
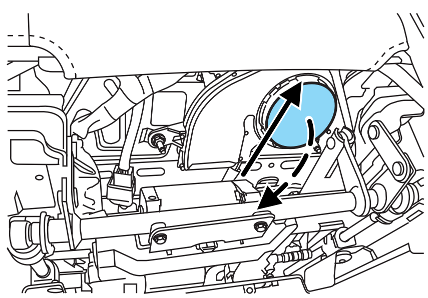
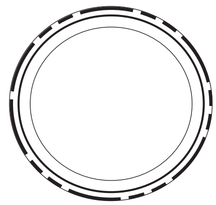
- The filter can be accessed from the first row seat. Move the front seats all the way back and up to ease access.

To remove an air filter:

- Remove key from ignition.
- Push up on the outside rigid edge of the filter until the tabs are released, then rotate the air filter toward the front of the vehicle.

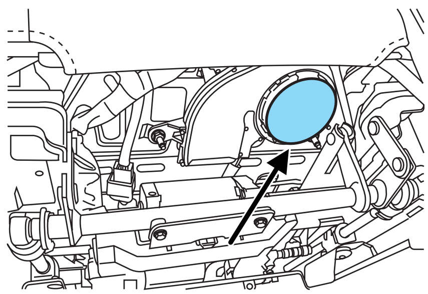


• Remove filter.



To install a filter:

• First, position the filter in it's housing making sure that the far forward end is all the way up in the housing. Then push in on the center of the outside edge of the filter and rotate up into the housing until it clips into position.

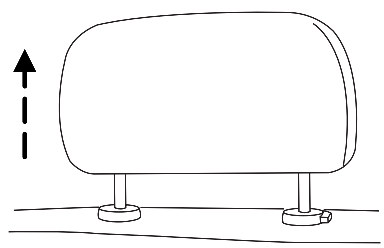


REAR SEATS

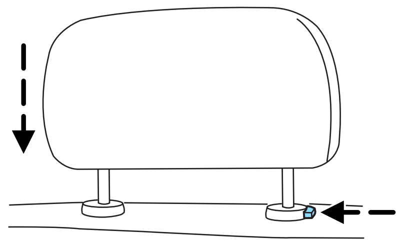
Head restraints

Lift the head restraint so that it is located directly or as close as possible behind your head.

The head restraints can be moved up by pulling up on the head restraint.



Push release button to lower head restraint.



Folding down the 60/40 rear seats

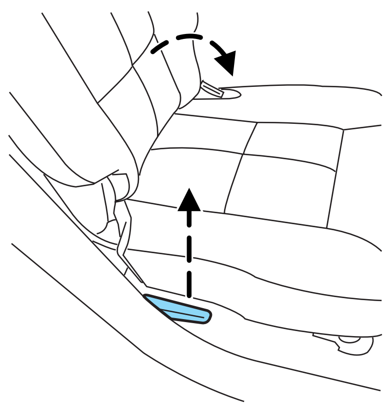
Note: The head restraints should be placed in the full down position before folding the seatback down.

Note: Ensure that no objects such as books, purses, or briefcases are on the floor in front of, on or under the second row seat cushion before actuating the release lever to cycle the seats to the load-floor position.

To prevent possible damage to the seat or safety belts, ensure that the safety belts are not buckled when moving the seat to the load floor position.

2nd row manual folding seat

To fold down the rear seat, pull up on the lever on the outboard side of the seat cushion and let the seatback rotate downward into the load floor position.



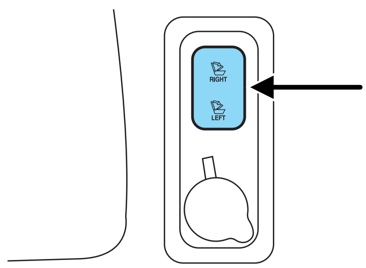
2nd row EasyFold™ seatback release

Ensure that the seat is unoccupied when folding it down. Folding the seat while occupied could result in damage to the seat or injury.

Note: The power feature is operational when the vehicle is in park and the lifgate has been open for less than 10 minutes.

The control buttons are located on the left-hand rear quarter trim panel (accessible from the liftgate area).

Press and hold the control mechanism to lower the seatback. The top portion lowers the right (40%) seatback, and the bottom portion lowers the left (60%) seatback.



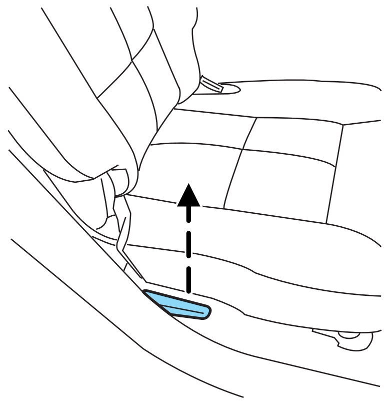
Returning the 2nd row seatback to the upright position

Before returning the seatback to its original position, make sure that cargo or any objects are not trapped behind the seatback. After returning the seatback to its original position, pull on the seatback to ensure that the latches are engaged. An unlatched seat may become dangerous in the event of a sudden stop or collision.

Rotate the seatback upward until the seatback latches in the upright position. The seatback will click when it is locked into position.

Adjusting the second row seatback

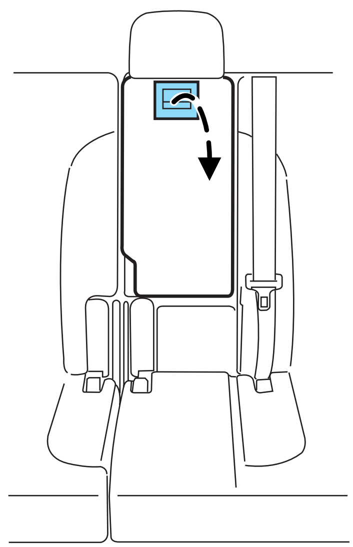
Reclining the seatback can cause an occupant to slide under the seat's safety belt, resulting in severe personal injuries in the event of a collision.



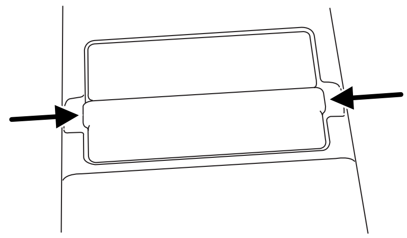
The second row seat reclines for additional comfort. To adjust the second row seatback to the desired position, while seated, pull the release lever up and push the seatback rearward.

Seat mounted armrest and cupholders

Your vehicle is equipped with a rear seat armrest. To fold the armrest down, release the latch located on the seatback by pressing down and pulling forward.



To access the cup holders, lift up one of the slotted areas on the cover.



Use only soft cups in the cupholder. Hard objects can injure you in a collision.

Returning the 2nd row armrest to the upright position

Close the cover on the cup holders. Rotate the armrest rearward until the armrest is in the latched position. The armrest will click when it is latched into position.

Rear heated seats (if equipped)

Persons who are unable to feel pain to the skin because of advanced age, chronic illness, diabetes, spinal cord injury, medication, alcohol use, exhaustion, or other physical conditions, must exercise care when using the seat heater. The seat heater may cause burns even at low temperatures, especially if used for long periods of time. Do not place anything on the seat that insulates against heat, such as a blanket or cushion, because this may cause the seat heater to overheat. Do not puncture the seat with pins, needles, or other pointed objects because this may damage the heating element which may cause the seat heater to overheat. An overheated seat may cause serious personal injury.

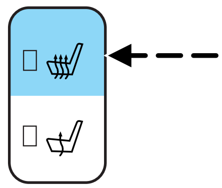
Note: Do not do the following:

- Place heavy objects on the seat
- Operate the seat heater if water or any other liquid is spilled on the seat. Allow the seat to dry thoroughly.

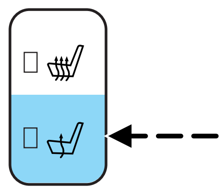
The rear seat heat controls are located on the rear door panels.

To operate the heated seats:

- Push the indicated side of the control for maximum heat.
- Push again to deactivate.



- Push the indicated side of the control for minimum heat.
- Push again to deactivate.



The heated seat module resets at every ignition run cycle. While the ignition is in the ON position, activating the high or low heated seat switch enables heating mode. When activated, they will turn off automatically when the engine is turned off.

The indicator light will illuminate when the heated seats have been activated.

SAFETY RESTRAINTS

Personal Safety System™

The Personal Safety System™ provides an improved overall level of frontal crash protection to front seat occupants and is designed to help further reduce the risk of airbag-related injuries. The system is able to analyze different occupant conditions and crash severity before activating the appropriate safety devices to help better protect a range of occupants in a variety of frontal crash situations.

Your vehicle's Personal Safety System™ consists of:

- Driver and passenger dual-stage airbag supplemental restraints.
- Front outboard safety belts with pretensioners, energy management retractors (first row only), and safety belt usage sensors.
- Driver's seat position sensor.
- Front passenger sensing system
- "Passenger airbag off" or "pass airbag off" indicator lamp

- Front crash severity sensors.
- Restraints Control Module (RCM) with impact and safing sensors.
- Restraint system warning light and back-up tone.
- The electrical wiring for the airbags, crash sensor(s), safety belt pretensioners, front safety belt usage sensors, driver seat position sensor, front passenger sensing system, and indicator lights.

How does the Personal Safety System™ work?

The Personal Safety System™ can adapt the deployment strategy of your vehicle's safety devices according to crash severity and occupant conditions. A collection of crash and occupant sensors provides information to the Restraints Control Module (RCM). During a crash, the RCM may activate the safety belt pretensioners and/or either one or both stages of the dual-stage airbag supplemental restraints based on crash severity and occupant conditions.

The fact that the pretensioners or airbags did not activate for both front seat occupants in a collision does not mean that something is wrong with the system. Rather, it means the Personal Safety System™ determined the accident conditions (crash severity, belt usage, etc.) were not appropriate to activate these safety devices. Front airbags are designed to activate only in frontal and near-frontal collisions (not rollovers, side impacts or rear impacts) unless the collision causes sufficient longitudinal deceleration. The pretensioners are designed to activate in frontal and near-frontal collisions, and in rollovers and side collisions when the Safety Canopy is activated.

Driver and passenger dual-stage airbag supplemental restraints

The dual-stage airbags offer the capability to tailor the level of airbag inflation energy. A lower, less forceful energy level is provided for more common, moderate-severity impacts. A higher energy level is used for the most severe impacts. Refer to *Airbag supplemental restraints* section in this chapter.

Front crash severity sensor

The front crash severity sensor enhances the ability to detect the severity of an impact. Positioned up front, it provides valuable information early in the crash event on the severity of the impact. This allows your Personal Safety System™ to distinguish between different levels of crash severity and modify the deployment strategy of the dual-stage airbags and safety belt pretensioners.

Driver's seat position sensor

The driver's seat position sensor allows your Personal Safety System™ to tailor the deployment level of the driver dual-stage airbag based on seat position. The system is designed to help protect smaller drivers sitting close to the driver airbag by providing a lower airbag output level.

Front passenger sensing system

For airbags to do their job they must inflate with great force, and this force can pose a potentially deadly risk to occupants that are very close to the airbag when it begins to inflate. For some occupants, this occurs because they are initially sitting very close to the airbag. For other occupants, this occurs when the occupant is not properly restrained by safety belts or child safety seats and they move forward during pre-crash braking. The most effective way to reduce the risk of unnecessary injuries is to make sure all occupants are properly restrained. Accident statistics suggest that children are much safer when properly restrained in the rear seating positions than in the front.

Air bags can kill or injure a child in a child seat. **NEVER** place a rear-facing child seat in front of an active air bag. If you must use a forward-facing child seat in the front seat, move the seat all the way back.

Always transport children 12 years old and under in the back seat and always properly use appropriate child restraints.

The front passenger sensing system can automatically turn off the front passenger airbag and passenger seat-mounted side airbag. The system is designed to help protect small (child size) occupants from frontal airbag deployments when they are seated or restrained in the front passenger seat contrary to proper child-seating or restraint usage recommendations. Even with this technology, parents are **STRONGLY** encouraged to always properly restrain children in the rear seat. The sensor also turns off the passenger front airbag and passenger seat-mounted side airbag (if equipped) when the passenger seat is empty and the safety belt is unbuckled.

Front safety belt usage sensors

The front safety belt usage sensors detect whether or not the driver and front outboard passenger safety belts are fastened. This information allows your Personal Safety System™ to tailor the airbag deployment and safety belt pretensioner activation depending upon safety belt usage. Refer to *Safety belt* section in this chapter.

Front safety belt pretensioners

The safety belt pretensioners at the front outboard seating positions are designed to tighten the safety belts firmly against the occupant's body during frontal collisions, and in rollover and side collisions when the Safety Canopy is activated. This helps increase the effectiveness of the safety belts. In frontal collisions, the safety belt pretensioners can be activated alone or, if the collision is of sufficient severity, together with the front airbags.

Front safety belt energy management retractors

The front outboard safety belt energy management retractors allow webbing to be pulled out of the retractor in a gradual and controlled manner in response to the occupant's forward momentum. This helps reduce the risk of force-related injuries to the occupant's chest by limiting the load on the occupant. Refer to *Energy management feature* section in this chapter.

Determining if the Personal Safety System™ is operational

The Personal Safety System™ uses a warning light in the instrument cluster or a back-up tone to indicate the condition of the system. Refer to the *Warning light* section in the *Instrument Cluster* chapter. Routine maintenance of the Personal Safety System™ is not required.

The Restraints Control Module (RCM) monitors its own internal circuits and the circuits for the airbag supplemental restraints, crash sensor(s), safety belt pretensioners, front safety belt buckle sensors, driver seat position sensor, and front passenger sensing system. In addition, the RCM also monitors the restraints warning light in the instrument cluster. A difficulty with the system is indicated by one or more of the following.

- The warning light will either flash or stay lit.
- The warning light will not illuminate immediately after ignition is turned on.
- A series of five beeps will be heard. The tone pattern will repeat periodically until the problem and warning light are repaired.

If any of these things happen, even intermittently, have the Personal Safety System™ serviced at an authorized dealer immediately. Unless serviced, the system may not function properly in the event of a collision.

Safety belt precautions

Always drive and ride with your seatback upright and the lap belt snug and low across the hips.

To reduce the risk of injury, make sure children sit where they can be properly restrained.

Never let a passenger hold a child on his or her lap while the vehicle is moving. The passenger cannot protect the child from injury in a collision.

All occupants of the vehicle, including the driver, should always properly wear their safety belts, even when an air bag supplemental restraint system (SRS) is provided.

It is extremely dangerous to ride in a cargo area, inside or outside of a vehicle. In a collision, people riding in these areas are more likely to be seriously injured or killed. Do not allow people to ride in any area of your vehicle that is not equipped with seats and safety belts. Be sure everyone in your vehicle is in a seat and using a safety belt properly.

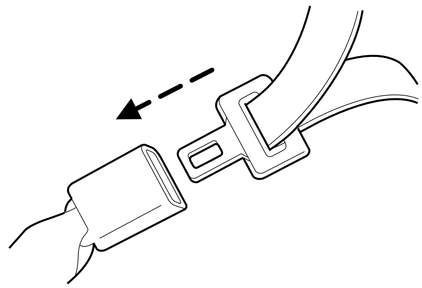
In a rollover crash, an unbelted person is significantly more likely to die than a person wearing a seat belt.

Each seating position in your vehicle has a specific safety belt assembly which is made up of one buckle and one tongue that are designed to be used as a pair. 1) Use the shoulder belt on the outside shoulder only. Never wear the shoulder belt under the arm. 2) Never swing the safety belt around your neck over the inside shoulder. 3) Never use a single belt for more than one person.

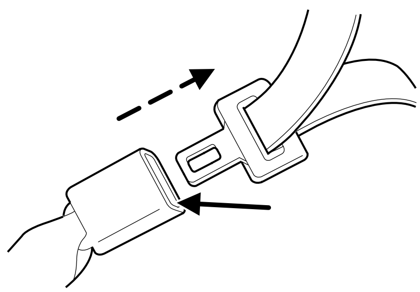
Always transport children 12 years old and under in the back seat and always properly use appropriate child restraints.

Combination lap and shoulder belts

1. Insert the belt tongue into the proper buckle (the buckle closest to the direction the tongue is coming from) until you hear a snap and feel it latch. Make sure the tongue is securely fastened in the buckle.



2. To unfasten, push the release button and remove the tongue from the buckle.



All restraints in the vehicle are combination lap and shoulder belts.

While you are fastened in the safety belt, the combination lap/shoulder belt adjusts to your movement. However, if you brake hard, turn hard, or if your vehicle receives an impact of 5 mph (8 km/h) or more, the safety belt will become locked and help reduce your forward movement.

Energy Management Feature — Front Outboard

- This vehicle has a safety belt system with an energy management feature at the front seats to help further reduce the risk of injury in the event of a head-on collision.
- The energy management feature has a retractor assembly that is designed to extend the safety belt webbing in a controlled manner. This helps reduce the belt force acting on the user's chest.

Failure to inspect and replace if necessary the Belt and Retractor assembly after an accident could increase the risk of injury in a collision.

All safety restraints in the vehicle are combination lap and shoulder belts. All of the passenger combination lap and shoulder belts have two types of locking modes described below:

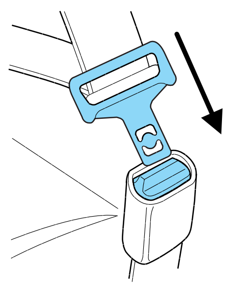
Vehicle sensitive mode

This is the normal retractor mode, which allows free shoulder belt length adjustment to your movements and locking in response to vehicle movement. For example, if the driver brakes suddenly or turns a corner sharply, or the vehicle receives an impact of approximately 5 mph (8 km/h) or more, the combination safety belts will lock to help reduce forward movement of the driver and passengers.

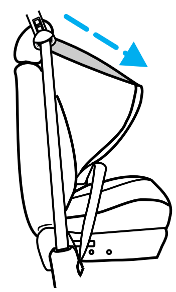
Automatic locking mode

How to use the automatic locking mode

- Buckle the combination lap and shoulder belt.



- Grasp the shoulder portion and pull downward until the entire belt is pulled out.



- Allow the belt to retract. As the belt retracts, you will hear a clicking sound. This indicates the safety belt is now in the automatic locking mode.

When to use the automatic locking mode

In this mode, the shoulder belt is automatically pre-locked. The belt will still retract to remove any slack in the shoulder belt. The automatic locking mode is not available on the driver safety belt.

This mode should be used **any time** a child safety seat, except a booster, is installed in passenger front or rear seating positions. Children 12 years old and under should be properly restrained in the rear seat whenever possible. Refer to *Safety restraints for children* or *Safety seats for children* later in this chapter.

How to disengage the automatic locking mode

Ford Motor Company recommends that all passenger safety belt assemblies and attaching hardware should be inspected by an authorized dealer after any collision to verify that the ″automatic locking retractor″ feature for child seats is still working properly. Safety belt assemblies should be inspected by an authorized dealer and must be replaced if either damage or improper operation is noted. Failure to replace the belt and retractor assembly could increase the risk of injury in a collision.

Unbuckle the combination lap/shoulder belt and allow it to retract completely to disengage the automatic locking mode and activate the vehicle sensitive (emergency) locking mode.

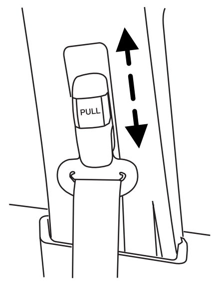
Safety belt pretensioner

Your vehicle is equipped with safety belt pretensioners at the driver and front outboard passenger seating positions.

The safety belt pretensioner tightens the safety belts firmly against the occupant's body at the start of the crash.

The driver and front passenger safety belt system (including retractors, buckles and height adjusters) must be replaced if the vehicle is involved in a collision that results in deployment of front airbags, seat-mounted side airbags and Safety Canopy™, and safety belt pretensioners.

Safety belt height adjustment

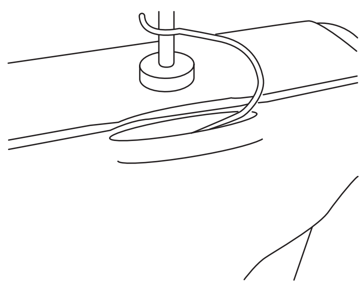


Your vehicle has safety belt height adjustments at the front outboard seating positions. Adjust the height of the shoulder belt so the belt rests across the middle of your shoulder.

To adjust the shoulder belt height, pull on the center button and slide the height adjuster up or down. Release the button and pull down on the height adjuster to make sure it is locked in place.

Position the safety belt height adjusters so that the belt rests across the middle of your shoulder. Failure to adjust the safety belt properly could reduce the effectiveness of the safety belt and increase the risk of injury in a collision.

Second row comfort guide

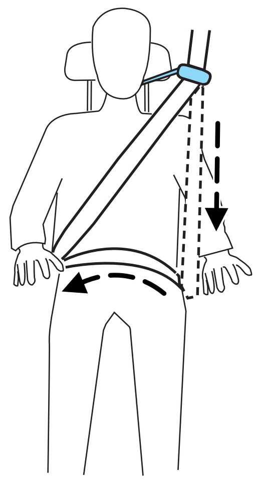


The second row outboard lap/shoulder belt is equipped with a belt comfort guide. This guide is attached to the head restraint and is stored in a pocket in the seatback. It is used to adjust the comfort of the shoulder belt for smaller occupants in the outboard second row seats.

To adjust the comfort guide:

1. Slip the shoulder belt into the belt guide.

2. Slide the guide up or down along the webbing so that the belt is centered on the occupant's shoulder.



Position the safety belt comfort guide so that the belt rests across the middle of your shoulder. Failure to adjust the safety belt properly could reduce the effectiveness of the safety belt and increase the risk of injury in a collision.

Safety belt extension assembly

If the safety belt is too short when fully extended, there is a 8 inch (20 cm) safety belt extension assembly that can be added (part number 611C22). This assembly can be obtained from an authorized dealer.

Use only extensions manufactured by the same supplier as the safety belt. Manufacturer identification is located at the end of the webbing on the label. Also, use the safety belt extension only if the safety belt is too short for you when fully extended.

Do not use extensions to change the fit of the shoulder belt across the torso.

Safety belt maintenance

Inspect the safety belt systems periodically to make sure they work properly and are not damaged. Inspect the safety belts to make sure there are no nicks, tears or cuts. Replace if necessary. All safety belt assemblies, including retractors, buckles, front safety belt buckle assemblies, buckle support assemblies (slide bar-if equipped), shoulder belt height adjusters (if equipped), shoulder belt guide on seatback (if equipped), child safety seat LATCH and tether anchors, and attaching hardware, should be inspected after a collision. Ford Motor Company recommends that all safety belt assemblies in use in vehicles involved in a collision be replaced. However, if the collision was minor and an authorized dealer finds that the belts do not show damage and continue to operate properly, they do not need to be replaced. Safety belt assemblies not in use during a collision should also be inspected and replaced if either damage or improper operation is noted.

Failure to inspect and if necessary replace the safety belt assembly under the above conditions could result in severe personal injuries in the event of a collision.

For proper care of soiled safety belts, refer to *Interior* in the *Cleaning* chapter.

Safety belt warning light and indicator chime

The safety belt warning light illuminates in the instrument cluster and a chime sounds to remind the occupants to fasten their safety belts.

Conditions of operation

If...	Then...
The driver's safety belt is not buckled before the ignition switch is turned to the ON position...	The safety belt warning light illuminates 1-2 minutes and the warning chime sounds 4-8 seconds.
The driver's safety belt is buckled while the indicator light is illuminated and the warning chime is sounding...	The safety belt warning light and warning chime turn off.
The driver's safety belt is buckled before the ignition switch is turned to the ON position...	The safety belt warning light and indicator chime remain off.

Belt-Minder®

The Belt-Minder® feature is a supplemental warning to the safety belt warning function. This feature provides additional reminders by intermittently sounding a chime and illuminating the safety belt warning light in the instrument cluster when the driver's and front passenger's safety belt is unbuckled.

The Belt-Minder® feature uses information from the front passenger sensing system to determine if a front seat passenger is present and therefore potentially in need of a warning. To avoid activating the Belt-Minder® feature for objects placed in the front passenger seat, warnings will only be given to large front seat occupants as determined by the front passenger sensing system.

Both the driver's and passenger's safety belt usages are monitored and either may activate the Belt-Minder® feature. The warnings are the same for the driver and the front passenger. If the Belt-Minder® warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder® feature.

If...	Then...
The driver's and front passenger's safety belts are buckled before the ignition switch is turned to the ON position or less than 1-2 minutes have elapsed since the ignition switch has been turned ON...	The Belt-Minder® feature will not activate.
The driver's or front passenger's safety belt is not buckled when the vehicle has reached at least 3 mph (5 km/h) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated - the safety belt warning light illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.
The driver's or front passenger's safety belt becomes unbuckled for approximately 1 minute while the vehicle is traveling at least 3 mph (5 km/h) and more than 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated - the safety belt warning light illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.

The following are reasons most often given for not wearing safety belts (All statistics based on U.S. data):

Reasons given...	**Consider...**
"Crashes are rare events"	**36700 crashes occur every day.** The more we drive, the more we are exposed to "rare" events, even for good drivers. *1 in 4 of us will be seriously injured in a crash during our lifetime.*
"I'm not going far"	**3 of 4** fatal crashes occur within **25** miles (40 km) of home.
"Belts are uncomfortable"	We design our safety belts to enhance comfort. If you are uncomfortable - try different positions for the safety belt upper anchorage and seatback which should be as upright as possible; this can improve comfort.
"I was in a hurry"	**Prime time for an accident.** Belt-Minder® reminds us to take a few seconds to buckle up.
"Safety belts don't work"	**Safety belts,** when used properly, **reduce risk of death** to front seat occupants by **45% in cars,** and by **60% in light trucks.**
"Traffic is light"	**Nearly 1 of 2 deaths occur in single-vehicle crashes,** many when no other vehicles are around.
"Belts wrinkle my clothes"	Possibly, but a serious crash can do much more than wrinkle your clothes, particularly if you are unbelted.
"The people I'm with don't wear belts"	Set the example, teen deaths occur 4 times more often in vehicles with TWO or MORE people. Children and younger brothers/sisters imitate behavior they see.

Reasons given...	Consider...
"I have an airbag"	Airbags offer greater protection when used with safety belts. Frontal airbags are not designed to inflate in rear and side crashes or rollovers.
"I'd rather be thrown clear"	Not a good idea. **People** who are **ejected are 40 times more likely to DIE.** Safety belts help prevent ejection, WE CAN'T "PICK OUR CRASH".

Do not sit on top of a buckled safety belt or insert a latchplate into the buckle to avoid the Belt-Minder® chime. To do so may adversely affect the performance of the vehicle's air bag system.

One time disable

If at any time the driver/front passenger quickly buckles then unbuckles the safety belt for that seating position, the Belt-Minder® is disabled for the current ignition cycle. The Belt-Minder® feature will enable during the same ignition cycle if the occupant buckles and remains buckled for approximately 30 seconds. Confirmation is not given for the one time disable.

Deactivating/activating the Belt-Minder® feature

The driver and front passenger Belt-Minder® are deactivated/activated independently. When deactivating/activating one seating position, do not buckle the other position as this will terminate the process.

Read Steps 1 - 4 thoroughly before proceeding with the deactivation/activation programming procedure.

Note: The driver and front passenger Belt-Minder® features must be disabled/enabled separately. Both cannot be disable/enabled during the same key cycle.

The driver and front passenger Belt-Minder® features can be deactivated/activated by performing the following procedure:

Before following the procedure, make sure that:

- The parking brake is set
- The gearshift is in N (Neutral) (manual transmission)
- The gearshift is in P (Park) (automatic transmission)
- The ignition switch is in the OFF position
- The driver and front passenger safety belts are unbuckled

While the design allows you to deactivate your Belt-Minder®, this system is designed to improve your chances of being safely belted and surviving an accident. We recommend you leave the Belt-Minder® system activated for yourself and others who may use the vehicle. To reduce the risk of injury, do not deactivate/activate the Belt-Minder® feature while driving the vehicle.

1. Turn the ignition switch to the RUN (or ON) position. DO NOT START THE ENGINE.

2. Wait until the safety belt warning light turns off (Approximately 1–2 minutes).

- Step 3 must be completed within 50 seconds after the safety belt warning light turns off.

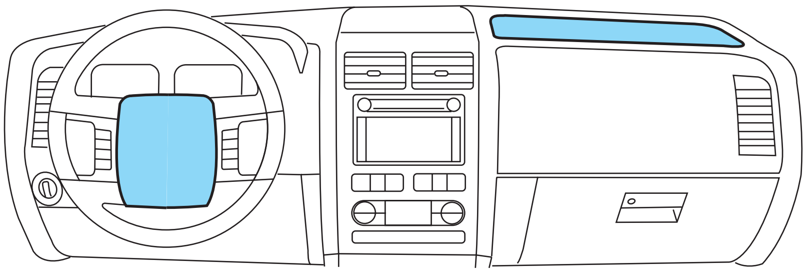
3. For the seating position being disabled, at a moderate speed, buckle then unbuckle the safety belt nine times, ending in the unbuckled state. Step 3 must be completed within 50 seconds after the safety belt warning light turns off.

- After Step 3, the safety belt warning light will be turned on for three seconds.

4. Within approximately seven seconds of the light turning off, buckle then unbuckle the safety belt.

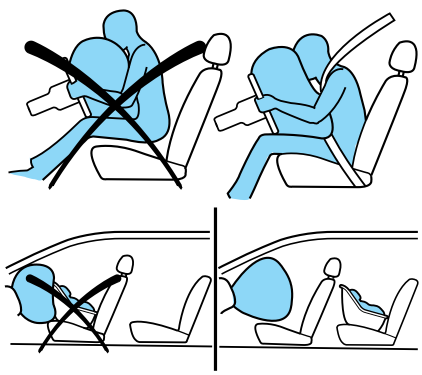
- This will disable the Belt-Minder® feature for that seating position if it is currently enabled. As confirmation, the safety belt warning light will flash four times per second for three seconds.
- This will enable the Belt-Minder® feature for that seating position if it is currently disabled. As confirmation, the safety belt warning light will flash four times per second for three seconds, followed by three seconds with the light off, then followed by the safety belt warning light flashing four times per second for three seconds again.

AIRBAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS)



Important supplemental restraint system precautions

Airbags DO NOT inflate slowly or gently and the risk of injury from a deploying airbag is greatest close to the trim covering the airbag module.



> ⚠ All occupants of the vehicle, including the driver, should always properly wear their safety belts, even when an air bag supplemental restraint system (SRS) is provided.

> ⚠ Always transport children 12 years old and under in the back seat and always properly use appropriate child restraints.

> ⚠ National Highway Traffic Safety Administration (NHTSA) recommends a minimum distance of at least 10 inches (25 cm) between an occupant's chest and the driver airbag module.

Never place your arm over the airbag module as a deploying airbag can result in serious arm fractures or other injuries.

Steps you can take to properly position yourself away from the airbag:

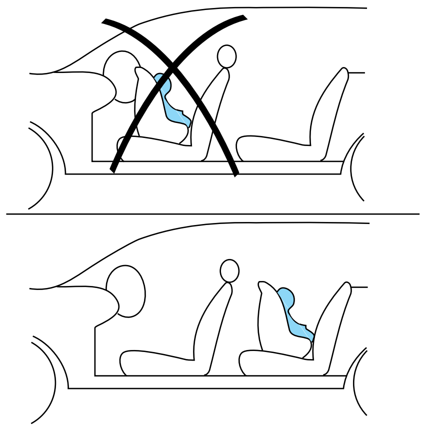
- Move your seat to the rear as far as you can while still reaching the pedals comfortably.
- Recline the seat slightly (one or two degrees) from the upright position.

Do not put anything on or over the airbag module. Placing objects on or over the airbag inflation area may cause those objects to be propelled by the airbag into your face and torso causing serious injury.

Do not attempt to service, repair, or modify the airbag supplemental restraint system (SRS) or its fuses. See your authorized dealer.

Modifying or adding equipment to the front end of the vehicle (including frame, bumper, front end body structure and tow hooks) may affect the performance of the airbag system, increasing the risk of injury. Do not modify the front end of the vehicle.

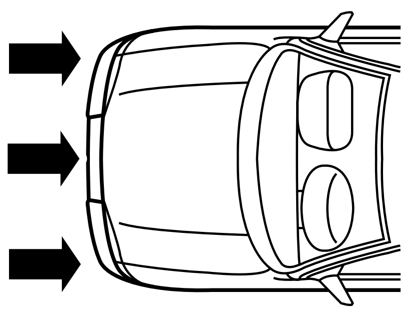
Children and airbags



Children must always be properly restrained. Accident statistics suggest that children are safer when properly restrained in the rear seating positions than in the front seating position. Failure to follow these instructions may increase the risk of injury in a collision.

> ⚠ Airbags can kill or injure a child in a child seat. **NEVER** place a rear-facing child seat in front of an active airbag. If you must use a forward-facing child seat in the front seat, move the seat all the way back.

How does the safety belt pretensioner and airbag supplemental restraint system work?



The safety belt pretensioner and airbag SRS are designed to activate when the vehicle sustains longitudinal deceleration sufficient to cause the sensors to close an electrical circuit that initiates pretensioner activation and airbag inflation.

The fact that the airbags did not activate in a collision does not mean that something is wrong with the system. Rather, it means the forces were not of the type sufficient to cause activation. Front airbags are designed to activate in frontal and near-frontal collisions, not rollover, side-impact, or rear-impacts unless the collision causes sufficient longitudinal deceleration.

The airbags inflate and deflate rapidly upon activation. After airbag deployment, it is normal to notice a smoke-like, powdery residue or smell the burnt propellant. This may consist of cornstarch, talcum powder (to lubricate the bag) or sodium compounds (e.g., baking soda) that result from the combustion process that inflates the airbag. Small amounts of sodium hydroxide may be present which may irritate the skin and eyes, but none of the residue is toxic.

While the system is designed to help reduce serious injuries, contact with a deploying airbag may also cause abrasions, swelling or temporary hearing loss. Because airbags must inflate rapidly and with considerable force, there is the risk of death or serious injuries such as fractures, facial and eye injuries or internal injuries, particularly to occupants who are not properly restrained or are otherwise out of position at the time of airbag deployment. Thus, it is extremely important that occupants be properly restrained as far away from the airbag module as possible while maintaining vehicle control.

Several air bag system components get hot after inflation. Do not touch them after inflation.

If the air bag has deployed, **the air bag will not function again and must be replaced immediately.** If the air bag is not replaced, the unrepaired area will increase the risk of injury in a collision.

The SRS consists of:

- driver and passenger airbag modules (which include the inflators and airbags)
- seat-mounted side airbags . Refer to *Seat-mounted side airbag system* later in this chapter
- safety belt pretensioners
- one or more impact and safing sensors

- a readiness light and tone
- and the electrical wiring which connects the components
- Side curtain airbag system. Refer to *Safety Canopy™ system* later in this chapter.
- Front passenger sensing system. Refer to *Front passenger sensing system.* later in this chapter.
- “Passenger airbag off” or “pass airbag off” indicator lamp. Refer to *Front passenger sensing system.* later in this chapter.

The diagnostic module monitors its own internal circuits and the supplemental airbag electrical system wiring (including the impact sensors), the system wiring, the airbag system readiness light, the airbag back up power, the airbag ignitors and safety belt pretensioners.

Front passenger sensing system

The front passenger sensing system is designed to meet the regulatory requirements of Federal Motor Vehicle Safety Standard (FMVSS) 208 and is designed to disable (will not inflate) the front passenger’s frontal airbag under certain conditions.

The front passenger sensing system works with sensors that are part of the front passenger’s seat and safety belt. The sensors are designed to detect the presence of a properly seated occupant and determine if the front passenger’s frontal airbag should be enabled (may inflate) or disabled (will not inflate).

The front passenger sensing system will disable (will not inflate) the front passenger’s frontal airbag if:

- the front passenger seat is unoccupied, or has small/medium objects in the front seat.
- the system determines that an infant is present in a rear-facing infant seat that is installed according to the manufacturer’s instructions.
- the system determines that a small child is present in a forward-facing child restraint that is installed according to the manufacturer’s instructions.
- the system determines that a small child is present in a booster seat.
- a front passenger takes his/her weight off of the seat for a period of time.

The front passenger sensing system uses a ″passenger airbag off″ or ″pass airbag off″ indicator which will illuminate and stay lit to remind you that the front passenger frontal airbag is disabled. The indicator lamp is located in the center stack of the instrument panel above the climate controls.

PASS AIRBAG OFF

Note: The indicator lamp will illuminate for a short period of time when the ignition is turned to the ON position to confirm it is functional.

When the front passenger seat is not occupied (empty seat) or in the event that the front passenger frontal airbag is enabled (may inflate), the indicator lamp will be unlit.

The front passenger sensing system is designed to disable (will not inflate) the front passenger's frontal airbag when a rear facing infant seat, a forward-facing child restraint, or a booster seat is detected.

- When the front passenger sensing system disables (will not inflate) the front passenger frontal airbag, the indicator lamp will illuminate and stay lit to remind you that the front passenger frontal airbag is disabled.
- If the child restraint has been installed and the indicator lamp is not lit, then turn the vehicle off, remove the child restraint from the vehicle and reinstall the restraint following the child restraint manufacturer's instructions.

The front passenger sensing system is designed to enable (may inflate) the front passenger's frontal airbag anytime the system senses that a person of adult size is sitting properly in the front passenger seat.

- When the front passenger sensing system enables the front passenger frontal airbag (may inflate), the indicator lamp will be unlit and stay unlit.

If a person of adult size is sitting in the front passenger's seat, but the ″passenger airbag off″ or ″pass airbag off″ indicator lamp is lit, it is possible that the person isn't sitting properly in the seat. If this happens:

- Turn the vehicle off and ask the person to place the seatback in the full upright position.
- Have the person sit upright in the seat, centered on the seat cushion, with the person's legs comfortably extended.
- Restart the vehicle and have the person remain in this position for about two minutes. This will allow the system to detect that person and enable the passenger's frontal airbag.

- If the indicator lamp remains lit even after this, the person should be advised to ride in the rear seat.

Occupant	**Pass Airbag Off Indicator Lamp**	**Passenger Airbag**
Empty seat	Unlit	Disabled
Small child in child safety seat or booster	Lit	Disabled
Small child with safety belt buckled or unbuckled	Lit	Disabled
Adult	Unlit	Enabled

Even with Advanced Restraints Systems, children 12 and under should be properly restrained in the back seat.

After all occupants have adjusted their seats and put on safety belts, it's very important that they continue to sit properly. A properly seated occupant sits upright, leaning against the seat back, and centered on the seat cushion, with their feet comfortably extended on the floor. Sitting improperly can increase the chance of injury in a crash event. For example, if an occupant slouches, lies down, turns sideways, sits forward, leans forward or sideways, or puts one or both feet up, the chance of injury during a crash is greatly increased.

Sitting improperly out of position or with the seat back reclined too far can take off weight from the seat cushion and affect the decision of the front passenger sensing system, resulting in serious injury or death in a crash.
Always sit upright against your seatback, with your feet on the floor.

The front passenger sensing system may detect small or medium objects placed on the seat cushion. For most objects that are in the front passenger seat, the passenger airbag will be disabled. Even though the passenger airbag is disabled, the ″pass airbag off″ lamp may or may not be illuminated according to the table below.

Objects	Pass Airbag Off Indicator Lamp	Passenger Airbag
Small (i.e. 3 ring binder, small purse, bottled water)	Unlit	Disabled
Medium (i.e. heavy briefcase, fully packed luggage)	Lit	Disabled
Empty seat, or small to medium object with safety belt buckled	Lit	Disabled

If you think that the status of the passenger airbag off indicator lamp is incorrect, check for the following:

- Objects lodged underneath the seat
- Objects between the seat cushion and the center console (if equipped)
- Objects hanging off the seat back
- Objects stowed in the seatback map pocket (if equipped)
- Objects placed on the occupant's lap
- Cargo interference with the seat
- Other passengers pushing or pulling on the seat
- Rear passenger feet and knees resting or pushing on the seat

The conditions listed above may cause the weight of a properly seated occupant to be incorrectly interpreted by the front passenger sensing system. The person in the front passenger seat may appear heavier or lighter due to the conditions described in the list above.

To reduce the risk of possible serious injury:
Do not stow objects in seat back map pocket (if equipped) or hang objects off seat back if a child is in the front passenger seat.
Do not place objects underneath the front passenger seat or between the seat and the center console (if equipped).
Check the "passenger airbag off" or "pass airbag off" indicator lamp for proper airbag status.
Failure to follow these instructions may interfere with the front passenger seat sensing system.

In case there is a problem with the front passenger sensing system, the airbag readiness light in the instrument cluster will stay lit.

If the airbag readiness light is lit, do the following:

The driver and/or adult passengers should check for any objects that may be lodged underneath the front passenger seat or cargo interfering with the seat.

If objects are lodged and/or cargo is interfering with the seat; please take the following steps to remove the obstruction:

- Pull the vehicle over.
- Turn the vehicle off.
- Driver and/or adult passengers should check for any objects lodged underneath the front passenger seat or cargo interfering with the seat.
- Remove the obstruction(s) (if found).
- Restart the vehicle.
- Wait at least 2 minutes and verify that the airbag readiness light is no longer illuminated
- If the airbag readiness light remains illuminated, this may or may/not be a problem due to the front passenger sensing system.

DO NOT attempt to repair or service the system; take your vehicle immediately to an authorized dealer.

If it is necessary to modify an advanced front airbag system to accommodate a person with disabilities, contact the Ford Customer Relationship Center at the phone number shown in the *Customer Assistance* section of this *Owner's Guide*.

> ⚠ Any alteration/modification to the front passenger seat may affect the performance of the front passenger sensing system.

Determining if the system is operational

The supplemental restraint system uses a warning indicator light in the instrument cluster or a back-up tone to indicate the condition of the system. Refer to the *Warning lights and chimes* section in the *Instrument Cluster* chapter. Routine maintenance of the airbag is not required.

A difficulty with the system is indicated by one or more of the following:

- The readiness light (same light for front and side airbag system) will either flash or stay lit.
- The readiness light will not illuminate immediately after ignition is turned on.
- A series of five beeps will be heard. The tone pattern will repeat periodically until the problem and/or light are repaired.

If any of these things happen, even intermittently, have the supplemental restraint system serviced at an authorized dealer immediately. Unless serviced, the system may not function properly in the event of a collision.

Seat-mounted side airbag system

Do not place objects or mount equipment on or near the airbag cover on the side of the seatbacks of the front seats or in front seat areas that may come into contact with a deploying airbag. Failure to follow these instructions may increase the risk of personal injury in the event of a collision.

Do not use accessory seat covers. The use of accessory seat covers may prevent the deployment of the side airbags and increase the risk of injury in an accident.

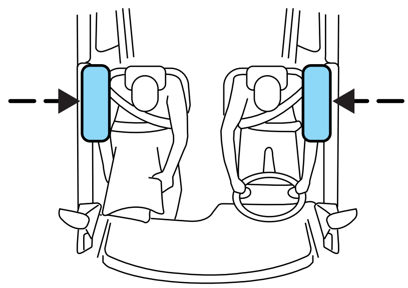
Do not lean your head on the door. The side airbag could injure you as it deploys from the side of the seatback.

Do not attempt to service, repair, or modify the airbag SRS, its fuses or the seat cover on a seat containing an airbag. See your authorized dealer.

All occupants of the vehicle should always wear their safety belts even when an airbag SRS is provided.

How does the side airbag system work?

The design and development of the side airbag system included recommended testing procedures that were developed by a group of automotive safety experts known as the Side Airbag Technical Working Group. These recommended testing procedures help reduce the risk of injuries related to the deployment of side airbags.



The side airbag system consists of the following:

- An inflatable nylon bag (airbag) with a gas generator concealed behind the outboard bolster of the driver and front passenger seatbacks.
- The same warning light, electronic control and diagnostic unit as used for the front airbags.
- Two crash sensors mounted on the B pillar (one on each side of the vehicle).
- Two crash sensors located at the C pillar behind the rear doors (one on each side of the vehicle).

Side airbags, in combination with safety belts, can help reduce the risk of severe injuries in the event of a significant side impact collision.

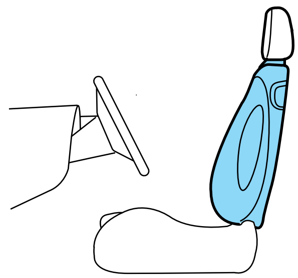
The side airbags are fitted on the outboard side of the seatbacks of the front seats. In certain lateral collisions, the airbag on the side affected by the collision will be inflated. If the front passenger sensing system detects an empty seat, the front passenger seat-mounted side airbag will be deactivated. The airbag was designed to inflate between the door panel and occupant to further enhance the protection provided occupants in side impact collisions.

The airbag SRS is designed to activate when the vehicle sustains lateral deceleration sufficient to cause the sensors to close an electrical circuit that initiates airbag inflation.

The fact that the airbags did not inflate in a collision does not mean that something is wrong with the system. Rather, it means the forces were not of the type sufficient to cause activation. Side airbags are designed to inflate in side-impact collisions, not roll-over, rear-impact, frontal or near-frontal collisions, unless the collision causes sufficient lateral deceleration.

Several air bag system components get hot after inflation. Do not touch them after inflation.

If the side airbag has deployed, **the airbag will not function again. The side airbag system (including the seat) must be inspected and serviced by an authorized dealer.** If the airbag is not replaced, the unrepaired area will increase the risk of injury in a collision.



Determining if the system is operational

The SRS uses a readiness light in the instrument cluster or a tone to indicate the condition of the system. Refer to the *Airbag readiness* section in the *Instrument cluster* chapter. Routine maintenance of the airbag is not required.

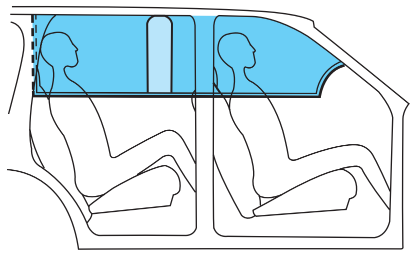
Any difficulty with the system is indicated by one or more of the following:

- The readiness light (same light as used for front airbag system) will either flash or stay lit.
- The readiness light will not illuminate immediately after ignition is turned to the RUN position.
- A series of five beeps will be heard. The tone pattern will repeat periodically until the problem and light are repaired.

If any of these things happen, even intermittently, have the SRS serviced at an authorized dealer immediately. Unless serviced, the system may not function properly in the event of a collision.

Safety Canopy™ system

Do not place objects or mount equipment on or near the headliner at the siderail that may come into contact with a deploying Safety Canopy™. Failure to follow these instructions may increase the risk of personal injury in the event of a collision.



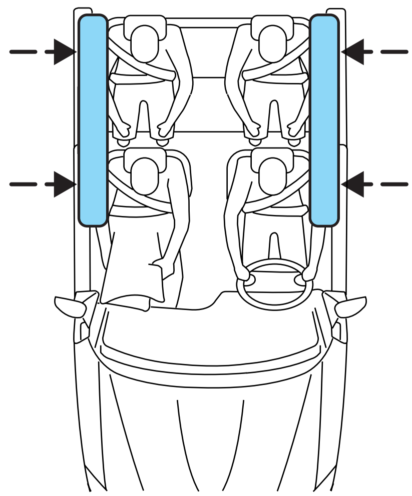
Do not lean your head on the door. The Safety Canopy™ could injure you as it deploys from the headliner.

Do not attempt to service, repair, or modify the Safety Canopy™ system, its fuses, the A, B, C or D pillar trim, or the headliner on a vehicle containing a Safety Canopy™. See your authorized dealer.

All occupants of the vehicle including the driver should always wear their safety belts even when an airbag SRS and Safety Canopy™ system is provided.

To reduce risk of injury, do not obstruct or place objects in the deployment path of the inflatable Safety Canopy™.

How does the Safety Canopy™ system work?



The design and development of the Safety Canopy™ system included recommended testing procedures that were developed by a group of automotive safety experts known as the Side Airbag Technical Working Group. These recommended testing procedures help reduce the risk of injuries related to the deployment of side airbags (including the Safety Canopy™).

The Safety Canopy™ system consists of the following:

- An inflatable nylon curtain with a gas generator concealed behind the headliner and above the doors (one on each side of vehicle).
- A headliner designed to flex open above the side doors to allow Safety Canopy™ deployment.
- The same readiness airbag light, electronic control and diagnostic unit as used for the front airbags.
- Two crash sensors mounted on the B pillar (one on each side of the vehicle).
- Two crash sensors located at the C pillar behind the rear doors (one on each side of the vehicle).
- Rollover sensor in the restraints control module (RCM).

The Safety Canopy™ system, in combination with safety belts, can help reduce the risk of severe injuries in the event of a significant side impact collision or rollover event.

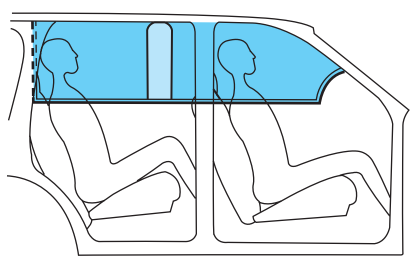
Children 12 years old and under should always be properly restrained in the second or third row seats. The Safety Canopy™ will not interfere with children restrained using a properly installed child or booster seat because it is designed to inflate downward from the headliner above the doors along the side window opening.

The Safety Canopy™ system is designed to activate when the vehicle sustains lateral deceleration sufficient to cause the side crash sensor to close an electrical circuit that initiates Safety Canopy™ inflation or when a certain likelihood of a rollover event is detected by the rollover sensor.

The Safety Canopy™ is mounted to roof side-rail sheet metal, behind the headliner, along the entire side of the vehicle. In certain lateral collisions or rollover events, the Safety Canopy™ system will be activated, regardless of which seats are occupied. The Safety Canopy™ is designed to inflate between the side window area and occupants to further enhance protection provided in side impact collisions and rollover events.

The fact that the Safety Canopy™ did not activate in a collision does not mean that something is wrong with the system. Rather, it means the forces were not of the type sufficient to cause activation. The Safety Canopy™ is designed to inflate in certain side impact collisions or rollover events, not in rear impact, frontal or near-frontal collisions, unless the collision causes sufficient lateral deceleration or rollover.

If the Safety Canopy™ system has deployed, **the Safety Canopy™ will not function again unless replaced. The Safety Canopy™ system (including the A, B, C, and D pillar trim and headliner) must be inspected and serviced by an authorized dealer.** If the Safety Canopy™ is not replaced, the unrepaired area will increase the risk of injury in a collision.



Determining if the system is operational

The SRS uses a readiness light in the instrument cluster or a tone to indicate the condition of the system. Refer to the *Airbag readiness* section in the *Instrument Cluster* chapter. Routine maintenance of the airbag is not required.

Any difficulty with the system is indicated by one or more of the following:

- The readiness airbag light (same light as for front airbag system) will either flash or stay lit.
- The readiness light will not illuminate immediately after ignition is turned on.
- A series of five beeps will be heard. The tone pattern will repeat periodically until the problem and light are repaired.

If any of these things happen, even intermittently, have the SRS serviced at your an authorized dealer immediately. Unless serviced, the system may not function properly in the event of a collision or rollover event.

Disposal of airbags and airbag equipped vehicles (including pretensioners)

See your authorized dealer. Airbags MUST BE disposed of by qualified personnel.

SAFETY RESTRAINTS FOR CHILDREN

See the following sections for directions on how to properly use safety restraints for children. Also see *Airbag supplemental restraint system (SRS)* in this chapter for special instructions about using airbags.

Important child restraint precautions

You are required by law to use safety restraints for children in the U.S. and Canada. If small children (generally children who are four years old or younger and who weigh 40 lb. [18 kg] or less) ride in your vehicle, you must put them in safety seats made especially for children. Many states require that children use approved booster seats until they are eight years old. Check your local and state or provincial laws for specific requirements regarding the safety of children in your vehicle. When possible, always place children under age 12 in the rear seat of your vehicle. Accident statistics suggest that children are safer when properly restrained in the rear seating positions than in the front seating position.

Never let a passenger hold a child on his or her lap while the vehicle is moving. The passenger cannot protect the child from injury in a collision.

Always follow the instructions and warnings that come with any infant or child restraint you might use.

Children and safety belts

If the child is the proper size, restrain the child in a safety seat. Children who are too large for child safety seats (as specified by your child safety seat manufacturer) should always wear safety belts.

Follow all the important safety restraint and airbag precautions that apply to adult passengers in your vehicle.

If the shoulder belt portion of a combination lap and shoulder belt can be positioned so it does not cross or rest in front of the child's face or neck, the child should wear the lap and shoulder belt. Moving the child closer to the center of the vehicle may help provide a good shoulder belt fit.

Do not leave children, unreliable adults, or pets unattended in your vehicle.

Child booster seats

Children outgrow a typical convertible or toddler seat when they weigh 40 lb. (18 kg) and are around 4 years of age. Although the lap/shoulder belt will provide some protection, these children are still too small for lap/shoulder belts to fit properly, which could increase the risk of serious injury in a crash.

To improve the fit of both the lap and shoulder belt on children who have outgrown child safety seats, Ford Motor Company recommends use of a belt-positioning booster.

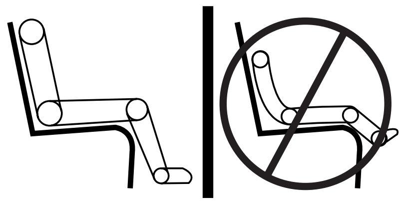
Booster seats position a child so that safety belts fit better. They lift the child up so that the lap belt rests low across the hips and the knees bend comfortably. Booster seats may also make the shoulder belt fit better and more comfortably. Try to keep the belt near the middle of the shoulder.

When children should use booster seats

Children need to use booster seats from the time they outgrow the toddler seat until they are big enough for the vehicle seat and lap/shoulder belt to fit properly. Generally this is when they weigh about 80 lb. (36 kg) (about 8 to 12 years old).

Booster seats should be used until you can answer YES to ALL of these questions:

- Can the child sit all the way back against the vehicle seat back with knees bent comfortably at the edge of the seat without slouching?



- Does the lap belt rest low across the hips?
- Is the shoulder belt centered on the shoulder and chest?
- Can the child stay seated like this for the whole trip?

Types of booster seats

There are two types of belt-positioning booster seats:

- Those that are backless.

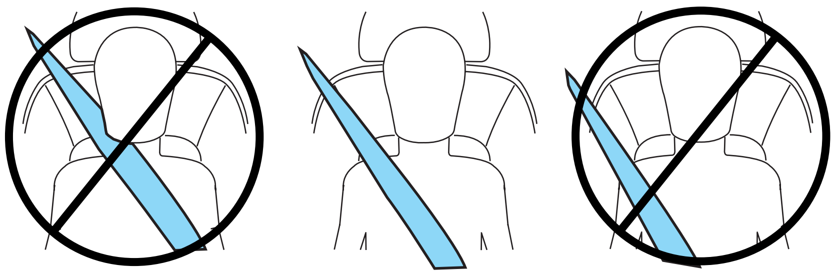
  If your backless booster seat has a removable shield, remove the shield and use the lap/shoulder belt. If a seating position has a low seat back and no head restraint, a backless booster seat may place your child's head (top of ear level) above the top of the seat. In this case, move the backless booster to another seating position with a higher seat back and lap/shoulder belts.

- Those with a high back.

  If, with a backless booster seat, you cannot find a seating position that adequately supports your child's head, a high back booster seat would be a better choice.

Either type can be used at any seating position equipped with lap/shoulder belts if your child is over 40 lb. (18 kg).

Children and booster seats vary widely in size and shape. Choose a booster that keeps the lap belt low and snug across the hips, never up across the stomach, and lets you adjust the shoulder belt to cross the chest and rest snugly near the center of the shoulder. The drawings below compare the ideal fit (center) to a shoulder belt uncomfortably close to the neck and a shoulder belt that could slip off the shoulder.



If the booster seat slides on the vehicle seat, placing a rubberized mesh sold as shelf or carpet liner under the booster seat may improve this condition.

The importance of shoulder belts

Using a booster without a shoulder belt increases the risk of a child's head hitting a hard surface in a collision. For this reason, you should never use a booster seat with a lap belt only. It is best to use a booster seat with lap/shoulder belts in the back seat- the safest place for children to ride.

Move a child to a different seating location if the shoulder belt does not stay positioned on the shoulder during use.

Follow all instructions provided by the manufacturer of the booster seat.

Never put the shoulder belt under a child's arm or behind the back because it eliminates the protection for the upper part of the body and may increase the risk of injury or death in a collision.

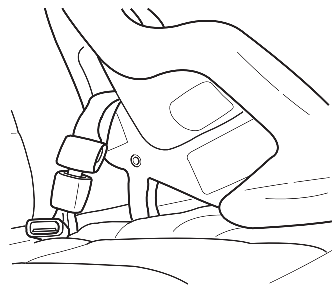
Never use pillows, books, or towels to boost a child. They can slide around and increase the likelihood of injury or death in a collision.

SAFETY SEATS FOR CHILDREN

Child and infant or child safety seats

Use a safety seat that is recommended for the size and weight of the child. Carefully follow all of the manufacturer's instructions with the safety seat you put in your vehicle. If you do not install and use the safety seat properly, the child may be injured in a sudden stop or collision.

When installing a child safety seat:



- Review and follow the information presented in the *Airbag Supplemental Restraint System* section in this chapter.
- Use the correct safety belt buckle for that seating position.
- Insert the belt tongue into the proper buckle until you hear a snap and feel it latch. Make sure the tongue is securely fastened in the buckle.
- Keep the buckle release button pointing up and away from the safety seat, with the tongue between the child seat and the release button, to prevent accidental unbuckling.
- Place seat back in upright position.
- Put the safety belt in the automatic locking mode. Refer to *Automatic locking mode.*
- LATCH lower anchors are recommended for use by children up to 48 lb (22 kg) in a child restraint. Top tether anchors can be used for children up to 60 lb (27 kg) in a child restraint, and to provide upper torso restraint for children up to 80 lb (36 kg) using an upper torso harness and a belt-positioning booster.

Ford Motor Company recommends the use of a child safety seat having a top tether strap. Install the child safety seat in a seating position with LATCH and tether anchors. For more information on top tether straps and anchors, refer to *Attaching safety seats with tether straps* in this chapter. For more information of LATCH anchors refer to *Attaching safety seats with LATCH (Lower Anchors and Tethers for Children) attachments* in this chapter.

Carefully follow all of the manufacturer's instructions included with the safety seat you put in your vehicle. If you do not install and use the safety seat properly, the child may be injured in a sudden stop or collision.

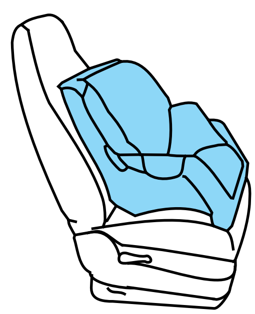
Rear-facing child seats or infant carriers should never be placed in front of an active passenger airbag.

Installing child safety seats with combination lap and shoulder belts

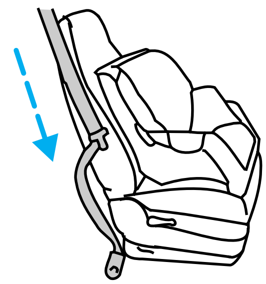
Airbags can kill or injure a child in a child seat. **NEVER** place a rear-facing child seat in front of an active airbag. If you must use a forward-facing child seat in the front seat, move the seat all the way back.

Children 12 and under should be properly restrained in the rear seat whenever possible.

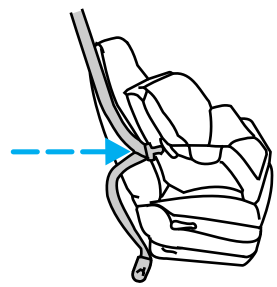
1. Position the child safety seat in a seat with a combination lap and shoulder belt.



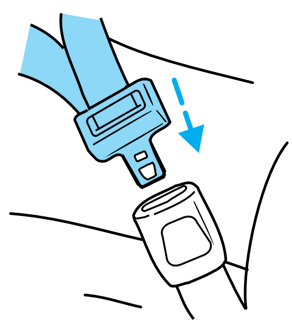
2. Pull down on the shoulder belt and then grasp the shoulder belt and lap belt together.



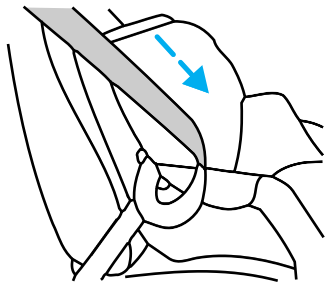
3. While holding the shoulder and lap belt portions together, route the tongue through the child seat according to the child seat manufacturer's instructions. Be sure the belt webbing is not twisted.



4. Insert the belt tongue into the proper buckle (the buckle closest to the direction the tongue is coming from) for that seating position until you hear a snap and feel the latch engage. Make sure the tongue is latched securely by pulling on it.

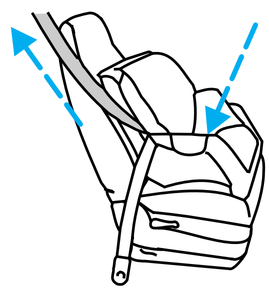


5. To put the retractor in the automatic locking mode, grasp the shoulder portion of the belt and pull downward until all of the belt is pulled out and a click is heard.



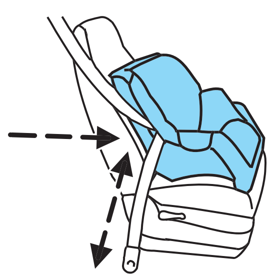
6. Allow the belt to retract. The belt will click as it retracts to indicate it is in the automatic locking mode.

7. Pull the lap belt portion across the child seat toward the buckle and pull up on the shoulder belt while pushing down with your knee on the child seat.



8. Allow the safety belt to retract to remove any slack in the belt.

9. Before placing the child in the seat, forcibly move the seat forward and back to make sure the seat is securely held in place. To check this, grab the seat at the belt path and attempt to move it side to side and forward. There should be no more than one inch of movement for proper installation.



10. Try to pull the belt out of the retractor to make sure the retractor is in the automatic locking mode (you should not be able to pull more belt out). If the retractor is not locked, unbuckle the belt and repeat Steps 2 through 9.

Check to make sure the child seat is properly secured before each use.

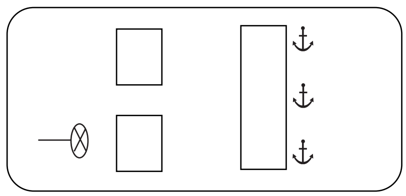
Attaching child safety seats with tether straps

Most new forward-facing child safety seats include a tether strap which goes over the back of the seat and hooks to an anchoring point. Tether straps are available as an accessory for many older safety seats. Contact the manufacturer of your child seat for information about ordering a tether strap.

The rear seats of your vehicle are equipped with built-in tether strap anchors located behind the seats as described below.

The tether anchors in your vehicle are located under the second row seat gap cover marked with tether anchor symbols (shown with title).

The tether strap anchors in your vehicle are in the following positions (shown from top view):



Attach the tether strap only to the appropriate tether anchor as shown. The tether strap may not work properly if attached somewhere other than the correct tether anchor.

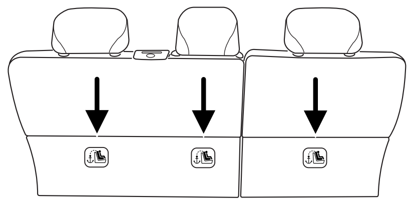
Do not use seat anchors as cargo tie downs.

1. Position the child safety seat on the seat cushion.

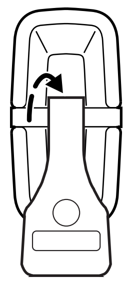
2. Route the child safety seat tether strap over the back of the seat.

For vehicles with adjustable head restraints, route the tether strap under the head restraint and between the head restraint posts. For seating positions with non-adjustable (fixed) head restraints, route the tether strap over the top of the head restraint.

3. Locate the correct anchor behind the gap cover for the selected seating position.



4. Clip the tether strap to the anchor as shown.



If the tether strap is clipped incorrectly, the child safety seat may not be retained properly in the event of a collision.

5. Install the child safety seat tightly using the LATCH anchors or safety belts. Follow the instructions in this chapter.

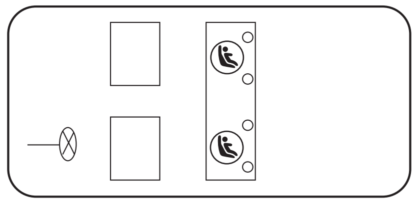
6. Tighten the child safety seat tether strap according to the manufacturer's instructions.

If the safety seat is not anchored properly, the risk of a child being injured in a collision greatly increases.

Attaching safety seats with LATCH (Lower Anchors and Tethers for Children) attachments for child seat anchors

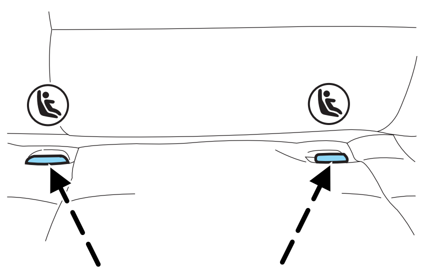
Some child safety seats have two rigid or webbing mounted attachments that connect to two anchors at certain seating positions in your vehicle. This type of child seat eliminates the need to use safety belts to attach the child seat. For forward-facing child seats, the tether strap must also be attached to the proper tether anchor. See *Attaching safety seats with tether straps* in this chapter.

Your vehicle has LATCH anchors for child seat installation at the seating positions marked with the child seat symbol.



The anchors at the center of the rear seat are further apart than the sets of lower anchors for child seat installation at other seating positions. A child seat with rigid LATCH attachments cannot be installed at this seating position. LATCH compatible child seats (with attachments on belt webbing) can be used at this seating position only if the child seat instructions state that the child seat can be installed to anchors that are spaced up to 20 inches (500 mm) apart. Do not attach a child seat to any lower anchor if an adjacent child seat is attached to that anchor.

Never attach two LATCH child safety seats to the same anchor. In a crash, one anchor may not be strong enough to hold two child safety seat attachments and may break, causing serious injury or death.



The lower anchors for child seat installation are located at the rear section of the rear seat between the cushion and seat back. The LATCH anchors are below the locator symbols on the seat back.

Follow the child seat manufacturer's instructions to properly install a child seat with LATCH attachments.

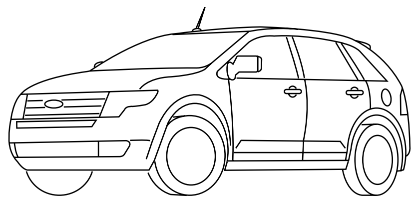
Attach LATCH lower attachments of the child seat only to the anchors shown.

If you install a child seat with rigid LATCH attachments, do not tighten the tether strap enough to lift the child seat off the vehicle seat cushion when the child is seated in it. Keep the tether strap just snug without lifting the front of the child seat. Keeping the child seat just touching the vehicle seat gives the best protection in a severe crash.

Each time you use the safety seat, check that the seat is properly attached to the lower anchors and tether anchor. Try to tilt the child seat from side to side. Also try to tug the seat forward. Check to see if the anchors hold the seat in place.

If the safety seat is not anchored properly, the risk of a child being injured in a crash greatly increases.

NOTICE TO CROSSOVER VEHICLE OWNERS



Crossover vehicles handle differently than passenger cars in the various driving conditions that are encountered on streets, highways and off-road. Crossover vehicles are not designed for cornering at speeds as high as passenger cars any more than low-slung sports cars are designed to perform satisfactorily under off-road conditions.

Crossover vehicles have a significantly higher rollover rate than other types of vehicles. To reduce the risk of serious injury or death from a rollover or other crash you must:

- Avoid sharp turns and abrupt maneuvers;
- Drive at safe speeds for the conditions;
- Keep tires properly inflated;
- Never overload or improperly load your vehicle; and
- Make sure every passenger is properly restrained.

In a rollover crash, an unbelted person is significantly more likely to die than a person wearing a seat belt. All occupants must wear seat belts and children/infants must use appropriate restraints to minimize the risk of injury or ejection.

Study your *Owner's Guide* for specific information about equipment features, instructions for safe driving and additional precautions to reduce the risk of an accident or serious injury.

VEHICLE CHARACTERISTICS

All Wheel Drive (AWD) System (if equipped)

Your vehicle may be equipped with a full-time All Wheel Drive (AWD) system. With the AWD option, power will be delivered to the front wheels and distributed to the rear wheels as needed. This increases traction which may enable you to safely drive over terrain and road conditions that a conventional two-wheel drive vehicle cannot. The AWD system is active all the time and requires no input from the operator.

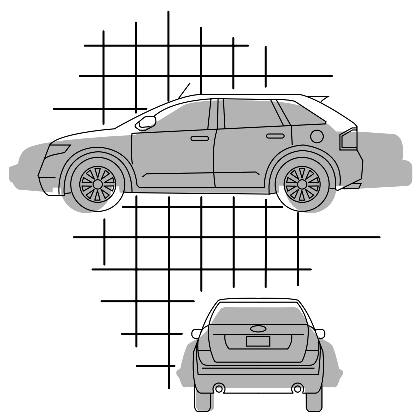
Note: Your AWD vehicle is not intended for off-road use. The AWD feature gives your vehicle some limited off-road capabilities in which driving surfaces are relatively level, obstruction-free and otherwise similar to normal on-road driving conditions. Operating your vehicle under other than those conditions could subject the vehicle to excessive stress which might result in damage which is not covered under your warranty.

For AWD vehicles, a spare tire of a different size other that the tire provided should never be used. A dissimilar spare tire size (other than the spare tire provided) or major dissimilar tire sized between the front and rear axles could cause the AWD system to stop functioning and default to front wheel drive.

Do not become overconfident in the ability of AWD vehicles. Although a AWD vehicle may accelerate better than two-wheel drive vehicle in low traction situations, it won’t stop any faster than two-wheel drive vehicles. Always drive at a safe speed.

How your vehicle differs from other vehicles

Crossover vehicles can differ from some other vehicles in a few noticeable ways. Your vehicle may be:



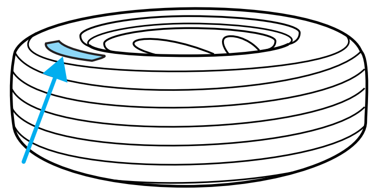
- Higher – to allow higher load carrying capacity.
- Shorter – to give it the capability to approach inclines. All other things held equal, a shorter wheelbase may make your vehicle quicker to respond to steering inputs than a vehicle with a longer wheelbase.
- Narrower — to provide greater maneuverability in tight spaces.

As a result of the above dimensional differences, crossover vehicles often will have a higher center of gravity and a greater difference in center of gravity between the loaded and unloaded condition.

These differences that make your vehicle so versatile also make it handle differently than an ordinary passenger car.

INFORMATION ABOUT UNIFORM TIRE QUALITY GRADING

Tire Quality Grades apply to new pneumatic passenger car tires. The Quality grades can be found where applicable on the tire sidewall between tread shoulder and maximum section width. For example:



- **Treadwear 200 Traction AA Temperature A**

These Tire Quality Grades are determined by standards that the United States Department of Transportation has set.

Tire Quality Grades apply to new pneumatic passenger car tires. They do not apply to deep tread, winter-type snow tires, space-saver or temporary use spare tires, light truck or "LT" type tires, tires with nominal rim diameters of 10 to 12 inches or limited production tires as defined in Title 49 Code of Federal Regulations Part 575.104(c)(2).

U.S. Department of Transportation-Tire quality grades: The U.S. Department of Transportation requires Ford Motor Company to give you the following information about tire grades exactly as the government has written it.

Treadwear

The treadwear grade is a comparative rating based on the wear rate of the tire when tested under controlled conditions on a specified government test course. For example, a tire graded 150 would wear one and one-half (1 1/2) times as well on the government course as a tire graded 100. The relative performance of tires depends upon the actual conditions of their use, however, and may depart significantly from the norm due to variations in driving habits, service practices, and differences in road characteristics and climate.

Traction AA A B C

The traction grades, from highest to lowest are AA, A, B, and C. The grades represent the tire's ability to stop on wet pavement as measured under controlled conditions on specified government test surfaces of asphalt and concrete. A tire marked C may have poor traction performance.

The traction grade assigned to this tire is based on straight-ahead braking traction tests, and does not include acceleration, cornering, hydroplaning or peak traction characteristics.

Temperature A B C

The temperature grades are A (the highest), B and C, representing the tire's resistance to the generation of heat and its ability to dissipate heat when tested under controlled conditions on a specified indoor laboratory test wheel. Sustained high temperature can cause the material of the tire to degenerate and reduce tire life, and excessive temperature can lead to sudden tire failure. The grade C corresponds to a level of performance which all passenger car tires must meet under the Federal Motor Vehicle Safety Standard No. 139. Grades B and A represent higher levels of performance on the laboratory test wheel than the minimum required by law.

The temperature grade for this tire is established for a tire that is properly inflated and not overloaded. Excessive speed, underinflation, or excessive loading, either separately or in combination, can cause heat buildup and possible tire failure.

TIRES

Tires are designed to give many thousands of miles of service, but they must be maintained in order to get the maximum benefit from them.

Glossary of tire terminology

- **Tire label:** A label showing the OE (Original Equipment) tire sizes, recommended inflation pressure and the maximum weight the vehicle can carry.
- **Tire Identification Number (TIN):** A number on the sidewall of each tire providing information about the tire brand and manufacturing plant, tire size and date of manufacture. Also referred to as DOT code.
- **Inflation pressure:** A measure of the amount of air in a tire.
- **Standard load:** A class of P-metric or Metric tires designed to carry a maximum load at 35 psi [37 psi (2.5 bar) for Metric tires]. Increasing the inflation pressure beyond this pressure will not increase the tire's load carrying capability.
- **Extra load:** A class of P-metric or Metric tires designed to carry a heavier maximum load at 41 psi [43 psi (2.9 bar) for Metric tires].

Increasing the inflation pressure beyond this pressure will not increase the tire's load carrying capability.

- **kPa:** Kilopascal, a metric unit of air pressure.
- **PSI:** Pounds per square inch, a standard unit of air pressure.
- **Cold inflation pressure:** The tire pressure when the vehicle has been stationary and out of direct sunlight for an hour or more and prior to the vehicle being driven for 1 mile (1.6 km).
- **Recommended inflation pressure:** The cold inflation pressure found on the Safety Compliance Certification Label or Tire Label located on the B-Pillar or the edge of the driver's door.
- **B-pillar:** The structural member at the side of the vehicle behind the front door.
- **Bead area of the tire:** Area of the tire next to the rim.
- **Sidewall of the tire:** Area between the bead area and the tread.
- **Tread area of the tire:** Area of the perimeter of the tire that contacts the road when mounted on the vehicle.
- **Rim:** The metal support (wheel) for a tire or a tire and tube assembly upon which the tire beads are seated.

INFLATING YOUR TIRES

Safe operation of your vehicle requires that your tires are properly inflated. Remember that a tire can lose up to half of its air pressure without appearing flat.

Every day before you drive, check your tires. If one looks lower than the others, use a tire gauge to check pressure of all tires and adjust if required.

At least once a month and before long trips, inspect each tire and check the tire pressure with a tire gauge (including spare, if equipped). Inflate all tires to the inflation pressure recommended by Ford Motor Company.

Use a tire gauge to check the tire inflation pressure, including the spare (if equipped), at least monthly and before long trips. You are strongly urged to buy a reliable tire pressure gauge, as automatic service station gauges may be inaccurate. Ford recommends the use of a digital or dial-type tire pressure gauge rather than a stick-type tire pressure gauge.

Use the recommended cold inflation pressure for optimum tire performance and wear. Under-inflation or over-inflation may cause uneven treadwear patterns.

Under-inflation is the most common cause of tire failures and may result in severe tire cracking, tread separation or "blowout", with unexpected loss of vehicle control and increased risk of injury. Under-inflation increases sidewall flexing and rolling resistance, resulting in heat buildup and internal damage to the tire. It also may result in unnecessary tire stress, irregular wear, loss of vehicle control and accidents. A tire can lose up to half of its air pressure and not appear to be flat!

Always inflate your tires to the Ford recommended inflation pressure even if it is less than the maximum inflation pressure information found on the tire. The Ford recommended tire inflation pressure is found on the Safety Compliance Certification Label or Tire Label which is located on the B-Pillar or the edge of the driver's door. Failure to follow the tire pressure recommendations can cause uneven treadwear patterns and adversely affect the way your vehicle handles.

Maximum Permissible Inflation Pressure is the tire manufacturer's maximum permissible pressure and/or the pressure at which the maximum load can be carried by the tire. This pressure is normally higher than the manufacturer's recommended cold inflation pressure which can be found on the Safety Compliance Certification Label or Tire Label which is located on the B-Pillar or the edge of the driver's door. The cold inflation pressure should never be set lower than the recommended pressure on the Safety Compliance Certification Label or Tire Label.

When weather temperature changes occur, tire inflation pressures also change. A 10°F (6°C) temperature drop can cause a corresponding drop of 1 psi (7 kPa) in inflation pressure. Check your tire pressures frequently and adjust them to the proper pressure which can be found on the Safety Compliance Certification Label or Tire Label.

To check the pressure in your tire(s):

1. Make sure the tires are cool, meaning they are not hot from driving even a mile.

If you are checking tire pressure when the tire is hot, (i.e. driven more than 1 mile [1.6 km]), never "bleed" or reduce air pressure. The tires are hot from driving and it is normal for pressures to increase above recommended cold pressures. A hot tire at or below recommended cold inflation pressure could be significantly under-inflated.

Note: If you have to drive a distance to get air for your tire(s), check and record the tire pressure first and add the appropriate air pressure when you get to the pump. It is normal for tires to heat up and the air pressure inside to go up as you drive.

2. Remove the cap from the valve on one tire, then firmly press the tire gauge onto the valve and measure the pressure.

3. Add enough air to reach the recommended air pressure.

Note: If you overfill the tire, release air by pushing on the metal stem in the center of the valve. Then recheck the pressure with your tire gauge.

4. Replace the valve cap.

5. Repeat this procedure for each tire, including the spare.

Note: Some spare tires operate at a higher inflation pressure than the other tires. For T-type/mini-spare tires (see *Dissimilar Spare Tire/Wheel Information* section for description): Store and maintain at 60 psi (4.15 bar). For Full Size and Dissimilar spare tires (see *Dissimilar Spare Tire/Wheel Information* section for description): Store and maintain at the higher of the front and rear inflation pressure as shown on the Tire Label.

6. Visually inspect the tires to make sure there are no nails or other objects embedded that could poke a hole in the tire and cause an air leak.

7. Check the sidewalls to make sure there are no gouges, cuts or bulges.

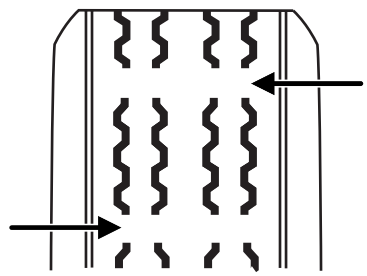
TIRE CARE

Inspecting your tires

Periodically inspect the tire treads for uneven or excessive wear and remove objects such as stones, nails or glass that may be wedged in the tread grooves. Check for holes or cuts that may permit air leakage from the tire and make necessary repairs. Also inspect the tire sidewalls for cracking, cuts, bruises and other signs of damage or excessive wear. If internal damage to the tire is suspected, have the tire demounted and inspected in case it needs to be repaired or replaced. For your safety, tires that are damaged or show signs of excessive wear should not be used because they are more likely to blow out or fail.

Improper or inadequate vehicle maintenance can cause tires to wear abnormally. Inspect all your tires, including the spare, frequently, and replace them if one or more of the following conditions exist:

Tire wear



When the tread is worn down to 1/16th of an inch (2 mm), tires must be replaced to help prevent your vehicle from skidding and hydroplaning. Built-in treadwear indicators, or "wear bars", which look like narrow strips of smooth rubber across the tread will appear on the tire when the tread is worn down to 1/16th of an inch (2 mm). When the tire tread wears down to the same height as these "wear bars", the tire is worn out and must be replaced.

Damage

Periodically inspect the tire treads and sidewalls for damage (such as bulges in the tread or sidewalls, cracks in the tread groove and separation in the tread or sidewall). If damage is observed or suspected have the tire inspected by a tire professional. Tires can be damaged during off-road use, so inspection after off-road use is also recommended.

Age

Tires degrade over time depending on many factors such as weather, storage conditions, and conditions of use (load, speed, inflation pressure, etc.) the tires experience throughout their lives.

In general, tires should be replaced after six years regardless of tread wear. However, heat caused by hot climates or frequent high loading conditions can accelerate the aging process and may require tires to be replaced more frequently.

You should replace your spare tire when you replace the road tires or after six years due to aging even if it has not been used.

U.S. DOT Tire Identification Number (TIN)

Both U.S. and Canada Federal regulations require tire manufacturers to place standardized information on the sidewall of all tires. This information identifies and describes the fundamental characteristics of the tire and also provides a U.S. DOT Tire Identification Number for safety standard certification and in case of a recall.

This begins with the letters "DOT" and indicates that the tire meets all federal standards. The next two numbers or letters are the plant code designating where it was manufactured, the next two are the tire size code and the last four numbers represent the week and year the tire was built. For example, the numbers 317 mean the 31st week of 1997. After 2000 the numbers go to four digits. For example, 2501 means the 25th week of 2001. The numbers in between are identification codes used for traceability. This information is used to contact customers if a tire defect requires a recall.

Tire replacement requirements

Your vehicle is equipped with tires designed to provide a safe ride and handling capability.

Only use replacement tires and wheels that are the same size, load index, speed rating and type (such as P-metric versus LT-metric or all-season versus all-terrain) as those originally provided by Ford. The recommended tire and wheel size may be found on either the Safety Compliance Certification Label or the Tire Label which is located on the B-Pillar or edge of the driver's door. If this information is not found on these labels then you should consult your Ford dealer. Use of any tire or wheel not recommended by Ford can affect the safety and performance of your vehicle, which could result in an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power transfer unit failure. If you have questions regarding tire replacement, see an authorized dealer.

When mounting replacement tires and wheels, you should not exceed the maximum pressure indicated on the sidewall of the tire to set the beads without additional precautions listed below. If the beads do not seat at the maximum pressure indicated, re-lubricate and try again.
When inflating the tire for mounting pressures up to 20 psi (1.38 bar) greater than the maximum pressure on the tire sidewall, the following precautions must be taken to protect the person mounting the tire:

1. Make sure that you have the correct tire and wheel size.
2. Lubricate the tire bead and wheel bead seat area again.
3. Stand at a minimum of 12 ft. (366 cm) away from the tire wheel assembly.
4. Use both eye and ear protection.

For a mounting pressure more than 20 psi (1.38 bar) greater than the maximum pressure, a Ford Dealer or other tire service professional should do the mounting.
Always inflate steel carcass tires with a remote air fill with the person inflating standing at a minimum of 12 ft. (366 cm) away from the tire wheel assembly.

Important: Remember to replace the wheel valve stems when the road tires are replaced on your vehicle.

It is recommended that the two front tires or two rear tires generally be replaced as a pair.

The tire pressure sensors mounted in the wheels (originally installed on your vehicle) are not designed to be used in aftermarket wheels.

The use of wheels or tires not recommended by Ford Motor Company may affect the operation of your Tire Pressure Monitoring System.

If the TPMS indicator is flashing, your TPMS is malfunctioning. Your replacement tire might be incompatible with your TPMS, or some component of the TPMS may be damaged.

Safety practices

Driving habits have a great deal to do with your tire mileage and safety.

- Observe posted speed limits
- Avoid fast starts, stops and turns
- Avoid potholes and objects on the road

- Do not run over curbs or hit the tire against a curb when parking

If your vehicle is stuck in snow, mud, sand, etc., **do not** rapidly spin the tires; spinning the tires can tear the tire and cause an explosion. A tire can explode in as little as three to five seconds.

Do not spin the wheels at over 35 mph (56 km/h). The tires may fail and injure a passenger or bystander.

Highway hazards

No matter how carefully you drive there's always the possibility that you may eventually have a flat tire on the highway. Drive slowly to the closest safe area out of traffic. This may further damage the flat tire, but your safety is more important.

If you feel a sudden vibration or ride disturbance while driving, or you suspect your tire or vehicle has been damaged, immediately reduce your speed. Drive with caution until you can safely pull off the road. Stop and inspect the tires for damage. If a tire is under-inflated or damaged, deflate it, remove wheel and replace it with your spare tire and wheel. If you cannot detect a cause, have the vehicle towed to the nearest repair facility or tire dealer to have the vehicle inspected.

Tire and wheel alignment

A bad jolt from hitting a curb or pothole can cause the front end of your vehicle to become misaligned or cause damage to your tires. If your vehicle seems to pull to one side when you're driving, the wheels may be out of alignment. Have an authorized dealer check the wheel alignment periodically.

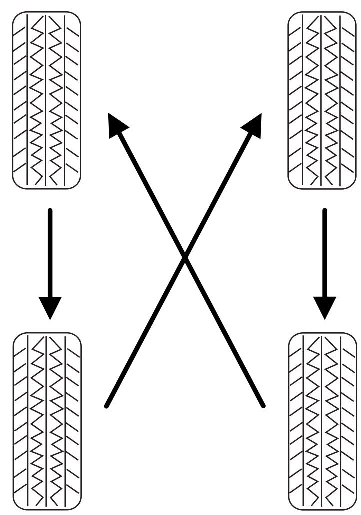
Wheel misalignment in the front or the rear can cause uneven and rapid treadwear of your tires and should be corrected by an authorized dealer. Front wheel drive (FWD) vehicles and those with an independent rear suspension (if equipped) may require alignment of all four wheels.

The tires should also be balanced periodically. An unbalanced tire and wheel assembly may result in irregular tire wear.

Tire rotation

Rotating your tires at the recommended interval (as indicated in the *scheduled maintenance information* that comes with your vehicle) will help your tires wear more evenly, providing better tire performance and longer tire life.

- Front Wheel Drive (FWD)/ All Wheel Drive vehicles (front tires at top of diagram)



Sometimes irregular tire wear can be corrected by rotating the tires.

Note: If your tires show uneven wear ask an authorized dealer to check for and correct any wheel misalignment, tire imbalance or mechanical problem involved before tire rotation.

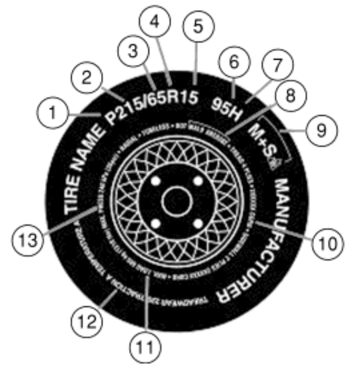
Note: Your vehicle may be equipped with a dissimilar spare tire/wheel. A dissimilar spare tire/wheel is defined as a spare tire and/or wheel that is different in brand, size or appearance from the road tires and wheels. If you have a dissimilar spare tire/wheel it is intended for temporary use only and should not be used in a tire rotation.

Note: After having your tires rotated, inflation pressure must be checked and adjusted to the vehicle requirements.

INFORMATION CONTAINED ON THE TIRE SIDEWALL

Both U.S. and Canada Federal regulations require tire manufacturers to place standardized information on the sidewall of all tires. This information identifies and describes the fundamental characteristics of the tire and also provides a U.S. DOT Tire Identification Number for safety standard certification and in case of a recall.

Information on "P" type tires



P215/65R15 95H is an example of a tire size, load index and speed rating. The definitions of these items are listed below. (Note that the tire size, load index and speed rating for your vehicle may be different from this example.)

1. **P:** Indicates a tire, designated by the Tire and Rim Association (T&RA), that may be used for service on cars, SUVs, minivans and light trucks.

Note: If your tire size does not begin with a letter this may mean it is designated by either ETRTO (European Tire and Rim Technical Organization) or JATMA (Japan Tire Manufacturing Association).

2. **215:** Indicates the nominal width of the tire in millimeters from sidewall edge to sidewall edge. In general, the larger the number, the wider the tire.

3. **65:** Indicates the aspect ratio which gives the tire's ratio of height to width.

4. **R:** Indicates a "radial" type tire.

5. **15:** Indicates the wheel or rim diameter in inches. If you change your wheel size, you will have to purchase new tires to match the new wheel diameter.

6. **95:** Indicates the tire's load index. It is an index that relates to how much weight a tire can carry. You may find this information in your *Owner's Guide*. If not, contact a local tire dealer.

Note: You may not find this information on all tires because it is not required by federal law.

7. **H:** Indicates the tire's speed rating. The speed rating denotes the speed at which a tire is designed to be driven for extended periods of time under a standard condition of load and inflation pressure. The tires on your vehicle may operate at different conditions for load and inflation pressure. These speed ratings may need to be adjusted for the difference in conditions. The ratings range from 81 mph (130 km/h) to 186 mph (299 km/h). These ratings are listed in the following chart.

Note: You may not find this information on all tires because it is not required by federal law.

Letter rating	Speed rating - mph (km/h)
M	81 mph (130 km/h)
N	87 mph (140 km/h)
Q	99 mph (159 km/h)
R	106 mph (171 km/h)
S	112 mph (180 km/h)
T	118 mph (190 km/h)
U	124 mph (200 km/h)
H	130 mph (210 km/h)
V	149 mph (240 km/h)
W	168 mph (270 km/h)
Y	186 mph (299 km/h)
Note: For tires with a maximum speed capability over 149 mph (240 km/h), tire manufacturers sometimes use the letters ZR. For those with a maximum speed capability over 186 mph (299 km/h), tire manufacturers always use the letters ZR.	

8. **U.S. DOT Tire Identification Number (TIN):** This begins with the letters "DOT" and indicates that the tire meets all federal standards. The next two numbers or letters are the plant code designating where it was manufactured, the next two are the tire size code and the last four numbers represent the week and year the tire was built. For example, the numbers 317 mean the 31st week of 1997. After 2000 the numbers go to four digits. For example, 2501 means the 25th week of 2001. The numbers in between are identification codes used for traceability. This information is used to contact customers if a tire defect requires a recall.

9. **M+S or M/S:** Mud and Snow, or
AT: All Terrain, or
AS: All Season.

10. **Tire Ply Composition and Material Used:** Indicates the number of plies or the number of layers of rubber-coated fabric in the tire tread and sidewall. Tire manufacturers also must indicate the ply materials in the tire and the sidewall, which include steel, nylon, polyester, and others.

11. **Maximum Load:** Indicates the maximum load in kilograms and pounds that can be carried by the tire. Refer to the Safety Compliance Certification Label, which is located on the B-Pillar or the edge of the driver's door, for the correct tire pressure for your vehicle.

12. **Treadwear, Traction and Temperature Grades**

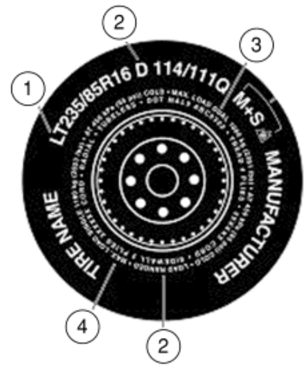
- **Treadwear:** The treadwear grade is a comparative rating based on the wear rate of the tire when tested under controlled conditions on a specified government test course. For example, a tire graded 150 would wear one and one-half (1½) times as well on the government course as a tire graded 100.
- **Traction:** The traction grades, from highest to lowest are AA, A, B, and C. The grades represent the tire's ability to stop on wet pavement as measured under controlled conditions on specified government test surfaces of asphalt and concrete. A tire marked C may have poor traction performance.
- **Temperature:** The temperature grades are A (the highest), B and C, representing the tire's resistance to the generation of heat and its ability to dissipate heat when tested under controlled conditions on a specified indoor laboratory test wheel.

13. **Maximum Permissible Inflation Pressure:** Indicates the tire manufacturers' maximum permissible pressure and/or the pressure at which the maximum load can be carried by the tire. This pressure is normally higher than the manufacturer's recommended cold inflation pressure which can be found on the Safety Compliance Certification Label or Tire Label which is located on the B-Pillar or the edge of the driver's door. The cold inflation pressure should never be set lower than the recommended pressure on the vehicle label.

The tire suppliers may have additional markings, notes or warnings such as standard load, radial tubeless, etc.

Additional information contained on the tire sidewall for "LT" type tires

"LT" type tires have some additional information beyond those of "P" type tires; these differences are described below.



Note: Tire Quality Grades do not apply to this type of tire.

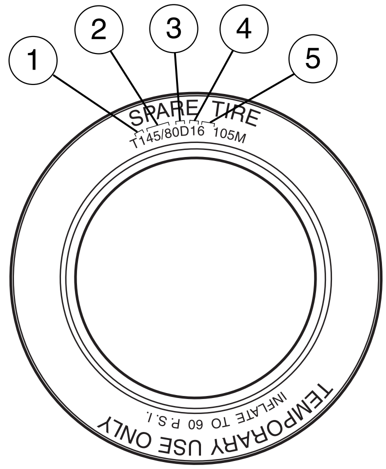
1. **LT:** Indicates a tire, designated by the Tire and Rim Association (T&RA), that is intended for service on light trucks.

2. **Load Range/Load Inflation Limits:** Indicates the tire's load-carrying capabilities and its inflation limits.

3. **Maximum Load Dual lb. (kg) at psi (kPa) cold:** Indicates the maximum load and tire pressure when the tire is used as a dual; defined as four tires on the rear axle (a total of six or more tires on the vehicle).

4. **Maximum Load Single lb. (kg) at psi (kPa) cold:** Indicates the maximum load and tire pressure when the tire is used as a single; defined as two tires (total) on the rear axle.

Information on "T" type tires



"T" type tires have some additional information beyond those of "P" type tires; these differences are described below:

T145/80D16 is an example of a tire size.

Note: The temporary tire size for your vehicle may be different from this example. Tire Quality Grades do not apply to this type of tire.

1. **T:** Indicates a type of tire, designated by the Tire and Rim Association (T&RA), that is intended for temporary service on cars, SUVs, minivans and light trucks.

2. **145:** Indicates the nominal width of the tire in millimeters from sidewall edge to sidewall edge. In general, the larger the number, the wider the tire.

3. **80:** Indicates the aspect ratio which gives the tire's ratio of height to width. Numbers of 70 or lower indicate a short sidewall.

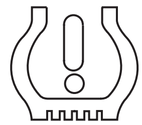
4. **D:** Indicates a "diagonal" type tire.
R: Indicates a "radial" type tire.

5. **16:** Indicates the wheel or rim diameter in inches. If you change your wheel size, you will have to purchase new tires to match the new wheel diameter.

Location of the tire label

You will find a Tire Label containing tire inflation pressure by tire size and other important information located on the B-Pillar or the edge of the driver's door. Refer to the payload description and graphic in the *Vehicle loading — with and without a trailer* section.

TIRE PRESSURE MONITORING SYSTEM (TPMS)



Each tire, including the spare (if provided), should be checked monthly when cold and inflated to the inflation pressure recommended by the vehicle manufacturer on the vehicle placard or tire inflation pressure label. (If your vehicle has tires of a different size than the size indicated on the vehicle placard or tire inflation pressure label, you should determine the proper tire inflation pressure for those tires.)

As an added safety feature, your vehicle has been equipped with a tire pressure monitoring system (TPMS) that illuminates a low tire pressure telltale when one or more of your tires is significantly under-inflated. Accordingly, when the low tire pressure telltale illuminates, you should stop and check your tires as soon as possible, and inflate them to the proper pressure. Driving on a significantly under-inflated tire causes the tire to overheat and can lead to tire failure. Under-inflation also reduces fuel efficiency and tire tread life, and may affect the vehicle's handling and stopping ability.

Please note that the TPMS is not a substitute for proper tire maintenance, and it is the driver's responsibility to maintain correct tire pressure, even if under-inflation has not reached the level to trigger illumination of the TPMS low tire pressure telltale.

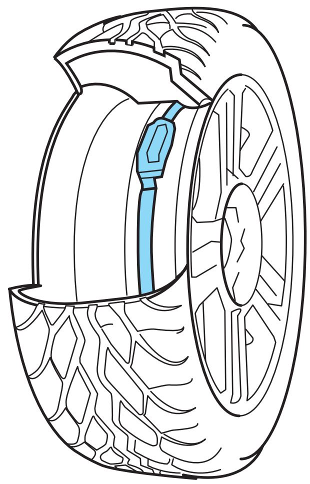
Your vehicle has also been equipped with a TPMS malfunction indicator to indicate when the system is not operating properly. The TPMS malfunction indicator is combined with the low tire pressure telltale. When the system detects a malfunction, the telltale will flash for approximately one minute and then remain continuously illuminated. This sequence will continue upon subsequent vehicle start-ups as long as the malfunction exists.

When the malfunction indicator is illuminated, the system may not be able to detect or signal low tire pressure as intended. TPMS malfunctions may occur for a variety of reasons, including the installation of replacement or alternate tires or wheels on the vehicle that prevent the TPMS from functioning properly. Always check the TPMS malfunction telltale after replacing one or more tires or wheels on your vehicle to ensure that the replacement or alternate tires and wheels allow the TPMS to continue to function properly.

The Tire Pressure Monitoring System complies with part 15 of the FCC rules and with RSS-210 of Industry Canada. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

The Tire Pressure Monitoring System is NOT a substitute for manually checking tire pressure. The tire pressure should be checked periodically (at least monthly) using a tire gauge, see *Inflating your tires* in this chapter. Failure to properly maintain your tire pressure could increase the risk of tire failure, loss of control, vehicle rollover and personal injury.

Changing tires with TPMS



Each road tire is equipped with a tire pressure sensor fastened to the inside rim of the wheel. The pressure sensor is covered by the tire and is not visible unless the tire is removed. The pressure sensor is located opposite (180 degrees) from the valve stem. Care must be taken when changing the tire to avoid damaging the sensor. It is recommended that you always have your tires serviced by an authorized dealer.

The tire pressure should be checked periodically (at least monthly) using an accurate tire gauge, refer to *Inflating your tires* in this chapter.

Understanding your Tire Pressure Monitoring System (TPMS)

The Tire Pressure Monitoring System measures pressure in your four road tires and sends the tire pressure readings to your vehicle. The Low Tire Pressure Warning Lamp will turn ON if the tire pressure is significantly low. Once the light is illuminated, your tires are under inflated and need to be inflated to the manufacturer's recommended tire pressure. Even if the light turns ON and a short time later turns OFF, your tire pressure still needs to be checked. Visit www.checkmytires.org for additional information.

When your temporary spare tire is installed

When one of your road tires needs to be replaced with the temporary spare, the TPMS system will continue to identify an issue to remind you that the damaged road wheel/tire needs to be repaired and put back on your vehicle.

To restore the full functionality of the Tire Pressure Monitoring System, have the damaged road wheel/tire repaired and remounted on your vehicle. For additional information, refer to *Changing tires with TPMS* in this section.

When you believe your system is not operating properly

The main function of the Tire Pressure Monitoring System is to warn you when your tires need air. It can also warn you in the event the system is no longer capable of functioning as intended. Please refer to the following chart for information concerning your Tire Pressure Monitoring System:

Low Tire Pressure Warning Light	Possible cause	Customer Action Required
Solid Warning Light	Tire(s) under-inflated	1. Check your tire pressure to ensure tires are properly inflated; refer to *Inflating your tires* in this chapter. 2. After inflating your tires to the manufacturer's recommended inflation pressure as shown on the Tire Label (located on the edge of driver's door or the B-Pillar), the vehicle must be driven for at least two minutes over 20 mph (32 km/h) before the light will turn OFF.
	Spare tire in use	Your temporary spare tire is in use. Repair the damaged road wheel/tire and reinstall it on the vehicle to restore system functionality. For a description on how the system functions, refer to *When your temporary spare tire is installed* in this section.
	TPMS malfunction	If your tires are properly inflated and your spare tire is not in use and the light remains ON, have the system inspected by your authorized dealer.

Low Tire Pressure Warning Light	Possible cause	Customer Action Required
Flashing Warning Light	Spare tire in use	Your temporary spare tire is in use. Repair the damaged road wheel and re-mount it on the vehicle to restore system functionality. For a description of how the system functions under these conditions, refer to *When your temporary spare tire is installed* in this section.
	TPMS malfunction	If your tires are properly inflated and your spare tire is not in use and the TPMS warning light still flashes, have the system inspected by your authorized dealer.

When inflating your tires

When putting air into your tires (such as at a gas station or in your garage), the Tire Pressure Monitoring System may not respond immediately to the air added to your tires.

It may take up to two minutes of driving over 20 mph (32 km/h) for the light to turn OFF after you have filled your tires to the recommended inflation pressure.

How temperature affects your tire pressure

The Tire Pressure Monitoring System (TPMS) monitors tire pressure in each pneumatic tire. While driving in a normal manner, a typical passenger tire inflation pressure may increase approximately 2 to 4 psi (14 to 28 kPa) from a cold start situation. If the vehicle is stationary over night with the outside temperature significantly lower than the daytime temperature, the tire pressure may decrease approximately 3 psi (20.7 kPa) for a drop of 30° F (16.6°C) in ambient temperature. This lower pressure value may be detected by the TPMS as being significantly lower than the recommended inflation pressure and activate the TPMS warning for low tire pressure. If the low tire pressure warning light is ON, visually check each tire to verify that no tire is flat. (If one or more tires are flat, repair as necessary.) Check air pressure in the road tires. If any tire is under-inflated, carefully drive the vehicle to the nearest location where air can be added to the tires. Inflate all the tires to the recommended inflation pressure.

SNOW TIRES AND CHAINS

Snow tires must be the same size, load index, speed rating as those originally provided by Ford. Use of any tire or wheel not recommended by Ford can affect the safety and performance of your vehicle, which could result in an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally, the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power transfer unit failure.

The tires on your vehicle have all weather treads to provide traction in rain and snow. However, in some climates, you may need to use snow tires and chains. If you need to use chains, it is recommended that only cable chains are used with steel wheels (of the same size and specifications) as chains may chip aluminum wheels.

Follow these guidelines when using snow tires and chains:

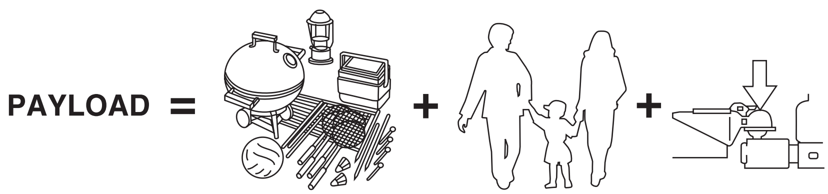
- Install cable chains only on the front wheels.
- Use only cable chains on 18 inch wheels with P245/60R18 tires.
- Do not use tire chains, cables or optional traction devices on 20 inch wheels and tires.
- Drive cautiously. If you hear the cable chains rub or bang against your vehicle, stop and re-tighten the cable chains. If this does not work, remove the cable chains to prevent damage to your vehicle.
- If possible, avoid fully loading your vehicle.
- Remove the tire cable chains when they are no longer needed. Do not use tire cable chains on dry roads.
- The suspension insulation and bumpers will help prevent vehicle damage. Do not remove these components from your vehicle when using snow tires and cable chains.

VEHICLE LOADING – WITH AND WITHOUT A TRAILER

This section will guide you in the proper loading of your vehicle and/or trailer, to keep your loaded vehicle weight within its design rating capability, with or without a trailer. Properly loading your vehicle will provide maximum return of vehicle design performance. Before loading your vehicle, familiarize yourself with the following terms for determining your vehicle's weight ratings, with or without a trailer, from the vehicle's Tire Label or Safety Compliance Certification Label:

Base Curb Weight – is the weight of the vehicle including a full tank of fuel and all standard equipment. It does not include passengers, cargo, or optional equipment.

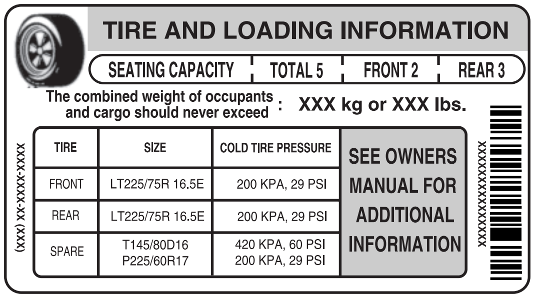
Vehicle Curb Weight – is the weight of your new vehicle when you picked it up from your authorized dealer plus any aftermarket equipment.

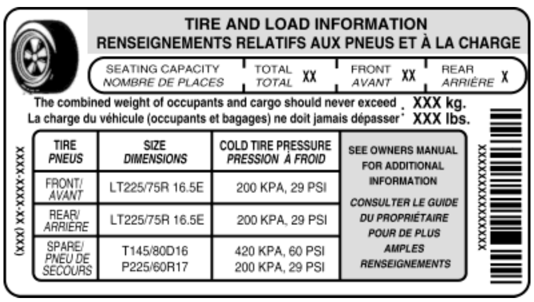


Payload – is the combined weight of cargo and passengers that the vehicle is carrying. The maximum payload for your vehicle can be found on the Tire Label on the B-Pillar or the edge of the driver's door (vehicles exported outside the US and Canada may not have a Tire Label). Look for **"THE COMBINED WEIGHT OF OCCUPANTS AND CARGO SHOULD NEVER EXCEED XXX kg OR XXX lb."** for maximum payload. The payload listed on the Tire Label is the maximum payload for the vehicle as built by the assembly plant. If any aftermarket or authorized-dealer installed equipment has been installed on the vehicle, the weight of the equipment must be subtracted from the payload listed on the Tire Label in order to determine the new payload.

The appropriate loading capacity of your vehicle can be limited either by volume capacity (how much space is available) or by payload capacity (how much weight the vehicle should carry). Once you have reached the maximum payload of your vehicle, do not add more cargo, even if there is space available. Overloading or improperly loading your vehicle can contribute to loss of vehicle control and vehicle rollover.

Example only:



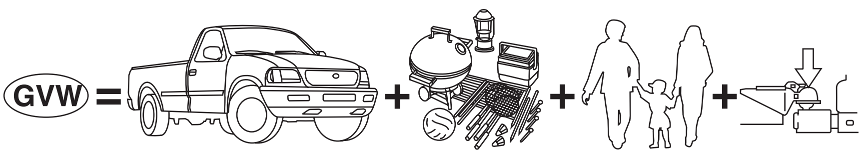


Cargo Weight – includes all weight added to the Base Curb Weight, including cargo and optional equipment. When towing, trailer tongue load weight is also part of cargo weight.

GAW (Gross Axle Weight) – is the total weight placed on each axle (front and rear) – including vehicle curb weight and all payload.

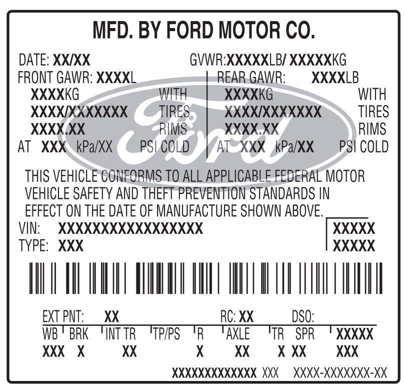
GAWR (Gross Axle Weight Rating) – is the maximum allowable weight that can be carried by a single axle (front or rear). **These numbers are shown on the Safety Compliance Certification Label located on the B-Pillar or the edge of the driver's door. The total load on each axle must never exceed its GAWR.**

Note: For trailer towing information refer to *Trailer towing* found in this chapter or the *RV and Trailer Towing Guide* provided by your authorized dealer.

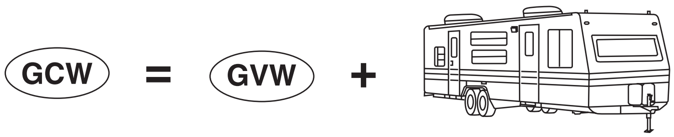


GVW (Gross Vehicle Weight) – is the Vehicle Curb Weight + cargo + passengers.

GVWR (Gross Vehicle Weight Rating) – is the maximum allowable weight of the fully loaded vehicle (including all options, equipment, passengers and cargo). **The GVWR is shown on the Safety Compliance Certification Label located on the B-Pillar or the edge of the driver's door. The GVW must never exceed the GVWR.**



Exceeding the Safety Compliance Certification Label vehicle weight rating limits could result in substandard vehicle handling or performance, engine, transmission and/or structural damage, serious damage to the vehicle, loss of control and personal injury.



GCW (Gross Combined Weight) – is the weight of the loaded vehicle (GVW) plus the weight of the fully loaded trailer.

GCWR (Gross Combined Weight Rating) – is the maximum allowable weight of the vehicle and the loaded trailer – including all cargo and passengers – that the vehicle can handle without risking damage. (Important: The towing vehicles' braking system is rated for operation at GVWR, not at GCWR. Separate functional brakes should be used for safe control of towed vehicles and for trailers where the GCW of the towing vehicle plus the trailer exceed the GVWR of the towing vehicle. **The GCW must never exceed the GCWR.**

Maximum Loaded Trailer Weight – is the highest possible weight of a fully loaded trailer the vehicle can tow. It assumes a vehicle with only mandatory options, no cargo (internal or external), a tongue load of 10–15% (conventional trailer), and driver only (150 lb. [68 kg]). **Consult your authorized dealer (or the** *RV and Trailer Towing Guide* **provided by your authorized dealer) for more detailed information.**

Do not exceed the GVWR or the GAWR specified on the Safety Compliance Certification Label.

Do not use replacement tires with lower load carrying capacities than the original tires because they may lower the vehicle's GVWR and GAWR limitations. Replacement tires with a higher limit than the original tires do not increase the GVWR and GAWR limitations.

Exceeding any vehicle weight rating limitation could result in serious damage to the vehicle and/or personal injury.

Steps for determining the correct load limit:

1. Locate the statement "The combined weight of occupants and cargo should never exceed XXX kg or XXX lbs." on your vehicle's placard.

2. Determine the combined weight of the driver and passengers that will be riding in your vehicle.

3. Subtract the combined weight of the driver and passengers from XXX kg or XXX lbs.

4. The resulting figure equals the available amount of cargo and luggage load capacity. For example, if the "XXX" amount equals 1,400 lbs. and there will be five 150 lb. passengers in your vehicle, the amount of available cargo and luggage load capacity is 650 lbs. (1400–750 (5 x 150) = 650 lb.). In metric units (635–340 (5 x 68) = 295 kg.)

5. Determine the combined weight of luggage and cargo being loaded on the vehicle. That weight may not safely exceed the available cargo and luggage load capacity calculated in Step 4.

6. If your vehicle will be towing a trailer, load from your trailer will be transferred to your vehicle. Consult this manual to determine how this reduces the available cargo and luggage load capacity of your vehicle.

The following gives you a few examples on how to calculate the available amount of cargo and luggage load capacity:

- Another example for your vehicle with 1,400 lb. (635 kg) of cargo and luggage capacity. You decide to go golfing. Is there enough load capacity to carry you, 4 of your friends and all the golf bags? You and four friends average 220 lb. (99 kg) each and the golf bags weigh approximately 30 lb. (13.5 kg) each. The calculation would be: 1,400 - (5 x 220) - (5 x 30) = 1,400 - 1,100 - 150 = 150 lb. Yes, you have enough load capacity in your vehicle to transport four friends and your golf bags. In metric units, the calculation would be: 635 kg - (5 x 99 kg) - (5 x 13.5 kg) = 635 - 495 - 67.5 = 72.5 kg.
- A final example for your vehicle with 1,400 lb. (635 kg) of cargo and luggage capacity. You and one of your friends decide to pick up cement from the local home improvement store to finish that patio you have been planning for the past 2 years. Measuring the inside of the vehicle with the rear seat folded down, you have room for 12-100 lb. (45 kg) bags of cement. Do you have enough load capacity to transport the cement to your home? If you and your friend each weigh 220 lb. (99 kg), the calculation would be: 1,400 - (2 x 220) - (12 x 100) = 1,400 - 440 - 1,200 = - 240 lb. No, you do not have enough cargo capacity to carry that much weight. In metric units, the calculation would be: 635 kg - (2 x 99 kg) - (12 x 45 kg) = 635 - 198 - 540 = -103 kg. You will need to reduce the load weight by at least 240 lb. (104 kg). If you remove 3-100 lb. (45 kg) cement bags, then the load calculation would be:

1,400 - (2 x 220) - (9 x 100) = 1,400 - 440 - 900 = 60 lb. Now you have the load capacity to transport the cement and your friend home. In metric units, the calculation would be: 635 kg - (2 x 99 kg) - (9 x 45 kg) = 635 - 198 - 405 = 32 kg.

The above calculations also assume that the loads are positioned in your vehicle in a manner that does not overload the Front or the Rear Gross Axle Weight Rating specified for your vehicle on the Safety Compliance Certification Label found on the edge of the driver's door.

TRAILER TOWING

Trailer towing with your vehicle may require the use of a trailer tow option package.

Trailer towing puts additional loads on your vehicle's engine, transmission, axle, brakes, tires, and suspension. For your safety and to maximize vehicle performance, be sure to use the proper equipment while towing.

When towing maximum loads under high outside temperatures and on steep grades, the A/C system may cycle on and off to protect the engine from overheating. This may result in a temporary increase of interior temperatures.

Follow these guidelines to ensure safe towing procedure:

- Stay within your vehicle's load limits.
- Thoroughly prepare your vehicle for towing. Refer to *Preparing to tow* in this chapter.
- Use extra caution when driving while trailer towing. Refer to *Driving while you tow* in this chapter.
- Service your vehicle more frequently if you tow a trailer. Refer to the severe duty schedule in the scheduled maintenance guide.
- Do not tow a trailer until your vehicle has been driven at least 1,000 miles (1600 km).
- Refer to the instructions included with towing accessories for the proper installation and adjustment specifications.

Do not exceed the maximum loads listed on the Safety Compliance Certification label. For load specification terms found on the label, refer to *Vehicle loading* in this chapter. Remember to figure in the tongue load of your loaded vehicle when figuring the total weight.

FWD			
GCWR (Gross Combined Weight Rating)/Trailer Weight			
Engine	**Maximum GCWR-lb. (kg)**	**Trailer weight range-lb. (kg) (0-Maximum)**	**Tongue load-lb. (kg) (0-Maximum)**
3.5L Class I towing (standard)	7350 (3334)	0–2000 (0-907)	0–200 (0–91)
3.5L Class II towing (optional)	8500 (3855)	0–3500 (0–1588)	0–350 (0–159)

AWD			
GCWR (Gross Combined Weight Rating)/Trailer Weight			
Engine	**Maximum GCWR-lb. (kg)**	**Trailer weight range-lb. (kg) (0-Maximum)**	**Tongue load-lb. (kg) (0-Maximum)**
3.5L Class I towing (standard)	7550 (3425)	0–2000 (0-907)	0–200 (0–91)
3.5L Class II towing (optional)	8720 (3955)	0–3500 (0–1588)	0–350 (0–159)

Do not exceed the GVWR or the GAWR specified on the certification label.

Towing trailers beyond the maximum recommended gross trailer weight exceeds the limit of the vehicle and could result in engine damage, transmission damage, structural damage, loss of vehicle control, vehicle rollover and personal injury.

Preparing to tow

Use the proper equipment for towing a trailer and make sure it is properly attached to your vehicle. See your authorized dealer or a reliable trailer dealer if you require assistance.

Hitches

Do not use hitches that clamp onto the vehicle's bumper or attach to the axle. You must distribute the load in your trailer so that 10%–15% of the total weight of the trailer is on the tongue.

Safety chains

Always connect the trailer's safety chains to the hook retainers on the hitch. To connect the trailer's safety chains, cross the chains under the trailer tongue and allow slack for turning corners.

If you use a rental trailer, follow the instructions that the rental agency gives to you.

Do not attach safety chains to the bumper.

Trailer brakes

Be sure your trailer conforms to all applicable local and Federal Regulations regarding trailer braking. If your trailer is equipped with electronically controlled brakes you will need to have an electronic brake controller with associated wiring installed to your vehicle by an authorized dealer.

Do not connect a trailer's hydraulic brake system directly to your vehicle's brake system. Your vehicle may not have enough braking power and your chances of having a collision greatly increase.

The braking system of the tow vehicle is rated for operation at the GVWR not GCWR.

Trailer lamps

Trailer lamps are required on most towed vehicles. Make sure all running lights, brake lights, turn signals and hazard lights are working.

Do not splice into the vehicle lamp wiring for trailer lamps. Your vehicle uses an advanced electronic module to control and monitor your vehicle lamps. Splicing into the wiring or attaching wiring to the vehicle bulb. may DISABLE the rear vehicle lamps or cause them not to function properly. Your lamp outage feature may also be disabled or provide incorrect information.

See your authorized dealer or trailer rental agency for proper instructions and equipment for hooking up trailer lamps.

Trailer tow connector (equipped on vehicles with a Class II trailer tow/prep package)

The trailer tow connector is located under the rear bumper, on the driver's side of the vehicle.

Refer to the following chart for information regarding the factory-equipped trailer tow connector:

Trailer tow connector	
Color	**Function**
1. Dark Green	Right hand turn signal/brake/hazard flasher
2. Yellow	Left hand turn signal/brake/hazard flasher
3. Brown	Tail lamps/parking lamps
4. White	Ground

Driving while you tow

When towing a trailer:

- To ensure proper "break-in" of powertrain components, do not trailer tow during the first 1,000 miles (1600 km) of a new vehicle.
- To ensure proper "break-in" of powertrain components during the first 500 miles (800 km) of trailer towing, drive no faster than 70 mph (112 km/h) with no full throttle starts.
- Turn off the speed control. The speed control may shut off automatically when you are towing on long, steep grades.
- Consult your local motor vehicle speed regulations for towing a trailer.
- To eliminate excessive shifting, use a lower gear. This will also assist in transmission cooling. (For additional information, refer to the *Understanding the positions of the 6–speed automatic transmission* section in this chapter.
- Anticipate stops and brake gradually.
- Do not exceed the GCWR rating or transmission damage may occur.

Servicing after towing

If you tow a trailer for long distances, your vehicle will require more frequent service intervals. Refer to your *Scheduled Maintenance Guide* for more information.

Trailer towing tips

- Practice turning, stopping and backing up before starting on a trip to get the feel of the vehicle trailer combination. When turning, make wider turns so the trailer wheels will clear curbs and other obstacles.
- Allow more distance for stopping with a trailer attached.
- If you are driving down a long or steep hill, shift to a lower gear. Do not apply the brakes continuously, as they may overheat and become less effective.
- The trailer tongue weight should be 10–15% of the loaded trailer weight.
- If you will be towing a trailer frequently in hot weather, hilly conditions, at GCWR, or any combination of these factors, consider refilling your rear axle with synthetic gear lube if not already so equipped. Refer to the *Maintenance and Specifications* chapter for the lubricant specification. Remember that regardless of the rear axle lube used, do not tow a trailer for the first 1,000 miles (1600 km) of a new vehicle, and that the first 500 miles (800 km) of towing be done at no faster than 70 mph (112 km/h) with no full throttle starts.
- After you have traveled 50 miles (80 km), thoroughly check your hitch, electrical connections and trailer wheel lug nuts.
- To aid in engine/transmission cooling and A/C efficiency during hot weather while stopped in traffic, place the gearshift lever in P (Park).
- Vehicles with trailers should not be parked on a grade. If you must park on a grade, place wheel chocks under the trailer's wheels.

RECREATIONAL TOWING

Follow these guidelines for your specific powertrain combination to tow your vehicle for personal travel (such as behind a motor home or a truck).

In case of roadside emergency with a disabled vehicle, please refer to *Wrecker towing* in the *Roadside Emergencies* chapter.

These guidelines are designed to prevent damage to your vehicle.

Front Wheel Drive (FWD) vehicles:

Tow your Front Wheel Drive vehicle with all four wheels on the ground or with the front wheels off the ground by using a tow dolly. If you are using a tow dolly follow the instructions specified by the equipment provider.

All Wheel Drive (AWD) vehicles:

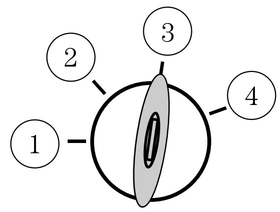
Tow your All Wheel Drive vehicle with all four wheels on the ground or with all four wheels off the ground using a vehicle transport trailer. **Do not tow your All Wheel Drive vehicle with the front wheels off the ground (by using a tow dolly) and the rear wheels on the ground.** This will cause damage to your AWD system. If you are using a vehicle transport trailer, follow the instruction specified by the equipment provider.

Note: If you tow your vehicle with all four wheels on the ground, follow these instructions:

- Tow only in the forward direction
- Release the parking brake
- Place the transmission shift lever in Neutral (N)
- Turn the key in the ignition to the ACC position (refer to *Starting* in the *Driving* chapter). The ACC position also unlocks the steering wheel.
- Do not exceed 65 mph (105 km/h)
- Start the engine and allow it to run for five minutes at the beginning of each day and at each fuel stop.

STARTING

Positions of the ignition



1. LOCK, locks the automatic transaxle gearshift lever and allows key removal. This position also shuts the engine and all electrical accessories off without locking the steering wheel. To lock the steering wheel, remove the key then turn the steering wheel.

2. ACC, allows the electrical accessories such as the radio to operate while the engine is not running. This position also unlocks the steering wheel.

3. RUN, all electrical circuits operational. Warning lights illuminated. Key position when driving.

4. START, cranks the engine. Release the key as soon as the engine starts.

Preparing to start your vehicle

Engine starting is controlled by the powertrain control system. This system meets all Canadian Interference-Causing Equipment standard requirements regulating the impulse electrical field strength of radio noise.

When starting a fuel-injected engine, avoid pressing the accelerator before or during starting. Only use the accelerator when you have difficulty starting the engine. For more information on starting the vehicle, refer to *Starting the engine* in this chapter.

Extended idling at high engine speeds can produce very high temperatures in the engine and exhaust system, creating the risk of fire or other damage.

Do not park, idle, or drive your vehicle in dry grass or other dry ground cover. The emission system heats up the engine compartment and exhaust system, which can start a fire.

WARNING: Do not start your vehicle in a closed garage or in other enclosed areas. Exhaust fumes can be toxic. Always open the garage door before you start the engine. See *Guarding against exhaust fumes* in this chapter for more instructions.

WARNING: If you smell exhaust fumes inside your vehicle, have your dealer inspect your vehicle immediately. Do not drive if you smell exhaust fumes.

Important safety precautions

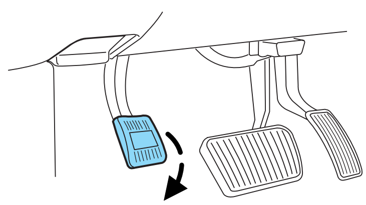
When the engine starts, the idle RPM runs faster to warm the engine. If the engine idle speed does not slow down automatically, have the vehicle checked.

Before starting the vehicle:

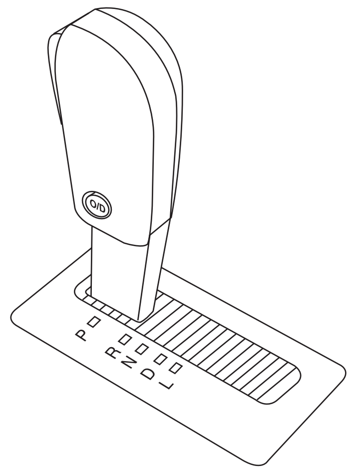
1. Make sure all vehicle occupants buckle their safety belts. For more information on safety belts and their proper usage, refer to the *Seating and Safety Restraints* chapter.

2. Make sure the headlamps and electrical accessories are off.

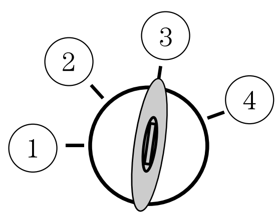
- Make sure the parking brake is set.



- Make sure the gearshift is in P (Park).



3. Turn the key to 3 (RUN) without turning the key to 4 (START).

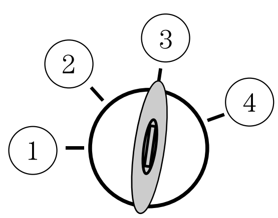


Some warning lights will briefly illuminate. See *Warning lights and chimes* in the *Instrument Cluster* chapter for more information regarding the warning lights.

Starting the engine

1. Turn the key to 3 (RUN) without turning the key to 4 (START).

2. Turn the key to 4 (START), then release the key as soon as the engine starts. Excessive cranking could damage the starter.



Note: If the engine does not start on the first try, turn the key to LOCK, wait 10 seconds and try again. If the engine still fails to start, press the accelerator to the floor and try again; this will allow the engine to crank with the fuel shut off in case the engine is flooded with fuel.

This vehicle has a computer assisted cranking system which assists in starting the engine. If the ignition key is turned to 4 (START) and then released when the engine begins cranking, the engine may continue cranking for up to 10 seconds or until the vehicle starts.

Guarding against exhaust fumes

Carbon monoxide is present in exhaust fumes. Take precautions to avoid its dangerous effects.

If you smell exhaust fumes inside your vehicle, have your dealer inspect your vehicle immediately. Do not drive if you smell exhaust fumes.

Important ventilating information

If the engine is idling while the vehicle is stopped for a long period of time, open the windows at least one inch (2.5 cm) or adjust the heating or air conditioning to bring in fresh air.

ENGINE BLOCK HEATER (IF EQUIPPED)

An engine block heater warms the engine coolant which aids in starting and allows the heater/defroster system to respond quickly. If your vehicle is equipped with this system, your equipment includes a heater element which is installed in your engine block and a wire harness which allows the user to connect the system to a grounded 120 volt a/c electrical source. The block heater system is most effective when outdoor temperatures reach below 0°F (-17°C).

Failure to follow engine block heater instructions could result in property damage or physical injury.

To reduce the risk of electrical shock, do not use your heater with ungrounded electrical systems or two-pronged (cheater) adapters.

Prior to using the engine block heater, follow these recommendations for proper and safe operation:

- For your safety, use an outdoor extension cord that is product certified by Underwriter's laboratory (UL) or Canadian Standards Association (CSA). Use only an extension cord that can be used outdoors, in cold temperatures, and is clearly marked ″Suitable for Use with Outdoor Appliances.″ Never use an indoor extension cord outdoors; it could result in an electric shock or fire hazard.
- Use a 16 gauge outdoor extension cord, minimum.
- Use as short an extension cord as possible.
- Do not use multiple extension cords. Instead, use one extension cord which is long enough to reach from the engine block heater cord to the outlet without stretching.
- Make certain that the extension cord is in excellent condition (not patched or spliced). Store your extension cord indoors at temperatures above 32°F (0°C). Outdoor conditions can deteriorate extension cords over a period of time.
- To reduce the risk of electrical shock, do not use your heater with ungrounded electrical systems or two pronged (cheater) adapters. Also ensure that the block heater, especially the cord, is in good condition before use.
- Make sure that when in operation, the extension cord plug /engine block heater cord plug connection is free and clear of water in order to prevent possible shock or fire.
- Be sure that areas where the vehicle is parked are clean and clear of all combustibles such as petroleum products, dust, rags, paper and similar items.
- Be sure that the engine block heater, heater cord and extension cord are solidly connected. A poor connection can cause the cord to become very hot and may result in an electrical shock or fire. Be sure to check for heat anywhere in the electrical hookup once the system has been operating for approximately a half hour.
- Finally, have the engine block heater system checked during your fall tune-up to be sure it's in good working order.

How to use the engine block heater

Ensure the receptacle terminals are clean and dry prior to use. To clean them, use a dry cloth.

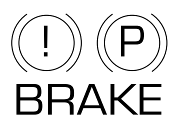
Depending on the type of factory installed equipment, your engine block heater system may consume anywhere between 400 watts or 1000 watts of energy per hour. Your factory installed block heater system does not have a thermostat; however, maximum temperature is attained after approximately 3 hours of operation. Block heater operation longer than 3 hours will not improve system performance and will unnecessarily use additional electricity.

Make sure system is unplugged and properly stowed before driving the vehicle. While not in use, make sure the protective cover seals the prongs of the engine block heater cord plug.

BRAKES

Occasional brake noise is normal. If a metal-to-metal, continuous grinding or continuous squeal sound is present, the brake linings may be worn-out and should be inspected by an authorized dealer. If the vehicle has continuous vibration or shudder in the steering wheel while braking, the vehicle should be inspected by an authorized dealer.

Refer to *Brake system warning light* in the *Instrument Cluster* chapter for information on the brake system warning light.



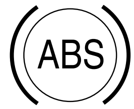
Four-wheel anti-lock brake system (ABS)

Your vehicle is equipped with an Anti-lock Braking System (ABS). This system helps you maintain steering control during emergency stops by keeping the brakes from locking. Noise from the ABS pump motor and brake pedal pulsation may be observed during ABS braking and the brake pedal may suddenly travel a little farther as soon as ABS braking is done and normal brake operation resumes. These are normal characteristics of the ABS and should be no reason for concern.

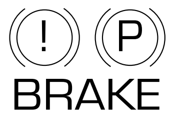
Using ABS

When hard braking is required, apply continuous force on the brake pedal; do not pump the brake pedal since this will reduce the effectiveness of the ABS and will increase your vehicle's stopping distance. The ABS will be activated immediately, allowing you to retain steering control during hard braking and on slippery surfaces. However, the ABS does not decrease stopping distance.

ABS warning lamp

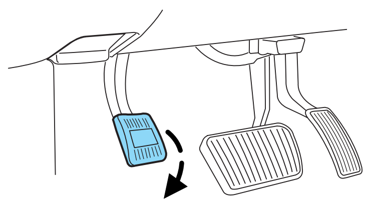


The ABS lamp in the instrument cluster momentarily illuminates when the ignition is turned on. If the light does not illuminate during start up, remains on or flashes, the ABS may be disabled and may need to be serviced.

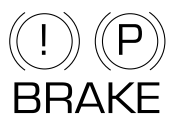


Even when the ABS is disabled, normal braking is still effective. If your BRAKE warning lamp illuminates with the parking brake released, have your brake system serviced immediately by an authorized dealer.

Parking brake



Apply the parking brake whenever the vehicle is parked. To set the parking brake, press the parking brake pedal down until the pedal stops.

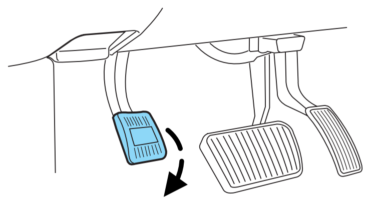


The BRAKE warning lamp in the instrument cluster illuminates and remains illuminated (when the ignition is turned ON) until the parking brake is released.

> Always set the parking brake fully and make sure that the gearshift is securely latched in P (Park).

The parking brake is not recommended to stop a moving vehicle. However, if the normal brakes fail, the parking brake can be used to stop your vehicle in an emergency. Since the parking brake applies only the rear brakes, the vehicle's stopping distance will increase greatly and the handling of your vehicle will be adversely affected.

Push the parking brake pedal downward again to release the parking brake. Driving with the parking brake on will cause the brakes to wear out quickly and reduce fuel economy.



Note: If the vehicle is driven with the parking brake applied, a chime will sound.

ADVANCETRAC® WITH ROLL STABILITY CONTROL™ (RSC) STABILITY ENHANCEMENT SYSTEM

The AdvanceTrac® with RSC system provides stability enhancement features such as Roll Stability Control™ (RSC), Electronic Stability Control (ESC) and Traction Control (TCS) for certain driving situations. The system includes an AdvanceTrac® with RSC on/off button, and a “sliding car” icon in the instrument cluster.

The Anti-lock Braking System (ABS) will work with the regular brakes in order to prevent wheel lock during a braking event. This feature will also help provide better steerability during braking.

During AdvanceTrac® with RSC operation you may experience the following:

- A rumble, grunting, or grinding noise after startup and when driving off
- A slight deceleration of the vehicle
- The AdvanceTrac® with RSC indicator light will flash when the system is activated.
- If your foot is on the brake pedal, you will feel a vibration in the pedal.

Traction Control

Traction Control helps your vehicle maintain traction, when driving on slippery and/or hilly road surfaces, by detecting and controlling wheel spin. Excessive wheel spin is controlled by momentarily reducing engine power and/or applying the anti-lock brakes.

If your vehicle should become stuck in deep snow or mud, try switching the AdvanceTrac® with RSC system off by pressing the AdvanceTrac® with RSC button momentarily. This will allow your wheels to spin and your tires to “dig” for traction. If your vehicle seems to lose engine power while driving in deep sand or very deep snow, switching off the

AdvanceTrac with RSC stability enhancement feature will restore full engine power and torque to each wheel.

If the AdvanceTrac® with RSC system is activated excessively in a short period of time, the brake portion of the system will disable to allow the brakes to cool down. In this situation, Traction Control will use only engine power reduction to help control the wheels from over-spinning. When the brakes have cooled down, the system will again function normally. Anti-lock braking, RSC and ESC are not affected by this condition and will function normally during the cool-down period.

During Traction Control events the “sliding car” icon in the instrument cluster will flash momentarily.

Electronic Stability Control (ESC)

The Electronic Stability Control (ESC) with RSC system may enhance your vehicle’s stability during adverse maneuvers.

The AdvanceTrac® with RSC system helps the driver maintain steering control. AdvanceTrac® with RSC will attempt to correct the vehicle motion by applying brake force at individual tires and, if necessary, by reducing engine power.

During Electronic Stability Control events the “sliding car” icon in the instrument cluster will flash momentarily.

Driving maneuvers which may activate AdvanceTrac® with RSC system include:

- Taking a turn too fast.
- Maneuvering quickly to avoid an accident, pedestrian or obstacle.
- Driving over a patch of ice.
- Changing lanes on a snow-rutted road.
- Entering a snow-free road from a snow-covered side street, or vice versa.
- Entering a paved road from a gravel road, or vice versa.
- Driving on slick surfaces.
- Cornering while towing a heavily loaded trailer (refer to *Trailer towing* in the *Tires, Wheels and Loading* chapter.)

Roll Stability Control™ (RSC)

The RSC system works in conjunction with the AdvanceTrac® system to help maintain roll stability of the vehicle during aggressive maneuvers by applying brake force to one or more wheels.

During Roll Stability Control™ (RSC) events the “sliding car” icon in the instrument cluster will flash momentarily.

Driving conditions that may activate AdvanceTrac® with RSC include:

- Emergency lane-change
- Taking a turn too fast
- Quick maneuvering to avoid an accident, pedestrian or obstacle

AdvanceTrac® with RSC button and icon functionality

The AdvanceTrac® with RSC system automatically turns on each time the engine is started, even if it was turned off when the engine was last shut down. The “sliding car” icon which is located with the warning lights in the instrument cluster will illuminate during bulb check at initial start-up and then go off. This tells you that the system is normal and active. All functions of the AdvanceTrac® with RSC system (RSC, ESC, Engine Traction Control, and Brake Traction Control) will be tested at start up. When the system is left active, the “sliding car” icon will flash only when any of the components of the system are affecting the vehicle’s performance, otherwise the light will remain off. Consequently, the “sliding car” icon will not be illuminated during most of your normal driving.

The AdvanceTrac® with RSC button, located on the center stack of the instrument panel, allows the driver to control certain features of the AdvanceTrac® with RSC system below 45 mph (70 km/h). If the vehicle is below 45 mph (70 km/h), pressing the AdvanceTrac® with RSC button will disable RSC, ESC and Engine Traction Control and steadily illuminate the “sliding car” icon. The AdvanceTrac® with RSC system will remain enabled when the vehicle speed is above 45 mph (70 km/h) even if the button has been pressed.

In R (Reverse), ABS and the Traction Control feature will continue to function, however ESC and RSC are disabled.

All these conditions are normal during AdvanceTrac® with RSC operation.

Do not alter or modify your vehicle’s suspension or steering; the resulting changes to the vehicle’s handling can adversely affect the AdvanceTrac® with RSC system.

Aggressive driving in any road conditions can cause you to lose control of your vehicle increasing the risk of severe personal injury or property damage. The occurrence of a AdvanceTrac® with RSC event is an indication that at least some of the tires have exceeded their ability to grip the road; this may lead to an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. If you experience a severe road event, SLOW DOWN.

If a failure is detected in the AdvanceTrac® with RSC system, and the AdvanceTrac® with RSC button has not been pushed, the warning indicator light in the instrument cluster will stay on. If the warning indicator light in the instrument cluster remains on while the engine is running, have the system serviced by an authorized dealer immediately.

STEERING

To help prevent damage to the power steering system:

- Never hold the steering wheel at its furthest turning points (until it stops) for more than a few seconds when the engine is running.
- Do not operate the vehicle with a low power steering fluid level (below the MIN mark on the reservoir).
- Some noise is normal during operation. If the noise is excessive, check for a low power steering fluid level before seeking service by your authorized dealer.
- Heavy or uneven steering efforts may be caused by a low power steering fluid level. Check for a low power steering fluid level before seeking service by your authorized dealer.
- Do not fill the power steering fluid reservoir above the MAX mark on the reservoir.

If the power steering system breaks down (or if the engine is turned off), you can steer the vehicle manually, but it takes more effort.

If the steering wanders or pulls, check for:

- an improperly inflated tire
- uneven tire wear
- loose or worn suspension components
- loose or worn steering components
- improper steering alignment

A high crown in the road or high crosswinds may also make the steering seem to wander/pull.

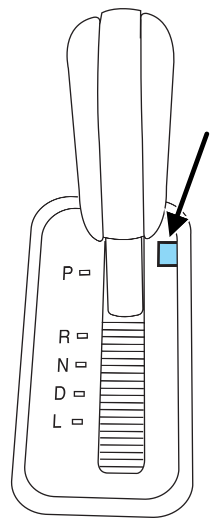
AUTOMATIC TRANSMISSION OPERATION

Brake-shift interlock

This vehicle is equipped with a brake-shift interlock feature that prevents the gearshift lever from being moved from P (Park) when the ignition is in the RUN position unless brake pedal is depressed.

If you cannot move the gearshift lever out of P (Park) with ignition in the RUN position and the brake pedal depressed:

1. Apply the parking brake, turn ignition key to LOCK, then remove the key.
2. Using a screwdriver (or similar tool), remove the protective cover to the interlock release access hole on the console.
3. Insert the screwdriver (or similar tool) into the access hole and press downward while pulling the gearshift lever out of the P (Park) position and into the N (Neutral) position.
4. Remove the tool and reinstall the protective cover.
5. Start the vehicle and release the parking brake.



If it is necessary to use the above procedure to move the gearshift lever, it is possible that a fuse has blown or the vehicle's brakelamps are not operating properly. Refer to *Fuses and relays* in the *Roadside Emergencies* chapter.

Do not drive your vehicle until you verify that the brakelamps are working.

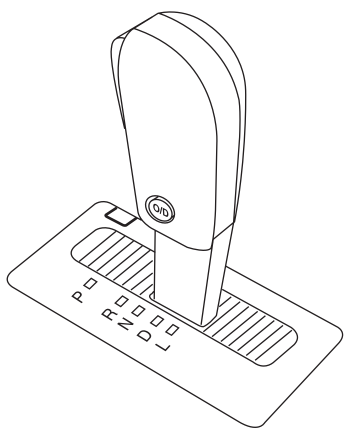
Always set the parking brake fully and make sure the gearshift is latched in P (Park). Turn the ignition to the LOCK position and remove the key whenever you leave your vehicle.

If the parking brake is fully released, but the brake warning lamp remains illuminated, the brakes may not be working properly. See your authorized dealer as soon as possible.

Automatic Transaxle Adaptive Learning

Your transaxle is equipped with an adaptive learning strategy found in the vehicle computer. This feature is designed to increase durability and provide consistent shift feel over the life of the vehicle. A new vehicle or transaxle may have firm and/or soft shifts. This operation is considered normal and will not affect function or durability of the transaxle. Over time, the adaptive learning process will fully update transaxle operation. Additionally, whenever the battery is disconnected or a new battery installed, the strategy must be relearned.

Understanding the gearshift positions of the 6–speed automatic transaxle



P (Park)

This position locks the transaxle and prevents the front wheels from turning.

To put your vehicle in gear:

- Depress the brake pedal

- Move the gearshift lever into the desired gear

To put your vehicle in P (Park):

- Come to a complete stop
- Move the gearshift lever and securely latch it in P (Park)

Always set the parking brake fully and make sure the gearshift is latched in P (Park). Turn the ignition to the LOCK position and remove the key whenever you leave your vehicle.

R (Reverse)

With the gearshift lever in R (Reverse), the vehicle will move backward. Always come to a complete stop before shifting into and out of R (Reverse).

N (Neutral)

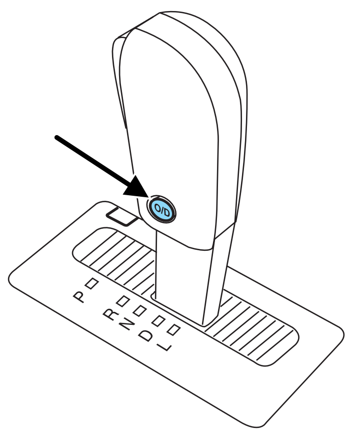
With the gearshift lever in N (Neutral), the vehicle can be started and is free to roll. Hold the brake pedal down while in this position.

D (Drive) with Overdrive

The normal driving position for the best fuel economy. Transaxle operates in gears one through six.

D (Drive) with Grade Assist

Overdrive can be deactivated by pressing the transmission control switch on the side of the gearshift lever. This will also activate Grade Assist.



- Transaxle operates in gears one through five.
- Provides engine braking. Depending on conditions the transaxle will automatically downshift to increase the level of engine braking while descending grades.
- Use when driving conditions cause excessive shifting from O/D to other gears. Examples: hilly terrain, mountainous areas and when engine braking is required.

- O/D OFF lamp in the instrument cluster is illuminated.

O/D
OFF

- To return to O/D (overdrive mode), press the transmission control switch. The O/D OFF lamp in the instrument cluster will not be illuminated.
- O/D (overdrive) is automatically returned each time the key is turned off.

L (Low)

- Provides maximum engine braking.
- Will downshift to the lowest available gear for the current vehicle speed; allows for first gear when vehicle reaches slower speeds.

If your vehicle gets stuck in mud or snow

If your vehicle gets stuck in mud or snow, it may be rocked out by shifting between forward and reverse gears, stopping between shifts in a steady pattern. Press lightly on the accelerator in each gear.

Do not rock the vehicle if the engine is not at normal operating temperature or damage to the transmission may occur.

Do not rock the vehicle for more than a minute or damage to the transmission and tires may occur, or the engine may overheat.

It may be beneficial to turn the AdvanceTrac® with RSC system off so the wheels are allowed to spin.

REVERSE SENSING SYSTEM (IF EQUIPPED)

The Reverse Sensing System (RSS) sounds a tone to warn the driver of obstacles near the rear bumper when the R (Reverse) is selected and the vehicle is moving at speeds less than 3 mph (5 km/h). The system is not effective at speeds above 3 mph (5 km/h) and may not detect certain angular or moving objects.

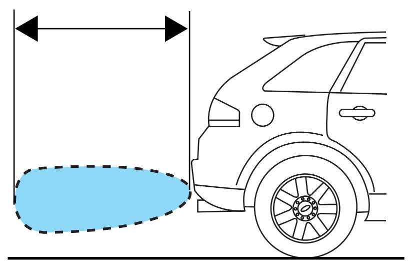
To help avoid personal injury, please read and understand the limitations of the reverse sensing system as contained in this section. Reverse sensing is only an aid for some (generally large and fixed) objects when moving in reverse on a flat surface at "parking speeds". Inclement weather may also affect the function of the RSS; this may include reduced performance or a false activation.

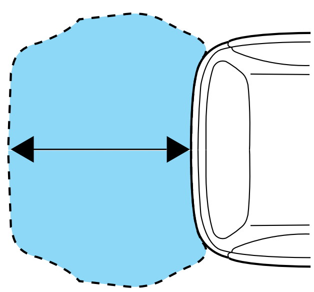
To help avoid personal injury, always use caution when in R (Reverse) and when using the RSS.

This system is not designed to prevent contact with small or moving objects. The system is designed to provide a warning to assist the driver in detecting large stationary objects to avoid damaging the vehicle. The system may not detect smaller objects, particularly those close to the ground.

Certain add-on devices such as large trailer hitches, bike or surfboard racks and any device that may block the normal detection zone of the RSS system may create false beeps.

The RSS detects obstacles up to six feet (two meters) from the rear bumper with a decreased coverage area at the outer corners of the bumper, (refer to the figures for approximate zone coverage areas). As you move closer to the obstacle, the rate of the tone increases. When the obstacle is less than 10 inches (25.0 cm) away, the tone will sound continuously. If the RSS detects a stationary or receding object further than 10 inches (25.0 cm) from the side of the vehicle, the tone will sound for only three seconds. Once the system detects an object approaching, the tone will sound again.





While receiving a warning the radio volume will be reduced to a predetermined level. After the warning goes away, the radio will return to the previous value.

The RSS automatically turns on when the gear selector is placed in R (Reverse) and the ignition is ON. A control in the message center allows the driver to disable the system only when the ignition is ON and the gear selector is in R (Reverse). Refer to *Message center* in the *Driver Controls* chapter for more information.

Keep the RSS sensors (located on the rear bumper/fascia) free from snow, ice and large accumulations of dirt (do not clean the sensors with sharp objects). If the sensors are covered, it will affect the accuracy of the RSS.

If your vehicle sustains damage to the rear bumper/fascia, leaving it misaligned or bent, the sensing zone may be altered causing inaccurate measurement of obstacles or false alarms.

ALL WHEEL DRIVE (AWD) SYSTEM (IF EQUIPPED)

Your vehicle may be equipped with a full-time All Wheel Drive (AWD) system. With the AWD option, power will be delivered to the front wheels and distributed to the rear wheels as needed. The AWD system is active all the time and requires no input from the operator.

All components of the AWD system are sealed for life and require no maintenance.

If your vehicle is equipped with AWD, a spare tire of a different size other than the tire provided should never be used. A dissimilar spare tire size (other than the spare tire provided) or major dissimilar tire sizes between the front and rear axles could cause the AWD system to stop functioning and default to front wheel drive and could damage the system.

Note: Your AWD vehicle is not intended for severe off-road use. The AWD feature gives your vehicle some limited off-road capabilities in which driving surfaces are relatively level, obstruction-free and otherwise similar to normal on-road driving conditions. Operating your vehicle under other than those conditions could subject the vehicle to excessive stress which might result in damage which is not covered under your warranty.

Driving off-highway with AWD vehicles

AWD vehicles are equipped for driving on sand, snow, mud and rough roads and have operating characteristics that are somewhat different from conventional vehicles, both on and off the highway.

When driving at slow speeds off-highway under high outside temperatures, use L (Low) gear when possible. L (Low) gear operation will maximize the engine and transmission cooling capability.

Under severe operating conditions, the A/C may cycle on and off to protect overheating of the engine.

Basic operating principles

- Drive slower in strong crosswinds which can affect the normal steering characteristics of your vehicle.
- Be extremely careful when driving on pavement made slippery by loose sand, water, gravel, snow or ice.

If your vehicle goes off the edge of the pavement

- If your vehicle goes off the edge of the pavement, slow down, but avoid severe brake application, ease the vehicle back onto the pavement only after reducing your speed. Do not turn the steering wheel too sharply while returning to the road surface.
- It may be safer to stay on the apron or shoulder of the road and slow down gradually before returning to the pavement. You may lose control if you do not slow down or if you turn the steering wheel too sharply or abruptly.
- It often may be less risky to strike small objects, such as highway reflectors, with minor damage to your vehicle rather than attempt a sudden return to the pavement which could cause the vehicle to slide sideways out of control or rollover. Remember, your safety and the safety of others should be your primary concern.

If your vehicle gets stuck

If your vehicle gets stuck in mud or snow it may be rocked out by shifting between forward and reverse gears, stopping between shifts, in a steady pattern. Press lightly on the accelerator in each gear.

If your vehicle is equipped with AdvanceTrac® with Roll Stability Control™, it may be beneficial to disengage the AdvanceTrac® with Roll Stability Control™ system while attempting to rock the vehicle.

Do not rock the vehicle if the engine is not at normal operating temperature or damage to the transmission may occur.

Do not rock the vehicle for more than a few minutes or damage to the transmission and tires may occur or the engine may overheat.

Always set the parking brake fully and make sure the gearshift is latched in P (Park). Turn the ignition to the LOCK position and remove the key whenever you leave your vehicle.

If the parking brake is fully released, but the brake warning lamp remains illuminated, the brakes may not be working properly. See your authorized dealer.

Do not spin the wheels at over 35 mph (56 km/h). The tires may fail and injure a passenger or bystander.

Emergency maneuvers

- In an unavoidable emergency situation where a sudden sharp turn must be made, remember to avoid “over-driving” your vehicle (i.e., turn the steering wheel only as rapidly and as far as required to avoid the emergency). Excessive steering will result in less vehicle control, not more. Additionally, smooth variations of the accelerator and/or brake pedal pressure should be utilized if changes in vehicle speed are called for. Avoid abrupt steering, acceleration or braking which could result in an increased risk of loss of vehicle control, vehicle rollover and/or personal injury. Use all available road surface to return the vehicle to a safe direction of travel.
- In the event of an emergency stop, avoid skidding the tires and do not attempt any sharp steering wheel movements.
- If the vehicle goes from one type of surface to another (i.e., from concrete to gravel) there will be a change in the way the vehicle responds to a maneuver (steering, acceleration or braking). Again, avoid these abrupt inputs.

AWD Systems (if equipped)

With AWD, the vehicle uses all four wheels to power the vehicle. This increases traction, enabling you to drive over terrain and road conditions that a conventional two-wheel drive vehicle cannot.

Sand

When driving over sand, try to keep all four wheels on the most solid area of the trail. Avoid reducing the tire pressures but shift to a lower gear and drive steadily through the terrain. Apply the accelerator slowly and avoid spinning the wheels.

Do not drive your AWD vehicle in deep sand for an extended period of time. This will cause the AWD system to overheat. If the rear tires stop spinning while the front tires spin in deep sand, turn off the vehicle and allow the AWD system to cool down for a minimum of 15 minutes. After the system has cooled down, normal AWD function will return. When driving at slow speeds in deep sand under high outside temperatures, use L (Low) gear when possible. L (Low) gear operation will maximize the engine and transmission cooling capability.

Under severe operating conditions, the A/C may cycle on and off to protect overheating of the engine.

Avoid excessive speed because vehicle momentum can work against you and cause the vehicle to become stuck to the point that assistance may be required from another vehicle. Remember, you may be able to back out the way you came if you proceed with caution.

Mud and water

If you must drive through high water, drive slowly. Traction or brake capability may be limited.

When driving through water, determine the depth; avoid water higher than the bottom of the wheel rims (for cars) or the bottom of the hubs (for trucks) (if possible) and proceed slowly. If the ignition system gets wet, the vehicle may stall.

Once through water, always try the brakes. Wet brakes do not stop the vehicle as effectively as dry brakes. Drying can be improved by moving your vehicle slowly while applying light pressure on the brake pedal.

Be cautious of sudden changes in vehicle speed or direction when you are driving in mud. Even AWD vehicles can lose traction in slick mud. As when you are driving over sand, apply the accelerator slowly and avoid spinning your wheels. If the vehicle does slide, steer in the direction of the slide until you regain control of the vehicle.

After driving through mud, clean off residue stuck to rotating driveshafts and tires. Excess mud stuck on tires and rotating driveshafts causes an imbalance that could damage drive components.

Driving through deep water may damage the transmission.

If the front or rear axle is submerged in water, the axle lubricant and PTU (Power Transfer Unit) lubricant should be checked and changed if necessary.

"Tread Lightly" is an educational program designed to increase public awareness of land-use regulations and responsibilities in our nations wilderness areas. Ford Motor Company joins the U.S. Forest Service and the Bureau of Land Management in encouraging you to help preserve our national forest and other public and private lands by "treading lightly."

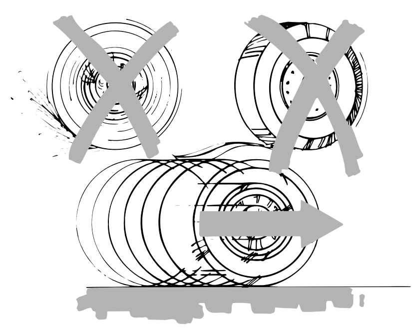
Driving on hilly or sloping terrain

Although natural obstacles may make it necessary to travel diagonally up or down a hill or steep incline, you should always try to drive straight up or straight down. **Avoid driving crosswise or turning on steep slopes or hills.** A danger lies in losing traction, slipping sideways and possibly rolling over. Whenever driving on a hill, determine beforehand the route you will use. Do not drive over the crest of a hill without seeing what conditions are on the other side. Do not drive in reverse over a hill without the aid of an observer.

When climbing a steep slope or hill, start in a lower gear rather than downshifting to a lower gear from a higher gear once the ascent has started. This reduces strain on the engine and the possibility of stalling.

If you do stall out, do not try to turnaround because you might roll over. It is better to back down to a safe location.

Apply just enough power to the wheels to climb the hill. Too much power will cause the tires to slip, spin or lose traction, resulting in loss of vehicle control.



Descend a hill in the same gear you would use to climb up the hill to avoid excessive brake application and brake overheating. Do not descend in neutral; instead, disengage overdrive or manually shift to a lower gear. When descending a steep hill, avoid sudden hard braking as you could lose control. The front wheels have to be turning in order to steer the vehicle.

Your vehicle has anti-lock brakes, therefore apply the brakes steadily. Do not "pump" the brakes.

Driving on snow and ice

Note: Excessive tire slippage can cause transaxle damage.

AWD vehicles have advantages over 2WD vehicles in snow and ice but can skid like any other vehicle.

Should you start to slide while driving on snowy or icy roads, turn the steering wheel in the direction of the slide until you regain control.

Avoid sudden applications of power and quick changes of direction on snow and ice. Apply the accelerator slowly and steadily when starting from a full stop.

Avoid sudden braking as well. Although an AWD vehicle may accelerate better than a two-wheel drive vehicle in snow and ice, it won't stop any faster, because as in other vehicles, braking occurs at all four wheels. Do not become overconfident as to road conditions.

Make sure you allow sufficient distance between you and other vehicles for stopping. Drive slower than usual and consider using one of the lower gears. In emergency stopping situations, apply the brake steadily. Since your vehicle is equipped with a four wheel anti-lock brake system (ABS), do not "pump" the brakes. Refer to the *Brakes* section of this chapter for additional information on the operation of the anti-lock brake system.

Maintenance and Modifications

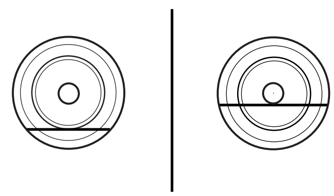
The suspension and steering systems on your vehicle have been designed and tested to provide predictable performance whether loaded or empty and durable load carrying capability. For this reason, Ford Motor Company strongly recommends that you do not make modifications such as adding or removing parts (such as lift kits or stabilizer bars) or by using replacement parts not equivalent to the original factory equipment.

Any modifications to a vehicle that raise the center of gravity can make it more likely the vehicle will rollover as a result of a loss of control. Ford Motor Company recommends that caution be used with any vehicle equipped with a high load or device (such as ladder or luggage racks).

Failure to maintain your vehicle properly may void the warranty, increase your repair cost, reduce vehicle performance and operational capabilities and adversely affect driver and passenger safety. Frequent inspection of vehicle chassis components is recommended if the vehicle is subjected to off-highway usage.

DRIVING THROUGH WATER

If driving through deep or standing water is unavoidable, proceed very slowly especially when the depth is not known. Never drive through water that is higher than the bottom of the wheel rims (for cars) or the bottom of the hubs (for trucks).



When driving through water, traction or brake capability may be limited. Also, water may enter your engine's air intake and severely damage your engine or your vehicle may stall. **Driving through deep water where the transmission vent tube is submerged may allow water into the transmission and cause internal transmission damage.**

Once through the water, always dry the brakes by moving your vehicle slowly while applying light pressure on the brake pedal. Wet brakes do not stop the vehicle as quickly as dry brakes.

ROADSIDE ASSISTANCE

Getting roadside assistance

To fully assist you should you have a vehicle concern, Ford Motor Company offers a complimentary roadside assistance program. This program is separate from the New Vehicle Limited Warranty. The service is available:

- 24–hours, seven days a week
- for the coverage period listed on the Roadside Assistance Card included in your Owner Guide portfolio.

Roadside assistance will cover:

- a flat tire change with a good spare (except vehicles that have been supplied with a tire inflation kit)
- battery jump start
- lock-out assistance (key replacement cost is the customer's responsibility)
- fuel delivery – Independent Service Contractors, if not prohibited by state, local or municipal law shall deliver up to 2.0 gallons (7.5L) of gasoline or 5 gallons (18.9L) of diesel fuel to a disabled vehicle. Fuel delivery service is limited to two no-charge occurrences within a 12-month period.
- winch out – available within 100 feet (30.5 meters) of a paved or county maintained road, no recoveries.
- towing – Ford/Mercury/Lincoln eligible vehicle towed to an authorized dealer within 35 miles (56.3 km) of the disablement location or to the nearest authorized dealer. If a member requests to be towed to an authorized dealer more than 35 miles (56.3 km) from the disablement location, the member shall be responsible for any mileage costs in excess of 35 miles (56.3 km).

Trailers shall be covered up to $200 if the disabled eligible vehicle requires service at the nearest authorized dealer. If the trailer is disabled, but the towing vehicle is operational, the trailer does not qualify for any roadside services.

Canadian customers refer to your Customer Information Guide for information on:

- coverage period
- exact fuel amounts
- towing of your disabled vehicle
- emergency travel expense reimbursement
- travel planning benefits

Using roadside assistance

Complete the roadside assistance identification card and place it in your wallet for quick reference. In the United States, this card is found in the Owner Guide portfolio in the glove compartment. In Canada, the card is found in the *Customer Information Guide* in the glove compartment.

U.S. Ford or Mercury vehicle customers who require roadside assistance, call 1–800–241–3673; Lincoln vehicle customers call 1–800–521–4140.

Canadian customers who require roadside assistance, call 1–800–665–2006.

If you need to arrange roadside assistance for yourself, Ford Motor Company will reimburse a reasonable amount for towing to the nearest dealership within 35 miles. To obtain reimbursement information, U.S. Ford or Mercury vehicle customers call 1–800–241–3673; Lincoln vehicle customers call 1–800–521–4140. Customers will be asked to submit their original receipts.

Canadian customers who need to obtain reimbursement information, call 1–800–665–2006.

Roadside coverage beyond basic warranty

In the United States, you may purchase additional roadside assistance coverage beyond this period through the Ford Auto Club by contacting your authorized dealer or by calling 1–800–FORD–CLUB.

Similarly in Canada, for uninterrupted Roadside Assistance coverage, you may purchase extended coverage prior to your Basic Warranty's Roadside Assistance expiring. For more information and enrollment, contact 1–877–294–2582 or visit our website at www.ford.ca.

HAZARD FLASHER CONTROL

The hazard flasher is located on the instrument panel by the radio. The hazard flashers will operate when the ignition is in any position or if the key is not in the ignition.

Push in the flasher control and all front and rear direction signals will flash. Press the flasher control again to turn them off. Use it when your vehicle is disabled and is creating a safety hazard for other motorists.

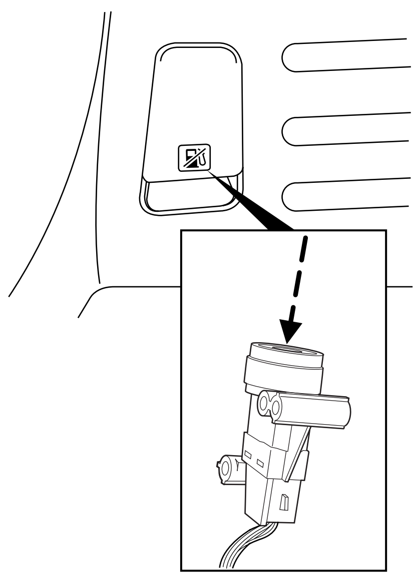
Note: With extended use, the flasher may run down your battery.

FUEL PUMP SHUT-OFF SWITCH

This device stops the electric fuel pump from sending fuel to the engine when your vehicle has had a substantial jolt.

After an accident, if the engine cranks but does not start, this switch may have been activated.

This switch is located behind a panel on the left side of the cargo area.



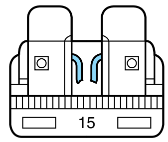
To reset the switch:

1. Turn the ignition OFF.
2. Check the fuel system for leaks.
3. If no leaks are apparent, reset the switch by pushing in on the reset button.
4. Turn the ignition ON.
5. Wait a few seconds and return the key to OFF.
6. Make another check for leaks.

FUSES AND RELAYS

Fuses

If electrical components in the vehicle are not working, a fuse may have blown. Blown fuses are identified by a broken wire within the fuse. Check the appropriate fuses before replacing any electrical components.



Note: Always replace a fuse with one that has the specified amperage rating. Using a fuse with a higher amperage rating can cause severe wire damage and could start a fire.

Standard fuse amperage rating and color

COLOR					
Fuse rating	**Mini fuses**	**Standard fuses**	**Maxi fuses**	**Cartridge maxi fuses**	**Fuse link cartridge**

Passenger compartment fuse panel

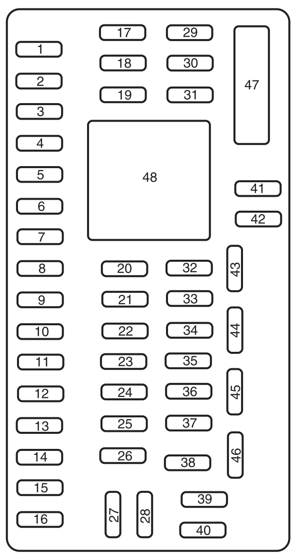
The fuse panel is located behind a trim panel on the left side of the driver’s footwell near the parking brake. To remove the trim panel, slide the release lever to the right then pull the trim panel out.

To remove the fuse panel cover, press in the tabs on both sides of the cover, then pull the cover off.

To reinstall the fuse panel cover, place the top part of the cover on the fuse panel, then push the bottom part of the cover until it clicks into place. Gently pull on the cover to make sure it is secure.

To reinstall the trim panel, align the tabs on the bottom of the panel with the grooves, push the panel shut and slide the release lever to the left to secure the panel.

To remove a fuse, use the fuse puller tool provided on the fuse panel cover.



The fuses are coded as follows.

Fuse/Relay Location	Fuse Amp Rating	Passenger Compartment Fuse Panel Description
1	30A	Passenger front smart window
2	15A	Not used (Spare)
3	15A	Family entertainment system (FES)/Rear seat control, SYNC
4	30A	Driver front smart window
5	10A	Keypad illumination, 2nd row seat, Tire Pressure Monitoring System (TPMS), Brake Shift Interlock (BSI)
6	20A	Turn signals
7	10A	Low beam headlamps (left)
8	10A	Low beam headlamps (right)

47	30A Circuit Breaker	Power windows
48	—	Delayed accessory relay

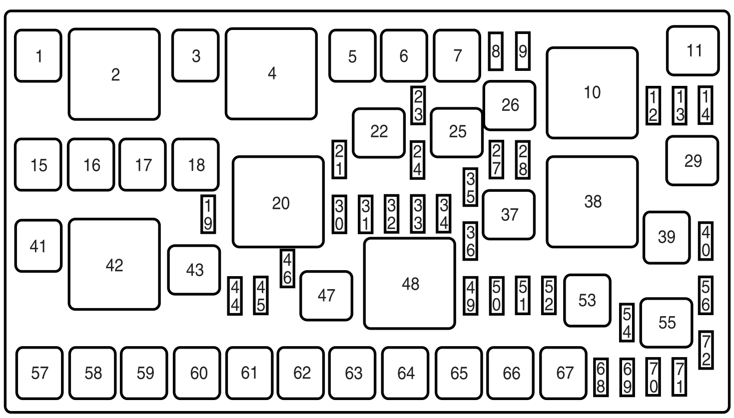
Power distribution box

The power distribution box is located in the engine compartment. The power distribution box contains high-current fuses that protect your vehicle's main electrical systems from overloads.

Always disconnect the battery before servicing high current fuses.

To reduce risk of electrical shock, always replace the cover to the Power Distribution Box before reconnecting the battery or refilling fluid reservoirs.

If the battery has been disconnected and reconnected, refer to the *Battery* section of the *Maintenance and Specifications* chapter.



The high-current fuses are coded as follows:

Fuse/Relay Location	Fuse Amp Rating	Power Distribution Box Description
1	—	Not used
2	—	Blower motor relay
3	—	Not used
4	—	Not used

Fuse/Relay Location	Fuse Amp Rating	Power Distribution Box Description

* Mini Fuses ** Cartridge Fuses		

CHANGING THE TIRES

If you get a flat tire while driving, do not apply the brake heavily. Instead, gradually decrease your speed. Hold the steering wheel firmly and slowly move to a safe place on the side of the road.

Note: The tire pressure monitoring system (TPMS) indicator light will illuminate when the spare tire is in use. To restore the full functionality of the monitoring system, all road wheels equipped with tire pressure monitoring sensors must be mounted on the vehicle.

Have a flat serviced by an authorized dealer in order to prevent damage to the TPMS sensors, refer to *Tire Pressure Monitoring System (TPMS)* in the *Tires, Wheels and Loading* chapter. Replace the spare tire with a road tire as soon as possible.

⚠ The use of tire sealants may damage your Tire Pressure Monitoring System and should not be used.

⚠ Refer to *Tire Pressure Monitoring System (TPMS)* in the *Tires, Wheels and Loading* chapter for important information. If the tire pressure monitor sensor becomes damaged, it will no longer function.

Dissimilar spare tire/wheel information

Failure to follow these guidelines could result in an increased risk of loss of vehicle control, injury or death.

If you have a dissimilar spare tire/wheel, then it is intended for temporary use only. This means that if you need to use it, you should replace it as soon as possible with a road tire/wheel that is the same size and type as the road tires and wheels that were originally provided by Ford. If the dissimilar spare tire or wheel is damaged, it should be replaced rather than repaired.

A dissimilar spare tire/wheel is defined as a spare tire and/or wheel that is different in brand, size or appearance from the road tires and wheels and can be one of three types:

1. **T-type mini-spare:** This spare tire begins with the letter “T” for tire size and may have “Temporary Use Only” molded in the sidewall

2. **Full-size dissimilar spare with label on wheel:** This spare tire has a label on the wheel that states: “THIS TIRE AND WHEEL FOR TEMPORARY USE ONLY”

When driving with one of the dissimilar spare tires listed above, **do not:**

- Exceed 50 mph (80 km/h)
- Load the vehicle beyond maximum vehicle load rating listed on the Safety Compliance Label
- Tow a trailer
- Use snow chains on the end of the vehicle with the dissimilar spare tire
- Use more than one dissimilar spare tire at a time
- Use commercial car washing equipment
- Try to repair the dissimilar spare tire

Use of one of the dissimilar spare tires listed above at any one wheel location can lead to impairment of the following:

- Handling, stability and braking performance
- Comfort and noise
- Ground clearance and parking at curbs
- Winter weather driving capability
- Wet weather driving capability

3. **Full-size dissimilar spare without label on wheel**

When driving with the full-size dissimilar spare tire/wheel, **do not:**

- Exceed 70 mph (113 km/h)
- Use more than one dissimilar spare tire/wheel at a time
- Use commercial car washing equipment
- Use snow chains on the end of the vehicle with the dissimilar spare tire/wheel

The usage of a full-size dissimilar spare tire/wheel can lead to impairment of the following:

- Handling, stability and braking performance
- Comfort and noise
- Ground clearance and parking at curbs
- Winter weather driving capability
- Wet weather driving capability
- All-Wheel driving capability (if applicable)
- Load leveling adjustment (if applicable)

When driving with the full-size dissimilar spare tire/wheel additional caution should be given to:

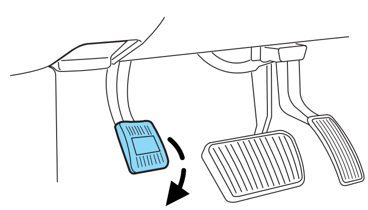
- Towing a trailer
- Driving vehicles equipped with a camper body
- Driving vehicles with a load on the cargo rack

Drive cautiously when using a full-size dissimilar spare tire/wheel and seek service as soon as possible.

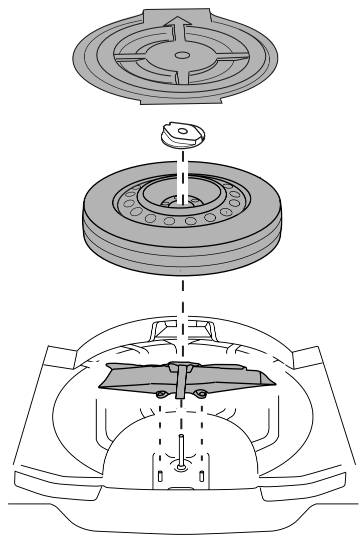
Stopping and securing the vehicle

1. Park on a level surface, activate hazard flashers and set the parking brake.

2. Place the gearshift lever in P (Park) and turn the engine OFF.



Removing the spare tire and jack



1. Lift the carpeted load floor panel located in the rear of the vehicle.

2. Remove the spare tire cover (if equipped).

3. Remove the wing nut securing the spare tire by turning it counterclockwise.

4. Lift and remove the temporary spare tire from the cargo area.

5. Remove the jack assembly from the vehicle. Loosen the bag tabs and remove the jack and lug wrench from the bag.

6. Fold down the wrench socket used to loosen the lug nuts and operate the jack.

Tire change procedure

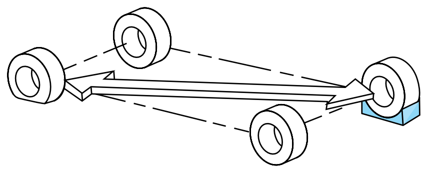
When one of the front wheels is off the ground, the transaxle alone will not prevent the vehicle from moving or slipping off the jack, even if the vehicle is in P (Park).

To help prevent the vehicle from moving when you change a tire, be sure to place the transaxle in P (Park), set the parking brake and block (in both directions) the wheel that is diagonally opposite (other side and end of the vehicle) to the tire being changed.

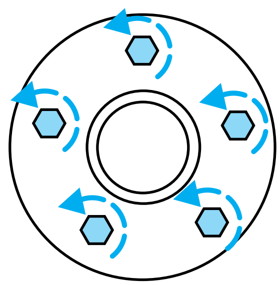
If the vehicle slips off the jack, you or someone else could be seriously injured.

Do not attempt to change a tire on the side of the vehicle close to moving traffic. Pull far enough off the road to avoid the danger of being hit when operating the jack or changing the wheel.

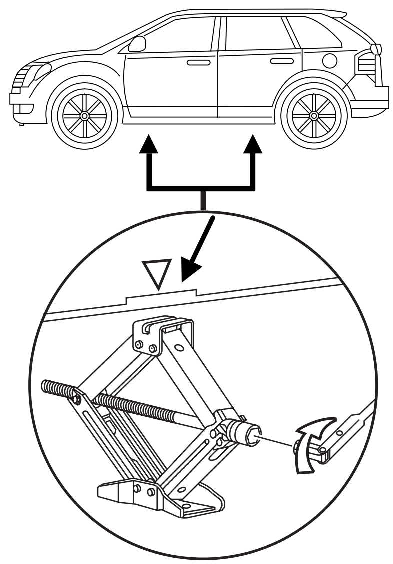
1. Block the diagonally opposite wheel.



2. Remove wheel cover (if equipped) with the lug wrench tip and loosen each wheel lug nut one-half turn counterclockwise but do not remove them until the wheel is raised off the ground.



3. Align the slot on top of the jack with the sheet metal flange indicated by the jack locator triangle next to the tire you are changing. Turn the jack handle clockwise until the wheel is completely off the ground.



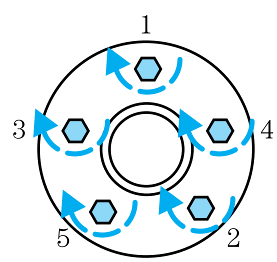
To lessen the risk of personal injury, do not put any part of your body under the vehicle while changing a tire. Do not start the engine when your vehicle is on the jack. The jack is only meant for changing the tire.

4. Remove the lug nuts with the lug wrench.

5. Replace the flat tire with the spare tire, making sure the valve stem is facing outward. Reinstall the lug nuts until the wheel is snug against the hub. Do not fully tighten the lug nuts until the wheel has been lowered.

6. Lower the wheel by turning the jack handle counterclockwise.

7. Remove the jack and fully tighten the lug nuts in the order shown. Refer to *Wheel lug nut torque specifications* later in this chapter for the proper lug nut torque specification.



Stowing the flat/spare tire and jack

1. Fully collapse the jack, fold the wrench socket into the handle and place them both into the bag making sure to secure the tabs.

2. Place the jack assembly in the spare tire well aligning it with the two vertical studs.

3. Place the tire in the spare tire well over the jack assembly.

If you are stowing a flat tire, place the tire in the spare tire well with the valve stem facing down. Rotate the tire until the jack assembly is able to protrude through a wheel opening.

If you are stowing the spare tire, place the spare in the spare tire well in its original position.

4. Secure the wheel by replacing the wing nut and turning clockwise.

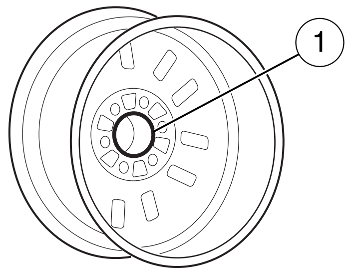
WHEEL LUG NUT TORQUE SPECIFICATIONS

Retighten the lug nuts to the specified torque within 100 miles (160 km) after any wheel disturbance (rotation, flat tire, wheel removal, etc.).

<table>
<tr><th rowspan="2">Lug nut socket size/Bolt size</th><th colspan="2">Wheel lug nut torque*</th></tr>
<tr><th>lb.ft.</th><th>N•m</th></tr>
<tr><td>Lug nut socket size: ¾ inch (19 mm) hex
Bolt size: ½ x 20</td><td>100</td><td>135</td></tr>
<tr><td colspan="3">* Torque specifications are for nut and bolt threads free of dirt and rust. Use only Ford recommended replacement fasteners.</td></tr>
</table>

When a wheel is installed, always remove any corrosion, dirt or foreign materials present on the mounting surfaces of the wheel or the surface of the wheel hub, brake drum or brake disc that contacts the wheel. Ensure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Installing wheels without correct metal-to-metal contact at the wheel mounting surfaces can cause the wheel nuts to loosen and the wheel to come off while the vehicle is in motion, resulting in loss of control.

Note: Inspect the wheel pilot hole prior to installation. If there is visible corrosion in wheel pilot hole, remove loose particles by wiping with clean rag and apply grease. Apply grease only to the wheel pilot hole surface by smearing a "dime" (1 square cm) sized glob of grease around the wheel pilot surface (1) with end of finger. DO NOT apply grease to lugnut/stud holes or wheel-to-brake surfaces.



JUMP STARTING

⚠ The gases around the battery can explode if exposed to flames, sparks, or lit cigarettes. An explosion could result in injury or vehicle damage.

⚠ Batteries contain sulfuric acid which can burn skin, eyes and clothing, if contacted.

Do not attempt to push-start your automatic transmission vehicle. Automatic transmissions do not have push-start capability. Attempting to push-start a vehicle with an automatic transmission may cause transmission damage.

Preparing your vehicle

When the battery is disconnected or a new battery is installed, the automatic transmission must relearn its shift strategy. As a result, the transmission may have firm and/or soft shifts. This operation is considered normal and will not affect function or durability of the transmission. Over time, the adaptive learning process will fully update transmission operation.

1. **Use only a 12–volt supply to start your vehicle.**

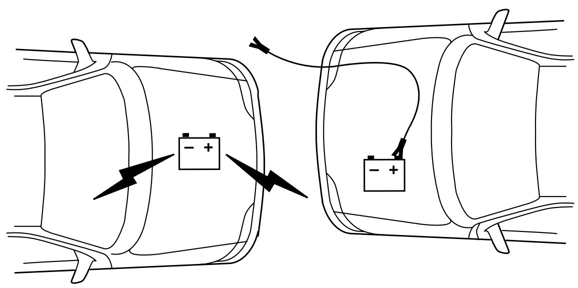
2. Do not disconnect the battery of the disabled vehicle as this could damage the vehicle's electrical system.

3. Park the booster vehicle close to the hood of the disabled vehicle making sure the two vehicles **do not** touch. Set the parking brake on both vehicles and stay clear of the engine cooling fan and other moving parts.

4. Check all battery terminals and remove any excessive corrosion before you attach the battery cables. Ensure that vent caps are tight and level.

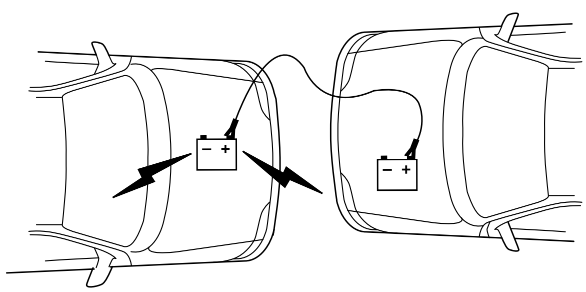
5. Turn the heater fan on in both vehicles to protect from any electrical surges. Turn all other accessories off.

Connecting the jumper cables

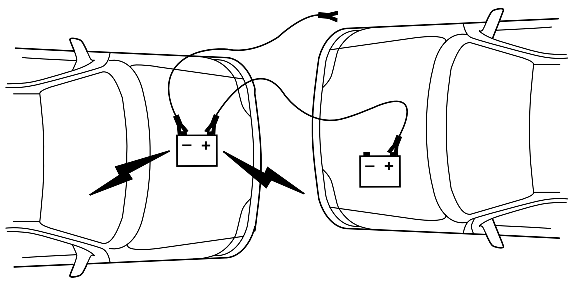


1. Connect the positive (+) jumper cable to the positive (+) terminal of the discharged battery.

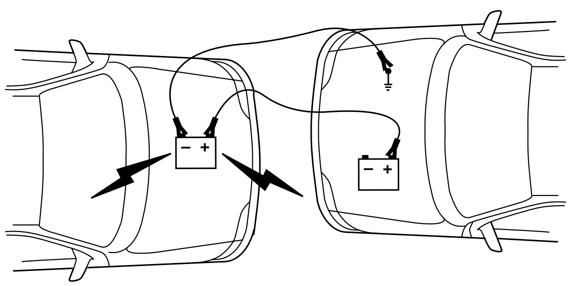
Note: In the illustrations, *lightning bolts* are used to designate the assisting (boosting) battery.



2. Connect the other end of the positive (+) cable to the positive (+) terminal of the assisting battery.



3. Connect the negative (-) cable to the negative (-) terminal of the assisting battery.



4. Make the final connection of the negative (-) cable to an exposed metal part of the stalled vehicle's engine, away from the battery and the carburetor/fuel injection system. **Do not** use fuel lines, engine rocker covers or the intake manifold as *grounding* points.

Do not connect the end of the second cable to the negative (-) terminal of the battery to be jumped. A spark may cause an explosion of the gases that surround the battery.

5. Ensure that the cables are clear of fan blades, belts, moving parts of both engines, or any fuel delivery system parts.

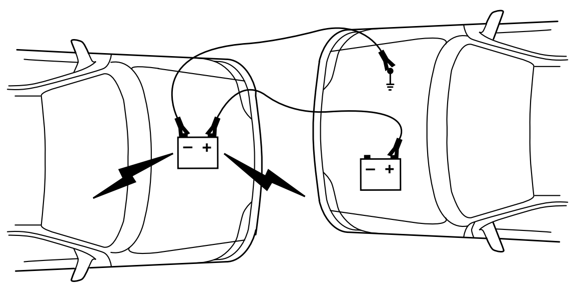
Jump starting

1. Start the engine of the booster vehicle and run the engine at moderately increased speed.

2. Start the engine of the disabled vehicle.

3. Once the disabled vehicle has been started, run both engines for an additional three minutes before disconnecting the jumper cables.

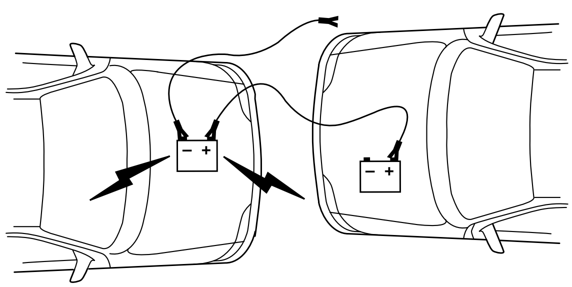
Removing the jumper cables



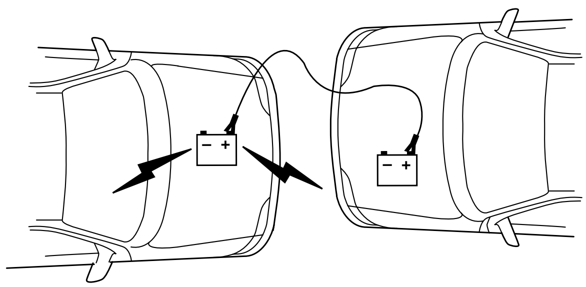
Remove the jumper cables in the reverse order that they were connected.

1. Remove the jumper cable from the *ground* metal surface.

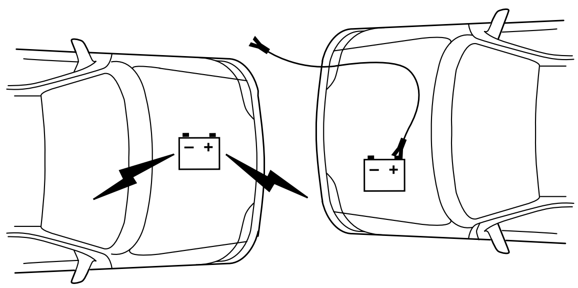
Note: In the illustrations, *lightning bolts* are used to designate the assisting (boosting) battery.



2. Remove the jumper cable on the negative (-) connection of the booster vehicle's battery.



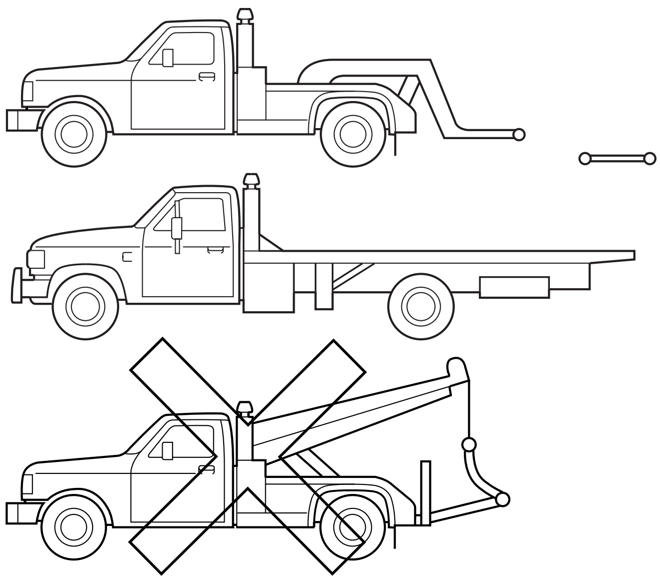
3. Remove the jumper cable from the positive (+) terminal of the booster vehicle's battery.



4. Remove the jumper cable from the positive (+) terminal of the disabled vehicle's battery.

After the disabled vehicle has been started and the jumper cables removed, allow it to idle for several minutes so the engine computer can *relearn* its idle conditions.

WRECKER TOWING



If you need to have your vehicle towed, contact a professional towing service or, if you are a member of a roadside assistance program, your roadside assistance service provider.

It is recommended that your vehicle be towed with a wheel lift and dollies or flatbed equipment. Do not tow with a slingbelt. Ford Motor Company has not approved a slingbelt towing procedure.

On FWD vehicles, if your vehicle is to be towed from the front, ensure proper wheel lift equipment is used to raise the front wheels off the ground. The rear wheels can be left on the ground when towed in this fashion.

If your vehicle is to be towed from the rear using wheel lift equipment, it is recommended that the front wheels (drive wheels) be placed on a dolly to prevent damage to the automatic transaxle.

On AWD vehicles, it is **required** that your vehicle be towed with a wheel lift and dollies or flatbed equipment with all the wheels off the ground to prevent damage to the automatic transaxle, AWD system or vehicle.

If the vehicle is towed by other means or incorrectly, vehicle damage may occur.

In case of a roadside emergency with a disabled vehicle (without access to wheel dollies, car hauling trailer, or flatbed transport vehicle) your vehicle (regardless of transmission powertrain configuration) can be flat towed (all wheels on the ground) under the following conditions:

- Place the transmission in N (Neutral).
- Maximum distance is 50 miles (80 km).
- Maximum speed is not to exceed 35 mph (56 km/h).

Ford Motor Company produces a towing manual for all authorized tow truck operators. Have your tow truck operator refer to this manual for proper hook-up and towing procedures for your vehicle.

GETTING THE SERVICES YOU NEED

At home

You must take your Lincoln or Mercury vehicle to an authorized dealer for warranty repairs. While any authorized dealer handling your vehicle line will provide warranty service, we recommend you return to your selling authorized dealer who wants to ensure your continued satisfaction. Please note that certain warranty repairs require special training and/or equipment, so not all authorized dealers are authorized to perform all warranty repairs. This means that, depending on the warranty repair needed, you may have to take your vehicle to another authorized dealer. A reasonable time must be allowed to perform a repair after taking your vehicle to the authorized dealer. Repairs will be made using Ford or Motorcraft parts, or remanufactured or other parts that are authorized by Ford.

If you have questions or concerns, or are unsatisfied with the service you are receiving, follow these steps:

1. Contact your Sales Representative or Service Advisor at your selling/servicing authorized dealer.

2. If your inquiry or concern remains unresolved, contact the Sales Manager, Service Manager or Customer Relations Manager.

3. If you require assistance or clarification on Ford Motor Company policies or procedures, please contact the Lincoln Mercury Customer Relationship Center at 1-800-521-4140.

Away from home

If you own a Ford or Mercury vehicle and are away from home when your vehicle needs service, or if you need more help than the authorized dealer could provide, after following the steps described above, contact the Ford Customer Relationship Center to find an authorized dealer to help you.

In the United States:

Ford Motor Company
Customer Relationship Center
P.O. Box 6248
Dearborn, MI 48121
1-800-392-3673 (FORD)
(TDD for the hearing impaired: 1-800-232-5952)
www.customersaskford.com

In Canada:
Customer Relationship Centre
Ford Motor Company of Canada, Limited
P.O. Box 2000
Oakville, Ontario L6J 5E4
1-800-565-3673 (FORD)
www.ford.ca

If you own a Lincoln vehicle and are away from home when your vehicle needs service, or if you need more help than the authorized dealer could provide, after following the steps described above, contact the Ford Customer Relationship Center to find an authorized dealer to help you.

In the United States:
Ford Motor Company
Customer Relationship Center
P.O. Box 6248
Dearborn, MI 48121
1-800-521-4140
(TDD for the hearing impaired: 1-800-232-5952)
www.customersaskford.com

In Canada:
Lincoln Centre
Ford Motor Company of Canada, Limited
P.O. Box 2000
Oakville, Ontario L6J 5E4
1-800-387-9333
www.lincolncanada.com

In order to help you service your Lincoln vehicle, please have the following information available when contacting the Lincoln Centre:

- Your telephone number (home and business)
- The name of the authorized dealer and the city where the authorized dealer is located
- The year and make of your vehicle
- The date of vehicle purchase
- The current odometer reading
- The vehicle identification number (VIN)

Additional Assistance

If you still have a complaint involving a warranty dispute, you may wish to contact the Better Business Bureau (BBB) AUTO LINE program (U.S. only).

In some states (in the U.S.) you must directly notify Ford in writing before pursuing remedies under your state's warranty laws. Ford is also allowed a final repair attempt in some states.

In the United States, a warranty dispute must be submitted to the BBB AUTO LINE before taking action under the Magnuson-Moss Warranty Act, or to the extent allowed by state law, before pursuing replacement or repurchase remedies provided by certain state laws. This dispute handling procedure is not required prior to enforcing state created rights or other rights which are independent of the Magnuson-Moss Warranty Act or state replacement or repurchase laws.

IN CALIFORNIA (U.S. ONLY)

California Civil Code Section 1793.2(d) requires that, if a manufacturer or its representative is unable to repair a motor vehicle to conform to the vehicle's applicable express warranty after a reasonable number of attempts, the manufacturer shall be required to either replace the vehicle with one substantially identical or repurchase the vehicle and reimburse the buyer in an amount equal to the actual price paid or payable by the consumer (less a reasonable allowance for consumer use). The consumer has the right to choose whether to receive a refund or replacement vehicle.

California Civil Code Section 1793.22(b) presumes that the manufacturer has had a reasonable number of attempts to conform the vehicle to its applicable express warranties if, within the first 18 months of ownership of a new vehicle or the first 18,000 miles (29,000 km), whichever occurs first:

1. Two or more repair attempts are made on the same non-conformity likely to cause death or serious bodily injury OR

2. Four or more repair attempts are made on the same nonconformity (a defect or condition that substantially impairs the use, value or safety of the vehicle) OR

3. The vehicle is out of service for repair of nonconformities for a total of more than 30 calendar days (not necessarily all at one time)

In the case of 1 or 2 above, the consumer must also notify the manufacturer of the need for the repair of the nonconformity at the following address:

Ford Motor Company
16800 Executive Plaza Drive
Mail Drop 3NE-B
Dearborn, MI 48126

THE BETTER BUSINESS BUREAU (BBB) AUTO LINE PROGRAM (U.S. ONLY)

Your satisfaction is important to Ford Motor Company and to your dealer. Experience has shown that our customers have been very successful in achieving satisfaction by following the three-step procedure outlined on the front page of the Warranty Guide. However, if your warranty concern has not been resolved using the three-step procedure, you may be eligible to participate in the BBB AUTO LINE program.

The BBB AUTO LINE program consists of two parts – mediation and arbitration. Initially, the BBB will try to resolve your question or concern through mediation. Mediation is a process through which a representative of the BBB will contact the parties and explore options for settlement of your claim. If mediation is not successful, customers with eligible claims may participate in the BBB AUTO LINE arbitration process. An arbitration hearing will be scheduled so that you can present your case in an informal setting before an impartial person. The arbitrator will consider the testimony provided and make a decision after the hearing. You are not bound by the decision but may choose to accept it. If you choose to accept the BBB AUTO LINE decision then Ford must abide by the accepted decision as well. If the arbitrator has decided in your favor and you accept the decision, the BBB AUTO LINE program will contact you to ensure that Ford has complied with the decision in a timely manner. Disputes submitted to the BBB AUTO LINE program are usually decided within forty days after you file your claim with the BBB.

To initiate a claim with the BBB AUTO LINE, you will be asked for your name and address, general information about your new vehicle, information about your warranty concerns and any steps you have already taken to try to resolve them. You will then be mailed a Customer Claim Form that you will need to complete, provide proof of vehicle ownership, sign and return the Customer Claim Form to the BBB. Upon receipt, the BBB will review the claim for eligibility under the Program Summary Guidelines.

You can get more information by calling BBB AUTO LINE at 1–800–955–5100, or writing to:

BBB AUTO LINE
4200 Wilson Boulevard, Suite 800
Arlington, Virginia 22203–1833

Note: Ford Motor Company reserves the right to change eligibility limitations, modify procedures, or to discontinue this process at any time without notice and without obligation.

UTILIZING THE MEDIATION/ARBITRATION PROGRAM (CANADA ONLY)

For vehicles delivered to authorized Canadian dealers. In those cases where you continue to feel that the efforts by Ford of Canada and the authorized dealer to resolve a factory-related vehicle service concern have been unsatisfactory, Ford of Canada participates in an impartial third party mediation/arbitration program administered by the Canadian Motor Vehicle Arbitration Plan (CAMVAP).

The CAMVAP program is a straight-forward and relatively speedy alternative to resolve a disagreement when all other efforts to produce a settlement have failed. This procedure is without cost to you and is designed to eliminate the need for lengthy and expensive legal proceedings.

In the CAMVAP program, impartial third-party arbitrators conduct hearings at mutually convenient times and places in an informal environment. These impartial arbitrators review the positions of the parties, make decisions and, when appropriate, render awards to resolve disputes. CAMVAP decisions are fast, fair, and final as the arbitrator's award is binding both to you and Ford of Canada.

CAMVAP services are available in all territories and provinces. For more information, without charge or obligation, call your CAMVAP Provincial Administrator directly at 1-800-207-0685.

FORD EXTENDED SERVICE PLAN

You can get more protection for your new car or light truck by purchasing Ford Extended Service Plan (Ford ESP) coverage. It provides the following:

- Benefits during the warranty period depending on the plan you purchase (such as: reimbursement for rentals; coverage for certain maintenance and wear items).
- Protection against covered repair costs after your Bumper-to-Bumper Warranty expires.

You may purchase Ford ESP from any participating authorized dealer. There are several plans available in various time, distance and deductible combinations which can be tailored to fit your own driving needs. Ford ESP also offers reimbursement benefits for towing and rental coverage.

When you buy Ford ESP, you receive Peace-of-Mind protection throughout the United States and Canada, provided by a network of more than 4,600 participating authorized dealers.

If you did not take advantage of the Ford Extended Service Plan at the time of purchasing your vehicle, you may still be eligible. Since this information is subject to change, please ask your authorized dealer for complete details about Ford Extended Service Plan coverage options, or visit the Ford ESP website at www.ford-esp.com.

GETTING ASSISTANCE OUTSIDE THE U.S. AND CANADA

Before exporting your vehicle to a foreign country, contact the appropriate foreign embassy or consulate. These officials can inform you of local vehicle registration regulations and where to find unleaded fuel.

If you cannot find unleaded fuel or can only get fuel with an anti-knock index lower than is recommended for your vehicle, contact a regional office or owner relations/customer relationship office.

The use of leaded fuel in your vehicle without proper conversion may damage the effectiveness of your emission control system and may cause engine knocking or serious engine damage. Ford Motor Company/Ford of Canada is not responsible for any damage caused by use of improper fuel. Using leaded fuel may also result in difficulty importing your vehicle back into the U.S.

If your vehicle must be serviced while you are traveling or living in Central America, the Caribbean, or the Middle East, contact the nearest authorized dealer. If the authorized dealer cannot help you, write or call:

FORD MOTOR COMPANY
FORD EXPORT OPERATIONS
1555 Fairlane Drive
Fairlane Business Park #3
Allen Park, Michigan 48101
U.S.A.
Telephone: (313) 594-4857
FAX: (313) 390-0804

If you are in another foreign country, contact the nearest authorized dealer. If the authorized dealer employees cannot help you, they can direct you to the nearest Ford affiliate office.

If you buy your vehicle in North America and then relocate outside of the U.S. or Canada, register your vehicle identification number (VIN) and new address with Ford Motor Company Export Operations.

Customers in the U.S. should call 1–800–392–3673.

ORDERING ADDITIONAL OWNER'S LITERATURE

To order the publications in this portfolio, contact Helm, Incorporated at:

HELM, INCORPORATED
P.O. Box 07150
Detroit, Michigan 48207

Or call:

For a free publication catalog, order toll free: 1-800-782-4356

Monday-Friday 8:00 a.m. - 6:00 p.m. EST

Helm, Incorporated can also be reached by their website:
www.helminc.com.

(Items in this catalog may be purchased by credit card, check or money order.)

Obtaining a French owner's guide

French Owner's Guides can be obtained from your authorized dealer or by writing to:
Ford Motor Company of Canada, Limited
Service Publications CHQ202
The Canadian Road
P.O. Box 2000
Oakville, ON, Canada
L6J 5E4

REPORTING SAFETY DEFECTS (U.S. ONLY)

If you believe that your vehicle has a defect which could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying Ford Motor Company.

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or Ford Motor Company.

To contact NHTSA, you may call the Vehicle Safety Hotline toll-free at 1–888–327–4236 (TTY: 1–800–424–9153); go to *http://www.safercar.gov;* or write to:

Administrator
1200 New Jersey Avenue, Southeast
Washington, D.C. 20590

You can also obtain other information about motor vehicle safety from *http://www.safercar.gov.*

REPORTING SAFETY DEFECTS (CANADA ONLY)

If you believe that your vehicle has a defect which could cause a crash or could cause injury or death, you should immediately inform Transport Canada, using their toll-free number: 1–800–333–0510.

WASHING THE EXTERIOR

Wash your vehicle regularly with cool or lukewarm water and a neutral pH shampoo, such as Motorcraft Detail Wash (ZC-3-A), which is available from your authorized dealer.

- Never use strong household detergents or soap, such as dish washing or laundry liquid. These products can discolor and spot painted surfaces.
- Never wash a vehicle that is “hot to the touch” or during exposure to strong, direct sunlight.
- Always use a clean sponge or car wash mitt with plenty of water for best results.
- Dry the vehicle with a chamois or soft terry cloth towel in order to eliminate water spotting.
- It is especially important to wash the vehicle regularly during the winter months, as dirt and road salt are difficult to remove and cause damage to the vehicle.
- Immediately remove items such as gasoline, diesel fuel, bird droppings and insect deposits because they can cause damage to the vehicle’s paintwork and trim over time. Use Bug and Tar Remover (ZC-42) which is available from your authorized dealer.
- Remove any exterior accessories, such as antennas, before entering a car wash.
- **Suntan lotions and insect repellents can damage any painted surface; if these substances come in contact with your vehicle, wash off as soon as possible.**

Exterior chrome

- Wash the vehicle first, using cool or lukewarm water and a neutral pH shampoo, such as Motorcraft Detail Wash (ZC-3-A).
- Use Custom Bright Metal Cleaner (ZC-15), available from your authorized dealer. Apply the product as you would a wax to clean bumpers and other chrome parts; allow the cleaner to dry for a few minutes, then wipe off the haze with a clean, dry rag.
- **Never use abrasive materials such as steel wool or plastic pads as they can scratch the chrome surface.**
- After polishing chrome bumpers, apply a coating of Motorcraft Premium Liquid Wax (ZC-53-A), available from your authorized dealer, or an equivalent quality product to help protect from environmental effects.

WAXING

- Wash the vehicle first.
- Do not use waxes that contain abrasives; use Motorcraft Premium Liquid Wax (ZC-53-A), which is available from your authorized dealer, or an equivalent quality product.
- Do not allow paint sealant to come in contact with any non-body (low-gloss black) colored trim, such as grained door handles, roof racks, bumpers, side moldings, mirror housings or the windshield cowl area. The paint sealant will "gray" or stain the parts over time.

PAINT CHIPS

Your authorized dealer has touch-up paint to match your vehicle's color. Take your color code (printed on a sticker in the driver's door jamb) to your authorized dealer to ensure you get the correct color.

- Remove particles such as bird droppings, tree sap, insect deposits, tar spots, road salt and industrial fallout before repairing paint chips.
- Always read the instructions before using the products.

ALUMINUM WHEELS AND WHEEL COVERS

Aluminum wheels and wheel covers are coated with a clearcoat paint finish. In order to maintain their shine:

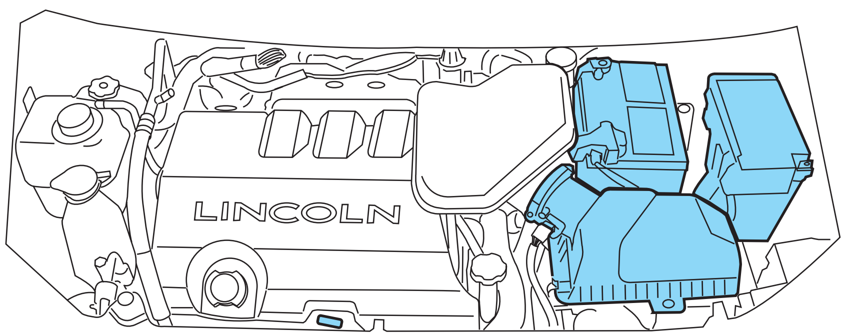
- Clean weekly with Motorcraft Wheel and Tire Cleaner (ZC-37-A), which is available from your authorized dealer. Heavy dirt and brake dust accumulation may require agitation with a sponge. Rinse thoroughly with a strong stream of water.
- Never apply any cleaning chemical to hot or warm wheel rims or covers.
- Some automatic car washes may cause damage to the finish on your wheel rims or covers. Chemical-strength cleaners, or cleaning chemicals, in combination with brush agitation to remove brake dust and dirt, could wear away the clearcoat finish over time.
- Do not use hydrofluoric acid-based or high caustic-based wheel cleaners, steel wool, fuels or strong household detergent.
- To remove tar and grease, use Motorcraft Bug and Tar Remover (ZC-42), available from your authorized dealer.

ENGINE

Engines are more efficient when they are clean because grease and dirt buildup keep the engine warmer than normal. When washing:

- Take care when using a power washer to clean the engine. The high-pressure fluid could penetrate the sealed parts and cause damage.
- Do not spray a hot engine with cold water to avoid cracking the engine block or other engine components.
- Spray Motorcraft Engine Shampoo and Degreaser (ZC-20) on all parts that require cleaning and pressure rinse clean. In Canada use Motorcraft Engine Shampoo (CXC-66-A).
- Cover the highlighted areas to prevent water damage when cleaning the engine.

3.5L ENGINE



- Never wash or rinse the engine while it is running; water in the running engine may cause internal damage.

PLASTIC (NON-PAINTED) EXTERIOR PARTS

Use only approved products to clean plastic parts. These products are available from your authorized dealer.

- For routine cleaning, use Motorcraft Detail Wash (ZC-3-A).
- If tar or grease spots are present, use Motorcraft Bug and Tar Remover (ZC-42).
- For plastic headlamp lenses, use Motorcraft Ultra Clear Spray Glass Cleaner (ZC-23).

WINDOWS AND WIPER BLADES

The windshield, rear and side windows and the wiper blades should be cleaned regularly. If the wipers do not wipe properly, substances on the vehicle's glass or the wiper blades may be the cause. These may include hot wax treatments used by commercial car washes, water repellent coatings, tree sap, or other organic contamination; these contaminants may cause squeaking or chatter noise from the blades, and streaking and smearing of the windshield. To clean these items, follow these tips:

- The windshield, rear windows and side windows may be cleaned with a non-abrasive cleaner such as Motorcraft Ultra-Clear Spray Glass Cleaner (ZC-23), available from your authorized dealer.
- The wiper blades can be cleaned with isopropyl (rubbing) alcohol or Motorcraft Premium Windshield Washer Concentrate (ZC-32-A), available from your authorized dealer. This washer fluid contains special solution in addition to alcohol which helps to remove the hot wax deposited on the wiper blade and windshield from automated car wash facilities. Be sure to replace wiper blades when they appear worn or do not function properly.
- Do not use abrasives, as they may cause scratches.
- Do not use fuel, kerosene, or paint thinner to clean any parts.

If you cannot remove those streaks after cleaning with the glass cleaner or if the wipers chatter and move in a jerky motion, clean the outer surface of the windshield and the wiper blades using a sponge or soft cloth with a neutral detergent or mild-abrasive cleaning solution. After cleaning, rinse the windshield and wiper blades with clean water. The windshield is clean if beads do not form when you rinse the windshield with water.

Do not use sharp objects, such as a razor blade, to clean the inside of the rear window or to remove decals, as it may cause damage to the rear window defroster's heated grid lines.

PANORAMIC ROOF DEFLECTOR (IF EQUIPPED)

Vacuum the wind deflector cloth to remove insects & loose dirt. Clean with Motorcraft Professional Strength Carpet & Upholstery Cleaner (ZC-54).

INSTRUMENT PANEL/INTERIOR TRIM AND CLUSTER LENS

Clean the instrument panel, interior trim areas and cluster lens with a clean and damp white cotton cloth, then with a clean and dry white cotton cloth; you may also use Motorcraft Dash & Vinyl Cleaner (ZC-38-A) on the instrument panel and interior trim areas.

- Avoid cleaners or polishes that increase the gloss of the upper portion of the instrument panel. The dull finish in this area helps protect the driver from undesirable windshield reflection.
- Be certain to wash or wipe your hands clean if you have been in contact with certain products such as insect repellent and suntan lotion in order to avoid possible damage to the interior painted surfaces.
- Do not use household or glass cleaners as these may damage the finish of the instrument panel, interior trim and cluster lens.

Do not use chemical solvents or strong detergents when cleaning the steering wheel or instrument panel to avoid contamination of the airbag system.

If a staining liquid like coffee/juice has been spilled on the instrument panel or on interior trim surfaces, clean as follows:

1. Wipe up spilled liquid using a clean, white, cotton cloth.
2. Apply Motorcraft Deluxe Leather and Vinyl Cleaner (ZC-11-A) [In Canada use Motorcraft Multi-Purpose Cleaner (CXC-101)] to the wiped area and spread around evenly.
3. Apply more Motorcraft cleaner to a clean, white, cotton cloth and press the cloth onto the soiled area–allow this to set at room temperature for 30 minutes.
4. Remove the soaked cloth, and if it is not soiled badly, use this cloth to clean the area by using a rubbing motion for 60 seconds.
5. Following this, wipe area dry with a clean, white, cotton cloth.

INTERIOR

For fabric, carpets, cloth seats and safety belts:

- Remove dust and loose dirt with a vacuum cleaner.
- Remove light stains and soil with Motorcraft Professional Strength Carpet & Upholstery Cleaner (ZC-54).
- If grease or tar is present on the material, spot-clean the area first with Motorcraft Spot and Stain Remover (ZC-14). In Canada, use Motorcraft Multi-Purpose Cleaner (CXC-101).

- If a ring forms on the fabric after spot cleaning, clean the entire area immediately (but do not oversaturate) or the ring will set.
- Do not use household cleaning products or glass cleaners, which can stain and discolor the fabric and affect the flame retardant abilities of the seat materials.

Do not use cleaning solvents, bleach or dye on the vehicle's seatbelts, as these actions may weaken the belt webbing.

LEATHER SEATS

Your leather seating surfaces have a clear, protective coating over the leather.

- To clean, use a soft cloth with Motorcraft Deluxe Leather and Vinyl Cleaner (ZC-11-A). In Canada, use Motorcraft Vinyl Cleaner (CXC-93). Dry the area with a soft cloth.
- To help maintain its resiliency and color, use the Motorcraft Deluxe Leather Care Kit (ZC-11-D), available from your authorized dealer. In Canada, use Motorcraft Vinyl Cleaner (CXC-93) or an equivalent high–quality leather care product.
- Do not use household cleaning products, alcohol solutions, solvents or cleaners intended for rubber, vinyl and plastics, or oil/petroleum-based leather conditioners. These products may cause premature wearing of the clear, protective coating.

Note: In some instances, color or dye transfer can occur when wet clothing comes in contact with leather upholstery. If this occurs, the leather should be cleaned immediately to avoid permanent staining.

CLEANING THE CLIMATE CONTROLLED SEATS (IF EQUIPPED)

Remove dust and loose dirt with a whisk broom or a vacuum cleaner. Remove fresh spots immediately. Clean the seat with a damp cloth, using a mild soap and water solution, if necessary.

UNDERBODY

Flush the complete underside of your vehicle frequently. Keep body and door drain holes free from packed dirt.

FORD AND LINCOLN MERCURY CAR CARE PRODUCTS

Your Ford or Lincoln Mercury authorized dealer has many quality products available to clean your vehicle and protect its finishes. These quality products have been specifically engineered to fulfill your automotive needs; they are custom designed to complement the style and appearance of your vehicle. Each product is made from high quality materials that meet or exceed rigid specifications. For best results, use the following products or products of equivalent quality:

Motorcraft Bug and Tar Remover (ZC-42)

Motorcraft Car Wash (Canada only) (CXC-21)

Motorcraft Custom Bright Metal Cleaner (ZC-15)

Motorcraft Custom Clear Coat Polish (ZC-8-A)

Motorcraft Custom Vinyl Protectant (ZC-40-A)

Motorcraft Dash and Vinyl Cleaner (ZC-38-A)

Motorcraft Deluxe Leather and Vinyl Cleaner (U.S. only) (ZC-11-A)

Motorcraft Leather Care Kit (U.S. only) (ZC-11-D)

Motorcraft Detail Wash (ZC-3-A)

Motorcraft Dusting Cloth (ZC-24)

Motorcraft Engine Shampoo and Degreaser (U.S. only) (ZC-20)

Motorcraft Engine Shampoo (Canada only) (CXC-66-A)

Motorcraft Multi-Purpose Cleaner (Canada only) (CXC-101)

Motorcraft Premium Glass Cleaner (Canada only) (CXC-100)

Motorcraft Premium Liquid Wax (ZC-53-A)

Motorcraft Premium Windshield Washer Concentrate (U.S. only) (ZC-32-A)

Motorcraft Professional Strength Carpet & Upholstery Cleaner (ZC-54)

Motorcraft Spot and Stain Remover (U.S. only) (ZC-14)

Motorcraft Tire Clean and Shine (ZC-28)

Motorcraft Triple Clean (U.S. only) (ZC-13)

Motorcraft Ultra-Clear Spray Glass Cleaner (ZC-23)

Motorcraft Vinyl Cleaner (Canada only) (CXC-93)

Motorcraft Wash and Wax (Canada only) (CXC-95)

Motorcraft Wheel and Tire Cleaner (ZC-37-A)

SERVICE RECOMMENDATIONS

To help you service your vehicle, we provide *scheduled maintenance information* which makes tracking routine service easy.

If your vehicle requires professional service, your authorized dealer can provide the necessary parts and service. Check your *Warranty Guide* to find out which parts and services are covered.

Use only recommended fuels, lubricants, fluids and service parts conforming to specifications. Motorcraft parts are designed and built to provide the best performance in your vehicle.

PRECAUTIONS WHEN SERVICING YOUR VEHICLE

- Do not work on a hot engine.
- Make sure that nothing gets caught in moving parts.
- Do not work on a vehicle with the engine running in an enclosed space, unless you are sure you have enough ventilation.
- Keep all open flames and other burning (cigarettes) material away from the battery and all fuel related parts.

Working with the engine off

1. Set the parking brake and ensure the gearshift is securely latched in P (Park).
2. Turn off the engine and remove the key.
3. Block the wheels to prevent the vehicle from moving unexpectedly.

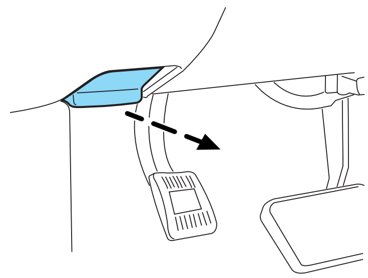
Working with the engine on

1. Set the parking brake and shift to P (Park).
2. Block the wheels.

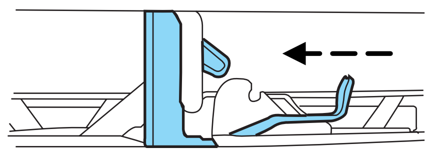
To reduce the risk of vehicle damage and/or personal burn injuries, do not start your engine with the air cleaner removed and do not remove it while the engine is running.

OPENING THE HOOD

1. Inside the vehicle, pull the hood release handle located under the bottom of the instrument panel near the steering column.



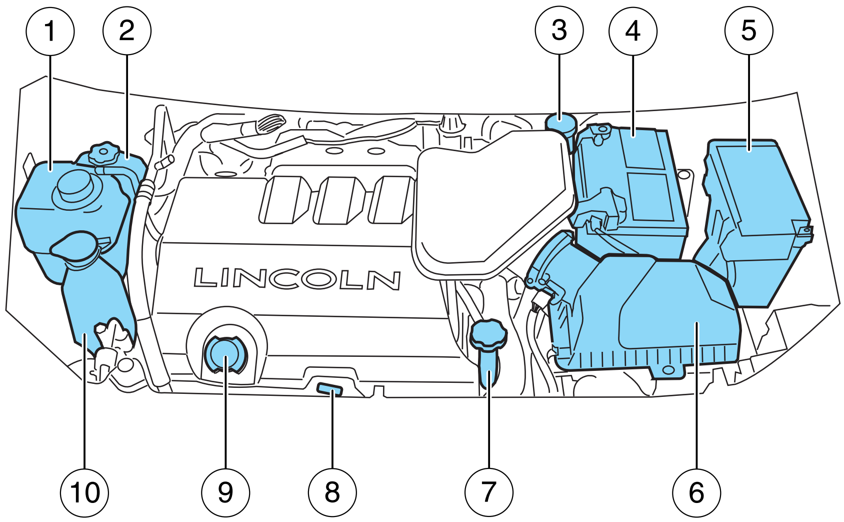
2. Go to the front of the vehicle and release the secondary hood latch that is located under the front center of the hood.



3. Lift the hood and support it with the prop rod.

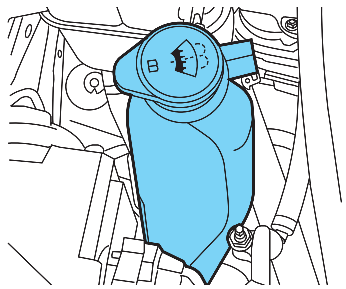
IDENTIFYING COMPONENTS IN THE ENGINE COMPARTMENT

3.5L V6 engine



1. Engine coolant reservoir
2. Power steering fluid reservoir
3. Brake fluid reservoir
4. Battery
5. Power distribution box
6. Air filter assembly
7. Transaxle fluid dipstick
8. Engine oil dipstick
9. Engine oil filler cap
10. Windshield washer fluid reservoir

WINDSHIELD WASHER FLUID



Add fluid to fill the reservoir if the level is low. In very cold weather, do not fill the reservoir completely.

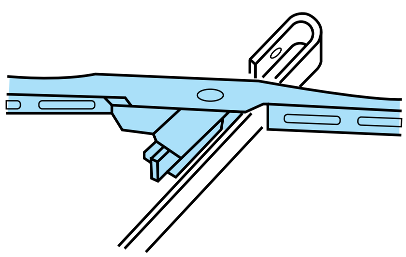
Only use a washer fluid that meets Ford specification WSB-M8B16-A2. Do not use any special washer fluid such as windshield water repellent type fluid or bug wash. They may cause squeaking, chatter noise, streaking and smearing. Refer to the *Maintenance product specifications and capacities* section in this chapter.

State or local regulations on volatile organic compounds may restrict the use of methanol, a common windshield washer antifreeze additive. Washer fluids containing non-methanol antifreeze agents should be used only if they provide cold weather protection without damaging the vehicle's paint finish, wiper blades or washer system.

If you operate your vehicle in temperatures below 40° F (4.5°C), use washer fluid with antifreeze protection. Failure to use washer fluid with antifreeze protection in cold weather could result in impaired windshield vision and increase the risk of injury or accident.

Note: Do not put washer fluid in the engine coolant reservoir. Washer fluid placed in the cooling system may harm engine and cooling system components.

CHANGING THE WIPER BLADES



1. Pull the wiper arm away from the vehicle. Turn the blade at an angle from the wiper arm. Push the lock pin manually to release the blade and pull the wiper blade down toward the windshield to remove it from the arm.
2. Attach the new wiper to the wiper arm and press it into place until a click is heard.

Replace wiper blades at least once per year for optimum performance.

Poor wiper quality can be improved by cleaning the wiper blades and the windshield, refer to *Windows and wiper blades* in the *Cleaning* chapter.

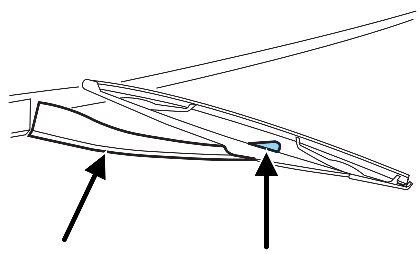
To prolong the life of the wiper blades, it is highly recommended to scrape off the ice on the windshield before turning on the wipers. The layer of ice has many sharp edges and can damage the micro edge of the wiper rubber element.

Changing rear window wiper blade

The rear wiper arm is designed without a service position. This reduces the risk of damage to the blade in an automatic car wash.

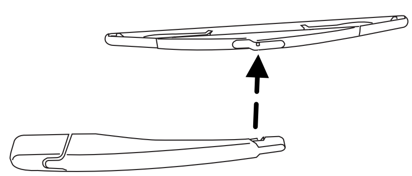
To replace the wiper blade:

1. Grab the wiper arm just below the blade attachment and pull it as far away from the glass as possible. Do not use excessive force because it can break the wiper arm at the heel. Hold it there until the next step.



2. Grab the wiper blade with your other hand and use your fingers to push the wiper arm tip through the wiper blade center to separate the blade from the arm.

3. Attach the new wiper to the wiper arm and press it into place until a click is heard.



If you find this procedure too difficult, please see your dealer.

ENGINE OIL

Checking the engine oil

Refer to the *scheduled maintenance information* for the appropriate intervals for checking the engine oil.

1. Make sure the vehicle is on level ground.

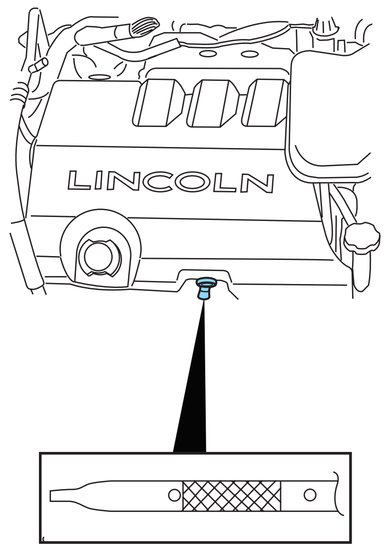
2. Turn the engine off and wait a few minutes for the oil to drain into the oil pan.

3. Set the parking brake and ensure the gearshift is securely latched in P (Park).

4. Open the hood. Protect yourself from engine heat.

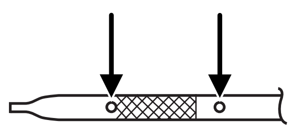
5. Locate and carefully remove the engine oil level dipstick.

- 3.5L V6 engine

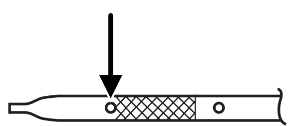


6. Wipe the dipstick clean. Insert the dipstick fully, then remove it again.

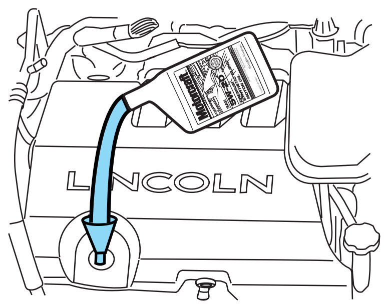
- If the oil level is **within this range,** the oil level is acceptable. **DO NOT ADD OIL.**



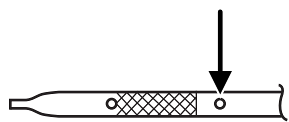
- If the oil level is **below this mark,** engine **oil must be added** to raise the level within the normal operating range.



• 3.5L V6 engine



• If required, add engine oil to the engine. Refer to *Adding engine oil* in this chapter.
• **Do not overfill the engine with oil. Oil levels above this mark may cause engine damage.** If the engine is overfilled, some oil must be removed from the engine by an authorized dealer.



7. Put the dipstick back in and ensure it is fully seated.

Adding engine oil

1. Check the engine oil. For instructions, refer to *Checking the engine oil* in this chapter.

2. If the engine oil level is not within the normal operating range, add only certified engine oil of the recommended viscosity. Remove the engine oil filler cap and use a funnel to pour the engine oil into the opening.

3. Recheck the engine oil level. Make sure the oil level is not above the normal operating range on the engine oil level dipstick.

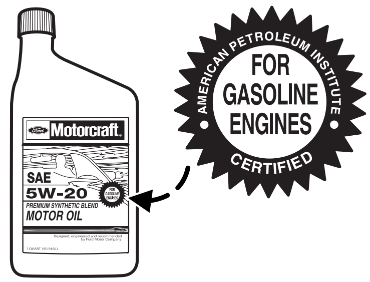
4. Install the dipstick and ensure it is fully seated.

5. Fully install the engine oil filler cap by turning the filler cap clockwise until it stops.

To avoid possible oil loss, DO NOT operate the vehicle with the engine oil level dipstick and/or the engine oil filler cap removed.

Engine oil and filter recommendations

Look for this certification trademark.



Use SAE 5W-20 engine oil

Only use oils "Certified For Gasoline Engines" by the American Petroleum Institute (API). An oil with this trademark symbol conforms to the current engine and emission system protection standards and fuel economy requirements of the International Lubricant Standardization and Approval Committee (ILSAC), comprised of U.S. and Japanese automobile manufacturers.

To protect your engine's warranty use Motorcraft SAE 5W-20 or an equivalent SAE 5W-20 oil meeting Ford specification WSS-M2C930-A. **SAE 5W-20 oil provides optimum fuel economy and durability performance meeting all requirements for your vehicle's engine.**

Do not use supplemental engine oil additives, cleaners or other engine treatments. They are unnecessary and could lead to engine damage that is not covered by Ford warranty.

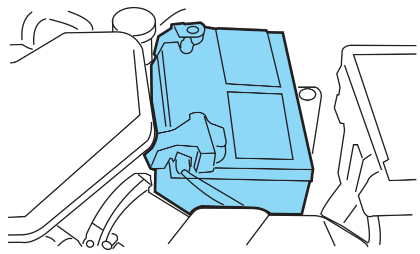
Change your engine oil and filter according to the appropriate schedule listed in *scheduled maintenance information.*

Ford production and aftermarket (Motorcraft) oil filters are designed for added engine protection and long life. If a replacement oil filter is used that does not meet Ford material and design specifications, start-up engine noises or knock may be experienced.

It is recommended you use the appropriate Motorcraft oil filter or another with equivalent performance for your engine application.

BATTERY

Your vehicle is equipped with a Motorcraft maintenance-free battery which normally does not require additional water during its life of service.



If your battery has a cover/shield, make sure it is reinstalled after the battery has been cleaned or replaced.

For longer, trouble-free operation, keep the top of the battery clean and dry. Also, make certain the battery cables are always tightly fastened to the battery terminals.

If you see any corrosion on the battery or terminals, remove the cables from the terminals and clean with a wire brush. You can neutralize the acid with a solution of baking soda and water.

It is recommended that the negative battery cable terminal be disconnected from the battery if you plan to store your vehicle for an extended period of time. This will minimize the discharge of your battery during storage.

Note: Electrical or electronic accessories or components added to the vehicle by the dealer or the owner may adversely affect battery performance and durability.

Batteries normally produce explosive gases which can cause personal injury. Therefore, do not allow flames, sparks or lighted substances to come near the battery. When working near the battery, always shield your face and protect your eyes. Always provide proper ventilation.

When lifting a plastic-cased battery, excessive pressure on the end walls could cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery. Lift the battery with a battery carrier or with your hands on opposite corners.

Keep batteries out of reach of children. Batteries contain sulfuric acid. Avoid contact with skin, eyes or clothing. Shield your eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If acid is swallowed, call a physician immediately.

Battery posts, terminals and related accessories contain lead and lead compounds. **Wash hands after handling.**

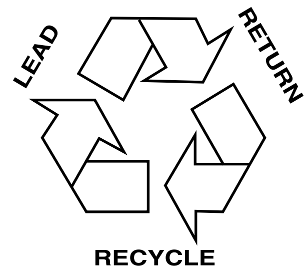
Because your vehicle's engine is electronically controlled by a computer, some control conditions are maintained by power from the battery. When the battery is disconnected or a new battery is installed, the engine must relearn its idle and fuel trim strategy for optimum driveability and performance. To begin this process:

1. With the vehicle at a complete stop, set the parking brake.
2. Put the gearshift in P (Park), turn off all accessories and start the engine.
3. Run the engine until it reaches normal operating temperature.
4. Allow the engine to idle for at least one minute.
5. Turn the A/C on and allow the engine to idle for at least one minute.
6. Release the parking brake. With your foot on the brake pedal and with the A/C on, put the vehicle in D (Drive) and allow the engine to idle for at least one minute.
7. Drive the vehicle to complete the relearning process.

- The vehicle may need to be driven 10 miles (16 km) or more to relearn the idle and fuel trim strategy.
- **If you do not allow the engine to relearn its idle trim, the idle quality of your vehicle may be adversely affected until the idle trim is eventually relearned.**

If the battery has been disconnected or a new battery has been installed, the clock and radio settings must be reset once the battery is reconnected.

- Always dispose of automotive batteries in a responsible manner. Follow your local authorized standards for disposal. Call your local authorized recycling center to find out more about recycling automotive batteries.



ENGINE COOLANT

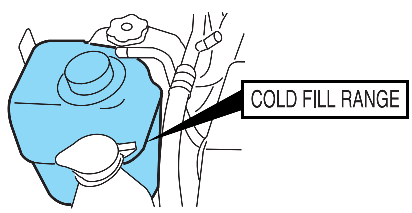
Checking engine coolant

The concentration and level of engine coolant should be checked at the intervals listed in *scheduled maintenance information.* The coolant concentration should be maintained at 50/50 coolant and distilled water, which equates to a freeze point of -34°F (-36°C). Coolant concentration testing is possible with a hydrometer or antifreeze tester (such as the Rotunda Battery and Antifreeze Tester, 014–R1060). The level of coolant should be maintained at the “FULL COLD” level or within the “COLD FILL RANGE” in the coolant reservoir. If the level falls below, add coolant per the instructions in the *Adding engine coolant* section.

Your vehicle was factory-filled with a 50/50 engine coolant and water concentration. If the concentration of coolant falls below 40% or above 60%, the engine parts could become damaged or not work properly. **A 50–50 mixture of coolant and water provides the following:**

- **Freeze protection down to -34°F (-36°C).**
- **Boiling protection up to 265°F (129°C).**
- **Protection against rust and other forms of corrosion.**
- **Enables calibrated gauges to work properly.**

When the engine is cold, check the level of the engine coolant in the reservoir.



- The engine coolant should be at the “FULL COLD” level or within the “COLD FILL RANGE” as listed on the engine coolant reservoir (depending upon application).

- Refer to *scheduled maintenance information* for service interval schedules.
- Be sure to read and understand *Precautions when servicing your vehicle* in this chapter.

If the engine coolant has not been checked at the recommended interval, the engine coolant reservoir may become low or empty. If the reservoir is low or empty, add engine coolant to the reservoir. Refer to *Adding engine coolant* in this chapter.

Note: Automotive fluids are not interchangeable; do not use engine coolant, antifreeze or windshield washer fluid outside of its specified function and vehicle location.

Adding engine coolant

When adding coolant, make sure it is a 50/50 mixture of engine coolant and distilled water. Add the mixture to the coolant reservoir, **when the engine is cool,** until the appropriate fill level is obtained.

Do not add engine coolant when the engine is hot. Steam and scalding liquids released from a hot cooling system can burn you badly. Also, you can be burned if you spill coolant on hot engine parts.

Do not put engine coolant in the windshield washer fluid container. If sprayed on the windshield, engine coolant could make it difficult to see through the windshield.

- **Add Motorcraft Premium Gold Engine Coolant or equivalent meeting Ford specification WSS-M97B51-A1.** Refer to *Maintenance product specifications and capacities* in this chapter.

Note: Do not use stop leak pellets or cooling system sealants/additives as they can cause damage to the engine cooling and/or heating systems. This damage would not be covered under your vehicle's warranty.

- **Do not add/mix an orange-colored, extended life coolant such as Motorcraft Specialty Orange Engine Coolant, meeting Ford specification WSS-M97B44-D, or DEX-COOL® brand with the factory-filled coolant.** Mixing Motorcraft Specialty Orange Engine Coolant or any orange-colored extended life product such as DEX-COOL® brand with your factory filled coolant can result in degraded corrosion protection.

- A large amount of water without engine coolant may be added, in case of emergency, to reach a vehicle service location. In this instance, the cooling system must be drained and refilled with a 50/50 mixture of engine coolant and distilled water as soon as possible. Water alone (without engine coolant) can cause engine damage from corrosion, overheating or freezing.
- **Do not use alcohol, methanol, brine or any engine coolants mixed with alcohol or methanol antifreeze (coolant).** Alcohol and other liquids can cause engine damage from overheating or freezing.
- **Do not add extra inhibitors or additives to the coolant.** These can be harmful and compromise the corrosion protection of the engine coolant.

For vehicles with overflow coolant systems with a non-pressurized cap on the coolant recovery system, add coolant to the coolant recovery reservoir when the engine is cool. Add the proper mixture of coolant and water to the "FULL COLD" level. For all other vehicles which have a coolant degas system with a pressurized cap, or if it is necessary to remove the coolant pressure relief cap on the radiator of a vehicle with an overflow system, follow these steps to add engine coolant.

To reduce the risk of personal injury, make sure the engine is cool before unscrewing the coolant pressure relief cap. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly.

Add the proper mixture of coolant and water to the cooling system by following these steps:

1. Before you begin, turn the engine off and let it cool.

2. When the engine is cool, wrap a thick cloth around the coolant pressure relief cap on the coolant reservoir (a translucent plastic bottle). Slowly turn cap counterclockwise (left) until pressure begins to release.

3. Step back while the pressure releases.

4. When you are sure that all the pressure has been released, use the cloth to turn it counterclockwise and remove the cap.

5. Fill the coolant reservoir slowly with the proper coolant mixture, to within the "COLD FILL RANGE" or the "FULL COLD" level on the reservoir. If you removed the radiator cap in an overflow system, fill the radiator until the coolant is visible and radiator is almost full.

6. Replace the cap. Turn until tightly installed. Cap must be tightly installed to prevent coolant loss.

After any coolant has been added, check the coolant concentration (refer to *Checking engine coolant*). If the concentration is not 50/50 (protection to –34° F/–36° C), drain some coolant and adjust the concentration. It may take several drains and additions to obtain a 50/50 coolant concentration.

Whenever coolant has been added, the coolant level in the coolant reservoir should be checked the next few times you drive the vehicle. If necessary, add enough 50/50 concentration of engine coolant and distilled water to bring the liquid level to the proper level.

If you have to add more than 1.0 quart (1.0 liter) of engine coolant per month, have your authorized dealer check the engine cooling system. Your cooling system may have a leak. Operating an engine with a low level of coolant can result in engine overheating and possible engine damage.

Recycled engine coolant

Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.

Used engine coolant should be disposed of in an appropriate manner. Follow your community's regulations and standards for recycling and disposing of automotive fluids.

Coolant refill capacity

To find out how much fluid your vehicle's cooling system can hold, refer to *Maintenance product specifications and capacities* in this chapter.

Fill your engine coolant reservoir as outlined in *Adding engine coolant* in this section.

Severe climates

If you drive in extremely cold climates (less than –34°F [–36°C]):

- **It may be necessary to increase the coolant concentration above 50%.**
- **NEVER increase the coolant concentration above 60%.**
- **Increased engine coolant concentrations above 60% will decrease the overheat protection characteristics of the engine coolant and may cause engine damage.**

- **Refer to the chart on the coolant container to ensure the coolant concentration in your vehicle will provide adequate freeze protection at the temperatures in which you drive in the winter months.**

If you drive in extremely hot climates:

- **It is still necessary to maintain the coolant concentration above 40%.**
- **NEVER decrease the coolant concentration below 40%.**
- **Decreased engine coolant concentrations below 40% will decrease the corrosion protection characteristics of the engine coolant and may cause engine damage.**
- **Decreased engine coolant concentrations below 40% will decrease the freeze protection characteristics of the engine coolant and may cause engine damage.**
- **Refer to the chart on the coolant container to ensure the coolant concentration in your vehicle will provide adequate protection at the temperatures in which you drive.**

Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.

What you should know about fail-safe cooling

If the engine coolant supply is depleted, this feature allows the vehicle to be driven temporarily before incremental component damage is incurred. The “fail-safe” distance depends on ambient temperatures, vehicle load and terrain.

How fail-safe cooling works

If the engine begins to overheat:

- The engine coolant temperature gauge will move to the red (hot) area.
- The  symbol will illuminate.

If the engine reaches a preset over-temperature condition, the engine will automatically switch to alternating cylinder operation. Each disabled cylinder acts as an air pump and cools the engine.

When this occurs the vehicle will still operate. However:

- The engine power will be limited.
- The air conditioning system will be disabled.

Continued operation will increase the engine temperature:

- The engine will completely shut down.
- Steering and braking effort will increase.

Once the engine temperature cools, the engine can be re-started. Take your vehicle to an authorized dealer as soon as possible to minimize engine damage.

When fail-safe mode is activated

You have limited engine power when in the fail-safe mode, so drive the vehicle with caution. The vehicle will not be able to maintain high speed operation and the engine will run rough. Remember that the engine is capable of completely shutting down automatically to prevent engine damage, therefore:

1. Pull off the road as soon as safely possible and turn off the engine.
2. Arrange for the vehicle to be taken to an authorized dealer.
3. If this is not possible, wait a short period for the engine to cool.
4. Check the coolant level and replenish if low.

> ⚠ Never remove the coolant reservoir cap while the engine is running or hot.

5. Restart the engine and take your vehicle to an authorized dealer.

Driving the vehicle without repairing the engine problem increases the chance of engine damage. Take your vehicle to an authorized dealer as soon as possible.

FUEL FILTER

Your vehicle is equipped with a lifetime fuel filter that is integrated with the fuel tank. Regular maintenance or replacement is not needed.

WHAT YOU SHOULD KNOW ABOUT AUTOMOTIVE FUELS

Important safety precautions

> ⚠ Do not overfill the fuel tank. The pressure in an overfilled tank may cause leakage and lead to fuel spray and fire.

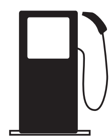
The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out and injure you or others.

If you do not use the proper fuel filler cap, excessive vacuum in the fuel tank may damage the fuel system or cause the fuel cap to disengage in a collision, which may result in serious personal injury.

Automotive fuels can cause serious injury or death if misused or mishandled.

Gasoline may contain benzene, which is a cancer-causing agent.

Observe the following guidelines when handling automotive fuel:



- Extinguish all smoking materials and any open flames before refueling your vehicle.
- Always turn off the vehicle before refueling.
- Automotive fuels can be harmful or fatal if swallowed. Fuel such as gasoline is highly toxic and if swallowed can cause death or permanent injury. If fuel is swallowed, call a physician immediately, even if no symptoms are immediately apparent. The toxic effects of fuel may not be visible for hours.
- Avoid inhaling fuel vapors. Inhaling too much fuel vapor of any kind can lead to eye and respiratory tract irritation. In severe cases, excessive or prolonged breathing of fuel vapor can cause serious illness and permanent injury.
- Avoid getting fuel liquid in your eyes. If fuel is splashed in the eyes, remove contact lenses (if worn), flush with water for 15 minutes and seek medical attention. Failure to seek proper medical attention could lead to permanent injury.
- Fuels can also be harmful if absorbed through the skin. If fuel is splashed on the skin and/or clothing, promptly remove contaminated clothing and wash skin thoroughly with soap and water. Repeated or prolonged skin contact with fuel liquid or vapor causes skin irritation.

- Be particularly careful if you are taking “Antabuse” or other forms of disulfiram for the treatment of alcoholism. Breathing gasoline vapors, or skin contact could cause an adverse reaction. In sensitive individuals, serious personal injury or sickness may result. If fuel is splashed on the skin, promptly wash skin thoroughly with soap and water. Consult a physician immediately if you experience an adverse reaction.

When refueling always shut the engine off and never allow sparks or open flames near the filler neck. Never smoke while refueling. Fuel vapor is extremely hazardous under certain conditions. Care should be taken to avoid inhaling excess fumes.

The flow of fuel through a fuel pump nozzle can produce static electricity, which can cause a fire if fuel is pumped into an ungrounded fuel container.

Refueling

Fuel vapor burns violently and a fuel fire can cause severe injuries. To help avoid injuries to you and others:

- Read and follow all the instructions on the pump island;
- Turn off your engine when you are refueling;
- Do not smoke if you are near fuel or refueling your vehicle;
- Keep sparks, flames and smoking materials away from fuel;
- Stay outside your vehicle and do not leave the fuel pump unattended when refueling your vehicle — this is against the law in some places;
- Keep children away from the fuel pump; never let children pump fuel.

Use the following guidelines to avoid electrostatic charge build-up when filling an ungrounded fuel container:
- Place approved fuel container on the ground.
- DO NOT fill a fuel container while it is in the vehicle (including the cargo area).
- Keep the fuel pump nozzle in contact with the fuel container while filling.
- DO NOT use a device that would hold the fuel pump handle in the fill position.

Fuel Filler Cap

Your fuel tank filler cap has an indexed design with a 1/4 turn on/off feature.

When fueling your vehicle:

1. Turn the engine off.
2. Carefully turn the filler cap counterclockwise 1/4 turn until it stops.
3. Pull to remove the cap from the fuel filler pipe.
4. To install the cap, align the tabs on the cap with the notches on the filler pipe.
5. Turn the filler cap clockwise 1/4 of a turn until at least a few clicks are heard.

If the check fuel cap light or a “check fuel cap” message comes on, the fuel filler cap may not be properly installed. The light or message can come on after several driving events after you’ve refueled your vehicle.

At the next opportunity, safely pull off of the road, remove the fuel filler cap, align the cap properly and reinstall it. The check fuel cap light or “check fuel cap” message may not reset immediately; it may take several driving cycles for the check fuel cap light or “check fuel cap” message to turn off. A driving cycle consists of an engine start-up (after four or more hours with the engine off) followed by city and highway driving.

Continuing to drive with the check fuel cap light or “check fuel cap” message on may cause the light to turn on as well.

If you must replace the fuel filler cap, replace it with a fuel filler cap that is designed for your vehicle. The customer warranty may be void for any damage to the fuel tank or fuel system if the correct genuine Ford, Motorcraft or other certified fuel filler cap is not used.

The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out and injure you or others.

If you do not use the proper fuel filler cap, excessive vacuum in the fuel tank may damage the fuel system or cause the fuel cap to disengage in a collision, which may result in personal injury.

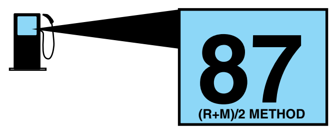
Choosing the right fuel

Use only UNLEADED fuel or UNLEADED fuel blended with a maximum of 10% ethanol. Your vehicle was not designed to run on E85 fuels that are blended with a maximum of 85% ethanol. The use of leaded fuel is prohibited by law and could damage your vehicle. Do not use fuel containing methanol. It can damage critical fuel system components.

Your vehicle was not designed to use fuel or fuel additives with metallic compounds, including manganese-based additives. Studies indicate that these additives can cause your vehicle's emission control system to deteriorate more rapidly.

Repairs to correct the effects of using a fuel for which your vehicle was not designed may not be covered by your warranty.

Octane recommendations



Your vehicle is designed to use "Regular" unleaded gasoline with pump (R+M)/2 octane rating of 87. We do not recommend the use of gasolines labeled as "Regular" that are sold with octane ratings of 86 or lower in high altitude areas.

Do not be concerned if your engine sometimes knocks lightly. However, if it knocks heavily under most driving conditions while you are using fuel with the recommended octane rating, see your authorized dealer to prevent any engine damage.

Fuel quality

If you are experiencing starting, rough idle or hesitation driveability problems, try a different brand of unleaded gasoline. "Premium" unleaded gasoline is not recommended for vehicles designed to use "Regular" unleaded gasoline because it may cause these problems to become more pronounced. If the problems persist, see your authorized dealer.

Do not add aftermarket fuel additive products to your fuel tank. It should not be necessary to add any aftermarket products to your fuel tank if you continue to use high quality fuel of the recommended octane rating. These products have not been approved for your engine and could cause damage to the fuel system. Repairs to correct the effects of using an aftermarket product in your fuel may not be covered by your warranty.

Many of the world's automakers approved the World-Wide Fuel Charter that recommends gasoline specifications to provide improved performance and emission control system protection for your vehicle. Gasolines that meet the World-Wide Fuel Charter should be used when available. Ask your fuel supplier about gasolines that meet the World-Wide Fuel Charter.

Cleaner air

Ford endorses the use of reformulated "cleaner-burning" gasolines to improve air quality, per the recommendations in the *Choosing the Right Fuel* section.

Running out of fuel

Avoid running out of fuel because this situation may have an adverse effect on powertrain components.

If you have run out of fuel:

- You may need to cycle the ignition from OFF to ON several times after refueling to allow the fuel system to pump the fuel from the tank to the engine. On restarting, cranking time will take a few seconds longer than normal.
- Normally, adding 1 gallon (3.8L) of fuel is enough to restart the engine. If the vehicle is out of fuel and on a steep grade, more than 1 gallon (3.8L) may be required.
- The *Service engine soon* indicator may come on. For more information on the *Service engine soon* indicator, refer to *Warning lights and chimes* in the *Instrument Cluster* chapter.

ESSENTIALS OF GOOD FUEL ECONOMY

Measuring techniques

Your best source of information about actual fuel economy is you, the driver. You must gather information as accurately and consistently as possible. Fuel expense, frequency of fill-ups or fuel gauge readings are NOT accurate as a measure of fuel economy. We do not recommend taking fuel economy measurements during the first 1,000 miles (1,600 km) of driving (engine break-in period). You will get a more accurate measurement after 2,000 miles–3,000 miles (3,000 km–5,000 km).

Filling the tank

The advertised fuel capacity of the fuel tank on your vehicle is equal to the rated refill capacity of the fuel tank as listed in the *Maintenance product specifications and capacities* section of this chapter.

The advertised capacity is the amount of the indicated capacity and the empty reserve combined. Indicated capacity is the difference in the amount of fuel in a full tank and a tank when the fuel gauge indicates empty. Empty reserve is the small amount of fuel remaining in the fuel tank after the fuel gauge indicates empty.

The amount of usable fuel in the empty reserve varies and should not be relied upon to increase driving range. When refueling your vehicle after the fuel gauge indicates empty, you might not be able to refuel the full amount of the advertised capacity of the fuel tank due to the empty reserve still present in the tank.

For consistent results when filling the fuel tank:

- Turn the engine/ignition switch to the off position prior to refueling, an error in the reading will result if the engine is left running.
- Use the same filling rate setting (low — medium — high) each time the tank is filled.
- Allow no more than two automatic click-offs when filling.
- Always use fuel with the recommended octane rating.
- Use a known quality gasoline, preferably a national brand.
- Use the same side of the same pump and have the vehicle facing the same direction each time you fill up.
- Have the vehicle loading and distribution the same every time.

Your results will be most accurate if your filling method is consistent.

Calculating fuel economy

1. Fill the fuel tank completely and record the initial odometer reading (in miles or kilometers).

2. Each time you fill the tank, record the amount of fuel added (in gallons or liters).

3. After at least three to five tank fill-ups, fill the fuel tank and record the current odometer reading.

4. Subtract your initial odometer reading from the current odometer reading.

5. Follow one of the simple calculations in order to determine fuel economy:

Calculation 1: **Divide total miles traveled by total gallons used.**

Calculation 2: **Multiply liters used by 100, then divide by total kilometers traveled.**

Keep a record for at least one month and record the type of driving (city or highway). This will provide an accurate estimate of the vehicle's fuel economy under current driving conditions. Additionally, keeping records during summer and winter will show how temperature impacts fuel economy. In general, lower temperatures give lower fuel economy.

Driving style — good driving and fuel economy habits

Give consideration to the lists that follow and you may be able to change a number of variables and improve your fuel economy.

Habits

- Smooth, moderate operation can yield up to 10% savings in fuel.
- Steady speeds without stopping will usually give the best fuel economy.
- Idling for long periods of time (greater than one minute) may waste fuel.
- Anticipate stopping; slowing down may eliminate the need to stop.
- Sudden or hard accelerations may reduce fuel economy.
- Slow down gradually.
- Driving at reasonable speeds (traveling at 55 mph [88 km/h] uses 15% less fuel than traveling at 65 mph [105 km/h]).
- Revving the engine before turning it off may reduce fuel economy.
- Using the air conditioner or defroster may reduce fuel economy.
- You may want to turn off the speed control in hilly terrain if unnecessary shifting between the top gears occurs. Unnecessary shifting of this type could result in reduced fuel economy.
- Warming up a vehicle on cold mornings is not required and may reduce fuel economy.
- Resting your foot on the brake pedal while driving may reduce fuel economy.
- Combine errands and minimize stop-and-go driving.

Maintenance

- Keep tires properly inflated and use only recommended size.
- Operating a vehicle with the wheels out of alignment will reduce fuel economy.
- Use recommended engine oil. Refer to *Maintenance product specifications and capacities* in this chapter.

- Perform all regularly scheduled maintenance items. Follow the recommended maintenance schedule and owner maintenance checks found in *scheduled maintenance information*.

Conditions

- Heavily loading a vehicle may reduce fuel economy at any speed.
- Carrying unnecessary weight may reduce fuel economy (approximately 1 mpg [0.4 km/L] is lost for every 400 lb [180 kg] of weight carried).
- Adding certain accessories to your vehicle (for example; bug deflectors, rollbars/light bars, running boards, ski/luggage racks) may reduce fuel economy.
- Using fuel blended with alcohol may lower fuel economy.
- Fuel economy may decrease with lower temperatures during the first 8–10 miles (12–16 km) of driving.
- Driving on flat terrain offers improved fuel economy as compared to driving on hilly terrain.
- Transmissions give their best fuel economy when operated in the top cruise gear and with steady pressure on the gas pedal.
- Close windows for high speed driving.

EPA window sticker

Every new vehicle should have the EPA window sticker. Contact your authorized dealer if the window sticker is not supplied with your vehicle. The EPA window sticker should be your guide for the fuel economy comparisons with other vehicles.

It is important to note the box in the lower left corner of the window sticker. These numbers represent the Range of MPG (L/100 km) expected on the vehicle under optimum conditions. Your fuel economy may vary depending upon the method of operation and conditions.

EMISSION CONTROL SYSTEM

Your vehicle is equipped with various emission control components and a catalytic converter which will enable your vehicle to comply with applicable exhaust emission standards. To make sure that the catalytic converter and other emission control components continue to work properly:

- Use only the specified fuel listed.
- Avoid running out of fuel.

- Do not turn off the ignition while your vehicle is moving, especially at high speeds.
- Have the items listed in *scheduled maintenance information* performed according to the specified schedule.

The scheduled maintenance items listed in *scheduled maintenance information* are essential to the life and performance of your vehicle and to its emissions system.

If other than Ford, Motorcraft or Ford-authorized parts are used for maintenance replacements or for service of components affecting emission control, such non-Ford parts should be equivalent to genuine Ford Motor Company parts in performance and durability.

WARNING: Do not park, idle, or drive your vehicle in dry grass or other dry ground cover. The emission system heats up the engine compartment and exhaust system, which can start a fire.

Illumination of the *Service engine soon* indicator, charging system warning light or the temperature warning light, fluid leaks, strange odors, smoke or loss of engine power could indicate that the emission control system is not working properly.

An improperly operating or damaged exhaust system may allow exhaust to enter the vehicle. Have a damaged or improperly operating exhaust system inspected and repaired immediately.

WARNING: Exhaust leaks may result in entry of harmful and potentially lethal fumes into the passenger compartment.

Do not make any unauthorized changes to your vehicle or engine. By law, vehicle owners and anyone who manufactures, repairs, services, sells, leases, trades vehicles, or supervises a fleet of vehicles are not permitted to intentionally remove an emission control device or prevent it from working. Information about your vehicle's emission system is on the Vehicle Emission Control Information Decal located on or near the engine. This decal also lists engine displacement.

Please consult your *Warranty Guide* for complete emission warranty information.

On board diagnostics (OBD-II)

Your vehicle is equipped with a computer that monitors the engine's emission control system. This system is commonly known as the On Board Diagnostics System (OBD-II). The OBD-II system protects the environment by ensuring that your vehicle continues to meet government emission standards. The OBD-II system also assists your authorized dealer in properly servicing your vehicle. When the *Service engine soon* indicator illuminates, the OBD-II system has detected a malfunction. Temporary malfunctions may cause the *Service engine soon* indicator to illuminate. Examples are:

1. The vehicle has run out of fuel—the engine may misfire or run poorly.

2. Poor fuel quality or water in the fuel—the engine may misfire or run poorly.

3. The fuel cap may not have been securely tightened. See *Fuel filler cap* in this chapter.

4. Driving through deep water—the electrical system may be wet.

These temporary malfunctions can be corrected by filling the fuel tank with good quality fuel, properly tightening the fuel cap or letting the electrical system dry out. After three driving cycles without these or any other temporary malfunctions present, the *Service engine soon* indicator should stay off the next time the engine is started. A driving cycle consists of a cold engine startup followed by mixed city/highway driving. No additional vehicle service is required.

If the *Service engine soon* indicator remains on, have your vehicle serviced at the first available opportunity. Although some malfunctions detected by the OBD-II may not have symptoms that are apparent, continued driving with the *Service engine soon* indicator on can result in increased emissions, lower fuel economy, reduced engine and transmission smoothness, and lead to more costly repairs.

Readiness for Inspection/Maintenance (I/M) testing

Some state/provincial and local governments may have Inspection/Maintenance (I/M) programs to inspect the emission control equipment on your vehicle. Failure to pass this inspection could prevent you from getting a vehicle registration. Your vehicle may not pass the I/M test if the *Service engine soon* indicator is on or not working properly (bulb is burned out), or if the OBD-II system has determined that some of the emission control systems have not been properly checked. In this case, the vehicle is considered not ready for I/M testing.

If the *Service engine soon* indicator is on or the bulb does not work, the vehicle may need to be serviced. Refer to the On board diagnostics (OBD-II) description in this chapter.

If the vehicle's engine or transmission has just been serviced, or the battery has recently run down or been replaced, the OBD-II system may indicate that the vehicle is not ready for I/M testing. To determine if the vehicle is ready for I/M testing, turn the ignition key to the ON position for 15 seconds without cranking the engine. If the *Service engine soon* indicator blinks eight times, it means that the vehicle is not ready for I/M testing; if the *Service engine soon* indicator stays on solid, it means that the vehicle is ready for I/M testing.

The OBD-II system is designed to check the emission control system during normal driving. A complete check may take several days. If the vehicle is not ready for I/M testing, the following driving cycle consisting of mixed city and highway driving may be performed:

15 minutes of steady driving on an expressway/highway followed by 20 minutes of stop-and-go driving with at least four 30-second idle periods.

Allow the vehicle to sit for at least eight hours without starting the engine. Then, start the engine and complete the above driving cycle. The engine must warm up to its normal operating temperature. Once started, do not turn off the engine until the above driving cycle is complete. If the vehicle is still not ready for I/M testing, the above driving cycle will have to be repeated.

POWER STEERING FLUID

Check the power steering fluid. Refer to the *scheduled maintenance information* for the service interval schedules.

1. Start the engine and let it run until it reaches normal operating temperature (the engine coolant temperature gauge indicator will be near the center of the normal area between H and C).

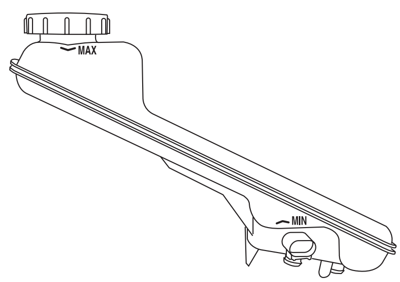
2. While the engine idles, turn the steering wheel left and right several times.

3. Turn the engine off.

4. Check the fluid level in the reservoir. It should be between the MIN and MAX lines. Do not add fluid if the level is in this range.

5. If the fluid is low, add fluid in small amounts, continuously checking the level until it reaches the range between the MIN and MAX lines. Be sure to put the cap back on the reservoir. Refer to *Maintenance product specifications and capacities* in this chapter for the proper fluid type.

BRAKE FLUID



The fluid level will drop slowly as the brakes wear, and will rise when the brake components are replaced. Fluid levels between the “MIN” and “MAX” lines are within the normal operating range; there is no need to add fluid. If the fluid levels are outside of the normal operating range the performance of the system could be compromised; seek service from your authorized dealer immediately.

TRANSAXLE FLUID

Checking automatic transaxle fluid

Refer to your *scheduled maintenance information* for scheduled intervals for fluid checks and changes.Your transaxle does not consume fluid. However, the fluid level should be checked if the transaxle is not working properly, i.e., if the transaxle slips or shifts slowly or if you notice some sign of fluid leakage.

Automatic transmission fluid expands when warmed. To obtain an accurate fluid check, drive the vehicle until it is warmed up (approximately 20 miles [30 km]). If your vehicle has been operated for an extended period at high speeds, in city traffic during hot weather or pulling a trailer, the vehicle should be turned off for about 30 minutes to allow fluid to cool before checking.

1. Drive the vehicle 20 miles (30 km) or until it reaches normal operating temperature.

2. Park the vehicle on a level surface and engage the parking brake.

3. With the parking brake engaged and your foot on the brake pedal, start the engine and move the gearshift lever through all of the gear ranges. Allow sufficient time for each gear to engage.

4. Latch the gearshift lever in P (Park) and leave the engine running.

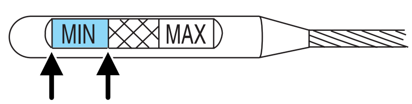
5. Remove the dipstick, wiping it clean with a clean, dry lint free rag. If necessary, refer to *Identifying components in the engine compartment* in this chapter for the location of the dipstick.

6. Install the dipstick making sure it is fully seated in the filler tube.

7. Remove the dipstick and inspect the fluid level. The fluid should be in the designated areas for normal operating temperature.

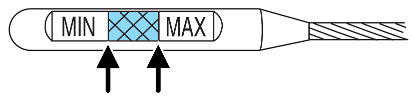
Low fluid level

Do not drive the vehicle if the fluid level is in the add range or does not show at all on the dipstick.



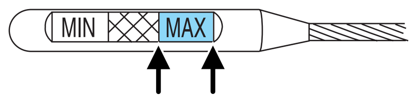
Correct fluid level

The transmission fluid should be checked at normal operating temperature 149°F (65°C) on a level surface. The normal operating temperature can be reached after approximately 20 miles (30 km) of driving.



The transmission fluid should be within the cross-hatch area if at normal operating temperature 149°F (65°C).

High fluid level



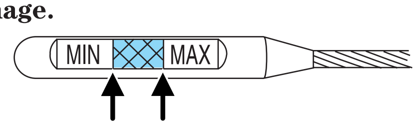
Fluid levels above the safe range may result in transaxle failure. An overfill condition of transmission fluid may cause shift and/or engagement concerns and/or possible damage.

High fluid levels can be caused by an overheating condition.

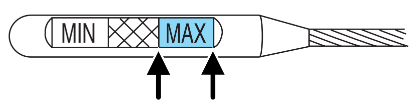
Adjusting automatic transmission fluid levels

Before adding any fluid, make sure the correct type is used. The type of fluid used is normally indicated on the dipstick and also in the *Maintenance product specifications and capacities* section in this chapter.

Use of a non-approved automatic transmission fluid may cause internal transaxle component damage.



If necessary, add fluid in 1/2 pint (250 mL) increments through the filler tube until the level is correct.



If an overfill occurs, excess fluid should be removed by an authorized dealer.

An overfill condition of transmission fluid may cause shift and/or engagement concerns and/or possible damage.

Do not use supplemental transmission fluid additives, treatments or cleaning agents. The use of these materials may affect transmission operation and result in damage to internal transaxle components.

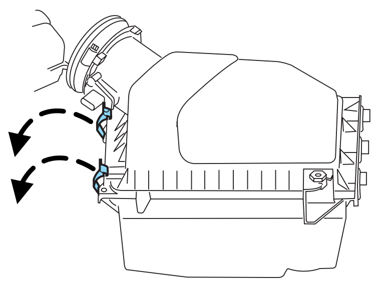
AIR FILTER

Refer to *scheduled maintenance information* for the appropriate intervals for changing the air filter element.

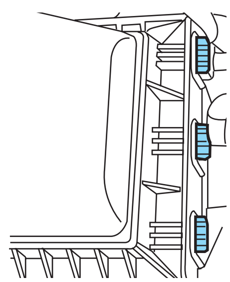
When changing the air filter element, use only the Motorcraft air filter element listed. Refer to *Motorcraft part numbers* in this chapter.

To reduce the risk of vehicle damage and/or personal burn injuries do not start your engine with the air cleaner removed and do not remove it while the engine is running.

Changing the air filter element



1. Release the clamps that secure the air filter housing cover.
2. Carefully separate the two halves of the air filter housing.
3. Remove the air filter element from the air filter housing.
4. Wipe the air filter housing and cover clean to remove any dirt or debris and to ensure good sealing.
5. Install a new air filter element. Be careful not to crimp the filter element edges between the air filter housing and cover. This could cause filter damage and allow unfiltered air to enter the engine if not properly seated.



6. Replace the air filter housing cover and secure the clamps. Be sure that the air cleaner cover tabs are engaged into the slots of the air cleaner housing.

Note: Failure to use the correct air filter element may result in severe engine damage. The customer warranty may be void for any damage to the engine if the correct air filter element is not used.

MOTORCRAFT PART NUMBERS

Component	3.5L V6 Engine
Engine air filter element	FA-1884
Battery	BXT-36R
Oil filter	FL-400-SB12
PCV valve	[1]
Spark plugs	[2]

[1]The PCV valve is a critical emission component. It is one of the items listed in *scheduled maintenance information* and is essential to the life and performance of your vehicle and to its emissions system.

For PCV valve replacement, see your authorized dealer. Refer to *scheduled maintenance information* for the appropriate intervals for changing the PCV valve.

Replace the PCV valve with one that meets Ford material and design specifications for your vehicle, such as a Motorcraft or equivalent replacement part. The customer warranty may be void for any damage to the emissions system if such a PCV valve is not used.

[2]For spark plug replacement, see your authorized dealer. Refer to *scheduled maintenance information* for the appropriate intervals for changing the spark plugs.

Replace the spark plugs with ones that meet Ford material and design specifications for your vehicle, such as Motorcraft or equivalent replacement parts. The customer warranty may be void for any damage to the engine if such spark plugs are not used.

MAINTENANCE PRODUCT SPECIFICATIONS AND CAPACITIES

Item	Capacity	Ford part name	Ford part number / Ford specification
Brake fluid	Between MIN and MAX on reservoir	Motorcraft High Performance DOT 3 Motor Vehicle Brake Fluid	PM-1-C / WSS-M6C62-A
Door weatherstrips	—	Silicone Spray Lubricant	XL-6 / ESR-M13P4-A
Door latch, hood latch, auxiliary hood latch, door hinges, striker plates, seat tracks and fuel filler door hinge	—	Multi-Purpose Grease	XG-4 or XL-5 / ESB-M1C93-B
Lock cylinders	—	Motorcraft Penetrating and Lock Lubricant	XL-1 / None
Engine oil[1]	5.5 quarts (5.2L)	Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil (US) Motorcraft SAE 5W-20 Super Premium Motor Oil (Canada)	XO-5W20-QSP (US) CXO-5W20–LSP12 (Canada) / WSS-M2C930-A with API Certification Mark
Engine coolant	11.7 quarts (11.09L)	Motorcraft Premium Gold Engine Coolant with bittering agent (yellow-colored)[2]	VC-7-B / WSS-M97B51-A1
Engine coolant–with trailer tow package	12.83 quarts (12.14L)		
Power steering fluid	Between MIN and MAX on reservoir	Motorcraft MERCON® V ATF	XT-5-QM / MERCON® V

Item	Capacity	Ford part name	Ford part number / Ford specification
Automatic transmission fluid	10.0 quarts (9.5L)[3]	Motorcraft MERCON® V ATF[4]	XT-5-QM / MERCON® V
Rear differential (AWD) fluid	2.4 pints (1.15L)	Motorcraft SAE 80W-90 Premium Rear Axle Lubricant	XY-80W90-QL / WSP-M2C197-A
Power Transfer Unit (PTU) fluid (AWD)[5]	12 ounces (0.35L)	Motorcraft SAE 75W-140 Synthetic Rear Axle Lubricant	XY-75W140-QL / WSL-M2C192-A
Windshield washer fluid	4.75 quarts (4.5L)	Motorcraft Premium Windshield Washer Concentrate	ZC-32-A / WSB-M8B16-A2
Fuel tank (front-wheel drive)	19.2 gallons (72.7L)	—	—
Fuel tank (all-wheel drive)	20.8 gallons (78.7L)	—	—

[1]Use of synthetic or synthetic blend motor oil is not mandatory. Engine oil need only meet the requirements of Ford specification WSS-M2C930-A and the API Certification mark.

[2]Add the coolant type originally equipped in your vehicle.

[3]Indicates only approximate dry-fill capacity. Some applications may vary based on cooler size and if equipped with an in-tank cooler. The amount of transmission fluid and fluid level should be set by the indication on the dipstick's normal operating range.

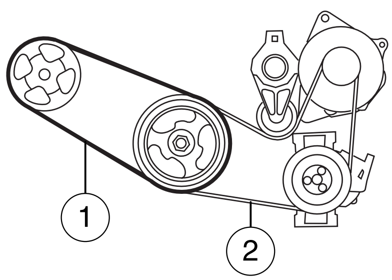
[4]Automatic transmissions that require MERCON® V should only use MERCON® V fluid or fluid that is specified dual usage MERCON®/MERCON® V. Refer to *scheduled maintenance information* to determine the correct service interval. Use of any fluid other than the recommended fluid may cause transmission damage.

[5]See your authorized dealer for fluid level checking or filling.

ENGINE DATA

Engine	3.5L-DOHC V6 engine
Displacement	3.5L
Required fuel	87 octane
Firing order	1–4–2–5–3–6
Spark plug gap	(0.052–0.056 inch) 1.32–1.42 mm
Ignition system	Coil on plug
Compression ratio	10.3:1

Engine drivebelt routing



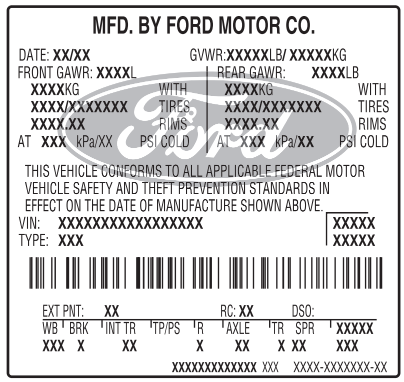
- 3.5L V6 Engine

1. Short drivebelt is on first pulley groove closest to engine.
2. Long drivebelt is on second pulley groove farthest from engine.

IDENTIFYING YOUR VEHICLE

Safety Compliance Certification Label

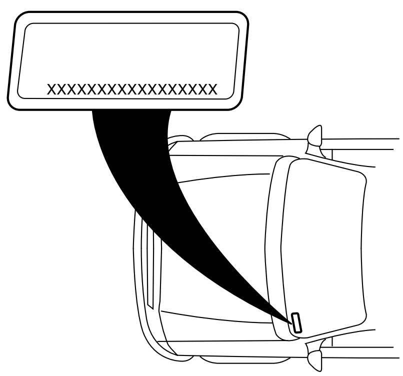
The National Highway Traffic Safety Administration Regulations require that a Safety Compliance Certification Label be affixed to a vehicle and prescribe where the Safety Compliance Certification Label may be located. The Safety Compliance Certification Label is located on the structure (B-Pillar) by the trailing edge of the driver's door or the edge of the driver's door.



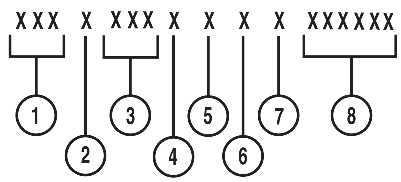
Vehicle identification number (VIN)

The vehicle identification number is located on the driver side instrument panel.

Please note that in the graphic, XXXX is representative of your vehicle identification number.



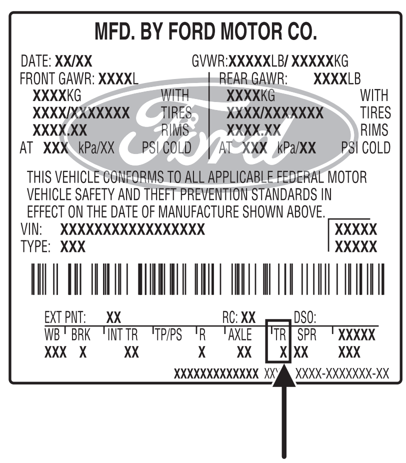
The Vehicle Identification Number (VIN) contains the following information:



1. World manufacturer identifier
2. Brake system / Gross Vehicle Weight Rating (GVWR) / Restraint System
3. Vehicle line, series, body type
4. Engine type
5. Check digit
6. Model year
7. Assembly plant
8. Production sequence number

TRANSMISSION/TRANSAXLE CODE DESIGNATIONS

You can find a transmission/transaxle code on the Safety Compliance Certification Label. The following table tells you which transmission or transaxle each code represents.



Description	Code
6F50 6–Speed Automatic Transaxle	J

GENUINE LINCOLN ACCESSORIES FOR YOUR VEHICLE

A wide selection of Genuine Lincoln Accessories are available for your vehicle through your local Lincoln or Ford of Canada dealer. These quality accessories have been specifically engineered to fulfill your automotive needs; they are custom designed to complement the style and aerodynamic appearance of your vehicle. In addition, each accessory is made from high quality materials and meets or exceeds Lincoln's rigorous engineering and safety specifications. Ford Motor Company will repair or replace any properly dealer-installed Genuine Lincoln Accessories found to be defective in factory-supplied materials or workmanship during the warranty period, as well as any component damaged by the defective accessories. The accessories will be warranted for whichever provides you the greatest benefit:

- 12 months or 12,000 miles (20,000 km) (whichever occurs first), or
- the remainder of your new vehicle limited warranty.

Contact your dealer for details and a copy of the warranty.

Following is a list of several Genuine Lincoln Accessories. Not all accessories are available for all models. To find out what accessories are available for your vehicle, please contact your dealer or visit our online store at: www.lincolnaccessories.com.

Exterior style

Bug shields

Deflectors

Splash guards

Interior style

Electrochromatic compass/temperature interior mirrors

Floor mats

Lifestyle

Ash cup / coin holder

Cargo organization and management

Cross bars

Trailer hitches, wiring harnesses and accessories

Peace of mind

Mobile-Ease™ hands-free communication system

TripTunes™ advanced portable audio solution

Remote start

Vehicle security systems

Wheel locks

For maximum vehicle performance, keep the following information in mind when adding accessories or equipment to your vehicle:

- When adding accessories, equipment, passengers and luggage to your vehicle, do not exceed the total weight capacity of the vehicle or of the front or rear axle (GVWR or GAWR as indicated on the Safety Compliance Certification label). Consult your authorized dealer for specific weight information.
- The Federal Communications Commission (FCC) and Canadian Radio Telecommunications Commission (CRTC) regulate the use of mobile communications systems — such as two-way radios, telephones and theft alarms - that are equipped with radio transmitters. Any such equipment installed in your vehicle should comply with FCC or CRTC regulations and should be installed only by a qualified service technician.
- Mobile communications systems may harm the operation of your vehicle, particularly if they are not properly designed for automotive use.
- To avoid interference with other vehicle functions, such as anti-lock braking systems, amateur radio users who install radios and antennas onto their vehicle should not locate the Amateur Radio Antennas in the area of the driver's side hood.
- Electrical or electronic accessories or components that are added to the vehicle by the authorized dealer or the owner may adversely affect battery performance and durability.

2008 ACCESSORIES & BODY, CAB

Rear View Mirrors - Edge & MKX

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Exterior mirror nuts	9	80

DESCRIPTION AND OPERATION

REAR VIEW MIRRORS

The main components of the rear view mirrors are:

- Exterior mirror control switch
- Exterior mirror cover
- Exterior mirror glass
- Exterior mirror glass adjustment motors
- Exterior mirror plastic housing
- Heated exterior mirror glass (optional)
- Interior auto-dimming rear view mirror
- LH exterior auto-dimming mirror glass (optional)
- Memory exterior mirrors (optional)
- Puddle lamps (optional)

For information on the puddle lamps, refer to **EXTERIOR LIGHTING** article.

Power Exterior Mirrors - Power mirrors allow the driver or passenger mirror glass to be positioned electronically. The position of the power mirror glass is controlled by the exterior rear view mirror control switch, which is located on the LH front door trim panel. Adjusting the exterior rear view mirror control switch to the LH or RH position determines which power mirror glass will be controlled.

Heated Exterior Mirrors - The power exterior rear view mirrors are available with a heated mirror glass option, which heats the mirror glass to remove frost, snow, ice and condensation. The rear window defrost switch controls the operation of the heated exterior rear view mirrors. The heated exterior rear view mirrors only operate when the rear window defrost system is on.

Memory Exterior Mirrors - The memory mirror function recalls the preferred positioning of the LH and RH exterior mirror glass that is retained in the driver seat module (DSM) memory. The memory mirror function is activated by the door mounted switches or the remote keyless entry (RKE) transmitter. When a memory position is recalled by the operator, the LH and RH exterior mirror glass will automatically adjust to the preferred position. The DSM is capable of setting a DTC for the memory mirror system when a system concern exists. For information on the DSM and Memory Position Programming, refer to **SEATING** article.

Auto-Dimming Rear View Mirror(s) - The interior rear view mirror and LH exterior mirror may be equipped with an auto-dimming feature. This feature automatically reduces the glare caused by headlamps reflecting in the mirror. The auto-dimming feature is activated when the ignition is in the RUN or ACC position. The interior rear view mirror adjusts the reflectance level of the interior rear view mirror and LH exterior mirror to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior rear view mirror. To provide increased visibility when backing up, the interior rear view mirror will automatically return to a high reflectance mode whenever the vehicle is in REVERSE.

DIAGNOSTIC TESTS

REAR VIEW MIRRORS

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

Power Exterior Mirrors

Adjusting the exterior rear view mirror control switch to the LH or RH position determines which power mirror glass will be controlled.

The exterior mirrors use a jumper harness between the vehicle wire harness connector and the exterior mirror motor. The exterior mirror jumper harness is integral to the exterior mirror. If a concern with the exterior mirror jumper harness exists and cannot be repaired, a new exterior mirror must be installed.

Memory Exterior Mirror

The memory exterior mirror feature is controlled by the driver seat module (DSM). The power driver seat positions are also stored and recalled with the memory exterior mirror positions. The memory exterior mirror function recalls the preferred positioning of the LH and RH exterior mirror motors when the transmission is in the PARK or NEUTRAL position and the door mounted switches or the remote keyless entry (RKE) transmitter are activated. The DSM constantly tracks the position of the LH and RH exterior mirror motors by using the potentiometers in the LH and RH exterior mirror motors. The position of the LH and RH exterior mirror motors are stored in the DSM memory as long as the DSM retains power. When a memory position is recalled by the operator, the DSM powers the LH and RH exterior mirror motors simultaneously and monitors the LH and RH potentiometer circuits. When the stored memory position is reached, the DSM removes the voltage from the LH and RH exterior mirror motors. If the exterior mirror control switch is operated during a memory recall, the DSM stops the recall and responds to the exterior mirror control switch command. The DSM is capable of setting a DTC for the memory mirror system when a system concern exists.

For information on the DSM and memory position programming, refer to **SEATING** article.

Heated Exterior Mirror

The heated exterior rear view mirrors only operate when the heated rear window is ON. The heated rear window switch controls the operation of the heated exterior rear view mirrors. The heated rear window switch is an integral part of the HVAC module and cannot be replaced separately. The heated exterior rear view mirror power is supplied by the heated mirror relay.

Auto-Dimming Mirrors

The interior rear view and LH exterior mirror may be equipped with an auto-dimming feature. This feature automatically reduces the glare caused by headlamps reflecting in the mirror. The auto-dimming feature is disabled when the vehicle is in REVERSE. Power is supplied to the auto-dimming interior mirror when the ignition is in the RUN or ACC position.

The interior auto-dimming rear view mirror has 2 photoelectric sensors that detect forward and rearward light conditions. Based on those inputs, the interior rear view mirror adjusts the reflectance level of the interior rear view mirror and LH exterior mirror to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior rear view mirror.

When the forward sensor detects daytime conditions, the rearward sensor is inactive and the mirror stays in a high reflectance mode. When the forward sensor detects nighttime conditions, the rearward sensor is active and detects glare from the headlights of vehicles approaching from the rear, or other glare producing light sources. To provide increased visibility when backing up, the interior rear view and LH exterior mirror will automatically return to a high reflectance mode whenever the vehicle is in REVERSE.

If the forward or rearward sensors are blocked, the interior auto-dimming rear view and LH exterior mirror might not work correctly.

Inspection and Verification

1. Verify the customer concern.
2. Inspect the components of the exterior mirror system to determine if any of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
- Exterior mirror - Exterior mirror control switch - Exterior mirror glass - Interior rear view mirror	- Smart junction box (SJB) fuse(s): 12 (7.5A) 31 (10A) - Battery junction box (BJB) fuse 28 (15A) - DSM - Heated mirror relay - Exterior mirror control switch - Exterior mirror motor - Exterior mirror - Exterior mirror glass - Interior rear view mirror - Driver seat module (DSM) - Loose or corroded connections - Wiring harness

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the

DSM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM.
9. If the DTCs retrieved are related to the concern, go to **DRIVER SEAT MODULE (DSM) DTC CHART**t. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart - Rear View Mirrors** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Mirror vibrates/loose	• Mirror glass adjustment motor screws loose • Exterior mirror mounting nuts loose **NOTE: Compare the LH and RH exterior mirror glass to verify that the exterior mirror glass is loose.** • Mirror glass loose • Aftermarket air deflector/stone shields	• REMOVE mirror glass and TIGHTEN mirror glass adjustment motor screws. • TIGHTEN nuts to 9 N.m (80 lb-in). • PRESS the center of the exterior mirror glass up, down, left and right to make sure that the exterior mirror glass is seated correctly. If the exterior mirror glass is still loose, REMOVE the exterior mirror glass and INSPECT the exterior mirror backing plate for damage. If the exterior mirror backing plate is damaged, INSTALL a new exterior mirror glass. REFER to **Exterior Mirror Glass**. • If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST the vehicle. If concern is no longer present, ADVISE customer that aftermarket components were causing undesired vibration.
• Wind noise	• Foam gasket between the exterior mirror and door is	• VERIFY gasket is present and in good condition. REPOSITION gasket

	missing or damaged • Exterior mirror is not correctly fitted to the door	between exterior mirror and door frame if necessary. • VERIFY that there are no gaps between the exterior mirror and the door. If necessary, LOOSEN the exterior mirror nuts and REPOSITION the exterior mirror.

Pinpoint Tests

Pinpoint Test A: The Mirrors are Inoperative - Non-Memory Mirrors

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch receives power through circuit SBP12 (GN/RD) and ground through circuit GD133 (BK). The exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror up/down and right/left movement.

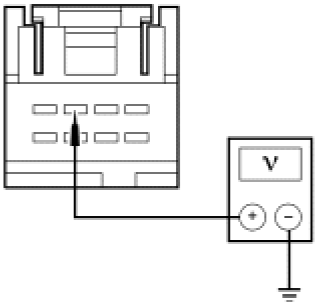
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Exterior mirror control switch

PINPOINT TEST A: THE MIRRORS ARE INOPERATIVE - NON-MEMORY MIRRORS

A1 CHECK THE VOLTAGE TO THE EXTERIOR MIRROR CONTROL SWITCH - CIRCUIT SBP12 (GN/RD)

- Disconnect: Exterior Mirror Control Switch C527
- Key in ON position.



N0006111

Fig. 1: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

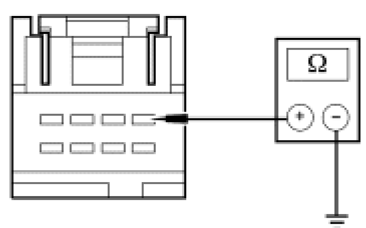
- Measure the voltage between exterior mirror control switch C527-3, circuit SBP12 (GN/RD) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation

A2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.



N0006112

Fig. 2: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

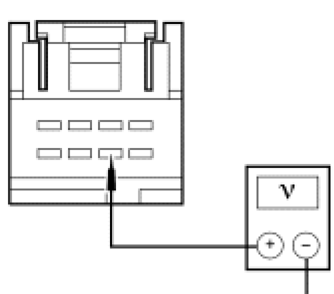
- Measure the resistance between exterior mirror control switch C527-1, circuit GD133 (BK) harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to A3.

  NO : REPAIR the circuit. TEST the system for normal operation.

A3 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO VOLTAGE

- Key in ON position.



A0073142

Fig. 3: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to A4.

A4 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO GROUND

- Key in OFF position.

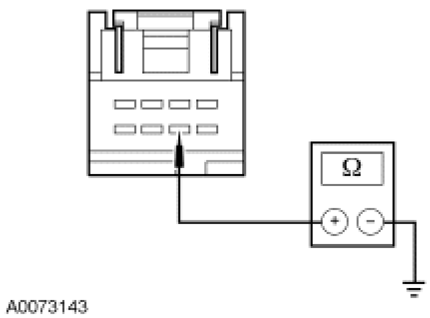


Fig. 4: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to A5.

  NO : REPAIR the circuit. TEST the system for normal operation.

A5 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN

- Disconnect: LH Exterior Mirror C516

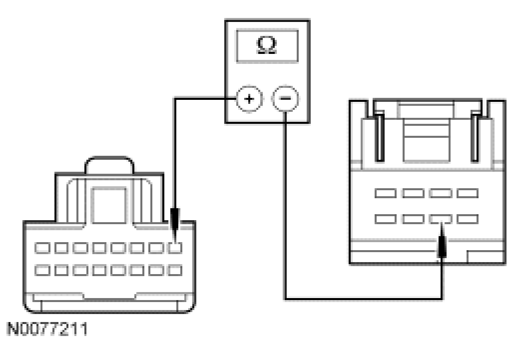

Fig. 5: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH exterior mirror C516-1, circuit CPM23 (GY) harness side and exterior mirror control switch C527-6, circuit CPM23 (GY) harness side.

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST system for normal operation.

Pinpoint Test B: A Single Mirror is Inoperative - Non-Memory Mirror

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror down/up and left/right movement.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST B: A SINGLE MIRROR IS INOPERATIVE - NON-MEMORY MIRRORS

B1 CHECK THE LH EXTERIOR MIRROR

- Set the exterior mirror control switch to the LH mirror position.
- Use the exterior mirror control switch to operate the LH exterior mirror.
- **Does the LH exterior mirror operate?**

  YES : Go to B2.

  NO : Go to B4.

B2 CHECK THE EXTERIOR MIRROR CONTROL SWITCH

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Carry out the Exterior Mirror Control Switch Component Test. Refer to COMPONENT TESTING.
- **Did the exterior mirror control switch pass the component test?**

  YES : Go to B3.

  NO : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

B3 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN

- Disconnect: RH Exterior Mirror C622

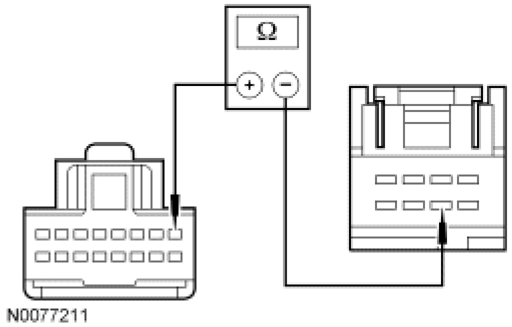

Fig. 6: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH exterior mirror C622-1, circuit CPM23 (GY) harness side and exterior mirror control switch C527-6, circuit CPM23 (GY) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

B4 CHECK THE EXTERIOR MIRROR CONTROL SWITCH

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Carry out the Exterior Mirror Control Switch Component Test. Refer to COMPONENT TESTING.
- **Did the exterior mirror control switch pass the component test?**

  YES : Go to B5.

  NO : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

B5 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN

- Disconnect: LH Exterior Mirror C516

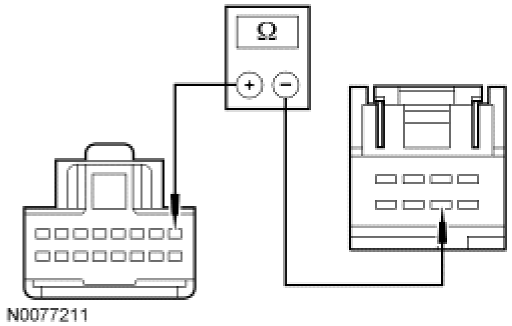

Fig. 7: Measuring Resistance

Courtesy of FORD MOTOR CO.

- Measure the resistance between LH exterior mirror C516-1, circuit CPM23 (GY) harness side and exterior mirror control switch C527-6, circuit CPM23 (GY) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: A Single Mirror Does Not Function with Switch Logic - Non-Memory Mirrors

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Normal Operation

The exterior mirror switch controls the LH exterior mirror movement by switching voltage and ground to circuits CPM16 (BN/BU), CPM17 (BU/GN) and CPM23 (GY). The exterior mirror switch controls the RH exterior mirror movement by switching voltage and ground to circuits CPM20 (BN/WH), CPM21 (YE/VT) and CPM23 (GY).

- When the LH/RH exterior mirror motor receives power through circuit CPM16 (BN/BU) or CPM20 (BN/WH) and ground through circuit CPM23 (GY), the LH or RH exterior mirror motor will operate right.
- When LH/RH exterior mirror motor receives ground through circuit CPM16 (BN/BU) or CPM20 (BN/WH) and power through circuit CPM23 (GY), the LH or RH exterior mirror motor will operate left.
- When the LH/RH exterior mirror motor receives power through circuit CPM17 (BU/GN) or CPM21 (YE/VT) and ground through circuit CPM23 (GY), the LH or RH exterior mirror motor will operate upward.
- When LH/RH exterior mirror motor receives ground through circuit CPM17 (BU/GN) or CPM21 (YE/VT) and power through circuit CPM23 (GY), the LH or RH exterior mirror motor will operate downward.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST C: A SINGLE MIRROR DOES NOT FUNCTION WITH SWITCH LOGIC - NON-MEMORY MIRRORS

C1 CHECK MIRROR MOVEMENT (LEFT/RIGHT)

- Operate the LH and RH exterior mirrors in the left and right direction.
- **Do the exterior mirrors move left and right?**

  YES : Go to C2.

  NO : Go to C3.

C2 CHECK MIRROR MOVEMENT (UP/DOWN)

- Operate the LH and RH exterior mirrors in the up and down direction.
- **Do the exterior mirrors move up and down?**

  YES : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

  NO : Go to C4.

C3 CHECK THE VOLTAGE TO THE INOPERATIVE MIRROR

- Key in OFF position.
- Disconnect: Inoperative Exterior Mirror C516 (LH) or C622 (RH)

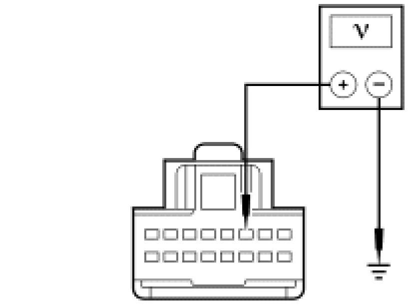

Fig. 8: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE: **Position the exterior mirror control switch to the LH or RH mirror position.**

- While operating the exterior mirror control switch in the RIGHT position, measure the voltage between ground and exterior mirror:
  - **(LH)** C516-3, circuit CPM16 (BN/BU) harness side.
  - **(RH)** C622-3, circuit CPM20 (BN/WH) harness side.
- **Is the voltage greater than 10 volts?**

  YES : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

NO : Go to C5.

C4 CHECK THE VOLTAGE TO THE INOPERATIVE MIRROR

- Disconnect: Inoperative Exterior Mirror C516 (LH) or C622 (RH)

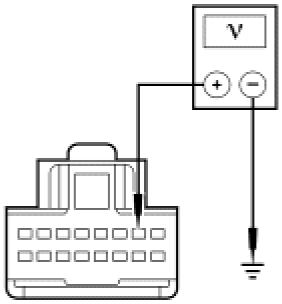

Fig. 9: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE:	**Position the exterior mirror control switch to the LH or RH mirror position.**

- While operating the exterior mirror control switch in the UP position, measure the voltage between ground and exterior mirror:
  - **(LH)** C516-2, circuit CPM17 (BU/GN) harness side.
  - **(RH)** C622-2, circuit CPM21 (YE/VT) harness side.
- **Is the voltage greater than 10 volts?**

  YES : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : Go to C6.

C5 CHECK CIRCUIT CPM16 (BN/BU) OR CIRCUIT CPM20 (BN/WH) FOR AN OPEN

- Disconnect: Exterior Mirror Control Switch C527

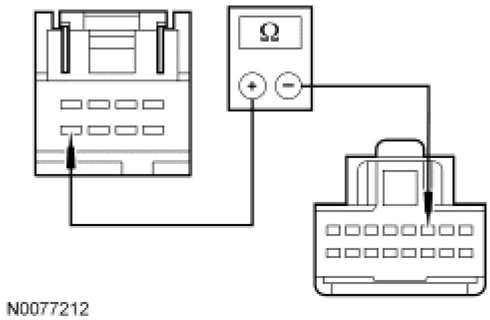

Fig. 10: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **Inoperative LH mirror:** Measure the resistance between exterior mirror control switch C527-8, circuit CPM16 (BN/BU) harness side and LH exterior mirror C516-3, circuit CPM16 (BN/BU) harness side.

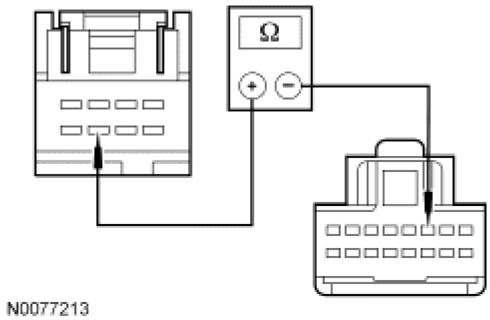

Fig. 11: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **Inoperative RH mirror:** Measure the resistance between exterior mirror control switch C527-7, circuit CPM20 (BN/WH) harness side and RH exterior mirror C622-3, circuit CPM20 (BN/WH) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

C6 CHECK CIRCUIT CPM17 (BU/GN) OR CIRCUIT CPM21 (YE/VT) FOR AN OPEN

- Disconnect: Exterior Mirror Control Switch C527

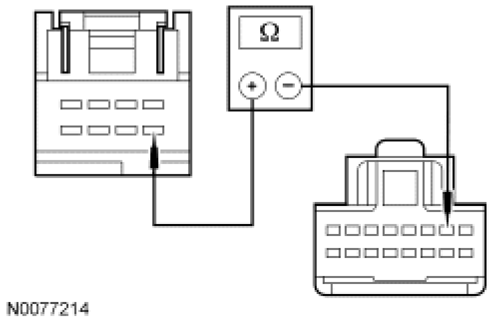

Fig. 12: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **Inoperative LH mirror:** Measure the resistance between exterior mirror control switch C527-5, circuit CPM17 (BU/GN) harness side and LH exterior mirror C516-2, circuit CPM17 (BU/GN) harness side.

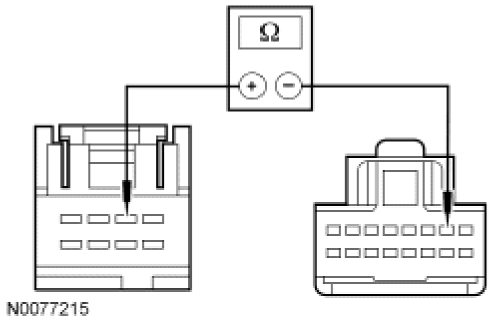

Fig. 13: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **Inoperative RH mirror:** Measure the resistance between exterior mirror control switch C527-2, circuit CPM21 (YE/VT) harness side and RH exterior mirror C622-2, circuit CPM21 (YE/VT) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test D: The Memory Mirror is Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch receives power from circuit SBP12 (GN/RD) and ground from circuit GD133 (BK). The exterior mirror control switch sends input to the driver seat module (DSM) for the LH exterior mirror by switching power and ground to circuits CPM16 (BU/BN), CPM17 (BU/GN) and CPM23 (GY), and for the RH exterior mirror by switching power and ground to circuits CPM20 (BN/WH), CPM21 (YE/VT) and CPM23 (GY). The DSM controls the vertical movement of the exterior mirror motors by supplying power and ground signals to the exterior mirror motor up/down circuits CPM26 (WH), CPM29 (GN), CPM31 (YE/GY) and CPM34 (WH/BN). The DSM controls the horizontal movement of the LH and RH exterior mirror motors by supplying power and ground signals to the exterior mirror motor left/right circuits CPM26 (WH), CPM28 (BU/BN), CPM31 (YE/GY) and CPM33 (WH/VT).

The DSM supplies the LH and RH exterior mirror feedback potentiometer reference voltage through circuit LPM30 (GY/VT) and ground through circuit RPM30 (YE). The DSM receives feedback from the LH exterior mirror feedback potentiometer through circuit (left/right) VPM35 (YE/BU) and circuit (up/down) VPM36 (BN/YE). The DSM receives feedback from the RH exterior mirror feedback potentiometer through circuit (left/right) VPM37 (BU/OG) and circuit (up/down) VPM38 (BN/GN).

DTC Description	Fault Trigger Conditions
B1667 - Mirror Driver Up/Down Motor Stalled	Open or incorrect mirror motor position reported to the DSM during On-Demand Self Test.
B1668 - Mirror Driver Right/Left Motor Stalled	Open or incorrect mirror motor position reported to the DSM during On-Demand Self Test.
B1669 - Mirror Passenger Up/Down Motor Stalled	Open or incorrect mirror motor position reported to the DSM during On-Demand Self Test.
B1670 - Mirror Passenger Right/Left Motor Stalled	Open or incorrect mirror motor position reported to the DSM during On-Demand Self Test.
B1733 - Mirror Driver Vertical Switch Circuit Failure	Short to ground or battery detected by the DSM.
B1737 - Mirror Driver Horizontal Switch Circuit Failure	Short to ground or battery detected by the DSM.
B1741 - Mirror Passenger Vertical Switch Circuit Failure	Short to ground or battery detected by the DSM.
B1745 - Mirror Passenger Horizontal Switch Circuit Failure	Short to ground or battery detected by the DSM.
B2223 - Mirror Driver Drive Circuit Failure	Short to ground or battery detected by the DSM.
B2224 - Mirror Passenger Drive Circuit Failure	Short to ground or battery detected by the DSM.
B2312 - Mirror Passenger Horizontal Feedback Potentiometer Circuit Failure	Open or short to ground detected by the DSM.
B2314 - Mirror Passenger Horizontal Feedback Potentiometer Circuit Short to Battery	Short to battery detected by the DSM.
B2316 - Mirror Passenger Vertical Feedback	Open or short to ground detected by the DSM.

Potentiometer Circuit Failure	
B2318 - Mirror Passenger Vertical Feedback Potentiometer Circuit Short to Battery	Short to battery detected by the DSM.
B2320 - Mirror Driver Horizontal Feedback Potentiometer Circuit Failure	Open or short to ground detected by the DSM.
B2322 - Mirror Driver Horizontal Feedback Potentiometer Circuit Short to Battery	Short to battery detected by the DSM.
B2324 - Mirror Driver Vertical Feedback Potentiometer Circuit Failure	Open or short to ground detected by the DSM.
B2326 - Mirror Driver Vertical Feedback Potentiometer Circuit Short to Battery	Short to battery detected by the DSM.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror
- DSM

PINPOINT TEST D: THE MEMORY MIRROR IS INOPERATIVE

D1 RETRIEVE THE DTCs FROM THE DSM

- Use the recorded DSM DTCs from the continuous and on-demand self tests.
- **Are any DTCs retrieved?**

  YES : If DTC B1667 or B1668 - If other DTCs are present, DIAGNOSE them first. If no other DTCs are present, INSPECT the LH exterior mirror motor for foreign material, damage or a binding condition. If no condition is found, Go to D12.

  If DTC B1669 or B1670 - If other DTCs are present, DIAGNOSE them first. If no other DTCs are present, INSPECT the RH exterior mirror motor for foreign material, damage or a binding condition. If no condition is found, Go to D14.

  If DTC B1733, B1737, B1741 or B1745 - CARRY OUT the exterior mirror control switch component test. Refer to COMPONENT TESTING. If the switch tests OK, go to D16.

  If DTC B2223, go to D18.

  If DTC B2224, go to D21.

  If DTC B2312, B2316, B2320 or B2324, go to D24.

  If DTC B2314, B2318, B2322 or B2326, go to D28.

  NO : Go to D2.

D2 CHECK OPERATION OF THE MIRRORS FROM THE EXTERIOR MIRROR CONTROL SWITCH

- Operate the mirrors using the exterior mirror control switch.

- **Do the mirrors operate from the exterior mirror control switch?**

  YES : Go to D9.

  NO : Go to D3.

D3 CHECK THE EXTERIOR MIRROR CONTROL SWITCH

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Carry out the Exterior Mirror Control Switch Component Test. Refer to COMPONENT TESTING.
- **Did the exterior mirror control switch pass the component test?**

  YES : Go to D4.

  NO : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

D4 CHECK CIRCUIT SBP12 (GN/RD) FOR VOLTAGE

- Key in ON position.

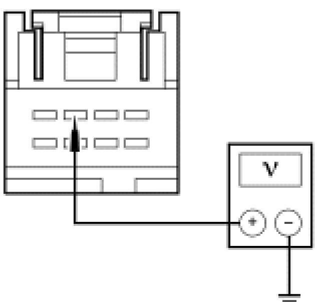

Fig. 14: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

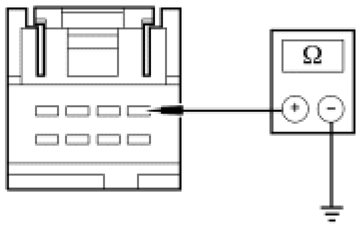
- Measure the voltage between ground and exterior mirror control switch C527-3, circuit SBP12 (GN/RD) harness side.
- **Is the voltage greater than 10 volts?**

  YES : Go to D5.

  NO : VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

D5 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.



N0006112

Fig. 15: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

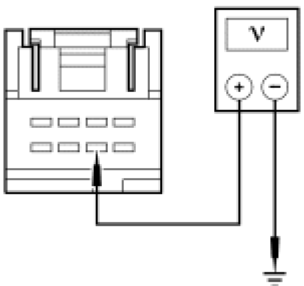
- Measure the resistance between ground and exterior mirror control switch C527-1, circuit GD133 (BK) harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to D6.

  NO : REPAIR the circuit. TEST the system for normal operation.

D6 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO VOLTAGE

- Key in ON position.
- Disconnect: DSM C3299D



N0077231

Fig. 16: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to D7.

  NO : REPAIR the circuit. TEST the system for normal operation.

D7 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO GROUND

- Key in OFF position.

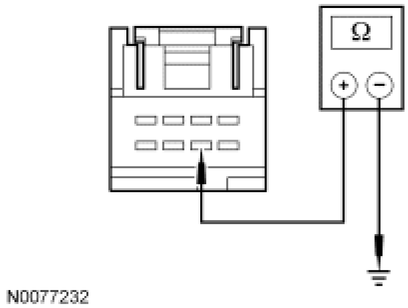


Fig. 17: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D8.

  NO : REPAIR the circuit. TEST the system for normal operation.

D8 CHECK CIRCUITS CPM16 (BU/BN), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) AND CPM23 (GY) FOR AN OPEN

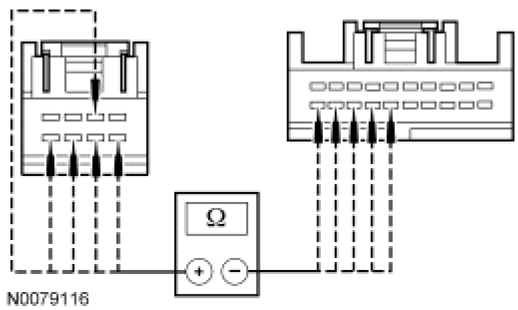

Fig. 18: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between exterior mirror control switch:
  - C527-2, circuit CPM21 (YE/VT) harness side and DSM C3299D-17, circuit CPM21 (YE/VT) harness side.
  - C527-5, circuit CPM17 (BU/GN) harness side and DSM C3299D-19, circuit CPM17 (BU/GN) harness side.
  - C527-6, circuit CPM23 (GY) harness side and DSM C3299D-16, circuit CPM23 (GY) harness side.
  - C527-7, circuit CPM20 (BN/WH) harness side and DSM C3299D-18, circuit CPM20 (BN/WH) harness side.
  - C527-8, circuit CPM16 (BU/BN) harness side and DSM C3299D-20, circuit CPM16 (BU/BN) harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to D30.

  NO : REPAIR the circuit(s). TEST the system for normal operation.

D9 CHECK CIRCUIT RPM30 (YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299D
- Key in ON position.

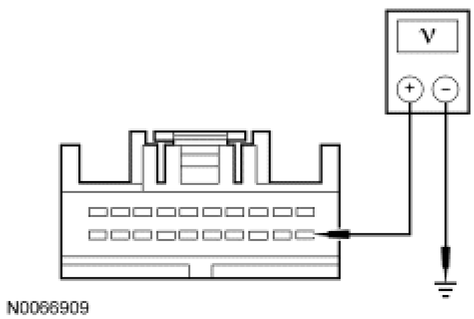

Fig. 19: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299D-11, circuit RPM30 (YE) harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to D10.

D10 CHECK CIRCUIT LPM30 (GY/VT) FOR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Exterior Mirror C516 and C622

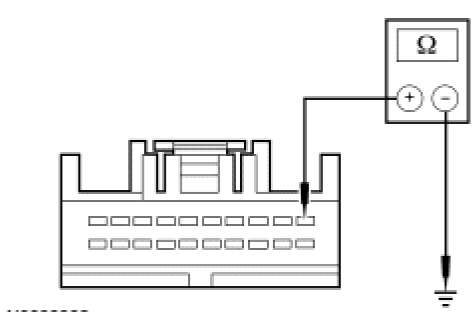

Fig. 20: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299D-1, circuit LPM30 (GY/VT) harness side and ground.

- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to D11.

D11 CHECK CIRCUITS RPM30 (YE) AND LPM30 (GY/VT) FOR AN OPEN

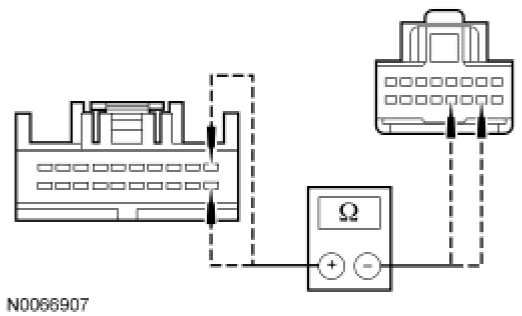

Fig. 21: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM:
  - C3299D-1, circuit LPM30 (GY/VT) harness side and LH exterior mirror C516-10, circuit LPM30 (GY/VT) harness side.
  - C3299D-11, circuit RPM30 (YE) harness side and RH exterior mirror C516-12, circuit RPM30 (YE) harness side.
  - C3299D-1, circuit LPM30 (GY/VT) harness side and LH exterior mirror C622-10, circuit LPM30 (GY/VT) harness side.
  - C3299D-11, circuit RPM30 (YE) harness side and RH exterior mirror C622-12, circuit RPM30 (YE) harness side.
- **Are the resistances less than 5 ohms?**

  YES : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH or RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

  NO : REPAIR the circuit(s). TEST the system for normal operation.

D12 CHECK THE EXTERIOR MIRROR FOR VOLTAGE FROM THE DSM

- Key in OFF position.
- Disconnect: LH Exterior Mirror C516
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DDM DataLogger

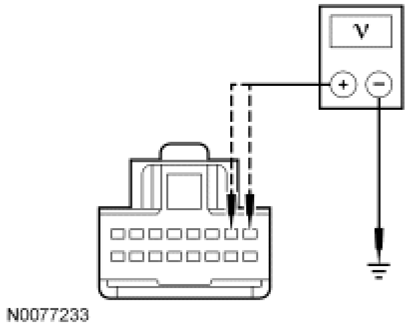

Fig. 22: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **DTC B1667:** Measure the voltage between LH exterior mirror C516-1, circuit CPM29 (GN) harness side and ground while toggling the LH exterior mirror DSM PID DR_UP to ON; and between LH exterior mirror C516-2, circuit CPM26 (WH) harness side and ground while toggling the LH exterior mirror DSM PID DR_DOWN to ON.

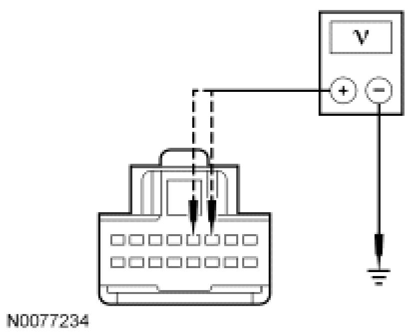

Fig. 23: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **DTC B1668:** Measure the voltage between LH exterior mirror C516-3, circuit CPM26 (WH) harness side and ground while toggling the LH exterior mirror DSM PID DR_LEFT to ON; and between LH exterior mirror C516-4, circuit CPM28 (BU/BN) harness side and ground while toggling the LH exterior mirror DSM PID DR_RIGHT to ON.
- **Do the voltages momentarily change from 0 volt to greater than 10 volts when the active command is toggled ON?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted and open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D13.

D13 CHECK CIRCUITS CPM26 (WH), CPM28 (BU/BN) AND CPM29 (GN) FOR AN OPEN

- Key in OFF position.

- Disconnect: DSM C3299D

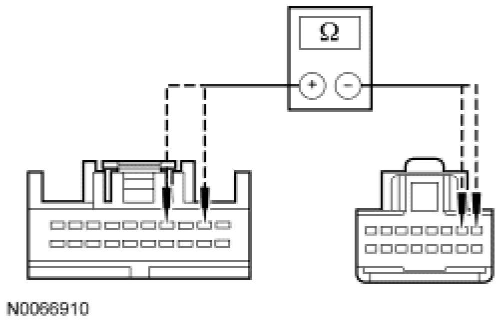

Fig. 24: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **DTC B1667:** Measure the resistance between DSM:
  - C3299D-2, circuit CPM26 (WH) harness side and LH exterior mirror C516-2, circuit CPM26 (WH) harness side.
  - C3299D-4, circuit CPM29 (GN) harness side and LH exterior mirror C516-1, circuit CPM29 (GN) harness side.

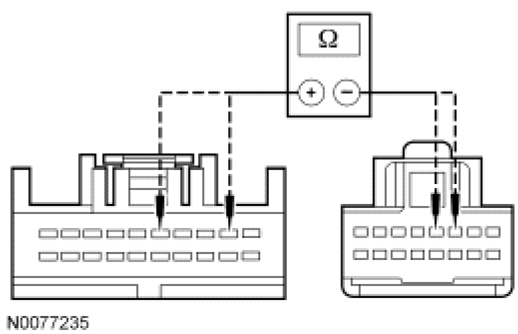

Fig. 25: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **DTC B1668:** Measure the resistance between DDM:
  - C3299D-2, circuit CPM26 (WH) harness side and LH exterior mirror C516-3, circuit CPM26 (WH) harness side.
  - C3299D-5, circuit CPM28 (BU/BN) harness side and LH exterior mirror C516-4, circuit CPM28 (BU/BN) harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to D30.

  NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D14 CHECK THE EXTERIOR MIRROR FOR VOLTAGE FROM THE DSM

- Key in OFF position.

- Disconnect: RH Exterior Mirror C622
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DSM DataLogger

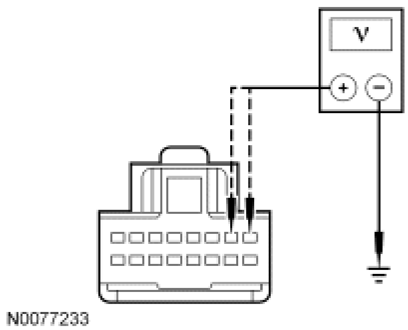

Fig. 26: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **DTC B1669:** Measure the voltage between RH exterior mirror C622-1, circuit CPM34 (WH/BN) harness side and ground while toggling the RH exterior mirror DSM PID PR_UP to ON; and between RH exterior mirror C622-2, circuit CPM31 (YE/GY) harness side and ground while toggling the RH exterior mirror DSM PID PR_DOWN to ON.

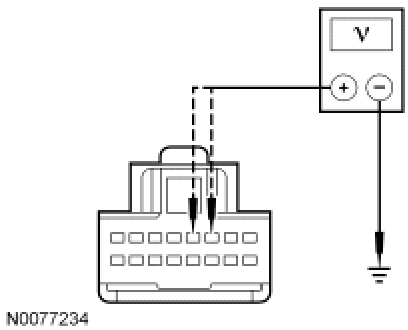

Fig. 27: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **DTC B1670:** Measure the voltage between RH exterior mirror C622-3, circuit CPM31 (YE/GY) harness side and ground while toggling the RH exterior mirror DSM PID PR_LEFT to ON; and between RH exterior mirror C622-4, circuit CPM33 (WH/VT) harness side and ground while toggling the RH exterior mirror DSM PID PR_RIGHT to ON.
- **Do the voltages momentarily change from 0 volt to greater than 10 volts when the active command is toggled ON?**

  YES : CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted and open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

NO : Go to D15.

D15 CHECK CIRCUITS CPM31 (YE/GY), CPM33 (WH/VT) AND CPM34 (WH/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: DSM C3299D

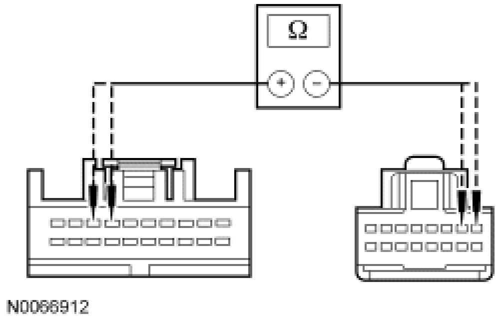

Fig. 28: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **DTC B1669:** Measure the resistance between DSM:
  - C3299D-7, circuit CPM34 (WH/BN) harness side and RH exterior mirror C622-1, circuit CPM34 (WH/BN) harness side.
  - C3299D-8, circuit CPM31 (YE/GY) harness side and RH exterior mirror C622-2, circuit CPM31 (YE/GY) harness side.

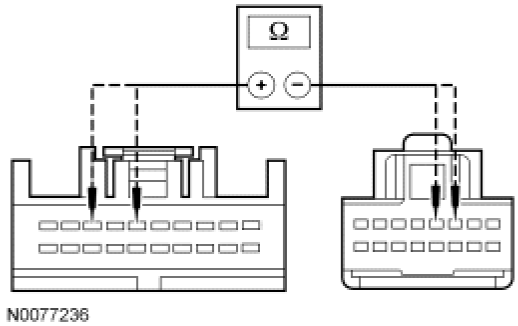

Fig. 29: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **DTC B1670:** Measure the resistance between DSM:
  - C3299D-6, circuit CPM33 (WH/VT) harness side and RH exterior mirror C622-4, circuit CPM33 (WH/VT) harness side.
  - C3299D-8, circuit CPM31 (YE/GY) harness side and RH exterior mirror C622-3, circuit CPM31 (YE/GY) harness side.
- **Are the resistances less than 5 ohms?**

YES : Go to D30.

NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D16 CHECK CIRCUITS CPM16 (BU/BN), CPM17 (BU/GN), CPM20 (BN/WH) OR CPM21 (YE/VT) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Disconnect: DSM C3299D
- Key in ON position.

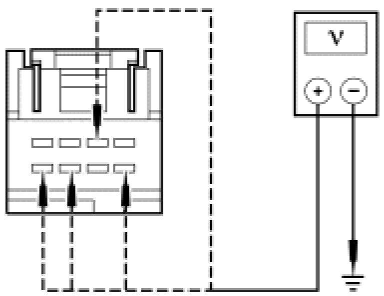

Fig. 30: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and exterior mirror control switch:
  - **DTC B1733:** C527-5, circuit CPM17 (BU/GN) harness side.
  - **DTC B1737:** C527-8, circuit CPM16 (BN/BU) harness side.
  - **DTC B1741:** C527-2, circuit CPM21 (YE/VT) harness side.
  - **DTC B1745:** C527-7, circuit CPM20 (BN/WH) harness side.
- **Is any voltage present?**

YES : REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

NO : Go to D17.

D17 CHECK CIRCUITS CPM16 (BU/BN), CPM17 (BU/GN), CPM20 (BN/WH) OR CPM21 (YE/VT) FOR A SHORT TO GROUND

- Key in OFF position.

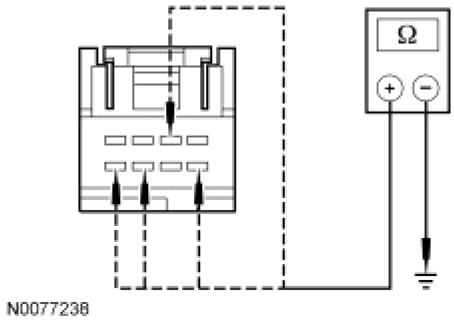

Fig. 31: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and exterior mirror control switch:
  - **DTC B1733:** C527-5, circuit CPM17 (BU/GN) harness side.
  - **DTC B1737:** C527-8, circuit CPM16 (BN/BU) harness side.
  - **DTC B1741:** C527-2, circuit CPM21 (YE/VT) harness side.
  - **DTC B1745:** C527-7, circuit CPM20 (BN/WH) harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D30.

D18 CHECK CIRCUITS CPM26 (WH), CPM28 (BU/BN) AND CPM29 (GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299D
- Key in ON position.

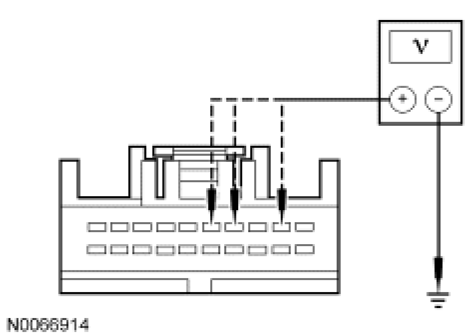

Fig. 32: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and DSM:
  - C3299D-2, circuit CPM26 (WH) harness side.
  - C3299D-4, circuit CPM29 (GN) harness side.
  - C3299D-5, circuit CPM28 (BU/BN) harness side.

- **Is any voltage present?**

  YES : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D19.

D19 CHECK CIRCUITS CPM26 (WH), CPM28 (BU/BN) AND CPM29 (GN) FOR A SHORT TO GROUND

- Key in OFF position.

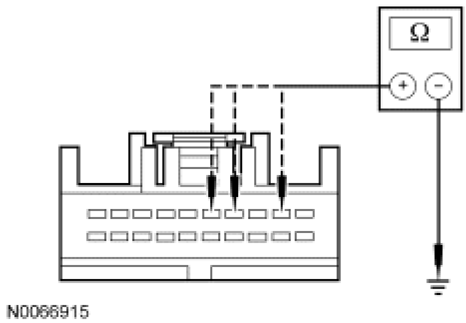

Fig. 33: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DSM:
  - C3299D-2, circuit CPM26 (WH) harness side.
  - C3299D-4, circuit CPM29 (GN) harness side.
  - C3299D-5, circuit CPM28 (BU/BN) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D30.

  NO : Go to D20.

D20 CHECK THE LH EXTERIOR MIRROR FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: LH Exterior Mirror C516

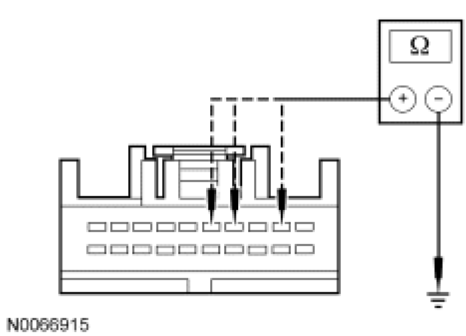

Fig. 34: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DSM:
  - C3299D-2, circuit CPM26 (WH) harness side.
  - C3299D-4, circuit CPM29 (GN) harness side.
  - C3299D-5, circuit CPM28 (BU/BN) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

  NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D21 CHECK CIRCUITS CPM31 (YE/GY), CPM33 (WH/VT) AND CPM34 (WH/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299D
- Key in ON position.

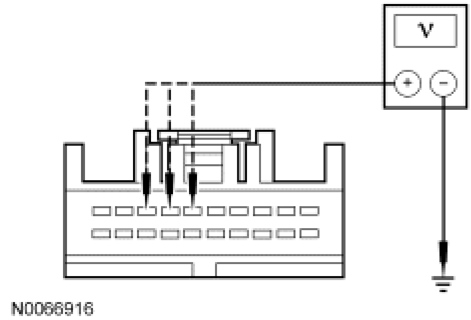

Fig. 35: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and DSM:
  - C3299D-6, circuit CPM33 (WH/VT) harness side.
  - C3299D-7, circuit CPM34 (WH/BN) harness side.
  - C3299D-8, circuit CPM31 (YE/GY) harness side.
- **Is any voltage present?**

  YES : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D22.

D22 CHECK CIRCUITS CPM31 (YE/GY), CPM33 (WH/VT) AND CPM34 (WH/BN) FOR A SHORT TO GROUND

- Key in OFF position.

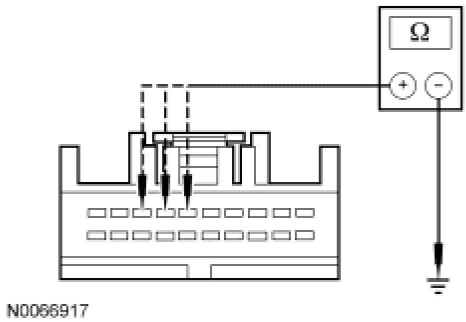

Fig. 36: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DSM:
  - C3299D-6, circuit CPM33 (WH/VT) harness side.
  - C3299D-7, circuit CPM34 (WH/BN) harness side.
  - C3299D-8, circuit CPM31 (YE/GY) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D30.

  NO : Go to D23.

D23 CHECK THE RH EXTERIOR MIRROR FOR A SHORT TO GROUND

- Disconnect: RH Exterior Mirror C622

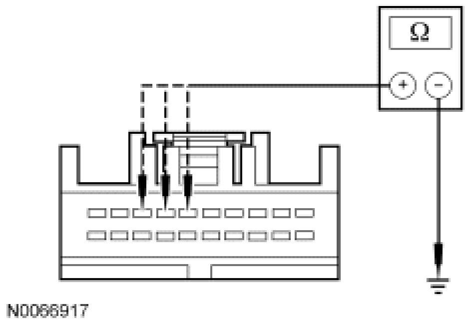

Fig. 37: Measuring Resistance
Courtesy of FORD MOTOR CO.

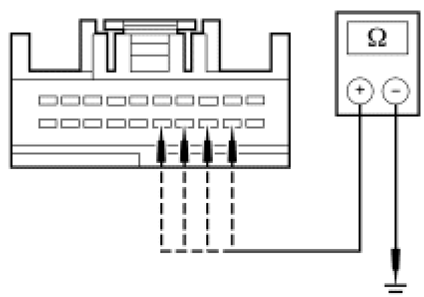
- Measure the resistance between ground and DSM:
  - C3299D-6, circuit CPM33 (WH/VT) harness side.
  - C3299D-7, circuit CPM34 (WH/BN) harness side.
  - C3299D-8, circuit CPM31 (YE/GY) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D24 CHECK THE LH AND RH EXTERIOR MIRRORS

- Key in OFF position.
- Disconnect: DSM C3299D



N0066919

Fig. 38: Measuring Resistance
Courtesy of FORD MOTOR CO.

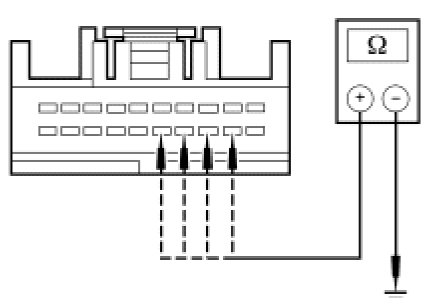
- Measure the resistance between ground and DSM:
  - **DTC B2312:** C3299D-15, circuit VPM37 (BU/OG) harness side.
  - **DTC B2316:** C3299D-14, circuit VPM38 (BN/GN) harness side.
  - **DTC B2320:** C3299D-13, circuit VPM35 (YE/BU) harness side.
  - **DTC B2324:** C3299D-12, circuit VPM36 (BN/YE) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D26.

  NO : Go to D25.

D25 CHECK CIRCUITS VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) AND VPM38 (BN/GN) FOR A SHORT TO GROUND

- Disconnect: **DTC B2312 or B2316:** RH Exterior Mirror C622
- Disconnect: **DTC B2320 or B2324:** LH Exterior Mirror C516



N0066919

Fig. 39: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DSM:
  - **DTC B2312:** C3299D-15, circuit VPM37 (BU/OG) harness side.
  - **DTC B2316:** C3299D-14, circuit VPM38 (BN/GN) harness side.
  - **DTC B2320:** C3299D-13, circuit VPM35 (YE/BU) harness side.
  - **DTC B2324:** C3299D-12, circuit VPM36 (BN/YE) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH or RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

  NO : REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

D26 CHECK THE LH OR RH MIRRORS FOR AN INTERNAL OPEN

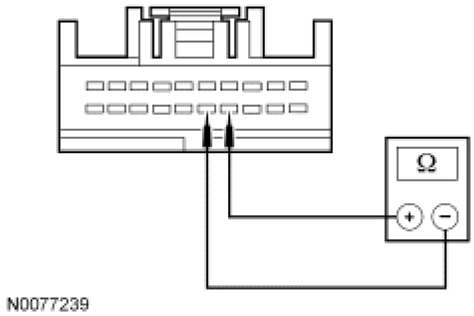


Fig. 40: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **DTC B2312 or B2316:** Measure the resistance between DSM C3299D-15, circuit VPM37 (BU/OG) harness side and DSM C3299D-14, circuit VPM38 (BN/GN) harness side.

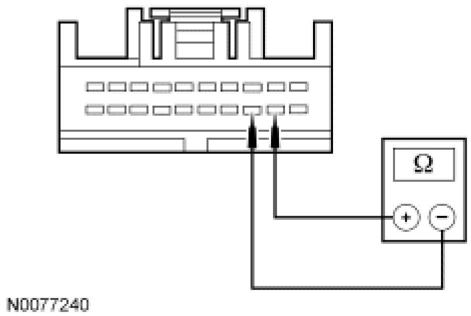

Fig. 41: Measuring Resistance

Courtesy of FORD MOTOR CO.

- **DTC B2320 or B2324:** Measure the resistance between DSM C3299D-12, circuit VPM36 (BN/YE) harness side and DSM C3299D-13, circuit VPM35 (YE/BU) harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to D30.

  NO : Go to D27.

D27 CHECK CIRCUITS VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) AND VPM38 (BN/GN) FOR AN OPEN

- Disconnect: **DTC B2312 or B2316:** RH Exterior Mirror C622
- Disconnect: **DTC B2320 or B2324:** LH Exterior Mirror C516

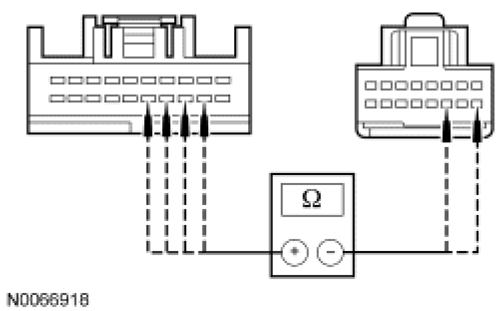

Fig. 42: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM:
  - **DTC B2312:** C3299D-15, circuit VPM37 (BU/OG) harness side and RH exterior mirror C622-11, circuit VPM37 (BU/OG) harness side.
  - **DTC B2316:** C3299D-14, circuit VPM38 (BN/GN) harness side and RH exterior mirror C622-9, circuit VPM38 (BN/GN) harness side.
  - **DTC B2320:** C3299D-13, circuit VPM35 (YE/BU) harness side and LH exterior mirror C516-11, circuit VPM35 (YE/BU) harness side.
  - **DTC B2324:** C3299D-12, circuit VPM36 (BN/YE) harness side and LH exterior mirror C516-9, circuit VPM36 (BN/YE) harness side.
- **Are the resistances less than 5 ohms?**

  YES : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH or RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

  NO : REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

D28 CHECK THE LH AND RH EXTERIOR MIRRORS

- Key in OFF position.
- Disconnect: DSM C3299D
- Key in ON position.

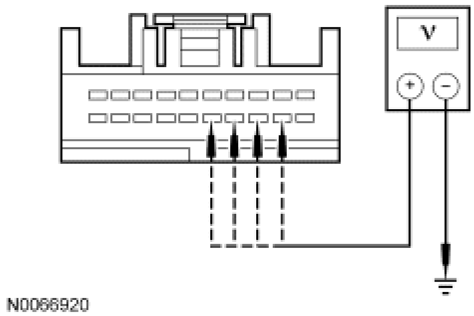

Fig. 43: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and DSM:
  - **DTC B2314:** C3299D-15, circuit VPM37 (BU/OG) harness side.
  - **DTC B2318:** C3299D-14, circuit VPM38 (BN/GN) harness side.
  - **DTC B2322:** C3299D-13, circuit VPM35 (YE/BU) harness side.
  - **DTC B2326:** C3299D-12, circuit VPM36 (BN/YE) harness side.
- **Is any voltage present?**

  YES : Go to D29.

  NO : Go to D30.

D29 CHECK CIRCUITS VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) AND VPM38 (BN/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: **DTC B2314 or B2318:** RH Exterior Mirror C622
- Disconnect: **DTC B2322 or B2326:** LH Exterior Mirror C516
- Key in ON position.

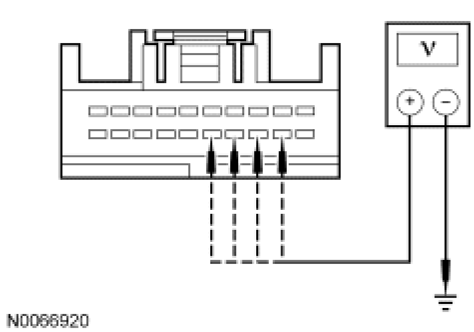

Fig. 44: Measuring Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and DSM:
  - **DTC B2314:** C3299D-15, circuit VPM37 (BU/OG) harness side.
  - **DTC B2318:** C3299D-14, circuit VPM38 (BN/GN) harness side.
  - **DTC B2322:** C3299D-13, circuit VPM35 (YE/BU) harness side.
  - **DTC B2326:** C3299D-12, circuit VPM36 (BN/YE) harness side.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

  NO : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH or RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

D30 CHECK THE DSM FOR CORRECT OPERATION

- Disconnect all DSM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all DSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Heated Exterior Mirror is Inoperative - Both Heated Exterior Mirrors

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Heated Windows for schematic and connector information.

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Normal Operation

When the rear window defrost switch is depressed on the HVAC module, the HVAC module grounds circuit CH122 (WH/OG) and the heated mirror relay closes. When the heated mirror relay is closed, power is supplied to the LH and RH exterior mirrors through circuit CRD13 (GN/VT). The LH exterior mirror receives ground through circuit GD133 (BK). The RH exterior mirror receives ground through circuit GD140 (BK/GN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Heated mirror relay
- HVAC module

PINPOINT TEST E: THE HEATED EXTERIOR MIRROR IS INOPERATIVE - BOTH HEATED EXTERIOR MIRRORS

E1 CHECK THE POWER TO THE HEATED MIRROR RELAY

- Key in OFF position.
- Disconnect: Heated Mirror Relay
- Key in ON position.

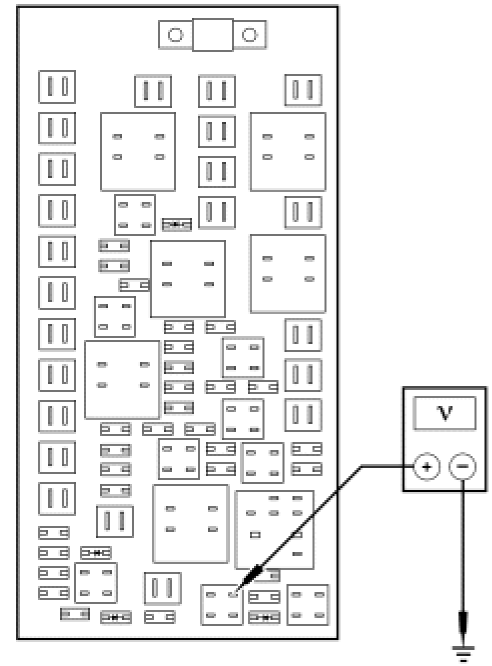

Fig. 45: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated mirror relay pin 5, harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to E2.

  NO : VERIFY that battery junction box (BJB) fuses 28 (15A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

E2 CHECK THE HVAC MODULE OUTPUT

- With the engine running, depress the rear window defrost switch to the ON position.

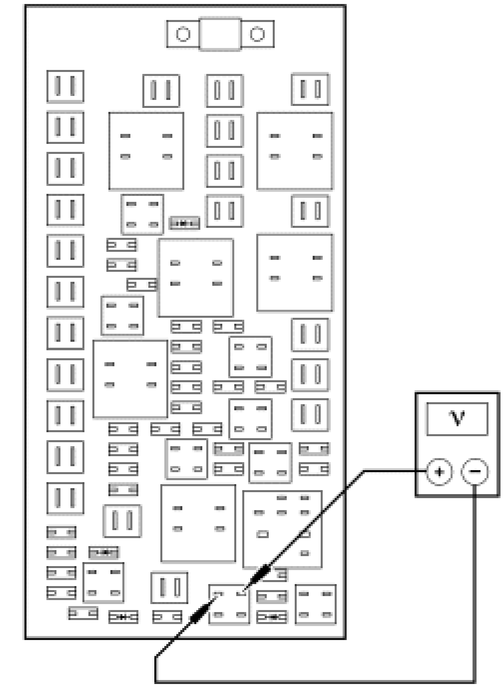

Fig. 46: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated mirror relay pin 5 harness side and heated mirror relay pin 2 harness side.
- **Is the voltage greater than 10 volts?**

  YES : Go to E3.

  NO : Go to E4.

E3 CHECK THE HEATED MIRROR RELAY

- Carry out the Heated Mirror Relay Component Test. Refer to COMPONENT TESTING.
- **Did the heated mirror relay pass the component test?**

  YES : Go to E5.

  NO : INSTALL a new heated mirror relay. TEST the system for normal operation.

E4 CHECK CIRCUIT CH122 (WH/OG) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module C228B

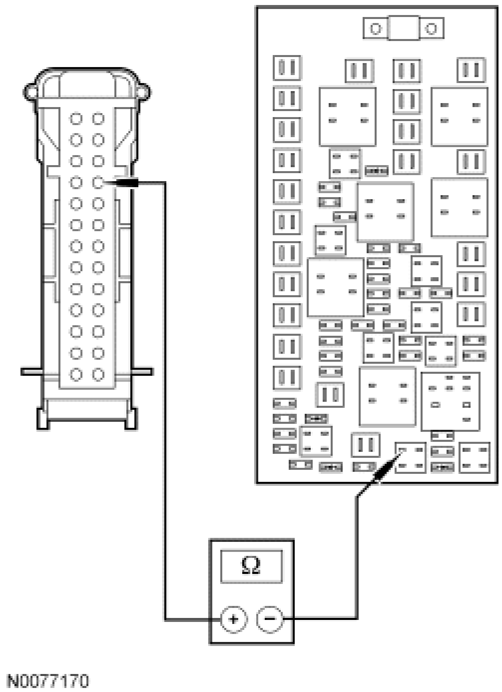

Fig. 47: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module C228B-23, circuit CH122 (WH/OG) and heated mirror relay pin 2 harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to E6.

  NO : REPAIR the circuit. TEST the system for normal operation.

E5 CHECK CIRCUIT CRD13 (GN/VT) FOR AN OPEN

- Key in OFF position.
- Disconnect: LH Exterior Mirror C516

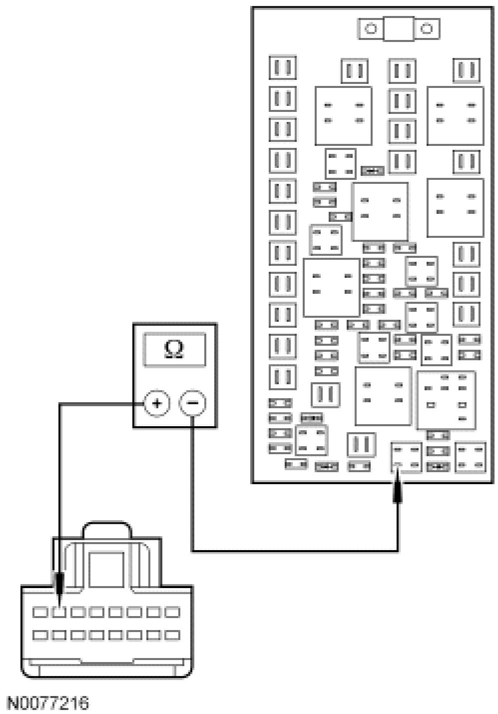

Fig. 48: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH exterior mirror C521-7, circuit CRD13 (GN/VT) harness side and heated mirror relay pin 3 harness side.
- **Is the resistance less than 5 ohms?**

  YES : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

E6 CHECK THE HVAC MODULE FOR CORRECT OPERATION

- Disconnect all HVAC module connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all HVAC module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: The Heated Exterior Mirror is Inoperative - LH Heated Exterior Mirror

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Heated Window for schematic and connector information.

Normal Operation

Under normal operation, when the rear window defrost switch is depressed on the HVAC module, the LH exterior mirror receives power through circuit CRD13 (GN/VT). The LH exterior mirror receives ground through circuit GD133 (BK).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH exterior mirror glass
- LH exterior mirror

PINPOINT TEST F: THE HEATED EXTERIOR MIRROR IS INOPERATIVE - LH HEATED EXTERIOR MIRROR

F1 CHECK CIRCUIT CRD13 (GN/VT) FOR VOLTAGE

- Key in OFF position.
- Disconnect: LH Exterior Mirror C516
- Key in ON position.
- With the engine running, depress the rear window defrost switch to the ON position.

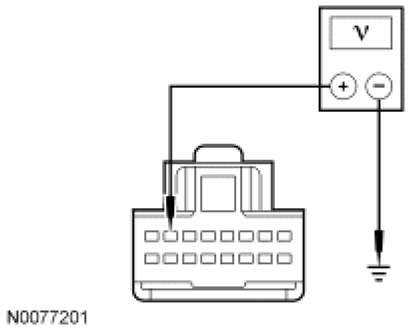

Fig. 49: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH exterior mirror C516-7, circuit CRD13 (GN/VT) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F2.

  NO : REPAIR the circuit. TEST the system for normal operation.

F2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.

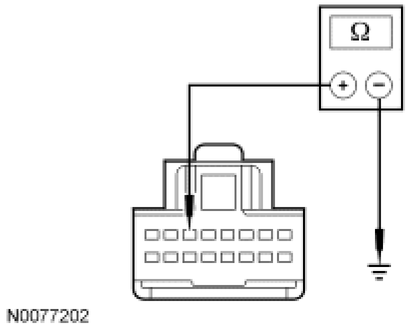

Fig. 50: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH exterior mirror C516-6, circuit GD133 (BK) harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror glass. REFER to **Exterior Mirror Glass**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test G: The Heated Exterior Mirror is Inoperative - RH Heated Exterior Mirror

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Heated Window for schematic and connector information.

Normal Operation

Under normal operation, when the rear window defrost switch is depressed on the HVAC module, the RH exterior mirror receives power through circuit CRD13 (GN/VT). The RH exterior mirror receives ground through circuit GD140 (BK/GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RH exterior mirror glass
- RH exterior mirror

PINPOINT TEST G: THE HEATED EXTERIOR MIRROR IS INOPERATIVE - RH HEATED EXTERIOR MIRROR

G1 CHECK CIRCUIT CRD13 (GN/VT) FOR VOLTAGE

- Key in OFF position.
- Disconnect: RH Exterior Mirror C622
- Key in ON position.
- With the engine running, depress the rear window defrost switch to the ON position.

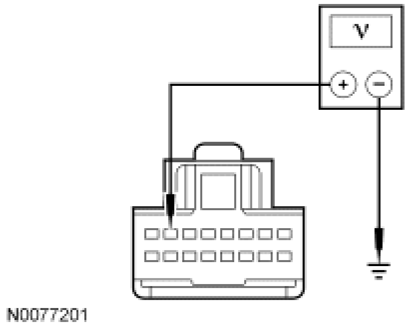

Fig. 51: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between RH exterior mirror C622-7, circuit CRD13 (GN/VT) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to G2.

  NO : REPAIR the circuit. TEST the system for normal operation.

G2 CHECK CIRCUIT GD140 (BK/GN) FOR AN OPEN

- Key in OFF position.

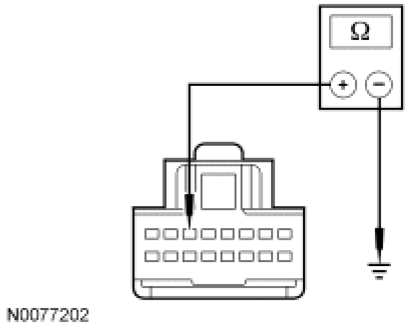

Fig. 52: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH exterior mirror C622-6, circuit GD140 (BK/GN) harness side and ground.

- **Is the resistance less than 5 ohms?**

  YES : CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror glass. REFER to **Exterior Mirror Glass**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test H: The Auto-Dimming Mirror Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Mirrors for schematic and connector information.

Normal Operation

The interior auto-dimming mirror receives power from circuit CBP31 (BU/OG) and ground from circuit GD133 (BK). When the vehicle is placed in REVERSE, voltage is sent to circuit CLS10 (GN/BN) and the interior auto-dimming mirror will turn the dimming feature off. There are 2 photoelectric sensors: one in the front of the interior rear view mirror and one mounted on the glass side of the mirror. If the sensors are blocked, the interior auto-dimming mirror might not work correctly. Always verify both sensors are not physically blocked before attempting to diagnose auto-dimming mirror concerns.

If equipped with a LH exterior auto-dimming mirror, and the auto-dimming feature is activated, voltage is sent from the interior mirror to the LH exterior mirror though circuit LRD12 (BU/GY). Ground for the LH exterior mirror is provided by the interior mirror through circuit RRD12 (BN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Interior auto-dimming mirror
- LH exterior mirror glass
- LH exterior mirror

PINPOINT TEST H: THE AUTO-DIMMING MIRROR DOES NOT OPERATE CORRECTLY

NOTE: **If the transmission range (TR) sensor is malfunctioning and the backup lamps are on all the time or do not turn on, the auto-dimming interior mirror will not darken or return to normal view.**

H1 CHECK THE OPERATION OF THE BACKUP LAMPS

- Key in ON position.
- Move the selector lever through the entire range.
- **Do the backup lamps illuminate only in REVERSE?**

YES : If the LH exterior mirror only is always dim, REPAIR circuit LRD12 (BU/GY) for a short to voltage. TEST the system for normal operation.

If the LH exterior mirror only does not dim correctly, go to H10 .

If the interior mirror only does not dim correctly and the LH exterior mirror does dim correctly, INSTALL a new interior auto-dimming mirror, REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

If the LH exterior mirror and interior mirror (if equipped) does not dim correctly, go to H2 .

NO : REFER to **EXTERIOR LIGHTING** article to diagnose backup lamps.

H2 VERIFY THAT THE FORWARD AND REARWARD FACING SENSORS ARE NOT BLOCKED

- Visually verify that the forward and rearward facing sensors are not blocked. Sources of blockage can include:
  - stickers, window decals or tags.
  - fold-down screens for TVs or DVD players.
  - non-OEM window tinting.
- **Were either of the sensors blocked?**

  YES : If possible, REMOVE the blockage. TEST the system for normal operation. If the blockage cannot be removed, REVIEW the operation of the auto-dimming interior mirror with the customer.

  NO : Go to H3.

H3 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - DAYLIGHT CONDITIONS

- Key in ON position.

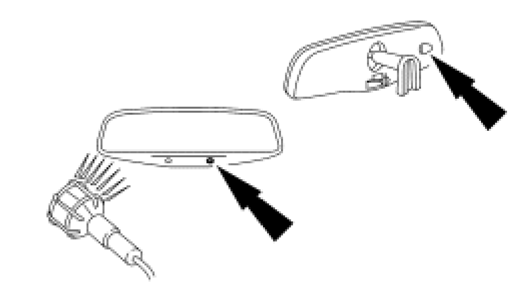

Fig. 53: Checking Operation Of Interior Auto-Dimming Mirror - Daylight Conditions
Courtesy of FORD MOTOR CO.

- Use a bright lamp to simultaneously illuminate the forward facing sensor and the rearward facing sensor. The mirror should adjust to a high reflectance mode (mirror will be clear).
- **Does the mirror adjust to the high reflectance (clear) mode?**

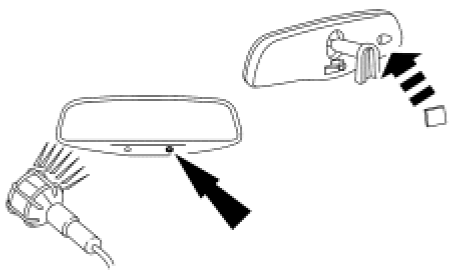
  YES : Go to H4.

  NO : Go to H7.

H4 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHT

TIME CONDITIONS WITH GLARE

- Key in ON position.



N0057546

Fig. 54: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions With Glare
Courtesy of FORD MOTOR CO.

- Simulate night time conditions with glare:

NOTE: Covering the sensor with a finger or hand is not adequate.

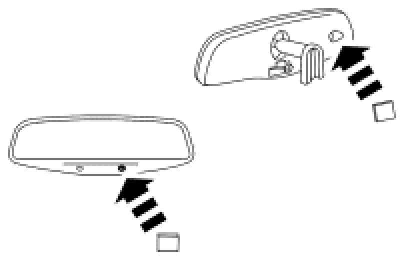
  - cover the forward facing sensor with black electrical tape or other dark material.
  - illuminate the rearward facing sensor. The mirror should darken to a lower reflectance mode.
- **Did the mirror darken to a lower reflectance (darker) mode?**

  YES : Go to H5.

  NO : Go to H7.

H5 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHT TIME CONDITIONS WITHOUT GLARE

- Key in ON position.



N0057547

Fig. 55: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions Without Glare
Courtesy of FORD MOTOR CO.

- Simulate night time conditions without glare:

NOTE: Covering the sensor with a finger or hand is not adequate.

- cover the forward facing sensor with black electrical tape or other dark material.
- cover the rearward facing sensor. The mirror should adjust to the high reflectance mode.

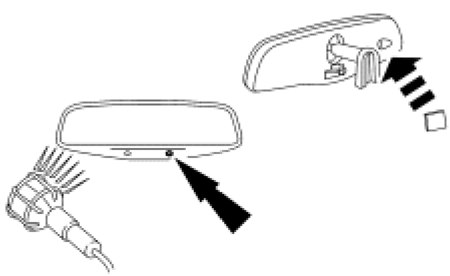
- **Did the mirror adjust to the high reflectance (clear) mode?**

  YES : Go to H6.

  NO : Go to H7.

H6 CHECK THE OPERATION OF THE AUTO-DIMMING MIRROR - NIGHT TIME CONDITIONS WITH THE VEHICLE IN REVERSE

- Key in ON position.



N0057546

Fig. 56: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions With Glare
Courtesy of FORD MOTOR CO.

- Simulate night time conditions with glare:

NOTE: Covering the sensor with a finger or hand is not adequate.

- cover the forward facing sensor with black electrical tape or other dark material.
- illuminate the rearward facing sensor.

- Select REVERSE.
- **Did the mirror adjust to a high reflectance (clear) mode?**

  YES : The system is operating normally at this time. REVIEW operation of the interior auto-dimming mirror feature with the customer.

  NO : Go to H7.

H7 CHECK CIRCUIT CBP41 (BU) FOR VOLTAGE

- Disconnect: Interior Auto-Dimming Mirror C911 (without microphone) or C9012 (with microphone)

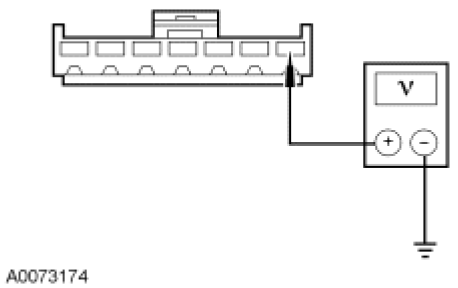


Fig. 57: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- **Without microphone:** Measure the voltage between interior auto-dimming mirror C911-1, circuit CBP31 (BU/OG) harness side and ground.

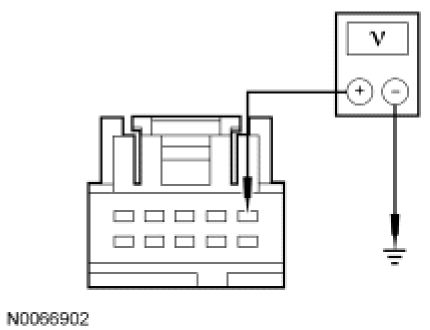

Fig. 58: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **With microphone:** Measure the voltage between interior auto-dimming mirror C9012-1, circuit CBP31 (BU/OG) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to H8.

  NO : VERIFY that smart junction box (SJB) fuse 31 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

H8 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.

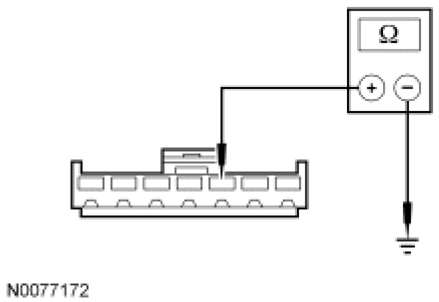

Fig. 59: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **Without microphone:** Measure the resistance between interior auto-dimming mirror C911-3, circuit GD133 (BK) harness side and ground.

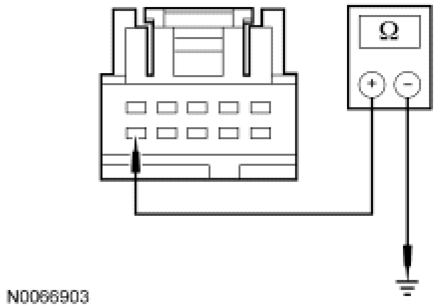

Fig. 60: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **With microphone:** Measure the resistance between interior auto-dimming mirror C9012-10, circuit GD133 (BK) harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to H9.

  NO : REPAIR the circuit. TEST the system for normal operation.

H9 CHECK CIRCUIT CLS10 (GN/BN) FOR VOLTAGE

- Key in ON position.
- Select REVERSE.

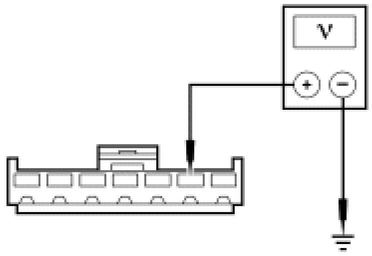

Fig. 61: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **Without microphone:** Measure the voltage between interior auto-dimming mirror C911-2, circuit CLS10 (GN/BN) harness side and ground.

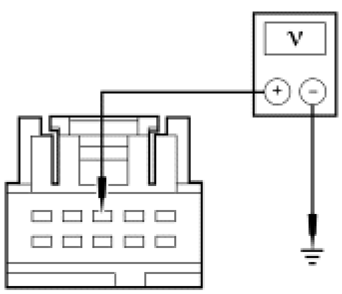

Fig. 62: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **With microphone:** Measure the voltage between interior auto-dimming mirror C9012-3, circuit CLS10 (GN/BN) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new interior auto-dimming mirror. REFER to **Interior Rear View Mirror**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

H10 CHECK THE INTERIOR MIRROR OUTPUT TO THE LH EXTERIOR MIRROR

- Key in OFF position.
- Disconnect: LH Exterior Mirror C516
- Key in ON position.

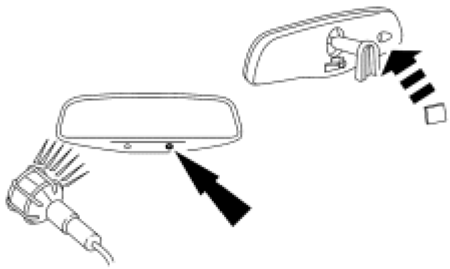

Fig. 63: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions With Glare
Courtesy of FORD MOTOR CO.

- Simulate nighttime conditions with glare:

NOTE: Covering the sensor with a finger or hand is not adequate.

  - cover the forward facing sensor with black electrical tape or other dark material.
  - illuminate the rearward facing sensor. The mirror should darken to a lower reflectance mode.

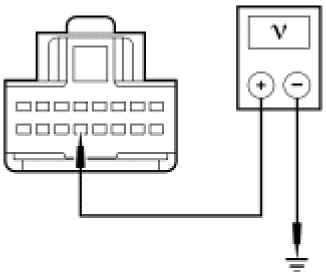

Fig. 64: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH exterior mirror C516-13, circuit LRD12 (BU/GY) and ground.
- **Is the voltage greater than 1 volt?**

  YES : Go to H11.

  NO : Go to H15.

H11 CHECK CIRCUIT RRD12 (BN) FOR A SHORT TO VOLTAGE

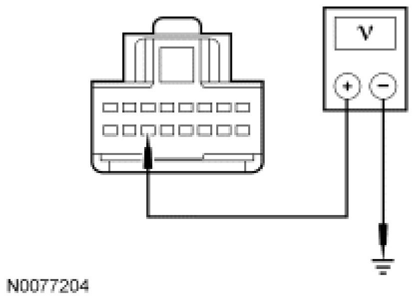

Fig. 65: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH exterior mirror C516-14, circuit RRD12 (BN) harness side and ground.
- **Is any voltage present?**

  YES : Go to H12.

  NO : Go to H13.

H12 ISOLATE THE SHORT TO VOLTAGE ON CIRCUIT RRD12 (BN)

- Key in OFF position.
- Disconnect: Interior Auto-Dimming Mirror C911 (without microphone) or C9012 (with microphone)
- Key in ON position.

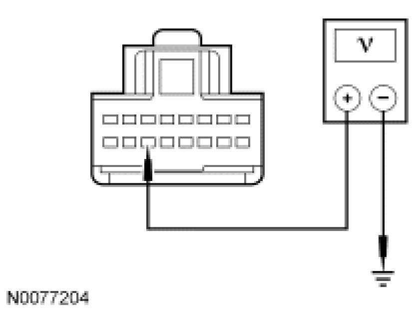

Fig. 66: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH exterior mirror C516-14, circuit RRD12 (BN) harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new interior auto-dimming mirror. REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

H13 CHECK CIRCUIT RRD12 (BN) FOR GROUND

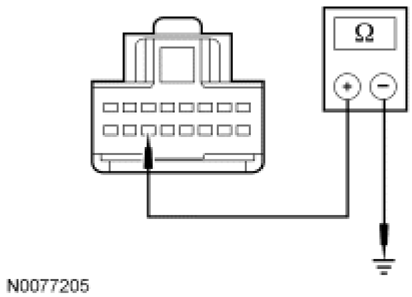

Fig. 67: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH exterior mirror C516-14, circuit RRD12 (BN) harness side and ground.
- **Is the resistance less than 15 ohms?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for shorted or open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH exterior mirror glass. REFER to **Exterior Mirror Glass**. TEST the system for normal operation.

  NO : Go to H14.

H14 CHECK CIRCUIT RRD12 (BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Interior Auto-Dimming Mirror C911 (without microphone) or C9012 (with microphone)

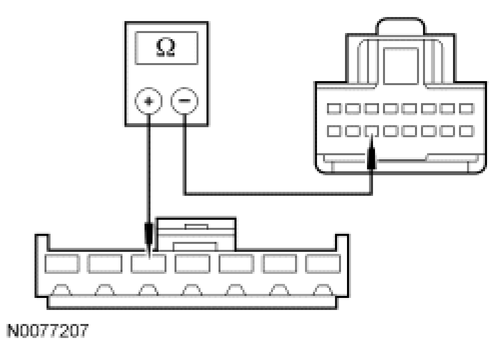

Fig. 68: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **Without microphone:** Measure the resistance between interior auto-dimming mirror C911-5, circuit RRD12 (BN) harness side and LH exterior mirror C516-14, circuit RRD12 (BN) harness side.

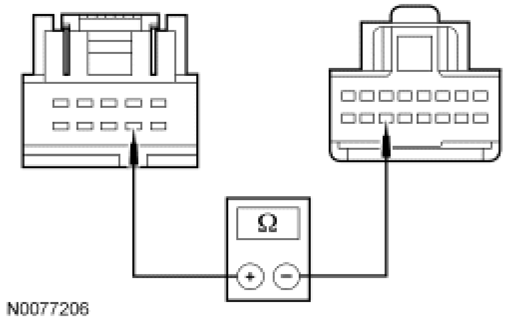

Fig. 69: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **With microphone:** Measure the resistance between interior auto-dimming mirror C9012-7, circuit RRD12 (BN) harness side and LH exterior mirror C516-14, circuit RRD12 (BN) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL new interior auto-dimming mirror. REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

H15 CHECK CIRCUIT LRD12 (BU/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Interior Auto-Dimming Mirror C911 (without microphone) or C9012 (with microphone)

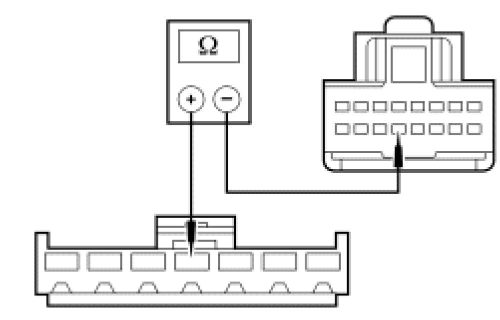

Fig. 70: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **Without microphone:** Measure the resistance between interior auto-dimming mirror C911-4, circuit LRD12 (BU/GY) harness side and LH exterior mirror C516-13, circuit LRD12 (BU/GY) harness side.

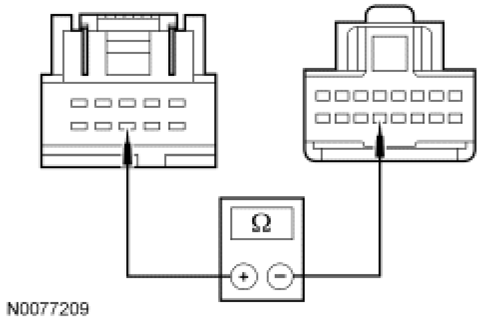

Fig. 71: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **With microphone:** Measure the resistance between interior auto-dimming mirror C9012-8, circuit LRD12 (BU/GY) harness side and LH exterior mirror C516-13, circuit LRD12 (BU/GY) harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H16.

  NO : REPAIR the circuit. TEST the system for normal operation.

H16 CHECK CIRCUIT LRD12 (BU/GY) FOR A SHORT TO GROUND

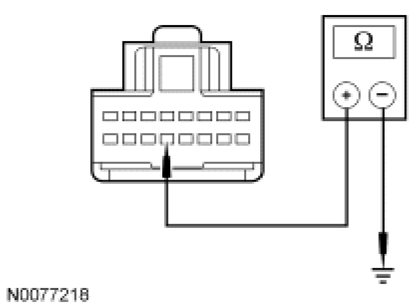

Fig. 72: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH exterior mirror C516-13, circuit LRD12 (BU/GY) harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL new interior auto-dimming mirror. REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

REMOVAL AND INSTALLATION

EXTERIOR MIRRORS - EXPLODED VIEW

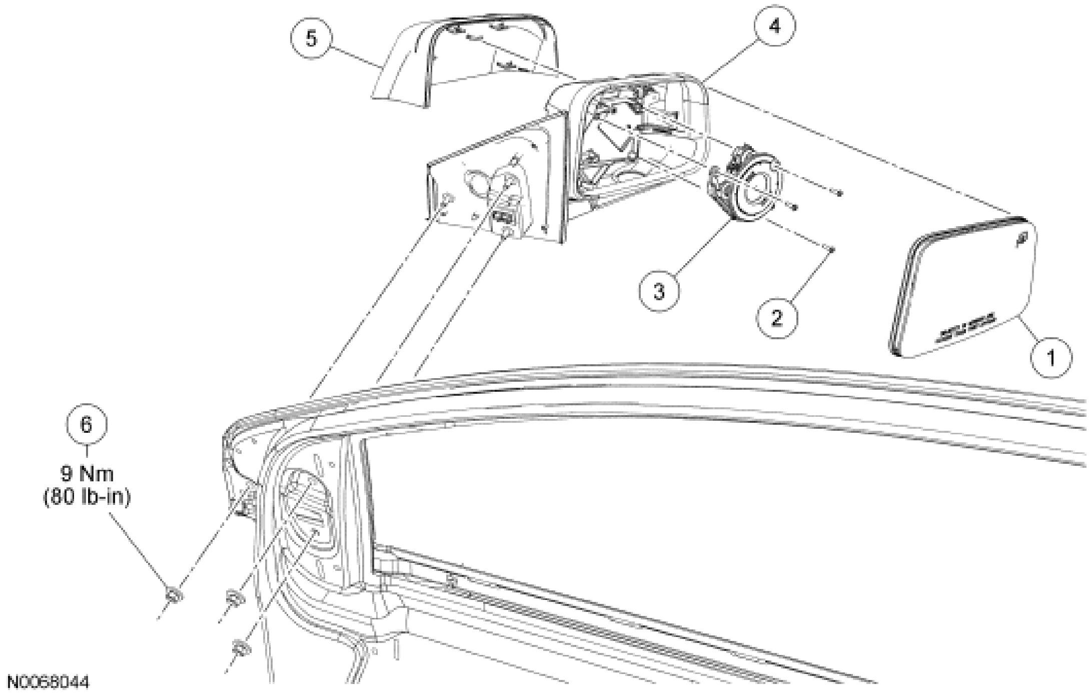

Fig. 73: Exploded View Of Exterior Mirrors With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	17K707	Exterior rear view mirror glass
2	-	Exterior rear view mirror motor mounting screw (3 required)
3	17D696	Exterior rear view mirror motor
4	17682 RH/ 17683 LH	Exterior rear view mirror housing
5	17D743 LH/ 17D742 RH	Exterior rear view mirror cover
6	N621906	Exterior rear view mirror mounting nut (3 required)

1. For additional information, refer to the appropriate procedures in this service information.

EXTERIOR MIRROR

REMOVAL AND INSTALLATION

1. Remove the front door sail panel.

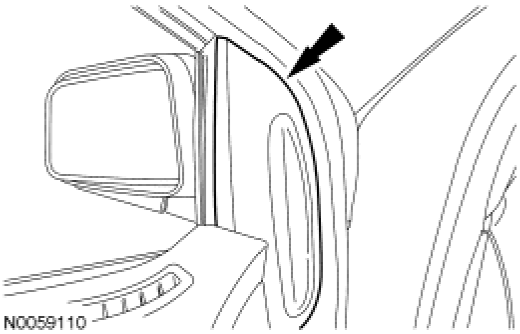

Fig. 74: Identifying Front Door Sail Panel
Courtesy of FORD MOTOR CO.

2. Disconnect the exterior mirror electrical connector.

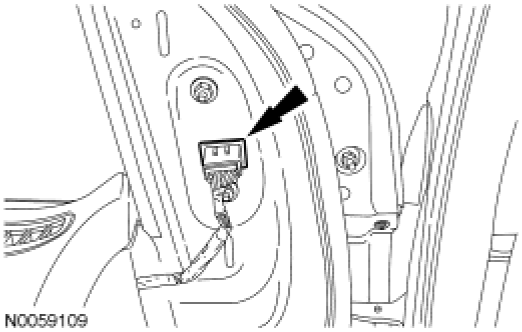

Fig. 75: Identifying Exterior Mirror Electrical Connector
Courtesy of FORD MOTOR CO.

3. Remove the 3 nuts and the exterior mirror.
   - To install, tighten to 9 Nm (80 lb-in).

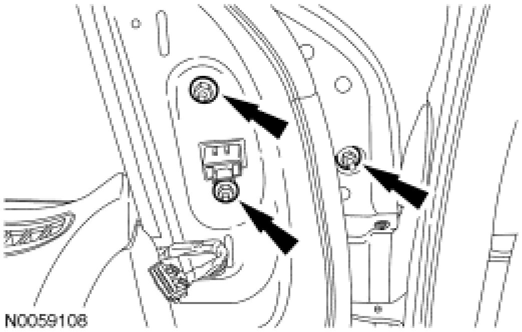

Fig. 76: Identifying Bolts & Exterior Mirror
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

EXTERIOR MIRROR GLASS

REMOVAL

1. Position the exterior mirror glass in a downward position to obtain a gap at the top edge of the mirror.

> **WARNING:** **Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

2. Disengage the exterior mirror glass.
   - Insert a flat-blade screwdriver between the exterior mirror glass retaining tabs and the exterior mirror glass backing plate and rotate to separate the retaining tabs from the exterior mirror glass backing plate.
   - Continue to insert and rotate the screwdriver until the remaining exterior mirror glass retaining tabs separate from the exterior mirror glass backing plate.
   - Carefully pull the top edge of the exterior mirror glass away from the exterior mirror housing.

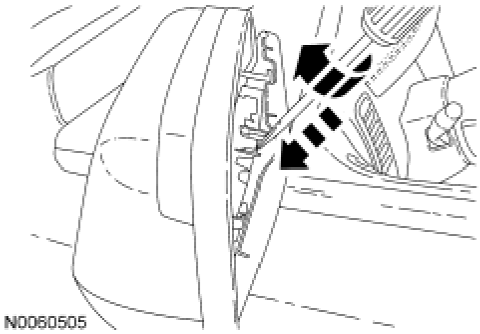

Fig. 77: Pulling Top Edge Of Glass Away From Exterior Mirror Housing
Courtesy of FORD MOTOR CO.

3. If equipped, disconnect the heated mirror and auto-dimming electrical connectors and remove the exterior mirror glass.

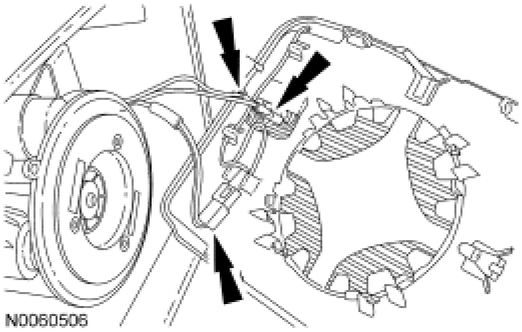

Fig. 78: Identifying Heated Mirror & Auto-Dimming Electrical Connectors
Courtesy of FORD MOTOR CO.

INSTALLATION

1. If equipped, connect the heated mirror and auto-dimming electrical connectors.

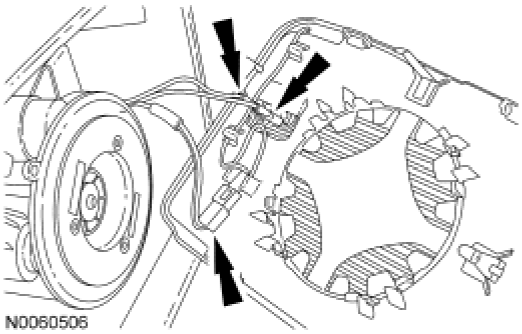

Fig. 79: Identifying Heated Mirror & Auto-Dimming Electrical Connectors
Courtesy of FORD MOTOR CO.

WARNING: **Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

2. Position the exterior mirror glass onto the exterior mirror motor.

NOTE: An audible click will be heard during installation.

3. Firmly press the exterior mirror glass until it snaps onto the exterior mirror motor.
4. Rotate the exterior mirror glass in all directions after the installation to make sure that all of the exterior mirror glass retaining clips are completely fastened.

EXTERIOR MIRROR MOTOR

1. Remove the exterior rear view mirror glass. For additional information, refer to **Exterior Mirror Glass**.
2. Remove the 3 exterior rear view mirror motor screws.

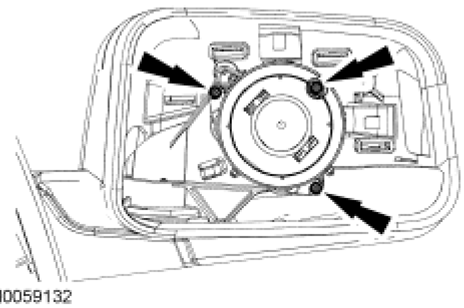

Fig. 80: Identifying Exterior Rear View Mirror Motor Screws

Courtesy of FORD MOTOR CO.

3. Disconnect the exterior rear view mirror motor electrical connector.
4. Remove the exterior rear view mirror motor.
5. To install, reverse the removal procedure.

INTERIOR REAR VIEW MIRROR

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Mirror Remover	501-D118
 ST1793-A	Installer, Rear View Mirror	501-025 (T94P-17700-AH)

REMOVAL

NOTE: Twisting the interior rear view mirror base from right to left may cause a stress fracture to the windshield.

1. Remove the wire cover (if equipped).
2. Remove the compass by pulling down on the compass rearmost edge (if equipped).
3. Insert the special tool between the mirror mount and windshield bracket from the bottom.

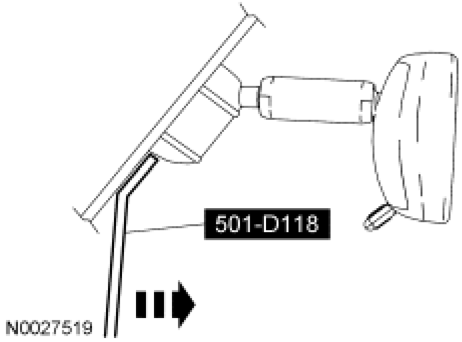

Fig. 81: Inserting Special Tool
Courtesy of FORD MOTOR CO.

4. Release the mirror mount from windshield bracket by pulling the tool away from the windshield.

INSTALLATION

1. Slide the mirror mount over the windshield bracket from the top and adjust the mirror to the upward position.

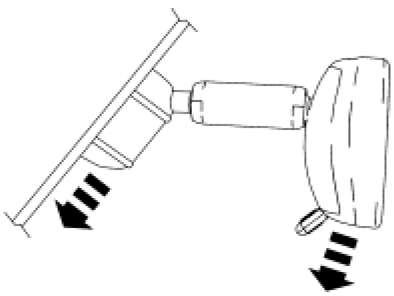

Fig. 82: Installing Mirror Mount Over The Windshield Bracket
Courtesy of FORD MOTOR CO.

2. Using the special tool, press the mirror assembly downward along the windshield until the mount is seated on the windshield bracket.

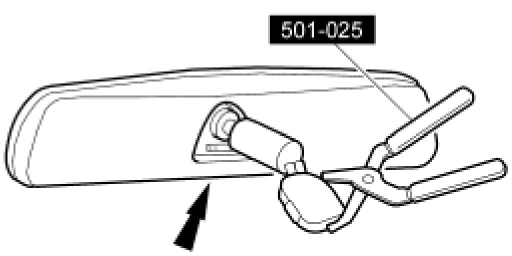

Fig. 83: Locating Mirror Assembly
Courtesy of FORD MOTOR CO.

3. Install compass and wire cover (if equipped).

AUTO-DIMMING INTERIOR MIRROR

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Mirror Remover	501-D118

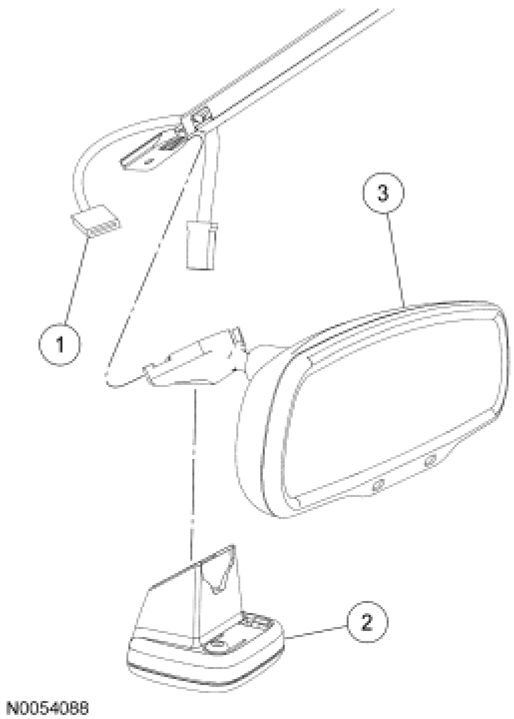

Fig. 84: Exploded View Of Auto-Dimming Interior Mirror
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Interior auto-dimming mirror electrical connector (part of 14A005)
2	19A548	Compass module
3	17700	Interior auto-dimming mirror

REMOVAL

1. Remove the wire cover.
2. Disconnect the electrical connector.

NOTE: If equipped, the compass module does not need to be removed prior to this step.

NOTE: High level mirror shown, others similar.

3. Insert the special tool between the mirror mount and windshield bracket from the top.

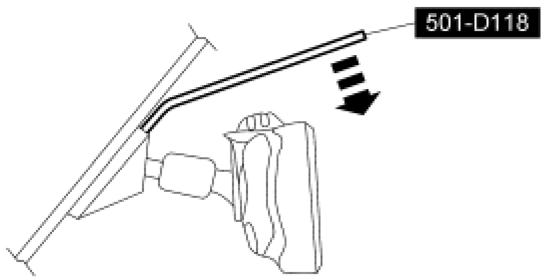

Fig. 85: Inserting Special Tool Between Mirror Mount & Windshield Bracket
Courtesy of FORD MOTOR CO.

4. If equipped, separate the compass module from the mirror assembly by disengaging the compass module locking tabs.

NOTE: Twisting the interior rear view mirror base from right to left may cause a stress fracture to the windshield.

5. Release the mirror mount from the windshield bracket by pulling the tool and mirror down and away from the windshield.

INSTALLATION

1. Slide the mirror mount over the windshield bracket from the top and adjust the mirror to the upward position.

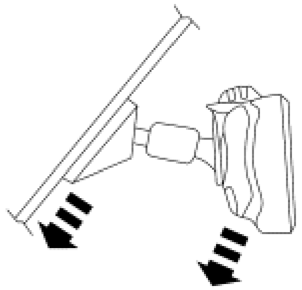

Fig. 86: Sliding Mirror Mount Over Windshield Bracket
Courtesy of FORD MOTOR CO.

2. Quickly press the mirror assembly downward along the windshield until a click is felt. The click indicates the base is engaged to the windshield bracket.
3. Connect the electrical connector and wire cover.
4. If equipped, install the compass module. Check the compass zone and calibration. For additional information, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

EXTERIOR MIRROR COVER

1. Remove the exterior mirror glass. For additional information, refer to **Exterior Mirror Glass**.
2. Depress the 4 tabs and remove the exterior mirror cover.

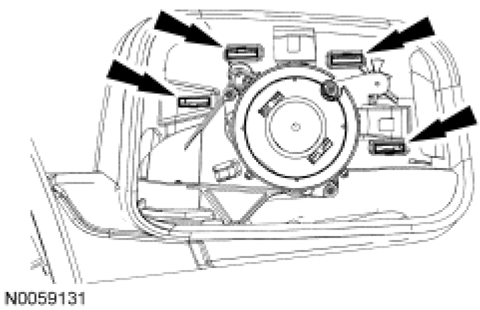

Fig. 87: Locating Tabs On Exterior Mirror Cover
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

EXTERIOR MIRROR CONTROL SWITCH

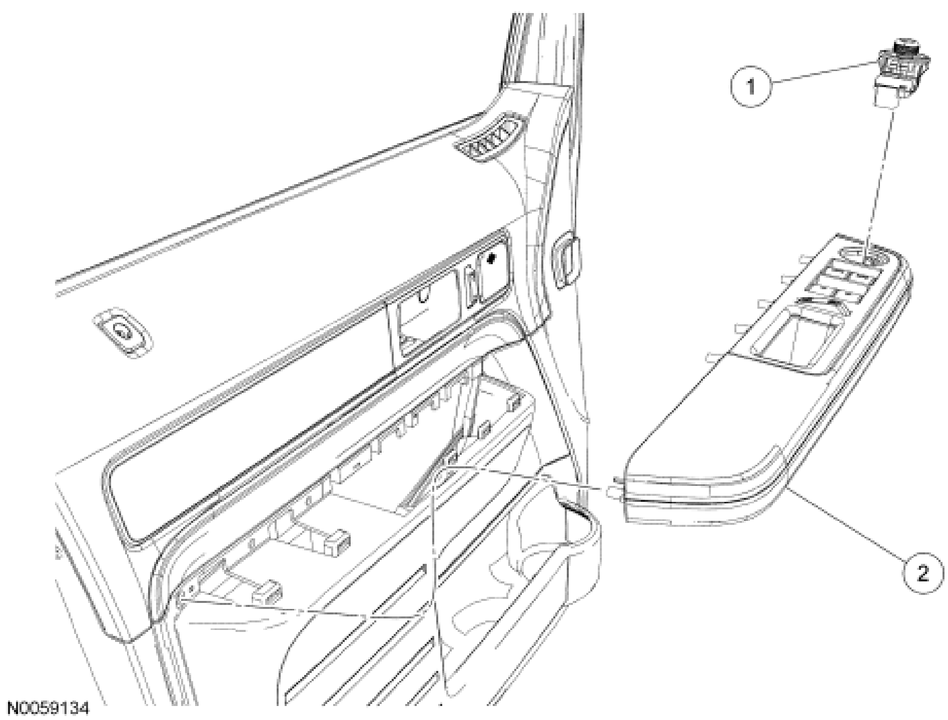

Fig. 88: Exploded View Of Exterior Mirror Control Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description

1	17B676	Exterior rear view mirror control switch
2	-	Front door control switch bezel

REMOVAL AND INSTALLATION

1. Remove the front door control switch bezel.
2. Remove the exterior mirror control switch.
    - Depress the 2 locking tabs.
    - Disconnect the electrical connector.

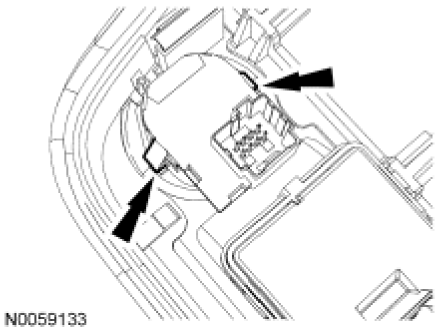

Fig. 89: Locating Locking Tabs On Electrical Connector
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Parking Aid - Edge & MKX

SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Azimuth system check object position 1 (P1) and position 5 (P5), distance from sensor	30 cm (12 in) rear
Azimuth system check object position 2 (P2) and position 4 (P4), distance from sensor	91 cm (36 in) rear
Azimuth system check object position 3 (P3), distance from sensor	152 cm (60 in) rear

DESCRIPTION AND OPERATION

PARKING AID

The parking aid system calculates the distance to an object around the rear of the vehicle by the use of 4 ultrasonic sensors. The parking aid system detects objects behind the vehicle when the REVERSE (R) gear is selected.

The parking aid system consists of:

- Parking aid sensors (located in the rear bumper cover)
- Parking aid module (PAM) and parking aid speaker (both located behind the LR quarter trim panel)
- Parking aid disable feature (integral to the instrument cluster (IC) message center)

DIAGNOSTIC TESTS

PARKING AID

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with	

 ST2834-A	appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

NOTE: Both the medium speed controller area network (MS-CAN) and the high speed controller area network (HS-CAN) are used for intermodule communication. A gateway message is transferred from one network to another network through the instrument cluster. Refer to MODULE COMMUNICATIONS NETWORK article.

The parking aid sensors detect objects approximately 1.6 m (5.3 ft) from the rear of the vehicle, 50 cm (1.6 ft) from the rear side of the vehicle, and 16 cm (6 in) above the ground. The parking aid module (PAM) calculates the distance to an object within the 170 degree semicircular azimuth area around the rear of the vehicle. A 750 Hz variable warning tone is generated from a parking aid speaker which is attached to the PAM. The parking aid speaker increases the warning tone rate as the vehicle gets nears an obstacle. When an object is detected within 25 cm (10 in) of the sensors, the warning tone becomes continuous.

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The parking aid system is disabled if a fault is detected in 1 of the 4 sensors, the parking aid speaker or the PAM. This condition is indicated by the parking aid disabled warning in the message center. The PAM is on the MS-CAN and can be diagnosed with a scan tool.

The PAM communicates with the scan tool, the SJB, the audio control module (ACM) and the instrument cluster (IC) or the MS-CAN. The following chart describes network messages used by the PAM:

PAM NETWORK COMMUNICATION MESSAGES

Broadcast Message	Originating Module	Network Type	Receiving Module
Ignition switch position	SJB	MS-CAN	PAM
Parking aid disable switch status	IC	MS-CAN	PAM
Parking aid system status	PAM	MS-CAN	IC
Transmission selector (PRNDL) range	PCM	HS-CAN	IC

Transmission selector (PRNDL) range (gateway)	IC	MS-CAN	PAM
Vehicle speed	PCM	HS-CAN	IC
Vehicle speed (gateway)	IC	MS-CAN	PAM
Parking aid audio volume cutback request	PAM	MS-CAN	ACM

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical
• Smart junction box (SJB) fuse 35 (10A) • Wiring, terminals or connectors • Parking aid module (PAM) • Parking aid sensors • Parking aid speaker

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
- If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PAM.

NOTE: Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes).

9. If the DTCs retrieved are related to the concern, go to **PARKING AID MODULE (PAM) DTC CHART** . For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

PARAMETER IDENTIFICATION (PID) CHART

PID	Description
LRI_DIST	Left rear inner sensor distance to object
LRO_DIST	Left rear outer sensor distance to object
RRI_DIST	Right rear inner sensor distance to object
RRO_DIST	Right rear outer sensor distance to object
LRI_ATTEN	Left rear inner sensor attenuation
LRO_ATTEN	Left rear outer sensor attenuation
RRI_ATTEN	Right rear inner sensor attenuation
RRO_ATTEN	Right rear outer sensor attenuation
TRANSGR	Transmission gear position

DTC Charts

PARKING AID MODULE (PAM) DTC CHART

DTC	Description	Action
B1299	Power Supply Sensor Circuit Short to Ground	Go to **Pinpoint Test E** .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the PAM self-test. If DTC B1342 is retrieved again, INSTALL a new PAM. REFER to **Parking Aid Module**. CLEAR all DTCs. REPEAT the self-test.
B2477	Module Configuration Failure	The PAM is not configurable. CLEAR the DTCs. REPEAT the PAM self-test. If DTC B2477 is retrieved again, INSTALL a new PAM. REFER to **Parking Aid Module**. CLEAR all DTCs. REPEAT the self-test.
C1699	Left Rear Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .

C1700	Left Rear Sensor Circuit Failure or Blockage	Go to **Pinpoint Test B** .
C1701	Left Rear Sensor Circuit Fault	Go to **Pinpoint Test D** .
C1702	Right Rear Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .
C1703	Right Rear Sensor Circuit Failure or Blockage	Go to **Pinpoint Test B** .
C1704	Right Rear Sensor Circuit Fault	Go to **Pinpoint Test D** .
C1705	Left Rear Center Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .
C1706	Left Rear Center Sensor Circuit Failure	Go to **Pinpoint Test B** .
C1707	Left Rear Center Sensor Circuit Fault	Go to **Pinpoint Test D** .
C1708	Right Rear Center Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .
C1709	Right Rear Center Sensor Circuit Failure	Go to **Pinpoint Test B** .
C1710	Right Rear Center Sensor Circuit Fault	Go to **Pinpoint TestD** .
C1742	Rear Sounder Circuit Failure	Go to **Pinpoint Test F** .
C1743	Rear Sounder Circuit Short to Vbat	Go to **Pinpoint Test F** .
U0140	Lost Communication With Body Control Module (GEM)	Go to **Pinpoint Test G** .
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	Go to **Pinpoint Test H** .
U2051	One or More Calibration Files Missing/Corrupt	INSTALL a new PAM. REFER to **Parking Aid Module**. CLEAR all DTCs. REPEAT the self-test.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the parking aid module (PAM)	• Fuse • Wiring, terminals or connectors • PAM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The parking aid is inoperative/does not operate correctly	• Parking aid sensors alignment • PAM • Rear bumper cover	• Go to **Pinpoint Test A** .
• Continuous or intermittent tone when no obstacles or fault codes are present (certain obstacles may appear "stealthy" to the system, depending on geometric shape, size and material)	• Dirty or iced over parking aid sensor (s)	• CLEAN the rear bumper and sensors with high-pressure water.

	• Parking aid sensor bezel(s) or parking aid sensor(s) locked into the rear bumper incorrectly • Parking aid sensors are not aligned correctly	• REMOVE and correctly INSTALL the parking aid sensor(s) and or bezel(s) as necessary. REFER to **Parking Aid Sensor**.
	• Parking aid sensor (s) • PAM	• CARRY OUT the azimuth system check and elevation system check. REFER to **Azimuth System Check** and **Elevation System Check**.
• The audio control module (ACM) volume does not decrease when transmission is selected to reverse and reverse sensing system is enabled.	• Wiring, terminals or connectors • PAM	• Go to **Pinpoint Test I** .

Pinpoint Tests

Pinpoint Test A: The Parking Aid Is Inoperative/Does Not Operate Correctly

Normal Operation

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The parking aid module (PAM) receives reverse gear input from the instrument cluster (IC) through the medium speed controller area network (MS-CAN). Voltage is supplied to the parking aid sensors from the PAM on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG). The system can be disabled through the message center which is integral to the IC.

This pinpoint test is intended to diagnose the following:

- Parking aid sensors alignment
- PAM
- Rear bumper cover

PINPOINT TEST A: THE PARKING AID IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are any PAM DTCs recorded?**

  YES : REFER to DTC Charts in this service information.

  NO : Go to A2.

A2 CHECK THE PARKING AID SENSORS FOR CORRECT ALIGNMENT

NOTE:	**If the vehicle was in a rear end collision, the parking aid sensors may not be aligned correctly.**

- Check the bumper for correct alignment.
- Carry out the azimuth system check. Refer to **Azimuth System Check**.
- Carry out the elevation system check. Refer to **Elevation System Check**.
- **Does the parking aid system pass both system checks?**

  YES : Go to A3.

  NO : REALIGN or INSTALL a new bumper cover. REFER to **BUMPERS** article. If the vehicle was in a rear end collision, additional body work may be required to bring the parking aid sensors into correct alignment.

A3 CHECK FOR CORRECT REVERSE GEAR INPUT

- Apply the parking brake.
- Key in ON position.
- Select REVERSE.
- Enter the following diagnostic mode on the diagnostic tool: PAM DataLogger
- Monitor the PAM TRANSGR PID.
- **Does the PID indicate YES (transmission in reverse)?**

  YES : Go to A4.

  NO : INSTALL a new PAM. REFER to **Parking Aid Module**. TEST the system for normal operation.

A4 CHECK THE MESSAGE CENTER FOR PARKING AID DISABLE SWITCH OPERATION

- While observing the IC message center, disable and enable the parking aid system.
- **Does the message center display PARK AID OFF when the parking aid system is disabled, and display PARK AID ON when the parking aid system is enabled?**

  YES : Go to A5.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the message center.

A5 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:

    - corrosion
    - damaged pins
    - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTCs C1700, C1703, C1706 And C1709 - Parking Aid Sensor Circuit Failure or Blockage

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid sensors from the parking aid module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG).

DTC Description	Fault Trigger Conditions
C1700 - Left Rear Sensor Circuit Failure or Blockage	A continuous and on-demand DTC that sets when any of the left rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
C1703 - Right Rear Sensor Circuit Failure or Blockage	A continuous and on-demand DTC that sets when any of the right rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
C1706 - Left Rear Center Sensor Circuit Failure	A continuous and on-demand DTC that sets when any of the left rear center parking aid sensor circuits are open or the sensor signal line is shorted to ground.
C1709 - Left Rear Center Sensor Circuit Failure	A continuous and on-demand DTC that sets when any of the right rear center parking aid sensor circuits are open or the sensor signal line is shorted to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM

- Parking aid sensor(s)
- Parking aid bumper harness

PINPOINT TEST B: DTCs C1700, C1703, C1706 AND C1709 - PARKING AID SENSOR CIRCUIT FAILURE OR BLOCKAGE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are multiple DTCs recorded?**

  YES : Go to B2.

  NO : For DTCs C1700, C1703, C1706 or C1709, go to B3.

  For all other DTCs, REFER to DTC Charts in this service information.

B2 CHECK THE BUMPER WIRING HARNESS

- Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion.
- **Is the bumper wiring harness OK?**

  YES : Go to B3.

  NO : REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.

B3 CHECK THE SENSOR CIRCUITRY FOR OPENS

- Key in OFF position.
- Disconnect: Suspect Parking Aid Sensor C4009, C4010, C4011 or C4012
- Disconnect: PAM C4014
- Measure the resistance between the PAM C4014, harness side and the suspect parking aid sensor, harness side as follows:

DTC	Rear Sensor	PAM Connector-Pin	Sensor Connector-Pin	Circuit
C1700	LH outer	C4014-9	C4009-1	LMP07 (BU/WH)
C1700	LH outer	C4014-15	C4009-2	VMP15 (YE/GN)
C1700	LH outer	C4014-12	C4009-3	RMP07 (GN/WH)
C1703	RH	C4014-9	C4011-1	LMP07

	outer			(BU/WH)
C1703	RH outer	C4014-16	C4011-2	VMP17 (YE/OG)
C1703	RH outer	C4014-12	C4011-3	RMP07 (GN/WH)
C1706	LH inner	C4014-9	C4010-1	LMP07 (BU/WH)
C1706	LH inner	C4014-14	C4010-2	VMP14 (WH/OG)
C1706	LH inner	C4014-12	C4010-3	RMP07 (GN/WH)
C1709	RH inner	C4014-9	C4012-1	LMP07 (BU/WH)
C1709	RH inner	C4014-13	C4012-2	VMP16 (YE/GY)
C1709	RH inner	C4014-12	C4012-3	RMP07 (GN/WH)

- **Are the resistances less than 5 ohms?**

  YES : Go to B4.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO GROUND

- Measure the resistance between the suspect parking aid sensor, harness side and ground as follows:

DTC	Rear Sensor	Connector-Pin	Circuit
C1700	LH outer	C4009-2	VMP15 (YE/GN)
C1703	RH outer	C4011-2	VMP17 (YE/OG)
C1706	LH inner	C4010-2	VMP14 (WH/OG)
C1709	RH inner	C4012-2	VMP16 (YE/GY)

- **Is the resistance greater than 10,000 ohms?**

  YES : If all of the parking aid sensors recorded DTCs, go to B5.

  If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
    - corrosion
    - damaged pins
    - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTCs C1699, C1702, C1705 And C1708 - Sensor Circuit Short To Vbat

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid sensors from the parking aid module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG).

DTC Description	Fault Trigger Conditions
C1699 - Left Rear Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the left rear parking aid sensor signal line is shorted to voltage.
C1702 - Right Rear Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the right rear parking aid sensor signal line is shorted to voltage.
C1705 - Left Rear Center Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the left rear center parking aid sensor signal line is shorted to voltage.
C1708 - Right Rear Center Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the right rear center parking aid sensor signal line is shorted to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)

- Parking aid bumper harness
- PAM

PINPOINT TEST C: DTCs C1699, C1702, C1705 AND C1708 - SENSOR CIRCUIT SHORT TO VBAT

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are multiple DTCs recorded?**

  YES : Go to C2.

  NO : For DTCs C1699, C1702, C1705 or C1708, go to C3.

  For all other DTCs, REFER to DTC Charts in this service information.

C2 CHECK THE BUMPER WIRING HARNESS

- Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion.
- **Is bumper wiring harness OK?**

  YES : Go to C3.

  NO : REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.

C3 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO VOLTAGE

- Key in OFF position.
- Disconnect: Suspect Parking Aid Sensor C4009, C4010, C4011 or C4012
- Disconnect: PAM C4014
- Key in ON position.
- Measure the voltage between the suspect parking aid sensor, harness side and ground as follows:

DTC	Rear Sensor	Connector-Pin	Circuit
C1699	LH outer	C4009-2	VMP15 (YE/GN)
C1702	RH outer	C4011-2	VMP17 (YE/OG)
C1705	LH inner	C4010-2	VMP14 (WH/OG)
C1708	RH inner	C4012-2	VMP16 (YE/GY)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C4.

C4 CHECK THE PARKING AID SENSORS

- Install a known good parking aid sensor(s) for each of the suspect parking aid sensor(s).
- Clear the DTCs. Repeat the self-test.
- Test the system for normal operation.
- **Is the concern still present?**

  YES : If all of the parking aid sensors recorded DTCs, go to C5.

  If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTCs C1701, C1704, C1707 And C1710 - Sensor Circuit Fault

Normal Operation

Voltage is supplied to the parking aid sensors from the parking aid module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG).

DTC Description	Fault Trigger Conditions
C1701 - Left Rear Sensor Circuit Fault	A continuous and on-demand DTC that sets when the left rear parking aid sensor has internally failed or has an incorrect attenuation time.

C1704 - Right Rear Sensor Circuit Fault	A continuous and on-demand DTC that sets when the right rear parking aid sensor has internally failed or has an incorrect attenuation time.
C1707 - Left Rear Center Sensor Circuit Fault	A continuous and on-demand DTC that sets when the left rear center parking aid sensor has internally failed or has an incorrect attenuation time.
C1710 - Right Rear Center Sensor Circuit Fault	A continuous and on-demand DTC that sets when the right rear center parking aid sensor has internally failed or has an incorrect attenuation time.

This pinpoint test is intended to diagnose the following:

- Dirty or obstructed parking aid sensor
- Parking aid sensor
- Parking aid bumper harness
- PAM

PINPOINT TEST D: DTCs C1701, C1704, C1707 AND C1710 - SENSOR CIRCUIT FAULT

D1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are parking aid DTCs other than C1701, C1704, C1707 or C1710 recorded?**

  YES : DIAGNOSE the other DTCs first. REFER to DTC Charts in this service information.

  NO : Go to D2.

D2 CHECK THE PARKING AID SENSOR OPERATION

NOTE: Make sure the area around the vehicle is clear of anything that might activate the parking aid system.

- Clean the rear bumper and sensors with high-pressure water.
- Carry out the azimuth system check. Refer to **Azimuth System Check**.
- Carry out the elevation system check. Refer to **Elevation System Check**.
- **Does the parking aid system pass both system checks?**

  YES : The system is operating correctly at this time. The concern may have been caused by a dirty or blocked parking aid sensor. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to D3.

D3 CHECK THE PARKING AID SENSOR DISTANCE PIDs

- Make sure the suspect parking aid sensor(s) is flush-mounted in the bezel.
- Key in ON position.

- Enter the following diagnostic mode on the diagnostic tool: PAM DataLogger
- With the brake pedal applied, shift the transmission into REVERSE (R) and monitor the parking aid sensor distance PID. The PID will read 255 cm (100 in) on a correctly functioning sensor with no object behind the vehicle.
- **Does the PID read 255 cm (100 in)?**

  YES : Go to D4.

  NO : Go to D5.

D4 CHECK THE PARKING AID SENSOR ATTENUATION PIDs

- Check the parking aid sensor attenuation PIDs.
- **Do the attenuation PIDs read between 0 and 16?**

  YES : Go to D6.

  NO : Go to D5.

D5 INSTALL A KNOWN GOOD PARKING AID SENSOR

- Install a known good sensor for the suspect parking aid sensor.
- Key in ON position.
- Clear the DTCs. Repeat the self-test. Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : Go to D6.

  NO : INSTALL a new parking aid sensor. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

D6 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module**. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: DTC B1299 - Power Supply Sensor Circuit Short To Ground

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid sensors from the parking aid module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH).

DTC B1299 is a continuous and on-demand DTC that sets when the sensor power supply circuit is shorted to ground or to circuit RMP07 (GN/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM

PINPOINT TEST E: DTC B1299 - POWER SUPPLY SENSOR CIRCUIT SHORT TO GROUND

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK THE BUMPER WIRING HARNESS

- Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion.
- **Is the bumper wiring harness OK?**

  YES : Go to E2.

  NO : REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.

E2 CHECK THE LH OUTER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4009
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

  YES : Go to E3.

  NO : INSTALL a new LH outer parking aid sensor. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E3 CHECK THE RH OUTER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4011
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

  YES : Go to E4.

NO : INSTALL a new RH outer parking aid sensor. CONNECT the parking aid sensors. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E4 CHECK THE LH INNER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4010
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

YES : Go to E5.

NO : INSTALL a new LH inner parking aid sensor. CONNECT the parking aid sensors. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E5 CHECK THE RH INNER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4012
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

YES : CONNECT the parking aid sensors. Go to E6.

NO : INSTALL a new RH inner parking aid sensor. CONNECT the parking aid sensors. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E6 CHECK CIRCUIT LMP07 (BU/WH) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: PAM C4014

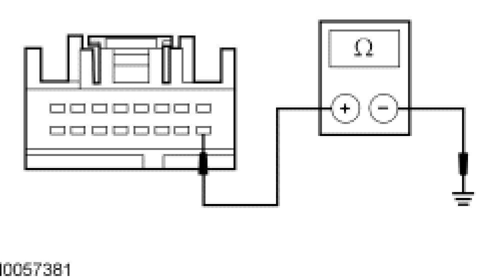

Fig. 1: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-9, circuit LMP07 (BU/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to E7.

NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E7 CHECK CIRCUIT LMP07 (BU/WH) FOR A SHORT TO CIRCUIT RMP07 (GN/WH)

- Key in OFF position.

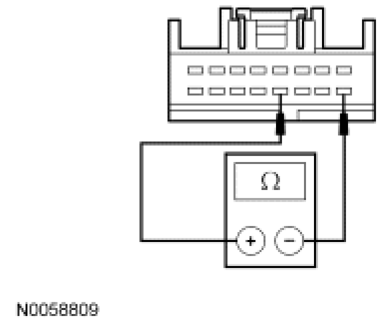

Fig. 2: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-9, circuit LMP07 (BU/WH), harness side and the PAM C4014-12, circuit RMP07 (GN/WH).
- **Is the resistance greater than 10,000 ohms?**

YES : Go to E8.

NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E8 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new PAM. REFER to **Parking Aid Module**. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC C1742 And C1743 - Rear Sounder Circuit Short To Voltage & Rear Sounder Circuit Failure

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Parking Aid for schematic and connector information.

Normal Operation

A 750 Hz variable warning tone is generated from the parking aid speaker. The parking aid module (PAM) increases the speaker warning tone rate as the vehicle gets closer to an obstacle. Circuits CMP09 (BN/BU) and RMP09 (BU/GN) provide the connection between the PAM and the speaker.

DTC C1742 is a continuous and on-demand DTC that sets when the sounder circuit is open or shorted to ground.

DTC C1743 is a continuous and on-demand DTC that sets when the sounder circuit is shorted to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM
- Parking aid speaker

PINPOINT TEST F: DTC C1742 - REAR SOUNDER CIRCUIT FAILURE AND DTC C1743 - REAR SOUNDER CIRCUIT SHORT TO VOLTAGE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

F1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS

- Key in ON position.
- Retrieve the PAM DTCs from the continuous and on-demand self-tests.
- **Is DTC C1742 or C1743 present?**

  YES : Go to F2.

  NO : For all other DTCs, REFER to DTC Charts in this service information.

F2 MEASURE THE PARKING AID SPEAKER RESISTANCE

- Disconnect: Parking Aid Speaker C3268

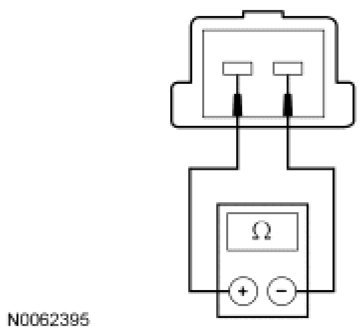

Fig. 3: Measuring Parking Aid Speaker Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the parking aid speaker pin 1, component side and the parking aid speaker pin 2, component side.
- **Is the resistance between 40 and 60 ohms?**

  YES : If DTC C1742 was recorded, go to F3.

  If DTC C1743 was recorded, go to F7.

  NO : INSTALL a new parking aid speaker. REFER to **Parking Aid Speaker**. CLEAR the DTCs. REPEAT the self-test.

F3 CHECK CIRCUIT CMP09 (BN/BU) FOR A SHORT TO GROUND

- Connect: Parking Aid Speaker C3268
- Disconnect: PAM C4014
- Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to F5.

  NO : Go to F4.

F4 CHECK CIRCUIT CMP09 (BN/BU) FOR A SHORT TO GROUND WITH THE PARKING AID SPEAKER DISCONNECTED

- Disconnect: Parking Aid Speaker C3268
- Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuit RMP09 (BU/GN). CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR circuit CMP09 (BN/BU). CLEAR the DTCs. REPEAT the self-test.

F5 CHECK CIRCUIT CMP09 (BN/BU) FOR AN OPEN

- Disconnect: Parking Aid Speaker C3268

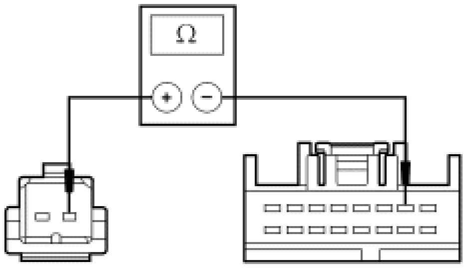

Fig. 4: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and the parking aid speaker C3268-2, circuit CMP09 (BN/BU), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to F6.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F6 CHECK CIRCUIT RMP09 (BU/GN) FOR AN OPEN

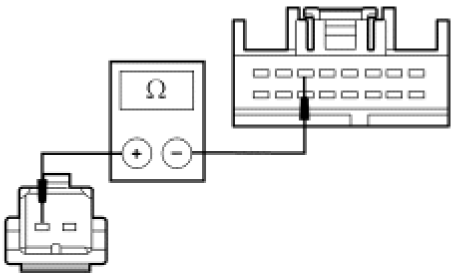

Fig. 5: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-6, circuit RMP09 (BU/GN), harness side and the parking aid speaker C3268-1, circuit RMP09 (BU/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F8.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

F7 CHECK THE PARKING AID SPEAKER CIRCUITRY FOR SHORTS TO VOLTAGE

- Key in ON position.

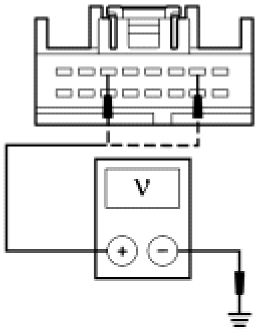

Fig. 6: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground; and between the PAM C4014-6, circuit RMP09 (BU/GN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to F8.

F8 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. The PAM and speaker are serviced as one assembly. REFER to **Parking Aid Module**. CLEAR the DTCs. REPEAT the self-test. CARRY OUT the scan tool data link test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTC U0140 - Ignition Switch Position Missing

Normal Operation

The parking aid module (PAM) receives the ignition switch state from the smart junction box (SJB) as a network message.

DTC U0140 is a continuous and on-demand DTC that sets in the PAM when ignition switch state messages are not received from the SJB.

This pinpoint test is intended to diagnose the following:

- SJB
- Networked data fault

PINPOINT TEST G: DTC U0140 - IGNITION SWITCH POSITION MISSING

G1 CONFIRM THE DTC WILL SET IN CONTINUOUS MEMORY

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PAM CMDTCs
- Clear the DTCs. Operate the system and determine if the concern is still present.
- Retrieve continuous PAM DTCs.
- **Is DTC U0140 present?**

  YES : Go to G2.

  NO : System is operating normally at this time.

G2 CHECK THE IGNITION SWITCH VOLTAGE PID

- Enter the following diagnostic mode on the diagnostic tool: PAM DataLogger
- Check the PAM ignition switch voltage PID (IGN_V).
- **Does the PID match the ignition switch position?**

  YES : REFER to **STEERING COLUMN SWITCHES** article.

  NO : Go to G3.

G3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: DTC U0155 - PRNDL Missing

Normal Operation

The parking aid module (PAM) receives the transmission selector (PRNDL) state from the instrument cluster (IC) as a gateway message from the PCM.

DTC U0155 is a continuous and on-demand DTC that sets in the PAM when PRNDL messages are not received from the smart junction box (SJB).

This pinpoint test is intended to diagnose the following:

- IC
- Networked data fault

PINPOINT TEST H: DTC U0155 - PRNDL MISSING

H1 CONFIRM THE DTC WILL SET IN CONTINUOUS MEMORY

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PAM CMDTCs
- Clear the DTCs. Operate the system and determine if the concern is still present.
- Retrieve continuous PAM DTCs.

- **Is DTC U0155 present?**

  YES : Go to H2.

  NO : System is operating normally at this time.

H2 VERIFY THE IC PRNDL DISPLAY FUNCTIONS CORRECTLY

- Monitor the IC PRNDL display while moving the gearshift lever through the range of positions.
- **Does the PRNDL match all range positions?**

  YES : Go to H3.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the PRNDL.

H3 CHECK FOR CORRECT IC OPERATION

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: The Volume Cutback Is Inoperative

Normal Operation

With the ignition switch in the RUN position and the gear selector in REVERSE (R), the parking aid system calculates the distance to an object by the use of a radar sensor. A 750 Hz variable warning tone is generated by the parking aid sounder. A volume cutback request message is sent to the audio control module (ACM) from the parking aid module (PAM) over the medium speed controller area network (MS-CAN) to decrease the volume of the audio system, so that the parking aid sounder may be clearly heard.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM
- ACM

PINPOINT TEST I: THE VOLUME CUTBACK IS INOPERATIVE

I1 VERIFY THE PAM COMMUNICATES WITH THE INSTRUMENT CLUSTER (IC) MESSAGE CENTER DISPLAY

- Apply the parking brake.
- Key in ON position.
- Apply the brake pedal and place the gear selector in REVERSE (R).
- Disable/enable the parking aid system by pressing the reset button on the message center switch.
- **Can the PAM be disabled/enabled in the IC message center display?**

  YES : Go to I3.

  NO : Go to I2.

I2 VERIFY THE CORRECT PAM IS INSTALLED

- Check to make sure the correct PAM is installed.
- **Has the PAM been replaced prior?**

  YES : VERIFY the correct PAM is installed. If correct, go to I3.

  NO : INSTALL the correct PAM. REFER to **Parking Aid Module**. TEST the system for normal operation.

I3 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module**. TEST the system for normal operation.

  NO : The system is operating correctly at this time.

GENERAL PROCEDURES

AZIMUTH SYSTEM CHECK

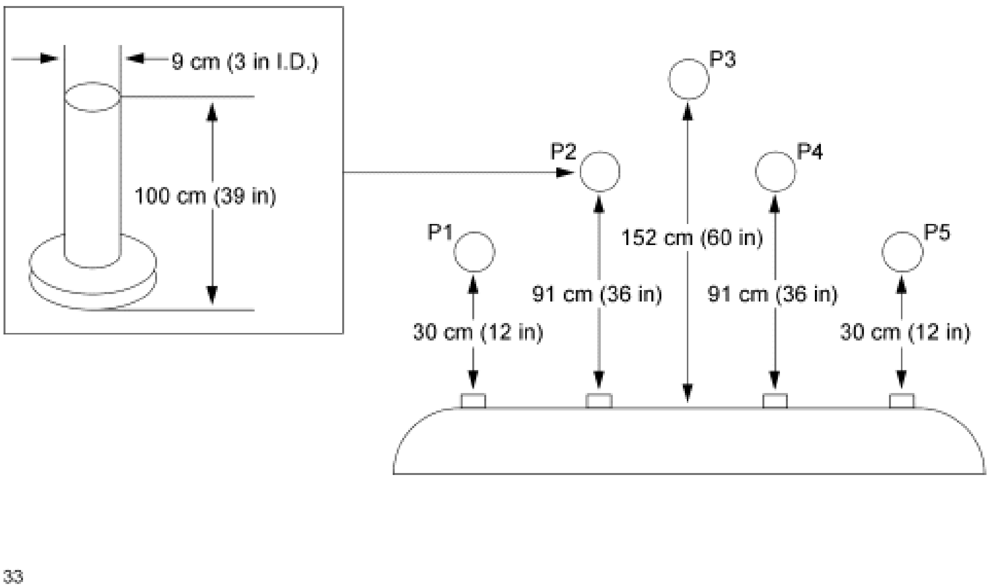

Fig. 7: Minimum Detectable Object Locations
Courtesy of FORD MOTOR CO.

NOTE:	**The object used in this system check can be fabricated from 9 cm O.D. (3 in I.D) plastic pipe 100 cm (39 in) in length (available as PVC pipe, or similar from a hardware or plumbing supply).**
NOTE:	**The following system check should be carried out with the vehicle on a level surface. The specified object locations are approximate, not absolute**
NOTE:	**The parking aid system will default to on when the ignition key is cycled from OFF to ON.**
NOTE:	**The scan tool may be used to monitor distance PIDs. The distance PIDs read between 0 and 255 cm (0 and 8 ft) on a correctly functioning system.**

1. Turn the ignition to the ON position, engine off.
2. Set the parking brake on.
3. Place the gear shift in REVERSE (R).
4. Verify that the parking aid system detects the specified object when placed within the 5 specified locations (P1, P2, P3, P4, P5). The pipe should be inside of these locations.
   - The speaker should beep slowly when objects are detected on the outer edges of the detection zone, and increase as the object is moved closer to the vehicle.

When the object is within 46 cm (18 in) of the rear bumper, the sounder should be on continuously.

ELEVATION SYSTEM CHECK

NOTE: The following system check should be carried out with the vehicle on a 3.0 m wide by 4.5 m deep (10 ft wide by 15 ft deep) smooth concrete surface, free of all obstacles and noise from fan and pneumatic tools.

1. Turn the ignition to the ON position, engine off.

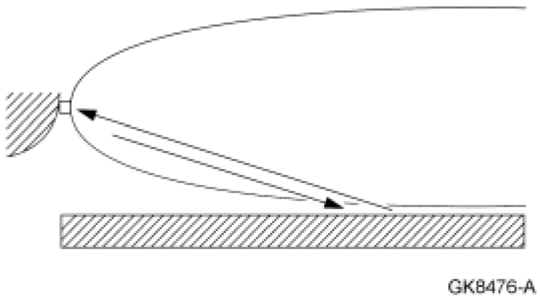

Fig. 8: Checking Parking Aid System
Courtesy of FORD MOTOR CO.

2. Set the parking brake.
3. Place the gear shift in REVERSE (R).
4. Verify that no audible alerts are heard. If audible alerts are heard, check to make sure the bumper is correctly installed and is not tilted downward so that the sensor is pointing at the ground.

REMOVAL AND INSTALLATION

PARKING AID MODULE

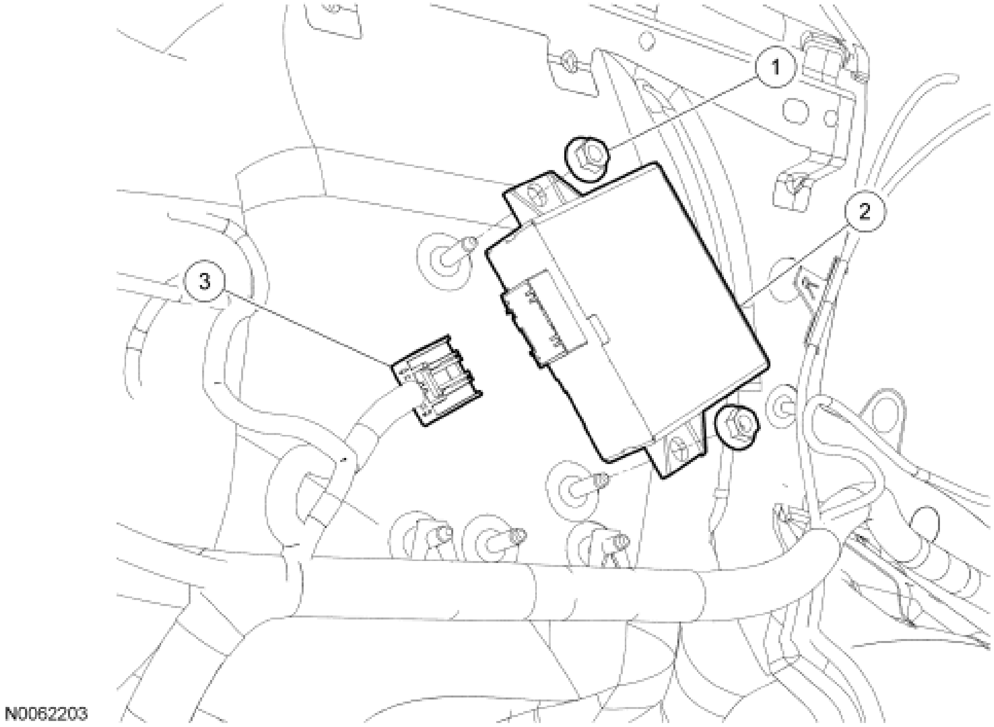

Fig. 9: Exploded View Of Parking Aid Module
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Parking aid module (PAM) nut
2	15K866	PAM
3	-	PAM electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.

1. Remove the LH rear quarter trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the 2 nuts and the parking aid module (PAM).
3. Disconnect the PAM electrical connector.
4. To install, reverse the removal procedure.

PARKING AID SENSOR

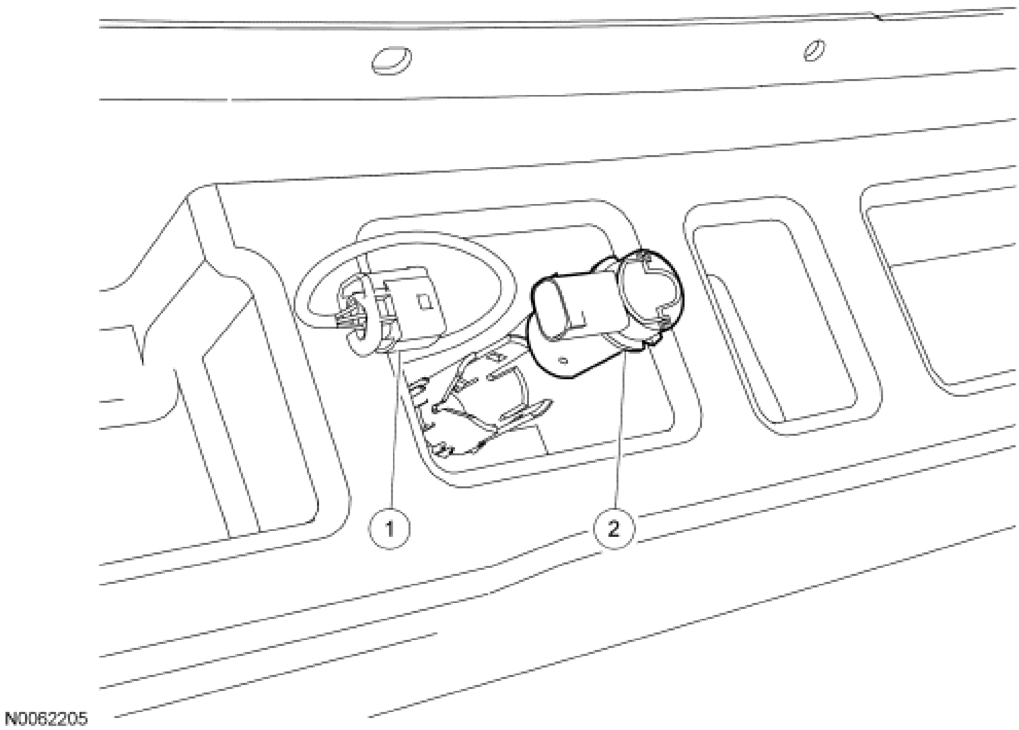

Fig. 10: Exploded View Of Parking Aid Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Parking aid sensor electrical connectors (part of 14N139)
2	14489	Parking aid sensors

1. Remove the rear bumper cover. For additional information, refer to **BUMPERS** article.
2. Disconnect the parking aid sensor(s) electrical connector(s).
3. Press the retaining tabs and remove the parking aid sensor(s).
4. To install, reverse the removal procedure.

PARKING AID SPEAKER

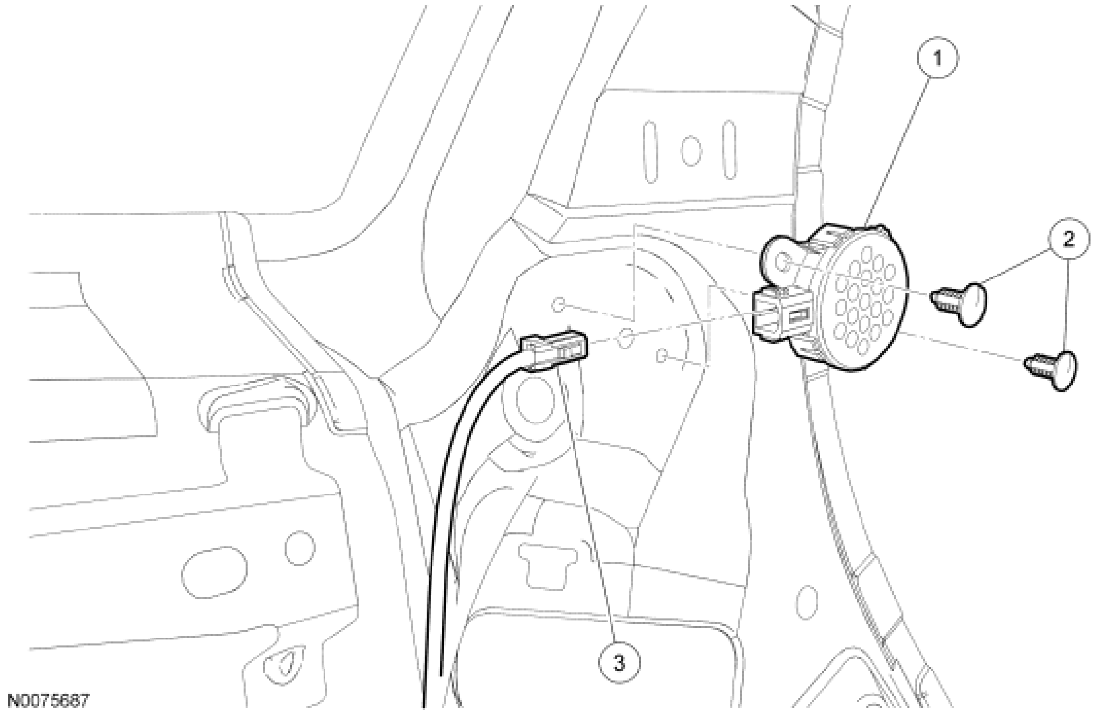

Fig. 11: Identifying Parking Aid Speaker
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	15K864	Parking aid speaker
2	W705635	Parking aid speaker push pins (2 required)
3	-	Parking aid speaker electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

1. Remove the LH rear quarter trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the 2 push pin and the parking aid speaker.
    - Disconnect the parking aid speaker electrical connector.
3. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

PARKING BRAKE

The parking brake and actuation system consists of the following components:

- Parking brake cables
- Parking brake control
- Parking brake shoes

The parking brake system is a mechanical system that activates a shoe-and-drum parking brake within the rear brake disc.

The parking brake system is cable-actuated and controlled by an independent pedal-operated parking brake control. The parking brake control applies tension to the front parking brake cable and conduit. The front parking brake cable is coupled to the LH rear parking brake cable and conduit which is coupled to the RH rear parking brake cable. The parking brake cable and conduits actuate the parking brake levers, engaging the parking brake shoes with the parking brake drum and hat assembly. The parking brake warning indicator is located in the instrument cluster. It illuminates to signal the driver that the parking brake is applied or to signal a low brake fluid condition. The warning indicator system is diagnosed in **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

The parking brake cable system tension is self-adjusting.

DIAGNOSTIC TESTS

PARKING BRAKE

Principles of Operation

Parking Brake System - The parking brake system is an independent cable-actuated system controlled by an foot-operated parking brake control that is not self-adjusting. When the parking brake control is pressed, tension is applied to the front cable and is applied to the brake shoes through the equalizer and the rear parking brake cables. To return the system to the released position, the parking brake control is pressed a second time.

Inspection and Verification

NOTE: Prior to carrying out any diagnosis, make sure the red brake warning indicator is functional. Refer to INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES article.

The first indication that something may be wrong in the brake system is a change in the feeling through the parking brake control. The parking brake not holding on an incline or dragging after being released are also indicators of system concerns.

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Check for any damaged cables and install new components as necessary. Carry out the brake system diagnosis.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Front parking brake cable and conduit • LH rear parking brake cable and conduit • Parking brake control • Parking brake cable equalizer • Rear parking brake shoes and hardware • RH rear parking brake cable and conduit

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and Go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
		• REPAIR or INSTALL new parking brake components as necessary. REFER to **Parking Brake Control**,

• Rear brakes drag	• Parking brake component	**Parking Brake Cable - Rear, LH**, **Parking Brake Cable - Rear, RH**, **Parking Brake Cable - Front** or **Parking Brake Shoes**.
	• Brake caliper guide pins	• INSPECT the brake caliper guide pins. REFER to Diagnosis and Testing in **BRAKE SYSTEM - GENERAL INFORMATION** article. REPAIR or INSTALL new components as necessary.
	• Brake caliper	• INSPECT the brake calipers as necessary. REFER to Diagnosis and Testing in **BRAKE SYSTEM - GENERAL INFORMATION** article. REPAIR or INSTALL new components as necessary.
	• Brake booster	• CARRY OUT the Brake Booster Component Test. REFER to Diagnosis and Testing in **BRAKE SYSTEM - GENERAL INFORMATION** article.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder Component Test. REFER to Diagnosis and Testing in **BRAKE SYSTEM - GENERAL INFORMATION** article.
• The parking brake does not apply	• Front parking brake cable • Parking brake control • Parking brake equalizer • Parking brake shoes and hardware • Rear parking brake cables	• Go to **Pinpoint Test A**.
• The parking brake will not release	• Front parking brake cable • Parking brake control • Parking brake control release handle • Parking brake return springs • Parking brake shoes and hardware	• Go to **Pinpoint Test B**.

	• Rear parking brake cables	

Pinpoint Tests

Pinpoint Test A: The Parking Brake Does Not Apply

Normal Operation

When the parking brake control is applied, tension is applied to the front parking brake cable. This tension is applied to both rear cables through the equalizer. The tension in the rear cables pulls on the parking brake shoe actuators and applies the parking brakes.

This pinpoint test is intended to diagnose the following:

- Front parking brake cable
- Parking brake control
- Parking brake shoe actuators
- Parking brake shoes and hardware
- Rear parking brake cables

PINPOINT TEST A: THE PARKING BRAKE DOES NOT APPLY

A1 CHECK THE PARKING BRAKE CONTROL

- Press the parking brake control pedal.
- **Does the parking brake control move?**

  YES : Go to A2.

  NO : Go to A3.

A2 CHECK FOR BROKEN CABLES

- Remove the rear brake disc. Refer to **REAR DISC BRAKE** article.

  NOTE: **Have an assistant press and release the parking brake pedal to help isolate disconnected cables or cables that do not move.**

- Inspect the following items for damage and correct connections:
  - Cable equalizer
  - Front cable
  - LH rear cable and return spring
  - Parking brake control
  - Parking brake shoe actuators
  - RH rear cable and return spring
- **Is any damage found or are any components disconnected?**

YES : CONNECT the component(s) or INSTALL new parking brake component(s) as necessary. TEST the system for normal operation.

NO : INSTALL new parking brake shoes. REFER to **Parking Brake Shoes**. TEST the system for normal operation.

A3 ISOLATE THE PARKING BRAKE CONTROL AND FRONT PARKING BRAKE CABLE

- Disconnect the return spring from the equalizer.
- Relieve the tension in the parking brake cable by loosening the equalizer adjustment nut until the rear cables can be disconnected from the equalizer.
- Disconnect both rear cables from the equalizer.
- Press the parking brake control pedal.
- **Does the parking brake control pedal move?**

YES : Go to A4.

NO : Go to A6.

A4 ISOLATE THE REAR PARKING BRAKE CABLES

- Remove the rear parking brake cable-to-support plate bolts and disconnect the rear parking brake cables from their actuators.
  - To install, tighten the bolts to 23 Nm (17 lb-ft).
- While holding the cable conduit, attempt to slide the LH and the RH cables inside their conduits.
- **Do the cables slide freely inside their conduits?**

YES : Go to A5.

NO : INSTALL new rear brake cable(s). REFER to **Parking Brake Cable - Rear, LH** and/or **Parking Brake Cable - Rear, RH**. TEST the system for normal operation.

A5 ISOLATE THE PARKING BRAKE SHOE ACTUATORS

- Remove the LH and RH parking brake shoes. Refer to **Parking Brake Shoes**.
- Attempt to move the LH and RH parking brake shoe actuators by hand.
- **Do the actuators move?**

YES : INSTALL new parking brake shoes. REFER to **Parking Brake Shoes**. TEST the system for normal operation.

NO : INSTALL new parking brake shoe actuator(s). REFER to Brake Caliper Support Plate in **REAR DISC BRAKE** article. TEST the system for normal operation.

A6 ISOLATE THE FRONT PARKING BRAKE CABLE

- Remove the parking brake control adjustment nut and remove the front parking brake cable from the parking brake control.
- Attempt to slide the front parking brake cable inside the conduit.
- **Does the cable slide freely inside the conduit?**

YES : INSTALL a new parking brake control. REFER to **Parking Brake Control**. TEST the system for normal operation.

NO : INSTALL a new front parking brake cable. REFER to **Parking Brake Cable - Front**. TEST the system for normal operation.

Pinpoint Test B: The Parking Brake Will Not Release

Normal Operation

When the parking brake control is fully applied and the pedal is pressed a second time, the ratchet mechanism and return spring in the parking brake control cause the tension on the parking brake cables to release. The springs on both rear parking brake cables and the spring on the equalizer provide the force necessary to return the system to the released position.

This pinpoint test is intended to diagnose the following:

- Front parking brake cable
- Parking brake control
- Parking brake shoe actuators
- Parking brake shoes and hardware
- Rear parking brake cables

PINPOINT TEST B: THE PARKING BRAKE WILL NOT RELEASE

B1 CHECK THE PARKING BRAKE CONTROL

- Press the parking brake control pedal.
- **Does the parking brake control move?**

  YES : Go to B3.

  NO : Go to B2.

B2 ISOLATE THE PARKING BRAKE CONTROL

- Release the parking brake cable tension at the parking brake control adjusting nut.
- Disconnect the parking brake cable at the parking brake lever.
- Press the parking brake control pedal.
- **Does the parking brake control move?**

  YES : Go to B3.

  NO : INSTALL a new parking brake control. REFER to **Parking Brake Control**. TEST the system for normal operation.

B3 ISOLATE THE FRONT PARKING BRAKE CABLE

- Disconnect the return spring from the equalizer.
- If necessary, relieve the tension in the parking brake cable by loosening the equalizer adjustment nut until the rear cables can be disconnected from the equalizer.
- Disconnect the LH and RH cables from the equalizer.
- Verify that the front cable can slide freely in the conduit.
- **Does the cable slide freely in the conduit?**

  YES : Go to B4.

  NO : INSTALL a new front cable. REFER to **Parking Brake Cable - Front**. TEST the system for normal operation.

B4 ISOLATE THE REAR PARKING BRAKE CABLES

- Remove the rear parking brake cable-to-support plate bolts and disconnect the rear parking brake cables from their actuators.
  - To install, tighten the bolts to 23 Nm (17 lb-ft).
- While holding the cable conduit, attempt to slide the LH and the RH cables inside their conduits.
- **Do the cables slide freely inside their conduits?**

  YES : Go to B5.

  NO : INSTALL new rear brake cable(s). REFER to **Parking Brake Cable - Rear, LH** and/or **Parking Brake Cable - Rear, RH**. TEST the system for normal operation.

B5 ISOLATE THE PARKING BRAKE SHOE ACTUATORS

- Remove the LH and RH parking brake shoes. Refer to **Parking Brake Shoes**.
- Attempt to move the LH and RH parking brake shoe actuators by hand.
- **Do the actuators move?**

  YES : INSTALL new parking brake shoes. REFER to **Parking Brake Shoes**. TEST the system for normal operation.

  NO : INSTALL new parking brake shoe actuator(s). REFER to Brake Caliper Support Plate in **REAR DISC BRAKE** article. TEST the system for normal operation.

GENERAL PROCEDURES

PARKING BRAKE CABLE ADJUSTMENT

NOTE: Cable tension is adjusted in 2 locations, the first location is at the parking brake control, the second location is at the parking brake cable equalizer. The tension must be adjusted equally at both locations.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

   NOTE: The dimension will vary depending on the amount of cable stretch. New cables require cycling the parking brake control 5-10 times to remove the cable slack.

2. Adjust the parking brake control adjustment nut as shown.

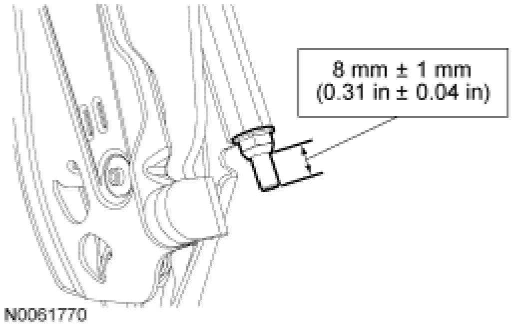

Fig. 1: Adjusting Parking Brake Control Adjustment Nut With Specifications
Courtesy of FORD MOTOR CO.

3. Adjust the parking brake cable equalizer adjustment nut as shown.

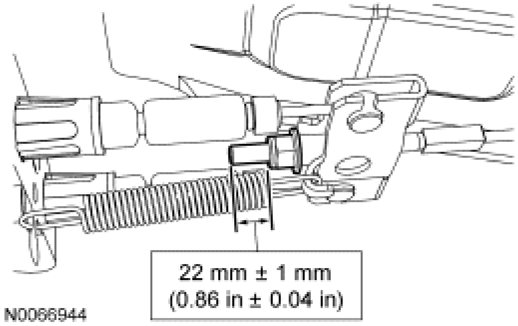

Fig. 2: Adjusting Parking Brake Cable Equalizer Adjustment Nut With Specifications
Courtesy of FORD MOTOR CO.

4. Fully apply the parking brake pedal 3 times to verify correct operation of the parking brake system.
    - With the parking brake cable in the fully released position, brake drag should not be present.

REMOVAL AND INSTALLATION

PARKING BRAKE WARNING INDICATOR SWITCH

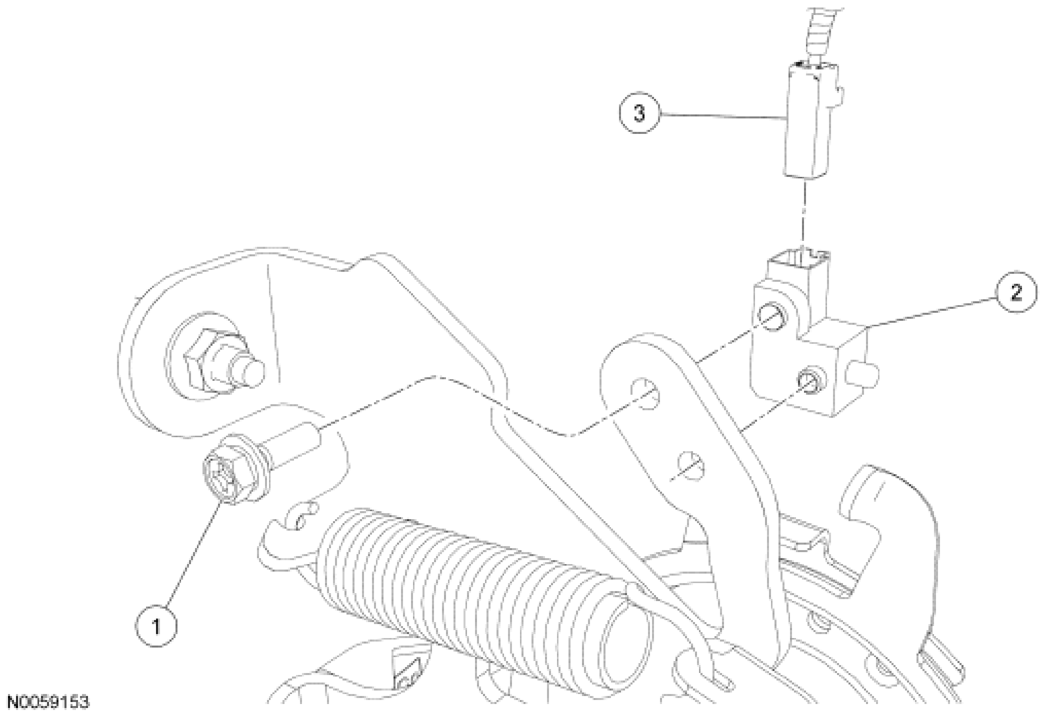

Fig. 3: Exploded View Of Parking Brake Warning Indicator Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Parking brake warning indicator switch screw (part of 15A851)
2	15A851	Parking brake warning indicator switch
3	-	Electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

1. Disconnect the parking brake warning indicator switch electrical connector.
2. Remove the parking brake warning indicator switch screw and the switch.
3. To install, reverse the removal procedure.

PARKING BRAKE CONTROL

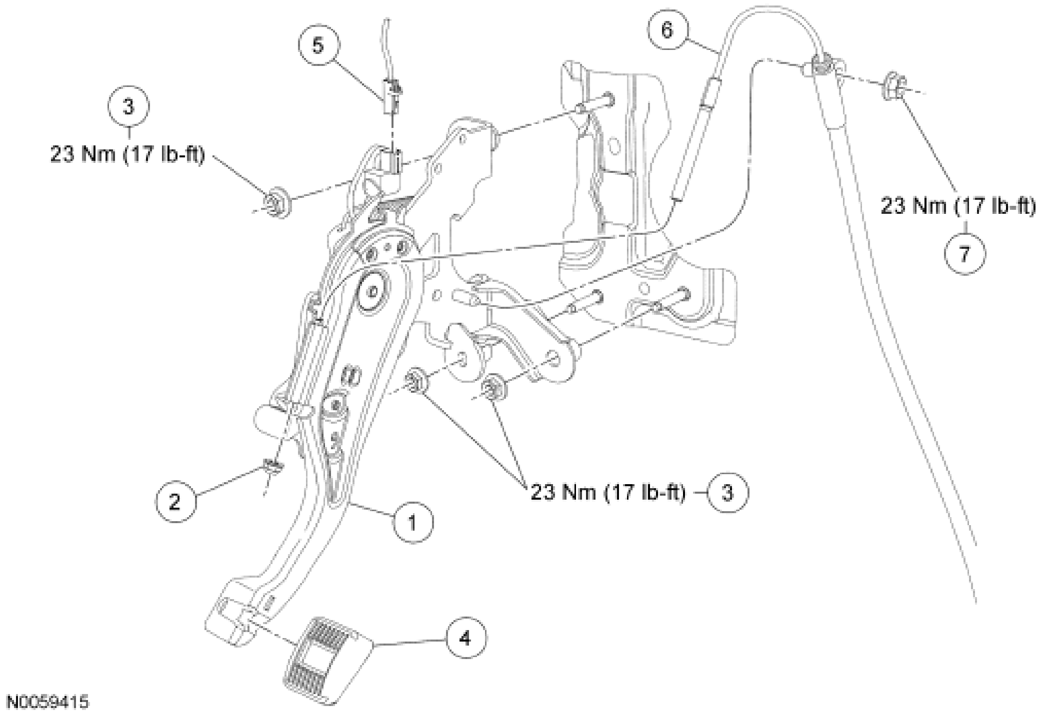

Fig. 4: Exploded View Of Parking Brake Control With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2760	Parking brake control
2	-	Parking brake control adjustment nut (part of 2853)
3	W707144	Parking brake control nuts (3 required)
4	2454	Parking brake control pad
5	15852	Parking brake switch electrical connector (part of 14A005)
6	2853	Front parking brake cable
7	-	Front parking brake cable-to-control nut (part of 2853)

REMOVAL AND INSTALLATION

1. Disconnect the parking brake switch electrical connector.
2. Remove the parking brake control adjustment nut.
3. Remove the front parking brake cable-to-control nut and position the front cable aside.
   - To install, tighten to 23 Nm (17 lb-ft).
4. Remove the 3 parking brake control nuts and the parking brake control.
   - To install, tighten to 23 Nm (17 lb-ft).

5. To install, reverse the removal procedure.
    - Adjust the parking brake cable. For additional information, refer to **Parking Brake Cable Adjustment**.

PARKING BRAKE CABLE - REAR, LH

NOTE: All wheel drive (AWD) vehicles shown, front wheel drive (FWD) vehicles similar.

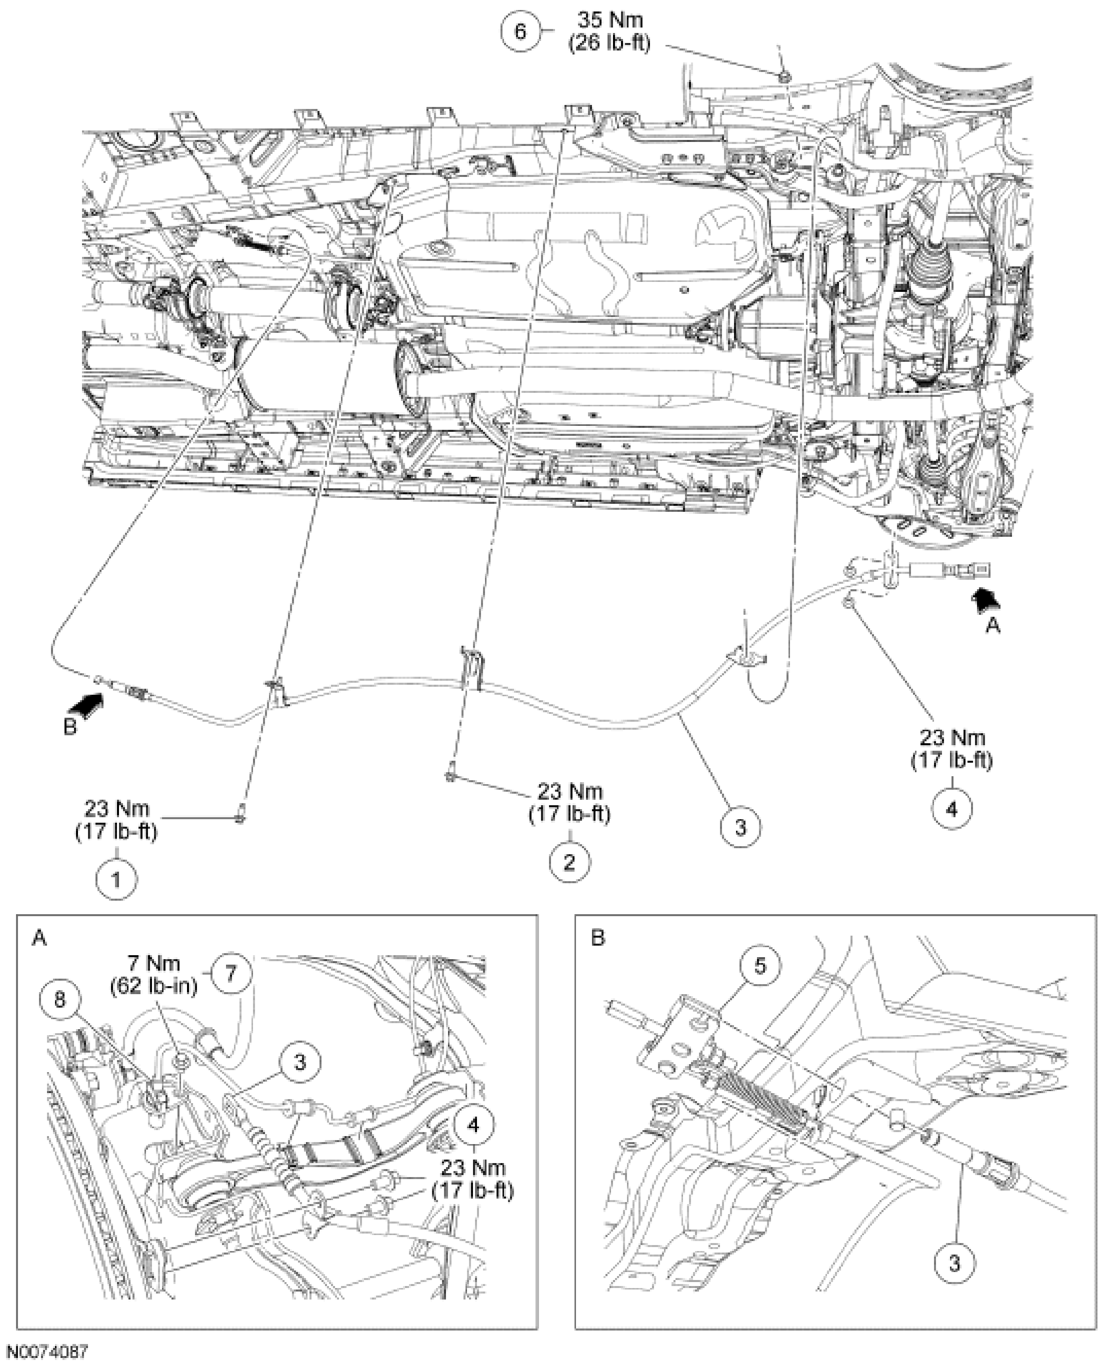

Fig. 5: Exploded View Of Rear LH Parking Brake Cable With Torque Specifications
Courtesy of FORD MOTOR CO.

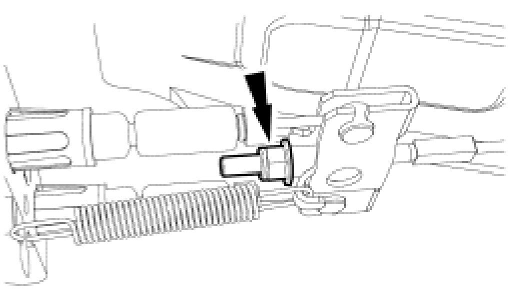
Item	Part Number	Description
1	W708004	Parking brake cable front bracket bolt
2	W708004	Parking brake cable middle bracket bolt

3	2A635	LH parking brake cable
4	W500021	Parking brake cable-to-support plate bolts (2 required)
5	-	Parking brake cable equalizer (part of 2853)
6	W520414	Rear stabilizer bar link nut
7	W500010	Wheel speed sensor bolt
8	2C190	Wheel speed sensor

REMOVAL AND INSTALLATION

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Relieve the tension in the parking brake cable by loosening the equalizer adjustment nut.



N0059407

Fig. 6: Locating Equalizer Adjustment Nut
Courtesy of FORD MOTOR CO.

3. Disconnect the LH parking brake cable from the equalizer.
4. Squeeze the tabs and disconnect the LH parking brake cable from the bracket.

All wheel drive (AWD) vehicles

5. Remove the wheel speed sensor bolt and position the wheel speed sensor aside.
   - To install, tighten to 7 Nm (62 lb-in).

All vehicles

6. Remove the 2 parking brake cable-to-support plate bolts and disconnect the cable from the lever.
   - To install, tighten to 23 Nm (17 lb-ft).
7. Remove the stabilizer bar link nut and position the stabilizer bar link aside.
   - To install, tighten to 35 Nm (26 lb-ft).

8. Remove the parking brake cable front bracket bolt, middle bracket bolt and the parking brake cable.
    - To install, tighten to 23 Nm (17 lb-ft).
9. To install, reverse the removal procedure.
    - Adjust the parking brake cable. For additional information, refer to **Parking Brake Cable Adjustment**.

PARKING BRAKE CABLE - REAR, RH

NOTE: All wheel drive (AWD) vehicles shown, front wheel drive (FWD) vehicles similar.

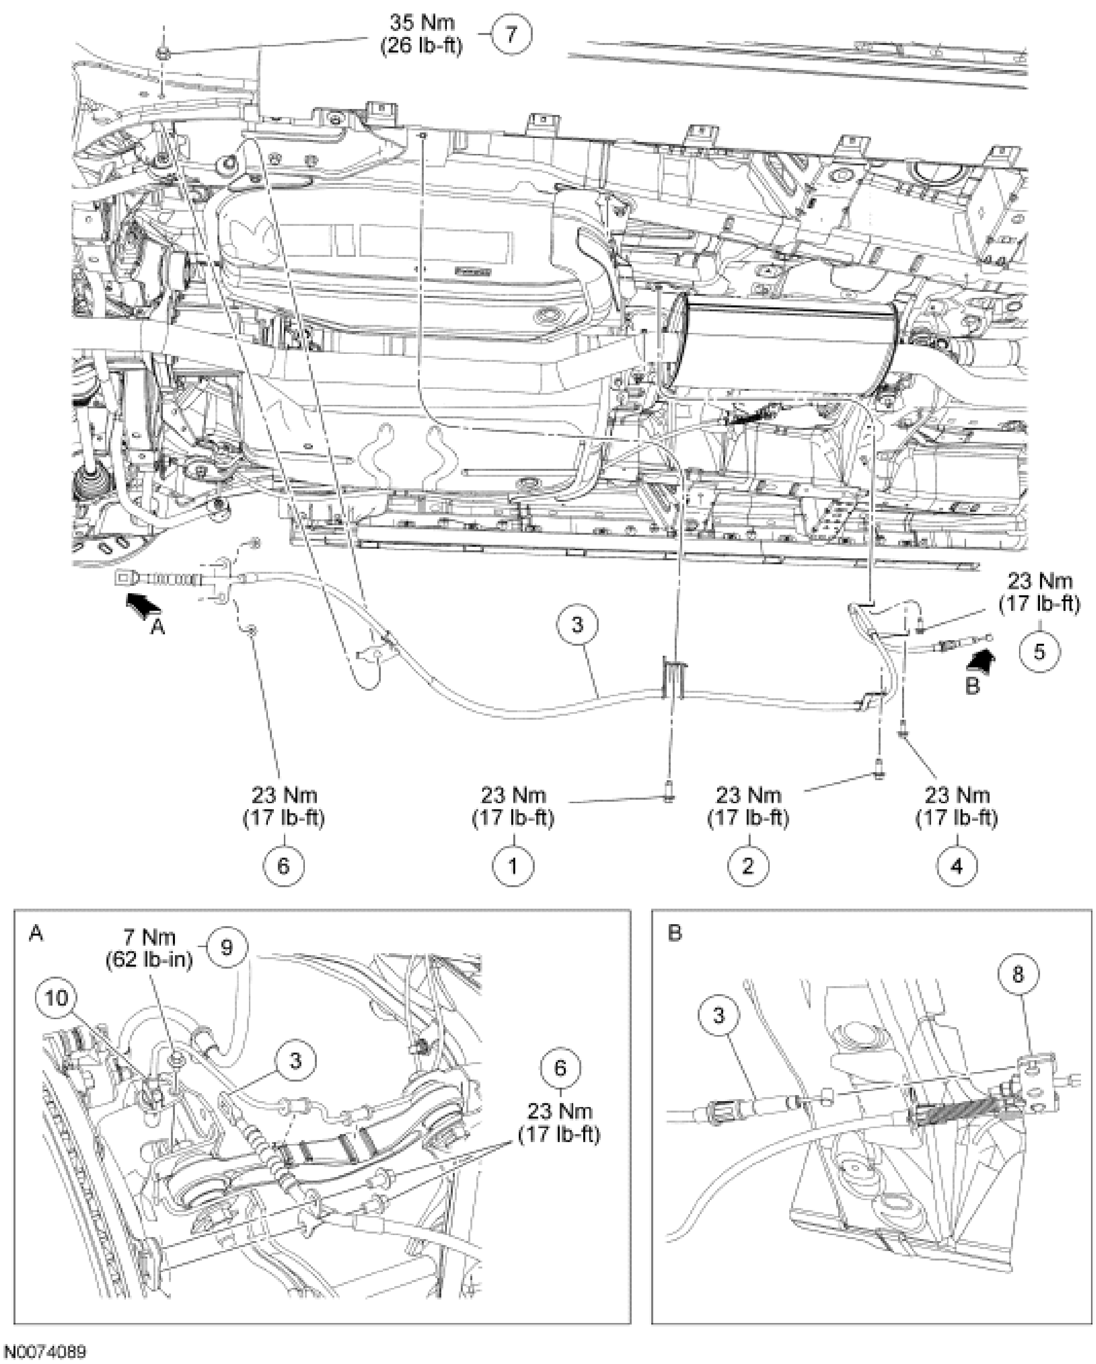


Fig. 7: Exploded View Of Rear RH Parking Brake Cable With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W708004	Parking brake cable rear bracket bolt
2	W708004	Parking brake cable middle bracket bolt

3	2A635	RH parking brake cable
4	W708004	Parking brake cable front LH bracket bolt
5	W708004	Parking brake cable front RH bracket bolt
6	W500021	Parking brake cable-to-support plate bolts (2 required)
7	W520414	Rear stabilizer bar link nut
8	-	Parking brake cable equalizer (part 2853)
9	W500010	Wheel speed sensor bolt
10	2C190	Wheel speed sensor

REMOVAL AND INSTALLATION

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Relieve the tension in the parking brake cable by loosening the equalizer adjustment nut.

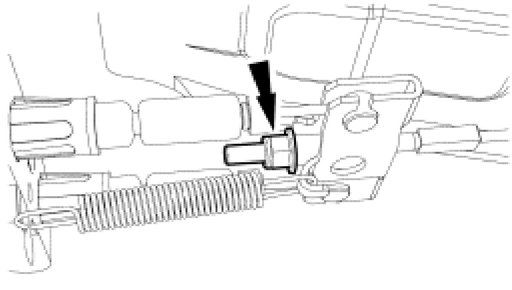

Fig. 8: Locating Equalizer Adjustment Nut
Courtesy of FORD MOTOR CO.

3. Disconnect the RH parking brake cable from the equalizer.
4. Squeeze the tabs and disconnect the RH parking brake cable from the bracket.

All wheel drive (AWD) vehicles

5. Remove the wheel speed sensor bolt and position the wheel speed sensor aside.
   - To install, tighten to 7 Nm (62 lb-in).

All vehicles

6. Remove the 2 parking brake cable-to-support plate bolts and disconnect the cable from the lever.
   - To install, tighten to 23 Nm (17 lb-ft).

7. Remove the stabilizer bar link nut and position the stabilizer bar link aside.
   - To install, tighten to 35 Nm (26 lb-ft).
8. Remove the 4 parking brake cable bracket bolts and the parking brake cable.
   - To install, tighten to 23 Nm (17 lb-ft).
9. To install, reverse the removal procedure.
   - Adjust the parking brake cable. For additional information, refer to **Parking Brake Cable Adjustment**.

PARKING BRAKE CABLE - FRONT

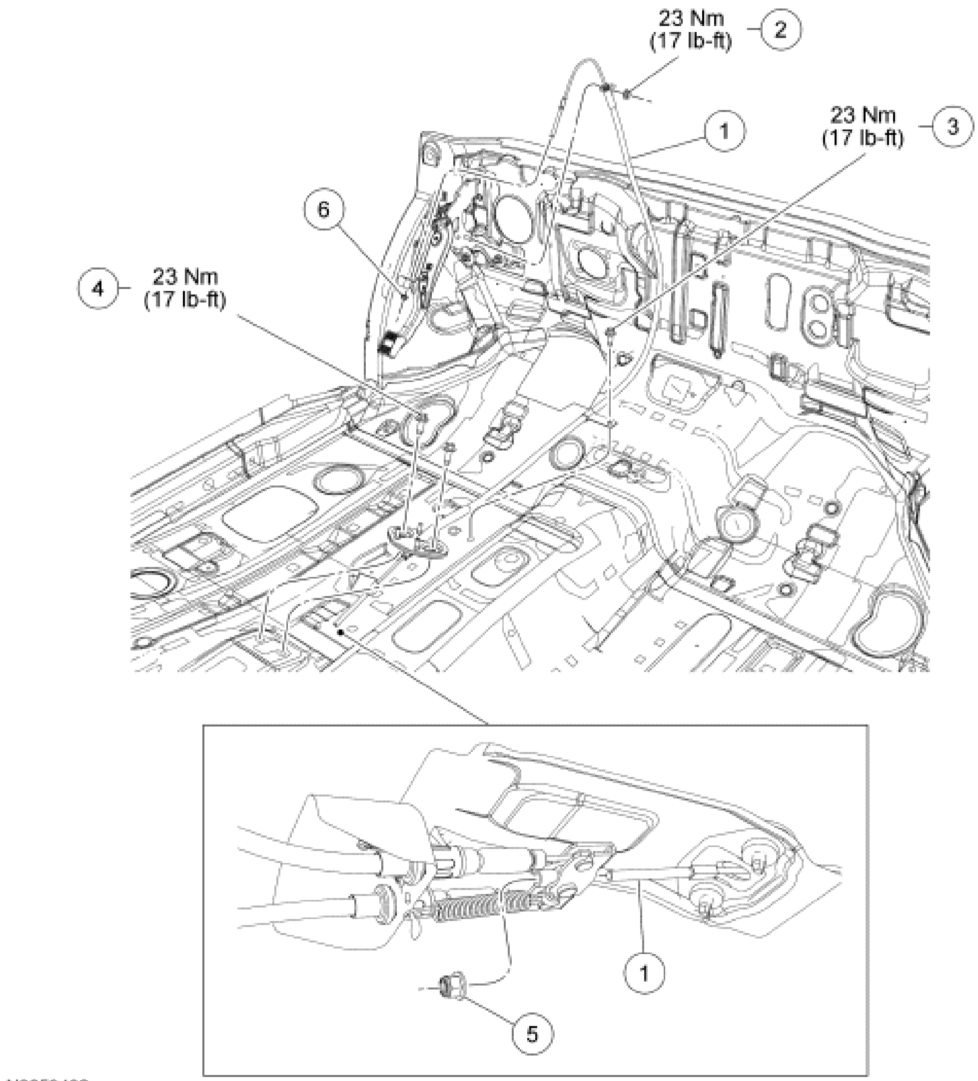

Fig. 9: Exploded View Of Front Parking Brake Cable With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2853	Front parking brake cable
2	-	Front parking brake cable-to-control nut (part of 2853)
3	W708004	Front parking brake cable bracket bolt
4	W708004	Front parking brake cable floor plate bolt (2 required)
5	W520201	Parking brake cable equalizer adjustment nut
6	-	Parking brake control adjustment nut (part of 2853)

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the parking brake cable equalizer adjustment nut and disconnect the front cable from the equalizer.
3. Remove the LH front seat. For additional information, refer to **SEATING** article.
4. Remove the LH front door scuff plate. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
5. Remove the parking brake control adjustment nut.
6. Remove the front parking brake cable-to-control nut and remove the front parking brake cable from the control.
    - To install, tighten to 23 Nm (17 lb-ft).
7. Remove the front parking brake cable bracket bolt.
    - To install, tighten to 23 Nm (17 lb-ft).
8. Remove the 2 front parking brake cable floor plate bolts.
    - To install, tighten to 23 Nm (17 lb-ft).
9. Remove the front parking brake cable.
10. To install, reverse the removal procedure.
    - Adjust the parking brake cable. For additional information, refer to **Parking Brake Cable Adjustment**.

PARKING BRAKE SHOES

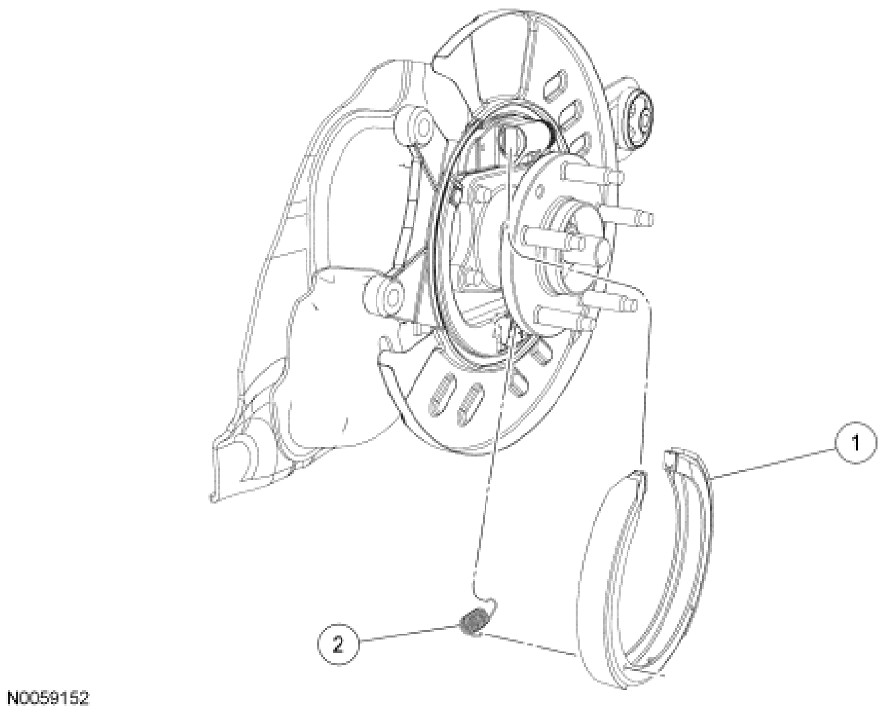

Fig. 10: Exploded View Of Parking Brake Shoes
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2648	Parking brake shoe
2	2L642	Parking brake shoe return spring

REMOVAL AND INSTALLATION

1. Remove the rear brake disc. For additional information, refer to **REAR DISC BRAKE** article.
2. Remove the parking brake shoe return spring.
3. Remove the parking brake shoe.
4. To install, reverse the removal procedure.
   - Check the parking brake for normal operation.

2008 ENGINE PERFORMANCE

Pinpoint Tests - Gasoline Engines

DIAGNOSTIC TESTS

PINPOINT TEST A: NO START

WARNING: **Stop this test at the first sign of a fuel leak and repair as required.**

No open flame. No smoking during fuel delivery checks.

Failure to follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- spark (as related to electronic engine control)
- powertrain control module (PCM) (12A650)

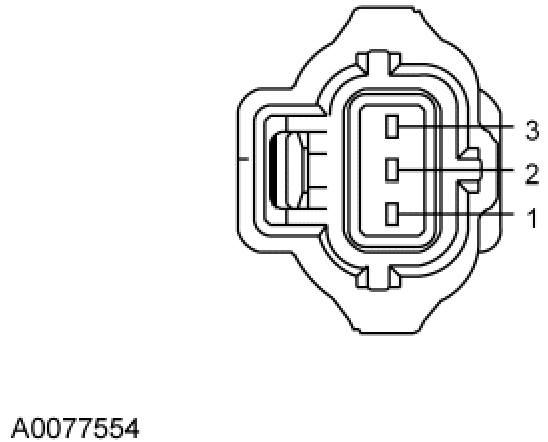

Fig. 1: Throttle Position (TP) Sensor Connector - A
Courtesy of FORD MOTOR CO.

Pin	Circuit
13	FEPS (Flash EEPROM Programming Signal)

A1 ATTEMPT TO CRANK THE ENGINE

NOTE: Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature for location.

- **Does the engine crank?**

Yes	No
GO to **A2**.	REFER to the **STARTING SYSTEM - GASOLINE ENGINES -- E-SERIES** and diagnose the engine does not crank symptom.

A2 IDENTIFY THE TYPE OF NO START

NOTE: The purpose of this test step is to identify intermittent no starts in order to determine the proper repair procedure.

- **Does the vehicle start?**

Yes	No
The vehicle has an intermittent no start. refer to **PINPOINT TEST Z**.	GO to **A3**.

A3 DETERMINE THE THROTTLE TYPE

- **Is the vehicle equipped with electronic throttle control?**

Yes	No
GO to **A5**.	GO to **A4**.

A4 CHECK THE VREF VOLTAGE TO TP SENSOR

- Key in OFF position.
- TP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **A6**.	refer to **PINPOINT TEST C**.

A5 CHECK VREF VOLTAGE TO ETBTPS SENSOR

- Key in OFF position.
- ETBTPS connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
ETCREF	ETCRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **A6**.	refer to **PINPOINT TEST C**.

A6 CHECK THE FLASH EEPROM PROGRAMMING SIGNAL (FEPS) CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- TP Sensor connector connected.
- ETBTPS connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) DLC, Harness Side	(-) Vehicle Battery
FEPS - Pin 13	Negative terminal

- **Is the voltage less than 9 V?**

Yes	No
GO to **A7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

A7 CHECK THE RPM IN THE PCM

NOTE: **Connect the scan tool to a reliable voltage source that is powered with the key in the START position (such as directly to the vehicle battery). Also verify that the vehicle battery is fully charged.**

NOTE: **Normal engine cranking speed is between 150 RPM and 350 RPM.**

- Access the PCM and monitor the RPM PID.
- Crank the engine while viewing the RPM PID.
- **Is the RPM between 150 RPM - 350 RPM?**

Yes	No
GO to **A8**.	For base engine concerns, REFER to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** - General Information and diagnose difficult starting symptom. For all others, GO to **JD2**.

A8 CHECK FOR CKP AND CMP SYNCHRONIZATION

- Access the PCM and monitor the SYNC PID.
- Crank the engine while viewing the SYNC PID.
- **Does the SYNC PID read YES?**

Yes	No
GO to **A9**.	GO to **JD2**.

A9 CHECK THE PCM DRIVER SIGNAL TO THE COILS

NOTE: Test lamp bulb filament wattages vary widely. The intensity and duration of blinking depends on the test lamp being used.

- Connect a test lamp between B+ and each coil driver circuit at the harness connector.
- Crank the engine.
- **Does the test lamp blink consistently for each coil driver (1 blink per engine revolution)?**

Yes	No
GO to **A10**.	For coil-on-plug (COP) ignition testing, GO to **JB2**. For coil pack ignition testing, GO to **JC2**.

A10 CHECK THE FUEL PRESSURE

WARNING: **The fuel system remains pressurized when the engine is not running. To prevent injury or fire, use caution when working on the fuel system.**

Refer to the fuel system WARNING information at the beginning of Pinpoint Test HC.

Failure to follow these instructions may result in personal injury.

NOTE: While activating the fuel pump on an electronic returnless fuel system a brief pressure spike may occur.

- Key in OFF position.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Connect the fuel pressure gauge to the Schrader valve using the appropriate fuel pressure test hose and adaptor.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Activate the fuel pump to obtain maximum fuel pressure.
- **Is the fuel pressure within specification (refer to the fuel pressure chart in Pinpoint Test HC)?**

Yes	No
GO to **A11**.	refer to **PINPOINT TEST HC**.

A11 CHECK THE FUEL PRESSURE LEAKDOWN

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Activate the fuel pump to obtain maximum fuel pressure.
- Exit output test mode.
- Monitor the fuel pressure.
- Verify the fuel pressure remains within 34 kPa (5 psi) of the maximum pressure for 1 minute after turning the pump off.
- **Does fuel pressure remain within 34 kPa (5 psi)?**

Yes	No
GO to **A12**.	refer to **PINPOINT TEST HC**.

A12 CHECK THE FUEL INJECTORS FOR VOLTAGE

NOTE: **A no start condition typically exists only if greater than half of the fuel injectors are without voltage. Check at least 2 fuel injectors, 1 on each bank on V type engines.**

- Key in OFF position.
- Disconnect 2 fuel injectors.
- Key ON, engine OFF.
- Measure the VPWR voltage at each fuel injector harness connector.
- **Is the voltage greater than 10 volts?**

Yes	No
GO to **A13**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

A13 CHECK THE FUEL INJECTORS' ABILITY TO DELIVER FUEL

- Cycle the key several times to charge the fuel system.
- Disable the fuel pump.
- Monitor the fuel pressure gauge while cranking the engine for at least 5 seconds.
- **Is there a pressure drop greater than 34 kPa (5 psi) while cranking the engine?**

Yes	No
The electronic engine control (EEC) system is not	

the cause of the no start. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to **A14**.

A14 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST B: POWERTRAIN CONTROL MODULE (PCM) POWER RELAY

NOTE: The IGN START/RUN and ground circuits, or the B+ and VPWR circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article Electronic Engine Control Cell for schematic and connector information.

This pinpoint test is intended to diagnose the following:

- harness circuits: B+, IGN START/RUN, INJPWRM, ISP-R, PCMRC, VPWR and GND
- PCM power relay (12A646)
- PCM (12A650)

		B37	PCMRC
All other vehicles	170 Pin	B35, B36	VPWR

B1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Is DTC P0685, P0689, or P0690 present?**

Yes	No
For DTCs P0685 or P0690, GO to **B8**. For DTC P0689, GO to **B11**.	GO to **B2**.

B2 CHECK THE B+ AND IGN START/RUN VOLTAGE TO PCM POWER RELAY

- Key in OFF position.
- PCM Power Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Power Relay Connector, Harness Side	(-)
B+	Ground
IGN START/RUN	Ground

- **Are the voltages greater than 10 V?**

Yes	No
For Crown Victoria, Grand Marquis, E-Series, Escape/Mariner, Ranger, and Town Car, GO to **B6**. For all others, GO to **B3**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B3 CHECK THE PCMRC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM	

Power Relay Connector, Harness Side	(-) PCM Connector, Harness Side
PCMRC	PCMRC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **B4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK THE PCMRC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
PCMRC	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **B5**.

B5 CHECK THE ISP-R VOLTAGE AT THE PCM HARNESS CONNECTOR

- Key in OFF position.
- PCM Power Relay connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **B7**.	REPAIR the open circuit. CLEAR the DTCs.

	REPEAT the self-test.

B6 CHECK THE PCM POWER RELAY GROUND CIRCUIT FOR AN OPEN

- Measure the voltage between:

(+) PCM Power Relay Connector, Harness Side	(-) PCM Power Relay Connector, Harness Side
B+	GND

- **Is the voltage greater than 10 V?**

Yes	No
GO to **B7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B7 CHECK FOR AN OPEN VPWR CIRCUIT BETWEEN THE PCM AND POWER RELAY

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Power Relay Connector, Harness Side	(-) PCM Connector, Harness Side
VPWR	VPWR

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new PCM Power relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B8 DTCS P0685 OR P0690: CHECK THE PCMRC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- PCM Power Relay connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
PCMRC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **B9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

B9 CHECK THE ISP-R CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **B10**.

B10 CHECK THE INJPWRM CIRCUIT FOR AN OPEN IN THE HARNESS

- INJ connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) INJ Connector, Harness Side
INJPWRM	VPWR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **B12**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B11 DTC P0689: CHECK THE ISP-R VOLTAGE AT THE PCM HARNESS CONNECTOR

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **B12**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B12 CHECK FOR CORRECT PCM OPERATION

- Key in OFF position.
- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST C: REFERENCE VOLTAGE (VREF)

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- harness circuits: ETCREF, ETCRTN, SIGRTN and VREF
- accelerator pedal position (APP) sensor (9F836)
- air conditioning pressure (ACP) transducer sensor (19D594)
- differential pressure feedback exhaust gas recirculation (EGR) sensor (9J460)
- EGR system module (ESM) (9Y456)
- fuel rail pressure temperature (FRPT) sensor (9G756)
- fuel tank pressure (FTP) sensor (9C052)
- manifold absolute pressure (MAP) sensor (9F479)
- power steering pressure (PSP) sensor (3N824)
- throttle position (TP) sensor (9B989)
- powertrain control module (PCM) (12A650)

NOTE:

- **ETCREF and ETCRTN are internally bussed within the PCM and are dedicated circuits for the APP sensor and the electronic throttle body TP sensor only. Refer to the Wiring Diagrams article Electronic Engine Controls Cell for schematic and connector information.**

C1 CHECK THE REFERENCE VOLTAGE TO SIGRTN/ETCRTN

NOTE: **Diagnostic trouble codes (DTCs) P0642 and P0643 are set due to VREF circuit concerns only. When diagnosing DTC P0642 or P0643, follow the path for VREF**

concerns.

- Key in OFF position.
- Disconnect the suspect sensor.
- Key ON, engine OFF.
- For ETCREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-) Suspect Sensor Connector, Harness Side
ETCREF	ETCRTN

- For VREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-) Suspect Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **C19**.	GO to **C2**.

C2 CHECK THE REFERENCE VOLTAGE TO GROUND

- For ETCREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the voltage between:

(+) Suspect	

Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **C18**.	GO to **C3**.

C3 CHECK THE REFERENCE VOLTAGE WITH ALL SENSORS DISCONNECTED

NOTE: **Refer to the Sensors Connected To VREF/ETCREF Chart at the beginning of this pinpoint test and the Wiring Diagrams article Electronic Engine Controls Cell to identify the sensors connected to VREF/ETCREF.**

- Key in OFF position.
- Disconnect all of the sensors connected to the VREF/ETCREF circuit.
- Key ON, engine OFF.
- Measure the voltage at the sensor disconnected in C1.
- For ETCREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For electronic throttle control (ETC) concerns, GO to **C8**.	GO to **C4**.

For all other VREF concerns, GO to **C10**.	

C4 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect the PCM.
- For ETCREF concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	ETCREF

- For VREF concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	VREF

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **C5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

- For ETCREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	ETCRTN

- Measure the resistance between:

(+) PCM	

Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
VREF	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **C6**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

C6 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VPWR

- For ETCREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	VPWR

- For VREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **C7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK THE REFERENCE VOLTAGE FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- For ETCREF concerns.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VREF	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **C20**.

C8 CHECK THE REFERENCE VOLTAGE WITH THE ELECTRONIC THROTTLE CONTROL CONNECTED

NOTE: If this sensor was used for the ETCREF measurement in C3, GO to C9.

- Key in OFF position.
- Connect the electronic throttle body throttle position sensor (ETBTPS).
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector,	(-)

Harness Side	
ETCREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
The concern is intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new ETBTPS. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C9 CHECK THE REFERENCE VOLTAGE WITH THE APP SENSOR CONNECTED

- Key in OFF position.
- Connect the APP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
ETCREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
The concern is intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C10 CHECK THE REFERENCE VOLTAGE WITH THE TP SENSOR CONNECTED

NOTE: If this sensor was used for the VREF measurement in C3, GO to C11.

- Key in OFF position.
- Connect the TP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect	

Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to **C11**. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C11 CHECK THE REFERENCE VOLTAGE WITH THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with a differential pressure feedback EGR sensor or if this sensor was used for the VREF measurement in C3, GO to C12.**

- Key in OFF position.
- Differential Pressure Feedback EGR Sensor connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to **C12**. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C12 CHECK THE REFERENCE VOLTAGE WITH THE ESM CONNECTED

NOTE: **If the vehicle is not equipped with an ESM or if this sensor was used for the VREF measurement in C3, GO to C13.**

- Key in OFF position.
- Connect the ESM.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to **C13**. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C13 CHECK THE REFERENCE VOLTAGE WITH THE MAP SENSOR CONNECTED

NOTE: If the vehicle is not equipped with a MAP sensor or if this sensor was used for the VREF measurement in C3, GO to C14.

- Key in OFF position.
- Connect the MAP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to **C14**. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new MAP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C14 CHECK THE REFERENCE VOLTAGE WITH THE FRPT SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with a FRPT sensor or if this sensor was used for the VREF measurement in C3, GO to C15.**

- Key in OFF position.
- Connect the FRPT sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to **C15**. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new FRPT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C15 CHECK THE REFERENCE VOLTAGE WITH THE FTP SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with a FTP sensor or if this sensor was used for the VREF measurement in C3, GO to C16.**

- Key in OFF position.
- Connect the FTP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No

For additional sensors disconnected, GO to **C16**. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C16 CHECK THE REFERENCE VOLTAGE WITH THE ACP TRANSDUCER SENSOR CONNECTED

NOTE: If the vehicle is not equipped with an ACP transducer sensor or if this sensor was used for the VREF measurement in C3, GO to C17.

- Key in OFF position.
- Connect the ACP transducer sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to **C17**. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.

C17 CHECK THE REFERENCE VOLTAGE WITH THE PSP SENSOR CONNECTED

- Key in OFF position.
- Connect the PSP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
The concern is intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new PSP sensor. CLEAR the DTCs. REPEAT the self-test.

C18 CHECK THE SIGRTN OR ETCRTN CIRCUIT(S) FOR AN OPEN

NOTE: Refer to the Wiring Diagrams article Electronic Engine Controls Cell for specific vehicle application and pin locations.

- Key in OFF position.
- Disconnect the PCM.
- For ETCRTN concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ETCRTN	ETCRTN

- For SIGRTN concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
SIGRTN	SIGRTN

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **C20**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

C19 CHECK THE SUSPECT SENSOR FOR AN INTERNAL SHORT

- Clear the KOEO, KOER, and continuous DTCs.
- Key in OFF position.
- Connect the suspect sensor.
- Key ON, engine OFF.
- Carry out the PCM self-test.
- **Is the concern still present?**

Yes	No
INSTALL a new sensor for the sensor in question. CLEAR the DTCs. REPEAT the self-test.	The concern is intermittent. refer to **PINPOINT TEST Z**.

C20 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DA: INTAKE AIR TEMPERATURE (IAT) SENSOR

This pinpoint test is intended to diagnose the following:

- integrated mass air flow/intake air temperature (MAF/IAT) sensor (12B579)
- harness circuits: IAT and SIGRTN
- powertrain control module (PCM) (12A650)

Voltage values calculated for VREF equal 5 volts. These values can vary by 15% due to sensor and VREF variations.

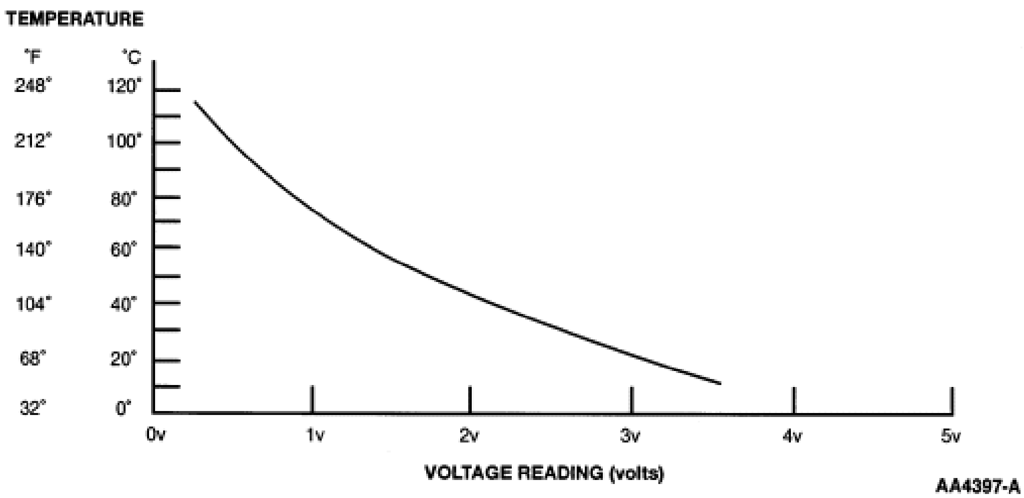

Fig. 30: Temperature Sensor Temperature To Voltage Graph
Courtesy of FORD MOTOR CO.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values	
°C	°F	Voltage	Resistance (K ohms)
120	248	0.28	1.18
110	230	0.36	1.55
100	212	0.47	2.07
90	194	0.61	2.80

Expedition, Fusion, Milan, MKZ, Navigator	140 Pin	B58 B43	SIGRTN IAT
F-150, Mark LT	190 Pin	E58 E22	SIGRTN IAT

Focus	190 Pin	B58 B47	SIGRTN IAT
All other vehicles	170 Pin	E58 E22	SIGRTN IAT

DA1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0111, P0112, P0113, P0114, or P1112 present?**

Yes	No
For DTC P0111, GO to **DA12**. For KOEO and KOER DTC P0112, GO to **DA6**. For KOEO and KOER DTC P0113, GO to **DA2**. For continuous memory DTCs P0112, P0113 or P1112, GO to **DA9**. For DTC P0114, GO to **DA9**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DA2 DTC P0113: CHECK THE IAT SIGNAL CIRCUIT

NOTE: The DTC indicates the sensor signal is greater than the self-test maximum.

- MAF/IAT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAF/IAT Sensor Connector, Harness Side	(-)
IAT - Pin 1	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **DA3**.	GO to **DA4**.

DA3 CHECK THE IAT SENSOR RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector,	(-) MAF/IAT Sensor Connector,

Component Side	Component Side
IAT - Pin 1	SIGRTN - Pin 2

- **Is the resistance between 1K - 500K ohms?**

Yes	No
GO to **DA4**.	INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DA4 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IAT - Pin 1	IAT
SIGRTN - Pin 2	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DA5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DA5 CHECK THE SIGNAL FOR A SHORT TO VOLTAGE IN HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAF/IAT Sensor Connector, Harness Side	(-)
IAT - Pin 1	Ground

- **Is the voltage greater than 1 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DA14**.

DA6 DTC P0112: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

NOTE: The DTC indicates the sensor signal is less than the self-test minimum.

- MAF/IAT Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the IAT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DA7**.

DA7 CHECK THE IAT CIRCUIT FOR A SHORT TO MAF RTN

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
IAT - Pin 1	MAF RTN - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DA8**.

DA8 CHECK THE IAT CIRCUIT FOR A SHORT TO GROUND

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
IAT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
IAT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DA14**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DA9 SELF-TEST DTCS P0112, P0113, P0114 OR P1112: INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the IAT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. If OK, INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DA10**.

DA10 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the IAT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No

ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DA11**.

DA11 CHECK THE PCM AND VEHICLE HARNESS CONNECTORS

- Key in OFF position.
- PCM connector disconnected.
- MAF/IAT Sensor connector disconnected.
- **Are the connectors and terminals OK?**

Yes	No
The concern is not present at this time. DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DA12 DTC P0111: CHECK THE RESISTANCE OF THE IAT SENSOR WITH THE ENGINE OFF

NOTE: **Verify the engine temperature is at ambient temperature before continuing with this test.**

- Key in OFF position.
- IAT Sensor connector disconnected.
- Measure the resistance between:

(+) IAT Sensor Connector, Component Side	(-) IAT Sensor Connector, Component Side
IAT	SIGRTN

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
GO to **DA13**.	INSTALL a new IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DA13 DTC P0111: CHECK THE RESISTANCE OF THE IAT SENSOR

NOTE: Verify the engine is at operating temperature before taking the IAT reading.

- IAT Sensor connector connected.
- Run the engine until the engine temperature stabilizes.
- Key in OFF position.
- IAT Sensor connector disconnected.
- Measure the resistance between:

(+) IAT Sensor Connector, Component Side	(-) IAT Sensor Connector, Component Side
IAT	SIGRTN

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
The concern is not present at this time. CARRY OUT the OBD drive cycle to determine if fuel, HO2S, catalyst and misfire monitors can be executed. REFER to On Board Diagnostic (OBD) Drive Cycle. REPEAT the PCM self-test if necessary.	INSTALL a new IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DA14 CHECK FOR CORRECT PCM OPERATION

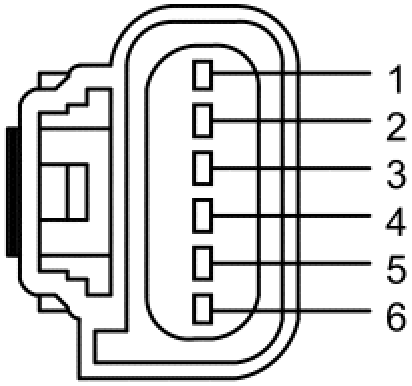
- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DC: MASS AIR FLOW (MAF) SENSOR

This pinpoint test is intended to diagnose the following:

- mass air flow (MAF) sensor (12B579)
- harness circuits: MAF SIG, MAF RTN, vehicle power (VPWR), power ground (PWRGND), IAT and SIGRTN
- powertrain control module (PCM) (12A650)



A0077520

Fig. 32: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - A
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	IAT (Intake Air Temperature)
2	SIGRTN (Signal Return)
4	MAF RTN (Mass Air Flow Return)
3	MAF (Mass Air Flow)
5	PWRGND (Power Ground)
6	VPWR (Vehicle Power)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, MKX, Sable, Taurus, Taurus X	190 Pin	B41 B42	MAF MAF RTN
Escape/Mariner	150 (50-50-50) Pin	B32	MAF

		B43	MAF RTN
Expedition, Fusion, Milan, MKZ, Navigator	140 Pin	B41 B42	MAF MAF RTN
F-150, Mark LT	190 Pin	E25 E26	MAF MAF RTN
Focus	190 Pin	B40 B41	MAF MAF RTN
All other vehicles	170 Pin	E25 E26	MAF MAF RTN

DC1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0102, P0103, P0104, P1100, or P1101 present?**

Yes	No
For KOER and continuous memory DTC P0102, P0104, GO to **DC5**. For DTC P0103, GO to **DC21**. For KOEO DTC P1101, GO to **DC7**. For KOER and continuous memory DTC P1101, GO to **DC2**. For continuous memory DTC P1100, GO to **DC19**.	For all other symptoms without DTCs, GO to **DC27**.

DC2 DTC P1101: CHECK FOR MAF SENSOR CONTINUOUS MEMORY DTCS

- Retrieve continuous memory DTCs.
- **Is a continuous memory MAF DTC present with the KOER DTC P1101?**

Yes	No
GO to **DC3**.	GO to **DC5**.

DC3 VERIFY CONTINUOUS MEMORY DTC P0102

- **Is a continuous memory DTC P0102 present with the KOER DTC P1101?**

Yes	No
GO to **DC5**.	GO to **DC4**.

DC4 VERIFY CONTINUOUS MEMORY DTC P0103

- **Is a continuous memory DTC P0103 present with the KOER DTC P1101?**

Yes	No
GO to **DC21**.	All other continuous memory DTCs: DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DC5 KOER AND CONTINUOUS MEMORY DTCS P0102, P0104 OR P1101: CHECK THE INTAKE AIR SYSTEM FOR LEAKS, OBSTRUCTIONS, AND DAMAGE

- Key in OFF position.
- Check the air inlet system (air cleaner, housing, duct work) for obstructions or blockage.
- Check for broken/loose air outlet tube clamps (throttle body and air cleaner assembly ends), cracks/holes in the air outlet tube, and worn gaskets between the MAF sensor and the air cleaner assembly. Check the throttle body bore for sludge. Verify the MAF sensor is connected. Repair as necessary.
- **Are there any concerns found during the visual inspection?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DC6**.

DC6 CHECK THE MAF PID

- Access the PCM and monitor the RPM PID.
- Run the engine up to 1,500 RPM for 5 seconds, then bring it back to idle.
- Access the PCM and monitor the MAF PID.
- **Is the voltage less than 0.23 V?**

Yes	No
GO to **DC9**.	GO to **DC7**.

DC7 CHECK THE MAF SIGNAL SENT TO THE PCM

NOTE: **DTC P1101 can be generated by a low charged vehicle battery or the garage exhaust ventilation system. Charge the battery as necessary, then remove the ventilation system and properly vent to the outside atmosphere. Check the air inlet system (air cleaner, housing, duct work) for obstructions or blockage. Repeat the KOEO self-test.**

- Key in OFF position.
- MAF/IAT Sensor connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.

- **Is the voltage less than 0.2 V?**

Yes	No
GO to **DC8**.	GO to **DC9**.

DC8 CHECK THE MAF SIGNAL SENT TO THE PCM

- Key ON, engine running.
- Access the PCM and monitor the MAF PID.
- **Is the voltage between 0.46 - 2.44 V?**

Yes	No
Unable to identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to **DC9**.

DC9 CHECK THE VPWR TO THE MAF SENSOR

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 6	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **DC10**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC10 CHECK THE PWRGND CIRCUIT TO THE MAF SENSOR

- Measure the voltage between:

(+) Vehicle Battery	(-) MAF/IAT Sensor Connector, Harness Side

Positive terminal	PWRGND - Pin 5

- **Is the voltage greater than 10 V?**

Yes	No
GO to **DC11**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC11 CHECK FOR SHORTS BETWEEN THE CIRCUITS IN THE MAF HARNESS

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF - Pin 3	PWRGND - Pin 5
MAF - Pin 3	MAF RTN - Pin 4
MAF - Pin 3	SIGRTN - Pin 2
MAF - Pin 3	IAT - Pin 1

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DC12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DC12 CHECK THE MAF RTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF RTN	MAF RTN - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DC13**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC13 CHECK THE MAF RTN CIRCUIT FOR A SHORT TO PWRGND IN THE HARNESS

- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF RTN - Pin 4	PWRGND - Pin 5

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DC14**.	REPAIR the short circuit to GND. CLEAR the DTCs. REPEAT the self-test.

DC14 CHECK THE MAF CIRCUIT FOR A SHORT TO PWRGND IN THE PCM

- PCM connector connected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF - Pin 3	PWRGND - Pin 5

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DC15**.	GO to **DC31**.

DC15 CHECK THE MAF CIRCUIT VOLTAGE CYCLING INTEGRITY

- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.

- Connect a 5 amp fused jumper wire between the following:

Point A MAF/IAT Sensor Connector, Harness Side	Point B MAF/IAT Sensor Connector, Harness Side
MAF RTN - Pin 4	PWRGND - Pin 5
MAF - Pin 3	VPWR - Pin 6

- Record the PID reading while both jumpers are installed.
- Remove the VPWR jumper while observing the MAF PID.
- **Does the MAF PID change from greater than 4.50 volts to less than 0.26 volt when the VPWR jumper is removed?**

Yes	No
INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to **DC16**.

DC16 CHECK THE MAF CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF	MAF - Pin 3

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DC17**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC17 CHECK THE PWRGND CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) Vehicle Battery
PWRGND - Pin 5	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DC18**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC18 CHECK THE MAF RTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF RTN	MAF RTN - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DC31**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC19 DTC P1100: CHECK THE MAF CIRCUIT FOR INTERMITTENT VOLTAGE TO THE PCM

- Check for broken/loose air outlet tube clamps (throttle body and air cleaner assembly ends), cracks/holes in the air outlet tube, and worn gaskets between the MAF sensor and the air cleaner assembly. Verify the MAF sensor is connected.
- Key ON, engine running.
- Access the PCM and monitor the MAF PID.
- If idle is not stable, refer to **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .
- Access the PCM and monitor the RPM PID.

- Run the engine up to 1,500 RPM for 5 seconds, then bring it back to idle.
- Lightly tap on the MAF sensor and wiggle the harness connector to simulate road shock.
- **Does the MAF PID go below 0.23 volt or above 4.6 volts?**

Yes	No
INSPECT the MAF/IAT sensor connector. If OK, INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to **DC20**.

DC20 CHECK THE MAF CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

- Key ON, engine running.
- Access the PCM and monitor the MAF PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Does the MAF PID go below 0.23 volt or above 4.6 volts?**

Yes	No
REPAIR as necessary. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	Unable to duplicate or identify the concern at this time. CLEAR the DTCs. REPEAT the self-test.

DC21 DTC P0103: CHECK THE MAF SENSOR SCREEN FOR CONTAMINATION

NOTE: **DTC P0103 can be generated by foreign material blocking the MAF sensor screen, causing an air flow restriction.**

- Check the MAF sensor screen for contamination or blockage.
- Check the air cleaner element and air tubes for proper installation and sealing.
- **Are any concerns present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DC22**.

DC22 DTC P0103: CHECK THE MAF SENSOR SIGNAL HIGH INPUT TO THE PCM

- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.
- **Is the voltage greater than 2.44 V?**

Yes	No
GO to **DC23**.	GO to **DC25**.

DC23 CHECK THE MAF SENSOR SIGNAL SENT TO THE PCM

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A MAF/IAT Sensor Connector, Harness Side	Point B MAF/IAT Sensor Connector, Harness Side
MAF RTN - Pin 4	PWRGND - Pin 5

- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.
- **Is the voltage less than 0.1 V?**

Yes	No
CHECK the MAF/IAT sensor electrical connector for damage, corrosion, and water ingress. If OK, INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to **DC24**.

DC24 CHECK THE MAF CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
MAF	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **DC26**.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

DC25 CHECK THE MAF SIGNAL SENT TO THE PCM

- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Monitor the MAF signal voltage while increasing the engine RPM from idle to approximately 2,500 RPM, and then back to idle.
- Access the PCM and monitor the MAF PID.
- **Is the voltage between 0.23 - 4.6 V?**

Yes	No
This is an intermittent concern. refer to **PINPOINT TEST Z**.	GO to **DC23**.

DC26 VERIFY THE IDLE CONCERN

- PCM connector connected.
- MAF/IAT Sensor connector connected.
- Key ON, engine running.
- **Is an idle concern present?**

Yes	No
DISREGARD DTC P0103 at this time. The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose unique idle concerns.	GO to **DC31**.

DC27 SYMPTOMS WITHOUT DTCS: CHECK THE CONDITIONS RELATED TO THE MAF SENSOR

- Check the air inlet system (air cleaner, housing, duct work) for obstructions or blockage.
- Check for broken/loose air outlet tube clamps (throttle body and air cleaner assembly ends), cracks/holes in the air outlet tube, and worn gaskets between the MAF sensor and the air cleaner assembly. Verify the MAF sensor is connected.
- **Is a concern present?**

Yes	No
REPAIR as necessary. RESET the keep alive	

memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to **DC28**.

DC28 DTCS P0171, P0172, P0174, P0175, P2195, P2196, P2197 OR P2198: CHECK THE FUNCTIONALITY OF THE MAF SENSOR

NOTE: A MAF PID value of less than 0.6 volt may indicate an incorrectly installed air cleaner or a leak in the air inlet system.

- Key ON, engine running.
- Allow the engine to stabilize at the correct operating temperature.
- Access the PCM and monitor the MAF PID.
- Check that the MAF PID at idle and NEUTRAL is not greater than 30% of the normal MAF listed in the **REFERENCE VALUES** article, Reference Values or not greater than 1.3 volts.
- **Is the PID value within the expected range?**

Yes	No
GO to **DC30**.	GO to **DC29**.

DC29 CHECK TO ISOLATE THE MAF SENSOR FROM A LEAN DRIVEABILITY OCCURRENCE

NOTE: Due to increasingly stringent emission/OBD requirements, a fuel system DTC on some vehicles can be generated without a noticeable driveability concern with or without the MAF sensor disconnected. Under these conditions, if the MAF PID indicates a MAF sensor concern, install a new MAF sensor. Refer to the ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES .

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- Key ON, engine running.
- Drive the vehicle on the road.
- **Is the lean driveability symptom (lack of power, spark knock/detonation, buck/jerk or hesitation/surge on acceleration) gone?**

Yes	No
INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to **DC30**.

DC30 VERIFY THE DTC

- **Are any of the following DTCs present:**

  P0171, P0172, P0174, P0175, P2195, P2196, P2197, or P2198?

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose performance while driving concerns.

DC31 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DD: FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

WARNING: **Vehicle fuel systems are pressurized even when the engine is not running. To avoid fire or personal injury, disable the fuel delivery system and relieve fuel system pressure before removing any fuel system component. Refer to the fuel system information at the beginning of pinpoint HC. Failure to follow these instructions may result in personal injury.**

NOTE: **With the engine running, the FRP PID value may be 48-70 kPa (7-10 psi) higher than a fuel pressure reading taken with a mechanical gauge.**

This pinpoint test is intended to diagnose the following:

- fuel rail pressure temperature (FRPT) sensor (9G756)

- harness circuits: FRP and FRT
- powertrain control module (PCM) (12A650)

FRPT SENSOR VOLTAGE AND PRESSURE SPECIFICATIONS

Voltage	Pressure (kPa)	Pressure (psi)
4.5	482	70
3.9	413	60
3.4	344	50
2.8	275	40
2.2	207	30
1.6	138	20
1.1	69	10
0.5	0	0

FRPT SENSOR TEMPERATURE, VOLTAGE, AND RESISTANCE SPECIFICATIONS

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	E40 E28 E41 E37	VREF FRT SIGRTN FRP
F-150, Mark LT	190 Pin	E57 E19 E58 E32	VREF FRT SIGRTN FRP
All other vehicles	170 Pin	E57 E19 E58 E32	VREF FRT SIGRTN FRP

DD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0180, P0181, P0182, P0183, P0190, P0191, P0192 or P0193 present?**

Yes	No

For DTC P0180, GO to **DD24**. For DTC P0181, GO to **DD26**. For continuous memory DTCs P0182 or P0183, GO to **DD2**. For KOEO and KOER DTCs P0182 or P0183, GO to **DD17**. For continuous memory DTC P0190, GO to **DD3**. For DTC P0191, GO to **DD11**. For continuous memory DTCs P0192 or P0193, GO to **DD16**. For KOEO and KOER DTCs P0192 or P0193, GO to **DD3**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DD2 CHECK THE FRPT AND PCM CONNECTORS FOR DAMAGE

- Key ON, engine OFF.
- Access the PCM and monitor the FRT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
  - Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM
- Check the FRPT and PCM connectors for damage and corrosion.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary.	DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DD3 CONTINUOUS MEMORY DTC P0190, KOEO AND KOER DTCS P0192 AND P0193: CHECK THE FRPT SENSOR FOR FUEL LEAKS

NOTE: Repair any fuel pump DTCs prior to this test.

- Key ON, engine running.
- Idle the engine for 2 minutes.
- Inspect the FRPT vacuum hose between the intake manifold and the FRPT sensor for air leaks and correct connection.
- Key in OFF position.
- Remove the vacuum hose from the FRPT.
- Inspect the FRPT and vacuum hose for traces of fuel.

- **Is any fuel present?**

Yes	No
INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DD4**.

DD4 CHECK THE VREF AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Connect the vacuum hose to the FRPT.
- FRPT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FRPT Sensor Connector, Harness Side	(-) FRPT Sensor Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 4

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For DTC P0190, GO to **DD12**. For DTC P0192, GO to **DD5**. For DTC P0193, GO to **DD7**.	refer to **PINPOINT TEST C**.

DD5 INDUCE A HIGH VOLTAGE ON THE FRPT CIRCUIT

- Key in OFF position.
- Connect a 5 amp fused jumper wire between the following:

Point A FRPT Sensor Connector, Harness Side	Point B FRPT Sensor Connector, Harness Side
VREF - Pin 2	FRP - Pin 1

- Key ON, engine OFF.
- Access the PCM and monitor the FRP PID.

- **Is the voltage greater than 4.5 V?**

Yes	No
INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DD6**.

DD6 CHECK THE FRP CIRCUIT FOR A SHORT TO FRT, SIGRTN, AND GND IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRP	SIGRTN
FRP	FRT

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
FRP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DD28**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD7 CHECK THE FRP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FRPT Sensor Connector, Harness Side
FRP	FRP - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DD8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DD8 CHECK THE FRP CIRCUIT FOR A SHORT TO VREF AND FRT IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRP	VREF
FRP	FRT

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DD9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD9 CHECK THE FRP CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) FRPT Sensor Connector, Harness Side	(-)
FRP - Pin 1	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DD10**.

DD10 INDUCE A LOW VOLTAGE ON THE FRPT CIRCUIT

- Key in OFF position.
- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A FRPT Sensor Connector, Harness Side	Point B FRPT Sensor Connector, Harness Side
FRP - Pin 1	SIGRTN - Pin 4

- Key ON, engine OFF.
- Access the PCM and monitor the FRP PID.
- **Is the voltage less than 0.01 V?**

Yes	No
INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DD28**.

DD11 DTC P0191: CHECK FOR FUEL PUMP DTCS

- Carry out the self-test.
- **Are DTCs P1233, P1234, P1235, P1236, P1237 or P1238 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DD12**.

DD12 INSPECT ALL THE VACUUM HOSES CONNECTED TO THE INTAKE MANIFOLD FOR LEAKS

- Key in OFF position.
- FRPT Sensor connector connected.
- Key ON, engine running.
- Allow the engine idle to stabilize.
- Inspect all the vacuum hoses connected to the intake manifold for leaks.

- **Are any vacuum hose concerns present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DD13**.

DD13 CHECK THE FRPT CONNECTOR FOR DAMAGE OR CORROSION

- Key in OFF position.
- FRPT Sensor connector disconnected.
- Inspect the sensor, wiring, and connector for damage, corrosion, or water intrusion.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DD14**.

DD14 CHECK THE FRP PID

NOTE: **The fuel pressure is likely to increase after the fuel pressure is relieved with the system closed. The rate and amount of the fuel pressure increase is dependent upon the ambient air and fuel temperatures.**

NOTE: **Prepare to record the FRP PID value within 5 seconds after the engine is shut off and also after the fuel pressure is relieved.**

- FRPT Sensor connector connected.
- Key ON, engine running.
- Allow the engine idle to stabilize.
- Access the PCM and monitor the FRP PID.
- Key in OFF position.
- Key ON, engine OFF.
- Record the FRP PID value within 5 seconds of the key off.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Disable the fuel pump.
- Key ON, engine OFF.
- Record the FRP PID value within 5 seconds of carrying out the fuel system pressure release procedure.
- **Is the difference between the recorded FRP PID values greater than 34 kPa (5 psi)?**

Yes	No

refer to **PINPOINT TEST HC**.	GO to **DD15**.

DD15 COMPARE THE FRP PID TO THE MECHANICAL GAUGE

NOTE: Most mechanical gauges are referenced to atmospheric pressure. The FRPT sensor is referenced to manifold pressure. In order to make a valid comparison, the engine must be off.

NOTE: The vehicle may exhibit a long crank until the fuel system is pressurized.

- Key in OFF position.
- Connect a mechanical fuel pressure gauge.
- Key ON, engine OFF.
- Monitor the mechanical gauge.
- Access the PCM and monitor the FRP PID.
- Compare the FRP PID value to the mechanical gauge.
- Key in OFF position.
- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- Key ON, engine running.
- Allow the fuel pressure to stabilize.
- Key in OFF position.
- Key ON, engine OFF.
- Compare the FRP PID value to the mechanical gauge.
- **Are the FRP PID values within 34 kPa (5 psi) of the mechanical gauge readings?**

Yes	No
GO to **DD28**.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DD16 CONTINUOUS MEMORY DTCS P0192 AND P0193: CHECK THE FRPT CIRCUIT FOR AN INTERMITTENT CONCERN

NOTE: Repair any fuel pump DTCs prior to this test.

- Key ON, engine OFF.

- Access the PCM and monitor the FRP PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
  - Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM
- Check the FRPT connector for damage or corrosion.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DD17 KOEO AND KOER DTCS P0182 OR P0183: CHECK THE RESISTANCE OF THE FRPT SENSOR

- Key in OFF position.
- FRPT Sensor connector disconnected.
- Measure the resistance between:

(+) FRPT Sensor Connector, Component Side	(-) FRPT Sensor Connector, Component Side
FRT - Pin 3	SIGRTN - Pin 4

- **Is the resistance between 2K - 96K ohms?**

Yes	No
GO to **DD18**.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DD18 CHECK THE FRPT FOR INTERNAL SHORTS

- Measure the resistance between:

(+) FRPT Sensor	

Connector, Component Side	(-)
FRT - Pin 3	Ground

- Measure the resistance between:

(+) FRPT Sensor Connector, Component Side	(-) FRPT Sensor Connector, Component Side
FRT - Pin 3	FRP - Pin 1
FRT - Pin 3	VREF - Pin 2

- **Are the resistances greater than 10K ohms?**

Yes	No
For DTC P0182, GO to **DD19**. For DTC P0183, GO to **DD21**.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DD19 CHECK THE FRT CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
FRT	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DD20**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD20 FRPT SENSOR: INDUCE A HIGH VOLTAGE ON THE FRT CIRCUIT

- PCM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the FRT PID.
- **Is the voltage greater than 4.5 V?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to **DD28**.

DD21 CHECK THE FRT AND SIG RTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FRPT Sensor Connector, Harness Side
FRT	FRT - Pin 3
SIGRTN	SIGRTN - Pin 4

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DD22**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DD22 CHECK THE FRT SIGNAL FOR A SHORT TO VREF AND FRP

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRT	VREF
FRT	FRP

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DD23**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD23 FOR THE FRPT SENSOR INDUCE A LOW VOLTAGE ON THE FRT CIRCUIT

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A FRPT Sensor Connector, Harness Side	Point B FRPT Sensor Connector, Harness Side
FRT - Pin 3	SIGRTN - Pin 4

- Key ON, engine OFF.
- Access the PCM and monitor the FRT PID.
- **Is the voltage less than 0.2 V?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to **DD28**.

DD24 DTC P0180: CHECK FOR THE PRESENCE OF DTC P0182 OR P0183

- Key ON, engine OFF.
- Carry out the self-test.
- **Are DTCs P0182 or P0183 present?**

Yes	No
GO to **DD17**.	GO to **DD25**.

DD25 CHECK THE FRT CIRCUIT FOR AN INTERMITTENT CONCERN

- PCM connector connected.
- Access the PCM and monitor the FRT PID.
- Carry out a thorough wiggle test on the FRPT sensor harness.
- **Is the FRT signal stable?**

Yes	No

GO to **DD27**.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DD26 KOEO AND KOER DTC P0181: CHECK THE FRT PID

NOTE: Allow vehicle temperatures to stabilize prior to temperature sensor tests.

- Key ON, engine OFF.
- The normal test range is 0°C to 100°C (32°F to 212°F).
- Access the PCM and monitor the FRT PID.
- **Is the voltage between 0.4 - 4.5 V?**

Yes	No
GO to **DD27**.	DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DD27 COMPARE THE PIDS AFTER STABILIZING THE VEHICLE TEMPERATURE

- Access the PCM and monitor the FRT, CHT and ECT PIDs.
- **Are the temperature PIDs nearly equal in value?**

Yes	No
The concern is not present at this time. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DD28 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

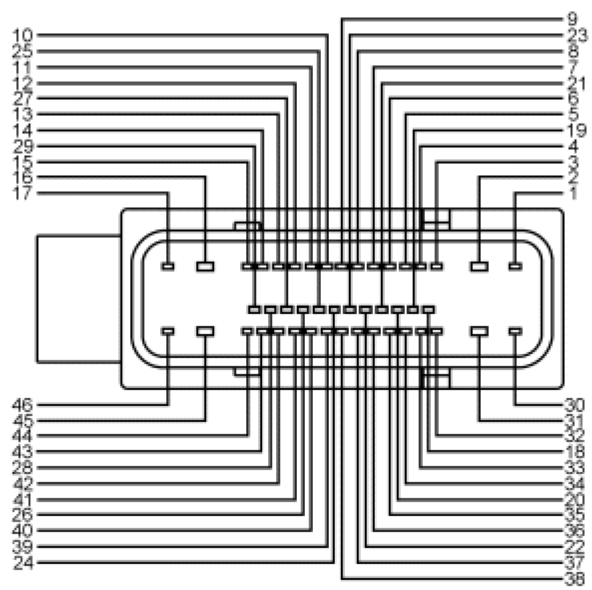
PINPOINT TEST DF: VEHICLE SPEED CIRCUIT (VSC) CHECK

WARNING: Strict observance of posted speed limits and driving conditions is mandatory when proceeding through the following drive cycles.

Failure to follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- harness circuits: VSC
- powertrain control module (PCM) (12A650)



A0077542

Fig. 34: Anti-lock Brake System (ABS) Module Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
21	VSC (Vehicle Speed Circuit)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
170 Pin	B29	VSC

DF1 DTCS P0500, P0503, P1500, P1501 AND P1502: CHECK THE VEHICLE SPEED CIRCUIT FOR INTERMITTENT CONCERNS

NOTE: The PCM detected an error in the vehicle speed information received from the ABS control module. This test step checks for the recurrence of this vehicle speed error.

- Key ON, engine OFF.
- Clear the DTCs.
- Gradually increase the vehicle speed to 80 km/h (50 mph).
- Coast to an idle and stop the vehicle.
- Key in OFF position.
- Key ON, engine OFF.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0500, P0503, P1500, P1501 or P1502 present?**

Yes	No
The vehicle speed input is incorrect. GO to **DF2**.	The vehicle speed input is correct. The concern that produced the original DTC may be intermittent. GO to **DF5**.

DF2 CHECK THE VSC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Anti-lock Brake System (ABS) Module connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VSC - Pin B29	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **DF3**.	GO to **DF6**.

DF3 CHECK FOR AN OPEN VSC BETWEEN THE PCM AND THE ABS CONTROL MODULE

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Anti-lock Brake System (ABS) Module Connector, Harness Side
VSC - Pin B29	VSC - Pin 21

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DF4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to **DF7**.

DF4 CHECK THE VSC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
VSC - Pin B29	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
REFER to the **VEHICLE DYNAMIC SYSTEMS -- E-SERIES** to continue diagnosis of the ABS control module, speed sensors and wheel speed sensor harness circuits. If these components are working properly, GO to **DF8**.	GO to **DF6**.

DF5 VISUAL INSPECTION

NOTE: Refer to the Wiring Diagrams article for harness, module, and connector locations.

- Key in OFF position.
- Visually inspect the VSC circuit harness and connectors at the PCM, ABS, and other VSC user modules for damage, loose connections, loose grounds, or incorrect routing.
- **Does the visual inspection reveal a concern?**

Yes	No

REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. GO to **DF7**.	Unable to duplicate or identify the concern at this time. REFER to the **VEHICLE DYNAMIC SYSTEMS -- E-SERIES** to continue diagnosis of the ABS control module, speed sensors and wheel speed sensor harness circuits.

DF6 VERIFY IF THE VSC IS SHORTED IN THE HARNESS OR ANOTHER MODULE

- Key in OFF position.
- Determine which, if any, modules are connected to the VSC. Refer to the Wiring Diagrams article. If no other modules are connected to the VSC, go to the YES Action To Take.
- One at a time, disconnect the modules associated with the VSC. After disconnecting each module, test again for a short circuit. (Refer to test step that sent you here). Repeat until each associated module is disconnected or the short circuit is eliminated.
- **Does the short circuit remain after all associated modules are disconnected?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. GO to **DF7**.	REFER to the Workshop article for further diagnosis of the appropriate module. GO to **DF7**.

DF7 VSC REPAIR VERIFICATION DRIVE CYCLE

NOTE: **Warm the engine to a normal operating temperature before continuing.**

NOTE: **Carry out the VSC drive cycle at least 3 times as described below.**

- Automatic Transmission Drive Cycle:
  - Place the transmission range selector lever in DRIVE range
  - Accelerate heavily to 56 km/h (35 mph)
  - Coast down to an idle and stop the vehicle
  - Cycle the key OFF and ON
- Manual Transmission Drive Cycle:
  - Accelerate moderately to 64 km/h (40 mph), while shifting from first to second gear
  - Coast down to an idle and stop the vehicle
  - Cycle the key OFF and ON
- Key in OFF position.
- Key ON, engine OFF.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0500, P0503, P1500, P1501 or P1502 present?**

Yes	No
REFER to the **VEHICLE DYNAMIC SYSTEMS -- E-SERIES** to continue diagnosis of the ABS control module, speed sensors and wheel speed sensor harness circuits. If these components are working properly, GO to **DF8**.	The repair has been verified.

DF8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DG: KNOCK SENSOR (KS)

This pinpoint test is intended to diagnose the following:

- knock sensors KS1, KS2 (12A699)
- harness circuits: KS1+, KS1-, KS2+, and KS2-
- powertrain control module (PCM) (12A650)

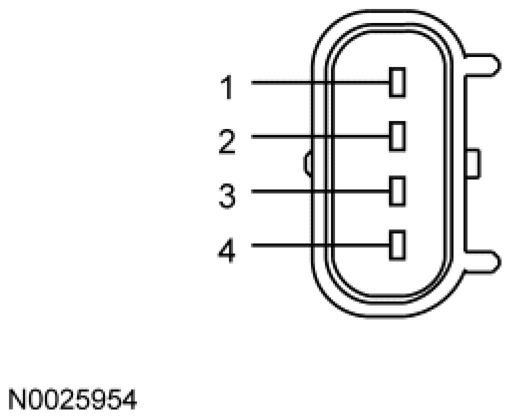


Fig. 35: Knock Sensor 1 (KS1) Connector - A
Courtesy of FORD MOTOR CO.

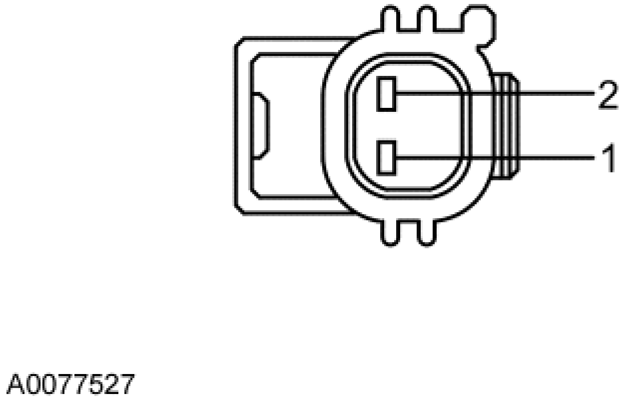

Fig. 36: Knock Sensor 1 (KS1) Connector - A
Courtesy of FORD MOTOR CO.

DG1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0325, P0326, P0330, or P0331 present?**

Yes	No
For KOER and continuous memory DTCs P0325, P0326, P0330 and P0331, GO to **DG2**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DG2 KOER AND CONTINUOUS MEMORY DTCS P0325, P0326, P0330 AND P0331: CHECK THE INTERNAL RESISTANCE OF THE KS

- KS connector disconnected.
- Measure the resistance between:

(+) KS Connector, Component Side	(-) KS Connector, Component Side
Suspect KS+	Suspect KS-

- **Is the resistance between 4.39M - 5.35M ohms?**

Yes	No
GO to **DG3**.	INSTALL a new KS. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DG3 CHECK THE KS+ CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	Suspect KS+

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DG4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG4 CHECK THE KS- CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS-	Suspect KS-

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DG5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG5 CHECK THE KS+ CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) Vehicle Battery
Suspect KS+	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DG6**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG6 CHECK THE KS- CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) Vehicle Battery
Suspect KS-	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DG7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG7 CHECK THE KS+ CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	VPWR
Suspect KS+	VREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DG8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG8 CHECK THE KS- CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS-	VREF
Suspect KS-	VPWR

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DG9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG9 CHECK THE KS+ CIRCUIT FOR INTERMITTENT CONCERNS

NOTE: **Carefully wiggle all accessible wiring and connectors associated with the KS circuit.**

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	Suspect KS+

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DG10**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG10 CHECK THE KS- CIRCUIT FOR INTERMITTENT CONCERNS

NOTE: **Carefully wiggle all accessible wiring and connectors associated with the KS circuit.**

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS-	Suspect KS-

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DG11**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG11 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY**	The system is operating correctly at this time. The concern may have been caused by a loose or

(EEPROM) , Programming the VID Block for a Replacement PCM.	corroded connector.

PINPOINT TEST DH: THROTTLE POSITION (TP) SENSOR

This pinpoint test is intended to diagnose the following:

- TP sensor (9B989)
- binding or sticking throttle linkage
- harness circuits: TP, SIGRTN, VREF, VPWR, and PWRGND
- powertrain control module (PCM) (12A650)

Escape/Mariner 2.3L, Ranger 2.3L	A	2 1 3	TP SIGRTN VREF
All other vehicles	B	2 3 1	TP SIGRTN VREF

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	E41 B47, B48, B49, B50 B40, E40 B35, B36 E19	SIGRTN PWRGND VREF VPWR TP
Ranger	170 Pin	E58 B47, B48, B49, B50 B40, E57 B35, B36 E61	SIGRTN PWRGND VREF VPWR TP

DH1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0068, P0121, P0122, P0123, P1120, or P1124 present?**

Yes	No
For DTC P0068, GO to **DH18**. For DTC P0121, GO to **DH24**. For KOEO and KOER DTC P0122, GO to **DH14**. For continuous memory DTC P0122, GO to **DH13**. For DTC P0123, GO to **DH9**. For DTC P1120, GO to **DH4**. For DTC P1124, GO to **DH2**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DH2 KOEO AND KOER DTC P1124: CHECK FOR ANY OTHER DTCS

- Key ON, engine OFF.
- Check for KOEO and KOER DTCs.
- **Is DTC P0405 present?**

Yes	No

DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DH3**.

DH3 CHECK FOR A STUCK THROTTLE PLATE OR LINKAGE

- Key in OFF position.
- Visually inspect the throttle linkage and throttle plate for binding or sticking.
- Verify the throttle plate and linkage is at closed throttle position.
- **Does the throttle move freely and return to a closed throttle position?**

Yes	No
The throttle plate and linkage are OK. GO to **DH9**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DH4 DTC P1120: CHECK THE TP CIRCUIT FOR FRAYED WIRES OR CORROSION ON THE CONNECTORS

- Key in OFF position.
- Carry out a visual inspection of the pins on the harness connector at the TP sensor for corrosion.
- Carry out a visual inspection of the harness wires between the TP sensor and the PCM for insulation fraying and corrosion.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DH5**.

DH5 CHECK FOR A STUCK TP SENSOR

- Key ON, engine OFF.
- Slowly move the throttle from the closed throttle position to the wide open throttle position and observe the TP PID.
- Access the PCM and monitor the TP PID.
- **Is the voltage greater than 4.5 V?**

Yes	No
GO to **DH22**.	GO to **DH6**.

DH6 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE TP SENSOR HARNESS CONNECTOR

- TP Sensor connector disconnected.

- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **DH7**.	refer to **PINPOINT TEST C**.

DH7 CHECK THE TP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TP Sensor Connector, Harness Side
TP	TP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DH8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DH8 CHECK THE TP SENSOR VOLTAGE TO THE PCM

- PCM connector connected.
- TP Sensor connector connected.
- Key ON, engine running.
- Idle the engine for 2 minutes.
- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Slowly move the throttle from the closed throttle position to the wide open throttle position and observe the TP PID.
- **Is the voltage between 0.17 - 0.49 V?**

Yes	No
INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	If DTC P1120 is still present, GO to **DH22**.

DH9 DTC P0123 OR DTC P1124: INDUCE THE OPPOSITE TP SENSOR VOLTAGE

- TP Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- **Is the voltage less than 0.17 V?**

Yes	No
GO to **DH10**.	GO to **DH11**.

DH10 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE TP SENSOR VEHICLE HARNESS CONNECTOR

- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST C**.

DH11 CHECK THE CIRCUIT FOR A SHORT TO VREF AND VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side

VPWR	TP
VREF	TP

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DH12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DH12 CHECK FOR AN INTERMITTENT SHORT TO VOLTAGE IN THE TP CIRCUIT

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VPWR	TP
VREF	TP

- Observe the digital multimeter (DMM) for an indication of a concern while shaking, wiggling, and bending the TP circuit between the TP sensor and the PCM.
- **Is a concern present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DH26**.

DH13 CONTINUOUS MEMORY DTC P0122: CHECK THE TP CIRCUIT FOR AN INTERMITTENT CONCERN

- Key ON, engine OFF.
- Clear the PCM DTCs.
- Key ON, engine running.
- Retrieve the continuous memory DTCs.
- **Is DTC P0122 present?**

Yes	No
GO to **DH14**.	refer to **PINPOINT TEST Z**.

DH14 KOEO AND KOER DTC P0122: CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE TP SENSOR VEHICLE HARNESS CONNECTOR

- Key in OFF position.
- TP Sensor connector disconnected.

- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **DH15**.	refer to **PINPOINT TEST C**.

DH15 CHECK THE TP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TP Sensor Connector, Harness Side
TP	TP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DH16**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DH16 CHECK THE TP CIRCUIT FOR A SHORT TO PWRGND OR SIGRTN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
TP	PWRGND
TP	SIGRTN

- **Are the resistances greater than 10K ohms?**

Yes	No

GO to **DH17**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DH17 INDUCE THE OPPOSITE TP SENSOR VOLTAGE

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A TP Sensor Connector, Harness Side	Point B TP Sensor Connector, Harness Side
VREF	TP

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- **Is the voltage greater than 4.65 V?**

Yes	No
INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DH26**.

DH18 DTC P0068: CHECK THE RATIONALITY BETWEEN THE TP AND MAF SENSORS

- Attempt to start the engine.
- **Does the engine start?**

Yes	No
GO to **DH19**.	CHECK for major leaks, cracks and openings between the MAF sensor and the throttle body. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. If OK, refer to **PINPOINT TEST A**.

DH19 CHECK THE TP SENSOR FOR MECHANICAL OPERATION

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Slowly move the throttle from the closed throttle position to the wide open throttle position and observe the TP PID.
- **Is the voltage between 0.49 - 4.65 V?**

Yes	No
GO to **DH20**.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH20 CHECK THE TP SENSOR SIGNAL HIGH VERSUS THE ENGINE LOAD WHILE DRIVING THE VEHICLE

- Key ON, engine running.
- Access the PCM and monitor the TP PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle, exercising the throttle and TP sensor.
- **Is the TP PID greater than 2.44 volts and the LOAD PID less than 30%?**

Yes	No
LISTEN for air noise around the MAF sensor and throttle body while the engine is running. REPAIR as necessary. If OK, INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DH21**.

DH21 CHECK THE TP SENSOR SIGNAL LOW VERSUS THE ENGINE LOAD WHILE DRIVING THE VEHICLE

- Key ON, engine running.
- Access the PCM and monitor the TP PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle while exercising the throttle and TP sensor near higher gears (preferably overdrive).
- **Is the TP PID less than 0.24 volt and the LOAD PID greater than 55%?**

Yes	No
If continuous memory DTC P0068 is present, INSTALL a new MAF sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DH22 CHECK FOR AN INTERMITTENT TP SIGNAL

- Key ON, engine running.
- Access the PCM and monitor the TP PID.
- Increase the engine speed to 1,500 RPM for 10 seconds.

- Lightly tap on the TP sensor and wiggle the harness connector to simulate road shock.
- **Is the voltage between 0.49 V - 4.65 V?**

Yes	No
GO to **DH23**.	INSPECT the TP sensor connector. REPAIR as necessary. If OK, INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH23 CHECK THE TP SENSOR HARNESS FOR INTERMITTENT OPENS OR SHORTS

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Grasp the vehicle harness closest to the TP sensor connector.
- Shake and bend a small section of the harness all the way to the bulkhead.
- Wiggle, shake, and bend the harness from the bulkhead to the PCM.
- **Is the voltage between 0.49 V - 4.65 V?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DH24 DTC P0121: CHECK FOR OBSTRUCTION OR STICKING CONCERNS

NOTE: Do not attempt to clean the throttle bore and plate area. Cleaning damages the throttle body assembly.

NOTE: Conditions of sticking or obstruction can either be within the cables or throttle body assembly.

- Disconnect the accelerator cable and speed control cable from the throttle body linkage.
- Rotate the throttle body linkage.
- **Does the throttle body rotate freely without a sticking, binding, or grabbing condition?**

Yes	No
INSPECT the cable(s). REPAIR as necessary. REPEAT the self-test. If DTC P0121 is still present,	INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL --**

GO to **DH25**.	**E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH25 CHECK THE FUNCTIONALITY OF THE THROTTLE POSITION SENSOR

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- While slowly pressing the accelerator from the closed throttle position to the wide open throttle position, observe the TP PID.
- **Does the TP PID display a smooth reading during accelerator movement?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH26 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DJ: AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

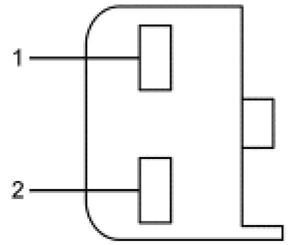
This pinpoint test is intended to diagnose the following:

- ACET sensor (19C734)
- harness circuits: ACET and SIGRTN
- powertrain control module (PCM) (12A650)

AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

°C	°F	Voltage	Resistance (K ohms)
100	212	0.47	2.08
90	194	0.61	2.8
80	176	0.80	3.84
70	158	1.05	5.34
60	140	1.37	7.55
50	122	1.77	10.93
40	104	2.23	16.11
30	86	2.74	24.25
20	68	3.26	37.34
10	50	3.73	58.99
0	32	4.14	95.85
-10	14	4.45	160.31
-20	-4	4.66	276.96

These values can vary by 15% due to sensor and VREF variations. Voltage values calculated for VREF are equal to 5 volts.



N0072971

Fig. 46: Powertrain Control Module (PCM) (12A650)
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	SIGRTN (Signal Return)
2	ACET (Air Conditioning Evaporator Temperature)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
140 Pin	B33, E57 B58, E58 B53	VREF SIGRTN ACET

DJ1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0537, P0538, P1436, or P1437 present?**

Yes	No
For KOEO and KOER DTCs P0538 or P1437, GO to **DJ2**. For KOEO and KOER DTCs P0537 or P1436, GO to **DJ6**. For continuous memory DTCs P0537, P0538, P1436 or P1437, GO to **DJ9**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DJ2 KOEO AND KOER DTCS P0538 OR P1437: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- ACET Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A ACET Sensor Connector, Harness Side	Point B ACET Sensor Connector, Harness Side
ACET - Pin 2	SIGRTN - Pin 1

- Check for self-test DTCs.
- **Are DTCs P0537 or P1436 present?**

Yes	No
INSTALL a new ACET sensor. CLEAR the DTCs. REPEAT the self-test.	GO to **DJ3**.

DJ3 CHECK THE ACET AND SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) ACET Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACET - Pin 2	ACET - Pin B53
SIGRTN - Pin 1	SIGRTN - Pin B58, E58

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DJ4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DJ4 CHECK THE ACET CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) ACET Sensor Connector, Harness Side	(-)
ACET - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **DJ5**.	REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

DJ5 CHECK THE ACET CIRCUIT FOR A SHORT TO VREF IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ACET - Pin B53	VREF - Pin E57

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DJ10**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DJ6 KOEO AND KOER DTCS P0537 OR P1436: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- ACET Sensor connector disconnected.
- Carry out the KOEO self-test.
- **Are DTCs P0538 or P1437 present?**

Yes	No
INSTALL a new ACET sensor. CLEAR the DTCs. REPEAT the self-test.	GO to **DJ7**.

DJ7 CHECK THE ACET CIRCUIT(S) FOR A SHORT TO SIGRTN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) ACET Sensor Connector, Harness Side	(-) ACET Sensor Connector, Harness Side
ACET - Pin 2	SIGRTN - Pin 1

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DJ8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DJ8 CHECK THE ACET CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) ACET Sensor Connector, Harness Side	(-)
ACET - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DJ10**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DJ9 CONTINUOUS MEMORY DTCS P0537, P0538, P1436 OR P1437: CHECK THE ACET AND SIGRTN CIRCUIT FOR AN INTERMITTENT CONCERN

NOTE: **The voltage should be between 4.5 and 5.5 volts. The voltage reading changes suddenly when a concern is detected. For P0537/P1436, a sudden change could indicate a short to ground. For P0538/P1436, a sudden change could indicate an**

open ACET or SIGRTN circuit.

- ACET Sensor connector disconnected.
- Inspect the connectors for signs of damage, water intrusion, or corrosion.
- Measure the voltage between:

(+) ACET Sensor Connector, Harness Side	(-) ACET Sensor Connector, Harness Side
ACET - Pin 2	SIGRTN - Pin 1

- Key ON, engine OFF.
- While monitoring the voltage reading on the digital multimeter (DMM), wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- Key in OFF position.
- **Is there any change in the voltage reading, or is a concern found?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DJ10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins.
  - corrosion.
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DK: ACCELERATOR PEDAL POSITION (APP) SENSOR

NOTE: After clearing an APP sensor diagnostic trouble code (DTC) to verify a repair or an intermittent concern, apply the accelerator pedal before carrying out the self-test. Take 10 seconds to carry out a full sweep of the accelerator pedal from fully released to fully applied and back to fully released.

This pinpoint test is intended to diagnose the following:

- accelerator pedal position (APP) sensor (9F836)
- harness circuits: ETCRTN, SIGRTN, ETCREF, APP1, APP2, and APP3
- powertrain control module (PCM) (12A650)

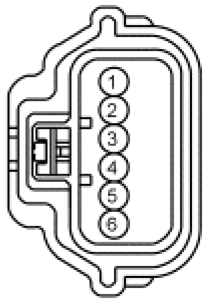


Fig. 47: Accelerator Pedal Position (APP) Sensor Connector - A
Courtesy of FORD MOTOR CO.

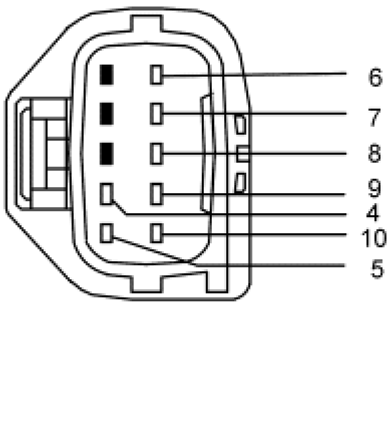

Fig. 48: Accelerator Pedal Position (APP) Sensor Connector - B
Courtesy of FORD MOTOR CO.

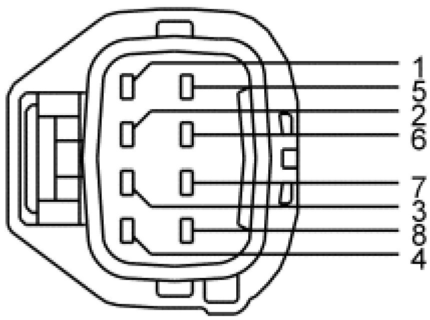

Fig. 49: Accelerator Pedal Position (APP) Sensor Connector - C

DK1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P1575, P2104, P2121, P2122, P2123, P2126, P2127, P2128, P2131, P2132, P2133, or P2138 present?**

Yes	No
	For a lack/loss of power, GO to **DK3**.

For DTC P1575, GO to **DK2**. For all others, GO to **DK4**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DK2 DTC P1575: REPEAT THE KOEO SELF-TEST

NOTE: Make sure the accelerator pedal is not applied during the KOEO self-test.

- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Are any DTCs present other than P1575?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DK3**.

DK3 CHECK THE ACCELERATOR PEDAL FOR OBSTRUCTION

- Key ON, engine OFF.
- Press the accelerator pedal fully to the floor and release.
- **Does the pedal move freely to the floor and back?**

Yes	No
GO to **DK4**.	ISOLATE and REPAIR the obstruction. CLEAR the DTCs. REPEAT the self-test.

DK4 CHECK THE APP SENSOR SIGNAL VOLTAGE RANGES FOR THE ACCELERATOR PEDAL FULLY APPLIED AND RELEASED POSITIONS

- Access the PCM and monitor the APP1, APP2 and APP3 PIDs.
- Press the accelerator pedal fully to the floor and release.

ACCELERATOR PEDAL FULLY APPLIED VOLTAGE VALUES

Vehicle	APP1	APP2	APP3
E-Series	0.73 - 1.28	3.03 - 4.55	2.59 - 3.89
Expedition, Navigator	0.79 - 2.09	2.75 - 4.33	2.26 - 3.73
Explorer, Explorer Sport Trac, Mountaineer	0.60 - 1.57	3.07 - 4.50	2.57 - 3.89
F-150, Mark	0.60 -	3.07 -	2.57 -

LT	1.57	4.50	3.89
F-Super Duty	0.28 - 0.97	3.45 - 4.71	2.95 - 4.10
Focus	3.69 - 4.60	1.75 - 2.40	-
Fusion, Milan, MKZ	1.20 - 2.50	2.50 - 3.94	2.00 - 3.33
All others	0.48 - 1.76	2.95 - 4.62	2.43 - 4.02

ACCELERATOR PEDAL FULLY RELEASED VOLTAGE VALUES

Vehicle	APP1	APP2	APP3
Focus	0.70 - 0.90	0.30 - 0.50	-
All vehicles	3.43 - 4.69	1.13 - 1.88	0.64 - 1.28

- **Are all APP signals out of range for the pedal fully applied and released positions?**

Yes	No
GO to **DK5**.	For continuous memory DTCs P2121 and P2126 with P2131, GO to **DK24**. For all others, GO to **DK5**.

DK5 CHECK THE VREF VOLTAGE TO APP SENSOR

- Key in OFF position.
- APP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
ETCREF	ETCRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
For E-Series, Explorer, Explorer Sport Trac, F-150, Mark LT, and Mountaineer, GO to **DK6**. For F-Super Duty, GO to **DK7**.	

For Fusion, Milan, and MKZ, GO to **DK10**. For Focus with DTC P2122, P2123, or P2138, GO to **DK12**. For Focus with DTC P2127 or P2128, GO to **DK16**. For all others, GO to **DK11**.	refer to **PINPOINT TEST C**.

DK6 E-SERIES, EXPLORER, EXPLORER SPORT TRAC, F-150, MARK LT, MOUNTAINEER: CHECK THE APP SENSOR FOR THE CORRECT RESISTANCE

NOTE: Make sure the accelerator pedal is fully released when taking the resistance measurements.

- Key in OFF position.
- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Component Side	(-) APP Sensor Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
APP1	ETCREF	550	1,390
APP1	ETCRTN	1,030	2,590
APP1	APP2	2,125	5,335
APP1	APP3	1,930	4,845
APP2	ETCREF	1,785	4,480

APP3	ETCRTN	1,135	2,860
ETCREF	ETCRTN	780	1,955
ETCREF	ETCREF	0	10
ETCRTN	ETCRTN	0	10

- **Are all the resistances within specifications?**

Yes	No
For DTCs P2121, P2122 or P2123 alone or in combination, GO to **DK12**. For DTCs P2126, P2127 or P2128 alone or in combination, GO to **DK16**. For DTCs P2131, P2132 or P2133 alone or in combination, GO to **DK20**. For DTC P2104 alone, GO to **DK30**.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal.

For a lack/loss of power, the concern is elsewhere. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction. For all others, GO to **DK24**.	CLEAR the DTCs. REPEAT the self-test.

DK7 F-SUPER DUTY: CHECK THE ACCELERATOR PEDAL CONFIGURATION AND APP SENSOR HOUSING

- Check the configuration of the accelerator pedal and determine the color of the APP sensor housing.
- **Is the vehicle equipped with an adjustable accelerator pedal?**

Yes	No
GO to **DK8**.	For F-Super Duty with a fixed accelerator pedal and a white APP sensor housing, GO to **DK9**. For all others, GO to **DK11**.

DK8 F-SUPER DUTY WITH ADJUSTABLE ACCELERATOR PEDAL: CHECK THE APP SENSOR FOR THE CORRECT RESISTANCE

NOTE: Make sure the accelerator pedal is fully released when taking the resistance measurements.

- Key in OFF position.
- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Component Side	(-) APP Sensor Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
APP1	ETCREF	550	1,390
APP1	ETCRTN	1,030	2,590

ETCREF	ETCRTN	200	470
ETCREF	ETCREF	0	10
ETCRTN	ETCRTN	0	10

- **Are all the resistances within specifications?**

Yes	No
For DTCs P2121, P2122 or P2123 alone or in	

combination, GO to **DK12**. For DTCs P2126, P2127 or P2128 alone or in combination, GO to **DK16**. For DTCs P2131, P2132 or P2133 alone or in combination, GO to **DK20**. For DTC P2104 alone, GO to **DK30**. For a lack/loss of power, the concern is elsewhere. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction. For all others, GO to **DK24**.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.

DK12 CHECK THE APP1 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- APP Sensor connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP1	APP1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DK13**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DK13 CHECK THE APP1 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) Vehicle Battery
APP1	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No

GO to **DK14**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK14 CHECK THE APP1 CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP1	ETCRTN
APP1	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DK15**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK15 CHECK THE APP1 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-) Vehicle Battery
APP1	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DK24**.

DK16 CHECK THE APP2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- APP Sensor connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP2	APP2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DK17**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DK17 CHECK THE APP2 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP2	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DK18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK18 CHECK THE APP2 CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP2	ETCRTN
APP2	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DK19**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK19 CHECK THE APP2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP2	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DK25**.

DK20 CHECK THE APP3 CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP3	APP3

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DK21**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DK21 CHECK THE APP3 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP3	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DK22**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK22 CHECK THE APP3 CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP3	ETCRTN
APP3	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DK23**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK23 CHECK THE APP3 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP3	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DK26**.

DK24 CHECK FOR THE APP1 CIRCUIT SHORTED TO SIGNALS IN THE SAME HARNESS

- Key in OFF position.
- PCM connector disconnected.

- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP1	APP2
APP1	APP3
APP1	ETCREF
APP1	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DK27**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK25 CHECK FOR THE APP2 CIRCUIT SHORTED TO SIGNALS IN THE SAME HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP2	APP1
APP2	APP3
APP2	ETCREF
APP2	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DK27**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK26 CHECK FOR THE APP3 CIRCUIT SHORTED TO SIGNALS IN THE SAME HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP3	APP1
APP3	APP2
APP3	ETCREF
APP3	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DK27**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK27 CHECK THE APP SENSOR CIRCUITS FOR AN INTERMITTENT CONCERN

- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP1	APP1
APP2	APP2
APP3	APP3

- **Are the resistances less than 5 ohms?**

Yes	No
For Focus, GO to **DK28**. For all others, GO to **DK30**.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DK28 CHECK FOR DTCS

- PCM connector connected.
- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Are DTCs P2122 and P2127 present?**

Yes	No
GO to **DK29**.	GO to **DK30**.

DK29 SIMULATE THE OPPOSITE SIGNAL

- Key in OFF position.
- Connect a 5 amp fused jumper wire between the following:

Point A APP Sensor Connector, Harness Side	Point B APP Sensor Connector, Harness Side
ETCREF	APP1
ETCREF	APP2

- Key ON, engine OFF.
- Access the PCM and monitor the APP1 and APP2 PIDs.
- **Are the voltages greater than 4.5 V?**

Yes	No
INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.	GO to **DK30**.

DK30 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DL: CYLINDER HEAD TEMPERATURE (CHT) SENSOR

This pinpoint test is intended to diagnose the following:

- cylinder head temperature (CHT) sensor (6G004)
- harness circuits: CHT, VREF, and SIGRTN
- powertrain control module (PCM) (12A650)

On applications that do not use an engine coolant temperature (ECT) sensor, the CHT sensor is used to determine the engine coolant temperature. To cover the entire temperature range of both the CHT and ECT sensors, the PCM has a dual switching resistor circuit on the CHT input. A graph showing the temperature switching from the COLD END line to the HOT END line, with increasing temperature and back with decreasing temperature is included. Note the temperature to voltage overlap zone. Within this zone it is possible to have either a COLD END or HOT END voltage at the same temperature. For example, at 90°C (194°F) the voltage could read either 0.60 volt or 3.71 volts. Refer to the table for the temperature to voltage expected values.

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

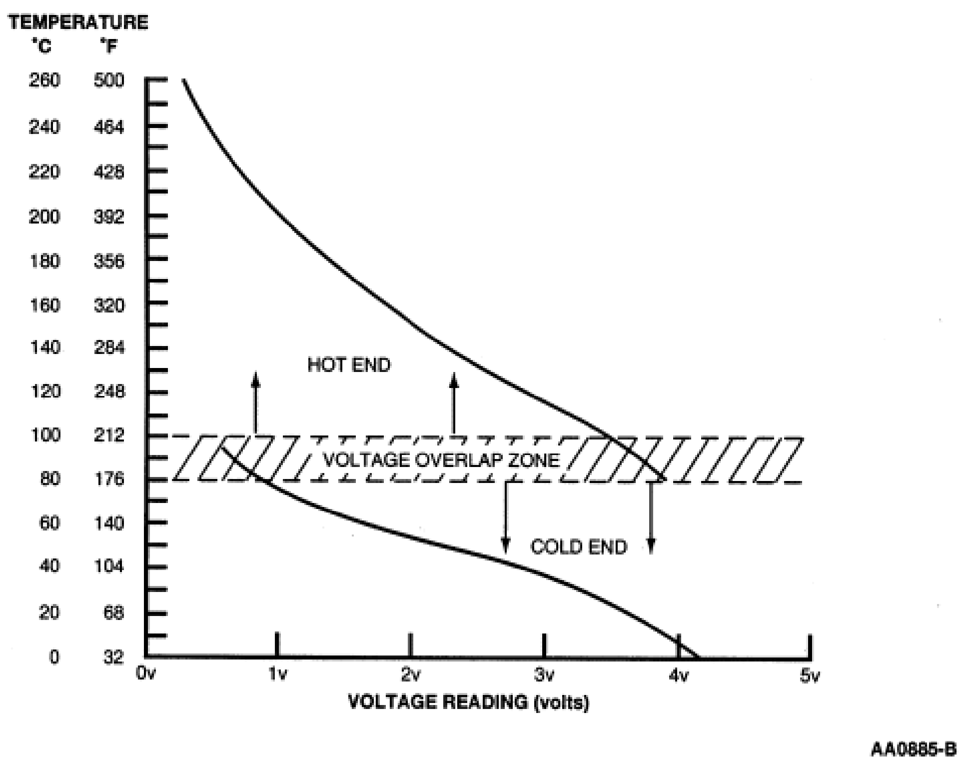

Fig. 50: Cylinder Head Temperature Sensor Voltage Graph
Courtesy of FORD MOTOR CO.

CYLINDER HEAD TEMPERATURE SENSOR EXPECTED VALUES

Temperature		CHT Sensor Values		
°C	°F	Cold End (volts)	Hot End (volts)	Resistance (K ohms)
-40	-40	4.89	-	965.808

-30	-22	4.81	-	513.019
-20	-4	4.67	-	283.664
-10	14	4.45	-	162.584

DL1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0116, P0119, P0125, P0128, P1116, P1285, P1288, P1289, P128A, P1290, or P1299 present?**

Yes	No
For DTCs P1116 or P1288, GO to **DL2**. For KOEO and KOER DTCs P1289 or P1290, GO to **DL8**. For continuous memory DTCs P0119, P1289, P128A, or P1290, GO to **DL15**. For KOEO or continuous memory DTC P1299, GO to **DL21**. For continuous memory DTCs P0125 or P0128, GO to **DL22**. For continuous memory DTC P0116, GO to **DL24**. For DTC P1285, GO to **DL18**.	For Temperature Warning Indicator Lamp or Gauge (applications with CHT sensor only) symptom, GO to **DL29**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DL2 SELF-TEST DTCS P1288 OR P1116: CHECK THE COOLING SYSTEM

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- The DTC indicates the temperature sensor is out of self-test range. The engine is not at normal operating temperature.
- Check the vehicle coolant level.
- **Is the cooling system OK?**

Yes	No
GO to **DL3**.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL3 CHECK IF THE VEHICLE ENGINE STARTS

- Attempt to start the engine.
- **Does the engine start and run normally?**

Yes	No
GO to **DL6**.	GO to **DL4**.

DL4 CHECK THE RESISTANCE OF THE CHT SENSOR WITH THE ENGINE OFF

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DL5**.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL5 CHECK THE CIRCUIT FROM THE MODULE TO THE COMPONENT

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- CHT Sensor connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the CHT PID.
- Using the data collected from the previous step, compare temperature resistance measured at the sensor to the PID temperature voltage measured at the PCM.
- **Does the measured value at the sensor agree with measured PID value at the PCM?**

Yes	No
The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** , for further direction.	GO to **DL12**.

DL6 CHECK THE CHT SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Carry out the PCM self-test.
- **Are DTCs P1116 or P1288 present?**

Yes	No
GO to **DL7**.	The engine temperature was not stabilized. REPAIR any other DTCs as necessary.

DL7 CHECK THE RESISTANCE OF THE CHT SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- The vehicle must be at normal operating temperature.
- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DL31**.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL8 DTCS P1289 OR P1290: ACCESS THE CHT PID AND CHECK THE VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the CHT PID.
- **Is the voltage less than 0.2 V?**

Yes	No

GO to **DL9**.	GO to **DL10**.

DL9 CHECK FOR A GROUNDED CIRCUIT

- CHT Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the CHT PID.
- **Is the voltage greater than 4.6 V?**

Yes	No
INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DL14**.

DL10 CHECK THE CHT CIRCUIT FOR A SHORT TO VOLTAGE

- CHT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CHT Sensor Connector, Harness Side	(-)
CHT - Pin 1	Ground

- **Is the voltage greater than 5.5 V?**

Yes	No
REPAIR the short circuit to PWR. CHECK the CHT sensor for damage. GO to **DL11**.	GO to **DL11**.

DL11 CHECK THE RESISTANCE OF THE CHT SENSOR WITH THE ENGINE OFF

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DL12**.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL12 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CHT - Pin 1	CHT
SIGRTN - Pin 2	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DL13**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DL13 CHECK THE SENSOR SIGNAL FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
CHT	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DL31**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DL14 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
CHT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
CHT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DL31**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DL15 DTCS P0119, P1289, P1290 OR P128A: INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the CHT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. If OK, INSTALL a new CHT sensor. REFER to the	

ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.	GO to **DL16**.

DL16 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the CHT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DL17**.

DL17 CHECK THE PCM AND VEHICLE HARNESS CONNECTORS

- PCM connector disconnected.
- CHT Sensor connector disconnected.
- **Are the connectors and terminals OK?**

Yes	No
GO to **DL31**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL18 SELF-TEST DTC P1285: EARLY WARNING OF ENGINE OVERHEAT CONDITION

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

NOTE: **If the electric cooling fan does not operate, return toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for electric cooling fan DTC. Return toNO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX for symptom diagnosis.**

- An engine overheat condition is sensed by the CHT sensor.
- Check the cooling system for:
  - correct coolant level
  - internal or external coolant leaks

- blockage of the radiator
- cooling fan operation

- **Is the cooling system OK?**

Yes	No
GO to **DL19**.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL19 CHECK THE OPERATION OF THE CYLINDER HEAD TEMPERATURE SENSOR

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Carry out the self-test.
- **Is DTC P1285 present?**

Yes	No
GO to **DL20**.	An engine overheat temperature was not detected. REPAIR any other DTCs as necessary.

DL20 CHECK THE RESISTANCE OF THE CHT SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- The vehicle must be at normal operating temperature.
- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DL31**.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** .

	CLEAR the DTCs. REPEAT the self-test.

DL21 SELF-TEST DTC P1299: INDICATES AN ENGINE OVERHEAT CONDITION

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

NOTE: Refer to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for possible causes and additional DTC description information.

- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the engine overheating condition. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL22 SELF-TEST DTCS P0125 OR P0128: CHECK THE ENGINE COOLANT LEVEL

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

NOTE: DTC P0125 or P0128 indicates the engine coolant temperature has not achieved the required engine operation temperature level, since start-up within a specified amount of time.

- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
GO to **DL23**.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL23 CHECK THE SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Access the PCM and monitor the CHT PID.
- **Is the temperature greater than 77°C (170.6°F)?**

Yes	No
The test is complete. CLEAR the DTCs. REPEAT the self-test.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnosis engine not reaching normal operating temperature. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL24 DTC P0116: CHECK THE RESISTANCE OF THE CHT SENSOR WITH THE ENGINE OFF

NOTE: **Verify the engine temperature is at ambient room temperature before continuing with this test. A soak period of 6 hours may be required. Refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for information concerning P0116.**

- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
GO to **DL25**.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL25 DTC P0116: CHECK THE RESISTANCE OF THE CHT SENSOR

NOTE: **Verify the engine is at operating temperature before taking the CHT reading.**

- CHT Sensor connector connected.
- Run the engine until the engine temperature stabilizes.
- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
The concern is not present at this time. CARRY OUT the OBD drive cycle to determine if fuel, HO2S, catalyst and misfire monitors can be executed. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . REPEAT the PCM self-test if necessary.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL26 DTC P0298: ENGINE OIL OVER TEMPERATURE CONDITION

NOTE: **The engine oil temperature protection strategy in the PCM has been activated. This protects the engine against mechanical damage due to overheating. Refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for possible causes and additional DTC description information.**

- Check for an overheating condition and base engine concerns.
- **Are there any overheating or base engine concerns?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DL27**.

DL27 CHECK FOR CHT DTCS

- Carry out the self-test.
- **Are DTCs P1285, P1288, P1289 or P1299 present?**

Yes	No
DISREGARD the engine oil temperature (EOT) diagnostic trouble code (DTC) at this time. ADDRESS the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DL28**.

DL28 ROAD TEST THE VEHICLE AND MONITOR FOR ENGINE OVER TEMPERATURE

- Access the freeze frame data (if available) and record the DTC malfunction conditions.
- Access the PCM and monitor the CHT PID.
- Test drive the vehicle and allow the engine to reach normal operating temperature.
- Observe CHT PID.
- **Does the engine overheat?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. REPAIR as necessary. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time.

DL29 ENGINE TEMPERATURE WARNING INDICATOR LAMP ON OR TEMPERATURE GAUGE INDICATES HOT, BUT ENGINE IS NOT OVERHEATING

NOTE: The PCM self-test must be carried out prior to entering this pinpoint test.

- **Was the PCM self-test carried out prior to entering this pinpoint test?**

Yes	No
GO to **DL30**.	The concern is elsewhere. RETURN to**PINPOINT TEST QT** for further direction.

DL30 ENGINE TEMPERATURE INDICATOR LAMP ON OR TEMPERATURE GAUGE INDICATES HOT WITH NO DTCS

NOTE: The engine temperature warning indicator (gauge or lamp) is a warning system that gives the driver information during an engine overheating condition. The PCM monitors the CHT sensor and determines if fail-safe cooling mode is needed. If fail-safe cooling mode is needed, the PCM sends a controller area network (CAN) message to the instrument cluster to signal an overheating condition. This causes the instrument cluster indicator to illuminate and forces the temperature gauge to the H (hot) zone. DTC P1285 is stored in the PCM.

NOTE: For Engine Temperature Warning Indicator system problems, refer to the INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES .

- PCM connector disconnected.
- Key ON, engine OFF.
- **Does the engine temperature warning indicator lamp turn OFF (prove out) and\or the temperature gauge return to the normal zone with the PCM disconnected?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	REFER to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect temperature gauge. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL31 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DM: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

This pinpoint test is intended to diagnose the following:

- manifold absolute pressure (MAP) sensor (9F479)
- harness circuits: MAP, SIGRTN, VREF
- powertrain control module (PCM) (12A650)

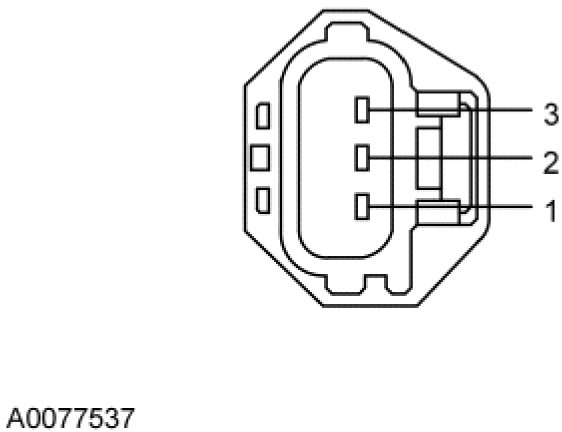

Fig. 52: Manifold Absolute Pressure (MAP) Sensor Connector - A
Courtesy of FORD MOTOR CO.

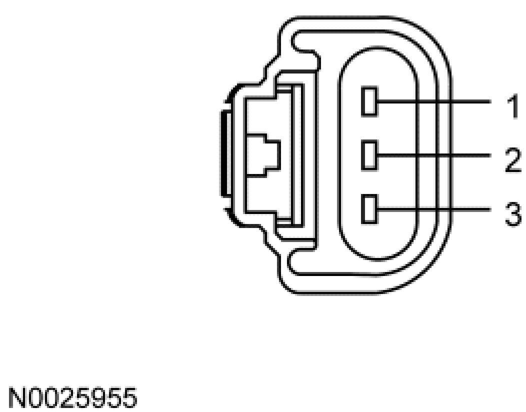

Fig. 53: Manifold Absolute Pressure (MAP) Sensor Connector - B
Courtesy of FORD MOTOR CO.

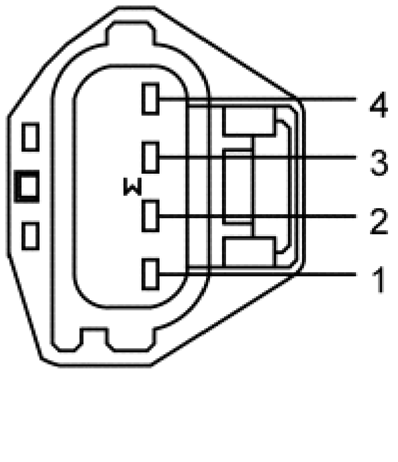

Fig. 54: Manifold Absolute Pressure (MAP) Sensor Connector - C
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Escape/Mariner 3.0L	A	2 3 1	MAP SIGRTN VREF
Fusion 3.0L, Milan 3.0L	B	1 2 3	MAP SIGRTN VREF
All other vehicles	C	1 4 2	MAP SIGRTN VREF

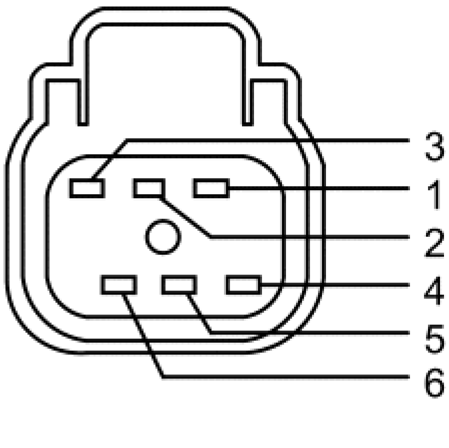

Fig. 55: EGR System Module (ESM) Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
4	VPWR (Vehicle Power)
3	MAP (Manifold Absolute Pressure)
6	SIGRTN (Signal Return)
2	VREF (Reference Voltage)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	B35, B36 B40, E40 B41, E41, T41 E23	VPWR VREF SIGRTN MAP
F-150	190 Pin	B51, B52, B53 B29, E57 B58, E58, T43 E62	VPWR VREF SIGRTN MAP
Focus	190 Pin	B67, B68 B52, B66, E63 B58, E64, T40 E40	VPWR VREF SIGRTN MAP
Fusion, Milan	140 Pin	B51, B52 B33, E57 B58, E58 E62	VPWR VREF SIGRTN MAP
All other vehicles	170 Pin	B35, B36 B40, E57 B41, E58, T41 E62	VPWR VREF SIGRTN MAP

DM1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0106, P0107, P0108, P0109, P012B, P012C, P012D, or P012E present?**

Yes	No
For vehicles with an EGR system module (ESM), KOEO, KOER DTCs P0107, P0108, P012C, or P012D. GO to **DM2**. For vehicles without an EGR system module (ESM), any DTC P0106, KOEO, KOER DTCs P0107 or P0108, GO to **DM20**. For vehicles with an EGR system module (ESM) continuous memory DTCs P0107, P0108, P012C, P012D or KOEO P0109, or P012E. GO to **DM14**. For vehicles without an EGR system module (ESM)	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

continuous memory DTCs P0107, P0108, or KOEO P0109, GO to **DM26**. For vehicles with an EGR system module (ESM) DTC P0106, or P012B. GO to **DM15**.	

DM2 DTCS P0107 AND P0108: MONITOR THE MAP PID

- Key ON, engine running.
- Carry out the KOER self-test.
- Access the PCM and monitor the MAP PID.
- **Is the voltage between 0.05 - 4.95 V?**

Yes	No
VERIFY the PCM is at the latest calibration level. REPROGRAM if necessary. If the PCM is at the latest calibration level, the concern is not present at this time.	GO to **DM3**.

DM3 VERIFY HARNESS AND CONNECTOR INTEGRITY

- Key in OFF position.
- ESM connector disconnected.
- Carry out a thorough visual inspection of the connector, pins and wires attaching to the pins.
- **Are there any concerns with the wiring or the ESM connection?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DM4**.

DM4 MONITOR THE MAP PID

- ESM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- **Is the voltage between 0.05 - 4.95 V?**

Yes	No
The concern is not present at this time. CLEAR the DTCs. REPEAT the self-test.	GO to **DM5**.

DM5 DETERMINE THE PRESENT MAP PID VOLTAGE

- Access the PCM and monitor the MAP PID.

- **Is the voltage less than 0.05 V?**

Yes	No
GO to **DM6**.	GO to **DM9**.

DM6 KOEO AND KOER DTC P0107: CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ESM HARNESS CONNECTOR

- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 6

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to **DM7**.	refer to **PINPOINT TEST C**.

DM7 CHECK THE MAP CIRCUIT FOR A SHORT TO SIGRTN AND GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) ESM Connector, Harness Side	(-)
MAP - Pin 3	Ground

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	SIGRTN - Pin 6

- **Is the resistance greater than 10K ohms?**

Yes	No

GO to **DM8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM8 INDUCE THE OPPOSITE MAP SENSOR VOLTAGE TO SIMULATE A HIGH CONDITION

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Harness Side
MAP - Pin 3	VREF - Pin 2

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- **Is the voltage greater than 4.6 V?**

Yes	No
INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DM27**.

DM9 KOEO AND KOER DTC P0108: CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ESM HARNESS CONNECTOR

- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 6

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to **DM10**.	refer to **PINPOINT TEST C**.

DM10 CHECK THE MAP AND SIGRTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP	MAP - Pin 3
SIGRTN	SIGRTN - Pin 6

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DM11**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DM11 CHECK THE MAP CIRCUIT FOR A SHORT TO VREF IN THE HARNESS

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	VREF - Pin 2

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DM12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM12 CHECK THE MAP CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	VPWR - Pin 4

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DM13**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM13 INDUCE THE OPPOSITE MAP SENSOR VOLTAGE TO SIMULATE A LOW CONDITION

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Harness Side
MAP - Pin 3	SIGRTN - Pin 6

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DM27**.

DM14 DTCS P0107, P0108 AND P0109: CHECK THE MAP CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Carry out a thorough wiggle test on the ESM harness.
- Lightly tap on the ESM and wiggle the harness connector to simulate road shock.
- **Does a sudden change in voltage occur while monitoring the PID?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DM15 DTC P0106: MAP RANGE/PERFORMANCE

NOTE: **If MAP DTC(s) P0107, P0108 or P0109 are present, diagnose those DTC(s) first. If any mass air flow (MAF) sensor related DTCs are present, diagnose those DTCs prior to diagnosing MAP DTC P0106. Disregard any DTC(s) generated as a result of this test.**

- Key in OFF position.
- ESM connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 6	SIGRTN - Pin 6

- Key ON, engine running.
- Measure the voltage between:

(+) ESM Connector, Component Side	(-) Vehicle Battery
MAP - Pin 3	Negative terminal

- **Is the voltage between 1 - 2 V?**

Yes	No
GO to **DM19**.	GO to **DM16**.

DM16 CHECK THE MAP CIRCUIT FOR AN OPEN IN THE ESM HARNESS

- Key in OFF position.
- Remove the jumper wires.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP	MAP - Pin 3

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DM17**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DM17 CHECK THE MAP CIRCUIT FOR A SHORT IN THE ESM HARNESS

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	SIGRTN - Pin 6
MAP - Pin 3	VREF - Pin 2
MAP - Pin 3	VPWR - Pin 4

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DM18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM18 KOEO AND KOER MAP VOLTAGE

NOTE: The MAP PID should change by at least 1.5 volts from key on engine off to key on engine running.

- Key in OFF position.
- ESM connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Record the KOEO MAP voltage.
- Key ON, engine running.
- Access the PCM and monitor the MAP PID.
- Record the KOER MAP voltage.
- **Does the MAP PID value change?**

Yes	No
GO to **DM19**.	CHECK the MAP hose for freezing or obstructions. If OK, INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DM19 COMPARE ACTUAL MAP VOLTAGE TO MAP PID VOLTAGE

- Key in OFF position.
- ESM connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

	Point B ESM

Point A ESM Connector, Harness Side	Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 6	SIGRTN - Pin 6
MAP - Pin 3	MAP - Pin 3

- Measure the voltage between:

(+) ESM Connector, Harness Side	(-)
MAP - Pin 3	Ground

- Record the actual MAP voltage values at key on engine off, idle, 1,000 and 2,000 RPM.
- Access the PCM and monitor the MAP PID.
- Record the MAP PID voltage values at key on engine off, idle, 1,000 and 2,000 RPM.
- **Does the MAP PID voltage stay within 0.5 volt of the actual MAP voltage?**

Yes	No
The concern is not present at this time. CLEAR the DTCs. REPEAT the self-test.	CARRY OUT a visual inspection. CHECK for loose connections, and damaged or corroded pins. WIGGLE the harness, attempting to RECREATE the concern. CLEAR the DTCs. REPEAT the self-test.

DM20 KOEO AND KOER DTCS P0106, P0107 AND P0108: CHECK THE VOLTAGE BETWEEN VREF AND SIGRTN AT THE MAP SENSOR

- MAP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-) MAP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **DM22**.	GO to **DM21**.

DM21 CHECK FOR VREF VOLTAGE AT THE SENSOR

- Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-) Vehicle Battery
VREF	Negative terminal

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
REPAIR the open SIGRTN circuit. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST C**.

DM22 CHECK MAP SIGNAL VOLTAGE AT THE SENSOR

- Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-) MAP Sensor Connector, Harness Side
MAP	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **DM24**.	GO to **DM23**.

DM23 CHECK THE MAP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) MAP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
MAP	MAP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DM24**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DM24 CHECK THE MAP CIRCUIT FOR A SHORT TO VOLTAGE OR SIGRTN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
MAP	VREF
MAP	SIGRTN
MAP	VPWR

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DM25**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM25 INDUCE THE OPPOSITE SIGNAL

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A MAP Sensor Connector, Harness Side	Point B MAP Sensor Connector, Harness Side
MAP	SIGRTN

- Access the PCM and monitor the MAP PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new MAP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** .	GO to **DM27**.

CLEAR the DTCs. REPEAT the self-test.	

DM26 DTCS P0107, P0108 AND P0109: CHECK THE MAP CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Carry out a thorough wiggle test on the MAP harness.
- Lightly tap on the MAP and wiggle the harness connector to simulate road shock.
- **Does a sudden change in voltage occur while monitoring the PID?**

Yes	No
GO to **DM20**.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DM27 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DP: OUTPUT SHAFT SPEED (OSS) SENSOR/VEHICLE SPEED SENSOR (VSS)/TRANSFER CASE SPEED SENSOR (TCSS)

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- OSS/VSS/TCSS (7F293/7M101/7H103)
- harness circuits: OSS/VSS, TCSS, and SIGRTN

- powertrain control module (PCM) (12A650)

DP1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

NOTE: For vehicles with automatic transmission and output shaft speed (OSS) sensor DTCs, refer to the DIAGNOSTIC METHODS -- GASOLINE ENGINES .

- **Are DTCs P0500, P0503, P0720, P0721, P0722, P0723, P1500, P1501, P1502 or P1900 present?**

Yes	No
For DTCs P0500, P0503, P1500, P1501 or P1502, with manual shift transfer case, GO to **DP16**. For DTCs P0500, P0720, P0721, P0722, P0723, P1502 or P1900, with a manual transmission or an electronic shift transfer case, GO to **DP2**. For DTCs P0503 or P1500, with a manual transmission or an electronic shift transfer case, GO to **DP13**. For DTC P1501, with a manual transmission or an electronic shift transfer case, GO to **DP12**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DP2 DTCS P0500, P0720, P0721, P0722, P0723, P1502 AND P1900: VERIFY THE DRIVE CYCLE

- Access the PCM and monitor the OSS PID.
- Access the PCM and monitor the VSS PID.
- Drive the vehicle.
- Monitor the PID in all transmission gear ranges while increasing and decreasing the speed.
- **Does the PID reading increase and decrease with engine and vehicle speed?**

Yes	No
GO to **DP3**.	GO to **DP4**.

DP3 VISUAL INSPECTION

- OSS/VSS connector disconnected.
- Inspect the OSS/VSS harness for damage.
- Inspect the OSS/VSS vehicle harness connector for damage and proper seating.
- If possible, carry out a wiggle test.

- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DP4 VERIFY THE TYPE OF OSS/VSS SENSOR

NOTE: The variable reluctance (VR) sensors have 2-wire connectors, Hall-effect sensors have 3-wire connectors.

- Key in OFF position.
- Inspect for a Hall-effect or a VR type of OSS/VSS sensor.
- **Is this a Hall-effect type OSS/VSS sensor?**

Yes	No
GO to **DP5**.	GO to **DP7**.

DP5 CHECK VOLTAGE TO THE OSS/VSS SENSOR

- Key in OFF position.
- OSS/VSS connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) OSS/VSS Connector, Harness Side	(-) Vehicle Battery
VPWR	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **DP6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP6 CHECK THE VPWR GROUND TO THE OSS/VSS SENSOR

- Key in OFF position.
- Measure the resistance between:

(+) OSS/VSS	

Connector, Harness Side	(-) Vehicle Battery
PWRGND	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DP7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP7 CHECK THE OSS/VSS CIRCUIT FOR A SHORT TO VREF AND VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- OSS/VSS connector disconnected.
- Measure the voltage between:

(+) OSS/VSS Connector, Harness Side	(-) Vehicle Battery
OSS/VSS	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **DP8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP8 CHECK THE OSS/VSS CIRCUIT(S) FOR AN OPEN IN THE HARNESS

NOTE: Hall-effect sensors are not equipped with a SIGRTN circuit. Disregard the SIGRTN measurement.

- Key in OFF position.
- PCM connector disconnected.
- OSS/VSS connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) OSS/VSS Connector, Harness Side
OSS/VSS	OSS/VSS

SIGRTN	SIGRTN
PWRGND	PWRGND

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DP9**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP9 CHECK THE OSS/VSS CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) OSS/VSS Connector, Harness Side	(-) OSS/VSS Connector, Harness Side
OSS/VSS	PWRGND

- **Is the resistance greater than 10K ohms?**

Yes	No
For Hall-effect sensors, GO to **DP10**. For VR sensors, GO to **DP11**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP10 CHECK THE OSS/VSS SIGNAL OUTPUT TO THE PCM, HALL-EFFECT TYPE SENSOR

NOTE: The opposite wheel must be held stationary.

- PCM connector disconnected.
- Raise the vehicle to allow for the rotation of the front drive wheels.
- Key ON, engine OFF.
- Transmission gear selector in NEUTRAL.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
OSS/VSS	PWRGND

- The voltage should rise above 5 volts and fall below 1 volt in a regular cycle. Observe several cycles.
- **Does the OSS/VSS output voltage rise and fall as specified?**

Yes	No

GO to **DP22**.	REMOVE the OSS/VSS sensor and inspect the target wheel. REPAIR as necessary. If OK, INSTALL a new OSS/VSS sensor. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP11 CHECK THE RESISTANCE OF THE OSS/VSS SENSOR

- Measure the resistance between:

(+) OSS/VSS Connector, Component Side	(-) OSS/VSS Connector, Component Side
OSS/VSS	SIGRTN

- **Is the resistance between 170 - 270 ohms (VSS) or 400 - 1.25K ohms (OSS)?**

Yes	No
GO to **DP22**.	REMOVE the OSS/VSS sensor and inspect the target wheel. REPAIR as necessary. If OK, INSTALL a new OSS/VSS sensor. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP12 KOER DTC P1501: CHECK THE VSS PID FOR AN INPUT SIGNAL

- Key ON, engine running.
- Access the PCM and monitor the VSS PID.
- Observe the VSS input to the PCM.
- Increase the engine speed, not greater than 2,000 RPM, several times while observing the VSS PID.
- **Is the reading on the PID less than 5 km/h (3 mph)?**

Yes	No
Unable to duplicate or identify the concern at this time. REFER to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for possible causes and additional DTC description information. If DTC P1501 still exists, refer to **PINPOINT TEST Z**.	GO to **DP15**.

DP13 DTCS P0503 AND P1500: INSPECT THE VSS AND THE CIRCUIT FOR AN INTERMITTENT

- Visually inspect the VSS and harness circuits for any potential failures.
- Use the following check list for reference:
    - loose wires/connectors
    - pushed out connector pins
    - damaged wiring harness insulation
    - incorrect harness routing
    - incorrect VSS mounting
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DP14**.

DP14 CHECK THE PCM VSS PID FOR AN INPUT SIGNAL

NOTE: For scan tools which have a data record feature, record the data for future playback to help identify any variations.

- Access the PCM and monitor the VSS PID.
- Drive the vehicle at several steady state speeds above and below 50 km/h (30 mph).
- **Are there any indicators of a noisy or intermittent signal with the VSS PID?**

Yes	No
GO to **DP15**.	Unable to duplicate or identify the concern at this time. REPAIR any other DTCs. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

DP15 CHECK THE VSS HARNESS ROUTING

NOTE: Refer to Pinpoint Test Schematic and Connectors at the beginning of this pinpoint test.

- Check the VSS harness routing:
    - Verify the harness is not routed adjacent to any high current wires such as ignition wires or generator wiring.
    - Verify the VSS harness is shielded and grounded, if applicable.
- Measure the resistance of the VSS harness.
- **Is a concern present?**

Yes	No

REPAIR as necessary.	Unable to duplicate or identify the concern at this time. REFER to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for possible causes and additional DTC description information. refer to **PINPOINT TEST Z**.

DP16 DTCS P0500, P0503, P1500, P1501 AND P1502: VISUAL INSPECTION OF TCSS

NOTE: **The TCSS provides the rotational speed of the output shaft of the transfer case.**

The PCM uses this information to control the powertrain behavior and on some applications it is used as the source for the vehicle speed information.

- TCSS connector disconnected.
- Inspect the TCSS vehicle harness connector for damage and proper seating.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DP17**.

DP17 CHECK THE RESISTANCE OF THE TCSS

- Measure the resistance between:

(+) TCSS Connector, Component Side	(-) TCSS Connector, Component Side
SIGRTN - Pin 1	TCSS - Pin 2

- **Is the resistance between 1K - 1.25K ohms?**

Yes	No
GO to **DP18**.	INSTALL a new TCSS. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP18 CHECK THE TCSS SENSOR OUTPUT

NOTE: **The opposite wheel must be held stationary.**

- With the vehicle in NEUTRAL and the parking brake off, position it on a hoist. Refer to the **JACKING AND LIFTING -- E-SERIES** for the locations of the lifting points.
- Raise the vehicle.
- Measure the frequency between:

(+) TCSS Connector, Component Side	(-) TCSS Connector, Component Side
SIGRTN - Pin 1	TCSS - Pin 2

- Monitor the TCSS signal while rotating the driven wheel as fast as possible.
- **Does the frequency reading increase and decrease with the wheel speed?**

Yes	No
GO to **DP19**.	REMOVE the TCSS and inspect the target wheel. REPAIR as necessary. If OK, INSTALL a new TCSS sensor. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP19 CHECK THE TCSS CIRCUIT(S) FOR A SHORT TO GROUND AND VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- TCSS connector disconnected.
- Measure the voltage between:

(+) TCSS Connector, Harness Side	(-)
TCSS - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **DP20**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP20 CHECK THE CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TCSS Connector, Harness Side
TCSS	TCSS - Pin 2
SIGRTN	SIGRTN - Pin 1

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DP21**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP21 CHECK THE HARNESS FOR A SHORT TO GROUND

- Measure the resistance between:

(+) TCSS Connector, Harness Side	(-) TCSS Connector, Harness Side
SIGRTN - Pin 1	TCSS - Pin 2

- Measure the resistance between:

(+) TCSS Connector, Harness Side	(-)
TCSS - Pin 2	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DP22**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP22 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.

- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DR: CAMSHAFT POSITION (CMP) SENSOR

This pinpoint test is intended to diagnose the following:

- camshaft position (CMP) sensor (6B288)
- harness circuits: CMP, CMP2, SIGRTN, VBPWR, VRSRTN, and VRSRTN2
- powertrain control module (PCM) (12A650)

DR1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0340, P0344, P0345, or P0349 present?**

Yes	No
For DTCs P0340, P0344, P0345 or P0349, GO to **DR2**.	For all others, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DR2 CONTINUOUS MEMORY DTCS P0340, P0344, P0345 AND P0349: CHECK IF THE ENGINE STARTS

- Attempt to start the engine.
- **Does the engine start?**

Yes	No
GO to **DR3**.	RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

DR3 CLEAR AND ATTEMPT TO RETRIEVE THE DTC

NOTE: If DTCs P0340, P0344, P0345, or P0349 are present, ignition, alternator noise, RFI and CKP concerns should be considered.

NOTE: For vehicles with variable camshaft timing (VCT), concerns with the engine oil level, oil filter, oil contamination, or the VCT system may cause camshaft positioning errors.

- Key ON, engine OFF.
- Clear the PCM DTCs.
- Key ON, engine running.
- Increase engine speed to greater than 1,500 RPM for 10 seconds. Repeat this 3 times.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0340, P0344, P0345 or P0349 present?**

Yes	No
GO to **DR4**.	refer to **PINPOINT TEST Z**.

DR4 CHECK THE GENERATOR FOR EXCESSIVE ELECTRICAL NOISE

NOTE: If the generator/regulator is electrically noisy, the noise decreases when the B+ connector is disconnected.

- PCM connector connected.
- CMP Sensor connector connected.
- Key ON, engine running.
- Monitor the generator for an audible electric noise.
- Key in OFF position.
- Generator/regulator B+ connector disconnected.
- Key ON, engine running.
- With the engine running, determine if the generator is still noisy.
- **Does the noise remain constant when the B+ connector is disconnected?**

Yes	No
For continuous memory DTCs P0340 or P0344, GO to **DR5**. For continuous memory DTCs P0345 or P0349, GO to **DR13**.	REFER to the **GENERATOR AND REGULATOR -- E-SERIES** to diagnose the generator is noisy symptom.

DR5 DETERMINE THE CMP SENSOR PHYSICAL TYPE

- Key in OFF position.
- **Is the CMP sensor a synchronizer (gear driven) type?**

Yes	No
GO to **DR6**.	GO to **DR7**.

DR6 VERIFY THE CORRECT INSTALLATION OF THE CMP SENSOR

NOTE: A CMP sensor identifies the cylinder 1 power stroke. A sensor that is improperly installed/indexed can identify the wrong cylinder as 1, produce a tip-in hesitation and generate DTC P0340.

- **Is the CMP sensor installed correctly?**

Yes	No
GO to **DR7**.	INSTALL the CMP sensor correctly. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** for the Camshaft Synchronizer removal and installation procedures. CLEAR the DTCs. REPEAT the self-test.

DR7 DETERMINE THE CMP SENSOR ELECTRONIC TYPE

NOTE: The variable reluctance (VR) sensors have 2-wire connectors, Hall-effect

sensors have 3-wire connectors.

- **Is the CMP sensor a VR type?**

Yes	No
GO to **DR8**.	The CMP sensor is a Hall-effect type. GO to **DR19**.

DR8 CONTINUOUS MEMORY DTCS P0340 AND P0344: CHECK THE CMP SENSOR RESISTANCE

- Key in OFF position.
- CMP Sensor connector disconnected.
- Measure the resistance between:

(+) CMP Sensor Connector, Component Side	(-) CMP Sensor Connector, Component Side
CMP	SIGRTN
CMP	VRSRTN

Vehicle	Minimum Resistance (ohms)	Maximum Resistance (ohms)
Edge, MKX	586	2,033
F-150 4.6L	1,978	5,590
F-150, Mark LT	205	579
MKZ	586	2,033
Taurus, Taurus X, Sable	586	2,033
All others	250	1,000

- **Is the resistance within specification?**

Yes	No
GO to **DR9**.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR9 CHECK THE CMP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
CMP	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **DR10**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR10 CHECK THE CMP AND SIGRTN OR VRSRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CMP Sensor Connector, Harness Side
CMP	CMP
SIGRTN	SIGRTN
VRSRTN	VRSRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DR11**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR11 CHECK FOR A SHORT IN THE HARNESS BETWEEN THE PCM AND THE CMP SENSOR

- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) CMP Sensor Connector, Harness Side

CMP	SIGRTN
CMP	VRSRTN

- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
CMP	Negative terminal
SIGRTN	Negative terminal
VRSRTN	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DR12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR12 CHECK THE CMP SENSOR OUTPUT

- Key in OFF position.
- Generator/regulator B+ connector connected.
- CMP Sensor connector disconnected.
- Key ON, engine running.
- Digital multimeter (DMM) on low voltage AC scale.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) CMP Sensor Connector, Component Side
CMP	SIGRTN
CMP	VRSRTN

- Run the engine at approximately 2,500 RPM.
- **Is the voltage greater than 0.25 V?**

Yes	No

For Edge, Expedition, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 5.4L, F-Super Duty 5.4L, Fusion, Mark LT, Milan, MKX, MKZ, Mountaineer 4.6L, Mustang 4.6L, Navigator, Sable, Taurus, and Taurus X, GO to **DR25**. For all others, GO to **DR26**.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR13 CONTINUOUS MEMORY DTCS P0345 AND P0349: CHECK THE CMP2 SENSOR RESISTANCE

- Key in OFF position.
- CMP2 Sensor connector disconnected.
- Measure the resistance between:

(+) CMP2 Sensor Connector, Component Side	(-) CMP2 Sensor Connector, Component Side
CMP2	SIGRTN
CMP2	VRSRTN
CMP2	VRSRTN2

Vehicle	Minimum Resistance (ohms)	Maximum Resistance (ohms)
Edge, MKX	586	2,033
F-150, Mark LT	205	579
MKZ	586	2,033
Taurus, Taurus X, Sable	586	2,033
All others	250	1,000

- **Is the resistance value(s) within specifications?**

Yes	No
GO to **DR14**.	INSTALL a new CMP2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR14 CHECK THE CMP2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP2 Sensor Connector, Harness Side	(-) Vehicle Battery
CMP2	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **DR15**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR15 CHECK THE CMP2 AND SIGRTN, VRSRTN, OR VRSRTN2 CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CMP2 Sensor Connector, Harness Side
CMP2	CMP2
SIGRTN	SIGRTN
VRSRTN	VRSRTN
VRSRTN2	VRSRTN2

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DR16**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR16 CHECK FOR A SHORT IN THE HARNESS BETWEEN THE PCM AND THE CMP2 SENSOR

- Measure the resistance between:

(+) CMP2 Sensor Connector, Harness Side	(-) CMP2 Sensor Connector, Harness Side
CMP2	SIGRTN
CMP2	VRSRTN
CMP2	VRSRTN2

- Measure the resistance between:

(+) CMP2 Sensor Connector, Harness Side	(-) Vehicle Battery
CMP2	Negative terminal
SIGRTN	Negative terminal
VRSRTN	Negative terminal
VRSRTN2	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DR17**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR17 CHECK FOR A SHORT BETWEEN THE CMP AND THE CMP2 CIRCUITS

- CMP Sensor connector disconnected.
- CMP2 Sensor connector disconnected.
- Measure the resistance between:

(+) PCM	(-) PCM

Connector, Harness Side	Connector, Harness Side
CMP	CMP2

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DR18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR18 CHECK THE CMP2 SENSOR OUTPUT

- Key in OFF position.
- Generator/regulator B+ connector connected.
- CMP2 Sensor connector disconnected.
- Key ON, engine running.
- DMM on low voltage AC scale.
- Measure the voltage between:

(+) CMP2 Sensor Connector, Component Side	(-) CMP2 Sensor Connector, Component Side
CMP2	SIGRTN
CMP2	VRSRTN
CMP2	VRSRTN2

- Run the engine at approximately 2,500 RPM.
- **Is the voltage greater than 0.25 V?**

Yes	No
For Edge, Expedition, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 5.4L, F-Super Duty 5.4L, Fusion, Mark LT, Milan, MKX, MKZ,	INSTALL a new CMP2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

Mountaineer 4.6L, Mustang 4.6L, Navigator, Sable, Taurus, and Taurus X, GO to **DR25**. For all others, GO to **DR26**.	

DR19 CONTINUOUS MEMORY DTCS P0340 AND P0344: CHECK THE VOLTAGE TO THE CMP SENSOR

- CMP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
VPWR	Negative terminal
VBPWR	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **DR20**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR20 CHECK THE PWRGND OR SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the voltage between:

(+) Vehicle Battery	(-) CMP Sensor Connector, Harness Side
Positive terminal	PWRGND
Positive terminal	SIGRTN

- **Is the voltage greater than 10 V?**

Yes	No
GO to **DR21**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR21 CHECK THE CMP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
CMP	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **DR22**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR22 CHECK FOR AN OPEN CIRCUIT BETWEEN THE PCM AND CMP SENSOR

- Key in OFF position.
- CMP Sensor connector disconnected.
- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CMP	CMP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DR23**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR23 CHECK THE CMP CIRCUIT FOR A SHORT TO PWRGND OR SIGRTN IN THE HARNESS

NOTE: The measurement may be taken at the PCM or CMP connector, whichever is easier to access.

- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) CMP Sensor Connector, Harness Side
CMP	PWRGND
CMP	SIGRTN

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DR24**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR24 CHECK THE CMP SENSOR FOR CORRECT OPERATION

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A CMP Sensor Connector, Harness Side	Point B CMP Sensor Connector, Component Side
VPWR	VPWR
VBPWR	VBPWR
SIGRTN	SIGRTN
PWRGND	PWRGND

- Key ON, engine running.
- DMM on low voltage DC scale.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) Vehicle Battery
CMP	Negative

	terminal

- **Does the voltage switch between LOW (less than 2 volts DC) and HIGH (greater than 8 volts DC)?**

Yes	No
GO to **DR26**.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR25 CHECK THE VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

NOTE: Only diagnose the bank indicated by the DTC.

- Check the VCT system for correct operation.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DR26**.

DR26 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

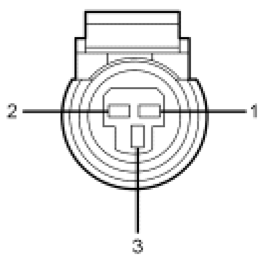
Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DS: AIR CONDITIONING PRESSURE (ACP) TRANSDUCER SENSOR

This pinpoint test is intended to diagnose the following:

- ACP transducer sensor (19D594)

- harness circuits: ACP, VREF, SIGRTN
- powertrain control module (PCM) (12A650)



N0025673

Fig. 69: Air Conditioning Pressure (ACP) Transducer Sensor Connector - A

A0077539

Fig. 70: Barometric Pressure (BARO) Sensor Connector
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Edge, Fusion, Milan, MKX, MKZ	A	3 1 2	ACP SIGRTN VREF
All other vehicles	B	3 1 2	ACP SIGRTN VREF

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Grand Marquis, Mustang, Town Car	170 Pin	B40, E57 B35 B47 B26	VREF VPWR PWRGND ACP
Expedition, Navigator	140 Pin	E57 B51 B67 B19	VREF VPWR PWRGND ACP
Explorer, Explorer Sport Trac	170 Pin	B40, E57 B35 B47 B18	VREF VPWR PWRGND ACP
F-150	190 Pin	B29, E57 B51 B67 B10	VREF VPWR PWRGND ACP
Focus	190 Pin	B52, B66, E63 B67 B69 B31	VREF VPWR PWRGND ACP
Fusion, Milan, MKZ	140 Pin	B33, E57 B51 B67 B63	VREF VPWR PWRGND ACP
All other vehicles	190 Pin	B29, B64 B51 B67 B37	VREF VPWR PWRGND ACP

DS1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0532, P0533, P1461, P1462, or P1463 present?**

Yes	No
For DTC P0533, P1461, GO to **DS2**. For DTC P0532, P1462, GO to **DS8**. For DTC P1463, GO to **DS17**.	For symptoms without DTCs, GO to **DS19**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DS2 DTC P0533, P1461: CHECK THE ACP PID

- Key ON, engine OFF.
- Access the PCM and monitor the ACP_PRESS PID.
- **Is the voltage less than 4.9 V?**

Yes	No
The ACP transducer sensor voltage is now below maximum. To determine if an intermittent condition exists, GO to **DS16**.	GO to **DS3**.

DS3 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ACP TRANSDUCER SENSOR VEHICLE HARNESS CONNECTOR

- Air Conditioning Pressure (ACP) Transducer Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to **DS4**.	refer to **PINPOINT TEST C**.

DS4 CHECK THE ACP CIRCUIT FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
ACP	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DS5**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DS5 CHECK THE ACP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-)
ACP	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **DS6**.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

DS6 CHECK FOR AN OPEN ACP CIRCUIT IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACP	ACP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DS7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DS7 CHECK THE PCM

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	Point B Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
ACP	SIGRTN

- Key ON, engine OFF.
- Access the PCM and monitor the ACP_PRESS PID.
- **Is the voltage less than 4.9 V?**

Yes	No
INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.	GO to **DS23**.

DS8 DTC P0532, P1462: CHECK THE ACP PID

- Key ON, engine OFF.
- Access the PCM and monitor the ACP_PRESS PID.
- **Is the voltage greater than 0.15 V?**

Yes	No
The ACP transducer sensor voltage is now above the minimum. To determine if an intermittent condition exists, GO to **DS16**.	GO to **DS9**.

DS9 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ACP TRANSDUCER SENSOR VEHICLE HARNESS CONNECTOR

- Air Conditioning Pressure (ACP) Transducer Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning	(-) Air Conditioning

Pressure (ACP) Transducer Sensor Connector, Harness Side	Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to **DS10**.	refer to **PINPOINT TEST C**.

DS10 SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- Key in OFF position.
- Connect a 5 amp fused jumper wire between the following:

Point A Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	Point B Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	ACP

- Key ON, engine OFF.
- Access the PCM and monitor the ACP_PRESS PID.
- **Is the voltage greater than 4 V?**

Yes	No
INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.	GO to **DS11**.

DS11 CHECK THE ACP CIRCUIT FOR A SHORT TO GND

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP)	

Transducer Sensor Connector, Harness Side	(-)
ACP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DS12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DS12 CHECK THE ACP CIRCUIT FOR A SHORT TO SIGRTN

- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
ACP	SIGRTN

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DS13**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DS13 CHECK THE ACP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACP	ACP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DS14**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DS14 CHECK FOR THE A/C CLUTCH TO ENGAGE

- PCM connector connected.
- Air Conditioning Pressure (ACP) Transducer Sensor connector connected.
- Key ON, engine running.
- While listening for the A/C clutch to engage, turn the A/C on. Repeat if necessary.
- **Does the A/C engage when the A/C is turned on?**

Yes	No
GO to **DS23**.	GO to **DS15**.

DS15 VERIFY THE A/C SYSTEM FUNCTION, INCLUDING THE REFRIGERANT CHARGE

- Restore the vehicle.
- Verify the A/C system function, including the refrigerant charge. Refer to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** .
- **Does the A/C system have the correct refrigerant charge and if so does the A/C system function correctly?**

Yes	No
GO to **DS23**.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

DS16 CHECK THE ACP CIRCUIT FOR AN INTERMITTENT CONCERN

NOTE: A concern is indicated by a sudden change in voltage.

- Key ON, engine OFF.
- Access the PCM and monitor the ACP PID.
- Observe the ACP PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the ACP, SIGRTN, and VREF wires between the ACP sensor and PCM
  - Lightly tap on the ACP transducer sensor to simulate road shock
- **Is a concern present?**

Yes	No

ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DS17 DTC P1463: VERIFY THE A/C CLUTCH CAN DISENGAGE

- Turn the A/C and defroster OFF.
- Key ON, engine running.
- Verify the A/C clutch can disengage.
- **Is the A/C clutch disengaged?**

Yes	No
GO to **DS18**.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is always on symptom.

DS18 CHECK FOR VOLTAGE AND GROUND TO THE A/C CLUTCH USING A NON-POWERED TEST LAMP

NOTE: If voltage and ground to the A/C clutch have already been checked or the A/C clutch can be heard clicking on when the A/C is turned on, go to the question at the end of this test step.

- Key in OFF position.
- A/CCS Switch connector disconnected.
- Connect a jumper wire in the A/C low pressure cycling switch harness connector to complete the circuit.
- A/CC Assembly connector disconnected.
- Connect a non-powered test lamp between the voltage pin and ground pin at the A/C clutch harness connector.
- Key ON, engine running.
- Turn the A/C on, and wait 15 seconds.
- Monitor the test lamp.
- Connect the A/C clutch and A/C cycling switch when done testing.
- **Does the lamp illuminate, or can the A/C clutch be heard clicking on?**

Yes	No
GO to **DS19**.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

DS19 DETERMINE IF A SUFFICIENT A/C PRESSURE CHANGE CAN BE DETECTED BY THE ACP PID

- Key ON, engine running.
- Turn the A/C and defroster OFF.
- Access the PCM and monitor the ACP PID.
- Turn the A/C and defroster OFF.
- Five seconds after A/C clutch engagement, note the voltage. If the clutch does not engage, follow the NO answer instructions.
- **Does the PCM-ACP PID change more than 0.3 volt within 5 seconds of clutch engagement?**

Yes	No
The ACP transducer sensor and the PCM can detect a sufficient change in the A/C pressure. For symptom without DTC P1463, REFER to the **SYMPTOM CHARTS** article, Symptom Charts. For all others, REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.	GO to **DS20**.

DS20 CHECK THE A/C SYSTEM PRESSURE AND PRESSURE CHANGE

- Key in OFF position.
- Install an A/C system manifold gauge set and check the A/C system high pressure reading.
- Turn the A/C and defroster OFF.
- Key ON, engine running.
- Note the A/C high pressure reading.
- While monitoring the A/C system high pressure reading, turn the A/C on. Five seconds after clutch engagement, note the pressure (the pressure should increase).
- A/C and defroster OFF.
- **Does the A/C high pressure reading change more than 207 kPa (30 psi) within 5 seconds of clutch engagement?**

Yes	No
GO to **DS21**.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

DS21 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ACP TRANSDUCER SENSOR VEHICLE HARNESS CONNECTOR

- Key in OFF position.

- Air Conditioning Pressure (ACP) Transducer Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to **DS22**.	refer to **PINPOINT TEST C**.

DS22 CHECK THE ACP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACP	ACP

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DS23 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins

  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DT: POWER STEERING PRESSURE (PSP) SENSOR

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- PSP sensor (3K215)
- harness circuit(s): PSP, SIGRTN and VREF
- powertrain control module (PCM) (12A650)

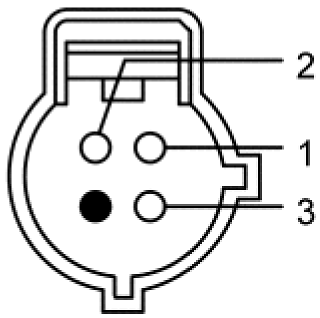

Fig. 71: Barometric Pressure (BARO) Sensor Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
3	PSP (Power Steering Pressure)

1	SIGRTN (Signal Return)
2	VREF (Reference Voltage)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Focus	190 Pin	T29	PSP
All other vehicles	190 Pin	E24	PSP

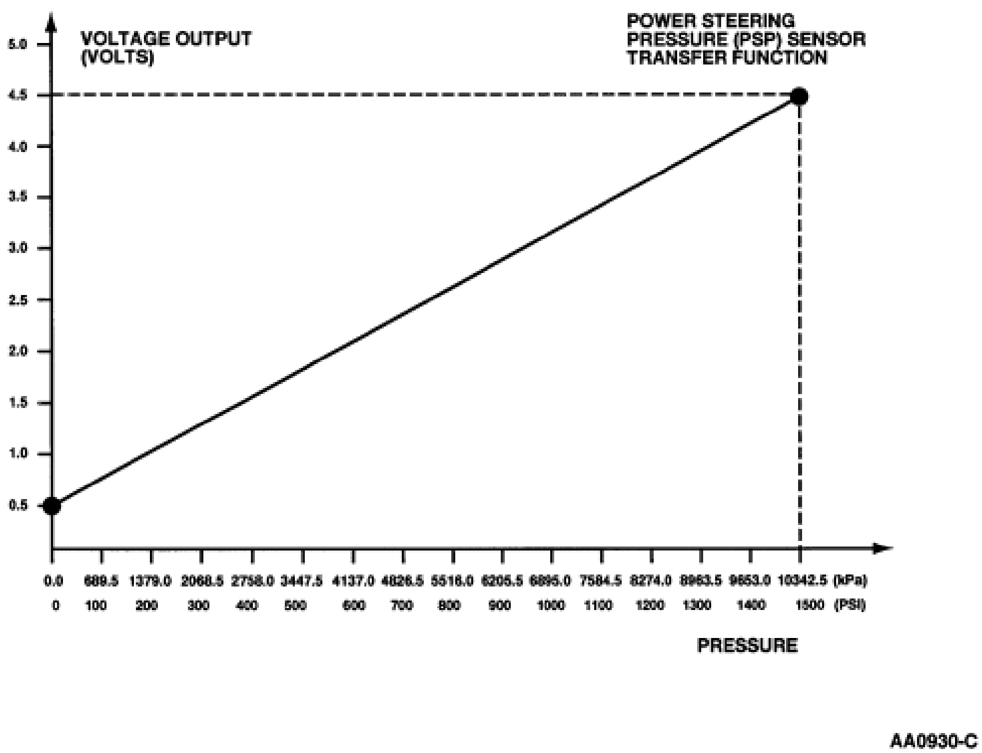

Fig. 72: Power Steering Pressure Sensor Voltage To Pressure Graph
Courtesy of FORD MOTOR CO.

DT1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0552, P0553, or P1550 present?**

Yes	No
For KOEO and KOER DTCs P0552 or P0553, GO to **DT4**. For continuous memory DTCs P0552 or P0553, GO to **DT8**. For KOEO and KOER DTC P1550, GO to **DT2**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DT2 DTC P1550: MAKE SURE THE STEERING WHEEL IS TURNED

- **Did you turn the steering wheel at least one half turn within 20 seconds of starting the KOER self-test?**

Yes	No
If there are any symptoms with the power steering system (for example, lack of power assist), REFER to the **STEERING SYSTEM - GENERAL INFORMATION -- E-SERIES** to diagnosis the lack of assist or inconsistent assist of steering system. If no symptoms are present with the power steering system, GO to **DT3**.	REPEAT the KOER self-test.

DT3 CHECK THE VOLTAGE BETWEEN VREF AND SIGRTN AT THE PSP SENSOR

- PSP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PSP Sensor Connector, Harness Side	(-) PSP Sensor Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 1

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to **DT4**.	refer to **PINPOINT TEST C**.

DT4 CHECK THE PSP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PSP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
PSP - Pin 3	PSP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DT5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DT5 CHECK THE PSP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PSP Sensor Connector, Harness Side	(-)
PSP - Pin 3	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **DT6**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DT6 CHECK THE PSP CIRCUIT FOR A SHORT TO VREF, SIGRTN AND GND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PSP Sensor Connector, Harness Side	(-) PSP Sensor Connector, Harness Side
PSP - Pin 3	VREF - Pin 2
PSP - Pin 3	SIGRTN - Pin 1

- Measure the resistance between:

(+) PSP Sensor Connector, Harness Side	(-)
PSP - Pin 3	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DT7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DT7 CHECK THE SENSOR OPERATION

- Connect a 5 amp fused jumper wire between the following:

Point A PSP Sensor Connector, Harness Side	Point B PSP Sensor Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 1	SIGRTN - Pin 1
PSP - Pin 3	PSP - Pin 3

- Start engine and allow to idle.
- Measure the voltage between:

(+) PSP Sensor Connector, Component Side	(-)
PSP - Pin 3	Ground

- Observe the voltage while turning the steering wheel at least 1/2 turn right and left.
- **Is the voltage reading between 0.3 and 4.7 volts and does the voltage change when the steering wheel is turned?**

Yes	No
GO to **DT9**.	INSTALL a new PSP sensor. CLEAR the DTCs. REPEAT the self-test.

DT8 CONTINUOUS MEMORY DTCS P0552 OR P0553: CHECK THE POWER STEERING PRESSURE SENSOR CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Key ON, engine OFF.
- Access the PCM and monitor the PSP PID.
- Observe the PSP PID for an indication of a concern while carrying out the following. (a concern is indicated by a sudden change in the voltage):
  - Shake, wiggle, and bend the PSP, VREF, SIGRTN circuit(s).
  - Lightly tap on the power steering pressure sensor to simulate road shock.

- **Is a concern indicated?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DT9 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DU: INTAKE AIR TEMPERATURE 2 (IAT2) SENSOR

This pinpoint test is intended to diagnose the following:

- intake air temperature 2 (IAT2) sensor (12A697)
- harness circuits: IAT2 and SIGRTN
- powertrain control module (PCM) (12A650)

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

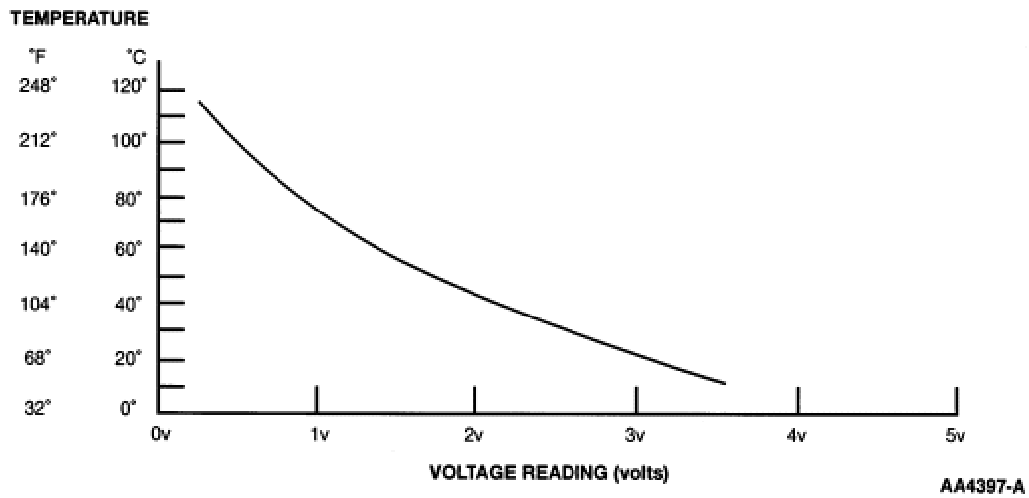

Fig. 73: Temperature Sensor Temperature To Voltage Graph
Courtesy of FORD MOTOR CO.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values	
°C	°F	Voltage	Resistance (K ohms)
120	248	0.28	1.18
110	230	0.36	1.55
100	212	0.47	2.07
90	194	0.61	2.80
80	176	0.80	3.84
70	158	1.05	5.37

Connector	Pin	Circuit
170 Pin	B41, E58, T41 B40, E57 E27	SIGRTN VREF IAT2

DU1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0097, P0098, P0127, P1114, or P1115 present?**

Yes	No
For DTCs P0097 or P1114, GO to **DU4**. For DTCs P0098 or P1115, GO to **DU2**. For DTC P0127, GO to **DU6**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DU2 CHECK FOR AN OPPOSITE SIGNAL TO THE PCM

- The DTC indicates the sensor signal is greater than the self-test maximum.
- IAT2 Sensor connector disconnected.
- Key ON, engine OFF.
- Connect a 5 amp fused jumper wire between the following:

Point A IAT2	Point B IAT2

Sensor Connector, Harness Side	Sensor Connector, Harness Side
IAT2 - Pin 1	SIGRTN - Pin 2

- Access the PCM and monitor the IAT2 PID.
- **Is the voltage less than 0.2 V?**

Yes	No
INSTALL a new IAT2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DU3**.

DU3 CHECK THE SENSOR SIGNAL FOR A SHORT TO VREF

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
IAT2 - Pin E27	VREF - Pin B40, E57

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DU10**.	REPAIR the short circuit to VREF. CLEAR the DTCs. REPEAT the self-test.

DU4 DTC P1114: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- The DTC indicates the sensor signal is less than the self-test minimum.
- IAT2 Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the IAT2 PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new IAT2 sensor. REFER to the	

ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.	GO to **DU5**.

DU5 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
IAT2 - Pin E27	SIGRTN - Pin B41, E58, T41

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
IAT2 - Pin E27	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DU10**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DU6 DTC P0127: CHECK CHARGE AIR COOLER PUMP (CAC) OPERATION

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- **Does the CAC pump run?**

Yes	No
GO to **DU7**.	DIAGNOSE the charge air cooler (CAC) pump. GO to **KP9**.

DU7 CHECK THE CHARGE AIR COOLER (CAC) SYSTEM

- Check the CAC system for low fluid level, cracked, blocked or misrouted coolant lines, cracked or blocked heat exchanger.

- **Is a concern present?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** , Supercharger Cooling to diagnose a loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DU8**.

DU8 SIMULATE THE HIGH IAT2 SIGNAL TO THE PCM

- Key ON, engine OFF.
- Access the PCM and monitor the IAT2 PID.
- Observe the PID while disconnecting the IAT2 sensor.
- **Is the voltage greater than 4.2 V?**

Yes	No
GO to **DU9**.	GO to **DU10**.

DU9 SIMULATE THE LOW IAT2 SIGNAL TO THE PCM

- Key in OFF position.
- IAT2 Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A IAT2 Sensor Connector, Harness Side	Point B IAT2 Sensor Connector, Harness Side
IAT2 - Pin 1	SIGRTN - Pin 2

- Key ON, engine OFF.
- Access the PCM and monitor the IAT2 PID.
- **Is the voltage less than 0.2 V?**

Yes	No
CONNECT the sensor and GO to the **REFERENCE VALUES** article, Reference Values. COMPARE the IAT2 PID to reference values under different road test conditions. If the sensor is not in range, INSTALL a new IAT2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DU10**.

DU10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DV: THROTTLE BODY ASSEMBLY ELECTRONIC THROTTLE CONTROL (ETC)

WARNING: **Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from throttle mechanism when actuated. Failure to follow these instructions may result in personal injury.**

NOTE: The voltage of the TP2 circuit and PID reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

This pinpoint test is intended to diagnose the following:

- electronic throttle body (ETB) (9F991)
- electronic throttle body throttle position sensor (ETBTPS) (9E928)
- harness circuits: ETCRTN, ETCREF, TP1, TP2, TACM+, and TACM-
- powertrain control module (PCM) (12A650)

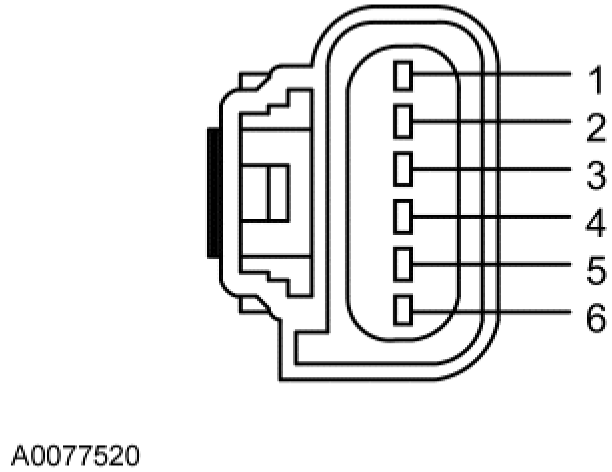

Fig. 75: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - A
Courtesy of FORD MOTOR CO.

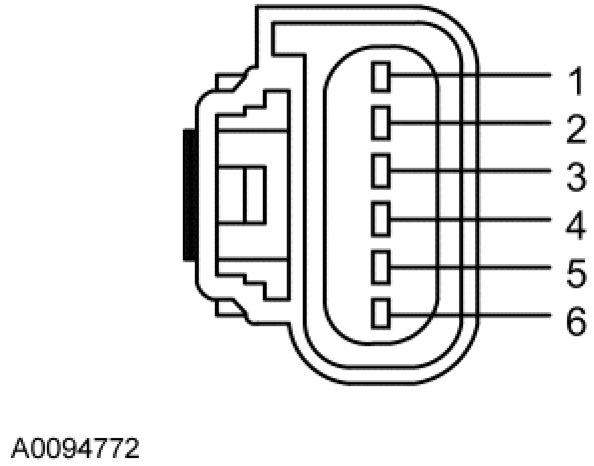

Fig. 76: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - B
Courtesy of FORD MOTOR CO.

DV1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

NOTE: Diagnose and repair ETBTPS circuit DTCs before addressing DTC P0068.

- **Are DTCs P0068, P0121, P0122, P0123, P0221, P0222, P0223, P1124, P2100, P2101, P2107, P2111, P2112, or P2135 present?**

Yes	No
For DTC P0068, GO to **DV12**. For DTCs P0121, P0122, P0123, P0221, P0222, P0223, P2111, or P2112, GO to **DV3**. For DTC P1124, GO to **DV2**. For DTC P2100, GO to **DV19**. For DTC P2101, GO to **DV27**. For DTC P2107, GO to **DV18**. For Fusion and Milan with DTC P2135, GO to **DV6**. For all others with DTC P2135, GO to **DV7**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DV2 DTC P1124: REPEAT THE KOEO OR KOER SELF-TEST

NOTE: Make sure the accelerator pedal is not applied during the KOEO and KOER self-tests.

- Key ON, engine OFF.
- Carry out the self-test.
- **Are any DTCs present other than P1124?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DV3**.

DV3 CHECK THE THROTTLE POSITION (TP) OPEN AND CLOSED VOLTAGES

NOTE: **Certain failure mode effects management (FMEM) operating strategies maintain limited vehicle function in the event of a PCM, harness, or component concern and may prevent the throttle plate from opening. If the throttle plate does not open, follow the NO answer.**

- Key ON, engine OFF.
- Access the PCM and monitor the TP1 and TP2 PIDs.
- Press the accelerator pedal to the floor and release.

ELECTRONIC THROTTLE CONTROL THROTTLE POSITION SENSOR SIGNAL VOLTAGES

Accelerator Pedal Position	TP1	TP2
Pedal fully released	3.7 - 4.7	0.3 - 1.9
Pedal fully applied	0.7 - 2.9	4.1 - 4.7

- **Are both PIDs within the chart ranges?**

Yes	No
For DTCs P2111 or P2112, GO to **DV4**. For all others, GO to **DV17**.	GO to **DV4**.

DV4 CHECK FOR OBSTRUCTION OF THE THROTTLE BODY

WARNING: **Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from throttle mechanism when actuated. Failure to follow these instructions may result in personal injury.**

- Key in OFF position.
- Remove the inlet tube from the throttle body.
- Visually inspect for throttle plate obstructions or engine deposits.
- Slowly, push the throttle plate to wide open and release.
- **Does the throttle plate move freely to wide open and back?**

Yes	No
For continuous memory DTCs P0121, P0122, P0123, P0221, P0222, or P0223 alone or together,	

GO to **DV5**. For DTCs P2111, P2112 or continuous memory DTCs P2100, P2101, or P2107 alone or together, GO to **DV19**. For Fusion and Milan with all other DTCs, GO to **DV6**. For all others, GO to **DV7**.	ISOLATE and REPAIR the obstruction. CLEAR the DTCs. REPEAT the self-test.

DV5 CHECK THE VREF VOLTAGE TO TP

- ETBTPS connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
ETCREF	ETCRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
For Fusion and Milan, GO to **DV6**. For all others, GO to **DV7**.	refer to **PINPOINT TEST C**.

DV6 FUSION, MILAN: CHECK THE RESISTANCE OF THE ETBTPS

NOTE: Do not move the throttle plate during the resistance measurement. Measure the sensor resistance with the throttle plate at the default position.

- Key in OFF position.
- ETBTPS connector disconnected.
- For Fusion 2.3L and Milan 2.3L, measure the resistance between:

(+) ETBTPS Connector, Component Side	(-) ETBTPS Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
ETCREF	ETCRTN	2,000	4,000

- For Fusion 3.0L and Milan 3.0L, measure the resistance between:

(+)	(-)		

ETBTPS Connector, Component Side	ETBTPS Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
TP1	ETCREF	380	987
TP1	ETCRTN	665	1,890
TP2	ETCREF	608	1,932
TP2	ETCRTN	390	1,187
ETCREF	ETCRTN	475	1,365

- **Are all the resistances within specifications?**

Yes	No
GO to **DV8**.	INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test.

DV7 ALL OTHERS: CHECK THE RESISTANCE OF THE ETBTPS

NOTE: Do not move the throttle plate during the resistance measurement. Measure the sensor resistance with the throttle plate at the default position.

- ETBTPS connector disconnected.
- Measure the resistance between:

(+) ETBTPS Connector, Component Side	(-) ETBTPS Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
TP1	ETCREF	700	1,800
TP1	ETCRTN	1,300	2,800
TP2	ETCREF	1,000	2,400
TP2	ETCRTN	500	1,500
ETCREF	ETCRTN	700	2,100

- **Are all the resistances within the specifications?**

Yes	No
	For E-Series 4.6L, Edge,

GO to **DV8**.	F-150 4.2L, F-150 4.6L, Focus, MKX, MKZ, Sable, Taurus, and Taurus X, INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test. For all others, INSTALL a new ETBTPS. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** to INSTALL a new TP sensor. CLEAR the DTCs. REPEAT the self-test.

DV8 CHECK THE TP1 AND TP2 CIRCUITS FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-)
TP1	Ground
TP2	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DV9**.

DV9 CHECK THE TP1 AND TP2 CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) PCM Connector, Harness Side
TP1	TP1

TP2	TP2

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DV10**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DV10 CHECK THE TP1 AND TP2 CIRCUITS FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) Vehicle Battery
TP1	Negative terminal
TP2	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DV11**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV11 CHECK THE TP CIRCUITS FOR A SHORT TOGETHER

- Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
TP1	TP2
TP1	ETCREF
TP1	ETCRTN
TP2	ETCREF
TP2	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DV14**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV12 DTC P0068: CHECK FOR DTCS

- Carry out the self-test.
- **Are DTCs P0121, P0122, P0123, P0221, P0222, P0223 or P2135 present?**

Yes	No
For DTCs P0121, P0122, P0123, P0221, P0222, and P0223, GO to **DV3**. For Fusion and Milan with DTC P2135, GO to **DV6**. For all others with DTC P2135, GO to **DV7**.	GO to **DV13**.

DV13 CHECK FOR INLET AIR LEAKS

- Check the air inlet system for leaks.
- Listen for air noise around the mass air flow (MAF) sensor and throttle body while the engine is running.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DV14**.

DV14 CHECK FOR A TP2 SIGNAL HIGH VERSUS LOAD WHILE DRIVING THE VEHICLE

- ETBTPS connector connected.
- PCM connector connected.
- Key ON, engine running.
- Access the PCM and monitor the TP2 PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle while exercising the throttle and ETCTP sensor and accessing the PIDS.
- **Is the TP2 PID greater than 2.44 volts and the LOAD PID less than 30%?**

Yes	No
GO to **DC5**.	GO to **DV15**.

DV15 CHECK FOR A TP2 SIGNAL LOW VERSUS LOAD WHILE DRIVING THE VEHICLE

- Key ON, engine running.
- Access the PCM and monitor the TP2 PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle while exercising the throttle and ETCTP sensor and accessing the PIDS.
- **Is the TP2 PID less than 0.24 volt and the LOAD PID greater than 55%?**

Yes	No
GO to **DV16**.	GO to **DV17**.

DV16 CHECK FOR SELF-TEST DTCS

NOTE: After retrieving the continuous memory DTCs, diagnose any non-ETC related DTCs before continuing.

- Key ON, engine OFF.
- Clear the DTCs.
- Drive the vehicle while exercising the throttle.
- Retrieve the continuous memory DTCs.
- **Are any DTCs present?**

Yes	No
For continuous memory DTC P0068, CHECK the MAF sensor and connector for damage and corrosion. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. For E-Series 4.6L, Edge, F-150 4.2L, F-150 4.6L, Focus, Fusion, Milan, MKX, MKZ, Sable, Taurus, and Taurus X with DTC P2135, INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test. For all others with DTC P2135, INSTALL a new ETBTPS. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** to INSTALL a new TP sensor. CLEAR the DTCs. REPEAT the self-test. For all others, GO to **DV17**.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DV17 CHECK THE TP CIRCUITS FOR AN INTERMITTENT CONCERN

- Access the PCM and monitor the TP1 and TP2 PIDs.
- Wiggle, shake, and bend the harness from the TP to the PCM.
- **Are the voltages between 0.49 - 4.65 V?**

Yes	No
GO to **DV29**.	REPAIR as necessary. If DTC P2100 or P2101 is present, GO to **DV19**.

DV18 DTC P2107: CHECK FOR OTHER SELF-TEST DTCS

NOTE: The DTC P2107 may set when a failure mode effects management (FMEM) action is taken. If the FMEM DTC P2110 is present with other DTCs, diagnose the other DTCs before diagnosing the DTC P2110.

- Key ON, engine OFF.
- Check for self-test DTCs.
- **Are any DTCs present other than P2107 and P2110?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	For DTC P2110, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** and diagnose the DTC. For DTC P2107, GO to **DV23**.

DV19 VISUALLY INSPECT THE ETB

NOTE: Make sure the ETB harness connector is properly connected.

- Key in OFF position.
- Inspect the ETB for damaged housing, harness connector, and harness.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DV20**.

DV20 CHECK THE TACM FOR A SHORT OR OPEN

- ETBTACM connector disconnected.
- Measure the resistance between:

(+) ETBTACM Connector, Component Side	(-) ETBTACM Connector, Component Side
TACM+	TACM-

- **Is the resistance between 1 ohm - 900 ohms?**

Yes	No

GO to **DV21**.	INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test.

DV21 CHECK THE TACM HARNESS FOR AN OPEN

- PCM connector disconnected.
- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) PCM Connector, Harness Side
TACM+	TACM+
TACM-	TACM-

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DV22**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DV22 CHECK THE TACM+ AND TACM- CIRCUITS FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-)
TACM+	Ground
TACM-	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DV23**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV23 CHECK THE HARNESS FOR A SHORT TO GND, PWR, ETCREF, AND ETCRTN

- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) PCM Connector, Harness Side
TACM+	PWRGND
TACM+	VPWR
TACM+	ETCRTN
TACM+	ETCREF
TACM-	PWRGND
TACM-	ETCRTN
TACM-	VPWR
TACM-	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DV24**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV24 CHECK FOR TACM HARNESS CIRCUITS SHORTED TOGETHER

- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) ETBTACM Connector, Harness Side
TACM+	TACM-

- **Is the resistance greater than 10K ohms?**

Yes	No
For DTCs P2111 or P2112, GO to **DV25**. For all others, GO to **DV26**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV25 CHECK FOR AN INTERMITTENT CONCERN

- ETBTACM connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the TP1 and TP2 PIDs.
- Wiggle, shake, and bend the harness from the TP to the PCM.
- **Are the voltages between 0.49 - 4.65 V?**

Yes	No
GO to **DV26**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DV26 CHECK FOR SELF-TEST CODES

- ETBTACM connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Carry out the self-test.
- **Is DTC P2101 present?**

Yes	No
GO to **DV27**.	GO to **DV29**.

DV27 CHECK FOR PROPER TACM+ WIRING IN THE HARNESS CONNECTOR

- Key in OFF position.
- ETBTACM connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) PCM Connector, Harness Side
TACM+	TACM+

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DV28**.	REPAIR the open circuit. WIRE the TACM harness connector per the TACM and PCM connector diagrams. CLEAR the DTCs. REPEAT the self-test.

DV28 CHECK FOR PROPER TACM- WIRING IN THE HARNESS CONNECTOR

- Measure the resistance between:

(+) ETBTACM Connector,	(-) PCM Connector, Harness Side

Harness Side	
TACM-	TACM-

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DV30**.	GO to **DV29**.

DV29 CHECK THE REPAIR THROUGH PROCEDURE

- Key ON, engine OFF.
- Record and clear the DTCs.
- Cycle the accelerator pedal to the floor and back several times.
- Check for self-test DTCs.
- **Are any ETC system related DTCs present?**

Yes	No
GO to **DV30**.	refer to **PINPOINT TEST Z**.

DV30 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DW: HEATED OXYGEN SENSOR (HO2S)

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: **While conducting tests on a hot engine take all safety precautions to prevent skin contact with hot engine components. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- HO2S/O2S (9F472)
- HO2S/O2S (9G444)
- harness circuits: HO2S, HO2S Heater, VPWR, and SIGRTN
- powertrain control module (PCM) (12A650)

The pin numbering for the connector is in reference to the connector lock tab. Not all connector key combinations are shown.

DW1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0040, P0041, P0053, P0054, P0055, P0059, P0060, P0132, P0133, P0135, P0138, P0139, P0141, P0144, P0147, P0152, P0153, P0155, P0158, P0159, P0161, or P1127 present?**

Yes	No
For DTCs P0040 or P0041, GO to **DW2**. For DTCs P0053, P0054, P0055, P0059 or P0060, GO to **DW14**. For DTCs P0132, P0138, P0144, P0152 or P0158, GO to **DW20**. For DTCs P0133 or P0153, GO to **DW3**. For DTCs P0135, P0139, P0141, P0147, P0155, P0159 or P0161, GO to **DW9**. For DTC P1127, GO to **DW19**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DW2 KOER DTCS P0040 AND P0041: CROSSED SENSOR WIRES

- Key in OFF position.
- Check the vehicle repair history.
- Verify the HO2S connectors are connected to the correct engine bank.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DW3 CONTINUOUS MEMORY DTCS P0133 AND P0153: CARRY OUT THE KOER SELF-TEST

- Engine at normal operating temperature.
- Carry out the KOER self-test.
- **Are DTCs P0040, P0041 or P1127 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DW4**.

DW4 CHECK THE HO2S RESPONSE TEST RESULTS

- Key ON, engine OFF.
- Access the diagnostic monitoring test results for the HO2S11 and HO2S21.
- **Is the indicated value greater than the minimum threshold?**

Yes	No
CLEAR the DTCs. GO to **DW3**.	GO to **DW5**.

DW5 CHECK FOR UNMETERED AIR LEAKS

NOTE: Fuel calculations can be affected by unmetered air leaks.

- Carefully inspect the following areas for potential air leaks:
  - hoses connecting to the mass air flow (MAF) sensor assembly
  - hoses connecting to the throttle body
  - intake manifold gasket leaks
  - PCV system
  - the vacuum lines are disconnected
  - improperly seated engine oil dipstick, tube or oil fill cap
  - exhaust leaks at flanges and gaskets
- **Are any air leaks present?**

Yes	No
REPAIR the source of the air leak. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **DW6**.

DW6 CHECK THE HO2S CIRCUIT CONTINUITY

NOTE: HO2S is displayed as O2S on the scan tool.

- HO2S connector disconnected.
- Check the connector (both halves) for any water contamination.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side
HO2S Signal	VPWR

- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **DW7**.

DW7 CHECK THE HO2S CIRCUIT(S) FOR AN OPEN IN THE HARNESS

NOTE: A vehicle hoist may be required to access the HO2S harness.

- Key in OFF position.
- Remove the jumper wire(s).
- Visually inspect the HO2S harness for exposed wiring, water contamination, corrosion, and proper assembly.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DW8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DW8 CHECK THE HO2S CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DW9**.	GO to **DW12**.

DW9 DTCS P0135, P0139, P0141, P0147, P0155, P0159 OR P0161: CHECK FOR A SOURCE OF POTENTIAL HO2S CONTAMINATION

- Investigate the following items as potential sources of HO2S contamination:
  - use of unapproved silicon sealers
  - fuel contaminated by silicon additives
  - excessive oil consumption
  - glycol leaking internally in the engine
  - lead-contaminated fuel
  - short drive cycles in cold weather
  - use of unapproved cleaning agents
- **Is a concern present?**

Yes	No
REPAIR the source of the contamination. CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **DW10**.

DW10 VISUALLY INSPECT THE HO2S HARNESS

- PCM connector connected.
- Visually inspect the HO2S harness for exposed wiring, water contamination, corrosion, and proper assembly.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	For DTCs P0139 or P0159, GO to **DW11**. For all others, GO to **DW12**.

DW11 CHECK THE EXHAUST SYSTEM FOR LEAKS AND MODIFICATIONS

- Check for leaks in the exhaust system.
- Visually inspect the vehicle for aftermarket accessories and performance modifications.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DW25**.

DW12 CHECK THE HO2S AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

NOTE: Verify the harness pins are in the proper location.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DW13**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DW13 CARRY OUT THE KOEO ON DEMAND SELF-TEST

- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Are DTCs P0135, P0141, P0147, P0155 or P0161 present?**

Yes	No
GO to **DW14**.	GO to **DW15**.

DW14 DTCS P0053, P0054, P0055, P0059 AND P0060: CHECK FOR VPWR IN THE HARNESS

NOTE: **If DTCs P0053, P0054, P0055, P0059, or P0060 are present, test their related circuits individually.**

- Key in OFF position.
- HO2S connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HO2S Connector, Harness Side	(-) HO2S Connector, Harness Side
VPWR	SIGRTN

- **Is the voltage greater than 10 V?**

Yes	No
GO to **DW15**.	REPAIR the open circuit. CHECK the fuses. CLEAR the DTCs. REPEAT the self-test.

DW15 CHECK THE HO2S HEATER FOR SHORTS IN THE HARNESS

NOTE: **If DTCs P0053, P0054, P0055, P0059, or P0060 are present, test their related circuits individually.**

- Key in OFF position.
- HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-) Vehicle Battery
HO2S Heater	Negative terminal

- Measure the resistance between:

(+) HO2S	(-) HO2S

Connector, Harness Side	Connector, Harness Side
HO2S Heater	VPWR
HO2S Heater	SIGRTN
HO2S Heater	HO2S Signal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DW16**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DW16 CHECK THE HO2S HEATER CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Heater	HO2S Heater

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DW17**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DW17 CHECK THE INTERNAL RESISTANCE OF THE HO2S HEATER

- Measure the resistance between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Heater	VPWR

- **Is the resistance between 3 - 30 ohms?**

Yes	No
GO to **DW18**.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER

	to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DW18 CHECK THE HO2S HEATER CIRCUIT FOR AN INTERNAL SHORT TO SIGRTN OR GND

- Measure the resistance between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Heater	SIGRTN

- Measure the resistance between:

(+) HO2S Connector, Component Side	(-) Vehicle Battery
HO2S Heater	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DW25**.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DW19 KOER DTC P1127: EXHAUST TEMPERATURE OUT OF RANGE

NOTE: Address all other DTCs before proceeding.

- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the HO2S Heater PID.
- **Is the PID state ON?**

Yes	No

CARRY OUT the KOER self-test.	RUN the engine until the PID indicates ON. CARRY OUT the KOER self-test.

DW20 DTCS P0132, P0138, P0144, P0152 AND P0158: VISUALLY INSPECT THE HO2S HARNESS

NOTE: Disconnect the suspect HO2S harness connector. Only the suspect HO2S needs to be diagnosed.

- Key in OFF position.
- HO2S connector disconnected.
- Visually inspect the HO2S harness.
  - check the connector (both halves) for contamination
  - make sure the connector pins are fully seated
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DW21**.

DW21 CHECK THE HO2S SIGNAL LEVEL TOO HIGH

- HO2S connector connected.
- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage less than 1.1 V?**

Yes	No
GO to **DW22**.	GO to **DW23**.

DW22 CARRY OUT A THOROUGH WIGGLE TEST ON THE HO2S HARNESS

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- Carry out a thorough wiggle test on the HO2S harness.
- **Does the voltage change during the wiggle test?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DW23 CHECK THE HO2S SIGNAL FOR A SHORT TO VPWR INSIDE THE SENSOR

- Key in OFF position.
- HO2S connector disconnected.
- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage less than 1.1 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **DW24**.

DW24 CHECK THE HO2S CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HO2S Connector, Harness Side	(-)
HO2S Signal	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DW25**.

DW25 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DX: ENGINE COOLANT TEMPERATURE (ECT) SENSOR

NOTE: Engine coolant temperature must be greater than 10°C (50°F) to pass the KOEO self-test and greater than 82°C (180°F) to pass the KOER self-test. to accomplish this, the engine must be at normal operating temperature.

This pinpoint test is intended to diagnose the following:

- engine coolant temperature (ECT) sensor (12A648)
- harness circuits: ECT and SIGRTN
- powertrain control module (PCM) (12A650)

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

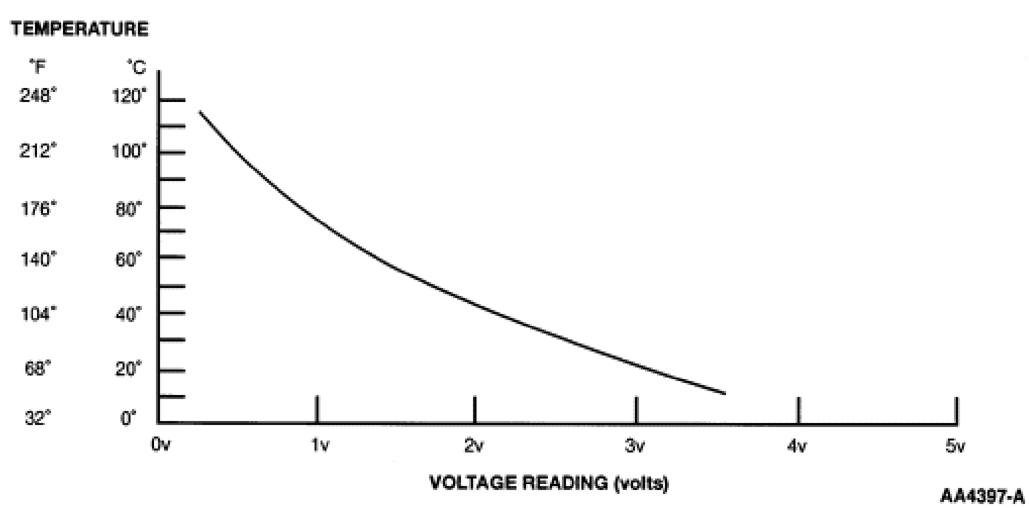

Fig. 87: Temperature Sensor Temperature To Voltage Graph

Pin	Circuit
2	SIGRTN (Signal Return)
1	ECT (Engine Coolant Temperature)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	E40 E41 E21	VREF SIGRTN ECT
Fusion, Milan	140 Pin	E57 E58 E18	VREF SIGRTN ECT

All other vehicles	170 Pin	E57 E58 E18	VREF SIGRTN ECT

DX1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0116, P0117, P0118, P0119, P0125, P0128, P0217, P1116, or P1117 present?**

Yes	No
For continuous memory DTC P0116, GO to **DX14**. For KOEO and KOER DTC P0117, GO to **DX12**. For continuous memory DTCs P0117, P0118, P0119, or P1117, GO to **DX16**. For KOEO and KOER DTC P0118, GO to **DX8**. For continuous memory DTCs P0125, or P0128, GO to **DX19**. For DTC P0217, GO to **DX21**. For KOEO and KOER DTC P1116, GO to **DX2**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DX2 DTC P1116: CHECK THE COOLING SYSTEM

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- The DTC indicates the temperature sensor is out of self-test range. The engine is not at normal operating temperature.
- Check the vehicle coolant level.
- **Is the cooling system OK?**

Yes	No
GO to **DX3**.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX3 CHECK IF THE VEHICLE ENGINE STARTS

- Attempt to start the engine.
- **Does the engine start and run normally?**

Yes	No

GO to **DX6**.	GO to **DX4**.

DX4 CHECK THE RESISTANCE OF THE ECT SENSOR WITH THE ENGINE OFF

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DX5**.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX5 CHECK THE CIRCUIT FROM THE MODULE TO THE COMPONENT

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- ECT Sensor connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the ECT PID.
- Using the data collected from the previous step, compare temperature resistance measured at the sensor to the PID temperature voltage measured at the PCM.
- **Does the measured value at the sensor agree with the measured PID voltage value at the PCM?**

Yes	No
RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to **DX10**.

DX6 CHECK THE ECT SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.

- Verify the upper radiator hose is hot and the cooling system is pressurized.
- Repeat the KOER self-test.
- **Is DTC P1116 present?**

Yes	No
GO to **DX7**.	The engine temperature was not stabilized. REPAIR any other DTCs as necessary.

DX7 CHECK THE RESISTANCE OF THE ECT SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- The vehicle must be at normal operating temperature.
- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DX25**.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX8 DTC P0118: CHECK THE ECT SIGNAL CIRCUIT

- The DTC indicates the sensor signal is greater than the self-test maximum.
- ECT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ECT Sensor Connector, Harness Side	(-) ECT Sensor Connector, Harness Side

ECT - Pin 1	SIGRTN - Pin 2

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **DX9**.	GO to **DX10**.

DX9 CHECK THE RESISTANCE OF THE ECT SENSOR WITH THE ENGINE OFF

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DX11**.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX10 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ECT Sensor Connector, Harness Side
ECT	ECT - Pin 1
SIGRTN	SIGRTN - Pin 2

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DX25**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DX11 CHECK THE SENSOR SIGNAL FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ECT	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DX25**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DX12 DTC P0117: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- The DTC indicates the sensor signal is less than the self-test minimum.
- Possible causes:
  - grounded circuit in the harness
  - incorrect harness connections
  - damaged sensor
  - damaged PCM
- ECT Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the ECT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DX13**.

DX13 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ECT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
ECT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DX25**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DX14 DTC P0116: CHECK THE RESISTANCE OF THE ECT SENSOR WITH THE ENGINE OFF

NOTE: **Verify the engine temperature is at ambient room temperature before continuing with this test. A soak period of 6 hours may be required. Refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for information concerning P0116.**

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to **DX15**.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX15 DTC P0116: CHECK THE RESISTANCE OF THE ECT SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

NOTE: Verify the engine is at operating temperature before taking the ECT reading.

- ECT Sensor connector connected.
- Run the engine until the engine temperature stabilizes.
- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
The concern is not present at this time. CARRY OUT the OBD drive cycle to determine if fuel, HO2S, catalyst and misfire monitors can be executed. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX16 DTCS P0117, P0118, P0119 OR P1117: INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the ECT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector

- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. If OK, INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DX17**.

DX17 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the ECT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DX18**.

DX18 CHECK THE PCM AND VEHICLE HARNESS CONNECTORS

- Key in OFF position.
- PCM connector disconnected.
- ECT Sensor connector disconnected.
- **Are the connectors and terminals OK?**

Yes	No
The concern is not present at this time. DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX19 DTCS P0125 OR P0128: CHECK THE ENGINE COOLANT LEVEL

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- The DTC indicates the engine coolant temperature has not achieved the required engine operation temperature level, since start-up within a specified amount of time.

- Possible causes:
  - insufficient warm up time
  - leaking or stuck-open thermostat
  - low engine coolant
- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
GO to **DX20**.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX20 CHECK THE SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Access the PCM and monitor the ECT PID.
- **Is the temperature greater than 77°C (170.6°F)?**

Yes	No
The test is complete. DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	REFER to the **ENGINE COOLING -- E-SERIES** for cooling system diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX21 DTC P0217: INDICATES AN ENGINE OVERHEAT CONDITION

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheating condition. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX22 DTC P0298: ENGINE OIL OVER TEMPERATURE CONDITION

NOTE: **The engine oil temperature protection strategy in the PCM is activated. This protects the engine against mechanical damage due to overheating.**

- Check for an overheating condition and base engine concerns.
- **Are there any overheating or base engine concerns?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DX23**.

DX23 CHECK FOR ECT DTCS

- Carry out the self-test.
- **Are DTCs P0117, P0118, P1116 or P1117 present?**

Yes	No
DISREGARD the engine oil temperature (EOT) diagnostic trouble code (DTC) at this time. ADDRESS the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DX24**.

DX24 ROAD TEST THE VEHICLE AND MONITOR FOR ENGINE OVER TEMPERATURE

- Access the freeze frame data (if available) and record the DTC concern conditions.
- Access the PCM and monitor the ECT PID.
- Test drive the vehicle and allow the engine to reach normal operating temperature.
- Observe the ECT PID.
- **Does the engine overheat?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. CLEAR the DTCs. REPEAT the self-test.

DX25 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins

  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DY: ENGINE OIL TEMPERATURE (EOT) SENSOR

This pinpoint test is intended to diagnose the following:

- engine oil temperature (EOT) sensor (12A648)
- harness circuits: EOT and SIGRTN
- powertrain control module (PCM) (12A650)

Engine oil temperature must be greater than 10°C (50°F) to pass the KOEO self-test and greater than 66°C (150°F) to pass the KOER self-test.

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

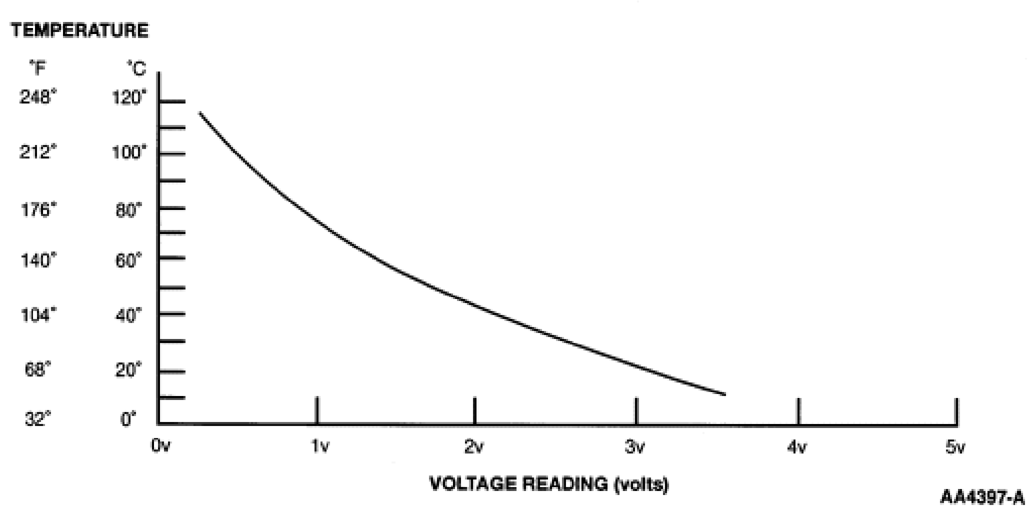

Fig. 89: Temperature Sensor Temperature To Voltage Graph
Courtesy of FORD MOTOR CO.

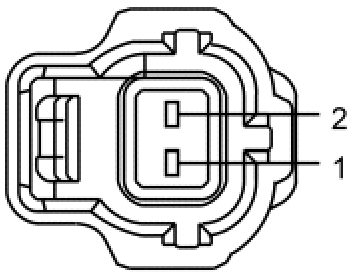

Fig. 91: Engine Oil Temperature (EOT) Sensor Connector - B
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Mustang	A	2 1	SIGRTN EOT
All other vehicles	B	2 1	SIGRTN EOT

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
170 Pin	E58 B35 E57 E27	SIGRTN VPWR VREF EOT

DY1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0196, P0197, P0198, P0298, or P1184 present?**

Yes	No
For DTCs P0196 or P1184, GO to **DY2**. For DTCs P0197 or P0198, GO to **DY3**. For continuous memory DTC P0298, GO to **DY14**.	For all others, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DY2 DTCS P0196 OR P1184: CHECK THE EOT SENSOR OPERATION

NOTE: **Before continuing with this pinpoint test, verify the engine oil condition and level are within specification.**

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Carry out the self-test.
- **Are DTCs P0196 or P1184 present?**

Yes	No
GO to **DY3**.	The engine temperature was not stabilized. REPAIR any other DTCs as necessary.

DY3 DTCS P0196, P0197, P0198, P1184 OR P0298: CHECK THE TEMPERATURE SENSOR SIGNAL

- Key ON, engine OFF.
- Access the PCM and monitor the EOT PID.
- **Is the voltage less than 0.3 V?**

Yes	No
GO to **DY4**.	GO to **DY6**.

DY4 SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- Key ON, engine OFF.
- EOT Sensor connector disconnected.
- Access the PCM and monitor the EOT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new EOT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DY5**.

DY5 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- PCM connector disconnected.
- Measure the resistance between:

(+) EOT Sensor Connector, Harness Side	(-) EOT Sensor Connector, Harness Side
EOT	SIGRTN

- Measure the resistance between:

(+) EOT Sensor Connector, Harness Side	(-) Vehicle Battery
EOT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DY18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DY6 CHECK FOR HIGH EOT SENSOR VOLTAGE

- Access the PCM and monitor the EOT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
GO to **DY7**.	GO to **DY11**.

DY7 CHECK THE EOT CIRCUIT VOLTAGE

- EOT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) EOT Sensor Connector, Harness Side	(-) EOT Sensor Connector, Harness Side
EOT	SIGRTN

- **Is the voltage greater than 4.2 V?**

Yes	No
GO to **DY8**.	GO to **DY10**.

DY8 CHECK THE RESISTANCE OF THE EOT SENSOR WITH THE ENGINE OFF

- Key in OFF position.
- EOT Sensor connector disconnected.
- Measure the resistance between:

(+) EOT Sensor Connector, Component Side	(-) EOT Sensor Connector, Component Side
EOT	SIGRTN

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
GO to **DY9**.	INSTALL a new EOT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DY9 CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORTS TO PWR

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EOT - Pin E27	VREF - Pin E57
EOT - Pin E27	VPWR - Pin B35

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DY18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DY10 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector,	(-) EOT Sensor

Harness Side	Connector, Harness Side
EOT - Pin E27	EOT
SIGRTN - Pin E58	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DY18**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DY11 INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the EOT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. REPAIR as necessary. If OK, INSTALL a new EOT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **DY12**.

DY12 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the EOT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DY13**.

DY13 CHECK THE RESISTANCE OF THE EOT SENSOR WITH THE ENGINE RUNNING

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Measure the resistance between:

(+) EOT Sensor Connector, Component Side	(-) EOT Sensor Connector, Component Side
EOT	SIGRTN

- **Is the resistance within specification for the given engine temperature?**

Yes	No
The concern is not present at this time. refer to **PINPOINT TEST Z**.	INSTALL a new EOT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DY14 DTC P0298: ENGINE OIL OVER TEMPERATURE CONDITION

NOTE: The engine oil temperature protection strategy in the PCM has been activated. This protects the engine against mechanical damage due to overheating.

- Check for an overheating condition and base engine concerns.
- **Are there any overheating or base engine concerns?**

Yes	No
ISOLATE the concern. REPAIR as necessary. REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. CLEAR the DTCs. REPEAT the self-test.	GO to **DY15**.

DY15 CHECK FOR EOT SENSOR HARDWARE

- The engine oil temperature protection strategy in the PCM can be activated with or without an EOT sensor.
- **Does the vehicle have a EOT sensor?**

Yes	No
GO to **DY3**.	GO to **DY16**.

DY16 IDENTIFY THE CUSTOMER'S DRIVING HABITS

- Identify the customers driving habits.
- Access the freeze frame data (if available) and record the DTC concern conditions.
- **Does the vehicle appear to have been driven in an incorrect transmission gear or at high RPM for an extended period?**

Yes	No
ADVISE the customer that improper transmission gear selection and high RPM for an extended period initializes the engine protection strategy. CLEAR the DTCs. REPEAT the self-test.	GO to **DY17**.

DY17 TYPE OF ENGINE COOLANT SENSOR

NOTE: When an oil temperature sensor is not present, the PCM uses an oil algorithm to infer actual temperature based on input from the engine temperature sensor.

- **Is the vehicle equipped with cylinder head temperature (CHT) sensor?**

Yes	No
GO to **DL26**.	GO to **DX22**.

DY18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DZ: UNIVERSAL HEATED OXYGEN SENSOR (HO2S)

WARNING: **While conducting tests on a hot engine take all safety precautions to prevent skin contact with hot engine components. Failure to follow these instructions may result in personal injury.**

NOTE: Only diagnose the suspect universal HO2S indicated by the DTC.

This pinpoint test is intended to diagnose the following:

- universal HO2S (9Y460)
- harness circuits: UO2S, UO2SGREF, UO2SHTR, UO2SPC, UO2SPCT, and VPWR
- powertrain control module (PCM) (12A650)

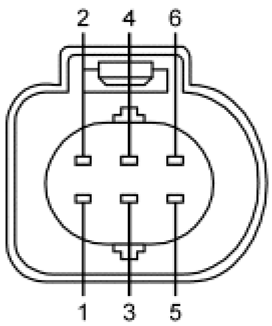

Fig. 92: Universal Heated Oxygen Sensor (HO2S)
Courtesy of FORD MOTOR CO.

Pin	Circuit
5	UO2SPCT (Universal Oxygen Sensor Pumping Current Trim)
1	UO2SPC (Universal Oxygen Sensor Pumping Current)
4	VPWR (Vehicle Power)
2	UO2SGREF (Universal Oxygen Sensor Ground Reference)
6	UO2S (Universal Oxygen Sensor)
3	UO2SHTR (Universal Oxygen Sensor Heater)

Pin	Circuit
E18	UO2S11 (Universal Oxygen Sensor Bank 1, Sensor 1)
E20	UO2S21 (Universal Oxygen Sensor Bank 2, Sensor 1)
E19	UO2SGREF11 (Universal Oxygen Sensor Ground Reference Bank 1, Sensor 1)
E21	UO2SGREF21 (Universal Oxygen Sensor Ground Reference Bank 2, Sensor 1)
E69	UO2SHTR11 (Universal Oxygen Sensor Heater Bank 1, Sensor 1)
E70	UO2SHTR21 (Universal Oxygen Sensor Heater Bank 2, Sensor 1)
E4	UO2SPC11 (Universal Oxygen Sensor Pumping Current Bank 1, Sensor 1)
E6	UO2SPC21 (Universal Oxygen Sensor Pumping Current Bank 2, Sensor 1)

E5	UO2SPCT11 (Universal Oxygen Sensor Pumping Current Trim Bank 1, Sensor 1)
E7	UO2SPCT21 (Universal Oxygen Sensor Pumping Current Trim Bank 2, Sensor 1)

DZ1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0030, P0040, P0050, P0053, P0059, P0130, P0133, P0134, P0135, P0150, P0153, P0154, P0155, P1127, P2096, P2097, P2098, or P2099 present?**

Yes	No
For DTCs P0030 or P0050, GO to **DZ2**. For DTC P0040, GO to **DZ5**. For DTCs P0053, P0059, P0135 or P0155, GO to **DZ6**. For DTCs P0130 or P0150, GO to **DZ11**. For DTCs P0133 or P0153, GO to **DZ15**. For DTCs P0134 or P0154, GO to **DZ18**. For DTC P1127, GO to **DZ19**. For DTCs P2096, P2097, P2098 or P2099, GO to **DZ20**.	For symptoms without DTCs, GO to **DZ23**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DZ2 DTCS P0030 AND P0050: CHECK FOR MISFIRE CONCERNS AND AFTERMARKET EQUIPMENT

- Key in OFF position.
- Check for the following:
  - misfire concern
  - non-factory or aftermarket equipment that may increase the exhaust temperature
- Universal HO2S connector disconnected.
- Check the universal HO2S connector for damage or corrosion.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DZ3**.

DZ3 CHECK THE UO2SHTR CIRCUIT FOR A SHORT TO VOLTAGE

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S	

Connector, Harness Side	(-)
UO2SHTR - Pin 3	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DZ4**.

DZ4 CHECK THE UO2S, UO2SGREF, UO2SHTR CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2S - Pin 6	UO2S
UO2SGREF - Pin 2	UO2SGREF
UO2SHTR - Pin 3	HO2S Heater

- **Are the resistances less than 5 ohms?**

Yes	No
INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ5 DTC P0040: CROSSED SENSOR WIRES

- Key in OFF position.
- Check the vehicle repair history.
- Verify the connectors are connected to the correct engine bank.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DZ6 DTCS P0053, P0059, P0135 AND P0155: CHECK FOR VPWR IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S Connector, Harness Side	(-)
VPWR - Pin 4	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **DZ7**.	REPAIR the open circuit. CHECK the fuses. CLEAR the DTCs. REPEAT the self-test.

DZ7 CHECK THE UO2SHTR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2SHTR - Pin 3	UO2SHTR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DZ8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ8 CHECK THE UO2SHTR CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) Vehicle Battery
UO2SHTR - Pin 3	Negative terminal

- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) Universal HO2S Connector, Harness Side
UO2SHTR - Pin 3	UO2S - Pin 6
UO2SHTR - Pin 3	UO2SGREF - Pin 2
UO2SHTR - Pin 3	UO2SPC - Pin 1
UO2SHTR - Pin 3	UO2SPCT - Pin 5
UO2SHTR - Pin 3	VPWR - Pin 4

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DZ9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DZ9 CHECK THE INTERNAL RESISTANCE OF THE UNIVERSAL HO2S HEATER

- Measure the resistance between:

(+) Universal HO2S Connector, Component Side	(-) Universal HO2S Connector, Component Side
VPWR - Pin 4	UO2SHTR - Pin 3

- **Is the resistance between 1.8 - 9 ohms?**

Yes	No
GO to **DZ10**.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ10 CHECK THE UO2SHTR CIRCUIT FOR AN INTERNAL SHORT TO GROUND

- Measure the resistance between:

(+) Universal HO2S Connector, Component Side	(-)
UO2SHTR - Pin 3	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **DZ25**.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ11 DTCS P0130 AND P0150: CHECK THE UO2S AND UO2SGREF CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector,	(-) PCM Connector,

Harness Side	Harness Side
UO2S - Pin 6	UO2S
UO2SGREF - Pin 2	UO2SGREF

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **DZ12**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ12 CHECK THE UO2S, UO2SGREF, UO2SPC, AND UO2SPCT CIRCUITS FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-)
UO2S - Pin 6	Ground
UO2SGREF - Pin 2	Ground
UO2SPC - Pin 1	Ground
UO2SPCT - Pin 5	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **DZ13**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DZ13 CHECK THE UO2S, UO2SGREF, UO2SPC, AND UO2SPCT CIRCUITS FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S Connector, Harness Side	(-)
UO2S - Pin 6	Ground

UO2SGREF - Pin 2	Ground
UO2SPC - Pin 1	Ground
UO2SPCT - Pin 5	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **DZ14**.

DZ14 CHECK THE UO2SGREF CIRCUIT FOR VOLTAGE

- Key in OFF position.
- PCM connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S Connector, Harness Side	(-)
UO2SGREF - Pin 2	Ground

- **Is the voltage between 2.4 - 2.6 V?**

Yes	No
INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **DZ25**.

DZ15 DTCS P0133 AND P0153: CARRY OUT THE KOER SELF-TEST

- Engine at normal operating temperature.
- Carry out the KOER self-test.
- **Are any DTCs present other than P0133 or P0153?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **DZ16**.

DZ16 CHECK FOR A SOURCE OF POTENTIAL CONTAMINATION

- Investigate the following items as potential sources of universal HO2S contamination:
  - use of unapproved silicon sealers
  - fuel contaminated by silicon additives
  - excessive oil consumption
  - glycol leaking internally in the engine
  - lead-contaminated fuel
  - short drive cycles in cold weather
  - use of unapproved cleaning agents
- **Is a concern present?**

Yes	No
REPAIR the source of the contamination. CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **DZ17**.

DZ17 CHECK THE UNIVERSAL HO2S RESPONSE TEST RESULTS

- Key ON, engine OFF.
- Access the diagnostic monitoring test results for the HO2S11 and HO2S21.
- **Is the indicated value greater than the minimum threshold?**

Yes	No
Unable to duplicate or identify the concern at this time. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ18 DTCS P0134 AND P0154: CHECK THE UO2SPC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2SPC - Pin 1	UO2SPC

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ19 KOER DTC P1127: EXHAUST TEMPERATURE OUT OF RANGE

NOTE: Address all other DTCs before proceeding.

- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the HTR11 and HTR21 PIDs.
- **Are the PID states ON?**

Yes	No
CARRY OUT the KOER self-test.	RUN the engine until the PID indicates ON. CARRY OUT the KOER self-test.

DZ20 DTCS P2096, P2097, P2098 AND P2099: VISUALLY INSPECT THE UPSTREAM AND DOWNSTREAM HO2S CONNECTORS

- Key in OFF position.
- HO2S connector disconnected.
- Universal HO2S connector disconnected.
- Check for a loose connection, and damaged or corroded terminals.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DZ21**.

DZ21 CHECK FOR LEAKS IN THE EXHAUST SYSTEM

- Visually inspect the exhaust system for the following:
  - exhaust leaks at flanges and gaskets
  - HO2Ss not tightened to specification
  - physical exhaust system concerns
  - aftermarket exhaust
  - punctures or cracks in the catalytic converter
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **DZ22**.

DZ22 CHECK FOR POTENTIAL SENSOR CONTAMINATION CONCERNS

- Investigate the following items as potential sources of universal HO2S contamination:
  - use of unapproved silicon sealers
  - fuel contaminated by silicon additives
  - excessive oil consumption
  - glycol leaking internally in the engine
  - lead-contaminated fuel
  - short drive cycles in cold weather
  - use of unapproved cleaning agents
- **Is a concern present?**

Yes	No
REPAIR the source of the contamination. CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **DZ25**.

DZ23 CHECK THE UO2SPCT CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.

- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2SPCT - Pin 5	UO2SPCT

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **DZ24**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ24 CHECK THE RESISTANCE OF THE CURRENT TRIM RESISTOR IN THE UNIVERSAL HO2S

- Measure the resistance between:

(+) Universal HO2S Connector, Component Side	(-) Universal HO2S Connector, Component Side
UO2SPCT - Pin 5	UO2SPC - Pin 1

- **Is the resistance between 25 - 330 ohms?**

Yes	No
The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** for further direction.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ25 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins

    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST EM: EMISSION COMPLIANCE

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

NOTE: **Canada and some states or metropolitan areas in the United States require periodic emission, or inspection/maintenance (I/M) tests. All Ford products are designed to pass these tests. If a Ford product fails an I/M test, it is probably because 1) the engine or catalyst temperature was not warm and stabilized before the test, or 2) the vehicle had idled excessively before the test.**

If any new emission components are installed, carry out the following steps before repeating the I/M test procedure:

- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- To relearn some basic adaptive learning (trim) values, run the engine at 2,500 RPM for 1 minute and idle the engine for 2 minutes.

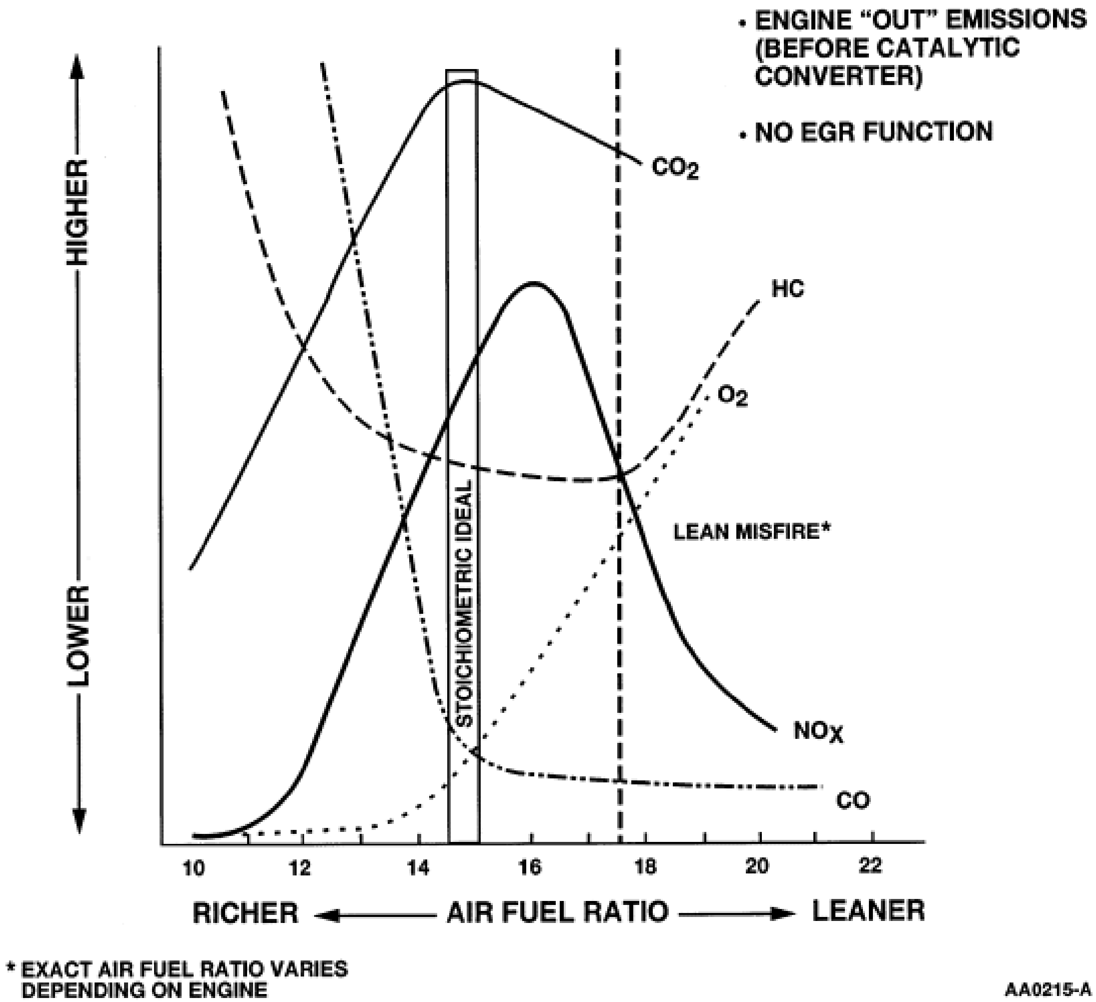

Fig. 93: Exhaust Gas Analysis Chart
Courtesy of FORD MOTOR CO.

Verifying an Excessive Grams Per Mile (GPM) Indication Using a Parts Per Million (PPM) Reading.

For vehicle gas reading(s) that are excessive, compare the actual GPM reading to the gas cut point level needed to pass testing. This gives an indication of how much the PPM reading has to be reduced (if the actual reading is twice the cut point, the baseline reading has to be cut in half or more).

Example:

- The actual HC produced by a vehicle is 1.6 gpm. The cut point for HC in this example is 0.8 gpm. The actual reading is twice the cut point.
- The HC reading obtained for the same vehicle during the baseline drive averages 440 ppm. In order for this vehicle to pass the I/M test, the HC reading from the verification trip must be at least half of the baseline reading, or an average of 220 ppm or less.
- This method only gives a general idea of how much the PPM reading needs to be reduced in order for the vehicle to pass an I/M test that calculates GPM. This test is not exact. Experience still has to be used to

determine if the emission readings are reduced enough for the vehicle to pass the I/M test.

EM1 ANALYZE THE I/M TEST REPORT

- Analyze the I/M test report for data entry errors.
  - model
  - model year
  - correct calibration, if included on the report
  - correct test weight, if included on the report (this number is less than the vehicle's GVW)
- Analyze the I/M test report results.
  - identify high and low gas readings.
  - for reports that include a drive trace, identify during which mode the gas(es) failed. Be aware that if all gases were high early then decreased, the catalyst may have been cool when testing began.
- **Has the I/M test report been analyzed?**

Yes	No
GO to **EM2**.	REPEAT the test step.

EM2 EVAP SYSTEM LEAK OR PURGE FLOW TEST (IF THESE TESTS WERE CARRIED OUT)

- **Does the vehicle fail only an EVAP system leak or purge flow test (if these tests are carried out)?**

Yes	No
This is an EVAP concern only. GO to **EM22**.	GO to **EM3**.

EM3 BASELINE THE VEHICLE

NOTE: Baselining the vehicle exhaust gas readings is important so the baseline readings can be used for comparison after any repair is made.

- Baseline the vehicle using an exhaust gas analyzer. If the vehicle must be driven, be certain any baseline drive used is repeatable. The same drive cycle will be used to verify any repair.
- During the baseline, check for any related symptoms that may be present, such as driveability, transmission shifting or exhaust smoke concerns.
- **Has the vehicle been baselined?**

Yes	No
GO to **EM4**.	REPEAT the test step.

EM4 SYMPTOM CHECKS

- Check if any of the following symptoms are present:

  - transmission concerns
  - idle concerns
  - driveability concerns
  - exhaust smoke
  - cooling system concerns
- **Are any of the symptoms present?**

Yes	No
CARRY OUT the PCM Quick Test. REFER to the **SYMPTOM CHARTS** article, QT: Step 1: Powertrain Control Module (PCM) Quick Test. REFER to the Exhaust Gas Analysis Chart at the beginning of this pinpoint test. After any repair, GO to **EM26**.	GO to **EM5**.

EM5 PRELIMINARY CHECKS

- Carry out the following checks:
  - vacuum lines for leaks and blockages
  - electrical connections
  - proper scheduled maintenance
  - Ford authorized emission controls and components installed on the vehicle
  - intake air tube and air cleaner concerns such as obstructions, leaks, or a dirty air cleaner element
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to **EM26**.	GO to **EM6**.

EM6 CARRY OUT THE PCM QUICK TEST

- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer to**PINPOINT TEST QT** .
- **Is a concern present?**

Yes	No
FOLLOW the Quick Test direction. After any repair, GO to **EM26**.	GO to **EM7**.

EM7 CHECK FOR EXCESSIVE CARBON MONOXIDE (CO) LEVELS

- **Does the vehicle have excessive CO levels?**

Yes	No
Excessive CO levels indicate the engine is running rich. GO to **EM10**.	GO to **EM8**.

EM8 CHECK FOR EXCESSIVE HYDROCARBON (HC) LEVELS

- **Does the vehicle have excessive HC levels?**

Yes	No
Excessive HC levels with low to normal CO levels indicate the engine is running lean. GO to **EM16**.	GO to **EM9**.

EM9 CHECK FOR EXCESSIVE OXIDES OF NITROGEN (NOX) LEVELS

- **Does the vehicle have excessive NOx levels?**

Yes	No
GO to **EM20**.	VERIFY the test step results.

EM10 HIGH CO LEVELS: CHECK THE HC LEVELS

- **Does the vehicle have excessive HC levels?**

Yes	No
CHECK for the engine running rich and incomplete combustion. GO to **EM11**.	GO to **EM12**.

EM11 CHECK THE SECONDARY IGNITION SYSTEM

- For ignition coil on plug (COP) equipped vehicles, GO to **JB2** and follow the pinpoint test direction.
- For ignition coil pack equipped vehicles, GO to **JC2** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to **EM26**.	GO to **EM12**.

EM12 CHECK THE FUEL DELIVERY SYSTEM FOR CONCERNS SUCH AS HIGH FUEL PRESSURE AND THE ABILITY TO HOLD PRESSURE

- refer to **PINPOINT TEST HC** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to **EM26**.	GO to **EM13**.

EM13 CHECK FOR VACUUM LEAKS/OBSTRUCTION IN THE PCV SYSTEM (SUCH AS OIL CAP, PCV VALVE, HOSES, CUT GROMMETS, VALVE COVER BOLT TORQUE/GASKET LEAK)

- GO to **HG2** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to **EM26**.	GO to **EM14**.

EM14 CHECK THE EXHAUST SYSTEM

- GO to **HF2** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to **EM26**.	GO to **EM15**.

EM15 CHECK THE BASE ENGINE

- Check for base engine concerns. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** .
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to **EM26**.	GO to **EM27**.

EM16 HIGH HC WITH A NORMAL TO LOW CO LEVEL

- Check the fuel delivery system for concerns. refer to **PINPOINT TEST HC** and follow the pinpoint test direction.

- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to **EM26**.	GO to **EM17**.

EM17 CHECK THE SECONDARY IGNITION

- For ignition coil on plug (COP) equipped vehicles, GO to **JB2** and follow the pinpoint test direction.
- For ignition coil pack equipped vehicles, GO to **JC2** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to **EM26**.	GO to **EM18**.

EM18 CHECK FOR VACUUM LEAKS/OBSTRUCTION IN THE PCV SYSTEM (SUCH AS OIL CAP, PCV VALVE, HOSES, CUT GROMMETS, VALVE COVER BOLT TORQUE/GASKET LEAK)

- GO to **HG2** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to **EM26**.	GO to **EM19**.

EM19 CHECK THE BASE ENGINE

- Check for base engine concerns such as intake manifold leaks, improper compression, or valvetrain or camshaft damage. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** to carry out the intake manifold vacuum test, compression test, and valve train analysis.
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to **EM26**.	GO to **EM27**.

EM20 HIGH NOX WITH NORMAL TO LOW HC AND CO LEVELS: CHECK THE BASE ENGINE

- Check for base engine concerns such as excessive carbon build up in the combustion chamber. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** to diagnose the abnormal combustion.
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to **EM26**.	GO to **EM21**.

EM21 ADDITIONAL CHECKS

- Check the following:
  - transmission torque converter clutch operation
  - cooling system concerns such as an aftermarket front fascia covering the intake air or intake air system modifications
  - engine running lean concerns such as vacuum leaks or low fuel pressure
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to **EM26**.	GO to **EM27**.

EM22 EVAP SYSTEM CONCERN: PRELIMINARY CHECKS

- Analyze the I/M test report to determine when the concern is present. Attempt to verify the concern.
- Check the following:
  - fuel filler cap
  - capless fuel tank filler pipe (if equipped)
  - EVAP system lines/hoses for proper connections, damage or blockage
  - fuel vapor storage canister damage
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to **EM25**.	GO to **EM23**.

EM23 CARRY OUT THE PCM QUICK TEST

- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer to**PINPOINT TEST QT** .

- **Is a concern present?**

Yes	No
FOLLOW the Quick Test direction. After any repair, GO to **EM25**.	GO to **EM24**.

EM24 EVAP SYSTEM CHECK

- Check the EVAP system for leaks. Refer to the **EVAPORATIVE EMISSIONS -- E-SERIES** to carry out the evaporative emission system leak test.
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to **EM25**.	VERIFY the test step results. If all the test steps are OK, refer to **PINPOINT TEST Z**. For additional symptoms, REFER to the **SYMPTOM CHARTS** article. After any repair, GO to **EM25**.

EM25 EVAP SYSTEM REPAIR VERIFICATION

- Confirm the vehicle repair.
- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . Be aware that this will set DTC P1000 and reset the On-Board System Readiness test.
- To relearn some basic adaptive learning (trim) values, run the engine at 2,500 RPM for 1 minute and idle the engine for 2 minutes.
- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer to**PINPOINT TEST QT** .
- Carry out the EVAP system leak test and flow check.
- **Does the vehicle pass the EVAP system leak test and flow check?**

Yes	No
SAVE any repair documentation that may be required by local/federal laws. RETURN the vehicle to the customer.	The original concern was not repaired, or another concern exists. GO to **EM1**.

EM26 REPAIR AND VERIFICATION

NOTE: **If the vehicle needs to be driven for the baseline test, it may be necessary to drive the vehicle first up to 8 km (5 miles) to relearn some additional adaptive learning (trim) values. Also, during the baseline make sure to use the same**

drive mode that was used for the original baseline test.

- Confirm the vehicle repair.
- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . Be aware that this will set DTC P1000 and reset the On-Board System Readiness test.
- To relearn some basic adaptive learning (trim) values, run the engine at 2,500 RPM for 1 minute and idle the engine for 2 minutes.
- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer to**PINPOINT TEST QT** . Repair any other DTCs.
- Carry out the baseline test using the exhaust gas analyzer.
- For I/M 240 emission testing areas:
  - Refer to the beginning of this pinpoint test for information on verifying an excessive grams per mile indication using a parts per million (PPM) reading.
- All others (original gas concentrations reported in parts per million):
  - Verify the gas levels are within the acceptable range
- **Are all gases within the acceptable range?**

Yes	No
SAVE any repair documentation that may be required by local/federal laws. RETURN the vehicle to the customer.	The gas level is still high, or another gas level is above the acceptable range. GO to **EM1**.

EM27 CATALYST DELTA TEMPERATURE TEST

- Complete all previous testing.
- Run the engine for 2 minutes at 2,500 RPM to heat the exhaust system.
- Key in OFF position.
- Disconnect and ground 1 spark plug wire from each cylinder bank (for coil-on-plug applications, disconnect the coil connector).
- Run the engine at approximately 1,000 RPM.
- Disconnect the IAC valve and maintain 1,000 RPM (if equipped).
- Measure the surface temperature at both the inlet and outlet of each catalytic converter.
- Compare the difference in temperature between the inlet and outlet readings of each catalytic converter.
- **Does each catalytic converter have a difference of more than 28°C (50°F) between its inlet and outlet reading?**

Yes	No
The catalytic converter(s) is operating correctly. CONNECT the spark plug wire(s) and the IAC (if equipped). CLEAR the DTCs.	For catalytic converter(s) that have less than 28°C (50°F) difference, testing indicates the catalytic converter(s) is not working. REPEAT the test to

VERIFY the test step results. If all test steps are OK, refer to **PINPOINT TEST Z**. For additional symptoms, REFER to the **SYMPTOM CHARTS** article. After any repair, GO to **EM26**.	verify the results. If the temperature difference is still less than required, INSTALL a new catalytic converter. After any repair, GO to **EM26**.

PINPOINT TEST FB: POWER TAKE OFF (PTO)

This pinpoint test is intended to diagnose the following:

- PTO switch
- harness circuit: PTO, PTOIL
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
170 Pin	B7 B42 B9 B26	PTORPM PTOIL PTOENG PTO

FB1 PTO INDICATOR LAMP

- **Did you come to this pinpoint test for an always on/ never on PTO indicator?**

Yes	No
GO to **FB7**.	GO to **FB2**.

FB2 PTO NOT WORKING CORRECTLY: CHECK THE PTO INDICATOR LAMP OPERATION

NOTE: **The following conditions must be met before the PTO engages:**

- **Engine at normal operating temperature**
- **Accelerator pedal is released**
- **TFT within normal operating temperature**
- **Parking brake is applied**
- **Brake pedal is released**
- **Automatic transmission is in the PARK position**
- **Manual transmission - the clutch pedal is released**

NOTE: This step requires operating the PTO component. Refer to the aftermarket manufacturer for the PTO operating instructions. Follow all safety precautions.

- Key ON, engine running.
- Activate the PTO switch.
- **Does the PTO indicator illuminate?**

Yes	No
GO to the aftermarket PTO mechanical manual.	GO to **FB3**.

FB3 CHECK THE INTEGRITY OF THE PTO SWITCH AND THE PTO SWITCH CIRCUIT

- Access the PCM and monitor the PTO PID.
- Cycle the PTO switch, from off to on to off.
- **Does the PTO PID change state?**

Yes	No
GO to **FB4**.	REPAIR the PTO circuit or switch as necessary. CLEAR the DTCs. REPEAT the self-test.

FB4 CHECK THE PTO LOAD PID STATE IN THE PCM

- Access the PCM and monitor the PTOLOAD PID.
- Cycle the PTO switch,
- **Does the PTO LOAD PID change state?**

Yes	No
GO to **FB5**.	REPAIR the PTO ENG circuit or switch as necessary. CLEAR the DTCs. REPEAT the self-test.

FB5 CHECK THE PTOIR_V PID STATE IN THE PCM

NOTE: The PTOIR_V PID represents an analog input which reflects the user requested engine speed.

- Access the PCM and monitor the PTOIR_V PID.
- Cycle the PTO switch,
- **Does the PTOIR_V PID change state?**

Yes	No
	REPAIR the PTO RPM circuit or switch as

GO to **FB6**.	necessary. CLEAR the DTCs. REPEAT the self-test.

FB6 CHECK THE PTOIL PID STATE IN THE PCM

- Access the PCM and monitor the PTOIL PID.
- Cycle the PTO switch,
- **Does the PTOIL PID change state?**

Yes	No
GO to **FB7**.	VERIFY no DTCs are present. VERIFY the vehicle conditions in step FB2 are correct for PTO operation.

FB7 PTO INDICATOR LAMP ALWAYS OFF OR ON: CHECK THE PTOIL_F PID

- Access the PCM and monitor the PTOIL_F PID.
- **Is a concern present?**

Yes	No
REPAIR the circuit as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to the aftermarket PTO mechanical manual.

PINPOINT TEST FD: BRAKE PEDAL INPUTS

This pinpoint test is intended to diagnose the following:

- brake pedal position (BPP) (13480)
- brake pedal switch (BPS) (9F924), (9C872)
- harness circuits: B+, BPP, BPS
- powertrain control module (PCM) (12A650)

Refer to the Wiring Diagrams article for specific vehicle application and pin locations.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Grand Marquis, Town Car	170 Pin	B9	BPS
E-Series, F-Super Duty	170 Pin	E65 B8	BPS BPP
Escape/Mariner	150 (50-50-50) Pin	B8	BPP

Expedition, Fusion, Milan, MKZ, Navigator	140 Pin	B47 B46	BPS BPP
Explorer, Explorer Sport Trac, Mountaineer, Mustang	170 Pin	B9 B8	BPS BPP
Focus	190 Pin	B46 B13	BPS BPP
Ranger	170 Pin	B8	BPP
All other vehicles	190 Pin	B47 B46	BPS BPP

FD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0504, P0572, P0573, P0703, P1572, or P1703 present?**

Yes	No
For KOEO or continuous memory DTCs P0504, P0572, P0573, P0703, P1703 and continuous memory DTC P1572, GO to **FD3**. For KOER DTCs P0703, or P1703, GO to **FD2**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

FD2 KOER DTCS P0703 AND P1703: VERIFY THE BRAKE PEDAL WAS APPLIED

- **Was the brake pedal applied and released during the KOER self-test?**

Yes	No
GO to **FD3**.	REPEAT the KOER self-test. APPLY and RELEASE the brake pedal during the KOER test. CLEAR the DTCs. REPEAT the self-test.

FD3 DTCS P0572, P0573, P0703, P1572 AND P1703: CHECK THE OPERATION OF THE STOPLAMP

- Key ON, engine OFF.
- Apply and release the brake pedal and check the stop lamp operation.
- **Do the stoplamp operate correctly?**

Yes	No
For Crown Victoria, Grand Marquis, Sable, Taurus,	REFER to the **EXTERIOR LIGHTING -- E-SERIES** to diagnose the inoperative stoplamp.

Taurus X, and Town Car, GO to **FD4**. For all others, GO to **FD5**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

FD4 CHECK THE BRAKE SWITCH OPERATION

- Key ON, engine OFF.
- Access the PCM and monitor the BPP_BOO PID.
- Apply and release the brake pedal while monitoring the brake position PID.
- **Does the PID cycle ON and OFF?**

Yes	No
GO to **FD6**.	REFER to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose the powertrain control module (PCM) not responding to the scan tool. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

FD5 CHECK FOR BPP CIRCUIT CYCLING

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Apply and release the brake pedal while monitoring the voltage.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
BPP	Ground

- **Is voltage less than 1 volt with the brake pedal released and greater than 10 volts with the brake pedal fully applied?**

Yes	No
For Ranger, GO to **FD7**. For all others, GO to **FD6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

FD6 CHECK FOR BPS CIRCUIT CYCLING

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.

- Apply and release the brake pedal while monitoring the voltage.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
BPS	Ground

- **Is voltage greater than 10 volts with the brake pedal released and less than 1 volt with the brake pedal fully applied?**

Yes	No
GO to **FD7**.	REFER to the **SPEED CONTROL -- E-SERIES** . CARRY OUT the diagnostic steps for DTC P1703 to continue diagnose.

FD7 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST FF: POWER STEERING PRESSURE (PSP) SWITCH

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- power steering pressure (PSP) Switch (3N824)
- harness circuits: PSPSW and SIGRTN

- powertrain control module (PCM) (12A650)

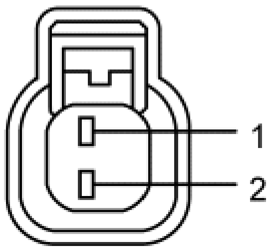

Fig. 94: Positive Crankcase Ventilation Thermal Extension -Harness Side (PCVTE-Harness Side)
Courtesy of FORD MOTOR CO.

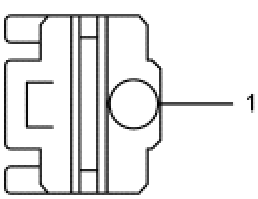

Fig. 95: Power Steering Pressure (PSP) Switch Connector - B
Courtesy of FORD MOTOR CO.

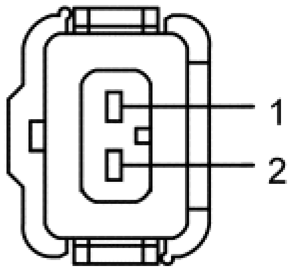

Fig. 96: Power Steering Pressure (PSP) Switch Connector - C
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Fusion 3.0L, Grand Marquis, Milan 3.0L, Town Car	A	2 1	SIGRTN PSPSW
Edge, Fusion 2.3L, Milan 2.3L, MKX, MKZ	B	1	PSPSW
Ranger	C	2 1	SIGRTN PSPSW
All other vehicles	C	1 2	SIGRTN PSPSW

The PSP and SIGRTN circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article for schematic and connector information.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, MKX	190 Pin	B17	PSPSW
Explorer, Explorer Sport Trac, Mountaineer	170 Pin	B41 B27	SIGRTN PSPSW

Fusion 3.0L, Milan 3.0L	140 Pin	E58 E65	SIGRTN PSPSW
Fusion 2.3L, Milan 2.3L, MKZ	140 Pin	E65	PSPSW
Ranger	170 Pin	B41 B34	SIGRTN PSPSW
Sable, Taurus, Taurus X	190 Pin	E41 B17	SIGRTN PSPSW
All other vehicles	170 Pin	E58 B34	SIGRTN PSPSW

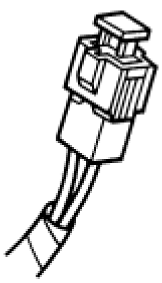

Fig. 97: Shorting Bar For Harness Circuit Without PSP Switch (Typical)
Courtesy of FORD MOTOR CO.

FF1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P1650 or P1651 present?**

Yes	No
For KOEO DTC P1650, GO to **FF3**. For KOER DTC P1650, GO to **FF2**. For continuous memory DTC P1651, GO to **FF7**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

FF2 KOER DTC P1650: CARRY OUT TURNING THE STEERING WHEEL ONE HALF TURN

- **Did you turn the steering wheel at least one half turn within 20 seconds of starting the KOER self-test?**

Yes	No
GO to **FF3**.	CARRY OUT the KOER self-test.

FF3 DTC P1650: CHECK THE PSP PID

- Key ON, engine running.

- Access the PCM and monitor the PSP PID.
- Turn the steering wheel back and forth.
- **Does the PID state change?**

Yes	No
GO to **FF7**.	GO to **FF4**.

FF4 CHECK THE PSP CIRCUITS TO THE PSP SWITCH FOR CYCLING

- Key in OFF position.
- PSP Switch connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the PSP PID.
- For Fusion/Milan 2.3L, Edge/MKX or MKZ,
- Connect a 5 amp fused jumper wire between the following:

Point A PSP Switch Connector, Harness Side	Point B
PSPSW	Ground

- For all others,
- Connect a 5 amp fused jumper wire between the following:

Point A PSP Switch Connector, Harness Side	Point B PSP Switch Connector, Harness Side
PSPSW	SIGRTN

- Remove the jumper wire(s).
- **Does the PID state change?**

Yes	No
INSTALL a new PSP switch. CLEAR the DTCs. REPEAT the self-test.	GO to **FF5**.

FF5 CHECK THE PSP AND SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PSP Switch Connector, Harness Side
PSPSW	PSPSW
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **FF6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

FF6 CHECK THE PSP CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Measure the resistance between:

(+) PSP Switch Connector, Harness Side	(-)
PSPSW	Ground

- Measure the resistance between:

(+) PSP Switch Connector, Harness Side	(-) PSP Switch Connector, Harness Side
PSPSW	SIGRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **FF8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

FF7 DTC P1651: CHECK THE PSP CIRCUIT(S) FOR INTERMITTENT CONCERNS

NOTE: **Be aware that P1651 could be set if the vehicle is towed with the engine running, or if a power steering hydraulic concern is present.**

- Key ON, engine OFF.

- Access the PCM and monitor the PSP PID.
- Check for open circuits while carrying out the following (a concern is indicated by a sudden change in the PCM-PSP PID):
  - Shake, wiggle, and bend the PSP and SIGRTN circuit(s).
  - Lightly tap on the PSP to simulate road shock
- PSP Switch connector disconnected.
- Check the PSP circuit for a short to ground. Shake, wiggle and bend the PSP circuits.
- **Is a concern present?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	CONNECT the PSP switch. Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

FF8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST H: FUEL CONTROL

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: **While conducting tests on a hot engine take all safety precautions to prevent skin contact with hot engine components. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- HO2S/O2S (9F472)
- HO2S/O2S (9G444)
- fuel injector(s) (9F593)
- harness circuits: HO2S, HO2S Heater, VPWR, and SIGRTN
- vacuum systems
- powertrain control module (PCM) (12A650)

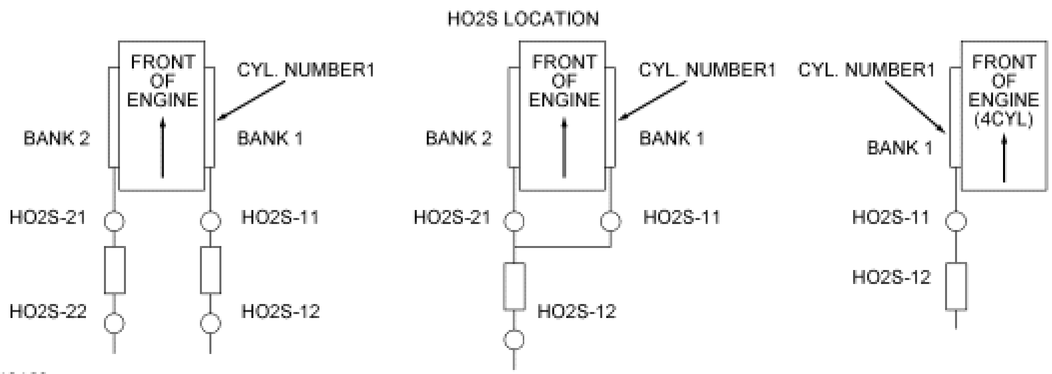

Fig. 98: Identifying HO2S Location (1 Of 2)
Courtesy of FORD MOTOR CO.

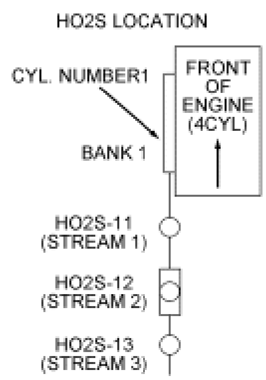

Fig. 99: Identifying HO2S Location (2 Of 2)
Courtesy of FORD MOTOR CO.

The pin numbering for the connector is in reference to the connector lock tab. Not all connector key combinations are shown.

All other vehicles	170 Pin	T48 E70 T47 E69 T25 E29 T24 E28 B35 B41, E58, T41	HTR22 HTR21 HTR12 HTR11 HO2S22 HO2S21 HO2S12 HO2S11 VPWR SIGRTN

H1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0171, P0172, P0174, P0175, P2195, P2196, P2197, P2198, P2270, P2271, P2272, P2273, P2274, or P2275 present?**

Yes	No
For DTCs P2270, P2271, P2272, P2273, P2274 or P2275, GO to **H32**. For DTCs P0171, P0174, P2195 or P2197, GO to	For all others, GO to**DIAGNOSTIC TROUBLE

H2. For DTCs P0172, P0175, P2196 or P2198, GO to **H7**.	**CODE (DTC) CHARTS AND DESCRIPTIONS** .

H2 DTCS P0171, P0174, P2195 OR P2197: LEAN SYSTEM DTCS

NOTE: Do not clear the DTCs or reset the keep alive memory (KAM).

- Access the PCM and record the engine coolant temperature (ECT) PID from the freeze frame data. The freeze frame data is used to recreate the concern.
- Retrieve and record the self-test DTCs.
- **Are any DTCs present other than the following: P0171, P0174, P2195 or P2197?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **H3**.

H3 CARRY OUT A VISUAL INSPECTION ON THE INTAKE AIR SYSTEM AND ALL VACUUM HOSES

- Key in OFF position.
- Check the intake air system for leaks, obstructions, and damage.
- Inspect the entire length of all the vacuum hoses for:
  - proper connections
  - damage or cracks
  - damaged or cracked vacuum tees
- Verify the integrity of the positive crankcase ventilation (PCV) system.
- Verify the proper PCV valve part number.
- **Is a concern present?**

Yes	No
GO to **H6**.	GO to **H4**.

H4 CHECK FOR THE PRESENCE OF A VACUUM LEAK

NOTE: Fuel trim values at idle are more sensitive to a vacuum leak. The vacuum leak (unmetered air) represents a larger portion of the total air flow at idle than at part throttle.

NOTE: The barometric pressure (BARO) PID is not a recommended PID to monitor when diagnosing a vacuum leak. Barometric pressure is calculated during high

engine load, when the vacuum leak represents a small portion of the total air flow.

NOTE: **When calculating the total fuel correction in the following steps, if LONGFT1 equals +13% and SHRTFT1 equals +23%, the total fuel correction for bank 1 equals +36%. If LONGFT2 equals +24% and SHRTFT2 equals -3% the total fuel correction for bank 2 equals +21%.**

NOTE: **If the freeze frame ECT PID is available, stabilize the engine at the temperature recorded by the freeze frame ECT PID. If the freeze frame ECT PID is not available, maintain the engine coolant temperature between 82°C - 101°C (180°F - 215°F) and the intake air temperature less than 46°C (115°F).**

- Key ON, engine running.
- Access the PCM and monitor the ECT, CHT and IAT PIDs.
- Access the PCM and monitor the LONGFT1, SHRTFT1, LONGFT2 and SHRTFT2 PIDs.
- Allow the engine to stabilize at the temperature necessary to recreate the concern.
- Mathematically add and record the LONGFT PID value to the SHRTFT PID value for each bank, for a total fuel correction at idle.
- Increase the engine speed to 3,500 RPM for 10 seconds. For vehicles with electronic throttle control (ETC), increase the engine speed to the maximum RPM without activating RPM limiting.

  Record the LONGFT1, SHRTFT1, LONGFT2, and SHRTFT2 PID values.
- Mathematically add and record the LONGFT PID value to the SHRTFT PID value for each bank, for a total fuel correction at 3,500 RPM or the maximum allowable RPM for vehicles with ETC.
- **Is the total fuel correction value difference, between idle and 3,500 RPM or the maximum allowable RPM for vehicles with ETC, less than 15 percent?**

Yes	No
No vacuum leak is present. For DTCs P0171 or P0174, GO to **H16**. For Sable, Taurus, and Taurus X PZEVs with DTCs P2195 or P2197, GO to **H15**. For all other vehicles with DTCs P2195 or P2197, GO to **H9**.	GO to **H5**.

H5 LOCATE THE VACUUM LEAK

NOTE: **Do not clamp or pinch a hard plastic hose. Use a vacuum cap or equivalent to restrict the hose.**

NOTE: **Restricting the EVAP vapor hose while the EVAP emission canister is purging**

may shift the SHRTFT. Carry out a visual inspection as necessary.

NOTE: **When monitoring for a decrease in the SHRTFT PIDs in the following steps, if SHRTFT1 equals +15% and the hose is restricted, SHRTFT1 decreases to -7%. The total decrease in the SHRTFT PIDs equals 22%.**

- Locate the vacuum tees for the intake air and PCV systems.
- Access the PCM and monitor the SHRTFT1 and SHRTFT2 PIDs.
- Restrict the vacuum lines one at a time for 30 seconds. If a vacuum leak is present, the SHRTFT PID values decrease as the hose is restricted.
- **Is the decrease in the SHRTFT PIDs greater than 15 percent when one of the vacuum hoses is restricted?**

Yes	No
GO to **H6**.	INSPECT the intake air system for a vacuum leak in the intake manifold or intake gaskets. REPAIR as necessary. For repair verification, GO to **H6**.

H6 VACUUM LEAK REPAIR VERIFICATION

NOTE: **If the freeze frame ECT PID is available, stabilize the engine at the temperature recorded by the freeze frame ECT PID. If the freeze frame ECT PID is not available, maintain the engine coolant temperature between 82°C - 101°C (180°F - 215°F) and the intake air temperature less than 46°C (115°F).**

- Access the PCM and monitor the SHRTFT1 and SHRTFT2 PIDs.
- Allow the engine to stabilize at the temperature necessary to recreate the concern.
- Record the SHRTFT1 and SHRTFT2 PID values.
- Key in OFF position.
- Repair the vacuum leak.
- Key ON, engine running.
- Allow the engine to stabilize at the temperature necessary to recreate the concern.
- Access the PCM and monitor the SHRTFT1 and SHRTFT2 PIDs.
- Compare the recorded SHRTFT PID values, prior to the vacuum leak repair, to the current SHRTFT PID values.
- **Is the decrease in the SHRTFT PIDs greater than 15 percent?**

Yes	No
RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	A vacuum leak is still present. GO to **H5**.

REPEAT the self-test.	

H7 DTCS P0172, P0175, P2196 OR P2198: RICH SYSTEM DTCS

NOTE: Do not clear the DTCs or reset the keep alive memory (KAM).

- Access the PCM and record the freeze frame data.
- Retrieve and record the self-test DTCs.
- **Are any DTCs present other than the following: P0172, P0175, P2196 or P2198?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **H8**.

H8 INSPECT THE ENTIRE INTAKE AIR SYSTEM FOR DEBRIS, BLOCKAGE OR OTHER DAMAGE

- Check the intake air system for obstructions, restrictions, and damage.
- Check the throttle plate for obstructions or sludge.
- Check the air filter element and housing for blockage.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	For DTCs P0172 or P0175, GO to **H16**. For Sable, Taurus, and Taurus X PZEVs with DTCs P2196 or P2198, GO to **H15**. For all other vehicles with DTCs P2196 or P2198, GO to **H13**.

H9 CHECK THE HO2S AND SIGRTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Disconnect the HO2S related to the current DTC.
- PCM connector disconnected.
- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **H10**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

H10 CHECK THE HO2S CIRCUIT FOR A SHORT TO SIGRTN IN THE HARNESS

- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	SIGRTN

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **H11**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H11 CHECK THE HO2S CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-)
HO2S Signal	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **H12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H12 HO2S CIRCUIT TEST (WITH LEAN DTCS)

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side

HO2S Signal	VPWR

- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.3 V?**

Yes	No
GO to **H16**.	GO to **H42**.

H13 HO2S CIRCUIT TEST (WITH RICH DTCS)

- Disconnect the HO2S related to the current DTC.
- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage less than 0.2 V?**

Yes	No
GO to **H16**.	GO to **H14**.

H14 CHECK THE HO2S CIRCUIT FOR A SHORT TO THE VPWR OR HEATER IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	HO2S Heater
HO2S Signal	VPWR

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **H42**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H15 CHECK THE UO2SPC CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: Only the suspect UO2S needs to be diagnosed.

- Key in OFF position.

- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2SPC - Pin 1	UO2SPC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **H16**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

H16 CHECK THE FUEL PRESSURE

WARNING: **When checking the fuel system remember that the fuel system may still be pressurized when the engine is switched off. Always follow the instructions related to fuel system pressure relief. All fuel handling safety precautions must be observed. Failure to follow these instructions may result in personal injury.**

NOTE: **For vehicle specific fuel pressure ranges, refer to the Fuel System Specification Chart in pinpoint test HC.**

- Remove the jumper wire(s).
- HO2S connector connected.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Mechanical fuel pressure gauge connected.
- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- Key ON, engine running.
- Allow the fuel pressure to stabilize.
- Key in OFF position.
- Key ON, engine running.
- Access the PCM and control the FP PID.
- Run the fuel pump to obtain maximum fuel pressure.
- **Is the fuel pressure within range for the vehicle being diagnosed?**

Yes	No
GO to **H17**.	refer to **PINPOINT TEST HC**.

H17 CHECK THE FUEL SYSTEM FOR PRESSURE STABILITY - FAST LEAKDOWN

NOTE: When the fuel pump is commanded off, the fuel pressure may substantially decrease and then stabilize.

NOTE: During output state control, the fuel pump stays commanded on for only about 5 seconds.

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and control the FP PID.
- Run the fuel pump to obtain maximum fuel pressure.
- Command the fuel pump off.
- Allow the fuel pressure to stabilize.
- Record the stabilized reading.
- Monitor the fuel pressure for 10 seconds.
- **Does the fuel pressure remain within 34 kPa (5 psi) of the recorded reading after 10 seconds?**

Yes	No
GO to **H19**.	GO to **H18**.

H18 CHECK FOR AN EXTERNAL FUEL LEAK

- Inspect the fuel tank, lines, and filler pipe for a fuel leak.
- **Is a concern present?**

Yes	No
REPAIR as necessary. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. CLEAR the DTCs. REPEAT the self-test.	GO to **H26**.

H19 CHECK THE FUEL SYSTEM FOR PRESSURE STABILITY - SLOW LEAKDOWN

- Continue to monitor the fuel pressure for 1 minute.
- **Does the fuel pressure remain within 34 kPa (5 psi) of the recorded reading (MRFS) or greater than 275 kPa (40 psi) (ERFS) after 1 minute?**

Yes	No
GO to **H20**.	GO to **HC13**.

H20 CHECK THE SEPARATION LEVEL OF THE ETHANOL/WATER MIXTURE AND GASOLINE IN THE FUEL

NOTE: **This step requires the use of a locally obtained 200 ml beaker and a 25 ml graduated cylinder.**

NOTE: **After approximately 3 minutes of standing, the ethanol and water mixes together and settles to the bottom of the 25 ml graduated cylinder. The gasoline rises to the top.**

- Fill the 200 ml beaker with 5 ml of clean water.
- Use the pressure relief valve on the mechanical fuel gauge to drain 22 ml of fuel into an approved clean container.
- Pour 20 ml of fuel from the approved clean container into the 25 ml graduated cylinder.
- Add enough water from the 200 ml beaker to the 25 ml graduated cylinder to bring the total volume of liquid to 24 ml.
- Insert a stopper plug in the opening of the 25 ml graduated cylinder.
- Firmly hold the stopper in place and shake the 25 ml graduated cylinder to mix the water and fuel.
- Allow the liquid to stand and separate for approximately 3 minutes.
- Record the separation level from the 25 ml graduated cylinder where the ethanol/water mixture and gasoline meet.
- **Did the ethanol/water mixture and gasoline separate?**

Yes	No
GO to **H21**.	COMPLETE all steps before continuing. The ethanol/water mixture will separate from the gasoline. If the fuel does not appear to separate, then the fuel is either 100% ethanol or a mixture of ethanol and water.

H21 CALCULATE THE PERCENTAGE OF ETHANOL IN THE FUEL

NOTE: **Use the illustration as an example for calculating the percentage of ethanol in the following steps. If the separation level is at 14 ml the calculation becomes; 14 minus 4, then multiply by 5 to equal 50. The percentage of ethanol in the fuel is 50%.**

- Key in OFF position.
- Take the recorded separation level from the previous step and subtract the amount of water added.
- Multiply the new value by 5. This new value is the percentage of ethanol in the fuel.

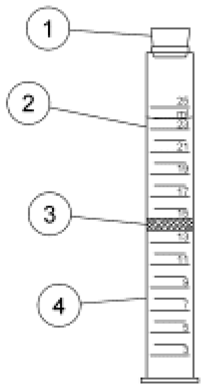

Fig. 107: Calculating Ethanol In Fuel
Courtesy of FORD MOTOR CO.

Item Number	Description
1	Stopper
2	Gasoline
3	Separation Point at 14 ml
4	Ethanol/Water Mixture

- Record the calculated percentage of ethanol in the fuel.
- **Is any ethanol present in the fuel?**

Yes	No
For flex fuel vehicles, GO to **H22**. For all others, GO to **H25**.	GO to **H26**.

H22 COMPARE THE FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

NOTE: When determining if the FF_INF PID value is within 50% of the calculated percentage of ethanol, if the calculated percentage of ethanol value is 40% then the PID value should be between 0 - 90%. The PID value cannot be less than zero.

- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- Compare the FF_INF PID to the calculated percentage of ethanol.
- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
GO to **H26**.	GO to **H23**.

H23 RESET THE PERCENT ETHANOL PARAMETER IN THE PCM

NOTE: **Certain customer fueling practices such as only fueling with small amounts of fuel or repeatedly switching between gasoline and an ethanol blend greater than E15 may prevent the PCM from learning the correct ethanol content in the fuel.**

- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- Key ON, engine running.
- Access the PCM and monitor the FF_LRND PID.
- Drive the vehicle approximately 11.3 km (7 miles) or until the FF_LRND PID indicates yes.
- **Is the PID state YES?**

Yes	No
GO to **H24**.	GO to **H42**.

H24 COMPARE THE UPDATED FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
RETURN the vehicle to the customer. ADVISE the customer of the correct fueling practices when using flex fuel. REFER to the Owner's Literature for additional information. ADVISE the customer to continue to use the same fuel for the next 2-3 refuels. This practice helps to verify the PCM is learning the correct percentage of ethanol in the fuel.	A fuel system concern may be present, which prevents the PCM from learning the correct percentage of ethanol in the fuel, GO to **HC13**.

H25 DETERMINE IF THE PERCENTAGE OF ETHANOL IN THE FUEL IS LESS THAN 25%

- Check the recorded calculated percentage of ethanol in the fuel.
- **Is the calculated percentage of ethanol in the fuel less than 25%?**

Yes	No
GO to **H26**.	REPAIR as necessary. ADVISE the customer of the correct fuel type required for this vehicle. REFER to the Owner's Literature for additional information. CLEAR the DTCs. REPEAT the self-test.

H26 FLOW TEST

- Key in OFF position.
- PCM connector connected.
- Flow test the injector using the fuel injector tester.
- **Is the flow rate for each injector within specification?**

Yes	No
For DTCs P0171, P0172, P0174 or P0175, GO to **DC28**. For DTCs P2195 or P2197, GO to **H27**. For DTCs P2196 or P2198, GO to **H28**.	INSTALL a new fuel injector. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H27 CHECK THE HO2S OUTPUT VOLTAGE

- HO2S connector disconnected.
- Visually inspect the HO2S circuit for exposed wiring, contamination, corrosion and correct assembly. Repair as necessary.
- Measure the voltage between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Signal	SIGRTN

- Increase the engine speed to 2,000 RPM for 3 minutes.
- Carry out the KOER self-test.
- Monitor the signal voltage during the self-test.
- **Is the voltage greater than 0.5 volt at any time during the self-test?**

Yes	No
GO to **H30**.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H28 ATTEMPT TO RETRIEVE DTC P2195 OR P2197

- HO2S connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B Vehicle Battery
HO2S Signal	Negative terminal

- Carry out the KOER self-test.
- **Are DTCs P2195 or P2197 present?**

Yes	No
GO to **H29**.	GO to **H42**.

H29 HO2S VOLTAGE CHECK

- Key in OFF position.
- Remove the jumper wire(s).
- HO2S connector disconnected.
- Key ON, engine running.
- Increase the engine speed to 2,000 RPM for 30 seconds.
- Measure the voltage between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Signal	SIGRTN

- Carry out the KOER self-test.
- Monitor the signal voltage during the self-test.
- **Is the voltage less than 0.4 volt at any time during the self-test?**

Yes	No
GO to **H30**.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H30 CARRY OUT A THOROUGH WIGGLE TEST ON THE HO2S HARNESS

- Key in OFF position.
- HO2S connector connected.
- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the HO2S Signal PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **While monitoring the HO2S PID, does the HO2S stop switching?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **H31**.

H31 TEST DRIVE THE VEHICLE WHILE MONITORING THE HO2S PID FOR SWITCHING

- Access the PCM and monitor the HO2S Signal PID.
- Access the PCM and monitor the FUELSYS PID.
- Start the engine and let idle until the vehicle goes into the closed loop fuel condition.
- Drive the vehicle in a manner consistent with the freeze frame data in an attempt to simulate the original concern.
- **Does the HO2S PID switch?**

Yes	No
GO to **DC28**.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H32 DTCS P2270, P2272, P2271, P2273, P2274 OR P2275: HO2S LACK OF SWITCHES STUCK LEAN OR RICH

NOTE: Address all continuous memory ignition and misfire DTCs before any KOER HO2S DTCs.

- Key in OFF position.
- Visually inspect for:
  - pinched, shorted, and corroded wiring and pins
  - oil or water contamination
  - crossed sensor wires

- contaminated or damaged sensor
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	For KOER DTCs P2270, P2271, P2272, P2273, P2274 or P2275, GO to **H34**. For continuous memory DTCs P2270, P2271, P2272, P2273, P2274 or P2275, GO to **H33**.

H33 CHECK FOR KOER DTCS

- Key ON, engine OFF.
- Clear the DTCs.
- Key ON, engine running.
- Run the engine at approximately 2,000 RPM. Maintain the engine speed for 3 minutes.
- Retrieve the continuous memory DTCs.
- **Are DTCs P2270, P2271, P2272, P2273, P2274 or P2275 present?**

Yes	No
GO to **H34**.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

H34 CHECK THE HO2S SIGNAL LEVEL TOO HIGH

NOTE: Fuel calculations can be affected by unmetered air leaks.

- Key in OFF position.
- Carefully inspect the following areas for potential air leaks:
  - hoses connecting to the mass air flow (MAF) sensor assembly
  - hoses connecting to the throttle body
  - intake manifold gasket leaks
  - PCV system
  - the vacuum lines are disconnected
  - improperly seated engine oil dipstick, tube or oil fill cap
  - exhaust leaks at flanges and gaskets
- With the vehicle in NEUTRAL, position it on a hoist. Refer to the **JACKING AND LIFTING -- E-SERIES** for the locations of the lifting points.
- Visually inspect for:
  - exhaust leaks at flanges and gaskets
  - HO2S not tightened to specification

- physical exhaust system concerns
- aftermarket exhaust
- punctures or cracks in the catalyst

- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **H35**.

H35 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE HO2S HARNESS

- PCM connector disconnected.
- Disconnect the HO2S harness connector.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
HO2S Signal	Negative terminal

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	SIGRTN
HO2S Signal	VPWR
HO2S Signal	HO2S Heater

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **H36**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H36 CHECK THE HO2S CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side

HO2S Heater	HO2S Heater
VPWR	VPWR
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **H37**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

H37 CHECK THE HO2S CIRCUIT VOLTAGE

- PCM connector connected.
- HO2S connector connected.
- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.5 V?**

Yes	No
For partial zero emission vehicle (PZEV), GO to **H40**. For all others, GO to **H39**.	GO to **H38**.

H38 CHECK THE HO2S CIRCUIT VOLTAGE

- Key in OFF position.
- PCM connector connected.
- HO2S connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side
HO2S Signal	VPWR

- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.5 V?**

Yes	No
INSTALL a new HO2S. REFER to the	

ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **H42**.

H39 CHECK FOR OVER VOLTAGE IN THE PCM

- Key in OFF position.
- HO2S connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HO2S Connector, Harness Side	(-) Vehicle Battery
SIGRTN	Negative terminal
HO2S Signal	Negative terminal

- **Are the voltages less than 1.5 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **H42**.

H40 CHECK THE HO2S CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- HO2S connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **H41**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H41 CHECK THE HO2S CIRCUIT VOLTAGE

- PCM connector connected.
- HO2S connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side
HO2S Signal	VPWR

- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.5 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **H42**.

H42 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH**	

ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HC: FUEL DELIVERY SYSTEM

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: **The fuel system remains under pressure after the engine is off. Relieve pressure before repairing. Highly flammable mixtures are present. To release pressure from the fuel system, carry out the following:**

- **Connect Rotunda fuel pressure gauge 134-R0087 or equivalent.**
- **Gradually open the testing kit valve to relieve the fuel pressure in the vehicle fuel system and drain the fuel into a suitable container or return it to the fuel tank.**
- **To avoid unnecessary fuel spillage and fire hazard, any time fuel lines are disconnected, the ignition switch must be in the OFF position unless fuel pump operation is required for test purposes.**

Failure to follow these instructions may result in personal injury.

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot**

vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

NOTE: Replacement fuel injectors may not be the same color as the original injectors in the vehicle. Verify the replacement injector is correct for the application by part number.

This pinpoint test is intended to diagnose the following:

- chassis components
- engine vacuum
- fuel pressure
- fuel supply line
- fuel supply
- fuel filter (9155)
- fuel injector(s) (9F593)
- fuel pump (9H307)

NOTE: With the engine running, the FRP PID value may be 48-70 kPa (7-10 psi) higher than a fuel pressure reading taken with a mechanical gauge.

FUEL SYSTEM SPECIFICATION CHART (KEY ON, ENGINE OFF VALUES)

Application	Fuel System Type	FRP PID Fuel Pressure (kPa)	FRP PID Fuel Pressure (psi)	External Pressure Gauge (kPa)	External Pressure Gauge (psi)
Crown Victoria/Grand Marquis/Town Car	ERFS (1)	240-485	35-70	240-485	35-70
Edge/MKX	MRFS (2)	-	-	331-485	48-70
Escape/Mariner	ERFS (1)	240-485	35-70	240-485	35-70
E-Series	ERFS (1)	240-485	35-70	240-485	35-70
Expedition/Navigator	MRFS (2)	-	-	331-485	48-70
Explorer/Explorer Sport Trac/Mountaineer	ERFS (1)	240-485	35-70	240-485	35-70
F-150, Mark LT	ERFS (1)	240-485	35-70	240-485	35-70
F-Super Duty	ERFS (1)	240-485	35-70	240-485	35-70
Taurus/Taurus X/Sable	MRFS (2)	-	-	331-485	48-70
Focus	MRFS (2)	-	-	331-485	48-70

Fusion/Milan/MKZ	MRFS (2)	-	-	331-485	48-70
Mustang	ERFS (1)	240-485	35-70	240-485	35-70
Ranger	MRFS (2)	-	-	331-485	48-70

Fuel System Type Definitions:

(1) Electronic Returnless Fuel System (ERFS):

This type of fuel delivery system does not return fuel to the fuel tank by means of a return line. This system does not incorporate a mechanical pressure regulator. Pressure is controlled by continuously varying the fuel pump speed through the fuel pump driver module (FPDM). All vehicles equipped with ERFS use a fuel rail pressure temperature (FRPT) sensor.

(2) Mechanical Returnless Fuel System (MRFS):

This type of fuel delivery system does not return fuel to the fuel tank by means of a return line. Fuel pressure is controlled by a mechanical pressure regulator located on the fuel pump module in the fuel tank. Vehicles equipped with MRFS do not use a fuel rail pressure temperature (FRPT) sensor.

WARNING: **If you see or smell gasoline at any time other than during fueling, do not reset the inertia fuel shutoff (IFS) switch. Failure to follow these instructions may result in personal injury.**

- Key in OFF position.
- Check for fuel leaks in the engine compartment.
- If no leak is present, reset the IFS switch by pushing the reset button on the top of the switch. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.
- In the closed position, the button can be pressed an additional 1.57 mm (1/16 in) against a spring.
- Key ON, engine OFF.
- Key in OFF position.
- Key ON, engine OFF.
- Key in OFF position.
- Check for leaking fuel.

HC1 DTC P0148 OR SYMPTOMS WITHOUT DTCS: CHECK THE SYSTEM INTEGRITY

- Visually inspect the complete fuel delivery system for damage and leakage.

  Check the following:

  - fuel lines and connections
  - relays
  - fuel tank

  - fuel pump
  - fuel pressure regulator
  - fuel pulse damper
  - fuel rail at injectors
  - damaged connector pins
  - electrical connectors not fully engaged
- Verify the vehicle has followed the maintenance schedule. A new fuel filter should have been installed within the last 48,280 km (30,000 miles).
- Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.
- Verify the fuse integrity.
- Verify the battery is fully charged.
- Verify clean sufficient fuel.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HC2**.

HC2 CHECK ALL SYSTEM RELATED DEVICES (SENSOR, DAMPER OR REGULATOR) FOR LEAKAGE

- Key in OFF position.
- FP connector connected.
- Remove the vacuum hose on each system device connected to the fuel rail.
- Inspect for the presence of fuel in the vacuum line of each device connected to the fuel rail.
- Key ON, engine running.
- Check for manifold vacuum at each system related component with a vacuum line.
- Key in OFF position.
- **Are all vacuum lines for system related devices indicating no fuel present?**

Yes	No
GO to **HC3**.	If the vacuum line connected to a component indicates that a fuel leak is present, INSTALL a new component. CLEAR the DTCs. REPEAT the self-test.

HC3 CHECK THE FUEL PRESSURE

- Key in OFF position.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.

- Mechanical fuel pressure gauge connected.
- Key ON, engine OFF.
- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- FP connector connected.
- Cycle the key several times to charge the fuel system.
- Compare the fuel pressure reading to the Fuel System Specification Chart.
- **Is the fuel pressure within range?**

Yes	No
GO to **HC6**.	GO to **HC4**.

HC4 CHECK THE FUEL PUMP GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: Refer to the Wiring Diagrams article for schematic and connector information.

- FP connector disconnected.
- Measure the voltage between:

(+) Vehicle Battery	(-) FP Connector, Harness Side
Positive terminal	FPGND

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HC5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HC5 CHECK THE FUEL PUMP POWER CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: During output state control, the fuel pump stays commanded on for only about 5 seconds.

- Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.
- FP connector disconnected.
- Key ON, engine OFF.
- Access the PCM and control the FP PID.

- Be aware that output state control turns off the FP after a calibrated time. If this happens, command the outputs on again to continue testing.
- Measure the voltage between:

(+) FP Connector, Harness Side	(-) Vehicle Battery
FPPWR	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HC12**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HC6 CHECK THE SEPARATION LEVEL OF THE ETHANOL/WATER MIXTURE AND GASOLINE IN THE FUEL

NOTE: **This step requires the use of a locally obtained 200 ml beaker and a 25 ml graduated cylinder.**

NOTE: **After approximately 3 minutes of standing, the ethanol and water mixes together and settles to the bottom of the 25 ml graduated cylinder. The gasoline rises to the top.**

- Fill the 200 ml beaker with 5 ml of clean water.
- Use the pressure relief valve on the mechanical fuel gauge to drain 22 ml of fuel into an approved clean container.
- Pour 20 ml of fuel from the approved clean container into the 25 ml graduated cylinder.
- Add enough water from the 200 ml beaker to the 25 ml graduated cylinder to bring the total volume of liquid to 24 ml.
- Insert a stopper plug in the opening of the 25 ml graduated cylinder.
- Firmly hold the stopper in place and shake the 25 ml graduated cylinder to mix the water and fuel.
- Allow the liquid to stand and separate for approximately 3 minutes.
- Record the separation level from the 25 ml graduated cylinder where the ethanol/water mixture and gasoline meet.
- **Did the ethanol/water mixture and gasoline separate?**

Yes	No
	COMPLETE all steps before continuing. The ethanol/water mixture will separate from the

GO to **HC7**.	gasoline. If the fuel does not appear to separate, then the fuel is either 100% ethanol or a mixture of ethanol and water.

HC7 CALCULATE THE PERCENTAGE OF ETHANOL IN THE FUEL

NOTE: Use the illustration as an example for calculating the percentage of ethanol in the following steps. If the separation level is at 14 ml the calculation becomes; 14 minus 4, then multiply by 5 to equal 50. The percentage of ethanol in the fuel is 50%.

- Key in OFF position.
- Take the recorded separation level from the previous step and subtract the amount of water added.
- Multiply the new value by 5. This new value is the percentage of ethanol in the fuel.

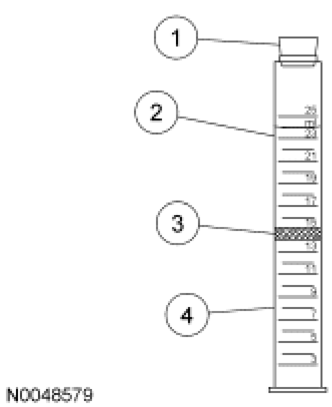

Fig. 108: Calculating Ethanol In Fuel
Courtesy of FORD MOTOR CO.

Item Number	Description
1	Stopper
2	Gasoline
3	Separation Point at 14 ml
4	Ethanol/Water Mixture

- Record the calculated percentage of ethanol in the fuel.
- **Is any ethanol present in the fuel?**

Yes	No
For flex fuel vehicles, GO to **HC8**. For all others, GO to **HC11**.	GO to **HC12**.

HC8 COMPARE THE FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

NOTE: **When determining if the FF_INF PID value is within 50% of the calculated percentage of ethanol, if the calculated percentage of ethanol value is 40% then the PID value should be between 0 - 90%. The PID value cannot be less than zero.**

- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- Compare the FF_INF PID to the calculated percentage of ethanol.
- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
GO to **HC12**.	GO to **HC9**.

HC9 RESET THE PERCENT ETHANOL PARAMETER IN THE PCM

NOTE: **Certain customer fueling practices such as only fueling with small amounts of fuel or repeatedly switching between gasoline and an ethanol blend greater than E15 may prevent the PCM from learning the correct ethanol content in the fuel.**

- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- Key ON, engine running.
- Access the PCM and monitor the FF_LRND PID.
- Drive the vehicle approximately 11.3 km (7 miles) or until the FF_LRND PID indicates yes.
- **Is the PID state YES?**

Yes	No
GO to **HC10**.	GO to **HC18**.

HC10 COMPARE THE UPDATED FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
RETURN the vehicle to the customer. ADVISE the customer of the correct fueling practices when using flex fuel. REFER to the Owner's Literature for	A fuel system concern may be present, which

additional information. ADVISE the customer to continue to use the same fuel for the next 2-3 refuels. This practice helps to verify the PCM is learning the correct percentage of ethanol in the fuel.	prevents the PCM from learning the correct percentage of ethanol in the fuel, GO to **HC12**.

HC11 DETERMINE IF THE PERCENTAGE OF ETHANOL IN THE FUEL IS LESS THAN 25%

- Check the recorded calculated percentage of ethanol in the fuel.
- **Is the calculated percentage of ethanol in the fuel less than 25%?**

Yes	No
GO to **HC12**.	REPAIR as necessary. ADVISE the customer of the correct fuel type required for this vehicle. REFER to the Owner's Literature for additional information. CLEAR the DTCs. REPEAT the self-test.

HC12 CHECK THE FUEL PRESSURE LEAKDOWN

NOTE: **When the fuel pump is commanded off, the fuel pressure may substantially decrease and then stabilize.**

NOTE: **During output state control, the fuel pump stays commanded on for only about 5 seconds.**

- Mechanical fuel pressure gauge connected.
- Key ON, engine OFF.
- Access the PCM and control the FP PID.
- Run the fuel pump to obtain maximum fuel pressure.
- Command the fuel pump off.
- Allow the fuel pressure to stabilize.
- Record the stabilized reading.
- Monitor the fuel pressure for 1 minute.
- **Does the fuel pressure remain within 34 kPa (5 psi) of the recorded reading (MRFS) or greater than 275 kPa (40 psi) (ERFS) after 1 minute?**

Yes	No
For ERFS, GO to **HC14**. For MRFS, GO to **HC15**.	GO to **HC13**.

HC13 CHECK THE FUEL INJECTOR FLOW AND LEAKAGE

NOTE: **Observe the Warnings, Cautions, and Notes.**

- Check the fuel injectors for leakage and flow rate using the injector flow tester or other method such as inspecting the intake manifold for fuel.
- **Are the test results satisfactory?**

Yes	No
For ERFS, GO to **HC14**. For MRFS, GO to **HC15**.	INSTALL a new fuel injector as necessary. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

HC14 COMPARE THE FRP PID TO THE MECHANICAL GAUGE

NOTE: Most mechanical gauges are referenced to atmospheric pressure. The FRPT sensor is referenced to manifold pressure. In order to make a valid comparison, the engine must be off.

NOTE: The vehicle may exhibit a long crank until the fuel system is pressurized.

- Key in OFF position.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Disable the fuel pump.
- Key ON, engine OFF.
- Monitor the mechanical gauge.
- Access the PCM and monitor the FRP PID.
- Compare the FRP PID value to the mechanical gauge.
- Key in OFF position.
- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- Key ON, engine running.
- Allow the fuel pressure to stabilize.
- Key in OFF position.
- Key ON, engine OFF.
- Compare the FRP PID value to the mechanical gauge.
- **Are the FRP PID values within 34 kPa (5 psi) of the mechanical gauge readings?**

Yes	No
GO to **HC15**.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of this pinpoint test. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HC15 MONITOR THE FUEL PRESSURE WHILE ROAD TESTING THE VEHICLE

WARNING: **Strict observance of posted speed limits and attention to driving conditions are mandatory when carrying out the road test. Failure to follow these instructions may result in personal injury.**

NOTE: Some concerns may only be present during certain fuel level conditions. Determine the fuel level at the time of the concern. Access the information from the customer information worksheet and the customer.

- Key in OFF position.
- Securely route the mechanical gauge so that the gauge is viewable while road testing the vehicle.
- Key ON, engine running.
- Engine at normal operating temperature.
- Monitor the mechanical gauge.
- From a stop, accelerate to 89 km/h (55 mph) at full throttle. Repeat this 3 times.
- **Is the fuel pressure always greater than 240 kPa (35 psi)?**

Yes	No
For misfire DTC diagnosis, GO to **HD8**. For symptoms without DTCs, the concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** for further direction. For all others, unable to duplicate or identify the concern at this time.	GO to **HC16**.

HC16 CHECK THE FUEL SUPPLY LINE FOR RESTRICTION

NOTE: Observe the Warnings, Cautions, and Notes.

- Key in OFF position.
- Disconnect the fuel supply line at the fuel rail.
- Disconnect the fuel supply line at the fuel pump.
- Check the fuel supply line for restriction.

- Apply 21 to 34 kPa (3 to 5 psi) air pressure to the fuel supply line.
- **Does air flow freely through the line?**

Yes	No
INSTALL a new Fuel Filter assembly. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . GO to **HC17**.	REPAIR the cause of the restriction. CLEAR the DTCs. REPEAT the self-test.

HC17 VERIFY THE REPAIR

WARNING: **Strict observance of posted speed limits and attention to driving conditions are mandatory when carrying out the road test. Failure to follow these instructions may result in personal injury.**

- Key ON, engine running.
- Engine at normal operating temperature.
- Monitor the mechanical gauge.
- From a stop, accelerate to 89 km/h (55 mph) at full throttle. Repeat this 3 times.
- **Is the fuel pressure always greater than 240 kPa (35 psi)?**

Yes	No
The test is complete and no concerns are present.	INSTALL a new FP module. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HC18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** .	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HD: MISFIRE DETECTION MONITOR

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

NOTE: Mechanical noise caused by the front end accessory drive components, mechanically driven cooling fans, or rough roads at high RPM with light load conditions may produce a nonsymmetrical loss of cylinder acceleration, which may result in a misfire.

This pinpoint test is intended to diagnose the misfire detection monitor.

Clearing the powertrain control module (PCM) diagnostic trouble codes (DTCs) erases any PCM recorded freeze frame data. Make sure to record any PCM freeze frame information before proceeding. Refer to**FREEZE FRAME DATA** .

HD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310, P0315, or P0316 present?**

Yes	No
For DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310 or P0316, GO to **HD2**. For DTC P0315, GO to **HD21**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HD2 DTCS P0300 THROUGH P0310 AND P0316: VIEW THE PCM MISFIRE FREEZE FRAME DATA

NOTE: The misfire freeze frame data may be used to determine the operating conditions when the misfire DTC was set.

- Retrieve and record any available misfire freeze frame data PID values from the PCM.
- Compare recorded freeze frame data PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No
REFER to the table in Pinpoint Test Z to find corresponding circuit, and proceed with the intermittent diagnosis. refer to **PINPOINT TEST Z**.	GO to **HD3**.

HD3 CHECK FOR OTHER NON-MISFIRE CONTINUOUS MEMORY DTCS

- Retrieve all continuous memory DTCs.
- **Are there any non-misfire continuous memory DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **HD4**.

HD4 CHECK FOR ANY KOEO SELF-TEST DTCS

- Carry out the KOEO self-test.

- **Are any KOEO DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **HD5**.

HD5 CHECK FOR ANY KOER DTCS

- Carry out the KOER self-test.
- **Are any KOER DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **HD6**.

HD6 CHECK THE IGNITION SYSTEM FOR CONCERNS

- For ignition coil on plug (COP) equipped vehicles, refer to **PINPOINT TEST JB** and follow the pinpoint test direction.
- For ignition coil pack equipped vehicles, refer to **PINPOINT TEST JC** and follow the pinpoint test direction.
- **Is an ignition related concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HD7**.

HD7 CHECK THE FUEL SYSTEM FOR CONCERNS

- refer to **PINPOINT TEST HC** and follow the pinpoint test direction.
- **Is a fuel system related concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HD8**.

HD8 CHECK THE VACUUM SYSTEM

NOTE: Some vacuum leaks can be heard.

- Visually inspect the vacuum hoses for signs of damage or deterioration. A collapsed vacuum hose may cause a blockage to one of the various actuators or sensors. If a blockage is found remove the blockage or install new parts as necessary.
- **Is the vehicle vacuum system OK?**

Yes	No
For vehicles equipped with a differential pressure feedback EGR system, GO to **HD9**. For vehicles equipped with an electric EGR (EEGR) system, GO to **HD10**. For vehicles equipped with an EGR system module (ESM) EGR system, GO to **HD11**. For all others, GO to **HD15**.	REPAIR the vacuum system. CLEAR the DTCs. REPEAT the self-test.

HD9 MONITOR THE DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM RELATED PIDS

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Access the PCM and monitor the DPFEGR PID.
- Access the PCM and monitor the EGRVR PID.
- Record the PID values with the engine idling.
- Key ON, engine OFF.
- Record the PID values with the engine off.
- Compare the recorded PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No
refer to **PINPOINT TEST HE** and diagnose the EGR system.	GO to **HD12**.

HD10 MONITOR THE EEGR SYSTEM RELATED PIDS

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Access the PCM and monitor the EGRMC1F, EGRMC2F, EGRMC3F and EGRMC4F PIDs.
- Access the PCM and monitor the MAP PID.
- Record the PID values with the engine idling.
- Key ON, engine OFF.
- Record the PID values with the engine off.
- Compare the recorded PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No
refer to **PINPOINT TEST KD** and diagnose the EGR system.	GO to **HD13**.

HD11 MONITOR THE ESM SYSTEM RELATED PIDS

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Access the PCM and monitor the DPFEGR PID.
- Access the PCM and monitor the EGRVR PID.
- Access the PCM and monitor the MAP PID.
- Record the PID values with the engine idling.
- Key ON, engine OFF.
- Record the PID values with the engine off.
- Compare the recorded PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No
refer to **PINPOINT TEST HH** and diagnose the EGR system.	GO to **HD14**.

HD12 RECREATE THE MISFIRE SYMPTOM WITH THE DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM DISABLED

NOTE: The PCM may store EGR system related DTCs during this procedure.

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- Key in OFF position.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Access the misfire freeze frame data (if available) and record the operating conditions.
- Obtain information from the customer information worksheet or any other available data from the customer.
- Recreate the misfire symptom using the freeze frame and customer information.
- **Can the symptom be recreated?**

Yes	No
GO to **HD15**.	REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. REFER to the **ENGINE**

	EMISSION CONTROL -- E-SERIES for more EGR system information. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HD13 RECREATE THE MISFIRE SYMPTOM WITH EEGR SYSTEM DISABLED

NOTE: The PCM may store EGR system related DTCs during this procedure.

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- Key in OFF position.
- EEGR Assembly connector disconnected.
- Access the misfire freeze frame data (if available) and record the operating conditions.
- Obtain information from the customer information worksheet or any other available data from the customer.
- Recreate the misfire symptom using the freeze frame and customer information.
- **Can the symptom be recreated?**

Yes	No
GO to **HD15**.	REMOVE and INSPECT the EEGR for signs of contamination, unusual wear, carbon deposits, binding or other damage. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** for more EGR system information. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HD14 RECREATE THE MISFIRE SYMPTOM WITH THE ESM SYSTEM DISABLED

NOTE: The PCM may store EGR system related DTCs during this procedure.

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- Key in OFF position.
- ESM connector disconnected.
- Access the misfire freeze frame data (if available) and record the operating conditions.
- Obtain information from the customer information worksheet or any other available data from the customer.
- Recreate the misfire symptom using the freeze frame and customer information.
- **Can the symptom be recreated?**

Yes	No
GO to **HD15**.	REMOVE and INSPECT the ESM for signs of contamination, unusual wear, carbon deposits, binding or other damage. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** for more EGR system information. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HD15 CHECK FOR BASE ENGINE CONCERNS

NOTE: The engine temperature may affect the results.

- This step determines if there are any base engine concerns that may have caused the misfire DTC or drive concern.
- Key in OFF position.
- Carry out the following tests in order to evaluate base engine integrity:
  - For vehicles equipped with mechanically driven cooling fans only, rotate the cooling fan by hand. The cooling fan should rotate freely, with no abnormal binding or interference. If binding or interference is present, remove any foreign materials or repair the cooling fan as necessary.
  - Refer to the **ACCESSORY DRIVE -- E-SERIES** and carry out checks in the Visual Inspection Chart.
  - Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** and carry out the Compression Test and Cylinder Leakage Detection.
  - Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** and carry out the Valve Train Analysis.
  - Visually inspect the positive crankcase ventilation (PCV) valve and tube for leaks.
  - Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** and carry out Component Tests.
- **Is a concern present?**

Yes	No
REPAIR as necessary. REFER to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HD19**.

HD16 DTC P1336: IDENTIFY THE CMP SENSOR TYPE

NOTE: The variable reluctance (VR) sensors have 2-wire connectors, Hall-effect sensors have 3-wire connectors.

- Identify which type of CMP sensor the vehicle uses.
- **Does the vehicle use a Hall-effect sensor?**

Yes	No
GO to **HD17**.	GO to **HD18**.

HD17 CHECK THE CMP SENSOR LOW RANGE OUTPUT VOLTAGE

- Key in OFF position.
- CMP Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A CMP Sensor Connector, Harness Side	Point B CMP Sensor Connector, Component Side
VPWR	VPWR
PWRGND	PWRGND

- Key ON, engine running.
- Digital multimeter (DMM) on low voltage DC scale.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) 12 Volt Vehicle Battery
CMP	Negative terminal

- **Does the voltage switch between LOW (less than 2 volts DC) and HIGH (greater than 8 volts DC)?**

Yes	No
A Hall-effect CMP sensor that is installed out of synchronization may produce a DTC. To verify the correct CMP sensor installation, REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** , Engine Synchronizer. If the CMP sensor is installed properly, GO to **HD19**.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HD18 CHECK THE CMP SENSOR OUTPUT VOLTAGE

- Key in OFF position.
- PCM connector connected.
- CMP Sensor connector disconnected.
- DMM on low voltage AC scale.

- Key ON, engine running.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) CMP Sensor Connector, Component Side
CMP	SIGRTN

- Run the engine at approximately 2,500 RPM.
- **Is the voltage greater than 0.25 V?**

Yes	No
GO to **HD19**.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HD19 CHECK THE GENERATOR FOR EXCESSIVE ELECTRICAL NOISE

NOTE: If the generator/regulator is electrically noisy, the noise decreases when the B+ connector is disconnected.

- Key ON, engine running.
- Monitor the generator for an audible electric noise.
- Key in OFF position.
- Generator/regulator B+ connector disconnected.
- Key ON, engine running.
- With the engine running, determine if the generator is still noisy.
- **Does the noise remain constant when the B+ connector is disconnected?**

Yes	No
GO to **HD20**.	REFER to the **GENERATOR AND REGULATOR -- E-SERIES** and diagnose the generator is noisy symptom.

HD20 CHECK THE CKP HARNESS FOR INTERMITTENT CONCERNS

NOTE: Chafed CKP wires or other physical damage to the harness may cause an intermittent short in the CKP circuit.

- Key in OFF position.

- Visually check for chafed CKP wires or other physical damage to the CKP harness.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HD21**.

HD21 DTC P0315: CHECK THE PHYSICAL CONDITION OF THE CRANKSHAFT PULSE WHEEL

NOTE: DTC P0315 is set when the PCM is unable to learn and correct for the mechanical variations in the crankshaft pulse wheel tooth spacing (the allowable correction tolerances are exceeded).

- Inspect the crankshaft pulse wheel for damaged teeth.
- Inspect the crankshaft pulse wheel for wobble.
- Check for a loose crankshaft pulse wheel.
- Check the CKP sensor for damage.
- **Are the CKP sensor and crankshaft pulse wheel OK?**

Yes	No
If the CKP is installed properly, GO to **HD22**.	REPAIR as necessary. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** and check for correct CKP sensor installation. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . COMPLETE the Misfire and Fuel Monitors drive cycle procedure to learn the profile. Refer to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . To verify the repair RECREATE the original conditions that set the misfire DTC or caused the symptom using the freeze frame data and customer information. MONITOR the cylinder misfire data in Mode 6 - On Board Test Results and VERIFY the misfire count is below 10. REFER to the scan tool manufacturer's article for specific information on the Mode 6 - On Board Test Results.

HD22 CHECK THE DAMPER AND PULLEY ASSEMBLY

NOTE: For engines that have damper mounted pulse rings, it may be necessary to remove the front cover or other components to observe the crank pulley.

- Observe the crank pulley for wobble.

- Examine the electronic ignition (EI) pulse ring fastened to the harmonic dampener.
- **Does the crank pulley wobble or is the pulse ring loose or damaged?**

Yes	No
INSTALL a new pulley or damper assembly. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . COMPLETE the Misfire and Fuel Monitors drive cycle procedure to learn the profile. Refer to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . To verify the repair RECREATE the original conditions that set the misfire DTC or caused the symptom using the freeze frame data and customer information. MONITOR the cylinder misfire data in Mode 6 - On Board Test Results and VERIFY the misfire count is below 10. REFER to the scan tool manufacturer's article for specific information on the Mode 6 - On Board Test Results.	GO to **HD23**.

HD23 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HE: EXHAUST GAS RECIRCULATION (EGR) SYSTEMS

This pinpoint test is intended to diagnose the following:

- differential pressure feedback exhaust gas recirculation (EGR) sensor (9J460)

- EGR valve (9D460) (9D475)
- EGR vacuum regulator solenoid (9J459)
- orifice tube assembly (9D477)
- differential pressure feedback EGR sensor pressure hoses
- vacuum lines
- harness circuits: VREF, DPFE, SIGRTN, EVR, VPWR, VREF and PWRGND
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	B47 E27 E40 E41 E44	PWRGND EVR VREF SIGRTN DPFE
Ranger	170 Pin	B47 E63 E57 E58 E21	PWRGND EVR VREF SIGRTN DPFE

HE1 CHECK FOR DTCS

- **Are DTCs P0401, P0402, P0403, P0405, P0406, P1405, P1406, P1408, or P1409 present?**

Yes	No
For DTCs P0401 and P1408, GO to **HE36**. For DTC P0402, GO to **HE13**. For KOEO and KOER DTCs P0403 and P1409, GO to **HE59**. For continuous memory DTCs P0403 and P1409, GO to **HE64**. For DTC P0405, GO to **HE2**. For DTC P0406, GO to **HE6**. For DTC P1405, GO to **HE27**. For DTC P1406, GO to **HE31**.	For symptoms without DTCs, GO to **HE57**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HE2 DTC P0405: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

NOTE: Depending on the application, verify a prior repair has not resulted in the differential pressure feedback EGR sensor being installed backwards or the vacuum hoses being installed on the opposite ports.

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage less than 0.05 V?**

Yes	No
GO to **HE3**.	An intermittent concern is suspected in the EGR system. GO to **HE12**.

HE3 CHECK THE VREF AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Differential Pressure Feedback EGR Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to **HE4**.	refer to **PINPOINT TEST C**.

HE4 CHECK THE DPFE CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
DPFE	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
DPFE	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HE5**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE5 INDUCE THE OPPOSITE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR VOLTAGE

- PCM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage between 4 - 5.5 V?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before	GO to **HE66**.

starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	

HE6 DTC P0406: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage greater than 4 V?**

Yes	No
GO to **HE7**.	An intermittent concern is suspected in the EGR system. GO to **HE12**.

HE7 CHECK THE VREF VOLTAGE TO THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Key in OFF position.
- Differential Pressure Feedback EGR Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to **HE8**.	refer to **PINPOINT TEST C**.

HE8 CHECK THE DPFE AND SIGRTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
DPFE	DPFE
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **HE9**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE9 CHECK THE DPFE CIRCUIT FOR A SHORT TO VREF

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	DPFE

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HE10**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE10 CHECK THE DPFE CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Vehicle Battery
DPFE	Negative terminal

- **Is the voltage less than 0.2 V?**

Yes	No
GO to **HE11**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE11 CHECK THE DPFEGR PID

- Key in OFF position.
- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A Differential Pressure Feedback EGR Sensor Connector, Harness Side	Point B
DPFE	Ground

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the DPFEGR PID greater than 4.5 V with the jumper wire removed and is the DPFEGR PID less than 0.1 V with the jumper wire installed?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. CLEAR the DTCs. REPEAT the self-test.	GO to **HE66**.

HE12 CARRY OUT A THOROUGH WIGGLE TEST ON THE DIFFERENTIAL PRESSURE FEEDBACK EGR HARNESS

- Access the PCM and monitor the DPFEGR PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there any change in the voltage reading, or is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

HE13 DTCS P0402 AND P1405: CHECK FOR SIMULTANEOUS PRESENCE

- **Is DTC P0402 present with DTC P1405?**

Yes	No
GO to **HE28**.	GO to **HE14**.

HE14 DTC P0402: CHECK FOR EGR FLOW AT IDLE WITH THE EGR VACUUM HOSE DISCONNECTED

NOTE: **A pinched or plugged EGR vacuum hose can trap vacuum between the EGR vacuum regulator solenoid and EGR valve, not allowing the EGR valve to close.**

NOTE: **Disregard DTC P1408 if it is generated as a result of carrying out the KOER self-test with the EGR vacuum source hose disconnected.**

- Trace each vacuum hose from the EGR vacuum regulator solenoid and verify each hose is connected correctly.
- Verify the EGR vacuum hose is not pinched or plugged and is routed correctly.
- Disconnect and plug the vacuum hose connected to the EGR valve.
- Carry out the KOER self-test.
- **Does KOER DTC P0402 appear or are you unable to run the KOER self-test due to an engine stall or no start?**

Yes	No
INSPECT the pressure hoses for correct routing, pinching, icing or other blockage. If OK, REMOVE and INSPECT the EGR valve and tube for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. GO to **HE15**.	CONNECT the EGR valve vacuum hose. GO to **HE16**.

HE15 CARRY OUT THE KOER SELF-TEST

- Clear the DTCs.
- Carry out the KOER self-test.
- **Is DTC P0402 present?**

Yes	No
GO to **HE18**.	The test is complete and no concerns are found. CLEAR the DTCs. REPEAT the self-test.

HE16 CHECK FOR EGR FLOW AT IDLE WITH THE EGR VACUUM HOSE CONNECTED

- Key in OFF position.

- Connect the EGR valve vacuum hose.
- Carry out the KOER self-test.
- **Does KOER DTC P0402 appear or are you unable to run the KOER self-test due to an engine stall or no start?**

Yes	No
GO to **HE17**.	INSPECT the pressure hoses for pinching, icing or other blockage. REPAIR as necessary. GO to **HE23**.

HE17 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release vacuum.
  - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	GO to **HE18**.

HE18 CHECK EGR FLOW AT IDLE WITH THE EGR VACUUM REGULATOR HARNESS CONNECTOR OFF

- Differential Pressure Feedback EGR Sensor connector connected.
- Disconnect the vacuum hose at the EGR valve and connect the hose to the vacuum gauge.
- Start the engine.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Observe the vacuum gauge:
  - The EGR valve requires vacuum greater than 5.4 kPa (1.6 in-Hg) to begin to open.
  - If the vacuum reading remains greater than 5.4 kPa (1.6 in-Hg) after the EGR vacuum regulator solenoid is disconnected, a concern may be present in the EGR vacuum regulator solenoid.
- **Does the EGR vacuum remain greater than 5.4 kPa (1.6 in-Hg) at idle after the EGR vacuum regulator is disconnected?**

Yes	No
GO to **HE19**.	GO to **HE20**.

HE19 INSPECT THE EGR VACUUM REGULATOR SOLENOID VENT FOR BLOCKAGE

NOTE: **When the EGR valve is closed, the EGR vacuum regulator solenoid vacuum is vented through the solenoid vent to the atmosphere. A plugged EGR vacuum regulator solenoid vent does not allow EGR vacuum to vent to the atmosphere.**

- Key in OFF position.
- Remove the EGR vacuum regulator solenoid vent cap.
- Remove the filter and inspect for blockage or icing.
- **Is the EGR vacuum regulator solenoid vent or vent filter plugged or restricted?**

Yes	No
REPAIR the vent, or if not repairable, INSTALL a new EGR vacuum regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE20 CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) EGR Vacuum Regulator Solenoid Connector, Component	(-) EGR Vacuum Regulator Solenoid Connector, Component

Side	Side
VPWR - Pin 1	EVR - Pin 2

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to **HE21**.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE21 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
EVR	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HE22**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE22 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR SHORT TO VREF

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HE66**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE23 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM

WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
    - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
    - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
    - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	GO to **HE24**.

HE24 CHECK THE EGR VALVE OPERATION

NOTE: **Typical sensor voltage with no EGR flow is between 0.25 volt and 1.3 volts.**

NOTE: **A higher voltage at idle may be due to a non-seating or heavily carbon EGR valve pintle.**

NOTE: **DPFEGR PID voltage must increase as the valve opens and decrease as the valve closes. A slow return voltage is an indication of a binding or slow closing EGR valve.**

- Differential Pressure Feedback EGR Sensor connector connected.
- Key ON, engine OFF.

- Access the PCM and monitor the DPFEGR PID.
- Disconnect the vacuum hose at the EGR valve and plug the hose.
- Connect the vacuum pump to the EGR valve.
- Start the engine.
- Observe the DPFEGR PID at idle and compare it to the KOEO voltage.
- Apply just enough vacuum to the EGR valve to open it without stalling the engine.
- Quickly release the vacuum.
- Repeat this 3 times.
- Observe the DPFEGR PID.
- **Does the DPFEGR PID voltage indicate an open, binding or slow closing EGR valve?**

Yes	No
REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE25**.

HE25 CARRY OUT A THOROUGH WIGGLE TEST ON THE EGR VACUUM REGULATOR HARNESS

NOTE: **An intermittent short to GND in the EGR vacuum regulator circuit causes the vacuum applied to the EGR valve to be higher than normal when the short is present. The vacuum available at the EGR valve at idle is normally below 3.4 kPa (1.6 in-Hg) for the valve to begin to open.**

NOTE: **A concern is indicated by a sudden jump in the vacuum reading during the wiggle test.**

- Key in OFF position.
- Remove the vacuum pump.
- Connect the vacuum gauge to the EGR valve vacuum hose.
- Connect a vacuum gauge to the EGR valve vacuum hose using a vacuum tee.
- Key ON, engine running.
- Observe the vacuum gauge.
    - Lightly tap on the EGR vacuum regulator solenoid.
    - Carry out a thorough wiggle test on the EGR vacuum regulator harness.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	CONNECT the vacuum hose(s). GO to **HE26**.

HE26 INSPECT THE EGR VACUUM REGULATOR SOLENOID AND VACUUM HOSES FOR PLUGGING

- Key in OFF position.
- Remove the EGR vacuum regulator solenoid vent cap.
- Remove the filter and inspect for blockage or icing.
- Inspect the pressure hoses for pinching, icing or other blockage.
- **Is the EGR vacuum regulator solenoid vent or vent filter plugged or restricted?**

Yes	No
REPAIR, or if not repairable, INSTALL a new EGR vacuum regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

HE27 DTC P1405: INSPECT THE UPSTREAM PRESSURE HOSE CONNECTIONS

- Inspect the upstream hose at the differential pressure feedback EGR sensor and orifice tube assembly for a disconnect or a poor connection.

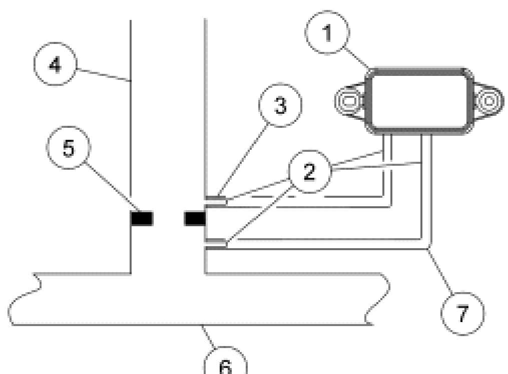

Fig. 118: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube

	Assembly
6	Exhaust Manifold
7	Downstream Pressure Hose

- **Is vacuum hose off or poorly connected?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE28**.

HE28 INSPECT THE UPSTREAM PRESSURE HOSE FOR PLUGGING

NOTE: It is essential that only the correct Ford replacement pressure hose be used.

- Visually inspect the upstream pressure hose routing. The hose must not be pinched or have dips in it where water could settle or freeze.
- Remove the upstream pressure hose and carefully inspect for plugging, water, or leaks.
- **Is a concern present?**

Yes	No
REPAIR or INSTALL a new pressure hose as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE29**.

HE29 CHECK THE ORIFICE TUBE ASSEMBLY AND THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Inspect the upstream connection on the differential pressure feedback EGR sensor for damage or plugging at the sensor.
- Inspect the exhaust manifold side pressure tube at the orifice tube assembly for plugging or damage.
- **Is the differential pressure feedback EGR sensor or orifice tube assembly plugged or damaged?**

Yes	No
REPAIR or INSTALL a new Differential Pressure Feedback EGR sensor or orifice tube assembly as necessary. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402.	GO to **HE30**.

CLEAR the DTCs. REPEAT the self-test.	

HE30 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
    - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
    - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
    - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

HE31 DTC P1406: INSPECT THE DOWNSTREAM PRESSURE HOSE CONNECTIONS

NOTE: **If the concern is currently present, DTC P1408 appears when running the KOER self-test.**

- Verify the EGR valve is securely attached and exhaust gases are not leaking from the sealing surface.
- Inspect the downstream hose at the differential pressure feedback EGR sensor and orifice tube assembly for a disconnect or a poor connection.

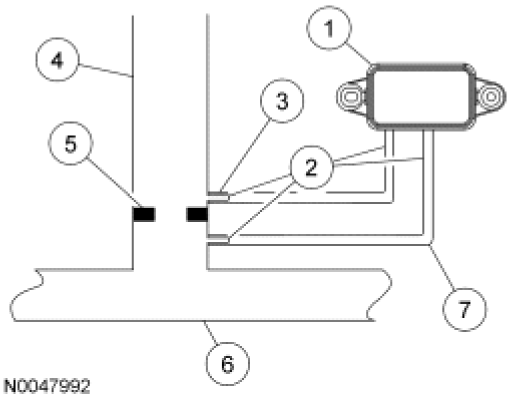

Fig. 119: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube Assembly
6	Exhaust Manifold
7	Downstream Pressure Hose

- **Is vacuum hose off or poorly connected?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE32**.

HE32 INSPECT THE DOWNSTREAM PRESSURE HOSE FOR PLUGGING

NOTE: It is essential that only the correct Ford replacement pressure hose be used.

- Visually inspect the downstream pressure hose routing.
- Remove the upstream pressure hose and carefully inspect for plugging, water, or leaks.
- **Is a concern present?**

Yes	No

REPAIR or INSTALL a new pressure hose as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE33**.

HE33 CHECK THE ORIFICE TUBE ASSEMBLY AND THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Inspect the connections at the differential pressure feedback EGR sensor for plugging or damage.
- Inspect the intake manifold side pressure tube at the orifice tube assembly for plugging or damage.
- **Is the differential pressure feedback EGR sensor or orifice tube assembly plugged or damaged?**

Yes	No
REPAIR or INSTALL a new Differential Pressure Feedback EGR sensor or orifice tube assembly as necessary. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	GO to **HE34**.

HE34 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
    - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
    - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
    - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No

GO to **HE35**.	refer to **PINPOINT TEST Z**.

HE35 CHECK THE DPFE CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
DPFE	DPFE
SIGRTN	SIGRTN
VREF	VREF

- **Are the resistances greater than 5 ohms?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.

HE36 DTC P0401: CARRY OUT THE KOER SELF-TEST

- Carry out the KOER self-test.
- **Does DTC P1408 appear?**

Yes	No
GO to **HE37**.	GO to **HE53**.

HE37 KOER AND CONTINUOUS MEMORY DTC P1408: RETRIEVE CONTINUOUS MEMORY DTCS

NOTE: **If any DTC other than P1406 appears, note the DTC and refer to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS after carrying out this**

pinpoint test.

- Retrieve all continuous memory DTCs.
- **Is DTC 1406 present?**

Yes	No
GO to **HE31**.	GO to **HE38**.

HE38 INSPECT THE DIFFERENTIAL PRESSURE FEEDBACK EGR PRESSURE HOSES

- Inspect the pressure hoses for a reverse connection at the differential pressure feedback EGR sensor or at the orifice tube assembly.
- Inspect the hoses for incorrect routing.
- Inspect both hoses for leaks and blockage.
- Inspect the differential pressure feedback EGR sensor and orifice tube assembly for blockage or damage at the pick-up tubes.

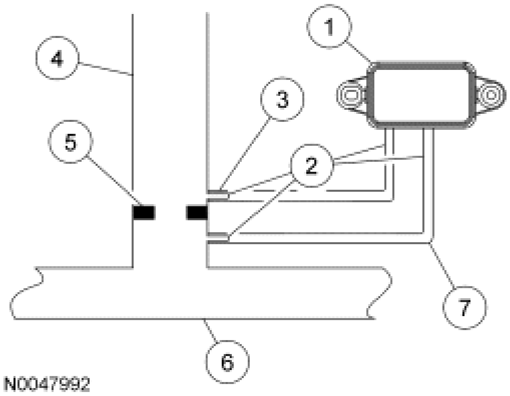

Fig. 120: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube Assembly
6	Exhaust Manifold
	Downstream Pressure

7	Hose

- **Is a concern present?**

Yes	No
REPAIR or INSTALL a new pressure hose as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE39**.

HE39 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	CONNECT all the hoses. GO to **HE40**.

HE40 CHECK THE VREF VOLTAGE TO THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Key in OFF position.
- Differential Pressure Feedback EGR Sensor connector disconnected.

- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to **HE41**.	refer to **PINPOINT TEST C**.

HE41 CHECK THE DPFE CIRCUIT FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	DPFE

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HE42**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE42 CARRY OUT THE KOER SELF-TEST WHILE MONITORING THE EGR VACUUM

NOTE: **Since the EGR vacuum hose is disconnected, ignore the DTCs during this KOER self-test.**

- PCM connector connected.
- Differential Pressure Feedback EGR Sensor connector connected.
- Disconnect the vacuum hose at the EGR valve and connect the hose to the vacuum gauge.
- Carry out the KOER self-test.

- Monitor the vacuum gauge. Approximately 30 seconds into the test, EGR flow will be requested for a few seconds. Vacuum at this time should increase to greater than 5.4 kPa (1.6 in-Hg) to open the valve.
- **Does the vacuum increase to 10 kPa (3.0 in-Hg) or greater at any time during the KOER self-test?**

Yes	No
GO to **HE43**.	GO to **HE44**.

HE43 CHECK THE EGR VALVE FUNCTION BY APPLYING VACUUM WITH THE HAND PUMP

- Key in OFF position.
- Disconnect the vacuum hose at the EGR valve and plug the hose.
- Connect the vacuum pump to the EGR valve.
- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds. If the engine wants to stall, increase the engine speed to approximately 1,000 RPM and hold steady.
- Monitor for the following:
  - The EGR valve starts opening at about 5.4 kPa (1.6 in-Hg) vacuum, indicated by an increasing DPFEGR PID voltage.
  - The DPFEGR PID voltage increases until the valve is fully open. The DPFEGR PID voltage must read at least 2.5 volts with full vacuum applied.
  - The DPFEGR PID voltage remains steady with steady vacuum. If voltage drops within a few seconds, the EGR valve or vacuum source may be leaking.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate the EGR valve is operating as described in the test step?**

Yes	No
GO to **HE47**.	GO to **HE44**.

HE44 PHYSICALLY INSPECT ALL VACUUM LINES BETWEEN THE EGR VALVE, EGR VACUUM REGULATOR AND VACUUM SOURCE

- Key in OFF position.
- Inspect all vacuum lines for leaks, kinks, pinches, disconnects, blockage, misrouting or physical damage of any type.
- Inspect the EGR vacuum regulator for cracks or other physical damage.
- **Is a concern present?**

Yes	No

REPAIR as necessary. If the EGR vacuum regulator is damaged, INSTALL a new EGR vacuum regulator. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HE45**.

HE45 PHYSICALLY INSPECT THE EGR VALVE

- Remove and inspect the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage.
- **Is a concern present?**

Yes	No
REPAIR as necessary. If repair is not possible, INSTALL a new EGR valve. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HE46**.

HE46 CHECK THE ENGINE VACUUM

- EGR vacuum regulator vacuum hoses disconnected.
- Connect a hand held vacuum gauge to the vacuum source.
- Key ON, engine running.
- Engine warm and at idle.
- Observe the vacuum gauge.
- **Is the vacuum gauge steadily reading at least 51 kPa (15 in-Hg)?**

Yes	No
GO to **HE47**.	ISOLATE the base engine concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HE47 CHECK THE VPWR VOLTAGE TO THE EGR VACUUM REGULATOR SOLENOID

- Key in OFF position.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) EGR	

Vacuum Regulator Solenoid Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HE48**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE48 CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) EGR Vacuum Regulator Solenoid Connector, Component Side	(-) EGR Vacuum Regulator Solenoid Connector, Component Side
VPWR - Pin 1	EVR - Pin 2

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to **HE49**.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE49 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector,	(-) Vehicle Battery

Harness Side	
EVR	Negative terminal

- **Is the voltage greater than 1 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **HE50**.

HE50 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) EGR Vacuum Regulator Solenoid Connector, Harness Side
EVR	EVR - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HE51**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE51 INSPECT THE EGR SYSTEM FOR LEAKS, RESTRICTIONS AND POOR CONNECTIONS

- EGR Vacuum Regulator Solenoid connector connected.
- PCM connector connected.
- Visually inspect the EGR system for signs of intermittent failure.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE52**.

HE52 CHECK THE EGR VACUUM REGULATOR SOLENOID VACUUM FLOW BY GROUNDING THE EVR CIRCUIT

NOTE: **If the EGR vacuum regulator does not react within 2 seconds, an EGR vacuum**

regulator concern may be present.

- Disconnect the vacuum hose at the EGR valve and connect the hose to the vacuum gauge.
- Key ON, engine running.
- Engine warm and at idle.
- Connect a 5 amp fused jumper wire between the following:

Point A EGR Vacuum Regulator Solenoid Connector, Harness Side	Point B Vehicle Battery
EVR - Pin 2	Negative terminal

- **Does the vacuum gauge indicate 13.5 kPa (4.0 in-Hg) or greater within 2 seconds?**

Yes	No
GO to **HE66**.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE53 INSPECT THE DIFFERENTIAL PRESSURE FEEDBACK EGR PRESSURE HOSES

- Visually inspect the upstream pressure hose routing.
- Visually inspect the downstream pressure hose routing.
- Inspect for a reversed connection at the differential pressure feedback EGR sensor or orifice tube assembly.
- The hose must not be pinched or have dips in it where water could settle or freeze.
- Inspect both hoses for leaks and blockage.
- Inspect the differential pressure feedback EGR sensor and orifice tube assembly for blockage or damage at the pick-up tubes.

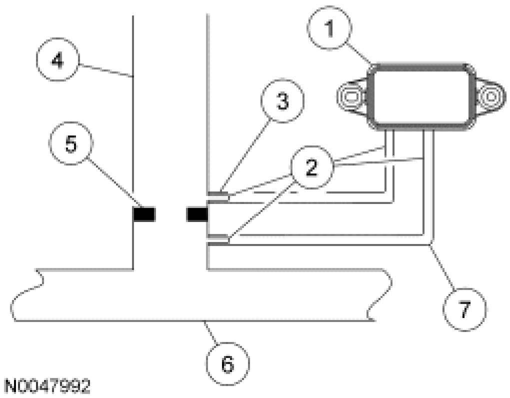

Fig. 121: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube Assembly
6	Exhaust Manifold
7	Downstream Pressure Hose

- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HE54**.

HE54 CHECK THE EGR VALVE FUNCTION BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.

- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	CONNECT all the hoses. GO to **HE55**.

HE55 CHECK THE EGR VALVE FUNCTION BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the vacuum hose at the EGR valve and plug the hose.
- Connect the vacuum pump to the EGR valve.
- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds. If the engine wants to stall, increase the engine speed to approximately 1,000 RPM and hold steady.
- Monitor for the following:
  - The EGR valve starts opening at about 5.4 kPa (1.6 in-Hg) vacuum, indicated by an increasing DPFEGR PID voltage.
  - The DPFEGR PID voltage increases until the valve is fully open. The DPFEGR PID voltage must read at least 2.5 volts with full vacuum applied.
  - The DPFEGR PID voltage remains steady with steady vacuum. If voltage drops within a few seconds, the EGR valve or vacuum source may be leaking.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate the EGR valve is operating as described in the test step?**

Yes	No
GO to **HE56**.	REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. If OK, REMOVE and INSPECT the EGR valve and tube for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HE56 INSPECT THE EGR VACUUM SIGNAL SUPPLY FOR AN INTERMITTENT CONCERN

- Key in OFF position.
- Remove the vacuum hose from the EGR valve and connect to a vacuum gauge.
- Key ON, engine running.
- Connect a 5 amp fused jumper wire between the following:

Point A EGR Vacuum Regulator Solenoid Connector, Harness Side	Point B Vehicle Battery
EVR - Pin 2	Negative terminal

- The solenoid is full ON.
- Vacuum gauge should read above 13.5 kPa (4 in-Hg).
- Observe the vacuum gauge.
- Look for a concern while carrying out the following checks:
  - Lightly tap on the EGR vacuum regulator solenoid.
  - Carry out a thorough wiggle test on the EGR vacuum regulator harness.
  - Inspect the EGR vacuum signal supply for an intermittent concern.
  - Inspect the EGR vacuum regulator solenoid and vacuum hoses for plugging.
  - A concern is indicated by a sudden drop in the vacuum reading.
- **Is a concern indicated?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. Note: In cold climates, the EGR valve may temporarily freeze shut and thaw when the engine warms.

	refer to **PINPOINT TEST Z**.

HE57 EGR DIAGNOSIS BY SYMPTOM: CHECK FOR EGR FLOW WITH THE EGR VACUUM HOSE DISCONNECTED AND PLUGGED

- Carry out the KOER self-test. Repair any other DTCs.
- Possible causes for EGR flow at idle with no related DTCs:
  - EGR valve not fully seating
  - EGR vacuum regulator solenoid vent restricted
  - Damaged EGR vacuum regulator solenoid
- Disconnect and plug the vacuum hose connected to the EGR valve.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Note the voltage.
- Key ON, engine running.
- With the engine at idle, observe the DPFEGR PID voltage. Compare to engine OFF voltage.
- An increase in voltage at idle indicates the differential pressure feedback EGR sensor is sensing EGR flow.
- **Is the DPFEGR PID voltage greater at idle by 0.15 V than with the engine off?**

Yes	No
REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Inspect the EGR vacuum regulator solenoid and vacuum hoses for plugging. INSPECT the EGR vacuum regulator solenoid vent for blockage. GO to **HE58**.

HE58 DETERMINE THE EGR VALVE VACUUM SUPPLY

- **Is a concern present in the EGR valve vacuum supply?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE59 DTCS P0403 AND P1409: CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Measure the resistance between:

(+) EGR Vacuum Regulator Solenoid Connector, Component Side	(-) EGR Vacuum Regulator Solenoid Connector, Component Side
VPWR - Pin 1	EVR - Pin 2

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to **HE60**.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE60 CHECK THE VPWR VOLTAGE TO EGR VACUUM REGULATOR SOLENOID

- Key ON, engine OFF.
- Measure the voltage between:

(+) EGR Vacuum Regulator Solenoid Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HE61**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE61 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

	(-) EGR

(+) PCM Connector, Harness Side	Vacuum Regulator Solenoid Connector, Harness Side
EVR	EVR - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HE62**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE62 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
EVR	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **HE63**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE63 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR	PWRGND

- **Is the resistance greater than 10K ohms?**

Yes	No
	REPAIR the short circuit. CLEAR the DTCs.

GO to **HE66**.	REPEAT the self-test.

HE64 CHECK FOR THE PRESENCE OF KOER DTCS P0403 OR P1409

- Carry out the KOER self-test.
- **Are DTCs P0403 or P1409 present?**

Yes	No
GO to **HE59**.	GO to **HE65**.

HE65 CARRY OUT A THOROUGH WIGGLE TEST ON THE EGR VACUUM REGULATOR HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR	PWRGND

- Lightly tap on the EGR vacuum regulator solenoid. Wiggle the EGR vacuum regulator solenoid connector. Carry out a thorough wiggle test on the harness. A concern is indicated by a voltage drop during the wiggle test.
- **Is the voltage greater than 10 V?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

HE66 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No

INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HF: CATALYST EFFICIENCY MONITOR AND EXHAUST SYSTEMS

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- catalytic converter
- exhaust system

HF1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0420 or P0430 present?**

Yes	No
GO to **HF2**.	For symptoms without DTCs, GO to **HF6**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HF2 CHECK FOR OTHER DTCS

NOTE: **Internal deterioration of a catalytic converter is usually caused by abnormal engine operation upstream of the catalyst. Events that can produce higher than normal temperatures in the catalyst are particularly suspect. For example, misfiring can cause higher than normal catalyst operating temperatures.**

NOTE: **Make sure the customer has not:**

- **refueled the vehicle with leaded gasoline.**
- **noticed a high vehicle oil consumption. An engine that consumes oil at a high rate deposits high levels of phosphorus on the catalyst and reduces the catalyst efficiency.**

- Check for self-test DTCs.
- **Are any DTCs present other than the following: P0420, P0430?**

Yes	No

GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for pinpoint test direction and REPAIR the misfire DTCs. CLEAR the DTCs. REPEAT the self-test.	GO to **HF3**.

HF3 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

NOTE: Check the HO2S electrical connectors to make sure the correct HO2S is connected to the correct electrical connector. The electrical connectors are color coded to make sure the correct connection is made.

If the electrical connection of the rear HO2S are interchanged/crossed, the catalyst efficiency monitor test fails.

- Visually inspect the HO2S harness connectors for any indication of crossed wiring.
- Visually inspect the harness for exposed wiring, corrosion and correct routing.
- Visually inspect the PCM connectors for damaged, or pushed out pins, corrosion and loose wires.
- **Are there any concerns with the wiring or the PCM connection?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. CARRY OUT the catalyst monitor drive cycle to verify the repairs.	GO to **HF4**.

HF4 CHECK THE FUEL PRESSURE

WARNING: **The fuel system remains pressurized when the engine is not running. To prevent injury or fire, use caution when working on the fuel system. Failure to follow these instructions may result in personal injury.**

WARNING: **Before repairing or installing a new component in the fuel system, reduce the possibility of injury or fire by following the warning, caution, and handling directions in pinpoint test HC. refer to PINPOINT TEST HC. Failure to follow these instructions may result in personal injury.**

NOTE: Fuel pressure above specification can produce an abnormally rich air/fuel mixture. This rich air/fuel mixture can cause higher than normal catalyst operating temperatures.

NOTE: On electronic returnless fuel system (ERFS), the fuel pressure can be monitored by the scan tool using the fuel rail pressure (FRP) PID.

- Mechanical returnless fuel systems (MRFS):
  - If applicable, inspect the vacuum hose going to the fuel rail pulse damper for proper installation

and cracks. Repair as necessary.

- Connect a Rotunda fuel pressure gauge or equivalent.
- Access the PCM and monitor the FRP PID.
- Start the engine. Record the fuel pressure.
- Compare the recorded fuel pressure reading to the Fuel System Specification Chart found at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**.
- Key in OFF position.
- **Is the fuel pressure within specifications?**

Yes	No
The fuel pressure is OK. If applicable, REMOVE the fuel pressure gauge. GO to **HF5**.	The fuel pressure is out of specification. GO to **HC3**.

HF5 CHECK FOR LEAKS IN THE EXHAUST SYSTEM

NOTE: If a catalyst is in series with a leaking exhaust system, it can fail the catalyst efficiency monitor test.

- Inspect the exhaust system for leaks, cracks, loose connections, punctures, or non-factory modifications.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. CARRY OUT the catalyst monitor drive cycle to verify the repairs.	GO to **HF10**.

HF6 CHECK FOR RESTRICTIONS IN THE EXHAUST SYSTEM

NOTE: A slight pressure in the exhaust system is normal, but excessive exhaust back pressure seriously affects engine operation.

- Inspect the following for damage or restrictions:
  - front and rear exhaust pipes
  - catalytic converter
  - muffler and tailpipe assembly
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HF7**.

HF7 CHECK FOR EXCESSIVE EXHAUST BACK PRESSURE

- The internal condition of exhaust system and its ability to flow can be checked with an exhaust back pressure tool.
- **Is an exhaust back pressure tester available?**

Yes	No
GO to **HF8**.	GO to **HF9**.

HF8 CHECK FOR EXCESSIVE EXHAUST BACK PRESSURE WITH EXHAUST BACK PRESSURE TOOL

NOTE: **Typical exhaust back pressure, when measured near the exhaust manifold and at normal engine operating temperature, should not exceed 20.7 kPa (3 psi) at idle and 55.2 kPa (8 psi) at wide open throttle (WOT) under load.**

- Install an exhaust back pressure tester and follow the tool manufacturer installation and testing instructions.
- **Does the exhaust back pressure test indicate a restriction?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.	No indication of restrictions or leaks has been detected in the exhaust system. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.

HF9 CHECK MANIFOLD VACUUM FOR AN INDICATION OF EXCESSIVE EXHAUST SYSTEM RESTRICTION

NOTE: **When the engine is first started and is idled, the reading may be normal 51-74 kPa (15-22 in-Hg), but as the engine RPM is increased, the back pressure caused by a clogged exhaust system causes the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust restriction causes the needle to drop to a low point even if the engine is only idling.**

- Attach a vacuum gauge to the intake manifold vacuum source.
- Observe the vacuum gauge while increasing the engine RPM.
- **Does the vacuum gauge indicate an exhaust restriction concern?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.	No indication of restrictions or leaks has been detected in the exhaust system. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.

HF10 CARRY OUT THE CATALYST MONITOR DRIVE CYCLE

- Carry out the catalyst monitor drive cycle. Refer to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .
- Retrieve the continuous memory DTCs.
- **Are DTCs P0420 or P0430 present?**

Yes	No
INSTALL a new catalyst between the monitored HO2S sensors, only for the bank referenced, (P0420 Bank 1), (P0430 Bank 2). Do not install a new unmonitored catalyst unless it is repaired as an assembly. REFER to the **EXHAUST SYSTEM -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	The test is complete and no concerns are present.

PINPOINT TEST HG: POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

This pinpoint test is intended to diagnose the following:

- positive crankcase ventilation (PCV) valve (6A666) and related vacuum lines
- electrically heated PCV valve (6A666) and heater circuit, both PCM and non-PCM controlled
- electrically heated PCV tube (9F624) and heater circuit, both PCM and non-PCM controlled
- powertrain control module (PCM) (12A650)
- PCV thermal extension harness (12A580)

NOTE: For the electrically heated PCV system only, refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM .

Electrically Heated PCV

This table is only for vehicles equipped with a PCM controlled PCV heater.

Vehicle	Connector	Pin	Circuit
E-Series, F-Super Duty	170 Pin	E2	PCVHC
F-150	190 Pin	E3	PCVHC
Fusion, Milan	140 Pin	E2	PCVHC
Mustang 5.4L	170 Pin	E67	PCVHC
All other vehicles	170 Pin	E3	PCVHC

HG1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- Check for DTCs P053A, P145E or P1489.
- **Are any of the above listed DTCs present?**

Yes	No
GO to **HG5**.	For all other symptoms without DTCs, GO to **HG2**.

HG2 VISUAL INSPECTION OF THE PCV VALVE

NOTE: If the PCV valve or tube is electrically heated, verify the electrical connection. On some applications the vehicle may be equipped with a thermal harness that only provides electrical continuity when the temperature is less than 5°C (40°F) +/- 4°C (+/- 7°F). Typically this harness is located close to the PCV valve or tube.

NOTE: If the PCV valve is water heated, verify the coolant hose and clip connections.

- Check the PCV valve, hoses and connections for leaks or restrictions.
- Verify the PCV valve maintenance schedule has been followed.
- Verify the proper PCV valve part number.
- Verify the PCV valve is clean.
- Verify the fresh air tube and related hoses are clean and routed correctly.
- **Is a concern present?**

Yes	No
REPAIR as necessary. VERIFY the symptom no longer exists.	For an electrically heated PCV tube, GO to **HG4**. For all others, GO to **HG3**.

HG3 STUCK PCV VALVE CHECK

- Disconnect the PCV valve from the valve cover.
- Shake the PCV valve.
- **Does the PCV valve rattle when shaken?**

Yes	No
REINSTALL the PCV valve. For PCV systems with electrical heating, GO to **HG4**. For PCV systems without electrical heating, GO to **HG12**.	The PCV valve is sticking. INSTALL a new PCV valve. VERIFY the symptom no longer exists.

HG4 CHECK FOR A PCM CONTROLLED PCV HEATER

NOTE: If a thermal extension harness is present then the PCV is non-PCM controlled. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM .

- Check if the PCV heater is PCM controlled.
- **Is the PCV heater PCM controlled?**

Yes	No
GO to **HG5**.	GO to **HG8**.

HG5 CHECK THE HARNESS VOLTAGE TO THE PCM CONTROLLED PCV HEATER

- Suspect PCV connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCVHF Connector, Harness Side	(-)
IGN START/RUN - Pin 2	Ground

- Measure the voltage between:

(+) PCV Connector, Harness Side	(-)
IGN START/RUN	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HG6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HG6 CHECK THE HARNESS CIRCUIT TO THE PCM CONTROLLED PCV HEATER

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCVHF Connector, Harness Side
PCVHF	PCVHF - Pin 1

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCV Connector, Harness Side
PCVHC	PCVHC

- **Is the resistance greater than 5 ohms?**

Yes	No
GO to **HG7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HG7 CHECK THE RESISTANCE OF THE PCM CONTROLLED PCV VALVE OR TUBE HEATER

- Measure the resistance between:

(+) PCVHF Connector, Component Side	(-) PCVHF Connector, Component Side
IGN START/RUN - Pin 2	PCVHF - Pin 1

- Measure the resistance between:

(+) PCV Connector, Component Side	**(-) PCV Connector, Component Side**
IGN START/RUN	PCVHC

- **Is the resistance between 10 - 35 ohms?**

Yes	No
GO to **HG13**.	INSTALL a new PCV valve or tube. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HG8 CHECK THE VOLTAGE AND GROUND AT THE HARNESS ELECTRICALLY HEATED PCV VALVE OR TUBE NON-PCM CONTROLLED

- PCV connector disconnected.
- PCVTE-Harness Side connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCVTE-Harness Side, Harness Side	**(-) PCVTE-Harness Side, Harness Side**
IGN START/RUN - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
For vehicles with a thermal extension harness, GO to **HG10**. For all others, GO to **HG11**.	GO to **HG9**.

HG9 CHECK THE VOLTAGE CIRCUIT

- PCV connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCV Connector,	**(-)**

Harness Side	
IGN START/RUN	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open GND circuit. TEST the system for normal operation.	REPAIR the open PWR circuit TEST the system for normal operation.

HG10 VALVE RESISTANCE CHECK WITHOUT AN EXTENSION HARNESS

NOTE: **On some applications the vehicle may be equipped with a thermal harness that only provides electrical continuity when the temperature is less than 5°C (40°F) +/- 4°C (+/- 7°F). Typically this harness is located close to the PCV valve or tube.**

- Disconnect the thermal extension harness from the PCV valve.
- Measure the resistance between:

(+) PCV Connector, Component Side	(-) PCV Connector, Component Side
IGN START/RUN	PCVHC

- **Is the resistance between 10 - 35 ohms?**

Yes	No
INSTALL a new thermal extension harness PCV. TEST the system for normal operation.	INSTALL a new PCV.

HG11 CHECK THE RESISTANCE OF THE ELECTRICALLY HEATED PCV VALVE OR TUBE

- Measure the resistance between:

(+) PCV Connector, Component Side	(-) PCV Connector, Component Side
IGN START/RUN	GND

- **Is the resistance between 10 - 35 ohms?**

Yes	No
GO to **HG12**.	INSTALL a new PCV valve or tube. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** .

HG12 PCV SYSTEM CHECK

- Start the engine and warm it until engine temperature is stable.
- Disconnect the closure (fresh air) hose from the remote air cleaner or air outlet tube (the tube connecting the mass air flow sensor and the throttle body).
- Place a stiff piece of paper over the hose end. Wait 1 minute.
- **Does vacuum hold the paper in place?**

Yes	No
The PCV system is OK. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	CHECK for vacuum leaks/obstruction in the PCV system (such as oil cap, PCV valve, hoses, cut grommets, valve cover bolt torque/gasket leak). REFER to the vehicle emissions control information (VECI) label for PCV system components and routing. REPAIR as necessary.

HG13 CHECK IF A CONCERN OR DTC IS STILL PRESENT

- Connect the PCV system.
- Clear the DTCs.
- Carry out the self-test.
- **Is the concern or DTC is still present?**

Yes	No
GO to **HG14**.	Unable to duplicate or identify the concern at this time. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

HG14 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HH: EXHAUST GAS RECIRCULATION SYSTEM MODULE (ESM)

This pinpoint test is intended to diagnose the following:

- ESM (9Y456)
- orifice tube assembly (9D477)
- differential pressure feedback exhaust gas recirculation (EGR) sensor pressure hoses
- vacuum lines
- harness circuits: DPFE, SIGRTN, EVR, VPWR and VREF
- powertrain control module (PCM) (12A650)

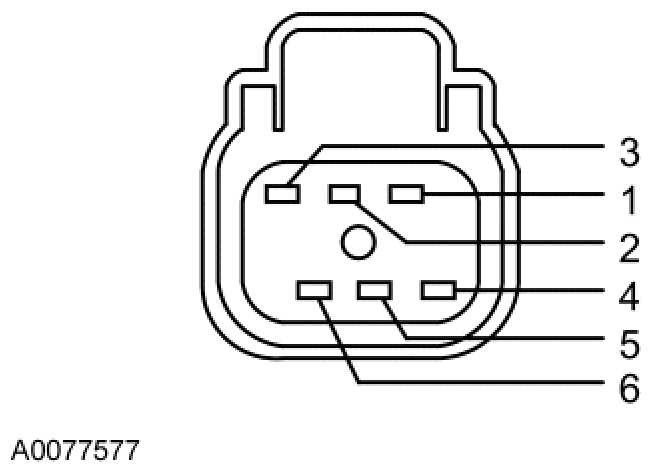

Fig. 127: EGR System Module (ESM) Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	EVR (EGR Vacuum Regulator)
4	VPWR (Vehicle Power)
6	SIGRTN (Signal Return)
5	DPFE (Differential Pressure Feedback EGR)
2	VREF (Reference Voltage)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series, F-Super Duty	170 Pin	E63 E58 E57 E58 E21	EVR SIGRTN VREF SIGRTN DPFE
F-150	190 Pin	E63 E58 B29, E57 B58, E58, T43 E21	EVR SIGRTN VREF SIGRTN DPFE
Mustang	170 Pin	E63 E58 B40, E57 B41, E58, T41 E21	EVR SIGRTN VREF SIGRTN DPFE
All other vehicles	170 Pin	E63 E58 E57 B41, E58, T41 E21	EVR SIGRTN VREF SIGRTN DPFE

HH1 CHECK FOR DTCS

- **Are DTCs P0401, P0402, P0403, P0405, P0406, P1408, or P1409 present?**

Yes	No
For DTC P0401, GO to **HH16**. For DTC P0402, GO to **HH12**. For DTCs P0403 and P1409, GO to **HH22**. For DTC P0405, GO to **HH2**. For DTC P0406, GO to **HH5**. For DTC P1408, GO to **HH17**.	For symptoms without DTCs, GO to **HH28**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HH2 DTC P0405: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage less than 0.05 V?**

Yes	No
GO to **HH3**.	GO to **HH11**.

HH3 INDUCE THE OPPOSITE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR SIGNAL

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage between 4 - 6 V?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HH4**.

HH4 CHECK THE DPFE CIRCUIT FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
DPFE	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
DPFE	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HH29**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH5 DTC P0406: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage greater than 4 V?**

Yes	No
GO to **HH6**.	GO to **HH11**.

HH6 CHECK THE VREF VOLTAGE TO THE ESM

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VREF - Pin 2	Negative terminal

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to **HH7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH7 CHECK THE DPFE CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
DPFE - Pin 5	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **HH8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH8 CHECK THE DPFE CIRCUIT FOR A SHORT TO VREF

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	DPFE

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HH9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH9 CHECK THE DPFE AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ESM Connector, Harness Side
DPFE	DPFE - Pin 5
SIGRTN	SIGRTN - Pin 6

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **HH10**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH10 INDUCE THE OPPOSITE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR VOLTAGE

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Harness Side
DPFE - Pin 5	SIGRTN - Pin 6

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HH29**.

HH11 CARRY OUT A THOROUGH WIGGLE TEST ON THE ESM HARNESS

- Access the PCM and monitor the DPFEGR PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there any change in the voltage reading, or is a concern found?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

HH12 DTC P0402: CHECK THE VREF VOLTAGE TO THE ESM

NOTE: Diagnose and repair all circuit concern DTCs before diagnosing range/performance or flow concerns. For circuit concern DTC diagnosis, refer to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS .

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VREF - Pin 2	Negative terminal

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **HH13**.	refer to **PINPOINT TEST C**.

HH13 SIMULATE THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR SIGNAL WITH A VACUUM PUMP

- Disconnect the downstream differential pressure feedback EGR sensor port hose at the ESM.
- Verify the hose and port are clear and free of obstructions.

- Connect a vacuum pump to the downstream differential pressure feedback EGR sensor port.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
    - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
    - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
    - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HH14**.

HH14 INSPECT THE EGR VACUUM REGULATOR SOLENOID VENT FOR BLOCKAGE

NOTE: When the EGR valve is closed, the EGR vacuum regulator solenoid vacuum is vented through the solenoid vent to the atmosphere. A plugged EGR vacuum regulator solenoid vent does not allow EGR vacuum to vent to the atmosphere.

- EGR vacuum regulator vacuum hoses disconnected.
- Connect a hand vacuum pump to the EGR vacuum regulator source port.
- Apply 34 to 51 kPa (10 to 15 in-Hg) vacuum.
- **Does the EGR vacuum regulator solenoid vacuum bleed off?**

Yes	No
GO to **HH15**.	INSTALL a new EGR vacuum regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HH15 CHECK THE EGR VALVE FOR CARBON BUILD-UP

- Remove the ESM.
- Visually inspect the EGR valve and valve seat for correct seating, carbon build-up and debris.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time.

HH16 DTC P0401: CARRY OUT THE KOER SELF-TEST

NOTE: Diagnose and repair all circuit concern DTCs before diagnosing range/performance or flow concerns.

- Carry out the KOER self-test.
- **Is DTC P1408 present?**

Yes	No
GO to **HH17**.	GO to **HH18**.

HH17 DTC P1408: CHECK THE VREF VOLTAGE TO THE ESM

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VREF - Pin 2	Negative terminal

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to **HH18**.	refer to **PINPOINT TEST C**.

HH18 CHECK THE EGR VACUUM REGULATOR SOLENOID VACUUM

- ESM connector connected.
- Disconnect the EGR vacuum regulator vacuum source hose.
- Connect a vacuum gauge to the EGR vacuum regulator vacuum source hose.
- Key ON, engine running.
- Monitor the vacuum gauge.
- **Is the manifold vacuum greater than 34 kPa (10 in-Hg)?**

Yes	No
GO to **HH19**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HH19 SIMULATE THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR SIGNAL WITH A VACUUM PUMP

- Key in OFF position.
- Disconnect the downstream differential pressure feedback EGR sensor port hose at the ESM.
- Verify the hose and port are clear and free of obstructions.
- Connect a vacuum pump to the downstream differential pressure feedback EGR sensor port.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
    - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
    - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
    - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	CONNECT all the hoses. GO to **HH20**.

HH20 CHECK THE EGR VACUUM REGULATOR SOLENOID OPERATION

- Key ON, engine running.
- Engine at normal operating temperature.
- Allow the engine idle to stabilize.
- Access the PCM and monitor the RPM PID.
- Access output state control.
- Increase the EGR vacuum regulator duty cycle while monitoring the RPM PID.
- **Does the RPM decrease or the engine stall as the EGR vacuum regulator duty cycle is increased?**

Yes	No

Unable to duplicate or identify the concern at this time.	GO to **HH21**.

HH21 CHECK FOR THE PRESENCE OF CARBON BUILD-UP IN THE EGR PASSAGE

NOTE: In certain vehicle applications, carbon build-up may occur downstream of the ESM. An inspection is required to make sure the passage in the upper intake manifold plenum chamber behind the ESM is open to allow exhaust gas flow.

- Key in OFF position.
- Remove the ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** .
- Disconnect the air inlet tube from the throttle body.
- Prop open the throttle body.
- Apply regulated shop air to the EGR port at the location where the ESM attaches to the upper intake manifold.
- **Is a restriction concern present?**

Yes	No
CLEAN the EGR port as necessary and INSTALL the ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HH22 DTCS P0403 AND P1409: CHECK THE EGR VACUUM REGULATOR SOLENOID OPERATION

- Key ON, engine running.
- Engine at normal operating temperature.
- Allow the engine idle to stabilize.
- Access the PCM and monitor the RPM PID.
- Access output state control.
- Increase the EGR vacuum regulator duty cycle while monitoring the RPM PID.
- **Does the RPM decrease or the engine stall as the EGR vacuum regulator duty cycle is increased?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to **HH23**.

HH23 CHECK THE VPWR VOLTAGE TO THE EGR VACUUM REGULATOR SOLENOID

- Key in OFF position.
- ESM connector disconnected.

- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 4	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HH24**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH24 CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) ESM Connector, Component Side	(-) ESM Connector, Component Side
VPWR - Pin 4	EVR - Pin 1

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to **HH25**.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HH25 CHECK THE EVR CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR - Pin 1	EVR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HH26**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH26 CHECK THE EVR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
EVR	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **HH27**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH27 CHECK THE EVR CIRCUIT FOR A SHORT TO GND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
EVR	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HH29**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH28 EGR DIAGNOSIS BY SYMPTOM: CHECK FOR EGR FLOW WITH THE EGR VACUUM REGULATOR VACUUM HOSE DISCONNECTED AND PLUGGED

NOTE: An increase in DPFEGR PID voltage at idle indicates EGR flow.

- Carry out the KOER self-test. Repair any other DTCs.
- Possible causes for EGR flow at idle with no related DTCs:
  - EGR valve not fully seating
  - EGR vacuum regulator solenoid vent restricted
  - Damaged EGR vacuum regulator solenoid
- Disconnect and plug the EGR vacuum regulator vacuum source hose.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Record the PID voltage.
- Key ON, engine running.
- With the engine at idle, observe the DPFEGR PID voltage. Compare to engine OFF voltage.
- **Is the idle DPFEGR PID voltage greater than 0.15 V when compared to the KOEO DPFEGR PID voltage?**

Yes	No
REMOVE and INSPECT the ESM for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. If no concerns are present, INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSPECT the EGR vacuum regulator solenoid vent for blockage. To continue symptom diagnosis, REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS** .

HH29 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HK: VARIABLE CAMSHAFT TIMING (VCT)

This pinpoint test is intended to diagnose the following:

- VCT solenoid (6L713) or (6B297)
- spider assembly right bank (6C260), or left bank (6C261)
- harness circuits: VPWR and VCT
- powertrain control module (PCM) (12A650)

HK1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0010, P0011, P0012, P0016, P0018, P0020, P0021, P0022, P052A, P052B, P052C or P052D present?**

Yes	No
For DTCs P0010 or P0020, GO to **HK2**. For DTCs P0011, P0012, P0021, P0022, P052A, P052B, P052C or P052D, GO to **HK17**. For DTCs P0016 and P0018 with or without P0011, P0012, P0021, P0022, P052A, P052B, P052C or P052D, GO to **HK16**.	For symptoms without DTCs, GO to **HK17**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HK2 DTCS P0010 OR P0020: CHECK FOR VCT DTCS

NOTE: The engine should be at operating temperature before running the self-test.

- Clear the DTCs.
- Carry out the KOER self-test.
- **Are DTCs P0010 or P0020 present?**

Yes	No

For KOER DTC P0010, GO to **HK4**. For KOER DTC P0020, GO to **HK10**.	GO to **HK3**.

HK3 CARRY OUT A THOROUGH WIGGLE TEST ON THE VCT HARNESS

- Carry out a thorough wiggle test on the VCT harness.
- Carry out the KOER self-test.
- **Are DTCs P0010 or P0020 present?**

Yes	No
For KOER DTC P0010, GO to **HK4**. For KOER DTC P0020, GO to **HK10**.	refer to **PINPOINT TEST Z**.

HK4 CHECK THE VCT1 SOLENOID RESISTANCE

- Key in OFF position.
- VCT1 Solenoid connector disconnected.
- Measure the resistance between:

(+) VCT1 Solenoid Connector, Component Side	(-) VCT1 Solenoid Connector, Component Side
VCT1	VPWR

- **Is the resistance between 5 - 14 ohms?**

Yes	No
GO to **HK5**.	INSTALL a new VCT1 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK5 CHECK THE VCT1 SOLENOID FOR INTERNAL SHORTS

- Measure the resistance between:

(+) VCT1 Solenoid Connector, Component Side	(-)
VCT1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HK6**.	INSTALL a new VCT1 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK6 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT1 Solenoid Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HK7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HK7 CHECK THE VCT1 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT1 Solenoid Connector, Harness Side	(-)
VCT1	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **HK8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK8 CHECK THE VCT1 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) VCT1 Solenoid Connector, Harness Side	(-) PCM Connector, Harness Side
VCT1	VCT1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HK9**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HK9 CHECK THE VCT1 CIRCUIT FOR A SHORT TO GND IN THE HARNESS

- Measure the resistance between:

(+) VCT1 Solenoid Connector, Harness Side	(-)
VCT1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HK18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK10 DTC P0020: CHECK THE VCT2 SOLENOID RESISTANCE

- Key in OFF position.
- VCT2 Solenoid connector disconnected.
- Measure the resistance between:

(+) VCT2 Solenoid Connector, Component Side	(-) VCT2 Solenoid Connector, Component Side

VCT2	VPWR

- **Is the resistance between 5 - 14 ohms?**

Yes	No
GO to **HK11**.	INSTALL a new VCT2 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK11 CHECK THE VCT2 SOLENOID FOR INTERNAL SHORTS

- Measure the resistance between:

(+) VCT2 Solenoid Connector, Component Side	(-)
VCT2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HK12**.	INSTALL a new VCT2 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK12 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT2 Solenoid Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HK13**.	REPAIR the open circuit. CLEAR the DTCs.

	REPEAT the self-test.

HK13 CHECK THE VCT2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT2 Solenoid Connector, Harness Side	(-)
VCT2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **HK14**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK14 CHECK THE VCT2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) VCT2 Solenoid Connector, Harness Side	(-) PCM Connector, Harness Side
VCT2	VCT2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HK15**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HK15 CHECK THE VCT2 CIRCUIT FOR A SHORT TO GND IN THE HARNESS

- Measure the resistance between:

(+) VCT2 Solenoid	

Connector, Harness Side	(-)
VCT2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HK18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK16 CONTINUOUS DTCS P0016, P0018 WITH OR WITHOUT P0011, P0012, P0021, P0022, P052A, P052B, P052C, P052D: CHECK THE FUNCTIONALITY OF THE VCT SYSTEM

NOTE: On 4.6L 3V and 5.4L 3V engines, the VCTADV PID indicates a positive value. For all others, the VCTADV PID indicates a negative value.

- Engine at normal operating temperature.
- Clear the DTCs.
- For DTC P0016.
- Access the PCM and monitor the VCTADV PID.
- For DTC P0018.
- Access the PCM and monitor the VCTADV2 PID.
- Run the engine at idle for 1 minute while monitoring the VCTADV (P0016) or VCTADV2 (P0018) PID.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0016 or P0018 present?**

Yes	No
For a VCTADV PID value between -16 and -46 degrees (2.3L, 3.5L), -14 and -36 degrees (3.0L), or 24 and 73 degrees (4.6L 3V, 5.4L 3V), INSTALL a new VCT solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test. For all others, REFER to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to verify the engine timing.	Unable to duplicate or identify the concern at this time.

HK17 CONTINUOUS DTCS P0011, P0012, P0021, P0022, P052A, P052B, P052C OR P052D: CHECK THE OPERATION OF THE VCT SYSTEM

NOTE: Some vehicles require higher RPMs and loads to actuate the VCT system than others. The VCTERR PID should be close to 0 whether actuating or not. During

rapid VCT movements, the VCTERR PID may momentarily deviate from 0.

- For DTCs P0011, P0012, P052A or P052B.
- Access the PCM and monitor the VCTADV PID.
- Access the PCM and monitor the VCTADVERR PID.
- For DTCs P0021, P0022, P052C or P052D.
- Access the PCM and monitor the VCTADV2 PID.
- Access the PCM and monitor the VCTADVERR2 PID.
- Drive the vehicle exercising the throttle to induce VCT movement.
- **Does the VCTADV PID indicate VCT movement while the VCTERR PID maintain close to 0?**

Yes	No
Unable to duplicate or identify the concern at this time.	INSTALL a new VCT solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HM: SECONDARY AIR INJECTION (AIR) SYSTEM

This pinpoint test is intended to diagnose the following:

- secondary air injection system relay (14B192)
- electric air injection pump (9A486)
- secondary air injection bypass solenoid (9H465)

- harness circuits: B+, VPWR, AIR, AIRM, ground
- powertrain control module (PCM) (12A650)

- secondary air injection diverter valve (9F491)
- vacuum supply
- hoses
- partial restricted exhaust

Refer to the Wiring Diagrams article for schematic and connector information.

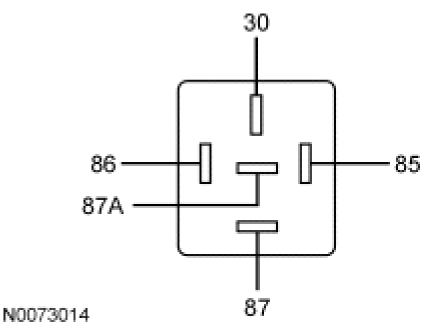

Fig. 133: Powertrain Control Module Power (PCM Power) Relay Connector - B
Courtesy of FORD MOTOR CO.

Pin	Circuit
86	AIR (Secondary Air Injection)
87	AIR_PWR (AIR Pump Power)
30	B+ (Battery Positive Voltage)
85	VPWR (Vehicle Power)

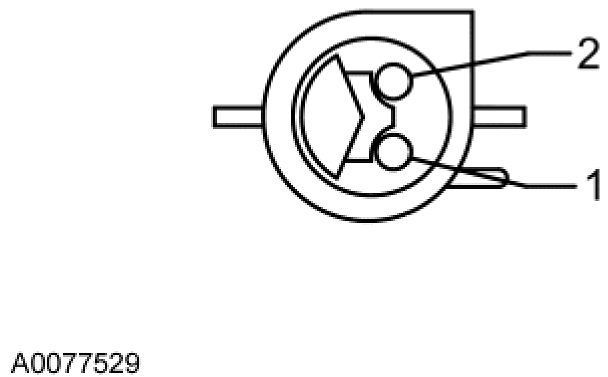

Fig. 134: Secondary Air Pump Connector

Courtesy of FORD MOTOR CO.

Pin	Circuit
2	AIR_PWR (AIR Pump Power)
1	AIR_GND (AIR Pump Ground)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
140 Pin	B58 B66 B67 B33 B51 B50 B1	SIGRTN CASE GND PWRGND VREF VPWR AIRM AIR

HM1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0410, P0412, P0491, P2257, P2258, or P2448 present?**

Yes	No
GO to **HM2**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HM2 VISUALLY INSPECT THE SECONDARY AIR SYSTEM COMPONENTS AND HOSES

- Visually inspect the secondary AIR system components, connectors and hoses for:
  - damaged hoses
  - obstructions
  - exhaust damage
  - restricted secondary AIR pump inlet
  - water or ice
- **Are the secondary AIR system components and hoses OK?**

Yes	No
GO to **HM3**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HM3 CHECK THE VPWR VOLTAGE TO THE SECONDARY AIR RELAY

- Secondary AIR relay removed.
- Key ON, engine OFF.

- Measure the voltage between:

(+) Secondary AIR Relay Connector, Harness Side	(-)
VPWR - Pin 85	Ground
B+ - Pin 30	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to **HM4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM4 CHECK THE SECONDARY AIR RELAY

- Key in OFF position.
- Carry out the relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the relay pass the component test?**

Yes	No
GO to **HM5**.	INSTALL a new secondary AIR relay. CLEAR the DTCs. REPEAT the self-test.

HM5 CHECK THE SECONDARY AIR PUMP GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

- Secondary AIR Pump Motor connector disconnected.
- Measure the resistance between:

(+) Secondary Air Pump Connector, Harness Side	(-)
AIR_GND - Pin 1	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HM6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM6 CHECK THE SECONDARY AIR PUMP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) Secondary AIR Relay Connector, Harness Side	(-) Secondary Air Pump Connector, Harness Side
AIR_PWR - Pin 87	AIR_PWR - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HM7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM7 CHECK THE SECONDARY AIR CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Secondary AIR Relay Connector, Harness Side
AIR - Pin B1	AIR - Pin 86
AIRM - Pin B50	AIR_PWR - Pin 87

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **HM8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM8 CHECK THE SECONDARY AIR MONITOR CIRCUIT AND THE SECONDARY AIR PUMP VOLTAGE CIRCUIT FOR A SHORT TO GROUND

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
AIRM - Pin B50	Ground
AIR - Pin B1	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **HM9**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM9 CHECK THE SECONDARY AIR MONITOR CIRCUIT AND THE SECONDARY AIR PUMP VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
AIRM - Pin B50	Ground
AIR - Pin B1	Ground

- **Is any voltage present?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **HM10**.

HM10 MEASURE THE VACUUM AT THE SECONDARY AIR SOLENOID VALVE

CAUTION: Running the secondary AIR pump with OTM longer than 2 minutes may overheat and damage the secondary AIR pump. Refer to{Output Test Mode}.

- Key in OFF position.
- Secondary AIR relay installed.
- Secondary AIR Solenoid connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Connect a vacuum gauge to the control vacuum outlet at the secondary AIR valve.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Observe the vacuum gauge reading at the secondary AIR valve.
- Command the outputs OFF.
- Exit output test mode.
- **Is vacuum present at the secondary AIR diverter valve?**

Yes	No
GO to **HM11**.	INSTALL a new secondary AIR valve. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HM11 CHECK THE SECONDARY AIR PUMP OPERATION

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Disconnect the inlet hose from the secondary AIR valve.
- Command the outputs ON.
- Place your hand over the secondary AIR valve inlet hose.
- Command the outputs OFF.
- Exit output test mode.
- **Is there any air flow from the secondary AIR inlet valve hose?**

Yes	No
INSTALL a new secondary AIR valve. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new secondary AIR pump. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST HU: INTAKE AIR SYSTEMS

This pinpoint test is intended to diagnose the following:

- accelerator cable linkage to throttle body (9C799)
- air cleaner assembly (including air cleaner element) (9600)
- air inlet tube (9F843)
- clean air tube hose and resonator (9R504) and (9F593)
- intake manifold runner control (IMRC) housing assembly (9U531), (9U524) and (9J447)
- IMRC actuator assembly (9J559)
- IMRC (9G730)
- intake manifold tuning valve (IMTV) (9L490)
- IMTV electric actuator assembly (9L490)
- speed control cable (9A825)
- throttle body assembly (9E926)
- harness circuits: IMRC, MONITOR, SIGNAL, SIGRTN, PWRGND, and VPWR
- harness circuits: IMTV, MONITOR, SIGNAL, and VPWR
- powertrain control module (PCM) (12A650)

IMRCM VOLTAGE VALUES

VEHICLE	IMRC OFF	IMRC ON
Focus, 2.0L	0	5
F-150 5.4L, Mark LT	5	0
All Others	2.5	0

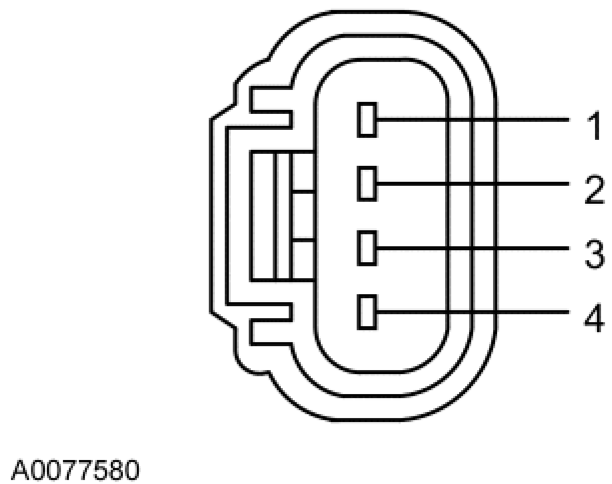

Fig. 135: Intake Manifold Runner Control (IMRC) Actuator Connector - A
Courtesy of FORD MOTOR CO.

HU1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0505, P0506, P0660, P0663, P1512, P1513, P1516, P1517, P1518, P1519, P151A, P1520, P1537, P1538, P1549, P2004, P2005, P2006, P2007, P2008, P2014, P2015, P2019, P2020, P2070, or P2071 present?**

Yes	No
For DTCs P0505 or P0506, on vehicles with electronic throttle control (ETC), GO to **HU51**. For DTCs P0505 or P0506, on vehicles without ETC, GO to **HU2**. For DTCs P0660, P0663, P1549, P2070 or P2071, GO to **HU42**.	For vehicles equipped with electronic throttle control (ETC) that have low idle concerns, difficulty

For DTC P151A, Mustang 4.6L, Explorer 4.6L, Explorer Sport Trac 4.6L, and Mountaineer 4.6L. GO to **HU18**. For DTC P151A, all others, GO to **HU17**. For DTCs P1512, P1513, P1516, P1517, P1518, P1519, P1520, P1537, P1538, P2004, P2005, P2006, P2007, P2008, P2014, P2015, P2019 or P2020, GO to **HU15**.	starting, hesitation, loss of RPM, GO to **HU51**. For lack/loss of power, GO to **HU42**. For all other symptoms without DTCs, GO to **HU2**.

HU2 PART THROTTLE SYMPTOM

- **Are any part throttle concerns present?**

Yes	No
GO to **HU7**.	GO to **HU3**.

HU3 CHECK THE BASE IDLE SPEED

NOTE: The vehicle must be at operating temperature and at idle for a minimum of 1 minute.

- Key ON, engine running.
- Determine if the idle speed is incorrect. Refer to the **REFERENCE VALUES** article Typical Reference Value Charts, if necessary.
- Access the PCM and monitor the RPM PID.
- If equipped, read the vehicle tachometer.
- **Is vehicle idle speed correct?**

Yes	No
GO to **HU5**.	GO to **HU4**.

HU4 CHECK THE THROTTLE ARM CONTACTS

- Key in OFF position.
- Check that the throttle arm contacts the return stop.
- **Is the idle speed high?**

Yes	No
GO to **HU9**.	GO to **HU10**.

HU5 CHECK FOR BINDING OR STICKING IN THE THROTTLE SYSTEM

- Gently cycle the throttle from fully closed to fully open and back to fully closed. Check for sticking or binding during rotation.

- **Is a stick and bind condition present?**

Yes	No
GO to **HU6**.	GO to **HU7**.

HU6 ISOLATE THE BINDING AND/OR STICKING CONCERN

NOTE: **Do not attempt to clean the throttle bore and plate area. Cleaning damages the throttle body assembly.**

NOTE: **The sticking or binding condition can either be within the cables or throttle body assembly.**

- Disconnect the accelerator cable and speed control cable from the throttle body linkage.
- Rotate the throttle body linkage.
- **Does the throttle body rotate freely without a sticking, binding or grabbing condition?**

Yes	No
REPAIR the cable(s) causing the concern. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HU7 CHECK THE FUNCTIONALITY OF THE THROTTLE POSITION (TP) SENSOR

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Gently cycle the throttle from fully closed to fully open and back to fully closed.
- **Does the TP PID display a smooth voltage reading?**

Yes	No
GO to **HU8**.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HU8 CHECK THE INTAKE AIR SYSTEM FOR LEAKS, OBSTRUCTIONS AND DAMAGE

NOTE: **The Focus air cleaner element is integral to the air cleaner assembly. Inspect the air restriction gauge (if equipped) for a restriction indication.**

- Key in OFF position.
- Remove the air cleaner element. Check the air cleaner for blockage.
- Check for restrictions between the air inlet and the throttle body.
- **Are any restriction concerns present?**

Yes	No
REMOVE the restriction. INSTALL a new air cleaner element. Refer to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	REINSTALL the air cleaner element. GO to **HU9**.

HU9 CHECK THE POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

NOTE: A high idle may indicate an incorrect PCV valve size or a vacuum leak.

- Check that no cracks or leaks are present.
- Remove the PCV valve.
  - Verify a clean PCV valve.
  - Verify the proper PCV valve part number.
- **Are any PCV system concerns present?**

Yes	No
INSTALL a new PCV valve. REPAIR as necessary. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	For high idle, GO to **HU13**. For all others, CONNECT the PCV valve. GO to **HU10**.

HU10 CHECK THE IDLE AIR CONTROL (IAC) VALVE RESPONSE

- Key ON, engine running.
- The vehicle must be at operating temperature and at idle for a minimum of 1 minute.
- IAC connector disconnected.
- **Does the RPM drop or the engine stall?**

Yes	No
GO to **HU12**.	GO to **HU11**.

HU11 CHECK THE IAC VALVE RESPONSE

- **Is the idle speed high?**

Yes	No

GO to **HU13**.	INSTALL a new IAC. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HU12 INSPECT THE THROTTLE BODY PLATE HOLE FOR PLUGGING

NOTE: **Only some applications have a throttle plate hole. If not equipped go to the SYMPTOM CHARTS article, Symptom Charts.**

- Key in OFF position.
- Remove the resonator from the throttle body assembly.
- Inspect the throttle plate hole for any restrictions.
- **Are any restriction concerns present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** , to diagnose performance while driving concerns.

HU13 CHECK FOR VACUUM LEAKS

- Listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for leaks such as:
    - cracked or punctured inlet air tube
    - loose connections on the inlet air tube at the air cleaner housing or throttle body
    - IAC valve assembly or gasket
    - EGR valve gasket leak to intake manifold
    - intake manifold assembly or gasket
    - EGR valve diaphragm or control solenoid
    - vacuum supply connectors and hose
- **Are any leaks present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HU14**.

HU14 CHECK THE THROTTLE BODY FOR EXCESSIVE WEAR

- Key in OFF position.

- Remove the throttle body assembly. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for removal and inspection.
- Check the following:
  - excessive wear or grooving in the throttle bore
  - misaligned or worn throttle plate
  - excessive gap between the throttle bore and plate
- **Are any concerns present?**

Yes	No
INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** , to diagnose performance while driving concerns.

HU15 DTCS P1512, P1513, P1516, P1517, P1518, P1519, P1520, P1537, P1538, P2004, P2005, P2006, P2007, P2008, P2014, P2015, P2019 OR P2020: VISUAL INSPECTION

NOTE: **If unable to fully carry out the following inspections, answer NO to the question in this step.**

NOTE: **The IMRC return spring is strong on vacuum systems. Make sure the vacuum system operates correctly and the plates open and close fully. On vacuum operated systems the engine must run for 20 seconds to restore vacuum then return to KOEO for testing.**

Some IMRC electrical systems are driven in both directions by the solenoid and do not use a return spring. They can not be opened manually.

- Visually inspect the linkage for possible causes of binding or obstructions. Check the lever/linkage for movement. There may be some tension in one direction but there should be full travel.
- Manually open and close the IMRC plates at the intake manifold while checking for sticking or binding.
- **Is a mechanical concern present?**

Yes	No
GO to **HU16**.	For Explorer 4.6L, Explorer Sport Trac 4.6L, Mountaineer 4.6L, and Mustang 4.6L, GO to **HU18**. For all others, GO to **HU17**.

HU16 CHECK THE IMRC FOR MECHANICAL OPERATION

NOTE: **The IMRC return spring is strong - approximately 0.34 to 0.45 Nm (3 to 4 in-lb).**

NOTE: **Some electric motor applications do not use a return spring and should move freely when open and closed.**

- Disconnect the IMRC linkage or remove the actuator assembly from the manifold.
- Rotate the IMRC plate lever to fully open and to fully closed, contacting both limits.
- Check for sticking or binding during rotation.
- **Is a mechanical concern present?**

Yes	No
REPAIR as necessary or INSTALL a new IMRC. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	CONNECT the IMRC linkage. For Explorer 4.6L, Explorer Sport Trac 4.6L, Mountaineer 4.6L, and Mustang 4.6L, GO to **HU18**. For all others, GO to **HU17**.

HU17 DTC P151A: CHECK THE FUNCTIONALITY OF THE IMRC

WARNING: **Keep fingers clear of the mechanism. Failure to follow these instructions may result in personal injury.**

NOTE: **The vehicle must be at operating temperature and at idle for a minimum of 1 minute.**

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Access the PCM and monitor the IMRC1M PID.
- Command IMRC ON then OFF.

IMRCM VOLTAGE VALUES

VEHICLE	IMRC OFF	IMRC ON
Focus, 2.0L	0	5
F-150 5.4L, Mark LT	5	0
All Others	2.5	0

- **Using the table for reference, do the IMRCM voltage values correctly change while the IMRC is cycled?**

Yes	No
refer to **PINPOINT TEST Z**.	GO to **HU19**.

HU18 CHECK THE FUNCTIONALITY OF BI-DIRECTIONAL IMRC

WARNING: **Keep fingers clear of the mechanism. Failure to follow these instructions may result in personal injury.**

NOTE: The vehicle must be at operating temperature and at idle for a minimum of 1 minute.

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Access the PCM and monitor the IMRC_F PID.
- Command IMRC ON then OFF.
- **Do the IMRC values correctly change from off to on while the IMRC is cycled and is the IMRCF PID no?**

Yes	No
refer to **PINPOINT TEST Z**.	GO to **HU19**.

HU19 CHECK THE FUNCTIONALITY OF THE IMRC

WARNING: **Keep fingers clear of the mechanism. Failure to follow these instructions may result in personal injury.**

NOTE: The vehicle must be at operating temperature and at idle for a minimum of 1 minute.

- Key ON, engine running.
- Physically monitor the IMRC actuator.
- Access the PCM and control the IMRC PID.
- Command the outputs ON.
- **Do the IMRC levers cycle from fully closed and remain fully open while the outputs are on?**

Yes	No
GO to **HU28**.	GO to **HU20**.

HU20 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.

- IMRC Actuator connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IMRC Actuator Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HU21**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU21 CHECK THE GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the voltage between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
VPWR	PWRGND

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HU22**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU22 VERIFY THE DRIVER CIRCUIT FUNCTION

- Connect a non-powered test lamp between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
VPWR	IMRC

- **Does the test lamp illuminate?**

Yes	No
GO to **HU27**.	GO to **HU23**.

HU23 VERIFY THE DRIVER CIRCUIT FUNCTION WHILE COMMANDING ON IMRC

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Connect a non-powered test lamp between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
VPWR	IMRC

- Command the outputs ON.
- **Does the test lamp illuminate?**

Yes	No
GO to **HU26**.	GO to **HU24**.

HU24 CHECK THE IMRC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) IMRC Actuator Connector, Harness Side	(-) PCM Connector, Harness Side
IMRC	IMRC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HU25**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU25 CHECK THE IMRC CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) IMRC Actuator Connector, Harness Side	(-)
IMRC	Ground

- **Is the voltage less than 10 V?**

Yes	No
GO to **HU53**.	REPAIR the short circuit to voltage. CLEAR the DTCs. REPEAT the self-test.

HU26 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE IMRC HARNESS

- Key in OFF position.
- PCM connector connected.
- Measure the resistance between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
IMRC	IMRCM
IMRC	PWRGND

- **Are the resistances greater than 10K ohms?**

Yes	No
INSTALL a new IMRC actuator. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HU27**.

HU27 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE IMRC HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
IMRC	IMRCM

IMRC	PWRGND

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **HU53**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.

HU28 CHECK THE IMRCM PID

- Key ON, engine OFF.
- Access the PCM and monitor the IMRC1M PID.
- **Is the IMRCM PID displaying either VREF or approximately 2.5 volts?**

Yes	No
GO to **HU29**.	GO to **HU33**.

HU29 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VPWR

NOTE: **The vehicle must be at operating temperature and at idle for a minimum of 1 minute.**

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Command the outputs ON.
- Access the PCM and monitor the IMRC1M PID.
- **Is the voltage less than 1 V?**

Yes	No
GO to **HU35**.	GO to **HU35**.

HU30 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key ON, engine OFF.
- IMRCM Sensor connector disconnected.
- Measure the voltage between:

(+) IMRCM Sensor Connector, Harness Side	(-)

IMRCM	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HU31**.	GO to **HU32**.

HU31 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VOLTAGE IN THE CONTROL MODULE

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IMRCM Sensor Connector, Harness Side	(-)
IMRCM	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the short circuit to voltage. CLEAR the DTCs. REPEAT the self-test.	GO to **HU53**.

HU32 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VPWR

- Key in OFF position.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Component Side	(-) IMRCM Sensor Connector, Component Side
IMRCM	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
CHECK for an intermittent concern. refer to **PINPOINT TEST Z**.	INSTALL a new IMRCM sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary.

	CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.

HU33 CHECK THE IMRCM CIRCUIT FOR A SHORT TO GROUND

- Key ON, engine OFF.
- Access the PCM and monitor the IMRC1M PID.
- IMRCM Sensor connector disconnected.
- **Does voltage change from less than 1 volt to VREF when disconnecting the IMRCM harness connector?**

Yes	No
INSTALL a new IMRCM sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.	GO to **HU34**.

HU34 CHECK THE IMRCM CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) IMRCM Sensor Connector, Harness Side
IMRCM	PWRGND

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HU53**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.

HU35 CHECK THE MONITOR CIRCUIT RESPONSE

- IMRCM Sensor connector disconnected.
- Access the PCM and monitor the IMRC1M PID.
- Connect a 5 amp fused jumper wire between the following:

Point A	

IMRCM Sensor Connector, Harness Side	Point B
IMRCM	Ground

- **Does voltage change from less than 1 volt to VREF when disconnecting the IMRCM harness connector?**

Yes	No
GO to **HU36**.	GO to **HU39**.

HU36 CHECK THE PWRGND CIRCUIT FOR CONTINUITY TO CHASSIS GND

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector connected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) Vehicle Battery
PWRGND	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HU37**.	GO to **HU38**.

HU37 CHECK THE MONITOR CIRCUIT FOR AN INTERMITTENT OPEN

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRCM	IMRCM

- Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module.

- **Is the resistance fluctuating while checking the harness?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.	INSTALL a new IMRCM sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.

HU38 CHECK THE HARNESS PWRGND CIRCUIT FOR CONTINUITY

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
PWRGND	PWRGND

- **Is the resistance less than 5 ohms?**

Yes	No
CHECK the circuit for an intermittent concern. refer to **PINPOINT TEST Z**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.

HU39 CHECK THE IMRCM CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRCM	IMRCM

- **Is the resistance less than 5 ohms?**

Yes	No

GO to **HU40**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.

HU40 CHECK THE MONITOR CIRCUIT FOR AN INTERMITTENT OPEN

- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRCM	IMRCM

- Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module.
- **Is the resistance fluctuating while checking the harness?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to **HU41**.	GO to **HU53**.

HU41 VERIFY THE REPAIR

- Key ON, engine OFF.
- Clear the PCM DTCs.
- Access the PCM and monitor the IMRC and IMRC_F PIDs.
- Access the PCM and monitor the IMRC1M PID.
- Key ON, engine running.
- Drive the vehicle, obeying all traffic and safety laws.
- Safely carry out 3 acceleration runs from a stop or roll to between 3,000 and 4,000 RPM.
- Watch for any PID change.
- Carry out the PCM self-test.
- **Are any DTCs received?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	The test completed successfully.

HU42 DTCS P0660, P0663, P1549, P2070 OR P2071: VISUAL INSPECTION OF INTAKE MANIFOLD TUNING

VALVE

- Inspect the component for signs of damage.
- Check the harness and connection.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HU43**.

HU43 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- IMTV Actuator connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IMTV Actuator Connector, Harness Side	(-) Vehicle Battery
VPWR	Negative terminal

- **Is the voltage greater than 10.5 V?**

Yes	No
GO to **HU44**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU44 CHECK THE IMTV CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) IMTV Actuator Connector, Harness Side	(-) PCM Connector, Harness Side
IMTV	IMTV

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HU45**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU45 CHECK THE IMTV CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
IMTV	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HU46**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HU46 CHECK THE IMTV CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
IMTV	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **HU47**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HU47 CHECK THE IMTV DRIVER CIRCUIT WITH THE PCM CONNECTED

- IMTV Actuator connector disconnected.
- PCM connector connected.
- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) IMTV Actuator Connector,	(-) IMTV Actuator Connector,

Harness Side	Harness Side
VPWR	IMTV

- **Does the test lamp illuminate?**

Yes	No
GO to **HU53**.	GO to **HU48**.

HU48 CHECK THE IMTV PCM DRIVER CIRCUIT WHEN COMMANDED ON

- Connect a non-powered test lamp between:

(+) IMTV Actuator Connector, Harness Side	(-) IMTV Actuator Connector, Harness Side
VPWR	IMTV

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the test lamp illuminate?**

Yes	No
GO to **HU49**.	GO to **HU53**.

HU49 CHECK THE IMTV FOR DAMAGE

- Key in OFF position.
- Remove the IMTV. Refer to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** .
- Visually inspect the shutter for damage.
- Manually rotate the shutter.
- **Is a concern present?**

Yes	No
INSTALL a new IMTV actuator. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **HU50**.

HU50 CHECK THE IMTV FOR FUNCTIONALITY WHEN COMMANDED ON

- IMTV Actuator connector connected.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the IMTV shutter rotate?**

Yes	No
The concern is an intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new IMTV actuator. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test.

HU51 PRELIMINARY DIAGNOSIS FOR DIAGNOSTIC TROUBLE CODES (DTCS) P0505 OR P0506

- Key ON, engine OFF.
- **Are any DTCs present other than P0505 or P0506?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **HU52**.

HU52 MONITOR THE INTAKE AIR SYSTEM RELATED PIDS

NOTE: Verify that the vehicle has reached the normal engine coolant operating temperature of 77°C (170°F). Allow the engine to idle an additional 5 minutes.

NOTE: The ETC_TRIM PID may not be available on all vehicles.

- Access the PCM and monitor the ECT PID.
- Access the PCM and monitor the ETC_TRIM PID.
- Access the PCM and monitor the IACTRIM and IACKAM2 PIDs.
- Mathematically add and record the value of the IACTRIM PID to the IACKAM2 PID value, for the total IAC value at idle.
- **Is the ETC_TRIM PID angle equal to 3.5 degrees or is the total IAC value greater than 0.5 lb/min?**

Yes	No
INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test.	RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

HU53 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HV: COOLING FAN CLUTCH

WARNING: **To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions may result in personal injury or death.**

NOTE: **Before starting this pinpoint test, turn the clutch fan assembly by hand and check for mechanical binding around the fan shroud or surrounding components. If binding is present, correct the problem then continue with the pinpoint test. If no binding is present, start the engine and warm up to normal operating temperature then continue with the pinpoint test.**

This pinpoint test is intended to diagnose the following:

- cooling fan clutch
- harness circuits: fan speed sensor (FSS), FSS PWRGND, FSS VPWR, fan control variable (FCV), and FCV VPWR
- powertrain control module (PCM) (12A650)

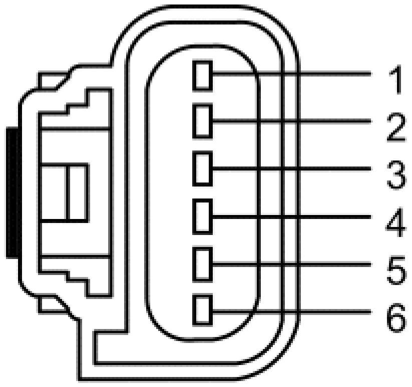

Fig. 143: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - A
Courtesy of FORD MOTOR CO.

Pin	Circuit
4	FSS (Fan Speed Sensor)
5	PWRGND (Power Ground)
2	VBPWR (Vehicle Buffered Power)
3	VPWR (Vehicle Power)
6	FCV (Fan Control Variable)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Pin	Circuit
Expedition, Navigator	B51, B52, B53 B45 B67, B68, B69, B70 B20 B48	VPWR FSS PWRGND VBPWR FCV
F-150	B51, B52, B53 E24 B67, B68, B69, B70 B20 B48	VPWR FSS PWRGND VBPWR FCV
All other vehicles	B35, B36 E24 B47, B48, B49, B50 E20 E7	VPWR FSS PWRGND VBPWR FCV

HV1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0480, P0483 or P0528 present?**

Yes	No
For KOEO and KOER DTC P0480, GO to **HV4**. For KOEO and KOER DTCs P0483 or P0528, GO to **HV2**. For continuous memory DTCs P0480 or P0528, GO to **HV10**.	GO to **HV2**.

HV2 CHECK THE COOLING FAN CLUTCH FOR MECHANICAL BINDING

NOTE: The cooling fan clutch uses a viscous coupling. The viscous drag should be smooth during fan rotation. The amount of resistance is dependent upon the final cooling fan operational state before engine shutdown.

- Key in OFF position.
- Manually rotate the cooling fan.
- **Does the cooling fan clutch rotation feel rough or binding?**

Yes	No
INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HV3**.

HV3 CHECK THE COOLING FAN CLUTCH OPERATION

- Key ON, engine running.
- Set the heater controls to OFF.
- Access the PCM and monitor the FANSS PID.
- **Does the FANSS PID indicate any RPM?**

Yes	No
GO to **HV4**.	GO to **HV11**.

HV4 KOEO AND KOER DTC P0480: CHECK THE COOLING FAN CLUTCH ACTUATOR VALVE SOLENOID RESISTANCE

NOTE: If necessary, install terminal adapters on the component side pins to carry out the resistance measurement.

- Key in OFF position.
- Cooling Fan Clutch connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Component Side	(-) Cooling Fan Clutch Connector, Component Side
FCV - Pin 6	VPWR - Pin 3

- **Is the resistance between 6 - 12 ohms?**

Yes	No
GO to **HV5**.	INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HV5 CHECK THE COOLING FAN CLUTCH ACTUATOR VALVE SOLENOID RESISTANCE

- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Component Side	(-)
FCV - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HV6**.	INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HV6 CHECK THE VPWR VOLTAGE TO THE COOLING FAN CLUTCH ACTUATOR VALVE SOLENOID

- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
VPWR - Pin 3	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HV7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV7 CHECK THE FCV CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
FCV - Pin 6	FCV

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HV8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV8 CHECK THE FCV CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FCV - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HV9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HV9 CHECK THE FCV CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling	

Fan Clutch Connector, Harness Side	(-)
FCV - Pin 6	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **HV19**.

HV10 CONTINUOUS MEMORY DTCS P0480 OR P0528: INTERMITTENT CHECK

NOTE: **Keep the coil arm of the cooling fan clutch secure while checking the wiring harness. If the coil arm rotates, faulty readings may occur.**

- Key ON, engine OFF.
- Access the PCM and monitor the FANSS PID.
- Access the PCM and monitor the FANVAR_F PID.
- While observing the PID wiggle, shake, and bend small sections of the wiring harness while working from the cooling fan clutch to the PCM.
- Check the cooling fan clutch and the PCM connectors for damage and corrosion.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary.	DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HV11 KOEO AND KOER DTC P0528: CHECK THE VOLTAGE AND GROUND TO THE FSS SENSOR

- Cooling Fan Clutch connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) Cooling Fan Clutch Connector, Harness Side
VBPWR - Pin 2	PWRGND - Pin 5

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HV15**.	GO to **HV12**.

HV12 CHECK THE VOLTAGE TO THE FSS SENSOR

- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
VBPWR - Pin 2	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HV14**.	GO to **HV13**.

HV13 CHECK THE VOLTAGE CIRCUIT TO THE FSS SENSOR FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
VBPWR - Pin 2	VBPWR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HV19**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV14 CHECK THE GROUND CIRCUIT TO THE FSS SENSOR FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
PWRGND - Pin 5	PWRGND

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HV19**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV15 CHECK THE FSS CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
FSS - Pin 4	FSS

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HV16**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV16 CHECK THE FSS CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FSS - Pin 4	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No

GO to **HV17**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HV17 CHECK THE FSS CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FSS - Pin 4	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **HV18**.

HV18 CHECK THE FUNCTIONALITY OF THE FSS CIRCUIT

- Key in OFF position.
- PCM connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FSS - Pin 4	Ground

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HV19**.

HV19 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:

- pushed out pins
- corrosion

- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HX: EVAPORATIVE EMISSION (EVAP) SYSTEM AND MONITOR

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: **Before repairing or installing a new component in the fuel system, reduce the possibility of injury or fire by following the warning, caution, and handling directions in pinpoint test HC. Failure to follow these instructions may result in personal injury.**

NOTE: **Use this pinpoint test only when directed here.**

The use of a soap solution around the fuel filler cap or capless fuel tank filler pipe (if equipped) or the use of the hydrocarbon emission analyzer to determine an evaporative emission system leak is not recommended. The mandatory Rotunda Evaporative Emission System Leak Tester for On Board Diagnostic (OBD) (including the ultrasonic tester) and the Rotunda Vacutec 522 Leak Detector Smoke Machine are the only devices to be used at this time for evaporative emission system leak detection.

When using the smoke machine, the fuel level in the fuel tank must be less than 85% full.

This pinpoint test is intended to diagnose the following:

- canister vent (CV) solenoid (9F945)
- fuel filler cap (9030)
- capless fuel tank filler pipe (9034)
- fuel tank pressure (FTP) sensor (9C052)

- EVAP canister purge (EVAPCP) valve (9C915). Also known as the vapor management valve (VMV).
- EVAP system leaks using the Rotunda Vacutec Leak Detector Smoke Machine.
- harness circuits: B+, CV, EVAPCP, FTP, FTPREF, SIGRTN, VPWR, VREF and CASE GND
- powertrain control module (PCM) (12A650)

For additional information on the EVAP system, refer to**EVAPORATIVE EMISSION (EVAP) SYSTEMS** , or the **EVAPORATIVE EMISSIONS -- E-SERIES** .

For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.

HX1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0442, P0443, P0446, P0451, P0452, P0453, P0455, P0456, P0457, P0460, P0461, P0462, P0463, P144A, P1450, P1451, or P260F present?**

Yes	No
For DTCs P0442 or P0456, GO to **HX46**. For DTC P0443, GO to **HX2**. For DTCs P0446 or P1451, GO to **HX30**. For DTC P0451, GO to **HX39**. For DTC P0452, GO to **HX18**. For DTC P0453, GO to **HX23**. For DTCs P0455 or P0457, GO to **HX40**. For DTC P0460, GO to **HX38**. For DTCs P0461 through P0463, GO to **HX36**. For DTC P144A, GO to **HX49**. For DTC P1450, GO to **HX8**. For DTC P260F, GO to **HX50**.	For symptoms without DTCs, GO to **HX13**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HX2 DTC P0443: CHECK THE PCM OUTPUT TO EVAP CANISTER PURGE VALVE

- Key in OFF position.
- EVAPCP Valve connector disconnected.
- Connect a non-powered test lamp between:

(+) EVAPCP Valve Connector, Harness Side	(-) EVAPCP Valve Connector, Harness Side
VPWR - Pin 1	EVAPCP - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .

- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the test lamp turn on and off when the output(s) is commanded on and off?**

Yes	No
GO to **HX3**.	GO to **HX4**.

HX3 CHECK THE EVAP CANISTER PURGE VALVE SOLENOID RESISTANCE

- Key in OFF position.
- EVAPCP Valve connector disconnected.
- Measure the resistance between:

(+) EVAPCP Valve Connector, Component Side	(-) EVAPCP Valve Connector, Component Side
EVAPCP - Pin 2	VPWR - Pin 1

- **Is the resistance between 2.5 - 7 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX4 CHECK THE VPWR VOLTAGE TO THE EVAP CANISTER PURGE VALVE

- Key ON, engine OFF.
- Measure the voltage between:

(+) EVAPCP Valve Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **HX5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX5 CHECK THE EVAP CANISTER PURGE VALVE CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) EVAPCP Valve Connector, Harness Side
EVAPCP	EVAPCP - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HX6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX6 CHECK THE EVAP CANISTER PURGE VALVE CIRCUIT FOR A SHORT TO PWRGND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
EVAPCP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HX7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX7 CHECK THE EVAP CANISTER PURGE VALVE CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) EVAPCP Valve Connector, Harness Side	(-)
EVAPCP - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **HX54**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX8 DTC P1450: CHECK FOR VISUAL CAUSES OF EXCESSIVE FUEL TANK VACUUM

NOTE: **If the CV solenoid and the fuel tank assemblies are not accessible during this step, refer to the EVAPORATIVE EMISSIONS -- E-SERIES and FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES for removal instructions.**

- Check for kinks or bends in the fuel vapor hoses/tubes (EVAPCP outlet tube and EVAP canister tube).
- Visually inspect the EVAP canister inlet port, CV solenoid filter, and canister vent hose assembly for contamination or debris.
- Check the CV solenoid filter for blockage or contamination.
- **Is a concern present?**

Yes	No
REMOVE any contamination or debris around the fuel vapor hose/tubes and CV solenoid assembly. REMOVE kinks or bends in the EVAPCP outlet tube, EVAP canister tube, and canister vent hose assembly. CLEAR the DTCs. For repair verification, CARRY OUT the evaporative emission leak check monitor repair verification drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	GO to **HX9**.

HX9 CHECK THE FTP SENSOR VOLTAGE WITH THE FUEL FILLER CAP REMOVED OR THE CAPLESS FUEL TANK FILLER PIPE OPENED

NOTE: **For vehicles with a capless fuel filler pipe, instead of removing the fuel filler cap, install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.**

- Remove the fuel filler cap.

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage between 2.4 - 2.8 V?**

Yes	No
GO to **HX13**.	GO to **HX10**.

HX10 CHECK FOR ANY OTHER DTCS

- Check for other 3-wire sensor DTCs (KOEO, KOER, or continuous memory) present with the DTC P1450.
- **Are any other DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **HX11**.

HX11 CHECK THE VOLTAGE TO THE FTP SENSOR

- Key in OFF position.
- FTP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	SIGRTN
FTPREF	SIGRTN

- **Are the voltages between 4 - 6 V?**

Yes	No
INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. For repair verification, CARRY OUT the evaporative emission leak check monitor repair	GO to **HX12**.

verification drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	

HX12 CHECK THE FTPREF OR VREF AND SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	VREF
SIGRTN	SIGRTN
FTPREF	FTPREF

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **HX54**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX13 CHECK IF THE ENGINE IDLES

- Key ON, engine running.
- **Does the engine stall or is it unable to maintain idle?**

Yes	No
GO to **HX14**.	GO to **HX15**.

HX14 CHECK THE EVAP SYSTEM FOR A STUCK OPEN VALVE

- Key in OFF position.
- Disconnect the fuel vapor to intake manifold line at the EVAPCP valve and cap the line at the EVAPCP valve.
- Key ON, engine running.
- **Does the engine stall or is it unable to maintain idle?**

Yes	No
The EVAP system is not the cause of the symptom. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX15 CHECK FOR BLOCKAGE IN THE FUEL TANK VENT SYSTEM

NOTE: The CV is normally open and venting to the atmosphere.

- Access the PCM and monitor the EVMV PID.
- Access the PCM and monitor the FTP PID.
- Access the PCM and monitor the EVAPCV PID.
- While monitoring the FTP PID, ramp open the EVAPCP valve by incrementally commanding the EVMV PID to a 1,000 mA.
- **Does the FTP sensor voltage drop below 2 volts when the EVAPCP valve is commanded fully open?**

Yes	No
CHECK for blockage in the vapor line to the CV solenoid. CHECK the CV solenoid filter for blockage or contamination. CHECK the carbon canister for blockage. If OK, INSTALL a new CV solenoid. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HX16**.

HX16 CHECK THE EVAP SYSTEM FOR A STUCK OPEN VALVE

- Key ON, engine running.
- Access the PCM and control the EVMV PID.
- Close the EVAPCP by commanding the EVMV PID to 0 mA.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- **Does the FTPV PID decrease, the engine RPM change, or the engine stall, as an indication that the EVAPCP valve is stuck open?**

Yes	No
INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **HX17**.

HX17 EVAP CANISTER PURGE VALVE TEST

- Key ON, engine running.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- Access the PCM and control the EVMV PID.
- While monitoring the FTP PID, ramp open the EVAPCP valve by incrementally commanding the EVMV

PID to a 1,000 mA.

- **Does the FTP PID decrease, the engine RPM change, or the engine stall as an indication that the EVAPCP valve is opening?**

Yes	No
For DTC P1450, unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**. For all others, CHECK the EVAP system for leaks.	CHECK for blockages between the fuel tank, the EVAPCP valve, and the engine intake manifold. CHECK for obstructions in the EVAPCP valve diaphragm and ports. If OK, INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX18 DTC P0452: CHECK FOR FUEL TANK PRESSURE SENSOR CONNECTOR CONTAMINATION

- Key in OFF position.
- Visually check for liquid fuel contamination of the FTP sensor electrical connector.
- Check for a completely submerged FTP sensor (tank-mounted type only) in the liquid fuel. This can affect the correct FTP voltage reading.
- **Does the FTP sensor and its connector show any signs of fuel contamination?**

Yes	No
REPAIR as necessary. ADJUST the fuel tank overfill. CLEAR the DTCs. REPEAT the self-test.	GO to **HX19**.

HX19 CHECK FOR LOW FTP SENSOR VOLTAGE

NOTE: The FTP sensor voltage with no pressure/vacuum on the fuel tank is between 2.4 and 2.8 volts.

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage less than 0.22 V?**

Yes	No
GO to **HX20**.	The concern that produced the DTC P0452 is intermittent. refer to **PINPOINT TEST Z**.

HX20 CHECK THE OPPOSITE INDUCED HIGH FTP SENSOR SIGNAL

- Key in OFF position.
- FTP Sensor connector disconnected.

- Connect a 5 amp fused jumper wire between the following:

Point A FTP Sensor Connector, Harness Side	Point B FTP Sensor Connector, Harness Side
VREF	FTP

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage between 4 - 6 V?**

Yes	No
INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. REPEAT the self-test.	GO to **HX21**.

HX21 CHECK THE VREF VOLTAGE TO THE FTP SENSOR

- Remove the jumper wire(s).
- Key ON, engine OFF.
- Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to **HX22**.	refer to **PINPOINT TEST C**.

HX22 CHECK THE FTP CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM	(-) PCM

Connector, Harness Side	Connector, Harness Side
FTP	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
FTP	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HX54**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX23 DTC P0453: CHECK FOR HIGH FTP SENSOR VOLTAGE

NOTE: **The FTP sensor voltage with no pressure/vacuum on the fuel tank is between 2.4 and 2.8 volts.**

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage greater than 4.5 V?**

Yes	No
GO to **HX24**.	The concern that produced the DTC P0453 is intermittent. refer to **PINPOINT TEST Z**.

HX24 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE FTP SENSOR VEHICLE HARNESS CONNECTOR

- Key in OFF position.
- FTP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FTP Sensor Connector,	(-) FTP Sensor Connector,

Harness Side	Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to **HX25**.	refer to **PINPOINT TEST C**.

HX25 CHECK THE FTP CIRCUIT FOR A SHORT TO VOLTAGE

- Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) Vehicle Battery
FTP	Negative terminal

- **Is the voltage less than 10 V?**

Yes	No
GO to **HX27**.	GO to **HX26**.

HX26 CHECK THE FTP CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
FTP	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **HX54**.

HX27 CHECK THE FTP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
FTP	FTP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HX28**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX28 CHECK THE FTP CIRCUIT FOR A SHORT TO VREF

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	FTP

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HX29**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX29 CHECK THE OPPOSITE INDUCED LOW FTP SIGNAL

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A FTP Sensor Connector, Harness Side	Point B FTP Sensor Connector, Harness Side
FTP	SIGRTN

- Key ON, engine OFF.

- Access the PCM and monitor the FTP PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. REPEAT the self-test.	GO to **HX54**.

HX30 DTCS P0446 OR P1451: CHECK THE PCM OUTPUT TO THE CV SOLENOID

NOTE: **For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.**

- Key in OFF position.
- CV Solenoid connector disconnected.
- Connect a non-powered test lamp between:

(+) CV Solenoid Connector, Harness Side	(-) CV Solenoid Connector, Harness Side
VPWR	CANV
KAPWR	CANV

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the test lamp turn on and off when the output(s) is commanded on and off?**

Yes	No
GO to **HX31**.	GO to **HX32**.

HX31 CHECK THE CV SOLENOID RESISTANCE

NOTE: **For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.**

- Key in OFF position.

- Measure the resistance between:

(+) CV Solenoid Connector, Component Side	(-) CV Solenoid Connector, Component Side
KAPWR	CANV
VPWR	CANV

- **Are the resistances between 48 - 65 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	INSTALL a new CV solenoid. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX32 CHECK THE VPWR VOLTAGE TO THE CV SOLENOID

NOTE: For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.

- Measure the voltage between:

(+) CV Solenoid Connector, Harness Side	(-)
KAPWR	Ground
VPWR	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to **HX33**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX33 CHECK THE CANV CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CV Solenoid Connector, Harness Side
CANV	CANV

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **HX34**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX34 CHECK THE CANV CIRCUIT FOR A SHORT TO PWRGND IN THE HARNESS

- Measure the resistance between:

(+) CV Solenoid Connector, Harness Side	(-) Vehicle Battery
CANV	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **HX35**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX35 CHECK THE CANV CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) CV Solenoid Connector, Harness Side	(-)
CANV	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **HX54**.	REPAIR the short circuit. CLEAR the DTCs.

	REPEAT the self-test.

HX36 DTCS P0461, P0462 AND P0463: CHECK THE INSTRUMENT CLUSTER (IC) MODULE FOR DTCS

- Key ON, engine OFF.
- Carry out the IC self-test.
- **Are any DTCs present?**

Yes	No
REFER to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to continue diagnosis.	GO to **HX37**.

HX37 CHECK THE FLI PID

- Key ON, engine running.
- Access the PCM and monitor the FLI PID.
- **Does the FLI PID match the fuel gauge?**

Yes	No
GO to **HX38**.	GO to **HX54**.

HX38 DTC P0460: CHECK FOR FUEL TANK FLOAT LEVEL RESPONSE

NOTE: **A dual-container (saddle type) fuel tank has 2 fuel level sensors. The FLI PID in the PCM is the average value of both fuel level sensors. Some dual-container tanks may require the fuel level to be greater 3/4 full before the fuel level equalizes.**

- Key ON, engine running.
- Access the PCM and monitor the FLI PID.
- Key in OFF position.
- If the fuel level is less than 1/4 (25% on FLI), add approximately 1/4 tank of fuel.
- If the fuel level is greater than 3/4 (75% on FLI), drain approximately 1/4 tank of fuel.
- Key ON, engine running.
- Access the PCM and monitor the FLI PID.
- **Does the FLI PID indicate a movement upward or downward as fuel is either added or drained?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	REFER to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect fuel gauge indication

	symptom.

HX39 DTC P0451: CHECK THE FTP SENSOR FOR CORRECT OPERATION

NOTE: For vehicles with a capless fuel filler pipe, instead of removing the fuel filler cap, install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.

- Key in OFF position.
- Remove the fuel filler cap.
- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the pressure between -0.42 and 0.42 kPa (-1.7 and 1.7 in-H2O)?**

Yes	No
CHECK for kinks or bends in the fuel vapor hoses/tubes between the fuel tank and dust separator. CHECK the EVAP canister ports and canister vent hose assembly for contamination or debris. CHECK the dust separator for blockage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. REPEAT the self-test.

HX40 DTCS P0455 OR P0457: CHECK THE FUEL FILLER CAP OF CAPLESS FUEL TANK FILLER PIPE

NOTE: If the fuel filler cap or capless fuel tank filler pipe is suspected as an EVAP leak source during visual inspection, do not disturb the fuel filler cap or capless fuel tank filler pipe until the repair verification method is complete. If the repair verification method fails, reposition or install a new fuel filler cap and repeat the test. For vehicles with a capless fuel tank filler pipe, install and remove the supplemental refueling adaptor provided with the vehicle to reseal the capless fuel tank filler pipe and repeat the test. This action isolates the fuel filler cap or capless fuel tank filler pipe from the rest of the EVAP system as a potential concern.

- For vehicles with a fuel filler cap, visually inspect the fuel filler cap without initially disturbing it.
  - Verify the fuel filler cap tether is visible and free to move.
  - Check for missing or loose fuel filler cap.
  - Check the fuel filler cap for damage.
- For vehicles with a capless fuel tank filler pipe, visually inspect the capless fuel tank filler pipe inlet without initially disturbing it.
  - Check the capless fuel tank filler pipe inlet for an obstruction that prevents it from sealing.
  - Check the capless fuel tank filler pipe for damage.

- **Is a concern present?**

Yes	No
For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. REPAIR as necessary. GO to **HX46**.	GO to **HX41**.

HX41 CHECK FOR FLI DTCS

- Key ON, engine OFF.
- Carry out the self-test.
- **Are DTCs P0460, P0461, P0462 or P0463 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **HX42**.

HX42 CHECK THE OPERATION OF THE FUEL GAUGE

NOTE: A fuel gauge that always indicates a fuel level less than a 1/2 tank or always a full tank, may be caused by a fuel level input (FLI) concern.

- Check operation of the fuel gauge.
- **Is the fuel gauge functioning properly?**

Yes	No
GO to **HX43**.	CHECK the functionality of the FLI circuit. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

HX43 EVAPORATIVE EMISSION SYSTEM VISUAL INSPECTION

- Key in OFF position.
- Visually inspect for:
  - EVAP system lines/hoses (check for proper connections, damage or blockage)
  - loose fuel vapor hose/tube connections to the EVAP system components
  - blocked vacuum hose between the EVAPCP valve and the engine intake manifold
  - damaged fuel tank or fuel filler pipe
- **Are there any concerns found during the visual inspection?**

Yes	No
REPAIR as necessary. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to **HX46**.	GO to **HX44**.

HX44 CHECK THE FTP SENSOR VOLTAGE WITH THE FUEL FILLER CAP REMOVED OR THE CAPLESS FUEL TANK FILLER PIPE OPENED

NOTE: For vehicles with a capless fuel filler pipe, instead of removing the fuel filler cap, install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.

- Remove the fuel filler cap.
- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage between 2.4 - 2.8 V?**

Yes	No
GO to **HX45**.	INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. REPEAT the test and VERIFY the results. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to **HX46**.

HX45 EVAP CANISTER PURGE VALVE TEST

- Key in OFF position.
- Install the fuel filler cap or remove the supplemental refueling adaptor.
- Key ON, engine running.
- Access the PCM and monitor the EVAPCV PID.
- Access the PCM and monitor the EVMV PID.
- Access the PCM and monitor the FTP PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- While monitoring the FTP PID, ramp open the EVAPCP valve by incrementally commanding the EVMV PID to a 1,000 mA.
- **Does the FTP PID decrease, the engine RPM change, or the engine stall as an indication that the EVAPCP valve is opening?**

Yes	No
GO to **HX46**.	INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . REPEAT the test and VERIFY the results. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to **HX46**.

HX46 DTCS P0442 OR P0456: HOOK UP THE SMOKE MACHINE (ROTUNDA VACUTEC)

NOTE: Removing the Schrader valve from the test port permanently damages the valve.

NOTE: The smoke and air flow from the smoke machine will not pass through liquid fuel. Liquid fuel may be present in the fuel tank filler pipe.

NOTE: Some vehicles are not equipped with an evaporative emission test port. Use a suitable hose adapter in the following diagnostic procedures.

- Key in OFF position.
- Connect the smoke machine power cables to the vehicle battery. Check to see that the smoke machine power indicator lamp is on, indicating a good battery contact.
- For vehicles not equipped with an evaporative emission test port:
  - Disconnect the fuel vapor to intake manifold line at the EVAPCP valve and cap the line.
  - Connect a suitable hose adapter to the fuel vapor to intake manifold connection at the EVAPCP valve.
- For vehicles equipped with an evaporative emission test port:
  - Locate the evaporative emission test port and remove the green cap. The cap is located on or close to the EVAPCP valve.
  - Install the EVAP test port adapter (provided with the Vacutec Smoke Machine) to the test port.
- **Is the smoke machine hook up complete?**

Yes	No
For leak detection, GO to **HX47**. For leak repair verification, GO to **HX48**.	REFER to the smoke machine operator article for additional instructions and for helpful tips.

HX47 CARRY OUT SMOKE MACHINE PHASE 2 - LEAK DETECTION SMOKE TEST

NOTE: If the leak is not detected from the top, check the EVAP system for leaks from under the vehicle.

- **Check the EVAP hoses, EVAPCP valve, CV solenoid, EVAP canister, fuel**

tank, fuel filler pipe, around the fuel tank area, and at the fuel filler cap or capless fuel tank filler pipe inlet.

- **Wiggle the components and connections to simulate road bumps while looking for signs of leaking smoke.**

If the leak is in the fuel tank filler pipe between the check valve and the fuel filler cap or capless fuel tank filler pipe inlet, smoke under pressure may not reach the leak. If leaking smoke is not found, a thorough visual inspection of the fuel tank filler pipe and fuel filler cap or capless fuel tank filler pipe inlet should be done.

- Set the smoke machine to SMOKE.
- Remove the fuel filler cap or install the supplemental refueling adaptor.
- Connect the smoke supply hose nozzle tip into the EVAP service port or suitable hose adapter.
- Key ON, engine OFF.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- For vehicles not equipped with an evaporative emission test port:
  - Start the smoke machine and verify the connection at the EVAPCP valve is correct and not leaking
  - Open the EVAPCP valve by commanding the EVMV PID to 1,000 mA
- Start the smoke machine. If smoke does not exit the fuel tank filler pipe after the system is pressurized, command the EVAPCV PID open to allow air to purge the CV solenoid. Once smoke is seen at the CV solenoid, command the EVAPCV PID close.
  - Install the fuel filler cap or remove the supplemental refueling adaptor once smoke is observed exiting the fuel tank neck area.
  - Continue to smoke the system for 60 seconds to obtain pressure.
  - Press and release the remote starter button in intervals of approximately 15 seconds on and 15 seconds off while checking for exiting smoke.
  - Use the halogen spotlight provided with the smoke machine to follow the EVAP system path and look for smoke exiting at the source of the leak(s).
- **Is the source of the EVAP leak located?**

Yes	No
REPAIR as necessary. CONNECT all the disconnected components. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to **HX48**.	The test passed. CONNECT all the disconnected components. CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to **HX48**.

HX48 CARRY OUT THE SMOKE MACHINE PHASE 1 - LEAK VERIFICATION PRESSURE TEST

- Position the control lever located on the smoke machine to METER.
- Calibrate the smoke machine flow meter using the 0.020 (DTC P0456) or 0.040 (DTC P0442) standard as follows:
  - Insert the air supply hose (transparent hose) nozzle tip into the appropriate EVAP system standard located on the front of the smoke machine.
  - Press the remote starter button on the smoke machine. Observe the position of the flow meter indicator ball.
  - Position the flow meter red pointer flag so that it aligns with the measurement of the indicator ball.
  - Release the button and remove the air supply hose nozzle tip from the EVAP system standard.
- Connect the air supply hose (transparent hose) nozzle tip into the EVAP test port or suitable hose adapter.
- Key ON, engine OFF.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- For vehicles not equipped with an evaporative emission test port, open the EVAPCP valve by commanding the EVMV PID to 1,000 mA.
- Press the remote starter button on the smoke machine. Notice that the ball in the flow meter is all the way at the top. This indicates the system is being pressurized.
- Continue to press the remote starter button until the ball stops descending. Once the ball stops descending, observe if it is above or below the red pointer flag. If the measurement is below the indicator flag, the system has passed the pressure test. If the measurement is above the indicator flag, the EVAP system has an unacceptable leak.
- **Does the EVAP system pass the smoke machine leak verification pressure test?**

Yes	No
The test passed and no concerns are present. CLEAR the DTCs. REPEAT the self-test.	GO to **HX47**.

HX49 DTC P144A: CHECK FOR A BLOCKED FUEL VAPOR TUBE BETWEEN THE FTP SENSOR AND THE FUEL TANK

- Key in OFF position.
- Remove the fuel vapor tube assembly. Refer to the **EVAPORATIVE EMISSIONS -- E-SERIES** .
- Visually inspect the fuel vapor tube for a blockage between the FTP sensor and the connection to the fuel tank or fuel pump module.
- Visually inspect the connection at the fuel tank or fuel pump module for a blockage.
- Attempt to manually remove the blockage.
- **Is the blockage visible and can be removed?**

Yes	No
REMOVE the blockage. INSTALL the Fuel Vapor Tube assembly. REFER to the **EVAPORATIVE**	INSTALL a new Fuel Vapor Tube assembly. REFER to the **EVAPORATIVE EMISSIONS --**

EMISSIONS -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.	**E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX50 DTC P260F: CHECK FOR THE PRESENCE OF ANY MODULE COMMUNICATION CONCERNS

- Key ON, engine OFF.
- Check for self-test DTCs in all of the vehicle modules.
- **Are any communication concerns or communication DTCs present?**

Yes	No
For communication concerns in the PCM, DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** . For communication concerns in other modules, REFER to the applicable Workshop article part to diagnose the communication DTC.	GO to **HX51**.

HX51 CHECK THE PERFORMANCE OF THE PROCESSOR

- Key in OFF position.
- Disconnect the battery and wait for 1 minute. Refer to the **BATTERY, MOUNTING AND CABLES -- E-SERIES** .
- Connect the battery.
- Key ON, engine running.
- Allow the engine idle to stabilize.
- Access the PCM and monitor the FTP PID.
- **Is the pressure equal to 0 kPa (0 psi)?**

Yes	No
GO to **HX53**.	GO to **HX52**.

HX52 CHECK FOR SELF-TEST DTC P260F

- Idle the engine for 2 minutes.
- Carry out the self-test.
- **Is DTC P260F present?**

Yes	No
GO to **HX53**.	RETURN the vehicle to the customer.

HX53 CHECK THE PCM FOR THE LATEST CALIBRATION

- Program the PCM to the latest calibration.
- Key ON, engine running.
- Idle the engine for 2 minutes.
- Carry out the self-test.
- **Is DTC P260F present?**

Yes	No
GO to **HX54**.	RETURN the vehicle to the customer.

HX54 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HY: GENERATOR/REGULATOR SYSTEM

This pinpoint test is intended to diagnose the following:

- generator/regulator (10346)
- powertrain control module (PCM) (12A650)

HY1 CHECK THE GENERATOR CIRCUITRY AND OPERATION

NOTE: If the concern is still present after checking the generator circuitry in the workshop article, return to the PC/ED to continue generator diagnosis.

- Check for any generator related DTCs. Refer to the **GENERATOR AND REGULATOR -- E-SERIES** to diagnose any generator related DTCs.
- **Is the charging system diagnosed and repaired in the GENERATOR AND REGULATOR -- E-SERIES ?**

Yes	No
The system is operating correctly at this time.	GO to **HY2**.

HY2 CHECK THE GENERATOR MONITOR SIGNAL

- Key ON, engine running.
- Access the PCM and monitor the GENMON PID.
- **Is the duty cycle between 5% and 97% and not excessively fluctuating?**

Yes	No
The system is operating correctly at this time.	GO to **HY3**.

HY3 CHECK FOR CORRECT PCM OPERATION

NOTE: **When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.**

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

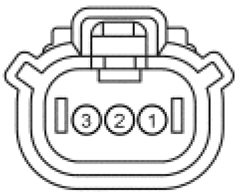
Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JB: SECONDARY IGNITION (COP)

NOTE: **A malfunctioning ignition system may cause high catalyst temperatures. Check the components next to the catalyst and muffler for heat damage.**

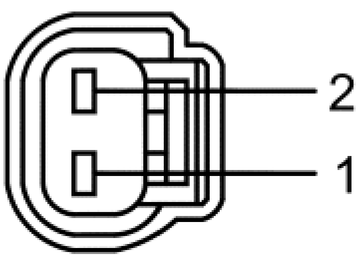
This pinpoint test is intended to diagnose the following:

- spark plugs (12405)
- secondary side of the coil



N0073029

Fig. 149: Coil On Plug (COP) Connector - A
Courtesy of FORD MOTOR CO.



A0077505

Fig. 150: Coil On Plug (COP) Connector - B
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Edge, MKX, MKZ, Taurus, Taurus X, Sable	A	3	IGN START/RUN
Escape/Mariner, Focus, Fusion, Milan, Mustang 5.4L	B	2	IGN START/RUN
All other vehicles	B	1	IGN START/RUN

Vehicle	Firing Order for Coil On Plug Applications

BASE, 4-cylinder applications	1 3 4 2
BASE, 6-cylinder applications	1 4 2 5 3 6
BASE, 8-cylinder applications	1 3 7 2 6 5 4 8
BASE, 10-cylinder applications	1 6 5 10 2 7 3 8 4 9

JB1 CHECK FOR DTCS

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310, or P050B present?**

Yes	No
For DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310 or P0316, GO to **JB3**. For DTC P050B, GO to **JB13**.	For symptoms without DTCs, GO to **JB2**. For all other DTCs, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

JB2 VISUAL INSPECTION OF THE IGNITION SYSTEM

- Visually inspect the engine compartment to make sure all coils are properly and securely connected.
- Examine all the wiring harnesses and connectors for damaged, burned, or overheated insulation, and loose or broken conditions.
- Make sure the vehicle battery is in good condition and all of the accessories are turned off.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **JB3**.

JB3 DTC P0301 THROUGH P0310: MISFIRE ON CYLINDERS 1 THROUGH 10

- **Are DTCs P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, or P0310 present?**

Yes	No
For Edge, Escape/Mariner 3.0L, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 4.6L, F-150 5.4L, Fusion, Milan, MKX, Sable, Taurus, and	GO to **JB6**.

Taurus X, GO to **JB4**. For all others, GO to **JB5**.	

JB4 CHECK SPARK DURATION RELATIVENESS

- Monitor the spark duration PIDs.
- **Are the PIDs relative to each other?**

Yes	No
GO to **JB10**.	INSPECT the coil boot(s) for the missing cylinder (s). INSTALL a new coil boot(s) if necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** , Spark Plugs, and INSPECT the spark plug(s) for the missing cylinder (s). MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 ohms or higher than 20,000 ohms. If the coil boot(s) and spark plugs are OK, INSTALL a new COP(s) for the missing cylinders. CLEAR the DTCs. REPEAT the self-test.

JB5 CHECK FOR SPARK AT THE CYLINDER(S) INDICATED BY THE DTC(S)

- Key in OFF position.
- Disconnect the ignition coil(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to the suspect coil.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester while cranking the engine.
- **Is a bluish-white spark present?**

Yes	No
GO to **JB8**.	INSPECT the coil boot(s) for the missing cylinder (s). INSTALL a new coil boot(s) if necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** , Spark Plugs, and INSPECT the spark plug(s) for the missing cylinder (s). MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 ohms or higher than 20,000 ohms. GO to JB7.

JB6 CHECK FOR SPARK AT ALL CYLINDERS

- Key in OFF position.

- Disconnect the ignition coil(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to the suspect coil.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester at each cylinder while cranking the engine.
- **Is a bluish-white spark consistent between all cylinders?**

Yes	No
GO to **JB8**.	INSPECT the coil boot(s) for the missing cylinder (s). INSTALL a new coil boot(s) if necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** , Spark Plugs, and INSPECT the spark plug(s) for the missing cylinder (s). MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 ohms or higher than 20,000 ohms. RECORD the cylinder(s) with inconsistent spark. GO to **JB7**.

JB7 CHECK THE SECONDARY COIL RESISTANCE FOR THE MISSING CYLINDERS

- Key in OFF position.
- Suspect coil connector disconnected.
- Measure resistance between: Suspect coil connector, IGN START/RUN, component side and ignition coil spring, located in the ignition coil boot.
- **Is the resistance between 5,000 and 6,000 ohms?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new COP. CLEAR the DTCs. REPEAT the self-test.

JB8 CHECK THE SPARK PLUGS

NOTE: To determine the condition of the spark plugs, refer to the ENGINE - 4.6L AND 5.4L -- E-SERIES and carry out the Spark Plug Inspection.

- Key in OFF position.
- Remove and inspect the plugs for damage, wear, carbon tracking or deposits and proper plug gap.
- **Are the plugs OK?**

Yes	No
GO to **JB9**.	REPAIR the plug(s). ADJUST the gap or INSTALL a new spark plug(s) as necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V)**

	-- E-SERIES . CLEAR the DTCs. REPEAT the self-test.

JB9 CHECK THE SPARK PLUG RESISTANCE

- Measure the spark plug resistance.
- **Is the resistance between 2,000 and 20,000 ohms?**

Yes	No
For Edge, Escape/Mariner 3.0L, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 4.6L, F-150 5.4L, Fusion, Milan, MKX, Sable, Taurus, and Taurus X, GO to **JB14**. For all others, GO to **JB10**.	INSTALL a new spark plug. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JB10 TEST DIRECTION FOR SYMPTOM CHARTS

- **Were you directed to this pinpoint test?**

Yes	No
RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to **JB11**.

JB11 TEST DIRECTION FOR PINPOINT TEST HD

- **Were you directed to this pinpoint test from pinpoint test step HD6?**

Yes	No
GO to **HD7**.	GO to **JB12**.

JB12 TEST DIRECTION FOR PINPOINT TEST A

- **Were you directed to this pinpoint test from pinpoint test step A8?**

Yes	No
GO to **A9**.	The concern is intermittent. refer to **PINPOINT TEST Z**.

JB13 DTC P050B: COLD START PERFORMANCE

- **Are any other codes besides P050B present?**

Yes	No
REPAIR all other powertrain related diagnostic trouble codes (DTCs) first.	GO to **JB14**.

JB14 CHECK THE SPARK CAPTURE CIRCUIT

- Access the PCM and monitor the IGNPCM_F PID.
- **Is a concern indicated?**

Yes	No
GO to **JB16**.	GO to **JB15**.

JB15 CHECK THE IGNITION TIMING PID

- Access the PCM and monitor the IGNX_F PIDs.
- **Is a concern indicated?**

Yes	No
Visually inspect the COP harness for damage, exposed wiring, water contamination, corrosion, and correct assembly. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **JB16**.

JB16 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JC: SECONDARY IGNITION (COIL PACK)

This pinpoint test is intended to diagnose the following:

- spark plugs (12405)
- spark plug wires (12280, 12281)

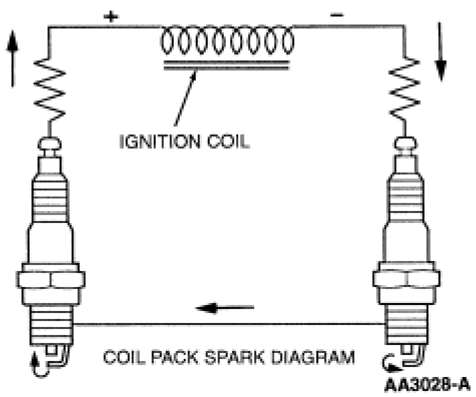


Fig. 151: Coil Pack Spark Diagram
Courtesy of FORD MOTOR CO.

Explorer 4.0L, Explorer Sport Trac 4.0L, F150 4.2L, Mountaineer 4.0L, Mustang 4.0L, Ranger.

JC1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306 or P050B present?**

Yes	No
For DTCs P0301, P0302, P0303, P0304, P0305 or P0306, GO to **JC13**. For DTC P0300, GO to **JC2**. For DTC P050B, GO to **JC18**.	For all other DTCs, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

JC2 VISUAL INSPECTION OF THE IGNITION SYSTEM

- Visually inspect the engine compartment to make sure all coils and spark plug wires are properly and securely connected.
- Examine all wiring harnesses and connectors for damaged, burned or overheated insulation and loose or broken conditions.
- Make sure the vehicle battery is in good condition and all accessories are turned off.
- **Is a concern present?**

Yes	No
REPAIR as necessary.	For a coil pack using an engine analyzer, GO to **JC3**.

CLEAR the DTCs. REPEAT the self-test.	For a coil pack not using an engine analyzer, GO to **JC12**.

JC3 CONNECT THE ENGINE ANALYZER

- Obtain an engine analyzer to diagnose concerns in the secondary side of the ignition system.
- **Is the engine analyzer connected?**

Yes	No
GO to **JC4**.	REPEAT Step JC2.

JC4 CHECK FOR THE IGNITION PATTERN

- Observe the pattern on a scope while cranking the engine.

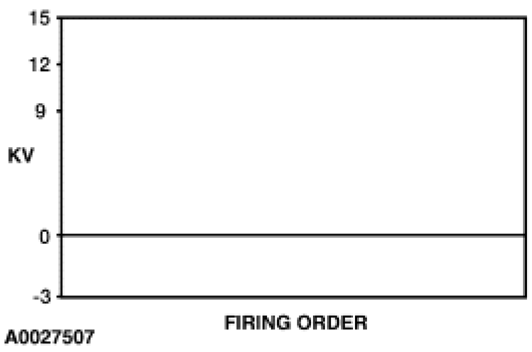

Fig. 152: Ignition Firing Pattern (No Spark)
Courtesy of FORD MOTOR CO.

- **Is the pattern flat, which indicates no spark on all cylinders?**

Yes	No
An IGN/START/RUN circuit concern. CHECK the condition of the related fuses/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the IGN START/RUN circuit for a short to ground. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **JC5**.

JC5 CHECK FOR A NORMAL IGNITION PATTERN

NOTE: Spark plugs may be fired more than once per combustion event. Multi-strike operating mode is RPM dependent.

- Key ON, engine running. If no start, crank the engine.

Fig. 153: Normal Ignition Firing Pattern
Courtesy of FORD MOTOR CO.

- **Are the patterns even and is the average value of spark plug firing voltage between 9 kV and 15 kV (higher during engine crank/no start)?**

Yes	No
refer to **PINPOINT TEST Z**.	GO to **JC6**.

JC6 IGNITION PATTERN EVALUATION

- **Is the ignition pattern normal?**

Yes	No
GO to **JC7**.	GO to **JC8**.

JC7 TEST DIRECTION

- **Were you directed to this pinpoint test from pinpoint test step A8?**

Yes	No
GO to **A9**.	GO to **JC8**.

JC8 CHECK FOR MISSING SPARK PATTERNS

- Observe for missing spark pattern.

Fig. 154: Identifying Missing Spark Pattern
Courtesy of FORD MOTOR CO.

- **Is the spark pattern inconsistent?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test. GO to **JE2**.	GO to **JC9**.

JC9 CHECK FOR A HIGH SPARK PLUG FIRING VOLTAGE

- Observe for a high spark plug firing voltage.

Fig. 155: Identifying High Spark Plug Firing Voltage
Courtesy of FORD MOTOR CO.

- **Is the average value of the spark plug firing voltage greater than 15 Kv?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark	

plug wires. INSTALL a new spark plug wire if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **JC10**.

JC10 CHECK FOR LOW SPARK PLUG FIRING VOLTAGE

- Check the spark plug firing voltage average pattern.

Fig. 156: Identifying Low Spark Plug Firing Voltage Pattern
Courtesy of FORD MOTOR CO.

- **Is there consistently low spark plug firing voltage or sloping spark line on one or more cylinders?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). MEASURE the resistance of the spark plug (s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 or higher than 20,000 ohms. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **JC11**.

JC11 CHECK FOR EVENESS BETWEEN CYLINDERS

- Check the spark plug firing voltage average pattern.

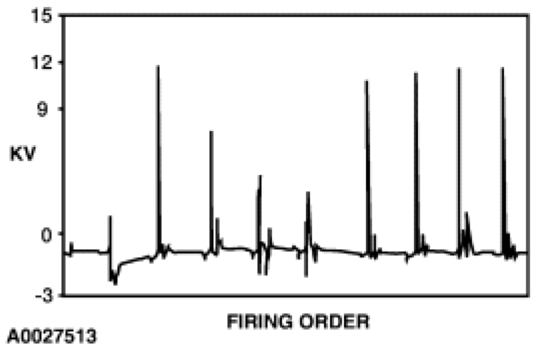

Fig. 157: Identifying Unevenness Between Cylinders Pattern
Courtesy of FORD MOTOR CO.

- **Is the evenness of spark plug firing voltage greater than 6 kV?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). CHECK for damaged spark plugs or narrow spark plug gaps. MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 or higher than 20,000 ohms. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

JC12 DTCS P0301 THROUGH P0306: MISFIRE ON CYLINDERS 1 THROUGH 6

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, or P0306 present?**

Yes	No
GO to **JC13**.	GO to **JC14**.

JC13 CHECK FOR SPARK AT THE CYLINDER(S) INDICATED BY THE DTC(S)

- Key in OFF position.
- Disconnect the spark plug wire(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to a spark plug wire.
- Crank the engine while the accelerator pedal is fully applied.
- Check for spark while cranking the engine.
- **Is the bluish-white spark present?**

Yes	No

GO to **JC16**.	INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire(s) if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . If the spark plug wires are OK, GO to **JC15**.

JC14 CHECK FOR SPARK AT ALL CYLINDERS

- Key in OFF position.
- Disconnect the spark plug wire(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to a spark plug wire.
- Crank the engine while the accelerator pedal is fully applied.
- Check for spark while cranking the engine.
- **Is the bluish-white spark present?**

Yes	No
GO to **JC16**.	INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire(s), if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . If the spark plug wires are OK, GO to **JC15**.

JC15 CHECK THE SECONDARY COIL RESISTANCE FOR THE MISSING CYLINDERS

NOTE: **Two adjacent coil towers share a common coil and are called a matched pair. For 6-tower coil pack (6 cylinder) applications, the matched pairs are 1 and 5, 2 and 6, and 3 and 4. For Mustang the matched pairs are 1 and 4, 2 and 5, and 3 and 6. For 4-tower coil pack (4 cylinder) applications, the matched pairs are 1 and 4, and 2 and 3.**

- Key in OFF position.
- Ignition coil pack disconnected.
- Disconnect spark plug wires from the coil pack.
- Measure the resistance of each matched pair.
- **Is the resistance between 9,500 and 15,500 ohms?**

Yes	No

refer to **PINPOINT TEST Z**.	INSTALL a new ignition coil pack. CLEAR the DTCs. REPEAT the self-test.

JC16 CHECK THE SPARK PLUGS

- Key in OFF position.
- Check for damaged spark plugs or narrow spark plug gaps.
- **Are the plugs OK?**

Yes	No
GO to **JC17**.	REPAIR the spark plug(s). ADJUST the gap or INSTALL a new spark plug(s) as necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JC17 CHECK THE SPARK PLUG RESISTANCE

- Measure the spark plug resistance.
- **Is the resistance between 2,000 and 20,000 ohms?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new spark plug(s). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JC18 DTC P050B: COLD START PERFORMANCE

- **Are any other codes besides P050B present?**

Yes	No
REPAIR all other powertrain related diagnostic trouble codes (DTCs) first.	GO to **JC19**.

JC19 CHECK THE SPARK CAPTURE CIRCUIT

- Access the PCM and monitor the IGNPCM_F PID.
- **Is a concern indicated?**

Yes	No
GO to **JC21**.	GO to **JC20**.

JC20 CHECK THE IGNITION TIMING PID

- Access the PCM and monitor the IGNX_F PIDs.
- **Is a concern indicated?**

Yes	No
Visually inspect the coil pack harness for damage, exposed wiring, water contamination, corrosion, and correct assembly. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **JC21**.

JC21 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JD: CRANKSHAFT POSITION (CKP) SENSOR

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- crankshaft position (CKP) sensor (6C315)
- harness circuits: CKP(+) and CKP(-)
- powertrain control module (PCM) (12A650)

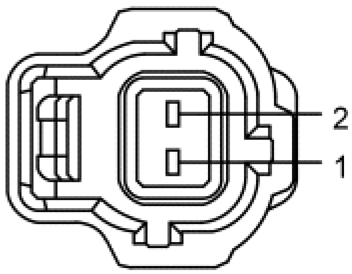

Fig. 158: Crankshaft Position (CKP) Sensor Connector - A
Courtesy of FORD MOTOR CO.

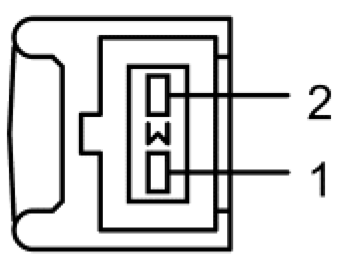

Fig. 159: Crankshaft Position (CKP) Sensor Connector - B
Courtesy of FORD MOTOR CO.

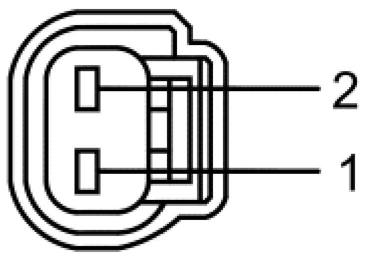

Fig. 160: Crankshaft Position (CKP) Sensor Connector - C
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Escape/Mariner 2.3L, Focus, Fusion 2.3L, Milan 2.3L, Ranger 2.3L	A	2 1	CKP- CKP+
Explorer 4.0L, Explorer Sport Trac 4.0L, Mountaineer 4.0L, Mustang 4.0L, Ranger 4.0L	B	2 1	CKP- CKP+
All other vehicles	C	1 2	CKP- CKP+

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, F-150, Mark LT, MKX, Sable, Taurus, Taurus X	190 Pin	E47 E46	CKP+ CKP-
Escape/Mariner	150 (50-50-50) Pin	E34 E45	CKP+ CKP-
Expedition,	140 Pin	E47	CKP+

Fusion, Milan, MKZ, Navigator		E46	CKP-
Focus	190 Pin	E58 E42	CKP+ CKP-
All other vehicles	170 Pin	E47 E46	CKP+ CKP-

JD1 CHECK THE CKP SENSOR SIGNAL SENT TO THE PCM

NOTE: The battery should be fully charged and the starting system should be functioning properly.

- Disable the inertia switch.
- Key ON, engine OFF.
- Access the PCM and monitor the RPM PID.
- Crank the engine.
- **Is the RPM greater than 150 RPM?**

Yes	No
For DTC P1336 with no start, refer to **PINPOINT TEST A**. For DTC P1336, GO to **HD16**. For all others, the CKP, PCM, and harness are working properly. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to **JD2**.

JD2 CHECK THE TIMING COVER, CKP SENSOR AND EXTERNAL TRIGGER WHEEL (OUTSIDE THE TIMING COVER) FOR OBVIOUS PHYSICAL DAMAGE

- Key in OFF position.
- Visually check the timing cover, CKP sensor and external trigger wheel (outside the timing cover) for obvious physical damage.
- **Do any parts appear physically damaged?**

Yes	No
REPAIR as necessary. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to **JD3**.

JD3 CHECK FOR PROPER CKP BIAS VOLTAGES IN THE PCM

- CKP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CKP Sensor Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

- **Are the voltages between 1 - 3 V?**

Yes	No
GO to **JD4**.	GO to **JD6**.

JD4 CHECK THE CKP SENSOR RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) CKP Sensor Connector, Component Side	(-) CKP Sensor Connector, Component Side
CKP+	CKP-

- **Is the resistance between 250 - 1K ohms?**

Yes	No
GO to **JD5**.	INSTALL a new CKP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

JD5 CHECK THE CKP HARNESS SHIELD GROUND

NOTE: **The harness shield protects the CKP signal from electrical noise and is grounded at one end, typically near the PCM.**

NOTE: Carry out the following resistance measurement between the CKP shield and the ground.

- Measure the resistance between:

(+) CKP_SHLD Assembly Connector, Harness Side	(-)
CKP_SHLD	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **JD6**.	REPAIR the open circuit. CHECK for a poor ground connection. CLEAR the DTCs. REPEAT the self-test.

JD6 CHECK FOR SHORT BETWEEN CKP(+) AND CKP(-) IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) CKP Sensor Connector, Harness Side
CKP+	CKP-

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **JD7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

JD7 CHECK THE CKP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) CKP Sensor Connector,	(-) PCM Connector, Harness Side

Harness Side	
CKP-	CKP-
CKP+	CKP+

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **JD8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JD8 CHECK THE CKP CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **JD9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

JD9 CHECK THE CKP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **JD10**.

JD10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JE: INTEGRATED IGNITION COIL PACK A, B, OR C FAILURE

This pinpoint test is intended to diagnose the following:

- ignition coil packs (12029)
- ignition coil harness
- IGN START/RUN circuit to coil packs
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

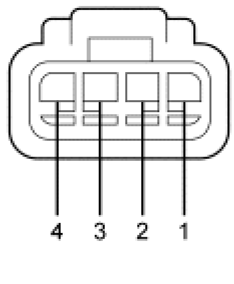

Fig. 161: Coil Pack Assembly Connector - A
Courtesy of FORD MOTOR CO.

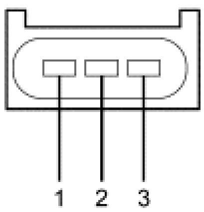

Fig. 162: Coil Pack Assembly Connector - B

	P0353	6	C	C	E16
All others	P0351	1	A	A	E17
	P0353	2	C	C	E16
	P0352	3	B	B	E12
	P0352	4	B	B	E12
	P0351	5	A	A	E17
	P0353	6	C	C	E16

JE1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0350, P0351, P0352, or P0353 present?**

Yes	No
GO to **JE2**.	For all other DTCs, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

JE2 DETERMINE WHICH COIL IS NOT FIRING PROPERLY

NOTE: **Electronic ignition engine timing is entirely controlled by the PCM. Electronic ignition timing is NOT adjustable. Do not attempt to check base timing. You will receive false readings.**

- Determine which coil is not firing properly using the information from Pinpoint Test JB or a DTC and the table at the beginning of this pinpoint test.
- Record the suspect cylinder, coil and PCM pin number from the table.
- **Is the suspect cylinder number, coil driver and PCM pin number recorded?**

Yes	No
GO to **JE3**.	To obtain the required information, REPEAT step JE2.

JE3 DTC P0351, P0352, P0353: CHECK IGN START/RUN VOLTAGE TO THE COIL PACK

- Suspect coil connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Coil Pack Assembly Connector, Harness Side	(-)
IGN START/RUN	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **JE4**.	The IGN START/RUN has a circuit concern. CHECK the condition of the related fuses/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the IGN START/RUN circuit for a short to ground. REPAIR as necessary. CARRY OUT the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE4 CHECK THE FUNCTIONALITY OF THE SUSPECT COIL DRIVER (CD) CIRCUIT

- Key in OFF position.
- Connect a test lamp between IGN START/RUN and the suspect CD circuit (determined from the table) at the coil pack harness connector.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the test lamp while cranking the engine.
- **Does the test lamp blink consistently?**

Yes	No
GO to **JE8**.	GO to **JE5**.

JE5 CHECK THE SUSPECT CD CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Coil Pack Assembly Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect coil driver	Suspect coil driver

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **JE6**.	REPAIR the open circuit. CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE6 CHECK THE SUSPECT CD CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
Suspect coil driver	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.	GO to **JE7**.

JE7 CHECK THE SUSPECT CD CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM	

Connector, Harness Side	(-)
Suspect coil driver	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **JE9**.	REPAIR the short circuit. CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE8 CHECK THE SUSPECT COIL FOR DAMAGE

- Key in OFF position.
- Remove the spark plug wire from the suspect coil tower (as determined from the table).
- Connect the Air Gap Spark Tester 303-D037 (D81P-6666-A) or equivalent to the suspect spark plug wire.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester while cranking the engine.
- **Is a bluish-white spark present?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new coil pack as needed. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE9 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH	

ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JF: INTEGRATED IGNITION COIL ON PLUG COIL A THROUGH J FAILURE

This pinpoint test is intended to diagnose the following:

- ignition coils (12029)
- ignition coil harness
- ignition coils relay
- powertrain control module (PCM) (12A650)

N0073029

JF1 DETERMINE WHICH COIL IS NOT FIRING PROPERLY

NOTE: Electronic ignition engine timing is entirely controlled by the PCM. Electronic ignition timing is NOT adjustable. Do not attempt to check base timing. You will receive false readings.

- Determine which coil is not firing properly using the information from Pinpoint Test JB or a DTC and the table at the beginning of this pinpoint test.
- Record the suspect cylinder, coil and PCM pin number from the table.
- **Is the suspect cylinder number, coil driver and PCM pin number recorded?**

Yes	No
GO to **JF2**.	REPEAT the test step to obtain the required information.

JF2 CHECK THE FUNCTIONALITY OF THE SUSPECT COIL DRIVER CIRCUIT

NOTE: This step may cause fuel pump related DTCs to set. Disregard any fuel pump related DTCs at this time.

NOTE: Test lamp bulb filament wattages vary widely. The intensity and duration of blinking depends on the test lamp being used.

- Key in OFF position.
- Suspect coil connector disconnected.
- Remove the fuel pump fuse to disable the fuel pump.
- Connect a non-powered test lamp between the IGN START/RUN and suspect coil driver, harness side.
- Observe the test lamp while cranking the engine.
- **Is the test lamp blinking consistently?**

Yes	No
GO to **JF3**.	GO to **JF4**.

JF3 CHECK THE FUNCTIONALITY OF THE SUSPECT COIL

- Key in OFF position.
- Carry out a visual inspection. Closely inspect the coil case and boot for carbon tracking, cracks and torn or improperly installed boots.
- Remove the suspect COP from the spark plug.
- Connect the Air Gap Spark Tester 303-DO37 (D81P-6666-A) or equivalent.
- Suspect coil connector connected.
- Crank the engine.
- Observe the spark tester while cranking the engine.

- **Is a bluish-white spark present?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new suspect coil. If necessary, INSTALL a new spark plug. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JF4 CHECK THE IGN START/RUN VOLTAGE TO THE SUSPECT COIL

- Key ON, engine OFF.
- Suspect coil connector disconnected.
- Measure the voltage between:

(+) COP Connector, Harness Side	(-) Vehicle Battery
IGN START/RUN	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **JF5**.	For Crown Victoria, Grand Marquis, and Town Car, GO to **JF9**. For all others, REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF5 CHECK THE SUSPECT COIL DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Suspect coil connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) COP Connector, Harness Side
Suspect coil driver	COP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **JF6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF6 CHECK THE SUSPECT COIL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
Suspect coil driver	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to **JF7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

JF7 CHECK THE SUSPECT COIL DRIVER CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
Suspect coil driver	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **JF12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. If the concern or DTC is still present, GO to **JF8**.

JF8 CHECK THE SUSPECT COIL FOR DAMAGE

- PCM connector connected.
- Connect the Air Gap Spark Tester 303-D037 (D81P-6666-A) or equivalent to the suspect coil.

- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester while cranking the engine.
- **Is a bluish-white spark present?**

Yes	No
If necessary, INSTALL a new spark plug. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new suspect coil. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JF9 CHECK VPWR CIRCUIT CONTINUITY BETWEEN THE SUSPECT COIL AND IGNITION COILS RELAY

- Key in OFF position.
- Ignition Coils Relay connector disconnected.
- Measure the resistance between:

(+) Ignition Coils Relay Connector, Harness Side	(-) Suspect coil Connector, Harness Side
VPWR - Pin 3	IGN START/RUN

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **JF10**.	REPAIR the open circuit. The open is between the splice and the ignition coils relay. CLEAR the DTCs. REPEAT the self-test.

JF10 CHECK THE B+ AND IGN START/RUN VOLTAGE TO IGNITION COILS RELAY

- Key ON, engine OFF.
- Measure the voltage between:

(+) Ignition Coils Relay Connector, Harness Side	(-)
B+ - Pin 5	Ground
IGN START/RUN - Pin 2	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to **JF11**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF11 CHECK THE IGNITION COILS RELAY GND CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the voltage between:

(+) Ignition Coils Relay Connector, Harness Side	(-) Ignition Coils Relay Connector, Harness Side
B+ - Pin 5	GND - Pin 1

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new Ignition Coils relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF12 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KA: FUEL PUMP (FP) RELAY

This pinpoint test is intended to diagnose the following:

- fuel pump relay (9345)
- inertia fuel shutoff (IFS) switch (9341)
- harness circuits: B+, VPWR, FP, GND, FPM, and FP PWR
- powertrain control module (PCM) (12A650)

The VPWR and FP circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article for schematic and connector information.

All other vehicles	190 Pin	B30 B62	FPM FP

KA1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0230, P0231, P0232, or P1641 present?**

Yes	No
For KOEO and KOER DTCs P0230 or P1641, GO to **KA2**. For continuous memory DTCs P0230 or P1641, GO	

to **KA32**. For KOEO and KOER DTC P0231, GO to **KA24**. For continuous memory DTC P0231, GO to **KA31**. For KOEO and KOER DTC P0232, GO to **KA12**. For continuous memory DTC P0232, GO to **KA29**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KA2 KOEO AND KOER DTCS P0230 AND P1641: CHECK FOR THE PRESENCE OF DTC P0685 OR P0690

- Carry out the self-test.
- **Are DTCs P0685 or P0690 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **KA3**.

KA3 CHECK THE VPWR VOLTAGE TO FUEL PUMP RELAY

- FP Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FP Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KA4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KA4 CHECK THE FUEL PUMP RELAY

- Key in OFF position.
- Carry out the FP relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the FP relay pass the component test?**

Yes	No
GO to **KA5**.	INSTALL a new FP relay. CLEAR the DTCs. REPEAT the self-test.

KA5 CHECK THE FP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FP Relay Connector, Harness Side	(-)
FP	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KA6**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KA6 CHECK THE FUEL PUMP CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-)
FP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KA7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KA7 CHECK THE FUEL PUMP CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-) PCM Connector, Harness Side
FP	FP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KA8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KA8 CHECK FOR KOEO DTCS

- Carry out the KOEO self-test.
- **Are DTCs P0231 or P0232 present?**

Yes	No
GO to **KA9**.	GO to **KA34**.

KA9 CHECK THE FP PRIMARY CIRCUIT INSIDE THE PCM

- PCM connector connected.
- FP Relay connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the FP_F PID.
- **Is the PID state YES?**

Yes	No
GO to **KA34**.	GO to **KA10**.

KA10 CHECK THE FUEL PUMP PRIMARY CIRCUIT INSIDE THE PCM WHILE CRANKING THE ENGINE

- Access the PCM and monitor the FP_F PID.
- While observing the PID, crank the engine.
- **Does the PID display indicate a concern during crank?**

Yes	No
GO to **KA34**.	The fuel pump primary circuit is OK in the harness and PCM. GO to **KA11**.

KA11 IS DTC P0231 PRESENT IN THE KOEO SELF-TEST?

- Carry out the KOEO self-test.
- **Is DTC P0231 present?**

Yes	No
GO to **KA24**.	GO to **KA12**.

KA12 KOEO AND KOER DTC P0232: DOES THE ENGINE START?

- **Does the engine start?**

Yes	No
GO to **KA13**.	GO to **KA18**.

KA13 VERIFY THE FUEL PUMP IS OFF

- Key ON, engine OFF.
- Wait for 5 seconds.
- The fuel pump is located above the fuel tank. Listen for the sound of the fuel pump operating which can be heard from outside the vehicle.
- **Is fuel pump off with the key ON?**

Yes	No
GO to **KA15**.	GO to **KA14**.

KA14 CHECK FOR FUEL PUMP RELAY CONTACTS ALWAYS CLOSED

- FP Relay connector disconnected.
- Key ON, engine OFF.
- **Is fuel pump off with the key ON?**

Yes	No
INSTALL a new FP relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the short circuit. The short circuit is between the FPPWR and FPM circuits or in the INJPWRM circuit. CLEAR the DTCs. REPEAT the self-test.

KA15 CHECK THE FPM CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- FP Relay connector disconnected.
- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-) PCM Connector, Harness Side
FPPWR	FPM

- **Is the resistance less than 5 ohms?**

Yes	No
	REPAIR the open circuit. The concern is between

GO to **KA16**.	the splice and the PCM. CLEAR the DTCs. REPEAT the self-test.

KA16 IS KOEO DTC P0231 PRESENT?

- Carry out the KOEO self-test.
- **Is DTC P0231 present?**

Yes	No
GO to **KA34**.	GO to **KA17**.

KA17 CHECK THE FPM PRIMARY CIRCUIT INSIDE THE PCM

- PCM connector connected.
- FP Relay connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- **Is the PID state OFF?**

Yes	No
The concern is not present at this time. The FPM circuit is OK in the harness and PCM. Disregard DTC P0232 at this time. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to **KA34**.

KA18 CHECK IF THE INERTIA FUEL SHUTOFF (IFS) SWITCH IS TRIPPED

- **Is the IFS switch tripped?**

Yes	No
RESET the IFS switch. CLEAR the DTCs. REPEAT the self-test.	GO to **KA19**.

KA19 CHECK THE INERTIA FUEL SHUTOFF

- IFS Switch connector disconnected.
- Measure the resistance between:

(+) IFS Switch Connector, Component Side	(-) IFS Switch Connector, Component Side
FPPWR-A - Pin	FPPWR-B - Pin

2	1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KA20**.	INSTALL a new IFS switch. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KA20 CHECK THE FP PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- FP Relay connector disconnected.
- Measure the resistance between:

(+) IFS Switch Connector, Harness Side	(-) FP Relay Connector, Harness Side
FPPWR-A - Pin 2	FPPWR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KA21**.	REPAIR the open circuit. CHECK for an open circuit between the IFS switch and the FPM splice. REFER to the Wiring Diagrams article for schematic and connector information. CLEAR the DTCs. REPEAT the self-test.

KA21 CHECK THE FUEL PUMP GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

- FP connector disconnected.
- Measure the resistance between:

(+) FP Connector, Harness Side	(-)
FPGND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
	REPAIR the open circuit. CLEAR the DTCs.

GO to **KA22**.	REPEAT the self-test.

KA22 CHECK THE FP PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FP Connector, Harness Side	(-) IFS Switch Connector, Harness Side
FPPWR	FPPWR-B - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KA23**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KA23 CHECK THE INTERNAL RESISTANCE OF THE FUEL PUMP

- Measure the resistance between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPGND

- **Is the resistance less than 10 ohms?**

Yes	No
The fuel pump circuit is OK in the harness and PCM. Disregard DTC P0232 at this time. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KA24 KOEO AND KOER DTC P0231: IS KOEO DTC P0230 ALSO PRESENT?

- Carry out the KOEO self-test.
- **Is DTC P0230 present?**

Yes	No
GO to **KA3**.	GO to **KA25**.

KA25 DOES THE ENGINE START?

- **Does the engine start?**

Yes	No
GO to **KA15**.	GO to **KA26**.

KA26 CHECK IF THE IFS SWITCH IS TRIPPED

- **Is the IFS switch tripped?**

Yes	No
RESET the IFS switch. CLEAR the DTCs. REPEAT the self-test.	GO to **KA27**.

KA27 CHECK THE B+ CIRCUIT VOLTAGE TO THE FP RELAY

- FP Relay connector disconnected.
- Measure the voltage between:

(+) FP Relay Connector, Harness Side	(-)
B+	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KA28**.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KA28 CHECK THE FP PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-)
FPPWR	Ground

- **Is the resistance less than 10 ohms?**

Yes	No
INSTALL a new FP relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. The open is between the splice and the FP relay. CLEAR the DTCs. REPEAT the self-test.

KA29 CONTINUOUS MEMORY DTC P0232: IS A CONTINUOUS DTC P0230 PRESENT?

- Retrieve the continuous memory DTCs.
- **Is DTC P0230 present?**

Yes	No
GO to **KA33**.	GO to **KA30**.

KA30 CHECK THE FUEL PUMP SECONDARY CIRCUITS FOR A CONCERN

NOTE: Be aware that DTC P0232 could be set if the IFS switch is tripped then reset, or if voltage is supplied to the FP PWR circuit when the PCM expects the fuel pump to be off. The fuel pump prime procedure produces this.

NOTE: The FPM PID turns ON when a concern is present.

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPPWR circuit between the FP RLY and the FP
  - Shake, wiggle, and bend the FP GND
  - Shake, wiggle, and bend the FPM circuit between the PCM and the splice to the FPPWR circuit
  - Shake, wiggle, and bend the INJPWRM circuit between the PCM and the splice to the FPPWR circuit
  - Lightly tap on the FP, IFS, and FP RLY to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KA31 CONTINUOUS MEMORY DTC P0231: CHECK THE HARNESS

- PCM connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B
FP	Ground

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPM	Ground

- The FP turns on and the voltage will be greater than 10 V.
- Check for an indication of a concern while carrying out the following. The voltage changes suddenly when a concern is present.
    - Shake, wiggle, and bend the B+ supply to the FP relay
    - Shake, wiggle, and bend the FP PWR circuit between the FP relay and the FPM splice
    - Lightly tap on the FP relay to simulate road shock
- Key in OFF position.
- Visually inspect the FP relay and its loom connector for damage and corrosion.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KA32 CONTINUOUS MEMORY DTC P0230: CHECK FOR THE PRESENCE OF DTC P0685 OR P0690

- Carry out the self-test.
- **Are DTCs P0685 or P0690 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **KA33**.

KA33 CHECK THE FP PRIMARY CIRCUITS

NOTE: The PID indicates YES when a concern is present.

- Key ON, engine OFF.
- Wait for 5 seconds.
- Access the PCM and monitor the FP_F PID.
- Observe the FP_F PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FP circuit between the PCM and the FP relay
  - Shake, wiggle, and bend the VPWR circuit between the electronic engine control power relay and the FP relay
  - Lightly tap on the FP relay to simulate road shock
- Key in OFF position.
- Visually inspect the PCM connector and wires as far back as the main loom for damage.
- Visually inspect the FPR connector and wires as far back as the main loom for damage.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KA34 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KB: FUEL PUMP DRIVER MODULE

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- fuel pump driver module (FPDM) (9D370) and (9D372)
- FPDM power supply relay
- inertia fuel shutoff (IFS) switch (9341)
- harness circuits: B+, GND, FPC, FPM, FPM2, FP PWR, FP2PWR, FP RTN, FP2RTN, VPWR Fuel, VPWR Fuel 2, and PWRGND
- powertrain control module (PCM) (12A650)

KB1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P1233, P1234, P1235, P1236, P1237, P1238, or P1641 present?**

Yes	No
For DTC P1233, GO to **KB2**. For DTC P1234, GO to **KB38**. For DTCs P1235 or P1641, GO to **KB20**. For DTC P1236, GO to **KB50**. For DTC P1237, GO to **KB26**. For DTC P1238, GO to **KB56**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KB2 DTC P1233: IS DTC P1233 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1233 applies to the FPDM mounted on the driver side of the luggage compartment.

- Carry out the KOEO self-test.
- **Is DTC P1233 present?**

Yes	No
GO to **KB3**.	The PCM is now receiving a signal from the FPDM. One possible cause of DTC P1233 is that the IFS switch was tripped, then reset. For a no start (engine cranks), DISREGARD the DTC at this time. RETURN to the **SYMPTOM CHARTS** article Symptom Charts and continue as directed. After repairing the no start, to diagnose the intermittent causes of P1233, GO to **KB19**. For all others, GO to **KB19**.

KB3 DOES THE ENGINE START?

NOTE: The Mustang 5.4L starts with 1 FPDM disabled.

- **Does the engine start?**

Yes	No
For Mustang 5.4L, GO to **KB4**. For all others, to check the FPM circuit, GO to **KB15**.	VERIFY the IFS switch is set (button pressed). If OK, GO to **KB4**.

KB4 CHECK THE VOLTAGE AND GROUND CIRCUITS TO THE FPDM

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
VPWR Fuel - Pin 5	PWRGND - Pin 3

- **Is the voltage greater than 10 V?**

Yes	No
For Mustang 5.4L, to check the FPM circuit, GO to **KB15**. For all others, INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **KB5**.

KB5 CHECK THE VOLTAGE TO THE FPDM

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
VPWR Fuel - Pin 5	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. The FPDM ground circuit is open. CLEAR the DTCs. REPEAT the self-test.	There is no voltage to the FPDM. For F-150, and Mark LT, GO to **KB11**. For all others, GO to **KB6**.

KB6 CHECK THE B+ VOLTAGE TO THE FPDM POWER SUPPLY RELAY

- Key in OFF position.
- FPDM PWR Relay connector disconnected.
- Measure the voltage between:

(+) FPDM PWR Relay Connector, Harness Side	(-)
B+	Ground

- **Is the voltage greater than 10 V?**

Yes	No
	A B+ circuit concern is present. CHECK the

GO to **KB7**.	condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KB7 CHECK THE VPWR VOLTAGE TO THE FPDM POWER SUPPLY RELAY

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM PWR Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KB8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB8 CHECK FOR GROUND TO THE FPDM POWER SUPPLY RELAY

- Measure the resistance between:

(+) FPDM PWR Relay Connector, Harness Side	(-)
GND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KB9**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB9 CHECK THE VPWR FUEL CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FPDM	(-) FPDM

Connector, Harness Side	PWR Relay Connector, Harness Side
VPWR Fuel - Pin 5	VPWR Fuel

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new FPDM relay. CLEAR the DTCs. REPEAT the self-test.	GO to **KB10**.

KB10 ISOLATE THE OPEN IN THE FPDM CIRCUIT

- IFS Switch connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-) IFS Switch Connector, Harness Side
VPWR Fuel - Pin 5	VPWR Fuel - B - Pin 1

- Measure the resistance between:

(+) FPDM PWR Relay Connector, Harness Side	(-) IFS Switch Connector, Harness Side
VPWR Fuel	VPWR Fuel - A - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new IFS switch. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . VERIFY the IFS switch is set (button pressed). CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB11 CHECK THE FUEL PUMP FUSE

NOTE: These steps are for applications with a FPDM PWR relay integral to the PDJB.

- Key in OFF position.
- Check the FPDM power supply relay fuse. Refer to the Wiring Diagrams article for schematic and connector information.
- **Is the fuse OK?**

Yes	No
GO to **KB12**.	INSTALL a new fuse. CHECK the associated circuits for a short to ground before installing the fuse. CLEAR the DTCs. REPEAT the self-test.

KB12 CHECK FOR VOLTAGE TO THE IFS SWITCH

- IFS Switch connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IFS Switch Connector, Harness Side	(-)
VPWR Fuel - A - Pin 2	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KB14**.	GO to **KB13**.

KB13 CHECK THE VPWR FUEL CIRCUIT FOR AN OPEN BETWEEN THE IFS AND PDJB

- Key in OFF position.
- PDJB connector disconnected. Refer to the Wiring Diagrams article for schematic and connector information.
- Measure the resistance between:

(+) IFS Switch Connector, Harness Side	(-) PDJB Connector, Harness Side
VPWR Fuel - A - Pin 2	VPWR Fuel - Pin 3

- **Is the resistance less than 5 ohms?**

Yes	No
CHECK the fuel pump fuse. REPAIR as necessary. If OK, INSTALL a new FP RLY/PDJB. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB14 CHECK THE IFS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between:

(+) IFS Switch Connector, Component Side	(-) IFS Switch Connector, Component Side
VPWR Fuel - A - Pin 2	VPWR Fuel - B - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
REPAIR the open circuit. The VPWR fuel circuit is open. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new IFS switch. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB15 CHECK THE FPM CIRCUIT FOR AN OPEN IN THE HARNESS

- FPDM connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-) PCM Connector, Harness Side
FPM - Pin 1	FPM

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KB16**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB16 CHECK THE FPM CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPM - Pin 1	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KB17**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB17 CHECK THE FPM CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-)
FPM - Pin 1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KB18**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB18 CHECK FOR FPM OUTPUT FROM THE FPDM

NOTE: It is OK for the voltage to cycle below this range and then return within range.

- FPDM connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPM	Ground

- **Is the voltage between 0.02 - 1 V?**

Yes	No
GO to **KB64**.	INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB19 CHECK THE CIRCUITS THAT MAY CAUSE AN INTERMITTENT LOSS OF VOLTAGE TO THE FPDM

NOTE: Be aware that P1233 could be set if the IFS switch is tripped then reset.

NOTE: With no concern present, the FPDM sends a 50% duty cycle (all OK) to the PCM on the FPM circuit. Depending on the scan tool type, the FPM PID may display 50%, or a random value that is fluctuating between 85% and 115%.

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the PWRGND circuit to the FPDM
  - Shake, wiggle, and bend the VPWR fuel circuit to the FPDM
  - Shake, wiggle, and bend the FPM circuit between the FPDM and the PCM
  - Shake, wiggle, and bend the B+ and ground circuits to the FPDM power supply relay
  - Lightly tap on the IFS switch to simulate road shock
  - Lightly tap on the FPDM to simulate road shock
  - Lightly tap on the FPDM power supply relay to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB20 DTC P1235: IS DTC P1235 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1235 applies to the FPDM mounted on the driver side of the luggage compartment.

NOTE: For ETC applications, check if ETC DTC P2105 is present. An ETC system concern could cause P1235, and should be diagnosed first.

- Carry out the KOEO self-test.
- **Is DTC P1235 present?**

Yes	No
GO to **KB21**.	GO to **KB25**.

KB21 CHECK THE FPC CIRCUIT FOR AN OPEN IN THE HARNESS

- FPDM connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FPDM Connector, Harness Side
FPC	FPC - Pin 6

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KB22**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB22 CHECK THE FPC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- FPDM2 connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPC - Pin 6	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KB23**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB23 CHECK THE FPC CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.

- Measure the resistance between:

(+) FPDM Connector, Harness Side	**(-)**
FPC - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KB24**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB24 CHECK THE FPC CIRCUIT IN THE FPDM

- FPDM connector connected.
- FPDM2 connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	**(-)**
FPC	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KB64**.	INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB25 CHECK THE FPC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: **With no concern present, the FPDM sends a 50% duty cycle (all OK) to the PCM on the FPM circuit. Depending on the scan tool type, the FPM PID may display 50%, or a random value that is fluctuating between 85% and 115%.**

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPC circuit between FPDM and the PCM

- Lightly tap on the FPDM to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB26 DTC P1237: IS DTC P1237 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1237 applies to the FPDM mounted on the driver side of the luggage compartment.

- Carry out the KOEO self-test.
- **Is DTC P1237 present?**

Yes	No
GO to **KB27**.	DTC P1237 is possibly intermittent, GO to **KB33**.

KB27 DOES THE ENGINE START?

NOTE: The Mustang 5.4L starts with 1 FPDM disabled.

- FPDM2 connector disconnected.
- **Does the engine start?**

Yes	No
GO to **KB36**.	GO to **KB28**.

KB28 CHECK THE FPPWR, FPRTN AND INTERNAL FUEL PUMP CIRCUIT RESISTANCE

- Key in OFF position.
- FPDM connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
FPPWR - Pin 4	FPRTN - Pin 2

- **Is the resistance less than 10 ohms?**

Yes	No
GO to **KB29**.	ISOLATE the concern, GO to **KB32**.

KB29 CHECK THE FPRTN CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPRTN - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KB30**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB30 CHECK THE FPPWR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- FP connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-)
FPPWR - Pin 4	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KB31**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB31 CHECK FOR VOLTAGE TO FP

NOTE: During output test mode, the fuel pump stays commanded on for only about 5 seconds.

- FPDM connector connected.
- FP connector disconnected.

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Measure the voltage between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPRTN

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	VERIFY the vehicle battery was at a proper charge during the test. VERIFY the pump ON command did not time out before the voltage check was made. REPEAT as necessary. If OK, INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB32 ISOLATE THE OPEN CIRCUIT

- FP connector disconnected.
- Measure the resistance between:

(+) FP Connector, Harness Side	(-) FPDM Connector, Harness Side
FPPWR	FPPWR - Pin 4
FPRTN	FPRTN - Pin 2

- Measure the resistance between:

(+) FP Connector, Component Side	(-) FP Connector, Component Side
FPPWR	FPRTN

- **Is the resistance less than 10 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	REPAIR the open circuit. If the open is internal to the pump, INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB33 VERIFY THE DTC P1237 IS INTERMITTENT

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- **Is the FPM PID 75% (or varying between 250% and 400%)?**

Yes	No
A concern is present. GO to **KB27**.	CHECK for an intermittent concern, GO to **KB34**.

KB34 CHECK THE FPPWR AND FPRTN CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: With no concern present, the FPDM sends a 50% duty cycle (all OK) to the PCM on the FPM circuit. Depending on the scan tool type, the FPM PID may display 50%, or a random value that is fluctuating between 85% and 115%.

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPPWR and FPRTN circuits between the FPDM and the FP
  - Lightly tap on the FP and FPDM to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KB35**.

KB35 CHECK THE FPPWR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

NOTE: The lamp turns on when a concern is present.

- Key in OFF position.
- FPDM connector disconnected.
- Connect a non-powered test lamp between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
FPPWR - Pin 4	VPWR Fuel - Pin 5

- Key ON, engine OFF.
- Observe the test lamp for an indication of a concern. Shake, wiggle, and bend the FPPWR circuit between the FPDM and the FP.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB36 CHECK THE FPPWR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPPWR - Pin 4	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KB37**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB37 CHECK THE FPRTN CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
VPWR Fuel -	FPRTN - Pin 2

Pin 5	

- **Is the voltage less than 1 V?**

Yes	No
INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB38 DTC P1234: IS DTC P1234 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1234 applies to the FPDM2 mounted on the passenger side of the luggage compartment.

- Carry out the KOEO self-test.
- **Is DTC P1234 present?**

Yes	No
GO to **KB39**.	The PCM is now receiving a signal from FPDM2. One possible cause of DTC P1234 is that the IFS switch was tripped, then reset. GO to **KB49**.

KB39 CHECK THE VOLTAGE AND GROUND CIRCUITS TO THE FPDM2

- FPDM2 connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 Connector, Harness Side
VPWR Fuel 2 - Pin 5	PWRGND - Pin 3

- **Is the voltage greater than 10 V?**

Yes	No
To check the FPM2 circuit, GO to **KB45**.	GO to **KB40**.

KB40 CHECK VOLTAGE TO FPDM2

- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
VPWR Fuel 2 - Pin 5	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. The FPDM2 ground circuit is open. CLEAR the DTCs. REPEAT the self-test.	There is no voltage to the FPDM2. GO to **KB41**.

KB41 CHECK THE B+ VOLTAGE TO THE FPDM2 POWER SUPPLY RELAY

- Key in OFF position.
- FPDM2 PWR Relay connector disconnected.
- Measure the voltage between:

(+) FPDM2 PWR Relay Connector, Harness Side	(-)
B+ - Pin 3	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KB42**.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KB42 CHECK THE VPWR VOLTAGE TO THE FPDM2 POWER SUPPLY RELAY

- Measure the voltage between:

(+) FPDM2 PWR Relay Connector,	(-)

Harness Side	
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KB43**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB43 CHECK FOR GROUND TO THE FPDM2 POWER SUPPLY RELAY

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 PWR Relay Connector, Harness Side	(-)
GND - Pin 2	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KB44**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB44 CHECK THE VPWR FUEL 2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 PWR Relay Connector, Harness Side
VPWR Fuel 2 - Pin 5	VPWR Fuel 2 - Pin 5

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new FPDM2 PWR relay. CLEAR the DTCs. REPEAT the self-test.	GO to **KB49**.

KB45 CHECK THE FPM2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- FPDM2 connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) PCM Connector, Harness Side
FPM2 - Pin 1	FPM2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KB46**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB46 CHECK THE FPM2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
FPM2 - Pin 1	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KB47**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB47 CHECK THE FPM2 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-)
FPM2 - Pin 1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KB48**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB48 CHECK FOR FPM2 OUTPUT FROM THE FPDM2

NOTE: It is OK for the voltage to cycle below this range and then return within range.

- FPDM2 connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPM2	Ground

- **Is the voltage between 0.02 - 1 V?**

Yes	No
GO to **KB64**.	INSTALL a new FPDM2. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB49 CHECK CIRCUITS THAT MAY CAUSE AN INTERMITTENT LOSS OF VOLTAGE SUPPLY TO THE FPDM2

NOTE: Be aware that P1234 could be set if the IFS switch is tripped then reset.

NOTE: With no concern present, the FPDM2 sends a 50% duty cycle (all OK) to the PCM on the FPM2 circuit. Depending on the scan tool type, the FPM2 PID may display 50%, or a random value that is fluctuating between 85% and 115%.

- Key ON, engine OFF.
- Access the PCM and monitor the FPM2 PID.
- Observe the FPM2 PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the PWRGND circuit to the FPDM2
  - Shake, wiggle, and bend the VPWR fuel 2 circuit to the FPDM2
  - Shake, wiggle, and bend the FPM2 circuit between the FPDM2 and the PCM
  - Shake, wiggle, and bend the B+ and ground circuits to the FPDM2 power supply relay
  - Lightly tap on the IFS switch to simulate road shock

- Lightly tap on the FPDM2 to simulate road shock
- Lightly tap on the FPDM2 power supply relay to simulate road shock

- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB50 DTC P1236: IS DTC P1236 PRESENT IN THE KOEO SELF-TEST?

- The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1236 applies to the FPDM2 mounted on the passenger side of the luggage compartment.
- Carry out the KOEO self-test.
- **Is DTC P1236 present?**

Yes	No
GO to **KB51**.	GO to **KB55**.

KB51 CHECK THE FPC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- FPDM2 connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FPC	FPC - Pin 6

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KB52**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB52 CHECK THE FPC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
FPC - Pin 6	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KB53**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB53 CHECK THE FPC CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-)
FPC - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KB54**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB54 CHECK THE FPC CIRCUIT IN THE FPDM2

- FPDM2 connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPC	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KB64**.	INSTALL a new FPDM2. REFER to the **FUEL SYSTEM - GENERAL INFORMATION -**

	GASOLINE AND DIESEL -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.

KB55 CHECK THE FPC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: With no concern present, the FPDM2 sends a 50% duty cycle (all OK) to the PCM on the FPM2 circuit. Depending on the scan tool type, the FPM2 PID may display 50%, or a random value that is fluctuating between 85% and 115%.

- Key ON, engine OFF.
- Access the PCM and monitor the FPM2 PID.
- Observe the FPM2 PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPC circuit between FPDM2 and the PCM
  - Lightly tap on the FPDM2 to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB56 DTC P1238: IS DTC P1238 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1238 applies to the FPDM2 mounted on the passenger side of the luggage compartment.

- Carry out the KOEO self-test.
- **Is DTC P1238 present?**

Yes	No
GO to **KB57**.	CHECK for an intermittent concern, GO to **KB63**.

KB57 CHECK THE FP2PWR, FP2RTN AND INTERNAL FUEL PUMP CIRCUIT RESISTANCE

- Key in OFF position.
- FPDM2 connector disconnected.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FP2PWR - Pin 4	FP2RTN - Pin 2

- **Is the resistance less than 10 ohms?**

Yes	No
GO to **KB58**.	ISOLATE the concern, GO to **KB62**.

KB58 CHECK THE FP2PWR AND FP2RTN CIRCUIT(S) FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- FP connector disconnected. Refer to the Wiring Diagrams article for schematic and connector information.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
FP2PWR - Pin 4	Ground
FP2RTN - Pin 2	Ground

- **Are the voltages less than 1 V?**

Yes	No
GO to **KB59**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB59 CHECK THE FP2PWR AND FP2RTN CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-)
FP2PWR - Pin 4	Ground
FP2RTN - Pin 2	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **KB60**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB60 CHECK FOR A SHORT BETWEEN THE FP2PWR AND FP2RTN CIRCUITS

- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FP2PWR - Pin 4	FP2RTN - Pin 2

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KB61**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB61 CHECK FOR VOLTAGE TO THE FP

NOTE: During output test mode, the fuel pump stays commanded on for only about 5 seconds.

- FPDM2 connector connected.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Measure the voltage between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FP2PWR	FP2RTN

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	VERIFY the vehicle battery was at a proper charge during the test. VERIFY the pump ON command did not time out before the voltage check was made. REPEAT as necessary. If OK, INSTALL a new FPDM2. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB62 ISOLATE THE OPEN CIRCUIT

- FP connector disconnected. Refer to the Wiring Diagrams article for schematic and connector information.
- Measure the resistance between:

(+) FP Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FP2PWR	FP2PWR - Pin 4
FP2RTN	FP2RTN - Pin 2

- Measure the resistance between:

(+) FP Connector, Component Side	(-) FP Connector, Component Side
FP2PWR	FP2RTN

- **Is the resistance less than 10 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	REPAIR the open circuit. If the open is internal to the pump, INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB63 CHECK THE FP2PWR AND FP2RTN CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: **With no concern present, the FPDM2 sends a 50% duty cycle (all OK) to the PCM on the FPM2 circuit. Depending on the scan tool type, the FPM2 PID may display 50%, or a random value that is fluctuating between 85% and 115%.**

- Key ON, engine OFF.
- Access the PCM and monitor the FPM2 PID.
- Observe the FPM2 PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FP2PWR and FP2RTN circuits between the FPDM2 and the FP
  - Lightly tap on the FP and FPDM2 to simulate road shock
- **Is a concern present?**

Yes	No

ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KB64 CHECK FOR CORRECT PCM OPERATION

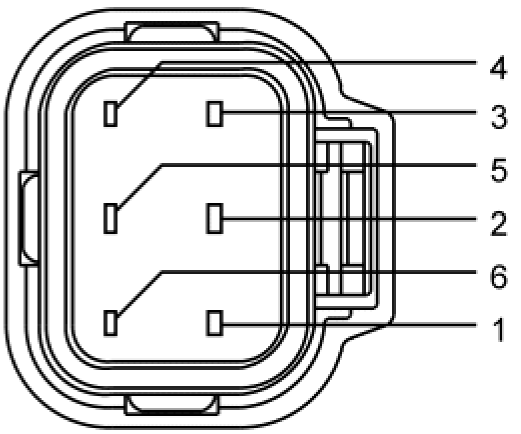
- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KD: ELECTRIC EXHAUST GAS RECIRCULATION (EEGR) SYSTEM

This pinpoint test is intended to diagnose the following:

- EEGR system
- EEGR stepper motor (9D475)
- harness circuits: EGRMC1, EGRMC2, EGRMC3, EGRMC4 and VPWR
- powertrain control module (PCM) (12A650)



A0077511

KD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0400, P0403, or P1408 present?**

Yes	No
For DTCs P0400 and P1408, GO to **KD9**. For DTC P0403, GO to **KD2**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KD2 DTC P0403: EGR CONTROL CIRCUIT - CHECK THE CONNECTION OF THE EEGR HARNESS CONNECTOR TO THE EEGR

NOTE: If the DTC is intermittent, wiggle the harness and connectors when taking measurements.

- Check the connection of the EEGR harness connector to the EEGR.
- **Are the connector contacts clean and correctly seated?**

Yes	No
GO to **KD3**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

KD3 CHECK FOR VPWR AT THE EEGR HARNESS CONNECTOR

- Key ON, engine OFF.
- EEGR Assembly connector disconnected.
- Measure the voltage between:

(+) EEGR Assembly Connector,	(-) Vehicle Battery

Harness Side	
VPWR - Pin 2	Negative terminal
VPWR - Pin 5	Negative terminal

- **Are the voltages greater than 10 V?**

Yes	No
GO to **KD4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KD4 CHECK THE EEGR CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) EEGR Assembly Connector, Harness Side	(-) PCM Connector, Harness Side
EGRMC1 - Pin 1	EGRMC1
EGRMC2 - Pin 3	EGRMC2
EGRMC3 - Pin 4	EGRMC3
EGRMC4 - Pin 6	EGRMC4

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **KD5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KD5 CHECK THE EEGR CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) EEGR Assembly Connector,	(-) Vehicle Battery

Harness Side	
EGRMC1 - Pin 1	Negative terminal
EGRMC2 - Pin 3	Negative terminal
EGRMC3 - Pin 4	Negative terminal
EGRMC4 - Pin 6	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **KD6**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KD6 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE EEGR HARNESS

NOTE: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EGRMC3	EGRMC1
EGRMC3	EGRMC2
EGRMC3	EGRMC4
EGRMC1	EGRMC2
EGRMC1	EGRMC4
EGRMC2	EGRMC4

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to **KD7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KD7 CHECK THE EEGR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) EEGR Assembly Connector, Harness Side	(-) Vehicle Battery
EGRMC1 - Pin 1	Negative terminal
EGRMC2 - Pin 3	Negative terminal
EGRMC3 - Pin 4	Negative terminal
EGRMC4 - Pin 6	Negative terminal

- **Are the voltages greater than 0.1 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **KD8**.

KD8 CHECK THE EEGR COILS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between:

(+) EEGR Assembly Connector, Component Side	(-) EEGR Assembly Connector, Component Side
EGRMC1 - Pin 1	VPWR - Pin 2
EGRMC2 - Pin 3	VPWR - Pin 2
EGRMC3 - Pin 4	VPWR - Pin 5
EGRMC4 - Pin 6	VPWR - Pin 5

- **Are the resistances between 15 - 24 ohms?**

Yes	No
GO to **KD12**.	INSTALL a new EEGR assembly. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** .

	CLEAR the DTCs. REPEAT the self-test.

KD9 DTCS P0400 AND P1408: CHECK FOR STUCK OR STICKY EGR VALVE OPERATION BY COMPARING ACTUAL MAP VOLTAGE TO MAP PID VOLTAGE

NOTE: Repair the following DTCs first, if present: P0102, P0103, P0107, P0108, P1100, P1101.

- Key in OFF position.
- MAP Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A MAP Sensor Connector, Harness Side	Point B MAP Sensor Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 4	SIGRTN - Pin 4

- Key ON, engine running.
- Measure the voltage between:

(+) MAP Sensor Connector, Component Side	(-) Vehicle Battery
MAP - Pin 1	Negative terminal

- **Is the voltage between 1 - 2 V?**

Yes	No
GO to **KD10**.	CHECK the MAP harness for open and short circuits.

KD10 COMPARE ACTUAL MAP VOLTAGE TO MAP PID VOLTAGE EGR

- Key in OFF position.
- Remove the jumper wires.
- MAP Sensor connected.
- Record the actual MAP voltage values at KOEO, idle, 1,000 and 2,000 RPM.

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Note the MAP PID voltage.
- Key ON, engine running.
- Note the MAP PID voltage.
- Increase engine speed to 1,000 RPM.

  Note the MAP PID voltage.

- Increase engine speed to 2,000 RPM.

  Note the MAP PID voltage.

- **Does the MAP PID voltage stay within 0.5 V of the actual MAP voltage?**

Yes	No
The concern is not present at this time. Make sure the MAP sensor is correctly seated and the vacuum source is not blocked.	GO to **KD11**.

KD11 CARRY OUT THE KOER SELF-TEST

- **Is DTC P1408 retrieved again?**

Yes	No
INSTALL a new EEGR assembly. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .

KD12 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH**	

ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KE: IDLE AIR CONTROL (IAC) VALVE

This pinpoint test is intended to diagnose the following:

- idle air control (IAC) valve (9F715)
- harness circuits: IAC, PWR and B+ (IAC-RC)
- powertrain control module (PCM) (12A650)

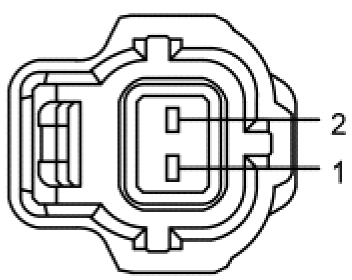

Fig. 180: Idle Air Control (IAC) Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	IAC (Idle Air Control)
1	PWR (POWER)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	E39	IAC
Ranger	170 Pin	E33	IAC

KE1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0505, P0506, P0507, P0511, P1504, P1506, or P1507 present?**

Yes	No
For DTCs P0505, P0506, P0511, P1504 or P1507, GO to **KE2**. For DTCs P0507 or P1506, GO to **KE15**.	For all other symptoms without DTCs, GO to **KE2**.

KE2 DTCS P0505, P0506, P0511, P1504 OR P1507: CHECK FOR INLET AIR LEAKS (OR STARTS ONLY AT PART THROTTLE)

- With the engine running at idle (if possible), listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for leaks such as:
  - damaged or loose IAC air tubes.
  - cracked or punctured intake air tube.
  - loose intake air tube at the air cleaner housing or throttle body.
  - IAC valve or gasket seal.
  - EGR valve gasket seal.
  - vacuum supply connector and hose.
  - PCV valve, connectors and hoses.
- **Are any leaks present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KE3**.

KE3 CHECK FOR VOLTAGE TO THE IAC SOLENOID

NOTE: If EGR DTC P0402 is output during the self-test, diagnose it first before continuing with this pinpoint test.

- IAC connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IAC Connector, Harness Side	(-) Vehicle Battery
PWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No

GO to **KE4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KE4 CHECK THE RESISTANCE OF THE IAC VALVE

- Key in OFF position.
- IAC connector disconnected.
- Measure the resistance between:

(+) IAC Connector, Component Side	(-) IAC Connector, Component Side
PWR - Pin 1	IAC - Pin 2

- **Is the resistance between 6 ohms - 15 ohms?**

Yes	No
GO to **KE5**.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KE5 CHECK THE IAC VALVE FOR AN INTERNAL SHORT TO THE IAC CASE

- Measure the resistance between:

(+) IAC Connector, Component Side	(-) IAC Connector, Component Side
IAC - Pin 2	IAC Case

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KE6**.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KE6 CHECK THE IAC CIRCUIT FOR AN OPEN IN THE HARNESS

- IAC connector disconnected.

- PCM connector disconnected.
- Measure the resistance between:

(+) IAC Connector, Harness Side	(-) PCM Connector, Harness Side
IAC - Pin 2	IAC

- **Is the resistance less than 5 ohms?**

Yes	No
For IAC-RC applications, GO to **KE7**. For all others, GO to **KE8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KE7 CHECK IAC-RC FOR VOLTAGE

- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
IAC-RC	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KE8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KE8 CHECK THE IAC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
IAC	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No

GO to **KE9**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KE9 CHECK THE IAC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
IAC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KE10**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KE10 CHECK FOR A DROP IN IDLE RPM WITH THE IAC DISCONNECTED

- PCM connector connected.
- IAC connector connected.
- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Transmission in PARK or NEUTRAL.
- Disconnect the IAC valve.
- **Does the RPM drop or the engine stall?**

Yes	No
GO to **KE12**.	GO to **KE11**.

KE11 CHECK FOR A STUCK IAC PINTLE

- Key in OFF position.
- Inspect the entire intake air system for debris, blockage or other damage.
- Remove and inspect the IAC valve and check the pintle movement.
- Check the air tubes (if equipped) for blockage or damage.
- Remove and inspect the air cleaner element for excessive dirt.
- **Is the IAC valve OK?**

Yes	No

GO to **KE12**.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KE12 VERIFY THE DTC

- **Is DTC P0511 or P1504 present in continuous memory or from the KOER self-test?**

Yes	No
GO to **KE22**.	GO to **KE13**.

KE13 CHECK THE IAC SIGNAL FROM THE PCM

NOTE: **If stalling occurs, place a shim under the hard stop screw to maintain idle conditions.**

NOTE: **With the engine at normal operating temperature, closed throttle and all accessories off, the IAC duty cycle should be between approximately 22% and 65%.**

- PCM connector connected.
- IAC connector connected.
- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Access the PCM and monitor the IAC PID.
- Slowly increase the engine speed to 3,000 RPM and return to closed throttle. (Note: If closed throttle RPM is significantly higher than normal, ignore this step).
- **Is the percentage between 22 - 65%?**

Yes	No
GO to **KE14**.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KE14 VERIFY THE DTC

- **Is DTC P0506, P0511, P1504 or P1507 present in continuous memory?**

Yes	No
	INSPECT the throttle body for damage. REPAIR as necessary. If OK, INSTALL a new IAC valve.

GO to **KE20**.	REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .

KE15 DTCS P0507 OR P1506: CHECK FOR INLET AIR LEAKS

- Key ON, engine running.
- With the engine running at idle, listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for leaks such as:
  - damaged or loose IAC air tubes.
  - cracked or punctured intake air tube.
  - loose intake air tube at the air cleaner housing or throttle body.
  - IAC valve or gasket seal.
  - EGR valve gasket seal.
  - vacuum supply connector and hose.
  - PCV valve, connectors and hoses.
- **Are any leaks present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KE16**.

KE16 CHECK FOR EVAP DTCS

NOTE: EVAP system malfunctions can cause IAC DTCs or idle speed concerns.

- **Are any EVAP DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **KE17**.

KE17 CHECK THE IAC VALVE FOR CORRECT FUNCTION

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Transmission in PARK or NEUTRAL.

- Disconnect the IAC Valve.
- **Does the RPM drop or the engine stall?**

Yes	No
GO to **KE18**.	INSPECT the throttle body for damage. REPAIR as necessary. If OK, INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . CLEAR the DTCs. REPEAT the self-test.

KE18 CHECK THE IAC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

NOTE: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Key in OFF position.
- Scan tool connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
IAC	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KE19**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KE19 VERIFY THE SYMPTOM

- **Is a fast idle symptom currently present?**

Yes	No
GO to **KE22**.	GO to **KE20**.

KE20 CHECK THE IAC SYSTEM FOR AN INTERMITTENT OPEN OR SHORT

- PCM connector connected.

- Key ON, engine running.
- Access the PCM and monitor the IAC PID.
- Access the PCM and monitor the RPM PID.
- With the engine at normal operating temperature, closed throttle and all accessories off, the IAC duty cycle should be between approximately 22% and 65%.
- Observe the PIDs while carrying out the following at idle:
  - Lightly tap on the and wiggle the harness connector to simulate road shock.
  - Grasp the vehicle harness closest to the IAC valve. Shake and bend a small section of the harness from the IAC to the bulkhead and from the bulkhead to the PCM.
- **Do the IAC or RPM PIDs suddenly change in value, indicating a concern?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KE21**.

KE21 VERIFY THE SYMPTOM

- **Is an idle quality, starting or stalling symptom currently present?**

Yes	No
INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose fast idle concerns.

KE22 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KF: FAN CONTROL (FC) RELAYS

This pinpoint test is intended to diagnose the following:

- LFC, MFC, HFC relays
- harness circuits: HFC, LFC, MFC, VPWR
- powertrain control module (PCM) (12A650)

Although the PCM output circuits are called low, medium and high fan control (FC), cooling fan operation is controlled by a combination of these outputs.

Refer to**ENGINE CONTROL COMPONENTS** .

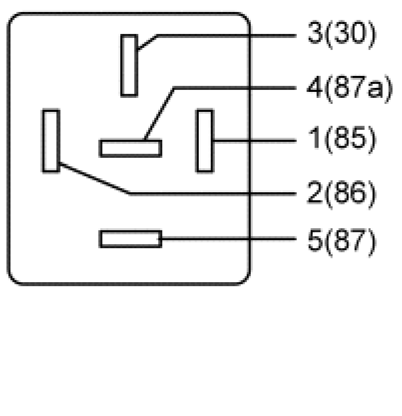

Fig. 181: Low Fan Control (LFC) Relay Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	LFC (Low Fan Control)
1	VPWR (Vehicle Power)

NOTE: The VPWR and LFC circuits may be reversed in the harness connector. Also, the LFC circuit may be wired to 2 separate relays. Refer to the Wiring Diagrams article for additional information.

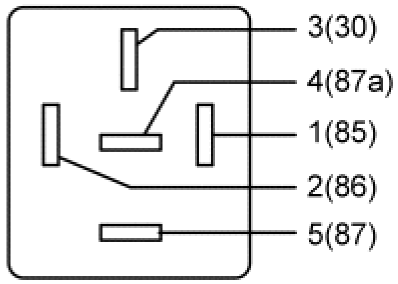

Fig. 182: Medium Fan Control (MFC) Relay Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	MFC (Medium Fan Control)
1	VPWR (Vehicle Power)

NOTE: The VPWR and MFC circuits may be reversed in the harness connector. Also, the MFC circuit may be wired to 2 separate relays. Refer to the Wiring Diagrams article for additional information.

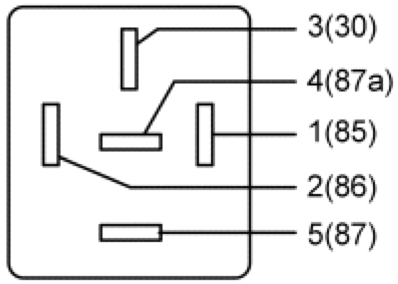

Fig. 183: High Fan Control (HFC) Relay Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	HFC (High Fan Control)

1	VPWR (Vehicle Power)

NOTE: The VPWR and HFC circuits may be reversed in the harness connector. Also, the HFC circuit may be wired to 2 separate relays. Refer to the Wiring Diagrams article for additional information.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Pin	Circuit
Escape/Mariner 2.3L	B38 B17 B39	HFC MFC LFC
Focus	B18 B34	HFC LFC
Mustang	E4 E7	HFC LFC
Ranger	E7	LFC
All other vehicles	B38 B39	HFC LFC

KF1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0480, P0481, P0482, P1474, P1477 or P1479 present?**

Yes	No
For KOEO and KOER DTCs P0480 or P1474, GO to **KF3**. For continuous memory DTCs P0480 or P1474, GO to **KF36**. For DTCs P0481, P0482, P1477 or P1479, GO to **KF2**.	For fans always on: components, GO to **KF47**. For fans always on: all others, GO to **KF46**. For cooling fan circuits, GO to **KF47**. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KF2 DTCS P0481, P0482, P1477 OR P1479: CHECK FOR THE PRESENCE OF THESE DTCS

- **Are DTCs P0481, P0482, P1477, or P1479 present? P0481 or P1479.**

Yes	No
For KOEO and KOER DTCs P0481 or P1479, Escape 3.0L, Mariner 3.0L. GO to **KF27**. For continuous memory DTCs P0481 or P1479, Escape 3.0L, Mariner 3.0L. GO to **KF44**. For KOEO and KOER DTCs P0481 or P1479, all others, GO to **KF13**.	For KOEO and KOER DTCs P0482 or P1477, Focus, GO to **KF18**. For continuous memory DTCs P0482 or P1477, Focus, GO to **KF42**. For KOEO and KOER DTCs P0482 or P1477, all others, GO to **KF8**.

For continuous memory DTCs P0481 or P1479, all others, GO to **KF38**.	For continuous memory DTCs P0482 or P1477, all others, GO to **KF40**.

KF3 KOEO AND KOER DTCS P0480 OR P1474: CHECK THE VPWR VOLTAGE TO THE LOW SPEED FC RELAY

- LFC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) LFC Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF4**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF4 CHECK FOR LFC CIRCUIT CYCLING

- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) LFC Relay Connector, Harness Side	(-) LFC Relay Connector, Harness Side
VPWR - Pin 1	LFC - Pin 2

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new LFC relay. CLEAR the DTCs. REPEAT the self-test.	GO to **KF5**.

KF5 CHECK THE LFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Remove the test lamp.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) LFC Relay Connector, Harness Side	(-)
LFC - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KF6**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF6 CHECK THE LFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) LFC Relay Connector, Harness Side	(-)
LFC - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KF7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF7 CHECK THE LFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) LFC Relay Connector, Harness Side	(-) PCM Connector, Harness Side
LFC - Pin 2	LFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KF59**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF8 KOEO AND KOER DTCS P0482 OR P1477: CHECK THE VPWR VOLTAGE TO THE MEDIUM SPEED FC RELAY

- MFC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF9**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF9 CHECK FOR MFC CIRCUIT CYCLING

- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) MFC Relay Connector, Harness Side	(-) MFC Relay Connector, Harness Side
VPWR - Pin 1	MFC - Pin 2

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new MFC relay. CLEAR the DTCs.	GO to **KF10**.

REPEAT the self-test.	

KF10 CHECK THE MFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Remove the test lamp.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC Relay Connector, Harness Side	(-)
MFC - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KF11**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF11 CHECK THE MFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) MFC Relay Connector, Harness Side	(-)
MFC - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KF12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF12 CHECK THE MFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) MFC Relay	(-) PCM

Connector, Harness Side	Connector, Harness Side
MFC - Pin 2	MFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KF59**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF13 KOEO AND KOER DTCS P0481 OR P1479: CHECK THE VPWR VOLTAGE TO THE HIGH SPEED FC RELAY

- HFC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF14**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF14 CHECK FOR HFC CIRCUIT CYCLING

- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) HFC Relay Connector, Harness Side	(-) HFC Relay Connector, Harness Side
VPWR - Pin 1	HFC - Pin 2

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.

- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new HFC relay. CLEAR the DTCs. REPEAT the self-test.	GO to **KF15**.

KF15 CHECK THE HFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Remove the test lamp.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC Relay Connector, Harness Side	(-)
HFC - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KF16**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF16 CHECK THE HFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) HFC Relay Connector, Harness Side	(-)
HFC - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KF17**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF17 CHECK THE HFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) HFC Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC - Pin 2	HFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KF59**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF18 KOEO AND KOER DTCS P0482 OR P1477: CHECK THE VPWR VOLTAGE TO THE MFC1 RELAY

NOTE: **This application has 2 relays wired to the MFC circuit. This procedure may call out MFC1 and MFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.**

- MFC1 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC1 Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF19**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF19 CHECK FOR MFC CIRCUIT CYCLING

- Connect a non-powered test lamp between:

(+) MFC1 Relay	(-) MFC1 Relay

Connector, Harness Side	Connector, Harness Side
VPWR	MFC

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new MFC1 relay at the end of diagnostics. Leave the relay disconnected. CLEAR the DTCs. REPEAT the self-test. GO to **KF24**.	Leave the test lamp connected. GO to **KF20**.

KF20 CHECK FOR MFC CIRCUIT CYCLING WITH THE MFC2 RLY DISCONNECTED

- Connect a non-powered test lamp between:

(+) MFC1 Relay Connector, Harness Side	(-) MFC1 Relay Connector, Harness Side
VPWR	MFC

- MFC2 Relay connector disconnected.
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new MFC2 relay. CLEAR the DTCs. REPEAT the self-test.	GO to **KF21**.

KF21 CHECK THE MFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC1 Relay Connector, Harness Side	(-)
MFC	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KF22**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF22 CHECK THE MFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) MFC1 Relay Connector, Harness Side	(-)
MFC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KF23**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF23 CHECK THE MFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) MFC1 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
MFC	MFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KF59**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF24 VERIFY THERE IS NOT AN OPEN IN THE CIRCUIT SPECIFIC TO THE MFC2 RELAY

- Access the PCM and monitor the MFC_F PID.
- Command the high speed fan ON.
- Command the outputs OFF.
- Command the low speed fan ON.
- Command the outputs OFF.
- **Does the PID indicate a concern (yes) when either the high or low speed cooling fan output is commanded on and off?**

Yes	No
GO to **KF25**.	INSTALL a new MFC relay. CLEAR the DTCs. REPEAT the self-test.

KF25 CHECK THE VPWR VOLTAGE TO THE MFC2 RELAY

- MFC2 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC2 Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF26**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF26 CHECK THE MFC CIRCUIT BETWEEN THE MEDIUM SPEED FC RELAY(S)

- Key in OFF position.
- Measure the resistance between:

(+) MFC1 Relay Connector, Harness Side	(-) MFC2 Relay Connector, Harness Side
MFC	MFC

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new MFC relay(s). CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF27 KOEO AND KOER DTCS P0481 OR P1479: CHECK THE VPWR VOLTAGE TO THE HFC1 RELAY

NOTE: This application has 2 relays wired to the HFC circuit. This procedure may call out HFC1 and HFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.

- HFC1 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC1 Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF28**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF28 CHECK FOR HFC CIRCUIT CYCLING

- Connect a non-powered test lamp between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC1 Relay Connector, Harness Side
VPWR	HFC

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is**

commanded on and off?

Yes	No
INSTALL a new HFC1 relay at the end of diagnostics. Leave the relay disconnected. CLEAR the DTCs. REPEAT the self-test. GO to **KF33**.	Leave the test lamp connected. GO to **KF29**.

KF29 CHECK FOR HFC CIRCUIT CYCLING WITH THE HFC2 RLY DISCONNECTED

- Connect a non-powered test lamp between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC1 Relay Connector, Harness Side
VPWR	HFC

- HFC2 Relay connector disconnected.
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new HFC2 relay. CLEAR the DTCs. REPEAT the self-test.	GO to **KF30**.

KF30 CHECK THE HFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC1 Relay Connector, Harness Side	(-)
HFC	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KF31**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF31 CHECK THE HFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) HFC1 Relay Connector, Harness Side	(-)
HFC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KF32**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF32 CHECK THE HFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) HFC1 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KF59**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF33 VERIFY THERE IS NOT AN OPEN IN THE CIRCUIT SPECIFIC TO THE HFC2 RELAY

- Access the PCM and monitor the HFC_F PID.
- Command the high speed fan ON.
- Command the outputs OFF.
- Command the low speed fan ON.
- Command the outputs OFF.

- **Does the PID indicate a concern (yes) when either the high or low speed cooling fan output is commanded on and off?**

Yes	No
GO to **KF34**.	INSTALL a new HFC1 relay. CLEAR the DTCs. REPEAT the self-test.

KF34 CHECK THE VPWR VOLTAGE TO HFC2 RLY

- HFC2 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC2 Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF35**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF35 CHECK THE HFC CIRCUIT BETWEEN THE HIGH SPEED FC RELAY(S)

- Key in OFF position.
- Measure the resistance between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC2 Relay Connector, Harness Side
HFC	HFC

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new HFC relay(s). CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF36 CONTINUOUS MEMORY DTCS P0480 OR P1474: CHECK THE LFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: If the test lamp does not turn on, command the high speed fan on.

- A/C and defrost off.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- LFC Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) LFC Relay Connector, Harness Side	(-) LFC Relay Connector, Harness Side
VPWR - Pin 1	LFC - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the LFC circuit(s).
  - Shake, wiggle, and bend the VPWR circuit to the LFC relay.
  - Inspect the LFC relay component for signs of damage.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KF37**.

KF37 CHECK THE LFC CIRCUIT FOR AN INTERMITTENT SHORT TO GROUND

- Key ON, engine OFF.
- Command the outputs OFF.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns on when a concern is detected.
  - Shake, wiggle, and bend the LFC circuit
  - Lightly tap on the LFC RLY to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KF38 CONTINUOUS MEMORY DTCS P0481 OR P1479: CHECK THE HFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: If the test lamp does not turn on, command the low speed fan ON.

- A/C and defrost off.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- HFC Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) HFC Relay Connector, Harness Side	(-) HFC Relay Connector, Harness Side
VPWR - Pin 1	HFC - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the high speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the HFC circuit(s)
  - Shake, wiggle, and bend the VPWR circuit to the HFC relay
  - Lightly tap on the HFC RLY to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KF39**.

KF39 CHECK THE HFC CIRCUIT FOR AN INTERMITTENT SHORT TO GROUND

- Key ON, engine OFF.
- Command the outputs OFF.
- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the HFC circuit(s). Shake, wiggle, and bend the PCM on both high speed FC relays.
- **Is a concern present?**

Yes	No
	Unable to duplicate or identify the concern at this

ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	time. refer to **PINPOINT TEST Z**.

KF40 CONTINUOUS MEMORY DTCS P0482 OR P1477: CHECK THE MFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: If the test lamp does not turn on, command the high speed fan on.

- A/C and defrost off.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- MFC Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) MFC Relay Connector, Harness Side	(-) MFC Relay Connector, Harness Side
VPWR - Pin 1	MFC - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the MFC circuit(s).
  - Shake, wiggle, and bend the VPWR circuit to the MFC relay.
  - Inspect the MFC RLY component for signs of damage.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KF41**.

KF41 CHECK THE MFC CIRCUIT FOR AN INTERMITTENT SHORT TO GROUND

- Key ON, engine OFF.
- Command the outputs OFF.
- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the HFC circuit(s). Shake, wiggle, and bend the PCM on both high speed FC relays.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KF42 CONTINUOUS MEMORY DTCS P0482 OR P1477: CHECK THE MFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: This application has 2 relays wired to the MFC circuit. This procedure may call out MFC1 and MFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.

NOTE: If the test lamp does not turn on, command the high speed fan ON.

- AC and defroster OFF.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- MFC1 Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) MFC1 Relay Connector, Harness Side	(-) MFC1 Relay Connector, Harness Side
VPWR	MFC

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the MFC circuit between the PCM and both medium speed FC relays
  - Shake, wiggle, and bend the VPWR circuit to both medium speed FC relays
  - Lightly tap on the medium speed FC relay that is still connected to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KF43**.

KF43 CHECK THE MFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key ON, engine OFF.
- Command the outputs OFF.
- Exit output test mode.
- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the MFC circuit(s).
- Inspect the medium speed FC relay that is disconnected for intermittent concerns.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KF44 CONTINUOUS MEMORY DTCS P0481 OR P1479: CHECK THE HFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: **This application has 2 relays wired to the HFC circuit. This procedure may call out HFC1 and HFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.**

NOTE: **If the test lamp does not turn on, command the high speed fan ON.**

- A/C and defroster OFF.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- HFC1 Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC1 Relay Connector, Harness Side
VPWR	HFC

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the PCM and both high speed FC relays.
  - Shake, wiggle, and bend the VPWR circuit to both high speed FC relays
  - Lightly tap on the high speed FC relay that is still connected to simulate road shock

- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KF45**.

KF45 CHECK THE HFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key ON, engine OFF.
- Command the outputs OFF.
- Exit output test mode.
- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the HFC circuit(s) between the PCM and on both high speed FC relays.
- Inspect the high speed FC relay that is disconnected for intermittent concerns.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KF46 THE COOLING FAN ALWAYS RUNS (NO DTCS): VERIFY THE FAN IS NOT ON BECAUSE OF A/C HIGH PRESSURE SWITCH INPUT TO THE PCM

- Key ON, engine running.
- Access the PCM and monitor the ACP PID.
- **Is the PID state CLOSED?**

Yes	No
The PCM turns the fan on when the medium pressure, normally open contacts of the ACHP switch are closed. GO to **KF57**.	The input is OK. GO to **KF47**.

KF47 COOLING FAN CONCERN (NO DTCS): CHECK THE FAN CONTROL PRIMARY CIRCUITS

NOTE: Chose the PIDs below as appropriate, according to which circuits the vehicle has.

- Verify that the A/C is OFF.
- Verify engine temperature is below the temperature where the cooling fan comes on.
- Key ON, engine OFF.
- Access the PCM and monitor the LFC_F, MFC_F and HFC_F PIDs.

- **Does either PID indicate a concern?**

Yes	No
A concern is present in the primary circuit(s). GO to **KF48**.	For all except Ranger, the PCM primary circuit(s) is OK. To check for secondary wiring, REFER to the **ENGINE COOLING -- E-SERIES** , for cooling system diagnosis. For Ranger: GO to **KF50**.

KF48 DOES THE LFCF PID INDICATE A CONCERN?

- **Does the LFCF PID indicate a concern?**

Yes	No
The low fan control (LFC) circuitry has a primary circuit concern. GO to **KF3**.	GO to **KF49**.

KF49 DOES THE MFCF PID INDICATE A CONCERN?

- **Does the MFCF PID indicate a concern?**

Yes	No
The medium fan control (MFC) primary circuitry has a circuit concern. For Focus, GO to **KF18**. For all others, GO to **KF8**.	The high fan control (HFC) primary circuitry has a circuit concern. For Escape 3.0L, and Mariner 3.0L, GO to **KF27**. For all others, GO to **KF13**.

KF50 IS THE SYMPTOM: COOLING FAN ALWAYS RUNS?

- **Is the symptom: cooling fan always runs?**

Yes	No
GO to **KF56**.	GO to **KF51**.

KF51 ELECTRIC COOLING FAN CONCERN (WITH NO DTCS): ELECTRIC COOLING FAN FUNCTIONAL CHECK

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- **Does the fan operate?**

Yes	No
All cooling fan circuit checks are OK. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts to continue diagnosis.	GO to **KF52**.

KF52 FAN INOPERATIVE: COMMAND THE LOW SPEED FAN ON AND CHECK FOR VOLTAGE TO THE CF

- Key in OFF position.
- CF Motor connector disconnected.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Measure the voltage between:

(+) CF Motor Connector, Harness Side	(-)
FAN PWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF53**.	GO to **KF54**.

KF53 CHECK THE GROUND CIRCUIT TO THE COOLING FAN

- Key in OFF position.
- Measure the resistance between:

(+) CF Motor Connector, Harness Side	(-)
GND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new CF motor. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF54 CHECK THE B+ VOLTAGE TO THE FC RELAY

- FC Relay connector disconnected.

- Measure the voltage between:

(+) FC Relay Connector, Harness Side	(-)
B+	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KF55**.	REPAIR the open circuit. There is a B+ circuit concern. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before replacing the fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KF55 CHECK THE FAN PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FC Relay Connector, Harness Side	(-) CF Motor Connector, Harness Side
FAN PWR	FAN PWR

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new FC relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF56 CHECK FOR FC RLY CONTACTS ALWAYS CLOSED

NOTE: Verify the A/C and defrost are off.

- FC Relay connector disconnected.
- Key ON, engine OFF.
- **Does the fan run with the key in the ON position?**

Yes	No
REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new FC relay. CLEAR the DTCs. REPEAT the self-test.

KF57 CHECK THE A/CHPSW (MEDIUM PRESSURE, NORMALLY OPEN CONTACTS)

- A/CHPSW connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the ACP PID.
- **Is the PID state CLOSED?**

Yes	No
GO to **KF58**.	CONNECT the A/CHPSW. REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** , to diagnose the A/C system pressure. If OK, INSTALL a new A/CHPSW. CLEAR the DTCs. REPEAT the self-test.

KF58 CHECK THE A/CPSW CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) A/CHPSW Connector, Harness Side	(-)
A/CPSW	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
VERIFY the results of the previous test steps. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts to continue diagnosis.	REPAIR the short circuit to GND. CLEAR the DTCs. REPEAT the self-test.

KF59 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KG: FUEL INJECTOR

This pinpoint test is intended to diagnose the following:

- fuel injector(s) (9F593)
- harness circuits: VPWR and INJ 1 - 10
- powertrain control module (PCM) (12A650)

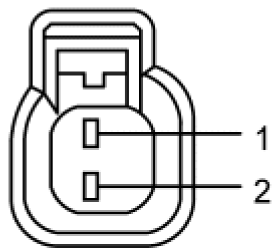

Fig. 184: Injector (INJ) Connector
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Fusion 3.0L, Milan 3.0L	A	2 1	INJ VPWR
All other vehicles	A	1 2	INJ VPWR

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series 6.8L, F-Super Duty 6.8L	170 Pin	E52 E35 E53	INJ1 INJ2 INJ3

		E36 E54 E37 E55 E38 E56 E39	INJ4 INJ5 INJ6 INJ7 INJ8 INJ9 INJ10
Edge, F-150 4.2L, MKX, Sable, Taurus, Taurus X	190 Pin	E52 E35 E53 E36 E54 E37	INJ1 INJ2 INJ3 INJ4 INJ5 INJ6
Escape/Mariner 3.0L	150 (50-50-50) Pin	E2 E5 E13 E4 E3 E15	INJ1 INJ2 INJ3 INJ4 INJ5 INJ6
Escape/Mariner 2.3L	150 (50-50-50) Pin	E2 E3 E4 E5	INJ1 INJ2 INJ3 INJ4
Expedition, Navigator	140 Pin	E52 E35 E53 E36 E54 E37 E55 E38	INJ1 INJ2 INJ3 INJ4 INJ5 INJ6 INJ7 INJ8
Explorer 4.0L, Explorer Sport Trac 4.0L, Mountaineer 4.0L, Mustang 4.0L, Ranger 4.0L, Ranger 3.0L	170 Pin	E52 E35 E53 E36 E54 E37	INJ1 INJ2 INJ3 INJ4 INJ5 INJ6
F-150 4.6L, F-150 5.4L, Mark LT	190 Pin	E52 E35 E53 E36 E54 E37 E55 E38	INJ1 INJ2 INJ3 INJ4 INJ5 INJ6 INJ7 INJ8

Focus	190 Pin	E1 E2 E3 E4	INJ1 INJ2 INJ3 INJ4

Ranger 2.3L	170 Pin	E52 E35 E53 E36	INJ1 INJ2 INJ3 INJ4
All other vehicles	170 Pin	E52 E35 E53 E36 E54 E37 E55 E38	INJ1 INJ2 INJ3 INJ4 INJ5 INJ6 INJ7 INJ8

KG1 DTCS P0201 THROUGH P0210 OR SYMPTOMS WITHOUT DTCS: CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: **Disconnect the suspect fuel injector harness connector. Only the suspect injector needs to be diagnosed.**

NOTE: **On some vehicles, the injector voltage is only present when the fuel pump relay is energized. Measure the injector voltage within 2 seconds of the key ON.**

- Key in OFF position.
- INJ connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) INJ Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KG2**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KG2 CHECK THE INJ CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) INJ Connector, Harness Side
Suspect INJ	INJ

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KG3**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KG3 CHECK THE INJ CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) INJ Connector, Harness Side	(-)
INJ	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KG4**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KG4 CHECK THE INJ CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) INJ Connector, Harness Side	(-)
INJ	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to **KG5**.

KG5 CHECK THE RESISTANCE OF THE FUEL INJECTOR

- Key in OFF position.
- Measure the resistance between:

(+) INJ Connector, Component Side	(-) INJ Connector, Component Side
VPWR	INJ

- **Is the resistance between 11 - 18 ohms?**

Yes	No
GO to **KG6**.	INSTALL a new fuel injector. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

KG6 CHECK THE FUNCTIONALITY OF THE INJ CIRCUIT

- PCM connector connected.
- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) INJ Connector, Harness Side	(-) INJ Connector, Harness Side
VPWR	INJ

- Key ON, engine running.

- **Is the test lamp blinking?**

Yes	No
GO to **KG7**.	GO to **KG8**.

KG7 CARRY OUT A THOROUGH WIGGLE TEST ON THE FUEL INJECTOR HARNESS

- Key in OFF position.
- INJ connector connected.
- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the INJ_F PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the fuel injector to the PCM.
- **Are any injector values fluctuating in and out of range?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KG8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KJ: SUPERCHARGER BYPASS CONTROL

This pinpoint test is intended to diagnose the following:

- supercharger bypass actuator
- vacuum hoses

KJ1 CHECK FOR DTCS

NOTE: **DTCs P1227 and P1228 are for informational purposes only and are usually accompanied by other DTCs. If concerns are present with the mass air flow (MAF) sensor, the exhaust gas recirculation (EGR) valve, or the manifold absolute pressure (MAP) sensor, DTCs P1227 or P1228 may be set. Diagnose all other DTCs before diagnosing DTCs P1227 or P1228.**

- **Are DTCs P1227, or P1228 present?**

Yes	No
GO to **KJ2**.	For lack/loss of power, GO to **KJ3**. For all other symptoms without DTCs, GO to **KJ2**.

KJ2 DTCS P1227 OR P1228: VERIFY THE DTC

- Record and clear the DTCs.
- Drive the vehicle at normal operating temperature with the engine exceeding 2,000 RPM.
- Check for DTCs.
- **Are any other DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **KJ4**.

KJ3 CHECK THE IAT2 PID

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- Key ON, engine running.
- Access the PCM and monitor the IAT2 PID.
- **Is the temperature greater than 110°C (230°F)?**

Yes	No

CHECK for low fluid level in the charge air cooler (CAC) system. CHECK for damaged CAC lines. REFER to the **ENGINE COOLING -- E-SERIES** , Supercharger Cooling to diagnose a loss of coolant.	GO to **KJ4**.

KJ4 CHECK THE SUPERCHARGER BYPASS ACTUATOR VACUUM HOSES

NOTE: For vehicle specific vacuum hose routing, refer to the VECI label located in the front of the engine compartment.

- Check for holes, cracks, bends or kinks in the vacuum lines going to the supercharger bypass actuator.
- Check for any disconnected hoses at the supercharger bypass actuator.
- **Are any concerns present?**

Yes	No
REPAIR or INSTALL new vacuum lines as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KJ5**.

KJ5 CHECK THE BYPASS VALVE ACTUATOR

NOTE: Additional DTCs may set as a result of disconnecting the vacuum line in this step.

- Visually inspect the bypass valve actuator for damage.
- Key in OFF position.
- Note the position of the supercharger bypass actuator linkage.
- Key ON, engine running.
- Note the position of the supercharger bypass actuator linkage.
- Disconnect the supercharger bypass actuator upper vacuum hose.
- **Does the supercharger bypass actuator linkage move when the engine is started, and return to the original position when the supercharger bypass actuator vacuum line is disconnected?**

Yes	No
The concern is not present at this time. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose lack/loss of power concerns.	INSTALL a new supercharger bypass actuator. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST KM: AIR CONDITIONING CLUTCH (A/CC) RELAY CIRCUIT

WARNING: Crown Victoria Police Interceptor vehicles equipped with fire suppression

system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- A/CC relay
- harness circuits: VPWR, A/CCR, A/CCS
- powertrain control module (PCM) (12A650)

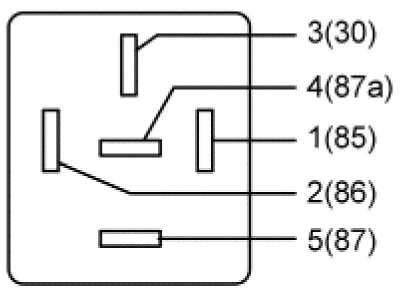

Fig. 185: Air Conditioning Clutch (A/CC) Relay Connector - A
Courtesy of FORD MOTOR CO.

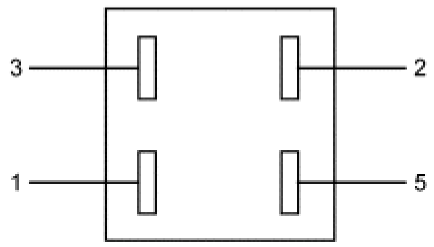

Fig. 186: Air Conditioning Clutch (A/CC) Relay Connector - B
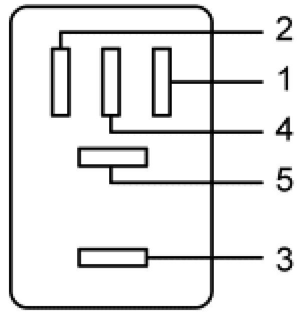
Courtesy of FORD MOTOR CO.



A0077584

Fig. 187: Air Conditioning Clutch (A/CC) Relay Connector - C
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Expedition, F-150, Mark LT, Navigator	A	1 2	A/CCR VPWR
Focus	B	2 1	A/CCR VPWR
All other vehicles	C	1 2	A/CCR VPWR

The VPWR and A/CCR circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article for additional information.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series, F-Super Duty	170 Pin	E3	A/CCR
Edge, F-150, Mark LT, MKX, Sable, Taurus, Taurus X	190 Pin	B18	A/CCR
Escape/Mariner	150 (50-50-50) Pin	B25	A/CCR
Expedition,	140 Pin	B18	A/CCR

Navigator			
Focus	190 Pin	B2	A/CCR
Fusion, Milan, MKZ	140 Pin	B64	A/CCR
All other vehicles	170 Pin	B14	A/CCR

KM1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0534, P0645, P1460, P1464 or P1469 present?**

Yes	No
For KOEO and KOER DTCs P0645 or P1460, GO to **KM2**. For continuous memory DTCs P0645 or P1460, GO to **KM10**. For KOEO and KOER DTC P1464, GO to **KM8**. For continuous memory DTCs P0534 or P1469, GO to **KM12**.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KM2 KOEO AND KOER DTCS P1460 OR P0645: VERIFY THAT THE ACCS PID IS OFF

NOTE: **Verify the A/C and the defrost are off during KOEO/KOER self-tests. If the vehicle is not equipped with A/C, the A/CCR circuit is not used and DTC P1460/P0645 can be ignored.**

- Key ON, engine running.
- A/C and defroster OFF.
- Access the PCM and monitor the ACCS PID.
- **Is the PID state OFF?**

Yes	No
GO to **KM3**.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

KM3 CHECK THE VPWR VOLTAGE TO THE A/CC RELAY

- Key in OFF position.
- A/CC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) A/CC Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KM4**.	REPAIR the open circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.

KM4 CHECK THE A/CC RELAY

- Key in OFF position.
- Carry out the A/CC relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the A/CC relay pass the component test?**

Yes	No
GO to **KM5**.	INSTALL a new A/CC relay. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. CLEAR the DTCs. REPEAT the self-test.

KM5 CHECK THE A/CCR (WAC) CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) A/CC Relay Connector, Harness Side	(-)
A/CCR	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KM6**.	REPAIR the short circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch.

	REPEAT the self-test.

KM6 CHECK THE A/CCR (WAC) CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) A/CC Relay Connector, Harness Side	(-)
A/CCR	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KM7**.	REPAIR the short circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.

KM7 CHECK THE A/CCR (WAC) CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) A/CC Relay Connector, Harness Side	(-) PCM Connector, Harness Side
A/CCR	A/CCR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KM14**.	REPAIR the open circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.

KM8 KOEO AND KOER DTC P1464: VERIFY THE A/C AND DEFROST ARE OFF DURING THE SELF-TEST

- Verify the A/C and defrost are off during the self-test.
- **Are the A/C and defrost off during the self-test?**

Yes	No
GO to **KM9**.	Turn the A/C and defrost off. REPEAT the self-test where DTC P1464 was retrieved.

KM9 CHECK THE ACCS PID

- Key ON, engine OFF.
- A/C and defroster OFF.
- Access the PCM and monitor the ACCS PID.
- **Is the PID state ON?**

Yes	No
The ACCS PID indicates the PCM is being requested to turn the A/C on. REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.	The ACCS PID indicates that the ACCS input to the PCM is low. VERIFY the test step results. Turn off the A/C and defrost. REPEAT the self-test.

KM10 CONTINUOUS MEMORY DTCS P1460 OR P0645: CHECK THE A/CCR (WAC) CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

NOTE: If the vehicle is not equipped with A/C, the A/CCR circuit is not used and the P1460/P0645 can be ignored.

NOTE: The A/C clutch clicks on when a concern is present.

- Key ON, engine OFF.
- Check the A/CCR (WAC) circuit for short to ground while carrying out the following:
    - Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module
    - Lightly tap on the A/CC relay to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.	GO to **KM11**.

KM11 CHECK THE A/CCR (WAC) FOR AN OPEN OR SHORT CIRCUIT TO VOLTAGE

NOTE: The A/C clutch clicks off if a concern is present.

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Check the A/CCR (WAC) circuit for an open or short to voltage while carrying out the following:
  - Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module
  - Lightly tap on the A/CC relay to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KM12 CONTINUOUS MEMORY DTCS P0534 OR P1469: CHECK FOR CAUSES OF FAST A/CCS CYCLING

- Check the following:
  - A/C system pressure
  - A/CCS cycle times

  REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary.	GO to **KM13**.

KM13 CHECK FOR INTERMITTENT OPEN IN THE A/CCS CIRCUIT

NOTE: The ACCS PID turns off and on quickly when a concern is present, indicating an intermittent open.

- Key ON, engine OFF.
- Access the PCM and monitor the ACCS PID.
- Turn on the A/C switch.
- Check the A/CCR (WAC) circuit for an open or short to voltage while carrying out the following:
  - Wiggle, shake, and bend small sections of the wiring harness while working from the component to

the module.
    - Lightly tap on the pressure switch (PS) (to simulate road shock).
- Inspect the A/CCS connector.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KM14 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KN: VARIABLE SPEED ELECTRIC COOLING FAN

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- variable speed electric cooling fan (8T00)
- harness circuits: FCV, B+, GND
- powertrain control module (PCM) (12A650)

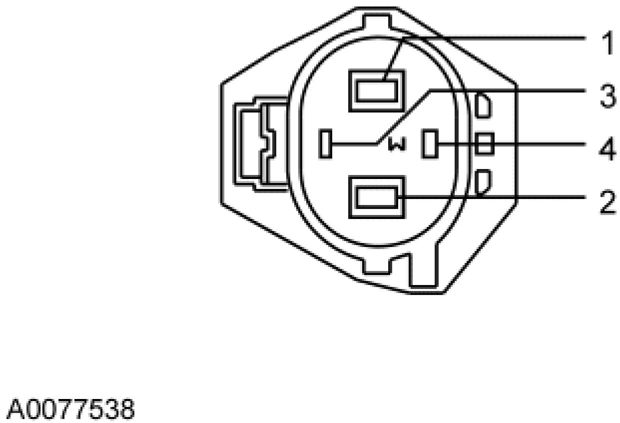


Fig. 188: Cooling Fan (CF) Motor Connector (1 Of 2)
Courtesy of FORD MOTOR CO.

Pin	Circuit
4	FCV (Fan Control Variable)
2	GND (Ground)
1	B+ (Battery Positive Voltage)

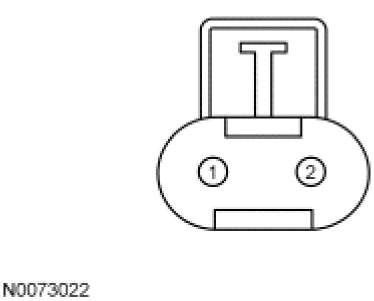

Fig. 189: Cooling Fan (CF) Motor Connector (2 Of 2)
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	GND (Ground)
2	VPWR (Vehicle Power)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Grand Marquis, Town Car	170 Pin	E7	FCV

Fusion, Milan, MKZ	140 Pin	B8	FCV
All other vehicles	190 Pin	B48	FCV

KN1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Is DTC P0480 or P0483 present?**

Yes	No
For KOEO and KOER DTC P0480, GO to **KN2**. For continuous memory DTC P0480, GO to **KN9**. For continuous memory DTC P0483, GO to **KN15**.	For electric cooling fan(s) does not operate (low, medium, high or variable speed), GO to **KN11**.

KN2 KOEO AND KOER DTC P0480: CHECK THE B+ AND GND CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- CF Module connector disconnected.
- Rotate the fan by hand. The fan should rotate freely, with no abnormal binding. If binding is present, remove any foreign materials or install a new fan assembly as required.
- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-) CF Module Connector, Harness Side
B+ - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KN4**.	GO to **KN3**.

KN3 CHECK THE VOLTAGE TO THE COOLING FAN MODULE USING GROUND AS A REFERENCE

- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
B+ - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link.

KN4 CHECK THE FCV CIRCUIT(S)

- Connect the 1.6K ohms resistor between the FCV and B+ circuits at the CF module harness connector (this simulates cooling fan circuitry).
- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Is DTC P0480 present?**

Yes	No
GO to **KN6**.	For Crown Victoria, Grand Marquis, and Town Car, GO to **KN5**. For all others, INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KN5 CHECK THE COOLING FAN OPERATION

- CF Motor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A 12 Volt Vehicle Battery	Point B CF Motor Connector, Component Side
Positive terminal	VPWR - Pin 2

- Connect a 5 amp fused jumper wire between the following:

Point A Vehicle Battery	Point B CF Motor Connector, Component Side
Negative	GND - Pin 1

terminal	

- **Does the cooling fan motor operate correctly?**

Yes	No
INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** .	INSTALL a new Cooling Fan. REFER to the **ENGINE COOLING -- E-SERIES** .

KN6 CHECK THE FCV CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **KN7**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KN7 CHECK THE FCV CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KN8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KN8 CHECK FOR AN OPEN CIRCUIT BETWEEN THE PCM AND COOLING FAN MODULE

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CF Module Connector, Harness Side
FCV	FCV - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KN16**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KN9 CONTINUOUS MEMORY DTC P0480: CHECK THE B+ AND GND CIRCUIT FOR AN INTERMITTENT CONCERN

- Key in OFF position.
- CF Module connector disconnected.
- Rotate the fan by hand. The fan should rotate freely, with no abnormal binding. If binding is present, remove any foreign materials or install a new fan assembly as required.
- Connect a non-powered test lamp between:

(+) CF Module Connector, Harness Side	(-) CF Module Connector, Harness Side
B+ - Pin 1	GND - Pin 2

- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is present.
  - Shake, wiggle, and bend the B+ and GND circuits to the CF
  - Shake, wiggle, and bend the associated fuse
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **KN10**.

KN10 CHECK THE FCV CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Connect the 1.6 K ohms resistor between the FCV and B+ circuits at the CF harness connector (this simulates cooling fan circuitry).

- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the digital multimeter (DMM) for an indication of a concern while shaking, wiggling, and bending the FCV circuit between the CF module and the PCM. Note that voltage changes suddenly when a concern is detected.
- Command the outputs OFF.
- Exit output test mode.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KN11 COOLING FAN MOTOR DOES NOT OPERATE (WITH NO DTCS): COMMAND THE FAN ON TO CHECK OPERATION

- Carry out the KOEO self-test.
- Listen to the fan.
- **Does the fan operate sometime during the KOEO self-test?**

Yes	No
The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** for further direction.	GO to **KN12**.

KN12 CHECK THE B+ AND GND CIRCUITS TO THE COOLING FAN MODULE

- Key in OFF position.
- CF Module connector disconnected.
- Rotate the fan by hand. The fan should rotate freely, with no abnormal binding. If binding is present, remove any foreign materials or install a new fan assembly as required.
- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-) CF Module Connector, Harness Side
B+ - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
For Crown Victoria, Grand Marquis, and Town Car, GO to **KN13**. For all others, INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to **KN14**.

KN13 CHECK THE COOLING FAN OPERATION

- CF Motor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A 12 Volt Vehicle Battery	Point B CF Motor Connector, Component Side
Positive terminal	VPWR - Pin 2

- Connect a 5 amp fused jumper wire between the following:

Point A Vehicle Battery	Point B CF Motor Connector, Component Side
Negative terminal	GND - Pin 1

- **Does the cooling fan motor operate correctly?**

Yes	No
INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** .	INSTALL a new Cooling Fan. REFER to the **ENGINE COOLING -- E-SERIES** .

KN14 CHECK THE VOLTAGE TO THE COOLING FAN MODULE USING GROUND AS A REFERENCE

- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
B+ - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KN15 CONTINUOUS MEMORY DTC P0483: CHECK FOR A COOLING FAN MOTOR OBSTRUCTION OR A COOLING FAN MOTOR MECHANICAL FAILURE

- **Is a cooling fan motor obstruction or a cooling fan motor mechanical failure present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	CLEAR the DTCs. REPEAT the self-test.

KN16 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Replacement PCM.	

PINPOINT TEST KP: CHARGE AIR COOLER (CAC) PUMP

This pinpoint test is intended to diagnose the following:

- CAC pump relay (14B192)
- CAC pump (8501)
- harness circuits: CAC, VPWR and GND
- powertrain control module (PCM) (12A650)

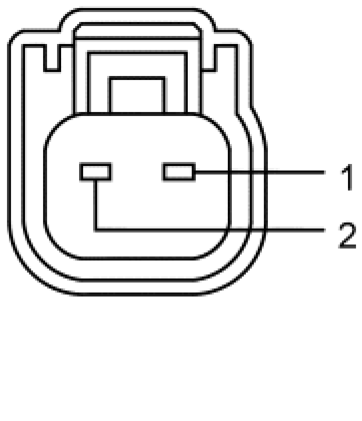

Fig. 190: Charge Air Cooler (CAC) Pump Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	GND (Ground)
1	PUMPPWR (Pump Power)

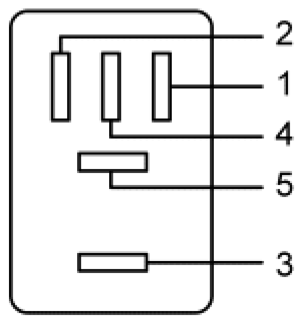

Fig. 191: Powertrain Control Module Power (PCM Power) Relay Connector - A
Courtesy of FORD MOTOR CO.

Pin	Circuit
5	PUMPPWR (Pump Power)
3	B+ (Battery Positive Voltage)
2	CAC (Charge Air Cooler)
1	VPWR (Vehicle Power)

Pin	Circuit
E64	CAC (Charge Air Cooler)

KP1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Is DTC P1229 present?**

Yes	No
For DTC P1229, GO to **KP2**.	For a boost gauge indicates higher than normal boost, GO to **KP9**.

KP2 DTC P1229: CHECK THE VOLTAGE TO THE CAC PUMP RELAY COIL

- Key in OFF position.
- CAC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CAC Relay	

Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KP3**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP3 CHECK THE CAC PUMP RELAY

- Key in OFF position.
- Remove the relay from the power distribution box.
- Measure the resistance between:

(+) CAC Relay Connector, Component Side	(-) CAC Relay Connector, Component Side
CAC - Pin 2	VPWR - Pin 1

- **Is the resistance between 65 - 100 ohms?**

Yes	No
GO to **KP4**.	INSTALL a new CAC relay. CLEAR the DTCs. REPEAT the self-test.

KP4 CHECK THE CAC PUMP RELAY

- Carry out the CAC pump relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the CAC pump relay pass the component test?**

Yes	No
GO to **KP5**.	INSTALL a new CAC relay. CLEAR the DTCs. REPEAT the self-test.

KP5 CHECK FOR AN OPEN CIRCUIT BETWEEN THE PCM AND THE CAC RELAY

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CAC Relay Connector, Harness Side
CAC - Pin E64	CAC - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KP6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP6 CHECK FOR A SHORT TO VOLTAGE BETWEEN THE PCM AND THE CAC RELAY

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
CAC - Pin E64	Negative terminal

- **Is the voltage less than 0.5 V?**

Yes	No
GO to **KP7**.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

KP7 CHECK BETWEEN THE PCM AND THE CAC RELAY FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
CAC - Pin E64	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **KP8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KP8 CHECK THE SCICP PID

- PCM connector connected.
- Access the PCM and monitor the SCICP PID.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- **Is the SCICP PID on?**

Yes	No
If the CAC reservoir is full, there is no air flow blockage at the CAC radiator, the IAT2 and connecting circuits are not high resistance or open, CAC hoses are not reversed and DTC P1229 is present in KOEO and KOER, GO to **KP15**.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KP9 CHECK THE CAC FOR MECHANICAL OPERATION

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Observe the CAC pump.
- Command the outputs OFF.
- **Does the CAC pump run?**

Yes	No
CHECK for low fluid level in the CAC system. CHECK for cracked or incorrectly routed CAC lines or airflow blockage at the CAC radiator. REPAIR the system as necessary. If the symptom still exists, RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose boost gauge indicates higher than normal boost.	GO to **KP10**.

KP10 CHECK THE VOLTAGE AND GROUND CIRCUITS AT THE CAC PUMP

- Charge Air Cooler (CAC) Pump connector disconnected.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Measure the voltage between:

(+) Charge	(-) Charge Air

Air Cooler (CAC) Pump Connector, Harness Side	Cooler (CAC) Pump Connector, Harness Side
PUMPPWR - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new Charge Air Cooler (CAC) Pump. REFER to the **ENGINE COOLING -- E-SERIES** , Supercharger Cooling. CLEAR the DTCs. REPEAT the self-test.	GO to **KP11**.

KP11 CHECK THE CAC VOLTAGE CIRCUIT TO GND

- Measure the voltage between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-) Vehicle Battery
PUMPPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KP12**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP12 CHECK THE INTEGRITY OF THE CAC PUMP GROUND CONNECTION

- Charge Air Cooler (CAC) Pump connector disconnected.
- Measure the resistance between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-) Vehicle Battery
GND - Pin 2	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **KP13**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP13 CHECK THE VOLTAGE TO THE CAC PUMP RELAY

- CAC Relay connector disconnected.
- Measure the voltage between:

(+) CAC Relay Connector, Harness Side	(-)
B+ - Pin 3	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **KP14**.	REPAIR the open circuit. CHECK the fuses. CLEAR the DTCs. REPEAT the self-test.

KP14 CHECK FOR AN OPEN CAC PUMP CIRCUIT

- Measure the resistance between:

(+) CAC Relay Connector, Harness Side	(-) Charge Air Cooler (CAC) Pump Connector, Harness Side
PUMPPWR - Pin 5	PUMPPWR - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new CAC pump relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP15 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.

- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to **FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. refer to **PINPOINT TEST Z**.

PINPOINT TEST NC: IGNITION ENGINE SPEED INPUT CIRCUIT

This pinpoint test is intended to diagnose the powertrain control module (PCM) (12A650).

NC1 CONTINUOUS MEMORY DTC P0320: ERRATIC IGNITION

- Verify all 2-way radio installations. Carefully follow the manufacturer's installation instructions regarding the routing of the antenna and voltage leads.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **NC2**.

NC2 NO START CONCERN

- **Is the customer complaint no start?**

Yes	No
refer to **PINPOINT TEST A**.	GO to **NC3**.

NC3 INTERMITTENT CONDITION

- **Is this an intermittent condition?**

Yes	No
refer to **PINPOINT TEST Z**.	refer to **PINPOINT TEST JD**.

PINPOINT TEST ND: ENGINE RPM\VEHICLE SPEED LIMITER REACHED

NOTE: Enter this pinpoint test only when directed here.

ND1 DTCS P0219, P0297 OR P1270: EXCESSIVE ENGINE RPM OR VEHICLE SPEED

- P0219 (engine over speed), P0297 (vehicle over speed) or P1270 DTCs indicate the vehicle was operated in a manner which caused the engine or vehicle speed to exceed a calibrated limit.
    - Excessive engine RPM in NEUTRAL or operated in the wrong transmission gear.
    - Excessive wheel slippage (water, ice, mud or snow).
    - Vehicle driven at a high rate of speed.
- **Was the vehicle operating in any of the above conditions?**

Yes	No
The on-board diagnostics (OBD) system is OK. RETURN the vehicle to customer with information about the DTC.	REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** . If there are no other symptoms, RETURN the vehicle to the customer with information about the DTC.

PINPOINT TEST QA: UNABLE TO ACTIVATE SELF-TEST/NETWORK COMMUNICATION ERROR

This pinpoint test is intended to diagnose the following:

- unable to communicate with PCM
- unable to activate the PCM self-test.
- incorrect self-test procedure
- harness circuits: ISP-R, PCMRC, PWRGND and VPWR

QA1 CARRY OUT A VEHICLE INSPECTION AND VERIFY THE SELF-TEST PROCEDURE

NOTE: **If the self-test or communication concern occurred after a failed or an aborted reprogram, the module may be blank. Attempt to reprogram the module again before continuing with this pinpoint test.**

- Visually inspect the following for obvious signs of electrical damage:
  - harness wiring
  - electrical connections
- Verify the correct procedure was used to activate the self-test for the scan tool. Refer to**SCAN TOOL SETUP AND FUNCTIONALITY** .
- **Was the correct self-test procedure used?**

Yes	No
GO to **QA2**.	REFER to**SCAN TOOL SETUP AND FUNCTIONALITY** .

QA2 CARRY OUT THE NETWORK TEST

- Key ON, engine OFF.
- Carry out the network test.
- **Do all modules indicate pass?**

Yes	No
REFER to Symptom Charts, **PINPOINT TEST QT** .	If only PCM indicates fail, GO to **QA3**. For network test or all other modules indicates fail, REFER to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose The Powertrain Control Module (PCM) Does Not Respond To The Scan Tool Or No High Speed

	Controller Area Network (HS-CAN) Communication Symptom.

QA3 CHECK FOR VREF VOLTAGE AT A SENSOR

NOTE: PCM voltage and ground can be determined by measuring VREF voltage at a sensor. Refer to the VREF Information Table at the beginning of this pinpoint test for the vehicle application and the applicable sensor to test.

- Key in OFF position.
- Disconnect the applicable sensor.
- Key ON, engine OFF.
- Measure the voltage between the applicable sensor VREF circuit, harness side and the applicable sensor SIGRTN circuit, harness side.
- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
REFER to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose The Powertrain Control Module (PCM) Does Not Respond To The Scan Tool Or No High Speed Controller Area Network (HS-CAN) Communication Symptom.	For Crown Victoria, Grand Marquis, E-Series, Escape/Mariner, Ranger, and Town Car, GO to **QA6**. For all others, GO to **QA4**.

QA4 CHECK THE ISP-R VOLTAGE AT THE PCM HARNESS CONNECTOR

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **QA5**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

QA5 CHECK THE PCM VPWR CIRCUITS FOR VOLTAGE

- Key in OFF position.
- Disconnect the PCM.
- Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B
PCMRC	Ground

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VPWR	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to **QA7**.	refer to **PINPOINT TEST B**.

QA6 CHECK THE PCM VPWR CIRCUITS FOR VOLTAGE

- Key in OFF position.
- Disconnect the PCM.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VPWR	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to **QA7**.	refer to **PINPOINT TEST B**.

QA7 CHECK THE PCM GROUND CIRCUITS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	**(-)**
PWRGND	Ground

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **QA8**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

QA8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the network test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST QB: DTCS P0603 OR P1633: KEEP ALIVE POWER (KAPWR)

This pinpoint test is intended to diagnose the following:

- battery terminal condition
- KAPWR wire routing
- harness circuit: KAPWR
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, F-150, Mark LT, MKX, Sable, Taurus, Taurus X	190 Pin	B54	KAPWR
Escape/Mariner	150 (50-50-50) Pin	B45	KAPWR
Expedition, Fusion, Milan, MKZ, Navigator	140 Pin	B54	KAPWR
Focus	190 Pin	B62	KAPWR
All other vehicles	170 Pin	B45	KAPWR

QB1 CHECK THE 12-VOLT BATTERY TERMINALS

NOTE: If the KAPWR is interrupted to the PCM when a breakout box is installed or the battery is disconnected, DTC P0603/P1633 can be generated on the first power-up.

NOTE: If DTC P0603 occurred right after or during an unsuccessful reprogramming of the PCM, clear the DTCs and repeat the PCM self-test. If DTC P0603 is retrieved again, continue with this pinpoint test.

- Inspect the 12-volt battery cables for loose connections and for corrosion.
- **Are the 12-volt battery terminal connections in good condition?**

Yes	No
GO to **QB2**.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

QB2 INSPECT THE ENGINE COMPARTMENT FOR CORRECT WIRE ROUTING

- Inspect the electronic engine control (EEC) system wiring for correct wire routing.
- Check the wiring routing to establish if any of the electrical connectors are being stressed due to poorly routed wiring. If necessary re-route and secure the wiring.
- Visually inspect the wiring and connectors.
- **Is a concern present?**

Yes	No

REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **QB3**.

QB3 CHECK KAPWR TO THE PCM

- Key in OFF position.
- PCM connector disconnected.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
KAPWR	Negative terminal

- While observing the multimeter, grasp the EEC harness and wiggle, shake or bend a small section while working from the battery to the PCM.
- **Is the voltage greater than 10 V?**

Yes	No
GO to **QB4**.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

QB4 CHECK FOR A REPEAT OF THE DTC

- PCM connector connected.
- Clear all DTCs that may have been caused by the PCM disconnect.
- Test drive the vehicle and allow the engine to reach normal operating temperature.
- Carry out the PCM self-test.
- **Is DTC P0603 or P1633 present?**

Yes	No
GO to **QB5**.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

QB5 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.

- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST QC: DTC P1000: ON-BOARD DIAGNOSTIC (OBD) SYSTEMS READINESS TEST NOT COMPLETE

NOTE: **Diagnostic trouble code (DTC) P1000 indicates that all the OBD monitors have not yet been successfully tested. In some areas, this DTC must be cleared to pass an inspection/maintenance test. The customer should be informed that the law specifies additional city and highway driving must be done to complete the check of the OBD system. This additional driving must occur before the vehicle is tested at the inspection/maintenance station. The amount of driving required varies with individual driving patterns. To complete this requirement in the shortest amount of time, refer toON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE .**

It is not necessary to clear DTC P1000 from the powertrain control module (PCM) by driving the vehicle unless it is requested by the customer to pass an inspection/maintenance test.

The only way DTC P1000 can be removed from memory is when all the OBD monitors are successfully completed.

DTC P1000 is set by the PCM under any of the following conditions.

- The vehicle is new from the factory and has not yet completed an OBD drive cycle.
- The battery or PCM is disconnected.
- An OBD monitor concern occurred before completion of an OBD drive cycle.
- The PCM DTCs have been cleared with a scan tool as part of a repair process.
- The PCM has been flashed and the vehicle has not yet completed an OBD drive cycle.
- DTC P1000 may not clear if the vehicle is equipped with a power take off (PTO) and the PTO is engaged or damaged.

QC1 CONTINUOUS MEMORY DTC P1000: CHECK FOR ANY OTHER DTCS

NOTE: **Enter this pinpoint test only if DTC P1000 was retrieved from continuous memory. Ignore DTC P1000 in KOEO or KOER memory.**

- DTC P1000 indicates all of the OBD monitors have not yet been successfully tested.

- **Are any other DTCs received with P1000?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **QC2**.

QC2 CHECK FOR PTO

- **Is the vehicle equipped with PTO?**

Yes	No
GO to **QC3**.	GO to **QC4**.

QC3 CHECK THE PTO PID

- Key ON, engine running.
- Access the PCM and monitor the PTO PID.
- Cycle the PTO switch/actuator ON and OFF. (Follow the PTO aftermarket instructions).
- **Does the PTO PID cycle ON and OFF?**

Yes	No
GO to **QC4**.	GO to **FB2**.

QC4 REQUEST TO CLEAR DTC P1000

NOTE: **An entire OBD drive cycle has not yet been completed to clear DTC P1000 from the PCM.**

- **Has the customer requested DTC P1000 be cleared from the PCM memory?**

Yes	No
CARRY OUT an OBD drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	INFORM the customer that if the law in your area requires additional driving in order to clear DTC P1000 from the PCM memory, it must be completed before an inspection/maintenance test.

PINPOINT TEST QD: DTC P1260: PASSIVE ANTI-THEFT SYSTEM

NOTE: **The passive anti-theft system (PATS) uses radio frequency identification technology to deter a drive away theft. Passive means that it does not require any activity from the user. The PATS uses a specially encoded ignition key. Each encoded ignition key contains a permanently installed electronic device**

called a transponder. Each transponder contains a unique electronic identification code. Each encoded ignition key must be programmed into the vehicle before it can be used to start the engine. DTC P1260 is stored any time the PCM disables the vehicle because of the PATS.

QD1 CHECK FOR PATS DTCS

- Repair all PATS DTCs before P1260. Refer to the **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) -- E-SERIES** for System Description, Operation and Self-Test.
- **Are all PATS DTCs diagnosed?**

Yes	No
GO to **QD2**.	REFER to the **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) -- E-SERIES** to diagnose any PATS related DTCs.

QD2 CHECK FOR ANY OTHER POWERTRAIN DTCS

- Repair all powertrain DTCs other than P1260.
- **Are all other powertrain DTCs diagnosed?**

Yes	No
GO to **QD3**.	DISREGARD DTC P1260. DIAGNOSE all other powertrain DTCs. REFER to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

QD3 ATTEMPT TO START THE ENGINE

- Carry out a keep alive memory reset to clear DTC P1260. Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- Attempt to start the engine.
- **Does the engine start?**

Yes	No
No system concerns exist at the present time. For intermittent no start or start stalls, CHECK for intermittent PATS concerns. (PATS cannot stall the engine after 1 second of operation). For intermittent stalls while driving, VERIFY scan tool-to-PCM communication during the concern. If a PCM communication error occurs, the possible causes are: loss of PWR or GND to the PCM, damaged PCM PWR relay, or a damaged EEC PWR diode. REPAIR as necessary.	DTC P1260 is not the cause of the No Start. REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .

CLEAR the DTCs. REPEAT the self-test.	

PINPOINT TEST QE: ELECTRONIC THROTTLE CONTROL (ETC) SYSTEM

NOTE: **Diagnose and repair the following DTCs through DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS and the Workshop article respectively before entering this pinpoint test:**

- **P0715**
- **P0720**
- **P0731-P0735**
- **P0102-P0104**
- **P0321**
- **C1165**
- **U1027**

This pinpoint test is intended to diagnose the informational powertrain control module (PCM) diagnostic trouble codes (DTCs).

The informational DTCs are the result of limited operating strategy (LOS) or failure mode effects management (FMEM) operating strategy that maintains limited vehicle function in the event of a PCM, harness, or component concern.

Circuit DTCs can be accompanied by the informational DTCs, and should be diagnosed first. Informational DTCs without circuit DTCs may or may not indicate the actual concern and should be diagnosed as a symptom.

Pin	Circuit
6	SIGRTN (Signal Return)
2	VREF (Reference Voltage)

QE1 CHECK FOR DTCS

NOTE: For DTC P061B, make sure the air cleaner and air inlet are correctly seated and properly installed before continuing diagnosis.

- **Are any DTCs present other than the following: P0600, P060A, P060B, P060C, P060D, P061B, P061C, P061D, P061F, P062C, P1674, P2104, P2105, P2110, or U0300?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	For Focus with DTC P0600, GO to **QE2**. For all others with DTC P0600, GO to **QE18**. For DTCs P060A, P060C, P060D, P061D, P1674 or U0300, GO to **QE2**. For DTC P060B, GO to **QE3**. For DTC P061B, GO to **QE13**. For DTC P061C, GO to **QE5**. For DTC P061F, GO to **QE7**. For DTCs P062C, P2104, P2105 or P2110, GO to **QE8**.

QE2 DTCS P060A, P060C, P060D, P061D, P1674 OR U0300: CHECK THE PCM FOR THE LATEST CALIBRATION

- Program the PCM to the latest calibration.
- Key in OFF position.
- Key ON, engine OFF.
- Key in OFF position.
- Key ON, engine running.
- Use the customer information to recreate the concern.
- Carry out the self-test.
- **Are DTCs P060A, P060C, P060D, P061D, P1674 or U0300 present?**

Yes	No
GO to **QE18**.	The concern is not present at this time.

QE3 DTC P060B: CHECK FOR REFERENCE VOLTAGE CONCERNS

- Inspect the PCM harness for damage.
- Verify the correct operation of the sensors using ETCREF, VREF and related circuits. refer to **PINPOINT TEST C** and follow the pinpoint test direction.

- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **QE4**.

QE4 CHECK FOR AN INTERMITTENT CONCERN

- Clear the DTCs.
- Carry out the self-test.
- **Is DTC P060B present?**

Yes	No
GO to **QE18**.	The concern is not present at this time.

QE5 DTC P061C: CHECK THE CKP SENSOR FOR CORRECT OPERATION

- Verify correct operation of the CKP sensor and related circuits. refer to **PINPOINT TEST JD** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **QE6**.

QE6 CHECK THE CMP SENSOR FOR CORRECT OPERATION

- Verify correct operation of the CMP sensor and related circuits. refer to **PINPOINT TEST DR** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **QE7**.

QE7 DTC P061F: VERIFY THE CUSTOMER CONCERN

- Clear the DTCs.
- Use the customer information to recreate the concern.
- Carry out the self-test.
- **Are DTCs P061C or P061F present?**

Yes	No

GO to **QE18**.	The concern is not present at this time.

QE8 DTCS P062C, P2104, P2105 OR P2110: CHECK FOR DTCS IN OTHER VEHICLE MODULES

- Check for self-test DTCs in all of the vehicle modules.
- **Are any DTCs present?**

Yes	No
REFER to the applicable Workshop article part to diagnose the DTC.	GO to **QE9**.

QE9 CHECK FOR THE PRESENCE OF ANY MODULE COMMUNICATION CONCERNS

- Check for self-test DTCs in all of the vehicle modules.
- **Are any communication concerns or communication DTCs present?**

Yes	No
For communication concerns in the PCM, DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** . For communication concerns in other modules, REFER to the applicable Workshop article part to diagnose the communication DTC.	For DTC P062C, GO to **QE16**. For DTC P2104, GO to **QE10**. For DTC P2105, GO to **QE11**. For DTC P2110, GO to **QE15**.

QE10 DTC P2104: CHECK FOR THE PRESENCE OF PCM DTCS

- Clear the PCM DTCs.
- Check for self-test DTCs.
- **Are any DTCs present other than P2104?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	refer to **PINPOINT TEST DK**.

QE11 DTC P2105: CHECK FOR THE PRESENCE OF PCM DTCS

NOTE: **P2105 may be set in combination with other DTCs. Diagnose other DTCs first.**

- Clear the PCM DTCs.
- Check for self-test DTCs.

- **Are any DTCs present other than P2105?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **QE12**.

QE12 CARRY OUT A VISUAL INSPECTION

- Key in OFF position.
- Visually inspect the following for obvious signs of damage:
    - ETB
    - PCM
- Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems. Make sure aftermarket wiring is not routed near the PCM.
- Verify aftermarket equipment does not generate radio frequency interference/electromagnetic interference (RFI/EMI).
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to **QE18**.

QE13 DTC P061B: CHECK FOR THE PRESENCE OF PCM DTCS

NOTE: **An intermittent CKP sensor or harness concern may cause DTC P061B to set. Check for intermittent CKP sensor and harness concerns.**

- Clear the PCM DTCs.
- Check for self-test DTCs.
- **Are any DTCs present other than P061B?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	For Crown Victoria, E-Series 4.6L, Explorer 4.0L, Explorer Sport Trac 4.0L, F-150 4.2L, F-150 4.6L, F-Super Duty 6.8L, Grand Marquis, Mountaineer 4.0L,

	Mustang 4.0L, Mustang 5.4L, and Town Car, GO to **QE14**. For all others, CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.

QE14 CHECK THE MAP INPUT FOR AN OFFSET SIGNAL

- Key in OFF position.
- Allow the vehicle to cool down.
- ESM connector disconnected.
- Measure the resistance between:

(+) ESM Connector, Component Side	(-) ESM Connector, Component Side
VREF - Pin 2	SIGRTN - Pin 6

- **Is the resistance greater than 2K ohms?**

Yes	No
For Crown Victoria, Grand Marquis, Explorer 4.0L, Explorer Sport Trac 4.0L, Mountaineer 4.0L, and Town Car, GO to **QE16**. For all others, CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.	INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

QE15 DTC P2110: CHECK FOR THE PRESENCE OF PCM DTCS

NOTE: P2110 sets in combination with other DTCs.

- Clear the PCM DTCs.
- Check for self-test DTCs.
- **Are any DTCs present other than P2110?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO	

to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to **QE18**.

QE16 CHECK FOR ABS AND WHEEL SPEED SENSOR CONCERNS

NOTE: Refer to the REFERENCE VALUES article Reference Values for the typical diagnostic reference values.

- ESM connector connected.
- Key ON, engine running.
- Access the PCM and monitor the ISS_SRC, OSS_SRC and TSS PIDs.
- Access the PCM and monitor the VSS PID.
- Access the ABS and monitor the LF_WSPD, LR_WSPD, RF_WSPD and RR_WSPD PIDs.
- Road test the vehicle under various load conditions while comparing the PIDs. Check for signals that are intermittent or do not correspond.
- **Do the PID values correspond with the vehicle operating conditions?**

Yes	No
For Explorer 4.0L, Explorer Sport Trac 4.0L, F-150 5.4L, Mark LT, and Mountaineer 4.0L, GO to **QE17**. For all others, CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.	REFER to the **VEHICLE DYNAMIC SYSTEMS -- E-SERIES** to diagnose any ABS concerns.

QE17 CHECK FOR A TRANSFER CASE MECHANICAL CONCERN

- Stop the vehicle.
- Select 4WD Low.
- **Does the vehicle shift into 4WD Low?**

Yes	No
CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.	REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** , Four Wheel Drive (4WD) Systems to diagnose any transfer case concerns.

QE18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:

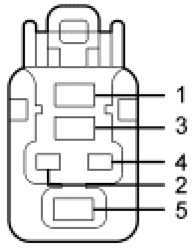
- pushed out pins
- corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST TA: CLUTCH PEDAL POSITION (CPP) SWITCH

This pinpoint test is intended to diagnose the following:

- CPP (11A152/7C534)
- harness circuits: CPP / CPP BT and SIGRTN / GND
- powertrain control module (PCM) (12A650)



N0047960

Vehicle	Connector	Pin	Circuit
Escape/Mariner	A	2 4	SIGRTN CPP
F-150	B	2 1	GND CPP
Mustang	C	2 1	GND CPP
Ranger	B	5 6	GND CPP
All other vehicles	D	2 1	GND CPP

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	B41, E41, T41 T27	SIGRTN CPP
F-150	190 Pin	B39 B58, E58, T43	CPP-BT SIGRTN
F-Super Duty	170 Pin	B34 B41, E58, T41	CPP-BT SIGRTN
Focus	190 Pin	T26 B58, E64, T40	CPP-BT SIGRTN
Fusion, Milan	140 Pin	B18 B58, E58	CPP-BT SIGRTN
All other vehicles	170 Pin	B41, E58, T41 B33	SIGRTN CPP

TA1 DTC P0704, P0830: CHECK THE CPP SWITCH

WARNING: **Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

NOTE: During self-test, the clutch pedal must be down and gearshift lever in NEUTRAL.

- Key ON, engine OFF.
- Access the PCM and monitor the CPP PID.
- **Does the reading cycle when the CPP switch is activated?**

Yes	No
This may be an intermittent circuit concern. INSPECT connectors for signs of damage, water intrusion, corrosion. REPAIR as necessary.	GO to **TA2**.

TA2 CHECK THE SWITCH CIRCUIT RESISTANCE

NOTE: The CPP switch is located near the clutch pedal.

NOTE: Measure the CPP switch resistance with the clutch pedal pressed down.

- Inspect the switches and brackets for damage. Repair as necessary.
- CPP Switch connector disconnected.
- For Focus or Escape,
- Measure the resistance between:

(+) CPP Switch Connector, Component Side	(-) CPP Switch Connector, Component Side
CPP	SIGRTN

- For all others,
- Measure the resistance between:

(+) CPP Switch Connector, Component	(-) CPP Switch Connector, Component

Side	Side
CPP	GND

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **TA3**.	INSTALL a new CPP switch. CLEAR the DTCs. REPEAT the self-test.

TA3 CHECK THE CPP FOR INTERNAL SHORTS

NOTE: Measure the CPP switch resistance with the clutch pedal released.

- For Focus or Escape,
- Measure the resistance between:

(+) CPP Switch Connector, Component Side	(-) CPP Switch Connector, Component Side
CPP	SIGRTN

- For all others,
- Measure the resistance between:

(+) CPP Switch Connector, Component Side	(-) CPP Switch Connector, Component Side
CPP	GND

- **Is the resistance greater than 10K ohms?**

Yes	No
For Focus or Escape, GO to **TA5**. For all others, GO to **TA4**.	INSTALL a new CPP switch. CLEAR the DTCs. REPEAT the self-test.

TA4 CHECK THE CPP AND GROUND CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) CPP Switch Connector, Harness Side	(-) PCM Connector, Harness Side
CPP	CPP

- Measure the resistance between:

(+) CPP Switch Connector, Harness Side	(-)
GND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **TA6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TA5 CHECK THE CPP AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CPP Switch Connector, Harness Side
CPP	CPP
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to **TA6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TA6 CHECK THE CPP CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) CPP	

Switch Connector, Harness Side	(-)
CPP	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to **TA7**.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

TA7 CHECK THE CPP CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) CPP Switch Connector, Harness Side	(-)
CPP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **TA8**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

TA8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Replacement PCM.	

PINPOINT TEST TB: TRANSMISSION CONTROL SWITCH (TCS)/ TRANSMISSION CONTROL INDICATOR LAMP (TCIL)

This pinpoint test is intended to diagnose the following:

- TCS
- TCIL
- harness circuits: TCS and TCIL
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series	170 Pin	B43 B27	TCIL TCS
Edge, MKX, Sable, Taurus, Taurus X	190 Pin	B16	TCS
Escape/Mariner	150 (50-50-50) Pin	B27	TCS
F-150, Mark LT	190 Pin	B45	TCS
F-Super Duty	170 Pin	B27	TCS
Focus	190 Pin	T30	TCS
Fusion	140 Pin	B16	TCS
All other vehicles	170 Pin	B29	TCS

TB1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Is DTC P1780 present?**

Yes	No
GO to **TB2**.	For TCIL never on, GO to **TB10**. For TCIL always on, GO to **TB8**.

TB2 DTC P1780: CHECK THE TCS FUNCTION

NOTE: Verify the TCS was cycled during self-test.

- Key ON, engine OFF.

- Access the PCM and monitor the TCS PID.
- Apply and release the TCS and then hold it applied for 3 seconds. Release the switch.
- **Does the TCS PID change from ON to OFF and does the PID indicate ON when the switch is applied?**

Yes	No
REPEAT the KOER self-test and cycle the TCS during the test.	GO to **TB3**.

TB3 CHECK THE TCS VOLTAGE

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
TCS	Ground

- Monitor the voltage while applying and releasing the TCS several times.
- **Does the voltage change states?**

Yes	No
GO to **TB12**.	GO to **TB4**.

TB4 CHECK THE TCS CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- TCS connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
TCS	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to **TB5**.	REPAIR the short circuit. CLEAR the DTCs.

	REPEAT the self-test.

TB5 CHECK FOR VOLTAGE TO THE TCS

- Key ON, engine OFF.
- Measure the voltage between:

(+) TCS Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to **TB6**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TB6 CHECK THE TCS CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TCS Connector, Harness Side
TCS	TCS

- **Is the resistance less than 5 ohms?**

Yes	No
GO to **TB7**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TB7 CHECK THE TCS CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) TCS Connector, Harness Side	(-)
TCS	Ground

- **Is the voltage less than 1 V?**

Yes	No
INSTALL a new TCS. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

TB8 TCIL ALWAYS ON: CHECK THE TCIL FUNCTION

- Key ON, engine OFF.
- Apply and release the TCS.
- **Does the TCIL change state?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to **TB9**.

TB9 CHECK THE TCIL CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

NOTE: The TCIL turns off when the PCM is disconnected.

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- **Does the TCIL change state?**

Yes	No
GO to **TB12**.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

TB10 TCIL NEVER ON: CHECK FOR KOER P1780

- Carry out the PCM KOER self-test.
- **Is DTC P1780 present?**

Yes	No
REPAIR the DTC. CLEAR the DTCs. REPEAT the self-test. GO to **TB2**.	GO to **TB11**.

TB11 CHECK FOR VOLTAGE TO THE TCIL

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B Vehicle Battery
TCIL	Negative terminal

- **Does the TCIL illuminate?**

Yes	No
GO to **TB12**.	CHECK the indicator bulb and the fuse. If OK, the open is in the wiring between the ignition switch and the TCIL pin at the harness connector. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

TB12 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST Z: INTERMITTENT

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to**

follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose and isolate intermittent concerns for the following:

- all electronic engine control (EEC) subsystems

This chart is used to determine which test to run for the suspect circuit. PIDs corresponding to each circuit are listed. Some circuits do not have an associated PID or the PID may not be available and has to be measured with a digital multimeter (DMM). More specific information on the PID can be found. If the vehicle has a coil pack system with a no start condition, carry out the ignition test.

Z1 DIRECTION FOR INTERMITTENT DIAGNOSTIC PATH

NOTE: **Proceed with this step only if the powertrain control module (PCM) was not previously cleared. Record freeze frame data prior to clearing the PCM DTCs. Clearing the DTCs clears any freeze frame data and eliminates FMEM. This helps to recreate the original conditions that set the DTCs or caused the symptom.**

- Key ON, engine OFF.
- Clear the PCM DTCs.
- **Are the PCM DTCs cleared?**

Yes	No
GO to **Z2**.	RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .

Z2 SELECT THE PIDS AND/OR SIGNALS RELATED TO THE SYSTEM

- A list of related PIDs and/or signals are needed for use with the scan tool to monitor the suspect areas. Obtain the customer symptom description. Use the Reference Value Symptom chart and proceed to the Reference Value PID/Signal Measurement chart located at the beginning of Reference Values.
- Highlight each available PID/signal recommended by the charts under the PID/signal selection menu on the scan tool.
- **Are all available PIDs/signals related to the symptom selected?**

Yes	No
GO to **Z3**.	REPEAT the test step. GO to **Z2**.

Z3 DECISION TO VERIFY THE SYMPTOM

NOTE: **The path to symptom verification is optional, but is recommended for several reasons. For example: the vehicle is back for a repeat repair, or there is no DTC present.**

- **Is a concern symptom detected?**

Yes	No
GO to **Z10**.	GO to **Z4**.

Z4 COLLECT ANY SYMPTOM RELATED DATA TO AID IN VERIFICATION

NOTE: Only MIL codes trigger freeze frame data. Refer to the scan tool instruction article to retrieve the freeze frame information.

- Prepare the freeze frame data for use with information from the Symptom Charts.
- Check for continuous memory DTCs that should have been recorded from an earlier pinpoint test.
- Access the information from the customer information worksheet and the customer if available. Access any other symptom related data available, such as TSBs and OASIS reports.
- **Is all available data recorded?**

Yes	No
GO to **Z5**.	GATHER as much data as possible to aid in isolating the intermittent concern area. REPEAT the test step. GO to **Z4**.

Z5 RECREATE THE SYMPTOM USING ALL AVAILABLE DATA

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- With the scan tool, select and monitor the same PIDs as displayed in freeze frame along with any previously selected PIDs/signals from step Z2. Using the freeze frame data recorded earlier, recreate the conditions described by each freeze frame PID. Pay special attention to ECT, LOAD, RPM and VSS. Also, use any available data from the customer, TSBs, and other sources to aid in producing the correct conditions for recreating the symptom.
- When the symptom occurs, press the trigger to begin recording. Refer to the scan tool instruction article for information on the recorder function.
- **Can the symptom be recreated?**

Yes	No
GO to **Z10**.	GO to **Z6**.

Z6 RECREATE THE SYMPTOM

NOTE: PIDs for output in the Reference Value Charts represent command values only. Circuit measurements with a digital multimeter indicate the actual output status. Therefore, in the case of a concern, the PID and circuit reading on the vehicle may not correspond with each other. PIDs for PCM circuits with a mismatch in the digital multimeter measurement indicate a possible PCM concern.

- The road test is the last attempt to locate the area of concern before physically disturbing vehicle circuits.
- The Intermittent Road Test Procedure is a set of instructions for monitoring PIDs/signals with a scan tool and circuit measurements with a digital multimeter. This is done under 4 different conditions - key

on/engine off, hot idle, 48 km/h (30 mph) and 88 km/h (55 mph). Use the typical diagnostic reference values to compare with the actual vehicle.

- Locate the correct Reference Value Chart.
- Setup the vehicle to measure the circuits with a digital multimeter and a scan tool.
- Connect a scan tool to the DLC.
- Key ON, engine OFF.
- With the scan tool, select and monitor PIDs and measure the circuits shown in the Reference Value Chart.
- Compare the scan tool PIDs and digital multimeter values to the Reference Value Charts.
- **Are any values out of range?**

Yes	No
GO to **Z10**.	GO to **Z7**.

Z7 RECREATE THE SYMPTOM USING THE HOT IDLE ROAD TEST

NOTE: The engine temperature should be at least 87°C (189°F).

- Key ON, engine running.
- Continue to monitor the PIDs and circuits as in the previous step.
- **Are any values out of range?**

Yes	No
GO to **Z10**.	GO to **Z8**.

Z8 RECREATE THE SYMPTOM DURING AN 48 KM/H (30 MPH) ROAD TEST

- Drive the vehicle on a preplanned route.
- Continue to monitor the PIDs and circuits as in the previous step.
- **Are any values out of range?**

Yes	No
GO to **Z10**.	GO to **Z9**.

Z9 RECREATE THE SYMPTOM DURING AN 88 KM/H (55 MPH) ROAD TEST

- Continue to drive the vehicle on the preplanned route.
- Continue to monitor the PIDs and circuits as in the previous step.
- **Are any values out of range?**

Yes	No
	It is now necessary to physically disturb the selected

GO to **Z10**.	vehicle circuits in an attempt to recreate the intermittent concern. GO to **Z10**.

Z10 SELECT THE CIRCUITS FROM THE PCM PIDS/SIGNALS CHART

NOTE: From the same chart, be sure to select and proceed with the appropriate test type.

NOTE: The Input Test step should be used on sensing inputs such as temperature, position or oxygen.

NOTE: The Output Test step should be used on output devices such as relays, coils or solenoids.

- Remain in the PID/Signal selection menu with the scan tool.
- Highlight only the PIDs/signals from step Z2.
- Proceed to the PCM PIDS/SIGNALS chart located at the beginning of this test.
- Match the selected PIDs/signals to the corresponding circuit in the chart. There may be more than one circuit to test. If a PID/signal recording was made with the scan tool, it may be helpful to replay it at this time. Refer to the scan tool instruction article for additional information.
- **Has a test been chosen?**

Yes	No
For the input test step, GO to **Z11**. For the output test step, GO to **Z15**.	To diagnose other driveability symptoms, REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .

Z11 KOEO INPUT TEST PROCEDURE FOR THE PCM SENSORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a digital multimeter to check the value.
- Proceed to the area of the suspect wiring or component concern.
- Key ON, engine OFF.
- If the input is a switch type-component, turn it on manually.
- Monitor the PID or DMM while tapping on the component.

- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Are there abrupt changes in the PID values that do not compare with the values?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z12**.

Z12 KOER INPUT TEST PROCEDURE FOR THE PCM SENSORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine running.
- Continue to monitor the PIDs and circuits as in the previous step.
- Proceed to the area of the suspect wiring or component concern.
- If the input is a switch type-component, turn it on manually.
- Monitor the PID or DMM while tapping on the component.
- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Are any values fluctuating in and out of range?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z13**.

Z13 KOEO WATER SOAK TEST PROCEDURE FOR THE PCM SENSORS, EXCLUDING HIGH VOLTAGE CIRCUITS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine OFF.
- Continue to monitor the PIDs and circuits as in the previous step.
- Proceed to the area of the suspect wiring or component concern.
- If the input is a switch type-component, turn it on manually.

- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Monitor while spraying the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Are any values fluctuating in and out of range?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z14**.

Z14 KOER WATER SOAK TEST PROCEDURE FOR THE PCM SENSORS, EXCLUDING HIGH VOLTAGE CIRCUITS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine running.
- Continue to monitor the PIDs and circuits as in the previous step.
- Proceed to the area of the suspect wiring or component concern.
- If the input is a switch type-component, turn it on manually.
- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Monitor while spraying the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Are any values fluctuating in and out of range?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z15**.

Z15 KOER WIGGLE TEST PROCEDURE FOR THE PCM SENSORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

NOTE: Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A digital multimeter measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur

during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.

- Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a DMM to check the value.
- Key ON, engine OFF.
- With the scan tool, turn on selected outputs using output state control. Refer to the scan tool instruction article.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PID or DMM while tapping on the component.
- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the Reference Value Charts?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z16**.

Z16 KOER OUTPUT TEST PROCEDURE FOR THE PCM ACTUATORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

NOTE: **Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A digital multimeter measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.**

- Key ON, engine running.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PIDs with the scan tool and note the values. Compare the scan tool values with values from a digital multimeter with the engine at idle. Look for fluctuations in the values while tapping on the suspect component.
- If a coil for a coil on plug application is suspect, turn off the key. Gain access to the coil and measure continuity from the spark plug terminal to the signal terminal while tapping the coil. A large fluctuation in

resistance indicates an intermittent open or short.

- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a scan tool to DMM value mismatch or an idle fluctuation?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z17**.

Z17 KOEO WATER SOAK TEST PROCEDURE FOR THE PCM ACTUATORS, EXCLUDING HIGH VOLTAGE CIRCUITS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

NOTE: **Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A digital multimeter measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.**

- Key ON, engine OFF.
- With the scan tool, turn on selected outputs using output state control. Refer to the scan tool instruction article.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the Reference Value Charts?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z18**.

Z18 KOER WATER SOAK TEST PROCEDURE FOR THE PCM ACTUATORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine running.
- Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a DMM to check the value.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Monitor while spraying the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the Reference Value Charts?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to **Z19**.

Z19 INSPECT FOR INTERMITTENT MECHANICAL CONCERNS

NOTE: It is possible for an intermittent mechanical concern to cause a good PCM system to react abnormally.

- An inspection of DTC related mechanical systems should have been carried out in an earlier part. If not, visually inspect at this time.
- Look for possible vacuum lines, wires, cables, linkage or hoses that may become kinked, shorted or restricted during normal engine operation.
- This may include engine/transmission gear changes, acceleration and deceleration, rough roads and various engine RPM and torque related conditions.
- **Is a mechanical concern detected?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	It is necessary to seek additional help. REFER to the Professional Technician Society (PTS) web site, the OASIS system or the Technical Hotline. A vehicle data recorder (VDR) or similar recorder may also be useful.

DESCRIPTION AND OPERATION

POWER STEERING

The power steering system consists of the following components:

- Power steering pump

- Power steering fluid reservoir
- Power steering pressure and return lines/hoses
- Power steering fluid cooler
- Power steering gear
- Inner tie rod

The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is then trapped between the pump vanes and moved to the high-pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

DIAGNOSTIC TESTS

POWER STEERING

Refer to **STEERING SYSTEM - GENERAL INFORMATION** .

REMOVAL AND INSTALLATION

POWER STEERING FLUID RESERVOIR

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

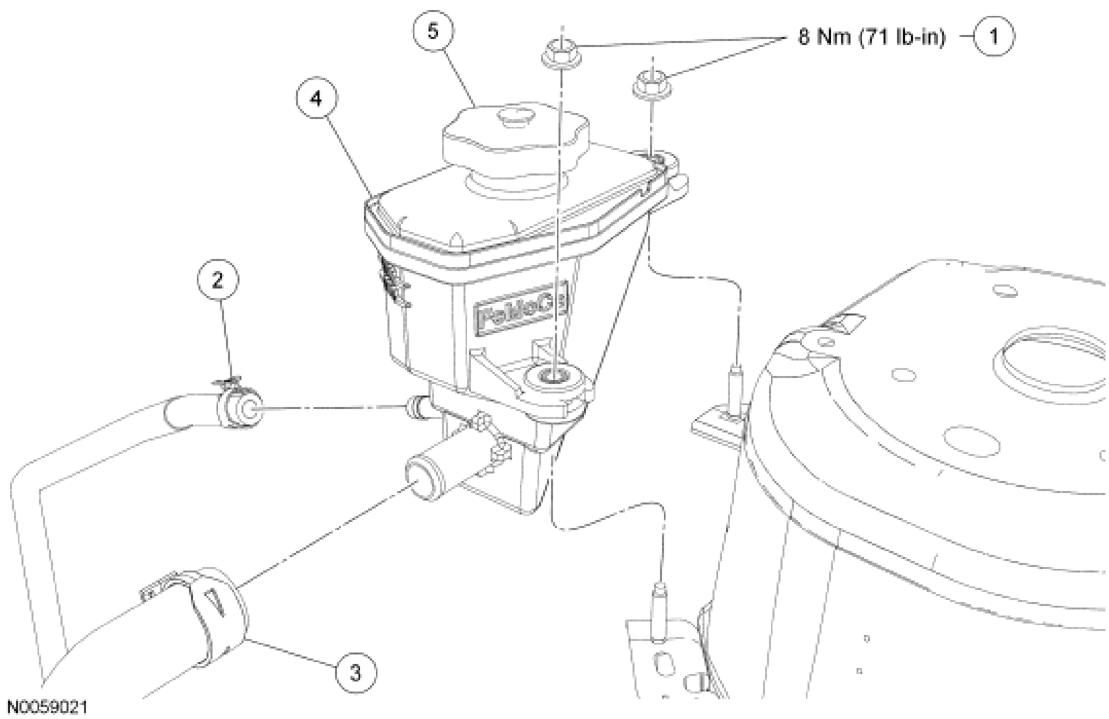

Fig. 1: Exploded View Of Power Steering Fluid Reservoir With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W707142	Power steering fluid reservoir nuts (2 required)
2	3A713B	Return hose
3	3E525	Power steering pump supply hose
4	3R700	Power steering fluid reservoir
5	3A006	Power steering fluid reservoir cap

REMOVAL AND INSTALLATION

CAUTION: While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.
2. Remove the 2 power steering fluid reservoir nuts and lift the reservoir from the mounting studs.
   - To install, tighten to 8 Nm (71 lb-in).
3. Release the clamp and disconnect the return hose from the power steering fluid reservoir.
4. Release the clamp and disconnect the power steering pump supply hose from the power steering fluid reservoir.
   - Remove the reservoir.

5. To install, reverse the removal procedure.
    - Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** .

POWER STEERING PUMP

Special Tools

Illustration	Tool Name	Tool Number

Item	Part Number	Description
1	3N623	Pressure line-to-power steering pump banjo bolt (also part of kit 3A719)
2	3A719	Pressure line kit
3	3N626	Pressure line seals (2 required) (also part of kit 3A719)
4	3E525	Power steering pump supply hose
5	W503299	Power steering pump bolts (3 required)
6	-	Power steering pressure switch electrical connector
7	3N824	Power steering pressure switch

8	3A696	Power steering pump

REMOVAL

CAUTION: While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** .
2. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.
3. Remove the RH inner fender splash shield. For additional information, refer to **FRONT END BODY PANELS** .
4. Using the special tool, disengage the power steering pump belt from the power steering pump pulley and position it aside.
   - Install the removal tool between the belt and the pulley and turn the crankshaft bolt clockwise to disengage the belt.

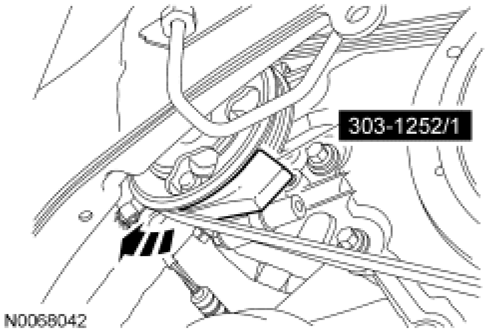

Fig. 3: Installing Removal Tool (303-1252/1) Between Belt & Pulley & Turn Crankshaft Bolt Clockwise
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

5. Remove the 4 bolts and position the driveshaft aside.

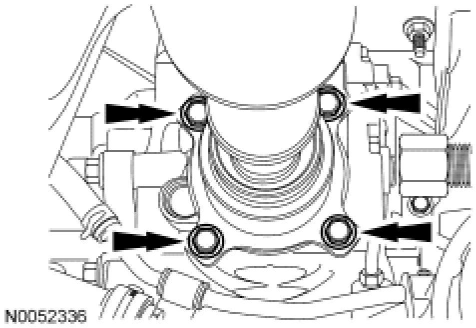

Fig. 4: Locating Driveshaft Aside Bolts
Courtesy of FORD MOTOR CO.

All vehicles

6. Using a suitable jack, support the rear of the subframe.
7. Remove the 2 nuts, 4 bolts and the subframe support brackets.

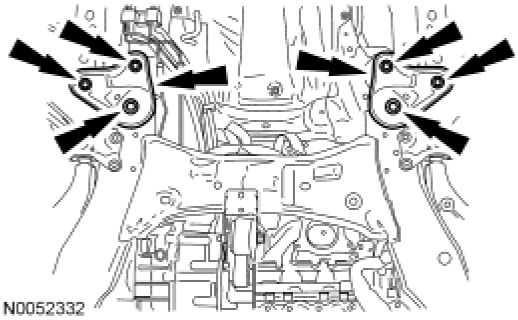

Fig. 5: Locating Subframe Support Brackets, Nuts & Bolts
Courtesy of FORD MOTOR CO.

8. Remove the 2 middle subframe nuts.

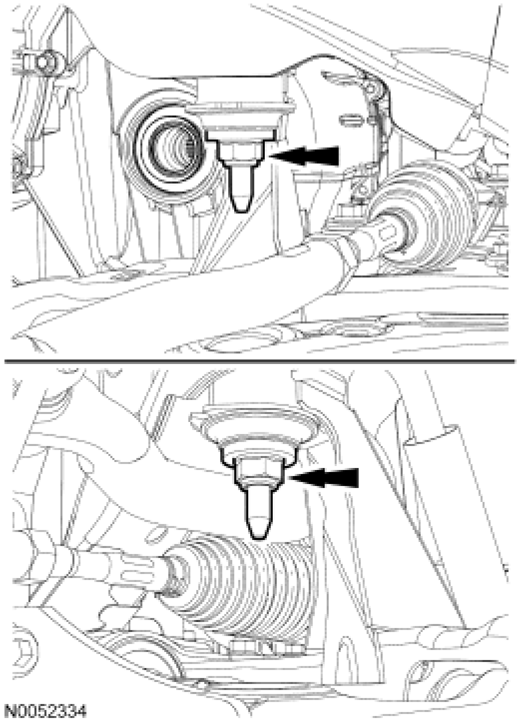

Fig. 6: Locating Middle Subframe Nuts
Courtesy of FORD MOTOR CO.

9. Lower the rear of the subframe.
10. Release the clamp and disconnect the power steering pump supply hose from the power steering pump.
11. Disconnect the power steering pressure switch electrical connector.
12. Remove the pressure line-to-power steering pump banjo bolt and disconnect the pressure line from the pump.
    - Discard the 2 seals.
13. Remove the 3 power steering pump bolts and the pump.

INSTALLATION

All vehicles

1. Position the power steering pump and install the 3 bolts.
    - Tighten to 24 Nm (18 lb-ft).

CAUTION: New seals must be installed any time the power steering pressure line is disconnected from the power steering pump, or a fluid leak may occur.

2. Position the pressure line and install the pressure line-to-power steering pump banjo bolt and seals.
    - Tighten to 48 Nm (35 lb-ft).

3. Connect the power steering pressure switch electrical connector.
4. Connect the power steering pump supply hose and secure the clamp.
5. Using the jack, raise the rear of the subframe.
6. Install the 2 middle subframe nuts.
   - Tighten to 150 Nm (111 lb-ft).

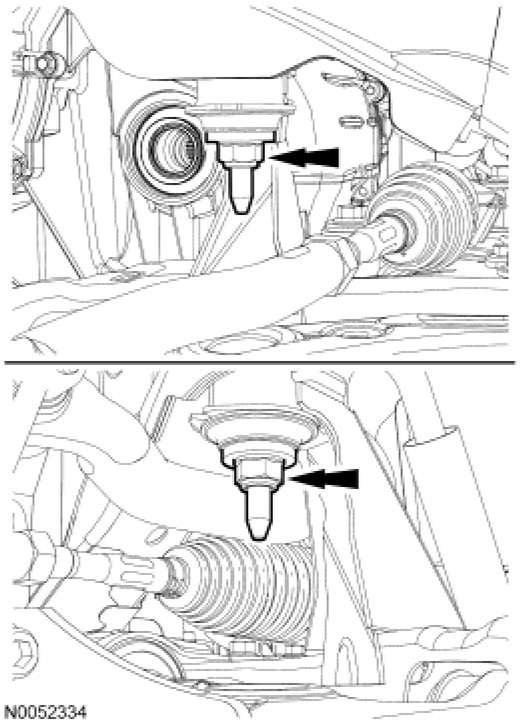

Fig. 7: Locating Middle Subframe Nuts
Courtesy of FORD MOTOR CO.

7. Install the 2 nuts, 4 bolts and the subframe support brackets.
   - Tighten the nuts to 150 Nm (111 lb-ft).
   - Tighten the bolts to 103 Nm (76 lb-ft).

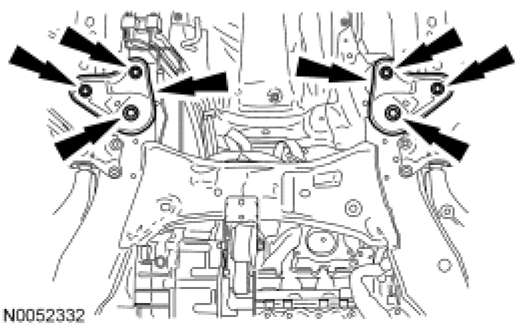

Fig. 8: Locating Subframe Support Brackets, Nuts & Bolts

Courtesy of FORD MOTOR CO.

AWD vehicles

8. Position the driveshaft and install the 4 bolts.
   - Tighten to 70 Nm (52 lb-ft).

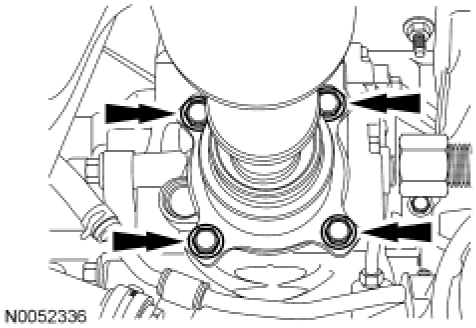

Fig. 9: Locating Driveshaft Aside Bolts

All vehicles

CAUTION: After installation, make sure the belt is correctly seated on the crankshaft and power steering pulley or damage to the belt may occur.

9. Using the special tool, install the power steering belt onto the power steering pump pulley.
   - Position the belt around the special tool and the power steering pump pulley. Make sure that the belt is engaged with the pulley and rotate the crankshaft clockwise to install the belt.

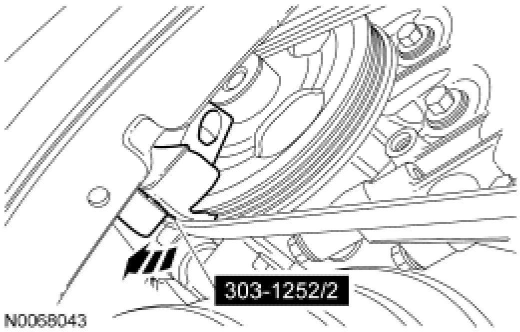

Fig. 10: Installing Power Steering Belt Onto Power Steering Pump Pulley Using Special Tool (303-1252/2)

8	37626	Pressure line-to-power steering pump seals (2 required) (also part of kit 3A719)
9	3A719	Pressure line kit

REMOVAL AND INSTALLATION

CAUTION: When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** .
2. Remove the pressure line-to-steering gear banjo bolt and disconnect the pressure line from the steering gear.
   - Discard the 2 seals.
   - To install, tighten to 48 Nm (35 lb-ft).
3. Release the clamp and disconnect the return hose from the steering gear.
4. Release the clamp and disconnect the return hose from the return line.
5. Remove the 3 pressure line bracket-to-steering gear bolts.
   - To install, tighten to 9 Nm (80 lb-in).
6. Disconnect the purge valve electrical connector.

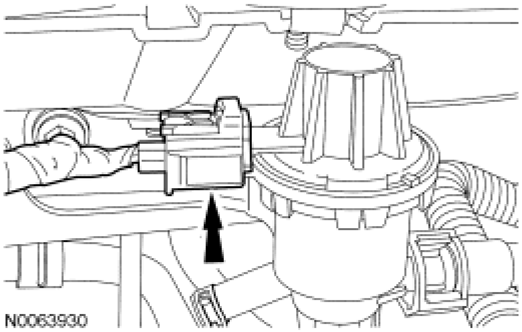

Fig. 12: Locating Purge Valve Electrical Connector
Courtesy of FORD MOTOR CO.

7. Disconnect the 3 PCM electrical connectors and position the wiring harness aside.

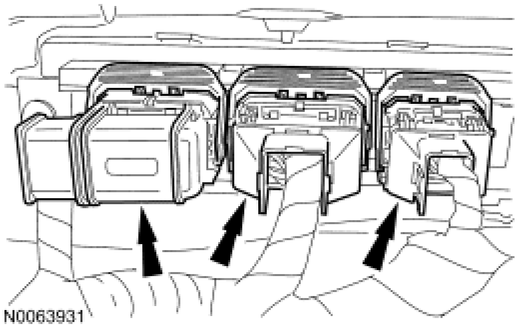

Fig. 13: Identifying PCM Electrical Connectors & Wiring Harness
Courtesy of FORD MOTOR CO.

8. Remove the pressure line-to-power steering pump banjo bolt and disconnect the pressure line from the pump.
   - Discard the 2 seals.
   - To install, tighten to 48 Nm (35 lb-ft).
9. To install, reverse removal procedure.
   - Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** .

POWER STEERING FLUID COOLER

REMOVAL

CAUTION: When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. Remove the stabilizer bar. For additional information, refer to **FRONT SUSPENSION** .
2. Remove the pressure line-to-steering gear banjo bolt.
   - Discard the 2 seals.
3. Release the clamp and disconnect the return hose from the steering gear.
4. Remove the 2 bolts and the steering gear heat shield.
5. Remove the 3 pressure line bracket-to-steering gear bolts.
6. Remove and discard the 4 steering gear bolts.
   - Remove the steering gear.

INSTALLATION

NOTE: When installing a new steering gear, install a new steering gear turn tube heat wrap.

1. Position the steering gear and tighten the 4 steering gear bolts to 103 Nm (76 lb-ft) in the sequence shown.

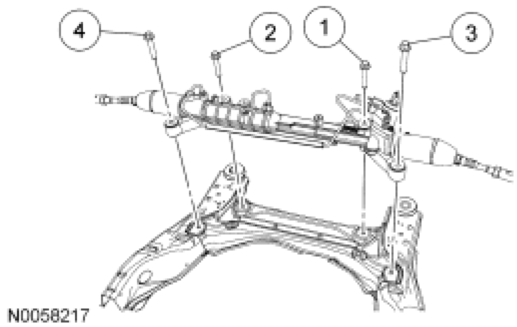

Fig. 16: Identifying Steering Gear Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

CAUTION: New seals must be installed any time the pressure line is disconnected from the power steering pump and/or the steering gear or a fluid leak may occur.

2. Install the pressure line-to-steering gear banjo bolt.
   - Tighten to 48 Nm (35 lb-ft).
3. Install the 3 pressure line bracket-to-steering gear bolts.
   - Tighten to 9 Nm (80 lb-in).
4. Release the clamp and connect the return hose to the steering gear.
5. Install the steering gear heat shield and the 2 bolts.
   - Tighten to 6 Nm (53 lb-in).
6. Install the stabilizer bar. For additional information, refer to **FRONT SUSPENSION** .
7. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** .

REMOVAL AND INSTALLATION

1. Remove the steering gear. For additional information, refer to **Steering Gear**.
2. Mark the pinion shaft and the steering gear housing for correct reference during installation.

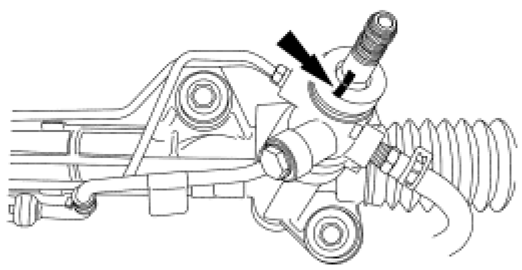

Fig. 19: Locating Pinion Shaft And Steering Gear Mark
Courtesy of FORD MOTOR CO.

CAUTION: Position the steering gear in a soft-jaw vise or damage to the steering gear may occur.

3. Loosen the tie-rod jam nut.
   - To install, tighten to 90 Nm (66 lb-ft).
4. Remove the outer tie-rod end and the tie-rod jam nut.
   - To install, tighten to 48 Nm (35 lb-ft).

NOTE: It is necessary to remove both bellows boots when removing the RH inner tie rod.

5. Remove the 4 bellows clamps and the 2 steering gear bellows boots.
6. Using a suitable wrench, hold the piston shaft.
7. Using a suitable wrench, remove the inner tie rod.
   - To install, tighten to 103 Nm (76 lb-ft).

NOTE: Using a suitable wrench, hold the piston shaft while tightening the inner tie rod.

NOTE: The new lock washer must be crimped after tightening the inner tie rod.

8. To install, reverse the removal procedure.
   - Thoroughly clean and inspect all the parts to be reused. Install new parts as necessary.

Side insulator bracket-to-rear axle differential bolts	90	66

DESCRIPTION AND OPERATION

REAR DRIVE AXLE AND DIFFERENTIAL

The rear drive unit (RDU) consists of the following components:

- Dished circular flange
- Full-time fluid drive coupling
- Aluminium housing with steel housing cover
- Matched ring and pinion
- Conventional open differential
- Rubber bushing isolated mounting points
- Cover mounted axle vent

- Silicone sealant rather than a gasket for the housing cover

The rear axle drive pinion receives power from the engine through the transaxle, power transfer unit (PTU), driveshaft and active torque coupling, and is engaged on demand. The pinion gear rotates the differential ring gear, which is bolted to the differential case outer flange. Inside the differential case, 2 differential pinion gears are mounted on a differential pinion shaft, which is pinned to the case. These differential pinion gears are engaged with the splined differential side gears. The halfshafts are held in the differential side gears by a retainer circlip that is located on the inboard constant velocity (CV) joint stub shaft. When each halfshaft is installed, the driveshaft bearing retainer circlip engages a step in the differential side gear. There are no stub shaft bearings in the differential housing. As the differential case turns, it rotates the halfshafts and rear wheels. When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the 2 halfshafts. The active torque coupling is installed new as an assembly with the rear axle. The pinion seal and the differential halfshaft seals are the only serviced components of the rear drive axle. If other components of the rear drive axle are worn or damaged, the assembly must be installed new.

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505262-S439	Differential cover bolt (10 required)
2	4N282	Differential fill plug

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

2. Remove the 10 bolts and the rear differential housing cover.
    - Drain the differential fluid from the housing.

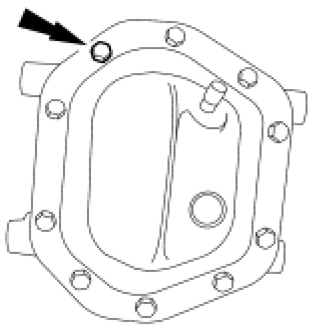

Fig. 15: Locating Rear Differential Housing Cover Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

CAUTION: Make sure the machined surfaces on the rear axle housing and the differential housing cover are clean and free of oil before installing the new silicone sealant. The inside of the rear axle must be covered when cleaning the machined surface to prevent damage to the component.

NOTE: Make sure the differential vent located on the rear cover is free of obstruction.

1. Clean the gasket mating surfaces of the differential housing and the differential housing cover.

NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

2. Apply a new continuous bead of clear silicone rubber as shown in the illustration.

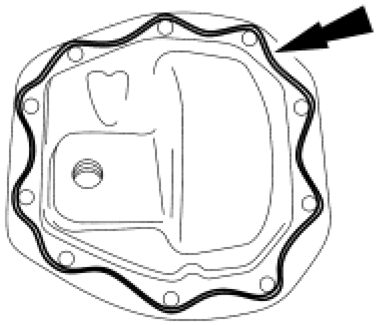

Fig. 16: Applying Sealant
Courtesy of FORD MOTOR CO.

3. Install the differential housing cover and the 10 bolts.
   - Tighten to 23 Nm (17 lb-ft).
4. Remove the filler plug, fill the rear axle with 1.15L (2.43 pt) of rear axle lubricant, 3-5 mm (0.118-0.196 in) below the bottom of the filler hole and install the filler plug.
   - Tighten to 29 Nm (21 lb-ft).

REMOVAL AND INSTALLATION

AXLE ASSEMBLY

Item	Part Number	Description
1	W506540-S	Differential housing-to-front insulator bracket bolt (4 required)
2	W500043-S	Side insulator bracket-to-rear axle housing bolts (5 required)

REMOVAL AND INSTALLATION

1. Remove the driveshaft. For additional information, refer to **DRIVESHAFT** article.
2. Remove the rear halfshafts. For additional information, refer to **REAR DRIVE HALFSHAFTS** article.
3. Remove the rear stabilizer bar and link. For additional information, refer to **REAR SUSPENSION** article.
4. Position a suitable transmission hydraulic jack to the axle housing. Securely strap the jack to the housing.

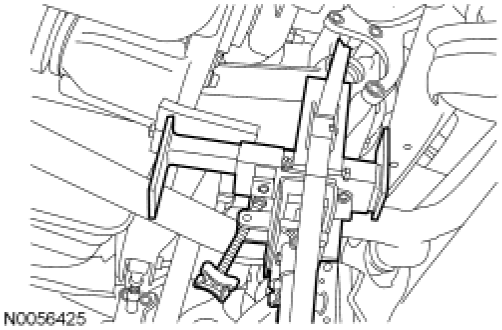

Fig. 18: Positioning Suitable Transmission Hydraulic Jack To Axle Housing
Courtesy of FORD MOTOR CO.

5. Disconnect the active torque coupling electrical connector at the front of the crossmember.
6. Remove the 4 differential housing-to-front insulator bracket bolts.
   - To install, tighten to 90 Nm (66 lb-ft).

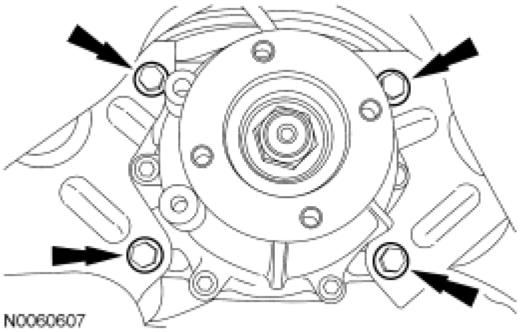

Fig. 19: Locating Differential Housing-To-Front Insulator Bracket Bolts
Courtesy of FORD MOTOR CO.

7. Loosen the LH front insulator bracket-to-subframe bolt, and rotate the bracket aside.
    - To install, tighten to 90 Nm (66 lb-ft).
8. Loosen the RH front insulator bracket-to-subframe bolt and the bracket, and rotate the bracket aside.
    - To install, tighten to 90 Nm (66 lb-ft).
9. Remove the 2 RH side insulator bracket-to-rear axle differential bolts and the axle assembly.
    - To install, tighten to 90 Nm (66 lb-ft).

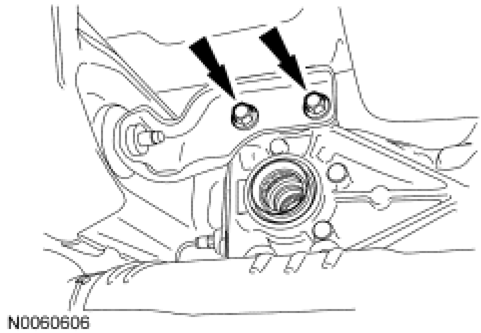

Fig. 20: Locating RH Side Insulator Bracket-To-Rear Axle Differential Bolts
Courtesy of FORD MOTOR CO.

10. Remove the 3 LH side insulator or bracket-to-rear axle differential bolts.
    - To install, tighten to 90 Nm (66 lb-ft).

DESCRIPTION AND OPERATION

REAR DISC BRAKE

The rear disc brake system consists of the following components:

- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake disc shield
- Brake flexible hose
- Brake pads

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing or stopping of wheel rotation and the vehicle.

DIAGNOSTIC TESTS

REAR DISC BRAKE

Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

BRAKE PADS

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

4	2552 RH/ 2553 LH	Brake caliper
5	-	Brake caliper guide pin bolt (2 required) (part of 2B296)

REMOVAL

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure**

to follow these instructions may result in serious personal injury.

WARNING: **Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Check the brake fluid level in the brake master cylinder reservoir.
   - If required, remove the fluid until the brake master cylinder reservoir is 1/2 full.
2. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

CAUTION: Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.

CAUTION: Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.

3. Remove the 2 brake caliper guide pin bolts and position the caliper aside.
   - Support the caliper using mechanic's wire.

NOTE: Install new brake pads if they are worn past the specified thickness. Refer to GENERAL SPECIFICATIONS .

4. Remove the 2 brake pads, shims and slide clips.
   - Inspect the brake pads and shims for wear, damage or contamination.
   - Discard the slide clips.

INSTALLATION

CAUTION: Protect the caliper pistons and boots when pushing the caliper piston into the caliper piston bores or damage to components may occur.

NOTE: Make sure the caliper piston boot is clean and free of foreign material.

1. If installing new brake pads, using a suitable tool and a worn brake pad, compress the disc brake caliper pistons into the caliper.

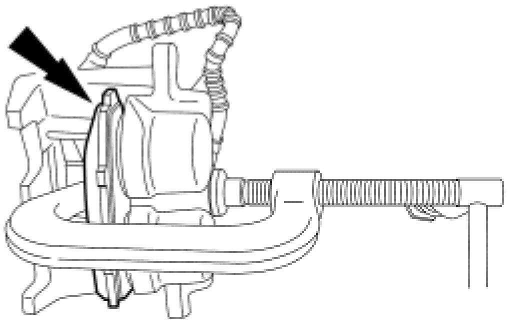

Fig. 2: Compressing Brake Caliper Pistons Into Caliper
Courtesy of FORD MOTOR CO.

2. Install the 2 brake pads, shims and new slide clips to the brake caliper anchor plate.

CAUTION: Make sure that the caliper guide pin boots are fully seated or damage to the caliper guide pin boots can occur.

NOTE: Make sure that the brake caliper hose is not twisted during caliper installation.

3. Position the brake caliper on the anchor plate and install the 2 guide pin bolts.
   - Tighten to 26 Nm (19 lb-ft).
4. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
5. Fill the brake master cylinder reservoir with clean, specified brake fluid.
   - Apply brakes several times to verify correct brake operation.

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

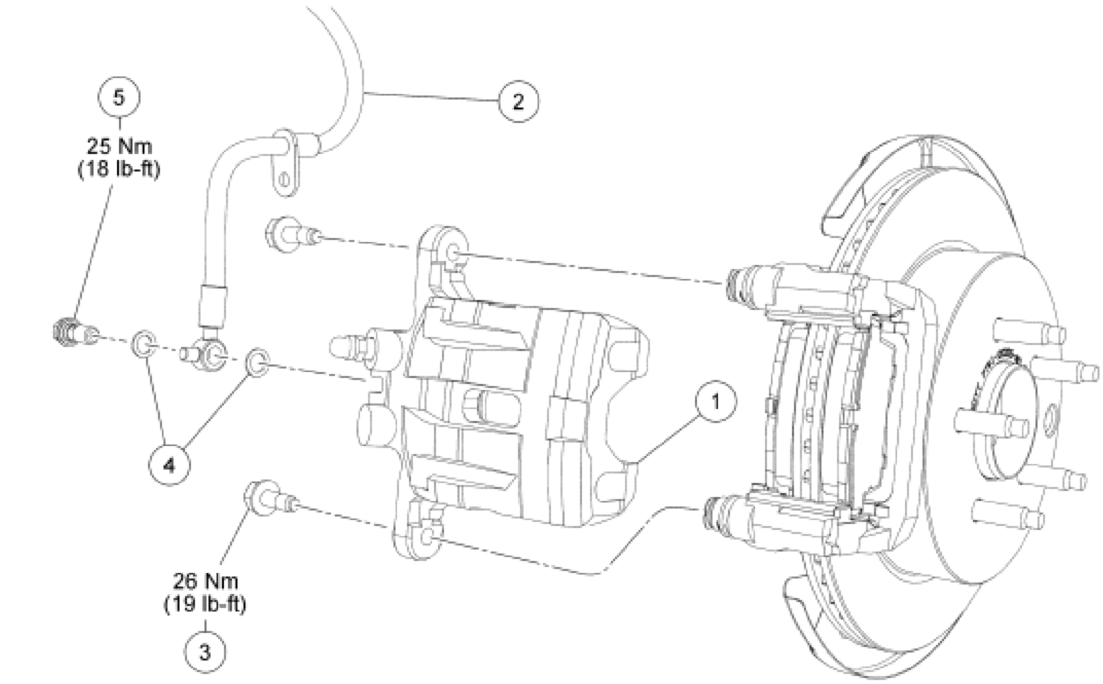

Fig. 3: Exploded View Of Brake Caliper With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2552 RH/ 2553 LH	Brake caliper
2	2282	Brake hose
3	-	Brake caliper guide pin bolt (2 required) (part of 2B296)
4	W711748	Copper washers (2 required)
5	2M085	Brake caliper flow bolt

REMOVAL

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Remove the brake caliper flow bolt and position the brake hose aside.
   - Discard the 2 copper washers.
3. Remove the 2 brake caliper guide bolts and the brake caliper.
   - If a leaking or damaged caliper piston boot is found, install a new disc brake caliper.

INSTALLATION

CAUTION: Make sure that the caliper guide pin boots are fully seated or damage to the caliper guide pin boots can occur.

NOTE: Make sure that the brake caliper hose is not twisted during caliper installation.

1. Position the brake caliper onto the anchor plate and brake pads.
2. Install the 2 brake caliper guide pin bolts.
   - To install, tighten to 26 Nm (19 lb-ft).
3. Using 2 new copper washers, position the brake hose and install the brake caliper flow bolt.
   - Tighten to 25 Nm (18 lb-ft).
4. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
5. Bleed the brake system. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

BRAKE CALIPER ANCHOR PLATE

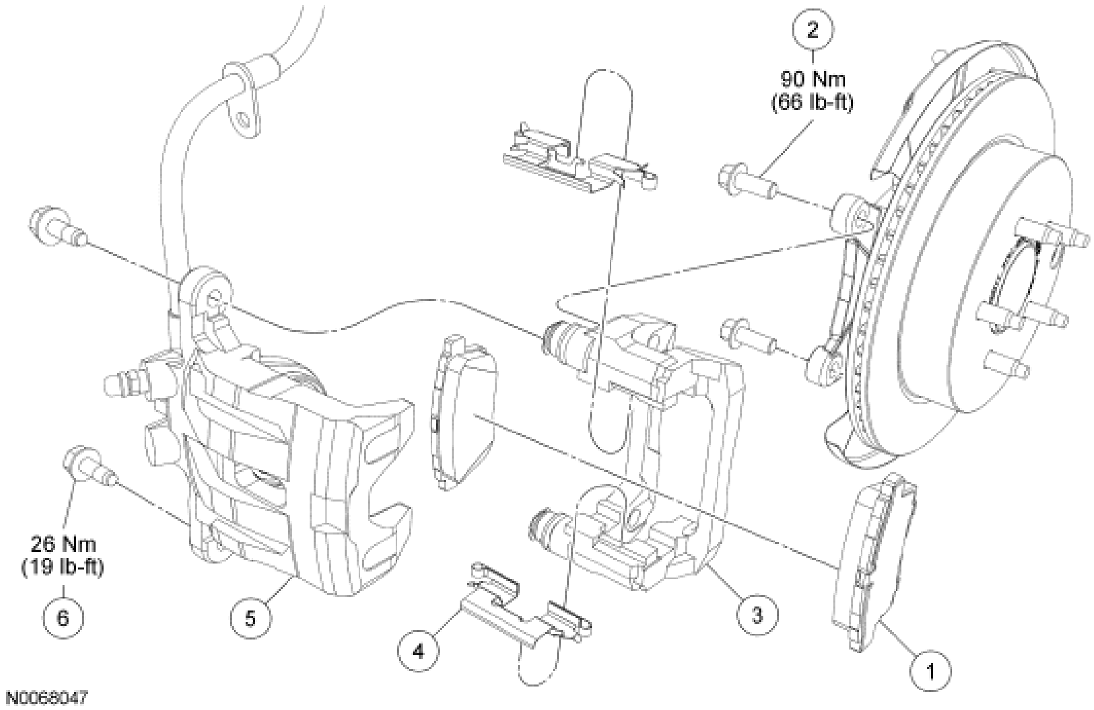

Fig. 4: Exploded View Of Brake Caliper Anchor Plate With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2200	Brake pad (2 required)
2	W711240	Brake caliper anchor plate bolt (2 required)
3	-	Brake caliper anchor plate
4	-	Brake pad slide clip (2 required) (part of 2200)
5	2552 RH/ 2553 LH	Brake caliper
6	-	Brake caliper guide pin bolt (2 required) (part of 2B296)

REMOVAL AND INSTALLATION

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

CAUTION: Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.

CAUTION: Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.

2. Remove the 2 brake caliper guide pin bolts and position the caliper aside.
    - Support the caliper using mechanic's wire.
    - To install, tighten to 26 Nm (19 lb-ft).
3. Remove the 2 brake pads, shims and slide clips. Inspect the brake pads for wear or contamination.
4. Remove the 2 brake caliper anchor plate bolts and the anchor plate.
    - To install, tighten to 90 Nm (66 lb-ft).

NOTE: Make sure that the brake caliper hose is not twisted during caliper installation.

5. To install, reverse the removal procedure.
    - Apply brakes several times to verify correct brake operation.

BRAKE DISC

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-

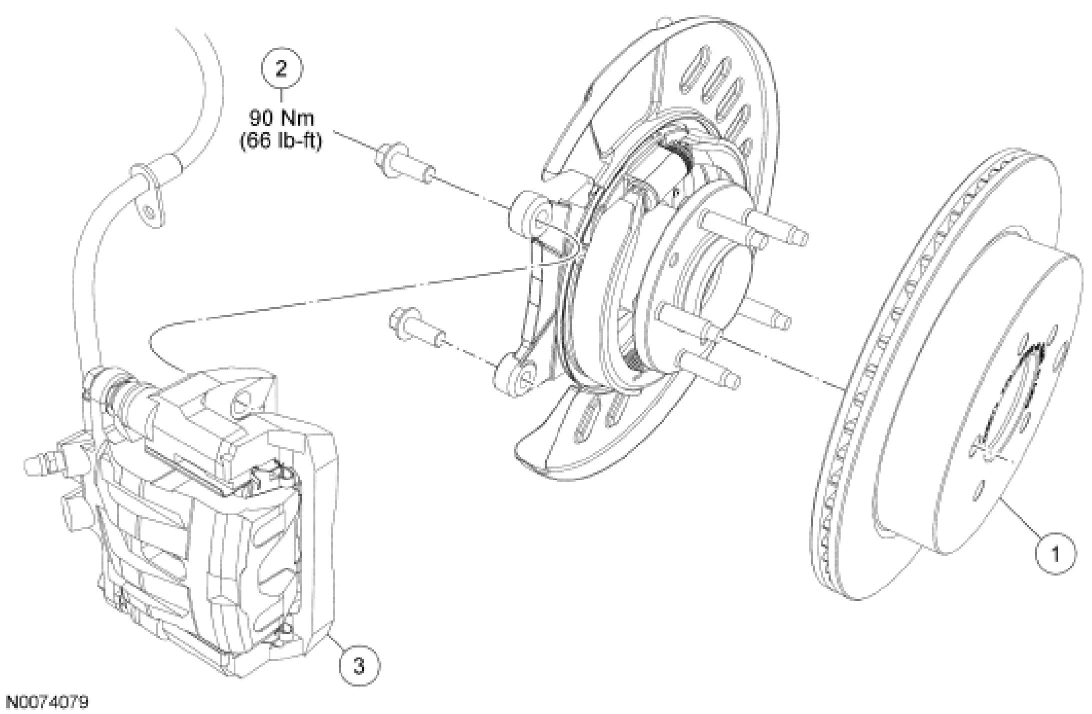

Fig. 5: Identifying Brake Disc With Torque Specifications

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2C026	Brake disc
2	W711240	Brake caliper anchor plate bolt (2 required)
3	-	Brake caliper and anchor plate assembly

REMOVAL

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

CAUTION: Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.

2. Remove the 2 brake caliper anchor plate bolts and position the brake caliper and anchor plate assembly aside.
   - Support the brake caliper and anchor plate assembly using mechanic's wire.
3. Remove the brake disc.

INSTALLATION

1. Clean and dry the brake disc-to-hub mounting surface and apply a thin coat of anti-seize lubricant where indicated.

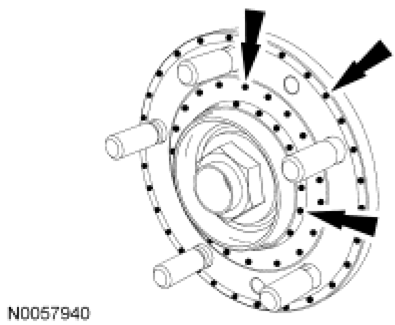

Fig. 6: Locating Brake Disc Screws
Courtesy of FORD MOTOR CO.

2. Install the brake disc onto the wheel hub.
3. Position the brake caliper and anchor plate assembly and install the 2 brake caliper anchor plate bolts.
   - Tighten to 90 Nm (66 lb-ft).
4. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
   - Apply brakes several times to verify correct brake operation.

BRAKE DISC SHIELD

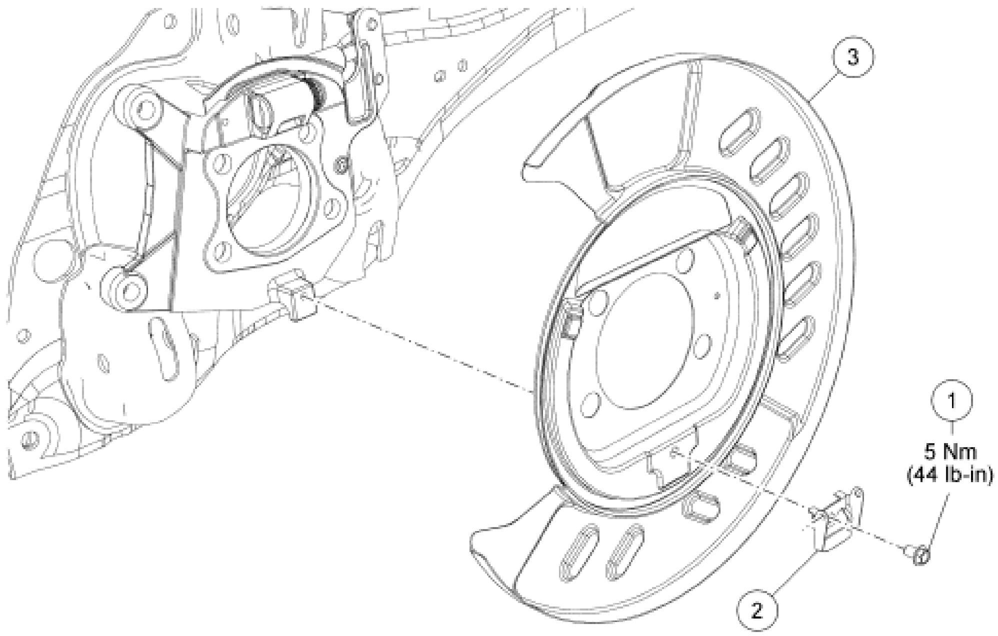

Fig. 7: Exploded View Of Brake Disc Shield With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W302607	Parking brake shoe return spring bracket bolt
2	2068	Parking brake shoe return spring bracket
3	2K045 RH/ 2K046 LH	Brake disc shield

REMOVAL AND INSTALLATION

1. Remove the wheel hub. For additional information, refer to **REAR SUSPENSION** article.
2. Remove the parking brake shoe return spring bracket bolt and bracket.
    - To install, tighten to 5 Nm (44 lb-in).
3. Remove the brake disc shield.
4. To install, reverse the removal procedure.

BRAKE CALIPER SUPPORT PLATE

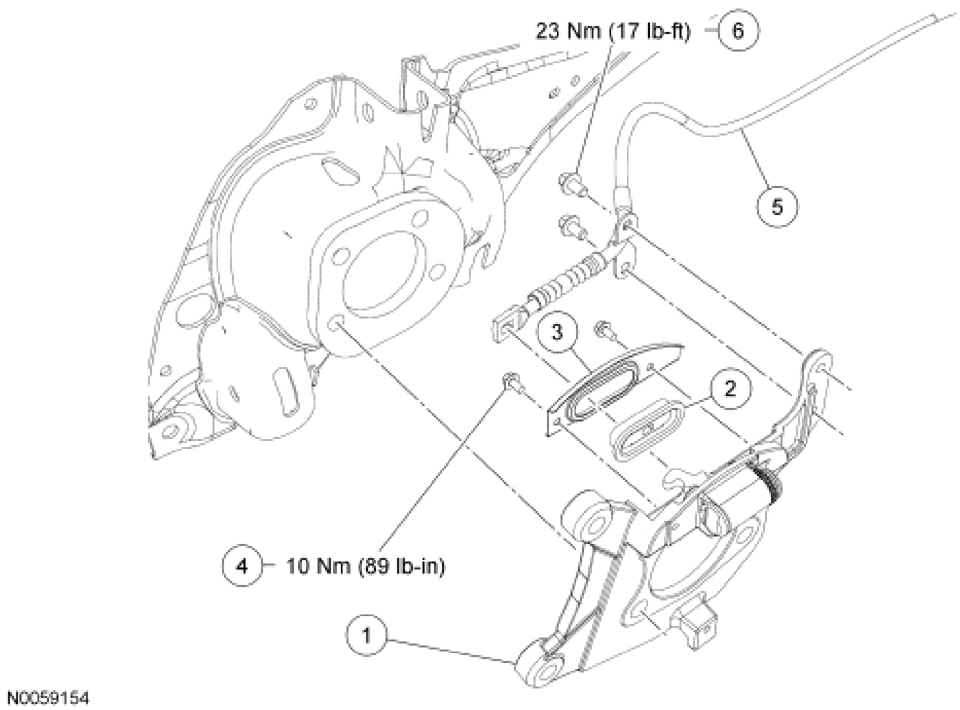

Fig. 8: Exploded View Of Brake Caliper Support Plate With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2C220	Brake caliper support plate
2	2092	Dust boot
3	-	Dust boot shield (part of 2C220)
4	W302608	Dust boot shield bolt (2 required)
5	2A635 LH/ 2A604 RH	Rear parking brake cable
6	W500021	Parking brake cable-to-support plate bolt (2 required)

REMOVAL AND INSTALLATION

1. Remove the brake disc shield. For additional information, refer to **Brake Disc Shield**.
2. Remove the 2 parking brake cable-to-support plate bolts, disconnect the parking brake cable from the lever and position the cable aside.
   - To install, tighten to 23 Nm (17 lb-ft).
3. Remove the 2 dust boot shield bolts and the dust shield.
   - To install, tighten to 10 Nm (89 lb-in).
4. Remove the dust boot.
5. To install, reverse the removal procedure.

BRAKE FLEXIBLE HOSE

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

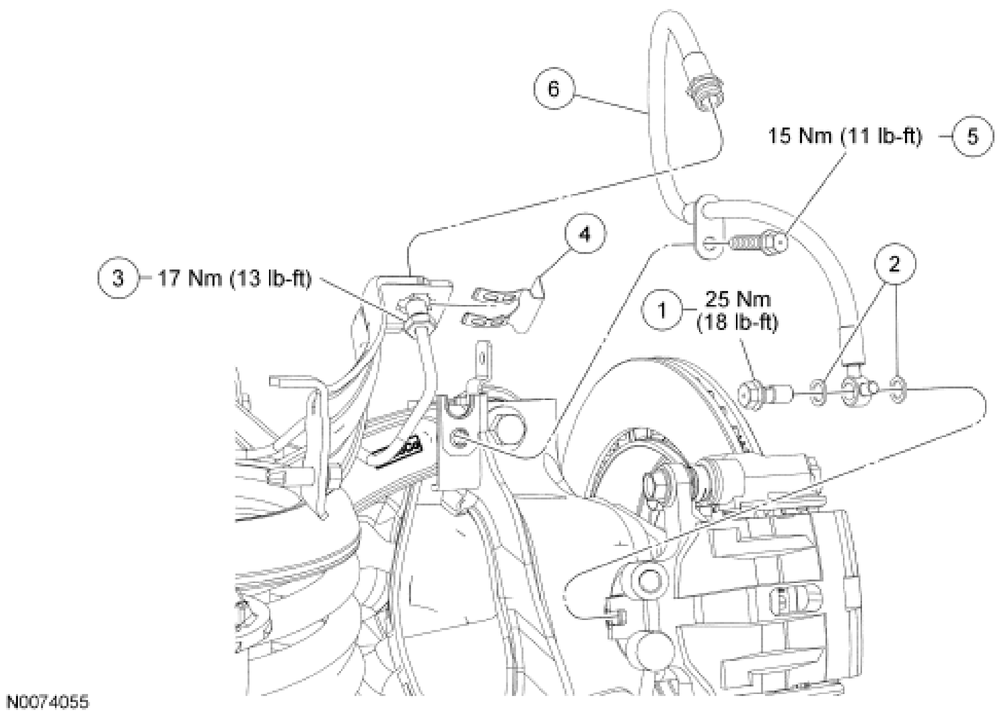

Fig. 9: Identifying Brake Flexible Hose With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2K573	Brake caliper flow bolt
2	W711784	Copper washers (2 required)
3	-	Brake tube fitting (part of 2265 RH/2C287 LH)
4	2B223	Brake flexible hose retaining clip
5	W500022	Brake flexible hose bracket bolt
6	2282	Brake flexible hose

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal**

injury.

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Remove the brake caliper flow bolt and discard the 2 copper washers.
    - To install, tighten to 25 Nm (18 lb-ft).
3. Disconnect the brake tube fitting from the brake flexible hose.
    - To install, tighten to 17 Nm (13 lb-ft).
4. Remove the brake flexible hose retaining clip.
5. Remove the brake hose bracket bolt and the brake hose.
    - To install, tighten to 15 Nm (11 lb-ft).
6. To install, reverse the removal procedure.
    - Bleed the brake caliper. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article for component bleeding.

2008 SUSPENSION

Rear Suspension - Edge & MKX

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	N.m	lb. ft.	lb-in
Brake caliper anchor plate bolt	55	41	-
Brake hose bracket bolt	7	-	62
Halfshaft nut (inner)	275	203	-
Halfshaft nut (outer)	175	129	-
Lower arm cam adjuster nut	150	111	-
Lower arm outboard bolt (1)	-	-	-
Parking brake cable bolt	18	13	-

Upper arm outboard bolt	150	111	-
Wheel bearing and wheel hub bolt	133	98	-
Wheel knuckle bracket bolt	150	111	-
Wheel knuckle bracket-to-frame bolts	47	35	-
Wheel speed sensor bolt	7	-	62
(1) Refer to procedure.			

DESCRIPTION AND OPERATION

REAR SUSPENSION

The rear suspension consists of the following components:

- Coil springs
- Lower arms
- Shock absorbers
- Stabilizer bar

- Stabilizer bar bushings
- Stabilizer bar links
- Toe links
- Upper arms
- Wheel bearing and wheel hub assemblies
- Wheel knuckles
- Wheel studs

The rear suspension utilizes an independent design. This suspension system allows the wheels to react to road imperfections independent of each other. This independent action offers improved isolation from the effects of jounce and rebound.

DIAGNOSTIC TESTS

REAR SUSPENSION

Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

WHEEL BEARING AND WHEEL HUB

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
	Front Hub Remover	205-D070 (D93P-1175-B) or equivalent

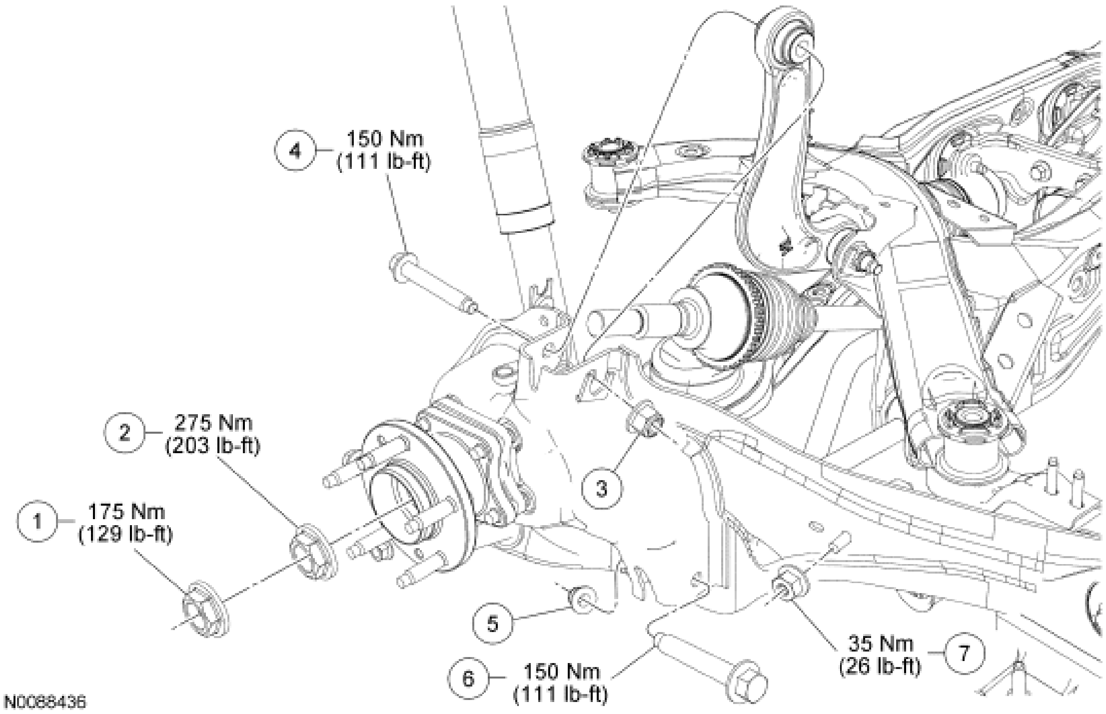

Fig. 1: All Wheel Drive (AWD) Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712435	Halfshaft nut (outer)
2	W712435	Halfshaft nut (inner)
3	W520516	Toe link outboard nut
4	W500766	Toe link outboard bolt
5	W520516	Lower arm outboard nut
6	W5000766	Lower arm outboard bolt
7	W520414	Stabilizer bar link upper nut

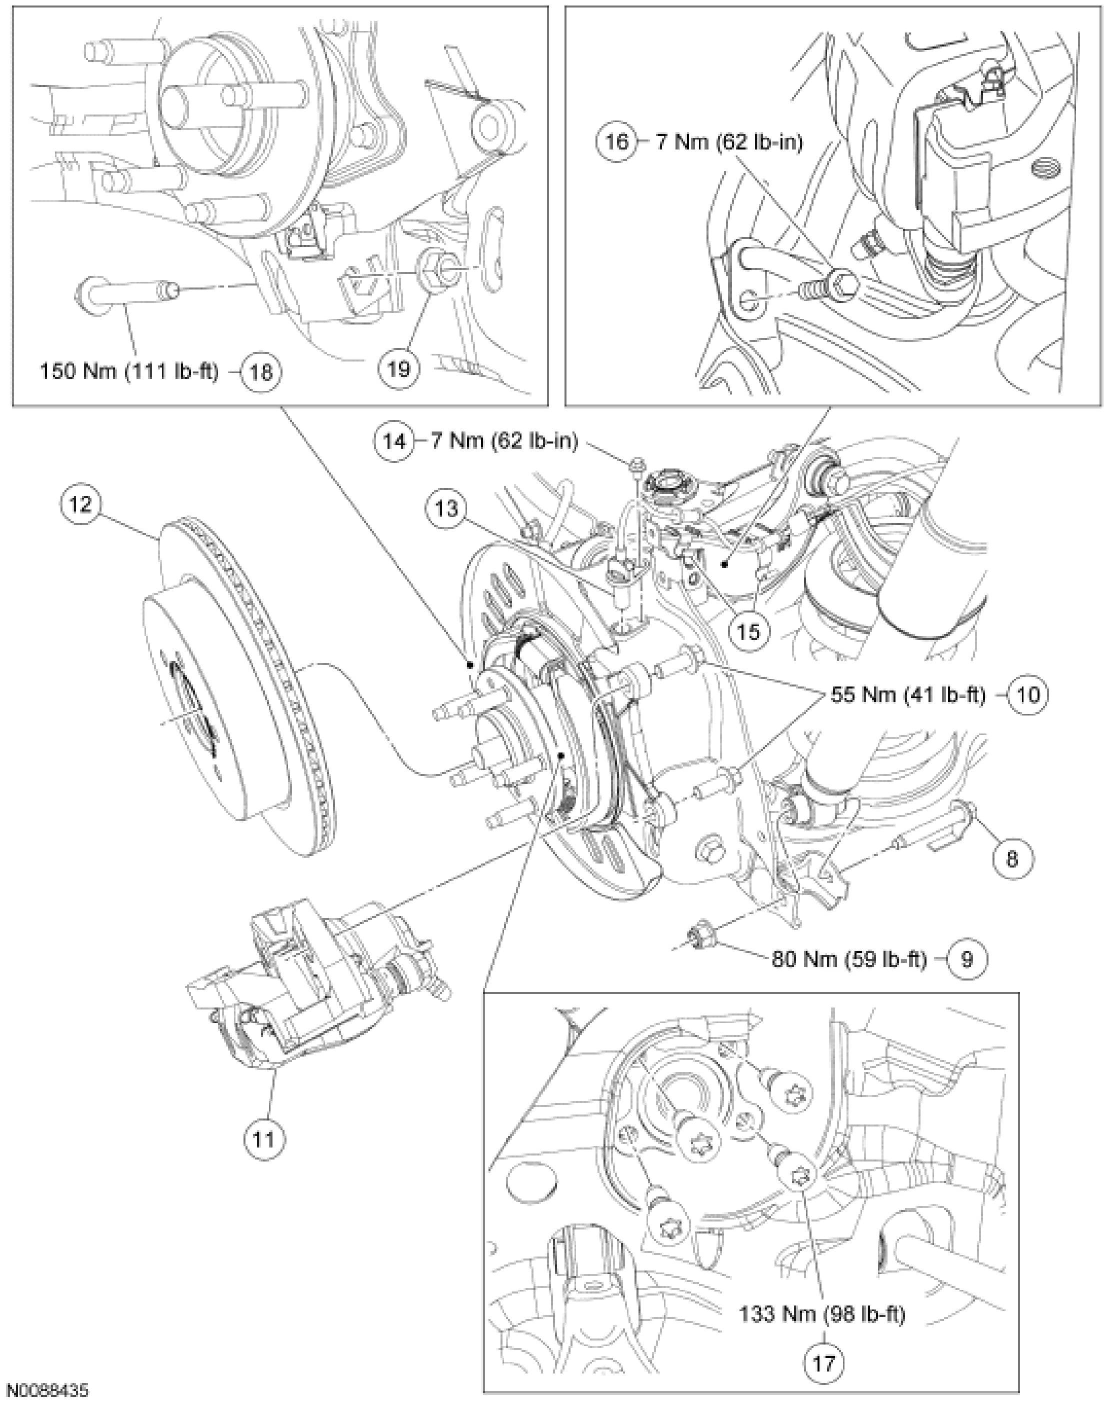

Fig. 2: All Wheel Drive (AWD) Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
8	W712459	Shock absorber lower flag bolt
9	W520214	Shock absorber lower nut

10	W711241	Brake caliper anchor plate bolts (2 required)
11	-	Brake caliper and anchor plate assembly
12	2C203	Brake disc
13	2C190	Wheel speed sensor
14	W500010	Wheel speed sensor bolt
15	-	Wheel speed sensor harness clips (part of 2C190) (2 required)
16	W500022	Brake hose bracket bolt
17	W712754	Wheel bearing and wheel hub bolt (4 required)
18	W500766	Toe link outboard bolt
19	W520516	Toe link outboard nut

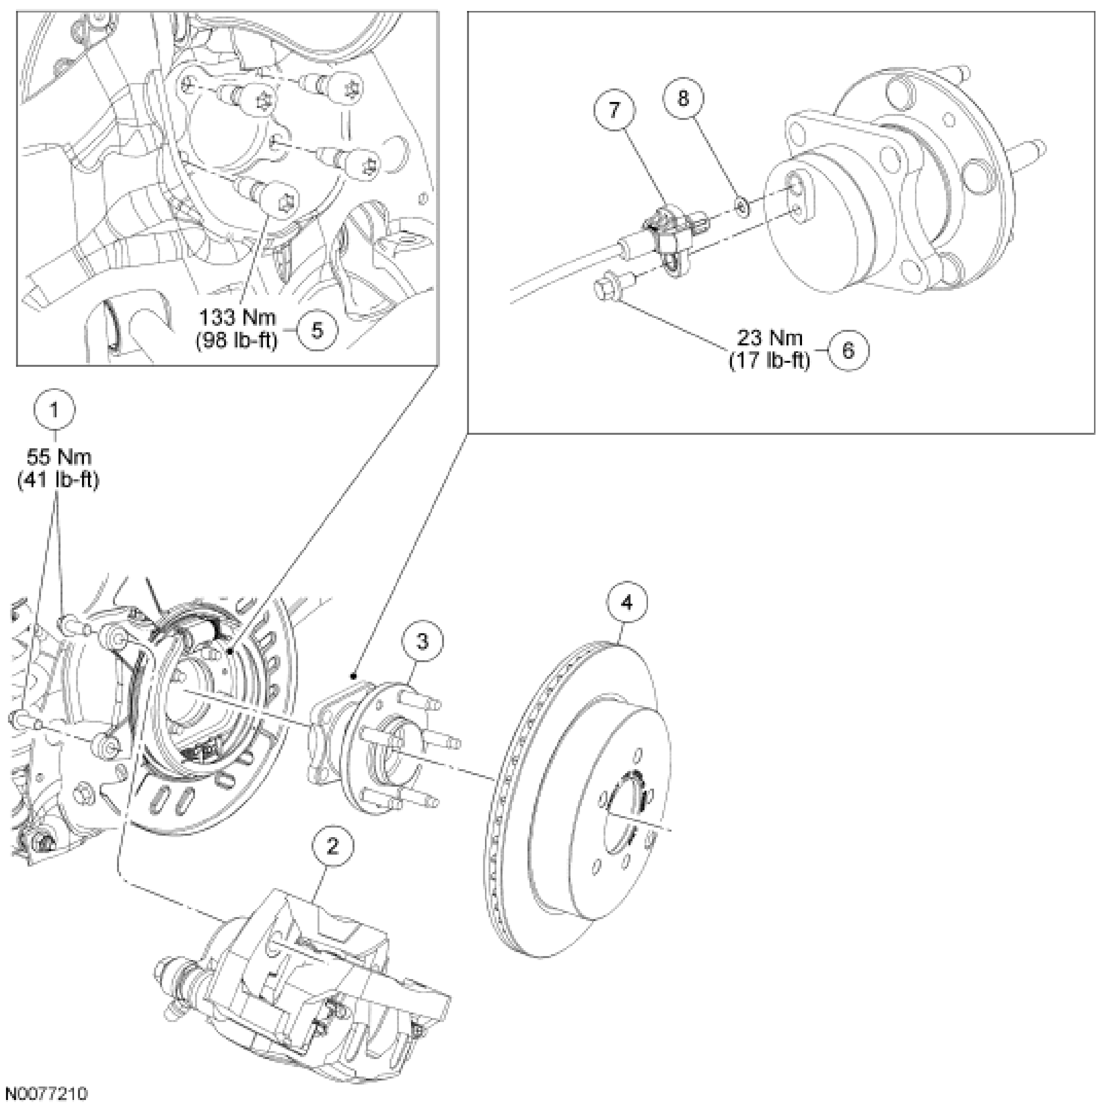

Fig. 3: Front Wheel Drive (FWD) Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W711240	Brake caliper anchor plate bolts (2 required)
2	-	Brake caliper and anchor plate assembly
3	2C299	Wheel hub and bearing assembly
4	2C203	Brake disc
5	W712754	Wheel bearing and wheel hub bolt (4 required)
6	W500222	Wheel speed sensor bolt
7	2C186 RH/ 2C187 LH	Wheel speed sensor
8	-	O-ring (part of 2C186 RH/ 2C187 LH)

REMOVAL

All vehicles

NOTE: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

   NOTE: Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.

2. Remove the 2 anchor plate bolts and position the brake caliper and anchor plate assembly aside.
   - Support the brake caliper and anchor plate assembly using mechanic's wire.
3. Remove the brake disc.

   All wheel drive (AWD) vehicles

   NOTE: Do not discard the inner nut at this time.

4. Remove the outer and inner halfshaft nuts.
   - Discard the outer nut.
5. Using the Front Hub Remover, separate the halfshaft from the hub and bearing assembly.

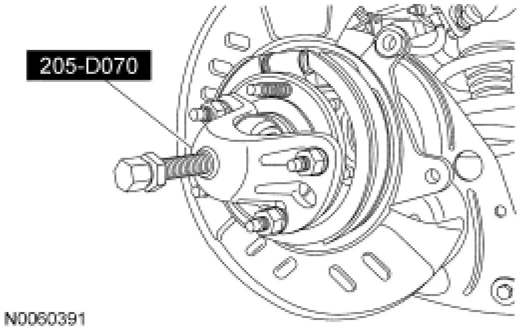

Fig. 4: Separating Halfshaft From Hub & Bearing Assembly Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

6. Remove the brake hose bracket bolt.
7. Remove the wheel speed sensor bolt and detach the sensor from the wheel knuckle.
8. Unclip the wheel speed sensor harness from the upper arm and position the wheel speed sensor assembly aside.
9. Remove and discard the upper arm outboard bolt and nut.
    - Separate the upper arm from the wheel knuckle.
10. Position a suitable screw type jack stand under the lower arm.
11. Remove and discard the shock absorber lower bolt and nut.
12. Remove and discard the stabilizer bar link upper nut.
13. Remove and discard the toe link outboard bolt and nut.
14. With the wheel knuckle supported by the screw type jack stand, remove and discard the toe link outboard bolt and nut.
15. Position the half shaft up through the wheel knuckle opening.

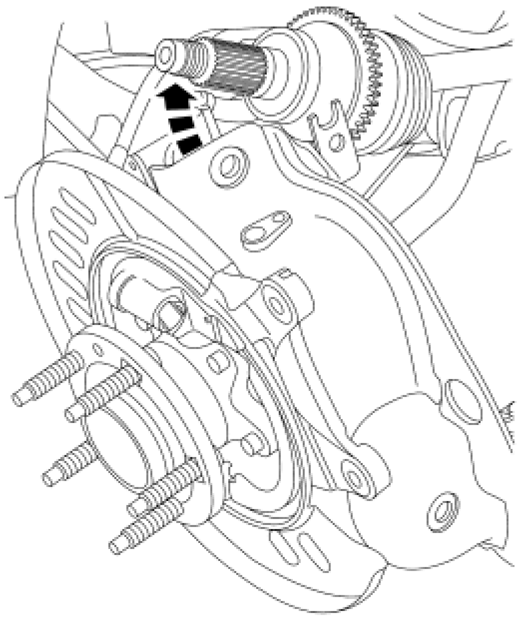

Fig. 5: Positioning Halfshaft Through Wheel Knuckle Opening & Secure Halfshaft Aside
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

16. Remove the wheel speed sensor bolt and detach the sensor from the wheel bearing and wheel hub.

All vehicles

17. Remove the 4 bolts and the wheel bearing and wheel hub.
    - Discard the bolts.

INSTALLATION

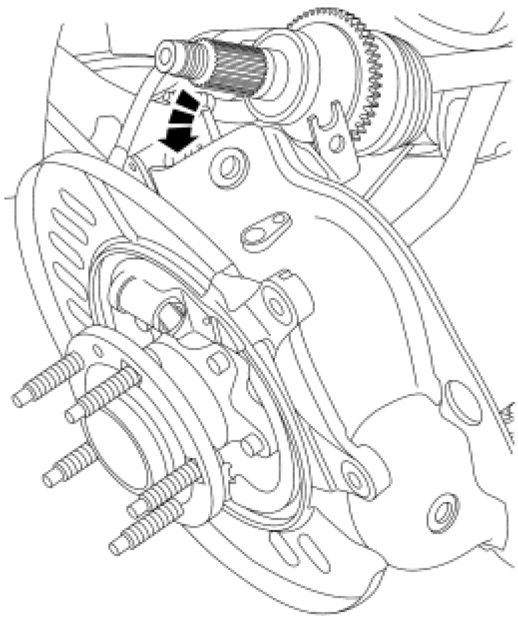
All vehicles

NOTE: **Before tightening the upper arm and lower arm bolts, use a jackstand to raise the rear suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in the removal procedure (curb height).**

1. Position the wheel bearing and wheel hub and install 4 new bolts.
    - Tighten to 133 N.m (98 lb. ft.).

AWD vehicles

2. Position the half shaft through the wheel knuckle and into the wheel bearing and wheel hub.



N0074222

Fig. 6: Positioning Halfshaft Into Wheel Bearing & Hub
Courtesy of FORD MOTOR CO.

3. Position the wheel knuckle onto the toe link and lower arm.
4. Loosely install the new toe link outboard bolt and nut.
5. Loosely install the new lower arm outboard bolt and nut.
6. Loosely install the new shock absorber lower bolt and nut.
7. Using the jack, raise the suspension and install the upper arm outboard bolt and nut.
   - Tighten the bolt to 150 N.m (111 lb. ft.).
8. Tighten the toe link outboard bolt to 150 N.m (111 lb. ft.).
9. Tighten the lower arm outboard bolt to 150 N.m (111 lb. ft.).
10. Tighten the shock absorber lower nut to 150 N.m (111 lb. ft.).
11. Position the stabilizer bar link and install the new upper link nut.
    - Tighten the nut to 35 N.m (26 lb. ft.).
12. Install the brake hose bracket bolt.
    - Tighten the bolt to 7 N.m (62 lb. ft.).
13. Position the wheel speed sensor and install the bolts.
    - Tighten the bolt to 7 N.m (62 lb. ft.).
    - Clip the 2 wheel speed sensor harness retainers to the upper arm.

FWD vehicles

14. Attach the wheel speed sensor to the wheel bearing and wheel hub and install the bolt.
    - Tighten to 23 N.m (17 lb. ft.).

All vehicles

15. Install the brake disc.
16. Position the brake caliper and anchor plate assembly and install the 2 bolts.
    - Tighten to 55 N.m (41 lb. ft.).

AWD vehicles

NOTE: Do not tighten the rear halfshaft nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered to the ground. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.

NOTE: Apply the brake to keep the halfshaft from rotating.

17. Position the halfshaft in the hub and use the previously removed halfshaft nut to seat the halfshaft.
    - Tighten to 275 N.m (203 lb. ft.).
    - Remove and discard the nut.

NOTE: Install and tighten the new halfshaft nut to specification within five minutes of starting it on the threads. Always install a new halfshaft nut after loosening or when not tightening within the specified time or damage to the components may occur.

18. Install a new inner halfshaft nut.
    - Tighten to 275 N.m (203 lb. ft.).
19. Install a new outer halfshaft nut.
    - Tighten to 175 N.m (129 lb. ft.).

All vehicles

20. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

WHEEL STUDS

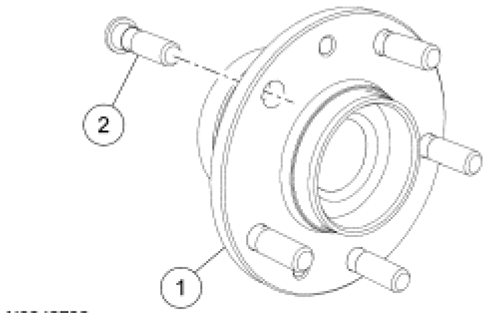


Fig. 7: Exploded View Of Wheel Studs
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2C299	Wheel bearing and wheel hub assembly
2	1107	Wheel stud

REMOVAL

1. Remove the wheel bearing and wheel hub. For additional information, refer to **WHEEL BEARING AND WHEEL HUB**.
2. Using a suitable press, remove the wheel stud from the wheel hub.
    - Discard the wheel stud.

INSTALLATION

1. Position the new wheel stud in the wheel hub, aligning the serrations in the wheel hub flange made by the original wheel stud.
2. Using a suitable press, install the wheel stud.
3. Install the wheel bearing and wheel hub. For additional information, refer to **WHEEL BEARING AND WHEEL HUB**.

WHEEL KNUCKLE

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
 ST2330-A	Front Hub Remover	205-D070 (D93P-1175-B) or equivalent

NOTE: **All wheel drive (AWD) shown in illustration, front wheel drive (FWD) similar.**

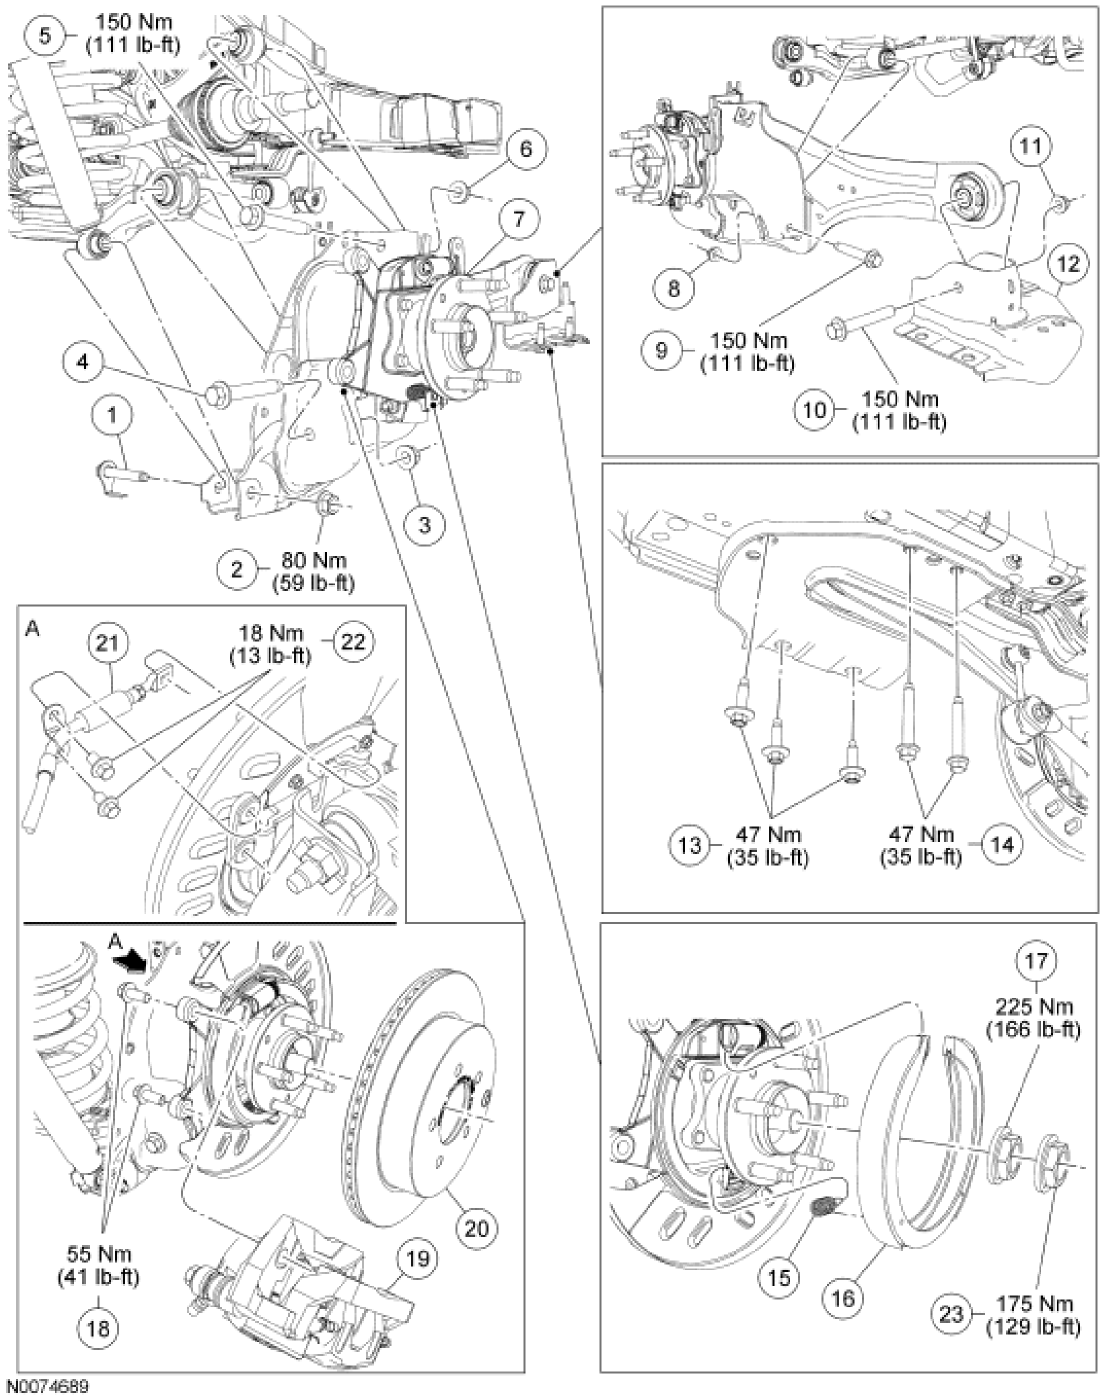

Fig. 8: Identifying Wheel Knuckle Components With Torque Specifications (1 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712459	Shock absorber lower flag bolt
2	W520214	Shock absorber lower nut

3	W520516	Lower arm outboard nut
4	W500766	Lower arm outboard bolt
5	W500766	Upper arm outboard bolt
6	W520516	Upper arm outboard nut
7	5A995 LH/ 5A994 RH	Wheel knuckle
8	W520516	Toe link outboard nut
9	W500766	Toe link outboard bolt
10	W500568	Wheel knuckle bracket bolt
11	W520516	Wheel knuckle bracket nut
12	5A757 RH/ 5A758 LH	Wheel knuckle arm bracket
13	W713905	Wheel knuckle bracket-to-frame bolts (3 required)
14	W500724	Wheel knuckle bracket-to-frame bolts (2 required)
15	-	Parking brake spring
16	-	Parking brake shoe
17	W712435	Inner halfshaft nut
18	W711241	Brake anchor plate bolts (2 required)
19	-	Brake caliper and anchor plate assembly
20	2C203	Brake disc
21	2A635	Parking brake cable
22	W500021	Parking brake cable rear bracket bolts (2 required)
23	W712435	Outer halfshaft nut

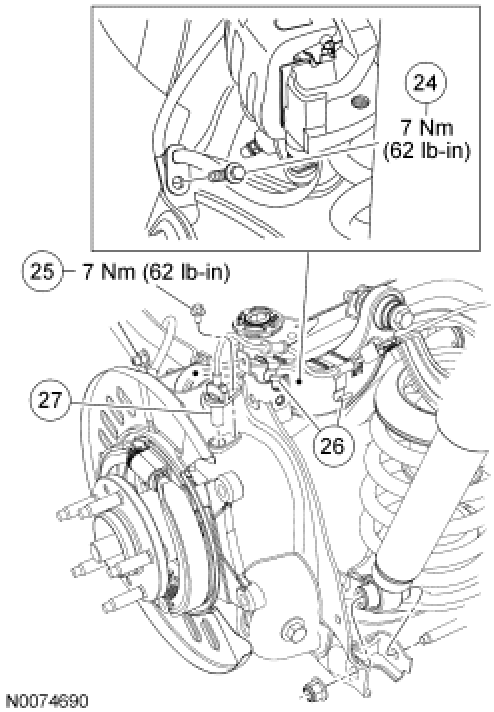

Fig. 9: Identifying Wheel Knuckle Components With Torque Specifications (2 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
24	-	Wheel speed sensor bolt (part of 2C190)
25	2C190	Wheel speed sensor
26	-	Wheel speed sensor harness clips
27	W500010	Wheel speed sensor bolt

REMOVAL

All vehicles

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.

CAUTION: Suspension bushing fasteners must be tightened with the weight of the vehicle resting on the wheel and tires or incorrect clamp load and bushing damage may occur.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

CAUTION: Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.

2. Remove the 2 anchor plate bolts and position the brake caliper and anchor plate assembly aside.
    - Support the brake caliper and anchor plate assembly using mechanic's wire.
3. Remove the brake disc.
4. Disconnect the parking brake shoe retaining spring and remove the spring and brake shoe assembly.
5. Remove the 2 bolts and disconnect the parking brake cable.
6. Remove the nut and disconnect the stabilizer bar link and parking brake cable bracket from the wheel knuckle.
    - Discard the nut.
7. Remove the bolt, unclip the 2 retainers and position aside the wheel speed sensor.
8. Remove the brake hose bracket bolt.

All wheel drive (AWD) vehicles

9. Remove and discard the outer and inner halfshaft nuts.
10. Using the special tool, separate the halfshaft from the wheel bearing and wheel hub.

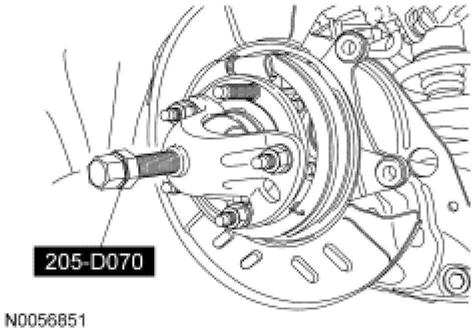

Fig. 10: Separating Halfshaft From Hub & Bearing Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

All vehicles

11. Position a suitable jackstand under the lower arm.

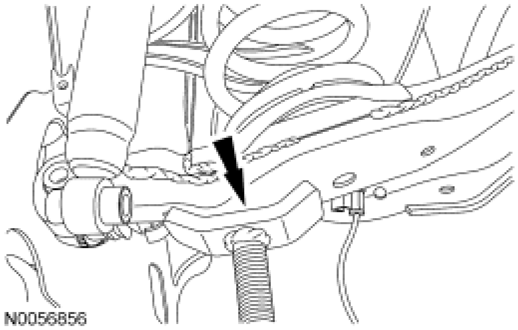

Fig. 11: Positioning Suitable Jackstand Under Lower Arm
Courtesy of FORD MOTOR CO.

12. Remove and discard the lower shock bolt and nut.
13. Remove and discard the upper arm outboard bolt and nut.
14. Remove and discard the lower arm outboard bolt and nut.
15. Remove and discard the toe link outboard bolt and nut.

AWD vehicles

16. Position the halfshaft through the wheel knuckle opening and secure the halfshaft aside.

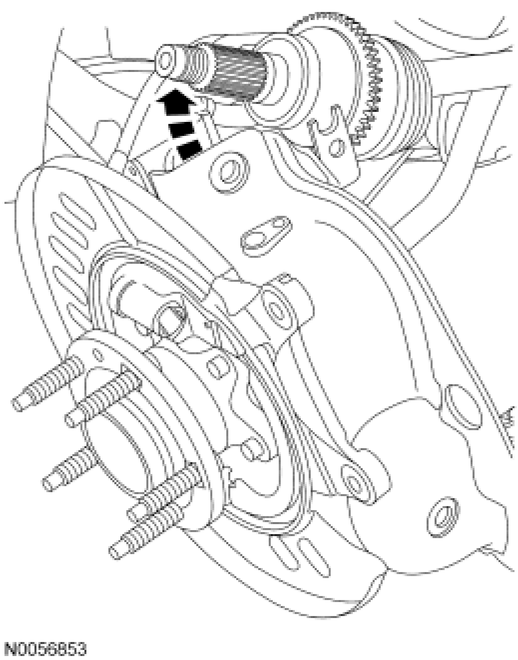

Fig. 12: Positioning Halfshaft Through Wheel Knuckle Opening & Secure Halfshaft Aside
Courtesy of FORD MOTOR CO.

All vehicles

17. Remove the 5 wheel knuckle bracket-to-frame bolts and the wheel knuckle.
    - Discard the bolts.
18. Remove and discard the wheel knuckle bracket bolt nut.

INSTALLATION

All vehicles

CAUTION: Suspension bushing fasteners must be tightened with the weight of the vehicle resting on the wheel and tires or incorrect clamp load and bushing damage may occur.

1. Install the wheel knuckle bracket bolt and nut.
    - Tighten the bolt to 150 N.m (111 lb. ft.).
2. Position the wheel knuckle and install the 5 wheel knuckle bracket-to-frame bolts.
    - Tighten the bolts to 47 N.m (35 lb. ft.).

AWD vehicles

3. Position the halfshaft into the wheel bearing and hub.

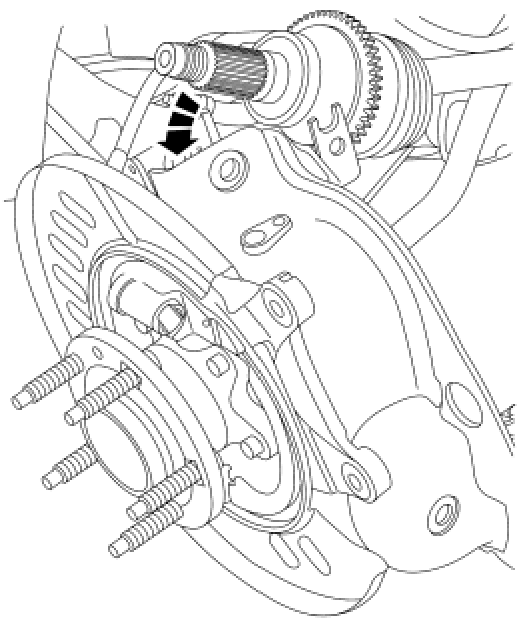

Fig. 13: Positioning Halfshaft Into Wheel Bearing & Hub
Courtesy of FORD MOTOR CO.

All vehicles

4. Position the wheel knuckle onto the toe link and lower arm.

NOTE: Do not tighten the lower arm outboard bolt at this time.

5. Loosely install the lower arm outboard bolt.

NOTE: Do not tighten the toe link outboard bolt at this time.

6. Loosely install the toe link outboard bolt.

NOTE: Do not tighten the shock absorber lower bolt at this time.

7. Loosely install the shock absorber lower bolt.
8. Using the jack, raise the suspension and install the upper arm outboard bolt and nut.
9. If installing a new wheel knuckle, tighten the lower outboard bolt in the following sequence.
    1. Tighten the bolt to 150 N.m (111 lb. ft.).
    2. Loosen the bolt 180 degrees.
    3. Tighten the bolt to 80 N.m (59 lb. ft.).
    4. Tighten the bolt an additional 90 degrees.
10. If installing the original wheel knuckle, tighten the lower arm outboard bolt to 80 N.m (59 lb. ft.).
    - Tighten the bolt an additional 90 degrees.
11. Tighten the toe link outboard bolt to 150 N.m (111 lb. ft.).
12. Tighten the shock absorber lower nut to 80 N.m (59 lb. ft.).

AWD vehicles

13. Using a suitable installation tool, install the halfshaft into the wheel hub.
14. Install the inner halfshaft nut.
    - Tighten to 275 N.m (203 lb. ft.).
15. Install the outer halfshaft nut.
    - Tighten to 175 N.m (129 lb. ft.).

All vehicles

16. Install the brake hose bracket bolt.
    - Tighten to 7 N.m (62 lb-in).
17. Position the wheel speed sensor, clip the 2 retainers to the upper arm and install the bolt.
    - Tighten to 7 N.m (62 lb-in).

NOTE: The parking brake cable bracket is fastened to the wheel knuckle with the same bolt as the stabilizer bar link.

18. Connect the parking brake cable bracket and the stabilizer bar link to the wheel knuckle.
    - Tighten the bolt to 35 N.m (26 lb. ft.).
19. Connect the parking brake cable and install the 2 bolts.
    - Tighten to 18 N.m (13 lb. ft.).
20. Install the parking brake shoe and retaining spring.
21. Install the brake disc.
22. Position the brake caliper and anchor plate assembly and install the anchor plate bolts.
    - Tighten to 55 N.m (41 lb. ft.).
23. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

LOWER ARM

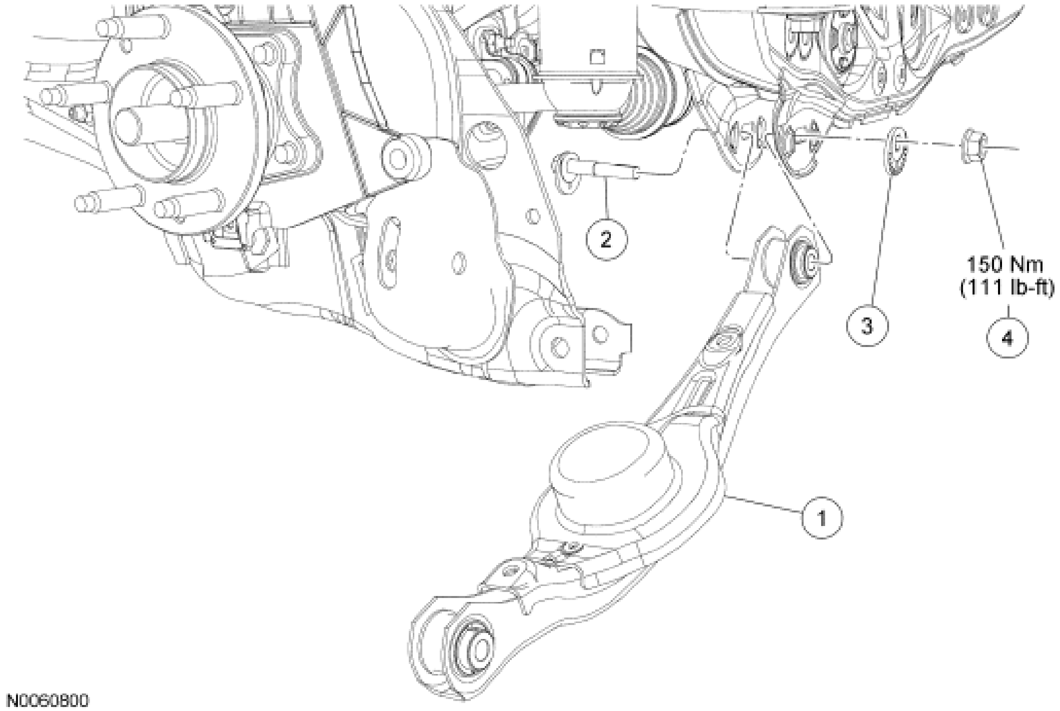

Fig. 14: Exploded View Of Lower Arm With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5A648	Lower arm
2	5K978	Lower arm cam bolt
3	5K751	Lower arm cam adjuster
4	W711798	Lower arm cam nut

REMOVAL AND INSTALLATION

1. Remove the spring. For additional information, refer to **SPRING**.
2. Remove the cam adjuster nut, cam adjuster and cam bolt.
   - Discard the cam bolt and nut.
   - To install, tighten to 150 N.m (111 lb. ft.).
3. To install, reverse the removal procedure.

UPPER ARM

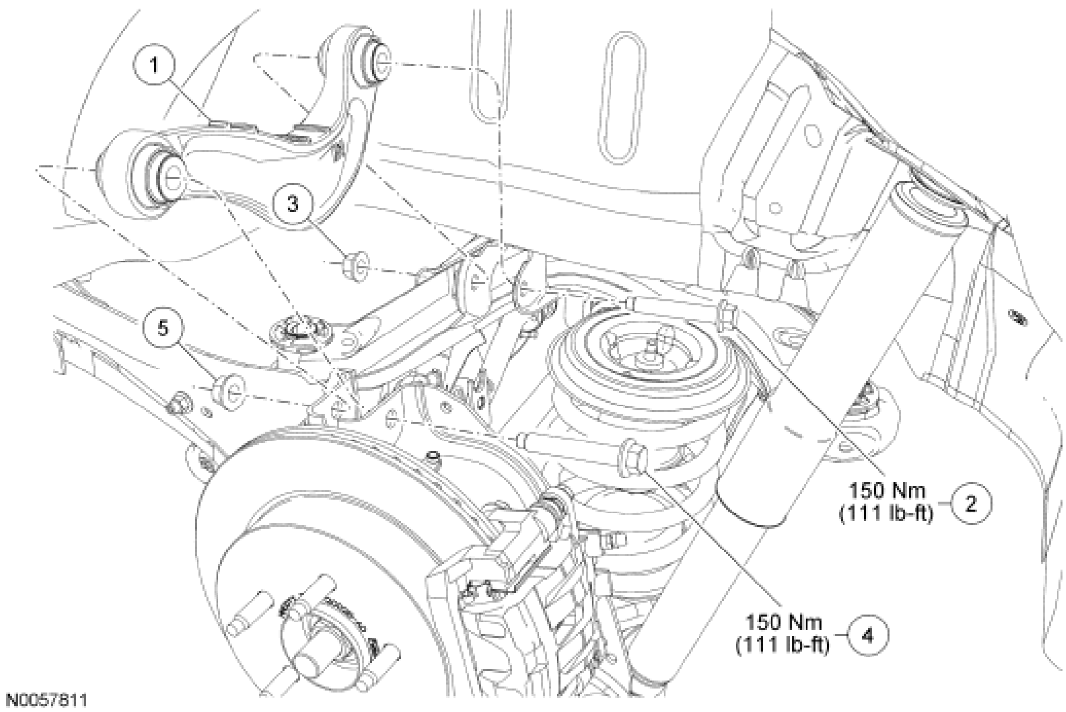

Fig. 15: Exploded View Of Upper Arm With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5500	Upper arm
2	W500766	Upper arm inboard bolt
3	W520516	Upper arm inboard nut
4	W500766	Upper arm outboard bolt
5	W520516	Upper arm outboard nut

REMOVAL

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service

expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.

CAUTION: Suspension bushing fasteners must be tightened with the weight of the vehicle resting on the wheel and tires or incorrect clamp load and bushing damage may occur.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Position a suitable jackstand under the lower arm and raise the suspension.
3. Remove and discard the upper arm outboard bolt and nut.
4. Carefully lower the lower arm and remove the jack.
5. Position the jackstand under the subframe.

NOTE: The upper arm inboard bolt cannot be removed without first lowering the subframe.

6. Remove and discard the 2 subframe bushing brace bolts.

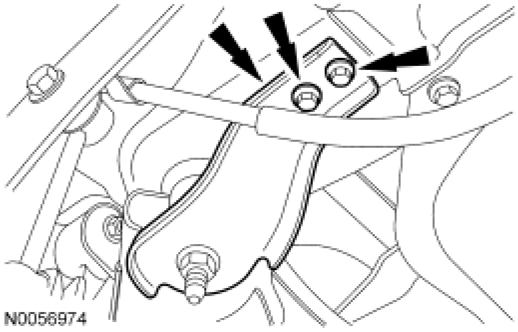

Fig. 16: Locating Subframe Bushing Brace Bolts
Courtesy of FORD MOTOR CO.

7. Remove the subframe forward nut.

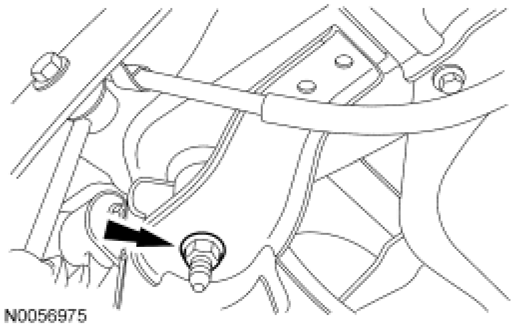

Fig. 17: Locating Subframe Forward Nut
Courtesy of FORD MOTOR CO.

NOTE: The upper arm inboard bolt cannot be removed without first lowering the subframe.

NOTE: The rear springs are under pressure. The jack must be lowered slowly while relieving the spring pressure.

8. Remove the subframe rearward nut and lower the jack.

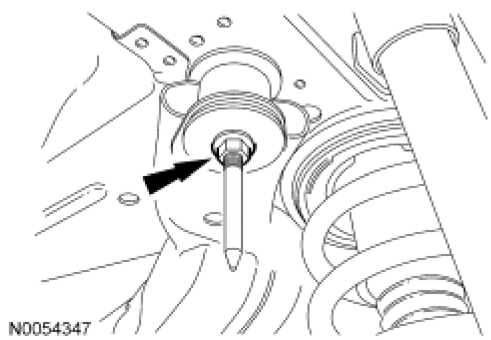

Fig. 18: Locating Subframe Rearward Nut
Courtesy of FORD MOTOR CO.

9. Remove and discard the upper arm inboard bolt and nut and remove the upper arm.

INSTALLATION

NOTE: Do not tighten the bolt at this time.

1. Position the upper arm and loosely install the upper arm inboard bolt and nut.
2. Raise the jack and install the subframe rearward nut.
   - Tighten to 90 N.m (66 lb. ft.).
3. Install the subframe forward nut.
   - Tighten to 90 N.m (66 lb. ft.).
4. Install the 2 subframe bushing brace bolts.
   - Tighten to 25 N.m (18 lb. ft.).
5. Reposition the jack under the lower arm and raise the jack.

NOTE: Do not tighten the bolt at this time.

6. Loosely install the upper arm outboard bolt and nut.
7. Remove the jack.

8. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
9. With the weight of the vehicle on the wheel and tire, tighten the upper arm outboard bolt to 150 N.m (111 lb. ft.).
10. With the weight of the vehicle on the wheel and tire, tighten the upper arm inboard bolt to 150 N.m (111 lb. ft.).

TOE LINK

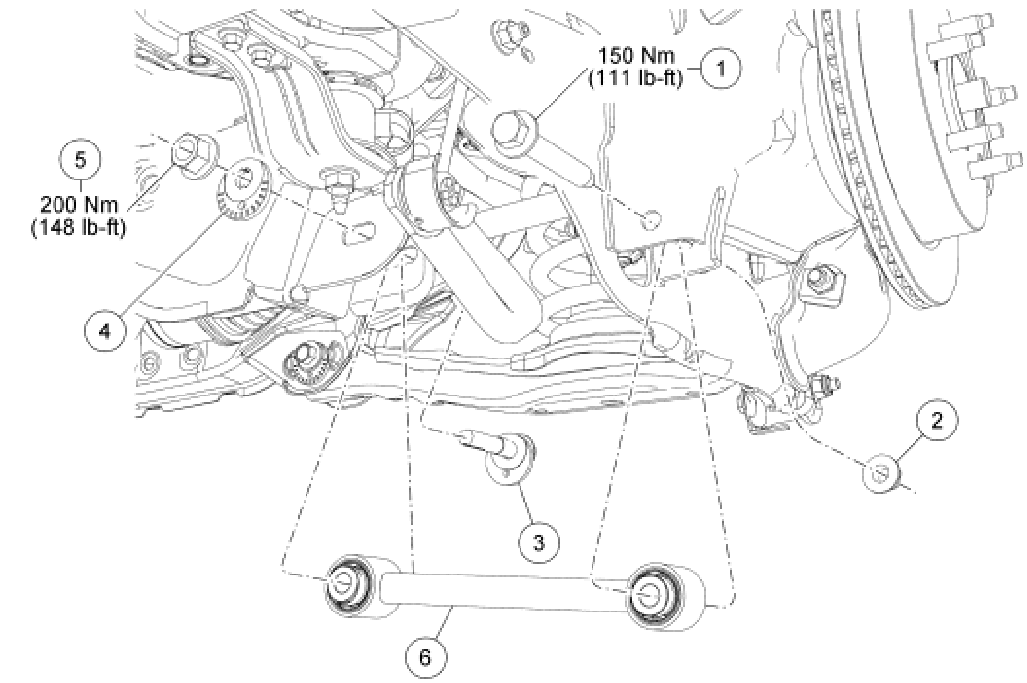

Fig. 19: Exploded View Of Toe Link With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500766	Toe link outboard bolt
2	W520516	Toe link outboard nut
3	5K978	Toe link inboard cam bolt
4	5K751	Toe link adjuster cam
5	W711798	Toe link inboard nut
6	5500	Toe link

REMOVAL

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or

equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.

CAUTION: Suspension bushing fasteners must be tightened with the weight of the vehicle resting on the wheel and tires or incorrect clamp load and bushing damage may occur.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Remove and discard the toe link inboard nut, cam adjuster and cam bolt.
3. Remove and discard the toe link outboard bolt and nut then remove the toe link.

INSTALLATION

NOTE: Do not tighten the bolt at this time.

1. Position the toe link and loosely install the toe link outboard bolt and nut.

NOTE: Do not tighten the bolt at this time.

2. Loosely install the toe link inboard bolt and nut.
3. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
4. With the weight of the vehicle on the wheel and tire, tighten the toe link outboard bolt to 150 N.m (111 lb. ft.).
5. With the weight of the vehicle on the wheel and tire, tighten the toe link inboard nut to 200 N.m (148 lb. ft.).

STABILIZER BAR AND LINK

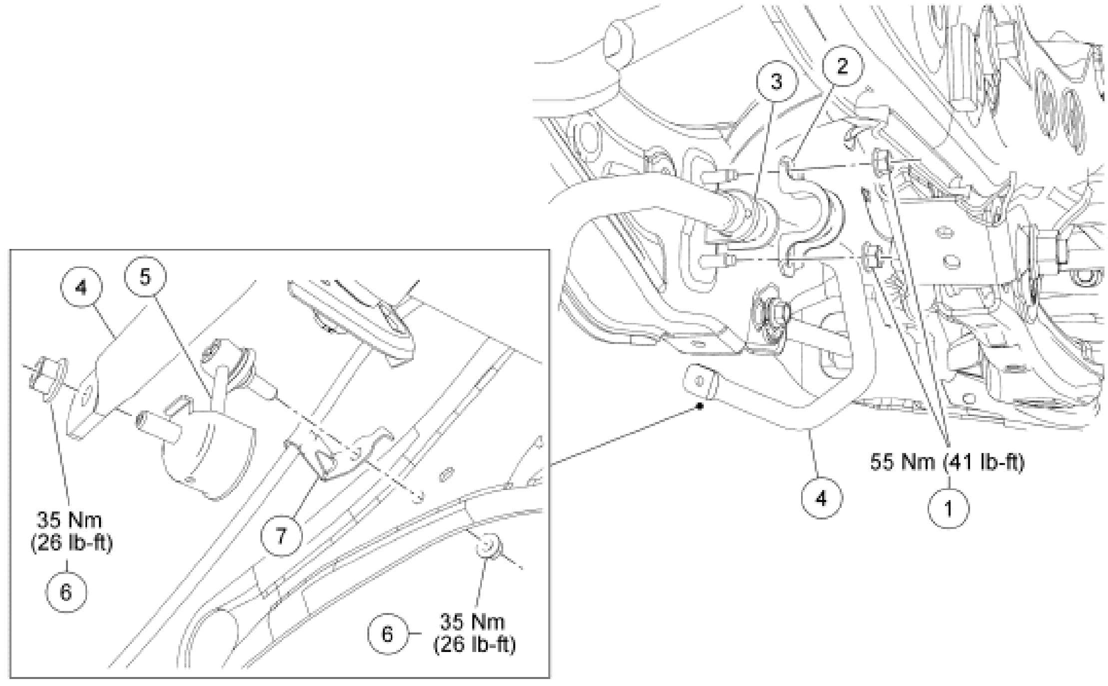

Fig. 20: Exploded View Of Stabilizer Bar & Link With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W520414	Stabilizer bar bracket nuts (4 required)
2	5B493	Stabilizer bar bracket (2 required)
3	-	Stabilizer bar bushing (part of 5B493) (2 required)
4	5A772	Stabilizer bar
5	5A486	Stabilizer bar link
6	W520414	Stabilizer bar link nut (4 required)
7	-	Parking brake cable (part of 2A635)

REMOVAL AND INSTALLATION

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

2. Remove and discard the stabilizer bar link upper nuts.
    - To install, tighten to 35 N.m (26 lb. ft.).
3. Remove and discard the stabilizer bar link lower nuts and remove the stabilizer bar links.
    - To install, tighten to 35 N.m (26 lb. ft.).
4. Remove and discard the stabilizer bar bracket nuts and remove the stabilizer bar brackets and the stabilizer bar.
    - To install, tighten to 55 N.m (41 lb. ft.).
5. Inspect the stabilizer bar bushings and install a new bushing(s), if necessary.
6. To install, reverse the removal procedure.

SPRING

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
	Front Hub Remover	205-D070 (D93P-1175-B) or equivalent

20	W712435	Outer halfshaft nut

REMOVAL

All vehicles

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Suspension bushing fasteners must be tightened with the weight of the vehicle resting on the wheel and tires or incorrect clamp load and bushing damage may occur.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

CAUTION: Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.

2. Remove the 2 anchor plate bolts and position the brake caliper and anchor plate assembly aside.

- Support the brake caliper and anchor plate assembly using mechanic's wire.

3. Remove the brake disc.
4. Remove the nut and disconnect the stabilizer bar link and parking brake cable bracket from the wheel knuckle.
    - Discard the nut.
5. Remove the bolt, unclip the 2 retainers from the upper arm and position aside the wheel speed sensor.
6. Remove the brake hose bracket bolt and position the hose aside.

All wheel drive (AWD) vehicles

7. Remove and discard the outer and inner halfshaft nuts.
8. Using the special tool, separate the halfshaft from the hub and bearing.

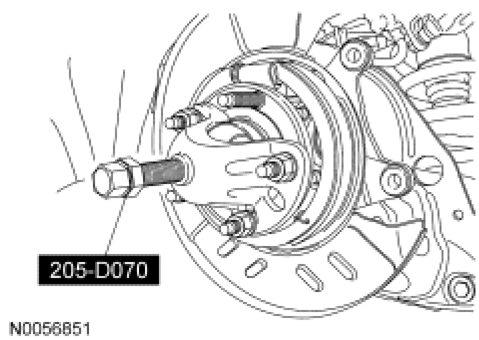

Fig. 22: Separating Halfshaft From Hub & Bearing Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

All vehicles

9. Position a suitable jackstand under the lower arm.
10. Remove and discard the shock absorber lower nut and flag bolt.
11. Remove and discard the upper arm outboard bolt and nut.
12. Remove and discard the toe link outboard bolt and nut.
13. Remove and discard the lower arm outboard bolt and nut.

AWD vehicles

14. Position the halfshaft through the wheel knuckle opening and secure the halfshaft aside.

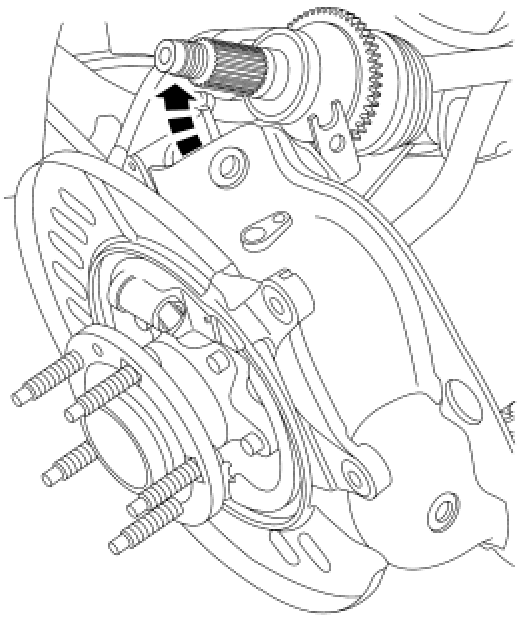

Fig. 23: Positioning Halfshaft Through Wheel Knuckle Opening & Secure Halfshaft Aside
Courtesy of FORD MOTOR CO.

All vehicles

WARNING: **The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.**

15. Pull outward on the wheel knuckle while lowering the jackstand and remove the spring.
    - Inspect the spring upper and lower seats, remove and discard seats as necessary.

INSTALLATION

All vehicles

1. If removed, position a new lower seat into the lower arm with the recess in the seat aligned with the projection on the lower arm.

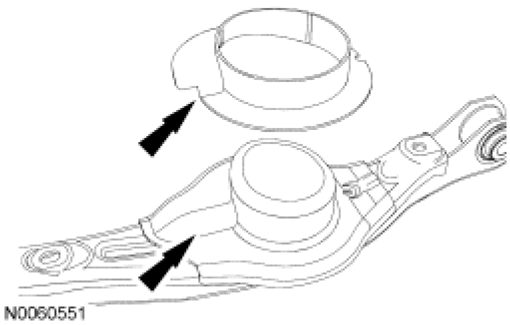

Fig. 24: Positioning Lower Seat Into Lower Arm With Recess In Seat Aligned With Projection On Lower Arm
Courtesy of FORD MOTOR CO.

2. On installation, position the spring onto the lower arm with the end of the spring 0-10 mm (0-0.39 in) from the step on the spring seat.

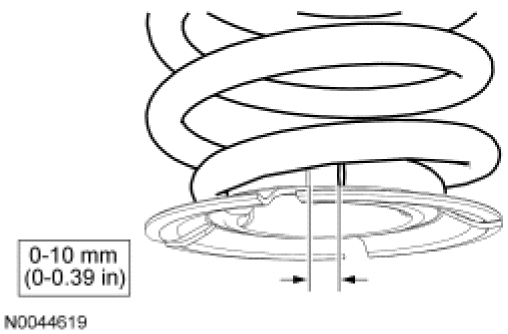

Fig. 25: Positioning Spring Onto Lower Arm With End Of Spring
Courtesy of FORD MOTOR CO.

WARNING: **The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.**

3. Pull outward on the wheel knuckle and install the spring.

All wheel drive (AWD) vehicles

4. Position the halfshaft into the wheel knuckle opening.

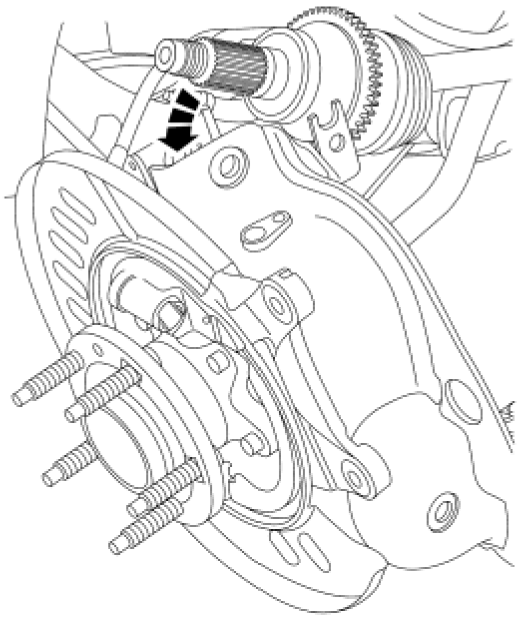

Fig. 26: Positioning Halfshaft Into Wheel Bearing & Hub
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: Do not tighten the bolt at this time.

5. Raise the jackstand and loosely install the lower arm outboard bolt and nut.

NOTE: Do not tighten the bolt at this time.

6. Position the toe link and loosely install the toe link outboard bolt and nut.

NOTE: Do not tighten the bolt at this time.

7. Position the upper arm and loosely install the upper arm outboard bolt and nut.

NOTE: Do not tighten the bolt at this time.

8. Loosely install the lower shock nut and flag bolt.
9. Lower and remove the jackstand.

AWD vehicles

10. Using a suitable installation tool, install the halfshaft into the wheel hub.
11. Install the inner halfshaft nut.
    - Tighten to 275 N.m (203 lb. ft.).
12. Install the outer halfshaft nut.
    - Tighten to 175 N.m (129 lb. ft.).

All vehicles

13. Install the brake hose bracket bolt.
    - Tighten to 7 N.m (62 lb-in).
14. Position the wheel speed sensor, clip the 2 retainers to the upper arm and install the wheel speed sensor and bolt.
    - Tighten the bolt to 7 N.m (62 lb-in).
15. Connect the parking brake cable bracket and stabilizer bar link to the wheel knuckle and install the nut.
    - Tighten the nut to 35 N.m (26 lb. ft.).
16. Install the brake disc.
17. Position the brake caliper and anchor plate assembly and install the 2 anchor plate bolts.
    - Tighten to 55 N.m (41 lb. ft.).
18. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
19. With the weight of the vehicle on the wheel and tire, tighten the lower shock nut to 80 N.m (59 lb. ft.).
20. With the weight of the vehicle on the wheel and tire, tighten the upper arm outboard bolt to 150 N.m (111 lb. ft.).
21. With the weight of the vehicle on the wheel and tire, tighten the toe link outboard bolt to 150 N.m (111 lb. ft.).
22. With the weight of the vehicle on the wheel and tire, tighten the lower arm outboard bolt in the following sequence.
    1. Tighten to 80 N.m (59 lb. ft.).
    2. Tighten an additional 90 degrees.
23. Check and if necessary, align the vehicle. For additional information, refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

SHOCK ABSORBER

REMOVAL

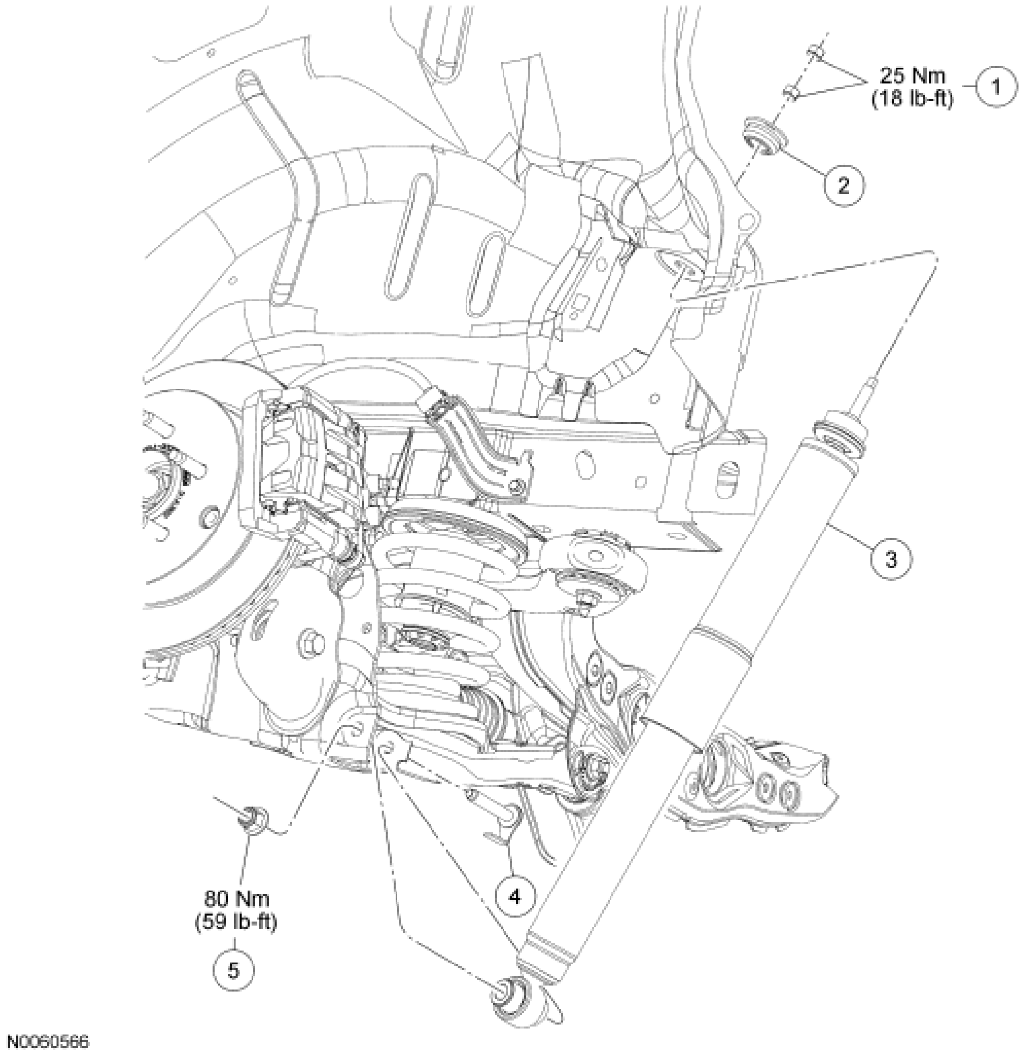

Fig. 27: Exploded View Of Shock Absorber With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W520504	Shock absorber upper nuts (2 required)
2	18080	Shock absorber
3	18017	Shock absorber upper bushing
4	W712459	Shock absorber lower flag bolt
5	W520214	Shock absorber lower nut

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part

of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.

CAUTION: Suspension bushing fasteners must be tightened with the weight of the vehicle resting on the wheel and tires or incorrect clamp load and bushing damage may occur.

NOTE: The new shock absorber is shipped with a strap securing it in the compressed position.

1. Remove the quarter trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove and discard the shock absorber upper nuts.
3. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
4. Position a suitable jackstand under the lower arm.
5. Remove the shock absorber lower bolt, flag nut and shock absorber.
    - Discard the bolt and flag nut.

INSTALLATION

NOTE: Do not tighten the bolt at this time.

1. Position the shock absorber and loosely install the shock absorber lower bolt and flag nut.
2. Remove the jackstand.
3. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
4. With the weight of the vehicle on the wheel and tire, tighten the shock absorber lower bolt to 80 N.m (59 lb. ft.).
5. Install the shock absorber upper nuts.
    - Tighten to 25 N.m (18 lb. ft.).
6. Install the quarter trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

DESCRIPTION AND OPERATION

SEATS

Front Seats

The front seats can be equipped with the following systems:

- Two-way manual seat track
- Four-way manual seat track
- Six-way power seat track
- Manual recline
- Power recline
- Backrest, without fold-flat
- Backrest with fold-flat (optional, passenger only)
- Heated seats
- Heated/cooled climate controlled seats
- Memory driver seat
- Manual lumbar
- Power lumbar
- Adjustable head restraints
- Seat side air bags (standard)
- Occupant classification sensor (OCS) system on passenger seat

Driver Seat Module (DSM) - Memory Seat

The power driver seat and power exterior rear view mirrors are controlled by the driver seat module (DSM) only when the vehicle is equipped with the programmable/recall memory option. The DSM is located on the driver seat track.

For information on programming memory positions or recalling a stored memory position, refer to **Memory Position Programming**.

Memory Recall - Remote Keyless Entry (RKE)

When the vehicle is equipped with a memory driver seat, the remote keyless entry (RKE) can be used with a key that includes an integrated keyhead transmitter (IKT). A personality or memory position for the driver seat and exterior rear view mirrors can be assigned to an IKT. Up to 2 personalities can be assigned, 1 per IKT. If the remote memory has been activated and that IKT has been assigned a personality, pushing the button to unlock the vehicle doors will recall the memory seat and exterior rear view mirror positions.

For information on diagnosing a RKE concern or associating an IKT to a memory position, refer to **HANDLES, LOCKS, LATCHES & ENTRY SYSTEMS** article.

Easy Entry/Easy Exit

The driver power seat easy entry/exit feature can be enabled/disabled using a scan tool. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's Literature or **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article for information on the message center.

Heated Seats

This system allows independent seat electrical heating of each front seat on demand.

The components of the system are:

- the seat heater mats located on the seat cushion and backrest.
- the heated seat module located on the passenger power seat track and cushion frame on manual seat track.
- the heated seat switches, located on the HVAC module.
- temperature sensors, located in the seat cushion heater mats.

A new heater mat will come assembled on a new foam pad.

Climate Controlled Seats

The climate controlled seat system is able to heat and cool the front seats. Each climate controlled seat is operated by push-buttons on the HVAC module located on the instrument panel. Each front seat temperature is then monitored and controlled by the dual climate control seat module (DCSM) located on the front passenger seat track.

The dual climate controlled seat system contains the following components:

- HVAC module
- DCSM
- Thermo-electric device (TED) and blower assembly within each front seat cushion and backrest
- Air filter (attached to each TED and blower assembly)
- Cushion TED adapter attached to the cushion frame
- Cushion and backrest manifolds
- Cushion and backrest foam pads
- Cushion and backrest trim covers

Manual Lumbar

The front seat manual lumbar is adjusted by a handle mounted on the side of the seat cushion side shield.

Power Lumbar

The driver seat can have an electromechanical backrest pad adjuster. The lumbar switch adjustment is on the side of the seat cushion side shield and is part of the seat control switch.

Manual Recline

The manual recline can be adjusted by a handle mounted on the outboard side of the cushion side shield.

Front Seats Without Backrest Fold Flat

Manual recliners on seats that do not fold-flat are only serviceable by installing a new backrest frame assembly.

Passenger Seats With Backrest Fold Flat

Front passenger seats can come with a backrest that folds flat, when optioned with manual recline. The recliners on this backrest will recline the backrest back or fold the backrest forward. Pull up on the recliner handle allowing the backrest to recline forward. When the backrest reclines fully forward, if the recliner handle is held up, the backrest can continue to fold forward until it reaches the fold-flat position. Manual recliners on seats that fold flat are serviced separately from the backrest frame assembly.

Power Recline

The front seats can come with an electromechanical backrest adjuster. The backrest adjustment switch is located on the side of the seat cushion side shield and is part of the seat control switch.

Power recliners are serviced separately from the backrest frame assembly. The recliner motor can also be serviced separately.

Seat Side Air Bags

The driver and passenger seat side air bags are attached to the seat backrest frame. If a seat side air bag deployment has occurred or for more information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Occupant Classification Sensor (OCS) System

The occupant classification sensor (OCS) system is standard equipment on all front passenger seats. For diagnosing or servicing the OCS system, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Rear Seats

WARNING: **Synchronize the seat recliners following the steps in the seat removal and installation procedure any time the seat is removed for service. The following actions may result in the loss of recliner synchronization that cannot be corrected and may cause the seat back to fail in a crash:**

- **Dropping the seat**

- **Sitting on the seat when removed**
- **Applying any load to the seat when removed**
- **Removing or loosening any recliner fasteners except for the safety belt buckle bolt**

Install a new seat back frame assembly if the seat recliners cannot be synchronized. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s) in a crash.

The rear seats are a 60/40 split folding/reclining backrest design. The recliner release handle will allow the backrest to recline as well as fold the backrest forward. When the backrest is folded forward, the front legs of the seat will fold down (kneel) creating a level load floor with the luggage area. The 60 percent seat has a fold down armrest with cup holders. The armrest latches to a striker in the backrest frame.

The rear seats can be equipped with the following systems:

- Power fold down backrests
- Heated seats

When the rear seats are removed from the vehicle, the inboard and outboard recliners must be synchronized before installing the seat back into the vehicle. If the recliners are not synchronized, carry out the synchronization steps in **Seat - Rear, 40 Percent** or **Seat - Rear, 60 Percent**. The recliners must not be moved from this synchronized position until all the seat-to-floor retainers are tightened to specification. Synchronizing the recliners may require the recliners to be released. Care must be used when working with the recliners as they are spring loaded and release with high force.

The 60 percent and 40 percent seat backrest frame assemblies include the backrest frame, anchor brackets and recliners (inboard and outboard). These parts must be serviced as an assembly. To prevent loss of recliner synchronization, recliner binding or backrest latch/release failure, the recliner bolts must never be loosened or removed, except for the safety belt buckle bolt. The backrest frame assemblies are assembled on a fixture not available for service.

The safety belt buckle bolt is the only bolt on either 40 or 60 percent seat recliner that may be removed for service. To service the safety belt buckle, refer to **SAFETY BELT SYSTEM** article.

Power Fold Down Backrest

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

The optional power fold down backrest, in addition to functioning with the manual recline handle, has a convenient power fold seat control switch mounted in the LH rear quarter trim panel rear hatch area. When the switch is pushed, left or right, an electromechanical motor releases that seat's recliners, through a cable attachment, and a spring load folds the backrest down and kneels the front legs. The seat backrest must then be manually lifted upright to the seating position with the recliners locked in place.

Heated Seats

This system allows independent seat electrical heating of each rear outboard seat on demand.

The components of the system are:

- the seat heater mats located on the seat cushion and backrest.
- the heated seat module located under the 60 percent seat.
- the heated seat switches, located in the LH and RH rear doors.
- temperature sensors, located in the seat cushion heater mats.

A new heater mat will come assembled on a new foam pad.

DIAGNOSTIC TESTS

SEATS

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Fluke 73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	Software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

High-Speed Controller Area Network (HS-CAN) and Medium-Speed Controller Area Network (MS-CAN)

This vehicle utilizes 2 communication systems called high-speed controller area network (HS-CAN) and medium-speed controller area network (MS-CAN). The memory seat and climate controlled seat communicate over the MS-CAN. When diagnosing the memory seat or climate controlled seat, use a Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool with the latest software update with the capability of communicating over the MS-CAN bus.

Principles of Operation

Driver and Passenger Power Seats Without Memory

The driver and front passenger power seat motors are hardwired to the seat control switches on each respective seat. The circuits are normally at ground through the seat control switch. Each individual seat track, recliner (if equipped) and lumbar (if equipped) motor circuit is switched to voltage when the specific adjustment position is selected.

Power Driver Seat With Memory

NOTE:	**Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.**

NOTE:	**A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.**

The memory driver seat feature allows the driver to program a personalized seat position that can be recalled using the memory switch or a remote keyless entry (RKE) transmitter (if associated). There are 2 memory settings possible. The power exterior mirror (if equipped) positions are also stored and recalled with the power driver seat positions.

For information on programming memory positions or recalling a stored memory position, refer to **Memory Position Programming**. For information on RKE transmitter programming, refer to **HANDLES, LOCKS, LATCHES & ENTRY SYSTEMS** article.

The driver seat module (DSM) is located under the driver seat. To install a new DSM, refer to **MULTIFUNCTION ELECTRONIC MODULES** article. Programmable module installation (PMI) must be carried out when installing a new DSM. Refer to **MODULE CONFIGURATION** article.

The driver seat control switch provides voltage to the DSM when activated. The neutral position of each driver seat control switch position is a ground state through the seat control switch contacts. A voltage input causes the DSM to power the appropriate motor until the input is removed. Ground is the normal state of the motor circuits through the DSM and is not switched to control the motors. The DSM internally switches the appropriate circuit from ground to voltage for operating the motors.

As the seat is adjusted, the DSM constantly monitors the motor position sensors to record the current seat position. The DSM will remove voltage from the motor upon termination of the seat control switch input or if the DSM does not see movement from the motor by monitoring the position sensor.

The DSM communicates DTC and other information using the medium-speed controller area network (MS-CAN) communication bus. It should be noted for diagnostics that because CAN bus communication is more robust and reliable than other methods, it may be possible to have limited module communication with one of the CAN bus circuits disconnected or shorted to ground. Refer to **MODULE COMMUNICATIONS NETWORK** article for information concerning MS-CAN bus communication.

This service information only diagnoses concerns specific to the memory driver seat. To diagnose an exterior mirror concern, refer to **REAR VIEW MIRRORS** article.

Easy Entry/Exit Feature

The easy entry/exit feature moves the driver seat backwards about 50.8 mm (2 in) when the ignition key is removed from the ignition switch. The DSM receives a key out command over the MS-CAN communication network and powers the driver seat rearward. This function will not operate if the seat is less than the 50.8 mm (2 in) travel distance to the end of the track or the function has been disabled. The DSM will also cancel this operation if a valid input command is received from the driver seat control switch, memory SET switch or exterior mirror control switch.

The DSM will record the current driver seat positions before powering the seat for an easy exit operation. This recorded position will be used to return the driver seat to this position on the easy entry operation. During easy entry operation, the seat is returned to the position previous to the easy exit operation.

The easy entry/exit feature can be enabled/disabled using a scan tool. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's Literature or **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article for information on the message center.

Remote Keyless Entry (RKE) Transmitter

NOTE: A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.

A remote keyless entry (RKE) transmitter can be used to recall previously set memory positions but must first be associated to that memory position. The transmitter associated with personality 1 is capable of recalling memory position 1 only. Similarly, the associated personality 2 transmitter can recall only memory position 2.

Memory recall occurs when the unlock switch is depressed on the RKE transmitter if it has been associated with a memory position. The second depression of the unlock switch, which unlocks passenger doors, does not initiate a memory recall.

For information on diagnosing a RKE concern or associating a RKE transmitter to a memory position, refer to **HANDLES, LOCKS, LATCHES & ENTRY SYSTEMS** article.

Driver Seat Module (DSM) Hard Stop/Soft Stop

A hard stop occurs when one of the memory seat track axes or backrest recline physically reach the end of travel and can go no further. A soft stop occurs when the seat stops before physically reaching the end of travel. The hard stop is set by seat design and cannot be changed or adjusted. The soft stop is set by the DSM. The seat track axes are forward/rearward, front up/down and rear up/down. The backrest axis is recline forward/backward. To prevent unnecessary stress on the seat and motors, the DSM will set soft stop positions, 2 for each moving axis. The DSM will use a preset distance from the hard stop to determine where the soft stop will occur. When an axis reaches the hard stop and the switch is held for approximately one second, the DSM establishes the soft stop for that axis in that direction.

Setting the Soft Stop

NOTE: **If a new DSM or driver seat track has been installed, all driver seat track soft stops must be reset.**

Use the following procedure once a new seat track or DSM has been installed.

During the setting procedure, if the seat track stops before the end of travel has been reached, the DSM has stopped at a previously set soft stop. To set the new soft stop, release the seat control switch and press again in the same direction until the seat track stops.

1. Turn the ignition key to the ON position.
2. Press the seat control switch horizontal button forward until the seat track stops.
3. Keep the horizontal button pressed forward for one second after the seat track reaches its forward end of travel. The horizontal forward soft stop has been set, release the switch button.
4. Repeat steps 2 and 3 for all seat track axis in both directions.

Heated Seats - Front

Vehicles equipped with front heated seats are equipped with a single-heated seat module to control both front heated seats. The heated seat module is located under the front passenger seat. The HVAC module includes both driver and passenger heated seat control buttons and indicators. The heated seat system will function independently of the vehicle's climate control system. A momentary ground signal is transmitted to the heated seat module when a heated seat switch button on the HVAC module is depressed and ignition switched voltage is supplied. Upon receiving each control signal to an input circuit, the heated seat module will decrease one setting (the sequence is hi, low, OFF, hi, etc.). When a heated seat is set to hi, both LED indicators above that heated seat's control button will illuminate. When a heated seat is set to low, only one LED indicator above that switch will illuminate. When activated, the heated seat module supplies voltage to the selected seat's heater circuit. Each seat's cushion heater mat and backrest heater mat is connected in a series circuit to the heated seat module and powered by the output circuit for that seat and ground. The heated seat module monitors inputs from a temperature sensor, located in each seat's cushion heater mat and maintains seat temperature by regulating current flow to the heater circuits. The heated seat module will remain ON until the heated seat switch button is depressed to cycle the heated seat module OFF or the ignition switch is set to OFF.

If a fault is detected by the heated seat module, the module will stop supplying voltage to that individual left or right seat and switch indicator, that the fault was detected on. The faults detected will be: a heater supply circuit short to battery, ground or open; sensor circuit short to battery or open; heated seat switch stuck closed to ground. To reset the module, cycle the ignition switch OFF and then ON. After the heated seat module has been reset, the module will return to an OFF state. The heated seat module does not report DTCs and does not communicate on any of the controller area networks (CANs).

Heated Seats - Rear

Vehicles equipped with rear heated seats are equipped with a single-heated seat module to control both rear heated seats. The heated seat module is located under the rear 60 percent seat. The left and right rear heated seat switches, with indicators, are located in the respective second row door trim panels. A momentary ground signal is transmitted to the heated seat module when a heated seat switch button is depressed and ignition switched voltage is supplied. Upon receiving each control signal to an input circuit, the heated seat module will decrease one setting (the sequence is hi, low, OFF, hi, etc.). When a heated seat is set to hi, both LED indicators on the heated seat switch will illuminate. When a heated seat is set to low, only one LED indicator will illuminate. When activated, the heated seat module supplies voltage to the selected seat's heater circuit. Each seat's cushion heater mat and backrest heater mat is connected in a series circuit to the heated seat module and powered by the output circuit for that seat and ground. The heated seat module monitors inputs from a temperature sensor, located in each seat's cushion heater mat and maintains seat temperature by regulating current flow to the heater circuits. The heated seat module will remain ON until the heated seat switch button is depressed to cycle the heated seat module OFF or the ignition switch is set to OFF.

If a fault is detected by the heated seat module, the module will stop supplying voltage to that individual left or right seat and switch indicator, that the fault was detected on. The faults detected will be: a heater supply circuit short to battery, ground or open; sensor circuit short to battery or open; heated seat switch stuck closed to ground or heated seat switch low and high inputs shorted together. To reset the module, cycle the ignition switch OFF and then ON. After the heated seat module has been reset, the module will return to an OFF state. The heated seat module does not report DTCs and does not communicate on any of the controller area networks (CANs).

Climate Controlled Seat System

NOTE: Avoid applying voltage directly to a thermo-electric device (TED) for testing its operation. Doing so may cause damage to the TED or shorten its usable life.

NOTE: When installing a new dual climate controlled seat module (DCSM), it is necessary to carry out programmable module installation (PMI). Refer to MODULE CONFIGURATION article.

Both the driver and front passenger climate controlled seats are independently controlled electronically by the DCSM mounted under the front passenger seat. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage on 2 fused circuits from the battery junction box (BJB). If one of the voltage circuits to the DCSM is lost, both seats will remain operational because the circuits are internally connected in the DCSM. If the system shuts down due to a DTC fault, cycling the ignition to off and then on again will reset the DCSM to function until the DTC resets.

Both climate controlled seats operate independently. If a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

The 4 switches (identified with seat icons) on the HVAC module activate each seat system setting and illuminate LEDs above each switch to indicate the operating mode, 3 LEDs for HIGH, 2 LEDs for MEDIUM or 1 LED for LOW. The push-buttons with the blue seat icon operate the seat cooling mode and the push-buttons with the red seat icon operate the seat heating mode.

Each driver and front passenger seat cushion and backrest is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air depending on the control switch settings. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC seat switch settings.

The temperature differences between the individual heated and cooled settings is minimal. For example, it is difficult to distinguish between LOW cool and MEDIUM cool settings. Measuring seat temperature at different settings is possible by monitoring the DCSM PIDs using the scan tool.

The HVAC module communicates climate controlled seat commands to the DCSM using the medium-speed controller area network (MS-CAN) communication bus. The MS-CAN bus is connected to the data link connector (DLC) for diagnostic use. No direct connection exists between the DCSM and HVAC for the climate controlled seat switches. The climate controlled seats can be commanded using the scan tool to verify both module communication on the MS-CAN bus and operation of the DCSM. This method may be useful for isolating a control switch concern. It should also be noted that because CAN bus communication is more robust and reliable than other methods, it may be possible to have limited module communication with one of the CAN bus circuits disconnected or shorted to ground. Refer to **MODULE COMMUNICATIONS NETWORK** article for additional information concerning CAN bus communication.

Heating Characteristics

- In heat mode, the TED circuits of a given seat are wired in parallel internally in the DCSM.
- The climate controlled seat system draws approximately 24 amperes, with both seats heating, until reaching the set point and then the system operates at a reduced amperage to maintain the climate setting.
- In heat mode, the TED can add up to 40°C-60°C (72°F-108°F) to the ambient inlet air temperature as it passes over the TED.
- The system control settings are based on the 3 LEDs above each seat heat switch button on the HVAC.
- In the LOW setting, the DCSM is set to maintain TED temperature at approximately 46°C (115°F) (not at seat surface).
- In the HIGH setting, the DCSM is set to maintain TED temperature at 65°C (149°F) (not at seat surface).
- When heating, the DCSM will vary the speed of the fans and the TED duty cycle in order to reach and maintain the temperature determined by the switch setting (closed loop operation). Refer to the following table for heating mode temperatures.
- Seat heating has a maximum operating duration of 15 minutes.

Climate Controlled Seat Heat State	Initial Temperature	Final Temperature
HIGH	90°C (194°F)	65°C (149°F)
MED	80°C (176°F)	60°C (140°F)
LOW	75°C (167°F)	46°C (115°F)

Cooling Characteristics

- In cool mode, the TED circuits of a given seat are wired in series internally in the DCSM.
- The climate controlled seat system draws approximately 7 amps when in cool mode on high setting.
- In cool mode, the TED can remove up to 8°C (14°F) from the ambient inlet air temperature as it passes

over the TED.

- The system control settings are based on the 3 LEDs above each seat cool switch button on the HVAC.
- When cooling, the DCSM maintains constant speed of the fans and constant TED supply voltage (duty cycle) in open loop cool mode. Refer to the following table for cooling mode temperatures.
- Seat cooling has a maximum operating duration of 30 minutes.

Climate Controlled Seat Cool State	TED Voltage	TED Supply Duty Cycle
HIGH	Vbat	100%
MED	Vbat	75%
LOW	Vbat	50%

The climate controlled seat system is deactivated by one of the following actions:

- Selecting the HVAC module climate control seat switch setting to manual OFF.
- Turning the vehicle OFF.

If the temperature at one of the TEDs falls below 5°C (41°F), the DCSM will shut down the TEDs and initiate system recovery mode. If the temperature continues to drop below 2°C (36°F), the DCSM will shut down the affected seat operation.

Climate Controlled Seat System Recovery Mode

NOTE: **The presence of overtemperature faults (DTCs B2729, B2730, B272A and B272B) can be induced by incorrect operation of the climate controlled seat system after an initial heat setting has been attained. If a heat setting is repeatedly turned OFF and ON in an attempt to increase the seat temperature or repeatedly toggled between heat and cool modes, an overtemperature condition can result and the DTCs will be set.**

If the temperature at one of the TEDs rises above 110°C (230°F) in the heat mode or 65°C (149°F) in the cool mode for more than 4 seconds, the DCSM will record an overtemperature DTC, remove voltage from the TEDs and go into recovery mode (blower only) for 30 seconds to cool down the TEDs. The same will occur if a temperature difference of 60°C (108°F) or greater is seen between the backrest and cushion TEDs on either front seat. The DCSM will continue to monitor the TEDs while in recovery mode. If the temperature of the TEDs does not drop to 105°C (221°F) in the heat mode or 60°C (140°F) in the cool mode after 30 seconds, the system will continue to cool the TEDs in recovery mode for up to 5 minutes. If the TEDs cool down at anytime after 30 seconds, but before 5 minutes (checked at 4 second intervals), the system will operate as normal. An overtemperature DTC will still be recorded even if the system recovers and is operating normally. Recovery mode is more likely to occur during extreme cabin temperatures with significant seat back sunload. If the system does not recover within 30 seconds in heat mode or within 5 minutes in cool mode, the DCSM will disable that seat (fault mode) and remain off until the ignition is cycled. Also, if the DCSM detects temperature differential fault twice during the same ignition cycle, it will shut down. When a fault causes a shutdown, the climate controlled seat indicators will turn off for the affected seat and that seat will not be operational until the next key cycle.

Second Row Power-Fold Seat

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

For the second row power-fold seat to operate, voltage is supplied by the SJB to the power-fold seat relay, enabling the seats to then be moved by pressing the second row power-fold seat switch. The second row power-fold seat operates only when the vehicle is in PARK and the liftgate glass or liftgate door is open.

The power-fold seat relay will be provided voltage on the coil side from the SJB for 30 minutes when the transmission selector is in PARK, and the liftgate, or liftgate glass, is open. The voltage will be disabled 30 minutes after turning the vehicle OFF. If the relay is disabled after 30 minutes, it can be enabled by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

The second row power-fold seat actuators release a locking mechanism allowing the seat backrest to fold down onto the seat cushion.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
	• Battery junction box (BJB) fuse(s): ○ 7 (30A) (rear heated seats) ○ 16 (30A) (climate controlled seats or front heated seats) ○ 27 (10A) (second row power-fold seats) ○ 60 (30A) (driver power seat or driver memory seat) ○ 61 (30A) (passenger power seat) • Smart junction box (SJB) fuse(s): ○ 5 (10A) (second

• Switch(es) • Seat tracks obstructed or damaged • Seat backrest obstructed • Lumbar assembly damaged • Recliner or latch assembly damaged (backrest frame) • Thermo-electric device (TED) assembly filter dirty (cushion or backrest) • Second row power-fold actuator and cable	row power-fold seats) ○ 12 (7.5A) (driver memory seat) ○ 35 (10A) (front/rear heated seats) • Wiring harness • Loose or corroded connections • Seat control switch(es) • Power seat motor (seat track) • Power recliner motor • Power lumbar motor • Memory SET switch • Driver seat module (DSM) • Seat cushion heater mat • Seat backrest heater mat • Heated seat module • Heated seat switch • TED assembly (cushion or backrest) • HVAC module • Dual climate controlled seat module (DCSM) • Second row power-fold actuator • Second row power-fold relay • Second row power-fold switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is with the power seat (non-memory seat) or heated seat and the cause is not visually evident, verify the symptom and Go to **Symptom Chart**.

NOTE: **Make sure to use the latest scan tool software release.**

5. If the concern is with the memory seat or climate controlled seat and the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

6. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
9. Clear the continuous DTCs and carry out the self-test diagnostics for the driver seat module (DSM) or dual climate controlled seat module (DCSM).
10. If the DTCs retrieved are related to the concern, go to **Driver Seat Module (DSM) DTC Chart**, go to **Dual Climate Controlled Seat Module (DCSM) DTC Chart** or go to **Smart Junction Box (SJB) DTC Chart**. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
11. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

B272A	Passenger Cushion Over-Temp Detected	On-Demand and Continuous	Go to **Pinpoint Test AL**.
B272B	Passenger Back Over-Temp Detected	On-Demand and Continuous	Go to **Pinpoint Test AM**.
B272C	Driver Differential Temperature Fault	On-Demand and Continuous	If on-demand, go to **Pinpoint Test AN**. If continuous only, and the system is operating, CHECK the TED cooling performance on the affected seat and VERIFY the system is operating correctly. REFER to **Component Test** - Thermo-Electric Device (TED) Cooling Performance. If a concern is found, CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold, air ducts and foam pad). CHECK for airflow restrictions (TED inlets and outlets, TED-to-manifold connections, filters and ducts) and REPAIR as needed. If OK, CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. The DTC may have been set by extreme cabin temperatures or excessive sun-load on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. If a concern cannot be found or duplicated, RETURN the vehicle to the customer.
			If on-demand, go to **Pinpoint Test AO**. If continuous only, and the system is operating, CHECK the TED cooling performance on the affected seat and VERIFY the system is operating correctly. REFER to **Component Test** - Thermo-Electric Device (TED) Cooling Performance. If a concern is found, CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold, air ducts and foam pad). CHECK for

B272D	Passenger Differential Temperature Fault	On-Demand and Continuous	airflow restrictions (TED inlets and outlets, TED-to-manifold connections, filters and ducts) and REPAIR as needed. If OK, CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. The DTC may have been set by extreme cabin temperatures or excessive sun-load on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. If a concern cannot be found or duplicated, RETURN the vehicle to the customer.
B272E	Driver Ignition Run/Blower Circuit Short to Ground (this DTC sets for an open or short to voltage)	On-Demand and Continuous	Go to **Pinpoint Test AP**.
B272F	Passenger Ignition Run/Blower Circuit Short to Ground (this DTC sets for an open or short to voltage)	On-Demand and Continuous	Go to **Pinpoint Test AQ**.
B2730	Back Over-Temp Detected (Driver)	On-Demand and Continuous	Go to **Pinpoint Test AR**.
U2050	No Application Present	Continuous	INSTALL a new DCSM and CARRY OUT PMI. REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test.
All Other DTCs	-	On-Demand and Continuous	REFER to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

Smart Junction Box (SJB) DTC Chart

NOTE: **The smart junction box (SJB) may also be identified as the generic electronic module (GEM).**

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Retrieved	Action
B2794	Third Row Power Fold Circuit Failure (applies to second row seat)	On-Demand	Go to **Pinpoint Test AQ**.
B2A2D	Third Row Power Fold Circuit Short to Ground (applies to second row	Continuous	Go to **Pinpoint Test AQ**.

All Other DTCs	-	-	REFER to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the driver seat module (DSM)	• Fuse • Circuitry • DSM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the dual climate controlled seat module (DCSM)	• Fuse • Circuitry • DCSM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The power seat is inoperative - driver, without power recliner	• Fuse • Circuitry • Front seat control switch	• Go to **Pinpoint Test A**.
• The power seat is inoperative - passenger, with power recline	• Fuse • Circuitry • Front seat control switch	• Go to **Pinpoint Test B**.
• The power seat is inoperative - passenger, without power recline	• Fuse • Circuitry • Front seat control switch	• Go to **Pinpoint Test C**.
• The power seat moves but is loose	• Fastening hardware • Seat track	• Go to **Pinpoint Test D**.
• The power seat moves but is noisy	• Seat track	• Go to **Pinpoint Test E**.
• The power seat does not make full travel	• Seat track obstructed • Seat track	• Go to **Pinpoint Test F**.
• The power seat does not move horizontally/vertically - driver	• Circuitry • Front seat motors • Front seat control switch	• Go to **Pinpoint Test G**.

• The power seat does not move horizontally/vertically/recline - passenger	• Circuitry • Front seat motors • Front seat control switch	• Go to **Pinpoint Test H**.
• The power seat does not move horizontally/vertically - passenger	• Circuitry • Front seat motors • Front seat control switch	• Go to **Pinpoint Test I**.
• The memory seat is inoperative/does not operate correctly - does not operate horizontally/vertically/recline, MKX	• Fuse • Circuitry • Seat control switch • Memory seat track • Memory recline motor • DSM	• Go to **Pinpoint Test J**.
• The memory seat does not operate correctly - does not operate using the memory SET switch, MKX	• Circuitry • Memory SET switch • Memory seat track • DSM	• Go to **Pinpoint Test K**.
• The memory seat is inoperative/does not operate correctly - does not operate horizontally/vertically, Edge	• Fuse • Circuitry • Seat control switch • Memory seat track • DSM	• Go to **Pinpoint Test L**.
• The memory seat does not operate correctly - does not operate using the memory SET switch, Edge	• Circuitry • Memory SET switch • Memory seat track • DSM	• Go to **Pinpoint Test M**.
• The memory seat does not operate correctly - the seat moves in one-second intervals	• Circuitry • DSM	• REFER to the **Driver Seat Module (DSM) DTC Chart**.
• The memory seat does not operate correctly - the seat does not move to the correct memory position	• Circuitry • Memory SET switch • DSM • Seat track	• REFER to the **Driver Seat Module (DSM) DTC Chart**.

• The memory seat does not operate correctly - does not operate using the remote transmitter	• Remote keyless entry (RKE) integrated keyhead transmitter (IKT) is not correctly associated to a memory position • Circuitry • IKT • DSM • Smart junction box (SJB)	• VERIFY the RKE transmitter is operating correctly and is associated to a memory position. REFER to Owner's Literature or **HANDLES, LOCKS, LATCHES & ENTRY SYSTEMS** article for information on associating a RKE transmitter. RUN the DSM self-test and REFER to the **Driver Seat Module (DSM) DTC Chart** to diagnose any DTCs retrieved.
• The memory SET switch indicator is inoperative/always on	• Circuitry • Memory SET switch • DSM	• Go to **Pinpoint Test N**.
• Easy exit/easy entry is inoperative/does not operate correctly	• Circuitry • Key in ignition switch • Instrument cluster (IC) module • DSM	• Go to **Pinpoint Test O**.
• The power lumbar is inoperative - driver	• Circuitry • Seat control switch • Power lumbar motor assembly	• Go to **Pinpoint Test P**.
• The power lumbar is inoperative - passenger	• Circuitry • Seat control switch • Power lumbar motor assembly	• Go to **Pinpoint Test Q**.
• The heated seats are inoperative - front	• Fuse • Circuitry • Heated seat module	• Go to **Pinpoint Test R**.
	• Fuse • Circuitry • HVAC module (heated seat switch)	

• The heated seat is inoperative/does not operate correctly - driver	• Seat cushion heater mat • Seat backrest heater mat • Heated seat module	• Go to **Pinpoint Test S**.
• The heated seat is inoperative/does not operate correctly - front passenger	• Fuse • Circuitry • HVAC module (heated seat switch) • Seat cushion heater mat • Seat backrest heater mat • Heated seat module	• Go to **Pinpoint Test T**.
• The heated seat is inoperative - driver seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • HVAC module (heated seat switch) • Heated seat module	• Go to **Pinpoint Test U**.
• The heated seat is inoperative - front passenger seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • HVAC module (heated seat switch) • Heated seat module	• Go to **Pinpoint Test V**.
• The front fold-flat seat backrest does not operate correctly - the recliners do not lock in place, release or are not synchronized	• Fold-flat recliner cable • RH fold-flat recliner • LH fold-flat recliner	• RELEASE the fold-flat recliner cable locking clip, allowing the cable to self-adjust. POSITION the backrest upright, locking the recliners in place. APPLY force to the backrest, verifying the recliners are locked in place. LOCK the locking clip back in place. If concern remains, CHECK

		cable and recliners for correct operation and install new as necessary.
• The heated seats are inoperative - rear	• Fuse • Circuitry • Heated seat module	• Go to **Pinpoint Test W**.
• The heated seat is inoperative/does not operate correctly - left rear	• Circuitry • Heated seat switch • Seat cushion heater mat • Seat backrest heater mat • Heated seat module	• Go to **Pinpoint Test X**.
• The heated seat is inoperative/does not operate correctly - right rear	• Circuitry • Heated seat switch • Seat cushion heater mat • Seat backrest heater mat • Heated seat module	• Go to **Pinpoint Test Y**.
• The heated seat is inoperative - left rear seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • Heated seat switch • Heated seat module	• Go to **Pinpoint Test Z**.
• The heated seat is inoperative - left rear seat does heat but the heated seat indicator is on all the time	• Wiring, terminals or connectors • Heated seat module	• Go to **Pinpoint Test AA**.
• The heated seat is inoperative - right rear seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • Heated seat switch • Heated seat module	• Go to **Pinpoint Test AB**.
• The heated seat is inoperative - right rear seat does heat but the heated	• Wiring, terminals or connectors • Heated seat	• Go to **Pinpoint Test AC**.

seat indicator is on all the time	module	
• All climate controlled seats are inoperative	• Fuse • Circuitry • Medium-speed controller area network (MS-CAN) communication fault • DCSM • HVAC module	• VERIFY battery junction box (BJB) fuse 16 (30A) is OK. If OK, CARRY OUT the network test using a scan tool and VERIFY network communication of the HVAC module and DCSM. REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose a module communication or network concern. If OK, CARRY OUT the DCSM on-demand self test and RETRIEVE any DTCs. If any DTC is present, REFER to the **Dual Climate Controlled Seat Module (DCSM) DTC Chart**. CHECK the climate control system for correct operation. REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION & DIAGNOSTICS** article for diagnosis of the HVAC or climate control system. If OK, INSTALL a new DCSM and CARRY OUT PMI. REFER to **Dual Climate Controlled Seat Module (DCSM)**.
• A single climate controlled seat is inoperative - switch indicators may or may not illuminate	• Circuitry • HVAC module • DCSM	**NOTE:** **If a fault occurs setting a DTC specific to only one climate controlled seat, the DCSM will disable only the affected seat outputs and allow the other seat to remain operational. CHECK for DTCs specific to the affected climate controlled seat and if a DTC is present, REFER to the Dual Climate Controlled Seat Module (DCSM) DTC Chart.**

		• Go to **Pinpoint Test AD**.
• A single climate controlled seat does not operate correctly - poor or intermittent cooling/heating	• Excessive sun-load or extreme cabin temperatures • Incorrectly installed thermo-electric device (TED) or manifold • Airflow blockage • TED • DCSM	• CARRY OUT the DCSM on-demand self test and retrieve any DTCs. If any DTC is present, REFER to the **Dual Climate Controlled Seat Module (DCSM) DTC Chart**. If no DTC is present, CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold air duct and foam pad) and REPAIR as needed. If OK, CHECK for airflow restrictions (TED inlets and outlets, TED-to-manifold connections, filters and ducts) and REPAIR as needed. CHECK the TED cooling performance on the affected seat and VERIFY the system is operating correctly. REFER to **Component Test** - Thermo-Electric Device (TED) Cooling Performance. RETEST the system for normal operation.
• A single climate controlled seat does not operate correctly - exhibits poor airflow or performance	• Incorrectly installed TED or manifold • Airflow blockage • Disconnected air duct	• CARRY OUT the DCSM on-demand self test and retrieve any DTCs. If any DTC is present, REFER to the **Dual Climate Controlled Seat Module (DCSM) DTC Chart**. If no DTC is present, CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold air duct and foam pad) and REPAIR as needed. If OK, CHECK for airflow restrictions (TED inlets and

		outlets, TED-to-manifold connections, filters and ducts) and REPAIR as needed. RETEST the system for normal operation.
• The power seat is inoperative/does not operate correctly - both rear, power fold	• Fuse • Circuitry • Power-fold relay • Power-fold switch • SJB	• Go to **Pinpoint Test AS**.
• The power seat is inoperative/does not operate correctly - left rear, power fold	• Circuitry • Power-fold relay • Power-fold switch • Power-fold actuator	• Go to **Pinpoint Test AT**.
• The power seat is inoperative/does not operate correctly - right rear, power fold	• Circuitry • Power-fold relay • Power-fold switch • Power-fold actuator	• Go to **Pinpoint Test AU**.
• The second row seat recliner does not operate correctly	• Seat recliner not synchronized • Seat recliner damaged • Seat recliner cable	• CHECK for correct seat recliner synchronization. REFER to **Seat - Rear, 40 Percent** or **Seat - Rear, 60 Percent**. If recliner synchronization is OK, INSTALL new parts as necessary.

Pinpoint Tests

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

NOTE: Electronic modules are sensitive to electrostatic discharge. If exposed to these charges, damage can result.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Use the correct probe adapter(s) when taking measurements. Failure to use the

correct probe adapter(s) may damage the connector.

Refer to **Inspection and Verification**, **Driver Seat Module (DSM) DTC Chart**, **Dual Climate Controlled Seat Module (DCSM) DTC Chart**, **Smart Junction Box (SJB) DTC Chart** and/or **Symptom Chart** for direction to the appropriate Pinpoint Test.

Pinpoint Test A: The Power Seat is Inoperative - Driver, Without Power Recliner

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB60 (GN/RD) and is supplied ground on circuit GD145 (BK/BU). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE - DRIVER, WITHOUT POWER RECLINER

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

A1 CHECK CIRCUIT SBB60 (GN/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Driver Seat Control Switch C352

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may**

result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

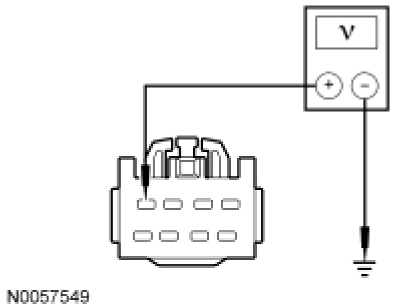

Fig. 1: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat control switch C352-4, circuit SBB60 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY battery junction box (BJB) fuse 60 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

A2 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN

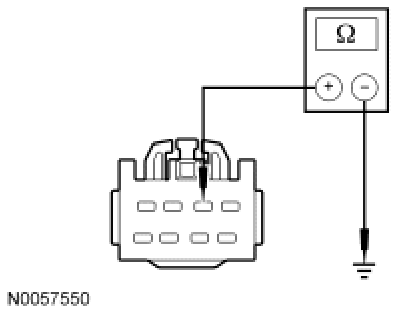

Fig. 2: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C352-2, circuit GD145 (BK/BU), harness side and ground.

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test B: The Power Seat is Inoperative - Passenger, With Power Recline

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB61 (GY/RD) and is supplied ground on circuit GD145 (BK/BU). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recliner motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recliner motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recliner mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST B: THE POWER SEAT IS INOPERATIVE - PASSENGER, WITH POWER RECLINE

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**
NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

B1 CHECK CIRCUIT SBB61 (GY/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Control Switch C3026

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

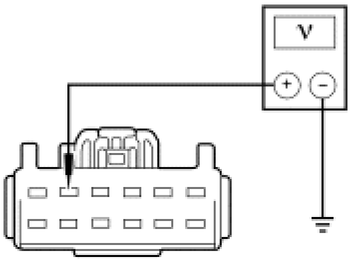

Fig. 3: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat control switch C3026-5, circuit SBB61 (GY/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

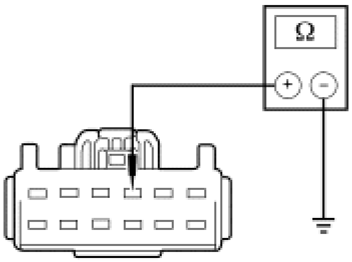
  YES : Go to B2.

  NO : VERIFY battery junction box (BJB) fuse 61 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

B2 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN



N0010825

Fig. 4: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-3, circuit GD145 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new passenger seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test C: The Power Seat is Inoperative - Passenger, Without Power Recline

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB61 (GY/RD) and is supplied ground on circuit GD145 (BK/BU). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST C: THE POWER SEAT IS INOPERATIVE - PASSENGER, WITHOUT POWER RECLINE

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

C1 CHECK CIRCUIT SBB61 (GY/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Control Switch C355

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

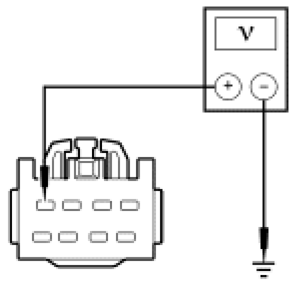


Fig. 5: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat control switch C355-4, circuit SBB61 (GY/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C2.

  NO : VERIFY battery junction box (BJB) fuse 61 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

C2 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN

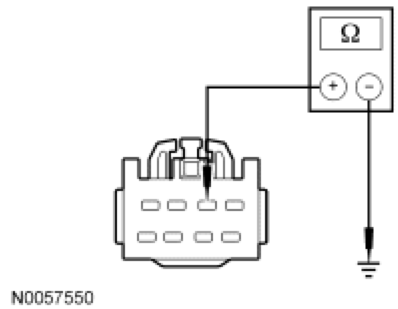

Fig. 6: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C355-2, circuit GD145 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test D: The Power Seat Moves But is Loose

Normal Operation

The power seat movement should be smooth and the seat cushion should not rock during or after operation.

This pinpoint test is intended to diagnose the following:

- Loose fastening hardware

- Seat track component

PINPOINT TEST D: THE POWER SEAT MOVES BUT IS LOOSE

D1 CHECK THE FASTENING HARDWARE

- Inspect for loose fastening hardware on the affected seat.
- **Is the fastening hardware loose?**

  YES : TIGHTEN all fastening hardware to specification. TEST the system for normal operation.

  NO : IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test E: The Power Seat Moves But is Noisy

Normal Operation

The power seat should move quietly during operation. Some noise is acceptable.

This pinpoint test is intended to diagnose the following:

- Misaligned seat track
- Seat track component
- Object obstructing seat movement

PINPOINT TEST E: THE POWER SEAT MOVES BUT IS NOISY

E1 CHECK THE TRACK ALIGNMENT

- Check the alignment of the track to the floor and the track to the seat.
- **Is the track out of alignment?**

  YES : ALIGN the track to the seat and the floor. TEST the system for normal operation.

  NO : IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test F: The Power Seat Does Not Make Full Travel

Normal Operation

The power seat should travel fully horizontal (forward/rearward) and vertical (front up/down and rear up/down).

This pinpoint test is intended to diagnose the following:

- Obstruction in the seat track
- Seat track component

PINPOINT TEST F: THE POWER SEAT DOES NOT MAKE FULL TRAVEL

F1 CHECK FOR AN OBSTRUCTION IN THE SEAT TRACK

- Remove the affected seat. Refer to **Seat - Front**

- **Are there any obstructions in the seat track?**

  YES : REMOVE the obstruction(s) from the track(s).

  INSTALL the seat. REFER to **Seat - Front**. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : IDENTIFY the cause and REPAIR as necessary.

  INSTALL the seat. REFER to **Seat - Front**. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

Pinpoint Test G: The Power Seat Does Not Move Horizontally/Vertically - Driver

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB60 (GN/RD) and is supplied ground on circuit GD145 (BK/BU). When pressed, the seat control switch supplies voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to the same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Seat track motor (seat track)

PINPOINT TEST G: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY - DRIVER

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**
NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

G1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Operate the driver seat forward and rearward.
- **Will the seat move horizontally?**

  YES : Go to G5.

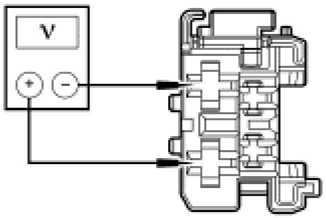
  NO : Go to G2.

G2 CHECK VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Driver Seat Horizontal Motor C362

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.



N0057525

Fig. 7: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat horizontal motor C362-1, circuit CPS28 (GN), harness side and C362-2, circuit CPS23 (GN/VT), harness side, while pushing the driver seat control switch forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to G3.

G3 CHECK HORIZONTAL MOTOR CIRCUIT CPS28 (GN) FOR AN OPEN

- Disconnect: Driver Seat Control Switch C352

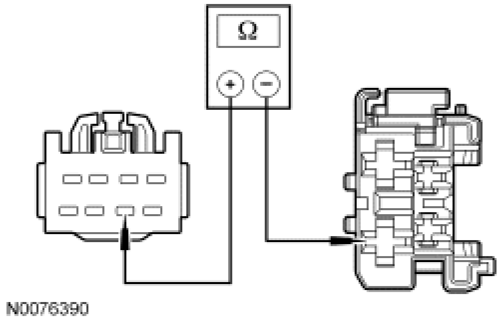


Fig. 8: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C352-6, circuit CPS28 (GN), harness side and driver seat horizontal motor C362-1, circuit CPS28 (GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to G4.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G4 CHECK HORIZONTAL MOTOR CIRCUIT CPS23 (GN/VT) FOR AN OPEN

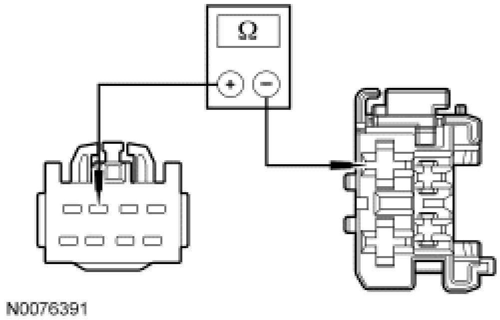

Fig. 9: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C352-3, circuit CPS23 (GN/VT), harness side and driver seat horizontal motor C362-2, circuit CPS23 (GN/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G5 DETERMINE THE SEAT HEIGHT ADJUST FAILURE

- Operate the seat front and rear height adjustments.
- **Does the seat front and rear height adjust up and down?**

  YES : If only the front height adjust motor operates, go to G6.

  If only the rear height adjust motor operates, go to G9.

  NO : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

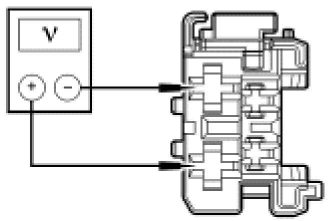
  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G6 CHECK VOLTAGE TO THE REAR HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Driver Seat Rear Height Motor C363

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.



N0057525

Fig. 10: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat rear height motor C363-2, circuit CPS26 (YE/BU), harness side and C363-1, circuit CPS27 (BU/BN), harness side, while depressing the rear height adjust switch up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

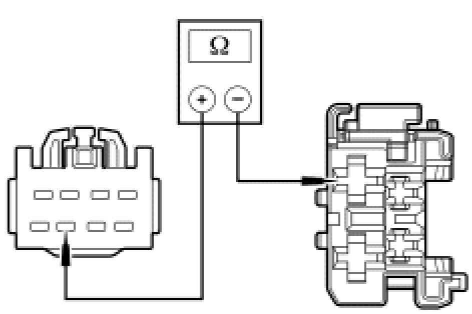
  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to G7.

G7 CHECK CIRCUIT CPS26 (YE/BU) FOR AN OPEN

- Disconnect: Driver Seat Control Switch C352



N0076392

Fig. 11: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C352-7, circuit CPS26 (YE/BU), harness side and driver seat rear height motor C363-2, circuit CPS26 (YE/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to G8.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G8 CHECK CIRCUIT CPS27 (BU/BN) FOR AN OPEN

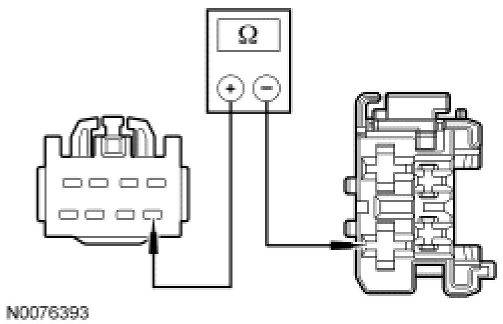


Fig. 12: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C352-5, circuit CPS27 (BU/BN), harness side and driver seat rear height motor C363-1, circuit CPS27 (BU/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G9 CHECK VOLTAGE TO THE DRIVER SEAT FRONT HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Driver Seat Front Height Motor C382

WARNING: **Make sure no one is in the vehicle and there is nothing**

blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

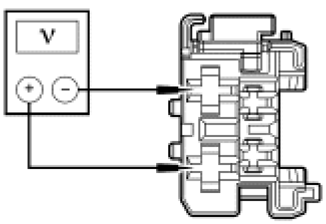

Fig. 13: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat front height motor C382-1, circuit CPS25 (WH/VT), harness side and C382-2, circuit CPS24 (GY), while depressing the front height adjust switch up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to G10.

G10 CHECK CIRCUIT CPS24 (GY) FOR AN OPEN

- Disconnect: Driver Seat Control Switch C352

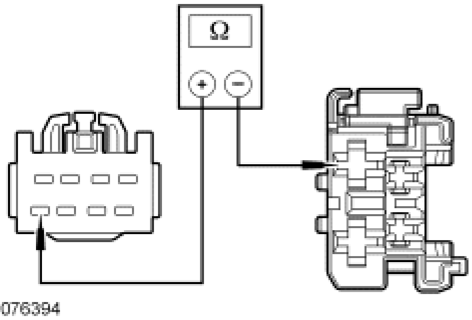

Fig. 14: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C352-8, circuit CPS24 (GY), harness side and driver seat front height motor C382-2, circuit CPS24 (GY), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to G11.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G11 CHECK CIRCUIT CPS25 (WH/VT) FOR AN OPEN

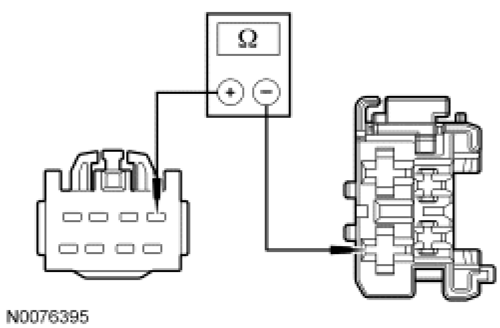

Fig. 15: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C352-1, circuit CPS25 (WH/VT) harness side, and driver seat front height motor C382-1, circuit CPS25 (WH/VT), harness side.
- **Is the resistance less than 5 ohms?**

YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test H: The Power Seat Does Not Move Horizontally/Vertically/Recline - Passenger

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB61 (GY/RD) and is supplied ground on circuit GD145 (BK/BU). When pressed, the seat control switch supplies voltage and ground to a power seat track motor or power recliner motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to the same power seat track motor or power recliner motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recliner mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Seat track motor (seat track)
- Power recliner motor

PINPOINT TEST H: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE - PASSENGER

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

H1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Operate the passenger seat forward and rearward.
- **Will the seat move horizontally?**

YES : Go to H2.

NO : Go to H3.

H2 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION

- Recline the passenger backrest forward and rearward.
- **Will the seat backrest recline forward and rearward?**

YES : Go to H6.

NO : Go to H13.

H3 CHECK VOLTAGE TO THE PASSENGER SEAT HORIZONTAL MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in

the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Horizontal Motor C332

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

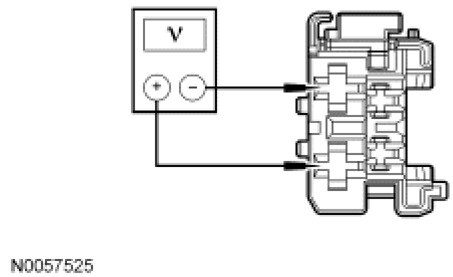

Fig. 16: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side and C332-2, circuit CPS33 (WH), harness side, while pushing the passenger seat control switch forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to H4.

H4 CHECK CIRCUIT CPS38 (GN/BU) FOR AN OPEN

- Disconnect: Passenger Seat Control Switch C3026

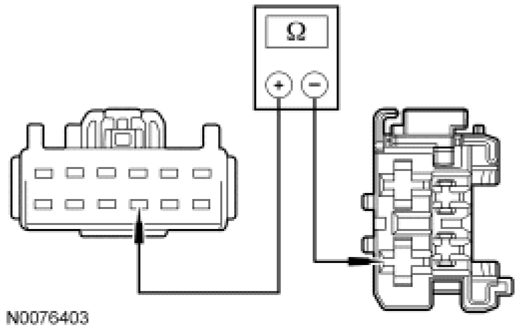

Fig. 17: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-9, circuit CPS38 (GN/BU), harness side and passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H5.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H5 CHECK CIRCUIT CPS33 (WH) FOR AN OPEN

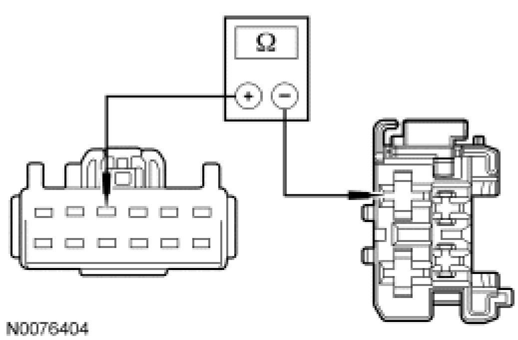

Fig. 18: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-4, circuit CPS33 (WH), harness side and passenger seat horizontal motor C332-2, circuit CPS33 (WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H6 DETERMINE THE SEAT HEIGHT ADJUST FAILURE

- Operate the seat front and rear height adjustments.
- **Does the seat front and rear height adjust up and down?**

  YES : If only the front height adjust motor operates, go to H7.

  If only the rear height adjust motor operates, go to H10.

  NO : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H7 CHECK VOLTAGE TO THE PASSENGER SEAT REAR HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Rear Height Motor C3075

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

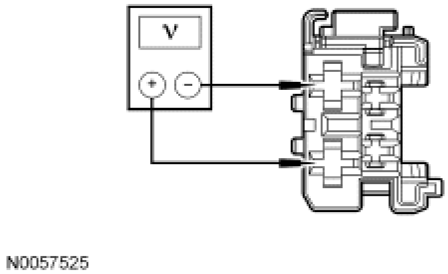

Fig. 19: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat rear height motor C3075-2, circuit CPS36 (YE/GY), harness side and C3075-1, circuit CPS37 (WH/BU), harness side, while depressing the rear height adjust switch up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to H8.

H8 CHECK CIRCUIT CPS36 (YE/GY) FOR AN OPEN

- Disconnect: Passenger Seat Control Switch C3026

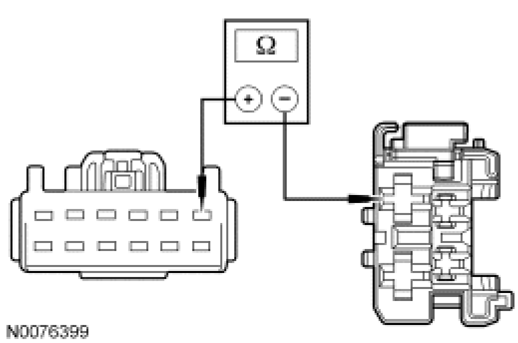

Fig. 20: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-1, circuit CPS36 (YE/GY), harness side and passenger seat rear height motor C3075-2, circuit CPS36 (YE/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H9.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H9 CHECK CIRCUIT CPS37 (WH/BU) FOR AN OPEN

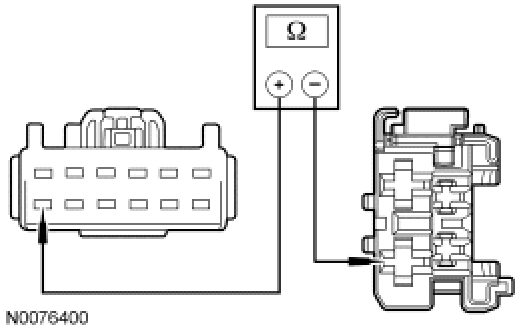

Fig. 21: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-12, circuit CPS37 (WH/BU), harness side and passenger seat rear height motor C3075-1, circuit CPS37 (WH/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H10 CHECK VOLTAGE TO THE PASSENGER SEAT FRONT HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Front Height Motor C3074

WARNING: Make sure no one is in the vehicle and there is nothing

blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

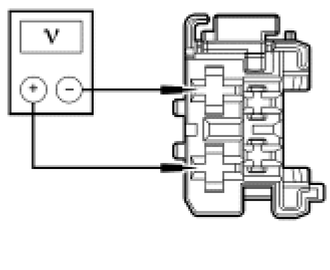

Fig. 22: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side and C3074-2, circuit CPS34 (GY/BU), while depressing the front height adjust switch up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to H11.

H11 CHECK CIRCUIT CPS34 (GY/BU) FOR AN OPEN

- Disconnect: Passenger Seat Control Switch C3026

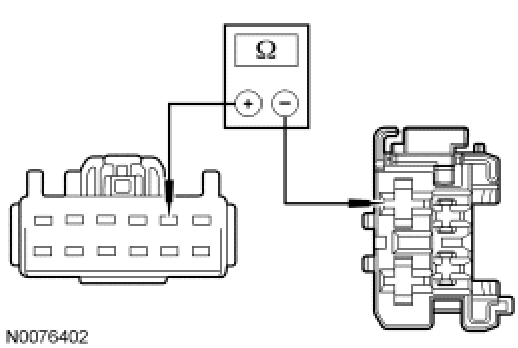

Fig. 23: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-2, circuit CPS34 (GY/BU), harness side and passenger seat front height motor C3074-2, circuit CPS34 (GY/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H12.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H12 CHECK CIRCUIT CPS35 (VT/GN) FOR AN OPEN

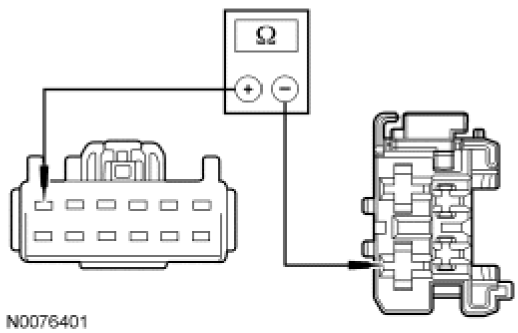

Fig. 24: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-6, circuit CPS35 (VT/GN) harness side, and passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H13 CHECK VOLTAGE TO THE PASSENGER SEAT RECLINER MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Recliner Motor C338

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

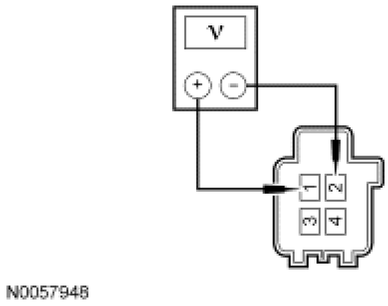

Fig. 25: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat recliner motor C338-2, circuit CPS39 (GY/YE), harness side and C338-1, circuit CPS40 (VT/GY), while pushing the recline switch forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat recliner motor. REFER to **Seat Recliner Motor**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to H14.

H14 CHECK CIRCUIT CPS39 (GY/YE) FOR AN OPEN

- Disconnect: Passenger Seat Control Switch C3026

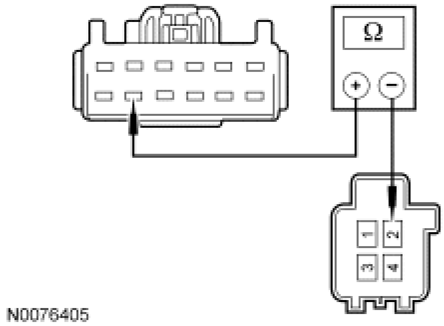

Fig. 26: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-11, circuit CPS39 (GY/YE), harness side and passenger seat recliner motor C338-2, circuit CPS39 (GY/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H15.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H15 CHECK CIRCUIT CPS40 (VT/GY) FOR AN OPEN

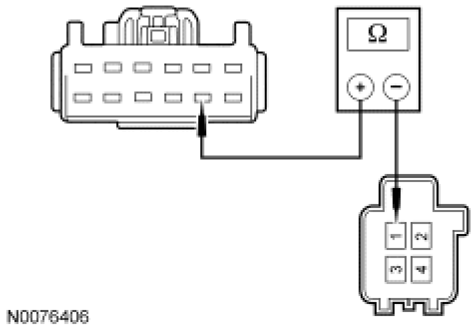

Fig. 27: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3026-8, circuit CPS40 (VT/GY) harness side, and passenger seat recliner motor C338-1, circuit CPS40 (VT/GY), harness side.
- **Is the resistance less than 5 ohms between the passenger seat recliner motor and the passenger seat control switch?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test I: The Power Seat Does Not Move Horizontally/Vertically - Passenger

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB61 (GY/RD) and is supplied ground on circuit GD145 (BK/BU). When pressed, the seat control switch supplies voltage and ground to a power seat track motor. When pressed in the opposite direction, the seat control switch reverses the polarity to the same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Seat track motor (seat track)

PINPOINT TEST I: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY - PASSENGER

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

I1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Operate the passenger seat forward and rearward.
- **Will the seat move horizontally?**

  YES : Go to I5.

  NO : Go to I2.

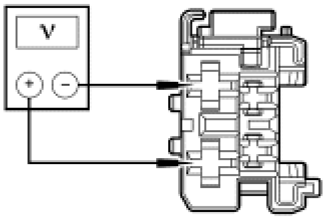
I2 CHECK VOLTAGE TO THE PASSENGER SEAT HORIZONTAL MOTOR

- Key in OFF position.

- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Horizontal Motor C332

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.



N0057525

Fig. 28: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side and C332-2, circuit CPS33 (WH), harness side, while pushing the passenger seat control switch forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to I3.

I3 CHECK CIRCUIT CPS38 (GN/BU) FOR AN OPEN

- Disconnect: Passenger Seat Control Switch C355

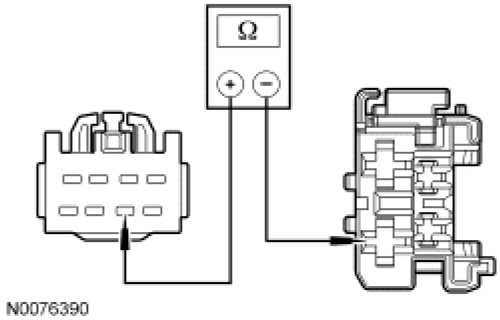


Fig. 29: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C355-6, circuit CPS38 (GN/BU), harness side and passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side?
- **Is the resistance less than 5 ohms between the passenger seat horizontal motor and the passenger seat control switch?**

  YES : Go to I4.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I4 CHECK CIRCUIT CPS33 (WH) FOR AN OPEN

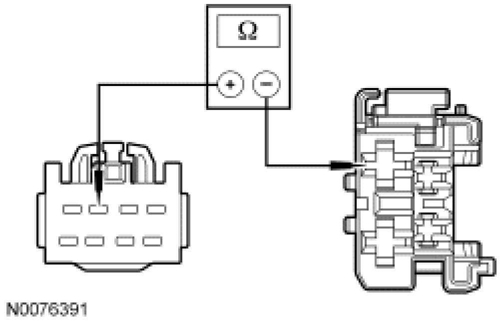

Fig. 30: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C355-3, circuit CPS33 (WH), harness side and passenger seat horizontal motor C332-2, circuit CPS33 (WH), harness side?
- **Is the resistance less than 5 ohms between the passenger seat horizontal motor and the passenger seat control switch?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I5 DETERMINE THE SEAT HEIGHT ADJUST FAILURE

- Operate the seat front and rear height adjustments.
- **Does the seat front and rear height adjust up and down?**

  YES : If only the front height adjust motor operates, go to I6.

  If only the rear height adjust motor operates, go to I9.

  NO : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

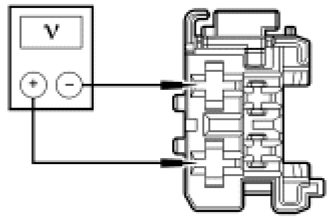
  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I6 CHECK VOLTAGE TO THE PASSENGER SEAT REAR HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Rear Height Motor C3075

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.



N0057525

Fig. 31: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat rear height motor C3075-2, circuit CPS36 (YE/GY), harness side and C3075-1, circuit CPS37 (WH/BU), harness side, while depressing the rear height adjust switch up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

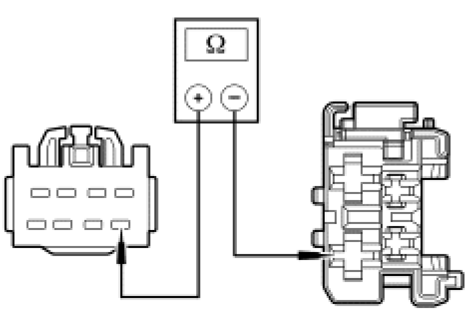
  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to I7.

I7 CHECK CIRCUIT CPS36 (YE/GY) FOR AN OPEN

- Disconnect: Passenger Seat Control Switch C355



N0076393

Fig. 32: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C355-5, circuit CPS36 (YE/GY), harness side and passenger seat rear height motor C3075-2, circuit CPS36 (YE/GY), harness side.
- **Is the resistance less than 5 ohms between the passenger seat rear height motor and the passenger seat control switch?**

YES : Go to I8.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I8 CHECK CIRCUIT CPS37 (WH/BU) FOR AN OPEN

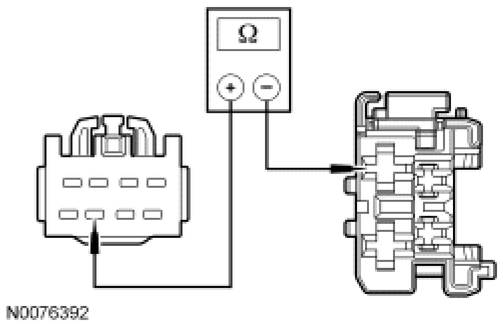


Fig. 33: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C355-7, circuit CPS37 (WH/BU), harness side and passenger seat rear height motor C3075-1, circuit CPS37 (WH/BU), harness side.
- **Is the resistance less than 5 ohms between the passenger seat rear height motor and the passenger seat control switch?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

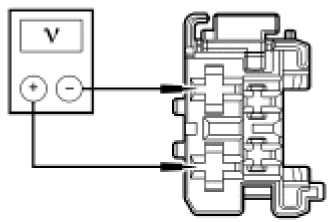
  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I9 CHECK VOLTAGE TO THE PASSENGER SEAT FRONT HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Passenger Seat Front Height Motor C3074

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.



N0057525

Fig. 34: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side and C3074-2, circuit CPS34 (GY/BU), while depressing the front height adjust switch up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to I10.

I10 CHECK CIRCUIT CPS34 (GY/BU) FOR AN OPEN

- Disconnect: Passenger Seat Control Switch C355

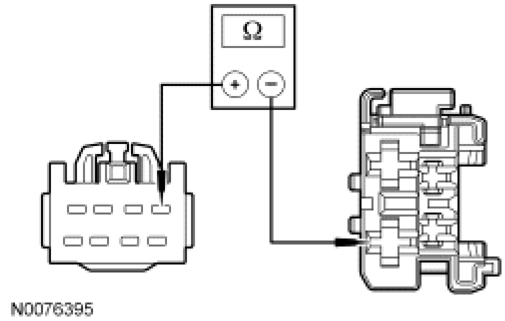


Fig. 35: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C355-1, circuit CPS34 (GY/BU), harness side and passenger seat front height motor C3074-2, circuit CPS34 (GY/BU), harness side.
- **Is the resistance less than 5 ohms between the passenger seat front height motor and the passenger seat control switch?**

  YES : Go to I11.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I11 CHECK CIRCUIT CPS35 (VT/GN) FOR AN OPEN

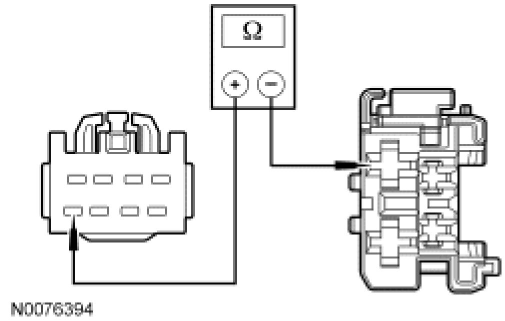

Fig. 36: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C355-8, circuit CPS35 (VT/GN) harness side, and passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side.
- **Is the resistance less than 5 ohms between the passenger seat front height motor and the passenger seat control switch?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test J: The Memory Seat is Inoperative/Does Not Operate Correctly - Does Not Operate Horizontally/Vertically/Recline, MKX

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Memory Seats for schematic and connector information.

Refer to appropriate COMPONENT TESTING article.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBP12 (GN/RD) and is supplied ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor, based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power recliner uses a single motor to move the seat backrest forward and rearward.

Battery voltage is supplied to DSM circuit SBB60 (GN/RD) and SBP12 (GN/RD). Ground is supplied to DSM circuit GD145 (BK/BU).

Each motor in the memory power seat track and power recliner contains a Hall-effect position sensor. The DSM supplies a signal supply circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat and seat backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory SET switch or a remote entry transmitter. Refer to **Principles of Operation** or the Owner's Literature for information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate in one or more directions when using the seat control switch. If the memory seat moves in all directions using the seat control switch, go to **Pinpoint Test K**.

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected,

	the DTC is set.
• B1663 - Seat Driver Front Up/Down Motor Stalled • B1664 - Seat Driver Rear Up/Down Motor Stalled • B1665 - Seat Driver Forward/Backward Motor Stalled	During self-test, the driver seat module (DSM) attempts to operate the appropriate seat track motor and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1666 - Seat Driver Recline Motor Stalled	During self-test, the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables the output.
• B1703 - Seat Driver Recline Forward Switch Circuit Short to Battery • B1707 - Seat Driver Recline Rearward Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1711 - Seat Driver Front Up Switch Circuit Short to Battery • B1715 - Seat Driver Front Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1719 - Seat Driver Forward Switch Circuit Short to Battery • B1723 - Seat Driver Rearward Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is

	ignored.
• B1727 - Seat Driver Rear Up Switch Circuit Short to Battery • B1731 - Seat Driver Rear Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch
- Missing controller area network (CAN) status information (CAN communication message):
  - ignition switch status
  - gear selector position
- Memory power seat track
- Memory power recliner motor
- DSM

PINPOINT TEST J: THE MEMORY SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE HORIZONTALLY/VERTICALLY/RECLINE, MKX

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.**

J1 CHECK DSM GEAR SELECTED (TRANSGEAR) PID STATES

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: TRANSGEAR
- Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states:

- D6_Park
- REV
- NTRL
- DRIVE5
- DRIVE1

- **Do the PID states agree with the selected positions?**

  YES : Go to J2.

  NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

J2 CHECK DSM IGNITION SWITCH STATUS (IGN_SW) PID STATES

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PID: IGN_SW
- Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states:
  - Off
  - Accessory
  - Run
  - Start
- **Do the PID states agree with the selected positions?**

  YES : Go to J3.

  NO : To diagnose an ignition switch status concern, REFER to **STEERING COLUMN SWITCHES** article.

J3 RETRIEVE DSM DTCs

- Operate the memory seat and memory mirrors in all directions through the full range of travel.
- Place the memory seat and memory mirrors in central travel positions.
- Enter the following diagnostic mode on the diagnostic tool: Self Test/DSM/Retrieve DTCs
- **Are any DSM DTCs retrieved?**

  YES : If DTCs B1663, B1664, B1665 and B1666 are all retrieved, go to J12.

  If DTC B1663, go to J22.

  If DTC B1664, go to J25.

  If DTC B1665, go to J28.

  If DTC B1666, go to J31.

  If DTC B1703, go to J5.

  If DTC B1707, go to J5.

  If DTC B1711, go to J5.

If DTC B1715, go to J5.

If DTC B1719, go to J5.

If DTC B1723, go to J5.

If DTC B1727, go to J5.

If DTC B1731, go to J5.

If DTC 1342, INSTALL a new DSM and CARRY OUT programmable module installation (PMI). REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

For any other DSM DTCs, REFER to the Driver Seat Module (DSM) DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

NO : Go to J4.

J4 MONITOR THE DSM PIDs AND CHECK FOR CORRECT MEMORY SEAT SWITCH INPUTS

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Driver Power Seat Front Up/Down Switch (SFNT_SW)
  - Driver Power Seat Forward/Backward Switch (SFWD_SW)
  - Driver Power Seat Recline Switch Status (SRCL_SW)
  - Driver Power Seat Rear Up/Down Switch (SREARSW)
- Monitor DSM seat switch PIDs while activating the seat switch in all positions.
- **Do the PID states agree with the switch positions?**

  YES : Go to J11.

  NO : VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If SJB fuse 12 (7.5A) fails while operating the seat control switch, DISCONNECT driver seat control switch C3016 and Go to J9.

  If OK, go to J5.

J5 CHECK THE SEAT CONTROL SWITCH

- Key in OFF position.
- Disconnect: Seat Control Switch C3016
- Check the seat control switch. Refer to appropriate COMPONENT TESTING article.
- **Is the seat control switch OK?**

  YES : Go to J6.

  NO : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J6 CHECK CIRCUIT SBP12 (GN/RD) FOR VOLTAGE TO THE SEAT CONTROL SWITCH

- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Measure the voltage between seat control switch C3016-5, circuit SBP12 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to J7.

NO : VERIFY SJB fuse 12 (7.5A) is OK, If OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J7 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

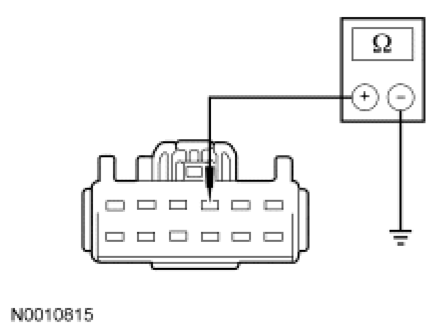

Fig. 37: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3016-3, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to J8.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J8 CHECK SEAT CONTROL SWITCH TO DSM CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DSM C3299b
- Key in ON position.

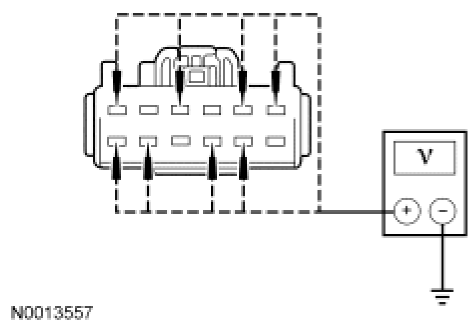

Fig. 38: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following seat control switch C3016 pins, harness side and ground:

Connector - Pin	Circuit
C3016-1	CPS27 (BU/BN)
C3016-2	CPS25 (WH/VT)
C3016-4	CPS23 (GN/VT)
C3016-6	CPS24 (GY)
C3016-8	CPS30 (VT/BN)
C3016-9	CPS28 (GN)
C3016-11	CPS29 (WH/BN)
C3016-12	CPS26 (YE/BU)

- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J9.

J9 CHECK SEAT CONTROL SWITCH TO DSM CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Seat Control Switch C3016

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

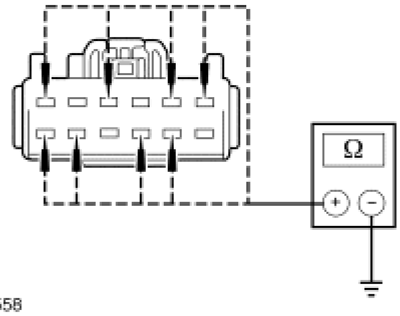

Fig. 39: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following seat control switch C3016 pins, harness side and ground:

Connector - Pin	Circuit
C3016-1	CPS27 (BU/BN)
C3016-2	CPS25

	(WH/VT)
C3016-4	CPS23 (GN/VT)
C3016-6	CPS24 (GY)
C3016-8	CPS30 (VT/BN)
C3016-9	CPS28 (GN)
C3016-11	CPS29 (WH/BN)
C3016-12	CPS26 (YE/BU)

- **Are the resistances greater than 10,000 ohms?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J10.

J10 CHECK SEAT CONTROL SWITCH TO DSM CIRCUITS FOR AN OPEN

- Disconnect: DSM C3299b

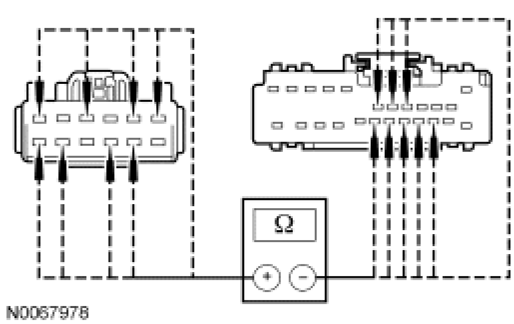

Fig. 40: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following seat control switch C3016 pins, harness side and DSM C3299b pins, harness side:

Seat Control Switch Connector	Circuit	DSM Connector - Pin

- Pin		
C3016-1	CPS27 (BU/BN)	C3299b-17
C3016-2	CPS25 (WH/VT)	C3299b-18
C3016-4	CPS23 (GN/VT)	C3299b-16
C3016-6	CPS24 (GY)	C3299b-6
C3016-8	CPS30 (VT/BN)	C3299b-7
C3016-9	CPS28 (GN)	C3299b-15
C3016-11	CPS29 (WH/BN)	C3299b-19
C3016-12	CPS26 (YE/BU)	C3299b-5

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J11 CHECK THE DSM FOR CORRECT OUTPUTS USING A SCAN TOOL AND DSM ACTIVE COMMANDS

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Front Motor Up (FRONT_UP)
  - Front Motor Down (FRONT_DWN)
  - Rear Motor Up (REAR_UP)
  - Rear Motor Down (REAR_DWN)
  - Horizontal Motor Forward (HORZ_FWD)
  - Horizontal Motor Backward (HORZ_BWD)
  - Recline Motor Forward (RECL_FWD)
  - Recline Motor Backward (RECL_BWD)

- Toggle the DSM active commands ON and OFF while monitoring the seat movement.
- **Does the driver seat operate correctly?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  NO : If no seat movement, go to J12.

  If no front vertical seat movement, go to J22.

  If no rear vertical seat movement, go to J25.

  If no horizontal seat movement, go to J28.

  If no recline seat movement, go to J31.

J12 CHECK DSM CIRCUIT SBB60 (GN/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

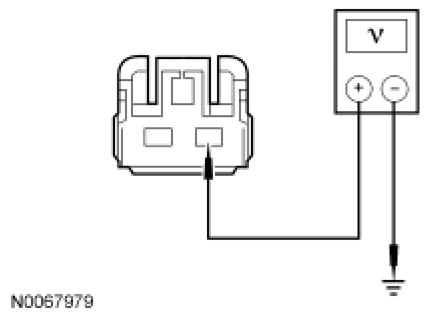

Fig. 41: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299a-1, circuit SBB60 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to J13.

NO : VERIFY battery junction box (BJB) fuse 60 (30A) is OK. If OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J13 CHECK CIRCUITS GD145 (BK/BU) AND GD133 (BK) FOR AN OPEN

- Disconnect: DSM C3299c

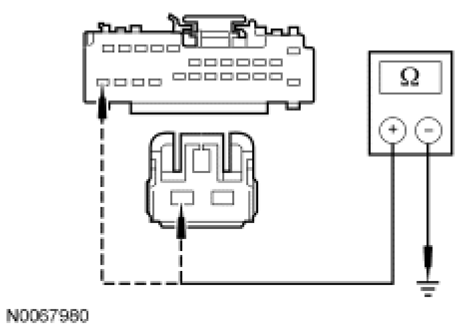

Fig. 42: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299a-2, circuit GD145 (BK/BU), harness side and ground; and between DSM C3299b-24, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to J14.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J14 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND

- Disconnect: DSM C3299b

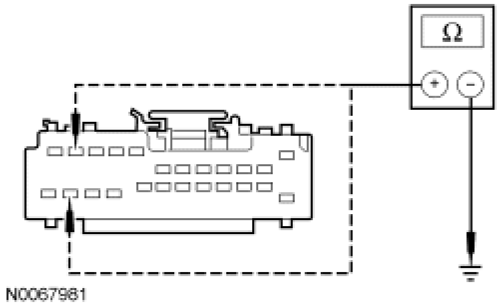

Fig. 43: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-23, circuit CPS03 (VT/GY), harness side and ground; and between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J16.

  NO : Go to J15.

J15 CHECK FRONT HEIGHT POWER SEAT MOTOR CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND

- Disconnect: Front Height Power Seat Motor C382

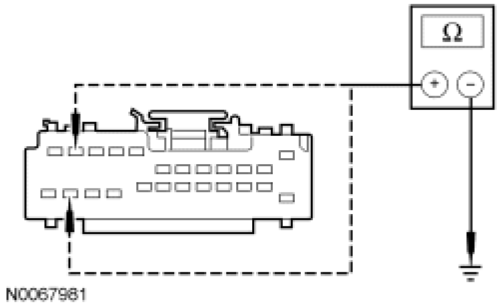

Fig. 44: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-23 circuit CPS03 (VT/GY), harness side and ground; and between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J16 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND

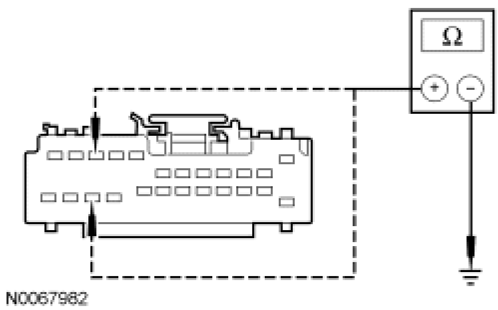

Fig. 45: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and ground; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J18.

  NO : Go to J17.

J17 CHECK THE REAR HEIGHT POWER SEAT MOTOR CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND

- Disconnect: Rear Height Power Seat Motor C363

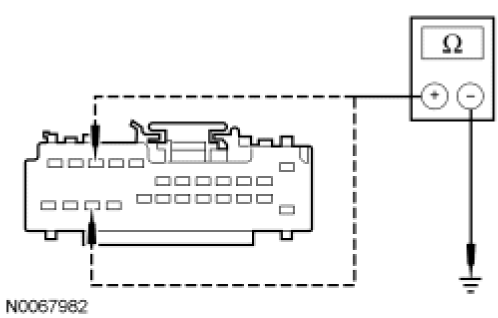

Fig. 46: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and ground; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J18 CHECK CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND

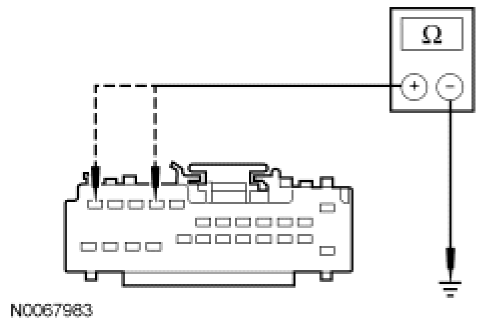

Fig. 47: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and ground; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J20.

  NO : Go to J19.

J19 CHECK THE HORIZONTAL POWER SEAT MOTOR CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND

- Disconnect: Horizontal Power Seat Motor C362

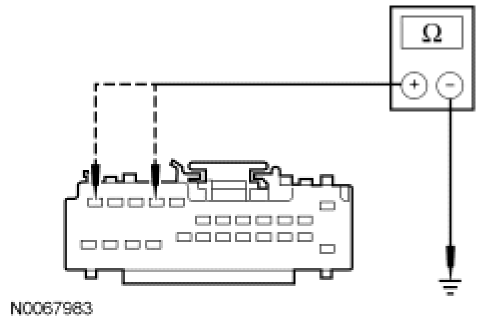

Fig. 48: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and ground; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J20 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO GROUND

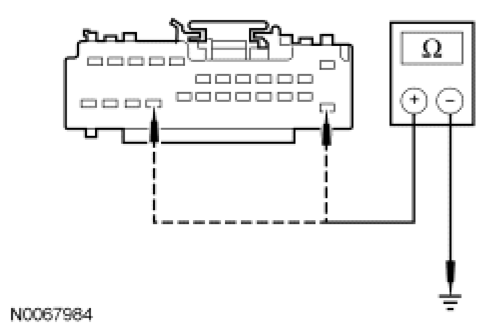

Fig. 49: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-13, circuit CPS07 (GY/BN), harness side and ground; and between DSM C3299b-21, circuit CPS08 (VT/OG), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J21.

J21 CHECK THE DRIVER POWER SEAT RECLINER MOTOR CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO GROUND

- Disconnect: Driver Power Seat Recliner Motor C368

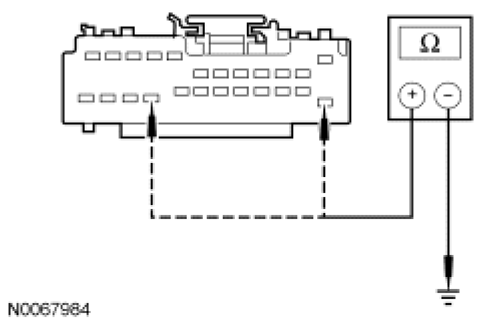

Fig. 50: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-13, circuit CPS07 (GY/BN), harness side and ground; and between DSM C3299b-21, circuit CPS08 (VT/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new seat recliner motor. REFER to **Seat Recliner Motor**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J22 CHECK THE FRONT HEIGHT POWER SEAT MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in

the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Front Height Power Seat Motor C382

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
    - Front Motor Up (FRONT_UP)
    - Front Motor Down (FRONT_DWN)

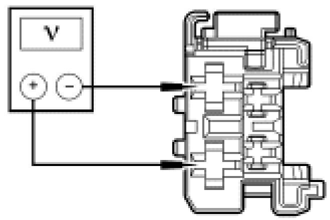

Fig. 51: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between front height power seat motor C382-2, circuit CPS02 (GY/YE) and C382-1, circuit CPS03 (VT/GY), harness side while toggling DSM active commands front motor up and front motor down, ON and OFF.
- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J23.

J23 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.

- Disconnect: DSM C3299b
- Key in ON position.

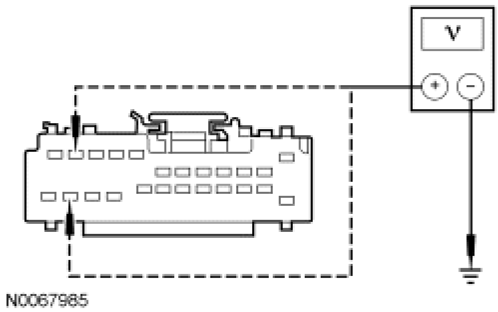

Fig. 52: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-23, circuit CPS03 (VT/GY), harness side and ground; and between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J24.

J24 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR AN OPEN

- Key in OFF position.

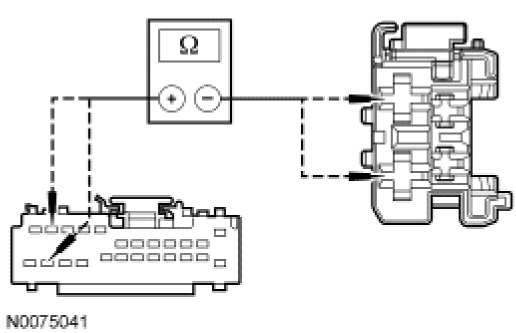

Fig. 53: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and front height power seat motor C382-2, circuit CPS02 (GY/YE), harness side; and between DSM C3299b-23, circuit CPS03 (VT/GY), harness side and front height power seat motor C382-1, circuit CPS03 (VT/GY), harness side.

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J25 CHECK THE REAR HEIGHT MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Rear Height Power Seat Motor C363

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Rear Motor Up (REAR_UP)
  - Rear Motor Down (REAR_DWN)

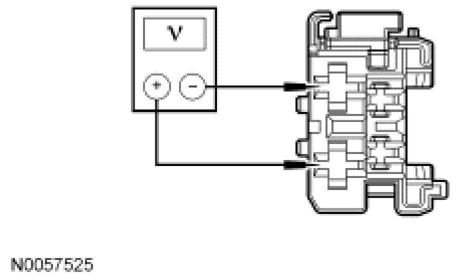

Fig. 54: Measuring Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage between rear height power seat motor C363-2, circuit CPS04 (YE/OG), harness side and C363-1, circuit CPS05 (BU/WH), harness side while toggling DSM active commands rear motor up and rear motor down, ON and OFF.
- **Is the voltage greater than 10 volts when commanded ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J26.

J26 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

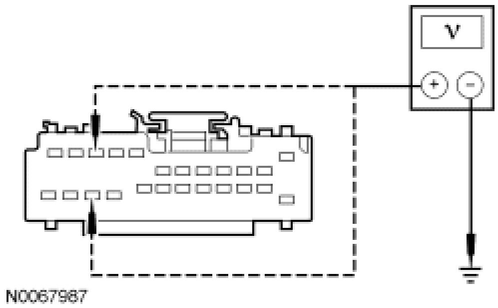

Fig. 55: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and ground; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J27.

J27 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR AN OPEN

- Key in OFF position.

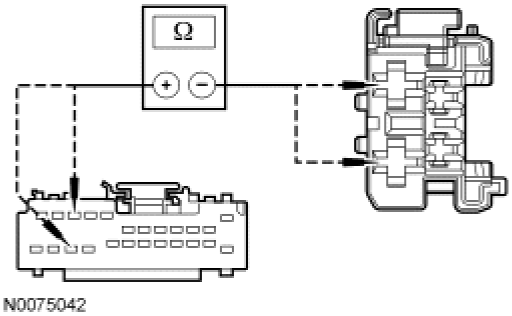

Fig. 56: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and rear height power seat motor C363-1, circuit CPS05 (BU/WH), harness side; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and rear height power seat motor C363-2, circuit CPS04 (YE/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J28 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Horizontal Power Seat Motor C362

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Horizontal Motor Forward (HORZ_FWD)
  - Horizontal Motor Backward (HORZ_BWD)

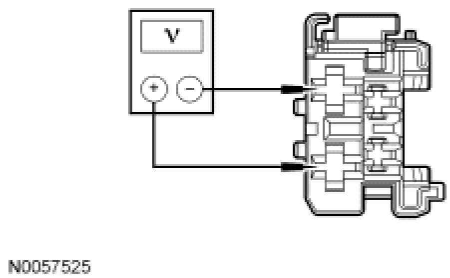

Fig. 57: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between horizontal power seat motor C362-2, circuit CPS01 (GN/BU) and C362-1, circuit CPS06 (GN/WH), harness side while toggling DSM active commands horizontal motor forward and horizontal motor backward, ON and OFF.
- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J29.

J29 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR A SHORT TO VOLTAGE

- Disconnect: DSM C3299b
- Key in ON position.

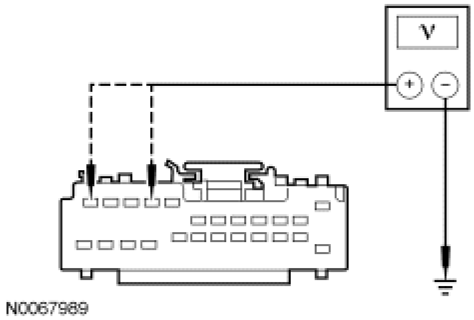

Fig. 58: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and ground; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J30.

J30 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR AN OPEN

- Key in OFF position.

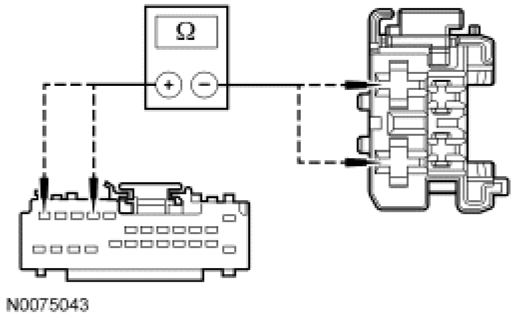

Fig. 59: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and horizontal power seat motor C362-1, circuit CPS06 (GN/WH), harness side; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and horizontal power seat motor C362-2, circuit CPS01 (GN/BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

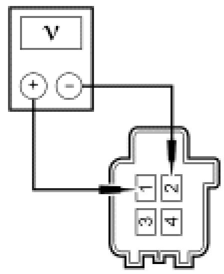
REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J31 CHECK THE DRIVER SEAT POWER RECLINER MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Driver Seat Power Recliner Motor C368

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Recline Motor Forward (RECL_FWD)
  - Recline Motor Backward (RECL_BWD)



N0057948

Fig. 60: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat power recliner motor C368-1, circuit CPS08 (VT/OG) and C368-2, circuit CPS07 (GY/BN), harness side while toggling DSM active commands recline motor forward and recline motor backward, ON and OFF.

- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new seat recliner motor. REFER to **Seat Recliner Motor**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J32.

J32 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO VOLTAGE

- Disconnect: DSM C3299b

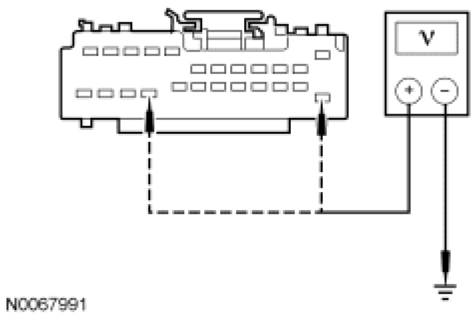


Fig. 61: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-13, circuit CPS07 (GY/BN), harness side and ground; and between DSM C3299b-21, circuit CPS08 (VT/OG), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J33.

J33 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR AN OPEN

- Key in OFF position.

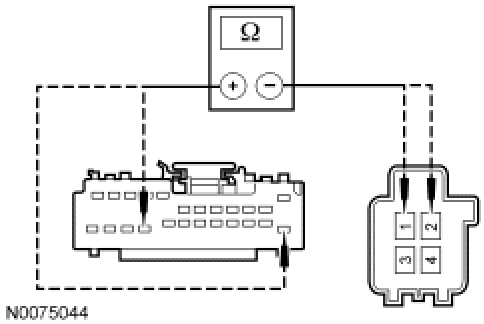

Fig. 62: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-13, circuit CPS07 (GY/BN), harness side and recliner power seat motor C368-2, circuit CPS07 (GY/BN), harness side; and between DSM C3299b-21, circuit CPS08 (VT/OG), harness side and recliner power seat motor C368-1, circuit CPS08 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test K: The Memory Seat Does Not Operate Correctly - Does Not Operate Using the Memory SET Switch, MKX

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Memory Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBP12 (GN/RD) and is supplied ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor, based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power recliner uses a single motor to move the seat backrest forward and rearward.

Battery voltage is supplied to DSM circuit SBB60 (GN/RD) and SBP12 (GN/RD). Ground is supplied to DSM circuit GD145 (BK/BU).

Each motor in the memory power seat track and power recliner contains a Hall-effect position sensor. The DSM supplies a signal supply circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat and seat backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory SET switch or a remote entry transmitter. Refer to **Principles of Operation** or the Owner's Literature for information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate correctly using the memory SET switch. If the memory seat does not move in all directions using the seat control switch, go to **Pinpoint Test J**.

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected, the DTC is set.
• B1530 - Memory SET Switch Circuit Short to Ground • B1534 - Memory 1 Switch Circuit Short to Ground • B1538 - Memory 2 Switch Circuit Short to Ground	If any activity is sensed on the switch input circuit during the DSM self-test, the DTC is set. If activity is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1663 - Seat Driver Front Up/Down Motor Stalled • B1664 - Seat Driver Rear Up/Down Motor Stalled • B1665 - Seat Driver Forward/Backward Motor Stalled	During self-test, the DSM attempts to operate the appropriate seat track motor and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1666 - Seat Driver Recline Motor Stalled	During self-test, the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables

	the output.
• B1952 - Seat Rear Up/Down Position Feedback Circuit Short to Battery • B1956 - Seat Front Up/Down Position Feedback Circuit Short to Battery • B1960 - Seat Recline Forward/Backward Position Feedback Circuit Short to Battery • B1964 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Battery	If a short to voltage condition is present on the affected motor's position sensor (Hall-effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one second increments.
• B1953 - Seat Rear Up/Down Position Feedback Circuit Short to Ground • B1957 - Seat Front Up/Down Position Feedback Circuit Short to Ground • B1961 - Seat Recline Forward/Backward Position Feedback Circuit Short to Ground • B1965 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Ground	If a short to ground condition is present on the affected motor's position sensor (Hall-effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one second increments.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Faulty memory SET switch
- Missing controller area network (CAN) status information (CAN communication message):
  - ignition switch status
  - gear selector position
- Remote entry transmitter
- Memory power seat track
- Memory recliner motor
- DSM

PINPOINT TEST K: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE USING THE MEMORY SET SWITCH, MKX

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**
NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

K1 CHECK DSM GEAR SELECTED (TRANSGEAR) PID STATES

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: TRANSGEAR
- Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states:
  - D6_Park
  - REV
  - NTRL
  - DRIVE5
  - DRIVE1
- **Do the PID states agree with the selected positions?**

  YES : Go to K2.

  NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

K2 CHECK DSM IGNITION SWITCH STATUS (IGN_SW) PID STATES

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: IGN_SW
- Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states:
  - Off
  - Accessory
  - Run
  - Start
- **Do the PID states agree with the selected positions?**

  YES : Go to K3.

  NO : To diagnose an ignition switch status concern, REFER to **STEERING COLUMN SWITCHES** article.

K3 RETRIEVE DSM DTCs

- Operate the memory seat and memory mirrors in all directions through the full range of travel.
- Place the memory seat and memory mirrors in central travel positions.
- Enter the following diagnostic mode on the diagnostic tool: Driver Seat Module (DSM) Self-Test/Retrieve DTCs
- **Are any DSM DTCs retrieved?**

  YES : If DTCs B1952, B1956, B1960 and B1964 are all retrieved, go to K10.

If DTCs B1953, B1957, B1961 and B1965 are all retrieved, go to K10.

If DTC B1530, go to K5.

If DTC B1534, go to K5.

If DTC B1538, go to K5.

If DTC B1663, go to K11.

If DTC B1664, go to K14.

If DTC B1665, go to K17.

If DTC B1666, go to K20.

If DTC B1952, go to K14.

If DTC B1953, go to K14.

If DTC B1956, go to K11.

If DTC B1957, go to K11.

If DTC B1960, go to K20.

If DTC B1961, go to K20.

If DTC B1964, go to K17.

If DTC B1965, go to K17.

If DTC 1342, INSTALL a new DSM and CARRY OUT programmable module installation (PMI). REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

For any other DSM DTCs, REFER to the **Driver Seat Module (DSM) DTC Chart**.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to K4.

K4 MONITOR THE DSM PIDs AND CHECK THE DSM FOR CORRECT MEMORY SET SWITCH INPUTS

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs

- Memory 1 recall switch status (MEM_1)
- Memory 2 recall switch status (MEM_2)
- Memory set switch status (MEM_S)

- Monitor the DSM PIDs while activating the memory SET switch, recall 1 and recall 2 buttons.
- **Do the PID states agree with the switch button positions?**

  YES : Go to K10.

  NO : Go to K5.

K5 CHECK THE MEMORY SET SWITCH

- Key in OFF position.
- Disconnect: Memory SET Switch C503

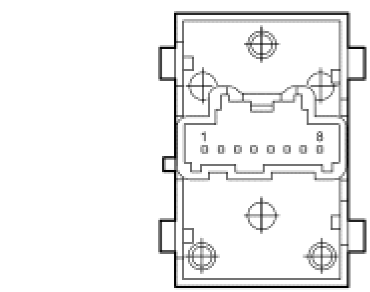

Fig. 63: Identifying Memory Set Switch Terminals
Courtesy of FORD MOTOR CO.

- Use the following table and illustration to check the memory SET switch. Measure the resistance between the memory SET switch pins, component side, while pressing the indicated switch buttons and compare the results to the table.

Switch Button	Pins	Ohms
Memory SET 1	7 and 2	Less than 7
Memory SET 2	7 and 6	Less than 7
Memory SET	7 and 5	Less than 7

NOTE: Refer to multi-meter user's manual for testing diodes.

- Use the following table and preceding illustration. Using the diode testing meter function, connect the meter leads to the memory SET switch pins, component side. Measure the voltages and compare the results to the table, to check the switch LED indicator.

Positive Lead	Negative Lead	Volts
Pin 1	Pin 7	Greater than 0.3
Pin 7	Pin 1	OL

- **Is the memory SET switch OK?**

  YES : Go to K6.

  NO : INSTALL a new memory SET switch. REFER to **Memory Set Switch**. REPEAT the self-test. CLEAR the DTCs.

K6 CHECK CIRCUIT GD133 (BK) TO THE MEMORY SET SWITCH FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

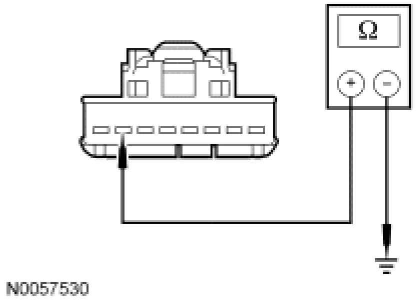

Fig. 64: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory SET switch C503-7, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to K7.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K7 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299c
- Key in ON position.

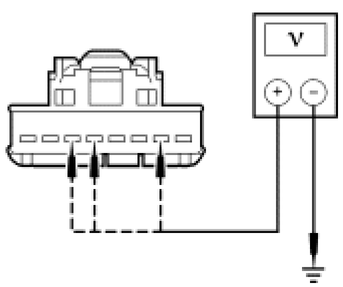

Fig. 65: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following memory SET switch C503 pins, harness side and ground:

Connector - Pin	Circuit
C503-2	CPS15 (VT/WH)
C503-5	CPS14 (GY/VT)
C503-6	CPS16 (YE)

- **Is voltage present on any circuit?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to K8.

K8 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR A SHORT TO GROUND

- Key in OFF position.

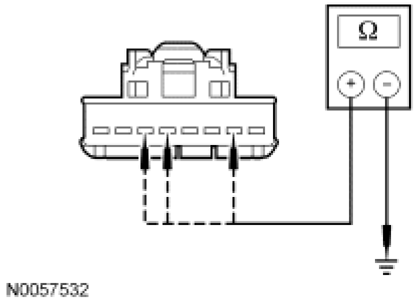

Fig. 66: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following memory SET switch C503 pins, harness side and ground:

Connector - Pin	Circuit
C503-2	CPS15 (VT/WH)
C503-5	CPS14 (GY/VT)
C503-6	CPS16 (YE)

- **Are the resistances greater than 10,000 ohms?**

YES : Go to K9.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K9 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR AN OPEN

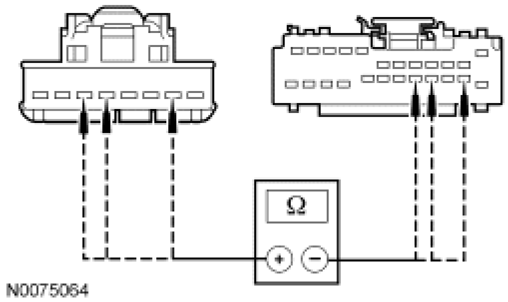

Fig. 67: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following memory SET switch C503 pins and DSM C3299c pins:

Memory SET Switch C503 - Pin	Circuit	DSM C3299c - Pin
C503-2	CPS15 (VT/WH)	C3299c-16
C503-5	CPS14 (GY/VT)	C3299c-14
C503-6	CPS16 (YE)	C3299c-17

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K10 MONITOR THE DSM PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Driver Mirror Left/Right Sensor Pinpoint (DMIR_H)

- Driver Mirror Up/Down Sensor Pinpoint (DMIR_V)
- Pedal sensor (PEDLFWD)
- Passenger Power Mirror Horizontal Sense (PMIR_H)
- Passenger Power Mirror Vertical Sense (PMIR_V)
- Driver Power Seat Front Up/Down Sense (SFNT_MT)
- Driver Power Seat Forward/Backward Sense (SFWD_MT)
- Driver Power Seat Recline Sense (SRCL_MT)
- Driver Power Seat Rear Up/Down Sense (SREARMT)

- Operate the memory seat and memory mirrors in all directions through the full range of travel while monitoring the PIDs.
- **Does each PID indicate the sensor is operational throughout each associated motor's full range of travel?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the front height PID indicates not sensed, go to K11.

  If the rear height PID indicates not sensed, go to K14.

  If the horizontal PID indicates not sensed, go to K17.

  If the recline PID indicates not sensed, go to K20.

  For a memory mirror sensor concern, REFER to **REAR VIEW MIRRORS** article.

  For a memory adjustable pedal sensor concern, REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article.

K11 CHECK CIRCUITS RPS13 (GN/OG) AND VPS10 (BU/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Front Height Motor C382

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the

battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

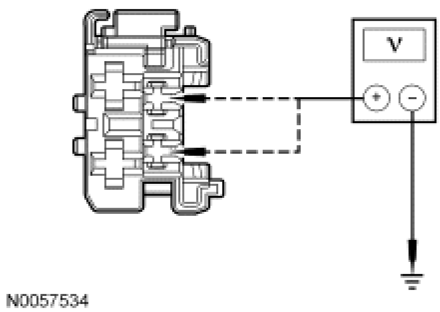

Fig. 68: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat front height motor C382-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat front height motor C382-4, circuit VPS10 (BU/GN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to K12.

K12 CHECK CIRCUITS RPS13 (GN/OG) AND VPS10 (BU/GN) FOR A SHORT TO GROUND

- Key in OFF position.

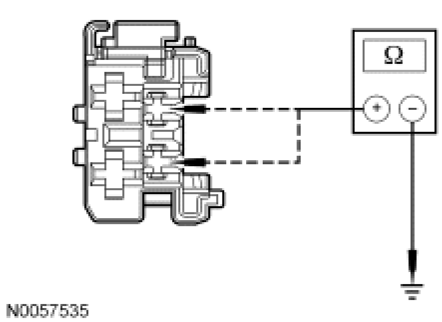

Fig. 69: Measuring Resistance

Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat front height motor C382-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat front height motor 382-4, circuit VPS10 (BU/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K13.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K13 CHECK CIRCUITS RPS13 (GN/OG) AND VPS10 (BU/GN) FOR AN OPEN

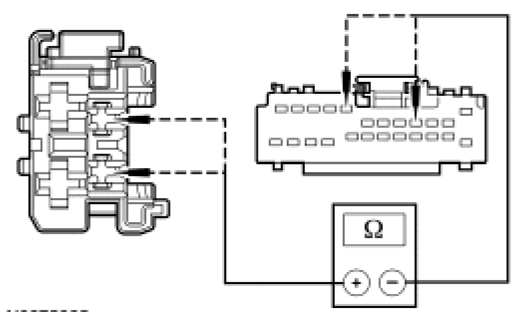

Fig. 70: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat front height motor C382-3, circuit RPS13 (GN/OG), harness side and DSM C3299b-8, circuit RPS13 (GN/OG), harness side; and between driver seat front height motor C382-4, circuit VPS10 (BU/GN), harness side and DSM C3299b-4, circuit VPS10 (BU/GN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K14 CHECK CIRCUITS RPS13 (GN/OG) AND VPS11 (GN/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Rear Height Motor C363

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

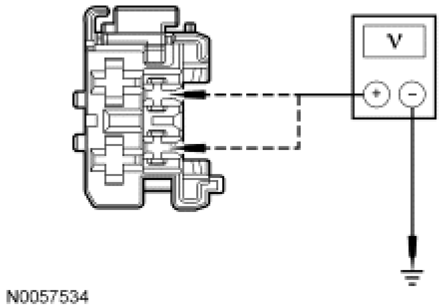

Fig. 71: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat rear height motor C363-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat rear height motor C363-4, circuit VPS11 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to K15.

K15 CHECK CIRCUITS RPS13 (GN/OG) AND VPS11 (GN/BN) FOR A SHORT TO GROUND

- Key in OFF position.

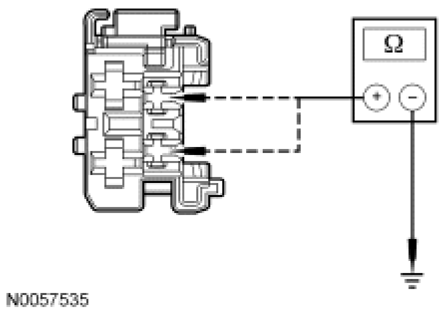

Fig. 72: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat rear height motor C363-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat rear height motor C363-4, circuit VPS11 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K16.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K16 CHECK CIRCUITS RPS13 (GN/OG) AND VPS11 (GN/BN) FOR AN OPEN

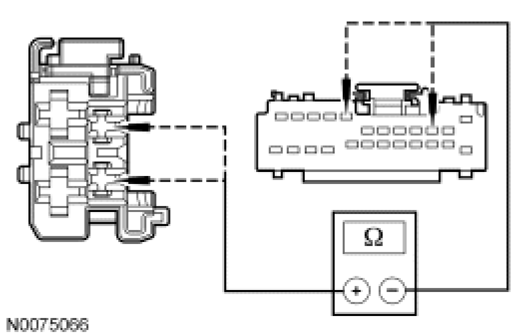

Fig. 73: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat rear height motor C363-3, circuit RPS13 (GN/OG), harness side and DSM C3299b-8, circuit RPS13 (GN/OG), harness side; and between driver seat rear height motor C363-4, circuit VPS11 (GN/BN), harness side and DSM C3299b-3, circuit VPS11 (GN/BN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K17 CHECK CIRCUITS RPS13 (GN/OG) AND VPS09 (BN/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Horizontal Motor C362

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

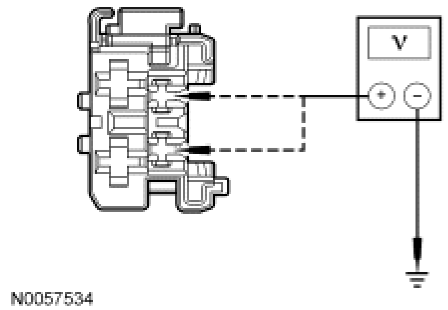

Fig. 74: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and ground.
- **Is any voltage present?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to K18.

K18 CHECK CIRCUITS RPS13 (GN/OG) AND VPS09 (BN/BU) FOR A SHORT TO GROUND

- Key in OFF position.

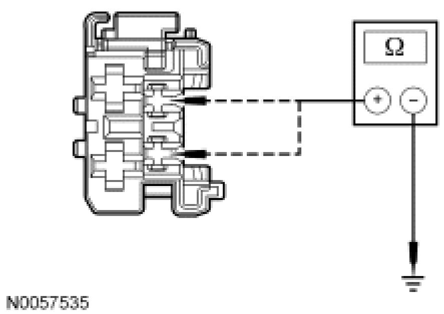

Fig. 75: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K19.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K19 CHECK CIRCUITS RPS13 (GN/OG) AND VPS09 (BN/BU) FOR AN OPEN

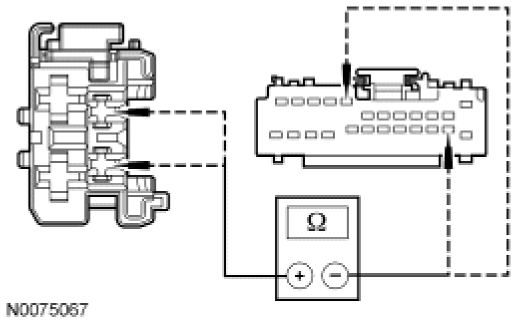

Fig. 76: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and DSM C3299b-8, circuit RPS13 (GN/OG), harness side; and between driver seat horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and DSM C3299b-14, circuit VPS09 (BN/BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

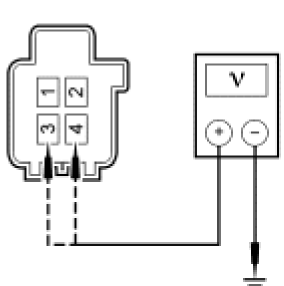
  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K20 CHECK CIRCUITS RPS13 (GN/OG) AND VPS12 (GY/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Recliner Motor C368

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.



N0058139

Fig. 77: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat recliner motor C368-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat recliner motor C368-4, circuit VPS12 (GY/OG), harness side and ground.
- **Is voltage present on either circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to K21.

K21 CHECK CIRCUITS RPS13 (GN/OG) AND VPS12 (GY/OG) FOR A SHORT TO GROUND

- Key in OFF position.

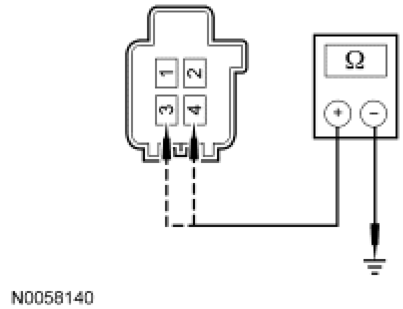


Fig. 78: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat recliner motor C368-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat recliner motor C368-4, circuit VPS12 (GY/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K22.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K22 CHECK CIRCUITS RPS13 (GN/OG) AND VPS12 (GY/OG) FOR AN OPEN

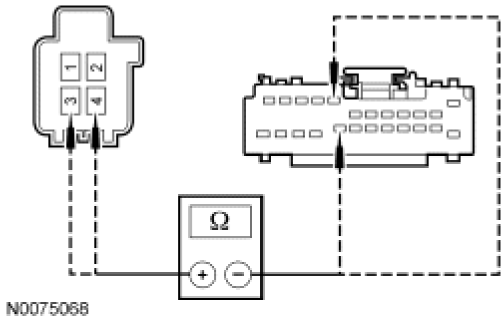

Fig. 79: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat recliner motor C368-3, circuit RPS13 (GN/OG), harness side and DSM C3299b-8, circuit RPS13 (GN/OG), harness side; and between driver seat recliner motor C368-4, circuit VPS12 (GY/OG), harness side and DSM C3299b-20, circuit VPS12 (GY/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat recliner motor. REFER to **Seat Recliner Motor**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test L: The Memory Seat is Inoperative/Does Not Operate Correctly - Does Not Operate Horizontally/Vertically, Edge

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Memory Seats for schematic and connector information.

Refer to appropriate COMPONENT TESTING article.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBP12 (GN/RD) and is supplied ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor circuits causing the seat to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down).

Battery voltage is also supplied to DSM circuit SBB60 (GN/RD) and is supplied ground to DSM circuit GD145 (BK/BU).

Each motor in the memory power seat track contains a Hall-effect position sensor. The DSM supplies a signal supply circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory SET switch or a remote entry transmitter. Refer to **Principles of Operation** or the Owner's Literature for information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate in one or more directions when using the seat control switch. If the memory seat moves in all directions using the seat control switch, go to **Pinpoint Test M**.

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected, the DTC is set.
• B1663 - Seat Driver Front Up/Down Motor Stalled • B1664 - Seat Driver Rear Up/Down Motor Stalled • B1665 - Seat Driver Forward/Backward Motor Stalled	During self-test, the driver seat module (DSM) attempts to operate all seat track motors and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1711 - Seat Driver Front Up Switch Circuit Short to Battery • B1715 - Seat Driver Front Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1719 - Seat Driver Forward Switch Circuit Short to Battery • B1723 - Seat Driver Rearward Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is

	ignored.
• B1727 - Seat Driver Rear Up Switch Circuit Short to Battery • B1731 - Seat Driver Rear Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch
- Missing controller area network (CAN) status information (CAN communication message):
  - ignition switch status
  - gear selector position
- Memory power seat track
- DSM

PINPOINT TEST L: THE MEMORY SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE HORIZONTALLY/VERTICALLY, EDGE

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.**

L1 CHECK DSM GEAR SELECTED (TRANSGEAR) PID STATES

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: TRANSGEAR
- Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states:
  - D6_Park

- REV
- NTRL
- DRIVE5
- DRIVE1

- **Do the PID states agree with the selected positions?**

  YES : Go to L2.

  NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

L2 CHECK DSM IGNITION SWITCH STATUS (IGN_SW) PID STATES

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PID: IGN_SW
- Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states:
  - Off
  - Accessory
  - Run
  - Start
- **Do the PID states agree with the selected positions?**

  YES : Go to L3.

  NO : To diagnose an ignition switch status concern, REFER to **STEERING COLUMN SWITCHES** article.

L3 CHECK IGNITION SWITCH STATUS, TRANSMISSION GEAR SELECTOR STATUS AND RETRIEVE DTCs

- Operate the memory seat and memory mirrors in all directions through the full range of travel.
- Place the memory seat and memory mirrors in central travel positions.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DSM/Retrieve DTCs
- **Are any DSM DTCs retrieved?**

  YES : If DTCs B1663, B1664 and B1665 are all retrieved, go to L12.

  If DTC B1663, go to L20.

  If DTC B1664, go to L23.

  If DTC B1665, go to L26.

  If DTC B1711, go to L5.

  If DTC B1715, go to L5.

  If DTC B1719, go to L5.

  If DTC B1723, go to L5.

If DTC B1727, go to L5.

If DTC B1731, go to L5.

If DTC 1342, INSTALL a new DSM and CARRY OUT programmable module installation (PMI). REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

For any other DSM DTCs, REFER to the Driver Seat Module (DSM) DTC Chart.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to L4.

L4 MONITOR THE DSM PIDs AND CHECK FOR CORRECT MEMORY SEAT SWITCH INPUTS

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Driver Power Seat Front Up/Down Switch (SFNT_SW)
  - Driver Power Seat Forward/Backward Switch (SFWD_SW)
  - Driver Power Seat Rear Up/Down Switch (SREARSW)
- Monitor DSM seat switch PIDs while activating the seat switch in all positions.
- **Do the PID states agree with the switch positions?**

  YES : Go to L11.

  NO : VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If SJB fuse 12 (7.5A) fails while operating the seat control switch, DISCONNECT the seat control switch C352 and Go to L9.

  If OK, go to L5.

L5 CHECK THE SEAT CONTROL SWITCH

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Seat Control Switch C352

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

- Check the seat control switch. Refer to appropriate COMPONENT TESTING article.
- **Is the seat control switch OK?**

  YES : Go to L6.

  NO : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L6 CHECK CIRCUIT SBP12 (GN/RD) FOR VOLTAGE TO THE SEAT CONTROL SWITCH

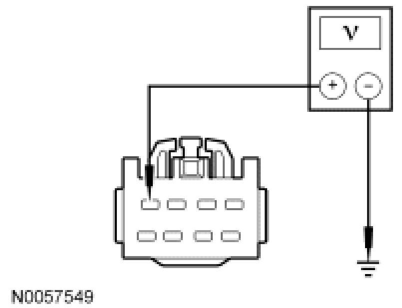

Fig. 80: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between seat control switch C352-4, circuit SBP12 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to L7.

  NO : VERIFY SJB fuse 12 (7.5A) is OK, If OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L7 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

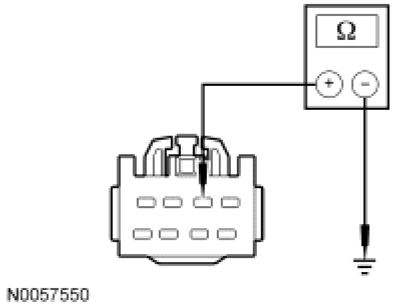

Fig. 81: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C352-2, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

 YES : Go to L8.

 NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

 DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

 REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L8 CHECK SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DSM C3299b
- Key in ON position.

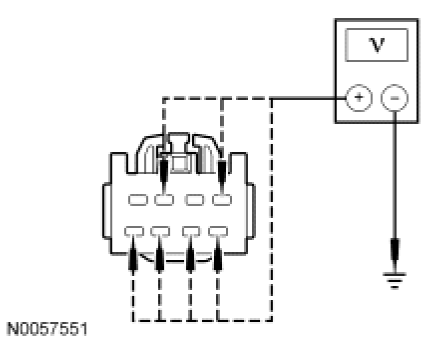

Fig. 82: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following seat control switch C352 pins, harness side and ground:

Connector - Pin	Circuit

C352-5	CPS27 (BU/BN)
C352-7	CPS26 (YE/BU)
C352-3	CPS23 (GN/VT)
C352-6	CPS28 (GN)
C352-1	CPS25 (WH/VT)
C352-8	CPS24 (GY)

- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L9.

L9 CHECK SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Seat Control Switch C352
- Disconnect: DSM C3299b

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

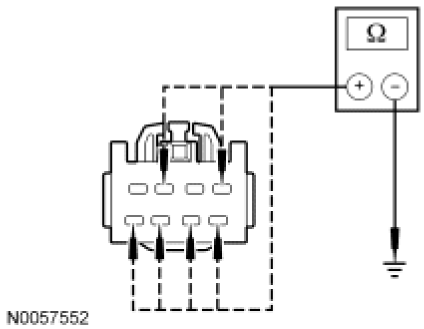

Fig. 83: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following seat control switch C352 pins, harness side and ground:

Connector - Pin	Circuit
C352-5	CPS27 (BU/BN)
C352-7	CPS26 (YE/BU)
C352-3	CPS23 (GN/VT)
C352-6	CPS28 (GN)
C352-1	CPS25 (WH/VT)
C352-8	CPS24 (GY)

- **Are the resistances greater than 10,000 ohms?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L10.

L10 CHECK SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR AN OPEN

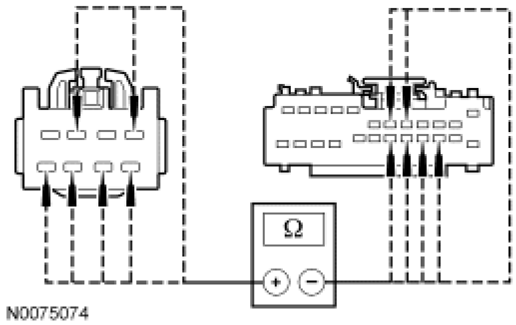

Fig. 84: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following seat control switch C352 pins, harness side and DSM C3299b pins, harness side:

Seat Control Switch Connector - Pin	Circuit	DSM Connector - Pin
C352-5	CPS27 (BU/BN)	C3299b-17
C352-7	CPS26 (YE/BU)	C3299b-5
C352-3	CPS23 (GN/VT)	C3299b-16
C352-6	CPS28 (GN)	C3299b-15
C352-1	CPS25 (WH/VT)	C3299b-18
C352-8	CPS24 (GY)	C3299b-6

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L11 CHECK THE DSM FOR CORRECT OUTPUTS USING A SCAN TOOL AND DSM ACTIVE COMMANDS

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Front Motor Up (FRONT_UP)
  - Front Motor Down (FRONT_DWN)
  - Rear Motor Up (REAR_UP)
  - Rear Motor Down (REAR_DWN)
  - Horizontal Motor Forward (HORZ_FWD)
  - Horizontal Motor Backward (HORZ_BWD)
- Toggle the DSM active commands ON and OFF while monitoring the seat movement.
- **Does the driver seat operate correctly?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If no seat movement, go to L12.

  If no front vertical seat movement, go to L20.

  If no rear vertical seat movement, go to L23.

  If no horizontal seat movement, go to L26.

L12 CHECK DSM CIRCUIT SBB60 (GN/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

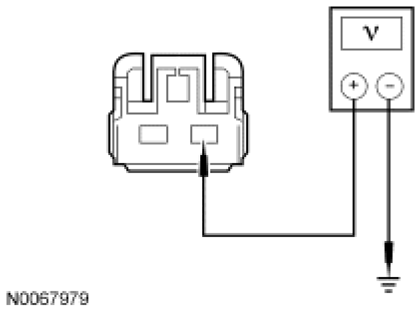

Fig. 85: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299a-1, circuit SBB60 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to L13.

  NO : VERIFY battery junction box (BJB) fuse 60 (30A) is OK. If OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L13 CHECK CIRCUITS GD145 (BK/BU) AND GD133 (BK) FOR AN OPEN

- Disconnect: DSM C3299c

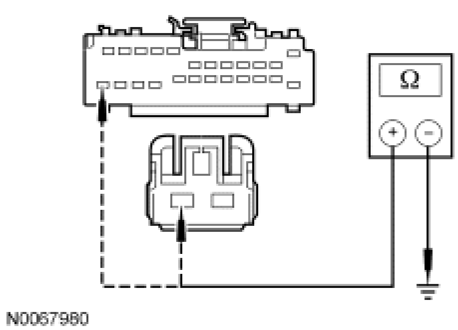

Fig. 86: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299a-2, circuit GD145 (BK/BU), harness side and ground; and between DSM C3299b-24, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to L14.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L14 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND

- Disconnect: DSM C3299b

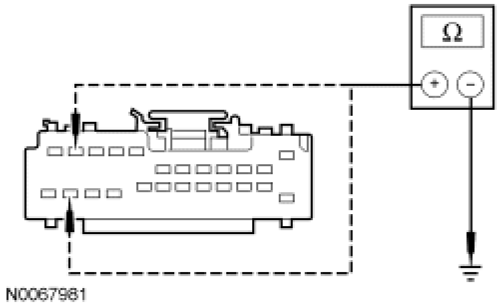

Fig. 87: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-23, circuit CPS03 (VT/GY), harness side and ground; and between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to L16.

  NO : Go to L15.

L15 CHECK FRONT HEIGHT POWER SEAT MOTOR CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND

- Disconnect: Front Height Power Seat Motor C382

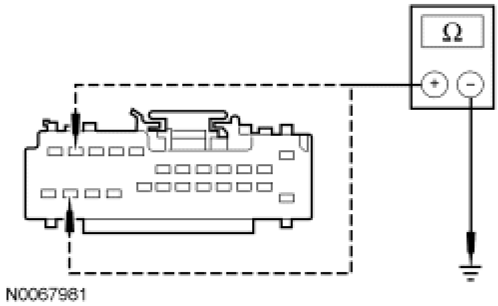

Fig. 88: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-23 circuit CPS03 (VT/GY), harness side and ground; and between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L16 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND

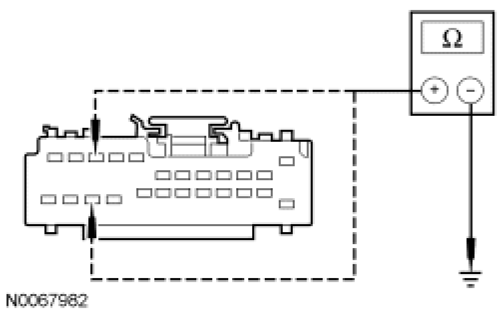

Fig. 89: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and ground; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to L18.

  NO : Go to L17.

L17 CHECK THE REAR HEIGHT POWER SEAT MOTOR CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND

- Disconnect: Rear Height Power Seat Motor C363

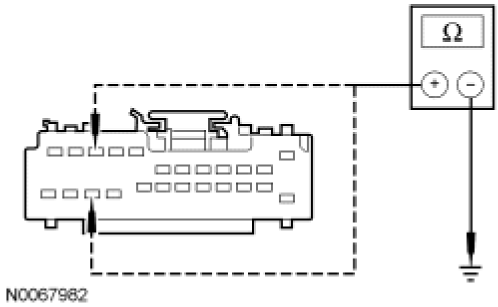

Fig. 90: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and ground; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L18 CHECK CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND

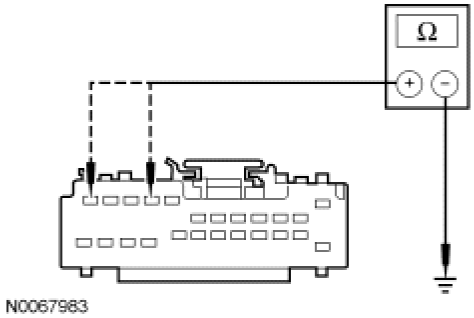

Fig. 91: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and ground; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to L20.

  NO : Go to L19.

L19 CHECK THE HORIZONTAL POWER SEAT MOTOR CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND

- Disconnect: Horizontal Power Seat Motor C362

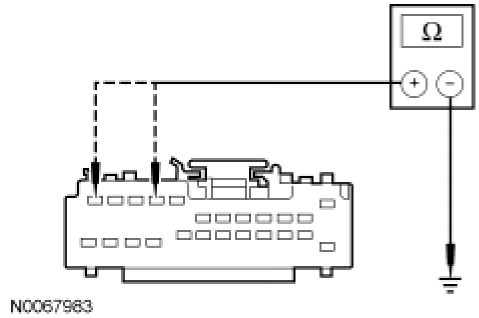

Fig. 92: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and ground; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

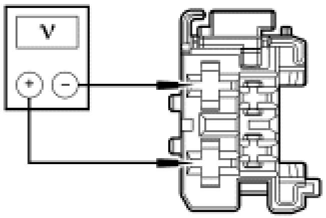
L20 CHECK THE FRONT HEIGHT POWER SEAT MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Front Height Power Seat Motor C382

WARNING: **Make sure no one is in the vehicle and there is nothing**

blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Front Motor Up (FRONT_UP)
  - Front Motor Down (FRONT_DWN)



N0057525

Fig. 93: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between front height power seat motor C382-2, circuit CPS02 (GY/YE) and C382-1, circuit CPS03 (VT/GY), harness side while toggling DSM active commands front motor up and front motor down, ON and OFF.
- **Is the voltage greater than 10 volts when commanded ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L21.

L21 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

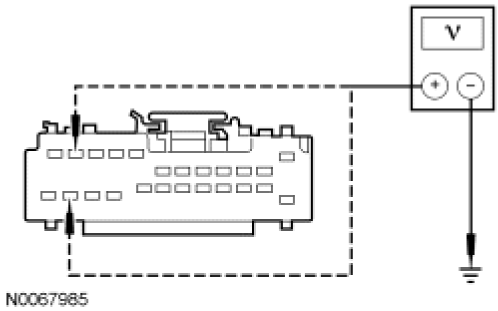


Fig. 94: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-23, circuit CPS03 (VT/GY), harness side and ground; and between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L22.

L22 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR AN OPEN

- Key in OFF position.

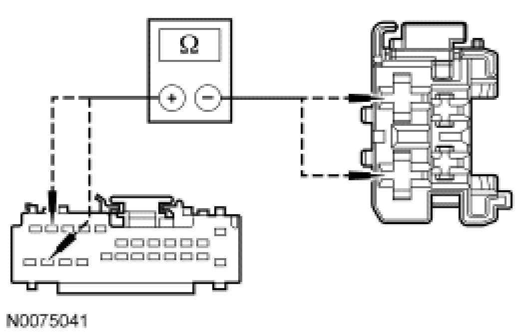

Fig. 95: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-11, circuit CPS02 (GY/YE), harness side and front height power seat motor C382-2, circuit CPS02 (GY/YE), harness side; and between DSM C3299b-23, circuit CPS03 (VT/GY), harness side and front height power seat motor C382-1, circuit CPS03 (VT/GY), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L23 CHECK THE REAR HEIGHT MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Rear Height Power Seat Motor C363

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Rear Motor Up (REAR_UP)
  - Rear Motor Down (REAR_DWN)

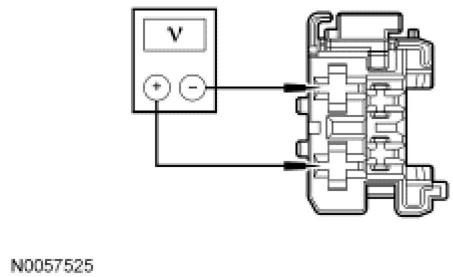

Fig. 96: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between rear height power seat motor C363-2, circuit CPS04 (YE/OG), harness side and C363-1, circuit CPS05 (BU/WH), harness side while toggling DSM active commands rear motor up and rear motor down, ON and OFF.

- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L24.

L24 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

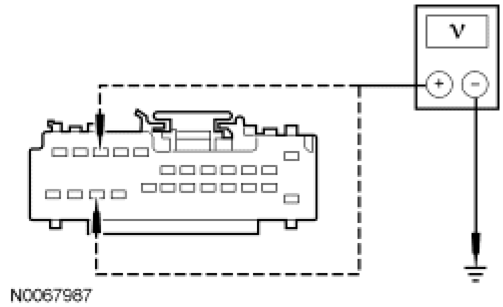

Fig. 97: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and ground; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L25.

L25 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR AN OPEN

- Key in OFF position.

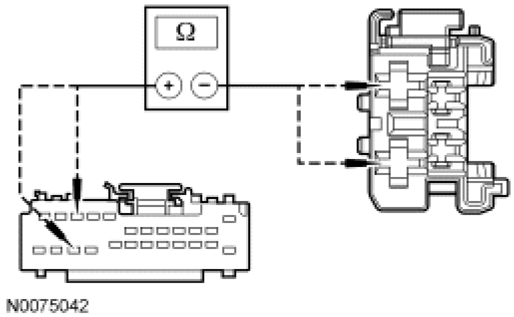

Fig. 98: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-22, circuit CPS05 (BU/WH), harness side and rear height power seat motor C363-1, circuit CPS05 (BU/WH), harness side; and between DSM C3299b-10, circuit CPS04 (YE/OG), harness side and rear height power seat motor C363-2, circuit CPS04 (YE/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

L26 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Horizontal Power Seat Motor C362

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Horizontal Motor Forward (HORZ_FWD)
  - Horizontal Motor Backward (HORZ_BWD)

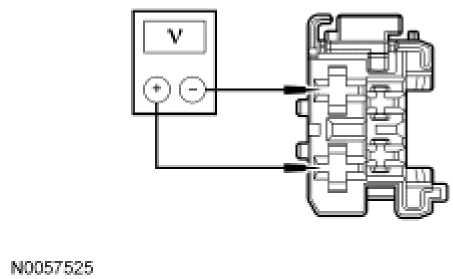

Fig. 99: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between horizontal power seat motor C362-2, circuit CPS01 (GN/BU) and C362-1, circuit CPS06 (GN/WH), harness side while toggling DSM active commands horizontal motor forward and horizontal motor backward, ON and OFF.
- **Is the voltage greater than 10 volts when commanded ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L27.

L27 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

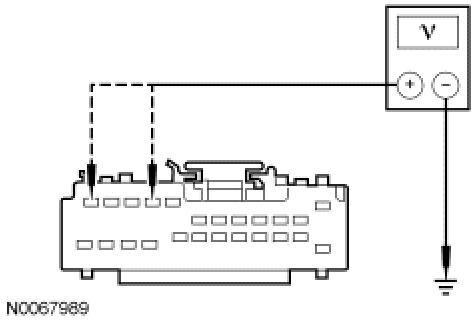

Fig. 100: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and ground; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to L28.

L28 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR AN OPEN

- Key in OFF position.

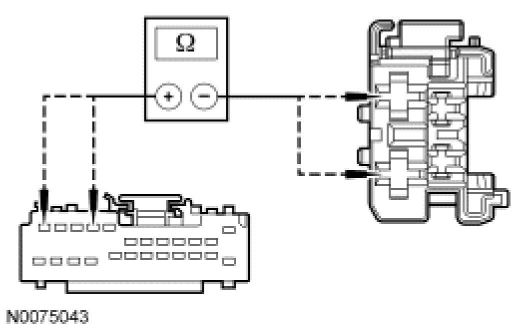

Fig. 101: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS06 (GN/WH), harness side and horizontal power seat motor C362-1, circuit CPS06 (GN/WH), harness side; and between DSM C3299b-12, circuit CPS01 (GN/BU), harness side and horizontal power seat motor C362-2, circuit CPS01 (GN/BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test M: The Memory Seat Does Not Operate Correctly - Does Not Operate Using the Memory SET Switch, Edge

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Memory Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBP12 (GN/RD) and is supplied ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down).

Battery voltage is supplied to DSM circuit SBB60 (GN/RD) and SBP12 (GN/RD). Ground is supplied to DSM circuit GD145 (BK/BU).

Each motor in the memory power seat track contains a Hall-effect position sensor. The DSM supplies a signal supply circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory SET switch or a remote entry transmitter. Refer to **Principles of Operation** or the Owner's Literature for additional information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate correctly using the memory SET switch. If the memory seat does not move in all directions using the seat control switch, go to **Pinpoint Test L**.

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected, the DTC is set.
• B1530 - Memory SET Switch Circuit Short to Ground • B1534 - Memory 1 Switch Circuit Short to Ground	If any activity is sensed on the switch input circuit during the DSM self-test, the DTC is set. If activity is

• B1538 - Memory 2 Switch Circuit Short to Ground	sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1663 - Seat Driver Front Up/Down Motor Stalled • B1664 - Seat Driver Rear Up/Down Motor Stalled • B1665 - Seat Driver Forward/Backward Motor Stalled	During self-test, the DSM attempts to operate the appropriate seat track motor and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1952 - Seat Rear Up/Down Position Feedback Circuit Short to Battery • B1956 - Seat Front Up/Down Position Feedback Circuit Short to Battery • B1964 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Battery	If a short to voltage condition is present on the affected motor's position sensor (Hall-effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one second increments.
• B1953 - Seat Rear Up/Down Position Feedback Circuit Short to Ground • B1957 - Seat Front Up/Down Position Feedback Circuit Short to Ground • B1965 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Ground	If a short to ground condition is present on the affected motor's position sensor (Hall-effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one second increments.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Faulty memory SET switch
- Missing controller area network (CAN) status information (CAN communication message):
  - ignition switch status
  - gear selector position
- Remote entry transmitter
- Memory power seat track
- DSM

PINPOINT TEST M: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE USING THE MEMORY SET SWITCH, EDGE

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.**

M1 CHECK DSM GEAR SELECTED (TRANSGEAR) PID STATES

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: TRANSGEAR
- Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states:
  - D6_Park
  - REV
  - NTRL
  - DRIVE5
  - DRIVE1
- **Do the PID states agree with the selected positions?**

  YES : Go to M2.

  NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

M2 CHECK DSM IGNITION SWITCH STATUS (IGN_SW) PID STATES

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: IGN_SW
- Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states:
  - Off
  - Accessory
  - Run
  - Start
- **Do the PID states agree with the selected positions?**

  YES : Go to M3.

  NO : To diagnose an ignition switch status concern, REFER to **STEERING COLUMN SWITCHES** article.

M3 RETRIEVE THE DSM DTCs

- Using the switches, operate the memory seat and memory mirrors in all directions through the full range of travel.
- Place the memory seat and memory mirrors in central travel positions.
- Enter the following diagnostic mode on the diagnostic tool: Self Test/Driver Seat Module (DSM)/Retrieve DTCs
- **Are any DSM DTCs retrieved?**

  YES : If DTCs B1952, B1956 and B1964 are all retrieved, go to M10.

  If DTCs B1953, B1957 and B1965 are all retrieved, go to M10.

  If DTC B1530, go to M5.

  If DTC B1534, go to M5.

  If DTC B1538, go to M5.

  If DTC B1663, go to M11.

  If DTC B1664, go to M14.

  If DTC B1665, go to M17.

  If DTC B1952, go to M14.

  If DTC B1953, go to M14.

  If DTC B1956, go to M11.

  If DTC B1957, go to M11.

  If DTC B1964, go to M17.

  If DTC B1965, go to M17.

  If DTC 1342, INSTALL a new DSM and CARRY OUT programmable module installation (PMI). REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  For any other DSM DTCs, REFER to the Driver Seat Module (DSM) DTC Chart.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to M4.

M4 MONITOR THE DSM PIDs AND CHECK THE DSM FOR CORRECT MEMORY SET SWITCH INPUTS

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Memory 1 recall switch status (MEM_1)
  - Memory 2 recall switch status (MEM_2)
  - Memory set switch status (MEM_S)
- Monitor the DSM PIDs while activating the memory SET switch, recall 1 and recall 2 buttons.
- **Do the PID states agree with the switch button positions?**

  YES : Go to M11.

  NO : Go to M5.

M5 CHECK THE MEMORY SET SWITCH

- Key in OFF position.
- Disconnect: Memory SET Switch C503

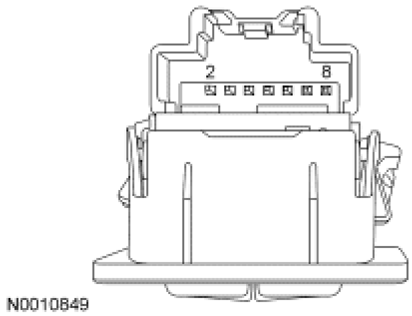

Fig. 102: Identifying Memory SET Switch Terminals
Courtesy of FORD MOTOR CO.

- Use the following table and illustration to check the memory SET switch. Measure the resistance between the memory SET switch pins, component side, while pressing the indicated switch buttons and compare the results to the table.

Switch Button	Pins	Ohms
Memory SET 1	7 and 2	Less than 7
Memory SET 2	3 and 2	Less than 7
Memory SET	4 and 2	Less than 7

NOTE: Refer to multi-meter user's manual for testing diodes.

- Use the following table and preceding illustration. Using the diode testing meter function, connect the meter leads to the memory SET switch pins, component side. Measure the voltages and compare the results to the table, to check the switch LED indicator.

Positive Lead	Negative Lead	Volts
Pin 8	Pin 2	Greater than 0.3
Pin 2	Pin 8	OL

- **Is the memory SET switch OK?**

  YES : Go to M6.

  NO : INSTALL a new memory SET switch. REFER to **Memory Set Switch**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M6 CHECK GROUND CIRCUIT GD133 (BK) TO THE MEMORY SET SWITCH

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

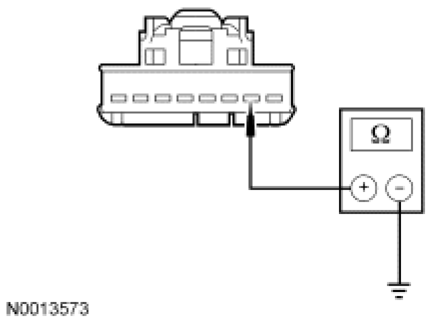

Fig. 103: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory SET switch C503-2, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to M7.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M7 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR A SHORT TO VOLTAGE

- Disconnect: DSM C3299c
- Key in ON position.

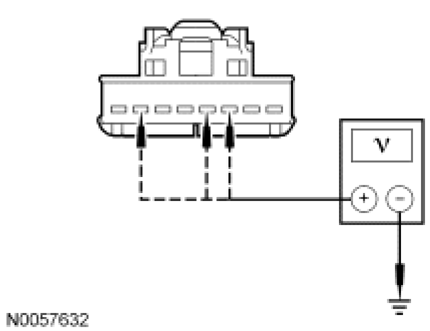

Fig. 104: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following memory SET switch C503 pins, harness side and ground:

Connector - Pin	Circuit

C503-3	CPS16 (YE)
C503-4	CPS14 (GY/VT)
C503-7	CPS15 (VT/WH)

- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to M8.

M8 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR A SHORT TO GROUND

- Key in OFF position.

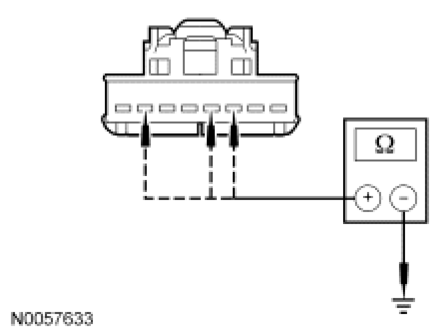

Fig. 105: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following memory SET switch C503 pins, harness side and ground:

Connector - Pin	Circuit
C503-3	CPS16 (YE)
C503-4	CPS14 (GY/VT)
C503-7	CPS15 (VT/WH)

- **Are the resistances greater than 10,000 ohms?**

YES : Go to M9.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M9 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR AN OPEN

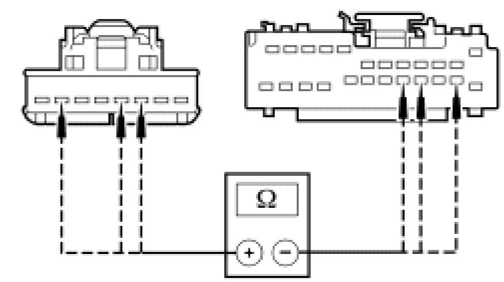

Fig. 106: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following memory SET switch C503 pins and DSM C3299c pins:

Memory SET Switch C503 - Pin	Circuit	DSM C3299c - Pin
C503-3	CPS16 (YE)	C3299c-17
C503-4	CPS14 (GY/VT)	C3299c-14
C503-7	CPS15 (VT/WH)	C3299c-16

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M10 MONITOR THE DSM PIDs

- Place the seat in a central position, using the seat control switch.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM PIDs
  - Driver Mirror Left/Right Sensor Pinpoint (DMIR_H)
  - Driver Mirror Up/Down Sensor Pinpoint (DMIR_V)
  - Pedal sensor (PEDLFWD)
  - Passenger Power Mirror Horizontal Sense (PMIR_H)
  - Passenger Power Mirror Vertical Sense (PMIR_V)
  - Driver Power Seat Front Up/Down Sense (SFNT_MT)
  - Driver Power Seat Forward/Backward Sense (SFWD_MT)
  - Driver Power Seat Rear Up/Down Sense (SREARMT)
- Using the switches, operate the memory seat and memory mirrors in all directions through the full range of travel while monitoring the PIDs.
- **Does each PID indicate the sensor is operational throughout each associated motor's full range of travel?**

  YES : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the front height PID indicates not sensed, go to M11.

  If the rear height PID indicates not sensed, go to M14.

  If the horizontal PID indicates not sensed, go to M17.

M11 CHECK CIRCUITS RPS13 (GN/OG) AND VPS10 (BU/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Front Height Motor C382

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in OFF position.
- Key in ON position.

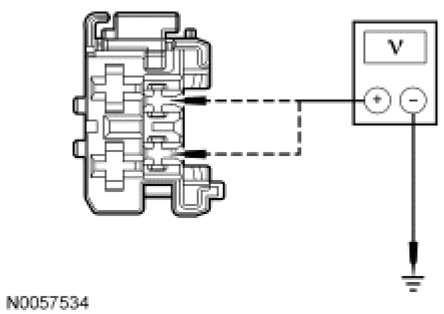

Fig. 107: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat front height motor C382-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat front height motor C382-4, circuit VPS10 (BU/GN), harness side and ground.
- **Is voltage present on a circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to M12.

M12 CHECK CIRCUITS RPS13 (GN/OG) AND VPS10 (BU/GN) FOR A SHORT TO GROUND

- Key in OFF position.

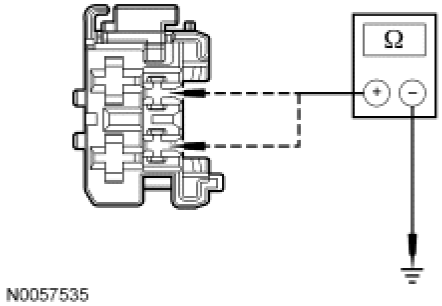

Fig. 108: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat front height motor C382-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat front height motor 382-4, circuit VPS10 (BU/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to M13.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M13 CHECK CIRCUITS RPS13 (GN/OG) AND VPS10 (BU/GN) FOR AN OPEN

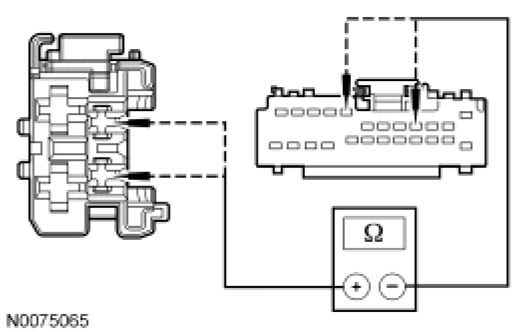

Fig. 109: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat front height motor C382-3, circuit RPS13 (GN/OG), harness side and DSM C3299b-8, circuit RPS13 (GN/OG), harness side; and between driver seat front height motor C382-4, circuit VPS10 (BU/GN), harness side and DSM C3299b-4, circuit VPS10 (BU/GN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M14 CHECK CIRCUITS RPS13 (GN/OG) AND VPS11 (GN/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Rear Height Motor C363

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

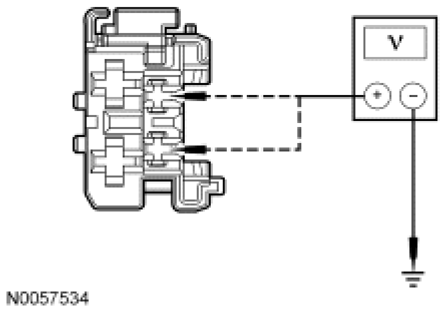

Fig. 110: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat rear height motor C363-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat rear height motor C363-4, circuit VPS11 (GN/BN), harness side and ground.
- **Is voltage present on a circuit?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to M15.

M15 CHECK CIRCUITS RPS13 (GN/OG) AND VPS11 (GN/BN) FOR A SHORT TO GROUND

- Key in OFF position.

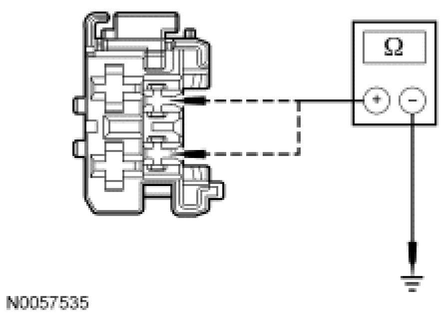

Fig. 111: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat rear height motor C363-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat rear height motor C363-4, circuit VPS11 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

YES : Go to M16.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M16 CHECK CIRCUITS RPS13 (GN/OG) AND VPS11 (GN/BN) FOR AN OPEN

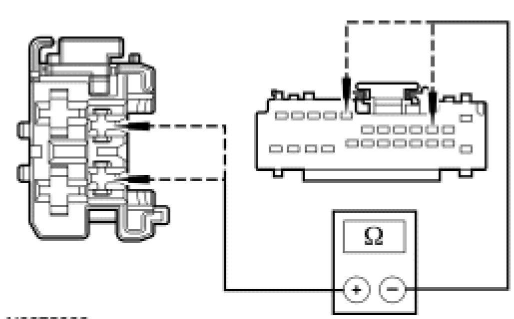

Fig. 112: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat rear height motor C363-3, circuit RPS13 (GN/OG), harness side and DSM C3299b-8, circuit RPS13 (GN/OG), harness side; and between driver seat rear height motor C363-4, circuit VPS11 (GN/BN), harness side and DSM C3299b-3, circuit VPS11 (GN/BN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

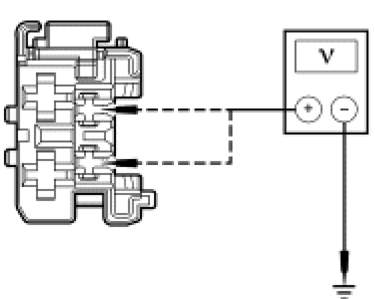
  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M17 CHECK CIRCUITS RPS13 (GN/OG) AND VPS09 (BN/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Horizontal Motor C362

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.



N0057534

Fig. 113: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and ground.
- **Is voltage present on a circuit?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to M18.

M18 CHECK CIRCUITS RPS13 (GN/OG) AND VPS09 (BN/BU) FOR A SHORT TO GROUND

- Key in OFF position.

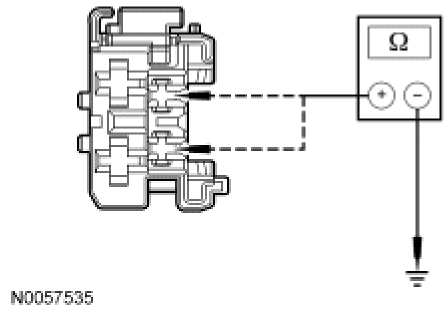


Fig. 114: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and ground; and between driver seat horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

YES : Go to M19.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M19 CHECK CIRCUITS RPS13 (GN/OG) AND VPS09 (BN/BU) FOR AN OPEN

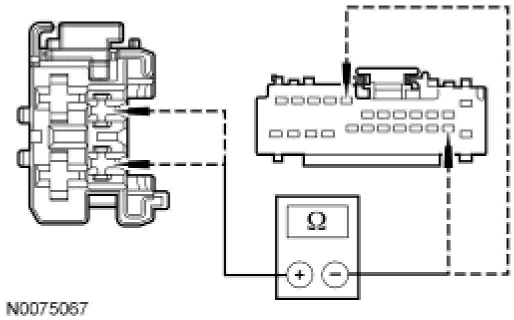

Fig. 115: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and DSM C3299b-8, circuit RPS13 (GN/OG), harness side; and between driver seat horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and DSM C3299b-14, circuit VPS09 (BN/BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test N: The Memory SET Switch Indicator is Inoperative/Always On

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Memory Seats for schematic and connector information.

Normal Operation

The memory SET switch indicator is provided voltage, for approximately 5 seconds, from the driver seat module (DSM) on circuit CPS55 (YE) after the SET switch has been pressed. Ground is supplied at circuit GD133 (BK). The indicator will turn off after memory switch 1 or memory switch 2 have been pressed or 5 seconds have elapsed.

- DTC B2084 Memory SET Indicator Short to Ground - If a short to ground or open condition is present on the memory SET switch indicator output circuit, the DTC is set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Memory SET switch
- DSM

PINPOINT TEST N: THE MEMORY SET SWITCH INDICATOR IS INOPERATIVE/ALWAYS ON

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.**

N1 RETRIEVE THE DTCs

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self Test/Driver Seat Module (DSM)/Retrieve DTCs

  NOTE: **During the self-test, document when the memory SET switch LED illuminates and turns off.**

- **Is DTC B2084 present, does memory SET switch LED fail to illuminate when SET button is pushed or does the memory SET switch LED fail to illuminate during the Self Test?**

  YES : If DTC B2084 is present or if the memory SET switch LED fails to illuminate during the Self Test, go to N2.

  NO : If the memory SET switch LED is on all the time, go to N6.

N2 CHECK CIRCUIT CPS55 (YE) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Memory SET Switch C503
- Disconnect: DSM C3299c

  WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

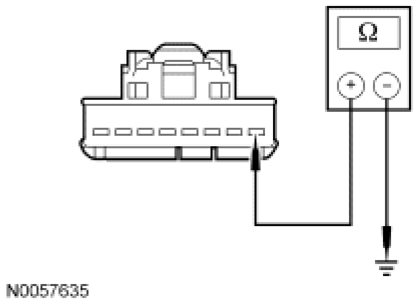

Fig. 116: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **For MKX vehicles,** measure the resistance between memory SET switch C503-1, circuit CPS55 (YE), harness side and ground.

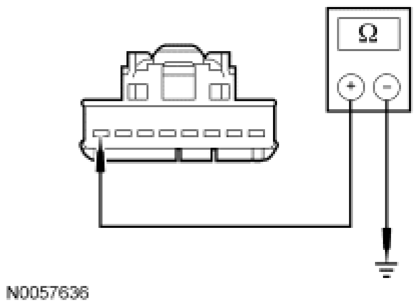

Fig. 117: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **For Edge vehicles,** measure the resistance between memory SET switch C503-8, circuit CPS55 (YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to N3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N3 CHECK CIRCUIT CPS55 (YE) FOR AN OPEN

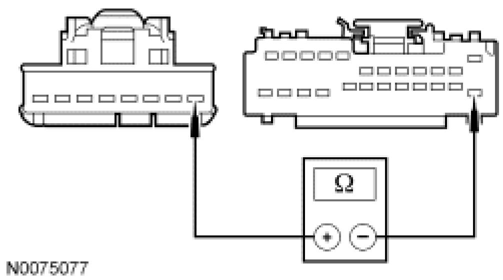

Fig. 118: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **For MKX vehicles,** measure the resistance between memory SET switch C503-1, circuit CPS55 (YE), harness side and DSM C3299c-13, circuit CPS55 (YE) harness side.

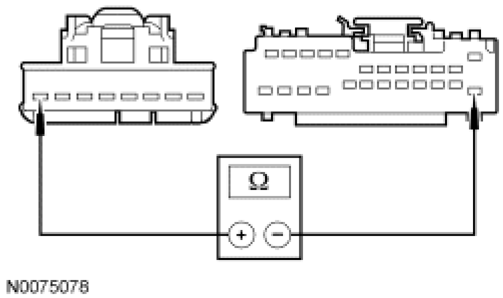

Fig. 119: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **For Edge vehicles,** measure the resistance between memory SET switch C503-8, circuit CPS55 (YE), harness side and DSM C3299c-13, circuit CPS55 (YE) harness side.
- **Is the resistances less than 5 ohms?**

  YES : Go to N4.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N4 CHECK GROUND CIRCUIT GD133 (BK) TO THE MEMORY SET SWITCH

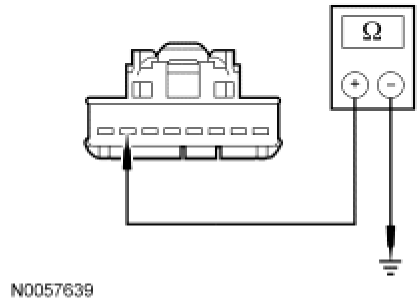

Fig. 120: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **For MKX vehicles,** measure the resistance between memory SET switch C503-7, circuit GD133 (BK), harness side and ground.

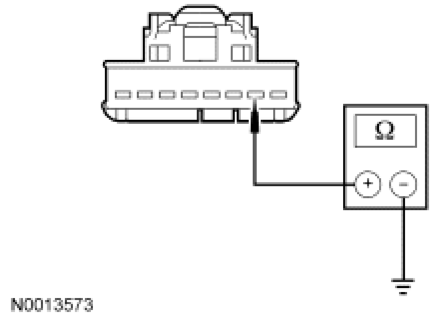

Fig. 121: Measuring Resistance
Courtesy of FORD MOTOR CO.

- **For Edge vehicles,** measure the resistance between memory SET switch C503-2, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to N5.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N5 CHECK CIRCUIT CPS55 (YE) FOR VOLTAGE

- Connect: DSM C3299c
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: Memory Recall Indicator LED (LED_STATE)

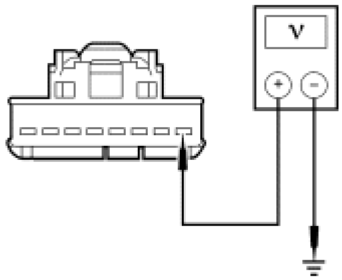

Fig. 122: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **For MKX vehicles,** measure the voltage between memory SET switch C503-1, circuit CPS55 (YE) harness side and ground while commanding the memory SET switch LED ON and OFF.

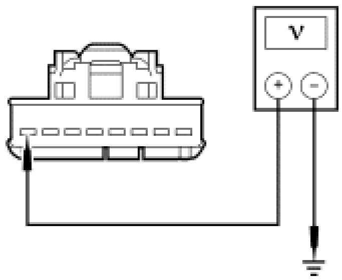

Fig. 123: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **For Edge vehicles,** measure the voltage between memory SET switch C503-8, circuit CPS55 (YE) harness side and ground while commanding the memory SET switch LED ON and OFF.
- **Is voltage present when the command is ON and no voltage present when command is OFF?**

  YES : INSTALL a new memory SET switch. REFER to **Memory Set Switch**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new DSM and CARRY OUT programmable module installation (PMI). REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N6 CHECK CIRCUIT CPS55 (YE) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Memory SET Switch C503

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

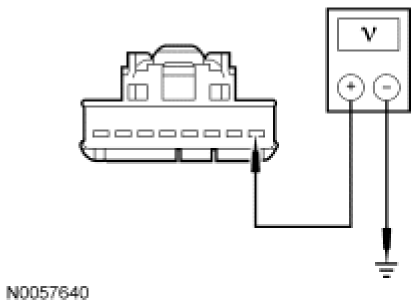

Fig. 124: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **For MKX vehicles,** measure the voltage between memory SET switch C503-1, circuit CPS55 (YE) harness side and ground.

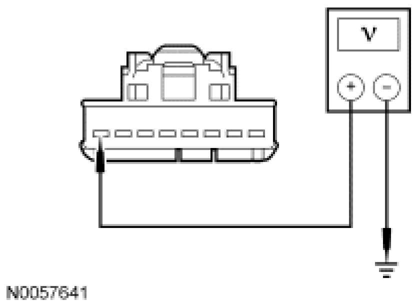

Fig. 125: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **For Edge vehicles,** measure the voltage between memory SET switch C503-8, circuit CPS55 (YE) harness side and ground.

- **Is voltage greater than 0.2 volt?**

  YES : Go to N7.

  NO : INSTALL a new memory SET switch. REFER to **Memory Set Switch**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N7 CHECK CIRCUIT CPS55 (YE) FOR SHORT TO VOLTAGE

- Disconnect: DSM C3299c

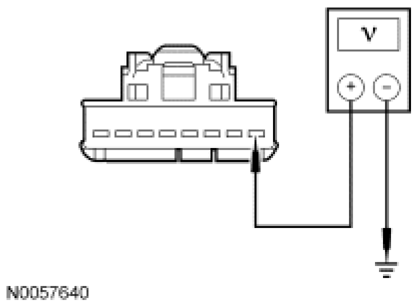

Fig. 126: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **For MKX vehicles,** measure the voltage between memory SET switch C503-1, circuit CPS55 (YE), harness side and ground.

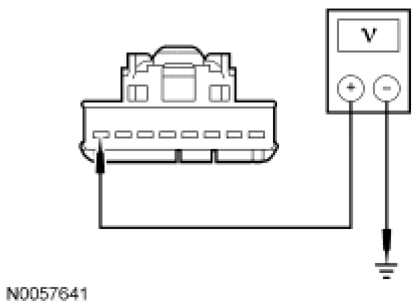

Fig. 127: Measuring Voltage
Courtesy of FORD MOTOR CO.

- **For Edge vehicles,** measure the voltage between memory SET switch C503-8, circuit CPS55 (YE), harness side and ground.
- **Is voltage greater than 0.2 volt?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new DSM and CARRY OUT PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test O: Easy Exit/Easy Entry is Inoperative/Does Not Operate Correctly

Normal Operation

The driver seat module (DSM) receives a key out command from the smart junction box (SJB) and a transmission range selection of park from the PCM, both coming over the medium-speed controller area network (MS-CAN) communication network and powers the memory driver seat rearward about 2 inches. When the ignition key is inserted, the memory driver seat goes back to its last known position.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Easy exit/easy entry not enabled
- Key-in-ignition warning switch
- Driver seat module (DSM)
- Missing controller area network (CAN) status information (CAN communication message):
  - ignition switch status
  - gear selector position

PINPOINT TEST O: EASY EXIT/EASY ENTRY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE:	**Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.**
NOTE:	**The transmission gear selector must be in park for the easy entry/exit feature to function.**
NOTE:	**Make sure all memory seat DTC and symptom based faults are corrected before proceeding with easy entry/exit diagnosis. Verify the PID(s) states agree with the ignition switch and transmission gear selector in all positions before proceeding with easy entry/exit diagnosis.**

O1 CHECK THE DRIVER POWER SEAT OPERATION

- Key in ON position.
- Check the message center to verify the easy entry/exit feature is enabled.
  - The easy entry/exit feature can be enabled/disabled using a scan tool in module programming. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's Literature or **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article for information on the message center.
- Using the seat control switch, verify the driver power seat operates fully forward and rearward.

NOTE: **During the Self-Test, each memory motor will be requested to move for one second. If a motor is near the end of travel, that position sensor feedback will not change as expected for one second resulting in a false DTC.**

- Place the memory seat and memory mirrors in central travel positions.
- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self Test/Driver Seat Module (DSM)/Retrieve DTCs
- **Are any DSM DTCs retrieved?**

  YES : REFER to the **Driver Seat Module (DSM) DTC Chart**.

  NO : If disabled, ENABLE the easy entry/exit feature with the message center. REFER to the Owner's Literature - Driver Controls for easy entry/exit feature enable/disable instructions. TEST the system for normal operation. If OK, INSTRUCT the customer on correct system operation.

  If easy entry/exit is enabled and the seat does not move horizontally from the seat control switch, go to **Pinpoint Test J** for MKX vehicles or Go to **Pinpoint Test L** for Edge vehicles.

  Otherwise, go to O2.

O2 CHECK DSM GEAR SELECTED (TRANSGEAR) PID STATES

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Driver Seat Module (DSM) PID: TRANSGEAR
- Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states:
  - D6_Park
  - REV
  - NTRL
  - DRIVE5
  - DRIVE1
- **Do the PID states agree with the selected positions?**

YES : Go to O3.

NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

O3 CHECK THE GENERIC ELECTRONIC MODULE (GEM/SJB) FOR CORRECT IGNITION SWITCH POSITION (IGN_SW) STATES

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/GEM/SJB PID: IGN_SW
- Insert and remove the ignition key into the ignition lock cylinder while monitoring the following DSM PID IGN_SW states:
  - Key In
  - KEY OUT
- Monitor the DSM ignition switch position PID with the ignition key in and with the key removed.
- **Do the DSM PID states agree?**

YES : INSTALL a new DSM and CARRY OUT programmable module installation (PMI). REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. REPEAT the self-test. CLEAR the DTCs.

NO : To diagnose the key-in-ignition warning switch fault, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES** article.

Pinpoint Test P: The Power Lumbar is Inoperative - Driver

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Memory Seats for schematic and connector information.

Normal Operation

The seat control switch is powered by battery voltage on circuit SBP12 (GN/RD) and is supplied ground on circuit GD133 (BK). When the lumbar knob on the seat control switch is pressed, voltage and ground are supplied to the power lumbar motor. When pressing the lumbar knob in the opposite direction, the seat control switch reverses the polarity to the power lumbar motor, which moves the lumbar mechanism in the opposite direction.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Power lumbar motor assembly

PINPOINT TEST P: THE POWER LUMBAR IS INOPERATIVE - DRIVER

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**
NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of**

faults before releasing the vehicle to the customer.

P1 CHECK CIRCUIT SBP12 (GN/RD) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Seat Control Switch C3016

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Measure the voltage between seat control switch C3016-5, circuit SBP12 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to P2.

  NO : VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

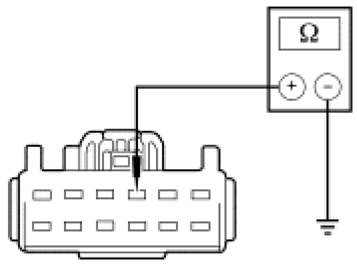

Fig. 128: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3016-3, circuit GD133 (BK), harness side and ground.

- **Is the resistance less than 5 ohms?**

  YES : Go to P3.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P3 CHECK THE LUMBAR MOTOR

- Connect: Seat Control Switch C3016
- Disconnect: Power Lumbar Motor C3215

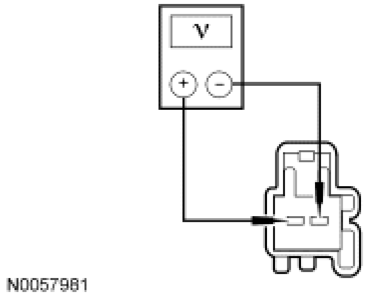

Fig. 129: Measuring Voltage
Courtesy of FORD MOTOR CO.

- While operating the seat control switch in both directions, measure the voltage between power lumbar motor C3215-1, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-2, circuit CPS19 (GY/VT), harness side.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new power lumbar assembly. REFER to **Lumbar Assembly - Power**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to P4.

P4 CHECK CIRCUIT CPS19 (GY/VT) AND CIRCUIT CPS18 (BN/GN) FOR A SHORT TO GROUND

- Disconnect: Seat Control Switch C3016

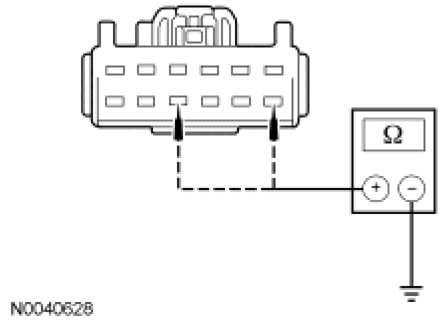

Fig. 130: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3016-10, circuit CPS18 (BN/GN), harness side and ground; and between seat control switch C3016-7, circuit CPS19 (GY/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms.**

YES : Go to P5.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P5 CHECK CIRCUIT CPS19 (GY/VT) AND CPS18 (BN/GN) FOR AN OPEN

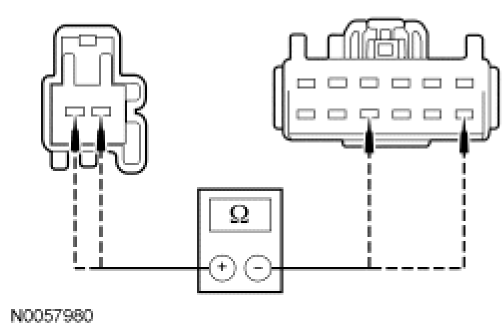

Fig. 131: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3016-10, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-1, circuit CPS18 (BN/GN), harness side; and between seat control switch C3016-7, circuit CPS19 (GY/VT), harness side and power lumbar motor C3215-2, circuit CPS19 (GY/VT), harness side.
- **Are the resistances less than 5 ohms?**

YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test Q: The Power Lumbar is Inoperative - Passenger

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The seat control switch is powered by battery voltage on circuit SBB61 (GY/RD) and is supplied ground on circuit GD145 (BK/BU). When the lumbar knob on the seat control switch is pressed, voltage and ground are supplied to the power lumbar motor. When pressing the lumbar knob in the opposite direction, the seat control switch reverses the polarity to the power lumbar motor, which moves the lumbar mechanism in the opposite direction.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Lumbar control switch
- Power lumbar motor assembly

PINPOINT TEST Q: THE POWER LUMBAR IS INOPERATIVE - PASSENGER

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

Q1 CHECK CIRCUIT SBB61 (GY/RD) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the**

battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Disconnect: Seat Control Switch C3026
- Measure the voltage between seat control switch C3026-5 , circuit SBB61 (GY/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to Q2.

  NO : VERIFY battery junction box (BJB) fuse 61 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Q2 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN

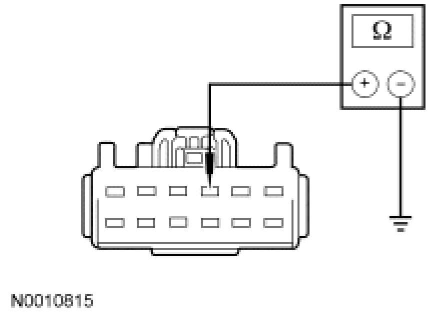

Fig. 132: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3026-3, circuit GD145 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to Q3.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Q3 CHECK THE LUMBAR MOTOR

- Connect: Seat Control Switch C3026

- Disconnect: Power Lumbar Motor C3216

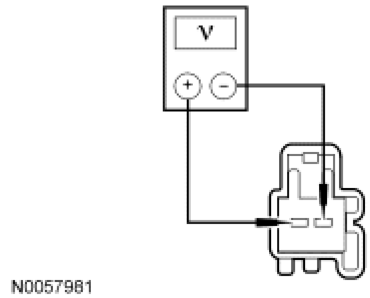

Fig. 133: Measuring Voltage
Courtesy of FORD MOTOR CO.

- While operating the seat control switch in both directions, measure the voltage between power lumbar motor C3216-1, circuit CPS20 (VT), harness side and power lumbar motor C3216-2, circuit CPS21 (WH/OG), harness side.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new power lumbar assembly. REFER to **Lumbar Assembly - Power**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to Q4.

Q4 CHECK CIRCUIT CPS20 (VT) AND CIRCUIT CPS21 (WH/OG) FOR A SHORT TO GROUND

- Disconnect: Seat Control Switch C3026

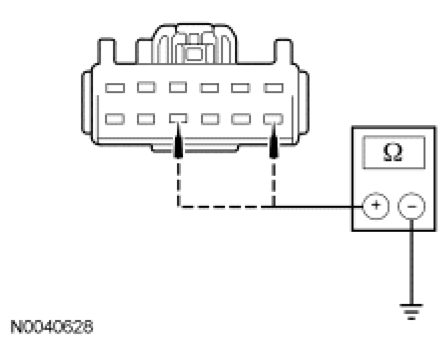

Fig. 134: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3026-10, circuit CPS20 (VT), harness side and ground; and between seat control switch C3026-7, circuit CPS21 (WH/OG), harness side and ground.

- **Are the resistances greater than 10,000 ohms.**

  YES : Go to Q5.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Q5 CHECK CIRCUIT CPS20 (VT) AND CIRCUIT CPS21 (WH/OG) FOR AN OPEN

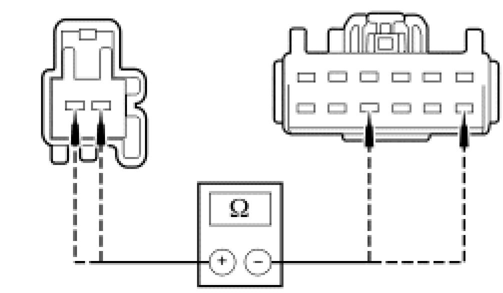

Fig. 135: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3026-10, circuit CPS20 (VT), harness side and power lumbar motor C3216-1, circuit CPS20 (VT), harness side; and between seat control switch C3026-7, circuit CPS21 (WH/OG), harness side and power lumbar motor C3216-2, circuit CPS21 (WH/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test R: The Heated Seats are Inoperative - Front

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and

connector information.

Normal Operation

The heated seat module receives ignition voltage on circuit CBP35 (YE/GY), battery voltage on circuit SBB16 (VT/RD) and is supplied ground on circuit GD133 (BK). When ignition switched voltage is supplied and the driver or passenger heated seat button on the HVAC module is pressed, a momentary ground signal is sent to the heated seat module to command the system ON or OFF. Upon receiving a signal, the heated seat module will decrease one setting (the sequence is hi, lo, OFF, hi, etc.). The heated seat module supplies voltage to the cushion and backrest heater mats, which are connected in series and operate together. A separate ground to the heater mats is provided on the backrest heater mat. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor and monitors the return signal from the temperature sensor for controlling current flow to the heater mats. The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF from the HVAC module or the ignition switch is turned OFF.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Heated seat module

PINPOINT TEST R: THE HEATED SEATS ARE INOPERATIVE - FRONT

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

R1 CHECK THE VOLTAGE TO THE HEATED SEAT MODULE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Heated Seat Module C329

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

- Key in ON position.

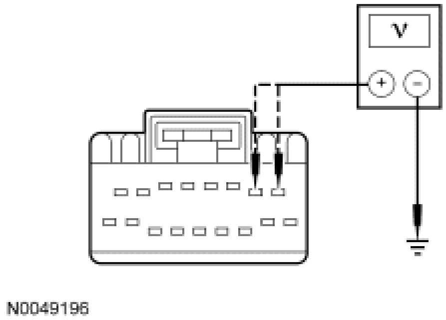

Fig. 136: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C329-2, circuit CBP35 (YE/GY), harness side and ground; and between heated seat module C329-1, circuit SBB16 (VT/RD), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to R2.

  NO : VERIFY battery junction box (BJB) fuse 16 (30A) and smart junction box (SJB) fuse 35 (10A) are OK. If OK, REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

R2 CHECK THE HEATED SEAT MODULE GROUND

- Key in OFF position.

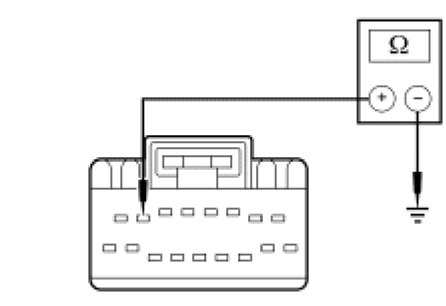

Fig. 137: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C329-7, circuit GD133 (BK), harness side and

ground.

- **Is the resistance less than 5 ohms?**

  YES : Go to R3.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

R3 CHECK THE SENSOR RETURN CIRCUIT FOR SHORT TO VOLTAGE

- Key in ON position.

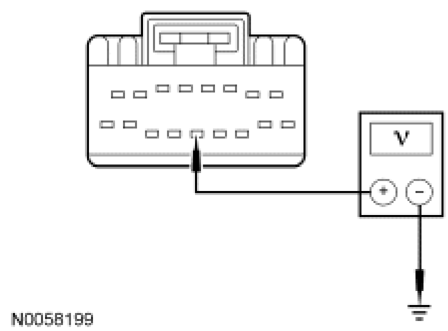

Fig. 138: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C329-13, circuit RHS05 (YE/VT), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to R4.

R4 CHECK THE SENSOR RETURN CIRCUIT FOR SHORT TO GROUND

- Key in OFF position.

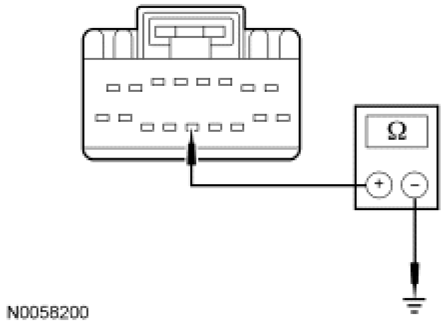

Fig. 139: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C329-13, circuit RHS05 (YE/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to R5.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

R5 CHECK THE SENSOR RETURN CIRCUIT FOR AN OPEN

- Disconnect: Passenger Heated Seat C3284

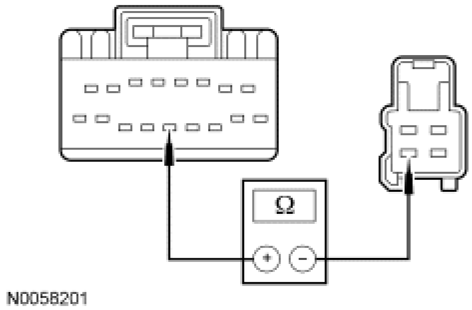

Fig. 140: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C329-13, circuit RHS05 (YE/VT), harness side and passenger heated seat C3284-3, circuit RHS05 (YE/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R6.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

R6 CHECK THE HEATED SEAT GROUND

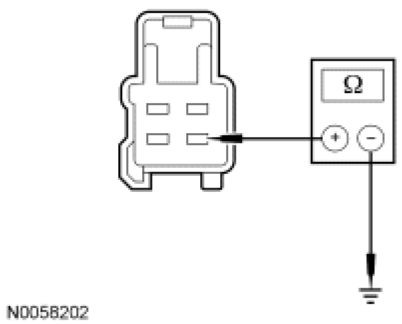

Fig. 141: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat C3284-4, circuit GD145 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test S: The Heated Seat is Inoperative/Does Not Operate Correctly - Driver

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

The heated seat module receives ignition voltage on circuit CBP35 (YE/GY), battery voltage on circuit SBB16 (VT/RD) and is supplied ground on circuit GD133 (BK). When ignition switched voltage is supplied and the driver heated seat button on the HVAC module is pressed, a momentary ground signal is sent to the heated seat module on circuit CHS29 (WH/BU) to command the system ON or OFF. Upon receiving a signal, the heated seat module will decrease one setting (the sequence is hi, lo, OFF, hi, etc.). The heated seat module supplies voltage to the cushion and backrest heater mats on circuit CHS02 (YE/BU). Ground to the heater mats is provided on circuit GD145 (BK/BU). The cushion and backrest heater mats are connected in series and operate together. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor on circuit RHS05 (YE/VT) and monitors the signal from the temperature sensor on circuit VHS26 (VT) for controlling current flow to the heater mats. The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF from the HVAC module or the ignition switch is turned OFF.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Heater mat
- Heated seat module
- HVAC module

PINPOINT TEST S: THE HEATED SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - DRIVER

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

S1 CHECK CIRCUIT SBB16 (VT/RD) FOR VOLTAGE TO THE HEATED SEAT MODULE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Heated Seat Module C329

WARNING:	**Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the**

battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

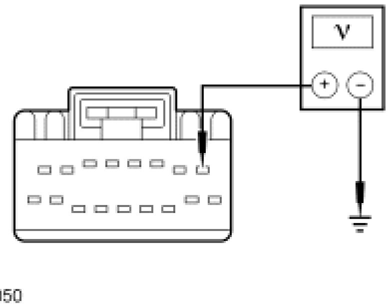

Fig. 142: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C329-1, circuit SBB16 (VT/RD) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to S2.

  NO : VERIFY battery junction box (BJB) fuse 16 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S2 CHECK CIRCUIT CHS02 (YE/BU) FOR AN OPEN OR SHORT TO GROUND

- Disconnect: Driver Cushion Heater Mat C3283

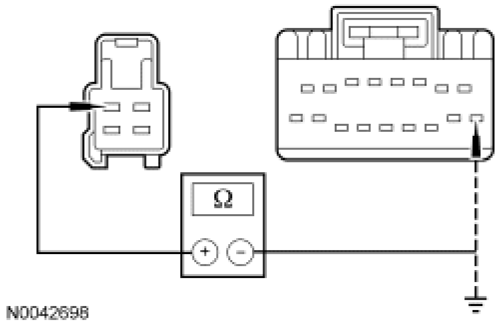

Fig. 143: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat cushion heater mat C3283-1, circuit CHS02 (YE/BU), harness side and ground; and between C3283-1, circuit CHS02 (YE/BU), harness side and heated seat module C329-9, circuit CHS02 (YE/BU) harness side.
- **Is the resistance greater than 10,000 ohms between the driver seat cushion heater mat and ground; and less than 5 ohms between the driver seat cushion heater mat and the heated seat module?**

  YES : Go to S3.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S3 CHECK CIRCUIT VHS26 (VT) FOR AN OPEN OR SHORT TO GROUND

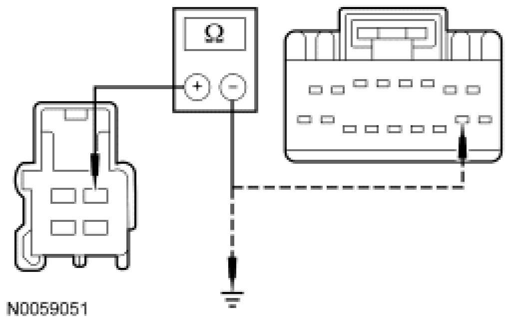

Fig. 144: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat cushion heater mat C3283-2, circuit VHS26 (VT), harness side and ground; and between C3283-2, circuit VHS26 (VT), harness side and heated seat module C329-10, circuit VHS26 (VT) harness side.

- **Is the resistance greater than 10,000 ohms between the driver seat cushion heater mat and ground and less than 5 ohms between the driver seat cushion heater mat and the heated seat module?**

  YES : Go to S4.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S4 CHECK CIRCUIT RHS05 (YE/VT) FOR AN OPEN OR SHORT TO GROUND

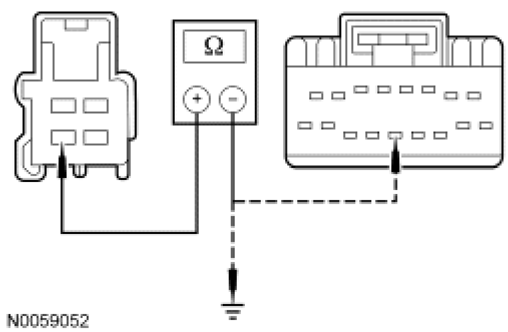

Fig. 145: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat cushion heater mat C3283-3, circuit RHS05 (YE/VT), harness side and ground; and between C3283-3, circuit RHS05 (YE/VT), harness side and heated seat module C329-13, circuit RHS05 (YE/VT) harness side.
- **Is the resistance greater than 10,000 ohms between the driver seat cushion heater mat and ground and less than 5 ohms between the driver seat cushion heater mat and the heated seat module?**

  YES : Go to S5.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S5 CHECK CIRCUITS CHS02 (YE/BU), VHS26 (VT) AND RHS05 (YE/VT) FOR SHORT TO VOLTAGE

- Key in ON position.

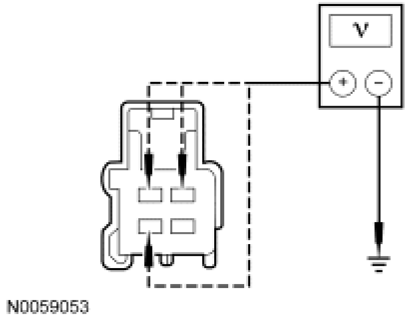

Fig. 146: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following driver seat cushion heater mat C3283 pins, harness side and ground:

Connector - Pin	Circuit
C3283-1	CHS02 (YE/BU)
C3283-2	VHS26 (VT)
C3283-3	RHS05 (YE/VT)

- **Is the voltage less than 0.2 volt?**

  YES : Go to S6.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S6 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN

- Key in OFF position.

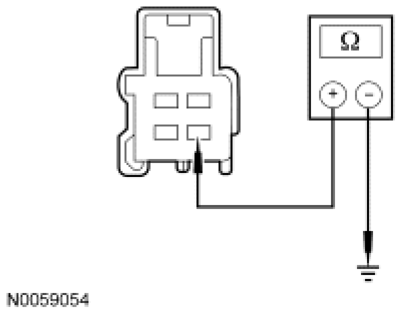

Fig. 147: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat cushion heater mat C3283-4, circuit GD145 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to S7.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S7 CHECK CUSHION AND BACKREST HEATER MAT AND SENSOR FOR SHORT TO VOLTAGE

- Key in ON position.

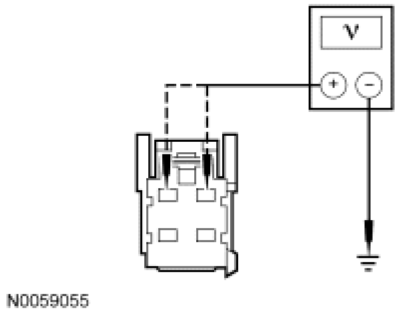

Fig. 148: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat cushion heater mat C3283 pin 1, component side and ground; and between driver seat cushion heater mat C3283 pin 2, component side and ground.

- **Is the voltage less than 0.2 volt?**

  YES : Go to S8.

  NO : REPAIR the circuit. INSTALL a new affected cushion or backrest heater mat. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S8 CHECK CUSHION HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Driver Seat Cushion Heater Mat to Driver Seat Backrest Heater Mat Connector

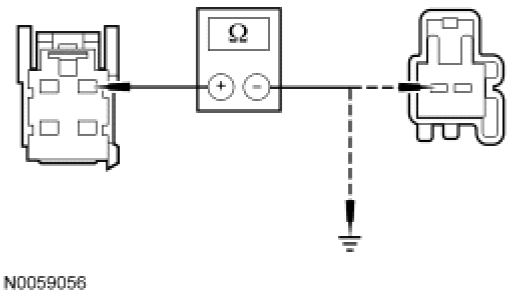

Fig. 149: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat cushion heater mat C3283 pin 1, component side and ground; and between driver seat cushion heater mat C3283 pin 1, component side and driver seat cushion heater mat to driver seat backrest heater mat connector pin 1, cushion side.
- **Is the resistance greater than 10,000 ohms between the driver seat cushion heater mat and ground; and between 1.4 and 2.2 ohms between the driver seat cushion heater mat to driver seat backrest heater mat?**

  YES : Go to S9.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S9 CHECK BACKREST HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

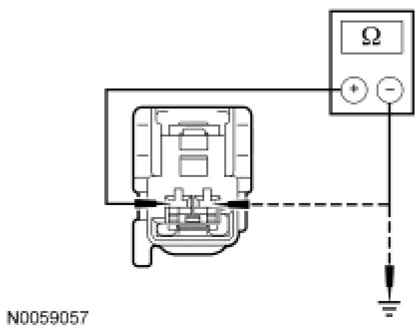

Fig. 150: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat backrest heater mat connector pin 2, component side and ground; and between driver seat backrest heater mat connector pin 1 and pin 2, component side.
- **Is the resistance greater than 10,000 ohms between the driver seat backrest heater mat and ground; and between 1.4 and 2.2 ohms between the driver seat backrest heater mat pins?**

  YES : Go to S10.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S10 CHECK CIRCUIT BETWEEN BACKREST AND CUSHION HEATER MAT

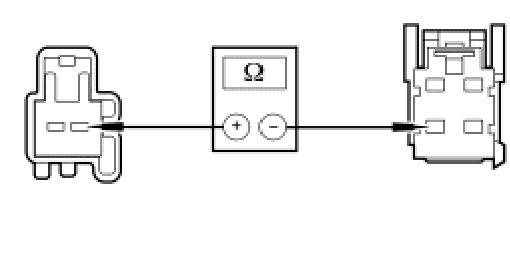

Fig. 151: Measuring Resistance

Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat cushion heater mat C3283 pin 4, component side and driver seat cushion heater mat to driver seat backrest heater mat connector pin 2, cushion side.
- **Is the resistance less than 5 ohms?**

  YES : Go to S11.

  NO : INSTALL a new seat cushion heater mat. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S11 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR AN OPEN OR SHORT TO GROUND

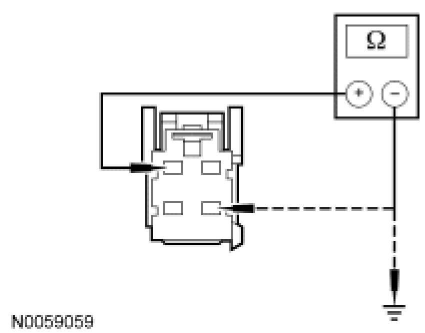

Fig. 152: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat cushion heater mat C3283 pin 2 and pin 3, component side; and between driver seat cushion heater mat C3283 pin 2, component side and ground.
- **Is the resistance less than 375,000 ohms and greater than 50 ohms between driver seat cushion heater mat pins; and greater than 10,000 ohms between driver seat cushion heater mat and ground?**

  YES : Go to S12.

  NO : INSTALL a new seat cushion heater mat. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S12 CHECK CIRCUIT CHS29 (WH/BU) FOR A SHORT TO VOLTAGE

- Disconnect: HVAC Module C228b
- Key in ON position.

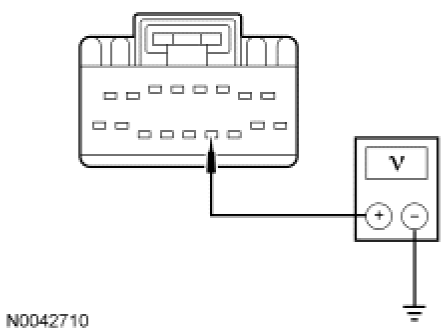

Fig. 153: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C329-12, circuit CHS29 (WH/BU), harness side and ground.
- **Is the voltage less than 0.2 volt?**

YES : Go to S13.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S13 CHECK CIRCUIT CHS29 (WH/BU) FOR A SHORT TO GROUND

- Key in OFF position.

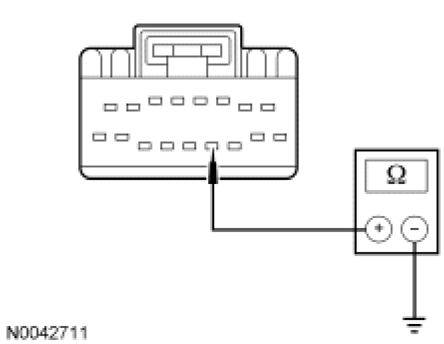

Fig. 154: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C329-12, circuit CHS29 (WH/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to S14.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S14 CHECK CIRCUIT CHS29 (WH/BU) FOR AN OPEN

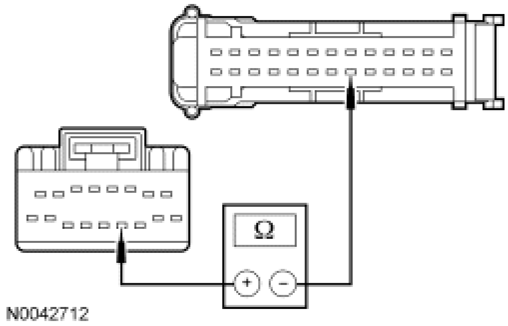

Fig. 155: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C329-12, circuit CHS29 (WH/BU), harness side and HVAC module C228b-6, circuit CHS29 (WH/BU), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to S15.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S15 CHECK THE HVAC MODULE OUTPUT

- Connect: HVAC Module C228b
- Connect: Heated Seat Module C329
- Key in ON position.

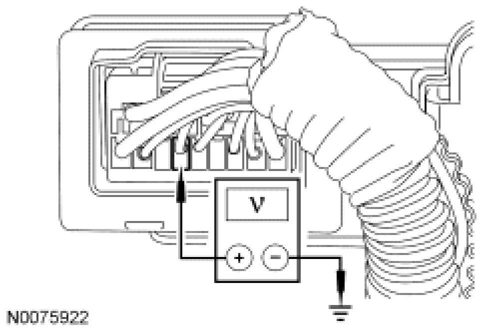

Fig. 156: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE:	**The following measurement must be taken by back-probing the heated seat module C329.**

NOTE:	**The voltage on circuit CHS29 (WH/BU) should drop momentarily when the driver heated seat control button is pressed.**

- Measure the voltage between heated seat module C329-12, circuit CHS29 (WH/BU), harness side and ground by back-probing heated seat module connector. Press the driver heated seat control button on the HVAC module and note the voltage.
- **Is the voltage greater than 10 volts before pressing the driver heated seat control button, then momentarily drops when the heated seat control button is pressed?**

YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : If the voltage is greater than 10 volts but did not drop when the driver heated seat button was pressed, INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

If the voltage is less than 10 volts, INSTALL a new heated seat module. REFER to **Heated Seat**

Module - Front. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test T: The Heated Seat is Inoperative/Does Not Operate Correctly - Front Passenger

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

The heated seat module receives ignition voltage on circuit CBP35 (YE/GY), battery voltage on circuit SBB16 (VT/RD) and is supplied ground on circuit GD133 (BK). When ignition switched voltage is supplied and the driver heated seat button on the HVAC module is pressed, a momentary ground signal is sent to the heated seat module on circuit CHS30 (GY/YE) to command the system ON or OFF. Upon receiving a signal, the heated seat module will decrease one setting (the sequence is hi, lo, OFF, hi, etc.). The heated seat module supplies voltage to the cushion and backrest heater mats on circuit CHS07 (GY/BU). Ground to the heater mats is provided on circuit GD145 (BK/BU). The cushion and backrest heater mats are connected in series and operate together. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor on circuit RHS05 (YE/VT) and monitors the signal from the temperature sensor on circuit VHS27 (WH/OG) for controlling current flow to the heater mats. The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF from the HVAC module or the ignition switch is turned OFF.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Heater mat
- Heated seat module
- HVAC module

PINPOINT TEST T: THE HEATED SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - PASSENGER

T1 CHECK CIRCUIT SBB16 (VT/RD) FOR VOLTAGE TO THE HEATED SEAT MODULE

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and**

free of faults before releasing the vehicle to the customer.

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: Heated Seat Module C329

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

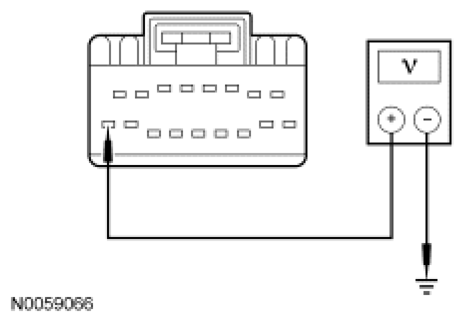

Fig. 157: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C329-17, circuit SBB16 (VT/RD) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to T2.

  NO : VERIFY battery junction box (BJB) fuse 16 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T2 CHECK CIRCUIT CHS07 (GY/BU) FOR AN OPEN OR SHORT TO GROUND

- Disconnect: Passenger Cushion Heater Mat C3284

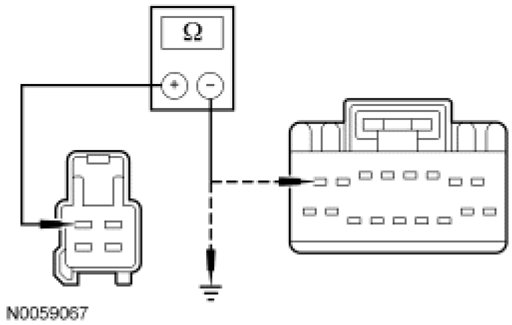

Fig. 158: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat cushion heater mat C3284-1, circuit CHS07 (GY/BU), harness side and ground; and between C3284-1, circuit CHS07 (GY/BU), harness side and heated seat module C329-8, circuit CHS07 (GY/BU) harness side.
- **Is the resistance greater than 10,000 ohms between the passenger seat cushion heater mat and ground; and less than 5 ohms between the passenger seat cushion heater mat and the heated seat module?**

  YES : Go to T3.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T3 CHECK CIRCUIT VHS27 (WH/OG) FOR AN OPEN OR SHORT TO GROUND

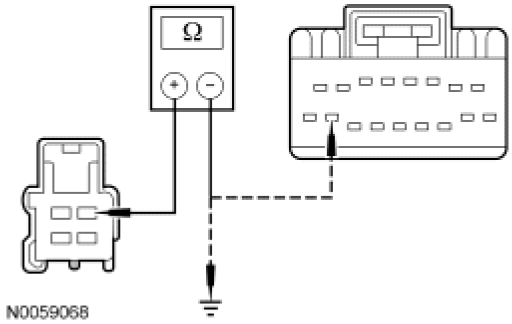

Fig. 159: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat cushion heater mat C3284-2, circuit VHS27 (WH/OG), harness side and ground; and between C3284-2, circuit VHS27 (WH/OG), harness side and heated seat module C329-16, circuit VHS27 (WH/OG) harness side.

- **Is the resistance greater than 10,000 ohms between the passenger seat cushion heater mat and ground; and less than 5 ohms between the passenger seat cushion heater mat and the heated seat module?**

  YES : Go to T4.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T4 CHECK CIRCUIT RHS05 (YE/VT) FOR AN OPEN OR SHORT TO GROUND

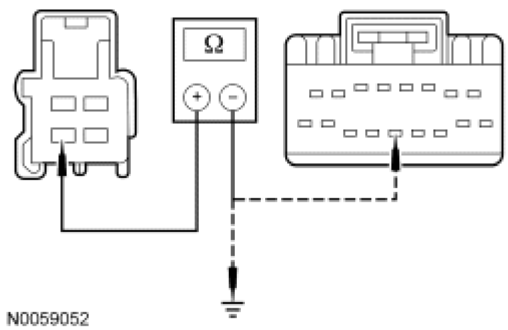

Fig. 160: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat cushion heater mat C3284-3, circuit RHS05 (YE/VT), harness side and ground; and between C3284-3, circuit RHS05 (YE/VT), harness side and heated seat module C329-13, circuit RHS05 (YE/VT) harness side.
- **Is the resistance greater than 10,000 ohms between the passenger seat cushion heater mat and ground; and less than 5 ohms between the passenger seat cushion heater mat and the heated seat module?**

  YES : Go to T5.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T5 CHECK CIRCUITS CHS07 (GY/BU), VHS27 (WH/OG) AND RHS05 (YE/VT) FOR SHORT TO VOLTAGE

- Key in ON position.

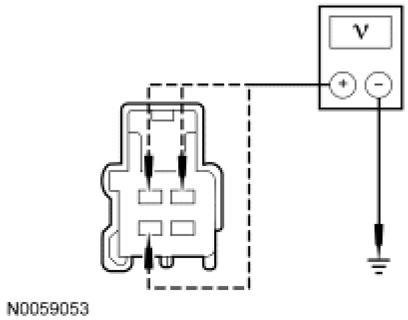

Fig. 161: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following passenger seat cushion heater mat C3284 pins, harness side and ground:

Connector - Pin	Circuit
C3284-1	CHS07 (GY/BU)
C3284-2	VHS27 (WH/OG)
C3284-3	RHS05 (YE/VT)

- **Is the voltage less than 0.2 volt?**

  YES : Go to T6.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T6 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN

- Key in OFF position.

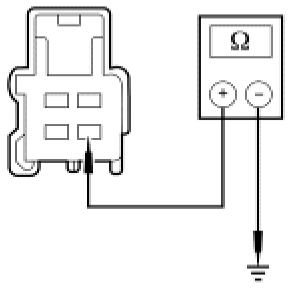

Fig. 162: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat cushion heater mat C3284-4, circuit GD145 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to T7.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T7 CHECK CUSHION AND BACKREST HEATER MAT AND SENSOR FOR SHORT TO VOLTAGE

- Key in ON position.

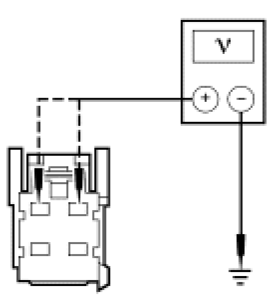

Fig. 163: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat cushion heater mat C3284 pin 1, component side and ground; and between passenger seat cushion heater mat C3284 pin 2, component side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to T8.

NO : REPAIR the circuit. INSTALL a new affected cushion or backrest heater mat. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T8 CHECK CUSHION HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Passenger Seat Cushion Heater Mat to Passenger Seat Backrest Heater Mat Connector

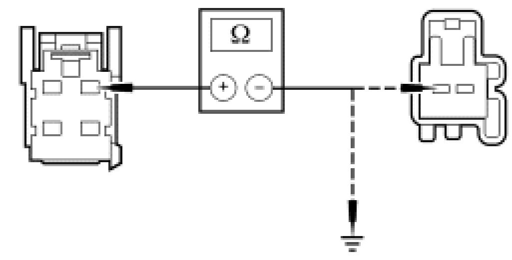

Fig. 164: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat cushion heater mat C3284 pin 1, component side and ground; and between passenger seat cushion heater mat C3284 pin 1, component side and passenger seat cushion heater mat to passenger seat backrest heater mat connector pin 1, cushion side.
- **Is the resistance greater than 10,000 ohms between the passenger seat cushion heater mat and ground; and between 1.4 and 2.2 ohms between the passenger seat cushion heater mat and passenger seat cushion heater mat to passenger seat backrest heater mat?**

YES : Go to T9.

NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T9 CHECK BACKREST HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

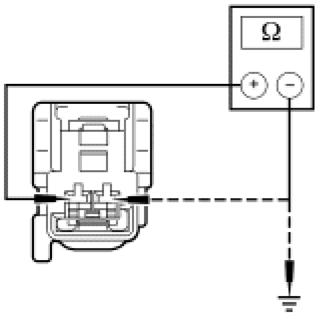

Fig. 165: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat backrest heater mat connector pin 2, component side and ground; and between passenger seat backrest heater mat connector pin 1 and pin 2, component side.
- **Is the resistance greater than 10,000 ohms between the passenger seat backrest heater mat and ground; and between 1.4 and 2.2 ohms between the passenger seat backrest heater mat pins?**

  YES : Go to T10.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T10 CHECK CIRCUIT BETWEEN BACKREST AND CUSHION HEATER MAT

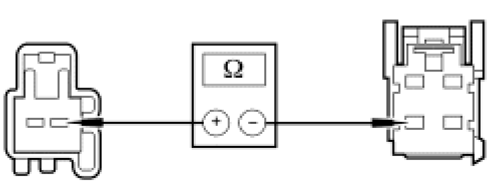

Fig. 166: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat cushion heater mat C3284 pin 4, component side and passenger seat cushion heater mat to passenger seat backrest heater mat connector pin 2, cushion side.

- **Is the resistance less than 5 ohms?**

  YES : Go to T11.

  NO : INSTALL a new seat cushion heater mat. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T11 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR AN OPEN OR SHORT TO GROUND

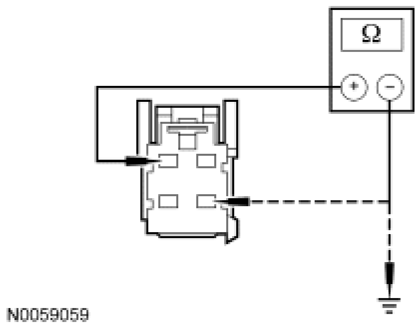

Fig. 167: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat cushion heater mat C3284 pin 2 and pin 3, component side; and between passenger seat cushion heater mat C3284 pin 2, component side and ground.
- **Is the resistance less than 375,000 ohms and greater than 50 ohms between passenger seat cushion heater mat pins; and greater than 10,000 ohms between passenger seat cushion heater mat and ground?**

  YES : Go to T12.

  NO : INSTALL a new seat cushion heater mat. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T12 CHECK CIRCUIT CHS30 (GY/YE) FOR A SHORT TO VOLTAGE

- Disconnect: HVAC Module C228b
- Key in ON position.

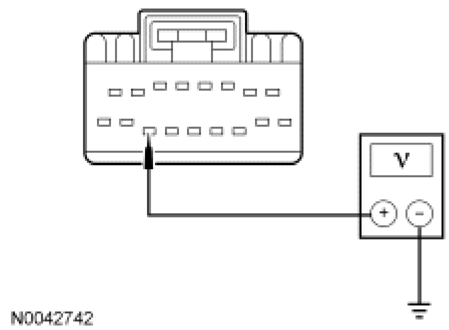

Fig. 168: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C329-15, circuit CHS30 (GY/YE), harness side and ground.
- **Is the voltage less than 0.2 volt?**

YES : Go to T13.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T13 CHECK CIRCUIT CHS30 (GY/YE) FOR A SHORT TO GROUND

- Key in OFF position.

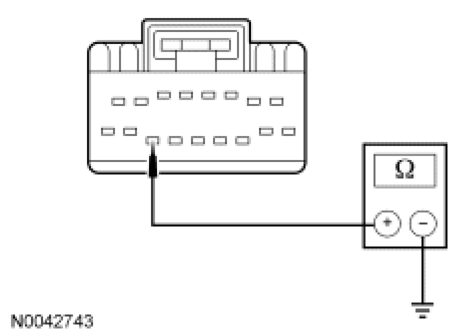

Fig. 169: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C329-15, circuit CHS30 (GY/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to T14.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T14 CHECK CIRCUIT CHS30 (GY/YE) FOR AN OPEN

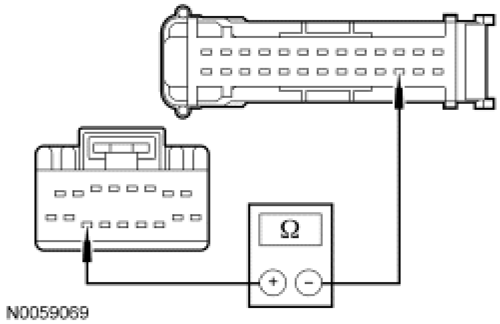

Fig. 170: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C329-15, circuit CHS30 (GY/YE), harness side and HVAC module C228b-3, circuit CHS30 (GY/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T15.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T15 CHECK THE HVAC MODULE OUTPUT

- Connect: HVAC Module C228b
- Connect: Heated Seat Module C329
- Key in ON position.

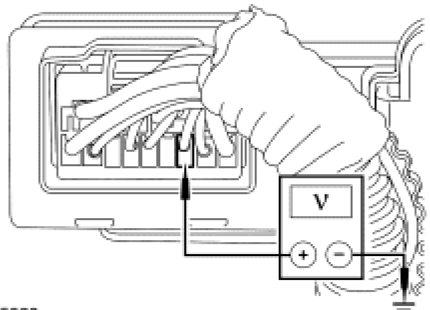

Fig. 171: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE:	**The following measurement must be taken by back-probing the heated seat module C329.**

NOTE:	**The voltage on circuit CHS30 (GY/YE) should drop momentarily when the passenger heated seat control button is pressed.**

- Measure the voltage between passenger heated seat module C329-15, circuit CHS30 (GY/YE), harness side and ground by back-probing heated seat module connector. Press the passenger heated seat control button on the HVAC module and note the voltage.
- **Is the voltage greater than 10 volts before pressing the passenger heated seat control button, then momentarily drops when the heated seat control button is pressed?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the voltage is greater than 10 volts but did not drop when the passenger heated seat button was pressed, INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  If the voltage is less than 10 volts, INSTALL a new heated seat module. REFER to **Heated Seat Module - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test U: The Heated Seat is Inoperative - Driver Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Upon receiving a signal from the HVAC module, the heated seat module will decrease one setting (the sequence is hi, lo, OFF, hi, etc.). When the driver heated seat is set to hi, both LED indicators above the driver heated seat control button will illuminate. When the driver heated seat is set to lo, only the left LED on the driver heated seat indicator will illuminate. When the driver heated seat is set to OFF, neither driver heated seat LED will illuminate.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module
- HVAC module

PINPOINT TEST U: THE HEATED SEAT IS INOPERATIVE - DRIVER SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

U1 CHECK CIRCUITS CHS04 (YE/GY) AND CHS13 (VT/BN) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: HVAC Module C228b
- Disconnect: Heated Seat Module C329

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

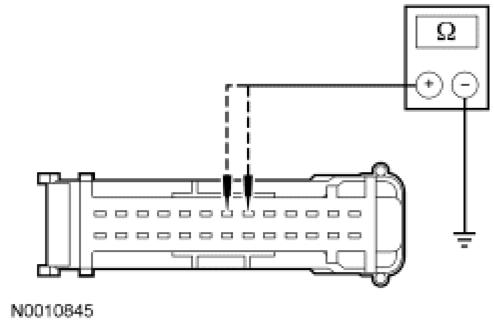

Fig. 172: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module C228b-7, circuit CHS04 (YE/GY), harness side and ground; and between HVAC module C228b-8, circuit CHS13 (VT/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to U2.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

U2 CHECK CIRCUITS CHS04 (YE/GY) AND CHS13 (VT/BN) FOR AN OPEN

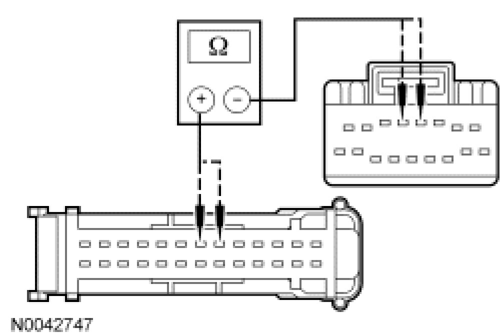

Fig. 173: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module C228b-7, circuit CHS04 (YE/GY), harness side and heated seat module C329-5, circuit CHS04 (YE/GY), harness side; and between HVAC module C228b-8, circuit CHS13 (VT/BN), harness side and heated seat module C329-4, circuit CHS13 (VT/BN), harness side.
- **Are the resistances less than 5 ohms?**

YES : Go to U3.

NO : REPAIR the affected circuit. TEST the system for normal operation.

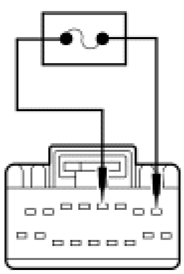
DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

U3 CHECK THE HEATED SEAT MODULE HI INDICATOR ON THE HVAC MODULE

- Connect: HVAC Module C228b
- Key in ON position.



N0042749

Fig. 174: Checking Heated Seat Module HI Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C329-4, circuit CHS13 (VT/BN), harness side and C329-1, circuit SBB16 (VT/RD), harness side.
- **Does the right driver heated seat indicator LED illuminate on the HVAC module?**

YES : Go to U4.

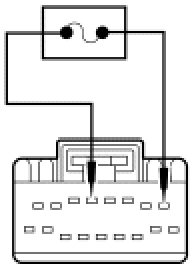
NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

U4 CHECK THE HEATED SEAT MODULE LOW INDICATOR ON THE HVAC MODULE



N0042750

Fig. 175: Checking Heated Seat Module Low Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C329-5, circuit CHS04 (YE/GY), harness side and C329-1, circuit SBB16 (VT/RD), harness side.
- **Does the left driver heated seat indicator LED illuminate on the HVAC module?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Front**. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test V: The Heated Seat is Inoperative - Front Passenger Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Upon receiving a signal from the HVAC module, the heated seat module will decrease one setting (the sequence is hi, lo, OFF, hi, etc.). When the passenger heated seat is set to hi, both LED indicators above the passenger heated seat control button will illuminate. When the passenger heated seat is set to lo, only the left LED on the passenger heated seat indicator will illuminate. When the passenger heated seat is set to OFF, neither passenger heated seat LED will illuminate.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module
- HVAC module

PINPOINT TEST V: THE HEATED SEAT IS INOPERATIVE - FRONT PASSENGER SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

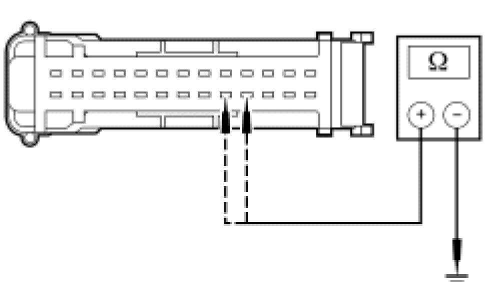
NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

V1 CHECK CIRCUITS CHS09 (GY) AND CHS14 (GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: HVAC Module C228b
- Disconnect: Heated Seat Module C329

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.



N0059077

Fig. 176: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module C228b-4, circuit CHS09 (GY), harness side and ground; and between HVAC module C228b-5, circuit CHS14 (GN), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to V2.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V2 CHECK CIRCUITS CHS09 (GY) AND CHS14 (GN) FOR AN OPEN

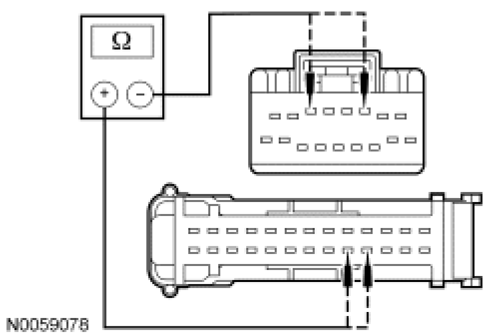


Fig. 177: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module C228b-4, circuit CHS09 (GY), harness side and heated seat module C329-3, circuit CHS09 (GY), harness side; and between HVAC module C228b-5, circuit CHS14 (GN), harness side and heated seat module C329-6, circuit CHS14 (GN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to V3.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

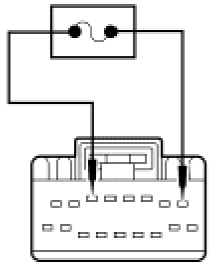
  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V3 CHECK THE HEATED SEAT MODULE HI INDICATOR ON THE HVAC MODULE

- Connect: HVAC Module C228b
- Key in ON position.



N0042754

Fig. 178: Checking Heated Seat Module HI Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C329-6, circuit CHS14 (GN), harness side and C329-1, circuit SBB16 (VT/RD), harness side.
- **Does the right passenger heated seat indicator LED illuminate on the HVAC module?**

  YES : Go to V4.

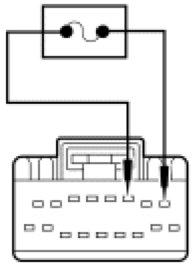
  NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V4 CHECK THE HEATED SEAT MODULE LOW INDICATOR ON THE HVAC MODULE



N0042755

Fig. 179: Checking Heated Seat Module Low Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between passenger heated seat module C329-3, circuit CHS09 (GY), harness side and C329-1, circuit SBB16 (VT/RD), harness side.
- **Does the left passenger heated seat indicator LED illuminate on the HVAC module?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Front**. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test W: The Heated Seats are Inoperative - Rear

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

The heated seat module receives battery voltage on circuit SBB07 (WH/RD) and ignition voltage on circuit CBP35 (YE/GY), and is supplied ground on circuit GD133 (BK). When the left rear heated seat control switch is pressed with the ignition switch in RUN or START, a ground is supplied on circuit CHS46 (YE/GN) to command the system ON or OFF in hi heat mode or circuit CHS47 (VT/GN) to command the system ON or OFF in low heat mode. When the right rear heated seat control switch is pressed with the ignition switch in RUN or START, a ground is supplied on circuit CHS50 (BU/GY) to command the system ON or OFF in hi heat mode or circuit CHS51 (YE/GY) to command the system ON or OFF in low heat mode. When commanded ON, voltage is supplied to the heated seat switch from the heated seat module on either circuit CHS48 (YE) (left rear) or CHS52 (BU) (right rear) (hi heat mode); or circuit CHS49 (VT) (left rear) or CHS53 (WH/BN) (right rear) (low heat mode) illuminating the switch indicator. The heated seat module also supplies voltage to the cushion and backrest heater mats on circuit CHS39 (GN/BU) (left rear) or CHS43 (GY/BU) (right rear) and ground to the heater mats on circuit GD126 (BK/WH) (left rear) or GD151 (BK/GN) (right rear). The cushion and backrest heater mats are connected in series and operate together. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module monitors the temperature sensors on circuit VHS42 (GN) (left rear) or VHS45 (GY/BN) (right rear) for adjusting the current flow to the heater mats and uses a ground supplied on circuit RHS41 (GN/BN). The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF or the ignition voltage is switched OFF.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Heated seat module

PINPOINT TEST W: THE HEATED SEATS ARE INOPERATIVE - REAR

W1 CHECK THE VOLTAGE TO THE HEATED SEAT MODULE

- Disconnect: Heated Seat Module C3162
- Key in ON position.

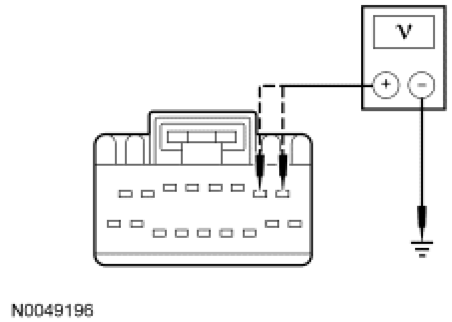


Fig. 180: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3162-2, circuit CBP35 (YE/GY), harness side and ground; and between heated seat module C3162-1, circuit SBB07 (WH/RD), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to W2.

  NO : VERIFY battery junction box (BJB) fuse 7 (30A) and smart junction box (SJB) fuse 35 (10A) are OK. If OK, REPAIR the affected circuit. TEST the system for normal operation.

W2 CHECK THE HEATED SEAT MODULE GROUND

- Key in OFF position.

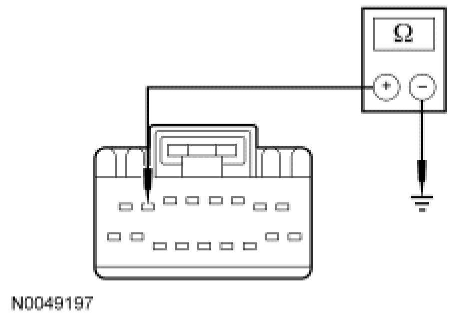

Fig. 181: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-7, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to W3.

NO : REPAIR the circuit. TEST the system for normal operation.

W3 CHECK THE SENSOR RETURN CIRCUIT FOR SHORT TO VOLTAGE

- Key in ON position.

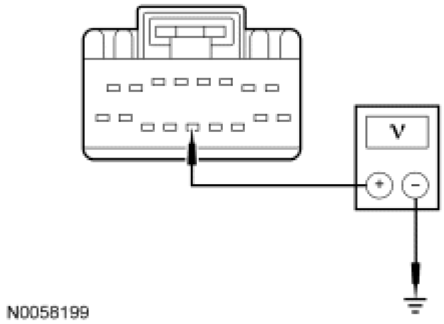

Fig. 182: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3162-13, circuit RHS41 (GN/BN), harness side and ground.
- **Is voltage greater than 0.2 volt?**

YES : REPAIR the circuit. TEST the system for normal operation.

NO : Go to W4.

W4 CHECK THE SENSOR RETURN CIRCUIT FOR SHORT TO GROUND

- Key in OFF position.

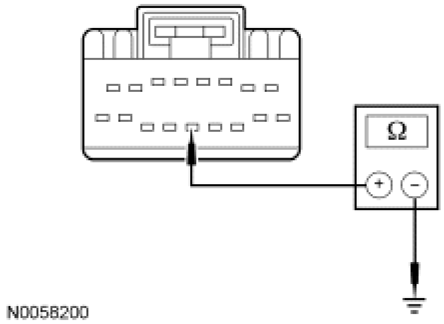

Fig. 183: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-13, circuit RHS41 (GN/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to W5.

NO : REPAIR the circuit. TEST the system for normal operation.

W5 CHECK THE SENSOR RETURN CIRCUIT FOR AN OPEN

- Disconnect: Right Rear Heated Seat C3169

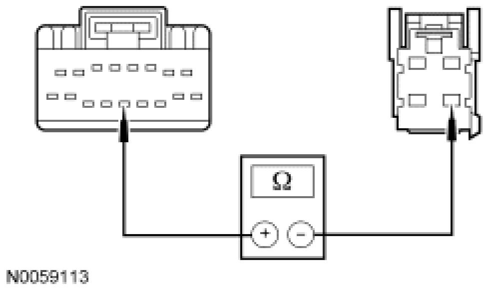

Fig. 184: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-13, circuit RHS41 (GN/BN), harness side and right rear heated seat C3169-3, circuit RHS41 (GN/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Rear Seat**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test X: The Heated Seat is Inoperative/Does Not Operate Correctly - Left Rear

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

The heated seat module receives battery voltage on circuit CBP35 (YE/GY) and ignition voltage on circuit SBB07 (WH/RD), and is supplied ground on circuit GD133 (BK). When the left rear heated seat control switch is pressed with the ignition switch in RUN or START, a ground is supplied on circuit CHS46 (YE/GN) to command the system ON or OFF in hi heat mode or circuit CHS47 (VT/GN) to command the system ON or OFF in low heat mode. When commanded ON, voltage is supplied to the heated seat switch from the heated seat module on either circuit CHS48 (YE) (hi heat mode) or circuit CHS49 (VT) (low heat mode) illuminating the switch indicator. The heated seat module also supplies voltage to the cushion and backrest heater mats on circuit CHS39 (GN/BU) and ground to the heater mats on circuit GD126 (BK/WH). The cushion and backrest heater mats are connected in series and operate together. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module monitors the temperature sensor on circuit VHS42 (GN) for adjusting the current flow to the heater mats and uses a ground supplied on circuit RHS41 (GN/BN). The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF or the ignition voltage is switched OFF.

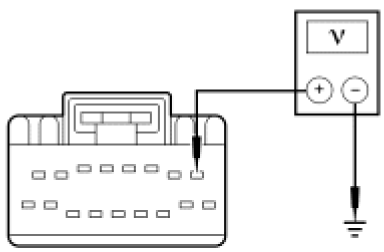
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heater mat
- Heated seat module
- Heated seat switch

PINPOINT TEST X: THE HEATED SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - LEFT REAR

X1 CHECK CIRCUIT SBB07 (WH/RD) FOR VOLTAGE TO THE HEATED SEAT MODULE

- Disconnect: Heated Seat Module C3162



N0059050

Fig. 185: Measuring Voltage
Courtesy of FORD MOTOR CO.

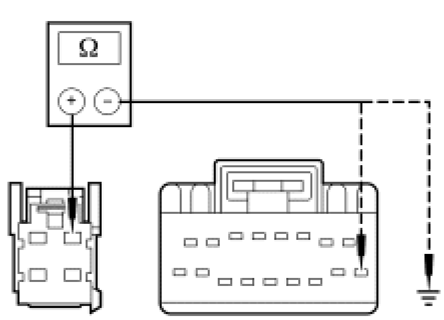
- Measure the voltage between heated seat module C3162-1, circuit SBB07 (WH/RD) harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to X2.

NO : REPAIR the circuit. TEST the system for normal operation.

X2 CHECK CIRCUIT CHS39 (GN/BU) FOR AN OPEN OR SHORT TO GROUND

- Disconnect: Left Rear Cushion Heater Mat C3167



N0059282

Fig. 186: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat cushion heater mat C3167-1, circuit CHS39 (GN/BU), harness side and ground; and between C3167-1, circuit CHS39 (GN/BU), harness side and heated seat module C3162-9, circuit CHS39 (GN/BU) harness side.

- **Is the resistance greater than 10,000 ohms between the left rear seat cushion heater mat and ground; and less than 5 ohms between the left rear seat cushion heater mat and the heated seat module?**

  YES : Go to X3.

  NO : REPAIR the circuit. TEST the system for normal operation.

X3 CHECK CIRCUIT VHS42 (GN) FOR AN OPEN OR SHORT TO GROUND

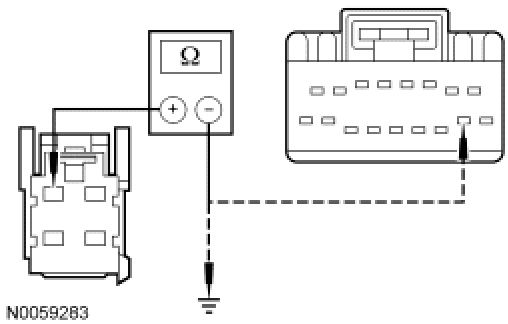


Fig. 187: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat cushion heater mat C3167-2, circuit VHS42 (GN), harness side and ground; and between C3167-2, circuit VHS42 (GN), harness side and heated seat module C3162-10, circuit VHS42 (GN) harness side.
- **Is the resistance greater than 10,000 ohms between the left rear seat cushion heater mat and ground and less than 5 ohms between the left rear seat cushion heater mat and the heated seat module?**

  YES : Go to X4.

  NO : REPAIR the circuit. TEST the system for normal operation.

X4 CHECK CIRCUIT RHS41 (GN/BN) FOR AN OPEN OR SHORT TO GROUND

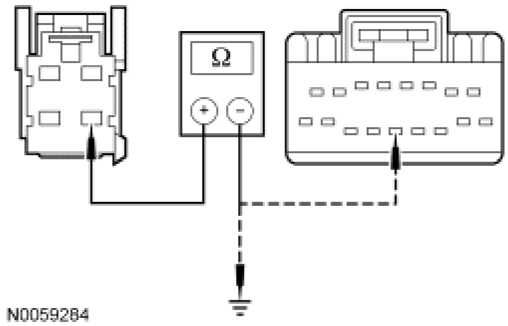

Fig. 188: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat cushion heater mat C3167-3, circuit RHS41 (GN/BN), harness side and ground; and between C3167-3, circuit RHS41 (GN/BN), harness side and heated seat module C3162-13, circuit RHS41 (GN/BN) harness side.
- **Is the resistance greater than 10,000 ohms between the left rear seat cushion heater mat and ground and less than 5 ohms between the left rear seat cushion heater mat and the heated seat module?**

  YES : Go to X5.

  NO : REPAIR the circuit. TEST the system for normal operation.

X5 CHECK CIRCUITS CHS39 (GN/BU), VHS42 (GN) AND RHS41 (GN/BN) FOR SHORT TO VOLTAGE

- Key in ON position.

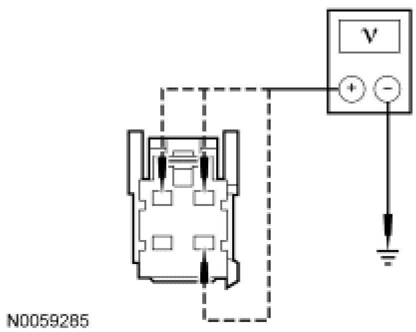

Fig. 189: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following left rear seat cushion heater mat C3167 pins, harness side and ground:

Connector - Pin	Circuit
C3167-1	CHS39 (GN/BU)
C3167-2	VHS42 (GN)
C3167-3	RHS41 (GN/BN)

- **Are the voltages less than 0.2 volt?**

  YES : Go to X6.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

X6 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Key in OFF position.

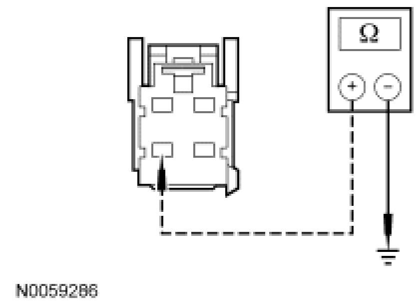

Fig. 190: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat cushion heater mat C3167-4, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to X7.

  NO : REPAIR the circuit. TEST the system for normal operation.

X7 CHECK CUSHION AND BACKREST HEATER MAT AND SENSOR FOR SHORT TO VOLTAGE

- Key in ON position.

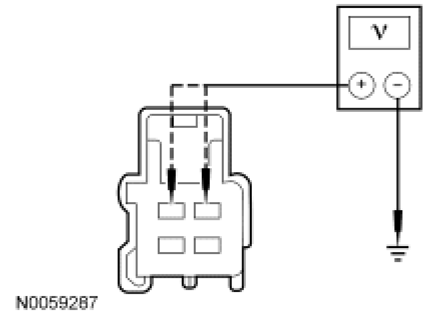

Fig. 191: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between left rear seat cushion heater mat C3167 pin 1, component side and ground; and between left rear seat cushion heater mat C3167 pin 2, component side and ground.
- **Are the voltages less than 0.2 volt?**

  YES : Go to X8.

  NO : REPAIR the circuit. INSTALL a new affected cushion or backrest heater mat. TEST the system for normal operation.

X8 CHECK CUSHION HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Left Rear Seat Cushion Heater Mat to Left Rear Seat Backrest Heater Mat Connector

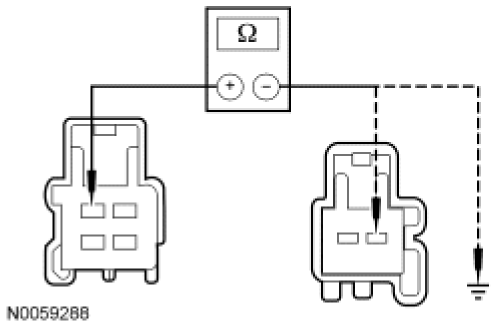

Fig. 192: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat cushion heater mat C3167 pin 1, component side and ground; and between left rear seat cushion heater mat C3167 pin 1, component side and left rear seat cushion heater mat to left rear seat backrest heater mat connector pin 1, cushion side.
- **Is the resistance greater than 10,000 ohms between the left rear seat cushion heater mat and ground; and between 1.6 and 2.2 ohms between the left rear seat cushion heater mat and left rear seat backrest heater mat?**

  YES : Go to X9.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

X9 CHECK BACKREST HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

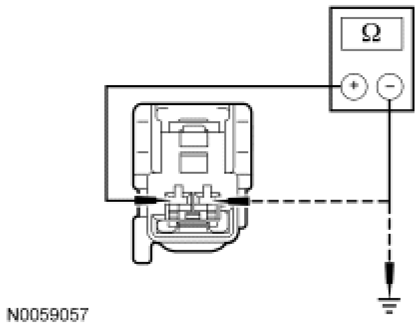

Fig. 193: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat backrest heater mat connector pin 2, component side and ground; and between left rear seat backrest heater mat connector pin 1 and pin 2, component side.
- **Is the resistance greater than 10,000 ohms between the left rear seat backrest heater mat and ground; and between 1.6 and 2.2 ohms between the left rear seat backrest heater mat pins?**

  YES : Go to X10.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

X10 CHECK CIRCUIT BETWEEN BACKREST AND CUSHION HEATER MAT

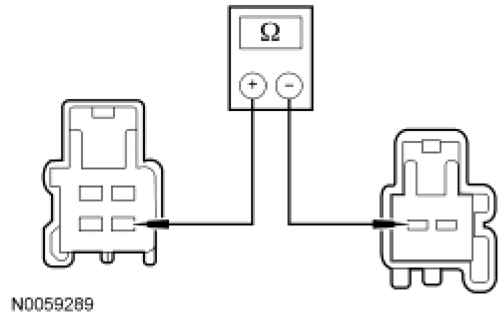

Fig. 194: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat cushion heater mat C3167 pin 4, component side and left rear seat cushion heater mat to left rear seat backrest heater mat connector pin 2, cushion side.
- **Is the resistance less than 5 ohms?**

  YES : Go to X11.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

X11 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR AN OPEN OR SHORT TO GROUND

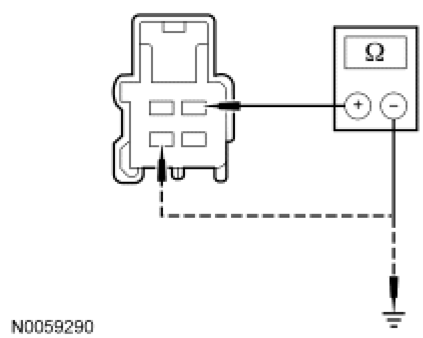

Fig. 195: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear seat cushion heater mat C3167 pin 2 and pin 3, component side; and between left rear seat cushion heater mat C3167 pin 2, component side and ground.
- **Is the resistance less than 300,000 ohms and greater than 50 ohms between left rear seat cushion heater mat pins; and greater than 10,000 ohms between left rear seat cushion heater mat and ground?**

  YES : Go to X12.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

X12 CHECK CIRCUITS CHS46 (YE/GN) AND CHS47 (VT/GN) FOR A SHORT TO VOLTAGE

- Disconnect: Left Rear Heated Seat Switch C722
- Key in ON position.

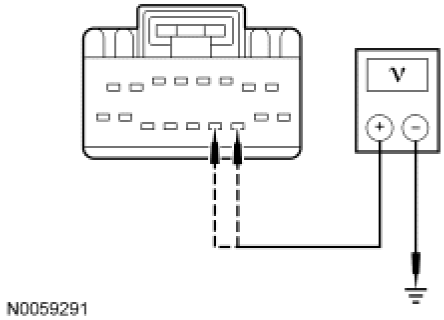

Fig. 196: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3162-11, circuit CHS46 (YE/GN), harness side and ground; and between heated seat module C3162-12, circuit CHS47 (VT/GN), harness side and ground.
- **Are the voltages less than 0.2 volt?**

  YES : Go to X13.

  NO : REPAIR the circuit. TEST the system for normal operation.

X13 CHECK CIRCUITS CHS46 (YE/GN) AND CHS47 (VT/GN) FOR A SHORT TO GROUND

- Key in OFF position.

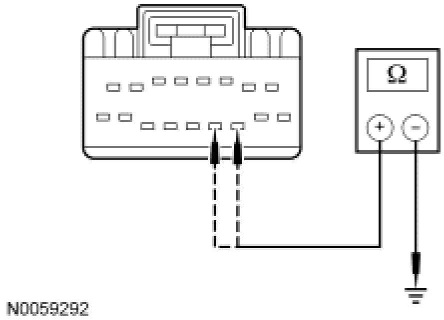

Fig. 197: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-11, circuit CHS46 (YE/GN), harness side and ground; and between heated seat module C3162-12, circuit CHS47 (VT/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to X14.

  NO : REPAIR the circuit. TEST the system for normal operation.

X14 CHECK BETWEEN CIRCUITS CHS46 (YE/GN) AND CHS47 (VT/GN) FOR A SHORT

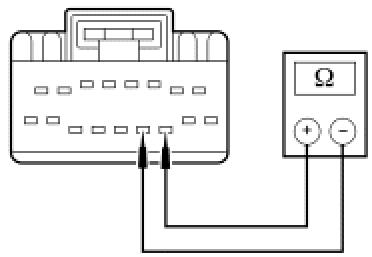

Fig. 198: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-11, circuit CHS46 (YE/GN), harness side and heated seat module C3162-12, circuit CHS47 (VT/GN), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to X15.

  NO : REPAIR the circuits. TEST the system for normal operation.

X15 CHECK CIRCUITS CHS46 (YE/GN) AND CHS47 (VT/GN) FOR AN OPEN

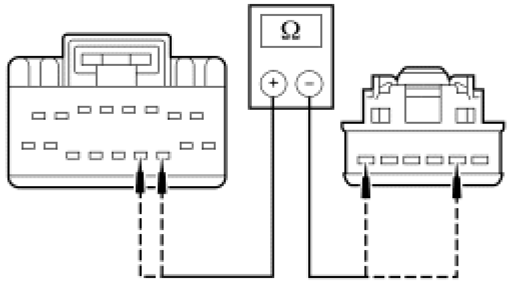

Fig. 199: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-11, circuit CHS46 (YE/GN), harness side and left rear heated seat switch C722-6, circuit CHS46 (YE/GN), harness side; and between heated seat module C3162-12, circuit CHS47 (VT/GN), harness side and left rear heated seat switch C722-2, circuit CHS47 (VT/GN), harness side
- **Are the resistances less than 5 ohms?**

  YES : Go to X16.

  NO : REPAIR the circuit. TEST the system for normal operation.

X16 CHECK HEATED SEAT SWITCH GROUND CIRCUIT GD126 (BK/WH)

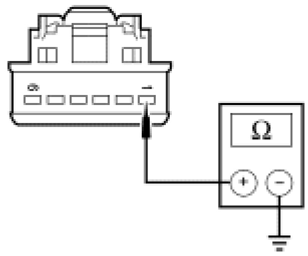

Fig. 200: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear heated seat switch C722-1, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to X17.

  NO : REPAIR the circuit. TEST the system for normal operation.

X17 CHECK THE RIGHT REAR HEATED SEAT SWITCH

- Connect the right rear heated seat switch to the left rear heated seat switch connector.
- Key in ON position.
- Check the left rear heated seat operation.
- **Does the left rear heated seat operate correctly?**

  YES : INSTALL a new heated seat switch. REFER to **Heated Seat Switch - Rear Seat**. TEST the system for normal operation.

  NO : INSTALL a new heated seat module. REFER to **Heated Seat Module - Rear Seat**. TEST the system for normal operation.

Pinpoint Test Y: The Heated Seat is Inoperative/Does Not Operate Correctly - Right Rear

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

The heated seat module receives battery voltage on circuit CBP35 (YE/GY) and ignition voltage on circuit SBB07 (WH/RD), and is supplied ground on circuit GD133 (BK). When the right rear heated seat control switch is pressed with the ignition switch in RUN or START, a ground is supplied on circuit CHS50 (BU/GY) to command the system ON or OFF in hi heat mode or circuit CHS51 (YE/GY) to command the system ON or OFF in low heat mode. When commanded ON, voltage is supplied to the heated seat switch from the heated seat module on either circuit CHS52 (BU) (hi heat mode) or circuit CHS53 (WH/BN) (low heat mode) illuminating the switch indicator. The heated seat module also supplies voltage to the cushion and backrest heater mats on circuit CHS43 (GY/BU) and ground to the heater mats on circuit GD151 (BK/GN). The cushion and backrest heater mats are connected in series and operate together. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module monitors the temperature sensor on circuit VHS45 (GY/BN) for adjusting the current flow to the heater mats and uses a ground supplied on circuit RHS41 (GN/BN). The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF or the ignition voltage is switched OFF.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heater mat
- Heated seat module
- Heated seat switch

PINPOINT TEST Y: THE HEATED SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - RIGHT REAR

Y1 CHECK CIRCUIT SBB07 (WH/RD) FOR VOLTAGE TO THE HEATED SEAT MODULE

- Disconnect: Heated Seat Module C3162

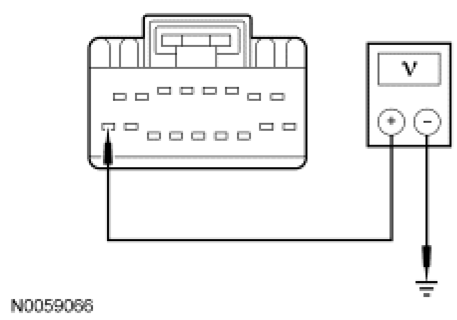

Fig. 201: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3162-17, circuit SBB07 (WH/RD) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to Y2.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y2 CHECK CIRCUIT CHS43 (GY/BU) FOR AN OPEN OR SHORT TO GROUND

- Disconnect: Right Rear Cushion Heater Mat C3169

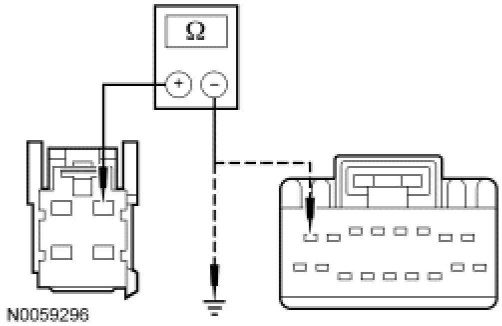

Fig. 202: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat cushion heater mat C3169-1, circuit CHS43 (GY/BU), harness side and ground; and between C3169-1, circuit CHS43 (GY/BU), harness side and heated seat module C3162-8, circuit CHS43 (GY/BU) harness side.
- **Is the resistance greater than 10,000 ohms between the right rear seat cushion heater mat and ground; and less than 5 ohms between the right rear seat cushion heater mat and the heated seat module?**

  YES : Go to Y3.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y3 CHECK CIRCUIT VHS45 (GY/BN) FOR AN OPEN OR SHORT TO GROUND

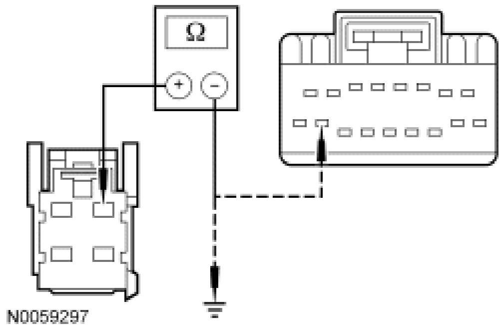

Fig. 203: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat cushion heater mat C3169-2, circuit VHS45 (GY/BN), harness side and ground; and between C3169-2, circuit VHS45 (GY/BN), harness side and heated seat module C3162-16, circuit VHS45 (GY/BN) harness side.
- **Is the resistance greater than 10,000 ohms between the right rear seat cushion heater mat and ground and less than 5 ohms between the right rear seat cushion heater mat and the heated seat module?**

  YES : Go to Y4.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y4 CHECK CIRCUIT RHS41 (GN/BN) FOR AN OPEN OR SHORT TO GROUND

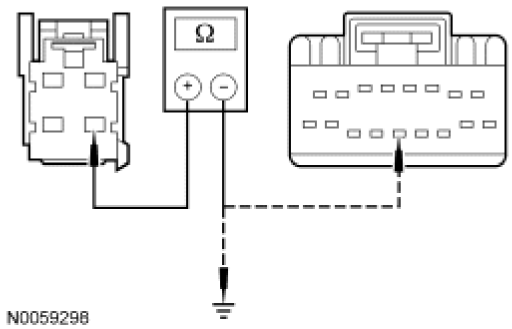

Fig. 204: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat cushion heater mat C3169-3, circuit RHS41 (GN/BN), harness side and ground; and between C3169-3, circuit RHS41 (GN/BN), harness side and heated seat module C3162-13, circuit RHS41 (GN/BN) harness side.
- **Is the resistance greater than 10,000 ohms between the right rear seat cushion heater mat and ground and less than 5 ohms between the right rear seat cushion heater mat and the heated seat module?**

  YES : Go to Y5.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y5 CHECK CIRCUITS CHS43 (GY/BU), VHS45 (GY/BN) AND RHS41 (GN/BN) FOR SHORT TO VOLTAGE

- Key in ON position.

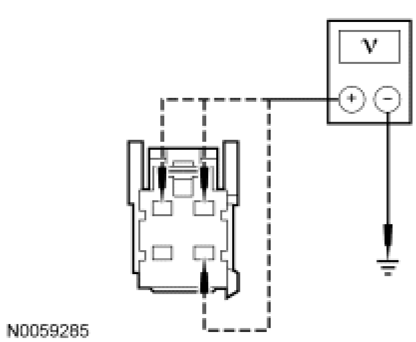

Fig. 205: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following left rear seat cushion heater mat C3169 pins, harness side and ground:

Connector - Pin	Circuit
C3169-1	CHS43 (GY/BU)

C3169-2	VHS45 (GY/BN)
C3169-3	RHS41 (GN/BN)

- **Are the voltages less than 0.2 volt?**

  YES : Go to Y6.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

Y6 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN

- Key in OFF position.

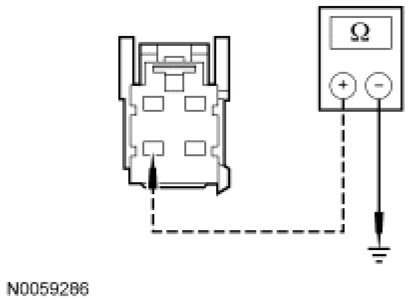

Fig. 206: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat cushion heater mat C3169-4, circuit GD151 (BK/GN), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to Y7.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y7 CHECK CUSHION AND BACKREST HEATER MAT AND SENSOR FOR SHORT TO VOLTAGE

- Key in ON position.

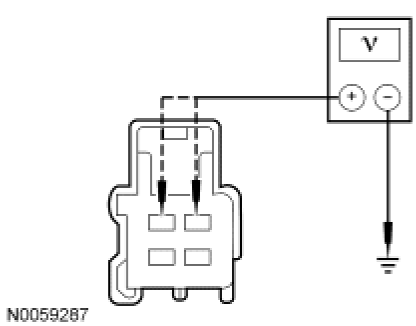

Fig. 207: Measuring Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage between right rear seat cushion heater mat C3169 pin 1, component side and ground; and between right rear seat cushion heater mat C3169 pin 2, component side and ground.
- **Are the voltages less than 0.2 volt?**

  YES : Go to Y8.

  NO : REPAIR the circuit. INSTALL a new affected cushion or backrest heater mat. TEST the system for normal operation.

Y8 CHECK CUSHION HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Right Rear Seat Cushion Heater Mat to Right Rear Seat Backrest Heater Mat Connector

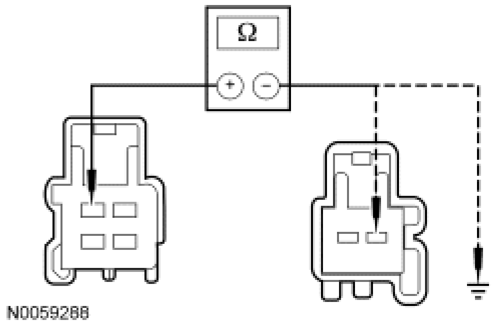

Fig. 208: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat cushion heater mat C3169 pin 1, component side and ground; and between right rear seat cushion heater mat C3169 pin 1, component side and right rear seat cushion heater mat to right rear seat backrest heater mat connector pin 1, cushion side.
- **Is the resistance greater than 10,000 ohms between the right rear seat cushion heater mat and ground; and between 1.6 and 2.2 ohms between the right rear seat cushion heater mat and right rear seat backrest heater mat?**

  YES : Go to Y9.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

Y9 CHECK BACKREST HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND

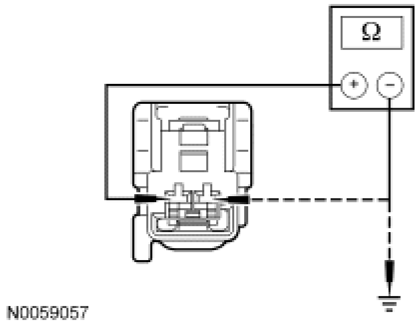

Fig. 209: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat backrest heater mat connector pin 2, component side and ground; and between right rear seat backrest heater mat connector pin 1 and pin 2, component side.
- **Is the resistance greater than 10,000 ohms between the right rear seat backrest heater mat and ground; and between 1.6 and 2.2 ohms between the right rear seat backrest heater mat pins?**

  YES : Go to Y10.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

Y10 CHECK CIRCUIT BETWEEN BACKREST AND CUSHION HEATER MAT

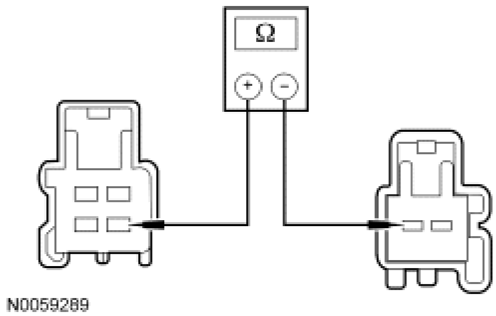

Fig. 210: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat cushion heater mat C3169 pin 4, component side and right rear seat cushion heater mat to right rear seat backrest heater mat connector pin 2, cushion side.
- **Is the resistance less than 5 ohms?**

  YES : Go to Y11.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

Y11 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR AN OPEN OR SHORT TO GROUND

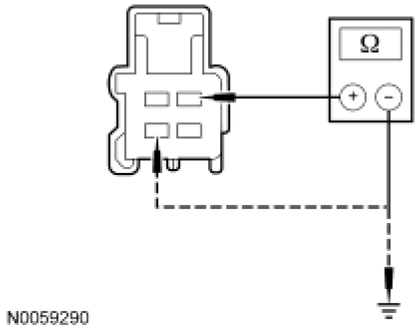

Fig. 211: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear seat cushion heater mat C3169 pin 2 and pin 3, component side; and between right rear seat cushion heater mat C3169 pin 2, component side and ground.
- **Is the resistance less than 300,000 ohms and greater than 50 ohms between right rear seat cushion heater mat pins; and greater than 10,000 ohms between right rear seat cushion heater mat and ground?**

  YES : Go to Y12.

  NO : INSTALL a new cushion heater mat. TEST the system for normal operation.

Y12 CHECK CIRCUITS CHS50 (BU/GY) AND CHS51 (YE/GY) FOR A SHORT TO VOLTAGE

- Disconnect: Right Rear Heated Seat Switch C822
- Key in ON position.

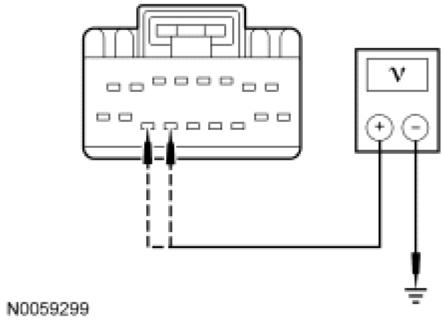

Fig. 212: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3162-14, circuit CHS50 (BU/GY), harness side and ground; and between heated seat module C3162-15, circuit CHS51 (YE/GY), harness side and ground.
- **Are the voltages less than 0.2 volt?**

  YES : Go to Y13.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y13 CHECK CIRCUITS CHS50 (BU/GY) AND CHS51 (YE/GY) FOR A SHORT TO GROUND

- Key in OFF position.

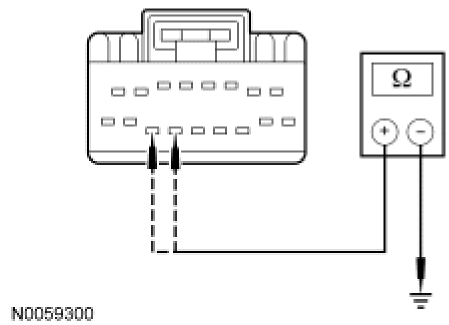

Fig. 213: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-14, circuit CHS50 (BU/GY), harness side and ground; and between heated seat module C3162-15, circuit CHS51 (YE/GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to Y14.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y14 CHECK BETWEEN CIRCUITS CHS50 (BU/GY) AND CHS51 (YE/GY) FOR A SHORT

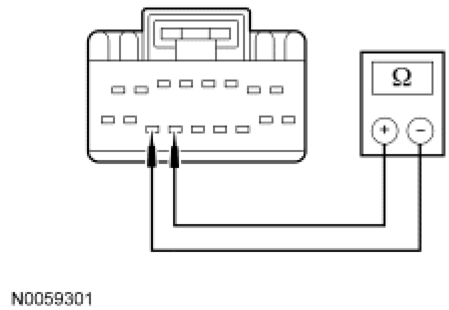

Fig. 214: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-14, circuit CHS50 (BU/GY), harness side and heated seat module C3162-15, circuit CHS51 (YE/GY), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to Y15.

  NO : REPAIR the circuits. TEST the system for normal operation.

Y15 CHECK CIRCUITS CHS50 (BU/GY) AND CHS51 (YE/GY) FOR AN OPEN

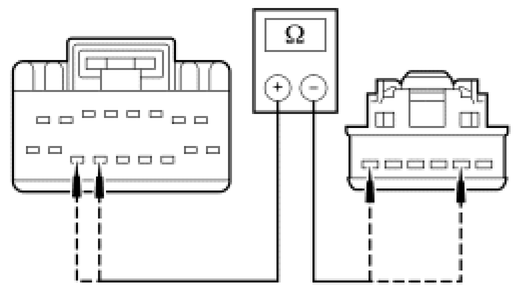

Fig. 215: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-14, circuit CHS50 (BU/GY), harness side and right rear heated seat switch C822-6, circuit CHS50 (BU/GY), harness side; and between heated seat module C3162-15, circuit CHS51 (YE/GY), harness side and right rear heated seat switch C822-2, circuit CHS51 (YE/GY), harness side
- **Are the resistances less than 5 ohms?**

  YES : Go to Y16.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y16 CHECK HEATED SEAT SWITCH GROUND CIRCUIT GD145 (BK/BU)

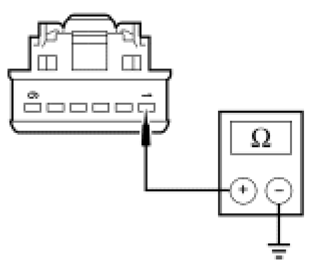

Fig. 216: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear heated seat switch C822-1, circuit GD145 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to Y17.

  NO : REPAIR the circuit. TEST the system for normal operation.

Y17 CHECK THE RIGHT REAR HEATED SEAT SWITCH

- Connect the left rear heated seat switch to the right rear heated seat switch connector.
- Key in ON position.
- Check the right rear heated seat operation.

- **Does the right rear heated seat operate correctly?**

  YES : INSTALL a new heated seat switch. REFER to **Heated Seat Switch - Rear Seat**. TEST the system for normal operation.

  NO : INSTALL a new heated seat module. REFER to **Heated Seat Module - Rear Seat**. TEST the system for normal operation.

Pinpoint Test Z: The Heated Seat is Inoperative - Left Rear Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Pressing the left rear heated seat switch once in either the hi or low mode will command ON the left rear heated seat. Voltage is then supplied to the left rear heated seat switch from the heated seat module on either circuit CHS48 (YE) (hi heat mode) or circuit CHS49 (VT) (low heat mode) illuminating the switch indicator. Pressing the left rear heated seat switch again in the mode that is currently on will set the left rear heated seat to OFF and also turn that LED OFF.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module
- Heated seat switch

PINPOINT TEST Z: THE HEATED SEAT IS INOPERATIVE - LEFT REAR SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

Z1 CHECK CIRCUITS CHS49 (VT) AND CHS48 (YE) FOR A SHORT TO GROUND

- Disconnect: Left Rear Heated Seat Switch C722
- Disconnect: Heated Seat Module C3162

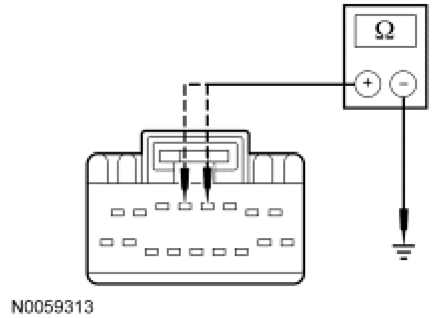

Fig. 217: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-5, circuit CHS49 (VT), harness side and ground; and between heated seat module C3162-4, circuit CHS48 (YE), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to Z2.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

Z2 CHECK CIRCUITS CHS49 (VT) AND CHS48 (YE) FOR AN OPEN

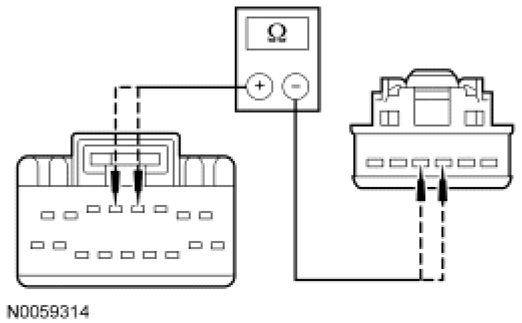

Fig. 218: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between left rear heated seat switch C722-3, circuit CHS49 (VT), harness side and heated seat module C3162-5, circuit CHS49 (VT), harness side; and between left rear heated seat switch C722-4, circuit CHS48 (YE), harness side and heated seat module C3162-4, circuit CHS48 (YE), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to Z3.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

Z3 CHECK THE HEATED SEAT HI INDICATOR

- Connect: Left Rear Heated Seat Switch C722
- Key in ON position.

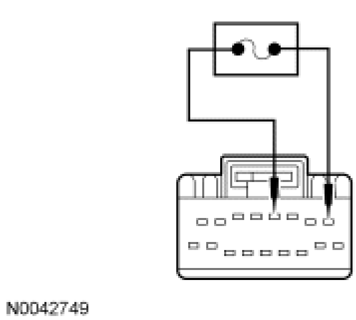

Fig. 219: Checking Heated Seat Module HI Indicator On EATC Module
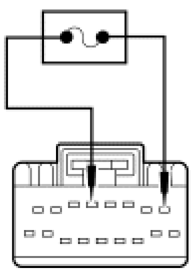
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C3162-4, circuit CHS48 (YE), harness side and C3162-1, circuit SBB07 (WH/RD), harness side.
- **Does the hi indicator LED illuminate on the left rear heated seat switch?**

  YES : Go to Z4.

  NO : INSTALL a new rear heated seat switch. REFER to **Heated Seat Switch - Rear Seat**. TEST the system for normal operation.

Z4 CHECK THE HEATED SEAT LOW INDICATOR



N0042750

Fig. 220: Checking Heated Seat Module Low Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C3162-5, circuit CHS49 (VT), harness side and C3162-1, circuit SBB07 (WH/RD), harness side.
- **Does the low indicator LED illuminate on the left rear heated seat switch?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Rear Seat**. TEST the system for normal operation.

  NO : INSTALL a new rear heated seat switch. REFER to **Heated Seat Switch - Rear Seat**. TEST the system for normal operation.

Pinpoint Test AA: The Heated Seat is Inoperative - Left Rear Seat Does Heat But the Heated Seat Indicator is On All the Time

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Pressing the left rear heated seat switch once in either the hi or low mode will command ON the left rear heated seat. Voltage is then supplied to the left rear heated seat switch from the heated seat module on either circuit CHS48 (YE) (hi heat mode) or circuit CHS49 (VT) (low heat mode) illuminating the switch indicator. Pressing the left rear heated seat switch again in the mode that is currently on will set the left rear heated seat to OFF and also turn that LED OFF.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Heated seat module

PINPOINT TEST AA: THE HEATED SEAT IS INOPERATIVE - LEFT REAR SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR IS ON ALL THE TIME

AA1 CHECK CIRCUITS CHS49 (VT) AND CHS48 (YE) FOR A SHORT TO VOLTAGE

- Disconnect: Heated Seat Module C3162
- **Did the affected hi or low indicator LED turn off when the heated seat module was disconnected?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Rear Seat**. TEST the system for normal operation.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

Pinpoint Test AB: The Heated Seat is Inoperative - Right Rear Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Pressing the right rear heated seat switch once in either the hi or low mode will command ON the left rear heated seat. Voltage is then supplied to the left rear heated seat switch from the heated seat module on either circuit CHS52 (BU) (hi heat mode) or circuit CHS53 (WH/BN) (low heat mode) illuminating the switch indicator. Pressing the right rear heated seat switch again in the mode that is currently on will set the right rear heated seat to OFF and also turn that LED OFF.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module
- Heated seat switch

PINPOINT TEST AB: THE HEATED SEAT IS INOPERATIVE - RIGHT REAR SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

AB1 CHECK CIRCUITS CHS53 (WH/BN) AND CHS52 (BU) FOR A SHORT TO GROUND

- Disconnect: Right Rear Heated Seat Switch C822
- Disconnect: Heated Seat Module C3162

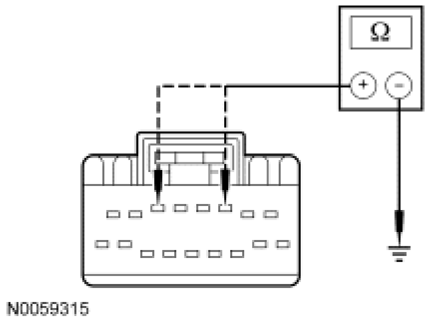


Fig. 221: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3162-3, circuit CHS53 (WH/BN), harness side and ground; and between heated seat module C3162-6, circuit CHS52 (BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AB2.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

AB2 CHECK CIRCUITS CHS53 (WH/BN) AND CHS52 (BU) FOR AN OPEN

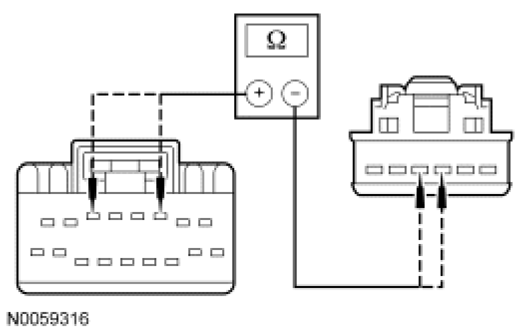

Fig. 222: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between right rear heated seat switch C822-3, circuit CHS53 (WH/BN), harness side and heated seat module C3162-3, circuit CHS53 (WH/BN), harness side; and between right rear heated seat switch C822-4, circuit CHS52 (BU), harness side and heated seat module C3162-6, circuit CHS52 (BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AB3.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

AB3 CHECK THE HEATED SEAT HI INDICATOR

- Connect: Right Rear Heated Seat Switch C822
- Key in ON position.

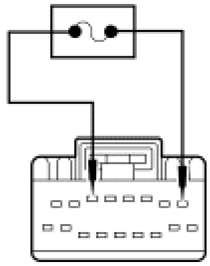

Fig. 223: Checking Heated Seat Module HI Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C3162-6, circuit CHS52 (BU), harness side and C3162-1, circuit SBB07 (WH/RD), harness side.
- **Does the hi indicator LED illuminate on the right rear heated seat switch?**

  YES : Go to AB4.

  NO : INSTALL a new rear heated seat switch. REFER to **Heated Seat Switch - Rear Seat**. TEST the system for normal operation.

AB4 CHECK THE HEATED SEAT LOW INDICATOR

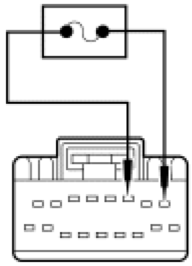

Fig. 224: Checking Heated Seat Module Low Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C3162-3, circuit CHS53 (WH/BN), harness side and C3162-17, circuit SBB07 (WH/RD), harness side.
- **Does the low indicator LED illuminate on the right rear heated seat switch?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Rear Seat**. TEST the system for normal operation.

  NO : INSTALL a new rear heated seat switch. REFER to **Heated Seat Switch - Rear Seat**. TEST the system for normal operation.

Pinpoint Test AC: The Heated Seat is Inoperative - Right Rear Seat Does Heat But the Heated Seat Indicator is On All the Time

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Pressing the right rear heated seat switch once in either the hi or low mode will command ON the left rear heated seat. Voltage is then supplied to the left rear heated seat switch from the heated seat module on either circuit CHS52 (BU) (hi heat mode) or circuit CHS53 (WH/BN) (low heat mode) illuminating the switch indicator. Pressing the right rear heated seat switch again in the mode that is currently on will set the right rear heated seat to OFF and also turn that LED OFF.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module

PINPOINT TEST AC: THE HEATED SEAT IS INOPERATIVE - RIGHT REAR SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR IS ON ALL THE TIME

AC1 CHECK CIRCUITS CHS53 (WH/BN) AND CHS52 (BU) FOR A SHORT TO VOLTAGE

- Disconnect: Heated Seat Module C3162
- **Did the affected hi or low indicator LED turn off when the heated seat module was disconnected?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module - Rear Seat**. TEST the system for normal operation.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

Pinpoint Test AD: A Single Climate Controlled Seat is Inoperative - Switch Indicators May or May Not Illuminate

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DSCM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Medium-speed controller area network (MS-CAN) fault
- HVAC module
- DCSM

PINPOINT TEST AD: A SINGLE CLIMATE CONTROLLED SEAT IS INOPERATIVE - SWITCH INDICATORS MAY OR MAY NOT ILLUMINATE

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AD1 CHECK OPERATION OF BOTH CLIMATE CONTROLLED SEATS AND VERIFY THE SYMPTOM

- Check the operation of both climate controlled seats and verify the symptom.
- **Is only a single climate controlled seat inoperative?**

  YES : Go to AD2.

  NO : If both seats are inoperative, go to **Symptom Chart**.

AD2 CHECK FOR DCSM AND HVAC DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/DCSM/Retrieve DTCs
- Enter the following diagnostic mode on the diagnostic tool: Self Test/HVAC module/Retrieve DTCs
- **Were any DTCs retrieved during the on-demand self tests?**

  YES : For DCSM DTCs, go to the **Dual Climate Controlled Seat Module (DCSM) DTC Chart**.

  For HVAC DTCs, REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION & DIAGNOSTICS** article to diagnose the HVAC module fault.

  NO : Go to AD3.

AD3 CHECK OPERATION OF THE DCSM USING PIDs

NOTE: The purpose of this step is to verify the DCSM is able to receive and process inbound command messages from the communication bus and demonstrate if the DCSM is operational. This indicates the HVAC module may not be sending the commands correctly.

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM

Driver Seat

- Seat cushion thermal electric device temperature (CSHTEMP)
- Seat back thermal electric device temperature (BK_TEMP)
- Climate-controlled seat heat command (TED_HEAT_D)

Front Passenger Seat

- Passenger Cushion Thermal Electric Device (TED) Temperature (PCSHTMP)
- Passenger Back TED Temperature (PBKTMP)
- Passenger TED Heat Mode (TED_HEAT_P)

NOTE: The DCSM active commands TED_HEAT_D (driver seat) and TED_HEAT_P (passenger seat) are limited to 15 seconds in the ON state.

- Operate the affected climate controlled seat using the active command while monitoring the appropriate PIDs for that seat.
  - When the command is in process the TED temperature PIDs on the affected seat should momentarily increase. If no temperature increase is noted, remove the cushion blower filter and repeat the active command while physically monitoring the cushion blower for fan movement.
- **Do the PID states or cushion blower movement indicate climate controlled seat operation when using the active command?**

  YES : Go to AD4.

  NO : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

AD4 USE THE HVAC SWITCH AND MONITOR THE DCSM PID FOR A RESPONSE

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM
  - Driver State Seat Mode (DCCSMOD) (driver seat)
  - Passenger State Seat Mode (PCCSMOD) (passenger seat)
- Key in START position.

NOTE: Operation of the climate controlled seats repeatedly ON and OFF or repeatedly switching between heat and cool modes may cause DCSM DTCs to set, disabling one or both seat system and may require DTCs to be cleared before seat operation may continue. It is recommended to allow time between modes for seat temperatures to return toward ambient temperatures before continuing.

- Attempt to operate the affected climate controlled seat in all modes using the appropriate switch on the HVAC while monitoring the DCSM PID DCCSMOD (driver seat) or PCCSMOD (passenger seat).

- **Do all the PID states match the climate controlled seat settings selected on the HVAC module?**

  YES : If the fault is intermittent, CHECK for causes of the intermittent fault. INSPECT the connectors, terminals and wiring. ATTEMPT to recreate the fault by flexing the wire harness and operating the system. CHECK the electrical connectors for corrosion, poor pin contact or pushed-out pins. REPAIR any intermittent concerns found and TIGHTEN any loose DCSM connector pins. REPEAT the self-test. CLEAR the DTCs.

  NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. REPEAT the self-test. CLEAR the DTCs.

Pinpoint Test AE: DTC B103B/B1111 - Thermo-electric Driver Overcurrent Low/Driver Thermo-electric Device Control Overtemperature Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B103B Thermo-electric Driver Overcurrent Low - If DCSM outputs to the driver seat backrest or cushion TED (circuit pins G, H, J or K at the DCSM connector) or any components within these circuit loops are shorted to ground or a TED resistance of less than 0.9 ohm is sensed, the DCSM will shut down the driver seat system and set this DTC.
- DTC B1111 Driver Thermo-electric Device Control Overtemperature Fault - If the DCSM TED driver integrated circuit temperature exceeds 175°C (347°F), the DCSM will shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AE: DTC B103B/B1111 - THERMO-ELECTRIC DRIVER OVERCURRENT LOW/DRIVER THERMO-ELECTRIC DEVICE CONTROL OVERTEMPERATURE FAULT

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AE1 CHECK THE TED CIRCUITS FOR SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Measure the resistance between the following DCSM C3036a pins, harness side and ground.

Connector-Pin	Circuit
C3036a-G	CHS02 (YE/BU)
C3036a-H	RHS02 (BU/OG)
C3036a-J	CHS01 (GY/VT)
C3036a-K	RHS01 (WH/VT)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AE2.

NO : If the resistances of C3036a-G, circuit CHS02 (YE/BU) and/or C3036a-H, circuit RHS02 (BU/OG) to ground were **not** greater than 10,000 ohms to ground, go to AE6.

If resistances of C3036a-J, circuit CHS01 (GY/VT) and/or C3036a-K, circuit RHS01 (WH/VT) to ground were **not** greater than 10,000 ohms to ground, go to AE7.

AE2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following DCSM C3036a pins, harness side and ground.

Connector-Pin	Circuit
C3036a-G	CHS02 (YE/BU)
C3036a-H	RHS02 (BU/OG)
C3036a-J	CHS01 (GY/VT)
C3036a-K	RHS01 (WH/VT)

- **Are the voltages less than one volt?**

  YES : Go to AE3.

  NO : If the voltages measured at C3036a-G and/or C3036a-H were **not** less than one volt, go to AE8.

  If voltages measured at C3036a-J and/or C3036a-K were **not** less than one volt, go to AE9.

AE3 CHECK THE TED RESISTANCE

- Key in OFF position.

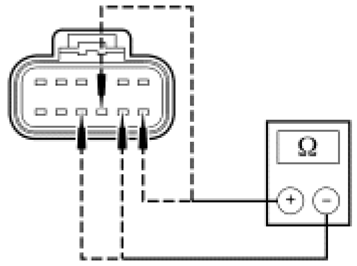

Fig. 225: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE: Make sure the thermo-electric devices (TEDs) are at room temperature and there is no air blowing across the TEDs. Do not handle a TED when measuring resistance. These conditions can cause incorrect readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between DCSM C3036a-G, circuit CHS02 (YE/BU), harness side and DCSM C3036a-H, circuit RHS02 (BU/OG), harness side; and between DCSM C3036a-J, circuit CHS01 (GY/VT), harness side and C3036a-K, circuit RHS01 (WH/VT), harness side and ground.
- **Are the resistances between 0.9 and 10 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance between DCSM C3036a-G and C3036a-H was **not** between 0.9 and 10 ohms, go to AE5.

  If the resistance between DCSM C3036a-J and C3036a-K was **not** between 0.9 and 10 ohms, go to AE4.

AE4 CHECK THE RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3322

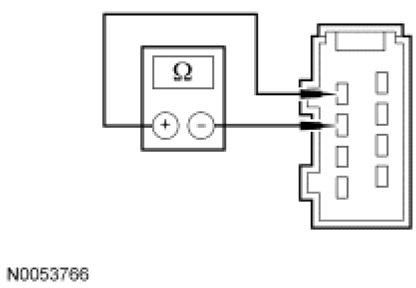

Fig. 226: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3322 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AE5 CHECK THE RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3327

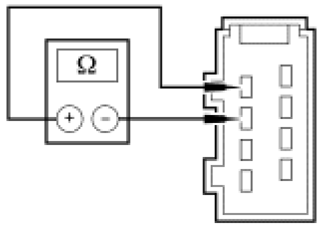

Fig. 227: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3327 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AE6 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO GROUND

- Disconnect: Cushion TED C3327

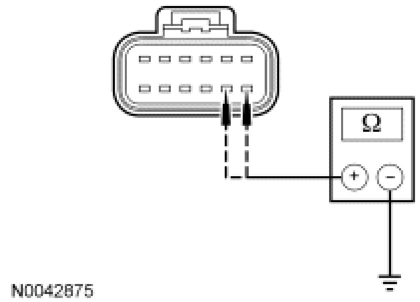

Fig. 228: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-G, circuit CHS02 (YE/BU), harness side and ground and between C3036a-H, circuit RHS02 (BU/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AE7 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO GROUND

- Disconnect: Backrest TED C3322

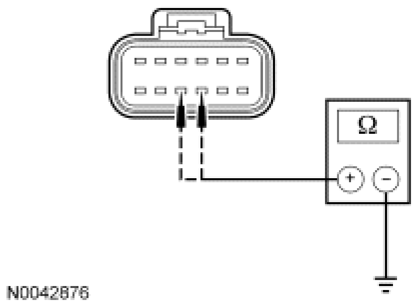

Fig. 229: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-J, circuit CHS01 (GY/VT), harness side and ground and between C3036a-K, circuit RHS01 (WH/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AE8 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Cushion TED C3327
- Key in ON position.

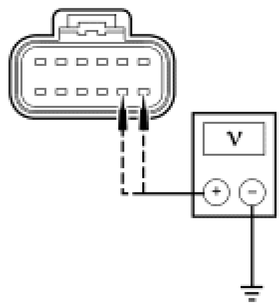

Fig. 230: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-G, circuit CHS02 (YE/BU), harness side and ground and between C3036a-H, circuit RHS02 (BU/OG), harness side and ground.
- **Are the voltages less than 1 volt?**

YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AE9 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Backrest TED C3322

- Key in ON position.

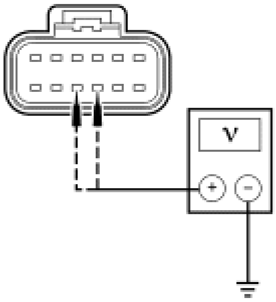

Fig. 231: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-J, circuit CHS01 (GY/VT), harness side and ground and between C3036a-K, circuit RHS01 (WH/VT), harness side and ground.
- **Are the voltages less than one volt?**

  YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AF: DTC B103C - Thermo-electric Driver Open Load

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B103C Thermo-electric Driver Open Load - If DCSM outputs to the driver seat backrest or cushion TED (circuit pins G, H, J or K at the DCSM connector) or any components within these circuit loops are open, disconnected or a TED resistance greater than 90K ohms is sensed, the DCSM continues normal operation and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AF: DTC B103C - THERMO-ELECTRIC DRIVER OPEN LOAD

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AF1 CHECK THE TED CIRCUITS FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036a
- Disconnect: Cushion TED C3327

- Disconnect: Backrest TED C3322

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Measure the resistance of the following circuits.

DCSM Connector-Pin	Circuit	TED Connector-Pin
C3036a-G	CHS02 (YE/BU)	C3327-1
C3036a-H	RHS02 (BU/OG)	C3327-3
C3036a-J	CHS01 (GY/VT)	C3322-1
C3036a-K	RHS01 (WH/VT)	C3322-3

- **Are the resistances less than 5 ohms?**

  YES : Go to AF2.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following DCSM C3036a pins, harness side and ground.

Connector-Pin	Circuit
C3036a-G	CHS02 (YE/BU)

C3036a-H	RHS02 (BU/OG)
C3036a-J	CHS01 (GY/VT)
C3036a-K	RHS01 (WH/VT)

- **Is voltage present on any circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AF3.

AF3 CHECK RESISTANCE OF THE TEDs

- Key in OFF position.

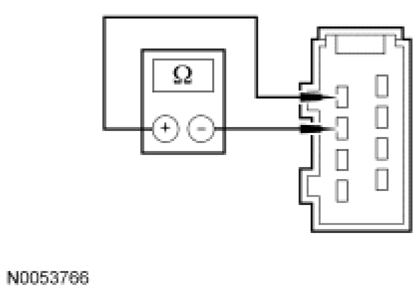

Fig. 232: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3322 pin 1 and pin 3, component side and between cushion TED C3327 pin 1 and pin 3, component side.
- **Are the resistances between 0.9 and 10 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : If the resistance of the backrest TED was **not** between 0.9 and 10 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

If the resistance of the cushion TED was **not** between 0.9 and 10 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AG: DTC B103D - Blower Driver Overtemperature

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B103D Blower Driver Overtemperature - If the DCSM outputs to the driver seat blower or any components within these circuit loops are shorted to ground or cause an excessive current draw, the

DCSM will overheat, shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AG: DTC B103D - BLOWER DRIVER OVERTEMPERATURE

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AG1 CHECK THE BLOWER CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036c
- Disconnect: Cushion TED C3327
- Disconnect: Backrest TED C3322

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

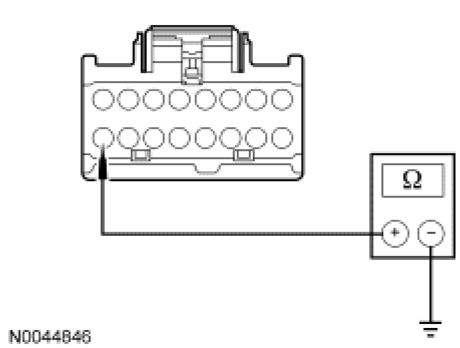

Fig. 233: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AG2.

  NO : REPAIR the affected circuit. REPEAT the self-test.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AG2 CHECK THE BLOWER CIRCUITS FOR A SHORT

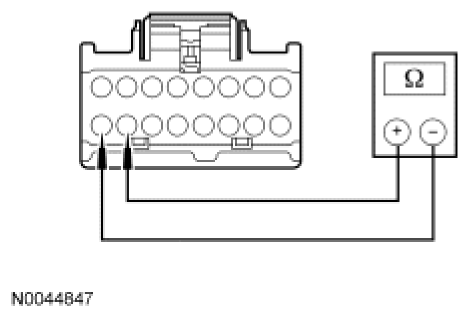

Fig. 234: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-15, circuit RHS03 (GY/OG), harness side and C3036c-16, circuit CHS03 (GN/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AG3.

  NO : REPAIR the affected circuits. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AG3 CHECK THE BLOWER RESISTANCE

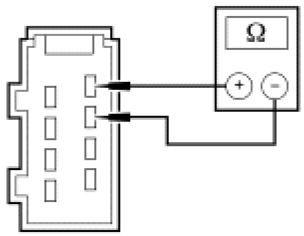

Fig. 235: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between cushion TED C3327 pin 2 and pin 4, component side and between backrest TED C3322 pin 2 and pin 4, component side.
- **Are the resistances between 6,000 ohms and 9,000 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AH: DTC B1113/B111B - Passenger Thermo-electric Device Control Overtemperature Fault/Passenger Thermo-electric Driver Overcurrent Low

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B1113 Passenger Thermo-electric Device Control Overtemperature Fault - If the DCSM TED driver integrated circuit temperature exceeds 175°C (347°F), the DCSM will shut down the passenger seat system and set this DTC.
- DTC B111B Passenger Thermo-electric Driver Overcurrent Low - If DCSM outputs to the passenger seat backrest or cushion TED (circuit pins A, B, C or D at the DCSM connector) or any components within these circuit loops are shorted to ground or a TED resistance of less than 0.9 ohms is sensed, the DCSM will shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AH: DTC B1113/B111B - PASSENGER THERMO-ELECTRIC DEVICE CONTROL OVERTEMPERATURE FAULT/PASSENGER THERMO-ELECTRIC DRIVER OVERCURRENT LOW

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AH1 CHECK THE TED CIRCUITS FOR SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036a

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Measure the resistance between the following DCSM C3036a pins, harness side and ground.

Connector-Pin	Circuit
C3036a-A	CHS07 (GY/BU)
C3036a-B	RHS07 (BU)
C3036a-C	CHS06 (BU/BN)
C3036a-D	RHS06 (WH)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AH2.

  NO : If the resistances of C3036a-A and/or C3036a-B to ground were **not** greater than 10,000 ohms to ground, go to AH6.

  If resistances of C3036a-C and/or C3036a-D to ground were **not** greater than 10,000 ohms to ground, go to AH7.

AH2 CHECK THE TED CIRCUITS FOR A SHORT TO VOLTAGE

- Key in ON position.

- Measure the voltage between the following DCSM C3036a pins, harness side and ground.

Connector-Pin	Circuit
C3036a-A	CHS07 (GY/BU)
C3036a-B	RHS07 (BU)
C3036a-C	CHS06 (BU/BN)
C3036a-D	RHS06 (WH)

- **Are the voltages less than one volt?**

  YES : Go to AH3.

  NO : If the voltages measured at C3036a-A and/or C3036a-B were **not** less than 1 volt, go to AH8.

  If voltages measured at C3036a-C and/or C3036a-D were **not** less than 1 volt, go to AH9.

AH3 CHECK THE TED RESISTANCE

- Key in OFF position.

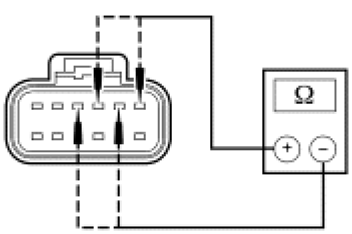

Fig. 236: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: Make sure the TEDs are at room temperature and there is no air blowing across the TEDs. Do not handle a TED when measuring resistance. These conditions can cause incorrect readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between DCSM C3036a-A, circuit CHS07 (GY/BU), harness side and DCSM C3036a-B, circuit RHS07 (BU), harness side; and between DCSM C3036a-C, circuit CHS06 (BU/BN), harness side and C3036a-D, circuit RHS06 (WH), harness die and ground.
- **Are the resistances between 0.9 and 10 ohms?**

YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : If the resistance between DCSM C3036a-A and C3036a-B was **not** between 0.9 and 10 ohms, go to AH5.

If the resistance between DCSM C3036a-C and C3036a-D was **not** between 0.9 and 10 ohms, go to AH4.

AH4 CHECK THE RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3326

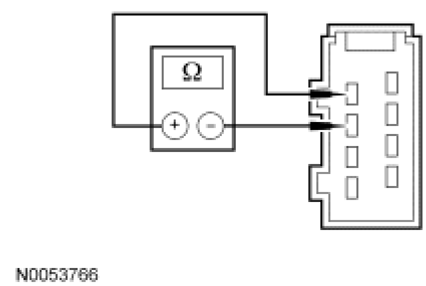

Fig. 237: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3326 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

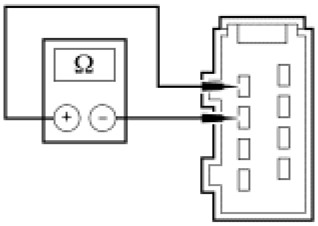
DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AH5 CHECK THE RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3328



N0053766

Fig. 238: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3328 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AH6 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO GROUND

- Disconnect: Cushion TED C3328

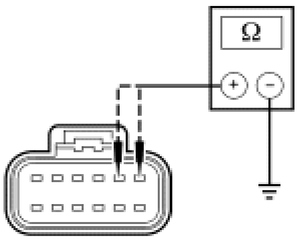


Fig. 239: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-A, circuit CHS07 (GY/BU), harness side and ground and between C3036a-B, circuit RHS07 (BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AH7 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO GROUND

- Disconnect: Backrest TED C3326

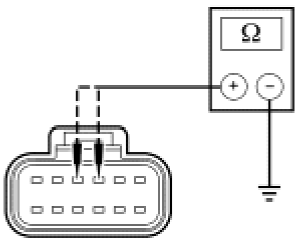

Fig. 240: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-C, circuit CHS06 (BU/BN), harness side and ground and between C3036a-D, circuit RHS06 (WH), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AH8 CHECK THE CUSHION TED CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Cushion TED C3328
- Key in ON position.

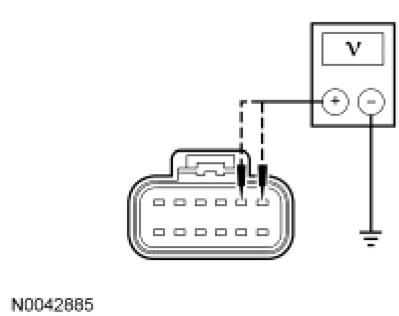

Fig. 241: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-A, circuit CHS07 (GY/BU), harness side and ground and between C3036a-B, circuit RHS07 (BU), harness side and ground.
- **Are the voltages less than one volt?**

  YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**.

REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AH9 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Backrest TED C3326
- Key in ON position.

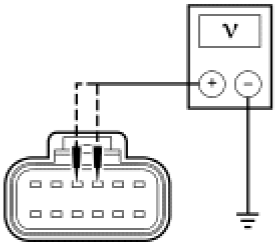

Fig. 242: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-C, circuit CHS06 (BU/BN), harness side and ground and between C3036a-D, circuit RHS06 (WH), harness side and ground.
- **Are the voltages less than one volt?**

  YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AI: DTC B111C - Passenger Thermo-electric Driver Open Load

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B111C Passenger Thermo-electic Driver Open Load - If DCSM outputs to the passenger seat backrest or cushion TED (circuit pins A, B, C or D at the DCSM connector) or any components within these circuit loops are open, disconnected or a TED resistance greater than 90K ohms is sensed, the DCSM continues normal operation and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AI: DTC B111C - PASSENGER THERMO-ELECTRIC DRIVER OPEN LOAD

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AI1 CHECK THE TED CIRCUITS FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036a
- Disconnect: Cushion TED C3328
- Disconnect: Backrest TED C3326

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Measure the resistance of the following circuits.

DCSM Connector-Pin	Circuit	TED Connector-Pin
C3036a-A	CHS07 (GY/BU)	C3328-1
C3036a-B	RHS07 (BU)	C3328-3
C3036a-C	CHS06 (BU/BN)	C3326-1
C3036a-D	RHS06 (WH)	C3326-3

- **Are the resistances less than 5 ohms?**

  YES : Go to AI2.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AI2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following DCSM C3036a pins, harness side and ground.

Connector-Pin	Circuit
C3036a-A	CHS07 (GY/BU)
C3036a-B	RHS07 (BU)
C3036a-C	CHS06 (BU/BN)
C3036a-D	RHS06 (WH)

- **Is voltage present on any circuit?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

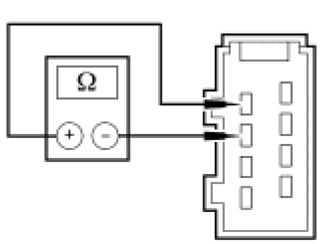
  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AI3.

AI3 CHECK RESISTANCE OF THE TEDs

- Key in OFF position.



N0053766

Fig. 243: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3326 pin 1 and pin 3, component side and between cushion TED C3328 pin 1 and pin 3, component side.

- **Are the resistances between 0.9 and 10 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the backrest TED was **not** between 0.9 and 10 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the cushion TED was **not** between 0.9 and 10 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AJ: DTC B111D - Passenger Blower Driver Overtemperature

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DSCM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B111D Passenger Blower Driver Overtemperature - If the DCSM outputs to the passenger seat blower or any components within these circuit loops are shorted to ground or cause an excessive current draw, the DCSM will overheat, shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AJ: DTC B111D - PASSENGER BLOWER DRIVER OVERTEMPERATURE

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AJ1 CHECK THE BLOWER CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036c
- Disconnect: Cushion TED C3328
- Disconnect: Backrest TED C3326

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

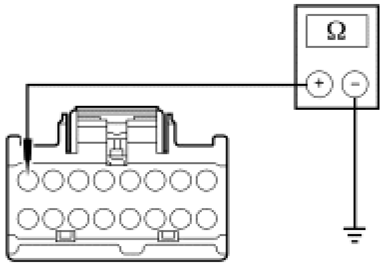


Fig. 244: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to AJ2.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AJ2 CHECK BLOWER CIRCUIT RHS08 (VT/WH) FOR A SHORT TO BLOWER CIRCUIT CHS08 (BN/YE)

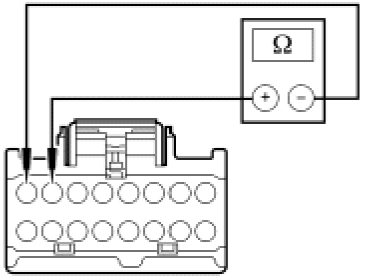

Fig. 245: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-7, circuit RHS08 (VT/WH), harness side and C3036c-8, circuit CHS08 (BN/YE), harness side.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to AJ3.

NO : REPAIR the circuits. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AJ3 CHECK THE BLOWER RESISTANCE

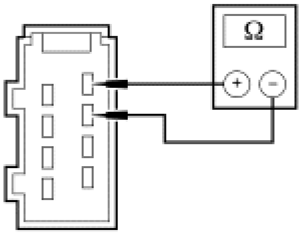

Fig. 246: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3328 pin 2 and pin 4, component side and between backrest TED C3326 pin 2 and pin 4, component side.
- **Are the resistances between 6,000 ohms and 9,000 ohms?**

YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AK: DTC B2729 - Driver Cushion Over-Temp Detected

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B2729 Cushion Over-Temp Detected - In the heating mode, if the driver seat cushion TED temperature exceeds 85°C (185°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.
- DTC B2729 Cushion Over-Temp Detected - In the cooling mode, if the driver seat cushion TED temperature exceeds 70°C (158°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion TED filter
- Crushed or restricted cushion foam pad
- Crushed or restricted climate controlled seat manifold
- Cushion TED assembly
- DCSM

PINPOINT TEST AK: DTC B2729 - DRIVER CUSHION OVER-TEMP DETECTED

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AK1 CHECK THE DCSM FOR DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/DCSM/Retrieve DTCs
- **Was DTC B2729 retrieved during the self-test?**

  YES : Go to AK2.

  NO : Go to AK4.

AK2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b
- Disconnect: Cushion TED C3327

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

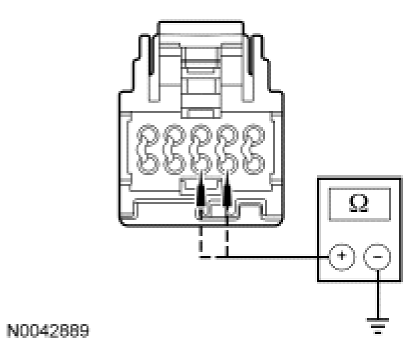

Fig. 247: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-7, circuit VHS26 (VT), harness side and ground and between DCSM C3036b-8, circuit RHS05 (YE/VT), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**
  YES : Go to AK3.
  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AK3 CHECK THE TED THERMISTOR

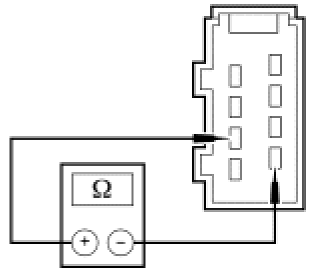

Fig. 248: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3327 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AK4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: **A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.**

- Attempt to recreate the fault. Start the vehicle and set the driver seat to HIGH heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to AK5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between heat and cool modes. REPEAT the self-test. CLEAR the DTCs.

AK5 CHECK OPERATION OF THE SEAT

- With the engine running, set both front seats to HIGH cool (3 LEDs illuminated on HVAC module).
- Compare the airflow from the driver seat cushion and compare it to the airflow from the passenger seat cushion.
- **Is the airflow exhausting from the driver seat cushion comparable to the airflow exhausting from the passenger seat cushion?**

  YES : Go to AK14.

NO : Go to AK6.

AK6 CHECK THE CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the cushion TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AK7.

AK7 CHECK THE CUSHION FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to HIGH cool (3 LEDs illuminated on HVAC module).
- Inspect the cushion blower for operation.
- **Does the cushion blower operate?**

  YES : Go to AK14.

  NO : Go to AK8.

AK8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036c
- Disconnect: Cushion TED C3327

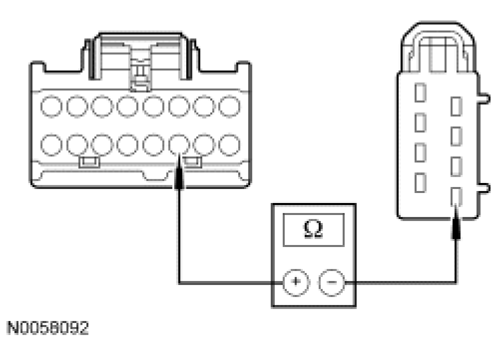

Fig. 249: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3265c-11, circuit VHS18 (BN/GN), harness side and cushion TED C3327-7, circuit VHS18 (BN/GN), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to AK9.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AK9 CHECK BLOWER CIRCUIT RHS03 (GY/OG) FOR A SHORT TO VOLTAGE

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

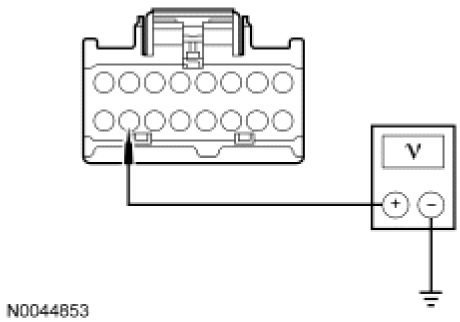

Fig. 250: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-15, circuit RHS03 (GY/OG), harness side and ground.
- **Is voltage greater than one volt?**

YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to AK10.

AK10 CHECK BLOWER CIRCUIT CHS03 (GN/BN) FOR A SHORT TO GROUND

- Key in OFF position.

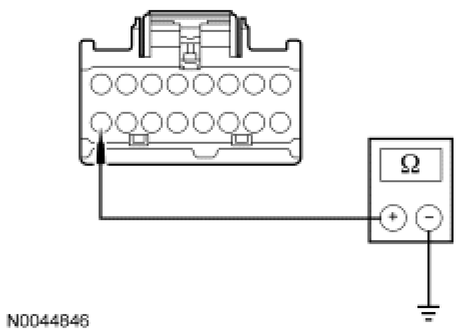

Fig. 251: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AK11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AK11 CHECK BLOWER CIRCUITS RHS03 (GY/OG) AND CHS03 (GN/BN) FOR AN OPEN

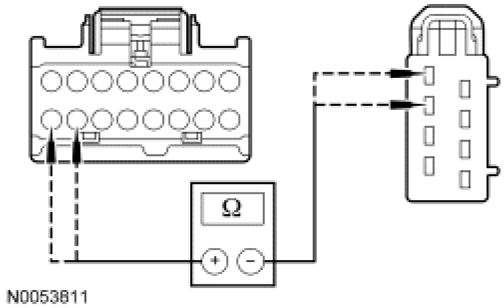

Fig. 252: Measuring Resistance

Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and cushion TED C3327-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3036c-15, circuit RHS03 (GY/OG), harness side and cushion TED C3327-4, circuit RHS03 (GY/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AK12.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

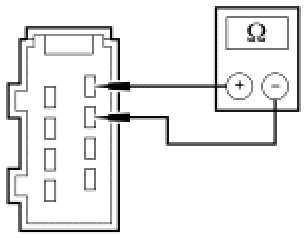
DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AK12 CHECK THE BLOWER RESISTANCE



N0053768

Fig. 253: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3327 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : Go to AK13.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AK13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

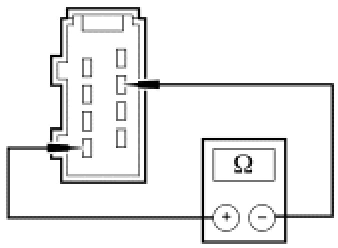


Fig. 254: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3327 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AK14.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AK14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT CUSHION

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:

- Is the TED correctly installed?
- Is the seat cushion foam pad crushed or restricted?
- Is the climate controlled seat manifold crushed or restricted?

- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : CONNECT the battery ground cable.

  INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. INSTALL the driver seat. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AL: DTC B272A - Passenger Cushion Over-Temp Detected

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B272A Passenger Cushion Over-Temp Detected - In the cooling mode, if the passenger seat cushion TED temperature exceeds 70°C (158°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.
- DTC B272A Passenger Cushion Over-Temp Detected - In the heating mode, if the passenger seat cushion TED temperature exceeds 85°C (185°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion TED filter
- Crushed or restricted cushion foam pad
- Crushed or restricted climate controlled seat manifold
- Cushion TED assembly
- DCSM

PINPOINT TEST AL: DTC B272A - PASSENGER CUSHION OVER-TEMP DETECTED

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AL1 CHECK THE DCSM FOR DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/DCSM/Retrieve DTCs
- **Was DTC B272A retrieved during the self-test?**

  YES : Go to AL2.

  NO : Go to AL4.

AL2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b

- Disconnect: Cushion TED C3328

> **WARNING:** **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

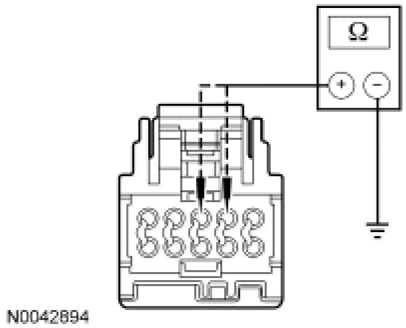

Fig. 255: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-2, circuit VHS27 (WH/OG), harness side and ground and between DCSM C3036b-3, circuit RHS10 (BU/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AL3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AL3 CHECK THE TED THERMISTOR

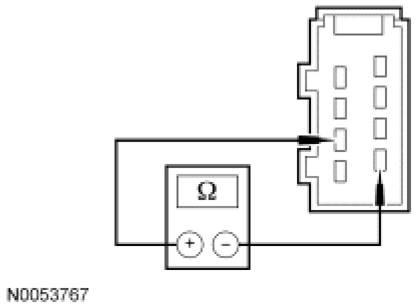

Fig. 256: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3328 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AL4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.

- Attempt to recreate the fault. Start the vehicle and set the passenger seat to HIGH heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to AL5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between heat and cool modes. REPEAT the self-test. CLEAR the DTCs.

AL5 CHECK OPERATION OF THE SEAT

- Key in ON position.
- With the engine running, set both front seats to HIGH cool (3 LEDs illuminated on HVAC module).
- Compare the airflow from the passenger seat cushion and compare it to the airflow from the driver seat cushion.
- **Is the airflow exhausting from the passenger seat cushion comparable to the airflow exhausting from the driver seat cushion?**

  YES : Go to AL14.

  NO : Go to AL6.

AL6 CHECK THE CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the cushion TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AL7.

AL7 CHECK THE CUSHION FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to HIGH cool (3 LEDs illuminated on HVAC module).
- Inspect the cushion blower for operation.
- **Does the cushion blower operate?**

  YES : Go to AL14.

NO : Go to AL8.

AL8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036c
- Disconnect: Cushion TED C3328

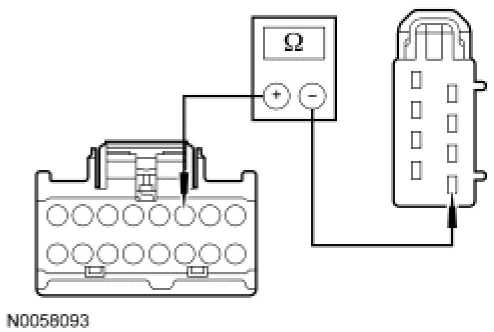

Fig. 257: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-3, circuit VHS23 (BN/BU), harness side and cushion TED C3328-7, circuit VHS23 (BN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to AL9.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AL9 CHECK THE BLOWER CIRCUIT RHS08 (VT/WH) FOR A SHORT TO VOLTAGE

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

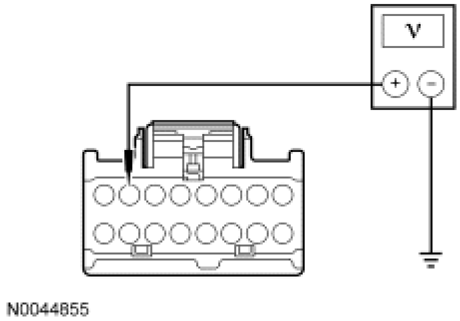

Fig. 258: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-7, circuit RHS08 (VT/WH), harness side and ground.
- **Is voltage greater than one volt?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AL10.

AL10 CHECK BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO GROUND

- Key in OFF position.

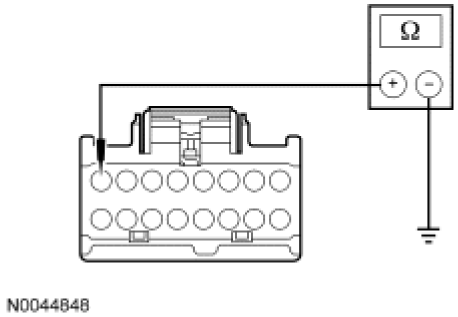

Fig. 259: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AL11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AL11 CHECK BLOWER CIRCUITS CHS08 (BN/YE) AND RHS08 (VT/WH) FOR AN OPEN

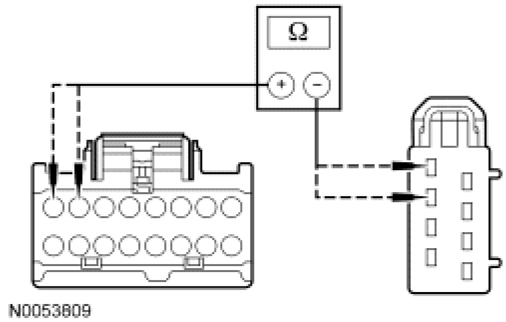

Fig. 260: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and cushion TED C3328-2, circuit CHS08 (BN/YE), harness side; and between DCSM C3036c-7, circuit RHS08 (VT/WH), harness side and cushion TED C3328-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

YES : Go to AL12.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AL12 CHECK THE BLOWER RESISTANCE

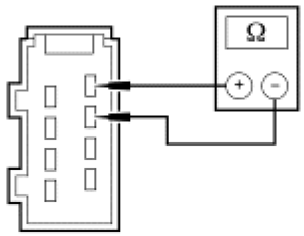

Fig. 261: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between cushion TED C3328 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

YES : Go to AL13.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AL13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

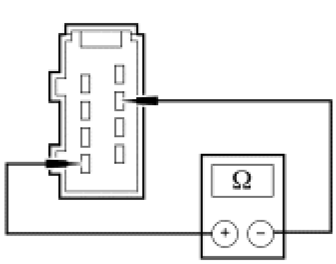

Fig. 262: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 7 and

the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between cushion TED C3328 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AL14.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AL14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT CUSHION

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:
  - Is the TED correctly installed?
  - Is the seat cushion foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : CONNECT the battery ground cable.

  INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. INSTALL the passenger seat. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AM: DTC B272B - Passenger Back Over-Temp Detected

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B272B Passenger Back Over-Temp Detected - In the cooling mode, if the passenger seat backrest TED temperature exceeds 70°C (158°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.
- DTC B272B Passenger Back Over-Temp Detected - In the heating mode, if the passenger seat backrest TED temperature exceeds 85°C (185°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted backrest TED filter
- Crushed or restricted backrest foam pad
- Crushed or restricted climate controlled seat manifold
- Backrest TED assembly
- DCSM

PINPOINT TEST AM: DTC B272B - PASSENGER BACK OVER-TEMP DETECTED

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AM1 CHECK THE DCSM FOR DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/DCSM/Retrieve DTCs
- **Was DTC B272B retrieved during the self-test?**

  YES : Go to AM2.

  NO : Go to AM4.

AM2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b
- Disconnect: Backrest TED C3326

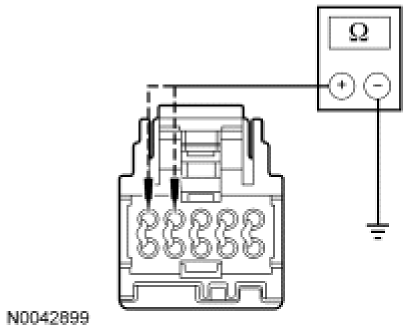

Fig. 263: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-4, circuit VHS36 (YE/BU), harness side and ground and between DCSM C3036b-5, circuit RHS20 (GN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AM3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AM3 CHECK THE TED THERMISTOR

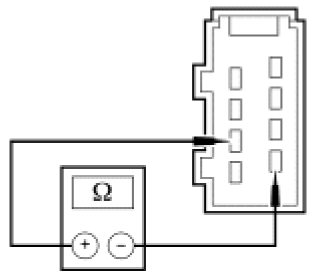

Fig. 264: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3326 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AM4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: A crushed seat backrest foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.

- Attempt to recreate the fault. Start the vehicle and set the front passenger seat to HIGH heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to AM5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between heat and cool modes. REPEAT the self-test. CLEAR the DTCs.

AM5 CHECK OPERATION OF THE SEAT

- Key in ON position.
- With the engine running, set both front seats to HIGH cool (3 LEDs illuminated on HVAC module).
- Compare the airflow from the front passenger seat backrest and compare it to the airflow from the driver seat backrest.
- **Is the airflow exhausting from the front passenger seat backrest comparable to the airflow exhausting from the driver seat backrest?**

  YES : Go to AM14.

  NO : Go to AM6.

AM6 CHECK THE BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the backrest TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AM7.

AM7 CHECK THE BACKREST FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to HIGH cool (3 LEDs illuminated on HVAC module).

- Inspect the backrest blower for operation.
- **Does the backrest blower operate?**

  YES : Go to AM14.

  NO : Go to AM8.

AM8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036c
- Disconnect: Backrest TED C3326

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

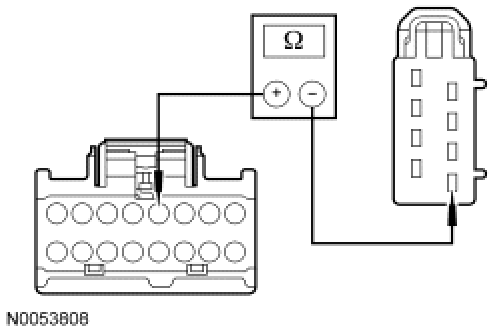

Fig. 265: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-4, circuit VHS21 (BU/WH), harness side and backrest TED C3326-7, circuit VHS21 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to AM9.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AM9 CHECK THE BLOWER CIRCUIT RHS08 (VT/WH) FOR A SHORT TO VOLTAGE

- Key in ON position.

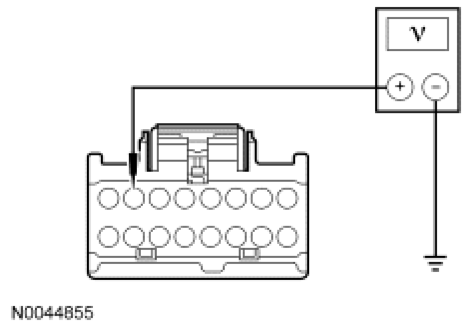

Fig. 266: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-7, circuit RHS08 (VT/WH), harness side and ground.
- **Is voltage greater than one volt?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AM10.

AM10 CHECK THE BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO GROUND

- Key in OFF position.

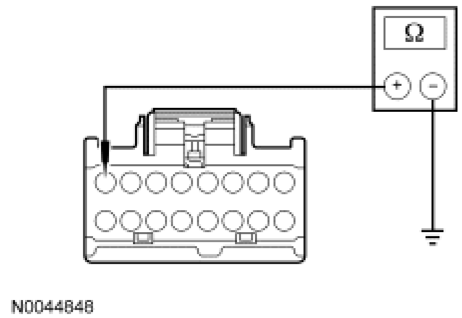

Fig. 267: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and

ground.

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AM11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AM11 CHECK THE BLOWER CIRCUITS RHS08 (VT/WH) AND CHS08 (BN/YE) FOR AN OPEN

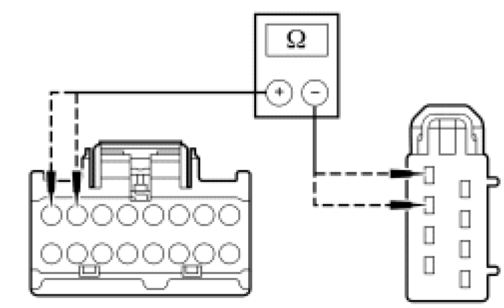

Fig. 268: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and backrest TED C3326-2, circuit CHS08 (BN/YE), harness side; and between DCSM C3036c-7, circuit RHS08 (VT/WH), harness side and backrest TED C3326-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AM12.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AM12 CHECK THE BLOWER RESISTANCE

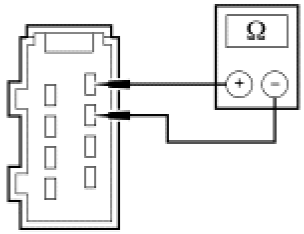

Fig. 269: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3326 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

YES : Go to AM13.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AM13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

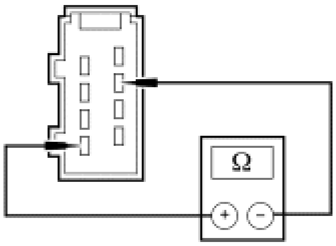

Fig. 270: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 7 and**

the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between backrest TED C3326 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AM14.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AM14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT BACKREST

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : CONNECT the battery ground cable.

  INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AN: DTC B272C - Driver Differential Temperature Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on the seat are reporting temperatures to the DCSM with a difference between them of 60°C (108°F) or greater. This can result from an air flow restriction or a circuit fault of either TED. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and not be the area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

- DTC B272C Driver Differential Temperature Fault - If there is a temperature differential between the driver backrest and cushion TED of 60°C (108°F) or more for more than 4 seconds, the TED is disconnected or the duct is blocked, this DTC will set. When this happens the first time in a key cycle, the DCSM puts the driver seat system into recovery mode (see principles of operation). If the system is able to recover, it will function normally. If the system is able to recover and it occurs a second time in the same key cycle, the DCSM will shut down the driver seat system.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Restricted cushion or backrest TED filter
- Crushed or restricted cushion or backrest foam pad
- Crushed or restricted cushion or backrest climate controlled seat manifold
- Cushion or backrest TED assembly
- DCSM

PINPOINT TEST AN: DTC B272C - DRIVER DIFFERENTIAL TEMPERATURE FAULT

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AN1 CHECK THE DCSM FOR DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/DCSM/Retrieve DTCs
- **Was DTC B2729 or B2730 retrieved in the self-test as an on-demand or a continuous DTC?**

  YES : For DTC B2729, go to **Pinpoint Test AK**. For DTC B2730, go to **Pinpoint Test AP**.

  NO : Go to AN2.

AN2 MONITOR THE DCSM TED TEMPERATURE PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM PIDs
  - Passenger Cushion Thermal Electric Device (TED) Temperature (PCSHTMP)
  - Passenger Back TED Temperature (PBKTMP)
  - Seat cushion thermal electric device temperature (CSHTEMP)
  - Seat back thermal electric device temperature (BK_TEMP)

NOTE: **Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs. Not allowing stabilization can cause incorrect readings and lead to incorrect identification of components that are not faulty.**

- Monitor the TED temperature PIDs with the climate controlled seats OFF. Compare the PID values of the driver seat to those of the front passenger seat. This can help identify if there is a concern with the driver seat cushion or backrest PID readings.
- **Are both driver seat TED temperature PID values within 10°C (18°F) of the ambient temperature?**

  YES : Go to AN3.

  NO : If the driver seat cushion PID value varies 10°C (18°F) or more from ambient temperature, go to AN16.

  If the driver seat backrest PID value varies 10°C (18°F) or more from ambient temperature, go to

AN31.

AN3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR THE BACKREST

- Key in OFF position.
- Key in ON position.

NOTE: **A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.**

NOTE: **If the seat shuts down before a 15-minute heat cycle has timed-out, carry out the DCSM self test and go to the Dual Climate Controlled Seat Module (DCSM) DTC Chart to continue diagnostics.**

- After cycling the ignition switch and with the engine running, set the driver seat to high heat (3 LEDs illuminated on HVAC module). Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the driver seat. If necessary, when the seat times-out after 15 minutes, set the driver seat to high heat once again.
- **Do the driver seat cushion TED and backrest TED PIDs vary more than 60°C (108°F) from each other?**

  YES : If the driver seat cushion PID value is 60°C (108°F) hotter than the backrest PID value, go to AN5.

  If the driver seat backrest PID value is 60°C (108°F) hotter than the cushion PID value, go to AN20.

  NO : Go to AN4.

AN4 CHECK THE TEDs COOLING PERFORMANCE

- Check the TEDs cooling performance on the driver seat. Refer to **Component Test** - Thermo-Electric Device (TED) Cooling Performance.
- **Did the TEDs pass the component test?**

  YES : The DTC may have been set by extreme cabin temperatures or excessive sun-load on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If a concern cannot be found or duplicated, RETURN the vehicle to the customer.

  NO : CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold, air ducts and foam pad). CHECK for airflow restrictions (TED inlets and outlets, TED-to-manifold connections, filters and ducts) and REPAIR as needed. CHECK for an intermittent wiring fault. REPAIR as needed. REPEAT the self-test. CLEAR the DTCs.

AN5 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT CUSHION

- Key in OFF position.

- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:
  - Is the cushion blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat cushion foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : Go to AN6.

  NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN6 CHECK BACKREST TED CIRCUIT RHS01 (WH/VT) FOR SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036a

NOTE: **Do not connect the seat side air bag electrical connector at this time.**

- Position the driver seat in the vehicle and connect the seat-to-floor connectors.

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

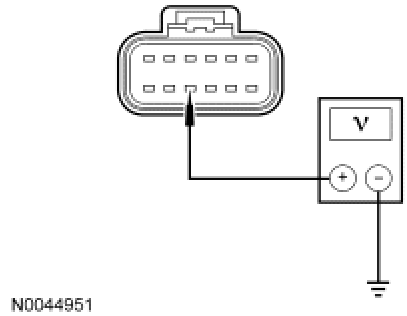

Fig. 271: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-K, circuit RHS01 (WH/VT), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AN7.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN7 CHECK BACKREST TED CIRCUIT CHS01 (GY/VT) FOR SHORT TO GROUND

- Key in OFF position.

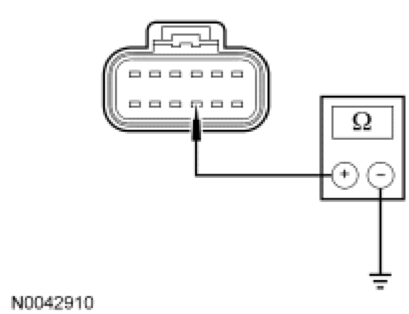

Fig. 272: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-J, circuit CHS01 (GY/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to AN8.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN8 CHECK RESISTANCE OF THE BACKREST TED AND WIRING

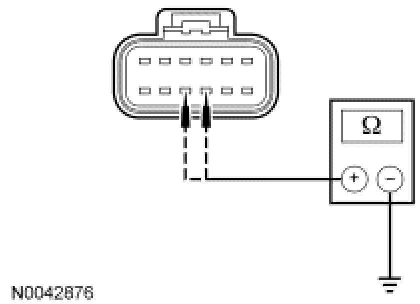

Fig. 273: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-J, circuit CHS01 (GY/VT), harness side and DCSM C3036a-K, circuit RHS01 (WH/VT), harness side.
- **Is the resistance between 0.9 and 10 ohms?**

YES : Go to AN10.

NO : Go to AN9.

AN9 CHECK RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3322

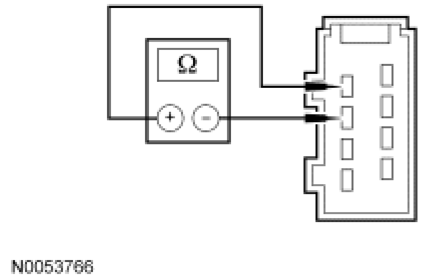

Fig. 274: Measuring Resistance

Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3322 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN10 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3036c
- Key in ON position.

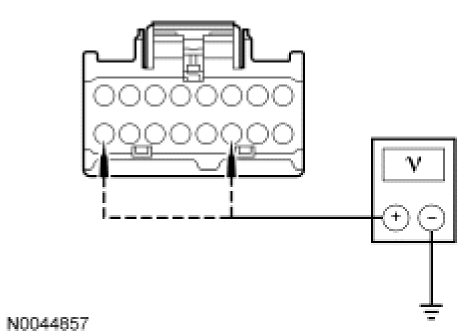

Fig. 275: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3036c-11, circuit VHS18 (BN/GN), harness side and ground.
- **Are the voltages less than one volt?**

YES : Go to AN11.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN11 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.

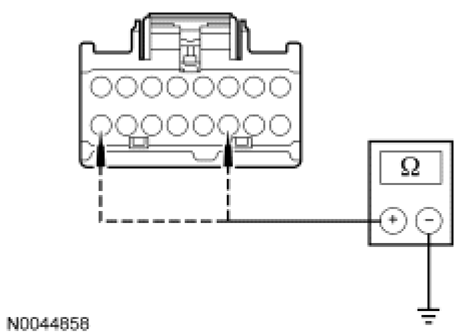

Fig. 276: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3036c-11, circuit VHS18 (BN/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

YES : Go to AN12.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN12 CHECK THE BLOWER AND WIRING

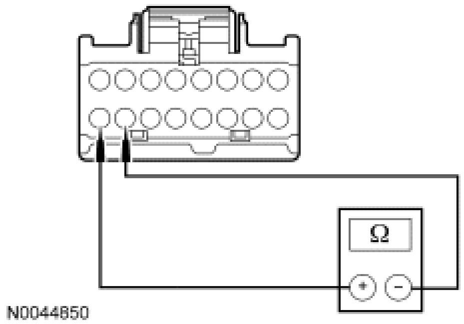

Fig. 277: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to dual climate controlled seat module (DCSM) C3036c-16, circuit CHS03 (GN/BN) and the negative lead to DCSM C3036c-15, circuit RHS03 (GY/OG) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and DCSM C3036c-15, circuit RHS03 (GY/OG), harness side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : Go to AN14.

  NO : Go to AN13.

AN13 CHECK THE BLOWER

- Disconnect: Cushion TED C3327

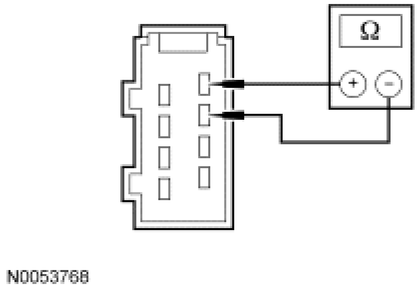

Fig. 278: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3327 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN14 CHECK BLOWER SPEED CONTROL AND BLOWER GROUND CIRCUIT

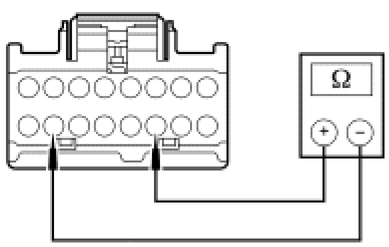

Fig. 279: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to C3036c-11, circuit VHS18 (BN/GN), harness side and the negative lead to C3036c-15, circuit RHS03 (GY/OG), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3036c-11, circuit VHS18 (BN/GN) harness side and DCSM C3036c-15, circuit RHS03 (GY/OG), harness side.

- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AN16.

  NO : Go to AN15.

AN15 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Cushion TED C3327

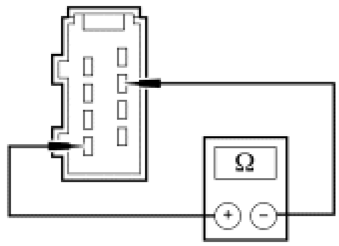

Fig. 280: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3327 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN16 CHECK THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

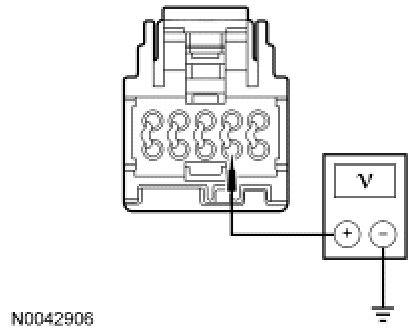

Fig. 281: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036b-7, circuit VHS26 (VT), harness side and ground.
- **Is the voltage less than 0.5 volt?**

YES : Go to AN17.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN17 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.

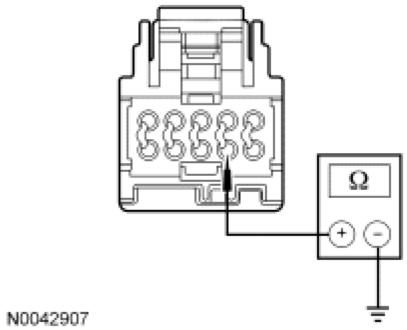

Fig. 282: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-7, circuit VHS26 (VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AN18.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN18 CHECK THE THERMISTOR AND WIRING

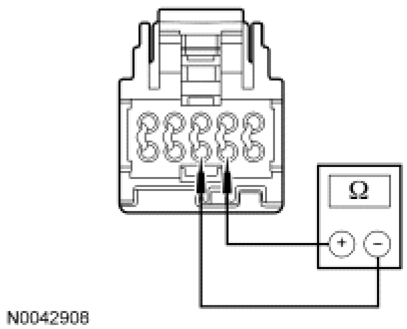

Fig. 283: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-7, circuit VHS26 (VT), harness side and DCSM C3036b-8, circuit RHS05 (YE/VT), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AN19.

AN19 CHECK THE THERMISTOR

- Disconnect: Cushion TED C3327

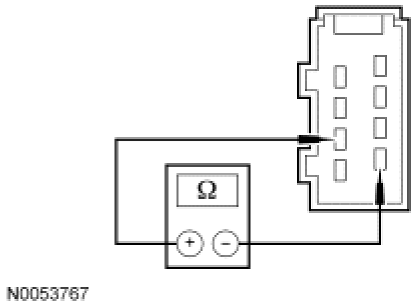

Fig. 284: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN20 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT BACKREST

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Remove the seat. Refer to **Seat - Front**.

- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the backrest blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : Go to AN21.

  NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN21 CHECK THE CUSHION TED CIRCUIT RHS02 (BU/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036a

NOTE: Do not connect the seat side air bag electrical connector at this time.

- Position the driver seat in the vehicle and connect the seat-to-floor connectors.

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

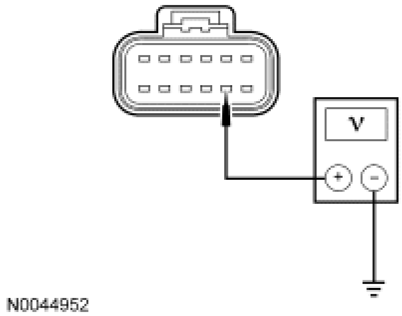

Fig. 285: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-H, circuit RHS02 (BU/OG), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AN22.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN22 CHECK CUSHION TED CIRCUIT CHS02 (YE/BU) FOR SHORT TO GROUND

- Key in OFF position.

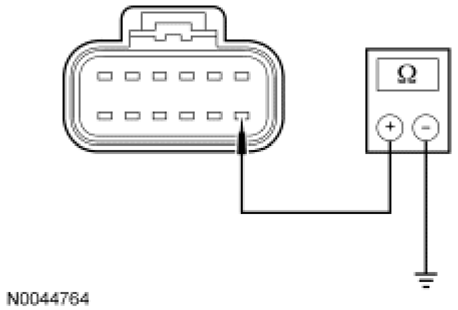

Fig. 286: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-G, circuit CHS02 (YE/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AN23.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN23 CHECK RESISTANCE OF THE CUSHION TED AND WIRING

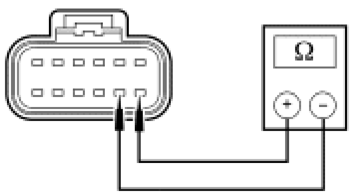

Fig. 287: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-G circuit CHS02 (YE/BU), harness side and DCSM C3036a-H, circuit RHS02 (BU/OG), harness side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : Go to AN25.

  NO : Go to AN24.

AN24 CHECK RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3327

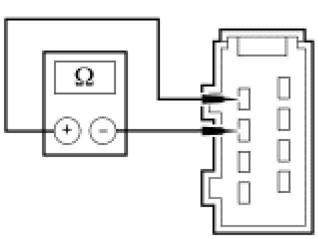

Fig. 288: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3327 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN25 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3036c
- Key in ON position.

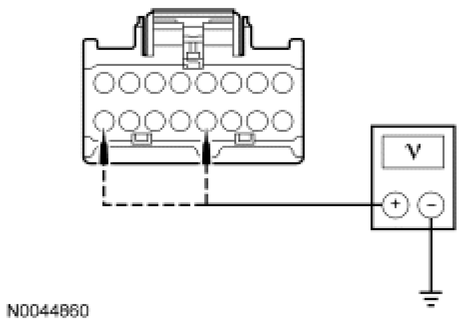

Fig. 289: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3036c-12, circuit VHS16 (BU/GN), harness side and ground.
- **Are the voltages less than one volt?**

  YES : Go to AN26.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN26 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.

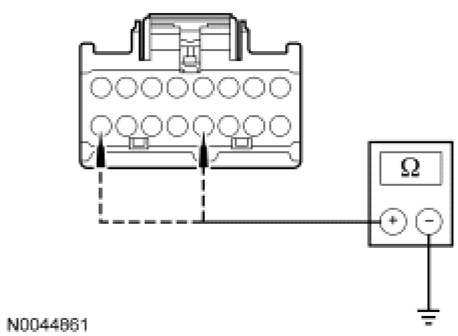

Fig. 290: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3036c-12, circuit VHS16 (BU/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AN27.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN27 CHECK THE BLOWER AND WIRING

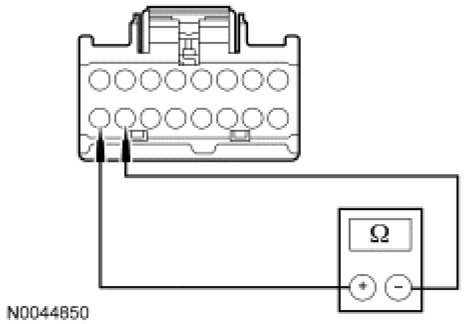

Fig. 291: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to DCSM C3036c-16, circuit CHS03 (GN/BN) and the negative lead to DCSM C3036c-15, circuit RHS03 (GY/OG) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and DCSM C3036c-15, circuit RHS03 (GY/OG), harness side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : Go to AN29.

  NO : Go to AN28.

AN28 CHECK THE BLOWER

- Disconnect: Backrest TED C3322

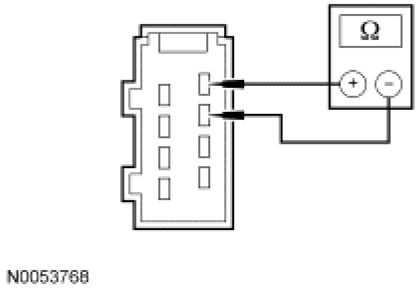

Fig. 292: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3322 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN29 CHECK BLOWER SPEED CONTROL AND CIRCUIT

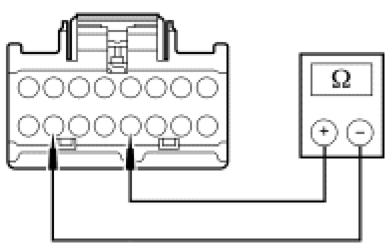

Fig. 293: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to C3036c-12, circuit VHS16 (BU/GN), harness side and the negative lead to C3036c-15, circuit RHS03 (GY/OG), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3036c-12, circuit VHS16 (BU/GN) harness side and DCSM C3036c-15, circuit RHS03 (GY/OG), harness side.

- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AN31.

  NO : Go to AN30.

AN30 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Backrest TED C3322

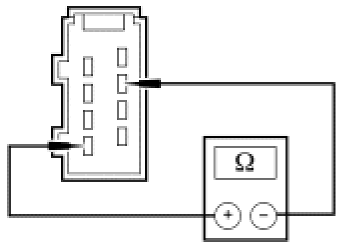

Fig. 294: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3322 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN31 CHECK THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

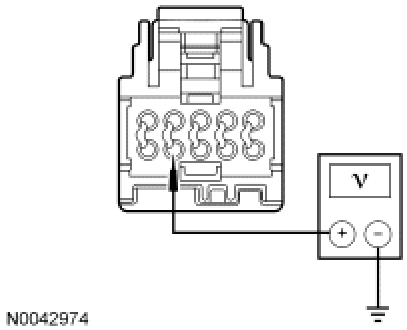

Fig. 295: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036b-9, circuit VHS35 (VT/OG), harness side and ground.
- **Is the voltage less than 0.5 volt?**

YES : Go to AN32.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN32 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.

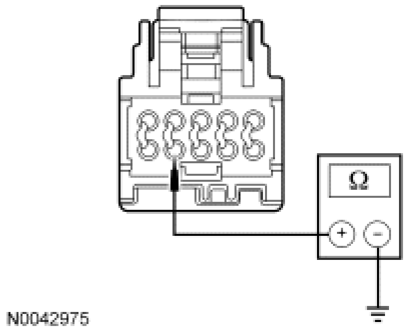

Fig. 296: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-9, circuit VHS35 (VT/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AN33.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AN33 CHECK THE THERMISTOR AND WIRING

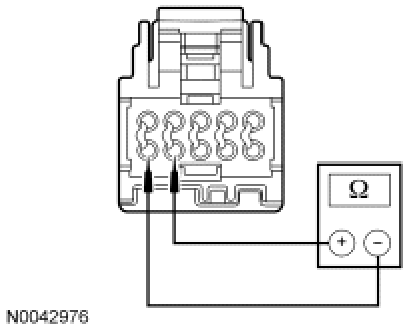

Fig. 297: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-9, circuit VHS35 (VT/OG), harness side and

DCSM C3036b-10, circuit RHS15 (GY/BN), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : INSTALL a new DCSM and CARRY OUT PMI. REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AN34.

AN34 CHECK THE THERMISTOR

- Disconnect: Backrest TED C3322

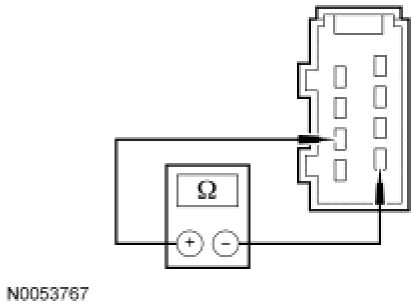

Fig. 298: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AO: DTC B272D - Passenger Differential Temperature Fault

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on the seat are reporting temperatures to the DCSM with a difference between them of 60°C (108°F) or greater. This can result from an air flow restriction or a circuit fault of either TED. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and not be the area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

- DTC B272D Passenger Differential Temperature Fault - If there is a temperature differential between the passenger backrest and cushion TED of 60°C (108°F) or more for more than 4 seconds, the TED is disconnected or the duct is blocked, this DTC will set. When this happens the first time in a key cycle, the DCSM puts the passenger seat system into recovery mode (see principles of operation). If the system is able to recover, it will function normally. If the system is able to recover and it occurs a second time in the same key cycle, the DCSM will shut down the passenger seat system.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion or backrest TED filter
- Crushed or restricted cushion or backrest foam pad
- Crushed or restricted cushion or backrest climate controlled seat manifold
- Cushion or backrest TED assembly
- DCSM

PINPOINT TEST AO: DTC B272D - PASSENGER DIFFERENTIAL TEMPERATURE FAULT

NOTE:	**The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AO1 CHECK THE DCSM FOR DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/DCSM/Retrieve DTCs
- **Was DTC B272A or B272B retrieved in the self-test as an on-demand or a continuous DTC?**

  YES : For DTC B272A, go to **Pinpoint Test AL**. For DTC B272B, go to **Pinpoint Test AM**.

  NO : Go to AO2.

AO2 MONITOR THE DCSM TED TEMPERATURE PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM PIDs
  - Passenger cushion thermal electric device (TED) temperature (PCSHTMP)
  - Passenger back TED temperature (PBKTMP)
  - Seat cushion thermal electric device temperature (CSHTEMP)
  - Seat back thermal electric device temperature (BK_TEMP)

NOTE: Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs. Not allowing stabilization can cause incorrect readings and lead to incorrect identification of components that are not faulty.

- Monitor the TED temperature PIDs with the climate controlled seats off. Compare the PIDs of the front passenger seat to those of the driver seat, this can help identify if there is a concern with the front passenger seat cushion or backrest PID readings.
- **Are both front passenger seat TED temperature PIDs within 10°C (18°F) of the ambient temperature?**

  YES : Go to AO3.

  NO : If the front passenger seat cushion PID varies 10°C (18°F) or more from ambient temperature, go to AO16.

  If the front passenger seat backrest PID varies 10°C (18°F) or more from ambient temperature, go to AO31.

AO3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR THE BACKREST

- Key in OFF position.
- Key in ON position.

NOTE: A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.

NOTE: If the seat shuts down before a 15-minute heat cycle has timed-out,

carry out the DCSM self test and go to the Dual Climate Controlled Seat Module (DCSM) DTC Chart to continue diagnostics.

- After cycling the ignition switch and with the engine running, set the driver seat to high heat (3 LEDs illuminated on HVAC module). Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the driver seat. If necessary, when the seat times-out after 15 minutes, set the driver seat to high heat once again.
- **Do the driver seat cushion TED and backrest TED PIDs vary more than 60°C (108°F) from each other?**

  YES : If the front passenger seat cushion PID is 60°C (108°F) hotter than the backrest PID, go to AO5.

  If the front passenger seat backrest PID is 60°C (108°F) hotter than the cushion PID, go to AO20.

  NO : Go to AO4.

AO4 CHECK THE TED COOLING PERFORMANCE

- Check the TEDs cooling performance on the passenger seat. Refer to **Component Test** - Thermo-Electric Device (TED) Cooling Performance.
- **Did the TEDs pass the component test?**

  YES : The DTC may have been set by extreme cabin temperatures or excessive sun-load on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If a concern cannot be found or duplicated, RETURN the vehicle to the customer.

  NO : CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold, air ducts and foam pad). CHECK for airflow restrictions (TED inlets and outlets, TED-to-manifold connections, filters and ducts) and REPAIR as needed. CHECK for an intermittent wiring fault. REPAIR as needed. REPEAT the self-test. CLEAR the DTCs.

AO5 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT CUSHION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:
  - Is the cushion blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat cushion foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

YES : Go to AO6.

NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO6 CHECK THE BACKREST TED CIRCUIT RHS06 (WH) FOR SHORT TO VOLTAGE

- Disconnect: DCSM C3036a

NOTE: Do not connect the seat side air bag electrical connector at this time.

- Position the front passenger seat in the vehicle and connect the seat-to-floor connectors.

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

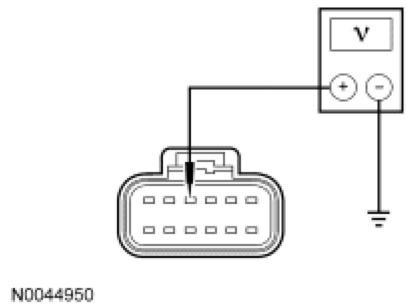

Fig. 299: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-D, circuit RHS06 (WH), harness side and ground.
- **Is the voltage less than 0.5 volt?**

YES : Go to AO7.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO7 CHECK THE BACKREST TED CIRCUIT CHS06 (BU/BN) FOR SHORT TO GROUND

- Key in OFF position.

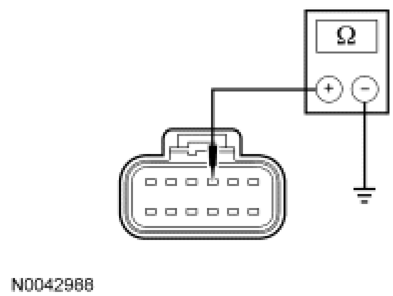

Fig. 300: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-C, circuit CHS06 (BU/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AO8.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO8 CHECK RESISTANCE OF THE BACKREST TED AND WIRING

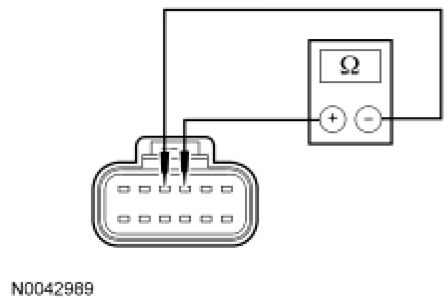

Fig. 301: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-C, circuit CHS06 (BU/BN), harness side and

DCSM C3036a-D, circuit RHS06 (WH), harness side.

- **Is the resistance between 0.9 and 10 ohms?**

  YES : Go to AO10.

  NO : Go to AO9.

AO9 CHECK RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3326

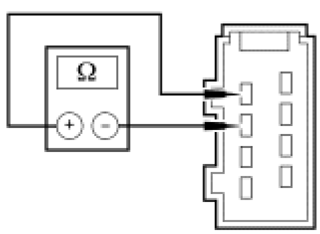

Fig. 302: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3326 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO10 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3036c
- Key in ON position.

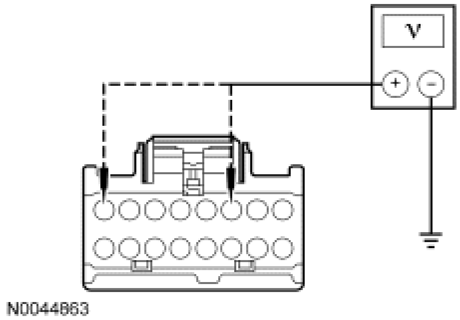

Fig. 303: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3036c-3, circuit VHS23 (BN/BU), harness side and ground.
- **Are the voltages less than 1 volt?**

  YES : Go to AO11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO11 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.

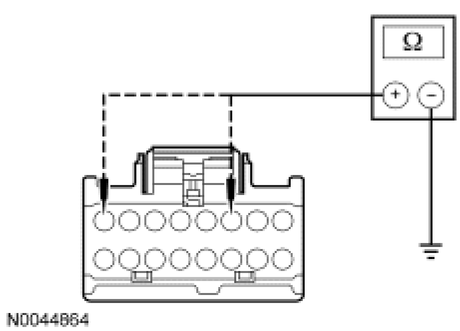

Fig. 304: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3036c-3, circuit VHS23 (BN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AO12.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO12 CHECK THE BLOWER AND WIRING

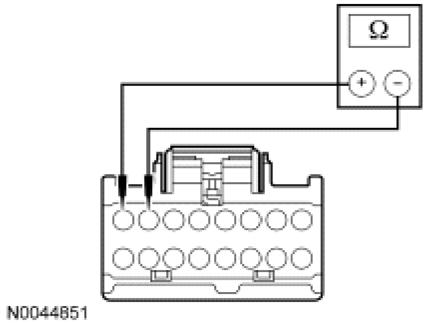

Fig. 305: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to dual climate controlled seat module (DCSM) C3036c-8, circuit CHS08 (BN/YE) and the negative lead to DCSM C3036c-7, circuit RHS08 (VT/WH) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and DCSM C3036c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : Go to AO14.

  NO : Go to AO13.

AO13 CHECK THE BLOWER

- Disconnect: Cushion TED C3328

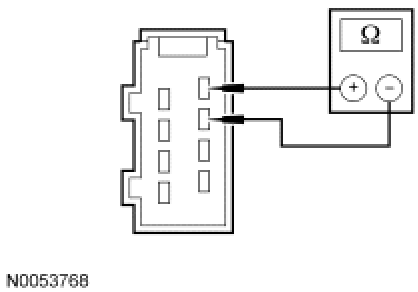

Fig. 306: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3328 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO14 CHECK BLOWER SPEED CONTROL AND CIRCUIT

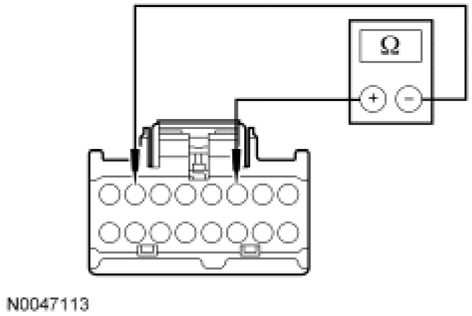

Fig. 307: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to C3036c-3, circuit VHS23 (BN/BU), harness side and the negative lead to C3036c-7, circuit RHS08 (VT/WH), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3036c-3, circuit VHS23 (BN/BU) harness side and DCSM C3036c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AO16.

  NO : Go to AO15.

AO15 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Cushion TED C3328

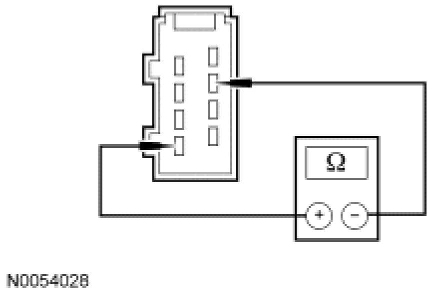

Fig. 308: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3328 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO16 CHECK THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

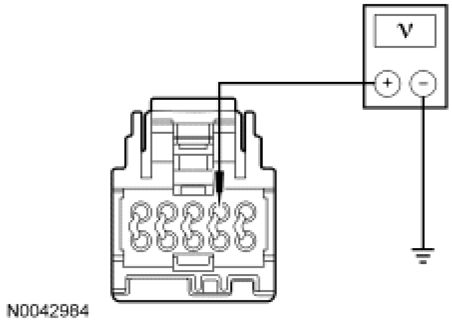

Fig. 309: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036b-2, circuit VHS27 (WH/OG), harness side and ground.
- **Is the voltage less than 0.5 volt?**

YES : Go to AO17.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO17 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.

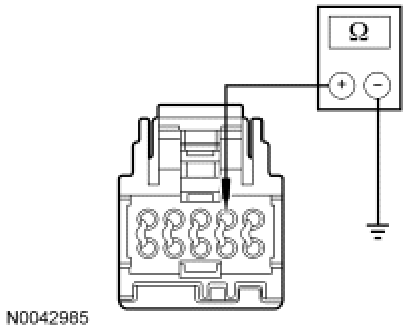

Fig. 310: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-2, circuit VHS27 (WH/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to AO18.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO18 CHECK THE THERMISTOR AND WIRING

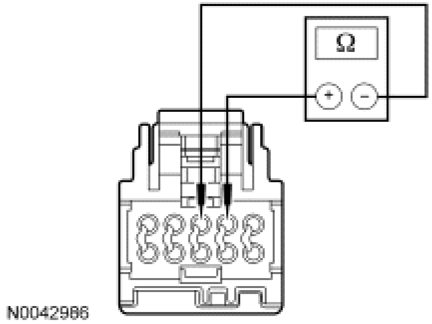

Fig. 311: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-2, circuit VHS27 (WH/OG), harness side and DCSM C3036b-3, circuit RHS10 (BU/OG), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AO19.

AO19 CHECK THE THERMISTOR

- Disconnect: Cushion TED C3328

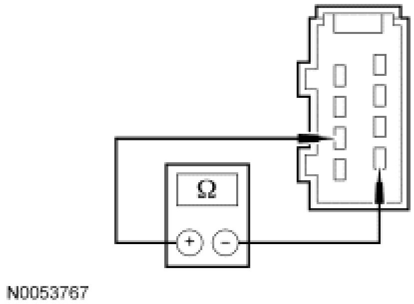

Fig. 312: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO20 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT BACKREST

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the backrest blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : Go to AO21.

  NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO21 CHECK CUSHION TED CIRCUIT RHS07 (BU) FOR SHORT TO VOLTAGE

- Disconnect: DCSM C3036a

NOTE: **Do not connect the seat side air bag electrical connector at this time.**

- Position the front passenger seat in the vehicle and connect the seat-to-floor connectors.

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

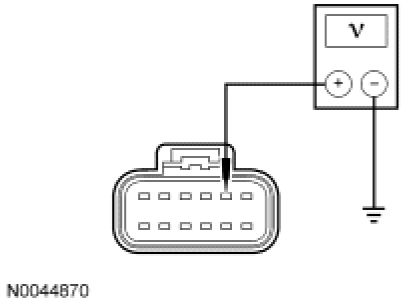

Fig. 313: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036a-B, circuit RHS07 (BU), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AO22.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO22 CHECK THE CUSHION TED CIRCUIT CHS07 (GY/BU) FOR SHORT TO GROUND

- Key in OFF position.

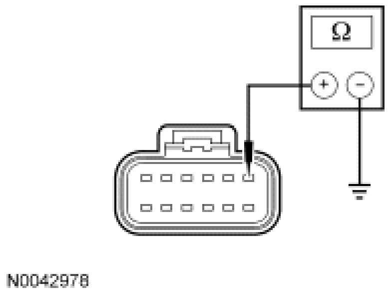

Fig. 314: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-A, circuit CHS07 (GY/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AO23.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO23 CHECK RESISTANCE OF THE CUSHION TED AND WIRING

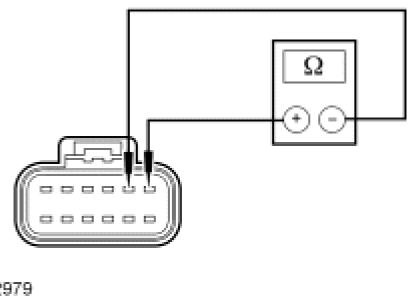

Fig. 315: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036a-A circuit CHS07 (GY/BU), harness side and DCSM C3036a-B, circuit RHS07 (BU), harness side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : Go to AO25.

  NO : Go to AO24.

AO24 CHECK RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3328

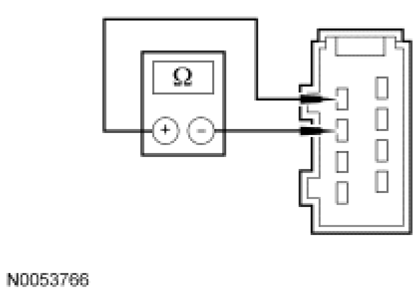

Fig. 316: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3328 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO25 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3036c
- Key in ON position.

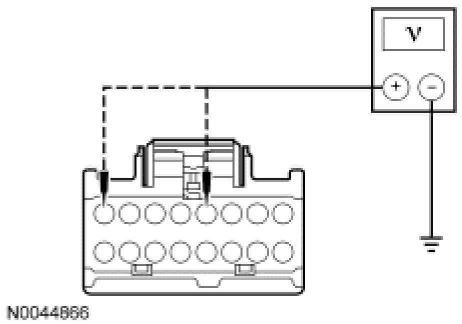

Fig. 317: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3036c-4, circuit VHS21 (BU/WH), harness side and ground.
- **Are the voltages less than one volt?**

  YES : Go to AO26.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO26 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO

GROUND

- Key in OFF position.

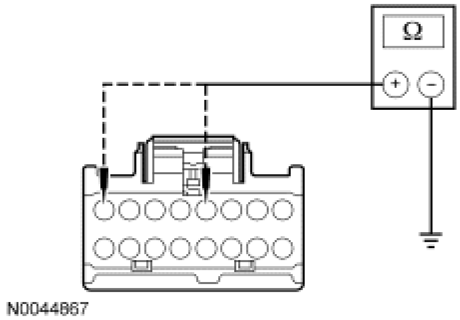

Fig. 318: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3036c-4, circuit VHS21 (BU/WH), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AO27.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO27 CHECK THE BLOWER AND WIRING

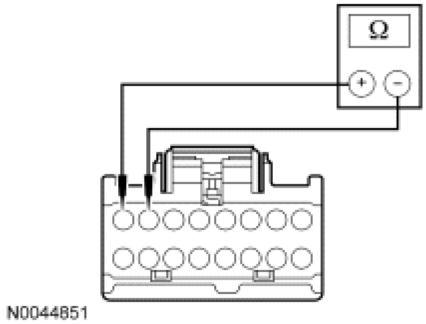

Fig. 319: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to dual climate controlled seat module (DCSM) C3036c-8, circuit CHS08 (BN/YE) and the negative lead to DCSM C3036c-7, circuit RHS08**

(VT/WH) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

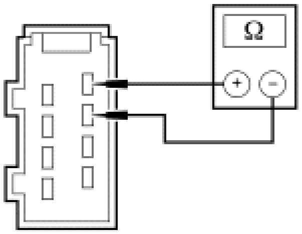
- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and DCSM C3036c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : Go to AO29.

  NO : Go to AO28.

AO28 CHECK THE BLOWER

- Disconnect: Backrest TED C3326



N0053768

Fig. 320: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3326 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO29 CHECK BLOWER SPEED CONTROL AND CIRCUIT

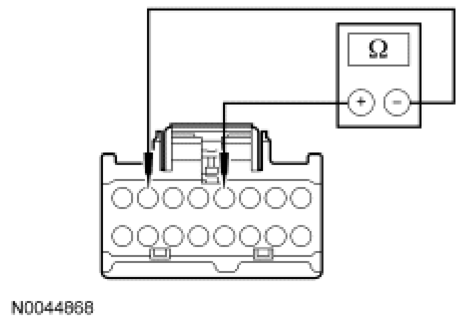


Fig. 321: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to C3036c-4, circuit VHS21 (BU/WH), harness side and the negative lead to C3036c-7, circuit RHS08 (VT/WH), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between DCSM C3036c-4, circuit VHS21 (BU/WH) harness side and DCSM C3036c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 290K ohms and 420K ohms?**

YES : Go to AO31.

NO : Go to AO30.

AO30 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Backrest TED C3326

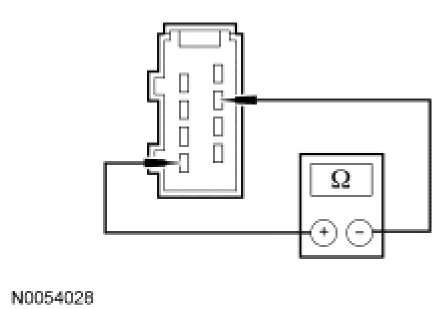

Fig. 322: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between backrest TED C3326 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO31 CHECK THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

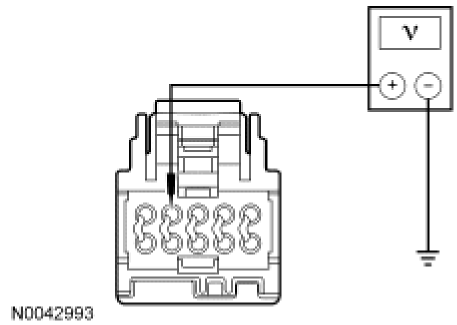

Fig. 323: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036b-4, circuit VHS36 (YE/BU), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AO32.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO32 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.

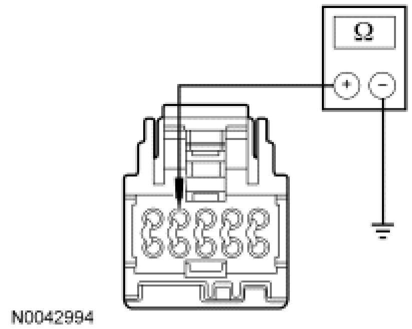

Fig. 324: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-4, circuit VHS36 (YE/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AO33.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AO33 CHECK THE THERMISTOR AND WIRING

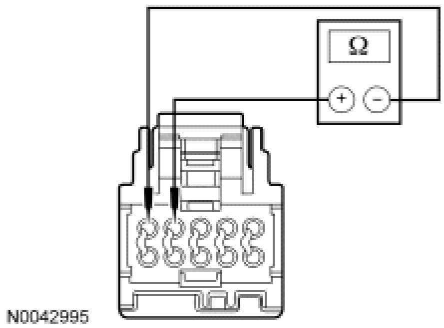

Fig. 325: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-4, circuit VHS36 (YE/BU), harness side and DCSM C3036b-5, circuit RHS20 (GN/BU), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

YES : INSTALL a new DCSM and CARRY OUT PMI. REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to AO34.

AO34 CHECK THE THERMISTOR

- Disconnect: Backrest TED C3326

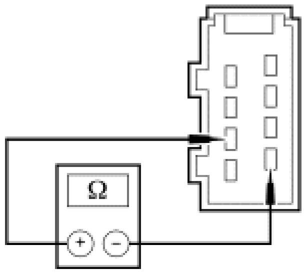

Fig. 326: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AP: DTC B272E - Driver Ignition Run/Blower Circuit Short to Ground

NOTE: This DTC sets for an open or short to voltage. See DTC setting description below.

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B272E Driver Ignition Run/Blower Circuit Short to Ground - This DTC is set if the blower voltage or ground circuit opens to both backrest and cushion blowers or if both blower voltage circuits short to voltage. Only one blower voltage circuit needs to be open for the DTC to be set if battery voltage is less than 12 volts.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module

- Backrest or cushion TED
- DCSM

PINPOINT TEST AP: DTC B272E - DRIVER IGNITION RUN/BLOWER CIRCUIT SHORT TO GROUND

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AP1 CHECK DCSM CLIMATE-CONTROLLED SEAT HEAT COMMAND (TED_HEAT_D) PID

- Access the cushion and backrest TEDs and remove the filters to watch the TED fans.
- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM PID TED_HEAT_D

NOTE: The DCSM active command TED_HEAT_D is limited to 15 seconds in the ON state.

- Operate the climate controlled seat using the active command while monitoring the cushion and backrest TEDs for fan movement.
- **Did both fans turn on?**

YES : CARRY OUT the network test. If DTCs are retrieved from the HVAC module, REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. If no DTCs are retrieved, CARRY OUT the HVAC Module Cold Boot Process in the Diagnosis and Testing portion of **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION & DIAGNOSTICS** article.

NO : Go to AP2.

AP2 CHECK FOR AN INTERMITTENT CONNECTION AT THE DCSM

- Key in OFF position.
- Disconnect: DCSM C3036c
- Connect: DCSM C3036c
- With the engine running and using the switches on the HVAC module, turn the driver climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the driver climate controlled seat system for a complete cycle in heat (15 minutes) and cool (30 minutes) until the system times out.
- **Did the climate controlled seat operate correctly?**

YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3036c and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

NO : Go to AP3.

AP3 CHECK FOR AN INTERMITTENT CONNECTION AT THE CUSHION TED

- Key in OFF position.
- Disconnect: Cushion TED C3327
- Connect: Cushion TED C3327
- With the engine running and using the switches on the HVAC module, turn the driver climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the driver climate controlled seat system for a complete cycle in heat (15 minutes) and cool (30 minutes) until the system times out.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3327 and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AP4.

AP4 CHECK FOR AN INTERMITTENT CONNECTION AT THE BACKREST TED

- Key in OFF position.
- Disconnect: Backrest TED C3322
- Connect: Backrest TED C3322
- With the engine running and using the switches on the HVAC module, turn the driver climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the driver climate controlled seat system for a complete cycle in heat (15 minutes) and cool (30 minutes) until the system times out.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3322 and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AP5.

AP5 CHECK BLOWER CIRCUIT CHS03 (GN/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036c
- Disconnect: Cushion TED C3327
- Disconnect: Backrest TED C3322

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

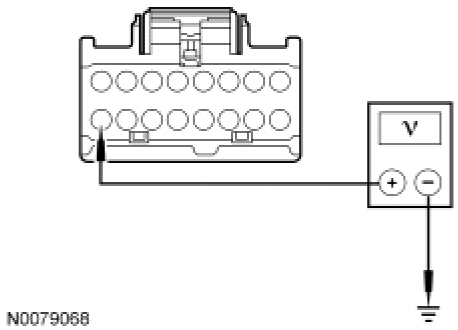

Fig. 327: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AP6.

AP6 CHECK CUSHION TED BLOWER CIRCUITS CHS03 (GN/BN) AND RHS03 (GY/OG) FOR AN OPEN

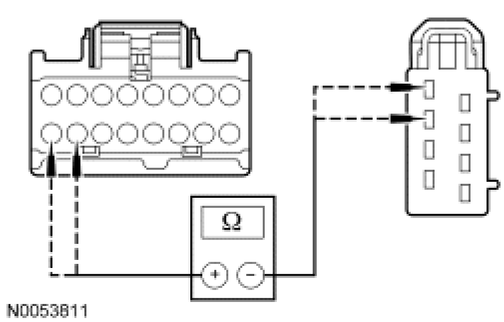

Fig. 328: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and cushion TED C3327-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3036c-15, circuit RHS03 (GY/OG), harness side and cushion TED C3327-4, circuit RHS03 (GY/OG), harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to AP7.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AP7 CHECK BACKREST TED BLOWER CIRCUITS CHS03 (GN/BN) AND RHS03 (GY/OG) FOR AN OPEN

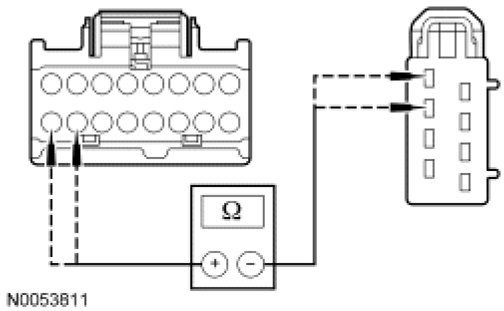

Fig. 329: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and cushion TED C3322-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3036c-15, circuit RHS03 (GY/OG), harness side and cushion TED C3322-4, circuit RHS03 (GY/OG), harness side.
- **Are the resistances less than 5 ohms?**

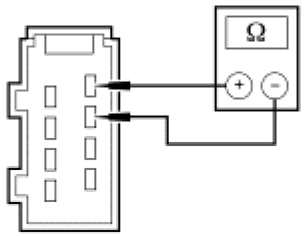
  YES : Go to AP8.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AP8 CHECK BLOWER RESISTANCE



N0053768

Fig. 330: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between cushion TED C3327 pin 2 and pin 4, component side and between backrest TED C3322 pin 2 and pin 4, component side.
- **Are the resistances between 6,000 ohms and 9,000 ohms?**

YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C328. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AQ: DTC B272F - Passenger Ignition Run/Blower Circuit Short to Ground

NOTE: This DTC sets for an open or short to voltage. See DTC setting description

below.

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B272F Passenger Ignition Run/Blower Circuit Short to Ground - This DTC is set if the blower voltage or ground circuit opens to both backrest and cushion blowers or if both blower voltage circuits short to voltage. Only one blower voltage circuit needs to be open for the DTC to be set if battery voltage is less than 12 volts.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module
- Backrest or cushion TED
- DCSM

PINPOINT TEST AQ: DTC B272F - PASSENGER IGNITION RUN/BLOWER CIRCUIT SHORT TO GROUND

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AQ1 CHECK DCSM PASSENGER TED HEAT MODE (TED_HEAT_P) PID

- Access the cushion and backrest TEDs and remove the filters to watch the TED fans.
- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM PID TED_HEAT_P

NOTE: The DCSM active command TED_HEAT_P is limited to 15 seconds in the ON state.

- Operate the climate controlled seat using the active command while monitoring the cushion and backrest TEDs for fan movement.
- **Did both fans turn on?**

  YES : CARRY OUT the network test. If DTCs are retrieved from the HVAC module, REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. If no DTCs are retrieved, CARRY OUT the HVAC Module Cold Boot Process in the Diagnosis and Testing portion of **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION & DIAGNOSTICS** article.

  NO : Go to AQ2.

AQ2 CHECK FOR AN INTERMITTENT CONNECTION AT THE DCSM

- Key in OFF position.
- Disconnect: DCSM C3036c
- Connect: DCSM C3036c
- With the engine running and using the switches on the HVAC module, turn the passenger climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the passenger climate controlled seat system for a complete cycle in heat (15 minutes) and cool (30 minutes) until the system times out.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3036c and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AQ3.

AQ3 CHECK FOR AN INTERMITTENT CONNECTION AT THE CUSHION TED

- Key in OFF position.
- Disconnect: Cushion TED C3328
- Connect: Cushion TED C3328
- With the engine running and using the switches on the HVAC module, turn the passenger climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the passenger climate controlled seat system for a complete cycle in heat (15 minutes) and cool (30 minutes) until the system times out.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3328 and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AQ4.

AQ4 CHECK FOR AN INTERMITTENT CONNECTION AT THE BACKREST TED

- Key in OFF position.
- Disconnect: Backrest TED C3326
- Connect: Backrest TED C3326
- With the engine running and using the switches on the HVAC module, turn the passenger climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the passenger climate controlled seat system for a complete cycle in heat (15 minutes) and cool (30 minutes) until the system times out.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3326 and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AQ5.

AQ5 CHECK BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036c
- Disconnect: Cushion TED C3328
- Disconnect: Backrest TED C3326

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.
- Key in ON position.

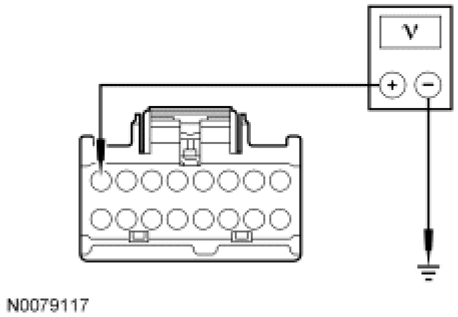


Fig. 331: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AQ6.

AQ6 CHECK CUSHION TED BLOWER CIRCUITS CHS08 (BN/YE) AND RHS08 (VT/WH) FOR AN OPEN

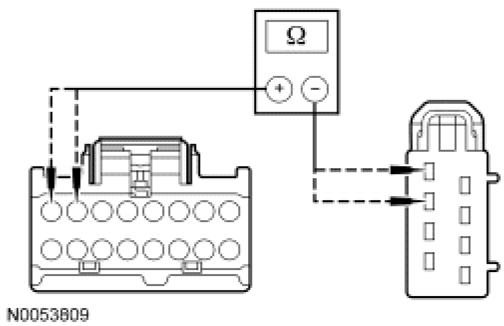

Fig. 332: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and cushion TED C3328-2, circuit CHS08 (BN/YE), harness side; and between DCSM C3036c-7, circuit RHS08 (VT/WH), harness side and cushion TED C3328-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AQ7.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AQ7 CHECK BACKREST TED BLOWER CIRCUITS CHS08 (BN/YE) AND RHS08 (VT/WH) FOR AN OPEN

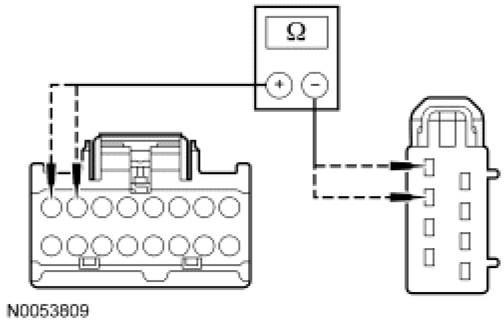

Fig. 333: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-8, circuit CHS08 (BN/YE), harness side and backrest TED C3326-2, circuit CHS08 (BN/YE), harness side; and between DCSM C3036c-7, circuit RHS08 (VT/WH), harness side and backrest TED C3326-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

YES : Go to AQ8.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AQ8 CHECK BLOWER RESISTANCE

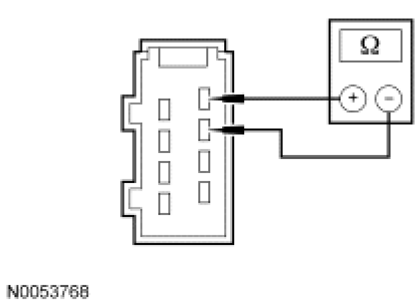

Fig. 334: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3328 pin 2 and pin 4, component side and between backrest TED C3326 pin 2 and pin 4, component side.

- **Are the resistances between 6,000 ohms and 9,000 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C327.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AR: DTC B2730 - Back Over-Temp Detected (Driver)

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 16 (30A) supplying battery voltage on circuit SBB16 (VT/RD) into DCSM C3036a pins E and F. If voltage is disconnected from either pin E or F of DCSM C3036a with the connection remaining on the other circuit, both seats will remain operational because the circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the DCSM and the other will remain operational.

Each driver and front passenger seat cushion and backrest are equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B2730 Back Over-Temp Detected (Driver) - In the cooling mode, if the driver seat backrest TED temperature exceeds 70°C (158°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.
- DTC B2730 Back Over-Temp Detected (Driver) - In the heating mode, if the driver seat backrest TED temperature exceeds 85°C (185°F) for more than 4 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted backrest TED filter
- Crushed or restricted backrest foam pad
- Crushed or restricted climate controlled seat manifold
- Backrest TED assembly
- DCSM

PINPOINT TEST AR: DTC B2730 - BACK OVER-TEMP DETECTED (DRIVER)

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AR1 CHECK THE DCSM FOR DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/DCSM/Retrieve DTCs
- **Was DTC B2730 retrieved during the self-test?**

  YES : Go to AR2.

  NO : Go to AR4.

AR2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327
- Disconnect: DCSM C3036b
- Disconnect: Backrest TED C3322

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may**

result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

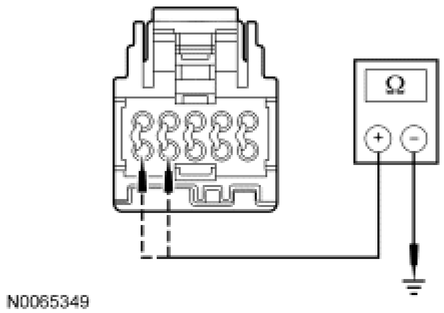

Fig. 335: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036b-9, circuit VHS35 (VT/OG), harness side and ground and between DCSM C3036b-10, circuit RHS15 (GY/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AR3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AR3 CHECK THE TED THERMISTOR

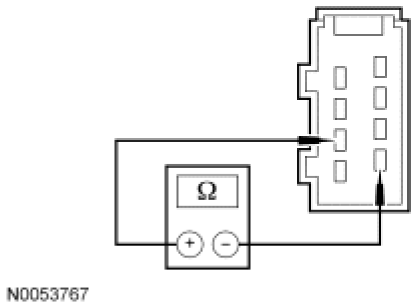

Fig. 336: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3322 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AR4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: **A crushed seat backrest foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on**

the seat to recreate the fault.

- Attempt to recreate the fault. Start the vehicle and set the driver seat to HIGH heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to AR5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between heat and cool modes. REPEAT the self-test. CLEAR the DTCs.

AR5 CHECK OPERATION OF THE SEAT

- Key in ON position.
- With the engine running, set both front seats to HIGH cool.
- Compare the airflow from the driver seat backrest and compare it to the airflow from the passenger seat backrest.
- **Is the airflow exhausting from the driver seat backrest comparable to the airflow exhausting from the passenger seat backrest?**

  YES : Go to AR14.

  NO : Go to AR6.

AR6 CHECK THE BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the backrest TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AR7.

AR7 CHECK THE BACKREST FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to HIGH cool.
- Inspect the backrest blower for operation.
- **Does the backrest blower operate?**

  YES : Go to AR14.

  NO : Go to AR8.

AR8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Driver Seat Side Air Bag C328
- Disconnect: Passenger Seat Side Air Bag C327

- Disconnect: DCSM C3036c
- Disconnect: Backrest TED C3322

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING & CABLES** article.

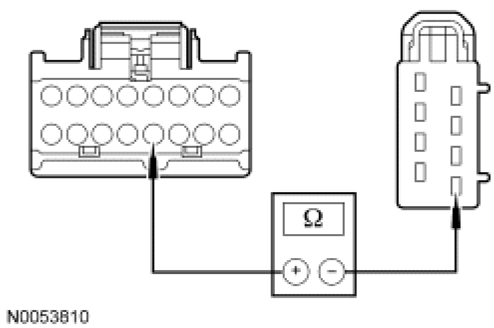

Fig. 337: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-12, circuit VHS16 (BU/GN), harness side and backrest TED C3322-7, circuit VHS16 (BU/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to AR9.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AR9 CHECK BLOWER CIRCUIT RHS03 (GY/OG) FOR A SHORT TO VOLTAGE

- Key in ON position.

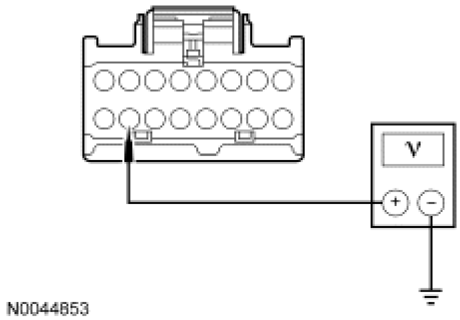

Fig. 338: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3036c-15, circuit RHS03 (GY/OG), harness side and ground.
- **Is voltage greater than one volt?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AR10.

AR10 CHECK BLOWER CIRCUIT CHS03 (GN/BN) FOR A SHORT TO GROUND

- Key in OFF position.

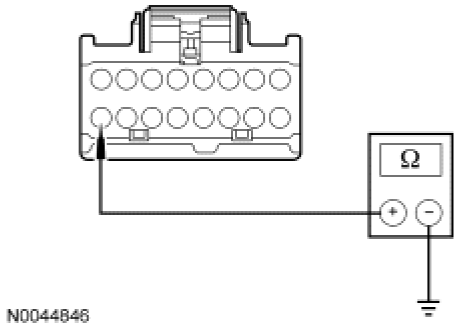

Fig. 339: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to AR11.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AR11 CHECK BLOWER CIRCUITS RHS03 (GY/OG) AND CHS03 (GN/BN) FOR AN OPEN

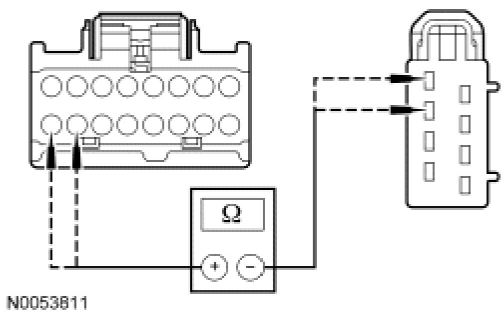

Fig. 340: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3036c-16, circuit CHS03 (GN/BN), harness side and backrest TED C3322-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3036c-15, circuit RHS03 (GY/OG), harness side and backrest TED C3322-4, circuit RHS03 (GY/OG), harness side.
- **Are the resistances less than 5 ohms?**

YES : Go to AR12.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AR12 CHECK THE BLOWER RESISTANCE

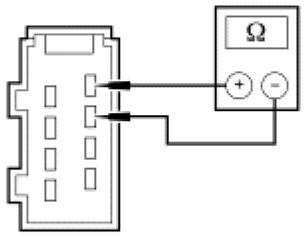

Fig. 341: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3322 pin 2 and pin 4, component side.
- **Is the resistance between 6,000 ohms and 9,000 ohms?**

YES : Go to AR13.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AR13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

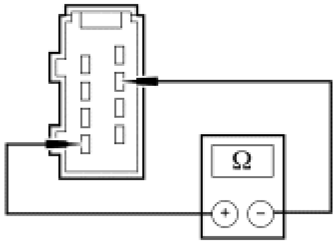

Fig. 342: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between backrest TED C3322 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AR14.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable.

  CONNECT passenger seat side air bag module C327.

  CONNECT driver seat side air bag module C328.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AR14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT BACKREST

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : CONNECT the battery ground cable.

  INSTALL a new DCSM and CARRY OUT PMI. REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

  CONNECT passenger seat side air bag module C327.

CONNECT driver seat side air bag module C328.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AS: The Power Seat is Inoperative/Does Not Operate Correctly - Both Rear, Power Fold

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Refer to appropriate COMPONENT TESTING article.

Normal Operation

The rear seat power-fold relay is provided voltage on the coil side from the smart junction box (SJB), on pin 2, circuit CPS 48 (BU), for 30 minutes after turning the vehicle off, when the transmission selector is in PARK and the liftgate is open. Ground for the coil side of the relay is on pin 1, circuit GD120 (BK/GN). The rear seat power-fold relay switched side is supplied voltage from battery junction box (BJB) fuse 27 (10A) on relay pin 3, and is hot at all times. Pushing the double-throw switch to the appropriate rear seat release actuator, left or right, will provide voltage from relay pin 5 and allow folding of that seat. If the relay is disabled after 30 minutes, it can be enabled as long as the transmission is in PARK by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

- DTC B2794 Third Row Power Fold Circuit Failure - If SJB output to the left or right third row folding seat relay is open or shorted to voltage, the SJB sets this code.
- DTC B2A2D Third Row Power Fold Circuit Short To Ground - If SJB output to the left or right third row folding seat relay is shorted to ground, the SJB sets this DTC.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- SJB
- Power-fold relay
- Rear seat control switch

PINPOINT TEST AS: THE POWER SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - BOTH REAR, POWER FOLD

NOTE: The SJB may also be identified as the generic electronic module (GEM).

AS1 CHECK FOR DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test/Generic Electronic Module (GEM/SJB)/Retrieve DTCs
- **Are any DTCs present?**

  YES : If DTC B2794 is present, go to AS2.

If DTC B2A2D is present, go to AS5.

For all other DTCs, go to **Driver Seat Module (DSM) DTC Chart**, **Dual Climate Controlled Seat Module (DCSM) DTC Chart**, **Smart Junction Box (SJB) DTC Chart** and/or refer to **MULTIFUNCTION ELECTRONIC MODULES** article.

NO : Go to AS2.

AS2 CHECK THE OPERATION OF THE POWER-FOLD REAR SEAT

NOTE: Shifting the transmission out of PARK will disable the voltage supply from the SJB to the BJB relay.

- Operate both power-fold rear seats.
- **Do both power-fold rear seats operate at all times?**

  YES : If DTC B2794 is present and the power-fold rear seats operate at all times, go to AS4.

  If both power-fold rear seats operate at all times, and no DTCs were present, go to AS3.

  NO : If DTC B2794 is present and neither power-fold rear seat operates, go to AS6.

  If no DTCs were present and neither power-fold rear seat operates, go to AS3.

AS3 CHECK TRANSMISSION GEAR SELECTOR TRANSMISSION RANGE (TR) PID STATES

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Transmission Control Module (TCM) PID: TR
- Operate the transmission gear selector in all positions while monitoring the following TCM PID TR states:
  - Park
  - Reverse
  - Neutral
  - OverDrive
  - Low
- **Do the PID states agree with the selected positions?**

  YES : If no DTCs were present and neither power-fold rear seat works, go to AS9.

  If no DTCs were present and both power-fold rear seat work all the time, go to AS14.

  NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - 6F50** article.

AS4 CHECK CIRCUIT CPS48 (BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: BJB Power-Fold Relay 25

- Disconnect: SJB C2280c
- Key in ON position.

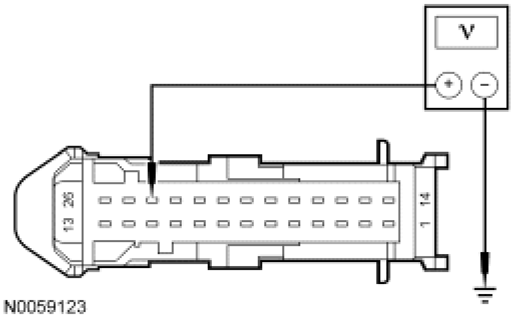

Fig. 343: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280c-24, circuit CPS48 (BU), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : INSTALL a new SJB. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

AS5 CHECK CIRCUIT CPS48 (BU) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280c
- Disconnect: BJB Power-Fold Relay 25

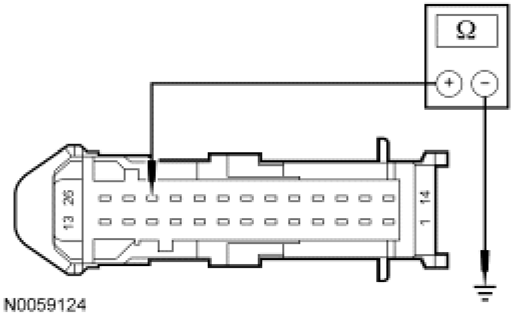

Fig. 344: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280c-24, circuit CPS48 (BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new SJB. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

AS6 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: BJB Power-Fold Relay 25

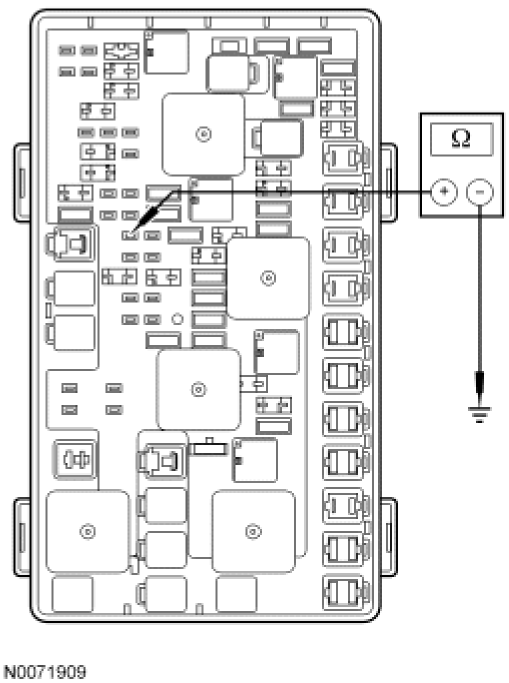

Fig. 345: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between power-fold relay cavity 1 BJB side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to AS7.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

AS7 CHECK CIRCUIT CPS48 (BU) FOR AN OPEN

- Disconnect: SJB C2280c
- Connect a jumper wire between power-fold relay 25, cavity 1 BJB side and cavity 2 BJB side.

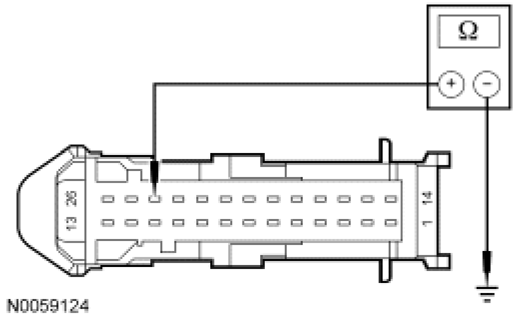

Fig. 346: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280c-24, circuit CPS48 (BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to AS8.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

AS8 CHECK THE ULTRA MICRO ISO RELAY

- Carry out the component test for ultra micro ISO relay. Refer to appropriate COMPONENT TESTING article.
- **Is the ultra micro ISO relay OK?**

  YES : INSTALL a new SJB. REPEAT the self-test. TEST the system for normal operation.

  NO : INSTALL a new ultra micro ISO relay. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

AS9 CHECK CIRCUIT CPS48 (BU) FOR VOLTAGE

- Make sure the transmission is in PARK.
- Activate the power-fold rear seats by carrying out one of the following within 30 minutes of checking circuit CPS48 (BU) for voltage.
  - Open 1 of the 4 doors, rear hatch or rear hatch glass
  - Turn the ignition switch to accessory or run
  - Press a keyless entry key pad button
  - Press a remote keyless entry (RKE) button
- Disconnect: BJB Power-Fold Relay 25

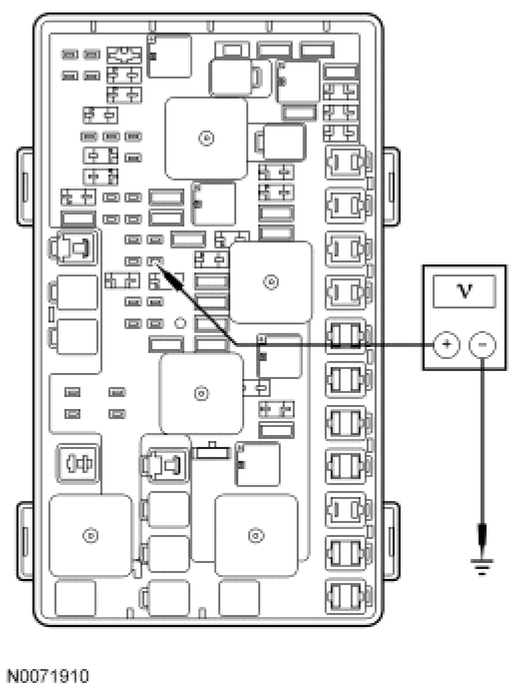

Fig. 347: Measuring Voltage
Courtesy of FORD MOTOR CO.

- With the SJB power-fold rear seat relay circuit CPS48 (BU) activated, measure the voltage at BJB power-fold relay 25 cavity 2 BJB side and ground.
- **Is the voltage greater than 10 volt?**

  YES : Go to AS10.

  NO : INSTALL a new SJB. REPEAT the self-test. TEST the system for normal operation.

AS10 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN

- Key in OFF position.

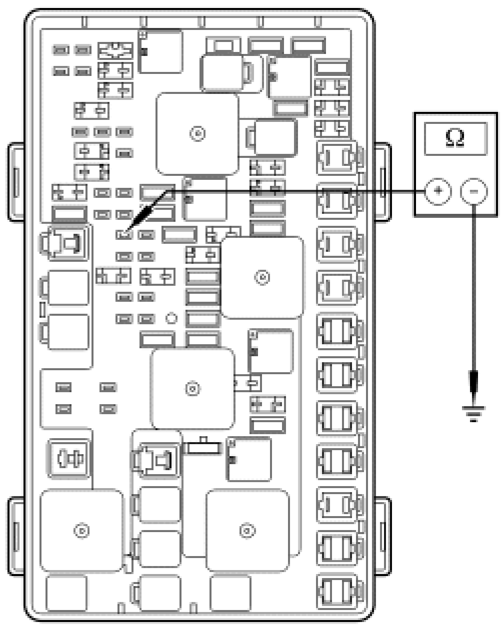

Fig. 348: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between power-fold relay cavity 1 BJB side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to AS11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

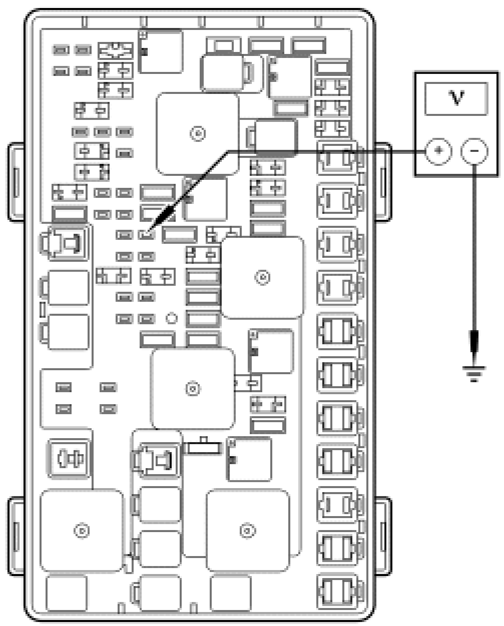
AS11 CHECK THE ULTRA MICRO ISO RELAY

- Carry out the component test for ultra micro ISO relay. Refer to appropriate COMPONENT TESTING article.
- **Is the ultra micro ISO relay OK?**

  YES : Go to AS12.

  NO : INSTALL a new ultra micro ISO relay. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

AS12 CHECK BJB FOR VOLTAGE



N0071911

Fig. 349: Measuring Voltage
Courtesy of FORD MOTOR CO.

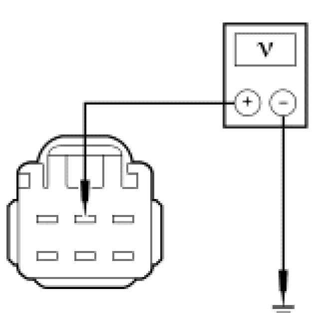
- Measure the voltage at power-fold relay cavity 3 BJB side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to AS13.

  NO : VERIFY BJB fuse 27 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

AS13 CHECK CIRCUIT CPS58 (WH/BN) FOR AN OPEN

- Connect: BJB Power-Fold Relay 25
- Open the liftgate.



N0059126

Fig. 350: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE: If the relay is disabled after 30 minutes, it can be enabled by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

- Measure the voltage between rear seat control switch C4351-2, circuit CPS58 (WH/BN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new rear seat control switch. REFER to **Seat Control Switch - Rear Seat**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

AS14 CHECK CIRCUIT CPS58 (WH/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: BJB Power-Fold Relay 25
- Key in ON position.
- Using the rear seat control switch, attempt to fold the rear left and right seats down.
- **Did the rear left and right seats fold down?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to AS15.

AS15 CHECK THE ULTRA MICRO ISO RELAY

- Carry out the component test for ultra micro ISO relay. Refer to appropriate COMPONENT TESTING article.
- **Is the ultra micro ISO relay OK?**

  YES : INSTALL a new SJB. TEST the system for normal operation.

  NO : INSTALL a new ultra micro ISO relay. REPEAT the self-test. CLEAR the DTCs. TEST the system for normal operation.

Pinpoint Test AT: The Power Seat is Inoperative/Does Not Operate Correctly - Left Rear, Power Fold

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The rear seat power-fold relay is provided voltage on the coil side from the smart junction box (SJB), on pin 2, circuit CPS 48 (BU), for 30 minutes after turning the vehicle off, when the transmission selector is in PARK and the liftgate is open. Ground for the coil side of the relay is on pin 1, circuit GD120 (BK/GN). The rear seat power-fold relay switched side is supplied voltage from battery junction box (BJB) fuse 27 (10A) on relay pin 3, and is hot at all times. Pushing the double-throw switch to the appropriate rear seat release actuator, left or right, will provide voltage from relay pin 5 and allow folding of that seat. If the relay is disabled after 30 minutes, it can be enabled as long as the transmission is in PARK by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Rear seat control switch
- Left power-fold seat actuator
- Power-fold relay

PINPOINT TEST AT: THE POWER SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - LEFT REAR, POWER FOLD

AT1 CHECK LH SEAT OPERATION

- Key in ON position.
- Select NEUTRAL.
- Press the rear seat control switch to release the left side backrest.
- **Does the LH seat operate all the time?**

  YES : Go to AT2.

  NO : Go to AT3.

AT2 CHECK CIRCUIT CPS58 (WH/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: BJB Power-Fold Relay 25
- Disconnect: Rear Seat Control Switch C4351
- Key in ON position.

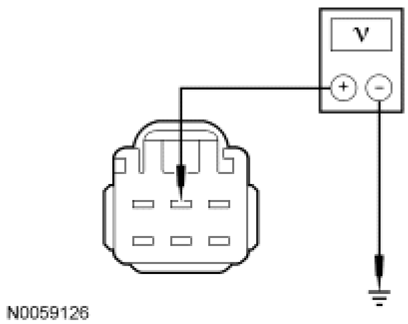


Fig. 351: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between rear seat control switch C4351-2, circuit CPS58 (WH/BN), harness side and ground.
- **Is the voltage greater than 0.2 volt?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new power-fold relay. TEST the system for normal operation.

AT3 CHECK THE REAR SEAT CONTROL SWITCH

- Select PARK.
- Key in OFF position.

- Gain access to the rear seat control switch C4351.
- Back probe for voltage between rear seat control switch C4351-1, circuit CPS56 (GN/BN), harness side and ground.

NOTE: If the relay is disabled after 30 minutes, it can be enabled by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

- While back probing for voltage, press the rear seat control switch to release the left side backrest.
- **Is the voltage greater than 10 volts when rear seat control switch is depressed?**

  YES : Go to AT4.

  NO : INSTALL a new rear seat control switch. REFER to **Seat Control Switch - Rear Seat**. TEST the system for normal operation.

AT4 CHECK CIRCUIT CPS56 (GN/BN) FOR AN OPEN

- Disconnect: Left Power-Fold Actuator C3317

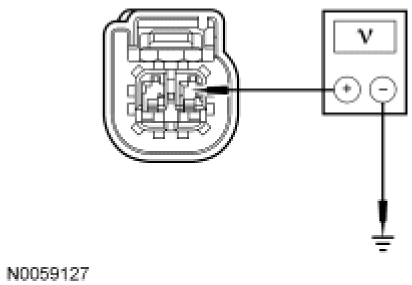

Fig. 352: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between left power-fold actuator C3317-1, circuit CPS56 (GN/BN), harness side and ground while pressing the rear seat control switch to release the left side backrest.
- **Is the voltage greater than 10 volts when rear seat control switch is depressed?**

  YES : Go to AT5.

  NO : REPAIR the circuit. TEST the system for normal operation.

AT5 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

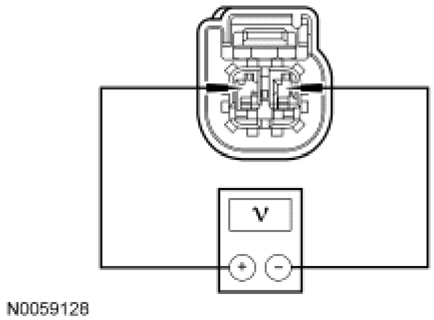

Fig. 353: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between left power-fold actuator C3317-1, circuit CPS56 (GN/BN), harness side and C3317-2, circuit GD126 (BK/WH), harness side while pressing the rear seat control switch to release the left side backrest.
- **Is the voltage greater than 10 volts when rear seat control switch is depressed?**

  YES : INSTALL a new left power-fold actuator. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test AU: The Power Seat is Inoperative/Does Not Operate Correctly - Right Rear, Power Fold

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Seats for schematic and connector information.

Normal Operation

The rear seat power-fold relay is provided voltage on the coil side from the smart junction box (SJB), on pin 2, circuit CPS 48 (BU), for 30 minutes after turning the vehicle off, when the transmission selector is in PARK and the liftgate is open. Ground for the coil side of the relay is on pin 1, circuit GD120 (BK/GN). The rear seat power-fold relay switched side is supplied voltage from battery junction box (BJB) fuse 27 (10A) on relay pin 3, and is hot at all times. Pushing the double-throw switch to the appropriate rear seat release actuator, left or right, will provide voltage from relay pin 5 and allow folding of that seat. If the relay is disabled after 30 minutes, it can be enabled as long as the transmission is in PARK by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Rear seat control switch
- Right power-fold seat actuator
- Power-fold relay

PINPOINT TEST AU: THE POWER SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - RIGHT REAR, POWER FOLD

AU1 CHECK RH SEAT OPERATION

- Key in ON position.
- Select NEUTRAL.
- Press the rear seat control switch to release the right side backrest.
- **Does the RH seat operate all the time?**

  YES : Go to AU2.

  NO : Go to AU3.

AU2 CHECK CIRCUIT CPS58 (WH/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: BJB Power-Fold Relay 25
- Disconnect: Rear Seat Control Switch C4351
- Key in ON position.

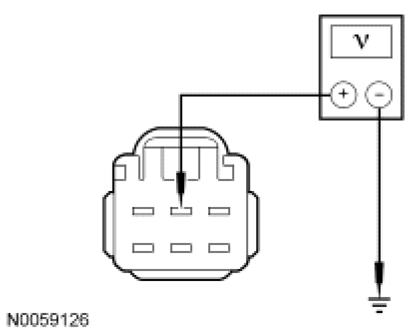

Fig. 354: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between rear seat control switch C4351-2, circuit CPS58 (WH/BN), harness side to ground.
- **Is the voltage greater than 0.2 volt?**

  YES : REPAIR circuit CPS58 (WH/BN). TEST the system for normal operation.

  NO : INSTALL a new power-fold relay. TEST the system for normal operation.

AU3 CHECK THE REAR SEAT CONTROL SWITCH

- Select PARK.
- Key in OFF position.
- Gain access to the rear seat control switch C4351.
- Back probe for voltage between rear seat control switch C4351-5, circuit CPS57 (GY/BN), harness side and ground.

NOTE: **If the relay is disabled after 30 minutes, it can be enabled by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.**

- While back probing for voltage, press the rear seat control switch to release the right side backrest.
- **Is the voltage greater than 10 volts when rear seat control switch is depressed?**

  YES : Go to AU4.

  NO : INSTALL a new rear seat control switch. REFER to **Seat Control Switch - Rear Seat**. TEST the system for normal operation.

AU4 CHECK CIRCUIT CPS57 (GY/BN) FOR AN OPEN

- Disconnect: Right Power-Fold Actuator C3334

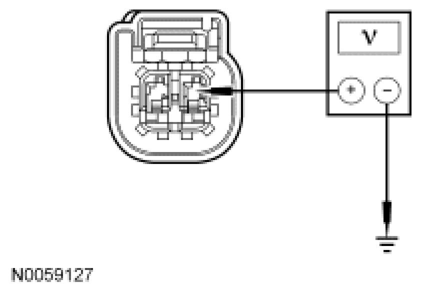

Fig. 355: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between right power-fold actuator C3334-1, circuit CPS57 (GY/BN), harness side and ground while pressing the rear seat control switch to release the right side backrest.
- **Is the voltage greater than 10 volts when rear seat control switch is depressed?**

  YES : Go to AU5.

  NO : REPAIR circuit CPS57 (GY/BN). TEST the system for normal operation.

AU5 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN

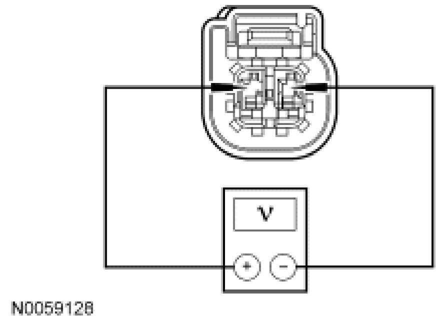

Fig. 356: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between right power-fold actuator C3334-1, circuit CPS57 (GY/BN), harness side and C3334-2, circuit GD151 (BK/GN), harness side while pressing the rear seat control switch to release the right side backrest.

- **Is the voltage greater than 10 volts when rear seat control switch is depressed?**
  YES : INSTALL a new right power-fold actuator. TEST the system for normal operation.
  NO : REPAIR the circuit GD151 (BK/GN). TEST the system for normal operation.

Component Test

Component Testing - Thermo-Electric Device (TED) Cooling Performance

NOTE: This test is intended to check the cooling mode performance of an operational climate controlled seat backrest or cushion thermo-electric device (TED) and verify it is cooling inlet air at the TED (ambient cabin air) between 6-8°C (10-14° F).

NOTE: Make sure the vehicle is out of direct sunlight and is in an area with a stable air temperature when testing the climate controlled seat system.

NOTE: For correct temperature measurements, the seat being tested should be occupied.

1. Enter DataLogger and monitor the following DCSM PIDs:
   - CSHTEMP (Cushion Thermal Electric Device [TED] Temperature)
   - BK_TEMP (Back Thermal Electric Device [TED] Temperature)
   - PCSHTMP (Passenger Cushion Thermal Electric Device [TED] Temperature)
   - PBKTMP (Passenger Back Thermal Electric Device [TED] Temperature)
   - DCCSMOD (Driver Climate Controlled System State)
   - PCCSMOD (Passenger Climate Controlled System State)
2. Any initial PID value of greater than 205°C (401°F) or less than 2°C (36°F) indicates a system hardware failure. Do not proceed with this test. Go to **Symptom Chart** or **Dual Climate Controlled Seat Module (DCSM) DTC Chart** for diagnosis.

   NOTE: Typical backrest and cushion TED shown in illustration, others similar.

3. Gain access to the seat backrest and cushion TEDs and use a suitable thermo-couple temperature measuring device to monitor the air inlet temperature.
   - Access the backrest TED.
     - Release the backrest trim cover J-clips at the sides and bottom.
     - Pull out at the bottom and detach the 2 lower hard back panel pin-type retainers.
     - Position the backrest trim cover out of the way.
   - Place the temperature probe near each TEDs air filter.

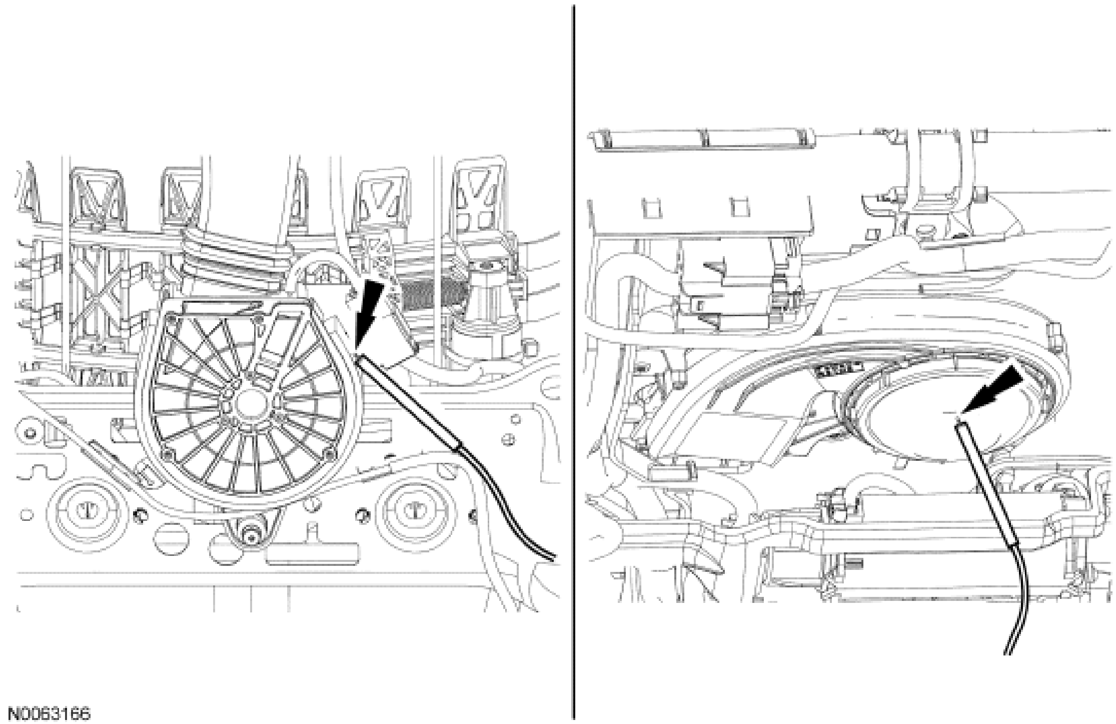

Fig. 357: Using Scan Tool To Measure Cushion TED PID Temperature
Courtesy of FORD MOTOR CO.

NOTE: The engine must be running to operate the climate controlled seat system and carry out this test.

4. Operate system in high cool mode and measure the temperature at the cushion TED filter using the thermo-couple device.
   - Obtain and record the air inlet temperature at the TED.
5. Use a scan tool to measure the cushion TED PID temperature and record the value.
   - Monitor the MODE PID and verify the system is operating. If during testing the PID value changes to Blower Only state, the system has entered into recovery mode and voltage to the TEDs is disabled. If this occurs, the seat has failed the test. Do not continue. Return to the diagnostic routine.
6. Subtract the cushion TED PID temperature from the cushion air inlet temperature and record the temperature difference value.
7. Continue to operate the system in high cool mode and use the thermo-couple device to measure the temperature at the backrest TED filter.
   - Obtain and record the air inlet temperature at the TED.
     - Secure the temperature probe at the backrest TED air filter and close the backrest trim cover before measuring.
8. Use a scan tool to measure the backrest TED PID temperature and record the value.
   - Monitor the MODE PID and verify the system is operating. If during testing the PID value changes to Blower Only state, the system has entered into recovery mode and voltage to the TEDs is

disabled. If this occurs, the seat has failed the test. Do not continue. Return to the diagnostic routine.

9. Subtract the backrest TED PID temperature from the backrest air inlet temperature and record the value.
10. Compare the cushion and backrest calculated temperature values. Both values should be between 6°-8°C (10.8°-14.4°F) and approximately equal (±1°C [±1.8°F]).
11. If the calculated temperature values are not within these specifications, check the climate controlled seat components for air duct or filter restrictions, blockages, duct or electrical disconnections and for incorrect assembly. Repair as needed. If OK, carry out the DCSM self-test and if any DTC is retrieved, go to **Dual Climate Controlled Seat Module (DCSM) DTC Chart** for diagnostic direction. Return to the diagnostic routine.

GENERAL PROCEDURES

MEMORY POSITION PROGRAMMING

Programming Memory Positions

NOTE: Memory positions can be stored at any time.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

NOTE: To program the remote keyless entry (RKE) transmitter, refer to HANDLES, LOCKS, LATCHES & ENTRY SYSTEMS article.

1. To set memory position(s) move the memory driver seat, memory exterior mirrors (if equipped), memory adjustable pedals (if equipped) and memory tilt steering column (if equipped) to the preferred position using the appropriate switch(es).

NOTE: Once the memory SET switch button is pressed, there is a 5-second time limit to input a memory position. If a memory position input is not received within the time limit, the operation is aborted and the memory SET switch LED (if equipped) is turned OFF.

NOTE: If one of the following other inputs is received during the time limit, the operation is aborted and the memory SET switch LED (if equipped) is turned OFF:

- **Driver seat control switch**
- **Memory SET switch button**
- **Adjustable pedal control switch (if equipped)**
- **Exterior mirror control switch (if equipped)**

- **Power tilt steering column switch (if equipped)**

2. Press the memory SET switch button, activating the memory SET switch LED (if equipped).
3. Within 5 seconds (before the LED goes out) (if equipped), press memory SET switch button 1 or 2.
4. Repeat Steps 1 through 3 to initiate another memory position setting.

Recalling a Stored Memory Position

NOTE: A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL gear and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the gearshift lever out of PARK or NEUTRAL.

NOTE: Input from the driver seat control switch, memory SET switch, adjustable pedal control switch (if equipped), exterior mirror control switch (if equipped) or power tilt steering column switch (if equipped) during a memory recall will abort the memory recall.

1. The driver can recall the desired memory driver seat, memory exterior mirror (if equipped), memory adjustable pedal (if equipped) and memory tilt steering column (if equipped) positions by depressing either memory SET switch button 1 or 2. Depressing memory SET switch button 1 will initiate a recall of the positions stored for Memory 1. Depressing memory SET switch button 2 will initiate a recall of the positions stored for Memory 2.

SEAT WIRE HARNESS ROUTING - FRONT PASSENGER CUSHION

All seat tracks

1. For correct front passenger seat cushion wire harness routing, refer to the illustrations with the correct seat option content.

Manual seat track

Item	Description
1	Inline electrical connector to vehicle harness electrical connector
2	Occupant classification system module (OCSM) electrical connector
3	Wire harness with gray tape
4	Side air bag electrical connector
5	Wire harness with orange tape

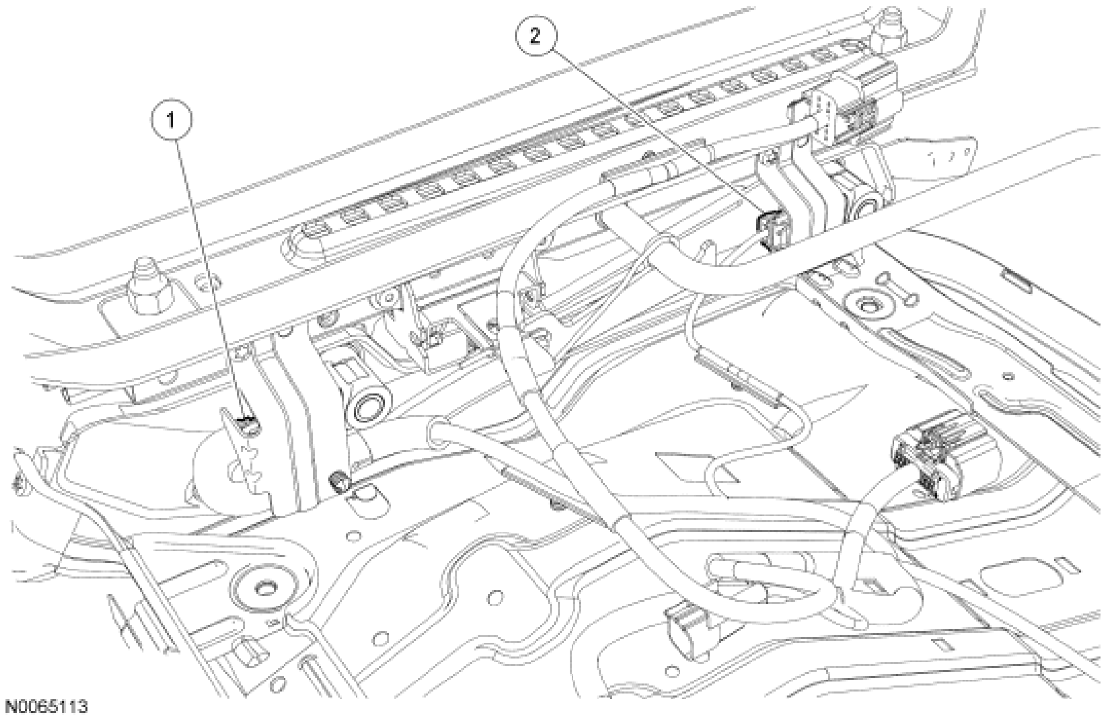

Fig. 360: Outboard Side of Cushion Frame and Manual Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Rear outboard occupant classification sensor (OCS) weight sensor bolt electrical connector
2	Front outboard OCS weight sensor bolt electrical connector

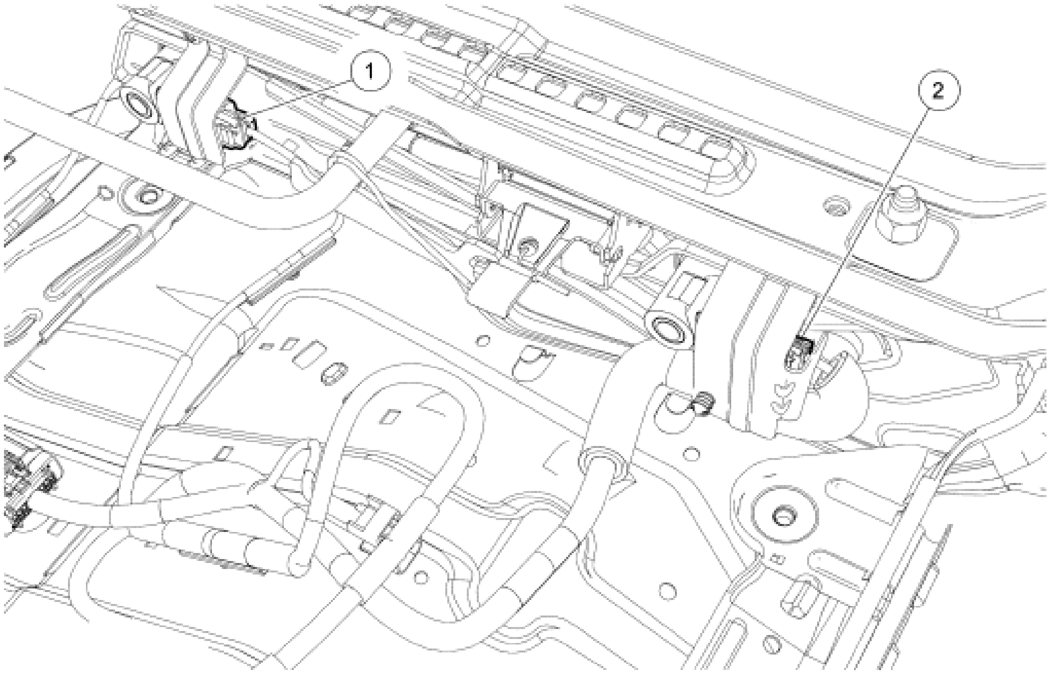

Fig. 361: Inboard Side of Cushion Frame and Manual Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Front inboard occupant classification sensor (OCS) weight sensor bolt electrical connector
2	Rear inboard OCS weight sensor bolt electrical connector

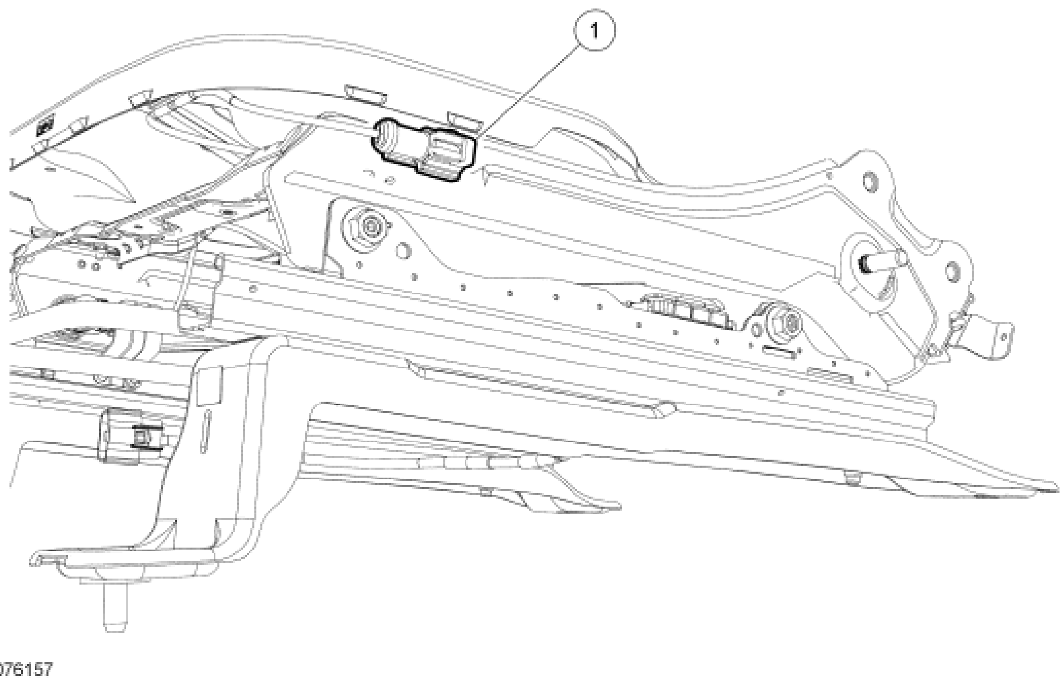

Fig. 362: Inboard Side of Cushion Frame and Manual Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Safety belt buckle switch electrical connector

1. Make sure the passenger seat cushion wire harness is correctly routed and attached.

Manual seat track with heat

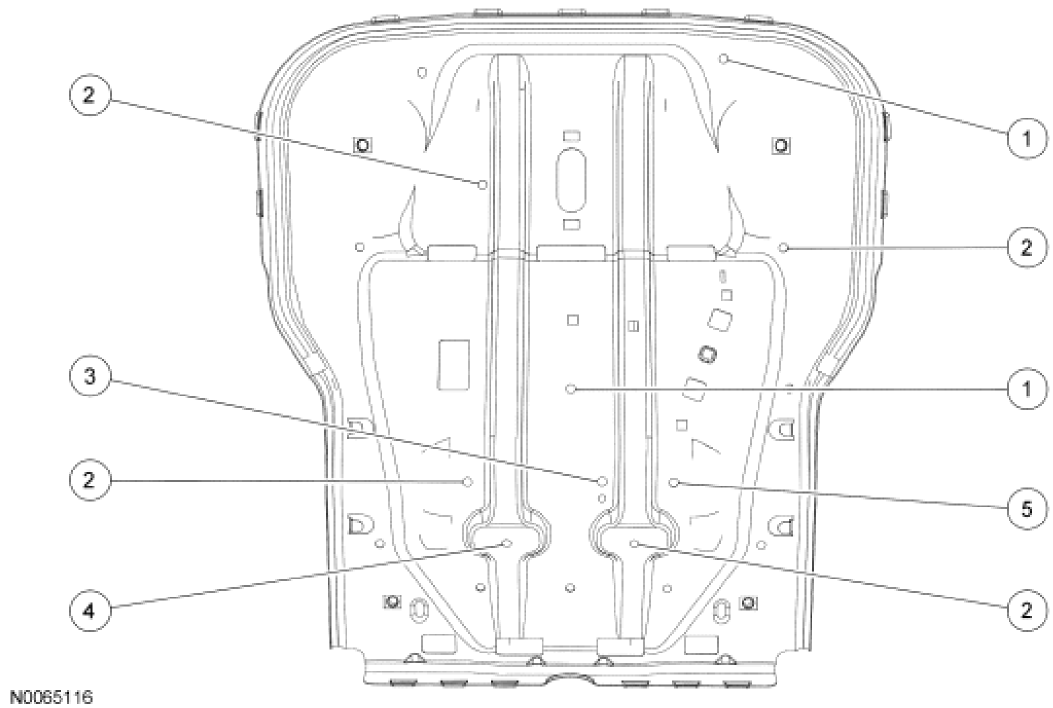

Fig. 363: Cushion Frame From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Wire harness main bundle
2	Occupant classification sensor (OCS) weight sensor bolt wire harness takeout
3	Side air bag electrical connector
4	Cushion heater mat electrical connector
5	Backrest heater mat electrical connector

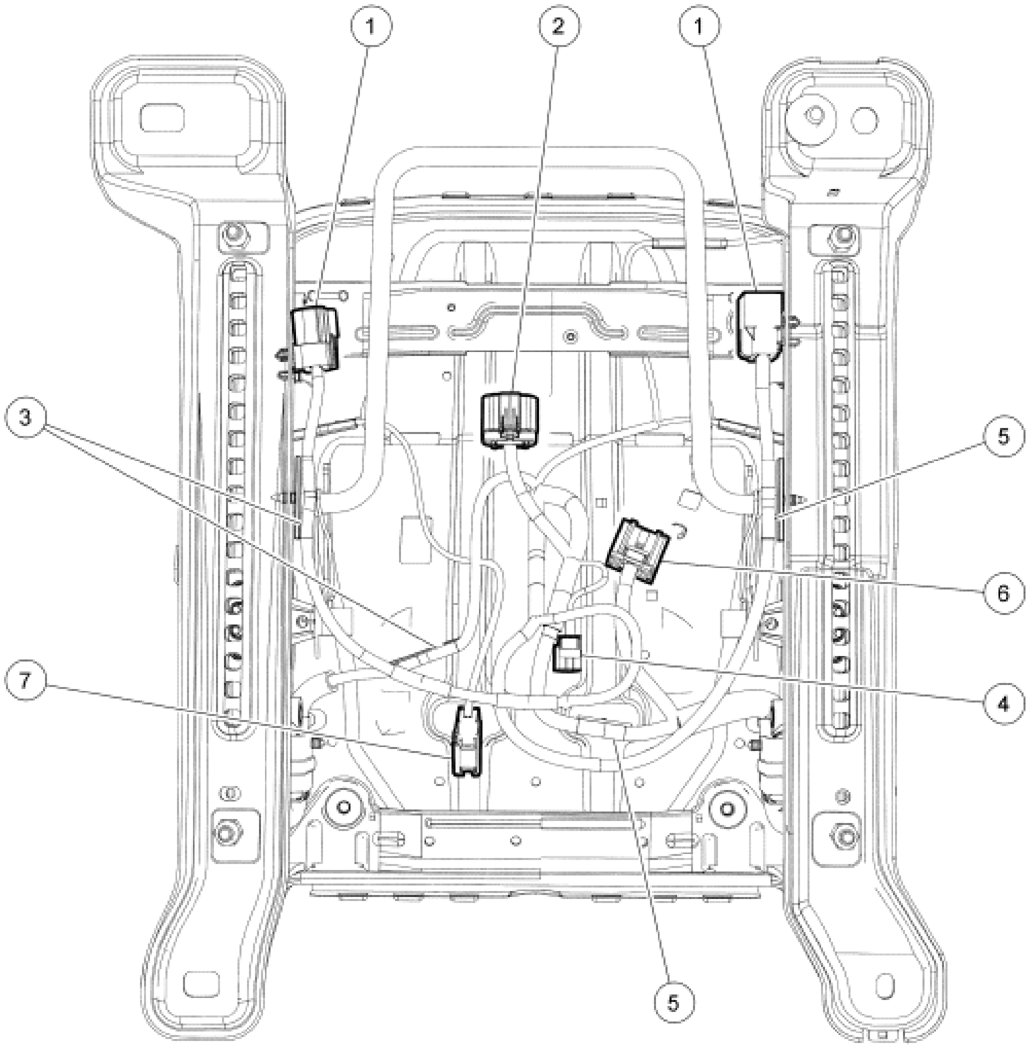

Fig. 364: Cushion Frame With Manual Seat Track Attached From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Inline electrical connector to vehicle harness electrical connector
2	Occupant classification system module (OCSM) connector
3	Wire harness with gray tape
4	Side air bag electrical connector
5	Wire harness with orange tape
6	Heated seat module electrical connector
7	Cushion heater mat electrical connector

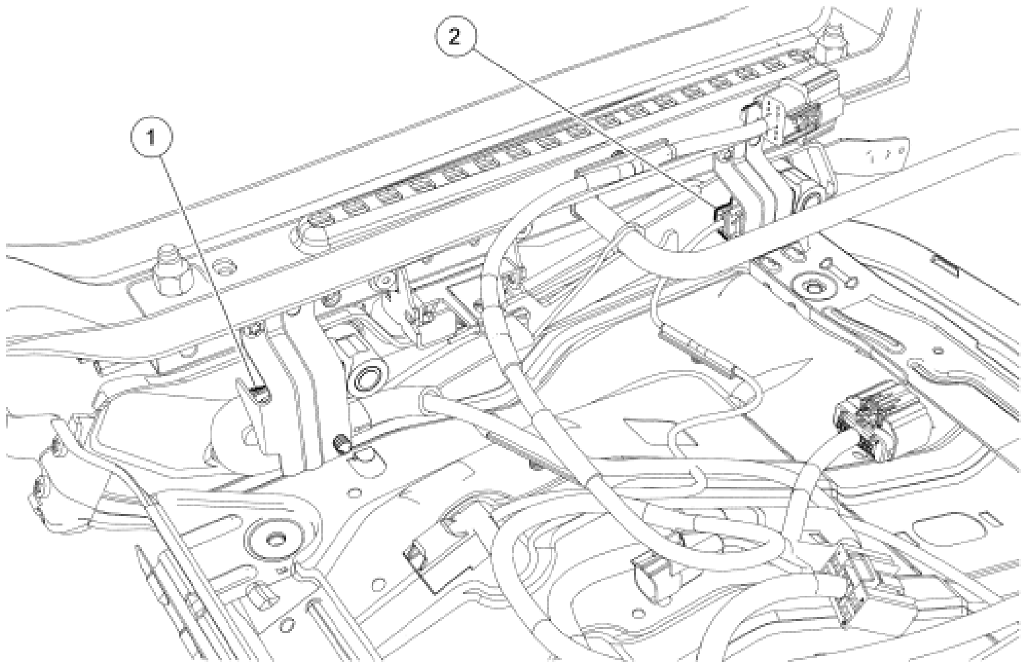

Fig. 365: Outboard Side of Cushion Frame and Manual Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Rear outboard occupant classification sensor (OCS) weight sensor bolt electrical connector
2	Front outboard OCS weight sensor bolt electrical connector

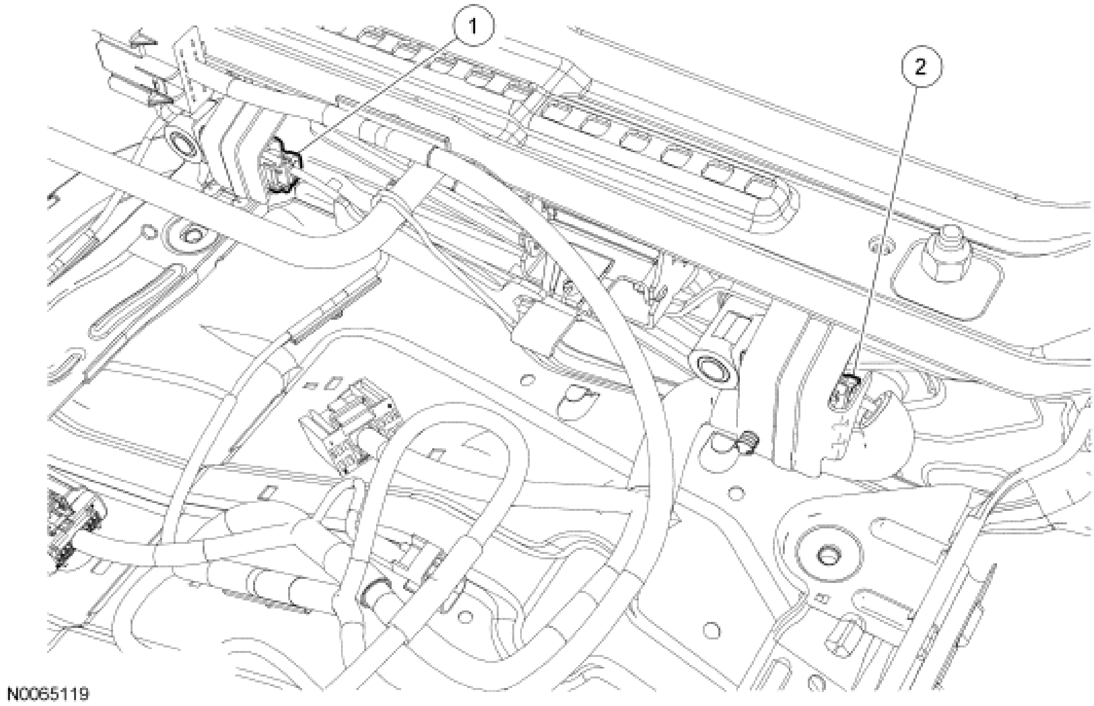

Fig. 366: Inboard Side of Cushion Frame and Manual Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Front inboard occupant classification sensor (OCS) weight sensor bolt electrical connector
2	Rear inboard OCS weight sensor bolt electrical connector

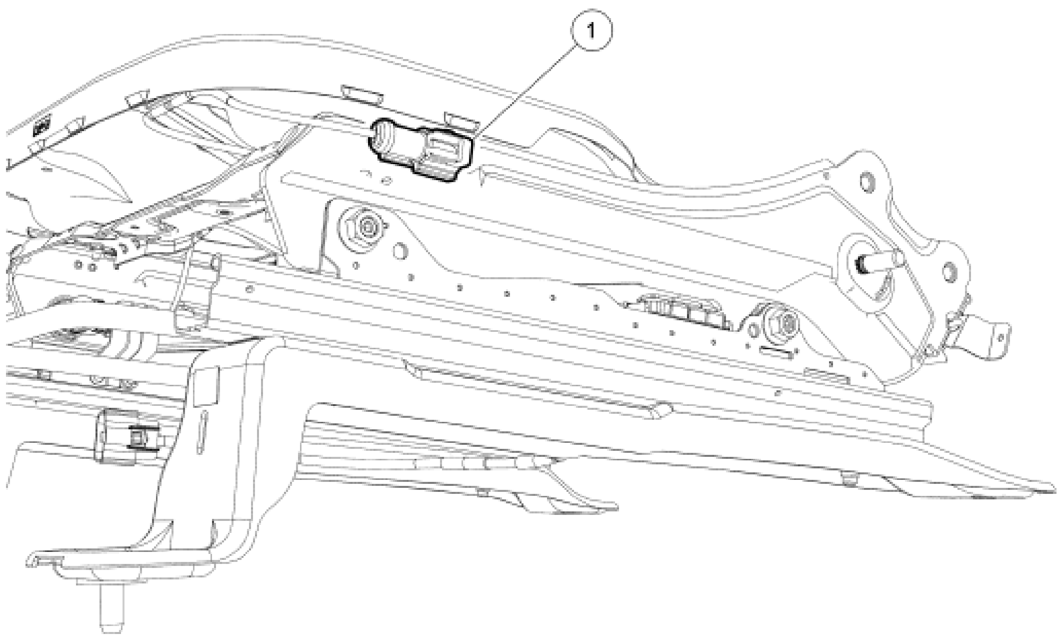

Fig. 367: Inboard Side of Cushion Frame and Manual Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Safety belt buckle switch electrical connector

1. Make sure the passenger seat cushion wire harness is correctly routed and attached.

Power seat track with heat

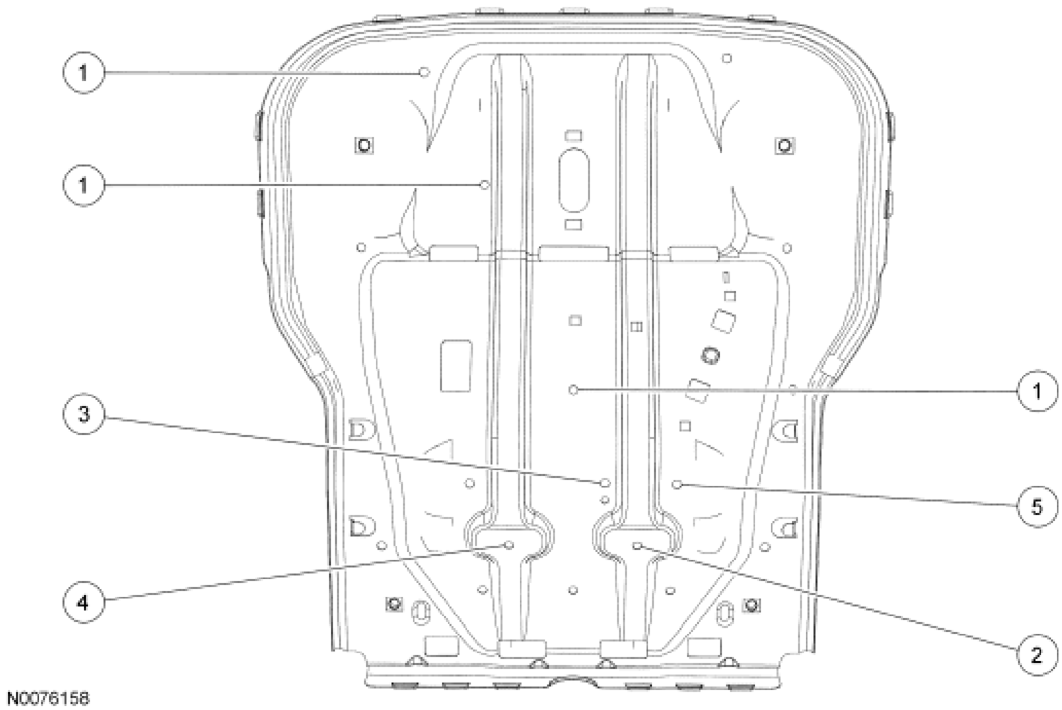

Fig. 368: Cushion Frame From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Wire harness main bundle
2	Occupant classification sensor (OCS) weight sensor bolt wire harness takeout
3	Side air bag electrical connector
4	Cushion heater mat electrical connector
5	Backrest heater mat electrical connector

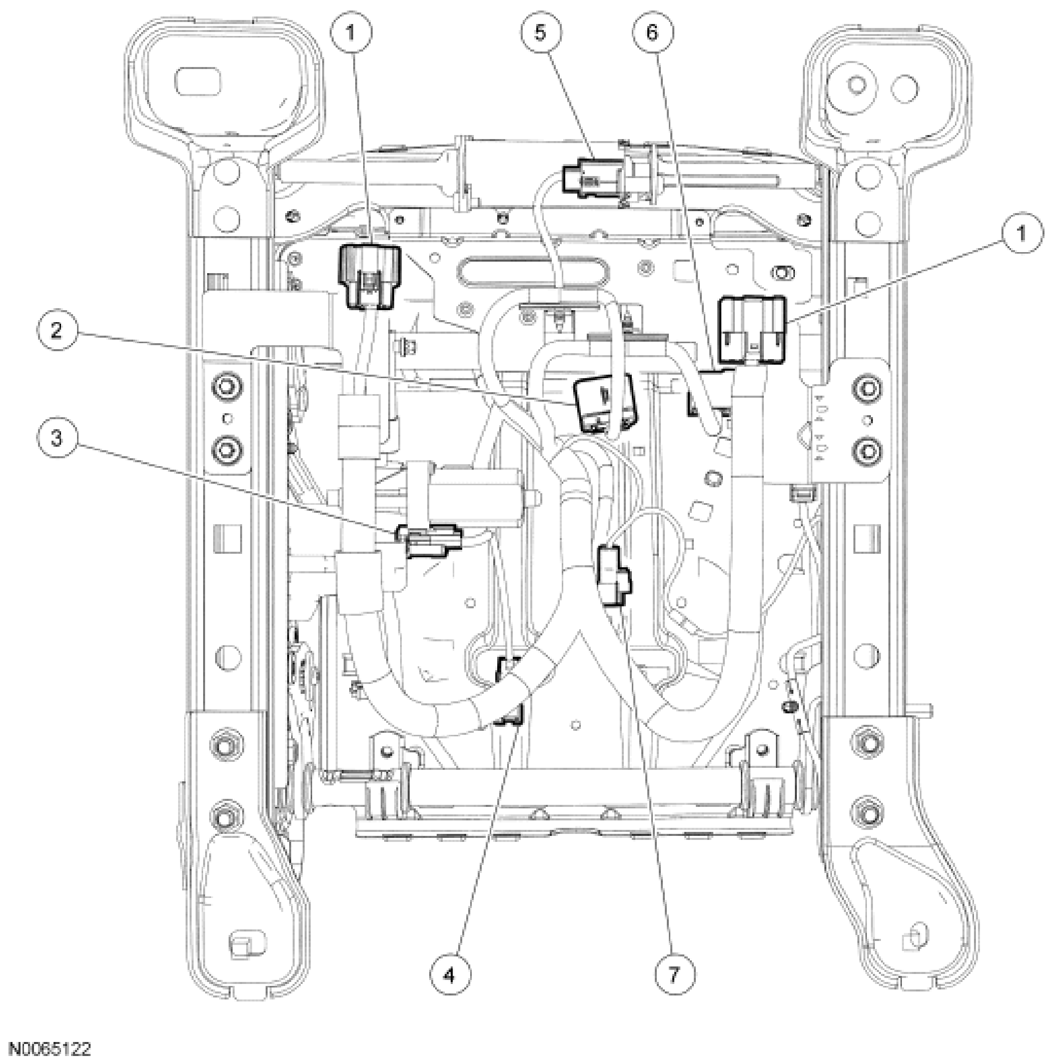

Fig. 369: Cushion Frame With Power Seat Track Attached From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Inline electrical connector to vehicle harness electrical connector
2	Occupant classification system module (OCSM) electrical connector
3	Front height motor electrical connector
4	Cushion heater mat electrical connector
5	Horizontal motor electrical connector
6	Heated seat module electrical connector
7	Side air bag electrical connector

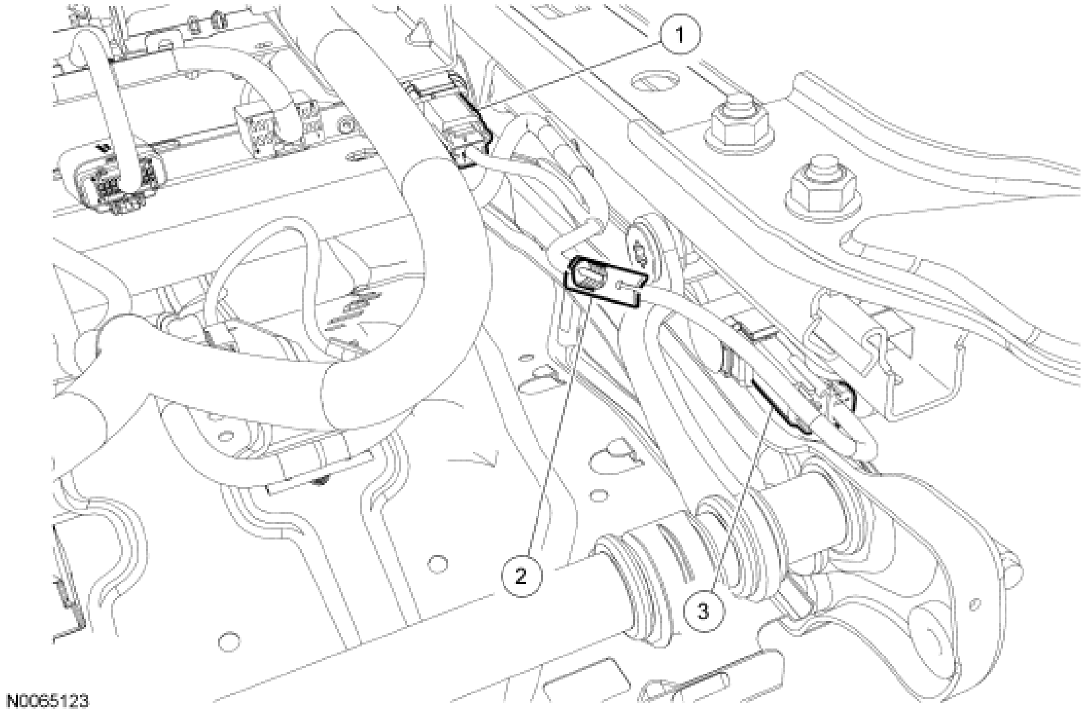

Fig. 370: Inboard Side of Cushion Frame and Power Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Front inboard occupant classification sensor (OCS) weight sensor bolt electrical connector
2	Attaches to inboard OCS weight sensor bolt protection bracket
3	Rear inboard OCS weight sensor bolt electrical connector

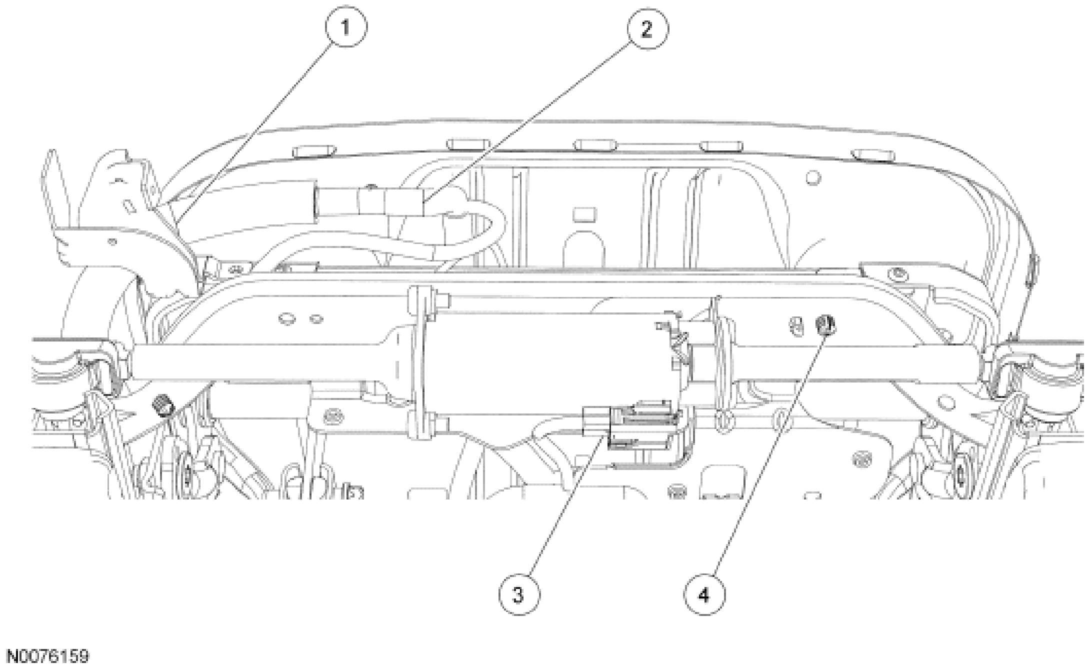

Fig. 371: Front of Cushion Frame and Power Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Seat control switch and rear height motor takeout must be routed on top of the bracket
2	Wire harness attachment points
3	Horizontal motor electrical connector
4	Safety belt buckle switch electrical connector pin-type retainer attached in place

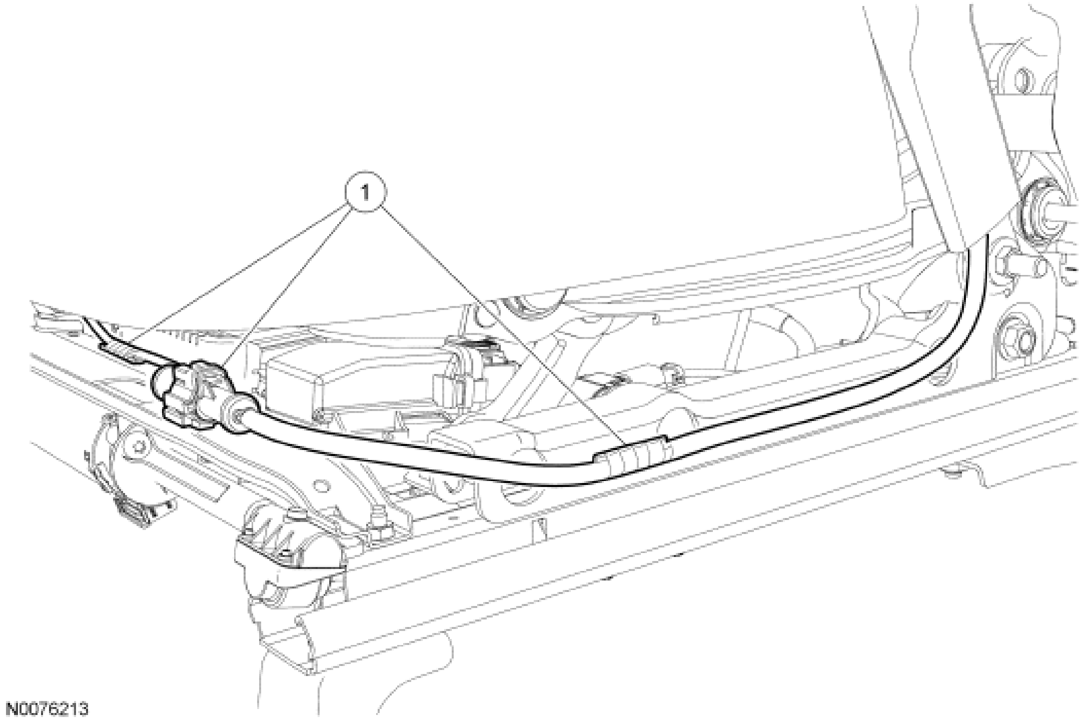

Fig. 372: Front Inboard Side of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Safety belt buckle switch electrical connector and wire harness takeout routing attachment points

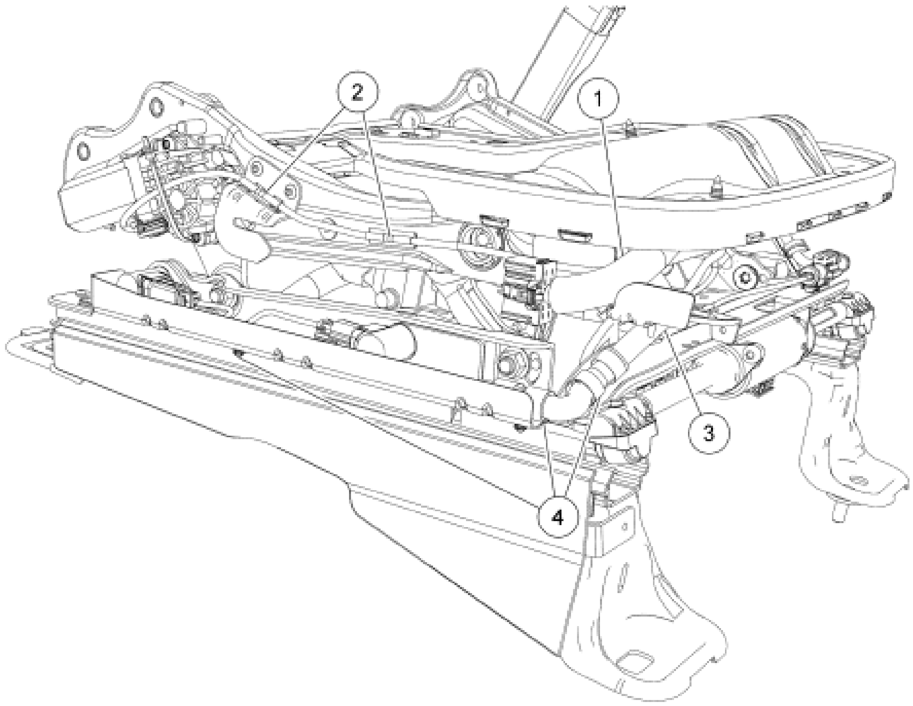

Fig. 373: Front and Outboard Side of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Seat control switch and rear height motor takeout must be routed on top of the bracket
2	Rear height motor takeout attachment points
3	Outboard occupant classification sensor (OCS) weight sensor bolt takeout must be routed under the bracket
4	Outboard OCS weight sensor bolt takeout attachment points

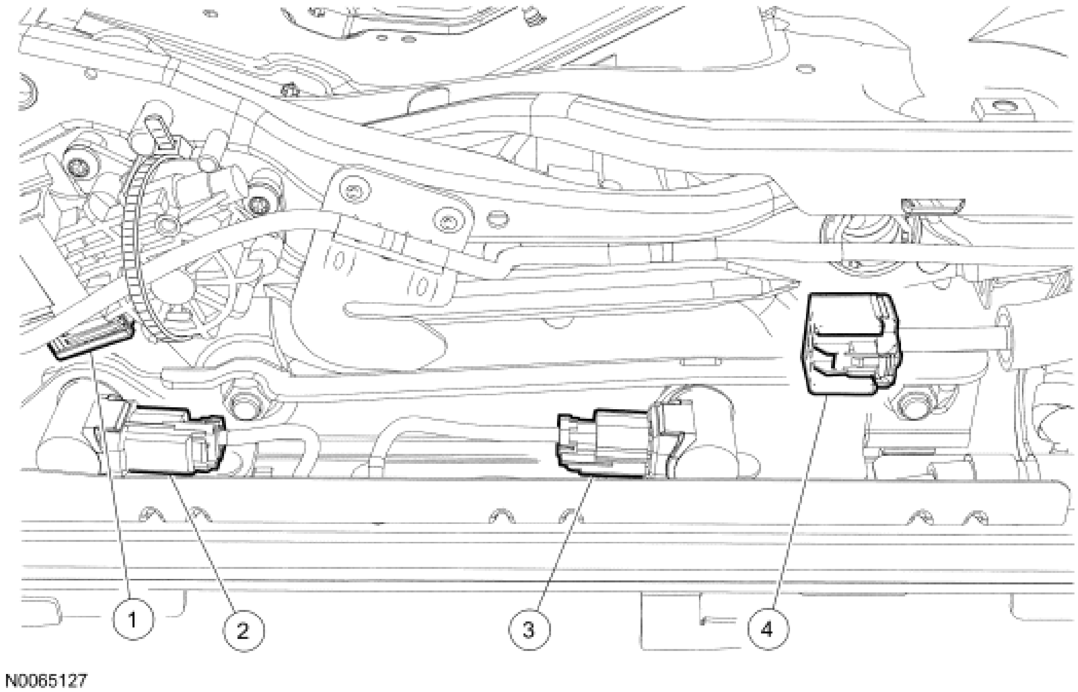

Fig. 374: Outboard of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Rear height motor electrical connector
2	Rear outboard occupant classification sensor (OCS) weight sensor bolt electrical connector
3	Front outboard OCS weight sensor bolt electrical connector
4	Seat control switch electrical connector

1. Make sure the passenger seat cushion wire harness is correctly routed and attached.

Power seat track

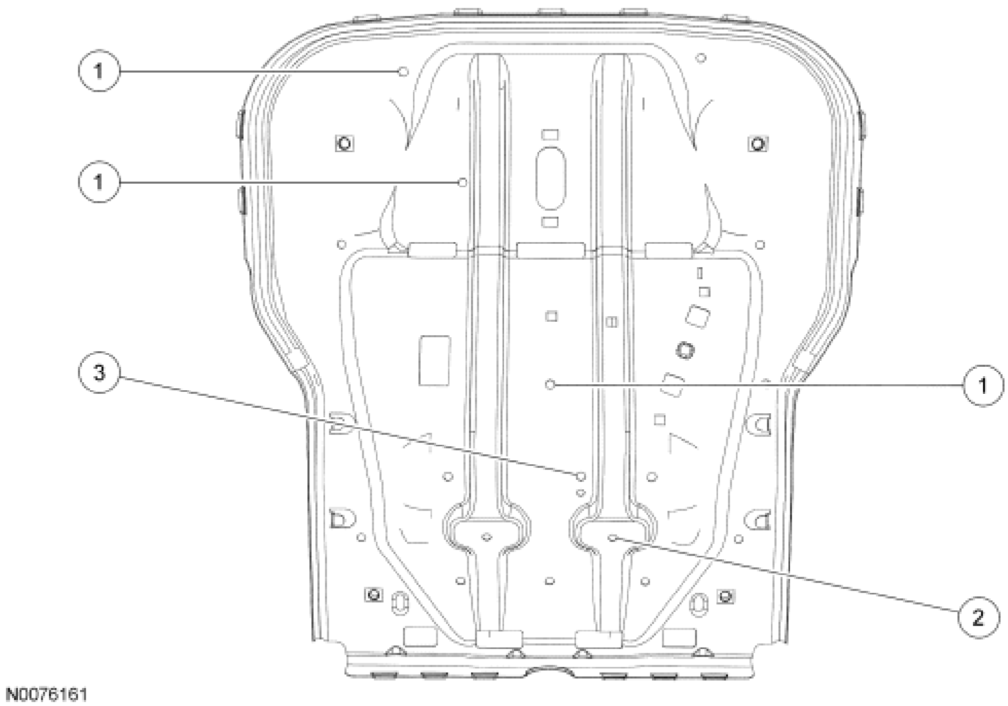

Fig. 375: Cushion Frame From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Wire harness main bundle
2	Occupant classification sensor (OCS) weight sensor bolt wire harness takeout
3	Side air bag electrical connector

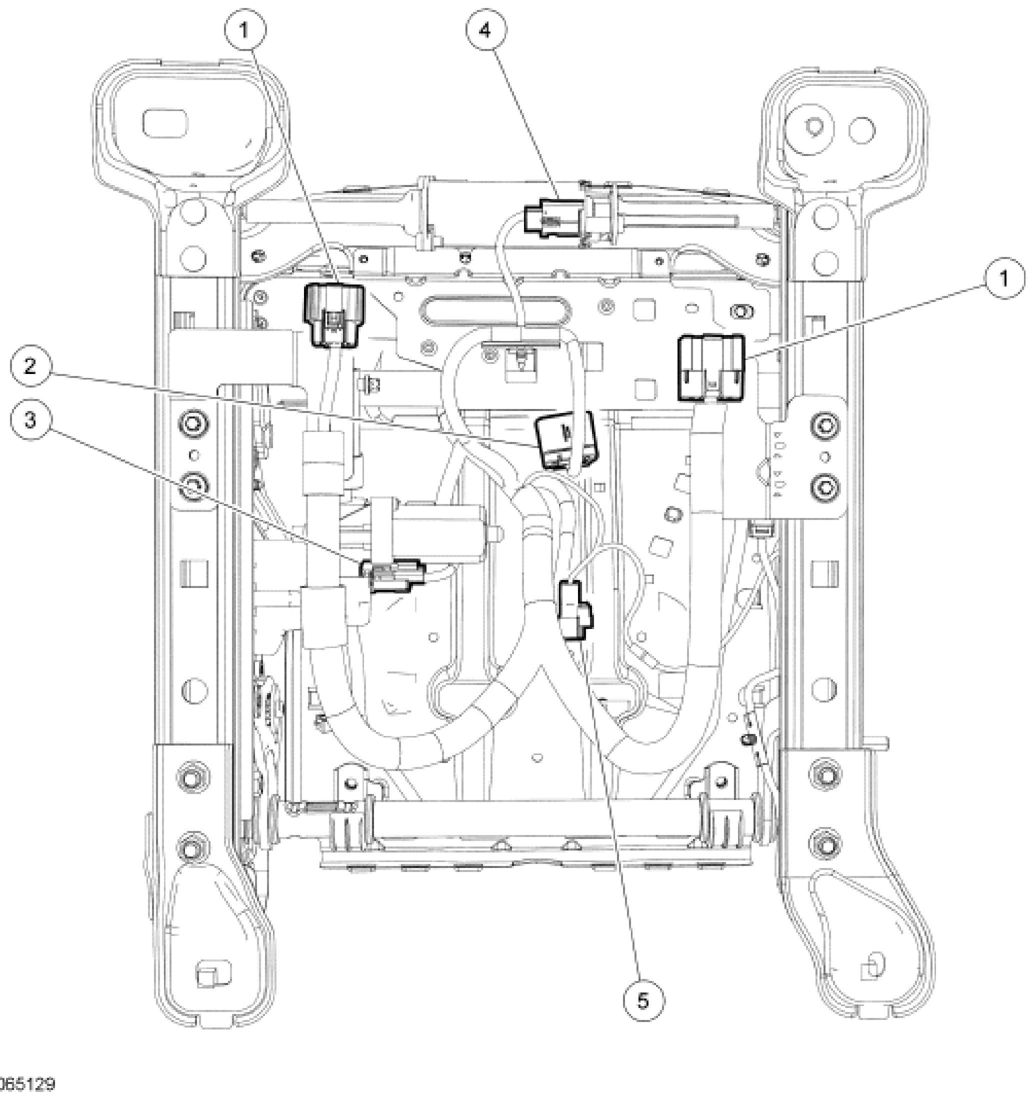

Fig. 376: Cushion Frame With Power Seat Track Attached From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Inline electrical connector to vehicle harness electrical connector
2	Occupant classification system module (OCSM) electrical connector
3	Front height motor electrical connector
4	Horizontal motor electrical connector
5	Side air bag electrical connector

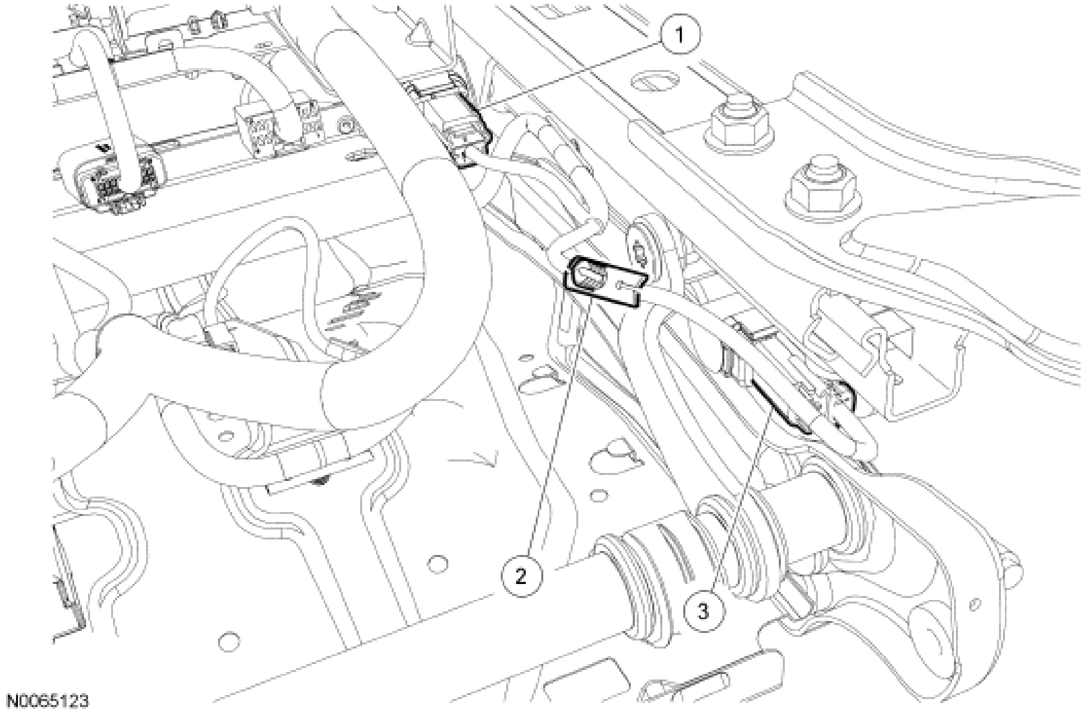

Fig. 377: Inboard Side of Cushion Frame and Power Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Front inboard occupant classification sensor (OCS) weight sensor bolt electrical connector
2	Attaches to inboard OCS weight sensor bolt protection bracket
3	Rear inboard OCS weight sensor bolt electrical connector

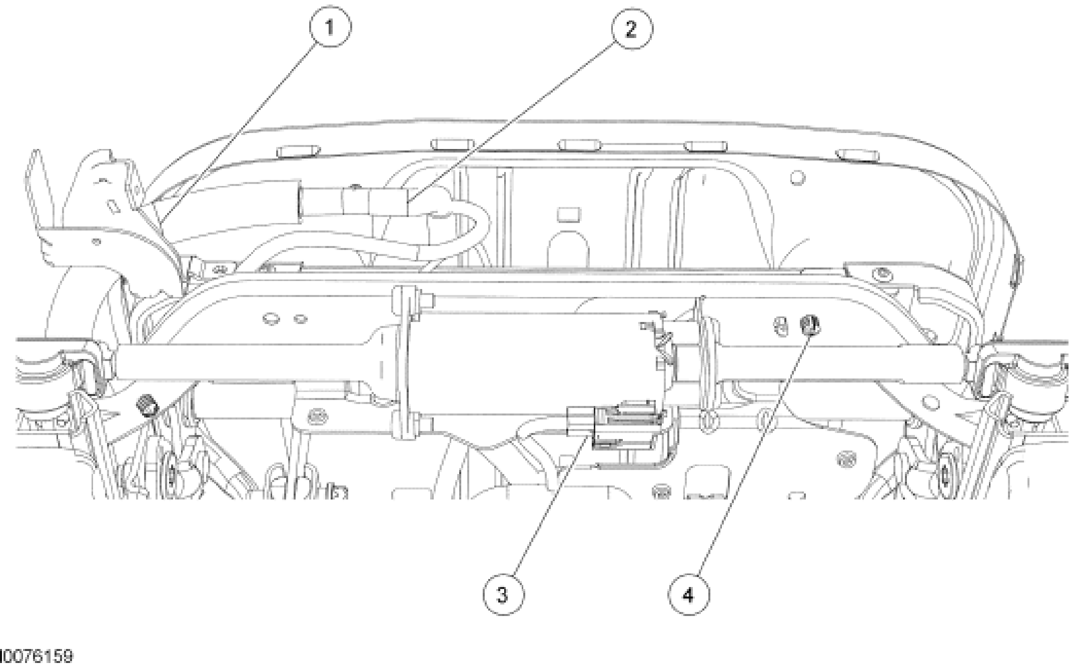

Fig. 378: Front of Cushion Frame and Power Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Seat control switch and rear height motor takeout must be routed on top of the bracket
2	Wire harness attachment points
3	Horizontal motor electrical connector
4	Safety belt buckle switch electrical connector pin-type retainer attached in place

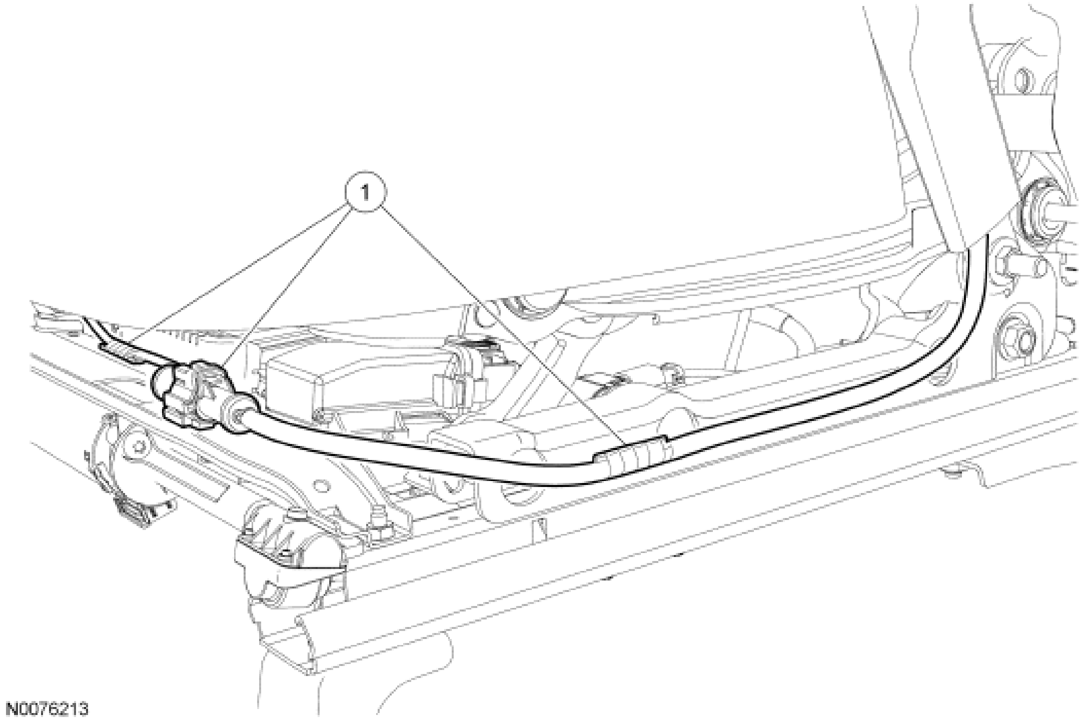

Fig. 379: Front Inboard Side of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Safety belt buckle switch electrical connector and wire harness takeout routing attachment points

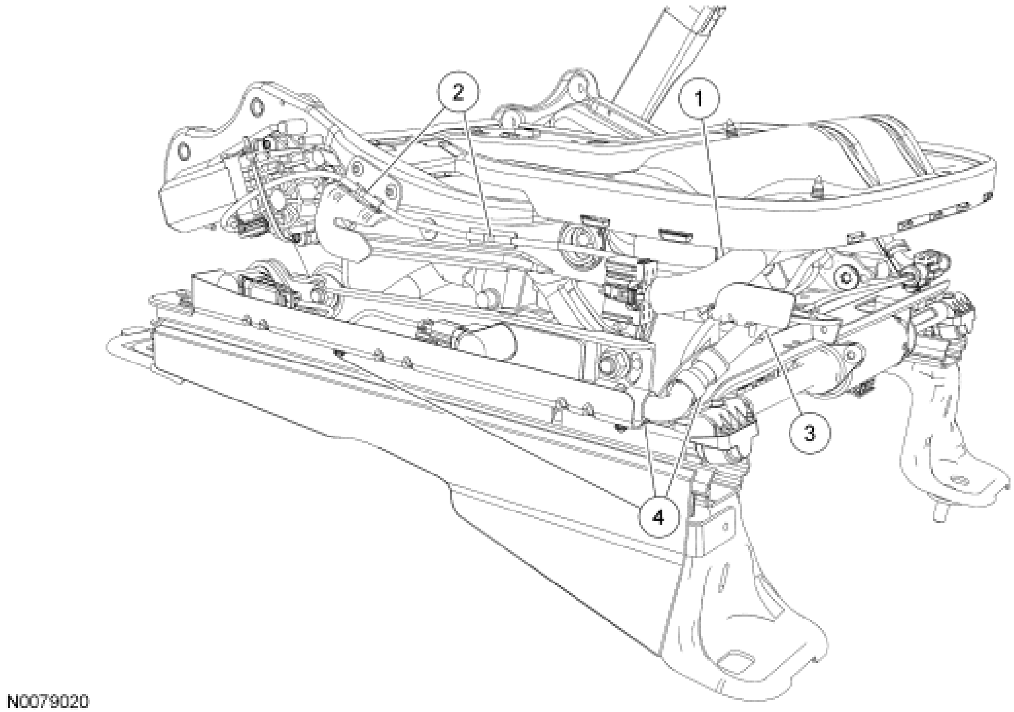

Fig. 380: Front and Outboard Side of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Seat control switch and rear height motor takeout must be routed on top of the bracket
2	Rear height motor takeout attachment points
3	Outboard occupant classification sensor (OCS) weight sensor bolt takeout must be routed under the bracket
4	Outboard OCS weight sensor bolt takeout attachment points

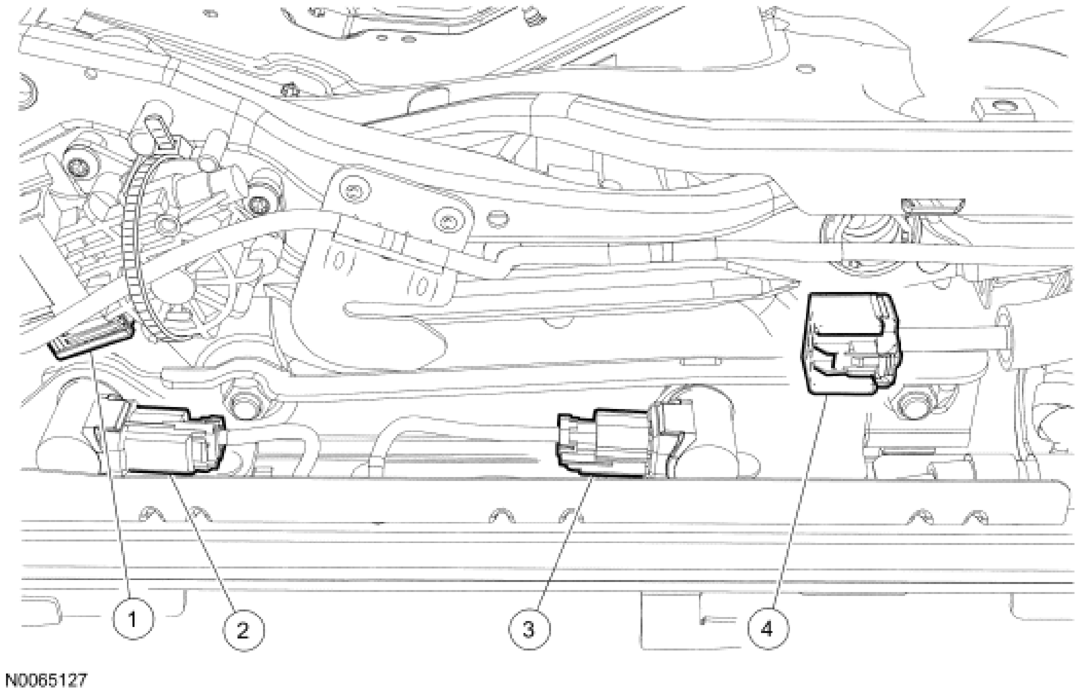

Fig. 381: Outboard of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Rear height motor electrical connector
2	Rear outboard occupant classification sensor (OCS) weight sensor bolt electrical connector
3	Front outboard OCS weight sensor bolt electrical connector
4	Seat control switch electrical connector

1. Make sure the passenger seat cushion wire harness is correctly routed and attached.

Power seat track with power recline, power lumbar and climate control

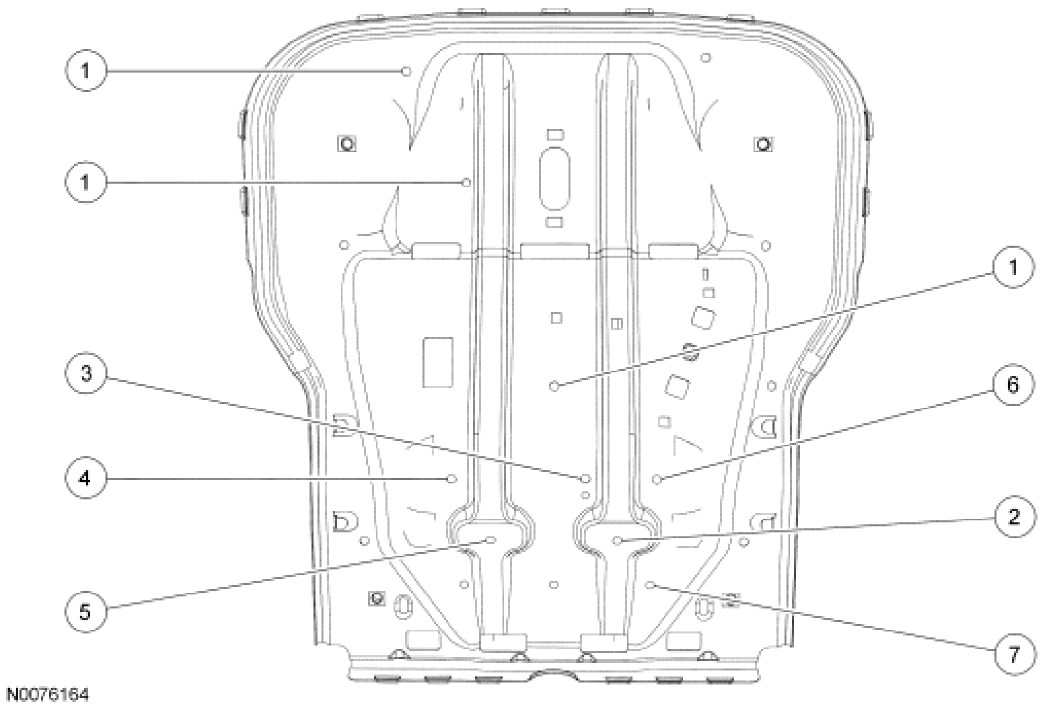

Fig. 382: Cushion Frame From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Wire harness main bundle
2	Occupant classification sensor (OCS) weight sensor bolt wire harness takeout
3	Side air bag electrical connector
4	Power recline electrical connector
5	Backrest thermo-electric device (TED) electrical connector
6	Cushion TED electrical connector
7	Power lumbar electrical connector

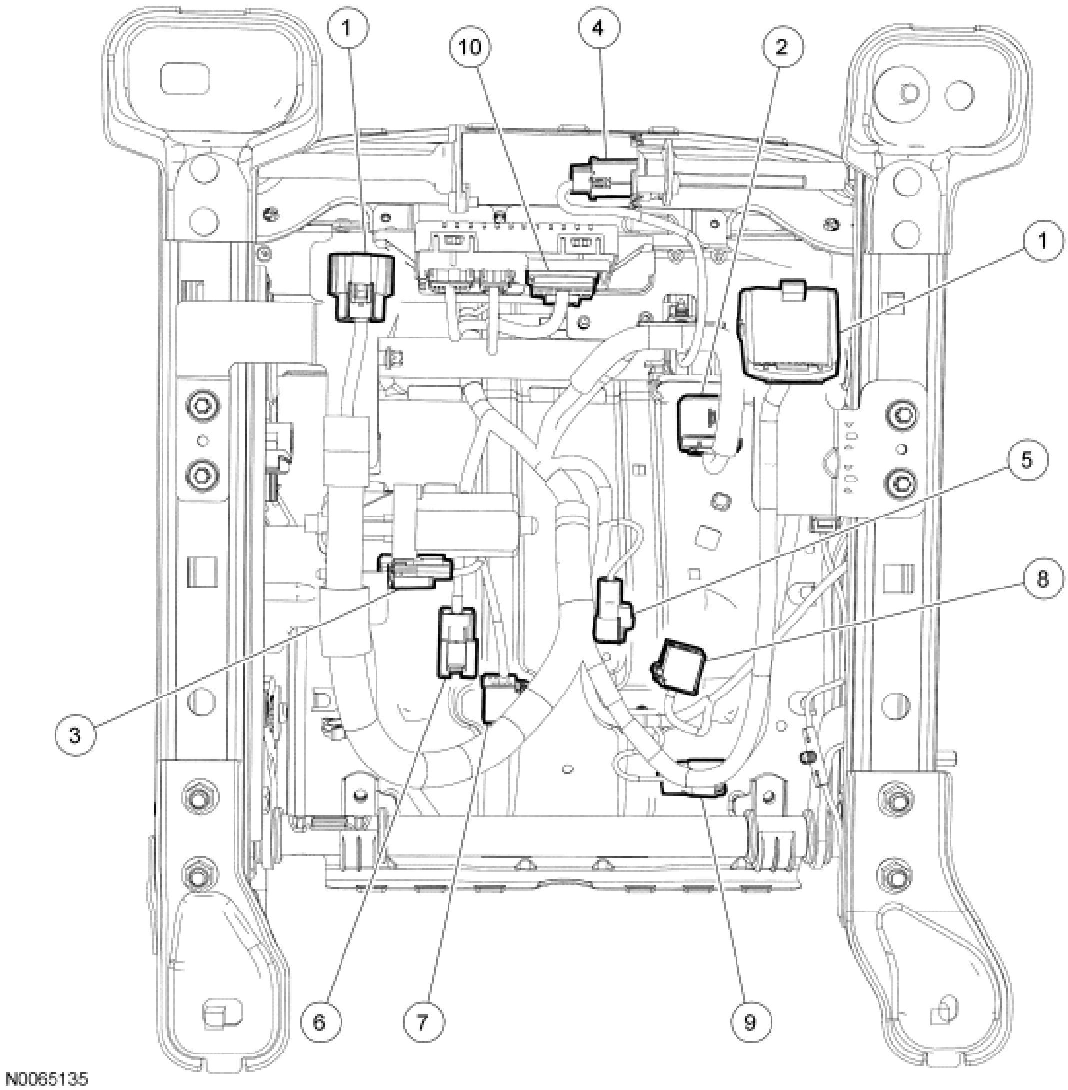

Fig. 383: Cushion Frame With Power Seat Track Attached From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Inline electrical connector-to-vehicle harness electrical connector
2	Occupant classification system module (OCSM) electrical connector
3	Front height motor electrical connector
4	Horizontal motor electrical connector
5	Side air bag electrical connector
6	Power recline electrical connector
7	Backrest thermo-electric device (TED) electrical connector
8	Cushion TED electrical connector
9	Power lumbar electrical connector
10	Dual climate controlled seat module (DCSM) and 3 electrical connectors

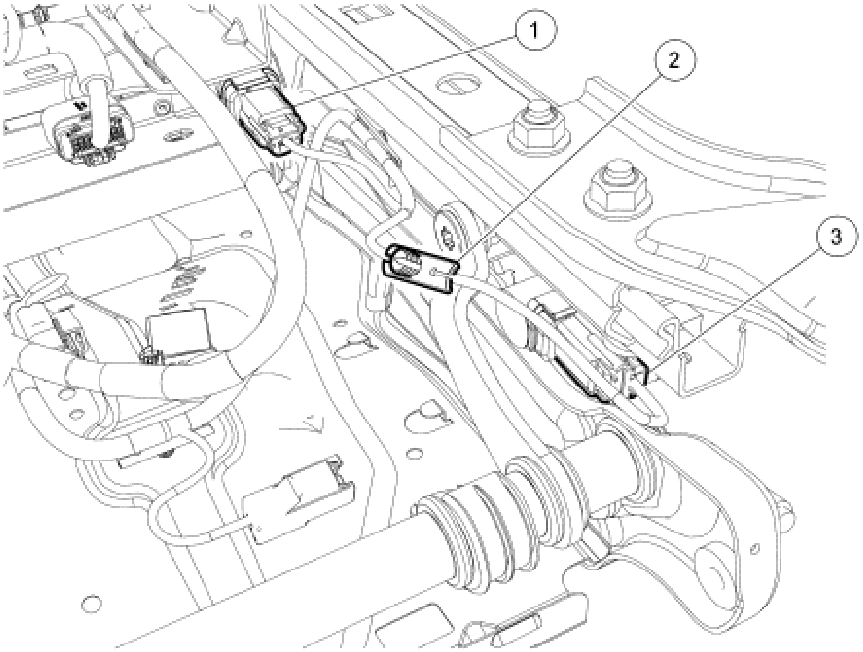

Fig. 384: Inboard Side of Cushion Frame and Power Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Front inboard occupant classification sensor (OCS) weight sensor bolt electrical connector
2	Attaches to inboard OCS weight sensor bolt protection bracket
3	Rear inboard OCS weight sensor bolt electrical connector

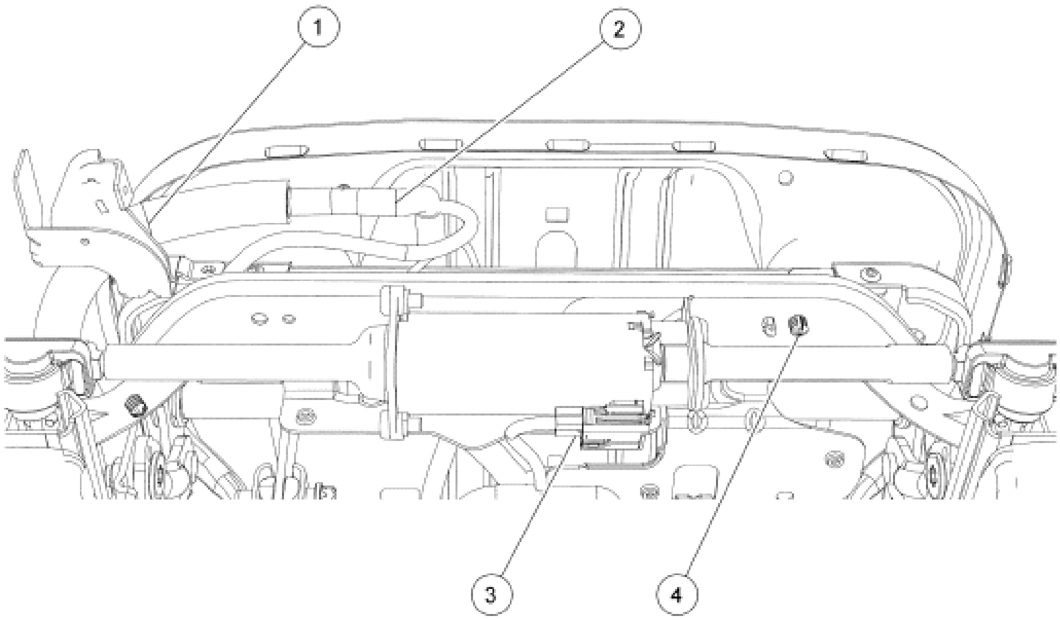

Fig. 385: Front of Cushion Frame and Power Seat Track From Underneath
Courtesy of FORD MOTOR CO.

Item	Description
1	Seat control switch and rear height motor takeout must be routed on top of the bracket
2	Wire harness attachment points
3	Horizontal motor electrical connector
4	Safety belt buckle switch electrical connector pin-type retainer attached in place

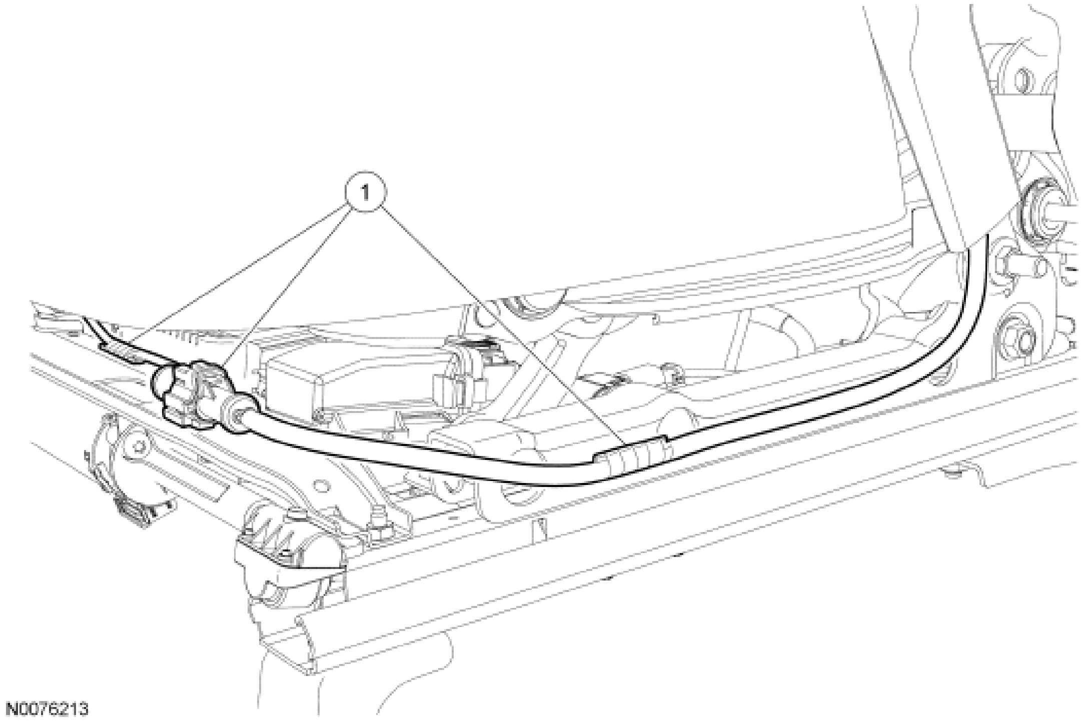

Fig. 386: Front Inboard Side of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Safety belt buckle switch electrical connector and wire harness takeout routing attachment points

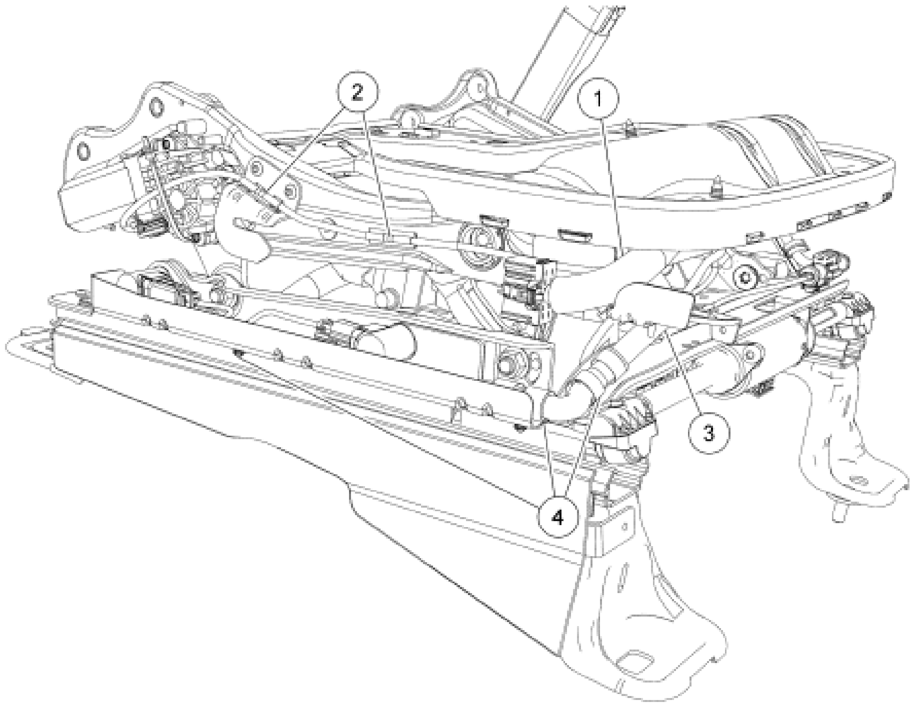

Fig. 387: Front and Outboard Side of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Seat control switch and rear height motor takeout must be routed on top of the bracket
2	Rear height motor takeout attachment points
3	Outboard occupant classification sensor (OCS) weight sensor bolt takeout must be routed under the bracket
4	Outboard OCS weight sensor bolt takeout attachment points

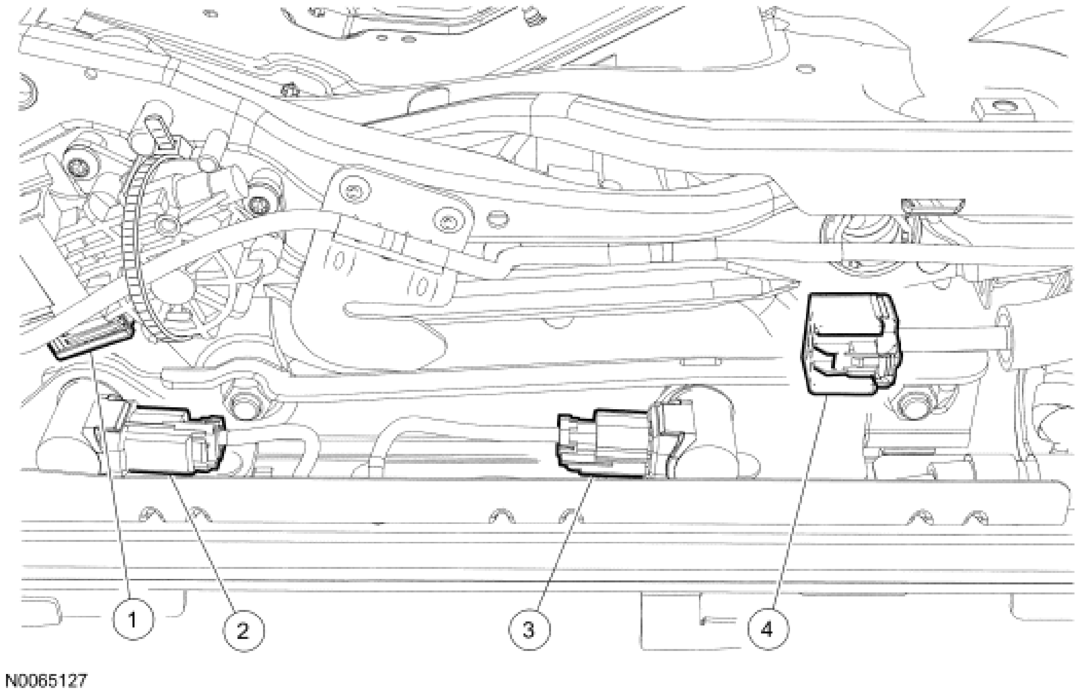

Fig. 388: Outboard of Cushion Frame and Power Seat Track From Upright
Courtesy of FORD MOTOR CO.

Item	Description
1	Rear height motor electrical connector
2	Rear outboard occupant classification sensor (OCS) weight sensor bolt electrical connector
3	Front outboard OCS weight sensor bolt electrical connector
4	Seat control switch electrical connector

1. Make sure the passenger seat cushion wire harness is correctly routed and attached.

REMOVAL AND INSTALLATION

SEAT - FRONT

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: Driver seat shown in illustration, passenger similar.

NOTE: For seat track-to-floor bolt torque specification and torque sequence, refer to the steps in this procedure.

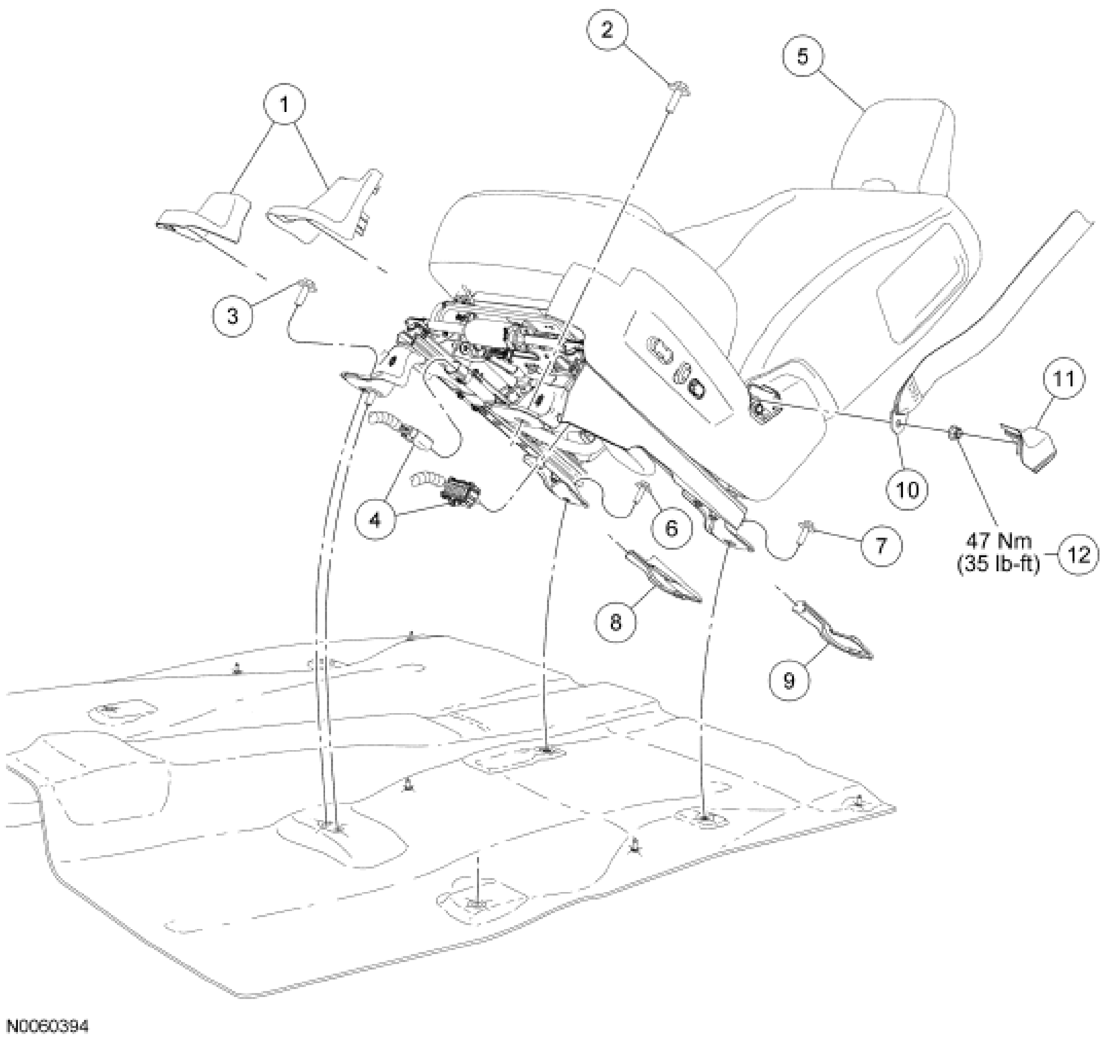

Fig. 389: Exploded View Of Front Seat Components With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	66410	Seat track-to-floor front bolt covers (2 required)
2	W712888	Seat track-to-floor front outboard bolt
3	W712888	Seat track-to-floor front inboard bolt
4	-	Electrical connectors (part of 14A005)
5	-	Front seat assembly
6	W712888	Seat track-to-floor rear inboard bolt

7	W712888	Seat track-to-floor rear outboard bolt
8	61748	Seat track-to-floor rear inboard bolt cover
9	61749	Seat track-to-floor rear outboard bolt cover
10	-	Safety belt retractor belt anchor (part of 611B08 RH/ 611B09 LH)
11	62187	Safety belt retractor belt anchor nut cover
12	-	Safety belt retractor belt anchor nut (part of 611B08 RH/ 611B09 LH)

REMOVAL

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: If servicing a power seat track, if possible, raise the front and rear to its highest point.

1. Position the seat to access all the seat track-to-floor bolts and the safety belt retractor belt anchor nut.
2. Depower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
3. Carefully pull up and out to remove the safety belt retractor belt anchor nut cover from the cushion side shield for access to the safety belt retractor belt anchor nut.
4. Remove the safety belt anchor nut and separate the safety belt anchor from the seat.
5. Pull forward and remove the 2 seat track-to-floor front bolt covers.
6. Remove the 2 seat track-to-floor rear bolt covers in the following sequence.
    1. Push the seat track-to-floor rear bolt cover forward.
    2. Lift to disengage the tab at the front of the seat track-to-floor rear bolt cover.
    3. Slide back and remove the seat track-to-floor rear bolt cover.
        - Repeat for the other side.

7. Remove the 4 seat track-to-floor bolts.
8. Tip the seat back and disconnect the seat electrical connectors.

WARNING: **Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

NOTE: **Use care when handling the driver seat and track assembly. Dropping the assembly or sitting on a seat not secured in the vehicle may result in damaged components.**

9. Remove the seat from the vehicle.

INSTALLATION

WARNING: **Make sure the front passenger seat is correctly installed and fastened to the vehicle. Do not force the alignment to the floorpan mounting holes. If the seat does not align to the floorpan mounting holes, repair the seat or floorpan as needed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.**

All seats

1. Position the seat in the vehicle.
2. Tip the seat and connect the electrical connectors.
3. Align the front inboard seat mounting locator to the guide hole in the floor and position the seat in place.
4. Start all the seat track-to-floor bolts by hand.

NOTE: **Driver shown in illustration, passenger similar.**

5. Install the seat track-to-floor bolts.
    1. Install the seat track-to-floor front inboard bolt.
        - Tighten to 55 Nm (41 lb-ft).
    2. Install the seat track-to-floor front outboard bolt.
        - Tighten to 55 Nm (41 lb-ft).
    3. Install the seat track-to-floor rear inboard bolt.
        - Tighten to 55 Nm (41 lb-ft).

4. Install the seat track-to-floor rear outboard bolt.
    - Tighten to 55 Nm (41 lb-ft).

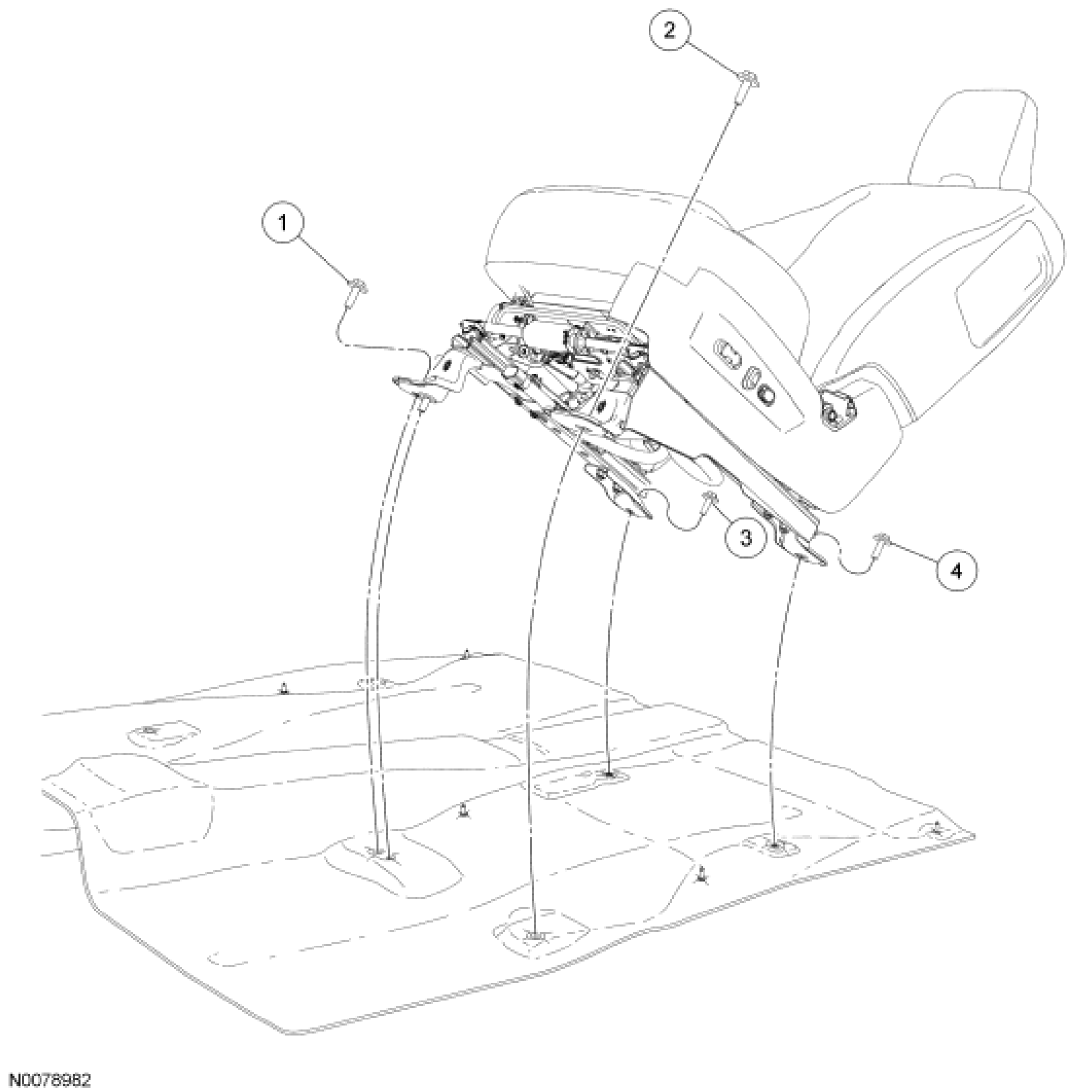

Fig. 390: Seat Track Bolts
Courtesy of FORD MOTOR CO.

6. Install the 4 seat track-to-floor front and rear bolt covers.

NOTE: **Make sure the safety belt webbing is not twisted prior to installation. Failure to follow this instruction may result in incorrect operation of the safety belt retractor.**

7. Position the safety belt retractor belt anchor onto the seat stud and install the safety belt retractor belt anchor nut.

- Tighten to 47 Nm (35 lb-ft).

8. Install the safety belt retractor belt anchor nut cover to the cushion side shield.
9. Repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Passenger seat with existing seat track, occupant classification system module (OCSM) and occupant classification sensor (OCS) weight sensor bolts

10. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Passenger seat with new seat track or OCSM or OCS weight sensor bolt(s)

11. Carry out the Occupant Classification Sensor (OCS) System Reset. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

All seats

12. Check the active restraint system for correct operation. For additional information, refer to safety belt system in the Diagnosis and Testing portion of **SAFETY BELT SYSTEM** article.
    - Make sure the safety belts and buckles are accessible to the occupants after installation.
    - Verify the safety belt retractor operates without excessive effort or binding.

SEAT - EXPLODED VIEW, FRONT

NOTE: **Driver backrest shown in illustration, passenger similar.**

NOTE: **Manual recliners without fold-flat backrest are serviced with the backrest frame. Power recliners without fold-flat backrest are serviced separately.**

NOTE: **A new heater mat will come assembled on a new foam pad.**

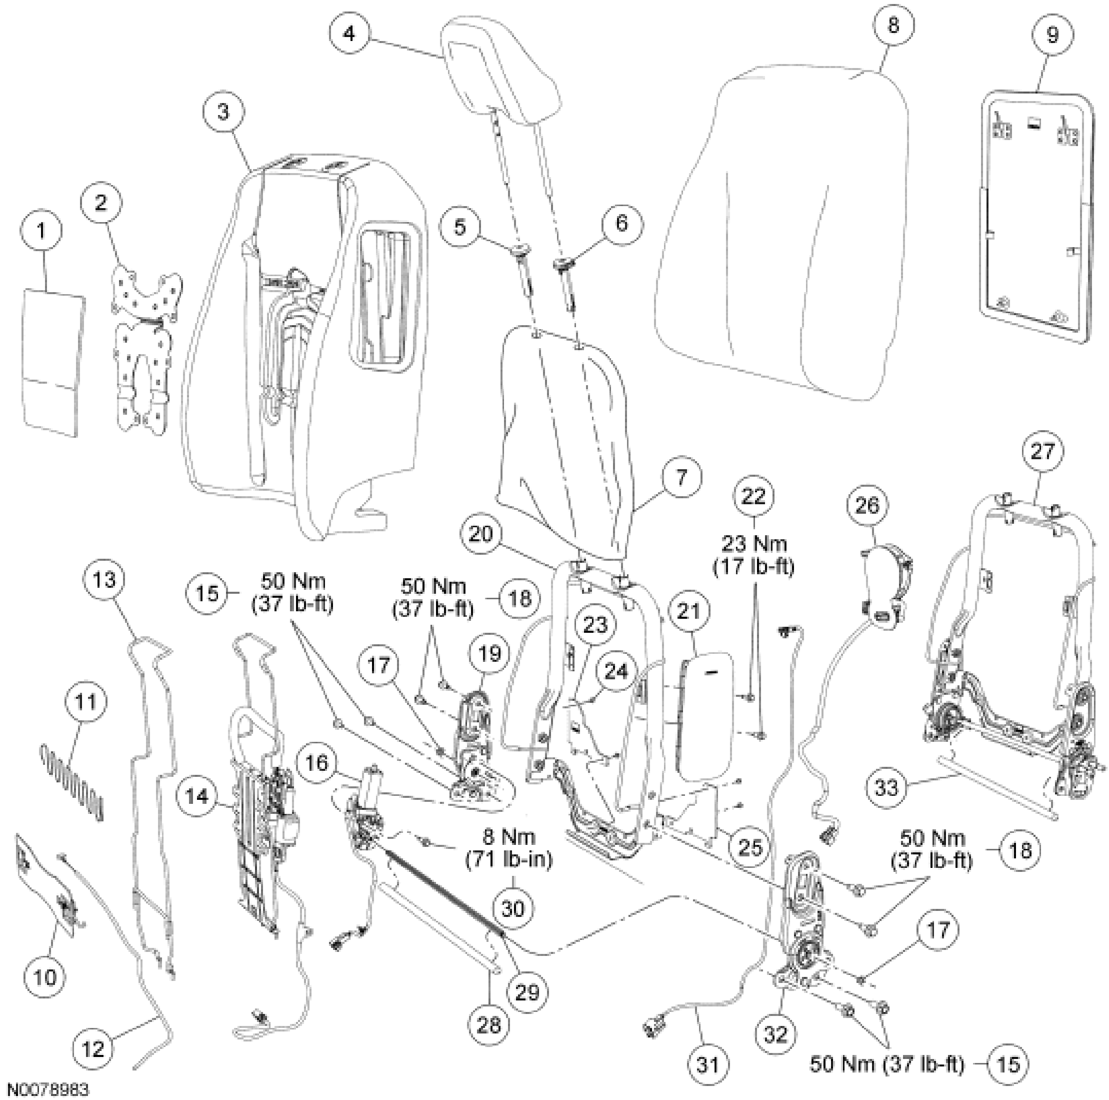

Fig. 391: Front Seat Backrest, Manual and Power Recline, Without Fold Flat
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Backrest heater mat (part of 64811) (if equipped)
2	18D507	Backrest climate control seat manifold (if equipped)
3	64811	Backrest foam pad
4	611A08	Head restraint
5	610A16	Head restraint guide, slave
6	610A16	Head restraint guide, master
7	-	Anti-squeak bag
8	64417	Backrest trim cover

9	-	Backrest trim panel
10	65500	Manual lumbar assembly (if equipped)
11	-	Upper support spring
12	-	Manual lumbar cable (part of 65500) (if equipped)
13	65500	Static lumbar
14	65500	Power lumbar assembly (if equipped)
15	W712240	Power/manual recliner-to-seat track bolts (4 required)
16	14547	Recliner motor (if equipped)
17	-	Recliner torque shaft clips (2 required) (if equipped)
18	W712240	Power recliner-to-backrest frame bolts (4 required) (if equipped)
19	62648	Inboard power recliner (if equipped)
20	61019	Backrest frame (with power recline) (if equipped)
21	611D11	Side air bag module
22	W506021	Side air bag module bolts
23	-	RH attachment panel
24	-	Screw (4 required)
25	-	LH attachment panel
26	18D507	Backrest thermo-electric device (TED) (if equipped)
27	61018	Backrest frame (with manual recline) (if equipped)
28	625A84	Power recline torque shaft cover (if equipped)
29	61726	Recliner torque shaft
30	-	Recliner motor bolt (if equipped)
31	14K155	Side air bag wire harness
32	62648	Outboard power recliner (if equipped)
33	625A84	Manual recline torque shaft cover (if equipped)

NOTE: Optional backrest on passenger seat only.

NOTE: Manual recliners with fold-flat backrest are serviced separately.

NOTE: A new heater mat will come assembled on a new foam pad.

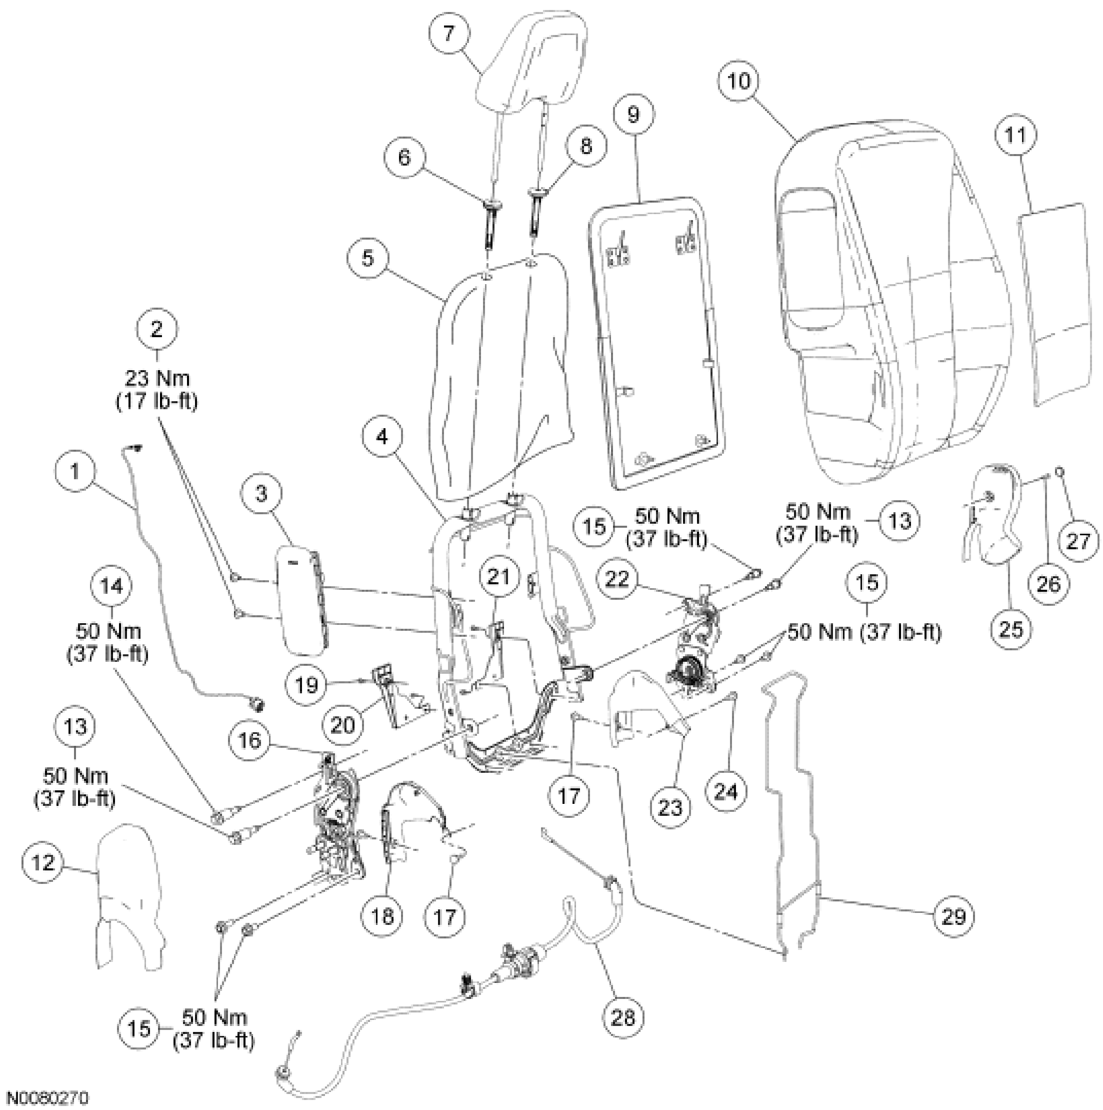

Fig. 392: Front Seat Backrest, Manual Recline With Fold Flat
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14K155	Side air bag wire harness
2	W506021	Side air bag module bolts
3	611D10	Side air bag module
4	-	Fold-flat backrest frame
5	-	Anti-squeak bag
6	610A16	Head restraint guide, slave
7	611A08	Head restraint
8	610A16	Head restraint guide, master
9	60508	Backrest trim panel
10	64810/64416	Backrest foam pad/backrest trim cover

11	-	Backrest heater mat (part of 64810) (if equipped)
12	62186	RH outer fold-flat recliner cover
13	W712059	Fold-flat recliner-to-fold-flat backrest frame front bolts (2 required)
14	W500720	Fold-flat recliner-to-fold-flat backrest frame rear bolts (2 required)
15	W712240	Fold-flat recliner-to-seat track bolts (4 required)
16	-	RH fold-flat recliner
17	62294	Inboard fold-flat recliner cover screws (3 required)
18	62186	RH inboard fold-flat recliner cover
19	-	Screw (4 required)
20	-	RH attachment panel
21	-	LH attachment panel
22	-	LH fold-flat recliner
23	62187	LH inboard fold-flat recliner cover
24	W714053	Scrivet
25	62187	LH outer fold-flat recliner cover
26	62294	LH outer fold-flat recliner cover screw
27	-	Screw cover
28	-	Fold-flat recliner cable
29	65500	Static lumbar

NOTE: Driver seat shown in illustration, passenger similar.

NOTE: A new heater mat will come assembled on a new foam pad.

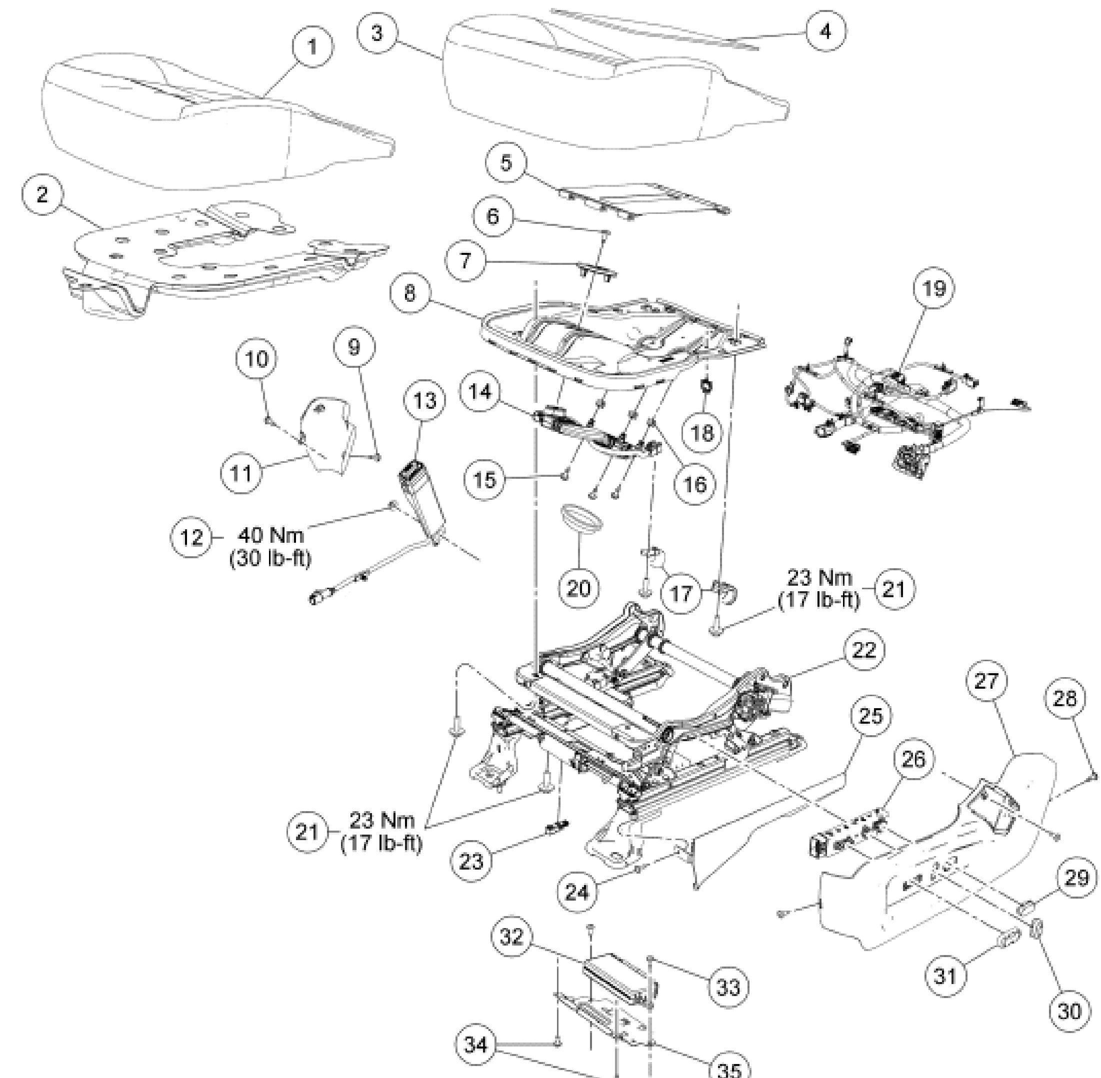

Fig. 393: Seat Cushion With Power Seat Track
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	62901	Cushion trim cover
2	18D507	Cushion climate control seat manifold (if equipped)
3	632A23	Cushion foam pad
4	-	Cushion heater mat (part of 632A23)
5	63226	Cushion support
6	-	Cushion thermo-electric device (TED)-to-climate control seat cushion adapter screw (if equipped)
7	18D507	Cushion TED adapter (if equipped)

8	63100	Cushion frame
9	62294	Recliner side shield screws
10	W714053	Scrivet
11	62187	Recliner side shield
12	-	Safety belt buckle-to-seat track nut (part of 61203)
13	61203	Safety belt buckle
14	18D507	Cushion TED (if equipped)
15	W505945	Cushion TED-to-cushion frame screw (3 required) (if equipped)
16	-	Screw grommet
17	-	Cushion frame-to-seat track rear brackets
18	-	Wire clip
19	14A699	Driver seat wire harness
20	19E880	Cushion TED filter (if equipped)
21	-	Seat track-to-cushion frame bolts (4 required)
22	61711	Power seat track assembly
23	14B416	Seat position sensor (driver only)
24	62294	Seat track cover retainer
25	62187	Seat track cover
26	14A701	Seat control switch
27	62187	Cushion side shield
28	62294	Cushion side shield retainer (3 required)
29	14711	Power lumbar switch knob (if equipped)
30	14711	Power seat recliner knob
31	14711	Seat control switch knob
32	14C708	Driver seat module (DSM) (if equipped)
33	62294	DSM-to-bracket screw (2 required) (if equipped)
34	62294	Bracket-to-seat track screws (if equipped)
35	14A301	DSM bracket (if equipped)

NOTE: A new heater mat will come assembled on a new foam pad.

SEAT BACKREST - FRONT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the cushion side shield in the following sequence.
    1. If equipped with manual recline, release the clip and remove the manual recline handle.
    2. If equipped with manual height adjust, pull and remove the manual height adjust handle.

    NOTE: Release the tension on the manual lumbar cable before removing the manual lumbar handle.

    3. If equipped with manual lumbar, release the 2 clips on the back of the manual lumbar handle then pull and remove the manual lumbar handle.
    4. Remove the cushion side shield screw(s).
    5. If equipped with power seat track, slide the cushion side shield up in the rear to release the retainer.
    6. Slide the cushion side shield forward to disengage the retainer.
        - If equipped with manual seat tracks, remove the cushion side shield.
    7. If equipped with power seat tracks, disconnect the seat control switch electrical connector.
        - Remove the cushion side shield.
3. Remove the screw and the scrivet and the recliner side shield.

Seats with manual lumbar

4. Remove the manual lumbar cable from the manual lumbar adjuster in the following sequence.
    1. Remove the manual lumbar adjuster bracket screw.
    2. Separate the manual lumbar adjuster from the bracket.
    3. Remove the manual lumbar cable from the manual lumbar adjuster.

Passenger seat with fold-flat backrest

5. Separate the recliner cable casing and Z-fitting from the LH fold-flat recliner.

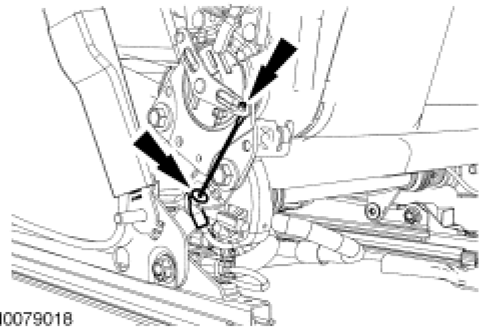

Fig. 397: Separating Recliner Cable Casing & Z-Fitting From LH Fold Flat Recliner
Courtesy of FORD MOTOR CO.

6. Separate the recliner cable casing and Z-fitting from the RH fold-flat recliner.

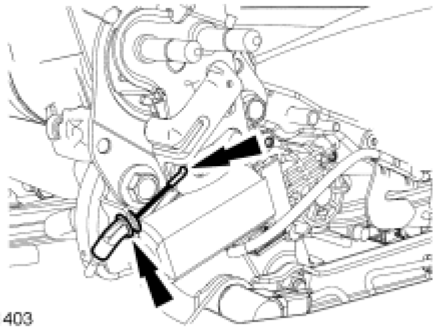

Fig. 398: Separating Recliner Cable Casing & Z-Fitting From RH Fold Flat Recliner
Courtesy of FORD MOTOR CO.

All seats

7. Disconnect the following electrical connectors, release any retainers and route out the wire harness for following components:
   - Side air bag module (if equipped).
   - Power lumbar motor (if equipped).
   - Power recline motor (if equipped).
   - Thermo-electric device (TED) (if equipped).
   - Backrest heater mat (if equipped).
8. Remove the 4 recliner-to-seat track bolts and remove the backrest assembly.
   - If equipped, route out the manual lumbar cable.

INSTALLATION

All seats

1. Position the backrest assembly to the seat track and install the 4 recliner-to-seat track bolts.
   - Route the manual lumbar cable (if equipped).
   - Tighten to 50 Nm (37 lb-ft).
2. Route the wire harnesses, connect the electrical connectors and attach the retainers for the following parts. For correct front passenger seat cushion wire harness routing, refer to **Seat Wire Harness Routing - Front Passenger Cushion**.
   - The side air bag module.
   - The power lumbar motor (if equipped).
   - The power recline motor (if equipped).
   - The TED (if equipped).
   - The backrest heater mat (if equipped).

   Passenger seat with fold-flat backrest

3. Install the Z-fitting to the RH fold-flat recliner and attach the recliner cable casing.

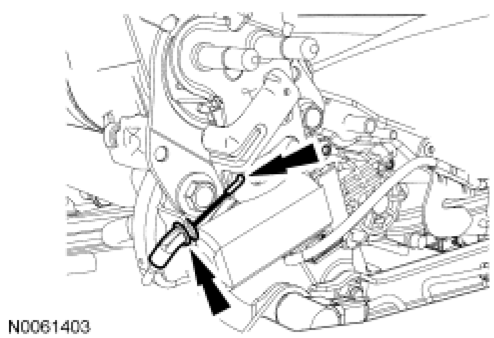

Fig. 399: Separating Recliner Cable Casing & Z-Fitting From RH Fold Flat Recliner
Courtesy of FORD MOTOR CO.

4. Install the Z-fitting to the LH fold-flat recliner and attach the recliner cable casing.

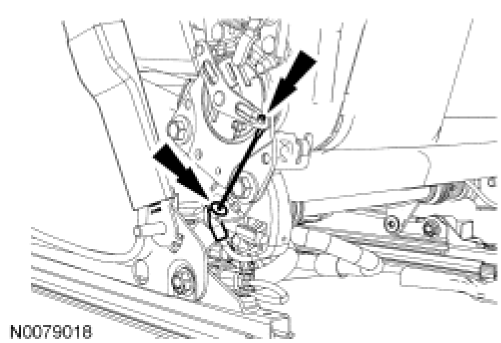

Fig. 400: Separating Recliner Cable Casing & Z-Fitting From LH Fold Flat Recliner
Courtesy of FORD MOTOR CO.

5. Adjust the fold-flat recliner cable in the following sequence.

1. Release the fold-flat recliner cable locking clip, allowing the cable to self-adjust.
2. Position the backrest upright, locking the recliners in place.
3. Apply force to the backrest, verifying the recliners are locked in place.
4. Lock the locking clip back in place.

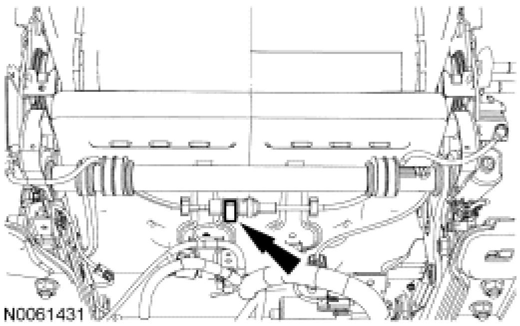

Fig. 401: Locating Fold Flat Recliner Cable Locking Clip
Courtesy of FORD MOTOR CO.

Seats with manual lumbar

6. Install the manual lumbar adjuster in the following sequence.
    1. Install the manual lumbar cable to the manual lumbar adjuster.
    2. Position the manual lumbar adjuster to the bracket.
    3. Install the manual lumbar adjuster bracket screw.

All seats

7. Position the recliner side shield and install the screw and scrivet.
8. Install the cushion side shield in the following sequence.
    1. Position the side shield to the seat and connect the seat control switch electrical connector (if equipped).
    2. Slide the cushion side shield rearward to engage the cushion side shield retainer to the seat track bracket.
    3. If equipped with power seat track, slide the cushion side shield down in the rear to engage the retainer.
    4. Install the cushion side shield screw(s).
    5. Install the manual lumbar handle (if equipped).
    6. Install the manual height adjust handle (if equipped).
    7. Position the clip on the manual recline handle and install the manual recline handle (if equipped).
9. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat

10. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST COVER - FRONT, WITHOUT FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of**

faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.

NOTE: **The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.**

2. Remove the backrest trim panel in the following sequence.
   1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
   2. Slide the backrest trim panel down to release the upper clips.
   3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

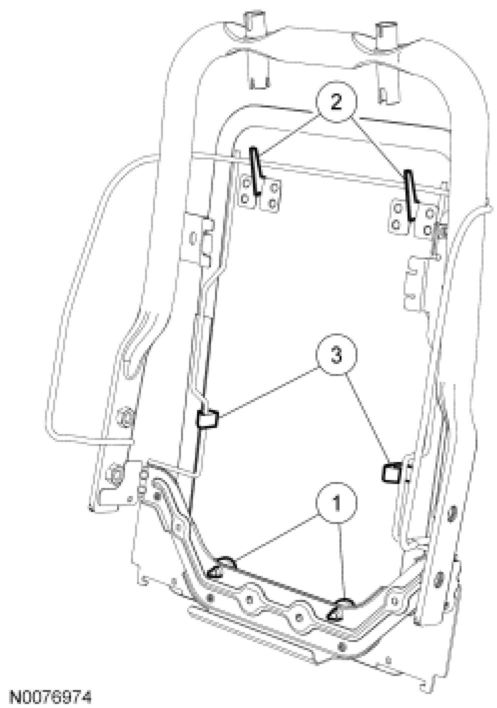

Fig. 402: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: **Lower outer J-clips are unfastened to show inner J-clips.**

3. Release the backrest trim cover outer and inner J-clips.

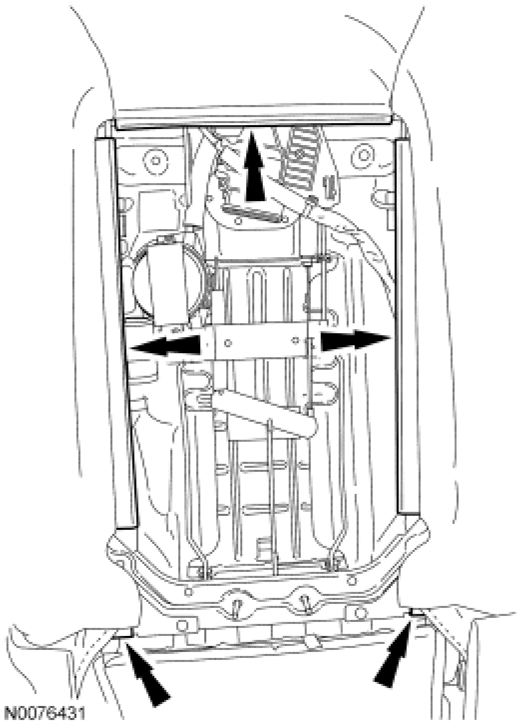

Fig. 403: Locating Inner J-Clips
Courtesy of FORD MOTOR CO.

4. Remove the head restraint.
    1. Using an appropriate tool, push in the hole, lift up on the head restraint and release one side of the head restraint.
    2. Push the release button and remove the head restraint.

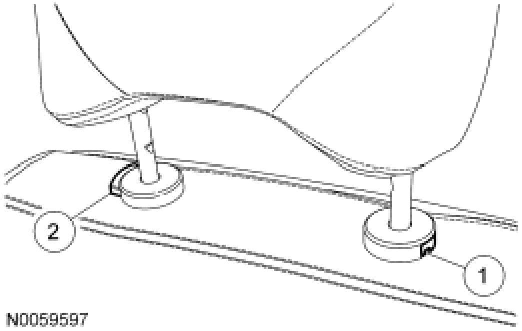

Fig. 404: Locating Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

5. Pull out and remove the master and slave head restraint guides.

NOTE: When installing, make sure the side air bag module wiring harness is not pinched between the side air bag module and the backrest frame or damage to the wiring harness can occur.

NOTE: When installing the side air bag module, new bolts must be installed.

6. Through the rear of the seat, remove and discard the 2 side air bag module bolts. Then separate the side air bag module from the seat backrest.
   - To install, tighten to 23 Nm (17 lb-ft).

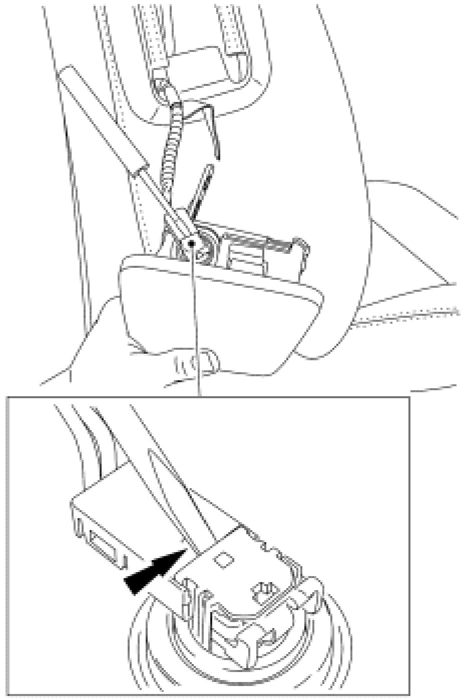
NOTE: Do not pull the side air bag module electrical connector out by the locking button. Damage to the locking button can occur.

NOTE: Do not install the side air bag module electrical connector by the locking button. Damage to the locking button can occur.

NOTE: The side air bag module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.

NOTE: The side air bag module electrical connector is unique and cannot be reversed when connected to the side air bag module. Match the electrical connector key to the keyway in the side air bag module. Do not force the electrical connector into the side air bag module or damage can occur.

7. Using a small screwdriver as shown in illustration, lift up and release the locking button on the side air bag module electrical connector. With the locking button released, remove the electrical connector and the side air bag module.



N0056883

Fig. 405: Lifting Up & Releasing Locking Button On Side Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE:	**Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.**

NOTE:	**A new heater mat will come assembled on a new foam pad.**

8. Remove the backrest trim cover from the backrest foam pad in the following sequence.
    1. Invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
        - Separate the hook-and-loop strips.
    2. Separate the backrest trim cover wire from the clips in the backrest foam pad.
        - If equipped with climate controlled seats, on assembly make sure the manifold is in place before snapping the backrest trim cover wire back into the backrest foam pad clips.
    3. Remove the backrest trim cover.
        - When installing the backrest trim cover, tuck the hook-and-loop strips into the backrest foam pad trenches last to get the best trim cover appearance.
9. To install, reverse the removal procedure.
10. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat

11. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

REMOVAL AND INSTALLATION

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Only the front passenger seat can come equipped with optional fold-flat backrest.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the screw and the LH outer fold-flat recliner cover.
3. Remove the RH outer fold-flat recliner cover in the following sequence.
    1. Pull to release the clips.
    2. Slide up to disengage the retainer and remove.

Seats with heat

4. From under the seat, disconnect the backrest heater mat electrical connector, release any pin-type retainers and route out the wire harness.

All seats

5. From under the seat, disconnect the side air bag electrical connector, release any pin-type retainers and route out the wire harness.
6. Remove the 4 fold-flat recliner-to-fold-flat backrest frame bolts and remove the backrest.
    - To install, tighten to 50 Nm (37 lb-ft).

NOTE: The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.

7. Remove the backrest trim panel in the following sequence.
    1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
    2. Slide the backrest trim panel down to release the upper clips.
    3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

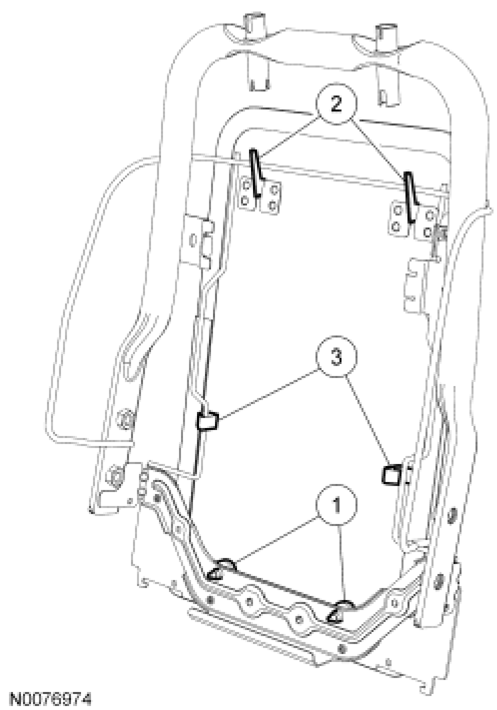

Fig. 406: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: Lower outer J-clips are unfastened to show inner J-clips.

8. Release the backrest trim cover outer and inner J-clips.

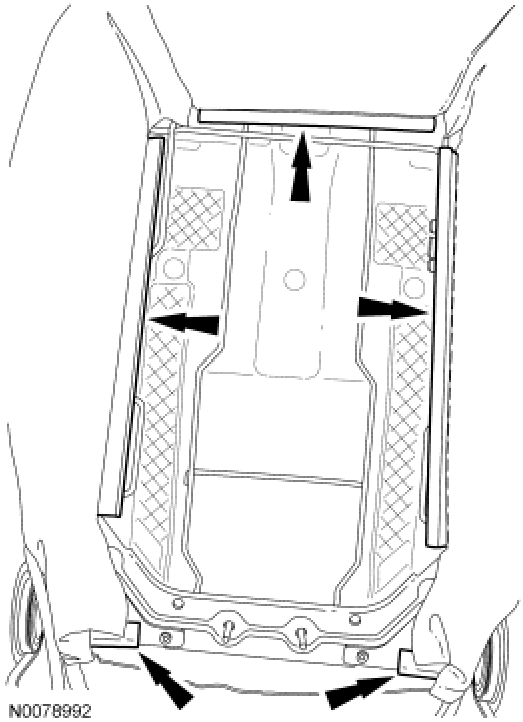

Fig. 407: Locating J-Clips
Courtesy of FORD MOTOR CO.

9. Remove the head restraint.
   1. Using an appropriate tool, push in the hole, lift up on the head restraint and release one side of the head restraint.
   2. Push the release button and remove the head restraint.

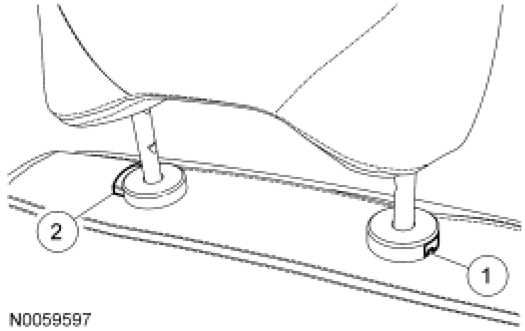

Fig. 408: Locating Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: **Always install a new slave head restraint guide.**

10. Pull out and remove the master and slave head restraint guides.

NOTE: Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.

11. Separate the backrest trim cover-to-backrest foam pad hook-and-loop strips.

NOTE: When installing, make sure the side air bag module wiring harness is not pinched between the side air bag module and the backrest frame or damage to the wiring harness can occur.

NOTE: When installing the side air bag module, new bolts must be installed.

12. Through the rear of the seat, remove and discard the 2 side air bag module bolts. Then separate the side air bag module from the seat backrest.
    - To install, tighten to 23 Nm (17 lb-ft).

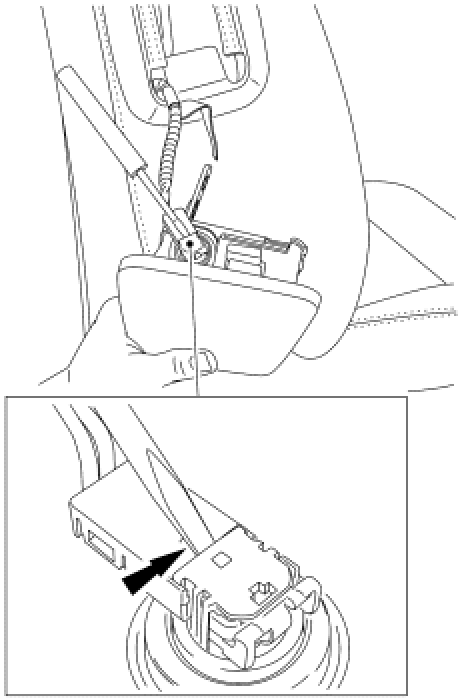
NOTE: Do not pull the side air bag module electrical connector out by the locking button. Damage to the locking button can occur.

NOTE: Do not install the side air bag module electrical connector by the locking button. Damage to the locking button can occur.

NOTE: The side air bag module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.

NOTE: The side air bag module electrical connector is unique and cannot be reversed when connected to the side air bag module. Match the electrical connector key to the keyway in the side air bag module. Do not force the electrical connector into the side air bag module or damage can occur.

13. Using a small screwdriver as shown in illustration, lift up and release the locking button on the side air bag module electrical connector. With the locking button released, remove the electrical connector and the side air bag module.



N0056883

Fig. 409: Lifting Up & Releasing Locking Button On Side Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

NOTE: Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.

NOTE: A new heater mat will come assembled on a new foam pad.

14. Remove the backrest trim cover in the following sequence.
    1. Invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
        - Separate the hook-and-loop strips.
    2. Separate the backrest trim cover wire from the clips in the backrest foam pad.
    3. If equipped, feed out the backrest heater mat and side air bag module wire harness from the opening in the side of the backrest trim cover.
    4. Remove the backrest trim cover.
15. To install, reverse the removal procedure.
    - For correct front passenger seat cushion wire harness routing at installation, refer to **Seat Wire Harness Routing - Front Passenger Cushion**.
16. Install the front seat. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
17. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional

information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CUSHION - FRONT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Release all wire harness and connector retainers to the cushion frame.

Passenger seat with fold-flat backrest

3. Separate the fold-flat recliner cable holders from the bottom of the cushion frame.

Seats with climate control

4. Disconnect the cushion thermo-electric device (TED).

Passenger seat with manual track and heat

5. Disconnect the heated seat module electrical connector and separate the pin-type retainers from the cushion frame.

Seats with heat

6. Disconnect the 2 heated seat electrical connectors and separate the pin-type retainers from the cushion frame.

   All seats

7. Remove the 4 cushion frame-to-seat track bolts and the cushion assembly.

INSTALLATION

Passenger seat with fold-flat backrest

1. Make sure the fold-flat recliner cable is routed correctly between the power seat track cross tube and cushion frame.

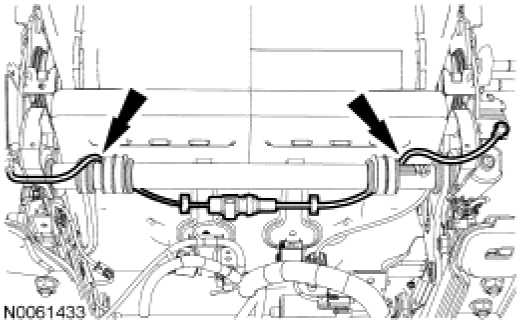


Fig. 410: Locating Fold Flat Recliner Cable
Courtesy of FORD MOTOR CO.

   All seats

2. Position the cushion assembly and install the 4 cushion frame-to-seat track bolts.
   - With power seat track, make sure the cushion frame-to-seat track rear brackets are aligned correctly with the tabs seated in the cushion frame (if equipped).
   - Tighten to 23 Nm (17 lb-ft).

   All passenger seats

3. For correct front passenger seat cushion wire harness routing, refer to **Seat Wire Harness Routing - Front Passenger Cushion**.

   Passenger seat with fold-flat backrest

4. Attach the 2 fold-flat recliner cable holders to the bottom of the cushion frame.

   Seats with heat

5. Route the heated seat wire harness, connect the 2 heated seat electrical connectors and attach the pin-type

retainers to the cushion frame.

Passenger seat with manual track and heat

6. Connect the heated seat module electrical connector and attach the pin-type retainers to the cushion frame.

Seats with climate control

7. Connect the cushion TED.

All seats

8. Attach any remaining wire harness and connector retainers to the cushion frame.
9. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat

10. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CUSHION COVER - FRONT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat cushion. For additional information, refer to **Seat Cushion - Front**.

3. Release the cushion trim cover retainers from the cushion frame and remove the cushion trim cover and cushion foam pad.

NOTE: Use care when separating the cushion trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the cushion foam pad.

NOTE: A new heater mat will come assembled on a new foam pad.

4. Remove the cushion trim cover in the following sequence.
    1. Separate the hook-and-loop strips.
    2. Separate the cushion trim cover wire retainer from the clips in the cushion foam pad.
        - For vehicles with climate controlled seats, on assembly make sure the climate controlled seat manifold is in place before snapping the cushion trim cover wire retainer back into the cushion foam pad.
    3. Remove the cushion trim cover.
5. To install, reverse the removal procedure.
6. Install the front seat cushion. For additional information, refer to **Seat Cushion - Front**.
    - For correct front passenger seat cushion wire harness routing, refer to **Seat Wire Harness Routing - Front Passenger Cushion**.
7. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

8. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT TRACK

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL

WARNING: Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of

serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: To install a new occupant classification system module (OCSM) or an occupant classification sensor (OCS) weight sensor bolt, refer to the appropriate procedure in SUPPLEMENTAL RESTRAINT SYSTEM article.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front**.
3. Separate the seat wire harness main feed electrical connector(s) from the seat track brackets.
4. Disconnect the safety belt buckle switch electrical connector. Separate any retainers holding the wire harness or electrical connector to the seat track.
5. Disconnect all the seat track motor electrical connectors and separate any retainers holding the wire harness or electrical connectors to the seat track (if equipped).

Driver seat

6. Disconnect the seat track position sensor and separate any retainers holding the wire harness or electrical connectors to the seat track.
7. Disconnect the driver seat module (DSM) electrical connectors and separate any retainers holding the wire harness to the seat track (if equipped).

Passenger seat with manual seat track

NOTE: Rear inboard OCS weight sensor bolt protection bracket shown in illustration, others similar.

8. Separate the wire harness from the OCS weight sensor bolt protection brackets, remove the 4 OCS weight sensor bolt protection bracket screws and remove the 4 OCS weight sensor bolt protection brackets.

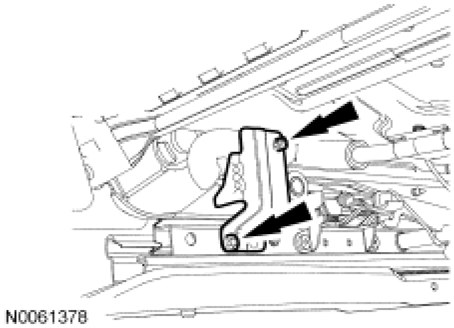

Fig. 411: Identifying OCS Weight Sensor Bolt Protection Brackets
Courtesy of FORD MOTOR CO.

Passenger seat with power seat track

9. Remove the cushion side shield in the following sequence.
    1. If equipped with manual recline, release the clip and remove the manual recline handle.

    NOTE: Release the tension on the manual lumbar cable before removing the manual lumbar handle.

    2. If equipped with manual lumbar, release the 2 clips on the back of the manual lumbar handle then pull and remove the manual lumbar handle.
    3. Remove the cushion side shield screw(s).
    4. Slide the cushion side shield up in the rear to release the retainer.
    5. Slide the cushion side shield forward to disengage the retainer.
    6. Disconnect the seat control switch electrical connector.
        - Remove the cushion side shield.
10. Separate the wire harness from the outboard OCS weight sensor bolt protection bracket, remove the 2 outboard OCS weight sensor bolt protection bracket screws and remove the outboard OCS weight sensor bolt protection bracket.
11. Separate the wire harness from the inboard OCS weight sensor bolt protection bracket, remove the inboard OCS weight sensor bolt protection bracket screw and the inboard OCS weight sensor bolt protection bracket.

Passenger seat

12. Mark the 4 OCS weight sensor bolt electrical connectors so that they can be reconnected in their same location at installation.
13. Disconnect the 4 OCS weight sensor bolt electrical connectors and detach any wire harness retainers to the seat track.
14. Disconnect the OCSM and detach any wire harness retainers to the seat track.

Passenger seat with power seat track

15. Disconnect the heated seat module electrical connector and detach any wire harness retainers to the seat track (if equipped).
16. Disconnect the dual climate controlled seat module (DCSM) electrical connectors and detach any wire harness retainers to the seat track (if equipped).

All seats

17. Separate any retainers holding the seat wire harness or electrical connectors to the seat track.
18. Remove the 4 seat track-to-cushion frame bolts and remove the seat track.

All passenger seats

19. To install a new OCSM or an OCS weight sensor bolt, refer to the appropriate procedure in **SUPPLEMENTAL RESTRAINT SYSTEM** article.

INSTALLATION

Power seat tracks

1. Position the cushion frame-to-seat track rear brackets to the power seat track rear cross tube.
   - Make sure the locator tabs of the cushion frame-to-seat track rear brackets are aligned correctly to the cushion frame.

Passenger seat with fold-flat backrest

2. Make sure the fold-flat recliner cable is routed correctly between the power seat track cross tube and cushion frame.

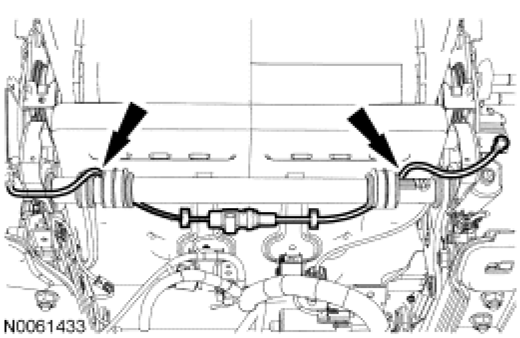

Fig. 412: Locating Fold Flat Recliner Cable
Courtesy of FORD MOTOR CO.

All seat tracks

3. Install the 4 cushion frame-to-seat track bolts.
   - Tighten to 23 Nm (17 lb-ft).

All passenger seats

4. For correct front passenger seat cushion wire harness routing, refer to **Seat Wire Harness Routing - Front Passenger Cushion**.
5. Connect the 4 OCS weight sensor bolt electrical connectors, as marked during removal and attach any retainers holding the wire harness to the seat track.
6. Connect the OCSM and attach any wire harness retainers to the seat track.

Passenger seat with power seat track

7. Position the inboard OCS weight sensor bolt protection bracket to the seat track, install the inboard OCS weight sensor bolt protection bracket screw and attach the wire harness to the inboard OCS weight sensor bolt protection bracket.
   - Tighten to 2 Nm (18 lb-in).
8. Position the outboard OCS weight sensor bolt protection bracket to the seat track, install the 2 outboard OCS weight sensor bolt protection bracket screws and attach the wire harness to the outboard OCS weight sensor bolt protection bracket.
   - Tighten to 6 Nm (53 lb-in).
9. Install the cushion side shield in the following sequence.
   1. Position the side shield to the seat and connect the seat control switch electrical connector.
   2. Slide the cushion side shield rearward to engage the cushion side shield retainer to the seat track bracket.
   3. Slide the cushion side shield down in the rear to engage the retainer.
   4. Install the cushion side shield screw(s).
   5. Install the manual lumbar handle (if equipped).
   6. Position the clip on the manual recline handle and install the manual recline handle (if equipped).
10. Connect the heated seat module electrical connector and attach any retainers holding the wire harness to the seat track (if equipped).
11. Connect the DCSM electrical connectors and attach any retainers holding the wire harness to the seat track (if equipped).

Passenger seat with manual seat track

NOTE: Rear inboard OCS weight sensor bolt protection bracket shown in illustration, others similar.

12. Position each of the 4 OCS weight sensor bolt protection brackets, install the 4 OCS weight sensor bolt protection bracket screws and attach the wire harness to the OCS weight sensor bolt protection brackets.
   - Tighten the front OCS weight sensor bolt protection brackets to 5 Nm (44 lb-in).
   - Tighten the rear OCS weight sensor bolt protection brackets to 2 Nm (18 lb-in).

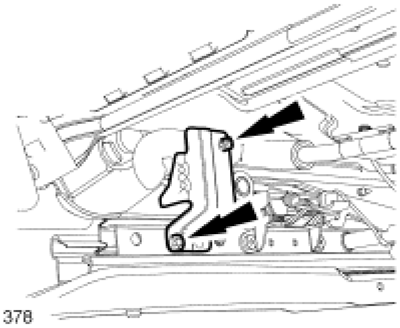

Fig. 413: Identifying OCS Weight Sensor Bolt Protection Brackets
Courtesy of FORD MOTOR CO.

Driver seat

13. Connect the DSM electrical connectors and attach any retainers holding the wire harness to the seat track (if equipped).
14. Connect the seat track position sensor and attach any retainers holding the wire harness or electrical connectors to the seat track.

All seats

15. Connect all the seat track motor electrical connectors and attach any retainers holding the wire harness or electrical connectors to the seat track (if equipped).
16. Connect the safety belt buckle switch electrical connector. Attach any retainers holding the wire harness or electrical connector to the seat track.
17. Attach the seat wire harness main feed in electrical connector(s) to the seat track brackets.
18. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front**.
19. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat with existing seat track

20. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Passenger seat with new seat track, OCS module or OCS weight sensor bolt

21. Carry out the Occupant Classification Sensor (OCS) System Reset. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Driver seat with memory

22. Set the memory seat soft stops. For additional information, carry out Setting the Soft Stops in the Principles of Operation portion of **Seats**.

SEAT RECLINER MOTOR

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. If equipped with power lumbar, release the tension on the power lumbar cable before removing the seat from the vehicle.
2. Remove the front seat. For additional information, refer to **Seat - Front**.
3. Remove the cushion side shield in the following sequence.

   NOTE: Release the tension on the manual lumbar cable before removing the manual lumbar handle.

   1. If equipped with manual lumbar, release the 2 clips on the back of the manual lumbar handle then pull and remove the manual lumbar handle.
   2. Remove the cushion side shield screw(s).
   3. Slide the cushion side shield up in the rear to release the retainer.
   4. Slide the cushion side shield forward to disengage the retainer.
   5. Disconnect the seat control switch electrical connector.
      - Remove the cushion side shield.
4. Remove the recliner side shield in the following sequence.
   1. Remove the recliner side shield screw and scrivet.
   2. Pull out and remove the recliner side shield.

NOTE: The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.

5. Remove the backrest trim panel in the following sequence.
    1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
    2. Slide the backrest trim panel down to release the upper clips.
    3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

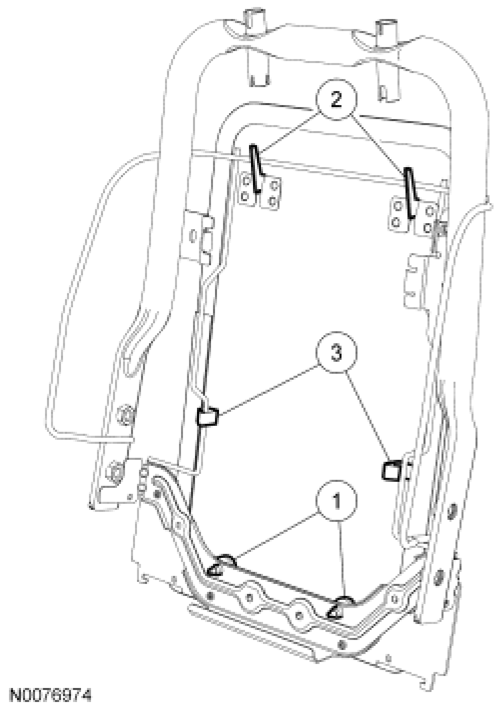

Fig. 414: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: Lower outer J-clips are unfastened to show inner J-clips.

6. Release the backrest trim cover outer and inner J-clips attached to the backrest frame.

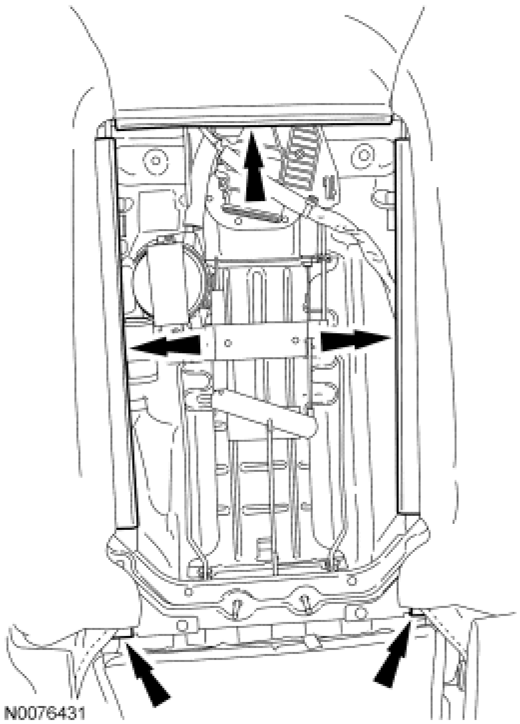

Fig. 415: Locating Inner J-Clips
Courtesy of FORD MOTOR CO.

7. Push the backrest foam pad away from the backrest frame.
8. Remove the recliner motor in the following sequence.
   1. Remove the clip from the torque shaft on the recliner motor side.
   2. Slide the torque shaft out of the recliner and recliner motor.
   3. Remove the recliner motor bolt.
      - To install, tighten to 8 Nm (71 lb-in).
   4. Disconnect and remove the recliner motor.
9. To install, reverse the removal procedure.
10. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat only

11. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

LUMBAR ASSEMBLY - MANUAL

Special Tools

Illustration	Tool Name	Tool Number

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the cushion side shield in the following sequence.
    1. If equipped with manual recline, release the clip and remove the manual recline handle.
    2. If equipped with manual height adjust, pull and remove the manual height adjust handle.

    NOTE: Release the tension on the manual lumbar cable before removing the manual lumbar handle.

    3. Release the 2 clips on the back of the manual lumbar handle then pull and remove the manual lumbar handle.
    4. Remove the cushion side shield screw(s).
    5. If equipped with power seat track, slide the cushion side shield up in the rear to release the retainer.
    6. Slide the cushion side shield forward to disengage the retainer.
        - If equipped with manual seat tracks, remove the cushion side shield.
    7. If equipped with power seat tracks, disconnect the seat control switch electrical connector.
        - Remove the cushion side shield.
3. Remove the lumbar cable from the manual lumbar adjuster in the following sequence.
    1. Remove the manual lumbar adjuster to bracket screw.
    2. Separate the manual lumbar adjuster from the bracket.
    3. Remove the lumbar cable from the manual lumbar adjuster.

NOTE: The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.

4. Remove the backrest trim panel in the following sequence.

1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
2. Slide the backrest trim panel down to release the upper clips.
3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

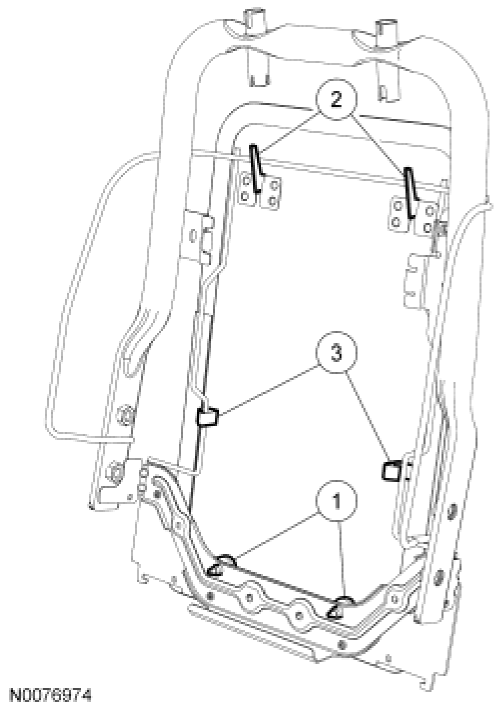

Fig. 416: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: Lower outer J-clips are unfastened to show inner J-clips.

5. Release the backrest trim cover outer and inner J-clips attached to the backrest frame.

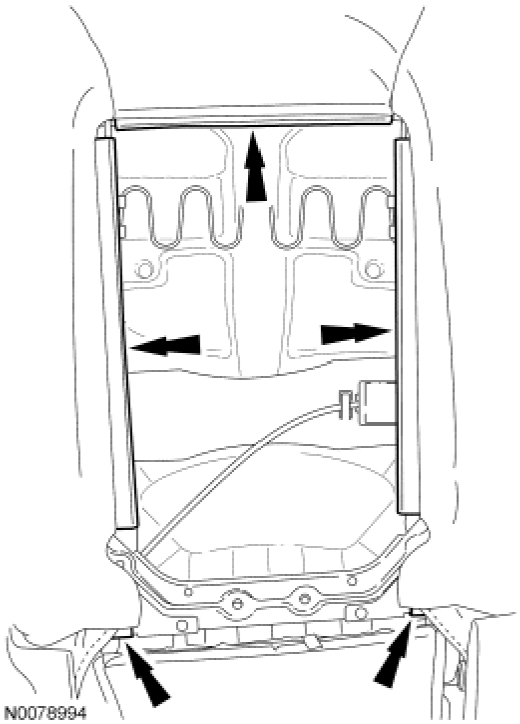

Fig. 417: Locating J-Clips
Courtesy of FORD MOTOR CO.

6. Release the manual lumbar hooks from the backrest frame, route out the manual lumbar cable and remove the manual lumbar assembly.
7. To install, reverse the removal procedure.
8. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

   Passenger seat

9. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

LUMBAR ASSEMBLY - POWER

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.

    NOTE: The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.

2. Remove the backrest trim panel in the following sequence.
    1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
    2. Slide the backrest trim panel down to release the upper clips.
    3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

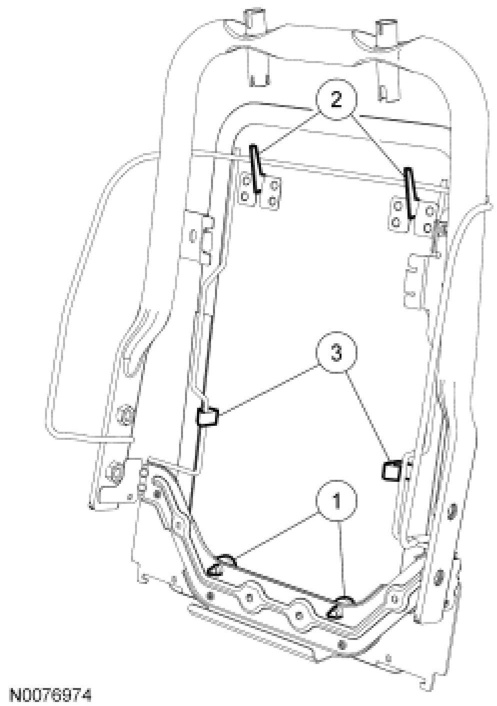

Fig. 418: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: Lower outer J-clips are unfastened to show inner J-clips.

3. Release the backrest trim cover outer and inner J-clips attached to the backrest frame.

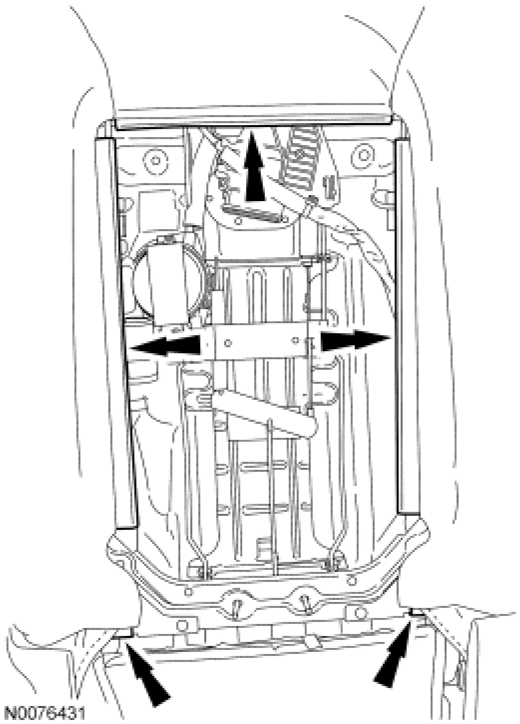

Fig. 419: Locating Inner J-Clips
Courtesy of FORD MOTOR CO.

4. Remove the head restraint.
   1. Using an appropriate tool, push in the hole, lift up on the head restraint and release one side of the head restraint.
   2. Push the release button and remove the head restraint.

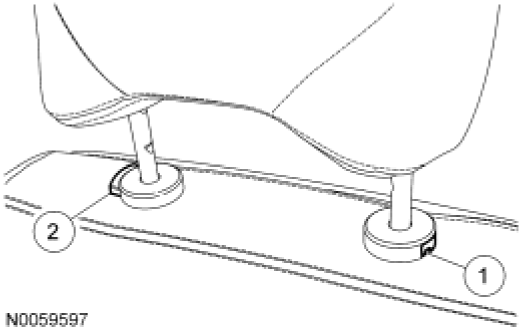

Fig. 420: Locating Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

5. Pull out and remove the master and slave head restraint guides.

NOTE: **When installing, make sure the side air bag module wiring harness is not pinched between the side air bag module and the backrest frame or damage to the wiring harness can occur.**

NOTE: **When installing the side air bag module, new bolts must be installed.**

6. Through the rear of the seat, remove and discard the 2 side air bag module bolts. Then separate the side air bag module from the seat backrest.
   - To install, tighten to 23 Nm (17 lb-ft).

NOTE: **Do not pull the side air bag module electrical connector out by the locking button. Damage to the locking button can occur.**

NOTE: **Do not install the side air bag module electrical connector by the locking button. Damage to the locking button can occur.**

NOTE: **The side air bag module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.**

NOTE: **The side air bag module electrical connector is unique and cannot be reversed when connected to the side air bag module. Match the electrical connector key to the keyway in the side air bag module. Do not force the electrical connector into the side air bag module or damage can occur.**

7. Using a small screwdriver as shown in illustration, lift up and release the locking button on the side air bag module electrical connector. With the locking button released, remove the electrical connector and the side air bag module.

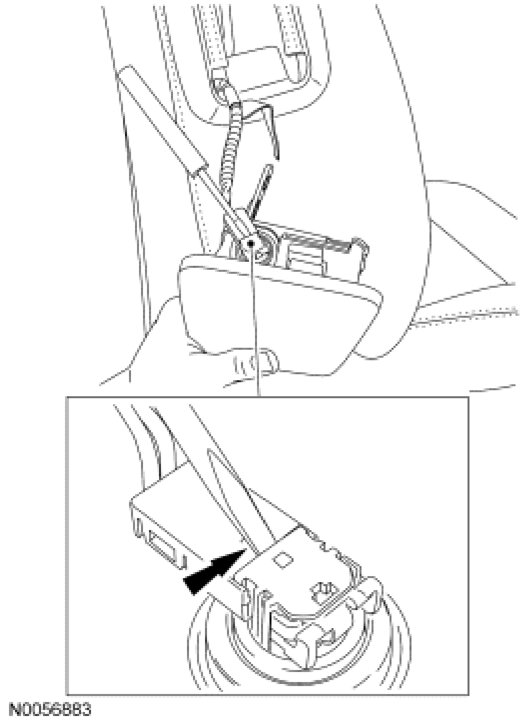

Fig. 421: Lifting Up & Releasing Locking Button On Side Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

8. Separate the backrest frame from the backrest foam pad.

   Seats with climate control

9. Remove the screw, release the 3 clips, disconnect the electrical connector and remove the backrest thermo-electric device (TED).

   All seats

10. Remove the power lumbar assembly in the following sequence.
    1. Disconnect the power lumbar motor.
    2. Release the power lumbar assembly clip at the top of the backrest frame.
    3. Slide the lumbar wire frame up and out at the bottom of the backrest frame.
    4. Remove the power lumbar assembly.
11. To install, reverse the removal procedure.
12. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

13. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional

information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST THERMO-ELECTRIC DEVICE

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The backrest thermo-electric device (TED) filter is detachable from the TED assembly housing and can be replaced without TED removal.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.

    NOTE: The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.

2. Remove the backrest trim panel in the following sequence.
    1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
    2. Slide the backrest trim panel down to release the upper clips.
    3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

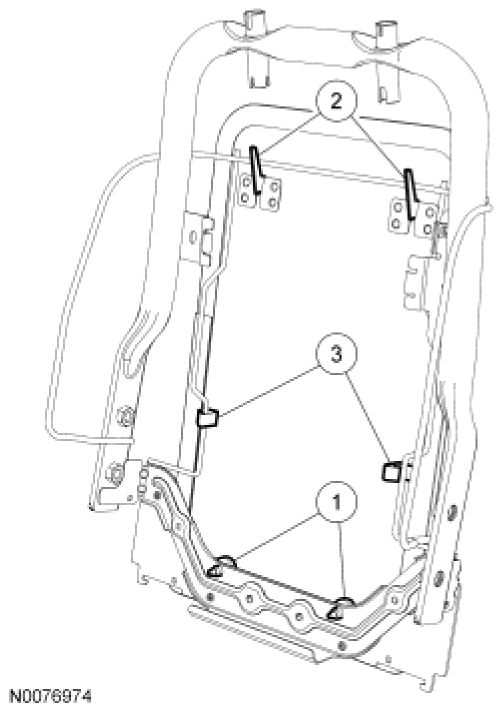

Fig. 422: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: Lower outer J-clips are unfastened to show inner J-clips.

3. Release the backrest trim cover outer and inner J-clips attached to the backrest frame.

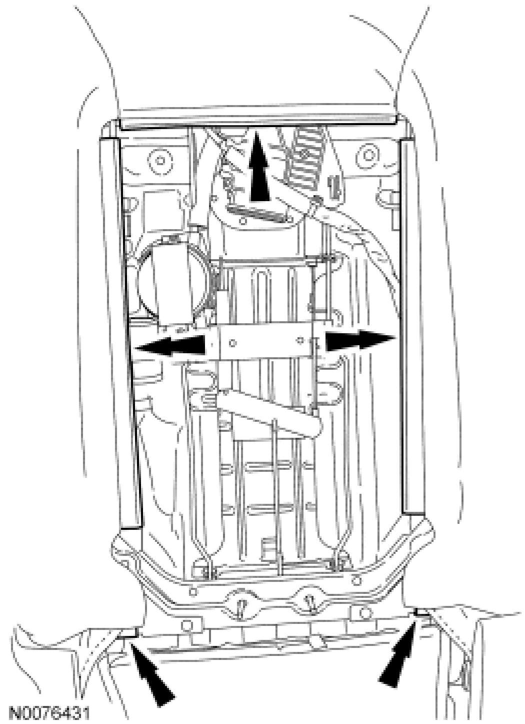

Fig. 423: Locating Inner J-Clips
Courtesy of FORD MOTOR CO.

4. Remove the head restraint.
    1. Using an appropriate tool, push in the hole, lift up on the head restraint and release one side of the head restraint.
    2. Push the release button and remove the head restraint.

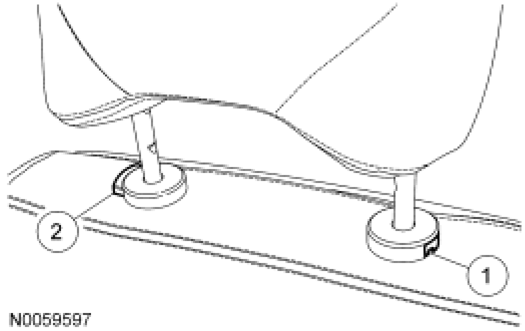

Fig. 424: Locating Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

5. Pull out and remove the master and slave head restraint guides.

NOTE: When installing, make sure the side air bag module wiring harness is not pinched between the side air bag module and the backrest frame or damage to the wiring harness can occur.

NOTE: When installing the side air bag module, new bolts must be installed.

6. Through the rear of the seat remove and discard the 2 side air bag module bolts. Then separate the side air bag module from the seat backrest.
    - To install, tighten to 23 Nm (17 lb-ft).

NOTE: Do not pull the side air bag module electrical connector out by the locking button. Damage to the locking button can occur.

NOTE: Do not install the side air bag module electrical connector by the locking button. Damage to the locking button can occur.

NOTE: The side air bag module electrical connector locking button must be in the released position when the connector is being installed or connector damage may occur.

NOTE: The side air bag module electrical connector is unique and cannot be reversed when connected to the side air bag module. Match the electrical connector key to the keyway in the side air bag module. Do not force the electrical connector into the side air bag module or damage can occur.

7. Using a small screwdriver as shown in illustration, lift up and release the locking button on the side air bag module electrical connector. With the locking button released, remove the electrical connector and the side air bag module.

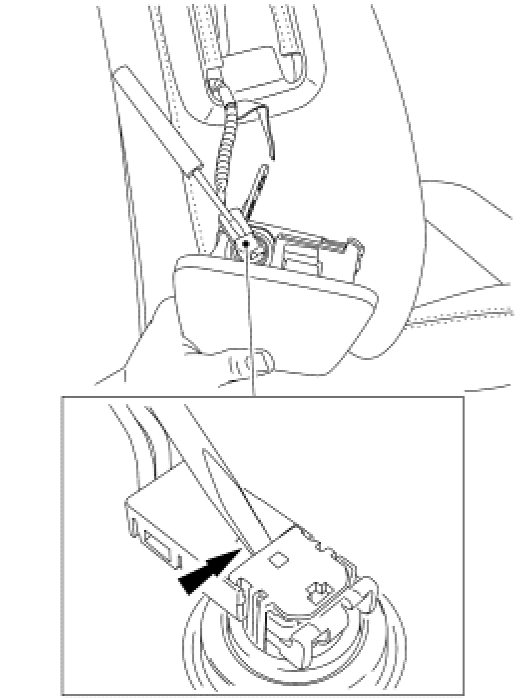

Fig. 425: Lifting Up & Releasing Locking Button On Side Air Bag Module Electrical Connector Using A Small Screwdriver
Courtesy of FORD MOTOR CO.

8. Separate the backrest frame from the backrest foam pad.
9. Release the 3 clips, disconnect the electrical connector and remove the backrest TED.
10. To install, reverse the removal procedure.
11. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

12. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CUSHION THERMO-ELECTRIC DEVICE

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

 ST2834-A		

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The cushion thermo-electric device (TED) filter is detachable from the TED assembly housing from underneath the seat cushion.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat cushion. For additional information, refer to **Seat Cushion - Front**.
3. Release the cushion trim cover retainers from the cushion frame and remove the cushion trim cover and cushion foam pad.
4. Remove the 3 cushion thermo-electric device (TED)-to-cushion frame screws.
5. Remove the cushion TED-to-climate control seat cushion adapter screw and remove the TED.
6. To install, reverse the removal procedure.
    - For correct front passenger seat cushion wire harness routing, refer to **Seat Wire Harness Routing - Front Passenger Cushion**.
7. Install the front seat cushion assembly. For additional information, refer to **Seat Cushion - Front**.
8. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

9. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

DUAL CLIMATE CONTROLLED SEAT MODULE (DCSM)

Special Tools

Illustration	Tool Name	Tool Number

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: When installing a new dual climate controlled seat module (DCSM), it is necessary to carry out programmable module installation (PMI). For additional information, refer to MODULE CONFIGURATION article.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Before removing the DCSM, carry out the appropriate steps in the PMI procedure. For additional information, refer to **MODULE CONFIGURATION** article.
2. Remove the front passenger seat. For additional information, refer to **Seat - Front**.
3. Remove the DCSM.
   - Disconnect the 3 electrical connectors.
   - Remove the 2 screws.
   - Remove the DCSM.
4. To install, reverse the removal procedure.
5. Install the front passenger seat. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
6. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
7. Install the DCSM software data. Carry out the appropriate steps in the PMI procedure. For additional information, refer to **MODULE CONFIGURATION** article.

HEATED SEAT MODULE - FRONT

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent	

 ST2834-A	scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the front passenger seat to access the heated seat module.
2. Depower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
3. From under the front of the front passenger seat, remove the heated seat module.
   - Vehicles with power seat track, remove the 2 screws and lower the bracket (if equipped).
   - Disconnect the heated seat module electrical connector.
   - Remove the screw and heated seat module.
4. To install, reverse the removal procedure.
5. Repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
6. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CONTROL SWITCH - FRONT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. If possible, position the seat all the way up and center the seat in the front door opening.
2. Depower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
3. Separate the safety belt retractor belt anchor from the seat in the following sequence.
    1. Carefully pull up and out to remove the safety belt retractor belt anchor nut cover from the cushion side shield.
    2. Remove the safety belt anchor nut.
        - To install, tighten to 47 Nm (35 lb-ft).
    3. Separate the safety belt retractor belt anchor from the seat.
4. Remove the seat control switch in the following sequence.
    1. Pull out and remove the seat control switch knob(s).
    2. If equipped with manual recline, release the clip and remove the manual recline handle.
    3. If equipped with manual lumbar, pull and remove the manual lumbar handle.
    4. Remove the cushion side shield screw(s).
    5. Slide the cushion side shield up in the rear to release the retainer.
    6. Slide the cushion side shield forward to disengage the retainer.
    7. Release the cushion side shield clips and separate the seat control switch.
    8. Disconnect the seat control switch electrical connector and remove the switch.
5. To install, reverse the removal procedure.
6. Repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

    Passenger seat

7. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

MEMORY SET SWITCH

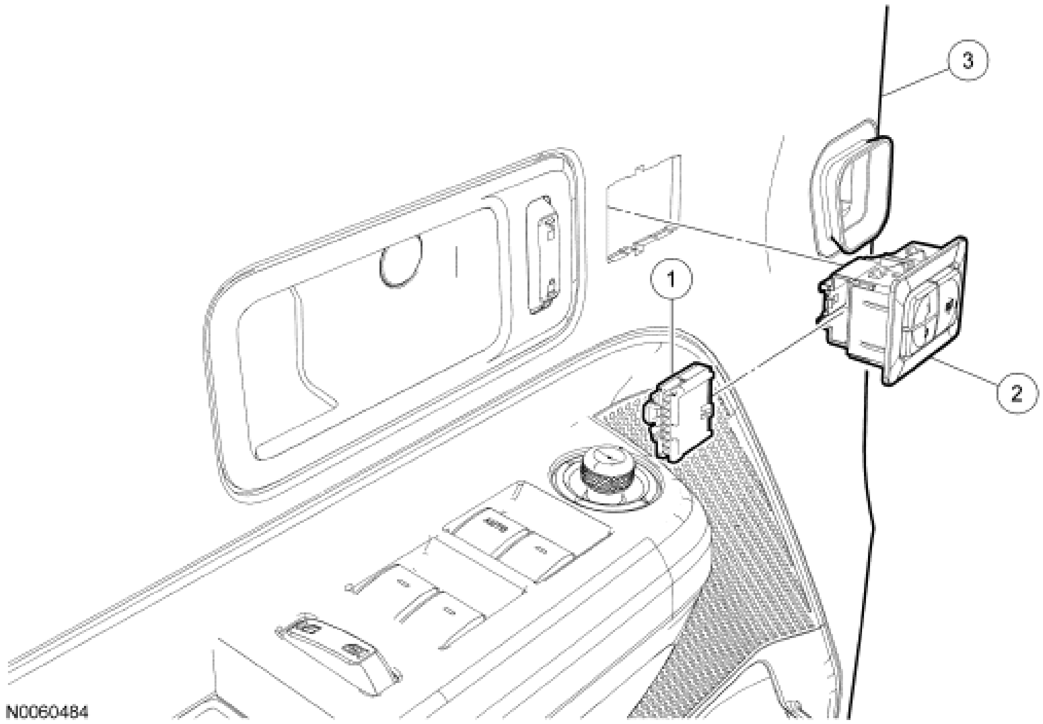

Fig. 426: Memory SET Switch, Edge
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Electrical connector (part of 14631)
2	14776	Memory SET switch
3	-	Driver door trim panel

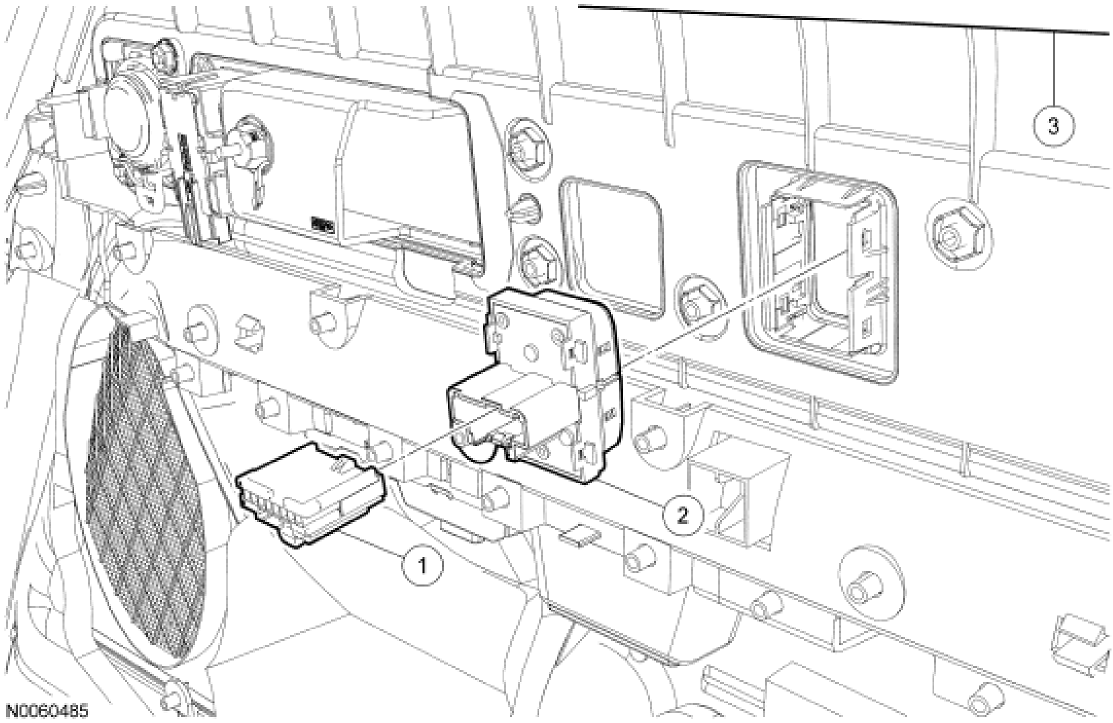

Fig. 427: Memory SET Switch, MKX
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Electrical connector (part of 14631)
2	14776	Memory SET switch
3	-	Driver door trim panel

REMOVAL AND INSTALLATION

All vehicles

1. Remove the driver door trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.

   Edge vehicles

2. Disconnect the electrical connector, release the 4 tabs and remove the memory SET switch through the front of the door trim panel.

   MKX vehicles

3. Disconnect the electrical connector, release the 4 tabs and remove the memory SET switch through the back of the door trim panel.

All vehicles

4. To install, reverse the removal procedure.

SEAT - REAR, 40 PERCENT

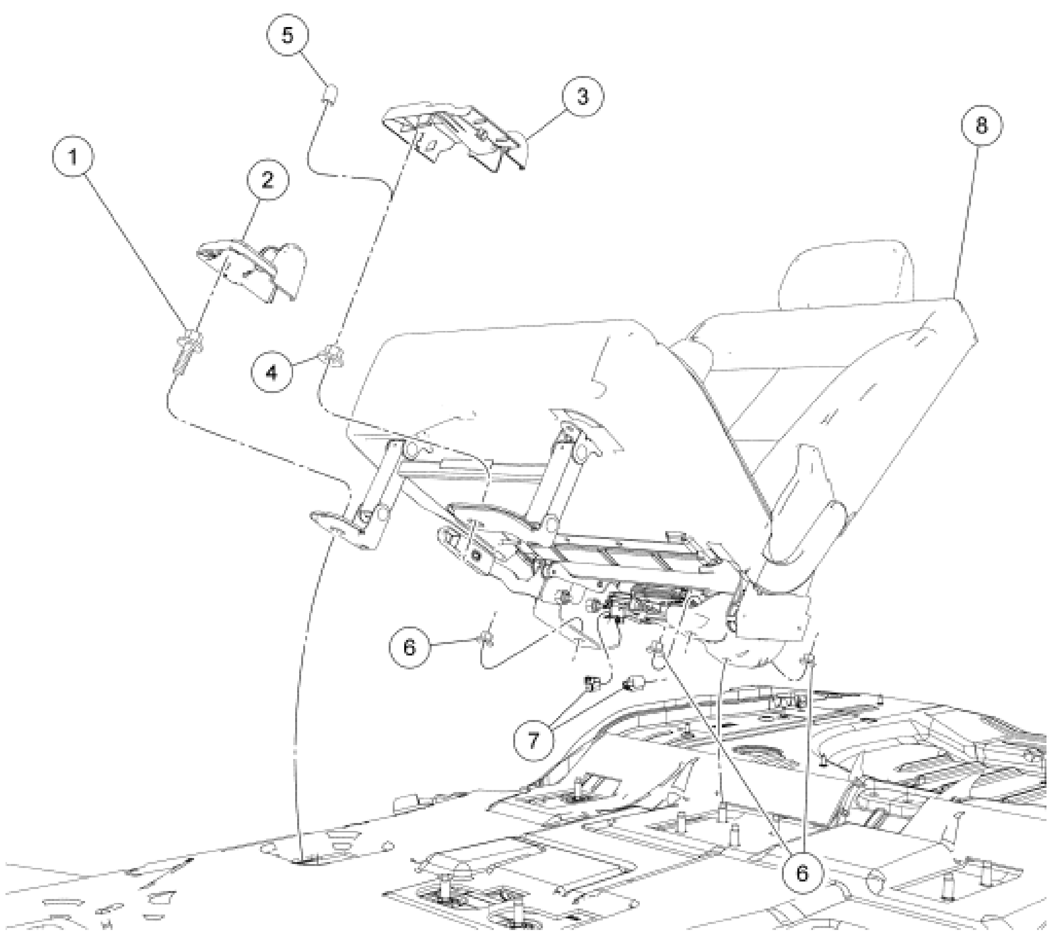

Fig. 428: Second Row 40 Percent Seat
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712026	40 percent seat kneeling assembly-to-floor bolt
2	63386	Outboard bolt cover
3	63386	Inboard nut cover (MKX only)

4	N801995	40 percent seat kneeling assembly-to-floor nut
5	-	Rubber stud cap (Edge only)
6	N801995	40 percent seat backrest assembly anchor bracket-to-floor nuts (3 required)
7	-	Electrical connectors (if equipped) (part of 14A005)
8	-	40 percent seat

REMOVAL

WARNING: **Keep hands clear of all moving seat mechanisms when releasing the recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Follow all seat recliner synchronization steps exactly as indicated. Always verify correct seat recliner alignment. Any misalignment may adversely affect seat back and seat retractor performance in a crash. Failure to follow these steps may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Always keep the seat back in the upright position while installing the seat and when tightening all retainers to specification. Always verify correct seat recliner alignment. Correct seat recliner alignment is critical for correct seat and safety belt retractor operation in a crash. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Synchronize the seat recliners following the steps in the seat removal and installation procedure any time the seat is removed for service. The following actions may result in the loss of recliner synchronization that cannot be corrected and may cause the seat back to fail in a crash:**

- **Dropping the seat**
- **Sitting on the seat when removed**
- **Applying any load to the seat when removed**
- **Removing or loosening any recliner fasteners except for the safety belt buckle bolt**

Install a new seat back frame assembly if the seat recliners cannot be synchronized. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s) in a crash.

1. Position the 40 percent seat backrest in the upright position.

2. Remove the 60 percent and 40 percent seat inboard nut covers (if equipped).
3. Remove the 40 percent seat kneeling assembly rubber stud cap (if equipped).
4. Remove the 40 percent seat outboard bolt cover.
5. Remove the 40 percent seat kneeling assembly-to-floor nut and bolt.
6. Pivot the 40 percent seat cushion upward.
7. Disconnect the heated seat (if equipped) and the power-fold actuator (if equipped) electrical connectors.
8. Remove the 40 percent seat backrest assembly anchor bracket-to-floor nuts.
9. Remove the 40 percent seat.

INSTALLATION

WARNING: **Keep hands clear of all moving seat mechanisms when releasing the recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Follow all seat recliner synchronization steps exactly as indicated. Always verify correct seat recliner alignment. Any misalignment may adversely affect seat back and seat retractor performance in a crash. Failure to follow these steps may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Always keep the seat back in the upright position while installing the seat and when tightening all retainers to specification. Always verify correct seat recliner alignment. Correct seat recliner alignment is critical for correct seat and safety belt retractor operation in a crash. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Synchronize the seat recliners following the steps in the seat removal and installation procedure any time the seat is removed for service. The following actions may result in the loss of recliner synchronization that cannot be corrected and may cause the seat back to fail in a crash:**

- **Dropping the seat**
- **Sitting on the seat when removed**
- **Applying any load to the seat when removed**
- **Removing or loosening any recliner fasteners except for the safety belt buckle bolt**

Install a new seat back frame assembly if the seat recliners cannot be synchronized. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s) in a crash.

Check for recliner synchronization

1. The recliner arm on the outboard recliner must be aligned to the stamped index mark as shown in illustration.

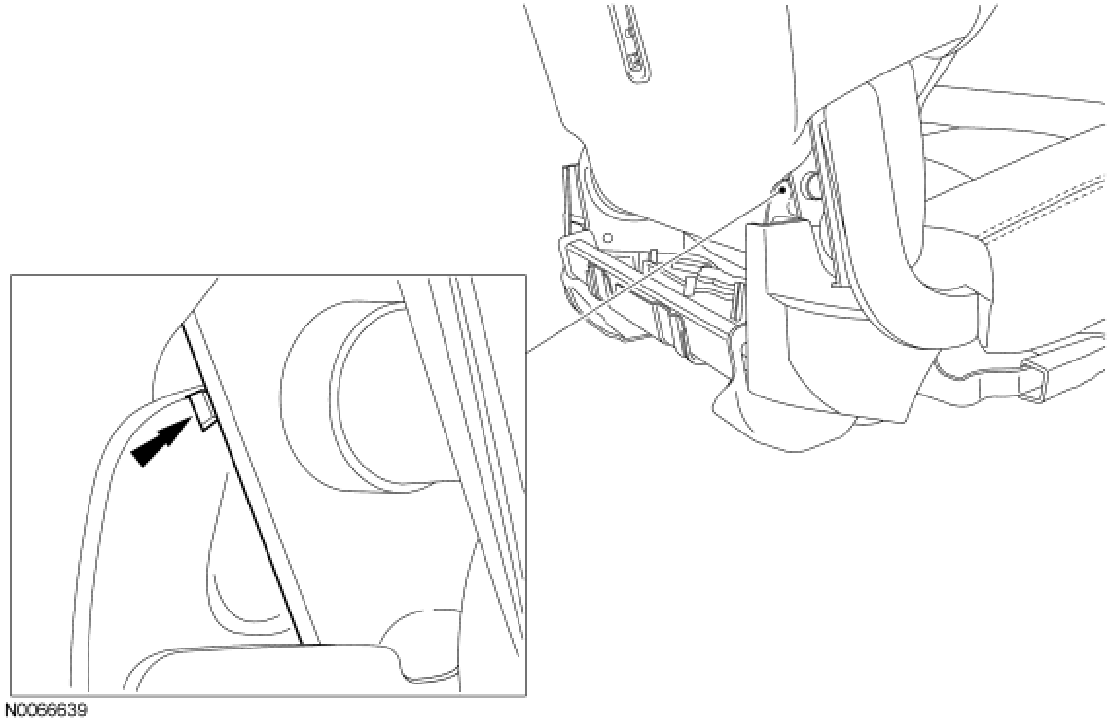

Fig. 429: Recliner Arm On Outboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

2. The recliner arm on the inboard recliner must be aligned to the stamped index mark as shown in illustration.

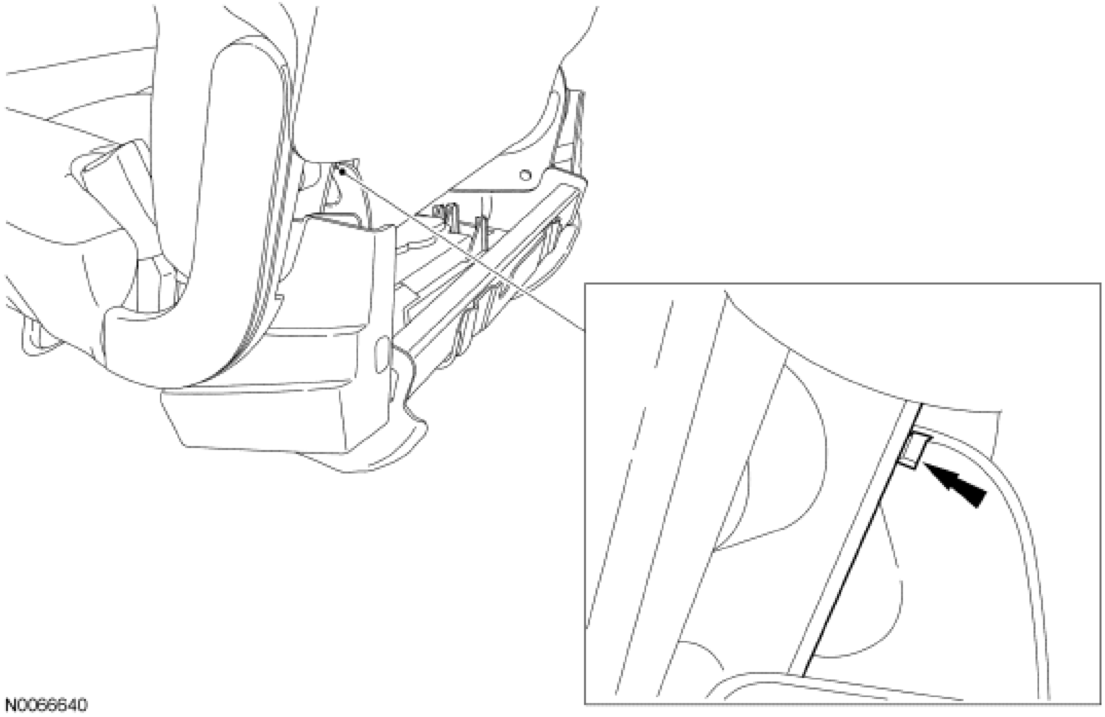

Fig. 430: Recliner Arm On Inboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

3. Make sure that the outboard and inboard recliners are aligned to the stamped index marks. This synchronizes the outboard and inboard recliners.
   - If the outboard and inboard recliner arms align to the stamped index mark on the recliners, the 40 percent seat can be installed. If the recliners are moved from this position or the recliner handle is actuated before the seat is secured in the vehicle, the recliners must be synchronized again.
   - If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners, carry out the recliner synchronization steps.

Recliner synchronization

WARNING: **Follow all seat recliner synchronization steps exactly as indicated. Always verify correct seat recliner alignment. Any misalignment may adversely affect seat back and seat retractor performance in a crash. Failure to follow these steps may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Keep hands clear of all moving seat mechanisms when releasing the recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.**

4. Using the recliner lever, release the recliners allowing the backrest assembly anchor brackets to pivot

upward.

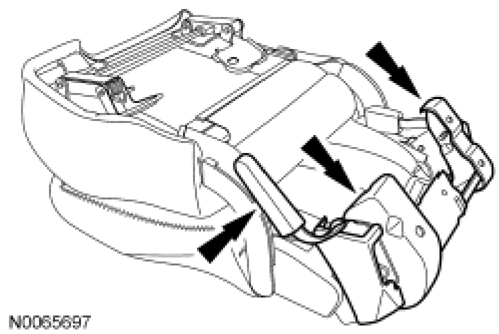

Fig. 431: Releasing Recliners Allowing Backrest Assembly Anchor Brackets To Pivot Upward Using Recliner Lever
Courtesy of FORD MOTOR CO.

NOTE: The outboard recliner (side with the recliner handle) must be pushed downward and latched in place first for correct synchronization to occur.

5. Synchronize the outboard and inboard recliners.
    1. Push downward on the outboard (side with the recliner handle) backrest assembly anchor bracket until an audible click is heard and the outboard recliner is latched in place.

        NOTE: It is possible that the inboard recliner may have latched in place when the outboard recliner was latched in place. Therefore, no audible click will be heard on the inboard side and the recliner will already be latched in place.

    2. Push downward on the inboard backrest assembly anchor bracket until an audible click is heard and the inboard recliner is latched in place.

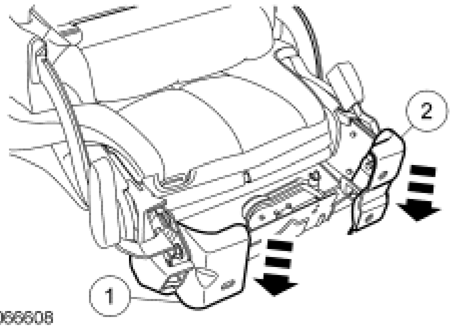

Fig. 432: Pushing Downward On Inboard Backrest Assembly Anchor Bracket Until An Audible Click Is Heard
Courtesy of FORD MOTOR CO.

6. The recliner arm on the outboard recliner must be aligned to the stamped index mark as shown in

illustration.

- If the outboard recliner arm does not align to the stamped index mark on the recliner, repeat the recliner synchronization steps.

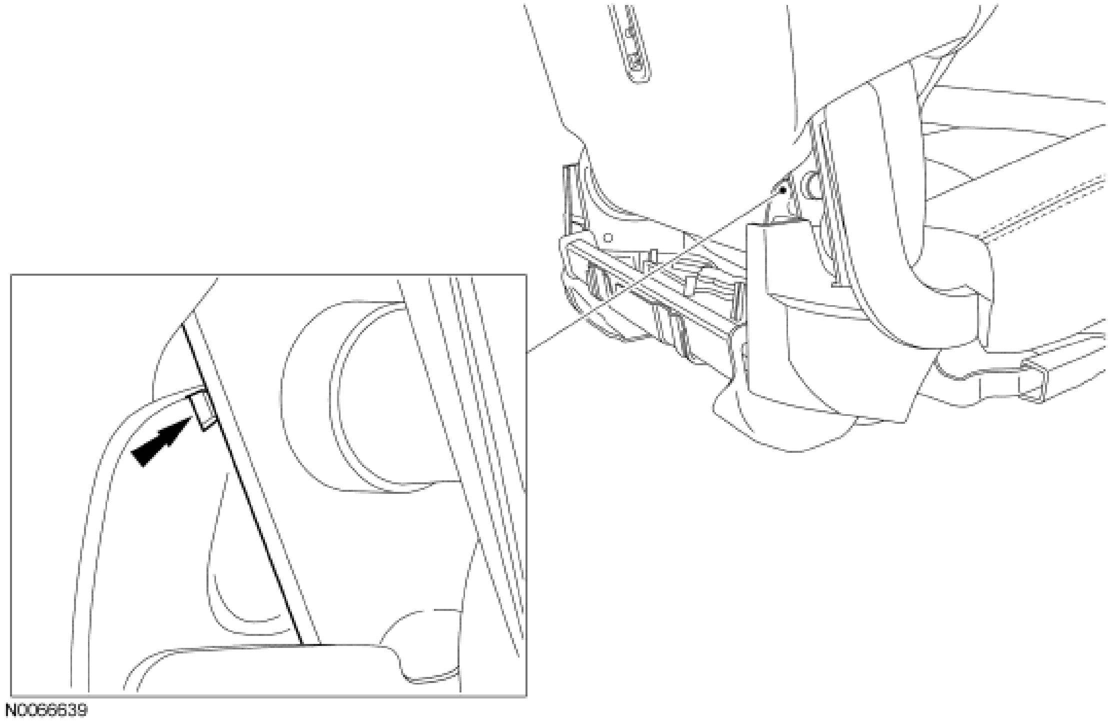

Fig. 433: Recliner Arm On Outboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

7. The recliner arm on the inboard recliner must be aligned to the stamped index mark as shown in illustration.
    - If the inboard recliner arm does not align to the stamped index mark on the recliner, repeat the recliner synchronization steps.

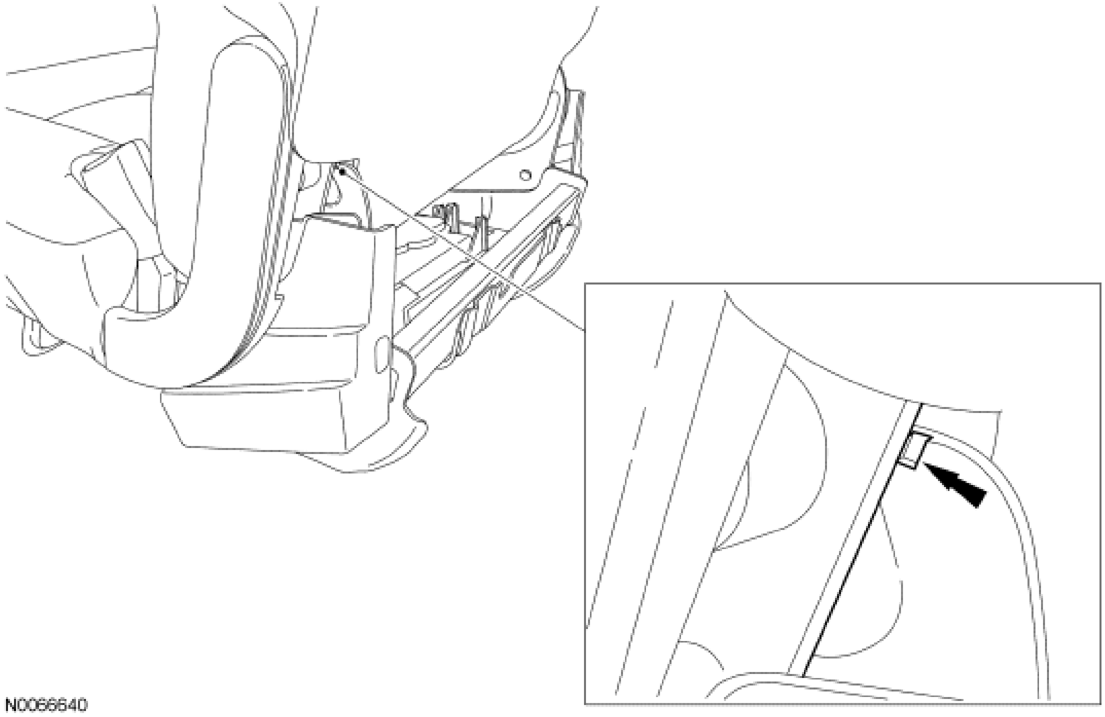

Fig. 434: Recliner Arm On Inboard Recliner Must Be Aligned To Stamped Index Mark
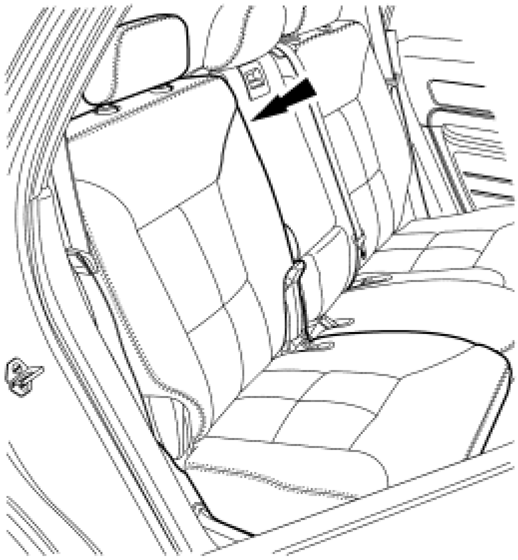
Courtesy of FORD MOTOR CO.

8. If the outboard and inboard recliner arms align to the stamped index mark on the recliners, proceed to the seat installation steps. If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners or the recliner handle is actuated, repeat the recliner synchronization steps.

Seat installation

WARNING: **Always keep the seat back in the upright position while installing the seat and when tightening all retainers to specification. Always verify correct seat recliner alignment. Correct seat recliner alignment is critical for correct seat and safety belt retractor operation in a crash. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s).**

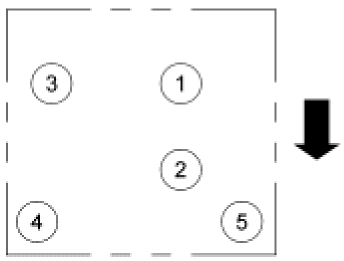
9. Install the 40 percent seat in the vehicle with the seat backrest in the upright position and the recliners aligned to the stamped index mark.



N0066671

Fig. 435: Installing 40 Percent Seat In Vehicle With Seat Backrest In Upright Position
Courtesy of FORD MOTOR CO.

10. Install the seat fasteners and tighten in the sequence shown in illustration.
    - Tighten to 70 Nm (52 lb-ft).
        - The outboard and inboard recliner arms must be aligned to the stamped index mark on the recliners and remain there until the seat-to-floor fasteners are tightened to specification in the sequence shown in illustration. If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners or the recliner handle is actuated before the seat-to-floor fasteners are tightened to specification in the sequence shown in illustration, remove the seat and carry out the recliner synchronization steps.



N0066668

Fig. 436: Identifying Seat-To-Floor Fasteners Tightening Sequence
Courtesy of FORD MOTOR CO.

11. Connect the heated seat (if equipped) and the power-fold actuator (if equipped) electrical connector(s).

12. Install the 40 percent seat outboard bolt cover.
13. Install the 40 percent seat kneeling assembly rubber stud cap (if equipped).
14. Install the 60 percent and 40 percent seat inboard nut covers (if equipped).
15. The recliner arm on the outboard recliner must be aligned to the stamped index mark as shown in illustration.

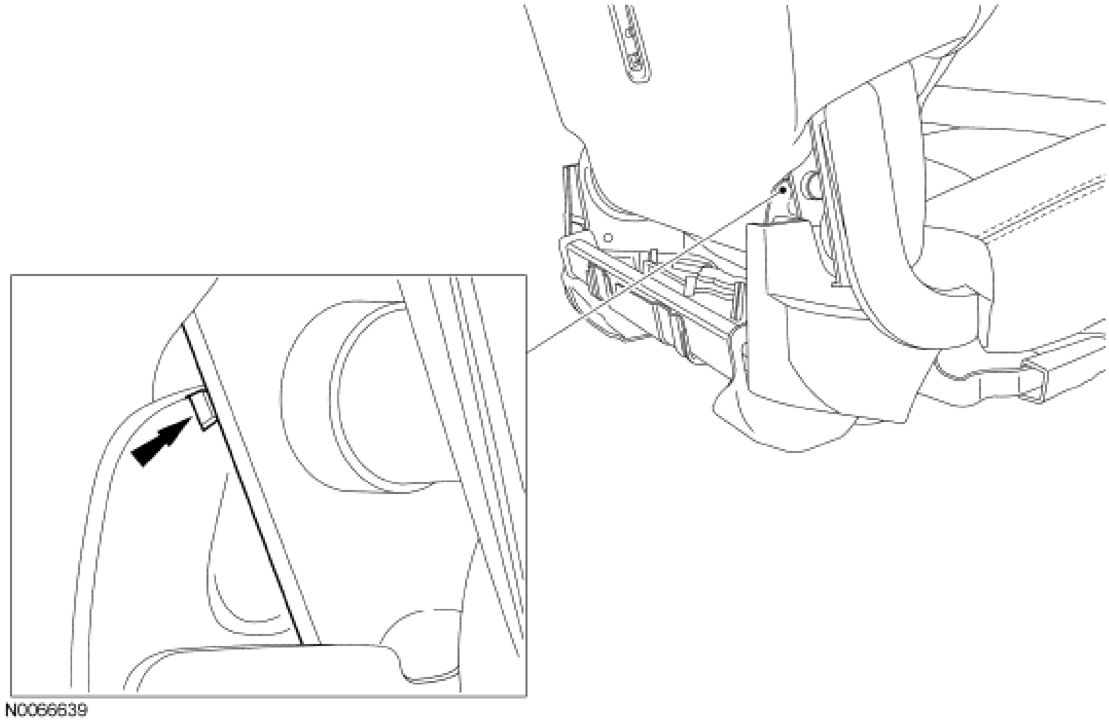


Fig. 437: Recliner Arm On Outboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

16. The recliner arm on the inboard recliner must be aligned to the stamped index mark as shown in illustration.

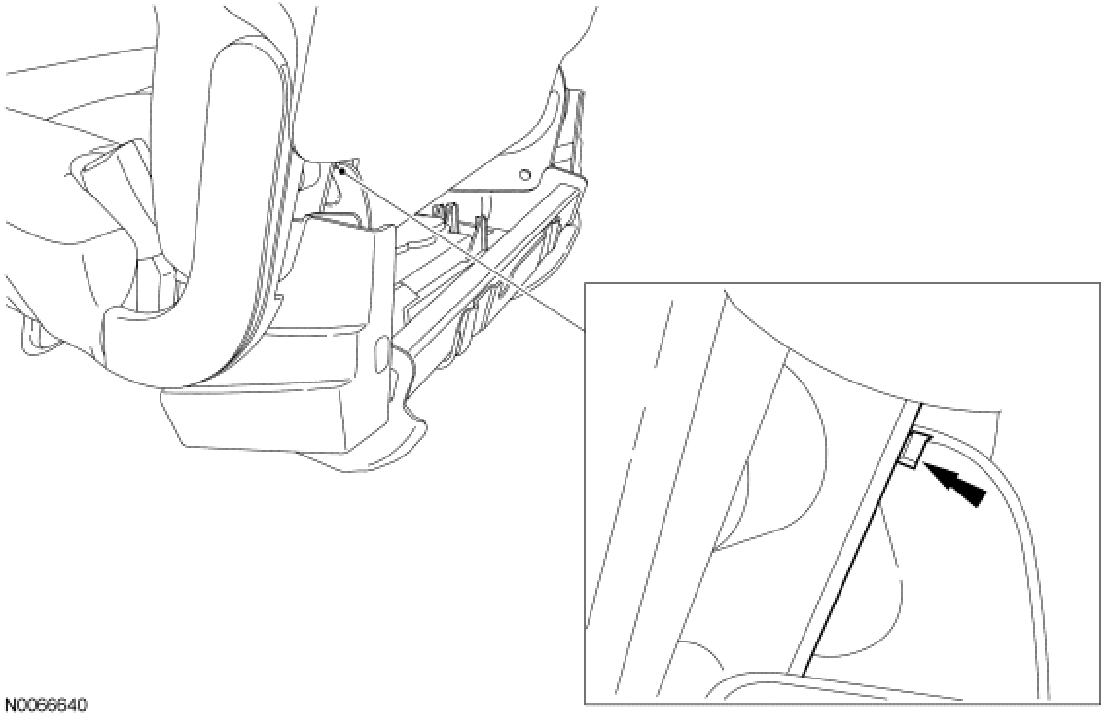

Fig. 438: Recliner Arm On Inboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

17. Make sure that the 40 percent seat outboard and inboard recliners are aligned to the stamped index marks and still synchronized. If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners or the recliner handle is actuated, remove the 40 percent seat and carry out the recliner synchronization steps.
18. Make sure the safety belt buckles are accessible to the occupants after installation.

SEAT - REAR, 60 PERCENT

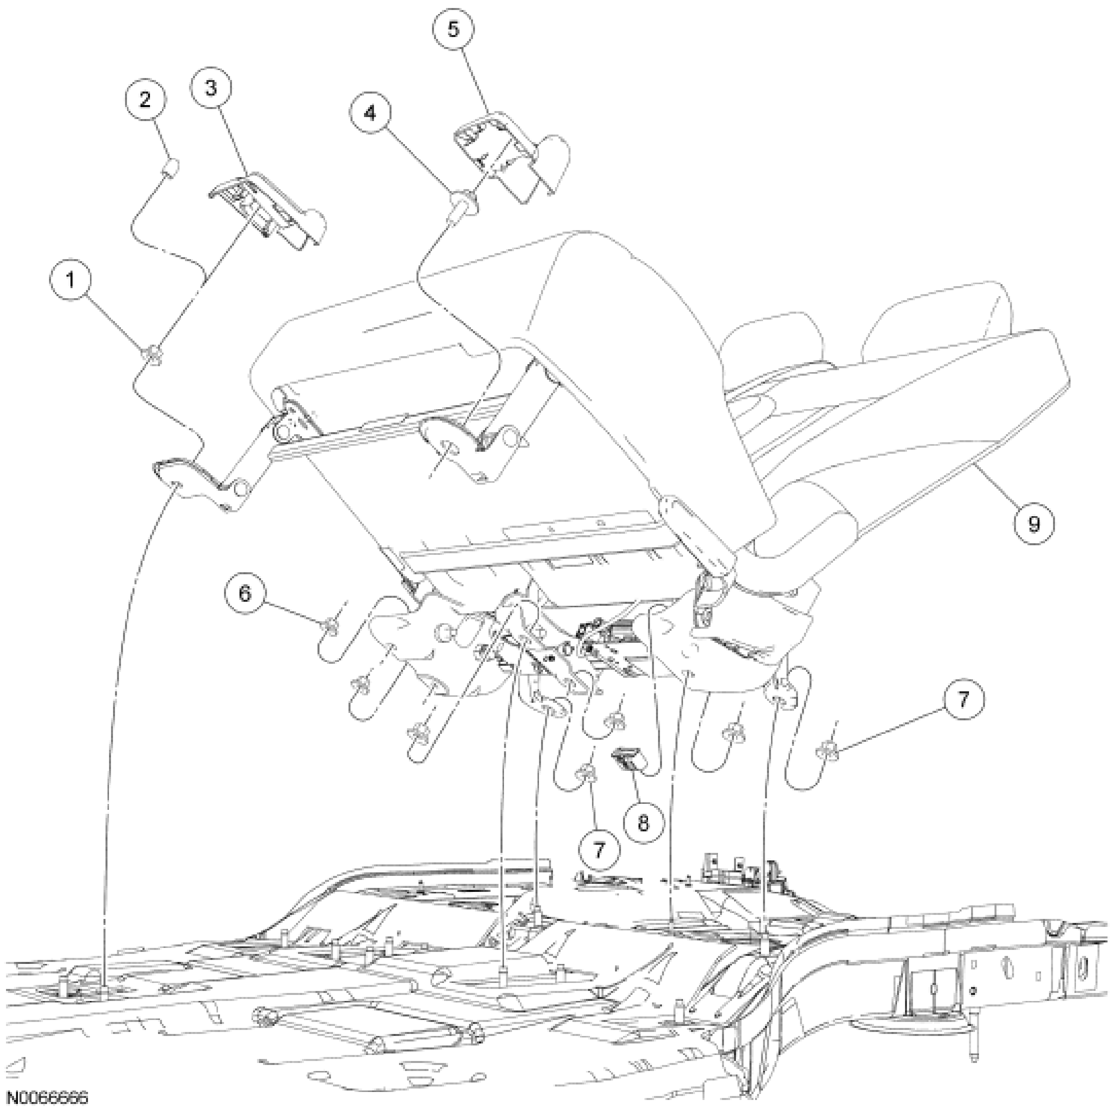

Fig. 439: Second Row 60 Percent Seat
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N801995	60 percent seat kneeling assembly-to-floor nut
2	-	Rubber stud cap (Edge only)
3	63386	Inboard nut cover (MKX only)
4	W712026	60 percent seat kneeling assembly-to-floor bolt
5	63386	Outboard bolt cover
6	N801995	60 percent seat backrest assembly anchor bracket-to-floor nut (5 required)
7	-	60 percent seat rear tie-down-to-floor

		nuts (2 required)
8	-	Electrical connector (if equipped) (part of 14A005)
9	-	60 percent seat

REMOVAL

WARNING: **Keep hands clear of all moving seat mechanisms when releasing the recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Follow all seat recliner synchronization steps exactly as indicated. Always verify correct seat recliner alignment. Any misalignment may adversely affect seat back and seat retractor performance in a crash. Failure to follow these steps may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Always keep the seat back in the upright position while installing the seat and when tightening all retainers to specification. Always verify correct seat recliner alignment. Correct seat recliner alignment is critical for correct seat and safety belt retractor operation in a crash. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Synchronize the seat recliners following the steps in the seat removal and installation procedure any time the seat is removed for service. The following actions may result in the loss of recliner synchronization that cannot be corrected and may cause the seat back to fail in a crash:**

- **Dropping the seat**
- **Sitting on the seat when removed**
- **Applying any load to the seat when removed**
- **Removing or loosening any recliner fasteners except for the safety belt buckle bolt**

Install a new seat back frame assembly if the seat recliners cannot be synchronized. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s) in a crash.

NOTE: **A new heater mat will come assembled on a new foam pad.**

NOTE: **When removing the 60 percent seat, the 40 percent seat must be removed first to gain access to the 60 percent seat backrest assembly anchor bracket-to-floor nuts.**

1. Remove the 40 percent seat. For additional information, refer to **Seat - Rear, 40 Percent**.
2. Position the 60 percent seat backrest in the upright position.
3. Remove the outboard bolt cover.
4. Remove the kneeling assembly rubber stud cap (if equipped).
5. Remove the kneeling assembly-to-floor nut and bolt.
6. Pivot the 60 percent seat cushion upward.
7. Disconnect the heated seat (if equipped) and the power-fold actuator (if equipped) electrical connector.
8. Remove the 5 backrest assembly anchor bracket-to-floor nuts.
9. Lift out and remove the load floor from the cargo area.
10. Through the rear hatch, remove the 2 rear tie-down-to-floor nuts.
11. Remove the 60 percent seat.

INSTALLATION

WARNING: **Keep hands clear of all moving seat mechanisms when releasing the recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Follow all seat recliner synchronization steps exactly as indicated. Always verify correct seat recliner alignment. Any misalignment may adversely affect seat back and seat retractor performance in a crash. Failure to follow these steps may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Always keep the seat back in the upright position while installing the seat and when tightening all retainers to specification. Always verify correct seat recliner alignment. Correct seat recliner alignment is critical for correct seat and safety belt retractor operation in a crash. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Synchronize the seat recliners following the steps in the seat removal and installation procedure any time the seat is removed for service. The following actions may result in the loss of recliner synchronization that cannot be corrected and may cause the seat back to fail in a crash:**

- **Dropping the seat**
- **Sitting on the seat when removed**
- **Applying any load to the seat when removed**
- **Removing or loosening any recliner fasteners except for the safety belt buckle bolt**

Install a new seat back frame assembly if the seat recliners cannot be synchronized. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s) in a crash.

Check for recliner synchronization

1. The recliner arm on the outboard recliner must be aligned to the stamped index mark as shown in illustration.

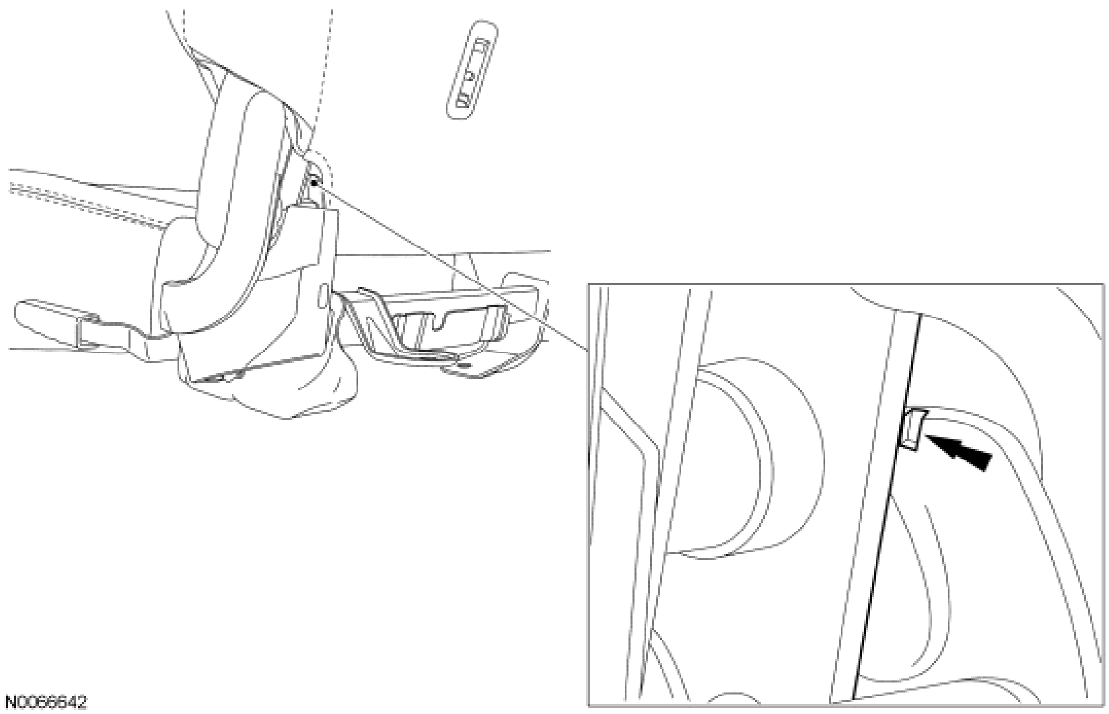

Fig. 440: Recliner Arm On Outboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

2. The recliner arm on the inboard recliner must be aligned to the stamped index mark as shown in illustration.

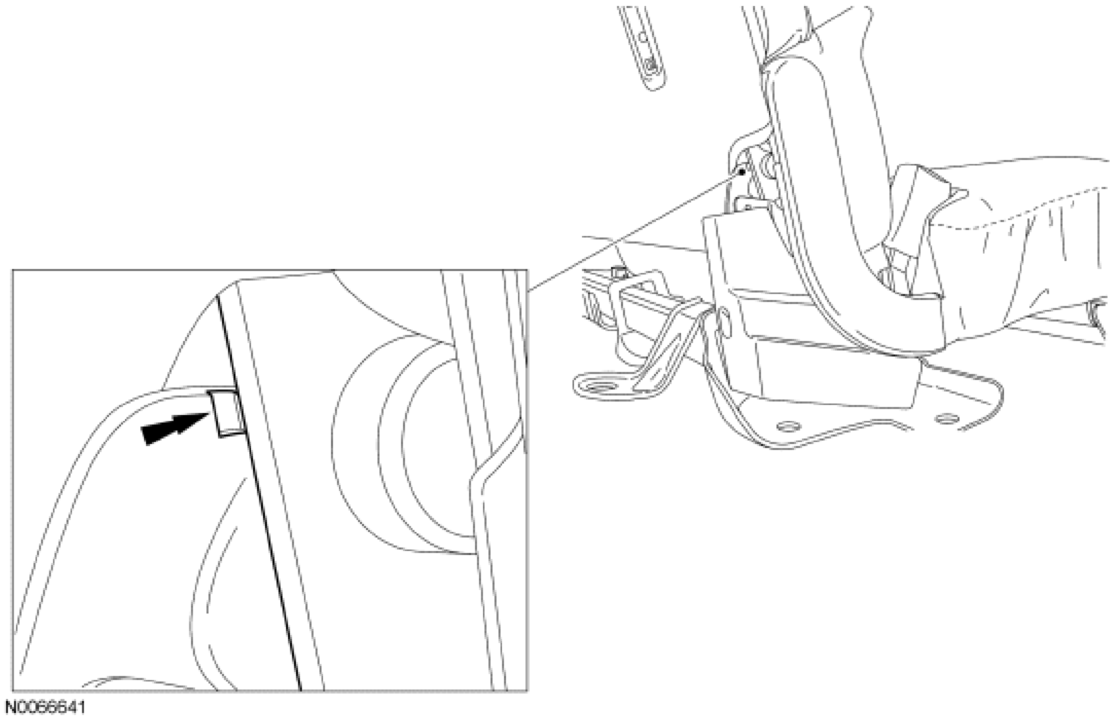

Fig. 441: Recliner Arm On Inboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

3. Make sure that the outboard and inboard recliners are aligned to the stamped index marks. This synchronizes the outboard and inboard recliners.
   - If the outboard and inboard recliner arms align to the stamped index mark on the recliners, the 60 percent seat can be installed. If the recliners are moved from this position or the recliner handle is actuated before the seat is secured in the vehicle, the recliners must be synchronized again.
   - If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners, carry out the recliner synchronization steps.

Recliner synchronization

WARNING: **Follow all seat recliner synchronization steps exactly as indicated. Always verify correct seat recliner alignment. Any misalignment may adversely affect seat back and seat retractor performance in a crash. Failure to follow these steps may result in serious personal injury to the vehicle occupant(s).**

WARNING: **Keep hands clear of all moving seat mechanisms when releasing the recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.**

4. Using the recliner lever, release the recliners allowing the backrest assembly anchor brackets to pivot

upward.

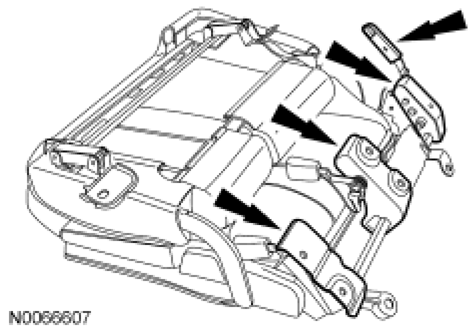

Fig. 442: Releasing Recliners Allowing Backrest Assembly Anchor Brackets To Pivot Upward Using Recliner Lever
Courtesy of FORD MOTOR CO.

NOTE: **The outboard recliner (side with the recliner handle) must be pushed downward and latched in place first for correct synchronization to occur.**

5. Synchronize the inboard and outboard recliners.
    1. Push downward on the outboard (side with the recliner handle) backrest assembly anchor bracket until an audible click is heard and the outboard recliner is latched in place.
    2. Push downward on the inboard backrest assembly anchor bracket until an audible click is heard and the inboard recliner is latched in place.

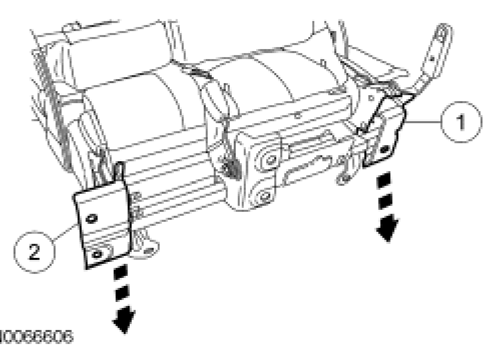

Fig. 443: Pushing Downward On Inboard Backrest Assembly Anchor Bracket Until An Audible Click Is Heard
Courtesy of FORD MOTOR CO.

6. The recliner arm on the outboard recliner must be aligned to the stamped index mark as shown in illustration.
    - If the outboard recliner arm does not align to the stamped index mark on the recliner, repeat the recliner synchronization steps.

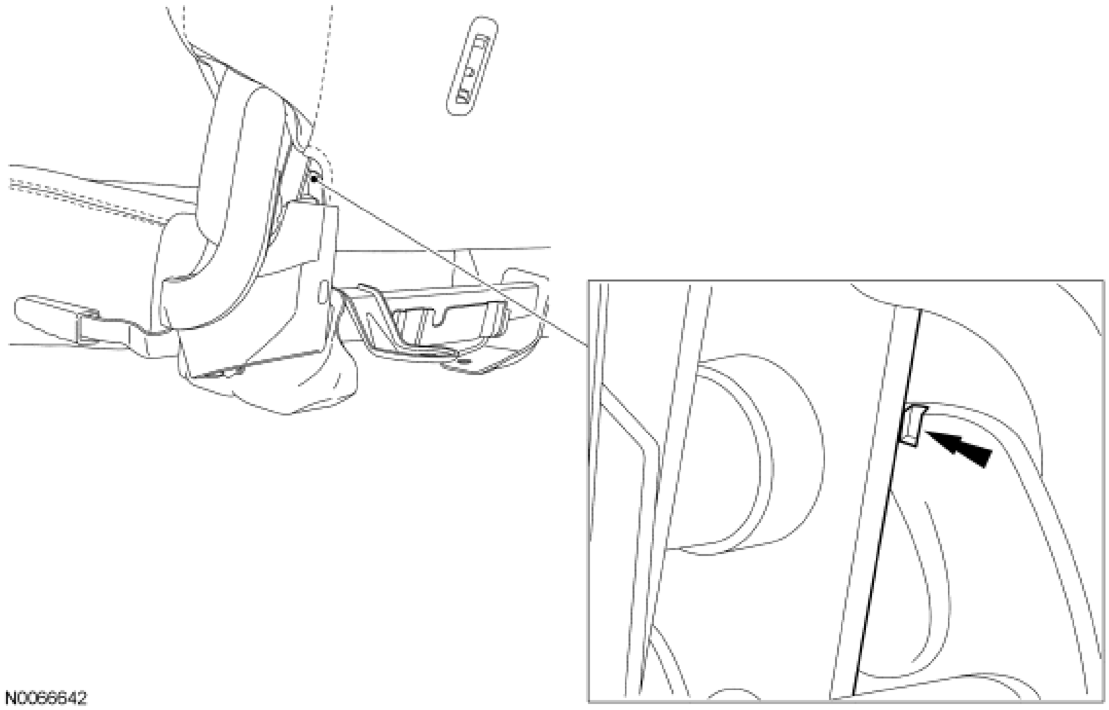

Fig. 444: Recliner Arm On Outboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

7. The recliner arm on the inboard recliner must be aligned to the stamped index mark as shown in illustration.
   - If the inboard recliner arm does not align to the stamped index mark on the recliner, repeat the recliner synchronization steps.

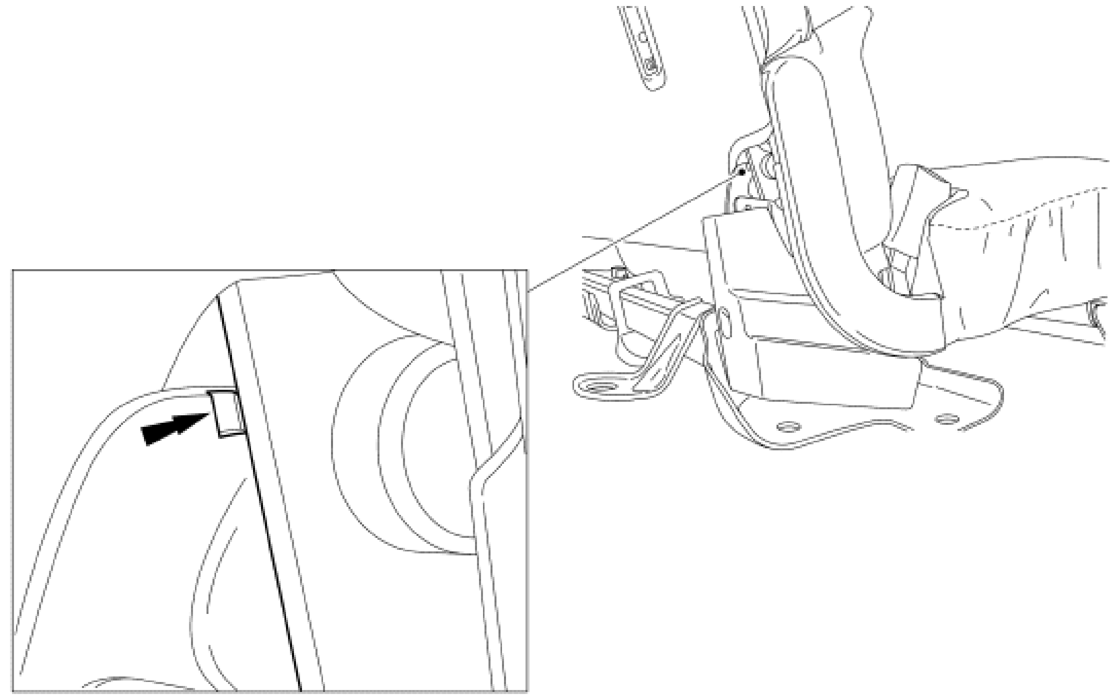

Fig. 445: Recliner Arm On Inboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

8. If the outboard and inboard recliner arms align to the stamped index mark on the recliners, proceed to the seat installation steps. If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners or the recliner handle is actuated, repeat the recliner synchronization steps.

Seat installation

WARNING: **Always keep the seat back in the upright position while installing the seat and when tightening all retainers to specification. Always verify correct seat recliner alignment. Correct seat recliner alignment is critical for correct seat and safety belt retractor operation in a crash. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s).**

9. Install the 60 percent seat in the vehicle with the seat backrest in the upright position and the recliners aligned to the stamped index mark.

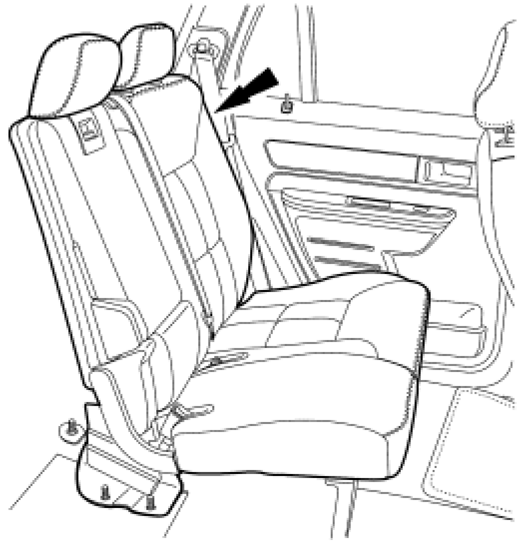

Fig. 446: Installing 60 Percent Seat In Vehicle With Seat Backrest In Upright Position
Courtesy of FORD MOTOR CO.

10. Position the 60 percent seat in the vehicle. Install and tighten seat fasteners 1 through 7 in the sequence shown in illustration.
    - Tighten to 70 Nm (52 lb-ft).
        - The outboard and inboard recliner arms must be aligned to the stamped index mark on the recliners and remain there until the seat-to-floor fasteners are tightened to specification in the sequence shown in illustration. If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners or the recliner handle is actuated before the seat-to-floor fasteners are tightened to specification in the sequence shown in illustration, remove the seat and carry out the recliner synchronization steps.

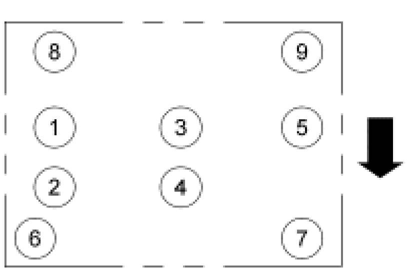

Fig. 447: Fastener Tightening Sequence
Courtesy of FORD MOTOR CO.

11. Through the back hatch, install and tighten seat fasteners 8 and 9 in the sequence shown in illustration.
    - Tighten to 55 Nm (41 lb-ft).
        - The outboard and inboard recliner arms must be aligned to the stamped index mark on the recliners and remain there until the seat-to-floor fasteners are tightened to specification in the sequence shown in illustration. If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners or the recliner handle is actuated before the seat-to-floor fasteners are tightened to specification in the sequence shown in illustration, remove the seat and carry out the recliner synchronization steps.

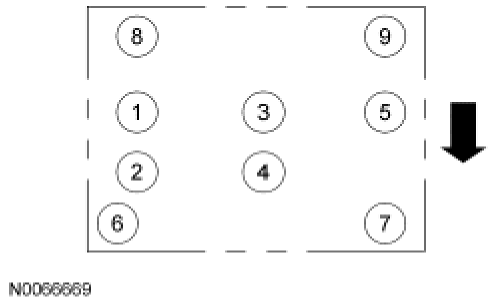

Fig. 448: Fastener Tightening Sequence
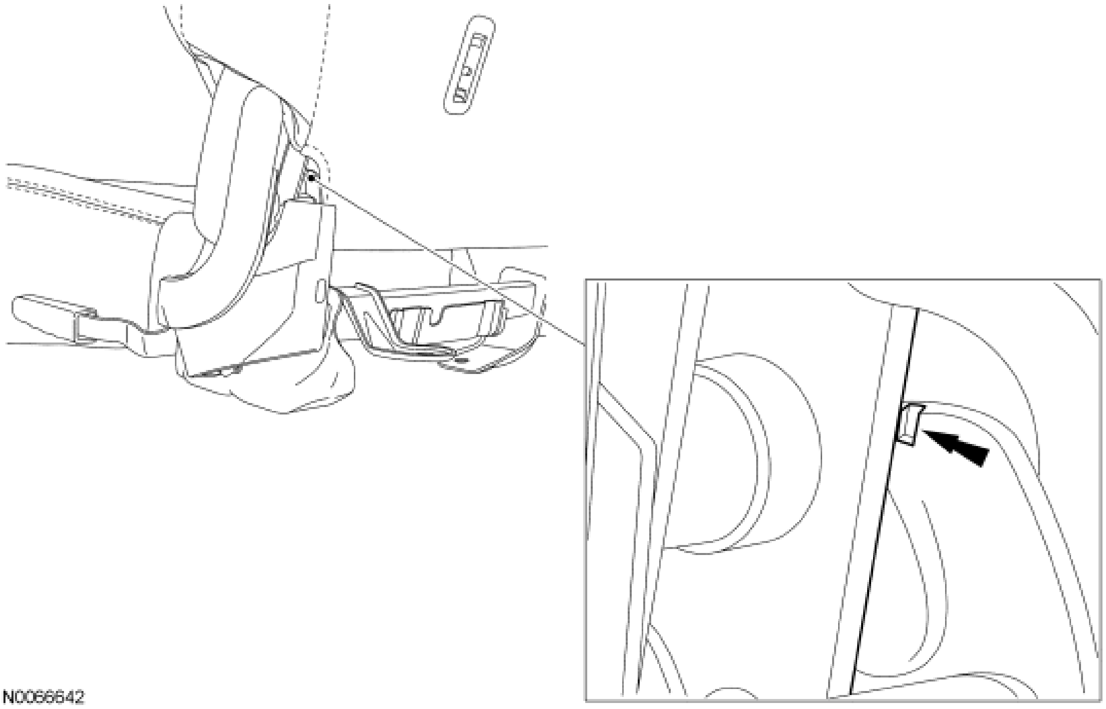
Courtesy of FORD MOTOR CO.

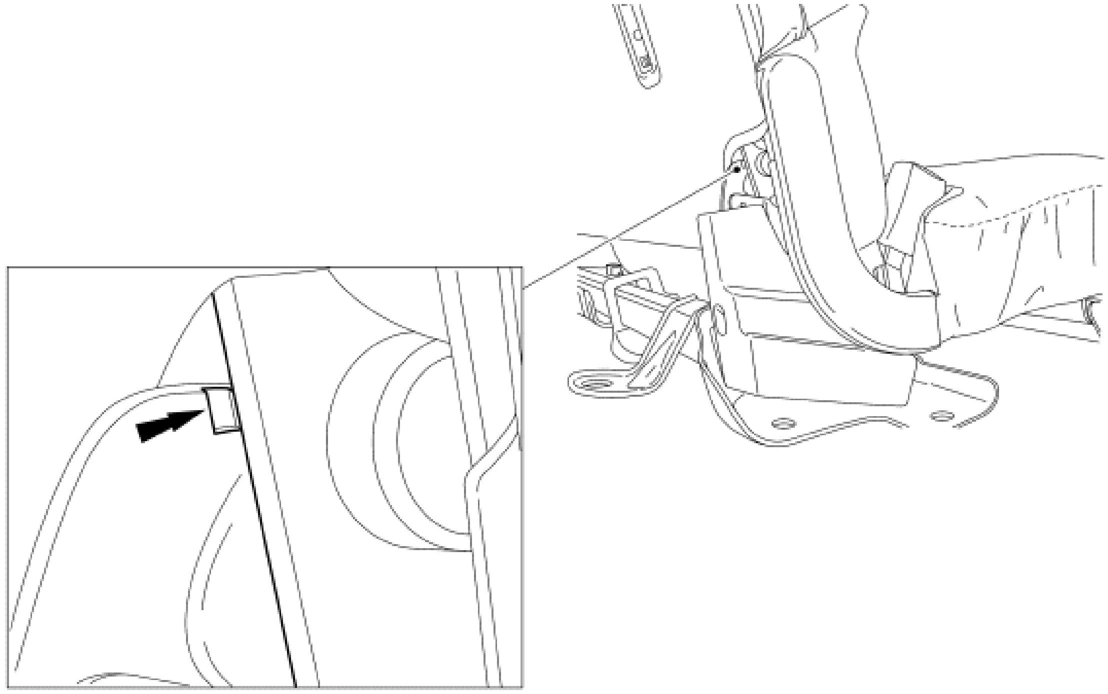
12. Connect the heated seat (if equipped) and the power-fold actuator (if equipped) electrical connector(s).
13. Install the load floor to the cargo area.
14. Install the 60 percent seat outboard bolt cover.
15. Install the kneeling assembly rubber stud cap (if equipped).
16. The recliner arm on the outboard recliner must be aligned to the stamped index mark as shown in illustration.



N0066642

Fig. 449: Recliner Arm On Outboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

17. The recliner arm on the inboard recliner must be aligned to the stamped index mark as shown in illustration.



N0066641

Fig. 450: Recliner Arm On Inboard Recliner Must Be Aligned To Stamped Index Mark
Courtesy of FORD MOTOR CO.

18. Make sure that the 60 percent seat outboard and inboard recliners are aligned to the stamped index marks and still synchronized. If the outboard and inboard recliner arms do not align to the stamped index mark on the recliners or the recliner handle is actuated, remove the 60 percent seat and carry out the recliner synchronization steps.
19. Install the 40 percent seat. For additional information, refer to **Seat - Rear, 40 Percent**.
20. Make sure the safety belt buckles are accessible to the occupants after installation.

SEAT - EXPLODED VIEW, REAR

NOTE: A new heater mat will come assembled on a new foam pad.

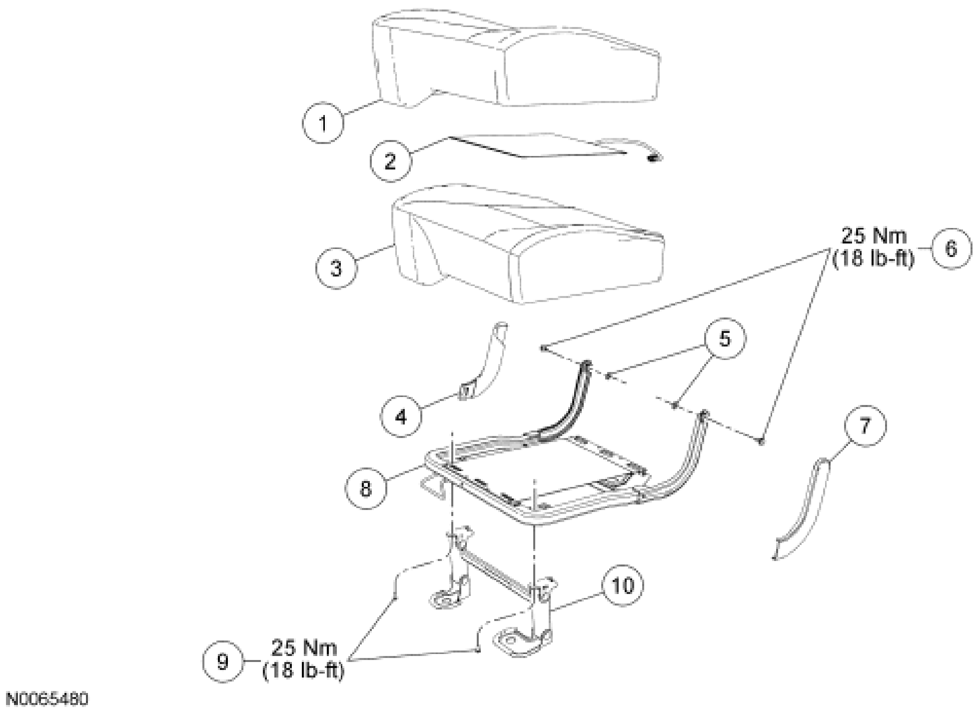


Fig. 451: Exploded View Of Rear Seat Cushion, 40 Percent With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	63804	Cushion trim cover
2	-	Cushion heater mat (if equipped) (part of 63840)
3	63840	Cushion foam pad
4	666L76	Outboard cushion frame pivot bracket cover

5	-	Wave washers
6	W712172	Cushion frame pivot bracket bolts
7	66L75	Inboard cushion frame pivot bracket cover
8	63160	Cushion frame
9	N605892	Kneeling assembly-to-cushion frame bolts
10	605B10	Kneeling assembly

47	-	Safety belt retractor nut

1. For additional information, refer to the appropriate procedure.

SEAT BACKREST COVER - REAR, 40 PERCENT

REMOVAL AND INSTALLATION

NOTE: A new heater mat will come assembled on a new foam pad.

1. Remove the 40 percent seat. For additional information, refer to **Seat - Rear, 40 Percent**.
2. Remove the 40 percent cushion. For additional information, refer to **Seat Cushion - Rear, 40 Percent**.
3. Remove the head restraint.
    1. Push in the hole, lift up on the head restraint and release one side of the head restraint.
    2. Push the release button and remove the head restraint.
    3. Remove the safety belt comfort guide.

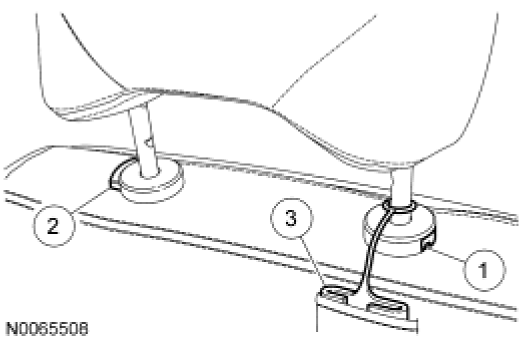

Fig. 455: Locating Safety Belt Comfort Guide & Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

4. Pull out and remove the master and slave head restraint guides.
5. Release the tabs and remove the child safety seat tether anchor bezel.

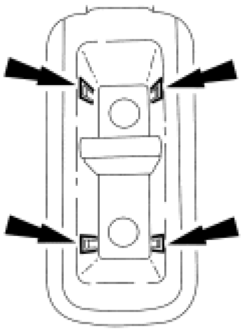

Fig. 456: Locating Tabs On Child Safety Seat Tether Anchor Bezel
Courtesy of FORD MOTOR CO.

6. Release the backrest trim cover lower J-clip.
   - Pull the heated seat electrical connector through the backrest trim cover opening (if equipped).
7. At the rear inboard side of the backrest, access the zipper tucked up behind the back panel and unzip the zipper.
8. Remove the pin-type retainer holding the backrest trim cover around the lower anchors and tethers for children (LATCH) and attaching to the lower rear of the backrest frame.
9. Remove the pin-type retainer from inside the safety belt comfort guide pocket.

NOTE: Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.

10. Release the hook-and-loop strips and invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
11. Separate the backrest trim cover wire from the clips in the backrest foam pad and remove the backrest trim cover.
12. To install, reverse the removal procedure.

SEAT BACKREST COVER - REAR, 60 PERCENT

REMOVAL AND INSTALLATION

NOTE: A new heater mat will come assembled on a new foam pad.

1. Remove the 60 percent seat. For additional information, refer to **Seat - Rear, 60 Percent**.
2. Remove the 60 percent cushion. For additional information, refer to **Seat Cushion - Rear, 60 Percent**.

NOTE: Make sure the safety belt webbing is not twisted prior to installation.

3. Remove the bolt and separate the safety belt retractor belt and buckle anchor from the riser.
   - To install, tighten to 65 Nm (48 lb-ft).
4. Remove the head restraint.

1. Push in the hole, lift up on the head restraint and release one side of the head restraint.
2. Push the release button and remove the head restraint.
3. Remove the safety belt comfort guide.

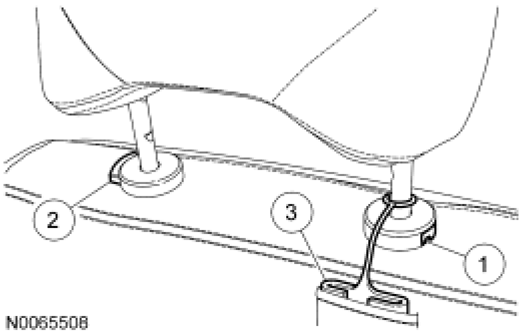

Fig. 457: Locating Safety Belt Comfort Guide & Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

5. Pull out and remove the master and slave head restraint guides.
6. Remove the armrest bracket trim cover pin-type retainer and the armrest bracket trim cover.
   - Cycle the armrest up and down to aid trim cover removal.
7. Remove the armrest bolt.
   - To install, tighten to 25 Nm (18 lb-ft).
8. Remove the armrest.
   - With the armrest upright, tip the outboard side of the armrest to disengage the stop from the backrest frame channel.
9. Remove the pin-type retainer in the armrest pocket, attaching the backrest trim cover to the backrest.
10. Release the tabs and remove the child safety seat tether anchor bezel.
    - Repeat for the other child safety seat tether anchor bezel.

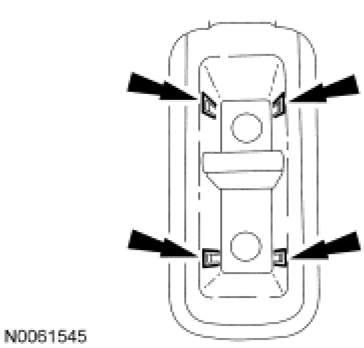

Fig. 458: Locating Tabs On Child Safety Seat Tether Anchor Bezel
Courtesy of FORD MOTOR CO.

11. Remove the safety belt bezel screw cover, the screw and the safety belt bezel.
    - During assembly, make sure the safety belt bezel clips in place.
12. Release the backrest trim cover lower J-clip.
    - Pull the heated seat electrical connector through the backrest trim cover opening (if equipped).
13. At the rear inboard side of the backrest, access the zipper tucked up behind the back panel and unzip the zipper.
14. Remove the 2 pin-type retainers holding the backrest trim cover around each of the 2 lower anchors and tethers for children (LATCH) and attaching to the lower rear of the backrest frame.
15. Remove the pin-type retainer from inside the safety belt comfort guide pocket.
16. Pull back the backrest trim cover over the armrest bracket and backrest frame latching wire for the armrest.
17. Remove the screw at the top and the pin-type retainer at the bottom of the armrest filler panel.
18. Lift the armrest filler panel over the armrest pivot bracket and slide out to the outboard side of the seat.
    - During assembly, make sure the armrest filler panel clips in place around the backrest trim cover J-clip, at the inboard side.
19. Release the backrest trim cover J-clip from the backrest frame in the armrest pocket.
20. From the back, invert the backrest trim cover up and over the backrest frame and remove the backrest trim cover and backrest foam pad.

NOTE: Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.

21. Remove the backrest trim cover from the backrest foam pad in the following sequence.
    1. Invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
        - Separate the hook-and-loop strips.
    2. Separate the backrest trim cover wire from the clips in the backrest foam pad.
    3. Remove the backrest trim cover.
        - Feed the safety belt retractor belt and safety belt buckle through the backrest trim cover and backrest foam pad.
22. To install, reverse the removal procedure.
    - Check the active restraint system for correct operation. For additional information, refer to safety belt system in the Diagnosis and Testing portion of **SAFETY BELT SYSTEM** article.
        - Verify the safety belt retractor operates without excessive effort or binding.
        - Make sure the LATCH is accessible to the occupant.

SEAT CUSHION - REAR, 40 PERCENT

REMOVAL AND INSTALLATION

All seats

1. Remove the 40 percent seat. For additional information, refer to **Seat - Rear, 40 Percent**.

   Seats equipped with heat

2. Disconnect the backrest heater mat electrical connector. Separate the 2 heated seat electrical connectors from the backrest assembly.

   All seats

3. Release the tab and remove the outboard cushion frame pivot bracket cover.
4. Release the tab and remove the inboard cushion frame pivot bracket cover.
5. Remove the 2 cushion frame pivot bracket bolts and the cushion assembly.
   - To install, tighten to 25 Nm (18 lb-ft).
6. To install, reverse the removal procedure.

SEAT CUSHION COVER - REAR, 40 PERCENT

REMOVAL AND INSTALLATION

NOTE: A new heater mat will come assembled on a new foam pad.

1. Remove the 40 percent seat. For additional information, refer to **Seat - Rear, 40 Percent**.
2. Release all the cushion trim cover-to-cushion frame retainers and remove the cushion foam pad and cushion trim cover.

   NOTE: Use care when separating the cushion trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the cushion foam pad.

3. Remove the cushion trim cover in the following sequence.
   1. Feed the heater mat wire harness and electrical connectors back through the cushion trim cover (if equipped).
   2. Release the hook-and-loop strips.
   3. Separate the cushion trim cover wire retainer from the clips in the cushion foam pad and remove the cushion trim cover.
4. To install, reverse the removal procedure.

SEAT CUSHION - REAR, 60 PERCENT

All seats

1. Remove the 60 percent seat. For additional information, refer to **Seat - Rear, 60 Percent**.

   Seats equipped with heat

2. Disconnect the 2 heater mat electrical connectors. Separate the 2 heater mat electrical connectors from the backrest assembly.

   All seats

3. Release the tab and remove the outboard cushion frame pivot bracket cover.
4. Release the tab and remove the inboard cushion frame pivot bracket cover.
5. Remove the 2 cushion frame pivot bracket bolts and the cushion assembly.
   - To install, tighten to 25 Nm (18 lb-ft).
6. To install, reverse the removal procedure.

SEAT CUSHION COVER - REAR, 60 PERCENT

REMOVAL AND INSTALLATION

NOTE: A new heater mat will come assembled on a new foam pad.

1. Remove the 60 percent seat. For additional information, refer to **Seat - Rear, 60 Percent**.
2. Release all the cushion trim cover-to-cushion frame retainers and remove the cushion foam pad and cushion trim cover.

   NOTE: Use care when separating the cushion trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the cushion foam pad.

3. Remove the cushion trim cover in the following sequence.
   1. Feed the heater mat wire harness and electrical connectors back through the cushion trim cover (if equipped).
   2. Release the hook-and-loop strips.
   3. Separate the cushion trim cover wire retainer from the clips in the cushion foam pad and remove the cushion trim cover.
4. To install, reverse the removal procedure.

POWER-FOLD SEAT MOTOR - REAR SEAT

REMOVAL AND INSTALLATION

1. Remove the affected 40 percent or 60 percent seat. For additional information, refer to **Seat - Rear, 40 Percent** or **Seat - Rear, 60 Percent**.
2. Remove 2 screws and the outboard lower side shield.
3. Remove the power fold motor in the following sequence.
   1. Remove the 2 screws from the power fold motor.
   2. Slide the cable housing out of the recliner.

3. Turn the cable end so the tab aligns with the slot in the lever and separate the cable.
4. Remove the power fold motor.

4. To install, reverse the removal procedure.

HEATED SEAT SWITCH - REAR SEAT

NOTE: RH switch shown in illustration, LH similar.

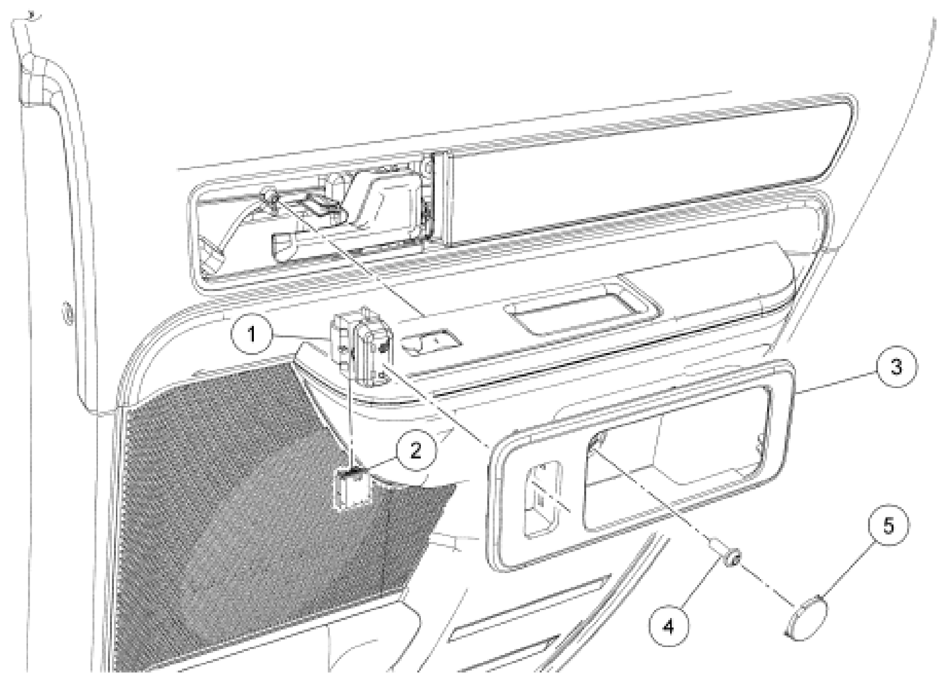

Fig. 459: Exploded View Of Rear Seat Heated Seat Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Heated seat switch
2	-	Electrical connector (part of 14632)
3	-	Rear door handle bezel
4	-	Rear door handle bezel screw
5	-	Rear door handle bezel screw cover

REMOVAL AND INSTALLATION

1. Remove the door handle bezel on the side of the affected switch in the following sequence.
   1. Remove the rear door handle bezel screw cover.
   2. Remove the rear door handle bezel screw.

   3. Separate the rear door handle bezel from the door trim panel.
2. Disconnect the electrical connector, release the clips and remove the heated seat switch from the back side of the rear door handle bezel.
3. To install, reverse the removal procedure.

SEAT CONTROL SWITCH - REAR SEAT

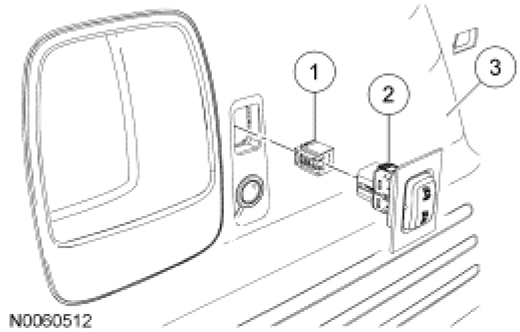

Fig. 460: Seat Control Switch Without Power Liftgate
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Electrical connector (part of 14A005)
2	-	Seat control switch
3	-	Quarter trim panel

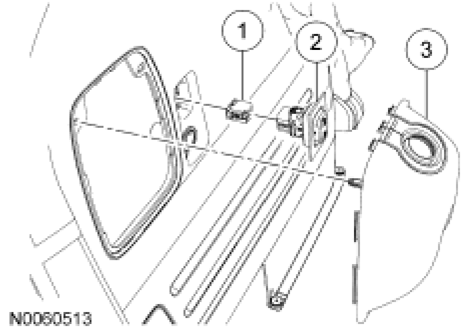

Fig. 461: Seat Control Switch With Power Liftgate
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Electrical connector (part of 14A005)
2	-	Seat control switch
3	-	Power liftgate strut cover

REMOVAL AND INSTALLATION

Vehicles without power liftgate

1. Remove the quarter trim panel. For additional information, refer to **INTERIOR TRIM & ORNAMENTATION** article.

   Vehicles with power liftgate

2. Pull out and remove the power liftgate strut cover in the quarter trim panel.

   All vehicles

3. Remove the seat control switch.
   - Disconnect the electrical connector.
   - Squeeze the tab at the top and bottom of the seat control switch and remove from the quarter trim panel.
4. To install, reverse the removal procedure.

HEATED SEAT MODULE - REAR SEAT

REMOVAL AND INSTALLATION

1. Remove the second row 60 percent seat front riser-to-floor nut and bolt.
   - To install, tighten to 70 Nm (52 lb-ft).
2. Pivot the front of the 60 percent seat cushion upward.
3. Remove the screw, disconnect the electrical connector and remove the heated seat module.
4. To install, reverse the removal procedure.

DISASSEMBLY AND ASSEMBLY

SEAT BACKREST - FRONT, WITHOUT FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: **Driver backrest shown in illustration, passenger similar.**

NOTE: **Manual recliners without fold-flat backrest are serviced with the backrest frame. Power recliners without fold-flat backrest are serviced separately.**

NOTE: A new heater mat will come assembled on a new foam pad.

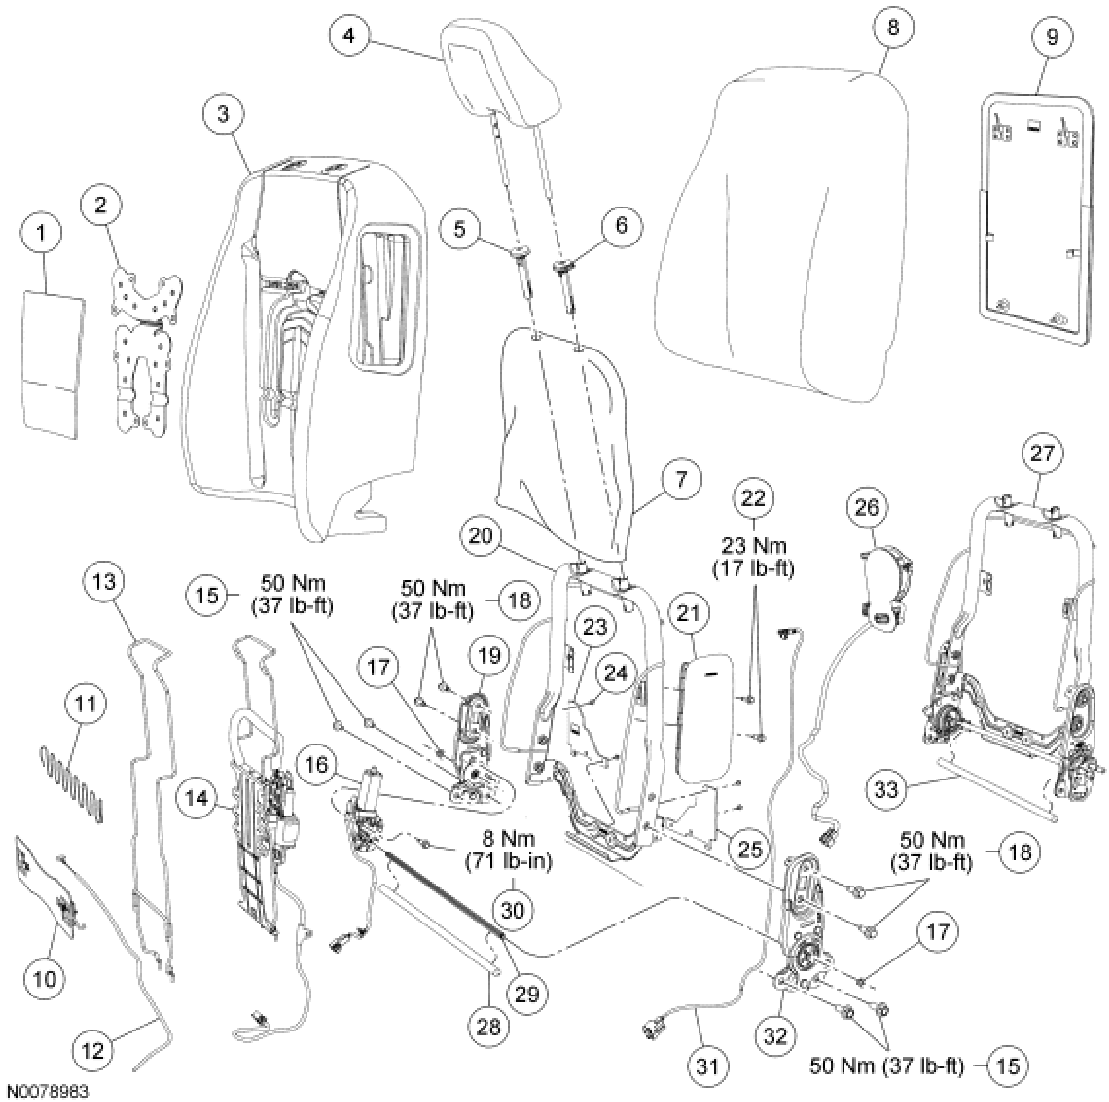

Fig. 462: Front Seat Backrest, Manual and Power Recline, Without Fold Flat
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Backrest heater mat (part of 64811) (if equipped)
2	18D507	Backrest climate control seat manifold (if equipped)
3	64811	Backrest foam pad
4	611A08	Head restraint
5	610A16	Head restraint guide, slave
6	610A16	Head restraint guide, master

7	-	Anti-squeak bag
8	64417	Backrest trim cover
9	-	Backrest trim panel
10	65500	Manual lumbar assembly (if equipped)
11	-	Upper support spring
12	-	Manual lumbar cable (part of 65500) (if equipped)
13	65500	Static lumbar
14	65500	Power lumbar assembly (if equipped)
15	W712240	Power/manual recliner-to-seat track bolts (4 required)
16	14547	Recliner motor (if equipped)
17	-	Recliner torque shaft clips (2 required) (if equipped)
18	W712240	Power recliner-to-backrest frame bolts (4 required) (if equipped)
19	62648	Inboard power recliner (if equipped)
20	61019	Backrest frame (with power recline) (if equipped)
21	611D11	Side air bag module
22	W506021	Side air bag module bolts
23	-	RH attachment panel
24	-	Screw (4 required)
25	-	LH attachment panel
26	18D507	Backrest thermo-electric device (TED) (if equipped)
27	61018	Backrest frame (with manual recline) (if equipped)
28	625A84	Power recline torque shaft cover (if equipped)
29	61726	Recliner torque shaft
30	-	Recliner motor bolt (if equipped)
31	14K155	Side air bag wire harness
32	62648	Outboard power recliner (if equipped)
33	625A84	Manual recline torque shaft cover (if equipped)

DISASSEMBLY

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result**

in serious personal injury in the event of an accidental deployment.

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front**.

   NOTE: The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.

3. Remove the backrest trim panel in the following sequence.
   1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
   2. Slide the backrest trim panel down to release the upper clips.
   3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

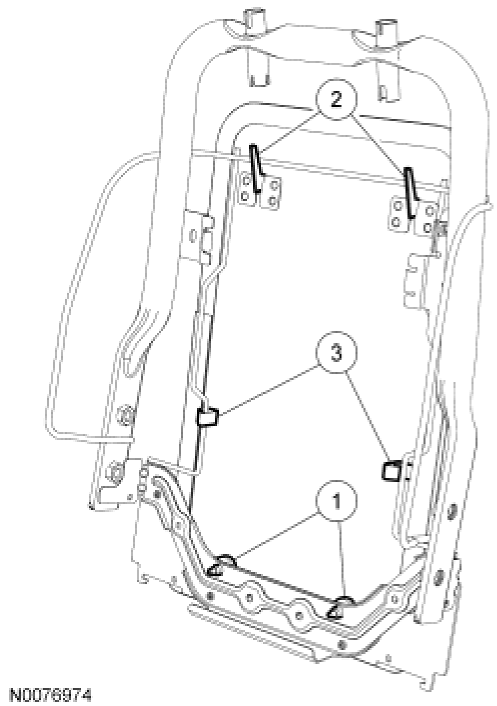

Fig. 463: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: Lower outer J-clips are unfastened to show inner J-clips.

4. Release the backrest trim cover outer and inner J-clips.

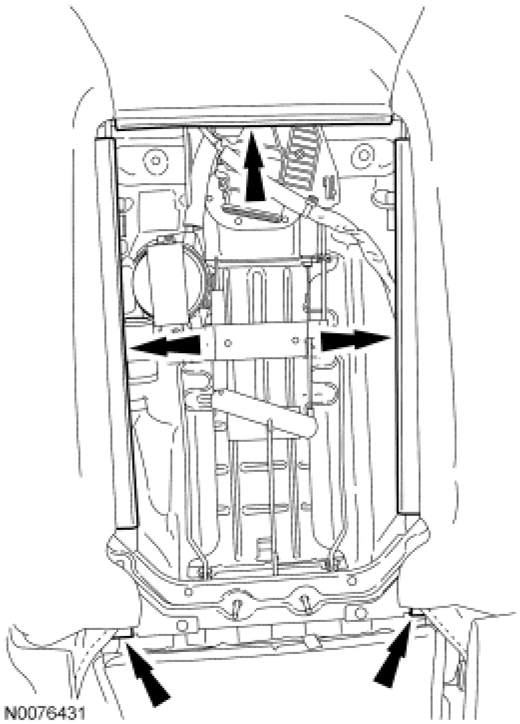

Fig. 464: Locating Inner J-Clips
Courtesy of FORD MOTOR CO.

5. Remove the head restraint.
    1. Using an appropriate tool, push in the hole, lift up on the head restraint and release one side of the head restraint.
    2. Push the release button and remove the head restraint.

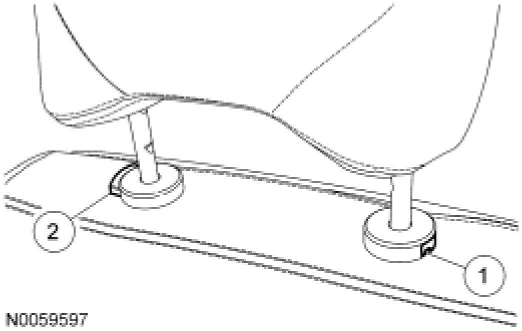

Fig. 465: Locating Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

6. Pull out and remove the master and slave head restraint guides.

NOTE: When installing, make sure the side air bag module wiring harness is not pinched between the side air bag module and the backrest frame or damage to the wiring harness can occur.

NOTE: When installing the side air bag module, new bolts must be installed.

7. Remove the side air bag module.
    1. Remove the 2 side air bag module bolts.
        - To install, tighten to 23 Nm (17 lb-ft).
    2. Remove the side air bag module with wire harness.
        - Detach any side air bag module wire harness retainers.

NOTE: Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.

NOTE: A new heater mat will come attached on a new foam pad.

8. Remove the backrest trim cover from the backrest foam pad in the following sequence.
    1. Invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
        - Separate the hook-and-loop strips.
    2. Separate the backrest trim cover wire from the clips in the backrest foam pad.
        - If equipped with climate controlled seats, on assembly make sure the climate control seat manifold is in place before snapping the backrest trim cover wire back into the backrest foam pad clips.
    3. Remove the backrest trim cover.
9. Separate the backrest frame from the backrest foam pad.
    - If equipped with climate controlled seats, on assembly make sure there is no air gap between the backrest thermo-electric device (TED) and the backrest foam pad.

Seats with climate control

10. Remove the backrest climate control seat manifold from the backrest foam pad.
11. Separate the wire harness pin-type retainer from the backrest frame, release the 3 clips and remove the TED.

Seats with power lumbar

12. Remove the power lumbar assembly in the following sequence.
    1. Disconnect the power lumbar motor.
    2. Release the power lumbar assembly clip at the top of the backrest frame.
    3. Slide the lumbar wire frame up and out at the bottom of the backrest frame.

4. Remove the power lumbar assembly.

Seats with manual lumbar

13. Release the manual lumbar hooks from the backrest frame, route out the manual lumbar cable and remove the manual lumbar assembly.

Seats with power recline

NOTE: The recliners are synchronized. Avoid rotating the recliner shaft until fully installed to keep the recliners synchronized.

14. Remove the power recline motor in the following sequence.
    1. Remove the clip from the torque shaft on the power recline motor side.
    2. Slide out and remove the torque shaft.
    3. Remove the power recline motor bolt.
        - To install, tighten to 8 Nm (71 lb-in).
    4. Disconnect and remove the power recline motor.

NOTE: Manual recliners are only serviced with the backrest frame. Do not remove the bolts retaining the manual recliners to the backrest frame.

NOTE: To install a new power recliner, using the torque shaft, rotate both recliners to their front or rear stop.

15. Remove the 4 bolts and the inboard and outboard **power** recliners.
    - To install, tighten to 50 Nm (37 lb-ft).

All seats

16. To assemble, reverse the disassembly procedure.
17. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front**.
18. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat

19. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST - FRONT, WITH FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: Optional backrest on passenger seat only.

NOTE: Manual recliners with fold-flat backrest are serviced separately.

NOTE: A new heater mat will come assembled on a new foam pad.

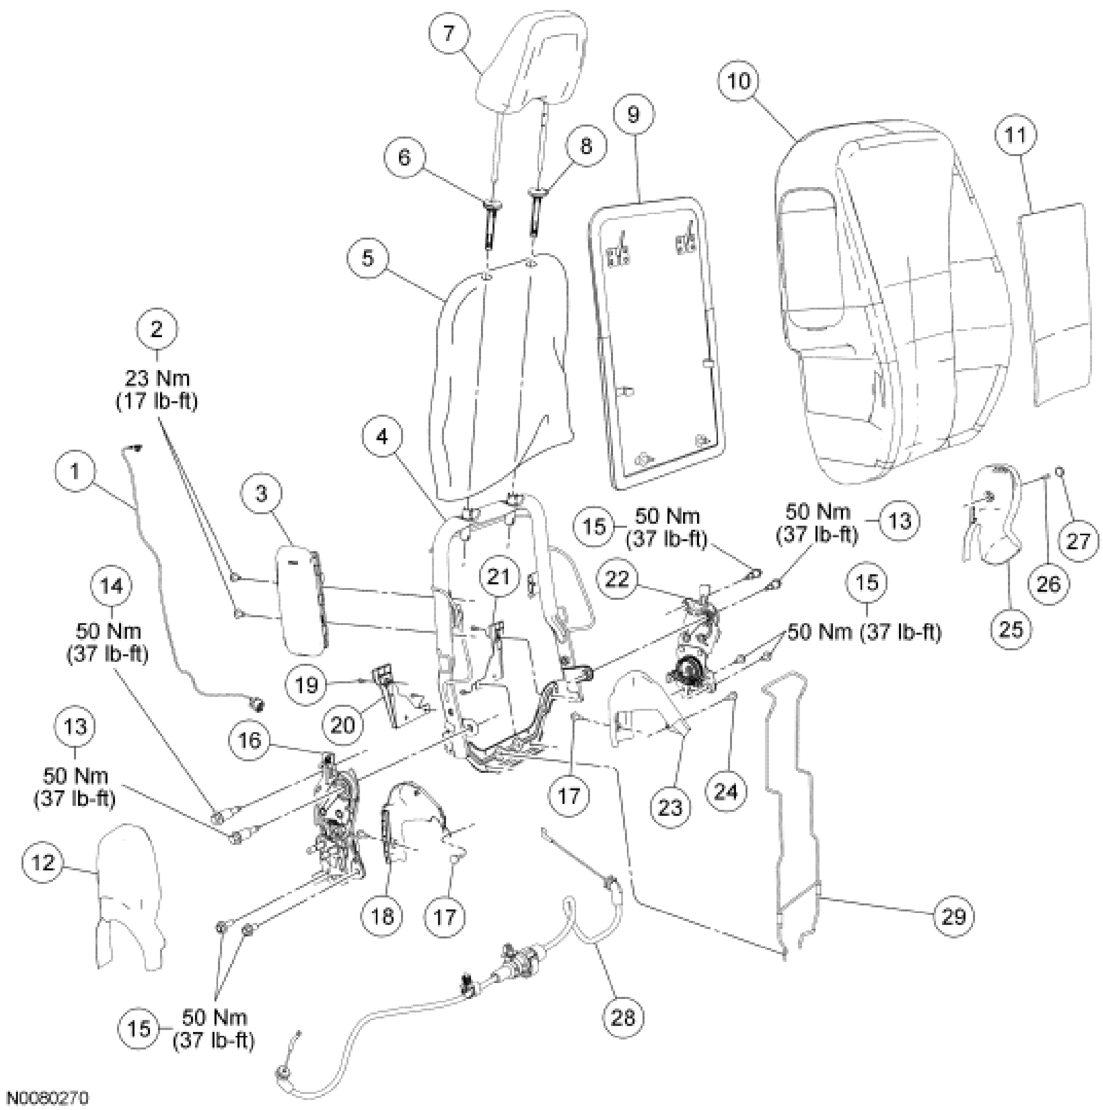

Fig. 466: Front Seat Backrest, Manual Recline With Fold Flat

10	64810/64416	Backrest foam pad/backrest trim cover

11	-	Backrest heater mat (part of 64810) (if equipped)
12	62186	RH outer fold-flat recliner cover
13	W712059	Fold-flat recliner-to-fold-flat backrest frame front bolts (2 required)
14	W500720	Fold-flat recliner-to-fold-flat backrest frame rear bolts (2 required)
15	W712240	Fold-flat recliner-to-seat track bolts (4 required)
16	-	RH fold-flat recliner
17	62294	Inboard fold-flat recliner cover screws (3 required)
18	62186	RH inboard fold-flat recliner cover
19	-	Screw (4 required)
20	-	RH attachment panel
21	-	LH attachment panel
22	-	LH fold-flat recliner
23	62187	LH inboard fold-flat recliner cover
24	W714053	Scrivet
25	62187	LH outer fold-flat recliner cover
26	62294	LH outer fold-flat recliner cover screw
27	-	Screw cover
28	-	Fold-flat recliner cable
29	65500	Static lumbar

DISASSEMBLY AND ASSEMBLY

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury**

or death in a crash.

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Only the front passenger seat can come equipped with optional fold-flat backrest.

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front**.
3. Remove the LH and RH outer fold-flat recliner covers.
   - Pull to release the clips.
   - Slide up to disengage the retainer and remove.
4. Remove the 4 fold-flat recliner-to-fold-flat backrest frame bolts.
   - To install, tighten to 50 Nm (37 lb-ft).
   - If necessary, remove the fold-flat recliner cable.

   NOTE: The seat backrest trim cover and foam pad have been removed to show the backrest trim panel retainers.

5. Remove the backrest trim panel in the following sequence.
   1. Release the 2 pin-type retainers at the bottom of the backrest trim panel.
   2. Slide the backrest trim panel down to release the upper clips.
   3. Turn the backrest trim panel to release the middle clips and remove the backrest trim panel.

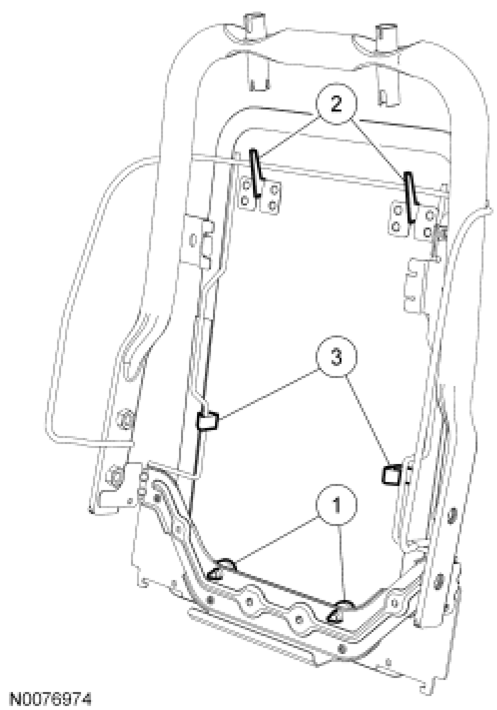

Fig. 467: Locating Pin-Type Retainers, Upper Clips & Middle Clips
Courtesy of FORD MOTOR CO.

NOTE: Lower outer J-clips are unfastened to show inner J-clips.

6. Release the backrest trim cover outer and inner J-clips.

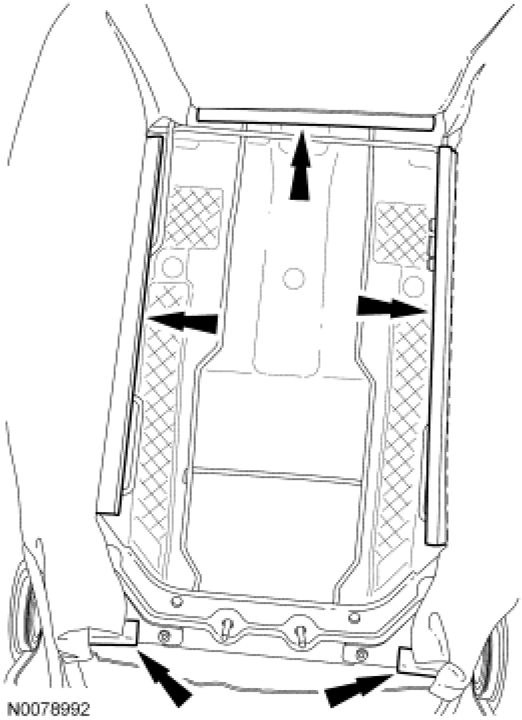

Fig. 468: Locating J-Clips
Courtesy of FORD MOTOR CO.

7. Remove the head restraint.
    1. Using an appropriate tool, push in the hole, lift up on the head restraint and release one side of the head restraint.
    2. Push the release button and remove the head restraint.

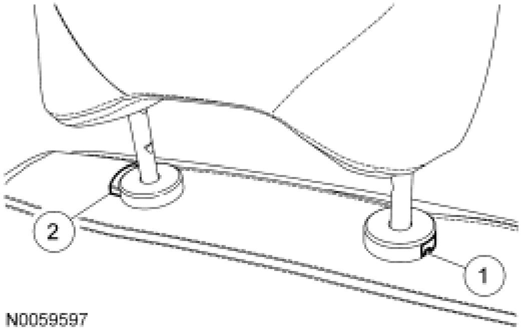

Fig. 469: Locating Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

8. Pull out and remove the master and slave head restraint guides.

NOTE: **When installing, make sure the side air bag module wiring harness is not pinched between the side air bag module and the backrest frame or damage to the wiring harness can occur.**

NOTE: **When installing the side air bag module, new bolts must be installed.**

9. Remove the side air bag module.
   - Remove the 2 side air bag module bolts.
     - To install, tighten to 23 Nm (17 lb-ft).
   - Remove the side air bag module with wire harness.
     - Detach any side air bag module wire harness retainers.

NOTE: **Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.**

NOTE: **A new heater mat will come attached on a new foam pad.**

10. Remove the backrest trim cover.
    - Invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
      - Separate the hook-and-loop strips.
    - Separate the backrest trim cover wire from the clips in the backrest foam pad.
    - If equipped, feed out the backrest heater mat wire harness from the opening in the side of the backrest trim cover.
    - Remove the backrest trim cover.
11. Separate the backrest frame from the backrest foam pad.
12. To assemble, reverse the disassembly procedure.
13. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front**.
14. Install the front seat. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
15. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CUSHION - FRONT

Special Tools

22	14B422	OCS weight sensor bolts (4 required) (part of 61710)
23	-	Inboard seat track rail (part of 61710)
24	-	Outboard seat track rail (part of 61710)
25	62294	Seat track cover retainer
26	62186	Seat track cover

DISASSEMBLY AND ASSEMBLY

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Driver seat shown in illustration, passenger similar.**

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat cushion. For additional information, refer to **Seat Cushion - Front**.
3. Release the cushion trim cover retainers from the cushion frame and remove the cushion trim cover and cushion foam pad.

   NOTE: **Use care when separating the cushion trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the cushion foam pad.**

   NOTE: **A new heater mat will come assembled on a new foam pad.**

4. Remove the cushion trim cover from the cushion foam pad in the following sequence.
   1. Separate the hook-and-loop strips.
   2. Separate the cushion trim cover wire retainer from the clips in the cushion foam pad.
      - For vehicles with climate controlled seat, on assembly make sure the climate control seat manifold is in place before snapping the cushion trim cover wire retainer back into the cushion foam pad.

   Seats with climate control

5. Remove the cushion climate control seat manifold from the cushion foam pad.
6. Remove the 3 cushion thermo-electric device (TED)-to-cushion frame screws.
7. Remove the cushion TED-to-climate control seat cushion adapter screw and remove the TED.
8. Release the clips and remove the cushion TED adapter from the cushion frame.

   Heated seats

9. Remove the screw and the heated seat module.

   All seats

10. Release the retainers from the cushion frame and remove the cushion support.
11. To assemble, reverse the disassembly procedure.

12. Install the front seat cushion. For additional information, refer to **Seat Cushion - Front**.
    - For correct front passenger seat cushion wire harness routing, refer to **Seat Wire Harness Routing - Front Passenger Cushion**.
13. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

14. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST - REAR, 60 PERCENT

NOTE: A new heater mat will come assembled on a new foam pad.

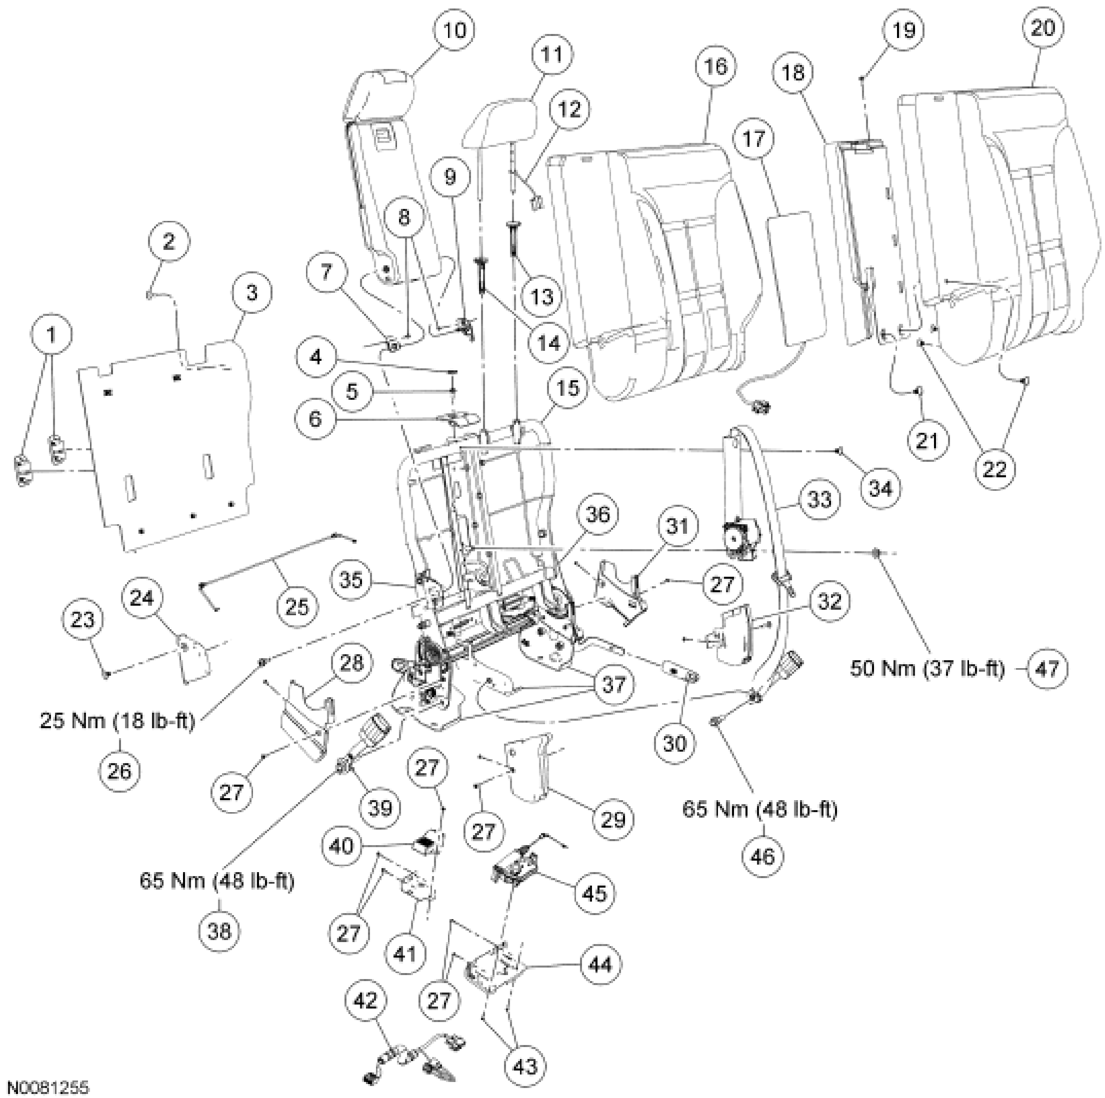

Fig. 474: Rear Seat Backrest, 60 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	666L76	Child safety seat tether anchor bezels
2	-	Pin-type retainer
3	60509	Back panel
4	237W10	Safety belt bezel screw cover (part of 611A70)
5	-	Safety belt bezel screw
6	611A70	Safety belt bezel
7	67336	RH armrest detent
8	-	Armrest detent-to-backrest frame screws
9	67336	LH armrest detent

10	67112	Armrest
11	611A08	Head restraint
12	-	Safety belt comfort guide
13	610A16	Head restraint guide (master)
14	610A16	Head restraint guide (slave)
15	-	Backrest frame (part of backrest assembly 613A39)
16	66801	Backrest foam pad
17	-	Backrest heater mat (if equipped) (part of 66801)
18	61046	Armrest filler panel
19	-	Screw
20	66601	Backrest trim cover
21	-	Pin-type retainer
22	-	Pin-type retainers
23	-	Pin-type retainer
24	61349	Armrest bracket trim cover
25	601L60	Recliner cable
26	-	Armrest bolt
27	W712241	Screws
28	61349	Inboard lower side shield
29	61349	Inboard upper side shield
30	62419	Recliner handle cover
31	61349	Outboard lower side shield
32	61349	Outboard upper side shield
33	611B64	Safety belt retractor
34	-	Pin-type retainer
35	-	Inboard recliner (part of backrest assembly 613A39)
36	-	Outboard recliner (part of backrest assembly 613A39)
37	-	Anchor brackets (part of backrest assembly 613A39)
38	-	Safety belt buckle bolt (part of 60044)
39	60044	Safety belt buckle
40	-	Heated seat module (if equipped)
41	60328	Heated seat module bracket (if equipped)
42	19K315	Wire harness (if equipped)
43	-	Screws (2 required) (if equipped)
44	-	Power fold motor bracket (if equipped)
45	613A68	Power fold motor (if equipped)

46	-	Safety belt retractor belt and buckle anchor bolt (part of 611B64)
47	-	Safety belt retractor nut

DISASSEMBLY AND ASSEMBLY

WARNING: Synchronize the seat recliners following the steps in the seat removal and installation procedure any time the seat is removed for service. The following actions may result in the loss of recliner synchronization that cannot be corrected and may cause the seat back to fail in a crash:

- **Dropping the seat**
- **Sitting on the seat when removed**
- **Applying any load to the seat when removed**
- **Removing or loosening any recliner fasteners except for the safety belt buckle bolt**

Install a new seat back frame assembly if the seat recliners cannot be synchronized. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s) in a crash.

All seats

1. Remove the 60 percent seat. For additional information, refer to **Seat - Rear, 60 Percent**.
2. Remove the 60 percent cushion. For additional information, refer to **Seat Cushion - Rear, 60 Percent**.

NOTE: Make sure the safety belt webbing is not twisted prior to installation.

3. Remove the bolt and separate the safety belt retractor belt and buckle anchor from the riser.
   - To install, tighten to 65 Nm (48 lb-ft).
4. Remove the head restraint.
   1. Push in the hole, lift up on the head restraint and release one side of the head restraint.
   2. Push the release button and remove the head restraint.
   3. Remove the safety belt comfort guide.

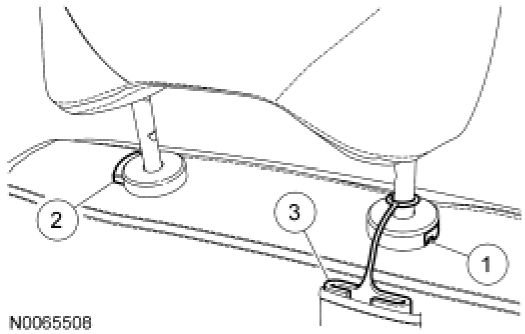

Fig. 475: Locating Safety Belt Comfort Guide & Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

5. Pull out and remove the master and slave head restraint guides.
6. Remove the armrest bracket trim cover pin-type retainer and the armrest bracket trim cover.
    - Cycle the armrest up and down to aid trim cover removal.
7. Remove the armrest bolt.
    - To install, tighten to 25 Nm (18 lb-ft).
8. Remove the armrest.
    - With the armrest upright, tip the outboard side of the armrest to disengage the stop from the backrest frame channel.
9. Remove the pin-type retainer in the armrest pocket, attaching the backrest trim cover to the backrest.
10. Release the tabs and remove the child safety seat tether anchor bezel.
    - Repeat for the other child safety seat tether anchor bezel.

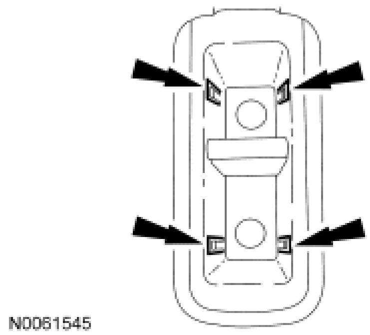

Fig. 476: Locating Tabs On Child Safety Seat Tether Anchor Bezel
Courtesy of FORD MOTOR CO.

11. Remove the safety belt bezel screw cover, the screw and the safety belt bezel.
    - During assembly, make sure the safety belt bezel clips in place.
12. Release the backrest trim cover lower J-clip.
    - Pull the heated seat electrical connector through the backrest trim cover opening (if equipped).

13. At the rear inboard side of the backrest, access the zipper tucked up behind the back panel and unzip the zipper.
14. Remove the 2 pin-type retainers holding the backrest trim cover around each of the 2 lower anchors and tethers for children (LATCH) and attaching to the lower rear of the backrest frame.
15. Remove the pin-type retainer from inside the safety belt comfort guide pocket.
16. Pull back the backrest trim cover over the armrest bracket and backrest frame latching wire for the armrest.
17. Remove the screw at the top and the pin-type retainer at the bottom of the armrest filler panel.
18. Lift the armrest filler panel over the armrest pivot bracket and slide out to the outboard side of the seat.
    - During assembly, make sure the armrest filler panel clips in place around the backrest trim cover J-clip, at the inboard side.
19. Release the backrest trim cover J-clip from the backrest frame in the armrest pocket.
20. From the back, invert the backrest trim cover up and over the backrest frame and remove the backrest trim cover and backrest foam pad.

NOTE: **Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.**

NOTE: **If a new heater mat or foam pad with heat are needed, the parts will already be assembled from the factory. There is no need to remove the heater mat from the foam pad.**

21. Remove the backrest trim cover from the backrest foam pad in the following sequence.
    1. Invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
        - Separate the hook-and-loop strips.
    2. Separate the backrest trim cover wire from the clips in the backrest foam pad.
    3. Remove the backrest trim cover.
        - Feed the safety belt retractor belt and safety belt buckle through the backrest trim cover and backrest foam pad.
22. Remove the backrest foam pad.
23. Release the retainers and remove the back panel.
24. Remove the safety belt retractor nut, pin-type retainer under the safety belt and the safety belt retractor.
    - To install, tighten to 50 Nm (37 lb-ft).
25. Remove 2 screws and the outboard upper side shield.
26. Remove 2 screws and the inboard upper side shield.
27. Remove 2 screws and the outboard lower side shield.
28. Remove 2 screws and the inboard lower side shield.

WARNING: **Keep hands clear of all moving seat mechanisms when releasing the**

recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.

NOTE: Note the position of the safety belt buckle anti-rotation tab for installation.

29. With the recliners released (backrest folded), remove the bolt and safety belt buckle.
    - To install, tighten to 65 Nm (48 lb-ft).
30. Separate the recliner cable casing at both ends from the recliners.
31. Remove the recliner cable in the following sequence.
    1. Turn the cable end so the tab aligns with the slot in the lever and separate the cable at one end.
    2. Turn the cable end so the tab aligns with the slot in the lever and separate the cable at the other end.
        - Remove the recliner cable.

Seats with power fold

32. Remove the power fold motor in the following sequence.
    1. Remove the 2 screws from the power fold motor.
    2. Slide the cable casing out of the recliner.
    3. Turn the cable end so the tab aligns with the slot in the lever and separate the cable.
    4. Remove the power fold motor.

Seats with heat

33. Disconnect the electrical connector, remove the screw and the heated seat module.

All seats

34. To assemble, reverse the disassembly procedure.
    - Check the active restraint system for correct operation. For additional information, refer to safety belt system in the diagnosis and testing portion of **SAFETY BELT SYSTEM** article.
        - Verify the safety belt retractor operates without excessive effort or binding.
        - Make sure the LATCH is accessible to the occupant.

SEAT BACKREST - REAR, 40 PERCENT

NOTE: A new heater mat will come assembled on a new foam pad.

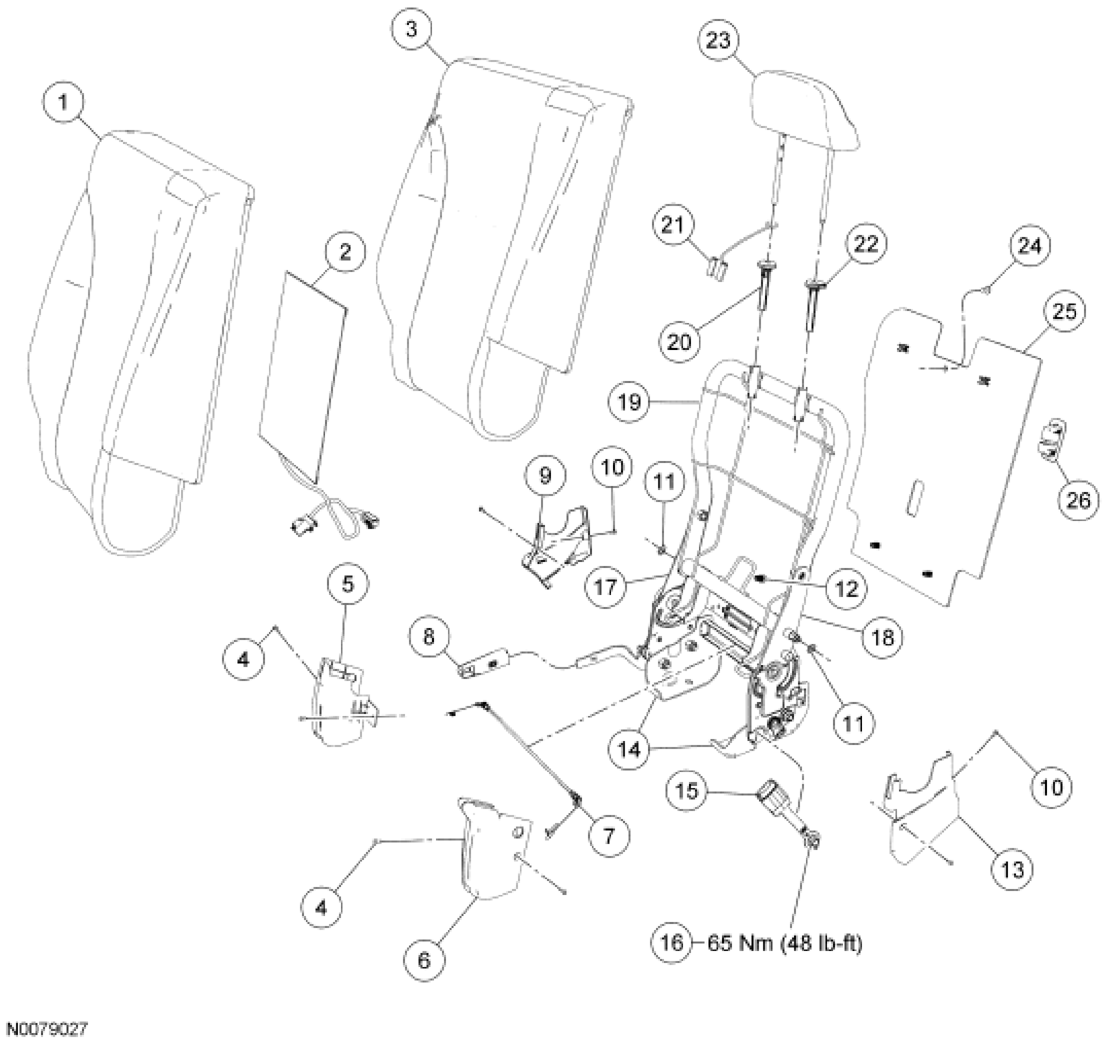

Fig. 477: Rear Seat Backrest, 40 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	66600	Backrest trim cover
2	-	Backrest heater mat (if equipped) (part of 66800)
3	66800	Backrest foam pad
4	-	Screws (4 required)
5	61348	Outboard upper side shield
6	61348	Inboard upper side shield
7	601L60	Recliner cable
8	62418	Recliner handle cover
9	61348	Outboard lower side shield

10	-	Screws (4 required)
11	-	Wave washers (2 required)
12	-	Pin-type retainer
13	61349	Inboard lower side shield
14	-	Anchor brackets (part of backrest assembly 613A38)
15	60044	Safety belt buckle
16	-	Safety belt buckle bolt (part of 60044)
17	-	Outboard recliner (part of backrest assembly 613A38)
18	-	Inboard recliner (part of backrest assembly 613A38)
19	-	Backrest frame (part of backrest assembly 613A38)
20	610A16	Head restraint guide (slave)
21	-	Safety belt comfort guide
22	610A16	Head restraint guide (master)
23	611A08	Head restraint
24	-	Pin-type retainer
25	60508	Back panel
26	666L76	Child safety seat tether anchor bezel

DISASSEMBLY AND ASSEMBLY

WARNING: **Synchronize the seat recliners following the steps in the seat removal and installation procedure any time the seat is removed for service. The following actions may result in the loss of recliner synchronization that cannot be corrected and may cause the seat back to fail in a crash:**

- **Dropping the seat**
- **Sitting on the seat when removed**
- **Applying any load to the seat when removed**
- **Removing or loosening any recliner fasteners except for the safety belt buckle bolt**

Install a new seat back frame assembly if the seat recliners cannot be synchronized. Failure to follow these instructions may result in serious personal injury to the vehicle occupant(s) in a crash.

All seats

1. Remove the 40 percent seat. For additional information, refer to **Seat - Rear, 40 Percent**.
2. Remove the 40 percent cushion. For additional information, refer to **Seat Cushion - Rear, 40 Percent**.

3. Remove the head restraint.
    1. Push in the hole, lift up on the head restraint and release one side of the head restraint.
    2. Push the release button and remove the head restraint.
    3. Remove the safety belt comfort guide.

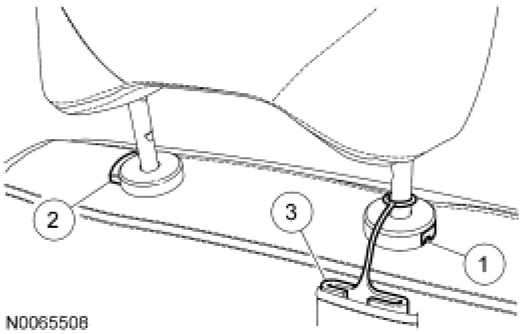

Fig. 478: Locating Safety Belt Comfort Guide & Release Button On Head Restraint
Courtesy of FORD MOTOR CO.

NOTE: Always install a new slave head restraint guide.

4. Pull out and remove the master and slave head restraint guides.
5. Release the tabs and remove the child safety seat tether anchor bezel.

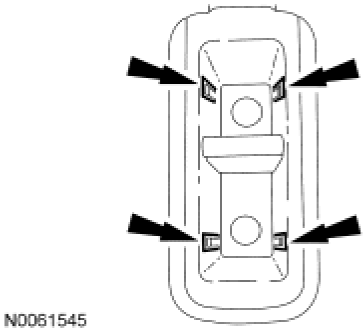

Fig. 479: Locating Tabs On Child Safety Seat Tether Anchor Bezel
Courtesy of FORD MOTOR CO.

6. Release the backrest trim cover lower J-clip.
    - Pull the heated seat electrical connector through the backrest trim cover opening (if equipped).
7. At the rear inboard side of the backrest, access the zipper tucked up behind the back panel and unzip the zipper.
8. Remove the pin-type retainer holding the backrest trim cover around the lower anchors and tethers for children (LATCH) and attaching to the lower rear of the backrest frame.
9. Remove the pin-type retainer from inside the safety belt comfort guide pocket.

NOTE: Use care when separating the backrest trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the backrest foam pad.

10. Release the hook-and-loop strips and invert the backrest trim cover in an inside out fashion to the wire in the backrest trim cover attached to the clips in the backrest foam pad.
11. Separate the backrest trim cover wire from the clips in the backrest foam pad and remove the backrest trim cover.
12. Remove the backrest foam pad.
13. Release the retainers and remove the back panel.
14. Remove 2 screws and the outboard upper side shield.
15. Remove 2 screws and the inboard upper side shield.
16. Remove 2 screws and the outboard lower side shield.
17. Remove 2 screws and the inboard lower side shield.

WARNING: Keep hands clear of all moving seat mechanisms when releasing the recliner lever. The recliners are spring loaded and release with high force. Failure to follow these instructions may result in serious personal injury.

NOTE: Note the position of the safety belt buckle anti-rotation tab for installation.

18. With the recliners released (backrest folded), remove the bolt and safety belt buckle.
    - To install, tighten to 65 Nm (48 lb-ft).
19. Separate the recliner cable casing at both ends from the recliners.
20. Remove the recliner cable in the following sequence.
    1. Turn the cable end so the tab aligns with the slot in the lever and separate the cable at one end.
    2. Turn the cable end so the tab aligns with the slot in the lever and separate the cable at the other end.
       - Remove the recliner cable.

Seats with power fold

21. Remove the power fold motor in the following sequence.
    1. Remove the 2 screws from the power fold motor.
    2. Slide the cable casing out of the recliner.
    3. Turn the cable end so the tab aligns with the slot in the lever and separate the cable.
    4. Remove the power fold motor.

All seats

22. To assemble, reverse the disassembly procedure.
    - Make sure the LATCH is accessible to the occupant.

- Check the active restraint system for correct operation. For additional information, refer to safety belt system in the diagnosis and testing portion of **SAFETY BELT SYSTEM** article.

SEAT CUSHION - REAR, 40 PERCENT

NOTE: A new heater mat will come assembled on a new foam pad.

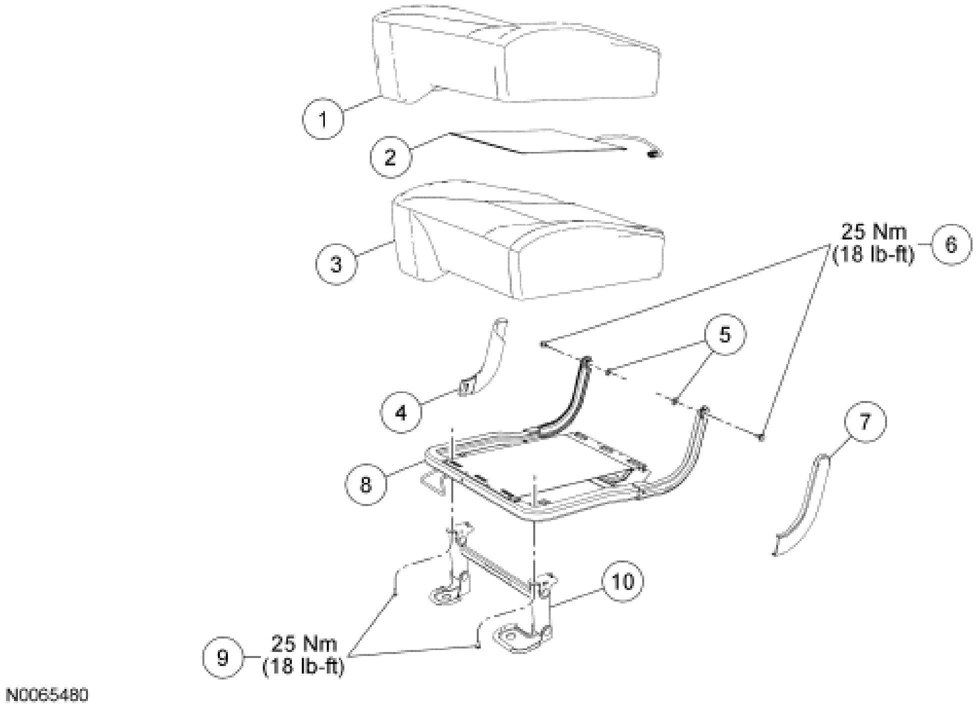

Fig. 480: Exploded View Of Rear Seat Cushion, 40 Percent With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	63804	Cushion trim cover
2	-	Cushion heater mat (if equipped) (part of 63840)
3	63840	Cushion foam pad
4	666L76	Outboard cushion frame pivot bracket cover
5	-	Wave washers
6	W712172	Cushion frame pivot bracket bolts
7	66L75	Inboard cushion frame pivot bracket cover
8	63160	Cushion frame
9	N605892	Kneeling assembly-to-cushion frame bolts

10	605B10	Kneeling assembly

DISASSEMBLY AND ASSEMBLY

1. Remove the 40 percent seat. For additional information, refer to **Seat - Rear, 40 Percent**.
2. Remove the 40 percent seat cushion. For additional information, refer to **Seat Cushion - Rear, 40 Percent**.
3. Remove the 2 kneeling assembly-to-cushion frame bolts. Remove the kneeling assembly.
   - To install, tighten to 25 Nm (18 lb-ft).
4. Release all the cushion trim cover-to-cushion frame retainers and remove the cushion foam pad and cushion trim cover.

NOTE: Use care when separating the cushion trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the cushion foam pad.

5. Remove the cushion trim cover in the following sequence.
   1. Feed the heater mat wire harness and electrical connectors back through the cushion trim cover (if equipped).
   2. Release the hook-and-loop strips.
   3. Separate the cushion trim cover wire retainer from the clips in the cushion foam pad and remove the cushion trim cover.
6. To assemble, reverse the disassembly procedure.

SEAT CUSHION - REAR, 60 PERCENT

NOTE: A new heater mat will come assembled on a new foam pad.

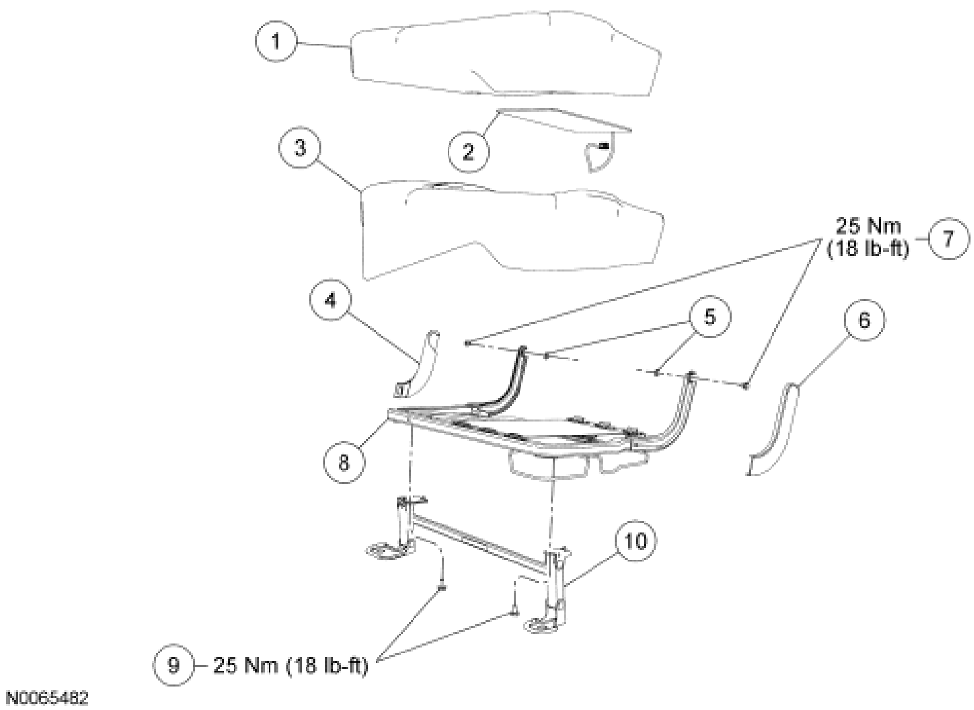

Fig. 481: Exploded View Of Rear Seat Cushion, 60 Percent With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	63805	Cushion trim cover
2	-	Cushion heater mat (if equipped) (part of 63841)
3	63841	Cushion foam pad
4	666L76	Inboard cushion frame pivot bracket cover
5	-	Wave washers
6	666L75	Outboard cushion frame pivot bracket cover
7	W712172	Cushion frame pivot bracket bolts
8	63161	Cushion frame
9	N605892	Kneeling assembly-to-cushion frame bolts
10	605B11	Kneeling assembly

DISASSEMBLY AND ASSEMBLY

1. Remove the 60 percent seat. For additional information, refer to **Seat - Rear, 60 Percent**.
2. Remove the 60 percent seat cushion. For additional information, refer to **Seat Cushion - Rear, 60 Percent**.

3. Remove the 2 bolts and the kneeling assembly.
   - To install, tighten to 25 Nm (18 lb-ft).
4. Release all the cushion trim cover-to-cushion frame retainers and remove the cushion foam pad and cushion trim cover.

NOTE: **Use care when separating the cushion trim cover from the hook-and-loop strips, or the hook-and-loop strips can be torn from the cushion foam pad.**

5. Remove the cushion trim cover in the following sequence.
   1. Feed the heater mat wire harness and electrical connectors back through the cushion trim cover (if equipped).
   2. Release the hook-and-loop strips.
   3. Separate the cushion trim cover wire retainer from the clips in the cushion foam pad and remove the cushion trim cover.
6. To assemble, reverse the disassembly procedure.

2008 ENGINE

Starting System - Edge & MKX

SPECIFICATIONS

TORQUE SPECIFICATIONS

Starter motor bolt	27	20	-
Starter motor solenoid battery cable nut	12	9	-
Starter motor solenoid wire nut	5	-	44
Starter motor stud bolt	27	20	-
Transmission manual control lever nut	18	13	-

DESCRIPTION AND OPERATION

STARTING SYSTEM

The starting system consists of the following:

- Starter motor
- Starter motor relay
- Transmission range (TR) sensor
- Battery
- Ignition switch
- PCM
- Start diode

When the starter solenoid is energized, a magnetic field is created in the starter solenoid windings. The iron plunger core is drawn into the starter solenoid coil, and a drive lever and pin connected to the starter drive engages the drive pinion gear to the flexplate ring gear. When the plunger is pulled all the way in, its contact disc closes the circuit between the battery and the motor feed terminals. This sends current to the motor, and the drive pinion gear cranks the flexplate to start the engine. When current flows to the starter motor, the starter solenoid pull-in coil is bypassed, and the hold-in coil keeps the drive pinion gear engaged with the flexplate.

An overrunning clutch in the starter drive protects the starter motor from excessive speeds during the brief period before the driver releases the ignition switch from the START position as the engine starts.

The starting system uses a TR sensor located in the transmission. The TR sensor prevents operation of the starter motor unless NEUTRAL or PARK is selected. The vehicle has one-touch integrated start (OTIS), a computer-assisted cranking system. This feature assists in starting the engine. If the ignition key is turned to the START position and released when the engine begins cranking, the engine may continue cranking for up to 10 seconds or until the vehicle starts.

One-Touch Integrated Start (OTIS)

Once the ignition is turned to the START position and the vehicle is in NEUTRAL or PARK, the PCM reads starter motor request (SMR) from the ignition switch and gains control of the starter engagement. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on the following events:

- The engine is started (RPM threshold)
- A set time has been exceeded (calibrated)
- The ignition key has been turned to the OFF position

DIAGNOSTIC TESTS

STARTING SYSTEM

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2574-A	Flex Probe Kit	105-R025C or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	-

Principles of Operation

The starting system is electronically controlled by the passive anti-theft system (PATS). PATS is controlled by the instrument cluster. PATS recognizes the correct electronically coded ignition key and the instrument cluster sends a message to the PCM to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid with the key in the START position, thereby allowing the starter motor to activate.

Inspection and Verification

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: The anti-theft system must be functioning correctly before a logical starting system diagnosis can be carried out. Address anti-theft system concerns before continuing.

1. Verify the customer concern by operating the starting system to duplicate the conditions.
2. Inspect to determine if any of the following mechanical or electrical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Starter motor • Starter motor bolts • Flexplate	• Battery • Open fuse • Battery junction box (BJB) fuse 41 (30A) • Smart junction box (SJB) fuse 27 (20A) • Damaged wiring harness • Starter relay • Anti-theft system • Loose or corroded connections

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.

- check the scan tool connection to the VCM.
- refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
9. If the DTCs retrieved are related to the concern, go to PCM DTC Chart or the Passive Anti-Theft System (PATS) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **SYMPTOM CHART**.

PCM DTC CHART

DTC	Description	Source	Action
P0512	Starter Request Circuit - Circuit has Power With the Ignition in the OFF Position	PCM	CARRY OUT the Ignition Switch Component Test. Refer to COMPONENT TESTING. If necessary, INSTALL a new ignition switch. If the ignition switch passed the component test, REPAIR circuit CDC35 (BU/WH) for a short to power.
P0705	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.
P0706	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.
P0708	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.
P0709	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.

PASSIVE ANTI-THEFT SYSTEM (PATS) DTC CHART

DTC	Description	Source	Action
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

B1342	ECU is Defective	Instrument Cluster/PCM	INSTALL a PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article.
B1600	Passive Anti-Theft System (PATS) Key Transponder Signal is Not Received	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1681	PATS Transceiver Module Signal is Not Received	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2103	Antenna Not Connected	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2141	NVM Configuration Failure	Instrument Cluster/PCM	There is no PCM ID stored in the instrument cluster. CARRY OUT a parameter reset of the instrument cluster and PCM, then CYCLE the ignition and make an attempt to start the vehicle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2431	Transponder Programming Failed	Instrument Cluster/PCM	VERIFY if the correct PATS key is being used. If the PATS key is defective, use a new key for programming. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
U0100	Lost Communication	Instrument Cluster/PCM	REFER to **ANTI-THEFT**

	With ECM/PCM		**- PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
U2510	Antenna Not Connected	Instrument Cluster/PCM	If DTC U2511 is not present also, CARRY OUT a parameter reset of the instrument cluster and the PCM and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
• The engine does not crank	• Battery • Fuse(s) • Starter motor • Circuitry • PCM • Starter motor relay • Ignition switch • Start diode • Anti-theft system	• Go to **Pinpoint Test A** .
• One-touch integrated start (OTIS) does not operate correctly	• Circuitry • PCM	• Go to **Pinpoint Test A** .
• The engine cranks slowly	• Battery • Starter motor • Circuitry	• CARRY OUT the Starter Motor Component Test.
• Unusual starter noise	• Starter motor mounting • Starter motor • Incorrect starter drive engagement	• Go to **Pinpoint Test C** .
• The starter spins but the engine does not crank	• Starter motor	• INSPECT the starter motor mounting and engagement.

-	• Damaged flexplate teeth	REPAIR as necessary. • INSPECT the flexplate for damaged, missing or worn teeth. REPAIR as necessary.

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank

Refer to appropriate SYSTEM WIRING DIAGRAM article for Starting System schematic and connector information.

Normal Operation

Under normal operation, constant power is supplied to the starter motor relay from the battery junction box (BJB) fuse 41 (30A). When the ignition switch is turned in the START position and held, with the vehicle in PARK or NEUTRAL, power flows to the starter motor relay through CDC35 (BU/WH). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter motor relay coil to energize and the relay contacts close. This allows power to be supplied from the starter motor relay contacts which then flows through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and closes the solenoid contacts allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine.

This pinpoint test is intended to diagnose the following:

- Battery
- Anti-theft system
- Starter relay
- Ignition switch
- Circuitry
- PCM
- Start diode

PINPOINT TEST A: THE ENGINE DOES NOT CRANK

A1 CHECK THE BATTERY

- Check the battery condition and charge. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to A2.

  NO : CHARGE or INSTALL a new battery as necessary. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A2 CHECK FOR PASSIVE ANTI-THEFT SYSTEM (PATS) DTCs

NOTE: **Passive anti-theft system (PATS) DTCs are the only DTCs of concern in this step. Only repair retrieved non-PATS DTCs if a customer concern is reported.**

- Check for PATS DTCs.
- **Were any PATS DTCs retrieved?**

  YES : REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article to diagnose the PATS DTCs.

  NO : Go to A3.

A3 CHECK THE BATTERY GROUND CABLE

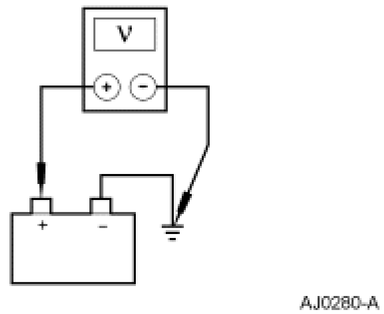

Fig. 1: Checking Battery Ground Cable
Courtesy of FORD MOTOR CO.

- Measure the voltage between the positive battery post and the battery ground cable connection at the engine.
- **Is the voltage greater than 10 volts?**

  YES : Go to A4.

  NO : INSTALL a new battery ground cable. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A4 CHECK THE STARTER MOTOR GROUND

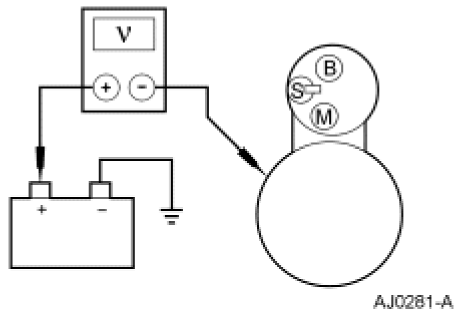

Fig. 2: Checking Starter Motor Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between the positive battery post and the starter motor case.
- **Is the voltage greater than 10 volts?**

  YES : Go to A5.

  NO : CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.

A5 CHECK THE POWER SUPPLY TO THE STARTER MOTOR

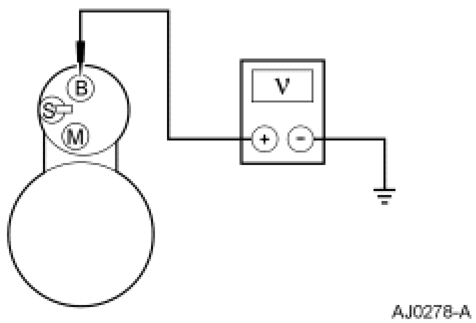

Fig. 3: Checking Power Supply To Starter Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between starter motor C197A, circuit SDC02 (RD) and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A6.

  NO : INSTALL a new positive battery cable. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A6 CHECK THE STARTER MOTOR B-PIN

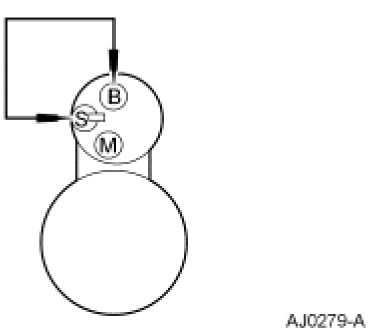

Fig. 4: Checking Starter Motor
Courtesy of FORD MOTOR CO.

- Connect one end of a fused (30A) jumper wire to starter motor solenoid C197A, circuit SDC02 (RD). Momentarily connect the other end of the jumper to starter motor C197B, circuit CDC25 (BN/GN).
- **Did the starter motor engage and the engine crank?**

YES : Go to A7.

NO : INSTALL a new starter motor. REFER to **STARTER MOTOR**. TEST the system for normal operation.

A7 CHECK STARTER MOTOR RELAY POWER

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

- Disconnect: Starter Motor Relay

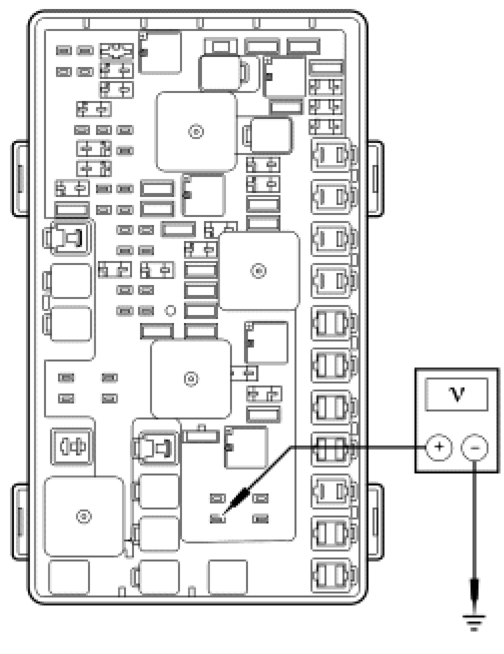

Fig. 5: Measuring Voltage Between BJB Starter Relay Pin 30, Circuit SDC02 (RD) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between battery junction box (BJB) starter motor relay pin 30, harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to A8.

NO : REPAIR or REPLACE the BJB. TEST the system for normal operation.

A8 CHECK THE STARTER MOTOR RELAY

- Carry out the Starter Motor Relay Component Test. Refer to COMPONENT TESTING.
- **Did the starter motor relay pass the component test?**

YES : Go to A9.

NO : INSTALL a new starter motor relay. TEST the system for normal operation.

A9 CHECK THE CIRCUIT TO THE STARTER MOTOR

- Key in OFF position.
- Disconnect: Starter Motor Solenoid C197B

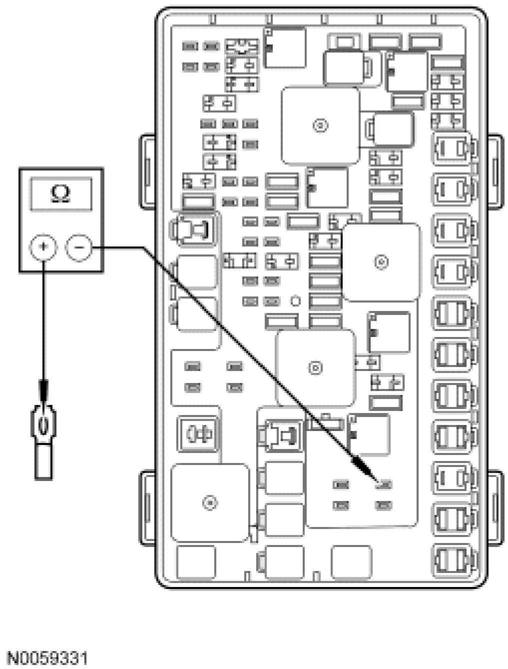

Fig. 6: Measuring Resistance Between BJB Starter Relay Pin 87, Circuit CDC25 (BN/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between starter motor solenoid S-terminal C197B, circuit CDC25 (BN/GN), harness side and the BJB starter motor relay pin 87, circuit CDC25 (BN/GN), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to A10.

NO : REPAIR circuit CDC25 (BN/GN). TEST the system for normal operation.

A10 CHECK CIRCUIT CDC35 (BU/WH) FOR VOLTAGE

- Connect: Starter Motor Solenoid C197B
- Connect: Starter Motor Relay
- Disconnect: Starter Diode

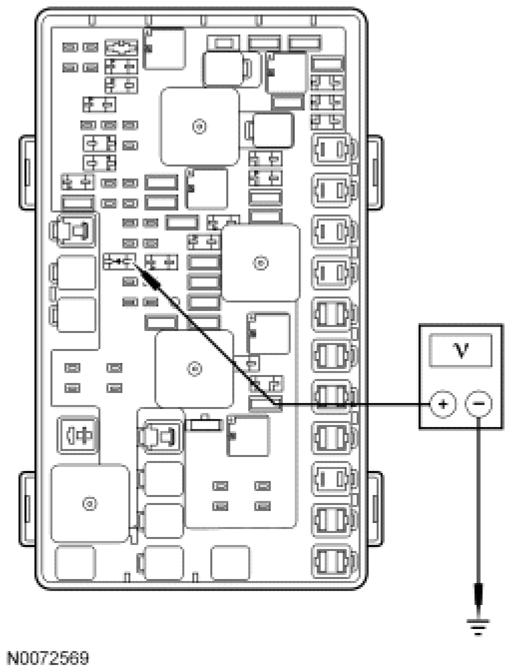

Fig. 7: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between BJB starter diode cell, circuit CDC35 (BU/WH) and ground with the ignition switch in the START position.
- **Is the voltage greater than 10 volts?**

  YES : Go to A13.

  NO : Go to A11.

A11 CHECK CIRCUIT SBP27 (BU/RD) FOR VOLTAGE

- Disconnect: Ignition Switch C250

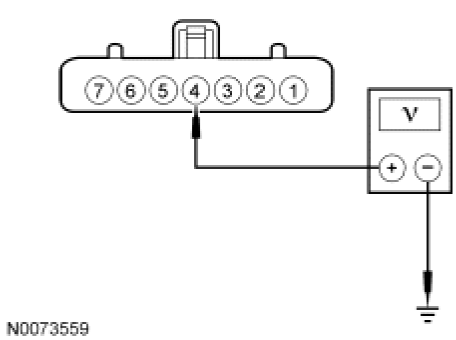

Fig. 8: Measuring Voltage Between Ignition Switch C250--4 And SBP27 (BU/RD)
Courtesy of FORD MOTOR CO.

- Measure the voltage between ignition switch C250-4, circuit SBP27 (BU/RD), harness side and

ground.

- **Is the voltage greater than 10 volts?**

  YES : Go to A12.

  NO : REPAIR circuit SBP27 (BU/RD). TEST the system for normal operation.

A12 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch Component Test. Refer to COMPONENT TESTING.
- **Did the ignition switch pass the component test?**

  YES : REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.

  NO : INSTALL a new ignition switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

A13 CHECK THE STARTER DIODE

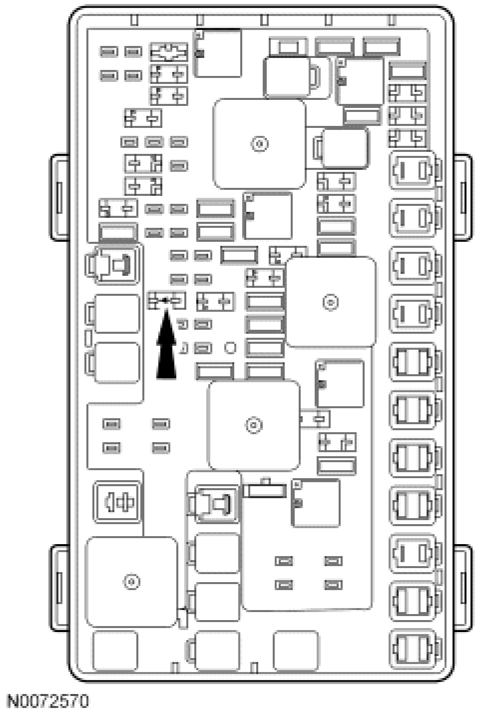

Fig. 9: Identifying Starter Diode
Courtesy of FORD MOTOR CO.

- Carry out a Starter Diode Test.
- **Is the starter diode open or shorted?**

  YES : INSTALL a new starter diode. TEST the system for normal operation.

  NO : Go to A14.

A14 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID STRT_RLY with the ignition switch in the START position.

- **Does the PID change from DISABLED to ENABLED?**

  YES : Go to A17.

  NO : Go to A15.

A15 CHECK CIRCUIT CDC35 (BU/WH) BETWEEN THE BJB AND THE PCM

- Key in OFF position.
- Disconnect: Starter Relay
- Disconnect: PCM C175B
- Disconnect: Smart Junction Box (SJB) C2280B

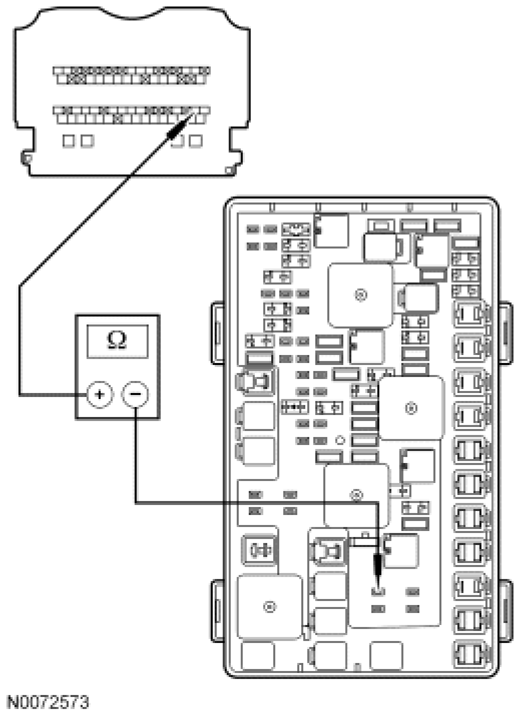

Fig. 10: Measuring Resistance Between BJB Starter Motor Relay Pin 85 And PCM C175b-35 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the BJB starter motor relay pin 85, circuit CDC35 (BU/WH), harness side and PCM C175b-35, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A16.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

A16 CHECK CIRCUIT CDC35 (BU/WH) BETWEEN THE BJB AND THE SJB

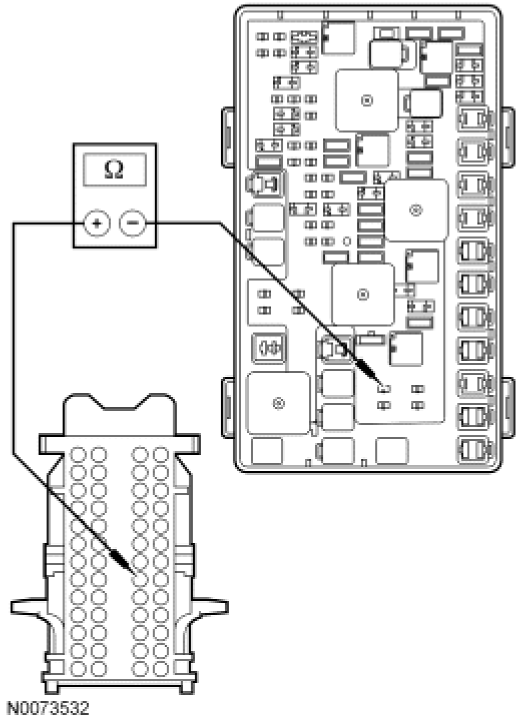

Fig. 11: Measuring Resistance Between BJB Starter Motor Relay Pin 85 And SJB C2280B-32 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the BJB starter motor relay pin 85, circuit CDC35 (BU/WH), harness side and SJB C2280B-32, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.

A17 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID SMC_MON with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : REPAIR circuit CDC12 (YE). TEST the system for normal operation.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

Pinpoint Test B: One-Touch Integrated Start (OTIS) Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAM article for Starting System schematic and connector information.

Normal Operation

When the ignition switch is turned in the START position and released, the PCM receives a starter motor request (SMR) signal through circuit CDC35 (BU/WH). With the vehicle in PARK or NEUTRAL, power flows from the PCM to the starter motor relay through circuit CDC35 (BU/WH). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter motor relay coil to energize and the relay contacts close. This allows power from starter motor relay through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and closes the solenoid contacts allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on engine running (rpm threshold), a set crank time has been exceeded or the ignition switch has been turned to the OFF position.

This pinpoint test is intended to diagnose the following:

- Circuitry
- PCM

PINPOINT TEST B: ONE-TOUCH INTEGRATED START (OTIS) DOES NOT OPERATE CORRECTLY

B1 CHECK THE STATUS OF ONE-TOUCH INTEGRATED START (OTIS) (OTS_STAT) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID OTS_STAT with the ignition switch in the RUN position.
- **Is the OTIS PID enabled?**

  YES : Go to B2.

  NO : ENABLE OTIS. TEST the system for normal operation. If OTIS will not enable, INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

B2 CHECK THE KEY POSITION FOR START INDICATED (START_KEY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID START_KEY with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : Go to B4.

  NO : Go to B3.

B3 CHECK CIRCUIT CDC35 (BU/WH)

- Disconnect: Start Diode
- Disconnect: PCM C175B

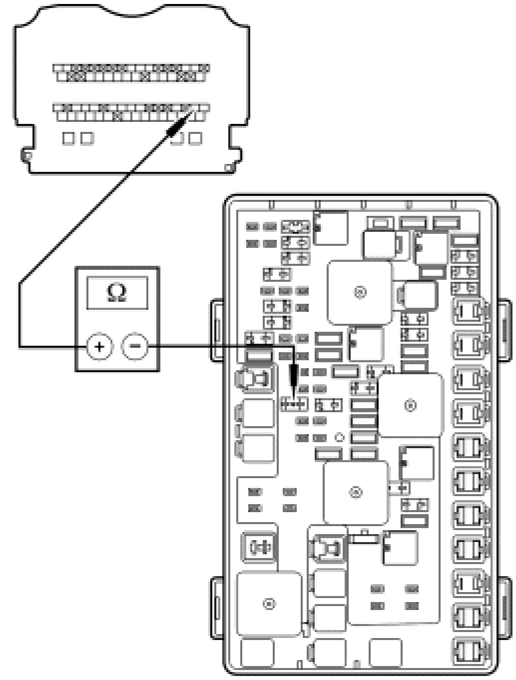

Fig. 12: Measuring Resistance Between Start Diode Cell Circuit CDC35 And PCM C175B-35 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the start diode cell, circuit CDC35 (BU/WH), harness side and PCM C175B-35, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

B4 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID STRT_RLY with the ignition switch in the START position.
- **Does the PID change from DISABLED to ENABLED?**

  YES : Go to B6.

  NO : Go to B5.

B5 CHECK CIRCUIT CDC35 (BU/WH) BETWEEN THE BJB AND THE PCM

- Key in OFF position.
- Disconnect: PCM C175B
- Disconnect: SJB C2280B

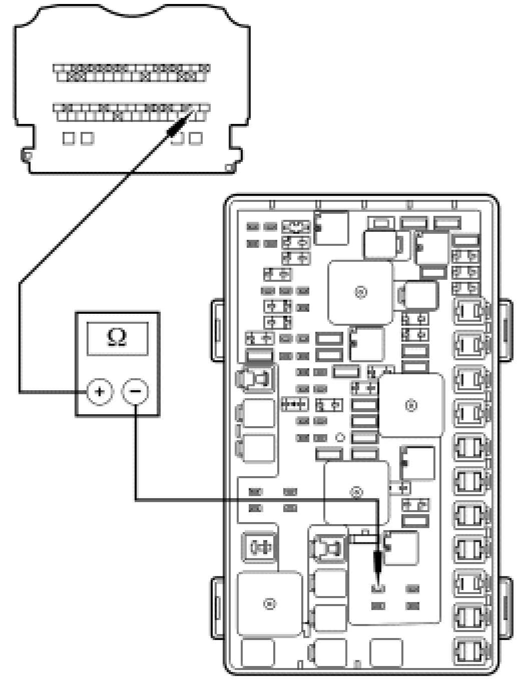

Fig. 13: Measuring Resistance Between BJB Starter Motor Relay Pin 85 And PCM C175b-35 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the BJB starter motor relay pin 85, circuit CDC35 (BU/WH), harness side and PCM C175b-35, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

B6 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID SMC_MON with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : REPAIR circuit CDC12 (YE). TEST the system for normal operation.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

Pinpoint Test C: Unusual Starter Noise

This pinpoint test is intended to diagnose the following:

- Starter motor
- Ring gear

PINPOINT TEST C: UNUSUAL STARTER NOISE

C1 CHECK THE STARTER MOUNTING

- Inspect the starter mounting bolts for looseness.
- **Is the starter motor mounted correctly?**

  YES : Go to C2.

  NO : INSTALL the starter motor correctly. REFER to **STARTER MOTOR**. TEST the system for normal operation.

C2 CHECK FOR ENGINE NOISE

- Key in OFF position.

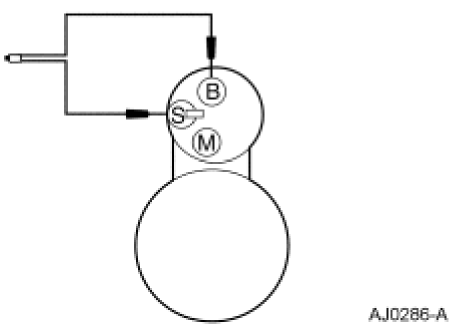

Fig. 14: Inspecting Starter Motor
Courtesy of FORD MOTOR CO.

- Connect a remote starter switch between the starter solenoid B- and S-terminals.
- Engage the starter motor and verify the noise is due to the starter operation.
- **Is the noise due to the starter motor engagement?**

  YES : Go to C3.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article to continue diagnosis.

C3 CHECK FOR UNUSUAL WEAR

- Remove the starter motor.
- Inspect the ring gear for damaged or worn teeth. Refer to **ENGINE - 3.5L** article.
- **Is the noise due to ring gear tooth damage?**

  YES : INSTALL a new flexplate ring gear. REFER to **ENGINE - 3.5L** article. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. REFER to **Starter Motor**. TEST the system for normal operation.

  NO : INSTALL a new starter motor. REFER to **STARTER MOTOR**. TEST the system for normal operation.

Component Tests

WARNING: Always disconnect the battery ground cable at the battery before

disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

Always make the 73III Automotive Meter connections at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor - Motor Feed Circuit

1. Make sure the battery is fully charged; carry out a battery load test. Refer to **BATTERY, MOUNTING AND CABLES** article.
2. Disconnect the inertia fuel shutoff (IFS) switch.
3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.
4. Connect the 73III Automotive Meter positive lead to the battery positive (+) post. Connect the negative lead to the starter solenoid M-terminal.

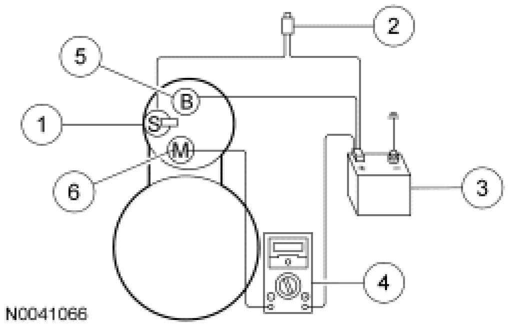

Fig. 15: Identifying S, M & B Terminals, 73III Automotive Meter, Battery, Remote Starter Switch & Motor Feed Circuit
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	S-terminal
2	-	Remote starter switch
3	10653	Battery
4	-	73III Automotive Meter
5	-	B-terminal
6	-	M-terminal

5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.
6. If the voltage reading is 0.5 volt or less, go to the starter motor-ground circuit component test.

7. If the voltage reading is greater than 0.5 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the 73III Automotive Meter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.5 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.

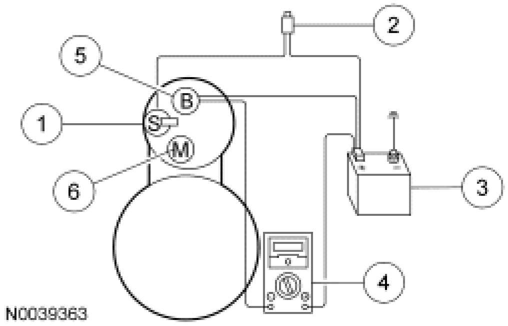

Fig. 16: Identifying S, M & B Terminals, 73III Automotive Meter, Battery & Remote Starter Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	S-terminal
2	-	Remote starter switch
3	10653	Battery
4	-	73III Automotive Meter
5	-	B-terminal
6	-	M-terminal

8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.5 volt when checked at the M-terminal or less than 0.5 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.
9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself.
10. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable.

Starter Motor - Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the 73III Automotive Meter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.2 volt or less.
3. If the voltage drop is more than 0.2 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connection. Retest.
4. If the voltage drop is greater than 0.2 volt, install a new cable. If the voltage reading is less than 0.2 volt and the engine still cranks slowly, install a new starter motor.

REMOVAL AND INSTALLATION

STARTER MOTOR

REMOVAL AND INSTALLATION

WARNING: **Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.**

1. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Remove the air cleaner. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.
3. Disconnect the transmission shift cable and adjustment lock from the transmission manual control lever.
4. Disconnect the transmission shift cable rotating slide snap and position aside the transmission cable.
5. Remove the nut and the transmission manual control lever.
    - To install, tighten to 18 N.m (13 lb-ft).
6. Remove the starter motor terminal cover.
7. Remove the starter motor solenoid battery cable nut.
    - To install, tighten to 12 N.m (9 lb-ft).
8. Remove the starter motor solenoid wire nut.
    - To install, tighten to 5 N.m (44 lb-in).
9. Detach the wiring harness retainer from the starter motor stud bolt and position the wiring harness aside.
10. Remove the starter motor bolt, stud bolt and the starter.
    - To install, tighten to 27 N.m (20 lb-ft).
11. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

STARTING SYSTEM

The starting system consists of the following:

- Starter motor
- Starter motor relay
- Transmission range (TR) sensor
- Battery
- Ignition switch
- PCM
- Start diode

When the starter solenoid is energized, a magnetic field is created in the starter solenoid windings. The iron plunger core is drawn into the starter solenoid coil, and a drive lever and pin connected to the starter drive engages the drive pinion gear to the flexplate ring gear. When the plunger is pulled all the way in, its contact disc closes the circuit between the battery and the motor feed terminals. This sends current to the motor, and the drive pinion gear cranks the flexplate to start the engine. When current flows to the starter motor, the starter solenoid pull-in coil is bypassed, and the hold-in coil keeps the drive pinion gear engaged with the flexplate.

An overrunning clutch in the starter drive protects the starter motor from excessive speeds during the brief period before the driver releases the ignition switch from the START position as the engine starts.

The starting system uses a TR sensor located in the transmission. The TR sensor prevents operation of the starter motor unless NEUTRAL or PARK is selected. The vehicle has one-touch integrated start (OTIS), a computer-assisted cranking system. This feature assists in starting the engine. If the ignition key is turned to the START position and released when the engine begins cranking, the engine may continue cranking for up to 10 seconds or until the vehicle starts.

One-Touch Integrated Start (OTIS)

Once the ignition is turned to the START position and the vehicle is in NEUTRAL or PARK, the PCM reads starter motor request (SMR) from the ignition switch and gains control of the starter engagement. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on the following events:

- The engine is started (RPM threshold)
- A set time has been exceeded (calibrated)
- The ignition key has been turned to the OFF position

DIAGNOSTIC TESTS

STARTING SYSTEM

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
 ST2311-A	73III Automotive Meter	105-R0057 or equivalent
 ST2312-A	Flex Probe Kit	105-R025C or equivalent
 ST1214-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	-

Principles of Operation

The starting system is electronically controlled by the passive anti-theft system (PATS). PATS is controlled by the instrument cluster. PATS recognizes the correct electronically coded ignition key and the instrument cluster sends a message to the PCM to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid with the key in the START position, thereby allowing the starter motor to activate.

Inspection and Verification

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: The anti-theft system must be functioning correctly before a logical starting system diagnosis can be carried out. Address anti-theft system concerns before continuing.

1. Verify the customer concern by operating the starting system to duplicate the conditions.
2. Inspect to determine if any of the following mechanical or electrical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Starter motor • Starter motor bolts • Flexplate	• Battery • Open fuse • Battery junction box (BJB) fuse 41 (30A) • Smart junction box (SJB) fuse 27 (20A) • Damaged wiring harness • Starter relay • Anti-theft system • Loose or corroded connections

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.

- check the scan tool connection to the VCM.
- refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
9. If the DTCs retrieved are related to the concern, go to PCM DTC Chart or the Passive Anti-Theft System (PATS) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **SYMPTOM CHART**.

PCM DTC CHART

DTC	Description	Source	Action
P0512	Starter Request Circuit - Circuit has Power With the Ignition in the OFF Position	PCM	CARRY OUT the Ignition Switch Component Test. Refer to COMPONENT TESTING. If necessary, INSTALL a new ignition switch. If the ignition switch passed the component test, REPAIR circuit CDC35 (BU/WH) for a short to power.
P0705	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.
P0706	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.
P0708	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.
P0709	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.

PASSIVE ANTI-THEFT SYSTEM (PATS) DTC CHART

DTC	Description	Source	Action
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

B1342	ECU is Defective	Instrument Cluster/PCM	INSTALL a PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article.
B1600	Passive Anti-Theft System (PATS) Key Transponder Signal is Not Received	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B1681	PATS Transceiver Module Signal is Not Received	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2103	Antenna Not Connected	Instrument Cluster/PCM	REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2141	NVM Configuration Failure	Instrument Cluster/PCM	There is no PCM ID stored in the instrument cluster. CARRY OUT a parameter reset of the instrument cluster and PCM, then CYCLE the ignition and make an attempt to start the vehicle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
B2431	Transponder Programming Failed	Instrument Cluster/PCM	VERIFY if the correct PATS key is being used. If the PATS key is defective, use a new key for programming. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
U0100	Lost Communication	Instrument Cluster/PCM	REFER to **ANTI-THEFT**

	With ECM/PCM		**- PASSIVE ANTI-THEFT SYSTEM (PATS)** article.
U2510	Antenna Not Connected	Instrument Cluster/PCM	If DTC U2511 is not present also, CARRY OUT a parameter reset of the instrument cluster and the PCM and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle. REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
• The engine does not crank	• Battery • Fuse(s) • Starter motor • Circuitry • PCM • Starter motor relay • Ignition switch • Start diode • Anti-theft system	• Go to **Pinpoint Test A** .
• One-touch integrated start (OTIS) does not operate correctly	• Circuitry • PCM	• Go to **Pinpoint Test A** .
• The engine cranks slowly	• Battery • Starter motor • Circuitry	• CARRY OUT the Starter Motor Component Test.
• Unusual starter noise	• Starter motor mounting • Starter motor • Incorrect starter drive engagement	• Go to **Pinpoint Test C** .
• The starter spins but the engine does not crank	• Starter motor	• INSPECT the starter motor mounting and engagement.

-	• Damaged flexplate teeth	REPAIR as necessary. • INSPECT the flexplate for damaged, missing or worn teeth. REPAIR as necessary.

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank

Refer to appropriate SYSTEM WIRING DIAGRAM article for Starting System schematic and connector information.

Normal Operation

Under normal operation, constant power is supplied to the starter motor relay from the battery junction box (BJB) fuse 41 (30A). When the ignition switch is turned in the START position and held, with the vehicle in PARK or NEUTRAL, power flows to the starter motor relay through CDC35 (BU/WH). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter motor relay coil to energize and the relay contacts close. This allows power to be supplied from the starter motor relay contacts which then flows through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and closes the solenoid contacts allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine.

This pinpoint test is intended to diagnose the following:

- Battery
- Anti-theft system
- Starter relay
- Ignition switch
- Circuitry
- PCM
- Start diode

PINPOINT TEST A: THE ENGINE DOES NOT CRANK

A1 CHECK THE BATTERY

- Check the battery condition and charge. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to A2.

  NO : CHARGE or INSTALL a new battery as necessary. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A2 CHECK FOR PASSIVE ANTI-THEFT SYSTEM (PATS) DTCs

NOTE: Passive anti-theft system (PATS) DTCs are the only DTCs of concern in this step. Only repair retrieved non-PATS DTCs if a customer concern is reported.

- Check for PATS DTCs.
- **Were any PATS DTCs retrieved?**

  YES : REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article to diagnose the PATS DTCs.

  NO : Go to A3.

A3 CHECK THE BATTERY GROUND CABLE

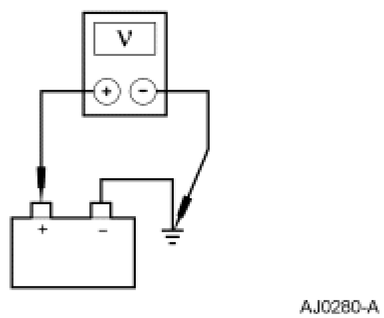

Fig. 1: Checking Battery Ground Cable
Courtesy of FORD MOTOR CO.

- Measure the voltage between the positive battery post and the battery ground cable connection at the engine.
- **Is the voltage greater than 10 volts?**

  YES : Go to A4.

  NO : INSTALL a new battery ground cable. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A4 CHECK THE STARTER MOTOR GROUND

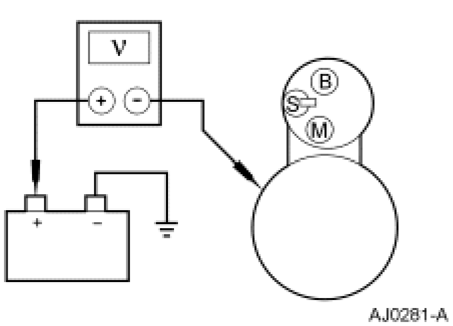

Fig. 2: Checking Starter Motor Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between the positive battery post and the starter motor case.
- **Is the voltage greater than 10 volts?**

  YES : Go to A5.

  NO : CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.

A5 CHECK THE POWER SUPPLY TO THE STARTER MOTOR

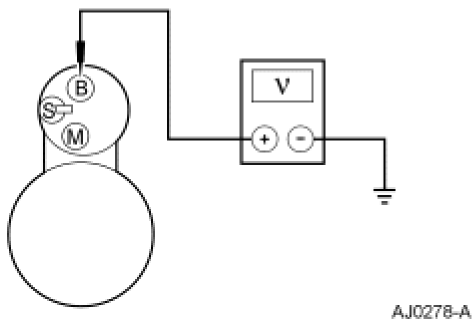

Fig. 3: Checking Power Supply To Starter Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between starter motor C197A, circuit SDC02 (RD) and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A6.

  NO : INSTALL a new positive battery cable. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A6 CHECK THE STARTER MOTOR B-PIN

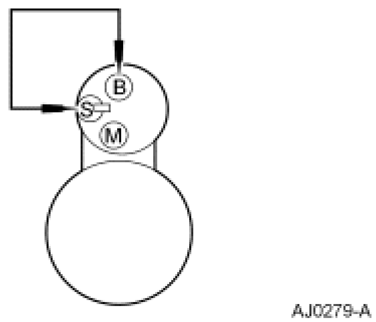

Fig. 4: Checking Starter Motor
Courtesy of FORD MOTOR CO.

- Connect one end of a fused (30A) jumper wire to starter motor solenoid C197A, circuit SDC02 (RD). Momentarily connect the other end of the jumper to starter motor C197B, circuit CDC25 (BN/GN).
- **Did the starter motor engage and the engine crank?**

YES : Go to A7.

NO : INSTALL a new starter motor. REFER to **STARTER MOTOR**. TEST the system for normal operation.

A7 CHECK STARTER MOTOR RELAY POWER

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

- Disconnect: Starter Motor Relay

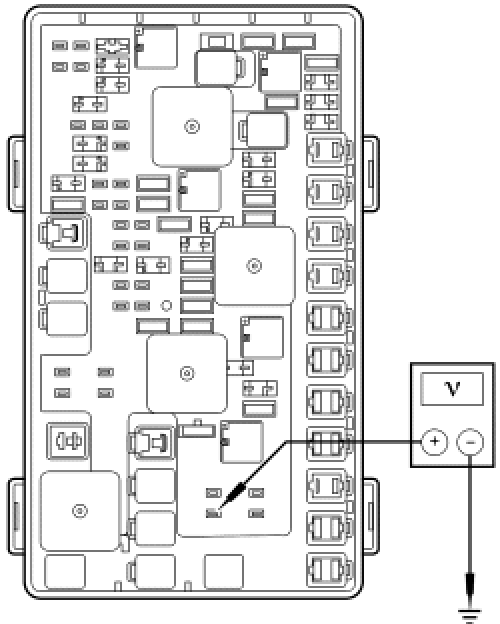

Fig. 5: Measuring Voltage Between BJB Starter Relay Pin 30, Circuit SDC02 (RD) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between battery junction box (BJB) starter motor relay pin 30, harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to A8.

NO : REPAIR or REPLACE the BJB. TEST the system for normal operation.

A8 CHECK THE STARTER MOTOR RELAY

- Carry out the Starter Motor Relay Component Test. Refer to COMPONENT TESTING.
- **Did the starter motor relay pass the component test?**

YES : Go to A9.

NO : INSTALL a new starter motor relay. TEST the system for normal operation.

A9 CHECK THE CIRCUIT TO THE STARTER MOTOR

- Key in OFF position.
- Disconnect: Starter Motor Solenoid C197B

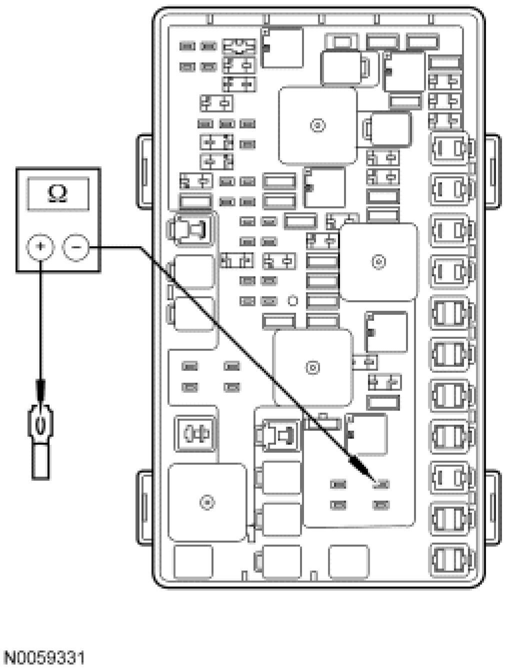

Fig. 6: Measuring Resistance Between BJB Starter Relay Pin 87, Circuit CDC25 (BN/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between starter motor solenoid S-terminal C197B, circuit CDC25 (BN/GN), harness side and the BJB starter motor relay pin 87, circuit CDC25 (BN/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A10.

  NO : REPAIR circuit CDC25 (BN/GN). TEST the system for normal operation.

A10 CHECK CIRCUIT CDC35 (BU/WH) FOR VOLTAGE

- Connect: Starter Motor Solenoid C197B
- Connect: Starter Motor Relay
- Disconnect: Starter Diode

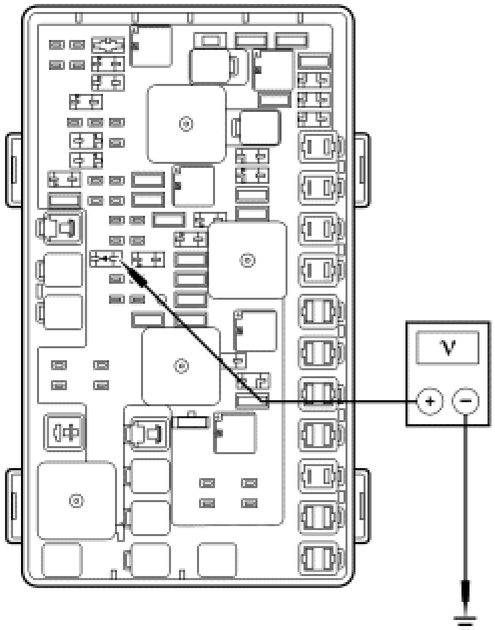

Fig. 7: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between BJB starter diode cell, circuit CDC35 (BU/WH) and ground with the ignition switch in the START position.
- **Is the voltage greater than 10 volts?**

  YES : Go to A13.

  NO : Go to A11.

A11 CHECK CIRCUIT SBP27 (BU/RD) FOR VOLTAGE

- Disconnect: Ignition Switch C250

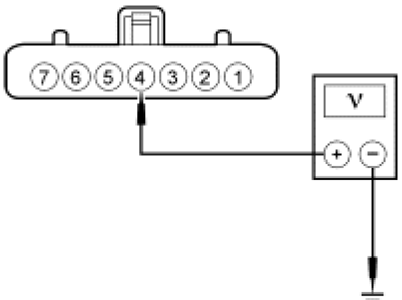

Fig. 8: Measuring Voltage Between Ignition Switch C250--4 And SBP27 (BU/RD)
Courtesy of FORD MOTOR CO.

- Measure the voltage between ignition switch C250-4, circuit SBP27 (BU/RD), harness side and

ground.

- **Is the voltage greater than 10 volts?**

  YES : Go to A12.

  NO : REPAIR circuit SBP27 (BU/RD). TEST the system for normal operation.

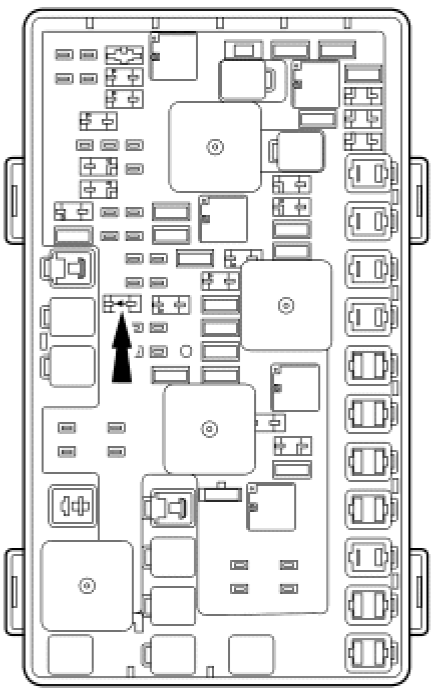
A12 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch Component Test. Refer to COMPONENT TESTING.
- **Did the ignition switch pass the component test?**

  YES : REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.

  NO : INSTALL a new ignition switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

A13 CHECK THE STARTER DIODE



N0072570

Fig. 9: Identifying Starter Diode
Courtesy of FORD MOTOR CO.

- Carry out a Starter Diode Test.
- **Is the starter diode open or shorted?**

  YES : INSTALL a new starter diode. TEST the system for normal operation.

  NO : Go to A14.

A14 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID STRT_RLY with the ignition switch in the START position.

- **Does the PID change from DISABLED to ENABLED?**

  YES : Go to A17.

  NO : Go to A15.

A15 CHECK CIRCUIT CDC35 (BU/WH) BETWEEN THE BJB AND THE PCM

- Key in OFF position.
- Disconnect: Starter Relay
- Disconnect: PCM C175B
- Disconnect: Smart Junction Box (SJB) C2280B

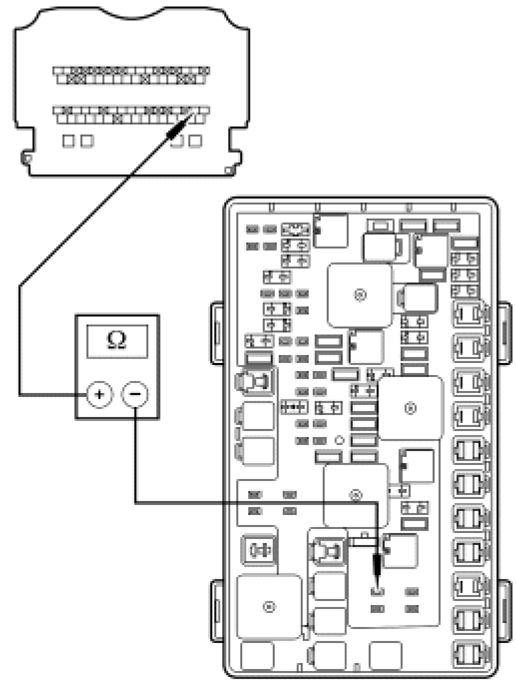


Fig. 10: Measuring Resistance Between BJB Starter Motor Relay Pin 85 And PCM C175b-35 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the BJB starter motor relay pin 85, circuit CDC35 (BU/WH), harness side and PCM C175b-35, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A16.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

A16 CHECK CIRCUIT CDC35 (BU/WH) BETWEEN THE BJB AND THE SJB

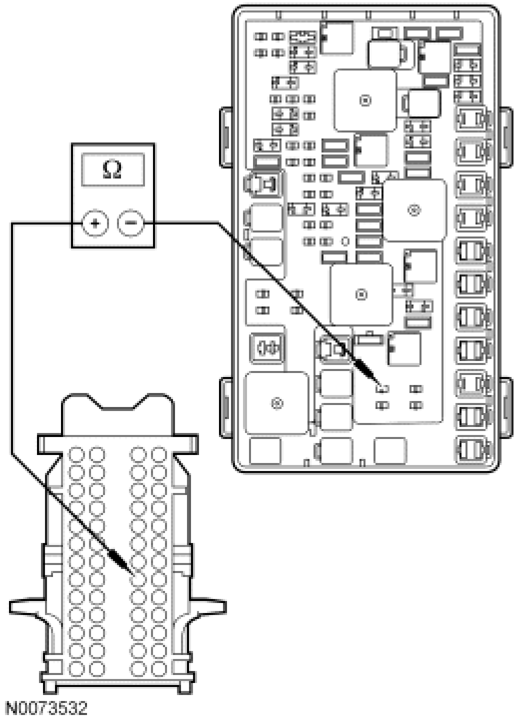

Fig. 11: Measuring Resistance Between BJB Starter Motor Relay Pin 85 And SJB C2280B-32 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the BJB starter motor relay pin 85, circuit CDC35 (BU/WH), harness side and SJB C2280B-32, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.

A17 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID SMC_MON with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : REPAIR circuit CDC12 (YE). TEST the system for normal operation.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

Pinpoint Test B: One-Touch Integrated Start (OTIS) Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAM article for Starting System schematic and connector information.

Normal Operation

When the ignition switch is turned in the START position and released, the PCM receives a starter motor request (SMR) signal through circuit CDC35 (BU/WH). With the vehicle in PARK or NEUTRAL, power flows from the PCM to the starter motor relay through circuit CDC35 (BU/WH). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter motor relay coil to energize and the relay contacts close. This allows power from starter motor relay through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and closes the solenoid contacts allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on engine running (rpm threshold), a set crank time has been exceeded or the ignition switch has been turned to the OFF position.

This pinpoint test is intended to diagnose the following:

- Circuitry
- PCM

PINPOINT TEST B: ONE-TOUCH INTEGRATED START (OTIS) DOES NOT OPERATE CORRECTLY

B1 CHECK THE STATUS OF ONE-TOUCH INTEGRATED START (OTIS) (OTS_STAT) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID OTS_STAT with the ignition switch in the RUN position.
- **Is the OTIS PID enabled?**

  YES : Go to B2.

  NO : ENABLE OTIS. TEST the system for normal operation. If OTIS will not enable, INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

B2 CHECK THE KEY POSITION FOR START INDICATED (START_KEY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID START_KEY with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : Go to B4.

  NO : Go to B3.

B3 CHECK CIRCUIT CDC35 (BU/WH)

- Disconnect: Start Diode
- Disconnect: PCM C175B

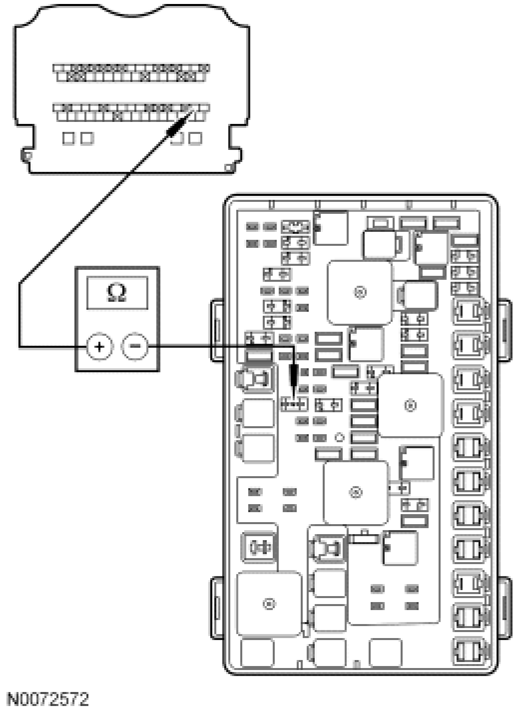

Fig. 12: Measuring Resistance Between Start Diode Cell Circuit CDC35 And PCM C175B-35 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the start diode cell, circuit CDC35 (BU/WH), harness side and PCM C175B-35, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

B4 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID STRT_RLY with the ignition switch in the START position.
- **Does the PID change from DISABLED to ENABLED?**

  YES : Go to B6.

  NO : Go to B5.

B5 CHECK CIRCUIT CDC35 (BU/WH) BETWEEN THE BJB AND THE PCM

- Key in OFF position.
- Disconnect: PCM C175B
- Disconnect: SJB C2280B

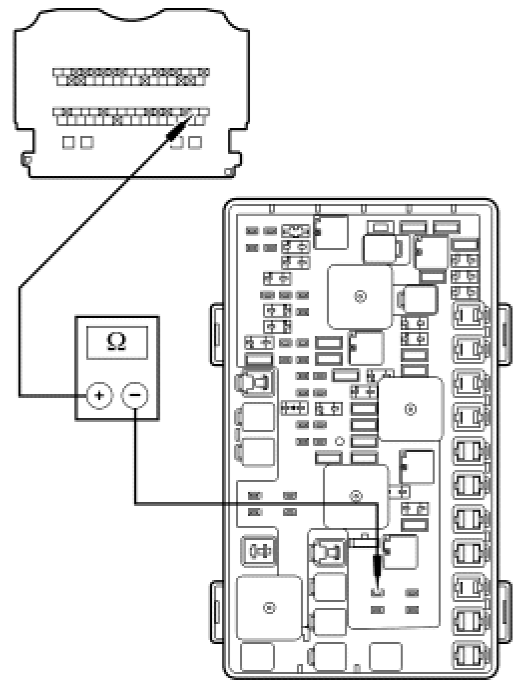

Fig. 13: Measuring Resistance Between BJB Starter Motor Relay Pin 85 And PCM C175b-35 Circuit CDC35
Courtesy of FORD MOTOR CO.

- Measure the resistance between the BJB starter motor relay pin 85, circuit CDC35 (BU/WH), harness side and PCM C175b-35, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

B6 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID SMC_MON with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : REPAIR circuit CDC12 (YE). TEST the system for normal operation.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS** article. TEST the system for normal operation.

Pinpoint Test C: Unusual Starter Noise

This pinpoint test is intended to diagnose the following:

- Starter motor
- Ring gear

PINPOINT TEST C: UNUSUAL STARTER NOISE

C1 CHECK THE STARTER MOUNTING

- Inspect the starter mounting bolts for looseness.
- **Is the starter motor mounted correctly?**

  YES : Go to C2.

  NO : INSTALL the starter motor correctly. REFER to **STARTER MOTOR**. TEST the system for normal operation.

C2 CHECK FOR ENGINE NOISE

- Key in OFF position.

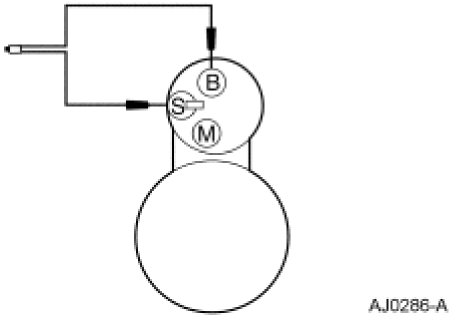

Fig. 14: Inspecting Starter Motor
Courtesy of FORD MOTOR CO.

- Connect a remote starter switch between the starter solenoid B- and S-terminals.
- Engage the starter motor and verify the noise is due to the starter operation.
- **Is the noise due to the starter motor engagement?**

  YES : Go to C3.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article to continue diagnosis.

C3 CHECK FOR UNUSUAL WEAR

- Remove the starter motor.
- Inspect the ring gear for damaged or worn teeth. Refer to **ENGINE - 3.5L** article.
- **Is the noise due to ring gear tooth damage?**

  YES : INSTALL a new flexplate ring gear. REFER to **ENGINE - 3.5L** article. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. REFER to **Starter Motor**. TEST the system for normal operation.

  NO : INSTALL a new starter motor. REFER to **STARTER MOTOR**. TEST the system for normal operation.

Component Tests

WARNING: **Always disconnect the battery ground cable at the battery before**

disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

Always make the 73III Automotive Meter connections at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor - Motor Feed Circuit

1. Make sure the battery is fully charged; carry out a battery load test. Refer to **BATTERY, MOUNTING AND CABLES** article.
2. Disconnect the inertia fuel shutoff (IFS) switch.
3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.
4. Connect the 73III Automotive Meter positive lead to the battery positive (+) post. Connect the negative lead to the starter solenoid M-terminal.

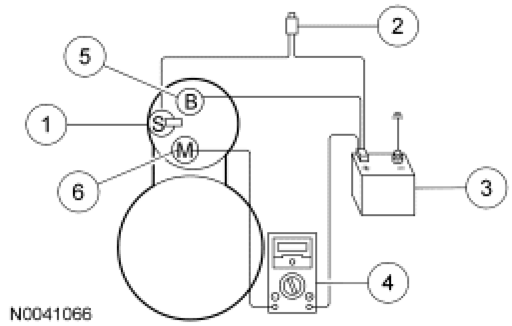

Fig. 15: Identifying S, M & B Terminals, 73III Automotive Meter, Battery, Remote Starter Switch & Motor Feed Circuit
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	S-terminal
2	-	Remote starter switch
3	10653	Battery
4	-	73III Automotive Meter
5	-	B-terminal
6	-	M-terminal

5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.
6. If the voltage reading is 0.5 volt or less, go to the starter motor-ground circuit component test.

7. If the voltage reading is greater than 0.5 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the 73III Automotive Meter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.5 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.

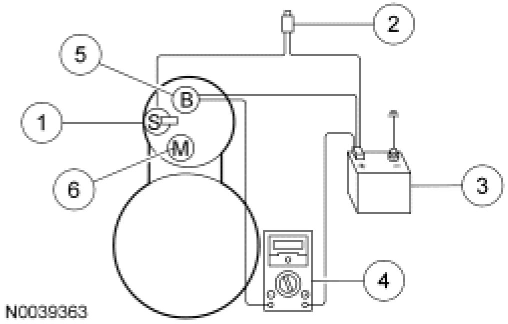

Fig. 16: Identifying S, M & B Terminals, 73III Automotive Meter, Battery & Remote Starter Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	S-terminal
2	-	Remote starter switch
3	10653	Battery
4	-	73III Automotive Meter
5	-	B-terminal
6	-	M-terminal

8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.5 volt when checked at the M-terminal or less than 0.5 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.
9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself.
10. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable.

Starter Motor - Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the 73III Automotive Meter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.2 volt or less.
3. If the voltage drop is more than 0.2 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connection. Retest.
4. If the voltage drop is greater than 0.2 volt, install a new cable. If the voltage reading is less than 0.2 volt and the engine still cranks slowly, install a new starter motor.

REMOVAL AND INSTALLATION

STARTER MOTOR

8	N805320	Starter motor solenoid wire nut
9	14463	Starter motor solenoid wire (part of 14B060)
10	13A506	Wire harness retainer (part of 14B060)
11	W711515	Starter motor stud bolt
12	W503320	Starter motor bolt
13	11000	Starter motor

REMOVAL AND INSTALLATION

WARNING: **Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.**

1. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Remove the air cleaner. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING** article.
3. Disconnect the transmission shift cable and adjustment lock from the transmission manual control lever.
4. Disconnect the transmission shift cable rotating slide snap and position aside the transmission cable.
5. Remove the nut and the transmission manual control lever.
   - To install, tighten to 18 N.m (13 lb-ft).
6. Remove the starter motor terminal cover.
7. Remove the starter motor solenoid battery cable nut.
   - To install, tighten to 12 N.m (9 lb-ft).
8. Remove the starter motor solenoid wire nut.
   - To install, tighten to 5 N.m (44 lb-in).
9. Detach the wiring harness retainer from the starter motor stud bolt and position the wiring harness aside.
10. Remove the starter motor bolt, stud bolt and the starter.
    - To install, tighten to 27 N.m (20 lb-ft).
11. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Steering Column Switches - Edge & MKX

DESCRIPTION AND OPERATION

STEERING COLUMN SWITCHES

The steering column switches consist of the following:

- Multifunction switch
- Ignition switch

The steering column switches receive driver inputs and send signals to various components. The multifunction switch controls the windshield wipers, hazard flasher, turn signal, headlamp low/high beam and headlamp dimmer/flash-to-pass. The ignition switch is used in conjunction with the lock cylinder key to start the vehicle. When the lock cylinder key is switched to different positions, it moves linkages which enable the ignition switch to send battery voltage to various components.

DIAGNOSTIC TESTS

STEERING COLUMN SWITCHES

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2574-A	Flex Probe Kit	105-R025B or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

Ignition Switch - The ignition switch is controlled by the ignition lock cylinder with a key. When the ignition cylinder is turned using the key, a mechanical connection positions the ignition switch to the selected position and allows the ignition switch to send voltage to specific components. The ignition switch is contained in the steering column lock module, if a new ignition switch needs to be installed, then a new lock module must be installed.

Multi-function Switch - The multi-function switch (flash-to-pass, high beam, turn signal, windshield wiper/washer and rear wiper/washer) controls the various components electrically. The multi-function switch is hard-wired to the SJB and controls a ground signal for the high beam, flash-to-pass and turn signal functions. The multi-function switch is also hard-wired to the smart wiper module and the rear wiper module, and controls a ground signal for the various wiper and washer functions.

For headlamp and turn signal concerns, refer to **EXTERIOR LIGHTING** article. For wiper and washer concerns, refer to **WIPERS AND WASHERS** article.

Inspection and Verification

1. Verify the customer concern by operating the multi-function switch or ignition switch.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Multi-function switch • Ignition switch • Steering column shrouds	• Smart junction box (SJB) fuse(s): ○ 27 (20A) ○ 28 (5A) ○ 43 (10A) ○ 45 (5A) • Wiring, terminals or connectors • Instrument cluster • Passive anti-theft system (PATS) module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to Smart Junction Box (SJB) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Source	Action
B2A20	Ignition stuck in START	Smart junction box (SJB)	Go to **Pinpoint Test E** .
B2844	Ignition fault	SJB	Go to **Pinpoint Test F** .
U2472	Unexpected Ignition State	SJB	Go to **Pinpoint Test F** .
-	All Other SJB DTCs	SJB	REFER to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No power in all ignition switch positions	• Fuse • Wiring, terminals or connectors • Ignition switch	• Go to **Pinpoint Test A** .

	• Smart junction box (SJB)	
• No power in ACC	• Fuse(s) • Wiring, terminals or connectors • Ignition switch • SJB	• Go to **Pinpoint Test B** .
• No power in RUN	• Fuse(s) • Wiring, terminals or connectors • Run/start relay • Ignition switch • SJB	• Go to **Pinpoint Test C** .
• No power in START	• Fuse • Wiring, terminals or connectors • Starter motor relay • Ignition switch • SJB	• Go to **Pinpoint Test D** .
• The ignition key is hard to turn	• Key • Ignition lock cylinder • Ignition switch rod • Ignition switch	• Go to the Ignition Switch - Mechanical Component Test in this service information.
• The multi-function switch does not operate correctly	• Multi-function switch	• Go to the Multi-function Switch - Electrical Component Test in this service information.

Pinpoint Tests

Pinpoint Test A: No Power in All Ignition Switch Positions

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch receives fused battery voltage along circuit SBP27 (BU/RD) from smart junction box (SJB) fuse 27 (20A). The ignition switch then sends that voltage out to various systems depending on ignition switch position. The ignition switch has 4 possible states:

- OFF - No power on any circuits

- ACC - Power on circuit CDC33 (VT/GN)
- RUN - Power on circuit CDC34 (WH/OG)
- START - Power on circuit CDC35 (BU/WH)

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST A: NO POWER IN ALL IGNITION SWITCH POSITIONS

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

NOTE: Verify that battery voltage is 10 volts or greater.

A1 CHECK FOR VOLTAGE AT SJB FUSE 27 (20A)

- Key in OFF position.
- Disconnect: SJB Fuse 27 (20A)
- Measure the voltage between SJB fuse 27 (20A), input side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A2.

  NO : Go to A3.

A2 CHECK FOR VOLTAGE ON CIRCUIT SBP27 (BU/RD)

- Connect: SJB Fuse 27 (20A)
- Disconnect: Ignition Switch C250

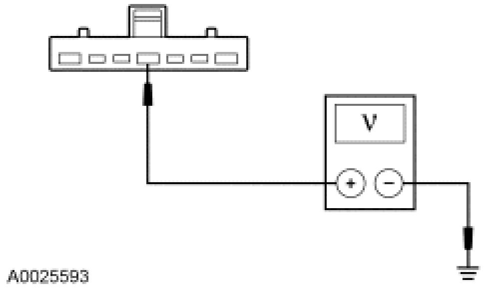

Fig. 1: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ignition switch C250-4, circuit SBP27 (BU/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new ignition switch. REFER to **Ignition Switch**. TEST the system for normal operation.

  NO : VERIFY SJB fuse 27 (20A) is OK. If OK, REPAIR circuit SBP27 (BU/RD). TEST the system for normal operation.

A3 CHECK FOR CORRECT SJB OPERATION

- Disconnect: SJB C2280a
- Disconnect: SJB C2280b
- Check the SJB connectors for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: SJB C2280a
- Connect: SJB C2280b
- Make sure the connectors seat correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: No Power in ACC

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in the ACC position, fused ignition voltage is sent to the smart junction box (SJB) along circuit CDC33 (VT/GN).

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST B: NO POWER IN ACC

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

NOTE: Verify that battery voltage is 10 volts or greater.

B1 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch - Electrical Component Test in this service information.
- **Is the ignition switch OK?**

  YES : Go to B2.

  NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. TEST the system for normal operation.

B2 CHECK CIRCUIT CDC33 (VT/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a
- Disconnect: Ignition Switch C250

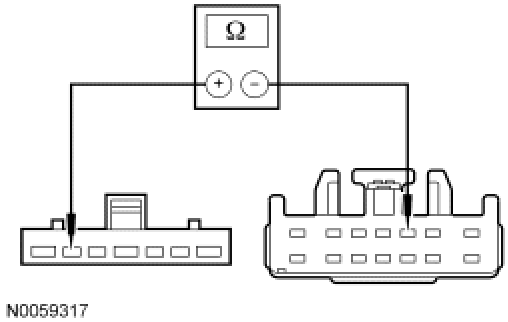

Fig. 2: Measuring Resistance Between Ignition Switch C250-6, Circuit CDC33 (VT/GN) & SJB C2280a-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between ignition switch C250-6, circuit CDC33 (VT/GN), harness side and SJB C2280a-3, circuit CDC33 (VT/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B3.

  NO : VERIFY SJB fuses 43 (10A) and 45 (5A) are OK. If OK, REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation.

B3 CHECK CIRCUIT CDC33 (VT/GN) FOR A SHORT TO GROUND

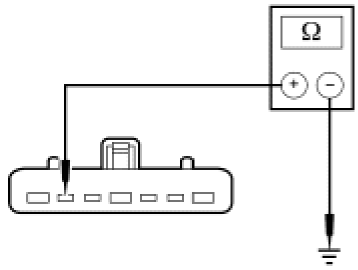

Fig. 3: Measuring Resistance Between Ignition Switch C250-6, Circuit CDC33 (VT/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ignition switch C250-6, circuit CDC33 (VT/GN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B4.

  NO : REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation.

B4 CHECK FOR CORRECT SJB OPERATION

- Check SJB C2208a for:
  - corrosion.
  - pushed-out pins.
  - spread terminal.
- Connect: SJB C2280a
- Make sure the connector is seated correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test C: No Power in RUN

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in the RUN position, fused ignition voltage is sent to:

- the smart junction box (SJB) along circuit CDC34 (WH/OG).
- pin 85 of the run/start relay in the battery junction box (BJB) along circuit CDC34 (WH/OG).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Run/start relay
- Ignition switch
- SJB
- BJB

PINPOINT TEST C: NO POWER IN RUN

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

NOTE: Verify that battery voltage is 10 volts or greater.

C1 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch - Electrical Component Test in this service information.
- **Is the ignition switch OK?**

YES : Go to C2.

NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. TEST the system for normal operation.

C2 CHECK FOR VOLTAGE AT THE SJB

- Key in OFF position.
- Disconnect: SJB C2280b
- Key in ON position.

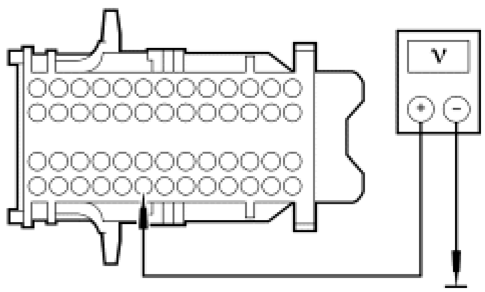

Fig. 4: Measuring Voltage Between SJB C2280B-45, Circuit CDC34 (WH/OG), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280b-45, circuit CDC34 (WH/OG), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to C3.

NO : REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.

C3 CHECK FOR IGNITION VOLTAGE AT THE RUN/START RELAY

- Key in OFF position.
- Connect: SJB C2280b
- Disconnect: Run/Start Relay
- Key in ON position.

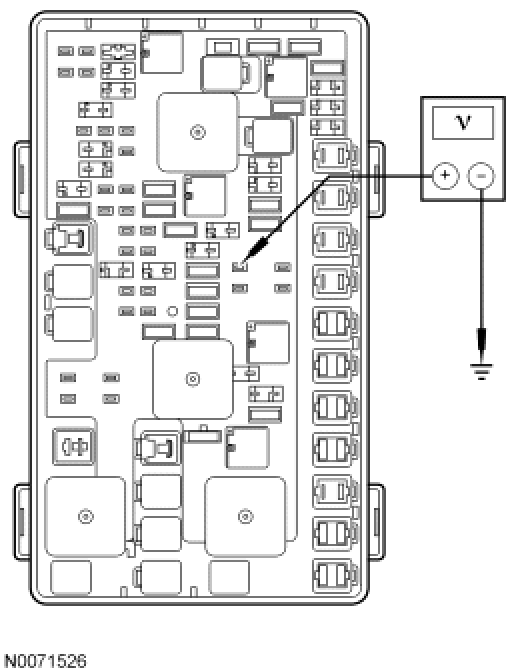

Fig. 5: Measuring Voltage Between Run/Start Relay Cavity 85, Circuit CDC34 (WH/OG) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between run/start relay cavity 85, circuit CDC34 (WH/OG), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to C4.

NO : REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.

C4 CHECK THE RUN/START RELAY

- Carry out the Mini ISO Relay Component Test. Refer to appropriate COMPONENT TESTING article.
- **Is the relay OK?**

YES : Go to C5.

NO : INSTALL a new relay. TEST the system for normal operation.

C5 CHECK FOR BATTERY VOLTAGE AT THE RUN/START RELAY

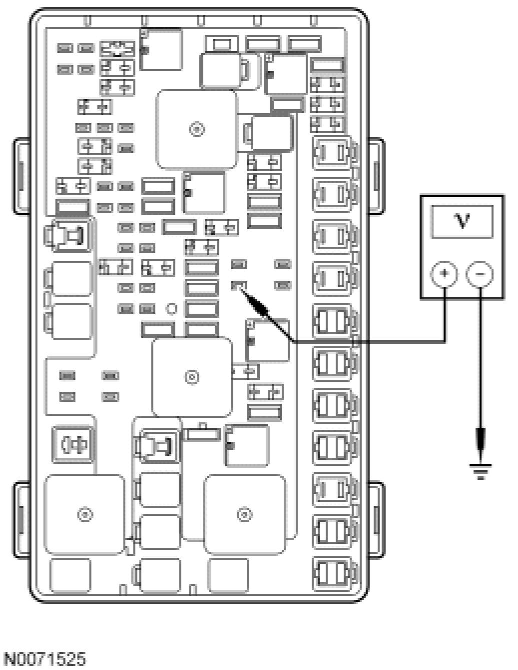

Fig. 6: Measuring Voltage Between Run/Start Relay Cavity 30, Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between run/start relay cavity 30, harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C6.

  NO : VERIFY battery voltage is 10 volts or greater. If OK, REPAIR or INSTALL a new BJB. TEST the system for normal operation.

C6 CHECK FOR CORRECT SJB OPERATION

- Disconnect: SJB C2280b
- Check the connector for:
  - corrosion.
  - pushed-out pins.
  - spread terminal.
- Connect: SJB C2280b
- Make sure the connector is seated correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. TEST the system for normal operation.

NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test D: No Power in START

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in the START position, fused ignition voltage is sent to the smart junction box (SJB) along circuit CDC35 (BU/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST D: NO POWER IN START

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

NOTE: Verify that battery voltage is 10 volts or greater.

D1 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch - Electrical Component Test in this service information.
- **Is the ignition switch OK?**

YES : Go to D2.

NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. TEST the system for normal operation.

D2 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: Ignition Switch C250
- Disconnect: SJB C2280b

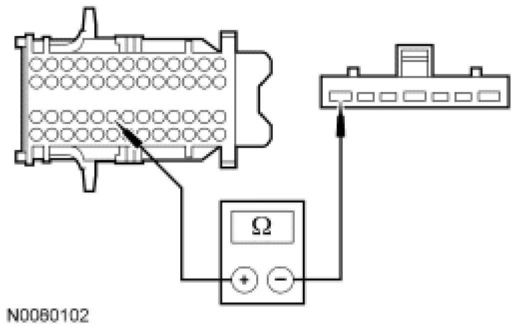

Fig. 7: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between ignition switch C250-7, circuit CDC35 (BU/WH), harness side and SJB C2280b-32, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to D3.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

D3 CHECK THE SJB START CIRCUIT FOR AN OPEN

- Disconnect: SJB C2280e
- Measure the resistance between SJB C2280b pin-32, component side and SJB C2280e pin-8, component side.
- **Is the resistance less than 5 ohms?**

  YES : Go to D4.

  NO : Go to D5.

D4 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN

- Disconnect: Starter Relay

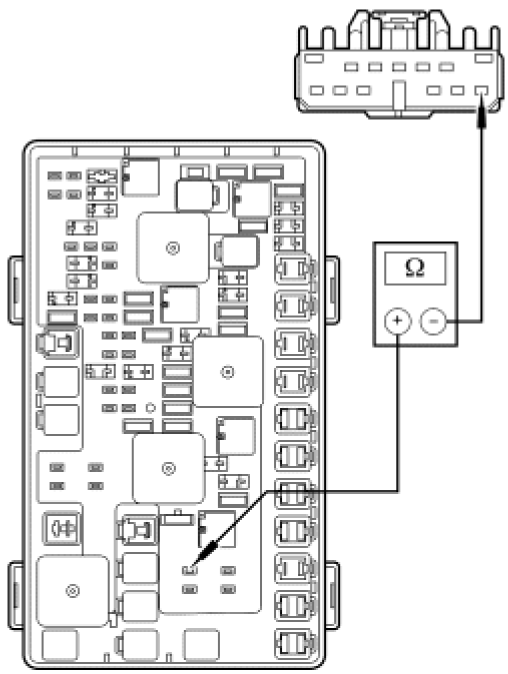

Fig. 8: Measuring Resistance Between SJB C2280E-8, Circuit CDC35 (BU/WH) & Starter Relay Cavity 85
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280e-8, circuit CDC35 (BU/WH), harness side and starter relay cavity 85, harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

  NO : REFER to **STARTING SYSTEM** article to diagnose the starting system.

D5 CHECK FOR CORRECT SJB OPERATION

- Check SJB connector C2280b and C2280e for:
  - corrosion.
  - pushed-out pins.
  - spread terminal.
- Connect: SJB C2280b
- Connect: SJB C2280e
- Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test E: B2A20 - Ignition Stuck in START

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in the START position, fused ignition voltage is sent to smart junction box (SJB) along circuit CDC35 (BU/WH). The ignition switch is spring-loaded to automatically return to the RUN position after being placed in the START position.

- B2A20 Ignition Stuck in START - The SJB continuously monitors the ignition switch state, if the SJB receives a START signal for more than 30 seconds, DTC B2A20 will be set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Starter relay
- Ignition switch
- SJB
- PCM

PINPOINT TEST E: B2A20 - IGNITION STUCK IN START

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

NOTE: Verify that battery voltage is 10 volts or greater.

E1 CHECK THE IGNITION SWITCH MECHANICAL FUNCTION

- Inspect the ignition switch for mechanical function. Refer to the Ignition Switch - Mechanical Component Test in this service information.
- **Is the ignition switch OK?**

  YES : Go to E2.

  NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. TEST the system for normal operation.

E2 CHECK THE IGNITION SWITCH FOR A SHORT

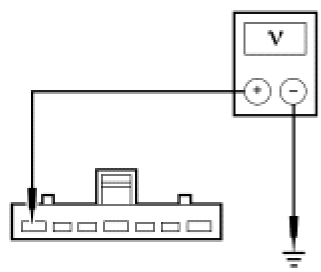
- Carry out the Ignition Switch - Electrical Component Test in this service information.
- **Is the ignition switch OK?**

  YES : Go to E3.

  NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. CLEAR the DTCs. REPEAT the self-test.

E3 CHECK CIRCUIT CDC35 (BU/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Ignition Switch C250
- Disconnect: SJB C2280b



N0059323

<u>Fig. 9: Measuring Voltage Between Ignition Switch C250-7, Circuit CDC35 (BU/WH), Harness Side & Ground</u>
Courtesy of FORD MOTOR CO.

- Measure the voltage between ignition switch C250-7, circuit CDC35 (BU/WH), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CDC35 (BU/WH). CLEAR the DTCs. REPEAT the self-test.

  NO : Go to E4.

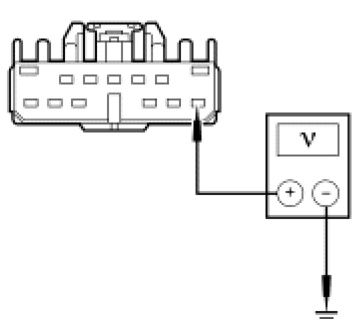
E4 CHECK THE SJB FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280e
- Measure the voltage between SJB C2280b-32, circuit CDC35 (BU/WH), component side and ground.
- **Is any voltage present?**

  YES : Go to E8.

  NO : Go to E5.

E5 CHECK CIRCUIT CDC35 (BU/WH) FOR A SHORT TO VOLTAGE



N0059324

<u>Fig. 10: Measuring Voltage Between SJB C2280E-8, Circuit CDC35 (BU/WH), Harness Side</u>

& Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280e-8, circuit CDC35 (BU/WH), harness side and ground.
- **Is any voltage present?**

  YES : Go to E6.

  NO : Go to E8.

E6 ISOLATE THE STARTER RELAY

- Disconnect: Starter Relay

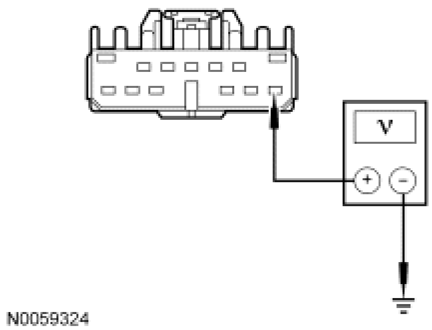


Fig. 11: Measuring Voltage Between SJB C2280E-8, Circuit CDC35 (BU/WH), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280e-8, circuit CDC35 (BU/WH), harness side and ground.
- **Is any voltage present?**

  YES : Go to E7.

  NO : INSTALL a new starter relay. CLEAR the DTCs. REPEAT the self-test.

E7 ISOLATE THE PCM

- Disconnect: PCM C175b

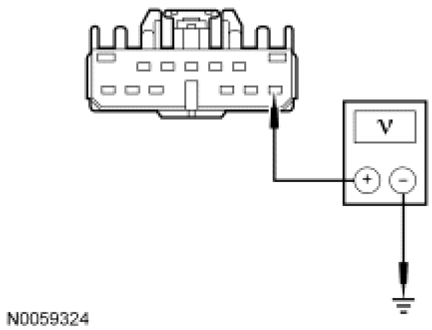

Fig. 12: Measuring Voltage Between SJB C2280E-8, Circuit CDC35 (BU/WH), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280e-8, circuit CDC35 (BU/WH), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CDC35 (BU/WH). CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new PCM. Refer to **ELECTRONIC ENGINE CONTROLS** article for the procedure. CLEAR the DTCs. REPEAT the self-test.

E8 CHECK FOR CORRECT SJB OPERATION

- Check SJB connectors C2280b and C2280e for:
  - corrosion.
  - pushed-out pins.
  - spread terminal.
- Connect: SJB C2280b
- Connect: SJB C2280e
- Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB, REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test F: DTCs B2844 and U2472 - Ignition Fault and Unexpected Ignition State

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch receives fused battery voltage along circuit SBP27 (BU/RD) from smart junction box (SJB) fuse 27 (20A). The ignition switch then sends that voltage out to various systems depending on ignition switch position. The SJB continuously monitors the ignition switch state.

- DTC B2844 Ignition Fault - If the SJB receives an invalid ignition state or cannot receive the ignition switch state during normal operation, DTC B2844 is set.
- DTC U2472 Unexpected Ignition State - If the SJB does not receive the ignition RUN signal, or any ignition switch signal, while performing an on-demand self test, DTC U2472 is set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST F: DTCs B2844 AND U2472 - IGNITION FAULT AND UNEXPECTED IGNITION STATE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

NOTE: Verify that battery voltage is 10 volts or greater.

F1 RETRIEVE THE DTCs

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test SJB
- Carry out the on-demand self test for the SJB. Retrieve and record any DTCs.
- **Is DTC U2472 present?**

  YES : Go to F2.

  NO : For DTC B2844, go to F5.

  For DTC B2A20, go to **Pinpoint Test E** .

  For all other SJB DTCs, REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

F2 CHECK THE IGNITION SWITCH

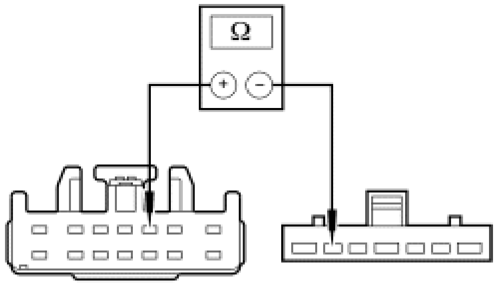
- Key in OFF position.
- Carry out the Ignition Switch - Electrical Component Test in this service information.
- **Is the ignition switch OK?**

  YES : Go to F3.

  NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. CLEAR the DTC. REPEAT the self-test.

F3 CHECK CIRCUIT CDC33 (VT/GN) FOR AN OPEN

- Disconnect: Ignition Switch C250
- Disconnect: SJB C2280a



N0059325

Fig. 13: Measuring Resistance Between Ignition Switch C250-6, Circuit CDC33 (VT/GN) & SJB C2280A-3
Courtesy of FORD MOTOR CO.

- Measure the resistance between ignition switch C250-6, circuit CDC33 (VT/GN), harness side and SJB C2280a-3, circuit CDC33 (VT/GN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuit CDC33 (VT/GN). CLEAR the DTC. REPEAT the self-test.

  NO : Go to F4.

F4 CHECK CIRCUIT CDC34 (WH/OG) FOR AN OPEN

- Disconnect: SJB C2280b

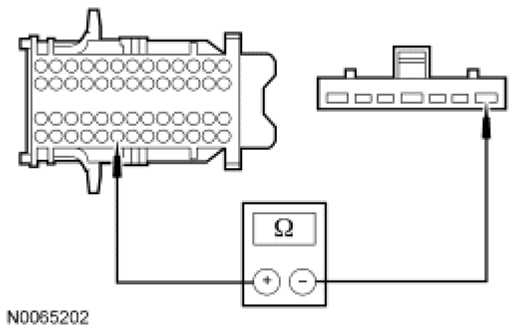


Fig. 14: Measuring Resistance Between Ignition Switch C250-1, Circuit CDC34 (WH/OG) & SJB C2280B-45
Courtesy of FORD MOTOR CO.

- Measure the resistance between ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280b-45, circuit CDC34 (WH/OG), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuit CDC34 (WH/OG). CLEAR the DTC. REPEAT the self-test.

  NO : Go to F7.

F5 CHECK THE IGNITION CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Ignition Switch C250
- Disconnect: SJB C2280a
- Disconnect: SJB C2280b
- Disconnect: Run/Start Relay
- Measure the voltage between ground and:
  - SJB C2280a-3, circuit CDC33 (VT/GN), harness side.
  - SJB C2280b-32, circuit CDC35 (BU/WH), harness side.
  - SJB C2280b-45, circuit CDC34 (WH/OG), harness side.
  - run/start relay cavity 85, circuit CDC34 (WH/OG), harness side.

- **Is any voltage present?**

  YES : REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test.

  NO : Go to F6.

F6 CHECK THE IGNITION CIRCUITS FOR AN OPEN

- Measure the resistance between:
  - ignition switch C250-6, circuit CDC33 (VT/GN), harness side and SJB C2280a-3, circuit CDC33 (VT/GN), harness side.
  - ignition switch C250-7, circuit CDC35 (BU/WH), harness side and SJB C2280b-32, circuit CDC35 (BU/WH), harness side.
  - ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280b-45, circuit CDC34 (WH/OG), harness side.
  - ignition switch C250-1, circuit CDC34 (WH/OG), harness side and run/start relay cavity 1, circuit CDC34 (WH/OG), harness side.
- **Are any of the resistances greater than 10,000 ohms?**

  YES : REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test.

  NO : Go to F7.

F7 CHECK FOR CORRECT SJB OPERATION

- Check SJB connectors C2280a and C2280b for:
  - corrosion.
  - pushed-out pins.
  - spread terminal.
- Connect: SJB C2280a
- Connect: SJB C2280b
- Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTC. REPEAT the self-test.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Component Tests

Ignition Switch - Mechanical

The following conditions can cause difficulty in operating the ignition switch and lock cylinder:

- Burrs on the lock cylinder key
- Insufficient lube on the lock cylinder
- Binding lock cylinder

- Burrs or foreign material around the rack-and-pinion actuator in the lock cylinder housing
- Insufficient lube on the actuator (do not apply lubricant to the inside of the ignition switch)
- Binding ignition switch

If the steering wheel lock is engaged with the wheels loaded against a curb, high effort will be necessary to turn the key from lock. Turn the steering wheel to either side of the lock to unload the system.

Carry out the following test to determine if the ignition switch and lock cylinder are operating correctly.

1. Inspect the ignition key for any burrs, damage or incorrect cut. Have a new ignition key made as necessary.

   NOTE: The steering wheel may be locked full left or full right. If the steering wheel is locked, it will be necessary to apply turning effort to the steering wheel in the direction of the lock while turning the key.

2. Turn the key to the ACC position and then the RUN position.
   - If the ignition key turns to the ACC and RUN position, continue with Step 3.
   - If the ignition key will not turn to the ACC and RUN position, continue with Step 4.

   NOTE: The ignition switch and lock cylinder should return from the START position back to the RUN position without assistance.

3. Turn the ignition key to the START position and release the key.
   - If the ignition switch and lock cylinder return from the START position back to the RUN position without assistance, the ignition switch is operating correctly at this time.
   - If the ignition switch and lock cylinder do not return from the START position back to the RUN position without assistance, continue with Step 4.
4. Remove the ignition lock cylinder. Refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
5. Rotate the ignition lock cylinder through all of the switch positions.
   - If the lock cylinder operates correctly, continue with Step 6.
   - If the lock cylinder does not operate correctly, install a new ignition lock cylinder. Refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
6. Check for binding or sticking ignition switch actuating rod, burrs around the rack-and-pinion actuator in the ignition lock cylinder housing or insufficient lubrication.
   - If there is sufficient lubrication and there are no burrs, binding or sticking conditions, install a new ignition switch. Refer to **Ignition Switch** in this service information.
   - If there is insufficient lubrication, burrs, binding or sticking conditions, repair or lubricate as necessary.

Ignition Switch - Electrical

Refer to appropriate COMPONENT TESTING article.

Multi-function Switch - Electrical

Refer to appropriate COMPONENT TESTING article.

REMOVAL AND INSTALLATION

IGNITION SWITCH

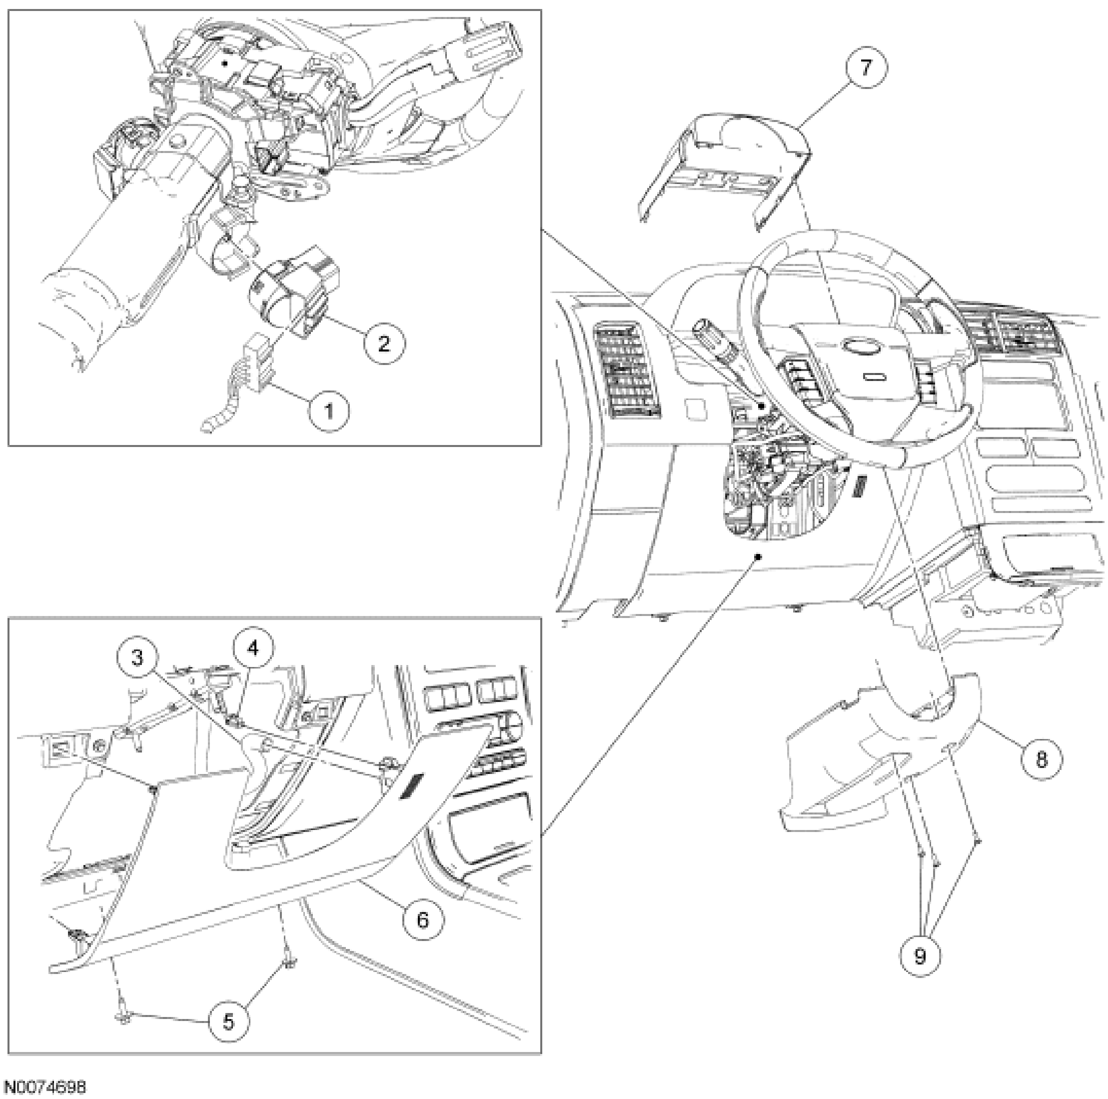

Fig. 15: Exploded View Of Ignition Switch Components
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
		Ignition switch electrical connector (part

1	-	of 14401)
2	11572	Ignition switch
3	-	In-vehicle temperature sensor hose (part of 19C734)
4	-	In-vehicle temperature sensor electrical connector (part of 14401)
5	W505002	Steering column opening cover bolts (2 required)
6	04459	Steering column opening cover
7	3530	Upper steering column shroud
8	3K512	Lower steering column shroud
9	W707658	Lower steering column shroud screws (3 required)

REMOVAL AND INSTALLATION

1. Depower the supplemental restraints system (SRS). For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NOTE: Release the upper steering column shroud by pressing inward on the sides and lifting upwards.

2. Remove the upper steering column shroud.
3. Release the tilt lever, remove the 3 lower steering column shroud screws and the shroud.

NOTE: The top of the steering column opening cover is held in by tabs that clip into the instrument panel.

4. Remove the 2 steering column opening cover screws.
   - Detach the steering column opening cover by pulling straight outward.
5. If equipped, disconnect the electrical connector and hose from the in-vehicle temperature sensor.
   - Remove the steering column opening cover.
6. Disconnect the ignition switch electrical connector.
7. Press the 2 locking tabs and remove the ignition switch.
8. To install, reverse the removal procedure.
9. Repower the SRS. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

STEERING COLUMN MULTIFUNCTION SWITCH

2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	-	Multi-function switch electrical connector (part of 14401)
5	W503521	Multi-function switch screws (2 required)
6	14K147	Multi-function switch

REMOVAL AND INSTALLATION

NOTE: Release the upper steering column shroud by pressing inward on the sides of the shroud and lifting upwards.

1. Remove the upper steering column shroud.
2. Release the tilt lever, remove the 3 lower steering column shroud screws and the shroud.
3. Disconnect the multi-function switch electrical connector.
4. Remove the 2 multi-function switch screws and remove the switch.
5. To install, reverse the removal procedure.

STEERING COLUMN LOCK MODULE

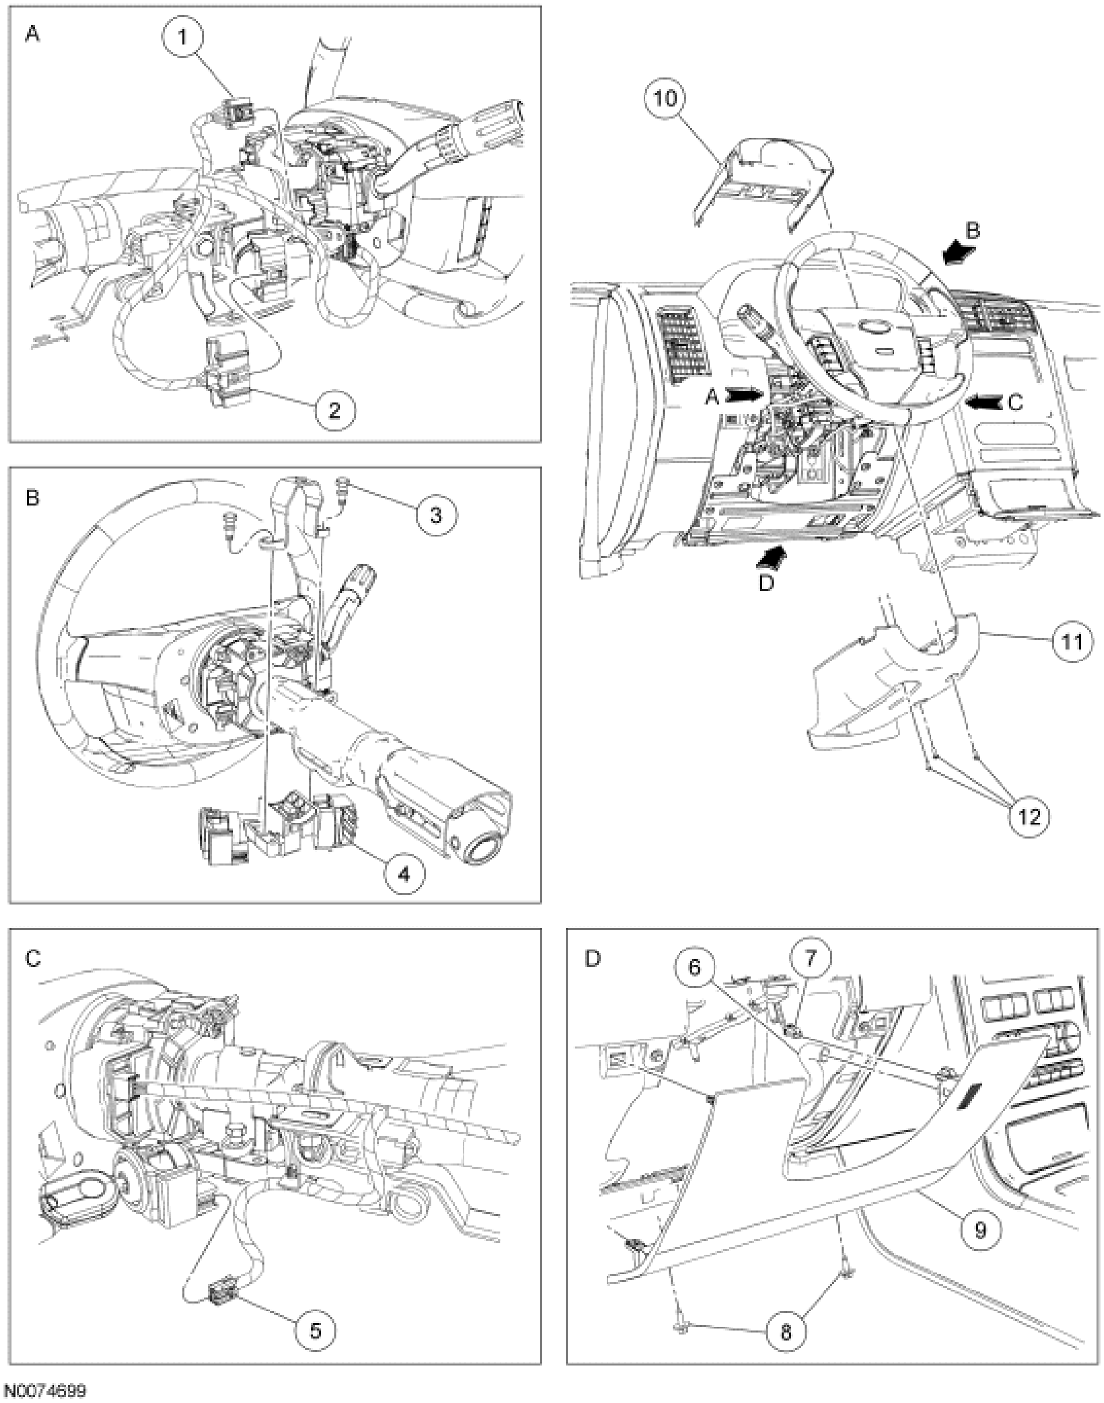

Fig. 17: Exploded View Of Steering Column Lock Module
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Multi-function switch electrical connector (part of 14401)
		Ignition switch electrical connector (part

2	-	of 14401)
3	12049	Steering column lock module bolt (2 required)
4	3511	Steering column lock module assembly
5	-	Passive anti-theft system (PATS) electrical connector (part of 14401)
6	-	In-vehicle temperature sensor hose (part of 19C734)
7	-	In-vehicle temperature sensor electrical connector (part of 14401)
8	W505002	Steering column opening cover bolts (2 required)
9	04459	Steering column opening cover
10	3530	Upper steering column shroud
11	3K512	Lower steering column shroud
12	W707658	Lower steering column shroud screws (3 required)

REMOVAL AND INSTALLATION

1. Depower the supplemental restraints system (SRS). For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NOTE: Release the upper steering column shroud by pressing inward on the sides of the shroud and lifting upwards.

2. Remove the upper steering column shroud.
3. Release the tilt lever, remove the 3 lower steering column shroud screws and remove the shroud.

NOTE: The top of the steering column opening cover is held in place by tabs that clip to the instrument panel.

4. Remove the 2 steering column opening cover screws.
    - Detach the steering column opening cover by pulling straight outward.
5. If equipped, disconnect the electrical connector and hose from the in-vehicle temperature sensor.
    - Remove the steering column opening cover.
6. Disconnect the multi-function switch electrical connector.
7. Disconnect the passive anti-theft system (PATS) and ignition switch electrical connectors.

NOTE: After cutting slots in the steering column lock module bolts, clean all metal shavings and foreign material from the steering column.

8. Using a suitable tool, cut slots into the heads of the 2 steering column lock module bolts.

NOTE: **The steering column lock module bolts are designed to sheer off when tightened.**

9. Remove the 2 steering column lock module bolts using a screwdriver.
   - Discard the bolts.
   - To install, tighten 2 new bolts until the bolt heads shear off.
10. Remove the steering column lock module assembly from the steering column.

NOTE: **Align the locating tab on the steering column lock module with the window of the steering column tube. Verify that the steering column lock module operates correctly.**

11. To install, reverse the removal procedure.
12. Repower the SRS. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

2008 STEERING

Steering Column - Edge & MKX

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Steering column shaft bolt	23	17
Steering column support bracket nuts	28	21
Steering wheel nut	35	26

DESCRIPTION AND OPERATION

STEERING COLUMN

The steering column consists of the following:

- Steering wheel
- Steering column
- Upper and lower steering column shafts
- Steering column switches

The steering column is the mechanical linkage between the steering wheel and the steering gear. The steering wheel is mounted to a shaft, which passes through the center of the steering column. The shaft is centered by bearings within the steering column. The steering column shaft then connects the steering column to the steering gear. The upper and lower steering column shaft connections utilize U-joint type couplings. The tilt function of the steering column is controlled by a mechanical lever on the underside of the steering column, which uses a cam to lock and unlock the steering column. When the tilt column lever is unlocked, the steering column can then be adjusted to various positions. The steering column switches (multi-function and ignition) are mounted to the steering column. These switches are covered by the upper and lower steering column shrouds.

For steering column switch service information, refer to **STEERING COLUMN SWITCHES** article.

DIAGNOSTIC TESTS

STEERING COLUMN

Refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

STEERING WHEEL

Item	Part Number	Description
1	3600/3F563	Steering wheel (urethane/leather)
2	-	Steering wheel switches electrical connector (part of 14672)
3	W711835	Steering wheel nut

REMOVAL AND INSTALLATION

1. Position the steering wheel in the straight-ahead position and turn the ignition switch to the OFF position.
   - Remove the key.
2. Remove the driver air bag module. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NOTE: Mark the steering wheel and column shaft for reference during installation.

3. Remove the steering wheel nut.
   - To install, tighten to 35 Nm (26 lb-ft).
4. Disconnect the steering wheel switches electrical connector.

CAUTION: Do not remove the steering wheel by hitting the shaft with a hammer. Damage to the column may occur.

5. Using a suitable puller, remove the steering wheel.

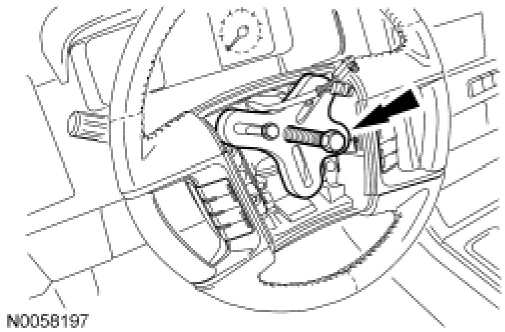

Fig. 2: Removing Steering Wheel Using A Suitable Puller
Courtesy of FORD MOTOR CO.

6. To install, reverse the removal procedure.
    - Align the steering wheel using the reference mark.

15	W712961	Steering column shaft bolt
16	N806423	Steering column support bracket nuts (4 required)
17	3C611B	Steering column dust seal
18	W704904	Lower steering column shaft joint cover nut (2 required)
19	3C611A	Lower steering column shaft joint cover

1. Turn the steering wheel to the straight-ahead position and turn the ignition switch to the OFF position.
    - Remove the key.
2. Depower the supplemental restraint system (SRS). For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NOTE: **Release the upper steering column shroud by pressing inward on the sides and lifting upwards.**

3. Remove the upper steering column shroud.
4. Release the tilt lever, remove the 3 lower steering column shroud screws and the shroud.

NOTE: **The top of the steering column opening cover is held in by tabs that clip into the instrument panel.**

5. Remove the 2 steering column opening cover screws.
    - Detach the steering column opening cover.
6. If equipped, disconnect the electrical connector and hose from the in-vehicle temperature sensor.
    - Remove the steering column opening cover.
7. Disconnect the multi-function switch, ignition switch and clockspring electrical connectors.
8. Disconnect the steering angle sensor electrical connector.
9. Disconnect the passive anti-theft system (PATS) electrical connector.
10. Detach the wiring harness retainer and position the wiring harness aside.
11. Remove the lower steering column shaft joint cover nuts and the cover.
12. Index-mark the steering column shaft position to the steering gear for reference during installation.

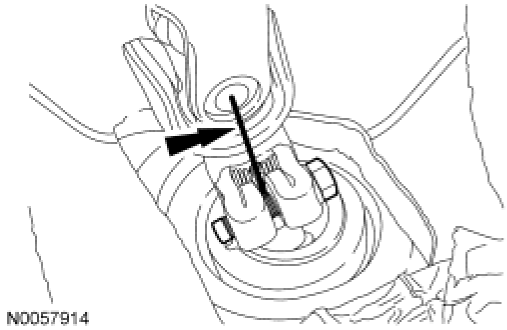

Fig. 5: Index-Marking Steering Column Shaft Position To Steering Gear
Courtesy of FORD MOTOR CO.

CAUTION: Do not allow the steering column to rotate while the steering column shaft is disconnected, or damage to the clockspring may result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

13. Remove the steering column shaft bolt and disconnect the shaft from the steering gear.
    - To install, tighten to 23 Nm (17 lb-ft).
14. Remove the 4 steering column support bracket nuts and the steering column.
    - To install, tighten to 28 Nm (21 lb-ft).
15. To install, reverse the removal procedure.
16. Repower the SRS. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

DESCRIPTION AND OPERATION

STEERING SYSTEM

The power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Steering gear
- Power steering lines
- Steering column
- Steering column shaft

The power steering system transfers driver inputs at the steering wheel to the front wheels of the vehicle. The steering column, hydraulic system and linkages that transfer these driver inputs make up the steering system. Gearing and hydraulic assist are used to significantly reduce steering efforts.

For information on the power steering fluid reservoir, power steering pump, power steering lines and steering gear, refer to **POWER STEERING** article.

For information on the steering wheel, steering column and steering column shaft, refer to **STEERING COLUMN** article.

Principles of Operation

Power Steering - The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is trapped between the pump vanes and moved to the high-pressure side of the pump, creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Fluid level • Tire pressure • Tires • Drive belt • Drive belt tensioner • Steering column alignment • Tie-rod ends

- Suspension components
- Steering column shaft U-joints
- Steering column shaft bolts
- Power steering reservoir baffle
- Power steering reservoir screen
- Pressure lines, fittings or O-rings
- Power steering return hoses and clamps
- Steering gear
- Power steering pump
- Power Steering Pressure (PSP) switch

3. Inspect the power steering fluid for the following conditions:
   - Aeration or foam: Purge the power steering system. Refer to **POWER STEERING SYSTEM PURGING**.
   - Overheating or contamination: Flush the power steering system. Refer to **POWER STEERING SYSTEM FLUSHING**.

NOTE: **It may be necessary to add power steering fluid to achieve the correct level.**

4. Check the fluid level and clean the power steering components.

   With the ignition OFF:

   - check the power steering fluid level and add fluid as necessary.
   - wipe off any visible signs of fluid or residue build up.

   NOTE: **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

   - Start the engine and turn the steering wheel from stop-to-stop several times.
5. Visually inspect the power steering hydraulic line/hose connections for leaks.
   - If a leak is detected at a threaded fitting or clamp plate joint, tighten to specification. If the leak is still evident, visually inspect the O-rings or Teflon® seals. Install new O-rings or Teflon® seals as necessary. Refer to **POWER STEERING** article.
   - If a leak is detected at a constant tension spring clamp, verify that the hose is not damaged and fully installed on the hose fitting. Make sure that the constant tension spring clamp is positioned 2 mm (0.078 in) from the end of the hose. If the leak remains, install a new constant tension spring clamp.
   - If a leak is detected at a screw clamp joint, verify that the hose is fully installed on the hose fitting and the clamp is positioned 2 mm (0.078 in) from the end of the hose before tightening the screw clamp. If the leak remains, install a new screw clamp. Refer to **POWER STEERING** article.

- If a leak is detected at the Power Steering Pressure (PSP) switch, install a new switch as necessary.

6. Visually inspect the power steering components for leaks.
    - If a leak is detected in the pressure line or return hose, install a new hose. Refer to **POWER STEERING** article.
    - If a leak is detected in the power steering pump, install a new power steering pump. Refer to **POWER STEERING** article.

    NOTE: On vehicles with rack-and-pinion steering gear, it may be necessary to remove the bellows boot clamp from the steering gear bellows boot to inspect for internal steering gear leaks.

    - If a leak is detected in the steering gear, repair or install a new steering gear. Refer to **POWER STEERING** article.
    - If a leak is detected in the power steering reservoir, install a new reservoir. Refer to **POWER STEERING** article.
7. For information on power steering leak detection, refer to **COMPONENT TESTS**.
8. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.
9. If the cause is not visually evident, verify the symptom and Go to **SYMPTOM CHART - STEERING SYSTEM** or Go to **SYMPTOM CHART - NVH**.

Steering System Symptom Definitions

Drift/Pull

Pull is described as a tugging sensation felt by the hands on the steering wheel that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull on a flat road can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle, such as wind or road camber.

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Lack of Assist or Inconsistent Assist

Lack of assist or inconsistent assist is experienced when the steering wheel effort is higher than normal. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and poor returnability/sticky steering.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving or during high-effort parking maneuvers.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or steering correction is completed.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Symptom Chart - Steering System

SYMPTOM CHART - STEERING SYSTEM

Condition	Possible Sources	Action
• Steering has lack of assist or inconsistent assist	• Contaminated power steering fluid • Steering gear • Power steering pump • Restricted power steering lines/hoses	• Go to **Pinpoint Test A** .
• Excessive steering wheel play	• Steering gear • Steering column shaft/U-joints • Steering linkage	• Go to **Pinpoint Test B** .
• Steering system drift/pull/wander	• Steering column shaft/U-joints • Steering gear mounts • Steering gear valve	• Go to **Pinpoint Test C** .
• Poor returnability/sticky steering	• Binding steering column shaft/U-joints	• INSTALL a new steering column shaft. REFER to **STEERING COLUMN** article.
-	• Loose, worn or damaged steering linkage	• Go to Steering Linkage in **COMPONENT TESTS**.
-	• Binding suspension components	• To continue the suspension diagnosis, REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

-	• Binding steering column bearing(s)	• INSTALL a new steering column. REFER to **STEERING COLUMN** article.
-	• Binding dash boot seal	• INSTALL a new dash boot seal. REFER to **STEERING COLUMN** article.
-	• Steering gear	• INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

SYMPTOM CHART - NVH

Condition	Possible Sources	Action
• Steering system cold start noise	• Blockage in the power steering fluid reservoir caused by power steering fluid contamination	**NOTE:** **Some noise during an extremely cold start (-12.2°C [-10°F]) is normal and should improve as the steering system warms up (usually within 60 seconds).** **NOTE:** **It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir screen.** • CHECK the power steering fluid reservoir for contamination. FLUSH the power steering system as necessary. REFER to **POWER STEERING SYSTEM FLUSHING**.

-	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test in **COMPONENT TESTS**. PURGE the air from the system. REFER to **POWER STEERING SYSTEM PURGING**.
• Steering grunt or shudder - occurs when turning into or out of a turn at low speeds (temperature sensitive)	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test in **COMPONENT TESTS**. PURGE the air from the system. REFER to **POWER STEERING SYSTEM PURGING**.
-	• Steering gear or power steering hoses	• Go to Steering Gear Grunt/Shudder in **COMPONENT TESTS**.
• Steering system clonk - hydraulic knocking sound	• Air in the steering hydraulic system (aerated fluid)	**NOTE:** **Some amount of clonk noise is considered acceptable. If in doubt of the acceptability, compare to another vehicle.** • CHECK for leaks in the system. REFER to Power Steering Leak Test in **COMPONENT TESTS**. PURGE the air from the system. REFER to **POWER STEERING SYSTEM PURGING**.
• Power steering pump moan - loud humming noise occurs when the steering wheel is rotated to the stop position. Produces a 120-600 Hz frequency that changes with rpm	• Low fluid and/or air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test in **COMPONENT TESTS**. PURGE the air from the system. REFER to **POWER STEERING SYSTEM PURGING**. If a pump moan still exists, INSTALL a new power steering pump. REFER to **POWER STEERING** article.

-	• Power steering fluid reservoir or screen is blocked or damaged	• INSPECT the reservoir. FLUSH or INSTALL a new reservoir as necessary.
-	• Power steering line/hose grounded to chassis	• INSPECT the power steering lines/hoses. REPAIR as necessary.
-	• Power steering pump brackets loose or misaligned	• CHECK bolts, brackets and bracket alignment. TIGHTEN bolts to specification. REPAIR or INSTALL new brackets as necessary. REFER to **POWER STEERING** article.
-	• Steering gear isolators	• INSPECT the isolators for wear or damage. REPAIR as necessary.
• Steering gear clunk - occurs only while cornering over a bump (can be temperature sensitive)	• Steering gear	• INSPECT the steering gear for loose mounting bolts. TIGHTEN to specification as necessary. REFER to **POWER STEERING** article.
• Feedback (rattle, chuckle or knocking noise in the steering gear) - roughness is felt in the steering wheel when the vehicle is driven over rough surfaces	• Steering column shaft/U-joints damaged or worn	• INSTALL a new steering column shaft. REFER to **STEERING COLUMN** article.
-	• Loose, damaged or worn tie-rod ends	• INSPECT and INSTALL new tie-rod ends as necessary. Go to Steering Linkage in **COMPONENT TESTS**.
-	• Steering gear insulators or mounting bolts loose or damaged	• TIGHTEN the bolts to specification or INSTALL new bolts as necessary. REFER to **POWER STEERING** article.
-	• Steering column shaft bolts are loose	• TIGHTEN the bolts to specification. REFER to **STEERING COLUMN** article.
-	• Steering column damaged or worn	• REPAIR or INSTALL a new steering column as necessary. REFER to **STEERING COLUMN** article.

• Power steering hiss or whistle	• Steering column shaft-to-steering gear is binding or misaligned	• REPAIR or INSTALL a new steering column shaft as necessary. REFER to **STEERING COLUMN** article.
-	• Grounded or loose steering column boot at the dash panel	• REPAIR as necessary.
-	• Damaged or worn steering gear input shaft and valve	• REPAIR or INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.
-	• Restricted power steering lines/hoses	• INSTALL new power steering lines/hoses as necessary. REFER to **POWER STEERING** article.
• Steering column rattle	• Loose bolts or attaching brackets	• TIGHTEN the bolts to specification.
-	• Loose, worn or insufficiently lubricated column bearings	• LUBRICATE bearings or INSTALL new steering column bearings or steering column as necessary. REFER to **STEERING COLUMN** article.
-	• Steering shaft insulators damaged or worn	• INSTALL new insulators. REFER to **STEERING COLUMN** article.
-	• Steering column shaft compressed or extended	• INSPECT the rubber spider coupling for damage. INSTALL a new steering column shaft. REFER to **STEERING COLUMN** article.
• Steering gear squeak	• Incorrect power steering fluid in system	• If incorrect power steering fluid is suspected, FLUSH the power steering system. REFER to **POWER STEERING SYSTEM FLUSHING**. If noise persists after system flush, INSTALL a new steering gear. REFER to **POWER STEERING** article.
		NOTE:

-	• Steering gear rotary seal	**VERIFY that the steering gear is the source of the noise. It may be necessary to replicate the customer operating conditions (fluid temperature, turning rate of steering wheel) to get the squeak to reoccur.** • INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.
-	• Stone shield (if equipped)	• MAKE SURE that the stone shield is correctly installed and that it is not making contact with the steering shaft. REPOSITION stone shield or INSTALL a new stone shield as necessary.
• Steering column squeak, cracks or grinds	• Insufficiently lubricated steering shaft bushings	• LUBRICATE the steering shaft and shaft tube seals.
-	• Loose or misaligned steering column shrouds	• TIGHTEN or ALIGN the steering column shrouds.
-	• Steering wheel rubbing against steering column shrouds	• REPOSITION the steering column shrouds.
-	• Upper or lower bearing sleeves out of position	• REPOSITION the bearing sleeves.
• Power steering pump noisy	• Power steering pump	• INSTALL a new power steering pump as necessary. REFER to **POWER STEERING** article.
• Power steering pump relief noise	• Power steering fluid flow into the bypass valve of the pump valve housing, with fluid temperature below 54°C (130°F)	• Acceptable condition.
• Power steering pump whine noise	• Aerated fluid	• CHECK for a leak in the system. REFER to Power Steering Fluid Leak Test in **COMPONENT TESTS**. PURGE the air from the system. REFER to **POWER STEERING SYSTEM PURGING**.

-	• Damaged power steering pump	• INSTALL a new power steering pump as necessary. REFER to **POWER STEERING** article.
• High speed shake or shimmy - occurs at high speeds	• Worn or damaged steering linkage components	• Go to Steering Linkage in **COMPONENT TESTS**.

Pinpoint Tests

Pinpoint Test A: Steering Has Lack of Assist or Inconsistent Assist

NOTE: **Hard steering or lack of assist is experienced when the steering wheel effort exceeds specifications. Hard steering can remain constant through the full turn, occur near the end of a turn or differ right to left. It is important to know the difference between hard steering/lack of assist and poor returnability/sticky steering.**

This pinpoint test is intended to diagnose the following:

- Power steering fluid contamination
- Steering gear
- Power steering pump
- Power steering hoses

PINPOINT TEST A: STEERING HAS LACK OF ASSIST OR INCONSISTENT ASSIST

A1 CHECK FOR POWER STEERING FLUID CONTAMINATION

- Check the power steering fluid for contamination.
- **Is the power steering fluid contaminated?**

  YES : FLUSH the power steering system. REFER to **POWER STEERING SYSTEM FLUSHING**. CHECK the system for normal operation. If assist concern still exists, go to A2.

  NO : Go to A2.

A2 CHECK THE STEERING ASSIST WITH THE ENGINE RPM RAISED

NOTE: **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

- Set the engine at 2,100 rpm and turn the steering wheel fully to the left and right.
- **Is steering assist normal with the engine rpm raised?**

  YES : INSTALL a new power steering pump. REFER to **POWER STEERING** article.

  NO : Go to A3.

A3 CHECK FOR A CHANGE OF ASSIST ON LEFT AND RIGHT TURNS

- With the engine at idle, turn the steering wheel fully to the left and to the right.
- **Does the steering assist change when turning from right to left?**

  YES : INSTALL a new steering gear. REFER to **POWER STEERING** article.

  NO : Go to A4.

A4 CHECK THE STEERING LINES AND HOSES FOR RESTRICTIONS

- Inspect the steering lines and hoses for damage, kinks or restrictions.
- **Are the steering lines or hoses damaged, kinked or restricted?**

  YES : INSTALL new lines or hoses as necessary.

  NO : Go to A5.

A5 MONITOR THE ENGINE RPM CHANGES

NOTE: **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

NOTE: **Make sure that the vehicle is on a flat dry surface, all accessories are in the OFF position and that the steering system is at normal operating temperature.**

- Connect the diagnostic tool.
- Start the engine.
- With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.
- While monitoring the Engine Revolutions Per Minute (RPM) PID with the scan tool, turn the steering wheel quickly to the left stop position and then to the right stop position.
- Note the engine rpm during the turns.
- **Does the engine rpm change (even temporarily) more than 30 rpm when turning the steering wheel?**

  YES : INSTALL a new steering gear. REFER to **POWER STEERING** article.

  NO : INSTALL a new power steering pump. REFER to **POWER STEERING** article.

Pinpoint Test B: Excessive Steering Wheel Play

This pinpoint test is intended to diagnose the following:

- Steering linkage
- Steering column shaft U-joints
- Steering gear

PINPOINT TEST B: EXCESSIVE STEERING WHEEL PLAY

B1 CHECK THE STEERING LINKAGE

- Carry out the Steering Linkage in **COMPONENT TESTS**.
- **Is the steering linkage OK?**

  YES : Go to B2.

  NO : INSTALL new steering linkage components as necessary. Refer to the appropriate Steering System article for the procedure.

B2 CHECK THE STEERING COLUMN SHAFT

- Inspect the steering column shaft U-joints and fasteners for looseness.
- **Are the U-joints and fasteners OK?**

  YES : INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

  NO : TIGHTEN the steering column shaft fasteners or INSTALL a new steering column shaft. REFER to **STEERING COLUMN** article.

Pinpoint Test C: Steering System Drift/Pull/Wander

This pinpoint test is intended to diagnose the following:

- Steering gear
- Steering column shaft
- Steering column shaft U-joints
- Steering gear mounts

PINPOINT TEST C: STEERING SYSTEM DRIFT/PULL/WANDER

C1 CHECK THE STEERING COLUMN SHAFT

NOTE: **Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to the appropriate RESTRAINTS article for the procedure.**

- Check the steering column and shaft for grounding.
- Disconnect the steering column shaft at the steering column.
- Inspect the steering column shaft U-joints for looseness or wear.
- **Are the steering column shaft U-joints OK?**

  YES : Go to C2.

  NO : INSTALL a new steering column shaft as necessary. REFER to **STEERING COLUMN** article.

C2 CHECK THE STEERING GEAR MOUNTING

- Check the steering gear mounts for looseness or wear.
- **Are the steering gear mounts OK?**

  YES : Go to C3.

NO : INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

C3 CHECK THE STEERING GEAR

- Carry out the Steering Gear Valve in **COMPONENT TESTS**.
- **Is the steering gear valve OK?**

  YES : REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article to diagnose suspension system drift/pull/wander.

  NO : REPAIR or INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

Component Tests

Power Steering Fluid Leak Test

NOTE: This test should only be carried out if a leak in the system has not been detected during a thorough visual inspection. Refer to INSPECTION AND VERIFICATION.

1. Check the power steering fluid level. If necessary, add the specified power steering fluid.
2. Remove the power steering pump reservoir cap and tightly install the Power Steering Evacuation Cap to the power steering pump reservoir.
3. Install the Vacuum Pump Kit to the Power Steering Evacuation Cap.
4. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.
5. Observe the vacuum gauge for 30 seconds. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg) a leak is present.
6. Remove the Vacuum Pump Kit.

NOTE: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

7. Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.
8. Visually inspect the system for leaks. If a leak is evident, repair as necessary. If a leak is not evident, add the specified UV fluorescent tracer dye to the power steering fluid. Use 14.78 mL (1/2 oz) of dye solution for every 1.89L (2 qt) of power steering fluid.

NOTE: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

9. Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.
10. Using the 100W/12 Volt DC UV Lamp, inspect the system for traces of UV dye. Repair as necessary.

Steering Gear Valve Test

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
    - Raise the vehicle until the front wheels are off the ground.

NOTE: Do not hold the steering wheel while carrying out this step.

2. Start the engine.
    - If the steering wheel rotates in either direction (with no hand input), install a new steering gear. Refer to **POWER STEERING** article.

Steering Gear Grunt/Shudder Test

1. Start and run the vehicle to operating temperature.
2. Set engine idle speed to 1,200 RPM.

NOTE: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.

3. Rotate the steering wheel to the RH stop, then turn the steering wheel 90 degrees back from that position. Slowly turn the steering wheel back and forth approximately one-twelfth of a full turn.
4. Turn the steering wheel another 90 degrees. Slowly turn the steering wheel back and forth approximately one-twelfth of a full turn.
5. Repeat the test with the power steering fluid at different temperatures.
6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition.
7. If a loud grunt is heard or a strong shudder is felt, purge the power steering system. Refer to **POWER STEERING SYSTEM PURGING**. If a loud grunt or strong shudder still exists, check the power steering lines/hoses for restrictions or damage and repair as necessary. Refer to **POWER STEERING** article. If the lines/hoses are OK, install a new steering gear. Refer to **POWER STEERING** article.

Steering Linkage Test

NOTE: Excessive vertical motion of the studs relative to the sockets may indicate excessive wear.

1. With the vehicle on the ground and the parking brake applied, start the vehicle and carry out the following:
    - Have an assistant rotate the steering wheel back and forth 360 degrees and watch for relative motion of the studs in the steering linkage ball sockets.
    - Watch for loose steering gear mounting.
2. As an additional check, with the Key ON Engine OFF (KOEO) and the front wheels raised off the ground, grasp the wheel at the front and rear and watch for excessive play or binding in the joints while trying to steer the wheels.
3. Install new components if necessary. Tighten any worn, damaged or loose components. Refer to the

appropriate Steering System article for the procedure.

GENERAL PROCEDURES

POWER STEERING SYSTEM FLUSHING

MATERIAL

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: Do not mix oil types. Any mixture or any unapproved oil may lead to seal deterioration and leaks. A leak may ultimately cause loss of fluid, which may result in a loss of power steering assist.

1. Remove the power steering fluid reservoir cap.
2. Using a suitable suction device, remove the power steering fluid from the reservoir.
3. Disconnect the return hose from the reservoir.
   - Remove the clamp.
4. Plug the power steering fluid reservoir inlet port.
5. Attach an extension hose to the return hose.

   NOTE: Do not reuse the power steering fluid that has been flushed from the power steering system.

6. Place the open end of the extension hose into a suitable container.

   NOTE: Do not overfill the reservoir.

7. Fill the reservoir as needed with the specified fluid.

   NOTE: Do not allow the power steering pump to run completely dry of power steering fluid. Damage to the power steering pump may occur.

8. Start the engine while simultaneously turning the steering wheel to lock and then immediately turn the ignition switch to the OFF position.

   NOTE: Avoid turning the steering wheel without the engine running as this may cause air to be pulled into the steering gear.

   NOTE: Do not overfill the reservoir.

9. Fill the reservoir as needed.
10. Repeat Steps 8 and 9, turning the steering wheel in the opposite direction each time, until the fluid exiting the power steering fluid return hose is clean and clear of foreign material.
11. Remove the extension hose from the return hose.
12. Remove the plug from the fluid reservoir inlet port.
13. Install the power steering return hose to the reservoir.
    - Install the clamp.

NOTE: **It is necessary to correctly fill the power steering system to remove any trapped air and completely fill the power steering system components.**

If, after correctly filling the power steering system, there is power steering noise accompanied by evidence of aerated fluid and there are no fluid leaks, it may be necessary to purge the power steering system. For additional information, refer to <u>POWER STEERING SYSTEM PURGING</u>.

14. Fill the power steering system. For additional information, refer to **<u>POWER STEERING SYSTEM FILLING</u>**.

POWER STEERING SYSTEM PURGING

SPECIAL TOOLS

Illustration	Tool Name	Tool Number

	Vacuum Pump Kit	416-D002 (D95L-7559-A) or equivalent

MATERIAL

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: **If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition may occur on pre-**

delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.

NOTE: A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

1. Remove the power steering pump reservoir cap. Check the fluid.
2. Raise the front wheels off the floor. Refer to the appropriate Service Information article for the procedure.
3. Tightly insert the Power Steering Evacuation Cap into the reservoir and connect the Vacuum Pump Kit.

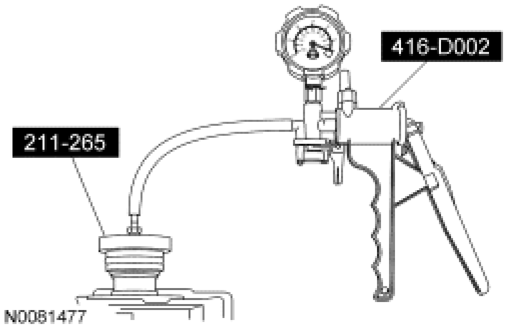

Fig. 1: Identifying Power Steering Evacuation Cap And Vacuum Pump Kit
Courtesy of FORD MOTOR CO.

4. Start the engine.
5. Using the Vacuum Pump Kit, apply vacuum and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).
6. If equipped with Hydro-Boost®, apply the brake pedal twice.

NOTE: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.

7. Cycle the steering wheel fully from stop-to-stop 10 times.
8. Stop the engine.
9. Release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.

NOTE: Do not overfill the reservoir.

10. Fill the reservoir.
    - Use approved transmission fluid.
11. Start the engine.
12. Install the Power Steering Evacuation Cap and the Vacuum Pump Kit. Apply and maintain the maximum

vacuum of 68-85 kPa (20-25 in-Hg).

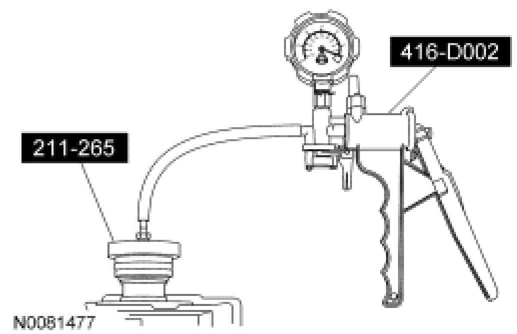

Fig. 2: Identifying Power Steering Evacuation Cap And Vacuum Pump Kit
Courtesy of FORD MOTOR CO.

NOTE: **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

13. Cycle the steering wheel fully from stop-to-stop 10 times.
14. Stop the engine, release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.

NOTE: **Do not overfill the reservoir.**

15. Fill the reservoir as needed and install the reservoir cap.
16. Visually inspect the power steering system for leaks.

NOTE: **Do not overfill the reservoir.**

17. Fill the reservoir as needed and visually inspect the power steering system for leaks.
18. Install the reservoir cap.

POWER STEERING SYSTEM FILLING

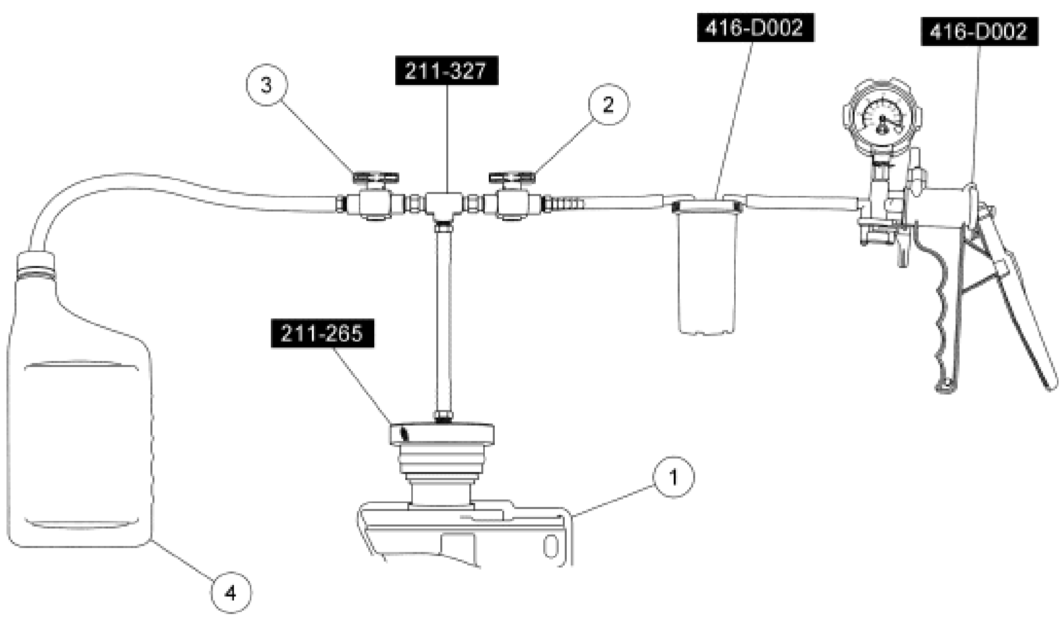
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



N0081484

Fig. 3: Power Steering System Filling Components
Courtesy of FORD MOTOR CO.

Item	Description
1	Power steering fluid reservoir
2	Control valve (vacuum side)

3	Control valve (fluid container side)
4	Fluid container

NOTE: **If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**

1. Remove the power steering fluid reservoir cap.
2. Install the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit as shown in the illustration.

NOTE: **The Power Steering Fill Adapter Manifold control valves are in the OPEN position when the point of the handles face the center of the Power Steering Fill Adapter Manifold.**

3. Close the Power Steering Fill Adapter Manifold control valve (fluid side).
4. Open the Power Steering Fill Adapter Manifold control valve (vacuum side).
5. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.
6. Observe the Vacuum Pump Kit gauge for 30 seconds.
7. If the Vacuum Pump Kit vacuum gauge reading drops more than 3 kPa (0.88 in-Hg), correct any leaks in the power steering system or the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit before proceeding.

NOTE: **The Vacuum Pump Kit gauge reading will drop slightly during this step.**

8. Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side) until power steering fluid completely fills the hose and then close the control valve.
9. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.
10. Close the Power Steering Fill Adapter Manifold control valve (vacuum side).
11. Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side).
12. Once power steering fluid enters the fluid reservoir and reaches the minimum fluid level indicator line on the reservoir, close the Power Steering Fill Adapter Manifold control valve (fluid side).
13. Remove the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit.
14. Install the reservoir cap.

NOTE: **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

NOTE: **There will be a slight drop in the power steering fluid level in the reservoir when the engine is started.**

15. Start the engine and turn the steering wheel from stop-to-stop.
16. Turn the ignition switch to the OFF position.

NOTE: Do not overfill the reservoir.

17. Remove the reservoir cap and fill the reservoir with the specified fluid.
18. Install the reservoir cap.

Roof opening panel glass rear screws	8	71
Shade motor retaining screws	5	44
Sliding glass motor retaining screws	5	44

DESCRIPTION AND OPERATION

ROOF OPENING PANEL

The roof opening panel consists of the following:

- Air deflector
- Concertina blinds
- Fixed glass front seal
- Fixed glass side seals
- Front shade assembly
- Front trim panel
- Front trim panel seal
- Guide track and mechanism
- Idler track and mechanism
- Motor wiring harness
- Overhead console control switch
- Rear shade assembly
- Roof opening panel fixed glass
- Roof opening panel shade motor
- Roof opening panel sliding glass
- Roof opening panel sliding glass motor
- Rear trim ring assembly
- Shade motor block and drive tube assembly
- Shade track and mechanism
- Sliding front panel motor block and drive tube assembly
- Sliding glass primary seal
- Side trim panel
- Side trim panel seals

The roof opening panel consists of an electronically operated sliding glass panel and electronically operated sunshades that can be opened or closed by pressing a switch located on the overhead console. The sliding glass panel has one-touch open, one-touch close and one-touch vent open features. The shades have a one-touch-open feature.

The front and rear shades operate together with a 80 mm (3.14 in) delay in the closing of the rear shade to the front. The sunshade may be in any position when the sliding glass panel is in the closed position. The shades will open a proportional amount when the sliding glass panel is in any position between closed and fully open. With the sliding glass panel in the fully OPEN position, the shades are disabled to prevent wind damage.

When the sliding glass panel is in the fully CLOSED position, pressing the overhead console roof opening panel control switch rearward to the second detent and then releasing it will activate the one-touch open feature and the glass panel will open to the comfort position. Pressing the switch a second time will move the glass to the fully OPEN position. The one-touch open feature can be canceled any time the sliding glass is moving by pressing the roof opening panel control switch in either direction.

With the sliding glass panel in any open position except VENT, rocking the roof opening panel control switch forward and then releasing it will activate the one-touch close feature. Pressing the roof opening panel control switch in either direction with the roof opening panel moving will cancel the one-touch close operation and the motion will immediately stop.

If an obstacle contacts the leading edge of the sliding glass panel during one-touch close operation, the roof opening panel glass will reverse direction and open to approximately the mid position and stop. The operator cannot stop this open motion once it has begun.

If an obstacle contacts the leading edge of the roof opening panel glass during one-touch vent close operation, the roof opening panel glass will reverse direction to the VENT position.

When the sliding glass panel is in the fully CLOSED position, pressing the roof opening panel control tilt switch and then releasing it will activate the one-touch vent feature. To vent the sliding glass panel from any position, press and hold the tilt switch. To close, press and hold the roof opening panel control switch in the forward position.

Global Open - MKX Only - The smart junction box (SJB) sends a signal on the global open circuit, to the roof opening panel motor, to open or close the windows based on a signal received from the remote keyless entry (RKE) transmitter. If the accessory delay relay is active, the global open feature will not operate.

DIAGNOSTIC TESTS

ROOF OPENING PANEL

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent

Principles of Operation

Roof Opening Panel Shade - The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel shades. The roof opening panel shade can be opened or closed by the shade control switch. Pressing the shade control switch in either the OPEN or CLOSE position supplies a ground to the roof opening panel shade motor/module. The shade panels are equipped with express open and close features. A short press of the shade control switch will cause the shade panel to express open to the full open position or close to the safety stop position. The shade will not close when the roof opening panel is open.

NOTE: Any glass opening operation will first fully open the shade panels. Before the shade panels may be closed, the glass panel must be fully closed.

The roof opening panel shade motor must be initialized when one of the following occurs:

- The replacement or removal of the drive system
- Excessive false stalls are encountered
- The shade(s) are removed or replaced
- The shade motor becomes de-initialized (will stutter step open)

The roof opening sliding glass panel motor must be initialized when one of the following occur:

- The replacement or removal of the drive system
- Excessive false stalls are encountered
- The sliding glass panel is removed
- The sliding glass motor becomes de-initialized (will stutter step open and have no express operation)

Roof Opening Panel - The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel sliding glass. The roof opening panel sliding glass can be opened, closed or tilted by the roof opening panel control switch. Pressing the open, close or tilt switch grounds those inputs to the glass panel motor/module. Momentarily pressing the tilt switch will cause the glass panel to express open to the VENT position if the glass panel is closed or cause the glass panel to close to the VENT position if the glass panel is in the slide open range and the tilt switch is pressed and held. Pressing and holding the control switch forward will close the glass panel (the safety stop position is skipped in manual mode). The glass panel has express open and close features that are activated when the switch is momentarily pressed to the double detent OPEN or CLOSE positions. Express open operation will first open the glass panel to the comfort stop position. Pressing the switch again will cause the glass to move to the full open position. Pressing the switch again will cause the glass to move to the full open position. Express close operation will move the glass panel to the full closed position.

NOTE: Any glass opening operation will first fully open the shade panels. Before the shade panels may be closed, the glass panel must be fully closed.

The shade motor and sliding glass panel motor have 3 thermal operating modes:

- Full function: In their fully functioning state, the motors allow all normal operations of the shades and glass.
- Reduced function: If either motor begins to overheat, it will enter a reduced function mode. No express operation is possible and it will allow open or close motion in steps of 50.8 mm (2 in).
- No function: Excessive heating causes no function mode. The motor will not operate in the close direction, but will open in steps of 50.8 mm (2 in). Once the open position is reached, the motor shuts itself down until it is sufficiently cooled.

Global Open - MKX only - When the unlock button of the remote keyless entry (RKE) transmitter is held for 2 seconds the global open activates. The smart junction box (SJB) sends a signal to activate the one-touch open operation of the roof opening panel. The global open feature does not operate if the delay accessory is active.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Roof opening panel sliding glass
• Roof opening panel fixed glass
• Roof opening panel front trim
• Roof opening panel side trim
• Roof opening panel blind
• Roof opening panel air deflector assembly
• Roof opening panel track(s)
• Roof opening panel seal (s)
• Roof opening panel shade(s)
• Roof opening panel module assembly
• Overhead console
• Headliner
	• Battery junction box (BJB) fuse 18 (30A)
	• Smart junction box (SJB) fuse(s):
	  ○ 17 (20A)
	  ○ 41 (15A)
	• Circuitry
	• Accessory delay relay
	• Roof opening panel switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, determine the symptom. Go to **Symptom Chart - Roof Opening Panel** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

Symptom Chart - Roof Opening Panel

Symptom Chart - Roof Opening Panel

Condition	Possible Sources	Action
	• Roof opening panel primary	

• The roof opening panel leaks	seal • Roof opening panel fixed rear glass urethane seal • Roof opening panel front trim • Windshield • Antenna • Roof opening panel module assembly	• Go to **Pinpoint Test B** .
	• Roof opening panel drain channel blockage	• CHECK the roof opening panel drain channels for blockage. REFER to **Water Drainage System Check and Water Leak Corrections**.
• The roof opening panel does not open or close	• Fuse(s) • Circuitry • Roof opening panel switch • Roof opening sliding glass panel motor/module • Accessory delay relay	• Go to **Pinpoint Test E** .
• The roof opening panel does not open in the VENT position	• Circuitry • Roof opening panel switch • Roof opening sliding glass panel motor/module • Roof opening panel shade motor not initialized	• Go to **Pinpoint Test F** .
• The roof opening panel shade does not open or close - both shades	• Circuitry • Roof opening panel switch • Roof opening panel shade motor/module • Roof opening panel shade motor not initialized	• Go to **Pinpoint Test G** .
• The express open/close feature is inoperative	• Roof opening panel shade motor not initialized • Roof opening sliding glass panel motor/module • Roof opening panel control switch	• Go to **Pinpoint Test H** .
	• Circuitry • Roof opening sliding glass	

• The global open function is inoperative	panel motor/module • Smart junction box (SJB) • Remote keyless entry (RKE) transmitters • Roof opening sliding glass panel motor not initialized	• Go to **Pinpoint Test I** .
• Roof opening panel reverses during operation	• Mechanism mistimed	• REFER to **Timing Adjustment**.
	• Binding or foreign material in the guide or tracks	• REMOVE the obstruction or CLEAN the foreign material from the guide or tracks.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• The roof opening panel has excessive wind noise	• Roof opening panel primary seal • Roof opening panel front trim panel seal • Roof opening panel side trim panel seals • Roof opening panel fixed glass seal • Air deflector assembly	• Go to **Pinpoint Test A** .
	• Roof opening panel sliding glass • Roof opening sliding glass panel motor/module • Roof opening panel shade motor/module • Roof opening sliding glass panel motor block and drive tube assembly • Roof opening panel shade motor	

	block and drive tube assembly • Roof opening panel guide tracks • Roof opening panel shade tracks • Roof opening panel rear trim ring • Roof opening panel motor wiring harness • Roof opening panel air deflector assembly • Roof opening panel module assembly • Overhead console • Headliner	
• The roof opening panel rattles		• Go to **Pinpoint Test C** .
• The roof opening panel is noisy during operation	• Roof opening panel sliding glass • Roof opening panel guide tracks • Roof opening panel shade tracks • Roof opening sliding glass panel motor/module • Roof opening panel shade motor/module • Roof opening sliding glass panel motor block and drive tube assembly • Roof opening panel shade motor block and drive tube assembly • Overhead console • Headliner	• Go to **Pinpoint Test D** .

Pinpoint Tests

Pinpoint Test A: The Roof Opening Panel has Excessive Wind Noise

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel and correctly sealed. When the roof opening panel glass is in the VENT position, the leading edge of the glass panel should contact the primary seal.

This pinpoint test is intended to diagnose the following:

- Damaged or poorly fitting roof opening panel primary seal
- Damaged or poorly fitting roof opening panel fixed glass front seal
- Damaged or poorly fitting roof opening panel front trim panel seal

- Damaged or poorly fitting roof opening panel side trim panel seal
- Damaged or poorly fitting roof opening panel fixed glass side seal
- Damaged or poorly fitting deflector assembly

PINPOINT TEST A: THE ROOF OPENING PANEL HAS EXCESSIVE WIND NOISE

A1 VERIFY ROOF OPENING PANEL NOISE

NOTE:	**It is normal to have some amount of wind noise when the roof opening panel is in the OPEN position. To determine if the wind noise is excessive, road test the vehicle at approximately 100 km/h (62 mph) with the roof opening panel closed, a single rear door window OPEN and all remaining door windows closed while observing the level of wind noise. If the level of wind noise observed with the roof opening panel OPEN (with all door windows closed) is greater than the wind noise observed with a single rear door window open, the wind noise is excessive.**

- Road test the vehicle with the roof opening panel in the CLOSED, VENT and OPEN positions.
- **Is the wind noise present only in the OPEN position?**

  YES : Go to A3.

  NO : Go to A2.

A2 CHECK THE ROOF OPENING PANEL GLASS SEALS

NOTE:	**When the roof opening panel sliding glass is in the VENT position, it is important that the leading edge of the glass is in contact with the sliding glass primary seal.**

- Check the roof opening panel front trim seal, sliding glass primary seal and fixed glass seal to make sure they are fitted properly and not damaged.
- **Are the roof opening panel front trim seal, sliding glass primary seal and fixed glass seal OK?**

  YES : CHECK for other vehicle conditions that could be causing the excessive wind noise. For example, aftermarket windshield wipers, side-view mirrors, HVAC door behind glove compartment, HVAC louvers in instrument panel, or antenna base to trim panel. REPAIR as necessary. TEST the system for normal operation.

  NO : INSTALL or REPAIR the roof opening panel seal(s) in question as necessary. REFER to **Roof Opening Panel - Exploded View** or **Roof Opening Panel Seal - Primary**. TEST the system for normal operation.

A3 CHECK THE SLIDING GLASS PRIMARY SEAL

- Make sure the air deflector is not damaged and is securely attached.
- **Is the air deflector OK?**

  YES : PARTIALLY close the roof opening panel until the noise is eliminated. If the noise is eliminated, INFORM the customer that changing glass location will eliminate the wind noise. If the wind noise is not eliminated, INSTALL a new air deflector. REFER to **Roof Opening Panel - Exploded View** and **Air Deflector**. TEST the system for normal operation.

NO : INSTALL new air deflector assembly. REFER to **Roof Opening Panel - Exploded View** and **Air Deflector**. TEST the system for normal operation.

Pinpoint Test B: The Roof Opening Panel Leaks

Normal Operation

The roof opening panel module assembly has 2 drain channels which are located under the side trim panels to direct water externally to the front and rear corners of the roof. There are no drain hoses in this system. When the roof opening panel glass is completely closed, it is flush with the roof panel and correctly sealed.

This pinpoint test is intended to diagnose the following:

- Damaged or poorly sealed roof opening panel primary seal
- Poorly sealed fixed rear glass
- Poorly sealed windshield
- Poorly sealed antenna
- Poorly sealed front trim panel
- Incorrect installation or damaged roof opening panel module assembly

PINPOINT TEST B: THE ROOF OPENING PANEL LEAKS

B1 VERIFY THE LEAK LOCATION

- Lower the headliner. Refer to **INTERIOR TRIM AND ORNAMENTATION** article.
- Check the roof opening panel and windshield for leaks.
- **Is the leak coming from the windshield?**

  YES : RESEAL the windshield. REFER to **GLASS, FRAMES AND MECHANISMS** article. TEST the system for normal operation.

  NO : Go to B2.

B2 VERIFY THE ROOF OPENING PANEL LEAK LOCATION

- Check the front and rear areas of the roof opening panel for leaks.
- **Is the leak coming from the rear fixed glass panel area of the roof opening panel?**

  YES : Go to B4.

  NO : Go to B3.

B3 CHECK THE ROOF OPENING PANEL PRIMARY SEAL CONDITION

- Check the roof opening panel primary seal for damage and correct installation. Carefully pull up on the seal to verify correct adhesion.
- **Is the roof opening panel primary seal OK?**

  YES : Go to B5.

NO : INSTALL a new roof opening panel primary seal. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Seal - Primary** . TEST the system for normal operation.

B4 CHECK THE ROOF OPENING PANEL FIXED REAR GLASS URETHANE SEAL

- Check the roof opening panel fixed rear glass urethane seal for damage.
- **Is the roof opening panel fixed rear glass urethane seal OK?**

  YES : Go to B6.

  NO : If the leak is at the front or sides of the fixed glass panel, it is possible to re-seal the area from the inside by removing the trim ring. If re-sealing the area does not correct the problem or the leak is at the rear of the fixed glass panel, REMOVE and REINSTALL the existing rear fixed glass assembly. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Glass - Rear Fixed**. TEST the system for normal operation.

B5 CHECK THE ROOF OPENING PANEL FRONT TRIM AND ANTENNA SEAL

- Check the antenna seal and roof opening panel front trim urethane seal for damage.
- **Is the roof opening panel front trim and antenna seal OK?**

  YES : Go to B6.

  NO : For the antenna seal, REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article. For the front trim panel, REFER to **Roof Opening Panel Trim - Front** . TEST the system for normal operation.

B6 CHECK THE CONDITION OF THE ROOF OPENING PANEL MODULE ASSEMBLY

- Check the roof opening panel module assembly for damage.
- **Is the roof opening panel module assembly OK?**

  YES : INSPECT other areas of the vehicle that may cause water to enter the roof area, such as the windshield or the rear window.

  NO : INSTALL a new roof opening panel module assembly. REFER to **Roof Opening Panel - Exploded View**, Roof Opening Panel Frame and **Roof Opening Panel Module** . TEST the system for normal operation.

Pinpoint Test C: The Roof Opening Panel Rattles

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel. All components should be secured correctly.

This pinpoint test is intended to diagnose the following:

- Roof opening panel sliding glass
- Roof opening panel air deflector assembly
- Roof opening panel guide tracks
- Roof opening panel shade tracks
- Roof opening sliding glass panel motor/module
- Roof opening panel shade motor/module

- Roof opening sliding glass panel motor block and drive tube assembly
- Roof opening panel shade motor block and drive tube assembly
- Roof opening panel module assembly
- Roof opening panel rear trim ring
- Roof opening panel motor wiring harness
- Overhead console
- Headliner

PINPOINT TEST C: THE ROOF OPENING PANEL RATTLES

C1 CHECK THE ROOF OPENING PANEL TIGHTNESS

- Open the roof opening sliding glass panel.
- Manually push up and fore/aft on the roof opening sliding glass panel.
- **Is the roof opening sliding glass panel loose?**

  YES : TIGHTEN the roof opening sliding glass panel. REFER to **Roof Opening Panel Glass - Front Sliding**. TEST the system for normal operation. If the glass panel still has movement after tightening the roof opening sliding glass panel screws, the guide shoes for the idler mechanism and/or front guide track mechanism may be damaged. REPAIR or INSTALL a new idler mechanism or front guide track and mechanism as necessary. REFER to **Roof Opening Panel Idler Track Mechanism** and **Roof Opening Panel Guide Track and Mechanism**.

  NO : Go to C2.

C2 CHECK THE ROOF OPENING PANEL REAR TRIM RING

- Verify that the roof opening panel rear trim ring is not damaged and is securely fastened.
- **Is the roof opening panel rear trim ring OK?**

  YES : Go to C3.

  NO : REINSTALL the roof opening panel rear trim ring or INSTALL a new roof opening panel rear trim ring. REFER to **Roof Opening Panel - Exploded View** or **Roof Opening Panel Trim - Fixed Glass, Interior**. TEST the system for normal operation.

C3 CHECK THE ROOF OPENING PANEL TRACKS

- Verify that the roof opening panel guide tracks, shade tracks and idler tracks and mechanism are not damaged and are securely fastened.
- **Are the roof opening panel tracks OK?**

  YES : Go to C4.

  NO : REPAIR or TIGHTEN the roof opening panel track that is affected. If the roof opening panel track cannot be repaired, INSTALL a new roof opening panel track. REFER to **Roof Opening Panel - Exploded View**, **Roof Opening Panel Guide Track and Mechanism**, **Roof Opening Panel Idler Track Mechanism**, **Roof Opening Panel Idler Track and Mechanism** or **Roof Opening Panel Shade Track and Mechanism**. TEST the system for normal operation.

C4 CHECK THE ROOF OPENING PANEL SUNSHADES

- Check the roof opening panel sunshades for correct installation or damage.
- **Are the roof opening panel sunshades OK?**

YES : Go to C5.

NO : REINSTALL the roof opening panel shade or INSTALL a new roof opening panel shade. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Shade Assembly**. TEST the system for normal operation.

C5 CHECK THE ROOF OPENING PANEL AIR DEFLECTOR ASSEMBLY

- Check the roof opening panel air deflector assembly for correct installation or damage.
- **Is the roof opening panel air deflector assembly OK?**

  YES : Go to C6.

  NO : REINSTALL the roof opening panel air deflector assembly or INSTALL a new roof opening panel air deflector assembly. REFER to **Roof Opening Panel - Exploded View** and **Air Deflector**. TEST the system for normal operation.

C6 CHECK THE ROOF OPENING SLIDING GLASS PANEL AND SHADE MOTORS

- Check the roof opening sliding glass panel and shade motors for correct installation or damage.
- **Are the roof opening sliding glass panel and shade motors OK?**

  YES : Go to C7.

  NO : REINSTALL the roof opening sliding glass panel and/or shade motors. TIGHTEN to the correct torque specification. If the roof opening sliding glass panel motor or shade motor is still loose or damaged, INSTALL a new roof opening sliding glass panel motor or shade motor. REFER to **Roof Opening Panel - Exploded View**, **Roof Opening Panel Motor - Sliding Front Panel** or **Roof Opening Panel Motor - Shades**. TEST the system for normal operation.

C7 CHECK THE ROOF OPENING SLIDING GLASS PANEL AND SHADE MOTOR BLOCK AND DRIVE TUBE ASSEMBLIES

- Check the roof opening sliding glass panel motor and shade motor block and drive tube assemblies for correct installation or damage.
- **Are the roof opening sliding glass panel and shade motor block and drive tube assemblies OK?**

  YES : Go to C8.

  NO : REINSTALL the roof opening sliding glass panel or shade motor block and drive tube assembly. TIGHTEN to the correct torque specification. If the roof opening sliding glass panel or shade motor block and drive tube assembly is damaged, INSTALL a roof opening sliding glass panel or shade motor block and drive tube assembly. REFER to **Roof Opening Panel - Exploded View**, **Roof Opening Panel Motor Block and Drive Tube Assembly - Sliding Front Panel** or **Roof Opening Panel Motor Block and Drive Tube Assembly - Shades**. TEST the system for normal operation.

C8 CHECK THE ROOF OPENING PANEL ASSEMBLY FOR RATTLES

- Check the roof opening panel assembly for any loose parts or for any condition that will cause rattles.
- **Are there any conditions that will cause rattles?**

  YES : CHECK for correct routing of the roof opening panel motor wiring harness. REFER to **Roof Opening Panel Motor Wiring Harness**. If the roof opening panel motor wiring harness is OK, INSTALL a suitable sound damper material to correct the condition. If the rattle still persists, INSTALL a new roof opening panel module assembly. REFER to **Roof Opening Panel -**

Exploded View and **Roof Opening Panel Module**. TEST the system for normal operation.

NO : INSPECT other areas of the vehicle that may cause rattles in the roof area, such as the headliner, roof opening panel motor wiring harness, overhead console, rear wiper hose to headliner or rear dome light. REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test D: The Roof Opening Panel is Noisy During Operation

Normal Operation

The roof opening panel operates smoothly and quietly while opening and closing.

This pinpoint test is intended to diagnose the following:

- Roof opening panel sliding glass
- Roof opening panel air deflector assembly
- Roof opening panel sliding glass tracks
- Roof opening panel shade tracks
- Roof opening sliding glass panel motor/module
- Roof opening panel shade motor/module
- Roof opening sliding glass panel motor block and drive tube assembly
- Roof opening panel shade motor block and drive tube assembly
- Roof opening panel module assembly
- Headliner
- Overhead console

PINPOINT TEST D: THE ROOF OPENING PANEL IS NOISY DURING OPERATION

D1 VERIFY THE ROOF OPENING PANEL SHADE OPERATION

NOTE: Before performing this pinpoint test, make sure the front guide tracks are free from any foreign material.

- With the roof opening panel glass fully closed, open and close the shades while observing the noise.
- **Is the noise present during shade operation?**

  YES : Go to D3.

  NO : Go to D2.

D2 VERIFY THE ROOF OPENING PANEL OPERATION

- With the shades fully open, open and close the roof opening sliding glass panel while observing the noise.
- **Is the noise present during sliding glass operation?**

  YES : If the noise occurs during primary seal engagement only, apply silicone spray lubricant to the primary seal. TEST the system for normal operation. If noise is still present, INSTALL a new primary seal. REFER to **Roof Opening Panel Seal - Primary**.

If the noise occurs during transition to VENT only, carefully spray PTFE lubricant to the front mechanism. TEST the system for normal operation.

If the noise occurs only while the air deflector is moving downward, LUBRICATE the air deflector arm and spring. TEST the system for normal operation. If noise is still present, INSTALL a new air deflector assembly. REFER to **Air Deflector**. If noise is still present, INSTALL new front drive track and mechanisms. REFER to **Roof Opening Panel Guide Track and Mechanism** .

If the noise sounds like a muffled ratchet/purr, INSTALL a new sliding glass motor block and drive tube assembly. REFER to **Roof Opening Panel Motor Block and Drive Tube Assembly - Sliding Front Panel**.

If none of the above conditions apply, INSTALL a new roof opening sliding glass panel motor. REFER to **Roof Opening Panel Motor - Sliding Front Panel**. TEST the system for normal operation.

NO : The roof opening panel is operating correctly at this time.

D3 CHECK THE ROOF OPENING PANEL FRONT SHADE

- With the front shade disconnected, open and close the rear shade.
- **Is the noise still present?**

YES : Go to D4.

NO : INSTALL a new front shade assembly. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Shade Assembly**. TEST the system for normal operation.

D4 CHECK THE ROOF OPENING PANEL REAR SHADE

- With the front and rear shade disconnected, open and close the shades.
- **Is the noise still present?**

YES : If the noise sounds like a muffled ratchet/purr, INSTALL a new LH and RH shade track assembly and shade motor block and tube assembly. REFER to **Roof Opening Panel Shade Track and Mechanism** and **Roof Opening Panel Motor Block and Drive Tube Assembly - Shades**. TEST the system for normal operation. If the noise is still present, INSTALL a new LH and RH guide track and mechanism. REFER to **Roof Opening Panel Guide Track and Mechanism**.

If the above condition does not apply, INSTALL a new shade motor. REFER to **Roof Opening Panel Motor - Shades**. TEST the system for normal operation.

NO : INSTALL a new rear shade assembly. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Shade Assembly**. TEST the system for normal operation.

Pinpoint Test E: The Roof Opening Panel Does Not Open or Close

The roof opening sliding glass panel motor/module must be initialized whenever the roof opening sliding glass panel motor/module has been removed from the roof opening panel system, a new roof opening sliding glass panel motor/module has been installed or a new roof opening panel module assembly has been installed. Refer to **Roof Opening Panel Motor Initialization**.

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Roof Opening Panel for schematic and connector information.

Normal Operation

The roof opening panel uses an integrated motor and module to operate the roof opening panel sliding glass.

The roof opening sliding glass panel motor/module receives voltage from the accessory delay relay through circuit CBP41 (BU) when the key is in the ACC or RUN position and voltage at all times through circuit SBB18 (YE/RD). Ground is supplied to the roof opening sliding glass panel motor/module through circuit GD133 (BK). The roof opening panel switch receives ground from the roof opening panel motor/module assembly through circuit GD133 (BK). When the roof opening panel open switch is pressed, the roof opening panel switch grounds circuit CPR31 (VT/BN) and the roof opening sliding glass panel motor/module opens the roof opening panel sliding glass. When the roof opening panel close switch is pressed, the roof opening panel switch grounds circuit CPR40 (YE/OG) and the roof opening sliding glass panel motor/module closes the roof opening panel sliding glass.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Roof opening panel switch
- Roof opening sliding glass panel motor/module
- Accessory delay relay
- Roof opening sliding glass panel motor not initialized

PINPOINT TEST E: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE

E1 CHECK THE POWER WINDOWS

- Key in ON position.
- Verify that the power windows operate.
- **Do the power windows operate?**

  YES : Go to E2.

  NO : REFER to **GLASS, FRAMES AND MECHANISMS** article to diagnose the accessory delay relay circuit.

E2 CHECK THE ROOF OPENING SLIDING GLASS PANEL MOTOR FOR INITIALIZATION

- Carry out the roof opening panel motor initialization procedure. Refer to **Roof Opening Panel Motor Initialization**.
- **Is the concern still present?**

  YES : Go to E3.

  NO : The system is operating normally at this time. The roof opening sliding glass panel motor was not initialized.

E3 CHECK THE ROOF OPENING PANEL SWITCH

- Key in OFF position.
- Disconnect: Roof Opening Panel Switch C912

- Carry out the roof opening panel switch component test. Refer to COMPONENT TESTING.
- **Did the roof opening panel switch pass the component test?**

  YES : Go to E4.

  NO : INSTALL a new roof opening panel switch. REFER to **Roof Opening Panel Control Switch**. TEST the system for normal operation.

E4 CHECK VOLTAGE TO THE ROOF OPENING SLIDING GLASS PANEL MOTOR/MODULE - CIRCUIT CBP41 (BU) AND SBB18 (YE/RD)

- Disconnect: Roof Opening Panel Motor/Module C920
- Key in ON position.

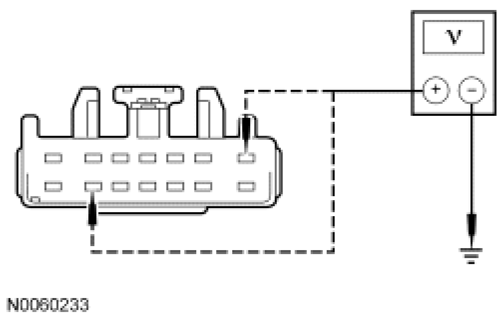

Fig. 1: Measuring Voltage Between Roof Opening Panel Motor/Module C920-13, Circuit CBP41 (BU)
Courtesy of FORD MOTOR CO.

- Measure the voltage between roof opening panel motor/module C920-13, circuit CBP41 (BU), harness side and ground; and between C920-1, circuit SBB18 (YE/RD), harness side and ground
- **Are the voltages greater than 10 volts?**

  YES : Go to E5.

  NO : VERIFY smart junction box (SJB) fuse 41 (15A) and battery junction box (BJB) fuse 18 (30A) are OK. If OK, REPAIR the circuit. TEST the system for normal operation.

E5 CHECK THE ROOF OPENING SLIDING GLASS PANEL MOTOR/MODULE GROUND - CIRCUIT GD133 (BK)

- Key in OFF position.

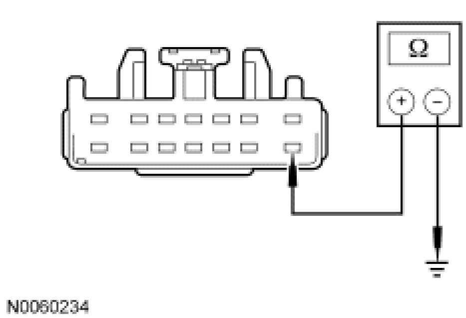

Fig. 2: Measuring Resistance Between Roof Opening Panel Motor/Module C920-8, Circuit GD133 (BK)
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel motor/module C920-8, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to E6.

NO : REPAIR the circuit. TEST the system for normal operation.

E6 CHECK THE ROOF OPENING PANEL SWITCH GROUND - CIRCUIT GD133 (BK) FOR AN OPEN

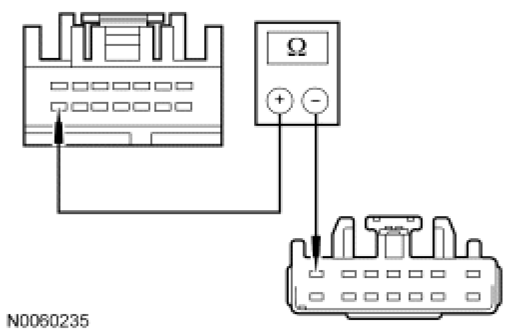

Fig. 3: Measuring Resistance Between Roof Opening Panel Switch C912-14, Circuit GD133 (BK)
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel switch C912-14, circuit GD133 (BK), harness side and roof opening panel motor/module C920-7, circuit GD133 (BK) harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to E7.

NO : REPAIR the circuit. TEST the system for normal operation.

E7 CHECK CIRCUITS CPR31 (VT/BN) AND CPR40 (YE/OG) FOR AN OPEN

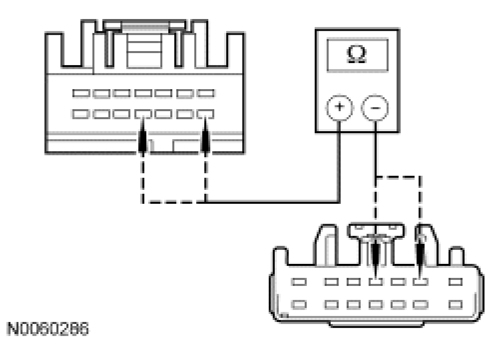

Fig. 4: Measuring Resistance Between Roof Opening Panel Switch C912-11, Circuit CPR31 (VT/BN)

Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel switch C912-11, circuit CPR31 (VT/BN), harness side and roof opening panel motor/module C920-2, circuit CPR31 (VT/BN) harness side; and between roof opening panel switch C912-8, circuit CPR40 (YE/OG), harness side and roof opening panel motor/module C920-4, circuit CPR40 (YE/OG) harness side
- **Are the resistances less than 5 ohms?**

YES : Go to E8.

NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

E8 CHECK CIRCUITS CPR31 (VT/BN), CPR38 (WH/BU) AND CPR40 (YE/OG) FOR A SHORT TO GROUND

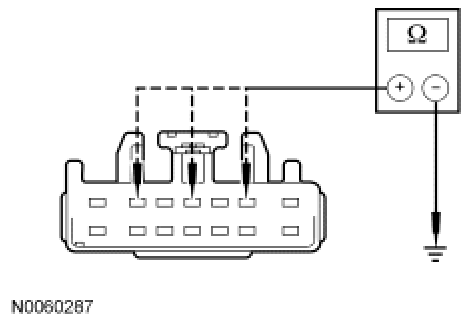

Fig. 5: Measuring Resistance Between Roof Opening Panel Switch C912 Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Using the following table, measure the resistance between roof opening panel switch C912 harness side and ground:

Roof Opening Panel Switch C912	Ground
C920-2, circuit CPR31 (VT/BN)	Ground
C920-6, circuit CPR38 (WH/BU)	Ground
C920-4, circuit CPR40	Ground

(YE/OG)	

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E9.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

E9 CHECK THE ROOF OPENING PANEL MOTOR WIRING HARNESS

- Using the following table, check the roof opening panel motor wiring harness for loose pins, an open or a short between roof opening panel motor/module C920 component side and the roof opening panel motor wiring harness socket:

Roof Opening Panel Motor/Module C920	Roof Opening Panel Motor Wiring Harness Socket
C920-1, circuit SBB18	Roof opening panel motor wiring harness socket circuit SBB18
C920-13, circuit CBP41	Roof opening panel motor wiring harness socket circuit CBP41
C920-7, circuit GD133	Roof opening panel motor wiring harness socket circuit GD133
	Roof

C920-8, circuit GD133	opening panel motor wiring harness socket circuit GD133
C920-2, circuit CPR31	Roof opening panel motor wiring harness socket circuit CPR31
C920-6, circuit CPR38	Roof opening panel motor wiring harness socket circuit CPR38
C920-4, circuit CPR40	Roof opening panel motor wiring harness socket circuit CPR40

- **Is the roof opening panel motor wiring harness OK?**

  YES : Go to E10.

  NO : INSTALL a new roof opening panel motor wiring harness. REFER to **Roof Opening Panel Motor Wiring Harness**. INITIALIZE the roof opening panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

E10 CHECK THE ROOF OPENING SLIDING GLASS PANEL MOTOR/MODULE FOR CORRECT OPERATION

- Disconnect all roof opening panel motor/module connectors.
- Check for:

    - corrosion.
    - bent or pushed-out pins.
- Connect all roof opening panel motor/module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new roof opening sliding glass panel motor/module. REFER to **Roof Opening Panel Motor - Sliding Front Panel**. INITIALIZE the roof opening sliding glass panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: The Roof Opening Panel Does Not Open in the VENT Position

The roof opening sliding glass panel motor/module must be initialized whenever the roof opening sliding glass panel motor/module has been removed from the roof opening panel system, the roof opening panel module assembly has been removed from the vehicle, a new roof opening sliding glass panel motor/module has been installed or a new roof opening panel module assembly has been installed. Refer to **Roof Opening Panel Motor Initialization** .

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Roof Opening Panel for schematic and connector information.

Normal Operation

The roof opening panel uses an integrated motor and module to operate the roof opening panel sliding glass.

The roof opening sliding glass panel motor/module receives voltage from the accessory delay relay through circuit CBP41 (BU) when the key is in the ACC or RUN position and voltage at all times through circuit SBB18 (YE/RD). Ground is supplied to the roof opening sliding glass panel motor/module through circuit GD133 (BK). The roof opening panel switch receives ground from the roof opening panel motor/module assembly through circuit GD133 (BK). When the roof opening panel tilt switch is pressed, the roof opening panel switch grounds circuit CPR38 (WH/BU) and the roof opening sliding glass panel motor/module opens the roof opening panel sliding glass to the VENT position.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Roof opening panel switch
- Roof opening sliding glass panel motor/module
- Roof opening sliding glass panel motor not initialized

PINPOINT TEST F: THE ROOF OPENING PANEL DOES NOT OPEN IN THE VENT POSITION

F1 CHECK THE ROOF OPENING SLIDING GLASS PANEL MOTOR FOR INITIALIZATION

- Carry out the roof opening panel motor initialization procedure. Refer to **Roof Opening Panel Motor Initialization**.
- **Is the concern still present?**

  YES : Go to F2.

  NO : The system is operating normally at this time. The roof opening sliding glass panel motor was not initialized.

F2 CHECK THE ROOF OPENING PANEL SWITCH

- Key in OFF position.
- Disconnect: Roof Opening Panel Switch C912
- Carry out the roof opening panel switch component test. Refer to COMPONENT TESTING.
- **Did the roof opening panel switch pass the component test?**

  YES : Go to F3.

  NO : INSTALL a new roof opening panel switch. REFER to **Roof Opening Panel Control Switch**. TEST the system for normal operation.

F3 CHECK CIRCUIT CPR38 (WH/BU) FOR AN OPEN

- Disconnect: Roof Opening Panel Motor/Module C920

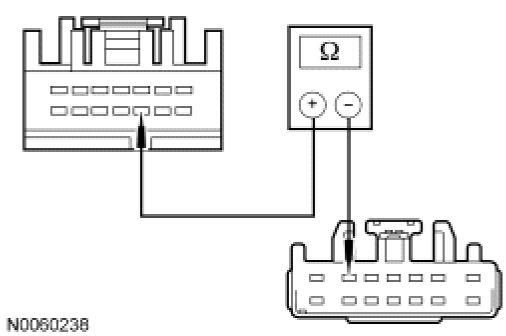

Fig. 6: Measuring Resistance Between Roof Opening Panel Switch C912-10, Circuit CPR38 (WH/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel switch C912-10, circuit CPR38 (WH/BU), harness side and roof opening panel motor/module C920-6, circuit CPR38 (WH/BU) harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F4.

  NO : REPAIR the circuit. TEST the system for normal operation.

F4 CHECK THE ROOF OPENING PANEL MOTOR WIRING HARNESS

- Check the roof opening panel motor wiring harness for loose pins, an open or a short between roof opening panel motor/module C920-6, circuit CPR38, component side and the roof opening panel motor wiring harness socket.
- **Is the roof opening panel motor wiring harness OK?**

  YES : Go to F5.

NO : INSTALL a new roof opening panel motor wiring harness. REFER to **Roof Opening Panel Motor Wiring Harness**. INITIALIZE the roof opening panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

F5 CHECK THE ROOF OPENING SLIDING GLASS PANEL MOTOR/MODULE FOR CORRECT OPERATION

- Disconnect all roof opening panel motor/module connectors.
- Check for:
    - corrosion.
    - bent or pushed-out pins.
- Connect all roof opening panel motor/module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new roof opening sliding glass panel motor/module. REFER to **Roof Opening Panel Motor - Sliding Front Panel**. INITIALIZE the roof opening sliding glass panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test G: The Roof Opening Panel Shade Does Not Open or Close - Both Shades

The roof opening panel shade motor/module must be initialized whenever the roof opening panel shade motor/module has been removed from the roof opening panel system, the roof opening panel module assembly has been removed from the vehicle, a new roof opening panel shade motor/module has been installed or a new roof opening panel module assembly has been installed. Refer to **Roof Opening Panel Motor Initialization**.

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Roof Opening Panel for schematic and connector information.

Normal Operation

The roof opening panel shade uses an integrated motor and module to operate the roof opening panel shades.

The roof opening panel shade motor/module receives voltage through circuit SBB18 (YE/RD). When the key is in the ACC or RUN position, the roof opening panel motor/module sends a signal to the roof opening panel shade motor/module. Ground is supplied to the roof opening panel shade motor/module through circuit GD133 (BK). The roof opening panel switch receives ground from the roof opening panel motor/module assembly through circuit GD133 (BK). When the roof opening panel shade OPEN switch is pressed, the roof opening panel switch grounds circuit CPR37 (YE/GY) and the roof opening panel shade motor/module opens the roof opening panel shade. When the roof opening panel shade CLOSE switch is pressed, the roof opening panel switch grounds circuit CPR32 (YE/GN) and the roof opening panel shade motor/module closes the roof opening panel shade.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Open in voltage or ground circuit of the overhead jumper harness
- Roof opening panel switch
- Roof opening panel shade panel motor/module
- Roof opening panel shade motor not initialized

PINPOINT TEST G: THE ROOF OPENING PANEL SHADE DOES NOT OPEN OR CLOSE - BOTH SHADES

G1 CHECK THE ROOF OPENING PANEL SHADE MOTOR FOR INITIALIZATION

- Carry out the roof opening panel motor initialization procedure. Refer to **Roof Opening Panel Motor Initialization**.
- **Is the concern still present?**

  YES : Go to G2.

  NO : The system is operating normally at this time. The roof opening panel shade motor was not initialized.

G2 CHECK THE ROOF OPENING PANEL SWITCH

- Key in OFF position.
- Disconnect: Roof Opening Panel Switch C912
- Carry out the roof opening panel switch component test. Refer to COMPONENT TESTING.
- **Did the roof opening panel switch pass the component test?**

  YES : Go to G3.

  NO : INSTALL a new roof opening panel switch. REFER to **Roof Opening Panel Control Switch**. TEST the system for normal operation.

G3 CHECK CIRCUITS CPR32 (YE/GN) AND CPR37 (YE/GY) FOR AN OPEN

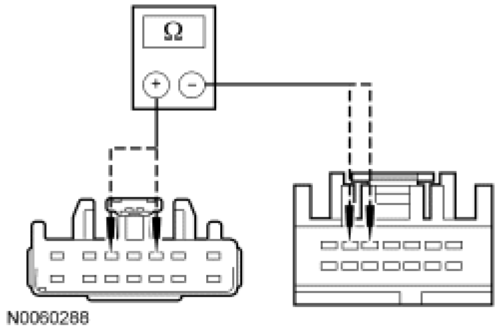

Fig. 7: Measuring Resistance Between Roof Opening Panel Switch C912-5, Circuit CPR32 (YE/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel switch C912-5, circuit CPR32 (YE/GN), harness side and roof opening panel motor/module C920-5, circuit CPR32 (YE/GN) harness side; and between roof opening panel switch C912-6, circuit CPR37 (YE/GY), harness side and roof opening panel motor/module C920-3, circuit CPR37 (YE/GY) harness side

- **Are the resistances less than 5 ohms?**

  YES : Go to G4.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

G4 CHECK CIRCUITS CPR32 (YE/GN) AND CPR37 (YE/GY) FOR A SHORT TO GROUND

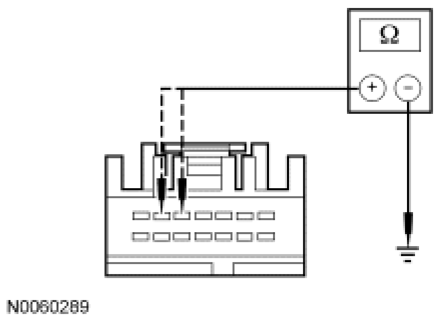

Fig. 8: Measuring Resistance Between Roof Opening Panel Switch C912-5, Circuit CPR32 (YE/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel switch C912-5, circuit CPR32 (YE/GN), harness side and ground; and between roof opening panel switch C912-6, circuit CPR37 (YE/GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to G5.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

G5 CHECK THE ROOF OPENING PANEL MOTOR WIRING HARNESS

- Using the following table, check the roof opening panel motor wiring harness for loose pins, an open or a short between roof opening panel motor/module C920 component side and the roof opening panel motor wiring harness socket:

Roof Opening Panel Motor/Module C920	Roof Opening Panel Motor Wiring Harness Socket
C920-1, circuit SBB18	Roof opening panel motor wiring harness

	socket circuit SBB18
C920-13, circuit CBP41	Roof opening panel motor wiring harness socket circuit CBP41
C920-5, circuit CPR32	Roof opening panel motor wiring harness socket circuit CPR32
C920-8, circuit GD133	Roof opening panel motor wiring harness socket circuit GD133
C920-3, circuit CPR37	Roof opening panel motor wiring harness socket circuit CPR37

- **Is the roof opening panel motor wiring harness OK?**

  YES : Go to G6.

  NO : INSTALL a new roof opening motor wiring harness. REFER to **Roof Opening Panel Motor Wiring Harness**. INITIALIZE the roof opening panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

G6 CHECK THE ROOF OPENING PANEL SHADE MOTOR FOR CORRECT OPERATION

- Disconnect all roof opening panel shade motor connectors.
- Check for:
  - corrosion.
  - bent or pushed-out pins.
- Connect all roof opening panel shade motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new roof opening panel shade motor. REFER to **Roof Opening Panel Motor - Shades**. INITIALIZE the roof opening panel shade motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test H: The Express Open/Close is Inoperative

The roof opening sliding glass panel motor/module must be initialized whenever the roof opening sliding glass panel motor/module has been removed from the roof opening panel system, the roof opening panel module assembly has been removed from the vehicle, a new roof opening sliding glass panel motor/module has been installed or a new roof opening panel module assembly has been installed. Refer to **Roof Opening Panel Motor Initialization** .

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Roof Opening Panel for schematic and connector information.

Normal Operation

The roof opening panel uses an integrated motor and module to operate the roof opening panel sliding glass.

The roof opening sliding glass panel motor/module receives voltage from the accessory delay relay through circuit CBP41 (BU) when the key is in the ACC or RUN position and voltage at all times through circuit SBB18 (YE/RD). Ground is supplied to the roof opening sliding glass panel motor/module through circuit GD133 (BK). The roof opening panel switch receives ground from the roof opening panel motor/module assembly through circuit GD133 (BK). When the roof opening panel switch is momentarily pressed to the double detent express open position, the roof opening panel switch grounds circuits CPR31 (VT/BN) and CPR38 (WH/BU) and the roof opening sliding glass panel motor/module opens the roof opening panel sliding glass to the express OPEN position. The roof opening sliding glass panel motor/module also sends a signal to the roof opening panel shade motor/module to open the roof opening panel shade. When the roof opening panel switch is momentarily pressed to the double detent express close position, the roof opening panel switch grounds circuits CPR40 (YE/OG) and CPR31 (VT/BN) and the roof opening sliding glass panel motor/module closes the roof opening panel sliding glass to the CLOSE position.

This pinpoint test is intended to diagnose the following:

- Roof opening panel switch

- Roof opening sliding glass panel motor not initialized

PINPOINT TEST H: THE EXPRESS OPEN/CLOSE IS INOPERATIVE

H1 CHECK THE ROOF OPENING SLIDING GLASS PANEL MOTOR FOR INITIALIZATION

- Carry out the roof opening panel motor initialization procedure. Refer to **Roof Opening Panel Motor Initialization**.
- **Is the concern still present?**

  YES : Go to H2.

  NO : The system is operating normally at this time. The roof opening sliding glass panel motor was not initialized.

H2 CHECK THE ROOF OPENING PANEL SWITCH

- Key in OFF position.
- Disconnect: Roof Opening Panel Switch C912
- Carry out the roof opening panel switch component test. Refer to COMPONENT TESTING.
- **Did the roof opening panel switch pass the component test?**

  YES : Go to H3.

  NO : INSTALL a new roof opening panel switch. REFER to **Roof Opening Panel Control Switch**. TEST the system for normal operation.

H3 CHECK THE ROOF OPENING SLIDING GLASS PANEL MOTOR/MODULE FOR CORRECT OPERATION

- Disconnect all roof opening panel motor/module connectors.
- Check for:
  - corrosion.
  - bent or pushed-out pins.
- Connect all roof opening panel motor/module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new roof opening sliding glass panel motor/module. REFER to **Roof Opening Panel Motor - Sliding Front Panel**. INITIALIZE the roof opening sliding glass panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test I: The Global Open Function is Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Roof Opening Panel for schematic and connector information.

Normal Operation

When the global open feature is activated, the smart junction box (SJB) sends a signal through circuit VPW01 (GN/BU) to the roof opening sliding glass panel motor/module to open the roof opening panel sliding glass to the VENT position. The roof opening sliding glass panel motor/module also sends a signal to the roof opening panel shade motor/module to open the roof opening panel shade. The global open feature does not function when the delayed accessory is active.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Roof opening sliding glass panel motor/module
- SJB
- Remote keyless entry (RKE) transmitters
- Roof opening sliding glass panel motor is not initialized

PINPOINT TEST I: THE GLOBAL OPEN FUNCTION IS INOPERATIVE

I1 VERIFY THE POWER WINDOWS ARE OPERATIONAL

- Operate the power windows using the global open procedure.
- **Do the power windows operate correctly?**

  YES : Go to I2.

  NO : REFER to **GLASS, FRAMES AND MECHANISMS** article to diagnose the inoperative windows.

I2 CHECK CIRCUIT VPW01 (GN/BU) FOR AN OPEN

- Disconnect: Roof Opening Panel Motor/Module C920
- Disconnect: SJB C2280c

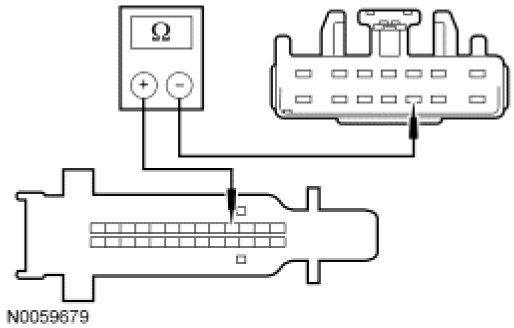

Fig. 9: Measuring Resistance Between Roof Opening Panel Motor/Module C920-10, Circuit VPW01 (GN/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel motor/module C920-10, circuit VPW01 (GN/BU), harness side and SJB C2280C-10, circuit VPW01 (GN/BU) harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to I3.

NO : REPAIR the circuit. INITIALIZE the roof opening panel motor/module. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

I3 CHECK THE ROOF OPENING PANEL MOTOR WIRING HARNESS

- Check the roof opening panel motor wiring harness for loose pins, an open or a short between roof opening panel motor/module C920-10, circuit VPW01, component side and the roof opening panel sliding glass wiring harness socket.
- **Is the roof opening panel motor wiring harness OK?**

  YES : Go to I4.

  NO : INSTALL a new roof opening panel motor wiring harness. REFER to **Roof Opening Panel Motor Wiring Harness**. INITIALIZE the roof opening panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

I4 CHECK THE ROOF OPENING PANEL MOTORS/MODULES FOR CORRECT OPERATION

- Disconnect all roof opening panel motor/module connectors.
- Check for:
  - corrosion.
  - bent or pushed-out pins.
- Connect all roof opening panel motor/module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : For an inoperative roof opening sliding glass panel motor, INSTALL a new roof opening sliding glass panel motor. REFER to **Roof Opening Panel Motor - Sliding Front Panel**. For an inoperative roof opening panel shade motor, INSTALL a new roof opening panel shade motor. REFER to **Roof Opening Panel Motor - Shades**. INITIALIZE the roof opening panel motors/modules. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

GENERAL PROCEDURES

ROOF OPENING PANEL MOTOR INITIALIZATION

WARNING: **Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.**

NOTE: New roof opening panel glass motor/shade motors must be initialized after installation.

NOTE: An de-initialized glass or shade motor will stutter step open when their

respective open switches are pressed.

NOTE: The glass close switch must be held during the entire initialization process or the sequence will be aborted and the roof will remain in a de-initialized state.

For a new drive assembly

NOTE: If installing a new roof opening panel shade motor assembly, use the existing drive assembly procedure.

1. Start the engine.
2. Press and hold the glass close switch.
   - The glass panel will move toward the front hard-stop, stall and then move backward a few millimeters and then forward.
   - The shade panels will move toward their front hard-stops, stall, move back a few millimeters, then forward.
   - After the shade panels have finished moving backward and forward, release the glass close switch.
3. Repress and hold the glass close switch while the glass and shades fully open and fully close.
4. Initialization is now complete. Verify successful initialization by carrying out one-touch open, one-touch close, one-touch vent (glass) and one-touch open for the shades.
   - If roof opening panel does not operate correctly, repeat Steps 2 through 4.

   For an existing drive assembly

5. Start the engine.
6. Press and hold the glass close switch until the glass is in CLOSED position.
7. Release, repress and hold the glass close switch (for at least 10 seconds).
   - The glass panel will move toward the front hard-stop and stall.
   - The shade panels will move toward their front hard-stops, stall, move back a few millimeters, then forward.
   - After the shade panels have finished moving backward and forward, release the glass close switch.
8. Press and hold the glass close switch.
   - The glass and shades will fully open together. Then, the glass will close first and then the shades will return to the fully CLOSED position. When the shades have stopped moving, release the glass close switch.
9. Initialization is now complete. Verify successful initialization by carrying out one-touch open, one-touch close, one-touch vent (glass) and one-touch open for the shades.
   - If roof opening panel does not operate correctly, repeat Steps 6 through 9.

TIMING ADJUSTMENT

NOTE: Anytime a roof opening panel glass/shade motor is removed, the cables/mechanisms can experience free-play movement. It is important that the cables do not move. The mechanisms are timed to be parallel with each other. If one or both are moved in either direction, they must be re-timed.

Roof Opening Panel - Sliding Glass Panel

1. Remove the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
2. Remove the roof opening panel sliding glass motor. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel**.
3. Manually move the sliding front glass mechanisms forward until they are flush against the track hard-stops.
4. Reinstall the roof opening panel sliding glass motor. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel**.
5. With the roof opening panel sliding glass still removed, initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

   NOTE: Press the glass open switch to move the mechanisms rearward to allow installation of the sliding glass panel.

   NOTE: It will be necessary to carry out the initialization procedure again after the glass panel is installed.

6. Install the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.

   Roof Opening Panel - Shades

7. Remove the roof opening panel shade motor. For additional information, refer to **Roof Opening Panel Motor - Shades**.
8. Carefully move the front and rear shades rearward to the fully OPEN position by pushing at the edges closest to the tracks.
9. Reinstall the roof opening panel shade motor. For additional information, refer to **Roof Opening Panel Motor - Shades**.
10. Initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

WATER DRAINAGE SYSTEM CHECK AND WATER LEAK CORRECTIONS

1. The roof opening panel module assembly has 2 drain channels which are located under the side trim panels to direct water externally to the front and rear corners of the roof. There are no drain hoses in this system.

If a drainage system blockage or obstruction is suspected, pour a small amount of water into the suspected drain channel while observing the front and rear channel openings for any water flow restriction. Attempt to clear any blockage or obstruction using compressed air at the front or rear opening of the drain channel.

If the blockage or obstruction cannot be cleared, the roof opening panel front trim and/or side trim must be removed to gain full access to the drain channel. For additional information, refer to **Roof Opening Panel Trim - Front** and **Roof Opening Panel Trim - Side**.

2. For water leak corrections, refer to the Diagnosis and Testing procedure in this service information.

ROOF OPENING PANEL MANUAL OPERATION

1. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

NOTE: Roof opening sliding glass panel motor shown, shade motor similar.

2. Insert an Allen wrench into the center of the manual drive hole of the roof opening panel motor(s). Rotate the Allen wrench counterclockwise to close the roof opening panel glass/shades or clockwise to open the roof opening panel glass/shades.

3	W790073	Rear shade track-to-housing fasteners (3 required per side)
3	W790082	Service replacement fasteners for W790073 (use only if threaded hole becomes stripped during assembly)
4	W790073	Rear shade track-to-drive tube bracket screws (1 required per side)
4	W790082	Service replacement fasteners for W790073 (use only if threaded hole becomes stripped during assembly)
5	78500B01 LH/78500B02 RH	Rear shade track and mechanism assembly
6	W790075	Stop screw (1 required per side)

NOTE: LH shown, RH similar.

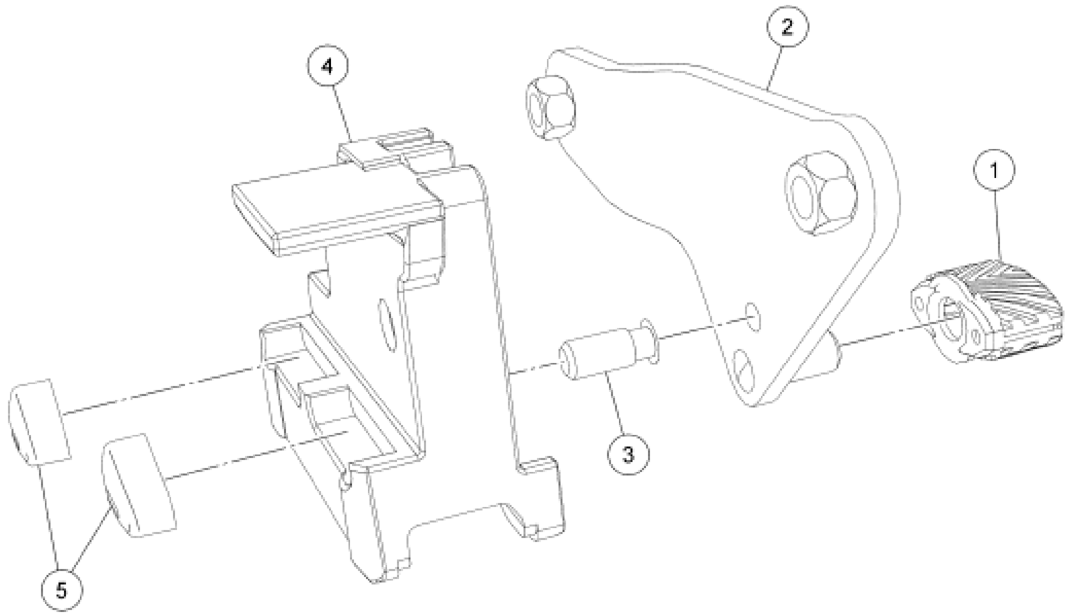

Fig. 20: Front Guide Track Mechanism
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Outer guide foot (PIA to guide track and mechanism assembly)
2	-	Sliding glass bracket (PIA to guide track and mechanism assembly)
3	-	Sliding glass bracket pin (PIA to guide track and mechanism assembly)
4	-	Guide mechanism (PIA to guide track and mechanism assembly)
5	-	Inner guide feet (2 required per side) (PIA to guide track and mechanism assembly)

1. For additional information, refer to the individual procedures in this service information.

AIR DEFLECTOR

REMOVAL AND INSTALLATION

NOTE: There may be a special service replacement fastener available if a screw hole

becomes stripped during installation. For additional information, refer to Roof Opening Panel - Exploded View .

1. Position the roof opening panel glass to the full OPEN position.
2. Remove the 2 air deflector-to-track screws and air deflector arm capture plate.

NOTE: If the nut plate(s) becomes stripped during installation, a new nut plate can be installed. For additional information, refer to Roof Opening Panel - Exploded View.

- To install, tighten to 2 N.m (18 lb-in).

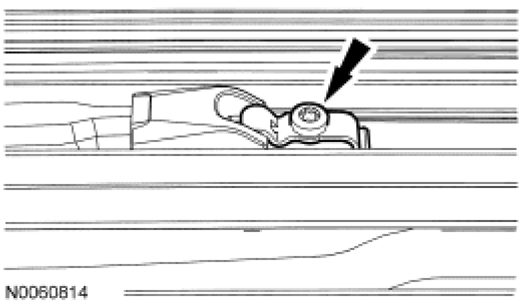

Fig. 21: Identifying Air Deflector-To-Track Screws
Courtesy of FORD MOTOR CO.

3. Remove the 6 air deflector catcher bracket screws.
   - To install, tighten to 2 N.m (18 lb-in).

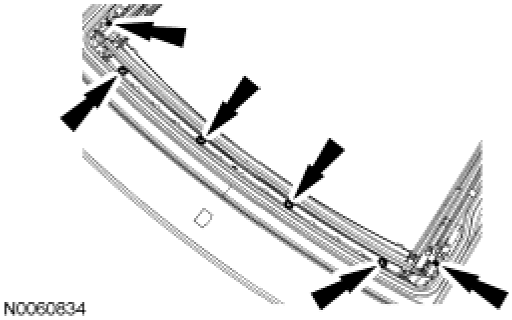

Fig. 22: Locating Air Deflector Catcher Bracket Screws
Courtesy of FORD MOTOR CO.

4. Remove the air deflector assembly.
5. To install, reverse the removal procedure.

ROOF OPENING PANEL CONTROL SWITCH

REMOVAL AND INSTALLATION

1. Remove the overhead console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Disengage the clips and remove the switch from the overhead console.
3. To install, reverse the removal procedure.

ROOF OPENING PANEL BLIND

REMOVAL AND INSTALLATION

1. Open the roof opening panel to the VENT position.
2. Detach the top of the concertina blind from the moving glass frame.
3. Open the roof opening panel to the fully OPEN position.
4. Detach the bottom of the concertina blind from the guide track and remove the blind.
    - To install, the blind should be attached to the guide track in the most forward position.
5. To install, reverse the removal procedure.

ROOF OPENING PANEL GLASS - FRONT SLIDING

REMOVAL AND INSTALLATION

1. Open the roof opening panel to the VENT position.
2. Detach the top of the concertina blind from the moving glass frame.
3. Reposition the sliding glass panel to any position rearward of VENT position.
4. Remove the 4 roof opening panel glass front screws.
    - To install, tighten to 8 N.m (71 lb-in).

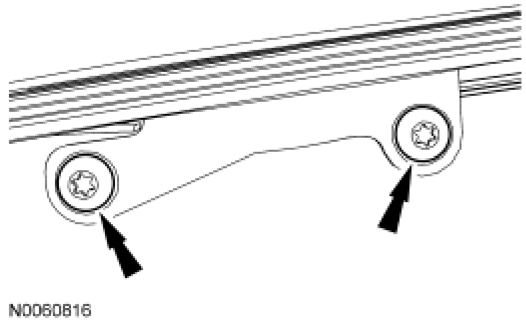

Fig. 23: Identifying Roof Opening Panel Glass Front Screws
Courtesy of FORD MOTOR CO.

5. Remove the 2 roof opening panel glass rear screws.
    - To install, tighten to 8 N.m (71 lb-in).

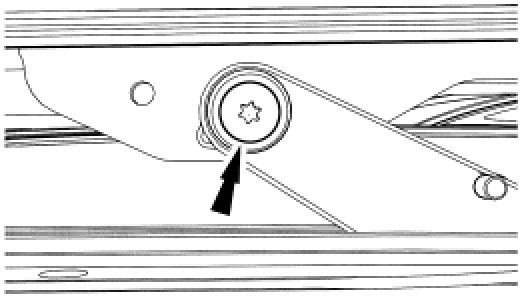

Fig. 24: Identifying Roof Opening Panel Glass Rear Screws
Courtesy of FORD MOTOR CO.

NOTE: It is possible for the idler mechanism to move freely once the glass panel is removed. Do not move the idler rearward or it may disengage from the idler track.

6. Carefully remove the roof opening panel glass.
7. To install, reverse the removal procedure.
   - Initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL GLASS - REAR FIXED

Special Tools

Illustration	Tool Name	Tool Number
	The Pumper	164-R2459 or equivalent
	Rotunda Interior Auto Glass Cut-Out Knife Kit	164-R2450 or equivalent

Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Dow Urethane One Step Glass Primer Betaprime® 5500/5500A/5500SA	-
Sika Urethane Adhesive	

Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

REMOVAL

1. Remove the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
2. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Remove the rear fixed glass interior trim ring. For additional information, refer to **Roof Opening Panel Trim - Fixed Glass, Interior**.

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.**

NOTE: Make sure the cutting blades are changed where the cutting depth changes to avoid damage to the body and trim panels.

NOTE: Lubricate the urethane adhesive with water to aid the special tool when cutting the urethane adhesive. Using the special tool, place the flat side of the knife against the rear glass.

NOTE: Using the special tool 164-R2459 (or equivalent), distance the roof opening panel fixed glass from the roof module as needed.

4. Refer to the adhesive path illustration and cut as follows:

   NOTE: Use caution when cutting to prevent damage to the fixed glass front trim seal.

   1. From the inside of the vehicle, start at the front and work towards the front corners.

   NOTE: Use caution when cutting to prevent damage to the side trim seals.

   2. Continue working along the side and towards the rear corners.
   3. Continue around the inside rear adhesive path.

NOTE: **Use caution when cutting along the side to prevent damage to the side trim seals.**

4. From the inside of the vehicle, work along the side of the glass.
5. From the inside of the vehicle, work from the center towards the rear corners.

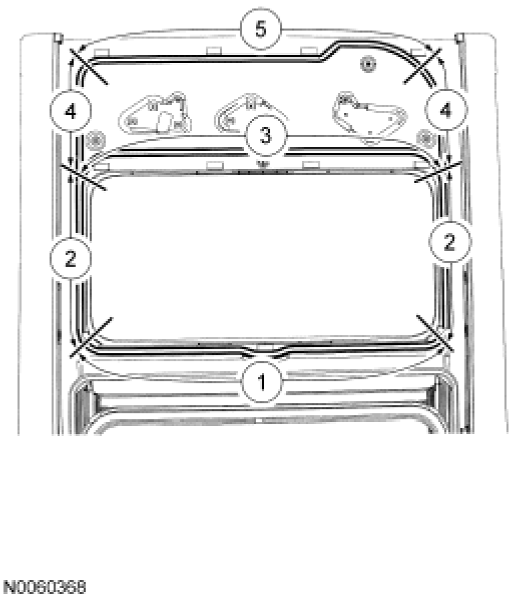

Fig. 25: Identifying Adhesive Path
Courtesy of FORD MOTOR CO.

5. Remove the fixed glass panel assembly.

NOTE: **Make sure the water channel is free from any foreign material.**

6. Using a soft brush or vacuum, remove any dirt or foreign material from the roof opening panel module.

INSTALLATION

NOTE: **For additional material guidelines, refer to the manufacturer's installation information.**

NOTE: **Avoid scratching the painted surfaces. For minor scratches or exposed metal, see the manufacturer's recommendations.**

1. Using an appropriate tool, trim the urethane adhesive leaving a 1-2 mm (0.04-0.08 in) base of original equipment urethane along the roof opening module surface.

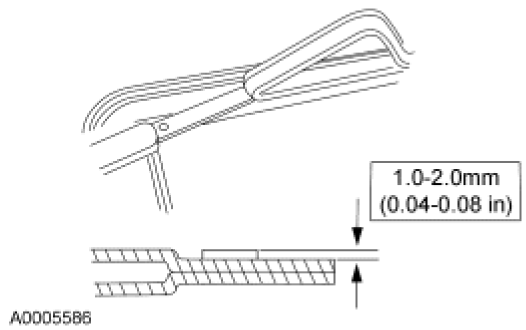

Fig. 26: Trimming Pinch Weld Urethane Adhesive
Courtesy of FORD MOTOR CO.

2. Clean the inside of the glass surface with glass cleaner.

NOTE:	**Be sure to use the same brand of cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. Refer to the Materials Chart in this procedure.**

3. Cut the urethane adhesive applicator tip to the specification.

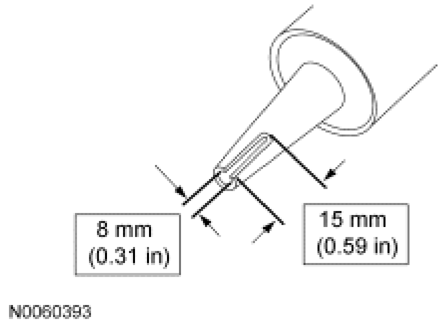

Fig. 27: Cutting Urethane Adhesive Applicator Tip To Specification
Courtesy of FORD MOTOR CO.

NOTE:	**The glass panel must be positioned within 10 minutes of applying the urethane adhesive.**

NOTE:	**Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.**

4. Apply urethane adhesive on top of the existing trimmed urethane adhesive bead. Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

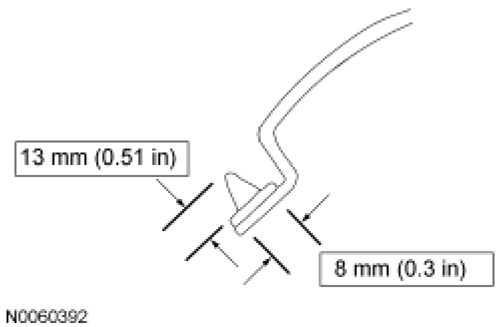

Fig. 28: Making Sure That All Gaps In Urethane Adhesive Are Smoothed Into One Continuous Bead
Courtesy of FORD MOTOR CO.

WARNING: **Do not drive vehicle until the urethane seal has cured. Follow urethane manufacturer's curing directions. Inadequate or incorrect curing of the urethane seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

NOTE: Before positioning the glass panel, open vehicle windows to prevent the air pressure of closing doors from affecting the adhesive bond.

5. Apply the fixed glass panel assembly to the roof module. Work the glass panel down using only vertical pressure.
6. Install the rear fixed glass interior trim ring. For additional information, refer to **Roof Opening Panel Trim - Fixed Glass, Interior**.
7. Install the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
8. Install the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.

ROOF OPENING PANEL GUIDE TRACK AND MECHANISM

REMOVAL

NOTE: There may be a special service replacement fastener available if a screw hole becomes stripped during installation. For additional information, refer to Roof Opening Panel - Exploded View .

1. Remove the roof opening panel blind. For additional information, refer to **Roof Opening Panel Blind**.
2. Remove the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.

NOTE: LH shown, RH similar.

3. Remove the air deflector-to-track screw and air deflector arm capture plate on the affected track.

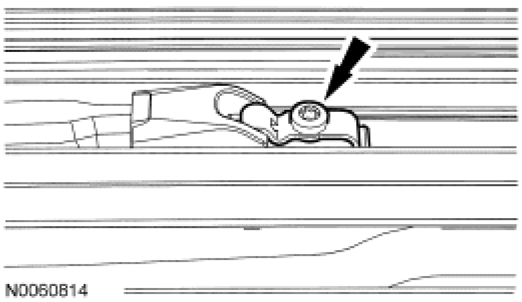

Fig. 29: Identifying Air Deflector-To-Track Screws
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

4. Remove the air deflector catcher bracket outer screw on the affected track.

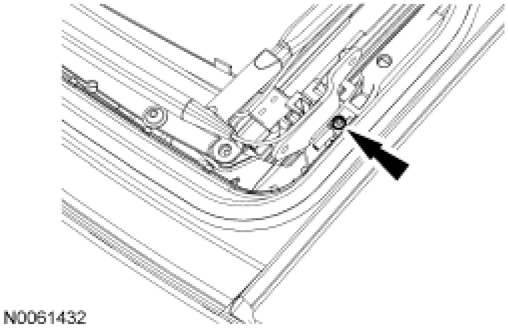

Fig. 30: Locating Air Deflector Catcher Bracket Outer Screw
Courtesy of FORD MOTOR CO.

5. Remove the front shade assembly. For additional information, refer to **Roof Opening Panel Shade Assembly**.
6. Remove the roof opening panel sliding glass motor. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel**.
7. Move the sliding glass mechanism to the full forward position on the affected track.
8. Remove the front drive tube bracket-to-guide-track screw.

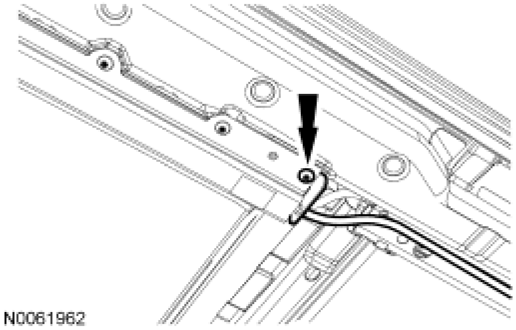

Fig. 31: Locating Front Drive Tube Bracket-To-Guide-Track Screw
Courtesy of FORD MOTOR CO.

NOTE:	**Carefully mark the location of the guide track in 3 places before removing any fasteners. The new guide track must be installed in exactly the same position.**

9. Remove the 8 front track-to-housing screws.

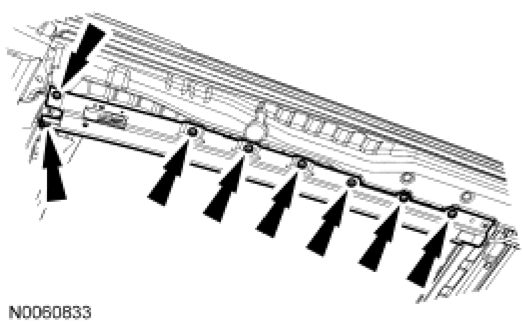

Fig. 32: Locating Front Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE:	**Protect the vehicle interior from grease when cable assembly is withdrawn from the drive tube.**

10. Drop the front of the guide track down while sliding the entire track and mechanism assembly forward and down. The drive cable will slowly withdraw from the drive tube until the entire assembly is free.

INSTALLATION

NOTE:	**Protect the vehicle interior from grease when cable assembly is inserted into the drive tube.**

1. While holding the track and mechanism assembly, slowly insert the sliding glass drive cable into the drive tube. Insert the shade cable into the track and make sure the front drive tube bracket is fully seated into the track assembly.

2. Install the 8 front track-to-housing screws.
    - Align the track to the marks previously made. Tighten to 5 N.m (44 lb-in).

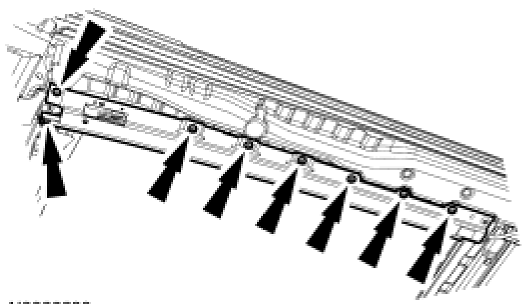

Fig. 33: Locating Front Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

3. Install the front drive tube bracket-to-guide-track screw. Tighten to 5 N.m (44 lb-in).

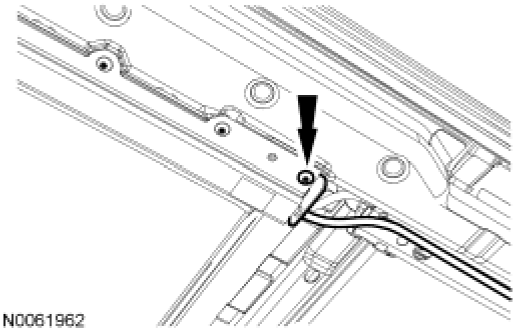

Fig. 34: Locating Front Drive Tube Bracket-To-Guide-Track Screw
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

4. Install the air deflector catcher bracket outer screw on the affected track.
    - Tighten to 2 N.m (18 lb-in).

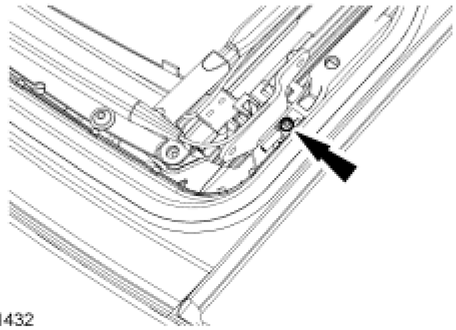

Fig. 35: Locating Air Deflector Catcher Bracket Outer Screw
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

5. Install the air deflector-to-track screw and air deflector arm capture plate on the affected track.

   NOTE: If the nut plate(s) becomes stripped during installation, a new nut plate can be installed. For additional information, refer to Roof Opening Panel - Exploded View.

   - Tighten to 2 N.m (18 lb-in).

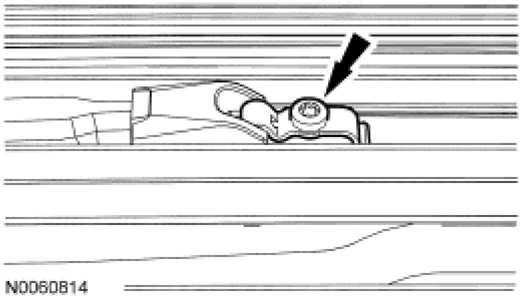

Fig. 36: Identifying Air Deflector-To-Track Screws
Courtesy of FORD MOTOR CO.

6. Attach the bottom of the concertina blind to the guide track in the most forward position.

NOTE: Do not install the headliner at this time.

7. Install the front shade assembly but do not carry out the roof opening panel motor initialization. For additional information, refer to **Roof Opening Panel Shade Assembly**.
8. Re-time the roof opening panel. For additional information, refer to **Timing Adjustment**.

ROOF OPENING PANEL IDLER TRACK MECHANISM

REMOVAL AND INSTALLATION

1. Remove the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
2. Remove the roof opening panel side trim. For additional information, refer to **Roof Opening Panel Trim - Side**.
3. Carefully slide the idler link forward and out of the front of the track.

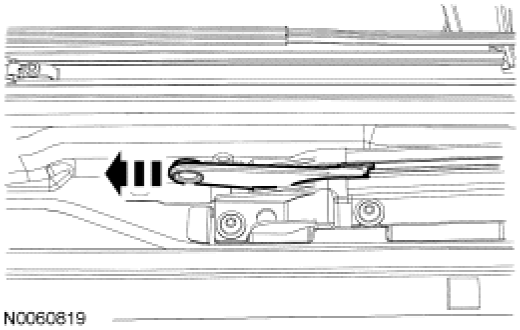

Fig. 37: Sliding Idler Link Forward & Out Of Front Of Track
Courtesy of FORD MOTOR CO.

NOTE: Make sure the idler mechanism guide shoes are compressed and aligned correctly during installation. The guide shoes cannot be serviced separately.

4. To install, reverse the removal procedure.

ROOF OPENING PANEL IDLER TRACK AND MECHANISM

REMOVAL

NOTE: There may be a special service replacement fastener available if a screw hole becomes stripped during installation. For additional information, refer to Roof Opening Panel - Exploded View .

1. Remove the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
2. Remove the roof opening panel side trim. For additional information, refer to **Roof Opening Panel Trim - Side**.
3. If installing a new roof opening panel idler track, carefully slide the idler link forward and out of the track.

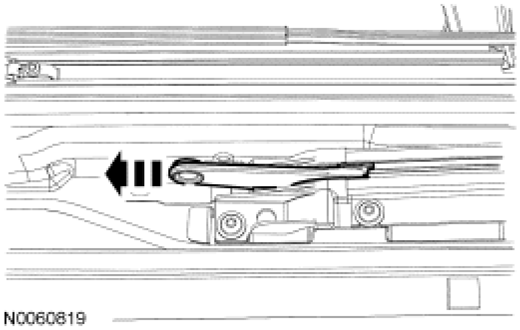

Fig. 38: Sliding Idler Link Forward & Out Of Front Of Track
Courtesy of FORD MOTOR CO.

NOTE: **Carefully mark the location of the idler track in 3 places before removing any fasteners. The new idler track must be installed in exactly the same position.**

NOTE: **LH shown, RH similar.**

4. Remove the 6 rear idler track-to-housing screws.

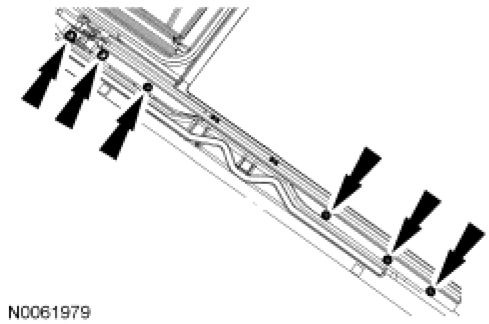

Fig. 39: Locating Rear Idler Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **The center rear idler track-to-housing screws will be captured inside the track rail. In some cases, it may be necessary to lift rails to completely remove screws from roof threads to allow idler track removal.**

5. Completely loosen the 2 center rear idler track-to-housing screws.

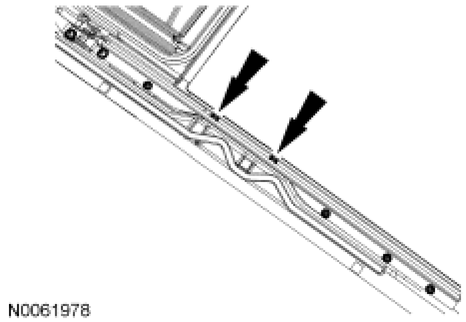

Fig. 40: Locating Center Rear Idler Track-To-Housing Screw
Courtesy of FORD MOTOR CO.

6. Slide track rearward to disengage front clip and remove assembly.
7. Remove the 2 center rear idler track-to-housing screws from the idler track.

INSTALLATION

1. Install the 2 center rear idler track-to-housing screws into the roof opening module by hand. Make sure

they are seated all the way.

2. If slots are not already present in the idler track, the idler track will need to be modified prior to installation. Using a small die grinder or equivalent, cut 2 clearance slots on the inside edge of the idler track to the specification shown.

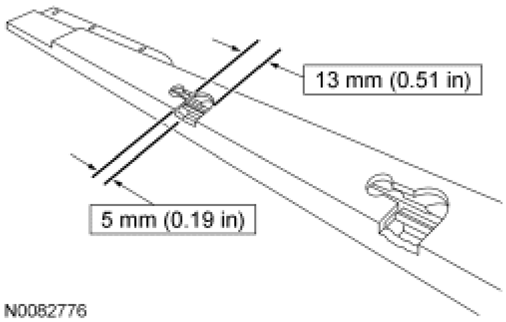

Fig. 41: Identifying Idler Track
Courtesy of FORD MOTOR CO.

3. Position the idler track into the roof module. The slots will allow clearance of the 2 center rear idler track-to-housing screws.
4. Loosen the 2 center rear idler track-to-housing screws as necessary to allow the idler track to slide forward to engage the front clip.
   - Align the idler track to the alignment marks made previously.
5. Install the remaining 6 rear idler track-to-housing screws and tighten to 4 Nm (35 lb-in).

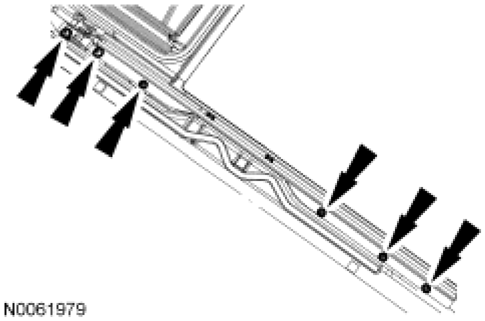

Fig. 42: Locating Rear Idler Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

6. Tighten the 2 center rear idler track-to-housing screws to 4 Nm (35 lb-in).

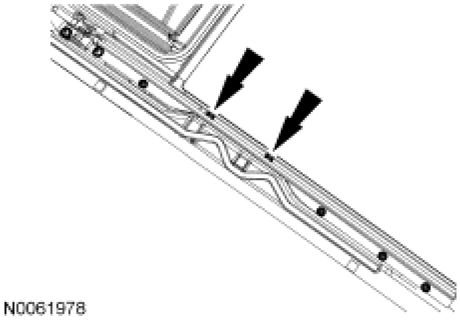

Fig. 43: Locating Center Rear Idler Track-To-Housing Screw
Courtesy of FORD MOTOR CO.

7. If installing a new roof opening panel idler track, install the link into the idler track. Make sure the idler mechanism guide shoes are compressed and aligned correctly during installation.
8. Install the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
9. Test the operation of the roof opening panel. If roof opening panel glass appears to bind or move slowly, remove the roof opening panel sliding glass and repeat Steps 4 through 8.
10. Install the roof opening panel side trim panel. For additional information, refer to **Roof Opening Panel Trim - Side**.

ROOF OPENING PANEL MODULE

Special Tools

Illustration	Tool Name	Tool Number
	Rotunda Interior Auto Glass Cut-Out Knife Kit	164-R2450 or equivalent

Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Dow Urethane One Step Glass Primer Betaprime® 5500/5500A/5500SA	-
Sika Urethane Adhesive Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-

REMOVAL

NOTE: If installing a new roof opening panel module assembly, the following components will need to be transferred from the original assembly: concertina blinds, front and rear shade assemblies, roof opening panel sliding glass, roof opening panel shade motor and roof opening panel sliding glass motor.

1. Remove the ditch moldings and clip strips.
2. Remove the concertina blinds. For additional information, refer to **Roof Opening Panel Blind**.
3. Remove the roof opening sliding glass panel. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
4. Remove the air deflector assembly. For additional information, refer to **Air Deflector**.
5. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
6. Remove the roof opening panel front trim. For additional information, refer to **Roof Opening Panel Trim - Front**.
7. Remove the roof opening panel side trim panels. For additional information, refer to **Roof Opening Panel Trim - Side**.
8. Disconnect the roof opening panel electrical harness connector.

   NOTE: Do not open the liftgate during this procedure.

   NOTE: Make sure the cutting blades are changed where the cutting depth changes to avoid damage to the body and trim panels.

   NOTE: Lubricate the urethane adhesive with water to aid the special tool when cutting the urethane adhesive. Using the special tool, place the flat side of the knife against the roof module.

9. Refer to the adhesive path illustration and cut as follows:

   NOTE: Use caution when cutting to prevent damage to the windshield glass seal.

   1. From the outside of the vehicle, start at the center and work towards the front corners and around the locator pin.

      NOTE: Add wedges as necessary to separate the roof opening panel module from the body to relieve pressure on the cutting blade.

   2. From the outside of the vehicle, continue working along the side and towards the rear corners.

      NOTE: Add wedges as necessary to separate the roof opening panel module from the body to relieve pressure on the cutting blade.

3. From the inside of the vehicle, work from the center towards the rear corners and around the rear locator pin.

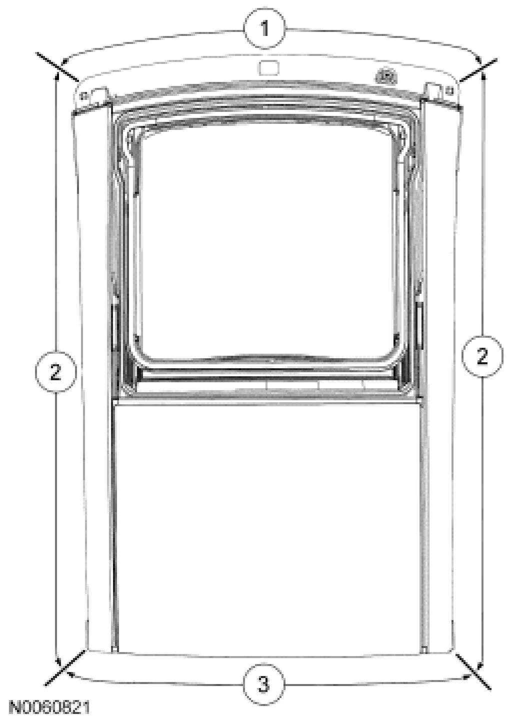

Fig. 44: Identifying Adhesive Path On Vehicle
Courtesy of FORD MOTOR CO.

10. With the aid of an assistant, remove the roof opening panel module assembly.

INSTALLATION

NOTE: **When installing urethane-installed parts, the vehicle must not be driven until the urethane has cured. Adequate cure time is specified on the drive away chart for each urethane product as the temperatures and humidity vary. Inadequate or incorrect curing can adversely affect the retention of the roof opening panel module assembly.**

NOTE: **For additional material guidelines, refer to the manufacturer's installation information.**

NOTE: **Avoid scratching the painted surfaces. For minor scratches or exposed metal, see the manufacturer's recommendations.**

1. Using an appropriate tool, trim the urethane adhesive leaving no more than 1 mm (0.03 in) base of original equipment urethane along the roof opening module body mounting surface.

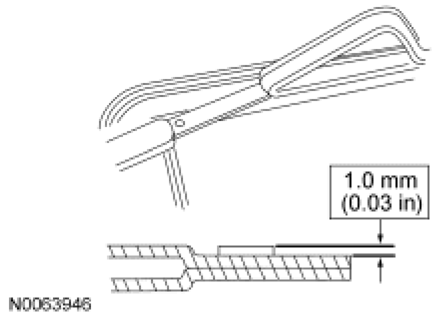

Fig. 45: Trimming Urethane Adhesive Leaving No More Than 1 Mm (0.03 in) base of original equipment urethane
Courtesy of FORD MOTOR CO.

2. Using a soft brush or vacuum, remove any dirt or foreign material from the vehicle body roof opening panel module flanges.
3. Make sure the locator pin holes are cleared of any foreign material which would affect installation of the new roof opening panel module.

NOTE: **Be sure to use the same brand of cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. Refer to the Materials Chart in this procedure.**

4. Cut the urethane adhesive applicator tip to the specification.

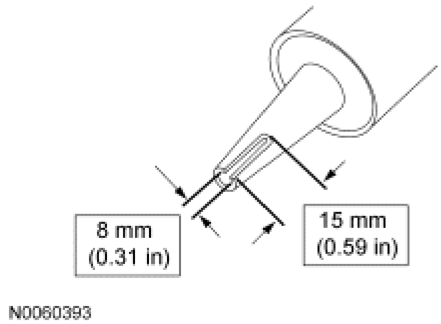

Fig. 46: Cutting Urethane Adhesive Applicator Tip To Specification
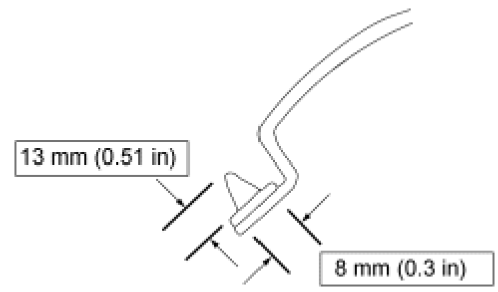
Courtesy of FORD MOTOR CO.

NOTE: **Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.**

5. Apply urethane adhesive on top of the existing trimmed urethane adhesive bead. Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.



N0060392

Fig. 47: Making Sure That All Gaps In Urethane Adhesive Are Smoothed Into One Continuous Bead
Courtesy of FORD MOTOR CO.

6. Install the roof opening panel module assembly.

    NOTE: Make sure the roof opening panel module assembly does not come into contact with the adhesive bead.

    1. With the aid of assistants, hold the roof opening panel module assembly approximately 50.8 mm (2 in) over the body structure.
    2. Line up the locator pin to the front hole and rear guide pin to the rear hole.

    NOTE: Make sure the windshield molding does not get pinched under the roof opening panel module assembly.

    NOTE: Make sure the roof opening panel module is lowered straight down and does not shift.

    3. Carefully lower the roof opening panel module assembly into position on the body.

NOTE: When installing urethane-installed parts, the vehicle must not be driven until the urethane has cured. Adequate cure time is specified on the drive away chart for each urethane product as the temperatures and humidity vary. Inadequate or incorrect curing can adversely affect the retention of the roof opening panel module assembly.

7. Firmly apply downward pressure to the entire sealing edges of the roof opening panel module assembly to make sure it is seated correctly.
8. Install the air deflector assembly. For additional information, refer to **Air Deflector**.
9. Attach the bottom of the concertina blind to the guide track in the most forward position.

NOTE: Do not install the headliner at this time.

10. If installing a new roof opening panel module assembly, install the front and rear shade assemblies but do

not carry out the roof opening panel motor initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Shades**.

11. Manually move the sliding front glass mechanisms forward until they are flush against the track hard-stops.
12. Carefully move the front and rear shades rearward to the fully OPEN position by pushing at the edges closest to the tracks.

NOTE: Do not install the headliner at this time.

13. Install the roof opening panel shade motor but do not carry out the roof opening panel motor initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Shades**.

NOTE: Do not install the headliner at this time.

14. Install the roof opening panel sliding glass motor but do not carry out the roof opening panel motor initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel**.
15. Connect the roof opening panel electrical harness connector.
16. Install the antenna. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
17. Install the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
18. With the roof opening sliding glass panel still removed, initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

NOTE: Press the glass open switch to move the mechanisms rearward to allow installation of the sliding glass panel.

NOTE: It will be necessary to carry out the initialization procedure again after the glass panel is installed.

19. Install the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
20. Install the ditch moldings and clip strips.

ROOF OPENING PANEL MOTOR BLOCK AND DRIVE TUBE ASSEMBLY - SHADES

REMOVAL

NOTE: There may be a special service replacement fastener available if a screw hole becomes stripped during installation. For additional information, refer to Roof Opening Panel - Exploded View .

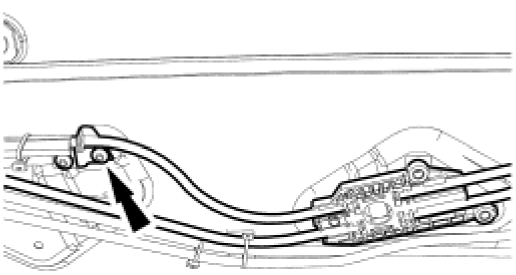
1. Remove the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel**

Glass - Front Sliding.

2. Remove the front and rear shade assemblies. For additional information, refer to **Roof Opening Panel Motor - Shades**.
3. Remove the roof opening panel shade motor. For additional information, refer to **Roof Opening Panel Motor - Shades**.
4. Remove the roof opening panel sliding glass motor. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel**.
5. Manually move the sliding front glass mechanisms and shade mechanisms rearward.

NOTE: LH shown, RH similar.

6. Remove the LH and RH rear drive tube bracket-to-housing screws.

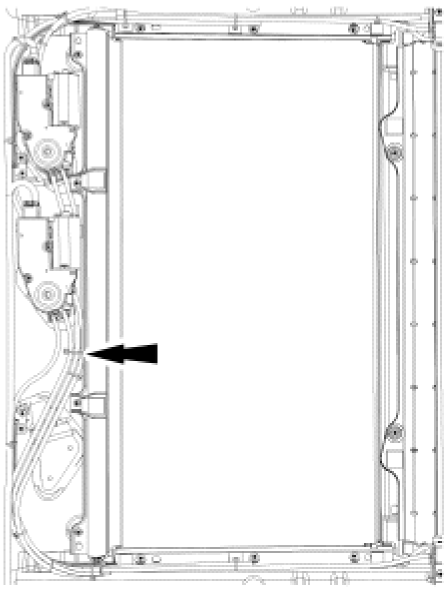


N0062485

Fig. 48: Locating LH & RH Rear Drive Tube Bracket-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: Make note of all the cable wrap locations, they must be reinstalled at the exact same locations.

7. Cut cable wraps to the shade motor block and drive tube assembly.



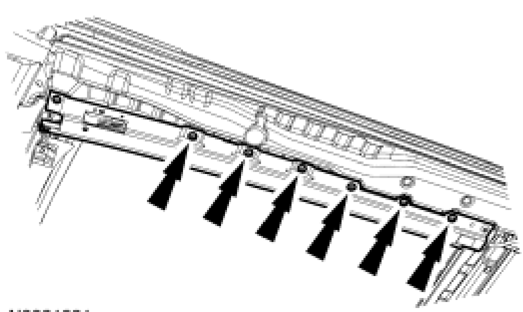
N0060826

Fig. 49: Cutting Cable Wraps To Motor Block & Drive Tube Assembly & Wiring Harness
Courtesy of FORD MOTOR CO.

NOTE:	**LH shown, RH similar.**

NOTE:	**Carefully mark the location of each guide track in 3 places before removing any fasteners. The guide tracks must be installed in exactly the same position.**

8. Remove the LH and RH rear 12 front guide track-to-housing screws.



N0061961

Fig. 50: Locating LH & RH Front Guide Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE:	**Carefully mark the location of each shade track in 3 places before**

removing any fasteners. The shade tracks must be installed in exactly the same position.

NOTE: **LH shown, RH similar.**

9. Remove the LH and RH 6 rear shade track-to-housing screws.

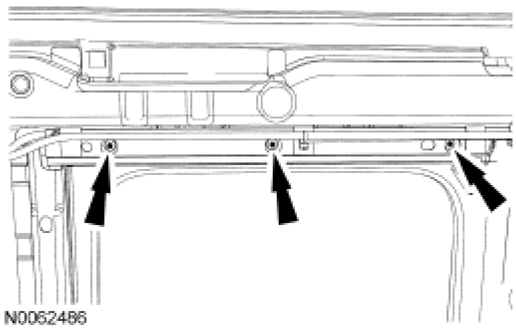


Fig. 51: Locating LH & RH Rear Shade Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **Support the sliding glass motor block and drive tube assembly.**

NOTE: **Protect the vehicle interior from cable grease.**

10. With the rear of the front guide tracks lowered, carefully pull the front shade guide feet out of the rear of the front guide tracks to release the cable. Remove the shade tracks and the motor block and tube assembly as one unit.

NOTE: **LH shown, RH similar.**

11. Remove the LH and RH rear shade track-to-drive tube bracket screws and pull the motor block tube out of the shade track.

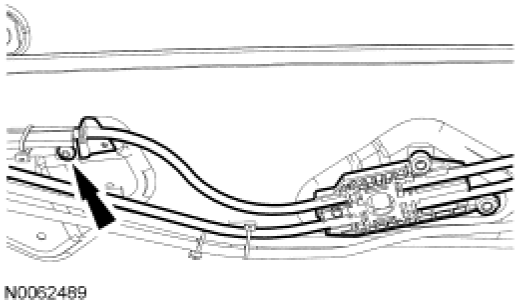

Fig. 52: Locating LH & RH Rear Shade Track-To-Drive Tube Bracket Screws
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

12. Remove the LH and RH rear shade track stop screws.

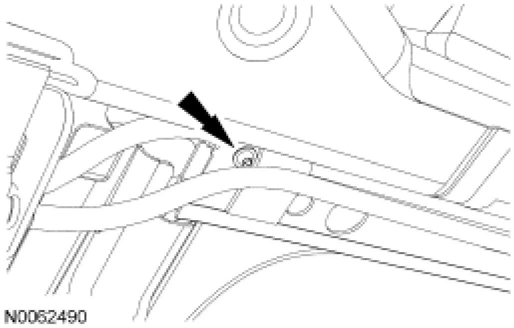

Fig. 53: Locating LH & RH Rear Shade Track Stop Screws
Courtesy of FORD MOTOR CO.

NOTE: **If installing a new LH or RH rear shade track, use the cable supplied with the replacement unit.**

13. Pull the shade cables through the front of the shade track assemblies.

INSTALLATION

NOTE: **If installing a new LH or RH rear shade track, use the cable supplied with the replacement unit.**

1. Feed the shade cables through the front of the shade track assemblies.

NOTE: **LH shown, RH similar.**

2. Install the LH and RH rear shade track stop screws.

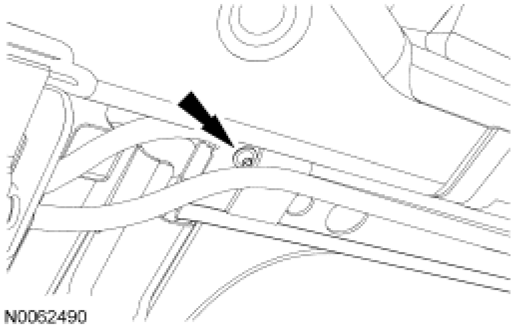

Fig. 54: Locating LH & RH Rear Shade Track Stop Screws
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

3. Push the shade motor block tubes into the rear of the shade track assemblies and install the LH and RH rear shade track-to-drive tube bracket screws.
   - Tighten to 5 N.m (44 lb-in).

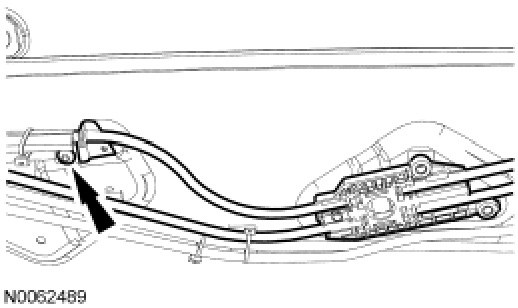

Fig. 55: Locating LH & RH Rear Shade Track-To-Drive Tube Bracket Screws
Courtesy of FORD MOTOR CO.

NOTE: Protect the vehicle interior from cable grease.

NOTE: Make sure the front drive tubes are seated fully into the front guide tracks.

4. Holding the shade tracks and the motor block and tube assembly as one unit, insert the front shade cables into the mechanisms. Move the mechanisms fully into the front guide tracks.

NOTE: LH shown, RH similar.

5. Install the center rear shade track-to-housing screws but do not tighten at this time.

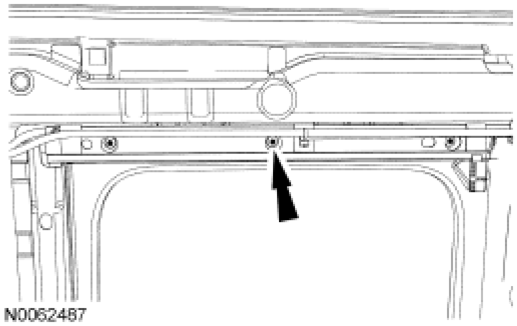

Fig. 56: Locating Center Rear Shade Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

6. Install the LH and RH 12 front guide track-to-housing screws.
   - Align the track to the marks previously made. Tighten to 5 N.m (44 lb-in).

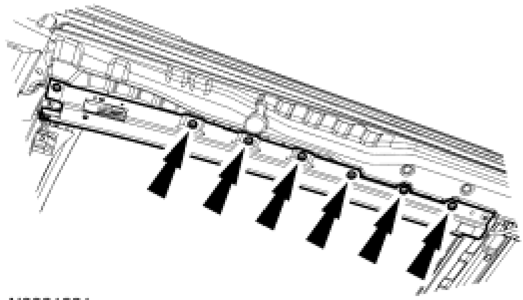

Fig. 57: Locating LH & RH Front Guide Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

7. Install the remaining 4 rear shade track-to-housing screws.
   - Align the track to the marks previously made. Tighten to 5 N.m (44 lb-in).

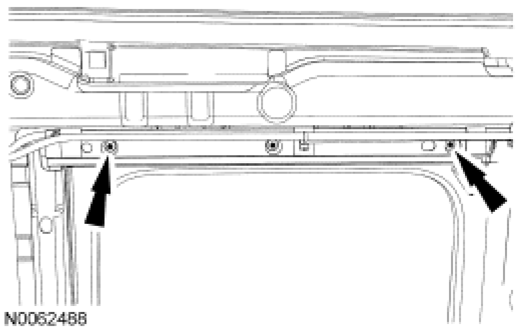

Fig. 58: Locating Rear Shade Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

8. Install the LH and RH rear drive tube bracket-to-housing screws.
   - Tighten to 5 N.m (44 lb-in).

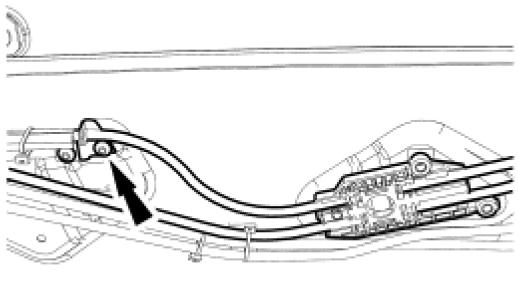

Fig. 59: Locating LH & RH Rear Drive Tube Bracket-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **Be careful not to overtighten cable wraps during assembly to prevent crimping the cable sheath.**

NOTE: **The cable wraps must be reinstalled at the exact same locations.**

9. Install new cable wraps to the shade motor block and drive tube assembly.

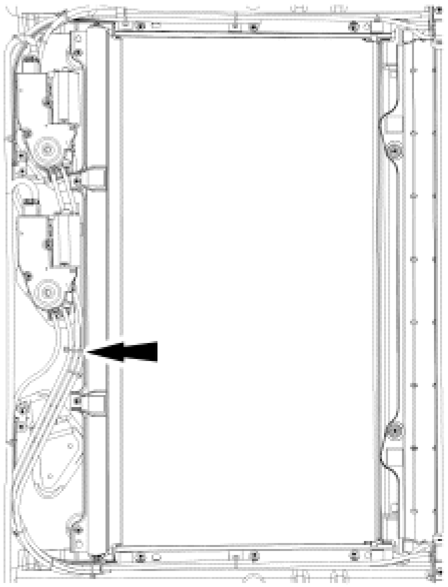

Fig. 60: Cutting Cable Wraps To Motor Block & Drive Tube Assembly & Wiring Harness
Courtesy of FORD MOTOR CO.

NOTE: **Do not install the headliner at this time.**

10. Install the front and rear shade assemblies but do not carry out the roof opening panel motor initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Shades**.
11. Manually move the sliding front glass mechanisms forward until they are flush against the track hard-stops.

NOTE: Do not install the headliner at this time.

12. Install the roof opening panel sliding glass motor but do not carry out the initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel** .
13. Carefully move the front and rear shades rearward to the fully OPEN position by pushing at the edges closest to the tracks.
14. Install the roof opening panel shade motor but do not carry out the initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Shades**.
15. With the roof opening sliding glass panel still removed, initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

NOTE: Press the glass open switch to move the mechanisms rearward to allow installation of the sliding glass panel.

NOTE: It will be necessary to carry out the initialization procedure again after the glass panel is installed.

16. Install the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.

ROOF OPENING PANEL MOTOR BLOCK AND DRIVE TUBE ASSEMBLY - SLIDING FRONT PANEL

REMOVAL

NOTE: There may be a special service replacement fastener available if a screw hole becomes stripped during installation. For additional information, refer to Roof Opening Panel - Exploded View .

1. Remove the roof opening sliding glass panel. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
2. Remove the front and rear shade assemblies. For additional information, refer to **Roof Opening Panel Motor - Shades**.
3. Remove the roof opening panel shade motor. For additional information, refer to **Roof Opening Panel Motor - Shades**.
4. Remove the roof opening sliding glass panel motor. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel**.
5. Manually move the sliding front glass mechanisms and shade mechanisms rearward.

NOTE: **Make note of all the cable wrap locations, they must be reinstalled at the exact same locations.**

6. Cut cable wraps to the motor block and drive tube assembly and wiring harness.

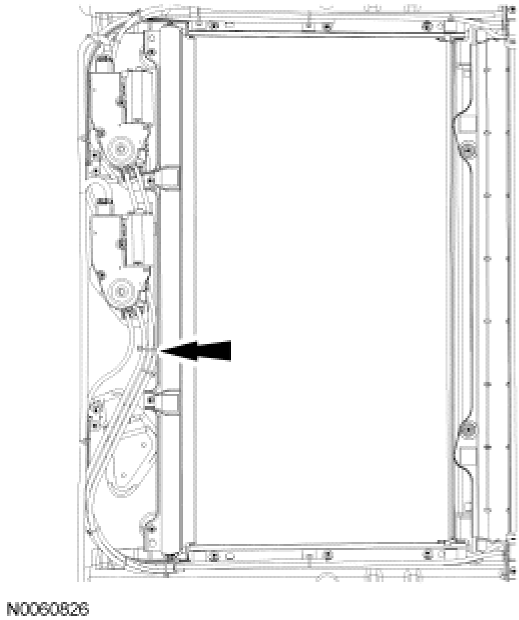

Fig. 61: Cutting Cable Wraps To Motor Block & Drive Tube Assembly & Wiring Harness
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

7. Remove the front drive tube bracket-to-guide track screws.

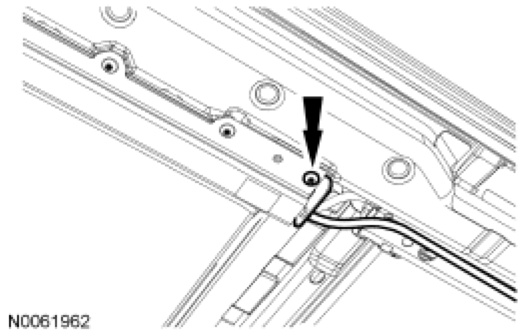

Fig. 62: Locating Front Drive Tube Bracket-To-Guide-Track Screw
Courtesy of FORD MOTOR CO.

NOTE: **Carefully mark the location of each guide track in 3 places before removing any fasteners. The guide tracks must be installed in exactly the same position.**

LH shown, RH similar.

8. Remove the LH and RH rear 12 front track-to-housing screws.

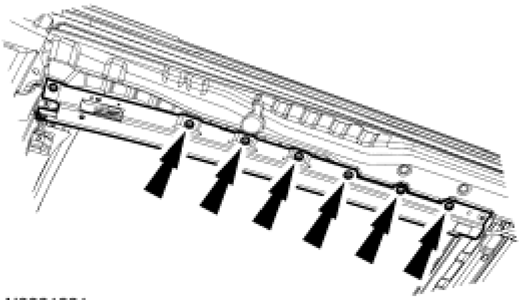

Fig. 63: Locating LH & RH Front Guide Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

9. Remove the LH and RH rear drive tube bracket-to-housing screws.

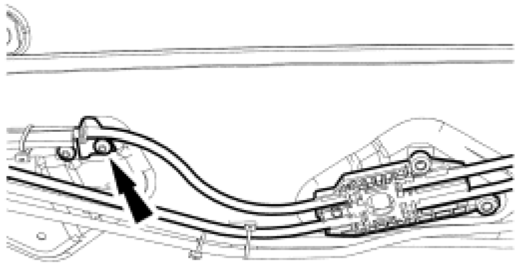

Fig. 64: Locating LH & RH Rear Drive Tube Bracket-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **Carefully mark the location of each shade track in 3 places before removing any fasteners. The shade tracks must be installed in exactly the same position.**

NOTE: **LH shown, RH similar.**

NOTE: **Support the shade track and shade motor block and tube assembly.**

10. Remove the LH and RH 6 rear shade track-to-housing screws.

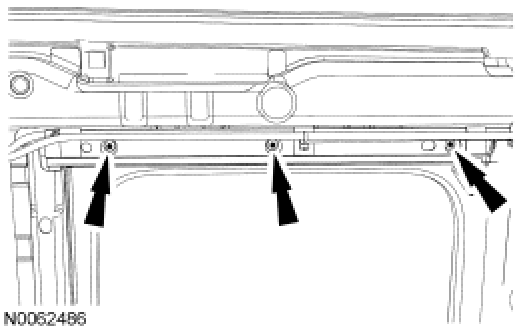

Fig. 65: Locating LH & RH Rear Shade Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: Protect the vehicle interior from cable grease.

11. Carefully pull the sliding glass front drive tube brackets out of the guide tracks.

NOTE: It is only necessary to pull the mechanisms halfway out of the guide tracks to disengage the cables. If the mechanisms are completely removed from the track, they will need to be reassembled first. For additional information, refer to Roof Opening Panel - Exploded View.

NOTE: LH shown, RH similar.

12. With the rear of the front guide tracks lowered, carefully pull the front sliding glass mechanisms halfway out of the guide tracks to disconnect the drive cables and remove the motor block and tube assembly.

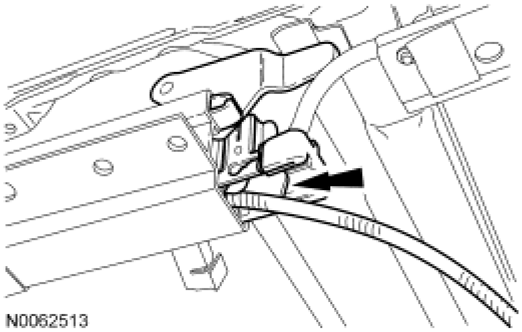

Fig. 66: Inserting Drive Cables Into Sliding Glass Mechanisms & Insert Mechanisms Completely Into Guide Tracks
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: LH shown, RH similar.

1. Insert the drive cables into the sliding glass mechanisms and insert the mechanisms completely into the guide tracks.

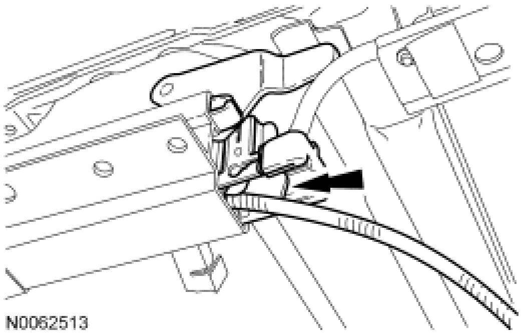

Fig. 67: Inserting Drive Cables Into Sliding Glass Mechanisms & Insert Mechanisms Completely Into Guide Tracks
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

2. Install the center rear shade track-to-housing screws but do not tighten at this time.

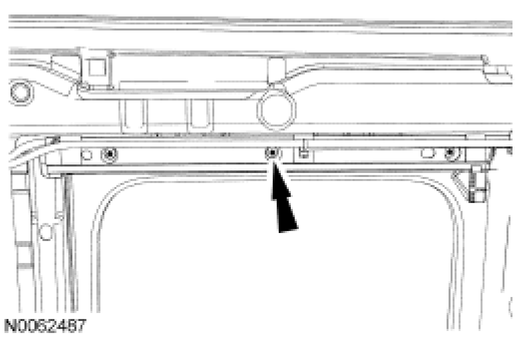

Fig. 68: Locating Center Rear Shade Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

3. Install the LH and RH 12 front guide track-to-housing screws.
    - Align the track to the marks previously made. Tighten to 5 N.m (44 lb-in).

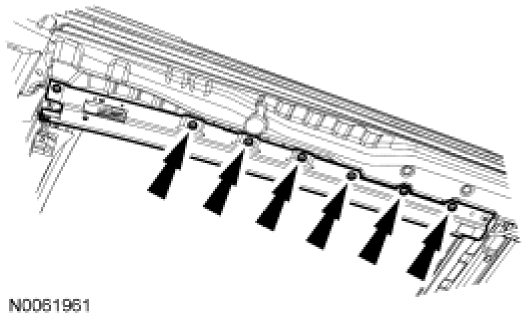

Fig. 69: Locating LH & RH Front Guide Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

4. Install the front drive tube bracket-to-guide track screws.
   - Tighten to 5 N.m (44 lb-in).

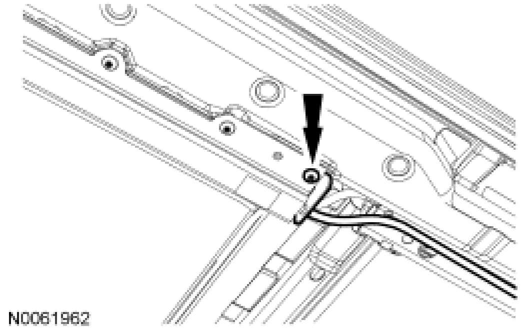

Fig. 70: Locating Front Drive Tube Bracket-To-Guide-Track Screw
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

5. Install the remaining 4 rear shade track-to-housing screws.
   - Align the track to the marks previously made. Tighten all shade track-to-housing screws to 5 N.m (44 lb-in).

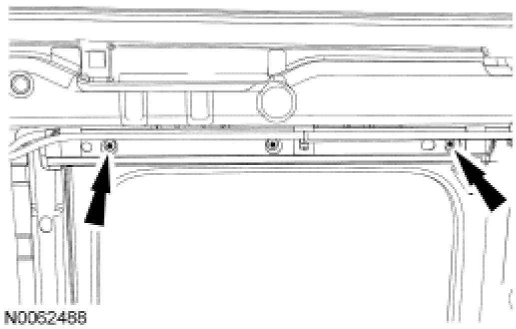

Fig. 71: Locating Rear Shade Track-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

6. Install the LH and RH rear drive tube bracket-to-housing screws.
   - Tighten to 5 N.m (44 lb-in).

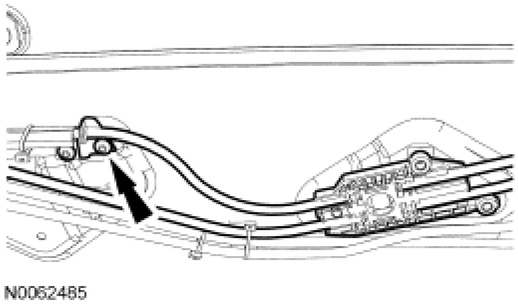

Fig. 72: Locating LH & RH Rear Drive Tube Bracket-To-Housing Screws
Courtesy of FORD MOTOR CO.

NOTE: **Be careful not to overtighten cable wraps during assembly to prevent crimping the cable sheath.**

NOTE: **The cable wraps must be reinstalled at the exact same locations.**

7. Install new cable wraps to the shade motor block and drive tube assembly.

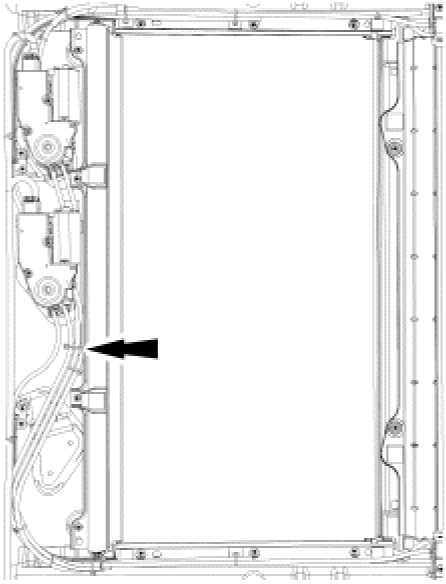

Fig. 73: Cutting Cable Wraps To Motor Block & Drive Tube Assembly & Wiring Harness
Courtesy of FORD MOTOR CO.

NOTE: Do not install the headliner at this time.

8. Install the front and rear shade assemblies but do not carry out the roof opening panel motor initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Shades**.
9. Manually move the sliding front glass mechanisms forward until they are flush against the track hard-stops.

NOTE: Do not install the headliner at this time.

10. Install the roof opening panel sliding glass motor but do not carry out the initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Sliding Front Panel** .
11. Carefully move the front and rear shades rearward to the fully OPEN position by pushing at the edges closest to the tracks.
12. Install the roof opening panel shade motor but do not carry out the initialization at this time. For additional information, refer to **Roof Opening Panel Motor - Shades**.
13. With the roof opening sliding glass panel still removed, initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

NOTE: Press the glass open switch to move the mechanisms rearward to allow installation of the sliding glass panel.

NOTE: It will be necessary to carry out the initialization procedure again after the glass panel is installed.

14. Install the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.

ROOF OPENING PANEL MOTOR - SHADES

REMOVAL AND INSTALLATION

NOTE: The roof opening panel shade motor contains ceramic magnets that may fail at any time if cracked. Any roof opening panel shade motor that has been dropped onto a hard surface during removal or installation should be replaced with a new motor.

1. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the electrical connector.

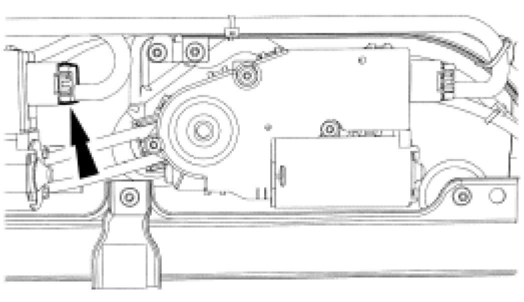

Fig. 74: Locating Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: During installation, it may be necessary to rotate the motor clockwise or counterclockwise for the gear teeth to set into the drive cable correctly.

3. Remove the 3 motor screws and the motor assembly.
   - To install, tighten to 5 N.m (44 lb-in).

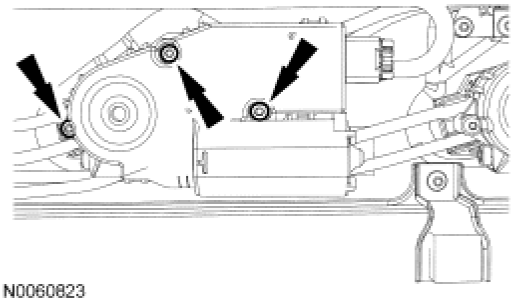

Fig. 75: Locating Motor Screws & Motor Assembly
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.
   - Initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL MOTOR - SLIDING FRONT PANEL

REMOVAL AND INSTALLATION

NOTE: **The roof opening panel sliding glass motor contains ceramic magnets that may fail at any time if cracked. Any roof opening panel sliding glass motor that has been dropped onto a hard surface during removal or installation should be replaced with a new motor.**

1. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the electrical connector.

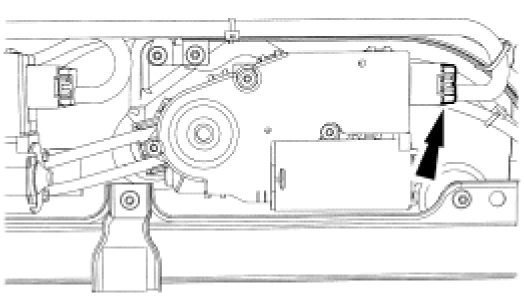

Fig. 76: Locating Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: **During installation, it may be necessary to rotate the motor clockwise or counterclockwise for the gear teeth to set into the drive cable correctly.**

3. Remove the 3 motor screws and the motor assembly.
    - To install, tighten to 5 N.m (44 lb-in).

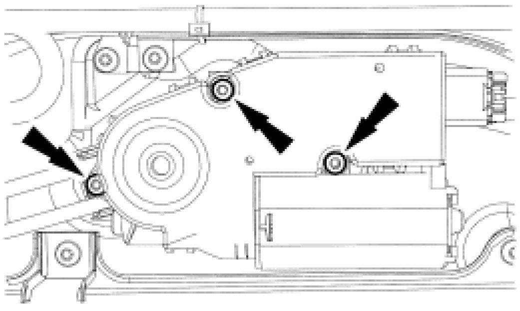

Fig. 77: Locating Motor Screws & Motor Assembly
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.
    - Initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL MOTOR WIRING HARNESS

REMOVAL AND INSTALLATION

1. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the electrical connectors to the roof opening panel sliding glass motor, shade motor and main harness.

NOTE: **Make note of all the cable wrap locations attaching the harness to the drive tubes, they must be reinstalled at the exact same locations.**

3. Remove the cable wraps and the wiring harness.

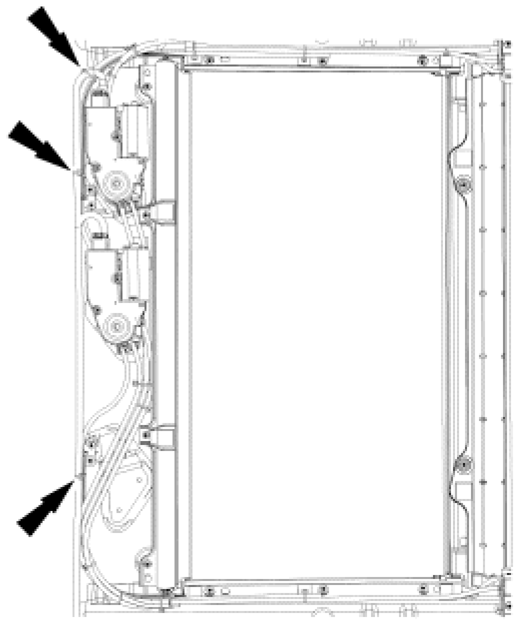

Fig. 78: Identifying Cable Wraps & Wiring Harness
Courtesy of FORD MOTOR CO.

NOTE:	**Be careful not to overtighten cable wraps during assembly to prevent crimping the cable sheath.**

4. To install, reverse the removal procedure.

ROOF OPENING PANEL SEAL - PRIMARY

REMOVAL

1. Remove the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
2. Carefully peel off the primary seal.
    - Clean residual adhesive tape from the housing using a suitable cleaner.

INSTALLATION

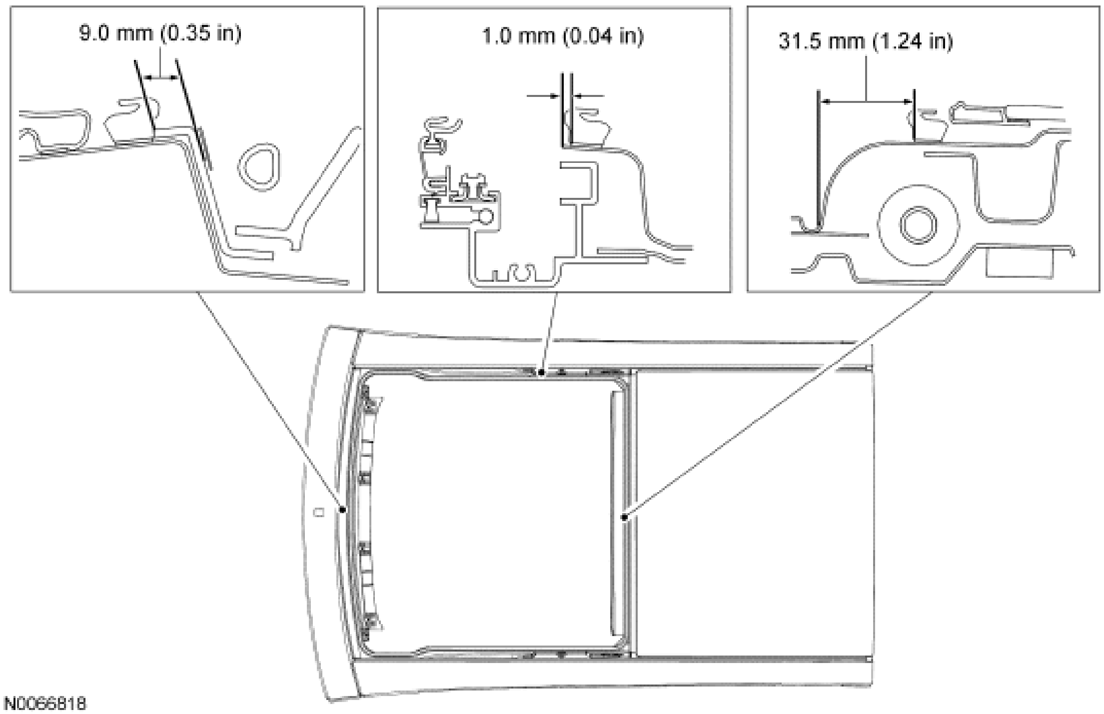

Fig. 79: Identifying Primary Seal Alignment
Courtesy of FORD MOTOR CO.

NOTE: The primary seal seam is placed at the rear centerline.

NOTE: Make sure the primary seal lip is facing outward.

1. Install the primary seal. Refer to the primary seal alignment figure above.

NOTE: When the roof opening sliding glass panel is in the VENT position, the roof opening panel primary seal should contact the leading edge of the sliding glass.

2. Install the roof opening panel sliding glass. For additional information, refer to **Roof Opening Panel Glass - Front Sliding**.
   - Initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL SHADE ASSEMBLY

REMOVAL AND INSTALLATION

Front and rear shade assembly

1. Move the glass to the fully CLOSED position.

2. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

Front shade assembly

NOTE: The shade is under spring tension.

3. Depress the tabs and slide the guide bar (leading edge of shade) forward to release it from the mechanism guide shoes and allow the shade to retract completely.

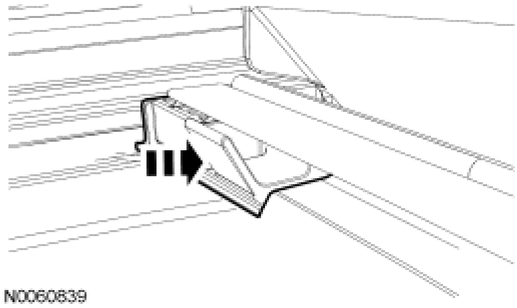

Fig. 80: Depressing Tabs & Sliding Guide Bar (Leading Edge Of Shade) Forward To Release It From Mechanism Guide Shoes
Courtesy of FORD MOTOR CO.

4. Remove the 2 front sunshade carrier outer screws.
   - To install, tighten to 5 N.m (44 lb-in).

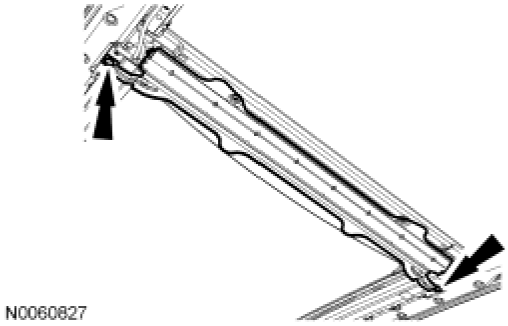

Fig. 81: Locating Front Sunshade Carrier Outer Screws
Courtesy of FORD MOTOR CO.

5. Remove the 2 front sunshade carrier center screws and the front sunshade assembly.
   - To install, tighten to 6 N.m (53 lb-in).

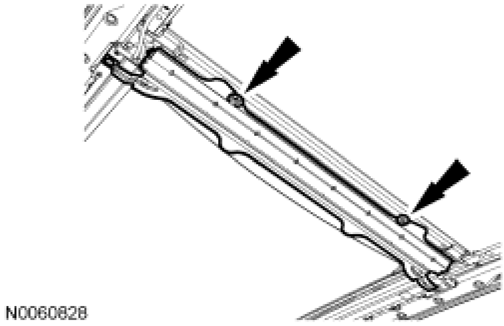

Fig. 82: Locating Front Sunshade Carrier Center Screws
Courtesy of FORD MOTOR CO.

Rear shade assembly

6. Open the rear shade to the half open position.

NOTE:	**Front guide shown, rear similar.**

NOTE:	**The shade is under spring tension.**

7. Depress the tabs and slide the guide bar (leading edge of shade) forward to release it from the mechanism guide shoes and allow the shade to retract completely.

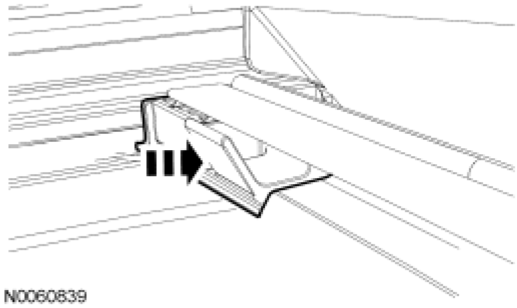

Fig. 83: Depressing Tabs & Sliding Guide Bar (Leading Edge Of Shade) Forward To Release It From Mechanism Guide Shoes
Courtesy of FORD MOTOR CO.

8. Remove the 2 rear sunshade carrier-to-housing screws and the rear sunshade assembly.
   - To install, tighten to 5 N.m (44 lb-in).

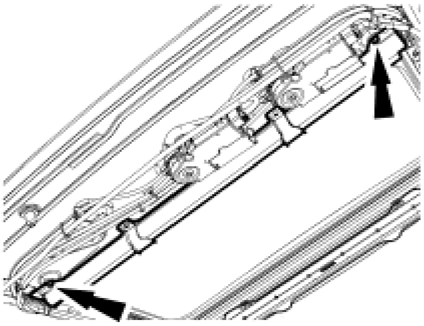

Fig. 84: Locating Rear Sunshade Carrier-To-Housing Screws
Courtesy of FORD MOTOR CO.

Front and rear shade assembly

9. To install, reverse the removal procedure.
   - Initialize the roof opening panel motor(s). For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL SHADE TRACK AND MECHANISM

REMOVAL AND INSTALLATION

NOTE: This procedure is for the rear shade track only. To service the front shade track, refer to Roof Opening Panel Guide Track and Mechanism.

1. The shade track and mechanisms are removed as an assembly with the shade motor block and drive tube assembly. For additional information, refer to **Roof Opening Panel Motor Block and Drive Tube Assembly - Shades**.

ROOF OPENING PANEL TRIM - FRONT

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Rotunda Interior Auto Glass Cut-Out Knife Kit	164-R2450 or equivalent

Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Dow Urethane One Step Glass Primer	

Betaprime® 5500/5500A/5500SA	-
Sika Urethane Adhesive Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-

REMOVAL

1. Position the roof opening sliding glass panel to the fully OPEN position.
2. Remove the antenna. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.

NOTE: A new roof opening panel front trim seal is supplied with the new front trim panel.

3. Remove the roof opening panel front trim seal.

NOTE: Make sure the cutting blades are changed where the cutting depth changes to avoid damage to the body, trim panels or windshield molding.

NOTE: Lubricate the urethane adhesive with water to aid the special tool when cutting the urethane adhesive. Using the special tool, place the flat side of the knife against the roof module.

4. Refer to the adhesive path illustration and begin cutting at the center of the front trim panel and work through towards the opposite corners.

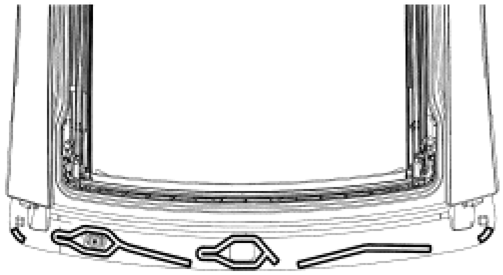

Fig. 85: Begin Cutting At Center Of Front Trim Panel And Work Through Towards Opposite Corners
Courtesy of FORD MOTOR CO.

5. Rotate the trim panel up and forward to clear the side trim panel. Cut off or bend the 2 steel alignment tabs if necessary.
6. Remove the front trim panel assembly and discard.

INSTALLATION

NOTE: **When installing urethane-installed parts, the vehicle must not be driven until the urethane has cured. Adequate cure time is specified on the drive away chart for each urethane product as the temperatures and humidity vary. Inadequate or incorrect curing can adversely affect the retention of the trim panel.**

NOTE: **For additional material guidelines, refer to the manufacturer's installation information.**

NOTE: **Avoid scratching the painted surfaces. For minor scratches or exposed metal, see the manufacturer's recommendations.**

1. Using an appropriate tool, trim the urethane adhesive and pads leaving no more than 0.5 mm (0.01 in) base of original equipment urethane along the roof opening module surface.

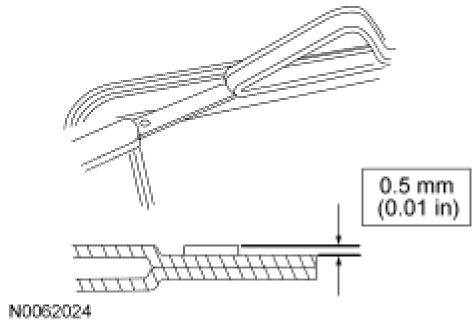

Fig. 86: Trimming Urethane Adhesive Leaving No More Than 0.5 mm (0.01 in) Base Of Original Equipment Urethane
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the water channel is free from any foreign material.**

2. Using a soft brush or vacuum, remove any dirt or foreign material from the roof opening panel module. Clean residual adhesive tape from the housing using a suitable cleaner.

NOTE: **Be sure to use the same brand of cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. For additional information, refer to the Materials Chart in this procedure.**

3. Cut the urethane adhesive applicator tip to the specification.

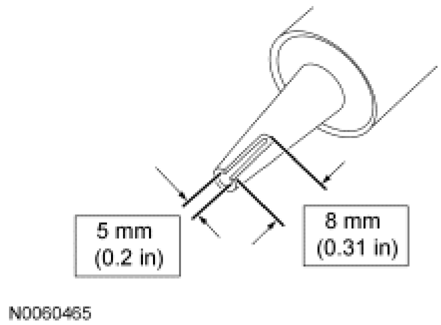

Fig. 87: Cutting Urethane Adhesive Applicator Tip To Specification
Courtesy of FORD MOTOR CO.

NOTE: Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.

4. Apply urethane adhesive on top of the existing trimmed urethane adhesive bead. Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

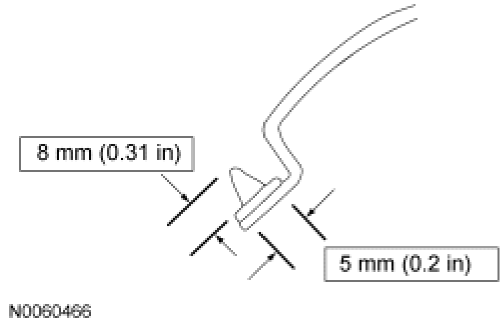

Fig. 88: Making Sure That All Gaps In Urethane Adhesive Are Smoothed Into One Continuous Bead
Courtesy of FORD MOTOR CO.

NOTE: Make sure the windshield molding does not get pinched under the front trim panel. The windshield molding should be pulled over the top of the leading edge of the trim panel during installation.

NOTE: Position front trim panel to best overall appearance.

5. Apply the front trim panel assembly to the roof module. Work the trim panel down using only vertical pressure.
6. Install the antenna. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.

ROOF OPENING PANEL TRIM - SIDE

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Rotunda Interior Auto Glass Cut-Out Knife Kit	164-R2450 or equivalent

Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Dow Urethane One Step Glass Primer Betaprime® 5500/5500A/5500SA	-
Sika Urethane Adhesive Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-

REMOVAL

1. Remove the ditch moldings and clip strip.
2. Remove the end cap.

NOTE: Protect the painted roof area next to the side trim panel to prevent damage to the paint.

NOTE: Make sure the cutting blades are changed where the cutting depth changes to avoid damage to the body or glass panel seals.

NOTE: Lubricate the urethane adhesive with water to aid the special tool when cutting the urethane adhesive. Using the special tool, place the flat side of the knife against the roof module.

NOTE: Position the sliding glass panel as required for necessary access.

3. Begin cutting the urethane at the rear of the side trim panel while bending the trim panel upward as needed for access. Work forward through all urethane and rubber net pads. Remove and discard the side trim panel.

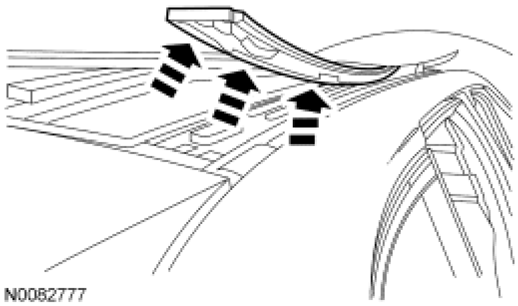

Fig. 89: Identifying Side Trim Panel
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: **When installing urethane-installed parts, the vehicle must not be driven until the urethane has cured. Adequate cure time is specified on the drive away chart for each urethane product as the temperatures and humidity vary. Inadequate or incorrect curing can adversely affect the retention of the trim panel.**

NOTE: **For additional material guidelines, refer to the manufacturer's installation information.**

NOTE: **Avoid scratching the painted surfaces. For minor scratches or exposed metal, see the manufacturer's recommendations.**

1. Using an appropriate tool, trim the urethane adhesive leaving no more than 0.5 mm (0.01 in) base of original equipment urethane along the roof opening module surface.

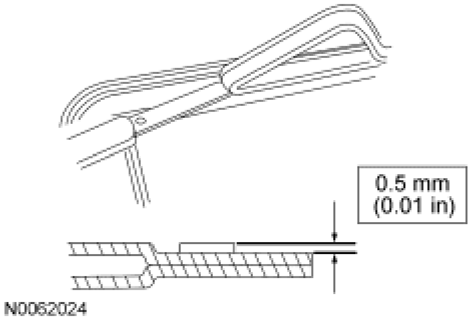

Fig. 90: Trimming Urethane Adhesive Leaving No More Than 0.5 mm (0.01 in) Base Of Original Equipment Urethane
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the water channel is free from any foreign material.**

2. Using a soft brush or vacuum, remove any dirt or foreign material from the roof opening panel module.

NOTE: **Be sure to use the same brand of cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. Refer to the Materials Chart in this procedure.**

3. Cut the urethane adhesive applicator tip to the specification.

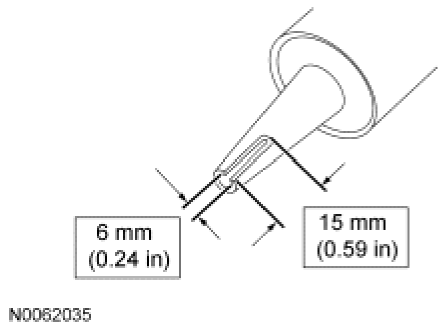

Fig. 91: Cutting Urethane Adhesive Applicator Tip To Specification
Courtesy of FORD MOTOR CO.

NOTE: **Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.**

4. Apply urethane adhesive on top of the existing trimmed urethane adhesive bead. Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

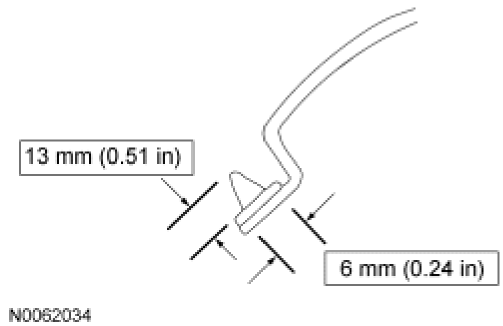

Fig. 92: Making Sure That All Gaps In Urethane Adhesive Are Smoothed Into One Continuous Bead
Courtesy of FORD MOTOR CO.

NOTE: **Position side trim panel to best overall appearance.**

5. Insert the front of the trim panel into the front trim seal then rotate the rear of the side trim panel down to engage. Apply the side trim panel assembly to the roof module.
6. Install the end cap.
7. Work the glass panel down using only vertical pressure.

8. Install the ditch moldings and clip strip.

ROOF OPENING PANEL TRIM - FIXED GLASS, INTERIOR

REMOVAL AND INSTALLATION

1. Position the sunshade(s) to the fully OPEN position.
2. Carefully bend/pry the trim ring from its hook-and-loop tape pads.

NOTE: A piece of paper may assist in keeping the hook-and-loop tape from sticking while aligning the trim ring. Once the trim ring is in position (front and rear locating pins lined up), remove the paper and press the trim firmly in place.

3. To install, reverse the removal procedure.

TORQUE SPECIFICATIONS

Description	N.m	lb-ft
Front tie-rod jam nuts	90	66
Rear camber adjustment bolts	150	111
Rear toe adjustment bolts	200	148
Stabilizer bar lower nut	90	66
Strut upper mounting plate nuts	30	22

DESCRIPTION AND OPERATION

WHEEL ALIGNMENT ANGLES

NOTE: When making rear alignment adjustments, it is important to know that when adjustments are made to the rear toe, the rear camber will also be adjusted (in the same direction as the toe adjustment). When making adjustments to the rear camber, the rear toe will also be adjusted (in the opposite direction of the camber adjustment). It will be necessary to check the rear camber whenever rear toe adjustments are made and to check the rear toe whenever rear camber adjustments are made.

Front toe is adjusted through the use of adjustable tie-rod ends. Front camber is adjusted through the use of the upper strut plate. Rotating the upper strut plate 180 degrees will change the camber +0.5 degrees. Front caster is not adjustable on the vehicle. Rear toe is adjusted through the use of adjustable toe link cams. Rear camber is adjusted through the use of a cam bolt that attaches the rear lower control arm to the rear subframe.

Camber

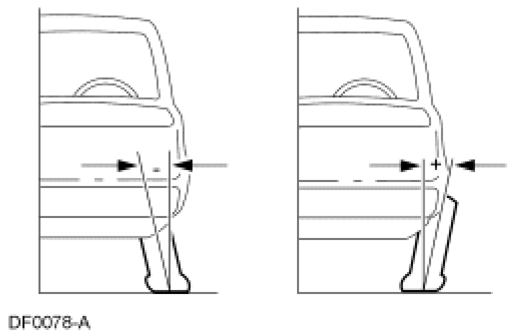

Fig. 1: Camber (Viewed from Front)
Courtesy of FORD MOTOR CO.

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct affect on tire wear.

Caster

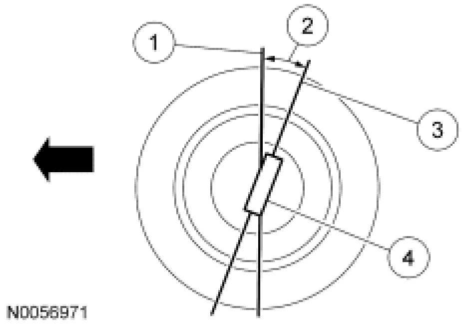

Fig. 2: Identifying Caster Angles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	True vertical
2	-	Positive caster angle
3	-	Shock-to-ball joint centerline
4	-	Pivot centerline

Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

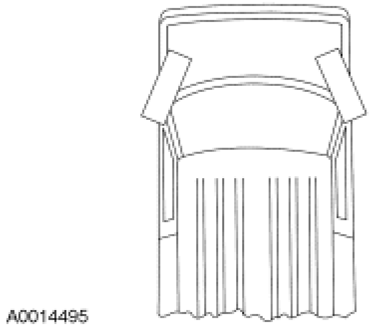

Fig. 3: Identifying Positive Toe (Toe In)
Courtesy of FORD MOTOR CO.

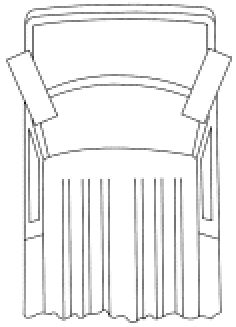

Fig. 4: Identifying Negative Toe (Toe Out)
Courtesy of FORD MOTOR CO.

The vehicle toe setting affects tire wear and directional stability.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel. For wheel and tire diagnosis, refer to **WHEELS AND TIRES** article.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe poor return of the steering wheel to center after a turn or steering correction.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.

- Drift/pull may be induced by conditions external to the vehicle (for example, wind, road crown).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center."

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
- In the diagnosis of a roadability problem, it is important to understand the difference between wander and poor groove feel.

DIAGNOSTIC TESTS

SUSPENSION SYSTEM

Inspection and Verification

1. Road test the vehicle.
    - If any suspension alignment or ride height concerns are present, go to **SYMPTOM CHART - SUSPENSION SYSTEM**.
    - Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are present, go to **NOISE, VIBRATION AND HARSHNESS (NVH)**.
2. Inspect the tires.
    - Check the tire pressures with all normal loads in the vehicle and the tires cold. Refer to the vehicle certification (VC) label.
    - Verify that all tires are sized to specification. Refer to the VC label.
    - Inspect the tires for incorrect wear and damage. Install new tires as necessary.
3. Inspect the chassis and underbody.
    - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
4. Inspect for aftermarket equipment.
    - Check for aftermarket changes to the steering, suspension, and wheel and tire components (such as competition or heavy duty). The specifications shown in this service information do not apply to vehicles equipped with aftermarket equipment.

VISUAL INSPECTION CHART

Mechanical
• Front or rear suspension components • Suspension fastener(s) • Incorrect spring usage

- Spring(s)
- Shock absorber(s)
- Strut(s)
- Suspension bushing(s)
- Steering system components
- Wheel bearing and wheel hub(s)
- Non-OEM parts or modifications

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
6. If the fault is not visually evident, go to **SYMPTOM CHART - SUSPENSION SYSTEM** or go to **NOISE, VIBRATION AND HARSHNESS (NVH)**.

Symptom Chart - Suspension System

SYMPTOM CHART - SUSPENSION SYSTEM

Condition	Possible Sources	Action
• Drift/pull	• Unequal tire pressure	• ADJUST the tire pressure. REFER to the vehicle certification (VC) label.
-	• Camber total split is not within specification	• CHECK the wheel alignment. REFER to **Camber Adjustment - Front**. ADJUST as necessary.
-	• Tires	• ROTATE the tires left to right. REFER to **WHEELS AND TIRES** article.
-	• Unevenly loaded or overloaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
-	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **STEERING SYSTEM - GENERAL INFORMATION** article.
-	• Brake drag	• REPAIR the base braking system as necessary. REFER to **FRONT DISC BRAKE** article or **REAR DISC BRAKE** article.
• Front bottoming or riding low	• Worn, damaged or incorrect springs	• MEASURE the ride height. REFER to **Ride Height**

		Measurement. INSTALL new springs as necessary. REFER to **FRONT SUSPENSION** article.
-	• Worn front strut(s)	• INSTALL new struts as necessary. REFER to **FRONT SUSPENSION** article.
• Abnormal/incorrect tire wear	• Incorrect tire pressure (rapid center rib or inner and outer edge wear)	• ADJUST the tire pressure. REFER to the VC label. REFER to **WHEELS AND TIRES** article Diagnosis and Testing for further tire wear diagnosis.
-	• Incorrect tire rotation intervals	• REFER to **MAINTENANCE SCHEDULE** article.
-	• High-speed cornering • Excessive front or rear toe (inner or outer edge wear) • Excessive negative or positive camber (inner or outer edge wear)	• REFER to **WHEELS AND TIRES** article Diagnosis and Testing for further tire wear diagnosis.
-	• Front or rear suspension components	• INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
• Sticky steering, poor returnability	• Damaged or worn front strut mount bearing(s)	• INSTALL a new front strut mount bearing(s) as necessary. REFER to **FRONT SUSPENSION** article.
-	• Binding ball joints	• REFER to the Ball Joint Inspection under **Component Tests**.
-	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **POWER STEERING** article.
• Steering wheel off-center	• Unequal front or rear	• CHECK the wheel alignment.

	toe setting (side-to-side)	REFER to **Toe Adjustment - Front** or **Toe Adjustment - Rear**. ADJUST as necessary.
	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **STEERING SYSTEM - GENERAL INFORMATION** article.
• Sway or roll	• Overloaded, unevenly or incorrectly loaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Loose wheel nut(s)	• TIGHTEN the wheel nut(s) to specification. REFER to **WHEELS AND TIRES** article.
	• Strut(s) or shock absorber(s)	• INSTALL new struts or shock absorbers as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Loose stabilizer bracket-to-frame bolts	• TIGHTEN the bolts to specification. REFER to **FRONT SUSPENSION** article.
	• Worn stabilizer bar bushings or links	• INSTALL new stabilizer bar bushings or links as necessary. REFER to **FRONT SUSPENSION** article.
	• Damaged or broken stabilizer bar	• INSTALL a new stabilizer bar as necessary. REFER to **FRONT SUSPENSION** article.
	• Worn spring(s)	• INSTALL new springs as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
• Vehicle leans to one side	• Unevenly loaded or overloaded vehicle	• NOTIFY the customer of incorrect vehicle loading.

	• Front or rear suspension components	• INSPECT the front and rear suspension systems. INSTALL new suspension components as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
-	• Incorrect drive axle(s) ride height. Side-to-side lean out of specification	• MEASURE the ride height. REFER to **Ride Height Measurement**. INSPECT the front and rear suspension systems. REPAIR or INSTALL new components as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
• Wander	• Overloaded, unevenly or incorrectly loaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
-	• Ball joint(s)	• INSPECT the ball joints. REFER to the Ball Joint Inspection under **Component Tests**.
-	• Damaged or missing front strut mount bearing(s)	• INSTALL a new front strut mount bearing(s) as necessary. REFER to **FRONT SUSPENSION** article.
-	• Loose, worn or damaged front wheel bearing(s)	• INSPECT the wheel bearings. INSTALL new wheel bearings as necessary.
-	• Loose, worn or damaged suspension component(s)	• INSTALL new suspension component(s) as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
-	• Loose suspension fasteners	• INSPECT the suspension fasteners. TIGHTEN to specification. REFER to

		FRONT SUSPENSION article for front suspension or **REAR SUSPENSION** article for rear suspension.
-	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **STEERING SYSTEM - GENERAL INFORMATION** article.
-	• Wheel alignment (excessive total front toe out)	• ADJUST as necessary. REFER to **Toe Adjustment - Front** or **Toe Adjustment - Rear**.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

SYMPTOM CHART - NOISE/VIBRATION AND HARSHNESS (NVH)

Condition	Possible Sources	Action
• Squeak or grunt - noise from the front suspension, occurs more in cold ambient temperatures. More noticeable over rough roads or when turning	• Front stabilizer bar insulators	• Under these conditions, the noise is acceptable. CHECK TSBs.
• Clunk - noise from the front suspension, occurs in and out of turns	• Loose front suspension	• INSPECT for loose nuts or bolts. TIGHTEN to specifications. REFER to **FRONT SUSPENSION** article for front suspension and **REAR SUSPENSION** article for rear suspension.
• Clunk - noise from the rear suspension, occurs when shifting from REVERSE to	• Loose rear suspension components	• INSPECT for loose or damaged rear suspension components. REPAIR or

DRIVE		INSTALL new components as necessary. REFER to **REAR SUSPENSION** article.
• Click or pop - noise from the front suspension. More noticeable over rough roads or over bumps	• Worn or damaged ball joint(s)	• CARRY OUT a ball joint inspection under **Component Tests**. INSTALL new ball joint(s) or control arm(s) as necessary.
• Front suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Front suspension components • Loose or damaged front struts, shock absorber(s) or shock absorber bushing(s) • Damaged spring or spring mount(s) • Damaged or worn control/radius arm bushing(s) • Worn or damaged stabilizer bar bushings or link(s)	• INSPECT the front suspension. INSTALL new components as necessary. REFER to **FRONT SUSPENSION** article.
• Rear suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Loose or damaged rear shock absorber(s) or shock absorber bushing (s) • Damaged spring or spring mount(s) • Damaged or worn control arm bushing(s) • Worn or damaged stabilizer bar bushing(s) or link(s)	• INSPECT the rear suspension. INSTALL new components as necessary. REFER to **REAR SUSPENSION** article.
• Shudder - occurs during acceleration from a slow speed or stop	• Incorrect ride height causing incorrect driveline angle	• REFER to **DRIVELINE SYSTEM - GENERAL INFORMATION** article for driveline angle diagnosis.
• Shimmy	• Loose wheel nut(s) • Loose front suspension fastener(s)	• TIGHTEN the nut(s) to specification. REFER to **WHEELS AND TIRES** article. • TIGHTEN the fastener(s) to specification. REFER to

		FRONT SUSPENSION article.
	• Loose front wheel bearing(s)	• INSPECT the front wheel bearing(s). INSTALL new bearing(s) as necessary. REFER to **FRONT SUSPENSION** article.
	• Strut(s) or shock absorber(s)	• INSTALL new struts or shock absorbers as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
• Shimmy - most noticeable on coast/deceleration. Also hard steering condition	• Excessive positive caster	• CHECK the wheel alignment. REFER to **Camber Adjustment - Front**. ADJUST as necessary.
• Rough/harsh ride	• Incorrect tire pressure	• ADJUST the tire pressure. REFER to the vehicle certification (VC) label.
	• Strut(s) or shock absorber(s)	• INSTALL new struts or shock absorbers as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Spring(s)	• MEASURE the ride height. REFER to **Ride Height Measurement**. INSTALL new springs as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Loose, worn or damaged suspension component(s)	• INSTALL new suspension component(s) as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.

Component Tests

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. Install a new wheel bearing as necessary. Refer to **FRONT SUSPENSION** article.

NOTE: In order to obtain accurate measurements, the suspension must be in full rebound with the weight of the vehicle supported by the frame.

2. Raise and support the vehicle by the frame to allow the wheels to hang in the rebound position.
3. Inspect the ball joint and ball joint boot for damage.
   - If the ball joint or ball joint boot is damaged, install a new ball joint as necessary. Refer to **FRONT SUSPENSION** article.

CAUTION: Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.

4. Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the wheel and tire assembly, by hand. Note any relative vertical movement between the wheel knuckle and lower arm at the lower ball joint.
   - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
   - If relative movement is found, continue with Step 5.

NOTE: In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis (center line) of the ball joint.

5. To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the lower control arm and the wheel knuckle or ball joint stud.

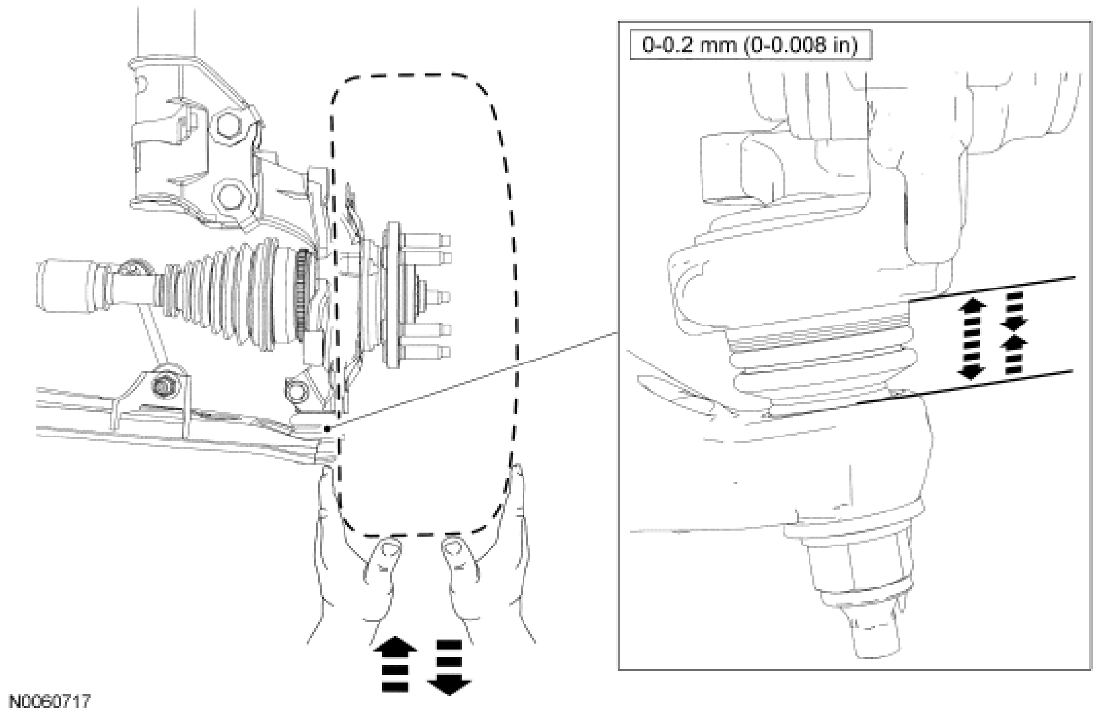

Fig. 5: Measuring Ball Joint Deflection While An Assistant Alternately Pulls Outward
Courtesy of FORD MOTOR CO.

6. Measure the ball joint deflection while an assistant pushes up and pulls down on the wheel and tire assembly, by hand.
   - If the deflection exceeds the specification, a new ball joint must be installed. Refer to **FRONT SUSPENSION** article.
   - If the deflection meets the specification, no further action is required.

GENERAL PROCEDURES

RIDE HEIGHT MEASUREMENT

Front Ride Height Measurement

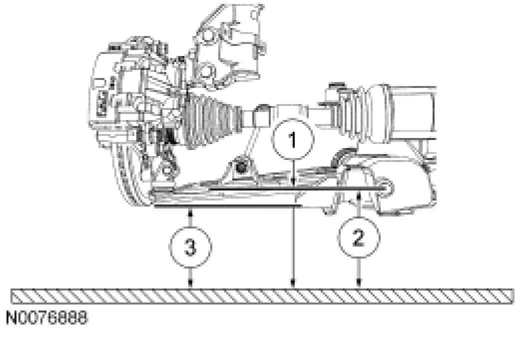

Fig. 6: Identifying Front Ride Height Measurement

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Ride height = A - B
2	-	Measurement A
3	-	Measurement B

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Position a suitable surface gauge (such as Starrett 57D Surface Gauge) on a flat, level surface as used in Step 1, adjust the gauge's arm until the scriber point is located in the center of the lower arm forward bolt.
    - Lock the surface gauge in this position.

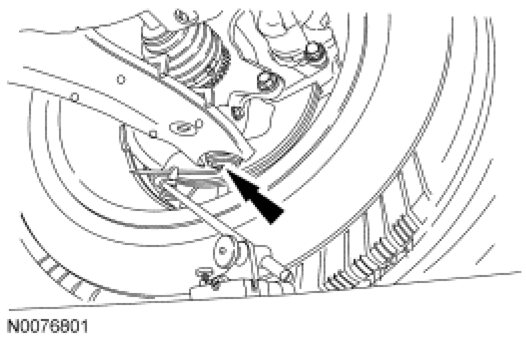

Fig. 7: Identifying Surface Gauge Position
Courtesy of FORD MOTOR CO.

2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement A).

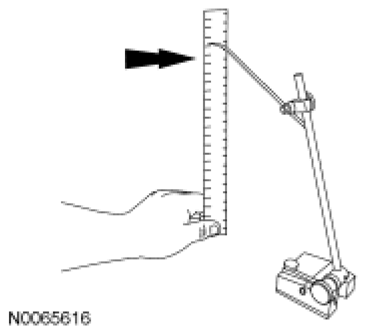

Fig. 8: Identifying Front Ride Height Measurement
Courtesy of FORD MOTOR CO.

3. Position the surface gauge on the same flat, level surface and adjust the gauge's arm until the scriber point is located on the center of the lower ball joint cap.

- Lock the surface gauge in this position.

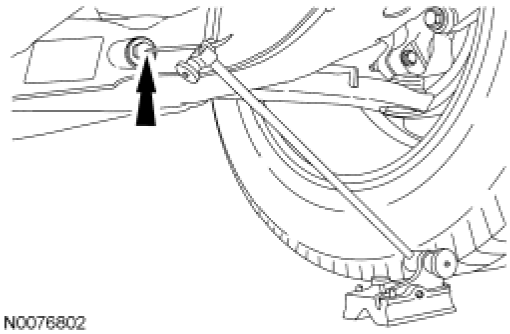

Fig. 9: Identifying Surface Gauge Position
Courtesy of FORD MOTOR CO.

4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement B).

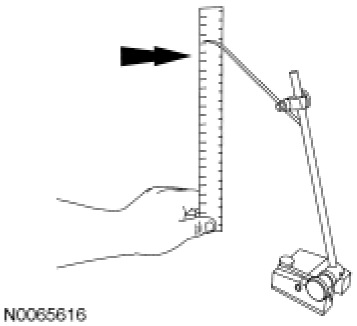

Fig. 10: Identifying Front Ride Height Measurement
Courtesy of FORD MOTOR CO.

5. Subtract measurement B from measurement A to obtain the front ride height.
   - Refer to **SPECIFICATIONS**.

Rear Ride Height Measurement

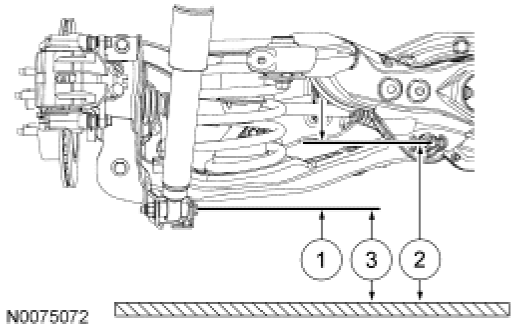

Fig. 11: Identifying Front Ride Height Measurement

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Ride height = A - B
2	-	Measurement A
3	-	Measurement B

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Measure the distance between the same flat level surface and the center of the lower arm-to-subframe bolt (measurement A).
2. Measure the distance between the flat level surface and the center of the lower shock bolt (measurement B).
3. Subtract measurement B from measurement A to obtain the rear ride height.
   - Refer to **SPECIFICATIONS**.

CAMBER ADJUSTMENT - FRONT

NOTE: Front camber is adjusted through the use of the upper strut plate. Rotating the upper strut plate 180 degrees will change the camber +0.5 degrees.

1. Using alignment equipment and the manufacturer's instructions, measure the camber.
2. Remove and discard the stabilizer bar link lower nut and disconnect the link from the lower arm.
   - To install, tighten to 90 N.m (66 lb. ft.).
3. Remove and discard the 4 strut upper mounting plate nuts.
   - To install, tighten to 30 N.m (22 lb. ft.).
4. Using a suitable jack, raise the vehicle body enough to allow the front strut upper plate mounting studs to clear the frame.

   NOTE: Rotating the upper strut plate 180 degrees will change the camber +0.5 degrees.

5. Rotate the upper mounting plate 180 degrees.
6. Recheck the front camber settings.
7. Check and, if necessary, adjust the front toe. For additional information, refer to **Toe Adjustment - Front**.

CAMBER ADJUSTMENT - REAR

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position or incorrect clamp load and

bushing damage may occur.

NOTE: **When making rear alignment adjustments, it is important to know that when adjustments are made to the rear toe, the rear camber will also be adjusted (in the same direction as the toe adjustment). When making adjustments to the rear camber, the rear toe will also be adjusted (in the opposite direction of the camber adjustment). It will be necessary to check the rear camber whenever rear toe adjustments are made and to check the rear toe whenever rear camber adjustments are made.**

1. Using alignment equipment and the manufacturer's instructions, measure the rear camber.
2. Loosen the rear camber adjustment bolt.
3. Rotate the camber adjustment bolt until the camber setting is within specifications.

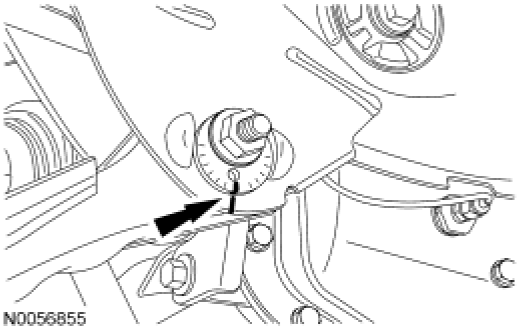

Fig. 12: Measuring Rear Camber Using Alignment Equipment
Courtesy of FORD MOTOR CO.

CAUTION: **Before tightening any suspension bushing fasteners, the weight of the vehicle must be resting on the wheels and tires or incorrect clamp load and bushing damage may occur.**

NOTE: **Do not allow the camber cam adjuster to rotate while tightening the bolt.**

4. Tighten the camber adjustment bolt to 150 N.m (111 lb. ft.).
5. Recheck the rear camber and toe.
   - Adjust as necessary.

TOE ADJUSTMENT - FRONT

1. Start the engine and center the steering wheel.
2. Turn the engine OFF and, using a suitable steering wheel holding device, lock the steering wheel in the straight ahead position.
3. Using alignment equipment and the manufacturer's instructions, measure the front toe.
4. Remove the steering gear bellows clamps.

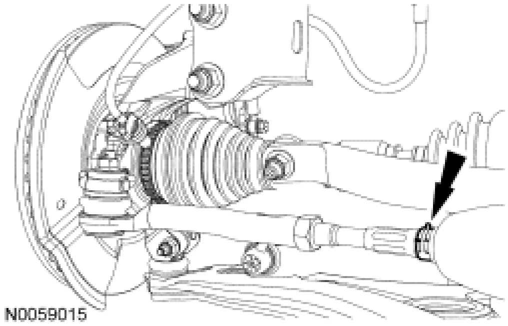

Fig. 13: Locating Steering Gear Bellows Clamps
Courtesy of FORD MOTOR CO.

5. Loosen the tie-rod jam nuts.

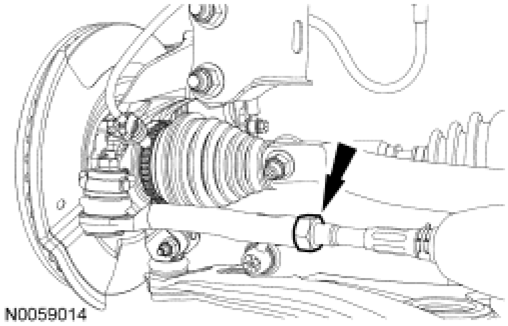

Fig. 14: Locating Tie-Rod Jam Nuts
Courtesy of FORD MOTOR CO.

NOTE: Do not allow the steering gear bellows to twist when the tie rod is rotated.

6. Rotate the tie rods until the toe setting is within specifications.

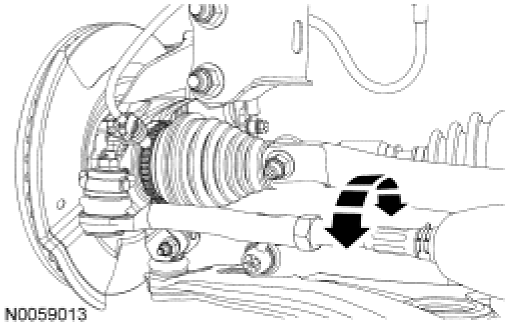

Fig. 15: Rotating Tie Rods Until Toe Setting
Courtesy of FORD MOTOR CO.

7. Tighten the jam nuts to 90 N.m (66 lb. ft.).
8. Install the steering gear bellows clamps.

TOE ADJUSTMENT - REAR

NOTE: When making rear alignment adjustments, it is important to know that when adjustments are made to the rear toe, the rear camber will also be adjusted (in the same direction as the toe adjustment). When making adjustments to the rear camber, the rear toe will also be adjusted (in the opposite direction of the camber adjustment). It will be necessary to check the rear camber whenever rear toe adjustments are made and to check the rear toe whenever rear camber adjustments are made.

1. Using alignment equipment and the manufacturer's instructions, measure the rear toe.
2. Loosen the toe link inboard bolt.
3. Rotate the toe link adjuster cam until the toe setting is within specifications.

   CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position or incorrect clamp load and bushing damage may occur.

   NOTE: Do not allow the toe link adjuster can to rotate while tightening the bolt.

4. Tighten the toe link inboard bolt to 200 N.m (148 lb. ft.).
5. Recheck the rear toe and camber.
   - Adjust as necessary.

DESCRIPTION AND OPERATION

POWER TRANSFER UNIT (PTU)

The All-Wheel Drive (AWD) system consists of the following:

- Power Transfer Unit (PTU)
- Rear driveshaft
- 4X4 control module
- Rear axle with coupling device

The PTU is a gearbox that attaches to the transaxle. The RH intermediate shaft passes through the PTU and engages the differential side gear as in normal Front Wheel Drive (FWD) applications. The PTU directs power to the rear driveshaft through a helical gear spline coupled to the transaxle differential case, a helical gear drop (idler gear) and hypoid/helical ring gear assembly and pinion set. The PTU is sealed from the transaxle and has its own oil sump.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, the cover seal and the PTU-transaxle compression seal. The internal components are not serviced. Do not remove the cover of the PTU. If any of the geared components, bearings, case cover or internal shafts are worn or damaged, a new PTU must be installed.

DIAGNOSTIC TESTS

POWER TRANSFER UNIT (PTU)

Principles of Operation

The Power Transfer Unit (PTU) is a gearbox that attaches to the transaxle. The RH intermediate shaft passes through the PTU and engages the differential side gear as in normal Front Wheel Drive (FWD) applications. The PTU directs power to the rear driveshaft through a helical gear spline coupled to the transaxle differential case, a helical gear drop (idler gear) and hypoid/helical ring gear assembly and pinion set. The PTU is sealed from the transaxle and has its own oil sump.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, the cover seal and the PTU-transaxle compression seal. The internal components are not serviced. Do not remove the cover of the PTU. If any of the geared components, bearings, case cover or internal shafts are worn or damaged, a new PTU must be installed.

Heat Protection Mode - During very extreme off-road operation, the All-Wheel Drive (AWD) system utilizes a heat protection mode to protect the Active Torque Coupling (ATC) solenoid (part of rear axle) from damage. If the system detects an overheat condition, it enters a locked mode. If the heat in the system continues to rise once in the locked mode, the 4X4 control module disables the ATC solenoid. Allow the system to cool down at least 10 minutes with the ignition switch in the ON position.

For concerns with the 4X4 control module or ATC, refer to <u>**FOUR WHEEL DRIVE (4WD) SYSTEMS**</u> article.

Inspection and Verification

1. Verify the customer concern.
2. Inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Power Transfer Unit (PTU) • Halfshafts and CV joints • Driveshaft and U-joints • Wheel/tire size and brand • Matching tire size and brand • Tire pressure
-

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and Go to **SYMPTOM CHART - POWER TRANSFER UNIT (PTU)**.

SYMPTOM CHART - POWER TRANSFER UNIT (PTU)

SYMPTOM CHART - POWER TRANSFER UNIT (PTU)

Condition	Possible Sources	Action
• The Power Transfer Unit (PTU) makes noise	• Tire inflation pressure • Tire and wheel size	• MAKE SURE all tires and wheels are the same size and brand and the inflation pressures are correct.
-	• Fluid level	• FILL with the correct type and amount of lubricant. REFER to **POWER TRANSFER UNIT (PTU) DRAINING AND FILLING**.
-	• Internal components	• OPERATE the vehicle in all gears. If there is noise in the transaxle in NEUTRAL, or in some gears and not in others, REMOVE and REPAIR the transaxle. Refer to the appropriate Automatic Transmission article for the procedure. If there is noise in all gears, INSTALL a new PTU. REFER to **POWER TRANSFER UNIT (PTU)**.
• Leaking fluid from the PTU vent	• PTU over filled	• REFER to **ANALYSIS OF LEAKAGE**.

• Leaking automatic transmission fluid	• PTU intermediate shaft seal • PTU compression seal	• REFER to **ANALYSIS OF LEAKAGE**.
• Leaking gear lubricant from the seals	• The PTU vent is plugged (located on top of the PTU)	• INSTALL a new PTU. REFER to **POWER TRANSFER UNIT (PTU)**.
-	• Damaged seals	• REFER to **ANALYSIS OF LEAKAGE**.
• Vehicle has no or inadequate torque at rear wheels	• Rear axle	• REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
-	• PTU mechanical failure	• REFER to **POWER TRANSFER UNIT (PTU)**.
• Vehicle binds in a turn or resists turning/pulsates or shudders in a straight line	• Wheels/tires	• REFER to **WHEELS AND TIRES** article.
-	• Brake system	• REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article.
-	• Wheel bearings	• REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
-	• Halfshafts	• REFER to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.
-	• Wheel speed sensor (s)	• REFER to **VEHICLE DYNAMIC SYSTEMS** article.
-	• ABS module	• REFER to **VEHICLE DYNAMIC SYSTEMS** article.

Analysis of Leakage

The PTU may leak different color fluids, red oil leak for an automatic transmission fluid and brown/black gear lube for PTU fluid. The PTU seals prevent these types of fluids from leaking. It is important to note which color of fluid is leaking to conduct the most appropriate service procedure.

PTU Leaks From the RH Side

NOTE: **Remove and replace leaking seals using the information found in the INTERMEDIATE SHAFT SEAL AND DEFLECTOR or COVER SEAL replacement procedure. The specified tools called out in this procedure will allow seal replacement without causing damage to the Power Transfer Unit (PTU)**

casing/drive gear.

If the leak is red automatic transmission fluid, then the PTU intermediate shaft seal needs replacement. This is inside the bore of the PTU shaft behind the deflector. Refer to the **INTERMEDIATE SHAFT SEAL AND DEFLECTOR** procedure.

If the leak is brown/black gear lube, then the PTU larger cover seal needs replacement. This is located on the PTU cover behind the deflector. Refer to **COVER SEAL** procedure.

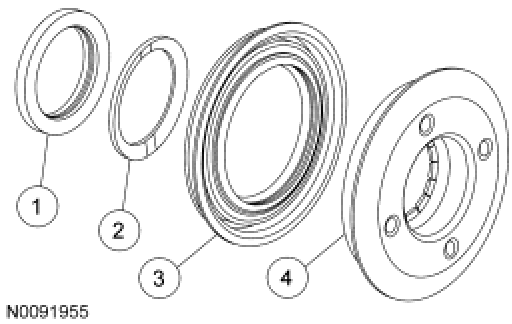

Fig. 1: Identifying Intermediate Shaft Seal
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Intermediate shaft seal (part of kit 7275)
2	-	Alignment washer (part of kit 7275)
3	-	Cover seal (part of kit 7275)
4	-	Seal deflector (part of kit 7275)

PTU Leaks From the LH Side

If the leak is the red automatic transmission fluid, the compression seal needs replacement. This is between the PTU and transmission. Refer to **POWER TRANSFER UNIT (PTU)** in the Removal portion of this service information.

If the leak is brown/black, the PTU is overfilled and venting fluid from the top of the PTU. Flush and fill the PTU. Refer to **POWER TRANSFER UNIT (PTU) DRAINING AND FILLING**.

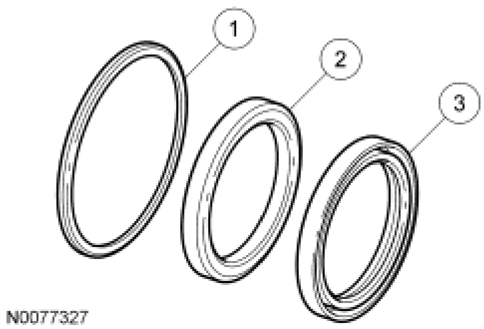

Fig. 2: PTU Leaks From LH Side
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Power Transfer Unit (PTU)-to-transaxle compression seal (7086)
2	-	Transfer case driver gear seal (not serviceable)
3	-	Transfer case driver gear seal (not serviceable)

GENERAL PROCEDURES

POWER TRANSFER UNIT (PTU) DRAINING AND FILLING

MATERIAL

Item	Specification
Motorcraft SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A

NOTE: **A new Power Transfer Unit (PTU) must be installed any time the PTU has been submerged in water.**

NOTE: **The Power Transfer Unit (PTU) is not to be drained unless contamination is suspected. To drain the PTU fluid, the PTU must be removed from the vehicle. The fluid that is drained may appear black and have a pungent odor. Do not mistake this for contaminated fluid. For additional information, refer to POWER TRANSFER UNIT (PTU) in the Removal portion of this service information.**

NOTE: **Fill level checks are done in-vehicle only. Let the vehicle sit 10 minutes after the road test before checking the fluid level.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

2. Clean the area around the filler plug before removing.

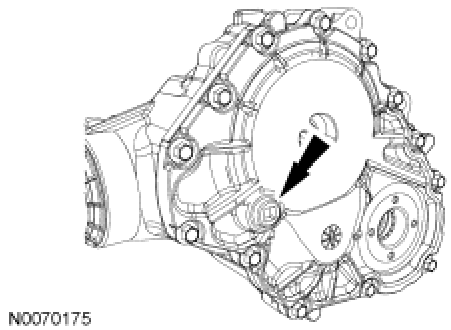

Fig. 3: Locating Fill Plug
Courtesy of FORD MOTOR CO.

3. Remove and discard the filler plug.
4. With the vehicle on a flat, level surface, fill the PTU with lubricant. The fluid must be even with the bottom of the fill opening.
   - Fluid capacity is 0.53L (18 oz).
5. Install a new filler plug.
   - Tighten to 20 N.m (177 lb-in).

IN-VEHICLE SERVICING

COVER SEAL

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
	Handle, Driver 32 in	205-907
	Installer, Halfshaft Oil Seal	308-431
	Installer, Shaft Bearing Cup	308-221 (T94P-7025-BH)

 ST1164-A		
 ST1582-A	Remover, Halfshaft	205-241
 ST1605-A	Slide Hammer	100-01 (T50T-100-A)

REMOVAL

NOTE: **The Power Transfer Unit (PTU) may leak different color fluids, red oil leak for automatic transmission fluid and brown/black gear lube for PTU fluid. The PTU seals prevent these types of fluids from leaking. It is important to note which color fluid is leaking to conduct the most appropriate service procedure. This procedure will correct a brown/black (gear lube) leak from the RH side of the PTU. For additional information, refer to ANALYSIS OF LEAKAGE.**

NOTE: **This procedure is to be performed through the RH wheel opening. It is not necessary to remove the exhaust components to complete this repair.**

1. Remove the intermediate shaft seal and deflector. For additional information, refer to **INTERMEDIATE SHAFT SEAL AND DEFLECTOR**.

   NOTE: **There is a bearing inside the PTU directly behind the cover seal. The bearing is not serviced.**

2. Remove the cover seal using the Slide Hammer, the extension from the Halfshaft Remover and a suitable seal puller inserted into the groove of the seal.

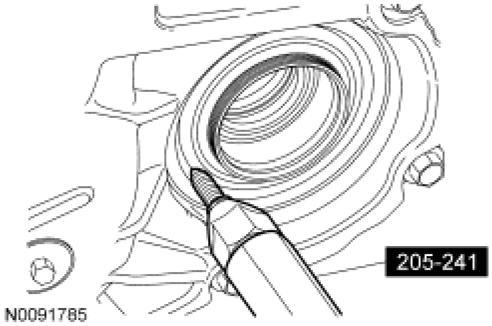

Fig. 4: Removing Cover Seal Using Slide Hammer
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Assemble the Driver Handle, the Halfshaft Oil Seal Installer and the Shaft Bearing Cup Installer as shown in illustration.

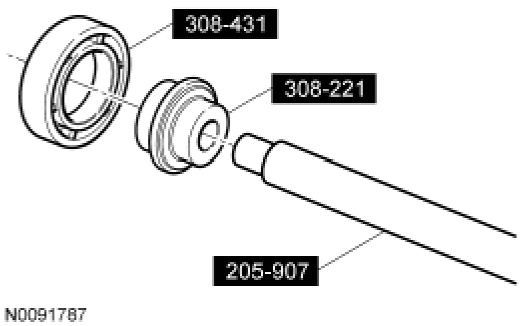

Fig. 5: Assembling Driver Handle, Halfshaft Oil Seal Installer & Shaft Bearing Cup Installer
Courtesy of FORD MOTOR CO.

2. Using the Driver Handle, the Halfshaft Oil Seal Installer and the Shaft Bearing Cup Installer, install the cover seal in the PTU.

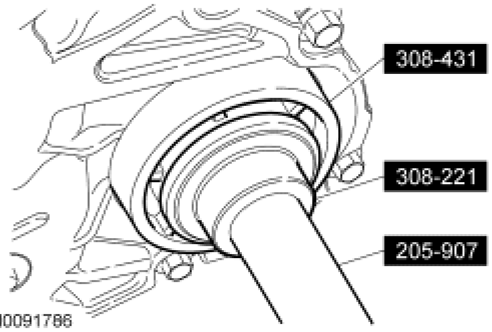

Fig. 6: Installing Cover Seal In PTU
Courtesy of FORD MOTOR CO.

3. Install the intermediate shaft seal and deflector. For additional information, refer to **INTERMEDIATE SHAFT SEAL AND DEFLECTOR**.
4. Fill the PTU fluid as necessary. For additional information, refer to **POWER TRANSFER UNIT (PTU) DRAINING AND FILLING**.

OUTPUT SHAFT SEAL

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
	Holding Fixture, Drive Pinion Flange	205-126 (T78P-4851-A)
	Installer, PTU Drive Gear Outer Oil Seal	308-430

Item	Part Number	Description
1	-	Collapsible spacer (part of 7275 kit)
2	-	Output shaft seal (part of 7275 kit)
3	-	Output shaft seal deflector (part of 7275 kit)
4	-	Output pinion flange (part of 7275 kit)
5	-	Pinion flange nut (part of 7275 kit)

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the exhaust flexible pipe. For additional information, refer to **EXHAUST SYSTEM** article.

NOTE: Index-mark both the driveshaft flanges for installation.

3. Remove the 4 driveshaft-to-Power Transfer Unit (PTU) output flange bolts. Disconnect the driveshaft from the PTU and position it aside.
    - Using mechanic's wire, support the driveshaft.

NOTE: Rotational torque of the PTU rear output shaft flange must be measured and recorded using a N.m (lb-in) torque wrench for correct pinion bearing preload when reassembled. This will be the torque-to-turn measurement.

4. Using a suitable torque wrench, measure and record the rotational torque.

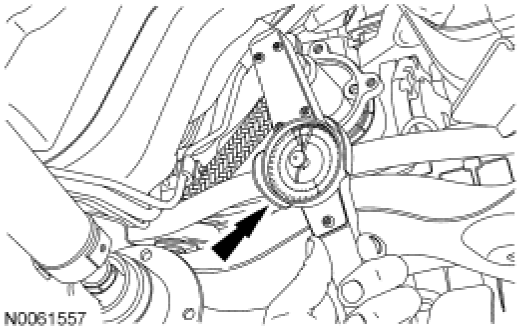

Fig. 8: Measuring Rotational Torque Using A Suitable Torque Wrench
Courtesy of FORD MOTOR CO.

5. Using the Drive Pinion Flange Holding Fixture, hold the output pinion flange. Remove and discard the pinion nut.

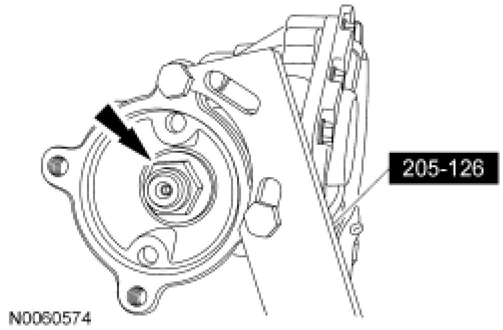

Fig. 9: Holding Output Pinion Flange Using Special Tool (205-126)
Courtesy of FORD MOTOR CO.

NOTE: Index-mark the output pinion flange to the pinion shaft.

6. Using the Output Flange Remover, remove the output pinion flange.

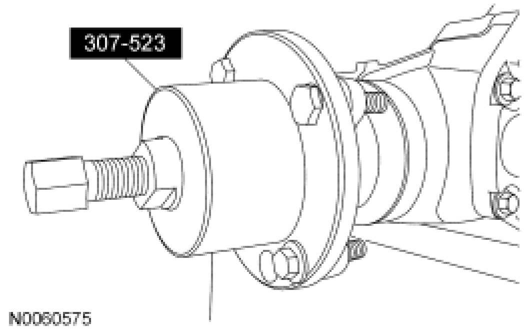

Fig. 10: Removing Output Pinion Flange Using Special Tool (307-523)
Courtesy of FORD MOTOR CO.

7. Remove and discard the output shaft seal deflector.
8. Remove and discard the output shaft seal.
9. Remove and discard the collapsible spacer.

INSTALLATION

1. Install the new collapsible spacer.
2. Using the PTU Drive Gear Outer Oil Seal Installer, install the output shaft seal.

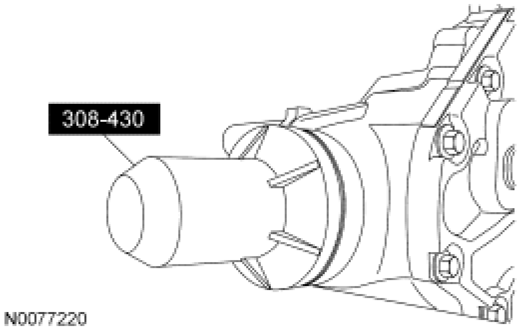

Fig. 11: Installing Output Shaft Seal Using Special Tool (308-430)
Courtesy of FORD MOTOR CO.

3. Using the PTU Drive Gear Outer Oil Seal Installer, install the output shaft seal deflector.

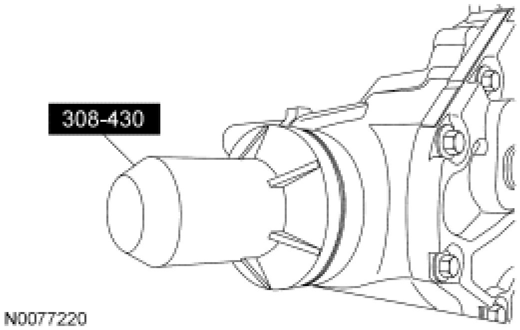

Fig. 12: Installing Output Shaft Seal Using Special Tool (308-430)
Courtesy of FORD MOTOR CO.

NOTE: **Install the output pinion flange to engage the spline as previously marked.**

4. Install the output pinion flange.

NOTE: **Refer to the rotational torque previously recorded with the N.m (lb-in) torque wrench. Tighten the pinion nut in small increments until it is within 0.3 N.m (3 lb-in) of the reference measurement. If 0.3 N.m (3 lb-in) is exceeded, then the collapsible spacer will be damaged and a new collapsible spacer will be required.**

5. Using the Drive Pinion Flange Holding Fixture to hold the output pinion flange, install and tighten the new pinion flange nut.

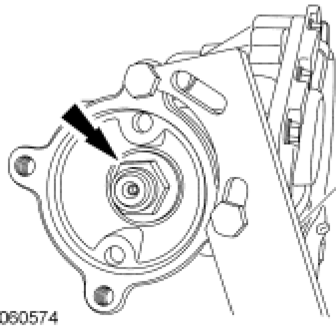

Fig. 13: Holding Output Pinion Flange Using Special Tool (205-126)
Courtesy of FORD MOTOR CO.

6. Position the driveshaft using the index mark and install the 4 driveshaft-to-PTU output flange bolts. Tighten bolts in a star pattern.
   - Tighten to 70 N.m (52 lb. ft.).
7. Install the exhaust flexible pipe. For additional information, refer to **EXHAUST SYSTEM** article.
8. Fill the PTU, if necessary. For additional information, refer to **POWER TRANSFER UNIT (PTU) DRAINING AND FILLING**.

REMOVAL

NOTE: **The Power Transfer Unit (PTU) may leak different color fluids, red oil leak for automatic transmission fluid and brown/black gear lube for PTU fluid. The PTU seals prevent these types of fluids from leaking. It is important to note which color fluid is leaking to conduct the most appropriate service procedure. This procedure will correct a red oil leak (automatic transmission fluid) from the intermediate shaft seal on the RH side of the PTU. For additional information, refer to ANALYSIS OF LEAKAGE.**

NOTE: **This procedure is to be performed through the RH wheel opening. It is not necessary to remove the exhaust components to complete this repair.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the RH front wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
3. Apply the brake to keep the halfshaft from rotating and remove the front wheel hub nut.
    - Do not discard the nut at this time.

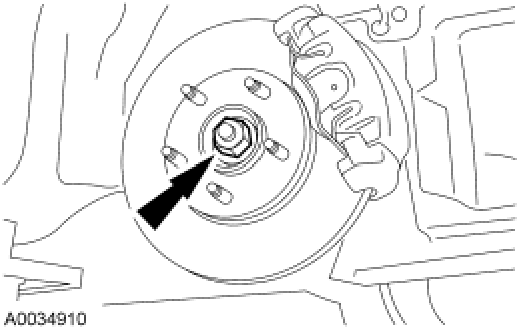

Fig. 14: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

4. Remove the brake flexible hose bracket bolt and disconnect the hose from the shock absorber.

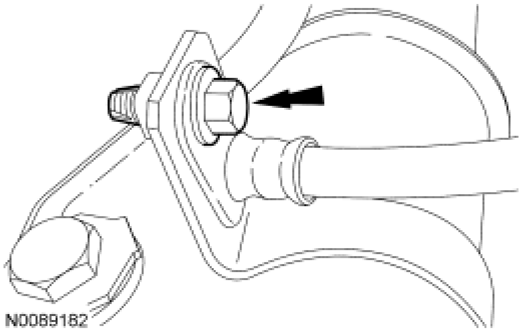

Fig. 15: Identifying Brake Flexible Hose Bracket Bolt
Courtesy of FORD MOTOR CO.

5. Disconnect the wheel speed sensor harness from the shock absorber bracket.

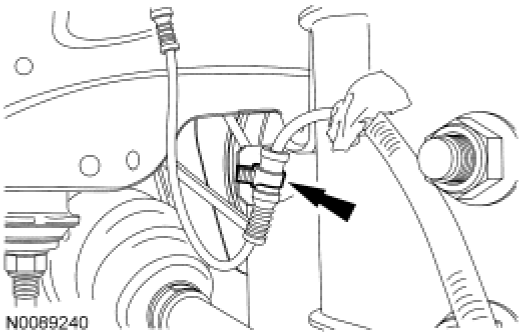

Fig. 16: Identifying Wheel Speed Sensor Harness
Courtesy of FORD MOTOR CO.

6. Remove the RH brake disc. For additional information, refer to **FRONT DISC BRAKE** article.

NOTE:	**Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

7. Remove and discard the upper stabilizer bar link nut.
   - Position the stabilizer bar link aside.

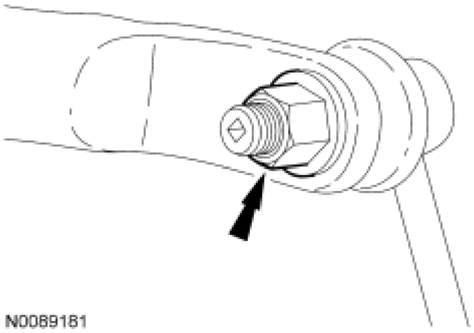

Fig. 17: Identifying Ball Joint-to-knuckle Bolt And Nut
Courtesy of FORD MOTOR CO.

8. Remove and discard the ball joint-to-knuckle bolt and nut.
   - Separate the lower control arm from the knuckle.

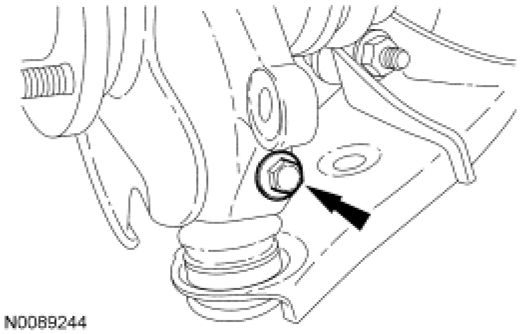

Fig. 18: Identifying Ball Joint-to-knuckle Bolt And Nut
Courtesy of FORD MOTOR CO.

9. Using the Front Wheel Hub Remover, separate the halfshaft from the wheel hub.

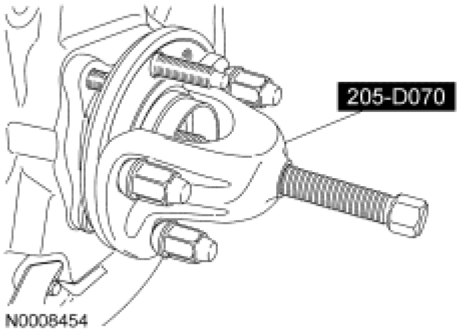

Fig. 19: Pressing Halfshaft From Wheel Bearing & Hub
Courtesy of FORD MOTOR CO.

10. Pull the knuckle outboard and rotate it toward the rear of the vehicle.
    - Secure the knuckle assembly.

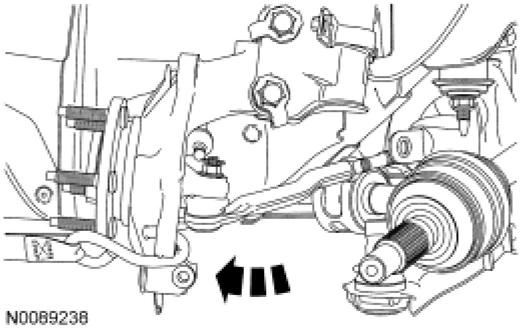

Fig. 20: Identifying Knuckle Assembly
Courtesy of FORD MOTOR CO.

NOTE:	**It is not necessary to separate the halfshaft from the intermediate shaft for this repair.**

11. Remove the 2 intermediate shaft bracket bolts and the intermediate and halfshaft assembly.
    - Inspect the intermediate shaft for pitting or damage in the seal contact area. Replace if necessary.

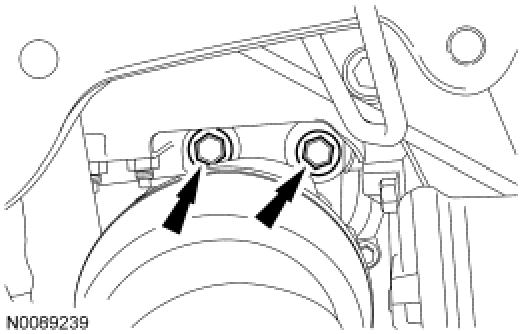

Fig. 21: Identifying Bearing Cup Remover
Courtesy of FORD MOTOR CO.

NOTE: The following instruction will prevent the Bearing Cup Remover from opening too far which would make removing the intermediate shaft seal deflector difficult.

12. Place a 16 mm (5/8 in) washer between the components of the Bearing Cup Remover as shown in illustration.

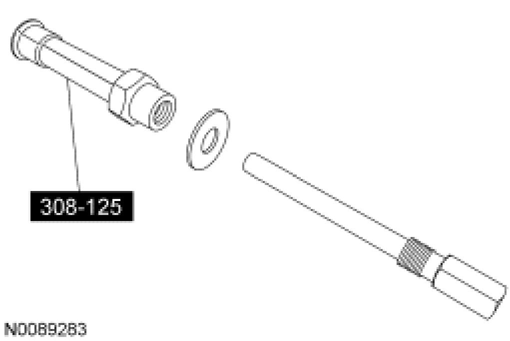

Fig. 22: Identifying 16 mm (5/8 in) Washer
Courtesy of FORD MOTOR CO.

NOTE: Using a 5-pound or larger slide hammer eases the removal of the seal deflector.

13. Using the Bearing Cup Remover, the extension from the Halfshaft Remover, and a suitable slide hammer, remove the seal deflector.
    - The seal deflector will have been damaged during removal. Remove all foreign material from the PTU before continuing with the repair.

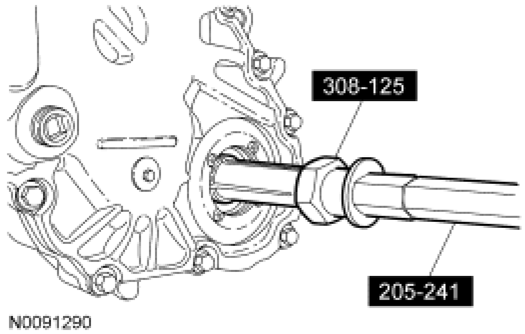

Fig. 23: Removing Seal Deflector
Courtesy of FORD MOTOR CO.

14. Using the Bearing Cup Remover, the extension from the Halfshaft Remover, and a suitable slide hammer, remove the intermediate shaft seal, and if equipped, the alignment washer.

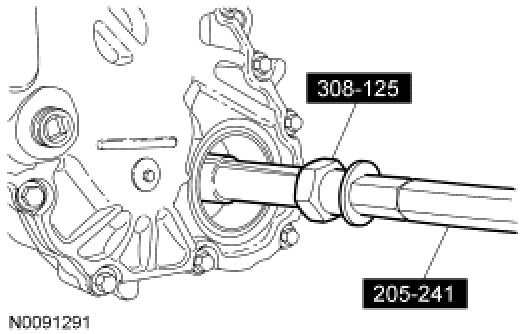

Fig. 24: Removing Intermediate Shaft Seal
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: **The following illustration shows the correct orientation of the seal components when installed in the vehicle.**

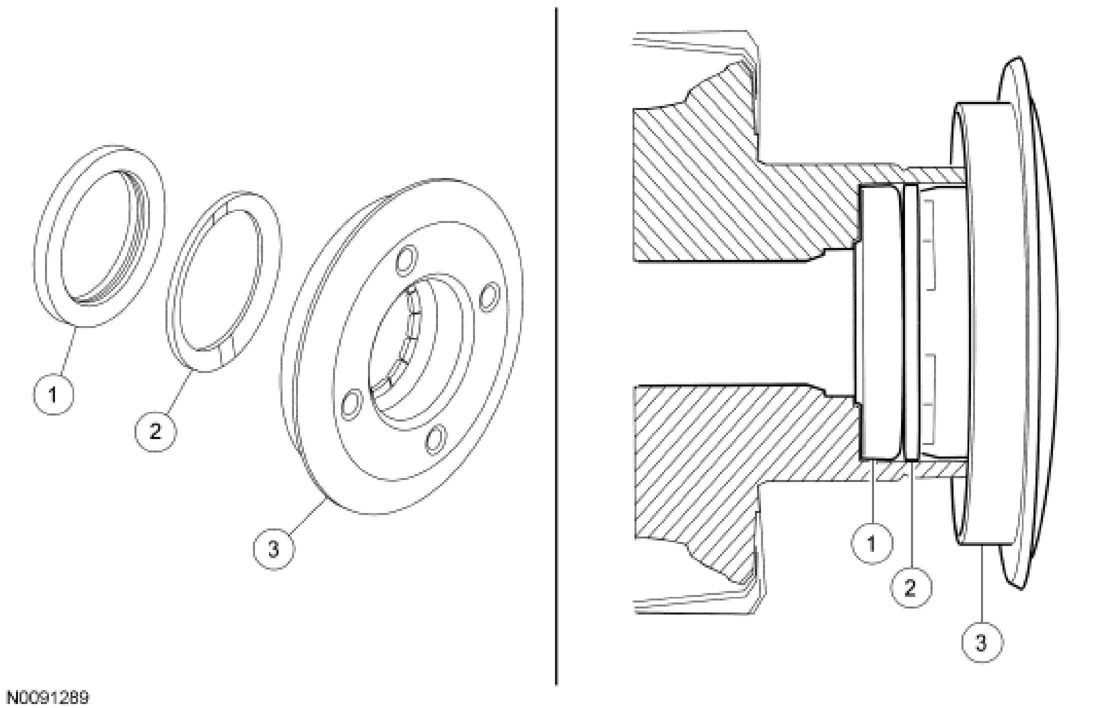

Fig. 25: View Of Correct Orientation Of Seal Components When Installed In Vehicle
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Intermediate shaft seal (part of 7275 kit)
2	-	Alignment washer (part of 7275 kit)
3	-	Seal deflector (part of 7275 kit)

1. Place the intermediate shaft seal on the PTU Linkshaft Seal Installer and Driver Handle with the spring side facing away from the tool.

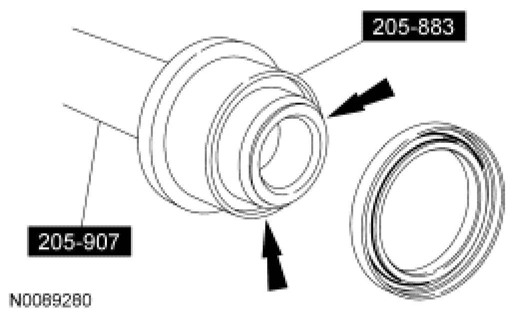

Fig. 26: Placing Intermediate Shaft Seal On PTU Link Shaft Seal Installer
Courtesy of FORD MOTOR CO.

2. Using the PTU Linkshaft Seal Installer and Driver Handle, install the intermediate shaft seal.

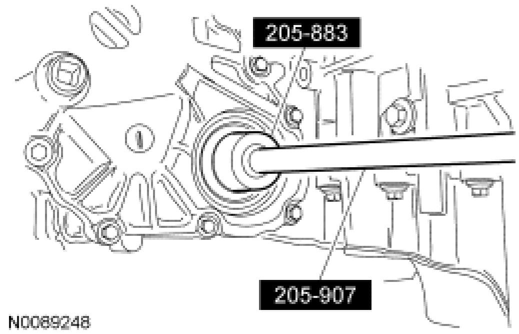

Fig. 27: Installing Intermediate Shaft Seal
Courtesy of FORD MOTOR CO.

3. Place the alignment washer on the PTU Linkshaft Seal Installer and Driver Handle with the beveled edge (white-striped side) facing towards the tool.

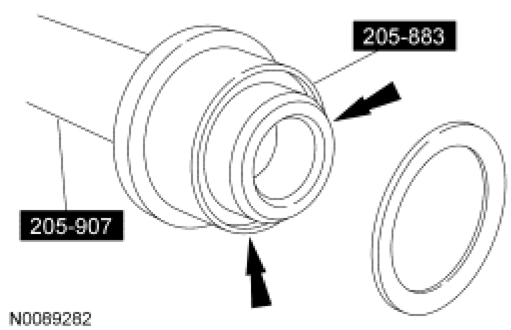

Fig. 28: Placing Intermediate Shaft Seal On PTU Link shaft Seal Installer
Courtesy of FORD MOTOR CO.

NOTE: Do not use force when installing the alignment washer or damage to the washer can occur.

4. Using the PTU Linkshaft Seal Installer and Driver Handle, install the alignment washer by hand, pushing it in until it bottoms against the seal.
    - When installed, the white-striped side should be facing out.

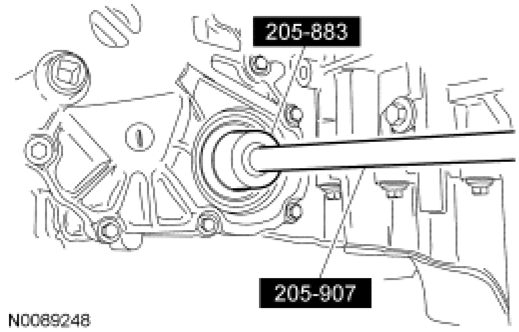

Fig. 29: Installing Intermediate Shaft Seal

Courtesy of FORD MOTOR CO.

NOTE:	**Do not overheat (melt) the seal deflector. Monitor the temperature of the deflector with a suitable temperature measuring device, such as a digital temperature laser or infrared thermometer, while heating. Do not allow the temperature to exceed 100°C (212°F). Overheating will damage the deflector. If the deflector is damaged, a new deflector must be used.**

NOTE:	**Apply a small amount of silicone brake caliper grease and dielectric compound to the inner lip of the deflector where it installs on the tube inside the PTU before heating. This will ease the installation of the deflector.**

5. Position the deflector on the PTU Linkshaft Seal Dust Shield Installer using silicone brake caliper grease and dielectric compound to retain it to the installer. Using a suitable heat gun, heat the deflector to a minimum of 66°C (150°F) and a maximum of 100°C (212°F) by concentrating the heat across the back of the installer while rotating, not directly on the deflector itself.
    - As an alternative method to heating the seal deflector, place the deflector in boiling water for 3 to 5 minutes. Dry off the deflector and install.

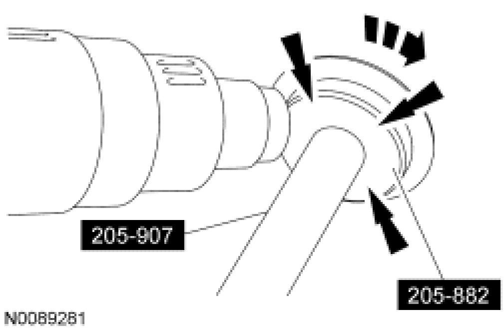

Fig. 30: Applying Small Amount Of Silicone Brake Caliper Grease & Dielectric Compound To Inner Lip Of Deflector
Courtesy of FORD MOTOR CO.

6. Install the seal deflector immediately after heating using the PTU Linkshaft Seal Dust Shield Installer and Driver Handle.

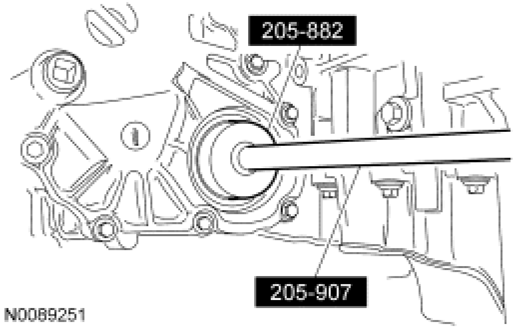

Fig. 31: Installing Seal Deflector
Courtesy of FORD MOTOR CO.

7. Make sure the deflector is completely seated all the way around and there are no cracks on the face or inner diameter white-colored tab. The deflector is correctly installed when the face of the deflector is recessed 3-5 mm (0.12-0.20 in) into the pocket all the way around.

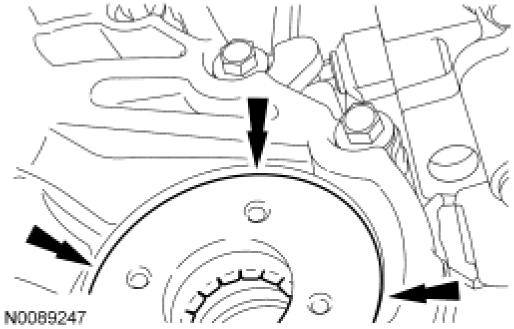

Fig. 32: Making Sure Deflector Is Completely Seated All The Way Around
Courtesy of FORD MOTOR CO.

NOTE: A slight effort may be required to fully seat the intermediate and halfshaft assembly as it passes through the alignment washer.

8. Install the intermediate and halfshaft assembly and the 2 bolts.
   - Tighten to 40 N.m (30 lb. ft.).

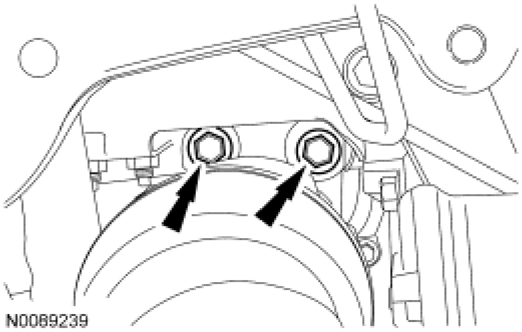

Fig. 33: Identifying Intermediate And Halfshaft Assembly And Bolts

Courtesy of FORD MOTOR CO.

NOTE: **Some residual fluid will collect between the seal and deflector during this repair. This is a normal condition and should not be misinterpreted as a leak after the repair is complete.**

9. Using brake parts cleaner, thoroughly clean the deflector and intermediate shaft area of any residual fluid that may have accumulated during the repair.
10. Position the halfshaft and ball joint into the wheel knuckle. Install the new ball joint bolt and nut.
    - Tighten to 55 N.m (41 lb. ft.).

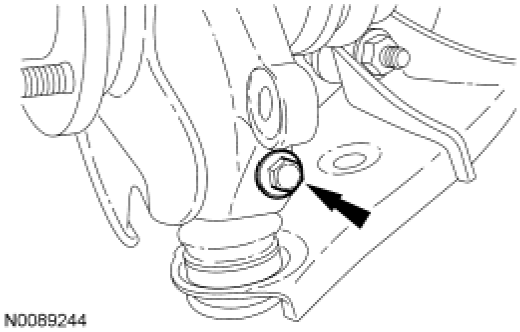

Fig. 34: Identifying Ball Joint Bolt And Nut
Courtesy of FORD MOTOR CO.

11. Position the stabilizer bar link and install the new nut.
    - Tighten to 90 N.m (66 lb. ft.).

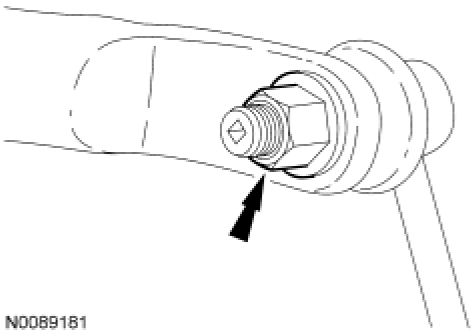

Fig. 35: Stabilizer Bar Link Nut
Courtesy of FORD MOTOR CO.

12. Install the RH brake disc. For additional information, refer to **FRONT DISC BRAKE** article.
13. Position the brake flexible hose bracket to the shock absorber and install the bolt.
    - Tighten to 20 N.m (177 lb-in).

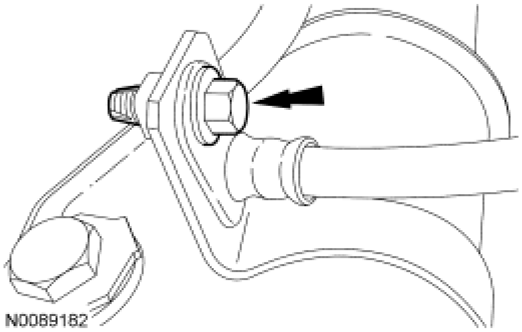

Fig. 36: Identifying Brake Flexible Hose Bracket
Courtesy of FORD MOTOR CO.

14. Connect the wheel speed sensor harness to the shock absorber bracket.

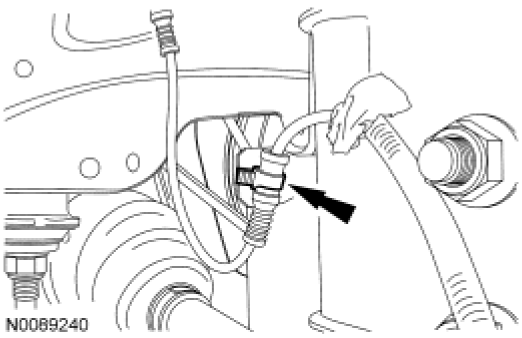

Fig. 37: Identifying Wheel Speed Sensor Harness
Courtesy of FORD MOTOR CO.

NOTE: Do not tighten the halfshaft nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.

15. Apply the brake to keep the halfshaft from rotating. Using the previously removed wheel hub nut, seat the halfshaft into the front wheel hub.
    - Tighten to 350 N.m (258 lb. ft.).
    - Remove and discard the wheel hub nut.

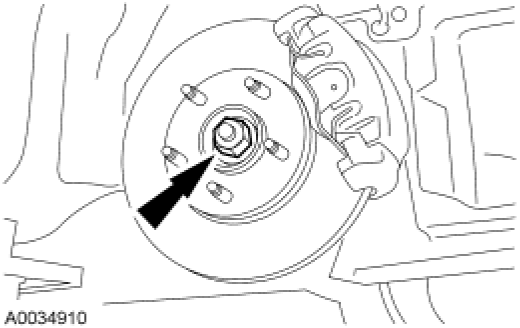

Fig. 38: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

NOTE:	**The wheel hub nut contains a one-time locking chemical that is activated by the heat created when it is tightened. Install and tighten the new wheel hub nut to specification within 5 minutes of starting it on the threads. Always install a new wheel hub nut after loosening or when not tightened within the specified time or damage to the components can occur.**

16. Apply the brake to keep the halfshaft from rotating and install a new wheel hub nut.
    - Tighten to 350 N.m (258 lb. ft.).
17. Install the RH front wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
18. Top off the transmission fluid as necessary.

REMOVAL

POWER TRANSFER UNIT (PTU)

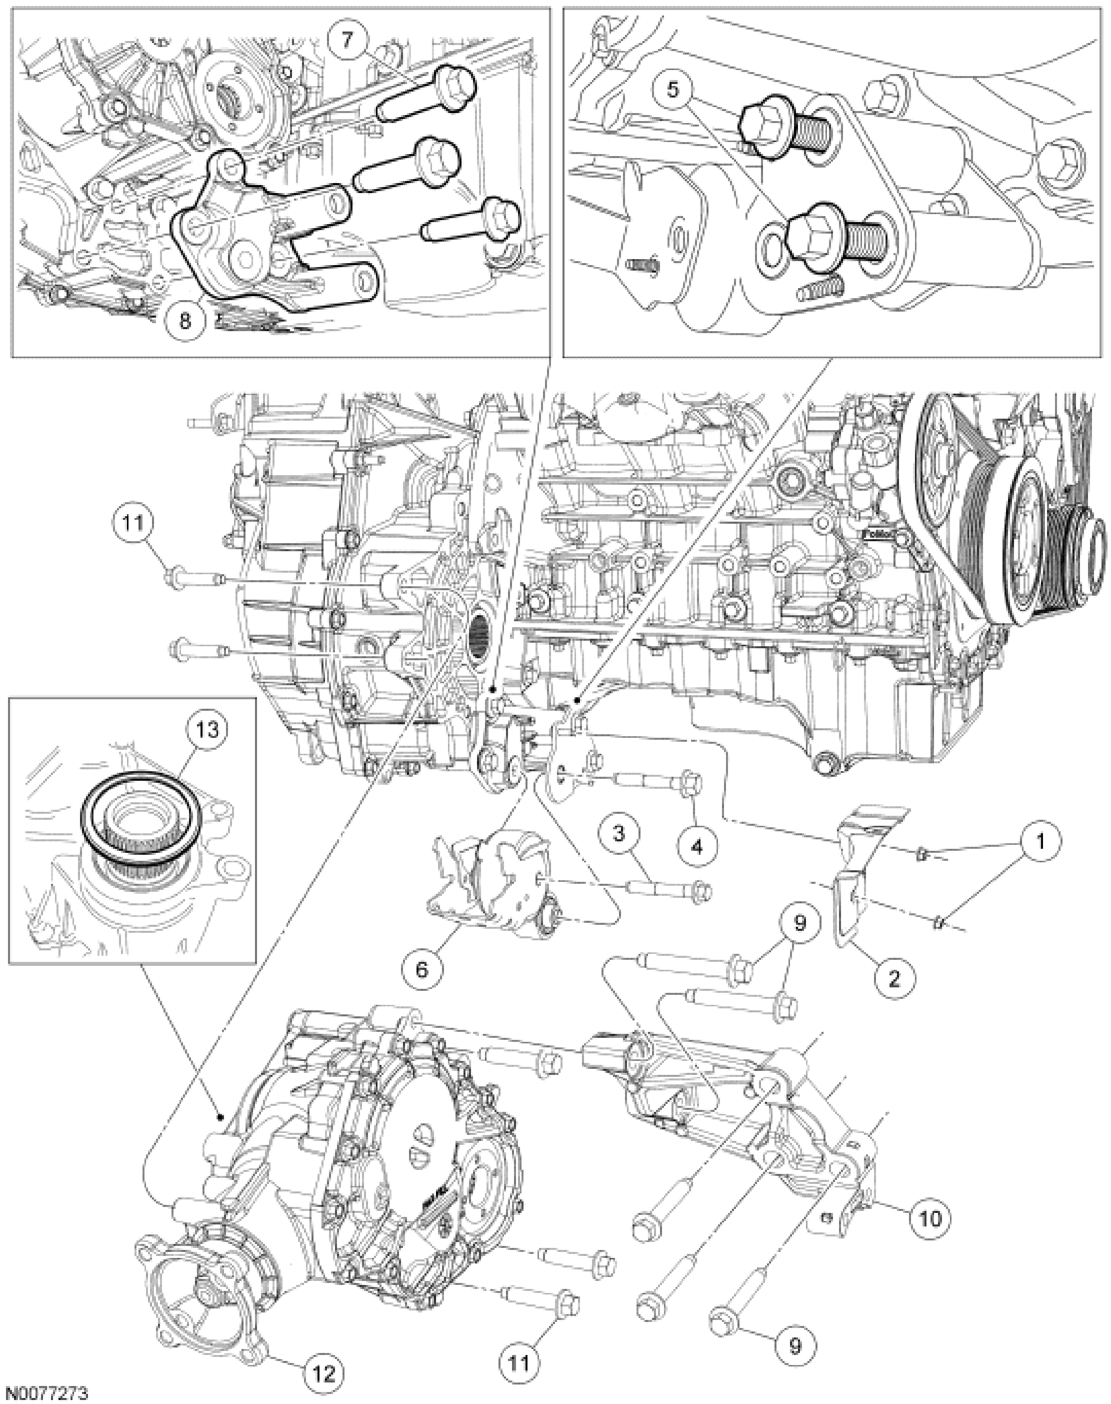

Fig. 39: Identifying Power Transfer Unit (PTU)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W700101	Roll restrictor shield nuts
2	6C038	Roll restrictor shield

3	W706674	Roll restrictor through bolt
4	W711843	Roll restrictor through bolt
5	W712830	Roll restrictor bracket bolts
6	6P082	Roll restrictor assembly
7	W712830	Roll restrictor bracket-to-transaxle bolt (3 required)
8	6P093	Roll restrictor bracket-to-transaxle
9	W500724	Power Transfer Unit (PTU)-to-support bracket bolts (5 required)
10	7A444	PTU support bracket
11	W500741	PTU-to-transaxle bolts (5 required)
12	7251	PTU
13	7086	Compression seal

NOTE: A new intermediate shaft seal and deflector must be installed whenever the intermediate shaft or Power Transfer Unit (PTU) is removed from the vehicle.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the LH and RH wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
3. Remove the intermediate shaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

NOTE: Index-mark the driveshaft for installation.

4. Remove the 4 bolts and support the driveshaft with a length of mechanic's wire.

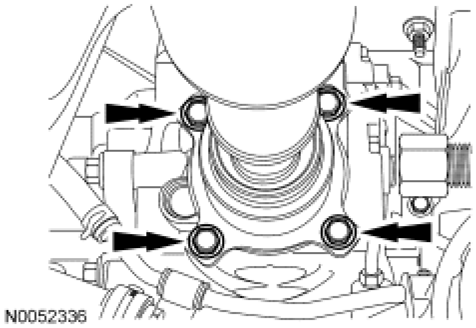

Fig. 40: Locating Driveshaft Aside Bolts
Courtesy of FORD MOTOR CO.

5. Remove the exhaust flexible pipe and the RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
6. Remove the 2 roll restrictor nuts and the roll restrictor shield.

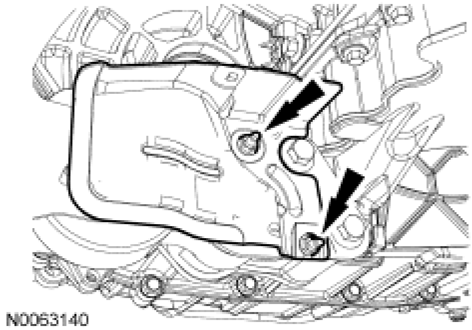

Fig. 41: Locating Roll Restrictor Heat Shield Nuts
Courtesy of FORD MOTOR CO.

7. Remove the roll restrictor through bolt.

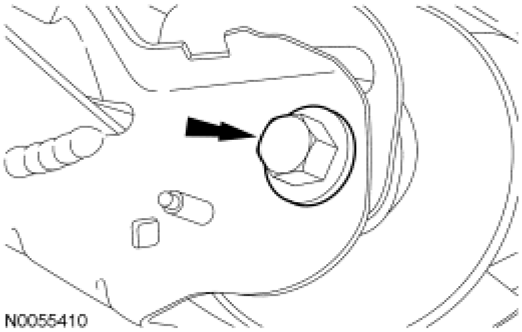

Fig. 42: Locating Roll Restrictor-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

8. Remove the roll restrictor through bolt, 2 roll restrictor bracket bolts and the roll restrictor assembly.

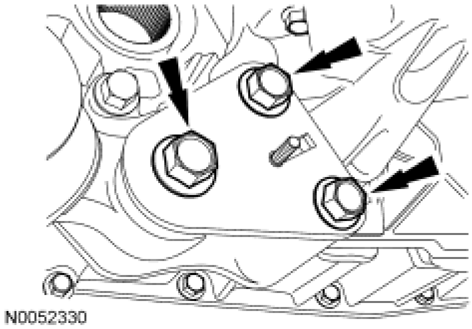

Fig. 43: Locating Roll Restrictor-To-Transaxle Bracket Plate Bolts
Courtesy of FORD MOTOR CO.

9. Remove the 3 roll restrictor bracket-to-transaxle bolts and the roll restrictor-to-transaxle bracket.

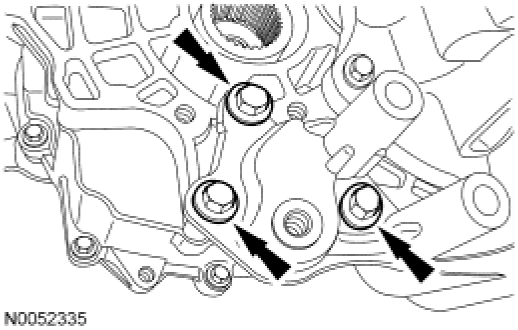

Fig. 44: Locating Transaxle Bracket Bolts
Courtesy of FORD MOTOR CO.

10. Remove the 5 PTU support bracket bolts and the PTU support bracket.

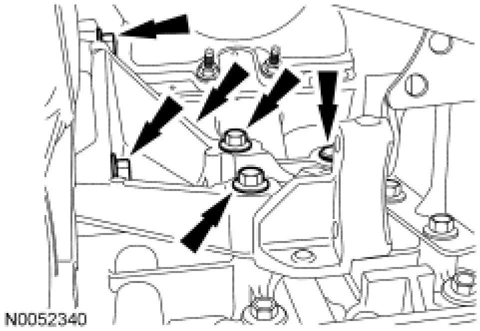

Fig. 45: Locating Power Transfer Unit (PTU) Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

11. Using a long extension, loosen but do not remove the 2 LH side PTU-to-transaxle bolts.

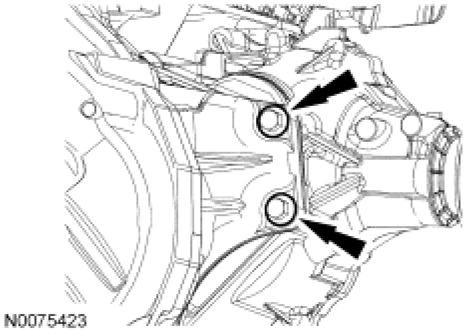

Fig. 46: Locating LH Side PTU-To-Transaxle Bolts
Courtesy of FORD MOTOR CO.

12. Remove the 3 RH side PTU-to-transaxle bolts and the 2 LH side PTU-to-transaxle bolts previously loosened.

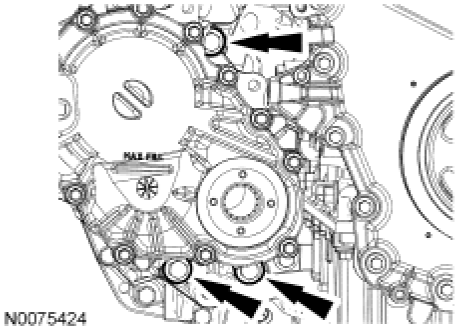

Fig. 47: Locating RH Side PTU-To-Transaxle Bolts
Courtesy of FORD MOTOR CO.

13. Separate the PTU from the transaxle and remove it from the vehicle.

NOTE: **A new compression seal must be installed whenever the PTU is removed from the vehicle.**

14. Using a suitable tool, remove the compression seal and discard.

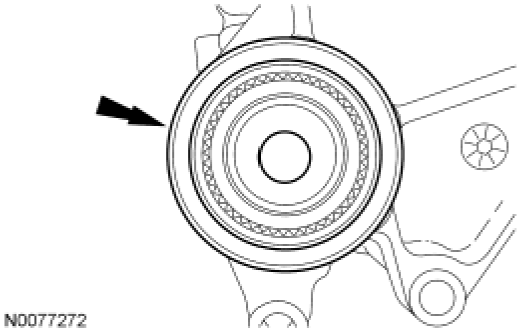

Fig. 48: Identifying Compression Seal
Courtesy of FORD MOTOR CO.

INSTALLATION

POWER TRANSFER UNIT (PTU)

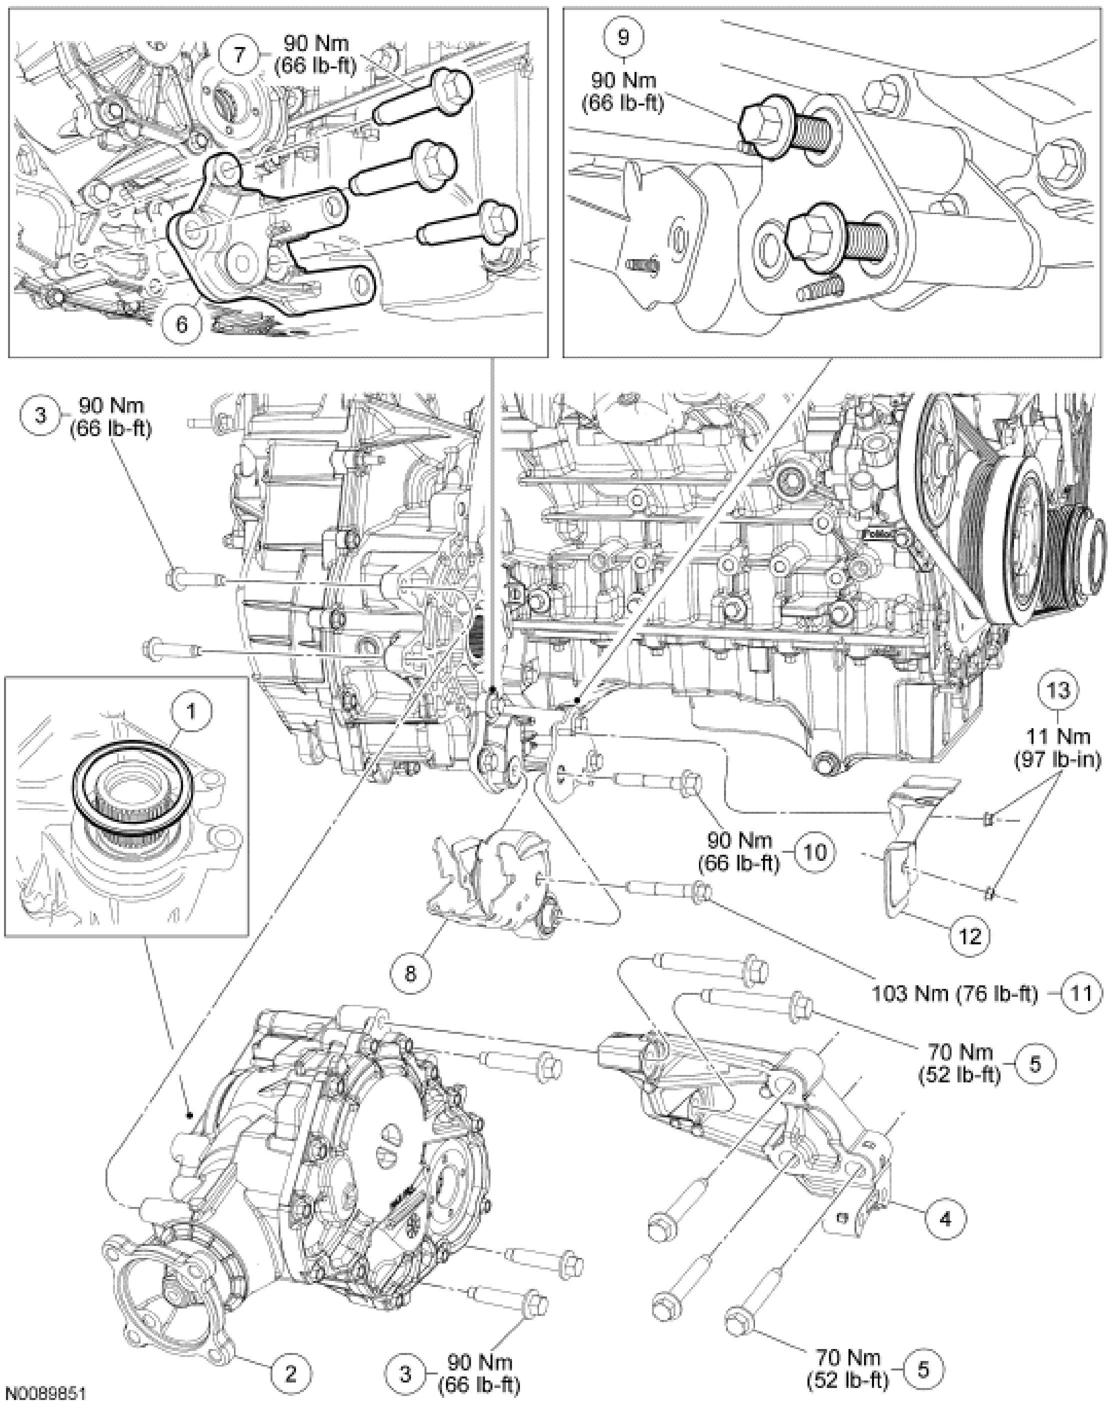

Fig. 49: Identifying Power Transfer Unit Assembly With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7086	Compression seal
2	7251	Power Transfer Unit (PTU)

3	W500741	PTU-to-transaxle bolts (5 required)
4	7A444	PTU support bracket
5	W500724	PTU-to-support bracket bolts (5 required)
6	6P093	Roll restrictor bracket
7	W712830	Roll restrictor bracket-to-transmission bolt (3 required)
8	6P082	Roll restrictor assembly
9	W712830	Roll restrictor bracket bolt (2 required)
10	W711843	Roll restrictor through bolt
11	W706674	Roll restrictor through bolt
12	6C038	Roll restrictor shield
13	W700101	Roll restrictor shield nuts

NOTE: **A new compression seal must be installed whenever the Power Transfer Unit (PTU) is removed from the vehicle.**

1. Using a suitable tool, install the new compression seal.

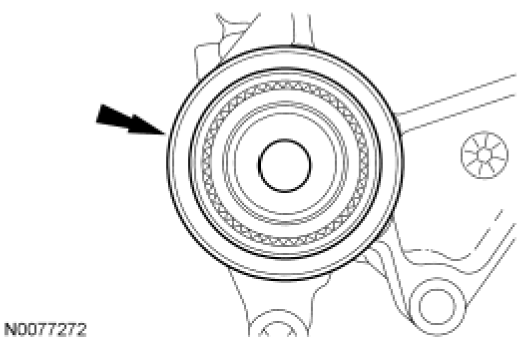

Fig. 50: Identifying Compression Seal
Courtesy of FORD MOTOR CO.

NOTE: **A new PTU intermediate shaft seal must be installed whenever the intermediate shaft or PTU is removed from the vehicle.**

2. Using a suitable pry bar, move the engine forward. Install a block of wood to hold the engine in the forward position. Install the PTU with the output flange facing the passenger side, filler plug facing upward. Rotate the PTU to the transaxle. Install the 5 PTU-to-transaxle bolts.
   - Tighten to 90 N.m (66 lb. ft.).

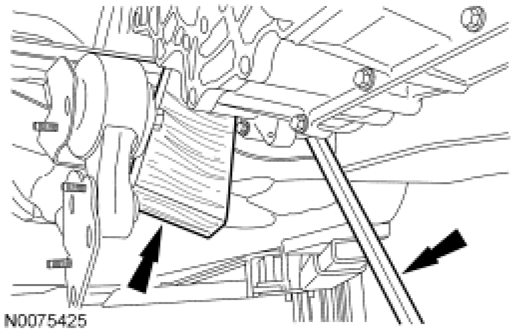

Fig. 51: Moving Engine Forward Using A Suitable Pry Bar
Courtesy of FORD MOTOR CO.

3. Position the PTU support bracket into place and hand-tighten the 5 PTU support bracket bolts.
   1. Tighten the bolts to the transaxle to 70 N.m (52 lb. ft.).
   2. Tighten the bolts to the engine to 70 N.m (52 lb. ft.).

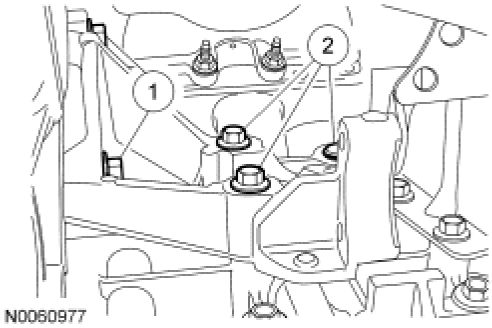

Fig. 52: Identifying Transaxle Bolts & Engine Bolts
Courtesy of FORD MOTOR CO.

4. Install the roll restrictor-to-transmission bracket and the 3 roll restrictor bracket-to-transmission bolts.
   - Tighten to 90 N.m (66 lb. ft.).

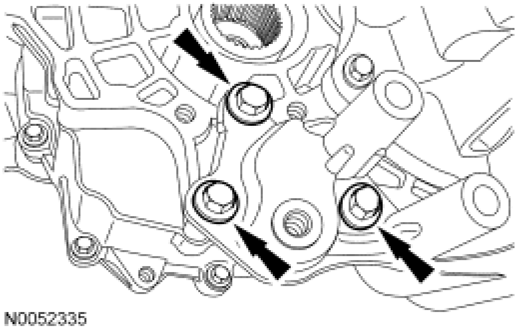

Fig. 53: Locating Transaxle Bracket Bolts
Courtesy of FORD MOTOR CO.

5. Install the roll restrictor through bolt and the 2 roll restrictor bracket bolts.
   - Tighten to 90 N.m (66 lb. ft.).

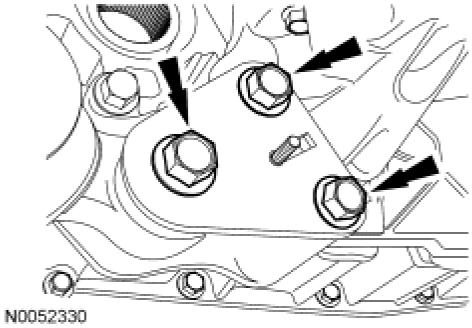

Fig. 54: Locating Roll Restrictor-To-Transaxle Bracket Plate Bolts
Courtesy of FORD MOTOR CO.

6. Install the roll restrictor through bolt
   - Tighten to 103 N.m (76 lb. ft.).

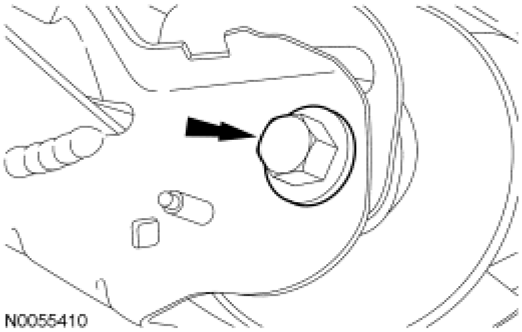

Fig. 55: Locating Roll Restrictor-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

7. Install the roll restrictor shield and the 2 roll restrictor nuts.
   - Tighten to 11 N.m (97 lb-in).

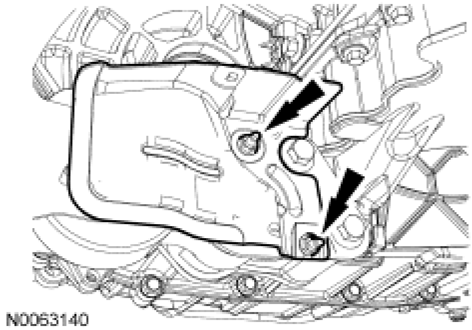

Fig. 56: Locating Roll Restrictor Heat Shield Nuts

Courtesy of FORD MOTOR CO.

8. Install the exhaust flexible pipe and RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
9. Install the intermediate shaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.
10. Line up the index marks on the driveshaft to the index marks on the PTU flange made during removal and install the 4 bolts.
    - Tighten to 70 N.m (52 lb. ft.).

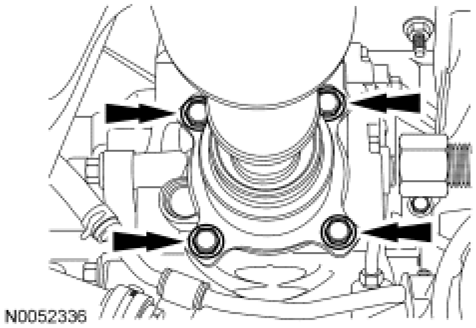

Fig. 57: Locating Driveshaft Aside Bolts
Courtesy of FORD MOTOR CO.

11. Fill the PTU, if necessary. For additional information, refer to **POWER TRANSFER UNIT (PTU) DRAINING AND FILLING**.
12. Install the LH and RH wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

2008 SUSPENSION

Wheels & Tires - Edge & MKX

SPECIFICATIONS

MATERIAL SPECIFICATIONS

Item	Specification	Fill Capacity
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A	-
Wheel and Tire Cleaner ZC-27-A or B	-	-

GENERAL SPECIFICATIONS

Item	Specification
Tire Balance Weight	
Maximum balance weight (Euro-flange wheel alloy/chrome)	180 g (6.4 oz) per inner and outer
Maximum balance weight (MC flange alloy/cladded)	135 g (4.8 oz) per inner and outer
Tire Inflation	
Tires	See Safety Certification Label located on driver door jamb.
NOTE: **Use only special tool 204-354 any time tire pressures are measured to be sure that accurate values are obtained.** **For accuracy, Ford recommends the use of a digital or dial-type tire pressure gauge rather than a stick-type pressure gauge.** Inflate the tire to the pressure specified on the safety certification sticker located on the driver door or door pillar.	

TORQUE SPECIFICATIONS

Sensor strap (worm gear)	3	-	27
Wheel nuts	135	100	-

DESCRIPTION AND OPERATION

WHEELS AND TIRES

Safety Precautions

WARNING: **Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always match the tire size to the wheel size during assembly. Incorrect matching can result in tire bead damage or tire separation from the wheel. Failure to follow this instruction may result in serious personal injury to technician or vehicle occupant(s).**

WARNING: **Before servicing any tire, ask the customer if anyone injected a tire sealant into the tire. Tire sealants may be flammable and can burn or explode if exposed to an ignition source. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Replacement wheels must be equivalent to the original equipment wheels in:**

- **load carrying capacity.**
- **diameter, width and offset.**
- **pilot hole and bolt circle.**

Combined load carrying capacity of replacement wheels for a given axle, must be equal to or greater than that axle's gross axle weight rating (GAWR) identified on the vehicle's Safety Compliance Certification label. All other specifications should be evaluated by measurement of both the original wheel and the replacement wheel. If specifications are not equivalent, the safety and handling of the vehicle may be degraded, which may result in serious injury to the vehicle occupant(s).

WARNING: **Never use wheels different than the original equipment. Additionally, never use wheel nuts different than the original equipment. Failure to follow these instructions may result in damage to the wheel or mounting system. This damage could cause the wheel to come off while the vehicle is being driven, which could result in serious personal injury or death to vehicle occupant(s).**

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Keep eyes away from valve stem when deflating tires. Reduce air pressure in tire as much as possible by pushing in valve core plunger prior to removing the core. Escaping air can carry particles that can injure the eyes. Failure to follow these instructions may result in serious**

personal injury.

WARNING: **Only use replacement tires that are the same size, load index, speed rating and type (such as P-metric versus LT-metric or all-season versus all-terrain) as those originally provided by Ford. The recommended tire and wheel size may be found on either the Safety Compliance Certification Label or the Tire Label, which is located on the B-pillar or edge of the driver's door. If the information is not found on these labels, consult a Ford dealer. Use of any tire or wheel not recommended by Ford can affect the safety and performance of the vehicle, which could result in an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally, the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power transfer unit failure.**

NOTE: Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents or damage to the wheel finish may occur. Use Wheel and Tire Cleaner ZC-27-A or -B or equivalent.

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, the tires should be rotated at recommended intervals.

Tire Pressure Monitoring System (TPMS)

NOTE: The Smart Junction Box (SJB) is also identified as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) includes:

- the SJB, TPMS functionality is integrated within the SJB.
- four tire pressure sensors.
- four tire pressure sensor cradles.
- four tire pressure sensor straps.
- an instrument cluster indicator.
- a message center (if equipped).

Tire Pressure Monitoring System (TPMS) Module

The SJB contains the TPMS functionality. Refer to **Tire Pressure Monitoring System** for TPMS fault diagnosis and repair.

The SJB compares the information of each tire pressure sensor transmission against a pressure limit. If the SJB determines that the tire pressure has fallen below the low limit, the SJB communicates this to the instrument cluster on the vehicle communication bus.

Tire Pressure Monitoring System (TPMS) Pressure Sensor

The SJB monitors the air pressure in the 4 road tires with tire pressure sensors. The sensors transmit radio frequency signals to the SJB approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph).

The tire pressure sensors are battery operated and are mounted to metal brackets (called cradles) on the wheels inside the tires. The sensors are mounted 180 degrees from the valve stem.

The tire pressure sensor can be serviced separately from the cradle and the strap.

Tire Pressure Monitoring System (TPMS) Pressure Sensor Cradle

The tire pressure sensor cradles are mounted to the wheels with metal straps and have an adhesive strip to aid in their retention to the wheel.

The sensor cradle is available with the strap in a kit. To service the sensor cradle, the strap must be removed and discarded.

Tire Pressure Monitoring System (TPMS) Pressure Sensor Strap

The sensor strap keeps the sensor and the cradle retained to the wheel. A factory-installed strap is joined together with a one-time-use buckle and a dealer-installed strap is joined together with a worm gear (similar to a radiator hose clamp). Both straps should be discarded after removal and should not be reused.

The cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter.

Instrument Cluster and Message Center

The instrument cluster illuminates the TPMS indicator when it receives a message from the SJB to do so and displays the appropriate message(s) in the message center (if equipped).

The instrument cluster and message center are diagnosed and serviced in their own respective service information . Refer to the appropriate Instrumentation and Warning Systems article for the procedure.

DIAGNOSTIC TESTS

WHEELS AND TIRES

Special Tools

Illustration	Tool Name	Tool Number
 ST2869-A	Digital Tire Gauge	204-354

Inspection and Verification

WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

Be sure to follow all warnings when carrying out Inspection and Verification.

Road Test

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, go to **Symptom Chart - NVH**.

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

The use of any other tire/wheel size or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- brake cooling.

New wheels need to be installed when the vehicle's wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire chart attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect the tires for signs of uneven wear. Refer to the following descriptions to identify the type of wear and Go to **Symptom Chart - Tire Wear** for the appropriate repair action to be carried out.
2. Check the tires for:
   - cuts.
   - stone bruises.
   - abrasions.
   - blisters.
   - embedded objects.
3. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become visible.

Tire Wear

Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread-wear indicators.

Abnormal/Incorrect Tire Wear

Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread and that creates performance-related issues.

Abnormal/incorrect wear can be caused by numerous factors, some of which include driving style (aggressive passive), climate (hot, cold), road conditions, vehicle loading and maintenance. It is important to determine the root cause of wear on a vehicle before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than 1.58 mm (2/32 in) and the tire is not causing a vehicle performance (noise/vibration) concern.

Some abnormal/incorrect wear patterns look the same all the way around the tread of the tire, other wear patterns are not consistent and can occur in various spots on the tread area. The underlying causes of the 6 wear categories are different. Refer to the following descriptions to identify the type of wear and Go to **Symptom Chart - Tire Wear** for the appropriate repair action to be carried out.

Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, the tread depth of each rib may need to be measured to compare it to that of the shoulder.

NOTE: RF tire shown, others similar.

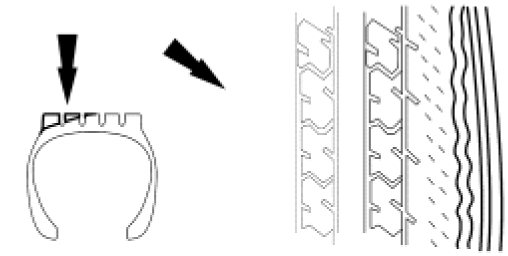

Fig. 1: Identifying Inner Edge/Shoulder Wear
Courtesy of FORD MOTOR CO.

Outer Edge/Shoulder Wear

Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, the tread depth of each rib may need to be measured to compare it to that of the shoulder.

NOTE: RF tire shown, others similar.

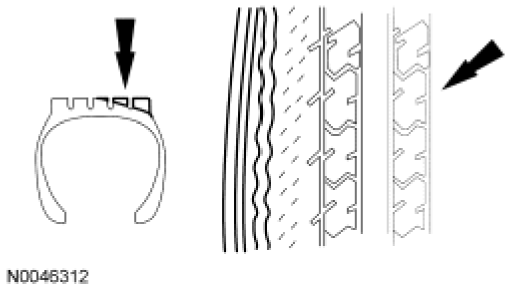

Fig. 2: Identifying Outer Edge/Shoulder Wear
Courtesy of FORD MOTOR CO.

Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. To determine whether tires have this type of wear, visually inspect the tires in both the inside and outside shoulder ribs. In some instances, the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib may need to be measured.

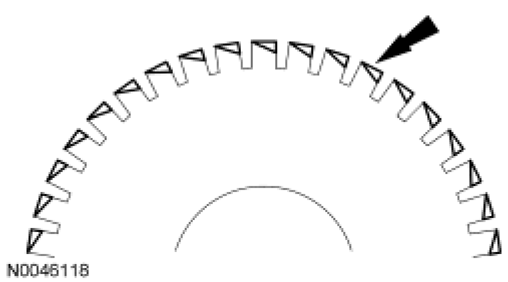

Fig. 3: Identifying Heel/Toe Wear
Courtesy of FORD MOTOR CO.

Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, the difference in tread depth along the diagonal wear pattern may need to be measured.

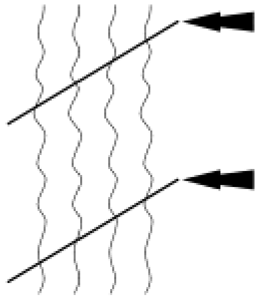

Fig. 4: Identifying Diagonal Wear
Courtesy of FORD MOTOR CO.

Symptom Chart - Tire Wear

Symptom Chart - Tire Wear

Condition	Possible Sources	Action
• Inner edge/shoulder wear	• Excessive toe out and/or negative camber • Incorrect wheel and tire assembly rotation intervals • High-speed cornering	• Go to **Pinpoint Test A** . • Go to **Pinpoint Test A** . • Go to **Pinpoint Test A** .
• Outer edge/shoulder wear	• Excessive toe in and/or positive camber • Incorrect wheel and tire assembly rotation intervals • High-speed cornering	• Go to **Pinpoint Test B** . • Go to **Pinpoint Test B** . • Go to **Pinpoint Test B** .
• Heel/toe wear	• Excessive toe in/out • Incorrect wheel and tire assembly rotation intervals	• ROTATE the wheel and tire assemblies. CHECK the alignment, ADJUST as necessary.
• Diagonal wear	• Excessive toe in/out • Incorrect tire rotation intervals • Loose, worn or damaged suspension components	• Go to **Pinpoint Test C** . • Go to **Pinpoint Test C** . • REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are

available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - NVH

Condition	Possible Sources	Action
• Wobble or shimmy	• Bent wheel • Damaged tire • Loose wheel nuts	• INSTALL a new wheel as necessary. • INSTALL a new tire as necessary. • TIGHTEN to specification.
• High-speed shake	• Tires/wheels	• REFER to **Component Tests** under Wheels And Tires .
• Vehicle vibration	• Tires/wheels	• REFER to **Component Tests** under Wheels And Tires .

Pinpoint Tests

For a description of the various tire wear patterns, refer to **Inspection and Verification**

Pinpoint Test A: Inner Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe out
- Incorrect wheel and tire rotation

PINPOINT TEST A: INNER EDGE/SHOULDER WEAR

A1 MEASURE THE TREAD DEPTH

- Using a tread depth gauge or similar tool, measure the inside edge/shoulder tread depth.
- **Is the tread depth greater than 1.58 mm (2/32 in)?**

  YES : ROTATE the wheel and tire assemblies.

  CHECK and ADJUST the toe to nominal +0.15 degree (toe in). CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

  NO : INSTALL a new tire(s).

CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Pinpoint Test B: Outer Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe in
- Incorrect wheel and tire rotation

PINPOINT TEST B: OUTER EDGE/SHOULDER WEAR

B1 MEASURE THE TREAD DEPTH

- Using a tread depth gauge or similar tool, measure the outside edge/shoulder tread depth.
- **Is the tread depth greater than 1.58 mm (2/32 in)?**

YES : ROTATE the wheel and tire assemblies.

CHECK and ADJUST the toe to nominal -0.15 degree (toe out). CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

NO : INSTALL a new tire(s).

CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Pinpoint Test C: Diagonal Wear

This pinpoint test is intended to diagnose the following:

- Incorrect wheel and tire rotation
- Excessive toe in/out
- Incorrect tire inflation
- Loose, worn or damaged suspension components

PINPOINT TEST C: DIAGONAL WEAR

C1 MEASURE THE TREAD DEPTH

- Using a tread depth gauge or similar tool, measure the tread depth of the wear pattern.
- **Is the tread depth greater than 1.58 mm (2/32 in)?**

YES : If no performance concerns (noise/vibration) are present, the tire can remain in service.

CHECK the air pressure in the tires, ADJUST as necessary.

ROTATE the wheel and tire assemblies.

INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary.

CHECK the alignment and ADJUST as necessary. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

NO : INSTALL a new tire(s).

CHECK the air pressure in the tires, ADJUST as necessary.

ROTATE the wheel and tire assemblies.

INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary.

CHECK the alignment and ADJUST as necessary. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Component Tests

Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Runout measurements of the wheel and tire assembly can be taken both on and off the vehicle. Runout measurements can be taken both radially and laterally using a runout gauge. The runout gauge is a delicate, precision instrument and should be handled as such. The runout gauge should be mounted on a heavy solid base to eliminate gauge movement when measuring runouts. The measurements are taken using a runout gauge, which defines total runout in 64th or thousandths of an inch (depending on the brand of gauge used) and locates the high and low points of the runout.

Radial Runout

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular on a circumference. On a wheel and tire assembly this usually means measuring the center tire tread rib, although other tread ribs can be measured as well. The center rib is usually a solid rib, easy to measure and normally indicative of the condition of the tire as a whole. It is important to keep in mind that any rib with excessive runout can cause a concern. Total runout is the reading from the gauge. The high spot is the location of maximum runout.

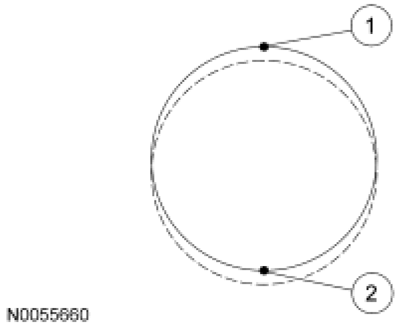

Fig. 5: Identifying Radial Runout
Courtesy of FORD MOTOR CO.

Item	Description
1	High spot
2	Low spot

NOTE: Warm up the tires prior to taking any measurements. This will eliminate slight flat spotting. This is done during a road test.

NOTE: Place the air chuck straight on the valve stem to inflate the tire. Do not cock the air chuck during the inflation cycle. Doing so may damage the valve stem and cause air leaks.

1. Make sure that the tire pressures are set to the correct pressure as indicated on the vehicle label.
2. With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
3. Make sure that all 4 positions can be measured. If measurements are to be taken with the wheel and tire assembly off the vehicle, mount each assembly on a suitable dynamic balancing machine.
4. For future reference of the original wheel and tire assembly's position on the wheel hub, index-mark the wheel and a wheel stud.
5. Position the runout gauge to take a radial measurement.
   - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
   - Adjust the runout gauge to read 0.
   - Rotate the wheel and tire assembly (or wheel) one complete revolution to make sure that the low spot has been found and that the runout gauge dial returns to a 0 reading.

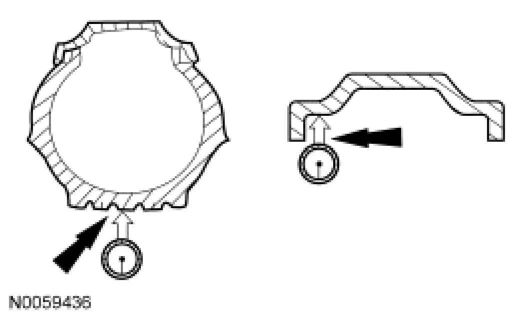

Fig. 6: Measuring Radial Runout
Courtesy of FORD MOTOR CO.

NOTE: If there is a vast difference in measurements taken from a wheel and tire assembly checked (on the vehicle) compared to readings taken (off the vehicle), check for excessive bolt circle runout, excessive hub runout or a fitting concern between the hub and wheel.

6. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.
    - Note the variance (runout) from 0 on the dial of the gauge.
    - If the runout reading of a wheel and tire assembly is not within 1.27 mm (0.050 in), locate and mark the high spot and proceed to Match Mounting, Step 1 to correct the concern.
    - If the runout reading of a wheel is not within 1.27 mm (0.050 in), install a new wheel.

Lateral Runout

Lateral runout is a sideways variation causing a twist or wobble and is measured on a side surface. On the wheel and tire assembly, the lateral runout measurement should be taken as close to the tread shoulder as possible. Total runout is the reading from the gauge.

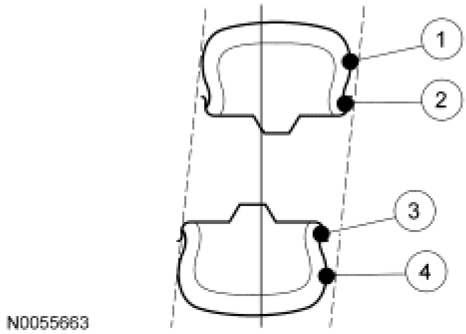

Fig. 7: Identifying Lateral Runout
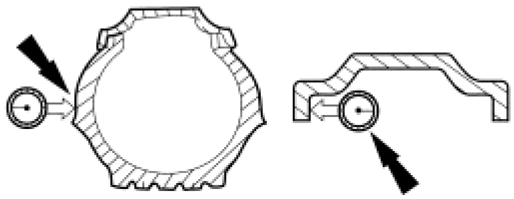
Courtesy of FORD MOTOR CO.

Item	Description
1	Tire high spot
2	Wheel high spot
3	Tire low spot
4	Wheel low spot

1. Position the runout gauge to take a lateral measurement.
    - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
    - Adjust the runout gauge to read 0.
    - Rotate the wheel and tire assembly (or wheel) one complete revolution to make sure that the low spot has been found and that the dial returns to a 0 reading.



N0059435

Fig. 8: Measuring Lateral Runout
Courtesy of FORD MOTOR CO.

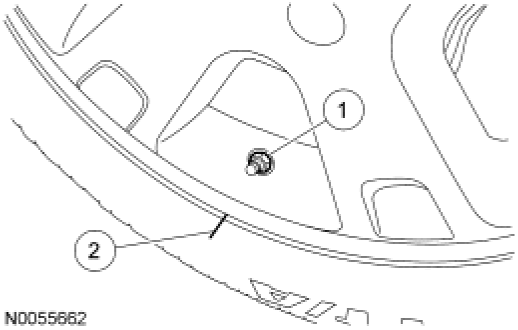
NOTE: **If there is a vast difference in measurements taken from a wheel and tire assembly checked on the vehicle compared to readings taken off the vehicle, check for excessive bolt circle runout, excessive hub runout or a fitting concern between the hub and wheel.**

2. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the lateral runout.
   - Note the variance (runout) from 0 on the dial of the gauge.
   - If the runout reading of a wheel and tire assembly is not within 1.27 mm (0.050 in), locate and mark the high spot and proceed to Match Mounting, Step 1 to correct the concern.
   - If the runout reading of a wheel is not within 1.27 mm (0.050 in), install a new wheel.

Match Mounting

Match mounting is a technique used to reduce radial and lateral runouts on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel or by changing the position of the wheel and tire assembly on the hub.

1. Remove the wheel and tire. Refer to **Wheel and Tire**.
2. Position the wheel and tire assembly on a suitable tire machine and put a reference mark on the tire sidewall at the valve stem position.



N0055662

Fig. 9: Locating Mark On Tire Side Wall At Valve Stem Position

Courtesy of FORD MOTOR CO.

Item	Description
1	Valve stem
2	Reference mark

NOTE: For tires equipped with Tire Pressure Monitoring System (TPMS), the sensor, cradle and strap can be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the Disassembly and Assembly procedure. Failure to follow these instructions may result in TPMS component damage.

3. Using a suitable tire machine, break the tire down from the wheel.
   - Position the tire 180 degrees (half-way around) on the rim so the tire reference mark made in Step 2 is opposite the valve stem.
4. Re-inflate the wheel and tire assembly to the specified air pressure and measure the assembly runout again. Mark the second high spot on the tire.
   - If the runout is reduced to within specifications, the problem has been solved.
5. If the second runout measurement is still not within specification and both measurements are close to each other (within 101.6 mm [4 in]), the root cause is probably the tire.

   NOTE: To be SURE that the tire is causing the high runout, there must be 2 runout measurements that are not within specification and the high spots must be in approximately the same location on the sidewall of the tire. In other words, the high spot followed the tire when it was repositioned 180 degrees on the wheel.

   - If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.

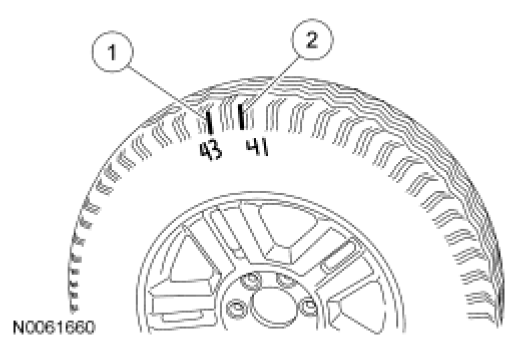


Fig. 10: Identifying High Spotting On Tire
Courtesy of FORD MOTOR CO.

Item	Description
1	First high spot on the tire

2	Second high spot on the tire

6. If the second high spot is still above specification and is within 101.6 mm (4 in) of being opposite the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. Install a new wheel if the wheel runout exceeds 1.27 mm (0.05 in).

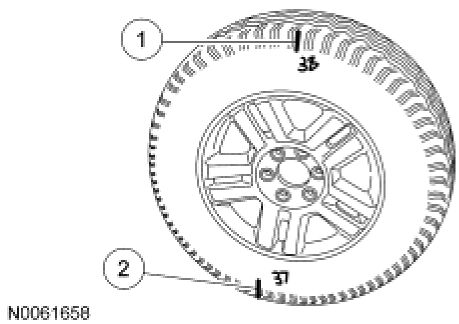

Fig. 11: Identifying High Spotting On Each End Of Tire
Courtesy of FORD MOTOR CO.

Item	Description
1	First high spot on the tire
2	Second high spot on the tire

NOTE: **If the second high spot did not follow the wheel or the tire and the runout is still not within specification, improvements may be made by rotating the tire 90 degrees (one-fourth turn).**

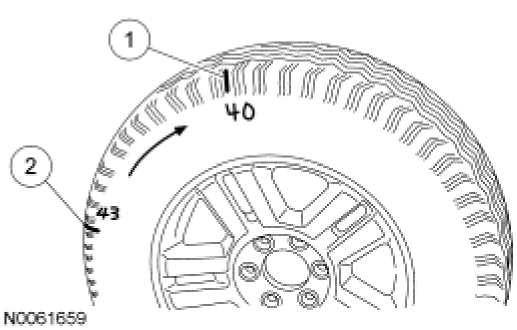

Fig. 12: Drawing Arrow On Tire Side Wall From Second High Spot Towards First High Spot
Courtesy of FORD MOTOR CO.

7. Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the shortest direction).
   - Rotate the tire 90 degrees (one-fourth turn) in the direction of the arrow.

Item	Description
1	First high spot on the tire
2	Second high spot on the tire

8. Install the wheel and tire. Refer to **Wheel and Tire**.
   - Align the wheel and tire assembly using the index mark made on the wheel and wheel stud during removal.

TIRE PRESSURE MONITORING SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
 ST2941-A	Activation Tool, Tire Pressure Monitor	204-363
 ST2869-A	Digital Tire Gauge	204-354
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also referred to as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the SJB. TPMS functionality is integral to the SJB. These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the instrument cluster. The instrument cluster then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

Ambient Temperature Change and Tire Pressure

WARNING: **The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.**

Tire pressures fluctuate with temperature changes. For this reason, tire pressure must be set to specification when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, the tire inflation pressure must be adjusted accordingly.

If the tires are inflated to specification at shop temperatures, and the vehicle is moved outdoors when the outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the TPMS and activate the TPMS warning lamp.

As the ambient temperature decreases by 6°C (10°F), tire pressure decreases 7 kPa (1 psi). Adjust the tire pressure by 7 kPa (1 psi) for each 6°C (10°F) ambient temperature drop as necessary to keep the tire at the specified Vehicle Certification (VC) label pressure. Refer to the following tables to adjust the tire pressure indoors for colder outside temperatures.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]

** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70°F. Max Pressure Adjustment is 7 psi.

	Tire Placard Pressure (PSI)																	
Outside Temperature (°F)	30	32	34	35	38	40	41	42	45	50	55	60	65	70	75	80	85	90
70	30	32	34	35	38	40	41	42	45	50	55	60	65	70	75	80	85	90

16	215	230	240	250	270	285	290	295	315	350	385	420	460	495	530	565	600	635
10	220	235	250	255	275	290	295	305	325	365	400	435	470	505	545	580	615	650
4	230	240	255	260	285	295	305	310	340	370	405	440	485	515	550	595	625	660
-1	235	250	260	270	290	305	315	325	345	380	420	455	495	530	565	600	635	670
-7	240	255	270	275	295	315	325	330	350	395	425	460	495	530	565	600	635	670
-12	250	260	275	285	310	325	330	340	360	395	425	460	495	530	565	600	635	670
-18	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670
-23	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670
-29	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670
-34	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670
-40	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670

[1] When Outside (Ambient) Temperature is greater than 21°C (70°F), Inflate tires to placard pressure.

[1] Use the table to adjust tire pressure for P-metric and LT tires only.

[1] Do NOT use table for Commercial Truck Tires (i.e. 19.5 inch tires for F450 & F550). See F-Super Duty Service Manual for tire inflation procedure.

N0057700

Fig. 13: Tire Pressure Table
Courtesy of FORD MOTOR CO.

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE:	**If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.**
NOTE:	**For vehicles with different front and rear tire pressures (such as E-Series and**

certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the TPMS indicator to illuminate.

1. The TPMS indicator remains on continuously for the following condition:
   - Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the VC label.

NOTE: **The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.**

2. If the vehicle has been stationary for more than 30 minutes, carry out the **Tire Pressure Monitoring System (TPMS) Sensor Activation** procedure .

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds, then remains ON solid when the ignition switch is turned to the ON position, for the following conditions:

1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE PRESSURE SENSOR FAULT when a tire pressure sensor is malfunctioning. Go to **Symptom Chart**.
2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the instrument cluster has not received any signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE PRESSURE MONITOR FAULT. Go to **Symptom Chart**.
3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE PRESSURE MONITOR FAULT when the tire pressure monitoring system is malfunctioning or communication with the instrument cluster has been lost. Go to **Symptom Chart**.

Inspection and Verification

NOTE: **The tire pressure sensors are not designed to be used with aftermarket wheels.**

NOTE: **The use of run-flat tires (tires with steel body cord plies in the tire sidewall) where not originally equipped, may cause the TPMS to malfunction and is therefore not recommended.**

1. Verify the customer concern by inspecting the vehicle and observing the message center (if equipped) and the TPMS indicator.

NOTE: **The valve-mounted TPMS sensors and the strap-mounted TPMS sensors**

are not compatible. Swapping wheels from one vehicle to another with the different systems will set a TPMS fault.

NOTE: **Swapping wheels between vehicles with the same TPMS will cause a TPMS fault to be set if the sensors are not trained. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training.**

NOTE: **Non-OEM modifications made to the vehicle may result in false TPMS warnings.**

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Low tire pressure • Tire Pressure Monitoring System (TPMS) sensor damaged or missing • Spare tire installed as a road wheel • Incorrect TPMS sensor installed • TPMS sensor installed incorrectly • Sensors not trained after a tire rotation on vehicles with different front and rear tire pressures • Non-OEM wheels installed (aftermarket rims) • Non-OEM equipped run-flat tires installed • Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks)	• Wiring, terminals or connectors • Smart Junction Box (SJB) damaged • Aftermarket electronic accessories

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no power to the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self test diagnostics for the SJB (the TPMS is part of the SJB).
9. If the DTCs retrieved are related to the concern, go to the Tire Pressure Monitoring System (TPMS) DTC Chart. For all other DTCs, refer to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

TIRE PRESSURE MONITORING SYSTEM (TPMS) DTC CHART

DTC	Description	Source	Action
B106A	Pressure Sensor Range Bit Incorrect State	Smart Junction Box (SJB)	Go to **Pinpoint Test G** .
B106B	Tire Pressure Sensor Low Battery	SJB	DTC B106B can be set during SJB configuration. Go to **Pinpoint Test H** .
B106D	Tire Pressure Monitoring System (TPMS) Initiators Not Configured	SJB	DTC B106D is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. VERIFY the SJB is correctly configured. If DTC B106D is still present, REFER to **MODULE CONFIGURATION** article.

B2477	Module Configuration Failure/Mismatch	SJB	DTC B2477 is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. MAKE SURE the SJB is configured correctly. If DTC B2477 is still present, REFER to **MODULE CONFIGURATION** article.
B2868	LF Tire Pressure Sensor Fault	SJB	DTC B2868 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2869	RF Tire Pressure Sensor Fault	SJB	DTC B2869 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2870	RR Tire Pressure Sensor Fault	SJB	DTC B2870 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2871	LR Tire Pressure Sensor Fault	SJB	DTC B2871 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2872	Tire Pressure Sensor Fault	SJB	**NOTE:** **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB.** ACTIVATE the TPMS sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Activation**. Go to **Pinpoint Test F** .
B287A	Tire Pressure System Fault	SJB	Go to **Pinpoint Test F** .

C2780	ECU in Manufacturing Mode	SJB	DTC C2780 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
U0155	Lost Communication with Instrument Cluster	SJB	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication problem.
All other SJB DTCs	-	SJB	REFER to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

NOTE: **For vehicles with different front and rear tire pressure (such as E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the Tire Pressure Monitoring System (TPMS) indicator to illuminate.**

For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Failure of a TPMS component may not cause the message center to display a fault message or a DTC to be stored. The Symptom Chart is a starting point to begin diagnosis of these concerns.

Symptom Chart

Condition	Possible Sources	Action
• Tire Pressure Monitoring System (TPMS) indicator ON solid and message center (if equipped) displays LOW TIRE PRESSURE	• Spare tire currently in use	• INSTALL the repaired road wheel/tire in place of the spare tire.
	• Air pressure not set to specifications listed on the Vehicle Certification (VC) label	• Go to **Pinpoint Test D** .
	• Sensors not trained	• ADVISE customer that on vehicles with different front and rear tire

	following tire rotation	pressure, the sensors must be trained as directed in their Owner's Literature.
• Smart Junction Box (SJB) will not enter sensor training mode when using the TPMS sensor training procedure	• Brake ON/OFF switch • Ignition switch • Vehicle communication bus • SJB	• Go to **Pinpoint Test E** .
• TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE SENSOR FAULT and DTC B2872 is present	• TPMS sensor(s) • TPMS sensor(s) not trained to the SJB • SJB	**NOTE:** **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB.** • ACTIVATE the TPMS sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Activation**. Go to **Pinpoint Test F** .
• Tire Pressure Monitoring System (TPMS) indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT and DTC B287A is present	• All TPMS sensors not trained to the SJB or all TPMS sensors are not installed	**NOTE:** **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB.** • ACTIVATE the TPMS sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Activation**. Go to **Pinpoint Test F** .
• TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE	• Vehicle communication issue between the SJB and the instrument cluster	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication concern.

MONITOR FAULT and there are no DTCs present		
	• SJB	• REFER to **MULTIFUNCTION ELECTRONIC MODULES** article to diagnose the SJB.
• One or more sensors will not train	• TPMS sensor(s) • Vehicle communication issue • SJB	• RETRIEVE and RECORD DTCs. REFER to **TIRE PRESSURE MONITORING SYSTEM (TPMS) DTC CHART** .
• One or more sensors will not train and no DTCs are present	• TPMS sensor(s)	• TRAIN all 4 tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**. • For any sensor(s) that did not train, ATTEMPT to activate the same sensor with the activation tool. If the sensor still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth turn and ATTEMPT to activate the same sensor again. • If the sensor(s) fail to train a second time, INSTALL a new sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

Pinpoint Tests

Pinpoint Test D: Tire Pressure Monitoring System (TPMS) Indicator ON Solid and Message Center (if equipped) Displays LOW TIRE PRESSURE

Normal Operation

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the Smart Junction Box (SJB). TPMS functionality is integral to the SJB. These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function (integral to the SJB) compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the instrument cluster. The instrument cluster then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

This symptom can also be caused by a spare tire currently being used in place of a road tire. Make sure that the spare tire is not currently in use. On vehicles with different front and rear tire pressures, if the sensors are not trained following a tire rotation, this symptom will also be present. Advise the customer that on vehicles with different front and rear tire pressures, the sensors must be trained as directed in the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Low air pressure in tire(s)
- Tire pressure sensor(s)

PINPOINT TEST D: Tire Pressure Monitoring System (TPMS) INDICATOR ON SOLID AND MESSAGE CENTER (IF EQUIPPED) DISPLAYS LOW TIRE PRESSURE

NOTE: **Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.**

NOTE: **If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.**

D1 CHECK THE TIRE PRESSURE

- Measure and record the air pressure in all 4 road tires.
- Adjust the air pressure for those found to be below the specification listed on the Vehicle Certification (VC) label.

  NOTE: **If the vehicle has been stationary for more than 30 minutes, activate each TPMS sensor. Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation. The TPMS sensor does not transmit when the vehicle is stationary.**

- Verify system operation.
- **Have the TPMS indicator and the message center (if equipped) warnings gone out?**

  YES : The system is functioning normally, diagnosis is complete. INFORM the customer of correct tire pressure maintenance as instructed in the scheduled maintenance guide and the Owner's Literature.

  NO : Go to D2.

D2 CHECK THE SYSTEM COMPONENTS

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- Connect the scan tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger SJB
- Read and record the following PIDs:
  - Left Front Tire Pressure (LF_PRES)
  - Right Front Tire Pressure (RF_PRES)
  - Left Rear Outer Tire Pressure (LRO_PRES)
  - Right Rear Outer Tire Pressure (RRO_PRES)

- Compare the air pressure readings recorded from the function test to those recorded in D1.
- **Do the compared tire pressure values match within ±5 psi, and have the TPMS indicator and the message center (if equipped) warnings gone out?**

  YES : The system is functioning normally, diagnosis complete.

  NO : **Before installing a new sensor(s):** If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth turn and ATTEMPT to activate the same sensor(s) again.

  INSTALL new tire pressure sensors for those with discrepancies or those that fail to activate. REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

Pinpoint Test E: Smart Junction Box (SJB) Will Not Enter Sensor Training Mode When Using the Tire Pressure Monitoring System (TPMS) Sensor Training Procedure

Normal Operation

For the Smart Junction Box (SJB) to enter Tire Pressure Monitoring System (TPMS) sensor training mode, the SJB must receive valid inputs from the Brake Pedal Position (BPP) switch (OFF-ON-OFF) and ignition switch (both OFF and RUN), and it must receive valid vehicle speed sensor input (0 km/h [0 mph]). Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training** for the complete sensor training procedure.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Brake ON/OFF switch
- Ignition switch
- SJB

PINPOINT TEST E: Smart Junction Box (SJB) WILL NOT ENTER SENSOR TRAINING MODE WHEN USING THE Tire Pressure Monitoring System (TPMS) SENSOR TRAINING PROCEDURE

E1 CHECK THE SJB BRAKE ON/OFF (GEM_BOO) PID

- Connect the scan tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger SJB
- Monitor the GEM_BOO PID (SJB reads the brake switch directly).
- Press and release the brake pedal while monitoring the PID.
- **Do the brake pedal PID values match the brake pedal positions?**

  YES : Go to E2.

  NO : REFER to **EXTERIOR LIGHTING** article to continue diagnosis of the stoplamp switch.

E2 CHECK THE SJB IGNITION SWITCH PIDs

- Monitor the following ignition switch PIDs:
  - Ignition Switch Off (IGN_O_ECU)
  - Ignition Switch RUN (IGN_R_ECU)
- Cycle the ignition switch to the RUN and OFF position while monitoring the PIDs (SJB reads the ignition switch directly).
- **Do the ignition switch status PID values match the ignition switch positions?**

  YES : Go to E3.

  NO : REFER to **STEERING COLUMN SWITCHES** article to continue diagnosis of the ignition switch.

E3 CHECK THE SJB VEHICLE SPEED (VSS_GEM) PID

- Monitor the VSS_GEM PID (SJB receives vehicle speed from the instrument cluster).
- **Does the vehicle speed PID value match the speed of the vehicle?**

  YES : Go to E4.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnosis of the instrument cluster/vehicle speed concern.

E4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check the connectors for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect all the SJB connectors and make sure that they are seated correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self test.

Pinpoint Test F: Tire Pressure Monitoring System (TPMS) Indicator FLASHES for 70 Seconds and Then Remains ON Solid When the Ignition Key is Turned to the ON Position, the Message Center (if equipped) Displays TIRE PRESSURE SENSOR or MONITOR FAULT and DTC B2872 or B287A is Present

Normal Operation

If there is a fault with 1, 2 or 3 of the Tire Pressure Monitoring System (TPMS) sensors, DTC B2872 will be set, the TPMS warning indicator will flash for 70 seconds and then remain ON solid when the ignition switch is turned to the ON position and the message center (if equipped) will display TIRE PRESSURE SENSOR FAULT.

If the Smart Junction Box (SJB) does not get a response from all 4 of the TPMS sensors, DTC B287A will be set and the message center (if equipped) will display TIRE PRESSURE MONITOR FAULT.

- B2872 Tire Pressure Sensor Fault - When 1, 2 or 3 of the tire pressure sensors are faulted or not responding, the SJB will set DTC B2872.
- B287A Tire Pressure Monitor Fault - When **all** 4 of the tire pressure sensors are faulted, not responding or not heard by the SJB, the SJB will set DTC B287A.

This pinpoint test is intended to diagnose the following:

- TPMS sensor(s) missing
- TPMS sensor(s) not trained to the vehicle
- TPMS sensor(s) swapped due to wheel swap
- TPMS sensor(s) damaged
- Vehicle communication issue
- SJB

PINPOINT TEST F: Tire Pressure Monitoring System (TPMS) INDICATOR FLASHES FOR 70 SECONDS AND THEN REMAINS ON SOLID WHEN THE IGNITION KEY IS TURNED TO THE ON POSITION, THE MESSAGE CENTER (IF EQUIPPED) DISPLAYS TIRE PRESSURE SENSOR OR MONITOR FAULT AND DTC B2872 OR B287A IS PRESENT

NOTE: **If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.**

F1 CHECK THE SENSOR IDs AND SYSTEM STATUS PIDs

- Connect the scan tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger SJB
- Read and record the following PIDs:
  - Left Front Tire Transmitter Identifier (LF_ID)
  - Right Front Tire Transmitter Identifier (RF_ID)
  - Left Rear Tire Transmitter Identifier (LR_ID)
  - Right Rear Tire Transmitter Identifier (RR_ID)
- Monitor the TPMS system status (TP_STAT) PID.
- **Does the TP_STAT PID display SENSOR FAULT?**

  YES : Go to F2.

  NO : If the TP_STAT PID displays SYSTEM FAULT, go to F3.

F2 CARRY OUT THE SENSOR TRAINING PROCEDURE

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire**

pressure sensor transmitted to the SJB?

YES : Using the scan tool, LOCATE the updated TPMS sensor identifiers trained to the SJB module.

COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position, any sensor identifiers that do not match those retrieved from the module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete.

DOCUMENT all TPMS sensor identifiers on the applicable warranty claim.

VERIFY system operation.

NO : **Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again.

If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

F3 TP_STAT PID EQUALS SYSTEM FAULT WITH DTC B287A PRESENT

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**

  YES : Using the scan tool, LOCATE the updated TPMS sensor identifiers trained to the SJB module.

  COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position, any sensor identifiers that do not match those retrieved from the module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete.

  DOCUMENT all TPMS sensor identifiers on the applicable warranty claim.

  VERIFY system operation.

  NO : **Before diagnosing the SJB** : If the sensors do not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensors with the Tire Pressure Monitor Activation Tool a second time. If the sensors still do not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensors again.

  If the sensors fail to train a second time, go to F4.

F4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB electrical connectors.
- Check the connectors for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect all the SJB connectors and make sure that they are seated correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : **NOTE:** The sensors may not be present. DISMOUNT the tire. REFER to **Wheel and Tire**. VERIFY that the sensors are present and mounted to the wheels. If missing, INSTALL new sensors.

  If the sensors are present, INSTALL a new SJB module. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self test.

Pinpoint Test G: DTC B106A - Pressure Sensor Range Bit Incorrect State

Normal Operation

This DTC may be encountered if a sensor designed for a different application is installed. Low pressure applications utilize a black- or blue-colored sensor, while heavy duty applications utilize a green-colored sensor. The Smart Junction Box (SJB) will only allow one type of sensor to be trained using the Tire Pressure Monitoring System (TPMS) sensor training procedure. Make sure the correct sensors are used to avoid compatibility issues.

- B106A Pressure Sensor Range Bit Incorrect State - When an attempt has been made to train a non-compatible sensor, the SJB will set DTC B106A.

This pinpoint test is intended to diagnose the following:

- Incorrect tire pressure sensor(s) installed

PINPOINT TEST G: DTC B106A - PRESSURE SENSOR RANGE BIT INCORRECT STATE

G1 DETERMINE IF THE VEHICLE IS EQUIPPED WITH AN INCORRECT SENSOR

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**

  YES : CLEAR the DTCs. REPEAT the self test. VERIFY system operation.

  NO : **Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure

Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again.

If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

Pinpoint Test H: DTC B106B - Tire Pressure Sensor Low Battery

Normal Operation

If there is a fault in the Tire Pressure Monitoring System (TPMS), such as a damaged or missing sensor(s), damaged module or a communication issue within the vehicle, DTCs are set in the Smart Junction Box (SJB), the TPMS warning indicator will flash for 70 seconds and then remain ON solid when the ignition switch is turned to the ON position and the message center (if equipped) will display TIRE PRESSURE SENSOR FAULT.

The tire pressure sensor is battery powered.

This DTC may be set when attempting to train a tire pressure sensor(s) with a low battery.

This pinpoint test is intended to diagnose the following:

- Tire pressure sensor battery
- Tire pressure sensor(s)

PINPOINT TEST H: DTC B106B - TIRE PRESSURE SENSOR LOW BATTERY

H1 DETERMINE WHICH SENSOR HAS A LOW BATTERY

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**

  YES : CLEAR the DTCs. REPEAT the self test. VERIFY system operation.

  NO : **Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again.

  If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

GENERAL PROCEDURES

TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR TRAINING

Special Tools

Illustration	Tool Name	Tool Number
 ST2941-A	Activation Tool, Tire Pressure Monitor	204-363
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

NOTE: **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the Smart Junction Box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.**

NOTE: **The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with a Tire Pressure Monitoring System (TPMS).**

Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: **If a sensor does not respond to the Tire Pressure Monitor Activation Tool, attempt to activate the same sensor with the Tire Pressure Monitor Activation Tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again.**

NOTE: **The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.**

NOTE: **For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.**

1. Turn the ignition switch to the OFF position, then press and release the brake pedal.
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
3. Press and release the brake pedal.
4. Turn the ignition switch to the OFF position.
5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
    - The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

NOTE: **It may take up to 6 seconds to activate a tire pressure sensor. During this time, the Tire Pressure Monitor Activation Tool must remain in place 180 degrees from the valve stem.**

6. Place the Tire Pressure Monitor Activation Tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the Tire Pressure Monitor Activation Tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.

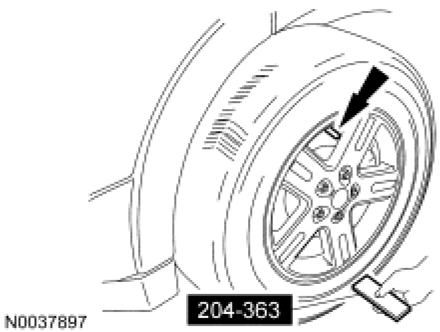

Fig. 14: Identifying Special Tool On LF Tire Side Wall Opposite (180 Degrees) From Valve Stem
Courtesy of FORD MOTOR CO.

7. Within 2 minutes of the horn sounding, place the Tire Pressure Monitor Activation Tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and release the test button to train the RF tire pressure sensor.

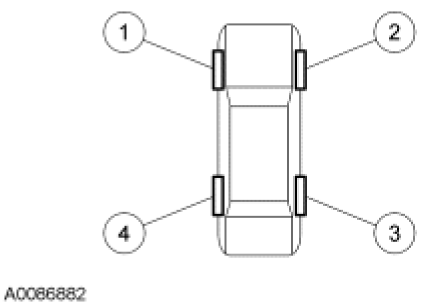

Fig. 15: Identifying Position Of Activation Tool

Courtesy of FORD MOTOR CO.

NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

8. Repeat Step 7 for the RR and LR tires.

   The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

   For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor identifiers trained to the SJB and document them on the applicable warranty claim.

   NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed SJB.

10. If the sensors are being trained due to the installation of a new SJB, clear any DTCs and carry out the SJB On-Demand Self Test.

TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR ACTIVATION

Special Tools

Illustration	Tool Name	Tool Number
 ST2941-A	Activation Tool, Tire Pressure Monitor	204-363

NOTE: The tire pressure sensors will go into a "sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode. It will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position.
2. Position the Tire Pressure Monitor Activation Tool against the LF tire sidewall, 180 degrees from the tire valve stem.

   NOTE: The Tire Pressure Monitor Activation Tool will provide feedback in the

form of a flashing green light and a beep sound for each successful response from a tire pressure sensor.

3. Press the test button on the Tire Pressure Monitor Activation Tool to activate the sensor, activate the sensor at least 2 times.
4. Repeat Steps 2 and 3 for the remaining tires.
5. If the Tire Pressure Monitoring System (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the appropriate Symptom Chart under **DIAGNOSTIC TESTS** .

REMOVAL AND INSTALLATION

WHEEL AND TIRE

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

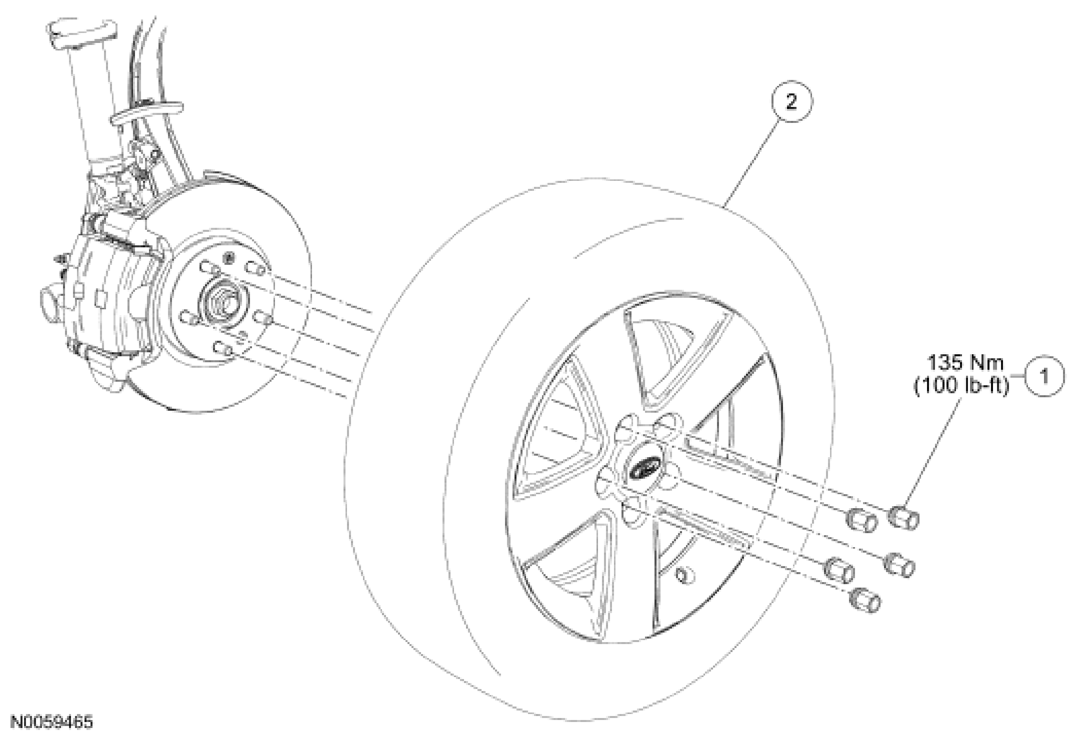

Fig. 16: Exploded View Of Wheel Nuts & Tire With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1012	Wheel nut (5 required)

2	-	Wheel and tire assembly

REMOVAL

CAUTION: Do not use heat to loosen a seized wheel nut or damage to the wheel and wheel bearing can occur.

1. With the weight of the vehicle on the wheels, loosen the wheel nuts.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
3. Remove the 5 wheel nuts.
4. Remove the wheel and tire assembly.

INSTALLATION

WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surface of the wheel and the mounting surface of the wheel hub, brake drum or brake disc. Make sure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Failure to follow these instructions when installing wheels may result in the wheel nuts loosening and the wheel coming off while the vehicle is in motion, which could result in loss of control, leading to serious injury or death to vehicle occupant(s).

1. Clean the wheel mounting surfaces and apply a thin coat of silicone grease and dielectric compound to the wheel hub pilot surface (inner wheel lip surface only).
2. Install the wheel and tire assembly.

WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

CAUTION: Failure to tighten the wheel nuts in a star pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder, and vibration.

3. Install the 5 wheel nuts.
   - Tighten the wheel nuts in a star pattern.
   - Tighten to 135 Nm (100 lb-ft).

DISASSEMBLY AND ASSEMBLY

WHEEL AND TIRE

Special Tools

Illustration	Tool Name	Tool Number
	Digital Tire Gauge	204-354

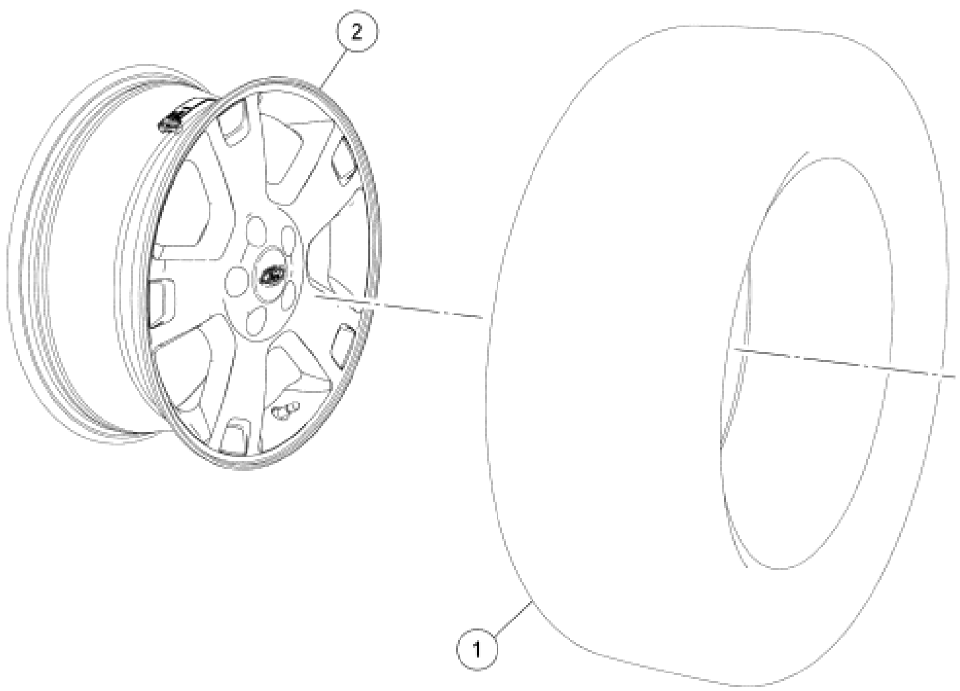

Fig. 17: Exploded View Of Wheel & Tire With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1508	Tire
2	1007	Wheel

DISASSEMBLY

NOTE: **Failure to follow the instructions below may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**

NOTE: **Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.**

NOTE: A wheel and tire equipped with a Tire Pressure Monitoring System (TPMS) sensor will have the following verbiage stamped or cast on the wheel: SENSOR MAY BE INSIDE.

NOTE: The TPMS sensor is mounted to the wheel 180 degrees opposite of the valve stem and is held in place by a stainless steel strap. The sensor is not mounted to the valve stem.

1. Remove the wheel and tire. For additional information, refer to **Wheel and Tire**.

    NOTE: Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the Tire Pressure Monitoring System (TPMS) sensor may occur.

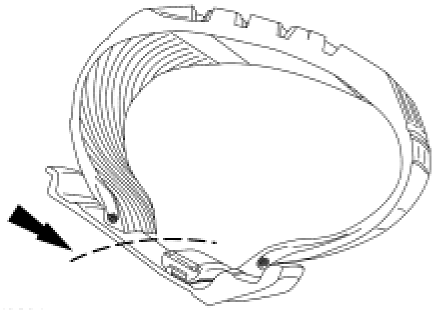

Fig. 18: Locating Tire Pressure Monitoring System (TPMS) Sensor
Courtesy of FORD MOTOR CO.

NOTE: Tire and valve stem position is critical to prevent damage to the Tire Pressure Monitoring System (TPMS) sensor when using a paddle-type bead separator.

NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position.

2. Position the wheel and tire assembly on a suitable tire machine and separate both beads of the tire from the wheel.
    - For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6 o'clock position and the paddle at the 3 o'clock position.
    - For a roller-type tire machine, align the valve stem with the roller at any position.

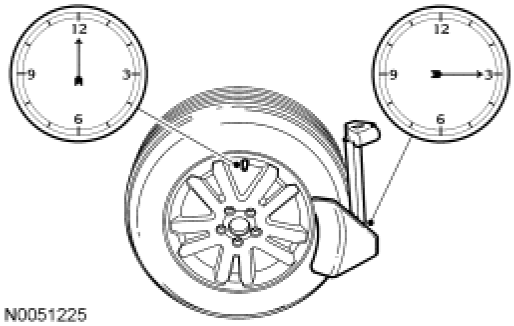

Fig. 19: Identifying Valve Stem And Paddle Position
Courtesy of FORD MOTOR CO.

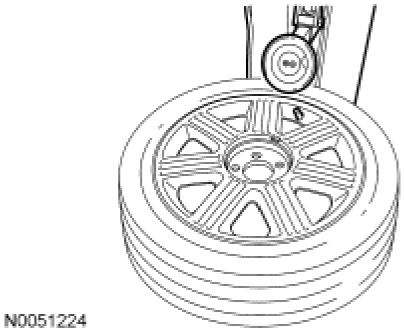

Fig. 20: Identifying Valve Stem And Roller
Courtesy of FORD MOTOR CO.

NOTE: Index-mark the valve stem and wheel weight positions on the tire.

3. Place the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5 o'clock and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.

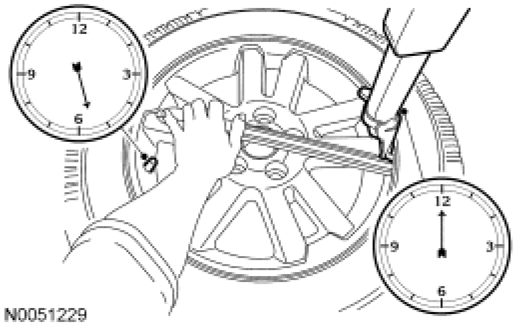

Fig. 21: Identifying Wheel And Tire Assembly On Turntable Tire Machine (Dismounting Outer Bead)
Courtesy of FORD MOTOR CO.

4. Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5

o'clock and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.

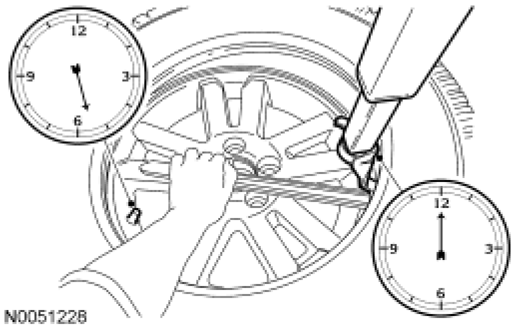

Fig. 22: Resetting Wheel And Tire Assembly On Turntable Of Tire Machine
Courtesy of FORD MOTOR CO.

5. Inspect the TPMS sensor, cradle and strap for damage. Install new parts as necessary.
   - For information on removal and installation of the TPMS sensor, refer to **Tire Pressure Monitoring System (TPMS) Sensor**.
   - When installing a new wheel, reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused. The new wheel will not come with a sensor strap. A sensor strap kit will need to be ordered with the new wheel.

ASSEMBLY

NOTE: **Damage to the Tire Pressure Monitoring System (TPMS) sensor may result if the tire mounting is not carried out as instructed.**

NOTE: **Use only a soap and water solution to lubricate the tire. Use of anything other than soap and water may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**

NOTE: **Do not mount the tire at this time.**

1. Position the wheel on the turntable of the tire machine, then lubricate and position the bottom bead of the tire on the wheel.
2. Position the wheel to align the valve stem with the machine arm at the 12 o'clock position and mount the bottom bead of the tire.

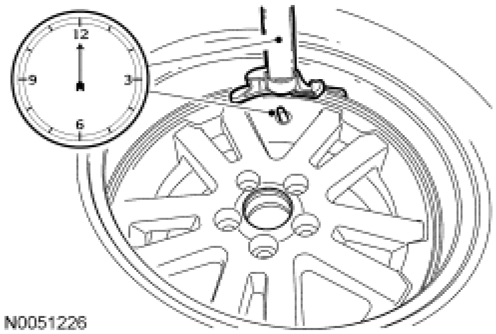

Fig. 23: Identifying Alignment Position Of Valve Stem With Machine Arm (Bottom Bead Of Tire)
Courtesy of FORD MOTOR CO.

3. Reposition the wheel to align the valve stem with the machine arm at the 12 o'clock position and mount the top bead of the tire.

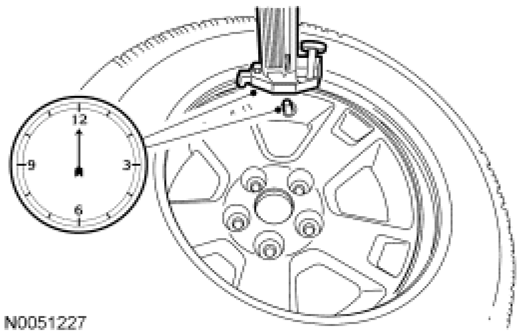

Fig. 24: Identifying Alignment Position Of Valve Stem With Machine Arm (Top Bead)
Courtesy of FORD MOTOR CO.

NOTE: Use only the Digital Tire Gauge any time tire pressures are measured to make sure that accurate values are obtained.

4. Using the Digital Tire Gauge, inflate the tire to the pressure specified on the Vehicle Certification (VC) label located on the driver door or door pillar.
   - Proceed to Step 5 if the tire beads do not seat at the specified inflation pressure.

WARNING: If there is a need to exceed the maximum pressure indicated on the sidewall of the tire, in order to seat the beads, follow ALL the steps listed below. Failure to follow these steps may result in serious personal injury.

5. **The following steps should only be carried out if the tire beads cannot be seated by inflating the tire up to the maximum inflation pressure listed on the tire sidewall.**
   1. Relubricate the tire bead and wheel bead seat area.
   2. Install a remote valve and pressure gauge.

3. Wear eye and ear protection and stand at a minimum of 3.65 m (12 ft) away from the wheel and tire assembly.
4. Inflate tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 138 kPa (20 psi) more than maximum inflation pressure on tire sidewall. If beads have not seated, deflate the tire and proceed to the next step.
5. Place the wheel and tire assembly in an OSHA-approved tire safety cage.
6. Inflate the tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 276 kPa (40 psi) more than maximum inflation pressure on the tire sidewall. **Do not exceed 276 kPa (40 psi) above the maximum pressure on tire sidewall. Install a new tire if the beads do not seat at this pressure.**

6. Install the wheel and tire. For additional information, refer to **Wheel and Tire**.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES

TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR

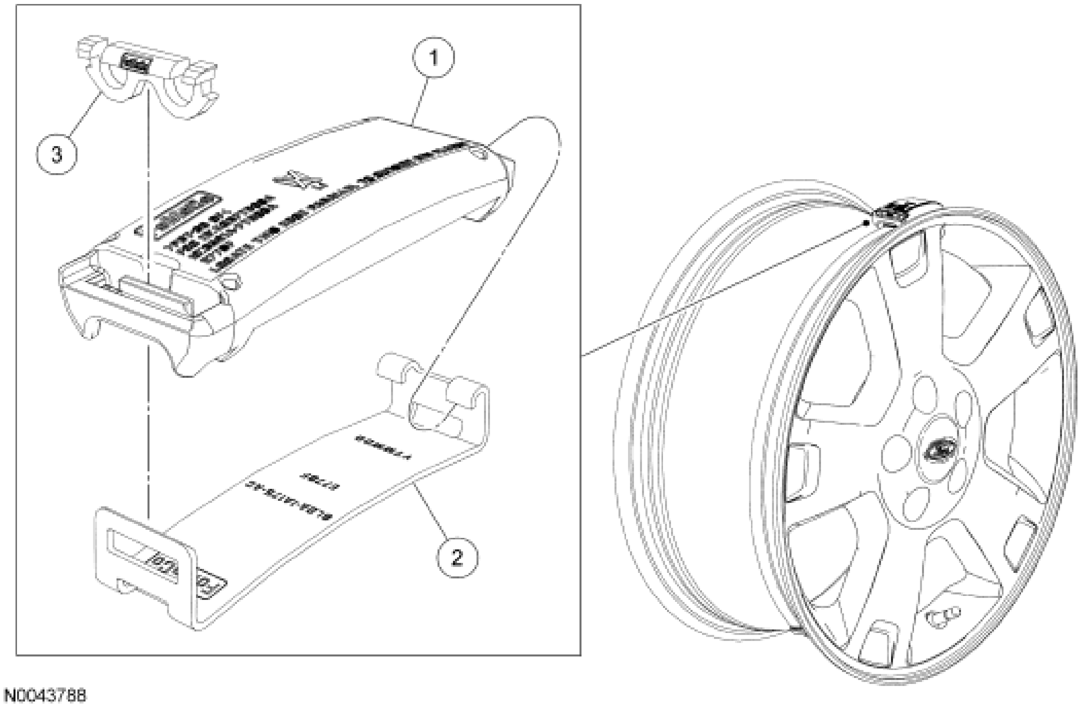

Fig. 25: Exploded View Of Tire Pressure Monitoring System (TPMS) Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle
3	14C202	Locking clip (also part of 1A189)

DISASSEMBLY

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

NOTE: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as instructed.

1. Remove the tire from the wheel. For additional information, refer to **Wheel and Tire**.

NOTE: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

2. Using a pocket screwdriver or similar tool, remove the sensor locking clip.

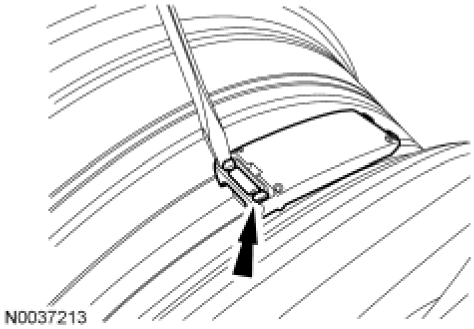

Fig. 26: Locating Sensor Locking Clip
Courtesy of FORD MOTOR CO.

NOTE: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

3. Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

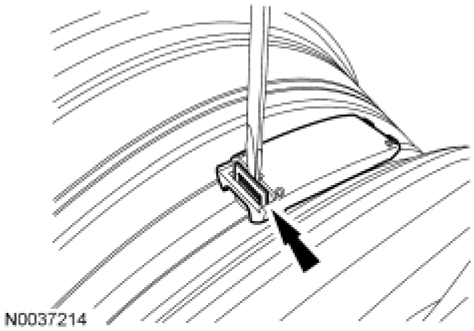

Fig. 27: Removing Sensor From Cradle
Courtesy of FORD MOTOR CO.

4. Remove the sensor.

ASSEMBLY

NOTE: Damage to the sensor may occur if excessive force is applied during sensor installation.

NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

1. Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

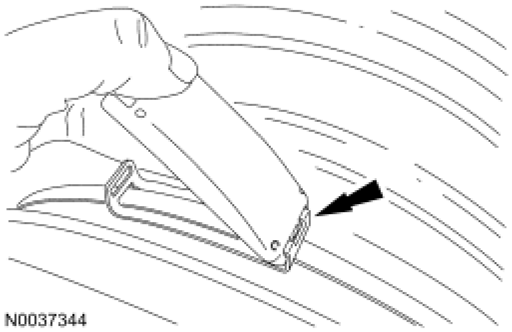

Fig. 28: Positioning Sensor Into Cradle
Courtesy of FORD MOTOR CO.

NOTE: The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then the

sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

2. Insert a new locking clip into the sensor.

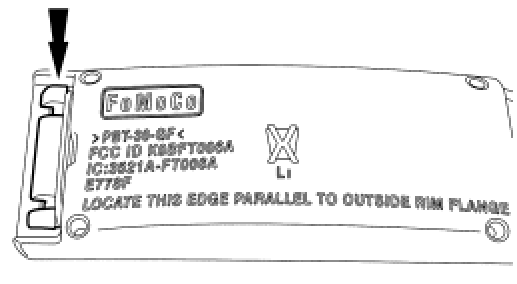

Fig. 29: Locating Locking Clip
Courtesy of FORD MOTOR CO.

NOTE: **The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.**

3. Install the tire onto the wheel. For additional information, refer to **Wheel and Tire**.

NOTE: **A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.**

4. Train the tire pressure sensor(s). For additional information, refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.

2	1A150/1A189	Tire pressure sensor/sensor kit
3	1A175	Sensor cradle (also part of 1A193)
4	14C202	Locking clip (also part of 1A189)

DISASSEMBLY

WARNING: **The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a**

minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: **Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.**

NOTE: **Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.**

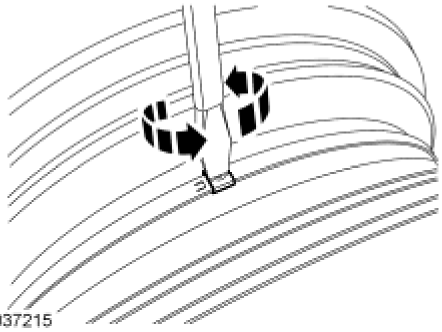
NOTE: **The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter, but all strap kits share the same base part number.**

1. Remove the Tire Pressure Monitoring System (TPMS) sensor. For additional information, refer to **Tire Pressure Monitoring System (TPMS) Sensor** .

   WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

   WARNING: **Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.**

2. Remove a factory-installed strap in the following sequence:
   1. Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item on both sides of the buckle, approximately 25 mm (0.98 in) from the buckle.
   2. Using a large screwdriver and a twisting motion, unbuckle the strap.
   3. Discard the strap.



N0037215

Fig. 31: Removing Factory Installed Strap
Courtesy of FORD MOTOR CO.

3. To remove a dealer-installed strap, turn the worm gear screw until the strap is fully released from the worm gear.
    - Discard the strap.

NOTE: **To aid assembly, mark the location of the cradle prior to disassembly.**

4. Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

ASSEMBLY

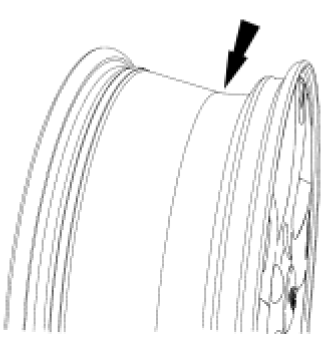
NOTE: **Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.**

1. Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

NOTE: **Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.**

NOTE: **The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.**

2. Using wheel and tire cleaner, clean the area where the sensor and cradle are to be installed.



N0037814

Fig. 32: Locating Sensor & Cradle Area
Courtesy of FORD MOTOR CO.

NOTE: **The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side) of the wheel.**

NOTE: The sensor has raised markings indicating how to position the sensor.

3. Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

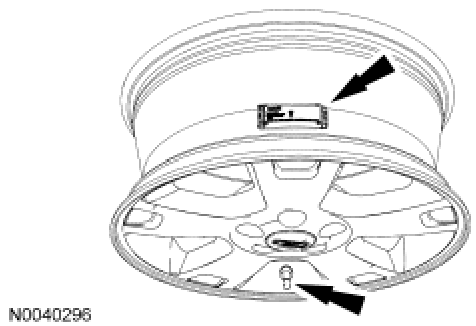


Fig. 33: Locating Sensor & Cradle Into Wheel Drop Well
Courtesy of FORD MOTOR CO.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the locking clip side of the sensor.

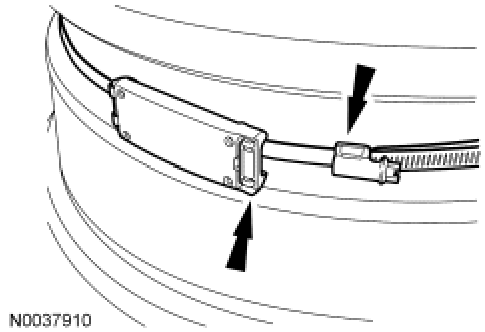

Fig. 34: Locating Worm Gear And Locking Clip
Courtesy of FORD MOTOR CO.

NOTE: Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot possible to avoid damaging the sensor during wheel and tire disassembly and assembly.

NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

5. Position the worm gear 13-26 mm (0.5-1.0 in) away from the sensor and tighten the worm gear.
   - Tighten to 3 Nm (27 lb-in).

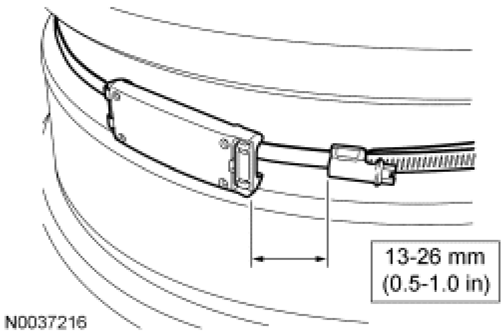

Fig. 35: Identifying Worm Gear Distance From Sensor (With Specifications)
Courtesy of FORD MOTOR CO.

NOTE: **The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.**

6. Install the tire onto the wheel. For additional information, refer to **Wheel and Tire**.

NOTE: **A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.**

7. Train the tire pressure sensor(s). For additional information, refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.

DESCRIPTION AND OPERATION

GLASS, FRAMES AND MECHANISMS

The glass, frames and mechanisms consist of the following:

- Accessory delay relay
- Door window regulator motors
- Front door glass top run
- Front door window glass
- Heated rear window grid
- Heated rear window grid relay
- Liftgate window glass
- Rear door glass top run
- Rear door window glass
- Rear fixed window glass
- Rear quarter glass
- Rear window regulator and motor - run and brackets
- Smart junction box (SJB)
- Window control switches
- Window regulators
- Windshield glass

The glass, frames and mechanisms include the following:

Edge

- Standard power windows, which include one-touch UP, one-touch DOWN and LOCK-OUT feature (LH front windows only)

MKX

- Standard power windows, which include one-touch UP, one-touch DOWN and LOCK-OUT feature (LH and RH front windows only)

All vehicles

- Liftgate glass which includes the rear defrost grid and rear wiper arm

- Standard plastic and laminate safety glass
- Windshield glass which is bonded to the opening flange with a urethane sealant

The window regulator control switch:

- is located on each door trim panel.
- may be used to manually raise or lower all windows from the left front window control switch or the individual side window from the corresponding individual door switch.
- can manually lower the driver side window when the left front window control switch is pressed and held in the DOWN position.
- can automatically lower the driver side window when the left front window control switch is momentarily pressed to the DOWN position and released.

Global Open - MKX Only

The SJB sends a signal on the global open circuit, to both front door window motors to open or close the windows based on a signal received from the remote keyless entry (RKE) transmitter. If the accessory delay relay is active, the global open feature will not operate.

DIAGNOSTIC TESTS

GLASS, FRAMES AND MECHANISMS

Special Tools

Illustration	Tool Name	Tool Number

 ST1137-A	73III Automotive Meter	105-R0057 or equivalent

Principles of Operation

Delayed Accessory Power

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

The SJB controls power to the power windows, the audio system and the power roof opening panel with the delayed accessory relay. The SJB activates the delayed accessory relay whenever the ignition switch is in the RUN or the ACCESSORY position, or when the ignition switch is changed from RUN or ACCESSORY to the OFF/LOCK position and the LH and RH front doors are closed.

The SJB will deactivate the delayed accessory feature when:

- the LF door is ajar and the ignition switch is in the OFF/LOCK or key-out position.
- the RF door is ajar and the ignition switch is in the OFF/LOCK or key-out position.
- ten minutes have elapsed since the ignition switch was changed from ACC or RUN to the OFF/LOCK position.

LH and RH Front Power Window Control - MKX

The LH and RH front window motors contain integral electronics which must be initialized whenever a new window motor has been installed. Initialization is required to learn both the full UP and full DOWN positions and the profile of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled. When mechanical repairs have been carried out on either front window regulator or glass run, the applicable front window motor must be de-initialized, and then initialized. Both the LH and RH front window control switches send 3 separate signals to the front window motors: up, down and auto. The front window control switches provide a 12-volt signal to the front window motor to request an up or down operation. When auto up or auto down is requested, the front window control switches provide a 12-volt signal on the up or down line and a ground signal on the auto line simultaneously. The up, down and auto feeds to the front window motors are all low current.

The LH and RH front window motors operate with the ignition switch in the RUN or ACCESSORY positions, or when the delayed accessory relay is active. The high current required to move the front windows are supplied through the B+ and motor ground input.

When the LH or RH front window motor is operating in auto up or auto down mode, movement of the front window can be stopped by pressing the switch to any position (UP, DOWN, auto UP, auto DOWN). The front window control switches must be released before the window will move again.

The LH and RH front window motors have a security override feature. If an obstacle has been detected in the window opening as the window glass is moving upward, the window motor will automatically reverse direction and move the glass toward the fully OPEN position (in both manual up and one-touch up modes). This is known as "bounce-back". Once the window motor stops the glass at its bounce-back position, and within 2 seconds the switch is released, then held in the auto UP position, the window motor will move the glass up with no bounce-back protection (security override). If the switch is released before the window glass reaches the fully CLOSED position, the window motor will stop with bounce-back automatically enabled for the next window up movement. If the ignition switch is turned to OFF or START (without delayed accessory), the window motor will stop. The only exception is when an obstacle is detected in the window opening while delayed accessory power is not present. In this case the window motor will bounce back, then stop. Ice, contaminant buildup and environmentally induced tight spots in the front window seals are all possible conditions that will activate the bounce-back feature. If an obstruction occurs between 4 mm (0.15 in) and 200 mm (7.87 in) of window opening, the bounce-back position will be 250 mm (9.84 in) of window opening. If an obstruction occurs at a position greater than 200 mm (7.87 in) of window opening, the bounce-back position will be 50 mm (1.96 in) below where the obstruction occurred.

The LH and RH front window control switches have illumination and illumination ground inputs, which are used to illuminate the switch when the headlamp switch is turned to the PARK or ON position (the AUTOLAMP position may also energize this input). These switch inputs do not directly affect operation of the front windows. The front window control switches use the delayed accessory power input, which is transferred to the up or down outputs when the corresponding switch contact is closed. The front window control switches are grounded to the chassis through the main switch ground input, which is transferred to the auto output when the corresponding front window control switch contact is closed. If the delayed accessory feed to the front window control switch is missing, the window will not function. If the main ground signal is missing, the auto functions will be inoperative and the window will also be inoperative.

If there is an open in the LH or RH front window control switch or the associated wiring, the related function will become inoperative. If the up contact of the switch or the associated wiring develops an open circuit, the front window will only operate in the down direction, or in the one-touch down mode. If the down contact of the switch or the associated wiring develops an open circuit, the window will only operate in the up direction or in the one-touch up mode. If the auto contact of the switch or the associated wiring develops an open circuit, the window will only move manually up or down.

A new LH or RH front window motor will not operate in one-touch up or one-touch down mode, and the bounce back feature will be disabled prior to initialization. If the switch is actuated to the auto UP or auto DOWN position and released, window movement will stop when the up or down contact in the front window control switch is released. If the front window motor is removed from the window regulator drum housing, or if a new front window motor is installed, it must be initialized. Refer to **Window Motor Initialization**.

Once initialized, the front window motors will soft stall into the upper and lower positions contributing to extended durability of the system. If the front window does not seal completely in the full UP position (very small gaps/non bounce-back events only), the front window switch can be actuated to the proportional UP position and the front window will be energized for a fraction of a second to fully seal and this new position will be learned.

LH Front Power Window Control - Edge

The one-touch UP/DOWN features are identical to the MKX LH front window.

Passenger Window Operation

Passenger windows may be raised or lowered using the LH front window control switch or the corresponding passenger window control switch. Passenger window control switches receive power when the delayed accessory relay is active and the LH front window lock switch is in the UNLOCK position. When the LH front window lock switch is in the LOCK position, the passenger windows will not operate.

Global Open

When the unlock button of the remote keyless entry (RKE) transmitter is held for 2 seconds, the global open activates. The smart junction box (SJB) sends a signal to activate the one-touch down operation of both front windows. The global open feature does not operate if the delay accessory is active.

Rear Window Defrost

The heated rear window control switch is part of the HVAC module located in the instrument panel. When the heated rear window control switch is pressed, ground is provided to the heated rear window relay coil. The heated rear window relay supplies voltage to the rear window defrost grid and the LH and RH exterior rear view mirror defrost grids.

The SJB will deactivate the heated rear window relay when one of the following conditions is met:

- The heated rear window control switch is pressed when the feature is active
- Ignition switch state is changed from RUN to OFF/LOCK
- The 17-minute timer completes

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM.
    - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the smart junction box (SJB).
7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

SMART JUNCTION BOX (SJB) DTC CHART

Pinpoint Tests

Pinpoint Test A: All Power Windows are Inoperative - MKX

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LH front power window control switch receives power through circuits CBP41 (BU) and CBP47 (GN/BU), which is the delayed accessory relay output from the smart junction box (SJB). The delayed accessory relay is integral to the SJB module. The LH and RH front power window motors each have their own separate power feeds and grounds and do not share any circuits with the LH or RH rear power window motors except through the master window control switch.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- LH front window control switch
- SJB

PINPOINT TEST A: ALL POWER WINDOWS ARE INOPERATIVE - MKX

A1 CHECK CIRCUITS CBP41 (BU) AND CBP47 (GN/BU) FOR VOLTAGE

- Disconnect: LH Front Window Control Switch C535A
- Disconnect: LH Front Window Control Switch C535B
- Key in ON position.

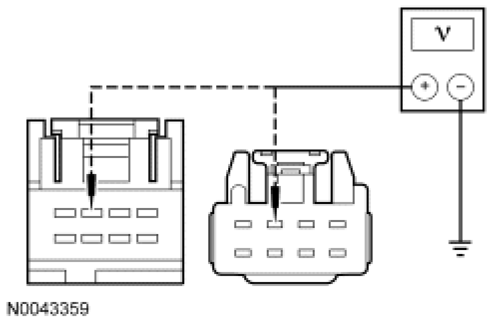

Fig. 1: Checking Circuit CBP02 (GN) And CPW30 (GY/YE) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window control switch C535A-3, circuit CBP41 (BU), harness side and ground; and between LH front window control switch C535B-3, circuit CBP47 (GN/BU), harness side and ground.
- **Is the voltage greater than 10 volts for both measurements?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : VERIFY the SJB fuse 41 (15A) is OK. If OK, go to A2.

A2 CHECK CIRCUITS CBP41 (BU) AND CBP47 (GN/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280D

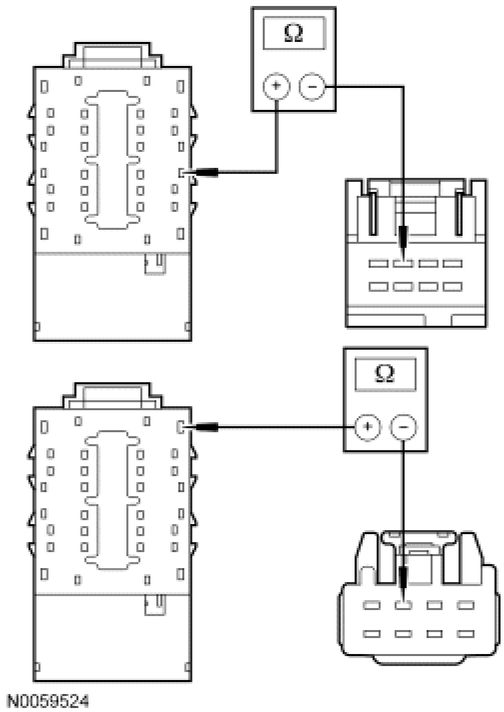

Fig. 2: Measuring Resistance Between LH Front Window Control Switch C535A-3, Circuit CBP41 (BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535A-3, circuit CBP41 (BU), harness side and SJB C2280D-16, circuit CBP41 (BU), harness side; and between LH front window control switch C535B-3, circuit CBP47 (GN/BU), harness side and SJB C2280D-32, circuit CBP47 (GN/BU), harness side.
- **Are the resistances less than 5 ohms for both measurements?**

  YES : Go to **Pinpoint Test L** to diagnose the delayed accessory relay circuit.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test B: All Power Windows are Inoperative - Edge

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LH front power window control switch receives power through circuit CBP47 (GN/BU), which is the delayed accessory relay output from the smart junction box (SJB). The delayed accessory relay is integral to the SJB module. The LH front power window control switch is grounded to the chassis through circuit GD133 (BK).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window control switch
- SJB

PINPOINT TEST B: ALL POWER WINDOWS ARE INOPERATIVE - EDGE

B1 CHECK CIRCUIT CBP47 (GN/BU) FOR VOLTAGE

- Disconnect: LH Front Window Control Switch C504A
- Key in ON position.

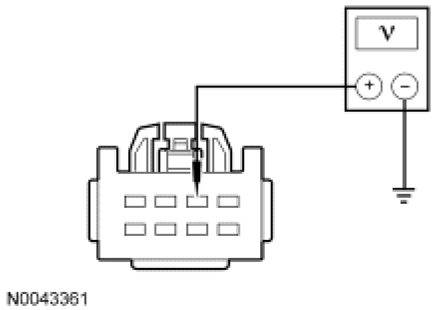

Fig. 3: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window control switch C504A-2, circuit CBP47 (GN/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to B3.

NO : Go to B2.

B2 CHECK CIRCUIT CBP47 (GN/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280D

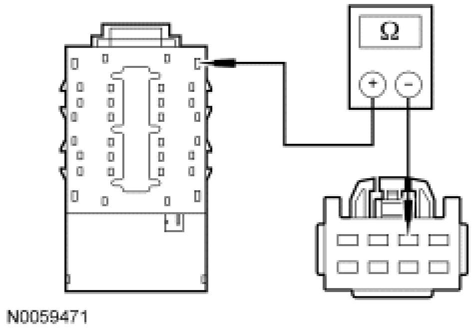

Fig. 4: Measuring Resistance Between LH Front Window Control Switch C504A-2, Circuit CBP47 (GN/BU)

Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C504A-2, circuit CBP47 (GN/BU), harness side and SJB C2280D-32, circuit CBP47 (GN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to **Pinpoint Test L** to diagnose the delayed accessory relay circuit.

  NO : REPAIR the circuit. TEST the system for normal operation.

B3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C504B

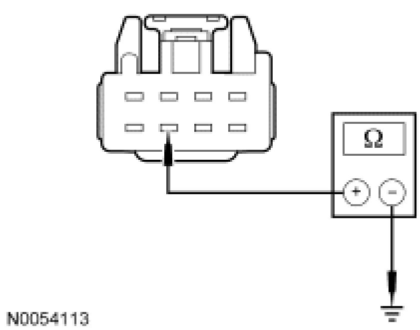

Fig. 5: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C504B-7, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: A Single Power Window is Inoperative - LH Front, MKX

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

NOTE:	**A new LH front power window motor will not operate in one-touch up or one-touch down mode until initialized. Refer to Window Motor Initialization.**
NOTE:	**The LH front power window motor must be initialized whenever a new motor is installed.**
NOTE:	**The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window**

regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

Normal Operation

The LH front power window control switch receives power from the delay accessory relay through circuit CBP41 (BU). The LH window motor receives battery power through circuit SBP04 (GN/RD) and ground through circuit GD133 (BK). When the LH front window control switch is operated in the UP position, the LH front window motor receives a voltage signal through circuit CPW11 (BU/GY). When the LH front window control switch is operated in the DOWN position, the LH front window motor receives a voltage signal through circuit CPW10 (YE/VT). When the LH front window motor receives a ground signal on circuit CPW29 (VT/GY), the LH front window motor will enter one-touch up/down mode.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- LH front window motor
- LH front window control switch
- LH front window motor not initialized

PINPOINT TEST C: A SINGLE POWER WINDOW IS INOPERATIVE - LH FRONT, MKX

C1 CHECK THE POWER TO THE WINDOW MOTOR

- Disconnect: LH Front Window Motor C540

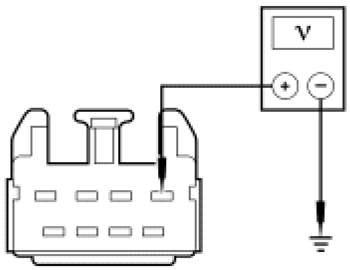

Fig. 6: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window motor C540-1, circuit SBP04 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C2.

  NO : VERIFY smart junction box (SJB) fuse 4 (30A) is OK. If OK, REPAIR the circuit. DE-

INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

C2 CHECK CIRCUIT CBP41 (BU) FOR AN OPEN

- Key in ON position.

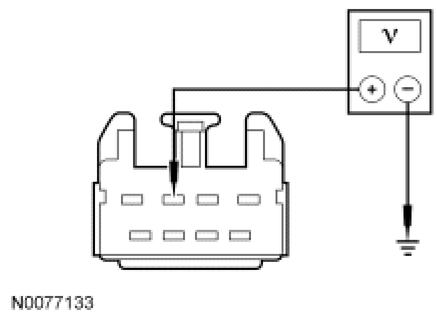

Fig. 7: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window motor C540-3, circuit CBP41 (BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C3.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

C3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.

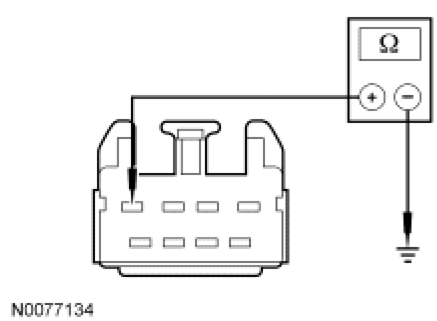

Fig. 8: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-4, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to C4.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor.

REFER to **Window Motor Initialization**. TEST the system for normal operation.

C4 CHECK THE LH FRONT WINDOW CONTROL SWITCH-TO-LH FRONT WINDOW MOTOR FEEDS

- Disconnect: LH Front Window Control Switch C535A

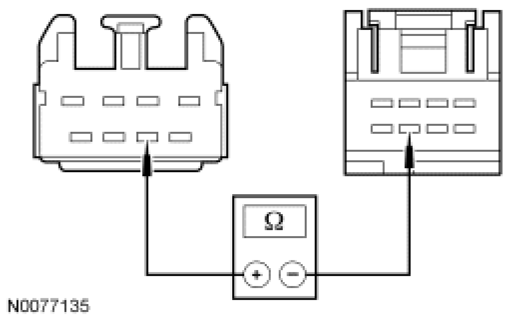

Fig. 9: Measuring Voltage Between LH Front Window Motor C540-6, Circuit CPW10 (YE/VT) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-6, circuit CPW10 (YE/VT), harness side and LH front window control switch C535A-7, circuit CPW10 (YE/VT), harness side.

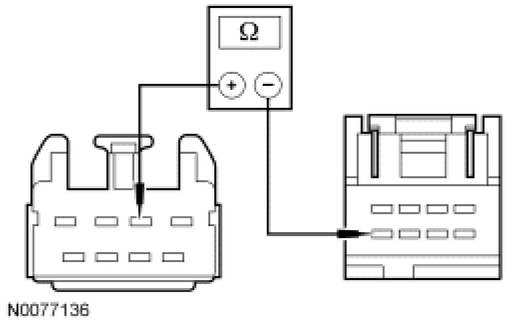

Fig. 10: Measuring Voltage Between LH Front Window Motor C540-2, Circuit CPW29 (VT/GY) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-2, circuit CPW29 (VT/GY), harness side and LH front window control switch C535A-8, circuit CPW29 (VT/GY), harness side.

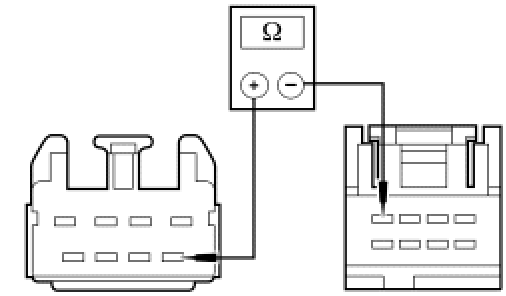

Fig. 11: Measuring Voltage Between LH Front Window Motor C540-5, Circuit CPW11 (BU/GY) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-5, circuit CPW11 (BU/GY), harness side and LH front window control switch C535A-4, circuit CPW11 (BU/GY), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to C5.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

C5 CHECK THE LH FRONT WINDOW CONTROL SWITCH

- Carry out the LH Front Window Control Switch Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the window control switch pass the component test?**

  YES : INSTALL a new LH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

  NO : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

Pinpoint Test D: A Single Power Window is Inoperative - LH Front, Edge

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

NOTE: **A new LH front power window motor will not operate in one-touch up or one-touch down mode until initialized. Refer to Window Motor Initialization.**

NOTE: **The LH front power window motor must be initialized whenever a new motor is installed.**

NOTE: **The front window motor must be de-initialized, then initialized whenever the LH**

or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

Normal Operation

The LH front power window control switch receives power from the delay accessory relay through circuit CBP41 (BU). The LH window motor receives battery power through circuit SBP04 (GN/RD) and ground through circuit GD133 (BK). When the LH front window control switch is operated in the UP position, the LH front window motor receives a voltage signal through circuit CPW11 (BU/GY). When the LH front window control switch is operated in the DOWN position, the LH front window motor receives a voltage signal through circuit CPW10 (YE/VT). When the LH front window motor receives a ground signal on circuit CPW29 (VT/GY), the LH front window motor will enter one-touch up/down mode.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- LH front window motor
- LH front window control switch
- LH front window motor not initialized

PINPOINT TEST D: A SINGLE POWER WINDOW IS INOPERATIVE - LH FRONT, EDGE

D1 CHECK THE POWER TO THE WINDOW MOTOR

- Disconnect: LH Front Window Motor C540

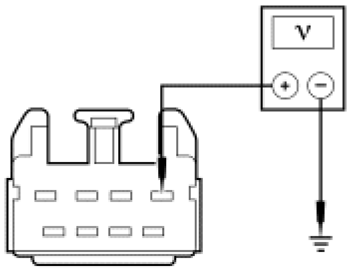

Fig. 12: Measuring Voltage
Courtesy of FORD MOTOR CO.

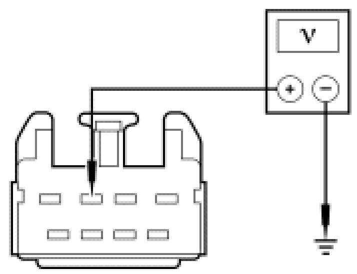
- Measure the voltage between LH front window motor C540-1, circuit SBP04 (GN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to D2.

NO : VERIFY smart junction box (SJB) fuse 4 (30A) is OK. If OK, REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

D2 CHECK CIRCUIT CBP41 (BU) FOR AN OPEN

- Key in ON position.



N0077133

Fig. 13: Measuring Voltage
Courtesy of FORD MOTOR CO.

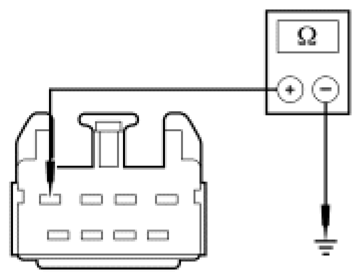
- Measure the voltage between LH front window motor C540-3, circuit CBP41 (BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to D3.

NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

D3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Key in OFF position.



N0077134

Fig. 14: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-4, circuit GD133 (BK), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to D4.

NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

D4 CHECK THE LH FRONT WINDOW CONTROL SWITCH-TO-LH FRONT WINDOW MOTOR FEEDS

- Disconnect: LH Front Window Control Switch C504A

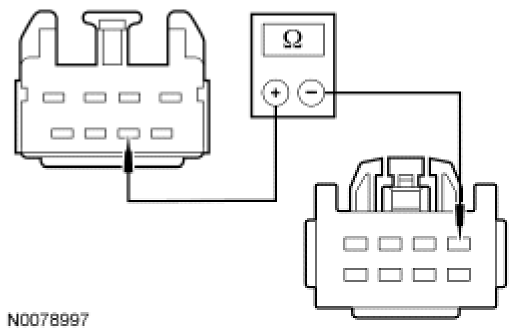


Fig. 15: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-6, circuit CPW10 (YE/VT), harness side and LH front window control switch C504A-1, circuit CPW10 (YE/VT), harness side.

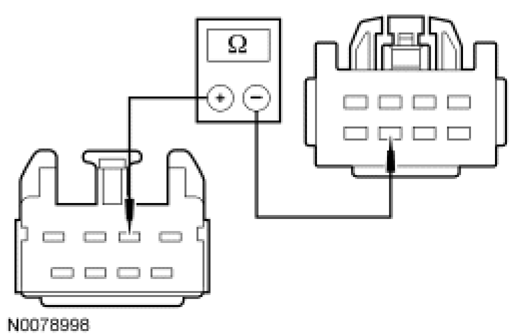

Fig. 16: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-2, circuit CPW29 (VT/GY), harness side and LH front window control switch C504A-7, circuit CPW29 (VT/GY), harness side.

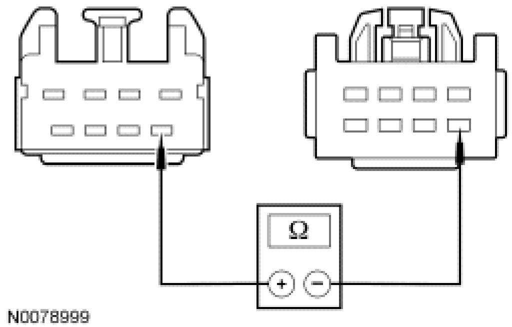

Fig. 17: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window motor C540-5, circuit CPW11 (BU/GY), harness side and LH front window control switch C504A-5, circuit CPW11 (BU/GY), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to D5.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

D5 CHECK THE LH FRONT WINDOW CONTROL SWITCH

- Carry out the LH Front Window Control Switch Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the window control switch pass the component test?**

  YES : INSTALL a new LH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

  NO : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

Pinpoint Test E: A Single Power Window is Inoperative - RH Front, MKX

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

NOTE:	**A new RH front power window motor will not operate in one-touch up or one-touch down mode until initialized. Refer to Window Motor Initialization.**
NOTE:	**The RH front power window motor must be initialized whenever a new motor is installed.**
NOTE:	**The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window**

regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

Normal Operation

The LH and RH front power window control switches receive power from the delay accessory relay through circuit CBP41 (BU). The RH window motor receives battery power through circuit SBP01 (RD) and ground through circuit GD140 (BK/GN). When the LH or RH front window control switch is operated in the UP position, the RH front window motor receives a voltage signal through circuit CPW13 (BN/YE). When the LH or RH front window control switch is operated in the DOWN position, the RH front window motor receives a voltage signal through circuit CPW12 (GN/OG). When the RH front window motor receives a ground signal on circuit CPW31 (GN/WH), the RH front window motor will enter one-touch up/down mode.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- RH front window motor
- LH or RH front window control switch
- RH front window motor not initialized

PINPOINT TEST E: A SINGLE POWER WINDOW IS INOPERATIVE - RH FRONT, MKX

E1 CHECK THE LH FRONT WINDOW CONTROL SWITCH OPERATION

- Attempt to operate the RH window using the LH front power window control switch.
- **Does the RH window operate when using the LH front power window control switch?**

  YES : Go to E7.

  NO : Go to E2.

E2 CHECK THE POWER TO THE WINDOW MOTOR

- Key in OFF position.
- Disconnect: RH Front Window Motor C646

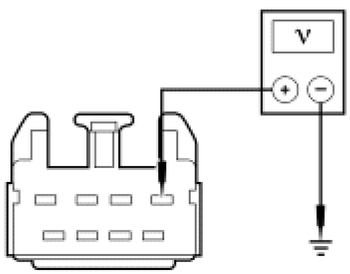

Fig. 18: Measuring Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage between RH front window motor C646-1, circuit SBP01 (RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to E3.

NO : VERIFY smart junction box (SJB) fuse 1 (30A) is OK. If OK, REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E3 CHECK CIRCUIT CBP41 (BU) FOR AN OPEN

- Key in ON position.

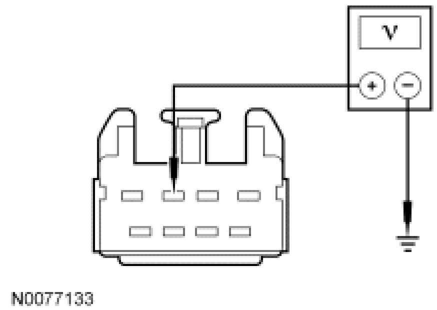

Fig. 19: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between RH front window motor C646-3, circuit CBP41 (BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to E4.

NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E4 CHECK CIRCUIT GD140 (BK/GN) FOR AN OPEN

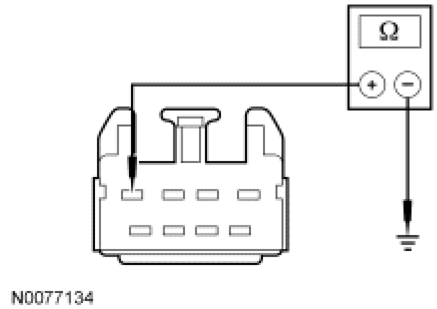

Fig. 20: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window motor C646-4, circuit GD140 (BK/GN), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E5.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E5 CHECK THE LH FRONT WINDOW CONTROL SWITCH-TO-RH FRONT WINDOW MOTOR FEEDS

- Disconnect: LH Front Window Control Switch C535A

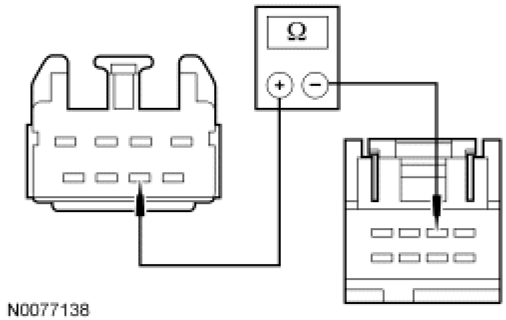

Fig. 21: Measuring Resistance Between RH Front Window Motor C646-6, Circuit CPW12 (GN/OG)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window motor C646-6, circuit CPW12 (GN/OG), harness side and LH front window control switch C535A-2, circuit CPW12 (GN/OG), harness side.

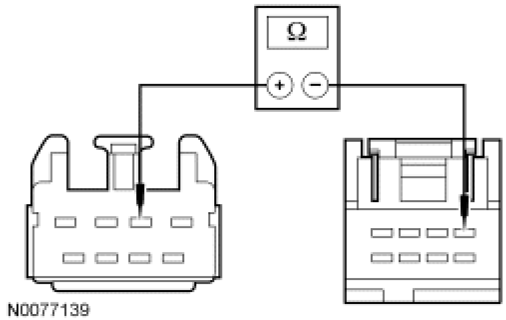

Fig. 22: Measuring Resistance Between RH Front Window Motor C646-2, Circuit CPW31 (GN/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window motor C646-2, circuit CPW31 (GN/WH), harness side and LH front window control switch C535A-1, circuit CPW31 (GN/WH), harness side.

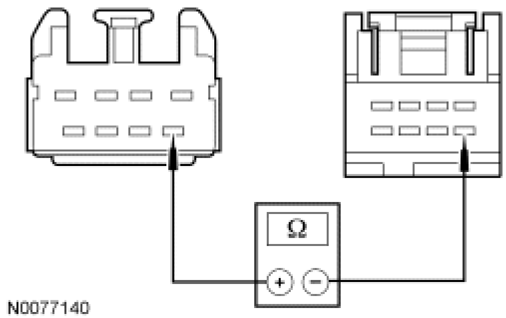

Fig. 23: Measuring Resistance Between RH Front Window Motor C646-5, Circuit CPW13 (BN/YE)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window motor C646-5, circuit CPW13 (BN/YE), harness side and LH front window control switch C535A-5, circuit CPW13 (BN/YE), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to E6.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E6 CHECK THE LH FRONT WINDOW CONTROL SWITCH

- Carry out the LH Front Window Control Switch Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the window control switch pass the component test?**

  YES : INSTALL a new RH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

  NO : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

E7 CHECK CIRCUIT CBP41 (BU) FOR VOLTAGE

- Disconnect: RH Front Window Control Switch C648
- Key in ON position.

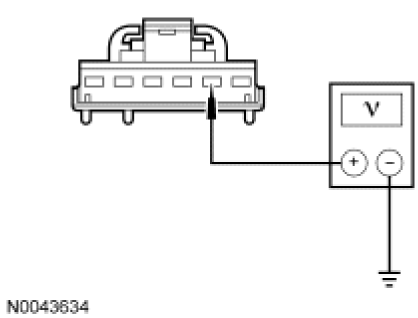

Fig. 24: Measuring Resistance
Courtesy of FORD MOTOR CO.

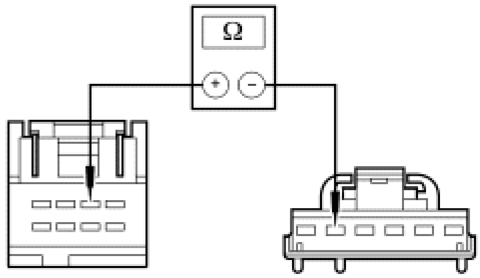
- Measure the voltage between RH front window control switch C648-2, circuit CBP41 (BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to E8.

  NO : REPAIR the circuit. TEST the system for normal operation.

E8 CHECK THE LH FRONT WINDOW CONTROL SWITCH-TO-RH FRONT WINDOW CONTROL SWITCH CIRCUITS

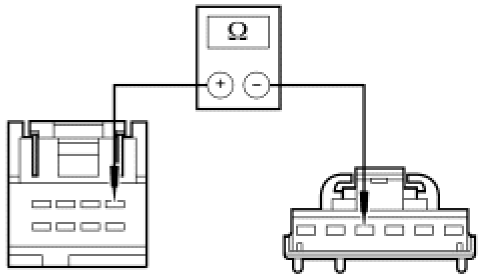
- Key in OFF position.
- Disconnect: LH Front Window Control Switch C535A



N0043635

Fig. 25: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window control switch C648-5, circuit CPW12 (GN/OG), harness side and LH front window control switch C535A-2, circuit CPW12 (GN/OG), harness side.



N0043636

Fig. 26: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window control switch C648-4, circuit CPW31 (GN/WH), harness side and LH front window control switch C535A-1, circuit CPW31 (GN/WH), harness side.

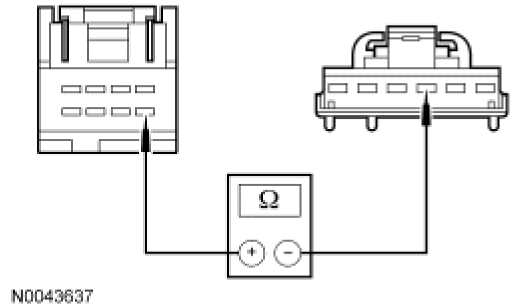


Fig. 27: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RH front window control switch C648-3, circuit CPW13 (BN/YE), harness side and LH front window control switch C535A-5, circuit CPW13 (BN/YE), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new RH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test F: A Single Power Window is Inoperative - LH or RH Rear, MKX

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

Normal Operation

The LH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory relay is active. When the LH rear window is operated in the up direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW21 (BN) and ground through circuit CPW22 (GN/VT). When the LH rear window is operated in the down direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW22 (GN/VT) and ground through circuit CPW21 (BN).

The RH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory relay is active. When the RH rear window is operated in the up direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW24 (WH/VT) and ground through circuit CPW23 (GY). When the RH rear window is operated in the down direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW23 (GY) and ground through circuit CPW24 (WH/VT).

Rear Window Operation From LH Front Switch

When the LH rear power window is operated in the up direction from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW16 (BU/OG), which transfers power to the LH rear window motor through circuit CPW21 (BN). The LH front window control switch provides ground to the LH rear window switch through circuit CPW15 (YE), which transfers ground to the LH rear window motor through circuit CPW22 (GN/VT).

During LH rear power window down operation from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW15 (YE), which transfers power to the LH rear window motor through circuit CPW22 (GN/VT). The LH front window control switch provides ground to the LH rear window switch through circuit CPW16 (BU/OG), which transfers ground to the LH rear window motor through circuit CPW21 (BN).

When the RH rear power window is operated in the up direction from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW18 (GY/VT), which transfers power to the RH rear window motor through circuit CPW24 (WH/VT). The LH front window control switch provides ground to the RH rear window switch through circuit CPW17 (BN/GN), which transfers ground to the RH rear window motor through circuit CPW23 (GY).

During RH rear power window down operation from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW17 (BN/GN), which transfers power to the RH rear window motor through circuit CPW23 (GY). The LH front window control switch provides ground to the RH rear window switch through circuit CPW18 (GY/VT), which transfers ground to the RH rear window motor through circuit CPW24 (WH/VT).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window switch
- Rear window motor
- Rear window switch

PINPOINT TEST F: A SINGLE POWER WINDOW IS INOPERATIVE - LH OR RH REAR, MKX

F1 CHECK THE VOLTAGE TO THE LH REAR OR RH REAR WINDOW CONTROL SWITCH

- Disconnect: Inoperative Rear Window Control Switch C701 (LH) or C801 (RH)
- Key in ON position.

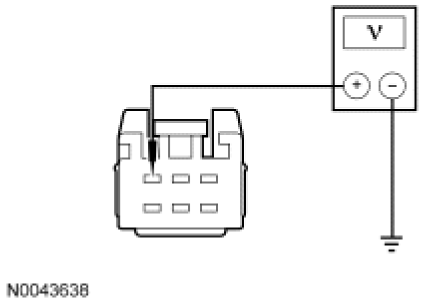

Fig. 28: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE: Set the LH front window lock switch to the UNLOCK position.

- Measure the voltage between the inoperative rear window connector and ground:
  - for the RH rear window control switch, measure the voltage between RH rear window control switch C801-3, circuit CPW14 (VT/WH), harness side and ground.
  - for the LH rear window control switch, measure the voltage between C701-3, circuit CPW14 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F4.

  NO : Go to F2.

F2 CHECK THE VOLTAGE TO THE LH FRONT WINDOW CONTROL SWITCH

- Disconnect: LH Front Window Control Switch C535B

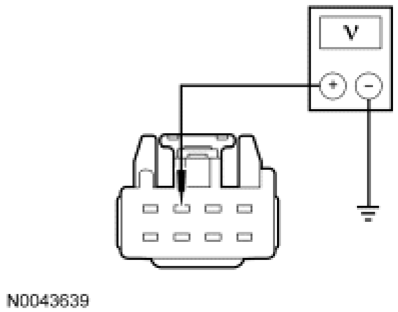

Fig. 29: Measuring Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH front window control switch C535B-3, circuit CBP47 (GN/BU), and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F3.

  NO : REPAIR the circuit. TEST the system for normal operation.

F3 CHECK FOR AN OPEN IN CIRCUIT CPW14 (VT/WH)

- Key in OFF position.

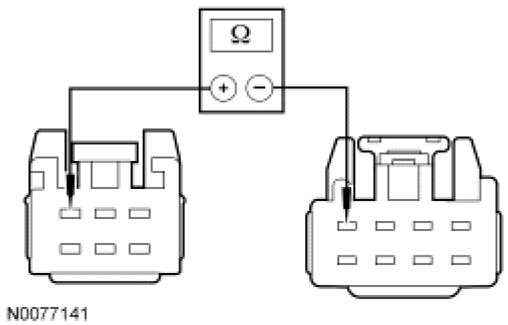

Fig. 30: Measuring Resistance Between Inoperative Rear Window Connector & LH Front Window Control Switch Connector
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative rear window connector and the LH front window control switch connector.
  - for the RH rear window control switch, measure the resistance between RH window control switch C801-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C535B-4, circuit CPW14 (VT/WH), harness side.
  - for the LH rear window control switch, measure the resistance between LH window control switch C701-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C535B-4, circuit CPW14 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

F4 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH

- Key in OFF position.

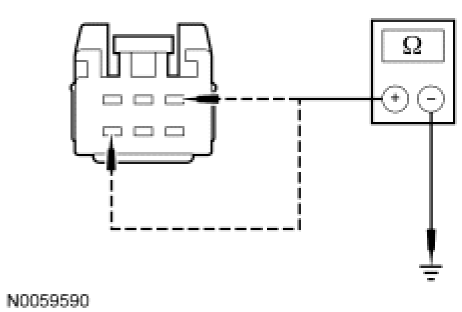

Fig. 31: Measuring Resistance Between Inoperative Window Control Switch & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative window control switch and ground:
  - for the RH rear window control switch, measure the resistance between RH rear window control switch C801-1, circuit CPW17 (BN/GN), harness side and ground; and between RH rear window control switch C801-6, circuit CPW18 (GY/VT), harness side and ground.
  - for the LH rear window control switch, measure the resistance between LH rear window control switch C701-1, circuit CPW15 (YE), harness side and ground; and between LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : Go to F7.

  NO : Go to F5.

F5 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C535B

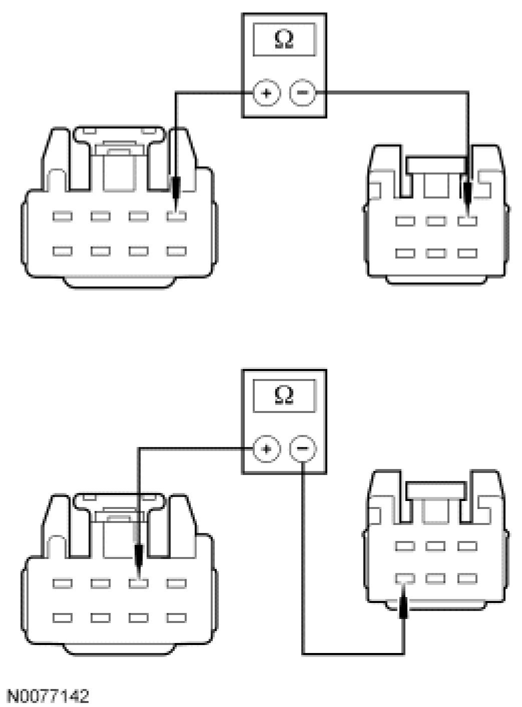

Fig. 32: Measuring Resistance Between LH Front Window Control Switch C535B-1, Circuit CPW15 (YE)
Courtesy of FORD MOTOR CO.

- For an inoperative LH rear power window, measure the resistance between LH front window control switch C535B-1, circuit CPW15 (YE) and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH front window control switch C535B-2, circuit CPW16 (BU/OG) and LH rear window control switch C701-6, circuit CPW16 (BU/OG) harness side.

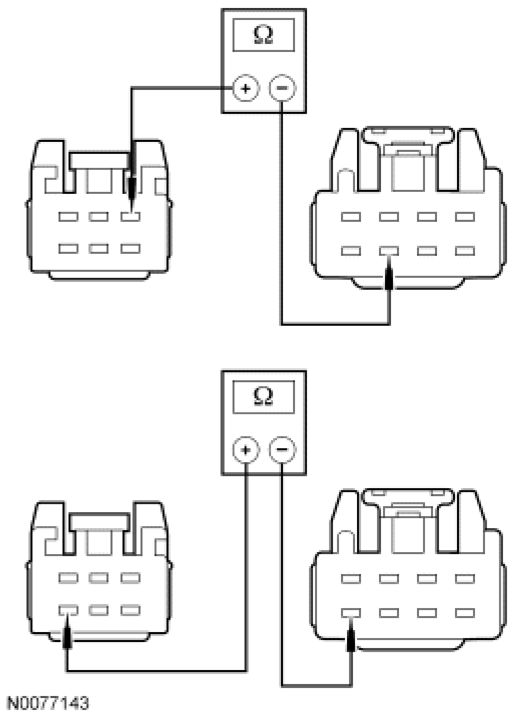

Fig. 33: Measuring Resistance Between LH Front Window Control Switch C535B-7, Circuit CPW17 (BN/GN)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear power window, measure the resistance between LH front window control switch C535B-7, circuit CPW17 (BN/GN) and RH window control switch C819-1, circuit CPW17 (BN/GN), harness side; and between LH front window control switch C535B-8, circuit CPW18 (GY/VT) and RH rear window control switch C819-6, circuit CPW18 (GY/VT) harness side.
- **Are the resistances less than 5 ohms?**

YES : Go to F6.

NO : REPAIR the circuit(s) for an open. TEST the system for normal operation.

F6 CHECK THE GROUND TO THE LH FRONT WINDOW CONTROL SWITCH

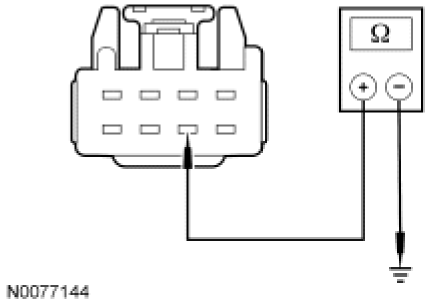

Fig. 34: Measuring Resistance Between LH Front Window Control Switch C535B-6, Circuit

GD133 (BK)
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535B-6, circuit GD133 (BK), and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

F7 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH

- Connect: LH Front Window Control Switch C535B
- Key in ON position.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side. The LH rear window should operate in the downward direction.

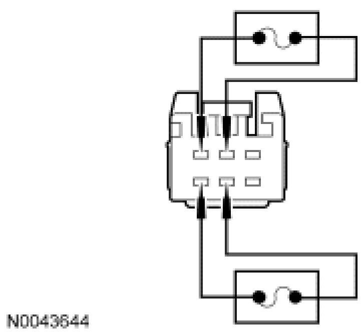

Fig. 35: Checking Inoperative Window Control Switch (1 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C801-2, circuit CPW23 (GY), harness side and RH rear window control switch C801-3, circuit CPW14 (VT/WH), harness side; and between RH rear window control switch C801-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C801-6, circuit CPW18 (GY/VT), harness side. The RH rear window should operate in the downward direction.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side. The LH rear window should operate in the upward direction.

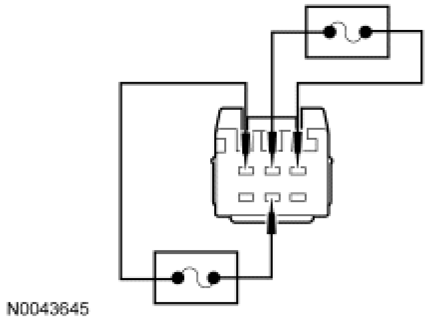

Fig. 36: Checking Inoperative Window Control Switch (2 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C801-2, circuit CPW22 (GN/VT), harness side and RH rear window control switch C801-1, circuit CPW17 (BN/GN), harness side; and between RH rear window control switch C801-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C801-3, circuit CPW14 (VT/WH), harness side. The RH rear window should operate in the upward direction.
- **Did the inoperative window operate correctly?**

  YES : INSTALL a new LH or RH rear window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : Go to F8.

F8 CHECK THE POWER WINDOW MOTOR CIRCUITS

- Key in OFF position.
- Disconnect: Inoperative Rear Window Motor C703 (LH) or C828 (RH)
- For an inoperative LH rear window, measure the resistance between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window motor C703-2, circuit CPW22 (GN/VT), harness side.

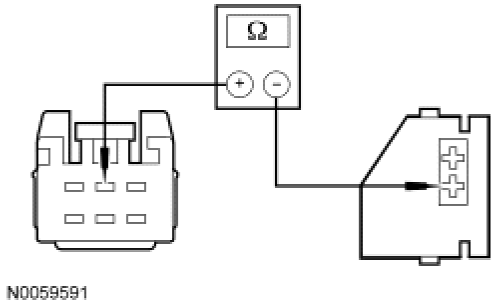

Fig. 37: Measuring Resistance Between RH Rear Window Control Switch C801-2, Circuit CPW23 (GY)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C801-2, circuit CPW23 (GY), harness side and RH rear window motor C828-2, circuit

CPW23 (GY), harness side.

- For an inoperative LH rear window, measure the resistance between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window motor C703-1, circuit CPW21 (BN), harness side.

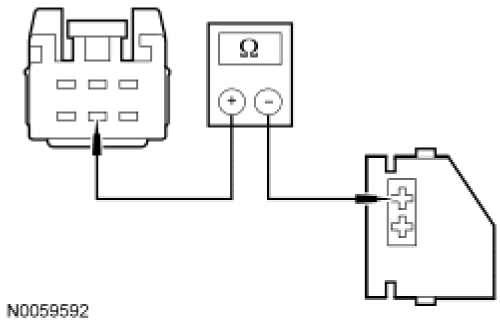

Fig. 38: Measuring Resistance Between RH Rear Window Control Switch C801-5, Circuit CPW24 (WH/VT)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C801-5, circuit CPW24 (WH/VT), harness side and RH rear window motor C703-1, circuit CPW24 (WH/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH or RH rear window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test G: A Single Power Window is Inoperative- RH Front, LH or RH Rear, Edge

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

Normal Operation

The RH front window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory feature is active. When the RH front window is operated in the up direction from the RH front window control switch, power is sent to the RH front window motor through circuit CPW20 (WH/OG) and ground through circuit CPW19 (VT). When the RH front window is operated in the down direction from the RH front window control switch, power is sent to the RH front window motor through circuit CPW19 (VT) and ground through circuit CPW20 (WH/OG).

The LH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory feature is active. When the LH rear window is operated in the up direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW21 (BN) and ground through circuit CPW22 (GN/VT). When the LH rear window is operated in the down direction from the LH rear window control switch, power is sent to the LH rear window motor through circuit CPW22 (GN/VT) and ground through circuit CPW21 (BN).

The RH rear window control switch receives delayed accessory power from the LH front window control switch through circuit CPW14 (VT/WH) when the window lock switch is set to the UNLOCK position, and the delayed accessory feature is active. When the RH rear window is operated in the up direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW24 (WH/VT) and ground through circuit CPW23 (GY). When the RH rear window is operated in the down direction from the RH rear window control switch, power is sent to the RH rear window motor through circuit CPW23 (GY) and ground through circuit CPW24 (WH/VT).

Window Operation From LH Front Switch

When the RH front power window is operated in the up direction from the LH front window control switch, power is sent to the RH front window control switch through circuit CPW13 (BN/YE), which transfers power to the RH front window motor through circuit CPW20 (WH/OG). Ground is provided to the RH front window switch through circuit CPW12 (GN/OG), which transfers ground to the RH front window motor through circuit CPW19 (VT).

During RH front power window down operation from the LH front window control switch, power is sent to the RH front window control switch through circuit CPW12 (GN/OG), which transfers power to the RH front window motor through circuit CPW19 (VT). Ground is provided to the RH front window switch through circuit CPW13 (BN/YE), which transfers ground to the RH front window motor through circuit CPW20 (WH/OG).

When the LH rear power window is operated in the up direction from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW16 (BU/OG), which transfers power to the LH rear window motor through circuit CPW21 (BN). Ground is provided to the LH rear window switch through circuit CPW15 (YE), which transfers ground to the LH rear window motor through circuit CPW22 (GN/VT).

During LH rear power window down operation from the LH front window control switch, power is sent to the LH rear window control switch through circuit CPW15 (YE), which transfers power to the LH rear window motor through circuit CPW22 (GN/VT). Ground is provided to the LH rear window switch through circuit CPW16 (BU/OG), which transfers ground to the LH rear window motor through circuit CPW21 (BN).

When the RH rear power window is operated in the up direction from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW18 (GY/VT), which transfers power to the RH rear window motor through circuit CPW24 (WH/VT). Ground is sent to the RH rear window switch through circuit CPW17 (BN/GN), which transfers ground to the RH rear window motor through circuit CPW23 (GY).

During RH rear power window down operation from the LH front window control switch, power is sent to the RH rear window control switch through circuit CPW17 (BN/GN), which transfers power to the RH rear window motor through circuit CPW23 (GY). Ground is sent to the RH rear window switch through circuit CPW18 (GY/VT), which transfers ground to the RH rear window motor through circuit CPW24 (WH/VT).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window switch
- RH front window switch
- Rear window motor
- Front window motor
- Rear window switch

PINPOINT TEST G: A SINGLE POWER WINDOW IS INOPERATIVE - RH FRONT, LH OR RH REAR, EDGE

G1 CHECK THE VOLTAGE TO THE RH FRONT, LH REAR OR RH REAR WINDOW CONTROL SWITCH

- Disconnect: Inoperative Rear Window Control Switch C624 (RH front), C701 (LH rear) or C801 (RH rear)
- Key in ON position.

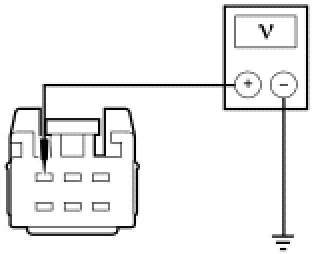

Fig. 39: Measuring Voltage
Courtesy of FORD MOTOR CO.

NOTE: Set the LH front window lock switch to the UNLOCK position.

- Measure the voltage between the inoperative rear window connector and ground:
  - for the RH front window control switch, measure the voltage between RH front window control switch C624-3, circuit CPW14 (VT/WH), harness side and ground.
  - for the RH rear window control switch, measure the voltage between RH rear window control switch C801-3, circuit CPW14 (VT/WH), harness side and ground.
  - for the LH rear window control switch, measure the voltage between C701-3, circuit CPW14 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to G3.

NO : Go to G2.

G2 CHECK FOR AN OPEN IN CIRCUIT CPW14 (VT/WH)

- Disconnect: LH Front Window Control Switch C504B
- Key in OFF position.

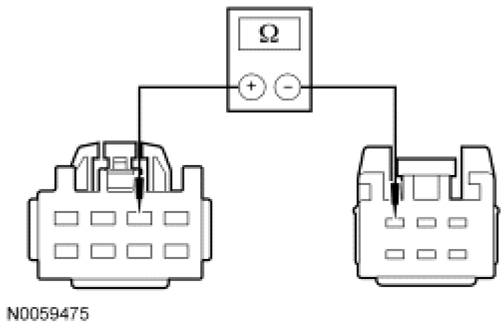

Fig. 40: Measuring Resistance Between Inoperative Rear Window Connector & LH Front Window Control Switch Connector
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative rear window connector and the LH front window control switch connector:
  - for the RH front window control switch, measure the resistance between RH front window control switch C624-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C504B-2, circuit CPW14 (VT/WH), harness side.
  - for the RH rear window control switch, measure the resistance between RH rear window control switch C819-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C504B-2, circuit CPW14 (VT/WH), harness side.
  - for the LH rear window control switch, measure the resistance between LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side and LH front window control switch C504B-2, circuit CPW14 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

G3 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH

- Key in OFF position.

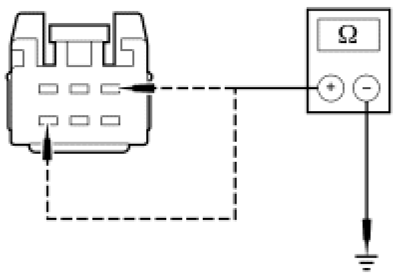

Fig. 41: Measuring Resistance Between Inoperative Window Control Switch & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the inoperative window control switch and ground:
  - for the RH front window control switch, measure the resistance between RH front window control switch C624-1, circuit CPW12 (GN/OG), harness side and ground; and between RH front window control switch C624-6, circuit CPW13 (BN/YE), harness side and ground.
  - for the RH rear window control switch, measure the resistance between RH rear window control switch C801-1, circuit CPW17 (BN/GN), harness side and ground; and between RH rear window control switch C801-6, circuit CPW18 (GY/VT), harness side and ground.
  - for the LH rear window control switch, measure the resistance between LH rear window control switch C701-1, circuit CPW15 (YE), harness side and ground; and between LH rear window control switch C701-6, circuit CPW16 (BU/OG), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : Go to G5.

  NO : Go to G4.

G4 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C504A and C504B

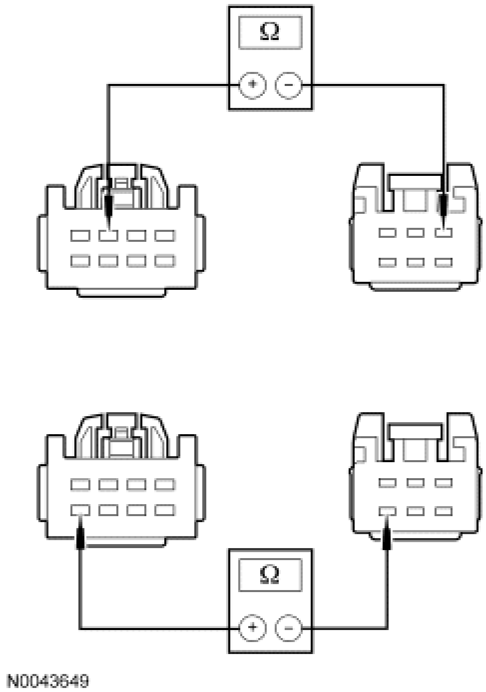

Fig. 42: Measuring Resistance
Courtesy of FORD MOTOR CO.

- For an inoperative RH front power window, measure the resistance between LH front window control switch C504A-3, circuit CPW12 (GN/OG) and RH front window control switch C624-1, circuit CPW12 (GN/OG), harness side; and between LH front window control switch C504A-8, circuit CPW13 (BN/YE) and RH front window control switch C624-6, circuit CPW13 (BN/YE) harness side.

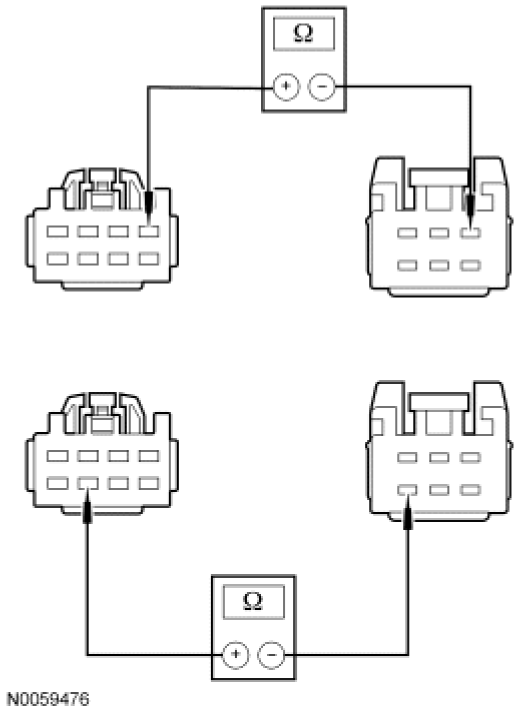

Fig. 43: Measuring Resistance Between LH Front Window Control Switch C504B-1, Circuit CPW15 (YE)
Courtesy of FORD MOTOR CO.

- For an inoperative LH rear power window, measure the resistance between LH front window control switch C504B-1, circuit CPW15 (YE) and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH front window control switch C504B-2, circuit CPW16 (BU/OG) and LH rear window control switch C701-6, circuit CPW16 (BU/OG) harness side.

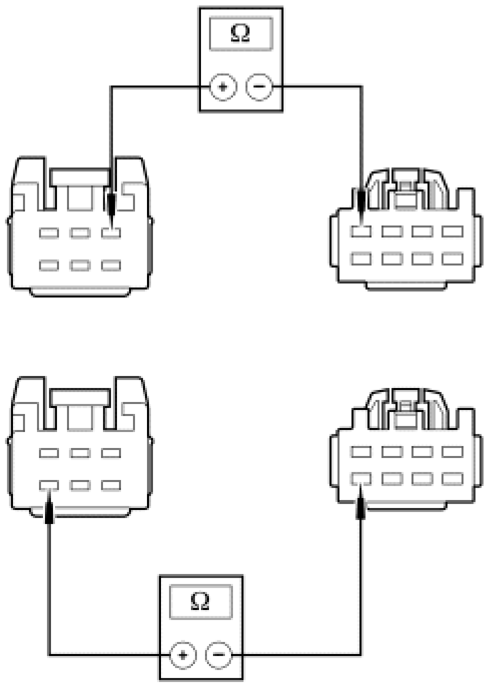

Fig. 44: Measuring Resistance Between LH Front Window Control Switch C504B-4, Circuit CPW17 (BN/GN)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear power window, measure the resistance between LH front window control switch C504B-4, circuit CPW17 (BN/GN) and RH window control switch C801-1, circuit CPW17 (BN/GN), harness side; and between LH front window control switch C504B-8, circuit CPW18 (GY/VT) and RH rear window control switch C801-6, circuit CPW18 (GY/VT) harness side.
- **Are the resistances less than 5 ohms?**

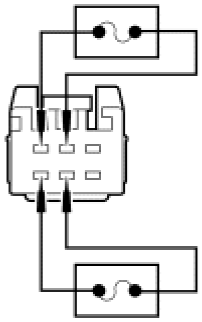
  YES : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit(s) for an open. TEST the system for normal operation.

G5 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH

- Key in ON position.
- For an inoperative RH front window, connect a fused jumper wire between RH front window control switch C624-2, circuit CPW19 (VT), harness side and RH front window control switch C624-3, circuit CPW14 (VT/WH), harness side; and between RH front window control switch C624-5, circuit CPW20 (WH/OG), harness side and RH front window control switch C624-6, circuit CPW13 (BN/YE), harness side. The RH front window should operate in the downward direction.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-6, circuit CPW16

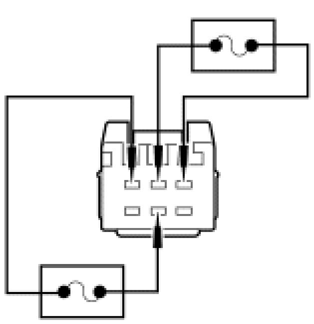
(BU/OG), harness side. The LH rear window should operate in the downward direction.



N0043644

Fig. 45: Checking Inoperative Window Control Switch (1 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C801-2, circuit CPW23 (GY), harness side and RH rear window control switch C801-3, circuit CPW14 (VT/WH), harness side; and between RH rear window control switch C801-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C801-6, circuit CPW18 (GY/VT), harness side. The RH rear window should operate in the downward direction.
- For an inoperative RH front window, connect a fused jumper wire between RH front window control switch C624-2, circuit CPW19 (VT), harness side and RH front window control switch C624-1, circuit CPW12 (GN/OG), harness side; and between RH front window control switch C624-5, circuit CPW20 (WH/OG), harness side and RH front window control switch C624-3, circuit CPW14 (VT/WH), harness side. The RH front window should operate in the upward direction.
- For an inoperative LH rear window, connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window control switch C701-1, circuit CPW15 (YE), harness side; and between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side. The LH rear window should operate in the upward direction.



N0043645

Fig. 46: Checking Inoperative Window Control Switch (2 Of 2)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, connect a fused jumper wire between RH rear window control switch C801-2, circuit CPW22 (GN/VT), harness side and RH rear window control switch C801-1, circuit CPW17 (BN/GN), harness side; and between RH rear window control switch C801-5, circuit CPW24 (WH/VT), harness side and RH rear window control switch C801-3, circuit CPW14 (VT/WH), harness side. The RH rear window should operate in the upward direction.

- **Did the inoperative window operate correctly?**

  YES : INSTALL a new LH or RH rear window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

  NO : Go to G6.

G6 CHECK THE POWER WINDOW MOTOR CIRCUITS

- Key in OFF position.
- Disconnect: Inoperative Window Motor C608 (RH front), C703 (LH rear) or C828 (RH rear)
- For an inoperative RH front window, measure the resistance between RH front window control switch C624-2, circuit CPW19 (VT), harness side and RH front window motor C608-2, circuit CPW19 (VT), harness side.

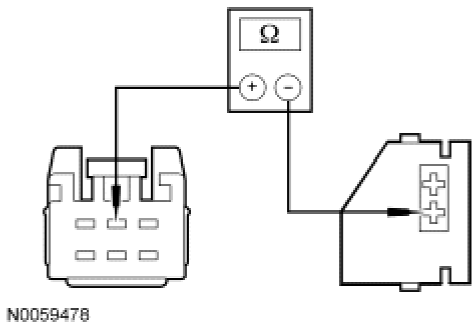


Fig. 47: Measuring Resistance Between LH Rear Window Control Switch C701-2, Circuit CPW22 (GN/VT)
Courtesy of FORD MOTOR CO.

- For an inoperative LH rear window, measure the resistance between LH rear window control switch C701-2, circuit CPW22 (GN/VT), harness side and LH rear window motor C703-2, circuit CPW22 (GN/VT), harness side.

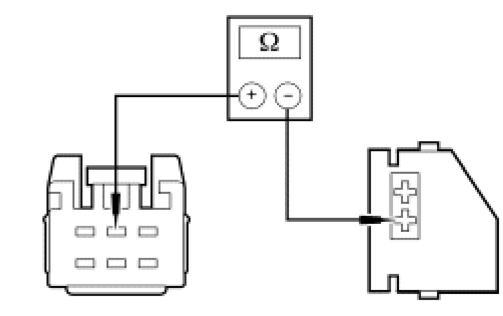

Fig. 48: Measuring Resistance Between RH Rear Window Control Switch C801-2, Circuit CPW23 (GY)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C801-2, circuit CPW23 (GY), harness side and RH rear window motor C828-2, circuit CPW23 (GY), harness side.
- For an inoperative RH front window, measure the resistance between RH front window control switch C624-5, circuit CPW20 (WH/OG), harness side and RH front window motor C608-1, circuit CPW20 (WH/OG), harness side.

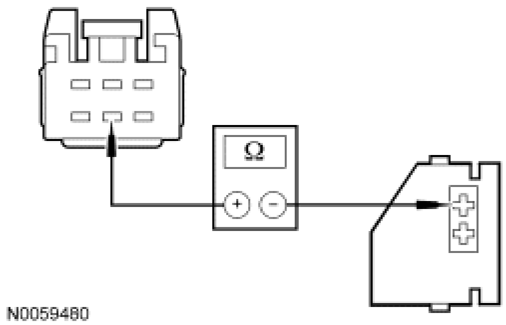

Fig. 49: Measuring Resistance Between LH Rear Window Control Switch C701-5, Circuit CPW21 (BN)
Courtesy of FORD MOTOR CO.

- For an inoperative LH rear window, measure the resistance between LH rear window control switch C701-5, circuit CPW21 (BN), harness side and LH rear window motor C703-1, circuit CPW21 (BN), harness side.

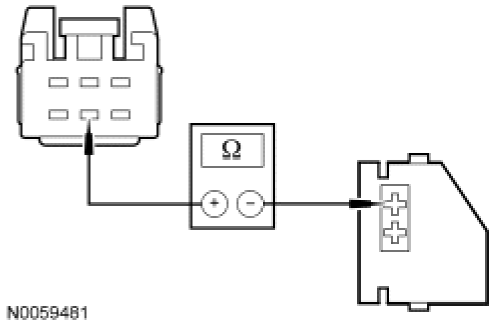

Fig. 50: Measuring Resistance Between RH Rear Window Control Switch C801-5, Circuit CPW24 (WH/VT)
Courtesy of FORD MOTOR CO.

- For an inoperative RH rear window, measure the resistance between RH rear window control switch C801-5, circuit CPW24 (WH/VT), harness side and RH rear window motor C828-1, circuit CPW24 (WH/VT), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new RH front, LH or RH rear window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test H: The One-Touch Up/Down Feature is Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

NOTE: **A new LH or RH (MKX) or LH (Edge) front power window motor will not operate in one-touch up or one-touch down mode until initialized. Refer to Window Motor Initialization.**

NOTE: **The LH or RH front power window motor must be initialized whenever a new motor is installed.**

NOTE: **The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

Normal Operation

The LH front power window control switch receives power from the delayed accessory relay through circuit CBP41 (BU) and is grounded through circuit GD133 (BK). When the LH front window control switch is pressed to the UP position, the LH front motor receives power through circuit CPW11 (BU/GY). When the LH front window control switch is pressed to the DOWN position, the LH front motor receives power through circuit CPW10 (YE/VT). When the LF window motor receives a ground signal on circuit CPW29 (VT/GY), the LF window motor will enter one-touch up or one-touch down.

The RH (MKX only) front power window control switch receives power from the delayed accessory relay through circuit CBP41 (BU) and is grounded through circuit GD133 (BK). When the RH front window control switch is pressed to the UP position, the RH front motor receives power through circuit CPW13 (BN/YE). When the RH front window control switch is pressed to the DOWN position, the RH front motor receives power through circuit CPW12 (GN/OG). When the RH window motor receives a ground signal on circuit CPW31 (GN/WH), the RH window motor will enter one-touch up or one-touch down.

This pinpoint test is intended to diagnose the following:

- B(+) power lost during LH or RH front window operation
- LH or RH front window motor
- LH or RH front window control switch
- LH or RH front motor not initialized
- Wiring, terminals or connectors

PINPOINT TEST H: THE ONE-TOUCH UP/DOWN FEATURE IS INOPERATIVE

H1 CHECK FOR POWER (B+) LOSS DURING LH OR RH FRONT WINDOW OPERATION

- Verify if power (B+) was lost during LH or RH front window operation.
- **Was power (B+) lost while LH or RH front window was in operation?**

  YES : RAISE the LH or RH front window to the fully CLOSED position. VERIFY the window glass stalls into the upper header seal. The front window should function normally. TEST the system for normal operation.

  NO : Go to H2.

H2 DE-INITIALIZE, THEN INITIALIZE THE FRONT MOTOR

- De-initialize the front window motor, then carry out the front window motor initialization procedure. Refer to **Window Motor Initialization**.
- **Is the one-touch down feature operating correctly?**

  YES : The system is operating normally at this time. The front window motor lost initialization.

  NO : For LH window, go to H3.

  For RH window (MKX only), go to H5.

H3 CHECK THE LH FRONT WINDOW CONTROL SWITCH

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C535A and C535B (MKX) or C504A and C504B (Edge)
- Carry out the LH Front Window Switch Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the LH front window switch pass the component test?**

  YES : Go to H4.

  NO : INSTALL a new LH front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

H4 CHECK CIRCUIT CPW29 (VT/GY) FOR AN OPEN

- Disconnect: LH Front Window Motor C540

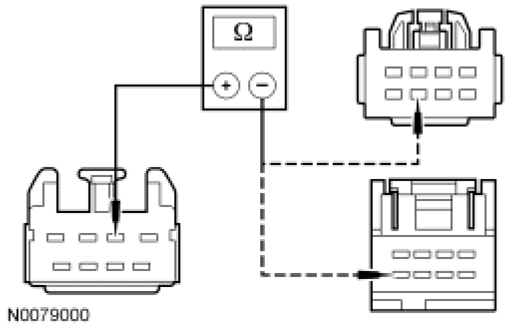

Fig. 51: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535A-8 (MKX) or C504A-7 (Edge), circuit CPW29 (VT/GY), harness side and LH front window motor connector C540-2, circuit CPW29 (VT/GY).

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH front window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

H5 CHECK THE LH and RH FRONT WINDOW CONTROL SWITCH

- Key in OFF position.
- Disconnect: LH Front Window Control Switch C535A, C535B and RH Front Window Control Switch C648
- Carry out the LH and RH front window switch component tests. Refer to appropriate COMPONENT TESTING article.
- **Did the LH and RH front window switches pass the component tests?**

  YES : Go to H6.

  NO : INSTALL a new front window control switch. REFER to **Window Control Switch**. TEST the system for normal operation.

H6 CHECK CIRCUIT CPW31 (GN/WH) FOR AN OPEN

- Disconnect: RH Front Window Motor C646

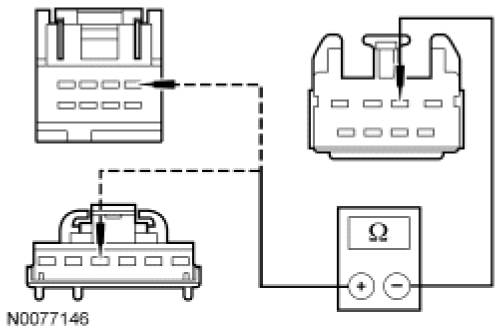

Fig. 52: Measuring Resistance Between LH Front Window Control Switch C535A-1, Circuit CPW31 (GN/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH front window control switch C535A-1, circuit CPW31 (GN/WH), harness side and RH front window motor connector C646-2, circuit CPW31 (GN/WH); and between RH front window control switch C648-4, circuit CPW31 (GN/WH), harness side and RH front window motor connector C646-2, circuit CPW31 (GN/WH).
- **Are the resistances less than 5 ohms for both measurements?**

  YES : INSTALL a new RH front window motor. REFER to **Window Regulator Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

Pinpoint Test I: The Global Open Function is Inoperative/Does Not Operate Correctly - MKX

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

Normal Operation

When the unlock button of the remote keyless entry (RKE) transmitter is held for 2 seconds the global open activates. The smart junction box (SJB) sends a signal on circuit VPW01 (GN/BU) to activate the one-touch down operation of both front windows.

The global open feature does not operate if the delayed accessory is active.

- DTC B2947 Global Opening/Closing Circuit Open - Open or short to ground in the global opening circuit.
- DTC B2949 Global Opening/Closing Circuit Short to Battery - Short to battery in the global opening circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- RKE transmitters
- Wiring, terminals or connectors
- SJB
- Window motors not initialized

PINPOINT TEST I: THE GLOBAL OPEN FUNCTION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - MKX

NOTE: **One-touch up/down must be operational for the global open function to operate correctly. Make sure one-touch up/down is operational before proceeding with this diagnostic.**

I1 CHECK THE DTCs

- Refer to the results from the previous SJB self-test.
- **Was DTC B2947 or B2949 retrieved?**

  YES : For B2949, go to I2.

  For B2947, go to I5.

  NO : VERIFY SJB fuse 41 (15A) is OK. If OK, go to I7.

I2 CHECK CIRCUIT VPW01 (GN/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280C
- Key in ON position.

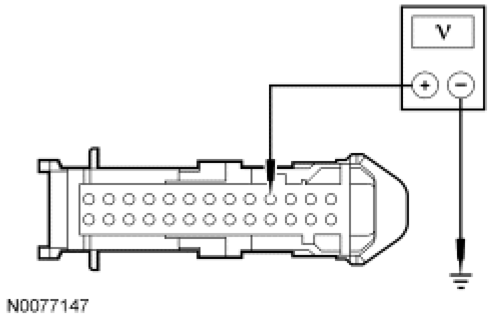

Fig. 53: Measuring Voltage Between SJB C2280C-10, Circuit VPW01 (GN/BU), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280C-10, circuit VPW01 (GN/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to I3.

  NO : Go to I9.

I3 CHECK CIRCUIT VPW01 (GN/BU) FOR A SHORT TO VOLTAGE

- Disconnect: LH Front Window Motor C540

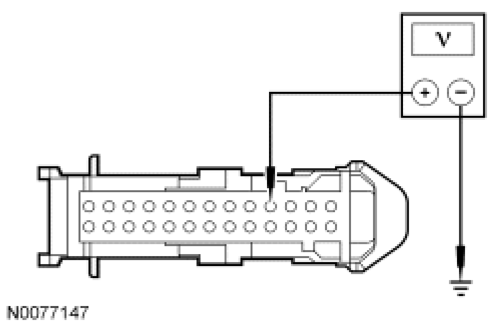

Fig. 54: Measuring Voltage Between SJB C2280C-10, Circuit VPW01 (GN/BU), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280C-10, circuit VPW01 (GN/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to I4.

  NO : INSTALL a new LH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

I4 CHECK CIRCUIT VPW01 (GN/BU) FOR A SHORT TO VOLTAGE

- Disconnect: RH Front Window Motor C646

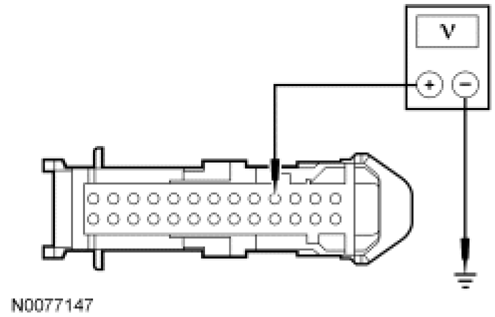

Fig. 55: Measuring Voltage Between SJB C2280C-10, Circuit VPW01 (GN/BU), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280C-10, circuit VPW01 (GN/BU), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH and RH front window motors. REFER to **Window Motor Initialization**. TEST the system for normal operation.

  NO : INSTALL a new RH front window motor. REFER to **Glass, Frames and Mechanisms - Exploded View, Front Door** and **Window Regulator and Motor - Front Door**. INITIALIZE the LH front window motor. REFER to **Window Motor Initialization**. TEST the system for normal operation.

I5 CHECK CIRCUIT VPW01 (GN/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280C
- Disconnect: LH Front Window Motor C540
- Disconnect: RH Front Window Motor C646

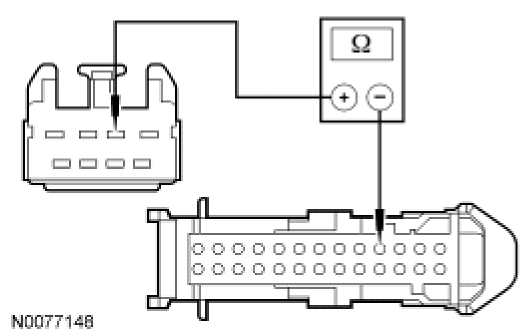

Fig. 56: Measuring Voltage Between SJB C2280C-10, Circuit VPW01 (GN/BU) & LH Front Window Motor C540-2
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280C-10, circuit VPW01 (GN/BU), harness side and LH front window motor C540-2, circuit CPW01 VPW01 (GN/BU), harness side; and between SJB C2280C-10, circuit VPW01 (GN/BU), harness side and RH front window motor C646-2, circuit

VPW01 (GN/BU), harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to I6.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH and RH front window motors. REFER To **Window Motor Initialization**. TEST the system for normal operation.

I6 CHECK CIRCUIT VPW01 (GN/BU) FOR A SHORT TO GROUND

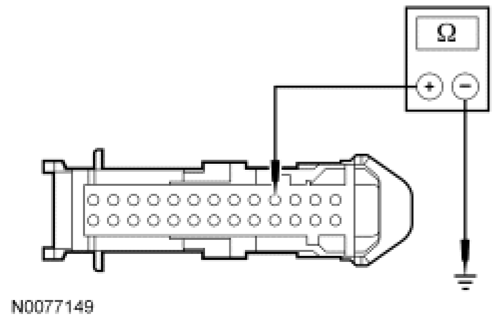

Fig. 57: Measuring Voltage Between SJB C2280C-10, Circuit VPW01 (GN/BU), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280C-10, circuit VPW01 (GN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I9.

  NO : REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH and RH front window motors. REFER to **Window Motor Initialization**. TEST the system for normal operation.

I7 CHECK THE RKE TRANSMITTER OPERATION

- Operate the RKE lock/unlock function using all of the RKE transmitters.
- **Does the RKE lock/unlock function operate correctly with at least one of the RKE transmitters?**

  YES : Go to I8.

  NO : REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article to continue diagnosis of the RKE system. TEST the system for normal operation.

I8 CHECK THE RKE TRANSMITTERS GLOBAL OPEN OPERATION

- Operate the global open function using all of the RKE transmitters.
- **Does the global open function operate correctly with at least one of the RKE transmitters?**

  YES : PROVIDE new RKE transmitters. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. TEST the system for normal operation.

  NO : Go to I9.

I9 CHECK THE SJB FOR CORRECT OPERATION

- Disconnect all of the SJB connectors.

- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all of the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test J: The Defrost System is Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Heated Window for schematic and connector information.

Normal Operation

The heated rear window relay, which is integral to the battery junction box (BJB), receives power from circuit CBP45 (YE). When the heated rear window switch is pressed, the HVAC module grounds circuit CH122 (WH/OG) to activate the heated rear window relay. When the heated rear window relay is activated, power is sent from the heated rear window relay to the heated rear window grid through circuit CRD06 (BN/YE). The heated rear window grid is grounded through circuit GD149 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Heated rear window relay
- HVAC module

PINPOINT TEST J: THE DEFROST SYSTEM IS INOPERATIVE

J1 CHECK CIRCUIT CRD06 (BN/YE) FOR POWER

- Disconnect: Heated Rear Window Grid C402A
- Key in ON position.
- Turn the heated rear window control switch on.

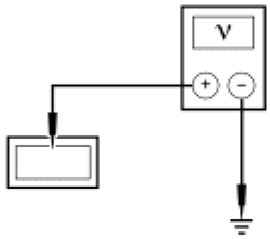

Fig. 58: Measuring Voltage Between Heated Rear Window Grid C402A-1, Circuit CRD06 (BN/YE)
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated rear window grid C402A-1, circuit CRD06 (BN/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to J4.

  NO : INSPECT BJB fuse 39 (40A). If OK, go to J2.

J2 CHECK CIRCUIT CRD06 (BN/YE) FOR AN OPEN

- Key in OFF position.
- Disconnect: Heated Rear Window Relay

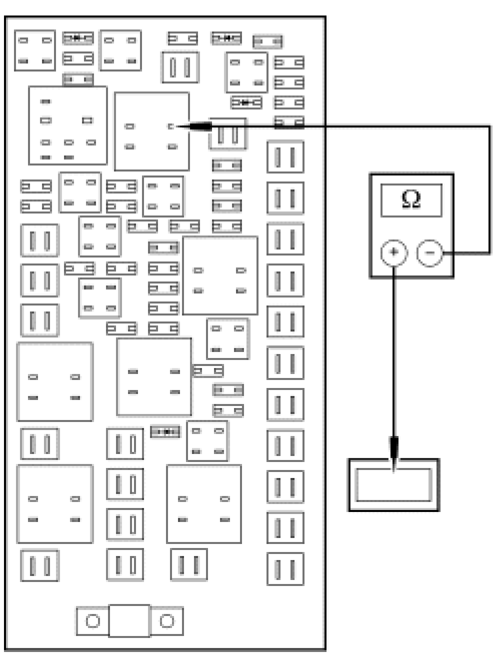

Fig. 59: Measuring Resistance Between Heated Rear Window Grid C402A-1, CRD06 (BN/YE)

Courtesy of FORD MOTOR CO.

- Measure the resistance between heated rear window grid C402A-1, CRD06 (BN/YE), harness side and heated rear window relay pin 87, CRD06 (BN/YE), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to J3.

NO : REPAIR the circuit. TEST the system for normal operation.

J3 CHECK THE BJB

- Key in ON position.

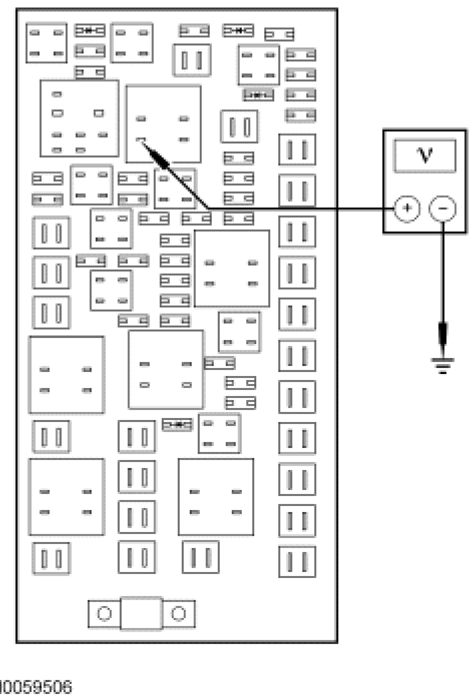

Fig. 60: Measuring Voltage Between Heated Rear Window Relay Pin 30, Circuit SDC02 (RD)
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated rear window relay pin 30, circuit SDC02 (RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to J5.

NO : VERIFY BJB fuse 1 (40A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

J4 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Heated Rear Window Grid C402B

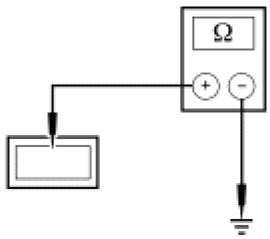

Fig. 61: Measuring Resistance Between C402B-1, Circuit GD149 (BK/GY), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between C402B-1, circuit GD149 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : CARRY OUT the heated rear window grid wire test. REFER to the component tests. REPAIR as necessary. TEST the system for normal operation.

NO : Go to J6.

J5 CHECK CIRCUIT CBP45 (YE) FOR AN OPEN

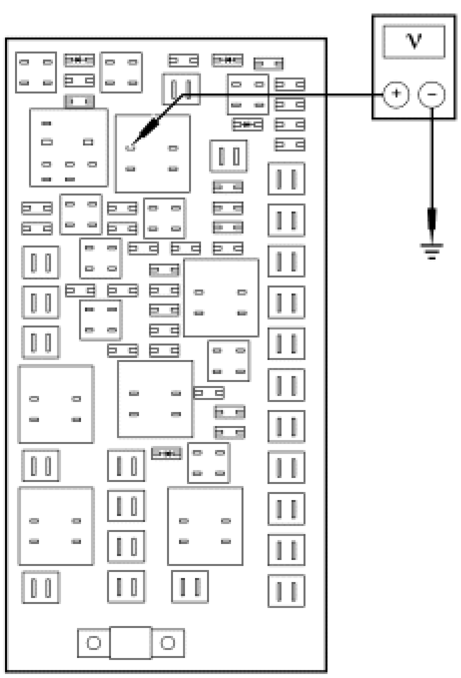

Fig. 62: Measuring Voltage Between Heated Rear Window Relay Pin 85, Circuit CBP45 (YE) & Ground
Courtesy of FORD MOTOR CO.

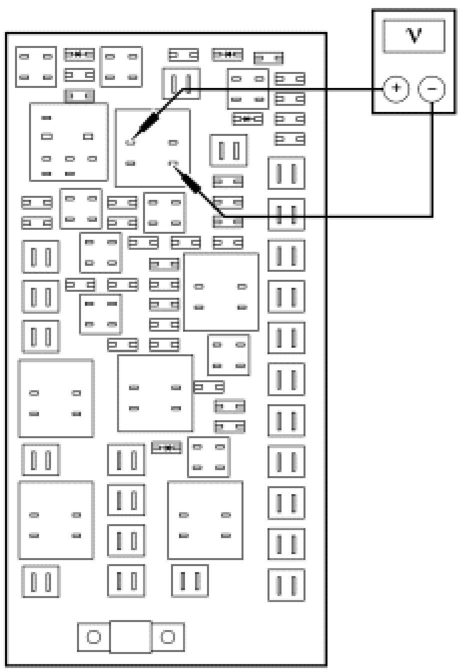
- Measure the voltage between heated rear window relay pin 85, circuit CBP45 (YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to J6.

  NO : REPAIR the circuit. TEST the system for normal operation.

J6 CHECK THE HVAC MODULE OUTPUT

- Key in ON position.
- Turn the heated rear window control switch on.



N0059503

Fig. 63: Measuring Voltage Between Heated Rear Window Relay Pin 85, Circuit CBP45 (YE)
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated rear window relay pin 85, circuit CBP45 (YE), harness side and heated rear window relay pin 86, circuit CH122 (WH/OG).
- **Is the voltage greater than 10 volts?**

  YES : Go to J7.

  NO : Go to J8.

J7 CHECK THE HEATED REAR WINDOW RELAY

- Carry out the Heated Rear Window Relay Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the heated rear window relay pass the component test?**

  YES : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

NO : INSTALL a new heated rear window relay. TEST the system for normal operation.

J8 CHECK CIRCUIT CH122 (WH/OG) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module - Electronic Automatic Temperature Control (EATC) C228B or HVAC module - Electronic Manual Temperature Control (EMTC) C2357A

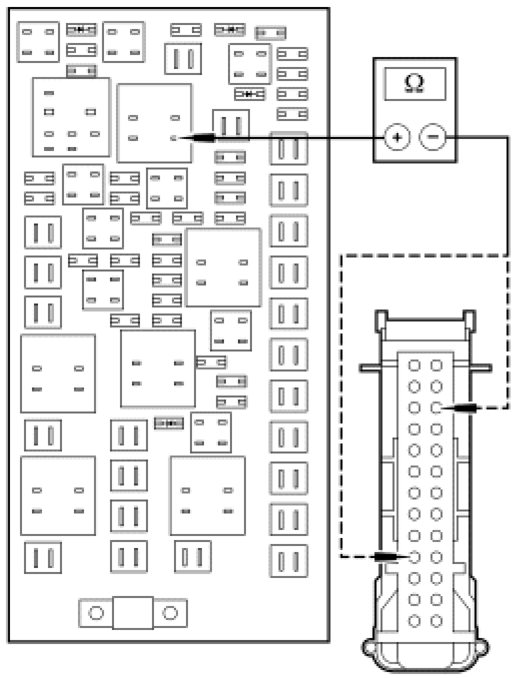


Fig. 64: Measuring Resistance Between Heated Rear Window Relay Socket, Circuit CH122 (WH/OG)
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated rear window relay socket, circuit CH122 (WH/OG), harness side and HVAC module - EATC C228B-23, circuit CH122 (WH/OG), harness side; or HVAC module - EMTC C2357A-3, circuit CH122 (WH/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test K: The Defrost System Will Not Shut Off Automatically

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Heated Window for schematic and connector information.

Normal Operation

The heated rear window relay, which is integral to the battery junction box (BJB), receives power from circuit CBP45 (YE). When the heated rear window switch is pressed, the HVAC module grounds circuit CH122 (WH/OG) to activate the heated rear window relay. When the heated rear window relay is activated, power is sent from the heated rear window relay to the heated rear window grid through circuit CRD06 (BN/YE). The heated rear window grid is grounded through circuit GD149 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated rear window relay
- HVAC module

PINPOINT TEST K: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY

K1 CHECK CIRCUIT CRD06 (BN/YE) FOR SHORT TO VOLTAGE

- Disconnect: Heated Rear Window Relay
- Key in ON position.

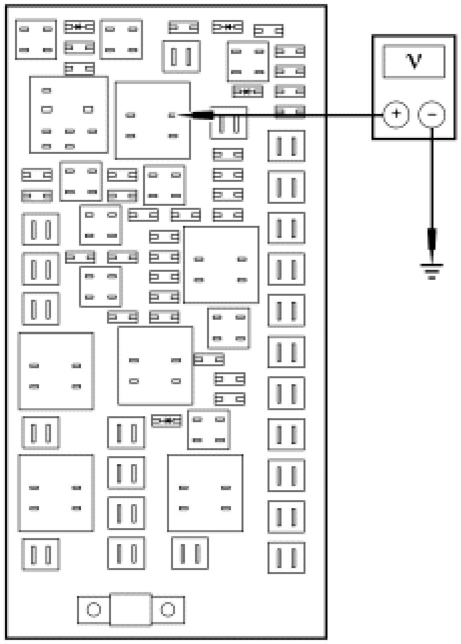

Fig. 65: Measuring Voltage Between Heated Rear Window Relay Pin 87, Circuit CRD06 (BN/YE) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated rear window relay pin 87, circuit CRD06 (BN/YE), harness side and ground.
- **Is any voltage present?**

YES : REPAIR the circuit. TEST the system for normal operation.

NO : Go to K2.

K2 CHECK CIRCUIT CH122 (WH/OG) FOR A SHORT TO GROUND

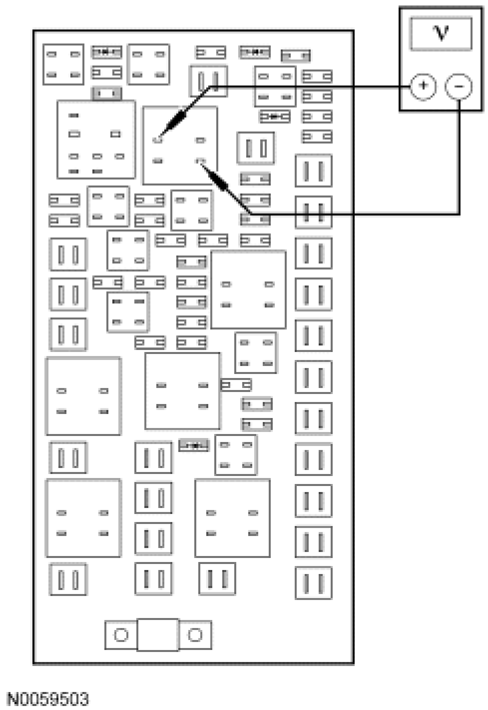

Fig. 66: Measuring Voltage Between Heated Rear Window Relay Pin 85, Circuit CBP45 (YE)
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated rear window relay pin 85, circuit CBP45 (YE), harness side and heated rear window relay pin 86, circuit CH122 (WH/OG), harness side.
- **Is any voltage present?**

YES : Go to K3.

NO : Go to K4.

K3 CHECK THE HVAC MODULE

- Key in OFF position.
- Disconnect: EATC C228B or EMTC C2357A
- Key in ON position.

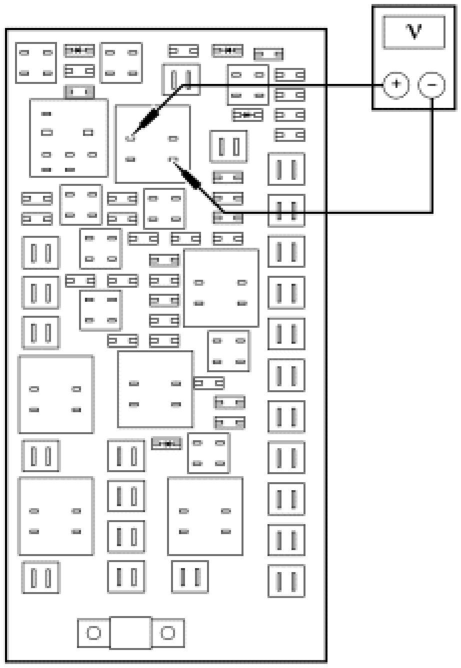

Fig. 67: Measuring Voltage Between Heated Rear Window Relay Pin 85, Circuit CBP45 (YE)
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated rear window relay pin 85, circuit CBP45 (YE), harness side and heated rear window relay pin 86, circuit CH122 (WH/OG), harness side.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

K4 CHECK THE HEATED REAR WINDOW RELAY

- Carry out the Heated Rear Window Relay Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the heated rear window relay pass the component test?**

  YES : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

  NO : INSTALL a new heated rear window relay. TEST the system for normal operation.

Pinpoint Test L: The Delayed Accessory is Inoperative/Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

Normal Operation

The accessory delay relay, which is integral to the smart junction box (SJB), receives power from the battery junction box (BJB) through circuit SDC02 (RD). When the ignition key is turned ON, the SJB activates the accessory delay relay. The accessory delay relay provides power to the LH front window control switch through circuit CBP47 (GN/BU). On MKX, the accessory delay relay also provides power to the RH front window switch and the LH and RH front window motors through circuit CBP41 (BU). The accessory delay relay remains active for 10 minutes after the ignition key is turned OFF or until either front door is opened.

- DTC B1302 Accessory Delay Relay Coil Circuit Failure - Open or short to ground in the accessory delay relay coil circuit.
- DTC B1304 Accessory Delay Relay Coil Circuit Short To Battery - Short to ground on accessory delay relay coil circuit.

This pinpoint test is intended to diagnose the following:

- SJB
- Accessory delay relay
- Door ajar switches

PINPOINT TEST L: THE DELAYED ACCESSORY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

L1 CHECK FOR CORRECT OPERATION OF THE INTERIOR LIGHTS

- Open and close the front doors. Verify the interior lights turn on when the doors are open, and off when the doors are closed.
- **Do the interior lights operate normally?**

  YES : Go to L2.

  NO : REFER to **INTERIOR LIGHTING** article to diagnose the interior lighting and door ajar switches.

L2 CHECK THE ACCESSORY DELAY RELAY

- Carry out the Accessory Delay Relay Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the accessory delay relay pass the component test?**

  YES : Go to L3.

  NO : INSTALL a new accessory delay relay. TEST the system for normal operation.

L3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article for the removal and installation procedure. TEST the system for normal operation.

NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test M: The Delayed Accessory Does Not Turn Off

Refer to appropriate SYSTEM WIRING DIAGRAMS article, Power Windows for schematic and connector information.

Normal Operation

The accessory delay relay, which is integral to the smart junction box (SJB), receives power from the battery junction box (BJB) through circuit SDC02 (RD). When the ignition key is turned ON, the SJB activates the accessory delay relay. The accessory delay relay provides power to the LH front window control switch through circuit CBP47 (GN/BU). On MKX, the accessory delay relay also provides power to the RH front window switch and the LH and RH front window motors through circuit CBP41 (BU). The accessory delay relay remains active for 10 minutes after the ignition key is turned OFF or until either front door is opened.

- DTC B1304 - Accessory delay relay coil circuit short to battery, short to ground on output.

This pinpoint test is intended to diagnose the following:

- Accessory delay relay
- SJB

PINPOINT TEST M: THE DELAYED ACCESSORY DOES NOT TURN OFF

M1 CHECK FOR STUCK/STICKING ACCESSORY DELAY RELAY

- Disconnect: Accessory Delay Relay
- **Are any delayed accessory features still operative?**

  YES : Go to M3.

  NO : Go to M2.

M2 CHECK THE ACCESSORY DELAY RELAY

- Carry out the Accessory Delay Relay Component Test. Refer to appropriate COMPONENT TESTING article.
- **Did the accessory delay relay pass the component test.**

  YES : Go to M4.

  NO : INSTALL a new accessory delay relay. CLEAR all DTCs. TEST the system for normal operation.

M3 CHECK CIRCUIT CBP47 (GN/BU) FOR A SHORT TO POWER

- Key in OFF position.

- Disconnect: SJB C2280D
- Key in ON position.

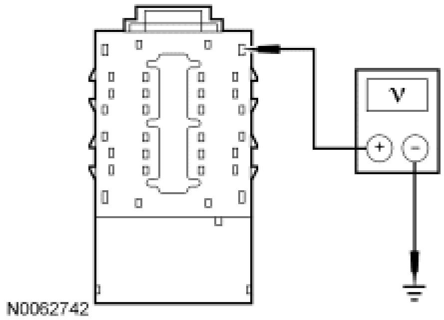

Fig. 68: Measuring Voltage Between SJB C2280D-32, Circuit CBP47 (GN/BU), Harness Side & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280D-32, circuit CBP47 (GN/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR all DTCs. TEST the system for normal operation.

  NO : Go to M4.

M4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all DTCs. TEST the system for normal operation.

Component Test

Grid Wire Test

1. Using a bright lamp in the vehicle, inspect the wire grid from the exterior. A broken grid wire will appear as a brown spot.
2. Run the engine at idle. Set the heated rear window switch to ON. The indicator light should come on.
3. Working in the vehicle with a voltmeter, contact the broad red-brown stripes of the rear glass window positive lead to battery side and the negative lead to ground side. The meter should read 10-13 volts. A

lower voltage reading indicates a loose ground connection.

4. Contact a good ground point with the negative lead of the meter. The voltage reading should not change.
5. With the negative lead of the meter grounded, touch each grid line of the heated rear window glass at its midpoint with the positive lead. A reading of approximately 6 volts indicates the line is good. A reading of 0 volt indicates the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates the circuit is broken between the midpoint of the grid line and ground.
6. Pinpointing the exact position of the break can be accomplished (if the voltmeter reads 0 volt when the midpoint of the grid line is touched with the positive lead of the voltmeter) by moving the positive lead of the voltmeter toward the B+ side of the grid line and touching the grid line until the voltmeter reads 12 volts. If the voltmeter reads 12 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter, simply move the positive lead of the voltmeter toward the ground connection of the grid line and touch the grid line until the voltmeter reads 0 volt.

GENERAL PROCEDURES

WINDOW GRID WIRE REPAIR

Material

Item	Specification
Lacquer Touch-Up Paint (match color to exterior grid wire) PM-19500-XXXXX or PMP-19500-XXXXX	ESR-M2P100-C
Polypropylene Film Fine Line Tape (commercially available)	-
Rear Window Defroster Repair PM-11 (US); CPM-11 (Canada)	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

NOTE: The grid line material is not embedded into the glass but is baked to the glass surface and consequently can be scraped off. An undamaged grid line will have small ridges that project above the surface of the glass and can easily be felt when running a fingernail across them. Grid lines that have been "razor bladed" will feel smooth when a fingernail is dragged across the affected area. Inoperative lines may appear to the eye to be undamaged due to residue remaining on the glass and will require diagnosis with a voltmeter or 12V test lamp. For additional information, refer to Diagnosis and Testing in this service information.

1. Bring the vehicle up to a room temperature of at least 16°C (60°F) or above.

CAUTION: Do not use scrapers, sharp instruments or abrasive window cleaners on the interior surface of the rear window glass as this may cause damage to the grid lines.

2. Clean the entire grid line repair area with window cleaner and 0000 steel wool to remove all dirt, wax, grease, oil or other foreign material.
3. Mark the location of the grid break on the exterior of the rear window glass.

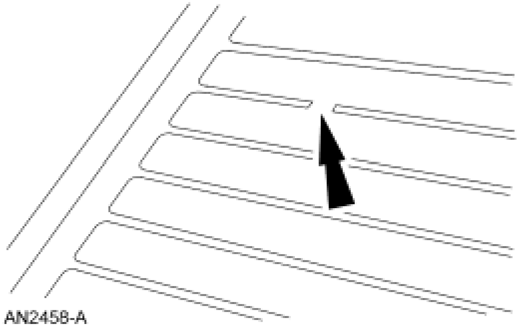

Fig. 69: Locating Grid Break
Courtesy of FORD MOTOR CO.

4. Using a polypropylene film fine line tape, mask the area directly above and below the grid break extending the tape 26 mm (1.02 in) beyond the concern area in both directions. The break area should be at the center of the mask.

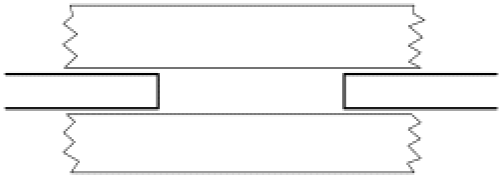

Fig. 70: Masking Grid Break Area
Courtesy of FORD MOTOR CO.

NOTE:	**If the brown layer is not broken or missing, apply only the silver grid repair compound to the break. If both the brown and silver layers of the grid are broken or missing, apply a coating of the lacquer touch up paint across the break in the grid line prior to applying the rear window defroster repair compound. Do not overlap the silver grid line with the paint. Several applications may be necessary to achieve a color match.**

NOTE:	**Allow at least 5 minutes of drying time between applications for the touch up paint or the silver repair coating. Applying fewer coats or not allowing adequate drying time between coats will produce repaired resistance that is greater than OEM resistance, resulting in poor defrost performance and excessive localized heating.**

5. Apply the repair coating to the grid break area in several smooth, continuous strokes. Extend the silver repair coating at least 6.35 mm (0.25 in) on both sides of the break area.

   Apply a minimum of 6 applications of the grid repair compound.

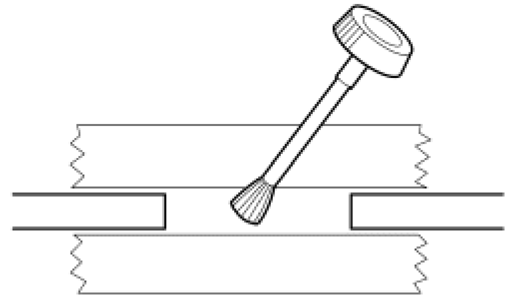

Fig. 71: Applying Repair Coating To Grid Break Area
Courtesy of FORD MOTOR CO.

NOTE: The repair coating air-dries in approximately one minute and can be energized after 5 minutes. Optimum adhesion occurs after approximately 24 hours.

6. Allow the repair area to dry completely and remove the mask.

CAUTION: Be careful not to damage the grid line with the razor blade. If this occurs, additional repair may be necessary.

7. Remove any excess repair compound above or below the grid line with a razor blade.

NOTE: The interior side of the grid lines are not painted, but due to the silver tarnishing will tend to change the grid to a gold or brown color. The repair area will be bright silver and will also tarnish over time to match the rest of the grid.

8. Test the system for normal operation.

LEAD TERMINAL REPAIR

Material

Item	Specification
Terminal Kit - Back Glass 4F1Z-14421-AA	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Bring the vehicle up to room temperature of at least 16°C (60°F) or above.

NOTE: **The new terminal will cover the original terminal location, but it must be placed so that the terminal conductive areas will be placed on a good conductive base.**

2. Clean the bus bar in the area to be repaired with steel wool (000 to 0000 grade), and then with window cleaner to remove all dirt, wax, grease, oil or other foreign material.

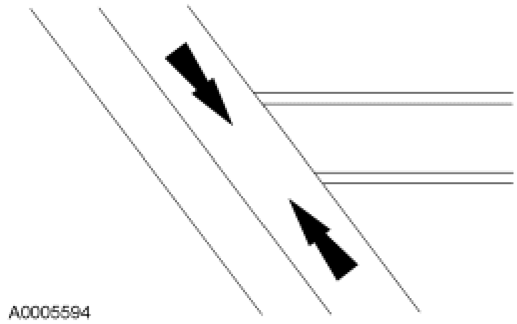

Fig. 72: Identifying Bus Bar Area To Be Repaired
Courtesy of FORD MOTOR CO.

CAUTION: **Do not use any type of flame torch or flame heated soldering gun for this procedure. Use of these tools provide inadequate heat generation at the tip and the exhaust heat can cause damage to plastic trim parts in the area. Use only an electric soldering gun with 100 watts or more of power. Before using the soldering gun, be sure to melt a small amount of rosin core solder to the tip. The solder will assist in achieving better heat transfer from the soldering gun tip to the new terminal.**

NOTE: **Depending on the original terminal location, and whether the terminal is covered by pillar trim, will determine where to locate the new terminal. Some grid line buss-bars may only allow the placement of the terminal above or below the original tab location due to space limitations. For most vehicle applications, the replacement tab location will cover the original tab location, but still allow the replacement tab to attach to the buss-bar on good conductive material.**

3. Place the replacement terminal type A over the original tab location, making sure the conductive areas of the terminal will be on a good conductive area. Do not place the terminal tab foot on the original location, which does not have conductive material.
4. Hold the terminal in place with an item such as a regular lead pencil at a 90 degree angle from the terminal. (Holding at other than a 90 degree angle may allow the terminal to slip when the solder liquefies.)

NOTE: The new terminal has pre-applied solder, flux and temperature-sensitive paint. The paint provides a visual indication when the terminal has reached the correct temperature to melt solder on the terminal. When the correct temperature is achieved, the temperature paint will liquefy and change color.

5. Place the soldering gun tip on the top of the terminal but not on the painted areas of the tab. Energize the soldering gun and watch for the painted area of the terminal to liquefy and change color. The paint should liquefy in approximately 25-45 seconds after heating. As soon as the paint color completely changes on either side of the terminal, de-energize the soldering gun and continue to hold the terminal in place with the soldering gun and pencil for an additional 30 seconds.
6. Remove the soldering gun and pencil from the terminal. The terminal should be allowed to cool for another 2 minutes before the wiring lead is attached to the terminal.
7. Attach the electrical lead connection to this terminal, turn on the heated rear window and verify the operation.

WINDOW MOTOR INITIALIZATION

NOTE: Initialization is required to learn both the full UP and full DOWN positions and the profile of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled. This procedure is only required for MKX (LH and RH front) or Edge (LH front only) window motors.

NOTE: The front window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

NOTE: A new (original factory setting) or de-initialized front window motor will not operate in one-touch up or one-touch-down mode until initialized. If a new front window motor has been installed, proceed to the initialization procedure.

NOTE: If diagnosing a LH or RH front window switch problem, carry out the window initialization procedure before installing a new window switch.

NOTE: All front window components (window glass, window regulator, window motor, seals and glass top run) must be installed and tightened to specification before carrying out the initialization procedure.

NOTE: Excessive bounce-back (window reverses direction with no obstructions present) may indicate that a de-initialization procedure may need to be carried out.

De-Initialization procedure

NOTE: The front window motor must be reset to its original factory settings first, then carry out the following de-initialization procedure.

1. Turn the ignition key ON.
2. Operate the window control switch in one-touch mode and remove power from the window motor **while the window is moving** by one of the following methods:
    1. Disconnect the vehicle battery cable **while the window is moving** .
    2. Disconnect the window motor connector **while the window is moving** .
    3. Remove the LH or RH front window motor fuse **while the window is moving** .
3. This will de-initialize the window motor and reset the window motor to its original factory settings.
4. Carry out the initialization procedure to turn the one-touch-up feature on.

Initialization procedure

WARNING: **Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.**

NOTE: The front window must be in the full OPEN position for this procedure to operate correctly.

NOTE: If the initialization procedure is only partially completed, the front window motor will remain un-initialized and will operate only in proportional up/down and one-touch-down modes.

5. Turn the ignition key ON.
6. Activate and hold the window control switch in the UP position at the second detent until the window glass stalls for 2 seconds into the glass top run and release the switch.
7. Activate and hold the window control switch in the DOWN position at the second detent until the window glass stalls for 2 seconds at the bottom of its travel and release the switch.
8. Test for correct window operation by carrying out the one-touch-up and one-touch-down features.

GLASS RESEAL - WINDSHIELD

Material

Item	Specification
DOW AUTOMOTIVE 2-HOUR CURE	
Dow Urethane Adhesive Betaseal® Express	

	-
SIKA 2-HOUR CURE	
Sika Urethane Adhesive Sika Tack ASAP	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
2. Remove the LH and RH A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Remove the LH and RH sun visors.
4. If equipped, remove the overhead console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
5. Lower the front portion of the headliner and block with a suitable material.
6. Clean the interior and exterior of the windshield glass surface with glass cleaner.
7. Cut the urethane adhesive applicator tip to 6 mm (0.24 in).

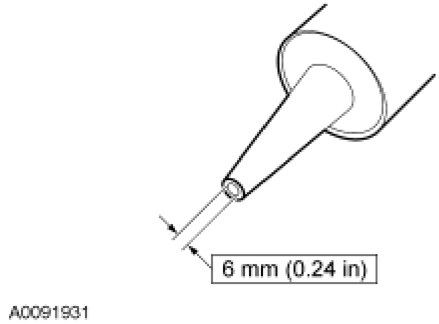

Fig. 73: Identifying Urethane Applicator Tip Specification
Courtesy of FORD MOTOR CO.

NOTE: **Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.**

NOTE: **Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.**

8. Apply urethane adhesive over top of the existing urethane adhesive.
    - Apply the urethane to the top and sides of the windshield from the interior of the vehicle.
    - Apply the urethane to the bottom of the windshield from the exterior of the vehicle.

NOTE: **The urethane adhesive must cure for a minimum of one hour before**

testing for air or water leaks.

9. After the urethane has cured, check the windshield seal for air or water leaks through the urethane bead and add urethane adhesive as necessary.
10. Position the front portion of the headliner.
11. If equipped, install the overhead console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
12. Install the LH and RH sun visors.
13. Install the LH and RH A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
14. Install the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
15. Clean the interior and exterior windshield glass with glass cleaner.

GLASS RESEAL - REAR

Material

Item	Specification
DOW AUTOMOTIVE 2-HOUR CURE	
Dow Urethane Adhesive Betaseal® Express	-
SIKA 2-HOUR CURE	
Sika Urethane Adhesive Sika Tack ASAP	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the upper and lower liftgate trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Clean the interior and exterior of the rear window glass surface with glass cleaner.
3. Cut the urethane adhesive applicator tip to specification.

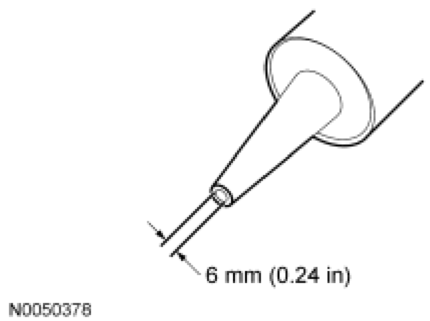

Fig. 74: Cutting Urethane Adhesive Applicator Tip To Specification

Courtesy of FORD MOTOR CO.

NOTE: **Use either a high ratio, electric or battery-operated caulk gun that applies the urethane with less effort and continuous bead.**

NOTE: **Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.**

4. Apply the urethane adhesive over the top of the existing urethane adhesive from the interior of the vehicle.

NOTE: **The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.**

5. After the urethane cures, check the rear glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.
6. Install the upper and lower liftgate trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

REMOVAL AND INSTALLATION

GLASS, FRAMES AND MECHANISMS - EXPLODED VIEW, FRONT DOOR

NOTE: **LH shown, RH similar.**

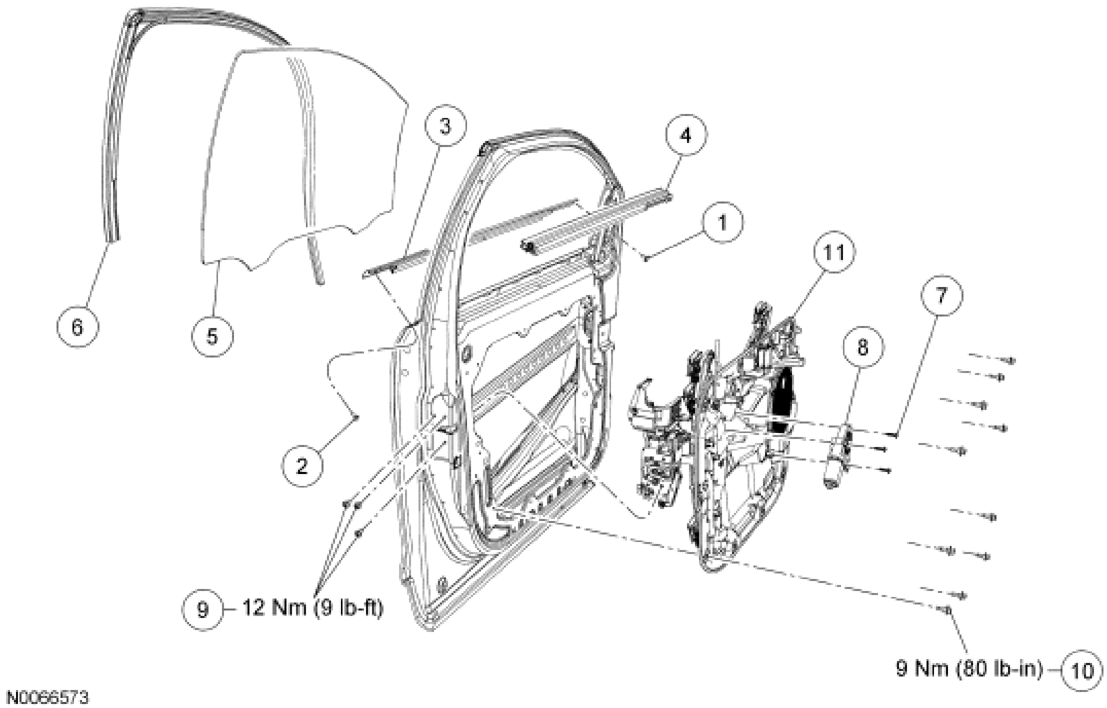

Fig. 75: Exploded View Of Front Door, Glass, Frames & Mechanisms With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W709451	Weatherstrip A-pillar screw
2	W709451	Weatherstrip B-pillar screw
3	5421453 LH/ 5421452 RH	Exterior door window glass molding
4	5421434	Interior door window glass molding
5	5421411 LH/ 5421410 RH	Front door window glass
6	5421597 LH/ 5421597 RH	Door window glass top run
7	166193	Window motor screw (3 required)
8	14A389 LH/ 14553 RH	Window motor
9	N811471	Door latch screws (3 required)
10	W713426	Door module bolt (10 required)
11	013300 LH/ 203A28 RH	Door module

1. For additional information, refer to the appropriate procedures in this service information.

WINDOW GLASS - FRONT DOOR

REMOVAL AND INSTALLATION

NOTE: LH shown, RH similar.

NOTE: The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

1. Remove the front door speaker. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.
2. Remove the 2 access plug hole covers.
3. Reconnect the window control switch.
4. Lower the window until the glass clamp bolts can be accessed through the 2 access holes.
5. Loosen the window glass clamp bolts.
    - To install, tighten to 8 N.m (71 lb-in).

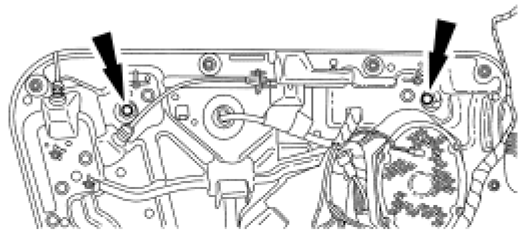

Fig. 76: Locating Window Glass Clamp Bolts
Courtesy of FORD MOTOR CO.

6. Tape the window in position, then lower the window regulator downward until it reaches the stops at the bottom of the regulator tracks.
7. Lift the window glass out of the door.
8. To install, reverse the removal procedure.
    - The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run. For additional information, refer to **Window Motor Initialization**.

WINDOW REGULATOR MOTOR

REMOVAL AND INSTALLATION

NOTE: LH shown, RH similar.

NOTE: Front door window motor removal shown, rear door window motor removal

similar.

NOTE: **The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the window motor electrical connector.

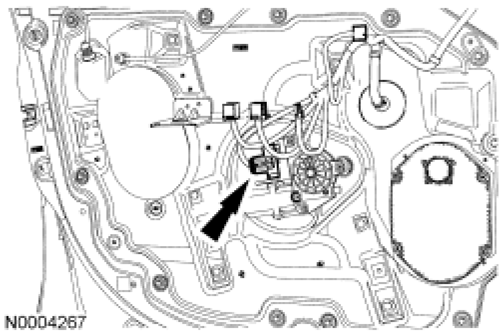

Fig. 77: Locating Window Motor Electrical Connector
Courtesy of FORD MOTOR CO.

3. Secure the glass in position with tape.
4. Remove the 3 window motor screws.

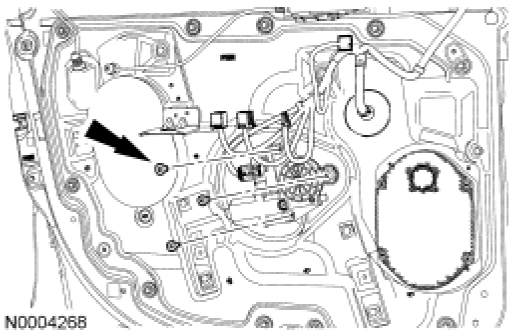

Fig. 78: Locating Window Motor Screws
Courtesy of FORD MOTOR CO.

5. Remove the window motor.
6. To install, reverse the removal procedure.
   - The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new

window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run. For additional information, refer to **Window Motor Initialization**.

WINDOW REGULATOR AND MOTOR - FRONT DOOR

REMOVAL AND INSTALLATION

NOTE: LH shown, RH similar.

NOTE: The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

Window operating/not operating

1. Remove the front door speaker. For additional information, refer to **INFORMATION AND ENTERTAINMENT SYSTEMS** article.

   Window not operating

   NOTE: Cutting the regulator cable should only be done if installing a new window regulator assembly.

   NOTE: Support window glass before cutting the window regulator cable.

2. Cut the window regulator cable.

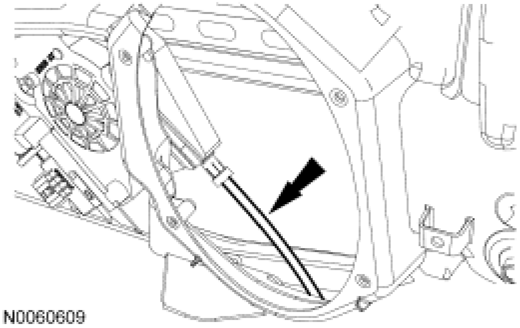

Fig. 79: Identifying Window Regulator Cable
Courtesy of FORD MOTOR CO.

   Window operating

3. Reconnect the window control switch.

Window operating/not operating

4. Remove the access plugs and lower the window until the glass clamp bolts can be accessed through the 2 access holes. Tape the glass in position.

NOTE: If the window regulator cable was cut previously, support the regulator before the glass clamp bolts are loosened.

5. Loosen the glass clamp bolts.
   - To install, tighten to 8 N.m (71 lb-in).

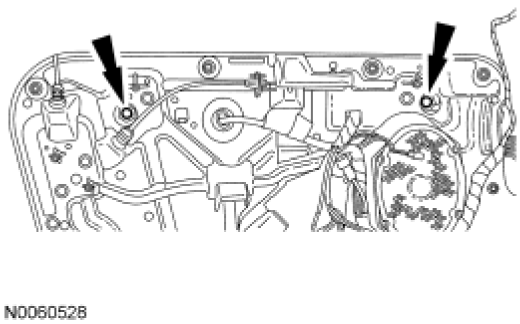

Fig. 80: Locating Window Glass Clamp Bolts
Courtesy of FORD MOTOR CO.

6. Lower the window regulator downward until it reaches the stops at the bottom of the regulator tracks.
7. If equipped, remove trim and disconnect the power mirror electrical connector.
   - Remove the wiring harness pushpins from the door.

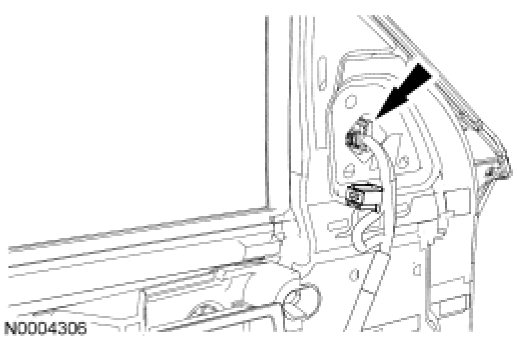

Fig. 81: Locating Power Mirror Electrical Connector
Courtesy of FORD MOTOR CO.

8. Disconnect the electrical connector at the A-pillar.

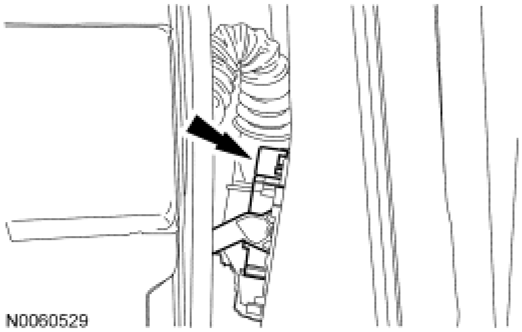

Fig. 82: Locating Electrical Connector At A-Pillar
Courtesy of FORD MOTOR CO.

9. Remove the 2 bolts from the electrical harness grommet to the door.

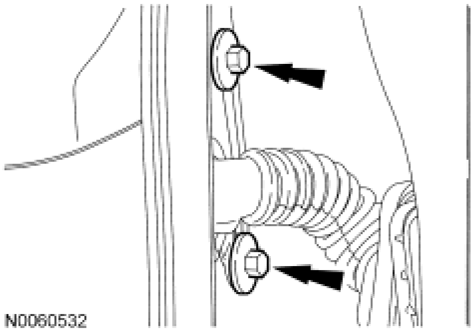

Fig. 83: Locating Electrical Harness Grommet Bolts
Courtesy of FORD MOTOR CO.

10. Using the speaker hole for access, release the clip on the harness from the inside to disconnect the harness from the door.
11. Unclip the weatherstrip and feed through the wiring harness between the weatherstrip and door.
12. Remove the 3 door latch screws.
    - To install, tighten to 12 N.m (9 lb-ft).

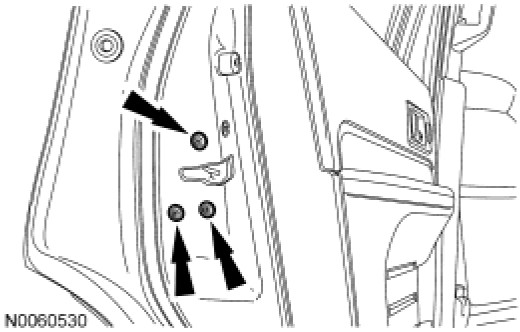

Fig. 84: Locating Door Latch Screws
Courtesy of FORD MOTOR CO.

13. Remove the access plug from the latch side of door and remove the outside door handle reinforcement screw.

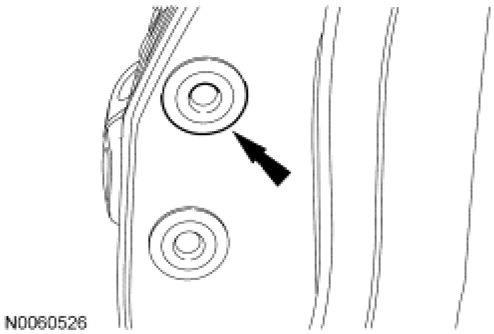

Fig. 85: Locating Access Plug From Latch Side Of Door
Courtesy of FORD MOTOR CO.

14. Remove the outside door handle. For additional information, refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
15. Using a suitable tool, release the retaining tab and remove the front door lock cylinder.
16. Remove the screw.
    - To install, tighten to 8 N.m (71 lb-in).

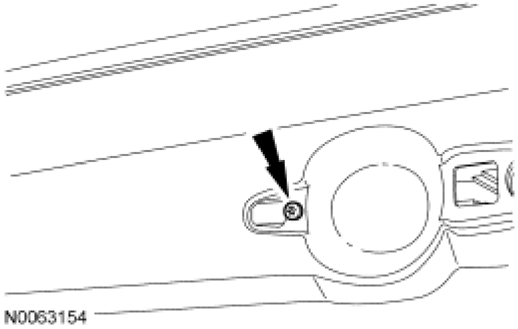

Fig. 86: Identifying Outside Door Handle Screw
Courtesy of FORD MOTOR CO.

17. If equipped, remove the keypad. For additional information, refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
18. Remove the 10 door module bolts and remove the front door module, transfer parts as necessary.
    - To install, tighten to 9 N.m (80 lb-in).

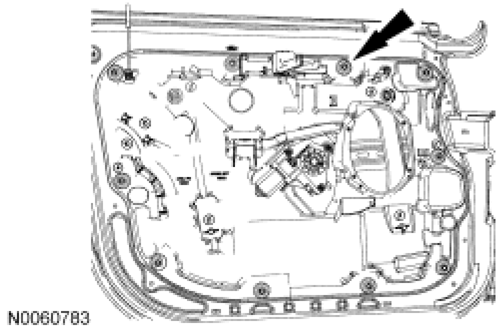

Fig. 87: Locating Door Module Bolts
Courtesy of FORD MOTOR CO.

19. To install, reverse the removal procedure.
    - The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run. For additional information, refer to Window Motor Initialization in this service information.

DOOR GLASS TOP RUN - FRONT

REMOVAL AND INSTALLATION

NOTE: **The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.**

1. Remove the front door window glass. For additional information, refer to **Window Glass - Front Door**.
2. Remove the front door window glass inner weatherstrip.

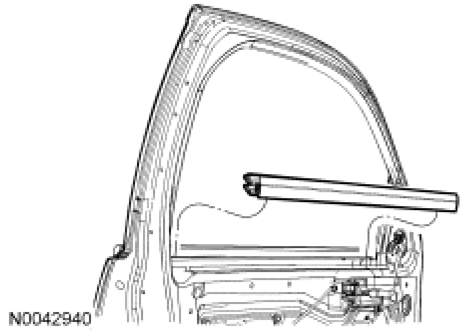

Fig. 88: Identifying Front Door Window Glass Inner Weatherstrip
Courtesy of FORD MOTOR CO.

3. Remove the front door glass top run.

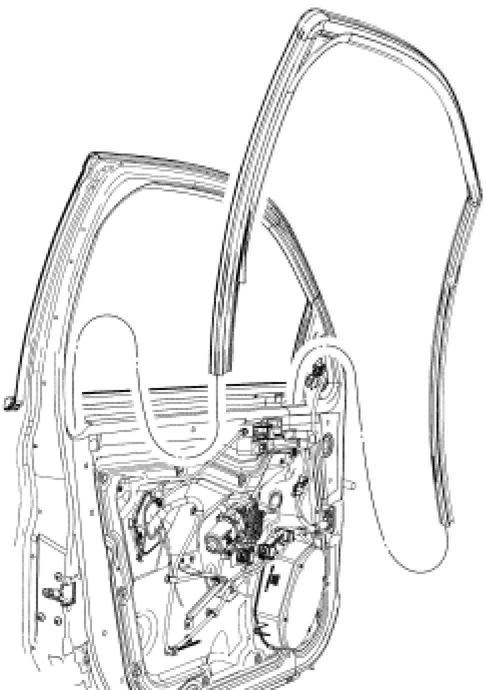

Fig. 89: Identifying Front Door Glass Top Run
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.
    - Make sure the top run is fully seated before reinstalling the front door window glass.
    - The front window motor must be de-initialized, then initialized whenever the LH or RH (MKX) or LH (Edge) front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run. For additional information, refer to **Window Motor Initialization**.

GLASS, FRAMES AND MECHANISMS - EXPLODED VIEW, REAR DOOR

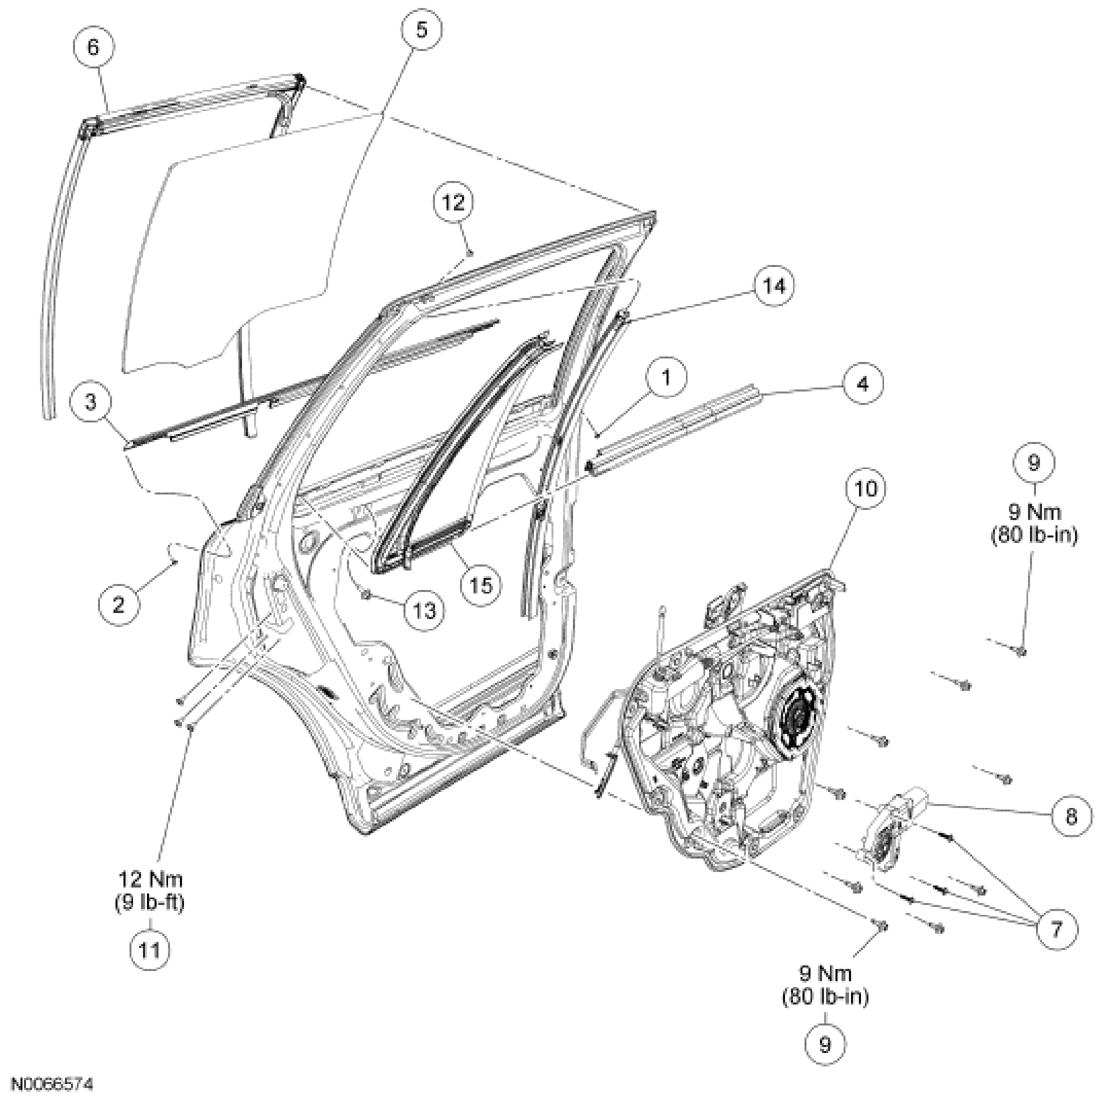

Fig. 90: Exploded View Of Rear Door, Glass, Frames & Mechanisms With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W709451	Rear door glass weatherstrip C-pillar screw
2	W709451	Rear door glass weatherstrip D-pillar
3	5425597 LH/ 5425596 RH	Rear door glass weatherstrip
4	5425860	Interior weatherstrip
5	5425713 LH/ 5425712 RH	Rear door window glass
6	5425767 LH/ 5425766 RH	Rear door glass top run
7	166193	Window motor screws
8	7423394 LH/ 7423395 RH	Window regulator motor
9	W713426	Door module bolts (9 required)

10	5424995 LH/ 5424994 RH	Rear door module
11	W505821	Door latch screw (3 required)
12	-	Upper fixed window screw
13	-	Lower fixed window screw
14	7825797 LH/ 7825796 RH	Center guide bracket
15	7829905	Fixed glass assembly

1. For additional information, refer to the appropriate procedures in this service information.

WINDOW GLASS - REAR DOOR

REMOVAL AND INSTALLATION

NOTE: LH shown, RH similar.

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Reconnect the window control switch.
3. Lower the window until the glass clamp bolt can be accessed through the access hole, then loosen the glass clamp bolt.
   - To install, tighten to 9 Nm (80 lb-in).

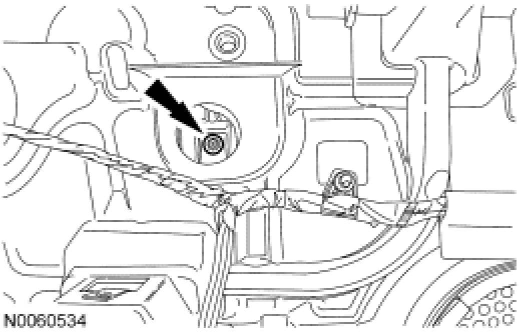

Fig. 91: Locating Glass Clamp Bolt
Courtesy of FORD MOTOR CO.

4. Tape the window in position, then lower the window regulator downward until it reaches the stops at the bottom of the regulator tracks.
5. Remove the rear door glass interior weatherstrip.

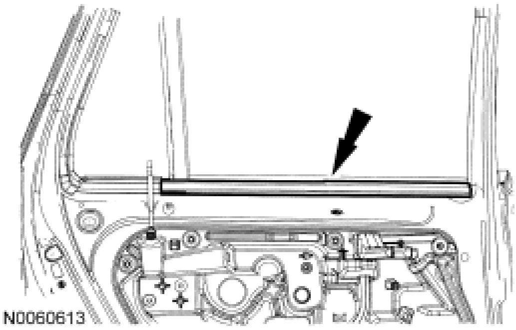

Fig. 92: Identifying Rear Door Glass Interior Weatherstrip
Courtesy of FORD MOTOR CO.

6. Remove the rear door window glass lower fixed window screw.

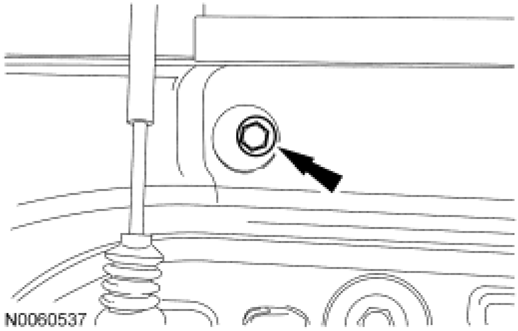

Fig. 93: Identifying Rear Door Window Glass Lower Fixed Window Screw
Courtesy of FORD MOTOR CO.

7. Remove the rear door window glass upper fixed window screw.

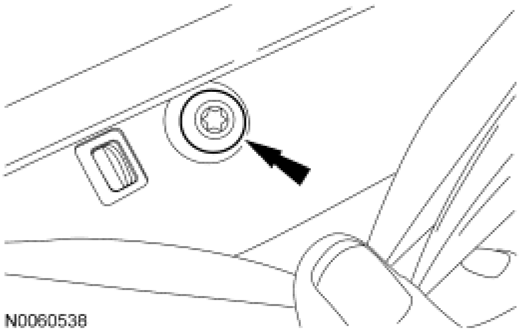

Fig. 94: Identifying Rear Door Window Glass Upper Fixed Window Screw
Courtesy of FORD MOTOR CO.

8. Position the top run aside as shown.

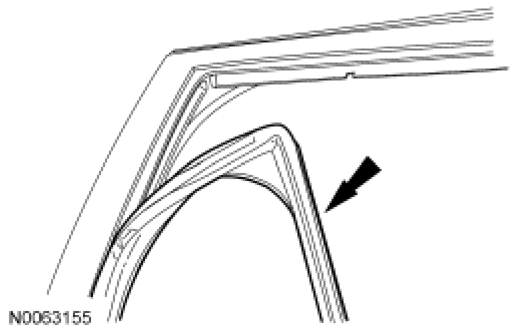

Fig. 95: Positioning Top Run Aside
Courtesy of FORD MOTOR CO.

NOTE: Protect the painted surfaces of the vehicle.

9. With the aid of an assistant (holding the glass in a lowered position to allow clearance), carefully pull the top of the bracket forward slightly, then upward and completely out of the door towards the inside of the vehicle.

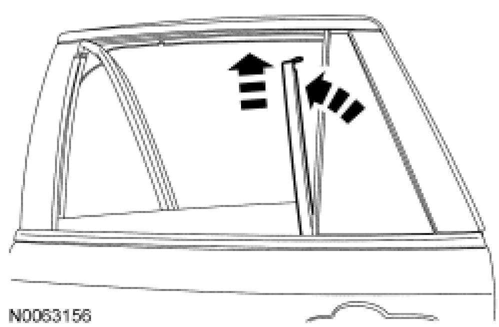

Fig. 96: Pulling Top Of Bracket Forward Slightly, Then Upward & Completely Out Of Door Towards Inside Of Vehicle
Courtesy of FORD MOTOR CO.

10. Slide the glass down, tilt and bring the glass back through the top of the window opening and remove the glass from the door.
11. To install, reverse the removal procedure.

WINDOW REGULATOR AND MOTOR - REAR DOOR

REMOVAL AND INSTALLATION

NOTE: LH shown, RH similar.

Window operating/not operating

1. Remove the rear door speaker. For additional information, refer to **INFORMATION AND**

ENTERTAINMENT SYSTEMS article.

Window not operating

NOTE: Cutting the regulator cable should only be done if installing a new window regulator assembly.

NOTE: Support window glass before cutting the window regulator cable.

2. Cut the window regulator cable.

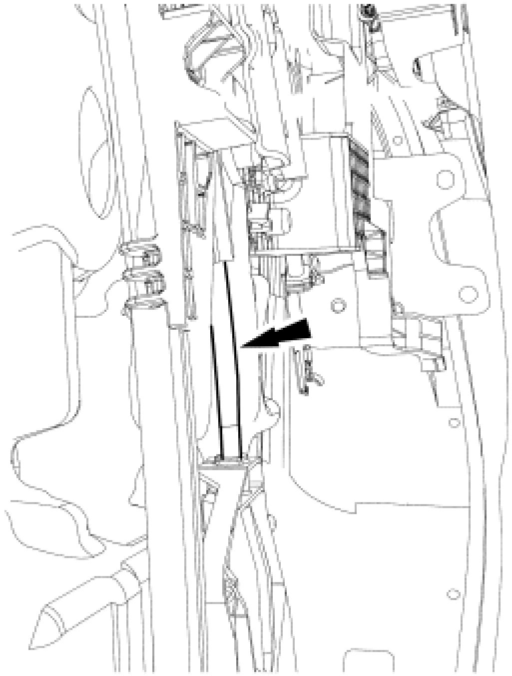

Fig. 97: Identifying Window Regulator Cable
Courtesy of FORD MOTOR CO.

Window operating

3. Reconnect the window control switch.

Window operating/not operating

4. Remove the access plug and lower the window until the glass clamp bolt can be accessed through the access hole. Tape the glass in position.

NOTE: If the window regulator cable was cut previously, support the regulator before the glass clamp bolt is loosened.

5. Loosen the glass clamp bolt.
   - To install, tighten to 9 Nm (80 lb-in).

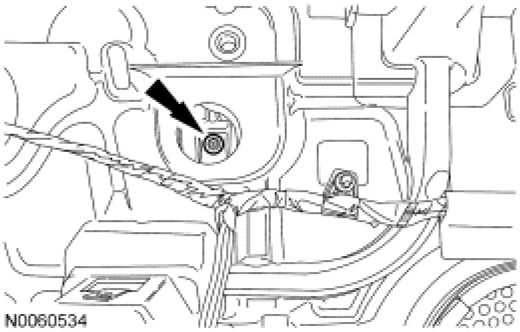

Fig. 98: Locating Glass Clamp Bolt
Courtesy of FORD MOTOR CO.

6. Lower the window regulator downward until it reaches the stops at the bottom of the regulator tracks.
7. Disconnect the electrical connector at the B-pillar.

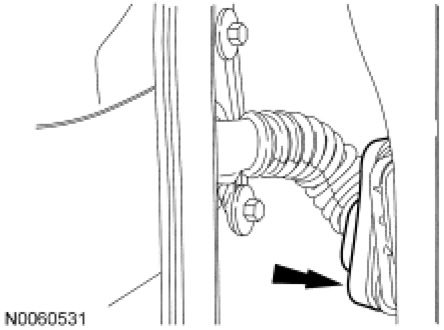

Fig. 99: Locating Electrical Connector At B-Pillar
Courtesy of FORD MOTOR CO.

8. Remove the 2 bolts from the electrical harness grommet to the door.

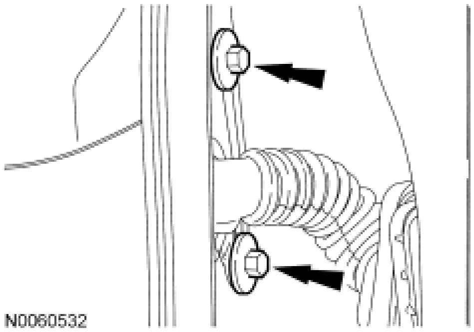

Fig. 100: Locating Electrical Harness Grommet Bolts
Courtesy of FORD MOTOR CO.

9. Using the speaker hole for access, release the clip on the harness from the inside to disconnect the harness from the door.
10. Unclip the weatherstrip and feed through the wiring harness between the weatherstrip and door.
11. Remove the 3 door latch screws.
    - To install, tighten to 12 Nm (9 lb-ft).

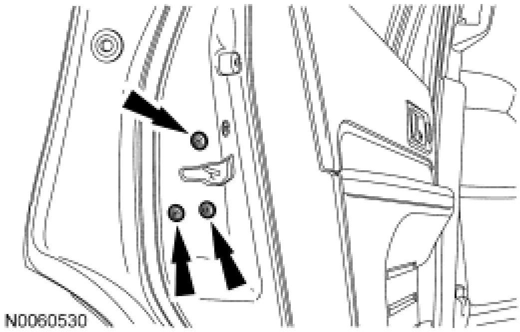

Fig. 101: Locating Door Latch Screws
Courtesy of FORD MOTOR CO.

12. Remove the access plug from the latch side of the door and remove the outside door handle reinforcement screw.

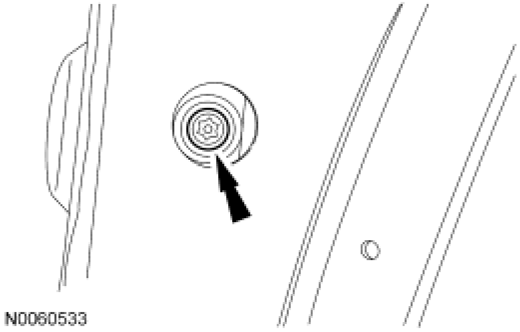

Fig. 102: Identifying Access Plug From Latch Side Of The Door
Courtesy of FORD MOTOR CO.

13. Remove the outside door handle. For additional information, refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
14. Remove the screw.
    - To install, tighten to 8 Nm (71 lb-in).

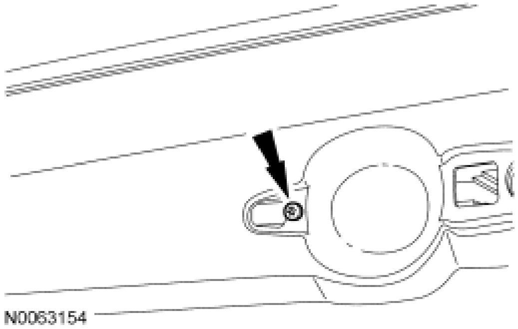

Fig. 103: Identifying Outside Door Handle Screw
Courtesy of FORD MOTOR CO.

15. If equipped, remove the door keypad. For additional information, refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
16. Remove the 9 door module bolts and remove the rear door module, transfer parts as necessary.
    - To install, tighten to 9 Nm (80 lb-in).

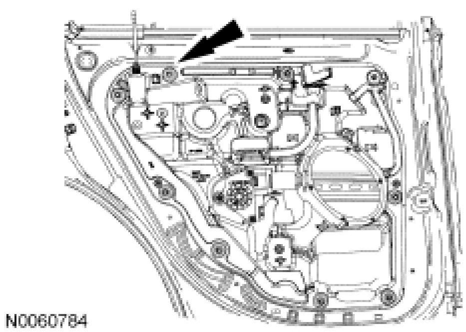

Fig. 104: Locating Door Module Bolts
Courtesy of FORD MOTOR CO.

17. To install, reverse the removal procedure.

DOOR GLASS RUN AND BRACKET - REAR

REMOVAL AND INSTALLATION

NOTE: The bracket is removed with the rear door glass.

1. Remove the rear door glass. For additional information, refer to **Window Glass - Rear Door**.
2. Remove the rear door speaker.
3. Remove the rear door glass top run.
4. To install, reverse the removal procedure.

WINDOW GLASS - REAR DOOR, FIXED

REMOVAL AND INSTALLATION

1. Remove the rear door window glass. For additional information, refer to **Window Glass - Rear Door**.
2. Remove the rear door fixed window glass from the door.
3. To install, reverse removal procedure.

WINDOW CONTROL SWITCH

REMOVAL AND INSTALLATION

Edge only

1. Pull the switch bezel straight up to unclip it from the door trim panel.

   MKX only

   NOTE: LH front shown, all others similar.

2. Pull up on the front edge of the switch bezel and pull forward to unhook it from the door trim panel.

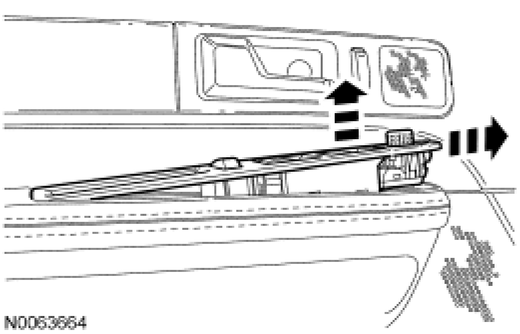

Fig. 105: Pulling Up On Front Edge Of Switch Bezel & Pulling Forward To Unhook It From Door Trim Panel
Courtesy of FORD MOTOR CO.

All vehicles

3. Disconnect the electrical connector(s).
4. Unclip the window control switch from the switch bezel.
5. To install, reverse the removal procedure.

Item	Part Number	Description
1	29711 LH/ 29710 RH	Rear quarter window glass

REMOVAL

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.**

1. Remove the C-pillar, D-pillar and rear quarter trim panels, For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

NOTE: **Lubricate the existing urethane adhesive with water to aid the special tool while cutting.**

2. From inside the vehicle, using the special tool, cut the glass starting at the upper C-pillar and work down, across the D-pillar, then across the bottom.
3. Remove the rear quarter window glass.

4. Using a soft brush or vacuum, remove any dirt or foreign material from the pinch weld.

INSTALLATION

NOTE: For additional material guidelines, refer to the manufacturer's installation information.

1. Dry fit the rear quarter window glass to the existing urethane adhesive bead on the body pinch weld.
2. For a uniform fit, use the 2 alignment pins on the rear quarter window glass to align the rear quarter window glass in the opening.
3. Remove the rear quarter window glass.

WARNING: Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: Avoid scratching the pinch weld. For minor scratches or exposed metal on the pinch weld, see the manufacturer's recommendations.

4. Using an appropriate tool, trim the urethane adhesive leaving a 1 mm (0.03 in) to 2 mm (0.07 in) base of original equipment urethane on the pinch weld.
5. If installing the original rear quarter window glass, remove the excess urethane adhesive.
6. Clean the inside of the rear quarter window glass surface with glass cleaner.

NOTE: Be sure to use the same brand urethane and cure-rate products for adhesive and primer. Do not mix different brands of urethane and primer. For additional information, refer to the Material Chart in this procedure.

NOTE: Sika uses the same black primer for the glass and pinch weld area.

7. If installing a new rear quarter window glass, apply urethane glass primer according to the manufacturer's instructions. Allow at least 6 minutes to dry.
8. Cut the urethane adhesive applicator tip to specification.

NOTE: Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and continuous bead.

9. Apply urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld. Make sure that all gaps in the urethane are smoothed into one continuous bead starting and ending at the bottom of the rear quarter window glass opening near the center.

WARNING: Do not drive vehicle until the urethane seal has cured. Follow

urethane manufacturer's curing directions. Inadequate or incorrect curing of the urethane seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

NOTE: **Before the urethane has set, partially lower the windows to prevent the glass from being pushed out of position when a door is closed.**

10. After the urethane has cured, check the rear quarter window glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.
11. Install the C-pillar, D-pillar and rear quarter trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

REMOVAL

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.**

1. Remove the liftgate window wiper arm and motor. For additional information, refer to **WIPERS AND WASHERS** article.
2. Remove the liftgate spoiler. For additional information, refer to **EXTERIOR TRIM AND ORNAMENTATION** article.
3. Remove the liftgate trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
4. Disconnect the 2 liftgate window defrost electrical connectors.

NOTE: Lubricate the existing urethane adhesive with water to aid the special tool while cutting.

5. Using the special tool, place the flat side of the knife against the liftgate window glass. Start cutting the adhesive away from the liftgate window glass at the top and work toward the corners.
6. Using the special tool, distance the liftgate window glass from the body.

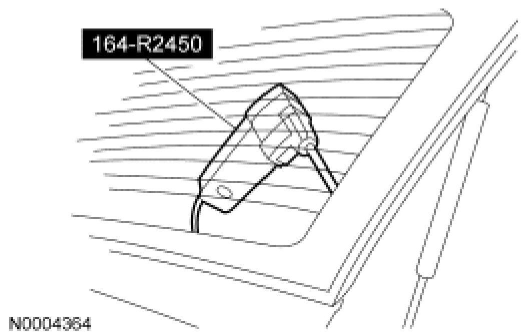

Fig. 108: Distance The Liftgate Window Glass From Body Using Special Tool (164-R2450)
Courtesy of FORD MOTOR CO.

7. Using the special tool, cut the remaining urethane adhesive and remove the liftgate window glass.

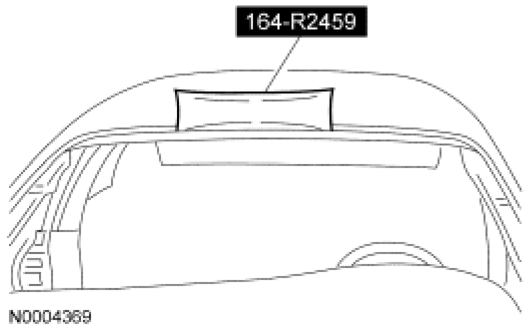

Fig. 109: Distancing Windshield Glass From The Body
Courtesy of FORD MOTOR CO.

8. Using a soft brush or vacuum, remove any dirt or foreign material from the pinch weld.

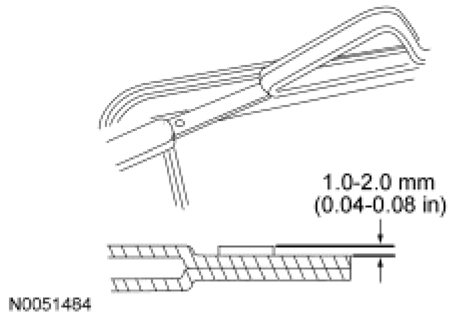

Fig. 110: Measuring Urethane With Appropriate Tool
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: For additional material guidelines, refer to the manufacturer's installation information.

1. Dry fit the liftgate window glass to the existing urethane adhesive bead on the body pinch weld.
2. For a uniform fit, use the 2 liftgate window glass alignment pins to align the liftgate window glass in the opening.
3. Remove the liftgate window glass.

WARNING: Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: Avoid scratching the pinch weld. For minor scratches or exposed metal on the pinch weld, see the manufacturer's recommendations.

4. Using an appropriate tool, trim the urethane adhesive leaving a 1 mm (0.03 in) to 2 mm (0.07 in) base of original equipment urethane on the pinch weld.
5. If installing the original liftgate window glass, remove the excess urethane adhesive.
6. Clean the inside of the liftgate window glass surface with glass cleaner.

NOTE: Be sure to use the same brand and cure-rate products for adhesive and primer. Do not mix different brands of urethane and primer. For additional information, refer to the Material Chart in this procedure.

NOTE: Sika uses the same black primer for the glass and pinch weld area.

7. If installing a new liftgate window glass, apply urethane glass primer according to the manufacturer's instructions.

8. Cut the urethane adhesive applicator tip to specification.

NOTE: Use either a high ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.

9. Apply urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld. Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead starting and ending at the bottom of the liftgate window glass opening near the center.

NOTE: Before the urethane has set, partially lower the windows to prevent the glass from being pushed out of position when a door is closed.

10. Install the liftgate window glass on the vehicle using the alignment pins.

WARNING: **Do not drive vehicle until the urethane seal has cured. Follow urethane manufacturer's curing directions. Inadequate or incorrect curing of the urethane seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

11. After the urethane has cured, check the liftgate window glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.
12. Connect the 2 liftgate window defrost electrical connectors.
13. Install the liftgate trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
14. Install the liftgate spoiler. For additional information, refer to **EXTERIOR TRIM AND ORNAMENTATION** article.
15. Install the liftgate window wiper arm and motor. For additional information, refer to **WIPERS AND WASHERS** article.

REMOVAL

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.**

1. Remove the A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the sun visors.
3. Remove the interior mirror. For additional information, refer to **REAR VIEW MIRRORS** article.
4. Partially lower the front portion of the headliner near the windshield header and block with suitable material. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
5. Remove the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.

NOTE: Lubricate the existing urethane adhesive with water to aid the special tool while cutting.

NOTE: Removing the windshield glass requires more than one technician.

6. Using the special tool, cut the urethane adhesive from the windshield glass starting at the top center and working toward the bottom corners.

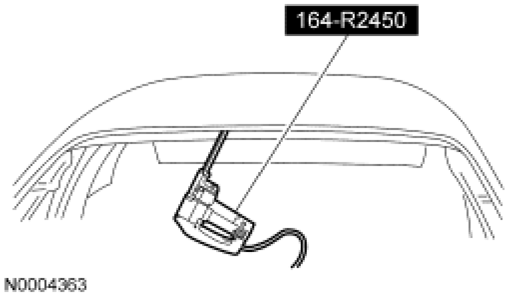

Fig. 112: Cutting Urethane Adhesive From Glass
Courtesy of FORD MOTOR CO.

7. Using the special tool, distance the windshield glass from the body.

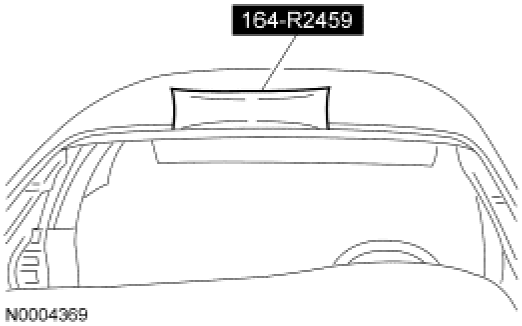

Fig. 113: Distancing Windshield Glass From The Body
Courtesy of FORD MOTOR CO.

8. Using the Pneumatic Knife with offset blade , cut the remaining urethane adhesive and remove the windshield glass.
9. Using a soft brush or vacuum, remove any dirt or foreign material from the pinch weld.

INSTALLATION

NOTE: For additional material guidelines, refer to the manufacturer's installation information.

1. Dry fit the windshield glass to the existing urethane adhesive bead on the body pinch weld. Align the

windshield glass in the opening for a uniform fit.

2. For a uniform fit, use the 2 alignment pins on windshield glass to align the windshield glass in the pin holes on the top pinch weld.
3. Use a non-permanent pencil to make alignment marks on the windshield glass at the setting blocks and the body to aid in the installation alignment of the windshield glass.
4. Remove the windshield glass.

WARNING: **Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

NOTE: Avoid scratching the pinch weld. For minor scratches or exposed metal on the pinch weld, see the manufacturer's recommendations.

5. Using an appropriate tool, trim the urethane adhesive leaving a 1-2 mm (0.04-0.08 in) base of original equipment urethane on the pinchweld.

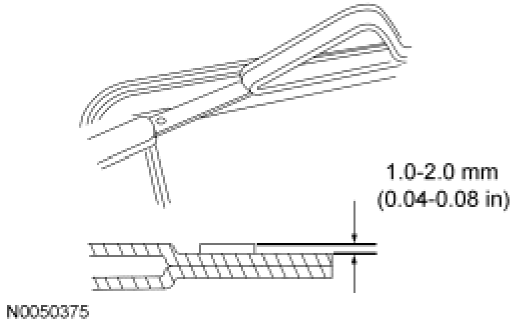

Fig. 114: Trimming Remaining Urethane Adhesive To Specification
Courtesy of FORD MOTOR CO.

6. If installing the original windshield glass, remove the excess urethane adhesive.
7. Clean the inside of the windshield glass surface with glass cleaner.

NOTE: Be sure to use the same brand urethane and cure-rate products for adhesive and primer. Do not mix different brands of urethane and primer. For additional information, refer to the Material Chart in this procedure.

NOTE: Sika uses the same black primer for the glass and pinch weld area.

8. If installing a new windshield glass, apply urethane glass primer according to manufacturer's instructions.
9. Cut the urethane adhesive applicator tip to specification.

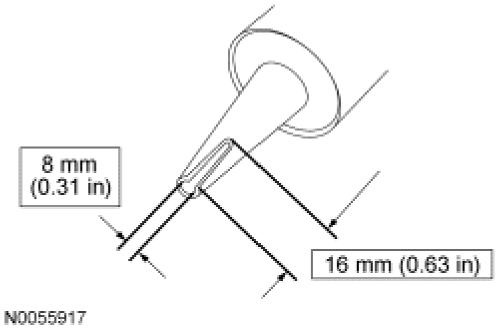

Fig. 115: Cutting Urethane Adhesive Applicator Tip (With Specifications)
Courtesy of FORD MOTOR CO.

NOTE: **Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.**

10. Apply urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld. Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead starting and ending at the bottom of the windshield near the center.

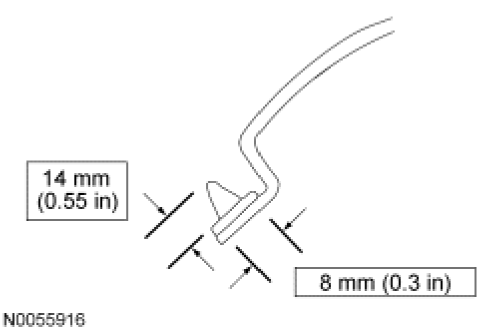

Fig. 116: Identifying Adhesive Application (With Specifications)
Courtesy of FORD MOTOR CO.

11. Install the windshield glass on the vehicle, aligning it with the markings made previously.

WARNING: **Do not drive vehicle until the urethane seal has cured. Follow urethane manufacturer's curing directions. Inadequate or incorrect curing of the urethane seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

12. After the urethane has cured, check the windshield glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.
13. Install the cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
14. Install the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

15. Install the interior mirror. For additional information, refer to **REAR VIEW MIRRORS** article.
16. Install the sun visors.
17. Install the A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

2008 ACCESSORIES & BODY, CAB

Wipers And Washers - Edge & MKX

SPECIFICATIONS

Front wiper pivot arm nuts	30	22	-
Rear wiper motor screws	11	8	-
Rear wiper pivot arm nut	12	9	-
Washer reservoir filler neck bolt	7	-	62
Washer reservoir nuts	7	-	62
Windshield wiper mounting arm and pivot shaft assembly bolts	7	-	62

DESCRIPTION AND OPERATION

WIPERS AND WASHERS

The wiper and washer system consists of the following:

- Rear window wiper blade
- Rear window wiper pivot arm
- Rear window wiper motor
- Smart junction box (SJB)
- Washer pump
- Washer reservoir
- Windshield wiper blades
- Windshield wiper mounting arm and pivot shaft
- Windshield wiper motor
- Windshield wiper pivot arms

- Windshield wiper/wash switch (part of the multi-function switch)

NOTE: The SJB may also be identified as the generic electronic module (GEM).

If equipped with automatic headlamps, the SJB will illuminate the exterior lamps, including the parking lamps, when the front wipers are on for more than 10 seconds and the headlamp control is in the AUTOLAMP position. When the wipers are turned off, the exterior lamps will remain on for 30 seconds before turning off.

Windshield Wiper/Wash Switch - The windshield wiper/washer switch is an integral component of the steering column multi-function switch. Refer to **STEERING COLUMN SWITCHES** article.

Windshield Washer Courtesy Wipe - When the front windshield washer system is activated, the wipers will cycle 3 times with washer fluid followed by one final courtesy wipe a few seconds later to clear any remaining fluid that is dripping down from the top of the windshield.

DIAGNOSTIC TESTS

WIPERS AND WASHERS

SPECIAL TOOLS

Illustration	Tool Name	Tool Number
	73III Automotive Meter	105-R00057 or equivalent
	Flex Probe Kit	105-R025B or equivalent
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	-

Principles of Operation

The wiper motors receive inputs from the following:

- Multi-function switch
- PCM
- Smart junction box (SJB)
- Battery junction box (BJB)

The following components are integrated in the wiper motors:

- Windshield wiper motor module
- Run/park relay
- High/low speed relay
- Run/park sense (Hall-effect)
- Washer pump relay

High-Speed Windshield Wipers

When the multi-function switch is set to the high-speed position, it supplies ground to the integral high/low speed relay coil and the integral run/park relay coil, which causes the windshield wiper motor to operate at high speed. During high-speed operation only, both the integral high/low-speed relay coil ground and the integral run/park relay coil ground are controlled directly by the multi-function switch. This differs from low speed or intermittent operation when the integral run/park relay coil is controlled by the microprocessor. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position and the internal Hall-effect sensor senses the motor magnet. The output to the integral run/park relay deactivates the relay and disconnects the voltage to the motor.

Since the integral high/low relay coil and the integral run/park relay coil are both controlled by a hard wired circuit to the multi-function switch, the windshield wipers will still operate in high speed mode if the internal windshield wiper module fails, but will not automatically park when the multi-function switch is turned to the OFF position.

Low-Speed Windshield Wipers

When the multi-function switch is set to the low-speed position, it supplies ground to the internal windshield wiper motor module low-speed inputs and the windshield wiper motor operates at low speed. During low-speed operation, the integral run/park relay is activated by the microprocessor and supplies 12 volts to the low-speed brush of the windshield wiper motor. The integral run/park relay coil ground is controlled by the internal windshield wiper motor module based on inputs received from the multi-function switch. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position and the internal Hall-effect sensor senses the motor magnet. The output to the integral run/park relay deactivates the relay and disconnects the voltage to the motor.

Since the integral run/park relay is controlled by the internal windshield wiper motor microprocessor, the wipers will only operate in high-speed mode if the internal windshield wiper motor module fails, and will not automatically park when the multi-function switch is turned to the OFF position. This is due to the integral run/park and integral high/low relay coils being directly hard-wired to the switch in high speed. The diode prevents current flow through the high/low relay coil so the relay remains in the normally closed low-speed position.

Intermittent Speed Windshield Wipers

When the multi-function switch is set to the intermittent position(s), it supplies ground to the windshield wiper motor module inputs and the windshield wiper motor operates in intermittent mode. During intermittent operation, the windshield wiper motor activates the integral run/park relay coil which sends voltage through the integral high/low relay. The integral high/low relay remains deactivated, supplying the voltage to the low-speed brush of the windshield wiper motor. The windshield motor continues to operate until the internal Hall-effect sensor senses the magnet (PARK position) and deactivates the integral run/park relay, which disconnects voltage from the wiper motor. The windshield wipers remain parked until the windshield wiper motor module completes a time-out and then repeats the intermittent windshield wiper cycle.

Speed Dependent Windshield Wipers

The speed-dependent feature increases the frequency of wiping to compensate for the extra moisture that accumulates on the windshield as the vehicle speed increases, when the multi-function switch is in any intermittent setting except the INT 1 position. The windshield wiper module receives vehicle speed sensor (VSS) information directly from the PCM. As vehicle speed increases, the speed-dependent feature gradually shortens the delay between wipes.

The speed-dependent feature is easiest to verify in the INT 2 position. With the vehicle at a standstill and the multi-function switch in the INT 2 position, the wipers should operate once every 10 seconds. As vehicle speed increases, the delay between wipes will gradually shorten. For example, by the time the vehicle reaches 100 km/h (62 mph), the wipers should operate every 5 seconds. Speed dependent operation is similar in INT 3, INT 4 and INT 5 modes.

Wiper Activated Headlamps (If Equipped with Autolamp System)

The headlamps will automatically turn on within 10 seconds when the headlamp switch is in the automatic position and the windshield wipers are activated in any mode except in the MIST or WASH positions. When the windshield wipers are deactivated, the headlamps will automatically turn off within 30 seconds.

Intermittent Rear Window Wiper System

When the multi-function switch is set to the rear intermittent position(s), it supplies ground to the rear window wiper motor module input and the wiper operates in intermittent mode. During intermittent operation, the rear wiper motor momentarily activates the rear window wiper relay (internal), which sends voltage to the motor. Once the rear window wiper motor is activated, the internal run/park switch connects voltage to the motor, keeping it operating. When the rear window wiper motor returns to the PARK position, the run/park switch disconnects voltage internally from the wiper motor input, reconnecting it to the rear window wiper motor module output. The rear window wiper remains parked until the rear window wiper motor module completes a time-out and then repeats the cycle.

Washer System

The front and rear washer system share the same washer reservoir and washer pump. The front and rear wiper motor modules each contain an integral washer relay that supplies a ground path for the washer pump whenever they are inactive. When windshield wash is selected on the multi-function switch, the windshield wiper motor module activates its integral washer relay which sends voltage to the washer pump to direct fluid to the windshield. When rear wash is selected on the multi-function switch, the rear wiper motor module activates its integral washer relay to send voltage to the washer pump to direct fluid to the rear window. If the front or rear washer button is applied for greater than 10 seconds, the associated wiper motor will default the washer system to off and the washer system will be inoperative for that ignition cycle.

Software Safe Mode

The windshield wiper motor defaults to software safe mode when the run/park sensor does not sense the Hall-effect magnet inside the wiper motor. This can be caused by an obstruction of the windshield wipers, a binding linkage or loss of the Hall sensor signal. The motor continues to operate in a high/low-speed condition, and when turned off, the wipers immediately park on the windshield. If necessary, the wipers can be turned on and off until they return to the PARK position.

WINDSHIELD WIPER CIRCUIT FUNCTION TABLE

Multi-Function Switch Position	Circuit CRW07 (GY/BN)	Circuit CRW08 (VT/OG)	Circuit CRW19 (BU/OG)	Circuit CRW18 (VT/WH)	Circuit CRW17 (GN/VT)

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Windshield washer hoses
• Wiper linkage
• Multi-function switch
	• Battery junction box (BJB) fuse:
	  ○ 58 (30A)
	• Smart junction box (SJB) fuses:
	  ○ 19 (25A)
	  ○ 43 (10A)
	  ○ 45 (5A)
	• Circuitry
	• Windshield wiper motor
	• Rear wiper motor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: The windshield wiper motor does not communicate on the network. The windshield wiper motor provides wiper on/off status directly to the smart junction box (SJB).

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the SJB.
7. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.

- If the network test passes, retrieve and record the continuous memory DTCs.

NOTE: The SJB may also be identified as the generic electronic module (GEM).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB and PCM.
9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) DTC Chart or the **INTRODUCTION - GASOLINE ENGINES** article for PCM related DTCs. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **SYMPTOM CHART - WIPERS AND WASHERS** table.

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B2008	Wipers On Signal Circuit Short to Ground	Go to **Pinpoint Test I** .

For a complete list of SJB DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.

• The wipers are inoperative - rear window	• Fuse(s) • Multi-function switch • Circuitry • Rear window wiper motor	• Go to **Pinpoint Test B** .
• The wipers stay on continuously - windshield	• Windshield wiper motor • Multi-function switch • Circuitry	• Go to **Pinpoint Test C** .
• The wipers stay on continuously - rear window	• Rear window wiper motor • Multi-function switch • Circuitry	• Go to **Pinpoint Test D** .
• The high/low wiper speeds do not operate correctly - windshield	• Multi-function switch • Circuitry • Windshield wiper motor	• Go to **Pinpoint Test E** .

• The intermittent wiper speed does not operate correctly - windshield	• Circuitry • Multi-function switch • Windshield wiper motor	• Go to **Pinpoint Test F** .
• The intermittent wiper speed does not operate correctly - rear window	• Multi-function switch • Circuitry • Rear window wiper motor	• Go to **Pinpoint Test G** .
• The wash and wipe function is inoperative - rear window	• Multi-function switch • Rear window wiper motor	• If the washer pump is inoperative, go to **Pinpoint Test H** . • If the washer pump is operative, INSTALL a new rear wiper motor. TEST the system for normal operation.
• The wash and wipe function is inoperative - windshield	• Windshield wiper motor	• If the washer pump is inoperative, go to **Pinpoint Test H** . • If the washer pump is operative, INSTALL a new windshield wiper motor. TEST the system for normal operation.
• The washer pump is inoperative	• Circuitry • Washer pump motor • Multi-function switch • Windshield wiper motor • Rear window wiper motor	• Go to **Pinpoint Test H** .
• The washer pump activates for 10 seconds whenever the ignition is turned on - front	• Circuitry	• CARRY OUT the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
-	• Multi-function switch	• CHECK circuit CRW17 (GY/BN) for a short to ground.
-	• Windshield wiper motor	• INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**.
• The washer pump activates for 10 seconds whenever the ignition is turned on - rear	• Circuitry	• CARRY OUT the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
-		

-	• Multi-function switch • Rear wiper motor	• CHECK circuit CRW20 (GY/YE) for a short to ground. • INSTALL a new rear wiper motor. REFER to **Wiper Motor - Rear Window**.
• The speed dependent interval mode does not operate correctly	• Circuitry • Windshield wiper motor • PCM	• Go to **Pinpoint Test I** .
• The wipers will not park at the correct position	• Linkage • Windshield wiper motor	• If the wipers immediately stop on the windshield as soon as they are turned off, INSTALL a new windshield wiper motor.
-	• Pivot arm adjustment	• ADJUST pivot arm, REFER to **Wiper Blade and Pivot Arm Adjustment - Windshield**.
• The wipers will not park at the correct position - rear window	• Pivot arm adjustment	• ADJUST pivot arm, REFER to **Wiper Blade and Pivot Arm Adjustment - Rear Window**.
• The headlamps do not illuminate when the wipers are on	• Circuitry • Windshield wiper motor • Smart junction box (SJB)	• Go to **Pinpoint Test J** .

Pinpoint Tests

Pinpoint Test A: The Wipers are Inoperative - Windshield

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the front windshield wiper motor receives power through circuits SBB58 (YE/RD) and CBP45 (YE). The front windshield wiper motor is grounded through circuit GD120 (BK/GN). The front windshield wiper motor receives open and ground inputs from the multi-function switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate speeds. The multi-function switch receives ground through circuit GD116 (BK/VT).

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Multi-function switch
- Windshield wiper motor

PINPOINT TEST A: THE WIPERS ARE INOPERATIVE - WINDSHIELD

A1 CHECK CIRCUITS SBB58 (YE/RD) AND CBP45 (YE) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Windshield Wiper Motor C1552
- Key in ON position.

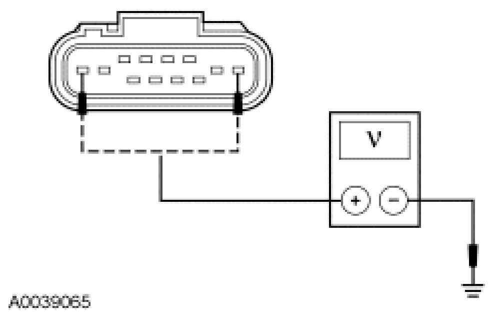

Fig. 1: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between windshield wiper motor C1552-5, circuit SBB58 (YE/RD), harness side and ground; and between windshield wiper motor C1552-8, circuit CBP45 (YE), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY that battery junction box (BJB) fuse 58 (30A) and smart junction box (SJB) fuse 45 (5A) are OK. If OK, REPAIR the circuit(s) in question. TEST the system for normal operation.

A2 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN

- Key in OFF position.

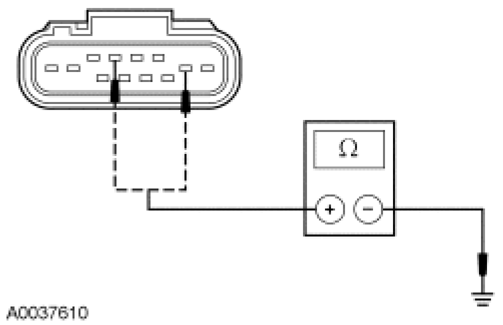

Fig. 2: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper motor C1552-6, circuit GD120 (BK/GN), harness side and ground; and between windshield wiper motor C1552-3, circuit GD120 (BK/GN), harness side and ground.
- **Are the resistances less than 5 ohms?**

  YES : Go to A3.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

A3 CHECK THE MULTI-FUNCTION SWITCH

- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to A4.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

A4 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

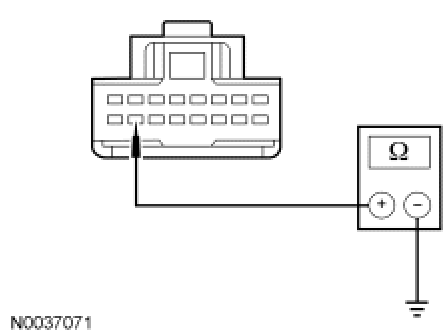

Fig. 3: Measuring Resistance Between Multi-Function Switch C202-15, Circuit GD116 (BK/VT) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between multi-function switch C202-15, circuit GD116 (BK/VT), harness side and ground.

- **Is the resistance less than 5 ohms?**

  YES : Go to A5.

  NO : REPAIR the circuit. TEST the system for normal operation.

A5 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS

- Measure the resistance at the windshield wiper motor electrical connector between the circuits shown in the table.

Windshield Wiper Motor C1552	Windshield Wiper Motor C1552
Pin 10, circuit CRW19 (BU/OG)	Pin 11, circuit CRW18 (VT/WH)
-	Pin 1, circuit CRW08 (VT/OG)
-	Pin 9, circuit CRW17 (GN/VT)
Pin 11, circuit CRW18 (VT/WH)	Pin 1, circuit CRW08 (VT/OG)
-	Pin 9, circuit CRW17 (GN/VT)
Pin 1, circuit CRW08 (VT/OG)	Pin 9, circuit CRW17 (GN/VT)

- **Is the resistance greater than 10,000 ohms for all measurements?**

  YES : Go to A6.

  NO : REPAIR the circuit. TEST the system for normal operation.

A6 CHECK FOR CORRECT WINDSHIELD WIPER MOTOR OPERATION

- Disconnect all windshield wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the windshield wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test B: The Wipers are Inoperative - Rear Window

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the rear window wiper motor receives power through circuits SBB19 (BU/RD) and CBP43 (GY). The rear window wiper motor is grounded through circuit GD149 (BK/GY). The rear window wiper motor receives open and ground inputs from the multi-function switch through circuits CRW20 (GY/YE) and CRW21 (YE/VT) to activate the wiper to the appropriate speeds. The multi-function switch supplies a ground input to the rear wiper motor on CRW21 (YE/VT) when INT 1 is selected. The multi-function switch supplies ground to the rear wiper motor on CRW21 (YE/VT) and CRW20 (GY/YE) when INT 2 is selected.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Multi-function switch
- Rear window wiper motor

PINPOINT TEST B: THE WIPERS ARE INOPERATIVE - REAR WINDOW

B1 CHECK CIRCUITS SBB19 (BU/RD) AND CBP43 (GY) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Rear Window Wiper Motor C4218
- Key in ON position.

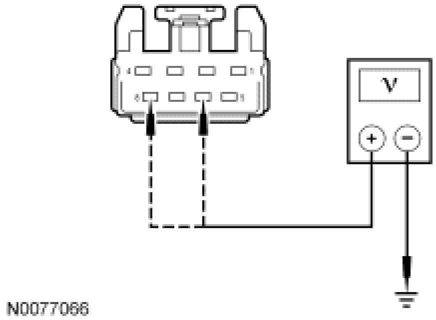

Fig. 4: Measuring Voltage Between Rear Window Wiper Motor Circuits, Harness Side And Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between rear window wiper motor C4218-6, circuit SBP19 (BU/RD), harness side and ground; and between rear window wiper motor C4218-8, circuit CBP43 (GY), harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to B2.

  NO : VERIFY smart junction box (SJB) fuses 19 (25A) and 43 (10A) are OK. If OK, REPAIR the circuit(s) in question. TEST the system for normal operation.

B2 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN

- Key in OFF position.

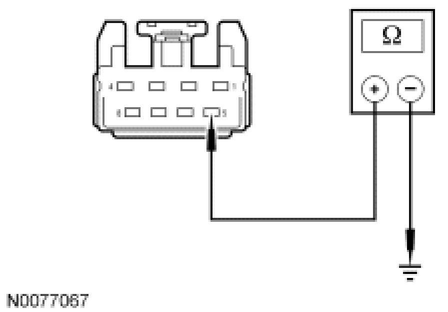

Fig. 5: Measuring Resistance Between Rear Window Wiper C4218-5, Circuit GD149 (BK/GY), Harness Side And Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between rear window wiper C4218-5, circuit GD149 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to B3.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

B3 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to B4.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

B4 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

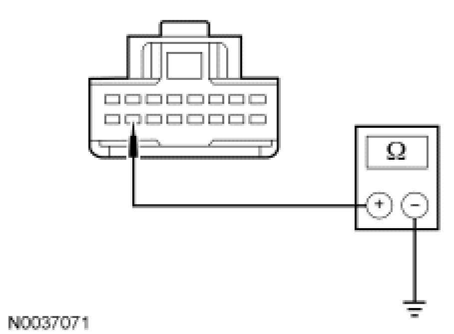

Fig. 6: Measuring Resistance Between Multi-Function Switch C202-15, Circuit GD116 (BK/VT) & Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance between multi-function switch C202-15, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to B5.

  NO : REPAIR the circuit. TEST the system for normal operation.

B5 CHECK CIRCUIT CRW21 (YE/VT) FOR AN OPEN

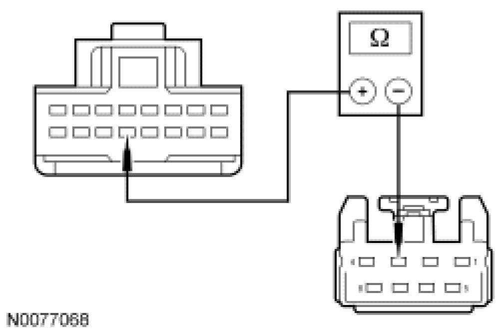

Fig. 7: Measuring Resistance Between Multi-Function Switch C202-13, Circuit CRW21 (YE/VT), Harness Side & Rear Window Wiper C4218-3, Circuit CRW21 (YE/VT), Harness Side
Courtesy of FORD MOTOR CO.

- Measure the resistance between multi-function switch C202-13, circuit CRW21 (YE/VT), harness side and rear window wiper C4218-3, circuit CRW21 (YE/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B6.

  NO : REPAIR the circuit. TEST the system for normal operation.

B6 CHECK FOR CORRECT WIPER MOTOR OPERATION

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new rear window wiper motor. REFER to **Wiper Motor - Rear Window**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test C: The Wipers Stay on Continuously - Windshield

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the windshield wiper motor receives open and ground inputs from the multi-function switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate speeds.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Windshield wiper motor
- Multi-function switch

PINPOINT TEST C: THE WIPERS STAY ON CONTINUOUSLY - WINDSHIELD

C1 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to C2.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

C2 CHECK CIRCUITS CRW19 (BU/OG), CRW18 (VT/WH), CRW08 (VT/OG) OR CRW17 (GN/VT) FOR A SHORT TO GROUND

- Disconnect: Windshield Wiper Motor C1552

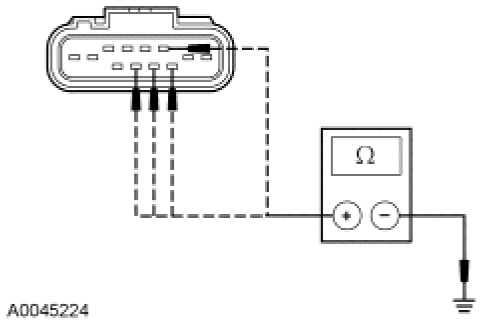

Fig. 8: Checking Circuits For Short To Ground
Courtesy of FORD MOTOR CO.

- Using the following table, measure the resistance between windshield wiper motor C1552 harness side and ground:

Windshield Wiper Motor C1552	Ground
C1552-10, circuit CRW19 (BU/OG)	ground
C1552-11, circuit CRW18 (VT/WH)	ground
C1552-1, circuit CRW08 (VT/OG)	ground
C1552-9, circuit CRW17 (GN/VT)	ground

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to C3.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

C3 CHECK FOR CORRECT WIPER MOTOR OPERATION

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test D: The Wipers Stay on Continuously - Rear Window

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the rear window wiper motor receives open and ground inputs from the multi-function switch through circuits CRW20 (GY/YE) and CRW21 (YE/VT) to activate the wiper to the appropriate speeds. The multi-function switch supplies a ground input to the rear wiper motor on CRW21 (YE/VT) when INT 1 is selected. The multi-function switch supplies ground to the rear wiper motor on CRW21 (YE/VT) and CRW20 (GY/YE) when INT 2 is selected.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Rear window wiper motor

- Multi-function switch

PINPOINT TEST D: THE WIPERS STAY ON CONTINUOUSLY - REAR WINDOW

D1 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to D2.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

D2 CHECK CIRCUITS CRW20 (GY/YE) AND CRW21 (YE/VT) FOR A SHORT TO GROUND

- Disconnect: Rear Window Wiper Motor C4218

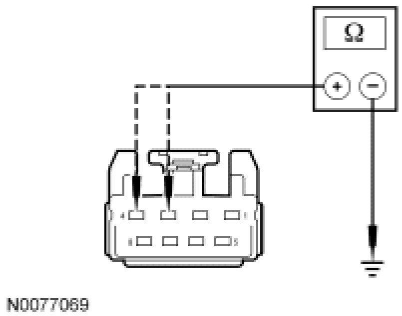

Fig. 9: Measuring Resistance Between Rear Window Wiper Motor Circuits, Harness Side And Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between rear window wiper motor C4218-4, circuit CRW20 (GY/YE), harness side and ground; and between rear window wiper motor C4218-3, circuit CRW21 (YE/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D3.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

D3 CHECK FOR CORRECT WIPER MOTOR OPERATION

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new rear window wiper motor. REFER to **Wiper Motor - Rear Window**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test E: The High/Low Wiper Speeds Do Not Operate Correctly - Windshield

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the windshield wiper motor receives open and ground inputs from the multi-function switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate speeds.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Windshield wiper motor
- Multi-function switch

PINPOINT TEST E: THE HIGH/LOW WIPER SPEEDS DO NOT OPERATE CORRECTLY - WINDSHIELD

E1 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to E2.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

E2 CHECK CIRCUITS CRW19 (BU/OG), CRW08 (VT/OG) AND CRW17 (GN/VT) FOR AN OPEN

- Disconnect: Windshield Wiper Motor C1552

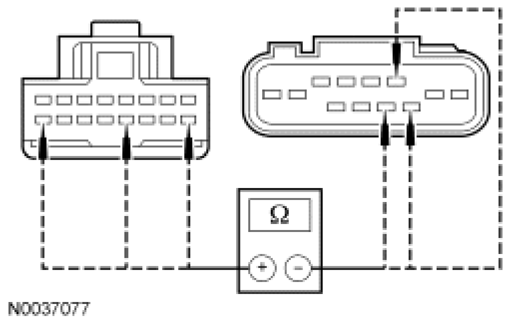

Fig. 10: Measuring Resistance Between Multi-Function Switch C202 Harness Side And Windshield Wiper Motor C1552 Harness Side Circuits
Courtesy of FORD MOTOR CO.

- Using the following table, measure the resistance between multi-function switch C202 harness side and windshield wiper motor C1552 harness side:

Multi-function Switch C202	Windshield Wiper Motor C1552
C202-16, circuit CRW19 (BU/OG)	C1552-10, circuit CRW19 (BU/OG)
C202-9, circuit CRW08 (VT/OG)	C1552-1, circuit CRW08 (VT/OG)
C202-12, circuit CRW17 (GN/VT)	C1552-9, circuit CRW17 (GN/VT)

- **Is the resistance less than 5 ohms?**

  YES : Go to E3.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

E3 CHECK CIRCUITS CRW19 (BU/OG), CRW08 (VT/OG) OR CRW17 (GN/VT) FOR A SHORT TO GROUND

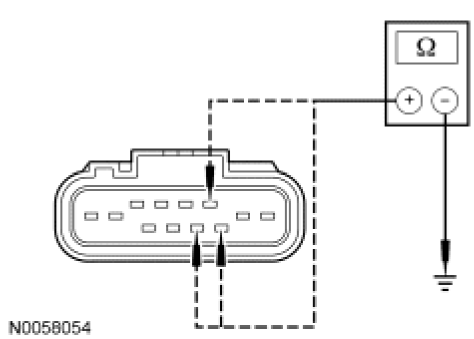

Fig. 11: Checking Circuits For Short To Ground
Courtesy of FORD MOTOR CO.

- Using the following table, measure the resistance between windshield wiper motor C1552 harness side and ground:

Windshield Wiper Motor C1552	Ground
C1552-10, circuit CRW19 (BU/OG)	ground
C1552-1, circuit CRW08 (VT/OG)	ground
C1552-9, circuit CRW17 (GN/VT)	ground

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E4.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

E4 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS

- Measure the resistance at the windshield wiper motor electrical connector between the circuits shown in the table.

Windshield Wiper Motor C1552	Windshield Wiper Motor C1552
Pin 10, circuit CRW19 (BU/OG)	Pin 11, circuit CRW18 (VT/WH)
-	Pin 1, circuit CRW08 (VT/OG)
-	Pin 9, circuit CRW17 (GN/VT)
Pin 11, circuit CRW18 (VT/WH)	Pin 1, circuit CRW08 (VT/OG)
-	Pin 9, circuit CRW17 (GN/VT)
Pin 1, circuit CRW08 (VT/OG)	Pin 9, circuit CRW17 (GN/VT)

- **Is the resistance greater than 10,000 ohms for all measurements?**

  YES : Go to E5.

  NO : REPAIR the circuit. TEST the system for normal operation.

E5 CHECK FOR CORRECT WIPER MOTOR OPERATION

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: The Intermittent Wiper Speed Does Not Operate Correctly - Windshield

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the windshield wiper motor receives open and ground inputs from the multi-function switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate speeds.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Windshield wiper motor
- Multi-function switch

PINPOINT TEST F: THE INTERMITTENT WIPER SPEED DOES NOT OPERATE CORRECTLY - WINDSHIELD

F1 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to F2.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

F2 CHECK CIRCUIT CRW19 (BU/OG), CRW18 (VT/WH) OR CRW17 (GN/VT) FOR AN OPEN

- Disconnect: Windshield Wiper Motor C1552

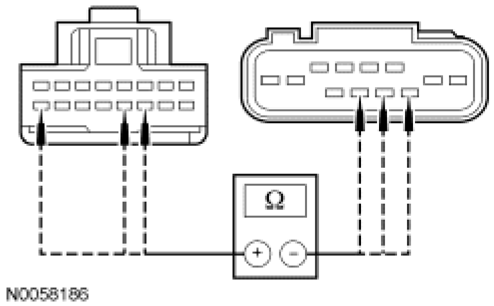

Fig. 12: Checking Circuits For Open
Courtesy of FORD MOTOR CO.

- Using the following table, measure the resistance between multi-function switch C202 harness side and windshield wiper motor C1552 harness side:

Multi-function Switch C202	Windshield Wiper Motor C1552
C202-16, circuit CRW19 (BU/OG)	C1552-10, circuit CRW19 (BU/OG)
C202-12, circuit CRW17 (GN/VT)	C1552-9, circuit CRW17 (GN/VT)
C202-11, circuit CRW18 (VT/WH)	C1552-11, circuit CRW18 (VT/WH)

- **Is the resistance less than 5 ohms?**

  YES : Go to F3.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

F3 CHECK CIRCUIT CRW19 (BU/OG), CRW18 (VT/WH) OR CRW17 (GN/VT) FOR A SHORT TO GROUND

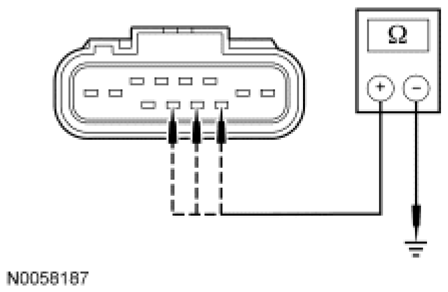

Fig. 13: Checking Circuits For Short To Ground
Courtesy of FORD MOTOR CO.

- Using the following table, measure the resistance between windshield wiper motor C1552 harness side and ground:

Windshield Wiper Motor C1552	Ground
C1552-10, circuit CRW19 (BU/OG)	ground
C1552-11, circuit CRW18 (VT/WH)	ground
C1552-9, circuit CRW17 (GN/VT)	ground

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to F4.

  NO : REPAIR the circuit(s) in question. TEST the system for normal operation.

F4 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS

- Measure the resistance at the windshield wiper motor electrical connector between the circuits shown in the table.

Windshield Wiper Motor C1552	Windshield Wiper Motor C1552
Pin 10, circuit CRW19 (BU/OG)	Pin 11, circuit CRW18 (VT/WH)
-	Pin 1, circuit CRW08 (VT/OG)
-	Pin 9, circuit CRW17 (GN/VT)
Pin 11, circuit CRW18 (VT/WH)	Pin 1, circuit CRW08 (VT/OG)
-	Pin 9, circuit CRW17 (GN/VT)
Pin 1, circuit CRW08 (VT/OG)	Pin 9, circuit CRW17 (GN/VT)

- **Is the resistance greater than 10,000 ohms for all measurements?**

  YES : Go to F5.

  NO : REPAIR the circuit. TEST the system for normal operation.

F5 CHECK FOR CORRECT WIPER MOTOR OPERATION

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test G: The Intermittent Wiper Speed Does Not Operate Correctly - Rear Window

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the rear window wiper motor receives open and ground inputs from the multi-function switch through circuits CRW20 (GY/YE) and CRW21 (YE/VT) to activate the wiper to the appropriate speeds. The multi-function switch supplies a ground input to the rear wiper motor on CRW21 (YE/VT) when INT 1 is selected. The multi-function switch supplies ground to the rear wiper motor on CRW21 (YE/VT) and CRW20 (GY/YE) when INT2 is selected.

This pinpoint test is intended to diagnose the following:

- Rear window wiper motor
- Multi-function switch

PINPOINT TEST G: THE INTERMITTENT WIPER SPEED DOES NOT OPERATE CORRECTLY - REAR WINDOW

G1 VERIFY REAR WASHER PUMP OPERATION

- Key in ON position.
- Activate the rear washer pump.
- **Does the rear washer pump activate?**

  YES : Go to G2.

  NO : Go to **Pinpoint Test I** .

G2 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to G3.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

G3 CHECK FOR A SHORT BETWEEN CIRCUITS CRW20 (GY/YE) AND CRW21 (YE/VT)

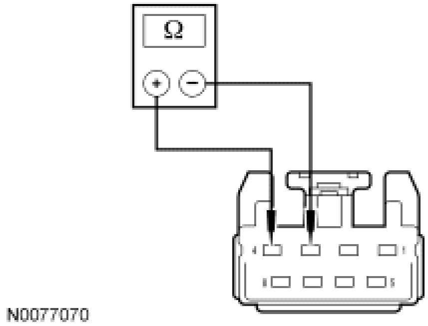

Fig. 14: Measuring Resistance Between Rear Window Wiper Circuits
Courtesy of FORD MOTOR CO.

- Measure the resistance between rear window wiper C4218-4, circuit CRW20 (GY/YE), harness side and rear window wiper C4218-3, circuit CRW21 (YE/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to G4.

  NO : REPAIR the circuit. TEST the system for normal operation.

G4 CHECK FOR CORRECT WIPER MOTOR OPERATION

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new rear window wiper motor. REFER to **Wiper Motor - Rear Window**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test H: The Washer Pump is Inoperative

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the windshield washer pump motor is grounded through internal relays in the wiper motors using circuits CRW14 (BU/WH) and CRW23 (VT/GN). The multi-function switch provides input to the windshield wiper motor through circuit CRW07 (GY/BN) to activate the washer. The windshield wiper motor activates the internal relay and then provides power through circuit CRW14 (BU/WH). When the rear window washer is activated, the multi-function switch provides input to the rear window wiper motor through circuit CRW20 (GY/YE) to activate the washer. The rear window wiper motor activates the internal relay and then provides power through circuit CRW23 (VT/GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multi-function switch
- Washer pump motor
- Windshield wiper motor
- Rear window wiper motor

PINPOINT TEST H: THE WASHER PUMP IS INOPERATIVE

H1 CHECK CIRCUIT CRW14 (BU/WH) FOR GROUND

- Disconnect: Washer Pump Motor C137
- Key in ON position.

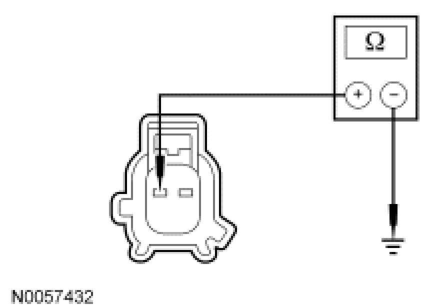

Fig. 15: Measuring Resistance Between Washer Pump Motor C137-2, Circuit CRW14 (BU/WH) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between washer pump motor C137-2, circuit CRW14 (BU/WH) harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to H3.

  NO : Go to H2.

H2 CHECK CIRCUIT CRW14 (BU/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: Windshield Wiper Motor C1552

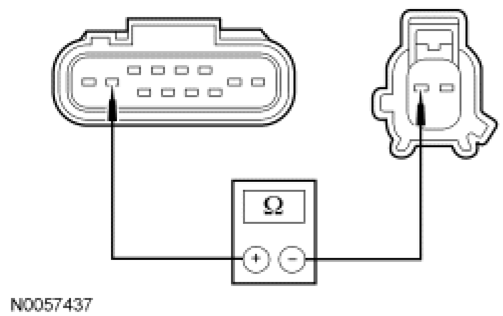

Fig. 16: Measuring Resistance Between Windshield Wiper Motor C1552-7, CRW14 (BU/WH) & Washer Pump Motor C137-2
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper motor C1552-7, circuit CRW14 (BU/WH), harness side and washer pump motor C137-2, circuit CRW14 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H13.

  NO : REPAIR the circuit. TEST the system for normal operation.

H3 CHECK CIRCUIT CRW23 (VT/GN) FOR GROUND

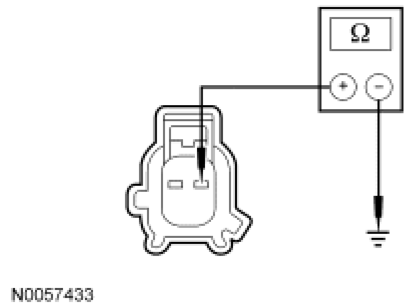

Fig. 17: Measuring Resistance Between Washer Pump Motor C137-1, Circuit CRW23 (VT/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between washer pump motor C137-1, circuit CRW23 (VT/GN) harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to H5.

  NO : Go to H4.

H4 CHECK CIRCUIT CRW23 (VT/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Rear Window Wiper Motor C4218

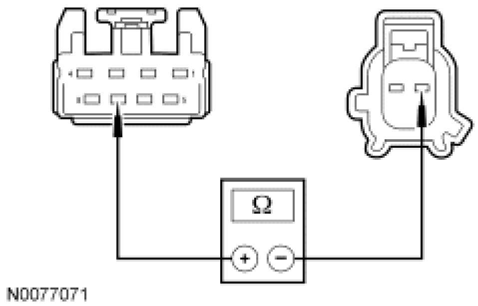

Fig. 18: Measuring Resistance Between Rear Window Wiper Motor C4218-7, Circuit CRW23 (VT/GN), Harness Side And Washer Pump Motor C137-1, Circuit CRW23 (VT/GN), Harness Side
Courtesy of FORD MOTOR CO.

- Measure the resistance between rear window wiper motor C4218-7, circuit CRW23 (VT/GN), harness side and washer pump motor C137-1, circuit CRW23 (VT/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to H14.

  NO : REPAIR the circuit. TEST the system for normal operation.

H5 CHECK CIRCUIT CRW14 (BU/WH) FOR VOLTAGE

NOTE:	**Holding the multi-function switch to the windshield wiper WASH position for greater than 10 seconds will default the washer system to OFF for that ignition cycle.**

- Key in ON position.

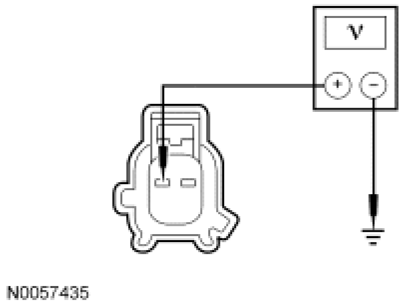

Fig. 19: Measuring Voltage Between Washer Pump Motor C137-2, Circuit CRW14 (BU/WH) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between washer pump motor C137-2, circuit CRW14 (BU/WH) harness side and ground while depressing the multi-function switch to the windshield wiper WASH position.
- **Is the voltage greater than 10 volts?**

YES : Go to H9.

NO : Go to H6.

H6 CHECK CIRCUIT CRW14 (BU/WH) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Windshield Wiper Motor C1552

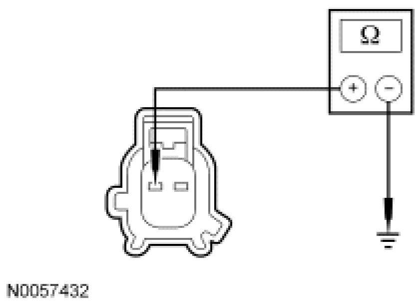

Fig. 20: Measuring Resistance Between Washer Pump Motor C137-2, Circuit CRW14 (BU/WH) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between washer pump motor C137-2, circuit CRW14 (BU/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to H7.

NO : REPAIR the circuit. TEST the system for normal operation.

H7 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

YES : Go to H8.

NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

H8 CHECK CIRCUIT CRW07 (GY/BN) FOR AN OPEN OR SHORT TO GROUND

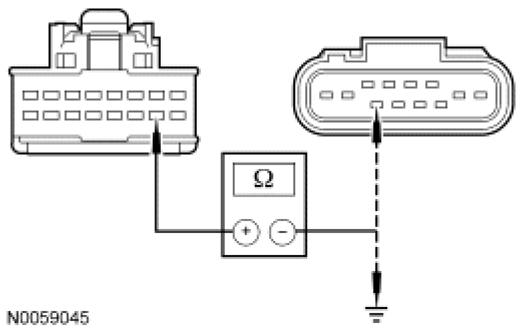

Fig. 21: Checking Circuit For Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper motor C1552-12, circuit CRW07 (GY/BN), harness side and multi-function switch C202-10, circuit CRW07 (GY/BN), harness side; and between multi-function switch C202-10, circuit CRW07 (GY/BN), harness side and ground.
- **Is the resistance less than 5 ohms between multi-function switch and wiper motor; and greater than 10,000 ohms between multi-function switch and ground?**

  YES : Go to H13.

  NO : REPAIR the circuit. TEST the system for normal operation.

H9 CHECK CIRCUIT CRW23 (VT/GN) FOR VOLTAGE

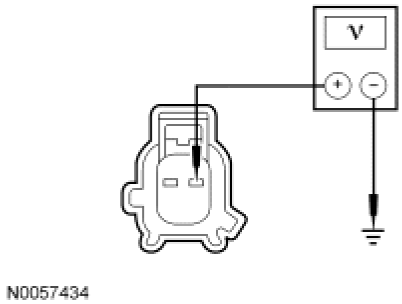

Fig. 22: Measuring Voltage Between Washer Pump Motor C137-1, Circuit CRW23 (VT/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between washer pump motor C137-1, circuit CRW23 (VT/GN) harness side and ground while depressing the multi-function switch to the rear window wiper WASH position.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new washer pump. REFER to **Washer Pump**. TEST the system for normal operation.

  NO : Go to H10.

H10 CHECK CIRCUIT CRW23 (VT/GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Rear Window Wiper Motor C4218

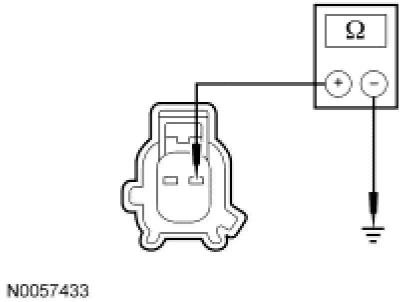

Fig. 23: Measuring Resistance Between Washer Pump Motor C137-1, Circuit CRW23 (VT/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between washer pump motor C137-1, circuit CRW23 (VT/GN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to H11.

  NO : REPAIR the circuit. TEST the system for normal operation.

H11 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to H12.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

H12 CHECK CIRCUIT CRW20 (GY/YE) FOR AN OPEN OR SHORT TO GROUND

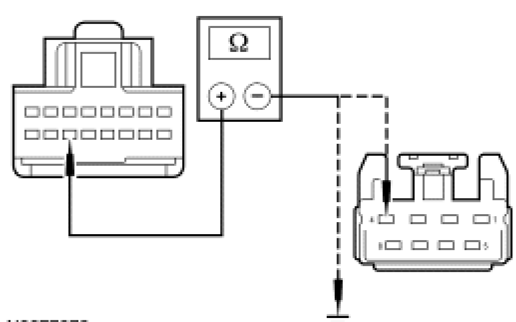

Fig. 24: Measuring Resistance Between Windshield Wiper Motor C4218-4, Circuit CRW20 (GY/YE), Harness Side And Multi-Function Switch Circuits, Harness Side
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper motor C4218-4, circuit CRW20 (GY/YE), harness side and multi-function switch C202-14, circuit CRW20 (GY/YE), harness side; and between multi-function switch C202-14, circuit CRW20 (GY/YE), harness side and ground.

- **Is the resistance less than 5 ohms between multi-function switch and wiper motor; and greater than 10,000 ohms between multi-function switch and ground?**

  YES : Go to H14.

  NO : REPAIR the circuit. TEST the system for normal operation.

H13 CHECK THE WINDSHIELD WIPER MOTOR

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**.

  NO : The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to **WIPER BLADE AND PIVOT ARM ADJUSTMENT - WINDSHIELD**. TEST the system for normal operation.

H14 CHECK THE REAR WINDOW WIPER MOTOR

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new rear window wiper motor. REFER to **Wiper Motor - Rear Window**.

  NO : The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to **WIPER BLADE AND PIVOT ARM ADJUSTMENT - REAR WINDOW**. TEST the system for normal operation.

Pinpoint Test I: The Speed Dependent Interval Mode Does Not Operate Correctly

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

Under normal operation, the windshield wiper motor receives vehicle speed information from the PCM through circuit VMC05 (VT/OG). The windshield wiper motor electronics then determine the speed of the windshield wiper motor. The speed dependent wipers function in all INT modes except INT 1.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- Windshield wiper motor

PINPOINT TEST I: THE SPEED DEPENDENT INTERVAL MODE DOES NOT OPERATE CORRECTLY

I1 REVIEW THE DTCs

- Review the DTCs from the PCM self-test.
- **Are any vehicle speed sensor (VSS) related DTCs present?**

  YES : REFER to the **INTRODUCTION - GASOLINE ENGINES** article to diagnose the VSS.

  NO : Go to I2.

I2 CHECK CIRCUIT VMC05 (VT/OG) FOR AN OPEN

- Key in OFF position.
- Disconnect: PCM C175b
- Disconnect: Windshield Wiper Motor C1552

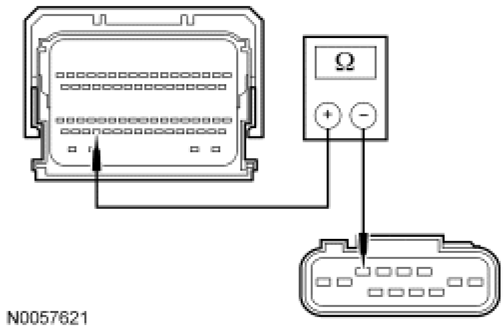

Fig. 25: Measuring Resistance Between PCM C175B-63, Circuit VMC05 (VT/OG) & Windshield Wiper Motor C125-4
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM C175b-63, circuit VMC05 (VT/OG), harness side and windshield wiper motor C125-4, circuit VMC05 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to I3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

I3 CHECK CIRCUIT VMC05 (VT/OG) FOR A SHORT TO GROUND

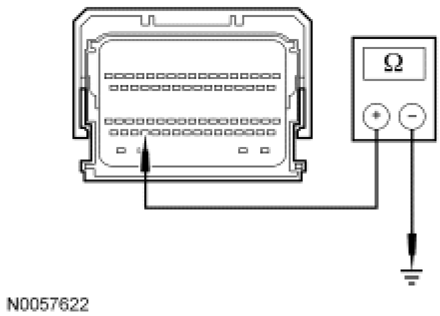

Fig. 26: Measuring Resistance Between PCM C175B-63, Circuit VMC05 (VT/OG) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM C175b-63, circuit VMC05 (VT/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I4.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

I4 CHECK CIRCUIT VMC05 (VT/OG) FOR A SHORT TO VOLTAGE

- Key in ON position.

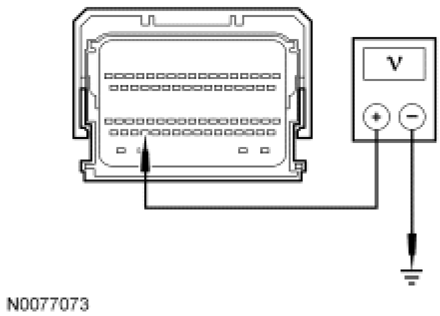

Fig. 27: Measuring Voltage Between PCM C175b-63, Circuit VMC05 (VT/OG), Harness Side And Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between PCM C175b-63, circuit VMC05 (VT/OG), harness side and ground.
- **Is any voltage present?**

  YES : Go to I5.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

I5 CHECK FOR CORRECT WIPER MOTOR OPERATION

- Disconnect all wiper motor connectors.
- Check for:
  - corrosion.
  - pushed-out pins.

- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test J: The Headlamps Do Not Illuminate When the Wipers are On

Refer to appropriate SYSTEM WIRING DIAGRAMS article for Wipers and Washers schematic and connector information.

Normal Operation

If equipped with automatic headlamps, the smart junction box (SJB) will illuminate the exterior lamps, including the parking lamps, when the front wipers are on for more than 10 seconds. The SJB monitors the front wiper motor on circuit CRW01 (WH).

- DTC B2008 Wipers On Signal Circuit Short to Ground - Short to ground on wiper motor on input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Windshield wiper motor
- SJB

PINPOINT TEST J: THE HEADLAMPS DO NOT ILLUMINATE WHEN THE WIPERS ARE ON

J1 CHECK CIRCUIT CRW01 (WH) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Windshield Wiper Motor C1552
- Key in ON position.

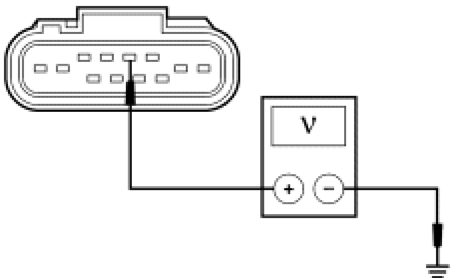

Fig. 28: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between windshield wiper motor C1552-2 circuit CRW01 (WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor - Windshield**. TEST the system for normal operation.

  NO : Go to J2.

J2 CHECK CIRCUIT CRW01 (WH) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280F

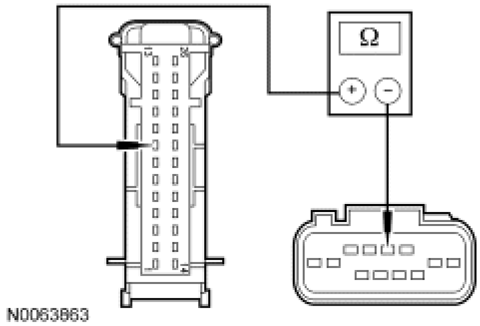

Fig. 29: Measuring Resistance Between SJB C2280F-8 Circuit CRW01 (WH), Harness Side And Windshield Wiper Motor C1552-2 Circuit, & Between SJB C2280F-8 Circuit CRW01 (WH), Harness Side And Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280F-8 circuit CRW01 (WH), harness side and windshield wiper motor C1552-2 circuit CRW01 (WH); then between SJB C2280F-8 circuit CRW01 (WH), harness side and ground.
- **Is the resistance less than 5 ohms between the SJB and windshield wiper motor and greater than 10,000 ohms between the SJB and ground?**

  YES : Go to J3.

  NO : REPAIR the circuit. TEST the system for normal operation.

J3 CHECK FOR CORRECT MODULE OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they are seated correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the SJB self-test.

NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

GENERAL PROCEDURES

WIPER BLADE AND PIVOT ARM ADJUSTMENT - WINDSHIELD

1. Cycle and park the windshield wipers.
2. Verify that the RH and LH windshield wiper blades are located at the alignment marks on the glass.

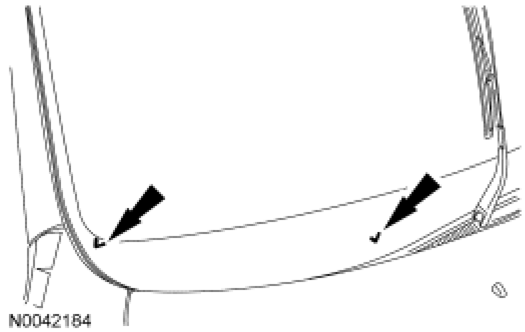

Fig. 30: Locating RH & LH Wiper Blade Alignment Marks
Courtesy of FORD MOTOR CO.

NOTE: Make sure there is no mechanical binding in the linkage preventing the wiper arms from returning to the fully parked position.

3. If necessary, remove the windshield wiper pivot arm nuts and the windshield wiper pivot arms and reposition them to the correct locations.
   - To install, tighten to 30 N.m (22 lb-ft).

WIPER BLADE AND PIVOT ARM ADJUSTMENT - REAR WINDOW

1. Cycle and park the rear window wiper.
2. Verify that the rear wiper blade is positioned at the first defroster line located on the rear window glass.

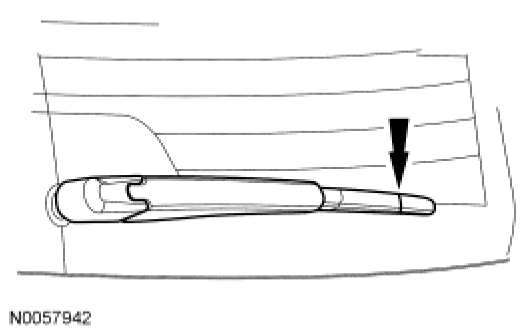

Fig. 31: Identifying Rear Wiper Blade
Courtesy of FORD MOTOR CO.

3. If necessary, remove the rear wiper pivot arm nut and the rear wiper pivot arm and reposition it to the correct location.
   - To install, tighten to 12 Nm (9 lb-ft).

WASHER HOSE REPAIR

1. Locate and verify the leaking washer hose.
2. Cut the hose cleanly and remove the damaged portion of the washer hose.
3. Install a windshield washer hose adapter between the cut ends of the hose.

NOTE: **In difficult cases, clamping may be required.**

4. Install a segment of 6.4 mm (0.25 in) inside diameter black rubber hose over the ends of the washer hose, and clamp both ends of the rubber hose using spring clamps.

REMOVAL AND INSTALLATION

WIPER AND WASHER SYSTEM - EXPLODED VIEW

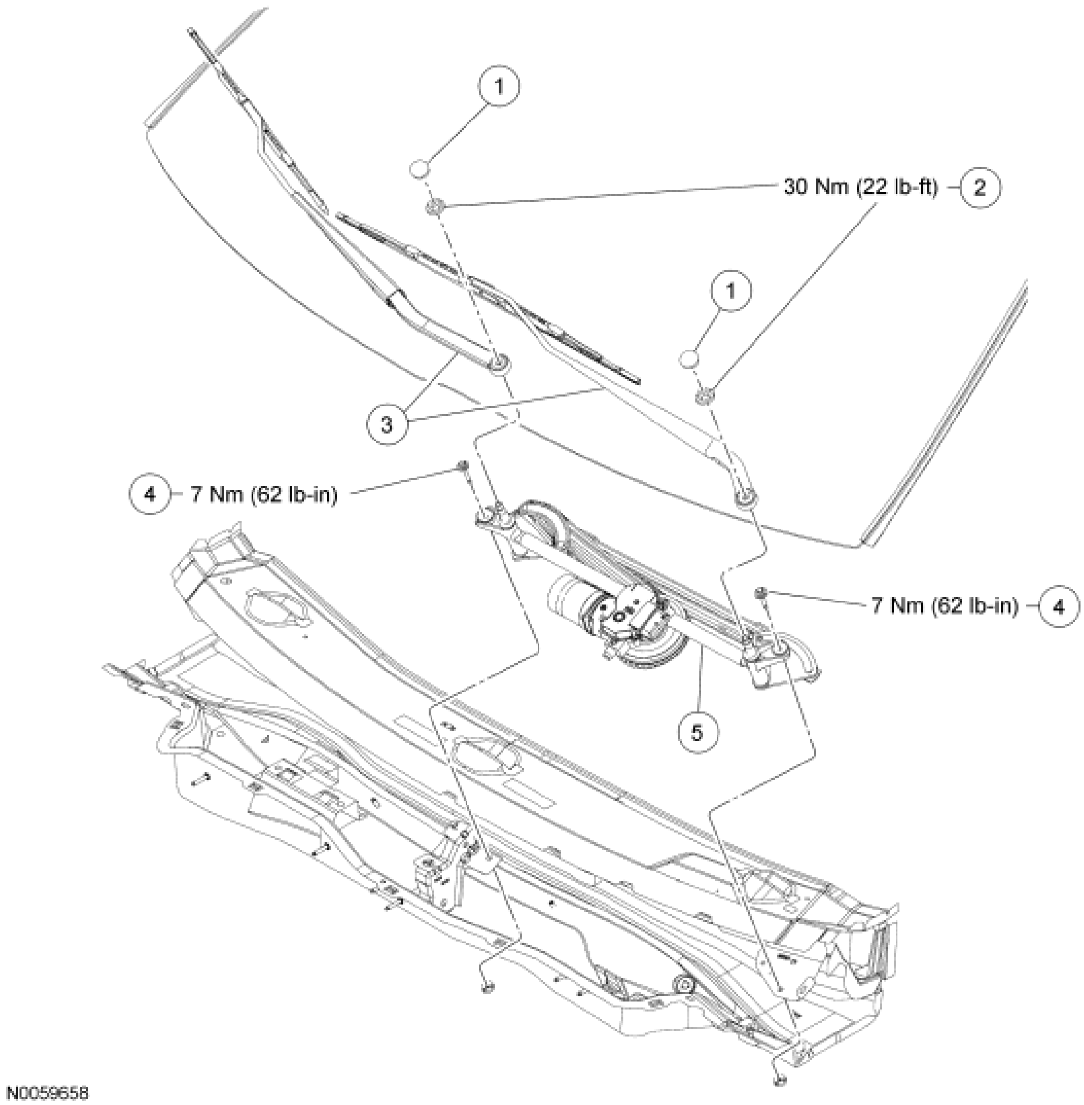

Fig. 32: Exploded View Of Front Wiper & Washer System With Torque Specifications

2	17A605	Windshield washer reservoir hoses
3	W702751	Windshield washer reservoir nuts (2 required)
4	17664	Windshield washer pump
5	17618	Windshield washer reservoir

1. For additional information, refer to the procedures in this service information.

WIPER PIVOT ARM - FRONT

REMOVAL AND INSTALLATION

1. Remove the front wiper pivot arm caps.

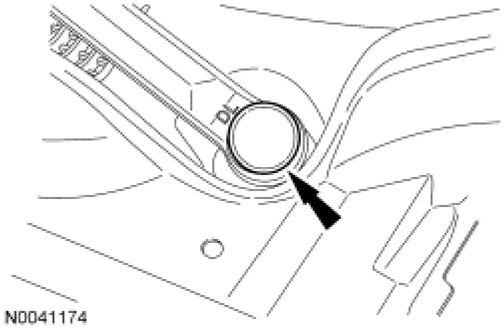

Fig. 35: Locating Wiper Pivot Arm Cap
Courtesy of FORD MOTOR CO.

2. Remove the front wiper pivot arm retaining nuts and the front wiper pivot arms.
   - To install, tighten to 30 N.m (22 lb-ft).

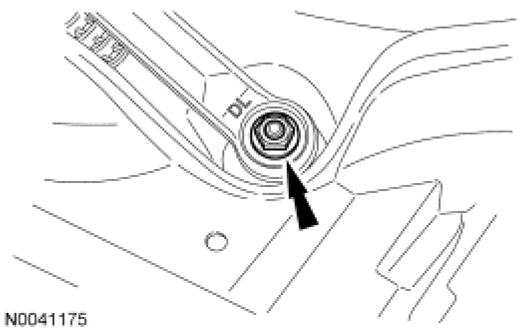

Fig. 36: Locating Wiper Pivot Arm Retaining Nut
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.
   - To adjust the windshield wiper pivot arms, refer to **Wiper Blade and Pivot Arm Adjustment - Windshield**.

WIPER MOUNTING ARM AND PIVOT SHAFT

REMOVAL AND INSTALLATION

1. Remove the upper cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
2. Disconnect the windshield wiper motor electrical connector.
3. Remove the 2 windshield wiper mounting arm and pivot shaft assembly bolts and the windshield wiper mounting arm and pivot shaft assembly.
   - To install, tighten to 7 Nm (62 lb-in).
4. To install, reverse the removal procedure.

WIPER MOTOR - WINDSHIELD

REMOVAL AND INSTALLATION

NOTE: The windshield wiper motor is not serviceable separately. The windshield wiper motor and the mounting arm and pivot shaft must be replaced together.

1. Remove the windshield wiper mounting arm and pivot shaft. For additional information, refer to **Wiper Mounting Arm and Pivot Shaft**.
2. To install, reverse the removal procedure.

WIPER PIVOT ARM - REAR

REMOVAL AND INSTALLATION

1. Open the rear wiper pivot arm nut cover.

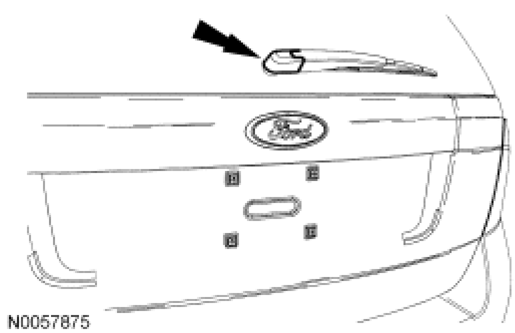

Fig. 37: Identifying Rear Wiper Pivot Arm Nut Cover
Courtesy of FORD MOTOR CO.

2. Remove the nut and the rear wiper pivot arm.
   - To install, tighten to 12 Nm (9 lb-ft).

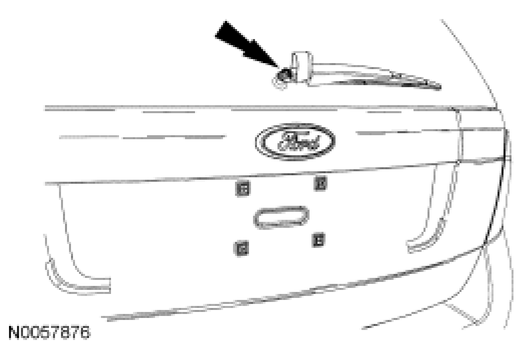

Fig. 38: Identifying Rear Wiper Pivot Arm Nut
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.
   - To adjust the rear wiper pivot arm, refer to **Wiper Blade and Pivot Arm Adjustment - Rear**

Window.

WIPER MOTOR - REAR WINDOW

REMOVAL

1. Remove the rear wiper pivot arm. For additional information, refer to **Wiper Pivot Arm - Rear**.
2. Remove the liftgate interior trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Disconnect the rear wiper motor electrical connector.
4. Remove the 3 rear wiper motor screws.
5. Remove the rear wiper motor.

INSTALLATION

1. Position the rear wiper motor on the liftgate and install the 3 rear wiper motor screws.
    - Tighten to 11 Nm (8 lb-ft).
2. Connect the rear wiper motor electrical connector.
3. Install the liftgate interior trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
4. Install the rear wiper pivot arm. For additional information, refer to **Wiper Pivot Arm - Rear**.

WASHER PUMP

MATERIAL

Item	Specification
Premium Quality Windshield Washer Fluid (Canada) CXC-37-(A, B, C, D, E, F, G, H) (Canada)	-
Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M8B16-A2

REMOVAL AND INSTALLATION

1. Remove the RH front fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

NOTE: To prevent spilling windshield washer fluid, drain the washer reservoir before washer pump removal.

2. Remove the washer pump.
    1. Disconnect the electrical connector.
    2. Disconnect the hoses.
    3. Remove the washer pump.

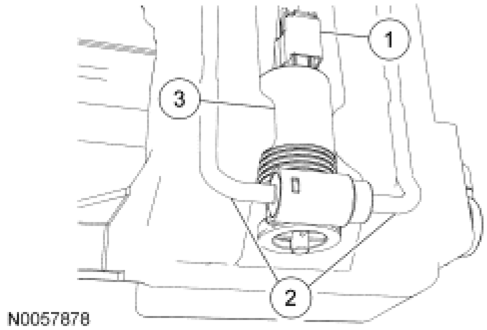

Fig. 39: Identifying Electrical Connector, Hoses & Washer Pump
Courtesy of FORD MOTOR CO.

CAUTION: Do not operate the washer pump prior to filling the washer reservoir. Failure to follow these instructions may result in premature pump failure.

3. To install, reverse the removal procedure.
    - Fill the washer reservoir with windshield washer fluid.

WASHER RESERVOIR

MATERIAL

Item	**Specification**
Premium Quality Windshield Washer Fluid (Canada) CXC-37-(A, B, C, D, E, F, G, H) (Canada)	-
Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M8B16-A2

REMOVAL AND INSTALLATION

1. Remove the RH front fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
2. Disconnect the washer pump electrical connector.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTE: To prevent spilling windshield washer fluid, drain the washer reservoir before removal.

3. Disconnect the washer pump hoses.
4. Remove the bolt from the washer reservoir filler neck.
   - To install, tighten to 7 N.m (62 lb-in).
5. Remove the washer reservoir nuts and the washer reservoir.
   - To install, tighten to 7 N.m (62 lb-in).

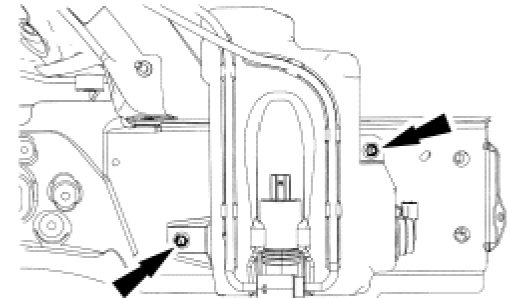

Fig. 40: Locating Washer Reservoir Nuts
Courtesy of FORD MOTOR CO.

CAUTION: Do not operate the washer pump prior to filling the washer reservoir. Failure to follow this instruction may result in premature pump failure.

6. To install, reverse the removal procedure.
   - Fill the washer reservoir with windshield washer fluid.
