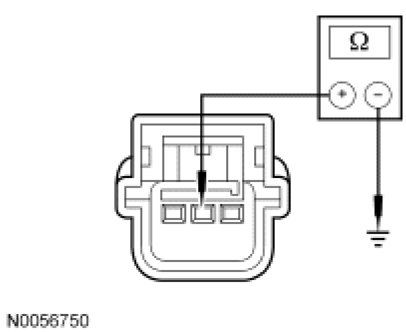

Fig. 34: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 3 C3330-2, circuit RR153 (GY/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F26.

  NO : REPAIR circuit RR153 (GY/BU). Go to F37.

F26 CHECK CIRCUIT VR226 (YE/GY) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Disconnect: OCSM C3159
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint**

System (SRS) Depowering and Repowering.

- Key in ON position.

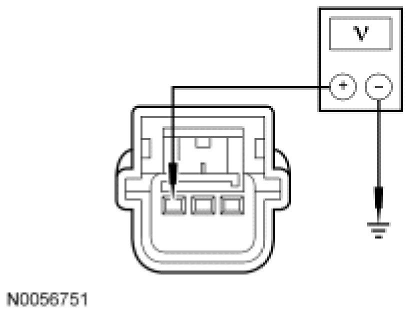

Fig. 35: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 3 C3330-3, circuit VR226 (YE/GY), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to F35.

  NO : REPAIR circuit VR226 (YE/GY). Go to F37.

F27 CHECK CIRCUITS CR154 (VT/OG), VR227 (VT/GN) AND RR154 (VT/WH) FOR AN OPEN

- Disconnect: OCSM C3159
- Disconnect: OCS Weight Sensor Bolt 4 C3331

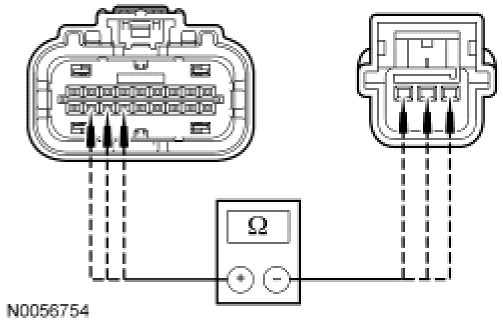

Fig. 36: Measuring Resistance Between OCSM C3159-16, Circuit VR227 (VT/GN) & OCS Weight Sensor Bolt 4 C3331-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-16, circuit VR227 (VT/GN), harness side and OCS weight sensor bolt 4 C3331-3, circuit VR227 (VT/GN), harness side; between OCSM C3159-17, circuit CR154 (VT/OG), harness side and OCS sensor 4 C3331-1, circuit CR154 (VT/OG), harness side; and between OCSM C3159-15, circuit RR154 (VT/WH), harness side and OCS sensor 4 C3331-2, circuit RR154 (VT/WH), harness side.

- **Are the resistances less than 0.5 ohm?**

  YES : Go to F28.

  NO : REPAIR circuit CR154 (VT/OG), circuit VR227 (VT/GN) or circuit RR154 (VT/WH). Go to F37.

F28 CHECK FOR A SHORT BETWEEN CIRCUITS CR154 (VT/OG), VR227 (VT/GN) AND RR154 (VT/WH)

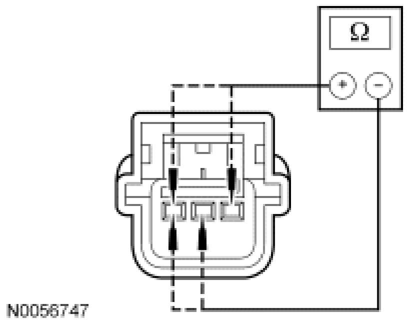

Fig. 37: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 4:
  - C3331-1, circuit CR154 (VT/OG), harness side and C3331-3, circuit VR227 (VT/GN), harness side.
  - C3331-1, circuit CR154 (VT/OG), harness side and C3331-2, circuit RR154 (VT/WH), harness side.
  - C3331-3, circuit VR227 (VT/GN), harness side and C3331-2, circuit RR154 (VT/WH), harness side.
- **Are the resistances greater than 10,0000 ohms?**

  YES : Go to F29.

  NO : REPAIR the affected circuits, circuits CR154 (VT/OG), VR227 (VT/GN) and/or RR154 (VT/WH). Go to F37.

F29 CHECK CIRCUIT VR227 (VT/GN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

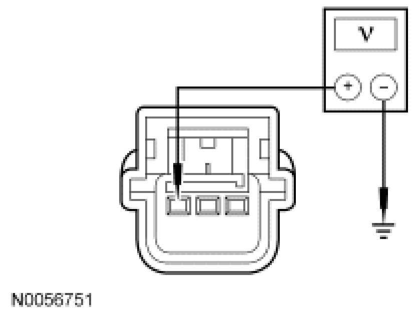

Fig. 38: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 4 C3331-3, circuit VR227 (VT/GN), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to F30.

  NO : REPAIR circuit VR227 (VT/GN). Go to F37.

F30 CHECK CIRCUIT VR227 (VT/GN) FOR A SHORT TO GROUND

- Key in OFF position.

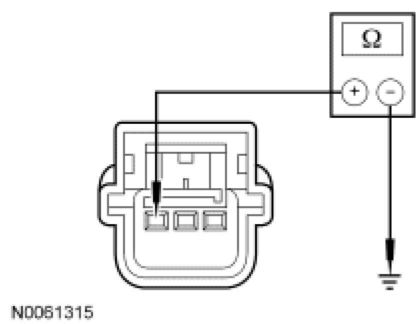

Fig. 39: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 4 C3331-3, circuit VR227 (VT/GN), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : INSTALL a new OCS weight sensor bolt 4. REFER to **Occupant Classification Sensor - Manual Seat Track** or **Occupant Classification Sensor - Power Seat Track**. Go to F37.

  NO : REPAIR circuit VR227 (VT/GN). Go to F37.

F31 CHECK CIRCUIT VR227 (VT/GN) FOR A SHORT TO GROUND AND A SHORT TO CIRCUIT RR154 (VT/WH)

- Disconnect: OCSM C3159
- Disconnect: OCS Weight Sensor Bolt 4 C3331

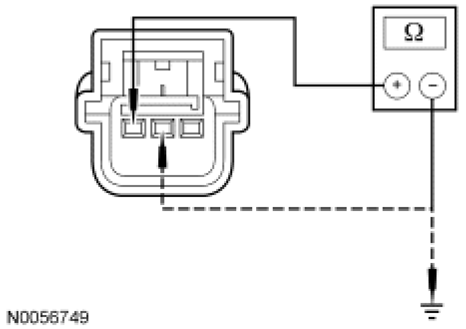

Fig. 40: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 4 C3331-3, circuit VR227 (VT/GN), harness side and ground; and between C3331-3, circuit VR227 (VT/GN), harness side and C3331-2, circuit RR154 (VT/WH), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F32.

  NO : REPAIR circuits VR227 (VT/GN) and/or RR154 (VT/WH). Go to F37.

F32 CHECK CIRCUIT CR154 (VT/OG) FOR AN OPEN

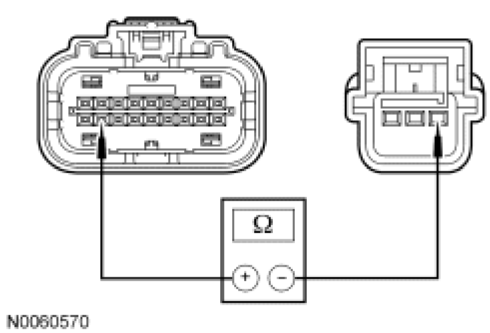

Fig. 41: Measuring Resistance Between OCS Weight Sensor Bolt 4 C3331-1, Circuit CR154 (VT/OG) & OCSM C3159-17
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 4 C3331-1, circuit CR154 (VT/OG), harness side and OCSM C3159-17, circuit CR154 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F35.

  NO : REPAIR circuit CR154 (VT/OG). Go to F37.

F33 CHECK CIRCUIT RR154 (VT/WH) FOR AN OPEN

- Disconnect: OCS Weight Sensor Bolt 4 C3331

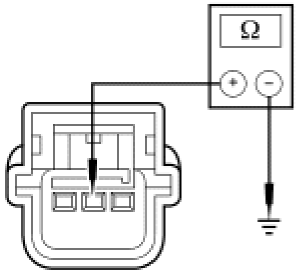

Fig. 42: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCS weight sensor bolt 4 C3331-2, circuit RR154 (VT/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F34.

  NO : REPAIR circuit RR154 (VT/WH). Go to F37.

F34 CHECK CIRCUIT VR227 (VT/GN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C327
- Disconnect: OCSM C3159
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

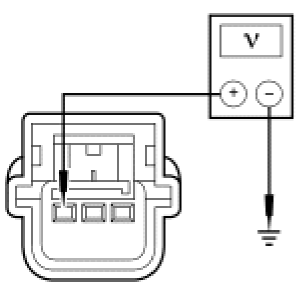

Fig. 43: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between OCS weight sensor bolt 4 C3331-3, circuit VR227 (VT/GN), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to F35.

  NO : REPAIR circuit VR227 (VT/GN). Go to F37.

F35 CONFIRM THE OCS MODULE FAULT

NOTE: **Make sure all restraint system sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: OCSM C3159 (if previously disconnected)
- Connect: Affected OCS Weight Sensor Bolt Electrical Connector(s)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
  - Refer to PID list in Normal Operation to view B2290 fault PIDs.
- **Does the original OCSM on-demand DTC B2290 fault PID indicate a fault?**

  YES : INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM) - Manual Seat Track** or **Occupant Classification System Module (OCSM) - Power Seat Track**. Go to F37.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to F36.

F36 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
  - Refer to PID list in Normal Operation to view B2290 fault PIDs.
- **Do any OCSM on-demand DTC B2290 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2290_3_OD (Passenger Seat OCS Sensor No. 4 Internal Fault), 2290_7_OD (Passenger Seat OCS Sensor No. 3 Internal Fault), 2290_11_OD (Passenger Seat OCS Sensor No.2 Internal Fault) or 2290_15_OD (Passenger Seat OCS Sensor No.1 Internal Fault), INSTALL a new OCS weight sensor bolt. REFER to **Occupant Classification Sensor - Manual Seat Track** or **Occupant Classification Sensor - Power Seat Track**.

For 2290_14_OD (Passenger Seat OCS Sensor No.1 Comm. Fault/Open), go to F3.

For 2290_13_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Ground), go to F7.

For 2290_12_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Battery), go to F9.

For 2290_10_OD (Passenger Seat OCS Sensor No.2 Comm. Fault/Open), go to F11.

For 2290_9_OD (Passenger Seat OCS Sensor No.2 Circuit Short to Ground), go to F15.

For 2290_8_OD (Passenger Seat OCS Sensor No.2 Circuit Short to Battery), go to F17.

For 2290_6_OD (Passenger Seat OCS Sensor No. 3 Comm. Fault/Open), go to F19.

For 2290_5_OD (Passenger Seat OCS Sensor No. 3 Circuit Short to Ground), go to F23.

For 2290_4_OD (Passenger Seat OCS Sensor No. 3 Circuit Short to Battery), go to F25.

For 2290_2_OD (Passenger Seat OCS Sensor No. 4 Comm. Fault/Open), go to F27.

For 2290_1_OD (Passenger Seat OCS Sensor No. 4 Circuit Short to Ground), go to F31.

For 2290_0_OD (Passenger Seat OCS Sensor No. 4 Circuit Short to Battery), go to F33.

NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to F37.

F37 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

  WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test G: DTC B2292 - Restraint System - Seatbelt Pretensioner Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) continuously monitors the safety belt retractor pretensioner circuits for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2292 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors safety belt retractor pretensioner circuits for resistance, it expects a normal resistance between 1.4 and 3.5 ohms.

If a loop resistance is between 0.9 and 1.4 or between 3.5 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

Fault PIDs[a]	Description	Fault Trigger Condition
2292_24_OD and 2292_24_CM	Pretensioner Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on either of the passenger pretensioner circuits, a fault will be indicated.
2292_25_OD and 2292_25_CM	Pretensioner Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger pretensioner circuits, a fault will be indicated.
2292_26_OD and 2292_26_CM	Pretensioner Circuit Open, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger pretensioner circuits, a fault will be indicated.
2292_27_OD and 2292_27_CM	Pretensioner Circuit Resistance Low, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger pretensioner circuits, a fault will be indicated.
2292_28_OD and 2292_28_CM	Pretensioner Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either of the driver pretensioner circuits, a fault will be indicated.

2292_29_OD and 2292_29_CM	Pretensioner Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either of the driver pretensioner circuits, a fault will be indicated.
2292_30_OD and 2292_30_CM	Pretensioner Circuit Open, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver pretensioner circuits, a fault will be indicated.
2292_31_OD and 2292_31_CM	Pretensioner Circuit Resistance Low, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver pretensioner circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2292. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2292.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Safety belt retractor pretensioner
- RCM

PINPOINT TEST G: DTC B2292 - RESTRAINT SYSTEM - SEATBELT PRETENSIONER FAULT

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt**

pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

G1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2292 Fault PIDs
  - Refer to PID list in Normal Operation to view B2292 fault PIDs.
- **Was on-demand DTC B2292 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side), go to G2.

  For 2292_30_OD (Pretensioner Circuit Open, Front Driver Side), go to G2.

  For 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side), go to G8.

  For 2292_29_OD (Pretensioner Circuit Short to Battery, Front Driver Side), go to G10.

  For 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side), go to G11.

  For 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side), go to G11.

  For 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side), go to G17.

For 2292_25_OD (Pretensioner Circuit Short to Battery, Front Passenger Side), go to G19.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side) or 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), go to G22.

For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) or 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), go to G24.

For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) or 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), go to G25.

G2 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER RESISTANCE PID (DR_PTENS)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: DR_PTENS (Pretensioner Circuit Resistance, Driver Side) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms**

  YES : Go to G21.

  NO : Go to G3.

G3 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER RESISTANCE PID (DR_PTENS) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the DR_PTENS (Pretensioner Circuit Resistance, Driver Side) resistance PID while carrying out a harness test of the driver safety belt retractor pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out a harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to G26.

  NO : If the driver safety belt retractor pretensioner resistance PID is less than 1.4 ohms, go to G4.

  If the driver safety belt retractor pretensioner resistance PID is greater than 3.5 ohms, go to G6.

G4 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER FOR LOW RESISTANCE FAULT

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
    - 2292_30_OD (Pretensioner Circuit Open, Front Driver Side)
    - 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety belt retractor pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to G20.

  NO : Go to G5.

G5 CHECK FOR A SHORT BETWEEN DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS CR120 (BU/OG) AND RR120 (BN/GN)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

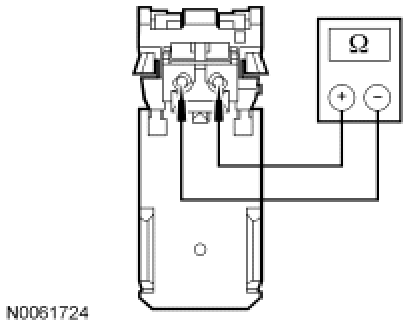

Fig. 44: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety belt retractor pretensioner C323-1, circuit CR120 (BU/OG), harness side and C323-2, circuit RR120 (GN/RD), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to G21.

  NO : REPAIR circuits CR120 (BU/OG) and RR120 (BN/GN). Go to G26.

G6 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER FOR AN OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Connect a fused jumper wire between driver safety belt retractor pretensioner C3201-1, circuit CR120 (BU/OG), harness side and C3201-2, circuit RR120 (BN/GN), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2292_30_OD (Pretensioner Circuit Open, Front Driver Side)
  - 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the driver safety belt retractor pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to G20.

  NO : Go to G7.

G7 CHECK CIRCUITS CR120 (BU/OG) AND RR120 (BN/GN) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the driver safety belt retractor pretensioner C323.
- Disconnect: RCM C310a and C310b

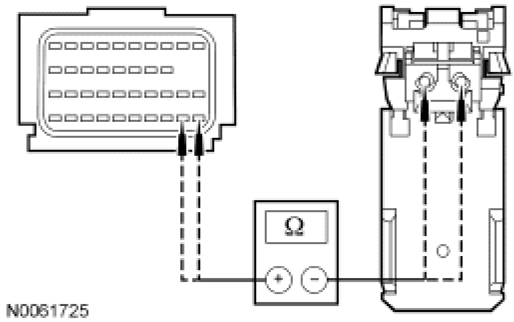

Fig. 45: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-31, circuit CR120 (BU/OG), harness side and driver safety belt retractor pretensioner C323-2, circuit CR120 (BU/OG), harness side; and between RCM C310b-32, circuit RR120 (BN/GN), harness side and driver safety belt retractor pretensioner C323-1, circuit RR120 (GN/RD), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to G21.

  NO : REPAIR circuit CR120 (BU/OG) or circuit RR120 (GN/RD). Go to G26.

G8 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER FOR A SHORT TO GROUND

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side)
  - 2292_30_OD (Pretensioner Circuit Open, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved.

- **Did the driver safety belt retractor pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to G20.

  NO : Go to G9.

G9 CHECK CIRCUITS CR120 (BU/OG) AND RR120 (GN/RD) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

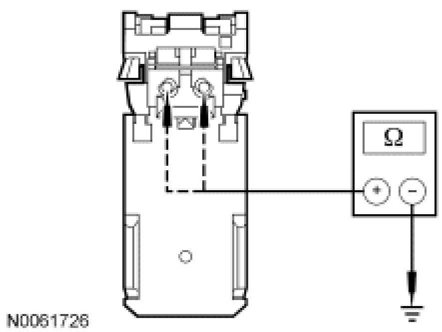

Fig. 46: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety belt retractor pretensioner C323-2, circuit CR120 (BU/OG), harness side and ground; and between driver safety belt retractor pretensioner C323-1, circuit RR120 (GN/RD), and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to G21.

  NO : REPAIR circuit CR120 (BU/OG) or circuit RR120 (GN/RD). Go to G26.

G10 CHECK CIRCUITS CR120 (BU/OG) AND RR120 (BN/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

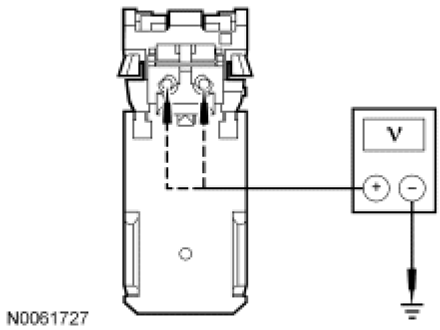

Fig. 47: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver safety belt retractor pretensioner C323-2, circuit CR120 (BU/OG), harness side and ground; and between driver safety belt retractor pretensioner C323-1, circuit RR120 (GN/RD), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to G21.

  NO : REPAIR circuit CR120 (BU/OG) or circuit RR120 (BN/GN). Go to G26.

G11 CHECK THE PASSENGER RETRACTOR PRETENSIONER RESISTANCE PID (PS_PTENS)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: PS_TENS (Pretensioner Circuit Resistance, Passenger Side) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms?**

  YES : Go to G21.

  NO : Go to G12.

G12 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER RESISTANCE PID (PS_PTENS) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the PS_TENS (Pretensioner Circuit Resistance, Passenger Side) resistance PID while carrying out a harness test of the passenger safety belt retractor pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to G26.

  NO : If the passenger safety belt retractor pretensioner resistance PID is less than 1.4 ohms, go to G13.

  If the passenger safety belt retractor pretensioner resistance PID is greater than 3.5 ohms, go to G15.

G13 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER FOR LOW RESISTANCE FAULT

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C303
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side)
  - 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety belt retractor pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to G21.

  NO : Go to G14.

G14 CHECK FOR A SHORT BETWEEN PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS RR122 (BN) AND CR122 (WH/OG)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

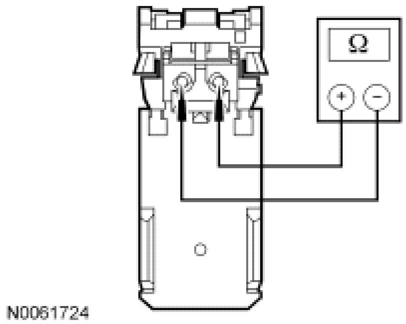

Fig. 48: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety belt pretensioner C303-2, circuit CR122 (WH/OG), harness side and C303-1, circuit RR122 (BN), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to G21.

  NO : REPAIR circuits CR122 (WH/OG) and RR122 (BN). Go to G26.

G15 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER FOR AN OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C303
- Connect a fused jumper wire between passenger safety belt retractor pretensioner C303-1, circuit CR122 (WH/OG), harness side and C303-2, circuit RR122 (BN), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side)
  - 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner circuits shorted together, a low resistance fault would normally be retrieved.

- **Did the passenger safety belt retractor pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to G20.

  NO : Go to G16.

G16 CHECK CIRCUITS CR122 (WH/OG) AND RR122 (BN) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the passenger safety belt retractor pretensioner fused jumper wire.
- Disconnect: RCM C310a and C310b

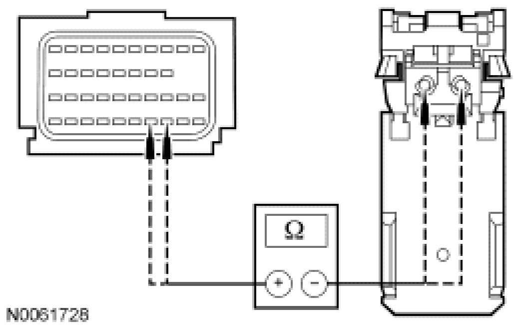

Fig. 49: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-34, circuit RR122 (BN), harness side and passenger safety belt retractor pretensioner C303-1, circuit RR122 (BU/RD), harness side; and between RCM C310b-33, circuit CR122 (WH/OG), harness side and passenger safety belt retractor pretensioner C303-2, circuit CR122 (WH/OG), harness side.
- **Is resistances less than 0.5 ohm?**

  YES : Go to G21.

  NO : REPAIR circuit RR122 (BN) or circuit CR122 (WH/OG). Go to G26.

G17 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER FOR A SHORT TO GROUND

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C303

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side)
  - 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety belt retractor pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to G20.

  NO : Go to G18.

G18 CHECK CIRCUITS CR122 (WH/OG) AND RR122 (BN) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

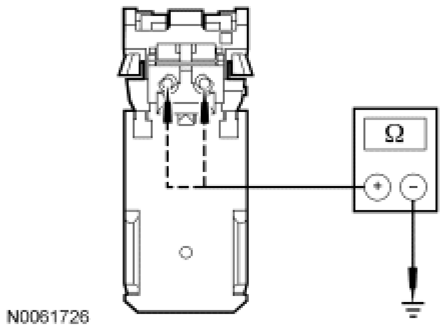

Fig. 50: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety belt retractor pretensioner C303-2, circuit CR122 (WH/OG), harness side and ground; and between passenger safety belt retractor pretensioner C303-1, circuit RR122 (BN), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to G21.

  NO : REPAIR circuit CR122 (WH/OG) or circuit RR122 (BN). Go to G26.

G19 CHECK CIRCUITS RR122 (BN) AND CR122 (WH/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C303
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

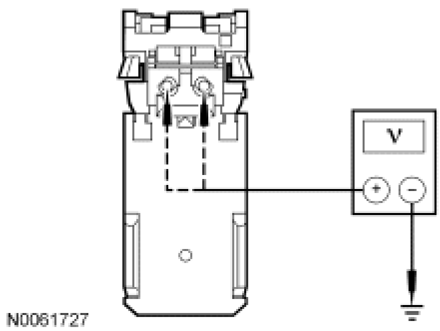

Fig. 51: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger safety belt retractor pretensioner C303-1, circuit RR122 (BN), harness side and ground; and between passenger safety belt retractor pretensioner C303-2, circuit CR122 (WH/OG), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to G21.

  NO : REPAIR circuit RR122 (BN) or circuit CR122 (WH/OG). Go to G26.

G20 CONFIRM THE SAFETY BELT RETRACTOR PRETENSIONER FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Affected Safety Belt Retractor Pretensioner C323 (Driver) C303 (Passenger)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record

All B2292 Fault PIDs

- Refer to PID list in Normal Operation to view B2292 fault PIDs.

- **Does the original RCM on-demand DTC B2292 fault PID indicate a fault?**

  YES : INSTALL a new driver or passenger safety belt retractor pretensioner. REFER to **SAFETY BELT SYSTEM** article. Go to G26.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side) or 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), go to G22.

  For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) or 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), go to G24.

  For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) or 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), go to G25.

G21 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: All Restraint System Components (if previously disconnected)
- Connect: RCM C310a and C310b (if previously disconnected)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2292 Fault PIDs
  - Refer to PID list in Normal Operation to view B2292 fault PIDs.
- **Does the original RCM on-demand DTC B2292 fault PID indicate a fault?**

  YES : INSTALL a new RCM and CARRY OUT PMI. REFER to **Restraints Control Module (RCM)**. Go to G26.

NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side) or 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), go to G22.

For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) or 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), go to G24.

For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) or 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), go to G25.

G22 CHECK FOR AN INTERMITTENT PRETENSIONER LOW RESISTANCE OR OPEN CIRCUIT FAULT

- If the fault PID was reported for the driver safety belt retractor pretensioner, monitor the following on the scan tool:
  - DR_PTENS (Pretensioner Circuit Resistance, Driver Side) resistance PID.
  - 2292_30_OD (Pretensioner Circuit Open, Front Driver Side) and 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side) on-demand fault PIDs.
- If the fault PID was reported for the passenger safety belt retractor pretensioner, monitor the following on the scan tool:
  - PS_PTENS (Pretensioner Circuit Resistance, Passenger Side) resistance PID.
  - 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side) and 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side) on-demand fault PIDs.

NOTE: **A resistance PID that reads between 0.9 and 1.4 ohms or between 3.5 and 5 ohms may or may not set an on-demand DTC, yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.**

- Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness.
- **Does any safety belt retractor pretensioner on-demand fault PID indicate a fault is present or is the pretensioner resistance PID less than 1.4 ohms or greater than 3.5 ohms?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to G26.

  NO : Go to G23.

G23 CHECK THE HARNESS AND CONNECTORS

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the affected safety belt retractor pretensioner C323 (driver) or C303 (passenger):
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to G26.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** Go to G26.

G24 CHECK FOR AN INTERMITTENT SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT SHORT TO GROUND FAULT

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2292 Fault PIDs
  - Refer to PID list in Normal Operation to view B2292 fault PIDs.
- If the fault PID was reported for the driver safety belt retractor pretensioner, monitor the 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side) on-demand fault PID on the scan tool.
- If the fault PID was reported for the passenger safety belt retractor pretensioner, monitor the 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side) on-demand fault PID on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any safety belt retractor pretensioner on-demand fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to G26.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** Go to G26.

G25 CHECK FOR AN INTERMITTENT SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT SHORT TO BATTERY FAULT

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2292 Fault PIDs
  - Refer to PID list in Normal Operation to view B2292 fault PIDs.

- If the fault PID was reported for the driver safety belt retractor pretensioner, monitor the 2292_29_OD (Pretensioner Circuit Short to Battery, Front Driver Side) on-demand fault PID.
- If the fault PID was reported for the passenger safety belt retractor pretensioner, monitor the 2292_25_OD (Pretensioner Circuit Short to Battery, Front Passenger Side) on-demand fault PID.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness.
- **Does the safety belt retractor pretensioner short to battery on-demand fault PID indicate a fault?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to G26.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** Go to G26.

G26 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

> **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test H: DTC B2293 - Restraint System - Air Bag Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) continuously monitors all front air bag module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2293 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault, it will send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors all front air bag module circuits for resistance, it expects a normal resistance for the driver air bag module loop 1 and 2, between 1.7 and 4.4 ohms.

The normal expected resistance for the passenger air bag module loop 1 and 2 is between 1.4 and 3.5 ohms.

If a loop resistance for the driver air bag loop 1 or 2 is between 0.9 and 1.7 or between 4.4 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

If a loop resistance for the passenger air bag loop 1 & 2 is between 0.9 and 1.4 or between 3.5 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

Fault PIDs[a]	Description	Fault Trigger Condition
2293_16_OD and 2293_16_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_17_OD and 2293_17_CM	Air Bag Circuit Open - Loop No. 2, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag loop circuits, a fault will be indicated.
2293_18_OD and 2293_18_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side	When the RCM senses a short to voltage on either on the passenger air bag loop circuits, a fault will be indicated.
2293_19_OD and 2293_19_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side	When the RCM senses a short to ground on either on the passenger air bag loop circuits, a fault will be indicated.
2293_20_OD and 2293_20_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
		When the RCM measures resistance greater than 5 ohms

2293_21_OD and 2293_21_CM	Air Bag Circuit Open - Loop No. 2, Front Driver Side	between the driver air bag loop circuits, a fault will be indicated.
2293_22_OD and 2293_22_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side	When the RCM senses a short to voltage on either on the driver air bag loop circuits, a fault will be indicated.
2293_23_OD and 2293_23_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side	When the RCM senses a short to ground on either on the driver air bag loop circuits, a fault will be indicated.
2293_24_OD and 2293_24_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_25_OD and 2293_25_CM	Air Bag Circuit Open - Loop No. 1, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag loop circuits, a fault will be indicated.
2293_26_OD and 2293_26_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side	When the RCM senses a short to voltage on either on the passenger air bag loop circuits, a fault will be indicated.
2293_27_OD and 2293_27_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side	When the RCM senses a short to ground on either on the passenger air bag loop circuits, a fault will be indicated.
2293_28_OD and 2293_28_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
2293_29_OD and 2293_29_CM	Air Bag Circuit Open - Loop No. 1, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver air bag loop circuits, a fault will be indicated.
2293_30_OD and 2293_30_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side	When the RCM senses a short to voltage on either on the driver air bag loop circuits, a fault will be indicated.
		When the RCM senses a short

2293_31_OD and 2293_31_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side	to ground on either on the driver air bag loop circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2293. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2293.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Driver air bag module
- Passenger air bag module
- RCM

PINPOINT TEST H: DTC B2293 - RESTRAINT SYSTEM - AIR BAG FAULT

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle**

to the customer.

H1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Do any RCM on-demand DTC B2293 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side), go to H2.

  For 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side), go to H2.

  For 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side), go to H10.

  For 2293_30_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side), go to H13.

  For 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to H15.

  For 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to H15.

  For 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to H23.

  For 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to H26.

  For 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side), go to H28.

  For 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side), go to H28.

  For 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side), go to H34.

  For 2293_26_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side), go to H36.

  For 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to H37.

For 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to H37.

For 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to H43.

For 2293_18_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to H45.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to H50.

For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to H50.

For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to H51.

For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to H53.

For 2293_24_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) or 2293_16_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to H50.

For 2293_25_CM (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) or 2293_17_CM (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to H50.

For 2293_27_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) or 2293_19_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to H52.

For 2293_26_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) or 2293_18_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to H54.

H2 CHECK THE DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID (D_ABAGR)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: D_ABAGR (Driver Air Bag) Resistance PID
- **Is the resistance PID value between 1.7 and 4.4 ohms?**

  YES : Go to H49.

  NO : Go to H3.

H3 CHECK THE DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID (D_ABAGR) WHILE CARRYING OUT A HARNESS TEST

NOTE: Do not remove the driver air bag module from its mounted position at this time.

- Continue monitoring the D_ABAGR (driver air bag) resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness, connectors and rotating the steering wheel frequently.
- **Does the resistance PID value read between 1.7 and 4.4 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to **Clockspring**. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

  NO : If the driver air bag module loop 1 resistance PID is less than 1.7 ohms, go to H4.

  If the driver air bag module loop 1 resistance PID is greater than 4.4 ohms, go to H7.

H4 CHECK THE DRIVER AIR BAG MODULE LOOP 1 LOW RESISTANCE FAULT

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

YES : Go to H46.

NO : Go to H5.

H5 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR LOW RESISTANCE BETWEEN THE CLOCKSPRING AND RCM

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Disconnect: Clockspring C218
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to H48.

  NO : Go to H6.

H6 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

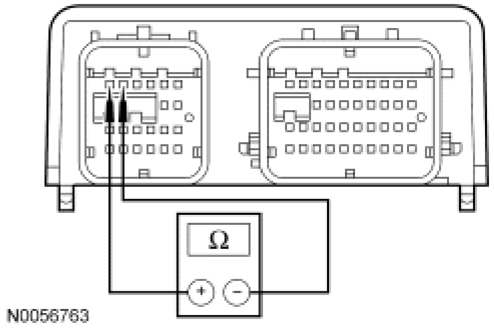

Fig. 52: Measuring Resistance Between RCM C310A Pin 1 & C310A Pin 2, Component Side
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 1 and C310a pin 2, component side.
- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR101 (VT/BN) and RR101 (YE/GN). Go to H56.

  NO : Go to H49.

H7 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FOR AN OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Connect a fused jumper wire between driver air bag module loop 1 electrical connector pin-1, harness side and pin-2, harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**

  YES : Go to H46.

  NO : Go to H8.

H8 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the**

fault.

- Key in OFF position.
- Remove the fused jumper wire from driver air bag module loop 1 electrical connector.
- Disconnect: Clockspring C218
- Connect a fused jumper wire between clockspring C218-1, circuit CR101 (VT/BN), harness side and clockspring C218-9, circuit RR101 (YE/GN), harness side.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**

  YES : Go to H48.

  NO : Go to H9.

H9 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS CR101 (VT/BN) AND RR101 (YE/GN) FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the clockspring connector.
- Disconnect: RCM C310a and C310b

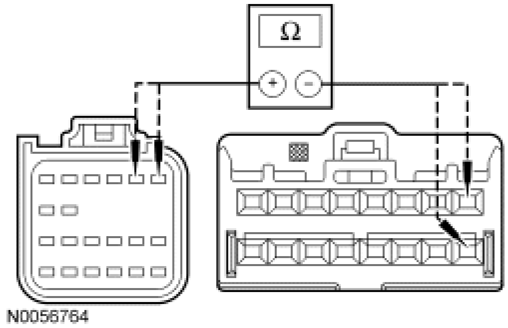

Fig. 53: Measuring Resistance Between RCM C310A-1, Circuit CR101 (VT/BN) & Clockspring C218-1
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-1, circuit CR101 (VT/BN), harness side and clockspring C218-1, circuit CR101 (VT/BN), harness side; and between RCM C310a-2, circuit RR101 (YE/GN), harness side and clockspring C218-9, circuit RR101 (YE/GN), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to H49.

  NO : REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). Go to H56.

H10 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FOR A SHORT TO GROUND

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
  - 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H46.

  NO : Go to H11.

H11 CHECK DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.

- Disconnect: Clockspring C218
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
  - 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H48.

  NO : Go to H12.

H12 CHECK CIRCUITS CR101 (VT/BN) AND RR101 (YE/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

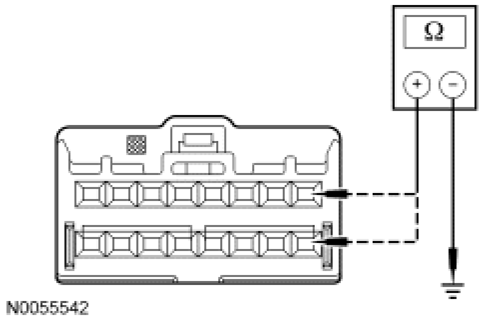

Fig. 54: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between clockspring C218-1, circuit CR101 (VT/BN), harness side and ground; and between clockspring C218-9, circuit RR101 (YE/GN), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). Go to H56.

H13 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Disconnect: Clockspring C218
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
  - 2293_30_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**

  YES : Go to H48.

  NO : Go to H14.

H14 CHECK CIRCUITS CR101 (VT/BN) AND RR101 (YE/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

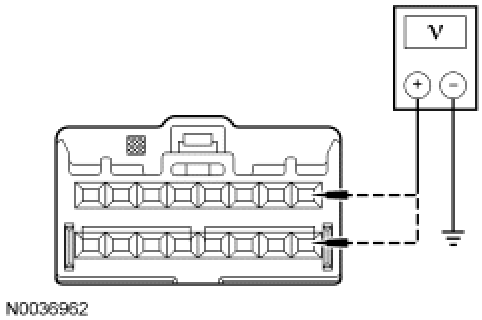

Fig. 55: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between clockspring C218-1, circuit CR101 (VT/BN), harness side and ground; and between clockspring C218-9, circuit RR101 (YE/GN), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). Go to H56.

H15 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID (D_ABAGR2)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: D_ABAGR2 (Driver Air Bag #2 Resistance) Resistance PID
- **Is the resistance PID value between 1.7 and 4.4 ohms?**

  YES : Go to H49.

  NO : Go to H16.

H16 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID (D_ABAGR2) WHILE CARRYING OUT A HARNESS TEST

NOTE:	**Do not remove the driver air bag module from its mounted position at this time.**

- With the driver air bag in its mounted position, continue monitoring the D_ABAGR2 (Driver Air Bag #2 Resistance) resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors), by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently.
- **Does the resistance PID value read between 1.7 and 4.4 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

NO : If the driver air bag module loop 2 resistance PID is less than 1.7 ohms, go to H17.

If the driver air bag module loop 2 resistance PID is greater than 4.4 ohms, go to H20.

H17 CHECK THE DRIVER AIR BAG MODULE LOOP 2 LOW RESISTANCE FAULT

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to H46.

  NO : Go to H18.

H18 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR LOW RESISTANCE BETWEEN THE CLOCKSPRING AND RCM

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Disconnect: Clockspring C218
- Key in ON position.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to H48.

  NO : Go to H19.

H19 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

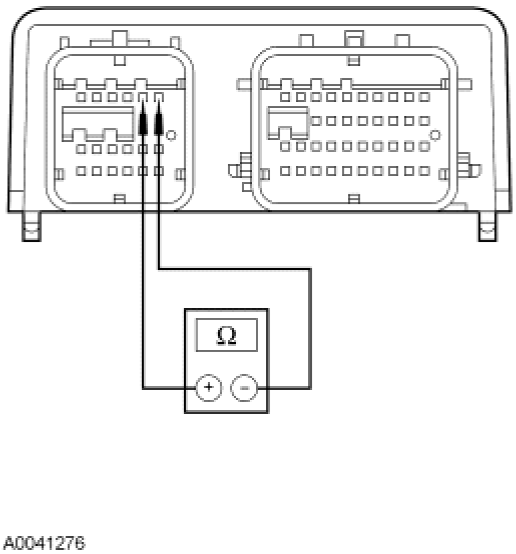

Fig. 56: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 5 and C310a pin 6, component side.

- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR102 (BU) and RR102 (WH). Go to H56.

  NO : Go to H49.

H20 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FOR AN OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Connect a fused jumper wire between driver air bag module loop 2 electrical connector, pin-1, harness side and pin-2, harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to H46.

  NO : Go to H21.

H21 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.

- Remove the fused jumper wire from driver air bag module loop 2 electrical connector.
- Disconnect: Clockspring C218
- Connect a fused jumper wire between clockspring C218-2, circuit CR102 (BU), harness side and clockspring C218-10, circuit RR102 (WH), harness side.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to H48.

  NO : Go to H22.

H22 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS CR102 (BU) AND RR102 (WH) FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the clockspring connector.
- Disconnect: RCM C310a and C310b

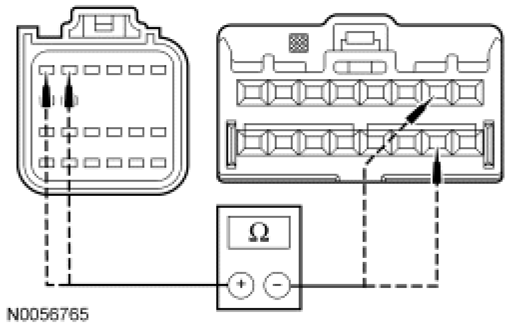

Fig. 57: Measuring Resistance Between RCM C310A-5, Circuit CR102 (BU) & Clockspring C218-2
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-5, circuit CR102 (BU), harness side and clockspring C218-2, circuit CR102 (BU), harness side; and between RCM C310a-6, circuit RR102 (WH), harness side and clockspring C218-10, circuit RR102 (WH), harness side.

- **Are resistances less than 0.5 ohm?**

  YES : Go to H49.

  NO : REPAIR circuit CR102 (BU) or circuit RR102 (WH). Go to H56.

H23 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
  - 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H46.

  NO : Go to H24.

H24 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Disconnect: Clockspring C218
- Key in ON position.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
  - 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H48.

  NO : Go to H25.

H25 CHECK CIRCUITS CR102 (BU) AND RR102 (WH) FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

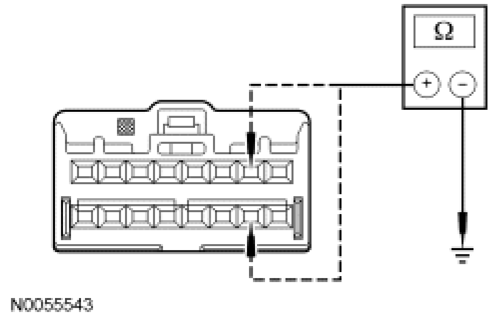

Fig. 58: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between clockspring C218-2, circuit CR102 (BU), harness side and ground; and between clockspring C218-10, circuit RR102 (WH), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR102 (BU) or circuit RR102 (WH). Go to H56.

H26 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Disconnect: Clockspring C218
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
  - 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**

  YES : Go to H48.

  NO : Go to H27.

H27 CHECK CIRCUITS CR102 (BU) AND RR102 (WH) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

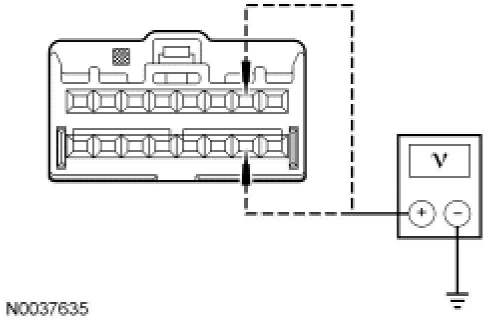

Fig. 59: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between clockspring C218-2, circuit CR102 (BU), harness side and ground; and between clockspring C218-10, circuit RR102 (WH), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR102 (BU) or circuit RR102 (WH). Go to H56.

H28 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID (P_ABAGR)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: P_ABAGR (Passenger Air Bag) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms?**

  YES : Go to H49.

  NO : Go to H29.

H29 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID (P_ABAGR) WHILE CARRYING OUT A HARNESS TEST

NOTE:	**Do not remove the passenger air bag module from its mounted position at this time.**

- With the passenger air bag in its mounted position, continue monitoring the P_ABAGR (Passenger Air Bag) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

NO : If the passenger air bag module loop 1 resistance PID is less than 1.4 ohms, go to H30.

If the passenger air bag module loop 1 resistance PID is greater than 3.5 ohms, go to H32.

H30 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 FOR LOW RESISTANCE FAULT

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side)
  - 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to H47.

  NO : Go to H31.

H31 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

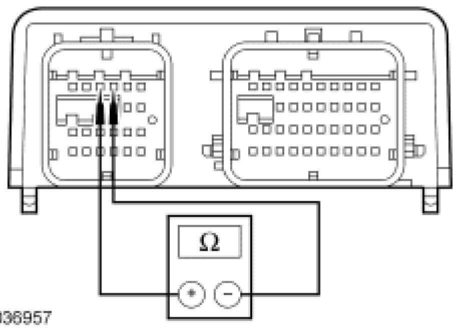

Fig. 60: Checking RCM
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 3 and C310a pin 4, component side.
- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR103 (GY/BU) and RR103 (VT/GN). Go to H56.

  NO : Go to H49.

H32 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 FOR AN OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a
- Connect a fused jumper wire between passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side and C256a-2, circuit RR103 (VT/GN), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side)
  - 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the passenger air bag being disconnected.
- **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating an**

open circuit to a low resistance fault?

YES : Go to H47.

NO : Go to H33.

H33 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR AN OPEN BETWEEN THE PASSENGER AIR BAG MODULE AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

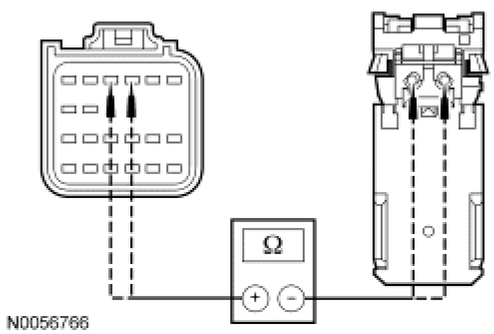

Fig. 61: Measuring Resistance Between RCM C310A-1, Circuit CR103 (GY/BU) & Passenger Air Bag Module C256A-1
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-1, circuit CR103 (GY/BU), harness side and passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side; and between RCM C310a-2, circuit RR103 (VT/GN), harness side and passenger air bag module C256a-2, circuit RR103 (VT/GN), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to H49.

  NO : REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). Go to H56.

H34 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO GROUND

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side)
  - 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H47.

  NO : Go to H35.

H35 CHECK CIRCUITS CR103 (GY/BU) AND RR103 (VT/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

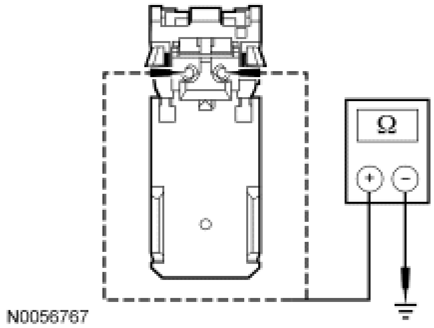

Fig. 62: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side and ground; and between passenger air bag module C256a-2, circuit RR103 (VT/GN), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). Go to H56.

H36 CHECK CIRCUITS CR103 (GY/BU) AND RR103 (VT/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

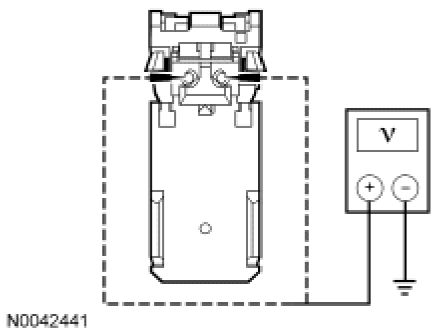

Fig. 63: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side and ground; and between passenger air bag module C256a-2, circuit RR103 (VT/GN), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). Go to H56.

H37 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID (P_ABAGR2)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: P_ABAGR2 (Passenger Side Air Bag #2 Resistance) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms?**

  YES : Go to H49.

  NO : Go to H38.

H38 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID (P_ABAGR2) WHILE CARRYING OUT A HARNESS TEST

NOTE:	**Do not remove the passenger air bag module from its mounted position at this time.**

- With the passenger air bag in its mounted position, continue monitoring the P_ABAGR2 (Passenger Side Air Bag #2 Resistance) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

  NO : If the passenger air bag module loop 2 resistance PID is less than 1.4 ohms, go to H39.

  If the passenger air bag module loop 2 resistance PID is greater than 3.5 ohms, go to H41.

H39 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 FOR LOW RESISTANCE FAULT

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side)
  - 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a low**

resistance to an open circuit fault?

YES : Go to H47.

NO : Go to H40.

H40 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

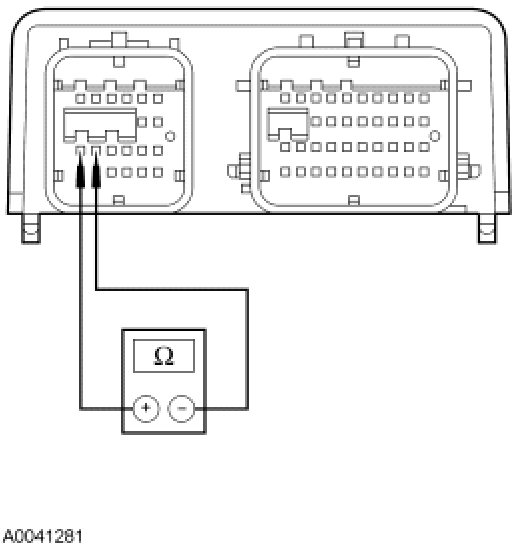

Fig. 64: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 13 and C310a pin 14, component side.
- **Is resistance greater than 10,000 ohms?**

YES : REPAIR circuits CR104 (YE/GY) and RR104 (WH/BU). Go to H56.

NO : Go to H49.

H41 CHECK PASSENGER AIR BAG MODULE LOOP 2 FOR AN OPEN

NOTE:	This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256b
- Connect a fused jumper wire between passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side and C256b-2, circuit RR104 (WH/BU), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side)
  - 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the passenger air bag module being disconnected.
- **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to H47.

  NO : Go to H42.

H42 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN BETWEEN THE PASSENGER AIR BAG MODULE AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from passenger air bag module C256b.
- Disconnect: RCM C310a and C310b

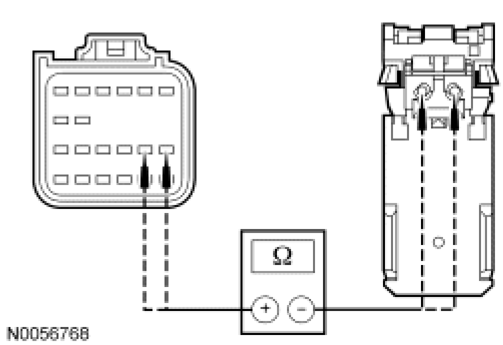

Fig. 65: Measuring Resistance Between RCM C310A-13, Circuit CR104 (YE/GY) & Passenger Air Bag Module C256B-1

Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-13, circuit CR104 (YE/GY), harness side and passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side; and between RCM C310a-14, circuit RR104 (WH/BU), harness side and passenger air bag module C256b-2, circuit RR104 (WH/BU), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to H49.

  NO : REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). Go to H56.

H43 CHECK THE PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side)
  - 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H47.

  NO : Go to H44.

H44 CHECK CIRCUITS CR104 (YE/GY) AND RR104 (WH/BU) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

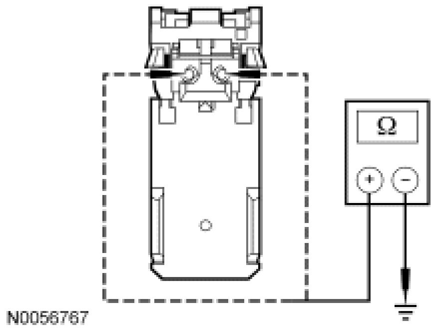

Fig. 66: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side and ground; and between passenger air bag module C256b-2, circuit RR104 (WH/BU), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). Go to H56.

H45 CHECK CIRCUITS CR104 (YE/GY) AND RR104 (WH/BU) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256b
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

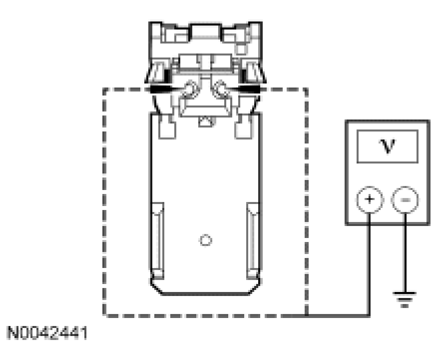

Fig. 67: Measuring Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side and ground; and between passenger air bag module C256b-2, circuit RR104 (WH/BU), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to H49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). Go to H56.

H46 CONFIRM THE DRIVER AIR BAG MODULE FAULT

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Install the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original RCM on-demand DTC B2293 fault PID indicate a fault?**

  YES : INSTALL a new driver air bag module. REFER to **Driver Air Bag Module**. Go to H56.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to H50.

  For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to H50.

For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to H51.

For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to H53.

H47 CONFIRM THE PASSENGER AIR BAG MODULE FAULT

NOTE: **Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Passenger Air Bag Module C256a and C256b (if previously disconnected)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original RCM on-demand DTC B2293 fault PID indicate a fault?**

  YES : INSTALL a new passenger air bag module. REFER to **Passenger Air Bag Module - Edge** or **Passenger Air Bag Module - MKX**. Go to H56.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2293_24_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) or 2293_16_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to H50.

  For 2293_25_CM (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) or 2293_17_CM (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to H50.

  For 2293_27_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) or 2293_19_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to H52.

  For 2293_26_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) or 2293_18_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to H54.

H48 CONFIRM THE CLOCKSPRING FAULT

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Clockspring C218
- Install the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original RCM on-demand DTC B2293 fault PID indicate a fault?**

  YES : INSTALL a new clockspring. REFER to **Clockspring**. Go to H56.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to H50.

  For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to H50.

  For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to H51.

  For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to H53.

H49 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If

not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If previously removed, install the driver air bag module. Refer to **Driver Air Bag Module**.
- Connect: Clockspring C218 (if previously disconnected)
- Connect: Passenger Air Bag Module C256a and C256b (if previously disconnected)
- Connect: RCM C310a and C310b (if previously disconnected)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original RCM on-demand DTC B2293 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to H56.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to H50.

  For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to H50.

  For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to H51.

  For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to H53.

  For 2293_24_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) or 2293_16_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to H50.

  For 2293_25_CM (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) or 2293_17_CM (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to H50.

For 2293_27_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) or 2293_19_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to H52.

For 2293_26_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) or 2293_18_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to H54.

H50 CHECK THE DRIVER OR PASSENGER AIR BAG MODULE FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

- If the fault PID was reported for the driver air bag module loop 1 or loop 2, monitor the following on the scan tool:
  - D_ABAGR (Driver Air Bag) resistance PID.
  - D_ABAGR2 (Driver Air Bag #2 Resistance) resistance PID.
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) and 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side) on-demand fault PID.
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) and 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) on-demand fault PID.
- If the fault PID was reported for the passenger air bag module loop 1 or loop 2, monitor the following on the scan tool:
  - P_ABAGR (Passenger Air Bag) resistance PID.
  - P_ABAGR2 (Passenger Side Air Bag #2 Resistance) resistance PID.
  - 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) and 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side) on-demand fault PID.
  - 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) and 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side) on-demand fault PID.

NOTE: **A resistance PID that reads between 0.9 and 1.7 ohms for driver air bag and between 0.9 and 1.4 ohms for passenger air bag or between 4.4 and 5 ohms for driver air bag or between 3.5 and 5 ohms for the passenger air bag may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.**

NOTE: **Do not remove the driver or passenger air bag module from its mounted position at this time.**

- With the driver or passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness, tilting and rotating the steering wheel frequently.
- **Does any driver or passenger air bag on-demand fault PID indicate a fault or is any air bag resistance PID less than 1.7 ohms for driver air bag and less than 1.4 ohms for passenger air bag or greater than 4.4 ohms for driver air bag and greater than 3.5 ohms for passenger air**

bag?

YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

NO : Go to H55.

H51 CHECK THE DRIVER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

- Monitor the 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side) and 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) on-demand fault PIDs.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

NOTE: **Do not remove the driver air bag module from its mounted position at this time.**

- With the driver air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.
- **Does any RCM on-demand B2293 fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

  NO : Go to H55.

H52 CHECK THE PASSENGER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

NOTE: **When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.**

- Key in ON position.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Monitor the 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) and 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side) on-demand fault PIDs.

NOTE: **Do not remove the passenger air bag module from its mounted position at this time.**

- With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any RCM on-demand B2293 fault PID indicate a fault is present?**

YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

NO : Go to H55.

H53 CHECK THE DRIVER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Monitor the 2293_30_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) and 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side) on-demand fault PIDs.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.
- **Does any driver air bag module short to battery fault PID indicate a fault?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

  NO : Go to H55.

H54 CHECK THE PASSENGER AIR BAG MODULE CIRCUITS FOR AN INTERMITTENT SHORT TO VOLTAGE FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Monitor the 2293_26_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) and 2293_18_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side) on-demand fault PIDs.

NOTE: **Do not remove the passenger air bag module from its mounted**

position at this time.

- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any passenger air bag module short to battery fault PID indicate a fault?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

  NO : Go to H55.

H55 CHECK THE HARNESS AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If the fault PID was reported for the driver air bag:
  - remove the driver air bag module.
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- If the fault PID was reported for the passenger air bag:
  - disconnect the passenger air bag module C256.
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to H56.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to H56.

H56 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at

this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test I: DTC B2294 - Restraint System - Curtain Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) continuously monitors the driver and passenger safety canopy module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2294 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault, it will send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors safety canopy module circuits for resistance, it expects a normal resistance between 1.4 and 3.5 ohms.

If a loop resistance is between 0.9 and 1.4 or between 3.5 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

Fault PIDs[a]	Description	Fault Trigger Condition
2294_24_OD and 2294_24_CM	A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side	When the RCM measures less than 0.9 ohm between the passenger safety canopy circuits, a fault will be indicated.
2294_25_OD and 2294_25_CM	A - B or A - C Pillar Curtain Circuit Open, Passenger Side	When the RCM measures greater than 5 ohms between the passenger safety canopy circuits, a fault will be indicated.
2294_26_OD and 2294_26_CM	A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side	When the RCM senses a short to ground on either on the passenger safety canopy circuits, a fault will be indicated.

2294_27_OD and 2294_27_CM	A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side	When the RCM senses a short to voltage on either on the passenger safety canopy circuits, a fault will be indicated.
2294_28_OD and 2294_28_CM	A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side	When the RCM measures less than 0.9 ohm between the driver safety canopy circuits, a fault will be indicated.
2294_29_OD and 2294_29_CM	A - B or A - C Pillar Curtain Circuit Open, Driver Side	When the RCM measures greater than 5 ohms between the driver safety canopy circuits, a fault will be indicated.
2294_30_OD and 2294_30_CM	A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side	When the RCM senses a short to ground on either on the driver safety canopy circuits, a fault will be indicated.
2294_31_OD and 2294_31_CM	A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side	When the RCM senses a short to voltage on either on the driver safety canopy circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2294. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2294.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Safety canopy module
- RCM

PINPOINT TEST I: DTC B2294 - RESTRAINT SYSTEM - CURTAIN FAULT

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air**

curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

I1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2294 Fault PIDs
  - Refer to PID list in Normal Operation to view B2294 fault PIDs.
- **Do any RCM on-demand DTC B2294 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), go to I2.

  For 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side), go to I2.

  For 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side), go to I9.

  For 2294_31_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side), go to I11.

  For 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side), go to I12.

  For 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to I12.

  For 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to

I19.

For 2294_27_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to I21.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to I24.

For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to I26.

For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to I27.

I2 CHECK THE DRIVER SAFETY CANOPY MODULE RESISTANCE PID (DCURTL1)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms?**

  YES : Go to I23.

  NO : Go to I3.

I3 CHECK THE DRIVER SAFETY CANOPY MODULE RESISTANCE PID (DCURTL1) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) resistance PID while carrying out a harness test of the driver safety canopy circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to I28.

  NO : If the driver safety canopy resistance PID is less than 1.4 ohm, go to I4.

  If the driver safety canopy resistance PID is greater than 3.5 ohms, go to I7.

I4 CHECK THE DRIVER SAFETY CANOPY FOR LOW RESISTANCE FAULT

NOTE: **This pinpoint test step will attempt to change the fault reported by the**

RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Canopy C9018
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side)
  - 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to I22.

  NO : Go to I5.

I5 CHECK FOR A SHORT BETWEEN DRIVER SAFETY CANOPY MODULE CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

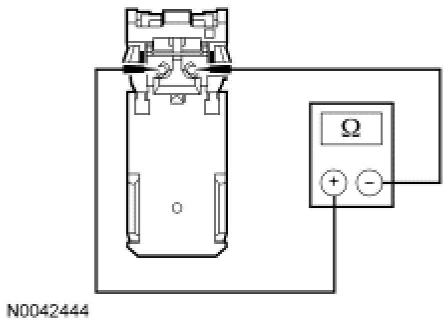

Fig. 68: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety canopy C9018-1, circuit CR109 (BN/BU), harness side and C9018-2, circuit RR109 (BU/GN), harness side.

- **Is resistance greater than 10,000 ohms?**

  YES : Go to I23.

  NO : Go to I6.

I6 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

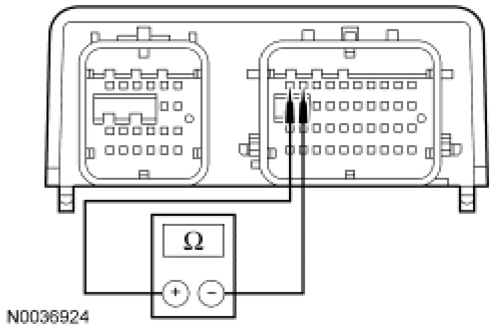

Fig. 69: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 1, component side, and C310b pin 2, component side.
- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR109 (BN/BU) and RR109 (BU/GN). Go to I28.

  NO : Go to I23.

I7 CHECK THE DRIVER SAFETY CANOPY MODULE FOR AN OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Canopy C9018
- Connect a fused jumper wire between driver safety canopy C9018-1, circuit CR109 (BN/BU), harness side and C9018-2, circuit RR109 (BU/GN), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side)
  - 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the driver safety canopy on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to I22.

  NO : Go to I8.

I8 CHECK CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN) FOR AN OPEN BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the driver safety canopy C9018.
- Disconnect: RCM C310a and C310b

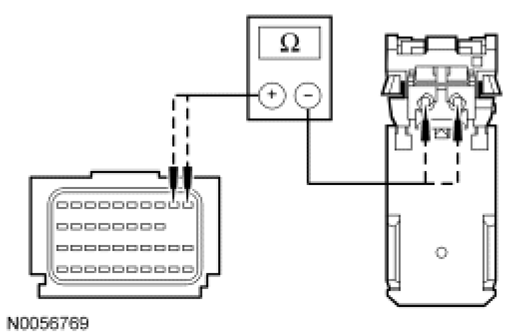

Fig. 70: Measuring Resistance Between RCM C310B-1, Circuit CR109 (BN/BU) & Driver Safety Canopy C9018-1
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-1, circuit CR109 (BN/BU), harness side and driver safety canopy C9018-1, circuit CR109 (BN/BU), harness side; and between RCM C310b-2, circuit RR109 (BU/GN), harness side and driver safety canopy C9018-2, circuit RR109 (BU/GN), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to I23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). Go to I28.

I9 CHECK THE DRIVER SAFETY CANOPY MODULE FOR A SHORT TO GROUND

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

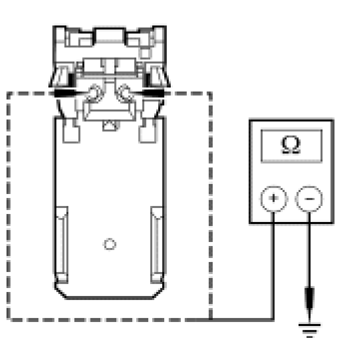
- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Canopy C9018
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side)
  - 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to I22.

  NO : Go to I10.

I10 CHECK CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b



N0056767

Fig. 71: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety canopy C9018-1, circuit CR109 (BN/BU), harness side and ground; and between driver safety canopy C9018-2, circuit RR109 (BU/GN), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to I23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). Go to I28.

I11 CHECK CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Canopy C9018
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

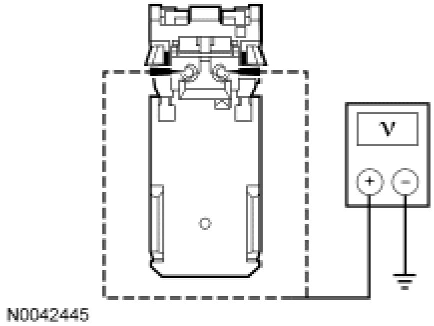


Fig. 72: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver safety canopy C9018-1, circuit CR109 (BN/BU), harness side and ground; and between driver safety canopy C9018-2, circuit RR109 (BU/GN), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to I23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). Go to I28.

I12 CHECK THE PASSENGER SAFETY CANOPY MODULE RESISTANCE PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms?**

  YES : Go to I23.

  NO : Go to I13.

I13 CHECK THE PASSENGER SAFETY CANOPY MODULE RESISTANCE PID (PCURTL1) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) resistance PID while carrying out a harness test of the passenger safety canopy circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to I28.

  NO : If the passenger safety canopy resistance PID is less than 1.4 ohm, go to I14.

  If the passenger safety canopy resistance PID is greater than 3.5 ohms, go to I17.

I14 CHECK THE PASSENGER SAFETY CANOPY MODULE FOR LOW RESISTANCE FAULT

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C9019
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs

- 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side)
- 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side)

- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to I22.

  NO : Go to I15.

I15 CHECK FOR A SHORT BETWEEN PASSENGER SAFETY CANOPY MODULE CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

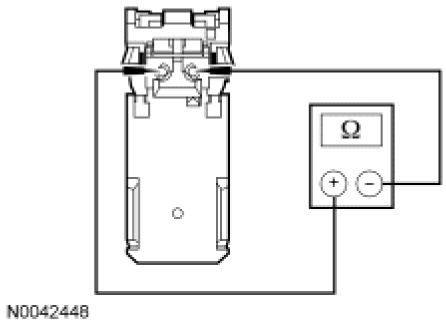

Fig. 73: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety canopy module C9019-1, circuit CR111 (BN/WH), harness side and C9019-2, circuit RR111 (YE/VT), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to I23.

  NO : Go to I16.

I16 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

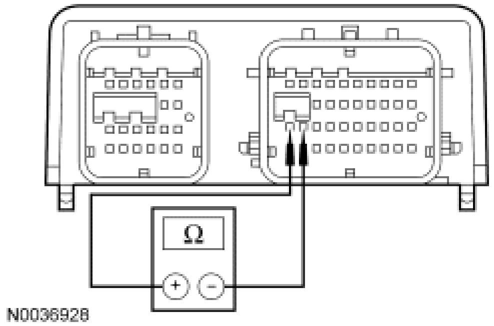

Fig. 74: Checking RCM
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 21, component side, and C310b pin 22, component side.
- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR111 (BN/WH) and RR111 (YE/VT). Go to I28.

  NO : Go to I23.

I17 CHECK THE PASSENGER SAFETY CANOPY MODULE FOR AN OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C9007
- Connect a fused jumper wire between passenger safety canopy C9019-1, circuit CR111 (BN/WH), harness side and C9019-3, circuit RR111 (YE/VT), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side)
  - 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the passenger safety canopy on-demand fault PIDs change from indicating an open**

circuit to a low resistance fault?

YES : Go to I22.

NO : Go to I18.

I18 CHECK CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the passenger safety canopy C9019.
- Disconnect: RCM C310a and C310b

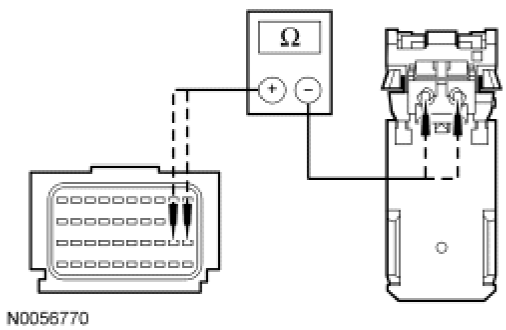

Fig. 75: Measuring Resistance Between RCM C310B-21, Circuit CR111 (BN/WH) & Passenger Safety Canopy Module C9019-1
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-21, circuit CR111 (BN/WH), harness side and passenger safety canopy module C9019-1, circuit CR111 (BN/WH), harness side; and between RCM C310b-22, circuit RR111 (YE/VT), harness side and passenger safety canopy module C9019-2, circuit RR111 (YE/VT), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to I23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). Go to I28.

I19 CHECK THE PASSENGER SAFETY CANOPY MODULE FOR A SHORT TO GROUND

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C9019
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side)
  - 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to I22.

  NO : Go to I20.

I20 CHECK CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

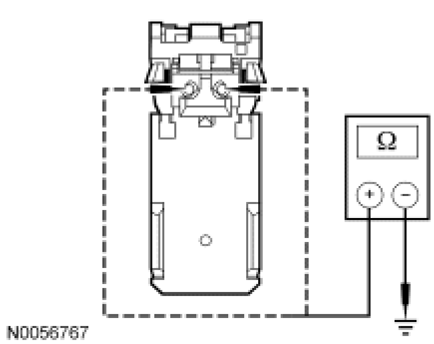

Fig. 76: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety canopy C9019-1, circuit CR111 (BN/WH), harness side and ground; and between passenger safety canopy C9019-2, circuit RR111 (YE/VT), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

YES : Go to I23.

NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). Go to I28.

I21 CHECK CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C9019
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

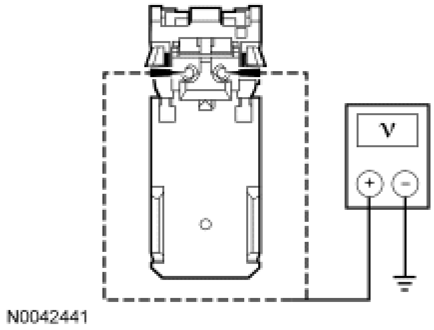

Fig. 77: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger safety canopy C9019-1, circuit CR111 (BN/WH), harness side and ground; and between passenger safety canopy C9019-2, circuit RR111 (YE/VT), harness side and ground.
- **Are voltages less than 0.2 volt?**

YES : Go to I23.

NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to I28.

I22 CONFIRM THE SAFETY CANOPY MODULE FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Affected Safety Canopy C9018 (Driver) C9019 (Passenger)
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2294 Fault PIDs
  - Refer to PID list in Normal Operation to view B2294 fault PIDs.
- **Does the original RCM on-demand DTC B2294 fault PID indicate a fault?**

  YES : INSTALL a new driver or passenger safety canopy. REFER to **Safety Canopy Module**. Go to I28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to I24.

  For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to I26.

  For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to I27.

I23 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.

- If previously directed to disconnect any SRS component(s):
  - Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
  - Connect all previously disconnected restraint system component(s), including RCM C310a and C310b.
  - Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2294 Fault PIDs
  - Refer to PID list in Normal Operation to view B2294 fault PIDs.
- **Does the original RCM on-demand DTC B2294 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to I28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to I24.

  For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to I26.

  For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to I27.

I24 CHECK FOR AN INTERMITTENT SAFETY CANOPY LOW RESISTANCE OR OPEN CIRCUIT FAULT

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2294 Fault PIDs
  - Refer to PID list in Normal Operation to view B2294 fault PIDs.
- If the fault PID was reported for the driver safety canopy, monitor the DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) resistance PID on the scan tool.
- If the fault PID was reported for the passenger safety canopy, monitor the PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) resistance PID on the scan tool.

NOTE: A resistance PID that reads between 0.9 and 1.4 ohms or between 3.5 and 5 ohms may or may not set an on-demand DTC yet indicates a

strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.

- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any RCM on-demand B2294 fault PID indicate a fault is present or is any safety canopy resistance PID less than 1.4 ohms or greater than 3.5 ohms?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to I28.

  NO : Go to I25.

I25 CHECK HARNESS AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the affected safety canopy module C9006 (driver) or C9007 (passenger):
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to I28.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to I28.

I26 CHECK FOR AN INTERMITTENT SAFETY CANOPY MODULE SHORT TO GROUND FAULT

NOTE: **When monitoring fault and/or resistance PIDs with the scan tool, up to a 2-second delay for the scan tool display to update should be expected.**

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- If the fault PID was reported for the driver safety canopy, monitor the 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) fault PID on the scan tool.
- If the fault PID was reported for the passenger safety canopy, monitor the 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side) fault PID on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing

the wire harness.

- **Does any safety canopy on-demand fault PID indicate a fault?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to I28.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to I28.

I27 CHECK FOR AN INTERMITTENT SAFETY CANOPY MODULE SHORT TO BATTERY FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If the fault PID was reported for the driver safety canopy, disconnect the driver safety canopy module C9018.
- If the fault PID was reported for the passenger safety canopy, disconnect the passenger safety canopy module C9019.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update.
- Monitor the 2294_31_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side) fault PIDs on the scan tool.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any safety canopy on-demand fault PID indicate a fault?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to I28.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to I28.

I28 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an**

accidental deployment.

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test J: DTC B2295 - Restraint System - Side Air Bag Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

A seat side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a safety canopy module. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The restraints control module (RCM) continuously monitors the driver and passenger side air bag module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2295 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault, it will send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors side air bag module circuits for resistance, it expects a normal resistance between 1.4 and 3.5 ohms.

If a loop resistance is between 0.9 and 1.4 or between 3.5 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

Fault PIDs[a]	Description	Fault Trigger Condition
2295_24_OD and 2295_24_CM	Side Air Bag Circuit Resistance Low, Front Passenger Side	When the RCM measures less than 0.9 ohm between the passenger side air bag module circuits, a fault will be indicated.
		When the RCM measures

2295_25_OD and 2295_25_CM	Side Air Bag Circuit Open, Front Passenger Side	greater than 5 ohms between the passenger side air bag module circuits, a fault will be indicated.
2295_26_OD and 2295_26_CM	Side Air Bag Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on either of the passenger side air bag module circuits, a fault will be indicated.
2295_27_OD and 2295_27_CM	Side Air Bag Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger side air bag module circuits, a fault will be indicated.
2295_28_OD and 2295_28_CM	Side Air Bag Circuit Resistance Low, Front Driver Side	When the RCM measures less than 0.9 ohm between the driver side air bag module circuits, a fault will be indicated.
2295_29_OD and 2295_29_CM	Side Air Bag Circuit Open, Front Driver Side	When the RCM measures greater than 5 ohms between the driver side air bag module circuits, a fault will be indicated.
2295_30_OD and 2295_30_CM	Side Air Bag Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either on the driver side air bag module circuits, a fault will be indicated.
2295_31_OD and 2295_31_CM	Side Air Bag Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either on the driver side air bag module circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2295. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2295.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Side air bag module
- RCM

PINPOINT TEST J: DTC B2295 - RESTRAINT SYSTEM - SIDE AIR BAG FAULT

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

J1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2295 Fault PIDs
  - Refer to PID list in Normal Operation to view B2295 fault PIDs.
- **Do any RCM on-demand DTC B2295 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the on-demand fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side), go to J2.

For 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side), go to J2.

For 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side), go to J9.

For 2295_31_OD (Side Air Bag Circuit Short to Battery, Front Driver Side), go to J11.

For 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side), go to J12.

For 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side), go to J12.

For 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to J19.

For 2295_27_OD (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to J21.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), go to J24.

For 2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to J26.

For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to J27.

J2 CHECK THE DRIVER SIDE AIR BAG MODULE RESISTANCE PID (DS_AB)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: DS_AB (Driver Side Impact Air Bag Resistance) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms?**

  YES : Go to J23.

  NO : Go to J3.

J3 CHECK THE DRIVER SIDE AIR BAG RESISTANCE PID (DS_AB) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the DS_AB (Driver Side Impact Air Bag Resistance) resistance PID while carrying out a harness test of the driver side air bag circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out the harness test?**

YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to J28.

NO : If the driver side air bag resistance PID is less than 1.4 ohms, go to J4.

If the driver side air bag resistance PID is greater than 3.5 ohms, go to J7.

J4 CHECK THE DRIVER SIDE AIR BAG MODULE FOR LOW RESISTANCE FAULT

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side)
  - 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag disconnected, an open circuit fault would normally be retrieved.
- **Did the driver side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to J22.

  NO : Go to J5.

J5 CHECK FOR A SHORT BETWEEN DRIVER SIDE AIR BAG MODULE CIRCUITS CR105 (GN/BU) AND RR105 (GY/YE)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

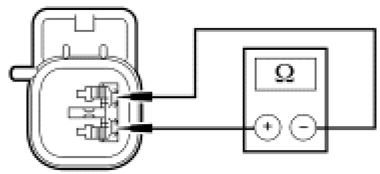

Fig. 78: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver side air bag C328-1, circuit CR105 (GN/BU), harness side and C328-2, circuit RR105 (GY/YE), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to J22.

  NO : Go to J6.

J6 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

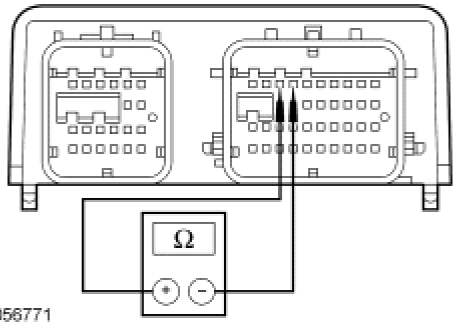

Fig. 79: Measuring Resistance Between RCM C310B Pin 3, Component Side, & C310B Pin 4
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 3, component side, and C310b pin 4, component side.
- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR105 (GN/BU) and RR105 (GY/YE). Go to J25.

  NO : Go to J23.

J7 CHECK THE DRIVER SIDE AIR BAG MODULE FOR AN OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag Module C328
- Connect a fused jumper wire between driver side air bag C328-1, circuit CR110 (GN/BN), harness side and C328-2, circuit RR110 (GY/OG), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
    - 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side)
    - 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the driver side air bag on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to J22.

  NO : Go to J8.

J8 CHECK CIRCUITS CR105 (GN/BU) AND RR105 (GY/YE) FOR AN OPEN BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the driver side air bag C328.
- Disconnect: RCM C310a and C310b

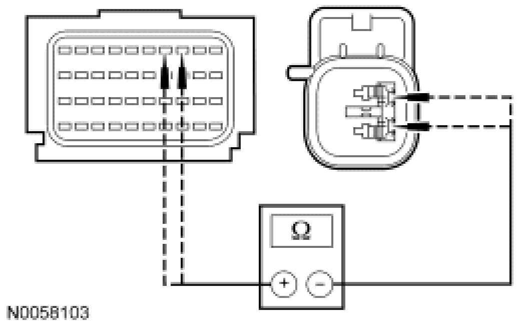

Fig. 80: Measuring Resistance Between RCM C310B-3 & C328-1, Circuit CR110 (GN/BN) & CR105 (GN/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-3, circuit CR110 (GN/BN), harness side and driver side air bag C328-1, circuit CR105 (GN/BU), harness side; and between RCM C310b-4, circuit RR105 (GY/YE), harness side and driver side air bag C328-2, circuit RR105 (GY/YE), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to J23.

  NO : REPAIR circuit CR105 (GN/BU) or circuit RR105 (GY/YE). Go to J28.

J9 CHECK THE DRIVER SIDE AIR BAG MODULE FOR A SHORT TO GROUND

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side)
  - 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module disconnected, an open circuit fault would normally be retrieved.
- **Did the driver side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to J22.

  NO : Go to J10.

J10 CHECK CIRCUITS CR105 (GN/BU) AND RR105 (GY/YE) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

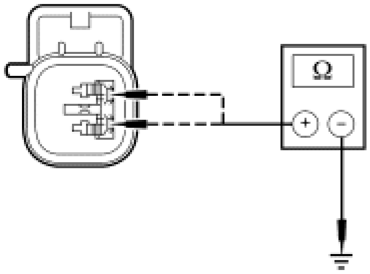

Fig. 81: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver side air bag C328-1, circuit CR105 (GN/BU), harness side and ground; and between driver side air bag C328-2, circuit RR105 (GY/YE), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to J23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR105 (GN/BU) or circuit RR105 (GY/YE). Go to J28.

J11 CHECK CIRCUITS CR105 (GN/BU) AND RR105 (GY/YE) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag C328
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

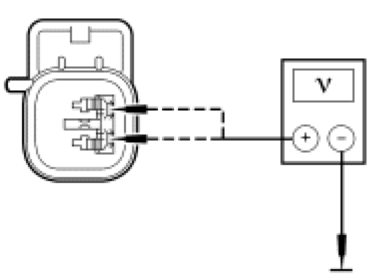

Fig. 82: Measuring Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage between driver side air bag C328-1, circuit CR105 (GN/BU), harness side and ground; and between driver side air bag C328-2, circuit RR105 (GY/YE), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to J23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR105 (GN/BU) or circuit RR105 (GY/YE). Go to J28.

J12 CHECK THE PASSENGER SIDE AIR BAG MODULE RESISTANCE PID (PS_AB)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM
- Enter the following diagnostic mode on the diagnostic tool: PS_AB (Passenger Side Impact Air Bag Resistance) Resistance PID
- **Is the resistance PID value between 1.4 and 3.5 ohms?**

  YES : Go to J23.

  NO : Go to J13.

J13 CHECK THE PASSENGER SIDE AIR BAG RESISTANCE PID (PS_AB) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the PS_AB (Passenger Side Impact Air Bag Resistance) resistance PID while carrying out a harness test of the passenger side air bag circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.4 and 3.5 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to J28.

  NO : If the passenger side air bag resistance PID is less than 1.4 ohms, go to J14.

  If the passenger side air bag resistance PID is greater than 3.5 ohms, go to J17.

J14 CHECK THE PASSENGER SIDE AIR BAG MODULE FOR LOW RESISTANCE FAULT

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Disconnect: Passenger Side Air Bag C327
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side)
  - 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit faults would normally be retrieved.
- **Did the passenger side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to J22.

  NO : Go to J15.

J15 CHECK FOR A SHORT BETWEEN PASSENGER SIDE AIR BAG MODULE CIRCUITS CR106 (VT/GY) AND RR106 (YE/OG)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

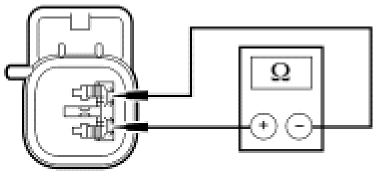

Fig. 83: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger side air bag C327-1, circuit CR106 (VT/GY), harness side and C327-2, circuit RR106 (YE/OG), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to J23.

  NO : Go to J16.

J16 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

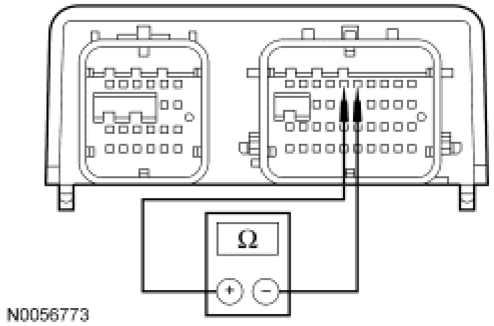

Fig. 84: Measuring Resistance Between RCM C310B Pin 5, Component Side, & C310B Pin 6
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 5, component side, and C310b pin 6, component side.
- **Is resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR106 (VT/GY) and RR106 (YE/OG). Go to J28.

  NO : Go to J23.

J17 CHECK THE PASSENGER SIDE AIR BAG MODULE FOR AN OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag C327
- Connect a fused jumper wire between passenger side air bag C327-1, circuit CR106 (VT/GY), harness side and C327-2, circuit RR106 (YE/OG), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
  - 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side)
  - 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the passenger side air bag on-demand fault PIDs change from indicating an open circuit**

to a low resistance fault?

YES : Go to J22.

NO : Go to J18.

J18 CHECK CIRCUITS CR106 (VT/GY) AND RR106 (YE/OG) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the passenger side air bag C327.
- Disconnect: RCM C310a and C310b

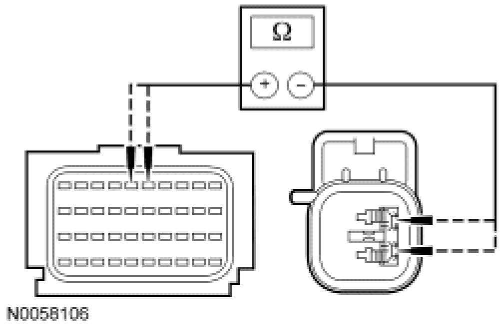

Fig. 85: Measuring Resistance Between RCM C310B-5, Circuit CR106 (VT/GY) & Passenger Side Air Bag Module C327-1
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-5, circuit CR106 (VT/GY), harness side and passenger side air bag module C327-1, circuit CR106 (VT/GY), harness side; and between RCM C310b-6, circuit RR106 (YE/OG), harness side and passenger side air bag module C327-2, circuit RR106 (YE/OG), harness side.
- **Are resistances less than 0.5 ohm?**

YES : Go to J23.

NO : REPAIR circuit CR106 (VT/GY) or circuit RR106 (YE/OG). Go to J28.

J19 CHECK THE PASSENGER SIDE AIR BAG MODULE FOR A SHORT TO GROUND

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag Module C327

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record the Following Fault PIDs
    - 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side)
    - 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to J22.

  NO : Go to J20.

J20 CHECK CIRCUITS CR106 (VT/GY) AND RR106 (YE/OG) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

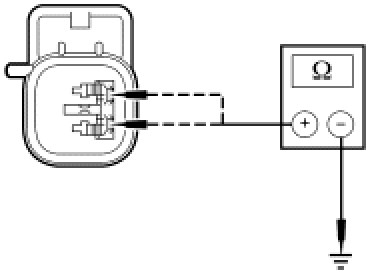

Fig. 86: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger side air bag C327-1, circuit CR106 (VT/GY), harness side and ground; and between passenger side air bag C327-2, circuit RR106 (YE/OG), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to J23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

REPAIR circuit CR106 (VT/GY) or circuit RR106 (YE/OG). Go to J28.

J21 CHECK CIRCUITS CR106 (VT/GY) AND RR106 (YE/OG) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag C327
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

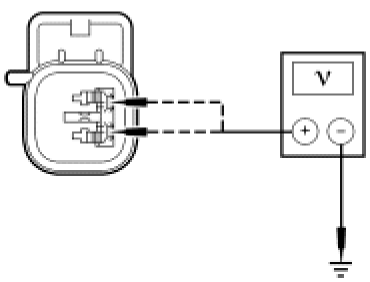

Fig. 87: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger side air bag C327-1, circuit CR106 (VT/GY), harness side and ground; and between passenger side air bag C327-2, circuit RR106 (YE/OG), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to J23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR106 (VT/GY) or circuit RR106 (YE/OG). Go to J28.

J22 CONFIRM THE SIDE AIR BAG MODULE FAULT

NOTE:	**Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and**

Repowering.

- Connect: Affected Side Air Bag C328 (Driver) C3327 (Passenger)
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2295 Fault PIDs
  - Refer to PID list in Normal Operation to view B2295 fault PIDs.
- **Does the original RCM on-demand DTC B2295 fault PID indicate a fault?**

  YES : REMOVE and INSPECT the seat side air bag module jumper harness, connector terminals for damage. REFER to **Side Air Bag Module**. If a concern is found, REPAIR or INSTALL a new seat jumper harness. Go to J28.

  If a concern was not found, INSTALL a new driver or passenger side air bag module. Go to J28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), go to J24.

  For 2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to J26.

  For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to J27.

J23 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- If previously directed to disconnect any SRS component(s):
  - Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
  - Connect all previously disconnected restraint system component(s), including RCM C310a

and C310b.

    - Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2295 Fault PIDs
    - Refer to PID list in Normal Operation to view B2295 fault PIDs.
- **Does the original RCM on-demand DTC B2295 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to J28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected.

  For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), go to J24.

  For 2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to J26.

  For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to J27.

J24 CHECK FOR AN INTERMITTENT SIDE AIR BAG MODULE LOW RESISTANCE OR OPEN CIRCUIT FAULT

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2295 Fault PIDs
    - Refer to PID list in Normal Operation to view B2295 fault PIDs.
- If the fault PID was reported for the driver side air bag module, monitor the DS_AB (Driver Side Impact Air Bag Resistance) resistance PID on the scan tool.
- If the fault PID was reported for the passenger side air bag, monitor the PS_AB (Passenger Side Impact Air Bag Resistance) resistance PID on the scan tool.

NOTE: **A resistance PID that reads between 0.9 and 1.4 ohms or between 3.5 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.**

- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any side air bag on-demand fault PID indicate a fault is present or is the side air bag resistance PID less than 1.4 ohms or greater than 3.5 ohms?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to J28.

  NO : Go to J25.

J25 CHECK THE HARNESS AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the affected side air bag C328 (driver) C327 (passenger):
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to J28.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to J28.

J26 CHECK FOR AN INTERMITTENT SIDE AIR BAG MODULE SHORT TO GROUND FAULT

- If the fault PID was reported for the driver side air bag module, monitor the driver side air bag short to ground on-demand fault PID 2295_30_OD on the scan tool.
- If the fault PID was reported for the passenger side air bag, monitor the passenger side air bag short to ground on-demand fault PID 2295_26_OD on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any RCM on-demand B2295 fault PID indicate a fault is present?**

  YES : REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to J28.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to J28.

J27 CHECK FOR AN INTERMITTENT SIDE AIR BAG SHORT TO VOLTAGE FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Affected Safety Canopy Module C328 (Driver) C327 (Passenger)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Monitor the 2295_31_OD (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_OD (Side Air Bag Circuit Short to Battery, Front Passenger Side) fault PIDs on the scan tool.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any RCM on-demand B2295 fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information. Go to J28.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to J28.

J28 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test K: DTC B2296 - Restraint System - Impact Sensor Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors all of the impact sensor circuits for faults. If the RCM detects one of the following faults on any of the impact sensor circuits, it will store DTC B2296 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

Fault PIDs[a]	Description	Fault Trigger Condition
2296_3_OD and 2296_3_CM	Driver/Center Front Crash Sensor Circuit Short to Battery	When the RCM senses a short to battery on the driver/center front impact sensor circuits, a fault will be indicated.
2296_5_OD and 2296_5_CM	Driver/Center Front Crash Sensor Communication Fault	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the driver/center front impact sensor, a fault will be indicated.
2296_6_OD and 2296_6_CM	Side Crash Sensor Circuit Short to Battery, Row No.2 Passenger Side	When the RCM senses a short to battery on the passenger second row side impact sensor, a fault will be indicated.
2296_7_OD and 2296_7_CM	Side Crash Sensor Circuit Short to Ground, Row No.2 Passenger Side	When the RCM senses a short to ground on the passenger second row side impact sensor, a fault will be indicated.
2296_8_OD and 2296_8_CM	Side Crash Sensor Communication Fault, Row No.2 Passenger Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the passenger second row side impact sensor, a fault will be indicated.
2296_9_OD and 2296_9_CM	Side Crash Sensor Circuit Short to Battery, Row No.2 Driver Side	When the RCM senses a short to battery on the driver second row side impact sensor circuits, a fault will be indicated.
		When the RCM senses a short to ground on the

2296_10_OD and 2296_10_CM	Side Crash Sensor Circuit Short to Ground, Row No.2 Driver Side	driver second row side impact sensor circuits, a fault will be indicated.
2296_11_OD and 2296_11_CM	Side Crash Sensor Communication Fault, Row No.2 Driver Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the driver second row side impact sensor, a fault will be indicated.
2296_12_OD and 2296_12_CM	Side Crash Sensor Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to battery on the passenger first row side impact sensor circuits, a fault will be indicated.
2296_13_OD and 2296_13_CM	Side Crash Sensor Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on the passenger first row side impact sensor circuits, a fault will be indicated.
2296_14_OD and 2296_14_CM	Side Crash Sensor Communication Fault, Front Passenger Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the passenger first row side impact sensor, a fault will be indicated.
2296_15_OD and 2296_15_CM	Side Crash Sensor Circuit Short to Battery, Front Driver Side	When the RCM senses a short to battery on the driver first row side impact sensor circuits, a fault will be indicated.
2296_16_OD and 2296_16_CM	Side Crash Sensor Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on the driver first row side impact sensor circuits, a fault will be indicated.
2296_17_OD and 2296_17_CM	Side Crash Sensor Communication Fault, Front Driver Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the driver first row side impact sensor, a fault will be indicated.
2296_18_OD and		When the RCM senses a internal failure with the

2296_18_CM	Driver/Center Front Crash Sensor Internal Fault	driver/center front impact sensor, a fault will be indicated.
2296_19_OD and 2296_19_CM	Driver/Center Front Crash Sensor Mount/Communication Fault	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the driver/center front impact sensor, a fault will be indicated.
2296_24_OD and 2296_24_CM	Side Crash Sensor 2 Internal Fault, Passenger Side	When the RCM senses a internal failure with the passenger second row side impact sensor, a fault will be indicated.
2296_25_OD and 2296_25_CM	Side Crash Sensor Mount or Communication Fault, Row No. 2 Passenger Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the passenger second row side impact sensor, a fault will be indicated.
2296_26_OD and 2296_26_CM	Side Crash Sensor 2 Internal Fault, Driver Side	When the RCM senses a internal failure with the driver second row side impact sensor, a fault will be indicated.
2296_27_OD and 2296_27_CM	Side Crash Sensor Mount or Communication Fault, Row No. 2 Driver Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the driver second row side impact sensor, a fault will be indicated.
2296_28_OD and 2296_28_CM	Side Crash Sensor Internal Fault, Front Passenger Side	When the RCM senses a internal failure with the passenger first row side impact sensor, a fault will be indicated.
2296_29_OD and 2296_29_CM	Side Crash Sensor Mount or Communication Fault, Front Passenger Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the passenger first row side impact sensor, a fault will be indicated.

2296_30_OD and 2296_30_CM	Side Crash Sensor Internal Fault, Front Driver Side	When the RCM senses a internal failure with the driver first row side impact sensor, a fault will be indicated.
2296_31_OD and 2296_31_CM	Side Crash Sensor Mount or Communication Fault, Front Driver Side	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the driver side first row side impact sensor, a fault will be indicated.
2296_55_OD and 2296_55_CM	Passenger Front Crash Sensor Circuit Short to Battery	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the passenger front impact sensor, a fault will be indicated.
2296_56_OD and 2296_56_CM	Passenger Front Crash Sensor Circuit Short to Ground	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the passenger front impact sensor, a fault will be indicated.
2296_57_OD and 2296_57_CM	Passenger Front Crash Sensor Communication Fault	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the passenger front impact sensor, a fault will be indicated.
2296_58_OD and 2296_58_CM	Passenger Front Crash Sensor Internal Fault	When the RCM senses a internal failure with the with the passenger front impact sensor, a fault will be indicated.
2296_59_OD and 2296_59_CM	Passenger Front Crash Sensor Mount/Communication Fault	When the RCM is unable to communicate (circuit open, short to ground or battery on sensor) with the driver/center front impact sensor, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2296. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2296.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Impact sensor
- Incorrect sensor mounting
- RCM

PINPOINT TEST K: DTC B2296 - RESTRAINT SYSTEM - IMPACT SENSOR FAULT

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

K1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any RCM on-demand DTC B2296 fault PIDs indicate a fault?**

YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2296_30_OD (Side Crash Sensor Internal Fault, Front Driver Side), INSTALL a new first row driver side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to K34.

For 2296_28_OD (Side Crash Sensor Internal Fault, Front Passenger Side), INSTALL a new first row passenger side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to K34.

For 2296_26_OD (Side Crash Sensor 2 Internal Fault, Driver side), INSTALL a new second row driver side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to K34.

For second row passenger side impact sensor with an internal fault (2296_24_OD (Side Crash Sensor 2 Internal Fault, Passenger side), INSTALL a new second row passenger side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to K34.

For 2296_18_OD (Driver/Center Front Crash Sensor Internal Fault), INSTALL a new driver/center front impact severity sensor. REFER to **Front Impact Severity Sensor**. Go to K34.

For 2296_58_OD (Passenger Front Crash Sensor Internal Fault), INSTALL a new passenger front impact severity sensor. REFER to **Front Impact Severity Sensor**. Go to K34.

For 2296_17_OD (Side Crash Sensor Communication Fault, Front Driver Side)/2296_31_OD (Side Crash Sensor Mount or Communication Fault, Front Driver Side), go to K2.

For 2296_16_OD (Side Crash Sensor Circuit Short to Ground, Front Driver Side), go to K4.

For 2296_15_OD (Side Crash Sensor Circuit Short to Battery, Front Driver Side), go to K6.

For 2296_14_OD (Side Crash Sensor Communication Fault, Front Passenger Side), go to K7.

For 2296_13_OD (Side Crash Sensor Circuit Short to Ground, Front Passenger Side), go to K9.

For 2296_12_OD (Side Crash Sensor Circuit Short to Battery, Front Passenger Side), go to K11.

For 2296_11_OD (Side Crash Sensor Communication Fault, Row No.2 Driver Side), go to K12.

For 2296_10_OD (Side Crash Sensor Circuit Short to Ground, Row No.2 Driver Side), go to K14.

For 2296_9_OD (Side Crash Sensor Circuit Short to Battery, Row No.2 Driver Side), go to K16.

For 2296_8_OD (Side Crash Sensor Communication Fault, Row No.2 Passenger Side), go to K17.

For 2296_7_OD (Side Crash Sensor Circuit Short to Ground, Row No.2 Passenger Side), go to

K19.

For 2296_6_OD (Side Crash Sensor Circuit Short to Battery, Row No.2 Passenger Side), go to K21.

For 2296_5_OD (Driver/Center Front Crash Sensor Communication Fault), go to K22.

For 2296_4_OD (Driver/Center Front Crash Sensor Circuit Short to Ground), go to K24.

For 2296_3_OD (Driver/Center Front Crash Sensor Circuit Short to Battery), go to K26.

For 2296_59_OD (Passenger Front Crash Sensor Mount/Communication Fault), go to K27.

For 2296_56_OD (Passenger Front Crash Sensor Circuit Short to Ground), go to K29.

For 2296_55_OD (Passenger Front Crash Sensor Circuit Short to Battery), go to K31.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to K33.

K2 CHECK CIRCUITS VR217 (GY/YE) AND RR131 (VT/GY) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Driver Side Impact Sensor C3209
- Disconnect: RCM C310a and C310b

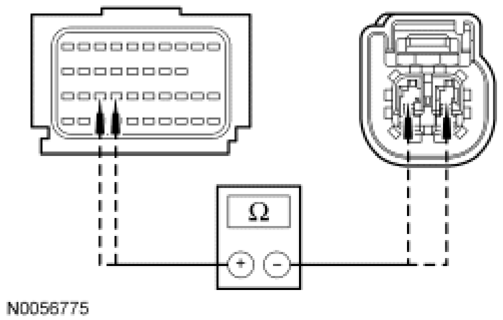

Fig. 88: Measuring Resistance Between RCM C310B-27 & C310B-28, Circuit VR217 (GY/YE) & RR131 (VT/GY)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-27, circuit VR217 (GY/YE), harness side and first row driver side impact sensor C3209-1, circuit VR217 (GY/YE), harness side; and between RCM C310b-28, circuit RR131 (VT/GY), harness side and first row driver side impact sensor C3209-2, circuit RR131 (VT/GY), harness side.

- **Are resistances less than 0.5 ohm?**

  YES : Go to K3.

  NO : REPAIR circuit VR217 (GY/YE) or circuit RR131 (VT/GY). Go to K34.

K3 CHECK THE FIRST ROW DRIVER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good first row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any on-demand B2296 fault PIDs for the first row driver side impact sensor indicating a fault?**

  YES : Go to K32.

  NO : Fault corrected. Go to K34.

K4 CHECK CIRCUITS VR217 (GY/YE) AND RR131 (VT/GY) FOR A SHORT TO GROUND BETWEEN THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Driver Side Impact Sensor C3209
- Disconnect: RCM C310a and C310b

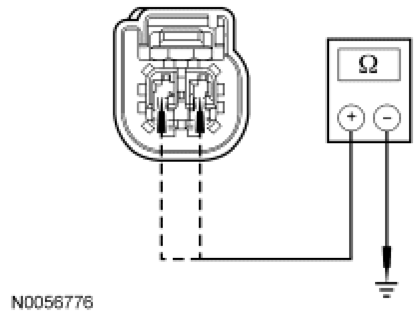

Fig. 89: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row driver side impact sensor C3209-2, circuit RR131 (VT/GY), harness side and ground; and between C3209-1, circuit VR217 (GY/YE), harness side and ground.

- **Are resistances greater than 10,000 ohms?**

  YES : Go to K5.

  NO : REPAIR circuit VR217 (GY/YE) or circuit RR131 (VT/GY). Go to K34.

K5 CHECK CIRCUIT VR217 (GY/YE) FOR A SHORT TO CIRCUIT RR131 (VT/GY) BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR

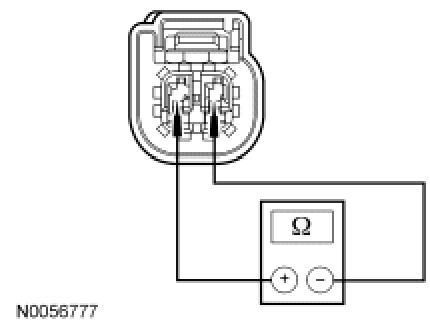

Fig. 90: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row driver side impact sensor C3209-1, circuit VR217 (GY/YE), harness side and C3209-2, circuit RR131 (VT/GY), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to K32.

  NO : REPAIR circuits VR217 (GY/YE) and RR131 (VT/GY). Go to K34.

K6 CHECK CIRCUITS VR217 (GY/YE) AND RR131 (VT/GY) FOR A SHORT TO VOLTAGE BETWEEN THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Driver Side Impact Sensor C3209
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

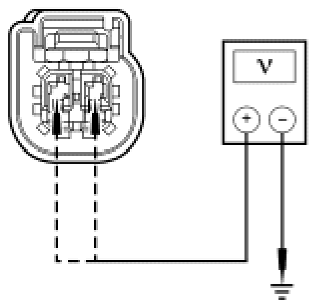

Fig. 91: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between first row driver side impact sensor C3209-2, circuit RR131 (VT/GY), harness side and ground; and between C3209-1, circuit VR217 (GY/YE), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to K32.

  NO : REPAIR circuit VR217 (GY/YE) or circuit RR131 (VT/GY). Go to K34.

K7 CHECK CIRCUITS VR218 (YE/OG) AND RR132 (BU/WH) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW PASSENGER SIDE IMPACT SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Passenger Side Impact Sensor C3211
- Disconnect: RCM C310a and C310b

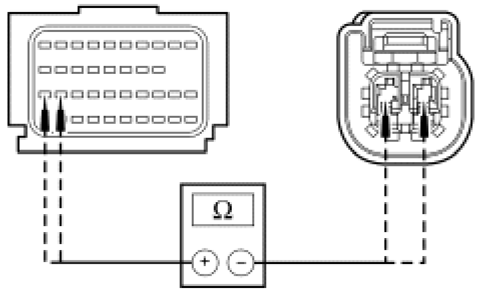

Fig. 92: Measuring Resistance Between RCM C310B-29 & C310B-30, Circuit VR218 (YE/OG) & RR132 (BU/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-29, circuit VR218 (YE/OG), harness side and first row passenger side impact sensor C3211-1, circuit VR218 (YE/OG), harness side; and between RCM C310b-30, circuit RR132 (BU/WH), harness side and first row passenger side impact sensor C3211-2, circuit RR132 (BU/WH), harness side.
- **Are resistances less than 0.5 ohm?**

YES : Go to K8.

NO : REPAIR circuit VR218 (YE/OG) or circuit RR132 (BU/WH). Go to K34.

K8 CHECK THE FIRST ROW PASSENGER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good first row passenger side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
    - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any on-demand B2296 fault PIDs for the first row passenger side impact sensor indicating a fault?**

YES : Go to K32.

NO : Fault corrected. Go to K34.

K9 CHECK CIRCUITS VR218 (YE/OG) AND RR132 (BU/WH) FOR A SHORT TO GROUND BETWEEN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Passenger Side Impact Sensor C3211
- Disconnect: RCM C310a and C310b

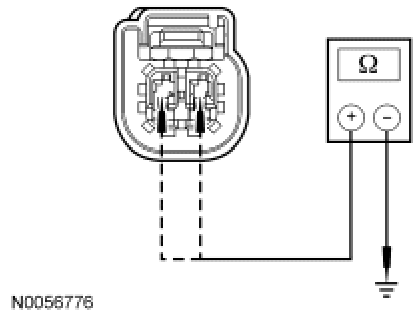

Fig. 93: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row passenger side impact sensor C3211-1, circuit VR218 (YE/OG), harness side and ground; and between C3211-2, circuit RR132 (BU/WH), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

YES : Go to K10.

NO : REPAIR circuit VR218 (YE/OG) or circuit RR132 (BU/WH). Go to K34.

K10 CHECK CIRCUIT VR218 (YE/OG) FOR A SHORT TO CIRCUIT RR132 (BU/WH) BETWEEN THE RCM AND FIRST ROW PASSENGER SIDE IMPACT SENSOR

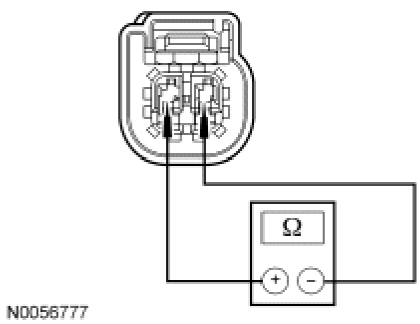

Fig. 94: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row passenger side impact sensor C3211-1, circuit VR218 (YE/OG), harness side and C3211-2, circuit RR132 (BU/WH), harness side.
- **Is resistance greater than 10,000 ohms?**

YES : Go to K32.

NO : REPAIR short between circuits VR218 (YE/OG) and RR132 (BU/WH). Go to K34.

K11 CHECK CIRCUITS VR218 (YE/OG) AND RR132 (BU/WH) FOR A SHORT TO VOLTAGE BETWEEN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Passenger Side Impact Sensor C3211
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

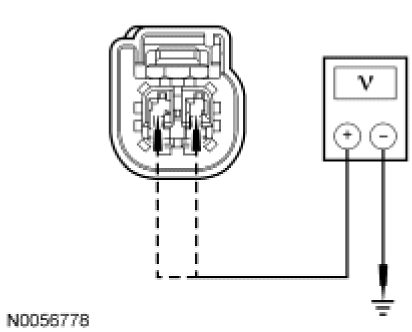

Fig. 95: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between first row passenger side impact sensor C3211-1, circuit VR218 (YE/OG), harness side and ground; and between C3211-2, circuit RR132 (BU/WH), harness side and ground.
- **Are voltages less than 0.2 volt?**

  YES : Go to K32.

  NO : REPAIR circuit VR218 (YE/OG) or circuit RR132 (BU/WH). Go to K34.

K12 CHECK CIRCUITS VR219 (GN/WH) AND RR133 (GY/BN) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Driver Side Impact Sensor C3248
- Disconnect: RCM C310a and C310b

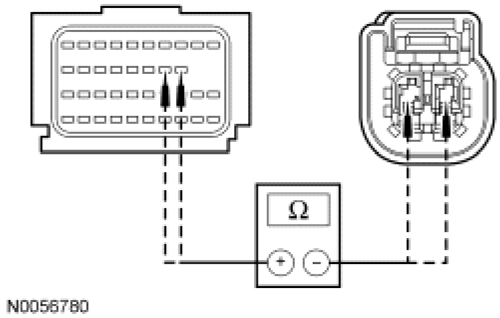

Fig. 96: Measuring Resistance Between RCM C310B-13 & C310B-14, Circuit VR219 (GN/WH) & RR135 (GY/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-13, circuit VR219 (GN/WH), harness side and second row driver side impact sensor C3248-1, circuit VR219 (GN/WH), harness side; and between RCM C310b-14, circuit RR135 (GY/BN), harness side and second row driver side impact sensor C3248-2, circuit RR133 (GY/BN), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to K13.

  NO : REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). Go to K34.

K13 CHECK THE SECOND ROW DRIVER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good second row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
    - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any on-demand B2296 fault PIDs for the second row driver side impact sensor indicating a fault?**

  YES : Go to K32.

  NO : Fault corrected. Go to K34.

K14 CHECK CIRCUITS VR219 (GN/WH) AND RR133 (GY/BN) FOR A SHORT TO GROUND BETWEEN THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Driver Side Impact Sensor C3248
- Disconnect: RCM C310a and C310b

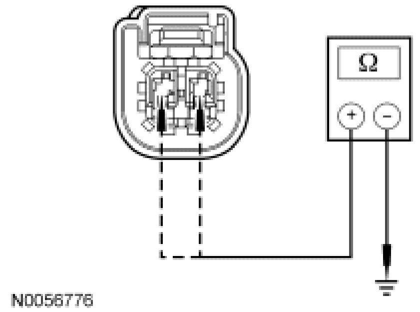

Fig. 97: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row driver side impact sensor C3248-1, circuit VR219 (GN/WH), harness side and ground; and between C3248-2, circuit RR133 (GY/BN), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to K15.

  NO : REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). Go to K34.

K15 CHECK CIRCUIT VR219 (GN/WH) FOR A SHORT TO CIRCUIT RR133 (GY/BN) BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR

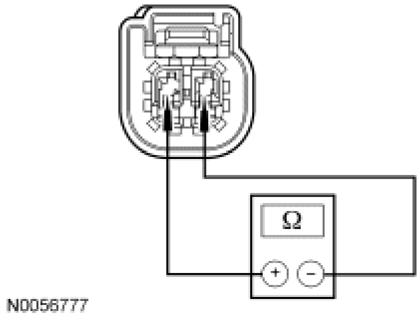

Fig. 98: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row driver side impact sensor C3248-1, circuit VR219 (GN/WH), harness side and C3248-2, circuit RR135 (GY/BN), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to K32.

  NO : REPAIR circuits VR219 (GN/WH) and RR133 (GY/BN). Go to K34.

K16 CHECK CIRCUITS VR219 (GN/WH) AND RR133 (GY/BN) FOR A SHORT TO VOLTAGE BETWEEN THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Driver Side Impact Sensor C3248
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

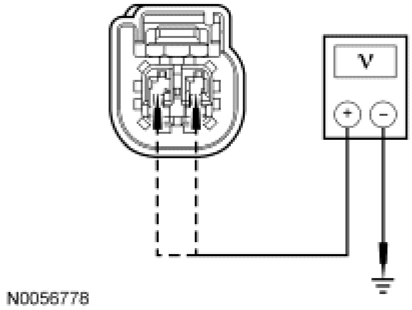

Fig. 99: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between second row driver side impact sensor C3248-1, circuit VR219 (GN/WH), harness side and ground; and between C3248-2, circuit RR133 (GY/BN), harness side and ground.

- **Are voltages less than 0.2 volt?**

  YES : Go to K32.

  NO : REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). Go to K34.

K17 CHECK CIRCUITS VR220 (VT/OG) AND RR134 (BN/BU) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW PASSENGER SIDE IMPACT SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Passenger Side Impact Sensor C3249
- Disconnect: RCM C310a and C310b

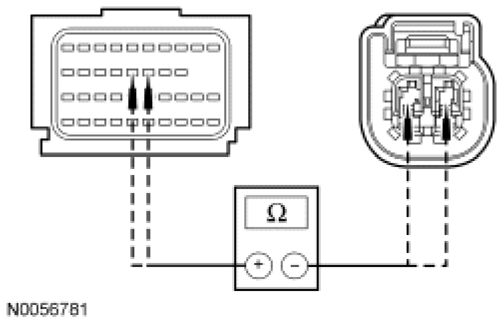

Fig. 100: Measuring Resistance Between RCM C310B-15 & C310B-16, Circuit VR220 (VT/OG) & RR134 (BN/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-15, circuit VR220 (VT/OG), harness side and second row passenger side impact sensor C3249-1, circuit VR220 (VT/OG), harness side and between RCM C310b-16, circuit RR134 (BN/BU), harness side and second row passenger side impact sensor C3249-2, circuit RR134 (BN/BU), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to K18.

  NO : REPAIR circuit VR220 (VT/OG) or circuit RR134 (BN/BU). Go to K34.

K18 CHECK THE SECOND ROW PASSENGER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good second row passenger side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs

- Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any on-demand B2296 fault PIDs for the second row passenger side impact sensor indicating a fault?**

  YES : Go to K32.

  NO : Fault corrected. Go to K34.

K19 CHECK CIRCUITS VR220 (VT/OG) AND RR134 (BN/BU) FOR A SHORT TO GROUND BETWEEN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Passenger Side Impact Sensor C3249
- Disconnect: RCM C310a and C310b

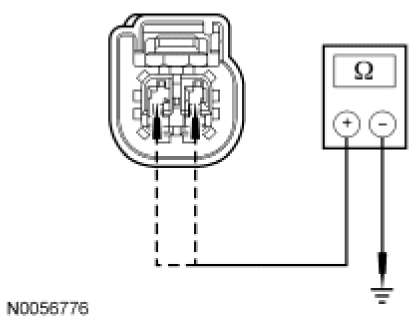

Fig. 101: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row passenger side impact sensor C3249-1, circuit VR220 (VT/OG), harness side and ground; and between C3249-2, circuit RR134 (BN/BU), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to K20.

  NO : REPAIR circuit VR220 (VT/OG) or circuit RR134 (BN/BU). Go to K34.

K20 CHECK CIRCUIT VR220 (VT/OG) FOR A SHORT TO CIRCUIT RR134 (BN/BU) BETWEEN THE RCM AND SECOND ROW PASSENGER SIDE IMPACT SENSOR

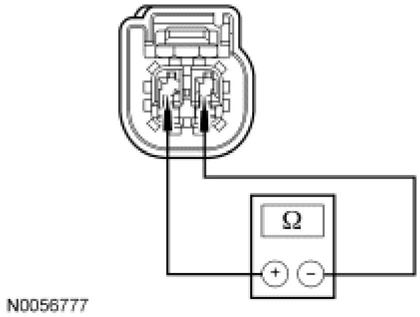

Fig. 102: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row passenger side impact sensor C3249-1, circuit VR220 (VT/OG), harness side and C3249-2, circuit RR134 (BN/BU), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to K32.

  NO : REPAIR circuits VR220 (VT/OG) and RR130 (GN/BU). Go to K34.

K21 CHECK CIRCUITS VR220 (VT/OG) AND RR134 (BN/BU) FOR A SHORT TO VOLTAGE BETWEEN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Passenger Side Impact Sensor C3249
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

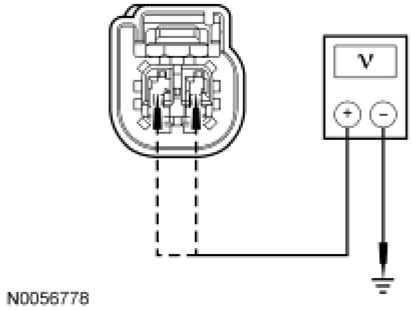

Fig. 103: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between second row passenger side impact sensor C3249-1, circuit VR220 (VT/OG), harness side and ground; and between C3249-2, circuit RR134 (BN/BU), harness side and ground.

- **Are voltages less than 0.2 volt?**

  YES : Go to K32.

  NO : REPAIR circuit VR220 (VT/OG) or circuit RR134 (BN/BU). Go to K34.

K22 CHECK CIRCUITS VR213 (VT/GN) AND RR129 (YE/GY) FOR AN OPEN BETWEEN THE RCM AND DRIVER/CENTER FRONT IMPACT SEVERITY SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver/Center Front Impact Severity Sensor C1465
- Disconnect: RCM C310a and C310b

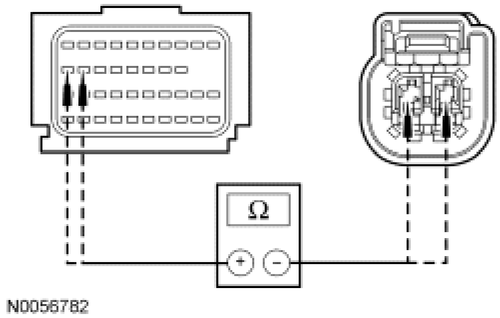

Fig. 104: Measuring Resistance Between RCM C310B-19 & C310B-20, Circuit VR213 (VT/GN) & RR129 (YE/GY)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-19, circuit VR213 (VT/GN), harness side and driver/center front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side; and between RCM C310b-20, circuit RR129 (YE/GY), harness side and driver/center front impact severity sensor C1465-2, circuit RR129 (YE/GY), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to K23.

  NO : REPAIR circuit VR213 (VT/GN) or circuit RR129 (YE/GY). Go to K34.

K23 CHECK THE DRIVER/CENTER FRONT IMPACT SEVERITY SENSOR

- Connect: RCM C310a and C310b
- Install a known good driver/center front impact severity sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs

- Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any on-demand B2296 fault PIDs for the driver/center front impact severity sensor indicating a fault?**

  YES : Go to K32.

  NO : Fault corrected. Go to K34.

K24 CHECK CIRCUITS VR213 (VT/GN) AND RR129 (YE/GY) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER/CENTER FRONT IMPACT SEVERITY SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver/Center Front Impact Severity Sensor C1465
- Disconnect: RCM C310a and C310b

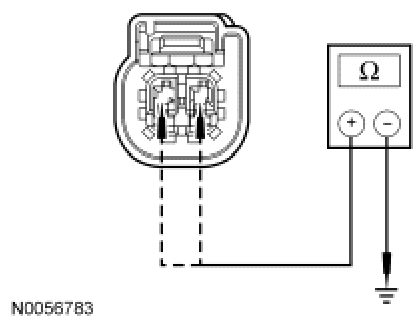

Fig. 105: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver/center front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side and ground; and between driver/center front impact severity sensor C1465-2, circuit RR129 (YE/GY), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to K25.

  NO : REPAIR circuit VR213 (VT/GN) or circuit RR129 (YE/GY). Go to K34.

K25 CHECK CIRCUIT VR213 (VT/GN) FOR A SHORT TO CIRCUIT RR129 (YE/GY) BETWEEN THE RCM AND DRIVER/CENTER FRONT IMPACT SEVERITY SENSOR

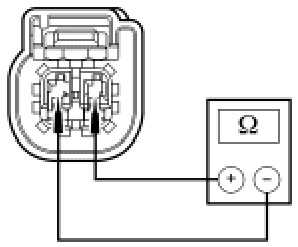

Fig. 106: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver/center front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side and C1465-2, circuit RR129 (YE/GY), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to K32.

  NO : REPAIR circuits VR213 (VT/GN) and RR129 (YE/GY). Go to K34.

K26 CHECK CIRCUITS VR213 (VT/GN) AND RR129 (YE/GY) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND DRIVER/CENTER FRONT IMPACT SEVERITY SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver/Center Front Impact Severity Sensor C1465
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

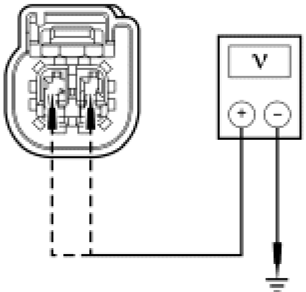

Fig. 107: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver/center front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side and ground; and between driver/center front impact severity sensor C1465-2, circuit RR129 (YE/GY), harness side and ground.

- **Are voltages less than 0.2 volt?**

  YES : Go to K32.

  NO : REPAIR circuit VR213 (VT/GN) or circuit RR129 (YE/GY). Go to K34.

K27 CHECK CIRCUITS VR214 (WH/BU) AND RR130 (GN/BU) FOR AN OPEN BETWEEN THE RCM AND PASSENGER FRONT IMPACT SEVERITY SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Front Impact Severity Sensor C1466
- Disconnect: RCM C310a and C310b

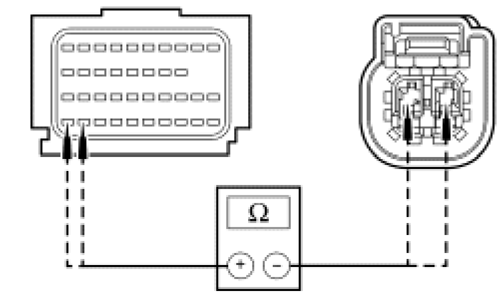

Fig. 108: Measuring Resistance Between RCM C310B-39 & C310B-40, Circuit VR214 (WH/BU) & RR130 (GN/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-39, circuit VR214 (WH/BU), harness side and driver/center front impact severity sensor C1466-1, circuit VR214 (WH/BU), harness side; and between RCM C310b-40, circuit RR130 (GN/BU), harness side and passenger front impact severity sensor C1466-2, circuit RR130 (GN/BU), harness side.
- **Are resistances less than 0.5 ohm?**

  YES : Go to K28.

  NO : REPAIR circuit VR214 (WH/BU) or circuit RR130 (GN/BU). Go to K34.

K28 CHECK THE PASSENGER FRONT IMPACT SEVERITY SENSOR

- Connect: RCM C310a and C310b
- Install a known good passenger front impact severity sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs

- Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any on-demand B2296 fault PIDs for the passenger front impact severity sensor indicating a fault?**

  YES : Go to K32.

  NO : Fault corrected. Go to K34.

K29 CHECK CIRCUITS VR214 (WH/BU) AND RR130 (GN/BU) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER FRONT IMPACT SEVERITY SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Front Impact Severity Sensor C1466
- Disconnect: RCM C310a and C310b

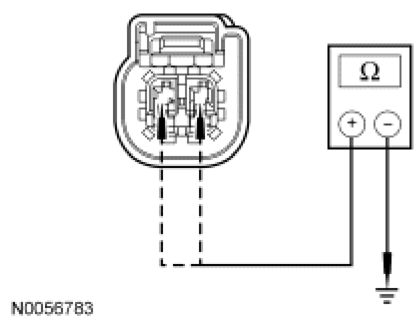

Fig. 109: Measuring Resistance
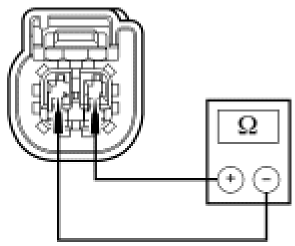
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger front impact severity sensor C1466-1, circuit VR214 (WH/BU), harness side and ground; and between passenger front impact severity sensor C1466-2, circuit RR130 (GN/BU), harness side and ground.
- **Are resistances greater than 10,000 ohms?**

  YES : Go to K30.

  NO : REPAIR circuit VR214 (WH/BU) or circuit RR130 (GN/BU). Go to K34.

K30 CHECK CIRCUIT VR214 (WH/BU) FOR A SHORT TO CIRCUIT RR130 (GN/BU) BETWEEN THE RCM AND PASSENGER FRONT IMPACT SEVERITY SENSOR



N0056784

Fig. 110: Measuring Resistance
Courtesy of FORD MOTOR CO.

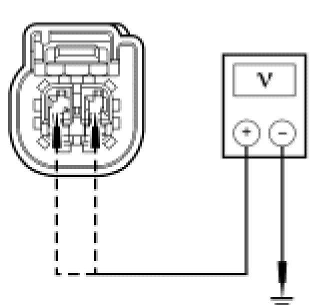
- Measure the resistance between passenger front impact severity sensor C1466-1, circuit VR214 (WH/BU), harness side and C1466-2, circuit RR130 (GN/BU), harness side.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to K32.

  NO : REPAIR circuits VR214 (WH/BU) and RR130 (GN/BU). Go to K34.

K31 CHECK CIRCUITS VR214 (WH/BU) AND RR130 (GN/BU) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER FRONT IMPACT SEVERITY SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Front Impact Severity Sensor C1466
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.



N0056785

Fig. 111: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger front impact severity sensor C1466-1, circuit VR214 (WH/BU), harness side and ground; and between passenger front impact severity sensor C1466-2, circuit RR130 (GN/BU), harness side and ground.

- **Are voltages less than 0.2 volt?**

  YES : Go to K32.

  NO : REPAIR circuit VR214 (WH/BU) or circuit RR130 (GN/BU). Go to K34.

K32 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Install the original sensor (if known good sensor was installed in a previous step).
- Connect: All Previously Disconnected SRS Components
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Does the original RCM on-demand DTC B2296 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to K34.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to K33.

K33 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any on-demand fault DTC B2296 PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is now present. The fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2296_30_OD (Side Crash Sensor Internal Fault, Front Driver Side), INSTALL a new first row driver side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to K34.

For 2296_28_OD (Side Crash Sensor Internal Fault, Front Passenger Side), INSTALL a new first row passenger side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to K34.

For 2296_26_OD (Side Crash Sensor 2 Internal Fault, Driver side), INSTALL a new second row driver side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to K34.

For second row passenger side impact sensor with an internal fault (2296_24_OD (Side Crash Sensor 2 Internal Fault, Passenger side), INSTALL a new second row passenger side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to K34.

For 2296_18_OD (Driver/Center Front Crash Sensor Internal Fault), INSTALL a new driver/center front impact severity sensor. REFER to **Front Impact Severity Sensor**. Go to K34.

For 2296_58_OD (Passenger Front Crash Sensor Internal Fault), INSTALL a new passenger front impact severity sensor. REFER to **Front Impact Severity Sensor**. Go to K34.

For 2296_17_OD (Side Crash Sensor Communication Fault, Front Driver Side)/2296_31_OD (Side Crash Sensor Mount or Communication Fault, Front Driver Side), go to K2.

For 2296_16_OD (Side Crash Sensor Circuit Short to Ground, Front Driver Side), go to K4.

For 2296_15_OD (Side Crash Sensor Circuit Short to Battery, Front Driver Side), go to K6.

For 2296_14_OD (Side Crash Sensor Communication Fault, Front Passenger Side), go to K7.

For 2296_13_OD (Side Crash Sensor Circuit Short to Ground, Front Passenger Side), go to K9.

For 2296_12_OD (Side Crash Sensor Circuit Short to Battery, Front Passenger Side), go to K11.

For 2296_11_OD (Side Crash Sensor Communication Fault, Row No.2 Driver Side), go to K12.

For 2296_10_OD (Side Crash Sensor Circuit Short to Ground, Row No.2 Driver Side), go to K14.

For 2296_9_OD (Side Crash Sensor Circuit Short to Battery, Row No.2 Driver Side), go to K16.

For 2296_8_OD (Side Crash Sensor Communication Fault, Row No.2 Passenger Side), go to K17.

For 2296_7_OD (Side Crash Sensor Circuit Short to Ground, Row No.2 Passenger Side), go to K19.

For 2296_6_OD (Side Crash Sensor Circuit Short to Battery, Row No.2 Passenger Side), go to K21.

For 2296_5_OD (Driver/Center Front Crash Sensor Communication Fault), go to K22.

For 2296_4_OD (Driver/Center Front Crash Sensor Circuit Short to Ground), go to K24.

For 2296_3_OD (Driver/Center Front Crash Sensor Circuit Short to Battery), go to K26.

For 2296_59_OD (Passenger Front Crash Sensor Mount/Communication Fault), go to K27.

For 2296_56_OD (Passenger Front Crash Sensor Circuit Short to Ground), go to K29.

For 2296_55_OD (Passenger Front Crash Sensor Circuit Short to Battery), go to K31.

NO : VISUALLY INSPECT the affected impact sensor and mounting surface for damage, corrosion or dirt. INSPECT the wiring, terminals and connectors for damage, corrosion or dirt. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to K34.

K34 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test L: DTC B2432 - Drivers Seat Belt Buckle Switch Circuit Open

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) checks the safety belt buckle switch circuits for faults. If the RCM detects an open circuit fault, it will store DTC B2432 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2432 Drivers Seat Belt Buckle Switch Circuit Open - If the RCM detects an open on the driver safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

PINPOINT TEST L: DTC B2432 - DRIVERS SEAT BELT BUCKLE SWITCH CIRCUIT OPEN

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

L1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2432 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to L2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to L6.

L2 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Buckle Switch C3065
- Connect a fused jumper wire between driver safety belt buckle switch C3065-1, circuit GD143 (BK/VT), harness side and C3065-2, circuit CR201 (BU/OG).
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the driver safety belt buckle switch on-demand DTC change from indicating B2432 to B2434?**

  YES : INSTALL a new driver safety belt buckle. REFER to **SAFETY BELT SYSTEM** article. Go to L7.

  NO : Go to L3.

L3 CHECK CIRCUIT CR201 (BU/OG) FOR AN OPEN BETWEEN THE RCM AND DRIVER SAFETY BELT BUCKLE SWITCH

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

- Remove the fused jumper wire from the driver safety belt buckle switch connector.

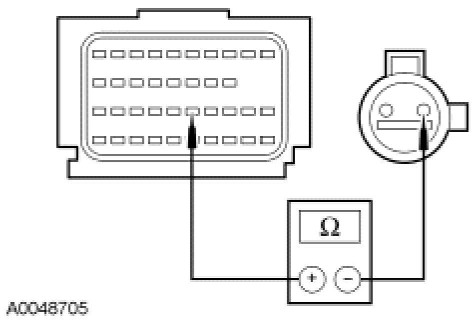


Fig. 112: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-25, circuit CR201 (BU/OG), harness side and driver safety belt buckle switch C3065-2, circuit CR201 (BU/OG), harness side.
- **Is resistance less than 0.5 ohm?**

  YES : Go to L4.

  NO : REPAIR circuit CR201 (BU/OG). Go to L7.

L4 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN

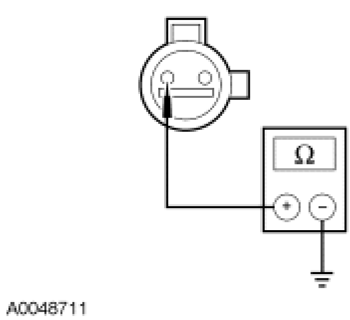

Fig. 113: Measuring Resistance Between Connector And Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety belt buckle switch C3065-1, circuit GD143 (BK/VT), harness side and ground.
- **Is resistance less than 0.5 ohm?**

  YES : Go to L5.

  NO : REPAIR circuit GD143 (BK/VT). Go to L7.

L5 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self**

test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Driver Safety Belt Buckle Switch C3065
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2432 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to L7.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to L6.

L6 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2432 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to L2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to L7.

L7 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints

- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test M: DTC B2433 - Drivers Seat Belt Buckle Switch Circuit Short to Battery

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) checks the safety belt buckle switch circuits for faults. If the RCM detects a short to voltage fault, it will store DTC B2433 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2433 Drivers Seat Belt Buckle Switch Circuit Short to Battery - If the RCM detects a short to battery on the driver safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

PINPOINT TEST M: DTC B2433 - DRIVERS SEAT BELT BUCKLE SWITCH CIRCUIT SHORT TO BATTERY

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor**

pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

M1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2433 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to M2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to M4.

M2 CHECK CIRCUIT CR201 (BU/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Side Air Bag Module C3628
- Disconnect: Driver Safety Belt Buckle Switch C3065
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

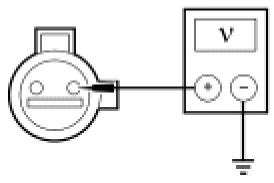

Fig. 114: Measuring Voltage Between connector And Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver safety belt buckle switch C3065-2, circuit CR201 (BU/OG), harness side and ground.
- **Is voltage less than 0.2 volt?**

  YES : Go to M3.

  NO : REPAIR circuit CR201 (BU/OG). Go to M5.

M3 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Driver Safety Belt Buckle Switch C3065
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2433 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to M5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to M4.

M4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2433 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to M2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to M5.

M5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test N: DTC B2434 - Drivers Seat Belt Buckle Switch Short to Ground

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store DTC B2434 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2434 Drivers Seat Belt Buckle Switch Circuit Short to Ground - If the RCM detects a short to ground on the driver safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

PINPOINT TEST N: DTC B2434 - DRIVERS SEAT BELT BUCKLE SWITCH SHORT TO GROUND

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle**

to the customer.

N1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2434 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to N2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to N5.

N2 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH FOR A SHORT TO GROUND

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Buckle Switch C3065
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, a open circuit fault would normally be retrieved.
- **Did the driver safety belt buckle switch on-demand DTC change from indicating B2434 to B2432?**

  YES : INSTALL a new driver safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to N6.

  NO : Go to N3.

N3 CHECK CIRCUIT CR201 (BU/OG) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER SAFETY BELT BUCKLE SWITCH

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

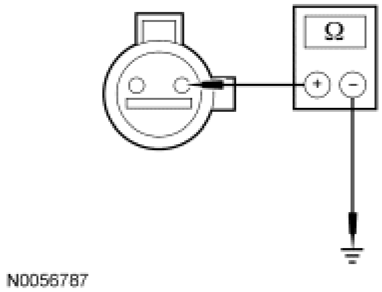

Fig. 115: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety belt buckle switch C3065-2, circuit CR201 (BU/OG), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to N4.

  NO : REPAIR circuit CR201 (BU/OG). Go to N6.

N4 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Connect: Driver Safety Belt Buckle Switch C3065
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2434 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to N6.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to N5.

N5 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs

- **Was RCM on-demand DTC B2434 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to N2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to N6.

N6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test O: DTC B2435 - Drivers Seat Belt Buckle Switch Resistance Out of Range

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store DTC B2435 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2435 Drivers Seat Belt Buckle Switch Resistance Out of Range - If the RCM detects a current out of range between buckled and unbuckled on the driver safety belt buckle switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Driver safety belt buckle and pretensioner assembly
- RCM

PINPOINT TEST O: DTC B2435 - DRIVERS SEAT BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

O1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs

- **Was RCM on-demand DTC B2435 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to O2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to O4.

O2 CHECK THE SAFETY BELT BUCKLE SWITCH

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Buckle Switch C3065
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, a open circuit fault would normally be retrieved.
- **Did the driver safety belt buckle switch on-demand DTC change from indicating B2435 to B2432?**

  YES : INSTALL a new driver safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to O3.

  NO : Go to O5.

O3 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Driver Safety Belt Buckle Switch C3065
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2435 retrieved?**

YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to O5.

NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to O4.

O4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the driver safety belt buckle switch C3065:
  - Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - Inspect wire harness for any damage, pinched, cut or pierced wires.
  - Repair any concerns found. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information.
- Connect: All Previously Disconnected Component(s)/Connector(s)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2435 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to O2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to O5.

O5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

> WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test P: DTC B2436 - Passengers Seat Belt Buckle Switch Circuit Open

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) checks the passenger safety belt buckle switch circuits for faults. If the RCM detects an open circuit fault, it will store DTC B2436 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2436 Passengers Seat Belt Buckle Switch Circuit Open - If the RCM detects an open on the passenger safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST P: DTC B2436 - PASSENGERS SEAT BELT BUCKLE SWITCH CIRCUIT OPEN

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

P1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2436 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to P2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to P6.

P2 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Buckle Switch C3066
- Connect a fused jumper wire between passenger safety belt buckle switch C3066-2, circuit CR203 (GY/VT), harness side and C3066-1, circuit GD143 (BK/VT), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2436 to B2438?**

  YES : INSTALL a new passenger safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to P7.

  NO : Go to P3.

P3 CHECK CIRCUIT CR203 (GY/VT) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SAFETY BELT BUCKLE SWITCH

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the passenger safety belt buckle switch C3066.
- Disconnect: RCM C310a and C310b

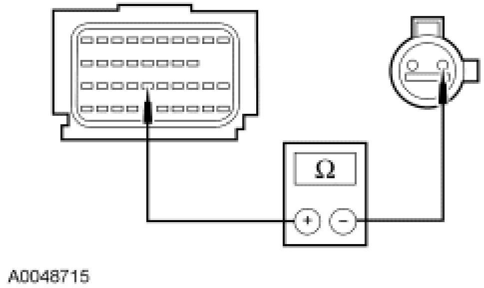

Fig. 116: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-26, circuit CR203 (GY/VT), harness side and the passenger safety belt buckle switch C3066-2, circuit CR203 (GY/VT), harness side.
- **Is resistance less than 0.5 ohm?**

  YES : Go to P4.

  NO : REPAIR circuit CR203 (GY/VT). Go to P7.

P4 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN

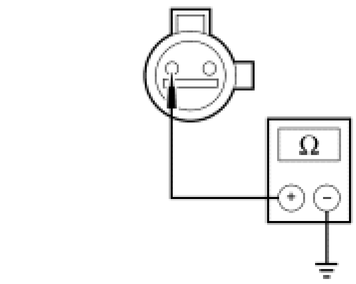

Fig. 117: Measuring Resistance Between Connector And Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety belt buckle switch C3066-2, circuit GD143 (BK/VT), harness side and ground.
- **Is resistance less than 0.5 ohm?**

  YES : Go to P5.

  NO : REPAIR circuit GD143 (BK/VT). Go to P7.

P5 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Passenger Safety Belt Buckle Switch C3066
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2436 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to P7.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to P6.

P6 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2436 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to P2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to P7.

P7 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test Q: DTC B2437 - Passengers Seat Belt Buckle Switch Circuit Short to Battery

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) checks the passenger safety belt buckle switch circuits for faults. If the RCM detects a short to voltage fault, it will store DTC B2437 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2437 Passengers Seat Belt Buckle Switch Circuit Short to Battery - If the RCM detects a short to battery on the passenger safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST Q: DTC B2437 - PASSENGER'S SEAT BELT BUCKLE SWITCH CIRCUIT SHORT TO BATTERY

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

Q1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

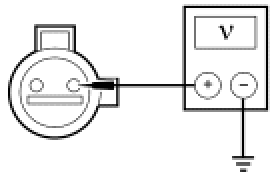
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2437 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to Q2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to Q4.

Q2 CHECK CIRCUIT CR203 (GY/VT) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect: Passenger Safety Belt Buckle Switch C3066
- Disconnect: Passenger Seat Side Air Bag Module C327
- Disconnect: Passenger Safety Belt Retractor Pretensioner C303
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.



A0048712

Fig. 118: Measuring Voltage Between connector And Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat belt buckle switch C3066-2, circuit CR203 (GY/VT), harness side and ground.
- **Is voltage less than 0.2 volt?**

  YES : Go to Q3.

  NO : REPAIR circuit CR203 (GY/VT). Go to Q5.

Q3 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self**

test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: RCM C310a and C310b
- Connect: Passenger Safety Belt Buckle Switch C3066
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2437 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to Q5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to Q4.

Q4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C303
- Disconnect: Passenger Seat Side Air Bag Module C327
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2437 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to Q2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to Q5.

Q5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: Turn the ignition OFF and wait one minute to deplete the

backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test R: DTC B2438 - Passengers Seat Belt Buckle Switch Short to Ground

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the passenger safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store DTC B2438 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2438 Passenger's Seat Belt Buckle Switch Circuit Short to Ground - If the RCM detects a short to ground on the passenger safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST R: DTC B2438 - PASSENGERS SEAT BELT BUCKLE SWITCH SHORT TO GROUND

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and**

the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

R1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2438 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to R2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to R5.

R2 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Buckle Switch C3066
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, a open circuit fault would normally be retrieved.
- **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2438 to B2436?**

  YES : INSTALL a new passenger safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to R6.

  NO : Go to R3.

R3 CHECK CIRCUIT CR203 (GY/VT) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SAFETY BELT BUCKLE SWITCH

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

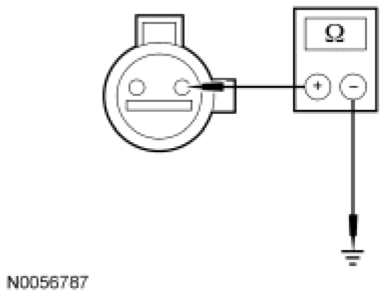


Fig. 119: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat belt buckle switch C3066-2, circuit CR203 (GY/VT), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to R4.

  NO : REPAIR circuit CR203 (GY/VT). Go to R6.

R4 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Connect: Passenger Safety Belt Buckle Switch C3066
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2438 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to R6.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to R5.

R5 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2438 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to R2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to R6.

R6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test S: DTC B2439 - Passengers Seat Belt Buckle Switch Resistance Out of Range

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the passenger safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store DTC B2439 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2439 Passengers Seat Belt Buckle Switch Resistance Out of Range - If the RCM detects a current out of range between buckled and unbuckled on the passenger safety belt buckle switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST S: DTC B2439 - PASSENGERS SEAT BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

S1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2439 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to S2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to S4.

S2 CHECK THE SAFETY BELT BUCKLE SWITCH

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Buckle Switch C3066
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs

- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, a open circuit fault would normally be retrieved.
- **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2439 to B2436?**

  YES : INSTALL a new passenger safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to S5.

  NO : Go to S3.

S3 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Passenger Safety Belt Buckle Switch C3066
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2439 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to S5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to S4.

S4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the passenger safety belt buckle switch C3066:
  - Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - Inspect wire harness for any damage, pinched, cut or pierced wires.
  - Repair any concerns found. Refer to appropriate SYSTEM WIRING DIAGRAMS article, Connector Repair Procedures for schematic and connector information.
- Connect: All Previously Disconnected Component(s)/Connector(s)

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC B2439 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to S2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to S5.

S5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test T: DTC B2792 - Cross Link Between Firing Loops

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors all the deployable devices for a cross link between the circuits of another deployable device. If the RCM detects a short between the circuits of the deployable devices, it will store DTC B2792 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

Fault PIDs[a]	Description	Fault Trigger Condition
2792_8_OD and 2792_8_CM	A-B or A-C pillar Curtain, Passenger Side	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_9_OD and 2792_9_CM	A-B or A-C pillar Curtain, Driver Side	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_12_OD and 2792_12_CM	Side Airbag Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_13_OD and 2792_13_CM	Side Airbag Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_26_OD and 2792_26_CM	Pretensioner Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_27_OD and 2792_27_CM	Pretensioner Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_28_OD and 2792_28_CM	Airbag Passenger Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_29_OD and 2792_29_CM	Airbag Passenger Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_30_OD and 2792_30_CM	Airbag Driver Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_31_OD and 2792_31_CM	Airbag Driver Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2792. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2792.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM

PINPOINT TEST T: DTC B2792 - CROSS LINK BETWEEN FIRING LOOPS

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

T1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record

On-Demand and Continuous Memory DTCs

- Enter the following diagnostic mode on the diagnostic tool: Datalogger - RCM - View and Record All B2792 Fault PIDs
- **Do any RCM on-demand B2792 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to T2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to T4.

T2 CHECK DEPLOYABLE CIRCUITS FOR A CROSS LINK FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect **ALL of the affected** deployable devices.
- Using the following chart, measure the resistance between the circuits of the affected deployable devices.

DEPLOYABLE DEVICES

Squib/Loop	Connector - Pin	Circuit
Driver air bag module loop 1	• Driver air bag module loop 1 electrical connector • Driver air bag module loop 1 electrical connector	• CR101 (VT/BN) • RR101 (YE/GN)
Driver air bag module loop 2	• Driver air bag module loop 2 electrical connector • Driver air bag module loop 2 electrical	• CR102 (BU) • RR102 (WH)

	connector	
Passenger air bag module loop 1	• C256a-1 • C256a-2	• CR103 (GY/BU) • RR103 (VT/GN)
Passenger air bag module loop 2	• C256b-1 • C256b-2	• CR104 (YE/GY) • RR104 (WH/BU)
Driver side air bag module (seat harness connector)	• C328-1 • C328-2	• CR105 (GN/BN) • RR105 (GY/YE)
Passenger side air bag module (seat harness connector)	• C327-1 • C327-2	• CR106 (VT/GY) • RR106 (YE/OG)
Driver safety canopy module	• C9018-1 • C9018-2	• CR109 (BN/BU) • RR109 (BU/GN)
Passenger safety canopy module	• C9019-1 • C9019-2	• CR111 (BN/WH) • RR111 (YE/VT)
Driver safety belt retractor pretensioner	• C3201-2 • C3201-1	• CR120 (BU/OG) • RR120 (BN/GN)
Passenger safety belt retractor pretensioner	• C3202-2 • C3202-1	• CR122 (WH/OG) • RR122 (BN)

- **Are resistances greater than 10,000 ohms between the affected circuits?**

  YES : Go to T3.

  NO : REPAIR the affected circuits. Go to T5.

T3 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Connect: All Previously Disconnected Restraint System Component(s)
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2792 Fault PIDs
- **Do any RCM on-demand B2792 fault PIDs indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to T5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to T4.

T4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If a cross link fault for driver air bag loop 1 or loop 2 is present continuous, remove the driver air bag module. Refer to **Driver Air Bag Module**.
- If a cross link fault for passenger air bag module loop 1 or loop 2 is present continuous, disconnect the passenger air bag module C256a and C256b.
- If a cross link fault for driver side air bag is present continuous, disconnect the driver side air bag module C328.
- If a cross link fault for passenger side air bag is present continuous, disconnect the passenger side air bag module C327.
- If a cross link fault for driver safety canopy module is present continuous, disconnect the driver safety canopy module C9018.
- If a cross link fault for passenger safety canopy module is present continuous, disconnect the passenger safety canopy module C9019.
- If a cross link fault for driver safety belt retractor pretensioner is present continuous, disconnect the driver safety belt retractor pretensioner C323.
- If a cross link fault for passenger safety belt retractor pretensioner is present continuous, disconnect the passenger safety belt retractor pretensioner C303.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint**

System (SRS) Depowering and Repowering.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2792 Fault PIDs
- **Do any RCM on-demand B2792 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to T2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to T5.

T5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test U: DTC B229B - Occupant Classification System Obstruction

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The occupant classification sensor (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The occupant classification system module (OCSM) monitors the 4 OCS weight sensors bolts and circuity for faults. If the OCSM detects an obstruction, an upward force on the passenger seat for 60 seconds, it will store DTC B229B in memory and send a message to the restraints control module (RCM). The RCM will store DTC B2290 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B229B Occupant Classification System Obstruction - If the OCSM detects a negative force on one or more OCS weight sensor bolt(s) (weight sensors), it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Foreign object placed under or contacting the passenger seat

PINPOINT TEST U: DTC B229B - OCCUPANT CLASSIFICATION SYSTEM OBSTRUCTION

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

U1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record Continuous Memory DTCs
- **Was OCSM on-demand DTC B229B retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to U2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to U4.

U2 INSPECT UNDER THE PASSENGER SEAT FOR FOREIGN OBJECTS AND WIRE HARNESS

- Key in OFF position.
- Position the seat and inspect under and on the sides of the seat for the presence of any foreign objects contacting the under side and side of the passenger seat. Carry out a thorough visual inspection of the passenger seat wire harness at or near the OCS weight sensor bolts and the related seat wiring harness and body wiring harness for correct harness routing.
- **Were any problems noted?**

  YES : REMOVE obstruction and/or REPAIR as necessary. Go to U5.

  NO : Go to U3.

U3 CONFIRM THE OCS MODULE FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record Continuous Memory DTCs
- **Was OCSM on-demand DTC B229B retrieved?**

  YES : INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM) - Manual Seat Track** or **Occupant Classification System Module (OCSM) - Power Seat Track**. Go to U5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to U5.

U4 CHECK FOR AN INTERMITTENT FAULT

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM - Retrieve and Record Continuous Memory DTCs
- **Was OCSM on-demand DTC B229B retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to U2.

NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to U5.

U5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test V: DTC C1946 - Front Driver's Seat Track Position Switch Circuit Open

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects an open circuit, it will store DTC C1946 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC C1946 Front Driver's Seat Track Position Switch Circuit Open - If the RCM detects a open on the driver seat track position sensor circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST V: DTC C1946 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT

OPEN

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

V1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1946 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to V2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to V6.

V2 CHECK THE DRIVER SEAT TRACK POSITION SENSOR

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

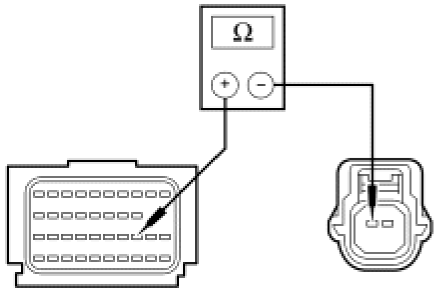
- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Track Position Sensor C356
- Connect a fused jumper wire between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and C356-1, circuit GD143 (BK/VT), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the driver seat track position switch on-demand DTC change from indicating C1946 to C1947?**

  YES : INSTALL a new driver seat track position sensor. REFER to **Seat Position Sensor**. Go to V7.

  NO : Go to V3.

V3 CHECK CIRCUIT VR215 (YE/VT) FOR AN OPEN BETWEEN THE RCM AND DRIVER SEAT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Remover the fused jumper wire from the driver seat track position sensor C356.



N0056788

Fig. 120: Measuring Resistance Between RCM C310B-23, Circuit VR215 (YE/VT) & Driver Seat Track Position Sensor C356-2
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-23, circuit VR215 (YE/VT), harness side and driver seat track position sensor C356-2, circuit VR215 (YE/VT).
- **Is resistance less than 0.5 ohm?**

  YES : Go to V4.

  NO : REPAIR circuit VR215 (YE/VT). Go to V7.

V4 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN TO GROUND

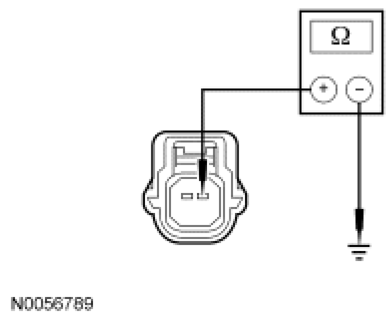


Fig. 121: Measuring Resistance Between Driver Seat Track Position Sensor C356-1, Circuit GD143 (BK/VT) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat track position sensor C356-1, circuit GD143 (BK/VT) and ground.
- **Is resistance less than 0.5 ohm?**

  YES : Go to V5.

  NO : REPAIR circuit GD143 (BK/VT). Go to V7.

V5 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Driver Seat Track Position Sensor C356
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1946 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to V7.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to V6.

V6 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Disconnect: Driver Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1946 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to V2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to V7.

V7 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints

- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test W: DTC C1947 - Front Driver's Seat Track Position Switch Circuit Short to Ground

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a short to ground, it will store DTC C1947 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC C1947 Front Driver's Seat Track Position Switch Circuit Short to Ground - If the RCM detects a short to ground on the driver seat track position sensor circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST W: DTC C1947 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT SHORT TO GROUND

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor**

pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

W1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1947 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to W2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to W5.

W2 CHECK THE SEAT TRACK POSITION SENSOR

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Seat Track Position Sensor C356
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs

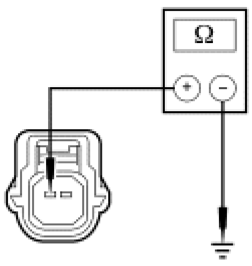
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor disconnected, an open circuit fault would normally be retrieved.
- **Did the driver seat track position switch on-demand DTC change from indicating C1947 to C1946?**

  YES : INSTALL a new driver seat track position sensor. REFER to **Seat Position Sensor**. Go to W6.

  NO : Go to W3.

W3 CHECK CIRCUIT VR215 (YE/VT) FOR A SHORT TO GROUND BETWEEN THE RCM AND SEAT TRACK POSITION SENSOR

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b



N0056790

Fig. 122: Measuring Resistance Between Driver Seat Track Position Sensor C356-2, Circuit VR215 (YE/VT) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat track position sensor C356-2, circuit VR215 (YE/VT) and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to W4.

  NO : REPAIR circuit VR215 (YE/VT). Go to W6.

W4 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Seat Track Position Sensor C356

- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1947 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to W6.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to W5.

W5 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Disconnect: Driver Side Air Bag Module C3051
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1947 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to W2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to W6.

W6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at

this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test X: DTC C1948 - Front Driver's Seat Track Position Switch Circuit Resistance Out of Range

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

NOTE: Due to the seat track position sensor being a Hall-effect type sensor, this pinpoint test will be diagnosing a current out of range fault instead of the current DTC definition for a resistance out of range fault.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a current out of range condition, it will store DTC C1948 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC C1948 Front Driver's Seat Track Position Switch Circuit Resistance Out of Range - If the RCM detects a current out of range between forward and rearward on the driver seat track position switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST X: DTC C1948 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT RESISTANCE OUT OF RANGE

WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in

the accidental deployment of the safety canopy and cause serious personal injury or death.

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

X1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1948 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to X2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to X4.

X2 CHECK THE DRIVER SEAT TRACK POSITION SENSOR

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Track Position Sensor C356
- Connect a fused jumper wire between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and C356-1, circuit GD143 (BK/VT), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the driver seat track position sensor on-demand DTC change from indicating C1948 to C1947?**

  YES : INSTALL a new driver seat track position sensor. REFER to **Seat Position Sensor**. Go to X5.

  NO : Go to X3.

X3 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Driver Seat Track Position Sensor C356
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1948 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to X5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to X4.

X4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Disconnect: Driver Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1948 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to X2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to X5.

X5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

  WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to**DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test Y: DTC C1982 - Front Driver's Seat Track Position Switch Circuit Short to Battery

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a short to battery, it will store DTC C1982 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC C1982 Front Driver's Seat Track Position Switch Circuit Short to Battery - If the RCM detects a short to battery on the driver seat track position sensor circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM

PINPOINT TEST Y: C1982 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT SHORT TO BATTERY

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to**

follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Y1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

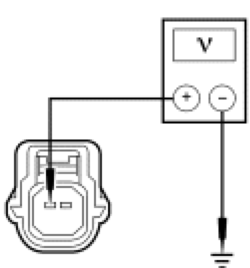
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1982 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to Y2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to Y4.

Y2 CHECK CIRCUITS VR215 (YE/VT) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect: Driver Seat Track Position Sensor C356
- Disconnect: Driver Side Air Bag Module C328
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.



N0056791

Fig. 123: Measuring Voltage Between Driver Seat Track Position Sensor C356-2, Circuit VR215 (YE/VT) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and ground.
- **Is voltage less than 0.2 volt?**

  YES : Go to Y3.

NO : REPAIR circuit VR215 (YE/VT). Go to Y5.

Y3 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: RCM C310a and C310b
- Connect: Driver Seat Track Position Sensor C356
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1982 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to Y5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of any electrical connector that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to Y4.

Y4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Disconnect: Driver Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM - Retrieve and Record On-Demand and Continuous Memory DTCs
- **Was RCM on-demand DTC C1982 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to Y2.

  NO : CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint**

test. REPAIR any intermittent wiring, terminal or connector concerns found. Go to Y5.

Y5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

> WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to **DTC Charts** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test Z: DTC B1013 - Occupant Classification Calibration Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Supplemental Restraint System for schematic and connector information.

Normal Operation

The occupant classification sensor (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The occupant classification system module (OCSM) monitors the OCS weight sensor bolts for a correct calibration/weight and ID from each sensor. If the OCSM detects an incorrect weight or ID from any of the 4 seat weight sensors, a seat track that is mis-aligned/bent, wire harness connected to the incorrect OCS weight sensor bolt, an unsuccessful system reset or if an OCS system component has been installed new, it will store DTC B1013 in memory and send a message to the restraints control module (RCM) which stores DTC B2290 in memory. The RCM will then send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

This pinpoint test is intended to diagnose the following:

- Wiring of OCS weight sensor bolts
- Wiring, terminals or connectors
- OCS system component installed new

- Passenger seat track
- Misrouted harness
- Seat track mounting and alignment
- Seat track fastener torque

PINPOINT TEST Z: DTC B1013 - OCCUPANT CLASSIFICATION CALIBRATION FAULT

NOTE: Do not install any new OCS system components until directed to do so during the pinpoint test.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: If a new OCS system component has been installed, the OCSM will store DTC B1013, causing the air bag warning indicator to illuminate during the prove out. This DTC will clear after a successful system reset.

Z1 CHECK THE SEAT HARNESS WIRING AND CONNECTORS

- Key in OFF position.
- Carry out a thorough visual inspection of the OCS system harness wiring, terminals and connectors and the related seat wiring harness and body wiring harness terminals and connectors for any damage, misrouting or pulling on any OCS weight sensor bolt.

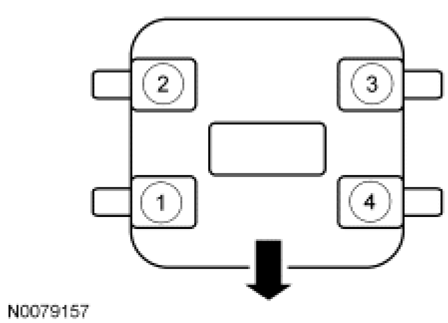


Fig. 124: Identifying OCS System Harness Connector
Courtesy of FORD MOTOR CO.

NOTE: The OCS weight sensor bolts do not have differently keyed connectors. Connecting the incorrect connector to a sensor will cause DTC B1013 to set and may cause other erroneous DTCs to set.

- Using the illustration, identify that the sensors are connected correctly. Refer to appropriate

SYSTEM WIRING DIAGRAMS article for schematic and connector information.

OCS Weight Sensor Bolt Location

- OCS weight sensor bolt 1, located at the front outboard
- OCS weight sensor bolt 2, located at the rear outboard
- OCS weight sensor bolt 3, located at the rear inboard
- OCS weight sensor bolt 4, located at the front inboard

- **Were any wiring or connector concerns noted?**

  YES : REPAIR the seat connectors and wiring as needed. CARRY OUT the OCS system reset. REFER to **Occupant Classification Sensor (OCS) System Reset**. Go to Z3.

  NO : Go to Z2.

Z2 CHECK THE SEAT TRACK

NOTE: Correct seat track alignment on a passenger front manual seat (if equipped) is critical before removing the seat from the vehicle. During seat installation, the inboard and outboard tracks must be in alignment with each other. Failure to follow this instruction may result in an unsuccessful system reset and incorrect operation of the OCS system.

NOTE: Check for a bent or binding power seat track assembly (if equipped). Position the seat in all positions and check for correct operation after installation of the seat into the vehicle. Failure to follow this instruction may result in an unsuccessful system reset and incorrect operation of the OCS system.

NOTE: The passenger seat bolts must be tightened to the correct specifications and in the correct sequence. Failure to follow this instruction may result in an unsuccessful system reset and incorrect operation of the OCS system. Refer to SEATING article Seat Removal and Installation.

- Loosen the 4 seat track to floor mounting bolts.
- Tighten the seat track-to-floor bolts in the following sequence.
  A. Tighten the front inboard seat track-to-floor bolt to 55 Nm (41 lb-ft).
  B. Tighten the front outboard seat track-to-floor bolt to 55 Nm (41 lb-ft).
  C. Tighten the rear inboard seat track-to-floor bolt to 55 Nm (41 lb-ft).
  D. Tighten the rear outboard seat track-to-floor bolt to 55 Nm (41 lb-ft).
- Carry out the OCS system reset. Refer to **Occupant Classification Sensor (OCS) System Reset**.
- **Did the system reset pass?**

  YES : Fault corrected. Go to Z3.

NO : INSTALL a new seat track with OCS weight sensor bolts. REFER to **SEATING** article. Go to Z3.

Z3 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

  WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the Supplemental Restraint System (SRS) DTC Chart for pinpoint test direction.

  NO : CLEAR all RCM and OCSM continuous memory DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

GENERAL PROCEDURES

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Depowering Procedure

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.**

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF.
2. Turn the ignition switch to OFF.
3. At the smart junction box (SJB), located in the LH lower kick panel, remove the lower kick panel fuse cover and the RCM fuse 46 (7.5A) from the SJB. For additional information, refer to the appropriate Wiring service information.
4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.
5. Turn the ignition switch to OFF.

WARNING: **Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

See DESCRIPTION AND OPERATION for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

6. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.

Repowering Procedure

1. Turn the ignition switch from OFF to ON.
2. Install RCM fuse 46 (7.5A) to the SJB and install the lower kick panel fuse cover.

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

3. Connect the battery ground cable.
4. Prove out the SRS as follows:

   Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag warning indicator will:

   - fail to light.

   - remain lit continuously.

   - flash at a 5 Hz rate (RCM not configured).

   The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

   Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Deactivation

WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

WARNING: **To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. Turn all vehicle accessories OFF.
2. Turn the ignition switch to OFF.
3. At the smart junction box (SJB), located in the LH lower kick panel, remove the lower kick panel fuse cover and the RCM fuse 46 (7.5A) from the SJB. For additional information, refer to the appropriate Wiring service information.
4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.
5. Turn the ignition OFF.

WARNING: **Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

See <u>DESCRIPTION AND OPERATION</u> for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

6. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.

NOTE: Repeat this step for both locking pins.

7. Using a 3-mm Allen wrench or a suitable tool through the access hole on the backside of the steering wheel, position the tool against the spring clip and push in, disengaging the clip from the locking pin. With the spring clip disengaged from the locking pin, gently pull back on that side of the driver air bag module to release it from the steering wheel.

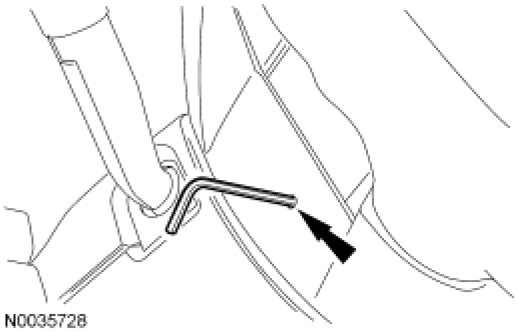

Fig. 125: Locating Allen Wrench
Courtesy of FORD MOTOR CO.

NOTE: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may occur.

8. Using a small screwdriver as shown in illustration, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

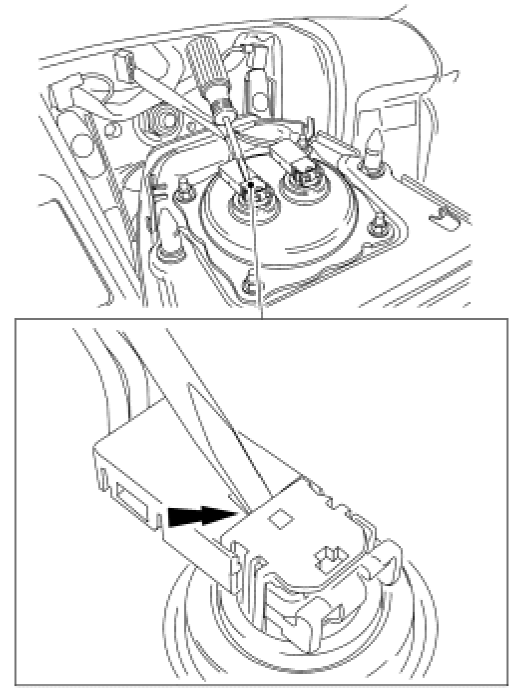

Fig. 126: Releasing Locking Buttons On Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

9. Open and lower the glove compartment door. Then unhook the glove compartment door from the instrument panel.
   - If equipped, detach the glove compartment door dampener.

Edge

10. Remove the 2 passenger air bag module bolts from the cross vehicle beam bracket.

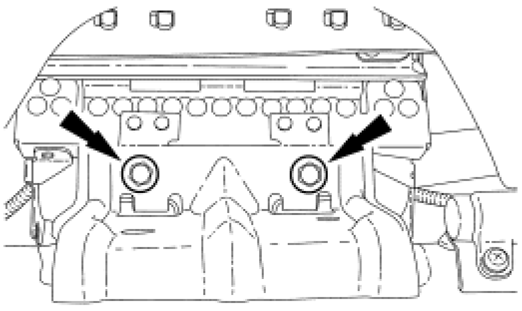

Fig. 127: Locating Passenger Air Bag Module Bolts From Cross Vehicle Beam Bracket
Courtesy of FORD MOTOR CO.

NOTE:	**Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the air bag module may occur.**

11. Through the glove compartment opening, release the 4 LH side deployment door clips. Then release the foreward-most 5 clips and separate the deployment door and passenger air bag module from the instrument panel.

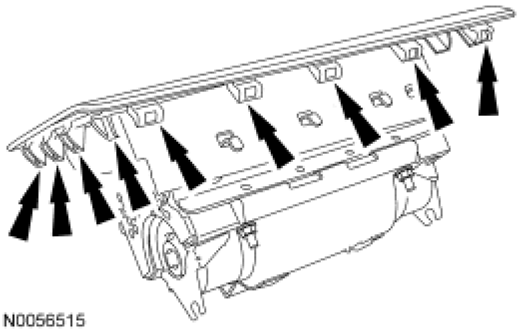

Fig. 128: Locating LH Side Deployment Door Clip
Courtesy of FORD MOTOR CO.

12. Using a small screwdriver as shown in illustration, lift up and release the locking button on the RH passenger air bag module electrical connector.

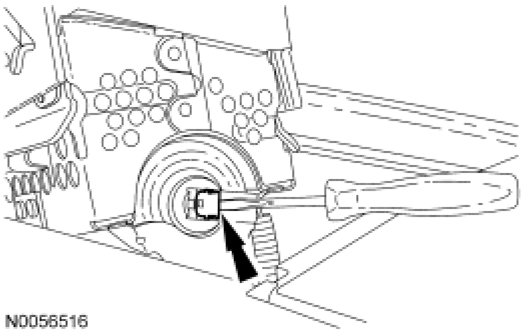

Fig. 129: Releasing Locking Button On RH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: **Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

13. With the RH locking button released, remove the RH electrical connector.
14. Using a small screwdriver as shown in illustration, lift up and release the locking button on the LH passenger air bag module electrical connector.

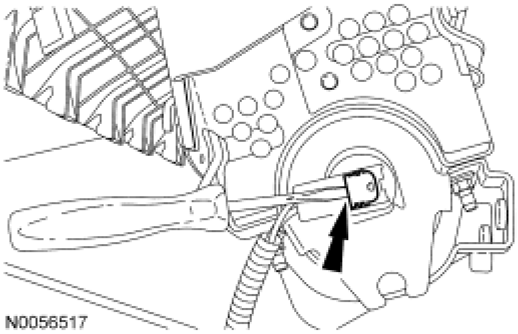

Fig. 130: Releasing Locking Button On LH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: **Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

15. With the LH locking button released, remove the LH electrical connector and remove the passenger air bag module.

    MKX

16. Pull straight out to release the 5 retaining clips and remove the RH instrument panel finish panel.

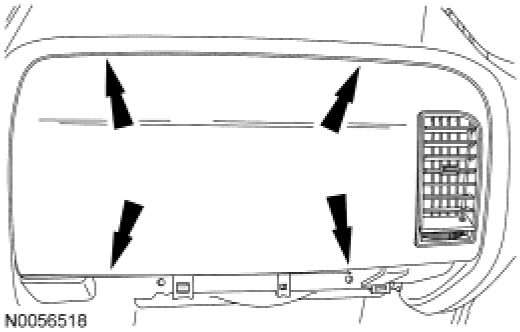

Fig. 131: Locating Retaining Clips On RH I/P Finish Panel
Courtesy of FORD MOTOR CO.

17. Remove the screw for the LH duct assembly bracket from the front of the instrument panel.

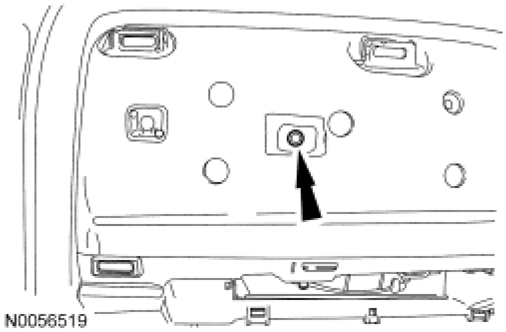

Fig. 132: Locating Screw On LH Duct Assembly Bracket
Courtesy of FORD MOTOR CO.

18. Through the glove compartment opening, remove the screw and the LH duct assembly.

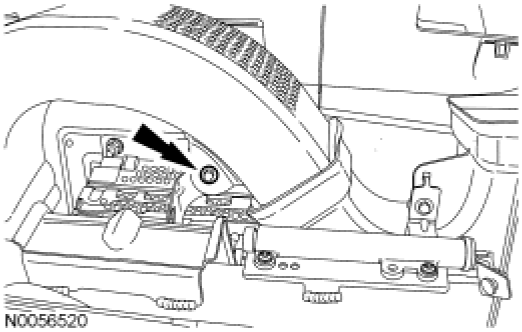

Fig. 133: Locating Screw On LH Duct Assembly
Courtesy of FORD MOTOR CO.

19. Through the glove compartment opening, remove the screw and the RH duct assembly.

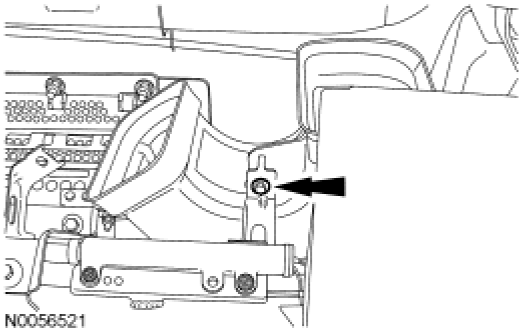

Fig. 134: Locating Screw On RH Duct Assembly
Courtesy of FORD MOTOR CO.

20. Remove the 4 bolts and the passenger air bag module support bracket.

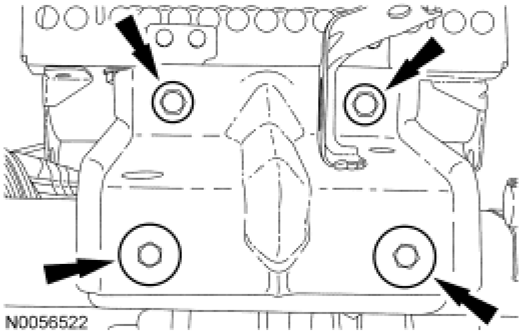

Fig. 135: Locating Bolts On Passenger Air Bag Module Support Bracket
Courtesy of FORD MOTOR CO.

21. Remove the 3 nuts from the passenger air bag module.

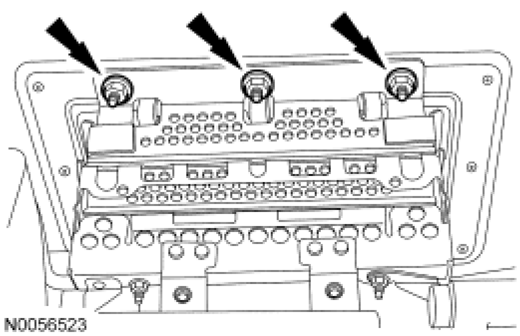

Fig. 136: Locating Nuts On Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

NOTE:	**Do not allow the passenger air bag module to hang from the wiring harness. Damage to the wiring harness and connectors may occur.**

22. Lower the rear of the passenger air bag module off the 3 mounting studs. Move the passenger air bag module rearward to release the 7 hooks from the instrument panel and rest the module on the cross vehicle beam.

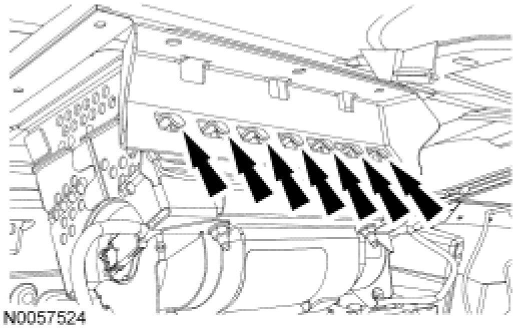

Fig. 137: Identifying Hooks On I/P
Courtesy of FORD MOTOR CO.

23. Using a small screwdriver as shown in illustration, lift up and release the locking button on the LH passenger air bag module electrical connector.

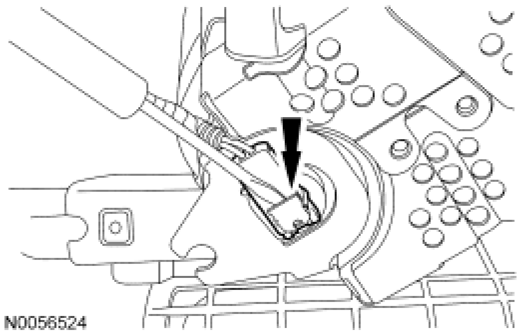

Fig. 138: Releasing Locking Button On LH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE:	**Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

24. With the LH locking button released, remove the LH electrical connector from the passenger air bag module.
25. Using a small screwdriver as shown in illustration, lift up and release the locking button on the RH passenger air bag module electrical connector.

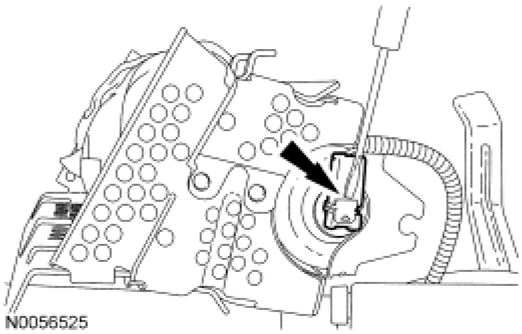

Fig. 139: Releasing Locking Button On RH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE:	**Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

26. With the RH locking button released, remove the RH electrical connector. Remove the passenger air bag module from the glove compartment opening.

All vehicles

27. From under the rear of the front passenger seat, slide and disengage the passenger seat side air bag module electrical connector locking clip, and then release the tab and disconnect the passenger seat side air bag module electrical connector.

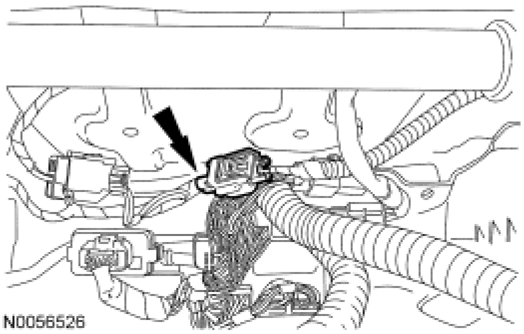

Fig. 140: Identifying Passenger Seat Side Air Bag Module Electrical Connector
Courtesy of FORD MOTOR CO.

28. Remove the passenger side D-pillar trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.

NOTE: Do not pull the passenger safety canopy module electrical connector out by the locking button. Damage to the locking button may occur.

29. With the locking button released, remove the electrical connector from the passenger safety canopy module.

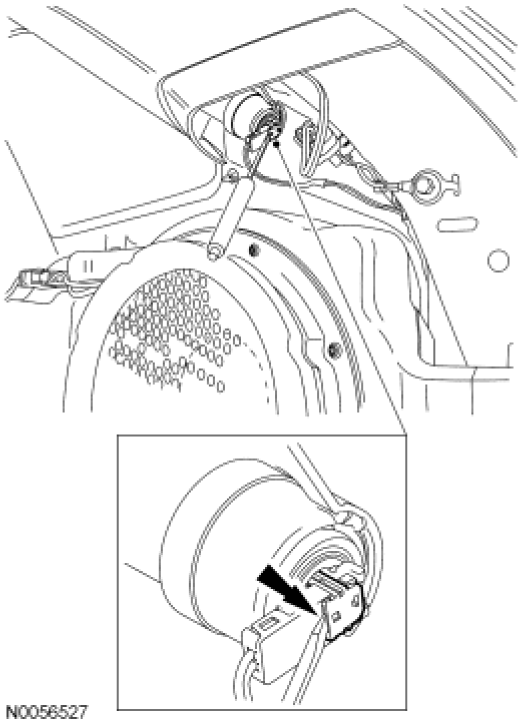

Fig. 141: Locating Electrical Connector From Passenger Safety Canopy Module
Courtesy of FORD MOTOR CO.

30. Remove the driver side D-pillar trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.

NOTE: Do not pull the driver safety canopy module electrical connector out by the locking button. Damage to the locking button may occur.

31. With the locking button released, remove the electrical connector from the driver safety canopy module.

Fig. 142: Locating Electrical Connector From Driver Safety Canopy Module
Courtesy of FORD MOTOR CO.

32. From under the rear of the driver seat, detach the driver seat side air bag module electrical connector from the seat cushion frame. Then slide and disengage the driver seat side air bag module electrical connector locking clip, and then release the tab and disconnect the driver seat side air bag module electrical connector.

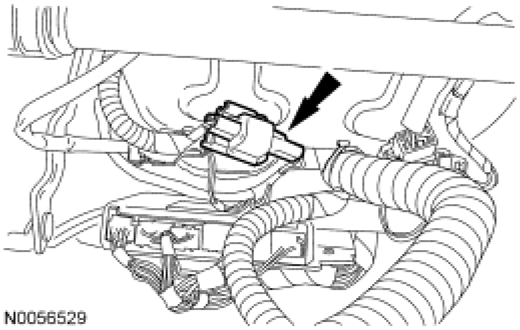

Fig. 143: Identifying Driver Seat Side Air Bag Module Electrical Connector Locking Clip
Courtesy of FORD MOTOR CO.

33. Install RCM fuse 46 (7.5A) to the SJB.
34. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.

Reactivation

All vehicles

1. Remove RCM fuse 46 (7.5A) from the SJB.
2. Disconnect the battery ground cable and wait at least one minute.
3. Connect the driver seat side air bag module electrical connector and then slide and engage the seat side air bag electrical connector locking clip. Then attach the driver seat side air bag module electrical connector to the seat cushion frame.

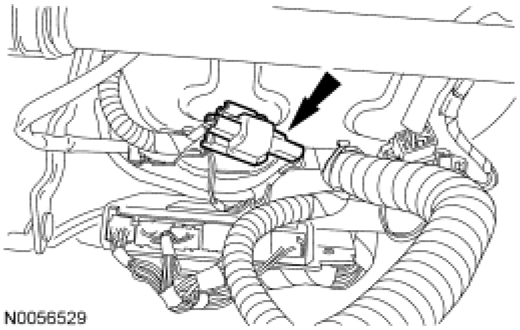

Fig. 144: Identifying Driver Seat Side Air Bag Module Electrical Connector Locking Clip
Courtesy of FORD MOTOR CO.

NOTE:	**Do not install the safety canopy module electrical connector by the locking button. Damage to the locking button may occur.**
NOTE:	**The safety canopy module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.**

NOTE: **The safety canopy module electrical connector is unique and cannot be reversed when connected to the safety canopy module. Match the electrical connector key to the keyway in the safety canopy module. Do not force the electrical connector into the safety canopy module. Damage to the connector or component may occur.**

4. With the locking button released, install the driver safety canopy module electrical connector fully into the driver safety canopy module and seat the locking button.

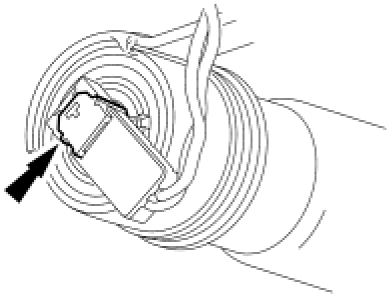

Fig. 145: Identifying Driver Safety Canopy Module Electrical Connector
Courtesy of FORD MOTOR CO.

5. Install the driver side D-pillar trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.

NOTE: **Do not install the safety canopy module electrical connector by the locking button. Damage to the locking button may occur.**

NOTE: **The safety canopy module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.**

NOTE: **The safety canopy module electrical connector is unique and cannot be reversed when connected to the safety canopy module. Match the electrical connector key to the keyway in the safety canopy module. Do not force the electrical connector into the safety canopy module. Damage to the connector or component may occur.**

6. With the locking button released, install the passenger safety canopy module electrical connector fully into the passenger safety canopy module and seat the locking button.

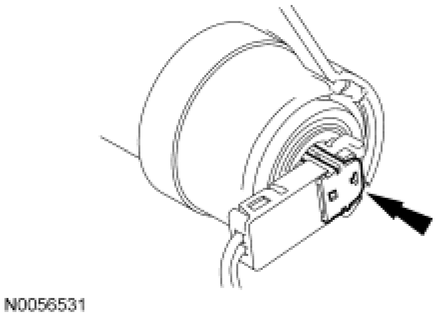

Fig. 146: Identifying Passenger Safety Canopy Module Electrical Connector
Courtesy of FORD MOTOR CO.

7. Install the passenger side D-pillar trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.
8. Connect the passenger seat side air bag module electrical connector and then slide and engage the seat side air bag electrical connector locking clip.

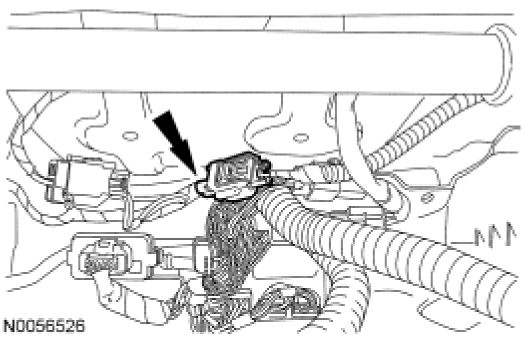

Fig. 147: Identifying Passenger Seat Side Air Bag Module Electrical Connector
Courtesy of FORD MOTOR CO.

MKX

NOTE:	**Do not install the passenger air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.**

NOTE:	**The passenger air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.**

NOTE:	**The passenger air bag module electrical connectors are unique and cannot be reversed when connected to the passenger air bag module. Match the electrical connector key to the keyway in the passenger air bag module. Do not force the electrical connectors into the passenger air bag module. Damage to the connector or component may occur.**

NOTE: RH side shown in illustration, LH side similar.

9. Position the passenger air bag module on the cross vehicle beam. With the locking buttons released, install the 2 passenger air bag module electrical connectors fully into the passenger air bag module and seat the locking buttons.

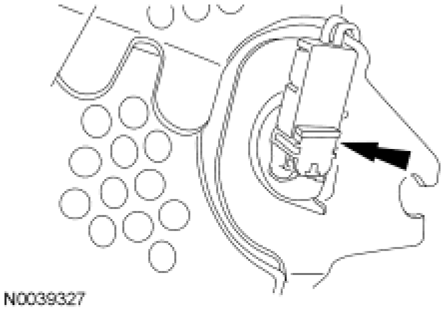

Fig. 148: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: During the passenger air bag module installation, make sure all 7 of the hooks are fully seated in the instrument panel.

10. Install the passenger air bag module 7 hooks into the instrument panel. Raise the rear of the passenger air bag module onto the 3 mounting studs.

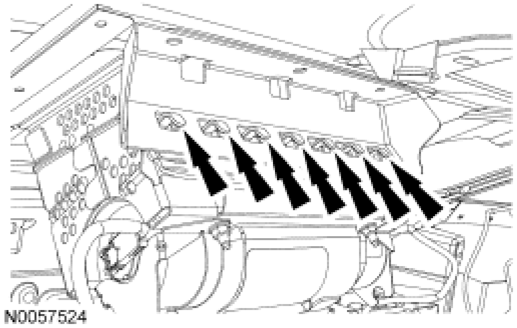

Fig. 149: Identifying Hooks On I/P
Courtesy of FORD MOTOR CO.

11. Install the 3 passenger air bag module nuts.
    - Tighten to 7 Nm (62 lb-in).

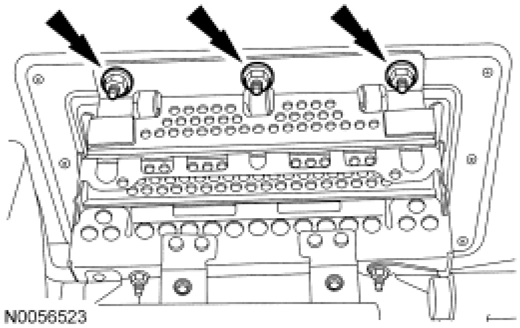

Fig. 150: Locating Nuts On Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

NOTE: To avoid a squeak or rattle condition, install the passenger air bag module bracket and passenger air bag module bolts in this order.

12. Install the passenger air bag module support bracket and the 4 bolts.
    1. Install the passenger air bag module support bracket and 2 bolts to the cross vehicle beam.
        - Tighten to 8 Nm (71 lb-in).
    2. Install the inboard passenger air bag module support bracket-to-passenger air bag module bolt.
        - Tighten to 8 Nm (71 lb-in).
    3. Install the outboard passenger air bag module support bracket-to-passenger air bag module bolt.
        - Tighten to 8 Nm (71 lb-in).

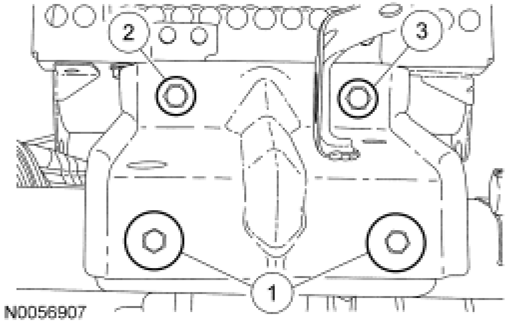

Fig. 151: Installing Passenger Air Bag Module Support Bracket Bolts In Sequence
Courtesy of FORD MOTOR CO.

13. Install the screw and the RH duct assembly.

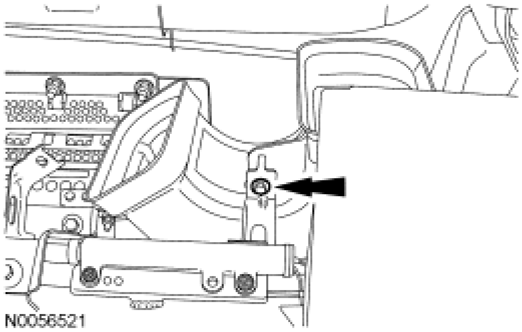

Fig. 152: Locating Screw On RH Duct Assembly
Courtesy of FORD MOTOR CO.

14. Install the screw and the LH duct assembly.

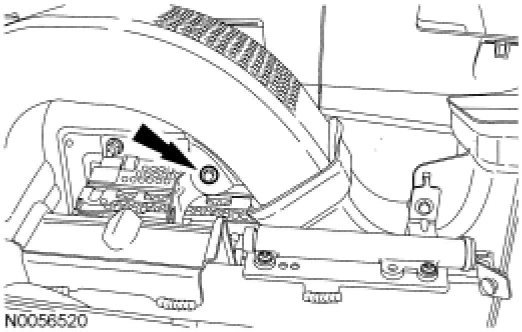

Fig. 153: Locating Screw On LH Duct Assembly
Courtesy of FORD MOTOR CO.

15. Install the screw for the LH duct assembly bracket in the front of the instrument panel.

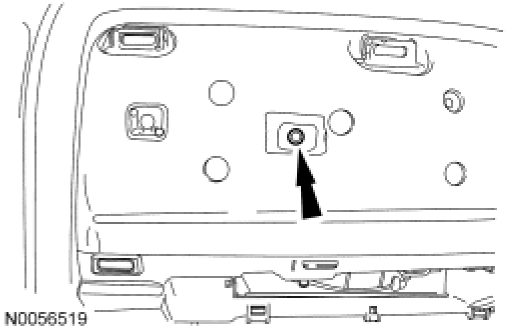

Fig. 154: Locating Screw On LH Duct Assembly Bracket
Courtesy of FORD MOTOR CO.

NOTE: Make sure the RH instrument panel finish panel 5 retaining clips are fully seated in the instrument panel.

16. Install the RH instrument panel finish panel.

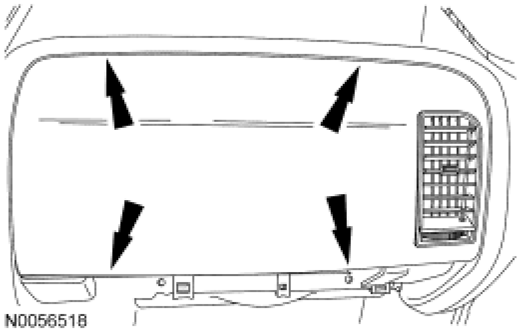

Fig. 155: Locating Retaining Clips On RH I/P Finish Panel
Courtesy of FORD MOTOR CO.

Edge

NOTE:	**Do not install the passenger air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.**
NOTE:	**The passenger air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.**
NOTE:	**The passenger air bag module electrical connectors are unique and cannot be reversed when connected to the passenger air bag module. Match the electrical connector key to the keyway in the passenger air bag module. Do not force the electrical connectors into the passenger air bag module. Damage to the connector or component may occur.**
NOTE:	**RH side shown in illustration, LH side similar.**

17. With the locking buttons released, install the 2 passenger air bag module electrical connectors fully into the passenger air bag module and seat the locking buttons.

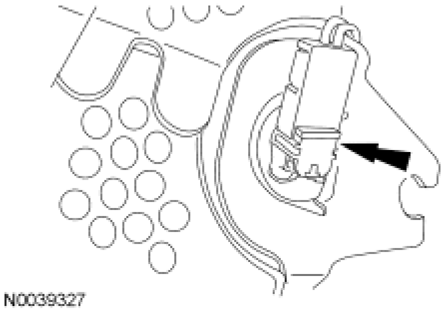

Fig. 156: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the air bag module may occur.

NOTE: During air bag module installation, make sure all the deployment door clips are fully seated in the instrument panel.

18. Install the passenger air bag module deployment door rear-most clips into the instrument panel first. Then install the side deployment door clips working around to the forward-most clips seating each of them fully into the instrument panel.

NOTE: To avoid a squeak or rattle condition, install the 2 passenger air bag module bolts in this order.

19. Install the passenger air bag module 2 bolts.
    1. Install the inboard passenger air bag module bolt.
        - Tighten to 8 Nm (71 lb-in).
    2. Install the outboard passenger air bag module bolt.
        - Tighten to 8 Nm (71 lb-in).

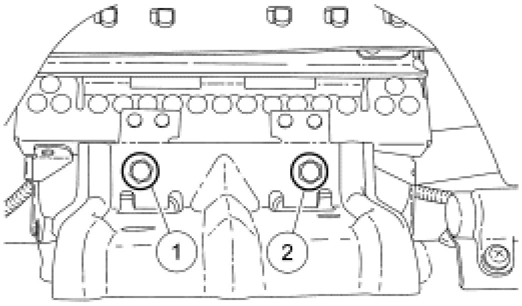

Fig. 157: Installing Passenger Air Bag Module Bolts In Sequence
Courtesy of FORD MOTOR CO.

All vehicles

20. Hook the glove compartment door to the instrument panel. Close the glove compartment door.
    - If equipped, attach the glove compartment door dampener.

NOTE: Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

NOTE: The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

NOTE: The passenger air bag module electrical connectors are unique and cannot be reversed when connected to the passenger air bag module. Match the electrical connector key to the keyway in the passenger air bag module. Do not force the electrical connectors into the passenger air bag module. Damage to the connector or component may occur.

21. With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

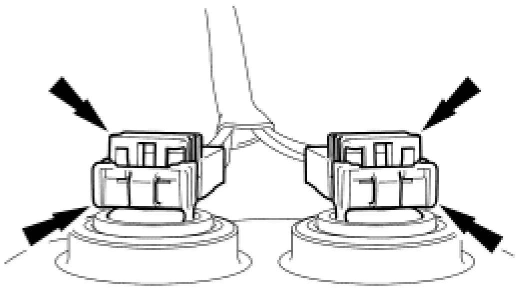

Fig. 158: Locating Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: Audible clicks will be heard when both wire clips are seated in the driver air bag module.

22. Align the driver air bag module locking pins to the steering wheel and, while pushing inward, seat the 2 driver air bag module locking pins to the steering wheel wire clips.
    - When the 2 locking pins are seated in place, there should be an even gap between the driver air bag module trim cover and the steering wheel.
23. Turn the ignition switch from OFF to ON.
24. Install RCM fuse 46 (7.5A) to the SJB and install the lower kick panel fuse cover.

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

25. Connect the battery ground cable.
26. Prove out the SRS as follows:

    Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:

- fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

INSPECTION AND REPAIR AFTER A SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPLOYMENT

WARNING: **Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

NOTE: After diagnosing or repairing a Supplemental Restraint System (SRS), the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.

NOTE: Deployable devices (such as air bag modules, pretensioners) may deploy alone or in various combinations depending on the impact event.

NOTE: Always refer to the appropriate service information procedures prior to carrying out vehicle repairs affecting the SRS and safety belt system.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

NOTE: Refer to the correct removal and installation procedure for all SRS components being installed.

1. When any deployable device or combination of devices are deployed and/or the Restraints Control Module (RCM) has the DTC B1231 (Event Threshold Exceeded) in memory, the repair of the vehicle SRS is to include the removal of all deployed devices and the installation of new deployable devices, the

removal and installation of new impact sensors, and the removal and installation of a new RCM. DTCs must be cleared from all required modules after repairs are carried out.

Vehicles with Occupant Classification Sensor (OCS) system

NOTE: After installation of new Occupant Classification Sensor (OCS) system components, carry out the Occupant Classification Sensor (OCS) System Reset procedure as instructed in the service information. Refer to the appropriate service information for OCS system removal and installation procedure.

2. When a vehicle has been involved in a collision and the Occupant Classification System Module (OCSM) has DTC B1231 stored in memory, the repair of the OCS system is to include the following procedures for the specified system:
   - For rail-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install new OCS system rails.
   - For weight sensor bolt-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS system weight sensor bolts. DTC must be cleared from the OCSM before carrying out Occupant Classification Sensor (OCS) System Reset. Do not install a new OCSM unless DTC B1231 cannot be cleared.

   NOTE: Most bladder-type OCSM do not store a DTC B1231 in memory after deployment. The DTC B1231 is stored only by the RCM.

   - For bladder-type OCS system, inspect for damage and repair as necessary. If installation of an OCS system component is required, an OCS system service kit must be installed.

All vehicles

3. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.
4. When the driver air bag module has deployed, a new clockspring must be installed.
5. New driver and/or front passenger safety belt systems (including retractors, buckles and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners. For additional information, refer to **SAFETY BELT SYSTEM** article.
6. Inspect the entire vehicle for damage, including the following components:
   - Steering column (deployable column if equipped)
   - Instrument panel knee bolsters and mounting points
   - Instrument panel braces and brackets
   - Instrument panel and mounting points
   - Seats and seat mounting points
   - Safety belts, safety belt buckles and safety belt retractors. For additional information, refer to **SAFETY BELT SYSTEM** article.

- SRS wiring, wiring harnesses and connectors

7. After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.

OCCUPANT CLASSIFICATION SENSOR (OCS) SYSTEM RESET

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

NOTE: If DTC B2290 is retrieved on-demand from the occupant classification system module (OCSM) and restraints control module (RCM):

- **There is a fault with the occupant classification sensor (OCS) weight sensor bolt(s) and/or wiring.**
- **The cause for the DTC must be corrected before carrying out the OCS system reset.**
- **Refer to DTC Charts for diagnostic direction.**
- **The RCM stores DTC B2290 in memory ONLY to identify a problem with the OCS system.**

If DTC B2290 is only present in the RCM and no on-demand or continuous DTC are present in the OCSM, CLEAR all DTCs from the RCM.

1. **Diagnostic Instruction:** The Occupant Classification Sensor (OCS) System Reset procedure **should only** be carried out if instructed to do so by the service information.

   If the concern is with the passenger air bag deactivation (PAD) indicator operation, refer to Passenger Air Bag Deactivation (PAD) Indicator and Occupant Classification Sensor (OCS) System in **DESCRIPTION AND OPERATION** .

   WARNING: **The following precautions must be taken before carrying out the following procedure on the front passenger seat:**

   - **Park the vehicle on level ground.**
   - **Make sure the occupant classification sensor (OCS) system is stabilized at a temperature in the range of 5°C to 48°C (41°F to 118°F) and is not exposed to temperatures outside that range.**
   - **Make sure the front passenger seat is empty and dry.**

- **Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.**
- **Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.**
- **Make sure nothing is underneath the front passenger seat.**
- **Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS system. Refer to the Owner's Literature.**
- **Make sure the seat is correctly installed in the vehicle.**

Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

NOTE: **Correct seat track alignment of the inboard and outboard seat tracks on a manual seat is critical for a successful system reset. Before removing a front passenger seat equipped with a manual seat track, mark both tracks to indicate correct alignment between the inboard and outboard tracks. Failure to follow this instruction will result in an unsuccessful system reset and incorrect operation of the occupant classification sensor (OCS) system.**

NOTE: **Make sure the occupant classification sensor (OCS) system weight sensor bolt protection brackets are correctly installed to the seat track and that they not contact the cushion side shield, wire harness or any other surrounding parts. Failure to follow this instruction may result in the incorrect operation of the OCS system.**

NOTE: **In the event of a deployable crash and OCSM DTC B1231 is retrieved on-demand, the DTC must be cleared before carrying out the Occupant Classification Sensor (OCS) System Reset.**

NOTE: **If a new OCS system component has been installed, the RCM and OCSM will:**

- **store DTC B1013 and B2290 in memory.**
- **cause the air bag warning indicator to illuminate.**
- **clear after a successful system reset.**

- **the RCM stores DTC B2290 in memory.**

2. Turn the ignition switch to the off position. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If no SRS DTCs are present **and no new OCS system components were installed** , the air bag warning indicator will remain off. If the SRS indicator illuminates, indicating a fault is present, use a scan tool to retrieve DTCs and refer to **DTC Charts** for diagnostic direction before carrying out the system reset procedure.
3. Cycle the ignition to the OFF position.

NOTE: **The following seat checks must be made before attempting to carry out an occupant classification sensor (OCS) system reset after the seat has been removed and re-installed for any reason:**

- **Make sure the seat is correctly installed in the vehicle.**
- **Make sure the seat has been tightened to specification as identified in the appropriate service information.**
- **Make sure the seat track is correctly aligned (manual seat track).**
- **Make sure the OCS weight sensor bolt harness connections are correct for each sensor at their correct location. Refer to appropriate SYSTEM WIRING DIAGRAMS article for schematic and connector information. Refer to the illustration for correct sensor location on the seat.**

OCS Weight Sensor Bolt Location

- **OCS weight sensor bolt 1, front outboard**
- **OCS weight sensor bolt 2, rear outboard**
- **OCS weight sensor bolt 3, rear inboard**
- **OCS weight sensor bolt 4, front inboard**

4. Position the front passenger seat.
   - Position the seat backrest in the upright (vertical) position.
   - Position the seat in the middle position of seat track travel.
   - Position the seat height to its middle position (power seat only).

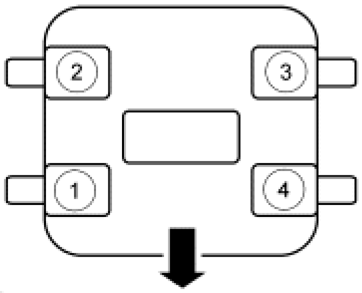

Fig. 159: Identifying OCS System Harness Connector
Courtesy of FORD MOTOR CO.

5. Remove the hysteresis from the front passenger seat by firmly hitting the back of the seat head restraint 3 times.

NOTE: Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before carrying out the System Reset active command.

6. Turn the ignition switch ON, wait 8 seconds and carry out the System Reset using the scan tool.
    - If the system passed, go to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.

    NOTE: Do not install any new OCS system components at this time. OCS system components should only be installed when directed to do so.

    - If the system did not pass, **proceed to Step 7.**
7. Carry out the OCSM self-test.
    - If DTCs B2290 and B1013 are retrieved on-demand in the OCSM, refer to **DTC Charts** for diagnostic direction. Carry out diagnostics for DTC B2290 before any other DTCs.
    - If any other DTC is retrieved on-demand in the OCSM, refer to **DTC Charts** for diagnostic direction.
    - If only DTC B1013 is retrieved on-demand in the OCSM, refer to **DTC Charts** for diagnostic direction.

OCCUPANT CLASSIFICATION SENSOR (OCS) SYSTEM ZERO SEAT WEIGHT TEST

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

WARNING: **The following precautions must be taken before carrying out the following procedure on the front passenger seat:**

- **Park the vehicle on level ground.**
- **Make sure the occupant classification sensor (OCS) system is stabilized at a temperature in the range of 5°C to 48°C (41°F to 118°F) and is not exposed to temperatures outside that range.**
- **Make sure the front passenger seat is empty and dry.**
- **Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.**
- **Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.**
- **Make sure nothing is underneath the front passenger seat.**
- **Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS system. Refer to the Owner's Literature.**
- **Make sure the seat is correctly installed in the vehicle.**

Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

NOTE: Make sure the occupant classification sensor (OCS) weight sensor bolt protection brackets are correctly installed to the seat track and that it does not contact the cushion side shield, wire harness or any other surrounding parts. Failure to follow this instruction may result in the incorrect operation of the OCS system.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The Zero Seat Weight Test is done with the passenger seat positioned in 2 different positions to make sure that there is nothing to affect the performance and operation of the occupant classification sensor (OCS) system.

NOTE: The Zero Seat Weight Test verifies the OCS system measures zero weight for an empty seat. It is necessary to carry out the Zero Seat Weight Test procedure after a successful System Reset or as directed to do so in the appropriate service information procedures.

NOTE: If the occupant classification system module (OCSM) has any on-demand DTCs except C1941 present, the fault condition(s) must be repaired and the DTCs cleared before carrying out the Zero Seat Weight Test on the front passenger seat. Failure to follow this instruction will result in an unsuccessful Zero Seat Weight Test and the incorrect operation of the OCS system.

WARNING: The following precautions must be taken before carrying out the following procedure on the front passenger seat:

- **Park the vehicle on level ground.**
- **Make sure the occupant classification sensor (OCS) system is stabilized at a temperature in the range of 5°C to 48°C (41°F to 118°F) and is not exposed to temperatures outside that range.**
- **Make sure the front passenger seat is empty and dry.**
- **Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.**
- **Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.**
- **Make sure nothing is underneath the front passenger seat.**
- **Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS system. Refer to the Owner's Literature.**
- **Make sure the seat is correctly installed in the vehicle.**

Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

1. Make sure the front passenger seat is empty and there is nothing underneath the seat. Remove any items from the seat that were not factory installed and make sure that the seat is correctly installed in the vehicle. For additional information, refer to Occupant Classification Sensor (OCS) System in **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.
2. Position the front passenger seat in the first position.
   - Position the seat backrest in the upright position.
   - Position the seat in the full forward position of seat track travel.
   - Position the seat height to its highest position (power seat only).

WARNING: Remove binding or resistance between all components of the front

passenger seat as directed in the following procedure. Failure to follow this instruction may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

3. Remove hysteresis from the front passenger seat by firmly hitting the back of the seat head restraint 3 times.
4. Turn the ignition to the OFF position.

WARNING: **Make sure nothing is placed on the front passenger seat during the following procedure. Do not press, touch or lay anything on the front passenger seat until the following procedure has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.**

5. Turn the ignition to the ON position.

NOTE: **Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before carrying out the Zero Seat Weight Test active command.**

6. Carry out the Zero Seat Weight Test using the scan tool.
   - If the system passed, **proceed to Step 7.**
   - If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), **proceed to Step 9.**
7. Position the front passenger seat to the second position.
   - Position the seat in the full rearward position of seat track travel.
   - Position the seat height to its lowest position (power seat only).
8. Carry out the Zero Seat Weight Test using the scan tool.
   - If the system passed, repair is complete, **Proceed to Step 10.**
   - If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), **proceed to Step 9.**

NOTE: **Check the repair history of the vehicle for any previous repair that required the removal or service of the passenger seat. The repair history may lead to an area of concern.**

9. Inspect the following for causes of a unsuccessful Zero Seat Weight Test.
   - Make sure the front passenger seat is empty and there is nothing underneath the seat. Remove any items from the seat that were not factory installed and make sure that the seat is correctly installed in the vehicle.
   - Make sure the seat wiring harnesses are routed and secured correctly and are not twisted, pinched,

pulling down or pushing up on any seat component. Refer to Seat Cushion Wire Harness Routing - Front Passenger Cushion in the General Procedures portion of **SEATING** article.

- Make sure the OCS weight sensor bolt protection brackets are correctly installed to the seat track and are not contacting the cushion side shield, wire harness or any other surrounding parts.
- Make sure the seat track and backrest frame are not bent, twisted or damaged.
- Move the seat and backrest to all seating positions. Make sure the seat track does not bind or have any resistance when moved to all seating positions. Make sure that there are no obstructions contacting any seat component when the seat is moved to all seating positions.
- Make sure the seat is assembled correctly and all fasteners are tightened to specifications.
    - If a concern was found, repair as necessary, **proceed to Step 1.**
    - If no concern was found, install a new passenger seat track assembly with OCS weight sensor bolts. Refer to **SEATING** article.

10. Prove out the SRS as follows:

    Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:

    - fail to light.

    - remain lit continuously.

    - flash at a 5 Hz rate (RCM not configured).

    The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

    Repair any unresolved DTCs.

    Clear all continuous DTCs from the RCM and OCSM using a scan tool.

PYROTECHNIC DEVICE DISPOSAL

Disposal of Deployable Devices and Pyrotechnic Devices That are Undeployed/Inoperative

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

NOTE: **All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must**

be treated the same as any inoperative live air bag being returned.

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the undeployed/inoperative device. For additional information, refer to the appropriate procedure in this service information or **SAFETY BELT SYSTEM** article.

NOTE: **When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the Vehicle Identification Number (VIN) must be recorded and sent to Ford Motor Company.**

3. If installing a new air bag module, record the necessary information and return the inoperative air bag module to Ford Motor Company.

Disposal of Deployable Devices and Pyrotechnic Devices That Are Deployed

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the deployed device. For additional information, refer to the appropriate procedure in this service information or **SAFETY BELT SYSTEM** article.

NOTE: **If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to DESCRIPTION AND OPERATION .**

3. Dispose of the deployed device in the same manner as any other part to be scrapped.

Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment

1. Safety and environmental concerns require consideration and treatment of restraints system deployable and pyrotechnic devices when disposing of vehicles, deployable devices or pyrotechnic devices. Deploying deployable and pyrotechnic devices before scrapping a vehicle or the device eliminates the potential for hazardous exposures or reactions during processing. If special handling procedures are followed, deployable and pyrotechnic devices can be deployed safely and recycled with the vehicle, shipped separately to a recycling facility or disposed of safely.

NOTE: **To determine the deployable devices a vehicle is equipped with, refer to DESCRIPTION AND OPERATION .**

A vehicle equipped with any of the following deployable devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

- Driver air bag module
- Passenger air bag module
- Seat side air bag modules
- Safety canopy modules
- Side air curtain modules

NOTE: **To determine the pyrotechnic devices a vehicle is equipped with, refer to DESCRIPTION AND OPERATION .**

2. A vehicle equipped with any of the following pyrotechnic devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.
   - Safety belt buckle pretensioners
   - Safety belt retractor pretensioners
   - Adaptive load limiting retractors
   - Deployable steering column

NOTE: **To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer toDESCRIPTION AND OPERATION .**

3. If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. For additional information, refer to Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment in this procedure.

Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Always carry or place a live safety canopy, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the**

event of an accidental deployment.

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.**

NOTE: For air bag modules with multiple loops, all the loops on the air bag module must be deployed.

NOTE: Some driver and passenger front air bags have 2 deployment stages. After a collision it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is mandatory that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

NOTE: A typical air bag disposal is shown in illustration that is similar for all vehicles.

All driver, passenger and seat side air bag modules

1. Make a container to house the air bag module for deployment.

   NOTE: The tires must be of sufficient size to accommodate the air bag module.

   - Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
   - With the tire and wheel assembly on the bottom, stack the tires.
   - Securely tie all of the tires together.

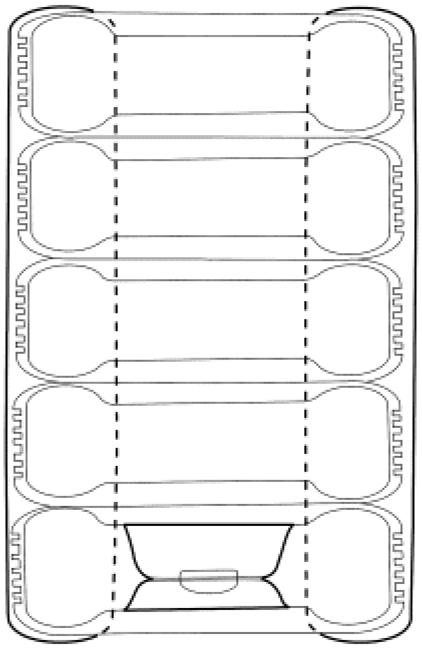

Fig. 160: Placing Air Bag Modules Inside Tire For Deployment
Courtesy of FORD MOTOR CO.

2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Remove the air bag module. For additional information, refer to the appropriate procedure.

NOTE: If the air bag module does not have a hardwired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the air bag module.

4. Cut each of the air bag module wires near the electrical connector that connects to the vehicle wire harness.
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

NOTE: Typical driver air bag module with 2 loops shown in illustration, other air bag modules with multiple loops similar.

6. For air bag modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

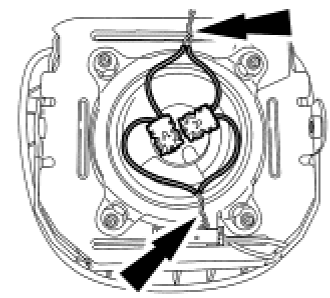

Fig. 161: Locating Air Bag Module Wire Squibs
Courtesy of FORD MOTOR CO.

7. Make a jumper harness to deploy the air bag module.
    - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
    - At one end of the jumper harness, connect the wires together.
8. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the air bag module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

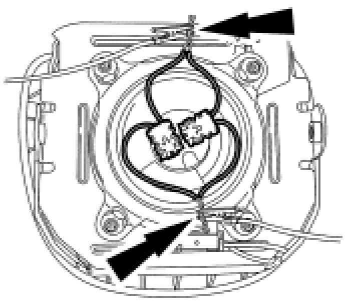

Fig. 162: Connecting Jumper Wires To Squibs
Courtesy of FORD MOTOR CO.

Driver air bag modules

NOTE: Make sure to maintain the connections to the air bag module.

9. With the stack of tires upright and the wheel on the bottom, carefully place the driver air bag module, with the trim cover facing up, on the wheel.

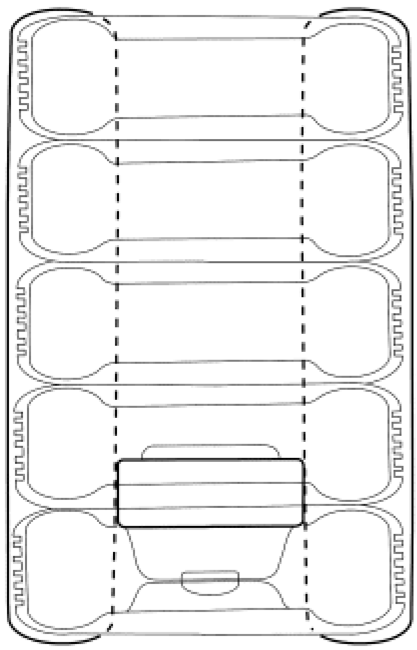

Fig. 163: Placing Driver Air Bag Modules Inside Tires For Deployment
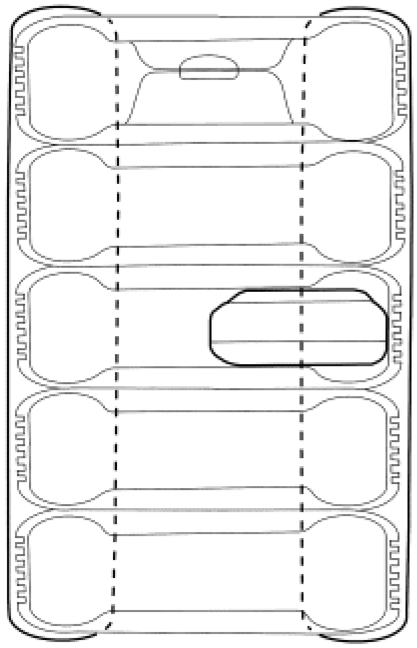
Courtesy of FORD MOTOR CO.

Passenger and seat side air bag modules

NOTE: **Make sure to maintain the connections to the air bag module.**

10. Tip the stack of tires on its side and place the air bag module inside the center tire, making sure that there are 2 tires beneath the tire containing the air bag module and 2 tires (including the tire and wheel assembly) above the tire containing the air bag module.
11. Place the tire stack upright, with the wheel on top.



N0033184

Fig. 164: Identifying Passenger Or Seat Side Air Bag Modules Inside Center Tire
Courtesy of FORD MOTOR CO.

All driver, passenger and seat side air bag modules

12. Remain at least 9.14 m (30 ft) away from the air bag module.
13. From the end of the jumper harness that is not connected to the air bag module, disconnect the 2 wires of the jumper harness from each other.
14. Deploy the air bag module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
15. To allow for cooling, wait at least 10 minutes before approaching the deployed air bag module.
16. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Adaptive Load Limiting Safety Belt Retractors - Remote Deployment

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud**

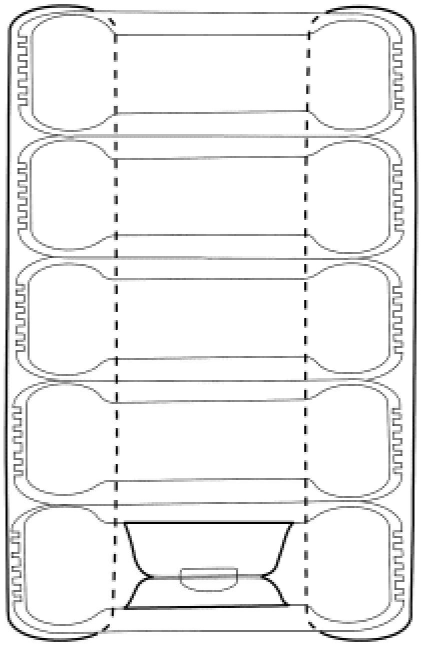
report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: A typical safety belt buckle and retractor disposal is shown in illustration that is similar for all vehicles.

1. Make a container to house the safety belt buckle or retractor for deployment.

    NOTE: The tires must be of sufficient size to accommodate the safety belt buckle or retractor.

    - Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
    - With the tire and wheel assembly on the bottom, stack the tires.
    - Securely tie all of the tires together.



N0033182

Fig. 165: Placing Air Bag Modules Inside Tire For Deployment
Courtesy of FORD MOTOR CO.

2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Remove the safety belt buckle or retractor. For additional information, refer to the appropriate procedure in **SAFETY BELT SYSTEM** article.
    - When deploying a safety belt buckle pretensioner, install a nut and bolt of sufficient length and of

the same diameter as was used to retain it to the seat.

NOTE: If the safety belt buckle or retractor does not have a hardwired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the safety belt buckle or retractor.

4. Cut each of the safety belt buckle or retractor wires near the electrical connector that connects to the vehicle wire harness.
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
6. Make a jumper harness to deploy the safety belt buckle or retractor.
    - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
    - At one end of the jumper harness, connect the wires together.

NOTE: Typical safety belt retractor pretensioner shown in illustration, other safety belt buckle pretensioners and load limiting retractors similar.

7. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

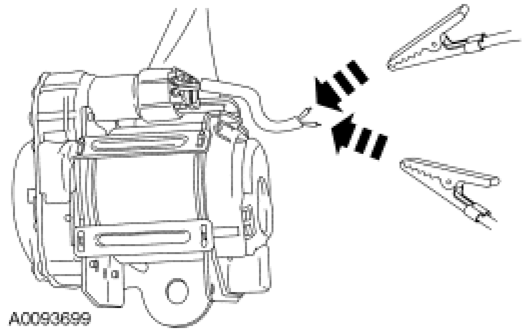


Fig. 166: Attaching Jumper Wires To Safety Belt Retractor Pretensioner
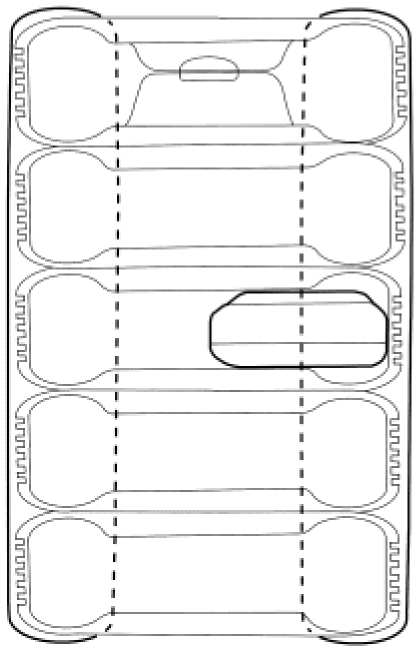
Courtesy of FORD MOTOR CO.

NOTE: Make sure to maintain the connections to the safety belt buckle or retractor.

8. Tip the stack of tires on its side and place the safety belt buckle or retractor inside the center tire, making sure that there are 2 tires beneath the tire containing the safety belt buckle or retractor and 2 tires (including the tire and wheel assembly) above the tire containing the safety belt buckle or retractor.
9. Place the tire stack upright, with the wheel on top.



N0033184

Fig. 167: Identifying Passenger Or Seat Side Air Bag Modules Inside Center Tire
Courtesy of FORD MOTOR CO.

10. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.
11. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.
12. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
13. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.
14. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Load Limiting Safety Belt Retractors - In-Vehicle Deployment

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud**

report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: **A typical safety belt buckle and retractor disposal is shown in illustration that is similar for all vehicles.**

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Access the safety belt buckle or retractor electrical connectors. For additional information, refer to **SAFETY BELT SYSTEM** article.
3. Cut each of the safety belt buckle or retractor wires, leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
5. Make a jumper harness to deploy the safety belt buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

   NOTE: **Typical safety belt retractor pretensioner shown in illustration, other safety belt buckle pretensioners and load limiting retractors are similar.**

6. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

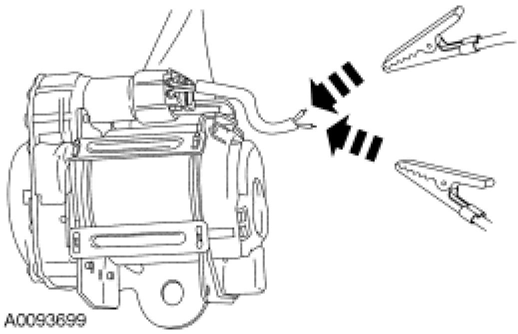


Fig. 168: Attaching Jumper Wires To Safety Belt Retractor Pretensioner
Courtesy of FORD MOTOR CO.

7. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.
8. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.

11. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

Safety Canopy Modules and Side Air Curtain Modules - In-Vehicle Deployment

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.**

NOTE: The safety canopy module deployment for a scrapped vehicle will occur in its installed position in the vehicle.

NOTE: A typical safety canopy module disposal is shown in illustration that is similar for all vehicles.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Access the safety canopy/side air curtain module electrical connectors. For additional information, refer to the appropriate procedure.
3. Cut each of the safety canopy/side air curtain module wires leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

   NOTE: Typical safety canopy/side air curtain module with 2 loops shown in illustration, other safety canopy/side air curtain modules with 2 loops are similar.

5. For safety canopy/side air curtain modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

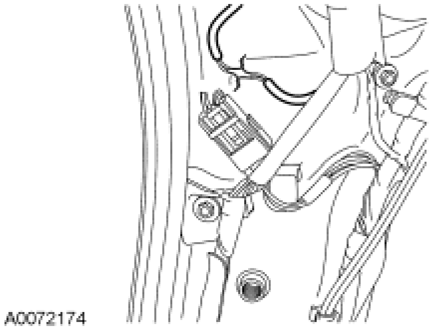

Fig. 169: Identifying Safety Canopy/Side Air Curtain Module Wire Squibs
Courtesy of FORD MOTOR CO.

6. Make a jumper harness to deploy the safety canopy/side air curtain module.
    - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
    - At one end of the jumper harness, connect the wires together.
7. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety canopy/side air curtain module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

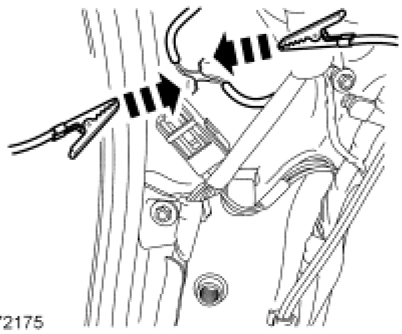

Fig. 170: Connecting Jumper Harness To Twisted Wires
Courtesy of FORD MOTOR CO.

8. From the end of the jumper harness that is not connected to the safety canopy/side air curtain module, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the safety canopy/side air curtain module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety canopy/side air curtain module.
11. Dispose of the deployed safety canopy/side air curtain module in the same manner as any other part to be scrapped.

Deployable Steering Column - In-Vehicle Deployment

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.**

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

NOTE: **It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering column electrical connector.**

2. Access the deployable steering column electrical connector.

NOTE: If the deployable steering column does not have a hardwired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the deployable steering column.

3. Cut each of the deployable steering column wires, leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
5. Make a jumper harness to deploy the deployable steering column.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.
6. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.

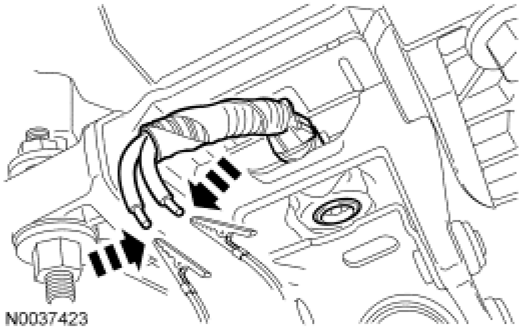

Fig. 171: Connecting Jumper Harness To Wires Of Deployable Steering Column
Courtesy of FORD MOTOR CO.

7. Remain at least 9.14 m (30 ft) away from the deployable steering column.
8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column.
11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.

REMOVAL AND INSTALLATION

AIR BAG TRIM COVER - PASSENGER, EDGE

Special Tools

Illustration	Tool Name	Tool Number

	Upholstery Clip Remover	SGT87810 (or equivalent)

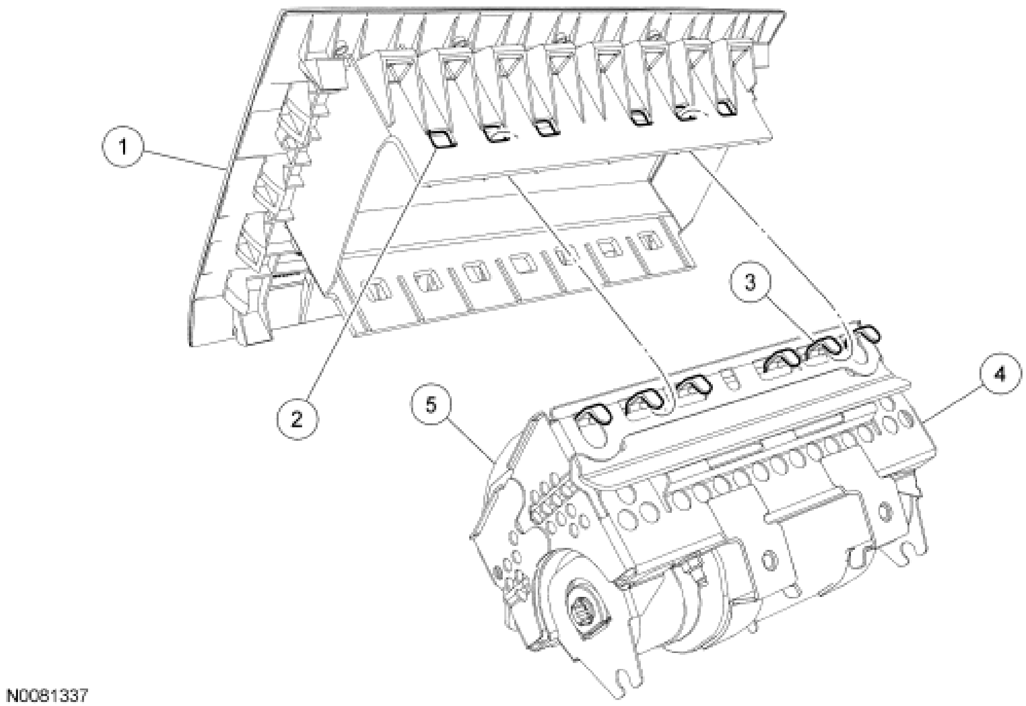

Fig. 172: Identifying Air Bag Trim Cover - Passenger, Edge
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04338	Passenger air bag cover
2	-	Passenger air bag cover window (part of passenger air bag cover)
3	-	Passenger air bag canister hook (part of canister)
4	-	Passenger air bag canister (part of 044A74)
5	-	Passenger air bag soft pack (part of 044A74)

REMOVAL

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do**

not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: **Do not use any sharp tools to separate the passenger air bag module trim cover from the passenger air bag module canister. Sharp tools may damage the passenger air bag module. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

WARNING: **Do not unpack or unroll the passenger air bag module soft pack. If the soft pack becomes unpacked or unrolled, install a new passenger air bag module assembly. Failure to follow these instructions may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

WARNING: **Do not manipulate or compromise the passenger air bag module hooks during the removal or installation procedure. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

1. Remove the passenger air bag module. Refer to **Passenger Air Bag Module - Edge** or **Passenger Air Bag Module - MKX**.
2. Place a mark on top of the passenger air bag module canister for correct installation.

WARNING: **Use a non-marring tool to separate the passenger air bag module cover from the passenger air bag module assembly. Sharp tools may damage the passenger air bag module. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

3. Using an Upholstery Clip Remover or equivalent tool, carefully lift the passenger air bag module cover from the bottom of the air bag module canister, separating the windows from the canister hooks.

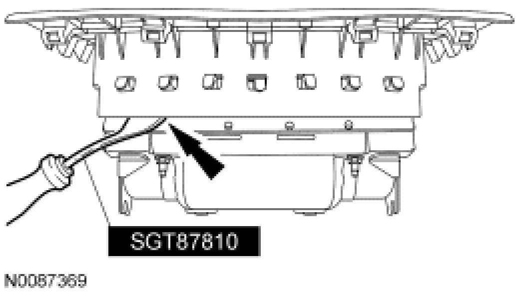

Fig. 173: View Of Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

NOTE: Place an X mark on the old air bag cover to avoid reinstalling.

4. Remove the passenger air bag cover from the canister, separating the top windows from the canister hooks.

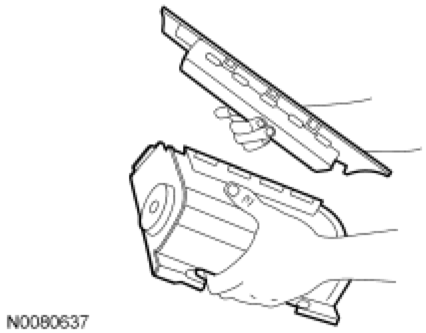

Fig. 174: Identifying Passenger Air Bag Cover
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Place the passenger air bag cover on a clean work surface once it is removed from the shipping package.

WARNING: Carefully inspect the passenger air bag trim cover, canister and soft pack before assembly. If any foreign objects are found, remove them before attaching the passenger air bag trim cover to the canister. If the canister or soft pack is damaged, install a new passenger air bag module assembly. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

2. Match the number of cover windows to the number of canister hooks before attaching the passenger air bag cover to the canister.
3. Match the top of the passenger air bag cover with the canister mark from the removal procedure.

4. Position the canister onto the passenger air bag cover and engage the bottom hooks into the air bag cover windows.
5. Push the top of the passenger air bag cover to engage the top canister hooks.

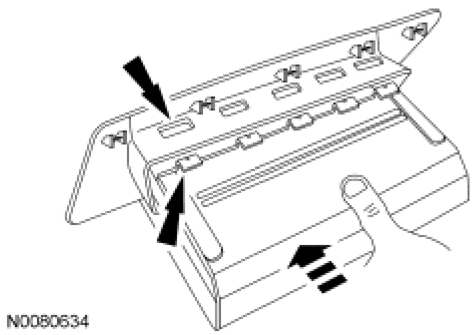

Fig. 175: Pushing Top Of Passenger Air Bag Cover To Engage Top Canister Hooks
Courtesy of FORD MOTOR CO.

6. Inspect the passenger air bag cover windows-to-canister hooks to verify that every window has a hook installed and the sides are not tucked or folded against the air bag canister.

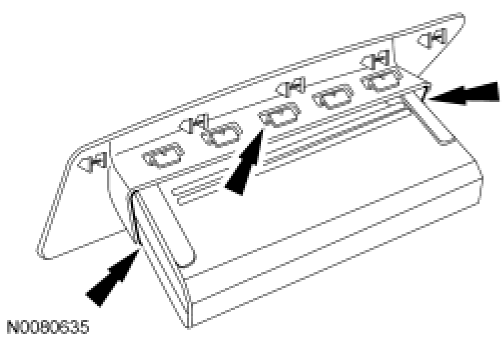

Fig. 176: Inspecting Passenger Air Bag Cover Windows-To-Canister Hooks To Verify Every Window Has A Hook Installed
Courtesy of FORD MOTOR CO.

7. Install the passenger air bag module. Refer to**Passenger Air Bag Module - Edge** or **Passenger Air Bag Module - MKX**.
8.

CLOCKSPRING

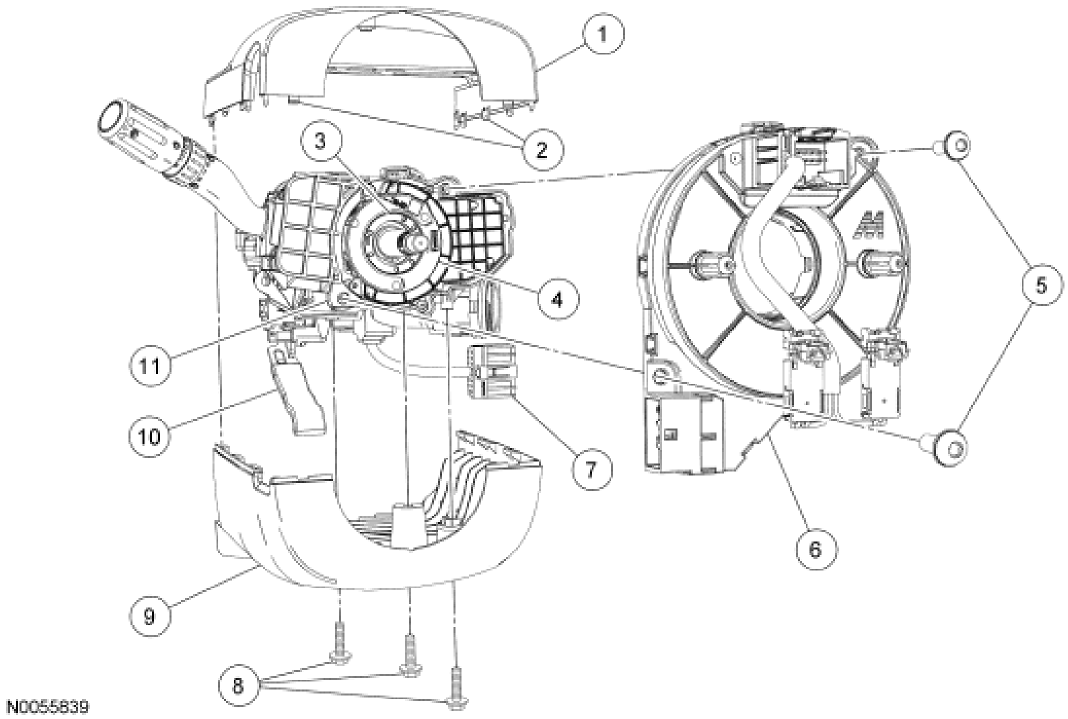

Fig. 177: Exploded View Of Clockspring
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3530A	Upper steering column shroud
2	-	Upper steering column shroud tabs (2 required) (part of 3530)
3	3F818	Steering wheel rotation sensor (if equipped)
4	-	Steering wheel rotation sensor ring (part of 3F818) (if equipped)
5	-	Clockspring screws (2 required) (part of 13K359)
6	14A644	Clockspring
7	-	Clockspring electrical connector (part of 14401)
8	-	Lower steering column shroud screws (3 required) (part of 3530B)
9	3530B	Lower steering column shroud
10	-	Steering column tilt lock/unlock handle
11	-	Multi-function switch housing

REMOVAL

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

1. Remove the driver air bag module. For additional information, refer to **Driver Air Bag Module**.

   NOTE: **Vehicles equipped with a steering wheel rotation sensor and/or adaptive headlamps, do not allow the clockspring rotor to turn from the straight-ahead position after the steering wheel is removed. Failure to follow this instruction may result in component damage and/or system failure.**

   NOTE: **Make sure the road wheels are in the straight-ahead position.**

2. Remove the steering wheel. For additional information, refer to **STEERING COLUMN** article.
3. Tape the clockspring rotor to the steering column shaft to prevent the clockspring rotor from moving out of center.
4. Release the 2 tabs and position the upper steering column shroud upward.
5. Remove the 3 screws and the lower steering column shroud.
6. Disconnect the clockspring electrical connector.
7. Remove the tape from the clockspring rotor to the steering column shaft. Do not allow the clockspring rotor to move from center after tape is removed.

   NOTE: **For vehicles equipped a with steering wheel rotation sensor and/or adaptive headlamps, do not allow the clockspring rotor to turn from the straight-ahead position after the steering wheel is removed. Failure to follow this instruction may result in component damage and/or system failure.**

   NOTE: **For vehicles equipped a with steering wheel rotation sensor and/or adaptive headlamps, after the clockspring has been removed, make sure the arrow on the steering wheel rotation sensor ring is lined up with the arrow on the steering wheel rotation sensor housing as shown in illustration.**

8. Remove the 2 clockspring screws and remove the clockspring.

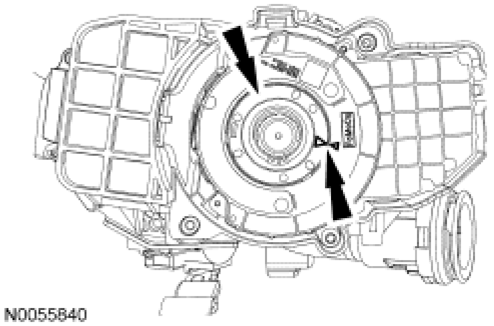

Fig. 178: Locating Clockspring Screws & Clockspring
Courtesy of FORD MOTOR CO.

INSTALLATION

Vehicle repairs reusing the same clockspring

WARNING: **If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.**

NOTE: Make sure the road wheels are in the straight-ahead position. Failure to follow this instruction may result in component damage and/or system failure.

1. If the vehicle's clockspring has rotated out of center, follow these steps to center the clockspring.
    1. Hold the clockspring outer housing stationary.

        NOTE: Overturning will destroy the clockspring. The internal ribbon wire acts as the stop and can be broken from its internal connection.

    2. While turning the rotor counterclockwise, carefully feel for the ribbon wire to run out of length and for a slight resistance. Stop turning at this point.
    3. Turn the clockspring clockwise (approximately 2.25 turns) until the clockspring rotor wiring and connector are in the 12 o'clock position. Clockspring is now centered.
        - Do not allow the rotor to turn from this position.

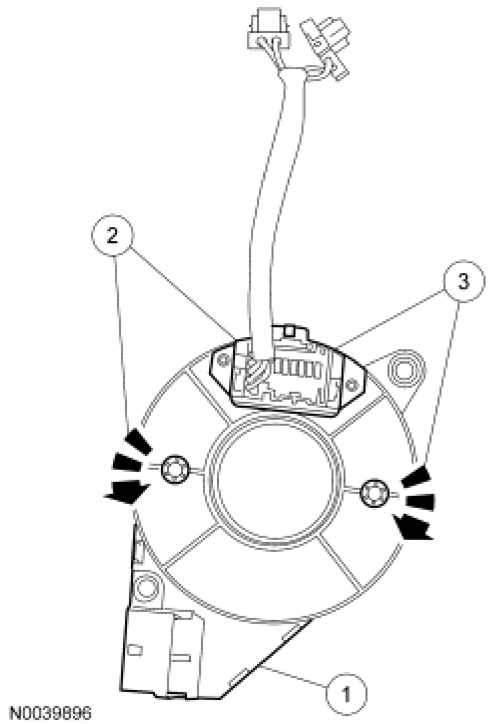

Fig. 179: Centering Clockspring
Courtesy of FORD MOTOR CO.

All vehicles

NOTE:	**Slight rotation of the steering wheel rotation sensor ring is allowed to align the 2 arrows.**

2. Make sure the steering wheel rotation sensor ring arrow is lined up with the steering wheel rotation sensor housing arrow as shown in illustration.

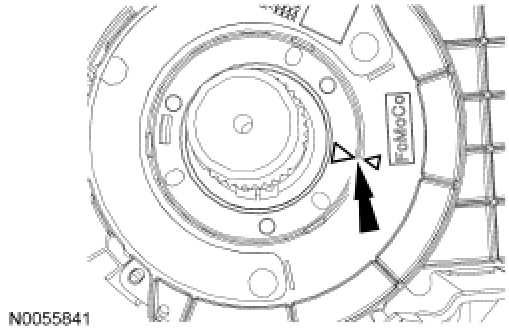

Fig. 180: Making Sure Sensor Ring Arrow Is Lined Up With Absolute Steering Angle Sensor Housing Arrow
Courtesy of FORD MOTOR CO.

NOTE:	**If the clockspring is left unattended by the technician between centralizing**

the clockspring and installing it to the multi-function switch housing, the centralizing procedure must be repeated. Failure to follow this instruction may result in component damage and/or system failure.

NOTE: **For vehicles equipped with a steering wheel rotation sensor and/or adaptive headlamps, slight rotation of the clockspring rotor might be needed to seat the clockspring 3 locator pins into the steering wheel rotation sensor and or adaptive headlamps sensor ring. Very slight rotation is possible on a new clockspring with the sealing key installed.**

NOTE: **Make sure the clockspring is fully seated into the multi-function switch housing before installing the clockspring screws.**

3. Install the clockspring and the 2 screws.

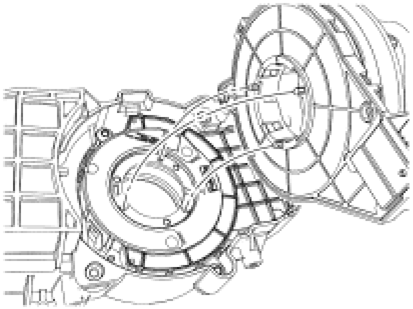

Fig. 181: Installing Clockspring & Screws
Courtesy of FORD MOTOR CO.

4. Connect the clockspring electrical connector.
5. Install the lower steering column shroud and the 3 screws.
6. Attach the upper steering column shroud to the lower steering column shroud.

NOTE: **If not installing a new clockspring, and the vehicle is left unattended by the technician between the installation of the clockspring to the multi-function switch housing and installing the steering wheel, the centralizing procedure can be repeated at this time with the clockspring being installed in the multi-function switch housing. Failure to follow this instruction may result in component damage and/or system failure.**

7. Install the steering wheel. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.
   - If a new clockspring is being installed, and after the steering wheel installation, remove the clockspring sealing key.
8. Install the driver air bag module. For additional information, refer to **Driver Air Bag Module**.

DRIVER AIR BAG MODULE

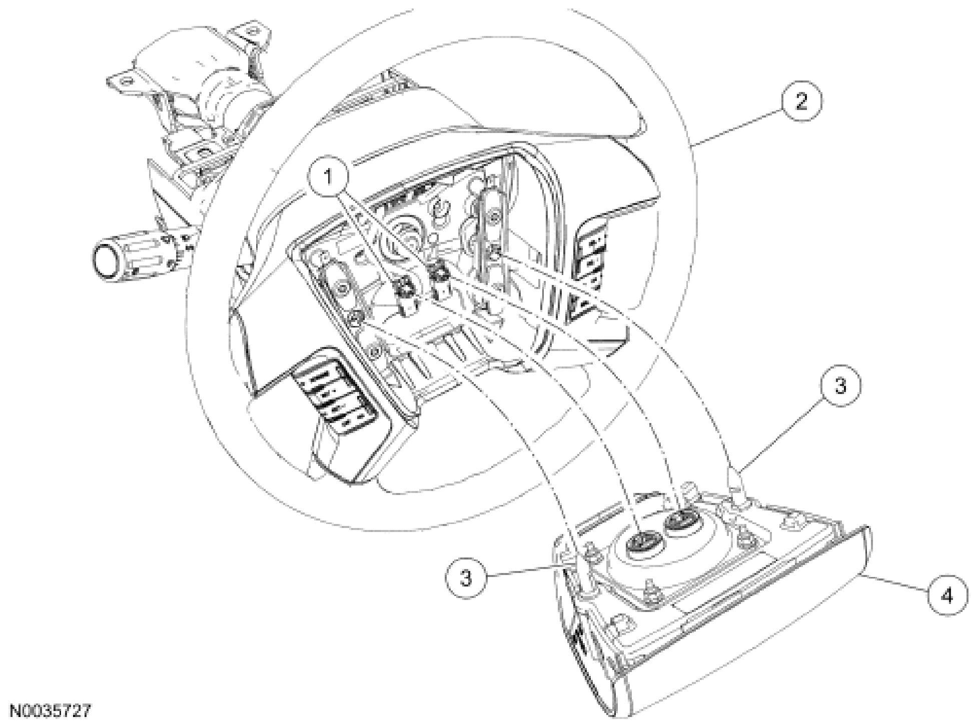

Fig. 182: Exploded View Of Driver Air Bag Module
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Driver air bag module electrical connectors (part of 14A664)
2	3600	Steering wheel
3	-	Driver air bag module locking pins (part of 43B13)
4	43B13	Driver air bag module

REMOVAL

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Do not repaint air bag modules with discolored or damaged trim covers or deployment doors; new air bag modules must be installed. Failure to follow this instruction may result in the air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

NOTE: Repeat this step for both locking pins.

2. Using a 3 mm (0.11 in) Allen wrench or a suitable tool through the access hole on the backside of the steering wheel, position the tool against the spring clip and push in, disengaging the clip from the locking pin. With the spring clip disengaged from the locking pin, gently pull back on that side of the driver air bag module to release it from the steering wheel.

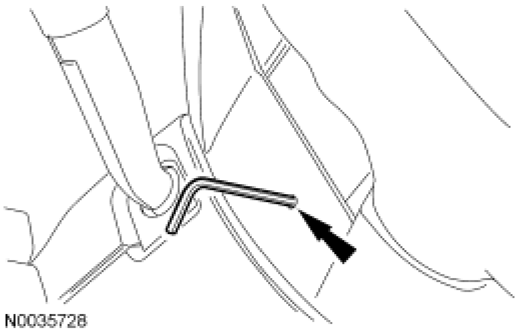

Fig. 183: Locating Allen Wrench
Courtesy of FORD MOTOR CO.

NOTE: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons can occur.

3. Using a small screwdriver as shown in illustration, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

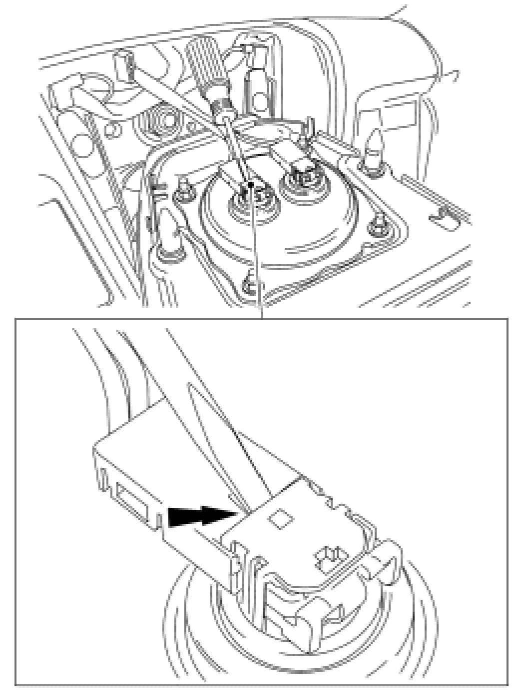

Fig. 184: Releasing Locking Buttons On Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE:	**Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons can occur.**

NOTE:	**The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.**

NOTE:	**The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.**

1. With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

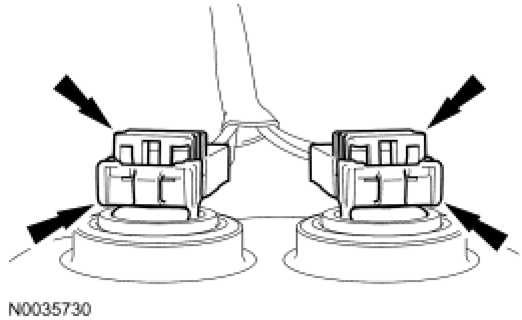

Fig. 185: Locating Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: Audible clicks will be heard when both wire clips are seated in the driver air bag module.

2. Align the driver air bag module locking pins to the steering wheel and, while pushing inward, seat the 2 driver air bag module locking pins to the steering wheel wire clips.
   - When the 2 locking pins are seated in place, there should be an even gap between the driver air bag module trim cover and the steering wheel.
3. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

FRONT IMPACT SEVERITY SENSOR

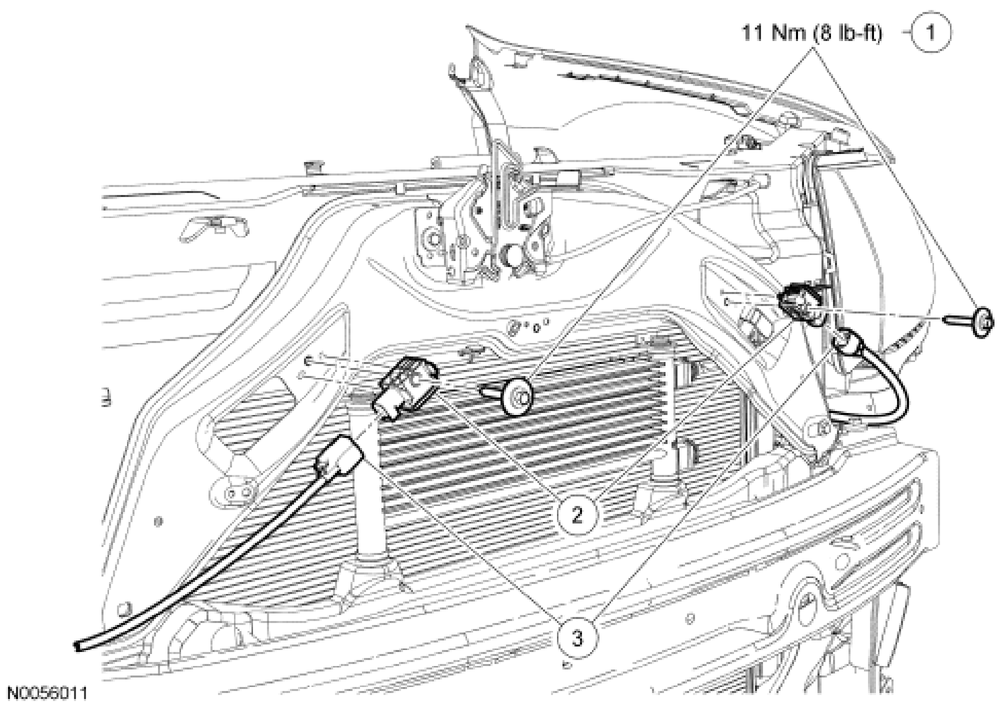

Fig. 186: Exploded View Of Front Impact Severity Sensor With Torque Specification

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712191	LH and RH front impact severity sensor bolts
2	14B006	LH and RH front impact severity sensors
3	-	LH and RH front impact severity sensor electrical connectors (part of 14290)

WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the front bumper cover. For additional information, refer to **BUMPERS** article.
3. Disconnect the front impact severity sensor electrical connector.

   WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   NOTE: Make sure the hood latch bracket and front impact severity sensor mating surfaces are clean and free of foreign material.

   NOTE: Note position of the 2 locator tabs on the front impact severity sensor for installation.

4. Remove the bolt and the front impact severity sensor.
   - To install, tighten to 11 Nm (8 lb-ft).
5. To install, reverse the removal procedure.
6. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) - MANUAL SEAT TRACK

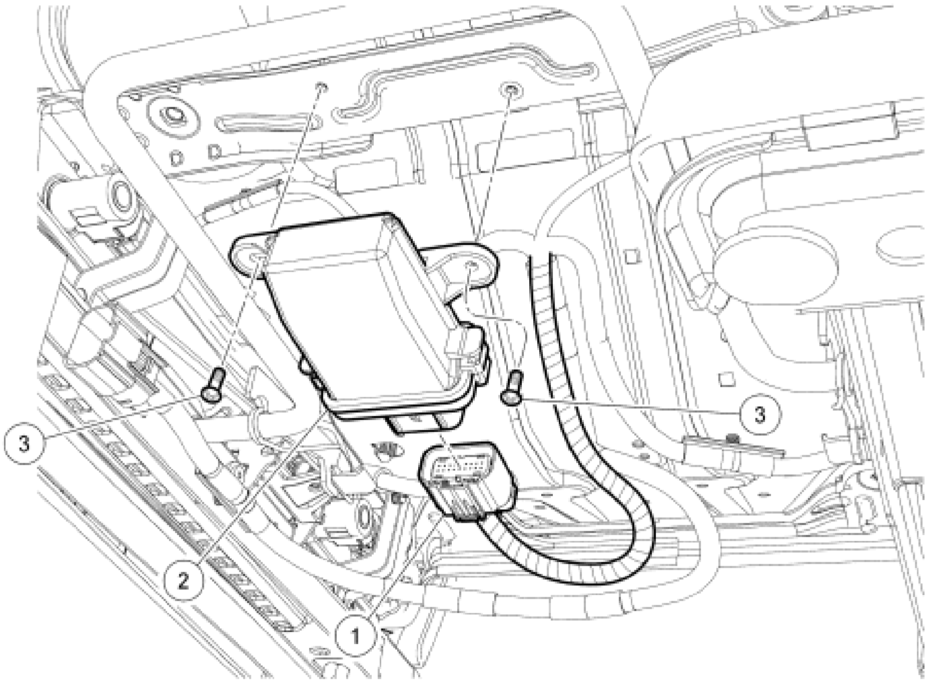

Fig. 187: Exploded View Of Occupant Classification Module - Manual Seat Track
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Occupant classification system module (OCSM) electrical connector (part of 14A698)
2	14B422	OCSM
3	-	OCSM screws

REMOVAL

WARNING: **Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of

faults before releasing the vehicle to the customer.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Disconnect the occupant classification system module (OCSM) electrical connector.
3. Remove the 2 screws and OCSM.
4. To install, reverse the removal procedure.
5. Install the passenger seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **SEATING** article.
6. Carry out the appropriate procedure after installation of an OCSM.
   - If installing the original OCSM, carry out the Zero Seat Weight Test and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.
   - If installing a new OCSM, carry out the System Reset procedure and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Reset**.

OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) - POWER SEAT TRACK

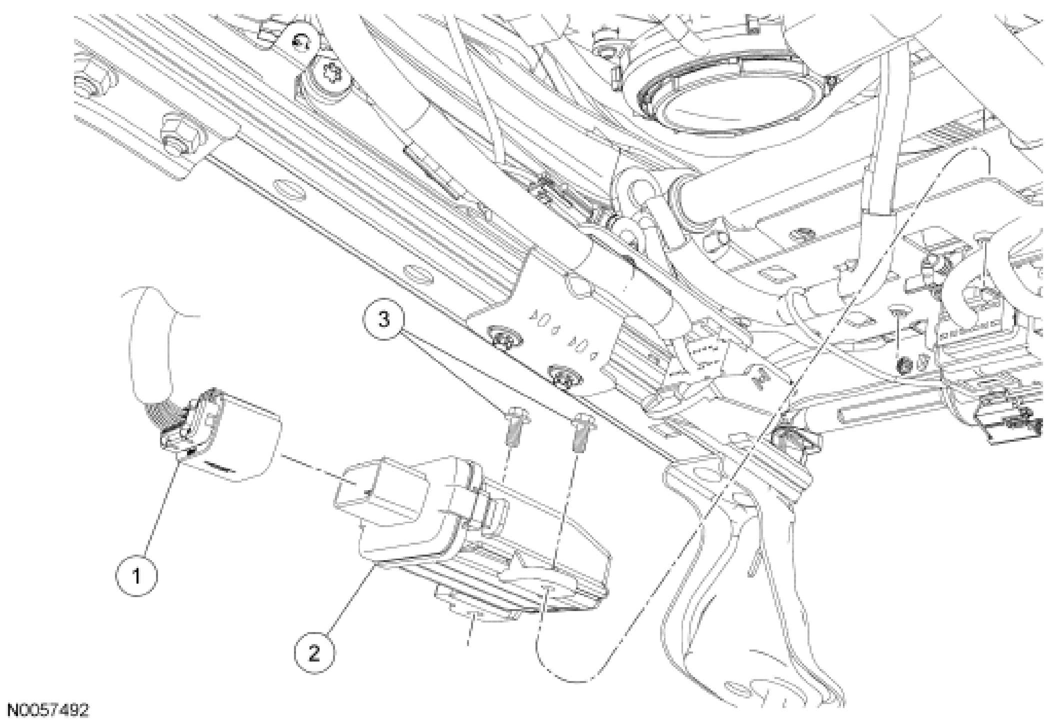

Fig. 188: Exploded View Of Occupant Classification Module - Power Seat Track
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Occupant classification system module (OCSM) electrical connector (part of

		14A698)
2	14B422	OCSM
3	-	OCSM screws

REMOVAL

WARNING: **Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

1. Remove the front passenger seat. For additional information, refer to **SEATING** article.
2. Disconnect the occupant classification system module (OCSM) electrical connector.
3. Remove the 2 screws and OCSM.
4. To install, reverse the removal procedure.
5. Install the front passenger seat. **Do not prove out the SRS at this time.** For additional information, refer to **SEATING** article.
6. Repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
7. Carry out the appropriate procedure after installation of an OCSM.
   - If installing the original OCSM, carry out the Zero Seat Weight Test. For additional information, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.
   - If installing a new OCSM, carry out the System Reset procedure. For additional information, refer to **Occupant Classification Sensor (OCS) System Reset**.

OCCUPANT CLASSIFICATION SENSOR - MANUAL SEAT TRACK

REMOVAL

WARNING: **Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.**

All occupant classification sensor (OCS) weight sensor bolt(s)

1. Remove the manual seat track. For additional information, refer to **SEATING** article.

    NOTE: **After marking the seat track rails, do not change the position of the seat track.**

2. Mark the position of both seat track rails.

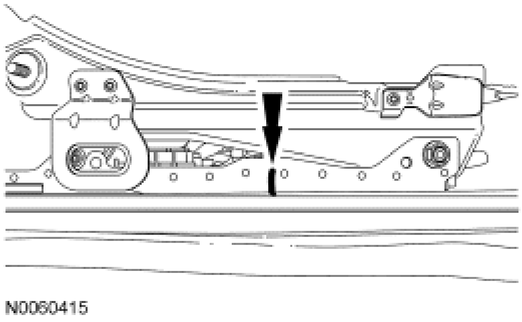

Fig. 189: Marking Position Of Both Seat Track Rails
Courtesy of FORD MOTOR CO.

Inboard OCS weight sensor bolt(s)

3. Remove the nut and safety belt buckle.

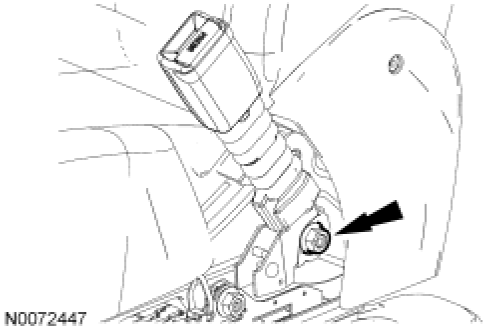

Fig. 190: Identifying Nut And Safety Belt Buckle

Courtesy of FORD MOTOR CO.

All OCS weight sensor bolt(s)

NOTE: **Outboard front cross brace screws shown in illustration, inboard similar.**

4. On the side with the affected OCS I-bolt(s), remove the 2 front cross brace screws.

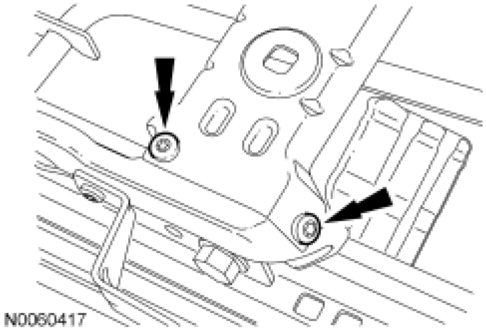

Fig. 191: Identifying Front Cross Brace Screws
Courtesy of FORD MOTOR CO.

5. On the side with the affected OCS weight sensor bolt(s), disengage the seat adjuster handle spring and position it aside.

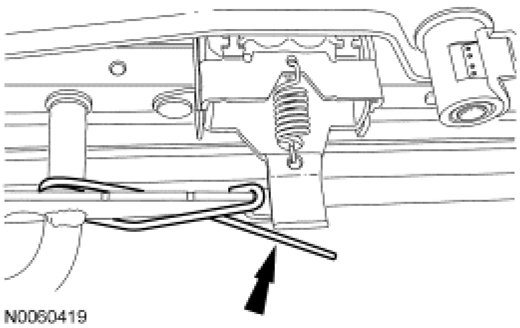

Fig. 192: Identifying Seat Adjuster Handle Spring
Courtesy of FORD MOTOR CO.

6. Separate the seat adjuster handle from the affected side of the seat track rail with the OCS weight sensor bolt(s).

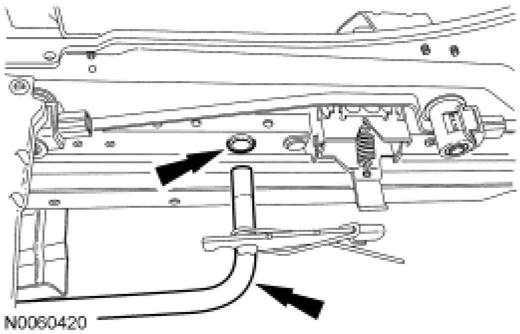

Fig. 193: Identifying Seat Track Rail & OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

NOTE: Outboard rear cross brace screws shown in illustration, inboard similar.

7. On the side with the affected OCS weight sensor bolt(s), remove the 2 rear cross brace screws.

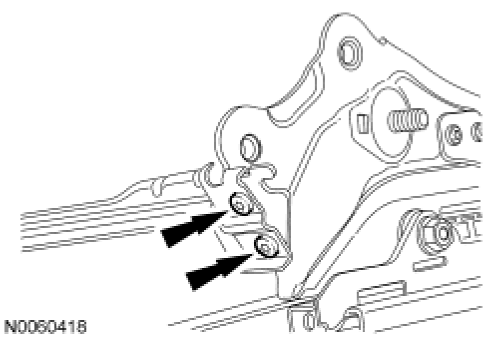

Fig. 194: Identifying Rear Cross Brace Screws
Courtesy of FORD MOTOR CO.

NOTE: If any occupant classification sensor (OCS) weight sensor bolt nuts are removed, new OCS weight sensor bolt nuts must be installed.

8. Remove and discard the 2 OCS weight sensor bolt nuts from the affected side of the seat track rail with the OCS weight sensor bolt(s).

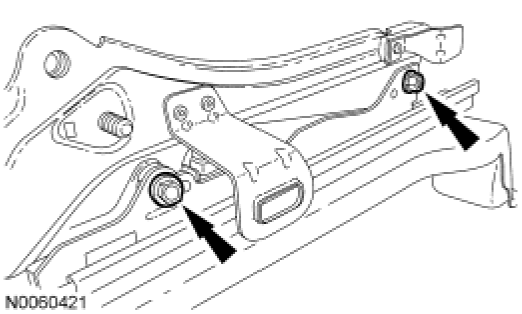

Fig. 195: Identifying OCS Weight Sensor Bolt Nuts

Courtesy of FORD MOTOR CO.

9. Remove the side plate with the OCS weight sensor bolt(s) from the seat track rail.

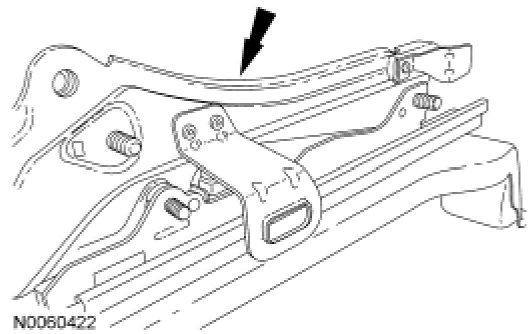

Fig. 196: Identifying Side Plate
Courtesy of FORD MOTOR CO.

NOTE:	**Do not overtighten the side plate with the occupant classification sensor (OCS) weight sensor bolts to the bench or table. Tighten only enough to compress the spring washer. Overtightening may damage the side plate or OCS weight sensor bolts.**

10. Using a suitable tool, clamp the side plate to a bench or table to compress the spring washer on the affected OCS weight sensor bolt as shown in illustration.

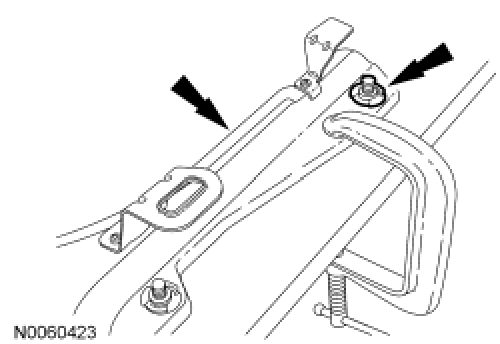

Fig. 197: Clamping Side Plate To A Bench Or Table Using A Suitable Tool
Courtesy of FORD MOTOR CO.

NOTE:	**Note the position of the OCS weight sensor bolt, spring washer and retaining clip for installation.**

11. Remove and discard the retaining clip from the affected OCS weight sensor bolt.

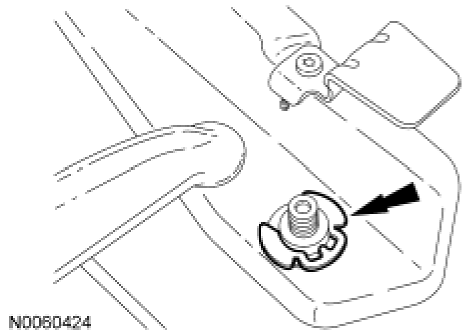

Fig. 198: Identifying Retaining Clip From Affected OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

12. Release the clamp and remove the OCS weight sensor bolt and spring washer from the side plate.

INSTALLATION

All OCS weight sensor bolt(s)

NOTE: **Do not overtighten the side plate with the occupant classification sensor (OCS) weight sensor bolts to the bench or table. Tighten only enough to compress the spring washer. Overtightening may damage the side plate or OCS weight sensor bolts.**

1. Position the spring washer and OCS weight sensor bolt in the side plate. Then clamp the side plate to a bench or table to compress the OCS weight sensor bolt spring washer.

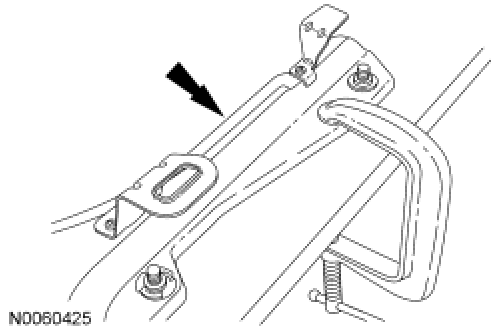

Fig. 199: Clamping Side Plate To A Bench Or Table Using A Suitable Tool
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the OCS weight sensor bolt retaining clip is seated fully in the OCS weight sensor bolt groove underneath the OCS weight sensor O-ring seal.**

2. Install the 2 new OCS weight sensor bolt retaining clips in the OCS weight sensor groove underneath the O-ring seal.

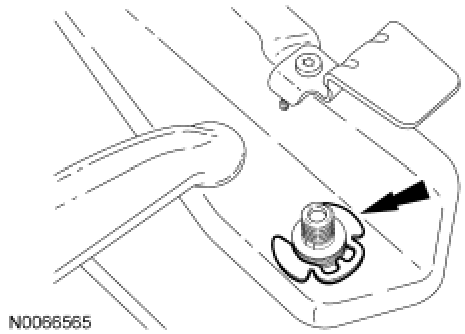

Fig. 200: Identifying Retaining Clip From Affected OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

3. Unclamp the side plate with the installed OCS weight sensor bolt from the bench or table.

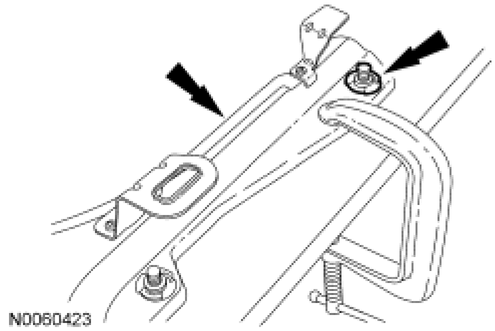

Fig. 201: Clamping Side Plate To A Bench Or Table Using A Suitable Tool
Courtesy of FORD MOTOR CO.

NOTE:	**Slight rotational adjustment of the OCS weight sensors bolts may be necessary to install the OCS weight sensor bolts and side plate to the seat track rail.**

4. Install the side plate and OCS weight sensor bolts to the seat track rail.

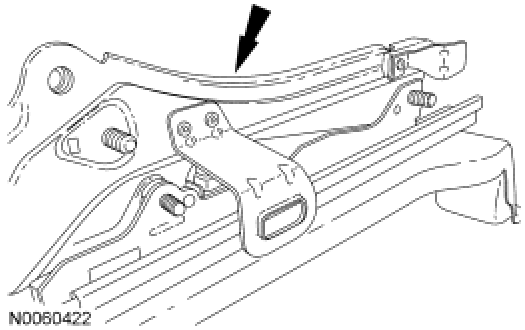

Fig. 202: Identifying Side Plate
Courtesy of FORD MOTOR CO.

NOTE: When installing the side plate to the seat track rail, 2 new OCS weight sensor nuts must be installed.

5. Install the 2 new OCS weight sensor bolt nuts to the seat track rail.
   - Tighten to 33 Nm (24 lb-ft).

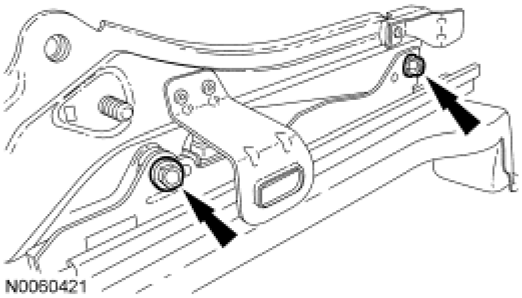

Fig. 203: Identifying OCS Weight Sensor Bolt Nuts
Courtesy of FORD MOTOR CO.

6. Install the seat adjuster handle to the seat track rail.

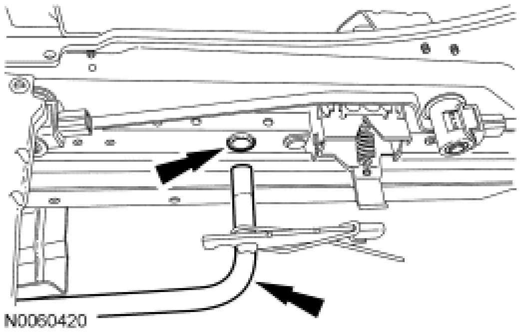

Fig. 204: Identifying Seat Track Rail & OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

7. Engage the seat adjuster handle spring.

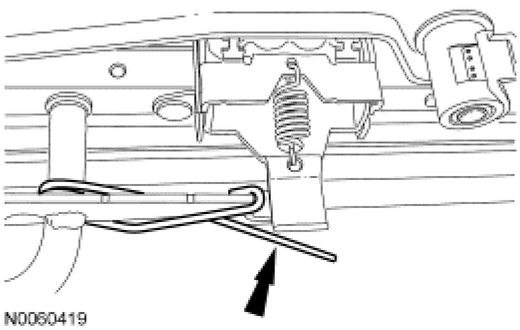

Fig. 205: Identifying Seat Adjuster Handle Spring

Courtesy of FORD MOTOR CO.

8. Install the 2 rear cross brace screws.
    - Tighten to 5 Nm (44 lb-in).

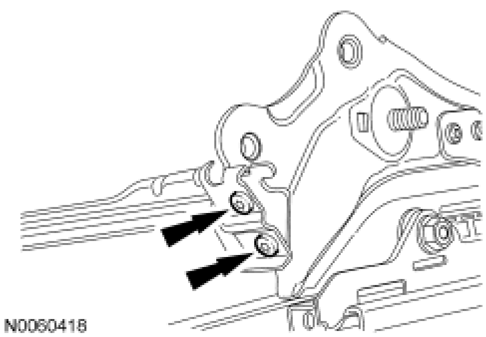

Fig. 206: Identifying Rear Cross Brace Screws
Courtesy of FORD MOTOR CO.

9. Install the 2 front cross brace screws.
    - Tighten to 5 Nm (44 lb-in).

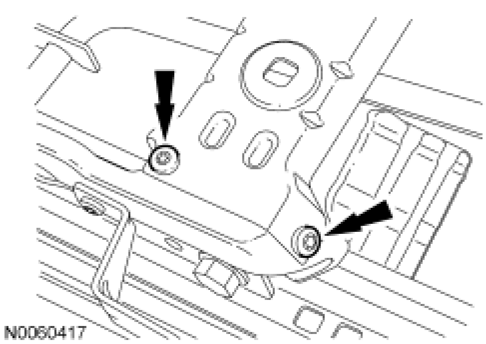

Fig. 207: Identifying Front Cross Brace Screws
Courtesy of FORD MOTOR CO.

Inboard OCS weight sensor bolt(s)

10. Install the nut and safety belt buckle.
    - Tighten to 40 Nm (30 lb-ft).

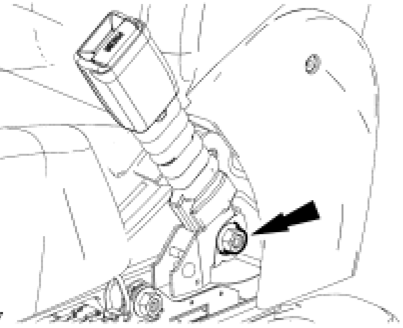

Fig. 208: Identifying Safety Belt Buckle Bolt
Courtesy of FORD MOTOR CO.

All OCS weight sensor bolt(s)

11. Install the manual seat track. For additional information, refer to **SEATING** article.
12. Install the passenger seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **SEATING** article.
13. Carry out the appropriate procedure after installation of an OCS system component.
    - If installing the original OCS system component, carry out the Zero Seat Weight Test and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.
    - If installing a new OCS system component, carry out the System Reset procedure and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Reset**.

OCCUPANT CLASSIFICATION SENSOR - POWER SEAT TRACK

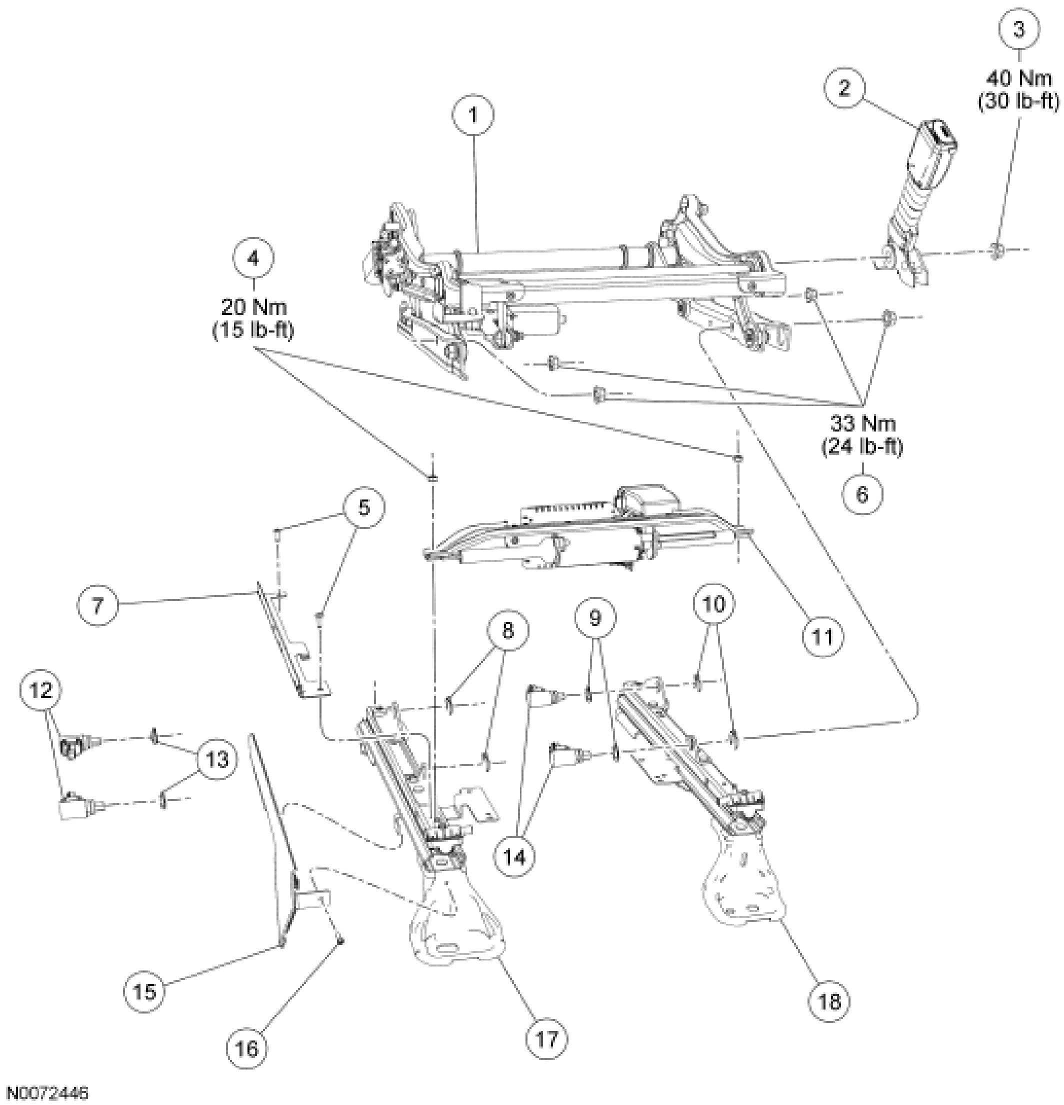

Fig. 209: Identifying Power Seat Track With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	61710	Power seat track assembly
2	61202	Safety belt buckle
3	-	Safety belt buckle nut (part of 61202)
4	-	Seat track front cross brace nuts (2 required) (part of 61710)
5	-	Occupant classification sensor (OCS) weight sensor bolt protection bracket screws (2 required) (part of 61710)
6	-	OCS weight sensor bolt nuts (4 required) (part of 61710)

7	-	OCS weight sensor bolt protection bracket (part of 61710)
8	-	Outboard seat track rail OCS weight sensor bolt retaining clips (2 required) (part of 61710)
9	-	Inboard seat track rail OCS weight sensor bolt spring washers (2 required) (part of 61710)
10	-	Inboard seat track rail OCS weight sensor bolt retaining clips (2 required) (part of 61710)
11	-	Seat track front cross brace (part of 61710)
12	-	Outboard seat track rail OCS weight sensor bolts (2 required) (part of 61710)
13	-	Outboard seat track rail OCS weight sensor bolt spring washers (2 required) (part of 61710)
14	-	Inboard seat track rail OCS weight sensor bolts (2 required) (part of 61710)
15	-	Outboard seat track riser cover shield (part of 61710)
16	-	Outboard seat track riser cover shield retainer (part of 61710)
17	-	Outboard seat track rail (part of 61710)
18	-	Inboard seat track rail (part of 61710)

REMOVAL

WARNING: **Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.**

All occupant classification sensor (OCS) weight sensor bolt(s)

1. Remove the power seat track. For additional information, refer to **SEATING** article.

NOTE: **Inboard seat track rail shown in illustration, outboard similar.**

NOTE: **After marking the seat track rails, do not change the position of the seat track.**

2. Mark the position of both seat track rails.

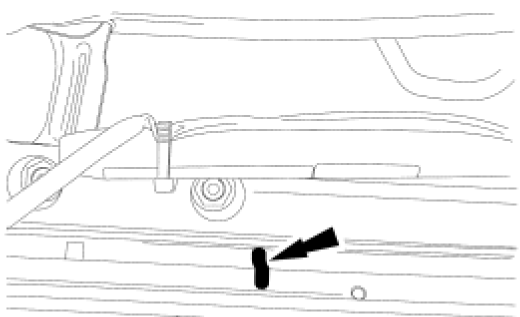

Fig. 210: Marking Position Of Both Seat Track Rails
Courtesy of FORD MOTOR CO.

Inboard OCS weight sensor bolt(s)

3. Remove the nut and safety belt buckle.

Outboard OCS weight sensor bolt(s)

4. Remove the front retainer and outboard seat track riser cover shield.
5. Remove the 2 retainers and occupant classification sensor (OCS) weight sensor bolt protection bracket.

All OCS weight sensor bolt(s)

6. On the side with the affected OCS weight sensor bolt(s), remove the nut from the seat track front cross brace.

NOTE: **If any OCS weight sensor bolt nuts are removed, new OCS weight sensor bolt nuts must be installed.**

7. Remove and discard the 2 OCS weight sensor bolt nuts from the affected side of the seat track rail with the OCS weight sensor(s).

NOTE: **Outboard side shown in illustration, inboard similar.**

8. Separate the front seat track motor cable from the affected seat track rail. Then remove the side plate with the OCS weight sensor bolts from the seat track rail.

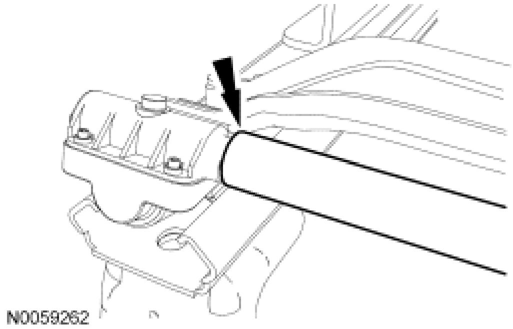

Fig. 211: Identifying Front Seat Track Motor Cable
Courtesy of FORD MOTOR CO.

NOTE: Do not overtighten the side plate with the occupant classification sensor (OCS) weight sensor bolts to the bench or table. Tighten only enough to compress the spring washer. Overtightening may damage the side plate or OCS weight sensor bolts.

9. Using a suitable tool, clamp the side plate to a bench or table to compress the spring washer on the affected OCS weight sensor bolt as shown in illustration.

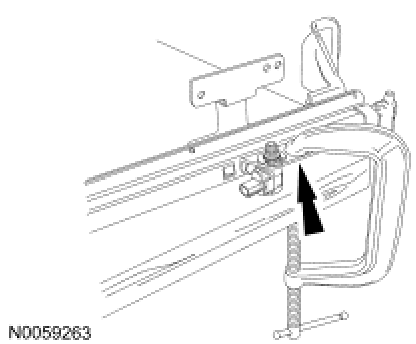

Fig. 212: Clamping Side Plate To A Bench Or Table To Compress Spring Washer On Affected OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

NOTE: Note the position of the OCS weight sensor bolt, spring washer and retaining clip for installation.

10. Remove and discard the retaining clip from the affected OCS weight sensor bolt.

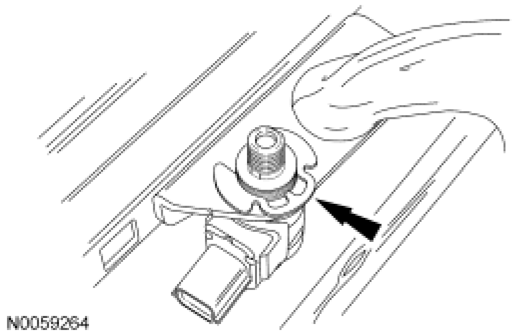

Fig. 213: Identifying Retaining Clip From Affected OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

11. Release the clamp and remove the OCS weight sensor bolt and spring washer from the side plate.

INSTALLATION

All OCS weight sensor bolt(s)

NOTE: Do not overtighten the side plate with the occupant classification sensor (OCS) weight sensor bolts to the bench or table. Tighten only enough to compress the spring washer. Overtightening may damage the side plate or OCS weight sensor bolts.

1. Position the spring washer and OCS weight sensor bolt in the side plate. Then clamp the side plate to a bench or table to compress the OCS weight sensor bolt spring washer.

NOTE: Make sure the OCS weight sensor bolt retaining clip is seated fully in the OCS weight sensor bolt groove underneath the OCS weight sensor O-ring seal.

2. Install the OCS weight sensor bolt retaining clip.

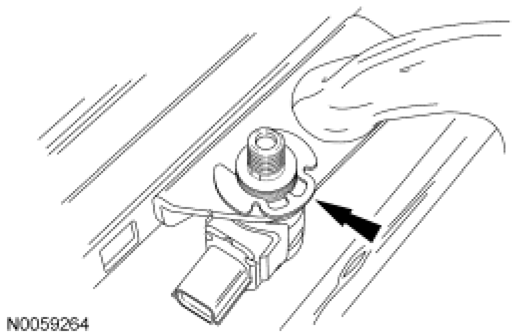

Fig. 214: Identifying Retaining Clip From Affected OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

3. Remove the clamp and side plate from the bench or table.

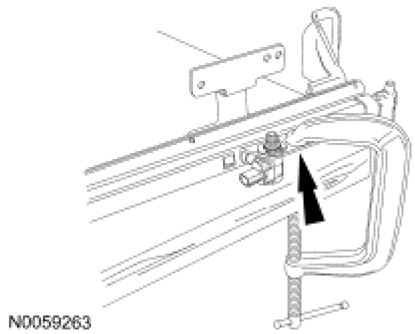

Fig. 215: Clamping Side Plate To A Bench Or Table To Compress Spring Washer On Affected OCS Weight Sensor Bolt
Courtesy of FORD MOTOR CO.

NOTE: **Slight rotational adjustment of the front seat track motor cable and OCS weight sensor bolts may be necessary to install the OCS weight sensor bolts and side plate to the seat track rail.**

4. Install the front seat track motor cable to the seat track rail. Then install the side plate with the OCS weight sensor bolts to the seat track rail.

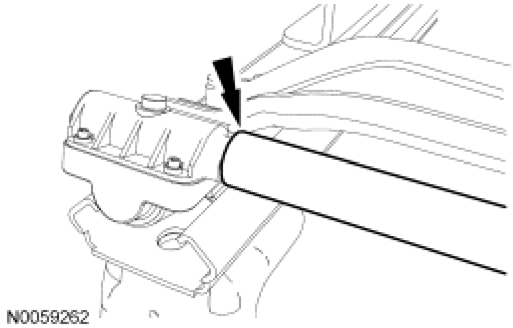

Fig. 216: Identifying Front Seat Track Motor Cable
Courtesy of FORD MOTOR CO.

NOTE: **When installing the side plate to the seat track rail, 2 new OCS weight sensor nuts must be installed.**

5. Install the 2 new OCS weight sensor bolt nuts to the seat track rail.
   - Tighten to 33 Nm (24 lb-ft).

NOTE: **Outboard side shown in illustration, inboard similar.**

6. Install the nut to the seat track front cross brace.
   - Tighten to 20 Nm (15 lb-ft).

Outboard OCS weight sensor bolt(s)

7. Install the 2 retainers and OCS weight sensor bolt protection bracket.
8. Install the front retainer and outboard seat track riser cover shield.

Inboard OCS weight sensor bolt(s)

9. Install the nut and safety belt buckle.
   - Tighten to 40 Nm (30 lb-ft).

All OCS weight sensor bolt(s)

10. Install the power seat track. For additional information, refer to **SEATING** article.
11. Install the passenger seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **SEATING** article.
12. Carry out the appropriate procedure after installation of an OCS system component.
    - If installing the original OCS system component, carry out the Zero Seat Weight Test and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.
    - If installing a new OCS system component, carry out the System Reset procedure and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Reset**n.

PASSENGER AIR BAG DEACTIVATION (PAD) INDICATOR

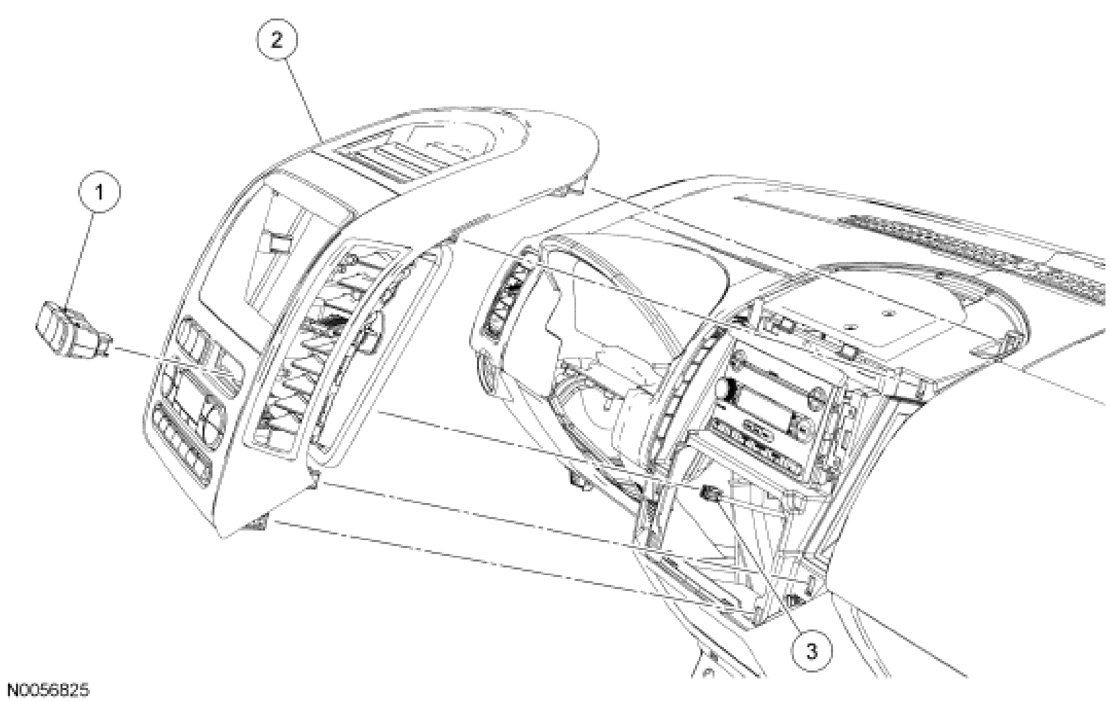

Fig. 217: Exploded View Of Passenger Air Bag Deactivation (PAD) Indicator - Edge
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13D730	Passenger airbag deactivation (PAD) indicator
2	04302	Instrument panel (I/P) center finish panel
3	-	Passenger airbag deactivation indicator electrical connector (part of 14401)

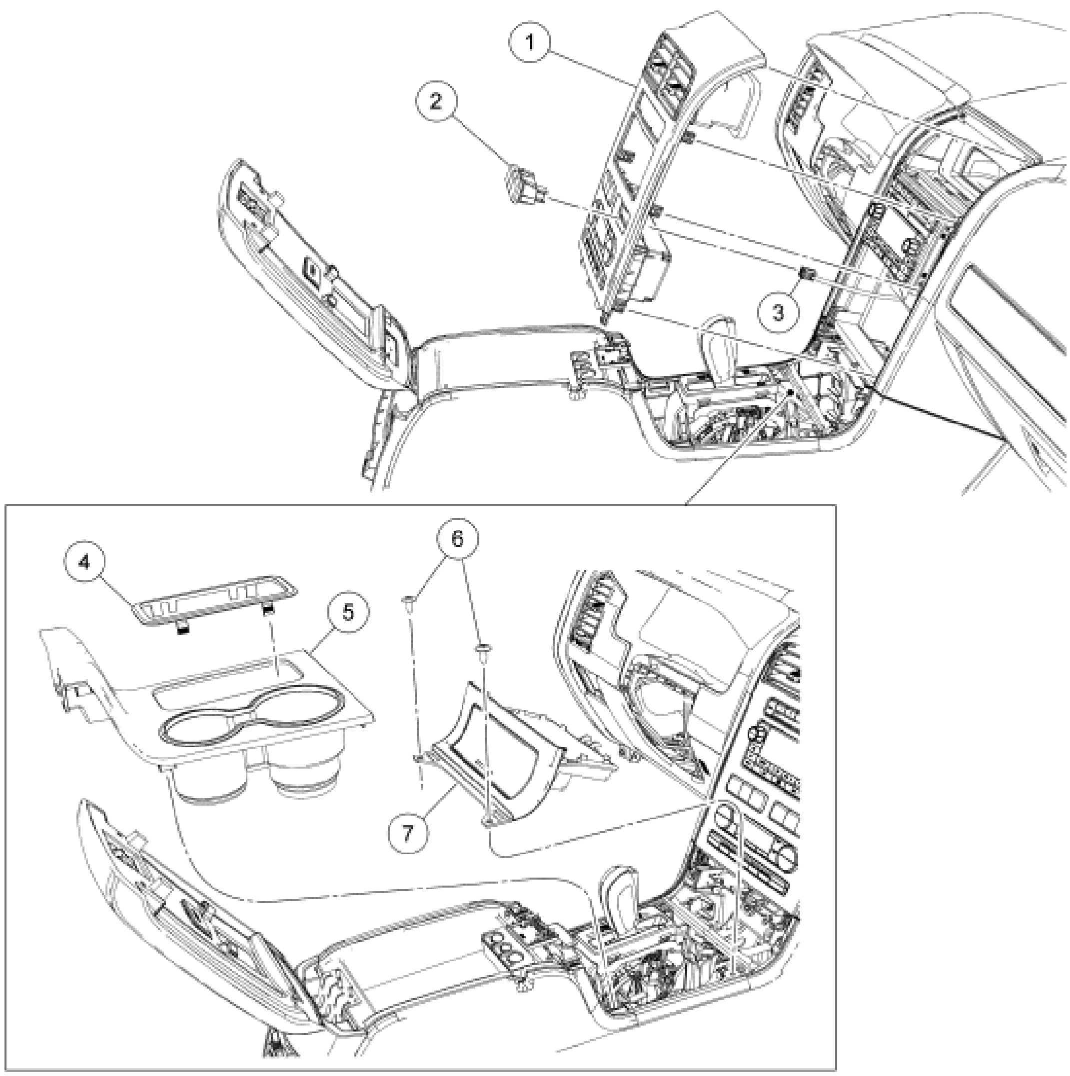

Fig. 218: Exploded View Of Passenger Air Bag Deactivation (PAD) Indicator - MKX
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04302	Instrument panel center finish panel
2	13D730	Passenger air bag deactivation (PAD) indicator

3	-	PAD indicator electrical connector (part of 14401)
4	7E391	Console shifter bezel
5	045A76	Center finish console panel
6	W706092	Instrument panel power point/storage bin retainers
7	047A04	Instrument panel power point/storage bin

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The passenger air bag deactivation (PAD) indicator is part of the hazard switch/traction control switch assembly.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the console shifter bezel (MKX only).
3. Remove the center finish console panel (MKX only).
4. Remove the 2 retainers from the power point/storage bin (MKX only).
5. Pull and release the instrument panel center finish panel.
6. Disconnect the PAD indicator electrical connector.
7. Release the 4 tabs (2 upper and 2 lower) on the PAD indicator and remove it from the instrument panel center finish panel.

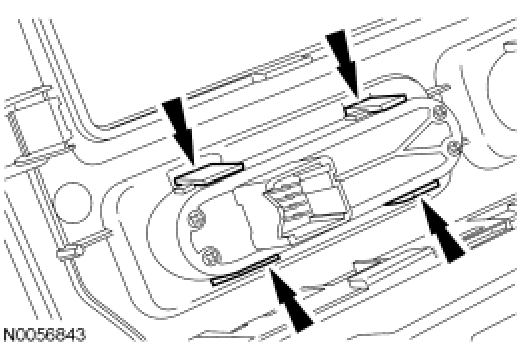

Fig. 219: Locating Tabs On Passenger Air Bag Deactivation Indicator
Courtesy of FORD MOTOR CO.

8. To install, reverse the removal procedure.
9. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

PASSENGER AIR BAG MODULE - EDGE

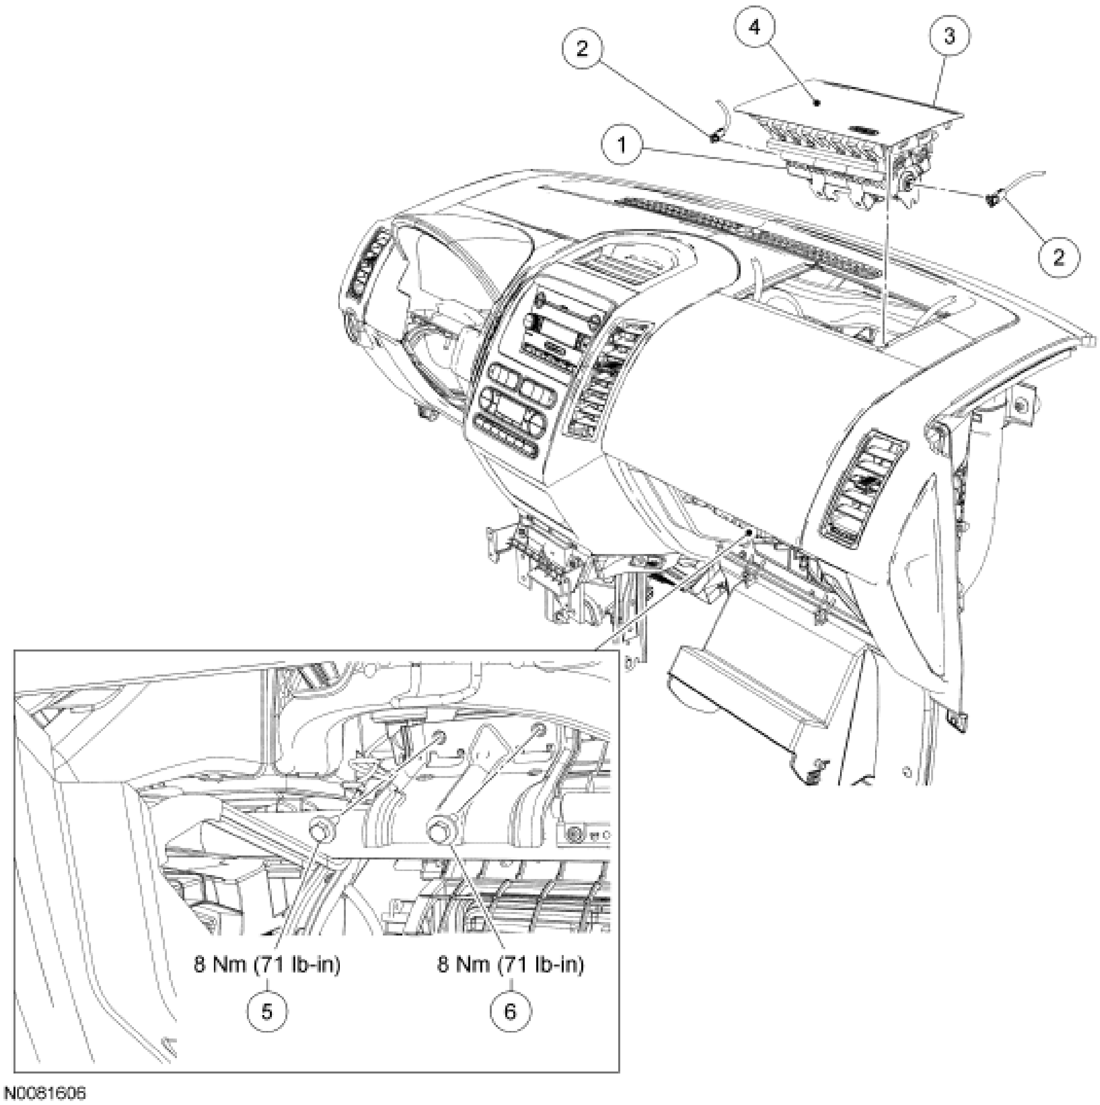

Fig. 220: Identifying Passenger Air Bag Module - Edge With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	044A74	Passenger air bag module assembly
2	-	Passenger air bag module electrical connectors (part of 14401)
3	-	Passenger air bag cover clips (part of 04338)
4	04338	Passenger air bag cover
5	W505422	Passenger air bag module inboard bolt
6	W505422	Passenger air bag module outboard bolt

REMOVAL

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Do no install a new passenger air bag module assembly due to a damaged or discolored passenger air bag cover. The passenger air bag cover can be serviced separately from the passenger air bag module assembly. For additional information, refer to Air Bag Trim Cover - Passenger, Edge.

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Open and lower the glove compartment door.
   - If equipped, detach the glove compartment door dampener.
3. Remove the 2 passenger air bag module bolts from the cross-car beam bracket.

   NOTE: Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the air bag module may occur.

4. Through the glove compartment opening, release the LH side passenger air bag cover clips. Then release the foreward-most passenger air bag cover clips and separate the passenger air bag cover and passenger air bag module from the instrument panel.
5. Using a small screwdriver as shown in illustration, lift up and release the locking button on the RH passenger air bag module electrical connector.

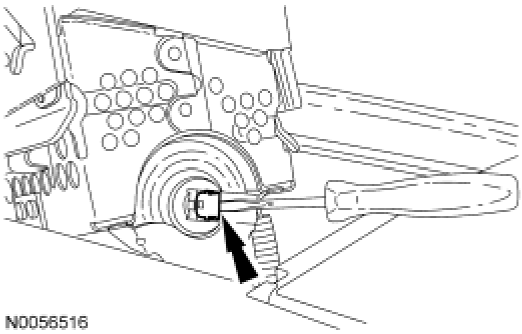

Fig. 221: Releasing Locking Button On RH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: **Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

6. With the RH locking button released, remove the RH electrical connector.
7. Using a small screwdriver as shown in illustration, lift up and release the locking button on the LH passenger air bag module electrical connector.

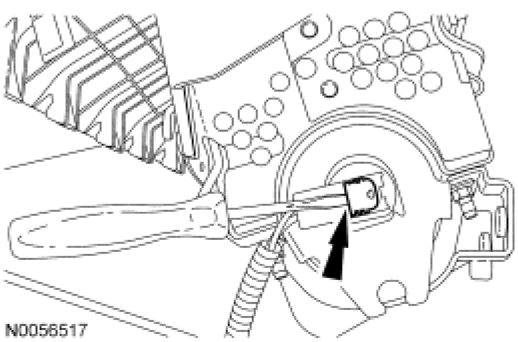

Fig. 222: Releasing Locking Button On LH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: **Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

8. With the LH locking button released, remove the LH electrical connector and remove the passenger air bag module.

INSTALLATION

NOTE: **Do not install the passenger air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.**

NOTE: The passenger air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

NOTE: The passenger air bag module electrical connectors are unique and cannot be reversed when connected to the passenger air bag module. Match the electrical connector key to the keyway in the passenger air bag module. Do not force the electrical connectors into the passenger air bag module. Damage to the connector or component may occur.

NOTE: RH shown in illustration, LH similar.

1. With the locking buttons released, install the 2 passenger air bag module electrical connectors fully into the passenger air bag module and seat the locking buttons.

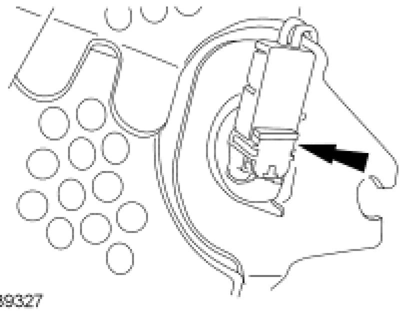

Fig. 223: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: Do not handle the passenger air bag module by grabbing the edges of the passenger air bag cover. Damage to the air bag module may occur.

NOTE: During passenger air bag module installation, make sure all the passenger air bag cover clips are fully seated in the instrument panel.

2. Install the passenger air bag module passenger air bag cover rear-most clips into the instrument panel first. Then install the side passenger air bag cover clips working around to the forward-most clips seating each of them fully into the instrument panel.

NOTE: To avoid a squeak or rattle condition, install the 2 passenger air bag module bolts in this order.

3. Install the passenger air bag module bolts.
   1. Install the inboard passenger air bag module bolt.
      - Tighten to 8 Nm (71 lb-in).

2. Install the outboard passenger air bag module bolt.
   - Tighten to 8 Nm (71 lb-in).

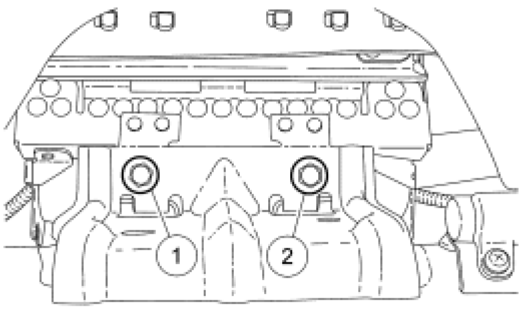

Fig. 224: Installing Passenger Air Bag Module Bolts In Sequence
Courtesy of FORD MOTOR CO.

4. Close the glove compartment door.
   - If equipped, attach the glove compartment door dampener.
5. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

PASSENGER AIR BAG MODULE - MKX

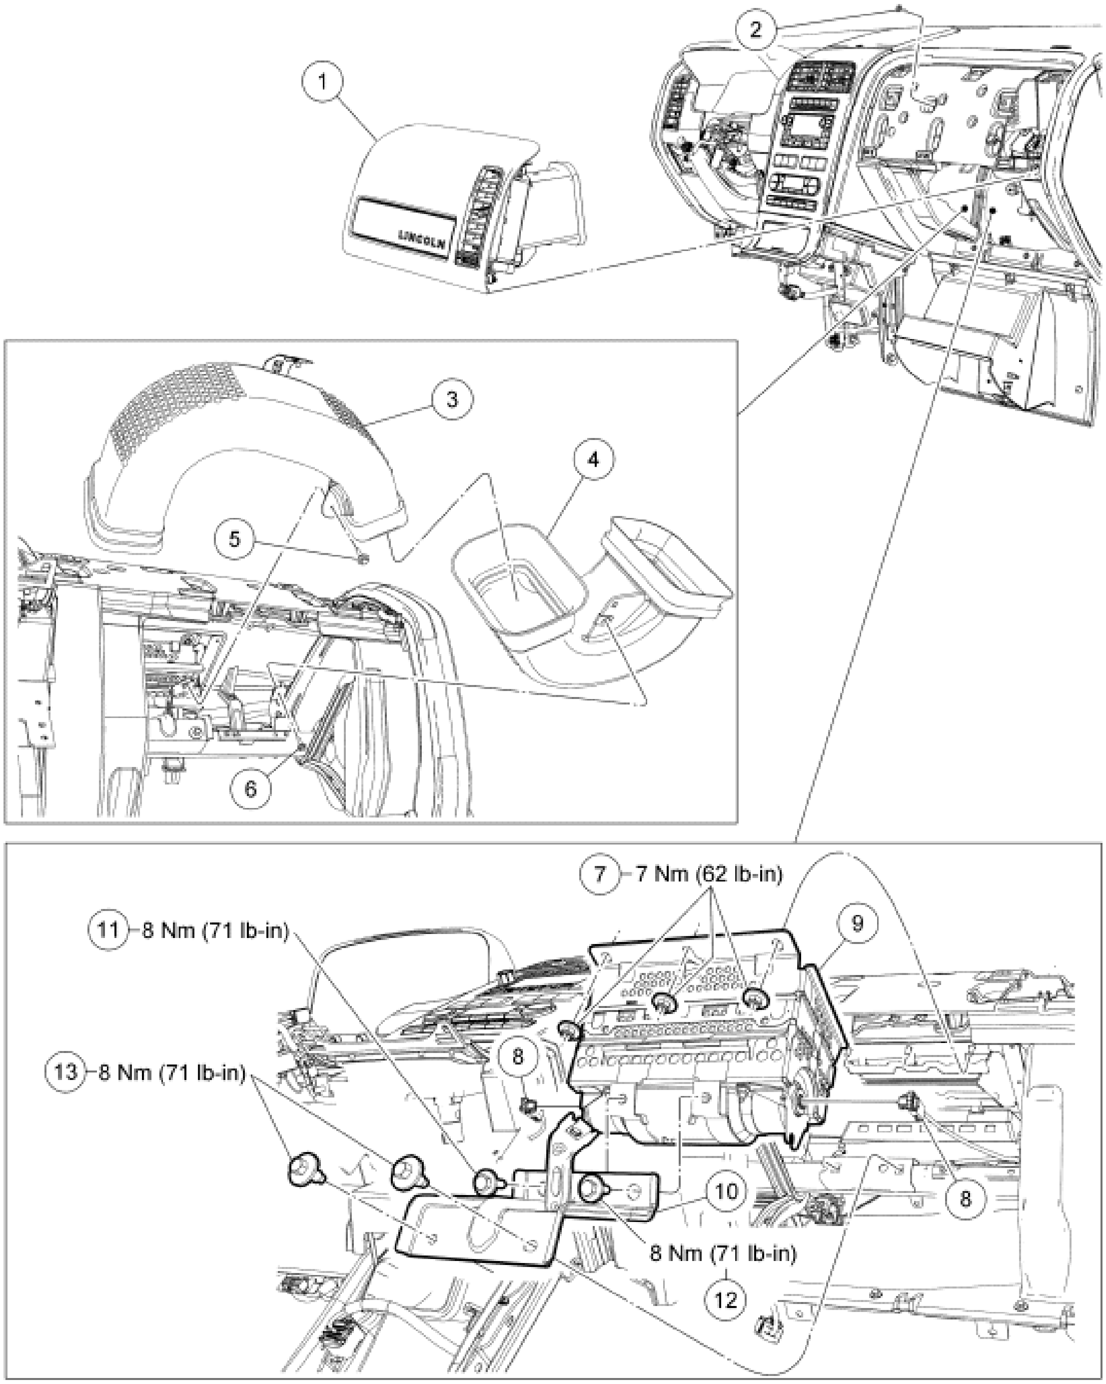

Fig. 225: Exploded View Of Passenger Air Bag Module With Torque Specifications - MKX
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04338	RH instrument panel finish panel
2	W707628	LH duct assembly bracket screw

3	19B680	LH duct assembly
4	19B680	RH duct assembly
5	W707628	LH duct assembly screw
6	W707628	RH duct assembly screw
7	W701014	Passenger air bag module nuts
8	-	Passenger air bag module electrical connectors part of 14401)
9	044A74	Passenger air bag module
10	-	Passenger air bag module support bracket
11	W505422	Inboard passenger air bag module-to-support bracket bolt
12	W505422	Outboard passenger air bag module-to-support bracket bolt
13	W503922	Passenger air bag module bracket-to-cross vehicle beam bolts

REMOVAL

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Open and lower the glove compartment door. Then unhook the glove compartment door from the instrument panel.
   - If equipped, detach the glove compartment door dampener.

3. Pull straight out to release the 5 retaining clips and remove the RH instrument panel finish panel.
4. Remove the screw from the LH duct assembly bracket from the front of the instrument panel.

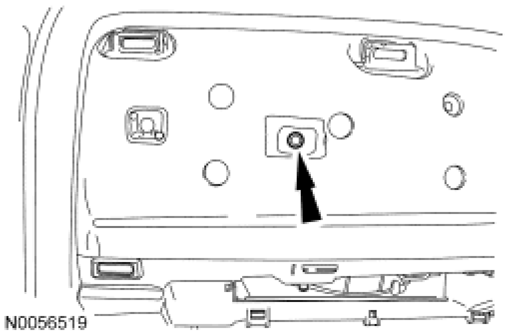

Fig. 226: Locating Screw On LH Duct Assembly Bracket
Courtesy of FORD MOTOR CO.

5. Through the glove compartment opening, remove the screw and the LH duct assembly.

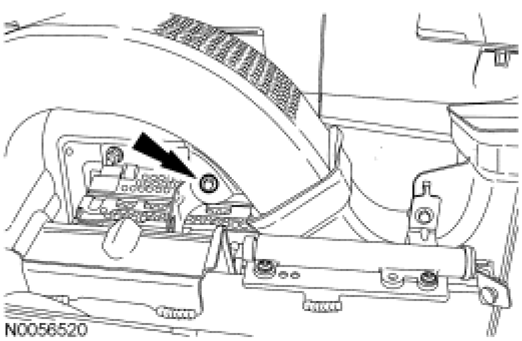

Fig. 227: Locating Screw On LH Duct Assembly
Courtesy of FORD MOTOR CO.

6. Through the glove compartment opening, remove the screw and the RH duct assembly.

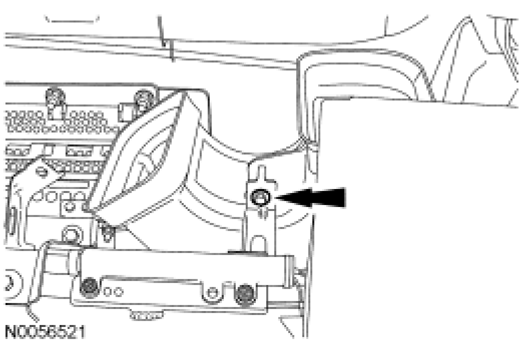

Fig. 228: Locating Screw On RH Duct Assembly
Courtesy of FORD MOTOR CO.

7. Remove the 4 bolts and the passenger air bag module support bracket.

8. Remove the 3 nuts from the passenger air bag module.

NOTE: Do not allow the passenger air bag module to hang from the wiring harness. Damage to the wiring harness and connectors may occur.

9. Lower the rear of the passenger air bag module off the 3 mounting studs. Move the passenger air bag module rearward to release the 7 hooks from the instrument panel and rest the module on the cross vehicle beam.

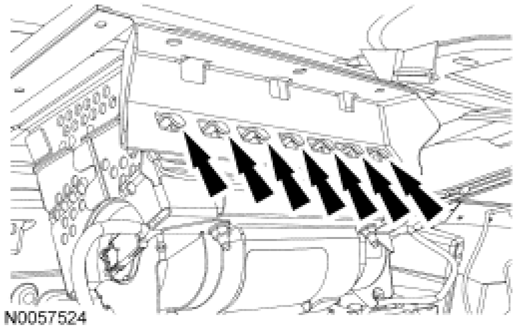

Fig. 229: Identifying Hooks On I/P
Courtesy of FORD MOTOR CO.

10. Using a small screwdriver as shown in illustration, lift up and release the locking button on the LH passenger air bag module electrical connector.

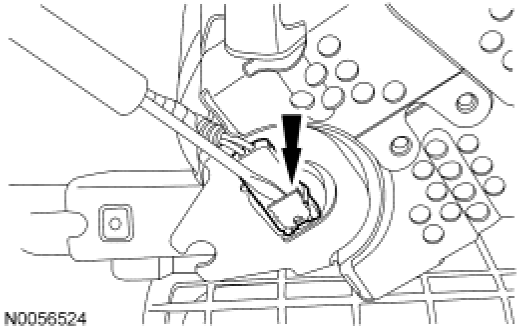

Fig. 230: Releasing Locking Button On LH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.

11. With the LH locking button released, remove the LH electrical connector from the passenger air bag module.
12. Using a small screwdriver as shown in illustration, lift up and release the locking button on the RH passenger air bag module electrical connector.

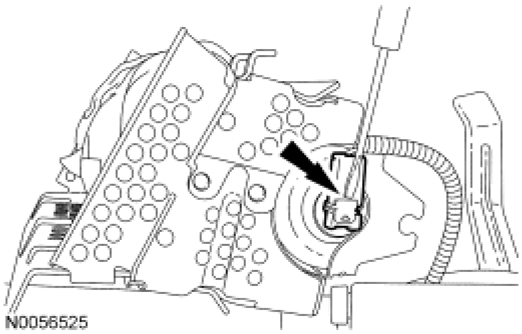

Fig. 231: Releasing Locking Button On RH Passenger Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: **Do not pull the passenger air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

13. With the RH locking button released, remove the RH electrical connector. Remove the passenger air bag module from the glove compartment opening.

INSTALLATION

NOTE: **Do not install the passenger air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.**

NOTE: **The passenger air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.**

NOTE: **The passenger air bag module electrical connectors are unique and cannot be reversed when connected to the passenger air bag module. Match the electrical connector key to the keyway in the passenger air bag module. Do not force the electrical connectors into the passenger air bag module. Damage to the connector or component may occur.**

NOTE: **RH shown in illustration, LH similar.**

1. Position the passenger air bag module on the cross vehicle beam. With the locking buttons released, install the 2 passenger air bag module electrical connectors fully into the passenger air bag module and seat the locking buttons.

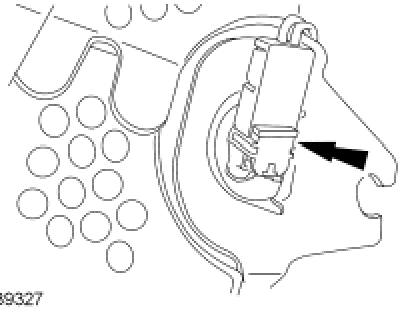

Fig. 232: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: During the passenger air bag module installation, make sure all 7 of the module hooks are fully seated in the instrument panel.

2. Install the passenger air bag module 7 hooks into the instrument panel. Raise the rear of the passenger air bag module onto the 3 mounting studs.

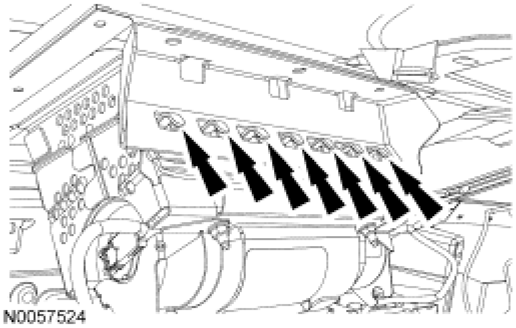

Fig. 233: Identifying Hooks On I/P
Courtesy of FORD MOTOR CO.

3. Install the 3 passenger air bag module nuts.
   - Tighten to 7 Nm (62 lb-in).

NOTE: To avoid a squeak or rattle condition, install the passenger air bag module bracket and passenger air bag module bolts in this order.

4. Install the passenger air bag module support bracket.
   1. Install the passenger air bag module support bracket and 2 bolts to the cross vehicle beam.
      - Tighten to 8 Nm (71 lb-in).
   2. Install the inboard passenger air bag module support bracket-to-passenger air bag module bolt.
      - Tighten to 8 Nm (71 lb-in).
   3. Install the outboard passenger air bag module support bracket-to-passenger air bag module bolt.
      - Tighten to 8 Nm (71 lb-in).

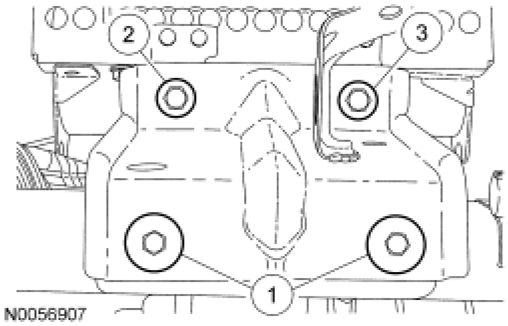

Fig. 234: Installing Passenger Air Bag Module Support Bracket Bolts In Sequence
Courtesy of FORD MOTOR CO.

5. Install the screw and the RH duct assembly.
6. Install the screw and the LH duct assembly.
7. Install the screw for the LH duct assembly bracket in the front of the instrument panel.

NOTE: Make sure the RH instrument panel finish panel 5 retaining clips are fully seated in the instrument panel.

8. Install the RH instrument panel finish panel.
9. Install and close the glove compartment door.
   - If equipped, attach the glove compartment door dampener.
10. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

RESTRAINTS CONTROL MODULE (RCM)

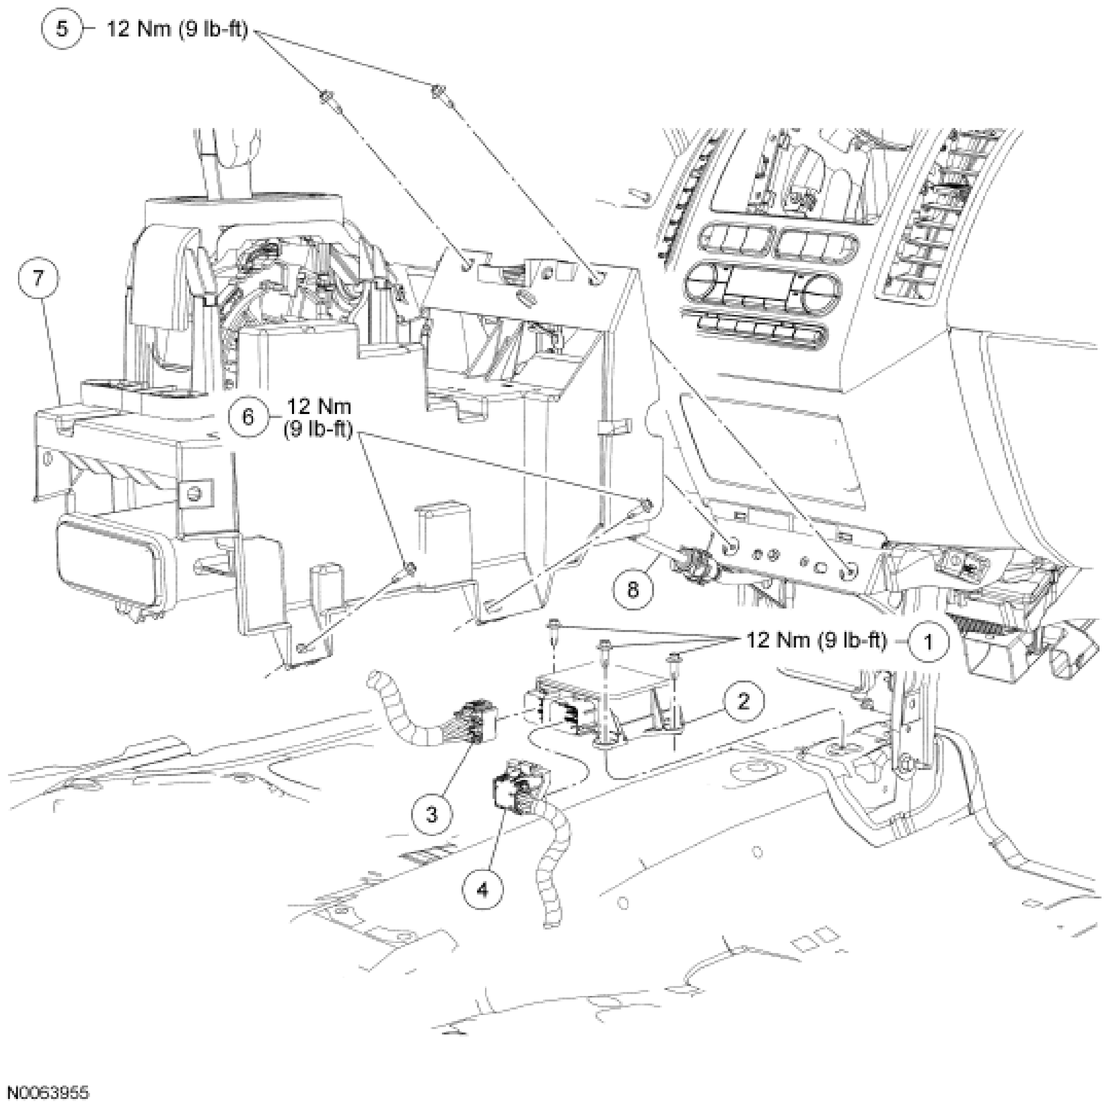

Fig. 235: Exploded View Of Restraints Control Module (RCM) With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W707935	Restraints control module (RCM) bolts
2	14B321	RCM
3	-	RCM small connector (part of 14401)
4	-	RCM large connector (part of 14A005)
5	W707935	Inner floor console support-to-instrument panel bolts (2 required)
6	W505157	Inner floor console support bolts (4 required)
7	45B34	Inner floor console support
8	7E395	Selector lever cable

REMOVAL

WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

NOTE: When installing a new restraints control module (RCM), it is necessary to carry out programmable module installation (PMI). For additional information, refer to MODULE CONFIGURATION article. Failure to follow this instruction may result in system failure.

NOTE: When installing a new restraints control module (RCM), always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.

NOTE: The air bag warning indicator illuminates when the correct RCM fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. If installing a new RCM, carry out the steps necessary to prepare for programmable module installation (PMI). For additional information, refer to **MODULE CONFIGURATION** article.
2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Remove the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
4. Disconnect the selector lever cable from the ball stud located on the shifter and remove the cable from the retaining clips.

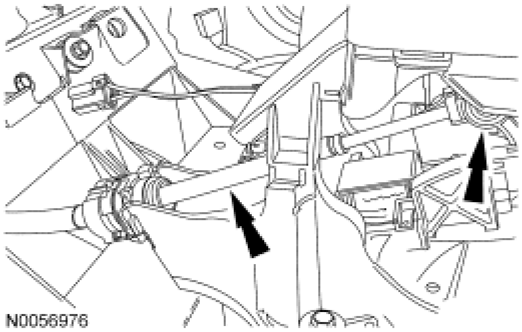

Fig. 236: Locating Shift Cable From Ball Stud On Shifter
Courtesy of FORD MOTOR CO.

5. Remove the 4 bolts (2 each side) from the inner floor console support.
6. Remove the bolts from the inner floor console support-to-instrument panel.
7. Disconnect the electrical connectors from the front inner floor console support.
8. Remove the inner floor console support.
9. Press to release the locking tab and disconnect the small RCM electrical connector.

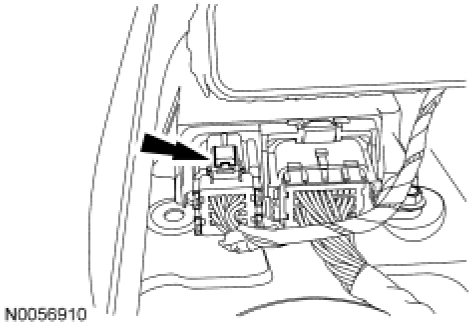

Fig. 237: Locating Locking Tab On Small RCM Electrical Connector
Courtesy of FORD MOTOR CO.

10. Disconnect the large RCM electrical connector.
    1. Pinch the thumb tab and pivot the connector position assurance lever all the way back until it stops.
    2. Pull out and disconnect the RCM electrical connector.

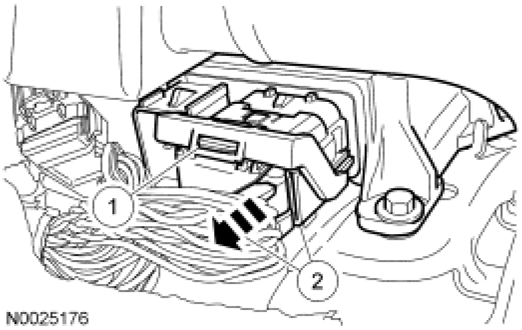

Fig. 238: Disconnecting RCM Electrical Connector
Courtesy of FORD MOTOR CO.

11. Remove the 3 bolts and RCM.

INSTALLATION

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

1. Install the RCM and the 3 bolts.
   - Tighten to 12 Nm (9 lb-ft).
2. Make sure the large RCM connector position assurance lever is in the full release position before attempting to connect the connector.

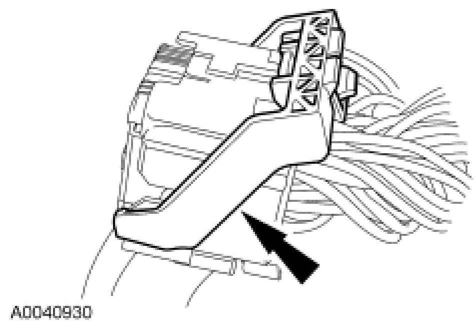

Fig. 239: View Of Connector Position Assurance Lever
Courtesy of FORD MOTOR CO.

NOTE: Placing the large restraints control module (RCM) electrical wiring connector into the RCM on an angle, may cause bad electrical connections and damaged components.

3. Position the large RCM electrical connector into the RCM.

NOTE: Do not push the connector to the point where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the restraints control module (RCM), before using the lever to fully seat the connector. Failure to follow these instructions may cause component or connector damage.

   - With the large RCM electrical connector uniformly aligned to the RCM, lightly push in until a subtle audible click is heard and slight resistance is felt.

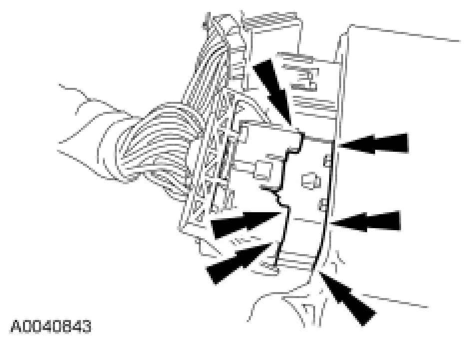

Fig. 240: Large RCM Electrical Wiring Connector
Courtesy of FORD MOTOR CO.

4. Connect the large RCM electrical connector.
    - Using the connector position assurance lever, pivot it toward the RCM, drawing the connector into the RCM.
        - Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.

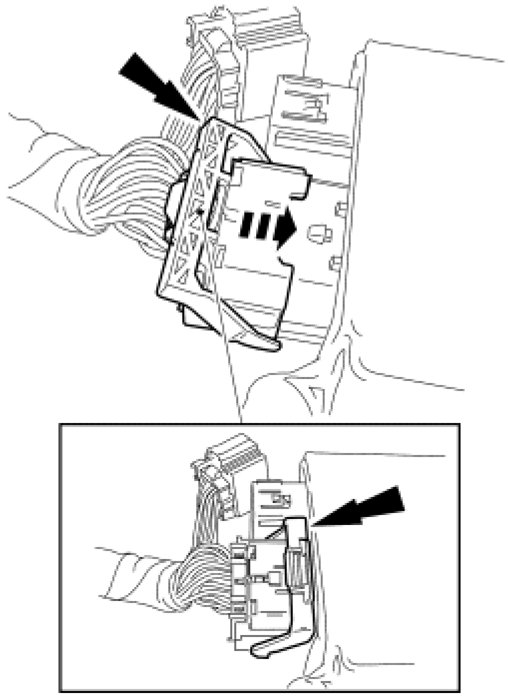

Fig. 241: Locating RCM Electrical Connector
Courtesy of FORD MOTOR CO.

5. Connect the small RCM electrical connector.
6. Install the inner floor console support.
7. Install the 4 bolts (2 each side) to the inner floor console support.
    - Tighten to 12 Nm (9 lb-ft).
8. Install the screws to the inner floor console support bracket-to-floor instrument panel.
    - Tighten to 12 Nm (9 lb-ft).
9. Install the selector lever cable in the selector lever housing.

NOTE:	**When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable end to make sure that the cable end is correctly installed.**

10. Connect the selector lever cable end to the floor shifter.
11. Attach the electrical connectors to the front inner floor console support bracket.
12. Install the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
13. Repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
14. When installing a new RCM, carry out the steps necessary to complete PMI. For additional information, refer to **MODULE CONFIGURATION** article.
15. Prove out the SRS as follows:

    Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag indicator will:

    - fail to light.

    - remain lit continuously.

    - flash at a 5 Hz rate (RCM not configured).

    The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

    Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

SAFETY CANOPY MODULE

NOTE: **RH shown in illustration, LH similar.**

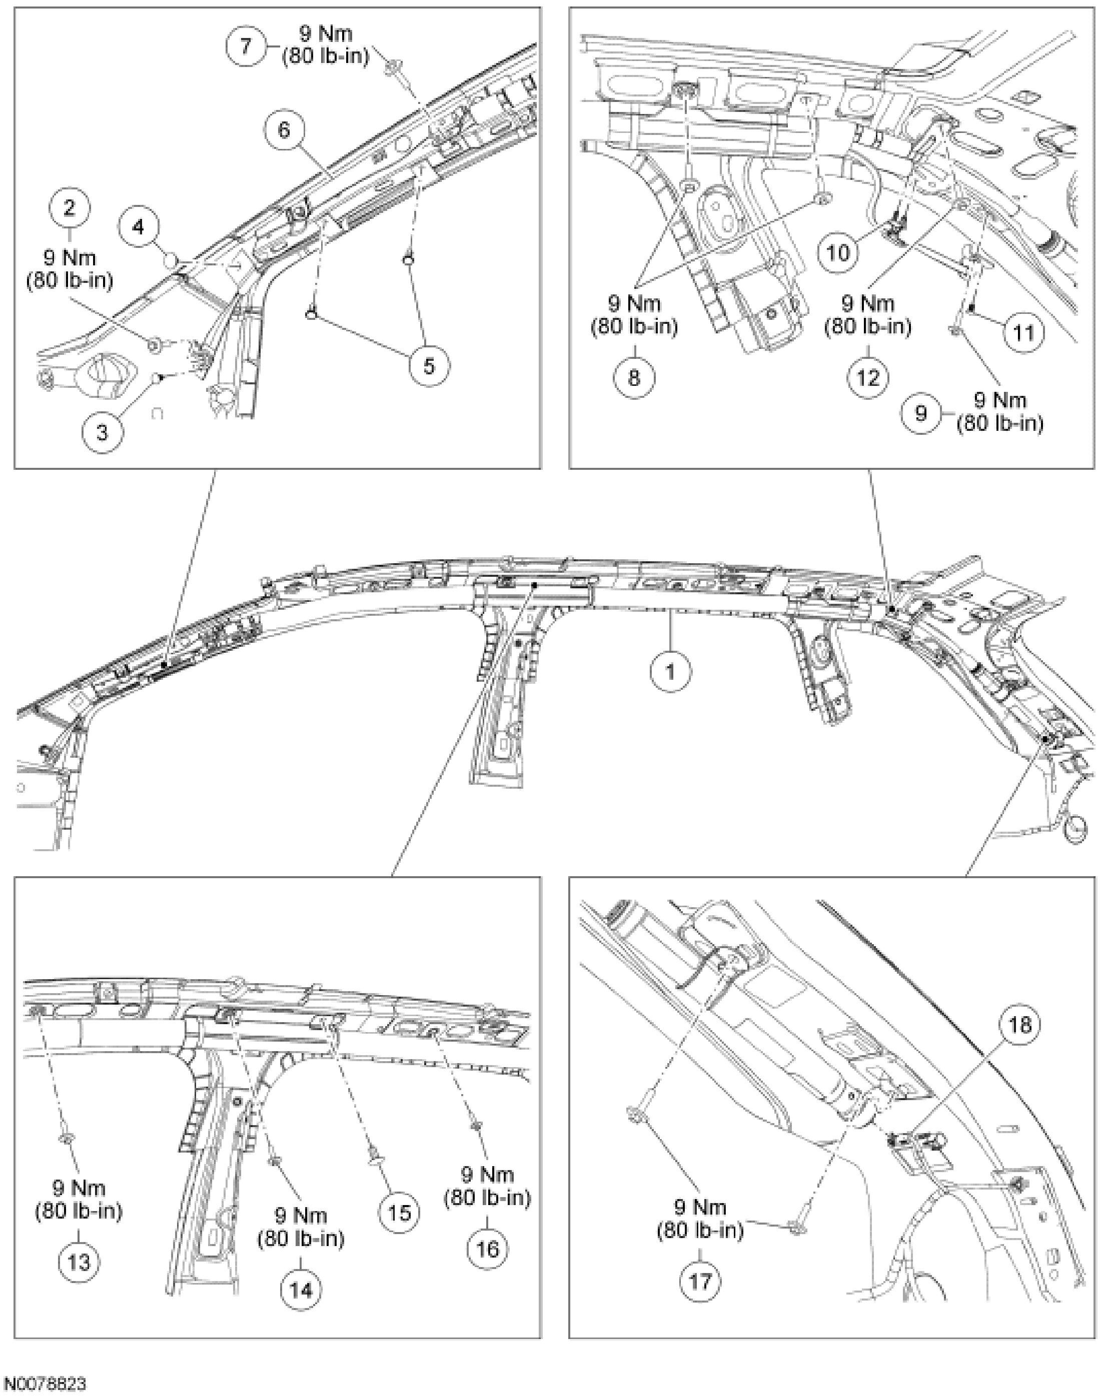

Fig. 242: Identifying Safety Canopy Module With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	042D94 RH/042D95 LH	Safety canopy module
2	W713437	Safety canopy module front tether cord anchor bolt

3	-	Safety canopy module front tether cord anchor pin-type retainer (part of 042D94)
4	-	Safety canopy module front tether cord A-pillar routing pin-type retainer (part of 042D94)
5	-	Safety canopy module front tether cord A-pillar trim bracket routing pin-type retainers (2 required) (part of 042D94)
6	-	A-pillar trim bracket
7	W713437	Safety canopy module A-pillar trim bracket bolt
8	W713437	Safety canopy module C-pillar bolts (2 required)
9	W713437	Safety canopy module rear tether cord anchor bracket bolt
10	-	Safety canopy module rear tether cord routing clip pin-type retainer (part of 042D94)
11	-	Safety canopy module rear tether cord anchor bracket pin-type retainer (part of 042D94)
12	W713437	Safety canopy module D-pillar bolt
13	W713437	Safety canopy module front door opening bolt
14	W713437	Safety canopy module B-pillar bolt
15	-	Safety canopy module B-pillar pin-type retainer (part of 042D94)
16	W713437	Safety canopy module rear door opening bolt
17	W713437	Safety canopy module rear bolts (2 required)
18	-	Safety canopy module electrical connector (part of 14A005)

REMOVAL

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always carry or place a live safety canopy, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

WARNING: Anytime the safety canopy or side air curtain module has deployed, a new headliner and new A-, B-, C- and D-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the safety canopy or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

WARNING: When installing a new headliner on a vehicle equipped with safety canopy or side air curtain modules, make sure the headliner has the word AIRBAG on the headliner where it meets each B-pillar trim panel. Otherwise, you have the wrong headliner. Failure to follow this instruction may result in the safety canopy or side air curtain module not deploying or deploying incorrectly, increasing the risk of personal injury or death in a crash.

WARNING: Before installing a safety canopy or side air curtain module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: Inspect a safety canopy or side air curtain module before installation. If the module is damaged, the cover has separated or the safety canopy/side air curtain material has been exposed, install a new module. Do not attempt to repair the module. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: Do not obstruct or place objects in the deployment path of the safety canopy or side air curtain module. Failure to follow this instruction may result in the safety canopy or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

WARNING: Never put any type of fastener or tie strap around any part of a safety canopy module, side air curtain module or interior trim panel. This will prevent the safety canopy or side air curtain module from deploying correctly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

WARNING: Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of

serious personal injury or death.

WARNING: **Always use new torque-prevailing type J-nuts when installing the safety canopy in the vehicle. Use of these J-nuts is mandatory to reduce the risk of loss of fastener effectiveness. Failure to follow this instruction may result in the safety canopy module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

NOTE: The air bag warning indictor illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

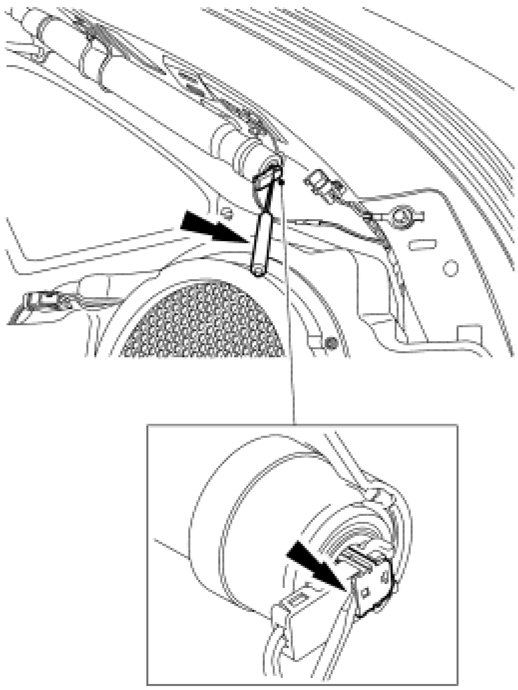
NOTE: The supplemental restraints system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the headliner. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.

   NOTE: Do not pull the safety canopy module electrical connector out by the locking button. Damage to the locking button can occur.

3. Using a small screwdriver as shown in illustration, lift up and release the locking button on the safety canopy module electrical connector. With the locking button released, remove the electrical connector.



N0059226

Fig. 243: Releasing Locking Button On Safety Canopy Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: Note the pin-type retainer on the safety canopy module front tether cord to the A-pillar sheet metal for installation.

4. Remove the anchor bolt, then detach the pin-type retainer and the front tether cord anchor from the A-pillar.
5. Remove the safety canopy module front tether cord routing pin-type retainer from the A-pillar sheet metal.
6. Detach the 2 safety canopy module front tether cord A-pillar trim bracket routing pin-type retainers from the A-pillar trim bracket.
7. Remove the safety canopy module A-pillar trim bracket bolt.
8. Remove the safety canopy module front door opening bolt.

NOTE: Note the position and the routing of the safety canopy module rear tether cord and routing clip pin-type retainer for installation.

9. Detach the safety canopy module rear tether cord routing clip pin-type retainer from the upper D-pillar sheet metal.

NOTE: Note the position of the safety canopy module rear tether anchor bracket hook and pin-type retainer in the D-pillar sheet metal.

10. Remove the bolt, then detach the pin-type retainer and remove the safety canopy module rear tether anchor bracket from the D-pillar sheet metal.
11. Remove the safety canopy module rear door opening bolt.
12. Remove the 2 safety canopy module bolts near the C-pillar.
13. Remove the safety canopy module D-pillar bolt.
14. Remove the 2 safety canopy module rear bolts.
15. Remove the safety canopy module bolt near the B-pillar.
16. Remove the safety canopy module B-pillar pin-type retainer.
17. Move the safety canopy module forward to release the rear bracket hook from the sheet metal and remove the safety canopy module.

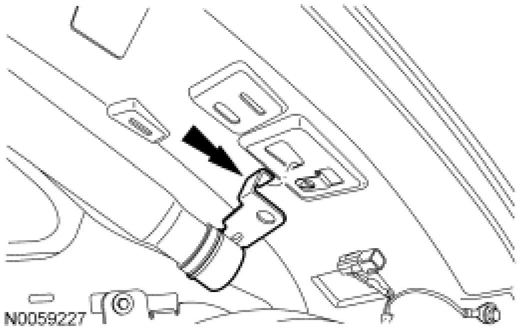


Fig. 244: Moving Safety Canopy Module Forward To Release Rear Bracket Hook From Sheet Metal
Courtesy of FORD MOTOR CO.

INSTALLATION

WARNING: **Before installing a safety canopy or side air curtain module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Inspect a safety canopy or side air curtain module before installation. If the module is damaged, the cover has separated or the safety canopy/side air curtain material has been exposed, install a new module. Do not attempt to repair the module. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Never put any type of fastener or tie strap around any part of a safety canopy module, side air curtain module or interior trim panel. This will prevent the safety canopy or side air curtain module from deploying**

correctly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

WARNING: **Always use new torque-prevailing type J-nuts when installing the safety canopy in the vehicle. Use of these J-nuts is mandatory to reduce the risk of loss of fastener effectiveness. Failure to follow this instruction may result in the safety canopy module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

1. Discard the 2 front J-nuts and install new.

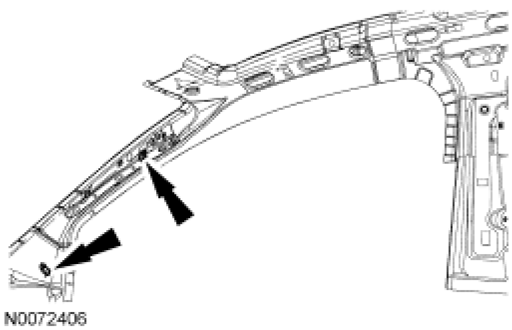

Fig. 245: Identifying 2 Front J-nuts
Courtesy of FORD MOTOR CO.

2. Discard the 2 rear J-nuts and install new.

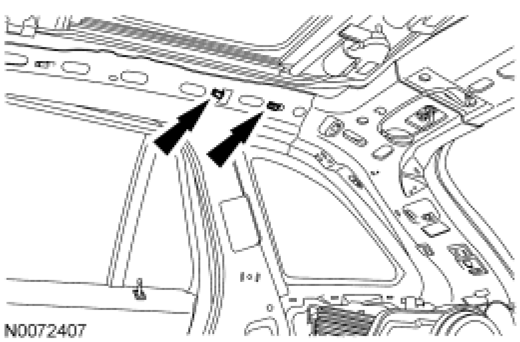

Fig. 246: Identifying 2 Rear J-nuts
Courtesy of FORD MOTOR CO.

3. Position the safety canopy module by moving it rearward, installing the rear bracket hook in the sheet metal.

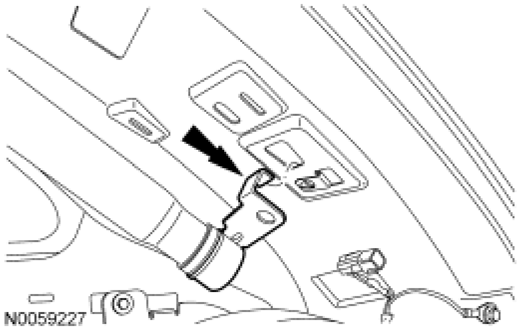

Fig. 247: Moving Safety Canopy Module Forward To Release Rear Bracket Hook From Sheet Metal
Courtesy of FORD MOTOR CO.

4. Install the safety canopy module B-pillar pin-type retainer.
5. Install the front tether cord anchor pin-type retainer.
6. Install the safety canopy module front tether cord routing pin-type retainer to the A-pillar sheet metal.
7. Attach the 2 safety canopy module front tether cord A-pillar trim bracket routing pin-type retainers to the A-pillar trim bracket.
8. Install the safety canopy module rear tether anchor bracket to the D-pillar sheet metal and attach the pin-type retainer.
9. Attach the safety canopy module rear tether cord routing clip pin-type retainer to the upper D-pillar sheet metal.

NOTE: Make sure that all safety canopy module bolt holes line up with all J-nuts.

10. Install the safety canopy module D-pillar bolt.
    - Tighten to 9 Nm (80 lb-in).
11. Install the safety canopy module A-pillar trim bracket bolt.
    - Tighten to 9 Nm (80 lb-in).
12. Install the safety canopy module bolt near the B-pillar.
    - Tighten to 9 Nm (80 lb-in).
13. Install the 2 safety canopy module rear bolts.
    - Tighten to 9 Nm (80 lb-in).
14. Install the 2 safety canopy module bolts near the C-pillar.
    - Tighten to 9 Nm (80 lb-in).
15. Install the safety canopy module rear door opening bolt.
    - Tighten to 9 Nm (80 lb-in).
16. Install the safety canopy module rear tether cord anchor bracket bolt.
    - Tighten to 9 Nm (80 lb-in).
17. Install the safety canopy module front door opening bolt.
    - Tighten to 9 Nm (80 lb-in).

18. Install the safety canopy module front tether cord anchor bolt.
    - Tighten to 9 Nm (80 lb-in).

NOTE: **Do not install the safety canopy module electrical connector by the locking button. Damage to the locking button may occur.**

NOTE: **The safety canopy module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.**

NOTE: **The safety canopy module electrical connector is unique and cannot be reversed when connected to the safety canopy module. Match the electrical connector key to the keyway in the safety canopy module. Do not force the electrical connector into the safety canopy module. Damage to the connector or component may occur.**

19. With the locking button released, install the safety canopy module electrical connector fully into the safety canopy module and seat the locking button.

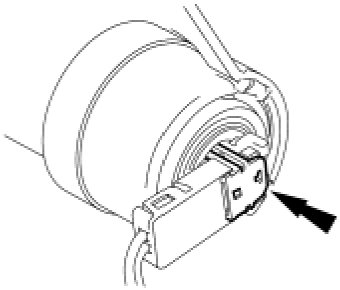

Fig. 248: Identifying Passenger Safety Canopy Module Electrical Connector
Courtesy of FORD MOTOR CO.

20. Install the headliner. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.
21. Repower the SRS For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SEAT POSITION SENSOR

NOTE: **Power seat shown in illustration, manual similar.**

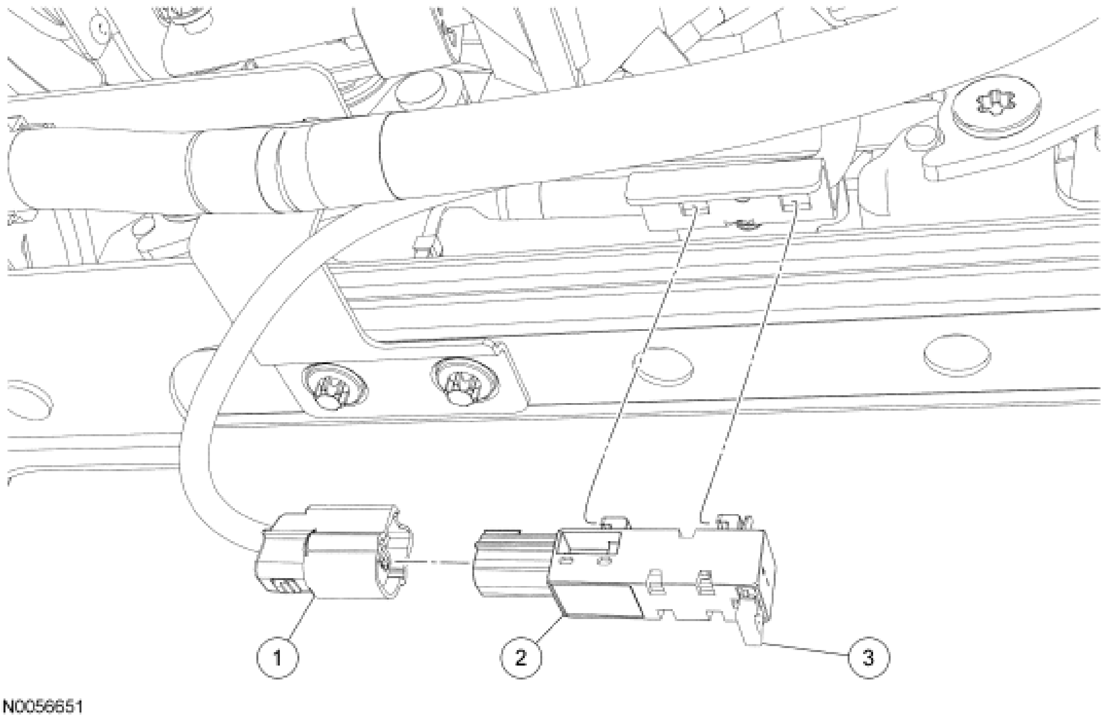

Fig. 249: Exploded View Of Seat Position Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Seat position sensor electrical connector (part of 14A699)
2	14B416	Seat position sensor
3	-	Seat position sensor retaining clip (part of 14B416)

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

All seats

1. Remove the driver seat. For additional information, refer to **SEATING** article.
2. Disconnect the seat position sensor electrical connector.

   Power seats

3. Detach the wire harness routing pin-type retainer from the seat position sensor bracket.

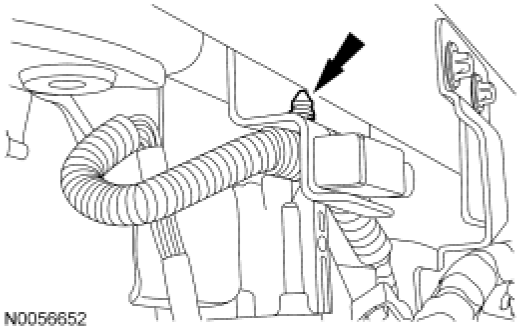

Fig. 250: Locating Wire Harness Routing Pin-Type Retainer From Seat Position Sensor Bracket
Courtesy of FORD MOTOR CO.

All seats

4. Push apart then inward to release the seat position sensor locking clip.

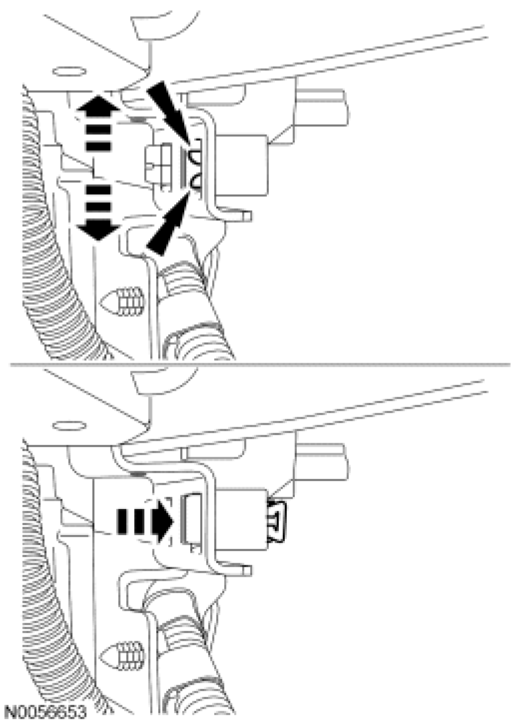

Fig. 251: Pushing Apart Then Inward To Release Seat Position Sensor Locking Clip
Courtesy of FORD MOTOR CO.

5. Slide the seat position sensor rearward to release the 2 hooks from the bracket. Then remove the seat position sensor.
6. To install, reverse the removal procedure.
7. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SIDE AIR BAG MODULE

NOTE: Passenger shown in illustration, driver similar.

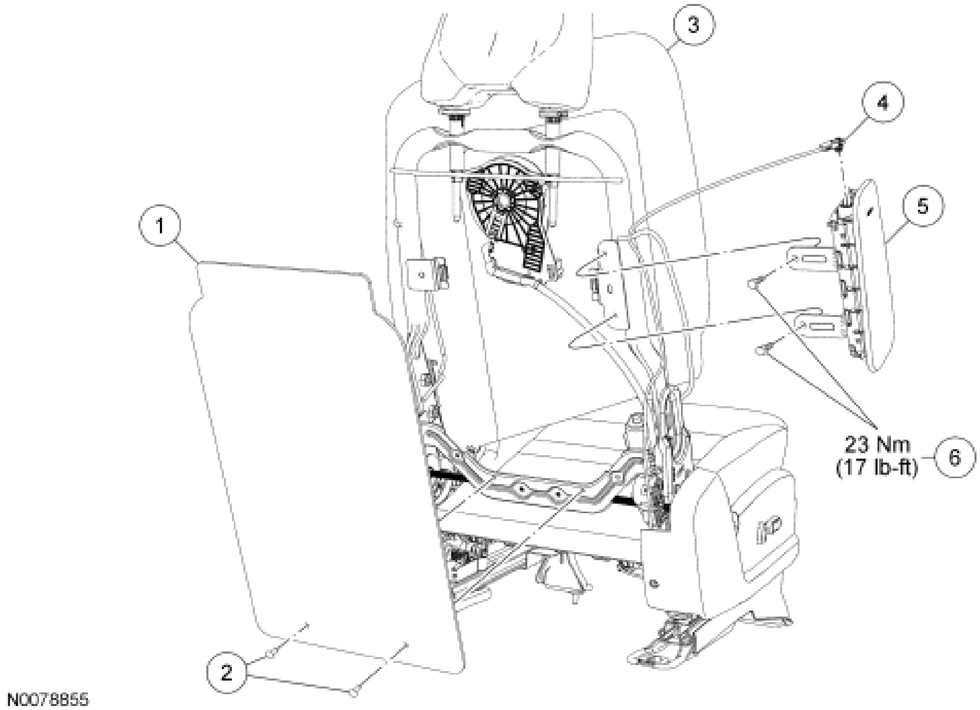

Fig. 252: Identifying Side Air Bag Module With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	60508	Seat backrest trim cover rear panel reinforcement board
2	-	Seat backrest trim cover rear panel reinforcement board pin-type retainers
3	64416/64810	Seat backrest trim cover and foam pad
4	-	Side air bag module electrical connector (part of 14K155)
5	611D10 RH/611D11 LH	Side air bag module
6	W506021	Side air bag module bolts (2 required)

REMOVAL

WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Always carry or place a live air bag module with the air bag and

deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

NOTE: If a side air bag deployment took place, a new side air bag module and bolts must be installed. The side air bag module bracket on the seat back frame should be inspected and installed new if necessary.

NOTE: When installing a new side air bag after deployment, refer to SEATING article for additional information.

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Position the affected seat and backrest fully up and forward.
2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Release the seat backrest trim cover rear panel lower J-clip. Then, release the 2 seat backrest trim cover rear panel side J-clips.

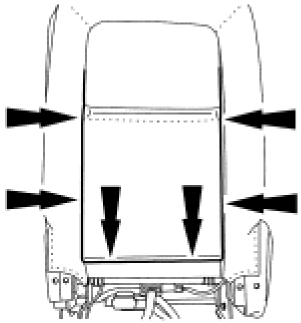

Fig. 253: Identifying Backrest Trim Cover J-Clips
Courtesy of FORD MOTOR CO.

NOTE: **The reinforcement board and seat backrest trim cover rear panel can be positioned aside with the reinforcement board still inside the seat backrest trim cover rear panel.**

4. Detach the 2 pin-type retainers and position aside the seat backrest trim cover rear panel and reinforcement board.
5. Through the rear of the seat remove and discard the 2 side air bag module bolts. Then, separate the side air bag module from the seat backrest.

NOTE: **Do not pull the side air bag module electrical connector out by the locking button. Damage to the locking button may occur.**

6. Using a small screwdriver as shown in illustration, lift up and release the locking button on the side air bag module electrical connector. With the locking button released, remove the electrical connector and the side air bag module.

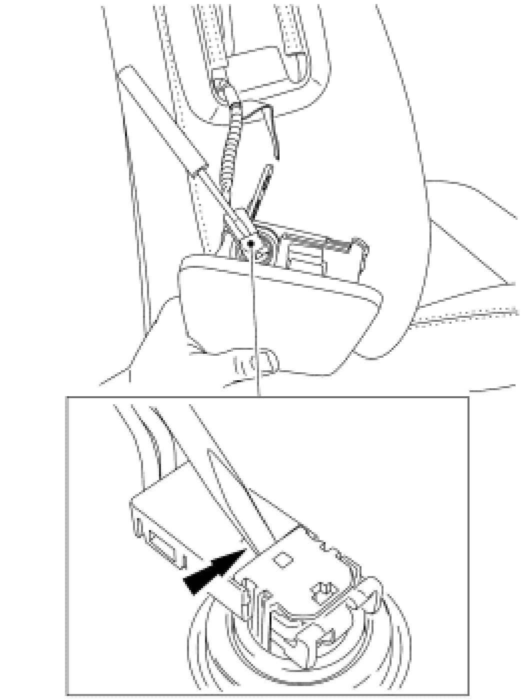

Fig. 254: Lifting Up & Releasing Locking Button On Side Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE:	**Do not install the side air bag module electrical connector by the locking button. Damage to the locking button may occur.**

NOTE:	**The side air bag module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.**

NOTE:	**The side air bag module electrical connector is unique and cannot be reversed when connected to the side air bag module. Match the electrical connector key to the keyway in the side air bag module. Do not force the electrical connector into the side air bag module. Damage to the connector or component may occur.**

1. With the locking button released, install the side air bag module electrical connector fully into the side air bag module and seat the locking button.

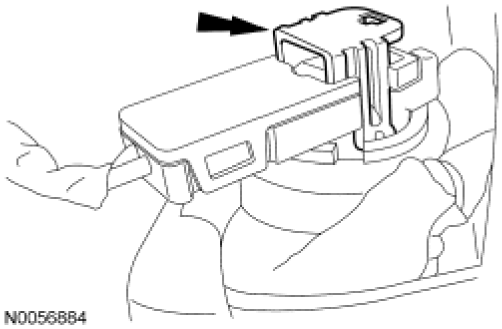

Fig. 255: Identifying Side Air Bag Module Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: Make sure the side air bag module wiring harness is not pinched between the side air bag module and the backrest frame. Damage to wire harness may occur.

NOTE: When installing the side air bag module, new bolts must be installed.

2. Position the side air bag module in the seat backrest and install the 2 new bolts.
   - Tighten to 23 Nm (17 lb-ft).
3. Position the seat backrest trim cover rear panel and attach the 2 pin-type retainers.
4. Attach the 2 seat backrest cover rear side J-clips. Then attach the seat backrest cover rear lower J-clip.
5. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SIDE IMPACT SENSOR - B-PILLAR

NOTE: RH shown in illustration, LH similar.

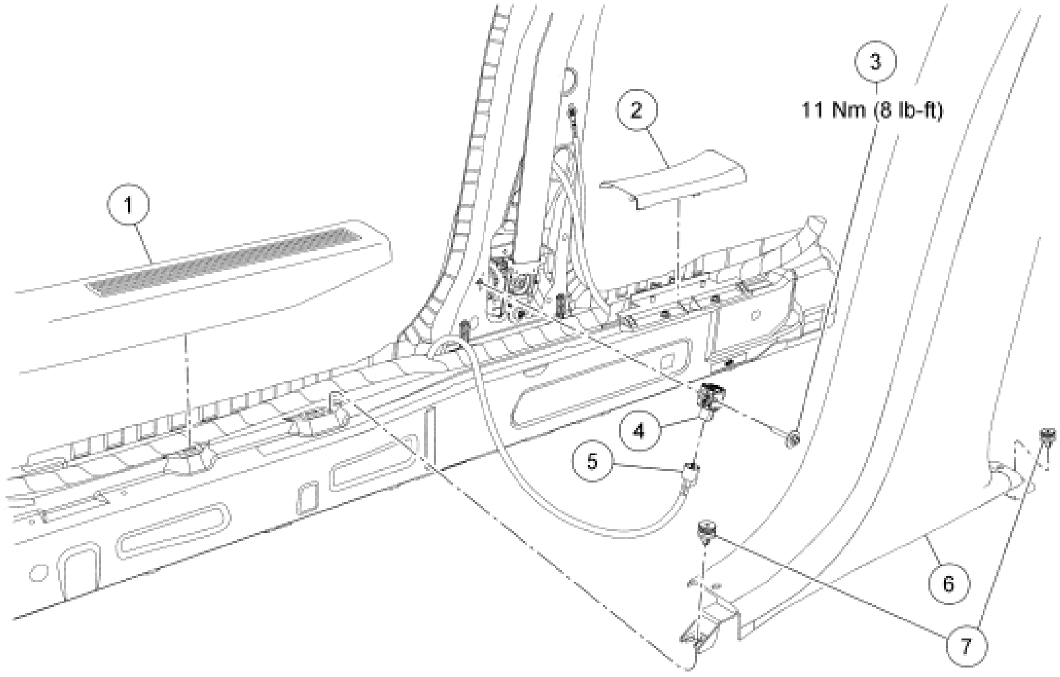

Fig. 256: Exploded View Of Side Impact Sensor - B-Pillar With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13208	Front door scuff plate
2	13228	Rear door scuff plate
3	W712191	Side impact sensor retaining bolt
4	14B345	Side impact sensor
5	-	Side impact sensor electrical connector (part of 14A005)
6	24356	Lower B-pillar trim panel
7	-	Lower B-pillar trim panel retainers (part of 24356)

WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the front seat forward.
2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Remove the front door scuff plate.
   - Pull up to release the 5 retaining clips.
4. Remove the rear door scuff plate.
   - Pull up to release the 2 retaining clips.
5. Detach the 2 retainers and remove the lower B-pillar trim panel.

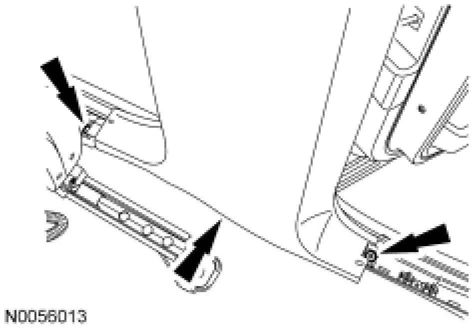

Fig. 257: Identifying Clips & Lower B-Pillar Trim Panel
Courtesy of FORD MOTOR CO.

6. Disconnect the side impact sensor electrical connector.

WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE: Make sure the B-pillar and side impact sensor mating surfaces are clean and free of foreign material.

NOTE: Note the position of the side impact sensor locating tabs for installation.

7. Remove the bolt and the side impact sensor.
   - To install, tighten to 11 Nm (8 lb-ft).
8. To install, reverse the removal procedure.
9. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SIDE IMPACT SENSOR - C-PILLAR

NOTE: **RH shown in illustration, LH similar.**

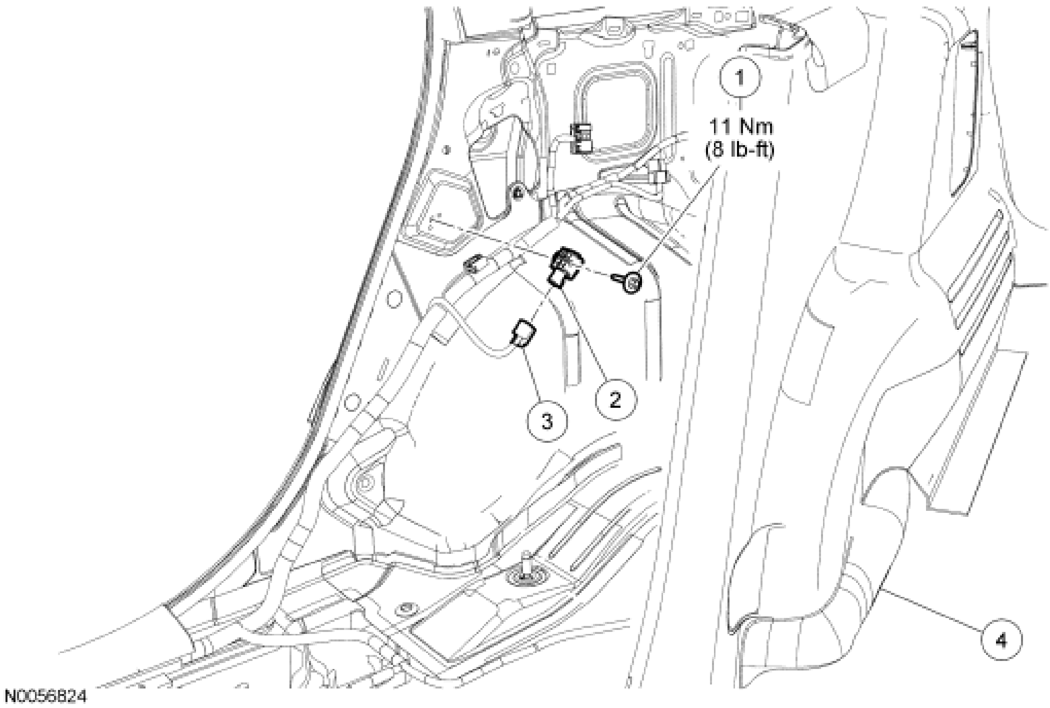

Fig. 258: Exploded View Of Side Impact Sensor - C-Pillar With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712191	Side impact sensor bolt
2	14B345	Side impact sensor
3	-	Side impact sensor electrical connector (part of 14A005)
4	31012	Quarter trim panel

WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Fold down the rear seat backrest.
2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Position aside the quarter trim panel.
   - Pull out on the quarter trim panel at the C-pillar to release the retaining clip to access the C-pillar side impact sensor.

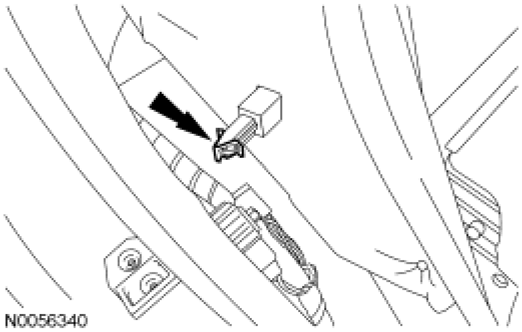

Fig. 259: Pulling Out On Quarter Trim Panel At C-Pillar
Courtesy of FORD MOTOR CO.

4. Disconnect the side impact sensor electrical connector.

   NOTE: Note the position of the 2 side impact sensor locating tabs for installation.

   NOTE: Make sure the C-pillar and side impact sensor mating surfaces are clean and free of foreign material.

5. Remove the bolt and the side impact sensor.
   - To install, tighten to 11 Nm (8 lb-ft).

     WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

6. To install, reverse the removal procedure.
7. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

2008 TRANSMISSIONS

Automatic Transaxle/Transmission External Controls - Edge & MKX

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	N.m	lb-ft	lb-in
Air cleaner assembly bolt	11	8	-
Air cleaner assembly outlet hose clamp	5	-	44
Manual control lever nut	18	13	-
Selector lever bolts	12	9	-
Selector lever cable bracket bolts	12	9	-
Selector lever cable grommet nuts	10	-	89
Selector lever knob screws	2	-	18

DESCRIPTION AND OPERATION

EXTERNAL CONTROLS

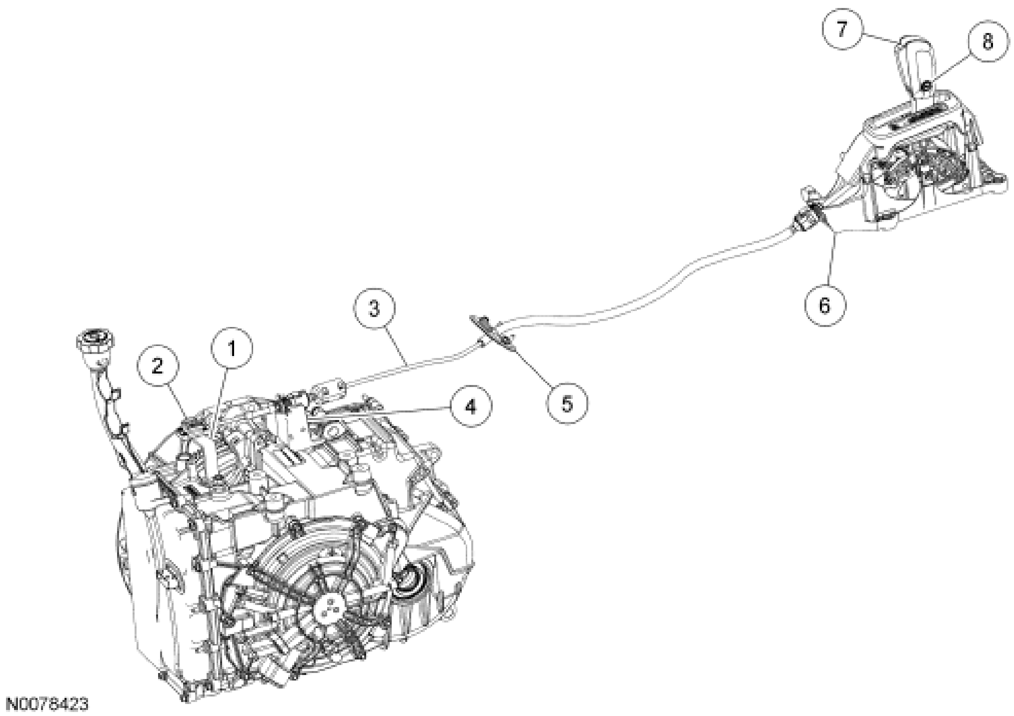

Fig. 1: Identifying External Controls
Courtesy of FORD MOTOR CO.

Item	Part Number	Description

1	7A257	Manual control lever
2	-	Adjuster locking tab (part of 7E395)
3	7E395	Selector lever cable
4	7B229	Selector lever cable bracket
5	-	Selector lever cable grommet (part of 7E395)
6	7K004	Selector lever assembly
7	7L010	Selector lever knob
8	-	Transmission control (TC)/overdrive (O/D) cancel switch (part of 7L010)

The transaxle selector lever linkage consists of:

- a selector lever cable that connects the transaxle manual control lever to the selector lever assembly.
- a brake shift interlock actuator (BSIA) that is integral to the selector lever assembly.
- a transmission control (TC) switch that turns off the operation of 6th gear.

The selector lever assembly:

- locks the transaxle selector lever in the PARK position when the ignition switch is in the LOCK position.
- requires the transaxle selector lever to be in the PARK position to turn the ignition switch to the LOCK position.

Range Selection

This transaxle has 5 range positions: P, R, N, D and L.

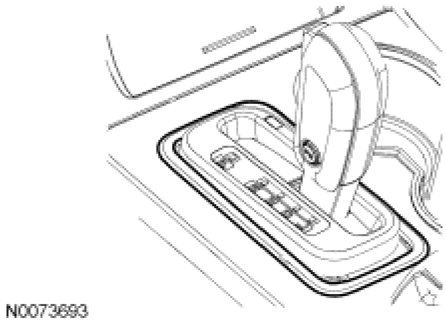

Fig. 2: Identifying 5 Range Positions
Courtesy of FORD MOTOR CO.

Park

In the PARK position:

- there is no powerflow through the transaxle.

- the parking pawl locks the final drive.
- the engine may be started.
- the ignition key may be removed.

Reverse

In the REVERSE position:

- the vehicle may be operated in a rearward direction, at a reduced gear ratio.
- engine braking will occur.

Neutral

In the NEUTRAL position:

- there is no powerflow through the transaxle.
- the output shaft is not held and is free to turn.
- the engine may be started.

Drive Position With Overdrive (O/D)

DRIVE is the normal position for most forward driving.

DRIVE provides:

- automatic shifts - 1st through 6th gears.
- apply and release of the torque converter clutch (TCC).
- maximum fuel economy during normal operation.

Manual L Position

This position provides:

- maximum engine braking.
- downshifts to the lowest available gear for the current vehicle speed.

Manual L position allows for 1st gear when the vehicle reaches slower speeds.

Drive with Grade Assist - Transmission Control (TC) Switch

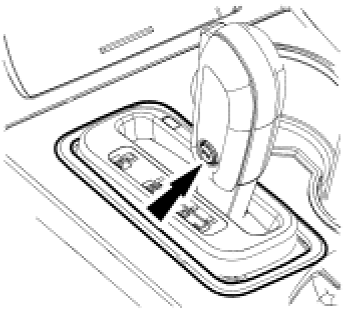

Fig. 3: Identifying Overdrive Switch
Courtesy of FORD MOTOR CO.

Drive with overdrive (O/D) cancel and grade assist is activated when the TC switch is pressed. The TC switch is located on the selector lever knob. When the TC switch is pressed, the 6th gear or O/D upshift is prevented or the transaxle shifts down to 5th gear. The TC switch is meant to be used when driving conditions cause excessive shifting from 6th to other gears such as hilly terrain, mountainous areas or when engine braking is required.

O/D Cancel

- O/D is cancelled.
- The transaxle operates in gears 1 through 5.
- The O/D OFF lamp illuminates on the instrument cluster.

Grade Assist

- Improves vehicle handling in hilly terrain or mountainous areas by providing engine braking and extending lower gear operation on uphill climbs.
- Additional engine braking is provided through the automatic transaxle shift strategy which reacts to vehicle inputs (vehicle acceleration, accelerator pedal, brake pedal and vehicle speed).
- The transaxle will select gears that will provide the engine braking desired, based on the vehicle inputs, this will increase engine RPM during engine braking.

It is recommended to return to DRIVE mode on flat terrain to provide the best fuel economy and transaxle function. The transaxle returns to O/D when the TC switch is pressed again or anytime the key is turned OFF.

Gear Availability

MANUAL LEVER POSITION	TRANSAXLE GEAR OPERATION	DESCRIPTION
P	Park	Forward or reverse gears available. Final drive is held to the transaxle case.
R	Reverse	Transaxle allows reverse only.
N	Neutral	Forward or reverse gears not available. Final drive moves freely.
D	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6	6 forward gears are available. Gears are dependent on vehicle speed and throttle position with coast braking.
D (O/D cancelled)	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ← 6	1st through 5th gears are available. Transaxle shifts to 5th gear if button is pressed when the transaxle is in 6th gear. Transaxle provides engine braking.
L	$\boxed{1}$ ← 2 ← 3 ← 4 ← 5 ← 6	1st gear hold with engine braking, the transaxle downshifts to 1st gear when L is selected above a calibrated speed under minimum to moderate accelerator pedal position.

N0080201

Fig. 4: Identifying Gear Availability
Courtesy of FORD MOTOR CO.

Brake Shift Interlock

The brake shift interlock system consist of the:

- BSIA.
- ignition switch.
- brake pedal position (BPP) switch powered by fuse 71 (10A).
- transmission range (TR) sensor.
- instrument cluster (IC).
- fuse 5 (10A).
- smart junction box (SJB).

When the ignition switch is in RUN/START, the solenoid inhibits the selector lever movement (from the PARK position) if the brake pedal is not depressed.

Inputs to SJB	Output from SJB

• Fuse(s):
  ○ 5 (10A)
  ○ 71 (10A)
• Brake pedal position (BPP) switch
	Brake shift interlock actuator (BSIA)

• Ignition switch position (RUN/START) • Transmission range (TR) sensor (PARK) • Instrument cluster (IC) -	

Brake Shift Interlock Operation

The BSIA inhibits the selector lever movement from the PARK position by mechanically blocking the detent pawl of the selector lever mechanism. When the brake pedal is depressed (BPP switch closed) with the ignition key in the RUN/START position and the transmission in PARK, the BSIA is energized by the SJB, this allows the selector lever to be moved out of the PARK position.

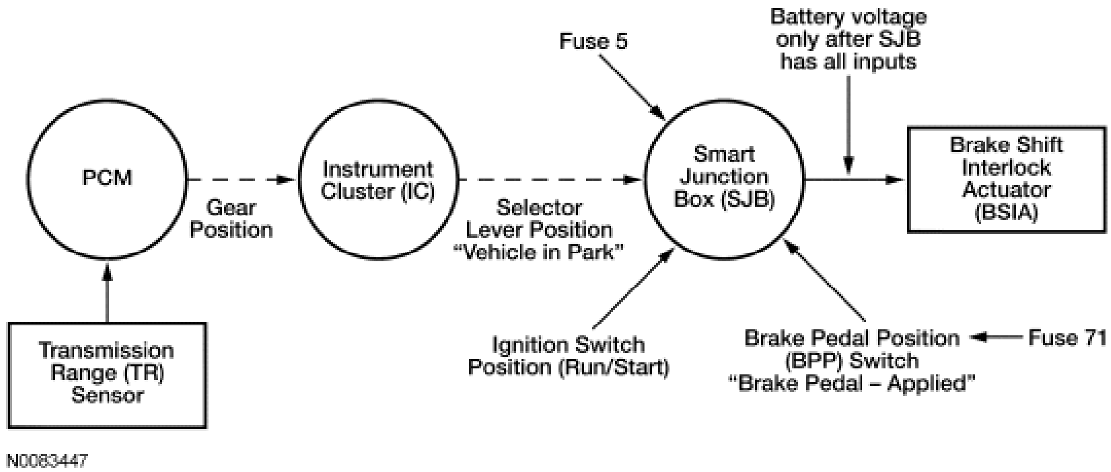

Fig. 5: Identifying Brake Shift Interlock Operation
Courtesy of FORD MOTOR CO.

Proper Operation Requirements

Three requirements for the selector lever to be moved from the PARK position are:

- Ignition switch in the RUN/START position
- TR sensor in the PARK position
- BPP switch closed (brakes applied - brake lamps on)

DIAGNOSTIC TESTS

EXTERNAL CONTROLS

SPECIAL TOOLS

Illustration	Tool Name	Tool Number

 ST1137-A	73 III Digital Multimeter	105-R0057 or equivalent
 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	-

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom. Go to **SYMPTOM CHART - EXTERNAL CONTROLS** table or Go to **SYMPTOM CHART - NOISE, VIBRATION AND HARSHNESS (NVH)** table.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Transmission selector lever cable
• Manual control lever
• Selector lever or selector lever knob
• Selector lever slider bunching or binding
	• Fuse
	• Smart junction box (SJB) fuse(s):
	    ○ 5 (10A)
	    ○ 71 (10A)
	• Connections
	• Wiring harness
	• Brake pedal position (BPP) switch
	• Brake shift interlock actuator (BSIA)
	• Transmission control (TC) switch

DTC CHART

DTC	Component	Description	Condition	Symptom	Action

			(SJB) or fuse, or the SJB itself may have an issue causing a brake shift interlock concern.	does not operate correctly.	
B2573	Brake Shift Interlock	Brake Shift Interlock Output Circuit Short to Ground	The associated circuitry connected to the SJB or fuse, or the SJB itself may have an issue causing a brake shift interlock concern.	Brake shift interlock is inoperative or does not operate correctly.	Go to **Pinpoint Test A** .

Symptom Chart - External Controls

SYMPTOM CHART - EXTERNAL CONTROLS

Condition	**Possible Sources**	**Action**
• Brake shift interlock system does not release/lock correctly	• Circuitry open/shorted • Fuse(s) • Brake pedal position (BPP) switch	• Go to **Pinpoint Test A** .
• Brake shift interlock system does not release/lock correctly	• Brake shift interlock actuator (BSIA) damaged	• INSTALL a new selector lever assembly. REFER to **SELECTOR LEVER**.
-	• Transmission range (TR) sensor	• DIAGNOSE and REPAIR all TR sensor DTCs. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.
• Transmission control (TC)/overdrive (O/D) cancel switch does not operate correctly	• Instrument cluster (IC) • Circuitry open/shorted • PCM • TC switch	• Go to **Pinpoint Test B** .
• Selector lever linkage is out of correct gear relationship	• Selector lever linkage out of adjustment	• REFER to **SELECTOR LEVER CABLE ADJUSTMENT**.
-	• Manual control lever not aligned correctly on the sensor (flat	• REMOVE the manual control lever nut and CHECK the alignment of the manual control lever.

	surfaces do not line up)	
-	• Loose selector lever cable bracket	• CHECK the selector lever cable bracket. TIGHTEN as necessary.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

SYMPTOM CHART - NOISE, VIBRATION AND HARSHNESS (NVH)

Condition	Possible Sources	Action
• Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	• Selector lever cable incorrectly routed, grounded out or loose	• CHECK the selector lever cable. REPAIR as necessary.

Electrical Connectors

Courtesy of FORD MOTOR CO.

Pin Number	Circuit	Circuit Function
1	CET53 (OG)	Brake shift interlock actuator (BSIA) solenoid power circuit
2	CDC41 (RD)	Park position signal to ignition switch
3	VLN37 (BU)	Power to PRNDL bulb
4	GD140 (BK)	Ground
5	CET34 (WH)	Transmission control (TC) switch signal
6	CBP30 (BN)	TC switch power circuit

Pinpoint Tests

Refer to appropriate SYSTEM WIRING DIAGRAM article for Transmission Controls schematic and connector information.

Refer to appropriate SYSTEM WIRING DIAGRAM article for Shift Interlock schematic and connector information.

PINPOINT TEST A: THE BRAKE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

A1 TEST THE BRAKE LIGHTS

- Apply the brake pedal and view the brake lights.
- **Do the brake lights illuminate?**

  YES : Go to A2.

  NO : REFER to **EXTERIOR LIGHTING** article.

A2 TEST SMART JUNCTION BOX (SJB) FUSE 5 (10A)

- Key in OFF position.
- Check fuse: SJB 5 (10A)

- **Is the resistance less than 5 ohms?**

  YES : Go to A3.

  NO : INSTALL a new fuse. Go to A3.

A3 TEST BRAKE SHIFT INTERLOCK ACTUATOR (BSIA) POWER CIRCUIT

- Disconnect: Selector Lever Harness C3245
- Key in ON position.

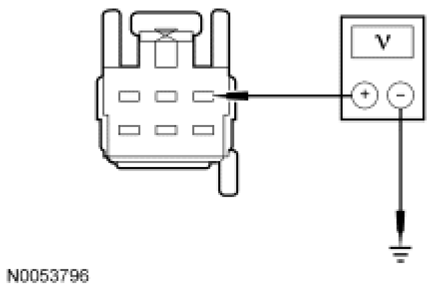

Fig. 8: Measuring Voltage Between Selector Lever Harness Connector C3245-1, Circuit CET53 (BU/OG) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between selector lever harness C3245-1, circuit CET53 (BU/OG) and ground, while applying the brake pedal.
- **Is the voltage greater than 10 volts?**

  YES : Go to A6.

  NO : Go to A4.

A4 TEST THE BSIA POWER CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280C

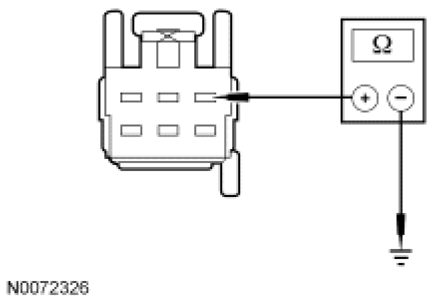

Fig. 9: Measuring Resistance Between Selector Lever Harness C3245-1, Circuit CET53 (BU/OG) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3245-1, circuit CET53 (BU/OG) and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to A5.

  NO : REPAIR circuit CET53 (BU/OG) for a short to ground. TEST the system for normal operation.

A5 TEST THE BSIA POWER CIRCUIT FOR AN OPEN

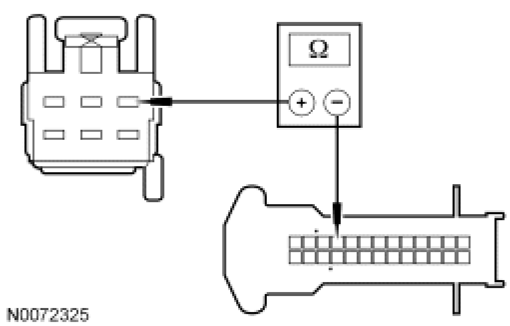

Fig. 10: Measuring Resistance Between Selector Lever Harness C3245-1, CET53 (BU/OG) & SJB C2280C-23
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3245-1, circuit CET53 (BU/OG) and SJB C2280C-23, circuit CET53 (BU/OG).
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new SJB. TEST the system for normal operation.

  NO : REPAIR circuit CET53 (BU/OG) for an open.

A6 TEST BSIA GROUND CIRCUIT

- Key in OFF position.

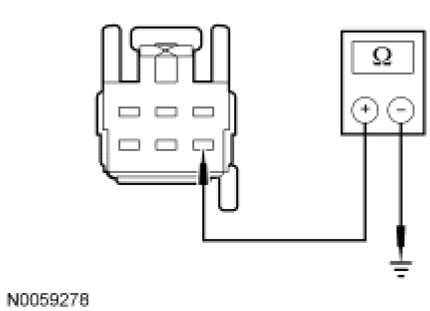

Fig. 11: Measuring Resistance Between Floor Selector Lever Harness Connector C3245-4, GD112 (BK/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between floor selector lever harness connector C3245-4, circuit GD112

(BK/GN) and ground.

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new selector lever. REFER to **SELECTOR LEVER**.

  NO : REPAIR circuit GD112 (BK/GN). TEST the system for normal operation.

PINPOINT TEST B: TRANSMISSION CONTROL (TC)/OVERDRIVE (O/D) CANCEL SWITCH DOES NOT OPERATE CORRECTLY

B1 TEST THE INSTRUMENT CLUSTER (IC)

- Connect the diagnostic tool.
- Using the scan tool, monitor the TCS PID while cycling the transmission control (TC) (O/D cancel) switch.
- **Does the TCS PID cycle from depressed to not depressed?**

  YES : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

  NO : Go to B2.

B2 CHECK SMART JUNCTION BOX (SJB) FUSE 71 (10A)

- Key in OFF position.
- Check fuse: SJB 71 (10A)
- **Is the resistance less than 5 ohms?**

  YES : Go to B3.

  NO : Go to B4.

B3 TEST THE TC (O/D CANCEL) SWITCH POWER CIRCUIT FOR AN OPEN

- Disconnect: Selector Lever Harness C3245
- Disconnect: SJB Fuse 71 (10A)

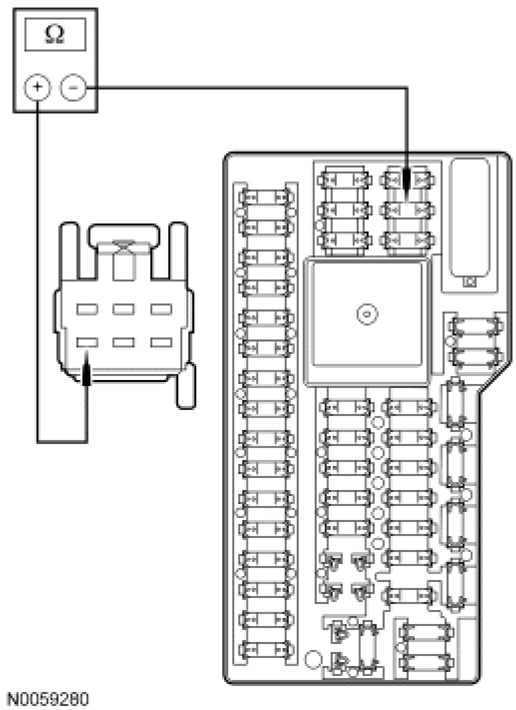

Fig. 12: Measuring Resistance Between Selector Lever Harness Connector C3245-6, Circuit CBP30 (YE/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3245-6, circuit CBP30 (YE/BU) and the output side of SJB fuse 71 (10A).
- **Is the resistance less than 5 ohms?**

  YES : Go to B5.

  NO : REPAIR the circuit CBP30 (YE/BU) for an open. RECONNECT all components. TEST the system for normal operation.

B4 TEST THE TC (O/D CANCEL) SWITCH POWER CIRCUIT FOR A SHORT TO GROUND

- Disconnect: Selector Lever Harness C3245
- Disconnect: SJB Fuse 71 (10A)

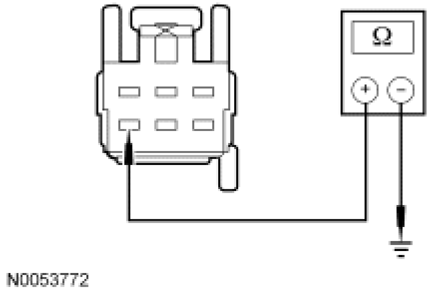

Fig. 13: Measuring Resistance Between Selector Lever Harness Connector C3245-6, CBP30

(YE/BU) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3245-6, circuit CBP30 (YE/BU) and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B6.

  NO : REPAIR circuit CBP30 (YE/BU) for a short to ground. RECONNECT all components. TEST the system for normal operation.

B5 TEST THE TC (O/D CANCEL) SWITCH SIGNAL CIRCUIT FOR AN OPEN

- Disconnect: PCM C175b

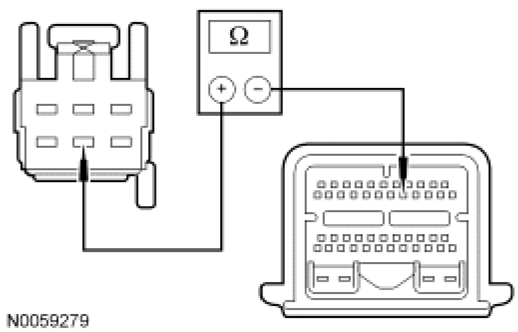

Fig. 14: Measuring Resistance Between Selector Lever Harness Connector C3245-5, Circuit CET34 (BN/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3245-5, circuit CET34 (BN/GN) and PCM C175b-16, circuit CET34 (BN/GN).
- **Is the resistance less than 5 ohms?**

  YES : Go to B7.

  NO : REPAIR circuit CET34 (BN/GN) for an open. RECONNECT all components. TEST the system for normal operation.

B6 TEST THE TC (O/D CANCEL) SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND

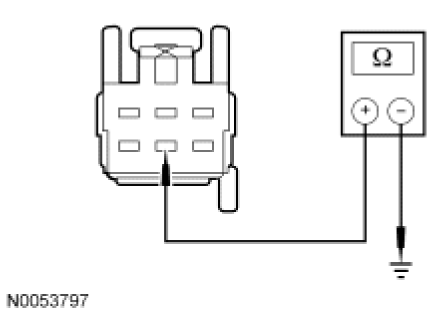

Fig. 15: Measuring Resistance Between Selector Lever Harness Connector C3245-5, CET34

(BN/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3245-5, circuit CET34 (BN/GN) and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B7.

  NO : REPAIR circuit CET34 (BN/GN) for a short to ground. TEST the system for normal operation.

B7 TEST THE TC (O/D CANCEL) SWITCH

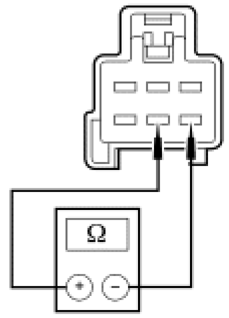

Fig. 16: Measuring Resistance Between Selector Lever Connector C3245-5 & C3245-6, Component Side
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever C3245-5 and C3245-6, component side, while cycling the TC (O/D cancel) switch.
- **Is the resistance less than 5 ohms when pressed and greater than 10,000 ohms when released?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : INSPECT the selector lever wiring harness for damage and repair as necessary. If the selector lever wiring harness is not damaged, INSTALL a new selector lever knob. REFER to **SELECTOR LEVER KNOB**. TEST the system for normal operation.

GENERAL PROCEDURES

BRAKE SHIFT INTERLOCK OVERRIDE

NOTE:	**If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.** **This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON**

position unless the brake pedal is depressed.

If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is depressed:

1. Apply the parking brake and remove the ignition key.

NOTE: Relief located at the front of the access panel.

2. Remove the override cap.

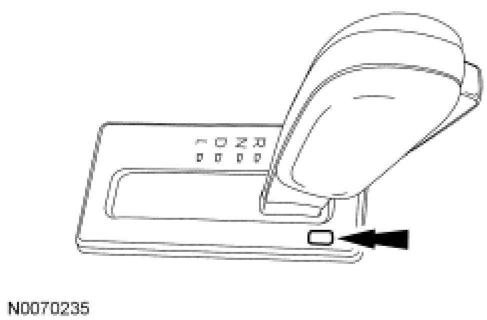

Fig. 17: Identifying Override Cap
Courtesy of FORD MOTOR CO.

3. Using a suitable tool, depress the brake shift interlock override mechanism on the selector lever, apply the brake, depress the button on the selector lever and move the selector lever into NEUTRAL.

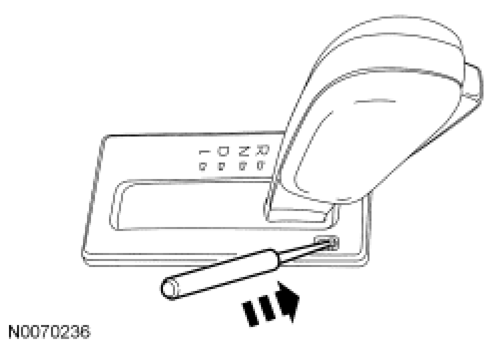

Fig. 18: Depressing The Brake Shift Interlock Override Mechanism
Courtesy of FORD MOTOR CO.

4. Start the vehicle.
5. To install, reverse the procedure.

SELECTOR LEVER CABLE ADJUSTMENT

1. Disconnect the selector lever cable end from the manual control lever.

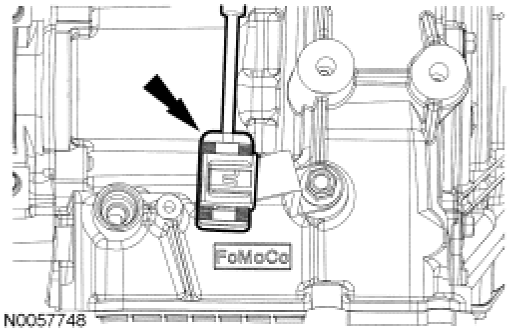

Fig. 19: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

2. Place the manual control lever in DRIVE.
    1. Rotate the manual control lever clockwise until it stops.
    2. Rotate the manual control lever counterclockwise one detent.

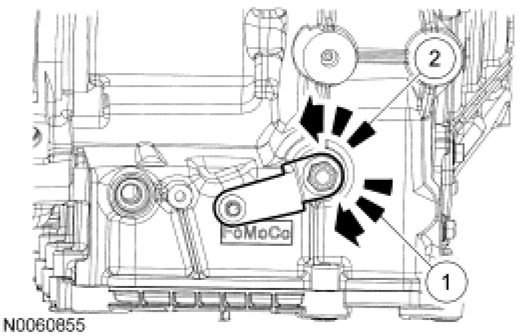

Fig. 20: Rotating Manual Control Lever Clockwise & Counterclockwise
Courtesy of FORD MOTOR CO.

3. Place the selector lever in DRIVE.

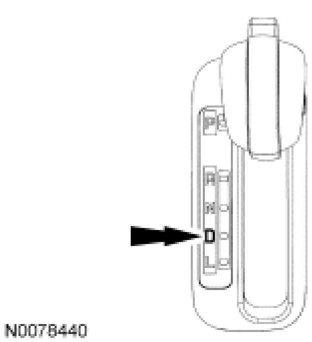

Fig. 21: Placing Selector Lever In Drive
Courtesy of FORD MOTOR CO.

4. Unlock the adjuster.

1. Pry the latch up.
2. Push the lock tab to slide it over.

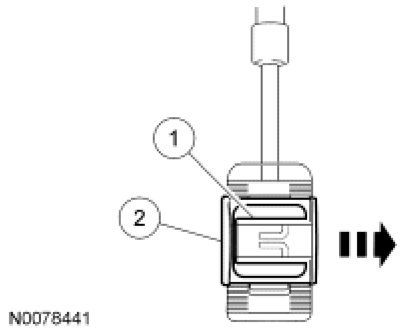

Fig. 22: Pushing Lock Tab To Slide It Over
Courtesy of FORD MOTOR CO.

5. Slide the selector lever cable end forward or backward to align it with the manual control lever.

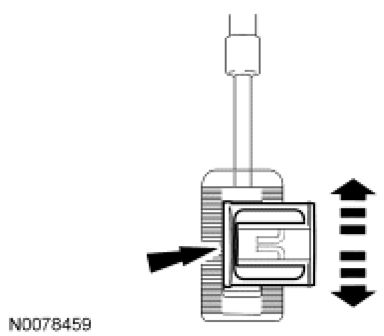

Fig. 23: Sliding Cable End Forward Or Backward To Align It With Manual Control Lever
Courtesy of FORD MOTOR CO.

6. With the adjuster locking tab released, connect the selector lever cable end to the manual control lever.

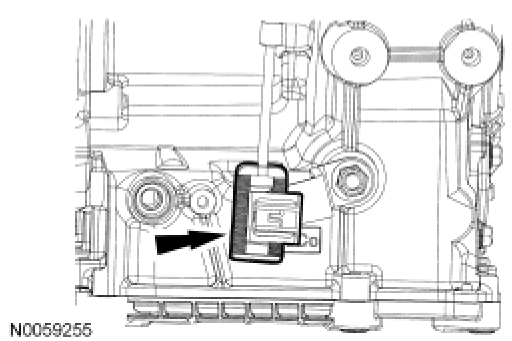

Fig. 24: Connecting Selector Lever Cable End To Manual Lever
Courtesy of FORD MOTOR CO.

7. Slide the release tab back to lock the adjuster.

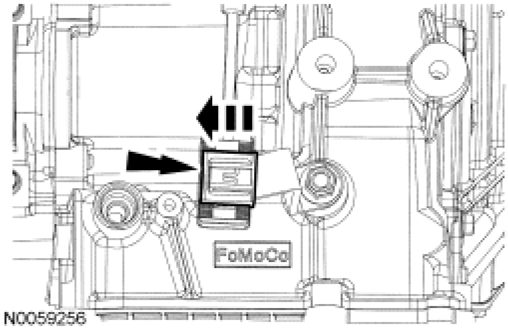

Fig. 25: Sliding Release Tab Back To Lock Adjuster
Courtesy of FORD MOTOR CO.

8. Verify that the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in REVERSE.

REMOVAL AND INSTALLATION

SELECTOR LEVER CABLE

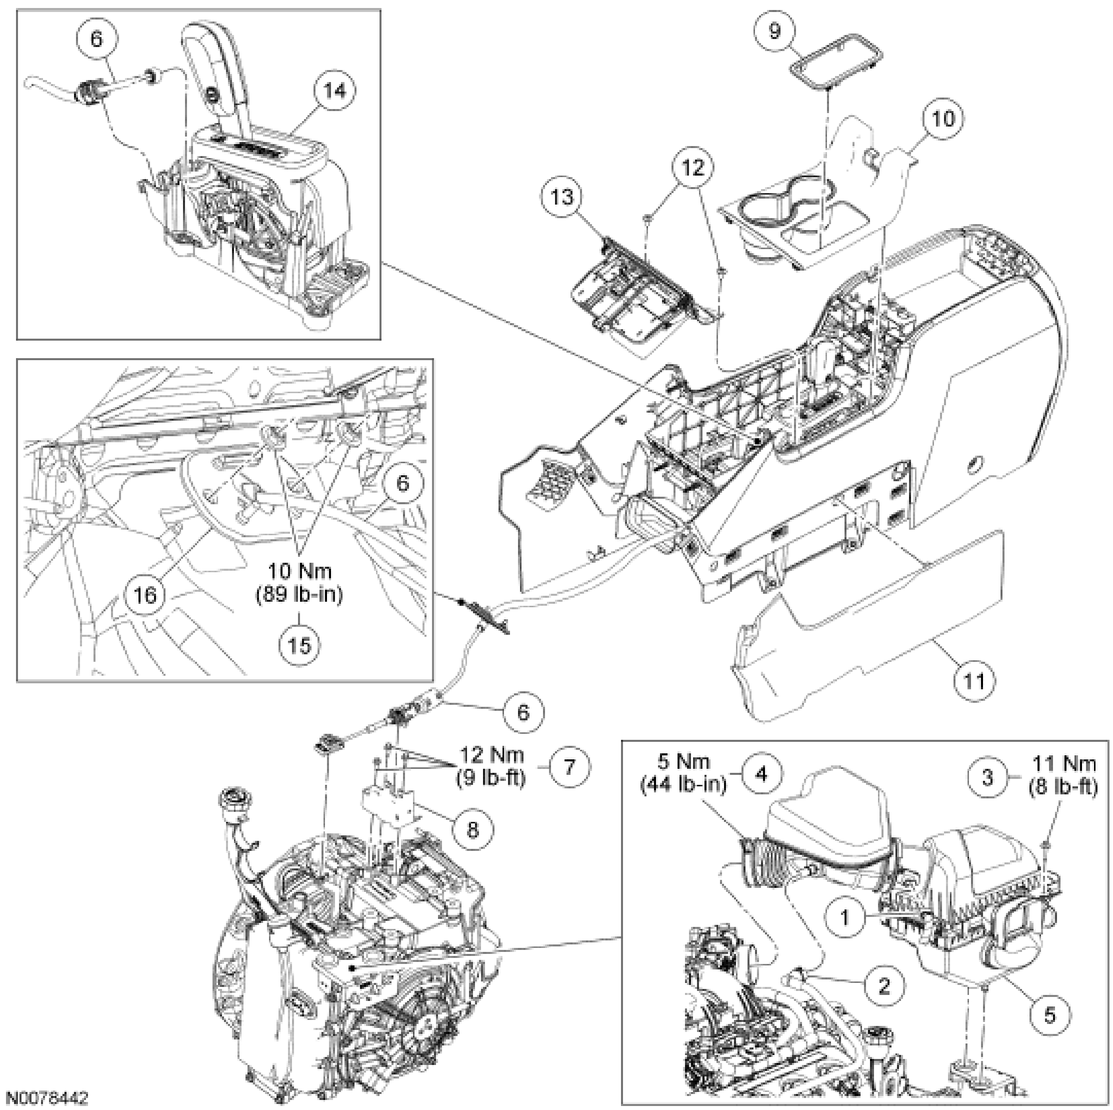

Fig. 26: Identifying Selector Lever Cable With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector
2	6758	Engine vent tube
3	N606678	Air cleaner assembly bolt
4	9C632	Air cleaner outlet tube clamp
5	9C662	Air cleaner assembly
6	7E395	Selector lever cable
7	W500213	Selector lever cable bracket bolts
8	7B229	Selector lever cable bracket
9	78061A16	Selector lever trim ring (MKX only)

10	78045A76	Center console trim cover
11	78045A06	Center console side cover
12	W706092	Power outlet trim cover fasteners
13	78047A04	Power outlet trim cover
14	7K004	Selector lever assembly
15	W707142	Selector lever cable floor grommet nuts
16	57809	Selector lever cable floor grommet

REMOVAL

All vehicles

1. Disconnect the mass air flow (MAF) sensor electrical connector and the wiring harness fastener from the air cleaner assembly.

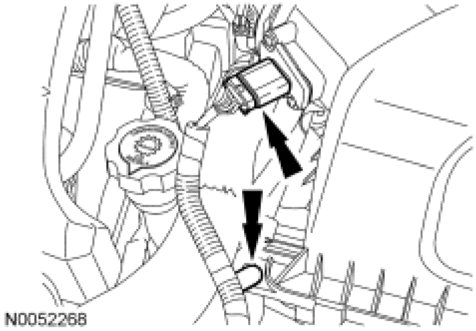

Fig. 27: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

2. Disconnect the brake booster vacuum hose from the air cleaner outlet pipe.

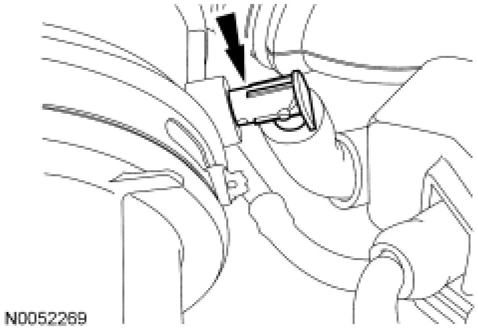

Fig. 28: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

3. Disconnect the engine breather from the air cleaner assembly.

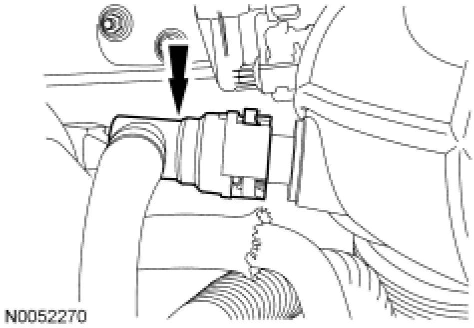

Fig. 29: Locating Engine Breather
Courtesy of FORD MOTOR CO.

4. Remove the air cleaner assembly bracket bolt.

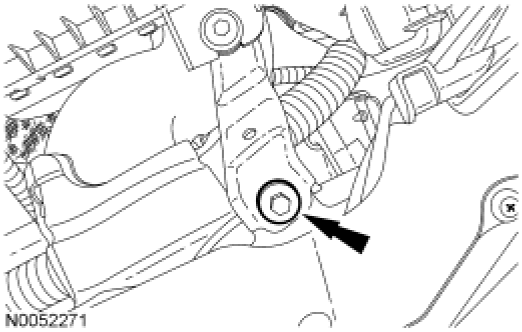

Fig. 30: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

5. Loosen the air cleaner outlet pipe clamp at the throttle body and remove the air cleaner and air cleaner outlet pipe assembly.

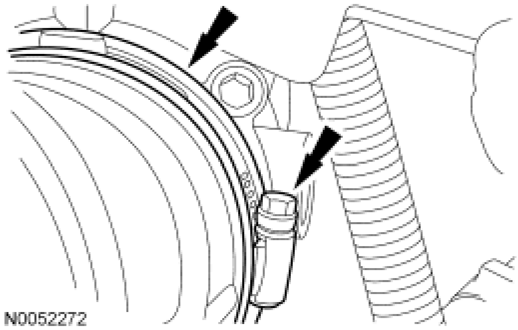

Fig. 31: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

6. Disconnect the selector lever cable end from the manual control lever.

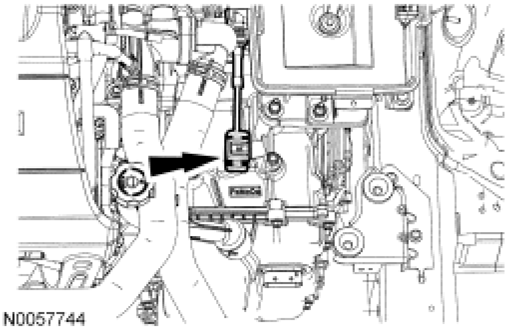

Fig. 32: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

7. Release the 2 tabs, remove the selector lever cable from the selector lever cable bracket and position the cable aside.

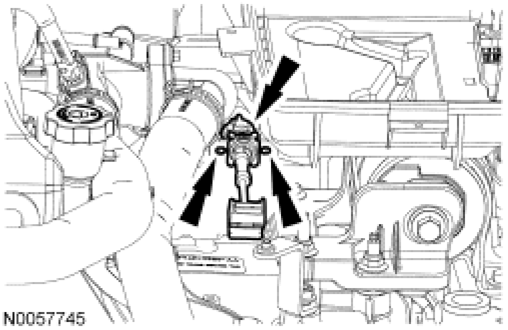

Fig. 33: Locating Selector Lever Cable Bracket & Tabs
Courtesy of FORD MOTOR CO.

8. Remove the 3 bolts and the selector lever cable bracket.

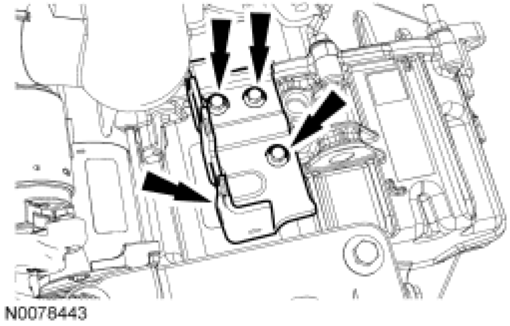

Fig. 34: Identifying Selector Lever Cable Bracket
Courtesy of FORD MOTOR CO.

MKX only

9. Using a suitable tool, remove the selector lever trim ring.

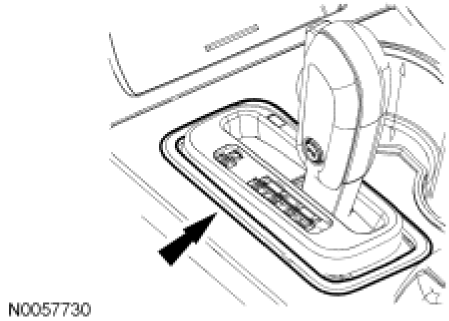

Fig. 35: Locating Selector Lever Trim Ring
Courtesy of FORD MOTOR CO.

All vehicles

10. Lift the armrest. Using a suitable tool, remove the center console trim cover.

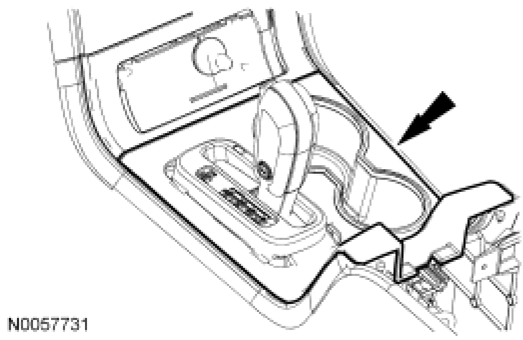

Fig. 36: Identifying Center Console Trim Cover
Courtesy of FORD MOTOR CO.

11. Remove the 2 fasteners and position aside the power outlet trim cover.

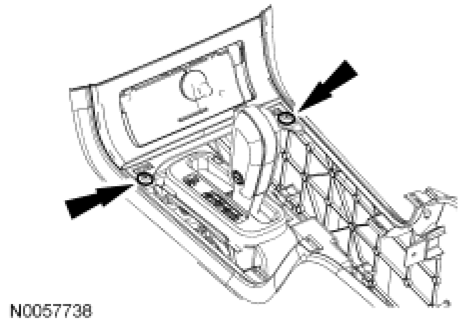

Fig. 37: Identifying Fasteners On Power Outlet Trim Cover
Courtesy of FORD MOTOR CO.

12. Remove the selector lever cable end from the selector lever.

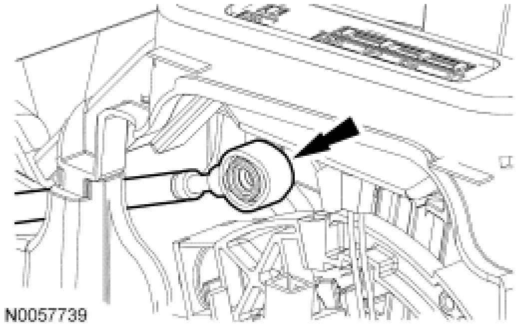

Fig. 38: Identifying Selector Lever Cable End From Selector Lever
Courtesy of FORD MOTOR CO.

13. Release the 2 tabs and remove the selector lever cable from the selector lever housing.

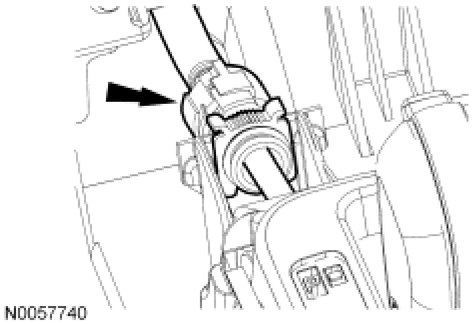

Fig. 39: Locating Selector Lever Cable On Selector Lever Housing
Courtesy of FORD MOTOR CO.

14. Remove the center console side cover.

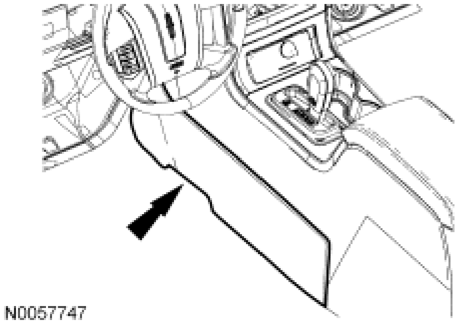

Fig. 40: Identifying Center Console Side Cover
Courtesy of FORD MOTOR CO.

15. Remove the 2 nuts from the grommet, route the selector lever cable from the engine compartment through the floor and remove the selector lever cable from the passenger compartment.

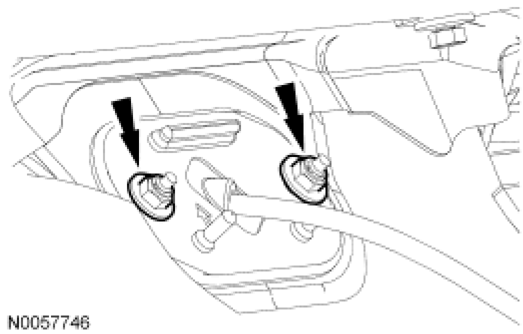

Fig. 41: Identifying Grommet Nuts
Courtesy of FORD MOTOR CO.

INSTALLATION

All vehicles

1. Install the selector lever cable, position the grommet in place and install the 2 nuts.
    - Tighten to 10 N.m (89 lb-in).

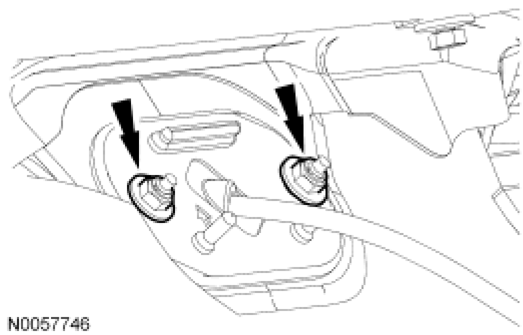

Fig. 42: Identifying Grommet Nuts
Courtesy of FORD MOTOR CO.

2. Install the center console side cover.

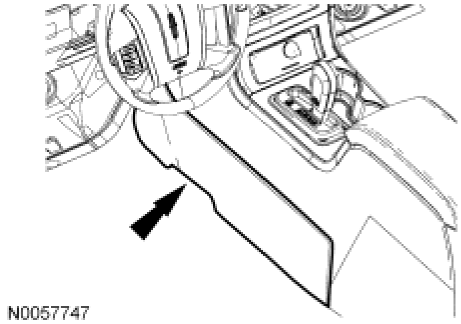

Fig. 43: Identifying Center Console Side Cover
Courtesy of FORD MOTOR CO.

NOTE: **When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the selector lever cable end is snapped onto the ball stud. Press the selector lever cable into the selector lever cable bracket and listen for the cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the selector lever cable bracket. Also make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed.**

3. Install the selector lever cable in the selector lever housing.

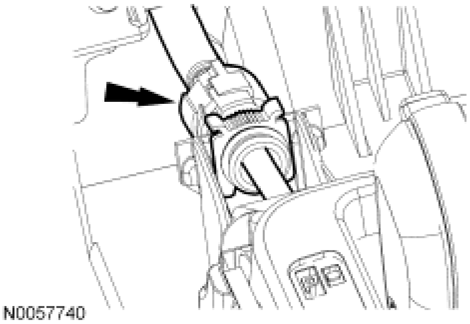

Fig. 44: Locating Selector Lever Cable On Selector Lever Housing
Courtesy of FORD MOTOR CO.

4. Place the selector lever in REVERSE.

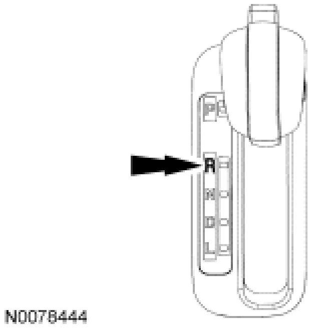

Fig. 45: Identifying REVERSE
Courtesy of FORD MOTOR CO.

5. Install the selector lever cable end on the selector lever.

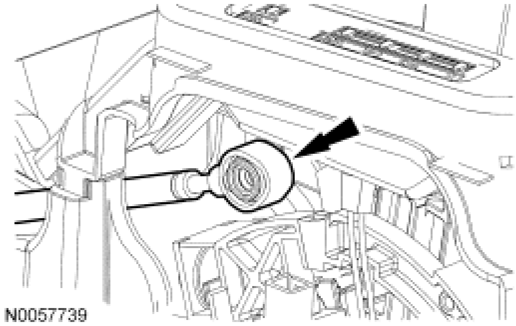

Fig. 46: Identifying Selector Lever Cable End From Selector Lever
Courtesy of FORD MOTOR CO.

6. Place the selector lever in DRIVE.

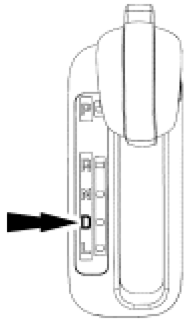

Fig. 47: Placing Selector Lever In Drive
Courtesy of FORD MOTOR CO.

7. Position the power outlet trim cover in place and install the 2 fasteners.

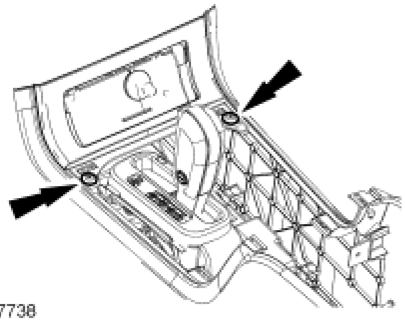

Fig. 48: Identifying Fasteners On Power Outlet Trim Cover
Courtesy of FORD MOTOR CO.

8. Install the center console trim cover.

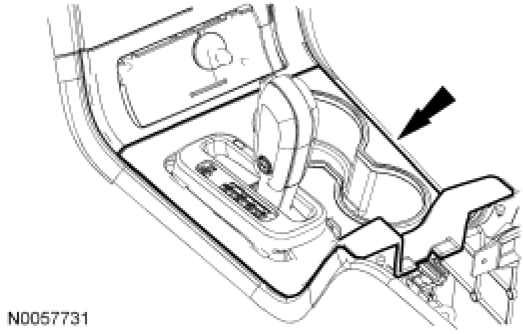

Fig. 49: Identifying Center Console Trim Cover
Courtesy of FORD MOTOR CO.

MKX only

9. Install the selector lever trim ring.

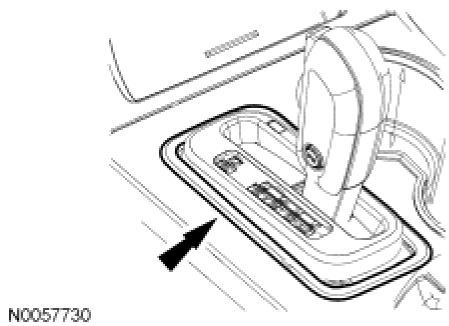

Fig. 50: Locating Selector Lever Trim Ring
Courtesy of FORD MOTOR CO.

All vehicles

10. Position the selector lever cable bracket in place and install the 3 bolts.
    - Tighten to 12 N.m (9 lb-ft).

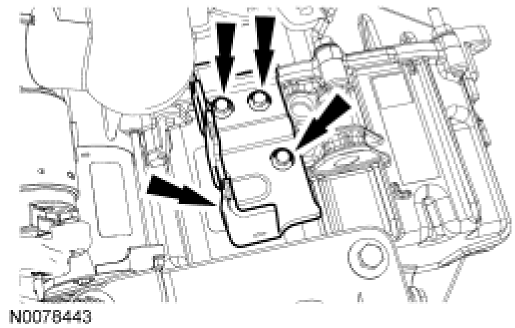

Fig. 51: Identifying Selector Lever Cable Bracket
Courtesy of FORD MOTOR CO.

11. Install the selector lever cable in the selector lever cable bracket.

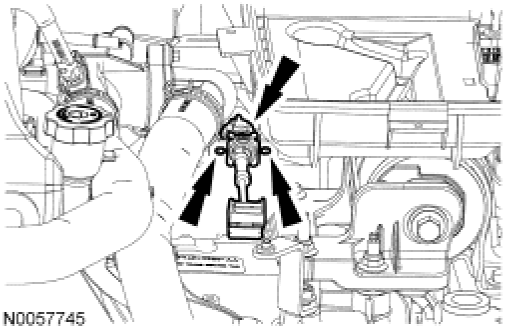

Fig. 52: Locating Selector Lever Cable Bracket & Tabs
Courtesy of FORD MOTOR CO.

12. Place the manual control lever in DRIVE.
    1. Rotate the manual control lever clockwise until it stops.
    2. Rotate the manual control lever counterclockwise one detent.

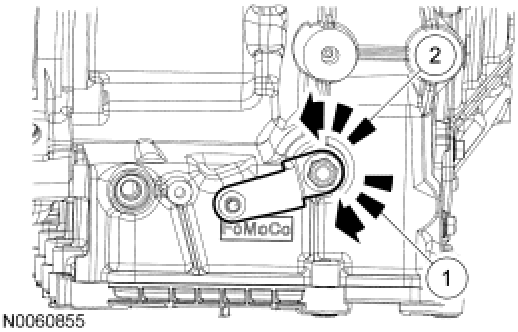

Fig. 53: Rotating Manual Control Lever Clockwise & Counterclockwise
Courtesy of FORD MOTOR CO.

13. Unlock the adjuster.
    1. Pry the latch up.
    2. Push the lock tab to slide it over.

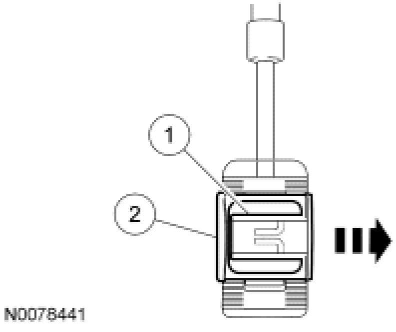

Fig. 54: Pushing Lock Tab To Slide It Over
Courtesy of FORD MOTOR CO.

14. Slide the selector lever cable end forward or backward to align it with the manual control lever.

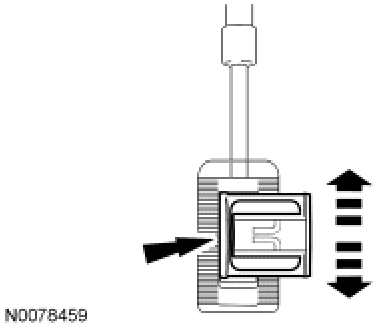

Fig. 55: Sliding Cable End Forward Or Backward To Align It With Manual Control Lever
Courtesy of FORD MOTOR CO.

15. With the adjuster locking tab released, connect the selector lever cable end to the manual control lever.

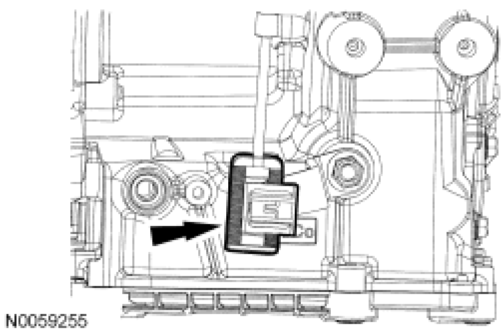

Fig. 56: Connecting Selector Lever Cable End To Manual Lever
Courtesy of FORD MOTOR CO.

16. Slide the release tab back to lock the adjuster.

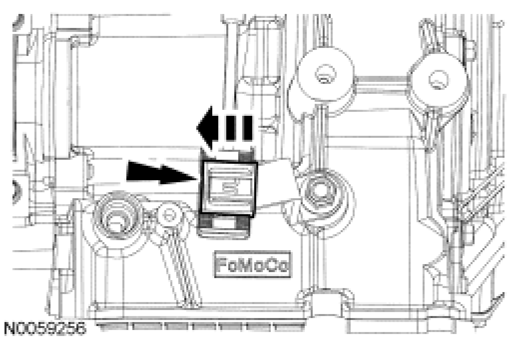

Fig. 57: Sliding Release Tab Back To Lock Adjuster
Courtesy of FORD MOTOR CO.

17. Connect the selector lever cable on the manual control lever.

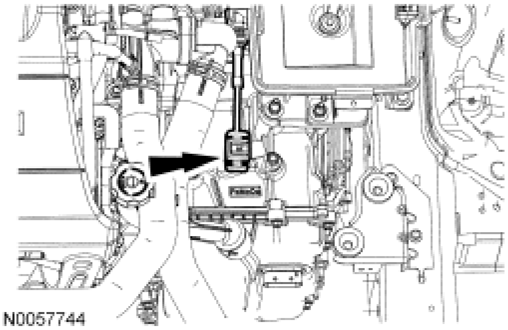

Fig. 58: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

18. Position the air cleaner assembly in place and install the bolt.
    - Tighten to 11 N.m (8 lb-ft).

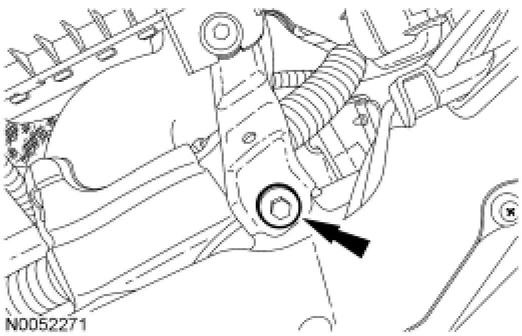

Fig. 59: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

19. Tighten the air cleaner outlet pipe clamp at the throttle body.
    - Tighten to 5 N.m (44 lb-in).

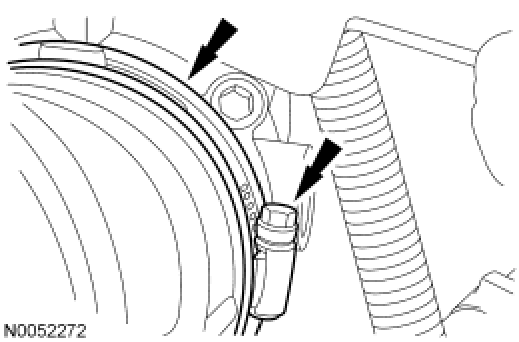

Fig. 60: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

20. Connect the engine breather to the air cleaner assembly.

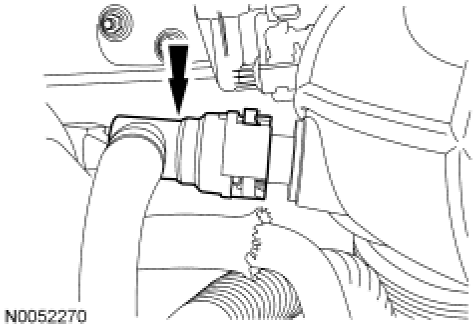

Fig. 61: Locating Engine Breather
Courtesy of FORD MOTOR CO.

21. Connect the brake booster vacuum hose to the air cleaner assembly.

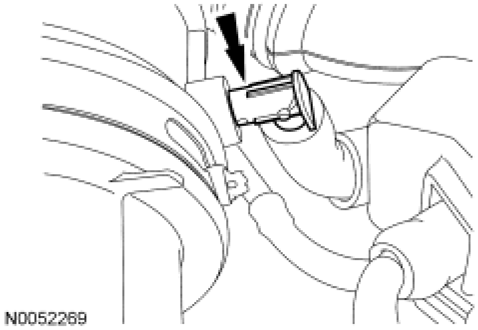

Fig. 62: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

22. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

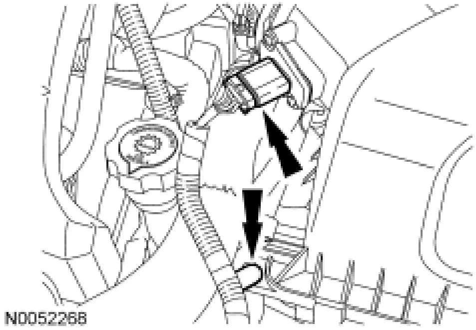

Fig. 63: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

23. Verify that the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in REVERSE.

SELECTOR LEVER

Item	Part Number	Description
1	78061A16	Selector lever trim ring (MKX only)
2	78045A76	Center console trim cover
3	7C453	Transmission control (TC) switch electrical connector
4	-	Selector lever knob trim covers (part of 7L010)
5	W790088	Selector lever knob screw (2 required)
6	7L010	Selector lever knob

REMOVAL

MKX only

1. Using a suitable tool, remove the selector lever trim ring.

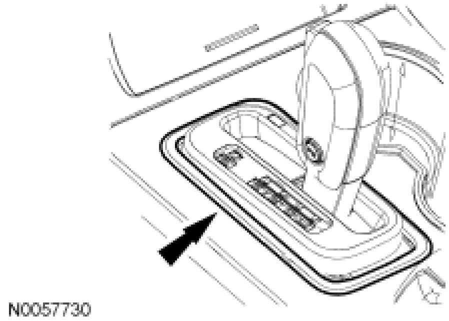

Fig. 88: Locating Selector Lever Trim Ring
Courtesy of FORD MOTOR CO.

All vehicles

2. Lift the armrest. Using a suitable tool, remove the center console trim cover.

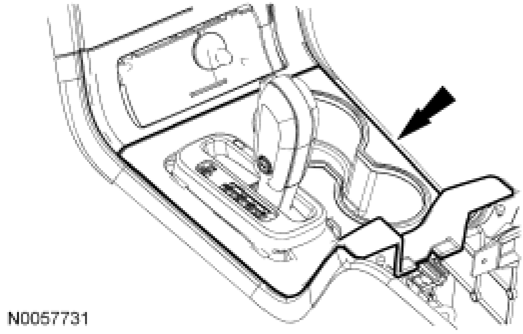

Fig. 89: Identifying Center Console Trim Cover
Courtesy of FORD MOTOR CO.

NOTE: Center console side trim cover removed for clarity.

3. Disconnect the transmission control (TC) switch electrical connector.

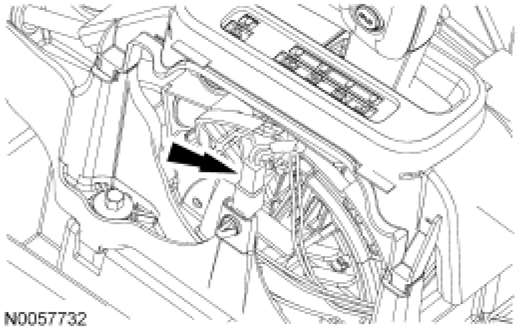

Fig. 90: Locating Transmission Control (TC) Switch Electrical Connector
Courtesy of FORD MOTOR CO.

4. Remove and discard the selector lever knob trim covers by carefully prying out on the bottom front corners, and then pry out on the top front corner and remove the covers.

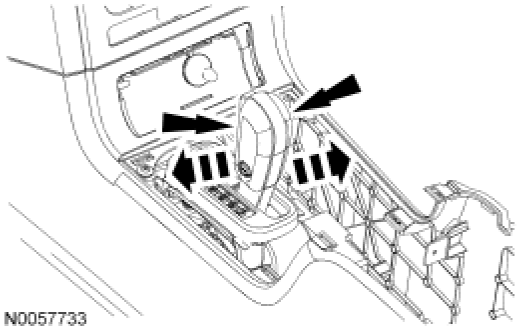

Fig. 91: Removing Selector Lever Knob Trim Covers By Carefully Prying Out On Bottom Front Corners
Courtesy of FORD MOTOR CO.

NOTE: Inspect the knob body for damage. Install a new knob body if necessary.

5. Remove and discard the 2 selector lever knob screws. Remove the selector lever knob while routing the TC switch electrical connector harness out of the selector lever.

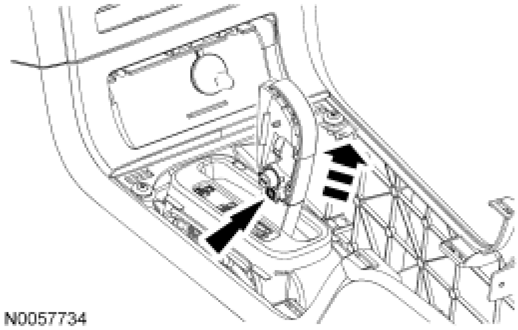

Fig. 92: Removing Selector Lever Knob While Routing TC Switch Electrical Connector Harness Out Of Selector Lever

Courtesy of FORD MOTOR CO.

INSTALLATION

All vehicles

1. Route the TC switch electrical connector harness through the selector lever and install the shift knob and 2 new screws. Loosely install both screws before tightening.
   - Tighten to 2 N.m (18 lb-in).

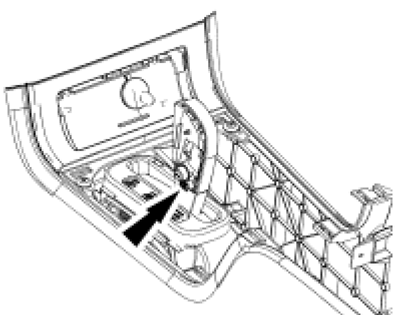

Fig. 93: Routing TC Switch Electrical Connector Harness Through Selector Lever
Courtesy of FORD MOTOR CO.

NOTE: Be sure that the selector lever knob bezel is correctly installed on the selector lever knob.

2. Install new selector lever knob trim covers.

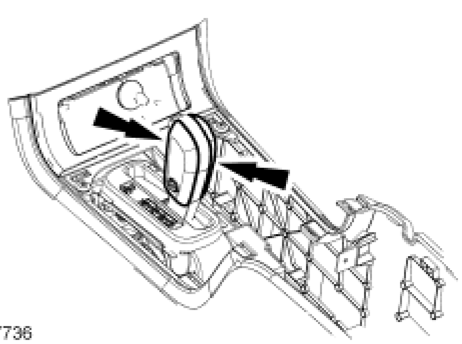

Fig. 94: Identifying Selector Lever Knob Trim Covers
Courtesy of FORD MOTOR CO.

EDGE only

3. Route the TC switch electrical connector wires behind the selector lever bezel light bulb wires.
   1. TC switch electrical connector wires
   2. Selector lever light bulb wires

2008 TRANSMISSIONS

Transaxle/Transmission Cooling - Edge & MKX

SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Fluid	
MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid, Motorcraft Continuously Variable Chain Type Transmission Fluid and FNR5 transmission fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for the transaxle will cause transaxle damage. Refer to the material specification for the correct transmission fluid. The transmission fluid should be changed every 96,560 km (60,000 mi) regardless of normal or special operating conditions.	
CAUTION: Do not use water-based cleaners to clean or flush the transmission fluid cooler tubes or transaxle damage will occur. Mineral spirits can be used to clean the transmission fluid cooler tubes, providing the transmission fluid cooler tubes are flushed with clean transmission fluid and blown dry with shop air. Use only clean transmission fluid designated for this transaxle and torque converter being serviced.	

MATERIAL SPECIFICATIONS

Item	Specification	Fill Capacity
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V	9.5L (10 qt)

Transmission fluid cooler bracket bolts	10	-	89
Transmission fluid cooler thermal bypass valve	9	-	80
Transmission fluid cooler tube bolts	9	-	80
Transmission fluid cooler tube fittings	25	18	-

DESCRIPTION AND OPERATION

TRANSAXLE COOLING

The transmission fluid cooling system consists of the following:

- Oil-to-air transmission fluid cooler
- Transmission fluid cooler tube assembly
- Transmission fluid cooler thermal bypass valve
- Transmission fluid cooler outlet tube
- Transmission fluid cooler return tube

These vehicles are equipped with an external transmission fluid cooler. The transmission fluid cooler is mounted in front of the engine radiator. The transmission fluid cooling system also consists of a transmission fluid cooler thermal bypass valve which is mounted on the transaxle main control cover. When the transmission fluid is below normal operating temperature, transmission fluid travels from the transaxle to the transmission fluid cooler thermal bypass valve then back to the transaxle. When the transmission fluid is at or above normal operating temperature, the transmission fluid cooler thermal bypass valve opens allowing transmission fluid to travel from the transaxle through the transmission fluid cooler then back to the transaxle. The transmission fluid cooler transfers heat from the transmission fluid to the outside air.

MATERIAL

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Inspection and Verification

1. Verify the customer concern by operating the vehicle to duplicate the condition.
2. If the inspection reveals obvious concern(s) that can be readily identified, repair as necessary.
3. Install new components if a transmission fluid leak is found in any of the transaxle cooling components.
4. If the concern(s) remains after the inspection, determine the symptom(s). Go to **Symptom Chart - Transaxle Cooling** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

Symptom Chart - Transaxle Cooling

Symptom Chart - Transaxle Cooling

Condition	Possible Sources	Action
• Transaxle overheating	• Clogged transmission fluid cooler or transmission fluid cooler tubes • Bent or crushed transmission fluid cooler tubes • Transmission fluid	• INSPECT the transmission fluid cooler, transmission fluid cooler tubes and transmission fluid cooler thermal bypass valve for damage or plugging. INSTALL new components as necessary.

	cooler thermal bypass valve stuck closed	
	• System leaks	• INSPECT transmission fluid cooler and transmission fluid cooler tubes for leaks. SERVICE as required.
	• Internal transaxle concerns	• REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Vibration - a high frequency (20-80 Hz) that is felt through the seat or gear shifter. Changes with engine speed	• Transmission fluid cooler tubes grounded	• CHECK the transmission fluid cooler tubes. REPAIR as necessary.

Check Transmission Fluid Level and Condition (All Vehicles)

CAUTION: The vehicle should not be driven if the transmission fluid level indicator shows the transmission fluid below the minimum transmission fluid level mark or internal failure could result.

If the vehicle has been operated for an extended period of time, at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid needs to cool down to obtain an accurate reading.

The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Transmission Fluid Level Check

NOTE: **The transmission fluid should be checked at normal operating temperature 80°C-93°C (175°F-200°F) on a level surface. Normal operating temperature can be reached after approximately 32 km (20 mi) of driving and can be checked using the scan tool.**

Under normal circumstances the transmission fluid level should be checked during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

1. With the transaxle in PARK, the engine at idle, foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever in the PARK position.
2. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
3. Wipe the transmission fluid level indicator with a clean cloth.
4. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the indicator. The transmission fluid level should be within the normal operating range.

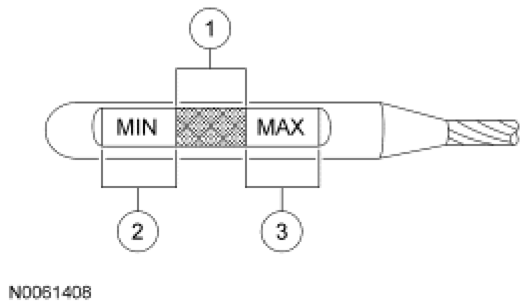

Fig. 2: Identifying Transmission Fluid Indicator
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Correct transmission fluid level at operating temperature 80°C-93°C (175°F-200°F)
2	-	Low transmission fluid level
3	-	High transmission fluid level

High Transmission Fluid Level

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

Low Transmission Fluid Level

A low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

CAUTION: MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid, Motorcraft Continuously Variable Chain Type Transmission Fluid and FNR5 Transmission Fluid are not interchangeable transmission fluids. The use of any fluid other than what is recommended for this transaxle will cause transaxle damage.

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid level indicator tube. Do not overfill the transmission fluid. For transmission fluid type, refer to the **MATERIAL** specification chart.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Observe the color and the odor. The color under normal circumstances should be a dark red color, not brown or black or have a burnt odor.
3. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the bottom of the transmission fluid pan, repair the transaxle and clean the transmission fluid cooler tubes and the transmission fluid cooler.
6. If the transaxle is to be overhauled or if installing a new transaxle, the transmission fluid cooler must be backflushed. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

[a] Refer to the appropriate procedure.

DIAGNOSTIC TESTS

DIAGNOSTIC STRATEGY

NOTE:	**Do not take shortcuts or assume that critical checks or adjustments have already been made.**

Troubleshooting an electronically controlled automatic transaxle is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Appropriate Transaxle articles
- **Introduction - Gasoline Engines** article
- TSBs
- Appropriate SYSTEM WIRING DIAGRAMS article

These publications provide the information required when diagnosing transaxle concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid levels and condition.
- Check for non-factory add-on items.
- Check selector lever linkage for correct adjustment.
- Check TSB messages regarding the concern.

Diagnostics

- Carry out On-Board Diagnostic (OBD) procedures Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER).
- Record all DTCs.
- Repair all non-transaxle codes first.
- Repair all transaxle codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes are obtained, refer to **Diagnosis By Symptom** for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

DIAGNOSTIC FLOW CHART

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module	

 ST2574-A	(VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool.	

Prior to carrying out the flow test, the following items should be checked:

- Know and understand the customer concerns.
- Verify the concern by operating the vehicle.
- Check the transmission fluid level and condition.
- Check for non-factory-installed items and verify correct installation.
- Check the selector lever linkage adjustments.
- Check TSB messages for vehicle concerns.
- Carry out both Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) Self Test.
- Record all DTCs.

DIAGNOSTIC FLOW CHART

Test	Result	Action
1) Were any DTCs recorded?	Yes	REPAIR all hard DTCs. FOLLOW the pinpoint tests. REFER to the **Introduction - Gasoline Engines** article first, then this service information, then Go to Step 2.
	No	REFER to **Diagnosis By Symptom**, then Go to Step 5.
2) Are any continuous test memory codes present?	Yes	CLEAR codes and CARRY OUT drive cycle test, then Go to Step 3.
	No	Go to Step 4.

3) Did the continuous test memory codes reappear?	Yes	REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the **Introduction - Gasoline Engines** article then the appropriate transmission articles , then this service information, then Go to Step 4.
	No	Go to Step 4.
4) Is the concern repaired?	Yes	CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self test to verify that no DTCs are present. CLEAR memory codes.
	No	REFER to **Diagnosis By Symptom**, then Go to Step 5.
5) Are there any electrical concerns?	Yes	INSTALL the scan tool. CARRY OUT KOEO and KOER tests and drive cycle test with the scan tool, then Go to Step 6.
	No	REFER to the hydraulic and mechanical routine to diagnose and repair the concern, then Go to Step 7.
6) Was the transmission concern corrected when the scan tool was installed?	Yes	REFER to the **Introduction - Gasoline Engines** article, intermittent fault diagnosis and use the scan tool to diagnose cause of concern in the

		processor, vehicle harness or external inputs (sensors or switches).
	No	REFER to the hydraulic and mechanical routine to diagnose the concern, then Go to Step 7.
7) Is the concern repaired?	Yes	CARRY OUT the final quick test to verify that no DTCs are present. CLEAR memory codes.
	No	Concern should have been repaired. GO back through the Diagnostic Flow Chart and review other components that may have contributed to the concern. CHECK and DIAGNOSE those components. Get assistance from other sources.

PRELIMINARY INSPECTION

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

The following items must be checked prior to beginning the diagnostic procedures.

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions as to when the concern occurs. For example:

- Hot or cold vehicle temperature

- Hot or cold ambient temperature
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to verifying the concern.

Verification of Condition

This article provides information which must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

NOTE: Some transaxle conditions may cause engine concerns. An electronic pressure control short circuit can cause engine misfiring. The

Torque Converter Clutch (TCC) not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting
- Engagement
- Noise/vibration - check for dependencies, either RPM dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent or temperature dependent.

Check Transmission Fluid Level and Condition

If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid needs to cool down to obtain an accurate reading.

The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Transmission Fluid Level Check

Under normal circumstances, the transmission fluid level should be checked during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

1. With the selector lever in PARK, the engine at idle and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever in the PARK position.
2. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
3. Wipe the transmission fluid level indicator with a clean cloth.
4. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid level indicator. The transmission fluid level should be within the normal operating range.

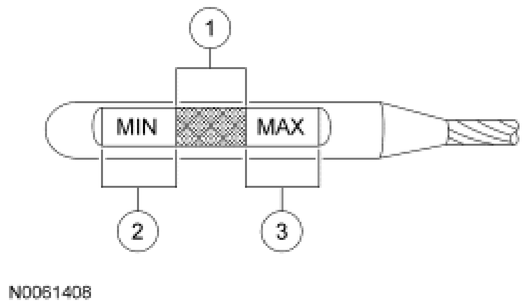

Fig. 1: Identifying Transmission Fluid Indicator
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Correct transmission fluid level at normal operating temperature 80°C-93°C (175°F-200°F)
2	-	Low transmission fluid level
3	-	High transmission fluid level

High Transmission Fluid Level

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to **Transmission Fluid Drain and Refill**.

Low Transmission Fluid Level

A low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

NOTE: The use of any other type of transmission fluid than specified could result in transaxle malfunction and/or damage.

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid filler tube. Do not overfill the transmission fluid.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Observe the color and the odor. The color under normal circumstances should be dark reddish, not brown or black or have a burnt odor.
3. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant in the transaxle. The engine cooling system should also be inspected at this time.
6. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the transmission fluid, the transaxle must be disassembled and completely cleaned. This includes the torque converter, cooler bypass valve, coolers and cooler tubes.
7. Carry out diagnostic checks and adjustments, refer to **Diagnosis By Symptom**.

Water in Transmission Fluid

To correctly repair a transmission or transaxle that has had water or coolant introduced into the system, completely disassemble, clean and replace the following parts:

- All internal and external seals
- All friction material; clutches and bands
- Torque converter
- All parts with bonded seals
- All solenoids
- All transmission fluid filters

Prior to installing the transmission or transaxle, the transmission fluid cooler(s), transmission fluid cooler tubes and transmission fluid cooler hoses need to be flushed and cleaned.

ROAD TESTING VEHICLE

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: If a new or remanufactured transaxle assembly is being installed or a new solenoid body is installed, the PCM will have to be reflashed with a new

solenoid body strategy and identification data file. The solenoid body strategy drive cycle should also be carried out. Refer to Solenoid Body Strategy.

The Shift Point Road Test and Torque Converter Operation Test provide diagnostic information on shift controls and torque converter operation.

SOLENOID BODY STRATEGY

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Solenoid Body Identification Procedure

1. Using the scan tool, select Powertrain, Transmission and Transmission Solenoid Body Identification from the toolbox icon and follow the instructions displayed on the scan tool.

   The solenoid body identification screen displays solenoid body identification information:

   - Solenoid body identification - 7-digit
   - Solenoid body strategy - 13-digit

     The next screen displays the current solenoid body identification and strategy data file stored in the PCM. If the solenoid body strategy field is blank, the module contains a partial transmission solenoid body strategy. This is due to a corrupt or missing file at the time the programmable parameters were completed.

2. Compare the solenoid body identification and strategy (if available) to the solenoid body service tag or the replacement solenoid body tag located on top of the transaxle case.

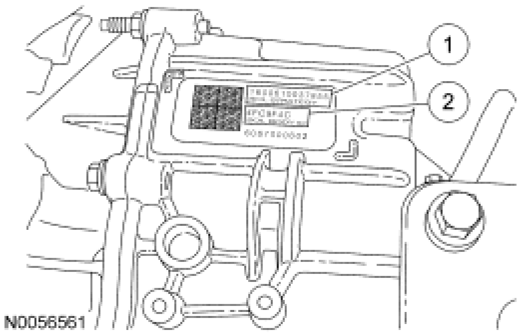

Fig. 2: Original Solenoid Body Service Tag
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Thirteen-digit solenoid body strategy
2	-	Seven-digit solenoid body identification

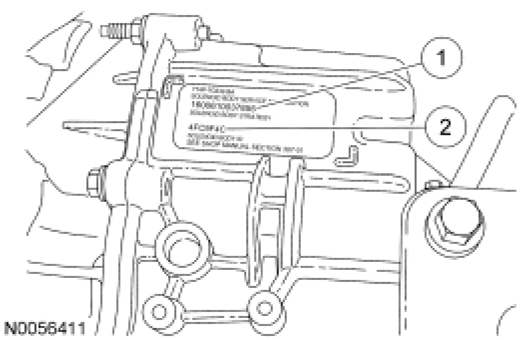

Fig. 3: Replacement Solenoid Body Service Tag
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Thirteen-digit solenoid body strategy
2	-	Seven-digit solenoid body identification

3. If the solenoid body identification and strategy on the scan tool match the solenoid body service tag or replacement tag, then the solenoid body identification and strategy are correct for this transaxle and a solenoid body strategy download is not required. If the solenoid body service tag or replacement tag is missing or damaged so that it is not readable or does not match the identification or strategy on the scan tool, remove the main control cover, refer to **Main Control Cover**.

   The 7-digit identification number and the 13-digit strategy number are stamped on the solenoid body.

   NOTE: **If the solenoid body information does not match the module information, transaxle damage or driveability concerns can occur.**

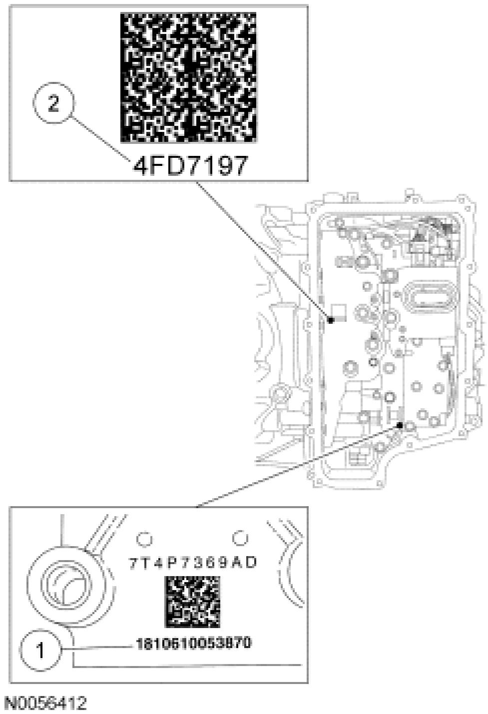

Fig. 4: Solenoid Body Identification Tag
Courtesy of FORD MOTOR CO.

4. Inspect the solenoid body identification and strategy stamped on the solenoid body and compare this to the solenoid body service tag on the transaxle case. If the solenoid body identification and strategy stamped on the solenoid body does not match the solenoid body service tag or if the solenoid body identification and strategy stamped on the solenoid body match the solenoid body service tag on the transaxle case but do not match the solenoid body identification and strategy numbers displayed on the scan tool, a solenoid body strategy data download is required.

Item	Part Number	Description
1	-	Thirteen-digit solenoid body strategy
2	-	Seven-digit solenoid body identification

Solenoid Body Strategy Data Download

1. Using the scan tool, select module programming and programmable parameters under the toolbox icon and select transmission. Follow the instructions displayed on the scan tool.

   There are fields to enter the solenoid body 7-digit identification and 13-digit strategy recorded from the solenoid body.

NOTE: If the solenoid body information is not correct, transaxle damage or driveability concerns can occur.

2. Enter the solenoid body identification and strategy.

   The scan tool will verify that the numbers entered are valid and display a message if the information is not valid.

   The scan tool checks to see if the file is present on the scan tool. If the file is present, the technician may proceed with downloading the file to the PCM. If the file is not present, the scan tool will need to be connected to the Professional Technician Society (PTS) server to download the file onto the scan tool.

3. Verify that the file is present on the scan tool. If the file is present, go to Step 8. If the file is not present, continue with this procedure.
4. Connect the scan tool to the PTS server.

   The screen will display a progress bar when connecting to the network.

5. Follow the instructions on the network to download the strategy file to the scan tool.

   The screen will display a progress bar when downloading the strategy file to the scan tool and display a message if it is downloaded successfully.

6. If the scan tool cannot connect to the PTS server, download the file from www.motorcraft.com.

   If the scan tool cannot download a strategy from the web site, a partial strategy will automatically be downloaded.

7. Reconnect the scan tool to the vehicle.
8. Follow the instructions displayed on the scan tool.
9. If a new solenoid body was installed, compare the 7-digit identification and the 13-digit strategy fields from the solenoid body to the replacement solenoid body tag provided with the solenoid body service kit and place it over the existing identification tag.

   The scan tool will automatically download the strategy file or partial strategy file to the PCM and will display a progress bar while downloading. The scan tool will display a message when it is finished downloading the data that states that the file was downloaded successfully.

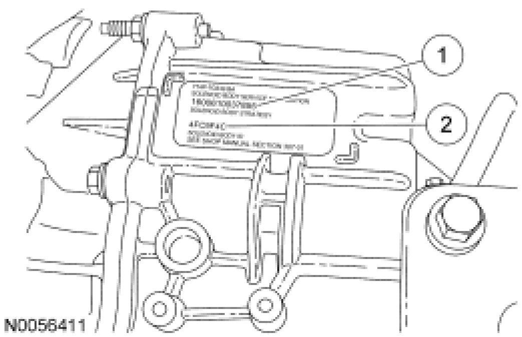

Fig. 5: Replacement Solenoid Body Service Tag

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Thirteen-digit solenoid body strategy
2	-	Seven-digit solenoid body identification

NOTE: If a drive cycle is not completed, the customer may feel erratic shifts and driveability concerns.

10. Test drive the vehicle. Refer to **Solenoid Body Strategy Drive Cycle**.

Solenoid Body Strategy Drive Cycle

Carry out the drive cycle after downloading the solenoid body strategy data file to the PCM.

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The engine and transaxle must be at normal operating temperature.

1. Bring the transaxle to normal operating temperature.
2. With the engine running and the brake applied, move the selector lever through the gears in the following order, pausing in each gear for 4 seconds: N, R, N, D, R, D, N. Repeat this pattern 2 times. If any engagements feel soft or harsh, repeat this procedure.
3. Drive the vehicle and accelerate at a moderate throttle so that the upshifts occur at 2,000 RPM up to 80 km/h (50 mph) and brake moderately to a stop. Repeat this pattern 2 times.
4. Drive the vehicle and accelerate at a moderate throttle so that the upshifts occur at 3,000 RPM up to 80 km/h (50 mph) and brake moderately to a stop. Repeat this pattern 2 times.
5. With the engine running and the brake applied, move the selector lever through the gears in the following order, pausing in each gear for 4 seconds: N, R, N, D, R, D, N. Repeat this pattern 2 times.

SHIFT POINT ROAD TEST

This test verifies that the shift control system is operating correctly.

1. Bring engine and transaxle up to normal operating temperature.
2. Operate vehicle with selector lever in D range.

NOTE: Shift speed ranges are approximate for all applications. For specific applications (engine, axle ratio and application) refer to the Automatic Transmission Specification Issue available from Ford Customer Service Division.

3. Apply minimum throttle and observe speeds at which upshift occurs and torque converter engages using

the shift speeds chart.

SHIFT SPEEDS

Throttle Position	Range	Shift	KM/H	MPH
Light Throttle	D	1-2	14-19	9-12
	D	2-3	24-31	15-19
	D	3-4	32-40	20-25
	D	4-5	45-56	28-35
	D	5-6	63-80	39-50
Medium Throttle	D	1-2	37-47	23-29
	D	2-3	58-71	36-44
	D	3-4	74-93	46-58
	D	4-5	108-135	67-84
	D	5-6	169-211	105-131
Heavy Throttle	D	1-2	55-69	34-43
	D	2-3	84-105	52-65
	D	3-4	127-158	79-98
	D	4-5	167-208	104-129
	D	5-6	179-222	111-138

4. With vehicle speed above 43 km/h (27 mph), press accelerator pedal to floor, Wide Open Throttle (WOT). The transaxle should shift from 4th to 3rd, or 4th to 2nd, depending on the vehicle speed. The Torque Converter Clutch (TCC) should release.
5. With vehicle speed above 56 km/h (35 mph), move the selector lever from D (DRIVE) range to L (LOW) range and remove foot from accelerator pedal. The transaxle should immediately downshift to 2nd gear. When vehicle speed drops below 32 km/h (20 mph), the transaxle should downshift into 4th gear.
6. If the transaxle fails to upshift/downshift or TCC does not apply and release, refer to **Diagnosis By Symptom** for possible causes.

TORQUE CONVERTER DIAGNOSIS

Prior to torque converter installation, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of new or remanufactured torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary Inspection
2. Know and Understand the Customer's Concern
3. Verify the Concern - carry out the Torque Converter Clutch (TCC) Operation Test.
4. Carry out Diagnostic Procedures:
    - Run OBDs. Refer to **Diagnostics**.
        - Repair all non-transmission related DTCs first.
        - Repair all transmission DTCs.

- Rerun OBD to verify repair.
- Carry out Line Pressure Test. Refer to **Special Testing Procedures**.
- Carry out Stall Speed Test. Refer to **Special Testing Procedures**.
- Carry out diagnostic routines. Refer to **Diagnosis By Symptom**.
- Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and repair as required, before installing a new torque converter.

Torque Converter Clutch (TCC) Operation Test

This test verifies that the TCC control system and the torque converter are operating correctly.

1. Carry out Self Test, refer to the tester manual. Check for DTCs.
2. Connect a tachometer to the engine.
3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in Overdrive (Circle D) position.
4. If the vehicle stalls in Overdrive (Circle D) at idle with vehicle at a stop, move the selector lever to manual L position. If the vehicle stalls, see torque converter operation concerns, refer to **Diagnosis By Symptom**. Repair as required. If the vehicle does not stall in Overdrive (Circle D), refer to **Diagnosis By Symptom**.

VISUAL INSPECTION

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - A/C
  - generator (alternators)
  - engine turbo
  - cellular telephone
  - cruise control
  - CB radio
  - linear amplifiers
  - backup alarm signal
  - computer
- Vehicle modification:
- These items, if not installed correctly, will affect the PCM or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.
- Leaks, refer to **Leakage Inspection**.

- Correct linkage adjustments, refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.

Selector Lever Linkage Check

If the selector lever linkage is not correctly adjusted, hydraulic leakage can occur at the manual control valve and can cause a delay in engagements and/or slipping while operating. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article for selector lever linkage adjustment.

Check TSBs

Refer to all TSBs which pertain to the concern and follow the procedure.

Carry Out On-Board Diagnostic (OBD)s Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) Self Test.

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Self Test using the scan tool. Refer to the **Introduction - Gasoline Engines** article for diagnosis and testing of the powertrain control system.

DIAGNOSTICS

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Digital Multimeter	105-R0057 or equivalent
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

On-Board Diagnostic (OBD) With Scan Tool

NOTE: For detailed instruction and other diagnostic methods using the scan tool or equivalent, refer to the scan tool tester manual and the Introduction - Gasoline Engines article.

These Self-Tests should be used to diagnose the PCM and should be carried out in order.

- Self Test - Key ON Engine OFF (KOEO)
- Self Test - Continuous Memory Codes
- Self Test - Key ON Engine Running (KOER)
- Special Test Modes:
  - Wiggle Test Mode
  - Output Test Mode
- PCM Reset Mode
- Clearing DTCs P1000
- On-Board Diagnostic (OBD) II Drive Cycle
- Other Diagnostic Tool Features

For further information on other diagnostic testing features using the scan tool, refer to the **Introduction - Gasoline Engines** article. Other diagnostic methods include the following.

- PID Access Mode
- Freeze Frame Data Access Mode
- Oxygen Sensor Monitor Mode

OUTPUT STATE CONTROL (OSC) MODE

Description

Output state control allows an off-board diagnostic scan tool direct control of specific transaxle components or functions. Output state control allows the technician to control the main functions or components of the transaxle to help the technician more quickly and easily diagnose the transaxle. For example, output state control may be used to change gears or remain in a specific gear. Output state control may be used to control the operation of the Torque Converter Clutch (TCC) to engage or disengage, or to keep the converter clutch from engaging at all. Output state control may also be used to help carry out solenoid electrical pinpoint tests by turning a solenoid off or on by controlling the actual current to the Variable Force Solenoid (VFS) solenoid.

Procedure

NOTE: Retrieve Continuous Codes and carry out a Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) Self Test before using any output state control. Any DTCs related to the Transmission Range (TR) sensor, the Output Shaft Speed (OSS) sensor or the Turbine Shaft Speed (TSS) sensor must be fixed or the PCM will not allow the output state control to operate.

Output state control is used to test various transaxle components and functions when the vehicle is either in the service bay or being driven on the road. Specific vehicle conditions are required for output state control to control each specific function or component. The following will describe which transaxle functions and components output state control may control and the specific vehicle conditions necessary for its operation.

Service Bay - Vehicle State No. 1

Vehicle state No. 1 is functional ONLY when the key is in the ON position and the vehicle gear selector is in PARK or NEUTRAL with the engine OFF. Vehicle state No. 1 is required when using output state control to carry out electrical pinpoint tests. The following transaxle components may be controlled using output state control in vehicle state No. 1.

- SSA/SS1 - Directs PCM to command Shift Solenoid E (SSE) OFF or ON
- SSD_AMP - Controls the current to Shift Solenoid D (SSD), VFS
- SSC_AMP - Controls the current to Shift Solenoid C (SSC), VFS
- SSB_AMP - Controls the current to Shift Solenoid B (SSB), VFS
- SSA_AMP - Controls the current to Shift Solenoid A (SSA), VFS
- TCC AMP - Controls the current to the TCC VFS
- PCA AMP - Controls the current to the Line Pressure Control (LPC) VFS

The vehicle requirements must be met when sending an output state control value to control each specific component such as the solenoids stated above. If the vehicle requirements are not met when sending the output state control value, an error message may appear. When the error message appears, output state control is cancelled and should be restarted.

After sending the output state control value, if the vehicle requirements are no longer met, the error message will not appear but the output state control value will be cancelled by the PCM. Use the scan tool to monitor the PID that corresponds to each output state control function or component to determine if the PCM is using the output state control value or normal control.

Output state control may be cancelled at any time, using the scan tool, to return the PCM to normal control for a specific output state control function or component. See instructions for specific scan tool.

Service Bay - Vehicle State No. 2

Vehicle state No. 2 is functional ONLY when the engine is running and the vehicle gear selector is in PARK or NEUTRAL with engine speed greater than 1,100 RPM. Vehicle state No. 2 is required when using output state control to carry out a line pressure check. Most, but not all, of the solenoids may be controlled during this vehicle state. It is recommended to use vehicle state No. 1 when using output state control to control the solenoids. The following transaxle function and components may be controlled using output state control in vehicle state No. 2.

- LINEDSD - Output state control function to command line pressure to a desired pressure
- SSD_AMP - Controls the current to SSD, VFS
- SSC_AMP - Controls the current to SSC, VFS
- SSB_AMP - Controls the current to SSB, VFS
- SSA_AMP - Controls the current to SSA, VFS

The vehicle requirements must be met when sending an output state control value to control each specific component such as the solenoids stated above. If the vehicle requirements are not met when sending the output state control value, an error message may appear. When the error message appears, output state control is cancelled and should be restarted.

After sending the output state control value, if the vehicle requirements are no longer met, the error message will not appear but the output state control value will be cancelled by the PCM. Use the scan tool to monitor the PID that corresponds to each output state control function or component to determine if the PCM is using the output state control value or normal control.

Output state control may be cancelled at any time, using the scan tool, to return the PCM to normal control for a specific output state control function or component. See instructions for specific scan tool.

Output state control values for SSA_AMP, SSB_AMP, SSC_AMP, SSD_AMP, PCA AMP and TCC AMP to control the current on the VFS are between zero (0) and one (1) amp. The following are examples.

- 0 - Commands PCM to control current to zero amps
- 0.25 - Commands PCM to control current to 1/4 amp or 250 milli-amps
- 0.50 - Commands PCM to control current to 1/2 amp or 500 milli-amps
- 0.75 - Commands PCM to control current to 3/4 amp or 750 milli-amps
- 1 - Commands PCM to control current to 1 amp or 1,000 milli-amps

Output state control will aid in testing the electronic functions of the PCM, VFS and associated circuitry. Output state control allows the technician to control the PCM commanded current of the VFS and the commanded state of the on/off solenoid. This allows the technician to accurately test the electronic circuitry by comparing the commanded current with the actual current or the on/off state with the actual voltage. Shifting the transmission through the various gears tests the mechanical operation of the VFS. When using output state control to control the VFS current, the technician may measure the circuit current using an inductive pickup or measure the circuit voltage drop to help verify the proper electrical operation of each VFS solenoid.

The output state control values for LINEDSD to command a desired line pressure are between 414 kPa (60 psi) and 1,931 kPa (280 psi). The following are examples.

- 60 psi - Commands PCM to control line pressure to 414 kPa (60 psi)
- 100 psi - Commands PCM to control line pressure to 689 kPa (100 psi)
- 150 psi - Commands PCM to control line pressure to 965 kPa (150 psi)
- 200 psi - Commands PCM to control line pressure to 1,517 kPa (200 psi)

NOTE: Do NOT command line pressure LOWER than 414 kPa (60 psi) or HIGHER than 1,931 kPa (280 psi) or damage to the transaxle can occur.

Output state control allows the technician to control the PCM commanded Line Pressure. This allows the technician to accurately test the electronic pressure control system by comparing the output state control commanded line pressure to the actual line pressure indicated on the pressure gauge. The pressure gauge should be connected to the line pressure tap on the transmission. The PID corresponding to the commanded Line Pressure must be monitored to make sure the PCM is using the output state control value for the commanded Line Pressure. This test will help verify the correct operation of the transmission pump assembly, pump regulator valve and the operation of the LPC solenoid.

Drive Test

Output state control allows control of 3 transmission functions while driving on the road. Each transmission function has a unique set of vehicle operating requirements that the technician is required to meet before the PCM will allow output state control to operate.

- TCC_OSC - Commands the PCM to engage or disengage the TCC
- GEAR_OSC - Commands the PCM to change gears (upshift or down-shift) or remain in a gear
- HRSH_SFT - Commands a slightly higher hydraulic pressure during engagements and upshifts

The vehicle requirements must be met when sending an output state control value to control the specific functions stated above. If the vehicle requirements are not met when sending the output state control value, an error message may appear. When the error message appears, output state control is cancelled and should be restarted.

After sending the output state control value, if the vehicle requirements are no longer met, the error message will not appear but the output state control value will be cancelled by the PCM. Use the scan tool to monitor the PID that corresponds to each output state control function or component to determine if the PCM is using the output state control value or normal control.

Output state control may be cancelled at any time, using the scan tool, to return the PCM to normal control for a specific output state control function or component. See instructions for specific scan tool.

Drive Test - Torque Converter Clutch Control

The output state control values for TCC_OSC to engage or disengage the TCC are as follows:

- 0 - PCM in normal control of TCC and output state control is cancelled
- 1 or OFF - Commands PCM to keep the TCC from engaging
- 2 or ON - Commands PCM to engage the TCC using a normal ramp rate
- 3 or ON - Commands PCM to engage the TCC using a fast ramp rate

Controlling the TCC will assist the technician in testing the operation of the torque converter for engagements and disengagements. Also, the technician may find it easier to evaluate upshifts and downshifts by first using output state control to keep the TCC from engaging.

Vehicle requirements when using TCC_OSC Controlling the TCC.

When sending the TCC_OSC value [1 or OFF], the engine must be running with the transaxle in the DRIVE position and the vehicle speed must be greater than 5 km/h (3 mph).

When sending the TCC_OSC value [2 or 3 or ON], the engine must be running with the selector lever in the DRIVE position, transaxle in 3rd, 4th, 5th or 6th gear, transaxle temperature between 4°C (40°F) and 121°C (250°F), the vehicle speed must be below 24 km/h (15 mph) and engine speed greater than 1,100 RPM with minimal engine load.

Drive Test - Upshift and Downshift Control

NOTE:	**Once output state control has successfully commanded the transmission to shift to the desired output state control gear, the transmission will remain in that gear until output state control commands a different gear or the vehicle conditions are no longer correct.**

The output state control values for GEAR_OSC to control the transaxle gear changes are as follows:

- 0 - PCM in normal shift control and output state control is cancelled
- 1 - Commands PCM to shift to 1st gear - no engine braking
- 2 - Commands PCM to shift to 2nd gear - with engine braking
- 3 - Commands PCM to shift to 3rd gear - with engine braking
- 5 - Commands PCM to shift to 5th gear - with engine braking
- 6 - Commands PCM to shift to 6th gear - with engine braking

Controlling the gear changes will assist the technician in testing the various clutches and bands and whether the transmission is slipping in any particular gear. Output state control will command the PCM to upshift or downshift depending on the output state control gear value the technician selects. The transmission will remain in the output state control gear selected until another output state control gear value is sent or until output state control is cancelled and/or the vehicle conditions for using output state control are no longer met.

Vehicle requirements when using GEAR_OSC Controlling Gear Changes

When sending a GEAR_OSC value, the engine must be running with the selector lever in the DRIVE position, and the vehicle speed must be greater than 5 km/h (3 mph).

Additional vehicle conditions required for upshifts:

- Vehicle speed must be greater then 32 km/h (20 mph) when commanding an upshift to 5th or 6th gear

Additional vehicle conditions required for downshifts:

- Vehicle speed must be less then 32 km/h (20 mph) when commanding a downshift to 1st gear
- Vehicle speed must be less then 64 km/h (40 mph) when commanding a downshift to 2nd gear
- Vehicle speed must be less then 97 km/h (60 mph) when commanding a downshift to 3rd gear
- Vehicle speed must be less then 129 km/h (80 mph) when commanding a downshift to 4th gear
- Vehicle speed must be less then 161 km/h (100 mph) when commanding a downshift to 5th gear

Drive Test - Pressure Added for Engagements and Upshifts

The output state control values for HRSH_SHFT to command a slight or moderate increase in hydraulic pressure to test for firmer engagements and upshifts are as follows:

- 0 or OFF - PCM in normal pressure control for shifts and engagements and output state control is cancelled
- 1 or ON - Commands PCM to moderately increase hydraulic pressure during engagements and upshifts

Setting HRSH_SFT to 1 or ON allows the technician to moderately increase the pressure when performing engagements such as P-R, P-D, N-R, N-D, R-D and when performing automatic upshifts. This can provide additional diagnostic information to help the technician determine whether the electronic pressure control system is providing at least limited control (a normal shift would become firmer). Using output state control to control HRSH_SHFT to 1 or ON should make a softer engagement or shift more normal and an already normal shift or engagement firmer by slightly increasing the pressure. This test should only be used to provide additional diagnostic information and should not be the only scan tool or test to determine a faulty electronic or hydraulic component.

Using Output State Control and Monitoring PIDs

To confirm that the output state control value was sent by the scan tool and the PCM has accepted the output state control command, a corresponding PID for each output state control parameter must be monitored. After SENDING the output state control value, the corresponding PID value should be the same as the output state control value that was sent. Additional PIDs are listed that may be monitored to help the technician accurately diagnose the transaxle.

The following is a list of output state control parameters and their corresponding PIDs:

Output State Control Parameter	Corresponding PID	Additional PIDs
HRSH_SHFT	HRSH_SHFT	

LINEDSD	LINEDSD	PCA, PCA AMP, PCA_F
TCC_OSC	TCC_OSC	TCCRAT, TCCMCMD, TSLIP
GEAR_OSC	GEAR_OSC	SHFT_TYP, GEAR, TRANRAT
SSA_AMP	SSA_AMP	SSPCA, SSPCA_F
SSB_AMP	SSB_AMP	SSPCB, SSPCB_F
SSC_AMP	SSC_AMP	SSPCC, SSPCC_F
SSD_AMP	SSD_AMP	SSPCD, SSPCD_F
PCA AMP	PCA AMP	PCA_F
TCC AMP	TCC AMP	TCCPC, TCCPC_F
SSA/SS1	SSA/SS1	SSA/SS1_F

DIAGNOSTIC PARAMETERS IDENTIFICATION (PID) CHART

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

PID Name	PID Description	Units
TCCPC	Commanded pressure for the Torque Converter Clutch (TCC) Variable Force Solenoid (VFS)	Pressure
TCC AMP	Commanded current for the TCC VFS	Amperes
TCCPC_F	Fault status for the TCC VFS	Fault/No Fault
GEAR	Commanded transaxle gear	P, R, N, 1, 2, 3, 4, 5 and 6
GEAR_RAT	Theoretical transaxle gear ratio	Ratio
TRAN_RAT	Actual transaxle gear ratio	Ratio
LINEDSD	Commanded line pressure	Pressure
PCA	Commanded pressure for the Line Pressure Control (LPC) VFS	Pressure
PCA AMP	Commanded current for the LPC VFS	Amperes
PCA_F	Fault status for the LPC VFS	Fault/No Fault

SSPCA	Commanded pressure for the Shift Solenoid A (SSA)/CB1234 VFS	Pressure
SSA_AMP	Commanded current for the SSA/CB1234 VFS	Amperes
SSPCA_F	Fault status for the SSA/CB1234 VFS	Fault/No Fault
SSPCB	Commanded pressure for the Shift Solenoid B (SSB)/C35R VFS	Pressure
SSB_AMP	Commanded current for the SSB/C35R VFS	Amperes
SSPCB_F	Fault status for the SSB/C35R VFS	Fault/No Fault
SSPCC	Commanded pressure for the Shift Solenoid C (SSC)/CB26 VFS	Pressure
SSC_AMP	Commanded current for the SSC/CB26 VFS	Amperes
SSPCC_F	Fault status for the SSC/CB26 VFS	Fault/No Fault
SSPCD	Commanded pressure for the Shift Solenoid D (SSD)/CBLR, C456 VFS	Pressure
SSD_AMP	Commanded current for the SSD/CBLR, C456 VFS	Amperes
SSPCD_F	Fault status for the SSD/CBLR, C456 VFS	Fault/No Fault
SSA/SS1	Commanded state for Shift Solenoid E (SSE)	ON/OFF
SSA/SS1_F	Fault status for SSE	Fault/No Fault
TCC_RAT	Actual speed ratio of torque converter (1.0 = fully engaged)	Ratio
TCC	Commanded torque converter slip (0 = engaged desired)	Ratio
TCC_SLIPACT	Actual difference between engine speed and turbine speed, measured in RPM.	RPM
TSS_SRC	Actual speed of the Turbine Shaft Speed (TSS) Sensor (RPM)	RPM
OSS_SRC	Actual speed of the Output Shaft Speed (OSS) Sensor (RPM)	RPM
TR1	Transmission Range (TR) - Switch 1 actual position	Open/Closed
TR2	TR - Switch 2 actual position	Open/Closed
TR3	TR - Switch 3 actual position	Open/Closed
TR4	TR - Switch 4 actual position	Open/Closed
TCS	Transmission Control Switch (TCS) Position	Depressed/Not Depressed
TFT	Transmission Fluid Temperature (TFT)	Degrees

TRANSAXLE DRIVE CYCLE TEST

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

ST2574-A

NOTE: **Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.**

After carrying out the Self Test, use the following Transaxle Drive Cycle Test for checking continuous codes.

NOTE: **The Transaxle Drive Cycle Test must be followed exactly. Malfunctions must occur 4 times consecutively for shift error DTC to be set and 5 times consecutively for continuous Torque Converter Clutch (TCC) code to set.**

NOTE: **When carrying out the Transaxle Drive Cycle Test, see the solenoid operation chart for correct solenoid operation. Refer to Pinpoint Tests - OSC Equipped Vehicle.**

1. Record and then erase Self Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transaxle in DRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transaxle to shift into 6th gear. Hold speed and throttle opening steady for minimum of 15 seconds.
5. With transaxle in 6th gear and maintaining steady speed and throttle opening, lightly apply and release brake (to operate stoplamps). Then hold speed and throttle steady for additional 5 seconds minimum.
6. Brake to a stop and remain stopped for minimum of 20 seconds.
7. Repeat Steps 4 through 6 at least 5 times.
8. Carry out Self Test and record continuous codes.
    - If DTCs are present, refer to **Diagnostic Trouble Code (DTC) Charts**. Service all non-transaxle DTCs first as they can directly affect the operation of the transaxle. Repeat the Self Test and Road Test to verify the correction. Erase DTCs, carry out drive cycle, and repeat the Self Test after completing service on the DTCs.
    - If the continuous test passes (system pass) and a concern is still present, refer to **Diagnosis By Symptom** in this article check TSBs for diagnostic concern.

After On-Board Diagnostic (OBD)

NOTE: The vehicle wiring harness, PCM and non-transaxle sensors may affect transaxle operations. Service these concerns first.

After the OBD procedures are completed, service all DTCs.

Begin with non-transaxle related DTCs, then service any transaxle related DTCs. Refer to the **Diagnostic Trouble Code (DTC) Charts** for information on Condition and Symptoms. This chart will be helpful in referring to the correct articles(s) and to aid in diagnosing internal transaxle concerns and external non-transaxle inputs. The pinpoint tests are used in diagnosing electrical concerns of the transaxle. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. Refer to the **Introduction - Gasoline Engines** article for diagnosing non-transaxle electronic components. The diagnostic routine hydraulic/mechanical charts will help in diagnosing internal transaxle concerns and external non-transaxle inputs.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the PCM wiring harness for correct connections, bent or broken pins, corrosion, loose wires, correct routing, correct seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Introduction - Gasoline Engines article.

NOTE: If a concern still exists after electrical diagnosis has been carried out, refer to Diagnosis By Symptom.

If DTCs appear while carrying out the OBDs, refer to the **Diagnostic Trouble Code (DTC) Charts** for the appropriate repair procedure. Prior to entering pinpoint tests, refer to any TSBs for transaxle concerns.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

DTC CHART

DTC	Grouping	Component	Description	Condition	Symptom	
P0657	-	Transaxle Solenoid Power Control	Transaxle solenoid power control electrical circuit failure.	Transaxle solenoid power control provides power to all the solenoids. This DTC sets if the transaxle solenoid power control circuit is open.	• No voltage to solenoids. • Defaults to 5th gear. • Only REVERSE and NEUTRAL available. • Will turn on Malfunction Indicator Lamp (MIL).	Go to **Pin**

P0705	P0705, P1702	Transmission Range (TR)	TR sensor circuit failure.	PCM is received an invalid combination of the 4-bit signal from the TR sensor.	• Possible no crank.
					• Only PARK, REVERSE, NEUTRAL and 5th gear available.
					• Harsh engagements.
					• Extremely delayed engagements (until a DTC is set).
					• After a DTC is set and the high side opened.
					  ○ Harsh engagements.
					  ○ Poor performance (due to a 5th gear drive away).
					  ○ No shifts.
					• Will turn on MIL.
						Go to **Pin**

P0706	P0706, P0709	TR Sensor	TR sensor range failure.	TR sensor A circuit range/performance. TR sensor stuck in transition zone (possible wiring, connector or TR sensor issue).	• Possible no crank. • Only PARK, REVERSE, NEUTRAL and 5th gear available. • Harsh engagements.	Go to **Pin**

					• Extremely delayed engagements (until a DTC is set).
					• After a DTC is set and the high side opened.
					  ◦ Harsh engagements.
					  ◦ Poor performance (due to a 5th gear drive away).
					  ◦ No shifts.
					• Will turn on MIL.	

P0708	P0708, P1702	TR Sensor	TR sensor circuit failure.	PCM is received all 4 TR sensor bits open (potential sensor disconnected, wiring, connector or TR sensor issue).	• Possible no crank.
					• Only PARK, REVERSE, NEUTRAL and 5th gear available.
					• Harsh engagements.
					• Extremely delayed engagements (until a DTC is set).
					• After a DTC is set and the high side opened.
					  ◦ Harsh engagements.
					  ◦ Poor performance (due to a 5th gear drive away).
					  ◦ No shifts.
					• Will turn on MIL.
						Go to **Pin**

P0709	P0709 or P0706, P0709	TR Sensor	TR sensor range failure.	TR sensor A circuit range/performance. TR sensor stuck in transition zone (possible wiring, connector or TR sensor	• Possible no crank. • Only PARK, REVERSE, NEUTRAL and 5th gear available.	Go to **Pin**

				issue).	• Harsh engagements.
					• Extremely delayed engagements (until a DTC is set).
					• After a DTC is set and the high side opened.
					  ○ Harsh engagements.
					  ○ Poor performance (due to a 5th gear drive away).
					  ○ No shifts.
					• Will turn on wrench lamp.	

P0710	-	Transmission Fluid Temperature (TFT)	TFT sensor circuit voltage input too low or too high.	• TFT sensor input indicates a short to ground or an open circuit (could be a wiring, connector or sensor issue). • Also see P0712 and P0713.	• Torque Converter Clutch (TCC) and stabilized shift schedule may be enabled sooner after cold start. • Harsh or soft shifts. • Will turn on wrench lamp.	Go to **Pin**
P0710	P0710, P0712	TFT	TFT sensor circuit voltage input too low.	TFT sensor input indicates a short to ground or an open circuit (could be a wiring, connector or sensor issue).	• TCC and stabilized shift schedule may be enabled sooner after cold start. • Harsh or soft shifts. • Will turn on wrench lamp.	Go to **Pin**
P0710	P0710, P0713	TFT	TFT sensor circuit voltage too high.	TFT sensor input indicates a short to ground or an open circuit (could be a wiring, connector or sensor issue).	• TCC and stabilized shift schedule may be enabled sooner after cold start. • Harsh or soft shifts. • Will turn on wrench lamp.	Go to **Pin**
P0711	-	TFT	No change in	PCM has detected no	• TCC and stabilized	Go to **Pin**

			TFT sensor input.	TFT change at low-range or high-range during operation.	shift schedule may be enabled sooner after a cold start. • Harsh or soft shifts. • Will turn on wrench lamp.	
P0712	P0710, P0712	TFT	TFT sensor circuit voltage input too low.	TFT sensor input indicates a short to ground or an open circuit (could be a wiring, connector or sensor issue).	• TCC and stabilized shift schedule may be enabled sooner after cold start. • Harsh or soft shifts. • Will turn on MIL.	Go to **Pin**
P0713	P0710, P0713	TFT	TFT sensor circuit voltage too high.	TFT sensor input indicates a short to ground or an open circuit (could be a wiring, connector or sensor issue).	• TCC and stabilized shift schedule may be enabled sooner after cold start. • Harsh or soft shifts. • Will turn on MIL.	Go to **Pin**
P0715	P0715, P0717	Turbine Shaft Speed (TSS) Sensor	Insufficient input from TSS sensor.	• PCM has detected TSS sensor signal failed to 0 speed when vehicle conditions (mainly output speed) indicate TSS sensor output should be present. • Electrical failures (open, short) of the TSS sensor wiring, connector or a failure of the sensor itself will cause this failure.	• Failure Mode Effects Management action opens transaxle solenoid power control (removes power from all solenoids). ○ Provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure).	Go to **Pin**

					- Poor launch performance (due to 5th gear drive away). - Will turn on MIL.	
P0717	P0717 or P0715, P0717	TSS	Insufficient input from TSS sensor.	- PCM has detected TSS sensor signal failed to 0 speed when vehicle conditions (mainly output speed) indicate TSS sensor output should be present. - Electrical failures (open, short) of the TSS sensor wiring, connector or a failure of the TSS sensor itself will cause this failure.	- Failure Mode Effects Management action opens transaxle solenoid power control (removes power from all solenoids). - Provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). - Harsh engagements (due to maximum line pressure). - Poor launch performance (due to 5th gear drive away). - Will turn on wrench lamp.	Go to **Pin**
P0718	-	TSS	TSS signal intermittent.	PCM has detected an erratic or no TSS signal.	Will turn on wrench lamp.	Go to **Pin**
P0720	P0720, P0722	Output Shaft Speed (OSS) Sensor	Insufficient input from OSS sensor.	PCM has detected OSS sensor signal failed to 0 speed when vehicle	Failure Mode Effects Management action opens transaxle solenoid power	Go to **Pin**

				conditions (mainly turbine speed) indicate OSS sensor output should be present. • Electrical failures (open, short) of the OSS sensor wiring, connector or a failure of the OSS sensor itself will cause this failure.	control (removes power from all solenoids). ○ provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure). • Poor launch performance (due to 5th drive away). • Will turn on MIL.	
P0721	-	OSS	OSS sensor signal noisy.	PCM has detected an erratic or no OSS sensor signal.	Will turn on wrench lamp.	Go to **Pin**
P0722	P0722 or P0720, P0722	OSS	Insufficient input from OSS sensor.	• PCM has detected OSS sensor signal failed to 0 speed when vehicle conditions (mainly turbine speed) indicate OSS output should be present. • Electrical failures (open, short) of the OSS sensor wiring, connector or a failure of the sensor itself will	• Failure Mode Effects Management action opens transaxle solenoid power control (removes power from all solenoids). ○ Provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open	Go to **Pin**

				cause this failure.	TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure). • Poor launch performance (due to 5th gear drive away). • Will turn on wrench lamp.	
P0729	P0729, P0734, P0735 or P0729, P0734, P0735, P0766	Overdrive Clutch System Faults (includes non-electrical Shift Solenoid D (SSD) faults, main control valve body and clutch)	SSD stuck off (SSD or main control valve body).	Sixth gear ratio error. SSD stuck off, both low/reverse clutch and overdrive clutch failed off. This code sets for: • Low/reverse clutch/overdrive clutch Variable Force Solenoid (VFS) non-electrical fault. • Low/reverse clutch/overdrive clutch regulator valve stuck in default position. • Low/reverse clutch/overdrive clutch boost valve stuck in default position.	• Customer may notice flares or neutral conditions on shifts into 4th, 5th or 6th gears. • Customer might notice erratic shifting, flares, neutral conditions while the code is being set. • First gear with engine braking. • Fourth, 5th and 6th gears are disabled. • Also might get delayed or no reverse engagement (need low/reverse clutch on to achieve reverse). • Customer might notice high engine speeds (since 3rd gear is the highest available gear). • Will turn on wrench lamp.	Refer to **D**
P072C	-	Low/Reverse	Low/reverse	• Low/reverse	Customer might notice:	Refer to **D**

		Clutch and One-Way Clutch (OWC) Faults (covers just the clutches)	clutch or OWC failed on.	clutch or OWC failed on (transmits torque both directions). • 1st gear is the only available gear with this failure.	• Decelerations on attempted upshifts (since tie-ups occur). • Stuck in 1st gear. • High engine RPM. • Low maximum vehicle speed. • No TCC apply. • Will turn on wrench lamp.	
P072E	P072E, P073A or P072E, P073A, P0757	Direct Clutch System Faults	Shift Solenoid B (SSB) failed on.	The codes: • P072E Stuck in 3rd gear. • P073A Stuck in 5th gear. These codes set together mean SSB is failed on, causing the direct clutch to be stuck on, 3rd and 5th gear are the only available gears. Since the hydraulic controls prevent direct clutch and low/reverse clutch on together in the forward ranges, the solenoid can be isolated from the clutch. These codes set if: • Non-electrical failures where SSB (direct clutch VFS) is stuck on (pressure). • Direct clutch regulator valve stuck in spring compress position.	• Customer may notice a vehicle deceleration on a shift into 2nd, 4th or 6th gears (direct clutch failing to release will cause a tie-up in these gears). • Customer might notice a harsh 1-3 shift. • Customer might notice erratic shifting while the test is confirming direct clutch is failed on. • After a code is stored, all gears but 3rd and 5th gear are disabled. • Since only 3rd and 5th gears are allowed, the customer might notice poor launch performance, lack of shifts and harsh engagements. • Will turn on wrench lamp.	Refer to **D**

P072F	P072F, P073A, P073B or P072F, P073A, P073B, P0767	Overdrive Clutch System Faults (includes non-electrical SSD faults, main control valve body and clutch)	Overdrive clutch failed on (clutch, SSD or main control valve body).	The codes: • P072F stuck in 4th gear. • P073A stuck in 5th gear. • P073B stuck in 6th gear. Set together to indicate the overdrive clutch is failed on. Overdrive clutch failed on, could be due to: • Low/reverse clutch/overdrive clutch VFS (SSD) non-electrical failed stuck on (pressure). • Overdrive clutch stuck on due to mechanical failure. • Low/reverse clutch, overdrive clutch regulator valve stuck in the spring compressed position.	• Customer may notice a vehicle deceleration on a shift into 2nd or 3rd gear (overdrive clutch failing to release will cause a tie-up in 2nd or 3rd gears). • Customer might notice harsh engagements, erratic shifting. • First gear with engine braking, 1st gear without engine braking, 2nd and 3rd gears are disabled. • Poor launch due to 4th gear drive away. • Harsh engagements. • Will turn on wrench lamp.	Refer to **D**
P0733	P0733, P0735 or P0733, P0735, P0756	Direct Clutch System Faults (includes non-electrical SSB faults, valve body and clutch)	Direct clutch failed off.	The codes: • P0733 - 3rd gear ratio error. • P0735 - 5th gear ratio error. Set together if direct clutch is detected failed off. Direct clutch failed off,	• Customer may notice flares or neutral conditions on shifts into 3rd or 5th gears. • PCM will command 3 shifts into 3rd or 5th gear and if the direct clutch is failed off the customer will	Refer to **D**

				could be due to: • Non-electrical failures where SSB (direct clutch VFS) is stuck off (no pressure). • Direct clutch regulator valve stuck in default position. • Direct clutch mechanical failure.	notice flares or neutral conditions that last one second or so. • Third and 5th gear are disabled, customer might notice transmission hangs in 2nd gear on acceleration until customer tips out to closed pedal (done to protect overdrive clutch). • Will turn on wrench lamp.	
P0734	P0729, P0734, P0735 or P0729, P0734, P0735, P0766	Overdrive Clutch System Faults (includes non-electrical SSD faults, valve body and clutch)	SSD stuck off (SSD or valve body).	The codes: • P0734 - 4th gear ratio error. • P0735 - 5th gear ratio error. • P0729 - 6th gear ratio error. Set together mean SSD is stuck off (see P0766 for details).	• Customer may notice flares or neutral conditions on shifts into 4th, 5th or 6th gears. • Customer might notice erratic shifting, flares, neutral conditions while the code is being set. • First gear with engine braking, 4th, 5th and 6th gears are disabled. • Customer might notice high engine speeds (since 3rd gear is highest available gear). • Also might get delayed or no REVERSE engagement (need low/reverse clutch on to achieve reverse). • Will turn on wrench lamp.	Refer to **D**

P0735	P0729, P0734, P0735 or P0729, P0734, P0735, P0766	Overdrive Clutch System Faults (includes non-electrical SSD faults, valve body and clutch)	SSD stuck off (SSD or valve body).	SSD stuck off, both low/reverse clutch and overdrive clutch failed off. This code sets for: • Low/reverse clutch/overdrive clutch VFS non-electrical fault. • Low/reverse clutch/overdrive clutch regulator valve stuck in default position. • Low/reverse clutch/overdrive clutch boost valve stuck in default position. Set together mean SSD is stuck off (see P0766 for details).	• Customer may notice flares or neutral conditions on shifts into 4th, 5th or 6th gears. • Customer might notice erratic shifting, flares, neutral conditions while the code is being set. • 1st gear with engine braking, 4th, 5th and 6th gears are disabled. • Customer might notice high engine speeds (since 3rd gear is highest available gear). • Also might get delayed or no reverse engagement (need low/reverse clutch on to achieve reverse). • Will turn on wrench lamp.	Refer to **D**
P0735	P0733, P0735 or P0733, P0735, P0756	Direct Clutch System Fault (includes non-electrical SSB faults, valve body and clutch)	Direct clutch failed off.	The codes: • P0733 - 3rd gear ratio error. • P0735 - 5th gear ratio error. Set together if direct clutch is detected failed off. Direct clutch failed off, could be due to: • Non-electrical failures where SSB (direct	• Customer may notice flares or neutral conditions on shifts into 3rd or 5th gears. • PCM will command 3 shifts into 3rd or 5th gear and if the direct clutch is failed off the customer will notice flares or neutral conditions that last approximately one second. • Third and 5th gears	Refer to **D**

				clutch VFS) is stuck off (no pressure). • Direct clutch regulator valve stuck in default position. • Direct clutch mechanical failure.	are disabled. • Customer might notice transmission hangs in 2nd gear on acceleration until customer tips out to closed pedal (done to protect the overdrive clutch). • Will turn on wrench lamp.	
P073A	P072F, P073A, P073B or P072F, P073A, P073B, P0767	Overdrive Clutch System Faults (includes non-electrical SSD faults, main control valve body and clutch)	Overdrive clutch failed on (clutch, SSD or main control valve body).	Overdrive clutch failed on, could be due to: • P072F - stuck in 4th gear. • P073A - stuck in 5th gear. • P073B - stuck in 6th gear. Set together to indicate the overdrive clutch is failed on. Overdrive clutch failed on, could be due to: • Low/reverse clutch, overdrive clutch, VFS (SSD) non-electrical failed stuck on (pressure). • Overdrive clutch stuck on due to mechanical failure. • Low/reverse clutch, overdrive clutch regulator valve stuck in the spring compressed	• Customer may notice a vehicle deceleration on a shift into 2nd or 3rd gear (overdrive clutch failing to release will cause a tie-up in 2nd or 3rd gear). • Customer might notice harsh engagements, erratic shifting). • 1st gear with engine braking, 1st gear without engine braking, 2nd and 3rd gears are disabled. • Poor launch due to 4th gear drive away. • Harsh engagements. • Will turn on wrench lamp.	Refer to **D**

				position.		
P073A	P072E, P073A or P072E, P073A, P0757	Direct Clutch System Faults	SSB failed on.	The codes: - P072E - stuck in 3rd gear. - P073A - stuck in 5th gear. These codes set together mean SSB is failed on, causing the direct clutch to be stuck on, 3rd and 5th gear are the only available gears. Since the hydraulic controls prevent direct clutch and low/reverse clutch on together in the forward ranges, the solenoid can be isolated from the clutch. These codes set if: - non-electrical failures where SSB (direct clutch VFS) is stuck on (pressure). - Direct clutch regulator valve stuck in spring compress position.	- Customer may notice a vehicle deceleration on a shift into 2nd, 4th or 6th gears (direct clutch failing to release will cause a tie-up in these gears). - Customer might notice a harsh 1-3 shift. - Customer might notice erratic shifting while the test is confirming direct clutch is failed on. - After a code is stored, all gears but 3rd and 5th are disabled. - Since only 3rd and 5th gears are allowed, the customer might notice poor launch performance, lack of shifts and harsh engagements. - Will turn on wrench lamp.	Refer to **D**
P073B	P072F, P073A, P073B or P072F, P073A, P073B, P0767	Overdrive Clutch System Faults (includes non-electrical SSD faults, valve body and clutch)	Overdrive clutch failed on (clutch, SSD or valve body).	Overdrive clutch failed on, could be due to: - P072F - stuck in 4th gear. - P073A - stuck in 5th gear. - P073B - stuck in 6th gear.	- Customer may notice a vehicle deceleration on a shift into 2nd or 3rd gears (overdrive clutch failing to release will cause a tie-up in 2nd or 3rd gears). - Customer might	Refer to **D**

				Set together to indicate overdrive clutch is failed on. Overdrive clutch failed on, could be due to: • Low/reverse clutch, overdrive clutch, VFS (SSD) non-electrical failed stuck on (pressure). • Overdrive clutch stuck on due to mechanical failure. • Low/reverse clutch/overdrive clutch regulator valve stuck in the spring compressed position.	notice harsh engagements, erratic shifting. • 1st gear with engine braking, 1st gear without engine braking, 2nd and 3rd gears are disabled. • Poor launch due to 4th gear drive away. • Harsh engagements. • Will turn on wrench lamp.	
P0740	P0740, P0743	TCC Solenoid Electrical Faults	TCC circuit is open.	Open circuit in solenoid or wiring.	• TCC failed off - vehicle might run hotter, lose fuel economy. • Will turn on MIL.	Go to **Pin**
P0741	P0741, P1744	TCC System Faults (includes TCC, main control valve body and non-electrical solenoid faults)	TCC failed off.	TCC is mechanically stuck off.	P0741 and P1744 mean the same thing: a non-electrical failure that caused the TCC to fail to apply. This code sets for: • Non-electrical TCC solenoid stuck off. • TCC mechanical failure. • TCC regulator apply valve stuck in TCC release position. • TCC control valve stuck in TCC	Refer to **D**

					release position. • TCC functional failure MIL code. • TCC failed to apply (less than 80 RPM slip error lasting at least 3 seconds when TCC is commanded on) 3 consecutive times. • Will turn on MIL.	
P0742	P0742, P0743	TCC Solenoid Electrical Faults	TCC circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL.	Go to **Pin**
P0743	-	TCC Solenoid Electrical Faults	TCC is open, shorted to ground or shorted to voltage.	Open, short to ground or short to power in solenoid or wiring.	• See P0740, P0742 or P0744. • Will turn on wrench lamp.	Go to **Pin**
P0743	P0740, P0743	TCC Solenoid Electrical Faults	TCC circuit is open.	Open circuit in solenoid or wiring.	• TCC failed off - vehicle might run hotter, lose fuel economy. • Will turn on	Go to **Pin**

					wrench lamp.	
P0743	P0742, P0743	TCC Solenoid Electrical Faults	TCC circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on wrench lamp.	Go to **Pin**
P0743	P0743, P0744	TCC Solenoid Electrical Faults	TCC is shorted to voltage.	Short to power in the wiring or solenoid.	• TCC failed off - vehicle might run hotter, lose fuel economy. • Will turn on wrench lamp.	Go to **Pin**
P0744	P0743, P0744	TCC Solenoid Electrical Faults	TCC is shorted to voltage.	Short to power in the wiring or solenoid.	• TCC failed off - vehicle might run hotter, lose fuel economy. • Will turn on MIL.	Go to **Pin**
P0748	-	Line Pressure Control (LPC) Solenoid Electrical Faults	LPC is open circuit, shorted to ground or shorted to voltage.	Open, short to ground or short to power in solenoid or wiring.	• See P0960, P0962 and P0963. • Will turn on wrench lamp.	Go to **Pin**
P0748	P0748, P0960	LPC Solenoid Electrical Faults	LPC circuit is open.	Open circuit in solenoid or wiring.	• Failed to maximum line pressure - harsh engagements.	Go to **Pin**

					• Will turn on wrench lamp.	
P0748	P0748, P0962	LPC Solenoid Electrical Faults	LPC circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failed to minimum line pressure. • Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on wrench lamp.	Go to **Pin**
P0748	P0748, P0963	LPC Solenoid Electrical Faults	LPC is shorted to voltage.	Short to power in the wiring or solenoid.	• Failed to maximum line pressure - harsh engagements. • Will turn on wrench lamp.	Go to **Pin**
P0750	P0750, P0753	Shift Solenoid A (SSA) Electrical Faults	SSA circuit is open.	Open circuit in solenoid or wiring.	• Forward clutch is failed off - 5th and 6th gears only available forward gears. • Neutral condition or flare when fault occurs. • Poor launch due to 5th gear drive away.	Go to **Pin**

					• Will turn on MIL.	
P0751	P0751, P2700	Forward Clutch System Faults (includes non-electrical SSA faults, valve body and clutch)	Forward clutch failed off.	Forward clutch failed off, could be due to: • Forward clutch VFS (SSA) non-electrical failed stuck off (no pressure). • Forward clutch stuck off due to mechanical failure. • Forward clutch regulator valve stuck in the default position. • Forward clutch boost valve stuck in the default position.	• Customer may notice neutral conditions or flares on downshifts from 5th or 6th gears as the test is determining forward is failed off. • Once a code is stored, all gears with forward on are disabled - leaving 5th and 6th gears as the only forward gears. • Customer might notice erratic shifting, harsh engagements, neutral conditions, flares, poor launch performance (due to 5th gear drive away), harsh reverse engagements. • Will turn on MIL.	Refer to **D**
P0752	P0752, P2700	Forward Clutch System Faults (includes non-electrical SSA faults, valve body and clutch)	Forward clutch failed on.	Forward clutch failed on, could be due to: • Forward clutch VFS (SSA) non-electrical failed stuck on (pressure). • Forward clutch stuck on due to mechanical failure. • Forward clutch regulator valve stuck in the default position.	• Customer may notice a vehicle deceleration on a shift into 5th or 6th (forward clutch failing to release will cause a tie-up in 5th or 6th). • Customer might notice erratic shifting or being stuck in 4th gear while the test is confirming forward clutch is failed on. • After a code is	Refer to **D**

				• Forward clutch regulator valve stuck in the spring compressed position.	stored 5th and 6th are disabled. • Customer might notice higher than normal engine speeds and loss of fuel economy. • Will turn on MIL.	
P0753	-	SSA Electrical Faults	SSA is open, shorted to ground or shorted to voltage.	Open, short to ground or short to power in solenoid or wiring.	• See P0750, P0973, P0974. • Will turn on wrench lamp.	Go to **Pin**
P0753	P0750, P0753	SSA Electrical Faults	SSA circuit is open.	Open circuit in solenoid or wiring.	• Forward clutch is failed off - 5th and 6th only available forward gears. • Neutral condition or flare when fault occurs. • Poor launch due to 5th gear drive away. • Will turn on wrench lamp.	Go to **Pin**
P0753	P0750, P0973	SSA Electrical Faults	SSA circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away).	Go to **Pin**

					• No TCC apply. • No shifts. • Will turn on wrench lamp.	
P0753	P0750, P0974	SSA Electrical Faults	SSA is shorted to voltage.	Short to power in the wiring or solenoid.	• Forward clutch is failed off - 5th and 6th gear only available forward gears. • Neutral condition or flare when fault occurs. • Poor launch performance (due to 5th gear drive away). • Will turn on wrench lamp.	Go to **Pin**
P0755	P0755, P0758	SSB Electrical Faults	Open circuit in solenoid or wiring.	SSB circuit is open.	• Direct clutch failed on - only 3rd and 5th gear available. • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • Will turn on MIL.	Go to **Pin**
P0756	P0733, P0735, P0756	Direct Clutch System Fault (includes non-electrical SSB faults, valve body and clutch)	Direct clutch failed off.	Direct clutch failed off, could be due to: • Non-electrical failures where SSB (direct clutch VFS) is stuck off (no pressure). • Direct clutch regulator valve stuck in default position. • Direct clutch mechanical	• Customer may notice flares or neutral conditions on shifts into 3rd or 5th gear. • PCM will command 3 shifts into 3rd or 5th gear, and if direct clutch is failed off the customer will notice flares or neutral conditions that last one second or so.	Refer to **D**

				failure.	3rd and 5th gear are disabled, customer might notice transmission hangs in 2nd on accelerate until customer tips out to closed pedal (done to protect overdrive clutch). - Will turn on MIL.	
P0757	P072E, P073A, P0757	Direct Clutch System Fault (includes non-electrical SSB faults, main control valve body and clutch)	SSB failed on.	SSB (direct clutch VFS) failed on, causing direct clutch failed on. Since the hydraulic controls prevent direct clutch and low/reverse clutch on together in the forward ranges we can isolate the solenoid from the clutch. This code sets if: - Non-electrical failures where SSB (direct clutch VFS) is stuck on (pressure). - Direct clutch regulator valve stuck in spring compress position.	- Customer may notice a vehicle deceleration on a shift into 2nd, 4th or 6th gears (direct clutch failing to release will cause a tie-up in these gears). - Customer might notice a harsh 1-3 shift. - Since only 3rd and 5th gears are allowed customer might notice poor launch performance lack of shifts, harsh engagements. - Will turn on MIL.	Refer to **D**
P0758	-	SSB Electrical Faults	SSB is open, shorted to ground or shorted to voltage.	Open, short to ground or short to power in solenoid or wiring.	- See P0755, P0976, P0977. - Will turn on wrench lamp.	Go to **Pin**
P0758	P0755, P0758	SSB Electrical Faults	Open circuit in solenoid or wiring.	SSB circuit is open.	- Direct clutch failed on - only 3rd and 5th gears available. - Harsh engagements. - Poor launch	Go to **Pin**

					performance (due to 3rd gear drive away). • Will turn on wrench lamp.	
P0758	P0758, P0976	SSB Electrical Faults	SSB circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on wrench lamp.	Go to **Pin**
P0758	P0758, P0977	SSB Electrical Faults	SSB is shorted to voltage.	Short to power in the wiring or solenoid.	• Direct clutch failed on - only 3rd and 5th gear available. • Harsh engagements. • Poor launch performance (due to 3rd gear drive away). • Will turn on wrench lamp.	Go to **Pin**
P0760	P0760, P0763	Shift Solenoid C (SSC) Electrical Faults	SSC circuit is open.	Open circuit in solenoid or wiring.	Incorrect gear selection depending on condition mode and manual lever position. See solenoid operation chart.	Go to **Pin**

					• Intermediate clutch is failed off - if fault occurs while in 2nd or 6th gear customer might notice a neutral condition before diagnostics disables 2nd and 6th gear. • Customer might notice erratic, delayed or harsh shifts. • Will turn on MIL.	
P0761	P0761, P2702	Intermediate Clutch System Faults (includes clutch, valve body and non-electrical SSC faults)	Intermediate clutch failed off.	Intermediate clutch failed off, could be due to: • Intermediate clutch VFS SSC non-electrical failed stuck off (no pressure). • Intermediate clutch stuck off due to mechanical failure. • Intermediate clutch regulator valve stuck in the default position.	• Customer may notice neutral conditions or flares on shifts to 2nd or 6th gear as the test is determining intermediate clutch is failed off. • Once a code is stored, all gears with intermediate clutch on are disabled (2nd and 6th gear) leaving 1st gear without engine braking, 1st gear with engine braking, 3rd, 4th and 5th gears. • Customer might notice erratic shifting, neutral conditions, flares, higher engine speeds on highway (due to 6th gear being disabled). • Will turn on MIL.	Refer to **D**
P0762	P0762, P2702	Intermediate Clutch System Faults (includes	Intermediate clutch failed on.	Intermediate clutch failed on, could be due to:	• Customer may notice a vehicle	Refer to **D**

		clutch, valve body and non-electrical SSC faults)		• Intermediate clutch VFS SSC non-electrical failed stuck on (pressure). • Intermediate clutch stuck on due to mechanical failure. • Intermediate clutch regulator valve stuck in the spring compressed position.	deceleration on a shift into 3rd or 5th gears (intermediate clutch failing to release will cause a tie-up in 3rd or 5th gears). • Customer might notice erratic shifting or being stuck in 6th gear while the test is confirming C26 is failed on. • After a code is stored 1st gear with engine braking, 1st gear without engine braking, 3rd, 4th and 5th gears are disabled. • Customer might notice hanging in 2nd on acceleration since 2nd-6th upshifts only occur at closed pedal (due to energy limitations of overdrive clutch), harsh reverse engagements (since low/reverse clutch is not on in 2nd gear). • Will turn on MIL.	
P0763	-	SSC Electrical Faults	SSC is open, shorted to ground or shorted to voltage.	Open, short to ground or short to power in solenoid or wiring.	• See P0760, P0979, P0980. • Will turn on wrench lamp.	Go to **Pin**
P0763	P0760, P0763	SSC Electrical Faults	SSC circuit is open.	Open circuit in solenoid or wiring.	• Intermediate clutch is failed off - if fault occurs while in 2nd or 6th gears, customer might	Go to **Pin**

					notice a neutral condition before diagnostics disables 2nd and 6th gears. • Customer might notice erratic, delayed or harsh shifts. • Will turn on wrench lamp.	
P0763	P0760, P0797	SSC Electrical Faults	SSC circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on wrench lamp.	Go to **Pin**
P0763	P0760, P0980	SSC Electrical Faults	SSC is shorted to voltage.	Short to power in the wiring or solenoid.	• Intermediate clutch is failed off - if fault occurs while in 2nd or 6th gear, customer might notice a neutral condition before diagnostics disables 2nd and 6th gear. • Customer might notice erratic,	Go to **Pin**

					delayed or harsh shifts. • Will turn on wrench lamp.	
P0765	P0765, P0768	SSD Electrical Faults	SSD circuit is open.	Open circuit in solenoid or wiring.	• Overdrive clutch failed on, only 4th, 5th and 6th gears available. • Harsh engagements. • Poor launch due to 4th gear drive away. • Will turn on MIL.	Go to **Pin**
P0766	P0729, P0734, P0735, P0766	Overdrive Clutch System Faults (includes non-electrical SSD faults, main control valve body and clutch)	SSD stuck off (SSD or main control valve body).	SSD stuck off, both low/reverse clutch and overdrive clutch failed off. This code sets for: • Low/reverse clutch/overdrive clutch VFS non-electrical fault. • Low/reverse clutch/overdrive clutch regulator valve stuck in default position. • Low/reverse clutch/overdrive clutch boost valve stuck in default position.	• Customer may notice flares or neutral conditions on shifts into 4th, 5th or 6th gears. • Customer might notice erratic shifting, flares, neutral conditions while the code is being set. • 1st gear with engine braking, 4th, 5th and 6th gears are disabled - customer might notice high engine speeds (since 3rd is highest available gear). • Also might get delayed or no reverse engagement (need low/reverse clutch on to achieve reverse). • Will turn on MIL.	Refer to **D**
P0767	P072F, P073A, P073B,	Overdrive Clutch System Faults (includes	Overdrive clutch failed on (clutch, SSD or	Overdrive clutch failed on, could be due to:	• Customer may notice a vehicle deceleration on a	Go to **Pin**

	P0767	non-electrical SSD faults, valve body and clutch)	valve body).	• Low/reverse clutch/overdrive clutch, VFS SSD non-electrical failed stuck on (pressure). • Overdrive clutch stuck on due to mechanical failure. • Low/reverse clutch/overdrive clutch regulator valve stuck in the spring compressed position.	shift into 2nd or 3rd gears (overdrive clutch failing to release will cause a tie-up in 2nd or 3rd gears). • First gear with engine braking, 1st gear without engine braking, 2nd and 3rd gears are disabled. • Poor launch due to 4th gear drive away. • Harsh engagements. • Will turn on MIL.	
P0768	-	SSD Electrical Faults	SSD is open, shorted to ground or shorted to voltage.	Open, short to ground or short to power in solenoid or wiring.	• See P0765, P0982, P0983. • Will turn on wrench lamp.	Go to **Pin**
P0768	P0765, P0768	SSD Electrical Faults	SSD circuit is open.	Open circuit in solenoid or wiring.	• Overdrive clutch failed on, only 4th, 5th and 6th gear available. • Harsh engagements. • Poor launch due to 4th gear drive away. • Will turn on wrench lamp.	Go to **Pin**
P0768	P0765, P0982	SSD Electrical Faults	SSD circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE,	Go to **Pin**

					NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on wrench lamp.	
P0768	P0765, P0983	SSD Electrical Faults	SSD is shorted to voltage.	Short to power in the wiring or solenoid.	• Overdrive clutch failed on, only 4th, 5th and 6th gears available. • Harsh engagements, poor launch due to 4th gear drive away. • Will turn on wrench lamp.	Go to **Pin**
P0770	P0770, P0773	Shift Solenoid E (SSE) Electrical Faults	SSE circuit failure.	Open, short to ground or short to power in solenoid or wiring.	SSE controls routing SSD pressure to low/reverse clutch or overdrive clutch. For SSE failed off (no pressure): • Customer might notice 4th gear drive away (when 1st gear is commanded). • After it is determined on/off is failed to no pressure then 1st gear with engine braking is disabled. • Customer may notice nothing or	Go to **Pin**

					may notice 2nd gear provided when 1st gear selected in low manual lever range. • Harsh reverse engagements since low/reverse clutch does not apply in neutral or drive in this failure mode. For SSE failed on (pressure): • High side is turned off. • Poor launch performance (due to 5th gear drive away). • Harsh engagements. • No TCC apply. • Will turn on MIL.	
P0771	P0771, P0774	SSE Non-Electrical Faults (SSE and main control valve body)	SSE stuck off.	• The on/off solenoid (SSE) controls the multiplexing of SSD (low/reverse clutch/overdrive clutch VFS). If this solenoid fails off (no pressure), then 1st gear with engine braking is failed to 4th gear. • Also, if clutch select valve 2 sticks in the default position, then 1st gear with engine braking is failed to 4th gear	• If the on/off solenoid (SSE) is failed off or valve 2 is stuck in default position, then the customer will get 4th gear when 1st gear with engine braking is selected. • Customer might notice 4th gear drive way in automatic range since the control system commands 1st gear with engine braking at a stop (turns low/reverse clutch	Refer to **D**

				and reverse is failed to neutral. • It is not necessary to distinguish SSE stuck off from valve 2 stuck default. This code means either: ○ Non-electrical SSE (on/off solenoid) failed off (no pressure). ○ Valve 2 stuck in default position.	on) in case the customer moves the manual lever to reverse. Also, for valve 2 failures, the customer might get a no engagements when selecting reverse. • Will turn on MIL.	
P0772	P0772, P0774	SSE Non-Electrical Faults (SSE and valve body)	SSE stuck on.	• The on/off solenoid (SSE) controls the multiplexing of SSD (low/reverse clutch/overdrive clutch VFS). If this solenoid fails on (pressure) then 1st gear without engine braking, 1st gear with engine braking and 2nd gear are the only available gears. Third gear is failed to 1st gear without engine braking, 4th gear is failed to 1st gear with engine braking, 5th gear is failed to neutral and 6th gear is a tie-up.	• If the on/off solenoid (SSE) is failed on or valve 2 is stuck in spring compressed position, then 1st and 2nd gears are the only available gears. • Customer might notice flares (on shifts into 3rd gear), deceleration (on shifts into 4th gear) or neutral conditions (on shifts into 5th gear). High engine RPM (since 2nd gear is top available gear). • Will turn on MIL.	Refer to **D**

				• Also, if clutch select valve 2 sticks in the spring compressed position the same ratio pattern will occur. This code means either:
				  ○ Non-electrical SSE (on/off solenoid) failed on (pressure).
				  ○ Valve 2 stuck in spring compressed position.		

P0773	P0770, P0773	SSE Electrical Faults	SSE circuit failure.	Open, short to ground or short to power in solenoid or wiring.	SSE controls routing SSD pressure to low/reverse clutch or overdrive clutch. For SSE failed off (no pressure): • Customer might notice 4th gear drive away (when 1st gear commanded). • After it is determined on/off is failed to no pressure then 1st gear with engine braking is disabled. • Customer may notice nothing or may notice 2nd gear provided when 1st gear selected in low manual lever range.	Go to **Pin**

					• Harsh reverse engagements since low/reverse clutch does not apply in neutral or drive in this failure mode. For SSE failed on (pressure): • High side is turned off. • Poor launch performance (due to 5th gear drive away). • Harsh engagements. • No TCC apply. • Will turn on wrench lamp.

P0973	P0973, P0753	SSA Electrical Faults	SSA circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL.	Go to **Pin**
P0974	P0974, P0753	SSA Electrical Faults	SSA is shorted to voltage.	Short to power in the wiring or solenoid.	• Forward clutch is failed off - 5th and 6th gears only available forward gears. • Neutral condition or flare when fault occurs.	Go to **Pin**

					• Poor launch due to 5th gear drive away • Will turn on MIL.	
P0976	P0976, P0758	SSB Electrical Faults	SSB circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL.	Go to **Pin**
P0977	P0977, P0758	SSB Electrical Faults	SSB is shorted to voltage.	Short to power in the wiring or solenoid.	• Direct clutch failed on - only 3rd and 5th gear available. • Harsh engagements. • Poor launch due to 3rd gear drive away. • Will turn on MIL.	Go to **Pin**
P0979	P0979, P0763	SSC Electrical Faults	SSC circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE,	Go to **Pin**

					NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL.	
P0980	P0980, P0763	SSC Electrical Faults	SSC is shorted to voltage.	Short to power in the wiring or solenoid.	Intermediate clutch is failed off: • If fault occurs while in 2nd or 6th gear, customer might notice a neutral condition before diagnostics disables 2nd and 6th gears. • Customer might notice erratic, delayed or harsh shifts. • Will turn on MIL.	Go to **Pin**
P0982	P0982, P0768	SSD Electrical Faults	SSD circuit is shorted to ground.	Short to ground in the solenoid or wiring.	• Failure Mode Effects Management action opens the transaxle solenoid power control removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th as the only forward gear with TCC open), harsh engagements. • Poor launch	Go to **Pin**

					performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL.	
P0983	P0983, P0768	SSD Electrical Faults	SSD is shorted to voltage.	Short to power in the wiring or solenoid.	• Overdrive clutch failed on, only 4th, 5th and 6th gears available. • Harsh engagements. • Poor launch due to 4th gear drive away. • Will turn on MIL.	Go to **Pin**
P1636	-	ADLR Faults	ADLR chip communication error.	• Lost communication with ADLR solenoid driver. • ADLR is an internal PCM chip that controls the solenoids. The main micro communicates with the ADLR over a serial interface, sending out the desired solenoid state and receiving back a circuit fault status. • If communication is lost with the ADLR, the solenoid states become unknown, so the control system forces the transaxle solenoid power	• Transaxle solenoid power control turned off, providing PARK, REVERSE, NEUTRAL and 5th gear with TCC open and maximum line pressure. • Harsh engagements. • Poor performance launch (due to 5th drive away). • No TCC apply. • No shifts. • Will turn on MIL.	Install a n **ELECTR** **CONTR(**

				control off.		
P163E	-	Transmission Identification Block (solenoid strategy data programmed into the PCM)	Transmission identification version.	• Transmission identification version incorrect (transmission identification version does not match version in PCM calibration). • 7-digit service banding code checksum or total transmission identification block checksum invalid. • Solenoid and Clutch characterization data unavailable. • Failure Mode Effects Management will increase pressure and allow only PARK, REVERSE, NEUTRAL, 1st gear without engine braking and 3rd.	• Failure Mode Effects Management action of limits function to 1st gear without engine braking and 3rd could cause high engine RPM, lack of shifts complaints. • No TCC apply. • Will turn on MIL.	Refer to **S**
P163F	-	Transmission Identification Block (solenoid characterization data programmed into the PCM)	Transmission identification block corrupted, not programmed.	• Transmission identification data not programmed. • Solenoid and Clutch strategy data unavailable. • Failure Mode Effects Management will increase pressure and allow only PARK, REVERSE,	• Failure Mode Effects Management action of limits function to 1st gear without engine braking and 3rd could cause high engine RPM, lack of shifts complaints. • No TCC apply. • Will turn on MIL.	Refer to **S**

				NEUTRAL, 1st gear without engine braking and 3rd.		
P1700	-	Other Main Control Valve Body Faults (stuck valves)	Multiplex manual valve (valve 3).	This DTC is set if the multiplex manual valve sticks in the default position for reverse while the manual valve is in the drive or low position. Neutral will be the default condition in all forward gear ranges with SSE on. Once the PCM sees this fault, the PCM turns off SSE (SSE off) and allows the transaxle to achieve 1st, 2nd, and 3rd gears only.	• Customer might notice neutral conditions when 1st gear with engine braking, 1st gear without engine braking or 2nd are commanded. • Erratic shifting as the OBD isolate the cause of the neutral condition to multiplex manual valve (valve 3). • High engine speeds since 3rd is top available gear, harsh reverse engagements (since low/reverse clutch is not on in drive at low speed with this failure). • Will turn on wrench lamp.	Refer to **D**
P1702	-	TR Sensor Electrical Faults	TR sensor circuit failure.	P1702 - see P0705 and P0708.	• Possible no crank, only PARK, REVERSE, NEUTRAL and 5th gear available, harsh engagements. • Extremely delayed engagements (until a DTC is set). • After a DTC is set and the high side opened - harsh engagements, poor performance (due to a 5th gear drive away), no shifts.	Go to **Pin**

					• Will turn on wrench lamp.	
P1702	P0705, P1702	TR Sensor	TR sensor circuit failure.	PCM is received an invalid combination of the 4-bit signal from the TR sensor (wiring, connector or TR sensor issue).	• Possible no crank, only PARK, REVERSE, NEUTRAL and 5th gear available, harsh engagements. • Extremely delayed engagements (until a DTC is set). • After a DTC is set and the high side opened - harsh engagements, poor performance (due to a 5th gear drive away), no shifts. • Will turn on wrench lamp.	Go to **Pin**
P1702	P0708, P1702	TR Sensor	TR sensor circuit failure.	PCM is received all 4 TR sensor bits open (potential sensor disconnected, wiring, connector or TR sensor issue).	• Possible no crank, only PARK, REVERSE, NEUTRAL and 5th gear available, harsh engagements. • Extremely delayed engagements (until a DTC is set). • After a DTC is set and the high side opened - harsh engagements, poor performance (due to a 5th gear drive away), no shifts. • Will turn on wrench lamp.	Go to **Pin**
P1705	-	TR Sensor	TR sensor.	TR sensor not indicating Park or Neutral during Key ON Engine OFF (KOEO) or Key ON Engine Running (KOER) self-	Carry out KOEO or KOER only.	Go to **Pin**

				test.		
P1711	-	TFT	TFT sensor.	TFT out of self-test range (less than -1°C [30°F] or greater than 105°C [220°F]).	Carry out KOEO or KOER only.	Go to **Pin**
P1744	P0741, P1744	TCC System Faults (includes TCC, main control valve body and non-electrical solenoid faults)	TCC failed off.	TCC is mechanically stuck off.	P0741 and P1744 mean the same thing non-electrical failure that caused the TCC to fail to apply. This code sets for: • Non-electrical TCC solenoid stuck off. • TCC mechanical failure. • TCC regulator apply valve stuck in TCC release position. • TCC control valve stuck in TCC release position. • TCC functional failure MIL code. • TCC failed to apply (less than 80 RPM slip error lasting at least 3 seconds when TCC is commanded on) 3 consecutive times. • Will turn on wrench lamp.	Refer to **D**
P1780	-	Transmission Control Switch (TCS)	TCS.	TCS did not change states during KOER Self Test.	Customer cannot cancel overdrive.	Refer to **A TRANSA EXTERN** article.
P1783	-	Transmission Over Temperature	Transmission over temperature.	Transmission over temperature condition (greater than 135°C [275°F] for at least 5 seconds).	• Torque converter lockup happens earlier than expected. • Will turn on wrench lamp.	Refer to **D**
P1910	-	Reverse Lamp	Reverse lamp	Reverse lamp control	• Reverse lamps do	Refer to **F**

		Control	control.	circuit fault.	not function correctly. • Will turn on wrench lamp.	**LIGHTI**
P2700	-	Forward Clutch System Fault (includes non-electrical SSA faults, main control valve body and forward clutch)	Forward clutch failed on or off.	See P0751 and P0752.	• See P0751 and P0752. • Will turn on wrench lamp.	Refer to **D**
P2700	P0751, P2700	Forward Clutch System Faults (includes non-electrical SSA faults, valve body and clutch)	Forward clutch failed off.	Forward clutch failed off, could be due to: • Forward clutch VFS (SSA) non-electrical failed stuck off (no pressure). • Forward clutch stuck off due to mechanical failure. • Forward clutch regulator valve stuck in the default position. • Forward clutch boost valve stuck in the default position.	• Customer may notice neutral conditions or flares on downshifts from 5th or 6th as the test is determining Forward is failed off. • Once a code is stored, all gears with Forward on are disabled - leaving 5th and 6th as the only Forward gears. • Customer might notice erratic shifting, harsh engagements, neutral conditions, flares, poor launch performance (due to 5th drive away), harsh reverse engagements. • Will turn on wrench lamp.	Refer to **D**
P2700	P0752, P2700	Forward Clutch System Faults (includes non-electrical SSA faults, valve body and	Forward clutch failed on.	Forward clutch failed on, could be due to: • Forward clutch VFS (SSA) non-electrical failed	• Customer may notice a vehicle deceleration on a shift into 5th or 6th gears (forward clutch failing to	Refer to **D**

		clutch)		stuck on (pressure). • Forward clutch stuck on due to mechanical failure. • Forward clutch regulator valve stuck in the default position. • Forward clutch regulator valve stuck in the spring compressed position.	release will cause a tie-up in 5th or 6th gears). • Customer might notice erratic shifting or being stuck in 4th gear while the test is confirming forward clutch is failed on. • After a code is stored 5th and 6th are disabled. Customer might notice higher than normal engine speeds and loss of fuel economy. • Will turn on wrench lamp.	
P2701	-	Direct Clutch System Fault (includes non-electrical SSB faults, valve body and clutch)	Direct clutch failed on.	• Direct clutch failed on due to a mechanical fault. • Due to the hydraulic controls the clutch can be isolated from the solenoid - this failure code means direct clutch is on in 1st gear under conditions where the SSB (direct clutch VFS) cannot cause it to apply.	• Customer may notice a vehicle deceleration on a shift into 2nd, 4th or 6th gear (direct clutch failing to release will cause a tie-up in these gears). • Customer might notice erratic shifting while the test is confirming direct clutch is failed on. • After a code is stored all gears but 3rd and 5th are disabled. • Since only 3rd and 5th gears are allowed the customer might notice: ○ poor launch	Refer to **D**

					performance. ◦ lack of shifts. ◦ harsh engagements. • Will turn on wrench lamp.	
P2702	-	Intermediate Clutch System Faults (includes clutch, valve body and non-electrical SSC faults)	Intermediate clutch failed on or off.	See P0761 and P0762.	• See P0761 and P0762. • Will turn on wrench lamp.	Refer to D
P2702	P0761, P2702	Intermediate Clutch System Faults (includes clutch, valve body and non-electrical SSC faults)	Intermediate clutch failed off.	Intermediate clutch failed off, could be due to: • Intermediate clutch VFS (SSC) non-electrical failed stuck off (no pressure). • Intermediate clutch stuck off due to mechanical failure. • Intermediate clutch regulator valve stuck in the default position.	• Customer may notice neutral conditions or flares on shifts to 2nd or 6th as the test is determining intermediate clutch is failed off. • Once a code is stored, all gears with intermediate clutch on are disabled (2nd and 6th gears) leaving 1st gear without engine braking, 1st gear with engine braking, 3rd, 4th and 5th gears. • Customer might notice erratic shifting, neutral conditions, flares, higher engine speeds on highway (due to 6th gear being disabled). • Will turn on wrench lamp.	Refer to D
P2702	P0762, P2702	Intermediate Clutch System Faults (includes	Intermediate clutch failed on.	Intermediate clutch failed on, could be due to:	• Customer may notice a vehicle deceleration on a	Refer to D

		clutch, valve body and non-electrical SSC faults)		• Intermediate clutch VFS (SSC) non-electrical failed stuck on (pressure). • Intermediate clutch stuck on due to mechanical failure. • Intermediate clutch regulator valve stuck in the spring compressed position.	shift into 3rd or 5th gears (intermediate clutch failing to release will cause a tie-up in 3rd or 5th gears). • Customer might notice erratic shifting or being stuck in 6th gear while the test is confirming C26 is failed on. • After a code is stored 1st gear with engine braking, 1st gear without engine braking, 3rd, 4th and 5th gears are disabled. • Customer might notice hanging in 2nd gear on acceleration since 2nd gear - 6th gear upshifts only occur at closed pedal (due to energy limitations of overdrive clutch), harsh reverse engagements (since low/reverse clutch is not on in 2nd gear). • Will turn on wrench lamp.	
P2703	-	Low/Reverse Clutch and OWC Faults (covers just the clutches)	Low/reverse clutch failed off.	Low/reverse clutch provides engine braking in 1st gear and is required to achieve reverse.	• Low/reverse clutch is only tested for failed off in the low manual lever position. • The customer might notice not getting engine braking in 1st gear	Refer to **D**

					with engine braking, and erratic shifting as the OBDs isolates the fault to low/reverse clutch failed off. • Once a code is stored 2nd gear will be provided in place of 1st in the Low manual lever range. • Customer might also experience delayed or no reverse engagement. • Will turn on wrench lamp.	
P2704	-	Overdrive Clutch System Faults (includes non-electrical SSD faults, valve body and clutch)	Overdrive clutch failed off (clutch fault only).	• Overdrive clutch failed off. • Since SSD (low/reverse clutch/overdrive clutch VFS) is multiplexed we can isolate overdrive clutch failed off mechanical faults (set P2704) from SSD failed to no pressure (sets P0766).	• Customer may notice neutral conditions or flares on shifts into 4th, 5th, or 6th gear. • 4th, 5th and 6th gears are disabled. • Customer might notice erratic shifting, neutral conditions, flares, high engine RPM (since 3rd gear is top available gear). • Will turn on wrench lamp.	Refer to **D**
P2705	-	OWC Faults (covers just the clutches)	OWC failed off.	• OWC holds in 1st gear without engine braking. If the OWC fails off, 1st gear without engine braking is failed to neutral. • First gear with engine braking is	• Customer might notice neutral conditions when 1st gear without engine braking is commanded. • Erratic shifting as the OBD isolates the cause of the neutral condition to	Refer to **D**

				disabled for this failure since low/reverse clutch is not intended to hold power on torque in 1st gear.	the OWC being failed. • Might also notice poor launch performance (due to 2nd gear drive away). • Harsh engagements. • Will turn on wrench lamp.	
P2783	-	Other Main Control Valve Body Faults (stuck valves)	TCC control valve.	• TCC control valve stuck in the apply position. When the TCC is commanded open there will be no flow through the TCC (both apply and release circuits will be exhausted). • Test will run in 3rd or higher (when valve 2 is in the latched position, pointing SSD at overdrive clutch) when the TCC is commanded open. SSE is turned on, if the control valve is stuck this will cause the TCC to apply even though the TCC VFS is off.	• Erratic shifts, vehicle disengages at a stop while in drive or low, early TCC apply. • Will turn on wrench lamp.	Refer to **D**

PINPOINT TESTS - OSC EQUIPPED VEHICLE

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Digital Multimeter	105-R0057 or equivalent
 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Anytime an electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required.

TRANSMISSION RANGE (TR) SENSOR DIAGNOSIS CHART

Selector Position	PID: TR	PID: TR_D			
		TR1	TR2	TR3	TR4
PARK	P/N	0	1	1	0
In Between	REV	0	0	1	0
REVERSE	REV	0	0	1	1
In Between	REV	1	0	1	1
NEUTRAL	NTRL	1	0	1	0
In Between	NTRL	1	0	0	0
Drive	Drive	1	0	0	1
In Between	Drive	0	0	0	1

Low	Low	0	0	0	0

A "In Between" reading could be caused by a selector lever cable or Transmission Range (TR) sensor misaligned or a TR sensor circuit failure of TR1, TR2, TR3 or TR4.

B TR PIDs: 1= Open TR switch, 0 = Closed TR switch.

C VCM Readings: Taken from PCM signal pins for TR1, TR2, TR3 and TR4 to signal return.

Wiggle Test Information for Open/Shorts

A Check TR1, TR2, TR3 and TR4 circuits for an intermittent open with the TR sensor positioned so that suspect circuit is in the closed position and monitor the TR PIDs with the scan tool.

B Check TR1, TR2, TR3 and TR4 circuits for an intermittent short with the TR sensor positioned so that suspect circuit is in the open position and monitor the TR PIDs with the scan tool. To determine the shorted components while observing TR PIDs, unplug the TR and see if the short goes away. If the short is still present, unplug the transaxle harness and see if the short goes away. If the short is still present, then the short is in the PCM or vehicle harness. Remove the suspect circuit(s) wire terminal from the PCM connector. If the short is still present, then the PCM has an internal failure. Otherwise, the failure is in the vehicle harness.

Shift Solenoid Pre-Diagnosis

Use the following shift solenoid operation information when carrying out Pinpoint Test A.

SOLENOID OPERATION CHART

Base Selector Lever Position	PCM Commanded Gear	Shift Solenoid SSA (VFS) NL (CB 1,2,3,4)	SSB (VFS) NH (C 3,5,R)	SSC (VFS) NL (CB 2,6)	SSD (VFS) NH (CB L,R/4,5,6)	SSE (On/Off) NC	TCC (VFS) NL
P	P	Off	On	Off	Off	On	Off
R	R	Off	Off	Off	Off	On	Off
N	N	Off	On	Off	Off[a]	On[a]	Off
D	1	On	On	Off	Off[b]	On[c]	Off
	2	On	On	On	On	Off	Off
	3	On	Off	Off	On	Off	Off
	4	On	On	Off	Off	Off	On/Off
	5	Off	Off	Off	Off	Off	On/Off
	6	Off	On	On	Off	Off	On/Off
L	L	On	On	Off	Off[b]	On[c]	Off

CB = Clutch brake
NC = Normally closed
NH = Normally high
NL = Normally low

[a] Solenoid state will change if vehicle is moving forward with the selector lever in the NEUTRAL position.

[b] Turns on above 10 km/h (6 mph).

[c] Turns off above 10 km/h (6 mph).

Shift Solenoid Failure Mode Chart Failed ON or Failed OFF

Failed ON/OFF due to PCM and/or vehicle wiring concerns and/or solenoid electrically, mechanically or hydraulically stuck ON/OFF.

SHIFT SOLENOID A (SSA)

Gear Commanded	Actual Gears Obtained	
	Failed ON (High Pressure)	Failed OFF (Low Pressure)
R	R	R
D	1, 2, 3, 4	5, 6

SHIFT SOLENOID B (SSB)

Gear Commanded	Actual Gears Obtained	
	Failed ON (Low Pressure)	Failed OFF (High Pressure)
R	N[a]	R
D	1, 2, 4, 6	3, 5

[a] Reverse is available if the solenoid circuit failed causing transaxle solenoid power control solenoid to remove voltage to all solenoids.

SHIFT SOLENOID C (SSC)

Gear Commanded	Actual Gears Obtained	
	Failed ON (High Pressure)	Failed OFF (Low Pressure)
R	R	R
D	2, 6	1, 3, 4, 5

SHIFT SOLENOID D (SSD)

Gear Commanded	Actual Gears Obtained	
	Failed ON (Low Pressure)	Failed OFF (High Pressure)
R	N[a]	R
D	1, 2, 3[b]	4, 5, 6

[a] Reverse is available if the solenoid circuit failed causing transaxle solenoid power control solenoid to remove voltage to all solenoids.

[b] No engine braking.

SHIFT SOLENOID E (SSE)

Gear Commanded	Actual Gears Obtained	
	Failed ON (High Pressure)	Failed OFF (Low Pressure)
R	R	R
D	1, 2	1[a] , 2, 3, 4, 5, 6

[a] No engine braking.

Pinpoint Tests

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Transmission Controls - 6 Speed for schematic and connector information.

PINPOINT TEST A: TRANSAXLE CONTROL SOLENOIDS

NOTE: Refer to the Transaxle Internal Harness Diagram illustration Transaxle Connector Layouts.

NOTE: Refer to the Transaxle Vehicle Harness Connector illustration Transaxle Connector Layouts.

A1 ELECTRONIC DIAGNOSTICS

- Check to make sure the transaxle harness connector is fully seated, terminals are engaged in connector and in good condition before proceeding.
- Connect the diagnostic tool.
- Carry out the Key ON Engine OFF (KOEO) Self Test until continuous DTCs have been displayed.
- Enter the Output Test Mode.
- Select the mode ALL ON. Push START to turn outputs ON. Push STOP to turn outputs OFF.
- **Does vehicle enter Output Test Mode?**

  YES : Go to A2.

  NO : PRESS START. If vehicle does not enter Output Test Mode, REFER to the **Introduction - Gasoline Engines** article.

A2 CHECK THE SOLENOID CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: Transaxle Vehicle Harness C168
- Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Disconnect: PCM Transaxle Electrical C175T
- Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Measure the resistance of the suspect solenoid circuit between PCM transaxle electrical C175T and

transaxle harness C168 using the following chart.

Shift Solenoid	Transaxle Vehicle Harness C168	PCM Transaxle C175T
Shift Solenoid A (SSA) CET05 (BU/GN)	C168-13	C175T-39
Shift Solenoid B (SSB) CET06 (GN/BN)	C168-16	C175T-27
Shift Solenoid C (SSC) CET07 (GY/OG)	C168-17	C175T-40
Shift Solenoid D (SSD) CET08 (BN/WH)	C168-12	C175T-28
Shift Solenoid E (SSE) CET18 (GY/YE)	C168-1	C175T-38
Line Pressure Control (LPC) CET09 (YE/VT)	C168-18	C175T-35
Torque Converter Clutch (TCC) CET10 (BU/GY)	C168-14	C175T-29

- **Is the resistance less than 5 ohms?**

  YES : Go to A3.

  NO : REPAIR the circuit(s) for an open. RECONNECT all components. TEST the system for normal operation.

A3 CHECK THE SOLENOID CIRCUIT FOR A SHORT TO GROUND

- Measure the resistance between transaxle vehicle harness C168 and ground.

Shift Solenoid	Transaxle Vehicle Harness C168	Ground
SSA CET05 (BU/GN)	C168-13	Ground
SSB CET06 (GN/BN)	C168-16	Ground
SSC CET07 (GY/OG)	C168-17	Ground
SSD CET08 (BN/WH)	C168-12	Ground
SSE CET18 (GY/YE)	C168-1	Ground
LPC CET09 (YE/VT)	C168-18	Ground
TCC CET10 (BU/GY)	C168-14	Ground

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to A4.

  NO : REPAIR the circuit(s) for a short to ground. RECONNECT all components. TEST the system for normal operation.

A4 CHECK THE SOLENOID CIRCUIT FOR A SHORT TO POWER

- Measure the voltage between transaxle vehicle harness C168 and ground.

Shift Solenoid	Transaxle Vehicle Harness C168	Ground
SSA CET05 (BU/GN)	C168-13	Ground
SSB CET06 (GN/BN)	C168-16	Ground
SSC CET07 (GY/OG)	C168-17	Ground

SSD CET08 (BN/WH)	C168-12	Ground
SSE CET18 (GY/YE)	C168-1	Ground
LPC CET09 (YE/VT)	C168-18	Ground
TCC CET10 (BU/GY)	C168-14	Ground

- **Is any voltage present?**

  YES : REPAIR the circuit(s) for a short to power. RECONNECT all components. TEST the system for normal operation.

  NO : Go to A5.

A5 CHECK THE RESISTANCE OF THE SOLENOID FIELD CIRCUIT

- Measure the resistance between transaxle solenoid body C168-15, component side and the suspect solenoid pin, component side and compare the value to the specifications in the table below.

Shift Solenoid	Transaxle C168 Component Side	Transaxle C168-15 Component Side
SSA CET05 (BU/GN)	C168-13	C168-15
SSB CET06 (GN/BN)	C168-16	C168-15
SSC CET07 (GY/OG)	C168-17	C168-15
SSD CET08 (BN/WH)	C168-12	C168-15
SSE CET18 (GY/YE)	C168-1	C168-15
LPC CET09 (YE/VT)	C168-18	C168-15
TCC CET10 (BU/GY)	C168-14	C168-15

SOLENOID RESISTANCE VALUES: SSA, SSB, SSC, SSD, TCC AND LPC

Temperature		Resistance (ohms)
°C	°F	
-20 to -10	-4 to 14	3.24-5.13
-10 to 0	14-32	3.43-5.32

60-70	140-158	22.65-31.54
70-80	158-176	23.54-32.44
80-90	176-194	24.44-33.34
90-100	194-212	25.34-34.24

- **Is the resistance within specifications?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. RECONNECT all components. TEST the system for normal operation.

  NO : REMOVE the main control cover. REFER to **Main Control Cover**. INSPECT the solenoid body for foreign material such as metal shavings on the exposed metal contacts or other components. CLEAR the solenoid body and RECHECK the resistance values. If the resistance values are still out of specification, INSTALL a new solenoid body assembly. REFER to **Solenoid Body Assembly**. RECONNECT all components. TEST the system for normal operation.

PINPOINT TEST B: TFT SENSOR

NOTE: **Refer to the Transaxle Vehicle Harness Connector illustration Transaxle Connector Layouts.**

NOTE: **Refer to the Transaxle Internal Harness Diagram illustration Transaxle Connector Layouts.**

B1 ELECTRONIC DIAGNOSTICS

- Check to make sure transaxle vehicle harness connector C168 is fully seated, terminals are fully engaged in connector and in good condition before proceeding.
- **Have the above items been checked?**

  YES : Go to B2.

  NO : CARRY OUT checks. CLEAR the DTCs. REPEAT the Self Test.

B2 CHECK THE TFT SENSOR CIRCUITS FOR AN OPEN

- Key in OFF position.
- Disconnect: Transaxle Vehicle Harness C168
- Disconnect: PCM Transaxle C175T

- Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.

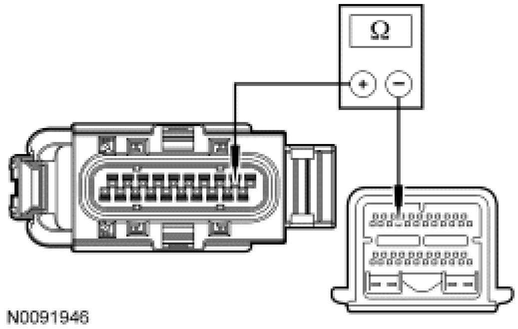

Fig. 14: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM transaxle C175T-20, circuit VET27 (BN/YE) and transaxle vehicle harness C168-2, circuit VET27 (BN/YE).

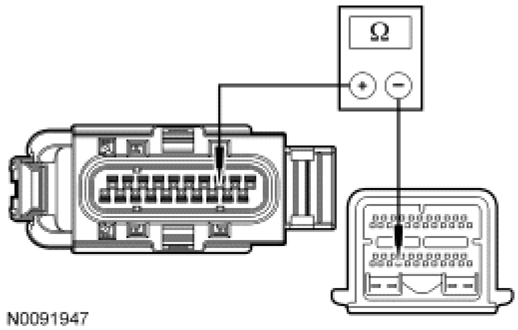

Fig. 15: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM transaxle C175T-43, circuit RE406 (GY/VT) and transaxle vehicle harness C168-3, circuit RE406 (GY/VT).
- **Is the resistance less than 5 ohms?**

  YES : Go to B3.

  NO : REPAIR the circuit(s) for an open. CONNECT all components. TEST the system for normal operation.

B3 CHECK THE TFT SENSOR CIRCUITS FOR A SHORT TO GROUND

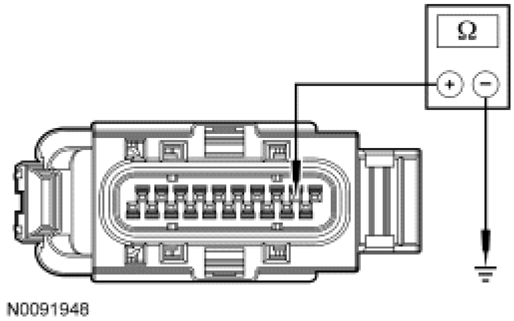

Fig. 16: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between transaxle vehicle harness C168-2, circuit VET27 (BN/YE) and ground.

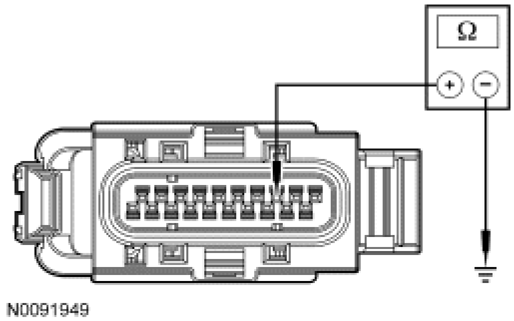

Fig. 17: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between transaxle vehicle harness C168-3, circuit RE406 (GY/VT) and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to B4.

  NO : REPAIR the circuit(s) for a short to ground. CONNECT all components. TEST the system for normal operation.

B4 CHECK THE TFT CIRCUITS FOR A SHORT TO VPWR

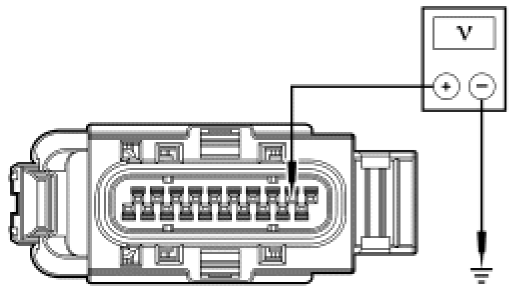

Fig. 18: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between transaxle vehicle harness C168-2, circuit VET27 (BN/YE) and ground.

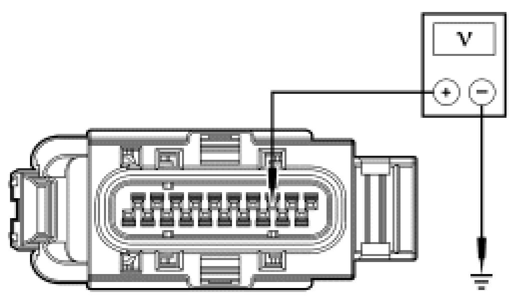

Fig. 19: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between transaxle vehicle harness C168-3, circuit RE406 (GY/VT) and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit(s) for a short to voltage. CONNECT all components. TEST the system for normal operation.

  NO : Go to B5.

B5 CHECK THE RESISTANCE OF THE TFT SENSORS/HARNESS

- Connect: Transaxle Vehicle Harness C168
- **TEST 1.**

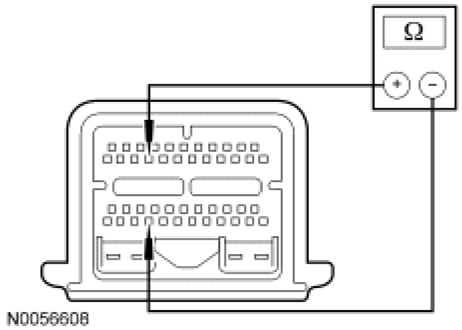

Fig. 20: Measuring Resistance Between PCM Transaxle Electrical Connector C175T Pins 20 & 43, Circuit VET27 (BN/YE) & RE406 (GY/VT)
Courtesy of FORD MOTOR CO.

- Measure and record the resistance between PCM transaxle C175T-20, circuit VET27 (BN/YE) and C175T-43, circuit RE406 (GY/VT).
- Compare the resistance value to the following table ranges:

TRANSMISSION FLUID TEMPERATURE

°C	°F	Resistance (Ohms)
-40 to -20	-40 to -4	1076K-269K
-19 to -1	-3 to 31	309K-91K
0-20	32-68	104K-35K
21-40	69-104	40K-15K
41-70	105-158	17K-4.9K
71-90	159-194	5.6K-2.5K
91-110	195-230	3.0K-1.4K
111-130	231-266	1.7K-0.8K
131-150	267-302	0.97K-0.56K

- **TEST 2.**
- Check for intermittent short or open.
- If the resistance was between 0.8k and 100k ohms, carry out the following test. If the transaxle is warm, allow it to cool. Check the TFT sensor resistance again. Compare the resistance with the initial resistance. The resistance should decrease if the transaxle was heated and should increase if the transaxle was allowed to cool. If correct, then change in the resistance occurs, repeat OBD.
- **Is the resistance in the range?**

  YES : INSTALL a new PCM. CONNECT all components. TEST the system for normal operation.

  NO : INSTALL a new solenoid body. REFER to **Solenoid Body Assembly**. RECONNECT all components. TEST the system for normal operation.

PINPOINT TEST C: TSS AND OSS SENSORS

NOTE: **Refer to the Transaxle Vehicle Harness Connector illustration Transaxle**

Connector Layouts.

NOTE: **Refer to the Transaxle Internal Harness Diagram illustration Transaxle Connector Layouts.**

C1 ELECTRONIC DIAGNOSTICS

- Check to make sure transaxle vehicle harness C168 is fully seated, terminals are engaged in connector and in good condition before proceeding.
- **Have the items above been checked?**

  YES : Go to C2.

  NO : CARRY OUT the checks. CLEAR the DTCs. RERUN the OBD Tests.

C2 ELECTRONIC DIAGNOSTICS

- Connect the diagnostic tool.
- Monitor the speed sensor PIDs while test driving the vehicle.
- **Are the Turbine Shaft Speed (TSS) and Output Shaft Speed (OSS) sensor signals present and consistent?**

  YES : The condition that set the DTC is intermittent and is not currently present. ERASE the codes. RERUN the OBD Tests.

  NO : Go to C3.

C3 CHECK THE TRANSAXLE VEHICLE HARNESS FOR AN OPEN CIRCUIT

- Disconnect: Transaxle Vehicle Harness C168
- Disconnect: PCM Transaxle C175T
- Use a mirror to inspect both ends of the connectors for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Measure the resistance for the speed sensor circuits between the transaxle vehicle harness C168 and the PCM transaxle C175T.

Speed Sensor Circuit	Transaxle Vehicle Harness C168	PCM Transaxle C175T
TSS/OSS power supply LE111 (VT/GN)	C168-20	C175T-41
TSS/OSS ground RET24 (BN/BU)	C168-9	C175T-45
TSS sensor signal VET33 (WH/OG)	C168-19	C175T-15
OSS sensor signal VET26 (BN/GN)	C168-10	C175T-14

- **Is the resistance less than 5 ohms?**

  YES : Go to C4.

  NO : REPAIR the circuit(s) for an open. CONNECT all components. TEST the system for normal operation.

C4 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO GROUND

- Measure the resistance for the speed sensor circuits between transaxle vehicle harness C168 and

ground.

Speed Sensor Circuit	Transaxle Vehicle Harness C168	Ground
TSS/OSS power supply LE111 (VT/GN)	C168-20	Ground
TSS/OSS ground RET24 (BN/BU)	C168-9	Ground
TSS sensor signal VET33 (WH/OG)	C168-19	Ground
OSS sensor signal VET26 (BN/GN)	C168-10	Ground

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to C5.

  NO : REPAIR the circuit(s) for a short to ground. CONNECT all components. TEST the system for normal operation.

C5 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO VPWR

- Check for voltage from the speed sensor circuits at transaxle vehicle harness C168.

Speed Sensor Circuit	Transaxle Vehicle Harness C168	Ground
TSS/OSS power supply LE111 (VT/GN)	C168-20	Ground
TSS/OSS ground RET24 (BN/BU)	C168-9	Ground
TSS sensor signal VET33 (WH/OG)	C168-19	Ground
OSS sensor signal VET26 (BN/GN)	C168-10	Ground

- **Is any voltage present?**

  YES : REPAIR the circuit(s) for a short to voltage. CONNECT all components. TEST the system for normal operation.

  NO : Go to C6.

C6 CHECK THE SOLENOID BODY FOR AN INTERNAL OPEN CIRCUIT

- Remove the main control cover. Refer to **Main Control Cover**.
- Disconnect: TSS Sensor
- Disconnect: OSS Sensor
- Use a mirror to inspect both ends of the connectors for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.

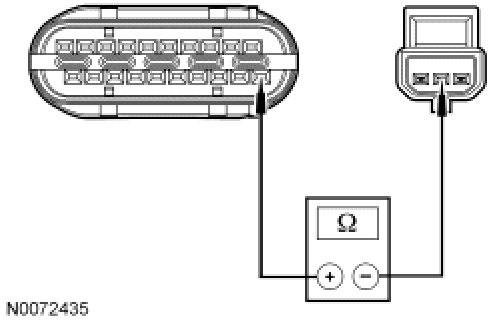

Fig. 21: Measuring Resistance Of Solenoid Body Internal Speed Sensor Power Circuit Between Main Solenoid Body Connector Pin 20 & OSS Sensor Connectors Pin 2
Courtesy of FORD MOTOR CO.

NOTE: The OSS sensor is above the main solenoid body connector next to the Transmission Range (TR) sensor, the TSS sensor connector is below the main solenoid body connector.

- Measure the resistance of the solenoid body internal speed sensor power circuit between the main solenoid body connector pin 20, solenoid body side and the TSS or OSS sensor connectors pin 2, solenoid body side.

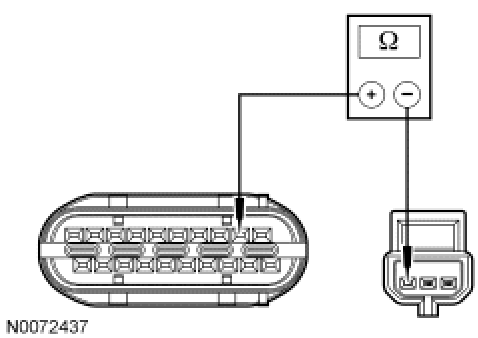

Fig. 22: Measuring Resistance Of Solenoid Body Internal Speed Sensor Power Circuit Between Main Solenoid Body Connector Pin 9 & OSS Sensor Connectors Pin 3
Courtesy of FORD MOTOR CO.

NOTE: The OSS sensor is above the main solenoid body connector next to the TR sensor.

- Measure the resistance of the solenoid body internal speed sensor ground circuit between the main solenoid body connector pin 9, solenoid body side and OSS sensor connector pin 3, solenoid body side.

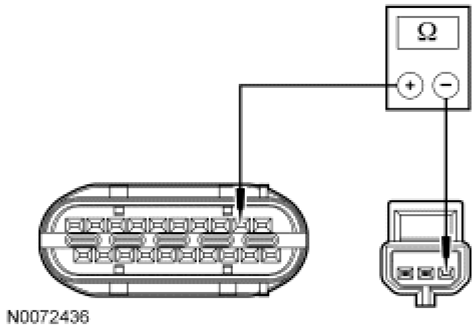

Fig. 23: Measuring Resistance Of Solenoid Body Internal Speed Sensor Power Circuit Between Main Solenoid Body Connector Pin 9 & TSS Sensor Connectors Pin 1
Courtesy of FORD MOTOR CO.

NOTE: The TSS sensor connector is below the main solenoid body connector.

- Measure the resistance of the solenoid body internal speed sensor ground circuit between the main solenoid body connector pin 9, solenoid body side and TSS sensor connector pin 1, solenoid body side.

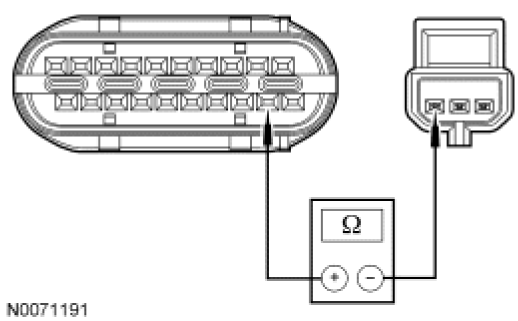

Fig. 24: Measuring Resistance Of Solenoid Body Internal Speed Sensor Power Circuit Between Main Solenoid Body Connector Pin 19 & TSS Sensor Connectors Pin 1
Courtesy of FORD MOTOR CO.

NOTE: The TSS sensor connector is below the main solenoid body connector.

- Measure the resistance of the solenoid body internal circuit for the TSS sensor signal between the main solenoid body connector pin 19, solenoid body side and TSS sensor connector pin 3, solenoid body side.

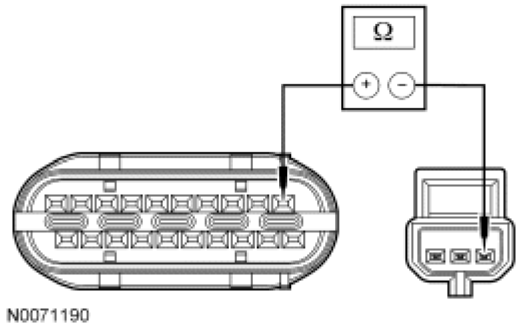

Fig. 25: Measuring Resistance Of Solenoid Body Internal Speed Sensor Power Circuit Between Main Solenoid Body Connector Pin 10 & OSS Sensor Connectors Pin 1
Courtesy of FORD MOTOR CO.

NOTE:	**The OSS sensor is above the main solenoid body connector next to the TR sensor.**

- Measure the resistance of the solenoid body internal circuit for the OSS sensor signal between the main solenoid body connector pin 10, solenoid body side and OSS sensor connector pin 1, solenoid body side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C7.

  NO : INSTALL a new solenoid body. REFER to **Solenoid Body Assembly**. CONNECT all components. TEST the system for normal operation.

C7 CHECK FOR VOLTAGE AT THE SPEED SENSOR CONNECTORS

- Connect: PCM Transaxle C175T
- Connect: Transaxle Vehicle Harness Connector C168
- Key in ON position.

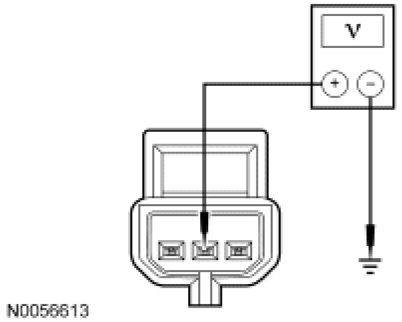

Fig. 26: Measuring Voltage At TSS Sensor Connector Pin 2, Solenoid Body Side Or OSS Sensor Connector Pin 2
Courtesy of FORD MOTOR CO.

- Measure the voltage at TSS sensor connector pin 2, solenoid body side or OSS sensor connector pin 2, solenoid body side.

- **Is the voltage greater than 10 volts?**

  YES : Go to C8.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. CONNECT all components. TEST the system for normal operation.

C8 CHECK FOR REFERENCE SIGNAL VOLTAGE AT THE SPEED SENSOR CONNECTORS

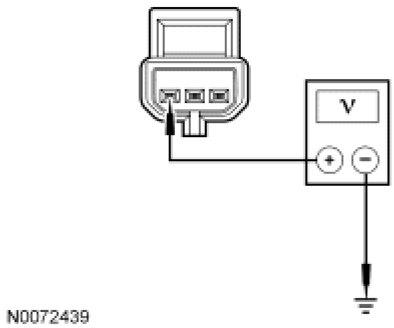

Fig. 27: Measuring Voltage At TSS Sensor Connector Pin 3, Solenoid Body Side
Courtesy of FORD MOTOR CO.

NOTE:	**The TSS sensor connector is below the main solenoid body connector.**

- Measure the voltage at TSS sensor connector pin 3, solenoid body side.

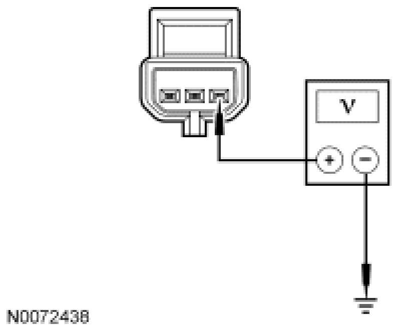

Fig. 28: Measuring Voltage At OSS Sensor Connector Pin 1, Solenoid Body Side
Courtesy of FORD MOTOR CO.

NOTE:	**The OSS sensor is above the main solenoid body connector next to the TR sensor.**

- Measure the voltage at OSS sensor connector pin 1, solenoid body side.
- **Is the voltage between 4.5 and 5.5 volts?**

  YES : Go to C9.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. CONNECT all components. TEST the system for normal operation.

C9 CHECK FOR GROUND AT THE SPEED SENSOR CONNECTORS

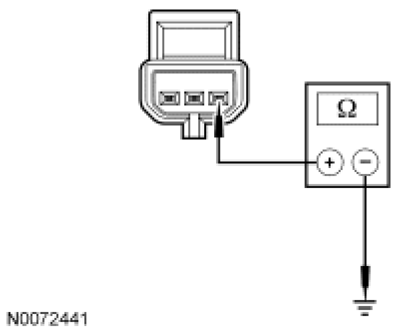

Fig. 29: Measuring Resistance Between TSS Sensor Connector Pin 1, Solenoid Body Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: **The TSS sensor connector is below the main solenoid body connector.**

- Measure the resistance between TSS sensor connector pin 1, solenoid body side and ground.

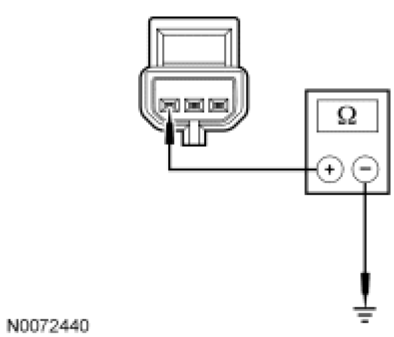

Fig. 30: Measuring Resistance Between OSS Sensor Connector Pin 3, Solenoid Body Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: **The OSS sensor is above the main solenoid body connector next to the TR sensor.**

- Measure the resistance between OSS sensor connector pin 3, solenoid body side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new speed sensor. REFER to **Turbine Shaft Speed (TSS) Sensor** or **Output Shaft Speed (OSS) Sensor**. TEST the system for normal operation. If the condition is still present, INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. CONNECT all components. TEST the system for normal operation.

PINPOINT TEST D: TR SENSOR

NOTE: **Refer to the Transmission Range (TR) Sensor Connector illustration Transaxle Connector Layouts.**

NOTE: **Refer to the Transmission Range (TR) Sensor Diagnosis Chart preceding these pinpoint tests.**

D1 VERIFY DTCs

- Key in OFF position.
- Select PARK.
- Carry out the On-Board Diagnostic (OBD) Test. DTCs P0705 and P0708 cannot be set by an incorrectly adjusted selector lever cable.
- **Are only DTCs P0705, P0708 present?**

  YES : Go to D3.

  NO : Go to D2.

D2 VERIFY SELECTOR LEVER CABLE/LINKAGE ADJUSTMENT

- Disconnect the selector lever cable end from the manual control lever.
- Place the transaxle manual control lever in the DRIVE position.
- Select DRIVE.
- Reconnect the selector lever cable/linkage.
- Verify that the selector lever cable/linkage is correctly adjusted. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
- **Is the selector lever cable/linkage correctly adjusted?**

  YES : Go to D3.

  NO : ADJUST the selector lever cable/linkage. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article. Go to D4.

D3 CHECK THE ELECTRICAL SIGNAL OPERATION

- Select PARK.
- Disconnect: PCM Transaxle C175T
- Disconnect: Transaxle Vehicle Harness C168
- Use a mirror to inspect both ends of the connectors for damaged or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- **Is there damage to the connectors, pins or harness?**

  YES : REPAIR as required. CLEAR DTCs and RERUN On-Board Diagnostic (OBD) Tests.

  NO : Go to D4.

D4 CHECK ELECTRICAL SYSTEM OPERATION TR AND PCM

- Key in OFF position.
- Connect the diagnostic tool.

- Connect: PCM Transaxle C175T
- Connect: Transaxle Vehicle Harness C168
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: TR PIDs: TR, TR1, TR2, TR3, and TR4
- Move the TR selector lever into each gear and stop.
- Observe any of the following PIDs (vehicle-dependent), TR, TR1, TR2, TR3, and TR4 while wiggling harness, tapping on sensor or driving the vehicle.
- Compare the PIDs to the Transmission Range (TR) Sensor Diagnosis Chart.
- **Do the PIDs TR, TR1, TR2, TR3, TR4 match the Transmission Range (TR) Sensor Diagnosis Chart, and do they remain steady when the harness is wiggled, the sensor is tapped on or the vehicle driven?**

  YES : The problem is not in the digital TR sensor system. REFER to **Diagnosis By Symptom** for further diagnosis.

  NO : If the PIDs change when wiggling the harness, tapping on the sensor or driving the vehicle, the problem may be intermittent. Go to D5.

D5 CHECK THE TRANSAXLE VEHICLE TRANSAXLE HARNESS FOR AN OPEN

- Disconnect: PCM Transaxle C175T
- Disconnect: Transaxle Vehicle Harness C168
- Measure the resistance for the TR sensor circuits between the transaxle vehicle harness C168 and the PCM transaxle C175T.

TR Sensor Circuit	Transaxle Vehicle Harness C168	PCM Transaxle C175T
TR-1 VET29 (VT/WH)	C168-4	C175T-17
TR-2 VET30 (YE)	C168-5	C175T-18
TR-3 VET31 (BU/OG)	C168-6	C175T-19
TR-4 VET32 (VT)	C168-7	C175T-32
TR Ground RET24 (BN/BU)	C168-8	C175T-45

- **Is the resistance less than 5 ohms?**

  YES : Go to D6.

  NO : REPAIR the circuit. CONNECT all components. TEST the system for normal operation.

D6 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO GROUND

- Measure the resistance for the TR sensor circuits between the transaxle vehicle harness C168 and ground.

TR Sensor Circuit	Transaxle Vehicle Harness C168	Ground
TR-1 VET29 (VT/WH)	C168-4	Ground
TR-2 VET30 (YE)	C168-5	Ground

TR-3 VET31 (BU/OG)	C168-6	Ground
TR-4 VET32 (VT)	C168-7	Ground
TR Ground RET24 (BN/BU)	C168-8	Ground

- **Are all resistances greater than 10,000 ohms?**

  YES : Go to D7.

  NO : REPAIR shorted circuit(s). RECONNECT all components. TEST the system for normal operation.

D7 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO POWER

- Measure the voltage for the TR sensor circuits between the transaxle vehicle harness C168 and ground.

TR Sensor Circuit	Transaxle Vehicle Harness C168	Ground
TR-1 VET29 (VT/WH)	C168-4	Ground
TR-2 VET30 (YE)	C168-5	Ground
TR-3 VET31 (BU/OG)	C168-6	Ground
TR-4 VET32 (VT)	C168-7	Ground
TR Ground RET24 (BN/BU)	C168-8	Ground

- **Is any voltage present?**

  YES : REPAIR shorted circuit(s). RECONNECT all components. TEST the system for normal operation.

  NO : Go to D8.

D8 CHECK FOR A SHORT BETWEEN TR/PCM INPUT SIGNAL CIRCUITS

- Measure the resistance between TR sensor and PCM Transaxle C175T.

TR Sensor Circuit	PCM Transaxle C175T	Ground
TR-1 VET29 (VT/WH)	C175T-17	Ground
TR-2 VET30 (YE)	C175T-18	Ground
TR-3 VET31 (BU/OG)	C175T-19	Ground
TR-4 VET32 (VT)	C175T-32	Ground
TR Ground RET24 (BN/BU)	C175T-45	Ground

- **Are all resistances greater than 10,000 ohms?**

  YES : Go to D9.

  NO : REPAIR shorts on circuits having less than 10,000 ohms between other TR/PCM input signal circuits. RECONNECT all components. TEST the system for normal operation.

D9 CHECK FOR AN INTERNAL SOLENOID BODY OPEN FOR THE TR SENSOR CIRCUITS

- Remove the main control cover. Refer to **Main Control Cover**.

- Disconnect: TR Sensor Connector
- Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Measure the resistance of the TR sensor circuits between the transaxle vehicle harness connector, component side and the TR sensor connector, solenoid body side.

TR Sensor Circuit	Transaxle Vehicle Harness Connector Pin (Component Side)	TR Sensor Connector Pin (Solenoid Body Side)
TR-1	4	5
TR-2	5	4
TR-3	6	3
TR-4	7	2
TR Ground	8	1

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new TR sensor. REFER to **Digital Transmission Range (TR) Sensor**. RECONNECT all components. TEST the system for normal operation.

  NO : INSTALL a new solenoid body. REFER to **Solenoid Body Assembly**. RECONNECT all components. TEST the system for normal operation.

PINPOINT TEST E: TRANSAXLE SOLENOID POWER CONTROL CIRCUIT

NOTE: **Refer to the Transaxle Vehicle Harness Connector illustration Transaxle Connector Layouts.**

E1 CHECK FOR VOLTAGE AT THE TRANSAXLE VEHICLE HARNESS C168

- Disconnect: Transaxle Vehicle Harness C168
- Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Key in ON position.

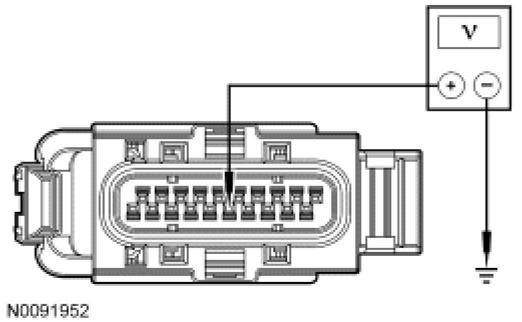

Fig. 31: Measuring Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage at the transaxle vehicle harness C168-15, circuit CET49 (BN).
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new solenoid body. REFER to **Solenoid Body Assembly**. RECONNECT all components. TEST the system for normal operation.

  NO : Go to E2.

E2 CHECK THE TRANSAXLE SOLENOID POWER CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect: PCM Transaxle C175T

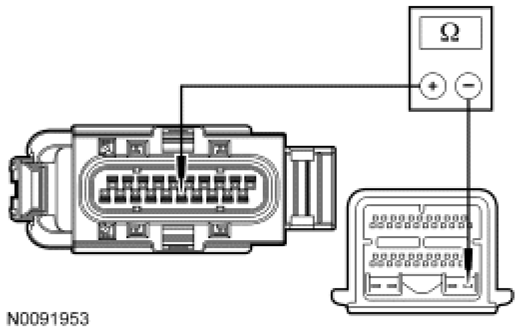

Fig. 32: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM transaxle C175T-47, circuit CET49 (BN) and transaxle vehicle harness C168-15, circuit CET49 (BN).
- **Is the resistance less than 5 ohms?**

  YES : Go to E3.

  NO : REPAIR circuit CET49 (BN) for an open. RECONNECT all components. TEST the system for normal operation.

E3 CHECK THE TRANSAXLE SOLENOID POWER CONTROL CIRCUIT FOR A SHORT TO GROUND

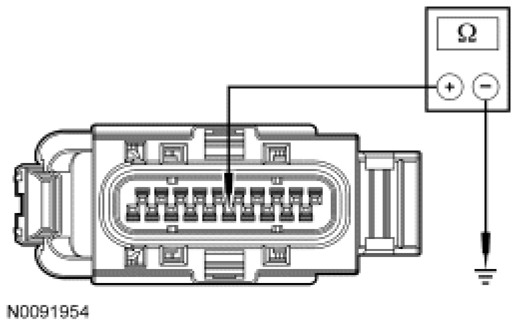

Fig. 33: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the transaxle vehicle harness C168-15, circuit CET49 (BN) and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. RECONNECT all components. TEST the system for normal operation.

  NO : REPAIR circuit CET49 (BN) for a short to ground. RECONNECT all components. TEST the system for normal operation.

SPECIAL TESTING PROCEDURES

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transaxle.

Engine Idle Speed Check

Refer to the **Introduction - Gasoline Engines** article for diagnosis and testing of the engine idle speed.

Line Pressure Test

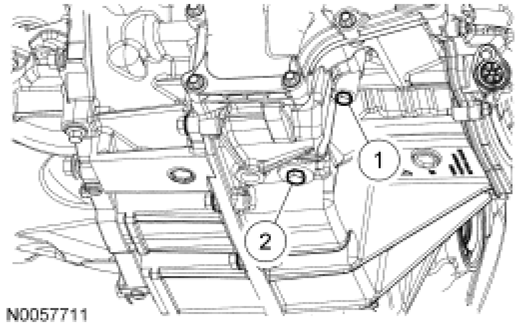

Fig. 34: Identifying Line Pressure Tap & Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Line pressure tap
2	-	Transmission fluid drain plug

NOTE: **Carry out the Line Pressure Test prior to carrying out the Stall Speed Test. If the line pressure is low at stall, do not carry out the Stall Speed Test or further transaxle damage will occur. Do not maintain Wide Open Throttle (WOT) in any transaxle range for more than 5 seconds.**

NOTE: **Do not mistake the transmission fluid drain plug for the line pressure tap plug or the transmission fluid will have to be refilled.**

This test verifies that the line pressure is within specification.

1. Connect a pressure gauge to the line pressure tap.
2. Start the engine and check the line pressures see the line pressure chart to determine if the line pressure is within specification.

LINE PRESSURE CHART

Gear	Line
Pressures at Idle[a]	
P	379-448 kPa (55-65 psi)
R	655-724 kPa (95-105 psi)
N	379-448 kPa (55-65 psi)
D	552-621 kPa (80-90 psi)
L	552-621 kPa (80-90 psi)
Pressure at Wide Open Throttle (WOT) Stall[a]	
P	379-448 kPa (55-65 psi)
R	2,034-2,206 kPa (295-320 psi)
N	379-448 kPa (55-65 psi)
D	1,689-1,758 kPa (245-255 psi)
L	1,689-1,758 kPa (245-255 psi)

[a] All pressures are approximate.

3. If the line pressure is not within specification, go to **Pinpoint Test A** to diagnose the Line Pressure Control (LPC) operation. If LPC operation is OK, see the Line Pressure Diagnosis Chart for line pressure

concern causes.

4. When the pressure tests are completed, install the pressure tap plug.
    - Tighten to 9 Nm (80 lb-in).

LINE PRESSURE DIAGNOSIS CHART

Test Results	Possible Source
HIGH at IDLE - ALL RANGES	Wiring Harnesses Line Pressure Control (LPC) Solenoid Main Regulator Valve
LOW at IDLE - ALL RANGES	Low Fluid Level Fluid Inlet Filter/Seal Main Control Body Cross Leaks Gaskets Pump Separator Plate
LOW in Park ONLY	Valve Body
LOW in Reverse ONLY	Separator Plate Reverse Clutch Valve Body Forward Clutch
LOW in Neutral ONLY	Valve Body
LOW in Overdrive ONLY	Forward Clutch Valve Body
LOW in Drive ONLY	Forward Clutch
LOW in Manual 1st ONLY	Forward Clutch Valve Body

Stall Speed Test

WARNING: **Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

NOTE: **Carry out Line Pressure Test prior to carrying out Stall Speed Test. If the line pressure is low at stall, do not carry out Stall Speed Test or further transaxle damage will occur.**

The Stall Speed Test checks:

- Torque Converter Clutch (TCC) operation and installation.
- holding ability of the forward clutch.
- reverse clutch (the low-reverse bands).
- planetary One-Way Clutch (OWC).

- engine driveability concerns.

Conduct this test with the engine coolant and transmission fluid at correct levels and at normal operating temperature.

Apply the parking brake firmly for each Stall Speed Test.

STALL SPEED CHART

Engine	Stall Speed
3.5L	2,350-2,650

1. Connect the scan tool.

   NOTE: If the recorded RPM exceeds the maximum limits, release the accelerator pedal immediately because clutch or band slippage is indicated.

2. In each of the following ranges D, L and R, press the accelerator pedal to the floor and hold it just long enough to let the engine get to WOT. While making this test, do not hold the throttle open for more than 5 seconds at a time.
3. Note the results in each range.
4. After each range, move the selector lever to NEUTRAL and run the engine at 1,000 RPM for about 15 seconds to cool the torque converter before making the next test.
5. Use the Stall Speed Diagnosis Chart for corrective actions.

   NOTE: The stall speed in REVERSE will be lower.

6. If stall speeds were too high, see the Stall Speed Diagnosis Chart. If stall speeds were too low, first check engine idle speed and tune up. If engine is OK, remove torque converter and check TCC for slippage.

STALL SPEED DIAGNOSIS CHART

Range	Possible Source
D, L	Forward Clutch Low/Reverse Clutch Low/One-Way Clutch (OWC)
R	Low/Reverse Clutch Direct Clutch

Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: **Do not try to stop the fluid leak by increasing the torque beyond specifications. This may cause damage to the case threads.**

Leakage at the transaxle pan-to-case gasket often can be stopped by tightening the attaching bolts to 9 Nm (80 lb-in). If necessary, install a new pan case gasket.

Check the transmission fluid filler tube connection at the transmission case. If leakage is found here, install a new grommet.

Check transmission fluid lines and fittings between the transmission and the cooler in the radiator tank for wear or damage. If leakage cannot be stopped by tightening a transmission fluid tube nut, install new parts. When transmission fluid is found leaking between the case and the cooler line fitting, check for missing or damaged O-ring, then tighten the fitting to maximum specification.

If the leak continues, install a new cooler tube fitting and tighten to specification. The same procedure should be followed for transmission fluid leaks between the radiator cooler and the cooler tube fittings. Refer to **TRANSAXLE/TRANSMISSION COOLING** article.

Check the engine coolant in the radiator. If the transmission fluid is present in the coolant, the cooler in the radiator is probably leaking. The cooler can be further checked for leaks by disconnecting the tubes for the cooler fittings and applying no more than 345 kPa (50 psi) air pressure to the fittings. Remove the coolant recovery cap to relieve the pressure buildup at the exterior of the transmission fluid cooler tank. If the cooler is leaking and/or will not hold pressure, install a new cooler.

If leakage is found at the transaxle range selector lever, install a new seal.

If leakage is found at the transaxle internal harness connector, install a new O-ring.

Fluid Leakage in Torque Converter Area

In diagnosing and correcting fluid leaks in the torque converter area, use the following procedures to locate the exact cause of the leakage. Leakage at the front of the transaxle, as evidenced by fluid around the torque converter housing, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of the leak before removing the transaxle from the vehicle. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5 steps following correspond with the numbers in the illustration.

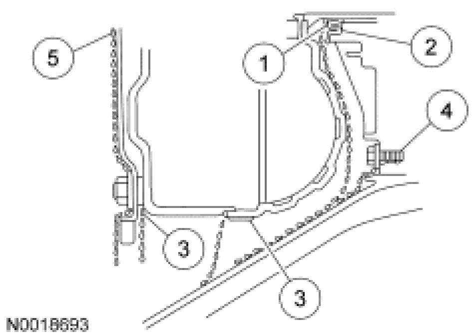

Fig. 35: Identifying Torque Converter Fluid Leakage Area
Courtesy of FORD MOTOR CO.

1. Transmission fluid leaking by the converter hub seal lip will tend to move along the drive hub and onto the back of the torque converter. Except in the case of a total seal failure, transmission fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.
2. Transmission fluid leakage by the outside diameter of the converter impeller hub seal and the case will follow the same path that leaks by the inside diameter of the converter hub seal follow.
3. Transmission fluid leakage from the converter cover weld or the converter-to-flexplate stud weld will appear at outside diameter of torque converter on the back face of the flexplate and in the converter housing only near the flexplate. If a converter-to-flexplate lug, lug weld or converter cover weld leak is suspected, remove the converter and pressure check.
4. Transmission fluid leakage from the bolts inside the converter housing will flow down the back of the torque converter housing. Leakage may be from loose or missing bolts.
5. Engine oil leaks are sometimes incorrectly diagnosed as transaxle converter hub seal leaks. The following areas of possible leakage should also be checked to determine if engine oil leakage is causing the concern.
    1. Leakage at the valve cover gasket may allow engine oil to flow over the torque converter housing or seep down between the torque converter housing and cylinder block causing oil to be present in or at the bottom of the torque converter housing.
    2. Oil galley plug leaks will allow engine oil to flow down the rear face of the cylinder block to the

bottom of the torque converter housing.

3. Leakage at the crankshaft rear oil seal will work back to the flexplate, and then into the torque converter housing.
4. Leakage at oil pressure sensor will allow engine oil to flow down the rear face of the cylinder block to the bottom of the torque converter housing.

Leak Check Test

1. Remove the transmission fluid level indicator and note the color of the transmission fluid. Original factory fill transmission fluid is dyed red to aid in determining if leakage is from the engine or transaxle. Unless a considerable amount of makeup transmission fluid has been added or the transmission fluid has been changed, the red color should assist in pinpointing the leak.
2. Remove the torque converter housing cover. Clean off any transmission fluid from the top and bottom of the torque converter housing, the front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a suitable nonflammable solvent and blow dry with compressed air.
3. Wash out the torque converter housing, the front of the flexplate and the converter drain plugs. The torque converter housing may be washed out using cleaning solvent and a squirt-type oil can. Blow all washed areas dry with compressed air.
4. Start and run the engine until the transaxle reaches its normal operating temperature. Observe the back of the cylinder block and top of the torque converter housing for evidence of transmission fluid leakage. Raise the vehicle on a hoist and run the engine at fast idle, then at engine idle, occasionally shifting to the OVERDRIVE and REVERSE ranges to increase pressure within the transaxle. Observe the front of the flexplate, back of the cylinder block (in as far as possible) and inside the torque converter housing and front of the case. Run the engine until transmission fluid leakage is evident and the probable source of leakage can be determined.

Leak Check Test With Black Light

Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda) is used to detect a transmission fluid leak.

1. Add Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye to the transmission fluid. Use one 30.0 mL (1 oz) of dye solution for every 3.8L (4 qt) of transmission fluid.
2. Start and run the engine until the transaxle reaches its normal operating temperature. Observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Raise the vehicle on a hoist and run the engine at fast idle, then at engine idle, occasionally shifting to the DRIVE and REVERSE ranges to increase pressure within the transaxle. Observe the front of the flexplate, back of the cylinder block (in as far as possible), inside the torque converter housing and the entire case until fluid leakage is evident and the probable source of leakage can be determined.

TRANSMISSION FLUID COOLER

Special Tools

Illustration	Tool Name	Tool Number

	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

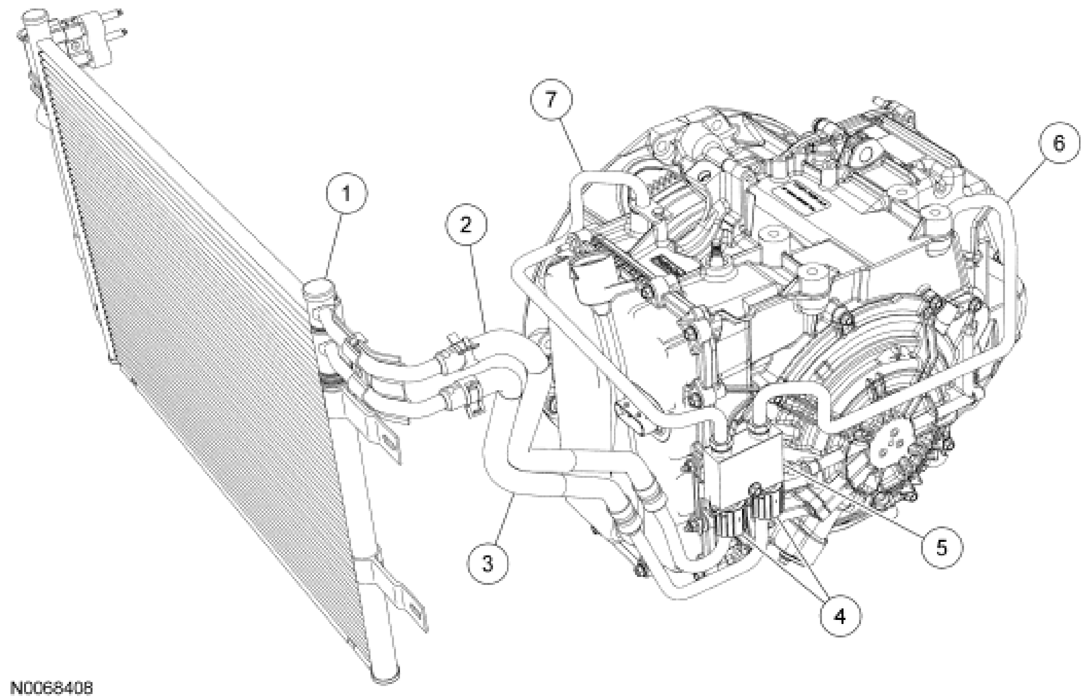

Fig. 36: Transaxle Cooling
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	19712	Transmission fluid cooler
2	7F113	Transmission fluid cooler outlet tube and hose assembly
3	7F112	Transmission fluid cooler inlet tube and hose assembly
4	7J081	Secondary latches
5	7H322	Transmission fluid cooler thermal bypass

		valve
6	7H420	Transmission fluid cooler inlet tube
7	7H420	Transmission fluid cooler outlet tube

When internal wear or damage has occurred in the transaxle, metal particles, clutch plate material or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transaxle troubles and must be removed from the system before the transaxle is put back into use. Refer to **Transmission Fluid Cooler Backflushing and Cleaning**.

Transmission Fluid Cooler Flow Test

NOTE: The selector lever linkage, selector lever cable adjustment, transmission fluid level and line pressure must be within specification before carrying out this test. Refer to AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS article for selector lever linkage and selector lever cable adjustment and refer to Special Testing Procedures for line pressure test. The transmission fluid must be above 82°C (180°F) for the cooler by-pass to open to carry out this test.

1. Using a scan tool, run the engine to establish the correct transmission fluid temperature of 82°C (180°F).
2. Remove the transmission fluid level indicator from the transmission fluid filler tube.
3. Place funnel in the transmission fluid filler tube.
4. With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING & LIFTING** article.
5. Remove the transmission fluid cooler return tube (rear fitting) from the fitting on the transaxle case.
6. Connect one end of a hose to the cooler return tube and route other end of the hose up to a point where it can be inserted into the funnel at the transmission fluid filler tube.
7. Start the engine and run it at idle with the transmission in NEUTRAL position.
8. When transmission fluid flowing from hose is in a steady stream, a liberal amount of transmission fluid should be observed. "Liberal" is described as about 1L (1 qt) delivered in 30 seconds. If a liberal flow is observed, the test is complete.
9. If the flow is not liberal, stop the engine. Disconnect the hose from the cooler return tube and connect it to the converter outlet tube fitting (front fitting) on the transaxle case.
10. Repeat Steps 7 and 8. If flow is now approximately 1L (1 qt) in 30 seconds, refer to **Transmission Fluid Cooler Backflushing and Cleaning**. If the flow is still not approximately 1L (1 qt) in 30 seconds, repair the pump and/or the torque converter.

    If new transmission fluid cooler tubes need to be installed, refer to **TRANSAXLE/TRANSMISSION COOLING** article.

DIAGNOSIS BY SYMPTOM

Special Tools

Illustration	Tool Name	Tool Number

 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

The Diagnostic Routines give the technician diagnostic information, direction and suggest possible components, using a symptom as a starting point.

The Diagnostic Routines are divided into 2 categories: Electrical Routines, indicated by 200 series numbers, and Hydraulic/Mechanical Routines, indicated by 300 series numbers. The Electrical Routines list the possible electrical components that could cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that could cause or contribute to the symptom described.

Diagnosis by Symptom Index Directions

1. Using the Symptom Index, select the Concern/Symptom that best describes the condition.
2. See the routine indicated in the Diagnosis By Symptom Index.
3. Always begin diagnosis of a symptom with:
    1. Preliminary inspections.
    2. Verifications of condition.
    3. Checking the fluid levels.
    4. Carry out other test procedures as directed.

    NOTE: **Not all concerns and conditions with electrical components will set a DTC. Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine listed.**

4. Begin with the Electrical Routine, if indicated. Follow the reference or action required statements. Always carry out the OBD tests as required. Never skip steps. Repair as required. If the concern is still present after electrical diagnosis, then proceed to the Hydraulic/Mechanical Routine listed.
5. The Hydraulic/Mechanical Routines list possible hydraulic or mechanical components that could cause the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to make sure of correct repair.

Diagnosis by Symptom Index

Title	Routines	
	Electrical[1]	Hydraulic/ Mechanical
Engagement Concerns:		
No Forward	201	301
No Reverse	202	302
Harsh Reverse	203	303
Harsh Forward	204	304
Delayed/Soft Reverse	205	305
Delayed/Soft Forward	206	306
No Forward and No Reverse	207	307
Delayed/Soft Forward and Reverse	209	309
Shift Concerns:		
Some or All Shifts Missing	210	310
Timing - Early/Late	211	311
Timing - Erratic/Hunting	212	312
Soft/Slipping	213	313
Harsh	214	314
No 1st Gear, Engages in Higher Gear	215	315
No 1-2 Shift (Automatic)	220	320
No 2-3 Shift (Automatic)	221	321
No 3-4 Shift (Automatic)	222	322
No 4-5 Shift (Automatic)	223	323
No 5-6 Shift (Automatic)	224	324
No 6-5 Shift (Automatic)	225	325
No 5-4 Shift (Automatic)	226	326
No 4-3 Shift (Automatic)	227	327
No 3-2 Shift (Automatic)	228	328
No 2-1 Shift (Automatic)	229	329
Soft/Slipping 1-2 Shift (Automatic)	230	330
Soft/Slipping 2-3 Shift (Automatic)	231	331
Soft/Slipping 3-4 Shift (Automatic)	232	332
Soft/Slipping 4-5 Shift (Automatic)	233	333
Soft/Slipping 5-6 Shift (Automatic)	234	334
Soft/Slipping 6-5 Shift (Automatic)	235	335
Soft/Slipping 5-4 Shift (Automatic)	236	336
Soft/Slipping 4-3 Shift (Automatic)	237	337
Soft/Slipping 3-2 Shift (Automatic)	238	338
Soft/Slipping 2-1 Shift (Automatic)	239	339
Harsh 1-2 Shift (Automatic)	240	340
Harsh 2-3 Shift (Automatic)	241	341

Harsh 3-4 Shift (Automatic)	242	342
Harsh 4-5 Shift (Automatic)	243	343
Harsh 5-6 Shift (Automatic)	244	344
Harsh 6-5 Shift (Automatic)	245	345
Harsh 5-4 Shift (Automatic)	246	346
Harsh 4-3 Shift (Automatic)	247	347
Harsh 3-2 Shift (Automatic)	248	348
Harsh 2-1 Shift (Automatic)	249	349
Torque Converter Operation Concerns:		
Torque Converter: No Apply	250	350
Torque Converter: Always Applied/Stalls Vehicle	251	351
Torque Converter: Cycling/Shudder/Chatter	252	352
Other Concerns		
Selector Lever Efforts High	261	361
External Leaks	262	362
Vehicle Driveability Concerns	263	363
Noise/Vibration - Forward or Reverse	264	364
Engine Will Not Crank	265	365
No Park Range	266	366
Overheating	267	367

(1) Carry out electrical routine first.

Diagnostic Routines

ENGAGEMENT CONCERN: NO FORWARD

Possible Component		Reference/Action
201 - ELECTRICAL ROUTINE		
Powertrain Control System		
	No electrical concerns	
301 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged or out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION**

		EXTERNAL CONTROLS article.
Incorrect Pressures		
	Line Pressure Control (LPC) solenoid stuck low	Check pressure at line pressure tap. Carry out Line Pressure Tests and Stall Speed Tests. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specification. If pressures are low, check the following possible components: • Main control valve body • Pump assembly • LPC solenoid
Main Control Valve Body		
	Bolts out of torque specification	Adjust bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect gaskets for damage. Install new as required.
	Manual Control Valve - damaged	Inspect for damage. Install new as required.
Pump Assembly		
	Bolts out of torque specification	Inspect for damage. Install a new pump as required.
	Porosity/cross leaks/ball missing or leaking	Inspect for damage. Install a new pump as required.
	Components - damaged	Inspect for damage. Install a new pump as required.

ENGAGEMENT CONCERN: NO REVERSE

Possible Component		Reference/Action
202 - ELECTRICAL ROUTINE		
Powertrain Control System		
	No electrical concerns	
302 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged or out of adjustment	Inspect for damage. Repair as required. Verify selector lever

		cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Incorrect Pressures		
	Line Pressure, Line Pressure Control (LPC) Pressure - low	Carry out Line Pressure Tests and Stall Speed Tests. Refer to **Special Testing Procedures**. Check pressure at line pressure tap. See the Line Pressure Chart for specifications. If pressures are low, check the following possible components: • Main control valve body • Pump assembly • Low/reverse clutch assembly • Direct clutch assembly • Shift Solenoid B (SSB), Shift Solenoid D (SSD) and Shift Solenoid E (SSE) solenoids
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gasket and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Manual Control Valve, Springs - stuck, damaged	Inspect for damage. Install new as required.
	Multiplex Valve, Springs - stuck, damaged	Inspect for damage. Install new as required.
	Low/Reverse Clutch Valve, Springs - stuck, damaged	Inspect for damage. Install new as required.
	Direct Clutch Valve, Springs - stuck, damaged	Inspect for damage. Install new as required.
Pump Assembly		
	Bolts out of torque	Inspect for damage. Install a new

	specification	pump as required.
	Porosity/cross leaks, pump assembly leaking, plugged hole	Inspect for damage. Install a new pump as required.
	Components damaged	Inspect for damage. Install a new pump as required.
Low/Reverse Clutch Assembly		
	SSD solenoid stuck low	Inspect for damage. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
	Low/Reverse regulator valve stuck	Inspect for damage. Repair as required.
	Seals, Piston, Springs - damaged	Inspect for damage. Repair as required.
	Clearance check out of specification	Inspect for damage. Carry out clearance checks.
	Friction Elements - damaged or worn	Inspect for damage. Repair as required.
Direct Clutch Assembly		
	Seals, Piston, Spring - damaged	Inspect for damage. Repair or install new as required.
	SSB solenoid	Inspect for damage. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
	Direct clutch regulator valve	Inspect for damage. Repair or install new as required.
	Clearance check out of specification	Inspect for damage. Carry out clearance checks.
	Friction Elements - damaged, clearance check incorrect	Inspect for damage. Repair as required.

ENGAGEMENT CONCERN: HARSH REVERSE

Possible Component		Reference/Action
203 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Mass Air Flow (MAF) Sensor, Intake Air	Run On-Board Diagnostic (OBD). Refer to the **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test**

	Temperature (IAT) Sensor, Throttle Position (TP) Sensor, Idle Speed Control (ISC), Power Steering Pressure (PSP) Sensor, Engine RPM, Line Pressure Control (LPC) Solenoid, Transmission Fluid Temperature (TFT) sensor, Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor, Shift Solenoid B (SSB), Shift Solenoid D (SSD) or transaxle solenoid power control circuit open/shorted	**A**, go to **Pinpoint Test B**, go to **Pinpoint Test C** and Go to **Pinpoint Test E**.
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
303 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line Pressure, LPC Solenoid Pressure - high	Carry out Line Pressure and Stall Speed Tests. Refer to **Special Testing Procedures**. Check pressure at line pressure taps. See the Line Pressure Chart for specifications. If high, check the Main Control Valve Body.
Pump Assembly		
	Bolts out of torque	Inspect for damage.

	specification	Install a new pump as required.
	Porosity/cross leaks, pump assembly leaking, plugged hole	Inspect for damage. Install a new pump as required.
	Components damaged	Inspect for damage. Install a new pump as required.
Main Controls		
	Bolts out of torque specification	Tighten bolts to specification.
	Gasket and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Low/Reverse regulator valve - stuck, damaged	Inspect for damage. Install new as required.
	Low/Reverse boost valve - stuck, damaged	Inspect for damage. Install new as required.
	Direct regulator valve - stuck, damaged	Inspect for damage. Install new as required.
	Direct boost valve - stuck, damaged	Inspect for damage. Install new as required.
	SSB mechanically stuck - high	Install a new solenoid body. Refer to **Solenoid Body Assembly**.
	SSD mechanically stuck - high	Install a new solenoid body. Refer to **Solenoid Body Assembly**.
	Main Regulator Valve - stuck, damaged	Inspect for damage. Install new as required.
Low/Reverse Clutch Assembly		
	SSD solenoid stuck low	Inspect for damage. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
	Low/Reverse regulator valve stuck	Inspect for damage. Install a new solenoid body as required.

	Seals, Piston, Springs - damaged	Inspect for damage. Repair as required.
	Clearance check out of specification	Inspect for damage. Carry out clearance checks.
	Friction Elements - damaged or worn	Inspect for damage. Repair as required.
Direct Clutch Assembly		
	Seals, Piston, Spring - damaged	Inspect for damage. Repair or install new as required.
	SSB solenoid stuck	Inspect for damage. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
	Direct clutch regulator valve	Inspect for damage. Repair or install new as required.
	Clearance check out of specification	Inspect for damage. Carry out clearance checks.
	Friction Elements - damaged, clearance check incorrect	Inspect for damage. Repair or install new as required.

ENGAGEMENT CONCERN: HARSH FORWARD

Possible Component		Reference/Action
204 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Mass Air Flow (MAF) Sensor, Intake Air Temperature (IAT) Sensor, Throttle Position (TP) Sensor, Idle Speed Control (ISC), Power Steering Pressure (PSP) Sensor, Engine RPM, Line Pressure Control (LPC)	Run On-Board Diagnostic (OBD). Refer to the **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B**, go to **Pinpoint Test C** and Go to **Pinpoint Test E**.

	Solenoid, Transmission Fluid Temperature (TFT) sensor, Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor, Shift Solenoid A (SSA) or transaxle solenoid power control circuit open/shorted	
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
304 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line Pressure, LPC Pressure - high	Carry out Line Pressure and Stall Speed Tests. Refer to **Special Testing Procedures**. Check pressure at line pressure taps. See the Line Pressure Chart for specifications. If high, check the Main Control Valve Body, Pump Assembly.
Pump Assembly		
	Bolts out of torque specification	Inspect for damage. Install a new pump as required.
	Porosity/cross leaks, pump assembly leaking, plugged hole	Inspect for damage. Install a new pump as required.
	Components damaged	Inspect for damage. Install a new pump as required.
Main Controls		
	Bolts out of torque	Tighten bolts to

	specification	specification.
	Gasket and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Forward Clutch Seal - Leaking Between Valve Body and Case	Inspect for damage. Install new as required.
	Forward clutch regulator valve - stuck, damaged	Inspect for damage. Install new as required.
	Forward clutch boost valve - stuck, damaged	Inspect for damage. Install new as required.
	Main Regulator Valve - stuck, damaged	Inspect for damage. Install new as required.
Forward Clutch Assembly		
	Seals, Piston - worn, damaged	Inspect for damage. Install new as required.
	Friction Elements - damaged	Inspect for damage. Install new as required.
	Wave Spring - damaged	Inspect for damage. Install new as required.

ENGAGEMENT CONCERN: DELAYED/SOFT REVERSE

Possible Component		Reference/Action
205 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Transmission Range (TR) Sensor, Vehicle Wiring Harnesses, PCM, Line Pressure Control (LPC) Solenoid, Transmission Fluid Temperature (TFT) sensor	Run On-Board Diagnostic (OBD). Refer to the **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B** and Go to **Pinpoint Test D**.
Solenoid Body		
	Incorrect solenoid	Verify solenoid body strategy data

	body strategy data stored in the PCM	stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
305 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Incorrect Pressures		
	Line Pressure, LPC Pressure - low	Check pressure at line pressure tap. Carry out Line Pressure and Stall Speed Tests. Refer to **Special Testing Procedures**. If pressures are low, check the following possible components: Main Control Valve Body, Pump Assembly, Low/Reverse Clutch Assembly, Direct Clutch Assembly.
Main Controls		
	Solenoid Body Filter Plugged	Inspect for damage. Install a new filter as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Low/Reverse regulator valve - stuck, damaged	Inspect for damage. Install new as required.
	Low/Reverse boost valve - stuck, damaged	Inspect for damage. Install new as required.

	Direct regulator valve - stuck, damaged	Inspect for damage. Install new as required.
	Direct boost valve - stuck, damaged	Inspect for damage. Install new as required.
	Manual Control Valve, Main Regulator Valve, Converter Drain Back Valve, Springs - missing, damaged, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) stuck low	Inspect for damage. Go to **Pinpoint Test A**. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
	Shift Solenoid D (SSD) stuck low	Inspect for damage. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
Pump Assembly		
	Pump Assembly - worn/cross leaks, leaking	Inspect for damage. Install new as required.
Low/Reverse Clutch Assembly		
	SSD solenoid stuck low	Inspect for damage. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
	Low/Reverse regulator valve stuck	Inspect for damage. Install new as required.
	Seals, Piston, Springs - damaged	Inspect for damage. Repair as required.
	Clearance check out of specification	Inspect for damage. Carry out clearance checks.
	Friction Elements - damaged or worn	Inspect for damage. Repair as required.
Direct Clutch Assembly		
	Seals, Piston, Spring - damaged	Inspect for damage. Repair or install new as required.
	SSB solenoid stuck	Inspect for damage. Install a new solenoid body as required. Refer to **Solenoid Body Assembly**.
	Direct clutch regulator valve	Inspect for damage. Repair or install new as required.

	Clearance check out of specification	Inspect for damage. Carry out clearance checks.
	Friction Elements - damaged, clearance check incorrect	Inspect for damage. Repair as required.

ENGAGEMENT CONCERN: DELAYED/SOFT FORWARD

Possible Component		Reference/Action
206 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Transmission Range (TR) Sensor, Vehicle Wiring Harnesses, PCM, Line Pressure Control (LPC) Solenoid, Transmission Fluid Temperature (TFT) sensor, Turbine Shaft Speed (TSS) sensor	Run On-Board Diagnostic (OBD). Refer to the **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B**, go to **Pinpoint Test C** and Go to **Pinpoint Test D**.
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
306 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS**

		article.
Incorrect Pressures		
	Line Pressure, Line Pressure Control (LPC) Pressure - low	Check pressure at line pressure tap. Carry out Line Pressure and Stall Speed Tests. Refer to **Special Testing Procedures**. If pressures are low, check the following possible components: Main Control Valve Body, Pump Assembly, and Forward Clutch.
Main Controls		
	Plugged Solenoid Body Filter	Inspect for damage. Install new as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Forward Clutch Regulator Valve stuck or damaged	Inspect for damage. Install new as required.
	Forward Clutch Boost Valve stuck or damaged	Inspect for damage. Install new as required.
	Main Regulator Valve - stuck, damaged, missing	Inspect for damage. Repair as required.
	LPC solenoid stuck low	Install a new solenoid body. Refer to **Solenoid Body Assembly**.
	SSA stuck low	Install a new solenoid body. Refer to **Solenoid Body Assembly**.
Pump Assembly		
	Bolts out of torque specification	Tighten bolts to specification.
	Worn/cross leaks	Inspect for wear and leaks. Install new as required.
Forward Clutch Assembly		
	Clutch Plates, Seals, Piston - worn, damaged	Inspect clutches, seals and piston for damage. Install new as required.
	Wave Spring - damaged	Inspect for damage. Install new as required.

ENGAGEMENT CONCERN: NO FORWARD AND NO REVERSE

Possible Component		Reference/Action
207 - ELECTRICAL ROUTINE		
	No electrical concerns	
307 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Halfshaft		
	Splines - worn, damaged	Inspect for damage. Repair as required.
	Shaft - misassembled, incorrect	Inspect for damage. Repair as required.
Selector Lever Linkage (Internal/External)		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Incorrect Pressures		
	Line Pressure, Line Pressure Control (LPC) Pressure - low	Carry out Line Pressure and Stall Tests. Check pressure at the line pressure tap. See the Line Pressure Chart for specifications. If pressures are low, check the following possible components: Transmission Fluid Filter and Seal Assembly, Main Control, Pump Assembly, Low/Reverse Clutch Assembly, Forward Clutch Assembly.
Transmission Fluid Filter and Seal Assembly		
	Plugged, damaged, not correctly seated	Inspect for damage. Install a new filter and seal assembly.
	Filter, Seal - damaged	Inspect for damage. Install a new filter and seal assembly.
Main Controls		
	Solenoid Body	Inspect for damage. Install a new

	Filter Plugged	filter as required.
	Manual Valve	Inspect for damage. Install new as required.
	Shift Valves	Inspect for damage. Install new as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Main Regulator Valve (only if line pressure is out of specification) - damaged	Inspect for damage. Repair as required.
	Components - damaged, check balls stuck	Inspect for damage. Repair as required.
Pump Assembly		
	Bolts out of torque specification	Tighten bolts to specification.
	Porosity/cross leaks - leaking, plugged hole	Install a new pump assembly.
	Components damaged - Chain, Sprocket or Shaft Broken	Inspect for damage. Install new as required.
Output Shaft		
	Splines - damaged	Inspect for damage. Repair as required.
Other Possible Components		
	Turbine Shaft	Inspect for damage. Repair as required.
	Pump Shaft, Sprockets and Drive Chain	Inspect for damage. Repair as required.
	Flexplate	Inspect for damage. Repair as required.
	Sun Gear and Shell Assemblies	Inspect for damage. Repair as required.
	Planetaries	Inspect for damage. Repair as required.
	Final Drive	Inspect for damage. Repair as

	Assembly	required.

ENGAGEMENT CONCERN: DELAYED/SOFT FORWARD AND REVERSE

Possible Component		Reference/Action
209 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Transmission Range (TR) Sensor, Transmission Fluid Temperature (TFT) Sensor, Turbine Shaft Speed (TSS) Sensor, Line Pressure Control (LPC) Solenoid, Vehicle Wiring Harnesses, PCM	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B**, go to **Pinpoint Test C** and Go to **Pinpoint Test D**.
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
309 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Incorrect Pressures		
	Line Pressure, LPC Pressure - low	Carry out Line Pressure and Stall Speed Tests. Refer to **Special Testing Procedures**. See the Line

		Pressure Chart for specifications. If pressures are low, check the following possible components: Main Control, Pump Assembly and LPC solenoid.
Transmission Fluid Filter and Seal Assembly		
	Plugged, damaged, not correctly seated	Inspect for damage. Install a new filter and seal assembly.
	Filter, Seal - damaged	Inspect for damage. Install a new filter and seal assembly.
Main Controls		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Seals, Manual Valve, Main Regulator Valve - missing, damaged or misassembled	Inspect for damage. Repair or install new as required.
Pump Assembly		
	Bolts out of torque specification	Tighten bolts to specification.
	Worn/cross leaks - leaking	Install a new pump assembly.
	Components damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOME OR ALL SHIFTS MISSING

Possible Component		Reference/Action
210 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E	Run On-Board Diagnostic (OBD). Refer to the **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test C** and Go to **Pinpoint Test D**.

	(SSE), Throttle Position (TP) sensor, Mass Air Flow (MAF) sensor, Output Shaft Speed (OSS) sensor, Turbine Shaft Speed (TSS) sensor, Transmission Range (TR) Sensor, Line Pressure Control (LPC) Solenoid	
310 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Incorrect transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Vehicle Speed Input		
	Insufficient, erratic or no input received by the PCM from the OSS sensor	Inspect for damage. Repair as required. Go to **Pinpoint Test C**.
Transmission Fluid Filter and Seal Assembly		
	Plugged, damaged, not correctly seated	Inspect for damage. Install a new filter and seal assembly.
	Filter, Seal - damaged	Inspect for damage. Install a new filter and seal assembly.
Main Controls		
	Regulator and/or Boost Valves - stuck, damaged, misassembled	Inspect for damage. Repair or install new as required.
	Plugged Solenoid Body Filter	Inspect for damage. Install new as required.

End Cover		
	End Cover Gasket - leaking	Inspect for damage. Repair or install new as required.
Planetary Gear Sets		
	Damaged	Inspect for damage. Repair as required.
One-Way Clutch Assembly		
	Damaged	Inspect for damage. Repair as required.
Other Components		
	Clutches	Inspect for damage. Repair as required.
	Output Shafts (Differential)	Inspect for damage. Repair as required.
	Powerflow Components	Inspect for damage. Repair as required.
	Go to Shift Concerns:	See the appropriate shift concern and routine: • Shift Concern: No 1-2, Routine 220/320 • Shift Concern: No 2-3, Routine 221/321 • Shift Concern: No 3-4, Routine 222/322 • Shift Concern: No 4-5, Routine 223/323 • Shift Concern: No 5-6, Routine 224/324 • Shift Concern: No 6-5, Routine 225/325 • Shift Concern: No 5-4, Routine 226/326 • Shift Concern: No 4-3, Routine 227/327 • Shift Concern: No 3-2, Routine 228/328 • Shift Concern: No 2-1, Routine 229/329

SHIFT CONCERNS: TIMING - EARLY/LATE

Possible Component	Reference/Action
211 - ELECTRICAL ROUTINE	

Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE), Throttle Position (TP) sensor, Mass Air Flow (MAF) sensor, Output Shaft Speed (OSS) sensor, Intake Air Temperature (IAT) sensor, Engine Coolant Temperature (ECT) sensor, Transmission Fluid Temperature (TFT) sensor, Turbine Shaft Speed (TSS) sensor, Internal Wire Harness, Line Pressure Control (LPC) Solenoid	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B** and Go to **Pinpoint Test C**.
		Carry out Shift Point Road Test. Refer to **Shift Point Road Test** and carry out Torque Converter Operation Test. Refer to **Torque Converter Diagnosis**.
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
311 - HYDRAULIC/MECHANICAL ROUTINE		
Other		
	Tire Size	See the specification decal and

		verify vehicle has original equipment. Changes in tire size will affect shift timing.
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Main Controls		
	Plugged Solenoid Body Filter	Inspect for damage. Install new as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Valves, Accumulators, Seals, Springs, Clips, Check balls - damaged, missing, misassembled	Inspect for damage. Repair as required. See the appropriate shift concern and routine for further diagnosis: • Shift Concern: Soft/Slipping 1-2, Routine 230/330 • Shift Concern: Soft/Slipping 2-3, Routine 231/331 • Shift Concern: Soft/Slipping 3-4, Routine 232/332 • Shift Concern: Soft/Slipping 4-5, Routine 233/333 • Shift Concern: Soft/Slipping

		5-6, Routine 234/334 • Shift Concern: Soft/Slipping 6-5, Routine 235/335 • Shift Concern: Soft/Slipping 5-4, Routine 236/336 • Shift Concern: Soft/Slipping 4-3, Routine 237/337 • Shift Concern: Soft/Slipping 3-2, Routine 238/338 • Shift Concern: Soft/Slipping 2-1, Routine 239/339
End Cover		
	End Cover Gasket - leaking	Inspect for damage. Repair or install new as required.
Planetary Gear Sets		
	Damaged	Inspect for damage. Repair or install new as required.
One-Way Clutch Assembly		
	Damaged	Inspect for damage. Repair or install new as required.
Other Components		
	Clutches	Inspect for damage. Repair or install new as required.
	Output Shaft (Differential)	Inspect for damage. Repair or install new as required.
	Powerflow Components	Inspect for damage. Repair as required.
Vehicle Speed Input		
	Insufficient, erratic or no input received by the PCM from the OSS or TSS sensors	Inspect for damage. Repair as required. Go to **Pinpoint Test C**.
Transmission Fluid Filter and Seal Assembly		
	Plugged, damaged, not correctly seated	Inspect for damage. Install a new filter and seal assembly.
	Filter, Seal - damaged	Inspect for damage. Install a new filter and seal assembly.

SHIFT CONCERNS: TIMING - ERRATIC/HUNTING

Possible Component		Reference/Action
212 - ELECTRICAL ROUTINE		
Powertrain Control System		

	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Torque Converter Clutch (TCC) and Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE), Throttle Position (TP) sensor, Output Shaft Speed (OSS) sensor, Engine Coolant Temperature (ECT) sensor, Intake Air Temperature (IAT) sensor, Mass Air Flow (MAF) sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor, Turbine Shaft Speed (TSS) sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B**, go to **Pinpoint Test C**, Go to **Pinpoint Test D** and Go to **Pinpoint Test E**.
		Carry out Shift Point Road Test. Refer to **Shift Point Road Test** and carry out Torque Converter Operation Test. Refer to **Torque Converter Diagnosis**.
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
312 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.

	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Main Control Valve Body		
	Plugged Solenoid Body Filter	Inspect for damage. Install new as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Valves, Seals, Clips, Check Ball - stuck, damaged, contaminated	Inspect for damage. Repair or install new as required.
End Cover		
	End Cover Gasket - leaking	Inspect for damage. Repair or install new as required.
Vehicle Speed Input		
	Insufficient, erratic or no input received by the PCM from the OSS or TSS sensor	Inspect for damage. Repair as required. Go to **Pinpoint Test C**.
Torque Converter Clutch (TCC)		
		See Torque Converter Cycling (Routine 254/354).
Planetary Gear Sets		
	Damaged	Inspect for damage. Repair as required.
Clutch Assemblies		
	Damaged Clutch Plates, Pistons, Seals, Return Springs	Inspect for damage. Repair or install new as required.
Transmission Fluid Filter and Seal Assembly		

	Plugged, damaged, not correctly seated	Inspect for damage. Install a new filter and seal assembly.
	Filter, Seal - damaged	Inspect for damage. Install a new filter and seal assembly.
For Diagnosis Related to a Specific Shift		
		See the appropriate shift concern and routine for further diagnosis: • Shift Concern: No 1-2, Routine 220/320 • Shift Concern: No 2-3, Routine 221/321 • Shift Concern: No 3-4, Routine 222/322 • Shift Concern: No 4-5, Routine 223/323 • Shift Concern: No 5-6, Routine 224/324 • Shift Concern: No 6-5, Routine 225/325 • Shift Concern: No 5-4, Routine 226/326 • Shift Concern: No 4-3, Routine 227/327 • Shift Concern: No 3-2, Routine 228/328 • Shift Concern: No 2-1, Routine 229/329 • Shift Concern: Soft/Slip 1-2, Routine 230/330 • Shift Concern: Soft/Slip 2-3, Routine 231/331 • Shift Concern: Soft/Slip 3-4, Routine 232/332 • Shift Concern: Soft/Slip 4-5, Routine 233/333 • Shift Concern: Soft/Slip 5-6, Routine 234/334 • Shift Concern: Soft/Slip 6-5, Routine 235/335 • Shift Concern: Soft/Slip 5-4, Routine 236/336 • Shift Concern: Soft/Slip 4-3,

		Routine 237/337 • Shift Concern: Soft/Slip 3-2, Routine 238/338 • Shift Concern: Soft/Slip 2-1, Routine 239/339 • Shift Concern: Harsh 1-2, Routine 240/340 • Shift Concern: Harsh 2-3, Routine 241/341 • Shift Concern: Harsh 3-4, Routine 242/342 • Shift Concern: Harsh 4-5, Routine 243/343 • Shift Concern: Harsh 5-6, Routine 244/344 • Shift Concern: Harsh 6-5, Routine 245/345 • Shift Concern: Harsh 5-4, Routine 246/346 • Shift Concern: Harsh 4-3, Routine 247/347 • Shift Concern: Harsh 3-2, Routine 248/348 • Shift Concern: Harsh 2-1, Routine 249/349

SHIFT CONCERNS: FEEL - SOFT/SLIPPING

Possible Component		Reference/Action
213 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Line Pressure Control (LPC) Solenoid, Mass Air Flow (MAF) sensor, Throttle Position (TP) sensor, Engine Coolant	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B** and Go to **Pinpoint Test C**.

	Temperature (ECT) sensor, Intake Air Temperature (IAT) sensor, Transmission Fluid Temperature (TFT) sensor, Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor	
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
313 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Selector Lever Linkage (Internal/External)		
	Damaged, out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Incorrect Pressures		
	Low LPC pressure	Check pressures at line pressure taps. Carry out Line Pressure and Stall Speed Tests. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specification. If pressures are low or all shifts are soft/slipping refer to **Main Control**. If pressures are OK and a specific shift is soft/slipping, see the following chart: • Soft/Slipping Shift 1-2,

		Routine 230/330 • Soft/Slipping Shift 2-3, Routine 231/331 • Soft/Slipping Shift 3-4, Routine 232/332 • Soft/Slipping Shift 4-5, Routine 233/333 • Soft/Slipping Shift 5-6, Routine 234/334 • Soft/Slipping Shift 6-5, Routine 235/335 • Soft/Slipping Shift 5-4, Routine 236/336 • Soft/Slipping Shift 4-3, Routine 237/337 • Soft/Slipping Shift 3-2, Routine 238/338 • Soft/Slipping Shift 2-1, Routine 239/339
Transmission Fluid Filter and Seal Assembly		
	Plugged, damaged, not correctly seated	Inspect for damage. Install a new filter and seal assembly.
	Filter, Seal - damaged	Inspect for damage. Install a new filter and seal assembly.
Main Controls		
	Plugged Solenoid Body Filter	Inspect for damage. Install new as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Sticking or Binding Valves, Check Balls, Clips, Springs - damaged, missing	Inspect for damage. Repair or install new as required.
Pump Assembly		
	Pump Assembly - worn/cross leaks, leaking	Inspect for damage. Install new as required.

SHIFT CONCERNS: FEEL - HARSH

Possible Component		Reference/Action
214 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Line Pressure Control (LPC) Solenoid, Mass Air Flow (MAF) sensor, Throttle Position (TP) sensor, Output Shaft Speed (OSS) sensor, Turbine Shaft Speed (TSS) sensor, Engine Coolant Temperature (ECT) sensor, Intake Air Temperature (IAT) sensor, Power Steering Pressure (PSP) switch, Transmission Fluid Temperature (TFT) sensor, Transmission Range (TR) Sensor, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD) and Shift Solenoid E (SSE)	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B**, go to **Pinpoint Test C** and Go to **Pinpoint Test D**.
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
314 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	Low transmission	Check transmission

	fluid level	fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Incorrect Pressures		
	High LPC pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If pressures are high or all shifts are harsh, go to Main Control. Refer to **Main Control**. If pressures are OK and a specific shift is harsh. See the appropriate shift routine in the following chart: • Shift 1-2, Routine 240/340 • Shift 2-3, Routine 241/341 • Shift 3-4, Routine 242/342 • Shift 4-5, Routine 243/343 • Shift 5-6, Routine 244/344 • Shift 6-5, Routine

		245/345 • Shift 5-4, Routine 246/346 • Shift 4-3, Routine 247/347 • Shift 3-2, Routine 248/348 • Shift 2-1, Routine 249/349
Main Control Valve Body		
	Plugged Solenoid Body Filter	Inspect for damage. Install new as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Valves, Springs, Clips, Check Balls - stuck, damaged	Inspect for damage. Repair or install new as required.
Pump Assembly		
	Pump Assembly - worn/cross leaks, leaking	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 1ST GEAR, ENGAGES IN HIGHER GEAR

Possible Component		Reference/Action
215 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, Go to **Pinpoint Test C** and Go to **Pinpoint Test E**.

	Solenoid E (SSE), Output Shaft Speed (OSS) sensor and Turbine Shaft Speed (TSS) sensor, transaxle solenoid power control circuit - no voltage at transaxle connector	Repair as required. Clear codes. Road Test and rerun On-Board Diagnostic (OBD).
315 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Plugged Solenoid Body Filter (SSA Filter Plate)	Inspect for damage. Install new as required.
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Forward Clutch Regulator Valve, Springs, Clips - stuck, damaged, missing, misassembled	Inspect for damage. Repair as required.
	Shift Solenoid - stuck, damaged	Inspect for damage. Go to **Pinpoint Test A**. Repair as required. Activate solenoid using the scan tool. Repair as required.
	For diagnosis related to a specific gear, use the scan tool to select the gear	See the following routines: • Shift 1-2, Routine 220/320 • Shift 2-3, Routine 221/321 • Shift 3-4, Routine 222/322 • Shift 4-5,

		Routine 223/323 • Shift 5-6, Routine 224/324
Mechanical		
	Clutches or Seals - damaged or worn	Inspect for damage. Repair or install new as required.

SHIFT CONCERNS: NO 1-2 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
220 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid C (SSC) and Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
320 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control. Refer to **Main Control**.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator Valve,	Inspect for damage. Repair or install new

	Springs, Clips - loose, stuck, missing, misassembled stuck off	as required.
	SSC not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Low/Reverse Clutch Assembly - Failed On		
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - overheated	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring	Inspect for damage.

	Assembly - damaged	Install new as required.
Pump Assembly		
	Worn/cross leaks	Inspect for damage. Install new as required.
	Component damaged	Inspect for damage. Install a new pump assembly as required.
Low One-Way Clutch Assembly		
	Not overrunning, damaged	Inspect for damage. Install new as required.
Planetary Carrier		
	Damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 2-3 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
221 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid B (SSB) Failed, Shift Solenoid C (SSC) Stuck On and Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
321 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control. Refer to **Main Control**.

Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, stuck off	Inspect for damage. Repair or install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, stuck on	Inspect for damage. Repair or install new as required.
	SSB or SSC not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub -	Inspect for damage.

	damaged	Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Intermediate Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 3-4 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
222 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid D (SSD) Failed, Shift Solenoid B (SSB) Stuck On and Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
322 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Overdrive Regulator	Inspect for damage.

	and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed off	Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	Inspect for damage. Repair or install new as required.
	SSD not functioning correctly, SSB stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Overdrive Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.

	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 4-5 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
223 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid B (SSB) Failed, Shift Solenoid A (SSA) Stuck On, Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
Transmission Control Switch (TCS)/Overdrive (O/D) Cancel Switch		
	Switch control circuit open/shorted, switch damaged	Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
323 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck,	Inspect for damage. Repair or install new as required.

	missing, misassembled, clutch failed off	
	Forward Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	Inspect for damage. Repair or install new as required.
	SSB not functioning correctly, SSA stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Forward Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 5-6 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
224 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid C (SSC) Failed, Shift Solenoid B (SSB) Stuck On, Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
Transmission Control Switch (TCS)/Overdrive (O/D) Cancel Switch		
	Switch control circuit open/shorted, switch damaged	Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
324 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed off	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	Inspect for damage. Repair or install new as required.
	SSC not functioning correctly, SSB stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body**

		Assembly. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 6-5 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
225 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid B (SSB) Failed, Shift Solenoid C (SSC) Stuck On, Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
325 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		

	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed off	Inspect for damage. Repair or install new as required.
	SSC not functioning correctly, SSB stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as

		required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 5-4 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
226 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid A (SSA) Failed, Shift Solenoid B (SSB) Stuck On, Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
326 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves,	Inspect for damage. Repair or install new

	Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	as required.
	Forward Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed off	Inspect for damage. Repair or install new as required.
	SSA not functioning correctly, SSB stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Forward Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage.

		Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 4-3 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
227 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid B (SSB) Failed, Shift Solenoid D (SSD) Stuck On, Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
327 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Overdrive Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch	Inspect for damage. Repair or install new as required.

	failed off	
	SSB not functioning correctly, SSD stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Overdrive Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring	Inspect for damage.

	Assembly - damaged	Install new as required.

SHIFT CONCERNS: NO 3-2 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
228 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid C (SSC) Failed, Shift Solenoid B (SSB) Stuck On, Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
328 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, stuck on	Inspect for damage. Repair or install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck,	Inspect for damage. Repair or install new as required.

	missing, misassembled, stuck off	
	SSB or SSC not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Intermediate Clutch Assembly - Failed Off		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as

		required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: NO 2-1 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
229 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Shift Solenoid C (SSC) Stuck On, Transmission Range (TR) Sensor	Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** and Go to **Pinpoint Test D**.
329 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator Valve, Springs, Clips - loose, stuck, missing, misassembled, stuck on	Inspect for damage. Repair or install new as required.
	SSC not functioning correctly, stuck on	Activate solenoid using scan tool. Refer

		to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly - Failed On		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Low One-Way Clutch Assembly		
	Damaged - Not holding	Inspect for damage. Install new as required.
Planetary Carrier		
	Damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 1-2 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
230 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download

		new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
330 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator Valve, Springs, Clips - loose, stuck, missing, binding, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		

	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Pump Assembly		
	Worn/cross leaks	Inspect for damage. Install new as required.
	Component damaged	Inspect for damage. Install a new pump assembly if required.

SHIFT CONCERNS: SOFT/SLIPPING 2-3 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
231 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
331 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If

		not OK, check Main Control. Refer to **Main Control**.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Multiplex Valve, Springs, Clips - loose, stuck, missing, binding misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.

	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 3-4 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
232 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
332 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.

	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Overdrive Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid D (SSD) or Shift Solenoid B (SSB) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Overdrive Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as

		required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 4-5 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
233 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
333 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Forward Regulator	Inspect for damage.

	and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid A (SSA) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Forward Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.

	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 5-6 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
234 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
334 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid C (SSC) or Shift Solenoid B (SSB) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid

		body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 6-5 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
235 - ELECTRICAL ROUTINE		
Solenoid Body		

	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
335 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid C (SSC) or Shift Solenoid B (SSB) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as

		required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 5-4 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
236 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
336 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque	Tighten bolts to

	specification	specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	Inspect for damage. Repair or install new as required.
	Forward Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed off	Inspect for damage. Repair or install new as required.
	Shift Solenoid A (SSA) not functioning correctly, Shift Solenoid B (SSB) stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring	Inspect for damage.

	Assembly - damaged	Install new as required.
Forward Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 4-3 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
237 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
337 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Overdrive Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.

	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled, clutch failed off	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid D (SSD) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Overdrive Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged,	Inspect for damage.

	worn	Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 3-2 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
238 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
338 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing,	Inspect for damage. Repair or install new as required.

	misassembled	
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Multiplex Valve, Spring, Clip - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as

		required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: SOFT/SLIPPING 2-1 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
239 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
339 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.

	Intermediate Regulator Valve, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Low One-Way Clutch Assembly		
	Damaged - not holding	Inspect for damage. Install new as required.
Planetary Carrier		
	Damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 1-2 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
240 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
340 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator Valve, Springs, Clips - loose, stuck, missing, binding, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body**

		Assembly. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Pump Assembly		
	Worn/cross leaks	Inspect for damage. Install new as required.
	Component damaged	Inspect for damage, missing ball. Install a new pump assembly if required.

SHIFT CONCERNS: HARSH 2-3 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
241 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
341 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		

	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Multiplex Valve, Springs, Clips - loose, stuck, missing, binding misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to

		Solenoid Body Strategy.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 3-4 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
242 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to

		Solenoid Body Strategy.
342 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Overdrive Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid D (SSD) or Shift Solenoid B (SSB) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Overdrive Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as

		required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 4-5 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
243 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
343 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and	Inspect for damage.

	Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Repair or install new as required.
	Forward Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid A (SSA) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Forward Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.

	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 5-6 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
244 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
344 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.

	Shift Solenoid C (SSC) or Shift Solenoid B (SSB) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as

		required.

SHIFT CONCERNS: HARSH 6-5 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
245 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
346 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid C (SSC) or Shift Solenoid B (SSB) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the

		PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 5-4 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
246 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as

		necessary. Refer to **Solenoid Body Strategy**.
346 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed on	Inspect for damage. Repair or install new as required.
	Forward Regulator and Boost Valves, Springs, Clips - loose, stuck, missing, misassembled, clutch failed off	Inspect for damage. Repair or install new as required.
	Shift Solenoid A (SSA) not functioning correctly, Shift Solenoid B (SSB) stuck on	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged,	Inspect for damage.

	worn	Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Forward Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 4-3 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
247 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
347 - HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.

	Overdrive Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled, clutch failed off	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid D (SSD) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Overdrive Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage.

		Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 3-2 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
248 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
348 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off	Inspect for damage. Install new as required.

	location	
	Direct Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Intermediate Regulator and Boost Valves, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid B (SSB) or Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Direct Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage.

		Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.

SHIFT CONCERNS: HARSH 2-1 SHIFT (AUTOMATIC)

Possible Component		Reference/Action
249 - ELECTRICAL ROUTINE		
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
349 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off	Inspect for damage. Install new as required.

	location	
	Intermediate Regulator Valve, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	Shift Solenoid C (SSC) not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Intermediate Clutch Assembly		
	Seals - damaged	Inspect for damage. Install new as required.
	Piston - damaged	Inspect for damage. Install new as required.
	Friction - damaged, worn	Inspect for damage. Install new as required.
	Cylinder Hub - damaged	Inspect for damage. Install new as required.
	Return Spring Assembly - damaged	Inspect for damage. Install new as required.
Low One-Way Clutch Assembly		
	Damaged - not holding	Inspect for damage. Install new as required.
Planetary Carrier		
	Damaged	Inspect for damage. Install new as required.

TORQUE CONVERTER OPERATION CONCERNS: NO APPLY

Possible Component		Reference/Action
250 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Torque Converter Clutch (TCC) Solenoid, Throttle Position (TP) sensor, Transmission Fluid Temperature (TFT) sensor, Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor and shorted shift solenoid	Carry out Torque Converter Operation Test. Refer to **Torque Converter Diagnosis**. Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A**, go to **Pinpoint Test B** and Go to **Pinpoint Test C**.
350 - HYDRAULIC/MECHANICAL ROUTINE		
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control Valve Body.
Main Control Valve Body		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect for damage. Install new as required.
	TCC Regulator Valve, Springs, Clips - loose, stuck, missing, misassembled	Inspect for damage. Repair or install new as required.
	TCC Control Valve, Springs, Clips - loose, stuck, missing,	Inspect for damage. Repair or install new as required.

	misassembled	
	TCC Solenoid - not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.
Turbine Shaft		
	Seals - damaged, missing	Inspect for damage. Repair as required.
	Holes - missing, plugged	Inspect for damage. Repair as required.
Stator Support Assembly		
	Seals - damaged, missing	Inspect for damage. Repair as required.
	Holes - missing, plugged	Inspect for damage. Repair as required.
Torque Converter Hub Bushing		
	Torque converter hub bushing worn	Inspect the bushing for damage and install a new torque converter as required.
	TCC worn	Install a new torque converter as required.

TORQUE CONVERTER OPERATION CONCERN: ALWAYS APPLIED/STALLS VEHICLE

Possible Component		Reference/Action
251 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Torque Converter Clutch (TCC) Solenoid	Carry out Torque Converter Operation Test. Refer to **Torque Converter Diagnosis**. Run On-Board Diagnostic (OBD). Refer to

		Introduction - Gasoline Engines article for diagnosis. Go to **Pinpoint Test A** using the scan tool. Repair as required. Clear codes. Road Test and rerun On-Board Diagnostic (OBD).
351 - HYDRAULIC/MECHANICAL ROUTINE		
Main Controls		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect gaskets. Repair as required.
	TCC Regulator Valve, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	TCC Control Valve, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	TCC Solenoid - not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the PCM. Refer to **Solenoid Body Strategy**.

TORQUE CONVERTER OPERATION CONCERN: CYCLING/SHUDDER/CHATTER

Possible Component	Reference/Action

252 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Torque Converter Clutch (TCC) Solenoid	Carry out Torque Converter Operation Test. Refer to **Torque Converter Diagnosis**. Run On-Board Diagnostic (OBD). Refer to **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test A** using the scan tool. Repair as required. Clear codes. Road Test and rerun On-Board Diagnostic (OBD).
Solenoid Body		
	Incorrect solenoid body strategy data stored in the PCM	Verify solenoid body strategy data stored in the PCM, download new identification and strategy as necessary. Refer to **Solenoid Body Strategy**.
352 - HYDRAULIC/MECHANICAL ROUTINE		
	Transmission fluid condition	Prior to carrying out this action, make sure all electrical diagnostics have been carried out. Inspect transmission fluid condition. If burnt, drain transmission fluid and converter. Install new transmission fluid and transmission fluid filter assembly. Bring vehicle to normal operating temperature. Carry out Transaxle Drive

		Cycle Test. Carry out On-Board Diagnostic (OBD). If condition still exists, continue diagnostics.
Incorrect Pressures		
	Line pressure	Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to **Special Testing Procedures**. See the Line Pressure Chart for specifications. If not OK, check Main Control. Refer to **Main Control**.
Main Controls		
	Bolts out of torque specification	Tighten bolts to specification.
	Gaskets and Separator Plate - damaged, off location	Inspect gaskets for damage. Repair as required.
	TCC Regulator Valve, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	TCC Control Valve, Springs, Clips - loose, stuck, binding, missing, misassembled	Inspect for damage. Repair or install new as required.
	TCC Solenoid - not functioning correctly	Activate solenoid using scan tool. Refer to **Output State Control (OSC) Mode**. Go to **Pinpoint Test A**. Install a new solenoid body. Refer to **Solenoid Body Assembly**. Download a new solenoid body strategy into the

		PCM. Refer to **Solenoid Body Strategy**.
Turbine Shaft		
	Seals - damaged, missing	Inspect for damage. Install new as required.
Torque Converter		
	Torque converter damaged	Refer to **Torque Converter**.
Stator Support Assembly		
	Stator support assembly - worn, damaged	Inspect for damage. Install new as required.
	Stator support seals - worn, damaged, leaking	Inspect for damage. Install new as required.

OTHER CONCERNS: SELECTOR LEVER EFFORTS HIGH

Possible Component		Reference/Action
261 - ELECTRICAL ROUTINE		
	No electrical concerns	
361 - HYDRAULIC/MECHANICAL ROUTINE		
Selector Lever Linkage (Internal, External)		
	Damaged or out of adjustment	Inspect for damage. Repair as required. Verify selector lever adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Manual Control Lever		
	External Retaining Pin - damaged, Nut - loose, Detent Spring - bent, damaged; or Park Mechanism - damaged, incorrect lever used	Inspect for damage. Repair or install new as required.
Main Control Valve Body		
	Manual Valve - stuck	Inspect for damage. Repair or install new as required.
	Bolts out of torque	Tighten bolts to specification.

	specification	
Brake Shift Interlock		
	Mechanically damaged	Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
	Transmission Range (TR) sensor indicating park	Go to **Pinpoint Test D**.

OTHER CONCERNS: EXTERNAL LEAKS

Possible Component		Reference/Action
262 - ELECTRICAL ROUTINE		
	No electrical concerns	
362 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid Level		
	High transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Seals, Gaskets		
	Leaks: Converter, Turbine Shaft Speed (TSS) Sensor, Halfshaft Axles, Gasket/Seal Manual Lever, Fluid Level Indicator, Main Control Cover, Incorrect Hub Seal	Locate source of leak. Repair as required.
Other		
	Leaks: Cooler Fitting, Pressure Taps, Transaxle Connector, Transaxle Pan, Cooler Tubes, Case Porosity, Case Cracked	Locate source of leak. Repair as required.

	Vent - blocked damaged	Check vent for damage or blockage. Repair as required.

OTHER CONCERNS: POOR VEHICLE PERFORMANCE

Possible Component		Reference/Action
263 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Torque Converter Clutch (TCC) Solenoid, Throttle Position (TP) sensor, Output Shaft Speed (OSS) sensor, Mass Air Flow (MAF) sensor, Intake Air Temperature (IAT) Sensor, Internal Wiring Harness	Run On-Board Diagnostic (OBD). Refer to the **Introduction - Gasoline Engines** article for diagnosis. Go to **Pinpoint Test C** using scan tool. Repair as required. Clear codes. Road test and rerun On-Board Diagnostic (OBD). Carry out Shift Point Road Test. Refer to **Shift Point Road Test** and carry out Torque Converter Operation Test. Refer to **Torque Converter Diagnosis**.
363 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid		
	Low transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
Verify Correct Shift Scheduling, Engagements, Line Pressures and Stall Speed		
		Go to the appropriate Diagnostic Routines per Index.
Converter Clutch Always Applied		
		Go to Routine 351.

NOTE: **NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

OTHER CONCERNS: NOISE/VIBRATION - FORWARD OR REVERSE

Possible Component		Reference/Action
264 - ELECTRICAL ROUTINE		
	No electrical concerns	
364 - HYDRAULIC/MECHANICAL ROUTINE		
For Noises/Vibrations That Change With Engine Speed		
	Converter components	Locate source of disturbance. Repair as required. Transmission fluid level (low) - pump cavitation. Pump assembly.
	Engine Drive Accessories Transmission Fluid Cooler Tubes grounding out Flexplate	
For Noises/Vibrations That Change With Vehicle Speed		
	Engine Mounts - loose or damaged Driveline concerns: • Halfshaft shudder • CV joints • Suspension • Modifications Output/Halfshaft Splines - worn or damaged	Locate source of disturbance and repair as required.
	Turbine Shaft Speed	Inspect for damage.

	(TSS) sensor - incorrectly installed	Repair as required.
Other Noises/Vibrations		
	Main Controls - Valve resonance	Locate source of disturbance and repair as required.
	Selector Lever Cable - vibration, grounding	Locate source of disturbance and repair as required.
	Transmission Fluid Cooler Tubes - grounding	Locate source of disturbance and repair as required.
	ABS	Refer to **VEHICLE DYNAMIC SYSTEMS** article.
	Power Steering Pump	Refer to **POWER STEERING** article.

OTHER CONCERNS: ENGINE WILL NOT CRANK

Possible Component		Reference/Action
265 - ELECTRICAL ROUTINE		
Powertrain Control System		
	Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Transmission Range (TR) Sensor	Carry out Torque Converter Operation Test. Refer to **Torque Converter Diagnosis**. Run On-Board Diagnostic (OBD). Refer to the **Introduction - Gasoline Engines** article for diagnosis.
365 - HYDRAULIC/MECHANICAL ROUTINE		
Selector Lever Linkage (Internal, External)		
	Damaged or out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.

OTHER CONCERNS: NO PARK RANGE

Possible Component		Reference/Action
266 - ELECTRICAL ROUTINE		
	No electrical concerns	
366 - HYDRAULIC/MECHANICAL ROUTINE		

Selector Lever Linkage (Internal/External)		
	Damaged or out of adjustment	Inspect for damage. Repair as required. Verify selector lever cable adjustment. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Park Mechanism		
	Park Brake Pawl, Parking Pawl Return Spring, Park Rod Abutment, Parking Pawl Shaft, Parking Pawl Actuating Rod, Manual Control Lever, Manual Lever Detent Spring - damaged	Inspect for damage. Repair as required.

OTHER CONCERNS: TRANSAXLE OVERHEATING

Possible Component		Reference/Action
267 - ELECTRICAL ROUTINE		
	No electrical concerns	
367 - HYDRAULIC/MECHANICAL ROUTINE		
Transmission Fluid		
	Incorrect transmission fluid level	Check transmission fluid level and adjust as necessary. Refer to **Preliminary Inspection**.
	Transmission fluid condition	Carry out transmission fluid condition check. Refer to **Preliminary Inspection**.
Transmission Fluid Cooler Tubes		
	Damaged, blocked, reversed, leaking	Inspect for damage. Repair as required.
Auxiliary Cooler		
	Damaged, blocked, restricted or	Inspect for damage. Repair as required.

	incorrectly installed	
Vehicle Concerns Causing Engine Overheating		
		Refer to **ENGINE COOLING** article.
Main Control Valve Body		
	Torque Converter Regulator Valve/Spring - stuck, damaged	Inspect for damage. Repair as required.
	Torque Converter Control Valve/Spring - stuck, damaged	Inspect for damage. Repair as required.
Torque Converter Not Applying		
	Seized Converter One-Way Clutch (OWC)	See Routine 250/350. Inspect for damage. Repair as required.
Excessive Towing Loads		
		Check GVW.
Idle or Driveability Concern		
		Refer to the **Introduction - Gasoline Engines** article.
Incorrect Clutch Application or Oil Pressure Control System		
		Carry out line pressure tests. Refer to **Special Testing Procedures** and carry out shift point road test. Refer to **Shift Point Road Test**. Repair as required. See the Line Pressure Chart, and Clutch Application Chart for specifications. Repair as required.

GENERAL PROCEDURES

TRANSMISSION FLUID COOLER BACKFLUSHING AND CLEANING

Special Tools

Illustration	**Tool Name**	**Tool Number**
	Turbo-Tank Heated Cooler Line	222-00004

 ST2971-A	Flusher	

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: **Transmission fluid cooler backflushing will be carried out using the Turbo-Tank Heated Cooler Line Flusher. Follow the manufacturer's instructions included with the machine. Test the equipment to make sure that a vigorous fluid flow is present before proceeding.**

1. Check and top off fluid level of the Turbo-Tank Heated Cooler Line Flusher tank with transmission fluid.
2. Allow the fluid in the flusher 15-30 minutes to heat up to 60°C (140°F) before using.
3. Install the line adapters on the transmission fluid cooler tubes.

   NOTE: **The FRONT transmission fluid cooler tube on the thermal bypass valve is the transmission fluid cooler pressure tube.**

4. Attach the flusher's red line to the transmission fluid cooler pressure tube quick disconnect fitting.
5. Attach the flusher's blue line to the transmission fluid cooler return tube quick disconnect fitting.
6. Follow the equipment instructions to purge the transmission fluid cooler tubes and transmission fluid cooler prior to starting the flushing procedure.
7. Allow the transmission fluid cooling system to backflush for 10-15 minutes, then flush the transmission fluid cooler in a normal flow direction for an additional 10-15 minutes.
8. Clean the transaxle mounted fluid cooler tubes and the thermal bypass valve by hand.

TRANSMISSION FLUID DRAIN AND REFILL

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: In order to completely clean the torque converter, this procedure needs to be carried out 3 times.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.

   NOTE: If an internal problem is suspected, drain the transmission fluid through a paper filter. A small amount of metal or friction particles may be found from normal wear. If an excessive amount of metal or friction material is present, the transaxle will need to be overhauled.

2. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

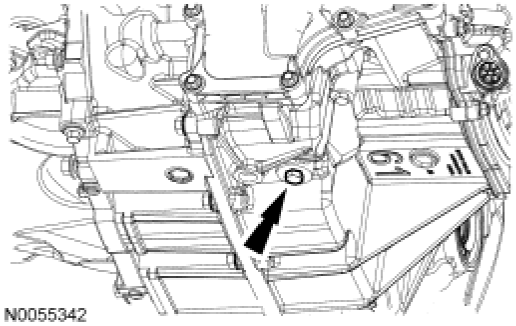

Fig. 37: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

3. Install the transmission fluid drain plug.
   - Tighten to 9 Nm (80 lb-in).

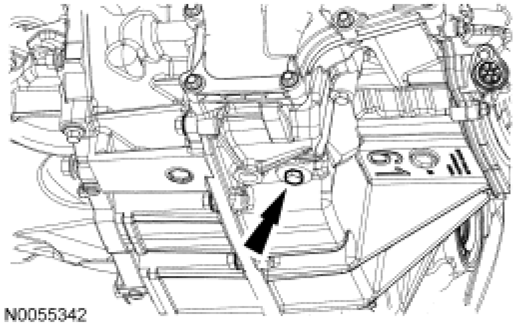

Fig. 38: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

4. Fill the transaxle with clean transmission fluid.

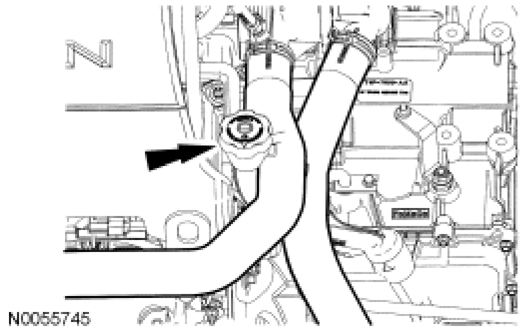

Fig. 39: Filling Transaxle With Clean Transmission Fluid
Courtesy of FORD MOTOR CO.

5. Start the engine and let it run for 3 minutes. Move the range selector lever into each gear position. Repeat Steps 2, 3, 4 and 5 two more times.

   After the transmission fluid has been changed a total of 3 times, check the transmission fluid level for a final time, making sure that the transmission fluid is at the correct level.

TORQUE CONVERTER

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
   - A torque converter malfunction has been determined based on complete diagnostic procedures.
   - Converter bolt holes, impeller hub or bushing are damaged.
   - Discoloration (due to overheating).
   - Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes:
     - Major metallic failure.
     - Multiple clutches or clutch plate failures.
     - Sufficient component wear which results in metallic contamination.
     - Internal torque converter contamination present. For additional information, refer to **Torque Converter Contamination Inspection**.

TORQUE CONVERTER CONTAMINATION INSPECTION

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: **Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur. Use only clean automatic transmission fluid designated for the transmission and converter being serviced.**

1. If a new or remanufactured torque converter is not being installed, the following steps must be completed.
2. With the torque converter on a bench, pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter and examine the transmission fluid.
3. Observe the color and odor of the fluid. The fluid should be red, not brown or black. Odor may indicate an overheating condition such as clutch disc or band failure.
4. Examine the stain on the tissue for evidence of particles of any kind. If particles are present in the transmission fluid, a new torque converter must be installed.
5. If there are no particles or contamination present, drain the remainder of the transmission fluid from the torque converter.
6. Add 1.9L (2 qt) of clean transmission fluid into the converter and agitate by hand.
7. Thoroughly drain the transmission fluid.

IN-VEHICLE SERVICING

MAIN CONTROL

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

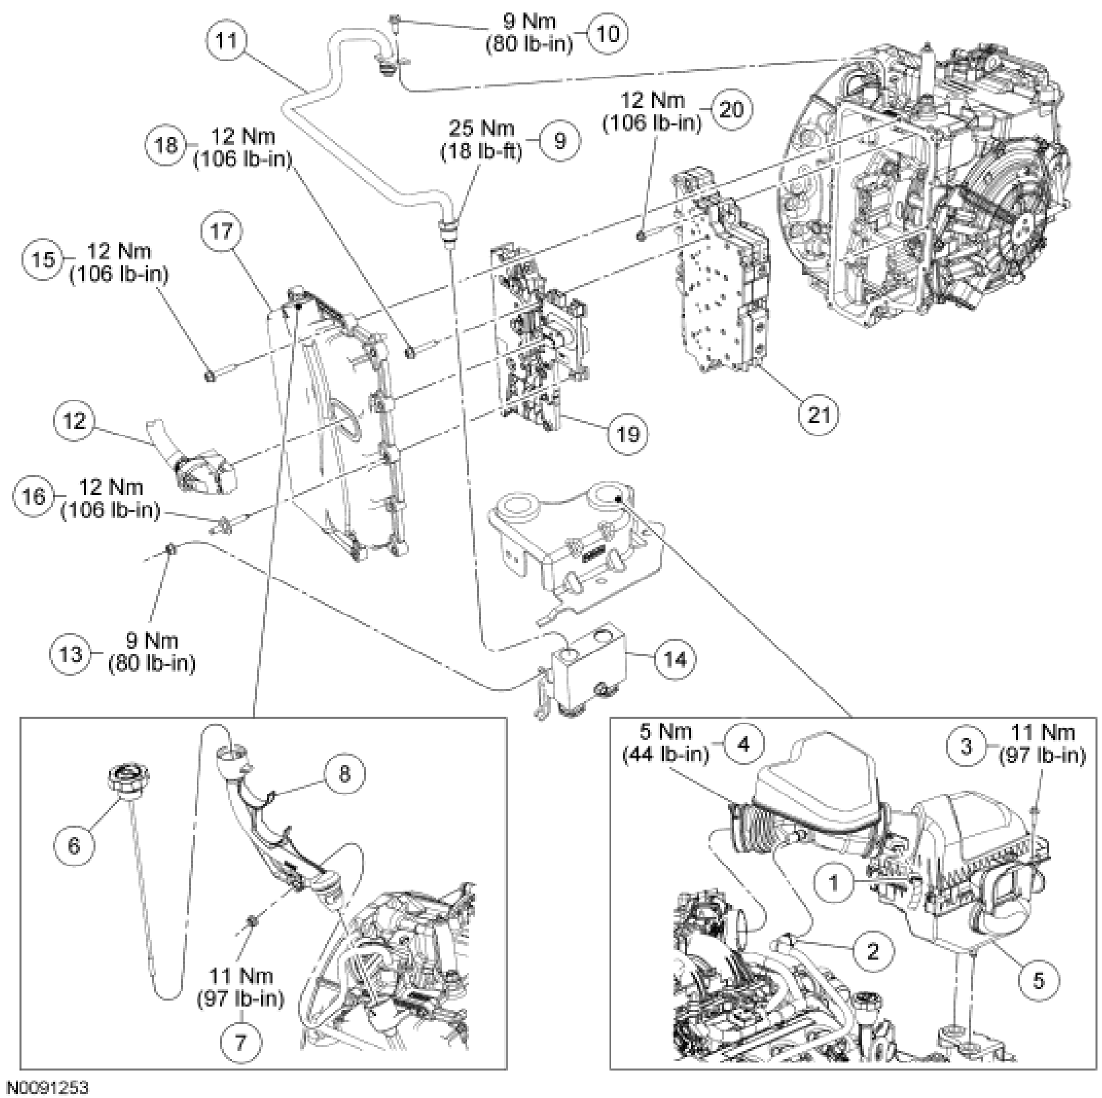

Fig. 40: Main Control & Solenoid Body Components (With Torque Specifications)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Electrical connector - Mass Air Flow (MAF) sensor
2	6758	Tube assembly - crankcase vent
3	N606678	Bolt - Air Cleaner (ACL) bracket
4	9C632	Clamp - ACL outlet pipe
5	9C662	ACL assembly
6	7A020	Transmission fluid level indicator
7	W520101	Transmission fluid filler tube nut
8	7A228	Transmission fluid filler tube
9	-	Nut - transmission fluid cooler tube (part

		of 7H420)
10	W711538	Bolt - transmission fluid cooler tube
11	7H420	Transmission fluid cooler tube
12	7A488	Connector - transaxle harness
13	W520101	Nut - bypass valve
14	7H322	Valve - transaxle fluid cooler bypass
15	7J289	Bolt - solenoid body cover (11 required)
16	W708442	Studbolt - solenoid body cover (3 required)
17	7G004	Cover - solenoid body
18	7J291	Bolt - solenoid body
19	7Z369	Solenoid body
20	7J291	Bolt - valve body
21	7A100	Valve body

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

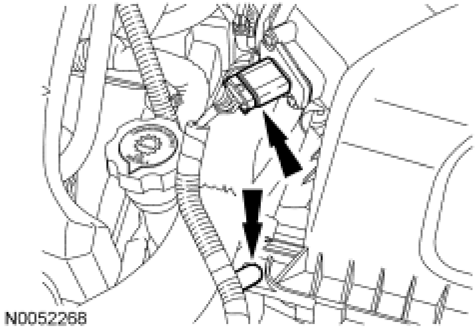

Fig. 41: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

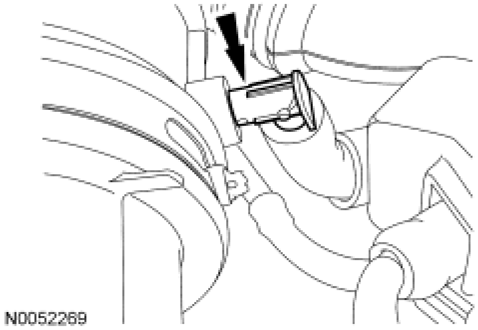

Fig. 42: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

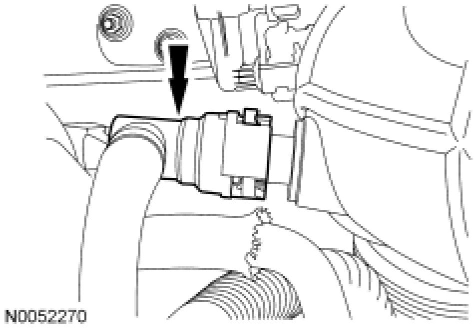

Fig. 43: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

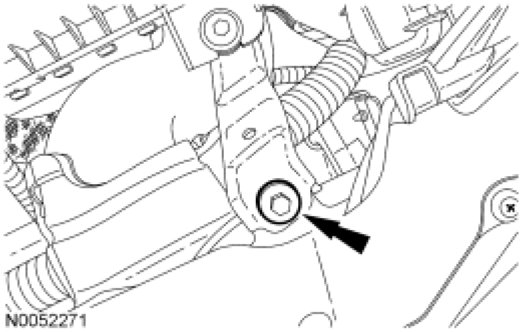

Fig. 44: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

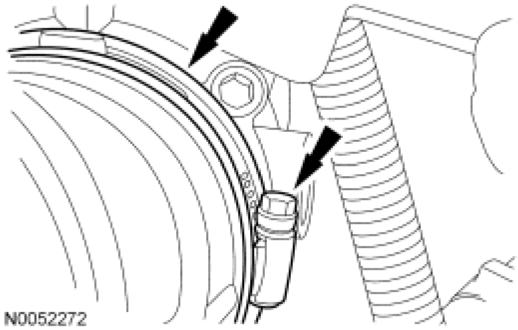

Fig. 45: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

7. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

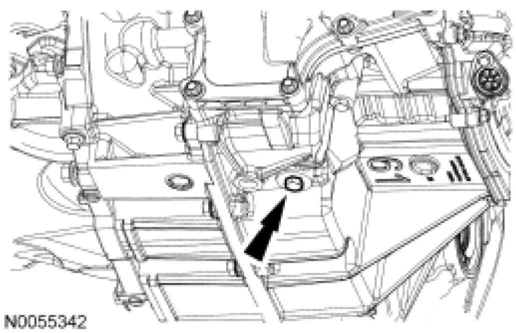

Fig. 46: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

8. Install the transmission fluid drain plug.
   - Tighten to 9 Nm (80 lb-in).

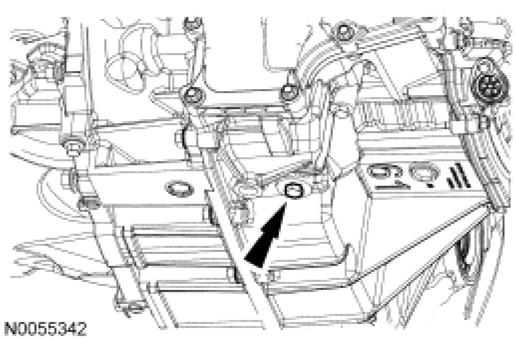

Fig. 47: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

9. Remove the coolant hoses from the transmission fluid filler tube and position aside.

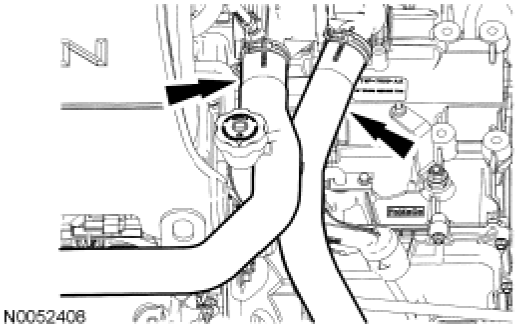

Fig. 48: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

10. Remove the transmission fluid level indicator.

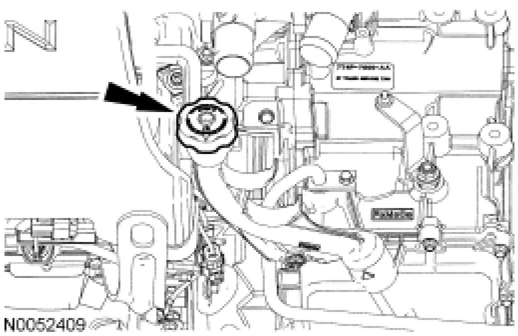

Fig. 49: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

11. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

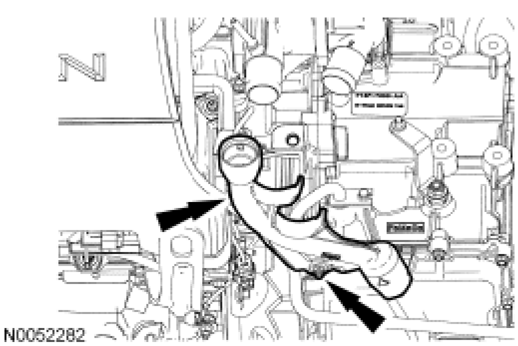

Fig. 50: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Loosen the transmission fluid cooler tube fitting from the thermal bypass valve.

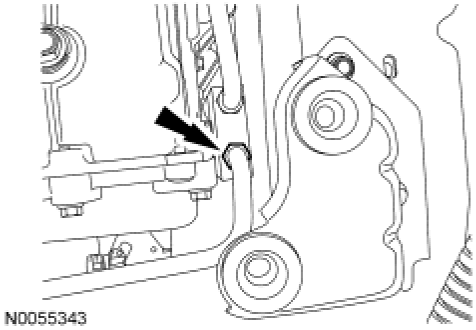

Fig. 51: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

13. Remove and discard the transmission fluid cooler tube bolt and remove the transmission fluid cooler tube.

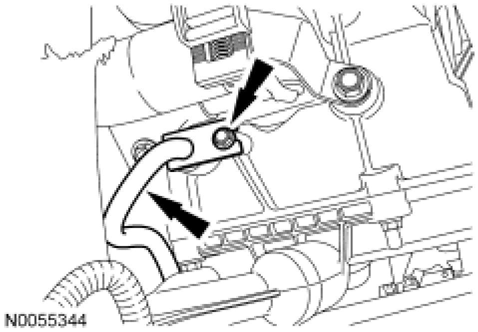

Fig. 52: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

14. Inspect the transaxle case to make sure that the transmission fluid cooler tube seal and backing ring were removed with the transmission fluid cooler tube and are not stuck in the transaxle case. If the transmission fluid cooler tube seal or backing ring are stuck in the transaxle case, remove the seal and backing ring.

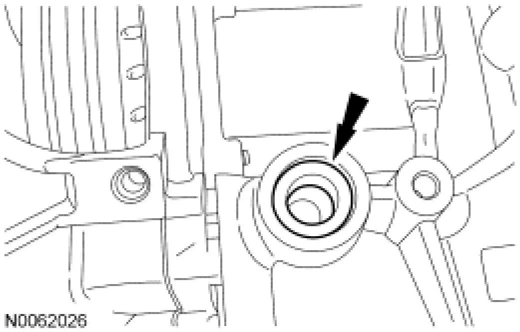

Fig. 53: Identifying Transmission Fluid Cooler Tube Seal
Courtesy of FORD MOTOR CO.

15. Disconnect the transaxle electrical connector.

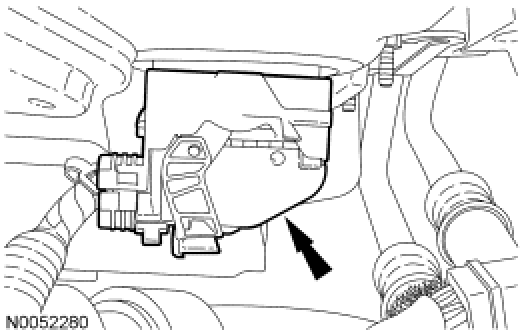

Fig. 54: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

16. Remove the 2 nuts, pull the transmission fluid cooler thermal bypass valve straight up and position it aside.

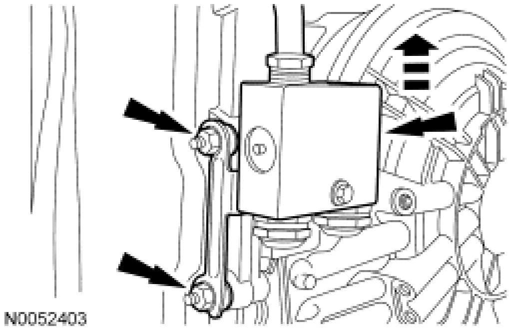

Fig. 55: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve Straight Up
Courtesy of FORD MOTOR CO.

NOTE: Note the location of the studbolts for assembly.

17. Remove the 14 bolts and the main control cover.

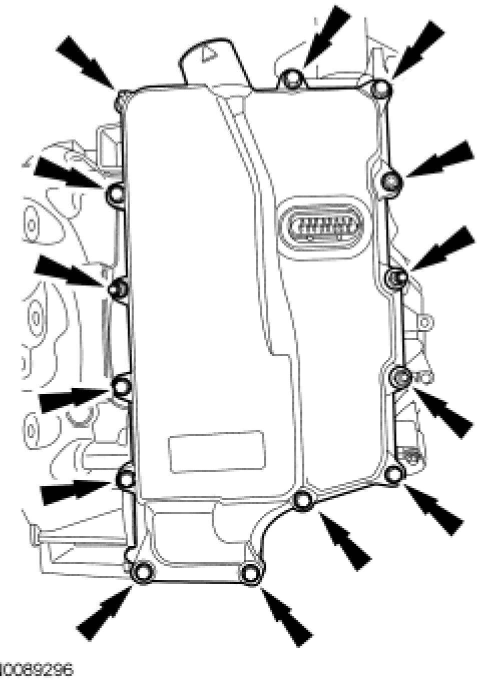

Fig. 56: Main Control Valve Cover Bolts
Courtesy of FORD MOTOR CO.

18. Disconnect the Transmission Range (TR) sensor electrical connector.
    1. Slide the lock over.
    2. Press the tab and disconnect the connector.

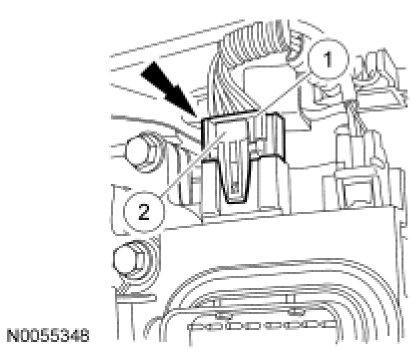

Fig. 57: Pressing Tab & Disconnecting Connector
Courtesy of FORD MOTOR CO.

19. Disconnect the Turbine Shaft Speed (TSS) and Output Shaft Speed (OSS) sensor electrical connectors.

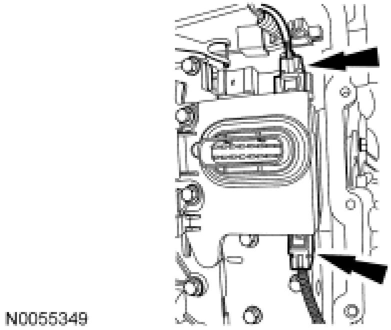

Fig. 58: Locating Turbine Shaft Speed (TSS) & Output Shaft Speed (OSS) Sensor Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: The solenoid body should be handled with care, damage to the solenoid body may occur.

NOTE: Note the location of the different length bolts for assembly.

20. Remove the 11 bolts and the solenoid body.

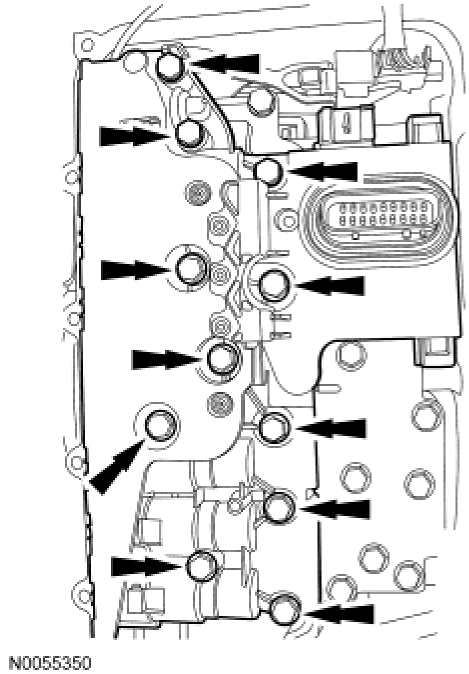

Fig. 59: Locating Solenoid Body Bolts
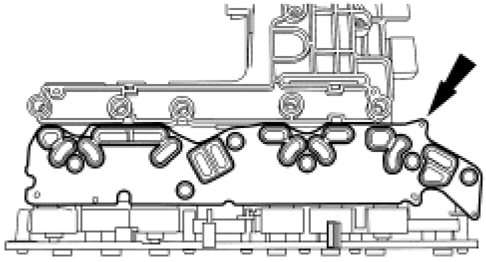
Courtesy of FORD MOTOR CO.

NOTE: Do not handle the solenoid body in the leadframe area or by the screens of

the solenoid body filter or damage to the solenoid body can occur.

NOTE: **Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**

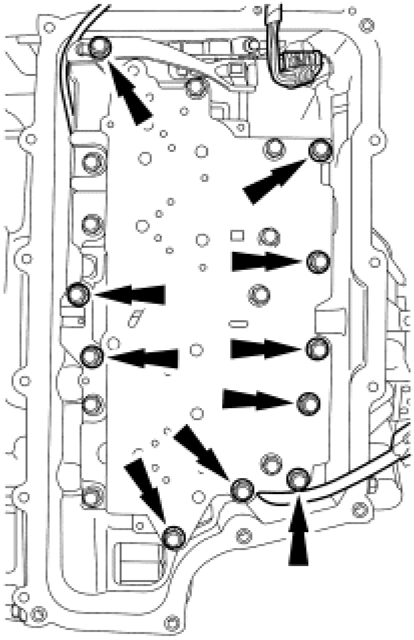
21. Remove the solenoid body filter assembly by pulling it straight up from the alignment tabs. Discard the filter.



N0055016

Fig. 60: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

22. Remove the 10 bolts, the TR sensor detent spring and the main control valve body.



N0057465

Fig. 61: Locating Main Control Valve Body Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: **If cleaning of the main control assembly or inspecting the valves, refer to AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50 article. If installing a new main control assembly continue with this procedure.**

NOTE: **Make sure that the manual control lever pin (part of the TR sensor) is correctly installed in the manual control valve.**

1. Position the TSS, OSS and TR sensor wiring harnesses aside and install the main control valve body, the TR sensor detent spring and the 10 bolts. Tighten the bolts in the sequence shown.
   - Tighten to 12 Nm (106 lb-in).

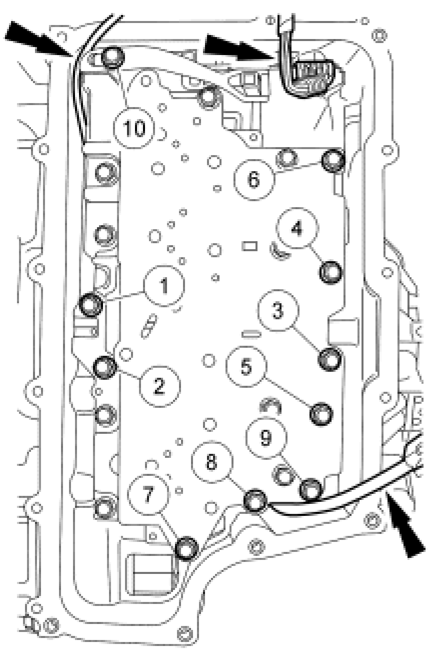


Fig. 62: Main Control Valve Body Bolt Tightening Sequence
Courtesy of FORD MOTOR CO.

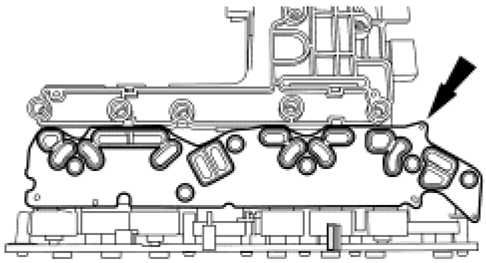
NOTE: **Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**

NOTE: **Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**

NOTE: **Make sure that the filter passage areas are clean of foreign material before**

installing the filter. Damage to the transaxle will occur if the filter passages are not clean.

2. Install a new solenoid body filter assembly by pushing it straight down on to the alignment tabs.



N0055016

Fig. 63: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

NOTE: Make sure not to pinch the Turbine Shaft Speed (TSS), Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the solenoid body.

NOTE: Install the different length bolts in the locations noted during disassembly.

3. Install the solenoid body and the 11 bolts.
    1. 42 mm (1.65 in) bolt
    2. 63 mm (2.48 in) bolts
    3. 80 mm (3.14 in) bolts
    4. 95 mm (3.74 in) bolts

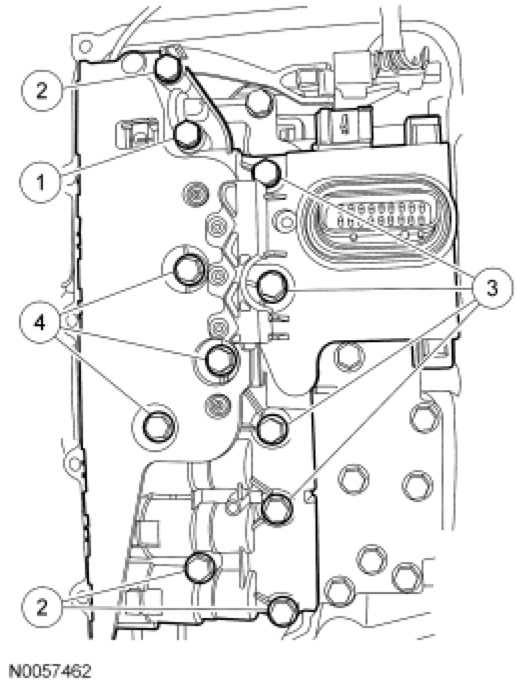


Fig. 64: Locating Solenoid Body Bolts
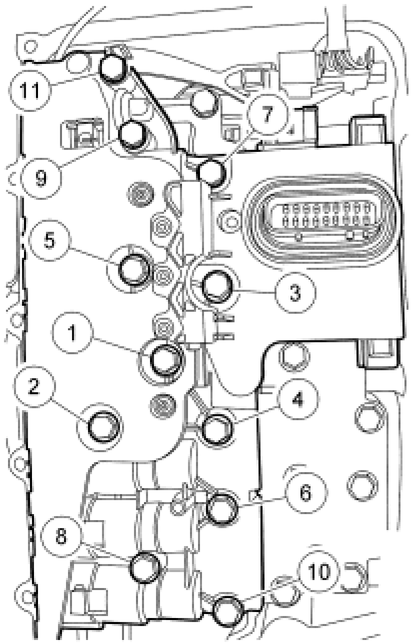
Courtesy of FORD MOTOR CO.

4. Tighten the solenoid body bolts in the sequence shown.
   - Tighten to 12 Nm (106 lb-in).



N0055351

Fig. 65: Tightening Solenoid Body Bolts In Sequence
Courtesy of FORD MOTOR CO.

5. Route the OSS sensor wiring harness and connect the electrical connector.

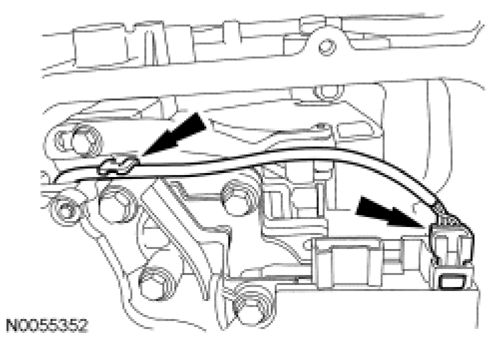


Fig. 66: Locating OSS Sensor Wiring Harness & Electrical Connector
Courtesy of FORD MOTOR CO.

6. Connect the TR sensor electrical connector.
    1. Connect the electrical connector.
    2. Slide the locking tab over.

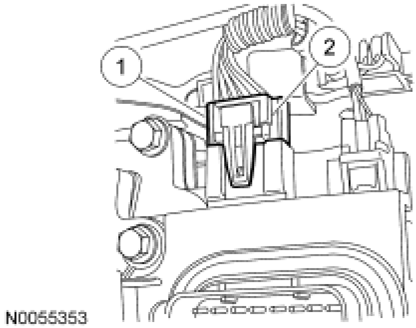

Fig. 67: Identifying TR Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

7. Connect the TSS sensor electrical connector.

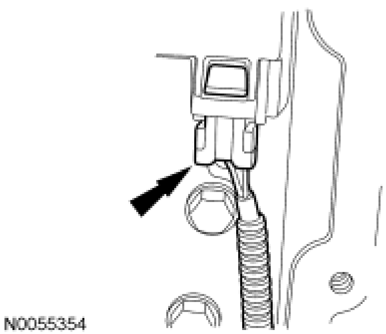

Fig. 68: Identifying TSS Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

8. Inspect the transaxle main control cover seal for damage and install new if necessary.

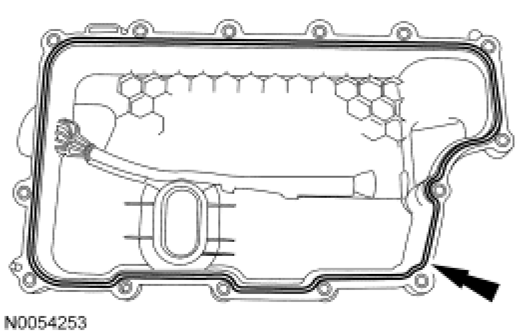

Fig. 69: Inspecting Transaxle Main Control Cover Seal For Damage
Courtesy of FORD MOTOR CO.

NOTE:	**Inspect the 20-pin solenoid body connector seal to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur.**

NOTE: Install the studbolts in the locations noted during disassembly.

9. Install the main control cover and loosely install the 14 bolts.
    1. Bolt location
    2. Studbolt location

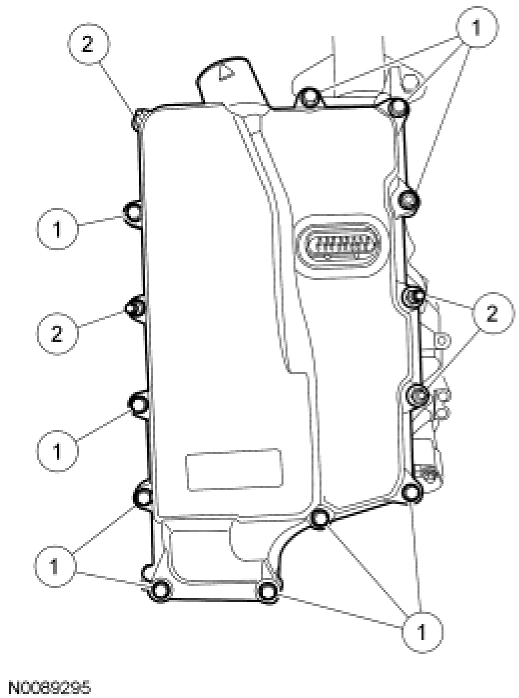

Fig. 70: Main Control Cover Bolts
Courtesy of FORD MOTOR CO.

10. Tighten the main control cover bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

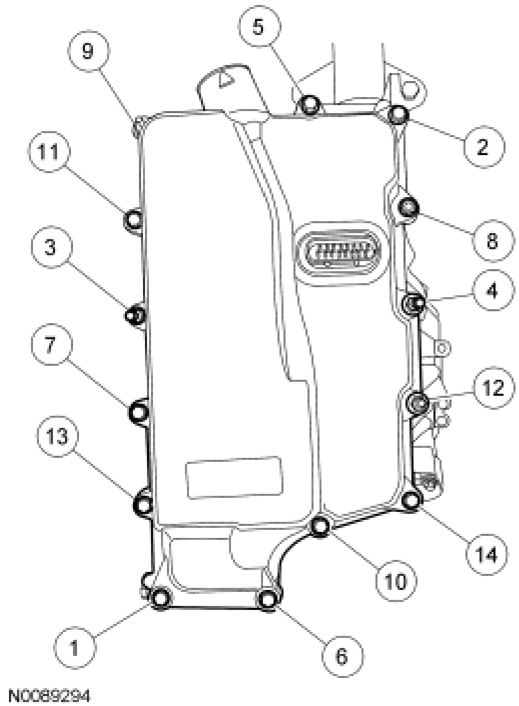

Fig. 71: Main Control Cover Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

11. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the 2 transmission fluid cooler tube bracket nuts.
    - Tighten to 9 Nm (80 lb-in).

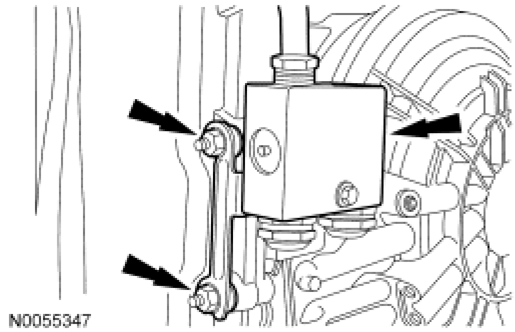

Fig. 72: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

12. Connect the transaxle electrical connector.

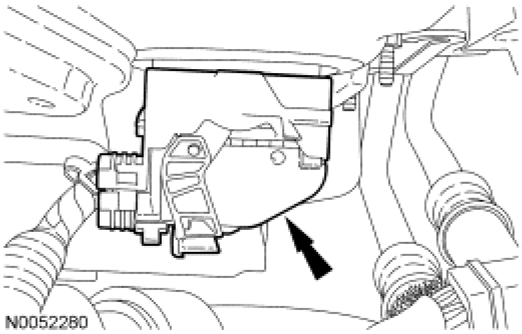

Fig. 73: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

13. Inspect the transmission fluid cooler tube backing ring and seal for damage and install a new backing ring or seal if necessary. Lubricate the transmission fluid cooler tube seal with clean transmission fluid and install the backing ring and seal on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

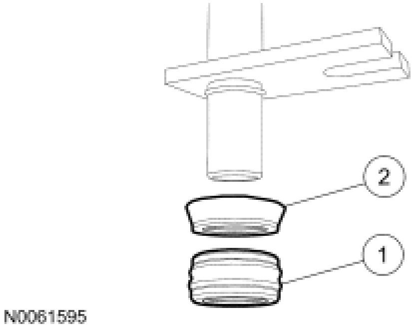

Fig. 74: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal
Courtesy of FORD MOTOR CO.

14. Position the transmission fluid cooler tube in place and install a new bolt.
    - Tighten to 9 Nm (80 lb-in).

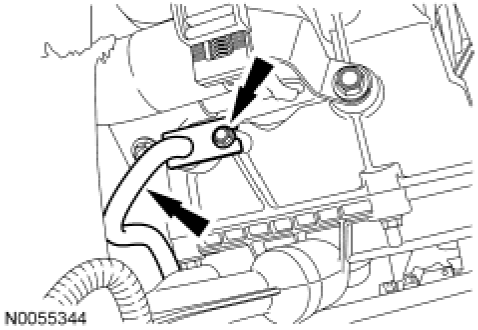

Fig. 75: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

15. Tighten the transmission fluid cooler tube fitting.
    - Tighten to 25 Nm (18 lb-ft).

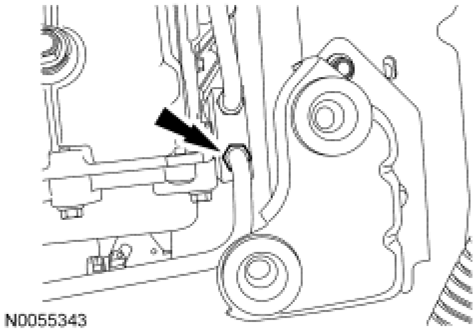

Fig. 76: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

16. Install the fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

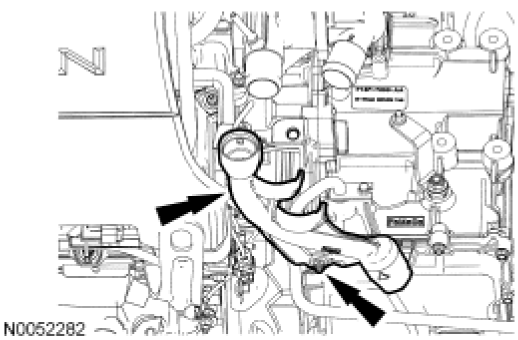

Fig. 77: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

17. Install the transmission fluid level indicator.

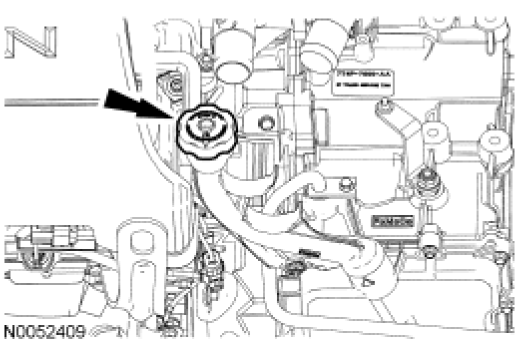

Fig. 78: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

18. Route the coolant hoses in the transmission fluid filler tube.

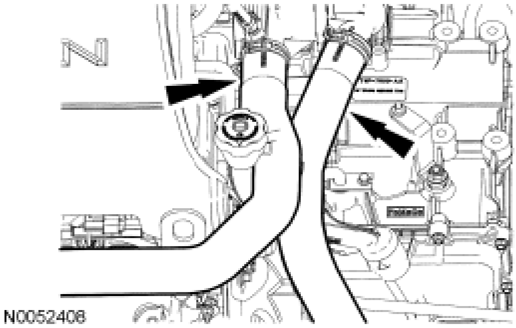

Fig. 79: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

19. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

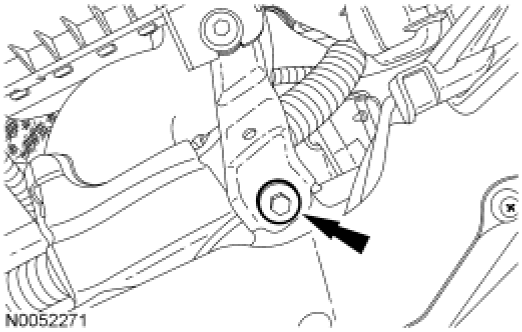

Fig. 80: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

20. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

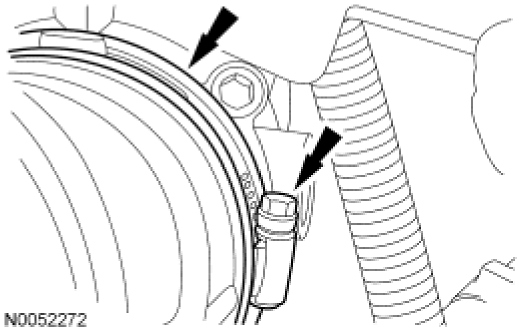

Fig. 81: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

21. Connect the engine breather to the ACL assembly.

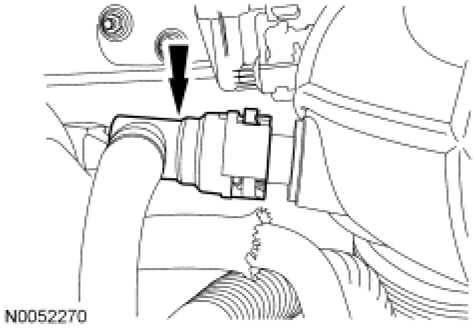

Fig. 82: Locating Engine Breather
Courtesy of FORD MOTOR CO.

22. Connect the brake booster vacuum hose to the ACL assembly.

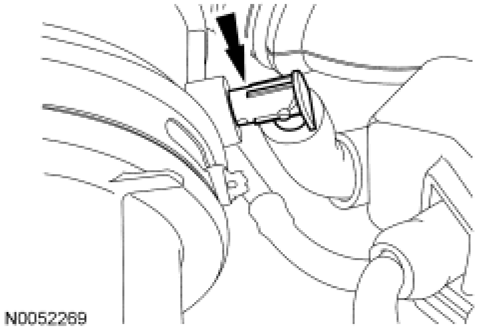

Fig. 83: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

23. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

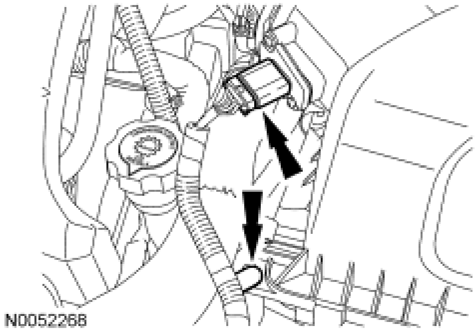

Fig. 84: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

24. Fill with clean transmission fluid to the correct level.

TURBINE SHAFT SPEED (TSS) SENSOR

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

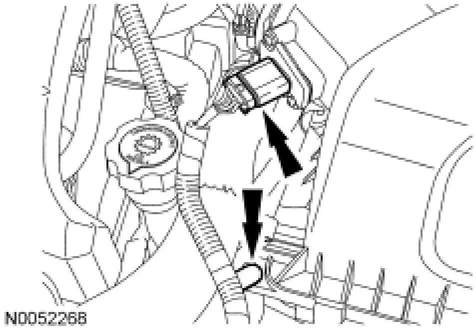

Fig. 85: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

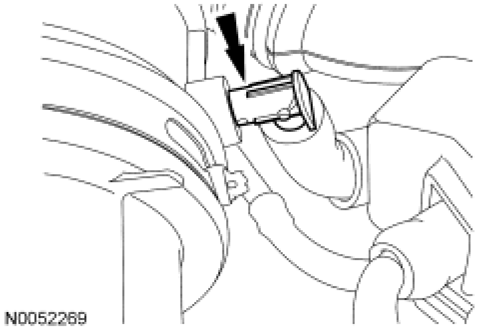

Fig. 86: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

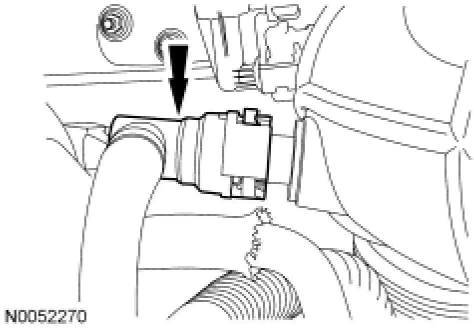

Fig. 87: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

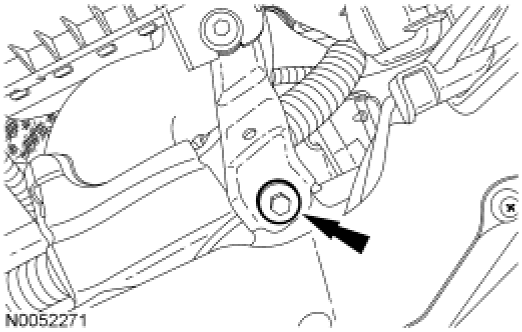

Fig. 88: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

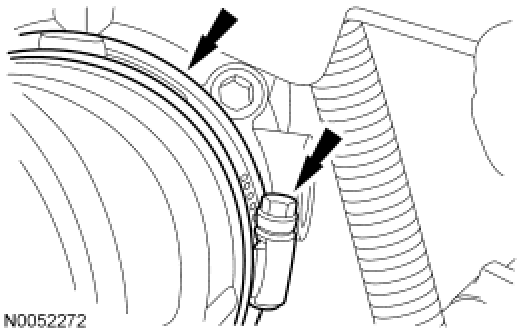

Fig. 89: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

7. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

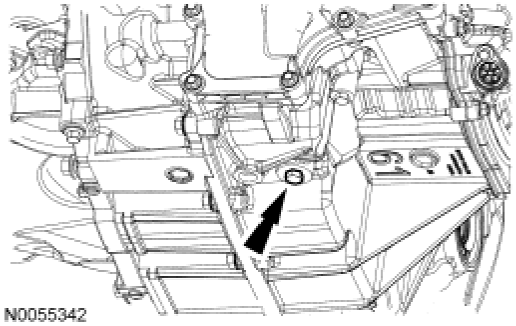

Fig. 90: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

8. Install the transmission fluid drain plug.
    - Tighten to 9 Nm (80 lb-in).

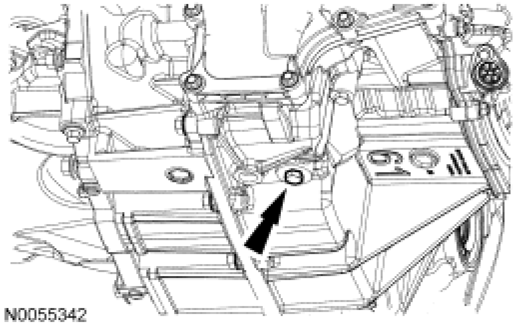

Fig. 91: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

9. Remove the coolant hoses from the transmission fluid filler tube and position aside.

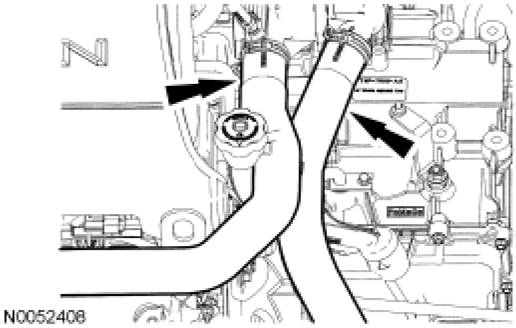

Fig. 92: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

10. Remove the transmission fluid level indicator.

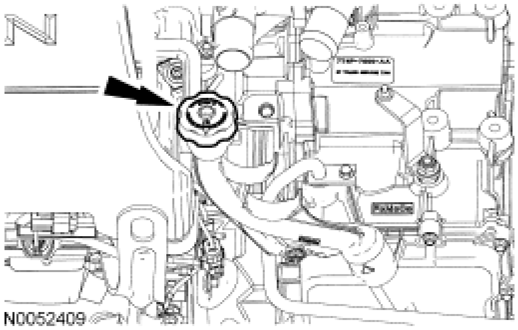

Fig. 93: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

11. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

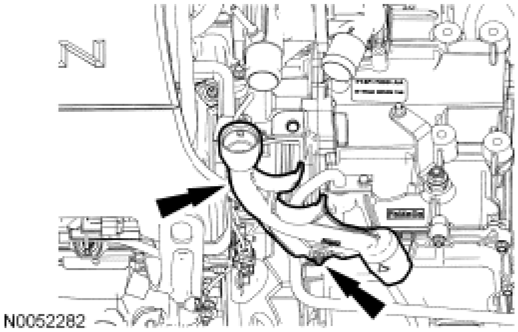

Fig. 94: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Loosen the transmission fluid cooler tube fitting from the thermal bypass valve.

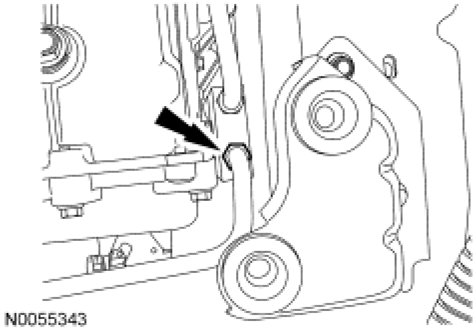

Fig. 95: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

13. Remove and discard the transmission fluid cooler tube bolt and remove the transmission fluid cooler tube.

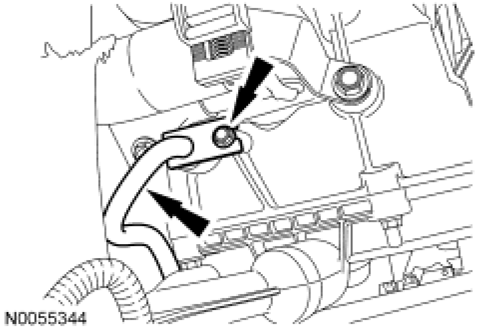

Fig. 96: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

14. Inspect the transaxle case to make sure that the transmission fluid cooler tube seal and backing ring were removed with the transmission fluid cooler tube and are not stuck in the transaxle case. If the transmission fluid cooler tube seal or backing ring are stuck in the transaxle case, remove the seal and backing ring.

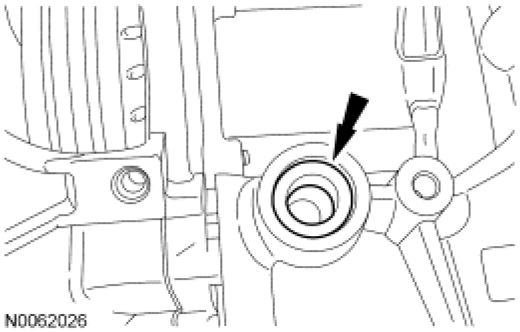

Fig. 97: Identifying Transmission Fluid Cooler Tube Seal
Courtesy of FORD MOTOR CO.

15. Disconnect the transaxle electrical connector.

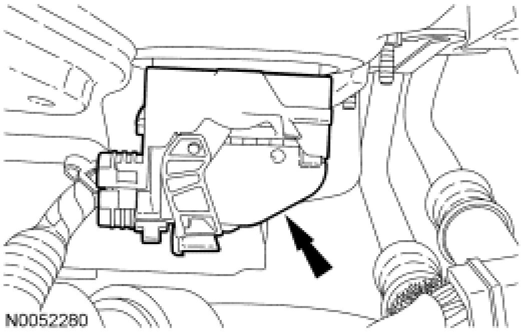

Fig. 98: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

16. Remove the 2 nuts, pull the transmission fluid cooler thermal bypass valve straight up and position it aside.

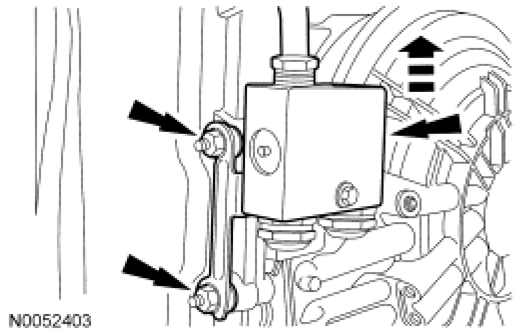

Fig. 99: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve Straight Up
Courtesy of FORD MOTOR CO.

NOTE: Note the location of the stud bolts for assembly.

17. Remove the 14 bolts and the main control cover.

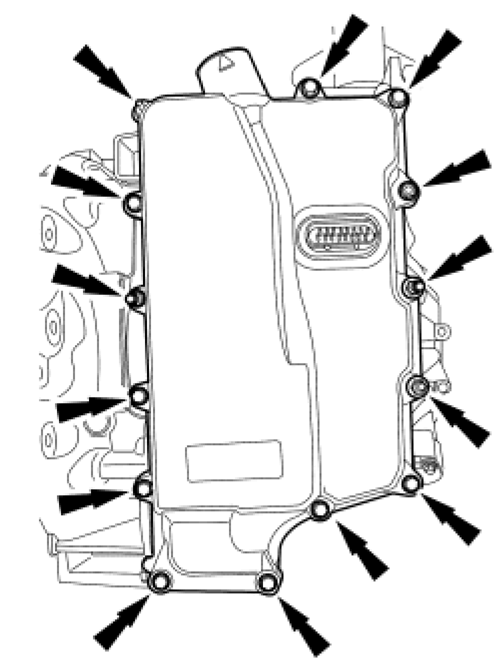

Fig. 100: Main Control Valve Cover Bolts
Courtesy of FORD MOTOR CO.

18. Disconnect the Transmission Range (TR) sensor electrical connector.
    1. Slide the lock over.
    2. Press the tab and disconnect the connector.

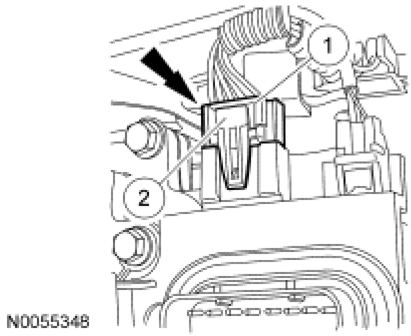

Fig. 101: Pressing Tab & Disconnecting Connector
Courtesy of FORD MOTOR CO.

19. Disconnect the Turbine Shaft Speed (TSS) and Output Shaft Speed (OSS) sensor electrical connectors.

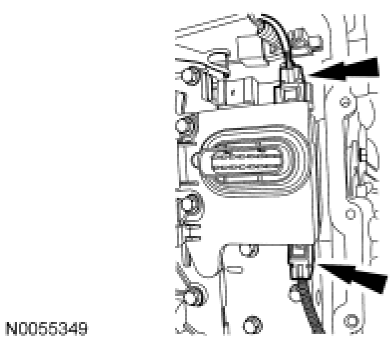

Fig. 102: Locating Turbine Shaft Speed (TSS) & Output Shaft Speed (OSS) Sensor Electrical Connectors
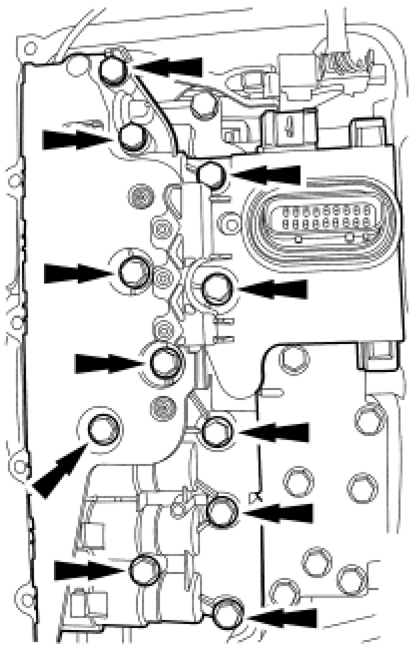
Courtesy of FORD MOTOR CO.

NOTE:	**The solenoid body should be handled with care, damage to the solenoid body may occur.**

NOTE:	**Note the location of the different length bolts for assembly.**

20. Remove the 11 bolts and the solenoid body.



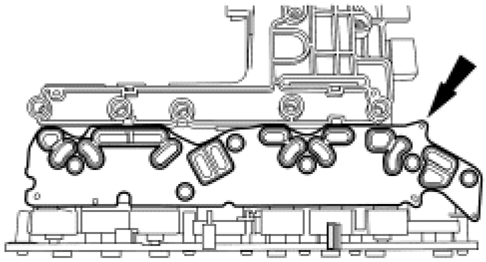
N0055350

Fig. 103: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

NOTE:	**Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**

NOTE:	**Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**

21. Remove the solenoid body filter assembly by pulling it straight up from the alignment tabs. Discard the filter.



N0055016

Fig. 104: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

22. Remove the 10 bolts, the TR sensor detent spring and the main control valve body.

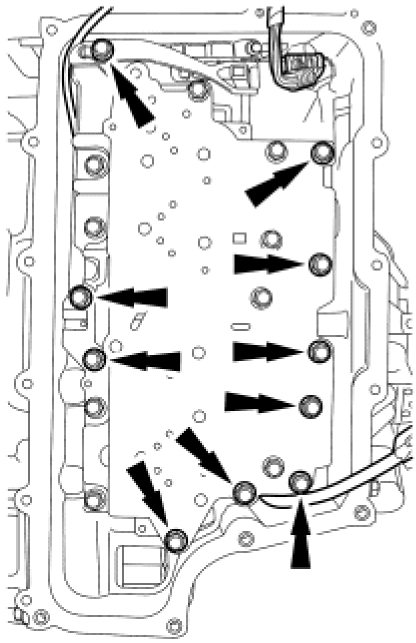


Fig. 105: Locating Main Control Valve Body Bolts
Courtesy of FORD MOTOR CO.

23. Remove the bolt and the TSS sensor.

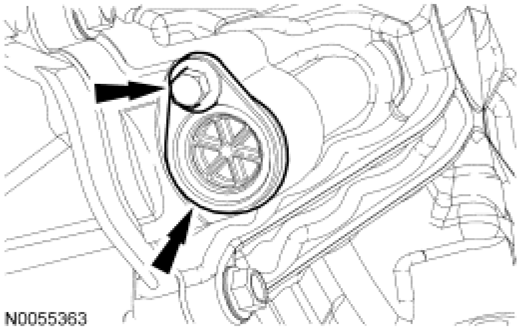

Fig. 106: Identifying TSS Sensor & Bolt
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Route the TSS sensor wiring harness through the cover and the transaxle case.
   - Tighten to 12 Nm (106 lb-in).

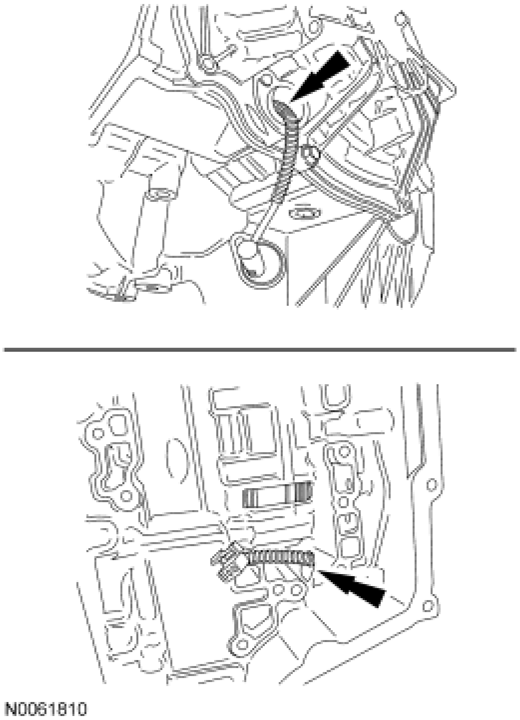

Fig. 107: Routing TSS Sensor Wiring Harness Through Cover & Transaxle Case
Courtesy of FORD MOTOR CO.

2. Install the TSS sensor in the cover and install the bolt.
    - Tighten to 12 Nm (106 lb-in).

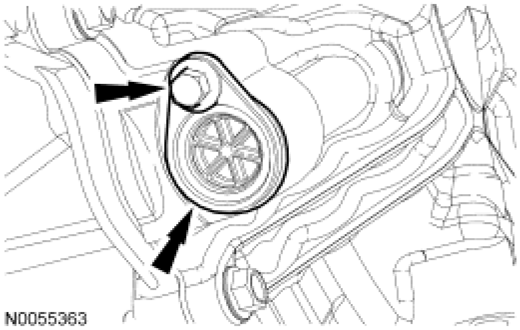

Fig. 108: Identifying TSS Sensor & Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure that the manual pin (part of the TR sensor) is correctly installed in the manual valve.**

3. Position the TSS, OSS and TR sensor wiring harnesses aside and install the main control valve body.

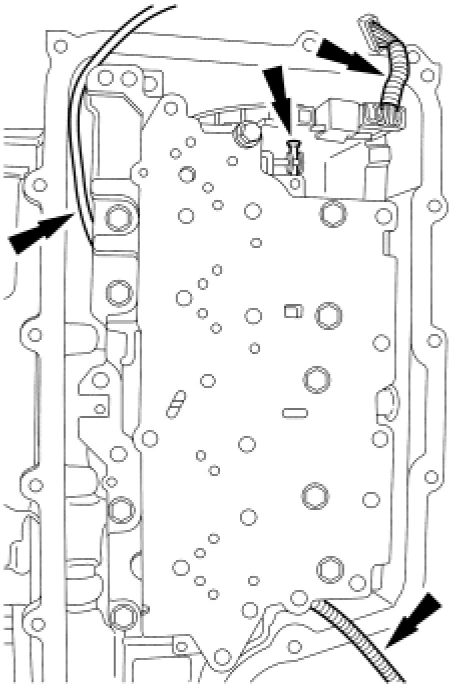

Fig. 109: Locating TSS, OSS & TR Sensor Wiring Harnesses
Courtesy of FORD MOTOR CO.

4. Inspect the manual pin to make sure it is correctly installed in the manual valve. If it is not, pull the valve body off the transaxle case. Correctly install the manual pin in the manual control valve and position the valve body in place.

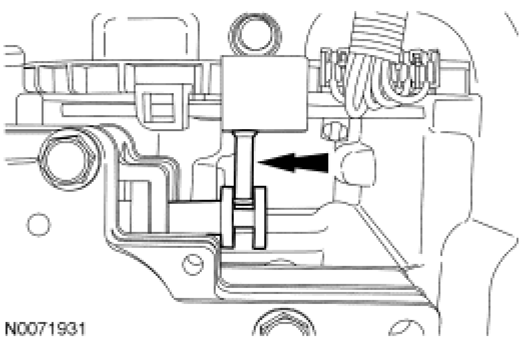

Fig. 110: Identifying Manual Pin
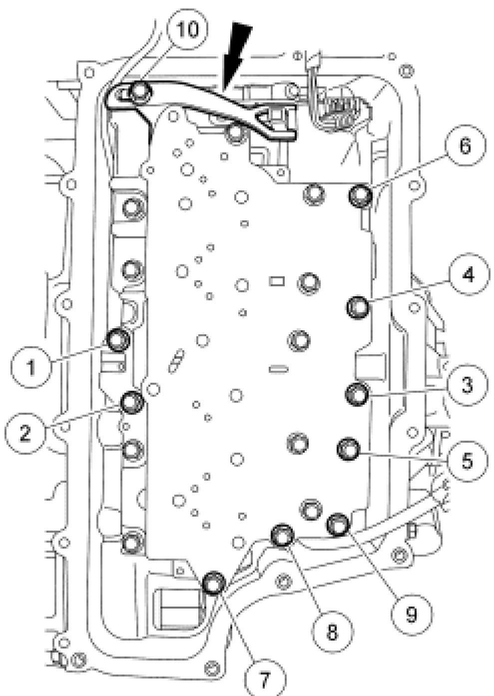
Courtesy of FORD MOTOR CO.

5. Install the TR sensor detent spring and the 10 bolts. Tighten the bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

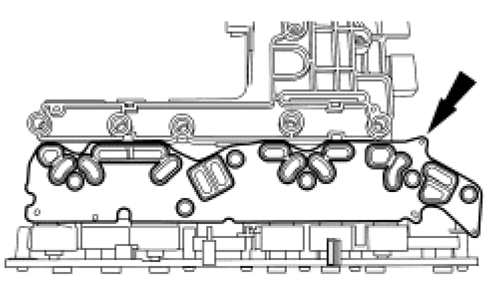


N0071930

Fig. 111: Tightening TR Sensor Detent Spring Bolts In Sequence
Courtesy of FORD MOTOR CO.

NOTE:	**Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**
NOTE:	**Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**
NOTE:	**Make sure that the filter passage areas are clean of foreign material before installing the filter. Damage to the transaxle will occur if the filter passages are not clean.**

6. Install a new solenoid body filter assembly by pushing it straight down on to the alignment tabs.



N0055016

Fig. 112: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

NOTE: **Make sure not to pinch the Turbine Shaft Speed (TSS) , Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the solenoid body. Damage to the wiring harness will occur.**

NOTE: **Install the different length bolts in the locations noted during disassembly.**

7. Install the solenoid body and the 11 bolts.
    1. 42 mm (1.65 in) bolt
    2. 63 mm (2.48 in) bolts
    3. 80 mm (3.14 in) bolts
    4. 95 mm (3.74 in) bolts

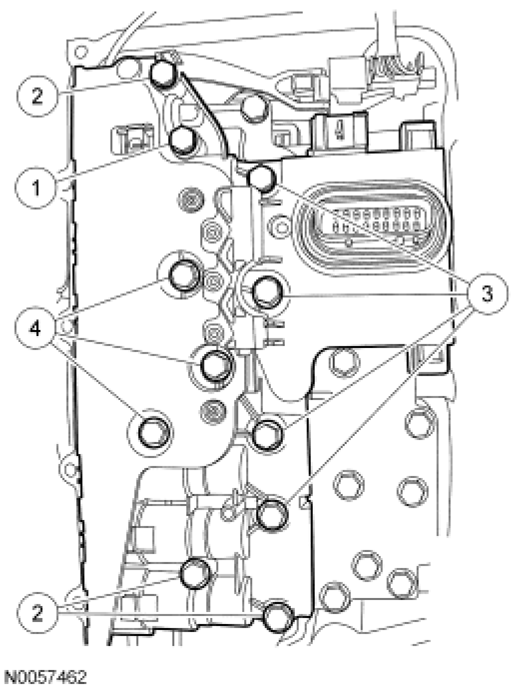


Fig. 113: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

8. Tighten the solenoid body bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

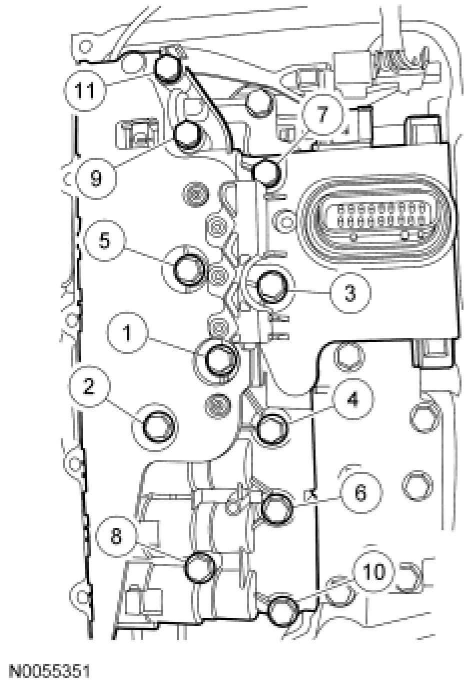

Fig. 114: Tightening Solenoid Body Bolts In Sequence
Courtesy of FORD MOTOR CO.

9. Route the OSS sensor wiring harness and connect the electrical connector.

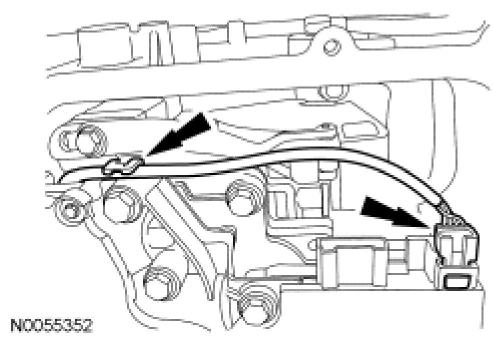

Fig. 115: Locating OSS Sensor Wiring Harness & Electrical Connector
Courtesy of FORD MOTOR CO.

10. Connect the TR sensor electrical connector.
    1. Connect the electrical connector.
    2. Slide the locking tab over.

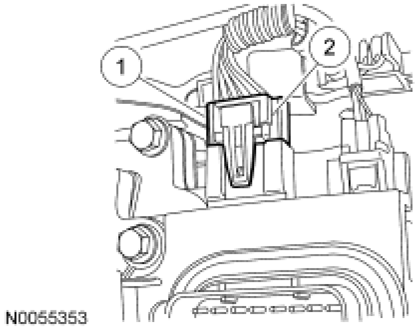

Fig. 116: Identifying TR Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

11. Connect the TSS sensor electrical connector.

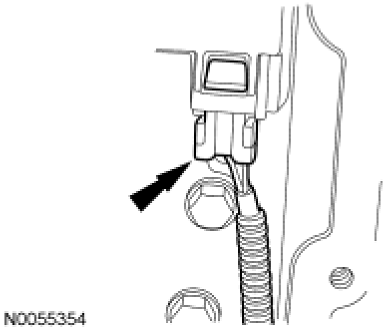

Fig. 117: Identifying TSS Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

12. Inspect the transaxle side cover seal for damage and install new if necessary.

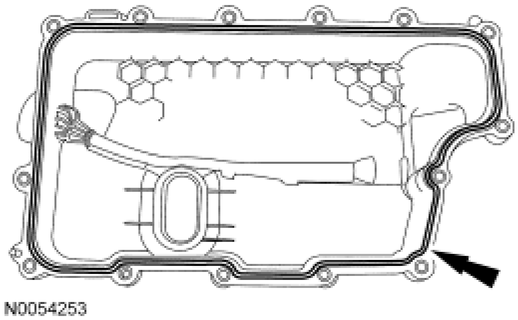

Fig. 118: Inspecting Transaxle Main Control Cover Seal For Damage
Courtesy of FORD MOTOR CO.

NOTE:	**Inspect the 20-pin solenoid body connector seal to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur.**

NOTE: Install the studbolts in the locations noted during disassembly.

13. Install the main control cover and install the 14 bolts.
    1. Bolt location
    2. Studbolt location

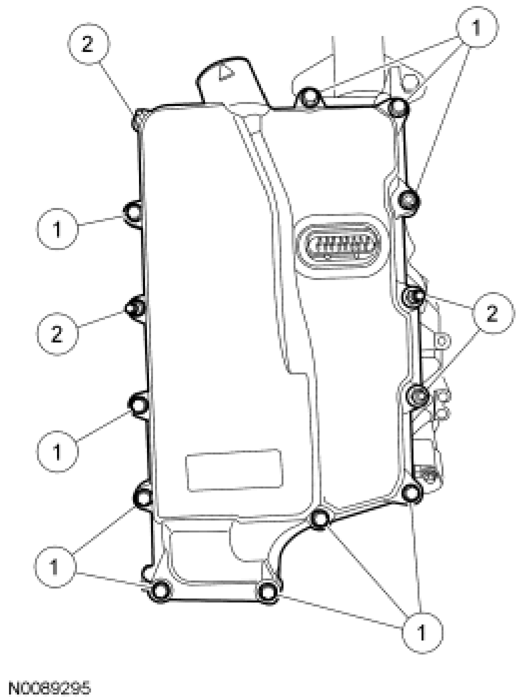

Fig. 119: Main Control Cover Bolts
Courtesy of FORD MOTOR CO.

14. Tighten the main control cover bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

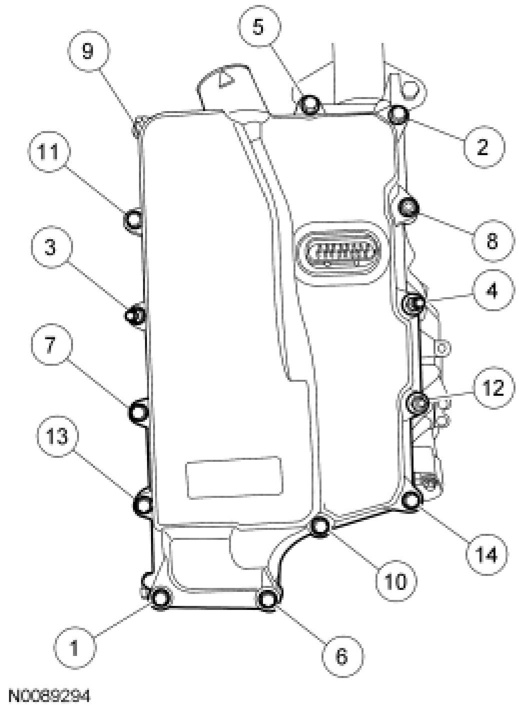

Fig. 120: Main Control Cover Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

15. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the 2 transmission fluid cooler line bracket nuts.
    - Tighten to 9 Nm (80 lb-in).

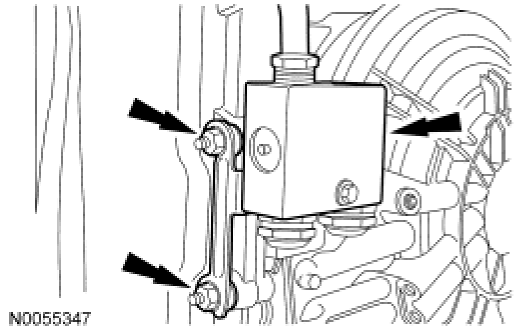

Fig. 121: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

16. Connect the transaxle electrical connector.

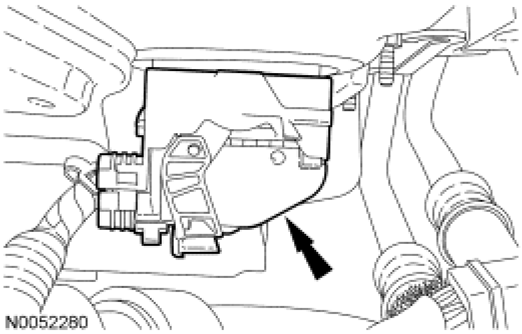

Fig. 122: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

17. Inspect the transmission fluid cooler tube backing ring and seal for damage and install a new backing ring or seal if necessary. Lubricate the transmission fluid cooler tube seal with clean transmission fluid and install the backing ring and seal on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

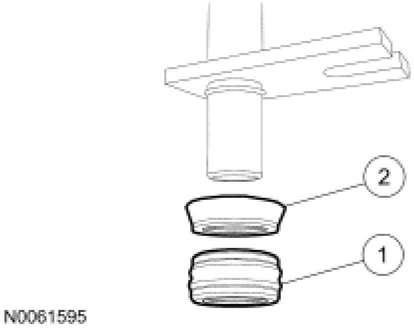

Fig. 123: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal
Courtesy of FORD MOTOR CO.

18. Position the transmission fluid cooler tube in place and install a new bolt.
    - Tighten to 9 Nm (80 lb-in).

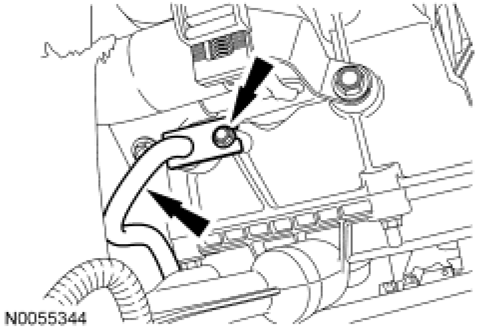

Fig. 124: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

19. Tighten the transmission fluid cooler tube fitting.
    - Tighten to 25 Nm (18 lb-ft).

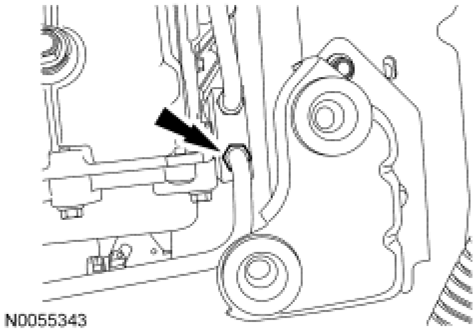

Fig. 125: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

20. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

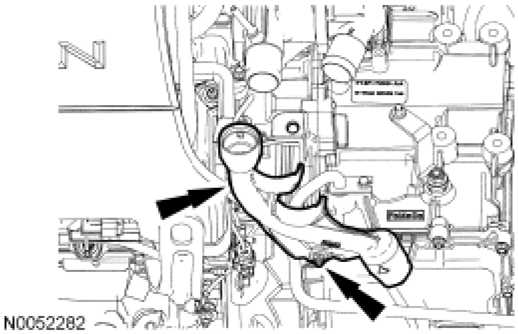

Fig. 126: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

21. Install the transmission fluid level indicator.

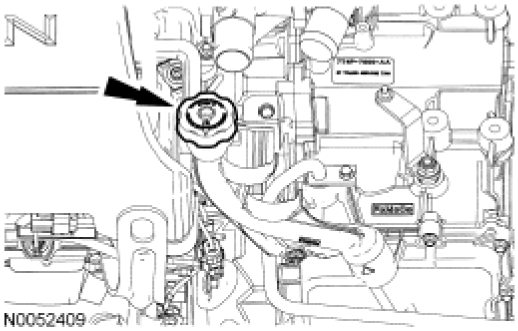

Fig. 127: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

22. Route the coolant hoses in the transmission fluid filler tube.

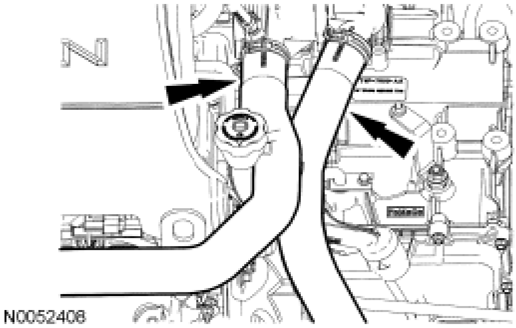

Fig. 128: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

23. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

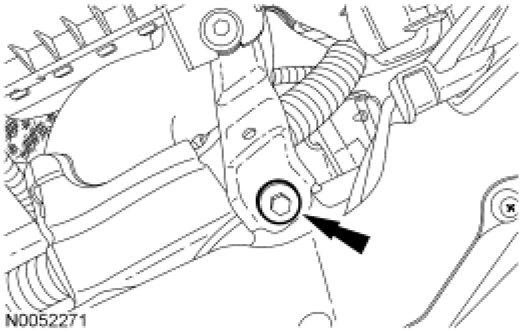

Fig. 129: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

24. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

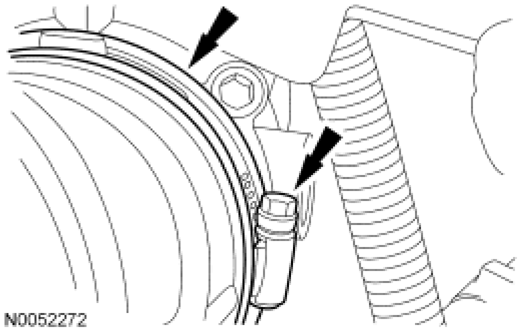

Fig. 130: Locating Air Cleaner Outlet Pipe Clamp
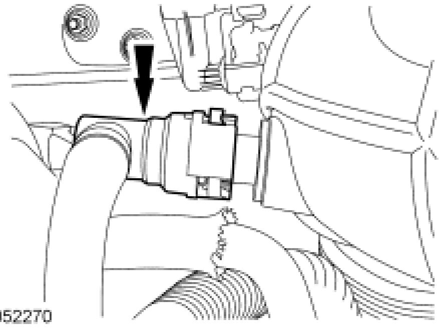
Courtesy of FORD MOTOR CO.

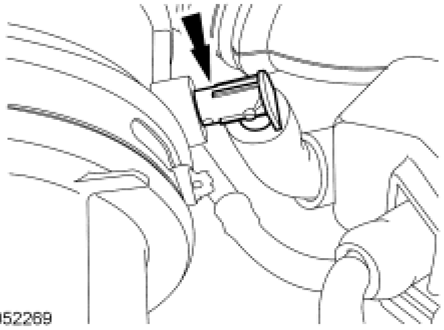
25. Connect the engine breather to the ACL assembly.



N0052270

Fig. 131: Locating Engine Breather
Courtesy of FORD MOTOR CO.

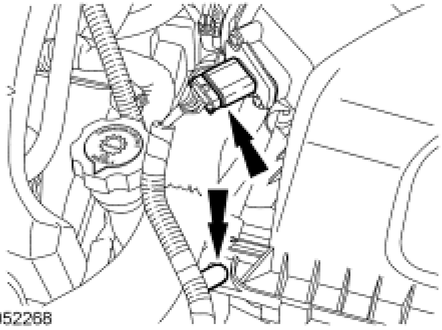
26. Connect the brake booster vacuum hose to the ACL assembly.



N0052269

Fig. 132: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

27. Connect the MAF sensor electrical connector and connect the electrical harness fastener.



N0052268

Fig. 133: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

28. Fill with clean transmission fluid to the correct level.

OUTPUT SHAFT SPEED (OSS) SENSOR

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

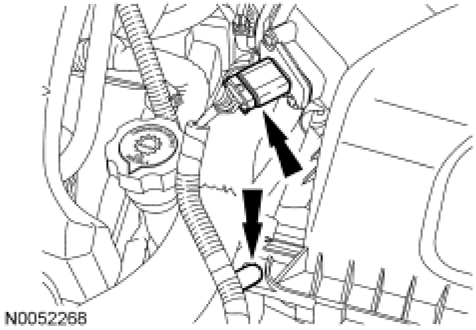


Fig. 134: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

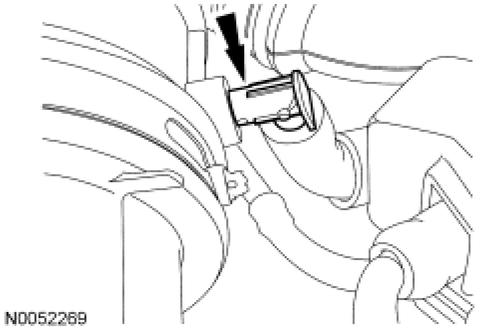

Fig. 135: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

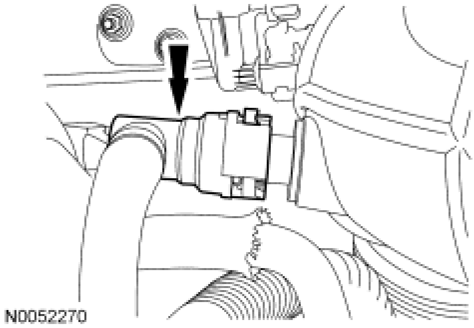

Fig. 136: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

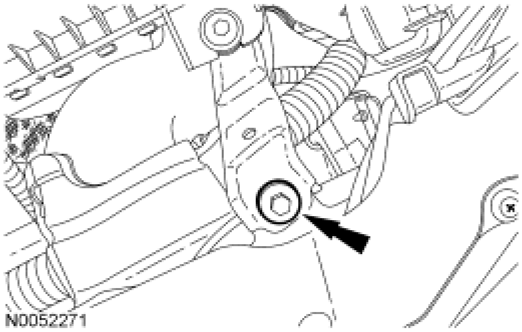

Fig. 137: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

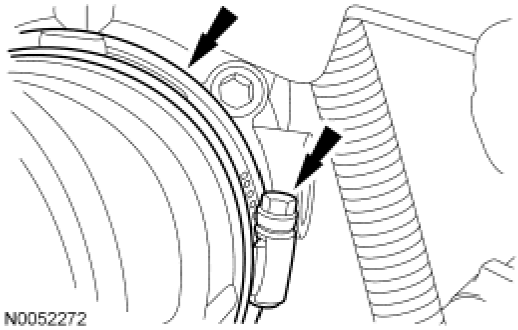

Fig. 138: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

7. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

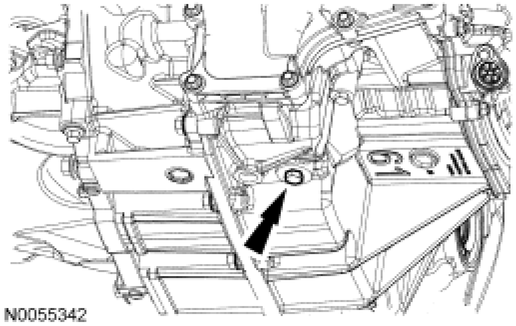

Fig. 139: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

8. Install the transmission fluid drain plug.
   - Tighten to 9 Nm (80 lb-in).

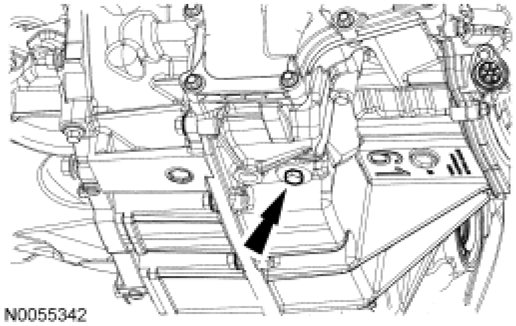

Fig. 140: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

9. Remove the coolant hoses from the transmission fluid filler tube and position aside.

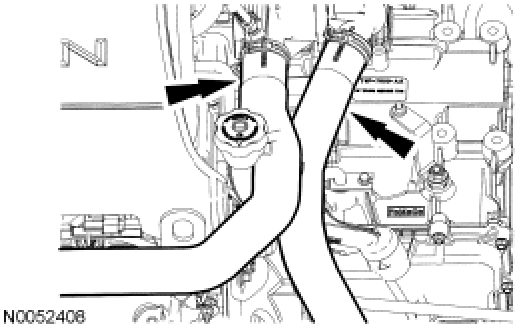

Fig. 141: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

10. Remove the transmission fluid level indicator.

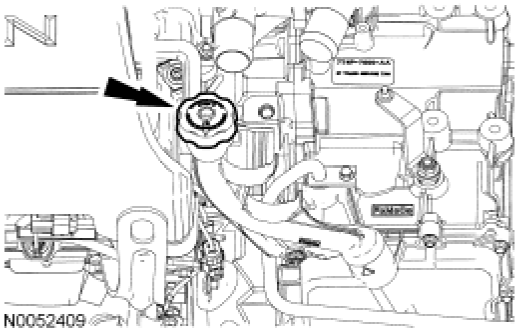

Fig. 142: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

11. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

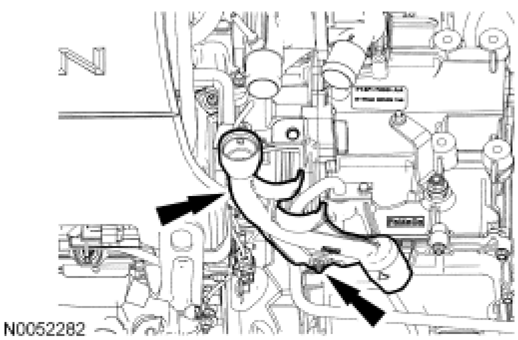

Fig. 143: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Loosen the transmission fluid cooler tube fitting from the thermal bypass valve.

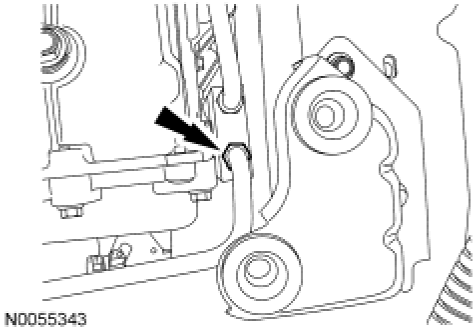

Fig. 144: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

13. Remove and discard the transmission fluid cooler tube bolt and remove the transmission fluid cooler tube.

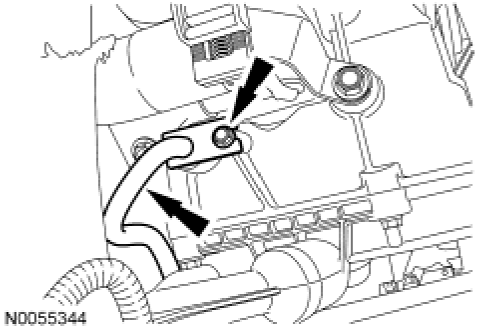

Fig. 145: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

14. Inspect the transaxle case to make sure that the transmission fluid cooler tube seal and backing ring were removed with the transmission fluid cooler tube and are not stuck in the transaxle case. If the transmission fluid cooler tube seal or backing ring are stuck in the transaxle case, remove the seal and backing ring.

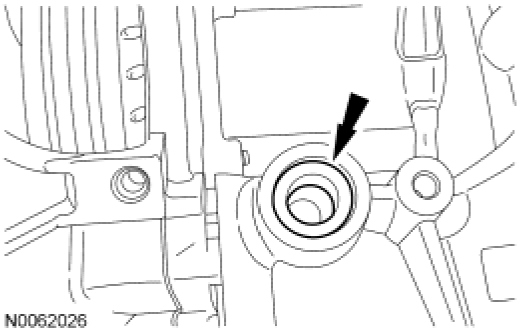

Fig. 146: Identifying Transmission Fluid Cooler Tube Seal
Courtesy of FORD MOTOR CO.

15. Disconnect the transaxle electrical connector.

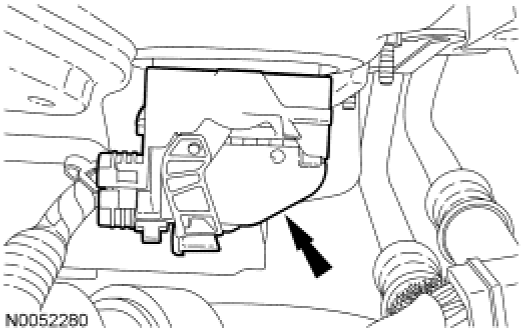

Fig. 147: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

16. Remove the 2 nuts, pull the transmission fluid cooler thermal bypass valve straight up and position it aside.

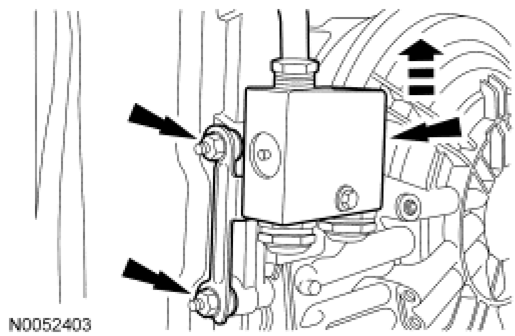

Fig. 148: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve Straight Up
Courtesy of FORD MOTOR CO.

NOTE: Note the location of the stud bolts for assembly.

17. Remove the 14 bolts and the main control cover.

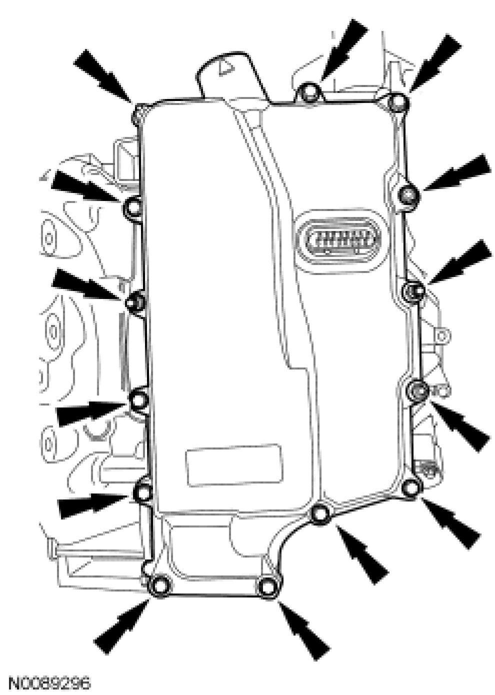

Fig. 149: Main Control Valve Cover Bolts
Courtesy of FORD MOTOR CO.

18. Disconnect the Transmission Range (TR) sensor electrical connector.
    1. Slide the lock over.
    2. Press the tab and disconnect the connector.

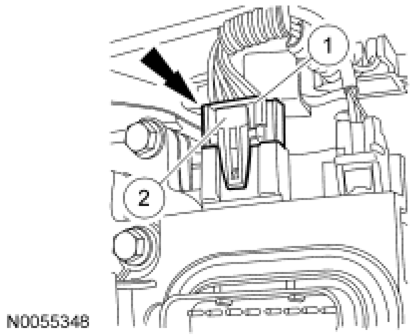

Fig. 150: Pressing Tab & Disconnecting Connector
Courtesy of FORD MOTOR CO.

19. Disconnect the Turbine Shaft Speed (TSS) and Output Shaft Speed (OSS) sensor electrical connectors.

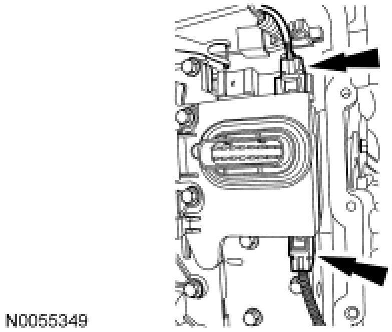

Fig. 151: Locating Turbine Shaft Speed (TSS) & Output Shaft Speed (OSS) Sensor Electrical Connectors
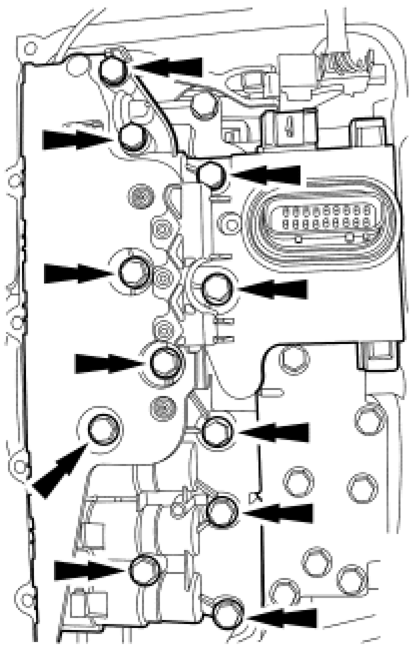
Courtesy of FORD MOTOR CO.

NOTE: **The solenoid body should be handled with care or damage to the solenoid body may occur.**

NOTE: **Note the location of the different length bolts for assembly.**

20. Remove the 11 bolts and the solenoid body.



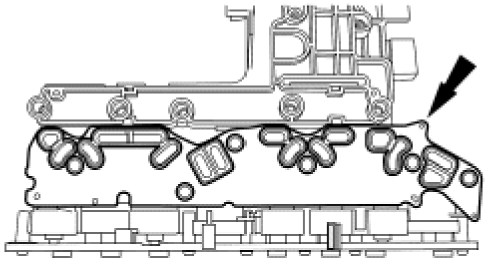
N0055350

Fig. 152: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: **Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**

NOTE: **Use care not to break the alignment tabs when removing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**

21. Remove the solenoid body filter assembly by pulling it straight up from the alignment tabs. Discard the filter.



N0055016

Fig. 153: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

22. Remove the 10 bolts, the TR sensor detent spring and the main control valve body.

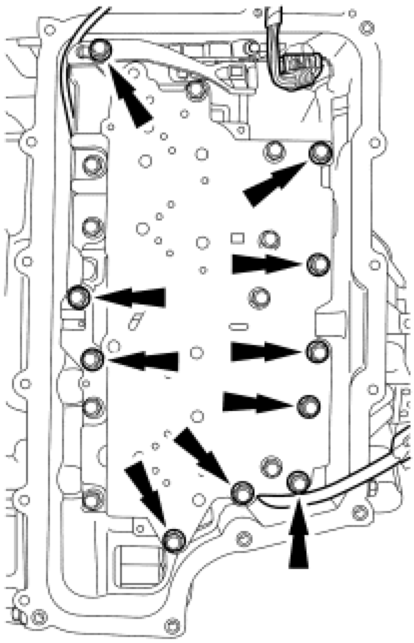


Fig. 154: Locating Main Control Valve Body Bolts
Courtesy of FORD MOTOR CO.

23. Remove the bolt and the OSS sensor.

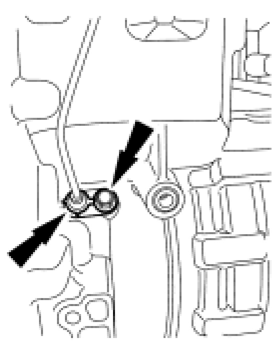

Fig. 155: Identifying OSS Sensor & Bolt
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install the OSS sensor and the bolt.
   - Tighten to 12 Nm (106 lb-in).

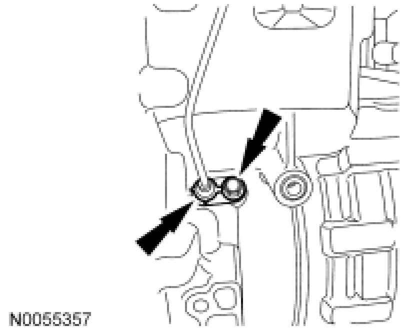

Fig. 156: Identifying OSS Sensor & Bolt
Courtesy of FORD MOTOR CO.

NOTE: Make sure that the manual pin (part of the TR sensor) is correctly installed in the manual valve.

2. Position the TSS, OSS and TR sensor wiring harnesses aside and install the main control valve body.

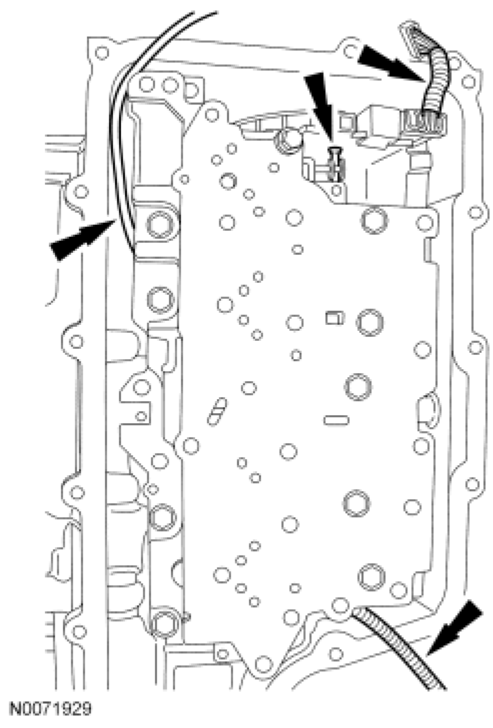

Fig. 157: Locating TSS, OSS & TR Sensor Wiring Harnesses
Courtesy of FORD MOTOR CO.

3. Inspect the manual pin to make sure it is correctly installed in the manual valve. If it is not, pull the valve body off the transaxle case. Correctly install the manual pin in the manual valve and position the valve body in place.

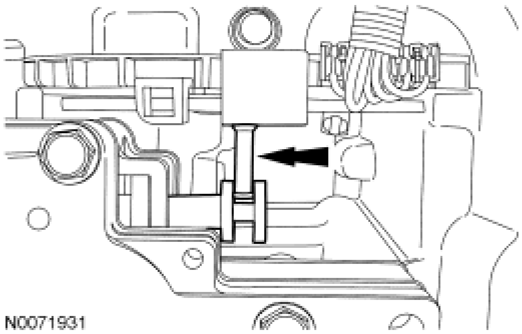

Fig. 158: Identifying Manual Pin
Courtesy of FORD MOTOR CO.

4. Install the TR sensor detent spring and the 10 bolts. Tighten the bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

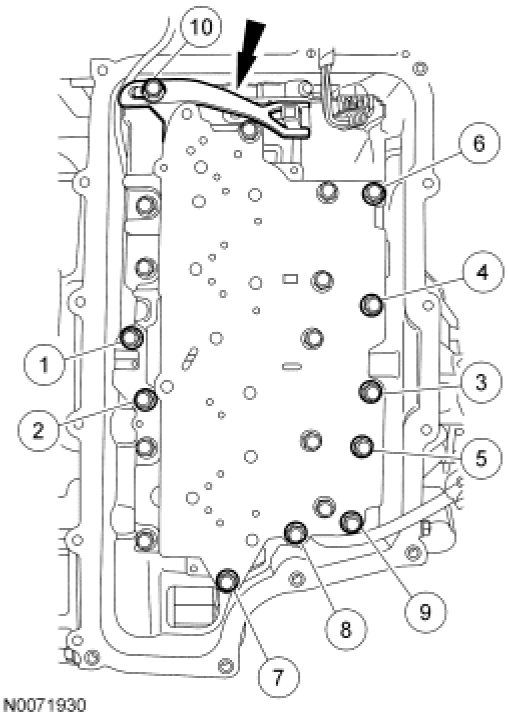

Fig. 159: Tightening TR Sensor Detent Spring Bolts In Sequence
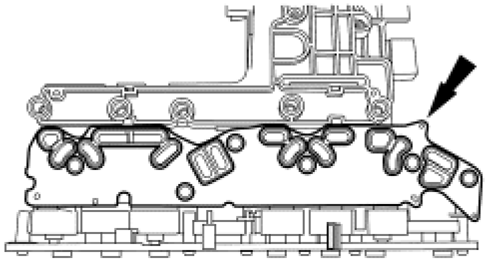
Courtesy of FORD MOTOR CO.

NOTE:	**Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**
NOTE:	**Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**

NOTE: **Make sure that the filter passage areas are clean of foreign material before installing the filter. Damage to the transaxle will occur if the filter passages are not clean.**

5. Install a new solenoid body filter assembly by pushing it straight down on to the alignment tabs.



N0055016

Fig. 160: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

NOTE: **Make sure not to pinch the Turbine Shaft Speed (TSS), Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the solenoid body. Damage to the wiring harness will occur.**

NOTE: **Install the different length bolts in the locations noted during disassembly.**

6. Install the solenoid body and the 11 bolts.
    1. 42 mm (1.65 in) bolt
    2. 63 mm (2.48 in) bolts
    3. 80 mm (3.14 in) bolts
    4. 95 mm (3.74 in) bolts

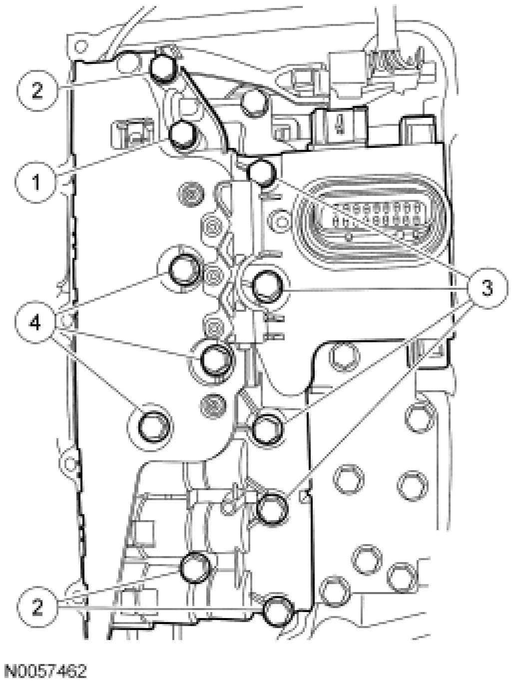


Fig. 161: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

7. Tighten the solenoid body bolts in the sequence shown.
   - Tighten to 12 Nm (106 lb-in).

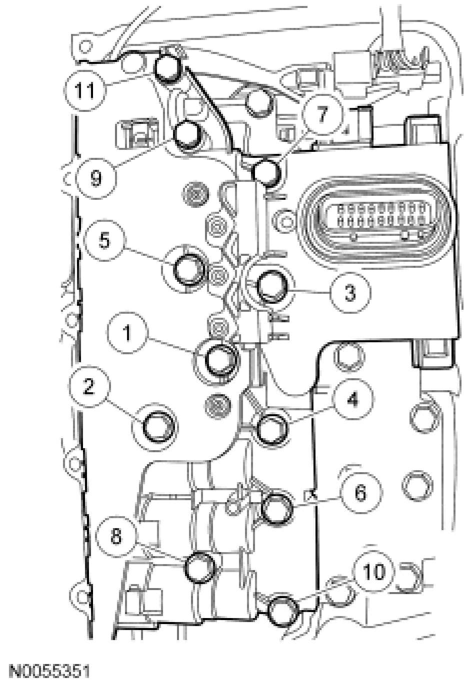

Fig. 162: Tightening Solenoid Body Bolts In Sequence
Courtesy of FORD MOTOR CO.

8. Route the OSS sensor wiring harness and connect the electrical connector.

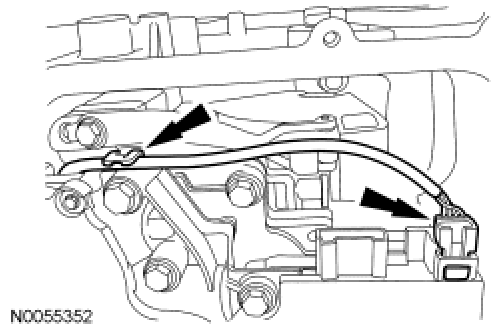

Fig. 163: Locating OSS Sensor Wiring Harness & Electrical Connector
Courtesy of FORD MOTOR CO.

9. Connect the TR sensor electrical connector.
    1. Connect the electrical connector.
    2. Slide the locking tab over.

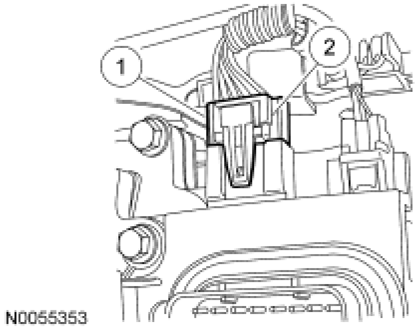

Fig. 164: Identifying TR Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

10. Connect the TSS sensor electrical connector.

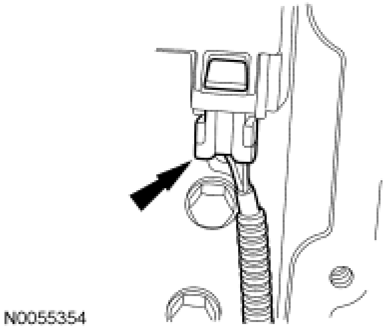

Fig. 165: Identifying TSS Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

11. Inspect the transaxle side cover seal for damage and install new if necessary.

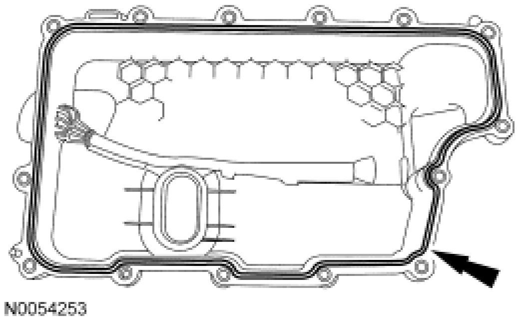

Fig. 166: Inspecting Transaxle Main Control Cover Seal For Damage
Courtesy of FORD MOTOR CO.

NOTE: **Inspect the 20-pin solenoid body connector seal to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur.**

NOTE: Install the studbolts in the locations noted during disassembly.

12. Install the main control cover and loosely install the 14 bolts.
    1. Bolt location
    2. Studbolt location

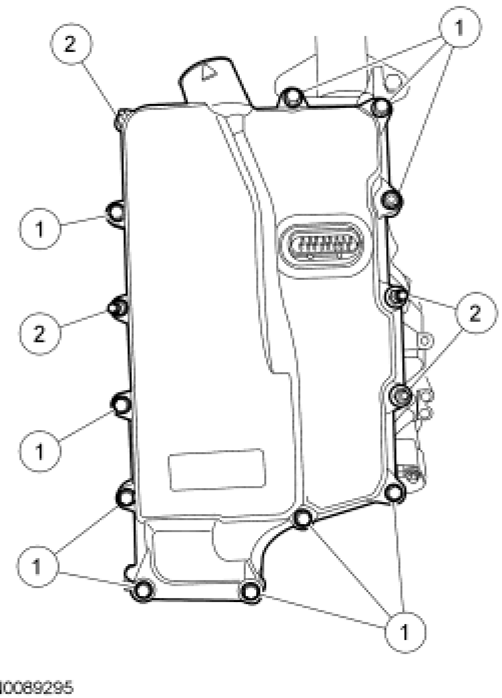

Fig. 167: Main Control Cover Bolts
Courtesy of FORD MOTOR CO.

13. Tighten the main control cover bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

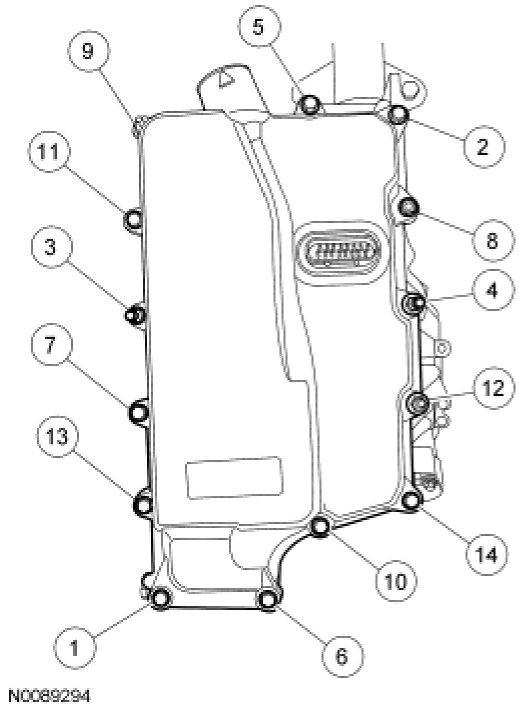

Fig. 168: Main Control Cover Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

14. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the 2 transmission fluid cooler tube bracket nuts.
    - Tighten to 9 Nm (80 lb-in).

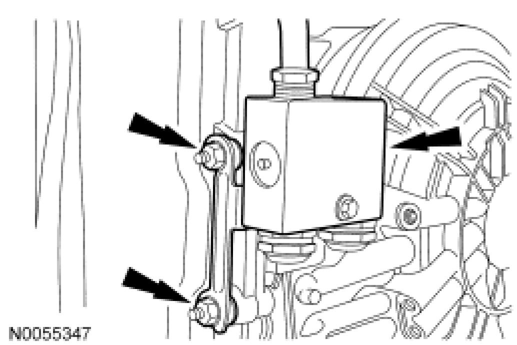

Fig. 169: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

15. Connect the transaxle electrical connector.

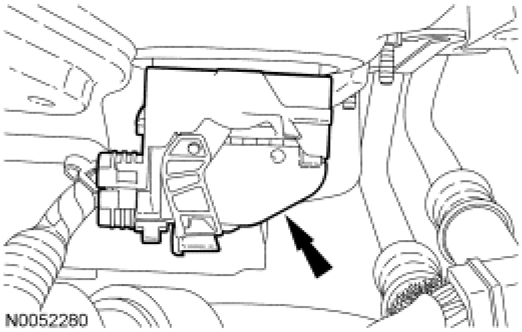

Fig. 170: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

16. Inspect the transmission fluid cooler tube backing ring and seal for damage and install a new backing ring or seal if necessary. Lubricate the transmission fluid cooler tube seal with clean transmission fluid and install the backing ring and seal on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

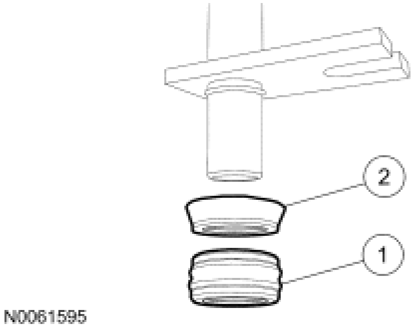

Fig. 171: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal
Courtesy of FORD MOTOR CO.

17. Position the transmission fluid cooler tube in place and install a new bolt.
    - Tighten to 9 Nm (80 lb-in).

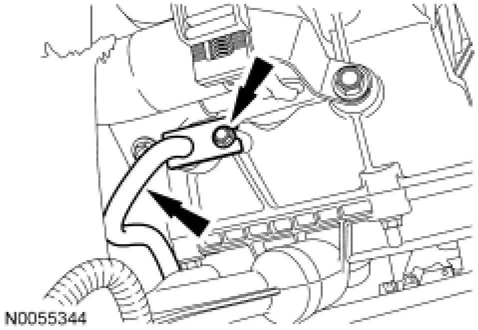

Fig. 172: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

18. Tighten the transmission fluid cooler tube fitting.
    - Tighten to 25 Nm (18 lb-ft).

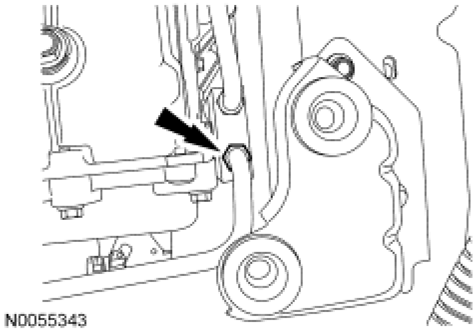

Fig. 173: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

19. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

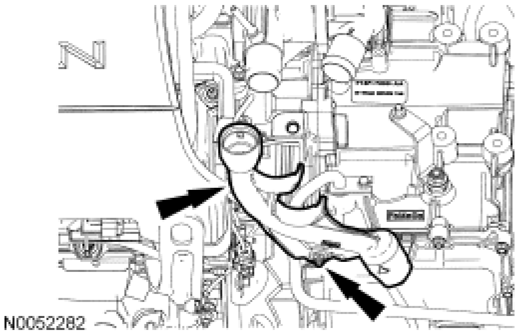

Fig. 174: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

20. Install the transmission fluid level indicator.

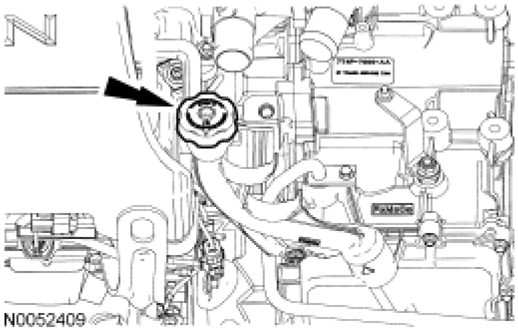

Fig. 175: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

21. Route the coolant hoses in the transmission fluid filler tube.

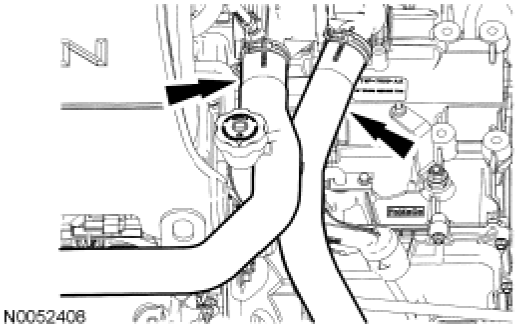

Fig. 176: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

22. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

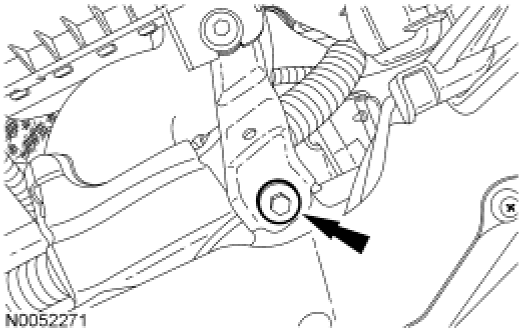

Fig. 177: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

23. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

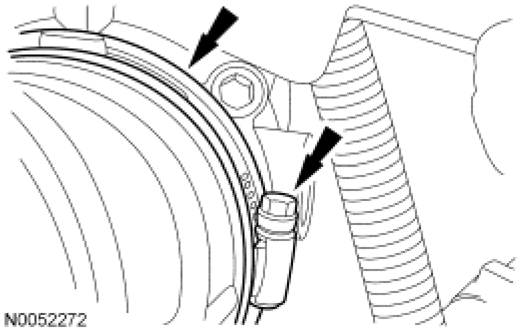

Fig. 178: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

24. Connect the engine breather to the ACL assembly.

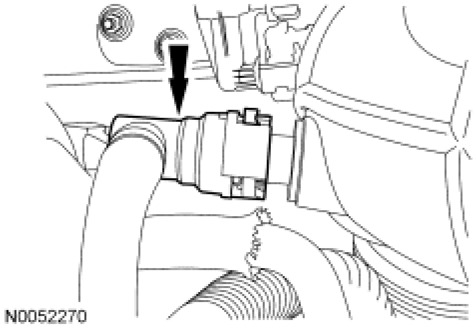

Fig. 179: Locating Engine Breather
Courtesy of FORD MOTOR CO.

25. Connect the brake booster vacuum hose to the ACL assembly.

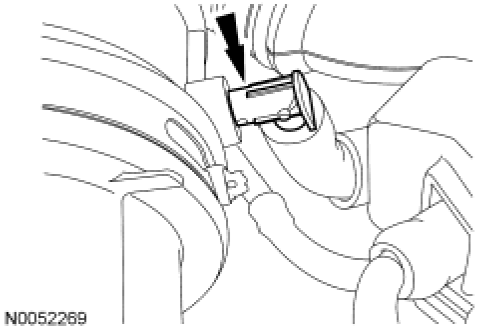

Fig. 180: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

26. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

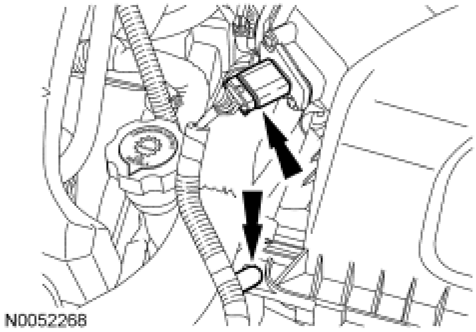

Fig. 181: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

27. Fill with clean transmission fluid to the correct level.

HALFSHAFT SEAL - LH

Special Tools

Illustration	Tool Name	Tool Number
 ST1255-A	Adapter for 303-224 (Handle)	205-153 (T80T-4000-W)
 ST3004-A	Installer, Halfshaft Seal	307-582A

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Remove the front LH halfshaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

3. Inspect the halfshaft hub for wear or damage and install a new halfshaft if necessary.
    1. Inspect the differential seal surface.
    2. Inspect the halfshaft bushing surface. If this surface is damaged, inspect the halfshaft bushing for damage.
    3. Inspect the differential side gear splines.

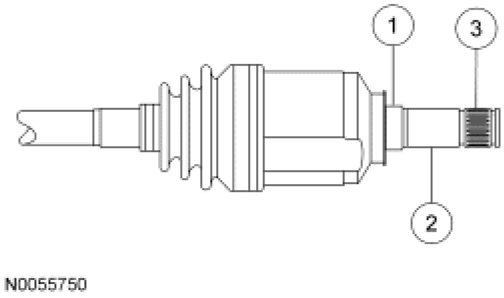

Fig. 182: Identifying Differential Side Gear Splines, Halfshaft Bushing & Differential Seal
Courtesy of FORD MOTOR CO.

4. Using a suitable awl, poke a small hole in the halfshaft seal.

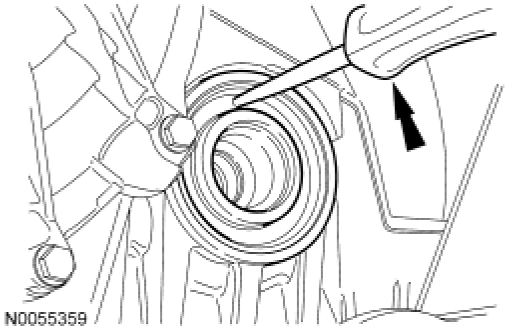

Fig. 183: Poking A Small Hole In The Halfshaft Seal Using A Suitable Awl
Courtesy of FORD MOTOR CO.

5. Using a suitable dent puller, remove the halfshaft seal.

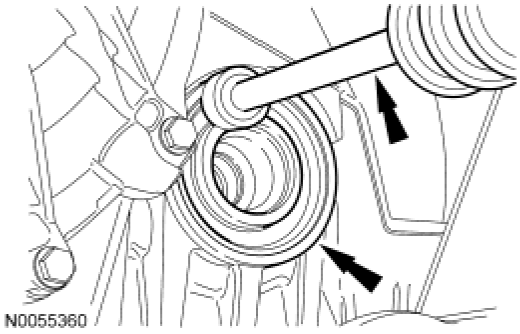

Fig. 184: Removing Halfshaft Seal Using A Suitable Dent Puller
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install a new halfshaft seal on the Cover Axle Seal Installer and Handle.

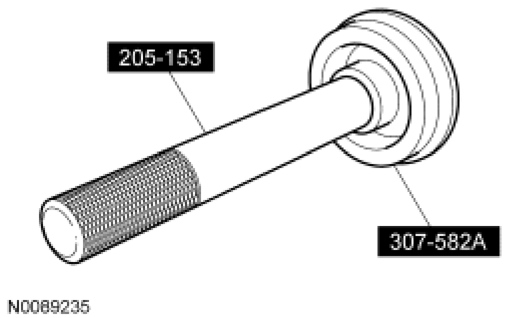

Fig. 185: Axle Seal Installer & Handle
Courtesy of FORD MOTOR CO.

2. Using the Cover Axle Seal Installer and Handle, install the LH halfshaft seal.

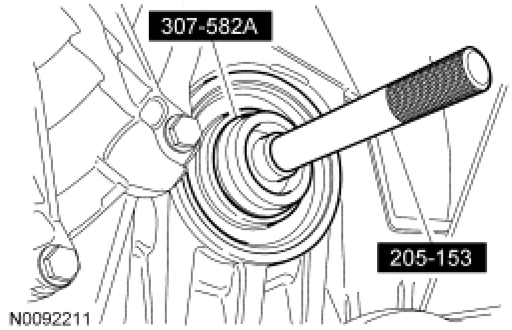

Fig. 186: Installing LH Halfshaft Seal
Courtesy of FORD MOTOR CO.

3. Install the front LH halfshaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.
4. Fill with clean transmission fluid to the correct level.

HALFSHAFT SEAL - RH

Special Tools

Illustration	Tool Name	Tool Number
	Adapter for 303-224 (Handle)	205-153 (T80T-4000-W)

		
	Installer, Halfshaft Seal	307-582A

Material

Item	**Specification**
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

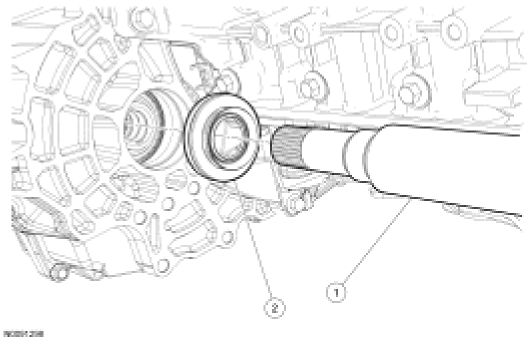

Fig. 187: Halfshaft & Seal
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3K183	Intermediate shaft
2	7H260	Seal assembly - halfshaft

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Remove the RH front wheel and tire. For additional information, refer to **WHEELS & TIRES** article.
3. Remove the RH halfshaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.
4. Inspect the halfshaft hub for wear or damage and install a new halfshaft if necessary.
    1. Inspect the differential seal surface.
    2. Inspect the halfshaft bushing surface. If this surface is damaged, inspect the halfshaft bushing for damage.
    3. Inspect the differential side gear splines.

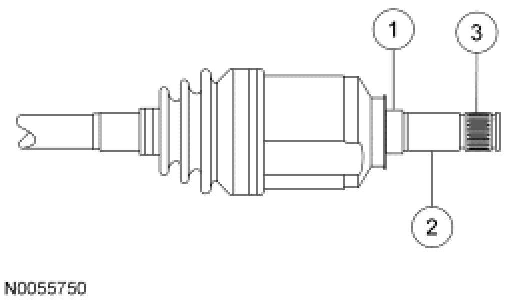

Fig. 188: Identifying Differential Side Gear Splines, Halfshaft Bushing & Differential Seal
Courtesy of FORD MOTOR CO.

5. Using a suitable awl, poke a small hole in the halfshaft seal.

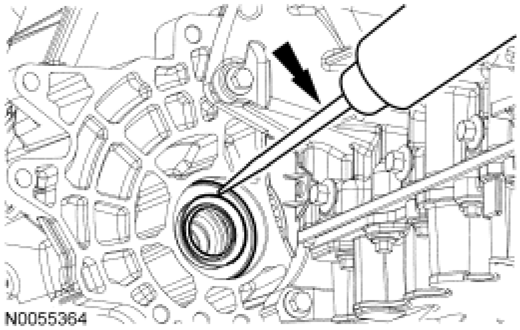

Fig. 189: Poking A Small Hole In Halfshaft Seal Using A Suitable Awl
Courtesy of FORD MOTOR CO.

6. Using a suitable dent puller, remove the halfshaft seal.

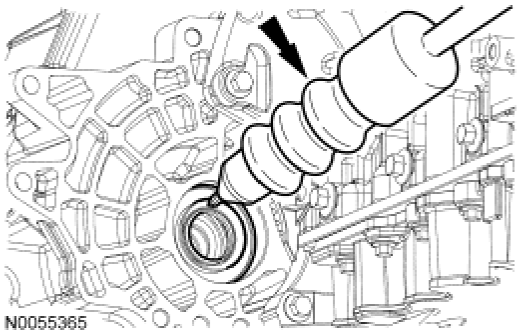

Fig. 190: Removing Halfshaft Seal Using A Suitable Dent Puller
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install a new halfshaft seal on the Cover Axle Seal Installer and Handle.

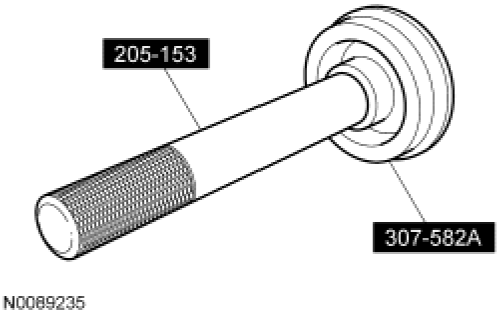

Fig. 191: Axle Seal Installer & Handle
Courtesy of FORD MOTOR CO.

2. Using the Cover Axle Seal Installer and Handle, install the RH halfshaft seal.

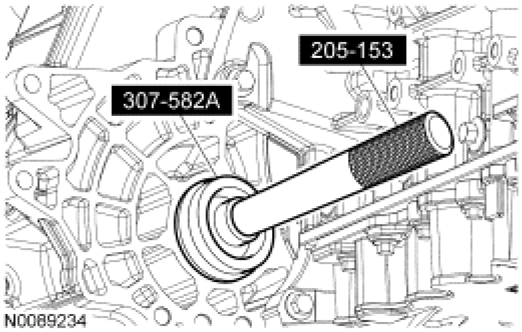

Fig. 192: installing RH Halfshaft Seal
Courtesy of FORD MOTOR CO.

3. Install the RH halfshaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.
4. Install the RH wheel and tire. For additional information, refer to **WHEELS & TIRES** article.

5. Fill with clean automatic transmission fluid to the correct level.

DIGITAL TRANSMISSION RANGE (TR) SENSOR

Special Tools

Illustration	Tool Name	Tool Number
 ST3000-A	Installer, Manual Lever Retaining Pin	307-592

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

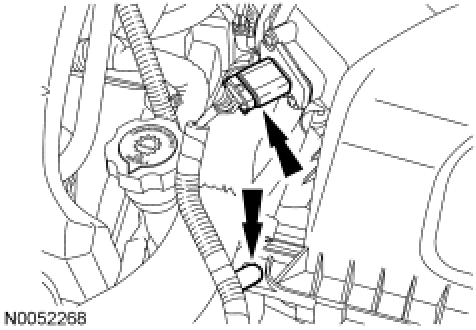

Fig. 193: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

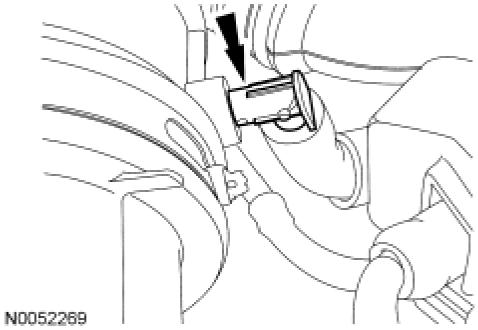

Fig. 194: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

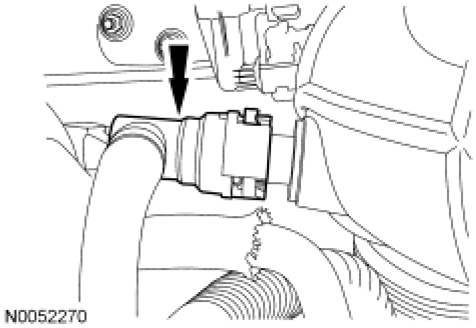

Fig. 195: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

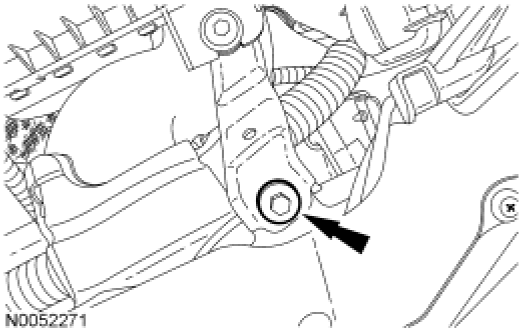

Fig. 196: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

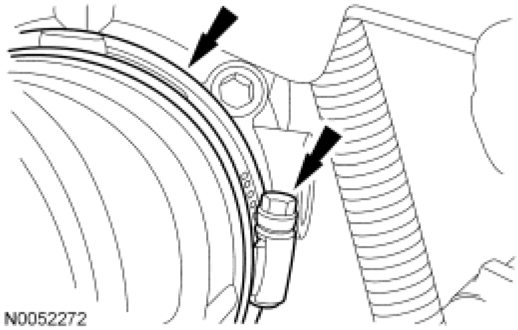

Fig. 197: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

7. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

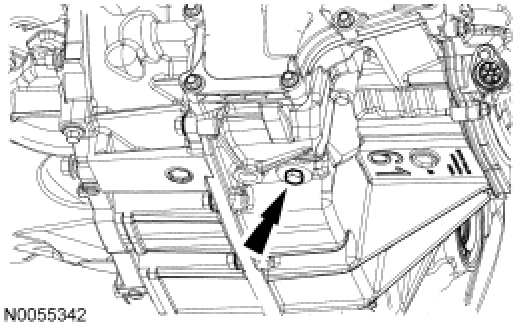

Fig. 198: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

8. Install the transmission fluid drain plug.
   - Tighten to 9 Nm (80 lb-in).

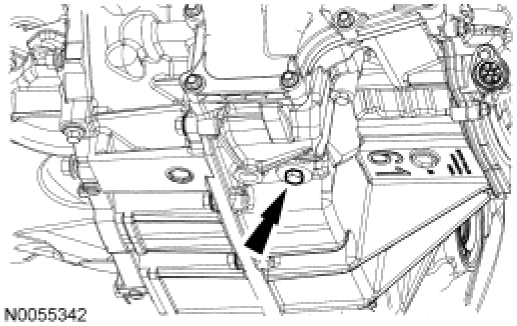

Fig. 199: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

9. Remove the coolant hoses from the transmission fluid filler tube and position aside.

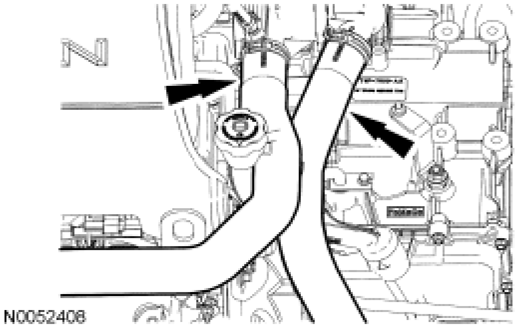

Fig. 200: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

10. Remove the transmission fluid level indicator.

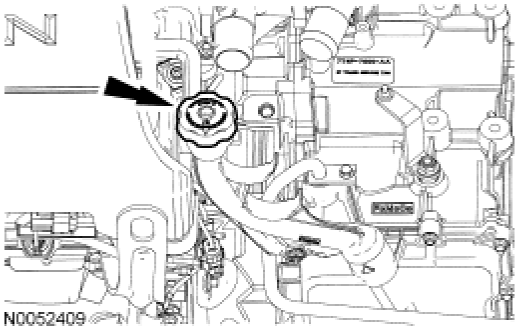

Fig. 201: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

11. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

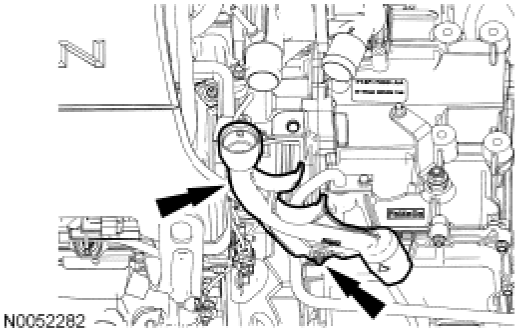

Fig. 202: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Disconnect the selector lever cable end from the manual control lever.

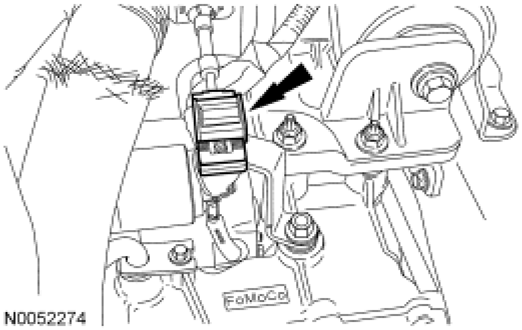

Fig. 203: Locating Selector Lever Cable End From Manual Lever
Courtesy of FORD MOTOR CO.

13. Remove the nut and the manual control lever.

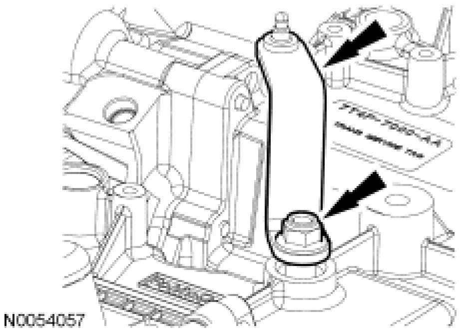

Fig. 204: Identifying Manual Control Lever & Nut
Courtesy of FORD MOTOR CO.

14. Loosen the transmission fluid cooler tube fitting from the thermal bypass valve.

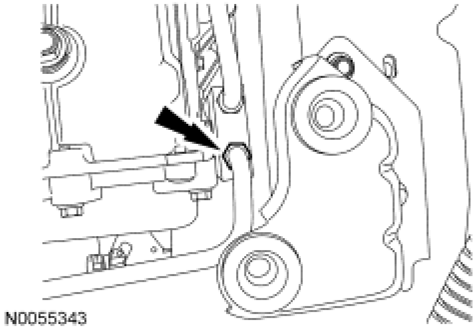

Fig. 205: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

15. Remove and discard the transmission fluid cooler tube bolt and remove the transmission fluid cooler tube.

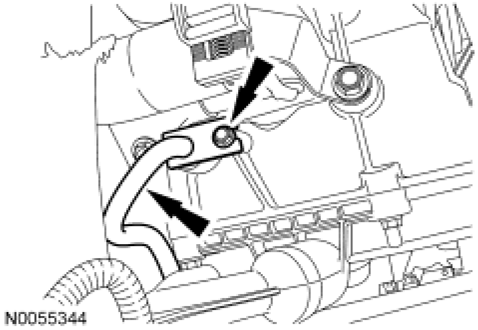

Fig. 206: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

16. Inspect the transaxle case to make sure that the transmission fluid cooler tube seal and backing ring were removed with the transmission fluid cooler tube and are not stuck in the transaxle case. If the transmission fluid cooler tube seal or backing ring are stuck in the transaxle case, remove the seal and backing ring.

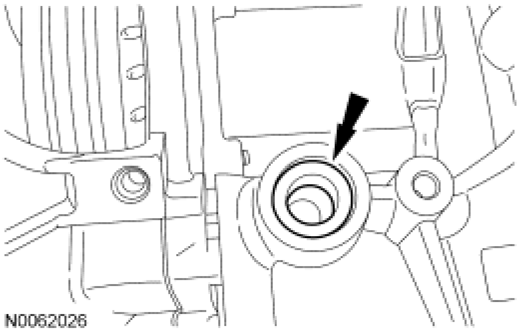

Fig. 207: Identifying Transmission Fluid Cooler Tube Seal
Courtesy of FORD MOTOR CO.

17. Disconnect the transaxle electrical connector.

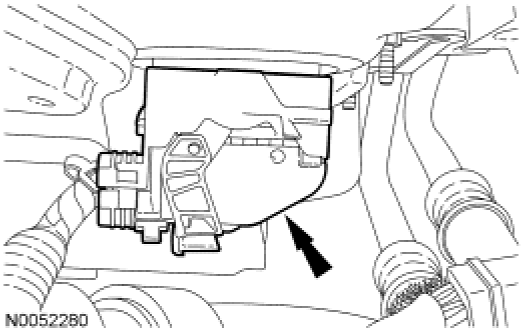

Fig. 208: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

18. Remove the transmission fluid cooler tube bracket nuts, pull the transmission fluid cooler thermal bypass valve straight up and position it aside.

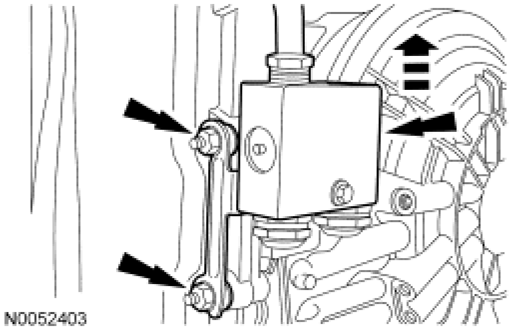

Fig. 209: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve Straight Up
Courtesy of FORD MOTOR CO.

NOTE: Note the location of the studbolts for assembly.

19. Remove the bolts and the main control cover.

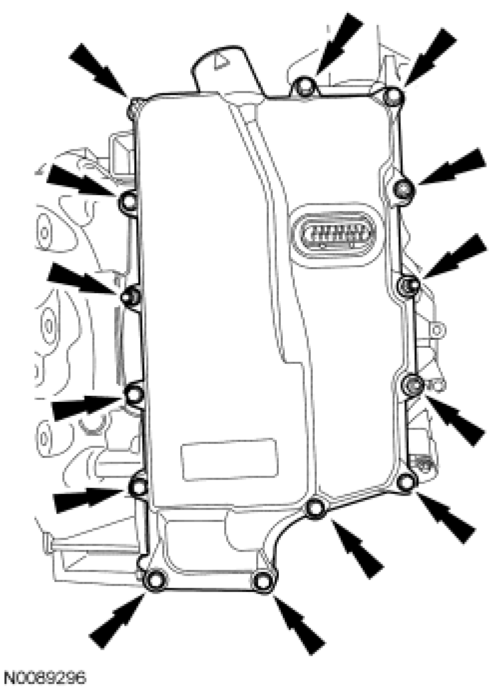

Fig. 210: Main Control Valve Cover Bolts
Courtesy of FORD MOTOR CO.

20. Disconnect the Transmission Range (TR) sensor electrical connector.
    1. Slide the lock over.
    2. Press the tab and disconnect the connector.

N0055348

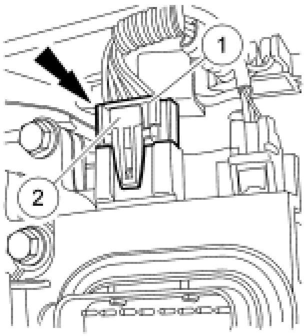

Fig. 211: Pressing Tab & Disconnecting Connector
Courtesy of FORD MOTOR CO.

21. Disconnect the Turbine Shaft Speed (TSS) and Output Shaft Speed (OSS) sensor electrical connectors.

N0055349

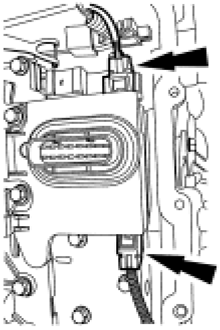

Fig. 212: Locating Turbine Shaft Speed (TSS) & Output Shaft Speed (OSS) Sensor Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: The solenoid body should be handled with care, damage to the solenoid body may occur.

NOTE: Note the location of the different length bolts for assembly.

22. Remove the bolts and the solenoid body.

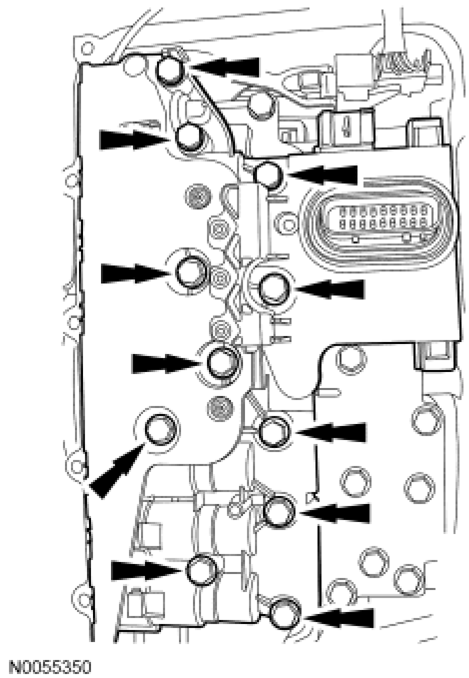

Fig. 213: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: **Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**

NOTE: **Use care not to break the alignment tabs when removing the solenoid body filter.**

23. Remove the solenoid body filter assembly by pulling it straight up from the alignment tabs. Discard the filter.

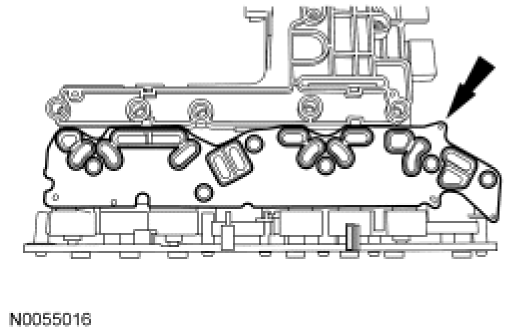

Fig. 214: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

24. Remove the bolts, the TR sensor detent spring and the main control valve body.

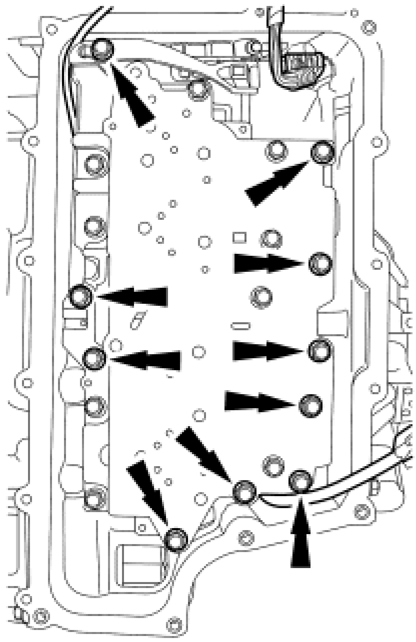

Fig. 215: Locating Main Control Valve Body Bolts
Courtesy of FORD MOTOR CO.

25. Using a suitable tool, remove and discard the TR sensor locking pin.

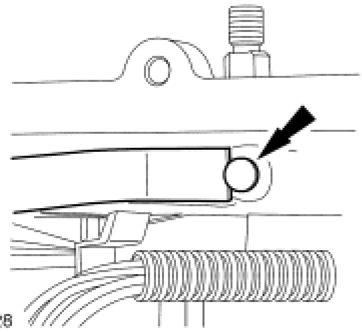

Fig. 216: Locating TR Sensor Locking Pin
Courtesy of FORD MOTOR CO.

NOTE:	**TR sensor removed for clarity.**

26. Make sure that the park pawl actuator rod does not become disengaged from the park pawl and the abutment by keeping the end of the park pawl actuator rod behind the machined valve body mating surface of the transaxle case. If the park pawl actuator rod becomes disengaged from the park pawl and the abutment, transaxle removal and disassembly is required to reinstall the actuator rod.

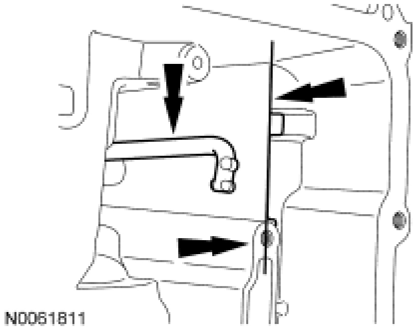

Fig. 217: Making Sure That Park Pawl Actuator Rod Does Not Become Disengaged From Park Pawl
Courtesy of FORD MOTOR CO.

NOTE: **Make sure that the park pawl actuator rod does not become disengaged from the park pawl and the abutment or transaxle removal and disassembly is required to reinstall the actuator rod.**

27. Remove the TR sensor.
    1. Slide the TR sensor down until the manual shaft is out of the transaxle case.
    2. Rotate the TR sensor detent plate counterclockwise, as viewed from below, until the plate rests against the transaxle case. Remove the park pawl actuating rod from the TR sensor and remove the TR sensor.

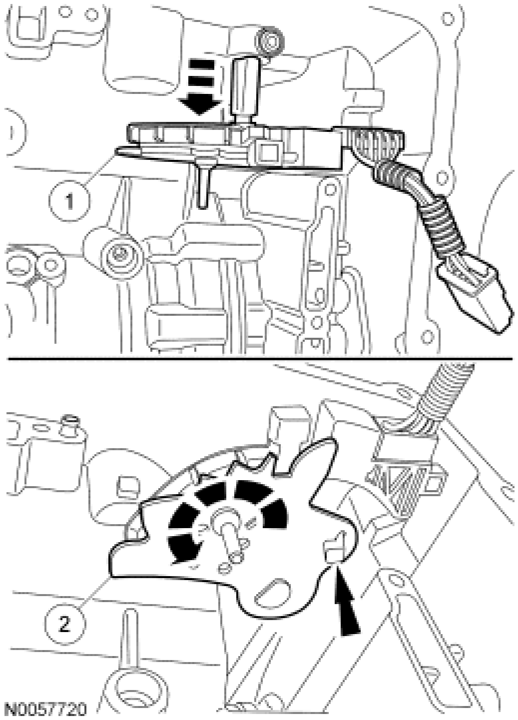

Fig. 218: Sliding TR Sensor Down & Rotating TR Sensor Detent Plate Counterclockwise
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install the TR sensor.
    1. Position the park pawl actuating rod in the TR sensor.
    2. Install the TR sensor in the transaxle case.

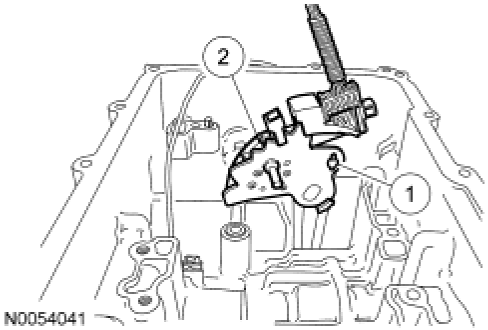

Fig. 219: Identifying TR Sensor In Transaxle Case
Courtesy of FORD MOTOR CO.

2. Using the Manual Retaining Pin Installer, install a new TR sensor locking pin.

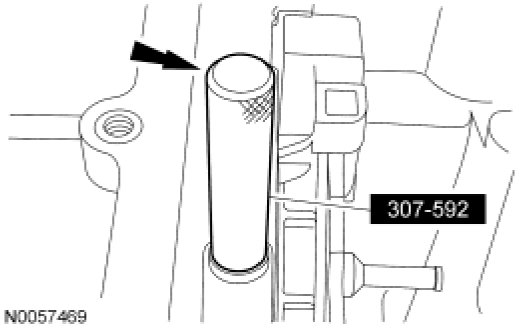

Fig. 220: Installing TR Sensor Locking Pin Using Special Tool (307-592)
Courtesy of FORD MOTOR CO.

NOTE: Make sure that the manual pin (part of the TR sensor) is correctly installed in the manual valve.

3. Position the TSS, OSS and TR sensor wiring harnesses aside and install the main control valve body.

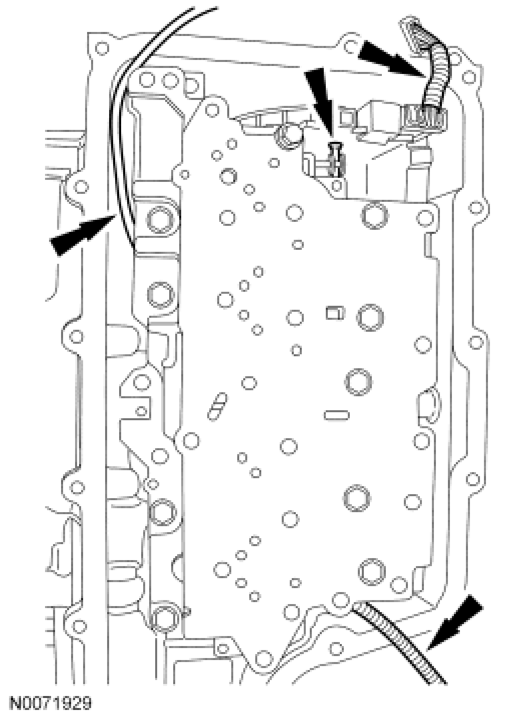

Fig. 221: Locating TSS, OSS & TR Sensor Wiring Harnesses
Courtesy of FORD MOTOR CO.

4. Inspect the manual pin to make sure it is correctly installed in the manual control valve. If it is not, pull the valve body off the transaxle case. Correctly install the manual pin in the manual control valve and position the valve body in place.

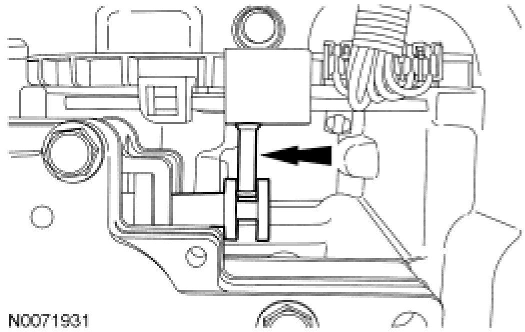

Fig. 222: Identifying Manual Pin
Courtesy of FORD MOTOR CO.

5. Install the TR sensor detent spring and the bolts. Tighten the bolts in the sequence shown.
   - Tighten to 12 Nm (106 lb-in).

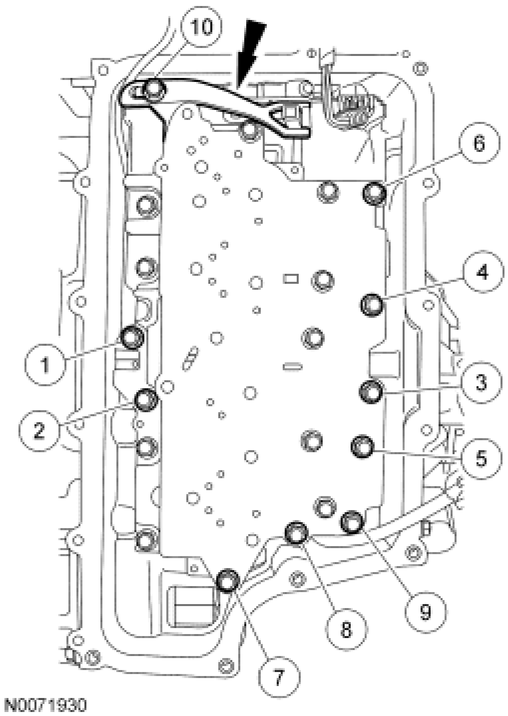

Fig. 223: Tightening TR Sensor Detent Spring Bolts In Sequence
Courtesy of FORD MOTOR CO.

NOTE: **Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**

NOTE: **Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**

NOTE: **Make sure that the filter passage areas are clean of foreign material before installing the filter. Damage to the transaxle will occur if the filter passages are not clean.**

6. Install a new solenoid body filter assembly by pushing it straight down on to the alignment tabs.

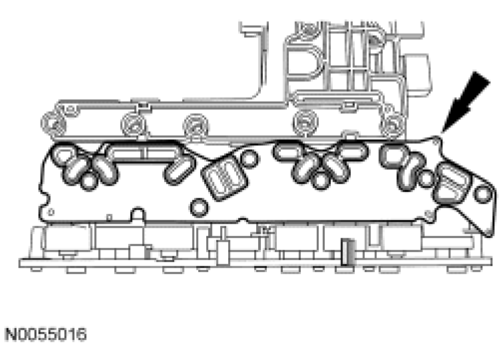

Fig. 224: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

NOTE: Make sure not to pinch the Turbine Shaft Speed (TSS), Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the solenoid body. Damage to the wiring harness will occur.

NOTE: Install the different length bolts in the locations noted during disassembly.

7. Install the solenoid body and the bolts.
    1. 42 mm (1.65 in) bolt
    2. 63 mm (2.48 in) bolts
    3. 80 mm (3.14 in) bolts
    4. 95 mm (3.74 in) bolts

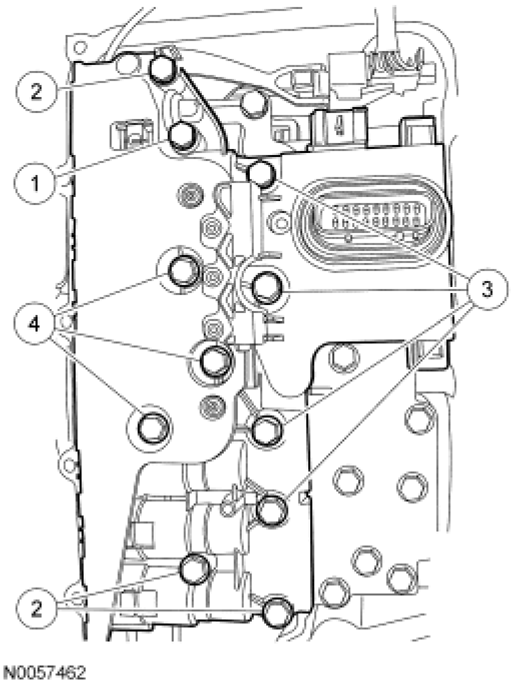

Fig. 225: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

8. Tighten the solenoid body bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

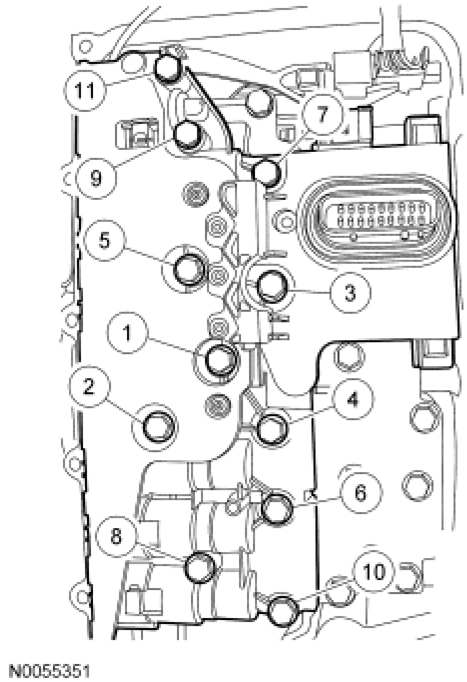

Fig. 226: Tightening Solenoid Body Bolts In Sequence
Courtesy of FORD MOTOR CO.

9. Route the OSS sensor wiring harness and connect the electrical connector.

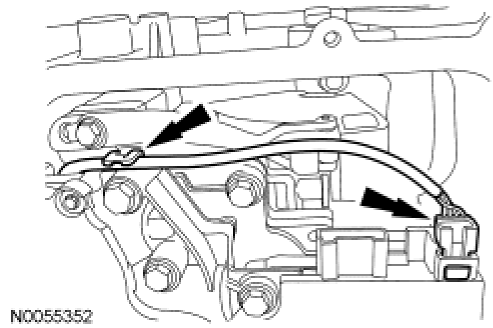

Fig. 227: Locating OSS Sensor Wiring Harness & Electrical Connector
Courtesy of FORD MOTOR CO.

10. Connect the TR sensor electrical connector.
    1. Connect the electrical connector.
    2. Slide the locking tab over.

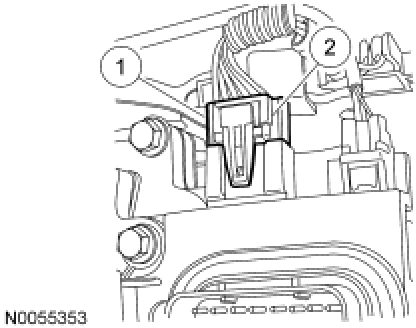

Fig. 228: Identifying TR Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

11. Connect the TSS sensor electrical connector.

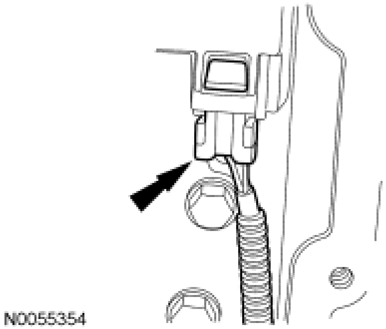

Fig. 229: Identifying TSS Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

12. Inspect the transaxle main control cover seal for damage and install new if necessary.

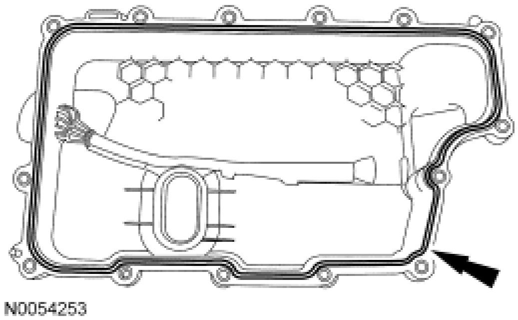

Fig. 230: Inspecting Transaxle Main Control Cover Seal For Damage
Courtesy of FORD MOTOR CO.

NOTE: **Inspect the 20-pin solenoid body connector seal to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur resulting in transmission damage.**

NOTE: Install the studbolts in the locations noted during disassembly.

13. Install the main control cover and loosely install the bolts.
    1. Bolt location
    2. Studbolt location

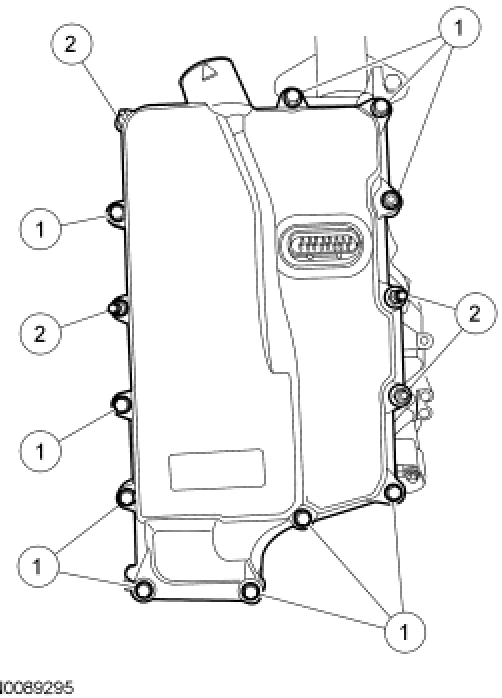

Fig. 231: Main Control Cover Bolts
Courtesy of FORD MOTOR CO.

14. Tighten the main control cover bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

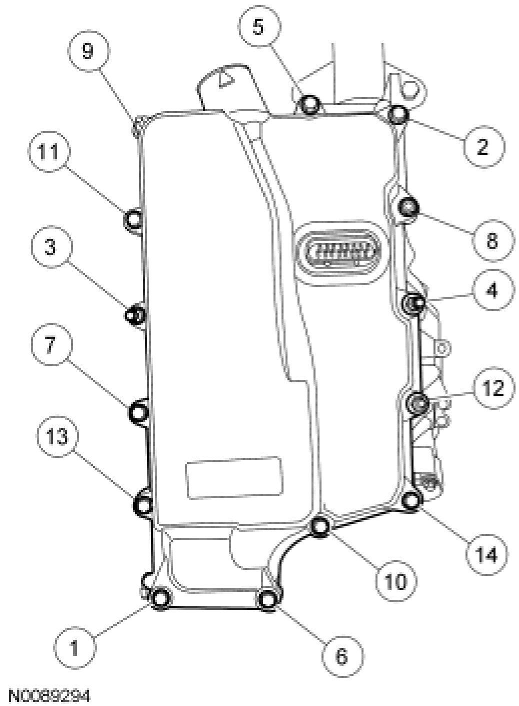

Fig. 232: Main Control Cover Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

15. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the nuts.
    - Tighten to 9 Nm (80 lb-in).

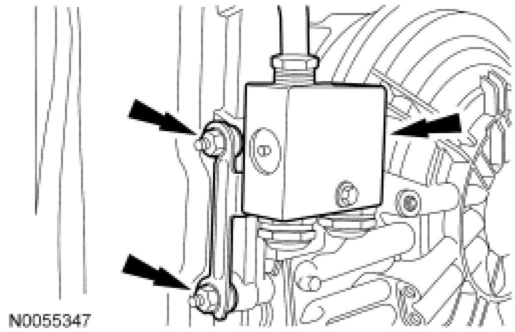

Fig. 233: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

16. Connect the transaxle electrical connector.

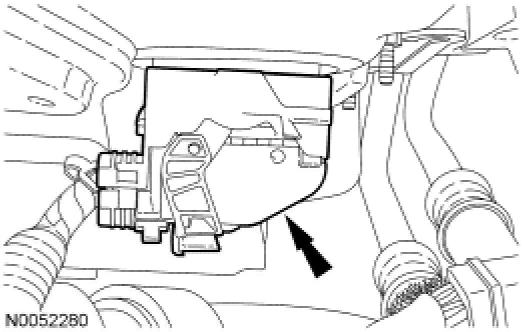

Fig. 234: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

17. Inspect the transmission fluid cooler tube backing ring and seal for damage and install a new backing ring or seal if necessary. Lubricate the transmission fluid cooler tube seal with clean transmission fluid and install the backing ring and seal on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

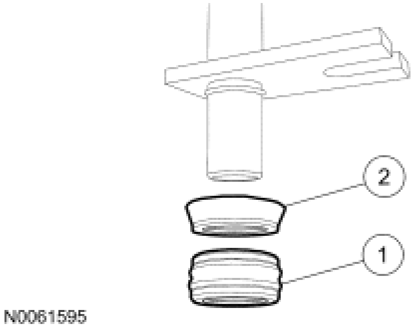

Fig. 235: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal
Courtesy of FORD MOTOR CO.

18. Position the transmission fluid cooler tube in place and install a new bolt.
    - Tighten to 9 Nm (80 lb-in).

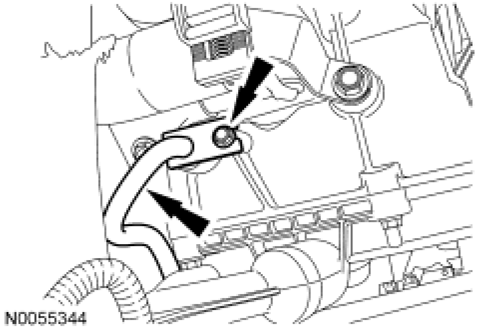

Fig. 236: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

19. Tighten the transmission fluid cooler tube fitting.
    - Tighten to 25 Nm (18 lb-ft).

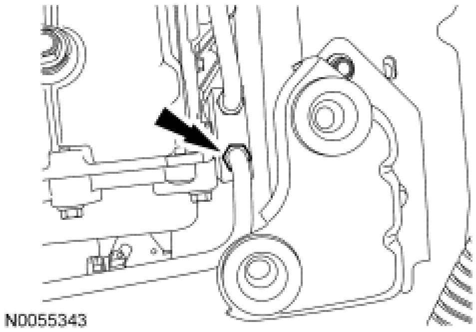

Fig. 237: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure that when installing the manual control lever it is fully seated onto the manual control lever shaft. Damage to the manual control lever shaft will occur and the lever will come loose.**

NOTE:	**Make sure to hold the manual control lever while tightening the manual control lever nut or damage to the manual control lever and park components will occur.**

20. Install the manual control lever and the nut.
    - Tighten to 18 Nm (159 lb-in).

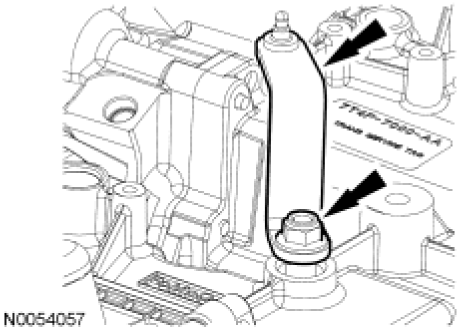

Fig. 238: Identifying Manual Control Lever & Nut
Courtesy of FORD MOTOR CO.

21. Connect the selector lever cable end to the manual control lever.

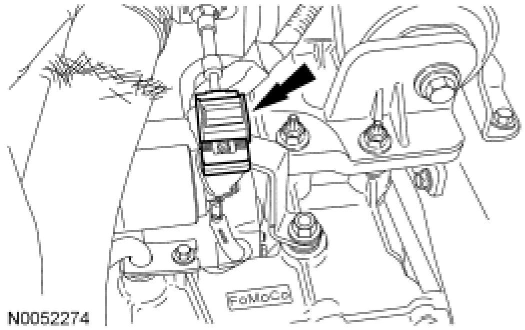

Fig. 239: Locating Selector Lever Cable End From Manual Lever
Courtesy of FORD MOTOR CO.

22. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

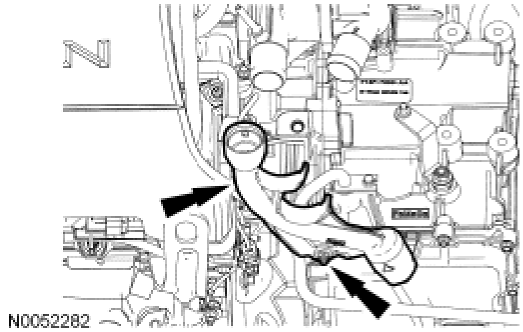

Fig. 240: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

23. Install the transmission fluid level indicator.

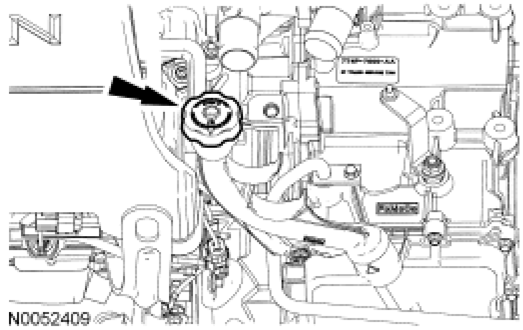

Fig. 241: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

24. Route the coolant hoses to the correct position on the transmission fluid filler tube.

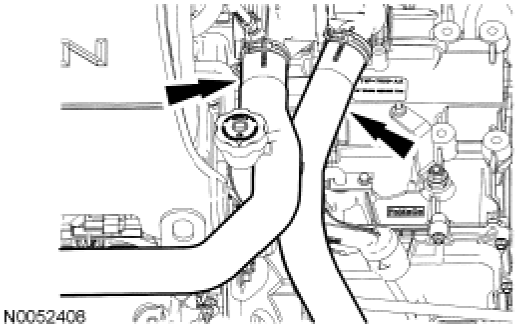

Fig. 242: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

25. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

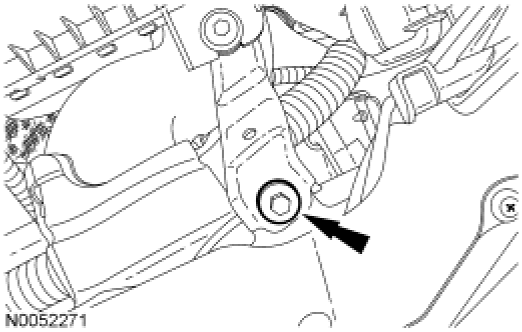

Fig. 243: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

26. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

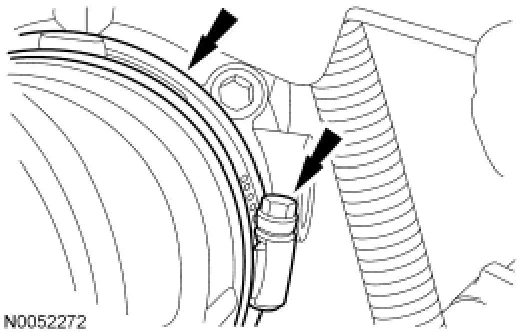

Fig. 244: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

27. Connect the engine breather to the ACL assembly.

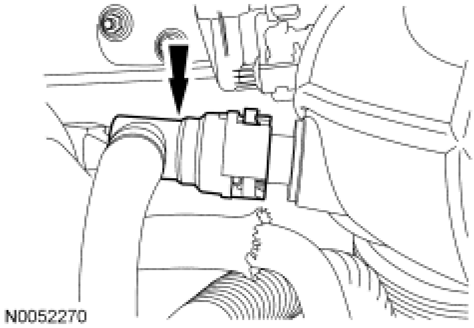

Fig. 245: Locating Engine Breather
Courtesy of FORD MOTOR CO.

28. Connect the brake booster vacuum hose to the ACL assembly.

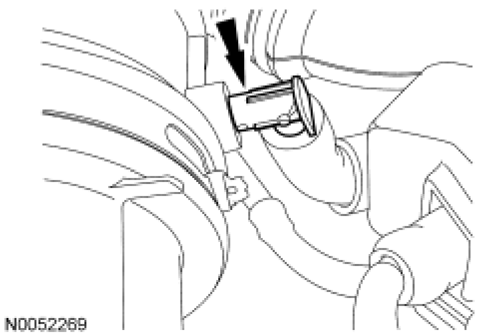

Fig. 246: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

29. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

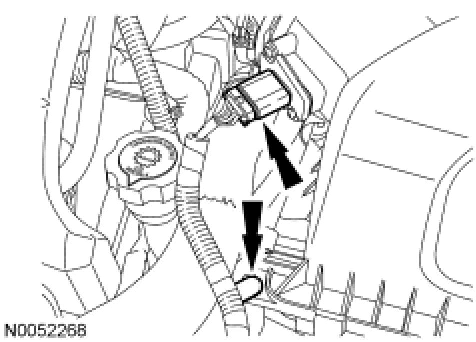

Fig. 247: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

30. Fill with clean transmission fluid to the correct level.

TRANSAXLE SUPPORT INSULATOR

Special Tools

Illustration	Tool Name	Tool Number
	Oil Pan Holding Fixture	303-1295

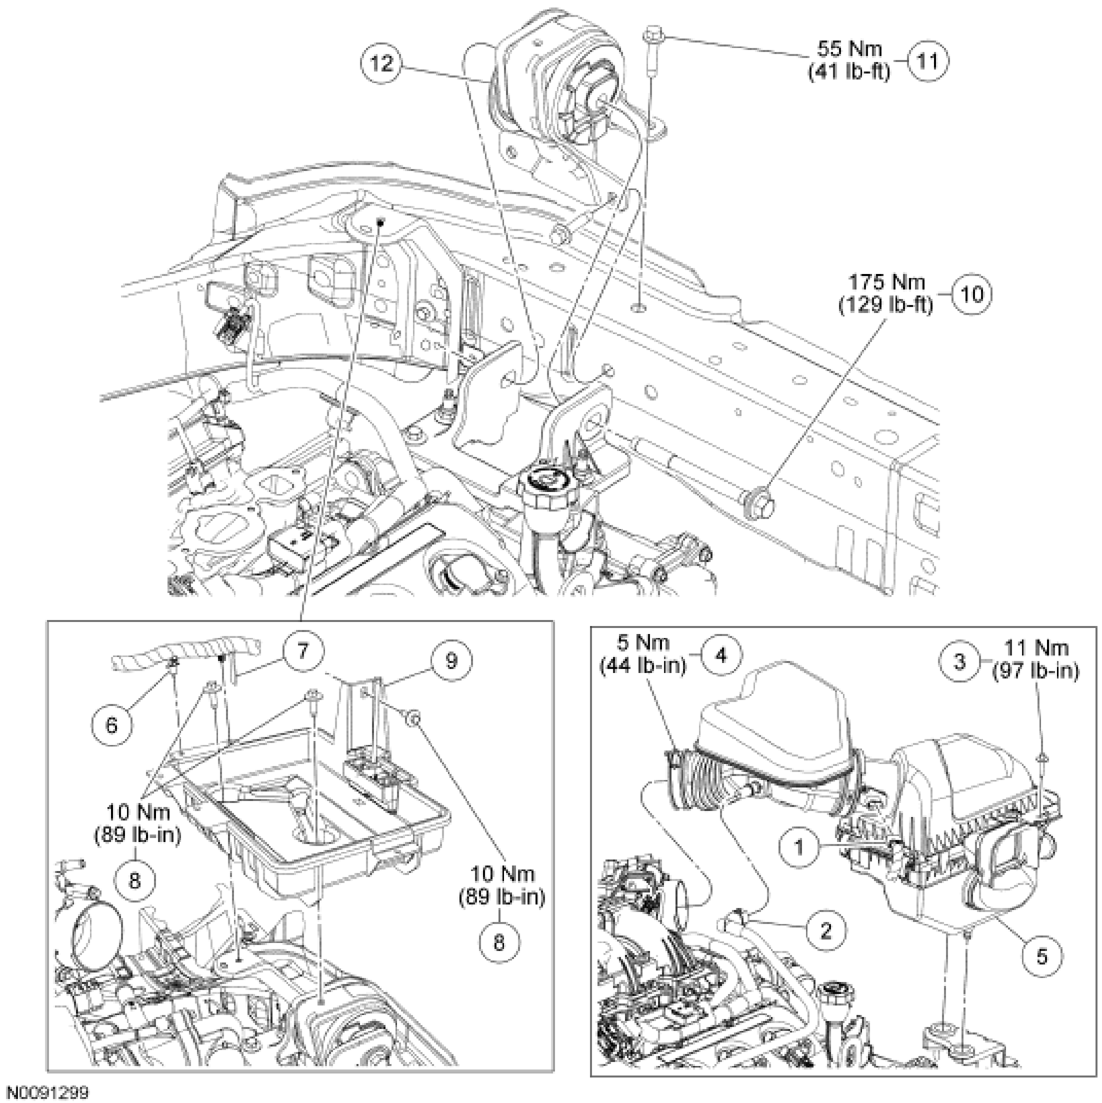

Fig. 248: Replacing Transaxle Support Insulator
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Electrical connector - Mass Air Flow (MAF) sensor
2	6758	Tube assembly - crankcase vent
3	N606678	Bolt - Air Cleaner (ACL) bracket
4	9C632	Clamp - ACL outlet pipe
5	9C662	ACL assembly
6	13A506	Fastener - wiring harness
7	13A506	Fastener - wiring harness
8	W503924	Bolts - battery tray
9	10723	Battery tray

10	W711873	Through bolt - transaxle support insulator
11	W709234	Bolt - transaxle support insulator (4 required)
12	6F020	Transaxle support insulator

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Loosen the exhaust flexible pipe clamp and disconnect the 2 exhaust hangers.

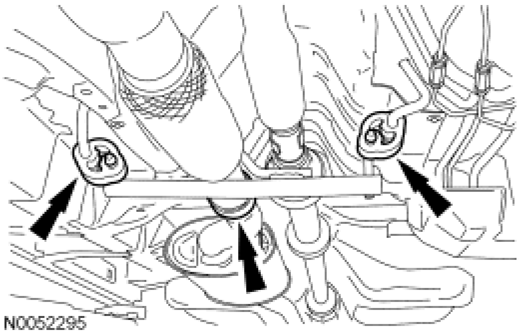

Fig. 249: Locating Exhaust Flexible Pipe Clamp & Exhaust Hangers
Courtesy of FORD MOTOR CO.

3. Remove the 4 nuts and the exhaust flexible pipe and Y-pipe as an assembly.
   - Discard the nuts and the gasket.

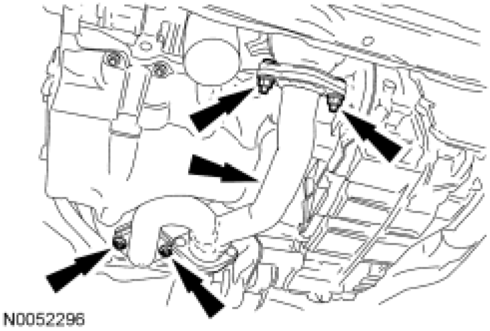

Fig. 250: Locating Exhaust Flexible Pipe, Y-Pipe & Nuts
Courtesy of FORD MOTOR CO.

4. Remove the 2 nuts and the roll restrictor heat shield.

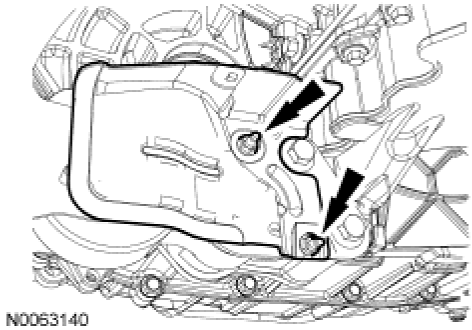

Fig. 251: Locating Roll Restrictor Heat Shield Nuts
Courtesy of FORD MOTOR CO.

5. Loosen the engine roll restrictor-to-subframe through bolt.

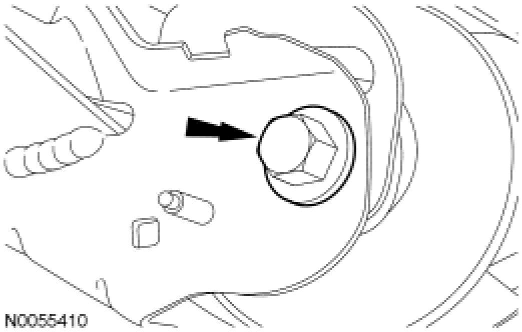

Fig. 252: Locating Roll Restrictor-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

6. Remove the 3 bolts from the roll restrictor bracket.

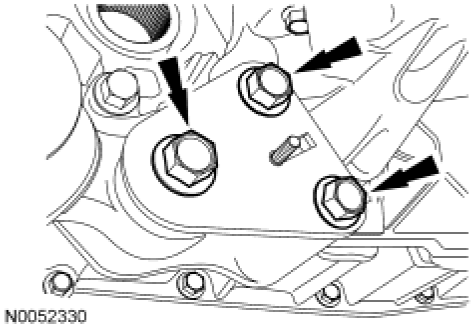

Fig. 253: Locating Roll Restrictor-To-Transaxle Bracket Plate Bolts
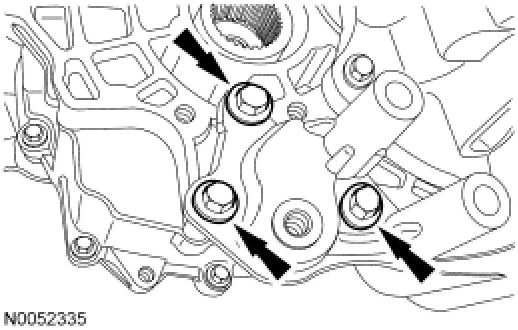
Courtesy of FORD MOTOR CO.

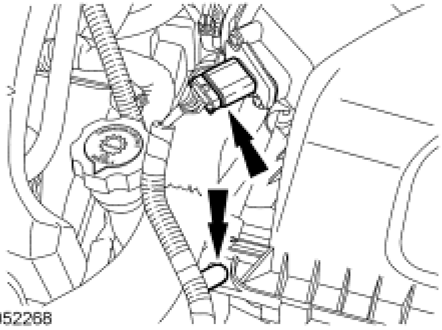
7. Remove the 3 bolts and the roll restrictor bracket.



N0052335

Fig. 254: Locating Transaxle Bracket Bolts
Courtesy of FORD MOTOR CO.

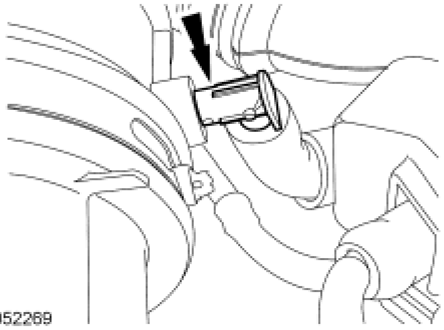
8. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.



N0052268

Fig. 255: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

9. Disconnect the brake booster vacuum hose from the ACL outlet pipe.



N0052269

Fig. 256: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

10. Disconnect the engine breather from the ACL assembly.

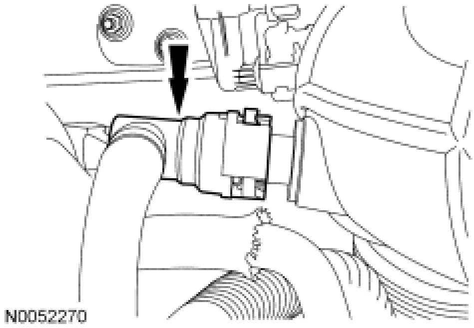


Fig. 257: Locating Engine Breather
Courtesy of FORD MOTOR CO.

11. Remove the ACL assembly bracket bolt.

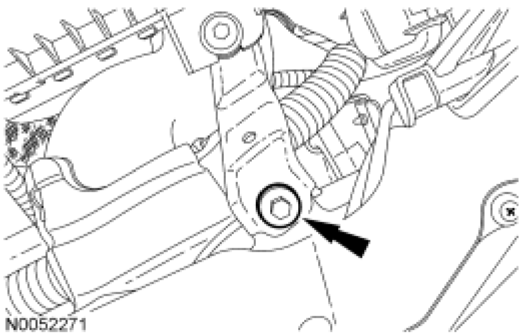

Fig. 258: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

12. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

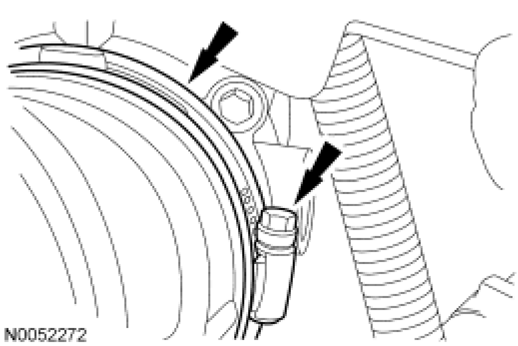

Fig. 259: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

13. Remove the battery. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.
14. Remove the battery tray.
    1. Disconnect the wiring harness fasteners.

2. Remove the 3 bolts and the battery tray.

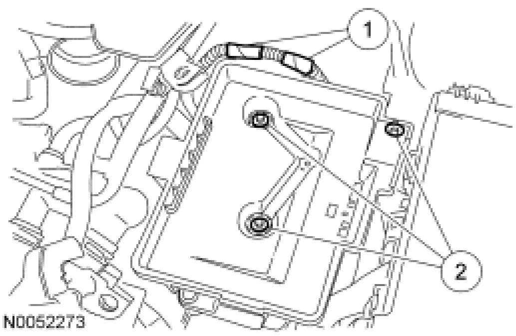

Fig. 260: Identifying Wiring Harness Fasteners, Battery Tray & Bolts
Courtesy of FORD MOTOR CO.

NOTE: The Oil Pan Holding Fixture must be carefully aligned to the mounting bosses on the oil pan. Failure to follow these instructions may result in damage to the oil pan.

NOTE: The Oil Pan Holding Fixture and floor jack are used to raise and lower the engine to access the engine front cover and engine mount bracket fasteners.

15. Position a floor jack and the Oil Pan Holding Fixture under the oil pan and raise the floor jack high enough to release the pressure on the transaxle support insulator.

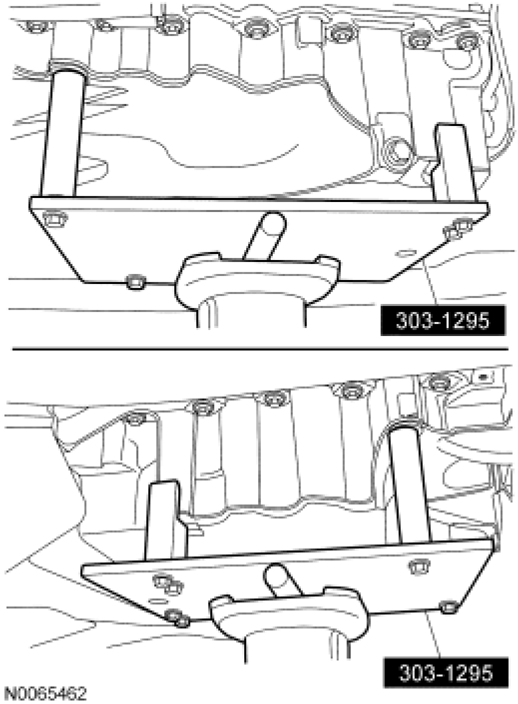

Fig. 261: Positioning Floor Jack & Special Tool (303-1295) Under Oil Pan
Courtesy of FORD MOTOR CO.

16. Remove the transaxle support insulator through bolt.

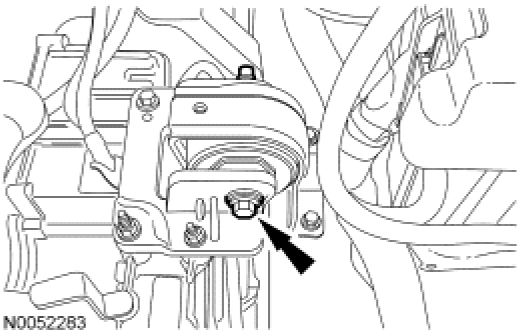

Fig. 262: Identifying Transaxle Support Insulator Bolt
Courtesy of FORD MOTOR CO.

17. Remove the 3 nuts, the bolt and the transaxle support insulator bracket.

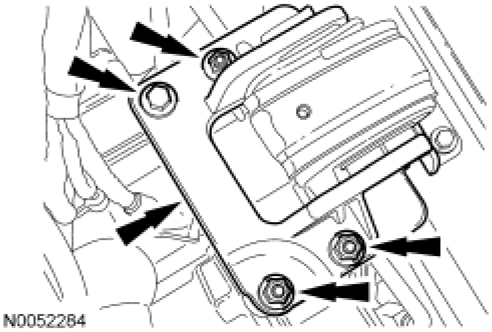

Fig. 263: Identifying Transaxle Support Insulator Bracket, Nuts & Bolts
Courtesy of FORD MOTOR CO.

18. Lower the jack until the transmission fluid cooler tube clears the lower transmission support insulator bolts.
19. Loosen the battery tray support bracket bolts.

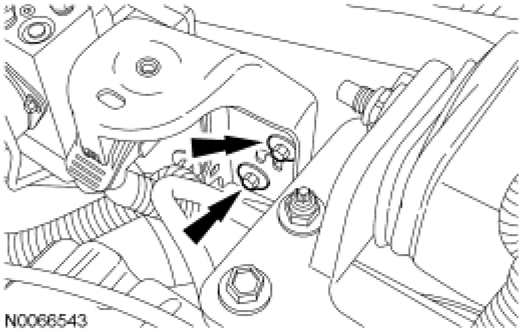

Fig. 264: Identifying Battery Tray Support Bracket Bolts
Courtesy of FORD MOTOR CO.

20. Remove the top transaxle support insulator bolts.

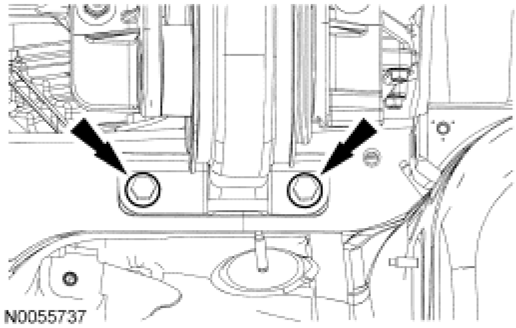

Fig. 265: Identifying Top Transaxle Support Insulator Bolts
Courtesy of FORD MOTOR CO.

21. Remove the bottom transaxle support insulator bolts.

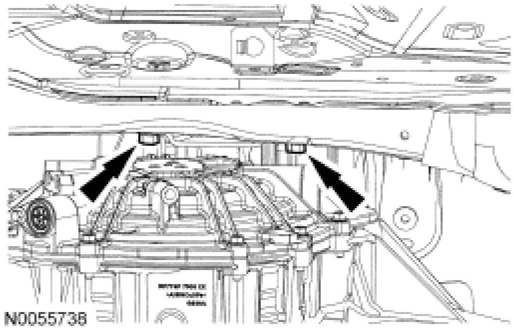

Fig. 266: Identifying Bottom Transaxle Support Insulator Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install the bottom transaxle support insulator bolts.
   - Tighten to 55 Nm (41 lb-ft).

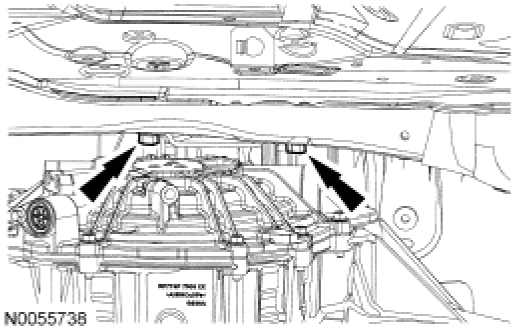

Fig. 267: Identifying Bottom Transaxle Support Insulator Bolts
Courtesy of FORD MOTOR CO.

2. Install the top transaxle support insulator bolts.
   - Tighten to 55 Nm (41 lb-ft).

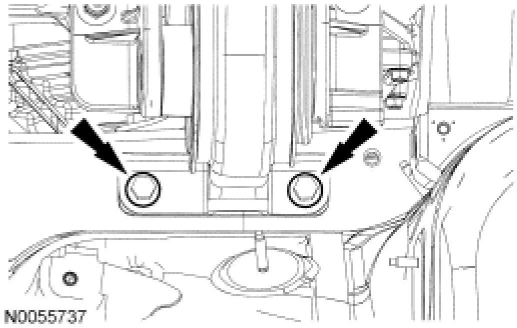

Fig. 268: Identifying Top Transaxle Support Insulator Bolts
Courtesy of FORD MOTOR CO.

3. Tighten the battery tray support bracket bolts.
   - Tighten to 10 Nm (89 lb-in).

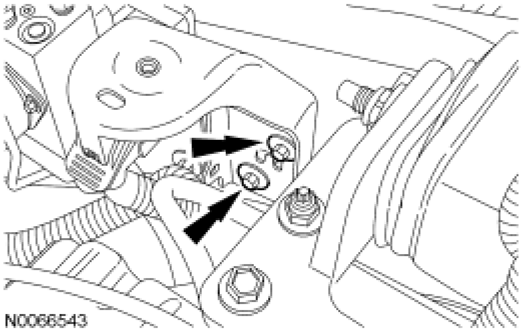

Fig. 269: Identifying Battery Tray Support Bracket Bolts
Courtesy of FORD MOTOR CO.

4. Using the jack and the Oil Pan Holding Fixture, lift the transaxle into place.

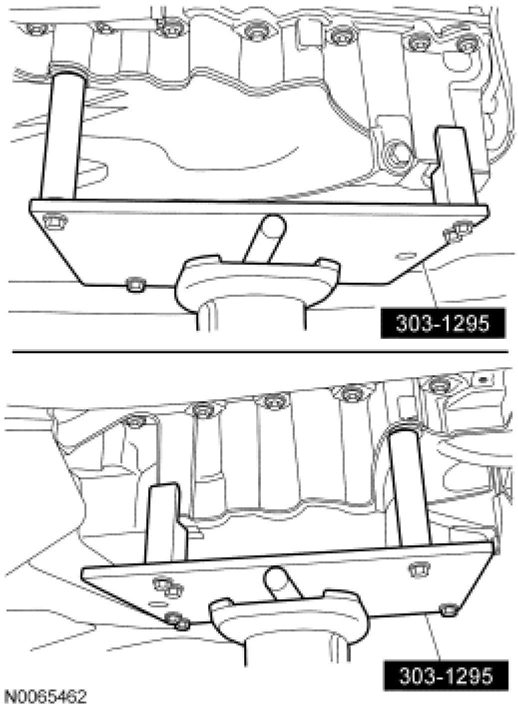

Fig. 270: Positioning Floor Jack & Special Tool (303-1295) Under Oil Pan
Courtesy of FORD MOTOR CO.

5. Install the transaxle support insulator bracket, bolt and the 3 nuts.
   - Tighten the transaxle support insulator bracket nuts to 63 Nm (46 lb-ft).
   - Tighten the transaxle support insulator bracket bolt to 63 Nm (46 lb-ft).

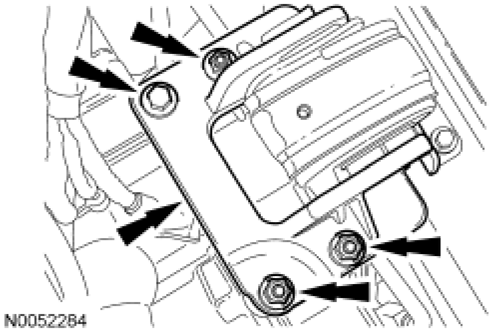

Fig. 271: Identifying Transaxle Support Insulator Bracket, Nuts & Bolts
Courtesy of FORD MOTOR CO.

6. Install the transaxle support insulator through bolt.
   - Tighten to 175 Nm (129 lb-ft).

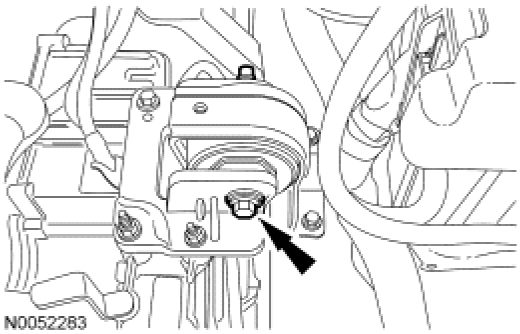

Fig. 272: Identifying Transaxle Support Insulator Bolt
Courtesy of FORD MOTOR CO.

7. Install the battery tray.
    1. Install the 3 bolts.
        - Tighten to 10 Nm (89 lb-in).
    2. Connect the wiring harness fasteners to the battery tray.

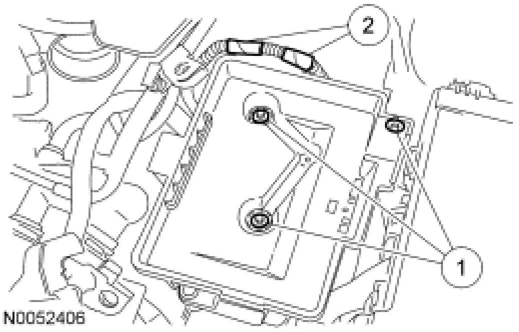

Fig. 273: Identifying Wiring Harness Fasteners, Battery Tray & Bolts
Courtesy of FORD MOTOR CO.

8. Install the battery. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.
9. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

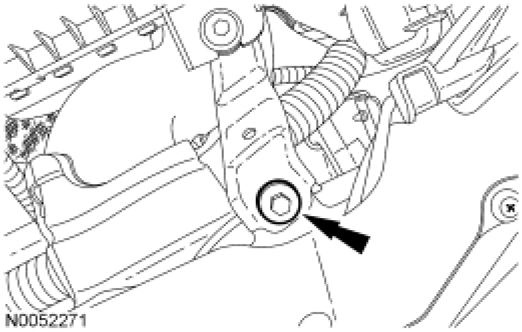

Fig. 274: Locating Air Cleaner Assembly Bracket Bolt

Courtesy of FORD MOTOR CO.

10. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

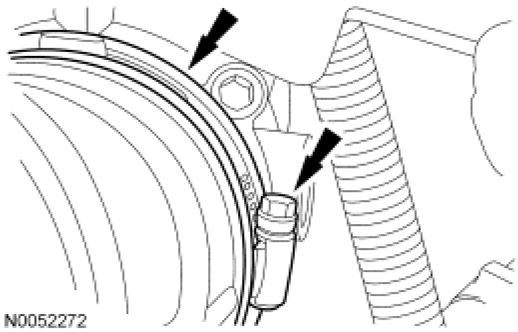

Fig. 275: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

11. Connect the engine breather to the ACL assembly.

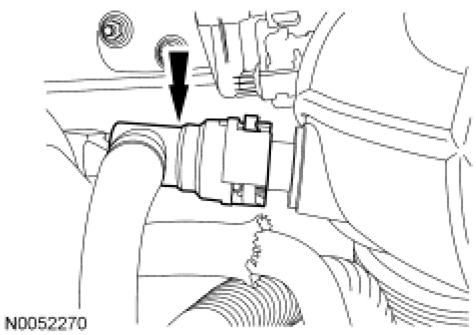

Fig. 276: Locating Engine Breather
Courtesy of FORD MOTOR CO.

12. Connect the brake booster vacuum hose to the ACL assembly.

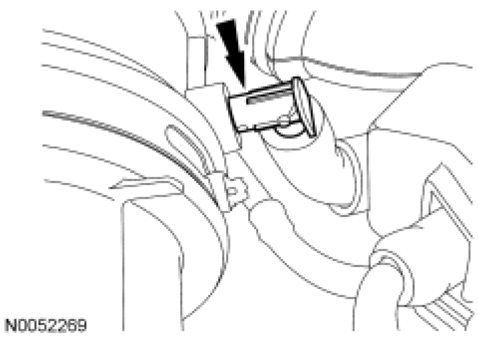

Fig. 277: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

13. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

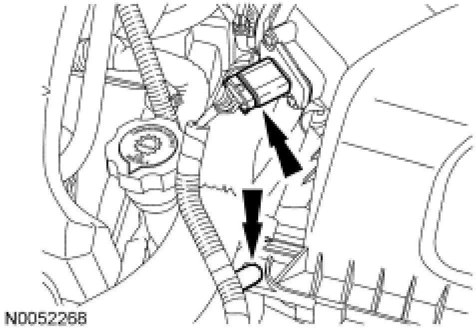

Fig. 278: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

14. Position the roll restrictor bracket on the transaxle and install the 3 bolts.
    - Tighten to 90 Nm (66 lb-ft).

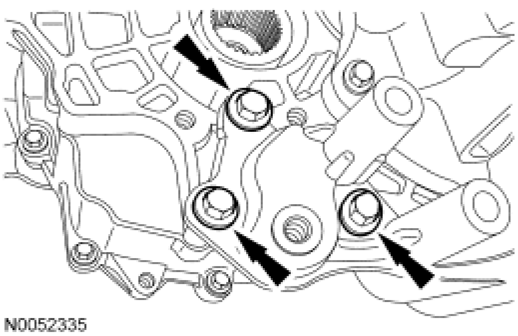

Fig. 279: Locating Transaxle Bracket Bolts
Courtesy of FORD MOTOR CO.

15. Position the roll restrictor in place, install the bracket and the 3 bolts.
    - Tighten to 90 Nm (66 lb-ft).

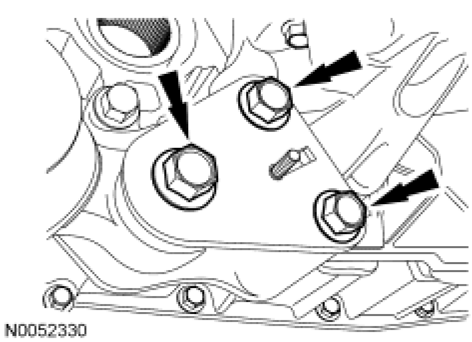

Fig. 280: Locating Roll Restrictor-To-Transaxle Bracket Plate Bolts
Courtesy of FORD MOTOR CO.

16. Install the engine roll restrictor-to-subframe through bolt.
    - Tighten to 103 Nm (76 lb-ft).

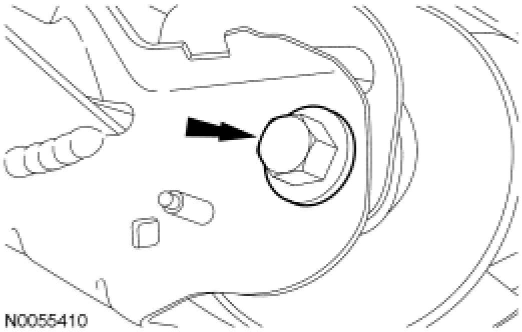

Fig. 281: Locating Roll Restrictor-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

17. Install the roll restrictor heat shield and the 2 nuts.
    - Tighten to 11 Nm (97 lb-in).

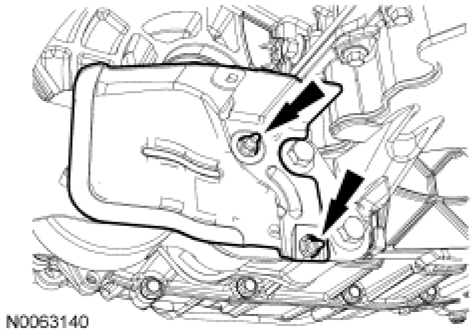

Fig. 282: Locating Roll Restrictor Heat Shield Nuts
Courtesy of FORD MOTOR CO.

18. Position the exhaust Y-pipe assembly in place and install a new gasket and 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

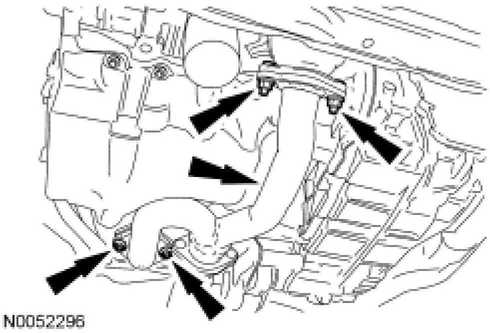

Fig. 283: Locating Exhaust Flexible Pipe, Y-Pipe & Nuts

Courtesy of FORD MOTOR CO.

19. Install the 2 exhaust hangers and tighten the exhaust clamp.
    - Tighten to 40 Nm (30 lb-ft).

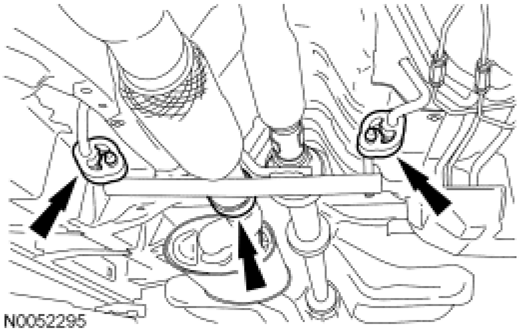

Fig. 284: Locating Exhaust Flexible Pipe Clamp & Exhaust Hangers
Courtesy of FORD MOTOR CO.

20. Check the transmission fluid level and fill with clean transmission fluid to the correct level.

SOLENOID BODY ASSEMBLY

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

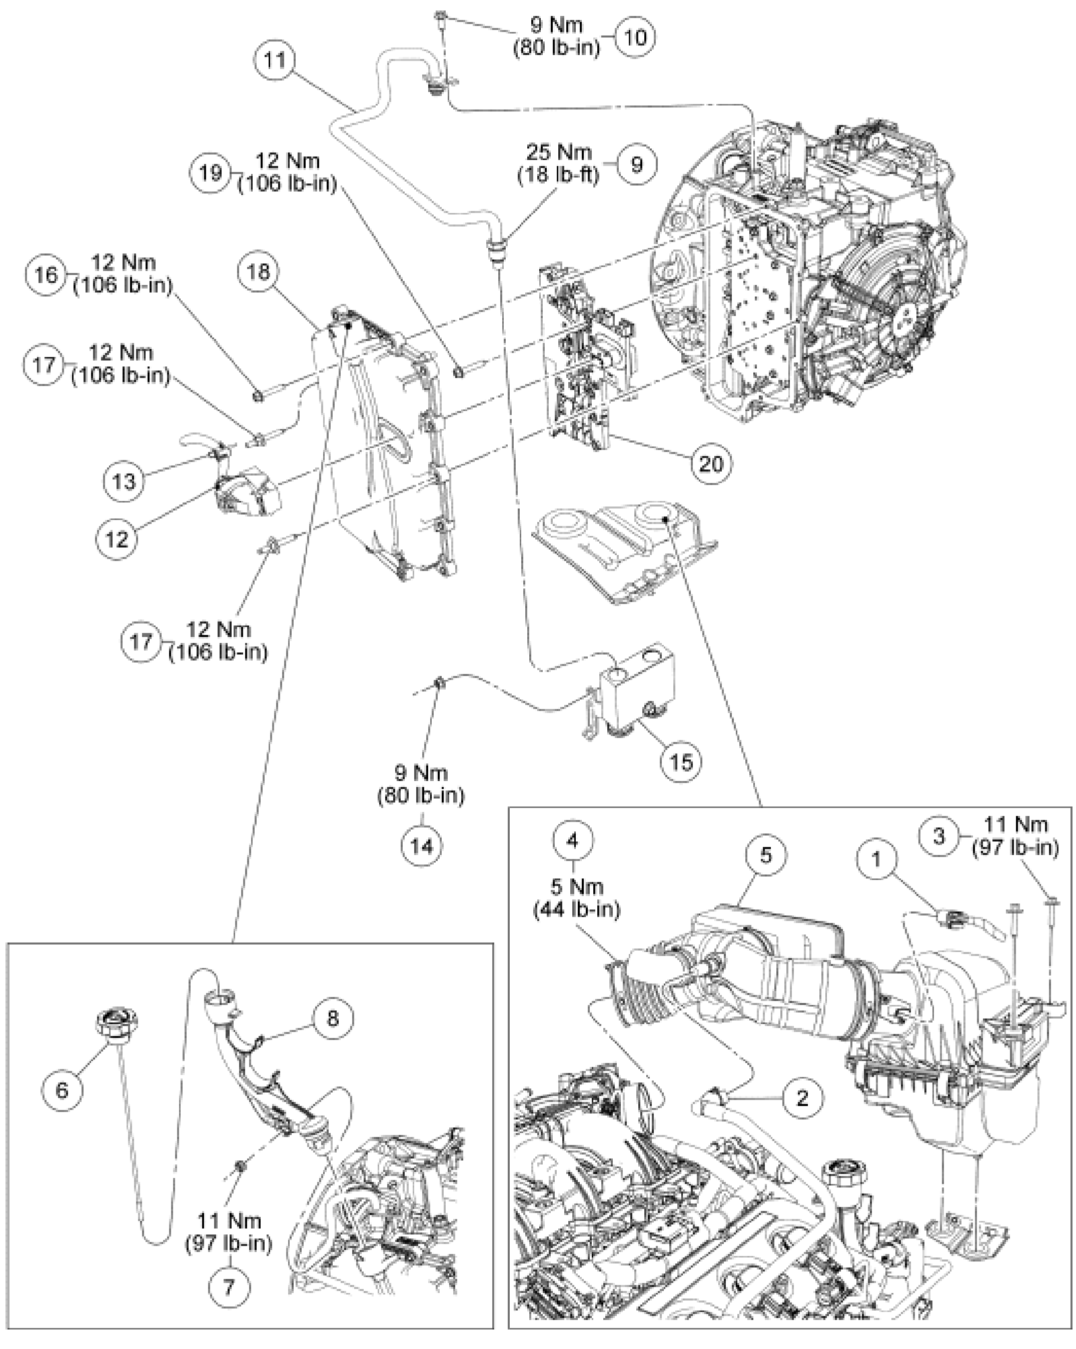

Fig. 285: Main Control & Solenoid Body Components (With Torque Specifications)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Electrical connector - Mass Air Flow (MAF) sensor
2	6758	Tube assembly - crankcase vent

3	N606678	Bolt - Air Cleaner (ACL) bracket
4	9C632	Clamp - ACL outlet pipe
5	9C662	ACL assembly
6	7A020	Transmission fluid level indicator
7	W520101	Transmission fluid filler tube nut
8	7A228	Transmission fluid filler tube
9	-	Nut - transmission fluid cooler tube (part of 7H420)
10	W711538	Bolt - transmission fluid cooler tube-to-transaxle
11	7H420	Tube - transmission fluid cooler
12	7A488	Connector - transaxle harness
13	14A169	Retainer - transaxle harness
14	W520101	Nut - bypass valve
15	7H322	Valve - transaxle fluid cooler bypass
16	7J289	Bolt - solenoid body cover (11 required)
17	W708442	Studbolt - solenoid body cover (3 required)
18	7G004	Cover - solenoid body
19	7J291	Bolt - solenoid body
20	7Z369	Solenoid body

REMOVAL

NOTE: **The PCM must be updated with a new solenoid body strategy data file and solenoid body identification anytime a new solenoid body is installed. A new solenoid body service tag must be installed over the current solenoid body service tag on top of the transaxle case.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

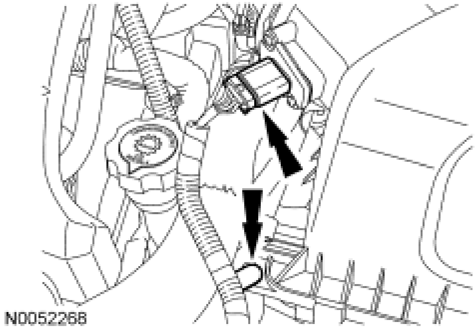

Fig. 286: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

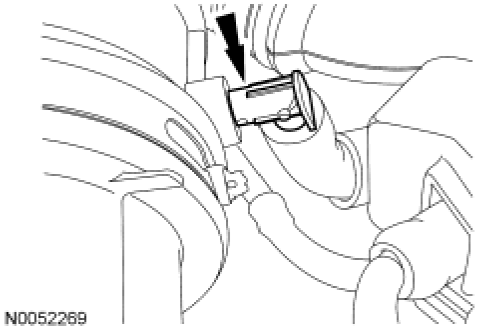

Fig. 287: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

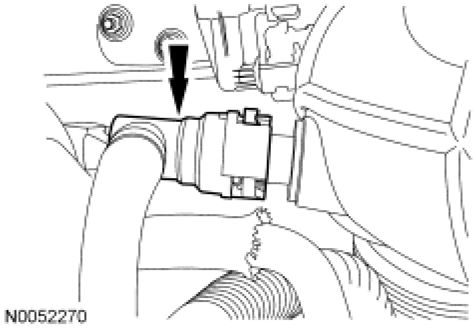

Fig. 288: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

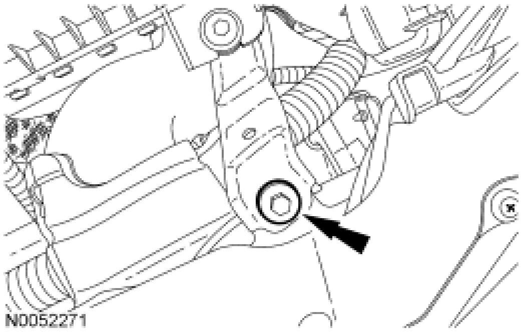

Fig. 289: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

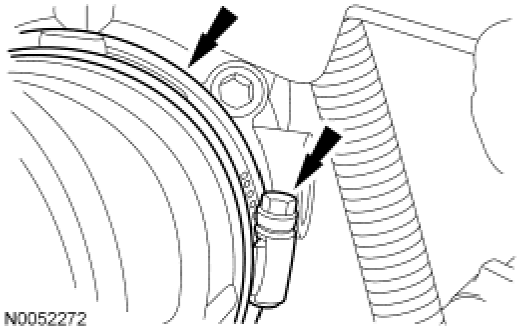

Fig. 290: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

7. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

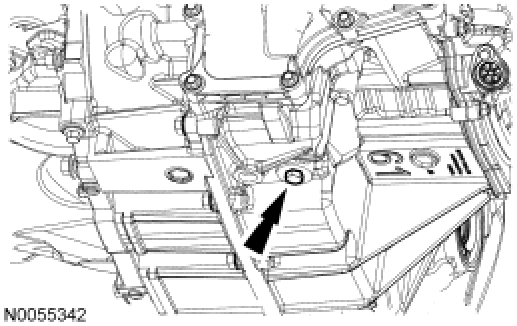

Fig. 291: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

8. Install the transmission fluid drain plug.
   - Tighten to 9 Nm (80 lb-in).

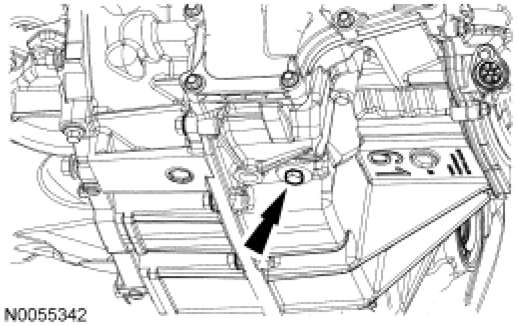

Fig. 292: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

9. Remove the coolant hoses from the transmission fluid filler tube and position aside.

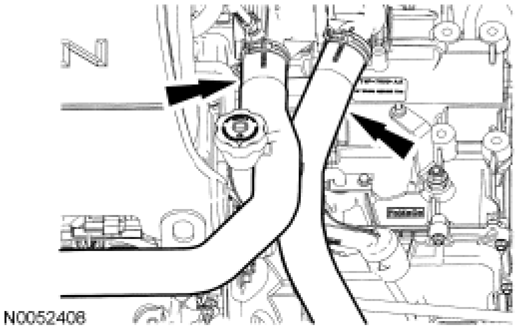

Fig. 293: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

10. Remove the transmission fluid level indicator.

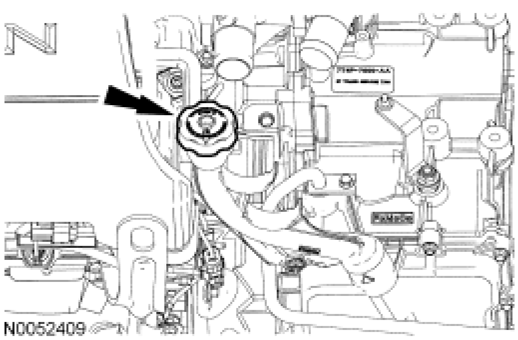

Fig. 294: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

11. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

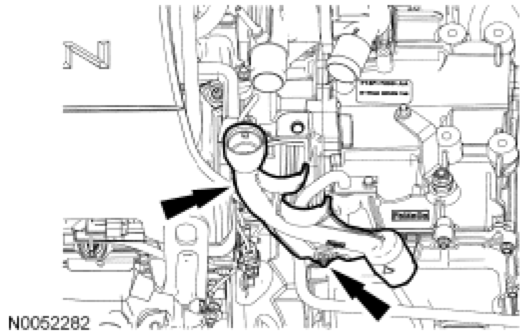

Fig. 295: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Loosen the transmission fluid cooler tube fitting from the thermal bypass valve.

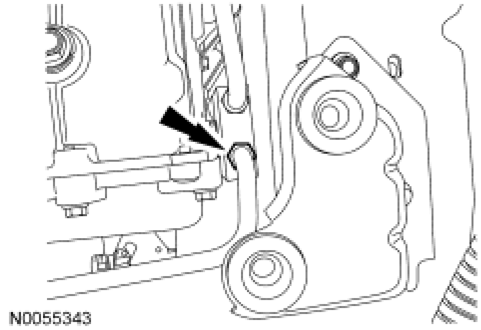

Fig. 296: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

13. Remove and discard the transmission fluid cooler tube bolt and remove the transmission fluid cooler tube.

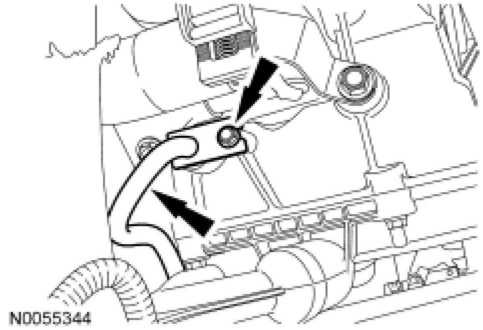

Fig. 297: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

14. Inspect the transaxle case to make sure that the transmission fluid cooler tube seal and backing ring were removed with the transmission fluid cooler tube and are not stuck in the transaxle case. If the transmission fluid cooler tube seal or backing ring are stuck in the transaxle case, remove the seal and backing ring.

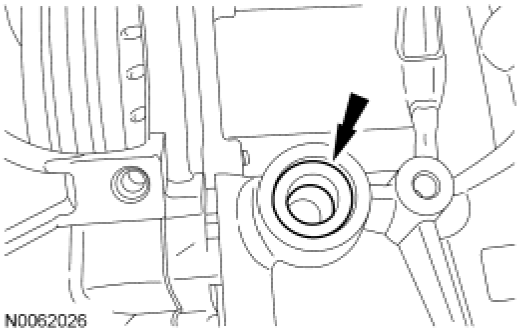

Fig. 298: Identifying Transmission Fluid Cooler Tube Seal
Courtesy of FORD MOTOR CO.

15. Disconnect the transaxle electrical connector.

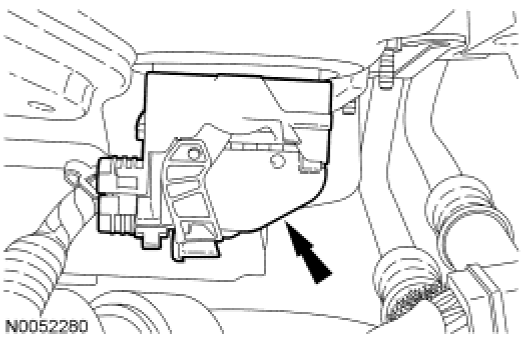

Fig. 299: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

16. Remove the 2 transmission fluid cooler thermal bypass valve nuts, pull the transmission fluid cooler thermal bypass valve straight up and position it aside.

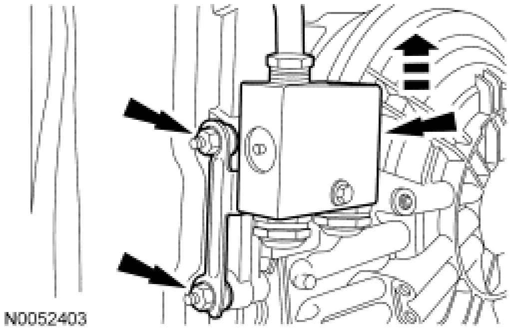

Fig. 300: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve Straight Up
Courtesy of FORD MOTOR CO.

NOTE: Note the location of the studbolts for assembly.

17. Remove the 14 bolts and the main control cover.

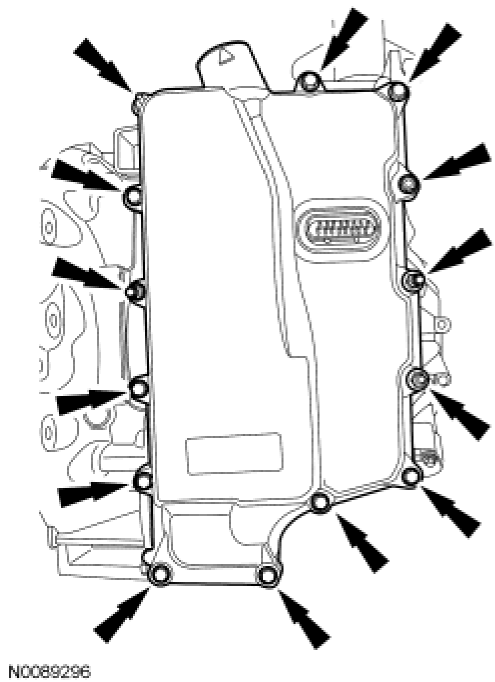

Fig. 301: Main Control Valve Cover Bolts
Courtesy of FORD MOTOR CO.

18. Disconnect the Transmission Range (TR) sensor electrical connector.
    1. Slide the lock over.
    2. Press the tab and disconnect the connector.

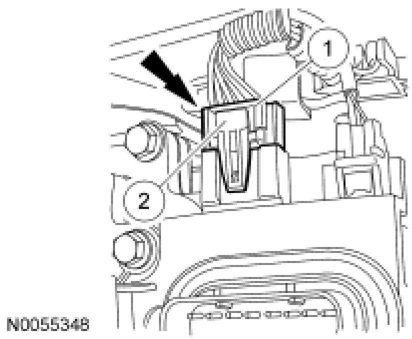

Fig. 302: Pressing Tab & Disconnecting Connector
Courtesy of FORD MOTOR CO.

19. Disconnect the Turbine Shaft Speed (TSS) and Output Shaft Speed (OSS) sensor electrical connectors.

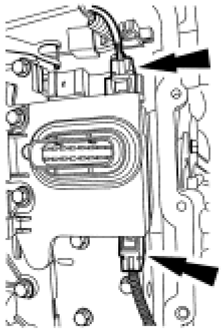

Fig. 303: Locating Turbine Shaft Speed (TSS) & Output Shaft Speed (OSS) Sensor Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: The solenoid body should be handled with care, damage to the solenoid body may occur.

NOTE: Note the location of the different length bolts for assembly.

20. Remove the 11 bolts and the solenoid body.

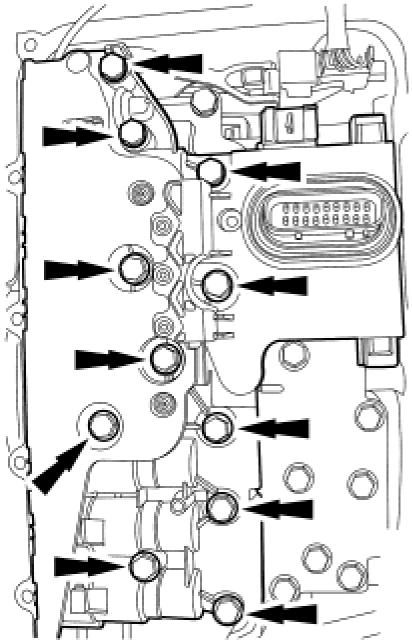

Fig. 304: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: Do not handle the solenoid body in the leadframe area or by the screens of

the solenoid body filter or damage to the solenoid body can occur.

NOTE: Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.

21. Remove the solenoid body filter assembly by pulling it straight up from the alignment tabs. Discard the filter.

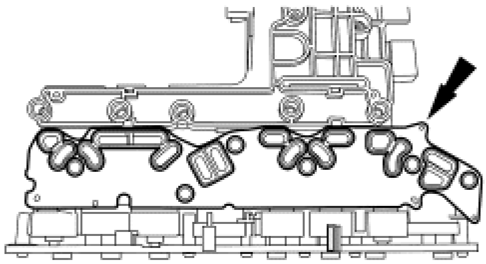

Fig. 305: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.

NOTE: Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.

NOTE: Make sure that the filter passage areas are clean of foreign material before installing the filter. Damage to the transaxle will occur if the filter passages are not clean.

1. Install a new solenoid body filter assembly by pushing it straight down on to the alignment tabs.

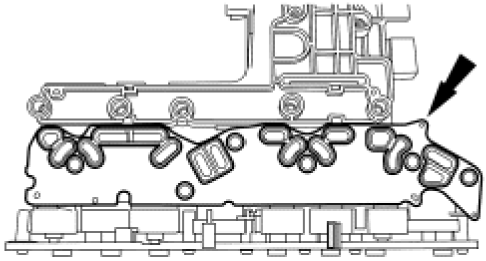

Fig. 306: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure not to pinch the Turbine Shaft Speed (TSS), Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the solenoid body. Damage to the wiring harness will occur.**

NOTE:	**Install the different length bolts in the locations noted during disassembly.**

2. Install the solenoid body and the 11 bolts.
   1. 42 mm (1.65 in) bolt
   2. 63 mm (2.48 in) bolts
   3. 80 mm (3.14 in) bolts
   4. 95 mm (3.74 in) bolts

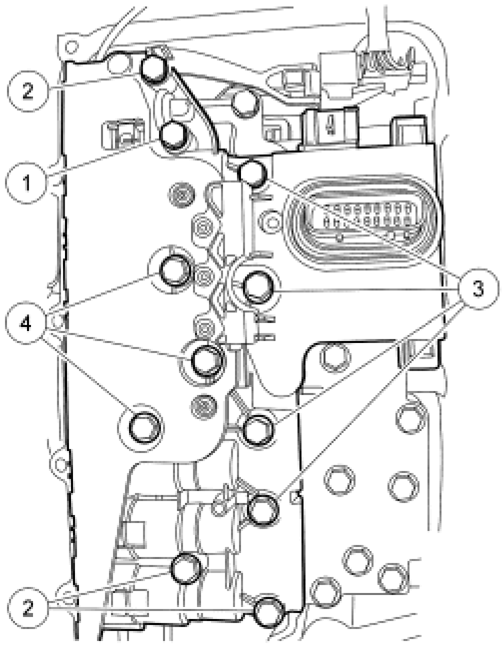

Fig. 307: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

3. Tighten the solenoid body bolts in the sequence shown.
   - Tighten to 12 Nm (106 lb-in).

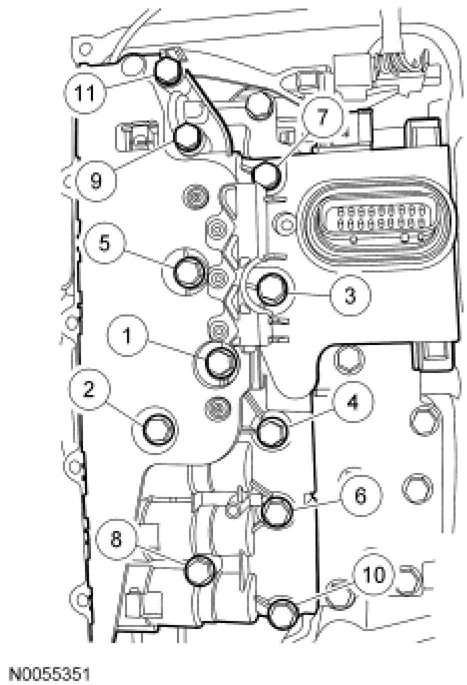

Fig. 308: Tightening Solenoid Body Bolts In Sequence
Courtesy of FORD MOTOR CO.

4. Route the OSS sensor wiring harness and connect the electrical connector.

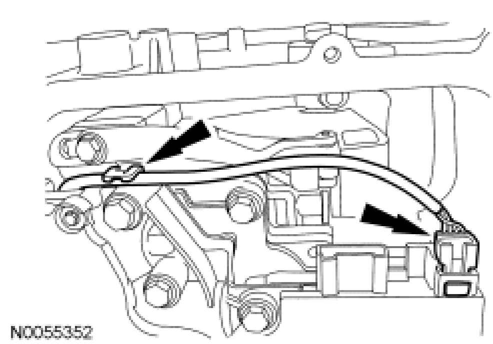

Fig. 309: Locating OSS Sensor Wiring Harness & Electrical Connector
Courtesy of FORD MOTOR CO.

5. Connect the TR sensor electrical connector.
   1. Connect the electrical connector.

2. Slide the locking tab over.

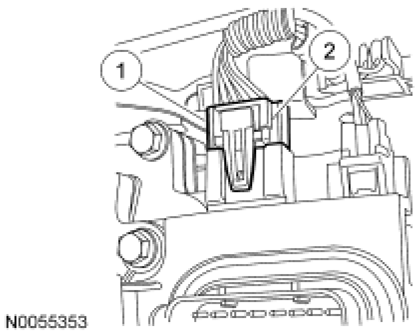

Fig. 310: Identifying TR Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

6. Connect the TSS sensor electrical connector.

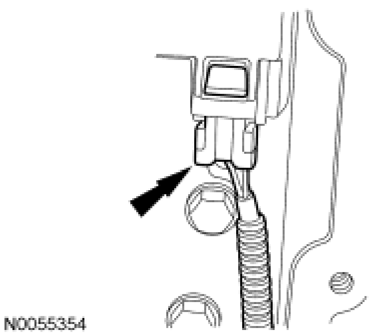

Fig. 311: Identifying TSS Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

7. Inspect the transaxle main control cover seal for damage and install new if necessary.

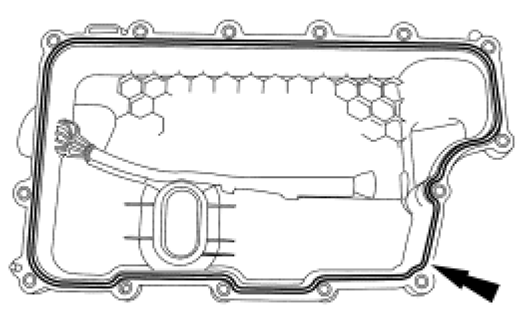

Fig. 312: Inspecting Transaxle Main Control Cover Seal For Damage
Courtesy of FORD MOTOR CO.

NOTE:	**Inspect the 20-pin solenoid body connector seal to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will**

occur resulting in transmission damage.

NOTE: Install the studbolts in the locations noted during disassembly.

8. Install the main control cover and loosely install the 14 bolts.
    1. Bolt location
    2. Studbolt location

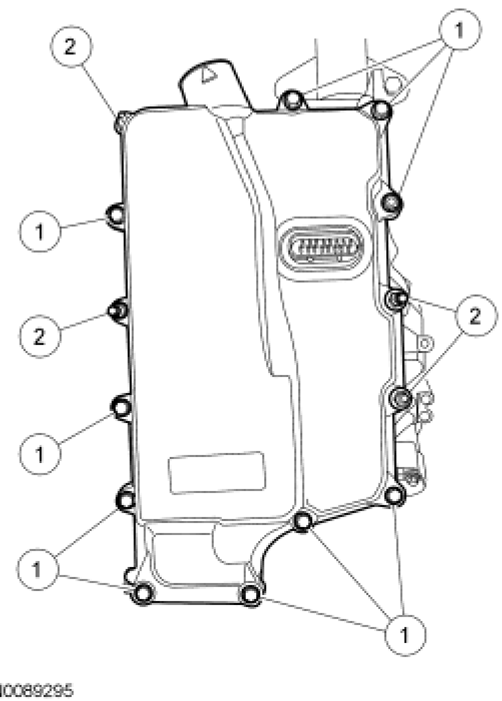

Fig. 313: Main Control Cover Bolts
Courtesy of FORD MOTOR CO.

9. Tighten the main control cover bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

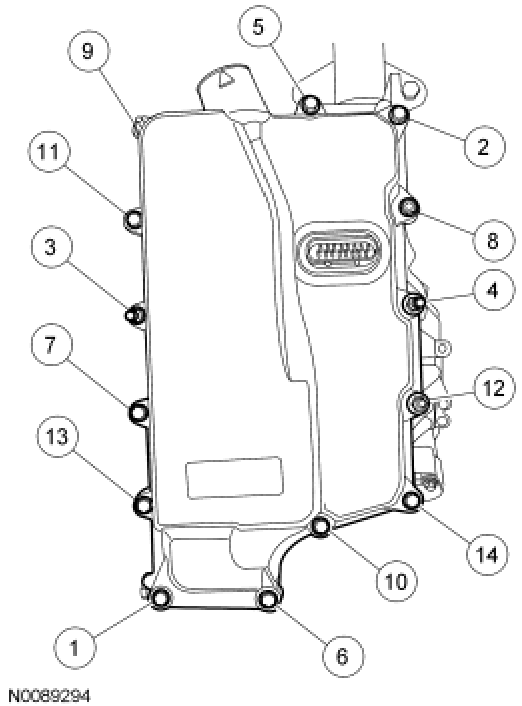

Fig. 314: Main Control Cover Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

10. Wipe the surface of the existing solenoid body strategy tag on top of the transaxle case clean and install the new solenoid body strategy tag (supplied with the solenoid body service kit) over it.

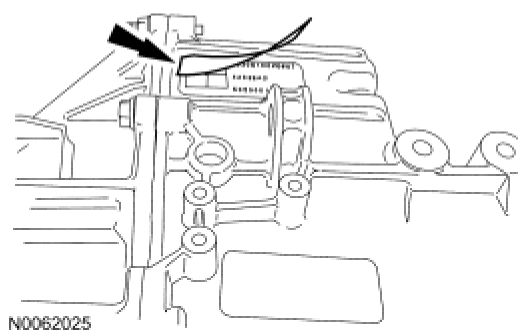

Fig. 315: Installing New Solenoid Body Strategy Tag Over Existing Solenoid Body Strategy Tag
Courtesy of FORD MOTOR CO.

11. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the 2 transmission fluid cooler thermal bypass valve bracket nuts.
    - Tighten to 9 Nm (80 lb-in).

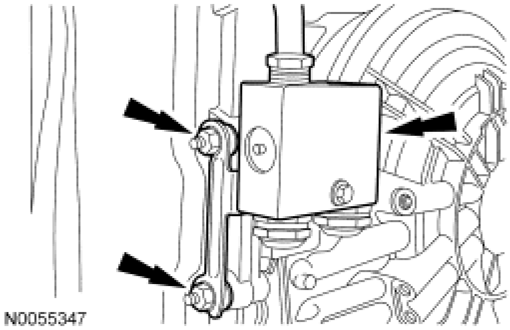

Fig. 316: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

12. Connect the transaxle electrical connector.

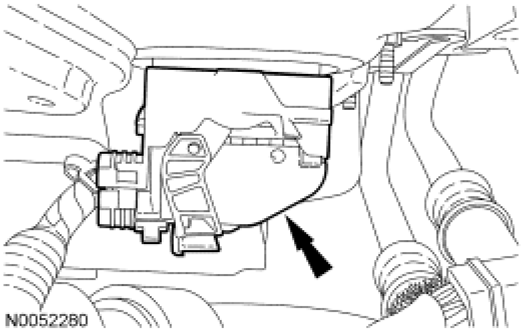

Fig. 317: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

13. Inspect the transmission fluid cooler tube backing ring and seal for damage and install a new backing ring or seal if necessary. Lubricate the transmission fluid cooler tube seal with clean transmission fluid and install the backing ring and seal on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

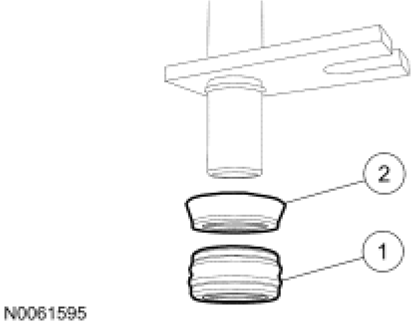

Fig. 318: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal

Courtesy of FORD MOTOR CO.

14. Position the transmission fluid cooler tube in place and install a new bolt.
    - Tighten to 9 Nm (80 lb-in).

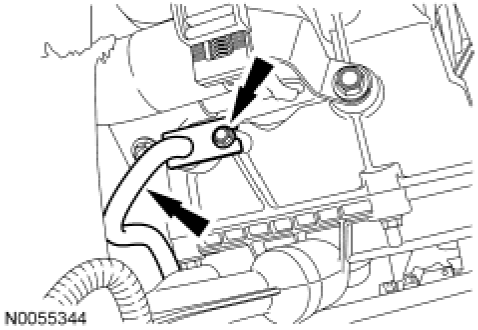

Fig. 319: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

15. Tighten the transmission fluid cooler tube fitting.
    - Tighten to 25 Nm (18 lb-ft).

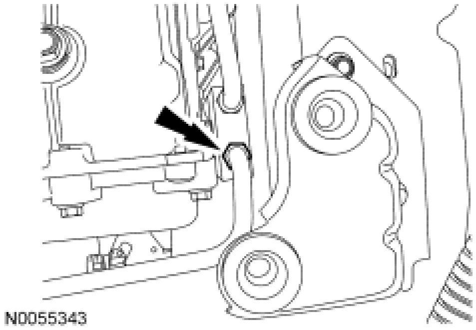

Fig. 320: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

16. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

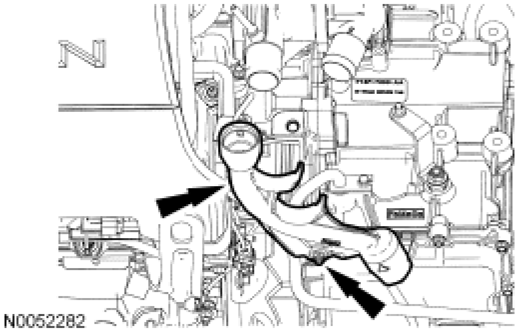

Fig. 321: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

17. Install the transmission fluid level indicator.

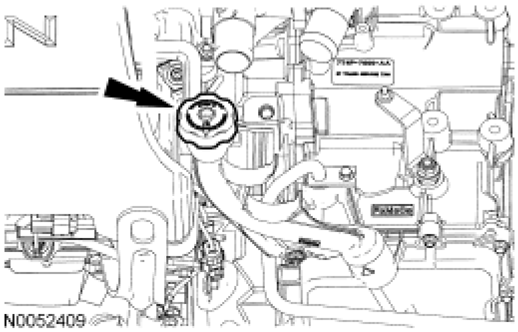

Fig. 322: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

18. Route the coolant hoses in the transmission fluid filler tube.

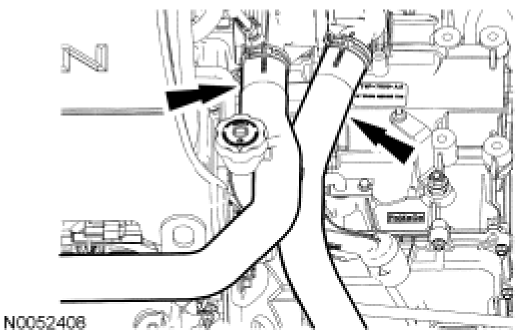

Fig. 323: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

19. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

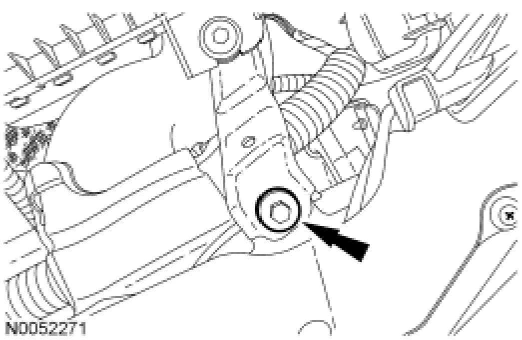

Fig. 324: Locating Air Cleaner Assembly Bracket Bolt

Courtesy of FORD MOTOR CO.

20. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

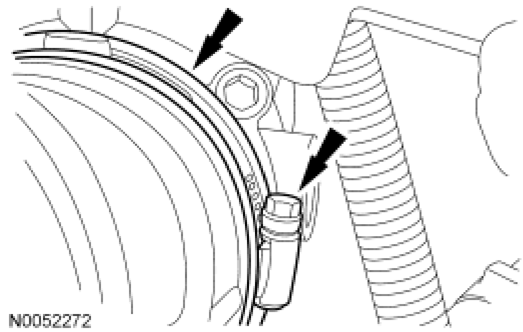

Fig. 325: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

21. Connect the engine breather to the ACL assembly.

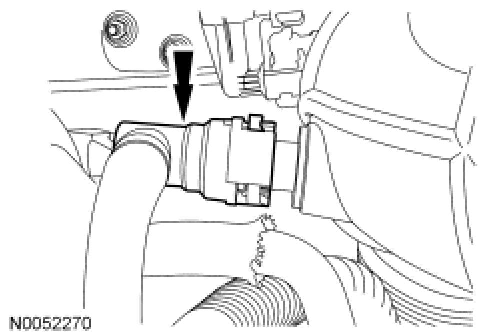

Fig. 326: Locating Engine Breather
Courtesy of FORD MOTOR CO.

22. Connect the brake booster vacuum hose to the ACL assembly.

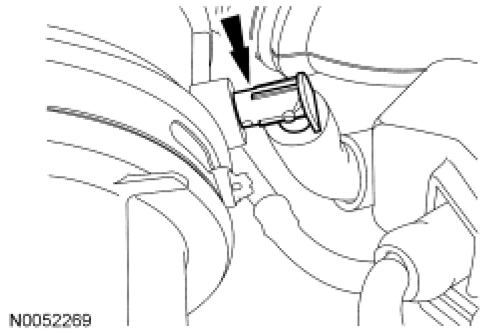

Fig. 327: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

23. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

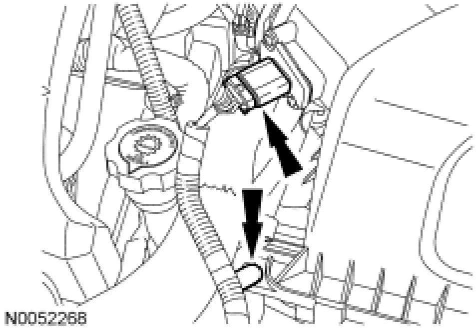

Fig. 328: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

24. Fill with clean transmission fluid to the correct level.
25. Download a new solenoid body strategy to the PCM. Refer to **Solenoid Body Strategy**.

MAIN CONTROL COVER

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

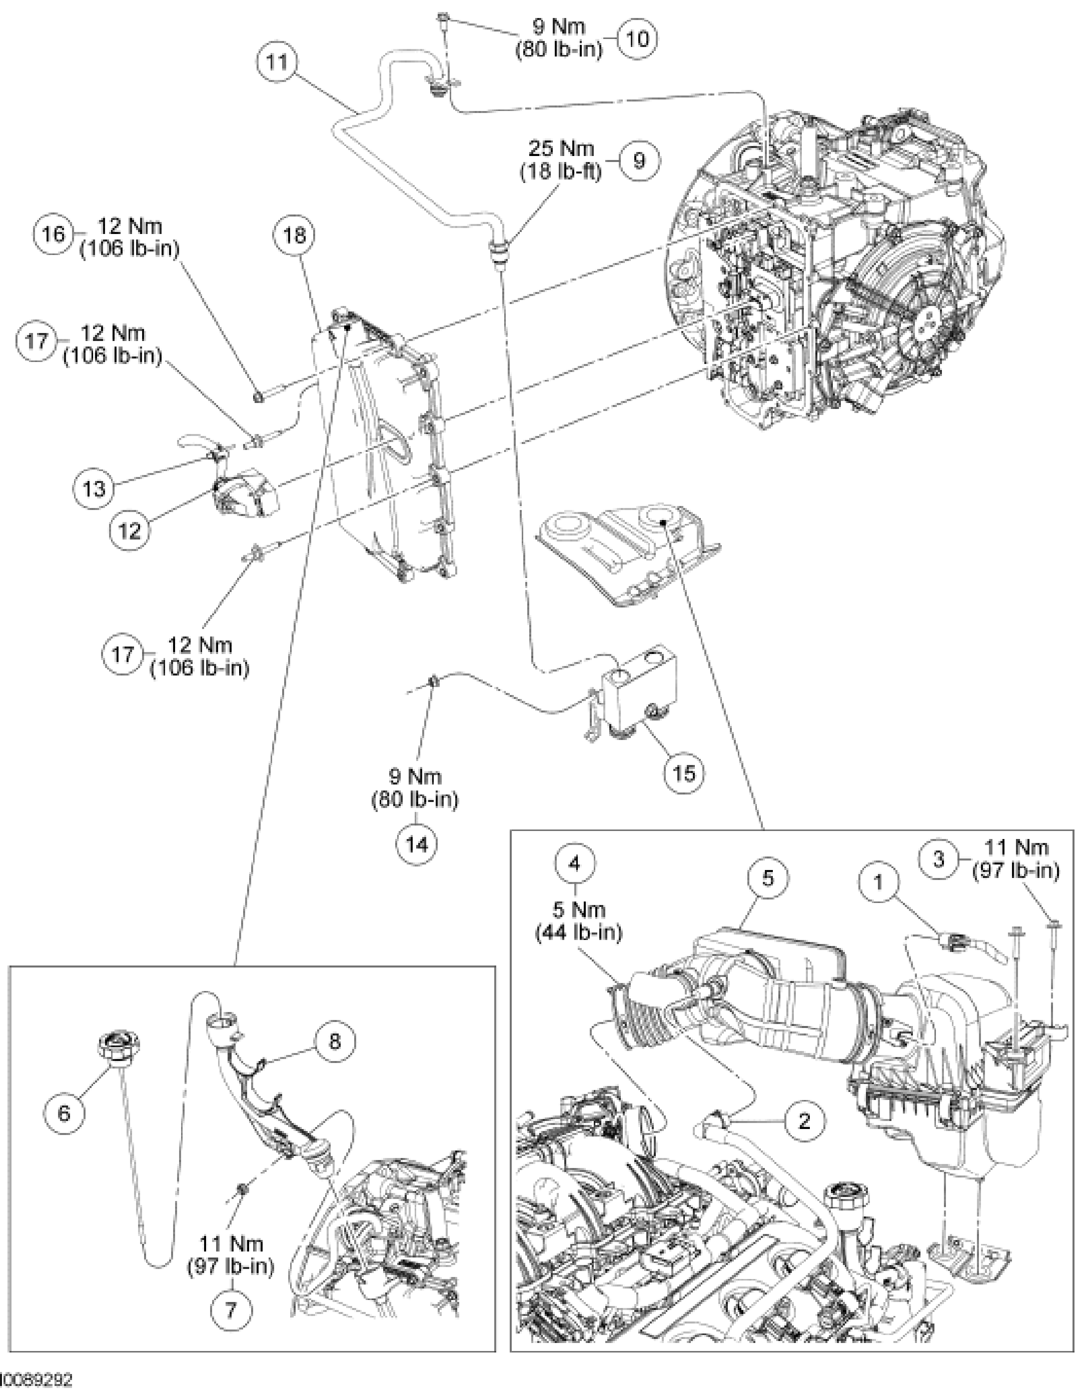

Fig. 329: Main Control & Solenoid Body Components (With Torque Specifications)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Electrical connector - Mass Air Flow (MAF) sensor
2	6758	Tube assembly - crankcase vent

3	N606678	Bolt - Air Cleaner (ACL) bracket
4	9C632	Clamp - ACL outlet pipe
5	9C662	ACL assembly
6	7A020	Transmission fluid level indicator
7	W520101	Transmission fluid filler tube nut
8	7A228	Transmission fluid filler tube
9	-	Nut - transmission fluid cooler tube (part of 7H420)
10	W711538	Bolt - transmission fluid cooler tube
11	7H420	Tube - transmission fluid cooler
12	7A488	Connector - transaxle harness
13	14A169	Retainer - transaxle harness
14	W520101	Nut - bypass valve
15	7H322	Valve - transaxle fluid cooler bypass
16	7J289	Bolt - solenoid body cover (11 required)
17	W708442	Studbolt - solenoid body cover (3 required)
18	7G004	Cover - solenoid body

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

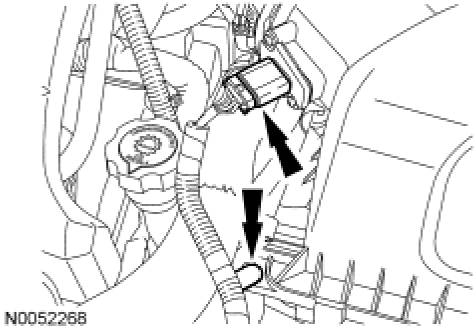

Fig. 330: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

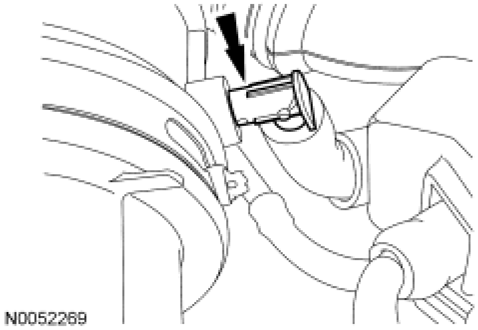

Fig. 331: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

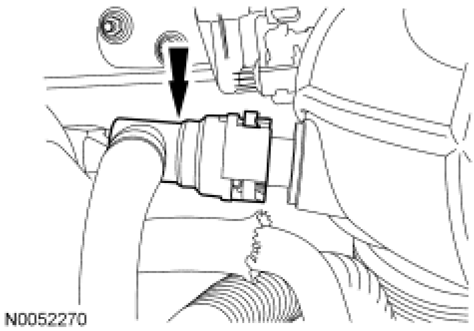

Fig. 332: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

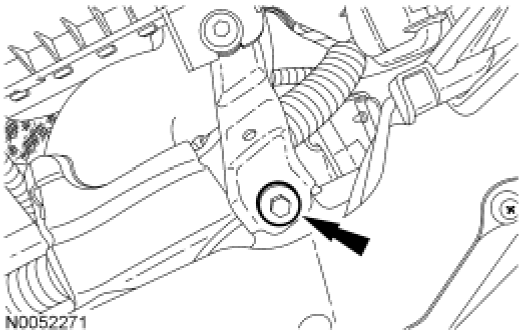

Fig. 333: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

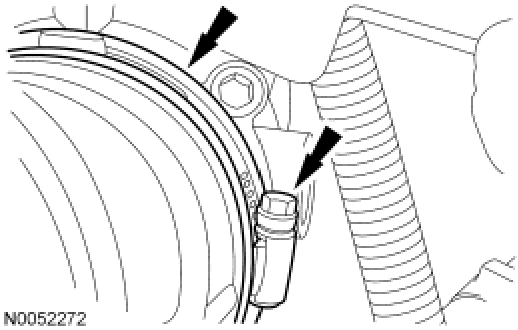

Fig. 334: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

7. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

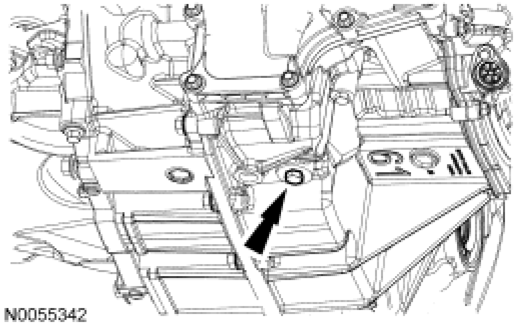

Fig. 335: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

8. Install the transmission fluid drain plug.
   - Tighten to 9 Nm (80 lb-in).

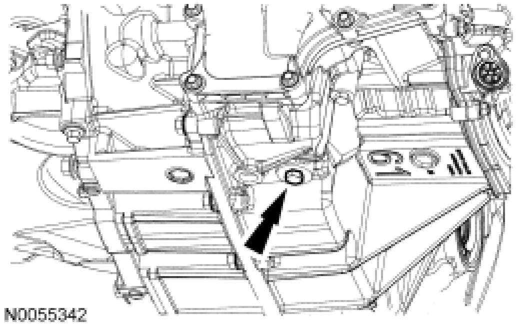

Fig. 336: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

9. Remove the coolant hoses from the transmission fluid filler tube and position aside.

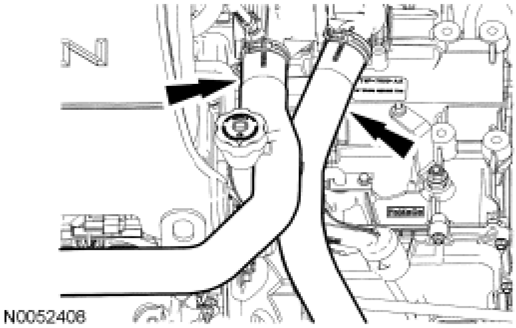

Fig. 337: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

10. Remove the transmission fluid level indicator.

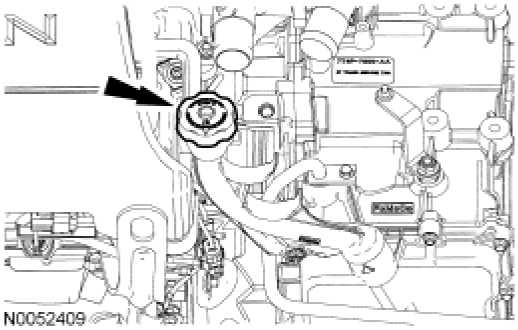

Fig. 338: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

11. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

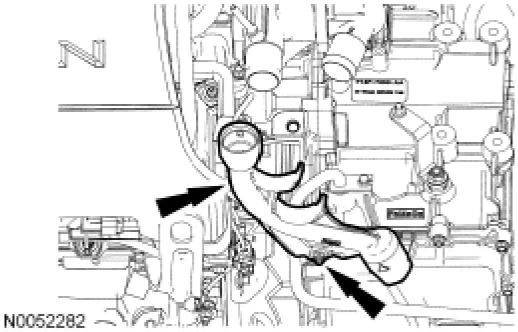

Fig. 339: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Loosen the transmission fluid cooler tube fitting from the thermal bypass valve.

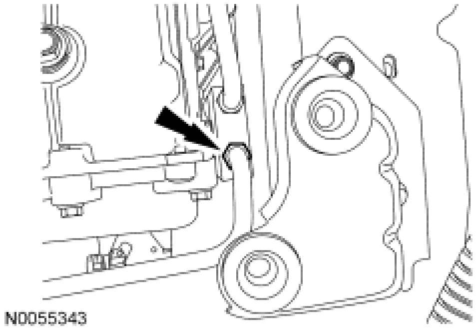

Fig. 340: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

13. Remove and discard the transmission fluid cooler tube bolt and remove the transmission fluid cooler tube.

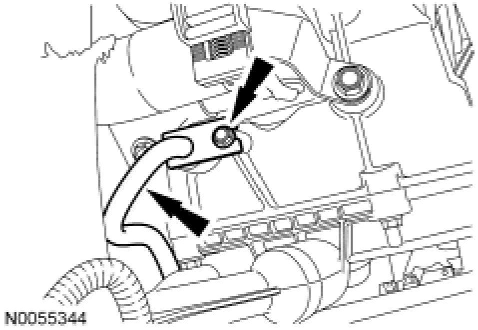

Fig. 341: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

14. Inspect the transaxle case to make sure that the transmission fluid cooler tube seal and backing ring were removed with the transmission fluid cooler tube and are not stuck in the transaxle case. If the transmission fluid cooler tube seal or backing ring are stuck in the transaxle case, remove the seal and backing ring.

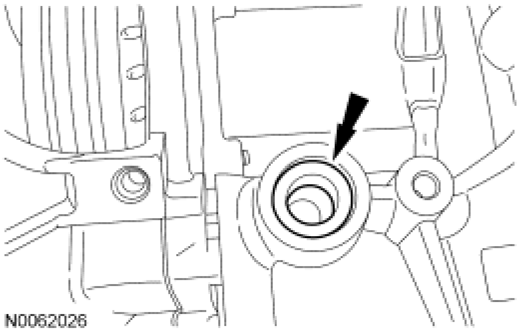

Fig. 342: Identifying Transmission Fluid Cooler Tube Seal
Courtesy of FORD MOTOR CO.

15. Disconnect the transaxle electrical connector.

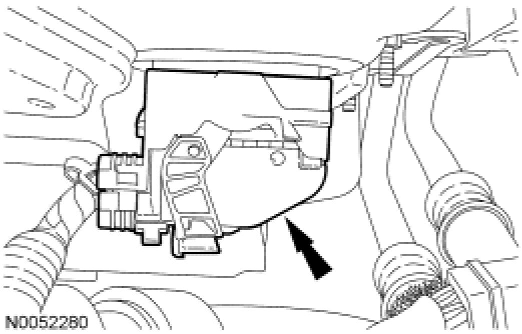

Fig. 343: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

16. Remove the 2 transmission fluid cooler thermal bypass valve bracket nuts, pull the transmission fluid cooler thermal bypass valve straight up and position it aside.

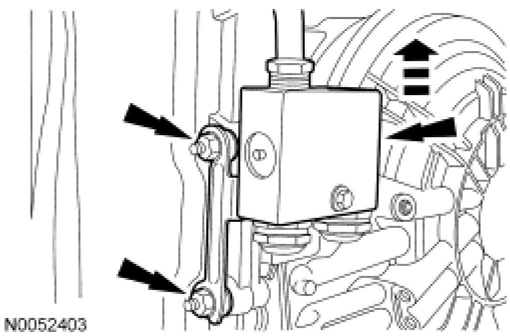

Fig. 344: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve Straight Up
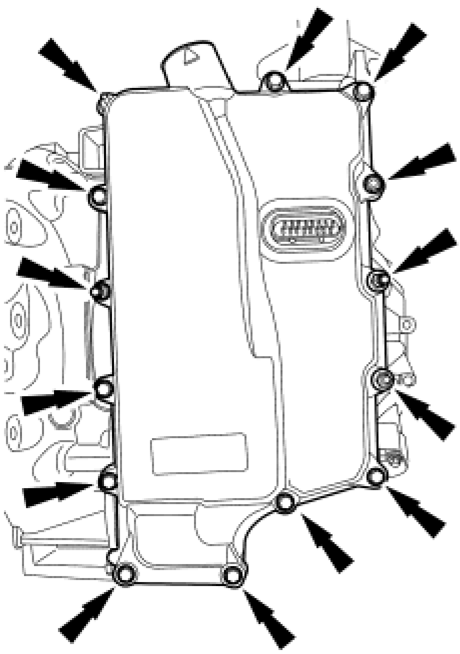
Courtesy of FORD MOTOR CO.

NOTE: Note the location of the studbolts for assembly.

17. Remove the 14 bolts and the main control cover.

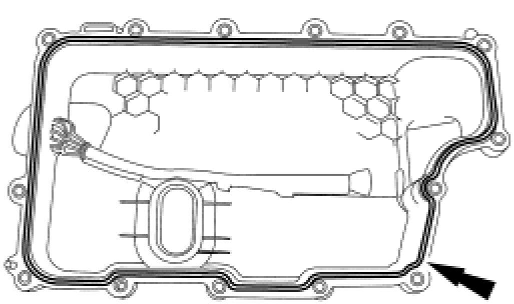


N0089296

Fig. 345: Main Control Valve Cover Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Inspect the transaxle main control cover seal for damage and install new if necessary.



N0054253

Fig. 346: Inspecting Transaxle Main Control Cover Seal For Damage
Courtesy of FORD MOTOR CO.

NOTE:	**Inspect the 20-pin solenoid body connector seal to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur resulting in transmission damage.**

NOTE:	**Install the studbolts in the locations noted during disassembly.**

2. Install the main control cover and loosely install the 14 bolts.
    1. Bolt location
    2. Studbolt location

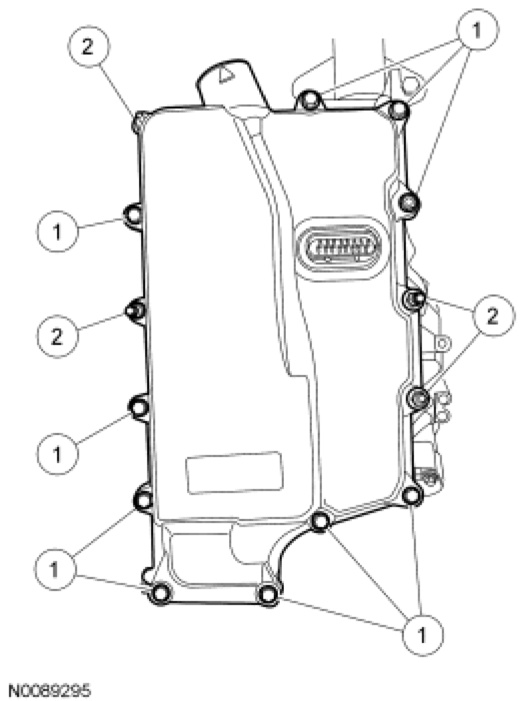


Fig. 347: Main Control Cover Bolts
Courtesy of FORD MOTOR CO.

3. Tighten the main control cover bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

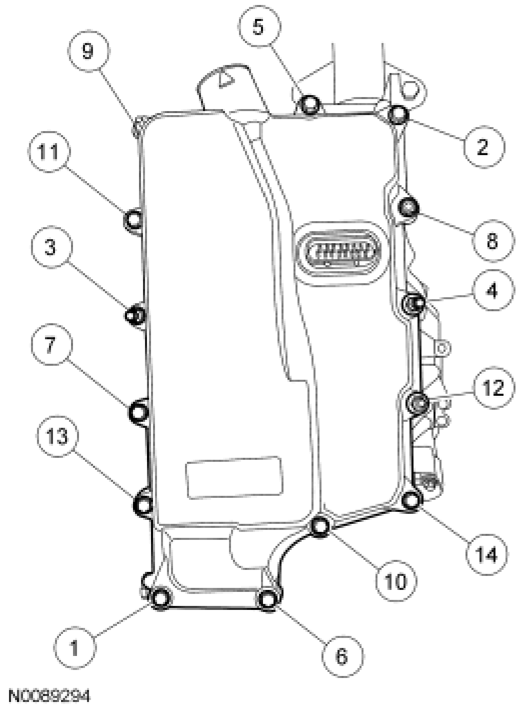

Fig. 348: Main Control Cover Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

4. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the 2 transmission fluid cooler thermal bypass valve bracket nuts.
   - Tighten to 9 Nm (80 lb-in).

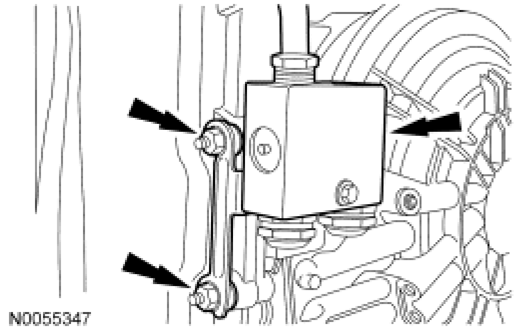

Fig. 349: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

5. Connect the transaxle electrical connector.

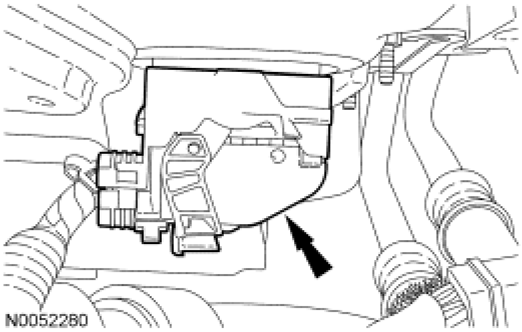

Fig. 350: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

6. Inspect the transmission fluid cooler tube backing ring and seal for damage and install a new backing ring or seal if necessary. Lubricate the transmission fluid cooler tube seal with clean transmission fluid and install the backing ring and seal on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

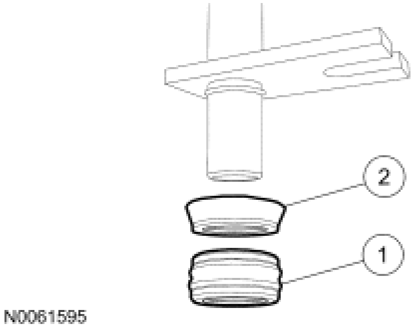

Fig. 351: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal
Courtesy of FORD MOTOR CO.

7. Position the transmission fluid cooler tube in place and install a new bolt.
   - Tighten to 9 Nm (80 lb-in).

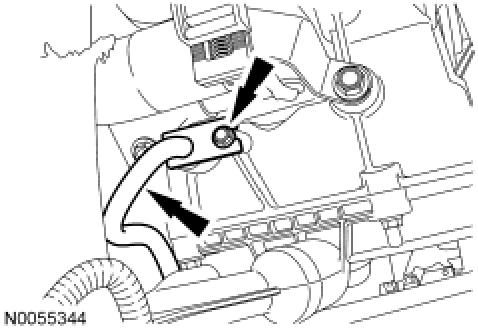

Fig. 352: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

8. Tighten the transmission fluid cooler tube fitting.
    - Tighten to 25 Nm (18 lb-ft).

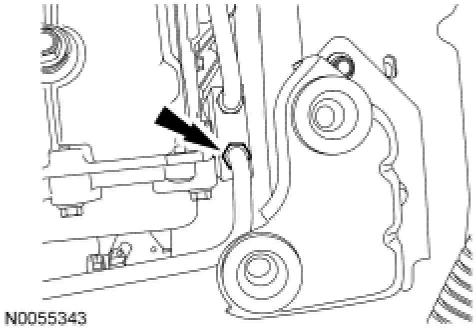

Fig. 353: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

9. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

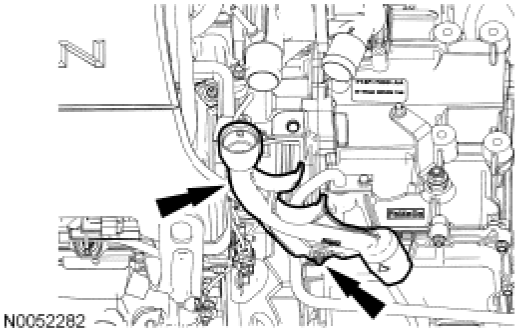

Fig. 354: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

10. Install the transmission fluid level indicator.

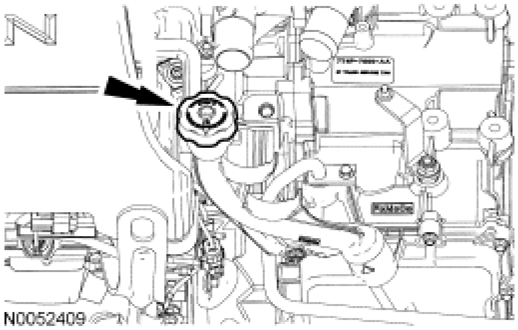

Fig. 355: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

11. Route the coolant hoses in the transmission fluid filler tube.

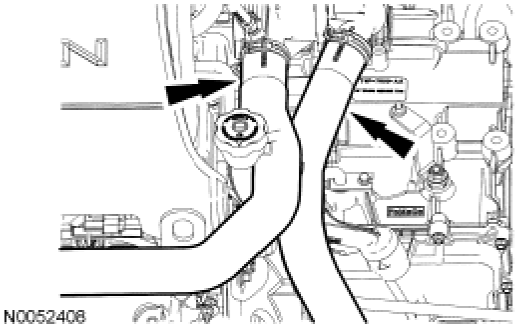

Fig. 356: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

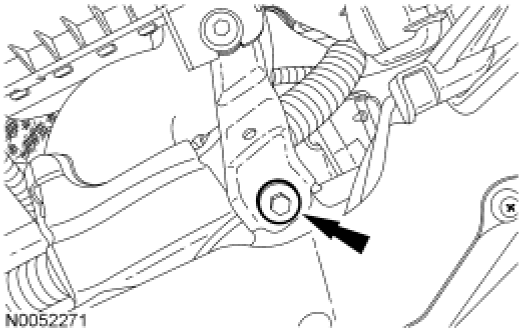

Fig. 357: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

13. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

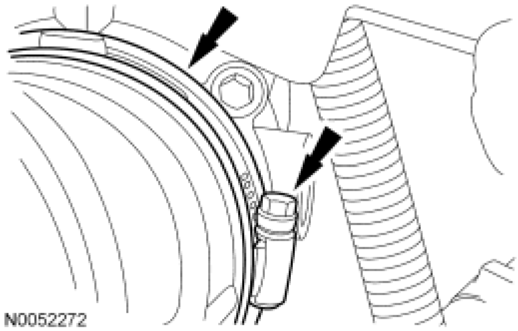

Fig. 358: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

14. Connect the engine breather to the ACL assembly.

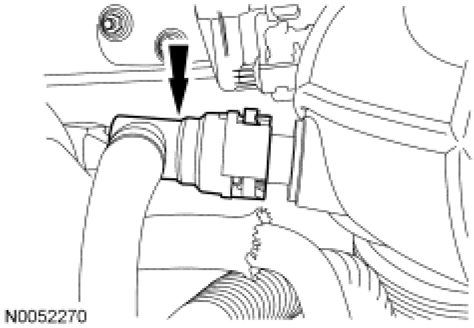

Fig. 359: Locating Engine Breather
Courtesy of FORD MOTOR CO.

15. Connect the brake booster vacuum hose to the ACL assembly.

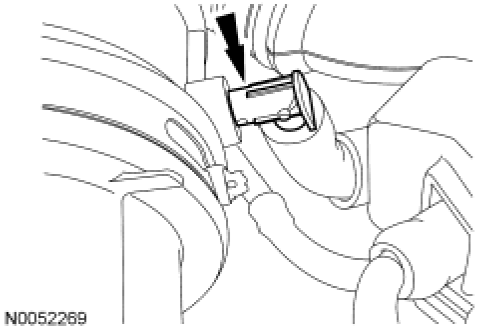

Fig. 360: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

16. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

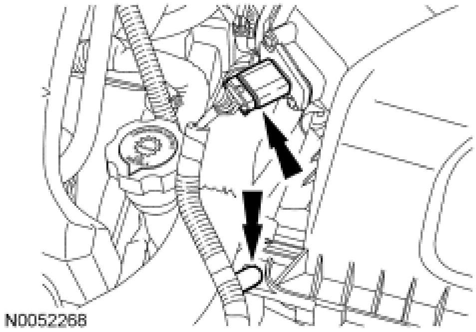

Fig. 361: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

17. Fill with clean transmission fluid to the correct level.

TRANSAXLE FILLER TUBE

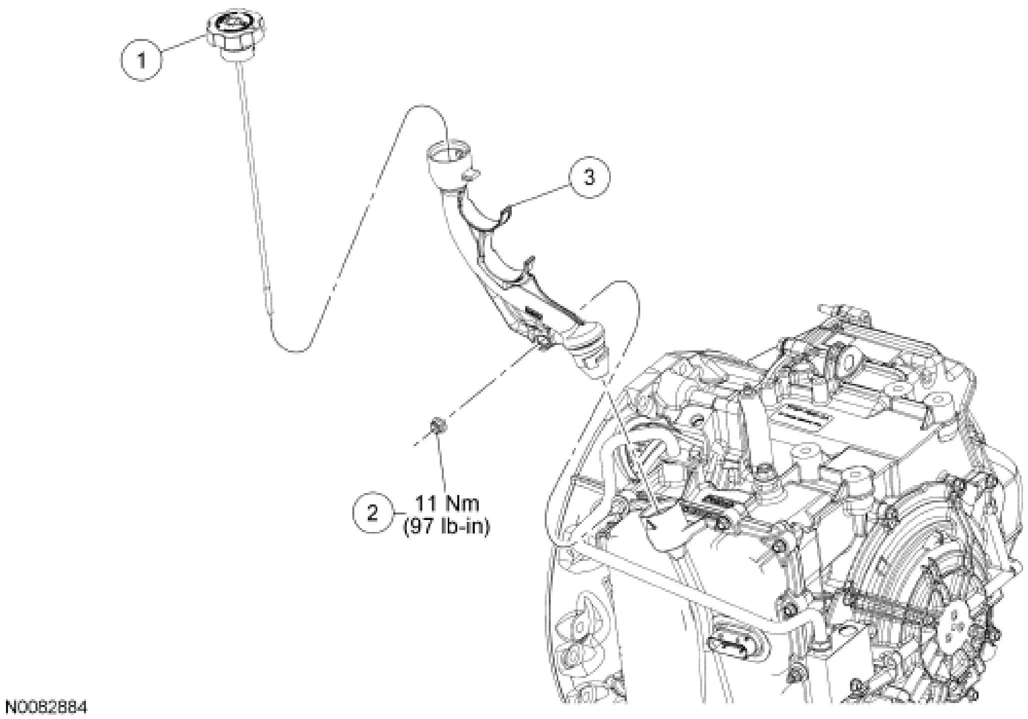

Fig. 362: Transaxle Filler Tube (With Torque Specifications)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7A020	Transmission fluid level indicator
2	W520101	Transmission fluid filler tube nut
3	7A228	Transmission fluid filler tube

REMOVAL

NOTE: The coolant hoses do not need to be removed from the engine.

1. Remove the coolant hoses from the transmission fluid filler tube and position aside.

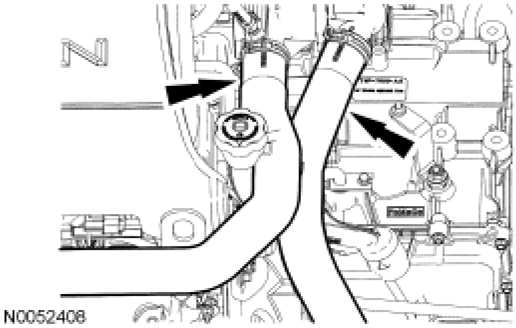

Fig. 363: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

2. Remove the transmission fluid level indicator.

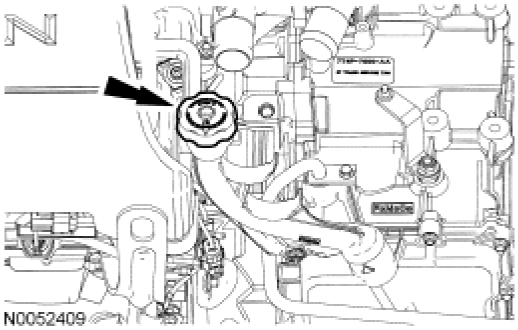

Fig. 364: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

3. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

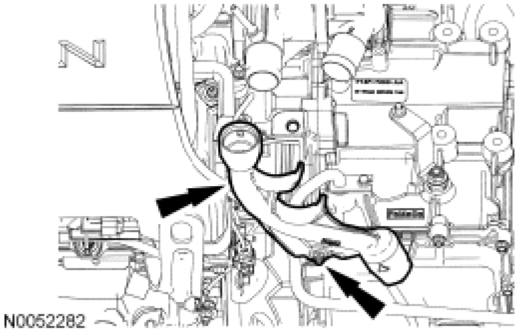

Fig. 365: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

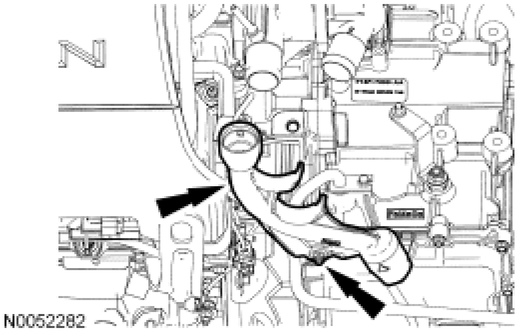

Fig. 366: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

2. Install the transmission fluid level indicator.

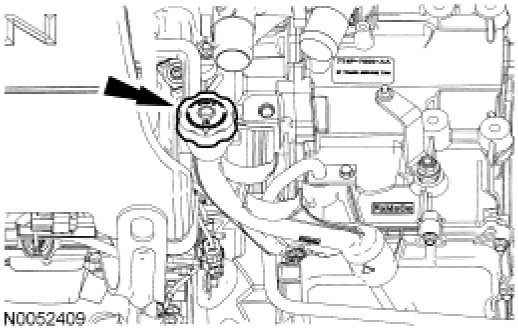

Fig. 367: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

3. Route the coolant hoses in the transmission fluid filler tube.

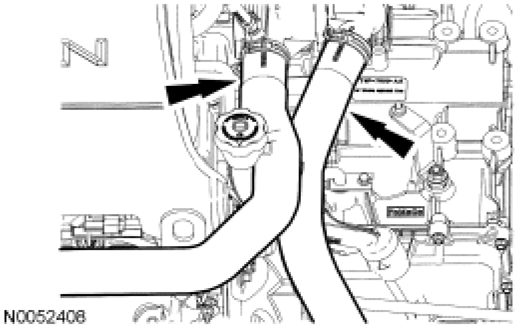

Fig. 368: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

MANUAL CONTROL LEVER SHAFT SEAL

Special Tools

Illustration	Tool Name	Tool Number
	Installer, Manual Lever Retaining Pin	307-592
	Installer, Manual Lever Shaft Seal	307-581

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

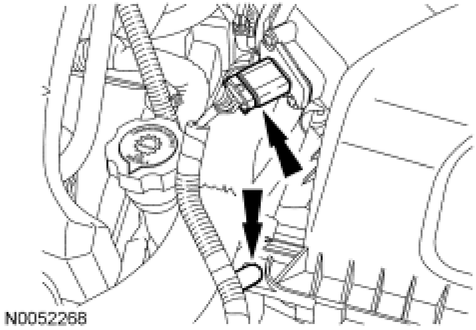

Fig. 369: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

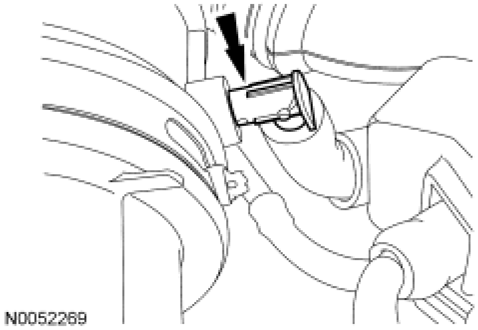

Fig. 370: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

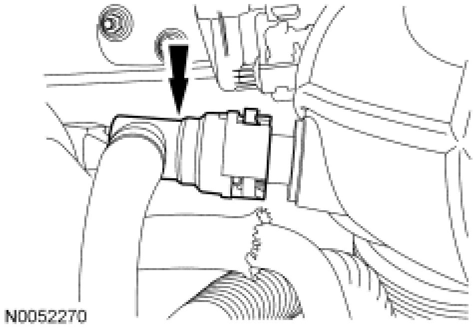

Fig. 371: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

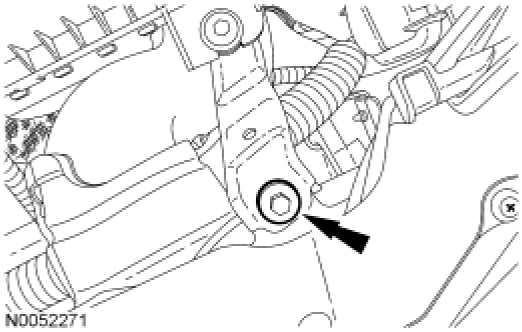

Fig. 372: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

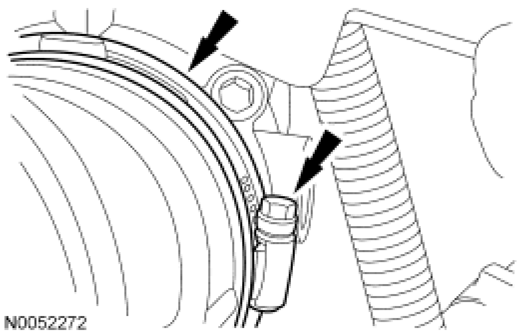

Fig. 373: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

7. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

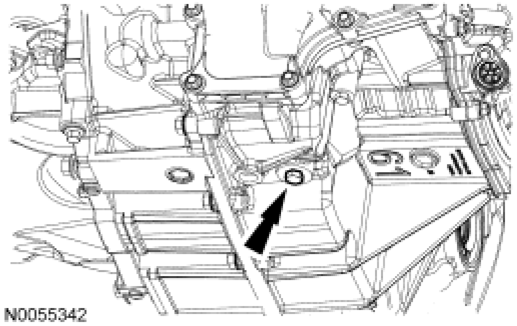

Fig. 374: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

8. Install the transmission fluid drain plug.
   - Tighten to 9 Nm (80 lb-in).

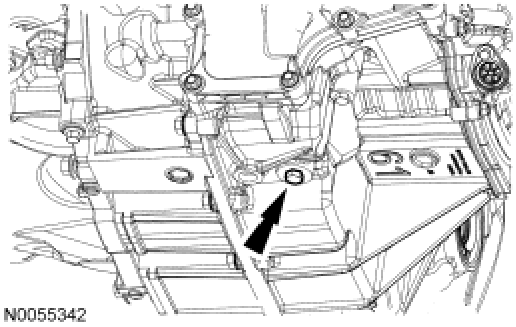

Fig. 375: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

9. Remove the coolant hoses from the transmission fluid filler tube and position aside.

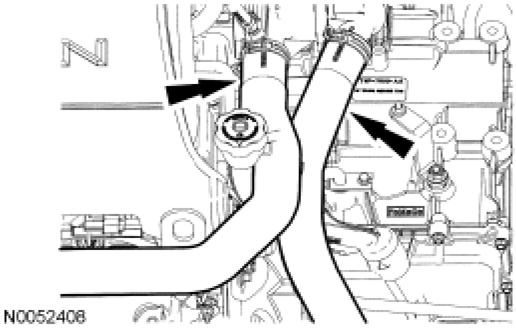

Fig. 376: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

10. Remove the transmission fluid level indicator.

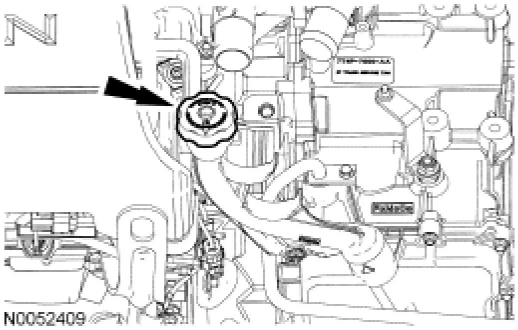

Fig. 377: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

11. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

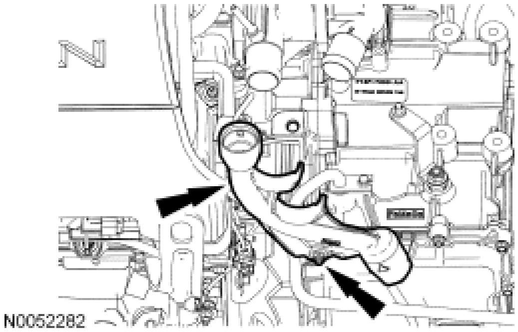

Fig. 378: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

12. Disconnect the selector lever cable end from the manual control lever.

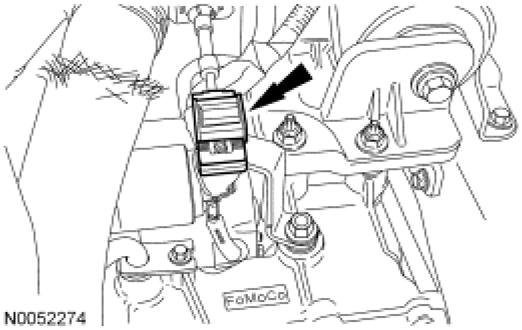

Fig. 379: Locating Selector Lever Cable End From Manual Lever
Courtesy of FORD MOTOR CO.

13. Remove the nut and the manual control lever.

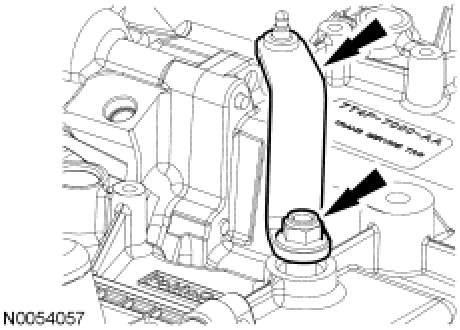

Fig. 380: Identifying Manual Control Lever & Nut
Courtesy of FORD MOTOR CO.

14. Loosen the transmission fluid cooler tube fitting from the thermal bypass valve.

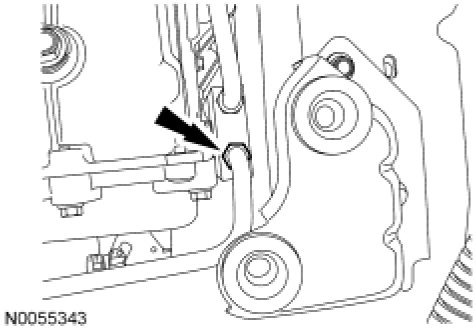

Fig. 381: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

15. Remove and discard the transmission fluid cooler tube bolt and remove the transmission fluid cooler tube.

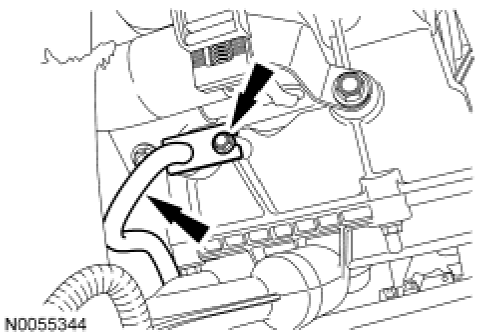

Fig. 382: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

16. Inspect the transaxle case to make sure that the transmission fluid cooler tube seal and backing ring were removed with the transmission fluid cooler tube and are not stuck in the transaxle case. If the transmission fluid cooler tube seal or backing ring are stuck in the transaxle case, remove the seal and backing ring.

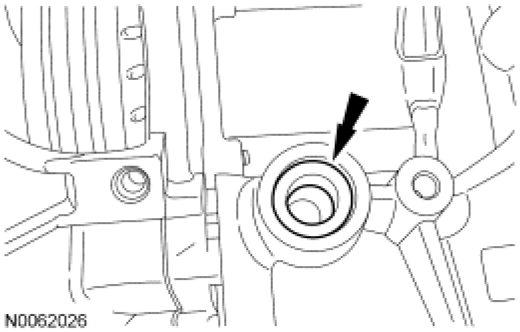

Fig. 383: Identifying Transmission Fluid Cooler Tube Seal
Courtesy of FORD MOTOR CO.

17. Disconnect the transaxle electrical connector.

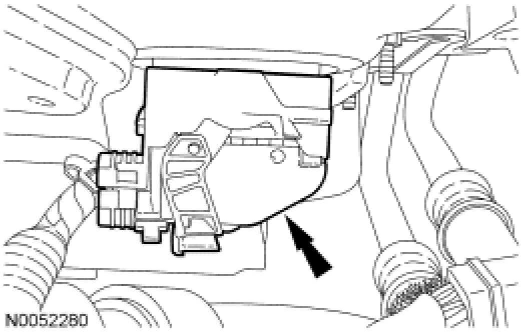

Fig. 384: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

18. Remove the transmission fluid cooler tube bracket nuts, pull the transmission fluid cooler thermal bypass valve straight up and position it aside.

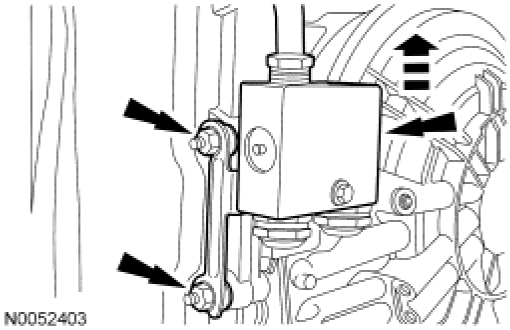

Fig. 385: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve Straight Up
Courtesy of FORD MOTOR CO.

NOTE: **Note the location of the studbolts for assembly.**

19. Remove the bolts and the main control cover.

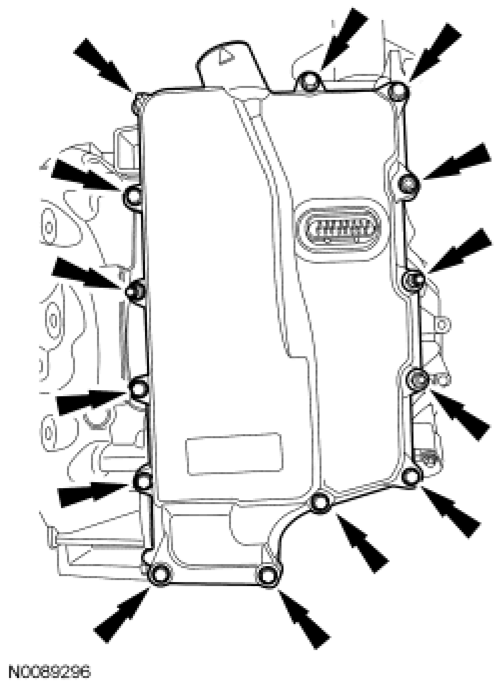

Fig. 386: Main Control Valve Cover Bolts
Courtesy of FORD MOTOR CO.

20. Disconnect the Transmission Range (TR) sensor electrical connector.
    1. Slide the lock over.
    2. Press the tab and disconnect the connector.

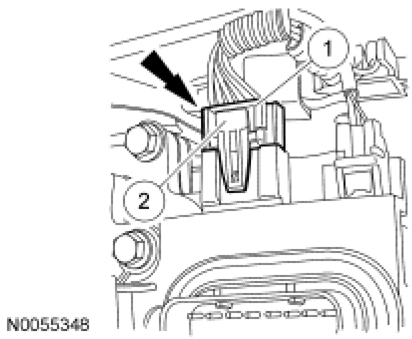

Fig. 387: Pressing Tab & Disconnecting Connector
Courtesy of FORD MOTOR CO.

21. Disconnect the Turbine Shaft Speed (TSS) and Output Shaft Speed (OSS) sensor electrical connectors.

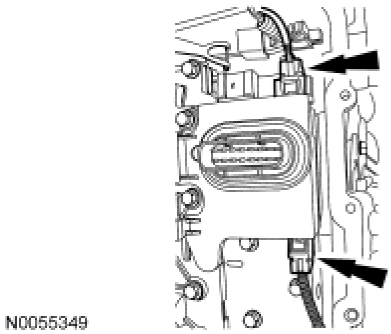

Fig. 388: Locating Turbine Shaft Speed (TSS) & Output Shaft Speed (OSS) Sensor Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: **The solenoid body should be handled with care, damage to the solenoid body may occur.**

NOTE: **Note the location of the different length bolts for assembly.**

22. Remove the bolts and the solenoid body.

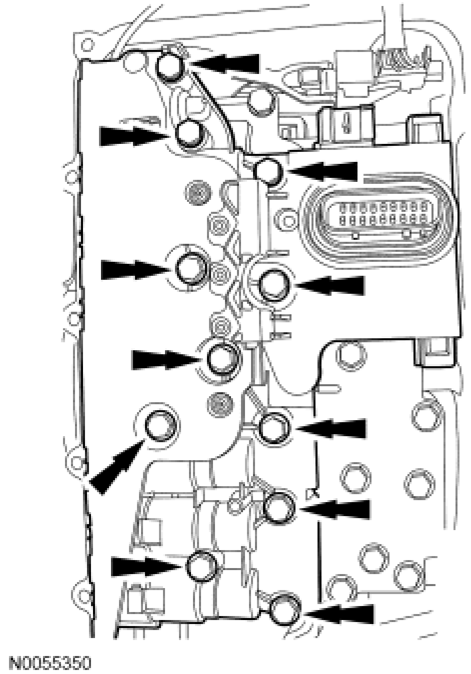

Fig. 389: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: **Do not handle the solenoid body in the leadframe area or by the screens of**

the solenoid body filter or damage to the solenoid body can occur.

NOTE: **Use care not to break the alignment tabs when removing the solenoid body filter.**

23. Remove the solenoid body filter assembly by pulling it straight up from the alignment tabs. Discard the filter.

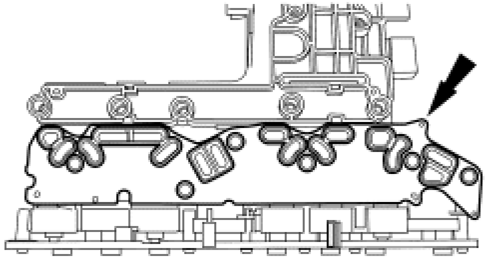

Fig. 390: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

24. Remove the bolts, the TR sensor detent spring and the main control valve body.

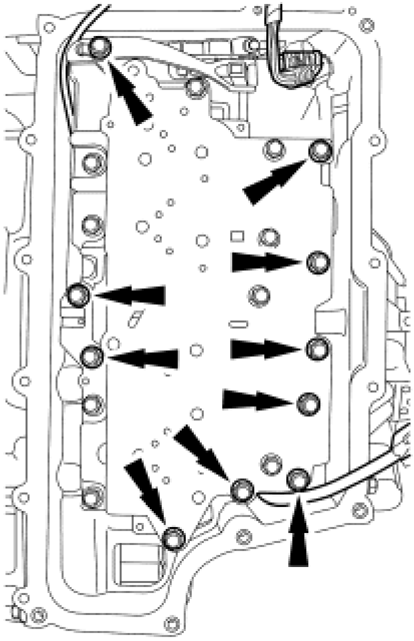

Fig. 391: Locating Main Control Valve Body Bolts
Courtesy of FORD MOTOR CO.

25. Using a suitable tool, remove and discard the TR sensor locking pin.

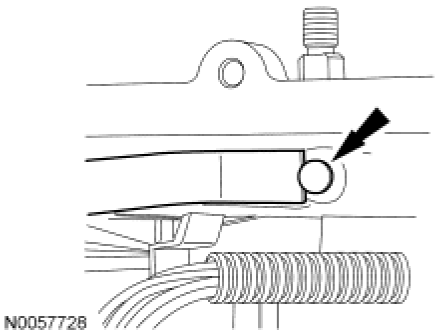

Fig. 392: Locating TR Sensor Locking Pin
Courtesy of FORD MOTOR CO.

NOTE: **TR sensor removed for clarity.**

26. Make sure that the park pawl actuator rod does not become disengaged from the park pawl and the abutment by keeping the end of the park pawl actuator rod behind the machined valve body mating surface of the transaxle case. If the park pawl actuator rod becomes disengaged from the park pawl and the abutment, transaxle removal and disassembly is required to reinstall the actuator rod.

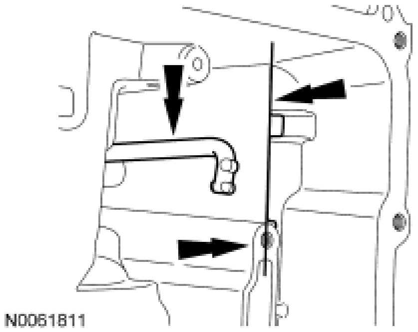

Fig. 393: Making Sure That Park Pawl Actuator Rod Does Not Become Disengaged From Park Pawl
Courtesy of FORD MOTOR CO.

NOTE: **Make sure that the park pawl actuator rod does not become disengaged from the park pawl and the abutment or transaxle removal and disassembly is required to reinstall the actuator rod.**

27. Remove the TR sensor.
    1. Slide the TR sensor down until the manual shaft is out of the transaxle case.
    2. Rotate the TR sensor detent plate counterclockwise, as viewed from below until the plate rests against the transaxle case, remove the park pawl actuating rod from the TR sensor and remove the TR sensor.

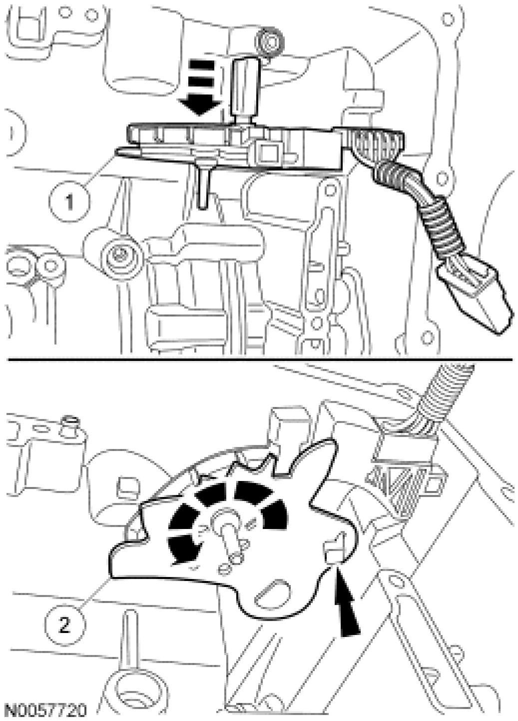

Fig. 394: Sliding TR Sensor Down & Rotating TR Sensor Detent Plate Counterclockwise
Courtesy of FORD MOTOR CO.

28. Using a suitable tool, remove the manual control lever shaft seal.

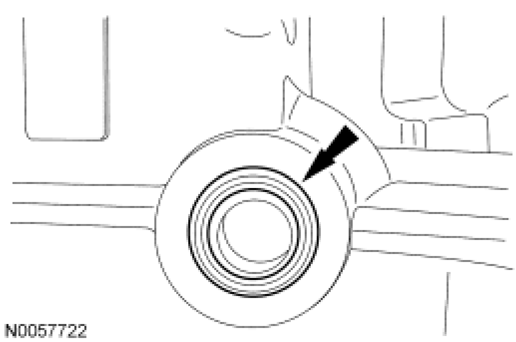

Fig. 395: Identifying Manual Control Lever Shaft Seal
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Using the Manual Lever Shaft Seal Installer, install a new manual control lever shaft seal.

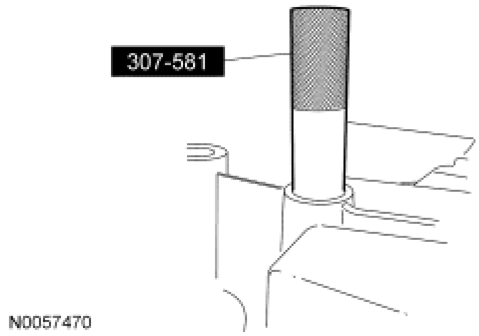

Fig. 396: Installing New Manual Control Lever Shaft Seal Using Special Tool (307-581)
Courtesy of FORD MOTOR CO.

2. Install the TR sensor.
    1. Position the park pawl actuating rod in the TR sensor.
    2. Install the TR sensor in the transaxle case.

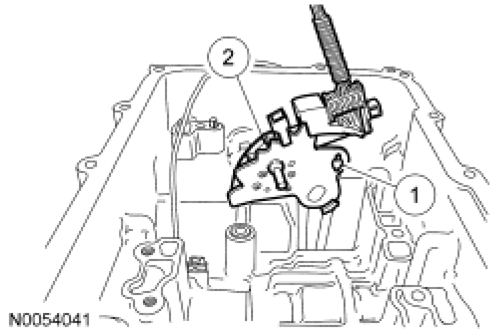

Fig. 397: Identifying TR Sensor In Transaxle Case
Courtesy of FORD MOTOR CO.

3. Using the Manual Retaining Pin Installer, install a new TR sensor locking pin.

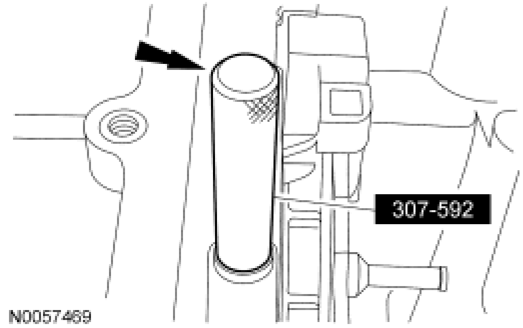

Fig. 398: Installing TR Sensor Locking Pin Using Special Tool (307-592)
Courtesy of FORD MOTOR CO.

NOTE: Make sure that the manual pin (part of the TR sensor) is correctly installed

in the manual valve.

4. Position the TSS, OSS and TR sensor wiring harnesses aside and install the main control valve body.

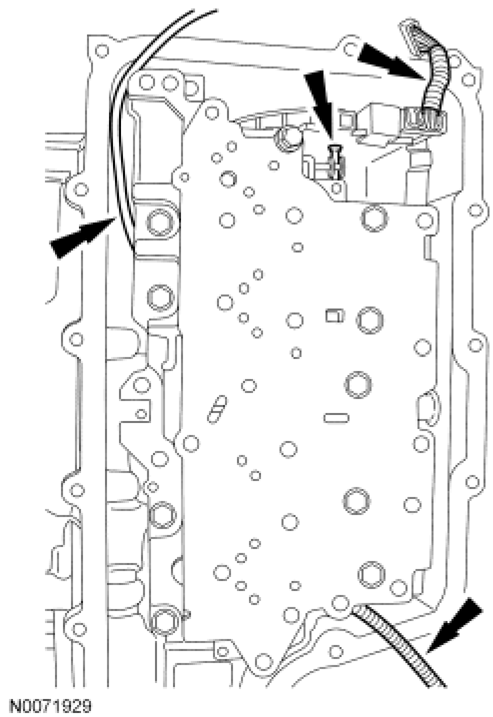

Fig. 399: Locating TSS, OSS & TR Sensor Wiring Harnesses
Courtesy of FORD MOTOR CO.

5. Inspect the manual pin to make sure it is correctly installed in the manual control valve. If it is not, pull the valve body off the transaxle case. Correctly install the manual pin in the manual control valve and position the valve body in place.

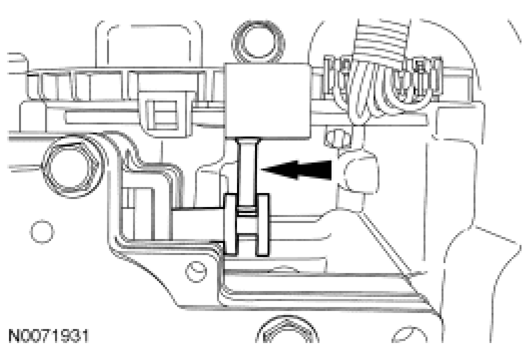

Fig. 400: Identifying Manual Pin
Courtesy of FORD MOTOR CO.

6. Install the TR sensor detent spring and the bolts. Tighten the bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

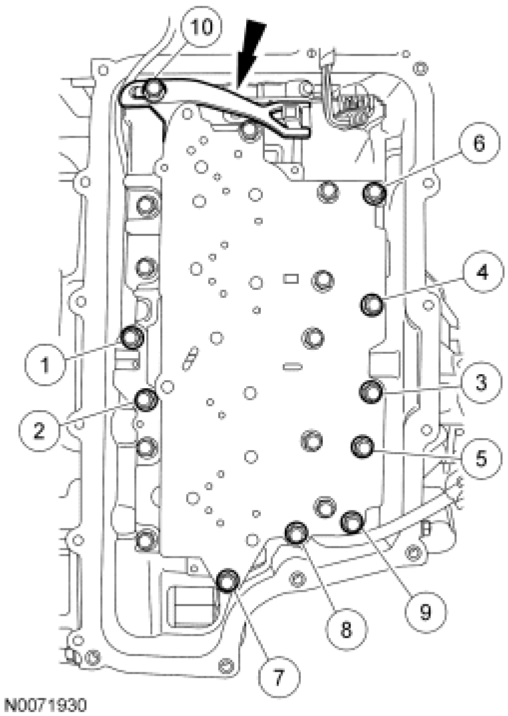

Fig. 401: Tightening TR Sensor Detent Spring Bolts In Sequence
Courtesy of FORD MOTOR CO.

NOTE:	**Do not handle the solenoid body in the leadframe area or by the screens of the solenoid body filter or damage to the solenoid body can occur.**
NOTE:	**Use care not to break the alignment tabs when installing the solenoid body filter. Damage to the transaxle will occur if the solenoid body is not correctly aligned.**
NOTE:	**Make sure that the filter passage areas are clean of foreign material before installing the filter. Damage to the transaxle will occur if the filter passages are not clean.**

7. Install a new solenoid body filter assembly by pushing it straight down on to the alignment tabs.

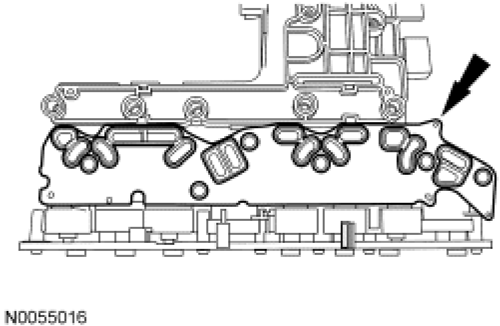

Fig. 402: Identifying Solenoid Body Filter Assembly
Courtesy of FORD MOTOR CO.

NOTE: **Make sure not to pinch the Turbine Shaft Speed (TSS), Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the solenoid body. Damage to the wiring harness will occur.**

NOTE: **Install the different length bolts in the locations noted during disassembly.**

8. Install the solenoid body and the bolts.
   1. 42 mm (1.65 in) bolt
   2. 63 mm (2.48 in) bolts
   3. 80 mm (3.14 in) bolts
   4. 95 mm (3.74 in) bolts

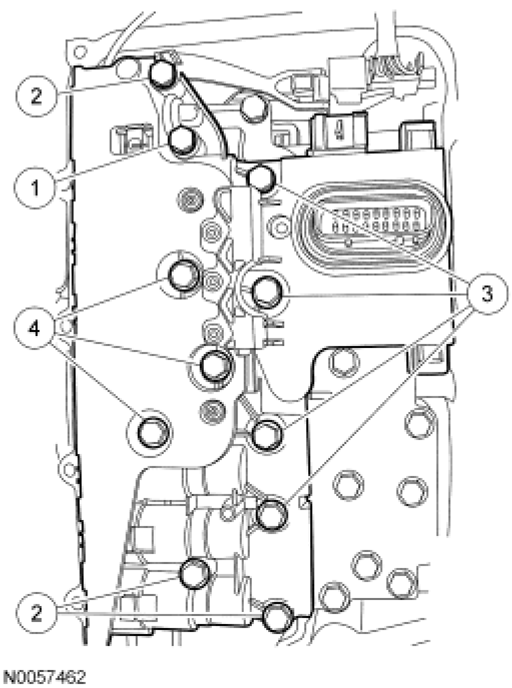

Fig. 403: Locating Solenoid Body Bolts
Courtesy of FORD MOTOR CO.

9. Tighten the solenoid body bolts in the sequence shown.
   - Tighten to 12 Nm (106 lb-in).

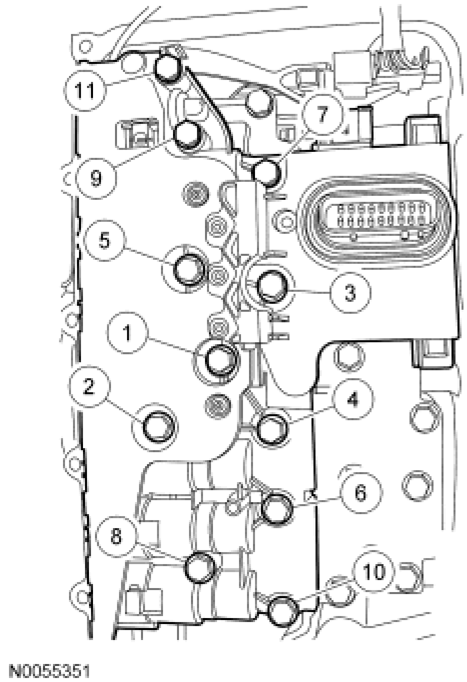

Fig. 404: Tightening Solenoid Body Bolts In Sequence
Courtesy of FORD MOTOR CO.

10. Route the OSS sensor wiring harness and connect the electrical connector.

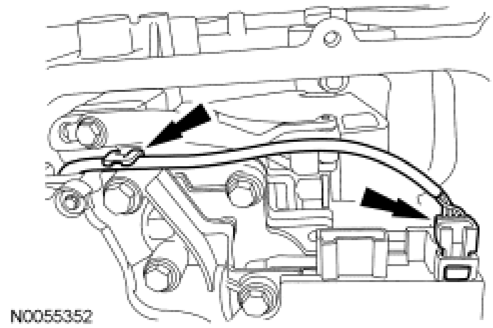

Fig. 405: Locating OSS Sensor Wiring Harness & Electrical Connector
Courtesy of FORD MOTOR CO.

11. Connect the TR sensor electrical connector.
    1. Connect the electrical connector.
    2. Slide the locking tab over.

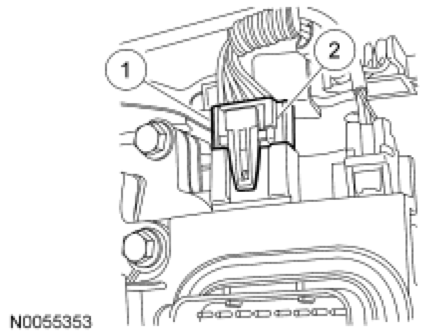

Fig. 406: Identifying TR Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

12. Connect the TSS sensor electrical connector.

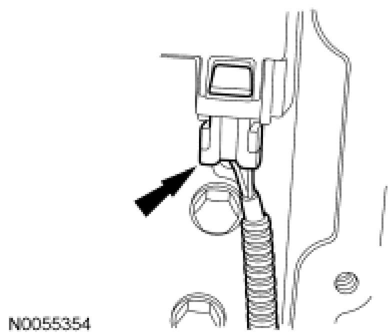

Fig. 407: Identifying TSS Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

13. Inspect the transaxle main control cover seal for damage and install new if necessary.

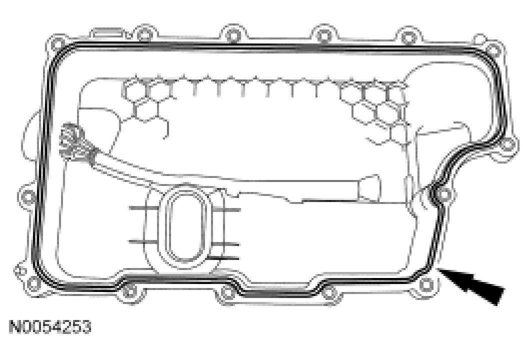

Fig. 408: Inspecting Transaxle Main Control Cover Seal For Damage
Courtesy of FORD MOTOR CO.

NOTE:	**Inspect the 20-pin solenoid body connector seal to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur resulting in transmission damage.**

NOTE: Install the studbolts in the locations noted during disassembly.

14. Install the main control cover and loosely install the bolts.
    1. Bolt location
    2. Studbolt location

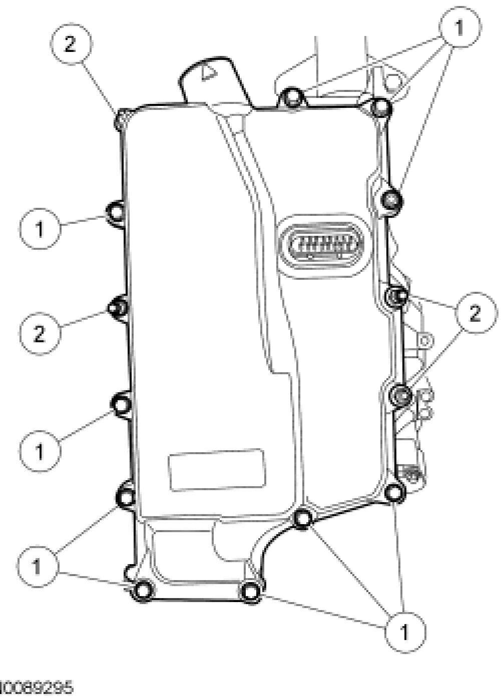

Fig. 409: Main Control Cover Bolts
Courtesy of FORD MOTOR CO.

15. Tighten the main control cover bolts in the sequence shown.
    - Tighten to 12 Nm (106 lb-in).

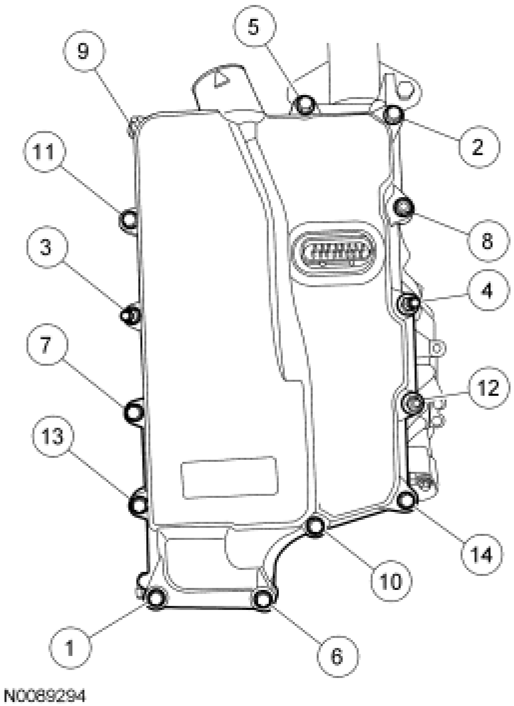

Fig. 410: Main Control Cover Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

16. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the nuts.
    - Tighten to 9 Nm (80 lb-in).

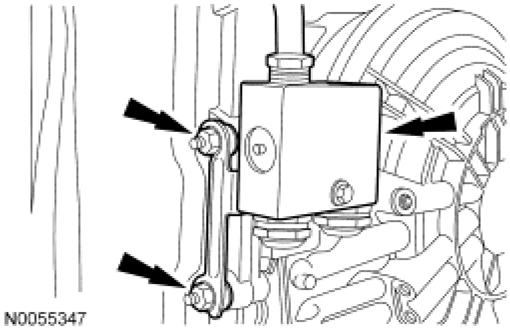

Fig. 411: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

17. Connect the transaxle electrical connector.

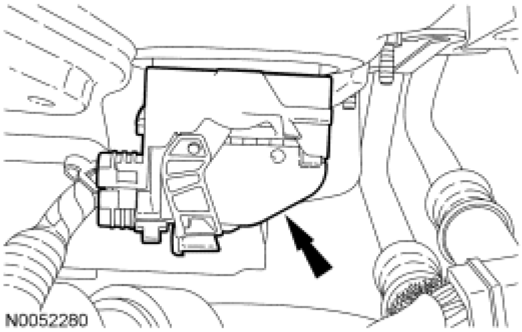

Fig. 412: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

18. Inspect the transmission fluid cooler tube backing ring and seal for damage and install a new backing ring or seal if necessary. Lubricate the transmission fluid cooler tube seal with clean transmission fluid and install the backing ring and seal on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

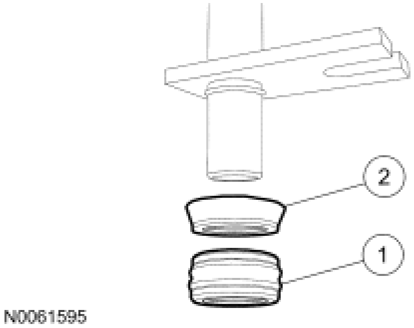

Fig. 413: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal
Courtesy of FORD MOTOR CO.

19. Position the transmission fluid cooler tube in place and install a new bolt.
    - Tighten to 9 Nm (80 lb-in).

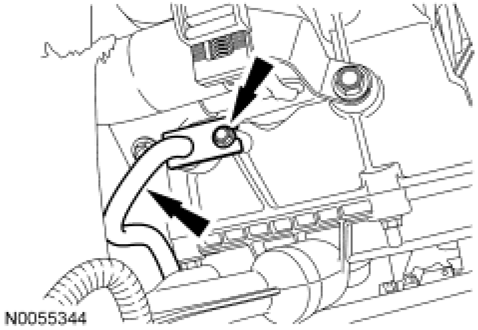

Fig. 414: Identifying Transmission Fluid Cooler Tube Bolt
Courtesy of FORD MOTOR CO.

20. Tighten the transmission fluid cooler tube fitting.
    - Tighten to 25 Nm (18 lb-ft).

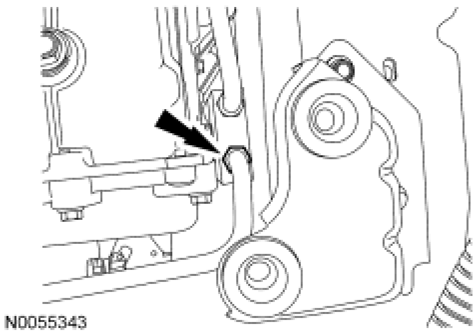

Fig. 415: Identifying Transmission Fluid Cooler Tube Fitting From Thermal Bypass Valve
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure that when installing the manual control lever it is fully seated onto the manual control lever shaft. Damage to the manual control lever shaft will occur and the lever will come loose.**

NOTE:	**Make sure to hold the manual control lever while tightening the manual control lever nut or damage to the manual control lever and park components will occur.**

21. Install the manual control lever and the nut.
    - Tighten to 18 Nm (159 lb-in).

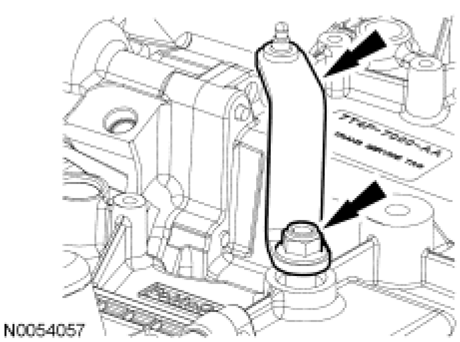

Fig. 416: Identifying Manual Control Lever & Nut
Courtesy of FORD MOTOR CO.

22. Connect the selector lever cable end to the manual control lever.

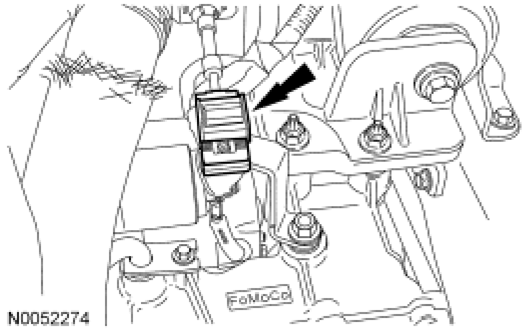

Fig. 417: Locating Selector Lever Cable End From Manual Lever
Courtesy of FORD MOTOR CO.

23. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

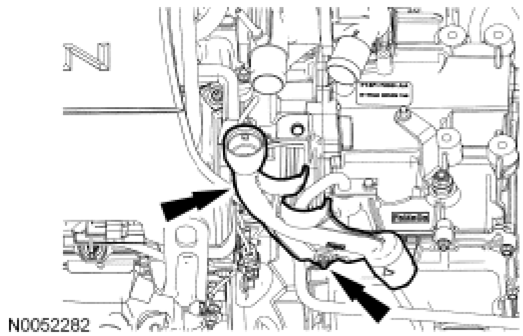

Fig. 418: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

24. Install the transmission fluid level indicator.

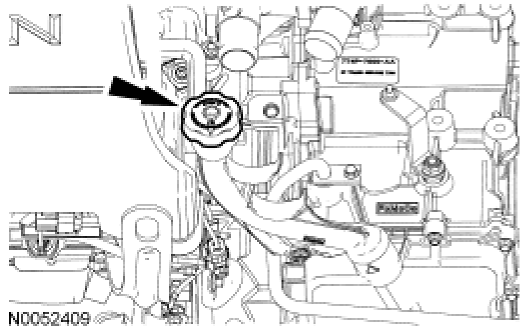

Fig. 419: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

25. Route the coolant hoses to the correct position on the transmission fluid filler tube.

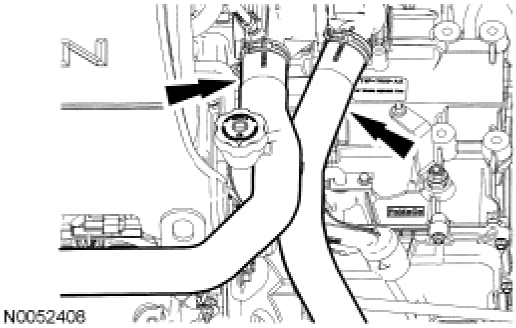

Fig. 420: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

26. Position the ACL assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

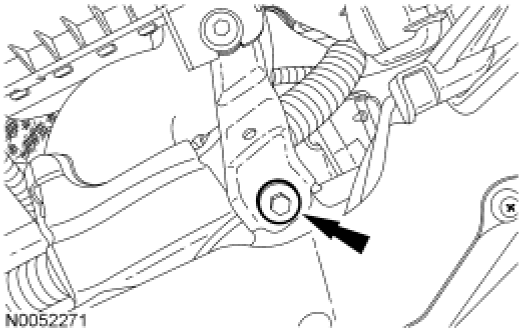

Fig. 421: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

27. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

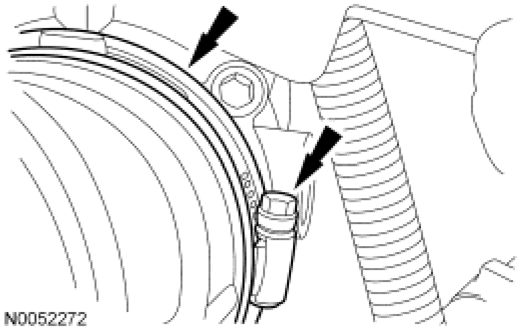

Fig. 422: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

28. Connect the engine breather to the ACL assembly.

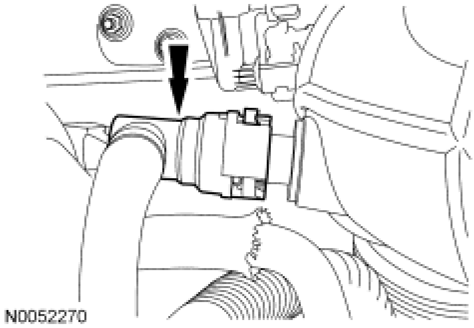

Fig. 423: Locating Engine Breather
Courtesy of FORD MOTOR CO.

29. Connect the brake booster vacuum hose to the ACL assembly.

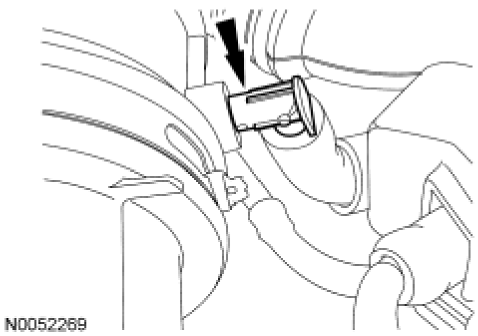

Fig. 424: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

30. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

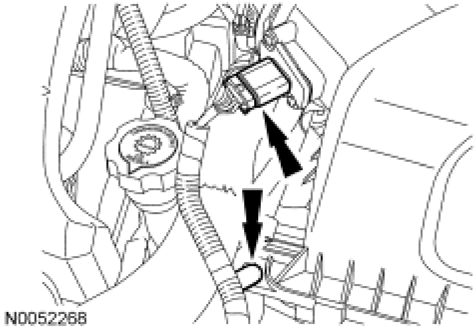

Fig. 425: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

31. Fill with clean transmission fluid to the correct level.

REMOVAL

TRANSAXLE

Special Tools

Illustration	Tool Name	Tool Number
 ST3033-A	Adapter, Transmission Jack	209-00152
 ST2977-A	Bar, Engine Spreader	303-1246
 ST2870-A	Disconnect Tool, Transmission Cooler Line	307-569
	Engine Lifting Bracket	303-1245

		
	Powertrain Lift	014-00765
	Support Bar, Engine	303-F072

REMOVAL

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.

2. Disconnect the Mass Air Flow (MAF) sensor electrical connector and the wiring harness fastener from the Air Cleaner (ACL) assembly.

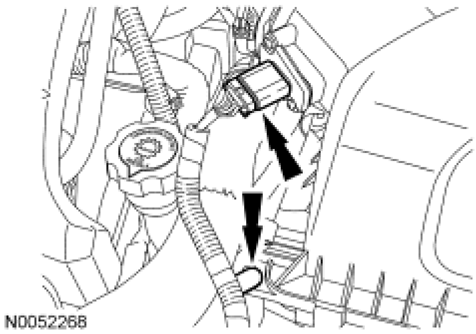

Fig. 426: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

3. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

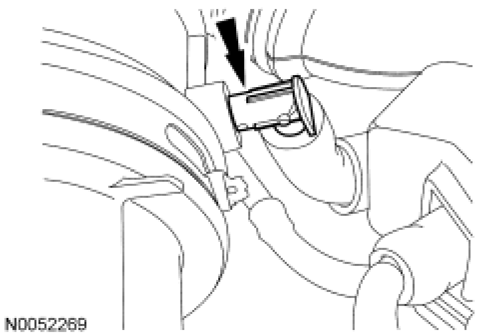

Fig. 427: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

4. Disconnect the engine breather from the ACL assembly.

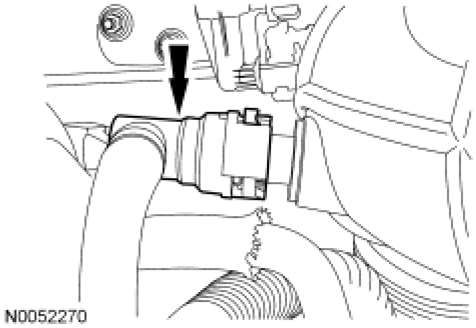

Fig. 428: Locating Engine Breather
Courtesy of FORD MOTOR CO.

5. Remove the ACL assembly bracket bolt.

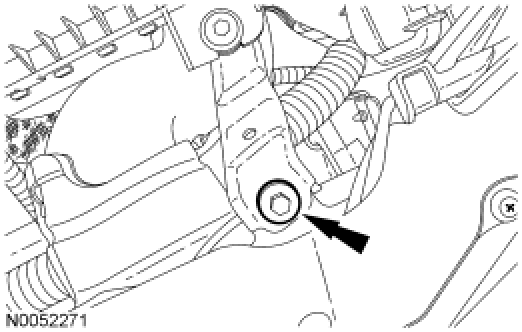

Fig. 429: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

6. Loosen the ACL outlet pipe clamp at the Throttle Body (TB) and remove the ACL and ACL outlet pipe assembly.

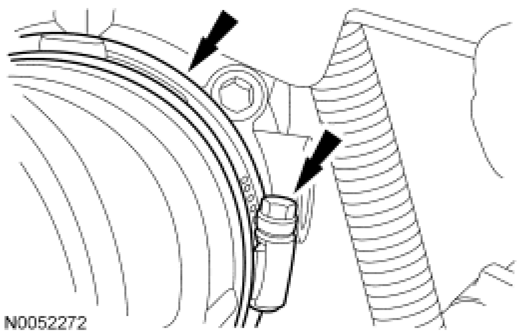

Fig. 430: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses do not need to be removed from the engine.

7. Remove the coolant hoses from the transmission fluid filler tube and position aside.

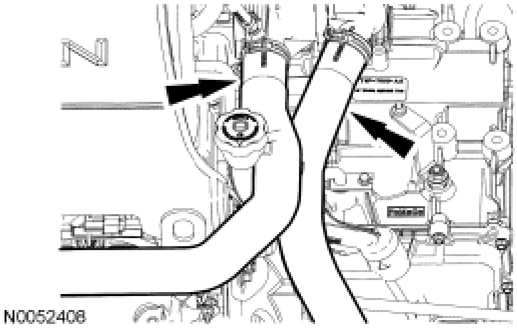

Fig. 431: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

8. Remove the transmission fluid level indicator.

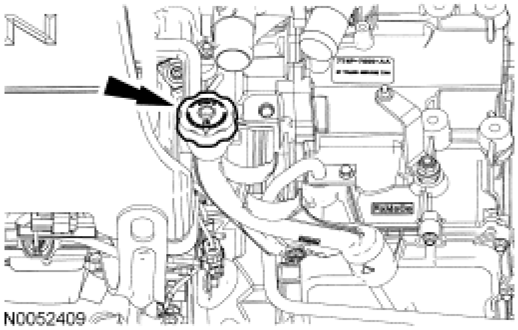

Fig. 432: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The coolant hoses have been removed for clarity.

9. Remove the nut, rotate the transmission fluid filler tube counterclockwise 90 degrees and remove the transmission fluid filler tube.

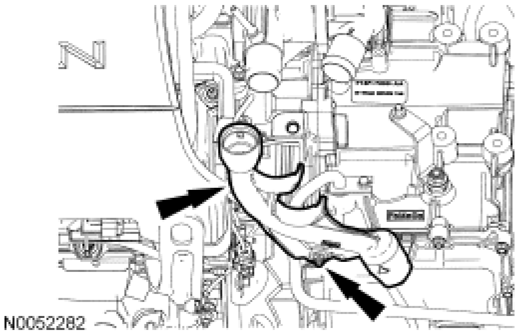

Fig. 433: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

10. Disconnect the selector lever cable end from the manual control lever.

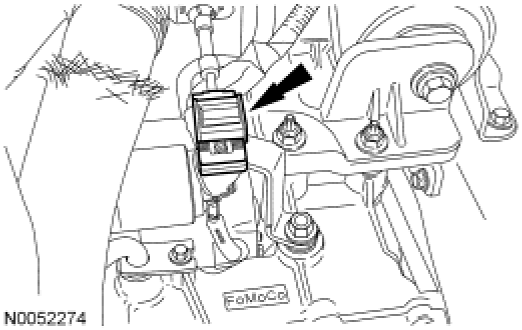

Fig. 434: Locating Selector Lever Cable End From Manual Lever
Courtesy of FORD MOTOR CO.

11. Remove the 3 selector lever cable bracket bolts and position aside the selector lever cable.

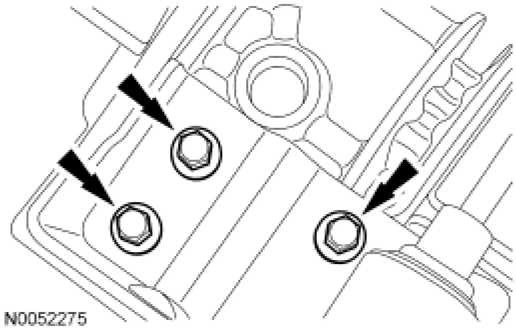

Fig. 435: Identifying Selector Lever Cable Bracket Bolts
Courtesy of FORD MOTOR CO.

12. Remove the starter motor electrical terminal cover.

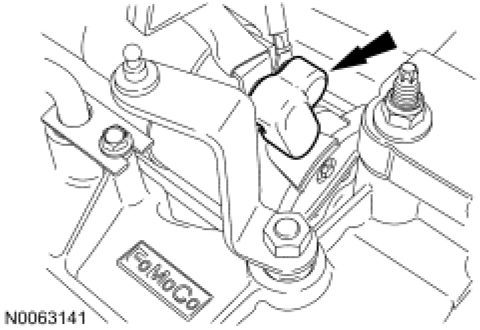

Fig. 436: Locating Starter Motor Electrical Terminal Cover
Courtesy of FORD MOTOR CO.

13. Position the starter cable boot back and remove the starter terminals from the starter.

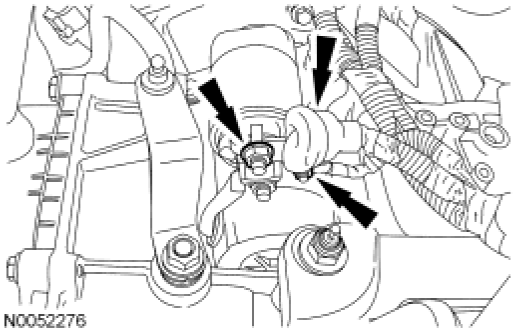

Fig. 437: Identifying Wire Terminals From Starter
Courtesy of FORD MOTOR CO.

14. Disconnect the wiring harness fastener from the starter motor studbolt.

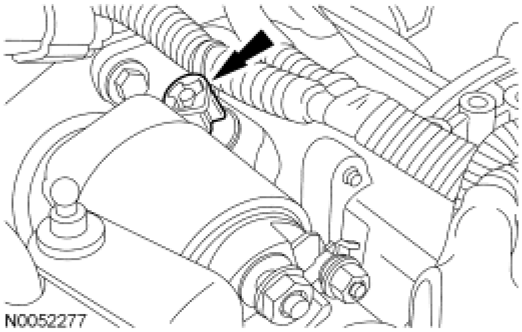

Fig. 438: Identifying Wiring Harness Retainer From Starter Motor Stud Bolt
Courtesy of FORD MOTOR CO.

15. Remove the bolt, studbolt and the starter.

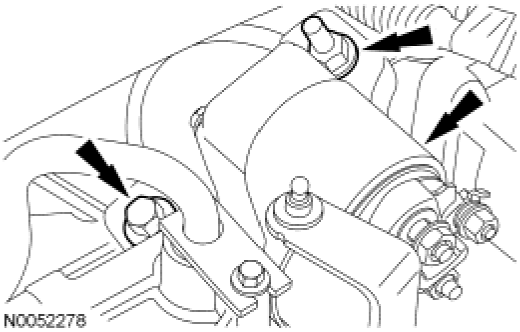

Fig. 439: Identifying Bolt, Stud Bolt & Starter
Courtesy of FORD MOTOR CO.

16. Disconnect the fuel hose routing clip from the transaxle stud and position the fuel hose aside.

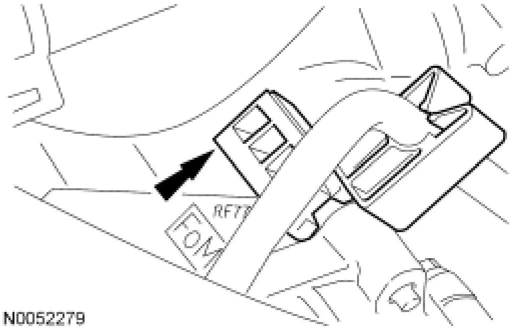

Fig. 440: Identifying Fuel Hose Routing Clip From Transaxle Stud
Courtesy of FORD MOTOR CO.

17. Disconnect the transaxle electrical connector.

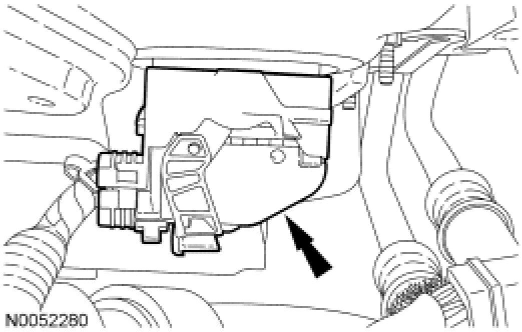

Fig. 441: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

18. Remove the top 4 torque converter housing bolts.

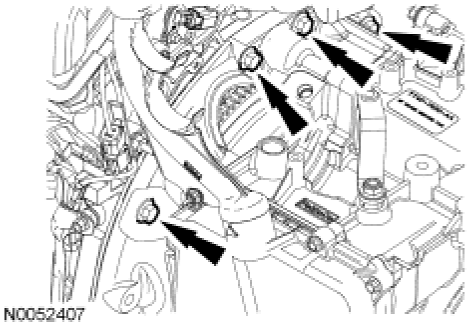

Fig. 442: Locating Torque Converter Housing Bolts
Courtesy of FORD MOTOR CO.

19. Install the Engine Lifting Bracket on the LH cylinder head.

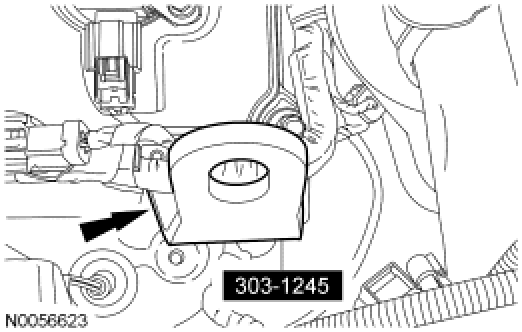

Fig. 443: Special Tool (303-1245) On LH Cylinder Head
Courtesy of FORD MOTOR CO.

20. Install the Engine Support Bar and Engine Spreader Bar to support the engine.

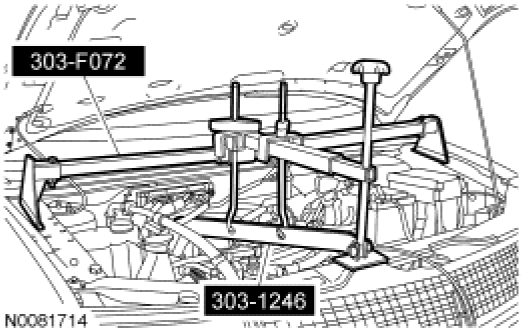

Fig. 444: Engine Support Bar & Engine Spreader Bar
Courtesy of FORD MOTOR CO.

21. Remove the transaxle support insulator through bolt.

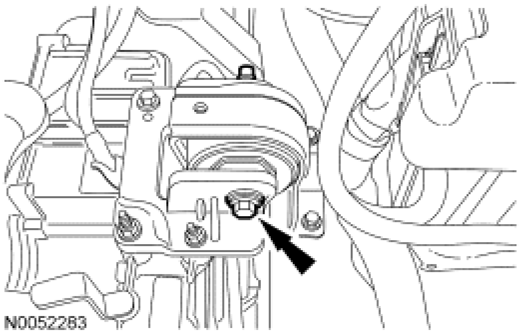

Fig. 445: Identifying Transaxle Support Insulator Bolt
Courtesy of FORD MOTOR CO.

22. Remove the 3 nuts, the bolt and the transaxle support insulator bracket.

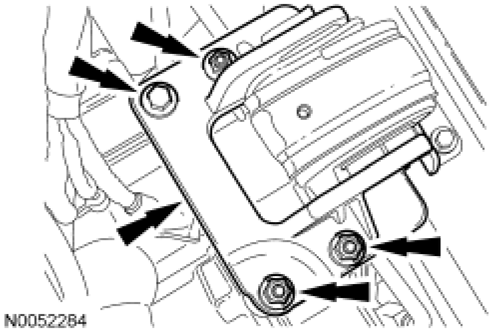

Fig. 446: Identifying Transaxle Support Insulator Bracket, Nuts & Bolts
Courtesy of FORD MOTOR CO.

23. Remove the RH splash shield.
    1. Remove the screws.
    2. Remove the pushpin fasteners and the RH splash shield.

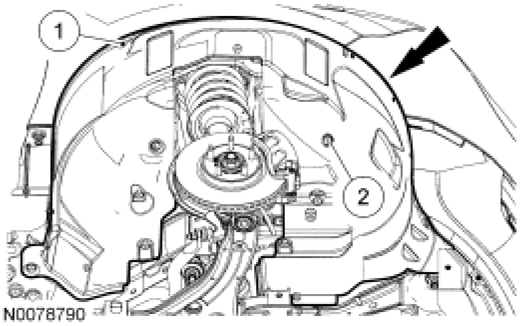

Fig. 447: Locating Push Pin Fasteners & RH Splash Shield
Courtesy of FORD MOTOR CO.

24. Remove the 3 pushpin fasteners, the 8 screws and the front splash shield.

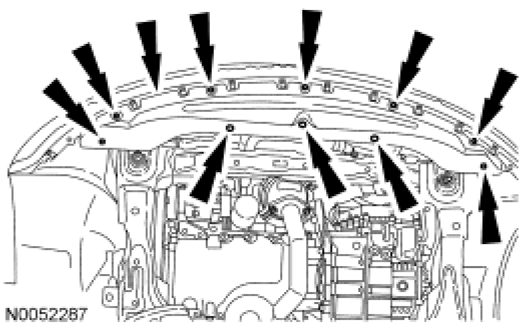

Fig. 448: Locating Push Pin Fasteners & Front Splash Shield Screws
Courtesy of FORD MOTOR CO.

25. Remove the 3 RH subframe-to-lower bumper nuts.

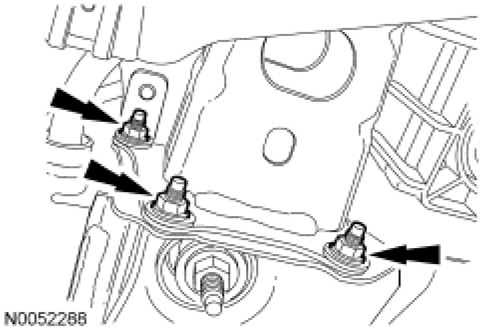

Fig. 449: Locating RH Subframe-To-Lower Bumper Nuts
Courtesy of FORD MOTOR CO.

26. Remove the 3 LH subframe-to-lower bumper nuts and separate the front support from the subframe.

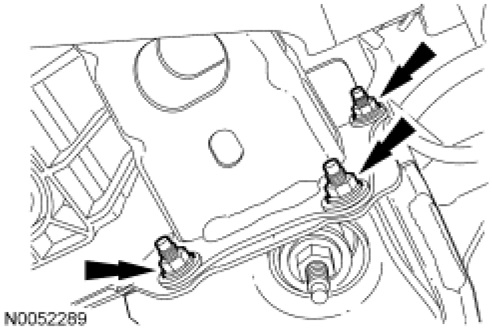

Fig. 450: Locating LH Subframe-To-Lower Bumper Nuts
Courtesy of FORD MOTOR CO.

27. Remove the 3 power steering tube bracket bolts from the subframe and position the power steering tube aside.

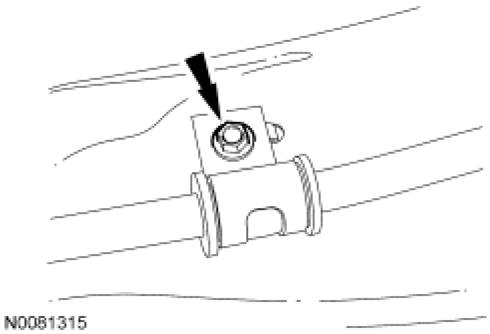

Fig. 451: Power Steering Tube Bracket Bolt
Courtesy of FORD MOTOR CO.

28. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

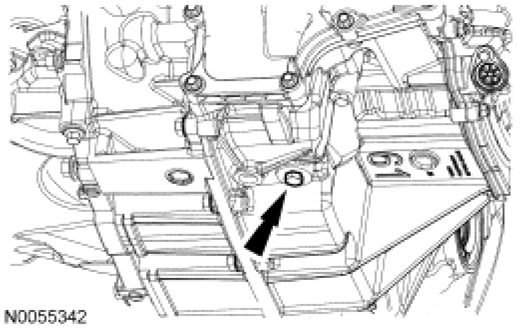

Fig. 452: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

29. Install the transmission fluid drain plug.
    - Tighten to 9 Nm (80 lb-in).

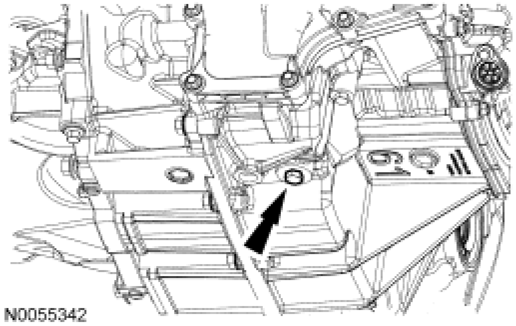

Fig. 453: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

30. Remove the LH and RH front halfshafts. For additional information, refer to**FRONT DRIVE HALFSHAFTS** article.
31. Inspect the halfshaft hubs for wear or damage and replace the halfshaft(s), if necessary.
    1. Inspect the differential seal surface.
    2. Inspect the halfshaft bushing surface. If this surface is damaged, inspect the halfshaft bushing for damage.
    3. Inspect the differential side gear splines.

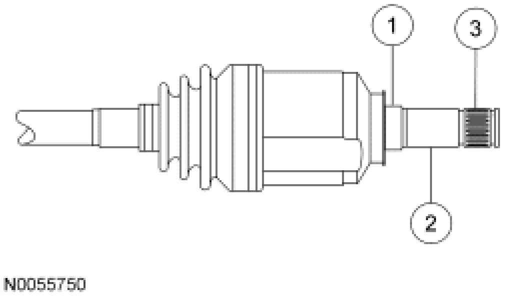

Fig. 454: Identifying Differential Side Gear Splines, Halfshaft Bushing & Differential Seal
Courtesy of FORD MOTOR CO.

32. Remove the bolts and the power steering rack heat shield.

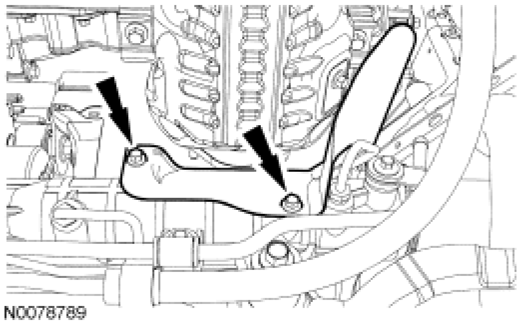

Fig. 455: Locating Power Steering Rack Heat Shield Bolts
Courtesy of FORD MOTOR CO.

33. Loosen the Y-pipe clamp and disconnect the 2 exhaust hangers.

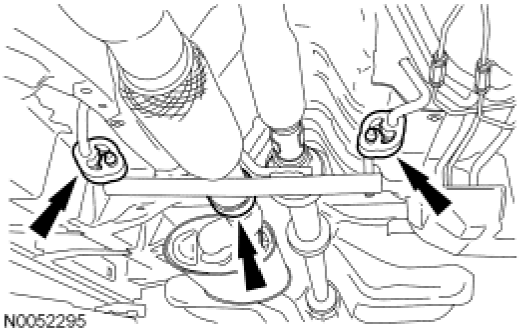

Fig. 456: Locating Exhaust Flexible Pipe Clamp & Exhaust Hangers
Courtesy of FORD MOTOR CO.

34. Remove the 4 nuts and the Y-pipe assembly.

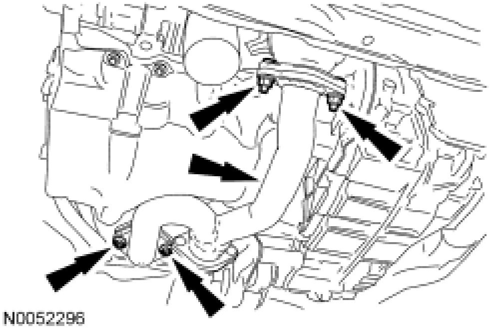

Fig. 457: Locating Exhaust Flexible Pipe, Y-Pipe & Nuts
Courtesy of FORD MOTOR CO.

35. Remove the 4 bolts and position the steering rack aside, using a suitable length of mechanic's wire.

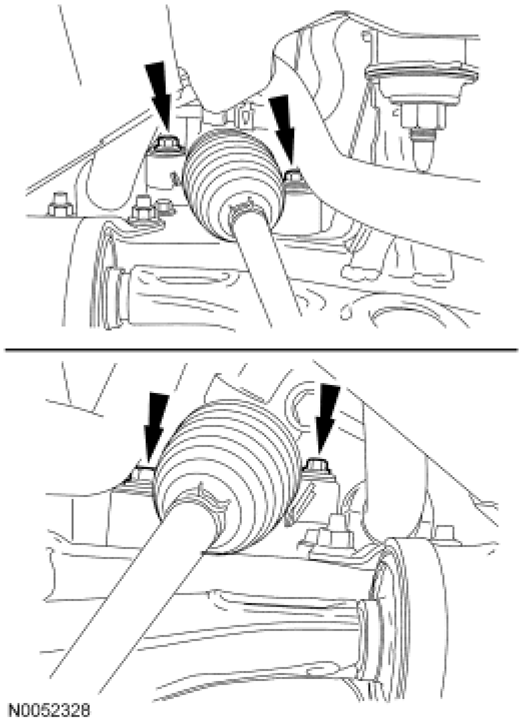

Fig. 458: Locating Steering Rack Bolts
Courtesy of FORD MOTOR CO.

36. Remove the 4 bolts and position the sway bar aside, using a suitable length of mechanic's wire.

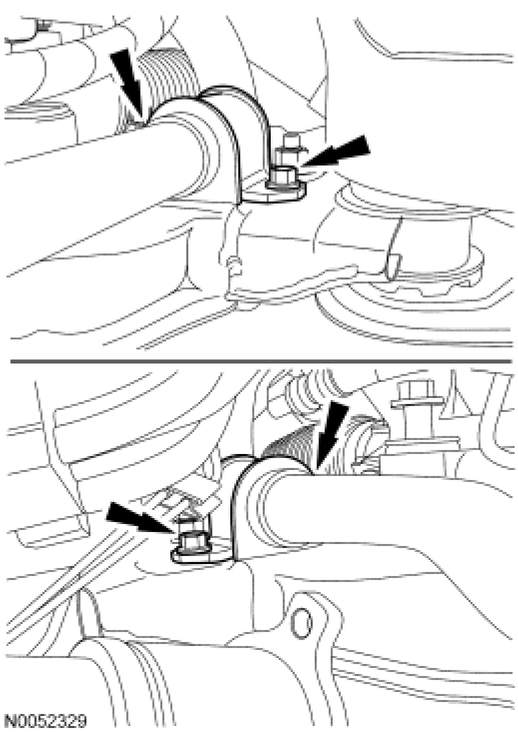

Fig. 459: Locating Stabilizer Bar & Bolts

Courtesy of FORD MOTOR CO.

37. Remove the 2 nuts and the roll restrictor heat shield.

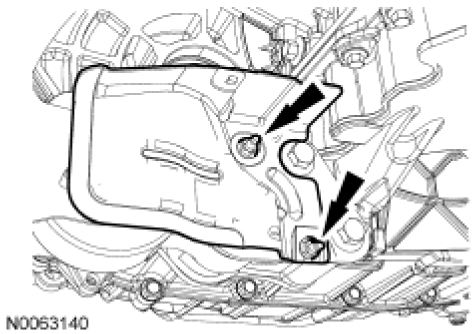

Fig. 460: Locating Roll Restrictor Heat Shield Nuts
Courtesy of FORD MOTOR CO.

38. Remove the 3 bolts from the roll restrictor bracket.

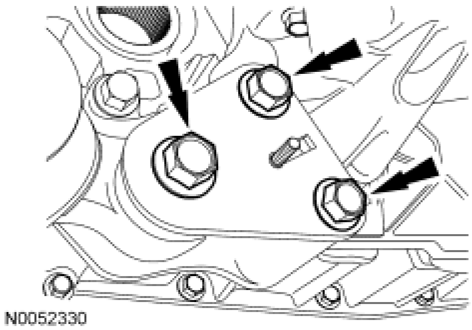

Fig. 461: Locating Roll Restrictor-To-Transaxle Bracket Plate Bolts
Courtesy of FORD MOTOR CO.

39. Support the subframe using the Powertrain Lift.
40. Remove the 2 nuts, 4 bolts and the subframe support brackets.

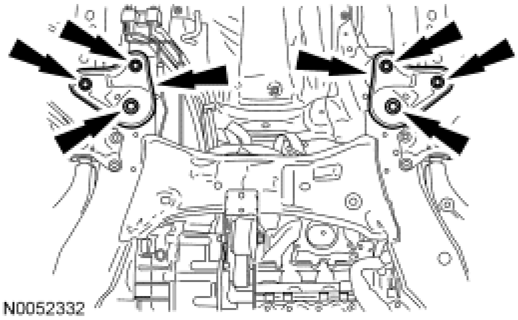

Fig. 462: Locating Subframe Support Brackets, Nuts & Bolts
Courtesy of FORD MOTOR CO.

41. Remove the 2 front subframe nuts.

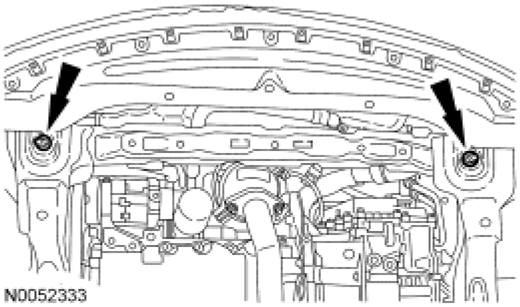

Fig. 463: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

42. Remove the 2 middle subframe nuts and remove the subframe.

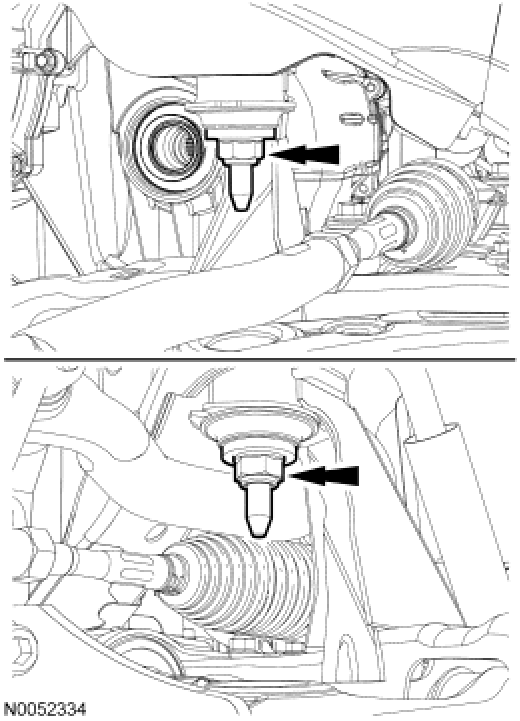

Fig. 464: Locating Middle Subframe Nuts
Courtesy of FORD MOTOR CO.

43. Remove the 3 bolts and the roll restrictor bracket.

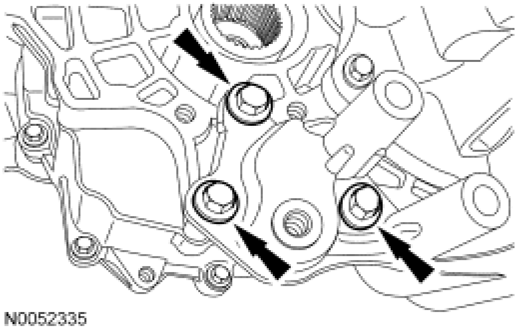

Fig. 465: Locating Transaxle Bracket Bolts
Courtesy of FORD MOTOR CO.

AWD vehicles

44. Index-mark the driveshaft, remove the 4 bolts and position the driveshaft aside.

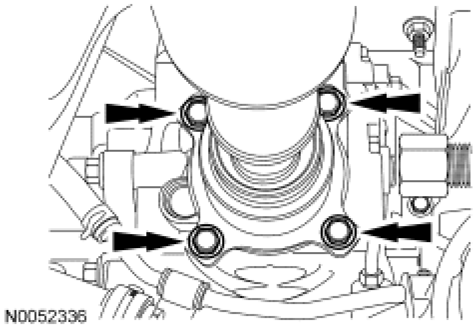

Fig. 466: Locating Driveshaft Aside Bolts
Courtesy of FORD MOTOR CO.

45. Disconnect the RH catalyst monitor electrical connector.

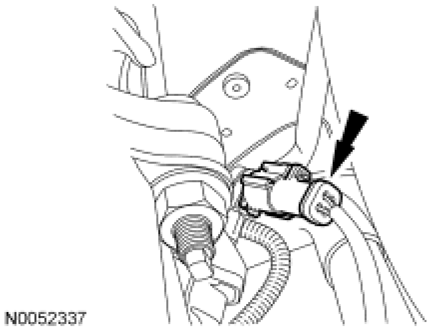

Fig. 467: Identifying RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

46. Remove the 2 catalytic converter support bracket bolts.

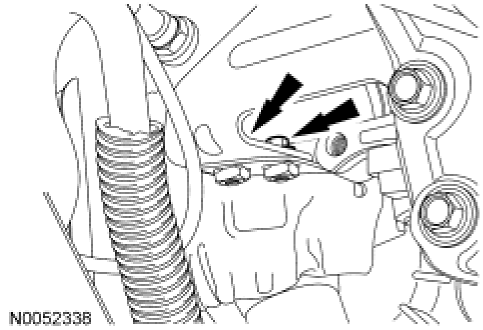

Fig. 468: Locating Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

47. Remove the 4 RH catalytic converter nuts and the RH catalytic converter.

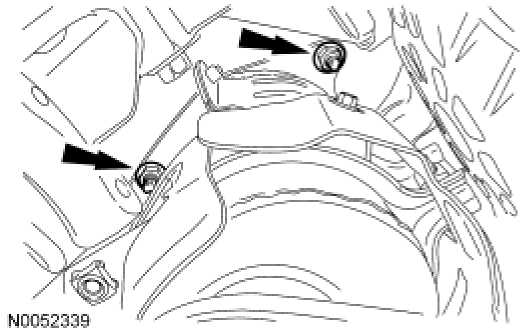

Fig. 469: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

48. Remove the 5 bolts and the Power Transfer Unit (PTU) support bracket.

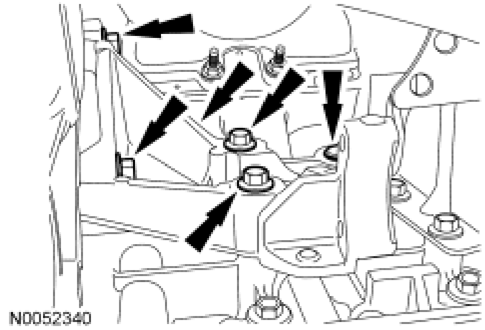

Fig. 470: Locating Power Transfer Unit (PTU) Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

49. Remove the 5 bolts and the PTU.

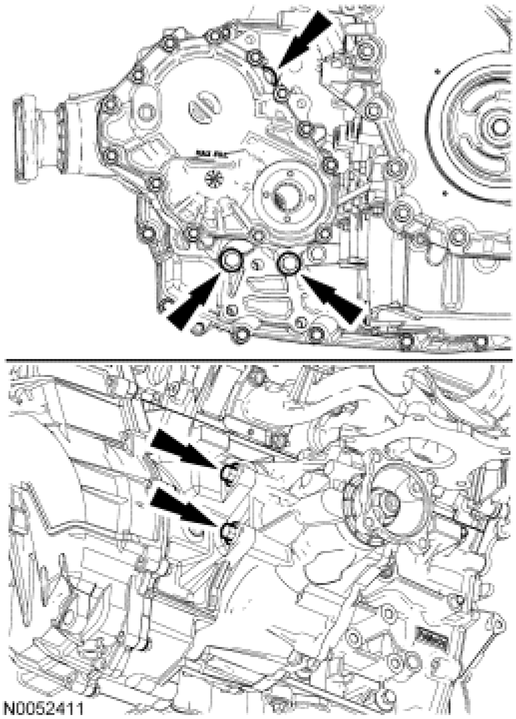

Fig. 471: Identifying PTU & Bolts
Courtesy of FORD MOTOR CO.

All vehicles

50. Remove the 2 fasteners and the inspection cover.

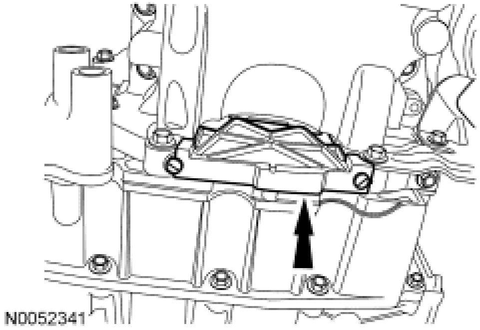

Fig. 472: Locating Oil Fasteners On Inspection Cover
Courtesy of FORD MOTOR CO.

51. Remove and discard the 3 torque converter bolts.

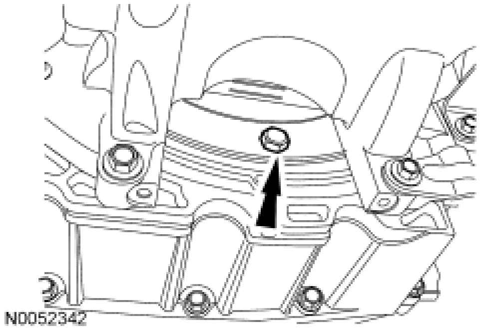

Fig. 473: Locating Torque Converter Bolts
Courtesy of FORD MOTOR CO.

52. Remove the 2 secondary latches from the transmission fluid cooler tubes at the transmission fluid cooler thermal bypass valve.

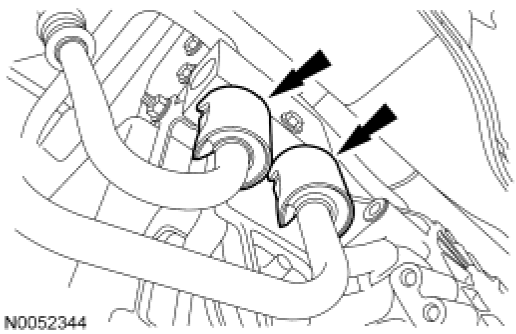

Fig. 474: Locating Secondary Latches On Transmission Fluid Cooler Tubes
Courtesy of FORD MOTOR CO.

53. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes from the transmission fluid cooler thermal bypass valve.

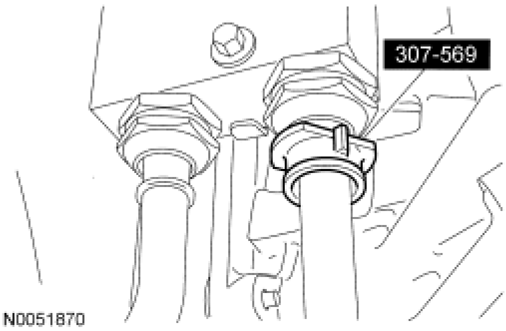

Fig. 475: Disconnecting Transmission Cooling Tubes Using Special Tool (307-569)
Courtesy of FORD MOTOR CO.

54. Using the Transmission Jack Adapter and a suitable transmission jack, support the transaxle.

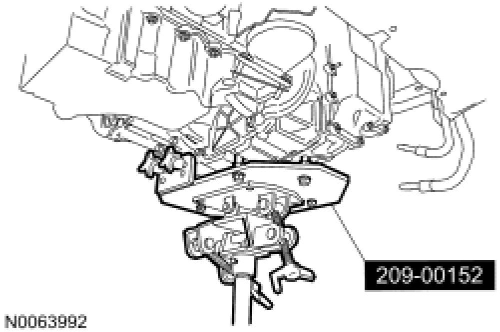

Fig. 476: Supporting Transaxle Using Special Tool (209-00152) & A Suitable Transmission Jack
Courtesy of FORD MOTOR CO.

55. Remove the 7 torque converter housing bolts and remove the transaxle from the vehicle.

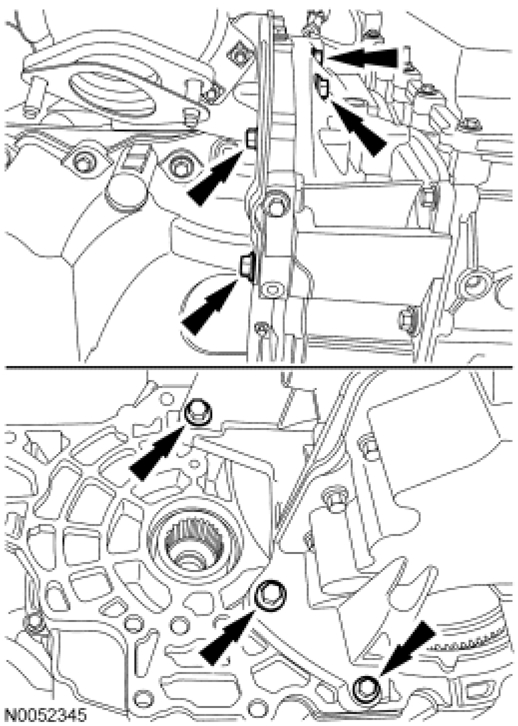

Fig. 477: Locating torque converter housing bolts
Courtesy of FORD MOTOR CO.

56. Inspect the torque converter housing mating surface to make sure that the dowel pins did not come out of the engine block when the transaxle was removed. If the dowel pin is stuck in the torque converter housing, remove the dowel pin from the torque converter housing.

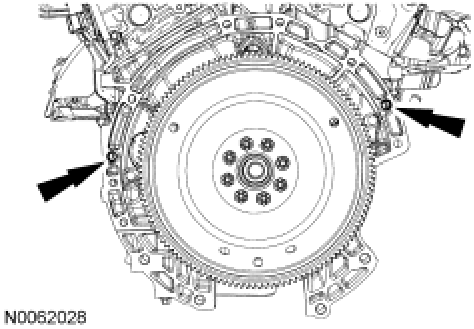

Fig. 478: Locating dowel pin from torque converter housing
Courtesy of FORD MOTOR CO.

57. Remove manual control lever.

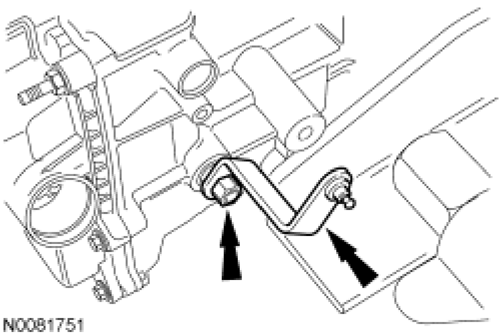

Fig. 479: Manual Control Lever
Courtesy of FORD MOTOR CO.

58. Remove and discard the transmission fluid cooler tube bolts.

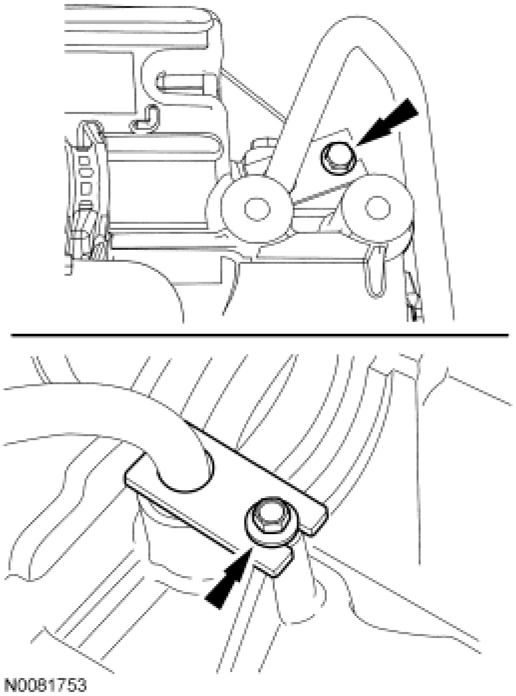

Fig. 480: Transmission Fluid Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

59. Remove the 2 transmission fluid cooler thermal bypass valve bracket nuts, pull the transmission fluid cooler thermal bypass valve and the transmission fluid cooler tubes straight up and remove the assembly from the transaxle.

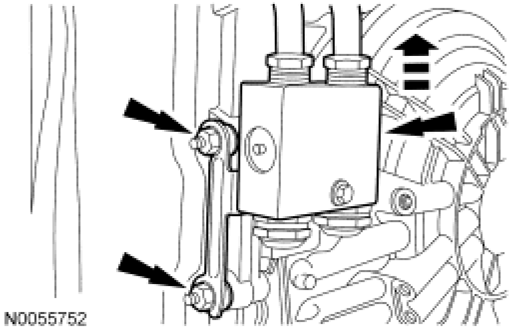

Fig. 481: Removing Nuts & Pulling Transmission Fluid Cooler Thermal Bypass Valve & Transmission Fluid Cooler Tubes Straight Up
Courtesy of FORD MOTOR CO.

60. Inspect the transaxle case to make sure that the transmission fluid cooler tube seals and backing rings were removed with the transmission fluid cooler tubes and are not stuck in the transaxle case. If the transmission fluid cooler tube seals or backing rings are stuck in the transaxle case, remove the seals and backing rings.

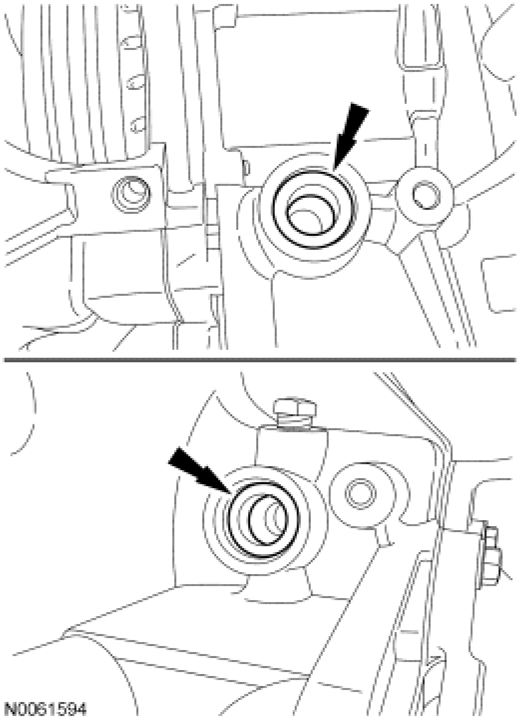

Fig. 482: Locating Transmission Fluid Cooler Tube Seals & Backing Rings
Courtesy of FORD MOTOR CO.

61. If the transaxle is to be overhauled or if installing a new transaxle, carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to **Transmission Fluid Cooler Backflushing and Cleaning**.
62. If a replacement transaxle assembly is being installed or a new solenoid body is installed, the PCM will have to be reflashed with a new solenoid body strategy and identification data file. For additional information, refer to **Solenoid Body Strategy**.

INSTALLATION

TRANSAXLE

Special Tools

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

INSTALLATION

All vehicles

NOTE: Prior to installation of a new or overhauled transaxle, the transmission fluid cooler tubes must be cleaned, otherwise transaxle failure can occur.

NOTE: Prior to installation of a new or overhauled transaxle, flush out the cooler and cooler lines. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning.

1. Inspect the transmission fluid cooler tube backing rings and seals for damage and install a new backing rings or seals if necessary. Lubricate the transmission fluid cooler tube seals with clean automatic transmission fluid and install the backing rings and seals on the transmission fluid cooler tube.

Item	Part Number	Description
1	7D285	Seal
2	7J324	Backing ring

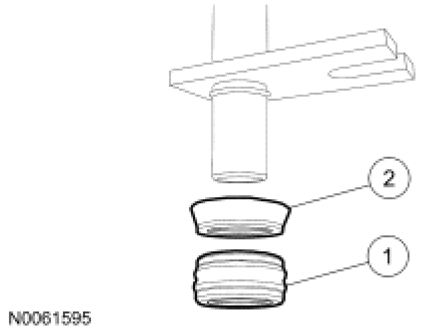

Fig. 483: Identifying Transmission Fluid Cooler Tube Backing Ring & Seal
Courtesy of FORD MOTOR CO.

2. Position the transmission fluid cooler thermal bypass valve and transmission fluid cooler tube assembly in place and install the transmission fluid cooler thermal bypass valve bracket nuts.
   - Tighten to 9 Nm (80 lb-in).

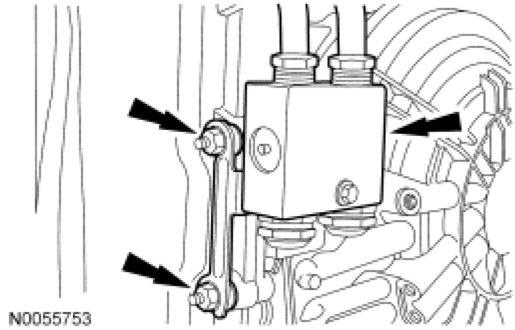

Fig. 484: Identifying Transmission Fluid Cooler Tube Assembly & Nuts
Courtesy of FORD MOTOR CO.

3. Install new transmission fluid cooler tube bolts.
   - Tighten to 9 Nm (80 lb-in).

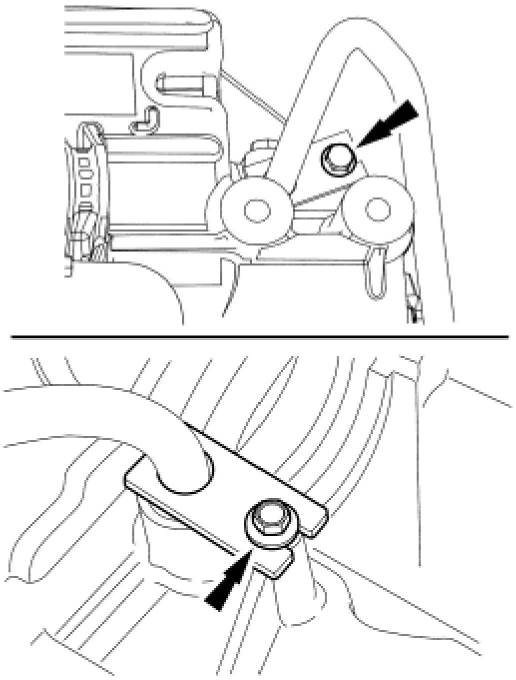

Fig. 485: Transmission Fluid Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

4. Lubricate the torque converter pilot hub with grease and install the torque converter into the transaxle.

NOTE: **Make sure that when installing the manual control lever it is fully seated onto the manual control lever shaft or damage to the manual control lever shaft will occur and the lever will come loose.**

NOTE: **Make sure to hold the manual control lever while tightening the manual control lever nut or damage to the manual control lever and park components will occur.**

5. Install the manual control lever and nut.
   - Tighten to 18 Nm (159 lb-in).

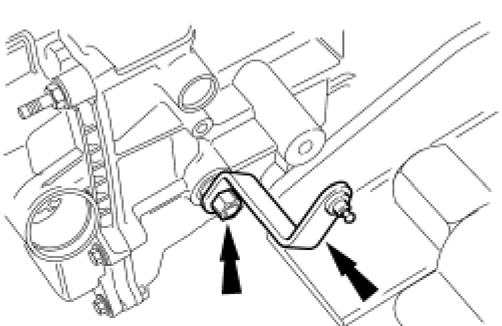

Fig. 486: Manual Control Lever
Courtesy of FORD MOTOR CO.

NOTE: If the transaxle is not positioned on the dowel pins, damage to the transaxle can occur.

6. If the dowel pins were pulled out of the engine block during removal, install new dowel pins in the engine block.

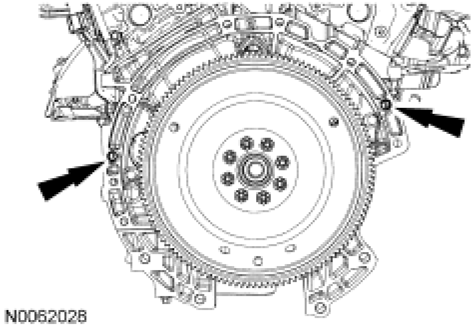

Fig. 487: Locating dowel pin from torque converter housing
Courtesy of FORD MOTOR CO.

7. Position the transaxle in place and install the 7 torque converter housing bolts.
    - Tighten to 48 Nm (35 lb-ft).

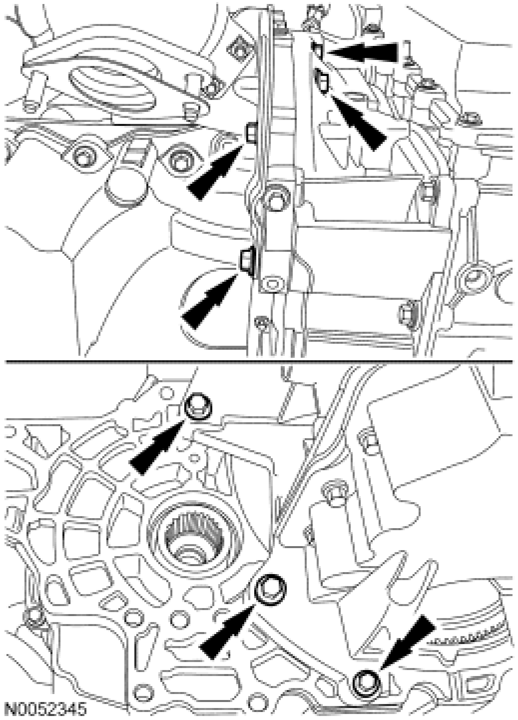

Fig. 488: Locating torque converter housing bolts

Courtesy of FORD MOTOR CO.

8. Remove the Transmission Jack Adapter from the transaxle.

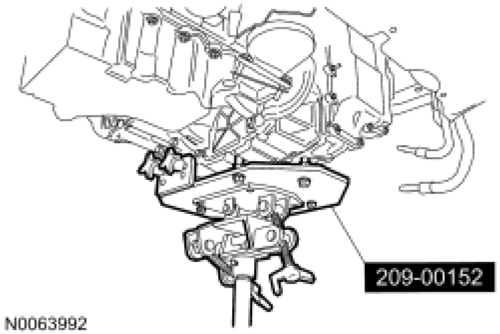

Fig. 489: Supporting Transaxle Using Special Tool (209-00152) & A Suitable Transmission Jack
Courtesy of FORD MOTOR CO.

9. Install the transmission fluid cooler tubes in the transmission fluid cooler thermal bypass valve.

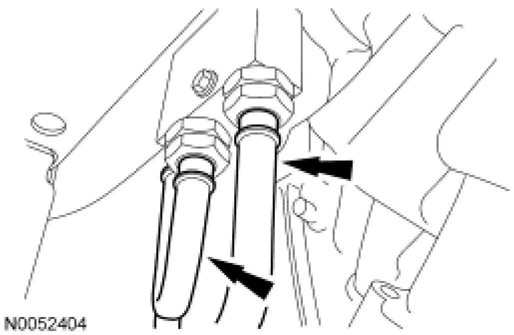

Fig. 490: Locating Transmission Fluid Cooler Tubes
Courtesy of FORD MOTOR CO.

10. Install the 2 secondary latches on the transmission fluid cooler tubes at the transmission fluid cooler thermal bypass valve.

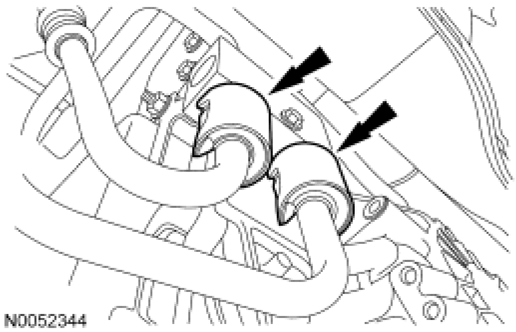

Fig. 491: Locating Secondary Latches On Transmission Fluid Cooler Tubes
Courtesy of FORD MOTOR CO.

11. Install 3 new torque converter bolts.
    - Tighten to 55 Nm (41 lb-ft).

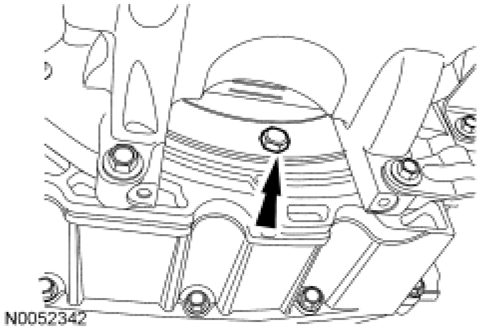

Fig. 492: Locating Torque Converter Bolts
Courtesy of FORD MOTOR CO.

12. Install the inspection cover and the 2 fasteners.

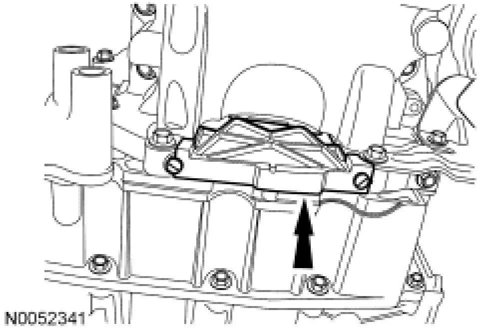

Fig. 493: Locating Oil Fasteners On Inspection Cover
Courtesy of FORD MOTOR CO.

All-Wheel Drive (AWD) vehicles

13. Position the Power Transfer Unit (PTU) in place and install the 5 PTU-to-transaxle bolts.
    - Tighten to 90 Nm (66 lb-ft).

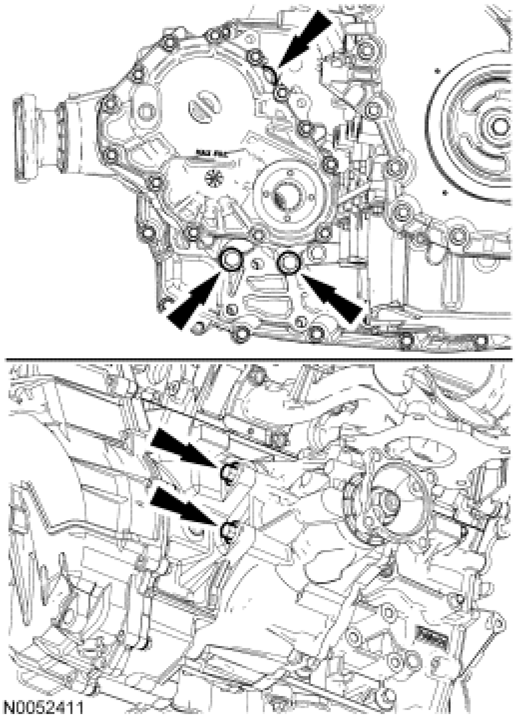

Fig. 494: Identifying PTU & Bolts
Courtesy of FORD MOTOR CO.

14. Position the PTU support bracket in place and install the 5 bolts.
    - Tighten to 70 Nm (52 lb-ft).

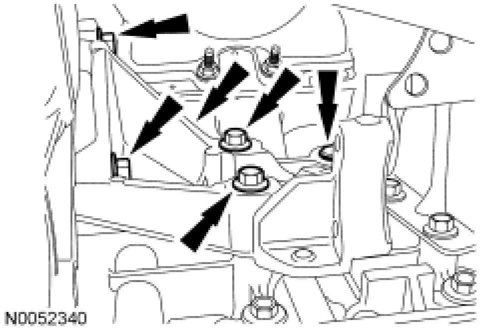

Fig. 495: Locating Power Transfer Unit (PTU) Support Bracket & Bolts

23. Install the rear subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

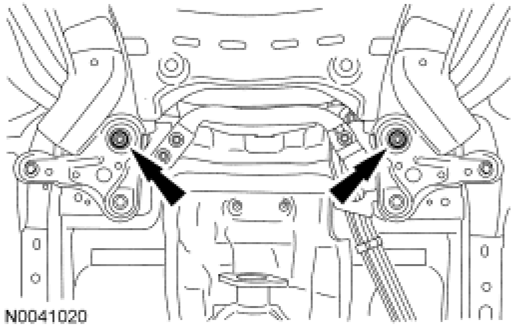

Fig. 504: Locating Rear Subframe Nuts
Courtesy of FORD MOTOR CO.

24. Tighten the subframe support bracket bolts.
    - Tighten to 103 Nm (76 lb-ft).

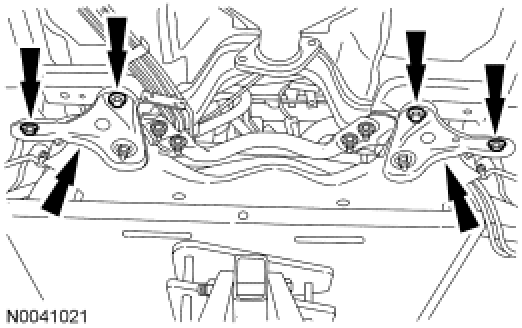

Fig. 505: Locating Subframe Support Brackets And Bolts
Courtesy of FORD MOTOR CO.

25. Position the roll restrictor in place, install the bracket and the 3 roll restrictor bolts.

- Tighten to 90 Nm (66 lb-ft).

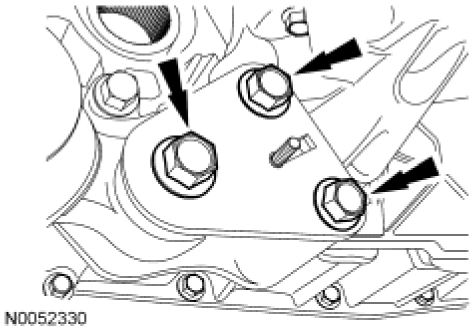

Fig. 506: Locating Roll Restrictor-To-Transaxle Bracket Plate Bolts
Courtesy of FORD MOTOR CO.

26. Install the roll restrictor heat shield and the 2 nuts.
    - Tighten to 11 Nm (97 lb-in).

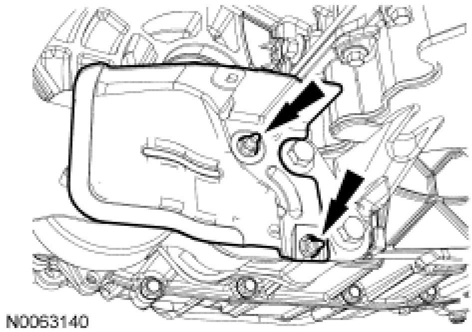

Fig. 507: Locating Roll Restrictor Heat Shield Nuts
Courtesy of FORD MOTOR CO.

27. Position the stabilizer bar in place and install the 4 stabilizer bar bracket bolts.
    - Tighten to 48 Nm (35 lb-ft).

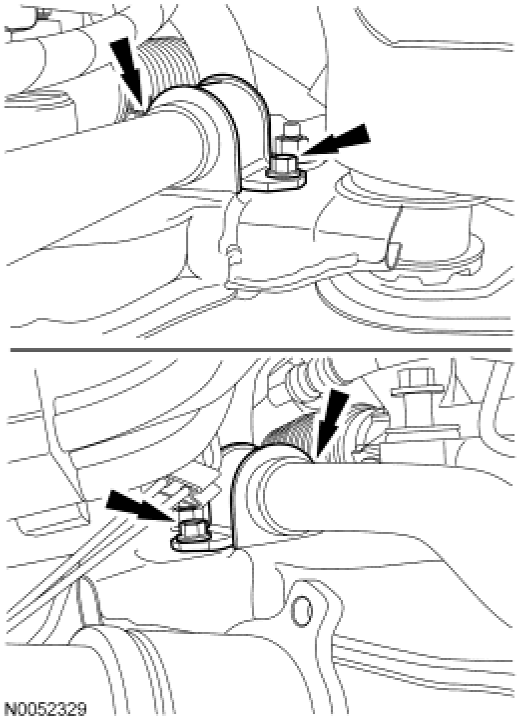

Fig. 508: Locating Stabilizer Bar & Bolts
Courtesy of FORD MOTOR CO.

28. Position the power steering rack in place and install the 4 power steering rack bolts.
    - Tighten to 107 Nm (79 lb-ft).

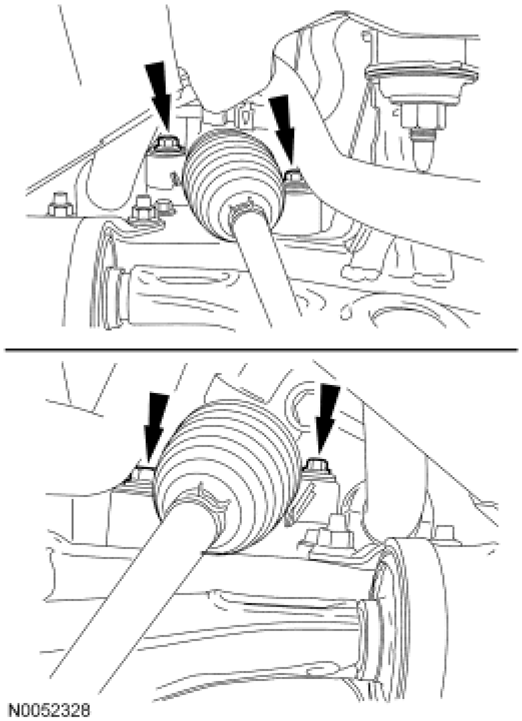

Fig. 509: Locating Steering Rack Bolts
Courtesy of FORD MOTOR CO.

29. Install the steering rack heat shield and the 2 bolts.
    - Tighten to 6 Nm (53 lb-in).

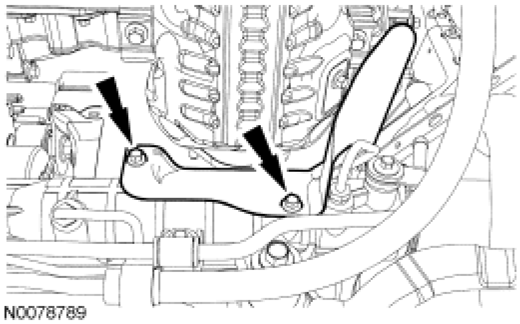

Fig. 510: Locating Power Steering Rack Heat Shield Bolts
Courtesy of FORD MOTOR CO.

30. Position the exhaust Y-pipe assembly in place and install the 4 exhaust Y-pipe nuts.
    - Tighten to 40 Nm (30 lb-ft).

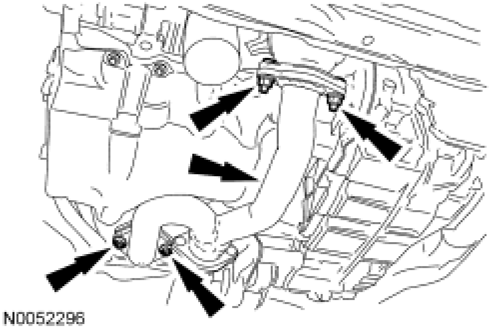

Fig. 511: Locating Exhaust Flexible Pipe, Y-Pipe & Nuts
Courtesy of FORD MOTOR CO.

31. Install the 2 exhaust hangers and tighten the exhaust clamp.
    - Tighten to 40 Nm (30 lb-ft).

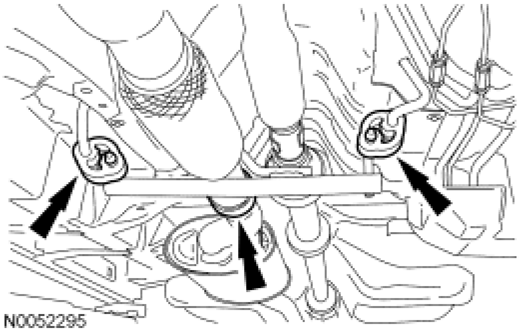

Fig. 512: Locating Exhaust Flexible Pipe Clamp & Exhaust Hangers
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

32. Position the RH halfshaft and intermediate shaft support bracket in the transaxle and in the steering knuckle. Install 1 stud bolt and 1 bolt.
    - Tighten to 55 Nm (41 lb-ft).

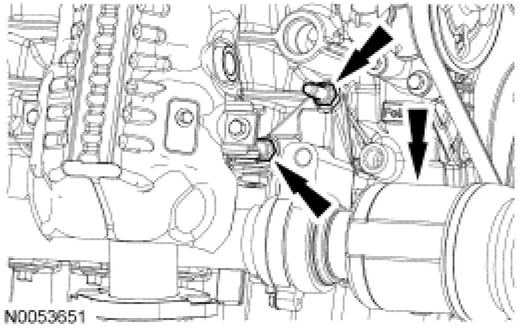

Fig. 513: Locating Stud Bolts & RH Halfshaft/Intermediate Shaft Assembly
Courtesy of FORD MOTOR CO.

33. Position the catalytic converter support bracket in place and install the bolt and the nut.
    1. Tighten the nut to 40 Nm (30 lb-ft).
    2. Tighten the bolt to 55 Nm (41 lb-ft).

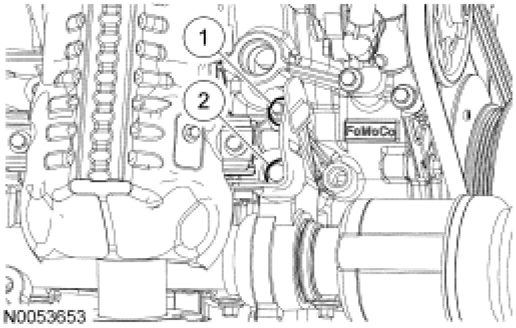

Fig. 514: Locating Catalytic Converter Bracket Bolt & Nut
Courtesy of FORD MOTOR CO.

34. Install the 2 RH catalytic converter support bracket bolts.
    - Tighten to 20 Nm (177 lb-in).

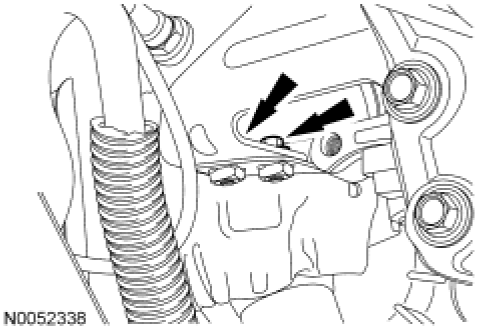

Fig. 515: Locating Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

All vehicles

35. Install the LH and RH halfshafts. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.
36. Position the lower bumper on the subframe and install the 3 LH lower bumper-to-subframe nuts.
    - Tighten to 10 Nm (89 lb-in).

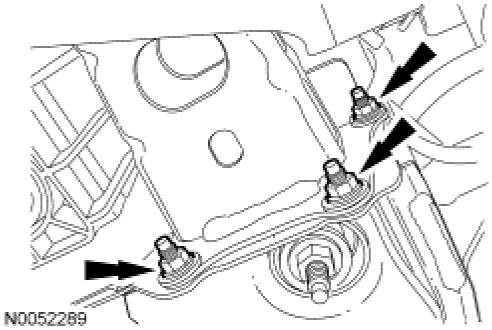

Fig. 516: Locating LH Subframe-To-Lower Bumper Nuts
Courtesy of FORD MOTOR CO.

37. Install the 3 RH lower bumper-to-subframe nuts.
    - Tighten to 10 Nm (89 lb-in).

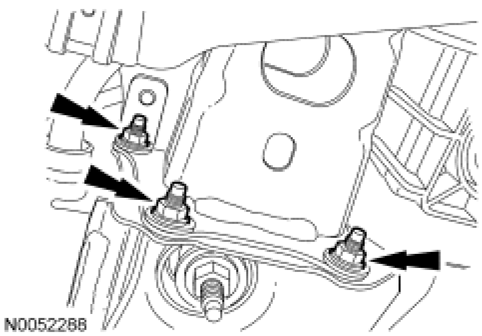

Fig. 517: Locating RH Subframe-To-Lower Bumper Nuts
Courtesy of FORD MOTOR CO.

38. Install the front splash shield and install the 7 screws and the 3 pushpin fasteners.

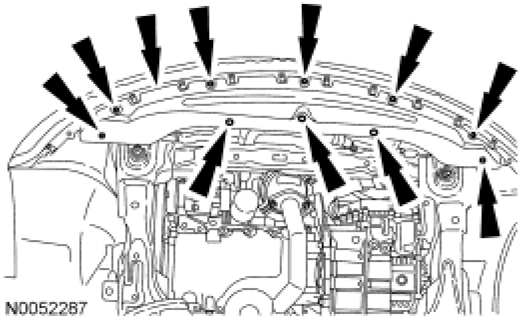

Fig. 518: Locating Push Pin Fasteners & Front Splash Shield Screws
Courtesy of FORD MOTOR CO.

39. Install the RH splash shield.
    1. Install the screws.

2. Install the pushpin fasteners.

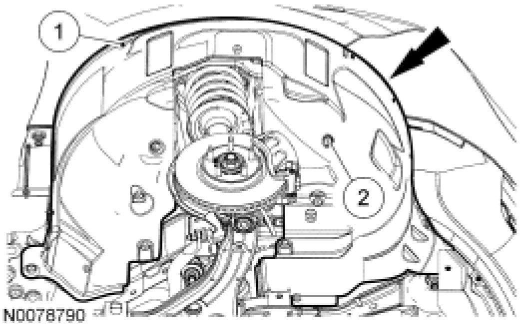

Fig. 519: Locating Push Pin Fasteners & RH Splash Shield
Courtesy of FORD MOTOR CO.

40. Install the transaxle support insulator bracket, install the bolt and the 3 nuts.
    - Tighten to 63 Nm (46 lb-ft).

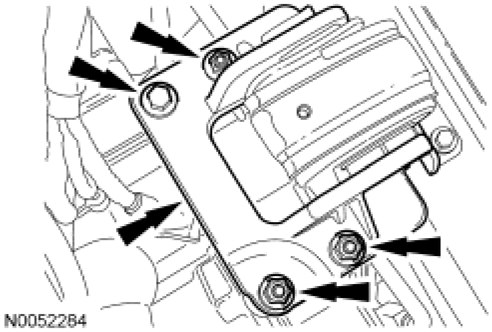

Fig. 520: Identifying Transaxle Support Insulator Bracket, Nuts & Bolts
Courtesy of FORD MOTOR CO.

41. Install the transaxle support insulator through bolt.
    - Tighten to 175 Nm (129 lb-ft).

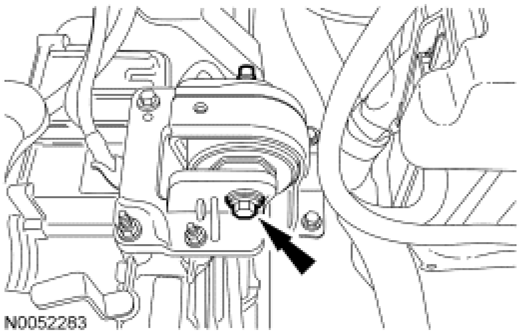

Fig. 521: Identifying Transaxle Support Insulator Bolt
Courtesy of FORD MOTOR CO.

42. Remove the Engine Support Bar and Engine Spreader Bar.

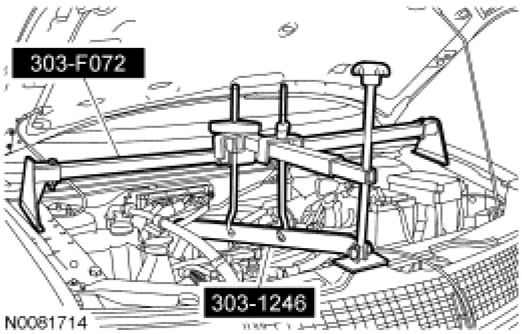

Fig. 522: Engine Support Bar & Engine Spreader Bar
Courtesy of FORD MOTOR CO.

43. Remove the Engine Lift Eye from the LH cylinder head.

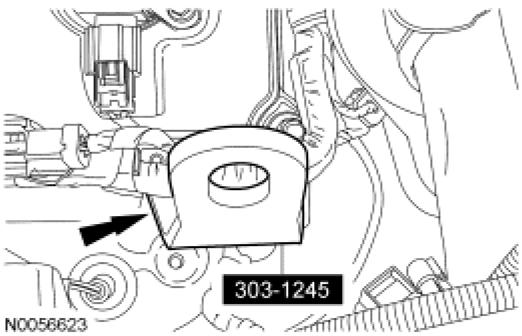

Fig. 523: Special Tool (303-1245) On LH Cylinder Head
Courtesy of FORD MOTOR CO.

44. If a new solenoid body was installed, wipe the surface of the existing solenoid body strategy tag on top of the transaxle case clean and install the new solenoid body strategy tag (supplied with the solenoid body service kit) over it.

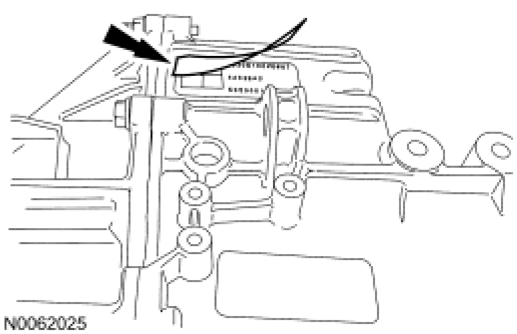

Fig. 524: Installing New Solenoid Body Strategy Tag Over Existing Solenoid Body Strategy Tag
Courtesy of FORD MOTOR CO.

45. Install the transmission fluid filler tube and the nut.
    - Tighten to 11 Nm (97 lb-in).

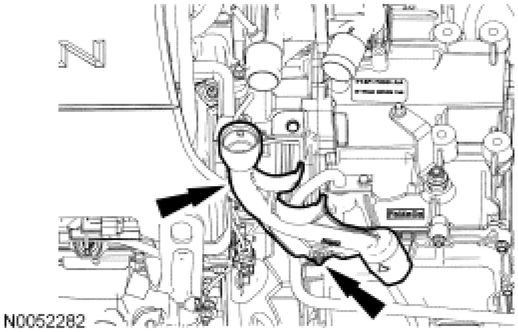

Fig. 525: Identifying Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

46. Install the transmission fluid level indicator.

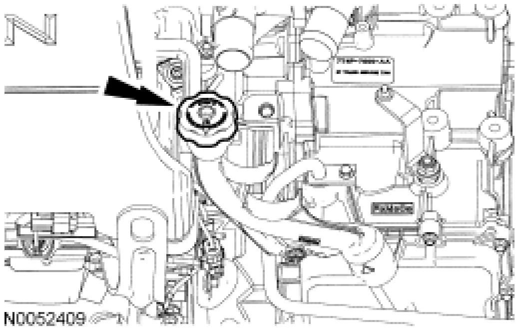

Fig. 526: Identifying Transmission Fluid Level Indicator
Courtesy of FORD MOTOR CO.

47. Route the coolant hoses in the transmission fluid filler tube.

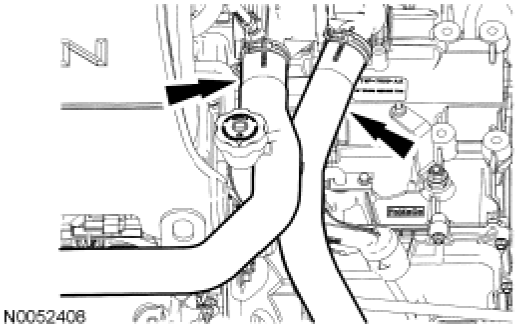

Fig. 527: Identifying Coolant Hoses From Transmission Fluid Filler Tube
Courtesy of FORD MOTOR CO.

48. Install the top 4 torque converter housing bolts.

- Tighten to 48 Nm (35 lb-ft).

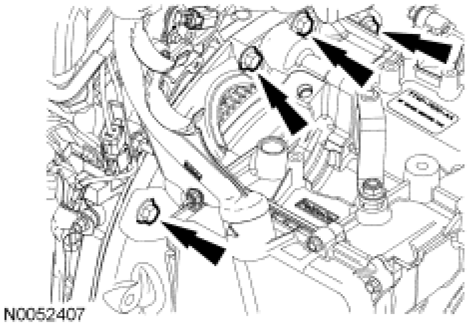

Fig. 528: Locating Torque Converter Housing Bolts
Courtesy of FORD MOTOR CO.

49. Connect the transaxle electrical connector.

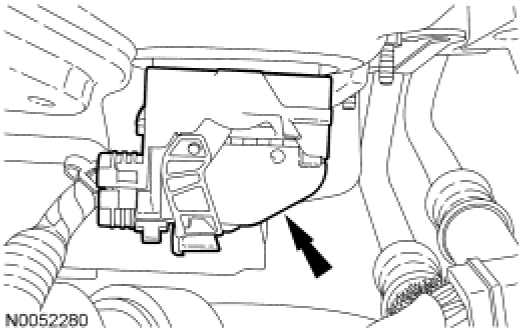

Fig. 529: Identifying Transaxle Control Electrical Connector
Courtesy of FORD MOTOR CO.

50. Position the fuel hose routing clip on the transaxle stud.

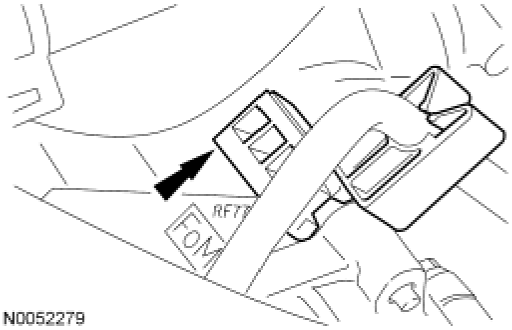

Fig. 530: Identifying Fuel Hose Routing Clip From Transaxle Stud
Courtesy of FORD MOTOR CO.

51. Install the starter, bolt and studbolt.
    - Tighten to 26 Nm (19 lb-ft).

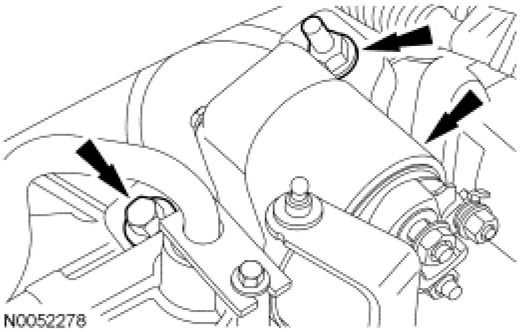

Fig. 531: Identifying Bolt, Stud Bolt & Starter
Courtesy of FORD MOTOR CO.

52. Install the wiring harness fastener on the starter motor studbolt.

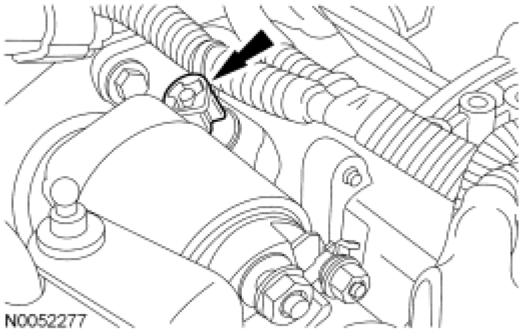

Fig. 532: Identifying Wiring Harness Retainer From Starter Motor Stud Bolt
Courtesy of FORD MOTOR CO.

53. Connect the starter motor terminals and position the starter terminal boot over the battery cable terminal.
    1. Tighten to 12 Nm (106 lb-in).
    2. Tighten to 6 Nm (53 lb-in).

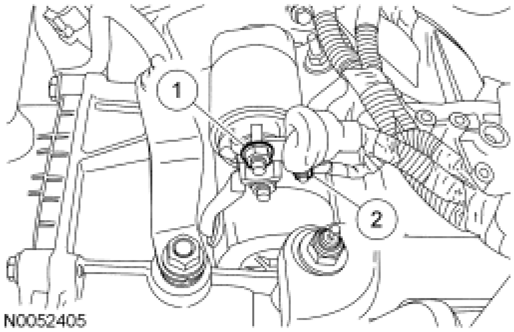

Fig. 533: Identifying Starter Motor Wire Terminals & Nuts
Courtesy of FORD MOTOR CO.

54. Install the starter motor electrical terminal cover.

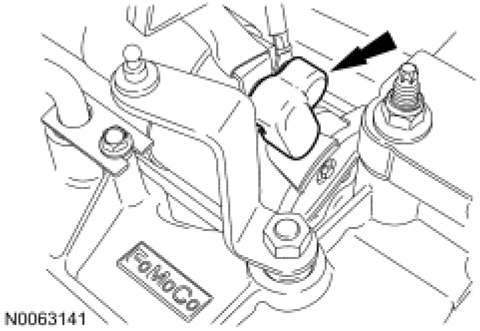

Fig. 534: Locating Starter Motor Electrical Terminal Cover
Courtesy of FORD MOTOR CO.

55. Position the selector lever cable and bracket in place and install the 3 bolts.
    - Tighten to 12 Nm (106 lb-in).

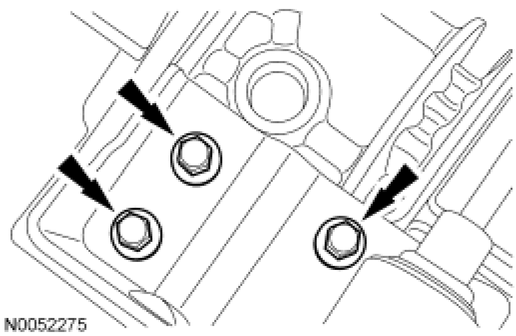

Fig. 535: Identifying Selector Lever Cable Bracket Bolts
Courtesy of FORD MOTOR CO.

56. Place the selector lever in DRIVE.

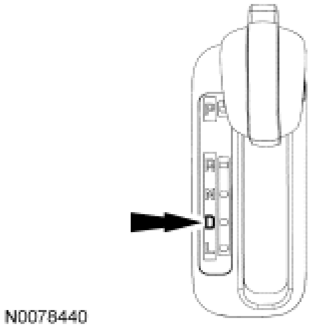

Fig. 536: Placing Selector Lever In Drive
Courtesy of FORD MOTOR CO.

57. Place the manual control lever in DRIVE.
    1. Rotate the manual control lever clockwise until it stops.

2. Rotate the manual control lever counterclockwise one detent until it stops.

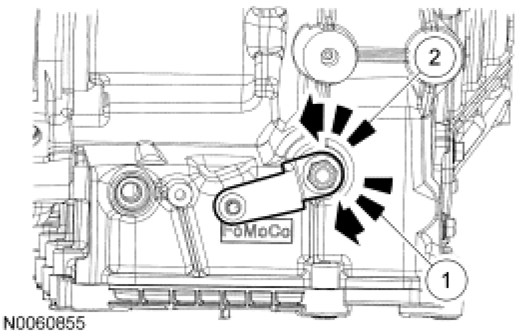

Fig. 537: Rotating Manual Control Lever Clockwise & Counterclockwise
Courtesy of FORD MOTOR CO.

58. Unlock the selector lever cable adjuster.
    1. Pry the latch up.
    2. Push the lock tab to slide it over.

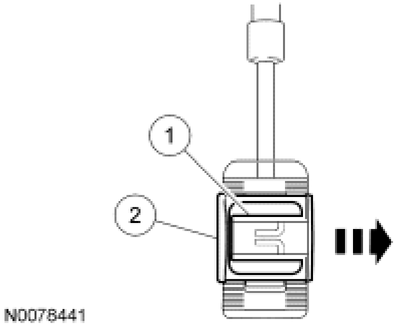

Fig. 538: Pushing Lock Tab To Slide It Over
Courtesy of FORD MOTOR CO.

59. Slide the cable end forward or backward to align it with the manual control lever.

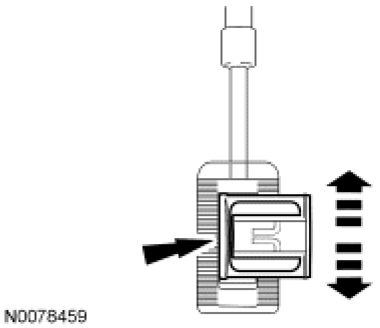

Fig. 539: Sliding Cable End Forward Or Backward To Align It With Manual Control Lever
Courtesy of FORD MOTOR CO.

60. With the adjuster locking tab released, connect the selector lever cable end to the manual control lever.

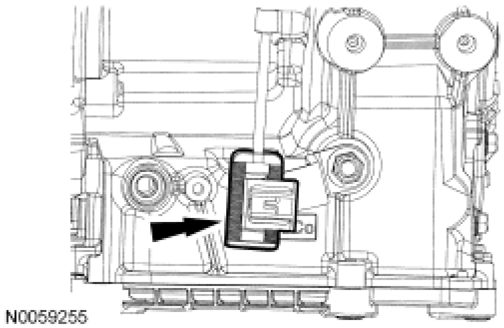

Fig. 540: Connecting Selector Lever Cable End To Manual Lever
Courtesy of FORD MOTOR CO.

61. Slide the release tab back to lock the adjuster.

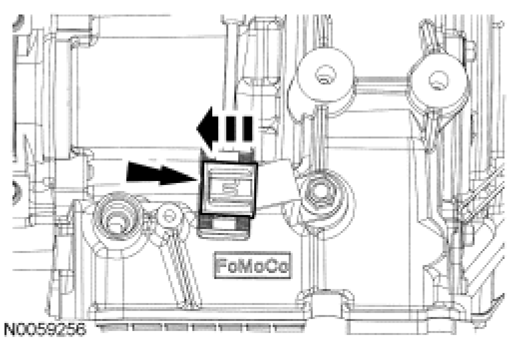

Fig. 541: Sliding Release Tab Back To Lock Adjuster
Courtesy of FORD MOTOR CO.

62. Install the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
63. Install the battery tray.
    1. Install the 3 bolts.
        - Tighten to 10 Nm (89 lb-in).
    2. Connect the wiring harness fasteners to the battery tray.

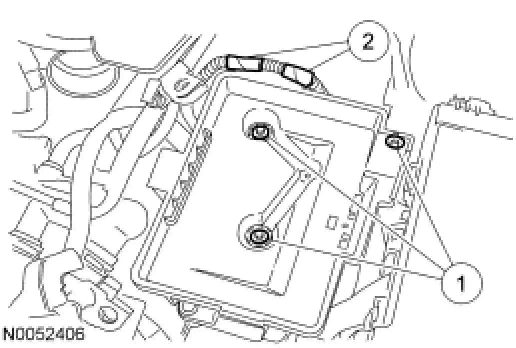

Fig. 542: Identifying Wiring Harness Fasteners, Battery Tray & Bolts
Courtesy of FORD MOTOR CO.

64. Install the battery. For additional information, refer to **BATTERY, MOUNTING & CABLES** article.
65. Position the Air Cleaner (ACL) assembly in place and install the bolt.
    - Tighten to 11 Nm (97 lb-in).

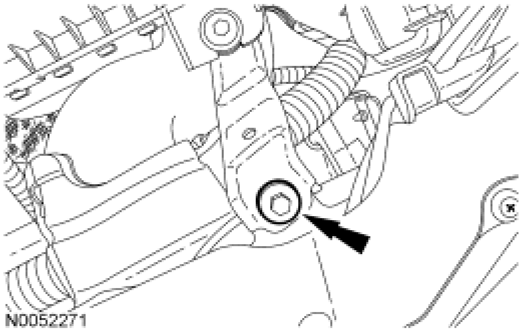

Fig. 543: Locating Air Cleaner Assembly Bracket Bolt
Courtesy of FORD MOTOR CO.

66. Tighten the ACL outlet pipe clamp at the TB.
    - Tighten to 5 Nm (44 lb-in).

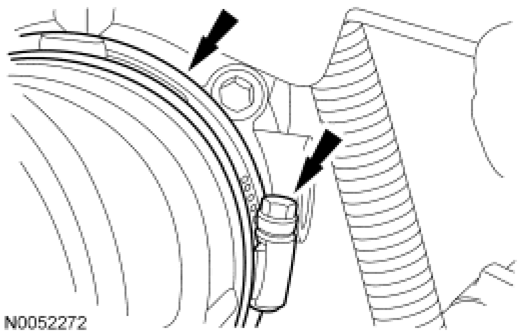

Fig. 544: Locating Air Cleaner Outlet Pipe Clamp
Courtesy of FORD MOTOR CO.

67. Connect the engine breather to the ACL assembly.

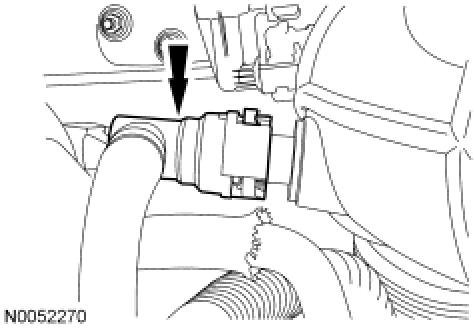

Fig. 545: Locating Engine Breather
Courtesy of FORD MOTOR CO.

68. Connect the brake booster vacuum hose to the ACL assembly.

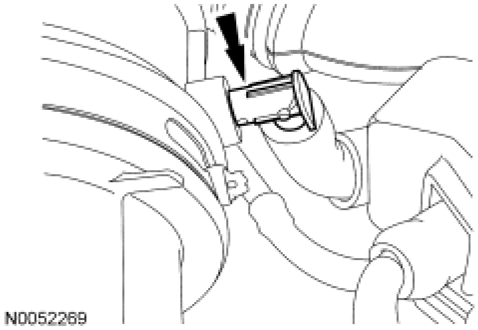

Fig. 546: Locating Brake Booster Vacuum Hose
Courtesy of FORD MOTOR CO.

69. Connect the MAF sensor electrical connector and connect the electrical harness fastener.

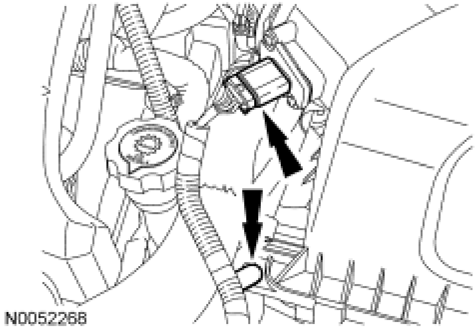

Fig. 547: Locating Mass Air Flow (MAF) Sensor Electrical Connector & Wiring Harness Fastener
Courtesy of FORD MOTOR CO.

70. Fill with clean transmission fluid to the correct level.
71. If a new solenoid body is installed, the solenoid body strategy and solenoid body identification will need to be updated. Refer to **Solenoid Body Strategy**.
72. If a replacement transaxle assembly is being installed or a new solenoid body is installed, the PCM will

have to be reflashed with a new solenoid body strategy and identification data file. For additional information, refer to **Solenoid Body Strategy**.

2008 DRIVELINE/AXLES

Front Drive Halfshafts - Edge & MKX

SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Left front halfshaft assembled length	671.8 mm (26.44 in)
Right front halfshaft assembled length (all wheel drive [AWD])	632.4 mm (24.89 in)
Right front halfshaft assembled length (front wheel drive [FWD])	605.4 mm (23.83 in)

LUBRICANTS & CAPACITIES

Lubricant	Specification	Capacity
Front Halfshaft Inboard Constant Velocity (CV) Joint		
Constant Velocity Joint Grease (from 3A331 kit)	-	295 g (10.41 oz)
Front Halfshaft Outboard CV Joint		
Constant Velocity Joint Grease (from 3A331 kit)	-	130 g (4.58 oz)

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Ball joint pinch nut	55	41
Catalytic converter support bracket bolts	20	15
Front stabilizer bar link nut	90	66
Front wheel hub nut	350	258
Intermediate shaft bearing support bolts (AWD)	40	30
Intermediate shaft bearing support bolts (FWD)	40	30

DESCRIPTION AND OPERATION

FRONT DRIVE HALFSHAFTS

The front drive halfshafts consist of the following:

- Inboard and outboard constant velocity (CV) joints connect to a splined shaft. Driveshaft bearing retainer circlips retain the CV joints to the splined shaft.
- A front axle wheel hub nut that secures the splined outboard CV joint to the wheel hub.
- Lubed-for-life CV joints use special CV joint grease requiring no periodic lubrication.
- A boot repair kit, 3A331, which includes the boots, clamps and grease is available.

On the LH side, the inboard CV joint is retained in the differential side gear with a 33 mm (1.29 in) retainer circlip. This circlip is oval in shape when viewed at the end. Install a new circlip every time the halfshaft is disconnected. On the RH side, a 30 mm (1.181 in) driveshaft bearing retainer circlip retains the splined inboard CV joint to the intermediate shaft. This circlip is round when view at the end. Install a new circlip every time you disconnect the halfshaft from the intermediate shaft.

The halfshafts are splined on the outboard stub shaft to drive the wheel hubs. They are retained in the wheel hubs by special wheel hub nuts which also control the wheel bearing preload. The LH halfshaft is splined on the inboard stub shaft and is retained in the differential side gear in the transaxle by a circlip. The RH halfshaft has internal splines which are driven by the intermediate shaft. The intermediate shaft has a circlip on the outboard end and is retained inside the inboard stub shaft. The circlips must be installed new whenever they are removed. The intermediate shaft is retained in the transaxle differential side gear by bolts that go through the intermediate shaft support bearing. The intermediate shaft also goes through the power transfer unit (PTU) on all wheel drive (AWD) vehicles. The outer seal of the PTU must be installed new whenever the intermediate shaft is removed.

Halfshaft Handling

CAUTION: Never pick up or hold the halfshaft only by the inboard or outboard constant velocity (CV) joint or damage to the component may occur.

Handle all halfshaft components carefully during removal and installation and during various component disassembly and assembly procedures. Do not overangle the CV joints. Damage will occur to an assembled inboard CV joint if it is overplunged outward from the joint housing. Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft. Do not allow the boots to contact sharp edges or hot exhaust components. Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints. Excessive pulling force on the interconnecting shaft between joints of the halfshaft will result in internal joint damage. Axial loads used in assisting removal must be applied through the inboard joint housing only. Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage.

DIAGNOSTIC TESTS

FRONT DRIVE HALFSHAFTS

Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

HALFSHAFT - RH

Special Tools

Illustration	Tool Name	Tool Number
	Remover, Front Wheel Hub	205-D070 (D93P-1175-B) or equivalent

 ST2272-A		

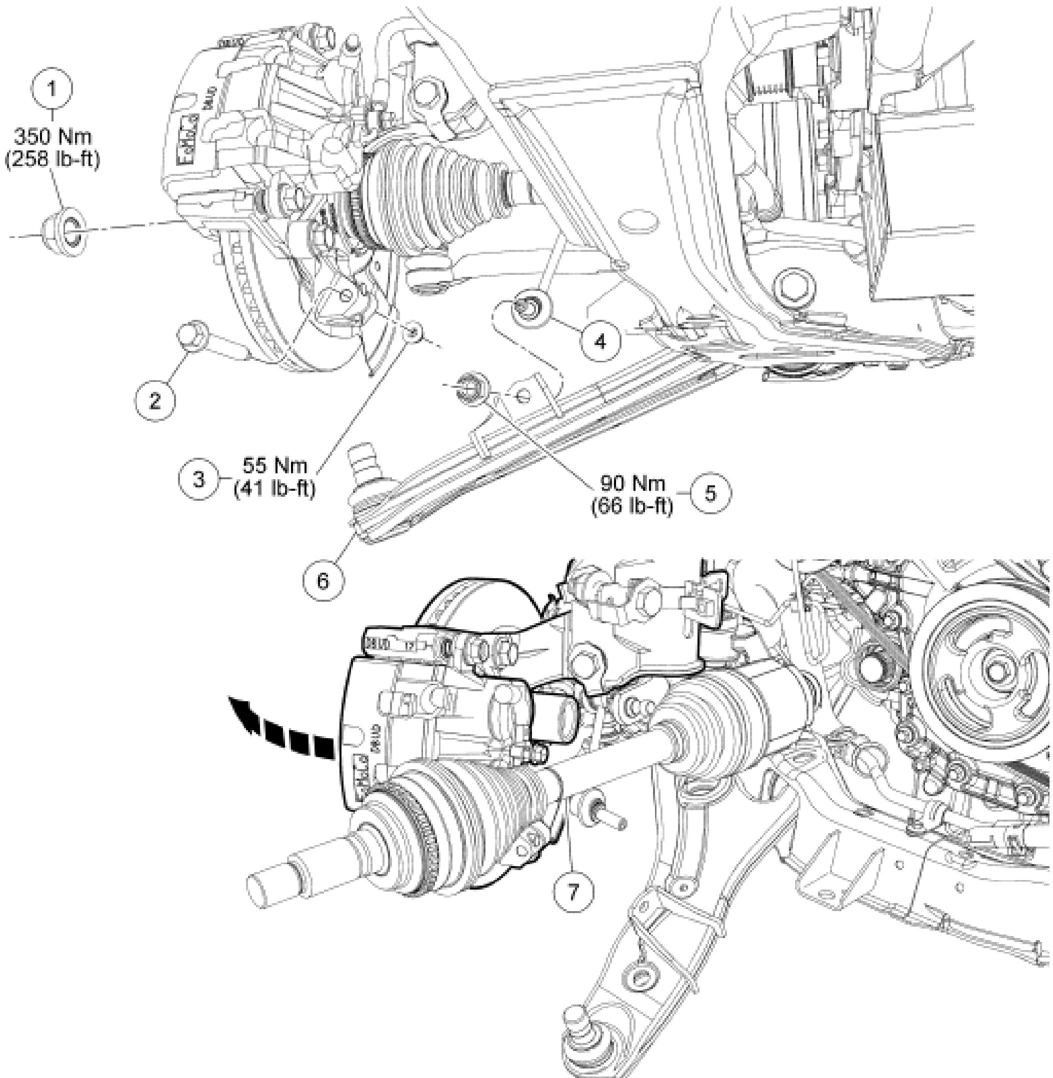

Fig. 1: Identifying Halfshaft With Torque Specifications - RH
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3N404	Wheel hub nut
2	W712481	Ball joint pinch bolt
3	W520213	Ball joint pinch nut
4	3B438	Stabilizer bar link

5	W520214	Stabilizer bar link nut
6	3A423	Lower arm
7	3A427	Halfshaft assembly

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Remove the front tire and wheel. For additional information, refer to **WHEELS & TIRES** article.

NOTE: Apply the brake to keep the halfshaft from rotating.

3. Remove and discard the front wheel hub nut.

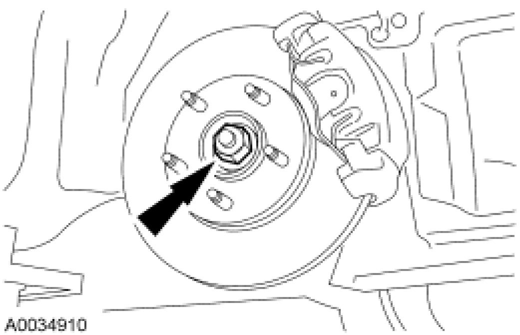

Fig. 2: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

4. Remove the stabilizer bar link nut and position the link aside.

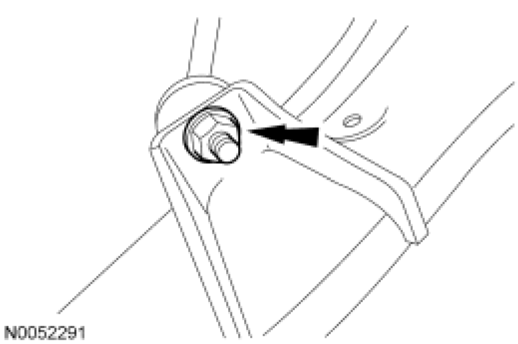

Fig. 3: Locating Stabilizer Bar Link Nut
Courtesy of FORD MOTOR CO.

5. Remove the ball joint pinch bolt from the knuckle and separate the lower control arm.

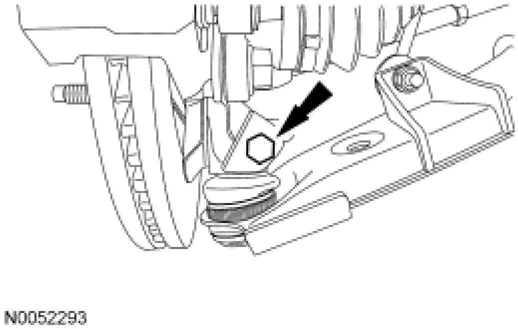

Fig. 4: Locating Ball Joint Pinch Bolt
Courtesy of FORD MOTOR CO.

6. Using the special tool, separate the halfshaft from the wheel hub.

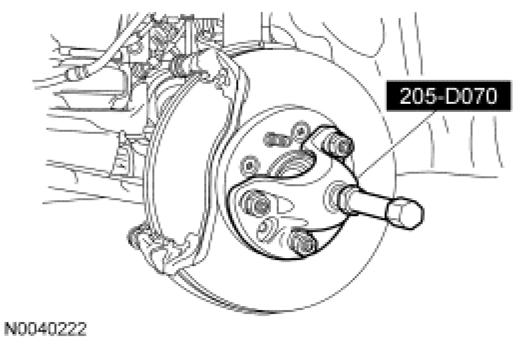

Fig. 5: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

NOTE: Support the knuckle with a suitable jackstand.

7. Pull the knuckle outboard and rotate it toward the rear of the vehicle.
8. Use a brass drift to strike the right side halfshaft in the indicated area and separate the RH halfshaft from the intermediate shaft.

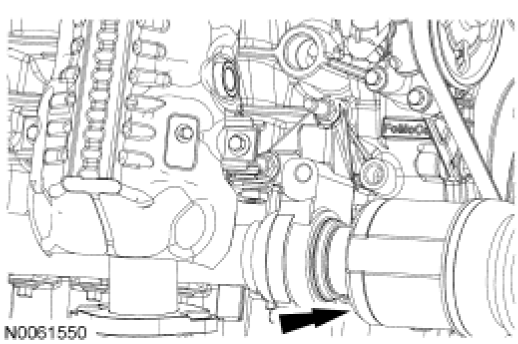

Fig. 6: Identifying Right Side Halfshaft
Courtesy of FORD MOTOR CO.

9. Remove and discard the circlip from the intermediate shaft.

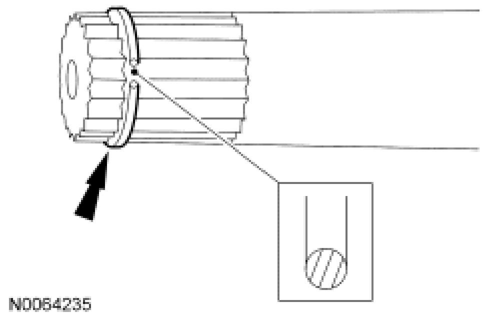

Fig. 7: Identifying Circlip From Intermediate Shaft
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install a new 30 mm (1.181 in) intermediate shaft circlip.

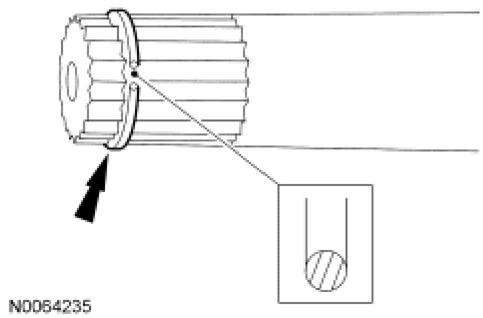

Fig. 8: Identifying Circlip From Intermediate Shaft
Courtesy of FORD MOTOR CO.

NOTE: Pull the right side inboard joint outward to make sure the circlip is locked.

2. Align the splines on the right side shaft with the intermediate shaft and push the stub shaft in until the circlip locks the shafts together.

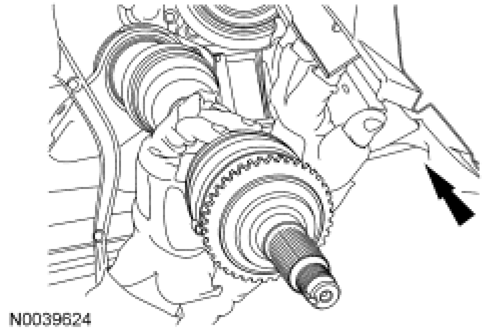

Fig. 9: Locating Pushpins
Courtesy of FORD MOTOR CO.

3. Insert the halfshaft into the wheel hub.
4. Rotate the knuckle into position.
5. Install the ball joint in the knuckle and install the pinch bolt and nut.
    - Tighten to 55 Nm (41 lb-ft).

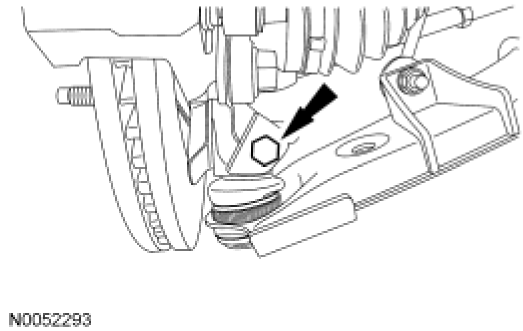

Fig. 10: Locating Ball Joint Pinch Bolt
Courtesy of FORD MOTOR CO.

6. Position the stabilizer bar link and install the link nut.
    - Tighten to 90 Nm (66 lb-ft).

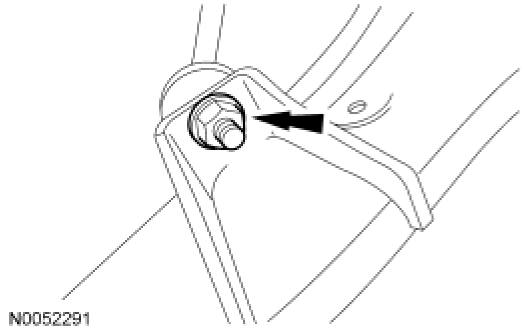

Fig. 11: Locating Stabilizer Bar Link Nut
Courtesy of FORD MOTOR CO.

7. Using a suitable tool, install the halfshaft in the wheel hub.

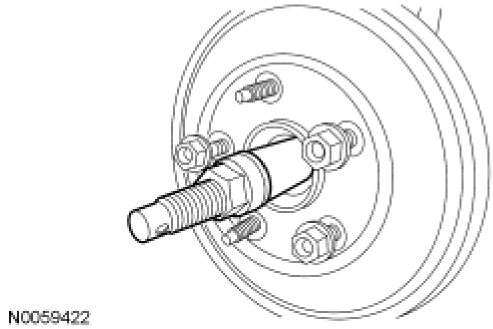

Fig. 12: Locating Halfshaft On Wheel Hub
Courtesy of FORD MOTOR CO.

NOTE: Do not tighten the front wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage may occur if the wheel bearing is loaded with the weight of the vehicle applied.

NOTE: Apply the brake to keep the halfshaft from rotating.

8. Install a new front wheel hub nut.
   - Tighten to 350 Nm (258 lb-ft).
9. Install the front tire and wheel. For additional information, refer to **WHEELS & TIRES** article.

HALFSHAFT - LH

Special Tools

Item	Part Number	Description
1	W520213	Lower ball joint pinch nut
2	W712481	Lower ball joint pinch bolt
3	3N404	Wheel end nut and washer assembly
4	W520214	Stabilizer bar link nut

5	3B438	Stabilizer bar link
6	3A423	Lower arm
7	3A428	Halfshaft assembly

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING & LIFTING** article.
2. Remove the front tire and wheel. For additional information, refer to **WHEELS & TIRES** article.

NOTE: Apply the brake to keep the halfshaft from rotating.

3. Remove and discard the front wheel hub nut.
4. Remove the ball joint pinch bolt from the knuckle and separate the lower control arm.

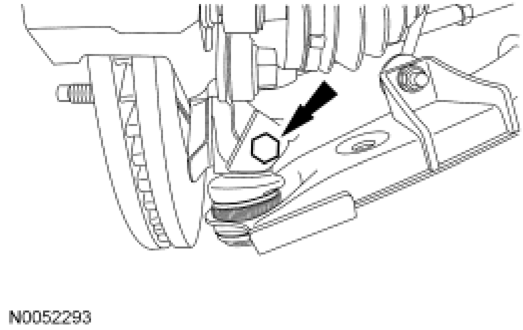

Fig. 14: Locating Ball Joint Pinch Bolt
Courtesy of FORD MOTOR CO.

5. Remove the stabilizer bar link nut and position the link aside.

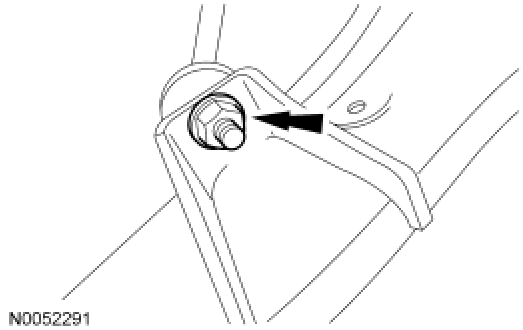

Fig. 15: Locating Stabilizer Bar Link Nut
Courtesy of FORD MOTOR CO.

6. Using the special tool, separate the halfshaft from the wheel hub.

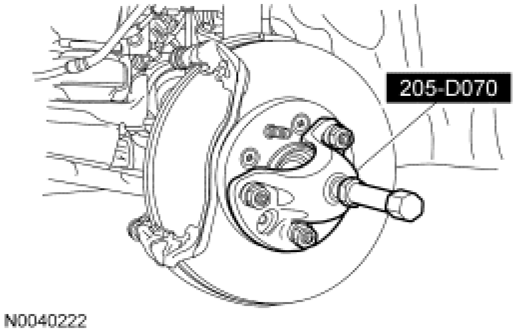

Fig. 16: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

NOTE: Support the knuckle with a suitable jackstand.

7. Pull the knuckle outboard and rotate it toward the front of the vehicle.

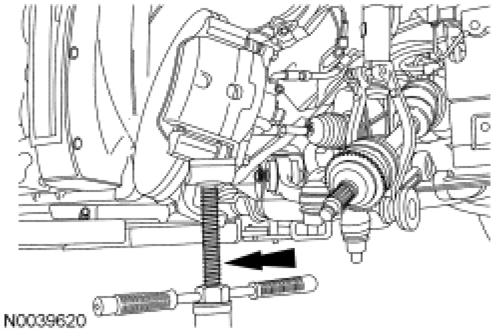

Fig. 17: Locating Jackstand
Courtesy of FORD MOTOR CO.

8. Using the special tools, remove the halfshaft from the transmission.

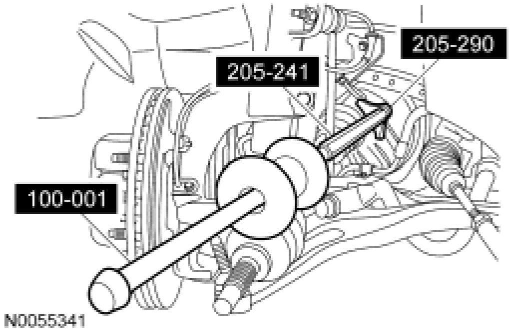

Fig. 18: Removing Halfshaft Using Special Tools (100-001), (205-241) & (205-290)
Courtesy of FORD MOTOR CO.

9. Remove and discard the circlip from the stub shaft.

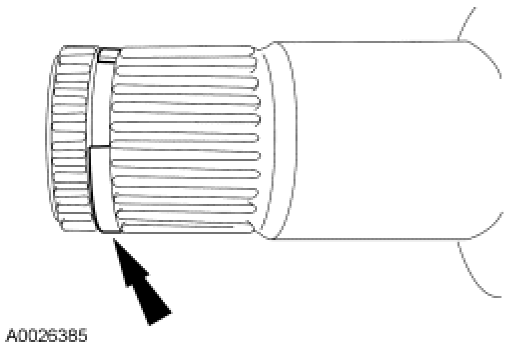

Fig. 19: Locating Halfshaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install a new stub shaft circlip.

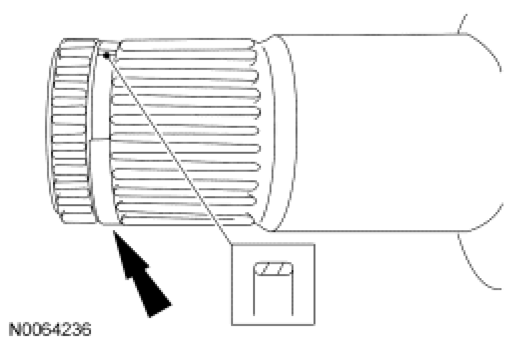

Fig. 20: Installing New Stub Shaft Circlip
Courtesy of FORD MOTOR CO.

2. Insert the halfshaft into the wheel hub.

CAUTION: The sharp edges on the stub shaft splines can slice or puncture the oil seal. Use care when inserting the stub shaft into the transmission to avoid oil seal damage.

NOTE: After insertion, pull the halfshaft inner end to make sure the circlip is locked.

3. Push the stub shaft into the transmission so the circlip locks into the differential side gear.
4. Rotate the knuckle into position.
5. Install the ball joint in the knuckle and install the pinch bolt and nut.
   - Tighten to 55 Nm (41 lb-ft).

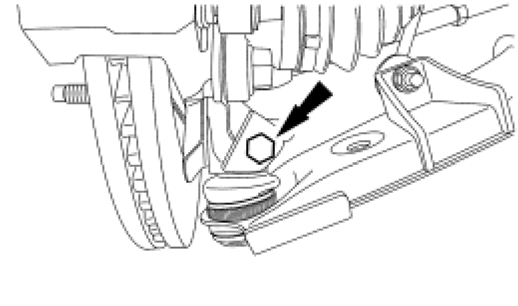

Fig. 21: Locating Ball Joint Pinch Bolt
Courtesy of FORD MOTOR CO.

6. Position the stabilizer bar link and install the link nut.
    - Tighten to 90 Nm (66 lb-ft).

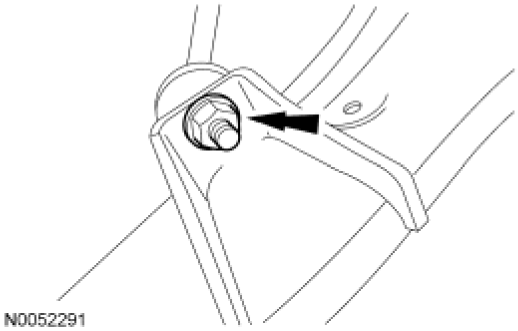

Fig. 22: Locating Stabilizer Bar Link Nut
Courtesy of FORD MOTOR CO.

7. Using a suitable tool, install the halfshaft in the wheel hub.

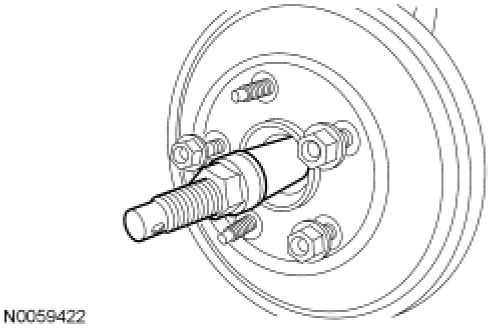

Fig. 23: Locating Halfshaft On Wheel Hub
Courtesy of FORD MOTOR CO.

CAUTION: Do not tighten the front wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the

wheel bearing is loaded with the weight of the vehicle applied.

NOTE: Apply the brake to keep the halfshaft from rotating.

8. Install a new front wheel hub nut.
   - Tighten to 350 Nm (258 lb-ft).
9. Install the front tire and wheel. For additional information, refer to **WHEELS & TIRES** article.

REMOVAL

1. Remove the right halfshaft. For additional information, refer to **Halfshaft - RH**.
2. Remove the 2 RH catalytic converter support bracket bolts.

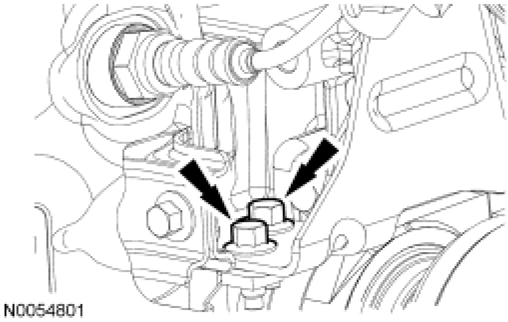

Fig. 25: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

3. Remove the bolts from RH catalytic converter support bracket.

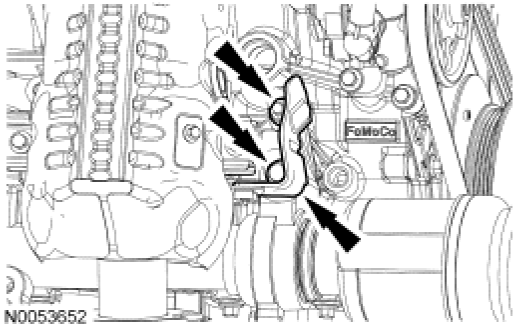

Fig. 26: Identifying RH Catalytic Converter Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

4. Remove the intermediate shaft bearing support bracket-to-block bolt.
5. Carefully remove the intermediate shaft while supporting both ends of the intermediate shaft.

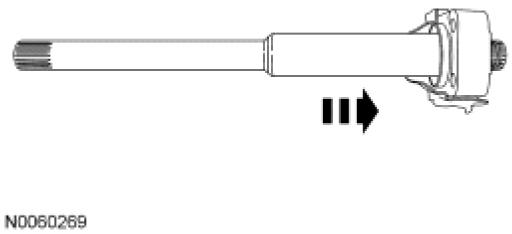

Fig. 27: Identifying Intermediate Shaft
Courtesy of FORD MOTOR CO.

6. Remove and discard the circlip from the outboard end of the intermediate shaft.

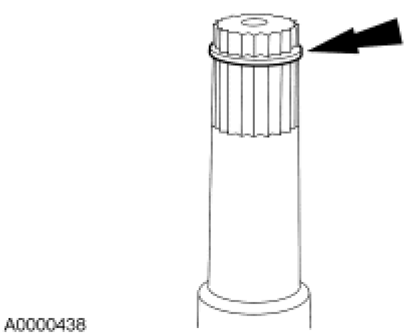

Fig. 28: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install a new 30 mm (1.181 in) circlip on the outboard end of the intermediate shaft.

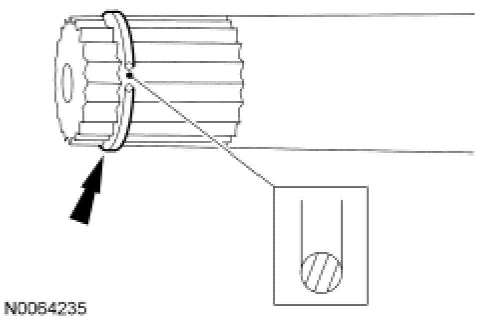

Fig. 29: Identifying Circlip From Intermediate Shaft
Courtesy of FORD MOTOR CO.

2. Position the special tool over the halfshaft oil seal.

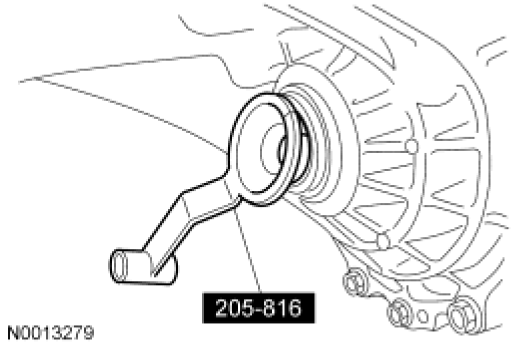

Fig. 30: Identifying Special Tool (205-816)
Courtesy of FORD MOTOR CO.

3. Position the intermediate shaft in the transaxle and engage the intermediate shaft splines with the transaxle side gears. Make sure the circlip is locked in the gear.
4. Install the intermediate shaft support bracket-to-block stud bolt.
   - Tighten to 40 Nm (30 lb-ft).
5. Install the RH catalytic converter support brackets and bolts.
   - Tighten to 40 Nm (30 lb-ft).

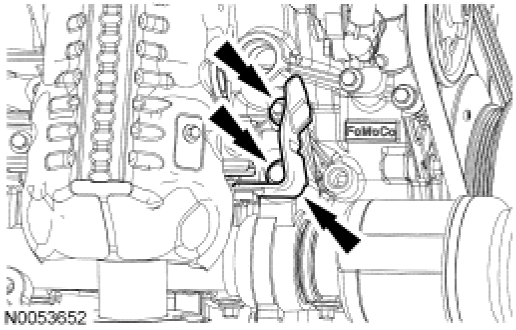

Fig. 31: Identifying RH Catalytic Converter Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

6. Install the 2 RH catalytic converter support bracket bolts.
   - Tighten to 20 Nm (15 lb-ft).

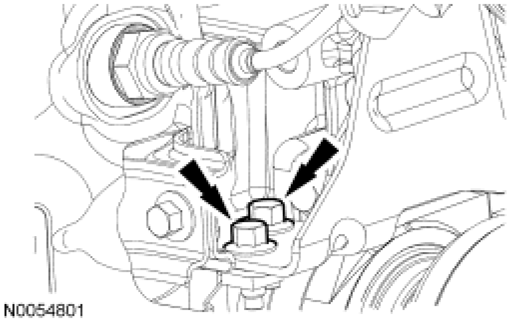

Fig. 32: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

7. Install the right halfshaft. For additional information, refer to **Halfshaft - RH**.

INTERMEDIATE SHAFT - ALL WHEEL DRIVE (AWD)

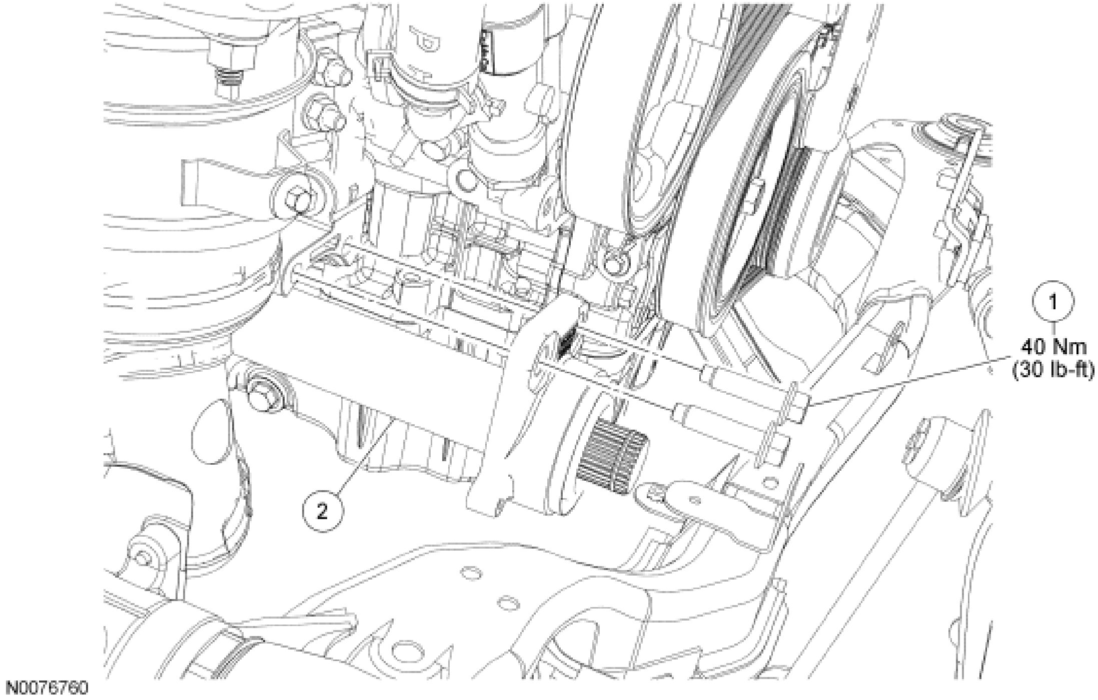

Fig. 33: Exploded View Of Intermediate Shaft - All Wheel Drive (AWD) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500235-S	Intermediate shaft support bracket bolt (2 required)
2	3K183	Intermediate shaft assembly

REMOVAL

NOTE: The intermediate shaft seal in the Power Transfer Unit (PTU) must be replaced whenever the intermediate shaft is removed. For additional information, refer to TRANSFER CASE - POWER TRANSFER UNIT (PTU) article.

1. Remove the right halfshaft assembly. For additional information, refer to **Halfshaft - RH**.
2. Remove the 2 intermediate shaft support bracket bolts and the intermediate shaft.
3. Remove and discard the circlip from the outboard end of the intermediate shaft.

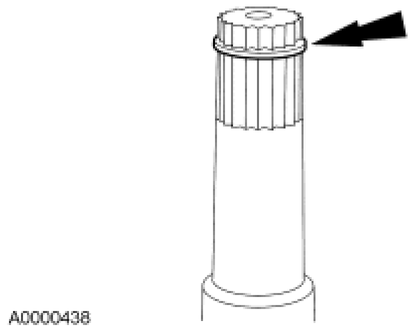

Fig. 34: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install a new 30 mm (1.181 in) circlip on the outboard end of the intermediate shaft.

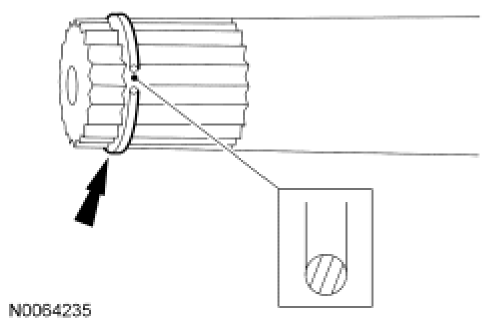

Fig. 35: Identifying Circlip From Intermediate Shaft
Courtesy of FORD MOTOR CO.

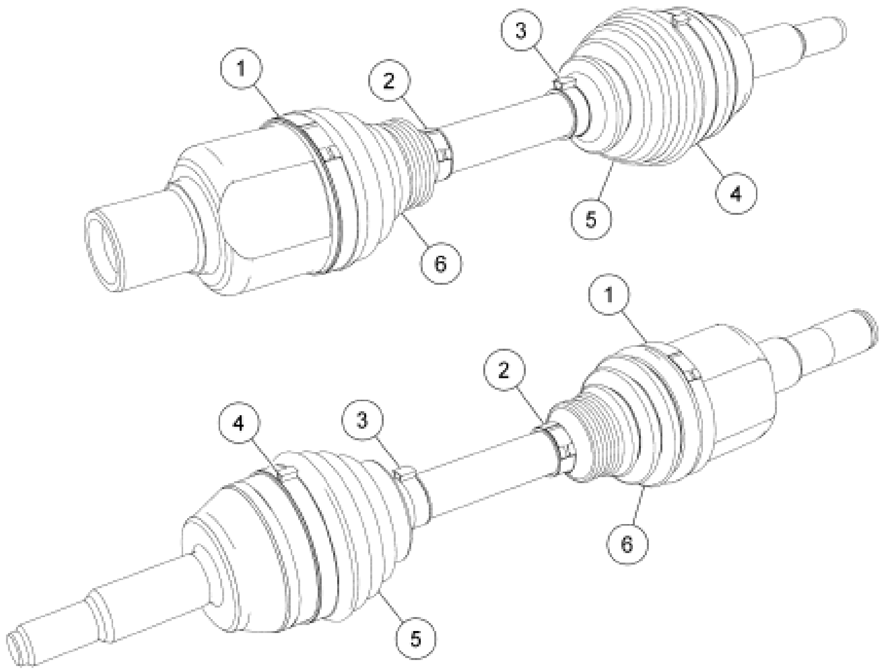
2. Install a new intermediate shaft seal in the PTU. For additional information, refer to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.
3. Position the intermediate shaft in the PTU and engage the intermediate shaft splines with the PTU gears.
4. Install the 2 intermediate shaft support bracket bolts.
   - Tighten to 40 Nm (30 lb-ft).
5. Install the right halfshaft. For additional information, refer to **Halfshaft - RH**.

CONSTANT VELOCITY (CV) JOINT BOOT

Special Tools

Illustration	Tool Name	Tool Number
	Installer, Constant Velocity Joint Boot Clamp	205-343 (T95P-3514-A)

 ST1301-A		



N0061549

Fig. 36: Exploded View Of Constant Velocity (CV) Joint Boot
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Low profile large inboard boots inner clamps (serviced in 3A331 kit only)
2	-	Low profile small inboard boots (serviced in 3A331 kit only)
3	-	Intermediate shaft boot clamps (serviced in 3A331 kit only)
4	-	Outboard boot outer clamps (serviced in 3A331 kit only)
5	-	Outboard constant velocity (CV) joint boots (serviced in 3A331 kit only)
6	-	Inboard CV joint boots (serviced in 3A331 kit only)

DISASSEMBLY

1. Remove the halfshaft assembly. For additional information, refer to **Halfshaft - RH** and **Halfshaft - LH**.
2. For the inboard constant velocity (CV) joint, remove and discard the boot clamps.
3. Remove the inboard CV joint retaining ring.

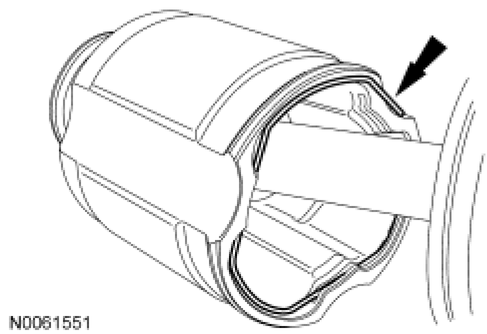


Fig. 37: Locating Retaining Ring
Courtesy of FORD MOTOR CO.

CAUTION: Do not let the roller bearings fall or damage to the component may occur.

4. For the inboard CV joint, carry out the following:
   - Remove and discard the retainer circlip.
   - Slide the boot away from the CV joint.

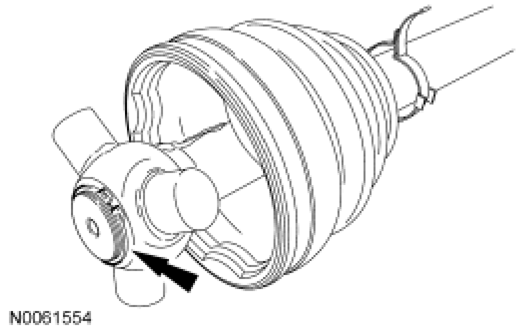

Fig. 38: Identifying CV Joint & Snap Ring On Halfshaft
Courtesy of FORD MOTOR CO.

5. Using a suitable 3-jaw puller, remove the CV joint.

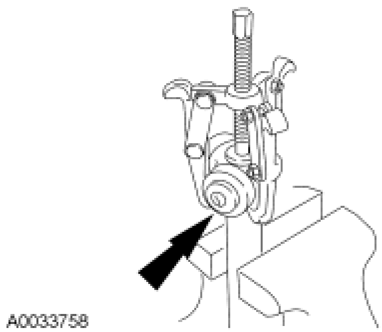

Fig. 39: Identifying CV Joint Using Suitable 3-Jaw Puller
Courtesy of FORD MOTOR CO.

6. Remove and discard the inner CV boot.

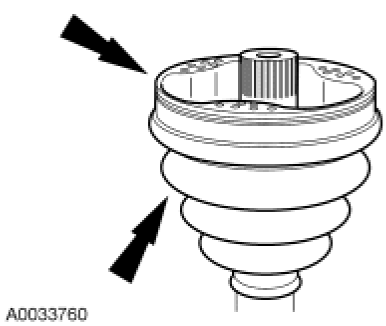

Fig. 40: Locating Inner CV Boot
Courtesy of FORD MOTOR CO.

NOTE:	**The outboard CV joint is not removable from the halfshaft. The boot must be removed or installed from the inboard CV joint side of the shaft.**

7. For the outboard CV joint, carry out the following:
   1. Remove and discard the boot clamps.
   2. Remove and discard the boot.

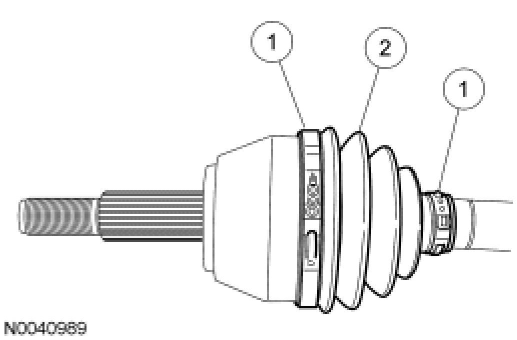

Fig. 41: Identifying Boot Clamps & Boot

Courtesy of FORD MOTOR CO.

ASSEMBLY

NOTE: Do not mix the boot clamps.

1. Lubricate the outboard CV joint.
    1. Pack the outboard CV joint with grease from the kit.
        - One-third of the grease must be installed in the joint with the remainder placed in the boot.
    2. Spread the remaining grease evenly inside the boot.

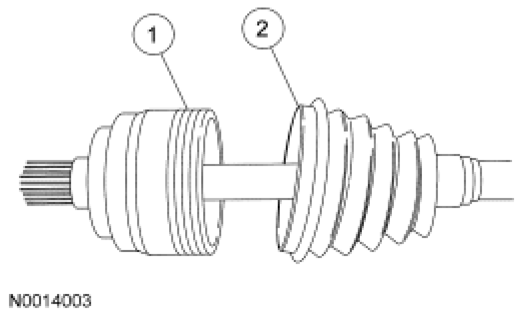

Fig. 42: Identifying Outboard CV Joint & Boot
Courtesy of FORD MOTOR CO.

2. Position the boot so the rib on the boot is located in the groove of the shaft.

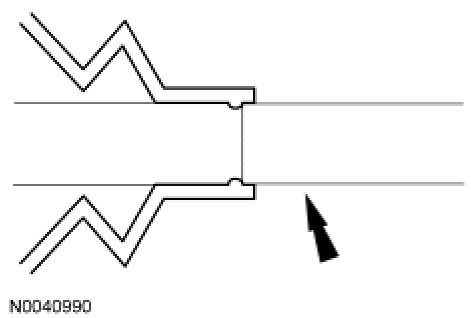

Fig. 43: Locating Boot In Groove Of Shaft
Courtesy of FORD MOTOR CO.

3. Position the outboard halfshaft boot and the outboard boot clamps.
    1. Position the boot.
    2. Position the boot clamps.

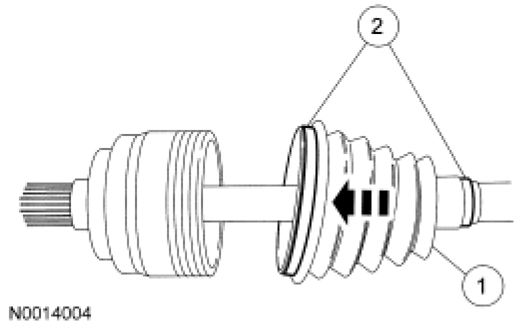

Fig. 44: Positioning Boot Clamps
Courtesy of FORD MOTOR CO.

4. Install the outboard CV boot clamps.

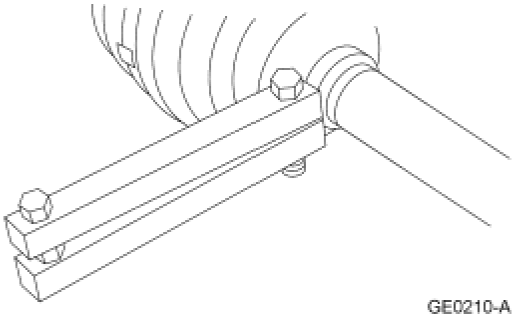

Fig. 45: Identifying Outboard CV Boot Clamp
Courtesy of FORD MOTOR CO.

5. Position the inboard clamp and boot.

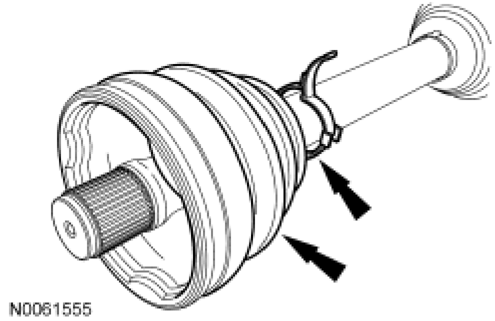

Fig. 46: Identifying Inboard Clamp & Boot
Courtesy of FORD MOTOR CO.

6. Install the CV joint and snap ring on the halfshaft.

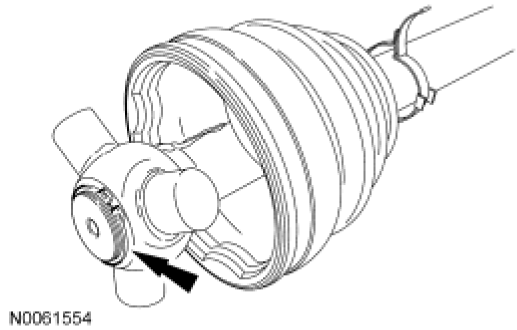

Fig. 47: Identifying CV Joint & Snap Ring On Halfshaft
Courtesy of FORD MOTOR CO.

7. Fill the inboard CV joint housing with grease from the kit.
   - One-half of the grease must be installed in the joint and the remainder placed in the boot.

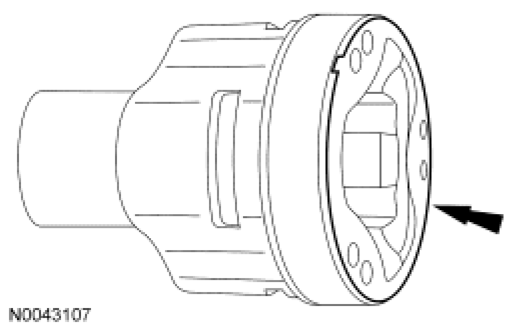

Fig. 48: Locating Inboard CV Joint Housing
Courtesy of FORD MOTOR CO.

CAUTION: Do not let the roller bearings fall or damage to the component may occur.

8. Position the CV housing on the CV joint.

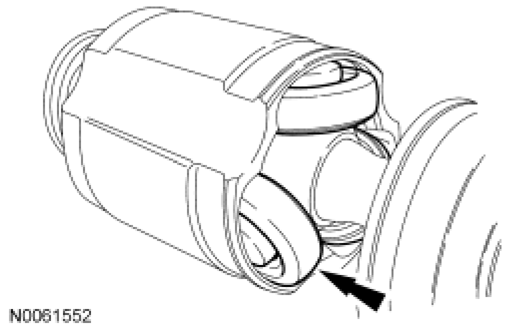

Fig. 49: Locating CV Housing On CV Joint
Courtesy of FORD MOTOR CO.

9. Install the retaining ring.

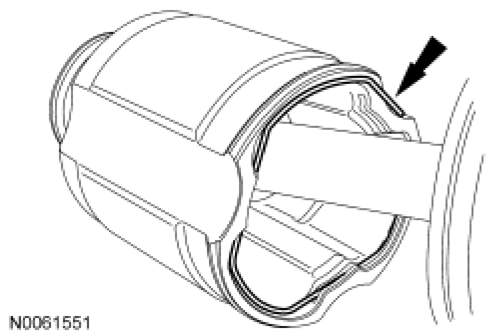

Fig. 50: Locating Retaining Ring
Courtesy of FORD MOTOR CO.

10. Position the inboard halfshaft boot and clamps.
    - Position the boot in the housing groove.
    - Position the boot clamps.

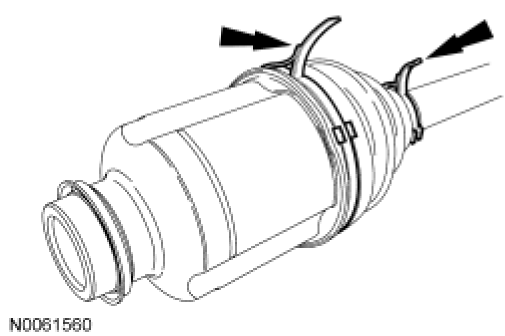

Fig. 51: Locating Boot Clamps & Housing Groove
Courtesy of FORD MOTOR CO.

11. Set the halfshaft assembled length to specifications. For additional information, refer to **SPECIFICATIONS** .
    1. Measure the entire assembly length.
    2. Push in or pull out on the inner joint as necessary to adjust the halfshaft assembled length.
    3. Hold the inner joint to prevent the assembled length from changing and insert a small flat-blade screwdriver between the boot and the joint to equalize the pressure.

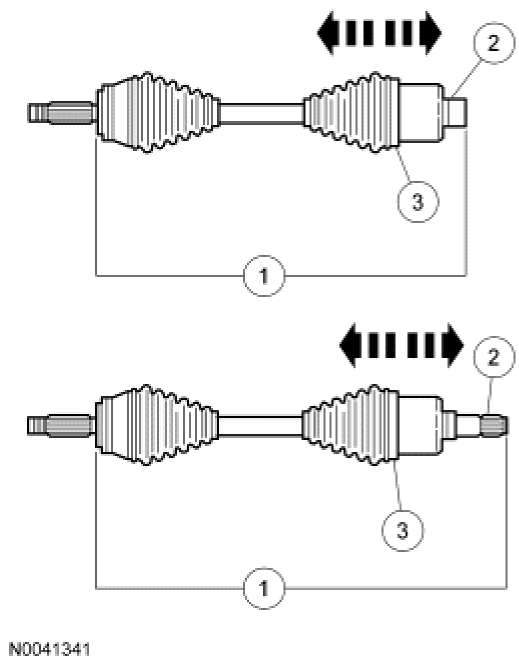

Fig. 52: Identifying Halfshaft Length Measurements
Courtesy of FORD MOTOR CO.

12. Install the boot clamps.
    - Place the lever arm to the closed position and use a soft-faced hammer to close the tabs.

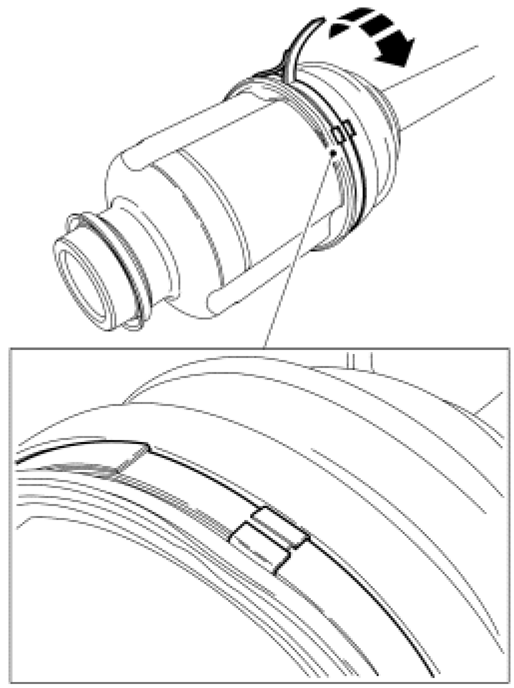

Fig. 53: Placing Lever Arm To Closed Position & Use A Soft-Faced Hammer To Close Tabs
Courtesy of FORD MOTOR CO.

13. Install the halfshaft assembly. For additional information, refer to **Halfshaft - RH** and **Halfshaft - LH**.

Toe link outboard bolt	150	111
Upper arm outboard bolt	150	111

DESCRIPTION AND OPERATION

REAR DRIVE HALFSHAFTS

Rear Drive Halfshafts

The rear drive halfshafts consist of the following:

- Inner constant velocity (CV) joints
- Outer CV joints
- Interconnecting shafts

- Convoluted CV joint boots
- CV joint boot clamps
- Special CV high-temperature grease
- Tripod joint housings
- Ball and cage housings
- Circlip stopper that holds the cross-groove inboard race assembly (inboard CV joint) together
- Circlip that retains the splined inboard CV joint to the differential side gear
- RH and LH halfshafts that are different lengths, with the LH halfshaft being the longer of the two

The rear drive halfshafts link the rear axle to the rear wheel hubs. The CV joints allow the halfshafts to rotate smoothly through the required changes in angles between the stationary axle and the varying angles of the rear wheels including jounce and rebound. The CV joints are either tri-lobed style or the caged-ball type, depending on inboard or outboard. New halfshaft components are available in kit 4L537 which contains grease, circlips, boots and clamps.

Handle all halfshaft components carefully during removal and installation and during various component disassembly and assembly procedures. Never pick up or hold the halfshaft only by the inboard or outboard CV joint. Do not overangle the CV joints. Damage will occur to an assembled inboard CV joint if it is overplunged outward from the joint housing. Never use a hammer to remove or install the halfshafts from the hub. Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft. Do not allow the boots to contact sharp edges or hot exhaust components. Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints. Excessive pulling force on the interconnecting shaft between joints of the halfshaft will result in internal joint damage. Axial loads used in assisting removal must be applied through the inboard joint housing only. Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage. Do not remove the outer CV joint by pulling on the interconnecting shaft. Inspect all machined surfaces and splines for damage.

DIAGNOSTIC TESTS

REAR DRIVE HALFSHAFTS

Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the rear wheel speed sensor. For additional information, refer to **VEHICLE DYNAMIC SYSTEMS** article.
3. Remove and discard the inner and outer rear wheel hub nuts.
4. Remove the brake caliper hose bracket bolt.

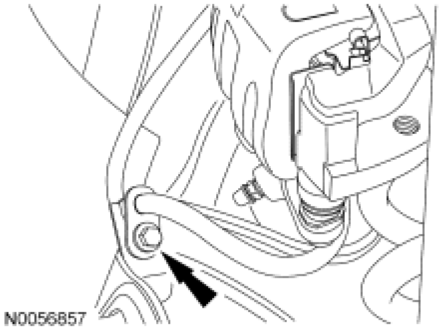

Fig. 2: Locating Brake Caliper Hose Bracket Bolt
Courtesy of FORD MOTOR CO.

5. Remove the rear brake disc. For additional information, refer to **REAR DISC BRAKE** article.
6. Remove the upper arm outboard bolt.

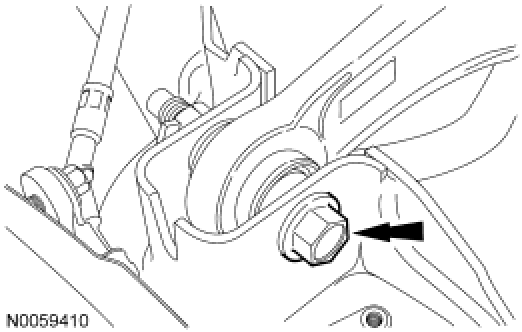

Fig. 3: Locating Upper Arm Bolt
Courtesy of FORD MOTOR CO.

7. Lift the upper arm from the knuckle.

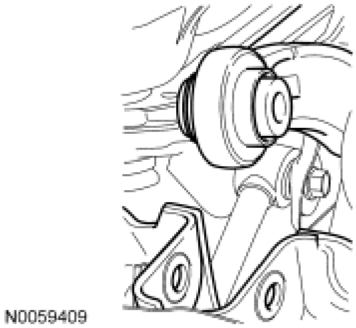

Fig. 4: Lifting Upper Arm From Knuckle
Courtesy of FORD MOTOR CO.

8. Support the lower arm and remove the lower shock nut and bolt.

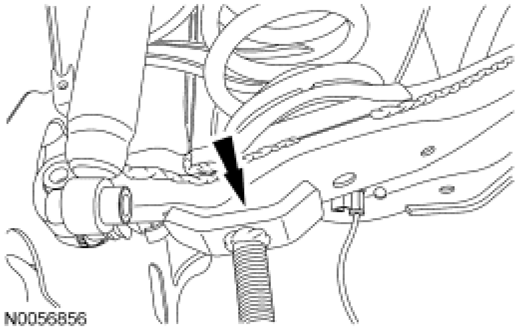

Fig. 5: Supporting Lower Arm
Courtesy of FORD MOTOR CO.

9. Remove the stabilizer link upper nut.

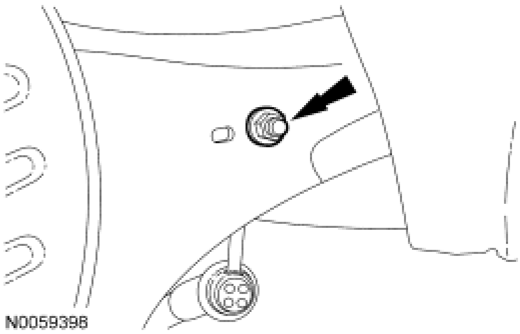

Fig. 6: Locating Stabilizer Link Upper Nut
Courtesy of FORD MOTOR CO.

10. Remove the outer toe link nut and bolt.

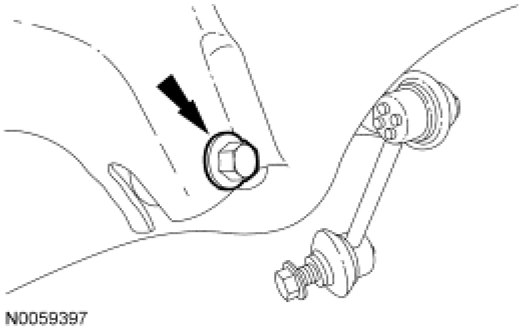

Fig. 7: Locating Outer Toe Link Nut & Bolt
Courtesy of FORD MOTOR CO.

11. Support the wheel knuckle and remove the lower arm nut and bolt.

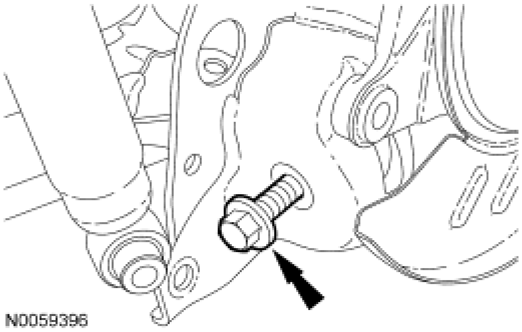

Fig. 8: Locating Lower Arm Bolt
Courtesy of FORD MOTOR CO.

12. Using the special tool, separate the halfshaft from the rear axle hub assembly.

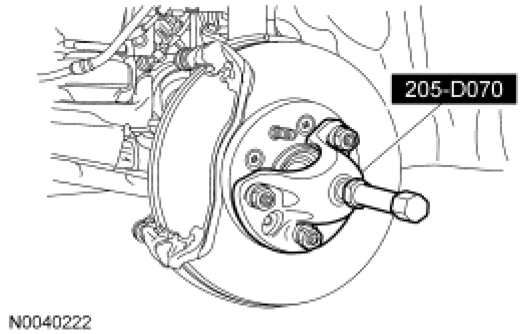

Fig. 9: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

CAUTION: Do not damage the oil seal when removing the axle halfshaft from the differential.

13. Using a suitable pry bar, remove the halfshaft.

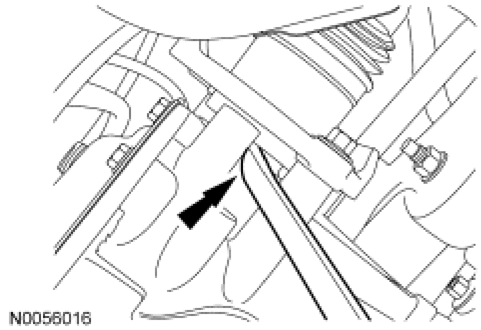

Fig. 10: Removing Halfshaft Using A Suitable Pry Bar
Courtesy of FORD MOTOR CO.

14. Position the halfshaft up through the wheel knuckle opening and remove the halfshaft.

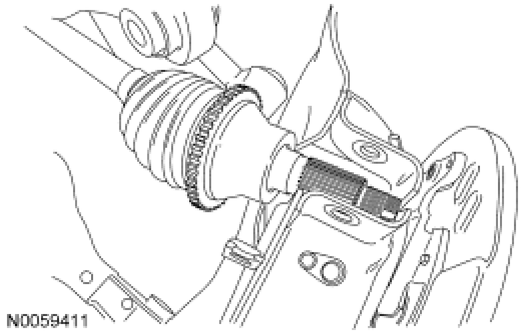

Fig. 11: Identifying Halfshaft & Wheel Knuckle
Courtesy of FORD MOTOR CO.

15. Remove and discard the circlip from the stub shaft.

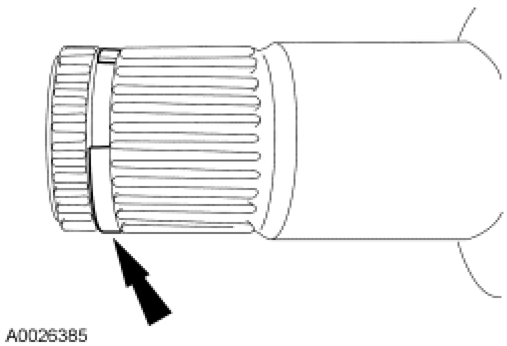

Fig. 12: Locating Halfshaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install a new 28 mm (1.102 in) circlip on the stub shaft.

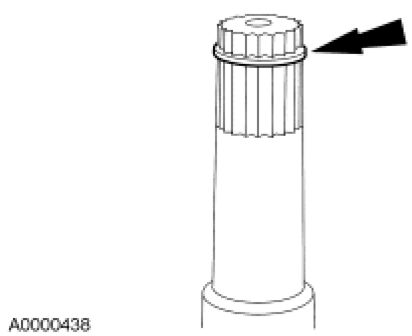

Fig. 13: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the oil seal protector is correctly aligned with the differential oil seal during installation.**

2. Using the special tool, install the halfshaft in the differential.

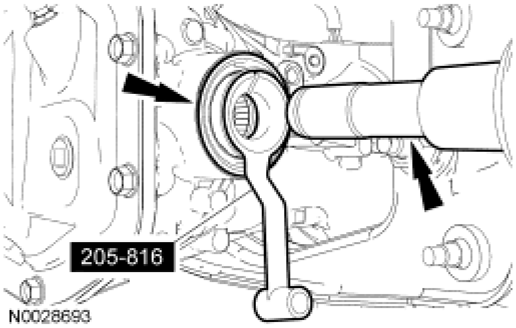

Fig. 14: Installing Halfshaft In Differential Using Special Tool (205-816)
Courtesy of FORD MOTOR CO.

3. Install the stub shaft in the rear drive unit.
   - Make sure the circlip locks in the side gear.

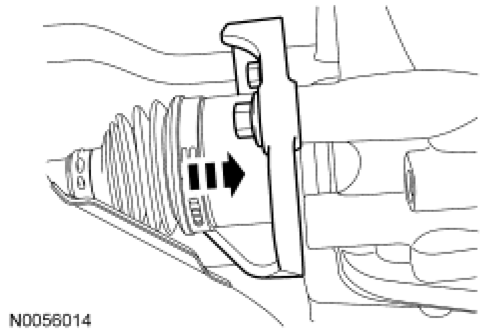

Fig. 15: Installing Stub Shaft In Rear Drive Unit
Courtesy of FORD MOTOR CO.

4. Slide the outboard CV joint down through the knuckle.

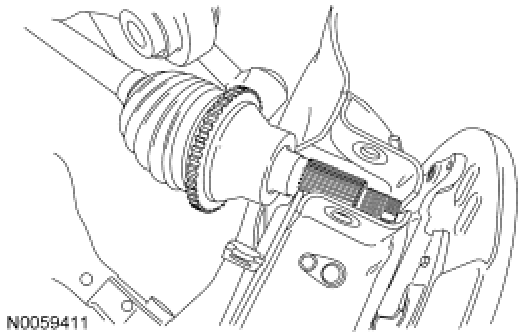

Fig. 16: Identifying Halfshaft & Wheel Knuckle
Courtesy of FORD MOTOR CO.

5. Position the halfshaft outer CV joint through the hub bearing.
6. Using a suitable tool, install the outer halfshaft end into the hub assembly.

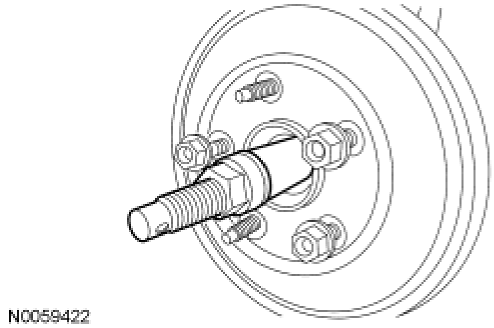

Fig. 17: Locating Halfshaft On Wheel Hub
Courtesy of FORD MOTOR CO.

7. Position the upper arm outboard end and install the bolt.
   - Tighten to 150 Nm (111 lb-ft).

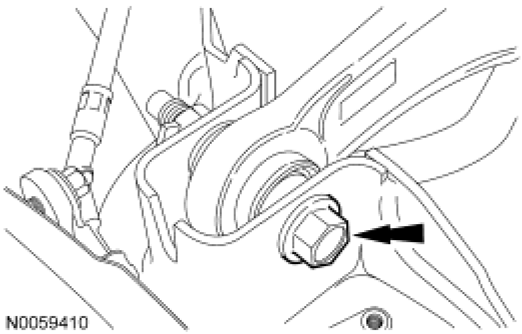

Fig. 18: Locating Upper Arm Bolt
Courtesy of FORD MOTOR CO.

8. Position the lower arm and install the lower arm bolt and nut.
   - Tighten to 150 Nm (111 lb-ft).

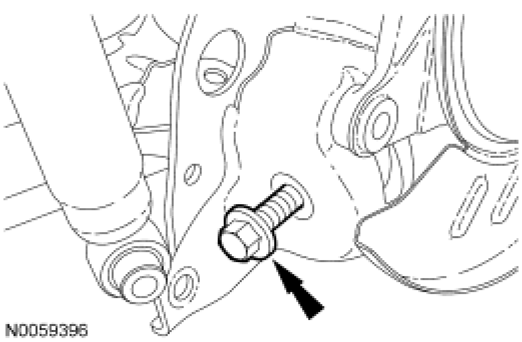

Fig. 19: Locating Lower Arm Bolt
Courtesy of FORD MOTOR CO.

CAUTION: Do not tighten the rear wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered to the ground. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.

9. Install the 2 new rear wheel hub nuts.
   - Tighten the inner hub nut to 275 Nm (203 lb-ft).
   - Tighten the outer hub nut to 175 Nm (129 lb-ft).
10. Install the rear toe link bolt.
    - Tighten to 200 Nm (148 lb-ft).

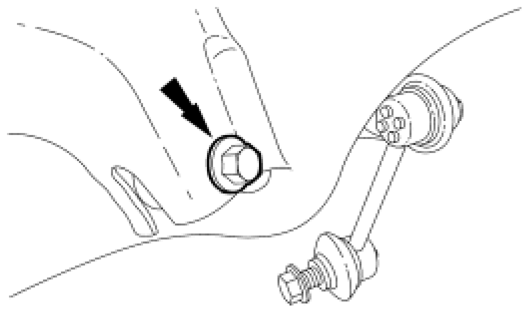

Fig. 20: Locating Outer Toe Link Nut & Bolt
Courtesy of FORD MOTOR CO.

11. Install stabilizer link upper nut.
    - Tighten to 35 Nm (26 lb-ft).

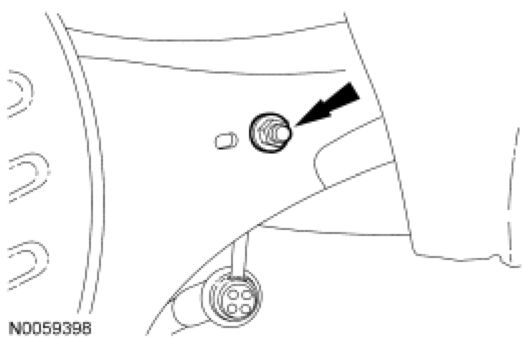

Fig. 21: Locating Stabilizer Link Upper Nut
Courtesy of FORD MOTOR CO.

12. Install the lower shock absorber bolt.
    - Tighten to 115 Nm (85 lb-ft).
13. Install the rear wheel speed sensor. For additional information, refer to **VEHICLE DYNAMIC SYSTEMS** article.
14. Install the rear brake disc. For additional information, refer to **REAR DISC BRAKE** article.
15. Install the brake caliper hose bracket bolt.
    - Tighten to 15 Nm (11 lb-ft).

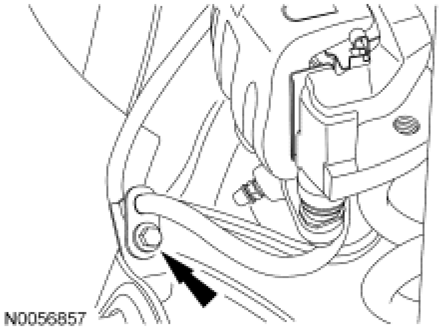

Fig. 22: Locating Brake Caliper Hose Bracket Bolt
Courtesy of FORD MOTOR CO.

16. Install the tire and wheel. For additional information, refer to **WHEELS AND TIRES** article.

CONSTANT VELOCITY (CV) JOINT BOOT

Special Tools

5	4B422	Retaining ring
6	-	Ball cage (part of 3C092)
7	-	Ball (8 required) (part of 3C092)
8	-	Inner race (part of 3C092)
9	3B426	Snap ring
10	3C092	Inboard CV joint housing

DISASSEMBLY

1. Remove the halfshaft assembly. For additional information, refer to **Halfshaft** .
2. Remove and discard the inboard constant velocity (CV) joint boot clamps.

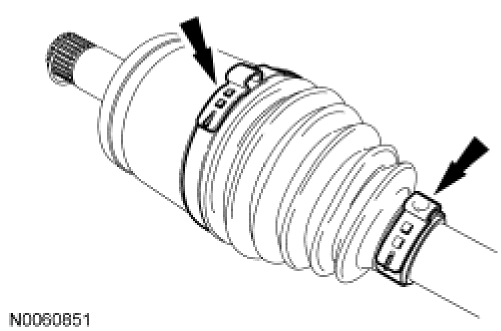

Fig. 24: Identifying Inboard Constant Velocity (CV) Joint Boot Clamps
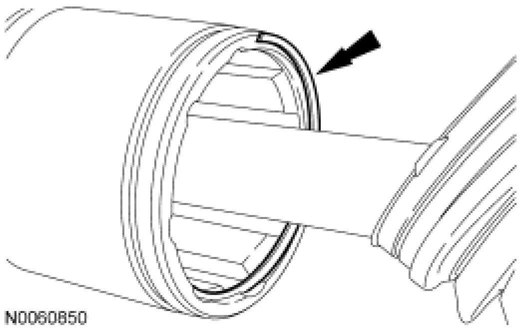
Courtesy of FORD MOTOR CO.

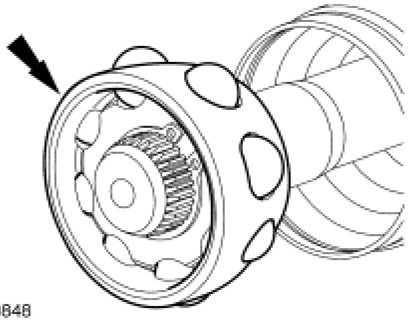
3. With the inboard CV joint boot removed from the housing, remove the retaining ring.



N0060850

Fig. 25: Locating Retaining Ring
Courtesy of FORD MOTOR CO.

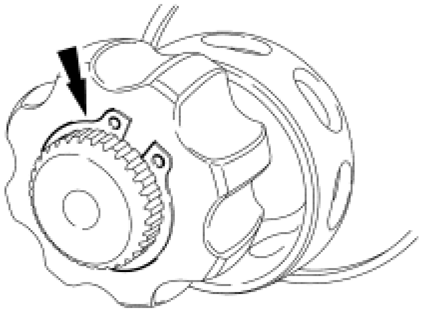
4. Remove the 8 balls and outer race.



N0060848

Fig. 26: Locating Outer Race Balls
Courtesy of FORD MOTOR CO.

5. Remove the CV joint housing snap ring.



N0060849

Fig. 27: Locating Retainer Snap Ring
Courtesy of FORD MOTOR CO.

6. Remove and discard the boot.

NOTE: **The outboard CV joint is not removable from the halfshaft. The boot must be removed or installed from the inboard CV joint side of the shaft.**

7. For the outboard CV joint boot, carry out the following:
    1. Remove and discard the boot clamps.
    2. Remove and discard the boot.

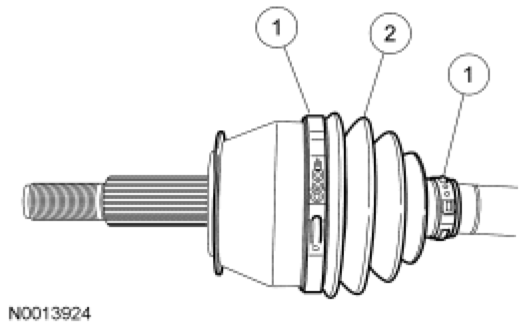


Fig. 28: Identifying Boot Clamps And Boot
Courtesy of FORD MOTOR CO.

ASSEMBLY

1. For the outboard CV joint, carry out the following:
    1. Slide the boot on the interconnecting shaft.
    2. Pack the outboard CV joint with 80 g (2.82 oz) of grease supplied in the boot kit.
    3. Spread any remaining grease evenly inside the boot.
    4. Install the boot by seating it in the groove in the CV joint housing.

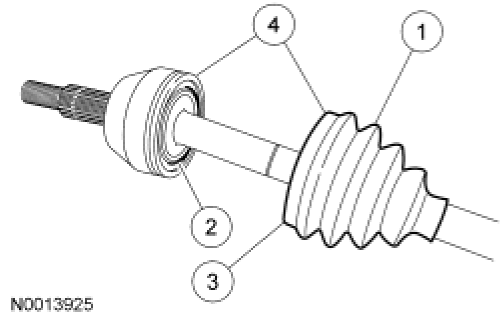

Fig. 29: Identifying CV Joint Housing
Courtesy of FORD MOTOR CO.

2. Using the special tool, install the 79.6 mm (3.13 in) boot clamps on the large end of the boot.

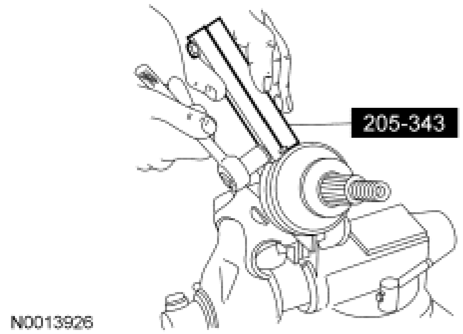

Fig. 30: Installing Boot Clamps Using Special Tool (205-343)
Courtesy of FORD MOTOR CO.

3. Install the small clamp on the small end of the boot.

CAUTION: Install a new circlip every time the halfshaft is removed from the axle or damage to the component may occur.

CAUTION: Start one end of the circlip in the groove and work the circlip over the halfshaft and into the groove to prevent the circlip from overexpanding or damage to the clamp may occur.

4. Install a new retainer circlip.

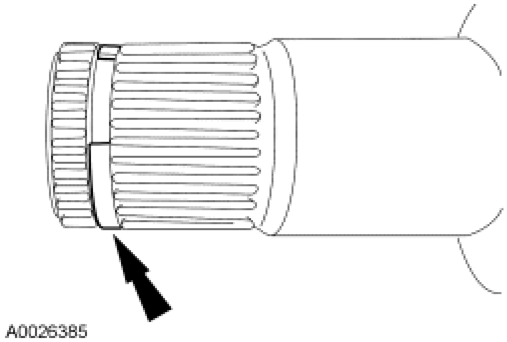

Fig. 31: Locating Halfshaft Circlip
Courtesy of FORD MOTOR CO.

5. Position the small clamp on the interconnecting shaft before installing the boot.
6. Position the boot on the interconnecting shaft.
7. Install the inner race and the retainer snap ring.

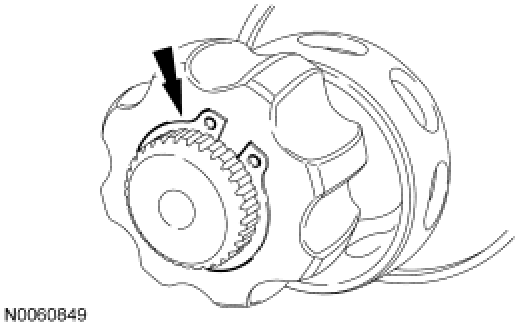

Fig. 32: Locating Retainer Snap Ring
Courtesy of FORD MOTOR CO.

8. Install the outer race with 8 balls.

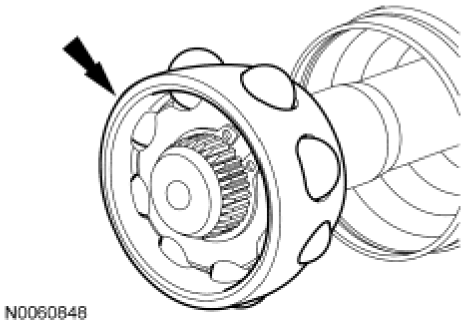

Fig. 33: Locating Outer Race Balls
Courtesy of FORD MOTOR CO.

9. Insert the assembly in the housing.
10. Install the retaining ring.

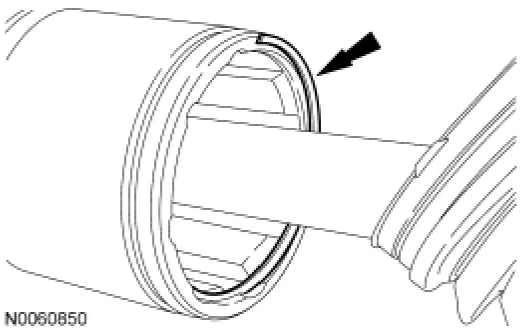

Fig. 34: Locating Retaining Ring
Courtesy of FORD MOTOR CO.

11. For the inboard CV joint, carry out the following steps in sequence:
    1. Pack the inboard CV joint housing with 108 g (3.80 oz) of grease supplied in the boot kit.

2. Spread any remaining grease evenly inside the boot and CV joint.
3. Install the inboard CV joint housing, seating the boot in the groove in the housing.

12. Set the halfshaft assembled length to specifications. For additional information, refer to **SPECIFICATIONS** .
    1. Measure the entire assembly length.
    2. Push in or pull out on the inner joint as necessary to adjust the halfshaft assembled length.
    3. Hold the inner joint to prevent the assembled length from changing and insert a soft, flat tool between the boot and the joint to equalize the pressure.

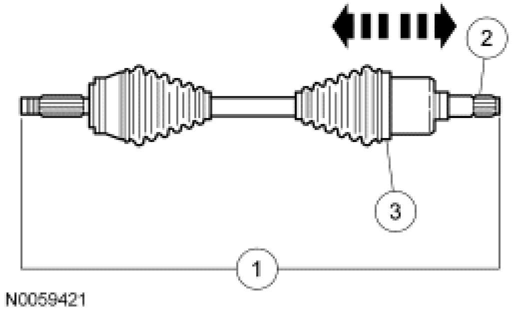

Fig. 35: Pushing In Or Pulling Out On Inner Joint As Necessary To Adjust Halfshaft Assembled Length
Courtesy of FORD MOTOR CO.

13. Using the special tool, install the 77.5 mm (3.05 in) boot clamps on the large end of the boot.

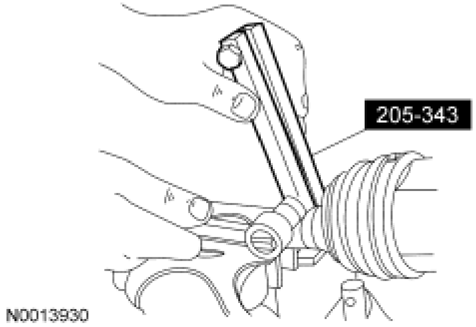

Fig. 36: Installing Both Boot Clamps Using Special Tool (205-343)
Courtesy of FORD MOTOR CO.

14. Install the smaller boot clamp.
15. Install the halfshaft assembly. For additional information, refer to **Halfshaft** .

2008 BRAKES

Power Brake Actuation - Edge & MKX

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Brake booster nuts	23	17

DESCRIPTION AND OPERATION

BRAKE BOOSTER

The power brake actuation system consists of the following components:

- Brake booster
- Brake booster check valve
- Brake booster vacuum supply hose

The brake booster uses engine vacuum from the intake manifold to create a partial vacuum inside the vacuum booster on both sides of the diaphragm. When the brake pedal is pressed, the booster rod opens a valve, allowing air to enter the booster on one side of the diaphragm while sealing off the opposite side. This increases pressure on that side of the diaphragm so that it helps push the rod, which in turn pushes the piston in the master cylinder. As the brake pedal is released, the valve seals off the outside air supply while opening the vacuum valve. This restores vacuum to both sides of the diaphragm, allowing everything to return to its original position.

DIAGNOSTIC TESTS

POWER BRAKE SYSTEM

Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

BRAKE BOOSTER

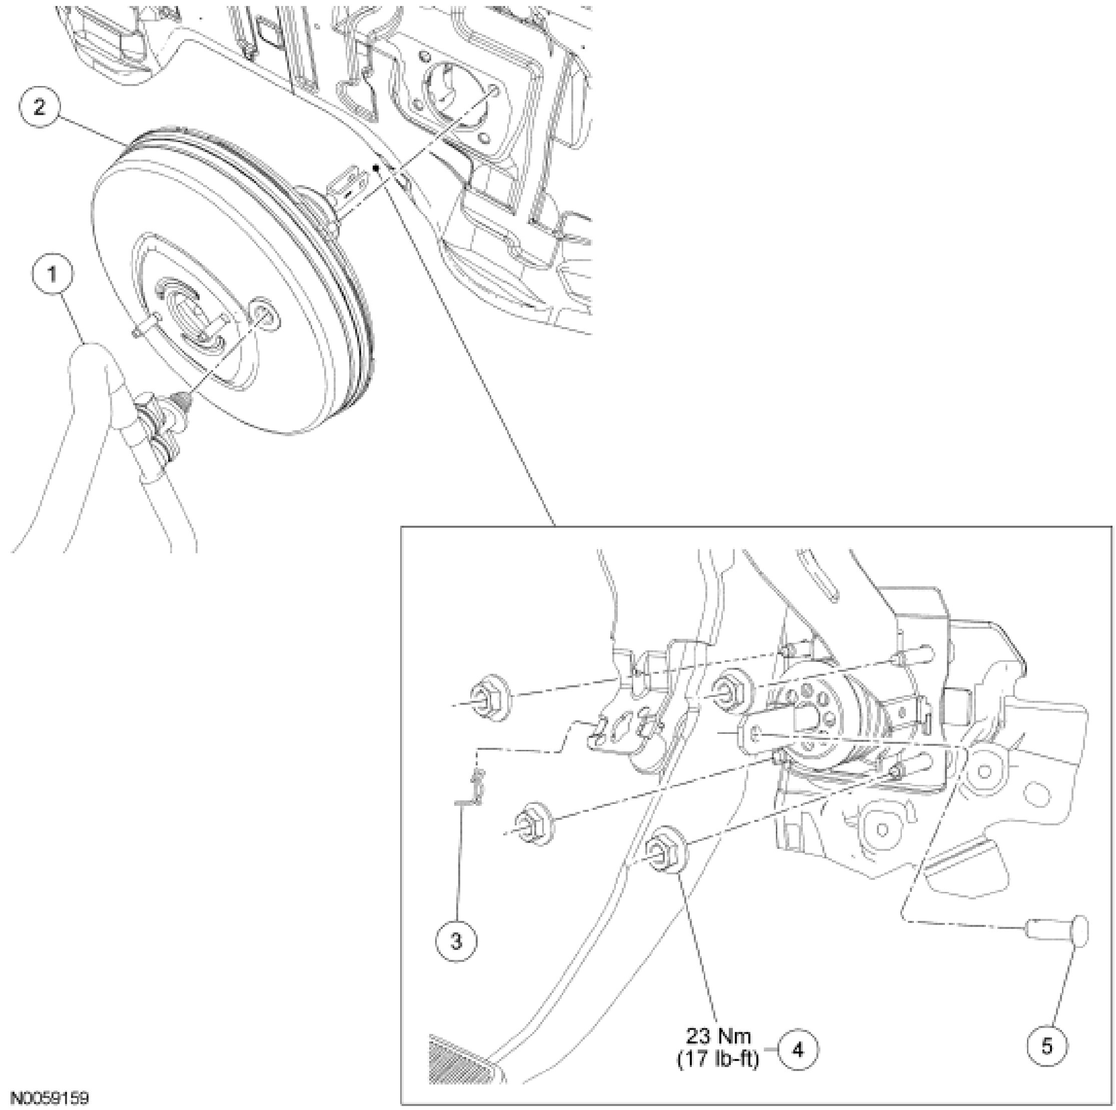

Fig. 1: Exploded View Of Brake Booster With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	9C490	Manifold vacuum hose assembly
2	-	Brake booster
3	7B096	Brake booster push rod spring clip
4	W707144	Brake booster nut (4 required)
5	2N513	Brake booster push rod pin

REMOVAL AND INSTALLATION

CAUTION: Do not service the brake pedal or brake booster without first removing the stoplamp switch and speed control deactivator switch.

These switches must be removed with the brake pedal in the at-rest position. Switch plungers must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.

1. Remove the stoplamp switch. For additional information, refer to **EXTERIOR LIGHTING** article.

CAUTION: The brake booster check valve must be disconnected from the brake booster (prior to removing the master cylinder) or the master cylinder seal may be drawn into the brake booster.

2. Disconnect the brake booster check valve from the brake booster to deplete the residual vacuum in the brake booster.
3. Remove the brake master cylinder. For additional information, refer to **HYDRAULIC BRAKE ACTUATION** article.

CAUTION: Make sure that the vacuum hose assembly is routed correctly so it does not make contact with surrounding components or damage to the hose may occur.

4. Disconnect the vacuum hose and wire harness from the studs and position aside.

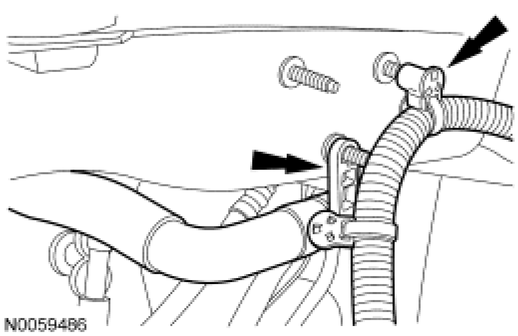

Fig. 2: Identifying Vacuum Hose & Wire Harness Studs
Courtesy of FORD MOTOR CO.

5. Remove the brake booster push rod pin and clip and disconnect the push rod from the brake pedal.
6. Remove the 4 brake booster nuts.
   - To install, tighten to 23 Nm (17 lb-ft).
7. Remove the brake booster.

CAUTION: Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch or the speed control deactivator switch. These switches must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing

these switches with the brake pedal in any other position will result in incorrect adjustment and may damage the switches.

8. To install, reverse the removal procedure.
9. Check the brake booster for correct operation.

TORQUE SPECIFICATIONS

Description	N.m	lb-ft	lb-in
Brake caliper bleeder screw	8	-	71
Master cylinder brake tube fittings	28	21	-

DESCRIPTION AND OPERATION

BRAKE SYSTEM

The brake system has the following components:

- Fixed position foot pedal
- Vacuum-assisted power brake booster
- Diagonal split hydraulic system
- Front disc brakes
- Rear disc brakes
- Drum-in-hat park brake system
- ABS hydraulic control unit (HCU).

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is pushed through the doubled-walled steel tubes and flexible hoses to the front and rear disc brake calipers. The brake fluid enters the disc brake calipers, forcing the caliper pistons and brake pads outward against the brake disc friction surface, slowing or stopping rotation. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear disc brake caliper pistons and brake pads to the unapplied position.

For information on:

- the non-adjustable pedals, refer to **HYDRAULIC BRAKE ACTUATION** article.
- ABS and HCU, refer to **VEHICLE DYNAMIC SYSTEMS** article.
- the master cylinder and fluid reservoir, refer to **HYDRAULIC BRAKE ACTUATION** article.
- the vacuum assisted power brake booster, refer to **POWER BRAKE ACTUATION** article.
- the front brake calipers, refer to **FRONT DISC BRAKE** article.
- the rear brake calipers, refer to **REAR DISC BRAKE** article.
- the drum-in-hat integrated parking brake system, refer to **PARKING BRAKE AND ACTUATION** article.

DIAGNOSTIC TESTS

BRAKE SYSTEM

MATERIAL

Item	**Specification**
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Principles of Operation

Brake System

Applying the brake pedal uses lever action to push a rod into the brake booster, which through the use of vacuum, boosts the force of the rod and then transmits this force into the master cylinder. This produces hydraulic pressure in the master cylinder. On vehicles not equipped with ABS, the hydraulic pressure is transmitted by brake fluid through the brake tubes to the individual brake calipers. On vehicles equipped with ABS, the hydraulic pressure is transmitted by brake fluid through the brake tubes to the ABS hydraulic control unit (HCU), which then distributes that pressure to the individual brake calipers. The brake calipers use hydraulic pressure to apply the pads. The application of the brake pads will cause the rotation of the wheels to slow or stop depending on how much brake pressure is applied. The parking brakes carry out the same function except that they are mechanically actuated by a cable that connects only to the rear brakes.

Red Brake Warning Indicator

The red brake warning indicator alerts the driver to certain conditions that exist in the brake system. The instrument cluster performs a bulb check when the ignition key is turned to the RUN position. The conditions that cause the indicator to illuminate are low brake fluid level, the parking brake is applied or there is a fault in the ABS (if the yellow ABS warning indicator is also illuminated).

Inspection and Verification

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

NOTE: **Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.**

NOTE: **Always check the fluid level in the brake master cylinder reservoir before carrying out the test procedures. If the fluid level is not at the correct level, clean the reservoir cap before removing, then add clean, specified brake fluid.**

NOTE: **Prior to carrying out any diagnosis, make sure the brake warning indicator operates correctly. If the brake indicator does not operate correctly, refer to <u>INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES</u> article.**

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal. The brake warning indicator in the instrument cluster and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. This bleeding operation may release the brakes but will not correct the cause of the concern. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

Inspect all hoses and connections. All unused vacuum connectors should be capped. Make sure hoses and their connections are correctly secured and in good condition with no holes, soft or collapsed areas.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Brake master cylinder • Brake master cylinder reservoir • Brake booster • Brake booster check valve • Brake booster vacuum hose • Brake hoses and tubes • Brake caliper • Brake caliper piston seals • Brake caliper guide pins • Brake disc • Brake pads • Brake pedal linkage • Wheel bearings • Tires	• Parking brake switch • Brake fluid level switch • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, go to **SYMPTOM CHART - BRAKE SYSTEM** table or Go to **SYMPTOM CHART - NOISE, VIBRATION AND HARSHNESS (NVH)** table.

   For low or spongy brake pedal concerns:

- check for fluid leaks. Repair as necessary.
- check and, if necessary, refill the brake master cylinder reservoir with clean, specified brake fluid.
- bleed the brake system and retest the brake pedal feel.
- if the brake pedal is still low or feels spongy, check the brake pedal mounting for looseness and correct installation. Check the power brake booster and the master cylinder for loose mounting. Correct as necessary and retest the system for normal operation.

For a slow or incomplete brake pedal return concern:

- inspect for binding, damage, correct installation or interference at the brake pedal.
- check the power brake booster for binding, damage and correct installation.

Road Test

The technician should have a thorough knowledge of the brake system operation and accepted general braking guidelines in order to detect any problems.

Select a road that is reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Avoid crowned roads.

A key factor in evaluating brake concerns is the deceleration rate. This varies from vehicle to vehicle and with changes in operating conditions. It is evident how well the brakes are working after just a few applications.

Brake Pads

NOTE:	**It is not required to install new brake pads if the friction material thickness is within specifications. It is also not required to install new brake pads when the brake discs are machined.**

- Remove the brake pads. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
- Inspect and measure the thickness of the brake pad friction material. Refer to **SPECIFICATIONS**.
  - If there are missing chunks or cracks in the lining through to the backing plate, install new brake pads. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
  - If the thickness of the friction material is less than the specified thickness, install new brake pads, Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
  - If the friction material shows taper wear that is not within specifications, verify the caliper guide pins are functioning correctly. Refer to Brake Caliper Guide Pins.

Brake Discs

NOTE:	**Using an impact tool without a torque socket will lead to unevenly tightened**

wheel nuts. This causes brake disc on-vehicle lateral runout and brake roughness.

NOTE: It is generally not required to install new brake discs to address noise issues.

- Remove the brake disc. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
- Inspect the brake discs and measure the brake disc thickness in a minimum of 4 places around the circumference of the brake disc. Record the measurements, refer to **SPECIFICATIONS**.
    - If the brake disc is cracked or otherwise damaged, install new a brake disc. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
    - If any thickness measurement is less than the minimum specification, install a new brake disc. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
    - If the diagnosis has revealed vibration in the steering wheel, seat or pedal while braking that varies with vehicle speed, machine the brake disc. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, discs must be above the minimum thickness specification. Refer to **SPECIFICATIONS** and **BRAKE DISC MACHINING**.

Brake Calipers

Inspect the brake calipers for the following:

- Brake fluid leaks
- Boots and seals for tears or cracks
- Caliper pistons for binding and corrosion
- Guide pins for correct operation. Refer to Brake Caliper Guide Pins.

Brake Caliper Guide Pins

NOTE: Do not use power tools for caliper guide pin bore cleaning. Damage to the bore may result.

NOTE: The guide pins are part of the anchor plate.

The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, install a new brake caliper anchor plate. Refer to **FRONT DISC BRAKE** article for the front brake caliper anchor plate or **REAR DISC BRAKE** article for the rear brake caliper anchor plate.

If the lining is not within specifications, install new brake pads. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.

Brake Hoses and Tubes

NOTE: Never use copper tubing. It is subject to fatigue, cracking and corrosion, which may result in brake tube failure.

- Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.
- If a section of the brake tube is damaged, the entire section must be installed with a new tube of the same type, size, shape and length.
- When installing the hydraulic brake tubing, hoses or connectors, tighten all connections to specifications. After installation, bleed the brake system. Refer to **BRAKE SYSTEM BLEEDING**.

Install a new brake flexible hose if the hose shows signs of softening, cracking or other damage.

When installing a new brake hose, position the hose to avoid contact with other vehicle components.

Non-Pressure Leaks

Two parts of the brake system that may have a brake fluid loss that does not appear when the system is under pressure are the brake master cylinder reservoir and the brake caliper under the following conditions:

Reservoir

- Missing or poorly-fitted brake master cylinder filler cap
- Missing or damaged brake master cylinder filler cap gasket
- Punctured or otherwise damaged brake master cylinder reservoir
- Missing, damaged or poorly-fitted sealing grommets between the brake master cylinder and the brake master cylinder reservoir

The brake master cylinder reservoir grommets are not serviceable and must be installed new as part of a new brake master cylinder and reservoir assembly. Refer to brake master cylinder in **HYDRAULIC BRAKE ACTUATION** article.

Brake Caliper

- Foreign material in the caliper piston seal groove
- Punctured or otherwise damaged caliper piston seal

The brake caliper piston seals are not serviceable and must be installed new as part of a new brake caliper. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.

Brake Master Cylinder - Normal Conditions

The following conditions are considered normal and are not indications that the brake master cylinder is in need of service.

Condition 1: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will fall during brake application and rise during release. The net fluid level (such as after brake application and release) will remain unchanged.

Condition 2: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

Condition 3: Fluid level will decrease with pad wear.

Brake Master Cylinder - Abnormal Conditions

Changes in brake pedal feel or travel are indicators that something may be wrong in the brake system. Go to **SYMPTOM CHART - BRAKE SYSTEM** table for abnormal condition diagnosis.

Brake Booster

Inspect the brake booster:

- for excessive corrosion or damage.
- vacuum connections for leakage.
- vacuum hoses for kinks or leakage.
- check valve for correct operation.

Parking Brake

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Check the rear brake adjustment or carry out the brake system diagnosis. Refer to **PARKING BRAKE AND ACTUATION** article.

Symptom Chart - Brake System

SYMPTOM CHART - BRAKE SYSTEM

Condition	Possible Sources	Action
• The red brake warning indicator and the yellow ABS warning indicator are illuminated	• DTCs in the ABS module	• REFER to **VEHICLE DYNAMIC SYSTEMS** article to diagnose the ABS module.
• The red brake warning indicator is always/never on	• Brake fluid level switch • Parking brake switch • Wiring, terminals or connectors	• REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the red brake warning

	• Instrument cluster • Smart junction box (SJB)	indicator.
• The brakes pull or drift	• Tires	• INSPECT the tires for uneven or excessive wear, and correct inflation. REFER to **WHEELS AND TIRES** article.
-	• Brake pads	• INSPECT the brake pads for contamination, uneven taper or excessive wear, REFER to Brake Pads.
-	• Brake discs	• INSPECT the brake discs and the hubs for contamination or damage. INSTALL new brake discs or hubs as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes. REFER to **FRONT SUSPENSION** article for front hubs or **REAR SUSPENSION** article for rear hubs.
-	• Brake calipers and/or guide pins	• INSPECT the brake calipers and guide pins, REFER to Brake Calipers and Brake Caliper Guide Pins.
-	• Suspension component and/or wheel alignment	• INSPECT the suspension and CHECK the wheel alignment. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
• Brake pedal goes down fast	• Brake fluid leaks and/or air in the system	• INSPECT the system for leaks. REPAIR as necessary. FILL the brake master cylinder reservoir. BLEED the system. REFER to **BRAKE SYSTEM BLEEDING**.
-	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder test in **COMPONENT TESTS**.
-	• Hydraulic control unit (HCU)	• INSPECT the HCU. REFER to **VEHICLE DYNAMIC SYSTEMS** article.

• The brake pedal eases down slowly	• Air in the system	• BLEED the system. REFER to **BRAKE SYSTEM BLEEDING**.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder test in **COMPONENT TESTS**.
	• HCU	• INSPECT the HCU. REFER to **VEHICLE DYNAMIC SYSTEMS** article.
• Brakes lock up under light brake pedal force	• Brake pads	• INSPECT the brake pads for uneven taper or excessive wear, REFER to Brake Pads.
	• Brake calipers and/or guide pins	• INSPECT the brake calipers and guide pins, REFER to Brake Calipers and Brake Caliper Guide Pins.
	• Anti-lock brake control system	• CHECK the anti-lock brake control system. REFER to **VEHICLE DYNAMIC SYSTEMS** article.
• Excessive/erratic brake pedal travel	• Brake fluid leaks and/or air in the system	• INSPECT the system for leaks. REPAIR as necessary. BLEED the system. REFER to **BRAKE SYSTEM BLEEDING**.
	• Brake calipers and/or guide pins	• INSPECT the brake calipers and guide pins, REFER to Brake Calipers and Brake Caliper Guide Pins.
	• Brake flexible hose	• INSPECT the brake flexible hoses for swelling and damage. INSTALL new as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder test in **COMPONENT TESTS**.
	• Brake pads	• INSPECT the brake pads for taper wear, REFER to Brake Pads.

-	• Brake pedal	• INSPECT the brake pedal for binding, obstructions and correct installation. REPAIR as necessary. CHECK the brake pedal fasteners for correct torque. REFER to Specifications in **HYDRAULIC BRAKE ACTUATION** article.
-	• Anti-lock brake control system	• CHECK the anti-lock brake control system. REFER to **VEHICLE DYNAMIC SYSTEMS** article.
• Brakes drag	• Parking brake component	• REPAIR or INSTALL new components as necessary. REFER to **PARKING BRAKE AND ACTUATION** article.
-	• Brake caliper guide pins	• INSPECT the caliper guide pins for correct operation. INSTALL new components as necessary. REFER to Brake Caliper Guide Pins.
-	• Disc brake caliper(s)	• INSPECT the brake calipers. REFER to Brake Calipers. REPAIR or INSTALL new brake calipers as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
-	• Brake booster	• CARRY OUT the Brake Booster test in **COMPONENT TESTS**.
-	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder test in **COMPONENT TESTS**.
• Excessive brake pedal effort	• Insufficient engine vacuum for brake booster operation	• CHECK engine vacuum. REFER to the Intake Manifold Vacuum Test in **ENGINE SYSTEM - GENERAL INFORMATION** article.
-	• Brake booster manifold	• VERIFY engine vacuum at the

	vacuum hose	booster. REROUTE, REPAIR or INSTALL new components as necessary.
-	• Brake booster	• VERIFY engine vacuum at the booster. CARRY OUT the Brake Booster test in **COMPONENT TESTS**.
-	• Brake booster check valve	• VERIFY engine vacuum at the booster. CARRY OUT the Check Valve test in **COMPONENT TESTS**.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

SYMPTOM CHART - NOISE, VIBRATION AND HARSHNESS (NVH)

Condition	Possible Sources	Action
• Vibration when the brakes are applied	• Tires	• CORRECT any wheel and tire concern before diagnosing the brake or suspension systems. REFER to **WHEELS AND TIRES** article to diagnose the tires.
-	• Uneven brake pad wear • Brake disc pad transfer • Uneven brake disc wear • Suspension components	• COMPLETE the brake system inspection described in **INSPECTION AND VERIFICATION**. If the condition still exists, go to **Pinpoint Test A** .
• Brake vibration/shudder - occurs when the brake pedal is released	• Brake caliper guide pins	• INSPECT the brake caliper guide pins for correct operation. REFER to Brake Caliper Guide Pins.
-	• Brake drag	• Go to **SYMPTOM CHART - BRAKE SYSTEM** table.

• Rattling noise	• Caliper mounting bolts loose	• CHECK the caliper bolts. TIGHTEN to specifications. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
-	• Damaged or worn caliper guide pins or retainers	• CHECK the caliper guide pins and retainers for correct operation. REFER to Brake Caliper Guide Pins. INSTALL new components as necessary.
-	• Missing or damaged anti-rattle clips or springs	• CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
-	• Loose brake disc shield	• TIGHTEN the brake disc shield bolts to specification. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
• Clicking noise - with brakes applied on vehicles equipped with ABS brakes	• ABS hydraulic control unit (HCU)	• Acceptable condition during an ABS event.
• Squealing noise - occurs on first (morning) brake application	• Brake pads	• Acceptable condition. Caused by humidity and low brake pad temperature.
• Squealing noise - a continuous squeal	• Brake pads worn below minimum thickness	• INSPECT brake pads for excessive wear, taper wear or uneven wear. VERIFY brake pads are within minimum specifications. REFER to Brake Pads.
• Squealing noise - an intermittent squeal brought on by cold, heat, water, mud or snow	• Brake pads	• Acceptable condition.
• Groaning noise - occurs at low speeds with brake lightly applied (creeping)	• Brake pads	• Acceptable condition.

• Grinding noise - continuous	• Brake pads worn below minimum thickness	• INSPECT the brake pads, brake discs, and attaching hardware for damage. VERIFY brake components are within specifications. REFER to **SPECIFICATIONS**.
• Moaning noise	• Brake pads contaminated with grease or oil	• INSPECT the brake pads for contamination. REPAIR or INSTALL new components as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.

Pinpoint Tests

Pinpoint Test A: Vibration When Brakes are Applied

Normal Operation

During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation alone or steering wheel nibble when the brakes are applied (frequency is proportional to the vehicle speed) indicates a concern with a brake or suspension component.

This pinpoint test is intended to diagnose the following:

- Brake pad(s)
- Brake disc(s)
- Wheel(s) and tire(s)
- Suspension component(s)

PINPOINT TEST A: VIBRATION WHEN THE BRAKES ARE APPLIED

A1 ROAD TEST THE VEHICLE - LIGHT BRAKING

- Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force.
- **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**

  YES : Go to A4.

  NO : Go to A2.

A2 ROAD TEST THE VEHICLE - MODERATE TO HEAVY BRAKING

- Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force.
- **Is there a vibration/shudder?**

  YES : Go to A3.

  NO : The concern is not present at this time.

A3 CHECK ABS OPERATION

- Road test the vehicle and apply the brakes on a dry, firm surface, then apply the brakes on a wet, snowy or loose surface (such as gravel).
- **Is the vibration/shudder only present on a wet, snowy or loose surface?**

  YES : This is a normal operating condition of the ABS.

  NO : Go to A4.

A4 CHECK THE FRONT SUSPENSION

- Check the front suspension. Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
- **Are all the suspension components in satisfactory condition?**

  YES : Go to A5.

  NO : REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

A5 RESURFACE THE FRONT BRAKE DISCS

NOTE: **Do not use a bench lathe to machine the brake discs. A bench lathe may cause brake disc on-vehicle lateral runout and brake roughness.**

NOTE: **Follow the brake lathe manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification.**

- Resurface the front brake discs. Refer to **BRAKE DISC MACHINING**.
- Road test the vehicle.
- **Is the vibration/shudder present?**

  YES : Go to A6.

  NO : The concern has been repaired.

A6 CHECK THE REAR SUSPENSION

- Check the rear suspension. Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
- **Are all the suspension components in satisfactory condition?**

  YES : RESURFACE the rear brake discs or brake drums. REFER to **BRAKE DISC MACHINING**.

  NO : REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

Component Tests

Brake Booster

1. Disconnect the check valve from the brake booster.
2. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
3. Verify that manifold vacuum is available at the check valve with the engine at idle speed and the transmission in NEUTRAL.
   - If manifold vacuum is available, stop the engine, connect the check valve and continue with Step 5.
   - If manifold vacuum is not available, continue with Step 4.
4. Disconnect the check valve from the vacuum hose and verify that manifold vacuum is available at the hose with the engine at idle speed and the transmission in NEUTRAL.
   - If manifold vacuum is available, stop the engine, install a new check valve and continue with Step 5.
   - If manifold vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the no vacuum condition.
5. Apply the brake pedal several times to exhaust all vacuum from the system.
6. Apply the brake pedal and hold it in the applied position. Start the engine and verify that the brake pedal moves downward after the engine starts.
   - If the brake pedal moves, the brake booster is operating correctly
   - If the brake pedal does not move, install a new brake booster. Refer to **POWER BRAKE ACTUATION** article.
7. Operate the engine a minimum of 10 seconds at fast idle. Stop the engine, and let the vehicle stand for 10 minutes. Then apply the brake pedal with approximately 89 N (20 lb) of force. The brake pedal feel should be the same as that noted with the engine operating. If the brake pedal feels hard (no power assist), install a new brake booster check valve and retest. If the brake pedal feels spongy, bleed the hydraulic system to remove air. Refer to **BRAKE SYSTEM BLEEDING**.

Brake Booster Check Valve

The function of the brake booster check valve is to allow manifold vacuum to enter the brake booster and prevent the escape of vacuum in case manifold vacuum is lost during sustained full throttle operation.

1. Disconnect the vacuum booster hose from the check valve.
2. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
3. Verify that manifold vacuum is available at the check valve end of the vacuum hose with the engine at idle speed and the transmission in NEUTRAL.
   - If manifold vacuum is available, stop the engine, connect the vacuum hose to the check valve and continue this test.
   - If manifold vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the no vacuum condition.
4. Connect the vacuum hose to the check valve and run the engine for at least 10 seconds.

5. Operate the brake pedal to check for power assist.
   - If power assist is present, continue with this test.
   - If power assist is not present, refer to Brake Booster test in **COMPONENT TESTS**.

NOTE: Do not remove the brake booster check valve from the brake booster in this step.

6. Stop the engine and disconnect the vacuum booster hose from the brake booster check valve.
7. Apply the brake and verify that there is enough vacuum retained in the brake booster for at least one power-assisted brake application.
   - If there is enough vacuum for at least one power-assisted brake application, the check valve is functioning correctly.
   - If there is not enough vacuum for at least one power-assisted brake application, continue with this test.
8. Inspect the brake booster for any signs of damage that may cause a leak.
   - If any damage is found, install a new brake booster and repeat this test.
   - If no damage is found, install a new check valve.

Brake Master Cylinder - Bypass Condition

1. Disconnect the brake tubes from the master cylinder.
2. Plug the outlet ports of the master cylinder.
3. Apply the brakes. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new brake master cylinder must be installed.

Brake Master Cylinder - Compensator Port

The purpose of the compensator ports in the brake master cylinder is to:

- supply additional brake fluid from the brake master cylinder reservoir needed by the brake system due to brake lining wear.
- allow brake fluid to return to the brake master cylinder reservoir when the brakes are released. The returning brake fluid creates a slight turbulence in the brake master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged.

Clogged compensator ports may cause the brakes to hang up or not fully release. If clogged compensator ports are suspected, proceed as follows:

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
2. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If an excessive amount of brake drag exists at all 4 wheels, continue with the test.
   - If an excessive amount of brake drag exists at only one wheel, it indicates a possible seized brake caliper, brake wheel cylinder or parking brake component. Repair or install new components as

necessary.

3. Check the brake stoplamp switch and the brake pedal free play to verify that the brake pedal is not partially applied.
4. Loosen the brake master cylinder nuts and position the brake master cylinder away from the brake booster.
5. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If the brake drag is no longer present, install a new brake booster. Refer to **POWER BRAKE ACTUATION** article.
   - If the brake drag is still present, install a new master cylinder. Refer to **HYDRAULIC BRAKE ACTUATION** article.

GENERAL PROCEDURES

BRAKE DISC MACHINING

NOTE: Do not use a bench lathe to machine the brake discs. Use an on-vehicle brake lathe only. Read the entire operating manual and/or view the video shipped with the lathe before installing, operating or repairing the lathe.

NOTE: An on-vehicle brake lathe with an automatic runout adjustment feature is preferred. However, if the lathe is not self adjusting, the lathe oscillation must be adjusted using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in). If the runout adjustment (automatic or manual) is carried out correctly prior to machining, then the final brake disc runout will be within specification and a runout measurement is not necessary after machining.

NOTE: Do not machine new brake discs.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specification.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

   NOTE: Do not allow the caliper to hang from the brake hose or damage to the hose may occur.

   NOTE: It is not necessary to disconnect the brake tube from the brake caliper.

2. Remove the bolts and position the brake caliper or brake caliper and anchor plate assembly aside, as required.
   - Support the brake caliper using mechanic's wire.

3. Install the hub adapter using:
    - four wheel nuts on a 4-stud wheel hub.
    - five wheel nuts on a 5-stud wheel hub.
    - six wheel nuts on a 6-stud wheel hub.
    - four wheel nuts on a 7- or 8-stud wheel hub.
    - five wheel nuts on a 10-stud wheel hub.
4. Install the cutting lathe.
5. If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in).
6. Center the cutting head, adjust the cutting bits and install the chip deflector/silencer.

NOTE: The depth of the cut should be between 0.10 and 0.40 mm (0.004 and 0.015 in). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.

7. Machine the brake disc.
8. Remove the lathe and the silencer.
9. Remove the wheel nuts and hub adapter.
10. Remove the metal shavings.

NOTE: It is not required to install new brake pads if friction material is within specifications. For additional information, refer to SPECIFICATIONS.

11. Position the brake caliper or brake caliper and anchor plate assembly.
    - Install the bolts.
    - For fastener torque specifications, refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
12. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

BRAKE SYSTEM BLEEDING

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	-

MATERIAL

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Pressure Bleed

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected.

NOTE: Pressure bleed the brake system at 207-345 kPa (30-50 psi).

NOTE: If the hydraulic control unit (HCU) or any component upstream of the HCU are installed new, carry out the Brake System Pressure Bleeding procedure, then the anti-lock HCU bleed procedure, followed by another Brake System Bleed Procedure.

1. Clean all the dirt from around the brake fluid reservoir cap and remove the cap. Fill the brake master cylinder reservoir with clean, specified brake fluid.

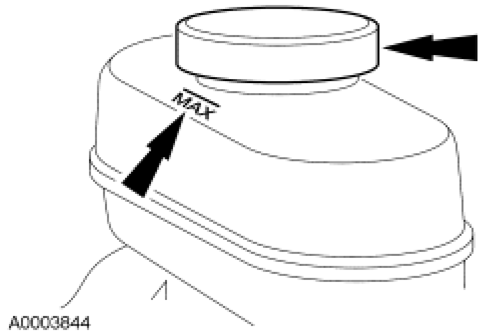

Fig. 1: Identifying Brake Master Cylinder Fluid Reservoir Cap And Max Fill Line
Courtesy of FORD MOTOR CO.

NOTE: **Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.**

2. Install the bleeder adapter to the brake master cylinder reservoir and attach the bleeder tank hose to the fitting on the adapter.

NOTE: **Bleed the longest line first. Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.**

3. Remove the RH rear brake caliper bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain tube to the RH rear bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.
4. Open the valve on the bleeder tank.
5. Loosen the RH rear brake caliper bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH rear bleeder screw.
    - Press and release the parking brake 5 times.
    - Repeat until clear, bubble-free fluid comes out.
6. Tighten the RH rear brake caliper bleeder screw to 8 N.m (71 lb-in), remove the rubber hose and install the bleeder screw cap.
7. Repeat Steps 5 and 6 for the LH rear brake caliper.
    - Tighten the LH rear brake caliper bleeder screw to 8 N.m (71 lb-in).
8. Continue bleeding the front of the system, going in order from the RH front brake caliper and then to the LH front brake caliper.
    - Tighten the front brake caliper bleeder screws to 8 N.m (71 lb-in).
9. Close the bleeder tank valve. Remove the tank hose from the adapter and remove the adapter. Fill the reservoir with clean, specified brake fluid and install the reservoir cap.

Manual Bleeding

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's**

specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system is disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with clean, specified brake fluid.

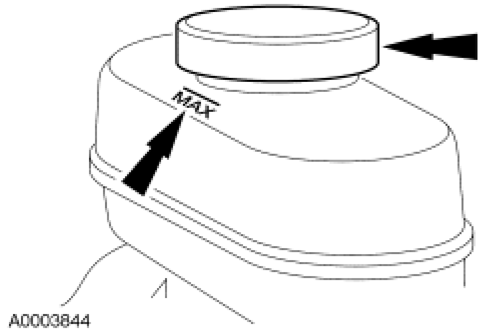

Fig. 2: Identifying Brake Master Cylinder Fluid Reservoir Cap And Max Fill Line
Courtesy of FORD MOTOR CO.

NOTE: Bleed the brake system from the longest to the shortest brake line.

2. Remove the RH rear brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container

partially filled with clean, specified brake fluid.

3. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.
4. Loosen the RH rear brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.
5. Tighten the RH rear brake caliper bleeder screw to 8 N.m (71 lb-in), remove the rubber hose and install the bleeder screw cap.
6. Repeat Steps 2 through 5 for the LH rear brake caliper bleeder screw.
   - Tighten the LH rear brake caliper bleeder screw to 8 N.m (71 lb-in).
7. Remove the RH front brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

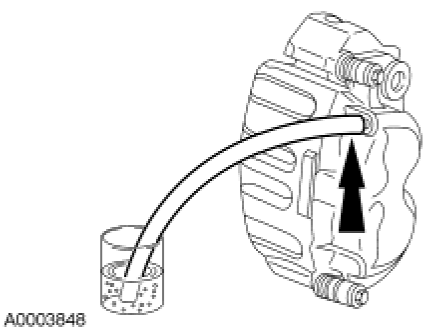

Fig. 3: Locating Rubber Drain Tube
Courtesy of FORD MOTOR CO.

8. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.
9. Loosen the RH front brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.
10. Tighten the RH front brake caliper bleeder screw to 8 N.m (71 lb-in), remove the rubber hose and install the bleeder screw cap.
11. Repeat Steps 7 through 10 for the LH front brake caliper bleeder screw.
    - Tighten the LH front brake caliper bleeder screw to 8 N.m (71 lb-in).

ABS Hydraulic Control Unit (HCU) Bleeding

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal**

injury.

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: This procedure is only required when a new hydraulic control unit (HCU) is installed.

NOTE: When any part of the hydraulic system is disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

NOTE: Carrying out the System Bleed function drives trapped air from the HCU. Subsequent bleeding removes the air from the brake hydraulic system through the bleeder screws.

NOTE: Adequate voltage to the HCU module is required during the anti-lock control portion of the system bleed.

1. Connect the scan tool to the vehicle.
2. Access the ABS HCU bleed function and follow the directions on the scan tool.
3. Manually bleed the brake hydraulic system. For additional information, refer to **MANUAL BLEEDING**.
4. Repeat the procedure carrying out a total of 2 scan tool cycles and 2 manual bleed cycles.

COMPONENT BLEEDING

MATERIAL

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid	WSS-M6C62-A or WSS-M6C65-A1

PM-1-C (US); CPM-1-C (Canada)	

Master Cylinder

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTE: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When a new brake master cylinder has been installed or the system has been emptied, or partially emptied, it should be primed to prevent air from getting into the system.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Disconnect the brake master cylinder outlet tubes.

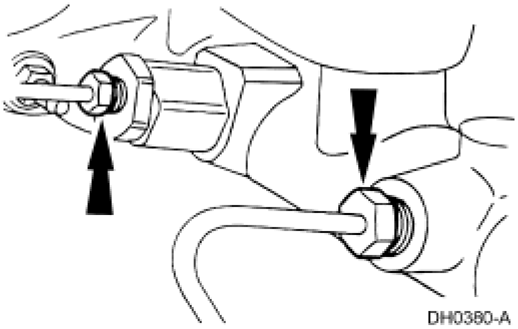

Fig. 4: Identifying Brake Lines
Courtesy of FORD MOTOR CO.

2. Install short brake tubes with ends submerged in the brake master cylinder reservoir and fill the brake master cylinder reservoir with clean, specified brake fluid.

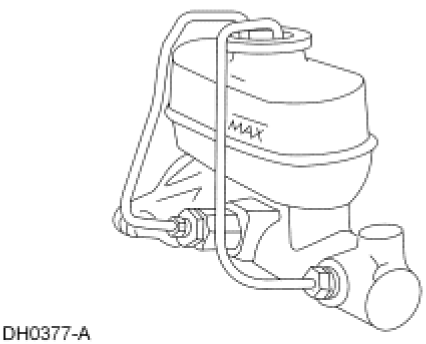

Fig. 5: Identifying Short Brake Tubes
Courtesy of FORD MOTOR CO.

3. Have an assistant pump the brake pedal until clear fluid flows from both brake tubes without air bubbles.
4. Remove the short brake tubes and install the brake outlet tubes.
5. Bleed each brake tube at the brake master cylinder as follows:
    1. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.
    2. Loosen the rearmost brake tube fittings until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the brake tube fitting.
    3. Repeat this operation until clear, bubble-free fluid comes out.
    4. Refill the brake master cylinder reservoir as necessary. Repeat the bleeding operation at the front brake tube.
6. While the assistant maintains pressure on the brake pedal, tighten the brake tubes.
    - Tighten to 28 N.m (21 lb-ft).

Brake Caliper

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been

previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: **Brake fluid is harmful to painted and plastic surfaces. If spilled, wipe up immediately before damage to the painted or plastic surface occurs.**

NOTE: **It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.**

1. Remove the brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

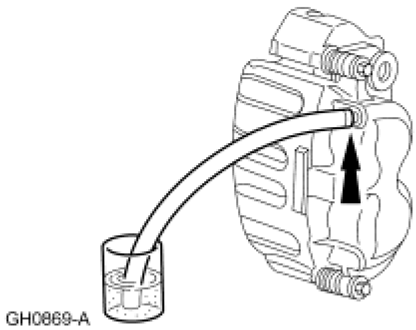

Fig. 6: Attaching Rubber Drain Hose To Disc Brake Caliper Bleeder Screw
Courtesy of FORD MOTOR CO.

2. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.
3. Loosen the bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.
4. Tighten the brake caliper bleeder screw, remove the rubber hose and install the bleeder screw cap.

- Tighten the bleeder screw to 8 N.m (71 lb-in).

7. To install, reverse the removal procedure.

BUMPER - REAR

All vehicles

1. Remove the rear bumper cover. For additional information, refer to **Bumper Cover - Rear**.

    Without trailer tow

2. Remove the 6 bumper mounting nuts (3 each side).
    - To install, tighten to 25 N.m (18 lb-ft).

    With trailer tow

3. Remove the 2 underbody heat shields.
    - Remove the 6 screws (3 each side).
    - Remove the 2 pushpin retainers (1 each side).
    - Disconnect the wiring harness from the heat shield.

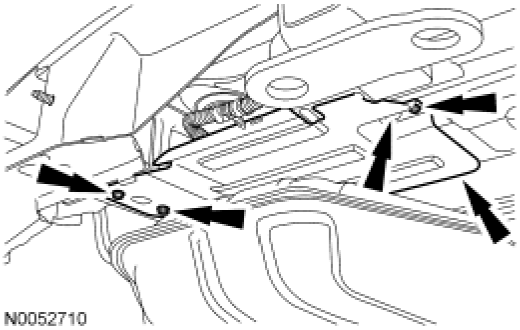

Fig. 22: Locating Wiring Harness From Heat Shield
Courtesy of FORD MOTOR CO.

4. Remove the 4 inside rear bumper bolts (2 each side) and the 2 nuts (1 each side).
   - To install, tighten rear bumper bolts to 90 N.m (66 lb-ft).
   - To install, tighten rear bumper nuts to 25 Nm (18 lb-ft).

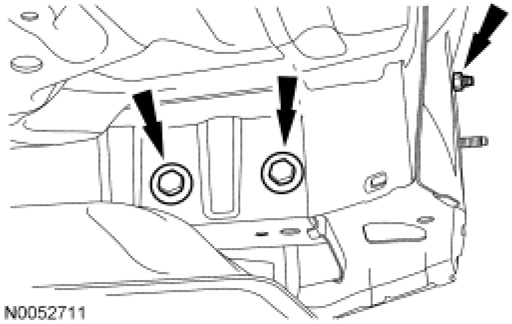

Fig. 23: Identifying Inside Rear Bumper Bolts & Nuts
Courtesy of FORD MOTOR CO.

5. Remove the 2 rear center bumper bolts.
   - To install, tighten to 40 N.m (30 lb-ft).

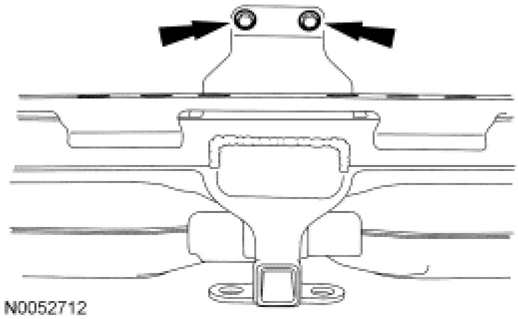

Fig. 24: Identifying Rear Center Bumper Bolts
Courtesy of FORD MOTOR CO.

All vehicles

6. Remove the rear bumper.
7. To install, reverse the removal procedure.

CABIN AIR FILTER

Cabin Air Filter - Edge, MKX

REMOVAL & INSTALLATION

NOTE: Manufacturer's terminology for this filter is Cabin Air Filter, or Air Inlet Screen.

A cabin air filter is available as standard equipment on dual-zone EATC vehicles. EMTC vehicles are not equipped from the factory with a cabin air filter, but are equipped with an air inlet screen in place of the filter to prevent any large foreign material from entering the heater core and evaporator core housing. The cabin air filter or screen can be accessed by removing the glove compartment and removing the cabin air filter access cover.

A cabin air filter can be installed as a dealer accessory on vehicles not originally equipped with a filter.

CAUTION: Only a screen or a filter should be installed, never both.

1. The cabin air filter is located behind glove box. Remove glove box.
2. Remove filter cover (7). See **Fig. 1**
3. Remove cabin air filter (6) See **Fig. 1**

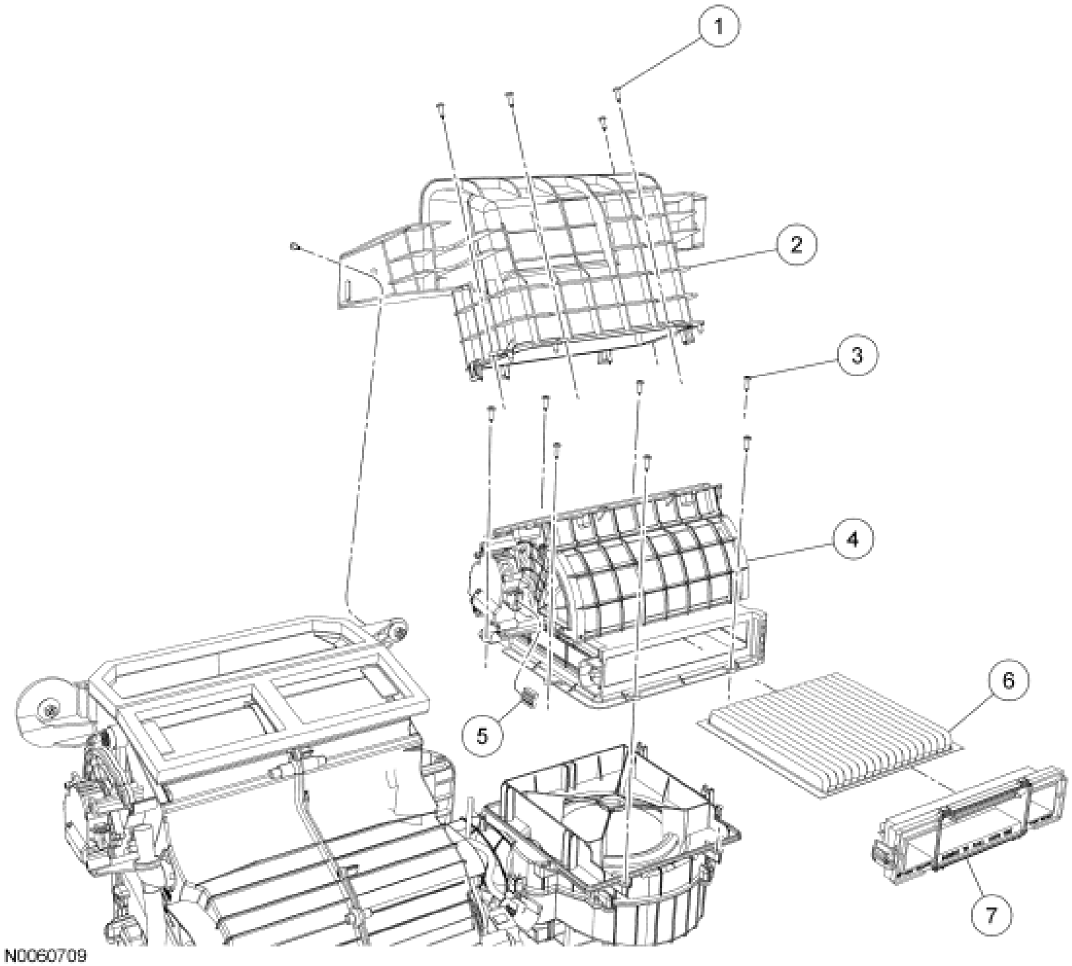

Fig. 1: Exploded View Of Air Inlet Duct
Courtesy of FORD MOTOR CO.

2008 GENERAL INFORMATION

Charging System - General Information - Edge & MKX

SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Generator	
Rating	78/143 amp (max) @ 620-2,500 engine RPM @ normal engine temperature
Voltage	12 volt

DESCRIPTION AND OPERATION

CHARGING SYSTEM

The charging system consists of the following:

- Generator
- Charging system warning indicator
- Necessary wiring and cables

The charging system is a negative ground system. The generator (including an internal voltage regulator) is belt-driven by the engine accessory drive system. When the engine is started, the generator begins to generate AC, which is internally converted to DC. This current is then supplied to the vehicle electrical system through the output (B+) terminal of the generator.

Battery

The battery is a 12V DC source connected in a negative ground system. The battery case is sealed with 2 vent holes to release gases. The battery has 3 major functions:

- Engine cranking power source
- Voltage stabilizer for the electrical system
- Temporary power source when electrical loads exceed the generator output current

DIAGNOSTIC TESTS

CHARGING SYSTEM

Special Tools

Illustration	Tool Name	Tool Number

 ST2311-A	73III Automotive Meter	105-R0057 or equivalent
 ST2312-A	Flex Probe Kit	105-R025B
 ST2834-A	SABRE Premium Battery and Electrical System Tester	010-00736 or equivalent
 ST1214-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

The PCM controlled charging system determines the optimal voltage setpoint for the charging system and communicates this information to the voltage regulator. This system is unique in that it has 2 communication lines between the PCM and the generator/regulator. Both of these communication lines are pulse-width modulated (PWM). The generator communication (GENCOM) line communicates the desired setpoint from the PCM to the voltage regulator. The generator monitor (GENMON) line communicates the generator load and error conditions to the PCM. The third pin on the voltage regulator, the A circuit pin, is a dedicated battery voltage sense line.

The generator charges the battery and at the same time supplies power for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM is able to adjust the charging voltage according to the battery temperature by using a signal from the intake air temperature (IAT) sensor. This means the voltage setpoint is calculated by the PCM and communicated to the regulator by the GENCOM circuit.

The PCM simultaneously controls and monitors the output of the generator. When the current consumption is high or the battery is discharged the PCM raises engine speed to increase generator output.

To minimize the engine drag when starting the engine, the PCM does not allow the generator to produce any output until the engine has started. The PCM turns off the generator during cranking to reduce the starter load and improve cranking speed. Once the engine starts, the PCM slowly increases generator output to help establish a stable engine speed.

The PCM controls the charging system warning indicator by sending a message over the high-speed controller area network (HS-CAN) to the instrument cluster (IC). The PCM turns the charging system warning indicator off when generator output begins. The charging system warning indicator is also illuminated by the PCM whenever the key is ON with the engine OFF.

This is a System 4 charging system, which uses the GENMON and GENCOM lines to control and monitor the charging system through the PCM. System 4 charging systems are virtually identical in design and therefore, share the same diagnostics. The circuit numbers and colors may be different, but the functions are the same.

Inspection and Verification

WARNING: **Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.**

CAUTION: Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals, fuses or fusible links.

CAUTION: Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.

NOTE: While carrying out any pinpoint test, disregard any DTCs set while following a specific pinpoint test. After the completion of a test, be sure to clear all DTCs in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Battery • Generator drive belt • Generator pulley	• Battery junction box (BJB) fuse 8 (10A) • Circuitry • Fusible links • Cables • Generator • PCM • Charging system warning indicator

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Verify the battery condition. Refer to **BATTERY, MOUNTING & CABLES** article.
5. Check the operation of the charging system warning indicator at the instrument cluster (IC). Normal operation is as follows:
   - With the key OFF, the charging system warning indicator should be off.
   - With the key ON and the engine OFF, the charging system warning indicator should be on.
   - With the engine running, the charging system warning indicator should be off.
6. Turn off the headlamps and the A/C system (if equipped). Turn the climate control blower to low/off. Check the battery voltage before and after starting the engine to determine if the battery voltage increases.

NOTE: Make sure to use the latest scan tool software release.

7. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

8. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
9. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
10. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
- If the network test passes, retrieve and record continuous memory DTCs.

11. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM and the IC.
12. If the DTCs retrieved are related to the concern, go to the **DTC CHART** . For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
13. If no DTCs related to the concern are retrieved, go to **SYMPTOM CHART**.

NOTE: **DTC P0622 can be set by the loss of the communication lines between the generator and the PCM. The charging system warning indicator then illuminates until the engine is operated at greater than 4,500 RPM (approximately wide open throttle [WOT]) for a minimum of 3 seconds. At this time, the generator self-excites. The charging system warning indicator remains illuminated, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off.**

DTC CHART

DTCs	Description	Source	Action
B1317	Battery Voltage High	Various Modules	Go to **Pinpoint Test B** .
B1318	Battery Voltage Low	Various Modules	Go to **Pinpoint Test F** .
B1676	Battery Voltage Out of Range	Various Modules	Go to **Pinpoint Test F** .
P0563	System Voltage High	PCM	Go to **Pinpoint Test B** .
P0620	Generator Control Circuit	PCM	Go to **Pinpoint Test B** .
P0622	Generator Field Term Circuit	PCM	Go to **Pinpoint Test B** .
P0625	Generator Field Terminal Circuit - Low	PCM	Go to **Pinpoint Test B** .
P0626	Generator Field Terminal Circuit - High	PCM	Go to **Pinpoint Test B** .
P065B	Generator Control Circuit Range/ Performance	PCM	Go to **Pinpoint Test B** .
All other DTCs	-	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The battery is discharged	• High key-off current drain(s) • Engine, generator and battery grounds	• Go to **Pinpoint Test**

or battery voltage is low	• Positive battery cable • Circuitry • Battery • Generator	**A** .
• The charging system warning indicator is on with the engine running and no charging system DTCs present	• Circuitry • PCM • Generator • Instrument cluster (IC)	• Go to **Pinpoint Test C** .
• The generator is noisy	• Accessory drive belt • Loose bolts/brackets • Generator/pulley	• Go to **Pinpoint Test D** .
• Radio interference	• Generator • Circuitry • In-vehicle entertainment system	• Go to **Pinpoint Test E** .

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrostatic discharge. If exposed to these charges, damage can result.

Refer to **INSPECTION AND VERIFICATION** , the **DTC CHART** and the **SYMPTOM CHART** for direction to the appropriate pinpoint test.

Pinpoint Test A: The Battery is Discharged or Battery Voltage is Low

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Charging System for schematic and connector information.

Normal Operation

The generator output voltage is supplied through the positive battery output (B+), circuit SDC14 (RD) terminal on the rear of the generator to the battery and electrical system. During normal operation the charging system warning indicator is off with the key ON engine running (KOER). The charging system warning indicator is on with the key ON engine OFF (KOEO).

This pinpoint test is intended to diagnose the following:

- High key-off current drain(s)
- Engine, generator and battery grounds
- Positive battery cable
- Circuitry

- Battery
- Generator

PINPOINT TEST A: THE BATTERY IS DISCHARGED OR BATTERY VOLTAGE IS LOW

A1 CHECK THE BATTERY CONDITION

- Carry out the Battery - Condition Test to determine if the battery can hold a charge and is OK for use. Refer to **BATTERY, MOUNTING & CABLES** article.
- **Does the battery pass the condition test?**

YES : Go to A2.

NO : INSTALL a new battery. REFER to **BATTERY, MOUNTING & CABLES** article. TEST the system for normal operation.

A2 CHECK THE GENERATOR OUTPUT

- Carry out the Generator On-Vehicle Load Test and No Load Test. Refer to the Component Tests in this service information.
- **Does the generator pass the component tests?**

YES : Go to A3.

NO : Go to **Pinpoint Test B** .

A3 CHECK FOR CURRENT DRAINS

- Carry out the Battery - Drain Testing. Refer to the Component Tests in this service information.
- **Are any circuits causing excessive current drains?**

YES : REPAIR as necessary. TEST the system for normal operation.

NO : Go to A4.

A4 CHECK THE VEHICLE GROUNDS

- Key in START position.

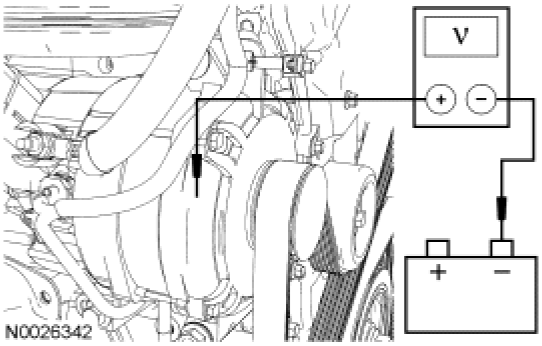

Fig. 1: Checking Vehicle Grounds
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between the generator housing and the negative battery terminal.
- **Is the voltage drop less than 0.1 volt?**

YES : Go to A5.

NO : CHECK the engine ground, generator ground and the battery ground for corrosion. TEST the system for normal operation.

A5 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT SDC14 (RD)

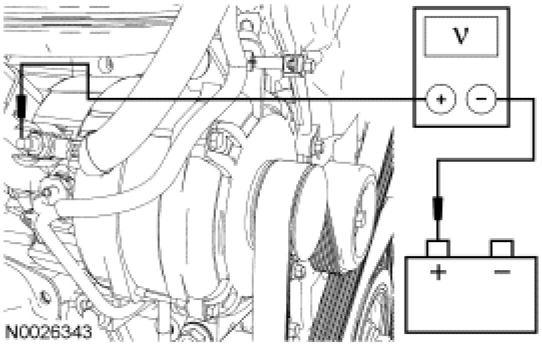

Fig. 2: Checking Voltage Drop
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between generator B+ C102b circuit SDC14 (RD) and the positive battery terminal.
- **Is the voltage drop less than 0.5 volt?**

  YES : CHECK if the customer left any electrical system(s) on or if there is an intermittent excessive battery draw. TEST the system for normal operation.

  NO : CHECK for any corrosion in the B+ SDC14 (RD), positive battery cable and/or connections. REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test B: DTCs B1317, P0563, P0620, P0625, P0626 and P065B - Charging System Failure

Refer to appropriate WIRING DIAGRAMS ARTICLE, Charging System for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The A sense circuit SBB08 (VT/RD) to the generator field coil is 13-15 volts. This voltage feedback is used by the regulator to maintain the battery voltage at the desired setpoint. The S (stator) circuit (internal to the generator) is used to monitor generator operation. This circuit and other regulator internal conditions are checked by the regulator to allow the PCM to turn off the charging system warning indicator by sending a message over the controller area network (CAN) bus to the instrument cluster (IC). The positive battery output (B+) circuit SDC14 (RD) is the generator output voltage supplied to the battery and electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- IC

- PCM

DTC Description	Fault Trigger Conditions
• B1317 - Battery Voltage High • P0563 - System Voltage High • P0620 - Generator Control Circuit • P0625 - Generator Field Circuit - Low • P0626 - Generator Field Circuit - High • P065B - Generator Control Circuit Range	Open, short to ground or battery. Charging system voltage is below 13 volts or above 16 volts and charging system lamp is illuminated.

PINPOINT TEST B: DTCs B1317, P0563, P0620, P0625, P0626 AND P065B - CHARGING SYSTEM FAILURE

NOTE: Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

B1 CONFIRM THE BATTERY CONDITION

- Carry out the Battery Condition Test. Refer to **BATTERY, MOUNTING & CABLES** article.
- **Is the battery OK?**

  YES : Go to B2.

  NO : CORRECT the battery condition and Go to B2.

B2 CHECK THE BATTERY JUNCTION BOX (BJB) FUSE 8 (10A)

- Check fuse: BJB 8 (10A)
- **Is BJB 8 (10A) OK?**

  YES : Go to B3.

  NO : REPAIR circuit SBB08 (VT/RD) and INSTALL a fuse. INSPECT PCM and engine ground circuits and make sure they are securely attached. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B3 CHECK THE GENERATOR B+ CONNECTION

- Key in OFF position.
- Inspect generator C102b circuit SDC14 (RD) connection. Connection should be tight.

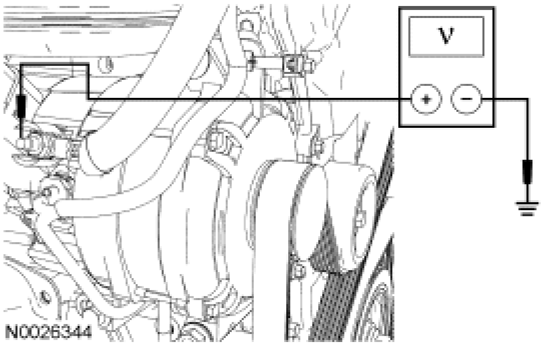

Fig. 3: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between generator C102b circuit SDC14 (RD) and ground.
- **Is generator C102b connection tight and does the generator B+ measure battery voltage?**

  YES : Go to B4.

  NO : TIGHTEN the generator B+ connection or REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B4 MONITOR THE PCM PIDs WITH KEY ON/ENGINE OFF (KOEO)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Clear the PCM DTCs
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger

  NOTE: Many of the PCM PIDs selected will be monitored later in this pinpoint test.

  Select and monitor the following PCM PIDs:

  - Generator Monitor (GENMON).
  - Generator Command Duty Cycle (GENCMD).
  - Generator Voltage Desired (GENVDSD).
  - Generator Fault Indicator Lamp (GENFIL).
  - Engine Revolutions Per Minute (RPM).
  - Module Supply Voltage (VPWR).
- Monitor the GENMON PID.
- **Does the PID read 0%?**

  YES : Go to B5.

  NO : Go to B8.

B5 MONITOR THE PCM PID GENMON WITH KEY ON/ENGINE RUNNING (KOER)

- Key in START position.
- With the engine at idle, wait 15 seconds for the GENVDSD PID to increase to greater than 13 volts.

- Monitor PID GENMON at idle and 3,000 RPM.
- **Does the GENMON PID read between 3% and 98% at engine idle speed and at 3,000 RPM?**

  YES : Go to B6.

  NO : Go to B8.

B6 MONITOR THE PCM PIDs GENMON, VPWR AND GENVDSD WITH THE ENGINE AT 3,000 RPM

- Turn all electrical accessories (lights, blower motor, etc.) off.

NOTE: If GENMON PID does not remain below 85%, make sure that the battery is at an acceptable state of charge and that all electrical accessories are off.

- Increase the engine speed to 3,000 RPM (or road test).
- **Does the VPWR PID remain within ± 0.5 volt of the GENVDSD PID when the GENMON PID is less than 85%?**

  YES : Go to B7.

  NO : Go to B17.

B7 MONITOR THE PCM PIDs GENMON, VPWR AND GENVDSD WITH THE ENGINE AT IDLE

- Return the engine speed to idle.

CAUTION: On vehicles with low electrical loads, it may be necessary to add external loads (devices connected to power points, etc.) to determine the maximum GENMON value. GENMON value will not read between 95%-98% on a vehicle with minimal electrical accessories. As long as there is a significant increase in the GENMON PID following the procedure below, answer YES to the question.

- Determine the maximum GENMON PID value by lowering engine idle RPM to 500 RPM or less using output state control (manual transaxle vehicles require the parking brake applied and the clutch pedal depressed) and turn on all electrical accessories until the VPWR PID is less than the GENVDSD PID by at least 0.7 volt. Under this condition the GENMON PID should read between 95% and 98%.
- **Does the GENMON PID read between 95% and 98%?**

  YES : Go to B19.

  NO : Go to B17.

B8 CHECK THE VOLTAGE OUTPUTS FROM THE PCM

- Key in OFF position.
- Disconnect: Generator C102a
- Key in ON position.

- Measure the voltage of the following circuits:

EXPECTED VOLTAGES

Generator Connector	Circuit	Expected Voltage (Approximate)
C102a-1	CDC15 (VT)	8-11 volts (should be less than battery voltage)
C102a-2	CDC10 (BU/OG)	0 volts
C102a-3	SBB08 (VT/RD)	Battery voltage

- **Are the voltages as indicated for each circuit?**

  YES : Go to B13.

  NO : If a fault is detected in the GENCOM circuit CDC10 (BU/OG) or GENMON circuit CDC15 (VT), go to B9.

  If a fault is detected in the A sense circuit SBB08 (VT/RD) circuit, go to B12.

B9 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR DAMAGE OR AN OPEN

- Key in OFF position.
- Disconnect: Generator C102a
- Disconnect: PCM C175b
- Inspect the following for damaged or pushed-out pins:

Component	Connector	Circuit
PCM	C175b-22	CDC10 (BU/OG)
PCM	C175b-23	CDC15 (VT)
Generator	C102a-2	CDC10 (BU/OG)
Generator	C102a-1	CDC15 (VT)

- Measure the resistance between PCM C175b-22, circuit CDC10 (BU/OG) harness side and generator C102a-2, circuit CDC10 (BU/OG) harness side and PCM C175b-23, circuit CDC15 (VT) harness side and generator C102a-1, circuit CDC15 (VT) harness side.
- **Are the connectors and pins free of damage and are the resistances less than 5 ohms?**

  YES : Go to B10.

NO : REPAIR the affected circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B10 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between generator C102a-1, circuit CDC15 (VT) harness side and ground and generator C102a-2, circuit CDC10 (BU/OG) harness side and ground.
- **Are the voltages approximately 0 volt?**

  YES : Go to B11.

  NO : REPAIR the affected circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B11 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between generator C102a-1, circuit CDC15 (VT) harness side and ground and generator C102a-2, CDC10 (BU/OG) harness side and ground and measure resistance between generator C102a-1, circuit CDC15 (VT) harness side and generator C102a-2, circuit CDC10 (BU/OG) harness side.
- **Are the resistances less than 5 ohms?**

  YES : REPAIR the affected circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to B24.

B12 CHECK CIRCUIT SBB08 (VT/RD) FOR DAMAGE OR AN OPEN

- Key in OFF position.
- Disconnect: Generator C102a
- Inspect C102a-3 for damaged or pushed-out pins.
- Measure the resistance of the A sense circuit SBB08 (VT/RD) between the battery and C102a-3 generator connector.
- **Are the connectors and pins free of damage and are the resistances less than 5 ohms?**

  YES : Go to B24.

  NO : REPAIR the affected circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B13 CHECK FOR SHORTED CIRCUITS

- Key in OFF position.
- Disconnect: Generator C102a
- Connect: PCM C175b
- Key in ON position.
- Verify that PID GENMON reads 100%.
- Carry out the Wiggle Test of wiring to determine if PID GENMON changes from 100%.
- **Does PID GENMON change from 100%?**

  YES : REPAIR short circuit on CDC15 (VT) C102a-1.

NO : Go to B14.

B14 CHECK THE PCM PID GENMON INPUT TO THE PCM

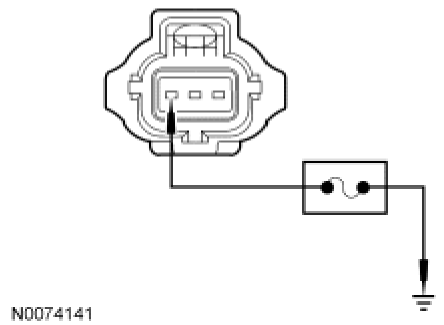

Fig. 4: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and ground.
- Key in ON position.
- Monitor the GENMON PID while performing a wiggle test on the wire harness.
- **Does the PID read 0%?**

  YES : Go to B15.

  NO : REPAIR open connection on circuit CDC15 (VT). INSPECT generator C102a-1 and PCM C175e-16 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B15 COMPARE THE PCM PIDS GENMON AND GENCMD

- Key in OFF position.
- Disconnect: Fused (10A) Jumper Wire

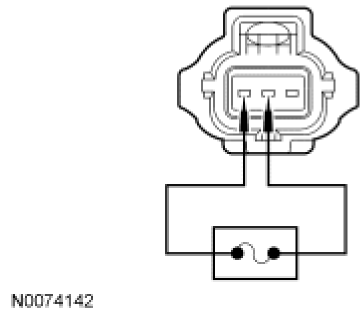

Fig. 5: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and generator C102a-2, circuit CDC10 (BU/OG), harness side.

- Key in ON position.
- Monitor the GENMON and GENCMD PIDs while performing a wiggle test on the harness.
- **Does the GENMON PID read within 2% of the GENCMD PID?**

  YES : Go to B16.

  NO : INSPECT C175b-66, circuit GD124 (BK/VT), PCM ground circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B16 A SENSE CIRCUIT LOAD TEST

NOTE: **This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault.**

- Key in ON position.
- Using a 12-volt test lamp, check for voltage at C102a-3, circuit SBB08 (VT/RD).
- **Does the test lamp illuminate?**

  YES : Go to B23.

  NO : REPAIR connection on circuit SBB08 (VT/RD). INSPECT generator C102a-3 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B17 CHECK THE PCM VPWR PID

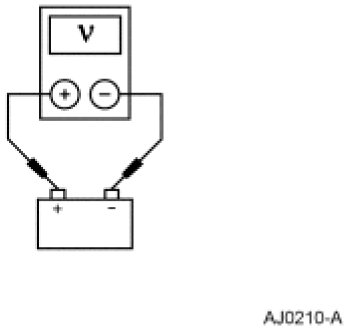

Fig. 6: Checking Charging System Voltage
Courtesy of FORD MOTOR CO.

- With the engine running, measure the battery voltage.
- Monitor the VPWR PID.
- **Are the battery voltage and PID within 0.5 volt of each other?**

  YES : Go to B19.

  NO : Go to B18.

B18 MEASURE THE PCM INPUT VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Connect a fused (10A) jumper wire between C175b-8 and ground.

- Key in ON position.

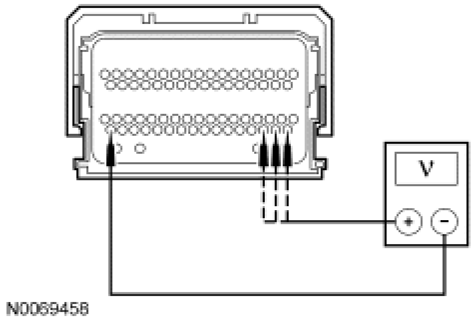

Fig. 7: Checking Circuits For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between PCM input voltage pins 51, 52 and 53 to PCM ground pin 66.
- **Are voltages within 0.5 volt of PID VPWR?**

YES : Go to B24.

NO : REPAIR high resistance or loose connections between C175b-51 circuit CBB30 (YE/BU), C175b-52 circuit CBB30 (YE/BU), C175b-53 circuit CBB30 (YE/BU) PCM power circuits or C175b-10, circuit GD122 (BK), PCM ground circuit.

B19 CHECK THE GENERATOR B+ RESISTANCE

- Key in OFF position.
- Disconnect: Battery
- Disconnect: Generator C102b

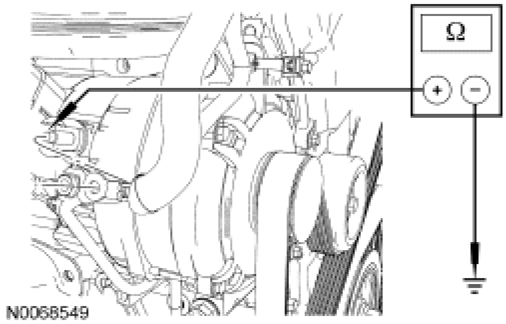

Fig. 8: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between generator C102b, component side and the generator housing.
- **Is the resistance greater than 125K ohms?**

YES : Go to B20.

NO : INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B20 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS TO GROUND

- Measure the resistance between generator C102a, component side and ground. Refer to the following table.

Pin	Expected Resistance
1	Greater than 1,000K ohms
2	Greater than 125K ohms
3	Greater than 125K ohms

- **Are the resistance values as indicated?**

  YES : Go to B21.

  NO : INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B21 ROAD TEST IN AN ATTEMPT TO VERIFY THE FAULT

- Connect: Generator C102b
- Connect: Generator C102a
- Connect: Battery
- Carry out a road test and monitor the following PIDs:
  - Generator monitor (GENMON).
  - Generator voltage desired (GENVDSD).
  - Module supply voltage (VPWR).
- **Does the GENMON PID read either 0% or 100% during the road test?**

  YES : Go to B2.

  NO : If a road test did not cause the fault to occur, intermittent fault condition may be present. Go to B22.

B22 USE THE VEHICLE DATA RECORDER (VDR) TO CAPTURE INTERMITTENT FAULT CONDITION

- Connect a VDR to the vehicle and setup to capture the following PIDs:
  - Generator monitor (GENMON).
  - Generator command duty cycle (GENCMD).
  - Generator voltage desired (GENVDSD).
  - Generator fault indicator lamp (GENFIL).

- Engine revolutions per minute (RPM).
- Module supply voltage (VPWR).
- Set the VDR to trigger if any of the following events occur during vehicle operation (waiting 15 seconds after start):
  - VPWR PID reads greater than 15.2 volts.
  - GENMON PID reads 0% or 100%.
- Road test the vehicle.
- **Was a fault captured by the VDR?**

  YES : RECORD any values from the VDR that may have been captured. If no charging system DTCs are present, go to **Pinpoint Test C** . If any charging system DTCs are present, go to B3.

  NO : No problem found at this time. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B23 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS

- Key in OFF position.
- Connect: Generator C102b
- Connect: Generator C102a
- Connect: PCM C175b
- Connect the diagnostic tool.
- Key in START position.
- With the engine running, monitor the charging system warning indicator lamp and the scan tool for DTCs.
- **Does the charging system warning indicator lamp illuminate and does any charging system DTC get stored into memory?**

  YES : INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : The fault is not present and cannot be recreated at this time. This may indicate an intermittent fault. Go to B19.

B24 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS

- Key in OFF position.
- Connect: Generator C102b
- Connect: Generator C102a
- Connect: PCM C175b
- Connect the diagnostic tool.
- Key in START position.
- With the engine running, monitor the charging system warning indicator lamp and the scan tool for DTCs.
- **Does the charging system warning indicator lamp illuminate and does any charging system DTC get stored into memory?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article.

NO : The fault is not present and cannot be recreated at this time. This may indicate an intermittent fault. Go to B19.

Pinpoint Test C: The Charging System Warning Indicator is On With the Engine Running and No Charging System DTCs Present

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Charging System for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The A sense circuit SBB08 (VT/RD) from the battery B+ to the generator regulator is 13-15 volts. This voltage feedback is used by the regulator to maintain the battery voltage at the desired setpoint. The S (stator) circuit (internal to the generator) is used to monitor generator operation. This circuit and other regulator internal conditions are checked by the regulator to allow the PCM to turn off the charging system warning indicator by sending a message over the controller area network (CAN) bus to the instrument cluster (IC). The positive battery output (B+) circuit SDC14 (RD) is the generator output supplied to the battery and electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Circuitry
- IC
- PCM

PINPOINT TEST C: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING AND NO CHARGING SYSTEM DTCs PRESENT

NOTE:	**Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.**

NOTE:	**Do not have a battery charger attached during vehicle testing.**

C1 CHECK THE BATTERY CONDITION

- Carry out the Battery - Condition Test to determine if the battery can hold a charge and is OK for use. Refer to **BATTERY, MOUNTING & CABLES** article.
- **Does the battery pass the condition test?**

  YES : Go to C2.

  NO : INSTALL a new battery. REFER to **BATTERY, MOUNTING & CABLES** article. TEST the system for normal operation.

C2 CHECK THE GENERATOR B+ CONNECTION

- Key in OFF position.

- Inspect generator C102b circuit SDC14 (RD) connection. Connection should be tight.

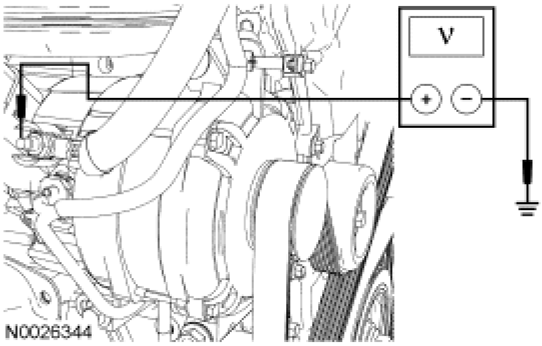

Fig. 9: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between generator C102b circuit SDC14 (RD) and ground.
- **Is generator C102b connection tight and does the generator B+ measure battery voltage?**

  YES : Go to C3.

  NO : TIGHTEN the generator B+ connection or REPAIR the circuit. CLEAR the any DTCs. REPEAT the self-test. TEST the system for normal operation.

C3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT SDC14 (RD)

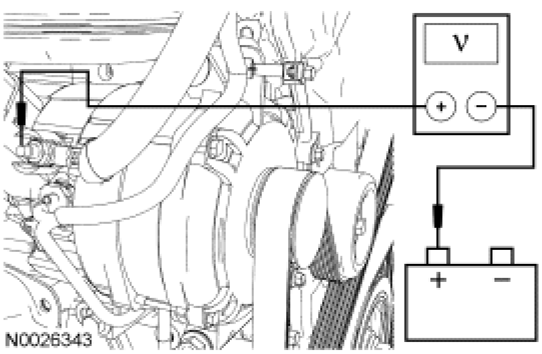

Fig. 10: Checking Voltage Drop
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between generator B+ C102b circuit SDC14 (RD) and the positive battery terminal.
- **Is the voltage drop less than 0.5 volt?**

  YES : Go to C4.

  NO : CHECK for any corrosion in the B+ C102b circuit SDC14 (RD), positive battery cable and/or connections. REPAIR as necessary. TEST the system for normal operation.

C4 CHECK THE DTCs IN THE PCM

- Key in OFF position.
- Connect the diagnostic tool.
- Key in START position.

- Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM DTCs
- Use the recorded PCM DTCs from the continuous and on-demand self tests.
- **Are any PCM DTCs recorded?**

  YES : For all DTCs EXCEPT charging system DTCs, REFER to the **INTRODUCTION - GASOLINE ENGINES** article. If any charging system DTCs are present, go to **Pinpoint Test B** . If referred here by the PC/ED, go to C5.

  NO : Go to C5.

C5 MONITOR PID GENFIL

- With the engine running, monitor PID GENFIL.
- **Does PID GENFIL show fault?**

  YES : Go to C6.

  NO : REPAIR/INSTALL a new IC, IC-to-PCM connection or the PCM. TEST the system for normal operation.

C6 MONITOR PID VPWR

- With the engine running, monitor PIDS VPWR, GENFIL, GENVDSD.
- **Is PID VPWR greater than 15.6 volts?**

  YES : Go to C7.

  NO : Go to C8.

C7 CHECK PCM VPWR PID

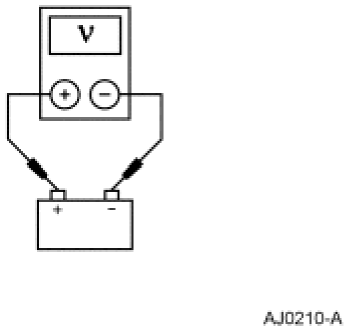

Fig. 11: Checking Charging System Voltage
Courtesy of FORD MOTOR CO.

- With the engine running, measure the battery voltage.
- Monitor the VPWR PID.
- **Are the battery voltage and VPWR PID within 0.6 volt of each other?**

  YES : Go to C8.

  NO : Go to C9.

C8 MEASURE THE PCM INPUT VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b

- Connect a fused (10A) jumper wire between C175b-8 and ground.
- Key in ON position.

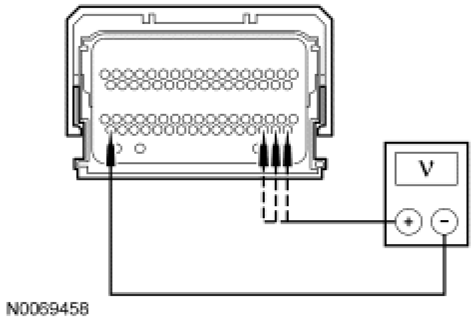

Fig. 12: Checking Circuits For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between PCM input voltage pins 51, 52 and 53 to PCM ground pin 66.
- **Are voltages within 0.5 volt of PID VPWR?**

  YES : INSTALL a new PCM.

  NO : REPAIR high resistance or loose connections between C175b-51 circuit CBB30 (YE/BU), C175b-52 circuit CBB30 (YE/BU), C175b-53 circuit CBB30 (YE/BU) PCM power circuits or C175b-10, circuit GD122 (BK), PCM ground circuit.

C9 MONITOR THE PCM PID GENERATOR MONITOR WITH KEY ON/ENGINE RUNNING

- Key in START position.
- With the engine at idle, wait 15 seconds for the GENVDSD PID to increase to greater than 13 volts.
- Monitor PID GENMON at idle and 3,000 RPM.
- **Does the GENMON PID read between 3% and 98% at engine idle speed and at 3,000 RPM?**

  YES : Go to C10.

  NO : Go to C11.

C10 MONITOR PID GENVDSD

- With the engine running, monitor PID GENVDSD.
- **Is PID GENVDSD greater than 15.2 volts?**

  YES : REPAIR connection on circuit SBB08 (VT/RD). INSPECT generator C102a-3 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If no problems are found, INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. TEST the system for normal operation.

  NO : INSTALL a new PCM.

C11 CHECK FOR SHORTED CIRCUITS

- Key in OFF position.
- Disconnect: Generator C102a
- Verify that PID GENMON reads 100%.

- Carry out the Wiggle Test of wiring to determine if PID GENMON changes from 100%.
- **Does PID GENMON change from 100%?**

  YES : REPAIR short circuit on C102a-1 CDC15 (VT).

  NO : Go to C12.

C12 CHECK THE PCM PID GENERATOR MONITOR INPUT TO THE PCM

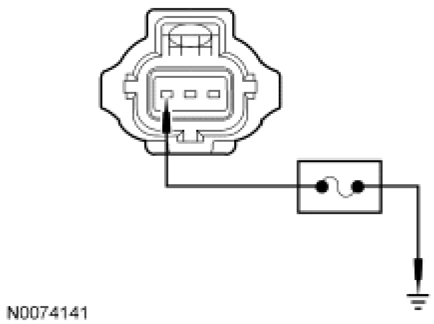

Fig. 13: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and ground.
- Key in ON position.
- Monitor the GENMON PID while carrying out a Wiggle Test on the wire harness.
- **Does the GENMON PID read 0%?**

  YES : REPAIR open connection on circuit CDC15 (VT) C102a-1 and PCM C175b-23. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: The Generator is Noisy

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Charging System for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system.

This pinpoint test is intended to diagnose the following:

- Accessory drive belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST D: THE GENERATOR IS NOISY

D1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS

- Key in OFF position.
- Check the accessory drive belt for damage and correct installation. Refer to **ACCESSORY DRIVE** article.
- Check the accessory mounting brackets and generator pulley for looseness or misalignment.
- **Is the accessory drive OK?**

  YES : Go to D2.

  NO : REPAIR as necessary. REFER to **ACCESSORY DRIVE** article for diagnosis and testing of the accessory drive system. TEST the system for normal operation.

D2 CHECK THE GENERATOR MOUNTING

- Check the generator mounting for loose bolts or misalignment.
- **Is the generator mounted correctly?**

  YES : Go to D3.

  NO : REPAIR as necessary. TEST the system for normal operation.

D3 CHECK THE GENERATOR FOR ELECTRICAL NOISE

- Disconnect: Generator C102b
- Key in START position.
- With the engine running, use a stethoscope or equivalent listening device to probe the generator.
- **Is the noise still present?**

  YES : Go to D4.

  NO : INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. TEST the system for normal operation.

D4 CHECK THE GENERATOR FOR MECHANICAL NOISE

- With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise.
- **Is the generator the noise source?**

  YES : INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. TEST the system for normal operation.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the source of the engine noise.

Pinpoint Test E: Radio Interference

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Charging System for schematic and connector information.

Normal Operation

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Circuitry
- In-vehicle entertainment system

PINPOINT TEST E: RADIO INTERFERENCE

E1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE

NOTE: **If the OEM audio unit has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before following this pinpoint test.**

- Key in START position.
- Start and run the engine.
- Tune the audio unit to a station where the interference is present.
- Key in OFF position.
- Disconnect: Generator C102b
- Key in START position.
- With the engine running, determine if the interference is still present.
- **Is the interference present with the generator disconnected?**

  YES : REFER to **INFORMATION & ENTERTAINMENT SYSTEMS** article for diagnosis and testing of the in-vehicle entertainment system.

  NO : INSTALL a new generator. REFER to **GENERATOR & REGULATOR** article. TEST the system for normal operation.

Pinpoint Test F: DTC B1318 or B1676 - Battery Voltage Low or Battery Voltage Out of Range

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Charging System for schematic and connector information.

Normal Operation

Various control modules within the vehicle operate at a voltage between 10-17 volts. Voltage to these modules is supplied through the vehicle harness to the module(s). Ground for the modules is provided by the modules ground circuit(s). If voltages to these modules rise above 17 volts, DTC B1317 or B1676 may set or if voltage drops below 10 volts, DTC B1318 or B1676 may set.

- DTC B1318 Battery Voltage Out Of Range - If charging system voltage falls below a certain voltage, some modules within the vehicle may set this DTC. Some modules have a different voltage minimum set point to set this DTC.

- DTC B1676 Battery Voltage High - If charging system voltage falls below or above a certain voltage, some modules within the vehicle may set this DTC. Some modules have a different voltage minimum or maximum set point to set this DTC.

This pinpoint test is intended to diagnose the following:

- Battery
- Charging system
- Module voltage supply
- Module ground

NOTE: DTC B1317 or B1318 can be set if the vehicle has had a discharged battery, has been recently jump started or has had the vehicle battery charged.

PINPOINT TEST F: DTC B1318 OR B1676 - BATTERY VOLTAGE LOW OR BATTERY VOLTAGE OUT OF RANGE

F1 CHECK FOR DTCs

- Key in OFF position.
- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Retrieve all continuous DTCs
- **Is DTC B1318 or B1676 present in only one module?**

  YES : If DTC B1317 or B1676 are recorded in only one module, go to F2.

  NO : If DTC B1318 or B1676 are recorded in more than one module, go to **Pinpoint Test B** .

F2 CHECK THE BATTERY VOLTAGE

- Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running, all accessory loads OFF.
- **Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running?**

  YES : Go to F3.

  NO : CHECK and/or REPAIR the charging system as necessary. Go to **Pinpoint Test B** . TEST the system for normal operation. CLEAR the DTCs. REPEAT the self-test.

F3 CHECK THE VOLTAGE TO THE MODULE

- Key in OFF position.
- Disconnect: Affected module which recorded the DTC B1317 or B1676
- Key in ON position.
- Measure all of the affected module's power circuits, harness side to ground. Refer to affected module Wiring Diagrams for schematic and connector information. Refer to appropriate SYSTEM WIRING DIAGRAMS article.
- **Is the voltage greater than 10 volts?**

  YES : Go to F4.

NO : REPAIR the module power circuit(s). CLEAR the DTCs. REPEAT the self-test.

F4 CHECK THE MODULE GROUNDS

- Key in OFF position.
- Measure the resistance between all of the affected module's ground circuits, harness side to ground. Refer to affected module Wiring Diagrams for schematic and connector information. Refer to appropriate SYSTEM WIRING DIAGRAMS article.
- **Is the resistance less than 5 ohms?**

  YES : Go to F5.

  NO : REPAIR the module ground circuit(s). CLEAR the DTCs. REPEAT the self-test.

F5 CHECK THE MODULE FOR CORRECT OPERATION

- Key in OFF position.
- Disconnect: All of the affected module connectors
- Check the connector and module for:
  - corrosion.
  - pushed out or damaged pins.
  - connector or module damage.
- Connect: All of the affected module connectors
- Clear all DTCs.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new module. REFER to the removal and installation procedure in the affected module's service information . CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been the result of a loose connection, may recently have had a discharged battery or may have been jump started. CLEAR the DTCs. REPEAT the self-test.

Component Tests

Battery - Drain Testing

WARNING: **Do not attempt to service, charge, recharge or jump start a battery unless the following information has been read and understood. Failure to follow this instruction may result in serious personal injury.**

CAUTION: To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.

CAUTION: If equipped with the CD6 audio unit, precautions must be taken when the battery has been disconnected. When reconnecting the battery, make sure no interruption of power occurs for 30 seconds. If power is interrupted

during the first 30 seconds, permanent damage to the CD6 audio unit will result.

NOTE: **No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.**

Check for current drains on the battery in excess of 50 mA (0.050 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure.

NOTE: **Many electronic modules draw 10 mA (0.010 amp) or more continuously.**

NOTE: **Use an in-line ammeter between the negative battery post and its respective cable.**

NOTE: **Typically, a drain of approximately one amp is attributed to an engine compartment lamp, glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it is due to the generator.**

NOTE: **To accurately test the drain on a battery, an in-line ammeter must be used. Use of a test lamp or voltmeter is not an accurate method due to the number of electronic modules.**

1. Make sure the junction box(es)/fuse panel(s) is accessible without turning on the interior lights or the underhood lights.
2. Drive the vehicle at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.
3. Allow the vehicle to sit with the key off for at least 40 minutes to allow the modules to time out/power down.
4. Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent modules from resetting and to catch capacitive drains.
5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.

   NOTE: **It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire procedure must be repeated.**

6. Connect the battery tester between the negative battery cable and the post. The meter must be capable of reading milliamps and should have a 10 amp capability.

   NOTE: **If the meter settings need to be switched or the test leads need to be**

moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

NOTE: **Amperage draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.**

NOTE: **No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.**

7. Remove the jumper wire.
8. Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.
9. If the draw is found to be excessive, remove the fuses from the smart junction box (SJB) one at a time and note the current reading. Do not reinstall the fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed and then install one fuse, note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.
10. If the current draw is still excessive, remove the fuses from the battery junction box (BJB) one at a time and note the current drop. Do not reinstall the fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse, note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located.
11. Check the wiring diagrams for any circuits that run from the battery without passing through the BJB or the SJB. Refer to appropriate SYSTEM WIRING DIAGRAMS article. If the current draw is still excessive, disconnect these circuits until the draw is found. Disconnect the generator electrical connections if the draw cannot be located. The generator may be internally shorted, causing the current drain.

Generator On-Vehicle Tests

CAUTION: **To prevent damage to the generator, do not make the jumper wire connections except as directed.**

CAUTION: **Do not allow any metal object to come in contact with the housing and the internal diode cooling fins with the key on or off. A short circuit may result and burn out the diodes.**

NOTE: **Battery posts and cable clamps must be clean and tight for accurate meter indications.**

NOTE: **Refer to the battery tester manual for complete directions for testing the charging system.**

1. Turn off all lamps and electrical components.
2. Place the transmission in NEUTRAL and apply the parking brake.
3. Carry out the Load Test and No-Load Test according to the following component tests:

Generator On-Vehicle Tests - Load Test

1. Switch the tester to the ammeter function.
2. Connect the positive and negative leads of the tester to the corresponding battery terminals.
3. Connect the current probe to the generator B+ output terminal, circuit SDC14 (RD).
4. With the engine running at approximately 2,000 RPM, adjust the tester load bank to determine the output of the generator. Generator output should be greater than the graph shown below. If not, refer back to the pinpoint test or Go to **Symptom Chart**.

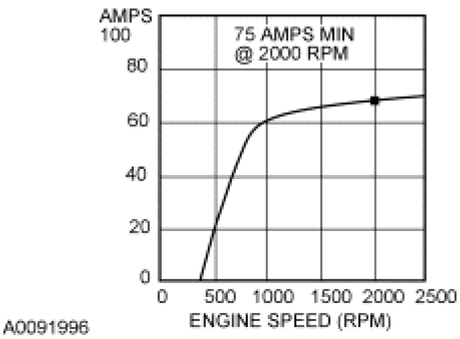

Fig. 14: Load Test Output Chart
Courtesy of FORD MOTOR CO.

Generator On-Vehicle Tests - No-Load Test

1. Switch the tester to the voltmeter function.
2. Connect the voltmeter positive lead to the generator B+ terminal, circuit SDC14 (RD), and the negative lead to ground.
3. Turn all electrical accessories off.
4. With the engine running at approximately 2,000 RPM, check the generator output voltage. The voltage should be between 13.2 and 15.5 volts. If not, refer back to the pinpoint test or Go to **Symptom Chart**.

Generator and Regulator - Edge & MKX

SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Generator pulley ratio	2.66:1
Rating	78/143 amp (max) @ 620-2,500 engine RPM @ normal engine temperature
Voltage regulator type	Electronic internal with generator

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Generator B+ terminal nut	12	9	-
Generator bolts	47	35	-
Generator nuts	47	35	-
Generator stud	8	-	71

DESCRIPTION AND OPERATION

GENERATOR

The charging system consists of the following components:

- Generator
- Integral voltage regulator

The generator is belt-driven by the engine accessory drive system. The generator has an internal voltage regulator that is not replaced separately. The generator and voltage regulator are repaired as an assembly.

DIAGNOSTIC TESTS

GENERATOR

Refer to **CHARGING SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

GENERATOR

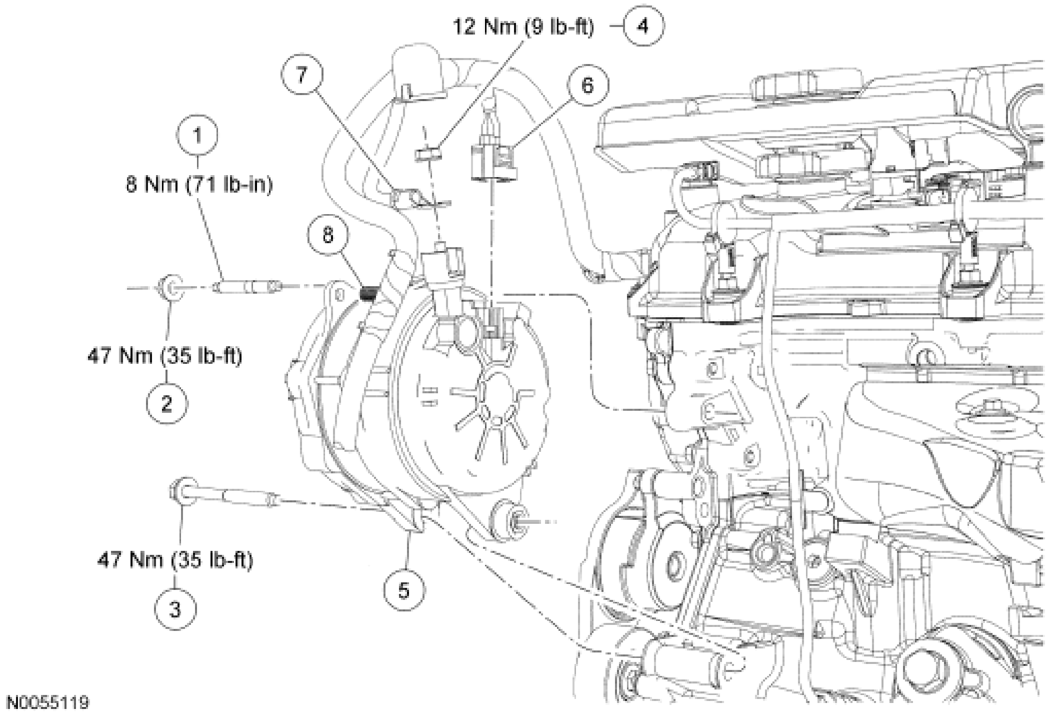

Fig. 1: Exploded View Of Generator Components With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712609	Generator stud
2	W520414	Generator nut
3	W709986	Generator bolt
4	7H953	Generator B+ terminal nut
5	10300	Generator
6	-	Generator electrical connector (part of 14B060)
7	-	Generator B+ terminal (part of 14B060)
8	-	Pin-type retainer, wiring harness

REMOVAL AND INSTALLATION

1. Disconnect the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Remove the cooling fan. For additional information, refer to **ENGINE COOLING** article.
3. Rotate the accessory drive belt tensioner counterclockwise and position the accessory drive belt aside.
4. Position the generator B+ terminal protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (9 lb-ft).
5. Disconnect the generator electrical connector.

- Detach the pin-type retainer and wiring harness.

6. Remove the generator stud nut.
   - To install, tighten to 47 Nm (35 lb-ft).
7. Remove the generator stud.
   - To install, tighten to 8 Nm (71 lb-in).
8. Remove the RH fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
9. Loosen the generator bolt and remove the generator.
   - To install, tighten to 47 Nm (35 lb-ft).
10. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

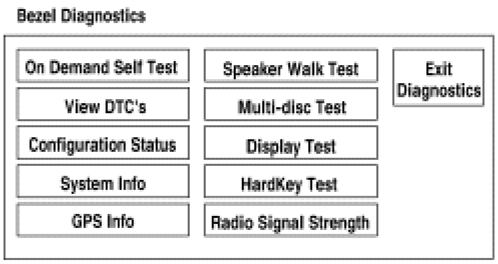
ENGINE COOLING

CAUTION: The engine cooling system is filled with Motorcraft Premium Gold Engine Coolant. Mixing coolant types degrades the corrosion protection of Motorcraft Premium Gold Engine coolant.

NOTE: Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.

The cooling system components are the:

- radiator.
- bypass tube.
- pressure relief cap.
- degas bottle.
- radiator draincock.
- coolant pump.
- engine coolant temperature indicator unit.
- thermostat (cold side).
- variable speed fan motor assembly.
- fan control module.
- engine block coolant weep hole.



N0026635

Fig. 1: Locating Engine Block Coolant Weep Hole
Courtesy of FORD MOTOR CO.

The engine is equipped with an engine block coolant weep hole. If the inner coolant pump shaft seal fails, coolant will be diverted out the weep hole in the LH side of the engine block. This prevents any coolant from entering the crankcase.

Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water.

To maintain the integrity of the coolant and the cooling system:

- add Motorcraft Premium Gold Engine Coolant. Do not mix coolant types.
- do not add/mix orange-colored Motorcraft Specialty Orange Engine Coolant or equivalent meeting Ford specification WSS-M97B44-D or green colored Motorcraft Premium Engine Coolant meeting Ford specification ESE-M97B44-A or equivalent. Mixing coolants may degrade the coolant's corrosion protection.
- do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.

NOTE: In the following illustration, Black arrows indicate hot, white arrows indicate cold.

MATERIAL

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

Principles of Operation

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. On most engines, the coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. Some engines use a belt driven by a pulley attached to the camshaft, and some engines use a sprocket driven by the timing chain to operate the coolant pump. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

NOTE: The vehicle is equipped with either a degas bottle or an expansion tank.

The degas bottle, if equipped, holds surplus coolant and removes air from the cooling system, which reduces hot spots. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The coolant expansion tank, if equipped, holds surplus coolant, allows for coolant expansion and replenishes coolant to the cooling system. It is equipped with a non-pressurized cap which allows coolant to be added to the tank to keep it filled to prescribed levels.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor will be executed once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set, and the malfunction indicator lamp will be illuminated.

For vehicle/engine specific information, refer to **ENGINE COOLING** in Description and Operation.

Inspection and Verification

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

CAUTION: The engine cooling system is filled with Motorcraft Premium Gold Engine Coolant. Mixing coolant types degrades the corrosion protection of Motorcraft Premium Gold Engine Coolant. Do not mix coolant types. Failure to follow these instructions may result in engine or cooling system damage.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.

1. Verify the customer concern.
2. Visually check the engine coolant level at the degas bottle or coolant expansion tank when the system is cold.
3. Make sure the pressure relief cap is installed correctly.
4. Record any cooling system DTCs retrieved. Refer to the **PCM DTC CHART** in this service information for DTC descriptions.

   NOTE: Take note of any coolant odor or steam coming from cooling system components.

5. If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.

NOTE: **Refer to the coolant flow diagram in ENGINE COOLING in Description and Operation .**

6. Inspect to determine if any of the following mechanical or electrical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Leaks or weeps at: ○ Hoses ○ Tubes ○ Clamp joints ○ Quick connect couplings (if equipped) ○ Gaskets ○ O-rings ○ Thermostat housing ○ Radiator ○ Pressure relief cap ○ Coolant pump ○ Heater core (wet floor or coolant odor in vehicle) ○ Heater control valve ○ Heated throttle body (TB) or heated TB adapter (if equipped) ○ Coolant crossover manifold assembly (if equipped) ○ Oil cooler (if equipped) ○ Degas bottle (if equipped) ○ Coolant expansion tank (if equipped)	• Inoperative or damaged: ○ Electric cooling fan (if equipped) ○ Electronically actuated fan clutch ○ Electronically actuated fan clutch controller ○ Wiring, connectors, relays or modules ○ Engine coolant temperature (ECT) sensor (if equipped) ○ Cylinder head temperature (CHT) sensor (if equipped) ○ Intake air temperature (IAT) sensor (if equipped) ○ Mass air flow (MAF) sensor ○ Vehicle speed sensor (VSS)

- Heated PCV (if equipped) - Fuel pressure regulator coolant bowl (if equipped, natural gas engine) - Cylinder block core plugs (if equipped) - Cylinder head core plugs (if equipped) - Block heater (if equipped)	

VISUAL INSPECTION CHART

Mechanical	Electrical
- Cracked or damaged: - Hoses - Tubes - Hose clamps - Heater control valve (if equipped) - Thermostat housing - Radiator - Pressure relief cap - Cooling fan - Fan clutch (if equipped) - Coolant pump - Degas bottle (if equipped) - Coolant expansion tank (if equipped) - Oil cooler (if equipped)	

- Coolant crossover manifold assembly (if equipped) - Cylinder block core plugs (if equipped) - Cylinder head core plugs (if equipped) - Block heater (if equipped) • Restricted airflow through the A/C condenser/radiator • Drive belt loose, worn or installed incorrectly • Broken or weak drive belt tensioner • Excessive white or light gray exhaust smoke (may have burnt coolant odor) • Coolant in engine oil • Engine oil in coolant • Coolant in automatic transmission fluid (if equipped) • Automatic transmission fluid (if equipped) in coolant	

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.
8. Inspect the coolant condition in the following sequence:
    1. Inspect the coolant color.
        - If Motorcraft Premium Gold Engine Coolant has a clear or pale yellow color, this indicates higher water content than required. Test the engine coolant freezing point range with the Battery/Antifreeze Tester. The freezing point should be in the range -45°C to -23°C (-50°F to -10°F). If the vehicle is driven in cold climates less than -36°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
        - A pale green color indicates incorrect coolant (green in color) may have been added to the

system. Use of incorrect (green in color) coolant degrades the corrosion protection of Motorcraft Premium Gold Engine Coolant. Flush the system and refill with the correct mixture of distilled water and Motorcraft Premium Gold Engine Coolant.

NOTE: If Cooling System Stop Leak Pellets are used, darkening of the Motorcraft Premium Gold Engine Coolant from yellow to golden tan will occur.

- Dark brown could indicate a commercially available stop leak may have been used. Flush the system and refill with the correct mixture of distilled water and Motorcraft Premium Gold Engine Coolant.
- A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Motorcraft Premium Gold Engine Coolant.
- An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For information on engine diagnosis, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
- A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to component tests in this service information. If engine oil is suspected, the cause of the leak may be internal to the engine. Refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
- A red, orange or light green colored sheen on top of the coolant may indicate that transmission fluid is entering the cooling system. The cause may be a leaky radiator. Pressure test the cooling system. Refer to **COMPONENT TESTS**.

2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Battery/Antifreeze Tester. The freezing point should be in the range -45°C to -23°C (-50°F to -10°F). If the vehicle is driven in cold climates less than -36°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
   - Maximum coolant concentration is 60/40 for cold weather areas.
   - Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant range and level if necessary:
   - If coolant is low, add specified coolant mixture only.
   - If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
   - If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

10. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

11. If the scan tool does not communicate with the VCM:
    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM.
    - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
12. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
13. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
14. Clear the continuous DTCs and carry out the self-test diagnostics PCM.
15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
16. If no DTCs related to the concern are retrieved, go to **SYMPTOM CHART** table.

PCM DTC CHART

DTC	Description	Action
P0217	Engine Coolant Overtemperature Condition	Go to **Pinpoint Test B** .
P1285	Cylinder Head Overtemperature Condition	Go to **Pinpoint Test B** .
P1299	Cylinder Head Overtemperature Protection Active	Go to **Pinpoint Test B** .
P0125	Insufficient Coolant Temp For Closed Loop Fuel Control	Go to **Pinpoint Test c** .
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	Go to **Pinpoint Test c** .
P0480 P0481 P0482	Fan 1, 2 or 3 Control Circuit, Respectively	REFER to the **Introduction - Gasoline Engines** article.
All Other DTCs	-	REFER to the **Introduction - Gasoline Engines** article.

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action

• Loss of coolant	• Coolant hoses or tubes • Hose clamps • Coolant pump O-ring seal or gasket • Thermostat O-ring seal or gasket • Thermostat housing • Radiator • Transmission fluid cooler (in radiator) (if equipped) (may leak internally or externally) • Degas bottle (if equipped) • Coolant expansion tank (if equipped) • Pressure relief cap • Coolant pump leaking from weep hole • Auxiliary coolant pump (if equipped) • Heater core • Heater control valve (if equipped) • Coolant crossover manifold assembly (if equipped) • Engine gaskets (may leak internally or externally) • Oil cooler (if equipped) (may leak internally or externally) • Heated throttle body (TB) or heated TB adapter (if equipped) • Heated PCV (if equipped) • Fuel pressure regulator coolant bowl (if equipped, natural gas engine) • Cylinder block core plugs (if equipped) • Cylinder head core plugs (if equipped) • Block heater (if equipped)	• Go to **Pinpoint Test A** .
• The engine overheats	• Low coolant level • External engine coolant leak • Airlock in system • Pressure relief cap installation • Restricted airflow through the A/C condenser/radiator	• Go to **Pinpoint Test B** .

	• Internal engine coolant leak • Coolant condition/concentration • Accessory drive components • Non-OEM engine enhancement components • Electric cooling fan (if equipped) • Mechanical cooling fan (if equipped) • Mechanical cooling fan clutch (if equipped) • Radiator • Thermostat • Engine coolant temperature (ECT) indicator system (gauge) • ECT sensor (if equipped) • Cylinder head temperature (CHT) sensor (if equipped) • Heater core • Coolant pump • Coolant flow restriction	
• The engine does not reach normal operating temperature	• Low coolant level • Thermostat • Mechanical fan clutch always engaged • Electric cooling fan always on • Engine coolant temperature indicator system (gauge) • ECT sensor (if equipped) • CHT sensor (if equipped)	• Go to **Pinpoint Test C** .
• The block heater does not operate correctly	• Block heater power cable	• CHECK continuity in all 3 power cable circuits. If any circuit measures greater than 5 ohms, INSTALL a new power cable.
-	• Block heater	• CHECK the resistance of the block heater. If the resistance does not measure between 12.5 and 17.0 ohms, INSTALL a new block

		heater.
• The electric cooling fan (s) or electronically controlled fan clutch is inoperative in one or more speeds or does not operate correctly (if equipped)	• Wiring • Relays • Fuses • Fan control module • Cooling fan motor(s) • Cooling fan resistor(s) • Electric fan clutch	• REFER to the **Introduction - Gasoline Engines** article.
• The electric cooling fan (s) stay(s) on all the time (if equipped)	• Wiring • Relays	• REFER to the **Introduction - Gasoline Engines** article.
• Noisy electric cooling fan operation (if equipped)	• Foreign material contamination • Fan motor	• REMOVE the foreign material from the cooling fan and shroud. TEST the system for normal operation. If still noisy, INSTALL a new cooling fan assembly.
-	• Fan blade detached from fan motor	• INSTALL a new cooling fan assembly.
• Noisy mechanical fan operation (if equipped)	• Fan clutch	• CARRY OUT the Fan Clutch Test - Minimum Speed Requirement component test.

Pinpoint Test A: Loss of Coolant

Normal Operation

The engine cooling system is a closed system that provides for coolant expansion and contraction and also changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps are used to contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Coolant loss can be attributed to either external or internal leaks anywhere within the cooling system.

For vehicle/engine specific information, refer to **ENGINE COOLING** in Description and Operation.

This pinpoint test is intended to diagnose the following:

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing
- Heater control valve (if equipped)
- Radiator
- Transmission fluid cooler (in radiator) (if equipped)
- Pressure relief cap
- Coolant pump leaking from weep hole
- Auxiliary coolant pump (if equipped)
- Heater core
- Heated throttle body (TB) or heated TB adapter (if equipped)
- Coolant crossover manifold assembly (if equipped)
- Engine gaskets
- Oil cooler (if equipped)
- Degas bottle (if equipped)
- Coolant expansion tank (if equipped)
- Heated PCV (if equipped)
- Fuel pressure regulator coolant bowl (if equipped, natural gas engine)
- Cylinder block core plugs (if equipped)
- Cylinder head core plugs (if equipped)
- Block heater (if equipped)
- Engine coolant temperature (ECT) sensor (if equipped)

PINPOINT TEST A: LOSS OF COOLANT

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

A1 CARRY OUT INSPECTION AND VERIFICATION

- Carry out the Inspection and Verification procedure in this service information.
- **Were any concerns found?**

  YES : REPAIR as needed. TEST the system for normal operation.

  NO : Go to A2 .

A2 CHECK THE ENGINE COOLANT LEVEL

NOTE: Allow the engine to cool before checking the engine coolant level.

- Key in OFF position.
- Visually inspect the engine coolant level at the degas bottle or the coolant expansion tank.
- **Is the engine coolant level within specifications?**

  YES : Go to A3.

  NO : ADJUST the engine coolant level as necessary. Go to A3.

A3 PRESSURE TEST THE ENGINE COOLING SYSTEM

- Pressure test the engine cooling system. Refer to Cooling System Pressure Test in **COMPONENT TESTS** in this service information.
- **Does the engine cooling system leak?**

  YES : REPAIR or INSTALL new components. TEST the system for normal operation.

  NO : If the vehicle is equipped with a coolant expansion tank, go to A4. If the vehicle is equipped with a degas bottle, go to A5.

A4 CHECK THE PRESSURE RELIEF CAP

- Carry out the pressure relief cap pressure test. Refer to Pressure Relief Cap Pressure Test in **COMPONENT TESTS** in this service information.
- **Is the pressure relief cap OK?**

  YES : Go to A5.

  NO : INSTALL a new pressure relief cap. TEST the system for normal operation.

A5 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

- Inspect the engine coolant in the degas bottle or coolant expansion tank for signs of engine oil or transmission fluid.
- **Is engine oil or transmission fluid evident in the coolant?**

  YES : If engine oil is evident, go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure. TEST the system for normal operation.

  NO : Go to A6.

A6 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT

- Remove the oil level indicators from the engine and the transmission.
- **Is coolant evident in the oil or transmission fluid?**

  YES : If coolant is in the engine oil, go to **ENGINE SYSTEM - GENERAL INFORMATION** article. If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure.

  NO : Go to A7.

A7 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

NOTE: Use U-View® Combustion Leak Tester part number 560000 or equivalent.

- Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.
- **Are combustion gases present?**

  YES : Go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis.

  NO : The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. On most engines, the coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. Some engines use a belt driven by a pulley attached to the camshaft, and some engines use a sprocket driven by the timing chain to operate the coolant pump. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant), or an inability to transfer engine generated heat to the outside air through the radiator.

For vehicle/engine specific information, refer to **ENGINE COOLING** in Description and Operation.

- DTC P0217 Engine Coolant Overtemperature Condition
- DTC P1285 Cylinder Head Overtemperature Condition
- DTC P1299 Cylinder Head Overtemperature Protection Active

This pinpoint test is intended to diagnose the following:

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator

- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components
- Electric cooling fan (if equipped)
- Mechanical cooling fan blade (if equipped)
- Mechanical cooling fan clutch (if equipped)
- Engine coolant temperature (ECT) indicator system (gauge)
- ECT sensor (if equipped)
- Cylinder head temperature (CHT) sensor (if equipped)
- Heater core
- Coolant pump
- Coolant flow restriction

PINPOINT TEST B: THE ENGINE OVERHEATS

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

B1 CARRY OUT INSPECTION AND VERIFICATION

- Carry out the Inspection and Verification procedure in this service information.
- **Were any concerns found?**

  YES : REPAIR as needed. TEST the system for normal operation.

  NO : Go to B2 .

B2 CHECK FOR DTCs

NOTE: **Refer to the INTRODUCTION - GASOLINE ENGINES article for correct scan tool hook-up procedure.**

- Check for DTC P0217, P1285 or P1299.
- **Is DTC P0217, P1285 or P1299 present?**

  YES : Go to B3.

  NO : Actual engine overheating has not been verified. CHECK the ECT gauge operation. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. If any other DTCs are retrieved, REFER to the **INTRODUCTION - GASOLINE ENGINES** article.

B3 CHECK FOR AN AIRFLOW OBSTRUCTION

- Check the radiator or A/C condenser for an obstruction such as leaves or cardboard.
- **Is an obstruction present?**

  YES : REMOVE the obstruction. TEST the system for normal operation.

  NO : Go to B4.

B4 CHECK THE ENGINE COOLANT LEVEL

NOTE: Allow the engine to cool before checking the coolant level.

- Key in OFF position.
- Visually check the engine coolant level in the degas bottle or coolant expansion tank.
- **Is the engine coolant level within specification?**

  YES : Go to B5.

  NO : ADJUST the engine coolant level as necessary. Go to B5.

B5 PRESSURE TEST THE ENGINE COOLING SYSTEM

- Pressure test the engine cooling system. Refer to Cooling System Pressure Test in **COMPONENT TESTS** in this service information.
- **Does the engine cooling system leak?**

  YES : REPAIR or INSTALL new components. TEST the system for normal operation.

  NO : Vehicles equipped with an expansion tank, go to B6. Vehicles equipped with a degas bottle, go to B7.

B6 CHECK THE PRESSURE RELIEF CAP

- Carry out the pressure relief cap pressure test. Refer to Pressure Relief Cap Pressure Test in **COMPONENT TESTS** in this service information.
- **Is the pressure relief cap OK?**

  YES : Go to B7.

  NO : INSTALL a new pressure relief cap. TEST the system for normal operation.

B7 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

- Inspect the engine coolant in the degas bottle or coolant expansion tank for signs of engine oil or transmission fluid.
- **Is engine oil or transmission fluid evident in the coolant?**

  YES : If engine oil is evident, go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure. TEST the system for normal operation.

  NO : Go to B8.

B8 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT

- Remove the oil level indicators from the engine and the transmission.
- **Is coolant evident in the oil or transmission fluid?**

  YES : If coolant is in the engine oil, go to **ENGINE SYSTEM - GENERAL INFORMATION**

article. If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure.

NO : Go to B9.

B9 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

NOTE:	**Use U-View® Combustion Leak Tester part number 560000 or equivalent.**

- Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.
- **Are combustion gases present?**

  YES : Go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis.

  NO : Go to B10.

B10 CHECK COOLANT CONDITION

- Check the coolant for dirt, rust or contamination and check the coolant concentration.
- **Is the coolant condition OK?**

  YES : Vehicles equipped with an electric cooling fan, go to B11 . Vehicles equipped with only a mechanical cooling fan, go to B12 .

  NO : FLUSH the engine cooling system. REFER to **COOLING SYSTEM FLUSHING**. TEST the system for normal operation.

B11 CHECK THE ELECTRIC COOLING FAN OPERATION

- Start the engine.
- Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position.
- **Did the electric cooling fan operate?**

  YES : If the vehicle is also equipped with a mechanical cooling fan, go to B12. Otherwise, go to B13.

  NO : DIAGNOSE the electric cooling fan operation. REFER to **INTRODUCTION - GASOLINE ENGINES** article.

B12 CHECK THE MECHANICAL COOLING FAN OPERATION

- Key in OFF position.
- If the vehicle is equipped with a viscous fan clutch, carry out the Fan Clutch Tests in **COMPONENT TESTS**. If the vehicle is equipped with an electronically actuated fan clutch, refer to the **INTRODUCTION - GASOLINE ENGINES** article.
- **Is the cooling fan operation OK?**

  YES : Go to B13.

  NO : INSTALL a new fan clutch. TEST the system for normal operation.

B13 CHECK THE COOLANT PUMP OPERATION

- Start the engine.
- Allow the engine to run for 10 minutes (hot side thermostat equipped vehicles) or 30 minutes (cold

side thermostat equipped vehicles). Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose.

- **Is the heater outlet hose hot?**

  YES : Go to B14.

  NO : INSTALL a new coolant pump. TEST the system for normal operation.

B14 CHECK THE THERMOSTAT OPERATION

- Start the engine.
- Allow the engine to run for 10 minutes (hot side thermostat equipped vehicles) or 30 minutes (cold side thermostat equipped vehicles). Feel the upper radiator hose (hot side thermostat equipped vehicles) or the lower radiator hose (cold side thermostat equipped vehicles).
- **Is the upper (hot side thermostat equipped vehicles) or lower (cold side equipped vehicles) radiator hose hot?**

  YES : CHECK the engine coolant temperature gauge operation. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

  NO : Go to B15.

B15 VISUALLY INSPECT THE THERMOSTAT

- Carry out the Thermostat Visual Inspection in **COMPONENT TESTS**.
- **Is the thermostat damaged?**

  YES : INSTALL a new thermostat. TEST the system for normal operation.

  NO : INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. On most engines, the coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. Some engines use a belt driven by a pulley attached to the camshaft, and some engines use a sprocket driven by the timing chain to operate the coolant pump. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions, or when the cooling fans operate all the time (electric fans) or the fan clutch is always engaged (engine driven fans). Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

For vehicle/engine specific information, refer to **ENGINE COOLING** in Description and Operation.

- DTC P0125 Insufficient Coolant Temp for Closed Loop Fuel Control
- DTC P0128 Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)

This pinpoint test is intended to diagnose the following:

- Low coolant level
- Thermostat
- Engine coolant temperature (ECT) indicator system (gauge)
- Engine cooling fan

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

C1 CARRY OUT INSPECTION AND VERIFICATION

- Carry out the Inspection and Verification procedure in this service information.
- **Were any concerns found?**

  YES : REPAIR as needed. TEST the system for normal operation.

  NO : Go to C2.

C2 CHECK FOR DTCs P0125 or P0128

NOTE: **Refer to the INTRODUCTION - GASOLINE ENGINES article for correct scan tool hook-up procedure.**

- Check for DTC P0125 or P0128.
- **Is DTC P0125 or P0128 present?**

  YES : If the vehicle is equipped with an electric cooling fan, go to C3. If the vehicle is equipped with only a mechanical cooling fan, go to C4.

  NO : The cooling system is operational. If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant temperature gauge operation. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article. If any other DTCs are retrieved, REFER to the **INTRODUCTION - GASOLINE ENGINES** article.

C3 CHECK THE ELECTRIC COOLING FAN OPERATION

- Allow the engine to cool.
- Make sure the A/C switch is OFF (if equipped).
- Start the engine.
- Check the electric cooling fan.
- **Is the electric cooling fan on all the time?**

  YES : DIAGNOSE the electric cooling fan operation. REFER to the **INTRODUCTION - GASOLINE ENGINES** article.

  NO : If the vehicle is also equipped with a mechanical cooling fan, go to C4. Otherwise, go to C5.

C4 CHECK THE MECHANICAL COOLING FAN OPERATION

- Carry out the Cooling Fan Clutch Component Test. For a mechanical cooling fan clutch, refer to **COMPONENT TESTS** in this service information. For an electronic cooling fan clutch, refer to the **INTRODUCTION - GASOLINE ENGINES** article.
- **Is the cooling fan clutch OK?**

  YES : Go to C5.

  NO : INSTALL a new cooling fan clutch. TEST the system for normal operation.

C5 CHECK THE COOLANT LEVEL

NOTE: Allow the engine to cool before checking the coolant level.

- Visually check the engine coolant level in the degas bottle or coolant expansion tank.
- **Is the engine coolant level within specification?**

  YES : INSTALL a new thermostat. TEST the system for normal operation.

  NO : Go to **Pinpoint Test A** to diagnose a coolant leak.

Component Tests

Pressure Test - Degas Bottle Systems

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant

expansion tank system have the pressure relief cap on the radiator.

1. Turn the engine OFF.
2. Check the engine coolant level. Adjust the coolant level as necessary.
3. Attach the Radiator/Heater Core Pressure Tester to the degas bottle nipple and overflow hose. Install a pressure test pump to the quick connect fitting of the test adapter.

CAUTION: Do not pressurize the cooling system beyond the maximum pressure listed in SPECIFICATIONS in this service information or cooling system components may be damaged.

NOTE: If the plunger of the pressure tester is depressed too fast, an erroneous pressure reading will result.

4. Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the **SPECIFICATIONS** , install a new pressure relief cap.
5. If the system does not hold pressure, remove the pressure relief cap and wash in clean water to dislodge all the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. Install the pressure relief cap.
6. Pressurize the engine cooling system as described in Step 4 above. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.
7. If no leaks are found and the pressure drops. the pressure relief cap may be leaking. Install a new pressure relief cap and retest the system.
8. If no leaks are found after a new pressure relief cap is installed, and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.
9. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the engine.
10. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.

Pressure Test - Coolant Expansion Tank Systems

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTE: **Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.**

1. Turn the engine OFF.
2. Remove the pressure relief cap. Top off the radiator as needed. Fit the pressure tester to the radiator fill neck.

    CAUTION: **Do not pressurize the cooling system beyond 138 kPa (20 psi) or cooling system components may be damaged.**

    NOTE: **If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.**

3. Pump the cooling system to a maximum of 138 kPa (20 psi) and hold for 2 minutes. If the pressure drops within this time, inspect for leaks and repair as necessary.
4. If no leaks are found and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.
5. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the engine.

Cap

1. Inspect the pressure relief cap and seals for damage or deterioration. Install a new pressure relief cap if necessary.
2. Fit the pressure relief cap to the Radiator/Heater Core Pressure Tester Kit using the correct adapter.

    NOTE: **If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.**

3. Slowly pump the pressure tester until the pressure gauge stops increasing and note the highest pressure reading. Release the pressure and repeat the test. Install a new pressure relief cap if the pressure is not within specification. Refer to the **GENERAL SPECIFICATIONS** table in this service information.

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.
2. Examine the thermostat for signs of damage including:
    - Valve not fully seated (light visible through the valve)
    - Foreign material lodged in the main valve
    - Bent or broken frame or flange
    - Bent or broken spring
    - Bent or broken valve or valve stem
    - Wax leaking from wax reservoir or a bulge in the reservoir
    - Any other damage or distortion

NOTE: If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

3. If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.
4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

Radiator Leak Test, Removed From Vehicle

CAUTION: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

1. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Fan Clutch Test

1. Turn the engine OFF and wait until the fan comes to a complete stop.
2. Spin the fan blade by hand. A light resistance should be felt. If there is no resistance or very high resistance, the minimum and maximum fan speeds must be checked. For an electronically actuated fan clutch, refer to the **INTRODUCTION - GASOLINE ENGINES** article. For a viscous fan clutch, carry out the following:

Fan Clutch Test - Minimum Speed Requirement

1. Use a suitable marker to mark the coolant pump or fan pulley and one of the fan blades.
2. Make sure the A/C is OFF, if equipped.

WARNING: **Do not operate the engine with the hood open until the fan blade has been examined for possible cracks and separation. A damaged fan can separate during operation. Failure to follow this instruction may result in serious personal injury.**

3. Start the engine and run it at approximately 2,000 RPM for 5 minutes or until there is a noticeable reduction in fan noise to allow the fan clutch to go into disengaged mode.
4. Aim a laser photo tachometer at the coolant pump or fan pulley. Run the engine to achieve 3,000 RPM at the coolant pump or fan pulley.
5. With the coolant pump or fan pulley at 3,000 RPM, aim the laser photo tachometer at the fan blade. Monitor and record fan speed.
6. The fan blade speed must be less than the specified RPM at 3,000 RPM coolant pump or fan pulley RPM. Refer to **SPECIFICATIONS** table in this service information for correct fan speed.
7. Turn the engine off.
8. If the fan blade speed was greater than specified, install a new fan clutch.

Fan Clutch Test - Maximum Speed Requirement

1. Use a suitable marker to mark the coolant pump or fan pulley and one of the fan blades.
2. Block off areas on each side of the radiator in the engine compartment, the front of the radiator grille and the bumper. Close the hood. This will raise the temperature of the air striking the fan clutch and should cause the fan blade to operate at maximum speed.
3. Place the climate control function selector switch in the MAX A/C position and the blower motor switch in the HI position, if equipped.

WARNING: **Do not operate the engine with the hood open until the fan blade has been examined for possible cracks and separation. A damaged fan can separate during operation. Failure to follow this instruction may result in serious personal injury.**

NOTE: **Do not open the hood to check the coolant pump or fan pulley temperature. This will lower the temperature of the air reaching the fan clutch and void the test. Aim the infrared thermometer through the wheel well or from under the vehicle.**

4. Start the engine and run it at approximately 2,000 RPM until normal operating temperature has been achieved. Using an infrared thermometer, monitor the coolant pump or fan pulley. Run the engine until the coolant pump or fan pulley is at least 96°C (205°F).

NOTE: **Do not open the hood to check the coolant pump or fan pulley or fan blade**

speed. This will lower the temperature of the air reaching the fan clutch and void the test. Aim the laser photo tachometer through the wheel well or from under the vehicle.

5. Aim a laser photo tachometer at the coolant pump or fan pulley. Run the engine to achieve 3,000 RPM at the coolant pump or fan pulley.
6. With the coolant pump or fan pulley at 3,000 RPM, aim the laser photo tachometer at the fan blade. Monitor and record fan blade speed.
7. The fan blade speed must be greater than the specified RPM at 3,000 RPM coolant pump or fan pulley RPM. Refer to **SPECIFICATIONS** in this service information for correct fan speed.
8. Open the hood and allow the engine to idle momentarily to lower engine temperature. Turn the engine off and remove the blocks from the radiator, grille and bumper.
9. If the fan blade speed is less than specified, install a new fan clutch.

GENERAL PROCEDURES

COOLING SYSTEM DRAINING, FILLING AND BLEEDING

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
	RADKITPLUS	078-00497

MATERIAL

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

Draining

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

CAUTION: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly. Using contaminated coolant may result in damage to the engine or cooling system components.

CAUTION: The engine cooling system is filled with Motorcraft Premium Gold Engine Coolant. Mixing coolant types degrades the corrosion protection of Motorcraft Premium Gold Engine Coolant.

NOTE: Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system resulting in degraded cooling system performance and/or failure.

NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Release the pressure in the cooling system by slowly turning the pressure relief cap 1/2 turn counterclockwise. When the pressure is released, remove the pressure relief cap.
3. Place a suitable container below the radiator draincock.
    - Open the draincock and allow to drain.
    - Close the draincock after draining.
4. When the coolant is drained, make sure drain plugs are installed and tight.

Filling and Bleeding with RADKITPLUS

1. Using the special tool, install the RADKITPLUS and follow the manufacturer's instructions to fill and bleed the cooling system.

Filling and Bleeding without RADKITPLUS

CAUTION: Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water.

To maintain the integrity of the coolant and the cooling system:

- **Vehicle cooling systems are filled with Motorcraft Premium Gold**

Engine Coolant. Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.

- **Do not add/mix orange-colored Motorcraft Specialty Orange Engine Coolant or equivalent, meeting Ford specification WSS-M97B44-D or green colored Premium Engine Coolant. Mixing coolants may degrade the coolant's corrosion protection.**
- **Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.**
- **Used engine coolant should be disposed of in an appropriate manner. Follow your community's regulations and standards for recycling and disposing of automotive fluids.**

NOTE: Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system resulting in degraded cooling system performance and/or failure.

1. Open the degas bottle cap and fill the degas bottle to the MAX fill line.
2. Close the degas bottle cap.

CAUTION: If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle maximum fill line once the engine cools. Failure to follow these instructions may result in damage to the engine.

3. Start the engine and let idle for 10 minutes or until the engine reaches normal operating temperature.
4. Repeat Step 3 if necessary.
5. Start the engine and turn the heater to the MAX position.

CAUTION: If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle maximum fill line once the engine cools. Failure to follow these instructions may result in damage to the engine.

6. Run the engine at 2,500 RPM for 10 minutes.
7. Repeat Step 6 if necessary.

WARNING: Always allow the engine to cool before opening the cooling system.

Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

8. Check the engine coolant level in degas bottle and fill as necessary.

COOLING SYSTEM FLUSHING

MATERIAL

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1
Premium Cooling System Flush VC-1	ESR-M14P7-A

1. To remove rust, sludge and other foreign material from the cooling system, use cooling system flush that is safe for use with aluminum radiators, For additional information, refer to **SPECIFICATIONS**. This cleaning restores cooling system efficiency and helps prevent overheating. A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction. In severe cases where cleaning solvents will not clean the cooling system efficiently, it will be necessary to use the pressure flushing method using cooling system flusher. Dispose of old coolant and flushing water contaminated with antifreeze and cleaning chemicals in accordance with local, state or federal laws.
2. Remove the radiator. For additional information, refer to **RADIATOR**.

CAUTION: Radiator internal pressure must not exceed 138 kPa (20 psi). Damage to the radiator can result.

3. Backflush the radiator with the radiator in an upside-down position with a high-pressure hose in the lower hose location and backflush.
4. Remove the thermostat. For additional information, refer to **THERMOSTAT**.
5. Backflush the engine. Position the high-pressure water hose into the engine through the engine return and backflush the engine.

REMOVAL AND INSTALLATION

BLOCK HEATER

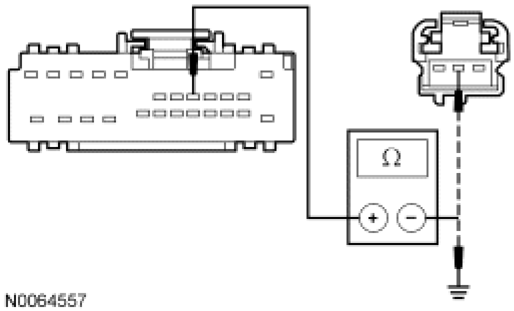

Fig. 3: Exploded View Of Block Heater With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	030104	Block heater cover
2	6B018	Block heater electrical connector
3	6A051	Block heater

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.
3. Remove the RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
4. Remove the block heater cover.

NOTE: Make sure that the block heater wiring is routed and secured away from rotating or hot components, or damage to the wiring may occur.

5. Disconnect the block heater electrical connector.
6. Remove the block heater.
   - To install, tighten to 40 N.m (30 lb-ft).
7. To install, reverse the removal procedure.
8. Fill and bleed the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.

THERMOSTAT

MATERIAL

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent	WSS-M97B51-A1

(yellow color)	

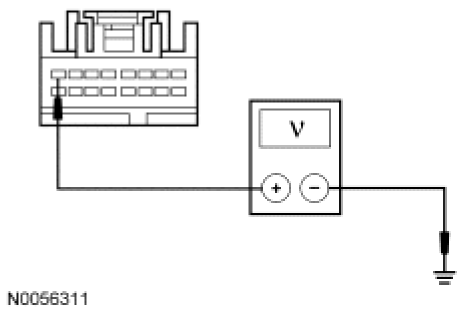

Fig. 4: Exploded View Of Thermostat With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500014	Thermostat housing cover bolt (2 required)
2	8594	Thermostat housing cover
3	-	O-ring seal
4	8575	Thermostat

REMOVAL AND INSTALLATION

1. Drain the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.
2. Remove the air cleaner assembly and outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.
3. Remove the 2 bolts and position aside the thermostat housing cover.
   - To install, tighten to 10 N.m (89 lb-in).
4. Remove the O-ring seal and thermostat.
   - Clean and inspect the O-ring seal. Install a new seal if necessary.

NOTE: Lubricate the thermostat O-ring seal with clean engine coolant.

5. To install, reverse the removal procedure.
6. Fill and bleed the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.

THERMOSTAT HOUSING

MATERIAL

Item	Specification

Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

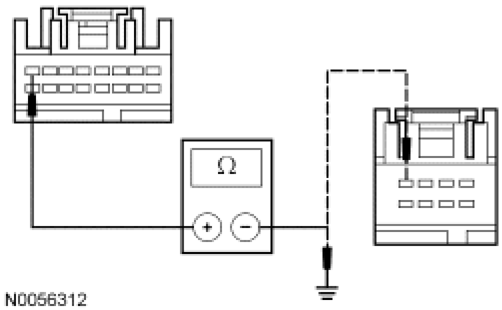

Fig. 5: Identifying Thermostat Housing With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8W005	Vent hose
2	8B273	Lower radiator hose
3	8B274	Upper radiator hose
4	18K580	Heater core outlet hose
5	18K579	Heater core inlet hose
6	W503279	Thermostat housing bolt (3 required)
7	8565	O-ring seal
8	8A571	O-ring seal
9	8A587	Thermostat housing

REMOVAL AND INSTALLATION

1. Drain the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.
2. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.
3. Disconnect the 5 coolant hoses from the thermostat housing and position them aside.
4. Remove the 3 thermostat housing bolts.
   - To install, tighten to 10 N.m (89 lb-in).

NOTE: Do not pull the other end of the coolant tube out of the engine block when separating the thermostat housing.

5. Separate the thermostat housing from the coolant tube and remove the thermostat housing.
   - Remove and discard the O-ring seals.

6. To install, reverse the removal procedure.
   - Lubricate the new O-ring seals with clean engine coolant.
7. Fill and bleed the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.

COOLANT PUMP

REMOVAL

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system.
3. Remove the engine front cover. For additional information, refer to **ENGINE - 3.5L** article.
4. Remove and discard the engine oil filter.
5. Rotate the crankshaft clockwise and align the timing marks on the variable camshaft timing (VCT) assemblies as shown in illustration.

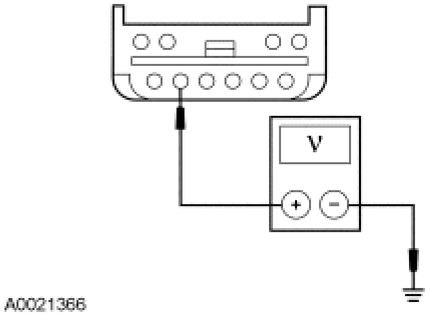

Fig. 6: Aligning Timing Marks On Variable Camshaft Timing (VCT) Assemblies
Courtesy of FORD MOTOR CO.

NOTE: The special tool will hold the camshafts in the top dead center (TDC) position.

6. Install the special tool onto the flats of the LH camshafts.

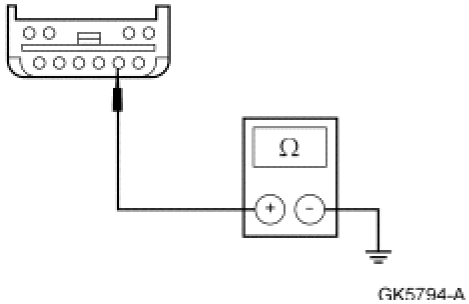

Fig. 7: Installing Special Tool Onto Flats Of LH Camshafts
Courtesy of FORD MOTOR CO.

NOTE: The special tool will hold the camshafts in the TDC position.

7. Install the special tool onto the flats of the RH camshafts.

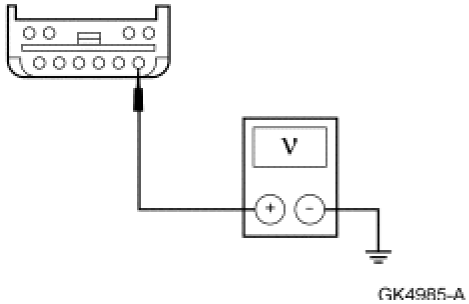

Fig. 8: Installing Special Tool Onto Flats Of RH Camshafts
Courtesy of FORD MOTOR CO.

8. Remove the 3 bolts and the RH VCT housing.

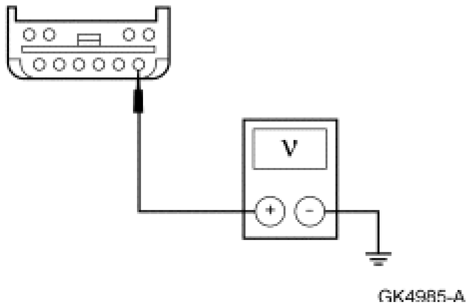

Fig. 9: Locating RH VCT Housing
Courtesy of FORD MOTOR CO.

9. Remove the 3 bolts and the LH VCT housing.

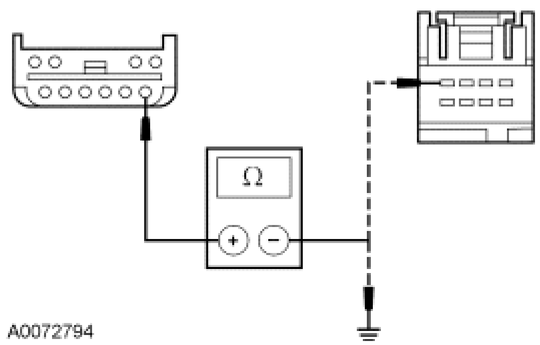

Fig. 10: Locating LH VCT Housing
Courtesy of FORD MOTOR CO.

10. Remove and discard the VCT housing seals.

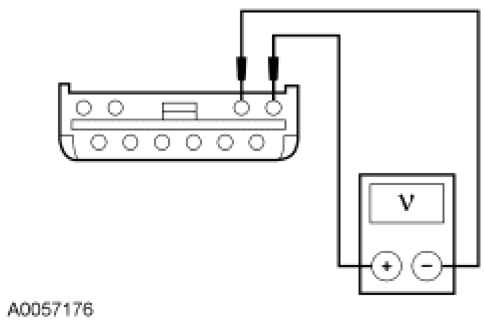

Fig. 11: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

11. Remove the 2 bolts and the primary timing chain tensioner.

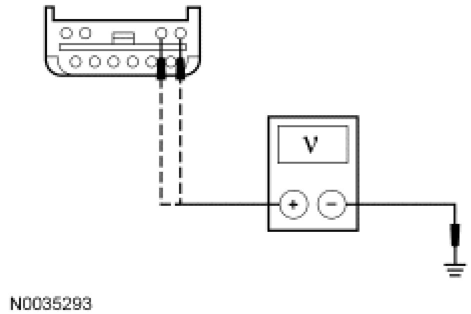

Fig. 12: Locating Primary Timing Chain Tensioner Bolts
Courtesy of FORD MOTOR CO.

12. Remove the primary timing chain tensioner arm.

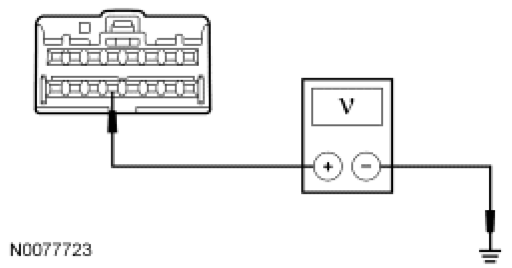

Fig. 13: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

13. Remove the 2 bolts and the lower LH primary timing chain guide.

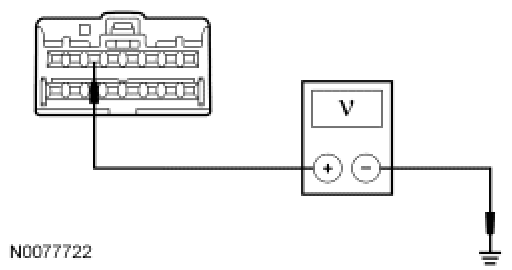

Fig. 14: Locating Lower LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

14. Remove the primary timing chain.

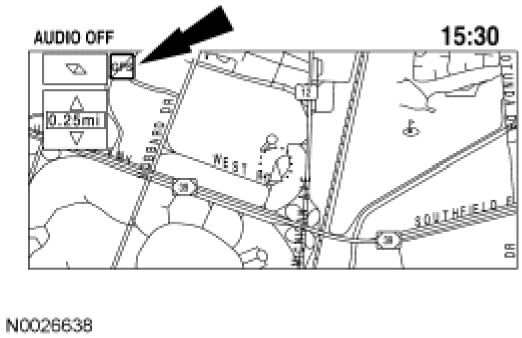

Fig. 15: Locating Primary Timing Chain
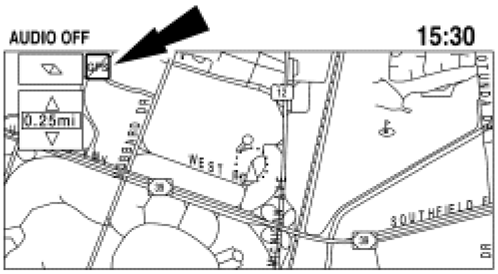
Courtesy of FORD MOTOR CO.

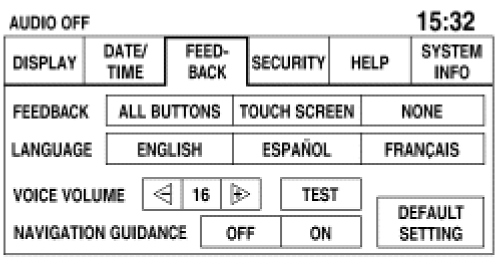
15. Remove the 2 bolts and the upper LH primary timing chain guide.



N0026638

Fig. 16: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

16. Remove the RH primary timing chain guide lower bolt.

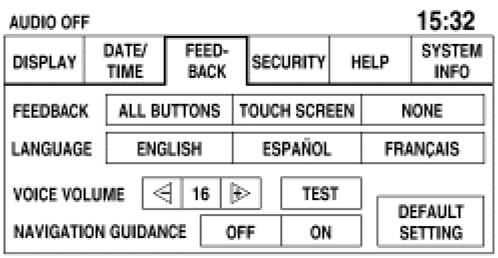


N0026637

Fig. 17: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

NOTE: The RH primary timing chain guide must be repositioned to allow the coolant pump to be removed.

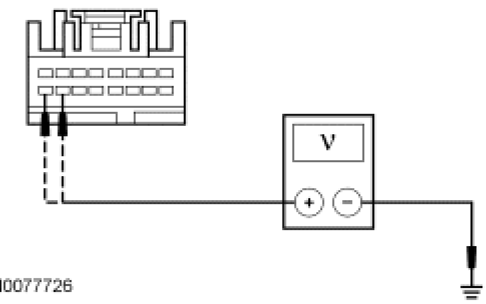
17. Loosen the RH primary timing chain guide upper bolt.
    - Rotate the guide and tighten the bolt.



N0026637

Fig. 18: Locating RH Primary Timing Chain Guide Upper Bolt
Courtesy of FORD MOTOR CO.

18. Place clean lint-free shop towels in the oil pan opening to prevent coolant from entering the oil pan during coolant pump removal.
19. Remove the 8 bolts and the coolant pump.



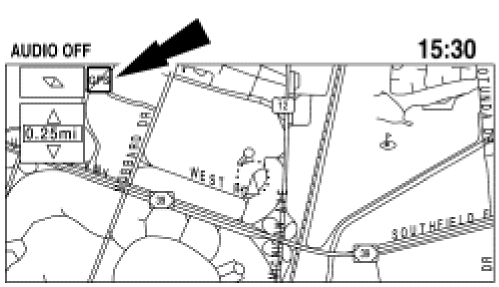
N0077726

Fig. 19: Locating Coolant Pump Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: Clean and inspect all sealing surfaces.

1. Install the coolant pump and the 8 bolts.
   - Tighten in the sequence shown in illustration to 10 N.m (89 lb-in).



N0026638

Fig. 20: Identifying Coolant Pump Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

2. Remove all of the shop towels from the oil pan opening.

CAUTION: Any coolant that has accumulated in the oil pan must be drained from the pan and any residual coolant cleaned from the front of the engine and oil pan. Failure to remove all traces of the coolant can result in oil contamination and severe engine damage.

3. Remove the oil pan drain plug and allow any accumulated coolant to drain.
   - Remove any residual coolant from the front of the engine and the oil pan using regulated

compressed air and clean lint-free shop towels.
- Install the oil pan drain plug and tighten to 27 N.m (20 lb-ft).

4. Loosen the RH primary timing chain guide upper bolt.
    - Position the RH primary timing chain guide and install the lower bolt.
    - Tighten the 2 bolts to 10 N.m (89 lb-in).

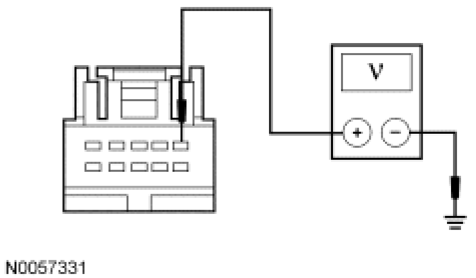


Fig. 21: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

5. Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

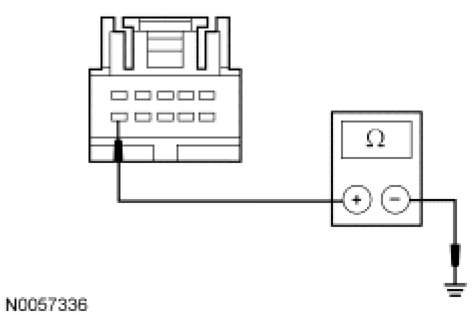

Fig. 22: Aligning Timing Marks On VCT Assemblies & Crankshaft Sprocket
Courtesy of FORD MOTOR CO.

6. Install the upper LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 N.m (89 lb-in).

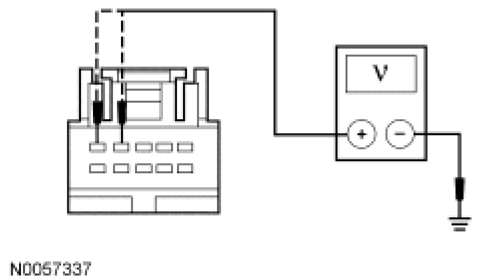

Fig. 23: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

7. Install the lower LH primary timing chain guide and the 2 bolts.
   - Tighten to 10 N.m (89 lb-in).

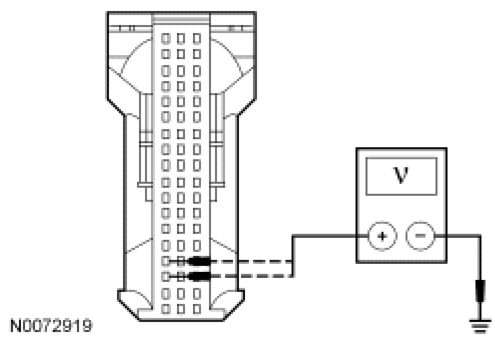

Fig. 24: Locating Lower LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

8. Install the primary timing chain tensioner arm.

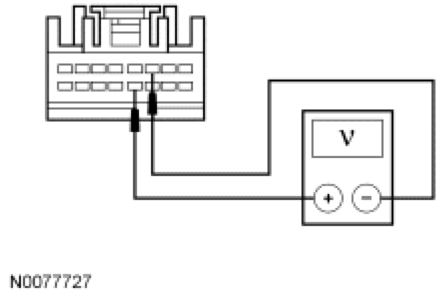

Fig. 25: Locating Primary Timing Chain Tensioner Arm
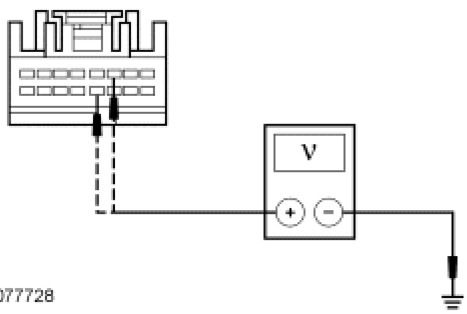
Courtesy of FORD MOTOR CO.

9. Reset the primary timing chain tensioner.
   - Rotate the lever counterclockwise.

- Using a soft-jawed vise, compress the plunger.
- Align the hole in the lever with the hole in the tensioner housing.
- Install a suitable lock pin.

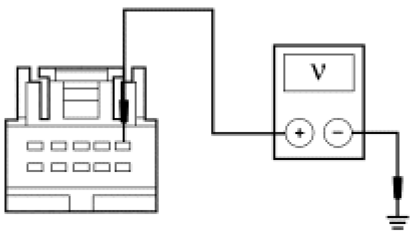


N0077728

Fig. 26: Compressing Plunger Using A Soft-Jawed Vise
Courtesy of FORD MOTOR CO.

NOTE: **It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.**

10. Install the primary tensioner and the 2 bolts.
    - Tighten to 10 N.m (89 lb-in).
    - Remove the lock pin.



N0057331

Fig. 27: Locating Primary Tensioner Bolts
Courtesy of FORD MOTOR CO.

11. As a post check, verify correct alignment of all timing marks.

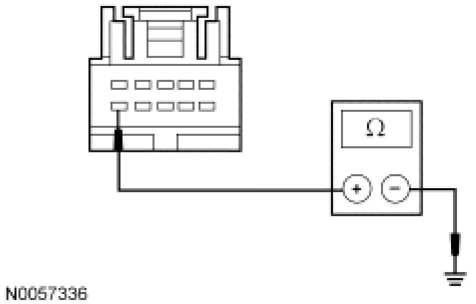


Fig. 28: Verifying Correct Alignment Of All Timing Marks
Courtesy of FORD MOTOR CO.

12. Install new VCT housing seals.

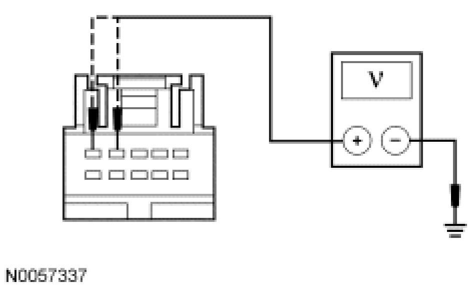

Fig. 29: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

CAUTION: Make sure the dowels on the variable camshaft timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.

13. Install the LH VCT housing and the 3 bolts.
    - Tighten in the sequence shown in illustration to 10 N.m (89 lb-in).

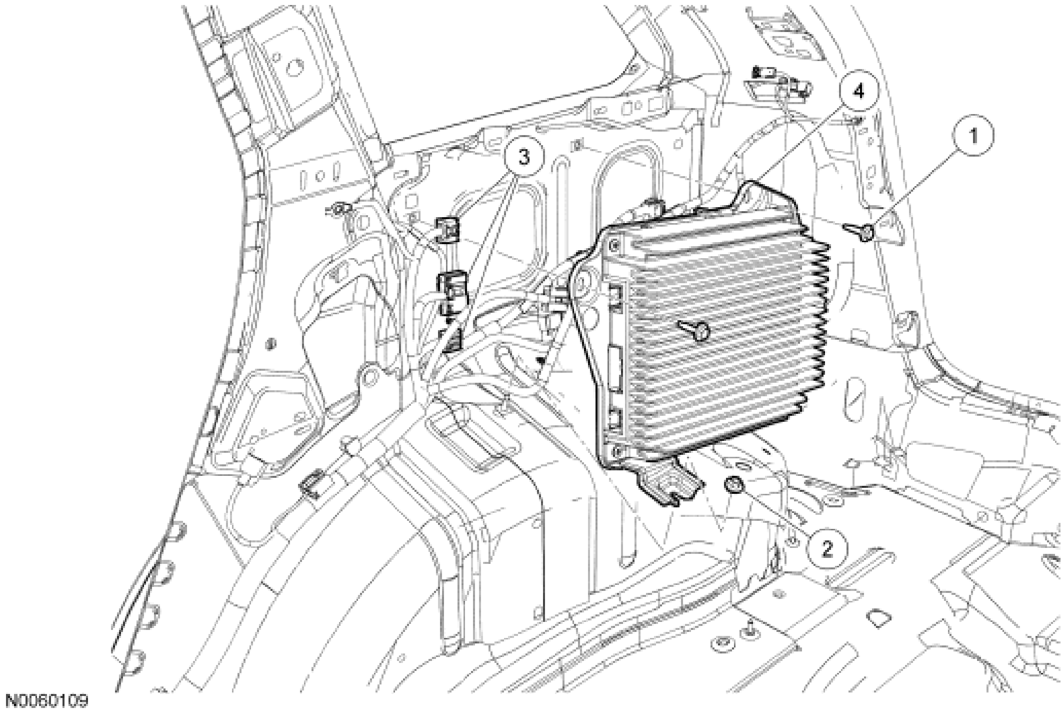

Fig. 30: Identifying LH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

CAUTION: Make sure the dowels on the variable camshaft timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.

14. Install the RH VCT housing and the 3 bolts.
    - Tighten in the sequence shown in illustration to 10 N.m (89 lb-in).

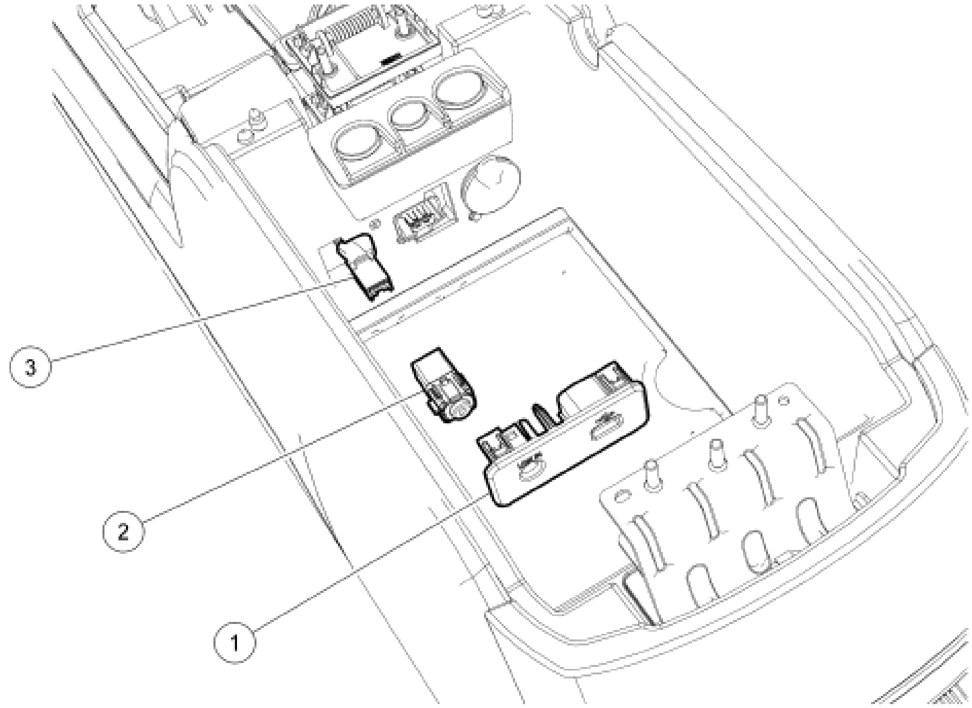

Fig. 31: Identifying RH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.

15. Install a new engine oil filter.
    - Tighten to 5 N.m (44 lb-in) and then rotate an additional 180 degrees.
16. Install the engine front cover. For additional information, refer to **ENGINE - 3.5L** article.
17. Fill and bleed the cooling system.

COOLING FAN MOTOR AND SHROUD

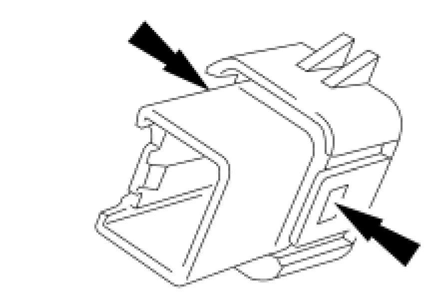

Fig. 32: Exploded View Of Cooling Fan Motor & Shroud With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13A506	Wiring harness retainer
2	8B274	Upper radiator hose
3	14A464	Cooling fan motor and shroud electrical connector
4	W503924	Cooling fan motor and shroud bolt (2 required)
5	8C607	Cooling fan motor and shroud
6	W503924	Oil cooler bracket bolt (if equipped)
7	-	Oil cooler bracket (if equipped)

REMOVAL AND INSTALLATION

1. Remove the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.
2. If equipped, detach the 2 block heater wiring clips from the radiator support.

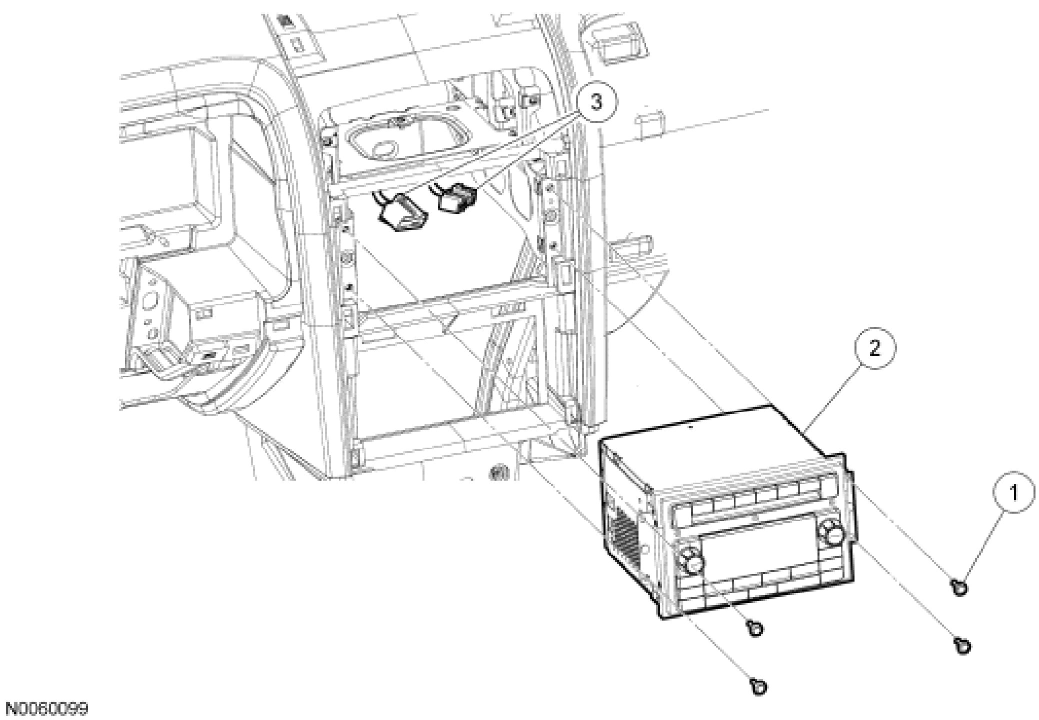

Fig. 33: Identifying Block Heater Wiring Clips
Courtesy of FORD MOTOR CO.

3. Detach the wiring harness retainers and position the harness aside.
4. Position aside the upper radiator hose from the cooling fan motor and shroud.
5. Disconnect the cooling fan motor and shroud electrical connector.
6. If equipped, remove the bolt and position aside the oil cooler bracket.

- To install, tighten to 6 N.m (53 lb-in).

7. Remove the 2 bolts and the cooling fan motor and shroud.
    - To install, tighten to 6 N.m (53 lb-in).
8. To install, reverse the removal procedure.

RADIATOR

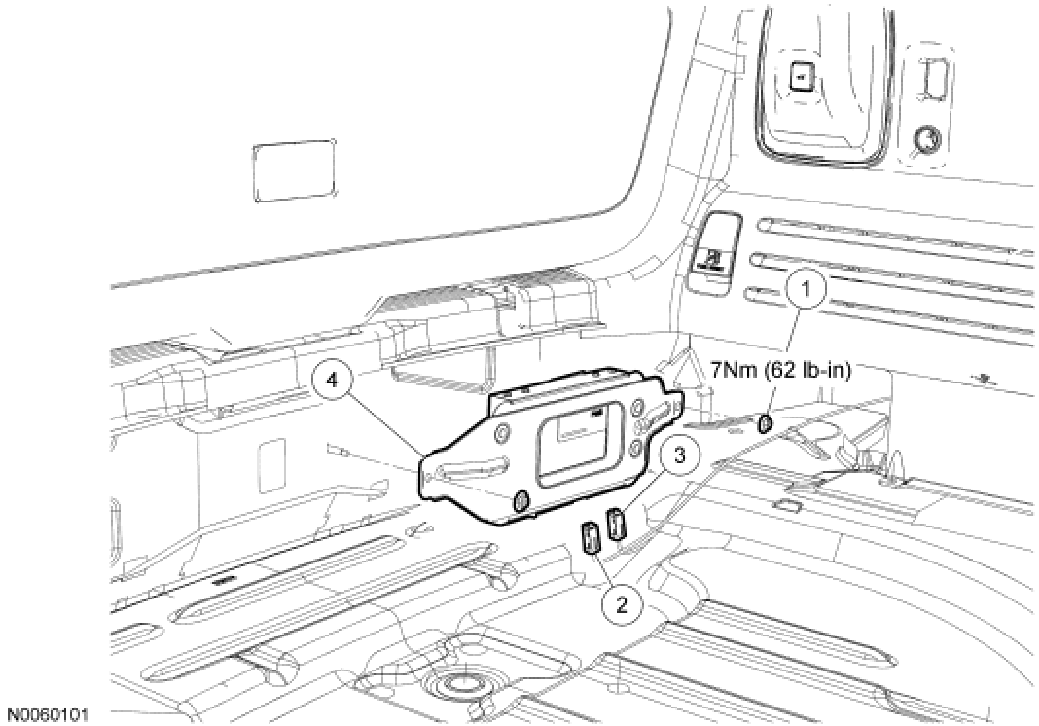

Fig. 34: Exploded View Of Radiator (Without A/C)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8B274	Upper radiator hose
2	8C633	Lower degas bottle hose
3	8B273	Lower radiator hose
4	8A194	Upper radiator support bracket (2 required)

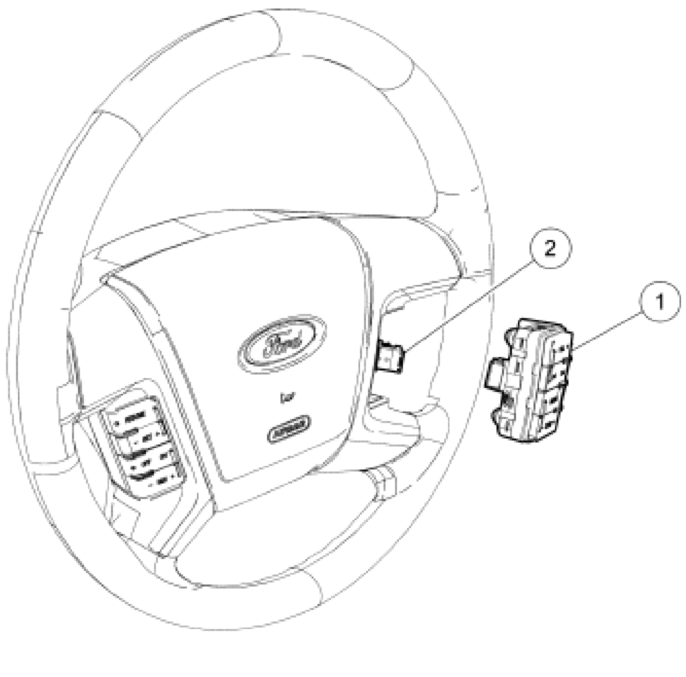

Fig. 35: Exploded View Of Radiator (With A/C) With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
5	-	A/C condenser bolt (2 required)
6	19710	A/C condenser
7	8005	Radiator
8	19D738	Pin-type retainer (2 required)
9	W707400	Compressor-to-condenser discharge line bracket bolt

REMOVAL AND INSTALLATION

1. Drain the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.
2. Remove the cooling fan motor and shroud. For additional information, refer to **COOLING FAN MOTOR AND SHROUD**.
3. Remove the front bumper cover. For additional information, refer to **BUMPERS** article.
4. Disconnect the upper radiator hose and lower degas bottle hose from the radiator.
5. Disconnect the lower radiator hose from the radiator.
6. Remove the compressor-to-condenser discharge line bracket bolt.
    - To install, tighten to 7 N.m (62 lb-in).
7. Lift and remove the tabs from the radiator support and position the radiator towards the engine.

8. Detach the 2 pin-type retainers from the radiator.
9. Remove the 2 A/C condenser bolts from the radiator and separate the condenser from the radiator.
   - To install, tighten to 10 N.m (89 lb-in).
10. Remove the radiator.
11. To install, reverse the removal procedure.
12. Fill and bleed the cooling system. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING**.

DEGAS BOTTLE

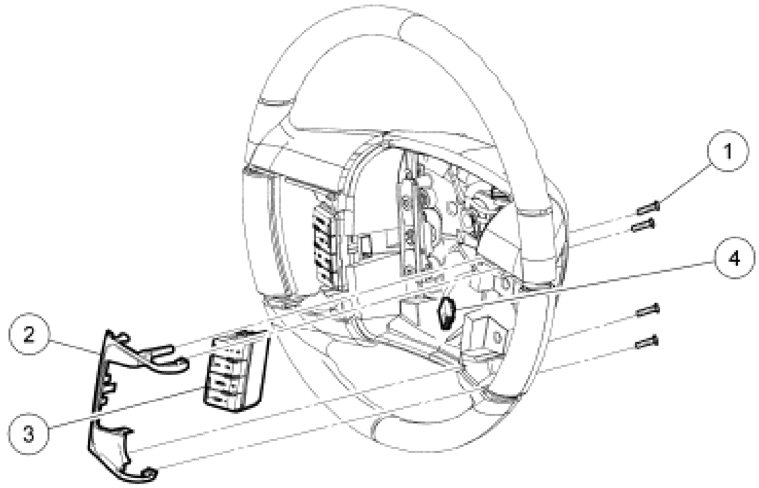

Fig. 36: Exploded View Of Degas Bottle With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8W005	Upper degas bottle hose
2	8C633	Lower degas bottle hose
3	N807658	Degas bottle-to-fender bolt (2 required)
4	N807658	Degas bottle-to-washer bottle screw
5	8A080	Degas bottle
6	8100	Pressure relief cap

REMOVAL AND INSTALLATION

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

1. Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure is released, remove the pressure relief cap.
2. Using hose clamp pliers, clamp the lower degas bottle hose.
3. Using a suitable suction device, siphon the coolant from the degas bottle.
4. Disconnect the upper degas bottle hose and position it aside.
5. Disconnect the lower degas bottle hose and position it aside.
6. Remove the degas bottle-to-washer bottle screw.
7. Remove the 2 bolts and the degas bottle.
   - To install, tighten to 9 N.m (80 lb-in).
8. To install, reverse the removal procedure.
9. Fill the degas bottle. For additional information, refer to **COOLING SYSTEM DRAINING, FILLING AND BLEEDING** for the recommended coolant mixture and fill level.

2008 ACCESSORIES & BODY, CAB

Speed Control - Edge & MKX

DESCRIPTION AND OPERATION

SPEED CONTROL

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The speed control system consists of the following components:

- Speed control switches
- Speed control deactivator switch (part of the stoplamp switch)
- Stoplamp switch
- Speed control indicator
- PCM

DIAGNOSTIC TESTS

SPEED CONTROL

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1300-A	Restraint System Diagnostic Tool (2 required)	418-F395

	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The speed control system is controlled by the PCM. The speed control system is designed to maintain a selected vehicle speed between 48 km/h (30 mph) and the maximum limited vehicle speed. The speed control system is controlled by the steering wheel mounted switches (ON, OFF, SET+, SET- and RESUME), the stoplamp switch, and the speed control deactivator switch (part of the stoplamp switch). The steering wheel mounted switches are hardwired to the PCM through the clockspring.

The speed control functions include:

- Turning the speed control system on
- Setting and maintaining the desired vehicle speed
- Accelerating the vehicle speed
- Decelerating the vehicle speed
- Turning the vehicle speed control system off
- Canceling the speed control

Pressing and releasing the ON switch turns the speed control system on. Pressing and releasing the SET+ or SET- switch while the vehicle is traveling at the desired speed activates the speed control system.

Tapping the SET+ or the SET- switch while in the set mode respectively, increases or decreases the maintained vehicle speed by 1.6 km/h (1 mph) per tap. If the respective button is pressed and held, the vehicle speed continues to accelerate or decelerate until the button is released.

Pressing and releasing the OFF switch, or switching the ignition switch to the OFF position, turns the speed control system off. Applying the brake pedal puts the speed control system into the STANDBY mode. Pressing the RESUME button, when the speed control system is in the STANDBY mode causes the vehicle to accelerate to the last set speed. Resume does not function if the OFF button is pressed, the ignition switch is in the OFF position, or if the current vehicle speed is below the minimum operational speed.

The clockspring provides the electrical interface between the steering column wiring and the speed control switches in the steering wheel.

The speed control deactivator switch (part of the stoplamp switch) is provided as an additional safety feature. When the brake pedal is applied, the speed control deactivator switch opens and removes the voltage signal from the PCM input circuit, deactivating the speed control system.

Whenever the speed control system is engaged and active, a speed control icon on the instrument cluster (IC) is illuminated.

The inputs to the PCM are:

- Output shaft speed (OSS) sensor
- Digital transmission range (TR) sensor
- Speed control switch
- Speed control deactivator switch (part of the stoplamp switch)
- Accelerator pedal position sensor
- Smart junction box (SJB)
- Parking brake

The outputs of the PCM are:

- Speed control indicator lamp
- Throttle command

The speed control system throttle position is completely controlled by the PCM through the electronically controlled throttle body. Speed control electronics are contained entirely within the PCM.

When the speed control system is active, the PCM corrects for deviations in the actual vehicle speed by proportionally moving the throttle plate. The PCM modulates the throttle to minimize error between the actual vehicle speed and the desired speed.

The PCM strategy uses the throttle control for smooth accelerations.

The PCM sends a message over the controller area network (CAN) to the instrument cluster (IC) whenever the speed control telltale should be turned on or off.

In the event of an off command or a deactivation request from any source, the speed control system carries out a deactivation and immediately returns the throttle to the idle position.

The speed control system provides self-diagnostics. Speed control is disabled anytime an error is detected in the system. No cluster telltale or message center messages are displayed when faults occur. Fault codes are logged by the PCM.

An electronically controlled throttle system fault also causes the speed control system to be disabled and the malfunction indicator lamp (MIL) illuminates, or a message center message is displayed.

Additionally, the following conditions cause the speed control system to deactivate:

- Transmission gear selector in a position other than D or OD
- Speed control set speed is over-ridden with the accelerator pedal for a period longer than 5 minutes

- Vehicle speed loss from set speed of greater than 16 km/h (10 mph) occurs
- Vehicle speed falls below the minimum allowable limit of 48 km/h (30 mph)
- Parking brake is applied
- Speed control switch is pressed or stuck for longer than 2 minutes

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Throttle body	• Battery junction box (BJB) fuse 32 (10A) • Wiring, terminals or connectors • Speed control switch • Speed control deactivator switch (part of the stoplamp switch) • Stoplamp switch • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Verify the speedometer operates correctly without speed control by test driving the vehicle. If the speedometer does not operate correctly, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, & WARNING CHIMES** article.
5. Verify the stoplamps operate correctly with the ignition switch in the ON position. If the stoplamps do not operate correctly, refer to **EXTERIOR LIGHTING** article.
6. Verify the parking brake warning indicator is operating correctly. If the parking brake warning indicator does not operate correctly, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, & WARNING CHIMES** article.

NOTE: Make sure to use the latest scan tool software release.

7. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

8. If the scan tool does not communicate with the VCM:

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM.
- Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.

9. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs.
11. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
12. If the DTCs retrieved are related to the concern, go to **PCM DTC CHART**. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
13. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

PCM DTC CHART

DTCs	Description	Action
P0579	Cruise Control Multifunction Input A Circuit Range/Performance	Go to **Pinpoint Test C** .
P0581	Cruise Control Multifunction Circuit High	Go to **Pinpoint Test C** .
P1572	Brake Pedal Switch Circuit	Go to **Pinpoint Test B** .
P1703	Brake Switch Out of Self-Test Range	Go to **Pinpoint Test B** .
All other DTCs	-	REFER to the **INTRODUCTION - GASOLINE ENGINES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The speed control is inoperative	• PCM not configured for speed control • Stoplamp switch • Speed control switch • Digital transmission range (TR) sensor • Vehicle speed signal	• Go to **Pinpoint Test A** .

	• PCM	
• The speed control indicator lamp is always on	• Wiring, terminals or connectors • Instrument cluster (IC) • PCM	• REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, & WARNING CHIMES** article.

Pinpoint Tests

Pinpoint Test A: The Speed Control Is Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Speed Control for schematic and connector information.

Normal Operation

The PCM sends a signal through circuit VES10 (WH) to the speed control switches, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring. When the brake pedal is applied, the SJB sends a message to the PCM to deactivate the speed control if engaged.

The speed control deactivator switch (part of the stoplamp switch) interrupts circuit CES09 (VT/OG) removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

This pinpoint test is intended to diagnose the following:

- PCM not configured for speed control
- Stoplamp switch
- Speed control switch
- Digital transmission range (TR) sensor
- Vehicle speed signal
- PCM

PINPOINT TEST A: THE SPEED CONTROL IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 VERIFY PCM CONFIGURATION

- Enter the following diagnostic mode on the diagnostic tool: Programmable Parameters
- Verify that the speed control is enabled in the PCM.
- **Is the speed control enabled?**

  YES : Go to A2.

  NO : Enable the speed control in the PCM using the scan tool programmable parameters menu. If no parameter exists, REFER to **MODULE CONFIGURATION** article to carry out PCM programmable module installation (PMI).

A2 RETRIEVE THE RECORDED PCM DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS

- Review the recorded DTCs from the PCM self-test.
- **Are any non-speed control DTCs recorded?**

  YES : REFER to the **INTRODUCTION - GASOLINE ENGINES** article. REPAIR all PCM DTCs and RETEST the speed control.

  NO : Go to A3.

A3 CHECK THE SPEED CONTROL COMMAND SWITCH (SCCS) PID

- Start the engine.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- With the engine running, monitor the PCM SCCS PID while pressing the speed control switches as follows:

Speed Control Switch	PID Minimum Value	PID Maximum Value
OFF	0.00 volts	1.089 volts
SET -	2.192 volts	3.057 volts
SET +	3.057 volts	3.721 volts
RESUME	3.721 volts	4.209 volts
ON	4.209 volts	4.556 volts
No switch pressed	4.556 volts	4.839 volts

- **Are the PCM SCCS PID values OK?**

  YES : TURN the engine off. Go to A5.

  NO : TURN the engine off. Go to A4.

A4 CHECK THE SPEED CONTROL SWITCH

- Key in OFF position.
- Disconnect: PCM C175b

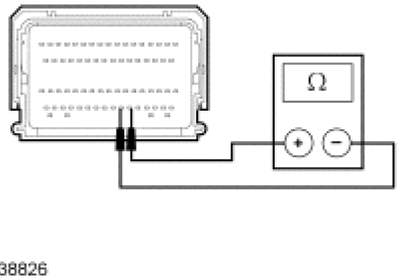

Fig. 1: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the PCM C175b-57, circuit RES08 (GN/BN), harness side while pressing the speed control switches as follows:

Speed Control Switch	Resistance Value
OFF	Less than 5 ohms
SET -	298 - 304 ohms
SET +	596 - 608 ohms
RESUME	1,101 - 1,123 ohms
ON	2,091 - 2,133 ohms
No switch pressed	4,279 - 4,363 ohms

- **Are the speed control switch resistance values OK?**

  YES : Go to A8.

  NO : INSTALL a new speed control switch. REFER to **SPEED CONTROL SWITCH**. TEST the system for normal operation.

A5 CHECK THE STOPLAMP SWITCH (BOO) PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor the PCM BOO PID.

- Apply and release the brake pedal.
- **Does the PID value agree with the brake pedal position?**

  YES : Go to A6.

  NO : Go to **Pinpoint Test B** .

A6 CHECK THE DIGITAL TRANSMISSION RANGE (TR) SENSOR PID

- Connect: PCM C175b
- Apply the parking brake.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor the PCM TR PID.
- Select DRIVE.
- **Does the PID value agree with the transmission range selector lever position?**

  YES : Go to A7.

  NO : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article to diagnose the digital TR sensor.

A7 CHECK THE VEHICLE SPEED

NOTE: This step may require an assistant.

- Enter the following diagnostic mode on the diagnostic tool: ABS Control Module DataLogger
- Monitor and record the ABS LF_WSPD PID while driving the vehicle at 48 km/h (30 mph) as indicated on the speedometer.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor and record the PCM VSS (vehicle speed) PID while driving the vehicle at 48 km/h (30 mph).
- **Does the speed indicated by the ABS control module wheel speed PID match the PCM VSS PID?**

  YES : Go to A8.

  NO : REFER to the **INTRODUCTION - GASOLINE ENGINES** article to diagnose the output shaft speed (OSS) sensor signal.

A8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC P1572 or P1703 - Brake On/Off Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Speed Control for schematic and connector information.

Normal Operation

When the brake pedal is applied, the SJB sends a message to the PCM to deactivate the speed control if engaged.

The speed control deactivator switch (part of the stoplamp switch) interrupts circuit CES09 (VT/OG) removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

- DTC P1572 (Brake Pedal Switch Circuit) - sets when the PCM does not sense the proper sequence of the brake pedal input signal from both the speed control deactivator and stoplamp switches when the brake pedal is pressed and released.
- DTC P1703 (Brake Switch Out of Self-Test Range) - sets when there is an open or short in the deactivator switch circuits or when there is an open or short in the stoplamp circuits.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Speed control deactivator switch (integral to the stoplamp switch)
- ABS control module
- PCM

PINPOINT TEST B: DTC P1572 OR DTC P1703 - BRAKE ON/OFF CIRCUIT FAILURE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK THE OPERATION OF THE STOPLAMPS

- Key in ON position.
- Operate the stoplamps.
- **Do the stoplamps operate correctly?**

  YES : Go to B2.

  NO : REFER to **EXTERIOR LIGHTING** article.

B2 CHECK CIRCUIT CCB08 (VT/WH) FOR VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Key in ON position.

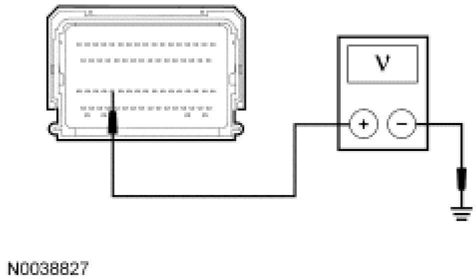

Fig. 2: Measuring Voltage
Courtesy of FORD MOTOR CO.

- While applying the brake pedal, measure the voltage between the PCM C175b-46, circuit CCB08 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts with the brake pedal applied?**

  YES : Go to B3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B3 CHECK THE SPEED CONTROL DEACTIVATOR SWITCH FOR CORRECT OPERATION

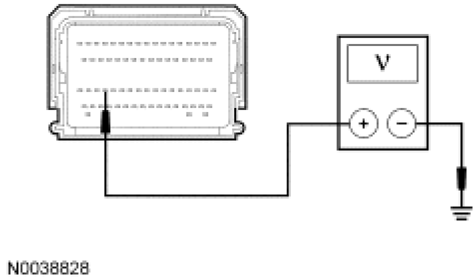

Fig. 3: Measuring Voltage
Courtesy of FORD MOTOR CO.

- While firmly applying and releasing the brake pedal, measure the voltage between the PCM C175b-47, circuit CES09 (VT/OG), harness side and ground.
- **Is the voltage greater than 10 volts with the brake pedal released and 0 volts with the brake pedal firmly applied?**

  YES : Go to B7.

  NO : Go to B4.

B4 CHECK CIRCUIT CBB32 (GN/VT) FOR AN OPEN

- Key in OFF position.
- Disconnect: Stoplamp Switch C2064
- Key in ON position.

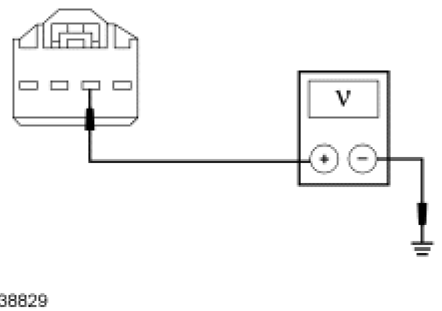

Fig. 4: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the stoplamp switch C2064-2, circuit CBB32 (GN/VT), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to B5.

  NO : VERIFY the battery junction box (BJB) fuse 32 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK CIRCUIT CES09 (VT/OG) FOR A SHORT TO VOLTAGE

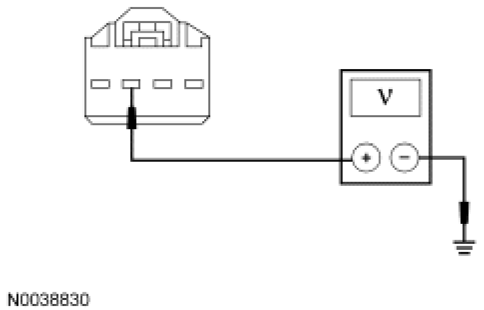

Fig. 5: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the stoplamp switch C2064-3, circuit CES09 (VT/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B6.

B6 CHECK CIRCUIT CES09 (VT/OG) FOR AN OPEN

- Key in OFF position.

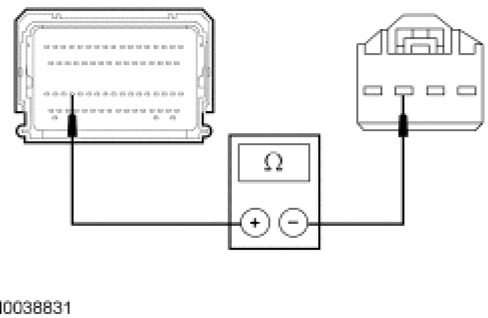

Fig. 6: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the stoplamp switch C2064-3, circuit CES09 (VT/OG), harness side and the PCM C175b-47, circuit CES09 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new stoplamp switch. REFER to **EXTERIOR LIGHTING** article. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B7.

B7 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: DTC P0579 or P0581 - Speed Control Switch Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Speed Control for schematic and connector information.

Normal Operation

The PCM sends a signal through circuit VES10 (WH) to the speed control switches, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring.

- DTC P0579 (Cruise Control Multifunction Input A Circuit Range/Performance) - may set when the speed control switch circuits are open, shorted to voltage or ground.
- DTC P0581 (Cruise Control Multifunction Circuit High) - may set when a speed control switch is stuck or the speed control switch circuits are shorted to voltage or open.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Speed control switch
- PCM

PINPOINT TEST C: DTC P0579 OR DTC P0581 - SPEED CONTROL SWITCH CIRCUIT FAILURE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Key in ON position.
- Turn the parking lamps on.

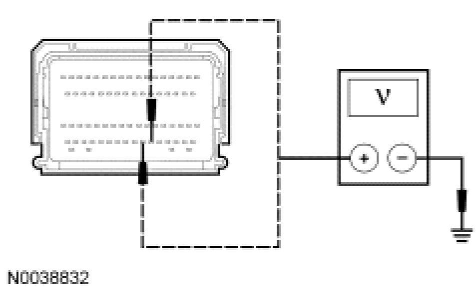

Fig. 7: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : TURN the parking lamps off. Go to C2.

NO : TURN the parking lamps off. Go to C4.

C2 CHECK CIRCUITS VES10 (WH) AND RES08 (GN/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Clockspring C218a
- Key in ON position.
- Turn the parking lamps on.

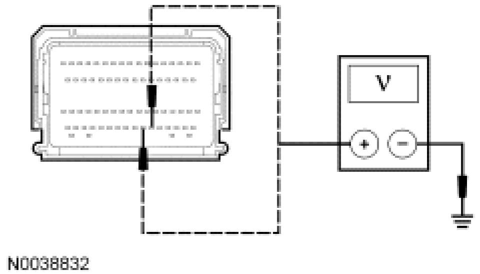

Fig. 8: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : TURN the parking lamps off. Go to C3.

C3 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Connect: Clockspring C218a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Upper Clockspring C218b
- Connect the restraint system diagnostic tools (418-F395) to the upper clockspring air bag connector.
- Connect the battery.
- Key in ON position.
- Turn the parking lamps on.

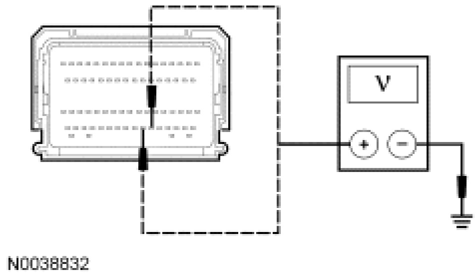

Fig. 9: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. DISCONNECT the battery. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new speed control switch. REFER to **Speed Control Switch**. DISCONNECT the battery. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

C4 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO GROUND

- Key in OFF position.

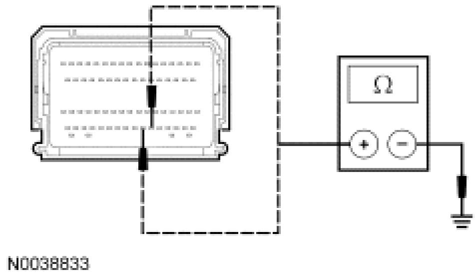

Fig. 10: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to C7.

  NO : Go to C5.

C5 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND

- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect: Upper Clockspring C218b

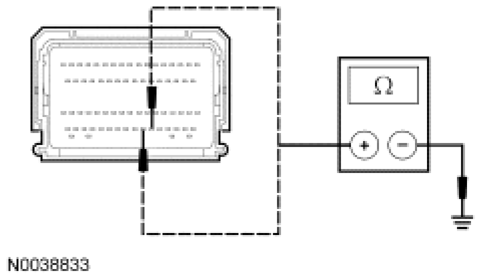

Fig. 11: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new speed control switch. REFER to **Speed Control Switch**. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C6.

C6 CHECK CIRCUITS VES10 (WH) AND RES08 (GN/BN) FOR A SHORT TO GROUND

- Disconnect: Clockspring C218a

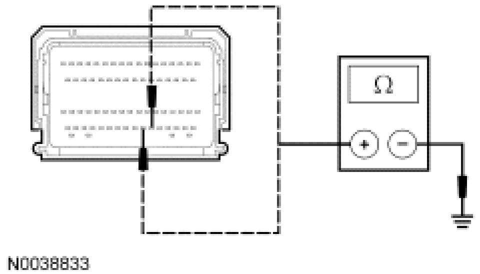

Fig. 12: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit in question. INSTALL the driver air bag module. REFER to

SUPPLEMENTAL RESTRAINT SYSTEM article. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR AN OPEN

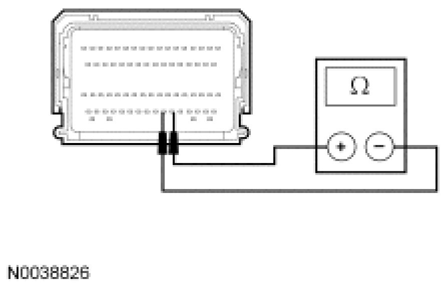

Fig. 13: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the PCM C175b-57, circuit RES08 (GN/BN), harness side.
- **Is the resistance between 4,279 and 4,363 ohms?**

  YES : Go to C10.

  NO : Go to C8.

C8 CHECK CIRCUITS VES10 (GN/BK) AND RES08 (GN/BN) FOR AN OPEN

- Disconnect: Clockspring C218a

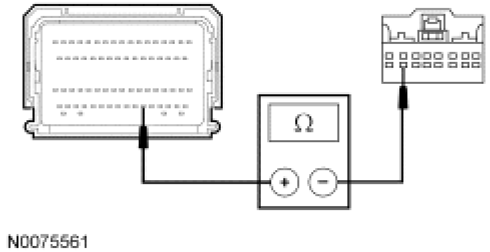

Fig. 14: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the clockspring C218a-15, circuit VES10 (WH), harness side.

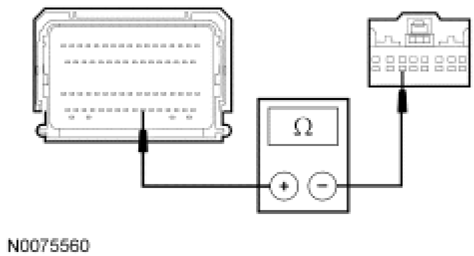

Fig. 15: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-57, RES08 (GN/BN), harness side and the clockspring C218a-14, circuit RES08 (GN/BN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to C9.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C9 CHECK THE CLOCKSPRING

- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

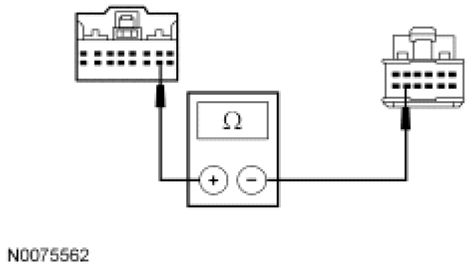

Fig. 16: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218a pin 15, component side and the upper clockspring C218b pin 8, component side.

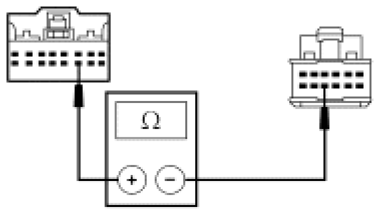

Fig. 17: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218a pin 14, component side and the upper clockspring C218b pin 9, component side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new speed control switch. REFER to **Speed Control Switch**. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

C10 CHECK FOR CORRECT PCM OPERATION

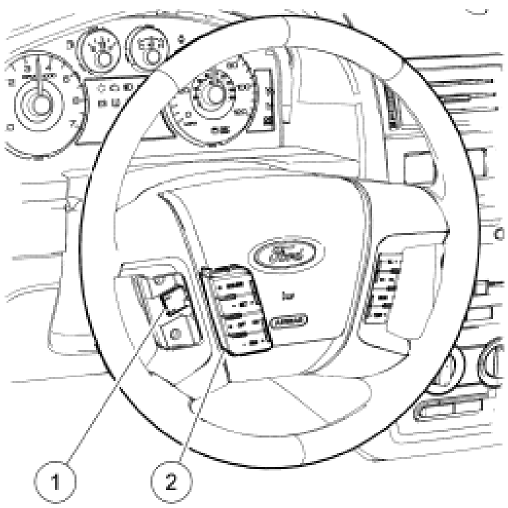
- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

REMOVAL AND INSTALLATION

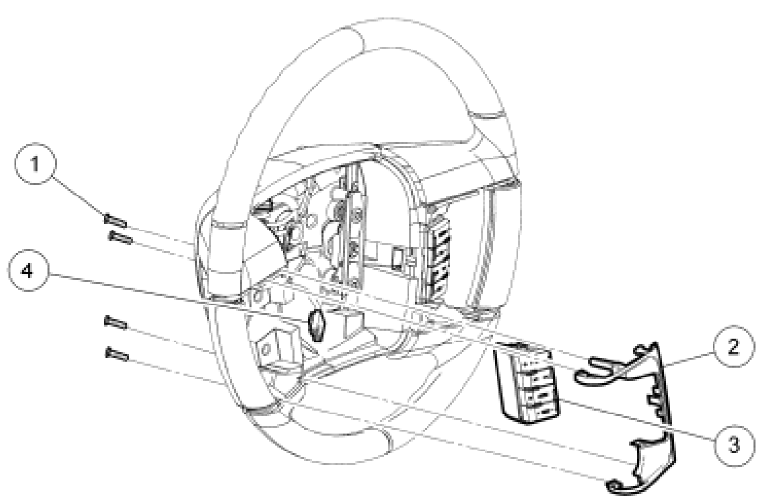
SPEED CONTROL SWITCH



N0060150

Fig. 18: Exploded View Of Speed Control Switch - Edge
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Speed control switch electrical connector (part of 14A411)
2	9C888	Speed control switch



N0060049

Fig. 19: Exploded View Of Speed Control Switch - MKX
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Steering wheel controls bezel screws (4 required)
2	-	Steering wheel controls bezel
3	9C888	Speed control switch
		Speed control switch electrical connector

4	-	(part of 14A441)

REMOVAL AND INSTALLATION

MKX

1. Remove the driver air bag module. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
2. Remove the 4 screws and the steering wheel control bezel.

   All vehicles

3. Remove the speed control switch by pulling the switch toward the rear of the vehicle.
   - Disconnect the electrical connector.
4. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Hood Latch

The hood latch components consist of the following:

- Hood latch release handle and cable
- Hood latch

Front Doors

The front door components consist of the following:

- Door ajar switch (part of the front door latch)
- Door lock control switch
- Door lock cylinder (driver door only)
- Exterior front door handle bezel
- Exterior front door handle reinforcement
- Exterior front door handle strap
- Front door latch
- Front door lock actuator (part of the front door latch)
- Interior front door handle actuating cable
- Interior front door handle
- Keyless entry keypad (driver door only)

Individual lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Rear Doors

The rear door components consist of the following:

- Door ajar switch (part of the rear door latch)
- Exterior rear door handle bezel
- Exterior rear door handle reinforcement
- Exterior rear door handle strap
- Interior rear door handle actuating cable
- Interior rear door handle
- Rear door latch
- Rear door lock actuator (part of the rear door latch)

Manual Liftgate

The manual liftgate consists of the following components:

- Liftgate ajar switch (part of the liftgate latch)
- Liftgate release switch (located on the exterior of the liftgate)
- Liftgate latch

Power Liftgate

The power liftgate consists of the following components:

- Liftgate ajar switch (part of the liftgate latch)
- Liftgate release switch (located on the exterior of the liftgate)
- Liftgate latch

Power Lock/Unlock

The power lock/unlock feature requests all of the vehicle doors locked or unlocked upon a customer request from either door lock control switch in the vehicle. The power door locking system functions independently of ignition status or vehicle speed.

Autolocks

The autolock feature will lock all the doors when:

- all the doors are closed,
- the ignition is in the RUN position,
- the vehicle is shifted into any gear putting the vehicle in motion, and
- the vehicle attains a speed greater than 20 km/h (12 mph) for greater than 2 seconds.

The autolock feature repeats when:

- any door is opened then closed while the ignition is in the RUN position and the vehicle speed is 15 km/h (9 mph) or lower, and
- the vehicle attains a speed greater than 20 km/h (12 mph) for greater than 2 seconds.

Auto-Unlock

NOTE: **The doors will not auto-unlock if the vehicle has been electronically locked before the driver door is opened.**

The auto-unlock feature will unlock all the doors when:

- the ignition is in the RUN position, all the doors are closed and the vehicle has been in motion at a speed greater than 20 km/h (12 mph),
- the vehicle has come to a stop and the ignition is turned to the OFF or ACC position, and
- the driver door is opened within 10 minutes of the ignition being transitioned to the OFF or ACC position.

Smart Unlock

The smart unlock feature prevents the doors from locking with the key in the ignition lock cylinder. When the SJB receives a lock command from a door lock control switch only, and the key is in the ignition lock cylinder with one of the front doors open, the SJB commands the doors to lock, then unlock.

The vehicle can still be locked by locking the doors with the push button rods, the door lock cylinder or an RKE command from an integrated key or the keyless entry keypad.

Remote Keyless Entry (RKE)

The remote keyless entry (RKE) system uses an integrated keyhead transmitter (IKT). The IKT incorporates both the passive anti-theft system (PATS) functions and the RKE transmitter functions in a single device.

The RKE transmitter is programmed automatically during PATS programming. During PATS programming, the instrument cluster (IC) obtains the transmitter identification code (TIC) from the IKT and sends the TIC data over the medium speed controller area network (MS-CAN) to the SJB.

The SJB accepts programming of up to 4 IKTs. In addition to the IKTs, 4 conventional keyfobs can also be programmed to the vehicle if requested by the customer. For information on programming the IKTs, refer to Key Programming Using Two Programmed Keys or Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. For information on programming the conventional keyfobs, refer to **Remote Keyless Entry Transmitter Programming**.

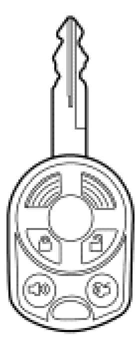

Fig. 1: Identifying Key With Power Liftgate
Courtesy of FORD MOTOR CO.

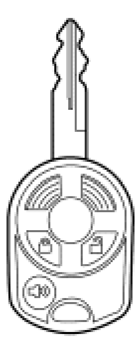

Fig. 2: Identifying Key Without Power Liftgate
Courtesy of FORD MOTOR CO.

The IKT initiates the following electronic system functions:

- Unlocks the driver door

- Unlocks all doors
- Locks all doors
- Opens the power liftgate (if equipped)
- Arms/disarms the perimeter alarm (if equipped)
- Activates/deactivates the panic alarm
- Commands the interior lamps on (when unlocking) and off (when locking)
- Recalls the memory seat position associated with a particular remote entry device (when enabled)
- Sounds the horn once when LOCK is pressed twice within 3 seconds, and the doors are closed
- Sounds the horn twice when LOCK is pressed twice within 3 seconds, and any door is ajar

The IKT has a normal operating range of 10 m (33 ft).

Remote Keyless Entry (RKE) Lock/Unlock Control - Unlock

The RKE feature provides lock/unlock functions independently of key position, vehicle speed, or transmission position. The RKE feature provides a stepped (if enabled) process for unlocking the doors. Upon receipt of the first request for unlocking the doors, the RKE control feature requests the SJB to unlock the driver door only. If another unlock request is received within 3 seconds of the first, the RKE feature requests the SJB to unlock all the doors. This feature can be disabled, so that all the doors unlock on the first press of the unlock button. Refer to **Stepped Unlock Programming** for programming information.

Remote Keyless Entry (RKE) Lock/Unlock Control - Lock

The RKE feature requests that all the doors be locked when the LOCK button is pressed. On any press of the LOCK button with all doors closed, the SJB provides one flash of the turn signals. If any door is ajar, no flash occurs. As soon as the last door is closed, the SJB provides the flash of the turn signals. If 2 presses of the LOCK button are received within 3 seconds, the horn chirps once and the turn signals flash twice to indicate that all the doors are closed and locked. If any door is ajar when the second lock request is received within 3 seconds of the first, the RKE transmitter feature requests the SJB chirp the horn twice without flashing the turn signals to indicate it locked all the doors but one or more doors are ajar. When the key is in the ON or START position, the turn signal flashes and horn chirp confirmations do not occur.

Remote Keyless Entry (RKE) Power Liftgate

The RKE feature provides a power liftgate open/close function independently of key position. The power liftgate button must be pressed twice within 3 seconds for the power liftgate to open or close.

Panic Alarm

The panic alarm feature provides audible and visual alarms which are evident from the exterior of the vehicle. The panic alarm feature requests that the turn signals are flashed and the horn sounds until deactivation. The flashing of the outputs occurs simultaneously. Activation of the panic alarm is accomplished by pressing the PANIC button on an integrated keyhead transmitter (IKT) whenever the key is in the OFF position. At all other times this feature is disabled. Deactivation of an active panic alarm is accomplished by any of the following actions:

- a second press of the IKT PANIC button
- the key is switched out of the OFF position
- a period of 2 minutes and 45 seconds has elapsed since the initial activation

Keyless Entry Keypad

The keyless entry keypad carries out the following functions:

- Unlocks the driver door
- Unlocks all the doors
- Locks all doors
- Enables/disables auto-unlocking
- Enables/disables autolocking
- Arms/disarms the perimeter alarm (if equipped)
- Recalls the memory seat position associated with a particular customer key code (when enabled)
- Programs/erases the customer key code
- Illuminates the keyless entry keypad lamp and issues illuminated entry on/off requests

The keypad feature operates independently of key position status, vehicle speed, or transmission position. When an keypad button is pressed, the keypad buttons illuminate to provide better visibility. If the lock all doors command is entered or 5 seconds have elapsed since the last button press, the illumination is turned off.

Each vehicle equipped with a keypad is programmed with a 5-digit entry code. This code is provided to the customer through a wallet card in the Owner's Literature. In addition, this code is available through a scan tool and is also printed on the SJB label. When entering codes each digit must be entered within 5 seconds of the previous button press.

Locking the Doors with the Keyless Entry Keypad System

It is not necessary to enter the factory set or personal code prior to locking all doors. To lock all doors, press the 7/8 and 9/0 controls at the same time.

Unlocking the Doors with the Keyless Entry Keypad System

To unlock the driver door, enter either the factory set code or a personal code; each digit must be pressed within 5 seconds of the prior digit. The interior lamps illuminate.

To unlock all doors, enter either the factory set code or a personal code (driver door unlocks) and press the 3/4 button within 5 seconds.

Anti-Scan Feature

To provide added security, the keypad is disabled for 1 minute after 35 button presses without a valid entry code being entered. The keypad flashes during this 1-minute mode with all functionality disabled except for 7/8 and

9/0 still being allowed to lock the vehicle.

Anti-scan is turned off after 1 minute of keypad inactivity, the UNLOCK button is pressed on an IKT, or the ignition is switched to the RUN position.

Perimeter Lighting Feature

Vehicles equipped with perimeter lighting can have this feature activated or deactivated. For information on programming the perimeter lighting feature, refer to **Perimeter Lighting Feature Programming**.

NOTE: **On vehicles with autolamps, the perimeter lighting feature does not activate in daylight conditions.**

The headlamps, park lamps, and tail lamps illuminate when the unlock control on the IKT is pressed. The illuminated entry system will turn off the interior lamps if:

- The ignition switch is turned to the RUN position
- The IKT lock control is pressed
- The vehicle is locked using the keyless entry keypad (if equipped)
- After 25 seconds have elapsed since the perimeter lighting was activated

DIAGNOSTIC TESTS

LOCKS, LATCHES AND ENTRY SYSTEMS

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

Power Locks

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB monitors the door lock control switches. When the SJB receives an unlock/lock command from either door lock control switch, the SJB energizes a relay to supply the correct power and grounds for the door lock actuators.

Liftgate Release

The liftgate release switch operates the liftgate latch electronically. When the switch is pressed, the SJB processes the input and releases the liftgate latch.

The doors must be unlocked electronically in order for the SJB to release the liftgate latch. When this condition is met and the SJB receives the input from the liftgate release switch, the SJB provides power to the latch release motor.

Keyless Entry Keypad

The SJB monitors the keyless entry keypad input. When the correct codes are entered into the SJB, the SJB carries out functions associated with the code entered. Based on input from the keypad, the SJB:

- locks all doors.
- unlocks the driver door.
- unlocks all doors.
- enters programming mode.
- enables/disables the autolock feature.
- enables/disables the auto-unlock feature.

Remote Keyless Entry (RKE)

The SJB receives input from programmed integrated keyhead transmitters (IKTs). Based on input from the IKT, the SJB:

- locks all doors.
- unlocks the driver door.
- unlocks all doors.
- activates/deactivates the panic alarm.
- arms/disarms the perimeter alarm (if equipped).
- if equipped, issues a command over the communication network to the liftgate/trunk module (LTM) to open the power liftgate.

- if equipped, activates the memory positions.
- turns the interior lamps on (when unlocking) and off (when locking), provided the defeat switch on the dimmer switch is not active.
- sounds the horn once when LOCK is pressed twice within 3 seconds, and the doors are closed.
- sounds the horn twice when LOCK is pressed twice within 3 seconds, and any door is open.

Field-Effect Transistor (FET) Protection

The SJB utilizes a FET protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. A continuous DTC is stored at that time for the fault. The circuit will then reset after a customer demand of the function (switching the component on, battery saver being energized). When an excessive circuit load occurs several times, the module shuts down the output until a repair procedure is carried out. At the same time, the continuous DTC that was stored on the first failure will not clear by a command to clear the continuous DTCs. The module will not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC will have been cleared and the circuit function will return.

Each circuit has 3 predefined levels of short circuit tolerance established in the module based on each circuits' capability. When the first or second level is reached, the continuous DTC associated with the circuit sets along with DTC B106E. These DTCs may be cleared using the Clear DTC operation on the scan tool as long as the fault itself has been corrected. If any of the circuits are shorted past the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. These DTCs cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the handles, locks, latches and entry systems are the liftgate lock actuator circuit CPL10 (GN/WH) and the keypad illumination circuit CPK28 (WH/GN).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Door/liftgate handles
• Latches
	• Smart junction box (SJB) fuse(s):
	  ○ 5 (10A)
	  ○ 14 (10A)
	  ○ 17 (20A)
	• Wiring, terminals and connectors
	• Door lock actuators

	• Door lock control switches • Integrated keyhead transmitter (IKT) • Keyless entry keypad • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
    - Check the VCM connection to the vehicle.
    - Check the scan tool connection to the VCM.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
    - Verify the ignition key is in the ON position.
    - Verify the scan tool operation with a known good vehicle.
    - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs for the SJB.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to **DTC Charts**. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

INSTRUMENT CLUSTER (IC) DTC CHART

DTC	Description	Action
B1137	Data Not Programmed	Go to **Pinpoint Test J** .

B1138	Memory Full	The smart junction box (SJB) limit of 4 integrated keys is exceeded. PROGRAM a maximum of 4 integrated keys. Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the instrument cluster (IC)	• Wiring, terminals or connectors • IC	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• All door locks are inoperative	• Fuse • Wiring, terminals or connectors • SJB	• Go to **Pinpoint Test A** .
• A single/more than one door lock is inoperative	• Wiring, terminals or connectors • Door lock actuator • SJB	• Go to **Pinpoint Test B** .
• The door locks operate only one way	• Wiring, terminals or connectors • Door lock control switch • SJB	• Go to **Pinpoint Test C** .
• All door locks are inoperative from one switch	• Wiring, terminals or connectors • Door lock control switch	• Go to **Pinpoint Test D** .
• The liftgate latch release is inoperative/does not operate correctly	• Wiring, terminals or connectors • Liftgate release switch • Liftgate latch • Liftgate/trunk module (LTM) • SJB	• Go to **Pinpoint Test F** .
• The doors do not lock/unlock using the keyless entry keypad	• Wiring, terminals or connectors • Keyless entry keypad • SJB	• Go to **Pinpoint Test G** .

• The keyless entry keypad illumination is inoperative/does not operate correctly	• Wiring, terminals or connectors • Keyless entry keypad • SJB	• Go to **Pinpoint Test H** .
• The remote keyless entry (RKE) transmitter is inoperative	• Integrated keyhead transmitter (IKT) • IKT battery • IKT button pressed a substantial amount of times while outside the range of the vehicle • IKT programming • SJB	• Go to **Pinpoint Test I** .
• An individual button/feature is inoperative from the remote keyless entry (RKE) transmitter	• Door locks • Horn system • Power liftgate release • Turn signal system • IKT	• Go to **Pinpoint Test K** .
• The remote keyless entry (RKE) transmitter has poor range performance	• IKT • IKT battery • Aftermarket systems • High power devices • TV/radio transmission towers • SJB	• Go to **Pinpoint Test L** .
• The smart unlock does not operate correctly	• Key-in-ignition switch • Door ajar switch input • SJB	• Go to **Pinpoint Test M** .
• The autolock does not operate correctly	• Wiring, terminals or connectors • Programming • Door ajar switches • SJB	• Go to **Pinpoint Test N** .
• The memory seat does not operate correctly	• SJB	• ACTIVATE the remote memory. REFER to **Remote Memory Activation**. TEST the system for normal operation. If the remote

using the remote keyless entry (RKE) transmitter	• Memory seat module	memory is still inoperative, REFER to **SEATING** article to diagnose the memory seat.
• The RKE two step door unlocking does not operate correctly	• Two step door unlocking is disabled	• PROGRAM the two step door unlocking. REFER to **Stepped Unlock Programming**. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: All Door Locks Are Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAM article, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) fuse 17 (20A) provides voltage for the power lock/unlock system. Ground for the power lock/unlock system is provided to the SJB through circuit GD133 (BK). The SJB contains internal relays that are energized depending on input received.

When the SJB receives a lock request from the door lock control switch, the SJB provides power to the door lock actuators through circuit CPL11 (GY/BN). Ground for the LH front door actuator is provided through circuit CPL51 (BU/GN) and ground for the remaining door lock actuators is provided through circuit CPL52 (VT/GY). When the SJB receives an unlock request, power and ground are reversed on the previously listed circuits.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST A: ALL DOOR LOCKS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK THE RECORDED SJB DTCs FROM ON-DEMAND SELF-TEST

- Check the recorded results from the SJB self-test.
- **Is DTC B2A25 present?**

  YES : Go to **Pinpoint Test E** .

  NO : Go to A2.

A2 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES

- Press the LOCK and UNLOCK button on both door lock control switches while observing the door lock operation.
- **Are the door locks inoperative from both switches?**

  YES : Go to A3.

  NO : Go to **Pinpoint Test D** .

A3 VERIFY ALL DOOR LOCKS ARE INOPERATIVE

- Press the LOCK and UNLOCK buttons from a door lock control switch while observing the door locks.
- **Are all the door locks inoperative from both switch positions (lock and unlock)?**

  YES : VERIFY the SJB fuse 17 (20A) is OK. If OK, go to A4.

  If not OK, go to A6.

  NO : Go to **Symptom Chart**.

A4 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280d

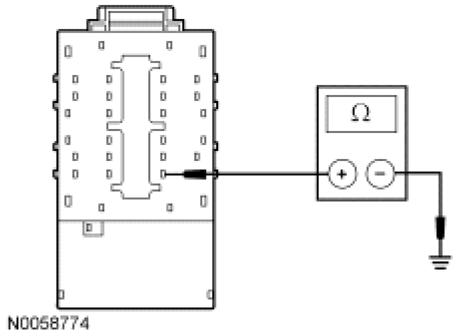

Fig. 3: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-7, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to A5.

  NO : REPAIR the circuit. TEST the system for normal operation.

A5 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN

- Disconnect: LH Front Door Lock Actuator C525

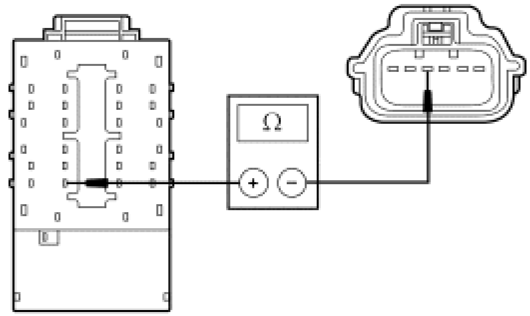

Fig. 4: Measuring Resistance Between SJB C2280D-6, Circuit CPL11 (GY/BN) & LH Front Door Lock Actuator C525-4
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-6, circuit CPL11 (GY/BN), harness side and the LH front door lock actuator C525-4, circuit CPL11 (GY/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A7.

  NO : REPAIR the circuit. TEST the system for normal operation.

A6 CHECK CIRCUIT CPL11 (GY/BN) FOR A SHORT TO GROUND

- Install a new SJB fuse 17 (20A).
- Operate the door lock actuators by pressing LOCK on the door lock control switch.
- **Is the SJB fuse 17 (20A) OK?**

  YES : REPAIR circuit CPL51 (BU/GN) or CPL52 (VT/GY) for a short to ground. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

A7 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: A Single/More Than One Door Lock Is Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAM article, Power Door Locks for schematic and connector information.

Normal Operation

When the smart junction box (SJB) receives a lock request from the door lock control switch, the SJB provides power to the door lock actuators through circuit CPL11 (GY/BN). Ground for the LH front door actuator is provided through circuit CPL51 (BU/GN) and ground for the remaining door lock actuators is provided through circuit CPL52 (VT/GY). When the SJB receives an unlock request, power and ground are reversed on the previously listed circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock actuator
- SJB

PINPOINT TEST B: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK THE DOOR LATCH FOR BINDING

- Lock and unlock the inoperative door lock using the door lock rod.
- **Does the door lock and unlock?**

YES : Go to B2.

NO : INSTALL a new door latch. REFER to **Door Latch**.

B2 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Inoperative Door Lock Actuator

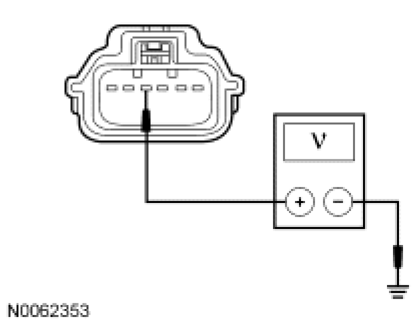

Fig. 5: Measuring Voltage Between Inoperative Door Lock Actuator, Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.

- While pressing the door lock control switch in the LOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:

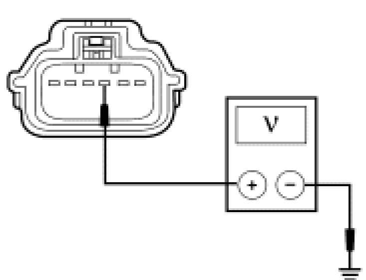
Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-4	CPL11 (GY/BN)
RH front	C603-4	CPL11 (GY/BN)
LH rear	C704-4	CPL11 (GY/BN)
RH rear	C804-4	CPL11 (GY/BN)

- **Is the voltage momentarily greater than 10 volts?**

  YES : Go to B3.

  NO : REPAIR the circuit. TEST the system for normal operation.

B3 CHECK CIRCUIT CPL52 (VT/GY) OR CIRCUIT CPL51 (BU/GN) FOR VOLTAGE



N0062352

Fig. 6: Measuring Voltage Between Inoperative Door Lock Actuator, Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.

- While pressing the door lock control switch in the UNLOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-3	CPL51 (BU/GN)
RH front	C603-3	CPL52 (VT/GY)
LH rear	C704-3	CPL52 (VT/GY)
RH rear	C804-3	CPL52 (VT/GY)

- **Is the voltage momentarily greater than 10 volts?**

  YES : INSTALL a new door latch. REFER to **Door Latch**.

  NO : Go to B4.

B4 CHECK CIRCUIT CPL51 (BU/GN) OR CIRCUIT CPL52 (VT/GY) FOR AN OPEN

- Disconnect: SJB C2280d

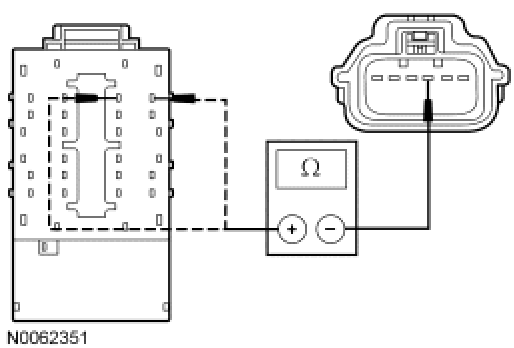


Fig. 7: Measuring Resistance Between SJB, Harness Side & Inoperative Door Lock Actuator, Harness Side
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB, harness side and the inoperative door lock actuator, harness side as follows:

SJB Connector-Pin	Inoperative Door Lock Actuator Connector-Pin	Circuit
C2280d-28	LH front C525-3	CPL51 (BU/GN)
C2280d-27	RH front C603-3	CPL52 (VT/GY)

C2280d-27	LH rear C704-3	CPL52 (VT/GY)
C2280d-27	RH rear C804-3	CPL52 (VT/GY)

- **Is the resistance less than 5 ohms?**

  YES : Go to B5.

  NO : REPAIR the circuit. TEST the system for normal operation.

B5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Door Locks Operate Only One Way

Refer to appropriate SYSTEM WIRING DIAGRAM article, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box SJB sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the LOCK or UNLOCK switch is pressed, the voltage signal is routed to ground.

The SJB contains internal relays that are energized depending on input received. When the SJB receives a lock or unlock request from the door lock control switch, the SJB energizes the appropriate relay(s) to lock or unlock the doors.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch
- SJB

PINPOINT TEST C: THE DOOR LOCKS OPERATE ONLY ONE WAY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE RECORDED SJB DTCs FROM ON-DEMAND SELF-TEST

- Check the recorded results from the SJB self-test.
- **Is DTC B2A25 present?**

  YES : Go to **Pinpoint Test E** .

  NO : Go to C2.

C2 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES

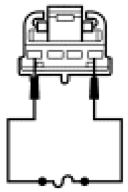
- Key in OFF position.
- Press the LOCK and UNLOCK button of both door lock control switches while observing the door lock operation.
- **Do the door locks operate only one way from both switches?**

  YES : Go to C4.

  NO : Go to C3.

C3 CHECK CIRCUIT CPL42 (GY/YE) (LOCK INPUT) OR CIRCUIT CPL43 (VT/GY) (UNLOCK INPUT) FOR AN OPEN (SINGLE SWITCH INOPERATIVE)

- Disconnect: Suspect Door Lock Control Switch
- Unlock the doors from the working door lock control switch.



N0062349

Fig. 8: Connecting Fused (5A) Jumper Wire Between LH Door Lock Control Switch C505-1, Circuit CPL42 (GY/YE)
Courtesy of FORD MOTOR CO.

- Observe the door locks while connecting a fused (5A) jumper wire between the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side and the LH door lock control switch C505-4, circuit GD133 (BK), harness side; or between the RH door lock control switch C605-1, circuit CPL42 (GY/YE), harness side and the RH door lock control switch C605-4, circuit GD140 (BK/GN), harness side.
- Remove the jumper wire.

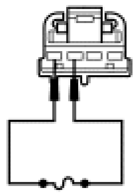


Fig. 9: Connecting Fused (5A) Jumper Wire Between LH Door Lock Control Switch C505-3, Circuit CPL43 (VT/GY)
Courtesy of FORD MOTOR CO.

- Observe the door locks while connecting a fused (5A) jumper wire between the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side and the LH door lock control switch C505-4, circuit GD133 (BK), harness side; or between the RH door lock control switch C605-3, circuit CPL43 (VT/GY), harness side and the RH door lock control switch C605-4, circuit GD140 (BK/GN), harness side.
- **Do the doors lock and unlock with the jumper wire?**

  YES : INSTALL a new door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

  NO : REPAIR the input circuit in question. TEST the system for normal operation.

C4 CHECK CIRCUIT CPL42 (GY/YE) (LOCK INPUT) OR CIRCUIT CPL43 (VT/GY) (UNLOCK INPUT) FOR AN OPEN (BOTH SWITCHES INOPERATIVE)

- Disconnect: LH Door Lock Control Switch C505
- Disconnect: SJB C2280c

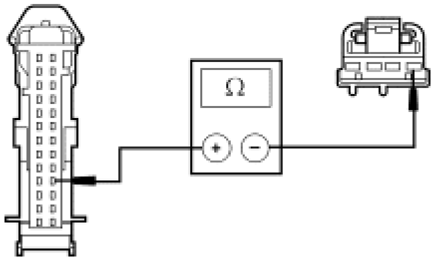

Fig. 10: Measuring Resistance
Courtesy of FORD MOTOR CO.

- If the doors do not lock, measure the resistance between the SJB C2280c-17, circuit CPL42 (GY/YE), harness side and the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side.

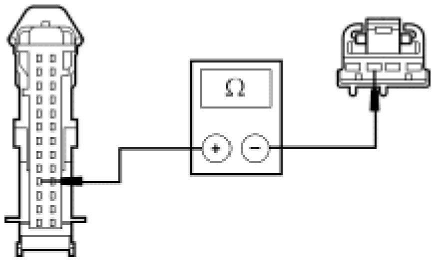

Fig. 11: Measuring Resistance
Courtesy of FORD MOTOR CO.

- If the doors do not unlock, measure the resistance between the SJB C2280c-4, circuit CPL43 (VT/GY), harness side and the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C5.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

C5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: All Door Locks Are Inoperative From One Switch

Refer to appropriate SYSTEM WIRING DIAGRAM article, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the LOCK or UNLOCK switch is pressed, the voltage signal is routed to ground. Ground for the LH door lock control switch is provided through circuit GD133 (BK), and the RH side through circuit GD140 (BK/GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch

PINPOINT TEST D: ALL DOOR LOCKS ARE INOPERATIVE FROM ONE SWITCH

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

D1 CHECK CIRCUIT GD133 (BK) OR GD140 (BK/GN) FOR AN OPEN

- Disconnect: Inoperative Door Lock Control Switch

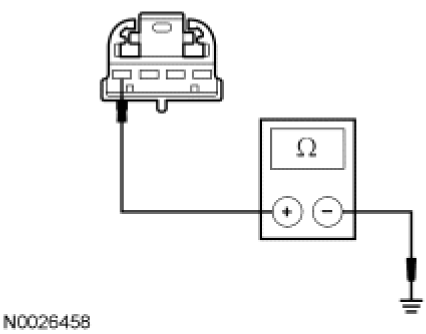

Fig. 12: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH door lock control switch C505-4, circuit GD133 (BK), harness side and ground; or between the RH door lock control switch C605-4, circuit GD140 (BK/GN), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test E: DTC B2A25 - Trim Panel Lock Switch Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAM article, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests, respectively. When the LOCK or UNLOCK switch is pressed, the voltage signal is routed to ground. Ground for the LH door lock control switch is provided through circuit GD133 (BK), and the RH side through circuit GD140 (BK/GN).

- DTC B2A25 (Trim Panel Lock Switch Circuit Failure) - is an on-demand DTC that sets when the SJB detects a short to ground from the lock or unlock request input circuits. This DTC may also set if either of the door lock control switches are pressed for longer than 2 minutes.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch
- SJB

PINPOINT TEST E: DTC B2A25 - TRIM PANEL LOCK SWITCH CIRCUIT FAILURE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK THE RECORDED SJB DTCs FROM ON-DEMAND SELF-TEST

- Check the recorded results from the SJB self-test.
- **Is DTC B2A25 present?**

  YES : Go to E2.

  NO : Go to **Symptom Chart**.

E2 CHECK THE LH DOOR LOCK CONTROL SWITCH

- Disconnect: LH Door Lock Control Switch C505
- Repeat the SJB on-demand self-test.
- **Is DTC B2A25 retrieved again?**

  YES : LEAVE the switch disconnected. Go to E3.

  NO : INSTALL a new LH door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

E3 CHECK THE RH DOOR LOCK CONTROL SWITCH

- Disconnect: RH Door Lock Control Switch C605
- Repeat the SJB on-demand self-test.
- **Is DTC B2A25 retrieved again?**

  YES : LEAVE the switch disconnected. Go to E4.

  NO : INSTALL a new RH door lock control switch. REFER to **Door Lock Control Switch**. TEST the system for normal operation.

E4 CHECK THE LOCK INPUT CIRCUIT OR THE UNLOCK INPUT CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c

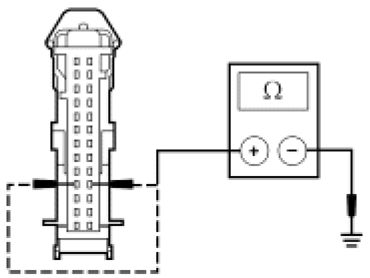

Fig. 13: Measuring Resistance Between SJB C2280c-17 & SJB C2280c-4, CPL42 (VT/GY) & CPL43 (VT/GY)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280c-17, circuit CPL42 (GY/YE), harness side and ground; and between the SJB C2280c-4, circuit CPL43 (VT/GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E5.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Liftgate Latch Release Is Inoperative/Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAM article, Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) does not release the liftgate unless the doors have been unlocked electronically or the request is initiated from a remote keyless entry (RKE) transmitter.

The SJB sends a voltage signal to the liftgate release switch through circuit CPL45 (BN). When the switch is activated, the signal is routed to ground through circuit GD149 (BK/GY). When the SJB detects a request from the liftgate release switch, the SJB provides voltage through circuit CPL10 (BN/BU) to the liftgate latch (vehicles equipped with a manual liftgate) or the liftgate/trunk module (LTM) (vehicles equipped with a power liftgate). For vehicles with a manual liftgate, ground for the liftgate latch is provided through circuit GD149 (BK/GY).

- DTC B2666 (Liftgate Release Switch Circuit Failure) - is a continuous and on-demand DTC that sets when the SJB detects a short to ground on the liftgate release switch input circuit CPL45 (BN). The DTC is also set if the liftgate release switch is actuated for longer than 2 minutes.
- DTC B273A (Liftgate Release Output Circuit Shorted to Ground) - is a continuous DTC that sets when the SJB detects a short to ground on the liftgate latch release output circuit CPL10 (GN/WH).
- DTC B273B (Liftgate Release Output Circuit Open or Shorted to Battery Voltage) - is a continuous and on-demand DTC that sets when the SJB detects an open or short to voltage on the liftgate latch release output circuit CPL10 (GN/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals and connectors
- Liftgate release switch
- Liftgate latch
- LTM
- SJB

PINPOINT TEST F: THE LIFTGATE LATCH RELEASE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

F1 RETRIEVE THE RECORDED SJB AND LTM DTCs FROM THE CONTINUOUS AND ON-DEMAND SELF-TESTS

- Check for recorded SJB and LTM DTCs from the continuous and on-demand self-tests.
- **Are any DTCs recorded?**

  YES : For SJB DTC B2666, go to F2.

  For SJB DTC B273A, go to F4.

  For SJB DTC B273B, go to F6 (manual liftgate) or Go to F7 (power liftgate).

  For all other SJB DTCs, REFER to **DTC Charts**.

  For any LTM DTCs, REFER to **BODY CLOSURES** article.

NO : Go to F11.

F2 REPEAT THE SJB CONTINUOUS AND ON-DEMAND SELF-TESTS FOR DTC B2666

- Disconnect: Liftgate Release Switch C4353 (Manual Liftgate) or C4216 (Power Liftgate)
- Clear the DTCs, then repeat the SJB continuous and on-demand self tests.
- **Is DTC B2666 recorded?**

  YES : Go to F3.

  NO : INSTALL a new liftgate release switch. REFER to **Liftgate Release Switch - Manual** or **Liftgate Release Switch - Power**. TEST the system for normal operation.

F3 CHECK CIRCUIT CPL45 (BN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c

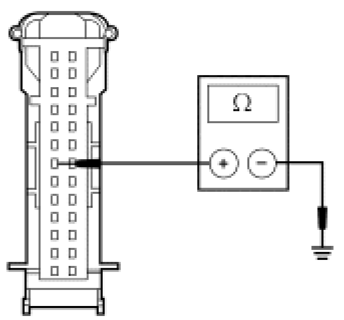

Fig. 14: Measuring Resistance Between SJB C2280C-7, Circuit CPL45 (BN), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280c-7, circuit CPL45 (BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to F15.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F4 REPEAT THE SJB CONTINUOUS SELF-TEST FOR DTC B273A

- Disconnect: Liftgate Latch C479 (Manual Liftgate) or Power Liftgate Module C4174b (Power Liftgate)

NOTE: DTC B273B may set and should be ignored when carrying out this step.

- Clear the DTCs, then repeat the SJB continuous self-test.
- **Is DTC B273A present?**

  YES : Go to F5.

  NO : For a manual liftgate, INSTALL a new liftgate latch. REFER to **Liftgate Latch - Manual**. TEST the system for normal operation.

For a power liftgate, go to F14.

F5 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280d

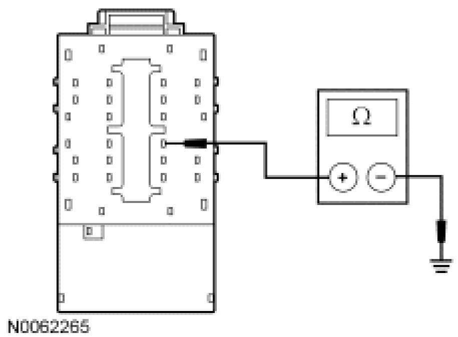

Fig. 15: Measuring Resistance Between SJB C2280D-15, Circuit CPL10 (GN/WH), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280d-15, circuit CPL10 (GN/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to F15.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F6 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN (LATCH)

- Key in OFF position.
- Disconnect: Liftgate Latch C479

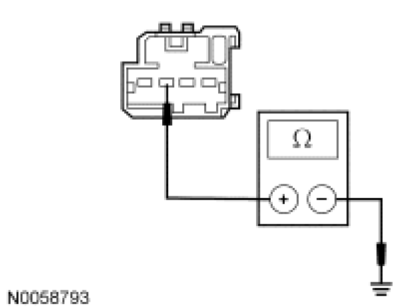

Fig. 16: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the liftgate latch C479-2, circuit GD149 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to F7.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F7 CHECK FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: LTM C4174b (If Equipped)
- Key in ON position.

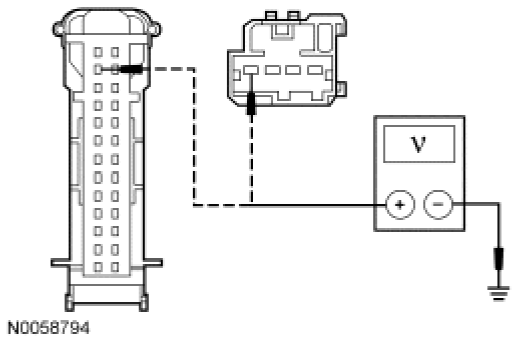

Fig. 17: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the LTM C4174b-12, circuit CPL10 (GN/WH), harness side and ground; or between the liftgate latch C479-1, circuit CPL10 (GN/WH), harness side and ground.
- **Is any voltage present?**

YES : Go to F8.

NO : Go to F9.

F8 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280d
- Key in ON position.

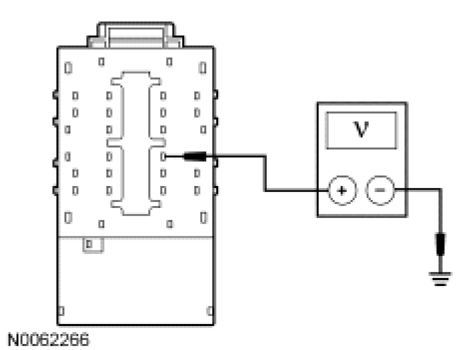

Fig. 18: Measuring Voltage Between SJB C2280D-15, Circuit CPL10 (GN/WH), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between the SJB C2280d-15, circuit CPL10 (GN/WH), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to F15.

F9 CHECK FOR SJB OUTPUT

- Key in OFF position.
- Unlock the doors with the door lock control switch.

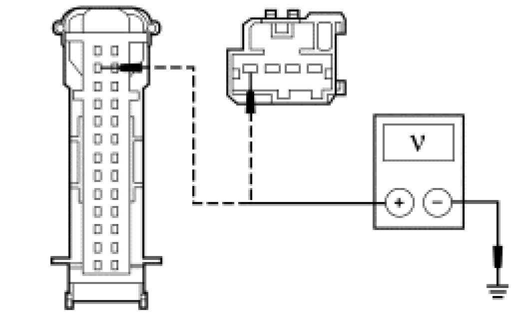

Fig. 19: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE: **The SJB only supplies voltage for the liftgate latch release momentarily. It is important to monitor the meter while activating the liftgate release switch.**

- While activating the liftgate release switch, measure the voltage between the LTM C4174b-12, circuit CPL10 (GN/WH), harness side and ground (power liftgate); or between the liftgate latch C479-1, circuit CPL10 (GN/WH), harness side and ground (manual liftgate).
- **Is the voltage greater than 10 volts when the switch is activated?**

  YES : For a manual liftgate, INSTALL a new liftgate latch. REFER to **Liftgate Latch - Manual**. CLEAR the DTCs. REPEAT the self-test.

  For a power liftgate, go to F14.

  NO : Go to F10.

F10 CHECK CIRCUIT CPL10 (GN/WH) FOR AN OPEN

- Disconnect: SJB C2280d

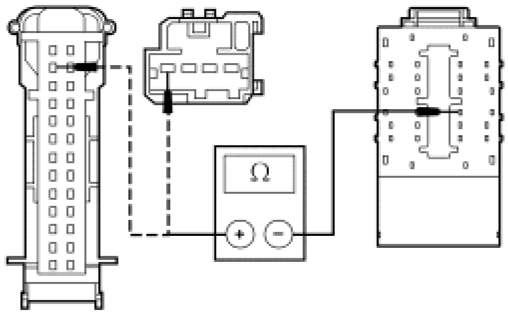

Fig. 20: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LTM C4174b-12, circuit CPL10 (GN/WH), harness side and the SJB C2280d-15, circuit CPL10 (GN/WH), harness side (power liftgate); or between the liftgate latch C479-1, circuit CPL10 (GN/WH), harness side and the SJB C2280d-15, circuit CPL10 (GN/WH), harness side (manual liftgate).
- **Is the resistance less than 5 ohms?**

  YES : Go to F15.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F11 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN (SWITCH)

- Disconnect: Liftgate Release Switch C4353 (Manual Liftgate) or C4216 (Power Liftgate)

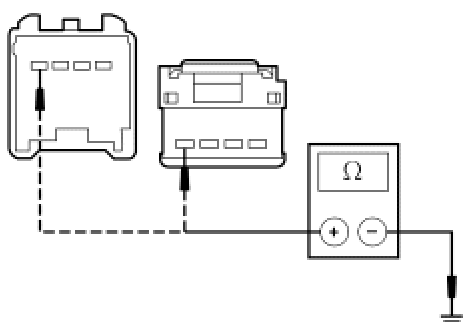

Fig. 21: Measuring Resistance
Courtesy of FORD MOTOR CO.

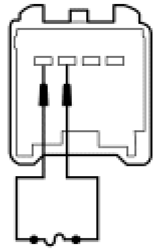
- Measure the resistance between the liftgate release switch C4353-4 (manual liftgate), circuit GD149 (BK/GY), harness side and ground; or between the liftgate release switch C4216-4 (power liftgate), circuit GD149 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F12.

  NO : REPAIR the circuit. TEST the system for normal operation.

F12 CHECK THE LIFTGATE RELEASE SWITCH

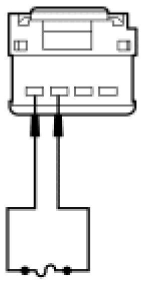
- Unlock the doors with the door lock control switch.



N0062300

Fig. 22: Connecting Fused (5A) Jumper Wire Between Liftgate Release Switch C4353-3, Circuit CPL45 (BN)
Courtesy of FORD MOTOR CO.

- For manual liftgate vehicles, connect a fused (5A) jumper wire between the liftgate release switch C4353-3, circuit CPL45 (BN), harness side and the liftgate release switch C4353-4, circuit GD149 (BK/GY), harness side.



N0062268

Fig. 23: Connecting Fused (5A) Jumper Wire Between Liftgate Release Switch C4216-3, Circuit CPL45 (BN)
Courtesy of FORD MOTOR CO.

- For power liftgate vehicles, connect a fused (5A) jumper wire between the liftgate release switch C4216-3, circuit CPL45 (BN), harness side and the liftgate release switch C4216-4, circuit GD149 (BK/GY), harness side.
- **Does the liftgate latch release?**

  YES : INSTALL a new liftgate release switch. REFER to **Liftgate Release Switch - Manual** or **Liftgate Release Switch - Power**. TEST the system for normal operation.

  NO : LEAVE the jumper wire connected. Go to F13.

F13 CHECK CIRCUIT CPL45 (BN) FOR AN OPEN

- Disconnect: SJB C2280c

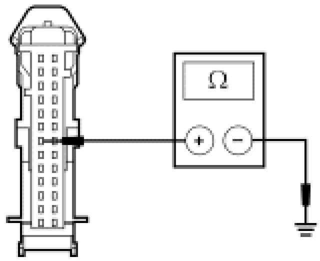


Fig. 24: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280c-7, circuit CPL45 (BN), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F15.

  NO : REPAIR the circuit. TEST the system for normal operation.

F14 CHECK FOR CORRECT LTM OPERATION

- Disconnect all the LTM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the LTM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new LTM. REFER to **BODY CLOSURES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

F15 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Doors Do Not Lock/Unlock Using The Keyless Entry Keypad

Refer to appropriate SYSTEM WIRING DIAGRAM article, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The smart junction box (SJB) monitors for a ground signal on the reference circuits CPK29 (GY/BU), CPK30 (VT/GN), and CPK31 (YE/GN) for the keyless entry keypad. When an individual keypad button is pressed, an individual or combination of the reference circuits is routed to ground. The SJB then determines which button was pressed based on which circuit(s) are grounded. The keypad is grounded through circuit GD133 (BK). Once the SJB determines that the 5-digit personal entry code, or the factory set 5-digit entry code has been entered on the keypad, the SJB then energizes the driver door unlock relay to unlock the driver door.

To unlock all the doors, the 3/4 button must be pressed within 5 seconds of the 5-digit code being entered.

To lock all the doors, the 5-digit code does not need to be entered. Press the 7/8 and 9/0 buttons at the same time.

- DTC B2A26 (Keypad Switch Circuit Failure) - is a continuous and on-demand DTC that sets when the SJB detects a short to ground on any of the keypad input circuits. This DTC may also set if any of the keypad buttons are pressed for longer than 2 minutes.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Keyless entry keypad
- SJB

PINPOINT TEST G: THE DOORS DO NOT LOCK/UNLOCK USING THE KEYLESS ENTRY KEYPAD

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

G1 CHECK THE SJB KEYCODE PID

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Observe the SJB PID (KEYCODE). Read and record the 5-digit factory set entry code.
- Enter the 5-digit factory set entry code on the keyless entry keypad, then press the 3/4 button.
- **Do the doors unlock?**

  YES : The system is operating as designed. INFORM the customer of the correct system operation.

NO : Go to G2.

G2 RETRIEVE THE RECORDED SJB DTCs FROM THE RUN-DEMAND SELF-TEST

- Check for recorded SJB DTCs from the on-demand self-test.
- **Is DTC B2A26 recorded?**

YES : Go to G3.

NO : Go to G5.

G3 REPEAT THE SJB RUN-DEMAND SELF-TEST

- Disconnect: Keyless Entry Keypad C500
- Clear the DTCs, then repeat the SJB on-demand self-test.
- **Is DTC B2A26 recorded?**

YES : Go to G4.

NO : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**. TEST the system for normal operation.

G4 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c
- Measure the resistance between the keypad, harness side and ground as follows:

Connector-Pin	Circuit
C500-7	CPK29 (GY/BU)
C500-5	CPK30 (VT/GN)
C500-1	CPK31 (YE/GN)

- **Are the resistances greater than 10,000 ohms?**

YES : Go to G10.

NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

G5 CHECK THE SJB KEY_PAD PID

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Press each keyless entry keypad button while observing the SJB PID (KEY_PAD).
- **Does the PID display the correct values?**

YES : Go to G10.

NO : Go to G6.

G6 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.

- Disconnect: Keyless Entry Keypad C500

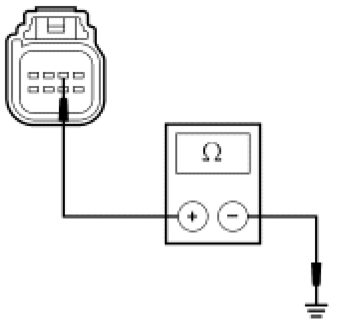

Fig. 25: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the keyless entry keypad C500-2, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to G7.

  NO : REPAIR the circuit. TEST the system for normal operation.

G7 CHECK THE KEYLESS ENTRY KEYPAD

- Connect a fused (5A) jumper wire between the keyless entry keypad harness side, while monitoring the SJB PID (KEY_PAD) as follows:

Keyless Entry Keypad Connector-Pin/Circuit	Keyless Entry Keypad Connector-Pin/Circuit	SJB PID (KEY_PAD) Value
C500-7 CPK29 (GY/BU)	C500-2 GD133 (BK)	1/2
C500-5 CPK30 (VT/GN)	C500-2 GD133 (BK)	7/8
C500-1 CPK31 (YE/GN)	C500-2 GD133 (BK)	9/0

- **Does the PID display the correct values?**

  YES : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**.

  NO : Go to G8.

G8 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR AN OPEN

- Disconnect: SJB C2280c

- Measure the resistance between the SJB, harness side and the keyless entry keypad, harness side as follows:

SJB Connector-Pin	Circuit	Keyless Entry Keypad Connector-Pin
C2280c-5	CPK29 (GY/BU)	C500-7
C2280c-18	CPK30 (VT/GN)	C500-5
C2280c-6	CPK31 (YE/GN)	C500-1

- **Are the resistances less than 5 ohms?**

  YES : Go to G9.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

G9 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR A SHORT TO EACH OTHER

- Measure the resistance between the keypad, harness side as follows:

Keypad Connector-Pin/Circuit	Keypad Connector-Pin/Circuit
C500-7 CPK29 (GY/BU)	C500-5 CPK30 (VT/GN)
C500-7 CPK29 (GY/BU)	C500-1 CPK31 (YE/GN)
C500-5 CPK30 (VT/GN)	C500-1 CPK31 (YE/GN)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to G10.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

G10 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion

    - damaged pins
    - pushed-out pins
  - Connect all the SJB connectors and make sure they seat correctly.
  - Operate the system and verify the concern is still present.
  - **Is the concern still present?**

    YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

    NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Keyless Entry Keypad Illumination Is Inoperative/Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAM article, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When the smart junction box (SJB) detects that a keyless entry keypad button is pressed, the SJB provides voltage for the keyless entry keypad illumination through circuit CPK28 (WH/GN). Ground for the keyless entry keypad illumination is provided through circuit GD133 (BK).

- DTC B1624 (Lamp Keypad Output Open Circuit) - is an on-demand DTC that sets when the SJB detects an open or short to voltage on the keyless entry keypad illumination output circuit CPK28 (WH/GN).
- DTC B1626 (Lamp Keypad Output Short Circuit to Ground) - is a continuous DTC that sets when the SJB detects a short to ground on the keyless entry keypad illumination output circuit CPK28 (WH/GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals and connectors
- Keyless entry keypad
- SJB

PINPOINT TEST H: THE KEYLESS ENTRY KEYPAD ILLUMINATION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

H1 CHECK THE KEYLESS ENTRY KEYPAD OPERATION

- Press the 7/8 and 9/0 buttons simultaneously on the keypad.
- **Does the doors lock using the keyless entry keypad?**

  YES : Go to H2.

NO : Go to **Pinpoint Test G** .

H2 CHECK THE RECORDED SJB DTCs FROM THE ON-DEMAND SELF-TEST

- Check the recorded results from the SJB self-test.
- **Is DTC B1624 or B1626 present?**

  YES : For DTC B1624, go to H3.

  For DTC B1626, go to H9.

  NO : Go to H11.

H3 CHECK THE KEYLESS ENTRY KEYPAD ILLUMINATION

- Key in OFF position.
- Check the keyless entry keypad illumination.
- **Is the keyless entry keypad illumination always on?**

  YES : Go to H8.

  NO : Go to H4.

H4 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Disconnect: Keyless Entry Keypad C500

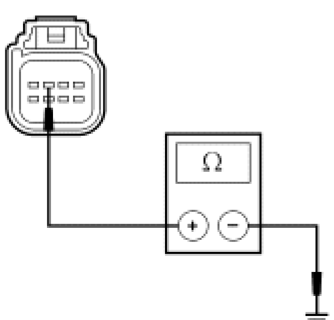

Fig. 26: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the keyless entry keypad C500-3, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to H5.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

H5 CHECK FOR CIRCUIT CPK28 (WH/GN) FOR REFERENCE VOLTAGE

NOTE:	**The SJB sends out a constant reference voltage on circuit CPK28 (WH/GN) for its own circuit diagnostics. This voltage is 10 volts +/- 1 volt.**

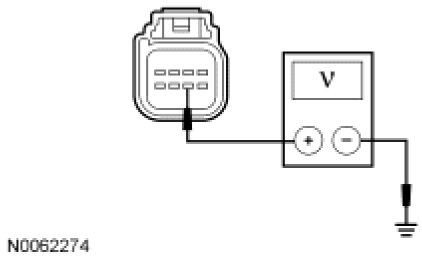

Fig. 27: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the keyless entry keypad C500-6, circuit CPK28 (WH/GN), harness side and ground.
- **Is 10 volts (+/- 1 volt) present?**

  YES : Go to H6.

  NO : Go to H7.

H6 CHECK FOR SJB OUTPUT

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger

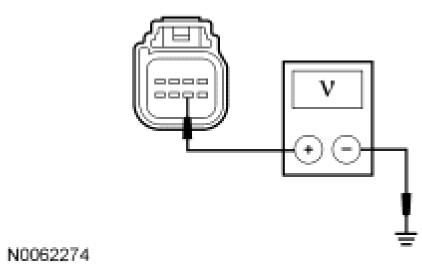

Fig. 28: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the keyless entry keypad C500-6, circuit CPK28 (WH/GN), harness side and ground while active commanding the SJB PID (KY_PAD_LMP) ON.
- **Is the voltage greater than 11 volts?**

  YES : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to H11.

H7 CHECK CIRCUIT CPK28 (WH/GN) FOR AN OPEN

- Disconnect: SJB C2280c

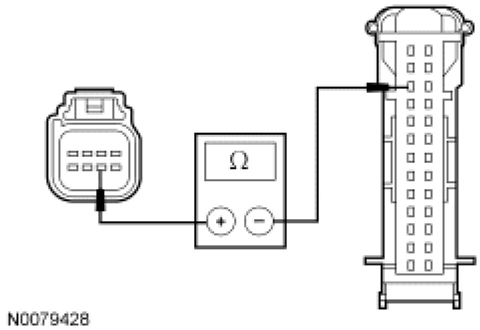

Fig. 29: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the keyless entry keypad C500-6, circuit CPK28 (WH/GN), harness side and the SJB C2280c-11, circuit CPK28 (WH/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H11.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

H8 CHECK CIRCUIT CPK28 (WH/GN) FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280c
- Key in ON position.
- Observe the keypad illumination.
- **Is the keypad still illuminated?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to H11.

H9 CHECK THE KEYLESS ENTRY KEYPAD FOR A SHORT TO GROUND

- Disconnect: Keyless Entry Keypad C500

NOTE: **DTC B1624 may set and should be ignored when carrying out this step.**

- Clear the DTCs, then repeat the SJB on-demand self-test.
- **Is DTC B1626 recorded?**

  YES : Go to H10.

  NO : INSTALL a new keyless entry keypad. REFER to **Keyless Entry Keypad**. TEST the system for normal operation.

H10 CHECK CIRCUIT CPK28 (WH/GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c

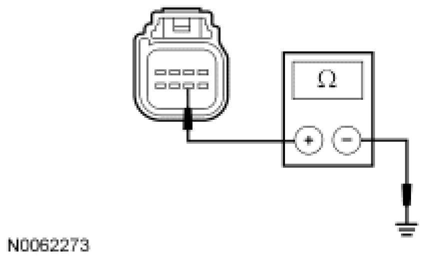

Fig. 30: Measuring Resistance Between Keyless Entry Keypad C500-6, Circuit CPK28 (WH/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the keyless entry keypad C500-6, circuit CPK28 (WH/GN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to H11.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

H11 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Remote Keyless Entry (RKE) Transmitter Is Inoperative

Normal Operation

Remote locking and unlocking of the doors, opening the power liftgate (if equipped), and activating the panic alarm is accomplished by the smart junction box (SJB) receiving a command message from the remote keyless entry (RKE) integrated keyhead transmitter (IKT). The IKTs and SJB also utilize a rolling code to prevent the code from being "captured" by a code grabber. The system advances the counter in the RKE transmitter and SJB every time an IKT button is pressed.

- DTC B1139 (Invalid Transmitter Identification Code) - is a continuous DTC that sets when the SJB detects an invalid TIC from an IKT.
- DTC B2425 (Remote Keyless Entry Out of Synchronization) - is a continuous DTC that sets when the SJB detects the rolling counter received from an RKE transmitter is 1,024 times greater than the rolling counter stored in the module.

This pinpoint test is intended to diagnose the following:

- IKT
- IKT battery
- IKT button pressed a substantial amount of times while outside the range of the vehicle
- IKT programming
- SJB

PINPOINT TEST I: THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER IS INOPERATIVE

NOTE: **All IKTs must be present to begin diagnosis of the RKE system.**

NOTE: **Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.**

I1 CHECK FOR THE CORRECT RKE TRANSMITTERS

NOTE: **Make sure the IKTs are those provided with the original equipment manufacturer (OEM) system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle.**

- Check that the correct IKTs are used with the vehicle.
- **Are all the correct IKTs present?**

  YES : Go to I2.

  NO : The system cannot be tested without the correct IKTs. INFORM the customer that all the correct IKTs must be present to proceed with diagnosis of the system.

I2 CHECK THE RECORDED SJB AND INSTRUMENT CLUSTER (IC) DTCs FROM THE ON-DEMAND SELF-TEST

- Check the recorded results from the SJB and IC self-test.
- **Are any DTCs recorded?**

  YES : For SJB DTC B2425, go to I3.

  For IC DTC B1139, go to I4.

  For IC DTC B1137, go to **Pinpoint Test J** .

For all other DTCs, REFER to **DTC Charts**.

NO : Go to I4.

I3 RESYNCHRONIZE THE INOPERATIVE IKT

- Key in OFF position.
- Key in ON position.
- Leave the IKT key in the RUN position for a minimum of 6 seconds.
- Key in OFF position.
- Press any button on the IKT.
- **Does the IKT operate?**

YES : The system is OK. CLEAR the DTCs. REPEAT the self-test.

NO : Go to I4.

I4 MAKE SURE THE RKE TRANSMITTER SIGNAL IS BEING RECEIVED

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Press a button on the IKT while observing the SJB PID (TIC_LAST).
- **Does the transmitter identification code (TIC) show up on the scan tool screen when a button is pressed?**

YES : Go to I5.

NO : Go to I6.

I5 CHECK IF THE RKE TRANSMITTERS ARE PROGRAMMED

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Press a button on the IKT and compare the SJB PID (TIC_LAST) with the PIDs (TIC_1, 2, 3, 4, 7, 8, 9, or 10).
- **Does the TIC displayed match any of the TICs stored in memory?**

YES : Go to I7.

NO : PROGRAM all of the IKTs. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation.

I6 CHECK THE IKT BATTERY

- Using a thin coin, open the IKT.
- Do not clean off any grease from the battery terminals on the back surface of the circuit board.
- Verify the correct battery is used (CR2032).
- Remove the IKT battery and measure the voltage.
- **Is the voltage greater than 2.5 volts?**

YES : Go to I7.

NO : INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the IKT (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.

I7 CHECK FOR NORMAL OPERATION WITH A KNOWN GOOD IKT

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Use the customer's second IKT, and press a button on the IKT while observing the SJB PID (TIC_LAST).
- **Does the TIC show up on the scan tool when a button is pressed?**

  YES : REPLACE the inoperative IKT. PROGRAM the new IKT. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. TEST the system for normal operation.

  NO : Go to I8.

I8 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: DTC B1137 - Data Not Programmed

Normal Operation

When an integrated keyhead transmitter (IKT) key is programmed, the remote keyless entry (RKE) transmitter identification code (TIC) data from the key is received by the instrument cluster (IC). The IC then sends the TIC data to the smart junction box (SJB) over the medium speed controller area network (MS-CAN). The SJB stores the TIC data in memory and sends an acknowledgment back to the IC that the TIC data was successfully programmed.

- DTC B1137 (Data Not Programmed) - is a continuous DTC that sets when the IC sends the RKE TIC data to the SJB over the MS-CAN network, and it does not receive a response from the SJB that the TIC data has been stored.

This pinpoint test is intended to diagnose the following:

- IKT programming
- MS-CAN network
- SJB

PINPOINT TEST J: DTC B1137 - DATA NOT PROGRAMMED

J1 CHECK FOR THE CORRECT RKE TRANSMITTERS

NOTE: Make sure the IKTs are those provided with the original equipment manufacturer (OEM) system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle.

- Check that the correct IKTs are used with the vehicle.
- **Are all the correct IKTs present?**

  YES : Go to J2.

  NO : The system cannot be tested without the correct IKTs. INFORM the customer that all the correct IKTs must be present to proceed with diagnosis of the system.

J2 CHECK FOR COMMUNICATION WITH THE IC AND SJB

- Enter the following diagnostic mode on the diagnostic tool: Network Test
- **Does the IC or SJB fail the network test?**

  YES : REFER to **MODULE COMMUNICATIONS NETWORK** article.

  NO : Go to J3.

J3 REPROGRAM THE IKT KEYS

- Erase and program all of the IKT keys using the scan tool method. Refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
- Erase all IC DTCs.
- Enter the following diagnostic mode on the diagnostic tool: IC Self-Test
- **Is DTC B1137 retrieved again?**

  YES : Go to J5.

  NO : Go to J4.

J4 CHECK THE OPERATION OF THE RKE TRANSMITTER

- Press any button on the suspect IKT key.
- **Does the RKE transmitter operate?**

  YES : The system is operating normally. The concern may have been caused by an improperly programmed IKT key.

  NO : Go to **Pinpoint Test I** .

J5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: An Individual Button/Feature Is Inoperative From The Remote Keyless Entry (RKE) Transmitter

Normal Operation

When any integrated keyhead transmitter (IKT) button is pressed, the SJB receives and processes the command to provide the appropriate output.

This pinpoint test is intended to diagnose the following:

- Door locks
- Horn system
- Power liftgate release
- Turn signal system
- IKT

PINPOINT TEST K: AN INDIVIDUAL BUTTON/FEATURE IS INOPERATIVE FROM THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER

NOTE: **The panic feature will only operate when the key is in the OFF or LOCK positions.**

K1 VERIFY THE DOOR LOCK OPERATION

- Press the LOCK and UNLOCK button on the driver door lock control switch while observing the door lock operation.
- **Do the door locks operate correctly?**

  YES : Go to K2.

  NO : Go to **Symptom Chart**.

K2 VERIFY THE HORN OPERATION

- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Select the SJB PID (HORN) and active command the horn on.
- **Does the horn sound when commanded on?**

  YES : Go to K3.

  NO : REFER to **HORN** article.

K3 VERIFY THE HAZARD LAMP OPERATION

- Place the hazard switch in the ON position.
- **Do the hazard lamps operate correctly?**

YES : For vehicles with power liftgate, go to K4.

For vehicles with a manual liftgate, REPLACE the inoperative IKT and PROGRAM all of the IKTs. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation.

NO : REFER to **EXTERIOR LIGHTING** article.

K4 VERIFY THE LIFTGATE RELEASE OPERATION

- Press the liftgate release button on the liftgate.
- **Does the liftgate open?**

YES : REPLACE the inoperative IKT and PROGRAM all of the IKTs. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation.

NO : Go to **Pinpoint Test F** .

Pinpoint Test L: The Remote Keyless Entry (RKE) Transmitter Has Poor Range Performance

Normal Operation

The remote keyless entry (RKE) transmitter sends a radio signal to the smart junction box (SJB) based on the user selected RKE transmitter button. The SJB then carries out the selected action.

This pinpoint test is intended to diagnose the following:

- IKT
- IKT battery
- Aftermarket systems
- High power devices
- TV/radio transmission towers
- SJB

PINPOINT TEST L: THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER HAS POOR RANGE PERFORMANCE

NOTE:	**All RKE transmitters must be present to begin diagnosis of the RKE system.**

NOTE:	**Aftermarket or dealer-installed systems may adversely affect RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.**

L1 CHECK FOR THE CORRECT RKE TRANSMITTERS

NOTE: Make sure the RKE transmitters are those provided with the original equipment manufacturer (OEM) system and not from an aftermarket system or a dealer-installed system.

- Check that the correct RKE transmitters are used with the vehicle.
- **Are all the correct RKE transmitters present?**

  YES : Go to L2.

  NO : The system cannot be tested without the correct RKE transmitters. INFORM the customer that all the correct RKE transmitters must be present to proceed with diagnosis of the system.

L2 CHECK ALL THE RKE TRANSMITTERS FOR POOR RANGE PERFORMANCE

NOTE: The 10 m (33 ft) measurement of range is not the standard but is a guideline that clearly indicates a vehicle is experiencing poor range performance.

- Check all the RKE transmitters for poor range performance (less than 10 m [33 ft]).
- **Do all RKE transmitters experience poor range?**

  YES : Go to L4.

  NO : Go to L3.

L3 CHECK THE IKT BATTERY

- Using a thin coin, open the IKT.
- Do not clean off any grease from the battery terminals on the back surface of the circuit board.
- Verify the correct battery is used (CR2032).
- Remove the IKT battery and measure the voltage.
- **Is the voltage greater than 2.5 volts?**

  YES : REPLACE the inoperative integrated key and PROGRAM all the integrated keys. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.

  NO : INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the IKT (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.

L4 CHECK THE LOCATION OF THE VEHICLE AND THE APPROACH ANGLES AROUND THE VEHICLE

- Make sure the poor performance is consistent in nature and is not from one approaching angle.
- The RKE transmitter range performance may be degraded in certain locations. For example, if the vehicle is within 0.8 km (0.5 miles) of high-power devices or radio/TV towers, the operating distance of the RKE transmitters may be reduced.
- **Is the poor range performance consistent around the vehicle?**

  YES : Go to L5.

  NO : The system is operating correctly at this time. TEST the system for normal operation.

L5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: The Smart Unlock Does Not Operate Correctly

Normal Operation

The smart junction box (SJB) automatically unlocks all the doors after the doors are locked with a door lock control switch if the key is in the ignition lock cylinder and a front door or the liftgate is ajar.

This pinpoint test is intended to diagnose the following:

- Key-in-ignition switch
- Door ajar switch input
- SJB

PINPOINT TEST M: THE SMART UNLOCK DOES NOT OPERATE CORRECTLY

M1 CHECK THE COURTESY LAMP OPERATION

- Open and close the front doors and liftgate while checking the courtesy lamp operation.
- **Do the courtesy lamps operate correctly?**

  YES : Go to M2.

  NO : REFER to **INTERIOR LIGHTING** article.

M2 CHECK THE KEY-IN-IGNITION CHIME

- Insert the key in the ignition lock cylinder.
- Open the driver door.
- **Does the key-in-ignition chime operate correctly?**

  YES : Go to M3.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article.

M3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Autolock Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAM article, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The smart junction box (SJB) energizes the lock relay based on input from the ajar switches, the ignition switch, the transmission range (TR) sensor and the vehicle speed sensor (VSS). The SJB locks the doors when the following conditions are met:

- all the doors are closed
- the ignition switch is in the ON position
- the vehicle is shifted into any gear putting the vehicle in motion, and
- the vehicle attains a speed greater than 20 km/h (12 mph) for longer than 2 seconds.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals and connectors
- Programming
- Door ajar switches
- SJB

PINPOINT TEST N: THE AUTOLOCK DOES NOT OPERATE CORRECTLY

N1 VERIFY THE AUTOLOCK FEATURE IS ENABLED

- Verify the autolock feature is enabled. Refer to **Autolock and Horn Chirp Programming**.
- **Is the autolock feature enabled?**

  YES : Go to N2.

NO : PROGRAM the autolock feature. REFER to **Autolock and Horn Chirp Programming**.

N2 CHECK THE COURTESY LAMP OPERATION

- Open and close the doors while checking the courtesy lamp operation.
- **Do the courtesy lamps operate correctly?**

YES : Go to N3.

NO : REFER to **INTERIOR LIGHTING** article.

N3 CHECK THE SJB PID (IGN_R_ECU)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB IGN PID (IGN_R_ECU).
- **Does the PID indicate RUN?**

YES : Go to N4.

NO : REFER to **STEERING COLUMN SWITCHES** article.

N4 RETRIEVE THE RECORDED SJB DTCs FROM THE CONTINUOUS SELF-TESTS

- Check for recorded SJB DTCs from the continuous self-tests.
- **Is DTC U0155 recorded?**

YES : REFER to **MODULE COMMUNICATIONS NETWORK** article.

NO : Go to N5.

N5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

GENERAL PROCEDURES

KEYLESS ENTRY KEYPAD CODE PROGRAMMING

Programming a Personal Code and Keypad Association to Memory Seats and Mirrors (If Equipped)

NOTE: **If the wrong code has been entered 7 times (35 consecutive button presses), the**

keypad will go into an anti-scan mode. This mode disables the keypad for one minute (only the lock control will operate on the keypad) and the keypad lamp will flash. The anti-scan feature will turn off after one minute of keypad inactivity, or after pressing the UNLOCK control on the integrated keyhead transmitter (IKT), or after the ignition key has been turned to the ON position.

NOTE: The factory set code cannot be associated with a memory setting.

1. Enter the permanent factory keyless entry keypad code.
2. Within 5 seconds, press the 1/2 button on the keypad.
3. Enter the new 5-digit keyless entry keypad code. Each number must be entered within five seconds of each other.
4. To associate the entry code with a memory setting, enter a sixth digit to indicate which driver should be set in a memory recalled by the personal entry code:
    - Pressing the 1/2 button recalls driver 1 settings
    - Pressing the 3/4 button recalls driver 2 settings
    - Pressing other keypad buttons or not pressing a keypad button as a sixth digit does not set a driver and will not recall a memory setting
5. The doors will lock then unlock to confirm the new code is programmed.

Erasing the Personal Codes

NOTE: If the wrong code has been entered 7 times (35 consecutive button presses), the keypad will go into an anti-scan mode. This mode disables the keypad for one minute (only the lock control will operate on the keypad) and the keypad lamp will flash. The anti-scan feature will turn off after one minute of keypad inactivity, or after pressing the UNLOCK control on the IKT, or after the ignition key has been turned to the ON position.

1. Enter the permanent factory keyless entry keypad code.
2. Within 5 seconds, press the 1/2 button on the keypad and release.
3. Within 5 seconds, press and hold the 1/2 button on the keypad for 2 seconds.
4. All personal codes are now erased and only the permanent factory keyless entry keypad code will work.

REMOTE KEYLESS ENTRY TRANSMITTER PROGRAMMING

NOTE: This procedure is for programming conventional keyfobs only. The Remote Keyless Entry (RKE) transmitter of the Integrated Keyhead Transmitter (IKT) is programmed automatically during the Passive Anti-Theft System (PATS) programming. For additional information, refer to Key Programming Using Two Programmed Keys or Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) article to program the IKT.

NOTE: All RKE transmitters must be programmed at the same time.

NOTE: Do not apply the brake pedal during this sequencing, as doing so ends the sequence and the transmitters will not be programmed.

1. Electronically unlock the door locks using the door lock control switch.
2. Cycle the ignition switch from the OFF to the RUN position 8 times in rapid succession (within 10 seconds), with the eighth turn ending in RUN. If the module successfully enters program mode, it locks and then unlocks all the doors.

   NOTE: If no action is taken within 20 seconds after a transmitter has been programmed, the programming sequence ends (the doors lock and unlock to confirm that programming is complete).

3. Within 20 seconds, press any button on the RKE transmitter to be programmed. The doors lock and then unlock to confirm that each RKE transmitter is programmed. Repeat this step for each RKE transmitter.
4. Exiting the programming mode is accomplished if one of the following occurs:
   - The key transitions to the OFF position.
   - 20 seconds have passed since entering programming mode or since the last RKE transmitter was programmed.
   - The maximum number (4) of RKE transmitters have been programmed.
5. Check the operation of the RKE transmitter. If the door locks do not respond for the programmed RKE transmitter(s), wait several seconds and press the button again. If the door locks still fail to respond, refer to **Locks, Latches and Entry Systems**. (Make sure that no more than the maximum number of RKE transmitters are attempted to be programmed.)

REMOTE MEMORY ACTIVATION

1. Position the driver seat and mirrors to the desired position.
2. Press the set button on the driver door panel.
3. Within 5 seconds press the 1 or 2 button on the driver door panel to associate with the driver 1 or driver 2 position.
4. Press the set button again.
5. Within 5 seconds press a button on the associated integrated keyhead transmitter (IKT).
6. Within 5 seconds press the 1 or 2 button on the driver door panel to associate with the driver 1 or driver 2 position.
7. If a second memory setting is desired, repeat the procedure with the second IKT.

REMOTE MEMORY DEACTIVATION

1. Press the set button on the driver door panel.
2. Within 5 seconds press any button on the integrated key that you wish to deactivate and then press the set button on the driver door panel.

3. If a second memory setting is desired to be deactivated, repeat the procedure with the second integrated key.

AUTOLOCK AND HORN CHIRP PROGRAMMING

Programming the Autolock Feature Using the Door Lock Control Switch

NOTE: The autolock feature can be activated or deactivated independently of the auto-unlock feature.

NOTE: The autolock feature of the Smart Junction Box (SJB) can also be configured ON or OFF with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

NOTE: When programming the autolock feature using the door lock control switch method the following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

NOTE: Prior to beginning, make sure the ignition key is in the OFF position and all vehicle doors are closed.

1. Turn the ignition key from the OFF to the ON position.
2. Press the unlock button on the door lock control switch 3 times.
3. Turn the ignition key from the ON to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.
5. Turn the ignition key to the ON position. The horn chirps once to indicate that programming mode is entered.
6. To enable/disable the autolock feature, press the unlock button on the door lock control switch, then the lock button. The horn chirps once if the autolocks are disabled or twice (one short chirp followed by a honk) if the autolocks are enabled.
7. Turn the ignition key to the OFF position. The horn chirps once to signal that the programming is complete.

Programming the Autolock Feature Using the Keyless Entry Keypad

NOTE: The autolock feature can be activated or deactivated independently of the auto-unlock feature.

NOTE: The autolock feature of the SJB can also be configured ON or OFF with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

1. Turn the ignition key to the OFF position and close all vehicle doors.
2. Enter the factory set 5-digit keyless entry keypad code.
3. Press and hold the 3/4 button on the keypad. While holding the 3/4 button, press the 7/8 button.
4. Release the 7/8 button, then release the 3/4 button. The horn chirps once if the autolocks are disabled or twice (one short chirp followed by a honk) if the autolocks are enabled.

Programming the Autolock Feature Using the Instrument Cluster Message Center

NOTE: The autolock feature can be activated or deactivated independently of the auto-unlock feature.

NOTE: The autolock feature of the SJB can also be configured ON or OFF with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

1. With all the vehicle doors closed, turn the ignition key from the OFF to the ON position.
2. Press the SETUP button on the message center switch until AUTOLOCK <ON> OFF is displayed.
3. Press the RESET button to select ON or OFF. If the autolocks are enabled, the message center will have brackets around the <ON> display. If the autolocks are disabled, the message center will have brackets around the <OFF> display.

Programming the Auto-Unlock Feature Using the Door Lock Control Switch

NOTE: The auto-unlock feature can be activated or deactivated independently of the autolock feature.

NOTE: The auto-unlock feature of the SJB can also be configured ON or OFF with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

NOTE: When programming the auto-unlock feature using the door lock control switch method the following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

NOTE: Prior to beginning, make sure the ignition key is in the OFF position and all vehicle doors are closed.

1. Turn the ignition key from the OFF to the ON position.
2. Press the unlock button on the door lock control 3 times.
3. Turn the ignition key from the ON to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.

5. Turn the ignition key to the ON position. The horn chirps once to indicate that programming mode is entered.
6. To enable/disable the auto-unlock feature, press the lock button on the door lock control switch then the unlock button. The horn chirps once if auto-unlock is disabled or twice (one short chirp followed by a honk) if auto-unlock is enabled.
7. Turn the ignition key to the OFF position. The horn chirps once to signal that the programming is complete.

Programming the Auto-Unlock Feature Using the Keyless Entry Keypad

NOTE: The auto-unlock feature can be activated or deactivated independently of the autolock feature.

NOTE: The auto-unlock feature of the SJB can also be configured ON or OFF with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

1. Turn the ignition key to the OFF position and close all vehicle doors.
2. Enter the factory set 5-digit keyless entry keypad code.
3. Press and hold the 3/4 button on the keypad. While holding the 3/4 button, press and release the 7/8 button. While still holding the 3/4 button, press and release the 7/8 button a second time.
4. Release the 3/4 button. The horn chirps once if auto-unlock is disabled or twice (one short chirp followed by a honk) if auto-unlock is enabled.

Programming the Auto-Unlock Feature Using the Instrument Cluster Message Center

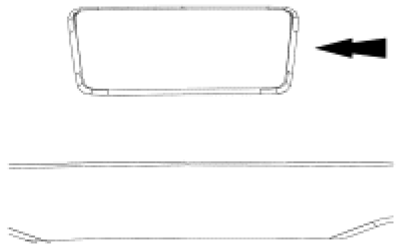
NOTE: The auto-unlock feature can be activated or deactivated independently of the autolock feature.

NOTE: The auto-unlock feature of the SJB can also be configured ON or OFF with the scan tool. For additional information on module configuration, refer to MODULE CONFIGURATION article.

1. Turn the ignition key from the OFF to the ON position.
2. Press the SETUP button on the message center switch until AUTOUNLOCK <ON> OFF is displayed.
3. Press the RESET button to select ON or OFF. If auto-unlock is enabled, the message center will have brackets around the <ON> display. If auto-unlock is disabled, the message center will have brackets around the <OFF> display.

LIFTGATE LATCH MANUAL RELEASE

1. Remove the liftgate latch access cover from the center of the liftgate trim panel.

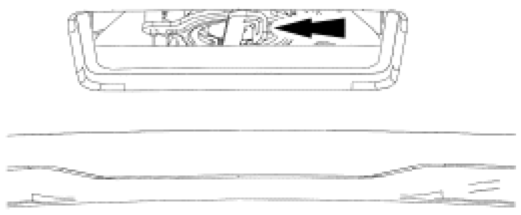


N0068894

Fig. 31: Identifying Liftgate Latch Access Cover
Courtesy of FORD MOTOR CO.

NOTE: Portions of the liftgate sheet metal are removed for clarity.

2. Vehicles with manual liftgate, press the liftgate latch manual release lever to the left to release the liftgate latch.

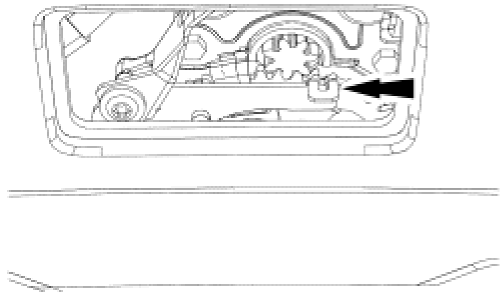


N0068895

Fig. 32: Pressing Liftgate Latch Manual Release Lever To Left To Release Liftgate Latch
Courtesy of FORD MOTOR CO.

NOTE: Portions of the liftgate sheet metal are removed for clarity.

3. Vehicles with power liftgate, press the liftgate latch manual release lever down to release the liftgate latch.



N0068896

Fig. 33: Pressing Liftgate Latch Manual Release Lever Down To Release Liftgate Latch

Courtesy of FORD MOTOR CO.

PERIMETER LIGHTING FEATURE PROGRAMMING

Programming the Perimeter Lighting Feature Using the Door Lock Control Switch

NOTE: The following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. Turn the ignition switch from the OFF to the ON position.
2. Press the unlock button on the door lock control switch 3 times.
3. Turn the ignition switch from the ON to the OFF position.
4. Press the unlock button on the door lock control switch 3 times.
5. Turn the ignition switch to the ON position. The horn chirps one time to indicate that programming mode is entered.

   NOTE: The unlock button must be pressed twice within 5 seconds.

6. Within 30 seconds of entering the programming mode, press the unlock button on the door lock control switch twice to enable/disable the perimeter lighting feature. The horn chirps once if the perimeter lighting is disabled or a chirp followed by a honk if the perimeter lighting is enabled.
7. Programming ends when the ignition switch state changes or times out after 2 minutes.

STEPPED UNLOCK PROGRAMMING

1. With the ignition in the OFF mode, press the LOCK and UNLOCK buttons on the Remote Keyless Entry (RKE) transmitter simultaneously for 4 seconds.
   - The turn signals will flash twice to indicate the mode change.
2. Repeat Step 1 to enable/disable the stepped unlocking feature.

REMOVAL AND INSTALLATION

HOOD LATCH AND COMPONENTS - EXPLODED VIEW

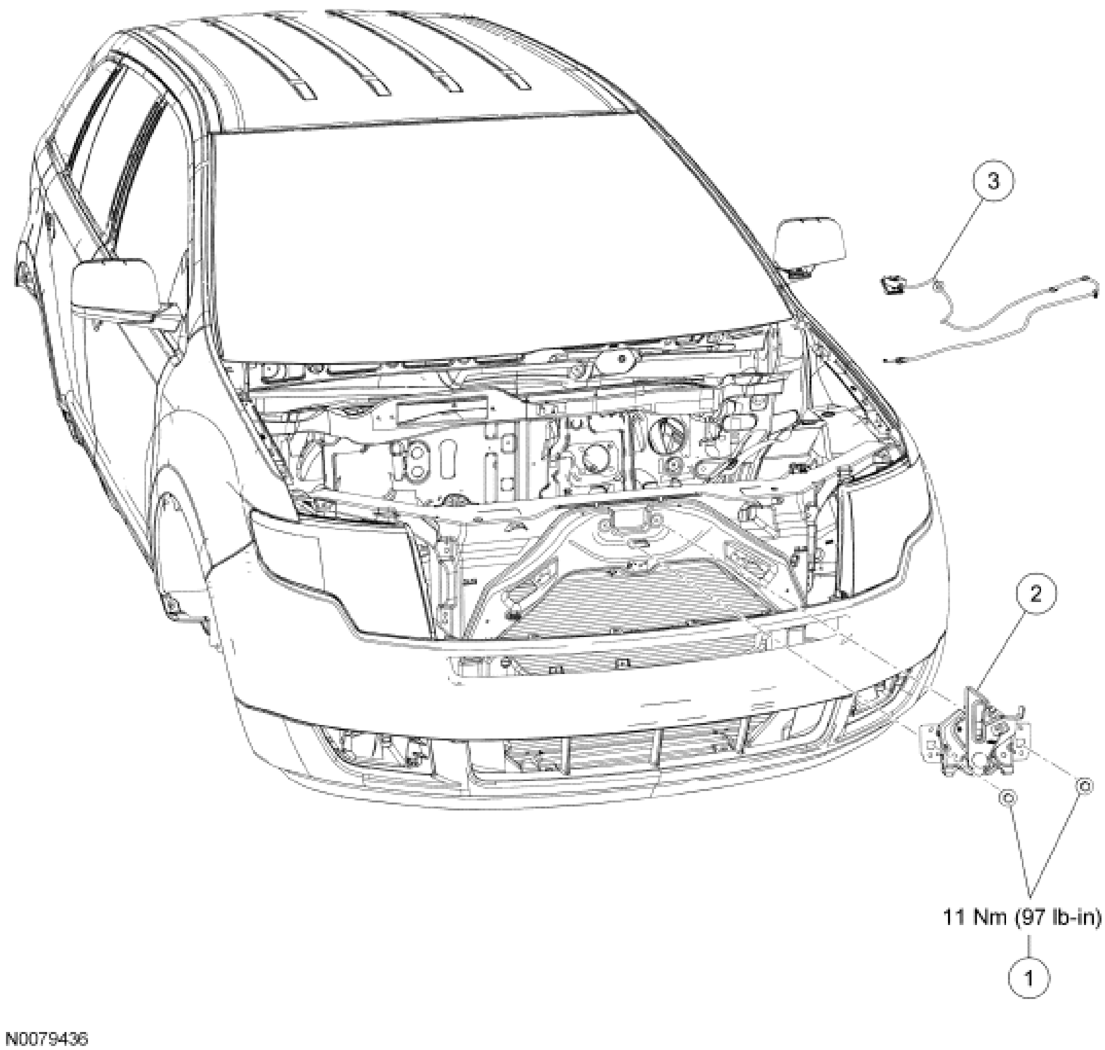


Fig. 34: Identifying Hood Latch and Components
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N808727	Hood latch bolts (2 required)
2	16700	Hood latch
3	16916	Hood latch release handle and cable

1. For additional information, refer to the appropriate procedures in this service information.

HOOD LATCH

Material

Item	Specification

Multi-Purpose Grease Spray XL-5	ESB-M1C93-B

REMOVAL AND INSTALLATION

NOTE: Mark the hood latch position prior to removal of the hood latch bolts.

1. Remove the 2 hood latch bolts and position the hood latch aside.
   - To install, tighten to 11 Nm (97 lb-in).
2. Disconnect the hood latch release cable and remove the hood latch.

NOTE: When the hood latch is installed, the latch adjustment must be checked to make sure the latch is installed and aligned correctly.

3. To install, reverse the removal procedure.
   - Lubricate the hood latch after installation.

HOOD LATCH RELEASE HANDLE

REMOVAL AND INSTALLATION

1. Remove the hood latch. For additional information, refer to **Hood Latch**.
2. Disconnect the hood latch release cable locator from the radiator grille opening panel reinforcement.
3. Disconnect the hood latch release cable locator from the LH inner fender.

NOTE: The hood latch release handle and cable assembly must be pulled through the dash panel into the passenger compartment.

4. Remove the hood latch release handle and cable assembly.
   1. Remove the hood latch release handle screw.
   2. Remove the hood latch release handle and cable assembly.

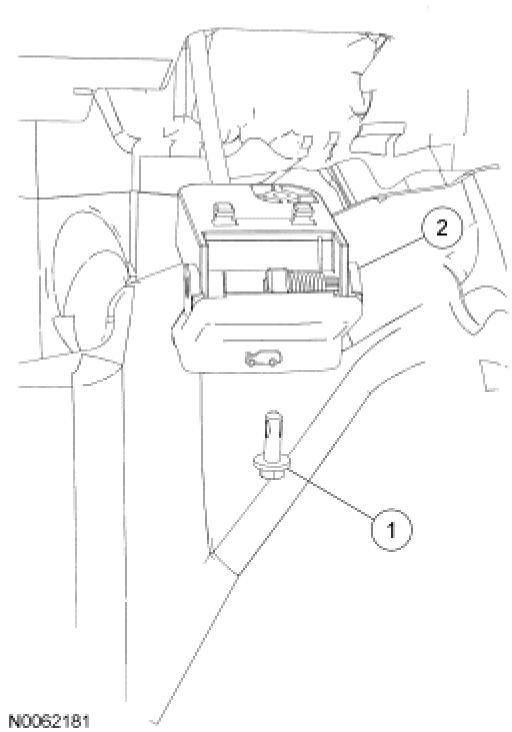

Fig. 35: Identifying Hood Latch Release Handle & Screw
Courtesy of FORD MOTOR CO.

5. To install, reverse the removal procedure.

FRONT DOOR HANDLES, LOCKS AND LATCHES - EXPLODED VIEW

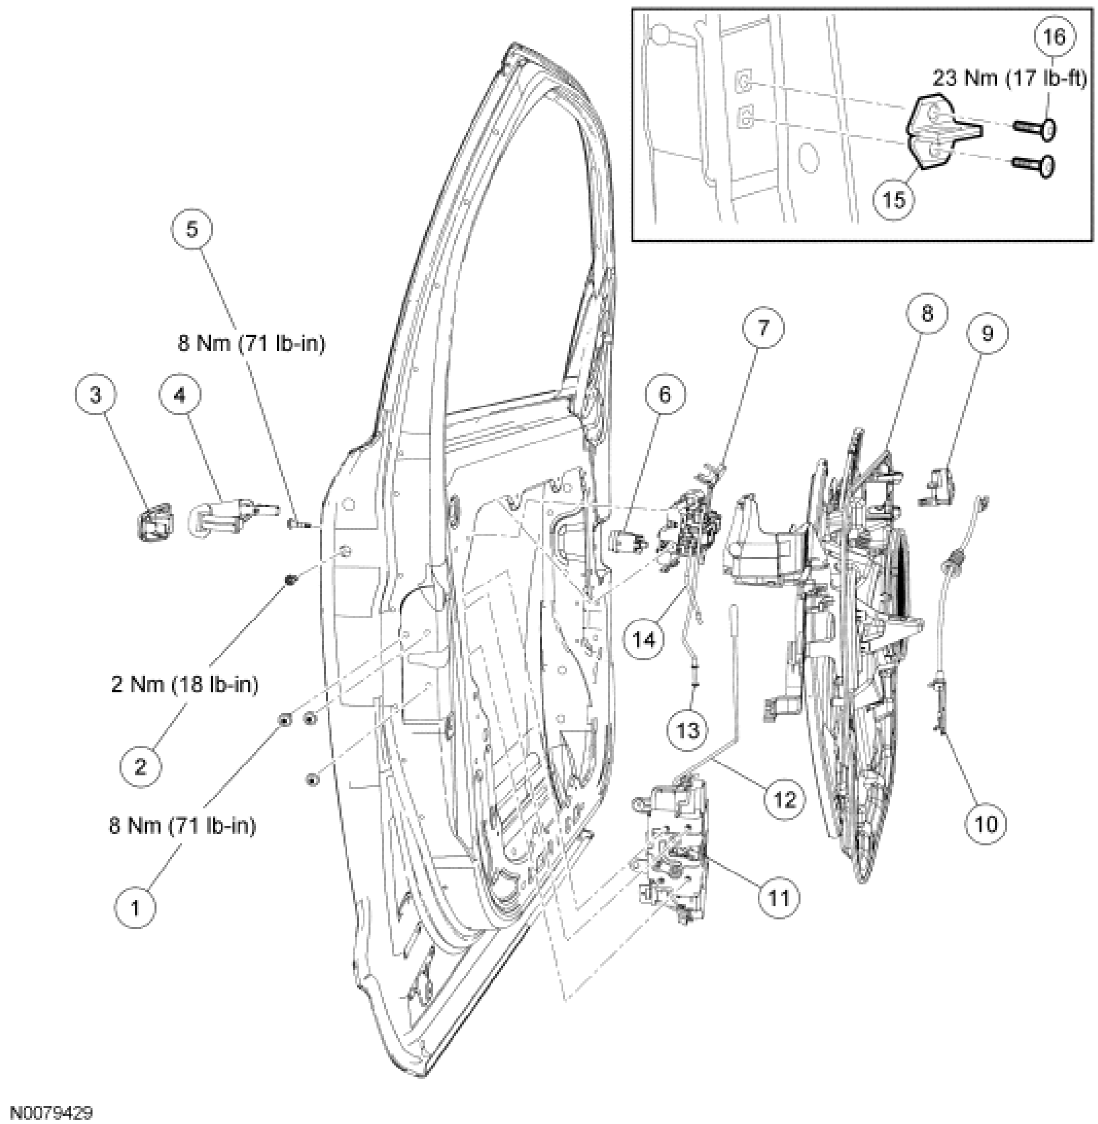

Fig. 36: Identifying Front Door Handles, Locks & Latches With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W705830	Front door latch bolts (3 required)
2	W506965	Exterior front door handle reinforcement screw
3	78218B08/78218A14	Exterior front door handle bezel (RH/LH)
4	7822404	Exterior front door handle strap
5	W708514	Exterior front door handle reinforcement bolt
6	5406082	Front door lock cylinder
7	7826684/7826685	Exterior front door handle

		reinforcement (RH/LH)
8	78235A86/78235A87	Front door panel component module assembly (RH/LH)
9	7822600/7822601	Interior front door handle (RH/LH)
10	78221A00	Interior front door handle actuating cable
11	7821812/7821813	Front door latch (RH/LH)
12	7821852/7821853	Front door lock actuating rod (RH/LH)
13	7822152/7822153	Exterior front door handle actuating rod (RH/LH)
14	7822135	Front door lock cylinder actuating rod (if equipped)
15	7822008	Striker
16	W710993	Door latch striker screws (2 required)

1. For additional information, refer to the appropriate procedures in this service information.

REAR DOOR HANDLES, LOCKS AND LATCHES - EXPLODED VIEW

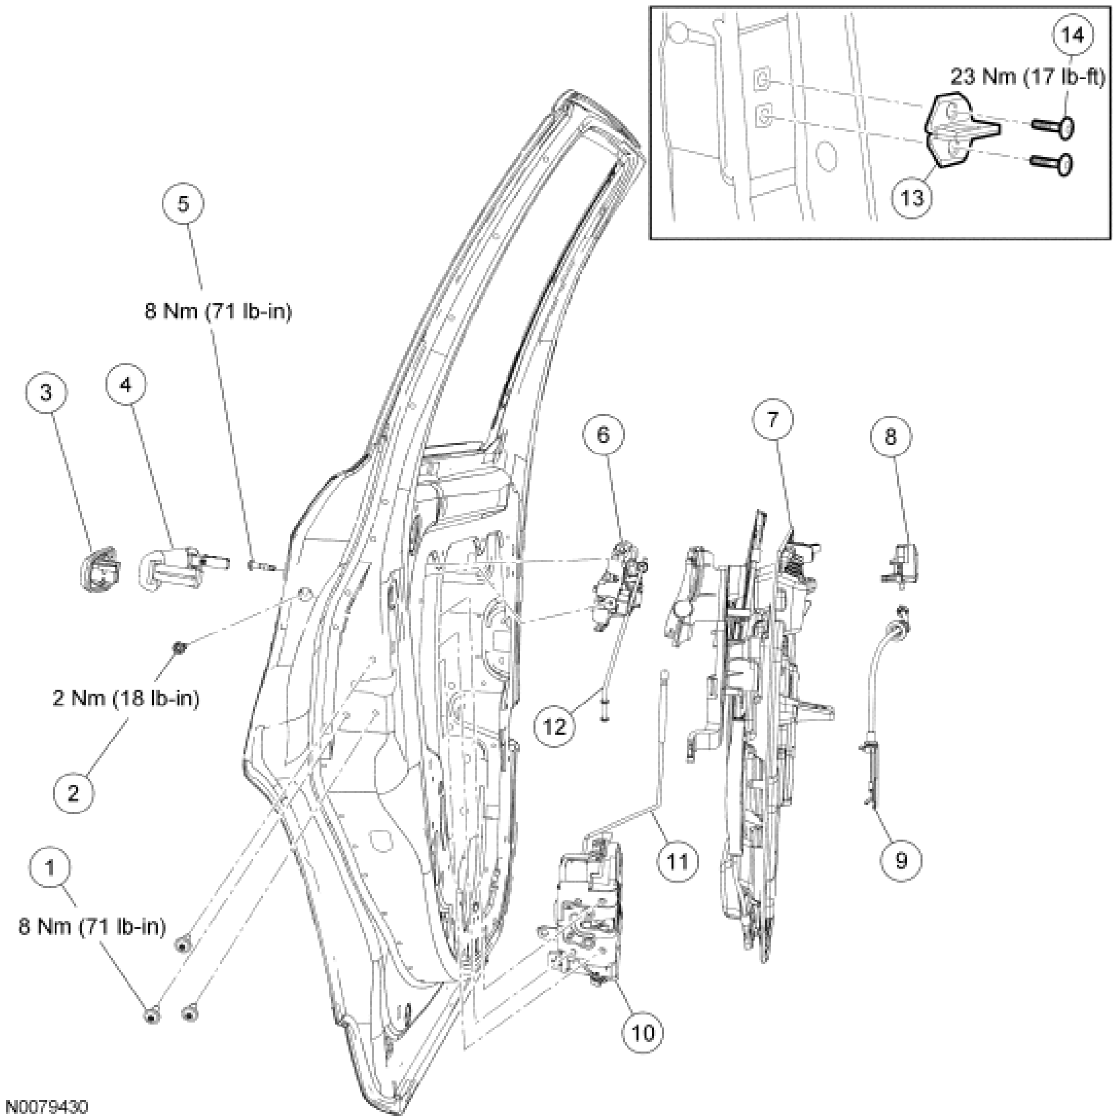

Fig. 37: Identifying Rear Door Handles, Locks & Latches With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W705830	Rear door latch bolts (3 required)
2	W506965	Exterior rear door handle reinforcement screw
3	78218B08	Exterior rear door handle bezel
4	7822404	Exterior rear door handle strap
5	W708514	Exterior rear door handle reinforcement bolt
6	7826684/7826685	Exterior rear door handle reinforcement (RH/LH)
7	78235A88/78235A89	Rear door panel component module

		assembly (RH/LH)
8	7822600/7822601	Interior rear door handle (RH/LH)
9	78221A00	Interior rear door handle actuating cable
10	7821812/7821813	Rear door latch (RH/LH)
11	7826460/7826461	Rear door lock actuating rod (RH/LH)
12	7826596/7826597	Exterior rear door handle actuating rod (RH/LH)
13	7822008	Striker
14	W710993	Door latch striker screws (2 required)

1. For additional information, refer to the appropriate procedures in this service information.

INTERIOR DOOR HANDLE

REMOVAL AND INSTALLATION

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.

NOTE: Front door shown, rear door similar.

2. Disconnect the interior door handle from the door window regulator and motor assembly.

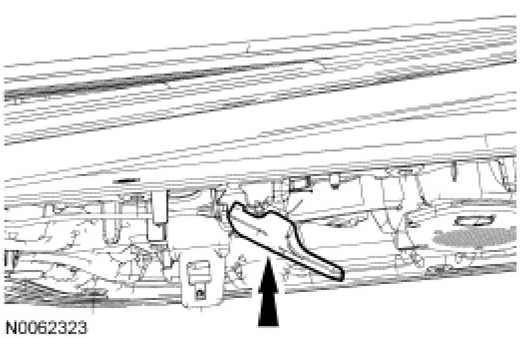

Fig. 38: Disconnecting Interior Door Handle From Door Window Regulator & Motor Assembly
Courtesy of FORD MOTOR CO.

NOTE: Front door shown, rear door similar.

3. Remove the interior door handle.
   - Disconnect the interior door handle actuating cable from the interior door handle.
   - Remove the interior door handle.

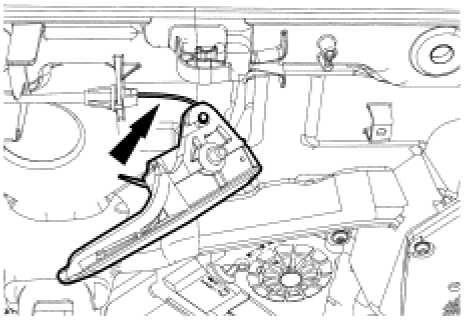

Fig. 39: Disconnecting Interior Door Handle Actuating Cable From Interior Door Handle
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

EXTERIOR DOOR HANDLE

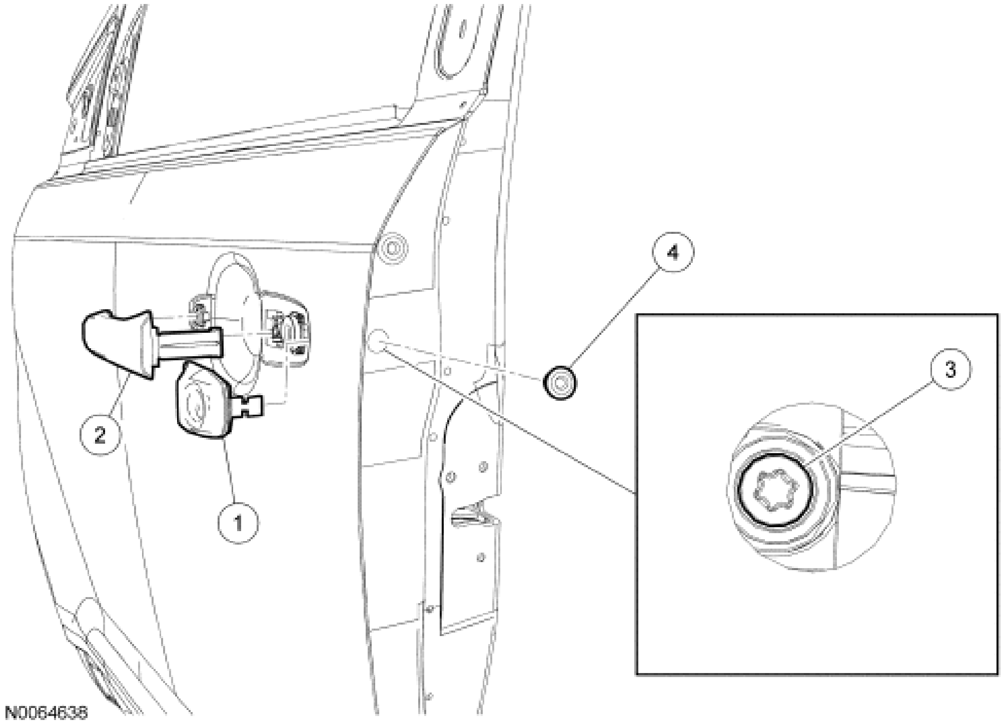

Fig. 40: Identifying Exterior Door Handle
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	78218A14/78218B08	Exterior door handle bezel (LH/RH)
2	7822404	Exterior door handle strap
3	N807169	Exterior door handle reinforcement screw

4	W651011	Plug

REMOVAL AND INSTALLATION

1. Remove the plug from the rear of the door.
2. Loosen the exterior door handle reinforcement screw and remove the exterior door handle bezel.

NOTE: Pull the exterior door handle strap outward and to the rear to release it from the exterior door handle reinforcement.

3. Remove the exterior door handle strap.
4. To install, reverse the removal procedure.

DOOR HANDLE REINFORCEMENT

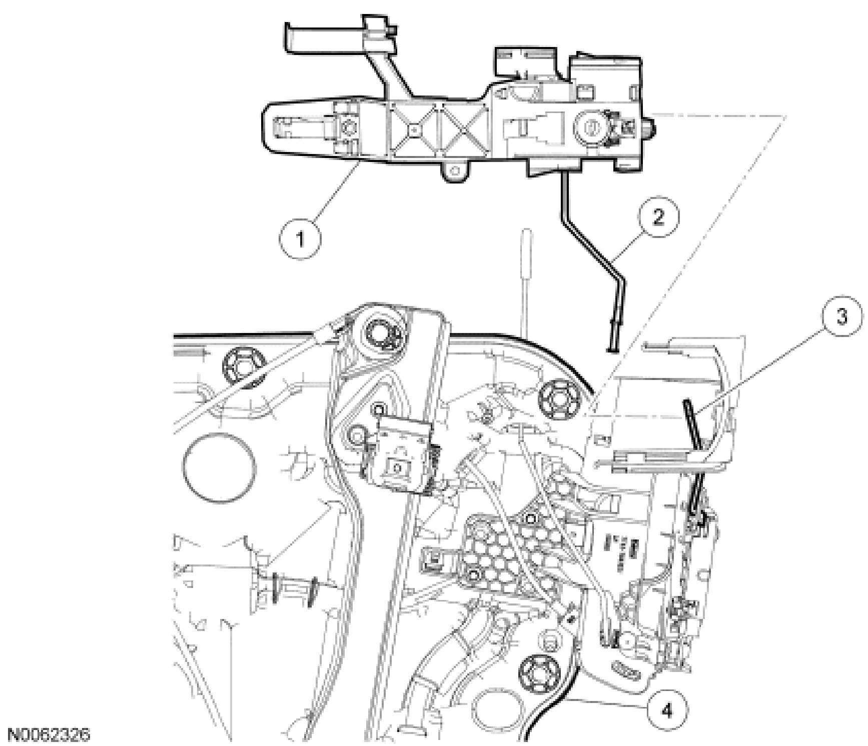

Fig. 41: Exploded View Of Exterior Front
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7826684/7826685	Exterior front door handle reinforcement (RH/LH)
2	7822152/7822153	Exterior front door handle actuating rod (RH/LH)
3	7822135	Front door lock cylinder actuating rod

		(if equipped)
4	-	Front window regulator and motor assembly

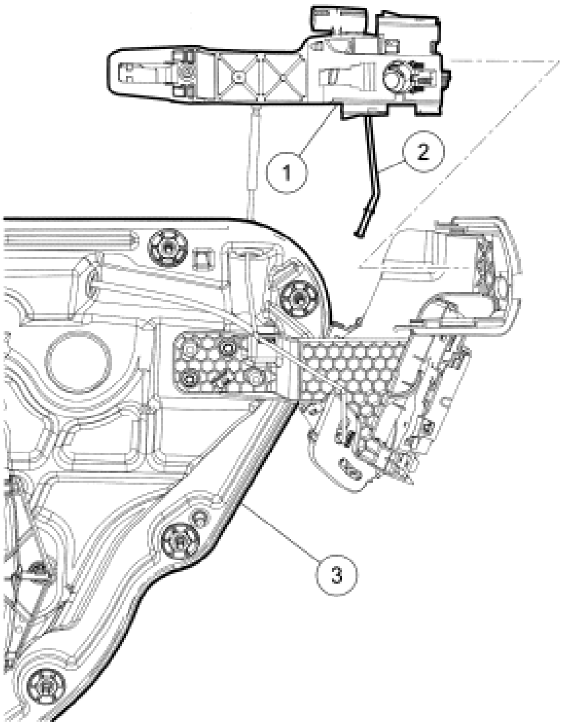

Fig. 42: Exploded View Of Exterior Rear
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7826684/7826685	Exterior rear door handle reinforcement (RH/LH)
2	7826596/7826597	Exterior rear door handle actuating rod (RH/LH)
3	-	Rear window regulator and motor assembly

REMOVAL AND INSTALLATION

1. Remove the exterior door handle. For additional information, refer to **Exterior Door Handle**.
2. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.
3. Remove the door window regulator and motor assembly. For additional information, refer to **GLASS, FRAMES & MECHANISMS** article.
4. If equipped, disconnect the upper lock cylinder actuating rod.
5. Disconnect the lower exterior door handle reinforcement actuating rod.

NOTE: Front door shown, rear door similar.

6. Remove the exterior door handle reinforcement.
    1. If equipped, disconnect the keyless entry keypad wiring harness retainer.
    2. Release the exterior door handle reinforcement locking clips from the door window regulator and motor assembly.
    3. Remove the exterior door handle reinforcement.

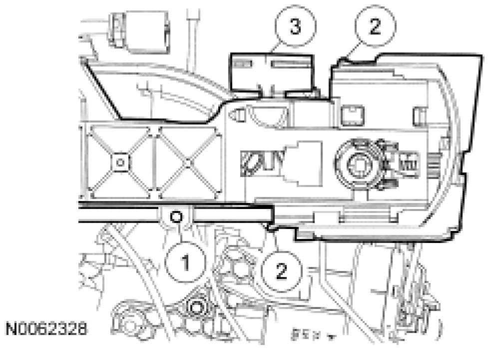

Fig. 43: Identifying Exterior Door Handle Reinforcement Locking Clips & Keyless Entry Keypad Wiring Harness Retainer
Courtesy of FORD MOTOR CO.

7. To install, reverse the removal procedure.

DOOR LATCH

Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

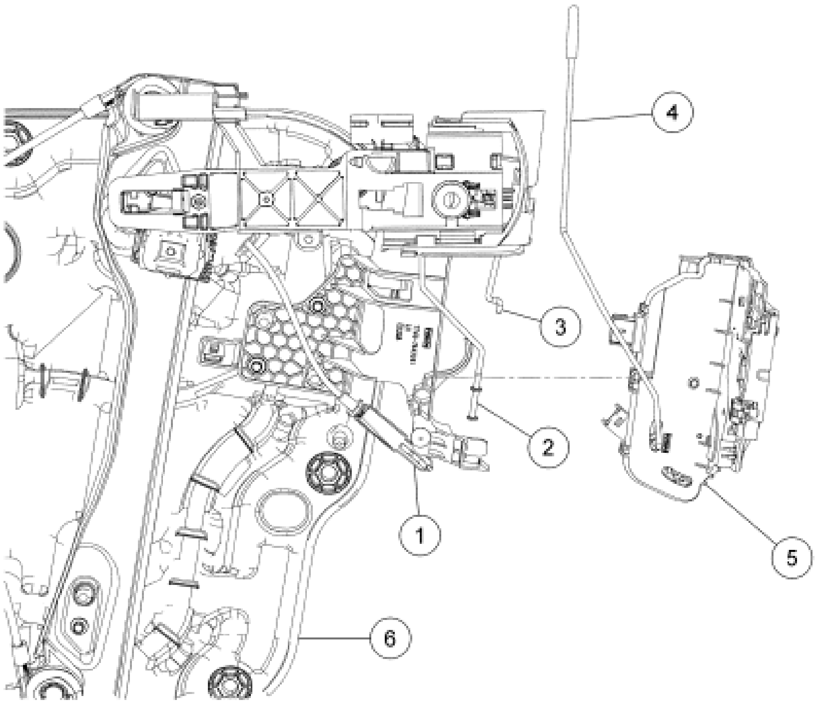

Fig. 44: Exploded View Of Front Door Latch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	78221A00	Interior front door handle actuating cable
2	7822152/7822153	Exterior front door handle actuating rod (RH/LH)
3	7822135	Front door lock cylinder actuating rod (if equipped)
4	7821852/7821853	Front door lock actuating rod (RH/LH)
5	7821812/7821813	Front door latch (RH/LH)
6	-	Front window regulator and motor assembly

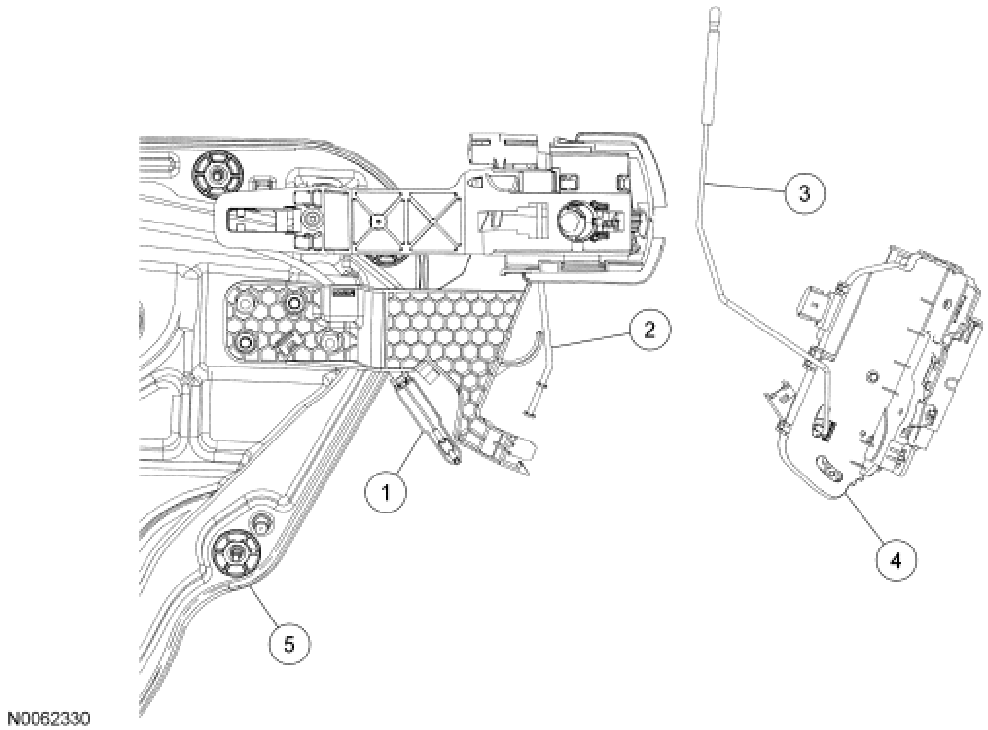

Fig. 45: Exploded View Of Rear Door Latch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	78221A00	Interior rear door handle actuating cable
2	7826596/7826597	Exterior rear door handle actuating rod (RH/LH)
3	7826460/7826461	Rear door lock actuating rod (RH/LH)
4	7821812/7821813	Rear door latch (RH/LH)
5	-	Rear window regulator and motor assembly

REMOVAL AND INSTALLATION

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.
2. Remove the door window regulator and motor assembly. For additional information, refer to **GLASS, FRAMES & MECHANISMS** article.
3. Disconnect the interior door handle actuating cable.
4. If equipped, disconnect the door lock cylinder actuating rod.
5. Disconnect the door handle reinforcement actuating rod.

NOTE: Front door shown, rear door similar.

6. Release the door latch rear locking clip.

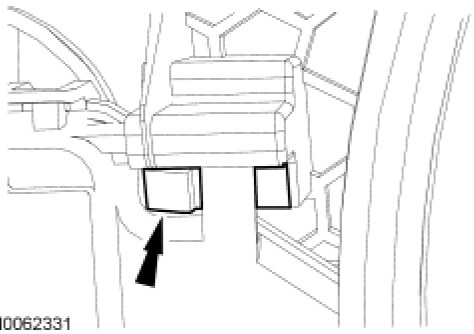

Fig. 46: Locating Door Latch Rear Locking Clip
Courtesy of FORD MOTOR CO.

NOTE: Front door shown, rear door similar.

7. Release the door latch front locking clip.
   1. Disconnect the door latch electrical connector.
   2. Release the door latch front locking clip.

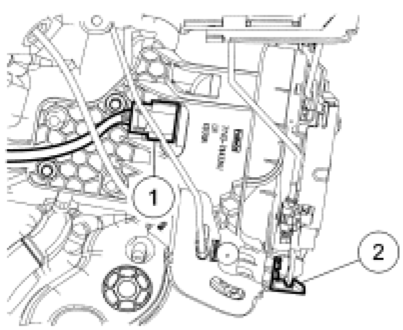

Fig. 47: Locating Door Latch Front Locking Clip & Door Latch Electrical Connector
Courtesy of FORD MOTOR CO.

8. Remove the door latch with the door lock actuating rod.
9. If necessary, disconnect the door lock actuating rod.
10. To install, reverse the removal procedure.
    - Lubricate the door latch to striker surfaces after installation.

DOOR LOCK CYLINDER

REMOVAL AND INSTALLATION

NOTE: Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock

repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

1. Remove the exterior door handle. For additional information, refer to **Exterior Door Handle**.

NOTE: Door handle reinforcement shown removed for clarity.

2. Using a suitable tool, release the retaining tab and remove the front door lock cylinder.

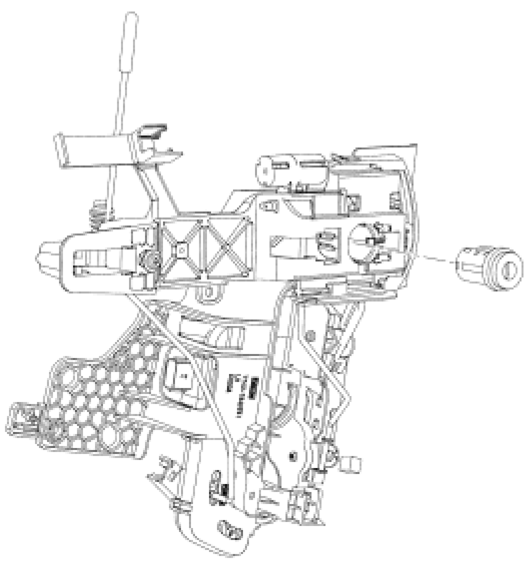

Fig. 48: Identifying Retaining Tab & Front Door Lock Cylinder
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

LIFTGATE LATCH - MANUAL

Material

Item	Specification
Multi-Purpose Grease Spray XL-5	ESB-M1C93-B

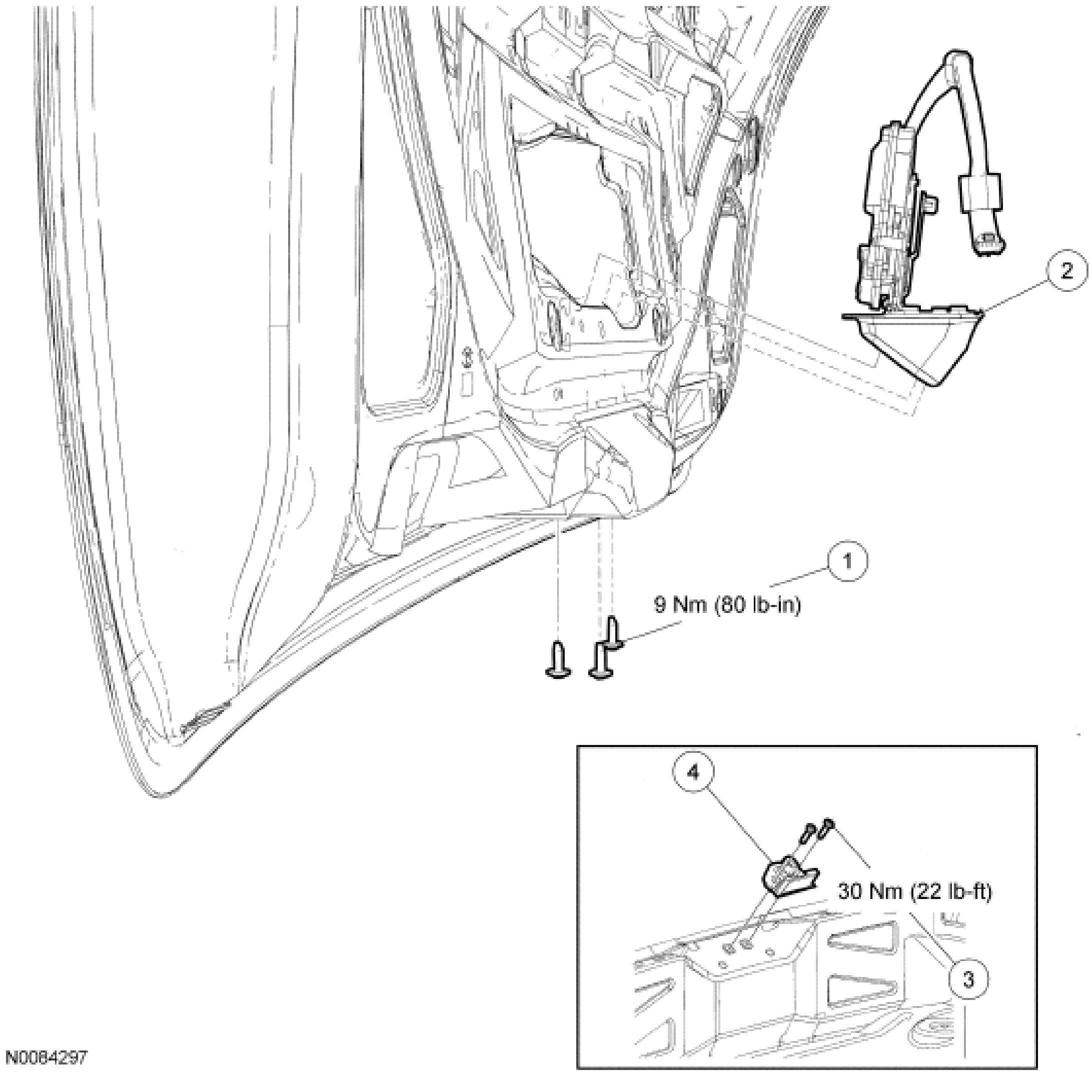

Fig. 49: Identifying Liftgate Latch - Manual With Torque Specifications

Item	Part Number	Description
1	W505423	Liftgate release switch molding bolts (2 required)
2	13508	Liftgate release switch molding
3	-	Liftgate release switch electrical connector (part of 14A583)
4	14018	Liftgate release switch

REMOVAL AND INSTALLATION

1. Remove the liftgate trim panel. For additional information, refer to **INTERIOR TRIM &**

ORNAMENTATION article.

2. Disconnect the liftgate release switch electrical connector.
3. Remove the 2 liftgate release switch molding bolts.
   - To install, tighten to 12 Nm (106 lb-in).
4. Press the tabs and remove the liftgate release switch.
5. To install, reverse the removal procedure.

IGNITION LOCK CYLINDER

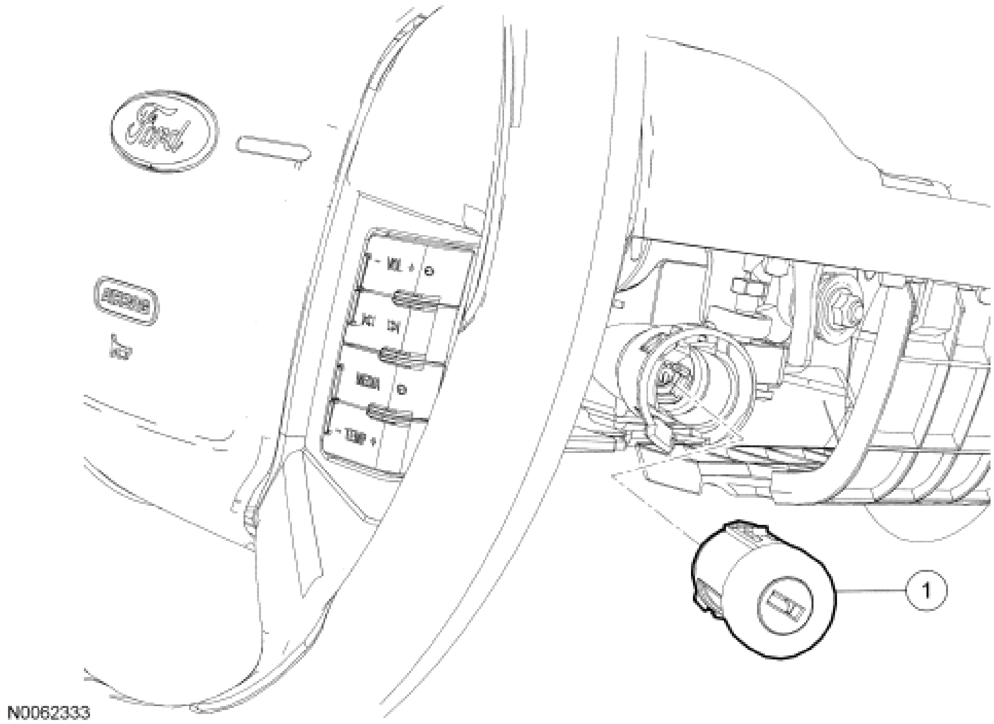

Fig. 53: Exploded View Of Ignition Lock Cylinder
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	11582	Ignition lock cylinder

REMOVAL AND INSTALLATION

1. Remove the passive anti-theft system (PATS) transceiver. For additional information, refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
2. Turn the ignition key to the ON position.
3. Using a suitable tool, press the ignition lock cylinder release button and remove the ignition lock cylinder.
4. To install, reverse the removal procedure.

DOOR LOCK CONTROL SWITCH

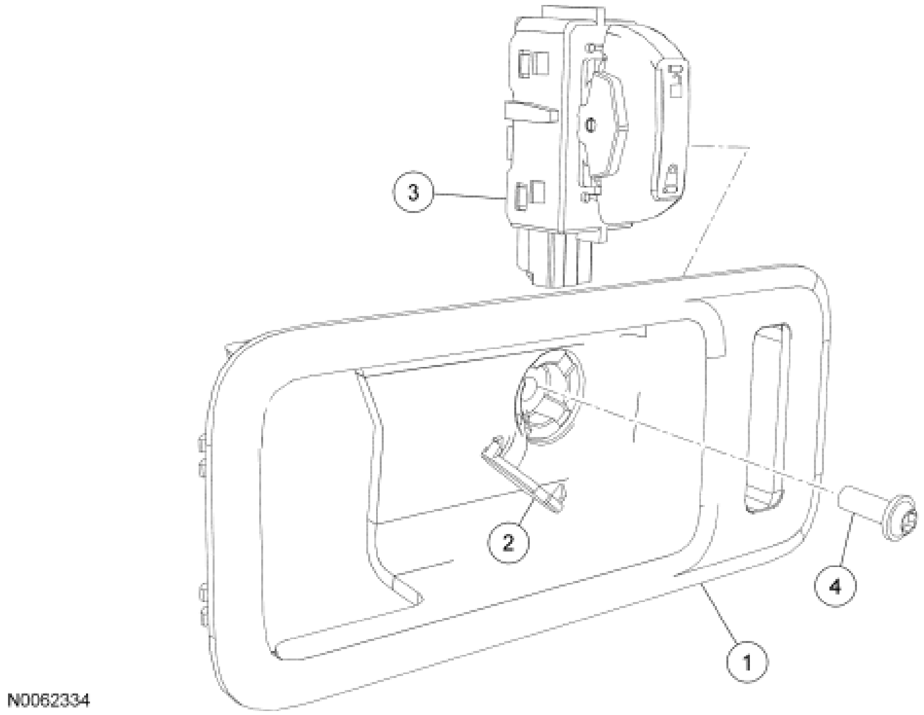

Fig. 54: Exploded View Of Door Lock Control Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Interior front door handle finish panel
2	-	Interior front door handle finish panel screw cover
3	-	Door lock control switch
4	-	Interior front door handle finish panel screw

REMOVAL AND INSTALLATION

1. Open the cover, remove the screw and position the interior front door handle finish panel aside.
2. Disconnect the door lock control switch electrical connector.
3. Release the locking clips and remove the door lock control switch.
4. To install, reverse the removal procedure.

KEYLESS ENTRY KEYPAD

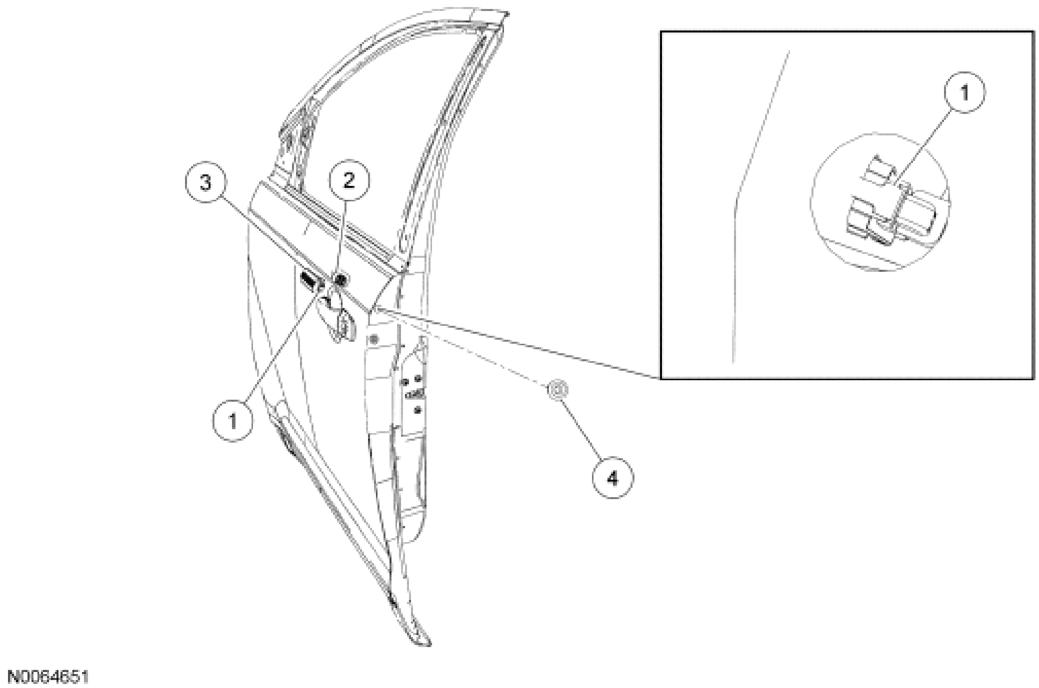

Fig. 55: Exploded View Of Keyless Entry Keypad
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Keyless entry keypad retaining clips (2 required) (part of 14A626)
2	-	Keyless entry keypad electrical connector (part of 14631)
3	14A626	Keyless entry keypad
4	W651011	Upper access plug

REMOVAL AND INSTALLATION

1. Remove the upper access plug.
2. Using a long, flat blade screwdriver, or suitable tool through the upper access hole, release the rear keyless entry keypad retaining clip and position the keyless entry keypad aside.
3. Remove the keyless entry keypad.
    - Disconnect the electrical connector.
4. To install, reverse the removal procedure.

2008 ENGINE

Accessory Drive - Edge & MKX

SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Accessory drive belt	6 ribs
Power steering pump drive belt	4-ribbed

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Accessory drive belt tensioner bolts	11	97

DESCRIPTION AND OPERATION

ACCESSORY DRIVE

This vehicle is equipped with the following components:

- V-ribbed serpentine accessory drive belt
- Automatic drive belt tensioner
- V-ribbed power steering pump drive belt

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator, power steering pump and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the A/C compressor clutch engaging or disengaging or demand changes on other systems powered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.

Accessory Drive Belt Routing

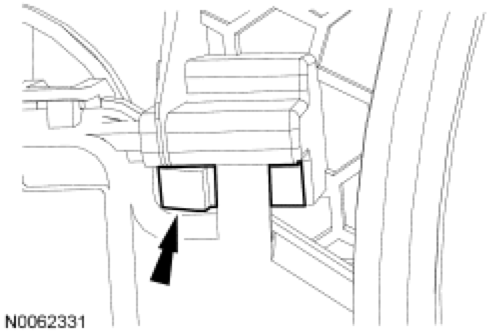

Fig. 1: Front End Accessory Drive (FEAD)

Item	Part Number	Description
1	6C301	Power steering pump drive belt
2	6316	Crankshaft pulley
3	3D639	Power steering pump pulley

Belt Tensioner

Automatic tensioners are calibrated to provide the correct amount of tension to the belt for a given accessory drive system. Unless a spring or damping band within the tensioner assembly breaks or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

DIAGNOSTIC TESTS

ACCESSORY DRIVE

Inspection and Verification

NOTE: Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

NOTE: Modular engine (without A/C) belt tensioner shown, others similar.

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

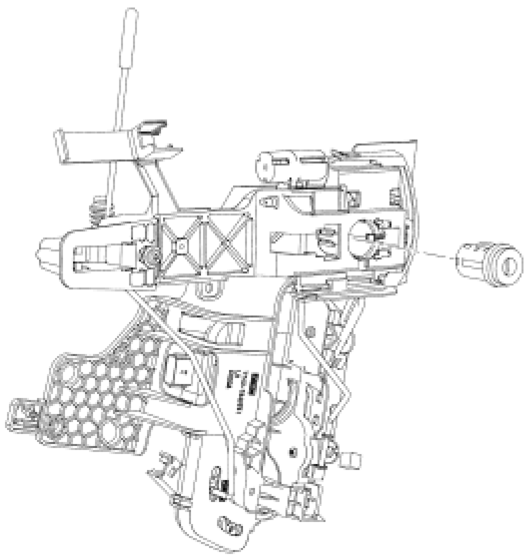

Fig. 3: Belt Tensioner With Belt Length Indicator
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Belt length indicator
2	-	Acceptable belt installation and wear range
3	-	Belt replacement range
4	-	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.
5. If a concern is found, correct the condition before proceeding to the next step.

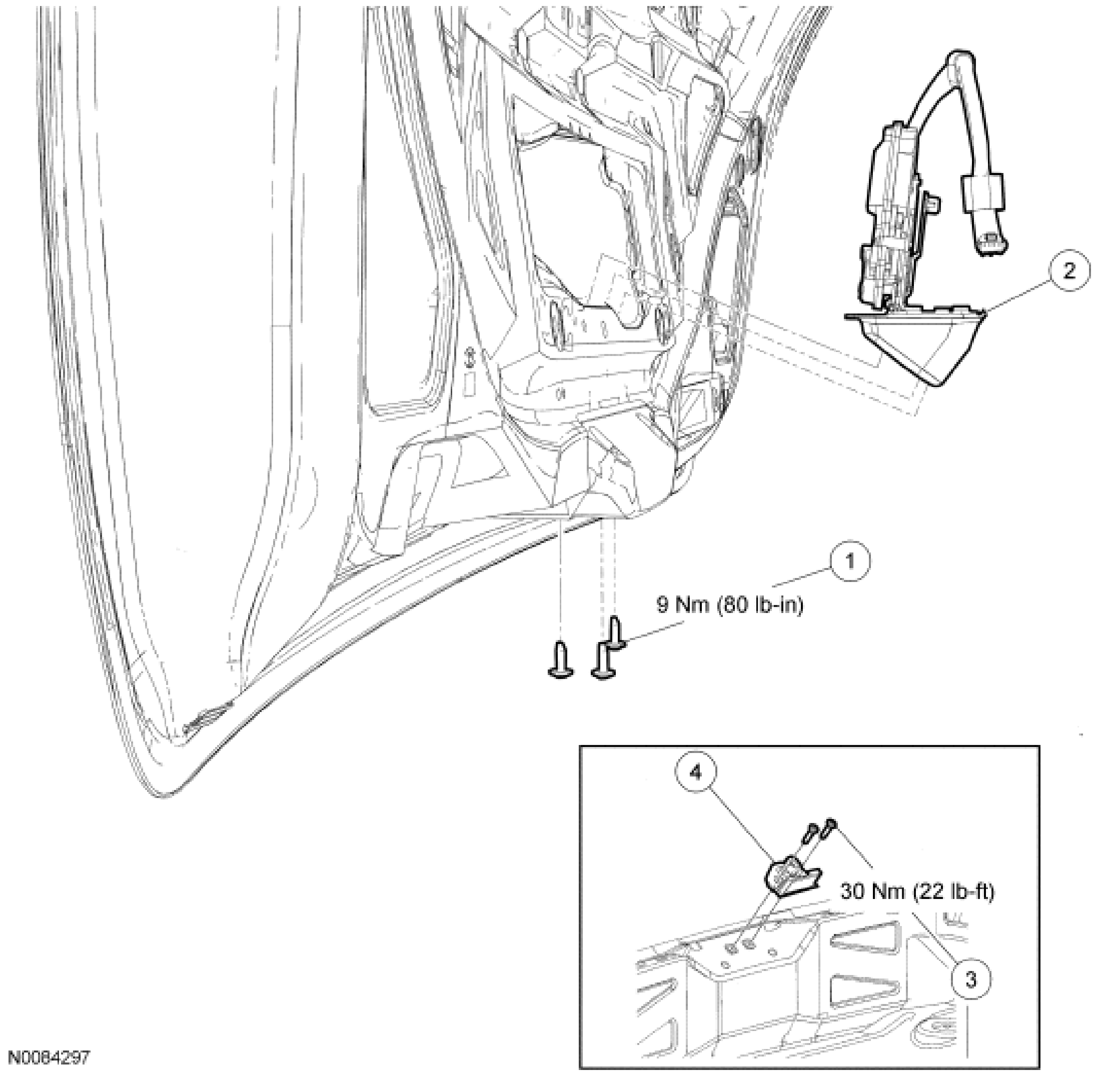

Fig. 4: V-Ribbed Serpentine Drive Belt With Cracks Across Ribs
Courtesy of FORD MOTOR CO.

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.

NOTE: **Piling is an excessive buildup in the V-grooves of the belt.**

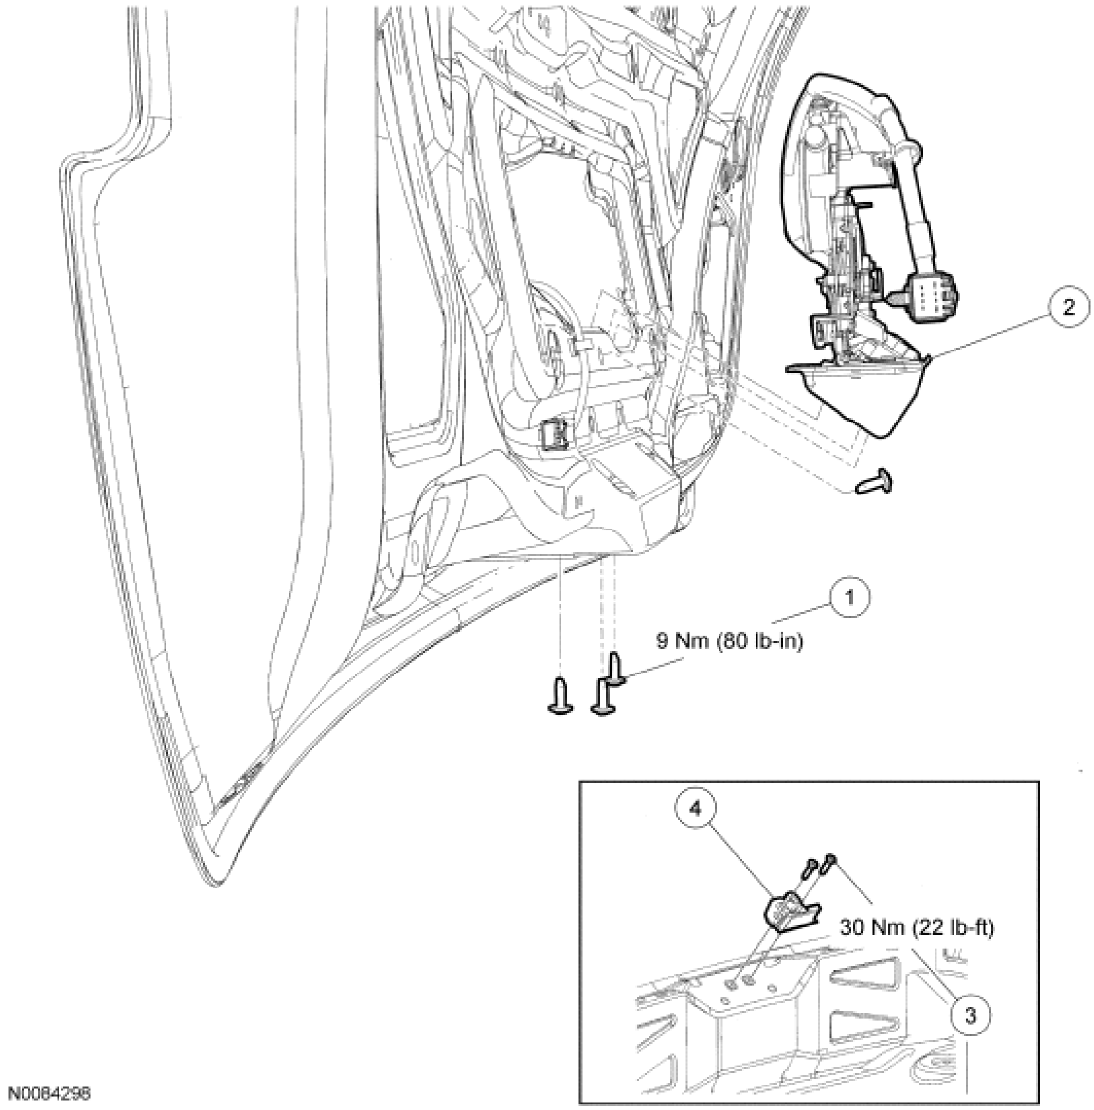

Fig. 5: Identifying V-Ribbed Serpentine Belt With Piling
Courtesy of FORD MOTOR CO.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

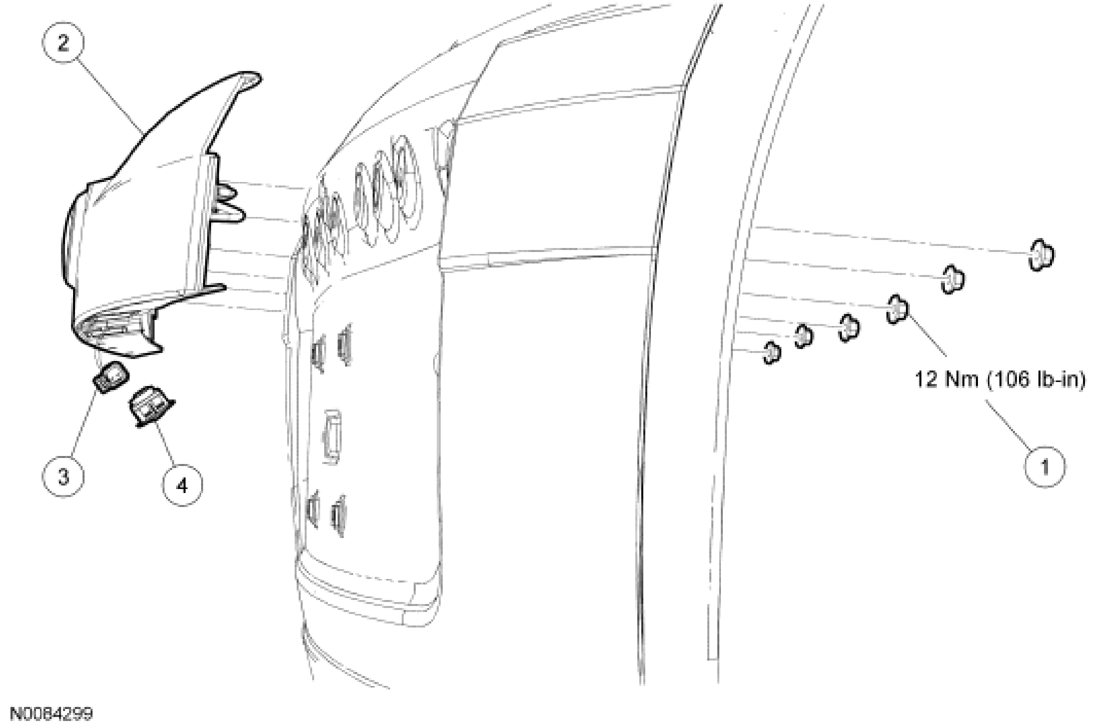

Fig. 6: Identifying V-Ribbed Serpentine Belt With Chunks of Rib Missing
Courtesy of FORD MOTOR CO.

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.
9. If the concern is not visually evident, verify the symptom and Go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Accessory drive belt cracking (over 15 cracks in a rib over a distance of 100 mm [4.0 in])	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to **Inspection and Verification**. INSTALL a new accessory drive belt as necessary.
• Accessory drive belt chunking	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to **Inspection and Verification**. INSTALL a new accessory drive belt as necessary. • INSPECT the accessory drive belt pulley grooves for

	• Damaged pulley grooves	damage. INSTALL a new pulley or component as necessary.
• Accessory drive belt noise, squeal, chirping or flutter	• Defective/worn or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged or worn accessory drive component or idler • Fluid contamination of accessory drive belt or pulleys	• REFER to **Component Tests**, Drive Belt - Noise/Flutter. REPAIR or INSTALL new parts as necessary.
	• Damaged or worn accessory drive belt tensioner	• REFER to **Component Tests**, Belt Tensioner - Mechanical and Belt Tensioner - Dynamics. INSTALL a new accessory drive belt tensioner as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
	• Accessory drive component failure	• CHECK the accessory drive components. INSTALL new components as necessary.
	• Accessory drive belt idler pulley bearing failure	• INSPECT the accessory drive belt idler pulley for freedom of rotation and damage. INSTALL a new accessory drive belt idler pulley as necessary.
• Premature accessory drive belt wear	• Defective or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged accessories • Incorrectly installed drive belt • Fluid contamination	• REFER to **Component Tests**, Drive Belt - Noise/Flutter and Drive Belt - Incorrect Installation. REPAIR or INSTALL new parts as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new

		pulley or component as necessary.

Component Tests

Drive Belt - Noise/Flutter

NOTE: Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - the A/C system is overcharged.
  - the A/C condenser core airflow is blocked.
  - the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.

- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.

NOTE: **The accessory drive belt tensioner arm should rotate freely without binding.**

- Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt - Incorrect Installation

NOTE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

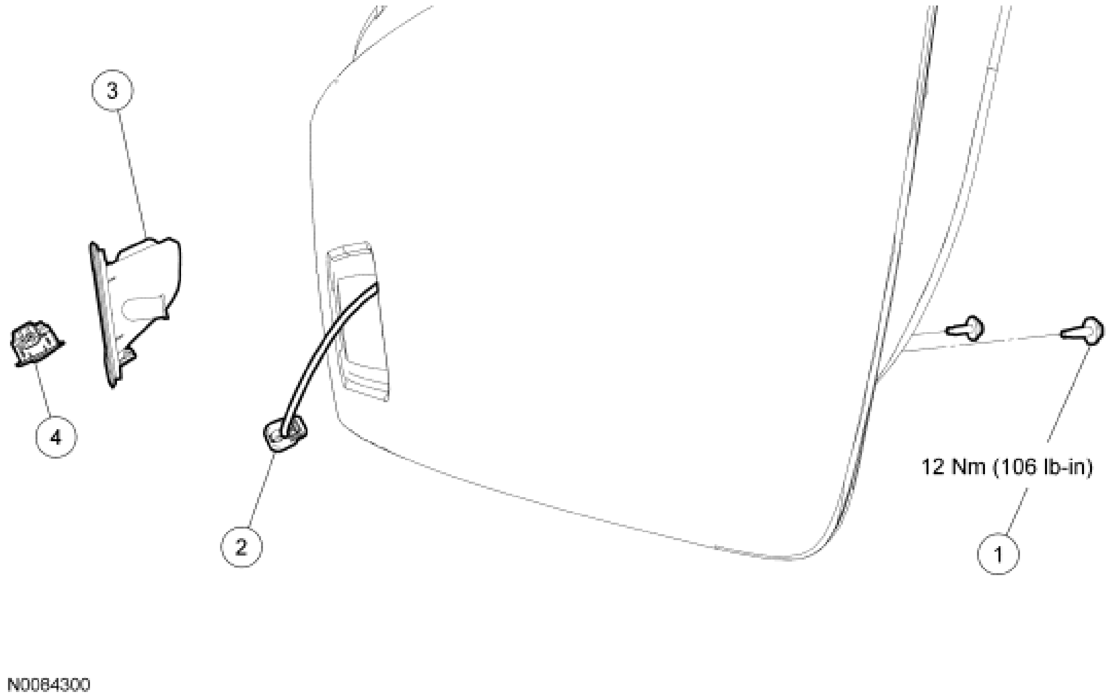

Fig. 7: Identifying Drive Belt Incorrect Installation
Courtesy of FORD MOTOR CO.

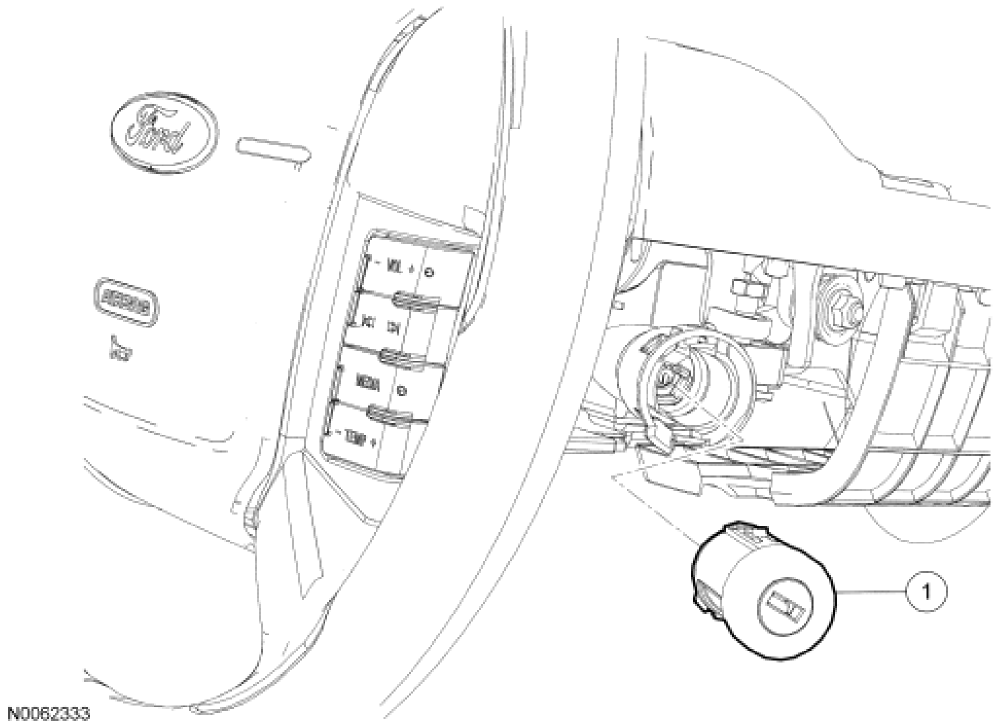

Fig. 8: Identifying Correct Installation Of Drive Belt
Courtesy of FORD MOTOR CO.

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under **Accessory Drive** .

NOTE: The accessory drive belt tensioner spring is very strong and requires substantial force to release.

2. Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:
    - Using the release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.
    - Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
    - Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.
3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.
4. If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

REMOVAL AND INSTALLATION

FRONT END ACCESSORY DRIVE (FEAD) - EXPLODED VIEW

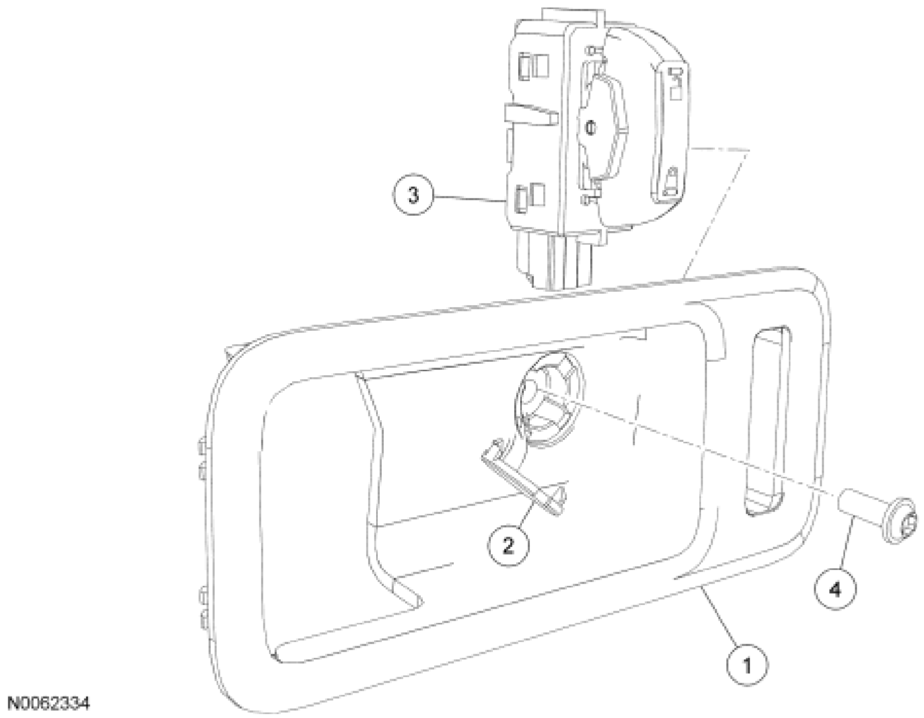

Fig. 9: Exploded View Of Front End Accessory Drive (FEAD) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8620	Accessory drive belt
2	W503278	Accessory drive belt tensioner bolt (3 required)
3	6B209	Accessory drive belt tensioner
4	6C301	Power steering pump drive belt

1. For additional information, refer to the appropriate procedure .

ACCESSORY DRIVE BELT

REMOVAL

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.

3. Remove the RH inner fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
4. Working from under the vehicle, remove the accessory drive belt.

INSTALLATION

1. Working from under the vehicle, position the accessory drive belt on all pulleys, with the exception of the generator pulley.

NOTE: After installation, make sure the accessory drive belt is correctly seated on all pulleys.

2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt.
3. Install the RH inner fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.

ACCESSORY DRIVE BELT TENSIONER

REMOVAL

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.
3. Remove the RH inner fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
4. Remove the 3 bolts and the accessory drive belt tensioner.

INSTALLATION

1. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 11 Nm (8 lb-ft).

NOTE: After installation, make sure the accessory drive belt is correctly seated on all pulleys.

2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt on the generator pulley.

3. Install the RH inner fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article

POWER STEERING PUMP BELT

Special Tools

Illustration	Tool Name	Tool Number
	Power Steering Belt Removal Tool	303-1252/1
	Power Steering Belt Installation Tool	303-1252/2

REMOVAL

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.
3. Remove the RH inner fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
4. Position the accessory drive belt off the crankshaft pulley.
5. Install the special tool between the power steering pump belt and pulley, turning the crankshaft bolt clockwise to remove the power steering belt.

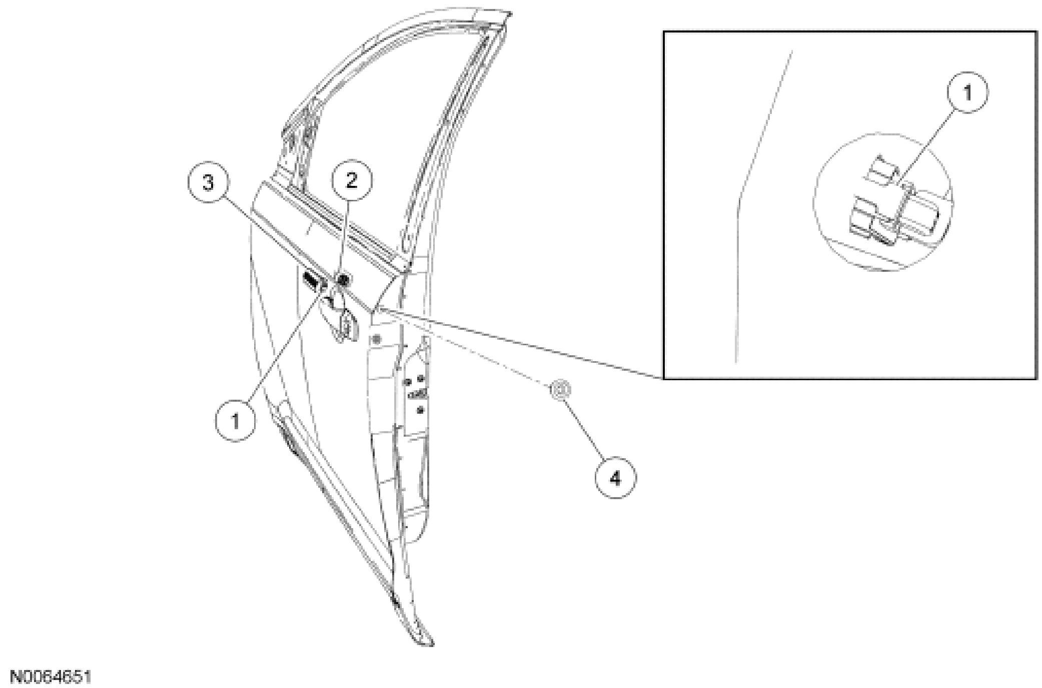

Fig. 10: Installing Special Tool (303-1252/1) Between Power Steering Pump Belt & Pulley, Turning Crankshaft Bolt Clockwise
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install the power steering belt on the crankshaft pulley.

CAUTION: After installation, make sure the belt is correctly seated on the crankshaft and power steering pulleys.

2. Position the power steering belt around the special tool and the power steering pulley. Make sure that the belt is engaged with the power steering pulley and rotate the crankshaft clockwise to install the power steering belt.

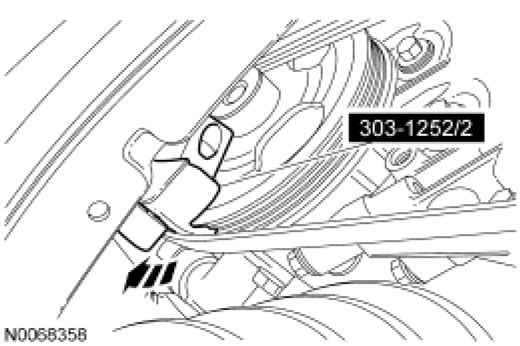

Fig. 11: Positioning Power Steering Belt Around Special Tool (303-1252/2) & Power Steering Pulley

Courtesy of FORD MOTOR CO.

3. Position the accessory drive belt on the crankshaft pulley.

NOTE: **After installation, make sure the accessory drive belt is correctly seated on all pulleys.**

4. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt.
5. Install the RH inner fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.

DESCRIPTION AND OPERATION

DRIVELINE SYSTEM

Driveline System

The driveline system consists of the following components:

- Center support bearing
- Driveshaft assembly
- Front halfshafts
- Rear halfshafts
- Active torque coupling/rear axle

On front wheel drive (FWD) vehicles, the transaxle transmits power from the engine to the halfshafts.

On all wheel drive (AWD) vehicles, power is transmitted from the engine through the transaxle to the power transfer unit (PTU). The PTU transfers engine power from the transaxle to the front halfshafts, and through the driveshaft to the active torque coupling/rear axle and halfshafts. For information on the PTU, refer to **FOUR WHEEL DRIVE (4WD) SYSTEMS** article or **POWER TRANSFER UNIT (PTU)** article.

The engine angle is built into the engine mounts. If the engine angle is out of specification, the engine mounts must be inspected for damage. Refer to **3.5L** article.

Fig. 1: Vehicle Certification (VC) Label Example
Courtesy of FORD MOTOR CO.

The vehicle certification (VC) label is located in the driver door jamb. The axle code is on the VC label. Refer to **IDENTIFICATION CODES** article.

The axle ratio is 2.93 and the ring gear has a diameter of 174 mm (6.85 in).

The wheel speed sensor rings for FWD vehicles are located on the front halfshafts and are mounted to the rear inner spindles.

The wheel speed sensor rings are located on the front and rear halfshafts for AWD vehicles.

Principals of Operation

Driveline System - General Information

The driveline system enables the power generated by the engine and transferred through the transmission in front wheel drive (FWD), or the transmission and the power transfer unit (PTU) in all wheel drive (AWD) to place the vehicle in motion. Rotational torque received from the transmission or PTU is delivered to the front wheels by halfshafts or the rear axle by way of the driveshaft(s). The U-joints or constant velocity (CV) joints at the ends of the shafts allow the shafts to rotate smoothly in an allowable angle plane. The rotational torque is introduced into the axle drive pinion which drives the differential ring gear. The ring gear is bolted to the axle differential which divides the torque between the left and right axle shafts, while permitting the shafts to turn at different speeds when required, such as when cornering.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• U-joints • Constant velocity (CV) joints • Center bearings • Driveshaft tubes • Mounting brackets • Flanges • Housing and cover damage • Differential bearings • Differential gearsets • Pinion bearings -

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and go to **SYMPTOM CHART - NOISE, VIBRATION AND HARSHNESS (NVH)**.

Driveshaft Center U-Joint and Constant Velocity (CV) Joint Inspection

With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article. Rotate the driveshaft by hand. Check for rough operation or seizure of the U-joints or constant velocity (CV) joints. Install a new driveshaft if it shows signs of seizure, excessive wear or incorrect seating. Refer to **DRIVESHAFT** article.

Driveshaft Center Bearing

With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article. Rotate the driveshaft by hand. If the bearing shows signs of roughness or is noisy, install a new driveshaft assembly. Refer to **DRIVESHAFT** article.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: Noise, vibration and harshness (NVH) symptoms should be identified using the

diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

SYMPTOM CHART - NOISE, VIBRATION AND HARSHNESS (NVH)

Condition	Possible Sources	Action
• Axle howling or whine - front or rear axle	• Axle lubricant low	• CHECK the lubricant level. FILL the axle to specification.
-	• Axle housing damage	• INSPECT the axle housing for damage. INSTALL a new axle as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• Damaged or worn wheel hub bearings	• CHECK for abnormal wheel hub bearing play or roughness. REFER to **FRONT SUSPENSION** article or **REAR SUSPENSION** article.
-	• Damaged or worn differential ring and pinion	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• Damaged or worn differential side or pinion bearings	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Driveline clunk - loud clunk when shifting from reverse to drive	• Incorrect axle lubricant level	• CHECK the lubricant level. FILL the axle to specification.
-	• Excessive backlash in the axle	• CHECK the axle backlash. INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• Damaged or worn pinion bearings	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• Damaged or worn U-joints	• INSPECT the U-joints for wear or damage. INSTALL a new driveshaft as necessary. REFER to

		DRIVESHAFT article.
- • Driveline clunk - occurs as the vehicle starts to move forward following a stop • Driveline clunk (front wheel drive [FWD] vehicles) - occurs during acceleration or from cruise to coast/deceleration	• Worn driveshaft constant velocity (CV) joint or U-joints with excessive play • Loose rear axle mount • Damaged or worn inner CV joint	• INSPECT the CV joint and U-joints for a worn condition. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article. • CHECK the axle for loose bolts. TIGHTEN to specification. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. • INSPECT the inner CV joint and boot. INSTALL a new CV joint as necessary. REFER to **FRONT DRIVE HALFSHAFTS** article.
- • Clicking, popping or grinding - occurs while the vehicle is turning • High pitched chattering - noise from the rear axle when the vehicle is turning - • Buzz - buzzing noise is the same at cruise or coast/deceleration	• Inadequate or contaminated lubrication in the CV joints • Another component contacting the halfshaft • Incorrect or contaminated lubricant • Damaged or worn differential (differential side gears and pinion gears) • Incorrect driveline angles	• CHECK the CV boots and joints for wear or damage. INSTALL new components as necessary. REFER to **FRONT DRIVE HALFSHAFTS** article. • CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary. • CHECK the vehicle by driving in tight circles (5 clockwise, 5 counterclockwise). DRAIN and REFILL with the specified rear axle lubricant and friction modifier as necessary. • INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. • CHECK for correct driveline angles. REPAIR as necessary. REFER to **Driveline Angle Measurement**.
• Rumble or boom - noise occurs at coast/deceleration, usually driveshaft speed-related and noticeable over a wide range of speeds	• Driveshaft is out-of-balance	• CHECK the driveshaft for damage, missing balance weights or undercoating. REFER to appropriate Driveshaft Balancing procedure.

-	• U-joints are binding or seized	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
• Grunting - normally associated with a shudder experienced during acceleration from a complete stop	• Driveshaft CV joint binding	• INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
-	• Loose rear axle mount bolts or suspension fasteners	• INSPECT the rear suspension and axle. TIGHTEN the fasteners to specification. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Howl - can occur at various speeds and driving conditions. Affected by acceleration and deceleration	• Incorrect ring and pinion contact, incorrect bearing preload or gear damage	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Chuckle - heard at coast/deceleration. Also described as a knock	• Incorrect ring and pinion contact or damaged teeth on the coast side of the ring and pinion	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Knock - noise occurs at various speeds. Not affected by acceleration or deceleration	• Gear tooth damage to the drive side of the ring and pinion	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Scraping noise - a continuous low pitched noise starting at low speeds	• Worn or damaged pinion bearings	• INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Driveline shudder - occurs during acceleration from a slow speed or stop	• Rear drive axle assembly mispositioned	• CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• Loose rear axle bolts	• CHECK the rear axle for loose bolts. TIGHTEN the bolts to specification. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• Driveline angles out	• CHECK for correct driveline angles.

	of specification	REFER to **Driveline Angle Measurement**.
-	• U-joints binding or seized	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
-	• Binding or damaged driveshaft CV joint	• INSPECT the driveshaft CV joint and coupling shaft for wear or damage. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
• Driveline vibration - occurs at cruising speeds	• Worn U-joints	• CHECK for wear or incorrect seating. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
-	• Worn or damaged driveshaft center bearing support	• CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
-	• Loose axle pinion flange bolts	• INSPECT the axle pinion flange. TIGHTEN the pinion flange bolts to specification. REFER to **DRIVESHAFT** article.
-	• Excessive axle pinion flange runout	• CARRY OUT a runout check. REPAIR as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• Driveshaft is out-of-balance	• CHECK the driveshaft for damage, missing balance weights or undercoating. CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REFER to **Driveshaft Runout and Balancing**.
-	• Binding or damaged driveshaft CV joint	• INSPECT the driveshaft CV joint for wear or damage. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
-	• Excessive driveshaft runout	• CARRY OUT a runout check. REFER to **Driveshaft Runout and Balancing**.

-	• Driveline angles out of specification	• CHECK for correct driveline angles. REPAIR as necessary. REFER to **Driveline Angle Measurement**.
-	• Incorrectly seated CV joint in the wheel hub	• CHECK the outer CV joint for correct seating into the hub. REPAIR as necessary. REFER to **FRONT DRIVE HALFSHAFTS** article for the front CV joints or **REAR DRIVE HALFSHAFTS** article for the rear CV joints.

Analysis of Leakage

Clean up the leaking area enough to identify the exact source.

A plugged rear drive unit (RDU) housing vent can cause excessive pinion seal lip wear due to internal pressure buildup.

Verify the RDU lubricant level is at least 3-5 mm (1/8-3/16 in) below the bottom of the fill hole.

Axle Vent

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. If the vent cannot be cleared, install a new vent.

Drive Pinion Seal

Leaks at the drive pinion seal originate from the following causes:

- Damaged seal
- Worn seal journal surface

Any damage to the seal bore (dings, dents, gouges or other imperfections) distorts the seal casing and allows leakage past the outer edge of the drive pinion seal.

The drive pinion seal can be torn, cut or gouged if it is not installed correctly. The spring that holds the drive pinion seal against the pinion flange may be knocked out and allow fluid to pass the lip.

Metal chips trapped at the sealing lip can cause oil leaks. These can cause a wear groove on the drive pinion flange and result in pinion seal wear.

When a seal leak occurs, install a new drive pinion seal and check the vent to make sure it is clean and free of foreign material.

A new drive pinion flange must be installed if any of these conditions exist.

Drive Pinion Nut

CAUTION: Install the drive pinion nut to the correct torque specifications or damage to the differential components may occur.

On some high-mileage vehicles, oil may leak through the threads of the drive pinion nut. This condition can be corrected by installing a new nut and applying threadlock and sealer on the threads and nut face.

Differential Seals

CAUTION: When installing shafts, do not allow splines to contact seals during installation or damage to the seals may occur.

Halfshaft pilot bearing housing seals are susceptible to the same types of damage as drive pinion seals if incorrectly installed. The seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. The seal journal surface must be free of nicks, gouges and rough surface texture.

For information on differential seals, refer to **REAR DRIVE AXLE/DIFFERENTIAL** article.

GENERAL PROCEDURES

DRIVELINE ANGLE MEASUREMENT

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
 ST1622-A	Anglemaster II Driveline Inclinometer/Protractor	164-R2402 or equivalent

NOTE: This procedure does not apply to CV joints, flex couplers or double Carden joints that are used in some driveshafts. This check is for single-cross and roller-style joints found in the driveshafts.

NOTE: Prior to checking driveline angularity, inspect the U-joints for correct operation.

NOTE: An incorrect driveline angle can cause a vibration or shudder. For additional information, refer to NOISE, VIBRATION AND HARSHNESS article.

NOTE: Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height, rear spring and engine mounts.

All vehicles

1. Carry out the following preliminary setup steps:
   - Inspect the U-joints for correct operation.
   - Park the vehicle on a level surface such as a drive-on hoist, or back onto a front end alignment rack.
   - Verify the curb position ride height is within specifications with the vehicle unloaded and all of the tires are inflated to their normal operating pressures.
   - Calibrate the Anglemaster II Driveline Inclinometer/Protractor by placing it on a clean, flat level section of the frame rail and press the ALT-ZERO button.

   Vehicles with flat-flanged, split-pin or slip-flanged U-joints

   NOTE: **If equipped, remove the snap ring to allow access to the base of the U-joint cup. Make sure the Anglemaster II Driveline Inclinometer/Protractor is seated against the U-joint cup.**

   NOTE: **Rotate the driveshaft until the flange U-joint cup is parallel with the floor. This will simplify taking measurements.**

2. To check the U-joint operating angle, install the Anglemaster II Driveline Inclinometer/Protractor. Check and record the flange angle as angle A.

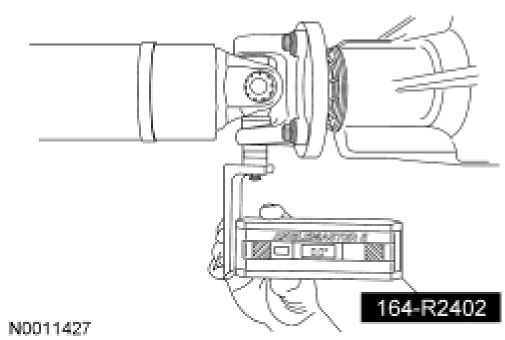

Fig. 2: Checking Flange Angle (1 Of 2)
Courtesy of FORD MOTOR CO.

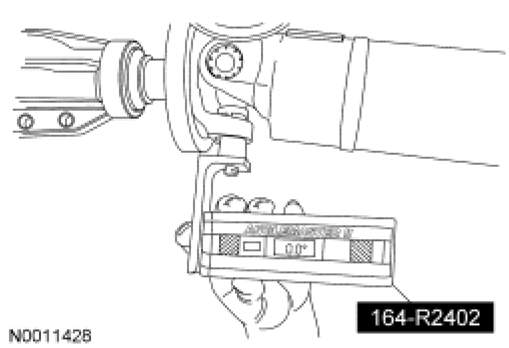

Fig. 3: Checking Flange Angle (2 Of 2)
Courtesy of FORD MOTOR CO.

3. Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the connecting component. Record the measurements of the component's angle as angle B.

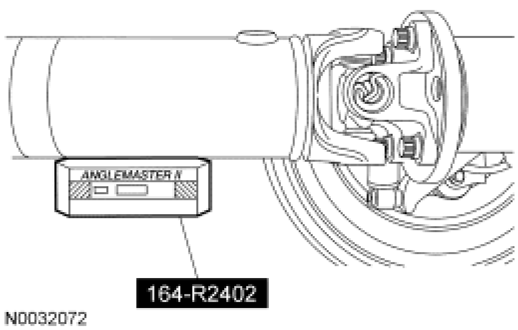

Fig. 4: Checking Driveshaft Angle
Courtesy of FORD MOTOR CO.

Multiple piece driveshafts

NOTE:	**Repeat this step for each center support bearing on the driveshaft.**

NOTE:	**It is not necessary to remove the U-joint snap ring, if equipped, for these measurements.**

4. Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the components in front and behind the center support bearing U-joint in the area indicated. Record the front component as angle A and the rear component as angle B.

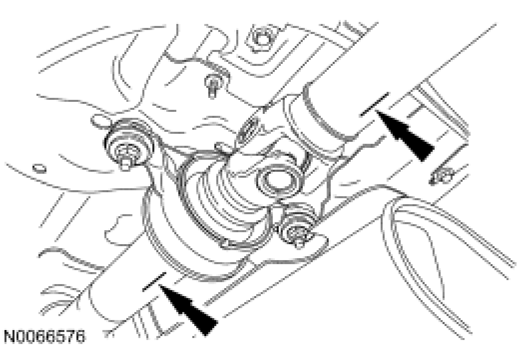

Fig. 5: Locating Index Mark On Driveshaft
Courtesy of FORD MOTOR CO.

All vehicles

NOTE:	**When 2 connected components slope in the same direction, subtract the**

smallest number from the larger number to find the U-joint operating angle. When 2 connected components slope in the opposite direction, add the measurements to find the U-joint operating angle.

5. Calculate the difference in the slope of the components to determine the U-joint operating angle.
    - The U-joint operating angle is the angle formed by 2 yokes connected by a cross and bearing kit. Ideally, the operating angles on each connection of the driveshaft must:
        - be equal or within one degree of each other.
        - have a 3 degree maximum operating angle.
        - have at least 1/2 of one degree continuous operating angle.
6. If the angle is not within specifications, repair or adjust to obtain the correct angle. Inspect the engine mounts, transmission mounts, center support bearing mounting, rear suspension, rear axle, rear axle mounting or the frame for wear or damage.

DRIVESHAFT RUNOUT AND BALANCING

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
 ST2574-A	Dial Indicator Gauge with Holding Fixture 100-02 (TOOL-4201-C) or equivalent	-
 ST3025-A	Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)	257-00018 or equivalent

Driveshaft Inspection

NOTE: **Driveline vibration exhibits a higher frequency and lower amplitude than high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is noticed at various speeds. Driveline vibration can be perceived as a tremor in the floorpan or heard as a rumble, hum or boom.**

NOTE: **Refer to <u>SPECIFICATIONS</u> for all runout specifications.**

NOTE: **Do not make any adjustments before carrying out a road test. Do not change the tire pressure or the vehicle load.**

1. Carry out a visual inspection of the vehicle. Operate the vehicle and verify the condition by reproducing it during the road test.

- The concern should be directly related to vehicle road speed, not affected by acceleration or deceleration or could not be reduced by coasting in NEUTRAL.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
   - The driveshaft should be kept at an angle equal to or close to the curb-weighted position. Use a twin-post hoist or a frame hoist with jackstands.
3. Inspect the driveshaft for damage, undercoating or incorrectly seated U-joints. Rotate the driveshaft slowly by hand and feel for binding or end play in the U-joint trunnions. Remove the driveshaft. For additional information, refer to **DRIVESHAFT** article. Inspect the slip yoke splines for any galling, dirt, rust or incorrect lubrication. Clean the driveshaft or install new U-joints as necessary. Install a new driveshaft if damaged. After any corrections or new components are installed, recheck for the vibration at the road test speed.
   - If the vibration is gone, test drive the vehicle.
   - If the vibration persists or the driveshaft passes visual inspection, measure the driveshaft runout.

Driveshaft Runout

1. Install the suitable Dial Indicator Gauge with Holding Fixture. Rotate the driveshaft by turning the axle and measure the runout at the front, the center and the rear of the driveshaft.
   - If the runout exceeds 0.89 mm (0.035 in) at the front or center, install a new driveshaft.
   - If the front and center is within 1 mm (0.254 in), but the rear runout is not, index-mark the rear runout high point and proceed to Step 2.
   - If the runout is within 0.89 mm (0.035 in) at all points, recheck for vibration at road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to appropriate Driveshaft Balancing procedure.

NOTE: Circular pinion flanges can be turned in 90 degree or 1/4 increments. Half-round pinion flanges are limited to 2 positions.

2. Index-mark the driveshaft to the pinion flange. Disconnect the driveshaft and rotate it 180 degrees. Reconnect the driveshaft. Recheck the runout at the rear of the driveshaft.
   - If the runout is still over specification, mark the high point and proceed to Step 3.
   - If the runout is within specification, check for the vibration at the road test speed. If the vibration is still present, balance the driveshaft. For additional information, refer to appropriate Driveshaft Balancing procedure.
3. Excessive driveshaft runout can originate in the driveshaft itself or from the pinion flange. To find the source, compare the 2 high points previously determined.
   - If the index marks are close together, within 25 mm (1 in), the driveshaft is eccentric. Install a new driveshaft.
   - If the marks are on opposite sides of the driveshaft, 180 degrees apart, the slip yoke or pinion flange is responsible. Check the pinion flange runout. If the pinion flange runout exceeds specifications, a bent pinion is indicated.
   - If the pinion flange and pinion runouts are within specifications, road test and check for the

vibration at the road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to appropriate Driveshaft Balancing procedure.

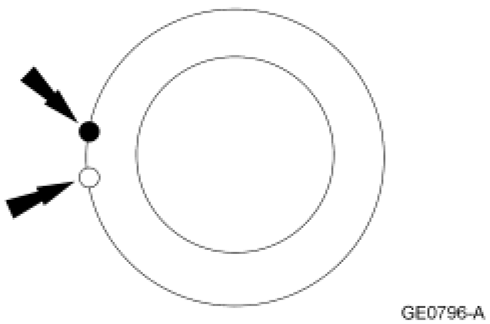

Fig. 6: Finding Excessive Driveshaft Runout (1 Of 2)
Courtesy of FORD MOTOR CO.

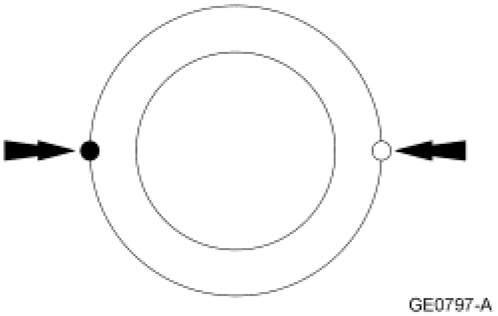

Fig. 7: Finding Excessive Driveshaft Runout (2 Of 2)
Courtesy of FORD MOTOR CO.

Driveshaft Balancing - Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)

All vehicles

1. Install the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) to the vehicle.
2. Working under the vehicle, install an accelerometer. The accelerometer can be attached and mounted near either the transmission or differential end of the driveshaft.
3. Clean an area of the driveshaft and install the reflective tape, then install the photo-tachometer sensor. The sensor should be placed at approximately a 20-degree angle from perpendicular to the surface of the reflective tape. Make sure the sensor does not get moved during the balance procedure.
    1. Reflective tape.
    2. Photo-tachometer sensor.

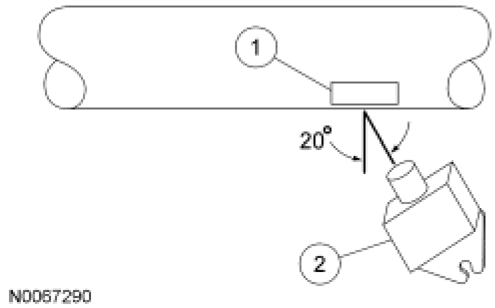

Fig. 8: Driveshaft Balancing - Using the MTS 4000
Courtesy of FORD MOTOR CO.

4. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a driveshaft balance test with the driveshaft unmodified.

Vehicles with tapped pinion flanges

5. Label the tapped holes in the pinion flange numerically, starting at the top hole as 1. Mark the remaining holes 2, 3 and 4. Label in the direction of rotation.

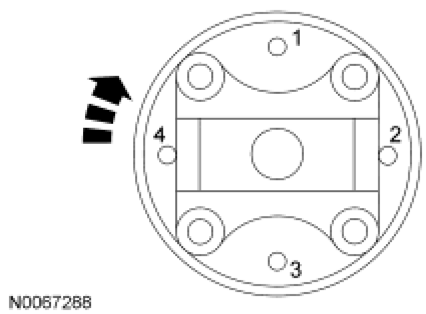

Fig. 9: Labeling Tapped Holes In The Pinion Flange
Courtesy of FORD MOTOR CO.

6. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with the 12 mm (0.47 in) test weight set screw in the No. 1 hole, previously marked on the pinion flange.
7. Remove the test weight, then install the weight combination directed by the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix).

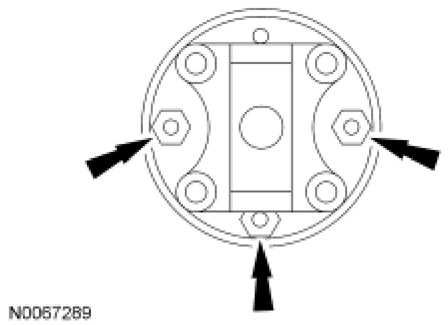

Fig. 10: Identifying Weight Combination
Courtesy of FORD MOTOR CO.

Vehicles without tapped pinion flanges

8. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with a test weight. Using a metal band, secure the test weight to the end of the driveshaft. The weight should be placed at the end of the driveshaft tube, as close to the tube-to-yoke weld seam as possible. Mark the location of the test weight on the driveshaft, as shown in the figure below.
   1. Test weight.
   2. Tube-to-yoke weld seam.
   3. Driveshaft pinion flange.
   4. Select the test weight based on driveshaft size. Larger driveshafts use 10 g (0.353 oz.). Smaller driveshafts use 5 g (0.176 oz.).

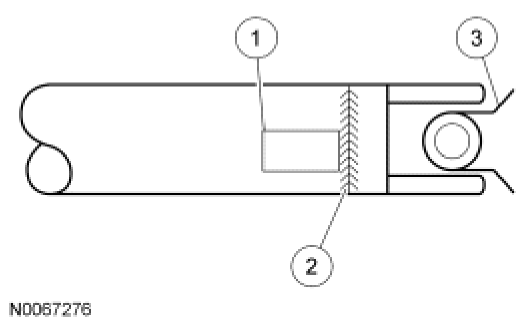

Fig. 11: Test Weight, Tube-To-Yoke Weld Seam, And Driveshaft Pinion Flange
Courtesy of FORD MOTOR CO.

9. Remove the test weight, then install the recommended weight at the position directed by the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix). Using a metal band and epoxy, secure the test weight to the driveshaft, as shown in the figure below.
   1. Test weight.
   2. Measure in this direction.
   3. Driveshaft diameter.
   4. Directional rotation.

5. Balance weight relative to test weight centerline.
6. The results are displayed with respect to the location to where the test weight was placed.

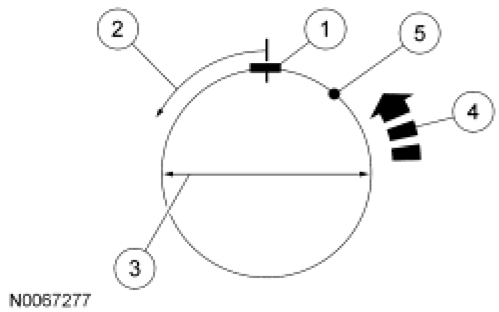

Fig. 12: Identifying Test Weight And Recommended Weight Positions
Courtesy of FORD MOTOR CO.

All vehicles

10. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a third test to verify the repair.

Driveshaft Balancing - Hose Clamp Method

1. Install 1 or 2 hose clamps on the driveshaft, near the rear. Position of the hose clamp head(s) can be determined through trial and error.
2. Mark the rear of the driveshaft into 4 approximately equal sectors and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1, as shown in the figure below. Check for vibration at road speed. Recheck with the clamp at each of the other positions to find the position that shows minimum vibration. If 2 adjacent positions show equal improvement, position the clamp head between them.

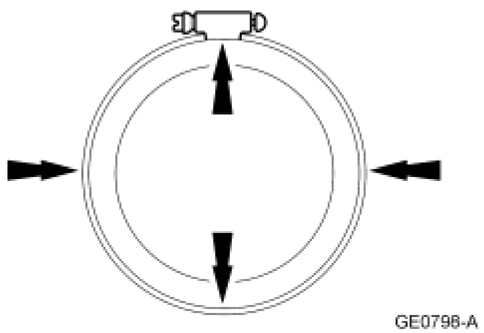

Fig. 13: Marking Rear Driveshaft Into Four Equal Sections
Courtesy of FORD MOTOR CO.

3. If the vibration persists, add a second clamp at the same position and recheck for vibration.

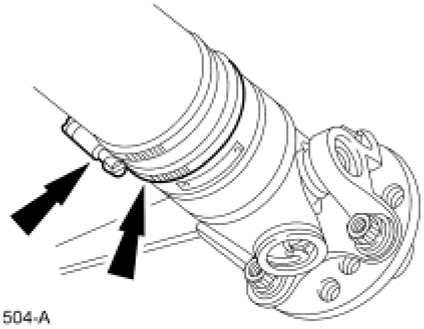

Fig. 14: Adding Second Clamp To Driveshaft
Courtesy of FORD MOTOR CO.

4. If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 2. Separate the clamp heads about 13 mm (1/2 in) and recheck for vibration at the road speed.

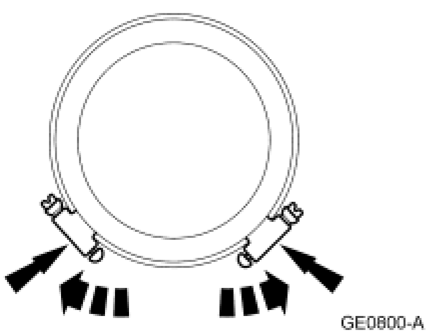

Fig. 15: Rotating Clamps In Opposite Directions
Courtesy of FORD MOTOR CO.

5. Repeat the process with increasing separation until the best combination is found or the vibration is reduced to an acceptable level.

DRIVESHAFT INDEXING

NOTE: **If indexing the driveshaft does not eliminate the vibration, balance the driveshaft. For additional information, refer to Driveshaft Runout and Balancing.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

   NOTE: **Do not reuse constant velocity (CV) joint bolts or flange bolts. Install new bolts or damage to the vehicle may occur.**

2. Remove and discard the driveshaft-to-transfer case bolts.

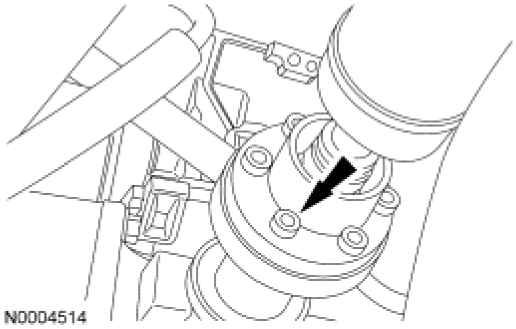

Fig. 16: Identifying Driveshaft Flange Bolts
Courtesy of FORD MOTOR CO.

3. Using a suitable pry bar as shown in illustration, separate the driveshaft from the Power Transfer Unit (PTU) flange.

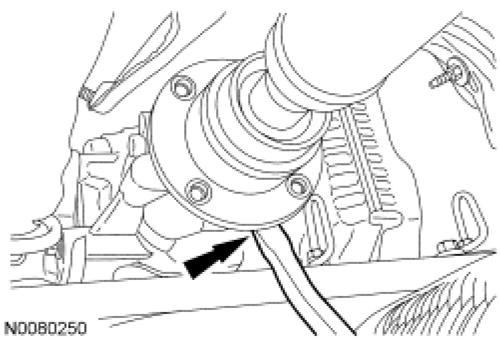

Fig. 17: Separating Driveshaft Flange From PTU Flange Using A Suitable Pry Bar
Courtesy of FORD MOTOR CO.

NOTE: Index-mark the shaft for reference.

4. Rotate the flange 90 degrees clockwise.

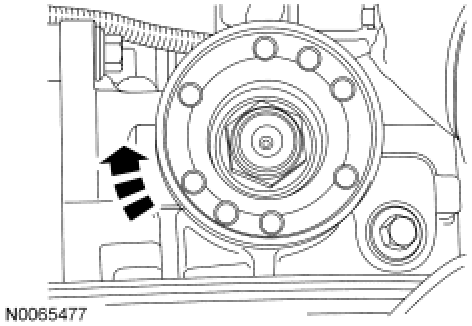

Fig. 18: Rotating Flange 90 Degrees Clockwise
Courtesy of FORD MOTOR CO.

5. Connect the front driveshaft and install the new bolts. For additional information, refer to

DRIVESHAFT article.

NOTE: **Do not reuse the bolts for the pinion yoke. Install new bolts or damage to the vehicle may occur.**

6. Disconnect the rear driveshaft U-joint flange.
   - Discard the bolts.

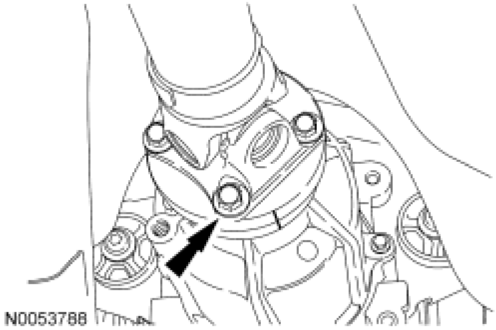

Fig. 19: Locating Rear Driveshaft Universal Joint Flange Bolts
Courtesy of FORD MOTOR CO.

7. Rotate the rear pinion 90 degrees clockwise.

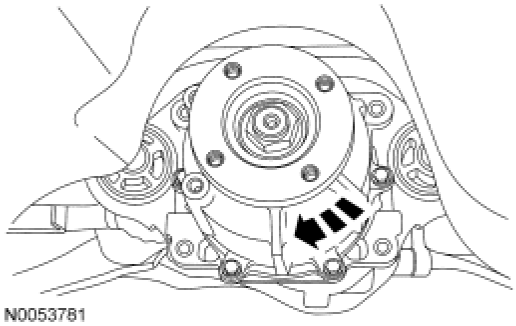

Fig. 20: Rotating Rear Pinion 90 Degrees Clockwise
Courtesy of FORD MOTOR CO.

8. Connect the rear driveshaft and install the new bolts. For additional information, refer to **DRIVESHAFT** article.
9. Test drive the vehicle.
10. Repeat the procedure if necessary.

2008 DRIVELINE/AXLES

Driveshaft - Edge & MKX

SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Driveshaft runout	1.1 mm (0.043 in)

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Center bearing support nuts	40	30
Front driveshaft-to-transfer case bolts	70	52
Rear driveshaft-to-pinion flange bolts	70	52

DESCRIPTION AND OPERATION

DRIVESHAFT

NOTE: All driveshaft assemblies are balanced. If undercoating the vehicle, protect the driveshaft to prevent overspray of any undercoating material.

The driveshaft assembly consists of the following:

- Rubber isolated center support bearings
- Constant velocity (CV) joint at the power transfer unit (PTU)
- U-joints at the center supports and pinion flange
- Assembly balanced with traditional balance weights
- Lubed-for-life joints requiring no periodic lubrication

The driveshaft transfers torque from the PTU to the rear axle. It is attached to the PTU flange with a CV joint. The 3-piece shaft is connected by a staked U-joint at each center bearing and attached to the rear pinion flange. The driveshaft joints allow the smooth continuous rotation of the driveshaft through the allowable angle planes and length variations required in normal vehicle operation. The driveshaft is always turning at front wheel speed. The driveshaft is not serviceable. A new driveshaft must be installed if worn or damaged.

UNIVERSAL JOINTS

The U-joints consist of the following:

- A single spider (cross)
- Lubed-for-life design and require no periodic lubrication

- Nylon thrust washers, located at each base of the bearing cup, which control end play, position the needle bearing and improve grease movement
- Grease seals located at the opening of each bearing cup to retain the grease for the bearing lubrication
- Bearing cups that retain the needle bearings and locate the spider on the centerline of the shaft bore to control shaft runout and balance

The U-joints are staked in place and are not serviced individually. If worn or damaged, install a new driveshaft assembly.

The 3 U-joints in this driveshaft assembly allow the driveshaft tubes to rotate smoothly through the varying angles of the power transfer unit (PTU), the center support bearings and the rear drive unit (RDU). The angles that cause the U-joints to accelerate and decelerate may cause vibration in the driveshaft assembly if the angles are either too great or too small. Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

DIAGNOSTIC TESTS

DRIVESHAFT

Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

DRIVESHAFT

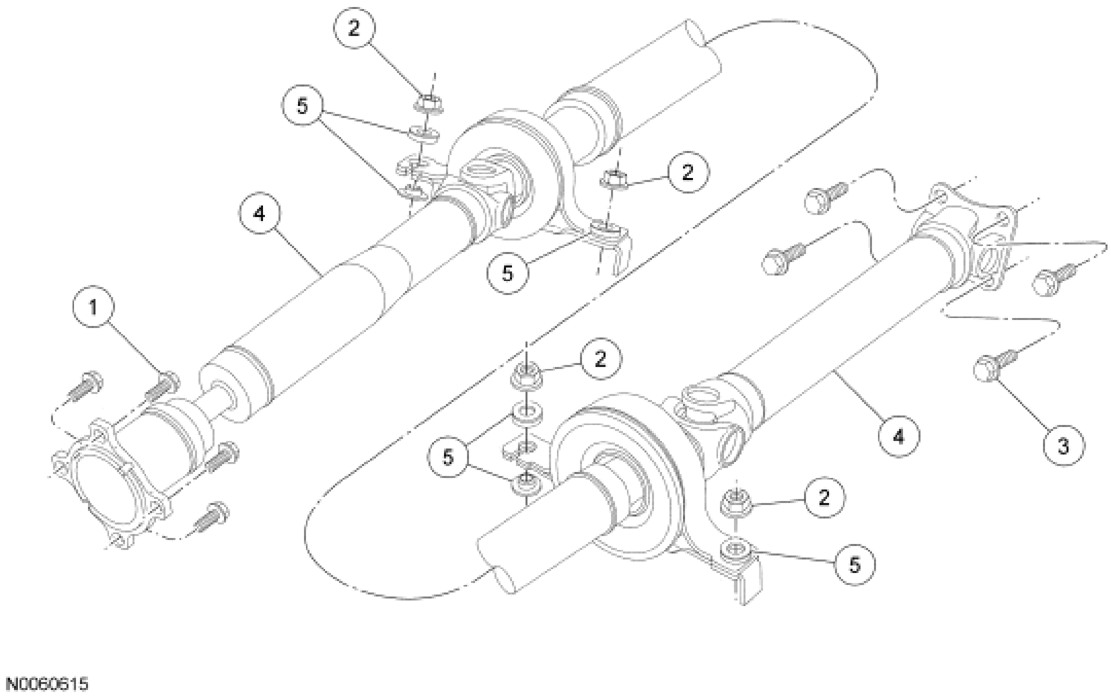

Fig. 1: View Of Driveshaft

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W711918	Front driveshaft-to-transfer case bolt (4 required)
2	W520113	Center bearing support nuts (4 required)
3	W711918	Universal flange-to-pinion flange bolt (4 required)
4	4K357	Driveshafts
5	4A169	Isolators (8 required)

REMOVAL AND INSTALLATION

NOTE: Index-mark both driveshaft flanges.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

CAUTION: Do not reuse the constant velocity (CV) joint bolts. Install new bolts or damage to the vehicle may occur.

2. Remove and discard the 4 front driveshaft-to-transfer case bolts.
   - To install, tighten to 70 Nm (52 lb-ft).

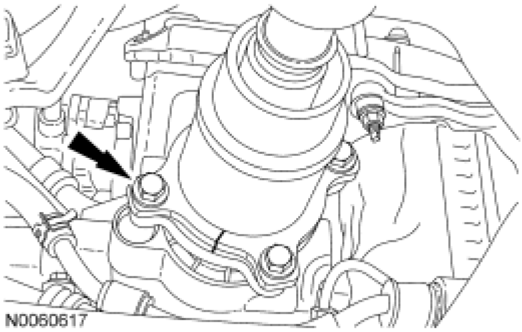

Fig. 2: Locating Front Driveshaft-To-Transfer Case Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Do not reuse the bolts for the rear U-joint flange or damage to the component may occur. Install new bolts.

3. Remove and discard the 4 U-joint flange bolts.
   - To install, tighten to 70 Nm (52 lb-ft).

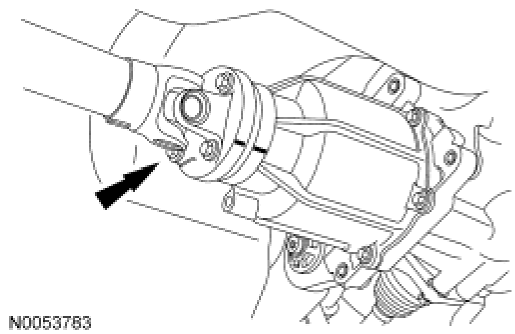

Fig. 3: Locating U-Joint Flange Bolts
Courtesy of FORD MOTOR CO.

4. With the help of an assistant, remove the 4 center bearing support nuts and the driveshaft.
   - To install, tighten to 40 Nm (30 lb-ft).

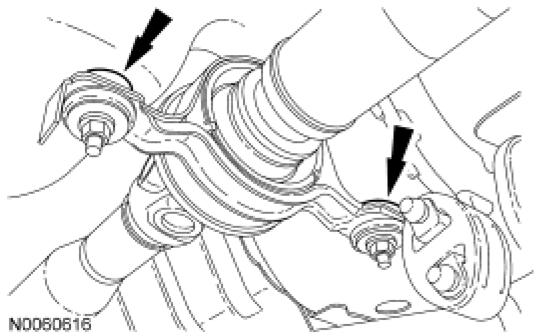

Fig. 4: Locating Center Bearing Support Nuts & Driveshaft
Courtesy of FORD MOTOR CO.

NOTE: **If a driveshaft is installed and driveshaft vibration is encountered after installation, index the driveshaft. For additional information, refer to DRIVELINE SYSTEM - GENERAL INFORMATION article.**

5. To install, reverse the removal procedure.

Fuel Pump Module	In fuel tank. See **Fig. 15**.
Heated Seat Module (Left Rear)	Under left rear seat. See **Fig. 21**.
Heated Seat Module (Passenger Side - Front)	Under front passenger's seat. See **Fig. 20**.
Manual Climate Control Module	Behind center of dash. See **Fig. 10**.
Memory Module	Under driver's seat. See **Fig. 19**.
Occupant Classification Sensor (OCS) Module	Under front passenger's seat. See **Fig. 20**.
Parking Aid Module (PAM)	Behind left rear quarterpanel. See **Fig. 15**.
Passenger Air Bag Module	Behind right side of dash. See **Fig. 10**.
Power Liftgate Module	In left "D" pillar. See **Fig. 15**.
Powertrain Control Module (PCM) (Edge)	Right front of engine. See **Fig. 3**.
Powertrain Control Module (PCM) (MKX)	Right front of engine. See **Fig. 5**.
Restraints Control Module	Under center console. See **Fig. 10**.
Side Air Bag Module (Left Front)	In left "B" pillar. See **Fig. 13**.
Side Air Bag Module (Right Front)	In right "B" pillar. See **Fig. 14**.
Side Air Curtain Module (Driver)	In left "D" pillar. See **Fig. 15**.
Side Air Curtain Module (Passenger)	In right "D" pillar. See **Fig. 16**.
Smart Wiper Module (Edge)	Left rear of engine compartment. See **Fig. 4**.
Smart Wiper Module (MKX)	Left rear of engine compartment. See **Fig. 6**.
Steering Angle Sensor Module (SASM)	On steering column. See **Fig. 31**.

MOTORS

MOTORS LOCATION

Component	Location

Blower Motor	Behind right side of dash. See **Fig. 9**.
Door Lock Actuator (Left Front)	Rear of driver's door. See **Fig. 22**.
Door Lock Actuator (Left Rear)	Rear of left rear door. See **Fig. 24**.
Door Lock Actuator (Right Front)	Rear of front passenger's door. See **Fig. 23**.
Door Lock Actuator (Right Rear)	Rear of right rear door. See **Fig. 25**.
Driver Seat Backrest Motor	Under driver's seat. See **Fig. 19**.
Driver Seat Front Height Motor	Under driver's seat. See **Fig. 19**.
Driver Seat Horizontal Motor	Under driver's seat. See **Fig. 19**.
Driver Seat Rear Height Motor	Under driver's seat. See **Fig. 19**.
Electronic Throttle Control (ETC) Motor	On throttle body. See **Fig. 8**.
Exterior Rear View Mirror (LH Side)	In driver's door. See **Fig. 22**.
Exterior Rear View Mirror (RH Side)	In front passenger's door. See **Fig. 23**.
Fresh/Recirculation Door Actuator	Middle of HVAC unit. See **Fig. 30**.
Liftgate Drive Unit	In left "D" pillar. See **Fig. 15**.
Lumbar Motor (Driver Seat)	Under driver's seat. See **Fig. 19**.
Lumbar Motor (Passenger Seat)	Under front passenger's seat. See **Fig. 20**.
Mode Door Actuator	Left side of HVAC unit. See **Fig. 30**.
Passenger Backrest Motor	Under front passenger's seat. See **Fig. 20**.
Passenger Seat Front Height Motor	Under front passenger's seat. See **Fig. 20**.
Passenger Seat Horizontal Motor	Under front passenger's seat. See **Fig. 20**.
Passenger Seat Rear Height Motor	Under front passenger's seat. See **Fig. 20**.
Power Window Motor (Driver Side Front)	Middle of driver's door. See **Fig. 22**.
Power Window Motor (Left Rear)	Middle of left rear door. See **Fig. 24**.
Power Window Motor (Passenger Side Front)	Middle of front passenger's door. See **Fig. 23**.
Power Window Motor (Right Rear)	Middle of right rear door. See **Fig. 25**.
Rear Window Wiper Motor (Edge)	In liftgate. See **Fig. 26**.
Rear Window Wiper Motor (MKX)	In liftgate. See **Fig. 27**.
Seat Release Actuator (Left Rear)	Under left rear seat. See **Fig. 15**.
Seat Release Actuator (Right Rear)	Under right rear seat. See **Fig. 16**.
Starter Motor (Edge)	Left rear of engine. See **Fig. 4**.
Starter Motor (MKX)	Left rear of engine. See **Fig. 6**.
Temperature Blend Door Actuator	Middle front of HVAC unit. See **Fig. 30**.
Temperature Blend Door Actuator (Driver)	Left side of HVAC unit. See **Fig. 30**.
Windshield Washer Pump Motor (Edge)	On washer fluid reservoir. See **Fig. 4**.
Windshield Washer Pump Motor (MKX)	On washer fluid reservoir. See **Fig. 6**.

SENDING UNITS & SENSORS

SENDING UNITS & SENSORS LOCATION

Component	**Location**
Accelerator Pedal Position (APP) Sensor (Edge)	Top of accelerator pedal. See **Fig. 3**.

Accelerator Pedal Position (APP) Sensor (MKX)	Top of accelerator pedal. See **Fig. 5**.
A/C Pressure Transducer Sensor (Edge)	Right front of engine compartment. See **Fig. 3**.
A/C Pressure Transducer Sensor (MKX)	Right front of engine compartment. See **Fig. 5**.
Camshaft Position Sensor 1	Rear of right cylinder bank. See **Fig. 7**.
Camshaft Position Sensor 2	Rear of left cylinder bank. See **Fig. 7**.
Crankshaft Position Sensor	Lower left rear of engine. See **Fig. 7**.
Crash Sensor (Left Rear)	Behind left rear quarterpanel. See **Fig. 15**.
Cylinder Head Temperature Sensor	Front of right cylinder bank. See **Fig. 8**.
Evaporator Discharge Air Temperature Sensor	Left side of HVAC unit. See **Fig. 30**.
Front Impact Sensor (Left) (Edge)	Left front of engine compartment. See **Fig. 3**.
Front Impact Sensor (Left) (MKX)	Left front of engine compartment. See **Fig. 5**.
Front Impact Sensor (Right) (Edge)	Right front of engine compartment. See **Fig. 3**.
Front Impact Sensor (Right) (MKX)	Right front of engine compartment. See **Fig. 5**.
Fuel Level Sensor	Top of fuel tank. See **Fig. 15**.
Fuel Tank Pressure Sensor	In fuel tank. See **Fig. 15**.
Heated Oxygen Sensor (HO2S) #11	Right rear side of engine. See **Fig. 8**.
Heated Oxygen Sensor (HO2S) #12	Right front side of engine. See **Fig. 8**.
Heated Oxygen Sensor (HO2S) #21	Left side of engine. See **Fig. 7**.
Heated Oxygen Sensor (HO2S) #22	Left rear side of engine. See **Fig. 7**.
In-Vehicle Temperature Sensor	Behind left side of dash. See **Fig. 10**.
Keyless Entry Keypad	Rear of driver's door. See **Fig. 22**.
Knock Sensor	Left rear of engine. See **Fig. 7**.
Liftgate Obstacle Detection Strip (Left)	Left side of liftgate. See **Fig. 27**.
Liftgate Obstacle Detection Strip (Right)	Right side of liftgate. See **Fig. 27**.
Light Sensor	Under top center of dash. See **Fig. 9**.
Mass Air Flow/Intake Air Temperature (MAF/IAT) Sensor (Edge)	On intake air duct. See **Fig. 4**.
Mass Air Flow/Intake Air Temperature (MAF/IAT) Sensor (MKX)	On intake air duct. See **Fig. 6**.
Occupant Classification Sensor (OCS) 1	Under right side of front passenger's seat. See **Fig. 20**.
Occupant Classification Sensor (OCS) 2	Under right side of front passenger's seat. See **Fig. 20**.
Occupant Classification Sensor (OCS) 3	Under left side of front passenger's seat. See **Fig. 20**.
Occupant Classification Sensor (OCS) 4	Under left side of front passenger's seat. See **Fig. 20**.
Outside Temperature Sensor (Edge)	Right front of engine compartment. See **Fig. 3**.
Outside Temperature Sensor (MKX)	Right front of engine compartment. See **Fig. 5**.
Parking Aid Sensor (Inner Left) (Edge)	Behind left side of rear bumper. See **Fig. 17**.
Parking Aid Sensor (Inner Left) (MKX)	Behind left side of rear bumper. See **Fig. 18**.

Parking Aid Sensor (Inner Right) (Edge)	Behind right side of rear bumper. See **Fig. 17**.
Parking Aid Sensor (Inner Right) (MKX)	Behind right side of rear bumper. See **Fig. 18**.
Parking Aid Sensor (Outer Left) (Edge)	Behind left end of rear bumper. See **Fig. 17**.
Parking Aid Sensor (Outer Left) (MKX)	Behind left end of rear bumper. See **Fig. 18**.
Parking Aid Sensor (Outer Right) (Edge)	Behind right end of rear bumper. See **Fig. 17**.
Parking Aid Sensor (Outer Right) (MKX)	Behind right end of rear bumper. See **Fig. 18**.
Passive Anti-Theft Transceiver	Behind left side of dash. See **Fig. 10**.
Seat Track Position Sensor (Left Front)	Under driver's seat. See **Fig. 19**.
Side Impact Sensor (Driver 1)	In left "B" pillar. See **Fig. 13**.
Side Impact Sensor (Passenger 1)	Base of right "B" pillar. See **Fig. 14**.
Side Impact Sensor (Right Rear)	Behind right rear quarterpanel. See **Fig. 16**.
Stability Control Sensor Cluster	Under right rear seat. See **Fig. 16**.
Steering Wheel Angle Sensor	On steering column. See **Fig. 10**.
Wheel Speed Sensor (Left Front) (Edge)	On left front wheel hub. See **Fig. 4**.
Wheel Speed Sensor (Left Front) (MKX)	On left front wheel hub. See **Fig. 6**.
Wheel Speed Sensor (Left Rear)	On left rear wheel hub. See **Fig. 16**.
Wheel Speed Sensor (Right Front) (Edge)	On right front wheel hub. See **Fig. 4**.
Wheel Speed Sensor (Right Front) (MKX)	On right front wheel hub. See **Fig. 6**.
Wheel Speed Sensor (Right Rear)	On right rear wheel hub. See **Fig. 16**.

SOLENOIDS & SOLENOID VALVES

SOLENOIDS & SOLENOID VALVES LOCATION

Component	Location
A/C Clutch Field Coil (Edge)	On A/C compressor. See **Fig. 4**.
A/C Clutch Field Coil (MKX)	On A/C compressor. See **Fig. 6**.
EVAP Canister Purge Valve (Edge)	Right rear of engine. See **Fig. 3**.
EVAP Canister Purge Valve (MKX)	Right rear of engine. See **Fig. 5**.
EVAP Canister Vent Control Solenoid	Under left side of vehicle. See **Fig. 13**.
Fuel Injector 1	Top right side of engine. See **Fig. 8**.
Fuel Injector 2	Top right side of engine. See **Fig. 8**.
Fuel Injector 3	Top right side of engine. See **Fig. 8**.
Fuel Injector 4	Top left side of engine. See **Fig. 7**.
Fuel Injector 5	Top left side of engine. See **Fig. 7**.
Fuel Injector 6	Top left side of engine. See **Fig. 7**.
Heated Positive Crankcase Ventilation (PCV) Valve	Top left side of engine. See **Fig. 8**.
Intelligent Torque Control Coupling (ITCC) Solenoid	Under right rear of vehicle. See **Fig. 16**.
Positive Crankcase Ventilation (PCV) Heated Fitting	Top right rear of engine. See **Fig. 8**.
Variable Camshaft Timing (VCT) Valve 1	Top front of right cylinder bank. See **Fig. 8**.

Variable Camshaft Timing (VCT) Valve 2	Top front of left cylinder bank. See **Fig. 7**.

SWITCHES

SWITCHES LOCATION

Component	Location
Anti-Theft Hood Switch	Right front of engine compartment. See **Fig. 5**.
Brake Fluid Level Switch (Edge)	On master cylinder reservoir. See **Fig. 4**.
Brake Fluid Level Switch (MKX)	On master cylinder reservoir. See **Fig. 6**.
Brake Pedal Position (BPP) Switch (Edge)	On brake pedal support bracket. See **Fig. 4**.
Brake Pedal Position (BPP) Switch (MKX)	On brake pedal support bracket. See **Fig. 6**.
Ignition Switch	On steering column. See **Fig. 31**.
Inertia Fuel Shutoff (IFS) Switch	In left "D" pillar. See **Fig. 15**.
Liftgate Ajar Switch (Edge)	Lower right side of liftgate. See **Fig. 26**.
Liftgate Ajar Switch (MKX)	Lower right side of liftgate. See **Fig. 27**.
Multifunction Switch	Top of steering column. See **Fig. 31**.
Oil Pressure Switch	Lower left side of engine. See **Fig. 7**.
Parking Brake Switch	Top of parking brake lever bracket. See **Fig. 13**.
Power Steering Pressure Switch (Edge)	Right front of engine. See **Fig. 4**.
Power Steering Pressure Switch (MKX)	Right front of engine. See **Fig. 6**.
Safety Belt Buckle Switch (Driver)	Integral to driver's seat belt buckle. See **Fig. 19**.
Safety Belt Buckle Switch (Passenger Side)	Integral to front passenger's seat belt buckle. See **Fig. 20**.
Washer Fluid Level Switch (Edge)	On washer fluid reservoir. See **Fig. 3**.
Washer Fluid Level Switch (MKX)	On washer fluid reservoir. See **Fig. 5**.

MISCELLANEOUS

MISCELLANEOUS LOCATION

Component	Location
ABS Test Connector (C126) (Edge)	Left side of engine compartment. See **Fig. 4**.
ABS Test Connector (C126) (MKX)	Left side of engine compartment. See **Fig. 6**.
A/C Compressor Clutch Diode	In battery junction box (BJB). See **Fig. 1**.
A/C Compressor Clutch Diode	In battery junction box (BJB). See **Fig. 1**.
Battery (Edge)	Left side of engine compartment. See **Fig. 3**.
Battery (MKX)	Left side of engine compartment. See **Fig. 5**.
Blower Motor Resistor	Behind right side of dash. See **Fig. 9**.
Clockspring	On steering column. See **Fig. 31**.
Coil On Plug (COP) 1	Top right side of engine. See **Fig. 8**.
Coil On Plug (COP) 2	Top right side of engine. See **Fig. 8**.
Coil On Plug (COP) 3	Top right side of engine. See **Fig. 8**.

Coil On Plug (COP) 4	Top left side of engine. See **Fig. 7**.
Coil On Plug (COP) 5	Top left side of engine. See **Fig. 7**.
Coil On Plug (COP) 6	Top left side of engine. See **Fig. 7**.
Data Link Connector (DLC)	Under left side of dash. See **Fig. 10**.
Fusible Link A (Edge)	Left side of engine compartment. See **Fig. 4**.
Fusible Link A (MKX)	Left side of engine compartment. See **Fig. 6**.
Generator (Edge)	Left front of engine. See **Fig. 4**.
Generator (MKX)	Left front of engine. See **Fig. 6**.
Horn (Edge)	Right front corner of engine compartment. See **Fig. 4**.
Horn (MKX)	Right front corner of engine compartment. See **Fig. 6**.
Ignition Transformer Capacitor 1	Right rear of engine. See **Fig. 8**.
Ignition Transformer Capacitor 2	Top left rear of engine. See **Fig. 7**.
Joint Connector 1 (Edge)	Left rear of luggage compartment. See **Fig. 17**.
Joint Connector 1 (MKX)	Left side of luggage compartment. See **Fig. 18**.
Joint Connector 2 (Edge)	Left rear of luggage compartment. See **Fig. 17**.
Joint Connector 2 (MKX)	Left side of luggage compartment. See **Fig. 18**.
Joint Connector 3	Behind right kick panel. See **Fig. 14**.
Joint Connector 4	Behind center of dash. See **Fig. 9**.
Joint Connector 5	Behind left side of dash. See **Fig. 9**.
Joint Connector 6	Behind left side of dash. See **Fig. 9**.
Joint Connector 7 (Edge)	Left rear of engine compartment. See **Fig. 3**.
Joint Connector 7 (MKX)	Left rear of engine compartment. See **Fig. 5**.
Joint Connector 8	In left "D" pillar. See **Fig. 15**.
Joint Connector 9	Behind right rear quarterpanel. See **Fig. 16**.
Safety Belt Buckle Pretensioner (Driver)	Base of seat belt buckle assembly. See **Fig. 20**.
Safety Belt Buckle Pretensioner (Passenger)	Base of seat belt buckle assembly. See **Fig. 20**.
Satellite Radio Receiver	Left rear of cargo area. See **Fig. 15**.
Seat Heater Element (Left Front)	In driver's seat cushion. See **Fig. 19**.
Seat Heater Element (Left Rear)	Under left rear seat. See **Fig. 21**.
Seat Heater Element (Right Front)	In front passenger's seat cushion. See **Fig. 20**.
THX Amplifier	Behind right rear quarterpanel. See **Fig. 16**.
Trailer Tow Connector (Edge)	Under center of rear bumper. See **Fig. 17**.
Trailer Tow Connector (MKX)	Under center of rear bumper. See **Fig. 18**.

CONNECTORS

CONNECTORS LOCATION

Component	Location
C110 (Edge) (8 Pin)	Left side of engine compartment. See **Fig. 4**.

C110 (MKX) (8 Pin)	Left side of engine compartment. See **Fig. 6**.
C134 (Edge) (20 Pin)	Left front of engine compartment. See **Fig. 4**.
C134 (MKX) (20 Pin)	Left front of engine compartment. See **Fig. 5**.
C139 (70 Pin)	Top left side of engine. See **Fig. 7**.
C140 (16 Pin)	Top left side of engine. See **Fig. 7**.
C192 (2 Pin)	Top front of engine. See **Fig. 8**.
C210 (16 Pin)	Base of left "A" pillar. See **Fig. 13**.
C211 (20 Pin)	Base of left "A" pillar. See **Fig. 13**.
C212 (Edge) (57 Pin)	Left rear of engine compartment. See **Fig. 3**.
C212 (MKX) (57 Pin)	Left rear of engine compartment. See **Fig. 5**.
C213 (57 Pin)	Behind left side of dash. See **Fig. 9**.
C214 (20 Pin)	Behind right kick panel. See **Fig. 14**.
C215 (30 Pin)	Behind left side of dash. See **Fig. 9**.
C260 (4 Pin)	Behind right side of dash. See **Fig. 9**.
C263 (6 Pin)	Behind right side of dash. See **Fig. 9**.
C264 (16 Pin)	Behind right side of dash. See **Fig. 9**.
C265 (16 Pin)	Behind right side of dash. See **Fig. 9**.
C300 (20 Pin)	Under left rear seat. See **Fig. 21**.
C311 (57 Pin)	Under driver's seat. See **Fig. 13**.
C312 (12 Pin)	Under driver's seat. See **Fig. 13**.
C313 (10 Pin)	Under center floor console. See **Fig. 14**.
C313 (10 Pin)	Under front of center floor console. See **Fig. 12**.
C314 (12 Pin)	Under front passenger's seat. See **Fig. 14**.
C315 (14 Pin)	Under front passenger's seat. See **Fig. 20**.
C316 (30 Pin)	Under front passenger's seat. See **Fig. 20**.
C316 (30 Pin)	Under front passenger's seat. See **Fig. 14**.
C327 (2 Pin)	Under front passenger's seat. See **Fig. 14**.
C328 (2 Pin)	Under driver's seat. See **Fig. 13**.
C405 (16 Pin)	Under left rear of vehicle. See **Fig. 15**.
C406 (edge) (16 Pin)	Behind center of rear bumper. See **Fig. 17**.
C406 (16 Pin)	Behind center of rear bumper. See **Fig. 18**.
C510 (54 Pin)	Behind left kick panel. See **Fig. 13**.
C610 (54 Pin)	Behind right kick panel. See **Fig. 14**.
C700 (14 Pin)	In left "B" pillar. See **Fig. 13**.
C800 (14 Pin)	In right "B" pillar. See **Fig. 14**.
C913 (Edge) (2 Pin)	Top of liftgate. See **Fig. 26**.
C913 (MKX) (2 Pin)	Top of liftgate. See **Fig. 27**.
C919 (8 Pin)	Top of left "D" pillar. See **Fig. 15**.
C922 (8 Pin)	Top of left "D" pillar. See **Fig. 15**.
C925 (4 Pin)	Top of left "D" pillar. See **Fig. 15**.
C934 (6 Pin)	Top of left "D" pillar. See **Fig. 15**.

GROUNDS

GROUNDS LOCATION

Component	Location
G100 (Edge)	Left side of engine compartment. See **Fig. 4**.
G100 (MKX)	Left side of engine compartment. See **Fig. 6**.
G101 (Edge)	Right rear of engine. See **Fig. 4**.
G101 (MKX)	Right rear of engine. See **Fig. 6**.
G102 (Edge)	Left side of engine compartment. See **Fig. 3**.
G102 (MKX)	Left side of engine compartment. See **Fig. 5**.
G103 (Edge)	Left side of engine compartment. See **Fig. 3**.
G103 (MKX)	Left side of engine compartment. See **Fig. 5**.
G104 (Edge)	Left front of engine compartment. See **Fig. 4**.
G104 (MKX)	Left front of engine compartment. See **Fig. 6**.
G105 (Edge)	Left front of engine compartment. See **Fig. 4**.
G105 (MKX)	Left front of engine compartment. See **Fig. 6**.
G106 (Edge)	Right front of engine compartment. See **Fig. 3**.
G106 (MKX)	Right front of engine compartment. See **Fig. 5**.
G107 (Edge)	Right front of engine compartment. See **Fig. 3**.
G107 (MKX)	Right front of engine compartment. See **Fig. 5**.
G108 (Edge)	Right rear of engine compartment. See **Fig. 3**.
G108 (MKX)	Right rear of engine compartment. See **Fig. 5**.
G109 (Edge)	Front of engine. See **Fig. 3**.
G109 (MKX)	Front of engine. See **Fig. 5**.
G110 (Edge)	Right front of engine. See **Fig. 4**.
G110 (MKX)	Right front of engine. See **Fig. 6**.
G111 (Edge)	Right rear of engine compartment. See **Fig. 4**.
G111 (MKX)	Right rear of engine compartment. See **Fig. 6**.
G200	Behind left kick panel. See **Fig. 13**.
G201	Behind left kick panel. See **Fig. 13**.
G202	Behind right kick panel. See **Fig. 14**.
G203	Behind right side of dash. See **Fig. 9**.
G204	Behind left side of dash. See **Fig. 9**.
G205	Behind left side of dash. See **Fig. 9**.
G206	Behind left side of dash. See **Fig. 9**.
G207	In steering wheel. See **Fig. 11**.
G300	Behind left rear seat. See **Fig. 15**.
G301	In left "B" pillar. See **Fig. 13**.
G302	In right "B" pillar. See **Fig. 14**.
G400	In left "D" pillar. See **Fig. 15**.
G401	In left "D" pillar. See **Fig. 15**.

G402	Behind right rear quarterpanel. See **Fig. 16**.
G403	Behind right rear quarterpanel. See **Fig. 16**.
G404	In right "D" pillar. See **Fig. 16**.

SPLICES

SPLICES LOCATION

Component	Location
S100 (Edge)	In dash panel wiring harness to headlight junction, near breakout to C110. See **Fig. 4**.
S100 (MKX)	In dash panel wiring harness to headlight junction, near breakout to C110. See **Fig. 6**.
S101 (Edge)	In dash panel wiring harness to headlight junction, near breakout to C110. See **Fig. 4**.
S101 (MKX)	In dash panel wiring harness to headlight junction, near breakout to C110. See **Fig. 6**.
S102 (Edge)	In battery wiring harness, near breakout to battery. See **Fig. 4**.
S102 (MKX)	In battery wiring harness, near breakout to battery. See **Fig. 6**.
S103 (Edge)	In battery wiring harness, near breakout to starter motor. See **Fig. 4**.
S103 (MKX)	In battery wiring harness, near breakout to starter motor. See **Fig. 6**.
S104 (Edge)	In dash panel wiring harness to headlight junction, near breakout to C110. See **Fig. 4**.
S104 (MKX)	In dash panel wiring harness to headlight junction, near breakout to C110. See **Fig. 6**.
S105 (Edge)	In dash panel wiring harness to headlight junction, near breakout to battery junction box. See **Fig. 4**.
S105 (MKX)	In dash panel wiring harness to headlight junction, near breakout to battery junction box. See **Fig. 6**.
S106 (Edge)	In dash panel wiring harness to headlight junction, near breakout to battery junction box. See **Fig. 4**.
S106 (MKX)	In dash panel wiring harness to headlight junction, near breakout to battery junction box. See **Fig. 6**.
S107	In dash panel wiring harness to headlight junction, near breakout to battery junction box. See **Fig. 6**.
S108	In dash panel wiring harness to headlight junction, near breakout to ABS test connector. See **Fig. 6**.
S109 (Edge)	In dash panel wiring harness to headlight junction, near breakout to ABS test connector. See **Fig. 4**.
S109 (MKX)	In dash panel wiring harness to headlight junction,

	near breakout to ABS test connector. See **Fig. 6**.
S110	In dash panel wiring harness to headlight junction, near breakout to left headlight. See **Fig. 6**.
S111 (Edge)	In dash panel wiring harness to headlight junction, near breakout to C134. See **Fig. 4**.
S111 (MKX)	In dash panel wiring harness to headlight junction, near breakout to C134. See **Fig. 6**.
S112 (Edge)	In dash panel wiring harness to headlight junction, near breakout to cooling fan module. See **Fig. 4**.
S112 (MKX)	In dash panel wiring harness to headlight junction, near breakout to cooling fan module. See **Fig. 6**.
S113 (Edge)	In dash panel wiring harness to headlight junction, near breakout to cooling fan module. See **Fig. 4**.
S113 (MKX)	In dash panel wiring harness to headlight junction, near breakout to cooling fan module. See **Fig. 6**.
S114 (Edge)	In dash panel wiring harness to headlight junction, near breakout to mass air flow/intake air temperature sensor. See **Fig. 4**.
S114 (MKX)	In dash panel wiring harness to headlight junction, near breakout to mass air flow/intake air temperature sensor. See **Fig. 6**.
S115 (Edge)	In dash panel wiring harness to headlight junction, near breakout to mass air flow/intake air temperature sensor. See **Fig. 4**.
S115 (MKX)	In dash panel wiring harness to headlight junction, near breakout to mass air flow/intake air temperature sensor. See **Fig. 6**.
S116 (Edge)	In dash panel wiring harness to headlight junction, near breakout to A/C pressure transducer sensor. See **Fig. 4**.
S116 (MKX)	In dash panel wiring harness to headlight junction, near breakout to A/C pressure transducer sensor. See **Fig. 6**.
S117 (Edge)	In dash panel wiring harness to headlight junction, near breakout to G108. See **Fig. 4**.
S117 (MKX)	In dash panel wiring harness to headlight junction, near breakout to G108. See **Fig. 6**.
S118 (Edge)	In dash panel wiring harness to headlight junction, near breakout to G110. See **Fig. 4**.
S118 (MKX)	In dash panel wiring harness to headlight junction, near breakout to G110. See **Fig. 6**.
S119	In dash panel wiring harness to headlight junction, near breakout to G109. See **Fig. 4**.
S120 (Edge)	In dash panel wiring harness to headlight junction,

	near breakout to G109. See **Fig. 4**.
S120 (MKX)	In dash panel wiring harness to headlight junction, near breakout to G109. See **Fig. 6**.
S121 (Edge)	In dash panel wiring harness to headlight junction, near breakout to powertrain control module. See **Fig. 4**.
S121 (MKX)	In dash panel wiring harness to headlight junction, near breakout to powertrain control module. See **Fig. 6**.
S122 (Edge)	In dash panel wiring harness to headlight junction, near breakout to powertrain control module. See **Fig. 4**.
S122 (MKX)	In dash panel wiring harness to headlight junction, near breakout to powertrain control module. See **Fig. 6**.
S123	In engine control sensor & fuel charge wiring harness, near breakout to coil on plug No. 3. See **Fig. 8**.
S124	In engine control sensor & fuel charge wiring harness, near breakout to ignition transformer capacitor No. 1. See **Fig. 8**.
S125	In engine control sensor & fuel charge wiring harness, near breakout to fuel injector No. 6. See **Fig. 7**.
S126	In engine control sensor & fuel charge wiring harness, near breakout to fuel injector No. 6. See **Fig. 7**.
S127	In engine control sensor & fuel charge wiring harness, near breakout to fuel injector No. 6. See **Fig. 7**.

Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-	-

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Camshaft position (CMP) sensor bolt	10	-	89
Catalyst monitor sensor	48	35	-
Crankshaft position (CKP) sensor bolt	10	-	89
Cylinder head temperature (CHT) sensor	10	-	89
Heat shield bolt and nut	10	-	89
Heated oxygen sensor (HO2S)	48	35	-
Knock sensor (KS) bolt	20	15	-
Mass airflow (MAF) sensor screws	2	-	18
PCM nuts	5	-	44
Variable camshaft timing (VCT) oil control solenoid bolt	10	-	89

DESCRIPTION AND OPERATION

ELECTRONIC ENGINE CONTROLS

The electronic engine controls consist of the:

- PCM.
- cylinder head temperature (CHT) sensor.

- camshaft position (CMP) sensor.
- crankshaft position (CKP) sensor.
- mass air flow (MAF) sensor.
- heated oxygen sensor (HO2S).
- catalyst monitor sensor.
- variable camshaft timing (VCT) oil control solenoid.
- knock sensor (KS).

The PCM carries out the following functions:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The CHT sensor:

- sends the PCM a signal indicating cylinder head temperature.
- resistance decreases as cylinder head temperature increases.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool.

The HO2S:

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The catalyst monitor sensor:

- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The KS:

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The VCT oil control solenoid:

- is an electrically controlled hydraulic valve that directs engine oil to the camshaft phaser. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

DIAGNOSTIC TESTS

ELECTRONIC ENGINE CONTROLS

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

CAMSHAFT POSITION (CMP) SENSOR

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

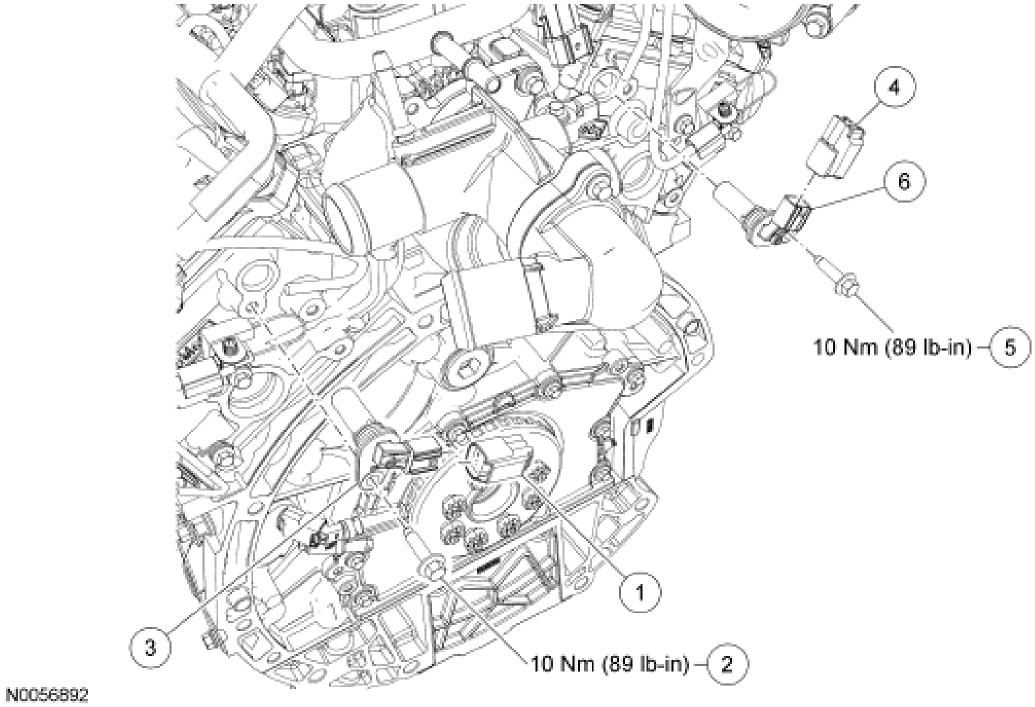

Fig. 1: Exploded View Of Camshaft Position (CMP) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	LH camshaft position sensor (CMP) electrical connector
2	W500214	LH CMP bolt
3	6B288	LH CMP
4	14A464	RH CMP electrical connector
5	W500214	RH CMP bolt
6	6B288	RH CMP

REMOVAL AND INSTALLATION

RH sensor

1. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.

   LH sensor

2. Remove the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.

   Both sensors

3. Disconnect the camshaft position sensor (CMP) electrical connector.
4. Remove the bolt and the CMP sensor.
   - To install, tighten to 10 Nm (89 lb-in).

NOTE: Lubricate the CMP O-ring seal with clean engine oil.

5. To install, reverse the removal procedure.

CRANKSHAFT POSITION (CKP) SENSOR

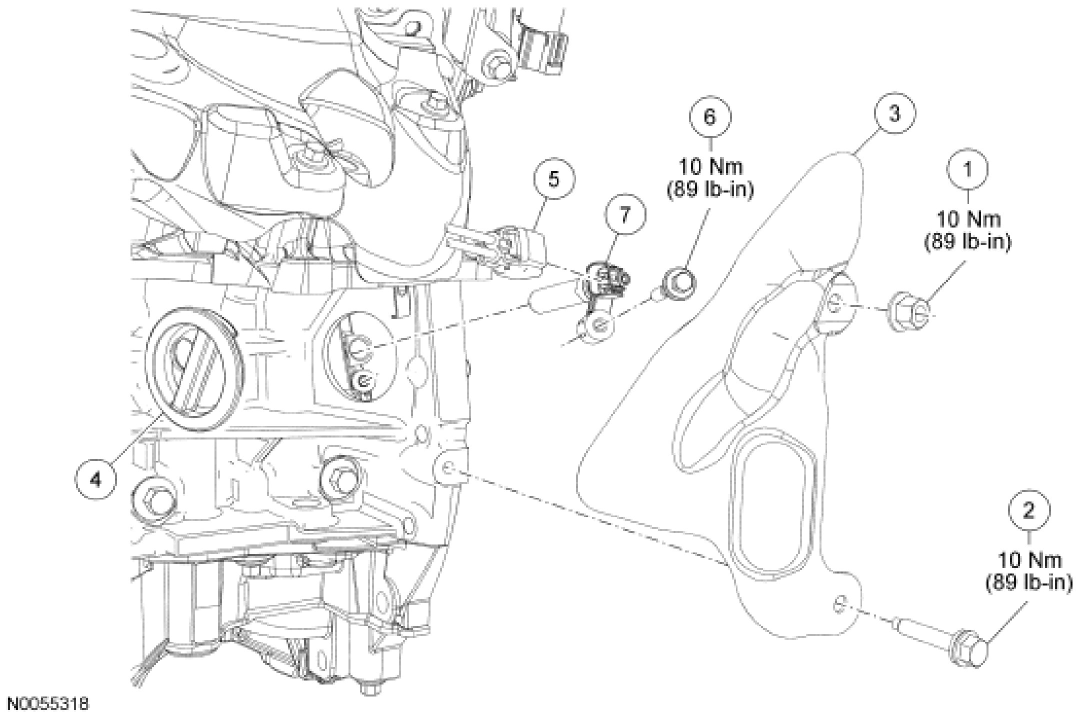

Fig. 2: Exploded View Of Crankshaft Position (CKP) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701542	Heat shield nut
2	W701669	Heat shield bolt
3	6K342	Heat shield
4	6C070	Rubber grommet cover
5	14A464	Crankshaft position (CKP) sensor electrical connector
6	6D327	CKP sensor bolt
7	6C315	CKP sensor

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the LH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
3. Remove the bolt, nut and the heat shield.
   - To install, tighten to 10 Nm (89 lb-in).
4. Remove the rubber grommet cover.
5. Disconnect the crankshaft position (CKP) sensor electrical connector.
6. Remove the bolt and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).
7. To install, reverse the removal procedure.

POWERTRAIN CONTROL MODULE (PCM)

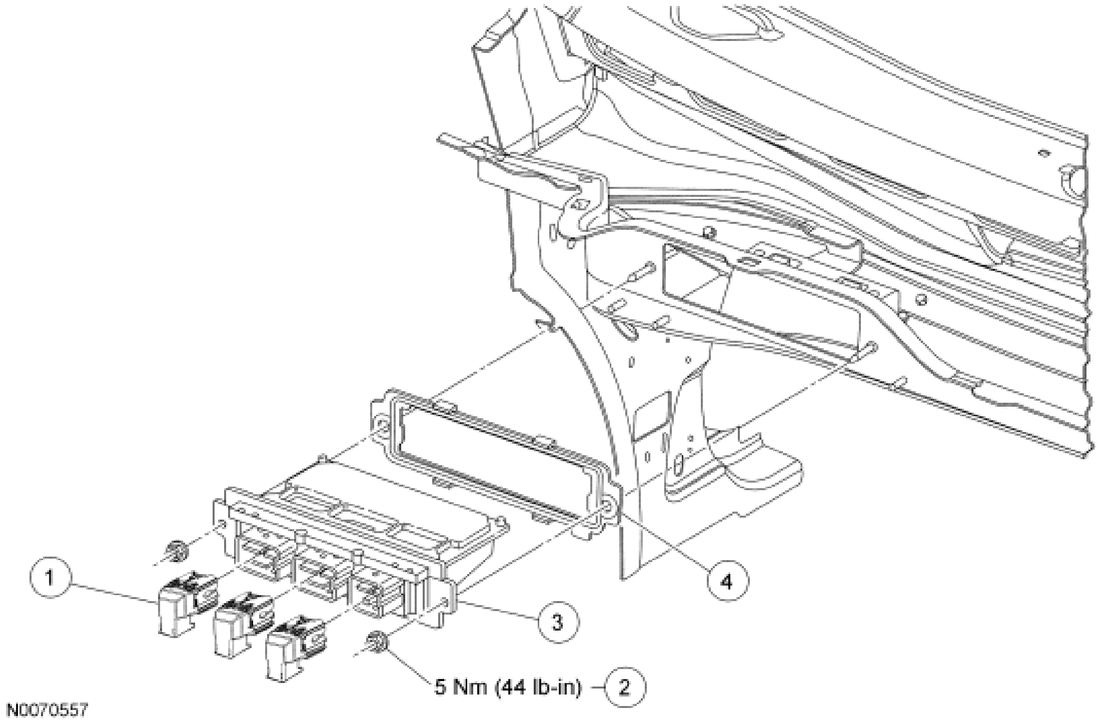

Fig. 3: Exploded View Of Powertrain Control Module (PCM) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	PCM electrical connector (part of 12B637) (3 required)
2	N804795	PCM nut (2 required)
3	12A650	PCM
4	12A696	PCM gasket

REMOVAL

NOTE: PCM replacement DOES NOT require new keys or programming of keys.

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. For additional information, refer to **MODULE CONFIGURATION** article.
2. Disconnect the 3 PCM electrical connectors.
3. Remove the 2 nuts and the PCM.
    - Remove the gasket.

INSTALLATION

1. Install the gasket and the PCM.
2. Install the 2 PCM nuts.
    - Tighten to 5 Nm (44 lb-in).
3. Connect the 3 PCM electrical connectors.
4. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation procedure. For additional information, refer to **MODULE CONFIGURATION** article.
5. Reprogram the passive anti-theft system (PATS). Carry out the Parameter Reset procedure. For additional information, refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

MASS AIR FLOW (MAF) SENSOR

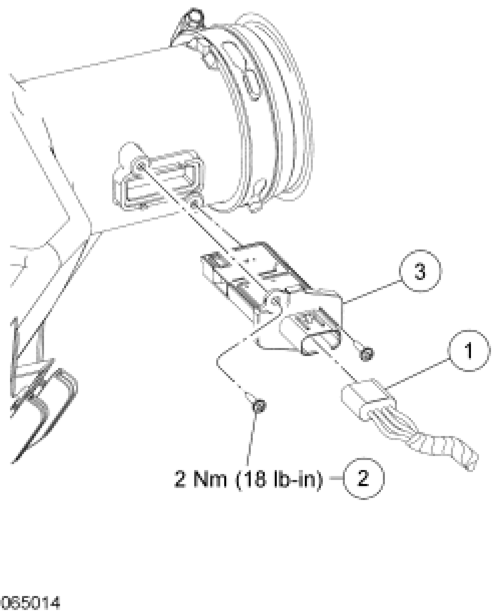

Fig. 4: Exploded View Of Mass Air Flow (MAF) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector
2	W709287	MAF sensor screw (2 required)
3	12B579	MAF sensor

REMOVAL AND INSTALLATION

1. Disconnect the mass air flow (MAF) sensor electrical connector.
2. Remove the 2 screws and the MAF sensor.
    - To install, tighten to 2 Nm (18 lb-in).
3. To install, reverse the removal procedure.

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

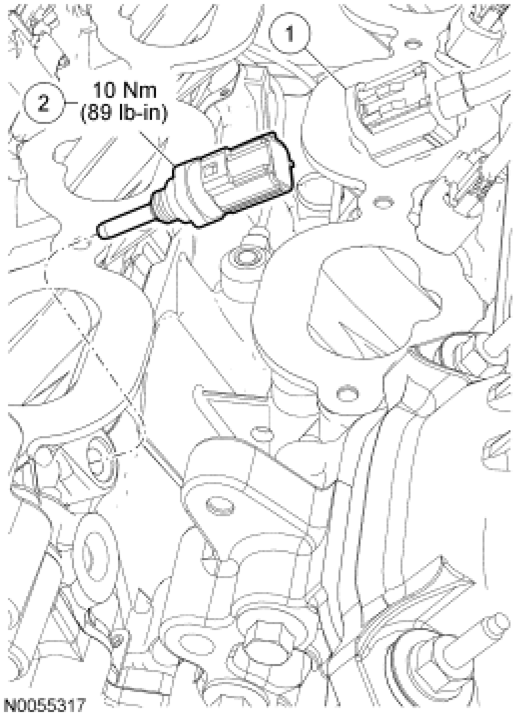

Fig. 5: Exploded View Of Cylinder Head Temperature (CHT) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Cylinder head temperature (CHT) sensor electrical connector
2	6G004	CHT sensor

REMOVAL AND INSTALLATION

1. Remove the lower intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
2. Disconnect the cylinder head temperature (CHT) sensor electrical connector.
3. Remove and discard the CHT sensor.
    - To install, tighten to 10 Nm (89 lb-in).
4. To install, reverse the removal procedure.
    - Do not reuse the CHT sensor, install a new sensor.

HEATED OXYGEN SENSOR (HO2S) AND CATALYST MONITOR SENSOR - EXPLODED VIEW

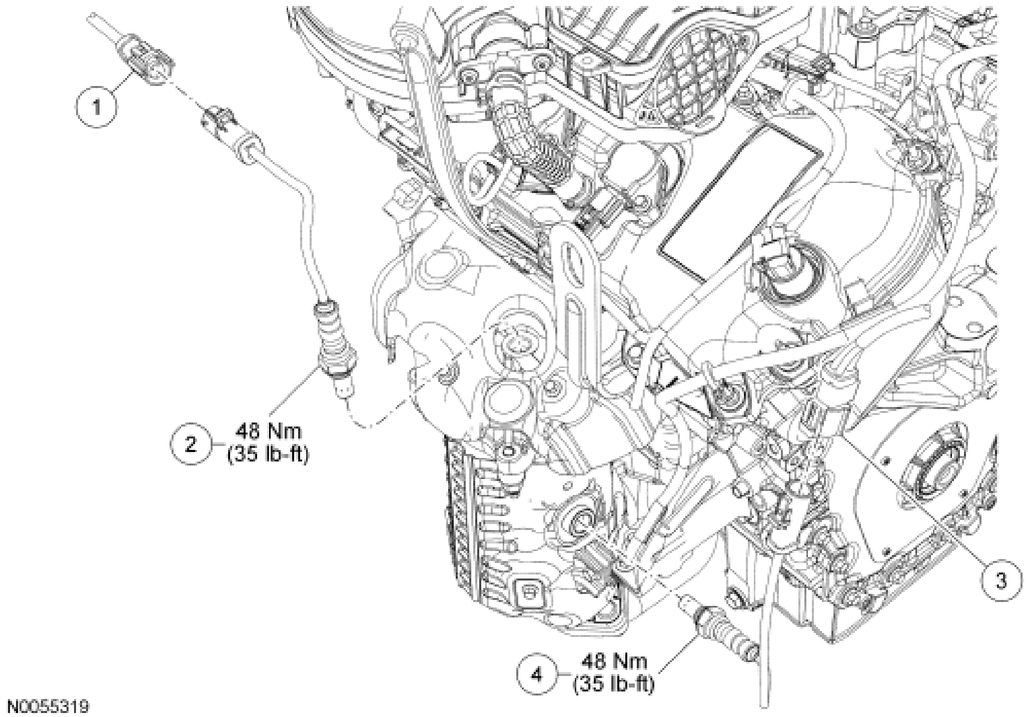

Fig. 6: Exploded View Of Heated Oxygen Sensor (HO2S) & Catalyst Monitor Sensor With Torque Specifications - RH Sensors
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Heated oxygen sensor (HO2S) electrical connector
2	9F472	HO2S
3	14A464	Catalyst monitor sensor electrical connector
4	9G444	Catalyst monitor sensor

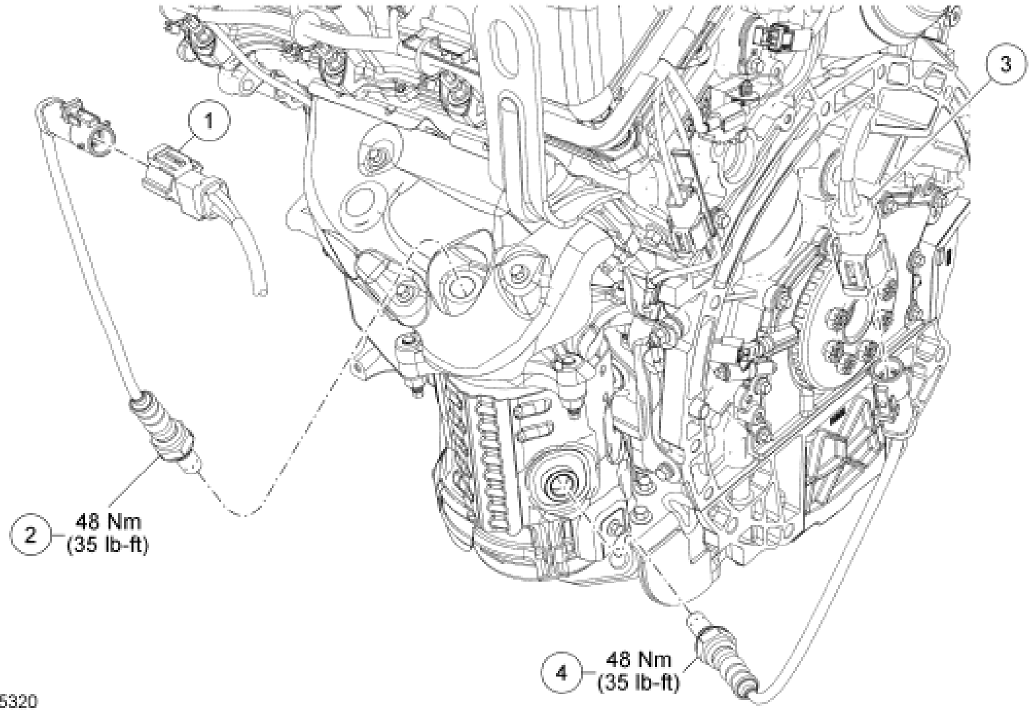

Fig. 7: Exploded View Of Heated Oxygen Sensor (HO2S) & Catalyst Monitor Sensor With Torque Specifications - LH Sensors
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Heated oxygen sensor (HO2S) electrical connector
2	9F472	HO2S
3	14A464	Catalyst monitor sensor electrical connector
4	9G444	Catalyst monitor sensor

1. For additional information, refer to the procedures in this article.

HEATED OXYGEN SENSOR (HO2S)

Special Tools

Illustration	Tool Name	Tool Number
	Socket, Exhaust Gas Oxygen Sensor	303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-

REMOVAL AND INSTALLATION

RH sensor

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

   Both sensors

2. Disconnect the heated oxygen sensor (HO2S) electrical connector.

   NOTE: **If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.**

3. Using the special tool, remove the HO2S.
   - To install, tighten to 48 Nm (35 lb-ft).

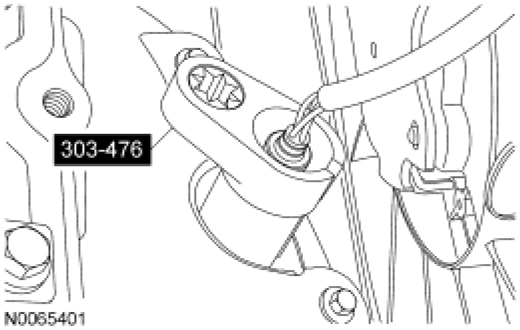

Fig. 8: Identifying Heated Oxygen Sensor (HO2S) & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

   NOTE: **Apply a light coat of anti-seize lubricant to the threads of the HO2S.**

4. To install, reverse the removal procedure.

CATALYST MONITOR SENSOR

Special Tools

Illustration	Tool Name	Tool Number

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor	303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the catalyst monitor sensor electrical connector.

NOTE: If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

3. Using the special tool, remove the catalyst monitor sensor.
   - To install, tighten to 48 Nm (35 lb-ft).

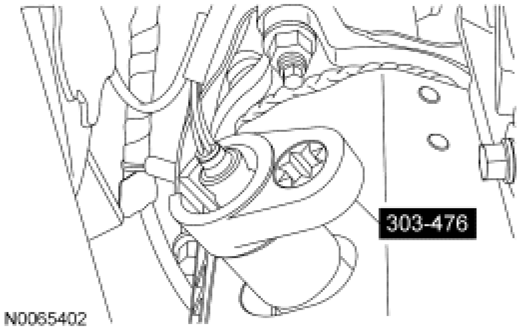

Fig. 9: Identifying Catalyst Monitor Sensor & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

NOTE: Apply a light coat of anti-seize lubricant to the threads of the catalyst monitor sensor.

4. To install, reverse the removal procedure.

VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID

NOTE: LH shown, RH similar.

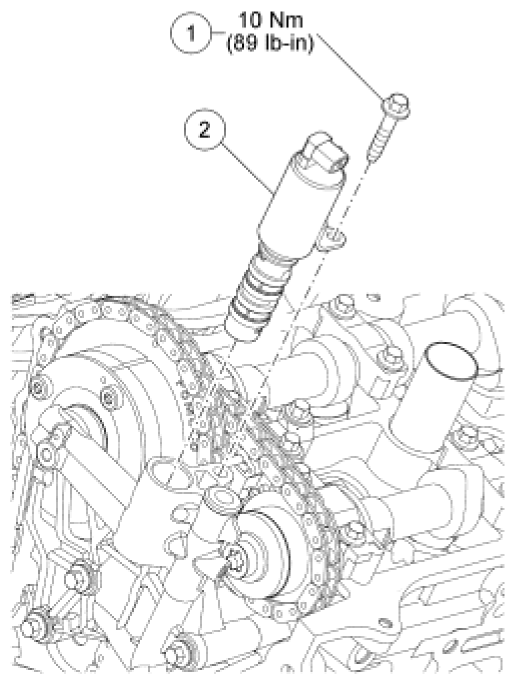

Fig. 10: Exploded View Of Variable Camshaft Timing (VCT) Oil Control Solenoid With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500215	Variable camshaft timing (VCT) oil control solenoid bolt
2	6B297	VCT oil control solenoid

REMOVAL AND INSTALLATION

1. Remove the LH or RH valve cover. For additional information, refer to **ENGINE - 3.5L** article.
2. Remove the bolt and the variable camshaft timing (VCT) oil control solenoid.
   - To install, tighten to 10 Nm (89 lb-in).
3. To install, reverse the removal procedure.

KNOCK SENSOR (KS)

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only)	WSS-M97B51-A1

VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	

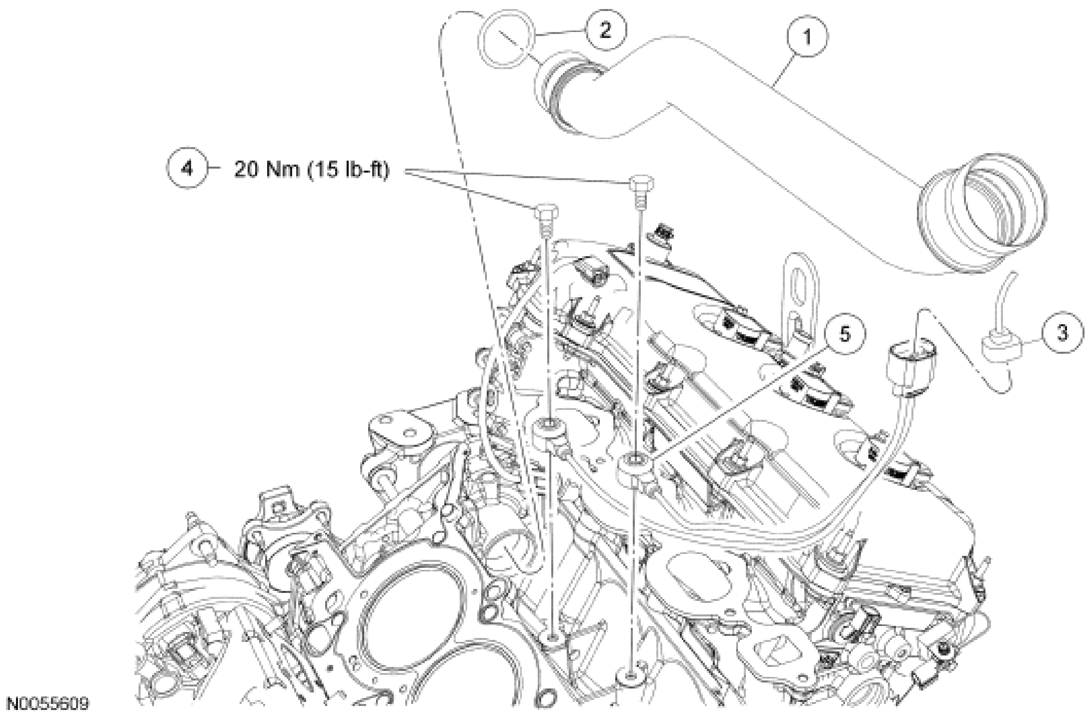

Fig. 11: Exploded View Of Knock Sensor (KS) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	9N271	Coolant tube
2	8565	O-ring seal
3	14A464	Knock sensor (KS) electrical connector
4	W500310	KS bolts (2 required)
5	12A699	KS

REMOVAL AND INSTALLATION

1. Remove the thermostat housing. For additional information, refer to **ENGINE COOLING** article.
2. Remove the lower intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
3. Remove the coolant tube.
    - Discard the O-ring seal.
4. Disconnect the knock sensor (KS) electrical connector.
5. Remove the 2 bolts and the KS.
    - To install, tighten to 20 Nm (15 lb-ft).
6. To install, reverse the removal procedure.

- Lubricate the new O-ring seal with clean engine coolant.

2008 ENGINE PERFORMANCE

Electronic Engine Controls - Edge & MKX

High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A	-
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1	-
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-	-

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Camshaft position (CMP) sensor bolt	10	-	89
Catalyst monitor sensor	48	35	-
Crankshaft position (CKP) sensor bolt	10	-	89
Cylinder head temperature (CHT) sensor	10	-	89
Heat shield bolt and nut	10	-	89
Heated oxygen sensor (HO2S)	48	35	-
Knock sensor (KS) bolt	20	15	-
Mass airflow (MAF) sensor screws	2	-	18
PCM nuts	5	-	44
Variable camshaft timing (VCT) oil control solenoid bolt	10	-	89

DESCRIPTION AND OPERATION

ELECTRONIC ENGINE CONTROLS

The electronic engine controls consist of the:

- PCM.
- cylinder head temperature (CHT) sensor.

- camshaft position (CMP) sensor.
- crankshaft position (CKP) sensor.
- mass air flow (MAF) sensor.
- heated oxygen sensor (HO2S).
- catalyst monitor sensor.
- variable camshaft timing (VCT) oil control solenoid.
- knock sensor (KS).

The PCM carries out the following functions:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The CHT sensor:

- sends the PCM a signal indicating cylinder head temperature.
- resistance decreases as cylinder head temperature increases.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool.

The HO2S:

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The catalyst monitor sensor:

- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The KS:

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The VCT oil control solenoid:

- is an electrically controlled hydraulic valve that directs engine oil to the camshaft phaser. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

DIAGNOSTIC TESTS

ELECTRONIC ENGINE CONTROLS

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

CAMSHAFT POSITION (CMP) SENSOR

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

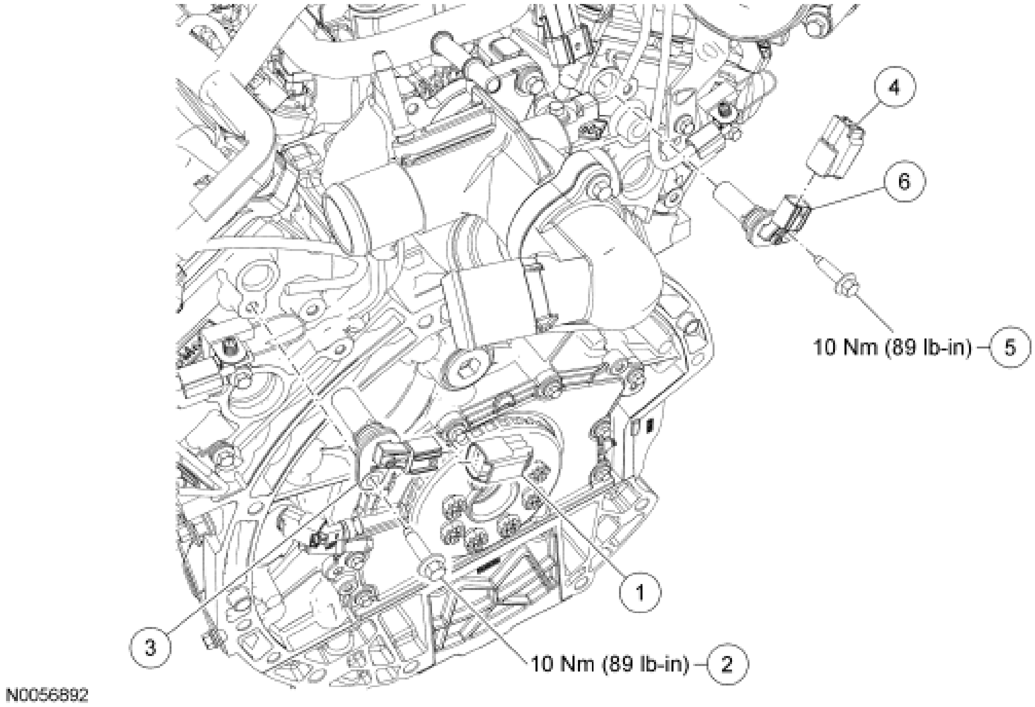

Fig. 1: Exploded View Of Camshaft Position (CMP) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	LH camshaft position sensor (CMP) electrical connector
2	W500214	LH CMP bolt
3	6B288	LH CMP
4	14A464	RH CMP electrical connector
5	W500214	RH CMP bolt
6	6B288	RH CMP

REMOVAL AND INSTALLATION

RH sensor

1. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.

   LH sensor

2. Remove the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.

   Both sensors

3. Disconnect the camshaft position sensor (CMP) electrical connector.
4. Remove the bolt and the CMP sensor.
    - To install, tighten to 10 Nm (89 lb-in).

NOTE: Lubricate the CMP O-ring seal with clean engine oil.

5. To install, reverse the removal procedure.

CRANKSHAFT POSITION (CKP) SENSOR

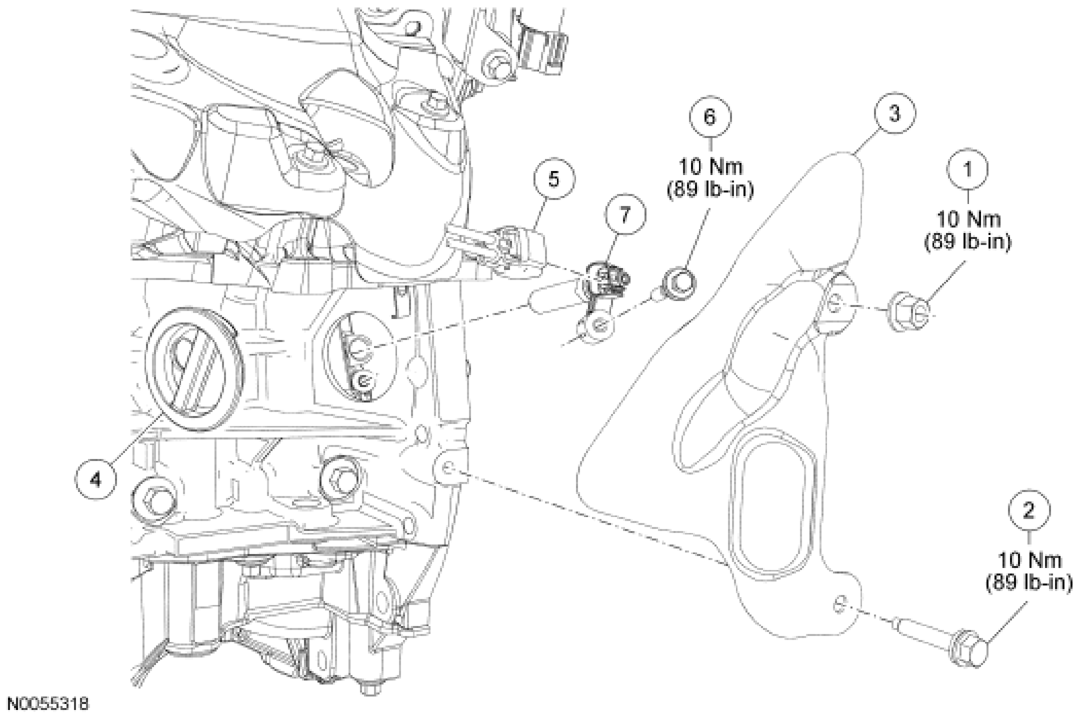

Fig. 2: Exploded View Of Crankshaft Position (CKP) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701542	Heat shield nut
2	W701669	Heat shield bolt
3	6K342	Heat shield
4	6C070	Rubber grommet cover
5	14A464	Crankshaft position (CKP) sensor electrical connector
6	6D327	CKP sensor bolt
7	6C315	CKP sensor

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the LH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
3. Remove the bolt, nut and the heat shield.
    - To install, tighten to 10 Nm (89 lb-in).
4. Remove the rubber grommet cover.
5. Disconnect the crankshaft position (CKP) sensor electrical connector.
6. Remove the bolt and the CKP sensor.
    - To install, tighten to 10 Nm (89 lb-in).
7. To install, reverse the removal procedure.

POWERTRAIN CONTROL MODULE (PCM)

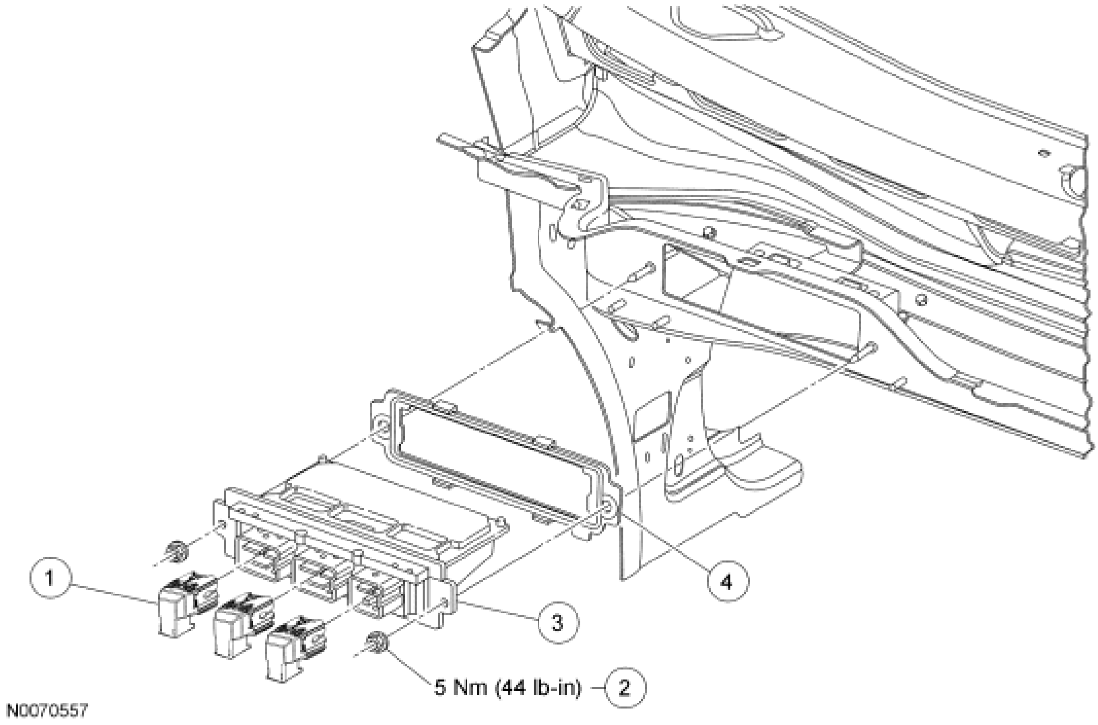

Fig. 3: Exploded View Of Powertrain Control Module (PCM) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	PCM electrical connector (part of 12B637) (3 required)
2	N804795	PCM nut (2 required)
3	12A650	PCM
4	12A696	PCM gasket

REMOVAL

NOTE: PCM replacement DOES NOT require new keys or programming of keys.

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. For additional information, refer to **MODULE CONFIGURATION** article.
2. Disconnect the 3 PCM electrical connectors.
3. Remove the 2 nuts and the PCM.
   - Remove the gasket.

INSTALLATION

1. Install the gasket and the PCM.
2. Install the 2 PCM nuts.
   - Tighten to 5 Nm (44 lb-in).
3. Connect the 3 PCM electrical connectors.
4. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation procedure. For additional information, refer to **MODULE CONFIGURATION** article.
5. Reprogram the passive anti-theft system (PATS). Carry out the Parameter Reset procedure. For additional information, refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

MASS AIR FLOW (MAF) SENSOR

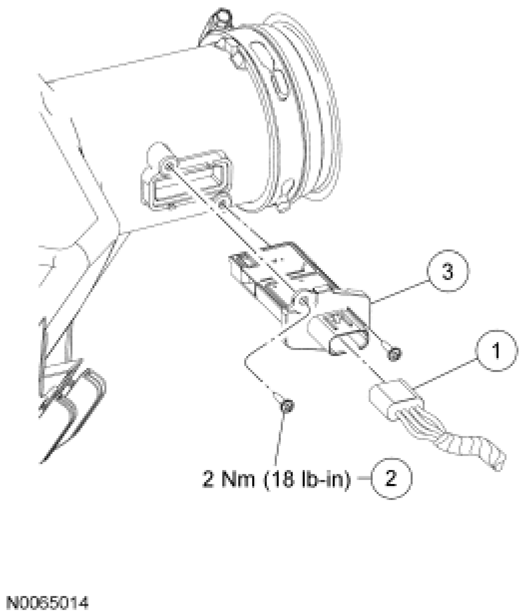

Fig. 4: Exploded View Of Mass Air Flow (MAF) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector
2	W709287	MAF sensor screw (2 required)
3	12B579	MAF sensor

REMOVAL AND INSTALLATION

1. Disconnect the mass air flow (MAF) sensor electrical connector.
2. Remove the 2 screws and the MAF sensor.
   - To install, tighten to 2 Nm (18 lb-in).
3. To install, reverse the removal procedure.

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

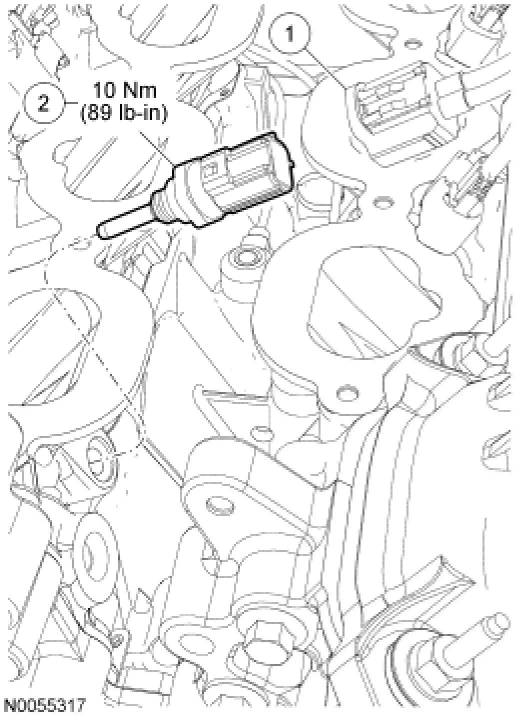

Fig. 5: Exploded View Of Cylinder Head Temperature (CHT) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Cylinder head temperature (CHT) sensor electrical connector
2	6G004	CHT sensor

REMOVAL AND INSTALLATION

1. Remove the lower intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
2. Disconnect the cylinder head temperature (CHT) sensor electrical connector.
3. Remove and discard the CHT sensor.
    - To install, tighten to 10 Nm (89 lb-in).
4. To install, reverse the removal procedure.
    - Do not reuse the CHT sensor, install a new sensor.

HEATED OXYGEN SENSOR (HO2S) AND CATALYST MONITOR SENSOR - EXPLODED VIEW

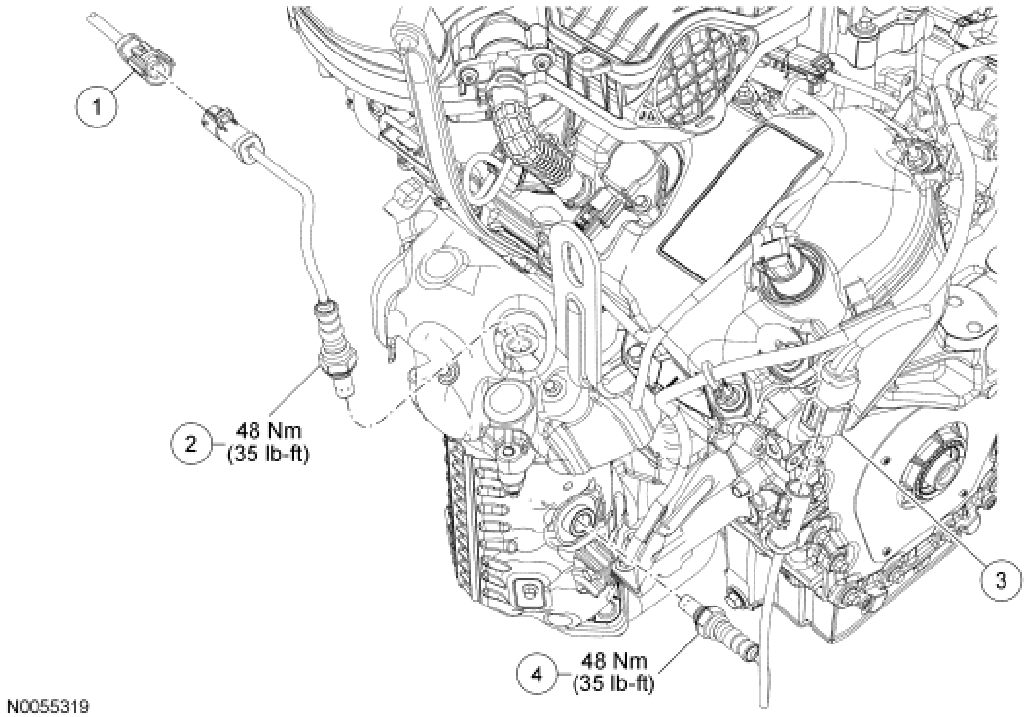

Fig. 6: Exploded View Of Heated Oxygen Sensor (HO2S) & Catalyst Monitor Sensor With Torque Specifications - RH Sensors
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Heated oxygen sensor (HO2S) electrical connector
2	9F472	HO2S
3	14A464	Catalyst monitor sensor electrical connector
4	9G444	Catalyst monitor sensor

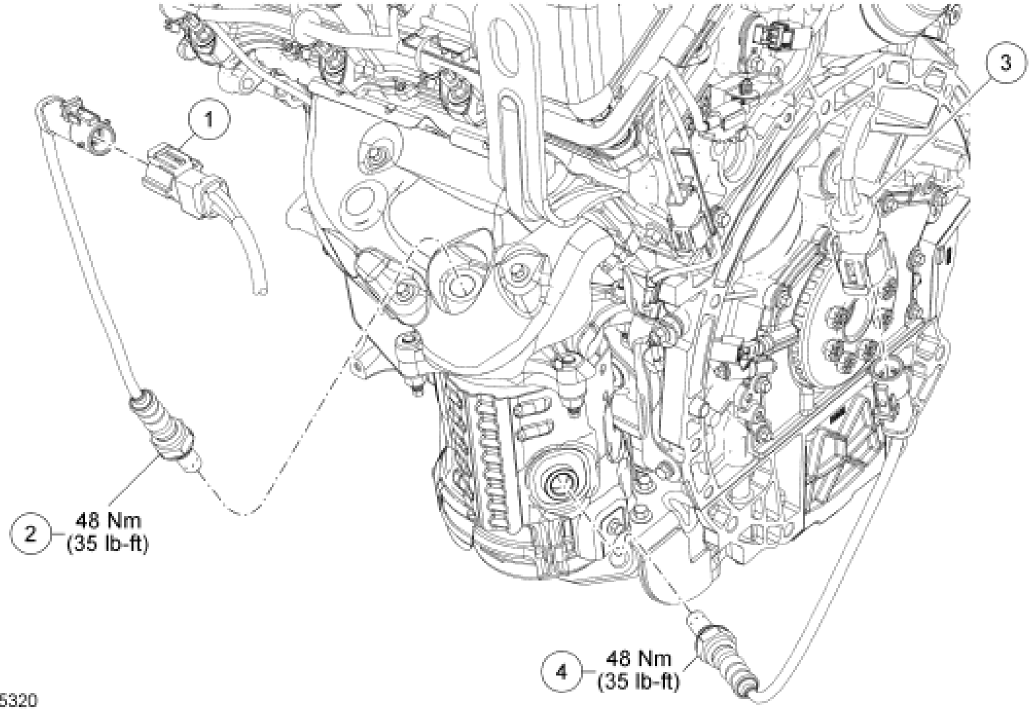

Fig. 7: Exploded View Of Heated Oxygen Sensor (HO2S) & Catalyst Monitor Sensor With Torque Specifications - LH Sensors
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Heated oxygen sensor (HO2S) electrical connector
2	9F472	HO2S
3	14A464	Catalyst monitor sensor electrical connector
4	9G444	Catalyst monitor sensor

1. For additional information, refer to the procedures in this article.

HEATED OXYGEN SENSOR (HO2S)

Special Tools

Illustration	Tool Name	Tool Number
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor	303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-

REMOVAL AND INSTALLATION

RH sensor

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

   Both sensors

2. Disconnect the heated oxygen sensor (HO2S) electrical connector.

   NOTE: If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

3. Using the special tool, remove the HO2S.
   - To install, tighten to 48 Nm (35 lb-ft).

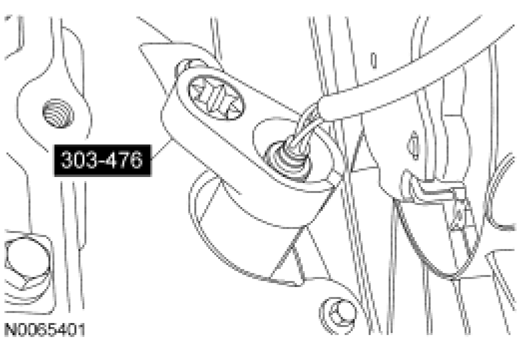

Fig. 8: Identifying Heated Oxygen Sensor (HO2S) & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

NOTE: Apply a light coat of anti-seize lubricant to the threads of the HO2S.

4. To install, reverse the removal procedure.

CATALYST MONITOR SENSOR

Special Tools

Illustration	Tool Name	Tool Number

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor	303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the catalyst monitor sensor electrical connector.

NOTE: If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

3. Using the special tool, remove the catalyst monitor sensor.
    - To install, tighten to 48 Nm (35 lb-ft).

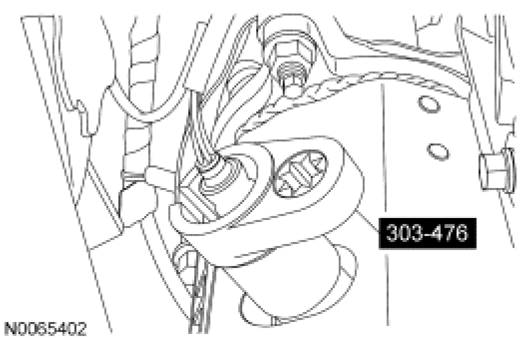

Fig. 9: Identifying Catalyst Monitor Sensor & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

NOTE: Apply a light coat of anti-seize lubricant to the threads of the catalyst monitor sensor.

4. To install, reverse the removal procedure.

VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID

NOTE: **LH shown, RH similar.**

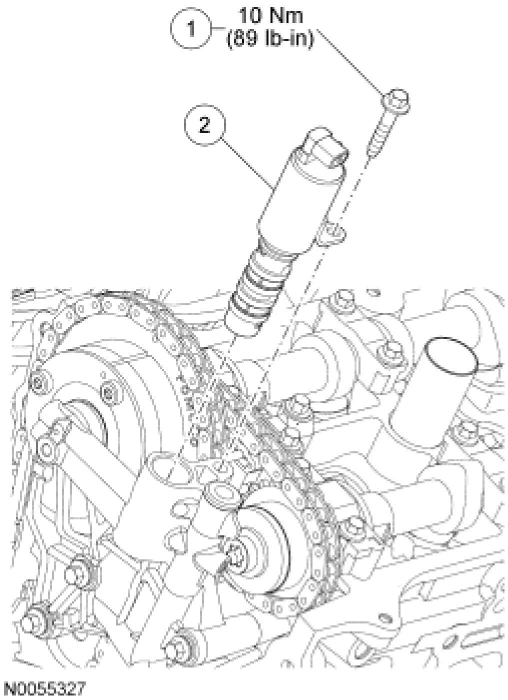

Fig. 10: Exploded View Of Variable Camshaft Timing (VCT) Oil Control Solenoid With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500215	Variable camshaft timing (VCT) oil control solenoid bolt
2	6B297	VCT oil control solenoid

REMOVAL AND INSTALLATION

1. Remove the LH or RH valve cover. For additional information, refer to **ENGINE - 3.5L** article.
2. Remove the bolt and the variable camshaft timing (VCT) oil control solenoid.
   - To install, tighten to 10 Nm (89 lb-in).
