HOW TO USE THIS MANUAL

GENERAL INFORMATION

1. INDEX

An INDEX is provided on the first page of each section to guide you to the item to be repaired. To assist you in finding your way through the manual, the section title and major heading are given at the top of every page.

2. PRECAUTION

At the beginning of each section, a PRECAUTION is given that pertains to all repair operations contained in that section.

Read these precautions before starting any repair task.

3. TROUBLESHOOTING

TROUBLESHOOTING tables are included for each system to help you diagnose the problem and find the cause. The fundamentals of how to proceed with troubleshooting are described on page IN-18.

Be sure to read this before performing troubleshooting.

4. PREPARATION

Preparation lists the SST (Special Service Tools), recommended tools, equipment, lubricant and SSM (Special Service Materials) which should be prepared before beginning the operation and explains the purpose of each one.

5. REPAIR PROCEDURES

Most repair operations begin with an overview illustration. It identifies the components and shows how the parts fit together.

Example:

IN00U-36

The procedures are presented in a step-by-step format:

- The illustration shows what to do and where to do it.
- The task heading tells what to do.
- The detailed text tells how to perform the task and gives other information such as specifications and warnings.

Example:

Illustration: what to do and where Task heading : what to do

Component part No.

21. CHECK PISTON STROKE OF OVERDRIVE BRAKE

(a) Place SST and a dial indicator onto the overdrive brake piston as shown in the illustration.

SST 09350-30020 (09350-06120)

Set part No.

Detailed text : how to do task

(b) Measure the stroke applying and releasing the compressed air $(392 - 785 \text{ kPa}, 4 - 8 \text{ kgf/cm}^2 \text{ or } 57 - 114 \text{ psi})$ as shown in the illustration.

Piston stroke: 1.40 — 1.70 mm (0.0551 — 0.0669 in.)

This format provides the experienced technician with a FAST TRACK to the information needed. The upper case task heading can be read at a glance when necessary, and the text below it provides detailed information. Important specifications and warnings always stand out in bold type.

6. **REFERENCES**

References have been kept to a minimum. However, when they are required you are given the page to refer to.

7. SPECIFICATIONS

Specifications are presented in bold type throughout the text where needed. You never have to leave the procedure to look up your specifications. They are also found in Service Specifications section for quick reference.

8. CAUTIONS, NOTICES, HINTS:

- CAUTIONS are presented in bold type, and indicate there is a possibility of injury to you or other people.
- NOTICES are also presented in bold type, and indicate the possibility of damage to the components being repaired.
- HINTS are separated from the text but do not appear in bold. They provide additional information to help you perform the repair efficiently.

9. SI UNIT

The UNITS given in this manual are primarily expressed according to the SI UNIT (International System of Unit), and alternately expressed in the metric system and in the English System. **Example:**

Torque: 30 N·m (310 kgf·cm, 22 ft·lbf)

IDENTIFICATION INFORMATION VEHICLE IDENTIFICATION AND ENGINE SERIAL NUMBER

1. VEHICLE IDENTIFICATION NUMBER

The vehicle identification number is stamped on the vehicle identification number plate and certification label.

- A: Vehicle Identification Number Plate
 - **B:** Certification Label

2. ENGINE SERIAL NUMBER

The engine serial number is stamped on the engine block, as shown in the illustration.

IN-3

IN01P-06

REPAIR INSTRUCTIONS GENERAL INFORMATION BASIC REPAIR HINT

(a) Use fender, seat and floor covers to keep the vehicle clean and prevent damage.

IN0CO-12

- (b) During disassembly, keep parts in the appropriate order to facilitate reassembly.
 -) Installation and removal of battery terminal:
 - (1) Before performing electrical work, disconnect the negative (-) terminal cable from the battery.
 - (2) If it is necessary to disconnect the battery for inspection or repair, first disconnect the negative (-) terminal cable.
 - (3) When disconnecting the terminal cable, to prevent damage to battery terminal, loosen the cable nut and raise the cable straight up without twisting or prying it.
 - (4) Clean the battery terminals and cable ends with a clean shop rag. Do not scrape them with a file or other abrasive objects.
 - (5) Install the cable ends to the battery terminals after loosening the nut, and tighten the nut after installation. Do not use a hammer to tap the cable ends onto the terminals.
 - (6) Be sure the cover for the positive (+) terminal is properly in place.
- (d) Check hose and wiring connectors to make sure that they are connected securely and correctly.
- (e) Non-reusable parts
 - (1) Always replace cotter pins, gaskets, O-rings, oil seals, etc. with new ones.
 - (2) Non-reusable parts are indicated in the component illustrations by the " " symbol.

(f) Precoated parts

Precoated parts are bolts, nuts, etc. that are coated with a seal lock adhesive at the factory.

- If a precoated part is retightened, loosened or caused to move in any way, it must be recoated with the specified adhesive.
- (2) When reusing precoated parts, clean off the old adhesive and dry with compressed air. Then apply the specified seal lock adhesive to the bolt, nut or threads.

IN-4

- (3) Precoated parts are indicated in the component illustrations by the "●" symbol.
- (g) When necessary, use a sealer on gaskets to prevent leaks.
- (h) Carefully observe all specifications for bolt tightening torques. Always use a torque wrench.
- (i) Use of special service tools (SST) and special service materials (SSM) may be required, depending on the nature of the repair. Be sure to use SST and SSM where specified and follow the proper work procedure. A list of SST and SSM can be found in Preparation section in this manual.

When replacing fuses, be sure the new fuse has the correct amperage rating. DO NOT exceed the rating or use one with a lower rating.

Illustration	Symbol	Part Name	Abbreviation
BE559	IN0365	FUSE	FUSE
BE559		MEDIUM CURRENT FUSE	M-FUSE
BE5590		HIGH CURRENT FUSE	H-FUSE
GA BE559	,	FUSIBLE LINK	FL
BE5590	IN0368	CIRCUIT BREAKER	СВ

V00076

- (k) Care must be taken when jacking up and supporting the vehicle. Be sure to lift and support the vehicle at the proper locations (See page IN-8).
 - Cancel the parking brake on the level place and shift the transmission in Neutral (or N position).
 - When jacking up the front wheels of the vehicle at first place stoppers behind the rear wheels.
 - When jacking up the rear wheels of the vehicle at first place stoppers before the front wheels.
 - When either the front or rear wheels only should be jacked up, set rigid racks and place stoppers in front and behind the other wheels on the ground.
 - After the vehicle is jacked up, be sure to support it on rigid racks. It is extremely dangerous to do any work on a vehicle raised on a jack alone, even for a small job that can be finished quickly.
- (I) Observe the following precautions to avoid damage to the following parts:
 - Do not open the cover or case of the ECU unless absolutely necessary. (If the IC terminals are touched, the IC may be destroyed by static electricity.)

- WRONG CORRECT MRONG CORRECT WRONG CORRECT MRONG CORRECT MRONG CORRECT MRONG CORRECT MRONG CORRECT MRONG CORRECT MRONG CORRECT
- (2) To disconnect vacuum hoses, pull off the end, not the middle of the hose.

- (3) To pull apart electrical connectors, pull on the connector itself, not the wires.
- (4) Be careful not to drop electrical components, such as sensors or relays. If they are dropped on a hard floor, they should be replaced and not reused.
- (5) When steam cleaning an engine, protect the electronic components, air filter and emission-related components from water.
- (6) Never use an impact wrench to remove or install temperature switches or temperature sensors.

6

(7)

- When checking continuity at the wire connector, insert the tester probe carefully to prevent terminals from bending.
- (8) When using a vacuum gauge, never force the hose onto a connector that is too large. Use a step-down adapter for adjustment. Once the hose has been stretched, it may leak air.

- When disconnecting vacuum hoses, use tags to identify how they should be reconnected to.
- (2) After completing a job, double check that the vacuum hoses are properly connected. A label under the hood shows the proper layout.
- (n) Unless otherwise stated, all resistance is measured at an ambient temperature of 20°C (68°F). Because the resistance may be outside specifications if measured at high temperatures immediately after the vehicle has been running, measurement should be made when the engine has cooled down.

IN0002

VEHICLE LIFT AND SUPPORT LOCATIONS

IN0DA-01

FOR ALL OF VEHICLES PRECAUTION

IN0DB-05

(a) The TOYOTA TACOMA is equipped with an SRS (Supplemental Restraint System), such as the driver airbag, front passenger airbag assembly and seat belt pretensioner.

Failure to carry out service operations in the correct sequence could cause the supplemental restraint system to unexpectedly deploy during servicing, possibly leading to a serious accident.

Further, if a mistake is made in servicing the supplemental restraint system, it is possible the SRS may fail to operate when required. Before servicing (including removal or installation of parts, inspection or replacement), be sure to read the following items carefully, then follow the correct procedure described in this manual.

- GENERAL NOTICE
 - (1) Malfunction symptoms of the supplemental restraint system are difficult to confirm, so the diagnostic trouble codes become the most important source of information when troubleshooting. When troubleshooting the supplemental restraint system, always inspect the diagnostic trouble codes before disconnecting the battery (See page DI-381).
 - (2) Work must be started after 90 seconds from the time the ignition switch is turned to the "LOCK" position and the negative (-) terminal cable is disconnected from the battery.

(The supplemental restraint system is equipped with a back-up power source so that if work is started within 90 seconds of disconnecting the negative (-) terminal cable from the battery, the SRS may deploy.)

When the negative (-) terminal cable is disconnected from the battery, memory of the clock and audio systems will be cancelled. So before starting work, make a record of the contents memorized by the each memory system. Then when work is finished, reset the clock and audio systems as before. To avoid erasing the memory of each memory system, never use a back-up power supply from another battery.

- IN-1 1
- (3) Even in cases of a minor collision where the SRS does not deploy, the steering wheel pad (See page RS-12), front passenger airbag assembly (See page RS-26) and seat belt pretensioner (See page BO-109) should be inspected.
- (4) Never use SRS parts from another vehicle. When replacing parts, replace them with new parts.
- (5) Before repairs, remove the airbag sensor if shocks are likely to be applied to the sensor during repairs.
- (6) Never disassemble and repair the airbag sensor assembly, steering wheel pad, front passenger airbag assembly or seat belt pretensioner.
- (7) If the airbag sensor assembly, steering wheel pad, front passenger airbag assembly or seat belt pretensioner has been dropped, or if there are cracks, dents or other defects in the case, bracket or connector, replace them with new ones.
- (8) Do not directly expose the airbag sensor assembly, steering wheel pad, front passenger airbag assembly or seat belt pretensioner to hot air or flames.
- Use a volt/ohmmeter with high impedance (10 kΩ/V minimum) for troubleshooting of the electrical circuit.
- (10) Information labels are attached to the periphery of the SRS components. Follow the instructions on the notices.
- After work on the supplemental restraint system is completed, check the SRS warning light (See page DI-381).

(c) SPIRAL CABLE (in Combination Switch)

The steering wheel must be fitted correctly to the steering column with the spiral cable at the neutral position, otherwise cable disconnection and other troubles may result. Refer to SR-19 concerning correct steering wheel installation.

- (d) STEERING WHEEL PAD (with Airbag)
 - (1) When removing the steering wheel pad or handling a new steering wheel pad, it should be placed with the pad top surface facing up.

Storing the pad with its metallic surface upward may lead to a serious accident if the airbag inflates for some reason. In addition do not store a steering wheel pad on top of another one.

- Never measure the resistance of the airbag squib. (This may cause the airbag to deploy, which is very dangerous.)
- (3) Grease should not be applied to the steering wheel pad and the pad should not be cleaned with detergents of any kind.
- (4) Store the steering wheel pad where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.
- (5) When using electric welding, first disconnect the airbag connector (yellow color and 2 pins) under the steering column near the combination switch connector before starting work.
- (6) When disposing of a vehicle or the steering wheel pad alone, the airbag should be deployed using an SST before disposal (See page RS-14).

Perform the operation in a safe place away from electrical noise.

- (e) FRONT PASSENGER AIRBAG ASSEMBLY
 - Always store a removed or new front passenger airbag assembly with the airbag deployment direction facing up.

Storing the airbag assembly with the airbag deployment direction facing down could cause a serious accident if the airbag deploys.

- Never measure the resistance of the airbag squib. (This may cause the airbag to deploy, which is very dangerous.)
- (3) Grease should not be applied to the front passenger airbag assembly and the airbag door should not be cleaned with detergents of any kind.
- (4) Store the airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.
- (5) When using electric welding, first disconnect the airbag connector (yellow color and 2 pins) installed on assembly before starting work.
- (6) When disposing of a vehicle or the airbag assembly alone, the airbag should be deployed using an SST before disposal (See page RS-28).

Perform the operation in a safe place away from electrical noise.

(f) SEAT BELT PRETENSIONER

- (1) Never measure the resistance of the seat belt pretensioner. (This may cause the seat belt pretensioner activation which is very dangerous.)
- (2) Never disassemble the seat belt pretensioner.
- (3) Never install the seat belt pretensioner in another vehicle.
- (4) Store the seat belt pretensioner where the ambient temperature remains below 80°C (176°F) and away from electrical noise without high humidity.
- (5) When using electric welding, first disconnect the connector (yellow color and 2 pins) before starting work.
- (6) When disposing of a vehicle or the seat belt pretensioner alone, the seat belt pretensioner should be activated before disposal (See page BO-1 10). Perform the operation in a safe place away from electrical noise.
- (7) The seat belt pretensioner is hot after activation, so let it cool down sufficiently before the disposal. However never apply water to the seat belt pretensioner.

- (g) AIRBAG SENSOR ASSEMBLY
 - (1) Never reuse the airbag sensor assembly involved in a collision when the SRS has deployed.
 - (2) The connectors to the airbag sensor assembly should be connected or disconnected with the sensor mounted on the floor. If the connectors are connected or disconnected while the airbag sensor assembly is not mounted to the floor, it could cause undesired ignition of the supplemental restraint system.
 - (3) Work must be started after 90 seconds from the time the ignition switch is turned to the "LOCK" position and the negative (-) terminal cable is disconnected from the battery, even if only loosening the set bolts of the airbag sensor assembly.
- (h) WIRE HARNESS AND CONNECTOR

The SRS wire harness is integrated with the cowl wire harness assembly and floor wire harness assembly. All the connectors for the system are also a standard yellow color. If the SRS wire harness becomes disconnected or the connector becomes broken due to an accident, etc., repair or replace it.

2. FOR VEHICLES EQUIPPED WITH A CATALYTIC CONVERTER CAUTION:

If large amount of unburned gasoline flows into the converter, it may overheat and create a fire hazard. To prevent this, observe the following precautions and explain them to your customer.

- (a) Use only unleaded gasoline.
- (b) Avoid prolonged idling.

Avoid running the engine at idle speed for more than 20 minutes.

- (c) Avoid spark jump test.
 - (1) Perform spark jump test only when absolutely necessary. Perform this test as rapidly as possible.
 - (2) While testing, never race the engine.
- (d) Avoid prolonged engine compression measurement Engine compression tests must be done as rapidly as possible.
- (e) Do not run engine when fuel tank is nearly empty.
 - This may cause the engine to misfire and create an extra load on the converter.
- (f) Avoid coasting with ignition turned off.
- (g) Do not dispose of used catalyst along with parts contaminated with gasoline or oil.

3. IF VEHICLE IS EQUIPPED WITH MOBILE COMMUNICATION SYSTEM

For vehicles with mobile communication systems such as two-way radios and cellular telephones, observe the following precautions.

- (1) Install the antenna as far as possible away from the ECU and sensors of the vehicle's electronic system.
- (2) Install the antenna feeder at least 20 cm (7.87 in.) away from the ECU and sensors of the vehicle's electronic systems. For details about ECU and sensors locations, refer to the section on the applicable component.
- (3) Do not wind the antenna feeder together with the other wiring as much as possible, also avoid running the antenna feeder parallel with other wire harness.
- (4) Check that the antenna and feeder are correctly adjusted.
- (5) Do not install powerful mobile communications system.

4. FOR USING OBD II SCAN TOOL OR TOYOTA HAND-HELD TESTER CAUTION:

Observe the following for safety reasons:

- Before using the OBD II scan tool or TOYOTA hand-held tester, the OBD II scan tool's instruction book or TOYOTA hand-held tester's operator manual should be read thoroughly.
- Be sure to route all cables securely when driving with the OBD II scan tool or TOYOTA handheld tester connected to the vehicle. (i.e. Keep cables away from feet, pedals, steering wheel and shift lever.)
- Two persons are required when test driving with the OBD II scan tool or TOYOTA hand-held tester, one person to drive the vehicle and one person to operate the OBD II scan tool or TOYO-TA hand-held tester.

HOW TO TROUBLESHOOT ECU CONTROLLED SYSTEMS GENERAL INFORMATION

A large number of ECU controlled systems are used in the TOYOTA TACOMA. In general, the ECU controlled system is considered to be a very intricate system requiring a high level of technical knowledge and expert skill to troubleshoot. However, the fact is that if you proceed to inspect the circuits one by one, troubleshooting of these systems is not complex. If you have adequate understanding of the system and a basic knowledge of electricity, accurate diagnosis and necessary repair can be performed to locate and fix the problem. This manual is designed through emphasis of the above standpoint to help service technicians perform accurate and effective troubleshooting, and is compiled for the following major ECU controlled systems:

The troubleshooting procedure and how to make use of it are described on the following pages.

System	Page
1. Engine (2RZ-FE, 3RZ-FE)	DI-1
2. Engine (5VZ-FE)	DI-144
3. Automatic Transmission (A340E, A340F)	DI-275
4. Anti-Lock Brake System	DI-338
5. Supplemental Restraint System	DI-379
6. Cruise Control System	DI-482
7. Body Control System	DI-528

FOR USING OBD II SCAN TOOL OR TOYOTA HAND-HELD TESTER

- Before using the scan tool or tester, the scan tool's instruction book or tester's operator manual should be read thoroughly.
- If the scan tool or tester cannot communicate with ECU controlled systems when you have connected the cable of the scan tool or tester to DLC3, turned the ignition switch ON and operated the scan tool, there is a problem on the vehicle side or tool side.
 - (1) If communication is normal when the tool is connected to another vehicle, inspect the diagnosis data link line (Bus < line) or ECU power circuit of the vehicle.
 - (2) If communication is still not possible when the tool is connected to another vehicle, the problem is probably in the tool itself, so perform the Self Test procedures outline in the Tester Operator's Manual.

HOW TO PROCEED WITH TROUBLESHOOTING

Carry out troubleshooting in accordance with the procedure on the following page. Here, only the basic procedure is shown. Details are provided in Diagnostics section, showing the most effective methods for each circuit. Confirm the troubleshooting procedures first for the relevant circuit before beginning troubleshooting of that circuit.

IN01U-07

1. CUSTOMER PROBLEM ANALYSIS

In troubleshooting, the problem symptoms must be confirmed accurately and all preconceptions must be cleared away in order to give an accurate judgment. To ascertain just what the problem symptoms are, it is extremely important to ask the customer about the problem and the conditions at the time it occurred. Important Point in the Problem Analysis:

The following 5 items are important points in the problem analysis. Past problems which are thought to be unrelated and the repair history, etc. may also help in some cases, so as much information as possible should be gathered and its relationship with the problem symptoms should be correctly ascertained for reference in troubleshooting. A customer problem analysis table is provided in Diagnostics section for each system for your use.

— Important Points in the Customer Problem Analysis -

- What ----- Vehicle model, system name
- When ----- Date, time, occurrence frequency
- Where ----- Road conditions
- ●Under what conditions? ----- Running conditions, driving conditions, weather conditions
- How did it happen? ----- Problem symptoms

(Sample) Engine control system check sheet.

2. SYMPTOM CONFIRMATION AND DIAGNOSTIC TROUBLE CODE CHECK

The diagnostic system in the TOYOTA TACOMA fulfills various functions. The first function is the Diagnostic Trouble Code Check in which a malfunction in the signal circuits to the ECU is stored in code in the ECU memory at the time of occurrence, to be output by the technician during troubleshooting. Another function is the Input Signal Check which checks if the signals from various switches are sent to the ECU correctly. By using these check functions, the problem areas can be narrowed down quickly and troubleshooting can be performed effectively. Diagnostic functions are incorporated in the following systems in the TOYOTA TA-COMA.

System	Diagnostic Trouble Code Check	Input Signal Check (Sensor Check)	Diagnostic Test Mode (Active Test)
1. Engine (2RZ-FE, 3RZ-FE)	O (with Check Mode)	0	0
2. Engine (5VZ-FE)	⊖ (with Check Mode)	0	0
3. Automatic Transmission	⊖ (with Check Mode)	0	
4. Anti-Lock Brake System	0	0	
5. Supplemental Restraint System	0		
6. Cruise Control System	0	0	

In diagnostic trouble code check, it is very important to determine whether the problem indicated by the diagnostic trouble code is still occurring or occurred in the past but returned to normal at present. In addition, it must be checked in the problem symptom check whether the malfunction indicated by the diagnostic trouble code is directly related to the problem symptom or not. For this reason, the diagnostic trouble codes should be checked before and after the symptom confirmation to determine the current conditions, as shown in the table below. If this is not done, it may, depending on the case, result in unnecessary troubleshooting for normally operating systems, thus making it more difficult to locate the problem, or in repairs not pertinent to the problem. Therefore, always follow the procedure in correct order and perform the diagnostic trouble code check.

DIAGNOSTIC TROUBLE CODE CHECK PROCEDURE

Diagnostic Trouble Code Check (Make a note of and then clear)	Confirmation of Symptoms	Diagnostic Trouble Code Check	Problem Condition
Diagnostic Trouble Code Display	Problem symptoms exist	Same diagnostic trouble code is displayed	Problem is still occurring in the diagnostic circuit
	>	Normal code is displayed	The problem is still occurring in a place other than in the diagnostic circuit (The diagnostic trouble code displayed first is either for a past problem or it is a secondary problem)
	No problem symptoms exist		The problem occurred in the diagnostic circuit in the past
Normal Code Display	Problem symptoms exist	Normal code is displayed	The problem is still occurring in a place other than in the diagnostic circuit
	No problem symptoms exist	Normal code is displayed	The problem occurred in a place other than in the diagnostic circuit in the past

Taking into account the points on the previous page, a flow chart showing how to proceed with troubleshooting using the diagnostic trouble code check is shown below. This flow chart shows how to utilize the diagnostic trouble code check effectively, then by carefully checking the results, indicates how to proceed either to diagnostic trouble code troubleshooting or to troubleshooting of problem symptoms table.

3. SYMPTOM SIMULATION

The most difficult case in troubleshooting is when there are no problem symptoms occurring. In such cases, a thorough customer problem analysis must be carried out, then simulate the same or similar conditions and environment in which the problem occurred in the customer's vehicle. No matter how much experience a technician has, or how skilled he may be, if he proceeds to troubleshoot without confirming the problem symptoms he will tend to overlook something important in the repair operation and make a wrong guess somewhere, which will only lead to a standstill. For example, for a problem which only occurs when the engine is cold, or for a problem which occurs due to vibration caused by the road during driving, etc., the problem can never be determined so long as the symptoms are confirmed with the engine hot condition or the vehicle at a standstill. Since vibration, heat or water penetration (moisture) is likely cause for problem which is difficult to reproduce, the symptom simulation tests introduced here are effective measures in that the external causes are applied to the vehicle in a stopped condition.

Important Points in the Symptom Simulation Test:

In the symptom simulation test, the problem symptoms should of course be confirmed, but the problem area or parts must also be found out. To do this, narrow down the possible problem circuits according to the symptoms before starting this test and connect a tester beforehand. After that, carry out the symptom simulation test, judging whether the circuit being tested is defective or normal and also confirming the problem symptoms at the same time. Refer to the problem symptoms table for each system to narrow down the possible causes of the symptom.

V07268

2	HEAT METHOD: When the problem seems to occur	when the suspect area is heated.	
Heat th with a occurs NOTIC (1) Do is (2) Do	he component that is the likely cause of the malfunction hair dryer or similar object. Check to see if the malfunction c. CE: o not heat to more than 60°C (140°F). (Temperature limited not to damage the components.) o not apply heat directly to parts in the ECU.	Malfunc- tion	
3	3 WATER SPRINKLING METHOD: When the malfunction seems to occur on a rainy day or in a high-humidity condition.		
 Sprinkle water onto the vehicle and check to see if the malfunction occurs. NOTICE: (1) Never sprinkle water directly into the engine compartment, but indirectly change the temperature and humidity by applying water spray onto the radiator front surface. (2) Never apply water directly onto the electronic components. HINT: If a vehicle is subject to water leakage, the leaked water may contaminate the ECU. When testing a vehicle with a water leakage problem, special caution must be taken. 		F16649	
4	OTHER: When a malfunction seems to occur when	electrical load is excessive.	
Turn o lights, functio	in all electrical loads including the heater blower, head rear window defogger, etc. and check to see if the mal- in occurs.	B02389	

IN-23

4. DIAGNOSTIC TROUBLE CODE CHART

The inspection procedure is shown in the table below. This table permits efficient and accurate troubleshooting using the diagnostic trouble codes displayed in the diagnostic trouble code check. Proceed with troubleshooting in accordance with the inspection procedure given in the diagnostic chart corresponding to the diagnostic trouble codes displayed. The engine diagnostic trouble code chart is shown below as an example.

DIAGNOSTIC TROUBLE CODE CHART

HINT:

Parameters listed in the chart may not be exactly the same as your reading due to the type of instrument or other factors.

If a malfunction code is displayed during the DTC check mode, check the circuit for the code listed in the table below. For details of each code, turn to the page referred to under the "See page" for the respective "DTC No." in the DTC chart.

SAE CONTROLLED

DTC No. (See page)	Detection Item	Trouble Area	MIL*	Memory

5. PROBLEM SYMPTOMS TABLE

The suspected circuits or parts for each problem symptom are shown in the table below. Use this table to troubleshoot the problem when a "Normal" code is displayed in the diagnostic trouble code check but the problem is still occurring. Numbers in the table indicate the inspection order in which the circuits or parts should be checked.

HINT:

When the problem is not detected by the diagnostic system even though the problem symptom is present, it is considered that the problem is occurring outside the detection range of the diagnostic system, or that the problem is occurring in a system other than the diagnostic system.

6. CIRCUIT INSPECTION

How to read and use each page is shown below.

V08423

27

HOW TO USE THE DIAGNOSTIC CHART AND INSPECTION PROCEDURE

1. CONNECTOR CONNECTION AND TERMINAL IN-SPECTION

IN05X-13

- For troubleshooting, diagnostic trouble code charts or problem symptom table are provided for each circuit with detailed inspection procedures on the following pages.
 - When all the component parts, wire harnesses and connectors of each circuit except the ECU are found to be normal in troubleshooting, then it is determined that the problem is in the ECU. Accordingly, if diagnosis is performed without the problem symptoms occurring, refer to Step 8 to replace the ECU. So always confirm that the problem symptoms are occurring, or proceed with inspection while using the symptom simulation method.
- The instructions "Check wire harness and connector" and "Check and replace ECU" which appear in the inspection procedure, are common and applicable to all diagnostic trouble codes. Follow the procedure outlined below whenever these instructions appear.

OPEN CIRCUIT:

This could be due to a disconnected wire harness, faulty contact in the connector, a connector terminal pulled out, etc. HINT:

- It is rarely the case that a wire is broken in the middle of it. Most cases occur at the connector. In particular, carefully check the connectors of sensors and actuators
- Faulty contact could be due to rusting of the connector terminals, to foreign materials entering terminals or a deformation of connector terminals. Simply disconnecting and reconnecting the connectors once changes the condition of the connection and may result in a return to normal operation. Therefore, in troubleshooting, if no abnormality is found in the wire harness and connector check, but the problem disappears after the check, then the cause is considered to be in the wire harness or connectors.

SHORT CIRCUIT:

This could be due to a contact between wire harness and the body ground or to a short circuit occurred inside the switch, etc. HINT:

When there is a short circuit between the wire harness and body ground, check thoroughly whether the wire harness is caught in the body or is clamped properly. 2.

CONNECTOR HANDLING

When inserting tester probes into a connector, insert them from the rear of the connector. When necessary, use mini test leads. For water resistant connectors which cannot be accessed from behind, take good care not to deform the connector terminals.

IN-29

CONTINUITY CHECK (OPEN CIRCUIT CHECK)

Disconnect the connectors at both ECU and sensor (a) sides

ECU Side Sensor Side IN0378

(b) Measure the resistance between the applicable terminals of the connectors.

Resistance: 1 Ω or less

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.

RESISTANCE CHECK (SHORT CIRCUIT CHECK) 4.

- Disconnect the connectors on both ends. (a)
- Measure the resistance between the applicable terminals (b) of the connectors and body ground. Be sure to carry out this check on the connectors on both ends. Resistance: 1 M Ω or higher

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.

VISUAL CHECK AND CONTACT PRESSURE CHECK 5.

- (a) Disconnect the connectors at both ends.
- Check for rust or foreign material, etc. in the terminals of (b) the connectors.
- (c) Check crimped portions for looseness or damage and check that the terminals are secured in lock portion.

HINT:

The terminals should not come out when pulled lightly from the back.

2001 TOYOTA TACOMA (RM835U)

Fig. 1

Senso

BE4063

(d) Prepare a test male terminal and insert it in the female terminal, then pull it out.

NOTICE:

When testing a gold-plated female terminal, always use a gold-plated male terminal.

HINT:

ECU

Z17004

When the test terminal is pulled out more easily than others, there may be poor contact in that section.

6. CHECK OPEN CIRCUIT

For the open circuit in the wire harness in Fig. 1, perform "(a) Continuity Check" or "(b) Voltage Check" to locate the section.

OPEN

 (\mathbf{B})

 (\mathbf{C})

(a) Check the continuity.

(1) Disconnect connectors "A" and "C" and measure the resistance between them. In the case of Fig. 2: Between terminal 1 of connector "A" and terminal 1 of connector "C" → No continuity (open) Between terminal 2 of connector "A" and terminal 2 of connector "C" → Continuity Therefore, it is found out that there is an open circuit between terminal 1 of connector "A" and terminal 1 of connector "C".

2001 TOYOTA TACOMA (RM835U)

(2) Disconnect connector "B" and measure the resistance between the connectors. In the case of Fig. 3: Between terminal 1 of connector "A" and terminal 1 of connector "B1" → Continuity Between terminal 1 of connector "B2" and terminal 1 of connector "C" → No continuity (open) Therefore, it is found out that there is an open circuit between terminal 1 of connector "B2" and terminal 1 of connector "C".

```

```

Date :

BE4066

Check the voltage.

In a circuit in which voltage is applied (to the ECU connector terminal), an open circuit can be checked for by conducting a voltage check.

As shown in Fig. 4, with each connector still connected, measure the voltage between body ground and terminal 1 of connector "A" at the ECU 5V output terminal, terminal 1 of connector "B", and terminal 1 of connector "C", in that order.

If the results are:

Z17007

5V: Between Terminal 1 of connector "A" and Body Ground 5V: Between Terminal 1 of connector "B" and Body Ground 0V: Between Terminal 1 of connector "C" and Body Ground Then it is found out that there is an open circuit in the wire harness between terminal 1 of "B" and terminal 1 of "C".

7. CHECK SHORT CIRCUIT

If the wire harness is ground shorted as in Fig. 5, locate the section by conducting a "continuity check with ground".

Check the continuity with ground.

(1) Disconnect connectors "A" and "C" and measure the resistance between terminal 1 and 2 of connector "A" and body ground.

In the case of Fig. 6:

Between terminal 1 of connector "A" and body ground \rightarrow Continuity (short)

Between terminal 2 of connector "A" and body ground \rightarrow No continuity

Therefore, it is found out that there is a short circuit between terminal 1 of connector "A" and terminal 1 of connector "C". INTRODUCTION -

(2) Disconnect connector "B" and measure the resistance between terminal 1 of connector "A" and body ground, and terminal 1 of connector "B2" and body ground.

In the case of Fig. 7:

Between terminal 1 of connector "A" and body ground \rightarrow No continuity

Between terminal 1 of connector "B2" and body ground \rightarrow Continuity (short)

Therefore, it is found out that there is a short circuit between terminal 1 of connector "B2" and terminal 1 of connector "C".

8. CHECK AND REPLACE ECU

First check the ECU ground circuit. If it is faulty, repair it. If it is normal, the ECU could be faulty, so replace the ECU with a normal functioning one and check that the symptoms appear.

 Measure the resistance between the ECU ground terminal and the body ground.

Resistance: 1 Ω or less

(2) Disconnect the ECU connector, check the ground terminals on the ECU side and the wire harness side for bend and check the contact pressure.

GLOSSARY OF SAE AND TOYOTA TERMS

This glossary lists all SAE-J1930 terms and abbreviations used in this manual in compliance with SAE recommendations, as well as their TOYOTA equivalents.

SAE ABBREVIATIONS	SAE TERMS	TOYOTA TERMS ()ABBREVIATIONS
A/C	Air Conditioning	Air Conditioner
ACL	Air Cleaner	Air Cleaner, A/CL
AIR	Secondary Air Injection	Air Injection (AI)
AP	Accelerator Pedal	-
B+	Battery Positive Voltage	+B, Battery Voltage
BARO	Barometric Pressure	HAC
CAC	Charge Air Cooler	Intercooler
CARB	Carburetor	Carburetor
CFI	Continuous Fuel Injection	-
СКР	Crankshaft Position	Crank Angle
CL	Closed Loop	Closed Loop
СМР	Camshaft Position	Cam Angle
СРР	Clutch Pedal Position	-
стох	Continuous Trap Oxidizer	-
СТР	Closed Throttle Position	LL ON, Idle ON
DFI	Direct Fuel Injection (Diesel)	Direct Injection (DI)
DI	Distributor Ignition	-
DLC1	Data Link Connector 1	1: Check Connector
DLC2	Data Link Connector 2	2: Total Diagnosis Comunication Link (TDCL)
DLC3	Data Link Connector 3	3: OBD II Diagnostic Connector
DTC	Diagnostic Trouble Code	Diagnostic Code
DTM	Diagnostic Test Mode	-
ECL	Engine Control Level	-
ECM	Engine Control Module	Engine ECU (Electronic Control Unit)
ECT	Engine Coolant Temperature	Coolant Temperature, Water Temperature (THW)
EEPROM	Electrically Erasable Programmable Read Only Memory	Electrically Erasable Programmable Read Only Memory (EEPROM), Erasable Programmable Read Only Memory (EPROM)
EFE	Early Fuel Evaporation	Cold Mixture Heater (CMH), Heat Control Valve (HCV)
EGR	Exhaust Gas Recirculation	Exhaust Gas Recirculation (EGR)
EI	Electronic Ignition	TOYOTA Distributorless Ignition (TDI)
EM	Engine Modification	Engine Modification (EM)
EPROM	Erasable Programmable Read Only Memory	Programmable Read Only Memory (PROM)
EVAP	Evaporative Emission	Evaporative Emission Control (EVAP)
FC	Fan Control	-
FEEPROM	Flash Electrically Erasable Programmable Read Only Memory	-
FEPROM	Flash Erasable Programmable Read Only Memory	-
FF	Flexible Fuel	
FP	Fuel Pump	Fuel Pump
GEN	Generator	Alternator
GND	Ground	Ground (GND)

2001 TOYOTA TACOMA (RM835U)

IN0CI-02

HO2S	Heated Oxygen Sensor	Heated Oxygen Sensor (HO ₂ S)	
IAC	Idle Air Control	Idle Speed Control (ISC)	
IAT	Intake Air Temperature	Intake or Inlet Air Temperature	
ICM	Ignition Control Module	-	
IFI	Indirect Fuel Injection	Indirect Injection (IDL)	
IFS	Inertia Fuel-Shutoff	-	
ISC	Idle Speed Control		
KS	Knock Sensor	Knock Sensor	
MAF	Mass Air Flow	Air Flow Meter	
MAP	Manifold Absolute Pressure	Manifold Pressure Intake Vacuum	
MC	Mixture Control	Electric Bleed Air Control Valve (EBCV) Mixture Control Valve (MCV) Electric Air Control Valve (EACV)	
MDP	Manifold Differential Pressure	-	
MFI	Multiport Fuel Injection	Electronic Fuel Injection (EFI)	
MIL	Malfunction Indicator Lamp	Check Engine Lamp	
MST	Manifold Surface Temperature		
MVZ	Manifold Vacuum Zone	-	
NVRAM	Non-Volatile Random Access Memory	-	
O2S	Oxygen Sensor	Oxygen Sensor, O ₂ Sensor (O ₂ S)	
OBD	On-Board Diagnostic	On-Board Diagnostic System (OBD)	
OC	Oxidation Catalytic Converter	Oxidation Catalyst Convert (OC), CCo	
OP	Open Loop	Open Loop	
PAIR	Pulsed Secondary Air Injection	Air Suction (AS)	
РСМ	Powertrain Control Module	-	
PNP	Park/Neutral Position	-	
PROM	Programmable Read Only Memory	-	
PSP	Power Steering Pressure	-	
РТОХ	Periodic Trap Oxidizer	Diesel Particulate Filter (DPF) Diesel Particulate Trap (DPT)	
RAM	Random Access Memory	Random Access Memory (RAM)	
RM	Relay Module	-	
ROM	Read Only Memory	Read Only Memory (ROM)	
RPM	Engine Speed	Engine Speed	
SC	Supercharger	Supercharger	
SCB	Supercharger Bypass	E-ABV	
SFI	Sequential Multiport Fuel Injection	Electronic Fuel Injection (EFI), Sequential Injection	
SPL	Smoke Puff Limiter	-	
SRI	Service Reminder Indicator	-	
SRT	System Readiness Test	-	
ST	Scan Tool	-	
ТВ	Throttle Body	Throttle Body	
ТВІ	Throttle Body Fuel Injection	Single Point Injection Central Fuel Injection (Ci)	
тс	Turbocharger	Turbocharger

OUTSIDE VEHICLE

GENERAL MAINTENANCE

The owners are responsible for these maintenance and inspection items.

They can be done by the owner or they can have them done at a service shop.

These items include those which should be checked on a daily basis, those which, in most cases, do not require (special) tools and those which are considered to be reasonable for the owner to do.

Items and procedures for general maintenance are as follows.

1. GENERAL NOTES

- Maintenance items may vary from country to country. Check the owner's manual supplement in which the maintenance schedule is shown.
- Every service item in the periodic maintenance schedule must be performed.
- Periodic maintenance service must be performed according to whichever interval in the periodic maintenance schedule occurs first, the odometer reading (miles) or the time interval (months).
- Maintenance service after the last period should be performed at the same interval as before unless otherwise noted.
- Failure to do even one item can cause the engine to run poorly and increase exhaust emissions.

2. TIRES

(a) Check the pressure with a gauge.

If necessary, adjust.

(b) Check for cuts, damage or excessive wear.

3. WHEEL NUTS

When checking the tires, check the nuts for looseness or for missing nuts.

If necessary, tighten them.

4. TIRE ROTATION

Check the owner's manual supplement in which the maintenance schedule is shown.

5. WINDSHIELD WIPER BLADES

Check for wear or cracks whenever they do not wipe clean.

If necessary, replace.

6. FLUID LEAKS

- (a) Check underneath for leaking fuel, oil, water or other fluid.
- (b) If you smell gasoline fumes or notice any leak, have the cause found and corrected.

7. DOORS AND ENGINE HOOD

- (a) Check that all doors and the tailgate operate smoothly, and that all latches lock securely.
- (b) Check that the engine hood secondary latch secures the hood from opening when the primary latch is released.

MA008-01

INSIDE VEHICLE

GENERAL MAINTENANCE

The owners are responsible for these maintenance and inspection items.

They can be done by the owner or they can have them done at a service shop.

These items include those which should be checked on a daily basis, those which, in most cases, do not require (special) tools and those which are considered to be reasonable for the owner to do.

Items and procedures for general maintenance are as follows.

1. GENERAL NOTES

- Maintenance items may vary from country to country. Check the owner's manual supplement in which the maintenance schedule is shown.
- Every service item in the periodic maintenance schedule must be performed.
- Periodic maintenance service must be performed according to whichever interval in the periodic maintenance schedule occurs first, the odometer reading (miles) or the time interval (months).
- Maintenance service after the last period should be performed at the same interval as before unless otherwise noted.
- Failure to do even one item can cause the engine to run poorly and increase exhaust emissions.

2. LIGHTS

- (a) Check that the headlights, stop lights, taillights, turn signal lights, and other lights are all working.
- (b) Check the headlight aim.

3. WARNING LIGHTS AND BUZZERS

Check that all warning lights and buzzers function properly.

4. HORN

Check that it is working.

5. WINDSHIELD

Check for scratches, pits or abrasions.

6. WINDSHIELD WIPER AND WASHER

- (a) Check operation of the wipers and washer.
- (b) Check that the wipers do not streak.

7. WINDSHIELD DEFROSTER

Check that air comes out from the defroster outlet when operating the heater or air conditioner.

8. REAR VIEW MIRROR

Check that it is mounted securely.

9. SUN VISORS

Check that they move freely and are mounted securely.

10. STEERING WHEEL

Check that it has the specified freeplay. Be alert for changes in steering condition, such as hard steering, excessive freeplay or strange noises.

11. SEATS

- (a) Check that the seat adjusters operate smoothly.
- (b) Check that all latches lock securely in any position.
- (c) Check that the head restraints move up and down smoothly and that the locks hold securely in any latch position.
- (d) For fold-down seat backs, check that the latches lock securely.

12. SEAT BELTS

- (a) Check that the seat belt system such as the buckles, retractors and anchors operate properly and smoothly.
- (b) Check that the belt webbing is not cut, frayed, worn or dameged.

Date :

MA009-02

13. ACCELERATOR PEDAL

Check the pedal for smooth operation and uneven pedal effort or catching.

14. CLUTCH PEDAL (See page CL-2)

- (a) Check the pedal for smooth operation.
- (b) Check that the pedal has the proper freeplay.

15. BRAKE PEDAL

- (a) Check the pedal for smooth operation.
- (b) Check that the pedal has the proper reserve distance and freeplay.
- (c) Check the brake booster function.

16. BRAKES

At a safe place, check that the brakes do not pull to one side when applied.

17. PARKING BRAKE

- (a) Check that the lever has the proper travel.
- (b) On a safe incline, check that the vehicle is held securely with only the parking brake applied.

18. AUTOMATIC TRANSMISSION "PARK" MECHANISM

- (a) Check the lock release button of the selector lever for proper and smooth operation.
- (b) On a safe incline, check that the vehicle is held securely with the selector lever in the P position and all brakes released.

UNDER HOOD

GENERAL MAINTENANCE

1. GENERAL NOTES

- Maintenance items may vary from country to country. Check the owner's manual supplement in which the maintenance schedule is shown.
- Every service item in the periodic maintenance schedule must be performed.
- Periodic maintenance service must be performed according to whichever interval in the periodic maintenance schedule occurs first, the odometer reading (miles) or the time interval (months).
- Maintenance service after the last period should be performed at the same interval as before unless otherwise noted.
- Failure to do even one item can cause the engine to run poorly and increase exhaust emissions.

2. WINDSHIELD WASHER FLUID

Check that there is sufficient fluid in the tank.

3. ENGINE COOLANT LEVEL

Check that the coolant level is between the FULL and LOW lines on the see-through reservoir.

4. RADIATOR AND HOSES

- (a) Check that the front of the radiator is clean and not blocked with leaves, dirt or bugs.
- (b) Check the hoses for cracks, kinks, rot or loose connections.

5. BATTERY ELECTROLYTE LEVEL

Check that the electrolyte level of all battery cells is between the upper and lower level lines on the case.

6. BRAKE AND CLUTCH FLUID LEVELS

Check that the brake and clutch fluid levels are near the upper level line on the see-through reservoirs.

7. ENGINE DRIVE BELTS

Check all drive belts for fraying, cracks, wear or oiliness.

8. ENGINE OIL LEVEL

Check the level on the dipstick with the engine turned off.

9. POWER STEERING FLUID LEVEL

- (a) Check the level on the dipstick.
- (b) The level should be in the HOT or COLD range depending on the fluid temperature.

10. AUTOMATIC TRANSMISSION FLUID LEVEL

- (a) Park the vehicle on a level surface.
- (b) With the engine idling and the parking brake applied, shift the selector into all positions from the P to L, and then shift into the P position.
- (c) Pull out the dipstick and wipe off the fluid with a clean rag. Reinsert the dipstick and check that the fluid level is in the HOT range.
- (d) Do this check with the fluid at normal driving temperature (70 80° C, 158 176°F).

HINT:

Wait until the engine cools down (approx. 30 min.) before checking the fluid level after extended driving at high speeds, in hot weather, in heavy traffic or pulling a trailer.

11. EXHAUST SYSTEM

If any change in the sound of the exhaust or smell of the exhaust fumes is noticed, have the cause located and corrected.

MA00A-01

MA00B-05

ENGINE INSPECTION

HINT:

Inspect these items when the engine is cold.

- 1. 5VZ-FE: REPLACE TIMING BELT (See pages EM-13 and EM-19)
- 2. ADJUST VALVE CLEARANCE (2RZ-FE, 3RZ-FE: See page EM-5) (5VZ-FE: See page EM-4)
- 3. INSPECT DRIVE BELTS (2RZ-FE, 3RZ-FE: See pages CH-1, SR-3 and AC-16) (5VZ-FE: See pages CH-1, SR-3 and AC-16)
- 4. REPLACE ENGINE OIL AND OIL FILTER (2RZ-FE, 3RZ-FE: See page LU-2)
 - (5VZ-FE: See page LU-2)
- 5. REPLACE ENGINE COOLANT (2RZ-FE, 3RZ-FE: See page CO-1) (5VZ-FE: See page CO-2)
- 6. INSPECT EXHAUST PIPES AND MOUNTINGS

Visually inspect the pipes, hangers and connections for severe corrosion, leaks or damage.

- 7. INSPECT AIR FILTER
- (a) Visually check that the air filter is not excessively dirty or oily.

HINT:

Oiliness may indicate a stuck PCV valve.

If necessary, replace the air filter.

- (b) Clean the air filter with compressed air.
 First blow from the inside thoroughly, then blow off the outside of the air filter.
- 8. REPLACE AIR FILTER

Replace the air filter with a new one.

9. INSPECT FUEL LINES AND CONNECTIONS, AND FUEL TANK VAPOR VENT SYSTEM HOSES AND FUEL TANK BAND

Visually inspect the fuel lines for cracks, leakage loose connections, deformation or tank band looseness.

- 10. REPLACE GASKET IN FUEL TANK CAP (2RZ-FE, 3RZ-FE: See page EC-5) (5VZ-FE: See page EC-5)
- 11. REPLACE SPARK PLUGS (2RZ-FE, 3RZ-FE: See page IG-1) (5VZ-FE: See page IG-1)
- 12. INSPECT CHARCOAL CANISTER (2RZ-FE, 3RZ-FE: See page EC-5) (5VZ-FE: See page EC-5)

MA-6

BRAKE INSPECTION

1. INSPECT BRAKE LINE PIPES AND HOSES HINT:

Inspect in a well-lighted area. Inspect the entire circumference and length of the brake hoses using a mirror as required. Turn the front wheels fully right or left before inspecting the front brake.

MA04L-01

(a) Check all brake lines and hoses.

- Check for damage.
- Check for wear.
- Check for deformation.
- Check for cracks.
- Check for corrosion.
- Check for leaks.
- Check for bends.
- Check for twists.
- (b) Check all clamps for tightness and connections for leakage.
- (c) Check that the hoses and lines are clear of sharp edges, moving parts and the exhaust system.
- (d) Check that the lines installed in grommets pass through the center of the grommets.
- 2. INSPECT FRONT BRAKE PADS AND DISCS (2WD: See page BR-27)

(4WD and PRE RUNNER: See page BR-33)

HINT:

If a squealing or scraping noise occurs from the brake during driving, check the pad wear indicator.

If there are traces of the indicator contacting the disc rotor, the disc pad should be replaced.

3. INSPECT REAR BRAKE LININGS AND DRUMS (2WD: See page BR-39) (4WD and PRE RUNNER: See page BR-45)

CHASSIS

INSPECTION

1. INSPECT STEERING LINKAGE

- (a) Check the steering wheel freeplay (See page SR-9).
- (b) Check the steering linkage for looseness or damage.
 - Check that the tie rod ends do not have excessive play.
 - Check that the dust seals and boots are not damaged.
 - Check that the boot clamps are not loose.

2. INSPECT STEERING GEAR HOUSING OIL

Check the steering gear housing for oil leaks.

If leakage is found, check for cause and repair.

3. INSPECT BALL JOINTS AND DUST COVERS

- (a) Inspect the ball joints for excessive looseness.
- (b) Inspect the dust cover for damage.
- 4. 4WD:

INSPECT DRIVE SHAFT BOOTS

Inspect the drive shaft boots for clamp looseness, grease leakage or damage.

5. CHECK OIL LEVEL IN MANUAL TRANSMISSION, TRANSFER AND DIFFERENTIAL

Remove the filler plug and feel inside the hole with your finger. Check that the oil comes to within 5 mm (0.20 in.) of the bottom edge of the hole.

If the level is low, add oil until it begins to run out of the filler hole.

- Transmission oil (2WD for R150, R150F): See page MT-6. Transmission oil (4WD for R150, R150F): See page MT-11. Transmission oil (2WD for W59): See page MT-7. Transmission oil (4WD for W59): See page MT-12. Transfer oil: See page TR-9. Front differential oil (4WD): See page SA-64. Rear differential oil (2RZ-FE): See page SA-156. Rear differential oil (3RZ-FE, 5VZ-FE w/o Diff. lock): See page SA-174. Rear differential oil (3RZ-FE, 5VZ-FE w/ Diff. lock): See page SA-195. REPLACE MANUAL TRANSMISSION, TRANSFER AND DIFFERENTIAL OIL
- 6. REPLACE MANUAL TRANSMISSION, ⁻(a) Remove the drain plug and drain the oil.
- (b) Reinstall drain plug securely.
- (c) Add new oil until it begins to run out of the filler hole.

Transmission oil (2WD for R150, R150F): See page MT-6.

Transmission oil (4WD for R150, R150F): See page MT-11.

Transmission oil (2WD for W59): See page MT-7.

Transmission oil (4WD for W59): See page MT-12.

Transfer oil: See page TR-9.

Front differential oil (4WD): See page SA-64.

Rear differential oil (2RZ-FE): See page SA-156.

Rear differential oil (3RZ-FE, 5VZ-FE w/o Diff. lock): See page SA-174.

Rear differential oil (3RZ-FE, 5VZ-FE w/ Diff. lock): See page SA-195.

- 7. CHECK FLUID LEVEL IN AUTOMATIC TRANSMISSION (See page DI-277)
- 8. REPLACE AUTOMATIC TRANSMISSION FLUID (See page DI-277)

MA04M-01

9. LUBRICATE PROPELLER SHAFT AND TIGHTEN BOLTS

(4WD and PRE RUNNER: See page PR-16)

10. ROTATE TIRES (See page SA-3)

(a) 4WD:

Lubricate propeller shaft, referring to the lubrication chart. Before pumping in grease, wipe off any mud and dust on the grease fitting.

Grease grade: Spider: Lithium base chassis grease NLGI No. 2 Slide yoke and double-cardan joint: Molybdenum disulphide lithium base chassis grease NLGI No. 2

BODY

(b)

INSPECTION

TIGHTEN BOLTS AND NUTS ON CHASSIS AND BODY

- (a) Where necessary, tighten all parts of the chassis.
 - Front axle and suspension
 - Drive train
 - Rear axle and suspension
 - Brake system
 - Engine mounting, etc.
 - Where necessary, tighten all parts of the body.
 - Seat belt system
 - Seats
 - Doors and hood
 - Body mountings
 - Fuel tank
 - Exhaust pipe system, etc.

DI12A-08

- **PRE-CHECK**
- 1. DIAGNOSIS SYSTEM
- (a) Description
  - When troubleshooting OBD II vehicles, the only difference from the usual troubleshooting procedure is that you need to connect the vehicle to the OBD II scan tool complying with SAE J1978 or TOYOTA hand-held tester, and read off various data output from the vehicle's ECM.
  - OBD II regulations require that the vehicle's onboard computer lights up the Malfunction Indicator Light (MIL) on the instrument panel when the computer detects a malfunction in the emission control system/components or in the powertrain control components which affect vehicle emissions, or a malfunction in the computer. In addition to the MIL lighting up when a malfunction is detected, the applicable Diagnostic Trouble Codes (DTCs) prescribed by SAE J2012 are recorded in the ECM memory (See page DI-14).

If the malfunction does not reoccur in 3 consecutive trips, the MIL goes off automatically but the DTCs remain recorded in the ECM memory.

To check the DTCs, connect the OBD II scan tool or TOYOTA hand-held tester to the Data Link Connector 3 (DLC3) on the vehicle. The OBD II scan tool or TOYOTA hand-held tester also enables you to erase the DTCs and check freeze frame data and various forms of engine data (For operating instructions, see the OBD II scan tool's instruction book.). DTCs include SAE controlled codes and manufacturer controlled codes. SAE controlled codes must be set as prescribed by the SAE, while manufacturer controlled codes can be set freely by a manufacturer within the prescribed limits (See DTC chart on page DI-14).

Date :

DLC3

**TOYOTA Hand-Held Tester** 

P22300

DI12B-12

- The diagnosis system operates in the normal mode during normal vehicle use. It also has a check mode for technicians to simulate malfunction symptoms and troubleshoot. Most DTCs use 2 trip detection logic* to prevent an erroneous detection and ensure the malfunction detection. By switching the ECM to the check mode when troubleshooting, a technician can cause the MIL to light up for a malfunction that is only detected once or momentarily. (TOYOTA hand-held tester only) (See step 2)
- *2 trip detection logic:
   When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory. (1st trip)

If the same malfunction is detected again during the second drive test, this second detection causes the MIL to light up. (2nd trip) (However, the ignition switch must be turned OFF between the 1st trip and 2nd trip.)

Freeze frame data:

Freeze frame data records the engine condition when a misfire (DTCs P0300 - P0304) or fuel trim malfunction (DTCs P0171 and P0172) or other malfunction (first malfunction only) is detected. Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when the malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

Priorities for troubleshooting:

If troubleshooting priorities for multiple DTCs are given in the applicable DTC chart, these should be followed.

If no instructions are given, troubleshoot DTCs according to the following priorities.

- (1) DTCs other than fuel trim malfunction (DTCs P0171 and P0172), EGR (DTCs P0401 and P0402), and misfire (DTCs P0300 P0304).
- (2) Fuel trim malfunction (DTCs P0171 and P0172), and EGR (DTCs P0401 and P0402).
- (3) Misfire (DTCs P0300 P0304).

(b) Check the DLC3.

The vehicle's ECM uses the ISO 9141-2 communication protocol. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 9141-2 format.

Terminal No.	Connection/Voltage or Resistance	Condition
7	Bus (+) Line/Pulse generation	During transmission
4	Chassis Ground - Body Ground/1 $\Omega$ or less	Always
5	Signal Ground - Body Ground/1 $\Omega$ or less	Always
16	Battery Positive - Body Ground/9 - 14 V	Always

HINT:

If your display shows UNABLE TO CONNECT TO VEHICLE when you have connected the cable of the OBD II scan tool or TOYOTA hand-held tester to the DLC3, turned the ignition switch ON and operated the scan tool, there is a problem on the vehicle side or tool side.

- If the communication is normal when the tool is connected to another vehicle, inspect the DLC3 of the original vehicle.
- If the communication is still not possible when the tool is connected to another vehicle, the problem is probably in the tool itself, so consult the Service Department listed in the tool's instruction manual.

## 2. Normal Mode:

## INSPECT DIAGNOSIS

- (a) Check the MIL.
  - (1) The MIL comes on when the ignition switch is turned ON and the engine is not running.

## HINT:

If the MIL does not light up, troubleshoot the combination meter (See page  $\mathsf{BE-2}$  ).

(2) When the engine started, the MIL should go off. If the light remains on, the diagnosis system has detected a malfunction or abnormality in the system.

(b) Check the DTC.

NOTICE:

 If there is no DTC in the normal mode, check the 1st trip DTC using Continuous Test Results function (Mode 7 for SAE J1979) on the OBD II scan tool or TOYOTA hand-held tester.

2001 TOYOTA TACOMA (RM835U)

#### TOYOTA hand-held tester only:

When the diagnosis system is switched from the normal mode to the check mode, all the DTCs and freeze frame data recorded in the normal mode will be erased. So before switching modes, always check the DTCs and freeze frame data, and note them down.

- Prepare the OBD II scan tool (complying with SAE J1978) or TOYOTA hand-held tester.
- (2) Connect the OBD II scan tool or TOYOTA handheld tester to the DLC3 at the lower left of the instrument panel.
- (3) Turn the ignition switch ON and turn the OBD II scan tool or TOYOTA hand-held tester switch ON.
- (4) Use the OBD II scan tool or TOYOTA hand-held tester to check the DTCs and freeze frame data and note them down (For operating instructions, see the OBD II scan tool's instruction book.).

If there is no DTC in the normal mode, check the 1st trip DTC using Continuous Test Results function (Mode 7 for SAE J1979) on the OBD II scan tool or TOYOTA hand-held tester.

(5) See page DI-14 to confirm the details of the DTCs.

NOTICE:

- When simulating symptoms with an OBD II scan tool (excluding TOYOTA hand-held tester) to check the DTCs, use the normal mode. For code on the DTC chart subject to "2 trip detection logic", perform the following either action.
- Turn the ignition switch OFF after the symptom is simulated the first time. Then repeat the simulation process again. When the problem has been simulated twice, the MIL lights up and the DTCs are recorded in the ECM.
- Check the 1st trip DTC using Mode 7 (Continuous Test Results) for SAE J1979.
- (c) Clear the DTC.

The DTCs and freeze frame data will be erased by either action.

- Operating the OBD II scan tool (complying with SAE J1978) or TOYOTA hand-held tester to erase the codes (See the OBD II scan tool's instruction book for operating instructions.).
- Disconnecting the battery terminals or EFI fuse.

## NOTICE:

If the TOYOTA hand-held tester switches the ECM from the normal mode to the check mode or vice-versa, or if the ignition switch is turned from ON to ACC or OFF during the check mode, the DTCs and freeze frame data will be erased.

3. Check Mode:

## INSPECT DIAGNOSIS

HINT:

TOYOTA hand-held tester only:

Compared to the normal mode, the check mode has furthur sensitivity to detect malfunctions.

Furthermore, the same diagnostic items which are detected in the normal mode can also be detected in the check mode. Check the DTC.

- (1) Initial conditions
  - Battery positive voltage 11 V or more
  - Throttle valve fully closed
  - Transmission in the P or N position
  - A/C switched OFF
- (2) Turn the ignition switch OFF.
- (3) Prepare the TOYOTA hand-held tester.
- (4) Connect the TOYOTA hand-held tester to the DLC3 in the at the lower left of the instrument panel.
- (5) Turn the ignition switch ON and push the TOYOTA hand-held tester ON.

(6) Switch the TOYOTA hand-held tester from the normal mode to the check mode. (Check that the MIL flashes.)

## NOTICE:

If the TOYOTA hand-held tester switches the ECM from the normal mode to the check mode or vice-versa, or if the ignition switch is turned from ON to ACC or OFF during the check mode, the DTCs and freeze frame data will be erased.

- (7) Start the engine (The MIL goes off after the engine started.).
- (8) Simulate the conditions of the malfunction described by the customer.

## NOTICE:

# Leave the ignition switch ON until you have checked the DTCs, etc.

(9) After simulating the malfunction conditions, use the TOYOTA hand-held tester diagnosis selector to check the DTCs and freeze frame data, etc.

Date :

#### HINT:

Take care not to turn the ignition switch OFF. Turning the ignition switch OFF switches the diagnosis system from the check mode to the normal mode, so all the DTCs, etc. are erased.

(10) After checking the DTC, inspect the applicable circuit.

## 4. FAIL-SAFE CHART

If any of the following codes is recorded, the ECM enters fail-safe mode.

DTC No.	Fail-Safe Operation	Fail-Safe Deactivation Conditions
P0100	<ul> <li>Ognition timing fixed at 5° BTDC</li> <li>Onjection time fixed</li> <li>Starting</li></ul>	Returned to normal condition
P0110	Intake air temperature fixed at 20°C (68°F)	Returned to normal condition
P0115	Engine coolant temperature fixed at 80°C ( 176°F)	Returned to normal condition
P0120	VTA fixed at 0°	The following condition must be repeated at least 2 times consecutively When closed throttle position switch is ON: VTA $> 0.1$ V and $< 0.95$ V
P0135 [*] P0141	The heater circuit in which an abnormality is detected is turned off	Ignition switch OFF
P0325	Max. timing retardation	Ignition switch OFF
P0340	Fuel cut	Returned to normal condition
P1300 P1310	Fuel cut	Returned to normal condition

*: California Spec.

## 5. CHECK FOR INTERMITTENT PROBLEMS

HINT:

TOYOTA hand-held tester only:

By putting the vehicle's ECM in the check mode, 1 trip detection logic is possible instead of 2 trip detection logic and sensitivity to detect open circuits is increased. This makes it easier to detect intermittent problems.

- (a) Clear the DTCs (See step 2).
- (b) Set the check mode (See step 3).
- (c) Perform a simulation test (See page IN-18).
- (d) Check the connector and terminal (See page IN-28).
- (e) Handle the connector (See page IN-28).

## 6. BASIC INSPECTION

When the malfunction code is not confirmed in the DTC check, troubleshooting should be performed in all the possible circuits considered as a cause of the problems. In many cases, by carrying out the basic engine check shown in the following flow chart, the location causing the problem can be found quickly and efficiently. Therefore, use of this check is essential to the engine troubleshooting.

|--|

## PREPARATION:

- (a) Warm up the engine to the normal operating temperature.
- (b) Switch off all the accessories.
- (c) Switch off the A/C.
- (d) Shift the transmission into the N position.
- (e) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3 of the vehicle.

## CHECK:

Use the CURRENT DATA to check the idle speed.

## <u>OK:</u>

## Idle speed: 650 - 750 rpm

2001 TOYOTA TACOMA (RM835U)

DI-9

Proceed to problem symptoms table on page DI-21.

OK

- (a) Be sure that the enough fuel is in the tank.
- (b) Connect the TOYOTA hand-held tester to the DLC3.
- (c) Turn the ignition switch ON and push the TOYOTA handheld tester main switch ON.
- (d) Use the ACTIVE TEST mode to operate the fuel pump.
- (e) Please refer to the TOYOTA hand-held tester operator's manual for further details.

2001 TOYOTA TACOMA (RM835U)

Fuel Return Hose

P25111

(f) If you have no TOYOTA hand-held tester, connect the positive (+) and negative (-) leads from the battery to the fuel pump connector (See page SF-5).

## CHECK:

Check for the fuel pressure in the fuel return hose when it is pinched by hand.

HINT:

At this time, you will hear the fuel flowing noise.

OK

8

Check for spark.

## California Spec.: PREPARATION:

- (a) Remove the ignition coil.
- (b) Remove the spark plug.
- (c) Install the spark plug to the ignition coil.
- (d) Disconnect the injector connector.
- (e) Ground the spark plug.

## CHECK:

Check if spark occurs while the engine is being cranked. **NOTICE:** 

To prevent excess fuel from being injected from the injectors during this test, don't crank the engine for more than 5 - 10 seconds at a time.

## Except California Spec.:

## PREPARATION:

- (a) Disconnect the high-tension cord from the spark plug.
- (b) Remove the spark plug.
- (c) Install the spark plug to the high-tension cord.
- (d) Disconnect the injector connector.
- (e) Ground the spark plug.

## CHECK:

Check if spark occurs while the engine is being cranked. **NOTICE:** 

To prevent excess fuel from being injected from the injectors during this test, don't crank the engine for more than 5 - 10 seconds at a time.

NG Proceed to page IG-1 , and continue to trouble-shoot.

Proceed to problem symptoms table on page DI-21 .

## 7. ENGINE OPERATING CONDITION

## NOTICE:

The values given below for "Normal Condition" are representative values, so a vehicle may still be normal even if its value differs from those listed here. So do not solely depend on the "Normal Condition" here when deciding whether a part is faulty or not.

(a) CARB mandated signals.

TOYOTA hand-held tester display	Measurement Item	Normal Condition*
FUEL SYS #1	Fuel System Bank 1 OPEN: Air-fuel ratio feedback stopped CLOSED: Air-fuel ratio feedback operating	Idling after warming up: CLOSED
CALC LOAD	Calculator Load: Current intake air volume as a proportion of max. intake air volume	Idling: 2RZ-FE: 17.2 - 24.6 % 3RZ-FE: 15.9 - 22.8 % Racing without load (2,500 rpm): 2RZ-FE: 16.4 - 23.1 % 3RZ-FE: 15.2 - 22.1 %

EGRT GAS	EGR Gas Temp. Sensor Value	EGR not operating: Temp. between intake air temp. and engine coolant temp.
EGR SYSTEM*2	EGR System Operating Condition	Idling: OFF
A/C CUT SIG	A/C Cut Signal	A/C S/W OFF: ON
FUEL PUMP	Fuel Pump Signal	Idling: ON
EVAP (PURGE) VSV	EVAP VSV Signal	Idling: Below 30 %
VAPOR PRESS VSV	Vapor Pressure VSV Signal	VSV operating: ON (TANK)
TOTAL FT B1	Total Fuel Trim Bank 1: Average value for fuel trim system of bank 1	Idling: 0.8 - 1.2 V
O2 LR B1 S1*3	Oxygen Sensor Lean Rich Bank 1 Sensor 1: Response time for oxygen sensor output to switch from lean to rich	Idling after warming up: 0 - 1,000 msec.
O2 RL B1 S1*3	Oxygen Sensor Rich Lean Bank 1 Sensor 1: Response time for oxygen sensor output to switch from rich to lean	Idling after warming up: 0 - 1,000 msec.

#### (b) TOYOTA enhanced signals.

*¹: If no conditions are specifically stated for "Idling", it means the shift lever is at N or P position, the A/C switch is OFF and all accessory switches are OFF.

*2: Except 2RZ-FE for California Spec.

*³: Except California Spec.

## DIAGNOSTIC TROUBLE CODE CHART

## HINT:

Parameters listed in the chart may not be exactly the same as your readings due to the type of instrument or other factors.

If a malfunction code is displayed during the DTC check in the check mode, check the circuit for the codes listed in the table below. For details of each code, refer to the "See page" under the respective "DTC No." in the DTC chart.

## SAE DEFINED

DTC No. (See page)	Detection Item	Trouble Area	MIL* ¹	Memory

DI12F-10

## **CIRCUIT INSPECTION**

DTC	P0100	Mass Air Flow Circuit Malfunction
-----	-------	-----------------------------------

## **CIRCUIT DESCRIPTION**

The mass air flow meter uses a platinum hot wire. The hot wire air flow meter consists of a platinum hot wire, thermistor and a control circuit installed in a plastic housing. the hot wire air flow meter works on the principle that the hot wire and thermistor located in the intake air bypass of the housing detect any changes in the intake air temperature.

The hot wire is maintained at the set temperature by controlling the current flow through the hot wire. This current flow is ten measured as the output voltage of the mass air flow meter.

The circuit is constructed so that the platinum hot wire and thermistor provide a bridge circuit with the power transistor controlled so that the potential of A and B remains equal to maintain the set temperature.

DTC No.	DTC Detection Condition	Trouble Area
P0100	Open or short in mass air flow meter circuit with more than 3 sec. engine speed 4,000 rpm or less	Open or short in mass air flow meter circuit
	Open or short in mass air flow meter circuit with more than 3 sec. engine speed 4,000 rpm or more (2 trip detection logic)	Mass air flow meter     ECM

HINT:

After confirming DTC P0100, use the OBD II scan tool or TOYOTA hand-held tester to confirm the mass air flow ratio from the CURRENT DATA.

Mass Air Flow Value (gm/sec.)	Malfunction
Approx. 0	<ul><li>Mass air flow meter power source circuit open</li><li>●/G circuit open or short</li></ul>
202.2 or more	€2G (California Spec.), E3 (Except California Spec.) circuit open

DI12G-10

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

## HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

# 1 Connect OBD II scan tool or TOYOTA hand-held tester, and read value of mass air flow rate.

## PREPARATION:

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.
- (c) Start the engine.

## CHECK:

Read the mass air flow rate on the OBD II scan tool or TOYOTA hand-held tester.

#### **RESULT:**

	Туре І	Туре II
Mass Air Flow Rate (gm/sec.)	Approx. 0	202.2 gm/sec. or more
	Type I Go to step 2.	
	Type II Go to step 5.	

#### DI-24

and	FCM	(See	nade	IN-28	۱
and			page	111-20	J•

ОК

Replace mass air flow meter.

5

Check continuity between terminal E2G of ECM connector and body ground.

## PREPARATION:

Remove the glove compartment (See page SF-49). CHECK:

Check the continuity between terminal E2G or E3 of the ECM connector and the body ground.

<u>OK:</u>

NG

Continuity (1  $\Omega$  or less)

 $\rangle$  Check and replace ECM (See page IN-28).

OK

6	Check for open in harness and connector between mass air flow meter and ECM (See page IN-28 ).			
	NG Repair or replace harness or connector.			
ОК				
Repla	ce mass air flow meter.			

DTC	P0101	Mass Air Flow Circuit Range/Performance Problem
-----	-------	----------------------------------------------------

## **CIRCUIT DESCRIPTION**

Refer to DTC P0100 on page DI-22.

DTC No.	DTC Detection Condition	Trouble Area
Parat	After engine is warmed up, conditions (a) and (b) continue with more than 10 sec. engine speed 900 rpm or less: (2 trip detection logic) (a) Throttle valve fully closed (b) Mass air flow meter output > 2.2 V	
P0101	<ul> <li>Conditions (a) and (b) continue with more than 10 sec. engine speed 1,850 rpm or more: (2 trip detection logic)</li> <li>(a) VTA &lt; 0.75 V</li> <li>(b) Mass air flow meter output &lt; 0.97 V for 2RZ-FE or Mass air flow meter output &lt; 1.0 V for 3RZ-FE</li> </ul>	●viass air flow meter

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI12H-10

DI12I-10

DTC

P0110

## Intake Air Temp. Circuit Malfunction

## **CIRCUIT DESCRIPTION**

The intake air temperature sensor is Built Into Mass Air Flow Meter and senses the intake air temperature.

A thermistor built in the sensor changes the resistance value according to the intake air temperature. The lower the intake air temperature, the greater the thermistor resistance value, and the higher the intake air temperature, the lower the thermistor resistance value (See Fig. 1).

The intake air temperature sensor is connected to the ECM (See below). The 5 V power source voltage in the ECM is applied to the intake air temperature sensor from terminal THA via a resistor R.

That is, resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes in accordance with changes in the intake air temperature, the potential at terminal THA also changes. Based on this signal, the ECM increases the fuel injection volume to improve driveability during cold engine operation.

DTC No.	DTC Detection Condition	Trouble Area
P0110	Open or short in intake air temp. sensor circuit	<ul> <li>Open or short in intake air temp. sensor circuit</li> <li>Ontake air temp. sensor (built into mass air flow meter)</li> <li>ECM</li> </ul>

## HINT:

After confirming DTC P110, use the OBD II scan tool or TOYOTA nand-held tester to confirm the intake air temperature from the CURRENT DATA.

Temperature Displayed	Malfunction
-40 °C (-40°F)	Open circuit
140°C (284°F) or more	Short circuit

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

- If DTCs P0110, P0115 and P0120 are output simultaneously, E2 (sensor ground) may be open.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

# Connect OBD II scan tool or TOYOTA hand-held tester, and read value of intake air temperature.

## PREPARATION:

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to DLC3.
- (b) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.

## CHECK:

1

Read the temperature value on the OBD II scan tool or TOYOTA hand-held tester.

#### <u>OK:</u>

## Same value as the actual intake temperature.

HINT:

- If there is open circuit, OBD II scan tool or TOYOTA hand-held tester indicates -40°C (-40°F).
- If there is short circuit, OBD II scan tool or TOYOTA hand-held tester indicates 140°C (284°F) or more.

-40 °C (-40°F) ... Go to step 2. 140 °C (284°F) or more ... Go to step 4.

ок	

Check for intermittent problems (See page DI-3 ).

# Engine Coolant Temp. Circuit Malfunction

# **CIRCUIT DESCRIPTION**

P0115

A thermistor built into the engine coolant temperature sensor changes the resistance value according to the engine coolant temperature.

The structure of the sensor and connection to the ECM is the same as in the DTC P0110 shown on page DI-27.

DTC No.	DTC Detection Condition	Trouble Area
P0115	Open or short in engine coolant temp. sensor circuit	<ul> <li>Open or short in engine coolant temp. sensor circuit</li> <li>Engine coolant temp. sensor</li> <li>ECM</li> </ul>

HINT:

After confirming DTC P0115, use the OBD II scan tool or TOYOTA hand-held tester to confirm the engine coolant temperature from the CURRENT DATA.

Temperature Displayed	Malfunction
-40 °C (-40 °F)	Open circuit
140°C (284°F) or more	Short circuit

### WIRING DIAGRAM

# **INSPECTION PROCEDURE**

HINT:

- If DTCs P0110, P0115 and P0120 are output simultaneously, E2 (sensor ground) may be open.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1	Connect OBD II scan tool or TOYOTA hand-held tester, and read value of engine
	coolant temperature.

### **PREPARATION:**

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.

### CHECK:

Read the temperature value on the OBD II scan tool or TOYOTA hand-held tester.

OK:

### Same as actual engine coolant temperature.

HINT:

- If there is open circuit, OBD II scan tool or TOYOTA hand-held tester indicates -40°C (-40°F).
- If there is open circuit, OBD II scan tool or TOYOTA hand-held tester indicates 140 °C (284 °F) or more.

OK

Check for intermittent problems (See page DI-3).

#### 2 Check for open in harness or ECM. **PREPARATION:** ON ſ (a) Disconnect the engine coolant temperature sensor con-ECM nector. Engine Coolant Temp. 5 V Connect the sensor wire harness terminals together. (b) Sensor 12 2 THW Turn the ignition switch ON. (E7 (c) 18 CHECK: E2 E7 Read the temperature value on the OBD II scan tool or TOYO-1 TA hand-held tester. Y BE6653 OK: A12237 A12232 Temperature value: 140°C (284°F) or more Confirm good connection at sensor. If OK, re-OK place engine coolant temperature sensor.

# 3 Check for open in harness or ECM.

### PREPARATION:

- (a) Remove the glove compartment (See page SF-49).
- (b) Connect between terminals THW and E2 of the ECM connector.

### HINT:

The engine coolant temperature sensor connector is disconnected. Before checking, do a visual and contact pressure check for the ECM connector (See page IN-28).

(c) Turn the ignition switch ON.

### CHECK:

Read the temperature value on the OBD II scan tool or TOYO-TA hand-held tester.

### <u>OK:</u>

### Temperature value: 140°C (284°F) or more

ок

Open in harness between terminal E2 or THW, repair or replace harness.

NG

# Confirm good connection at ECM. If OK, replace ECM.

### DI-34

# DTC P0116 Engine Coolant Temp. Circuit Range/Performance Problem

# **CIRCUIT DESCRIPTION**

### Refer to DTC P0115 on page DI-31.

DTC No.	DTC Detection Condition	Trouble Area	
P0116	If THW < -6.7°C (19.4°F) or THA < -6.7°C (19.4°F) 20 min. or more after starting engine, engine coolant temp. sensor value is 15°C (59°F) or less (2 trip detection logic)		
	If THW $\square$ -6.7 °C (19.4 °F) and THA < -6.7 °C (19.4 °F) and 10 °C (50 °F) at engine start, 5 min. or more after starting en- gine, engine coolant temp. sensor value is 30 °C (86 °F) or less (2 trip detection logic)		
	If THW < 10°C (50°F) and THA < 10°C (50°F) at engine start, 2 min. or more after starting engine, engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	Cooling system	
	<ul> <li>When THW 2 35°C (95°F) and 60°C (140°F), THA &lt;</li> <li>-6.7°C (19.4°F) when starting engine, conditions (a) and (b) continue (2 trip detection logic)</li> <li>(a) Vehicle speed is changing (Not stable)</li> <li>(b) Water temp. change is lower than 3°C (5.4°F) from water temp. since when starting engine</li> </ul>		
	In case that reading value of water temp. sensor will not change more than $1^{\circ}C(1.8^{\circ}F)$ even after repeating 6 trips (detection logic) of adjusting speed pattern with THW more than $60^{\circ}C(140^{\circ}F)$ when starting engine		

### **INSPECTION PROCEDURE**

HINT:

- If DTCs P0115 and P0116 are output simultaneously, engine coolant temp. sensor circuit may be open.
   Perform troubleshooting of DTC P0115 first.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

ΟΚ

Replace thermostat.

Replace engine coolant temperature sensor.

DI6WO-02

# DTC

P0120

# Throttle/Pedal Position Sensor/Switch "A" Circuit Malfunction

# **CIRCUIT DESCRIPTION**

The throttle position sensor is mounted in the throttle body and detects the throttle valve opening angle.

When the throttle valve is fully closed, a voltage of approximately 0.3 - 0.8 V is applied to terminal VTA of the ECM. The voltage applied to the terminals VTA of the ECM increases in proportion to the opening angle of the throttle valve and becomes approximately 3.2 - 4.9 V when the throttle valve is fully opened. The ECM judges the vehicle driving conditions from these signals input from terminal VTA, uses it as one of the conditions to decide the air-fuel ratio correction, power increase correction and fuel-cut control etc.

DTC No.	DTC Detection Condition	Trouble Area
P0120	Condition (a) or (b) continues with more than 5 sec.: (a) VTA < 0.1 V	<ul><li>Dpen or short in throttle position sensor circuit</li><li>Throttle position sensor</li></ul>
	(b) VTA > 4.9 V	<b>E</b> CM

### HINT:

After confirming DTC P0120, use the OBD II scan tool or TOYOTA hand-held tester to confirm the throttle valve opening percentage and closed throttle position switch condition.

0 %	0 %	<ul><li>/C circuit open</li><li>/TA circuit open or short</li></ul>
Approx. 100 %	Approx. 100 %	€2 circuit open

### WIRING DIAGRAM

### INSPECTION PROCEDURE

HINT:

- If DTCs P0110, P0115 and P0120 are output simultaneously, E2 (sensor ground) may be open.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

### 1 Connect OBD II scan tool or TOYOTA hand-held tester, and read throttle valve opening percentage.

### **PREPARATION:**

- Connect the OBD II scan tool or TOYOTA hand-held tes-(a) ter to DLC3.
- (b) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.

### CHECK:

Read the throttle valve opening percentage.

OK:

Throttle valve	Throttle valve opening position expressed as percentage
Fully open	Approx. 75 %
Fully closed	Approx. 10 %

OK

$\setminus$	Check for intermittent problems (See page
	DI-3 ).

NG

2 Check voltage between terminal 2 of throttle position sensor connector and body ground.

### **PREPARATION:**

(a) Disconnect the throttle position sensor connector.

(b) Turn the ignition switch ON.

### CHECK:

NG

Measure the voltage between terminal 2 of the throttle position sensor connector and the body ground.

### <u>OK:</u>

Voltage: 4.5 - 5.5 V

Go to step 5.

OK

**DI-39** 

ОК

Check for open in harness and connector in VC circuit between ECM throttle position and sensor (See page IN-28).

DTC	P0121	Throttle/Pedal Position Sensor/Switch "A" Circuit Range/Performance Problem
-----	-------	--------------------------------------------------------------------------------

Refer to DTC P0120 on page DI-37.

DTC No.	DTC Detection Condition	Trouble Area
P0121	While vehicle speed drops from 30 km/h (19 mph) or more to 0 km/h (0 mph), output value of throttle position sensor is out of applicable range (2 trip detection logic)	Throttle position sensor

# **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI12M-10

DTC	P0121	Throttle/Pedal Position Sensor/Switch "A" Circuit Range/Performance Problem
-----	-------	--------------------------------------------------------------------------------

Refer to DTC P0120 on page DI-37.

DTC No.	DTC Detection Condition	Trouble Area
P0121	While vehicle speed drops from 30 km/h (19 mph) or more to 0 km/h (0 mph), output value of throttle position sensor is out of applicable range (2 trip detection logic)	Throttle position sensor

# **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI12M-10

DTC	P0125	Insufficient Coolant Temp. for Closed Loop Fuel Control
-----	-------	------------------------------------------------------------

To obtain a high purification rate for the CO, HC and NOx components of the exhaust gas, a three-way catalytic converter is used, but for the most efficient use of the three-way catalytic converter, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio.

The A/F sensor has the characteristic that provides output voltage* approximately proportional to the existing air-fuel ratio. The A/F sensor output voltage* is used to provide feedback for the ECM to control the air-fuel ratio.

By the A/F sensor output, the ECM can determine the deviation amount from the stoichiometric air-fuel ratio and control the proper injection time immediately. If the A/F sensor is malfunctioning, ECM is unable to perform accurate air-fuel ratio control.

The A/F sensor is equipped with a heater which heats the zirconia element. The heater is controlled by the ECM. When the intake air volume is low (the temp. of the exhaust gas is low), current flows to the heater to heat the sensor for accurate oxygen concentration detection.

*: The voltage value changes at the inside of the ECM only.

DTC No.	DTC Detection Condition	Trouble Area
P0125	After engine is warmed up, A/F sensor output* does not change when conditions (a), (b) and (c) continue for at least 1.5 min.: *: Output value changes at inside of ECM only (a) Engine speed: 1,500 rpm or more (b) Vehicle speed: 40 - 100 km/h (25 - 62 mph) (c) Throttle valve does not fully closed (d) After starting engine < 140 sec.	<ul> <li>Dpen or short in A/F sensor (bank 1 sensor 1) circuit</li> <li>V/F sensor (bank 1 sensor 1)</li> <li>Air induction system</li> <li>Fuel pressure</li> <li>Injector</li> <li>Gas leakage on exhaust system</li> <li>ECM</li> </ul>

HINT:

- After confirming DTC P0125, use the OBD II scan tool or TOYOTA hand—held tester to confirm voltage output of the heated oxygen sensor (bank 1 sensor 1) from the CURRENT DATA.
- The ECM controls the voltage of the AFL+ and AFL- terminals of the ECM to the fixed voltage. Therefore, it is impossible to confirm the A/F sensor output voltage without OBD II scan tool or TOYOTA hand-held tester.

DI6WP-02

• OBD II scan tool (excluding TOYOTA hand-held tester) displays the one fifth of the A/F sensor output voltage which is displayed on the TOYOTA hand-held tester.

# WIRING DIAGRAM

# **INSPECTION PROCEDURE**

HINT:

- If the vehicle run out of fuel, the air-fuel ratio is LEAN and DTC P0125 will be recorded. The MIL then comes on.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

### Are there any other codes (besides DTC P0125) being output?

YES

 $\rangle$  Go to relevant DTC chart (See page DI-14).

NO

### 2 Connect OBD II scan tool or TOYOTA hand-held tester, and read value for voltage output of A/F sensor (bank 1 sensor 1).

### PREPARATION:

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Warm up the A/F sensor with the engine speed at 2,500 rpm for approx. 90 sec. 2001 TOYOTA TACOMA (RM835U)

Author :

Date :

### CHECK:

Read the voltage value of the A/F sensor on the screen of the OBD II scan tool or TOYOTA hand-held tester when you perform all the following conditions.

### HINT:

The voltage of AFL+ terminal of the ECM is 3.3 fixed and the AFL- terminal is 3.0 V fixed. Therefore, it is impossible to check the A/F sensor output voltage at the terminals (AFL+/AFL-) of the ECM. **OK:** 

Condition	A/F Sensor Voltage value	
Engine idling Engine racing	Not remains at 3.3. V (0.660 V*) Not remains at 3.8 V (0.76 V*) or more	
Driving at engine speed 1,500 rpm or more and vehicle speed 40 km/h (25 mph) or move, and operate throttle valve open and close	Not remains at 2.8 V (0.56 V*) or less *: When using the OBD II scan tool (excluding TOYOTA hand-held tester)	

HINT:

- During fuel enrichment, there is a case that the output voltage of the A/F sensor is below 2.8 V (0.56 V*), it is normal.
- During fuel cut, there is a case that the output voltage of the A/F sensor is above 3.8 V (0.76 V*), it is normal.
- If the output voltage of the A/F sensor remains at 3.30 V (0.660 V*) even after performing all the above conditions, the A/F sensor circuit may be open.
- If the output voltage of the A/F sensor remains at 3.8 V (0.76 V*) or more, or 2.8 V (0.56 V*) or less even after performing all the above conditions, the A/F sensor circuit may be short.

Go to step 9.

OK

*: When you use the OBD II scan tool (excluding TOYOTA hand-held tester).

2001 TOYOTA TACOMA (RM835U)

### DI-46

# 10 Is there DTC P0125 being output again? YES Check and replace ECM (See page IN-28 ). NO 11 11 Did vehicle run out of fuel in past? NO Check for intermittent problems (See page DI-3 ). YES DTC P0125 is caused by shortage of fuel.

DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)
-----	-------	--------------------------------------------------------

Refer to DTC P0125 on page DI-42.

DTC No.	DTC Detection Condition	Trouble Area
P0136	Voltage output of heated oxygen sensor remains at 0.45 V or less 0.60V or more when vehicle is driven at 50 km/h (31 mph) or more after engine is warmed up (2 trip detection logic)	<ul><li>Dpen or short in heated oxygen sensor circuit</li><li>Heated oxygen sensor</li></ul>

HINT:

Sensor 2 refers to the sensor farther away from the engine body.

### WIRING DIAGRAM

Refer to DTC P0125 on page DI-42.

# **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

### (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.

(b) Warm up the engine to normal operating temperature.

2001 TOYOTA TACOMA (RM835U)

Author :

DI12R-11

### CHECK:

Read the voltage output of the heated oxygen sensor when the engine is suddenly raced. HINT:

Perform quick racing to 4,000 rpm 3 times using the accelerator pedal.

### <u>OK:</u>

Heated oxygen sensor output voltage: Alternates from 0.45 V or less to 0.60 V or more.

# DTC P0141 Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)

# **CIRCUIT DESCRIPTION**

Refer to DTC P0125 on page DI-42.

DTC No.	DTC Detection Condition	Trouble Area	
	When heater operates, heater current exceeds 2 A (2 trip detection logic)	Den or short in heater circuit of heated oxygen sensor	
P0141	Heater current of 0.20 A or less when heater operates (2 trip detection logic)	Heated oxygen sensor heater     ECM	

HINT:

Sensor 2 refers to the sensor farther away from the engine body.

# WIRING DIAGRAM

Refer to DTC P0125 on page DI-42.

# **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

	OK	
_		_

Check and repair harness or connector between EFI main relay (Marking: EFI) and heated oxygen sensor, and heated oxygen sensor and ECM (See page IN-28).

|--|

P0172	
-------	--

# System too Lean (Fuel Trim)

# **CIRCUIT DESCRIPTION**

Fuel trim refers to the feedback compensation value compared to the basic injection time. Fuel trim includes short-term fuel trim and long-term fuel trim.

Short-term fuel trim is the short-term fuel compensation used to maintain the air-fuel ratio at its ideal theoretical value. The signal from the A/F sensor is approximately proportional to the existing air-fuel ratio, and ECM comparing it with the ideal theoretical value, the ECM reduces fuel volume immediately if the air-fuel ratio is rich and increases fuel volume if it is lean.

Long-term fuel trim compensates for the deviation from the central value of the short-term fuel trim stored up by each engine tolerance, and the deviation from the central value due to the passage of time and changes of environment.

If both the short-term fuel trim and long-term fuel trim exceed a certain value, it is detected as a malfunction and the MIL lights up.

DTC No.	DTC Detection Condition	Trouble Area
P0171	When air fuel ratio feedback is stable after warming up engine, fuel trim is considerably in error on RICH side (2 trip detection logic)	<ul> <li>Air induction system</li> <li>njector blockage</li> <li>Mass air flow meter</li> <li>Engine coolant temp. sensor</li> <li>Fuel pressure</li> <li>Gas leakage on exhaust system</li> <li>Open or short in A/F sensor (bank 1 sensor 1) circuit</li> <li>V/F sensor (bank 1 sensor 1)</li> <li>ECM</li> </ul>
P0172	When air fuel ratio feedback is stable after warming up engine, fuel trim is considerably in error on LEAN side (2 trip detection logic)	<ul> <li>Injector leak, blockage</li> <li>Mass air flow meter</li> <li>Engine coolant temp. sensor</li> <li>Ignition system</li> <li>Fuel pressure</li> <li>Gas leakage on exhaust system</li> <li>Open or short in A/F sensor (bank 1 sensor 1) circuit</li> <li>V/F sensor (bank 1 sensor 1)</li> <li>ECM</li> </ul>

HINT:

- When the DTC P0171 is recorded, the actual air-fuel ratio is on the LEAN side. When DTC P0172 is recorded, the actual air-fuel ratio is on the RICH side.
- If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 is recorded. The MIL then comes
  on.
- If the total of the short-term fuel trim value and long-term fuel trim value is within ±35 % (80°C (176°F) or more), the system is functioning normally.
- The A/F sensor (bank 1 sensor 1) output voltage and the short-term fuel trim value can be read using the OBD II scan tool or TOYOTA hand-held tester.
- The ECM controls the voltage of the AFL- and AFL- terminals of the ECM to the fixed voltage. Therefore, it is impossible to confirm the A/F sensor output voltage without OBD II scan tool or TOYOTA hand-held tester.

• OBD II scan tool (excluding TOYOTA hand-held tester) displays the one fifth of the A/F sensor output voltage which is displayed on the TOYOTA hand-held tester.

# WIRING DIAGRAM

Refer to DTC P0125 on page DI-42.

# **INSPECTION PROCEDURE**

### HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

Check for intermittent problems (See page DI-3 ).

# YES

DTC P0171 or P0172 is caused by shortage of fuel.

		Di820-01
DTC	P0300	Random/Multiple Cylinder Misfire Detected
DTC	P0301	Cylinder 1 Misfire Detected
DTC	P0302	Cylinder 2 Misfire Detected
		•
DTC	P0303	Cylinder 3 Misfire Detected
DTC	P0304	Cylinder 4 Misfire Detected

Misfire: The ECM uses the crankshaft position sensor and camshaft position sensor to monitor changes in the crankshaft rotation for each cylinder.

The ECM counts the number of times the engine speed change rate indicates that misfire has occurred. And when the misfire rate equals or exceeds the count indicating that the engine condition has deteriorated, the MIL lights up.

If the misfire rate is high enough and the driving conditions will cause catalyst overheating, the MIL blinks when misfiring occurs.

DTC No.	DTC Detection Condition	Trouble Area
P0300	Misfiring of random cylinders is detected during any particular 200 or 1,000 revolutions	<ul> <li>Dpen or short in engine wire</li> <li>Connector connection</li> <li>Vacuum hose connection</li> <li>gnition system</li> <li>njector</li> <li>Fuel pressure</li> </ul>
	For any particular 200 revolutions for engine, misfiring is de- tected which can cause catalyst overheating (This causes MIL to blink) (2 trip detection logic)	
P0301 P0302 P0303 P0304	For any particular 1,000 revolutions of engine, misfiring is de- tected which causes a deterioration in emissions (2 trip detection logic)	<ul> <li>EGR system (Except 2RZ-FE for California Spec.)</li> <li>Mass air flow meter</li> <li>Engine coolant temp. sensor</li> <li>Compression pressure</li> <li>Valve clearance</li> <li>Valve timing</li> <li>ECM</li> </ul>

HINT:

When the 2 or more codes for a misfiring cylinder are recorded repeatedly but no random misfire code is recorded, it indicates that the misfires were detected and recorded at different times.

### WIRING DIAGRAM

# CONFIRMATION DRIVING PATTERN

- (a) Connect the TOYOTA hand-held tester or OBD II scan tool.
- (b) Record DTC and the freeze frame data.
- (c) Use the TOYOTA hand-held tester to set to the Check Mode (See page DI-3).
- (d) Drive the vehicle several times with the engine speed, load and its surrounding range shown with EN-GINE SPD, CALC LOAD in the freeze frame data or MISFIRE RPM, MISFIRE LOAD in the data list.

If you have no TOYOTA hand-held tester, turn the ignition switch OFF after the symptom is simulated the first time. Then repeat the simulation process again. HINT:

In order to memorize DTC of misfire, it is necessary to drive around MISFIRE RPM, MISFIRE LOAD in the data list for the following period of time.

Engine Speed	Time
Idling	3 minutes 30 seconds or more
1,000 rpm	3 minutes or more
2,000 rpm	1 minute 30 seconds or more
3,000 rpm	1 minute or more

- (e) Check whether there is misfire or not by monitoring DTC and the freeze frame data. After that, record them.
- (f) Turn the ignition switch OFF and wait at least 5 seconds.

# **INSPECTION PROCEDURE**

HINT:

- If it is the case that DTC besides misfire is memorized simultaneously, first perform the troubleshooting for them.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.
- When the vehicle is brought to the workshop and the misfire is not occurred, misfire can be confirmed by reproducing the condition of freeze frame data. Also, after finishing the repair, confirm that there is no misfire (See the confirmation driving pattern).

DI-57

1

- When either of SHORT FT #1, LONG FT #1, SHORT FT #2 or LONG FT #2 in the freeze frame data is besides the range of ± 20 %, there is a possibility that the air-fuel ratio is inclining either to RICH (-20 % or less) or LEAN (+20 % or more).
- When COOLANT TEMP in the freeze frame data is less than 80°C (176°F), there is a possibility of misfire only during warmed up.
- In the case that misfire cannot be reproduced, the reason may be because of the driving with lack of fuel, the use of improper fuel, a stain of the ignition plug, and etc.

### Check spark plug and spark of misfiring cylinder.

### PREPARATION:

- (a) Disconnect the ignition coil.
- (b) Remove the spark plug.

### CHECK:

- (a) Check the electrode for carbon deposits.
- (b) Check the electrode gap.

<u>OK:</u>

- (a) No large carbon deposit present. Not wet with gasoline or oil.
- (b) Electrode gap: 1.1 mm (0.043 in.)

### PREPARATION:

- (a) Install the spark plug to the ignition coil.
- (b) Disconnect the injector connector.
- (c) Ground the spark plug.

### CHECK:

Check if spark occurs while the engine is being cracked. **NOTICE:** 

To prevent excess fuel from being injected from the injectors during this test, don't crank the engine for more than 5 - 10 seconds at a time.

<u>OK:</u>

Spark jumps across electrode gap.

Replace or check ignition system (See page IG-1).

OK

2

### Check voltage of ECM terminals for injector of failed cylinder.

### PREPARATION:

(a) Remove the glove compartment (See page SF-49).

(b) Turn the ignition switch ON.

### CHECK:

Measure the voltage between applicable terminal of the ECM connector and the body ground. **OK:** 

Voltage: 9 - 14 V

### Reference: INSPECTION USING OSCILLOSCOPE

With the engine idling, check the waveform between terminals #10 - #40 and E01 of the ECM connector. HINT:

The correct waveform is as shown.

Check and repair fuel pump, pressure regulator, fuel pipe line and filter (See page SF-1 ).

DTC

# P0325

# Knock Sensor 1 Circuit Malfunction (Bank 1)

# **CIRCUIT DESCRIPTION**

Knock sensor is fitted to the cylinder block to detect engine knocking. This sensor contains a piezoelectric element which generates a voltage when it becomes deformed, which occurs when the cylinder block vibrates due to knocking. If engine knocking occurs, ignition timing is retarded to suppress it.

DTC No.	DTC Detection Condition	Trouble Area
P0325	No knock sensor 1 signal to ECM with engine speed 1,200 rpm or more	<ul> <li>Dpen or short in knock sensor 1 circuit</li> <li>Knock sensor 1 (looseness)</li> <li>ECM</li> </ul>

### WIRING DIAGRAM

# **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI12U-10

### DI-62

1

Check continuity between terminal KNK1 of ECM connector and body ground.

### 2 Check knock sensor (See page SF-44 ).

Replace knock sensor.

3	Check for open and short in harness and connector between ECM and knock sensor (See page IN-28 ).	
	NG Repair or replace harness or connector.	
ОК		
4	Does malfunction disappear when good knock sensor is installed?	
	YES Replace knock sensor.	
NO		
Checl	k and replace ECM (See page IN-28 ).	
DTC	P0335	Crankshaft Position Sensor "A" Circuit Mal- function
-----	-------	---------------------------------------------------------
-----	-------	---------------------------------------------------------

Crankshaft position sensor (NE signal) consists of and pickup coil.

The NE signal plate has 34 teeth and is mounted on the crankshaft. The NE signal sensor generates 34 signals at every engine revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and the engine speed by the NE signal.

DTC No.	DTC Detection Condition	Trouble Area	
Dooos	No crankshaft position sensor signal to ECM during cranking (2 trip detection logic)	Dpen or short in crankshaft position sensor circuit Crankshaft position sensor	
P0335	No crankshaft position sensor signal to ECM with engine speed 600 rpm or more (2 trip detection logic)	<ul> <li>Gignal plate (Crankshaft position sensor rotor)</li> <li>ECM</li> </ul>	

# WIRING DIAGRAM

# **INSPECTION PROCEDURE**

HINT:

- Perform troubleshooting of DTC P0335 first. If no trouble is found, troubleshoot the following mechanical system.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI12V-10

325

DTC	P0340	Camshaft Position Sensor Circuit Malfunc- tion
-----	-------	---------------------------------------------------

Camshaft position sensor (G signal) consists of a magnet, iron core and pickup coil. The G signal plate has 1 tooth on its outer circumference and is mounted on intake camshaft.

When the camshafts rotate, the protrusion on the signal plate and the air gap on the pickup coil change, causing fluctuations in the magnetic field and generating an electromotive force in the pickup coil.

The NE signal plate has 34 teeth and is mounted on the crankshaft. The NE signal sensor generates 34 signals at every engine revolution. The ECM detects the standard crankshaft angle based on the G signal and the actual crankshaft angle and the engine speed by the NE signal.

DTC No.	DTC Detection Condition	Trouble Area
<b>D</b> 0040	No camshaft position sensor signal to ECM during cranking (2 trip detection logic)	Open or short in camshaft position sensor circuit
P0340	No camshaft position sensor signal to ECM during engine run- ning	ECM

# WIRING DIAGRAM

Refer to DTC P0335 on page DI-64.

# **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

NG

OK

Repair or replace harness or connector.

DI6WU-02

DTC	P0401	Exhaust Gas Recirculation Flow Insufficient Detected (Only for 3RZ-FE)
-----	-------	------------------------------------------------------------------------

The EGR system recirculates exhaust gas, which is controlled to the proper quantity to suit the driving conditions, into the intake air mixture to slow down combustion, reduce the combustion temperature and reduce NOx emissions. The amount of EGR is regulated by the EGR vacuum modulator according to the engine load.

If even one of the following conditions is fulfilled, the VSV is turned ON by a signal from the ECM.

This results in atmospheric air acting on the EGR valve, closing the EGR valve and shutting off the exhaust gas (EGR cut-off). Under the following conditions, EGR is cut to maintain driveabil-

- Before the engine is warmed up.
- During deceleration (throttle valve closed).
- Light engine load (amount of intake air very small).
- Engine racing.

DTC No.	DTC Detection Condition	Trouble Area
P0401	After engine is warmed up and run at 80 km/h (50 mph) for 3 to 5 minutes, small difference between value of EGR gas temp. sensor and ambient air temp. (2 trip detection logic)	<ul> <li>Dpen in EGR gas temp. sensor circuit</li> <li>EGR gas temp. sensor</li> <li>Vacuum or EGR hose disconnected</li> <li>Dpen or short in VSV circuit for EGR</li> <li>VSV for EGR</li> <li>EGR system</li> <li>EGR vacuum modulator</li> <li>EGR valve stuck closed</li> <li>ECM</li> </ul>

DI12Y-12

## WIRING DIAGRAM

# SYSTEM CHECK DRIVING PATTERN

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Start and warm up the engine with all the accessories switched OFF.
- (c) Run the vehicle at 70 90 km/h (43 56 mph) for 3 minutes or more.
- (d) Idle the engine for about 2 minutes.
- (e) Do steps (c) and (d) again.

(f) Check the READINESS TESTS mode on the OBD II scan tool or TOYOTA hand-held tester.

If COMPL is displayed and the MIL does not light up, the system is normal.

If INCMPL is displayed and the MIL does not light up, run the vehicle step (e) from some times and check it.

HINT:

INCMPL is displayed when either condition (1) or (2) exists.

(1) The system check is incomplete.

2001 TOYOTA TACOMA (RM835U)

Date :

DI-69

(2) There is a malfunction in the system.

If there is a malfunction in the system, the MIL will light up after steps (b) to (e) above are done (2 trip detection logic).

# **INSPECTION PROCEDURE**

#### HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

## **TOYOTA** hand-held tester:

1 Connect TOYOTA hand-held tester, and read value of EGR gas temperature value.

#### PREPARATION:

- (a) Connect the TOYOTA hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the TOYOTA hand-held tester main switch ON.

## CHECK:

Read the EGR gas temperature on the TOYOTA hand-held tester.

#### <u> 0K:</u>

EGR gas temperature: 10°C (50°F) or more

HINT:

If there is an open circuit, the TOYOTA hand-held tester indicates 3.1°C (37.6°F).

2001 TOYOTA TACOMA (RM835U)

331

#### 10 Check value of EGR gas temperature sensor.

#### PREPARATION:

- (a) Connect the TOYOTA hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the TOYOTA hand-held tester main switch ON.
- (c) Select the ACTIVE TEST mode on the TOYOTA hand-held tester (EGR system ON).
- (d) Race the engine at 4,000 rpm for 3 min.

#### CHECK:

Measure the EGR gas temperature while racing the engine at 4,000 rpm.

<u>OK:</u>

#### EGR gas temperature after 3 minutes 100°C (212°F) or more

ОК

Check and replace ECM (See page IN-28).

2

Repair or replace harness or connector.

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)
-----	-------	-----------------------------------------------------

The ECM observes the waveform of the heated oxygen sensor located behind the catalyst to determine whether the catalyst is performance has deteriorated. If the catalyst is functioning normally, the waveform of the heated oxygen sensor located behind the catalyst switches back and forth between rich and lean much more slowly. When the waveform of the heated oxygen sensor located behind the catalyst alternates flatter-ingly between rich and lean, it indicates that catalyst performance has deteriorated.

DTC No.	DTC Detection Condition	Trouble Area
P0420	After engine and catalyst are warmed up, and while vehicle is driven within set vehicle and engine speed range, waveform of heated oxygen sensor (bank 1 sensor 2) alternates flatteringly between rich and lean (2 trip detection logic)	<ul> <li>Gas leakage on exhaust system</li> <li>●\/F sensor (bank 1 sensor 1)</li> <li>●leated oxygen sensor (bank 1 sensor 2)</li> <li>●hree-way catalytic converter</li> </ul>

DI6WV-02

# **CONFIRMATION ENGINE RACING PATTERN**

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Start the engine and warm it up with all the accessories switched OFF until the water temperature is stable.
- (c) Race the engine at 2,500 3,000 rpm for about 3 minutes.
- (d) When racing the engine at 3,000 rpm for 2 seconds and 2,000 rpm for 2 seconds alternately, check the waveform of the heated oxygen sensor (bank 1 sensor 2).

# **INSPECTION PROCEDURE**

#### HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

OK

DTC	P0440	Evaporative Emission Control System Mal- function
-----	-------	------------------------------------------------------

The vapor pressure sensor and VSV for vapor pressure sensor are used to detect abnormalities in the evaporative emission control system.

The ECM decides whether there is an abnormality in the evaporative emission control system based on the vapor pressure sensor signal.

DTC P0440 is recorded by the ECM when evaporative emissions leak from the components within the dotted line in Fig. 1 below, or when the vapor pressure sensor malfunctions.

DTC No.	DTC Detection Condition	Trouble Area
P0440	Fuel tank pressure is atmospheric pressure after vehicle is driven for 20 min. (2 trip detection logic)	<ul> <li>Hose or tube cracked, holed, damaged or loose seal ((3) in Fig. 1)</li> <li>Fuel tank cap incorrectly installed</li> <li>Fuel tank cap cracked or damaged</li> <li>Vacuum hose cracked, holed, blocked, damaged or disconnected ((1) or (2) in Fig. 1)</li> <li>Fuel tank cracked, holed or damaged</li> <li>Charcoal canister cracked, holed or damaged</li> <li>Dpen or short in vapor pressure sensor circuit</li> <li>Vapor pressure sensor</li> <li>ECM</li> </ul>

- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.
- When the ENGINE RUN TIME in the freeze frame data is less than 200 seconds, carefully check the VSV for EVAP, charcoal canister and vapor pressure sensor.

#### DI-103

DI8ZV-01

## DTC

P0500

# Vehicle Speed Sensor Malfunction

## **CIRCUIT DESCRIPTION**

The vehicle speed sensor outputs a 4-pulse signal for every revolution of the rotor shaft, which is rotated by the transmission output shaft via the driven gear. After this signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter, it is then transmitted to the ECM. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC No.	DTC Detection Condition	Trouble Area
P0500	No vehicle speed sensor signal to ECM under following condi- tions: (2 trip detection logic) For A/T: (a) Park/neutral position switch is OFF (b) Vehicle is being driven For M/T: (a) Engine speed is between 1,800 rpm and 4,000 rpm	Combination meter Open or short in No.1 vehicle speed sensor circuit ECM No.1 vehicle speed sensor

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected, when troubleshooting it is useful for determining whether the vehicle was running or stopped, the engine warmed up or not, the air-fuel ratio lean or rich, etc. at the time of the malfunction.

#### Check operation of speedometer.

#### **CHECK:**

Drive the vehicle and check if the operation of the speedometer in the combination meter is normal. HINT:

The vehicle speed sensor is operating normally if the speedometer display is normal.

# DTC P1130 A/F Sensor Circuit Range/Performance Malfunction (Bank 1 Sensor 1)

## **CIRCUIT DESCRIPTION**

#### Refer to DTC P0125 on page DI-42.

DTC No.	DTC Detection Condition	Trouble Area
P1130	Voltage output* of A/F sensor remains at 3.8 V or more, or 2.8 V or less, during engine running after engine is warmed up (2 trip detection logic) *: Output value changes at inside of ECM only Voltage output* of A/F sensor does not change from 3.30 V, during engine running after engine is warmed up (2 trip detection logic) *: Output value changes at inside of ECM only	Dpen or short in A/F sensor circuit A/F sensor Air induction system Fuel pressure Injector ECM
	Open or short in A/F sensor circuit (2 trip detection logic)	

HINT:

- After confirming DTC P1130, use the OBD II scan tool or TOYOTA hand-held tester to confirm voltage output of the A/F sensor (AFS B1 S1/O2S B1 S1) from the CURRENT DATA.
- The A/F sensor's output voltage and the short-term fuel value can be read using the OBD II scan tool or TOYOTA hand-held tester.
- The ECM controls the voltage of AFL+ and AFL- terminals of ECM to the fixed voltage. Therefore, it is impossible to confirm the A/F sensor output voltage without OBD II scan tool or TOYOTA hand-held tester.
- OBD II scan tool (excluding TOYOTA hand-held tester) displays the one fifth of the A/F sensor output voltage which is displayed on the TOYOTA hand-held tester.

## WIRING DIAGRAM

Refer to DTC P0125 on page DI-42.

## **CONFIRMATION DRIVING PATTERN**

- (a) Connect the TOYOTA hand-held tester to the DLC3.
- (b) Switch the TOYOTA hand-held tester from the normal mode to the check mode (See page DI-3).
- (c) Start the engine and warm it up with all the accessory switches OFF.
- (d) Drive the vehicle at 60 120 km/h (38 75 mph) and the engine speed at 1,600 3,200 rpm for 3 5 minutes.

HINT:

If a malfunction exists, the MIL will light up during step (d).

NOTICE:

- If the conditions in this test are not strictly followed, detection of the malfunction will not be possible.
- If you do not have a TOYOTA hand-held tester, turn the ignition switch OFF after performing steps (c) and (d), then perform steps (c) and (d) again.

## **INSPECTION PROCEDURE**

HINT:

- If DTC P1130 is displayed, check bank 1 sensor 1 circuit.
- Read frame freeze data using the TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.
- 1 Are there any other codes (besides DTC P1130) being output?

NO

2 Connect OBD II scan tool or TOYOTA hand-held tester, and read value for voltage output of A/F sensor.

#### PREPARATION:

(a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.

(b) Warm up the A/F sensor with the engine speed at 2,500 rpm for approximately 90 seconds.

#### CHECK:

Read the voltage of the A/F sensor on the screen of OBD II scan tool or TOYOTA hand-held tester when you perform all the following conditions.

HINT:

The voltage of the AFL+ terminal of the ECM is fixed at 3.3 V and the voltage of the AFL- terminal is fixed at 3.0 V. Therefore, it is impossible to check the A/F sensor output voltage at the terminals (AFL+/AFL-) of the ECM.

DI-109

<u>OK:</u>

Condition	A/F Sensor Voltage value
Engine idling	
Engine racing	Not remains at 3.30 V (0.660 V*) Not remains at 3.8 V (0.76 V*) or more
Driving at engine speed 1,500 rpm or more and vehicle speed 40 km/h (25 mph) or more, and operate throttle valve open and close.	Not remains at 2.8 V (0.78 V ) of more Not remains at 2.8 V (0.56 V*) or less *: When using the OBD II scan tool (excluding TOYOTA hand-held tester)

HINT:

- During fuel enrichment, there is a case that the output voltage of the A/F sensor is below 2.8 V (0.56 V*), it is normal.
- During fuel cut, there is a case that the output voltage of the A/F sensor is above 3.8 V (0.76 V*), it is normal.
- If the output voltage of the A/F sensor remains at 3.30 V (0.660 V*) even after performing all the above conditions, the A/F sensor circuit may be open.
- If the output voltage of the A/F sensor remains at 3.8 V (0.76V*) or more, or 2.8 V (0.56 V*) or less even after performing all the above conditions, the A/F sensor circuit may be short.
- *: When using the OBD II scan tool (excluding TOYOTA hand-held tester).

3 Check for open and short in harness and connector between ECM and A/F sensor (See page IN-28).

NG

Replace A/F sensor.

DI-1 11

# 10 Did vehicle run out of fuel in past? NO Check for intermittent problems (See page DI-3 ).

DTC P1130 is caused by shortage of fuel.

#### **A/F Sensor Circuit Response Malfunction** DTC P1133 (Bank 1 Sensor 1)

## **CIRCUIT DESCRIPTION**

#### Refer to DTC P0125 on page DI-42.

DTC No.	DTC Detection Condition	Trouble Area
P1133	After engine is warmed up and during vehicle driving at engine speed 1,400 rpm or more and vehicle speed 60 km/h (38 mph) or more, if response characteristic of A/F	<ul> <li>Oper or short in A/F sensor circuit</li> <li>A/F sensors</li> <li>Air induction system</li> <li>Fuel pressure</li> </ul>
	sensor becomes deteriorated (2 trip detection logic)	Onjector ECM

## WIRING DIAGRAM

Refer to DTC P0125 on page DI-42.

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using the TOYOTA hand-held tester or OBD II scan tool, as freeze frame records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

#### 1 Are there any other codes (besides DTC P1133) being output?

Go to relevant DTC chart.

NO

#### 2 Connect OBDII scan tool or TOYOTA hand-held tester, and read value for voltage output of A/F sensor.

#### **PREPARATION:**

(a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.

Warm up the A/F sensor with the engine at speed 2,500 rpm for approximately 90 seconds. (b)

#### CHECK:

Read the voltage of the A/F sensor on the screen of the OBD II scan tool or TOYOTA hand-held tester when you perform all the following conditions.

HINT:

The voltage of the AFL+ terminal of the ECM is fixed at 3.3 V and the voltage of the AFL- terminal is fixed at 3.0 V. Therefore, it is impossible to check the A/F sensor output voltage at the terminals (AFL+/AFL-) of the ECM.

<u>OK:</u>

Condition	A/F Sensor Voltage Value

DTC	P1300	Igniter Circuit Malfunction (No.1)	
DTC	P1305	Igniter Circuit Malfunction (No.2)	
DTC	P1310	Igniter Circuit Malfunction (No.3)	
DTC	P1315	Igniter Circuit Malfunction (No.4)	

## **CIRCUIT DESCRIPTION**

A Direct Ignition System (DIS) has been adopted. The DIS improves the ignition timing accuracy, reduces high-voltage loss, and enhances the the overall reliability of the ignition system by eliminating the distributor. The DIS is a 1-cylinder ignition system which ignites one cylinder with one ignition coil. In the 1-cylinder ignition system, the one spark plug is connected to the end of the secondary winding. High voltage generated in the secondary winding is applied directly to the spark plug. The spark of the spark plug pass from the center electrode to the ground electrode.

The ECM determines ignition timing and outputs the ignition signal (IGT) for each cylinder. Based on IGT signals, the power transistors in the igniter cuts off the current to the primary coil in the ignition coil is supplied to the spark plug that are connected to the end of the secondary coil. At the same time, the igniter also sends an ignition confirmation signal (IGF) as a fail-safe measure to the ECM.

DTC No	DTC Detection Condition	Trouble Area
P1300 P1305 P1310 P1315	No IGF signal to ECM while engine is running	<ul> <li>Open or short in IGF or IGT circuit from ignition coil with igniter to ECM</li> <li>Opinition coil with igniter</li> <li>ECM</li> </ul>

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

- If DTC P1300 is displayed, check No.1 ignition coil with igniter circuit.
- If DTC P1305 is displayed, check No.2 ignition coil with igniter circuit.
- If DTC P1310 is displayed, check No.3 ignition coil with igniter circuit.
- If DTC P1315 is displayed, check No.4 ignition coil with igniter circuit.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI-129

#### DI13A-10

DTC	P1780	Park/Neutral Position Switch Malfunction (Only for A/T)
-----	-------	---------------------------------------------------------

## **CIRCUIT DESCRIPTION**

The park/neutral position switch goes on when the shift lever is in the N or P shift position. When it goes on, terminal NSW of the ECM is grounded to body ground via the starter relay, thus the terminal NSW voltage becomes 0V. When the shift lever is in the D, 2, L or R position, the park/neutral position switch goes off, so the voltage of ECM. Terminal NSW becomes battery positive voltage, the voltage of the ECM internal power source. If the shift lever is moved from the N position to the D position, this signal is used for air-fuel ratio correction and for idle speed control (estimated control), etc.

DTC No.	DTC Detection Condition	Trouble Area
P1780	Only for 3RZ-FE: 2 or more switches are ON simultaneously for P, R, N, D, 2 and L position (2 trip detection logic)	Chort in park/neutral position switch circuit
	<ul> <li>When driving under conditions (a) and (b) for 30 sec. or more park/neutral position switch is ON (N position):</li> <li>(2 trip detection logic)</li> <li>(a) Vehicle speed: 70 km/h (44 mph) or more</li> <li>(b) Engine speed: 1,500 ~ 2,500 rpm</li> </ul>	<ul><li>●ark/neutral position switch</li><li>●ECM</li></ul>

HINT:

After confirming DTC P1780, use the TOYOTA hand-held tester to confirm the park/neutral position switch signal from CURRENT DATA.

#### WIRING DIAGRAM

Refer to DTC P1780 on page DI-318.

## **INSPECTION PROCEDURE**

Refer to DTC P1780 on page DI-318 . HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected, when troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine warmed up or not, the air-fuel ratio lean or rich, etc. at the time of the malfunction.
# **Starter Signal Circuit**

## **CIRCUIT DESCRIPTION**

When the engine is cranked, the intake air flow is slow, so fuel vaporization is poor. A rich mixture is therefore necessary in order to achieve good startability. While the engine is being cranked, the battery positive voltage is applied to terminal STA of the ECM. The starter signal is mainly used to increase the fuel injection volume for the starting injection control and after-start injection control.

# WIRING DIAGRAM

DI17C-04

#### **INSPECTION PROCEDURE**

HINT:

This diagnostic chart is based on the premise that the engine is cranked normally. If the engine is not cranked, proceed to the problem symptoms table on page DI-21.

#### **TOYOTA** hand-held tester:

		1

Connect TOYOTA hand-held tester, and check STA signal.

#### PREPARATION:

(a) Connect the TOYOTA hand-held tester to the DLC3.

(b) Turn the ignition switch ON and push the TOYOTA hand-held tester main switch ON.

#### **CHECK:**

Read the STA signal on the TOYOTA hand-held tester while the starter operates.

# OK:

Ignition Switch Position	ON	START
STA Signal	OFF	ON

Repair or replace harness or connector.

5	Check for open in harness and connector between EFI main relay (Marking: EFI) and battery, and EFI main relay and ECM (See page IN-28).
	NG Repair or replace harness or connector.
ОК	

DI-137

# **Fuel Pump Control Circuit**

## **CIRCUIT DESCRIPTION**

In the diagram below, when the engine is cranked, current flows from terminal ST of the ignition switch to the starter relay coil and also current flows to terminal STA of ECM (STA signal).

When the STA signal and NE signal are input to the ECM, Tr is turned ON, current flows to coil of the circuit opening relay, the relay switches on, power is supplied to the fuel pump and the fuel pump operates.

While the NE signal is generated (engine running), the ECM keeps Tr ON (circuit opening relay ON) and the fuel pump also keeps operating.

DIORK-09

**PRE-CHECK** 

#### 1. DIAGNOSIS SYSTEM

- (a) Description
  - When troubleshooting OBD II vehicles, the only difference from the usual troubleshooting procedure is that you need to connect the OBD II scan tool complying with SAE J1978 or TOYOTA hand-held tester to the vehicle, and read off various data output from the vehicle's ECM.

DI0RL-11

OBD II regulations require that the vehicle's onboard computer lights up the Malfunction Indicator Light (MIL) on the instrument panel when the computer detects a malfunction in the emission control system/components or in the powertrain control components which affect vehicle emissions, or a malfunction in the computer. In addition to the MIL lighting up when a malfunction is detected, the applicable Diagnostic Trouble Codes (DTCs) prescribed by SAE J2012 are recorded in the ECM memory (See page DI-156).

If the malfunction does not reoccur in the 3 consecutive trips, the MIL goes off automatically but the DTCs remain in the ECM memory.

To check the DTCs, connect the OBD II scan tool or TOYOTA hand-held tester to the Data Link Connector 3 (DLC3) of the vehicle. The OBD II scan tool or TOYOTA hand-held tester also enables you to erase the DTCs and check freeze frame data and various forms of engine data. (For operating instructions, see the OBD II scan tool's instruction book.) DTCs include SAE controlled codes and manufacturer controlled codes. SAE controlled codes must be set as prescribed by the SAE, while manufacturer controlled codes can be set freely by a manufacturer within the prescribed limits (See the DTC chart on page DI-156).

The diagnosis system operates in normal mode during normal vehicle use. It also has a check mode for technicians to simulate malfunction symptoms and troubleshoot. Most DTCs use 2 trip detection logic* to prevent erroneous detection and ensure the malfunction detection. By switching the ECM to check mode when troubleshooting, a technician can cause the MIL to light up for a malfunction that is only detected once or momentarily. (TOYOTA hand-held tester only) (See step 2)

 *2 trip detection logic: When a malfunction is first detected, the malfunc-

tion is temporarily stored in the ECM memory. (1st trip)

If the same malfunction is detected again during the second drive test, this second detection causes the MIL to light up. (2nd trip) (However, the ignition switch must be turned OFF between the 1st 2 trip and 2nd 2 trip.)

• Freeze frame data:

Freeze frame data records the engine condition when a misfire (DTCs P0300) or fuel trim malfunction (DTCs P0171 and P0172) or other malfunction (first malfunction only), is detected.

Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when the malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

Priorities of troubleshooting:

If troubleshooting priorities for multiple DTCs are given in the applicable DTC chart, these should be followed.

If no instructions are given, troubleshoot DTCs according to the following priorities.

- (1) DTCs other than fuel trim malfunction (DTCs P0171 and P0172) and misfire (DTCs P0300).
- (2) Fuel trim malfunction (DTCs P0171 and P0172).
- (3) Misfire (DTCs P0300).
- (b) Check the DLC3.

The vehicle's ECM uses the ISO 9141-2 communication protocol. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 9141-2 format.

9 10 11 12 13 14 15 16 9 10 11 12 13 14 15 16	
DLC3	
	A04550

2001 TOYOTA TACOMA (RM835U)

Terminal No.	Connection/Voltage or Resistance	Condition
7	Bus (+) Line/Pulse generation	During transmission
4	Chassis Ground - Body Ground/1 $\Omega$ or less	Always
5	Signal Ground - Body Ground/1 $\Omega$ or less	Always
16	Battery Positive - Body Ground/9 - 14 V	Always

HINT:

If your display shows UNABLE TO CONNECT TO VEHICLE when you have connected the cable of the OBD II scan tool or TOYOTA hand-held tester to the DLC3, turned the ignition switch ON and operated the scan tool, there is a problem on the vehicle side or tool side.

- If the communication is normal when the tool is connected to another vehicle, inspect the DLC3 of the original vehicle.
- If the communication is still impossible when the tool is connected to another vehicle, the problem is probably in the tool itself, so consult the Service Department listed in the tool's instruction manual.

#### 2. Normal Mode: INSPECT DIAGNOSIS

- (a) Check the MIL.
  - (1) The MIL comes on when the ignition switch is turned ON and the engine is not running.

HINT:

If the MIL does not light up, troubleshoot the combination meter (See page  $\ensuremath{\mathsf{BE-39}}$  ).

(2) When the engine started, the MIL should go off. If the lamp remains on, the diagnosis system has detected a malfunction or abnormality in the system.

#### (b) Check the DTC.

NOTICE:

- If there is no DTC in normal mode, check the 1st trip DTC using Continuous Test Results function (Mode 7 for SAE J1979) or the OBD II scan tool or TOYOTA hand-held tester.
- TOYOTA hand-held tester only:

When the diagnosis system is switched from normal mode to check mode all the DTCs and freeze frame data recorded in normal mode will be erased. So before switching modes, always check the DTCs and freeze frame data, and note them down.

- Prepare the OBD II scan tool (complying with SAE J1978) or TOYOTA hand-held tester.
- (2) Connect the OBD II scan tool or TOYOTA handheld tester to the DLC3 at the lower left of the instrument panel.

- (3) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.
- (4) Use the OBD II scan tool or TOYOTA hand-held tester to check the DTCs and freeze frame data and note them down (For operating instructions, see the OBD II scan tool's instruction book.).

If there is no DTC in normal mode, check the 1st trip DTC using Continuous Test Results function (Mode 7 for SAE J1979) on the OBD II scan tool or TOYOTA hand-held tester.

(5) See page DI-156 to confirm the details of the DTCs.

NOTICE:

- When simulating symptoms with an OBD II scan tool (excluding TOYOTA hand-held tester) to check the DTCs, use the normal mode. For code on the DTC chart subject to "2 trip detection logic", perform the following either action.
- Turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again. When the problem has been simulated twice, the MIL lights up and the DTCs are recorded in the ECM.
- Check the 1st trip DTC using Mode 7 (Continuous Test Results) for SAE J1979.
- (c) Clear the DTC.

The DTCs and freeze frame data will be erased by either action.

- Operating the OBD II scan tool (complying with SAE J1978) or TOYOTA hand-held tester to erase the codes. (See the OBD II scan tool's instruction book for operating instructions.)
- Disconnecting the battery terminals or EFI fuse.

#### NOTICE:

If the TOYOTA hand-held tester switches the ECM from normal mode to check mode or vice-versa, or if the ignition switch is turned from ON to ACC or OFF during check mode, the DTCs and freeze frame data will be erased.

3. Check Mode:

#### INSPECT DIAGNOSIS

HINT:

TOYOTA hand-held tester only:

Compared to the normal mode, the check mode has further sensitivity to detect malfunctions.

Furthermore, the same diagnostic items which are detected in the normal mode can also be detected in the check mode.

- (a) Check the DTC.
  - (1) Initial conditions

- Battery positive voltage 11 V or more
- Throttle valve fully closed
- Transmission in P or N position
- Air conditioning switched OFF
- (2) Turn ignition switch OFF.
- (3) Prepare the TOYOTA hand-held tester.
- (4) Connect the TOYOTA hand-held tester to the DLC3 at the lower left of the instrument panel.
- (5) Turn the ignition switch ON and push the TOYOTA hand-held tester main switch ON.
- (6) Switch the TOYOTA hand-held tester from the normal mode to the check mode (Check that the MIL flashes.).

#### NOTICE:

If the TOYOTA hand-held tester switches the ECM from normal mode to check mode or vice-versa, or if the ignition switch is turned from ON to ACC or OFF during check mode, the DTCs and freeze frame data will be erased.

- (7) Start the engine (The MIL goes off after the engine started).
  - (8) Simulate the conditions of the malfunction described by the customer.

#### NOTICE:

# Leave the ignition switch ON until you have checked the DTCs, etc.

(9) After simulating the malfunction conditions, use the TOYOTA hand-held tester diagnosis selector to check the DTCs and freeze frame data, etc.

#### HINT:

Take care not to turn the ignition switch OFF. Turning the ignition switch OFF switches the diagnosis system from the check mode to the normal mode. so all the DTCs, etc. are erased.

(10) After checking the DTC, inspect the applicable circuit.

#### 4. FAIL-SAFE CHART

If any of the following codes is recorded, the ECM enters fail-safe mode.

DTC No.	Fail-Safe Operation	Fail-Safe Deactivation Conditions
P0100	Ignition timing fixed at 10° BTDC	Returned to normal condition
P0110	Intake air temperature is fixed at 20°C (68°F)	Returned to normal condition
P0115	Engine coolant temperature is fixed at 80°C (176°F)	Returned to normal condition
P0120	VTA is fixed at 0°	The following condition must be repeated at least 2 times consecutively VTA $>$ 0.1 V and $<$ 0.95 V
P0135 P0141	The heater circuit in which an abnormality is detected is turned off	Ignition switch OFF
P0325 P0330	Max. timing retardation	Ignition switch OFF
P0340	Fuel cut	Returned to normal condition
P1300	Fuel cut	Returned to normal condition

#### 5. CHECK FOR INTERMITTENT PROBLEMS

#### HINT:

TOYOTA hand-held tester only:

By putting the vehicle's ECM in check mode, 1 trip detection logic is possible instead of 2 trip detection logic and sensitivity to detect open circuits is increased. This makes it easier to detect intermittent problems.

- (a) Clear the DTCs (See step 2).
- (b) Set the check mode (See step 3).
- (c) Perform a simulation test (See page IN-18).
- (d) Check the connector and terminal (See page IN-28).
- (e) Handle the connector (See page IN-28).

#### 6. BASIC INSPECTION

When the malfunction code is not confirmed in the DTC check, troubleshooting should be performed in all the possible circuits considered as the cause of the problems. In many cases, by carrying out the basic engine check shown in the following flow chart, the location causing the problem can be found quickly and efficiently. Therefore, use of this check is essential in the engine troubleshooting.

#### **PREPARATION:**

- (a) Warm up the engine to the normal operating temperature.
- (b) Switch off all the accessories.
- (c) Switch off the A/C.
- (d) Shift the transmission into the N position.
- (e) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3 of the vehicle.

#### CHECK:

Use the CURRENT DATA to check the idle speed.

<u>OK:</u>

#### Idle speed: 650 - 750 rpm

ок

#### **PREPARATION:**

- (a) Warm up the engine to the normal operating temperature.
- (b) Shift the transmission into the N position.
- (c) Keep the engine speed at idle.
- (d) Using SST, connect terminals TE1 and E1 of the DLC1. SST 09843-18020
- (e) Using a timing light, connect the tester to the No.1 hightension cord.

#### CHECK:

Check ignition timing.

<u>OK:</u>

#### Ignition timing: 8 - 12° BTDC at idle

Proceed to page IG-1 , and continue to trouble-shoot.

OK

Proceed to problem symptoms table on page **DI-163**.

# 7 Check fuel pressure.

#### PREPARATION:

- (a) Be sure that enough fuel is in the tank.
- (b) Connect the TOYOTA hand-held tester to the DLC3.
- (c) Turn the ignition switch ON and push the TOYOTA handheld tester main switch ON.
- (d) Use the ACTIVE TEST mode to operate the fuel pump.
- (e) Please refer to the TOYOTA hand-held tester operator's manual for further details.
- (f) Without TOYOTA hand-held tester, connect the positive
   (+) and negative (-) leads from the battery to the fuel pump connector (See page SF-5).

#### CHECK:

Check for the fuel pressure in the fuel inlet hose when it is pinched by hand.

HINT:

At this time, you will hear the fuel flowing noise.

NG Proceed to page SF-5 , and continue to troubleshoot.

ΟΚ

Proceed to problem symptoms table on page DI-163 .

# 7. ENGINE OPERATING CONDITION NOTICE:

The values given below for "Normal Condition" are representative values, so a vehicle may still be normal even if its value differs from those listed here. So do not depend solely on the "Normal Condition" here when deciding whether a part is faulty or not solely according to the "Normal Condition" here.

(a) CARB mandated signals.

TOYOTA hand-held tester display	Measurement Item	Normal Condition*
FUEL SYS #1	Fuel System Bank 1 OPEN: Air-fuel ratio feedback stopped CLOSED: Air-fuel ratio feedback operating	Idling after warming up: CLOSED
CALC LOAD	Calculator Load: Current intake air volume as a proportion of max. intake air volume	Idling: 14.9 - 21.3 % Racing without load (2,500rpm): 16.6 - 23.5 %
COOLANT TEMP	Engine Coolant Temp. Sensor Value	After warming up: 80 - 95°C (176 - 203°F)
SHORT FT #1	Short-term Fuel Trim Bank 1	0 ± 20 %
LONG FT #1	Long-term Fuel Trim Bank 1	0 ± 20 %
ENGINE SPD	Engine Speed	Idling: 650 - 750 rpm
VEHICLE SPD	Vehicle Speed	Vehicle stopped: 0 km/h (0 mph)

2001 TOYOTA TACOMA (RM835U)

IGN ADVANCE	Ignition Advance: Ignition Timing of Cylinder No.1	Idling: BTDC 12.5 - 22.0°
INTAKE AIR	Intake Air Temp. Sensor Value	Equivalent to ambient temp.
MAF	Air Flow Rate Through Mass Air Flow Meter	Idling: 3.3 - 4.7 gm/sec. Racing without load (2,500 rpm): 12.9 - 18.3 gm/sec.
THROTTLE POS	Output Voltage of Throttle Position Sensor Calculated as a percentage: 0 V $\rightarrow$ 0 %, 5 V $\rightarrow$ 100 %	Throttle valve fully closed: 7 - 11 % Throttle valve fully open: 65 - 75 %
O2S B1 S1	Output Voltage of Oxygen Sensor Bank 1 Sensor 1	ldling: 0.1 - 0.9 V
O2FT B1 S1	Oxygen Sensor Fuel Trim Bank 1 Sensor 1 (Same as SHORT FT #1)	0 ± 20 %
O2S B1 S2	Output Voltage of Oxygen Sensor Bank 1 Sensor 2	Driving 50 km/h (31 mph): 0.1 - 0.9 V

*: If no conditions are specifically stated for "Idling", it means the shift lever is at the N or P position, the A/C switch is OFF and all the accessory switches are OFF.

(b) TOYOTA Enhanced Signals.

TOYOTA hand-held tester display	Measurement Item	Normal Condition*
MISFIRE RPM	Engine RPM for first misfire range	Misfire 0: 0 rpm
MISFIRE LOAD	Engine load for first misfire range	Misfire 0: 0 g/r
INJECTOR	Fuel injection time for cylinder No.1	Idling: 1.82 - 3.15 ms
IAC DUTY RATIO	Intake Air Control Valve Duty Ratio Opening ratio rotary solenoid type IAC valve	Idling: 22 - 46 %
STARTER SIG	Starter Signal	Cranking: ON
A/C SIG	A/C Switch Signal	A/C ON: ON
PNP SW	Park/Neutral Position Switch Signal	P or N position: ON
STOP LIGHT SW	Stop Light Switch Signal	Stop light switch ON: ON
FC IDL	Fuel Cut Idle: Fuel cut when throttle valve fully closed, during deceleration	Fuel cut operating: ON
FC TAU	Fuel Cut TAU: Fuel cut during very light load	Fuel cut operating: ON
CYL#1 - CYL#6	Abnormal revolution variation for each cylinder	0 %
IGNITION	Total number of ignition for every 1,000 revolu- tions	0 - 3,000
A/C CUT SIG	A/C Cut Signal	A/C S/W OFF: ON
FUEL PUMP	Fuel Pump Signal	Idling: ON
EVAP (PURGE) VSV	EVAP VSV Signal	VSV operating: ON
VAPOR PRESS VSV	Vapor Pressure VSV Signal	VSV operating: ON
TOTAL FT B1	Total Fuel Trim Bank 1: Average value for fuel trim system of bank 1	Idling: 0.8 - 1.2 V
O2 LR B1 S1	Oxygen Sensor Lean Rich Bank 1 Sensor 1: Re- sponse time for oxygen sensor output to switch from lean to rich	Idling after warming up: 0 - 1,000 msec.
O2 RL B1 S1	Oxygen Sensor Rich Lean Bank 1 Sensor 1: Response time for oxygen sensor output to switch from rich to lean	Idling after warming up: 0 - 1,000 msec.

*: If no conditions are specifically stated for "Idling", it means the shift lever is at the N or P position, the A/C switch is OFF and all the accessory switches are OFF.

# DIAGNOSTIC TROUBLE CODE CHART

#### HINT:

Parameters listed in the chart may not be exactly the same as your readings due to the type of instrument or other factors.

If a malfunction code is displayed during the DTC check in the check mode, check the circuit for the codes listed in the table below. For details of each code, refer to the "See page" under the respective "DTC No." in the DTC chart.

#### SAE DEFINED

DTC No. (See page)	Detection Item	Trouble Area	MIL*1	Memory
P0100 (DI-164)	Mass Air Flow Circuit Malfunc- tion	<ul> <li>Open or short in mass air flow meter circuit</li> <li>Mass air flow meter</li> <li>ECM</li> </ul>	0	0

# **CIRCUIT INSPECTION**

DTC	P0100	Mass Air Flow Circuit Malfunction
-----	-------	-----------------------------------

# **CIRCUIT DESCRIPTION**

The mass air flow meter uses a platinum hot wire. The hot wire air flow meter consists of a platinum hot wire, thermistor and a control circuit installed in a plastic housing. The hot wire air flow meter works on the principle that the hot wire and thermistor located in the intake air bypass of the housing detect any changes in the intake air temperature.

The hot wire is maintained at the set temperature by controlling the current flow through the hot wire. This current flow is ten measured as the output voltage of the mass air flow meter.

The circuit is constructed so that the platinum hot wire and thermistor provide a bridge circuit with the power transistor controlled so that the potential of A and B remains equal to maintain the set temperature.

DTC No.	DTC Detection Condition	Trouble Area
	Open or short in mass air flow meter circuit with engine speed 4,000 rpm or less	Open or short in mass air flow meter circuit
P0100	Open or short in mass air flow meter circuit with engine speed 4,000 rpm or more (2 trip detection logic)	Mass air flow meter ECM

HINT:

After confirming DTC P0100, use the OBD II scan tool or TOYOTA hand-held tester to confirm the mass air flow ratio from the CURRENT DATA.

Mass Air Flow Value (gm/sec.)	Malfunction
Approx. 0	<ul><li>Mass air flow meter power source circuit open</li><li>●/G circuit open or short</li></ul>
11.0 - 25.1 (Idling after warmed up)	€2G (California Spec.), E3 (Except California Spec.) circuit open

DIORQ-13

#### WIRING DIAGRAM

## **INSPECTION PROCEDURE**

#### HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

# 1 Connect OBD II scan tool or TOYOTA hand-held tester, and read value of mass air flow rate.

#### PREPARATION:

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.
- (c) Start the engine.

#### CHECK:

Read the mass air flow rate on the OBD II scan tool or TOYOTA hand-held tester.

#### **RESULT:**

	Туре І	Туре II
Mass air flow rata (gm/sec.)	Approx. 0	11.0 - 25.1 (Idling after warmed up)
	Type I Go to step 2.	
	Type II Go to step 5.	

#### DI-166

DTC	P0101	Mass Air Flow Circuit Range/Performance Problem
-----	-------	----------------------------------------------------
-----	-------	----------------------------------------------------

## **CIRCUIT DESCRIPTION**

Refer to DTC P0100 on page DI-164.

DTC No.	DTC Detection Condition	Trouble Area
<b>D</b> 0/0/	After engine is warmed up, conditions (a) and (b) continue with engine speed 900 rpm or less: (2 trip detection logic) (c) Throttle valve fully closed (d) Mass air flow meter output > 2.2 V	
P0101	Conditions (a) and (b) continue with engine speed 1,500 rpm or more: (2 trip detection logic) (a) VTA 0.63 V (b) Mass air flow meter output < 1.06 V	●Mass air flow meter

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1

#### Are there any other codes (besides DTC P0101) being output?

NO

Replace mass air flow meter.

YES

Go to relevant DTC chart (See page DI-156).

DI0RR-12

DI0RS-13

DTC

P0110

## Intake Air Temp. Circuit Malfunction

## **CIRCUIT DESCRIPTION**

The intake air temperature sensor is built into the mass air flow meter and senses the intake air temperature.

A thermistor built in the sensor changes the resistance value according to the intake air temperature.

The lower the intake air temperature. The greater the thermistor resistance value becomes, and the higher the intake air temperature is, the lower the thermistor resistance value becomes (See Fig. 1).

The intake air temperature sensor is connected to the ECM (See below ). The 5 V power source voltage in the ECM is applied to the intake air temperature sensor from terminal THA via resistor R.

That is, resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes in accordance with changes in the intake air temperature, the potential at terminal THA also changes. Based on this signal, the ECM increases the fuel injection volume to improve driveability during the cold engine operation.

DTC No.	DTC Detection Condition	Trouble Area
P0110	Open or short in intake air temp. sensor circuit	<ul> <li>Open or short in intake air temperature sensor circuit</li> <li>Intake air temp. sensor (built into mass air flow meter)</li> <li>ECM</li> </ul>

#### HINT:

After confirming DTC P0110, use the OBD II scan tool or TOYOTA hand-held tester to confirm the intake air temperature from the CURRENT DATA.

Displayed Temperature	Malfunction
-40 °C (-40 °F)	Open circuit
140°C ( 284°F ) or more	Short circuit

## WIRING DIAGRAM

DIAGNOSTICS - ENGINE (5VZ-FE)

## **INSPECTION PROCEDURE**

HINT:

- If DTCs P0110, P0115 and P0120 are output simultaneously, E2 (sensor ground) may be open.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

## Connect OBD II scan tool or TOYOTA hand-held tester, and read value of intake air temperature.

#### PREPARATION:

- (a) Connector the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.

#### CHECK:

1

Read the temperature value on the OBD II scan tool or TOYOTA hand-held tester.

## <u>OK:</u>

## Same value as the actual intake air temperature.

HINT:

- If there is open circuit, OBD II scan tool or TOYOTA hand-held tester indicates -40°C (-40°F).
- If there is short circuit, OBD II scan tool or TOYOTA hand-held tester indicates 140°C (284°F) or more.

-40 °C (-40°F) ... Go to step 2. 140 °C (284°F) or more ... Go to step 4.

0	Κ	

Check for intermittent problems (See page DI-146 ).

DI0RT-12

## DTC

## P0115

## Engine Coolant Temp. Circuit Malfunction

## **CIRCUIT DESCRIPTION**

A thermistor built in the engine coolant temperature sensor changes the resistance value according to the engine coolant temperature.

The structure of the sensor and connection to the ECM is the same as in the DTC P0110 shown on page DI-169.

DTC No.	DTC Detection Condition	Trouble Area
P0115	Open or short in engine coolant temp. sensor circuit	<ul> <li>Dpen or short in engine coolant temp. sensor circuit</li> <li>Engine coolant temp. sensor</li> <li>ECM</li> </ul>

HINT:

After confirming DTC P0115, use the OBD II scan tool or TOYOTA hand-held tester to confirm the engine coolant temperature from the CURRENT DATA.

Temperature Displayed	Malfunction
-40 °C (-40 °F)	Open circuit
140C° (284°F) or more	Short circuit

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

- If DTCs P0110, P0115 and P0120 are output simultaneously, E2 (sensor ground) may be open.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1	Connect OBD II scan tool or TOYOTA hand-held tester, and read value of engine
	coolant temperature.

#### **PREPARATION:**

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the OBD II scan tool or TOYOTA hand-held tester main switch ON.

#### CHECK:

Read the temperature value on the OBD II scan tool or TOYOTA hand-held tester.

#### PREPARATION:

- (a) Remove the glove compartment (See page SF-54).
- (b) Connect terminals THW and E2 of the ECM connector together.

#### HINT:

The engine coolant temperature sensor connector is disconnected. Before checking, do a visual and contact check of the pressur of the ECM connector (See page IN-28).

(c) Turn the ignition switch ON.

## CHECK:

Read the temperature value on the OBD II scan tool or TOYO-TA hand-held tester.

#### <u>OK:</u>

#### Temperature value: 140°C (284°F) or more

ок

Open in harness between terminals E2 and THW, repair or replace harness.

NG

## Confirm good connection at ECM. If OK, check and replace ECM (See page IN-28 ).

DI0RU-12

## DTC P0116 Engine Coolant Temp. Circuit Range/Performance Problem

## **CIRCUIT DESCRIPTION**

#### Refer to DTC P0115 on page DI-173.

DTC No.	DTC Detection Condition	Trouble Area
P0116	If THW < -6.7 °C (19.4 °F) or THA < -6.7 °C (19.4 °F) 20 min. or more after starting engine, engine coolant temp. sensor value is 15 °C (59 °F) or less (2 trip detection logic)	€cooling system
	If THW $\square$ -6.7 °C (19.4 °F) and THA < -6.7 °C (19.4 °F) and 10 °C (50 °F) at engine start, 5 min. or more after starting en- gine, engine coolant temp. sensor value is 30 °C (86 °F) or less (2 trip detection logic)	
	If THW < 10°C (50°F) and THA < 10°C (50°F) at engine start, 2 min. or more after starting engine, engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	
	<ul> <li>When THW 2 35°C (95°F) and 60°C (140°F), THA &lt;</li> <li>-6.7°C (19.4°F) when starting engine, conditions (a) and (b) continue: (2 trip detection logic)</li> <li>(a) Vehicle speed is changing (Not stable)</li> <li>(b) Water temp. change is lower than 3°C (5.4°F) from water temp. since when starting engine</li> </ul>	Engine coolant temp. sensor
	In case that reading value of water temp. sensor will not change more than $1^{\circ}C(1.8^{\circ}F)$ even after repeating 6 trips (detection logic) of adjusting speed pattern with THW more than $60^{\circ}C(140^{\circ}F)$ when starting engine	

## **INSPECTION PROCEDURE**

HINT:

- If DTCs P0115 and P0116 are output simultaneously, engine coolant temperature sensor circuit may be open. Perform a troubleshooting of DTC P0115 first.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI6WH-02

## DTC

## Throttle/Pedal position Sensor/Switch "A" Circuit Malfunction

## **CIRCUIT DESCRIPTION**

The throttle position sensor is mounted in the throttle body and detects the throttle valve opening angle. When the throttle valve is fully closed, a voltage of approximately 0.3 - 1.0 V is applied to terminal VTA of the ECM. The voltage applied to terminals VTA of the ECM increases in proportion to the opening angle of the throttle valve and becomes approximately 2.7 - 5.2 V when the throttle valve is fully opened. The ECM judges the vehicle driving conditions these signals input from terminals VTA and uses them as one of the conditions to decide the air-fuel ratio correction, power increase correction and fuel-cut control, etc.

 
 DTC No.
 DTC Detection Condition
 Trouble Area

 P0120
 Condition (a) or (b) continues: (a) VTA < 0.1 V (b) VTA > 4.9 V
 Open or short in throttle position sensor circuit

 ECM

Measure the voltage between terminals VC and E2 of the ECM connector.

#### <u> 0K:</u>

#### Voltage: 4.5 - 5.5 V

 $\rangle$  Check and replace ECM (See page IN-28).

Date :

DI-181

ОК

Check for open in harness and connector in VC circuit between ECM and throttle position sensor (See page IN-28).

DTC	P0121	Throttle/Pedal Position Sensor/Switch "A" Circuit Range/Performance Problem
-----	-------	--------------------------------------------------------------------------------

## **CIRCUIT DESCRIPTION**

Refer to DTC P0120 on page DI-179.

DTC No.	DTC Detection Condition	Trouble Area
P0121	While vehicle speed drops from 30 km/h (19 mph) or more to 0 km/h (0 mph), output value of throttle position sensor is out of applicable range (2 trip detection logic)	Throttle position sensor

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI0RW-10

DTC	P0125	Insufficient Coolant Temp. for Closed Loop Fuel Control
-----	-------	------------------------------------------------------------

## **CIRCUIT DESCRIPTION**

To obtain a high purification rate of the CO, HC and NOx components of the exhaust gas, a three-way catalytic converter is used. For the most efficient use of the three-way catalytic converter, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio.

The A/F sensor has a characteristic of providing an output voltage* approximately proportional to the existing air-fuel ratio. The A/F sensor output voltage* is used to provide feedback for the ECM to control the air-fuel ratio.

By the A/F sensor output, the ECM can determine the deviation amount from the stoichiometric air-fuel ratio and control the proper injection time immediately. If the A/F sensor is malfunctioning, the ECM is unable to perform the accurate air-fuel ratio control.

The A/F sensor is equipped with a heater which heats the zirconia element. The heater is controlled by the ECM. When the intake air volume is low (the temperature of the exhaust gas is low), current flows to the heater to heat the sensor for the accurate oxygen concentration detection.

*: The voltage value changes at the inside of the ECM only.

DTC No.	DTC Detection Condition	Trouble Area
P0125	After engine is warmed up, A/F sensor output* does not change when conditions (a), (b) and (c) continue for at least 1.5 min.: *: Output value changes at inside of ECM only (a) Engine speed: 1,500 rpm or more (b) Vehicle speed: 40 - 100 km/h (25 - 62 mph) (c) Throttle valve does not fully closed (d) After starting engine < 140 sec.	<ul> <li>Dpen or short in A/F sensor (bank 1 sensor 1) circuit</li> <li>V/F sensor (bank 1 sensor 1)</li> <li>Air induction system</li> <li>Fuel pressure</li> <li>Injector</li> <li>Gas leak on exhaust system</li> <li>ECM</li> </ul>

HINT:

- After confirming DTC P0125, use the OBD II scan tool or TOYOTA hand held tester to confirm output voltage of the heated oxygen sensor (bank 1 sensor 1) from the CURRENT DATA.
- The ECM controls the voltage of the AF1+ and AF1- terminals of the ECM to the fixed voltage. Therefore it is impossible to confirm the A/F sensor output voltage without OBD II scan tool or TOYOTA hand-held tester.

DI8YY-01

• OBD II scan tool (excluding TOYOTA hand-held tester) displays the one fifth of the A/F sensor output voltage which is displayed on the TOYOTA hand-held tester.

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

- If the vehicle runs out of fuel, the air-fuel ratio is LEAN and DTC P0125 will be recorded. The MIL then comes on.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

## 2 Connect OBD II scan tool or TOYOTA hand-held tester, and read value for output voltage of A/F sensor (bank 1 sensor 1).

#### PREPARATION:

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Warm up the A/F sensor with the engine speed at 2,500 rpm for approxiwately 90 seconds.

#### CHECK:

Read the voltage value of the A/F sensor on the screen of the OBD II scan tool or TOYOTA hand-held tester when performing all the following conditions.

#### HINT:

The voltage of the AF1+ terminal of the ECM is fixed at 3.3 V and the AF1- terminal is fixed at 3.0 V. Therefore it is impossible to check the A/F sensor output voltage at the terminals (AF1+/AF1-) of the ECM. **OK:** 

Condition	A/F Sensor Voltage value	
Engine idling	●Not remains at 3.3. V (0.660 V*)	
Driving at engine speed 1,500 rpm or more and vehicle speed 40 km/h (25 mph) or move, and operate throttle valve	<ul> <li>Not remains at 3.8 V (0.76 V*) or more</li> <li>Not remains at 2.8 V (0.56 V*) or less</li> <li>*: When using the OBD II scan tool (excluding TOYOTA hand-held tester)</li> </ul>	
open and close	······································	

HINT:

- Although there is a case that the output voltage of the A/F sensor is below 2.8 V (0.56 V*) during fuel enrichment, it is normal.
- Although there is a case that the output voltage of the A/F sensor is above 3.8 V (0.76 V*) during fuel cut, it is normal.
- If the output voltage of the A/F sensor remains at 3.30 V (0.660 V*) even after performing all the above conditions, the A/F sensor circuit may be open.
- If the output voltage of the A/F sensor remains at 3.8 V (0.76 V*) or more, or 2.8 V (0.56 V*) or less even after performing all the above conditions, A/F sensor circuit may be short.
- *: When using the OBD II scan tool (excluding TOYOTA hand-held tester).

Sensor 2)	DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)
-----------	-----	-------	--------------------------------------------------------

## **CIRCUIT DESCRIPTION**

Refer to DTC P0125 on page DI-184.

DTC No.	DTC Detection Condition	Trouble Area
P0136	Voltage output of heated oxygen sensor remains at 0.45 V or less to 0.60 V or more when vehicle is driven at 50 km/h (31 mph) or more after engine is warmed up (2 trip detection logic)	<ul><li>Dpen or short in heated oxygen sensor circuit</li><li>Heated oxygen sensor</li></ul>

HINT:

Sensor 2 refers to the sensor farther away from the engine body.

## WIRING DIAGRAM

Refer to DTC P0125 on page DI-184.

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

## 3 Check output voltage of heated oxygen sensor.

#### PREPARATION:

(a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.

(b) Warm up the engine to normal operating temperature.

#### CHECK:

Read the voltage output of the heated oxygen sensor when the engine is suddenly raced. HINT:

Perform quick racing to 4,000 rpm 3 min. using the accelerator pedal.

#### <u>OK:</u>

#### Heated oxygen sensor output voltage:

Alternates from 0.45 V or less to 0.60 V or more.

NG

Replace heated oxygen sensor.

DI8YX-01	

DTC	P0141	Oxygen Sensor Heater Circuit Malfunction
		(Bank 1 Sensor 2)

## **CIRCUIT DESCRIPTION**

Refer to DTC P0125 on page DI-184.

DTC No.	DTC Detection Condition	Trouble Area	
P0135	When heater operates, heater current exceeds 2.35 A (2 trip detection logic)	<ul> <li>Dpen or short in heater circuit of heated oxygen sensor</li> <li>Heated oxygen sensor heater</li> <li>ECM</li> </ul>	
P0141	Heater current is 0.2 A or less when heater operates (2 trip detection logic)		

HINT:

Sensor 2 refers to the sensor farther away from the engine body.

## WIRING DIAGRAM

Refer to DTC P0125 on page DI-184.

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

	οκ	
_		_

Check and repair harness or connector between EFI main relay (Marking: EFI) and heated oxygen sensor, and heated oxygen sensor and ECM (See page IN-28).

DTC	P0171	System too Lean (Fuel Trim)

P0172

## System too Rich (Fuel Trim)

## **CIRCUIT DESCRIPTION**

Fuel trim is related to the feedback compensation value, not to the basic injection time. Fuel trim includes short-term fuel trim and long-term fuel trim.

Short-term fuel trim is the short-term fuel compensation used to maintain the air-fuel ratio at its ideal theoretical value. The signal from the A/F sensor is approximately proportional to the existing air-fuel ratio, and ECM compares it with the ideal theoretical value, the ECM reduces fuel volume immediately if the air-fuel ratio is RICH and increases fuel volume if it is LEAN.

Long-term fuel trim compensates for the deviation from the central value of the short-term fuel trim stored by each engine tolerance, and the deviation from the central value due to the passage of time and changes of environment.

If both the short-term fuel trim and long-term fuel trim exceed a certain value, it is detected as a malfunction and the MIL lights up.

DTC No.	DTC Detection Condition	Trouble Area
P0171	When air fuel ratio feedback is stable after warming up engine, fuel trim is considerably in error on RICH side (2 trip detection logic)	<ul> <li>Air induction system</li> <li>Onjector blockage</li> <li>Mass air flow meter</li> <li>Engine coolant temp. sensor</li> <li>Fuel pressure</li> <li>Gas leak on exhaust system</li> <li>Open or short in A/F sensor (bank 1 sensor 1) circuit</li> <li>V/F sensor (bank 1 sensor 1)</li> <li>ECM</li> </ul>
P0172	When air fuel ratio feedback is stable after warming up engine, fuel trim is considerably in error on LEAN side (2 trip detection logic)	<ul> <li>Injector leak blockage</li> <li>Mass air flow meter</li> <li>Engine coolant temp. sensor</li> <li>Ignition system</li> <li>Fuel pressure</li> <li>Gas leak on exhaust system</li> <li>Open or short in A/F sensor (bank 1 sensor 1) circuit</li> <li>V/F sensor (bank 1 sensor 1)</li> <li>ECM</li> </ul>

HINT:

- When the DTC P0171 is recorded, the actual air-fuel ratio is on the lean side. When DTC P0172 is
  recorded, the actual air-fuel ratio is on the rich side.
- If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 is recorded. The MIL then comes
  on.
- If the total of the short-term fuel trim value and long-term fuel trim value is within ± 35 % (80°C (176°F) or more), the system is functioning normally.
- The A/F sensor (bank 1 sensor 1) output voltage and the short-term fuel trim value can be read using the OBD II scan tool or TOYOTA hand-held tester.
- The ECM controls the voltage of the terminals AF1+ and AF1- of the ECM to the fixed voltage. Therefore it is impossible to confirm the A/F sensor output voltage without OBD II scan tool or TOYOTA hand-held tester.

DI8YZ-01

 OBD II scan tool (excluding TOYOTA hand-held tester) displays the one fifth of the A/F sensor (bank 1 sensor 1) output voltage which is displayed on the TOYOTA hand-held tester.

## WIRING DIAGRAM

Refer to DTC P0125 on page DI-184.

## **INSPECTION PROCEDURE**

#### HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

	NG Repair or replace.		
ОК			
4	Check for spark and ignition (See page IG-1 ).		

Date :

#### **PREPARATION:**

(a) Connect the OBDII scan tool or TOYOTA hand-held tester to the DLC3.

(b) Warm up the A/F sensor with the engine speed of 2,500 rpm for approximately 90 seconds.

#### CHECK:

Read the voltage value of the A/F sensor on the screen of the OBDII scan tool or TOYOTA hand-held tester, when performing all the following conditions. HINT:

The voltage of the AF1+ terminal of the ECM is fixed at 3.3 V and the AF- terminal is fixed at 3.0 V. Therefore it is impossible to check the A/F sensor output voltage at the terminals (AF1+/AF1-) of the ECM. **OK:** 

Condition	A/F Sensor Voltage value
Engine idling	
Engine racing	Not remains at 3.30 V (0.660 V [*] ) Not remains at 3.8 V (0.76 V [*] ) or more
Driving at engine speed 1,500 rpm or more and vehicle speed 40 km/h (25 mph) or more, and operating throttle valve open and close	Not remains at 2.8 V (0.56 V*) or less *: When using the OBDII scan tool (excluding TOYOTA hand-held tester)

HINT:

- Although there is a case that the output voltage of the A/F sensor is below 2.8 V (0.56 V*) during fuel enrichment,, it is normal.
- Although there is case that the output voltage of the A/F sensor is above 3.8 V (0.76 V*) during fuel cut, it is normal.
- If the output voltage of the A/F sensor remains at 3.30 V (0.660 V*) even after performing all the above conditions, the A/F sensor circuit may be open.
- If the output voltage of the A/F sensor remains at 3.8 V (0.76 V*) or more, or 2.8 V (0.56 V*) or less even after performing all the above conditions, the A/F sensor circuit may be short.
- *: When using the OBDII scan tool (excluding TOYOTA hand-held tester).

Check for intermittent problems (See page DI-146 ).

## YES

DTC P0171 or P0172 is caused by shortage of fuel.

		DI8ZW-01
DTC	P0300	Random/Multiple Cylinder Misfire Detected
DTC	P0301	Cylinder 1 Misfire Detected
DTC	P0302	Cylinder 2 Misfire Detected
DTC	P0303	Cylinder 3 Misfire Detected
DTC	P0304	Cylinder 4 Misfire Detected
	-	
DTC	P0305	Cylinder 5 Misfire Detected

DTC	P0306	Cylinder 6 Misfire Detected
-----	-------	-----------------------------

## **CIRCUIT DESCRIPTION**

Misfire: The ECM uses the crankshaft position sensor and camshaft position sensor to monitor changes in the crankshaft rotation of each cylinder.

The ECM counts the number of times of indicating that misfire has occurred by using the engine speed change rate. And when the misfire rate equals to or exceeds the count of indicating that the engine condition has deteriorated, the MIL lights up.

If the misfire rate is very high and the driving conditions cause the catalyst to overheat, the MIL shows an occurence of misfire by blinking.

DTC No.	DTC Detection Condition	Trouble Area
P0300	Misfiring of random cylinders is detected during any particular 200 or 1,000 revolutions	<ul><li>Open or short in engine wire</li><li>Connector connection</li><li>/acuum hose connection</li></ul>
P0301 P0302 P0303	For any particular 200 revolutions for engine, misfiring is de- tected which can cause catalyst overheating (This causes MIL to blink)	<ul> <li>Ggnition system</li> <li>Onjector</li> <li>Fuel pressure</li> <li>Mass air flow meter</li> <li>Engine conjust temp, concert</li> </ul>
P0304 P0305 P0306	For any particular 1,000 revolutions of engine, misfiring is de- tected which causes a deterioration in emission (2 trip detection logic)	Compression pressure Valve clearance Valve timing ECM

#### HINT:

When the 2 or more codes for a misfiring cylinder are recorded repeatedly but no Random Misfire code is recorded, it indicates that the misfires were detected and recorded at different times.

## WIRING DIAGRAM

## **CONFIRMATION DRIVING PATTERN**

- (a) Connect the TOYOTA hand-held tester or OBD II scan tool.
- (b) Record the DTC and freeze frame data.
- (c) Use the TOYOTA hand-held tester to set to the check mode (See page DI-146).
- (d) Drive the vehicle several times with the engine speed, load and its surrounding range shown with EN-GINE SPD, CALC LOAD in the freeze frame data or MISFIRE RPM, MISFIRE LOAD in the data list. Without TOYOTA hand-held tester, turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again.

#### HINT:

In order to memorize DTC of misfire, it is necessary to drive around MISFIRE RPM, MISFIRE LOAD in the following period of time in the data list.

Engine Speed	Time
Idling	3 minutes 30 seconds or more
1,000 rpm	3 minutes or more

2001 TOYOTA TACOMA (RM835U)

Author :

459

2,000 rpm	1 minute 30 seconds or more
3,000 rpm	1 minute or more

- (e) Check whether there is misfire or not by monitoring the DTC and freeze frame data, and then record them.
- (f) Turn the ignition switch OFF and wait at least 5 seconds.

## **INSPECTION PROCEDURE**

HINT:

- In case that DTCs besides misfire are memorized simultaneously, first perform the troubleshooting for them.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.
- If the misfine does not occur when the vehicle is brought to the workshop, misfire can be confirmed by reproducing the condition of the freeze frame data. Also, after finishing the repair, confirm that there is no misfire (See the confirmation driving pattern).
- When either of SHORT FT #1, LONG FT #1, SHORT FT #2 or LONG FT#2 in the freeze frame data is over the range of ±20 %, there is a possibility that the air-fuel ratio is inclining either to RICH (-20 % or less) or LEAN (+20 % or more).
- When COOLANT TEMP in the freeze frame data is less than 80°C (176°F), there is a possibility of misfire only during warmed up the engine.
- In case that the misfire cannot be reproduced, the reason may be because of driving with lack of fuel, a use of improper fuel, a stain of the ignition plug, and etc.

Check wire harness, connector and vacuum hose in engine room.

#### CHECK:

1

- (a) Check the connection conditions of wire harness and connector.
- (b) Check the disconnection, piping and break of vacuum hose.

Repair or replace, then confirm that there is no misfire (See confirmation driving pattern).

## OK

2

## Check spark plug and spark of misfiring cylinder.

## PREPARATION:

- (a) Remove the ignition coil and high tension cord.
- (b) Remove the spark plug.

## CHECK:

- (a) Check the spark plug type.
- (b) Check the electrode for carbon deposits.
- (c) Check the electrode gap.

#### <u>OK:</u>

(a) Twin ground electrodes type.

Recommended spark plug:

DENSO made: K16TR11

NGK made: BKR5EKB-11

- (b) No large carbon deposit present.
- (c) Electrode gap: 1.1 mm (0.043 in.)

#### PREPARATION:

- (a) Install the spark plug to the ignition coil or high tension cord.
- (b) Disconnect the injector connector.
- (c) Ground the spark plug.

### CHECK:

Check if spark occurs while the engine is being cranked. **NOTICE:** 

To prevent excess fuel from being injected from the injectors during this test, don't crank the engine for more than 5 - 10 sec. at a time.

<u>OK:</u>

Spark is scattered on electrode gap.

ок

3

Check voltage of ECM terminal for injector of failed cylinder.

#### **PREPARATION:**

- (a) Remove the glove compartment (See page SF-54).
- (b) Turn the ignition switch ON.

#### CHECK:

Measure the voltage between applicable terminal of the ECM connector and the body ground.

<u> 0K:</u>

Voltage: 9 - 14 V

#### **Reference: INSPECTION USING OSCILLOSCOPE**

With the engine idling, check the waveform between terminals #10 - #60 and E01 of the ECM connector. HINT:

The correct waveform is as shown.

|--|

DTC	P0330	Knock Sensor 2 Circuit Malfunction (Bank 2)
-----	-------	---------------------------------------------

Each knock sensor is fitted to the right bank and left bank of the cylinder block to detect engine knocking. This sensor contains a piezoelectric element which generates a voltage when it becomes deformed, which occurs when the cylinder block vibrates due to the knocking. If engine knocking occurs, ignition timing is retarded to suppress it.

DTC No.	DTC Detection Condition	Trouble Area
P0325	No signal of knock sensor 1 to ECM with engine speed be- tween 2,000 rpm and 5,600 rpm	<ul> <li>Open or short in knock sensor 1 circuit</li> <li>Knock sensor 1 (looseness)</li> <li>ECM</li> </ul>
P0330	No signal of knock sensor 2 to ECM with engine speed be- tween 2,000 rpm and 5,600 rpm	<ul> <li>Open or short in knock sensor 2 circuit</li> <li>Knock sensor 2 (looseness)</li> <li>ECM</li> </ul>

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

- DTC P0325 is for the right bank knock sensor circuit.
- DTC P0330 is for the left bank knock sensor circuit.

DI0S4-12

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

# 1

# Connect OBD II scan tool or TOYOTA hand-held tester, and check knock sensor circuit.

#### **PREPARATION:**

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Disconnect the wire to wire connector ED1.
- (c) Connect the terminals of the disconnected ED1 male connector and ED1 female as follows.

Male connector - Female connector
Terminal 1 - Terminal 2
Terminal 2 - Terminal 1

- (d) Turn ignition switch ON and push the OBDII scan tool or TOYOTA hand-held tester main switch ON.
- (e) After the engine is warmed up, perform quick racing to 4,000 rpm three times.

#### CHECK:

Check the DTC.

#### RESULT:

Туре І	DTC same as when vehicle brought in P0325 $\rightarrow$ P0325 or P0330 $\rightarrow$ P0330
Type II	DTC different to when vehicle brought in P0325 $\rightarrow$ P0330 or P0330 $\rightarrow$ P0325

#### Reference: INSPECTION USING OSCILLOSCOPE

 With the engine racing (4,000 rpm), check the waveform between terminal KNK1, KNK2 of the ECM connector and the body ground.

HINT:

The correct waveform is as shown.

• Spread the time on the horizontal axis, and confirm that period of the wave is 0.141 msec. (Normal mode vibration the frequency of knock sensor: 7.1 kHz)

HINT:

A00113

If the normal mode vibration frequency is not 7.1 kHz, the sensor is malfunctioning.

Type II Go to step 3.

0.1 msec./Division

	NG Tighten sensor. Replace RH camshaft timing pulley.
ОК	

Check and replace ECM (See page IN-28).

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)
-----	-------	-----------------------------------------------------

The ECM observes the waveform of the heated oxygen sensor located behind the catalyst to determine whether the catalyst is performance has deteriorated. If the catalyst functions normally, the waveform of the heated oxygen sensor located behind the catalyst switches back and forth between rich and lean much more slowly. When the waveform of the heated oxygen sensor located behind the catalyst alternates flatteringly between rich and lean, it indicates the catalyst performance has deteriorated.

DTC No.	DTC Detection Condition	Trouble Area
P0420	After engine and catalyst are warmed up, and while vehicle is driven within set vehicle and engine speed range, waveform of heated oxygen sensor (bank 1 sensor 2) alternates flatteringly	<ul> <li>Gas leak on exhaust system</li> <li>●\/F sensor (bank 1 sensor 1)</li> <li>●Heated oxygen sensor (bank 1 sensor 2)</li> </ul>
	between rich and lean (2 trip detection logic)	Three-way catalytic converter

DI5C9-07

## **CONFIRMATION ENGINE RACING PATTERN**

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Start the engine and warm it up with all the accessories switched OFF until the water temperature is stable.
- (c) Race the engine at 2,500 3,000 rpm for about 3 minutes.
- (d) When racing the engine at 3,000 rpm for 2 seconds and 2,000 rpm for 2 seconds alternately, check the waveform of the heated oxygen sensor (bank 1 sensor 2).

## **INSPECTION PROCEDURE**

#### HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

2001 TOYOTA TACOMA (RM835U)

OK

DTC	P0440	Evaporative Emission Control System Mal- function
-----	-------	------------------------------------------------------

The vapor pressure sensor and VSV for vapor pressure sensor are used to detect abnormalities in the evaporative emission control system.

The ECM decides whether there is an abnormality in the evaporative emission control system by the vapor pressure sensor signal.

DTC P0440 is recorded by the ECM when evaporative emissions leak from the components within the dotted line in Fig. 1 below, or when the vapor pressure sensor malfunctions.

DTC No.	DTC Detection Condition	Trouble Area
P0440	Pressure of fuel tank is the same as one of atomospheric after vehicle is driven for 20 min. (2 trip detection logic)	<ul> <li>Hose or tube cracked, holed, damaged or loose seal ((3) in Fig. 1)</li> <li>Fuel tank cap incorrectly installed</li> <li>Fuel tank cap cracked or damaged</li> <li>Vacuum hose cracked, holed, blocked, damaged or disconnected ((1) or (2) in Fig. 1)</li> <li>Fuel tank cracked, holed or damaged</li> <li>Charcoal canister cracked, holed or damaged</li> <li>Dpen or short in vapor pressure sensor circuit</li> <li>Vapor pressure sensor</li> <li>ECM</li> </ul>

#### WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

- If DTC P0441, P0446, P0450 or P0451 is output after DTC P0440, first troubleshoot DTC P0441, P0446, P0450 or P0451. If no more malfunction is detected, troubleshoot DTC P0440 next.
- Ask the customer whether, after the MIL came on, the customer found the fuel tank cap was loose and tightened it. Also ask the customer whether the fuel tank cap was loose when refuelling. If the fuel tank cap was loose, it was the cause of the DTC. If the fuel tank cap was not loose or if the customer was not sure if it was loose, troubleshoot according to the following procedure.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DI-217

#### **PREPARATION:**

- (a) Remove the glove compartment (See page SF-54).
- (b) Turn the ignition switch ON.

#### CHECK:

Measure the voltage between terminals PTNK and E2 of the ECM connector.

- (1) Disconnect the vacuum hose from the vapor pressure sensor.
- Using the MITYVAC (Hand-Held Vacuum Pump), apply a vacuum of 4.0 kPa (30 mmHg, 1.18 in.Hg) to the vapor pressure sensor.

#### NOTICE:

ΟΚ

The vacuum applied to the vapor pressure sensor must be less than 66.7 kPa (500 mmHg, 19.7 in.Hg).

#### <u> 0K:</u>

 $\langle$  Go to step 12.

NG

11 Check for open and short in harness and connector between vapor pressure sensor and ECM (See page IN-28).

It is possible that vehicle user did not properly close fuel tank cap. Please explain to customer how to properly install fuel tank cap.

DTC	P0441	Evaporative Emission Control System Incor- rect Purge Flow
-----	-------	---------------------------------------------------------------

DTC	P0446	Evaporative Emission Control System Vent Control Malfunction
-----	-------	-----------------------------------------------------------------

The vapor pressure sensor and VSV for vapor pressure sensor are used to detect abnormalities in the evaporative emission control system.

The ECM decides whether there is an abnormality in the evaporative emission control system by the vapor pressure sensor signal.

DTCs P0441 and P0446 are recorded by the ECM when evaporative emissions leak from the components within the dotted line in Fig. 1 below, or when there is a malfunction anywhere in the VSV for EVAP, the VSV for vapor pressure sensor, or in the vapor pressure sensor itself.

DI17F-04

DTC No.	DTC Detection Condition	Trouble Area	
P0441	The pressure in charcoal canister does not drop during purge control (2 trip detection logic)		
	During purge cut-off, the pressure in charcoal canister is very low compared with atmospheric pressure (2 trip detection logic)	<ul> <li>Vacuum hose cracked, holed blocked, damaged or disconnected ((1), (4), (5), (6) and (7) in Fig. 1)</li> <li>Dpen or short in vapor pressure sensor circuit</li> <li>Vapor pressure sensor</li> <li>Dpen or short in VSV circuit for EVAP</li> <li>VSV for EVAP</li> <li>Dpen or short in VSV circuit for vapor pressure sensor</li> <li>VSV for vapor pressure sensor</li> <li>Charcoal canister cracked, holed or damaged</li> <li>ECM</li> </ul>	
P0446	When VSV for vapor pressure sensor is OFF, ECM judges that there is no continuity between vapor pressure sensor and charcoal canister (2 trip detection logic)		
	When VSV for vapor pressure sensor is OFF, ECM judges that there is no continuity between vapor pressure sensor and fuel tank (2 trip detection logic)		
	After the purge cut off operates, pressure in charcoal canister is maintained at atmospheric pressure (2 trip detection logic)		

## WIRING DIAGRAM

Refer to DTC P0440 on page DI-214 .

## **INSPECTION PROCEDURE**

HINT:

- If DTC P0441, P0446, P0450 or P0451 is output after DTC P0440, first troubleshoot DTC P0441, P0446, P0450 or P0451. If no more malfunction is detected, troubleshoot DTC P0440 next.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

## **TOYOTA** hand-held tester:

- (a) Check that the vacuum hose is connected correctly.
- (b) Check the vacuum hose for looseness and disconnection.
- (c) Check the vacuum hose for cracks, hole, damage and blockage.

DTC	P0450	Evaporative Emission Control System Pres- sure Sensor Malfunction
-----	-------	----------------------------------------------------------------------

DTC	P0451	Evaporative Emission Control System Pres- sure Sensor Range/Performance
		5

The vapor pressure sensor and VSV for vapor pressure sensor are used to detect abnormalities in the evaporative emission control system.

The ECM decides whether there is an abnormality in the evaporative emission control system by the vapor pressure sensor signal.

DTC P0450 or P0451 is recorded by the ECM when the vapor pressure sensor malfunctions.

DTC No.	DTC Detection Condition	Trouble Area
P0450	<ul> <li>10 seconds or more after engine starting condition (a) or (b) continues for 7 seconds or more: (2 trip detection logic)</li> <li>(a) Vapor pressure sensor value &lt; -3.5 kPa (-26 mmHg, -1.0 in.Hg)</li> <li>(b) Vapor pressure sensor value &lt; 1.5 kPa (11 mmHg, 0.4 in.Hg)</li> </ul>	<ul> <li>●Dpen or short in vapor pressure sensor circuit</li> <li>●/apor pressure sensor</li> <li>●CM</li> </ul>
P0451	<ul> <li>Vapor pressure sensor output extremely changes under conditions of (a), (b) and (c): (2 trip detection logic)</li> <li>(a) Vehicle speed: 0 km/h (0mph)</li> <li>(b) Engine speed: Idling</li> <li>(c) VSV for vapor pressure sensor is ON</li> </ul>	

DI0SA-11

#### WIRING DIAGRAM

Refer to DTC P0440 on page DI-214.

#### **INSPECTION PROCEDURE**

#### HINT:

- If DTC P0441, P0446, P0450 or P0451 is output after DTC P0440, first troubleshoot DTC P0441, P0446 P0450 or P0451. If no more malfunction is detected, troubleshoot DTC P0440 next.
- Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

DTC

P0500

## Vehicle Speed Sensor Malfunction

## **CIRCUIT DESCRIPTION**

The speed sensor for ABS detects the wheel speed and sends the appropriate signals to the ABS ECU. The ECU converts these signals into a 4-pulse signal and outputs it to the combination meter. After this signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter, it is then transmitted to the ECM. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC No.	DTC Detection Condition	Trouble Area
P0500	No speed sensor signal to ECM under following conditions: (2 trip detection logic) For A/T: (a) Park/neutral position switch is OFF (b) Vehicle is being driven	<ul> <li>Dpen or short in speed signal circuit</li> <li>Combination meter</li> <li>ECM</li> <li>Dpen or short in speed sensor circuit for ABS</li> </ul>
	(a) Engine speed is between 1.800 rpm and 3.500 rpm	ABS ECO

## WIRING DIAGRAM

DI0SB-10

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool. Because freeze frame records the engine conditions when the malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1

#### Check operation of speedometer.

#### CHECK:

Drive the vehicle and check if the operation of the speedometer in the combination meter is normal. HINT:

The vehicle speed operates normally if the speedometer display is normal.

2001 TOYOTA TACOMA (RM835U)

3	Check for open or short in harness and connector between combination meter and ECM (See page IN-28).		
	OK Check and replace ECM (See page IN-28 ).		
NG			

Repair or replace harness or connector.

# DTC

P0505

## **Idle Control System Malfunction**

## **CIRCUIT DESCRIPTION**

The rotary solenoid type IAC valve is located in front of the intake air chamber and intake air bypassing the throttle valve is directed to the IAC valve through a passage.

In this way, the intake air volume bypassing the throttle valve is regulated, controlling the engine speed.

The ECM operates only the IAC valve to perform idle-up and provide feedback for the target idling speed.

DTC No.	DTC Detection Condition	Trouble Area
P0505	Idle speed continues to vary greatly from target speed (2 trip detection logic)	<ul> <li>Dpen or short in IAC valve circuit</li> <li>AC valve is stuck or closed</li> <li>Dpen or short in A/C signal circuit</li> <li>Air induction system</li> <li>ECM</li> </ul>

## WIRING DIAGRAM

## **INSPECTION PROCEDURE**

HINT:

Read freeze frame data using TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

### Check engine idle speed.

#### PREPARATION:

- (a) Warm up the engine to normal operating temperature.
- (b) Switch off all the accessories.
- (c) Switch off the A/C.
- (d) Shift the transmission into the N or neutral position.
- (e) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3 on the vehicle.
- (f) Using SST, connect terminals TE1 and E1 of the DLC1. SST 09843-18020

#### CHECK:

Check the difference of engine speed between the ones, less than 5 sec. and more than 5 sec. after connecting terminals TE1 and E1 of the DLC1.

#### <u> 0K:</u>

#### Difference of engine speed: More than 100 rpm

## DTC P1130 A/F Sensor Circuit Range/Performance Malfunction (Bank 1 Sensor 1)

## **CIRCUIT DESCRIPTION**

#### Refer to DTC P0125 on page DI-184.

DTC No.	DTC Detection Condition	Trouble Area
P1130	Output voltage* of A/F sensor remains at 3.8 V or more, or 2.8 V or less, during engine running after engine is warmed up (2 trip detection logic) *: Output value changes at inside of ECM only Output voltage* of A/F sensor does not change from 3.30 V, during engine running after engine is warmed up (2 trip detection logic) *: Output value changes at inside of ECM only	<ul> <li>Dpen or short in A/F sensor circuit</li> <li>A/F sensor</li> <li>Air induction system</li> <li>Fuel pressure</li> <li>Onjector</li> <li>ECM</li> </ul>
	Open or short in A/F sensor circuit (2 trip detection logic)	

HINT:

- After confirming DTC P1130, use the OBD II scan tool or TOYOTA hand-held tester to confirm output voltage of the A/F sensor (AFS B1 S1/O2S B1 S1) from the CURRENT DATA.
- The A/F sensor's output voltage and the short-term fuel value can be read by using the OBD II scan tool or TOYOTA hand-held tester.
- The ECM controls the voltage of AF1+ and AF1- terminals of ECM to the fixed voltage. Therefore it
  is impossible to confirm the A/F sensor output voltage without OBD II scan tool or TOYOTA hand-held
  tester.
- OBD II scan tool (excluding TOYOTA hand-held tester) displays the one fifth of the A/F sensor output voltage which is displayed on the TOYOTA hand-held tester.

## WIRING DIAGRAM

Refer to DTC P0125 on page DI-184.

## **CONFIRMATION DRIVING PATTERN**

- (a) Connect the TOYOTA hand-held tester to the DLC3.
- (b) Switch the TOYOTA hand-held tester from the normal mode to the check mode (See page DI-146).
- (c) Start the engine and warm it up with all the accessory switched OFF.
- (d) Drive the vehicle at 60 120 km/h (38 75 mph) and the engine speed at 1,600 3,200 rpm for 3 5 minutes.

#### HINT:

If a malfunction exists, the MIL will light up during step (d).

#### NOTICE:

- If the conditions in this test are not strictly followed, detection of the malfunction will impossible.
- Without a TOYOTA hand-held tester, turn the ignition switch OFF after performing steps (c) and (d), then perform steps (c) and (d) again.

## **INSPECTION PROCEDURE**

HINT:

- If DTC P1130 is displayed, check bank 1 sensor 1 circuit.
- Read frame freeze data using the TOYOTA hand-held tester or OBD II scan tool, as freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

#### 1 Are there any other codes (besides DTC P1130) being output?

YES  $\rangle$  Go to relevant DTC chart (See page DI-156).

NO

# 2 Connect OBD II scan tool or TOYOTA hand-held tester, and read value of output voltage of A/F sensor.

#### PREPARATION:

- (a) Connect the OBD II scan tool or TOYOTA hand-held tester to the DLC3.
- (b) Warm up the A/F sensor with the engine speed of 2,500 rpm for approximately 90 seconds.

#### CHECK:

Read the voltage of the A/F sensor on the screen of OBD II scan tool or TOYOTA hand-held tester when performing all the following conditions.

HINT:

The voltage of the AF1+ terminal of the ECM is fixed at 3.3 V and the voltage of the AF1- terminal is fixed at 3.0 V. Therefore, it is impossible to check the A/F sensor output voltage at the terminals (AF1+/AF1-) of the ECM.

<u>OK:</u>

Condition	A/F Sensor Voltage value
Engine idling	
Engine racing	Not remains at 3.30 V (0.660 V*)
Driving at engine speed 1,500 rpm or more and vehicle speed 40 km/h (25 mph) or more, and operate throttle valve open and close.	Not remains at 2.8 V (0.76 V) of hidre Not remains at 2.8 V (0.56 V*) or less *: When using the OBD II scan tool (excluding TOYOTA hand-held tester)

HINT:

- Although there is a case that the output voltage of the A/F sensor is below 2.8 V (0.56 V*) during fuel enrichment, it is normal.
- Although there is a case that the output voltage of the A/F sensor is above 3.8 V (0.76 V*) during fuel cut, it is normal.
- If the output voltage of the A/F sensor remains at 3.30 V (0.660 V*) even after performing all the above conditions, the A/F sensor circuit may be open.
- If the output voltage of the A/F sensor remains at 3.8 V (0.76V*) or more, or 2.8 V (0.56 V*) or less even after performing all the above conditions, the A/F sensor circuit may be short.
- *: With the OBD II scan tool (excluding TOYOTA hand-held tester).

NG

3 Check for open and short in harness and connector between ECM and A/F sensor (See page IN-28).

# 10 Did vehicle run out of fuel in past? NO Check for intermittent problems (See page DI-146 ).

DTC P1130 is caused by shortage of fuel.

DI5CB-08

DTC	P1133	A/F Sensor Circuit Response Malfunction

# Igniter Circuit Malfunction

## **CIRCUIT DESCRIPTION**

A DIS (Direct Ignition System) has been adopted. The DIS improves the ignition timing accuracy, reduces high-voltage loss, and enhances the overall reliability of the ignition system by eliminating the distributor. The DIS is a 2-cylinder simultaneous ignition system which ignites 2 cylinders simultaneously with 1 ignition coil. In the 2-cylinder simultaneous ignition system, each of the 2 spark plugs is connected to the end of the secondary winding. High voltage generated in the secondary winding is applied directly to the spark plugs. The sparks of the 2 spark plugs pass simultaneously from the center electrode to the ground electrode. The ECM determines ignition timing end outputs the ignition signals (IGT) for each cylinder. Based on IGT signals, the igniter controls the primary ignition signals (IGC) for all ignition coils. At the same time, the igniter also sends an ignition confirmation signal (IGF) as a fail-safe measure to the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P1300	Condition (a) is repeated 3 times consecutively during 6 con- secutively IGT signals while engine is running: (a) IGF signal is not input to ECM for 2 or more ignitions	<ul> <li>Genition system</li> <li>Dpen or short in IGF or IGT circuit from igniter to ECM</li> <li>Geniter</li> <li>Genition coil</li> <li>ECM</li> </ul>
