The values stored in long term adaptive memory are used for all operating conditions, including open loop and cold starting. However, the updating of the long term memory occurs after the engine has exceeded approximately 170°-190° F, with fuel control in closed loop and two minutes of engine run time. This is done to prevent any transitional temperature or start-up compensations from corrupting long term fuel correction.

Long term adaptive memory can change the pulse-width by as much as 25%, which means it can correct for all of short term. It is possible to have a problem that would drive long term to 25% and short term to another 25% for a total change of 50% away from base pulse-width calculation.

TYPICAL ADAPTIVE MEMORY FUEL CELLS

	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Idle	Decel
Vacuum	20	17	13	9	5	0		
Above 1,984 rpm	1	3	5	7	9	11	13 Drive	15
Below 1,984 rpm	0	2	4	6	8	10	12 Neutral	14
MAP volt =	0	1.4	2.0	2.6	3.3	3.9		

Fuel Correction Diagnostics

There are two fuel correction diagnostic routines:

- Fuel System Rich
- Fuel System Lean

A DTC is set and the MIL is illuminated if the PCM detects either of these conditions. This is determined based on total fuel correction, short term times long term.

PROGRAMMABLE COMMUNICATIONS INTERFACE (PCI) BUS

DESCRIPTION

The Programmable Communication Interface Multiplex system (PCI Bus) consist of a single wire. The Body Control Module (BCM) acts as a splice to connect each module and the Data Link Connector (DLC) together. Each module is wired in parallel to the data bus through its PCI chip set and uses its ground as the bus reference. The wiring is a minimum 20 gage wire.

OPERATION

Various modules exchange information through a communications port called the PCI Bus. The Powertrain Control Module (PCM) transmits the Malfunction Indicator Lamp (Check Engine) On/Off signal and engine RPM on the PCI Bus. The PCM receives the Air Conditioning select input, transaxle gear position inputs over the PCI Bus. The PCM also receives the air conditioning evaporator temperature signal from the PCI Bus.

The following components access or send information on the PCI Bus.

- Instrument Panel
- Body Control Module
- Air Bag System Diagnostic Module
- Full ATC Display Head (if equipped)
- ABS Module

FUEL INJECTION (Continued)

- Transmission Control Module
- Powertrain Control Module
- Travel Module

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) .

The composite manifolds uses special Plastic screws. The factory installed Plastic screws can be removed and installed up to 5 times. Do not exceed the specified torque. These screws must be installed slowly (less than 600 rpms) to avoid melting the parent material. There are service repair screws available for repair. They require a higher torque than the original screws.

ACCELERATOR PEDAL

REMOVAL

(1) Hold the throttle body throttle lever in the wide open position. Remove the throttle cable from the throttle body cam (Fig. 1).

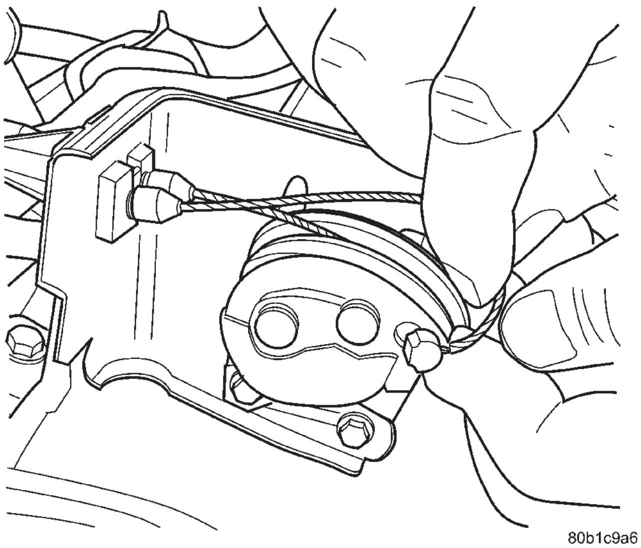

Fig. 1 THROTTLE CABLE RELEASE

(2) From inside the vehicle, hold up the pedal and remove the pedal retainer and throttle cable from the upper end of the pedal lever (Fig. 2).

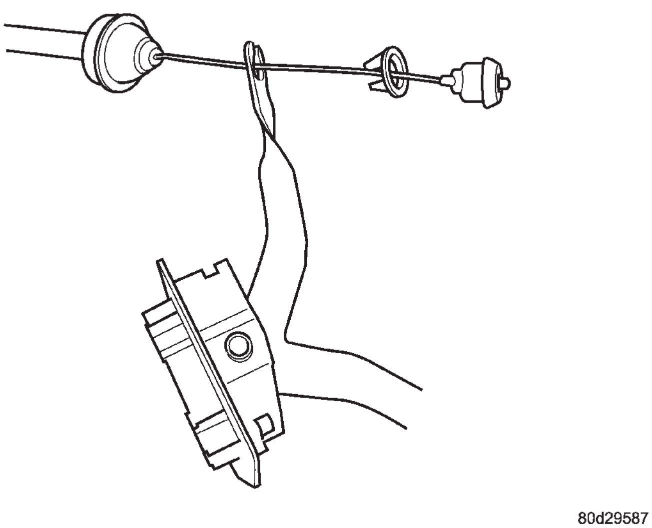

Fig. 2 CABLE CLIP

(3) Remove nuts from accelerator pedal attaching studs. Remove assembly from vehicle (Fig. 3).

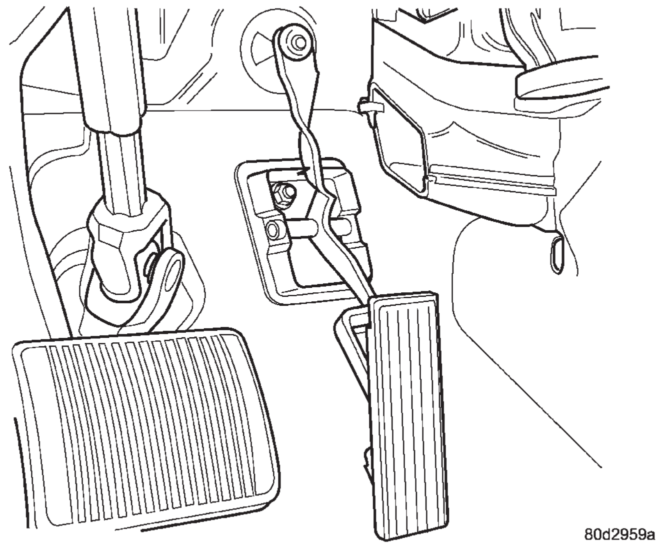

Fig. 3 ACCELERATOR PEDAL

INSTALLATION

(1) Position accelerator pedal assembly on dash panel. Install retaining nuts. Tighten retaining nuts to 12 N·m (105 in. lbs.) torque (Fig. 3).

(2) From inside the vehicle, hold up the pedal and install the throttle cable and pedal retainer in the upper end of the pedal lever (Fig. 2).

(3) From the engine compartment, hold the throttle body lever in the wide open position and install the throttle cable (Fig. 1).

CRANKSHAFT POSITION SENSOR

DESCRIPTION

The 4 cylinder crankshaft sensor is located on the rear of the engine near the accessory drive belt (Fig. 4). The 2.7L crankshaft sensor is located on the rear of the transmission housing, above the differential housing (Fig. 5). The bottom of the sensor is positioned next to the drive plate.

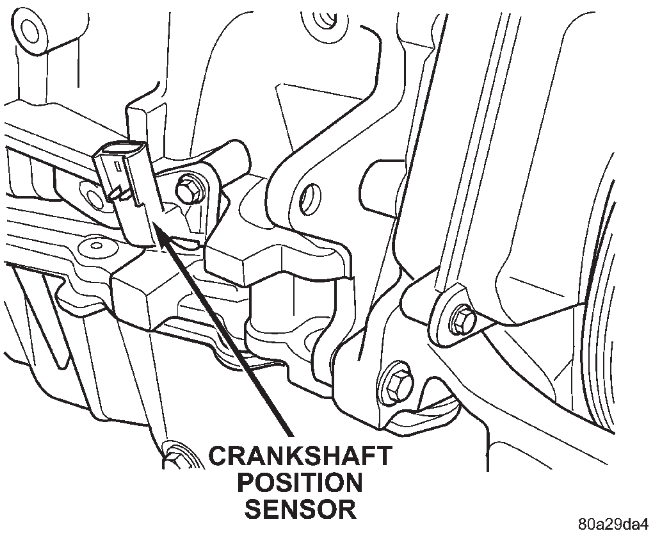

Fig. 4 4 Cylinder

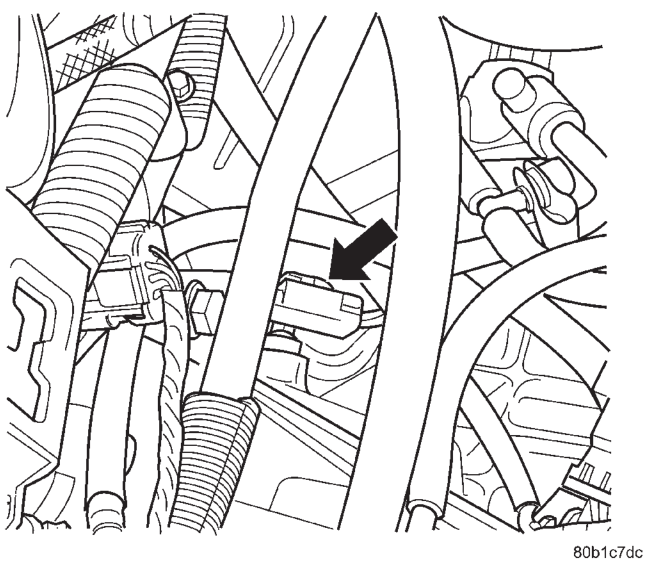

Fig. 5 2.7L

OPERATION

The Crankshaft Position (CKP) sensor is a Hall-effect sensor. The PCM sends approximately 8 volts to the Hall-effect sensor. This voltage is required to operate the Hall-effect chip and the electronics inside the sensor. A ground for the sensor is provided through the sensor return circuit of the PCM. The input to the PCM occurs on a 5 volt output reference circuit.

The notches generate pulses from high to low in the crankshaft position sensor output voltage. When a metal portion of the counterweight aligns with the crankshaft position sensor, the sensor output voltage goes low (less than 0.5 volts). When a notch aligns with the sensor, voltage goes high (5.0 volts). As a group of notches pass under the sensor, the output voltage switches from low (metal) to high (notch) then back to low.

If available, an oscilloscope can display the square wave patterns of each voltage pulses. From the width of the output voltage pulses, the PCM calculates engine speed. The width of the pulses represent the amount of time the output voltage stays high before switching back to low. The period of time the sensor output voltage stays high before switching back to low is referred to as pulse width. The faster the engine is operating, the smaller the pulse width on the oscilloscope.

By counting the pulses and referencing the pulse from the 60 degree signature notch, the PCM calculates crankshaft angle (position). In each group of timing reference notches, the first notch represents 69 degrees before top dead center (BTDC). The second notch represents 49 degrees BTDC. The third notch represents 29 degrees. The last notch in each set represents 9 degrees before top dead center (TDC).

The timing reference notches are machined at 20° increments. From the voltage pulse width the PCM tells the difference between the timing reference notches and the 60 degree signature notch. The 60 degree signature notch produces a longer pulse width than the smaller timing reference notches. If the camshaft position sensor input switches from high to low when the 60 degree signature notch passes under the crankshaft position sensor, the PCM knows cylinder number one is the next cylinder at TDC. The crankshaft position sensor notifies the PCM that 2 cylinders are on Top Dead Center. Based on this, the PCM will energize one of these 2 cylinder's injectors and ignition coil. The camshaft position sensor identifies which cylinder of the 2 is on Top Dead Center and on the compression stroke.

The second crankshaft counterweight has two sets of four timing reference notches including a 60 degree signature notch (Fig. 6).

The crankshaft position sensor detects slots cut into the transmission driveplate extension (Fig. 7). There are 3 sets of slots. Two sets contains 4 slots, and 1 set contains 5 slots for a total of 13 slots (Fig. 8). Basic timing is set by the position of the last slot in each group. Once the Powertrain Control Module (PCM) senses the last slot, it determines crankshaft

CRANKSHAFT POSITION SENSOR (Continued)

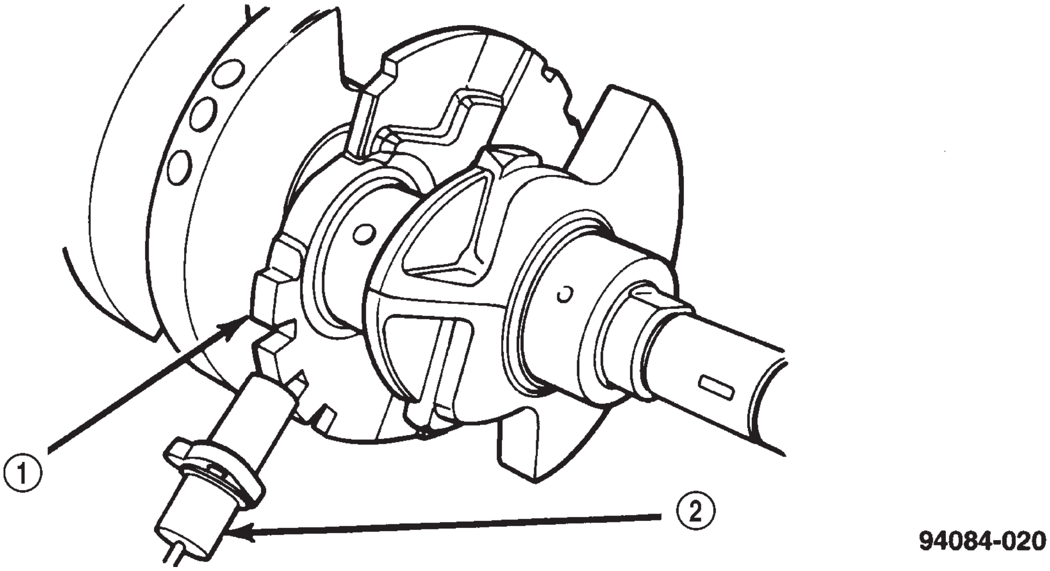

Fig. 6 Timing Reference Notches - 4 Cylinder

1 - MACHINED NOTCHES
2 - CRANKSHAFT POSITION SENSOR

position (which piston will next be at TDC) from the camshaft position sensor input. The 4 pulses generated by the crankshaft position sensor represent the 69°, 49°, 29°, and 9° BTDC marks. It may take the PCM one engine revolution to determine crankshaft position.

The PCM uses crankshaft position reference to determine injector sequence, ignition timing and the presence of misfire. Once the PCM determines crankshaft position, it begins energizing the injectors in sequence.

REMOVAL

REMOVAL - 4 CYLINDER

(1) Disconnect the negative battery cable.
(2) Raise vehicle and support.
(3) Disconnect the electrical connector (Fig. 9).

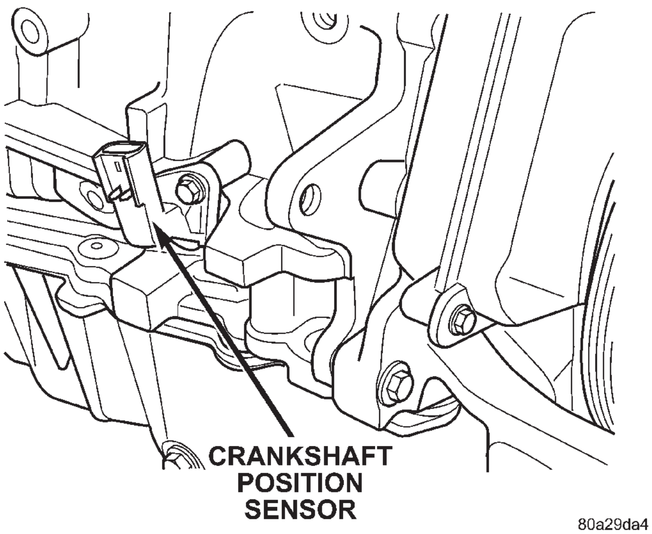

Fig. 9 CRANKSHAFT SENSOR

(4) Remove crankshaft sensor bolt.
(5) Remove the crankshaft sensor.

REMOVAL - 2.7L

(1) Disconnect the negative battery cable.
(2) Remove the air cleaner box.
(3) Disconnect the electrical connector from Crankshaft position sensor (Fig. 10).

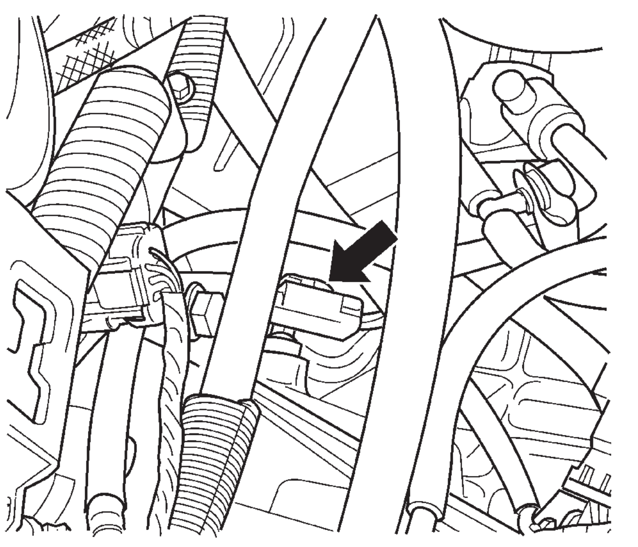

Fig. 10 CRANKSHAFT SENSOR 2.7L

(4) Remove bolt.
(5) Remove sensor.

INSTALLATION

INSTALLATION - 4 CYLINDER

(1) Install the crankshaft sensor.
(2) Install crankshaft sensor bolt and tighten.
(3) Connect the electrical connector (Fig. 9).
(4) Lower vehicle.
(5) Connect the negative battery cable.

INSTALLATION - 2.7L

(1) Install crankshaft sensor (Fig. 10).
(2) Tighten bolt.
(3) Install air cleaner box.
(4) Connect the negative battery cable.

ENGINE SPEED SENSOR

DESCRIPTION

The PCM receives a signal from the TCM and the transaxle output speed sensor over the bus communication line to indicate vehicle speed on automatic transmission cars. On Manual transmission cars (if equipped) vehicle, a dedicated vehicle speed sensor is connected to the PCM.

OPERATION

The Transmission Control Module (TCM) supplies the road speed and distance traveled inputs to the PCM. From these inputs and the throttle position sensor input, the PCM determines when a deceleration condition occurs.

FUEL INJECTOR

DESCRIPTION

The injectors are positioned in the intake manifold or cylinder head with the nozzle ends directly above the intake valve port (Fig. 11).

OPERATION

The fuel injectors are 12 volt electrical solenoids (Fig. 12). The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a hollow cone or two streams. The spraying action atomizes the fuel, adding it to the air entering the

FUEL INJECTOR (Continued)

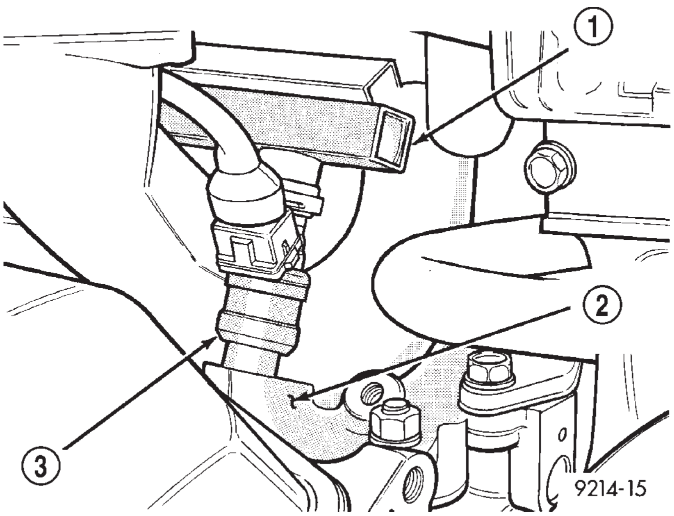

Fig. 11 Fuel Injector Location - Typical

combustion chamber. Fuel injectors are not interchangeable between engines.

The PCM provides battery voltage to each injector through the ASD relay. Injector operation is controlled by a ground path provided for each injector by the PCM. Injector on-time (pulse-width) is variable, and is determined by the PCM processing all the data previously discussed to obtain the optimum injector pulse width for each operating condition. The pulse width is controlled by the duration of the ground path provided.

3 - FUEL RAIL RECEIVER

(2) Remove injector clip and pull injector out of fuel rail.

(3) Check injector O-ring for damage. If O-ring is damaged, it must be replaced. Replace the injector clip if it is damaged.

(4) Repeat for remaining injectors.

FUEL INJECTOR (Continued)

REMOVAL - 2.7L

(1) Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.

(2) Disconnect negative cable to battery.

(3) Remove the Fuel Rail, refer to Fuel rail removal in this section.

(4) Position the fuel rail assembly so that the fuel injectors are easily accessible.

(5) Remove retaining clips from fuel injectors at fuel rail.

(6) Remove fuel injectors.

(7) Repeat for remaining injectors.

(8) Check injector O-ring for damage. If O-ring is damaged, it must be replaced. Replace the injector clip if it is damaged.

INSTALLATION

INSTALLATION - 4 CYLINDER

(1) Before installing an injector the rubber O-ring must be lubricated with a drop of clean engine oil to aid in installation.

(2) Install injector clip by sliding open end into the top slot of the injector. The edge of the receiver cup will slide into the side slots of clip.

(3) Install injector top end into fuel rail receiver cap. Be careful not to damage O-ring during installation (Fig. 15).

(4) Repeat steps for remaining injectors.

(5) Install the fuel rail, refer to the Fuel Rail Installation in this section.

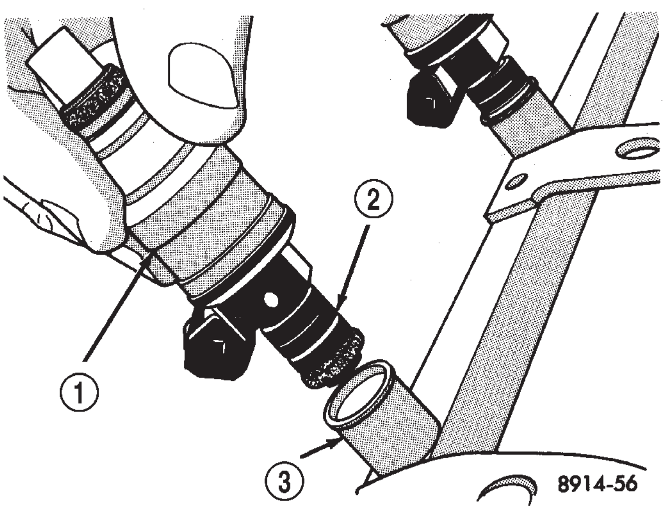

Fig. 15 SERVICING FUEL INJECTOR TYPICAL

1 - FUEL INJECTOR
2 - LOCKING SLOT
3 - FUEL RAIL RECEIVER CUP

INSTALLATION - 2.7L

(1) Check injector o-ring for damage. If o-ring is damaged it must be replaced. Replace injector clip if it is damaged.

(2) Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.

(3) Install retaining clips on fuel injectors.

(4) Push injectors into fuel injector rail until clips are in the correct position.

(5) Install the Fuel Rail, refer to the Fuel Rail installation in this section.

FUEL PUMP RELAY

DESCRIPTION

The fuel pump relay is located in the PDC. The inside top of the PDC cover has a label showing relay and fuse location.

OPERATION

The fuel pump relay supplies battery voltage to the fuel pump. A buss bar in the Power Distribution Center (PDC) supplies voltage to the solenoid side and contact side of the relay. The fuel pump relay power circuit contains a fuse between the buss bar in the PDC and the relay. The fuse is located in the PDC. Refer to the Wiring Diagrams for circuit information.

The PCM controls the fuel pump relay by switching the ground path for the solenoid side of the relay on and off. The PCM turns the ground path off when the ignition switch is in the Off position. When the ignition switch is in the On position, the PCM energizes the fuel pump. If the crankshaft position sensor does not detect engine rotation, the PCM de-energizes the relay after approximately one second.

IDLE AIR CONTROL MOTOR

DESCRIPTION

The idle air control motor (IAC) attaches to the throttle body (Fig. 16) or (Fig. 17). It is an electric stepper motor.

OPERATION

The PCM adjusts engine idle speed through the idle air control motor to compensate for engine load, coolant temperature or barometric pressure changes.

The throttle body has an air bypass passage that provides air for the engine during closed throttle idle. The idle air control motor pintle protrudes into the air bypass passage and regulates air flow through it.

The PCM adjusts engine idle speed by moving the IAC motor pintle in and out of the bypass passage. The adjustments are based on inputs the PCM

IDLE AIR CONTROL MOTOR (Continued)

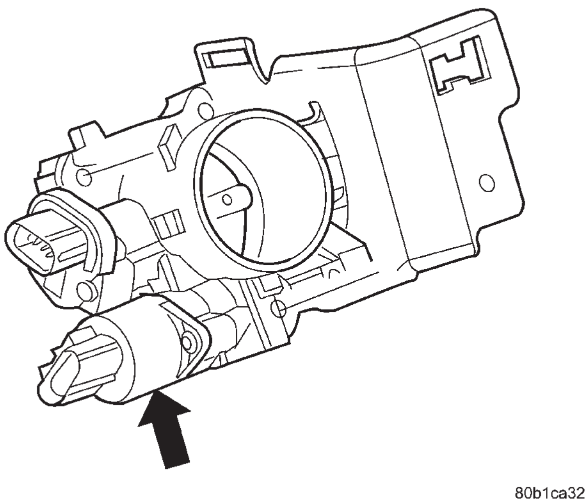

Fig. 16 IAC MOTOR 4 CYLINDER

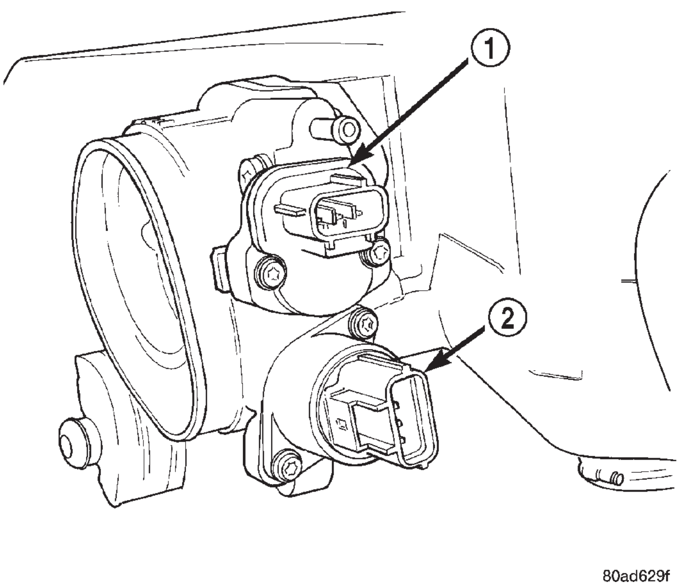

Fig. 17 IDLE AIR CONTROL MOTOR 2.7L

1 - THROTTLE POSITION SENSOR
2 - IDLE AIR CONTROL MOTOR

receives. The inputs are from the throttle position sensor, crankshaft position sensor, coolant temperature sensor, MAP sensor, vehicle speed sensor and various switch operations (brake, park/neutral, air conditioning).

When engine rpm is above idle speed, the IAC is used for the following functions:

- Off-idle dashpot
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)

Target Idle

Target idle is determined by the following inputs:

- Gear position
- ECT Sensor
- Battery voltage
- Ambient/Battery Temperature Sensor
- VSS
- TPS
- MAP Sensor

REMOVAL

REMOVAL - 4 CYLINDER

When servicing throttle body components, always reassemble components with new O-rings and seals where applicable. Never use lubricants on O-rings or seals, damage may result. If assembly of component is difficult, use water to aid assembly. Use care when removing hoses to prevent damage to hose or hose nipple.

(1) Disconnect negative cable from battery.

(2) Remove electrical connector from idle air control motor.

(3) Remove idle air control motor mounting screws (Fig. 16).

(4) Remove motor from throttle body. Ensure the O-ring is removed with the motor.

REMOVAL - 2.7L

(1) Disconnect the negative battery cable.

(2) Disconnect the IAC electrical connector (Fig. 18).

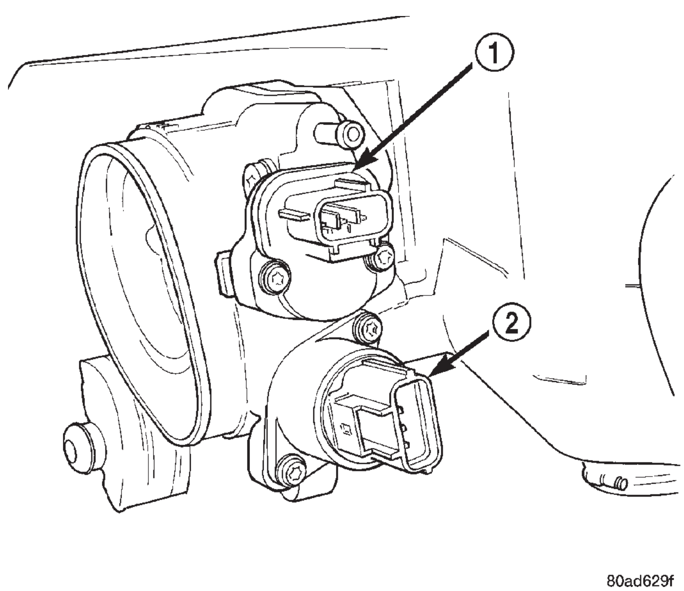

Fig. 18 Idle Air Control Motor

1 - THROTTLE POSITION SENSOR
2 - IDLE AIR CONTROL MOTOR

IDLE AIR CONTROL MOTOR (Continued)

(3) Remove the IAC mounting screws.
(4) Remove the IAC.

INSTALLATION

INSTALLATION - 4 CYLINDER

When servicing throttle body components, always reassemble components with new O-rings and seals where applicable. Never use lubricants on O-rings or seals, damage may result. If assembly of component is difficult, use water to aid assembly. Use care when removing hoses to prevent damage to hose or hose nipple.

(1) The new idle air control motor has a new O-ring installed on it. If pintle measures more than 1 inch (25 mm) it must be retracted. Use the DRB III® Idle Air Control Motor Open/Close Test to retract the pintle (battery must be connected.)
(2) Carefully place idle air control motor into throttle body (Fig. 16).
(3) Install mounting screws. Tighten screws to 4.5 N·m (40 in. lbs.) torque.
(4) Connect electrical connector to idle air control motor
(5) Connect negative cable to battery.

INSTALLATION - 2.7L

(1) Install the IAC to the throttle body (Fig. 18).
(2) Tighten mounting screws to 5.1 N·m (45 in. lbs.) torque.
(3) Attach electrical connector to the IAC.
(4) Connect the negative battery cable.

INLET AIR TEMPERATURE SENSOR

DESCRIPTION

The IAT Sensor is a Negative Temperature Coefficient (NTC) Sensor that provides information to the PCM regarding the temperature of the air entering the intake manifold (Fig. 19).

OPERATION

Inlet/Intake Air Temperature

The inlet air temperature sensor replaces the intake air temperature sensor and the battery temperature sensor. The PCM uses the information from the inlet air temperature sensor to determine values to use as an intake air temperature sensor and a battery temperature sensor.

The Intake Air Temperature (IAT) sensor value is used by the PCM to determine air density.

The PCM uses this information to calculate:

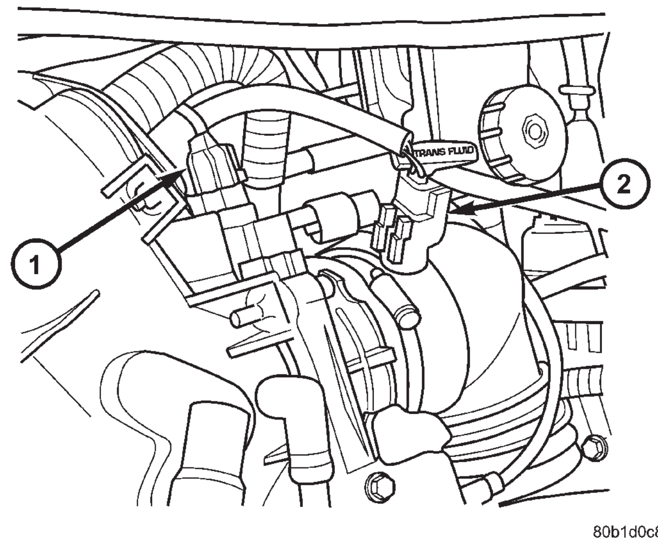

Fig. 19 TPS AND INLET AIR TEMP. SENSOR 2.7L

1 - Throttle Position Sensor
2 - Inlet Air Temperature Sensor

- Injector pulse width
- Adjustment of ignition timing (to prevent spark knock at high intake air temperatures)

Battery Temperature

The inlet air temperature sensor replaces the intake air temperature sensor and the battery temperature sensor. The PCM uses the information from the inlet air temperature sensor to determine values for the PCM to use as an intake air temperature sensor and a battery temperature sensor.

The battery temperature information along with data from monitored line voltage (B+), is used by the PCM to vary the battery charging rate. System voltage will be higher at colder temperatures and is gradually reduced at warmer temperatures.

The battery temperature information is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled depending upon the battery temperature sensor input (example: disable purge, enable LDP). Most OBD II monitors are disabled below 20°F.

MAP SENSOR

DESCRIPTION

The MAP sensor mounts to the driver side of the intake manifold plenum (Fig. 20) or (Fig. 21).

OPERATION

The MAP serves as a PCM input, using a silicon based sensing unit, to provide data on the manifold

MAP SENSOR (Continued)

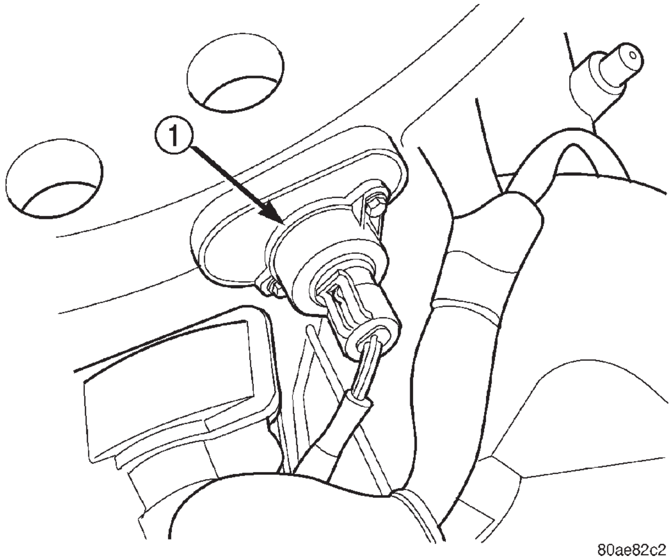

Fig. 20 MAP Sensor 2.7L

1 - MAP SENSOR

vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When MAP equals Barometric pressure, the pulse width will be at maximum.

Also like the cam and crank sensors, a 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0 — 15 psi the voltage changes 4.0V. The sensor is supplied a regulated 4.8 to 5.1 volts to operate the sensor. Like the cam and crank sensors ground is provided through the sensor return circuit.

The MAP sensor input is the number one contributor to pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or is it in Denver at 5000 feet above sea level, because the air density changes with altitude. It will also help to correct for varying weather conditions. If a hurricane was coming through the pressure would be very, very low or there could be a real fair weather, high pressure area. This is important because as air pressure changes the barometric pressure changes. Barometric pressure and altitude have a direct inverse correlation, as altitude goes up barometric pressure goes down. The first thing that happens as the key is rolled on, before reaching the crank position, the PCM powers up, comes around and looks at the MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure relative to altitude. Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key on. The difference between current and what it was at key on is manifold vacuum.

During key On (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring known good sensor in your work area.

As the altitude increases the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key On the barometric pressure needs to be updated. Any time the PCM sees Wide Open throttle, based upon TPS angle and RPM it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor to aid in calculating the following:

- Barometric pressure
- Engine load
- Manifold pressure
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (F4AC1 transmissions only, via the CCD bus)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As the pressures changes the diaphragm moves causing the element to deflect which stresses the silicone. When silicone is exposed to stress its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg (Table 1). Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is 29.92 in Hg. For every 100 feet of altitude barometric pressure drops .10 in. Hg. If a storm goes through it can either add, high pressure, or decrease, low pressure, from what should be present for that altitude. You should make a habit of knowing what the average pressure and corresponding barometric pressure is for your area. Always use the Diagnostic Test Procedures Manual for MAP sensor testing.

(2) Attach electrical connector to sensor (Fig. 22).

(3) Install the negative battery cable.

O2 SENSOR

DESCRIPTION

The upstream oxygen sensor threads into the outlet flange of the exhaust manifold (Fig. 24) or (Fig. 25).

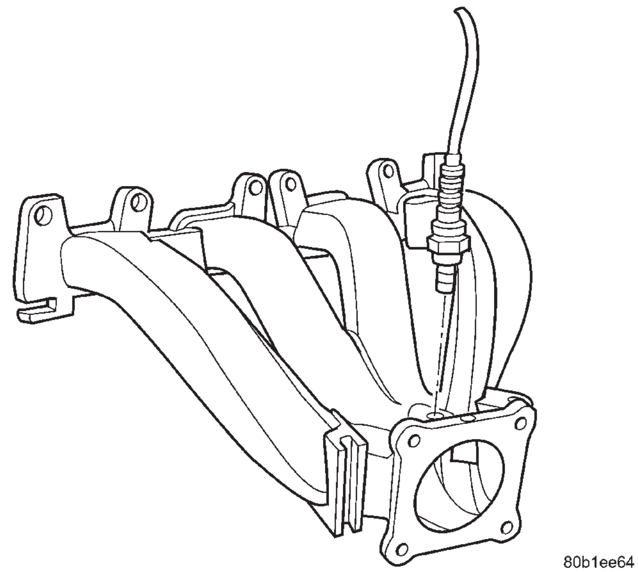

Fig. 24 O2 SENSOR UPSTREAM 1/1 4 CYLINDER

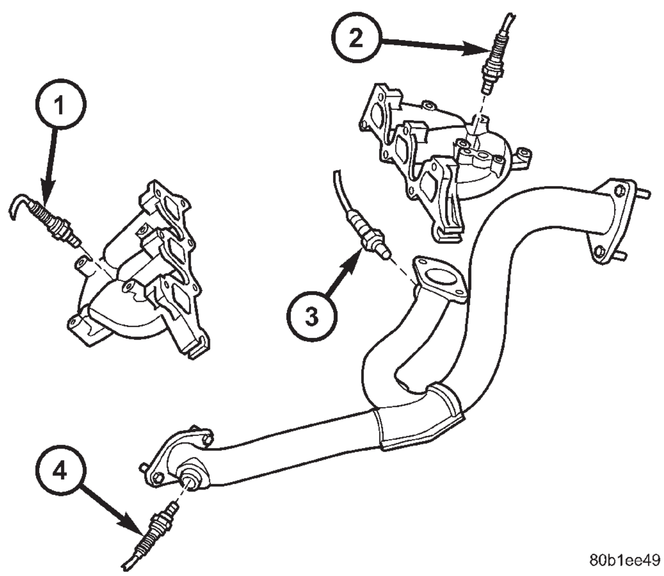

Fig. 25 O2 SENSORS 2.7L

1 - Upstream 2/1
2 - Upstream 1/1
3 - Downstream 1/2
4 - Downstream 2/2

The downstream heated oxygen sensor threads into the outlet pipe at the rear of the catalytic convertor (Fig. 26).

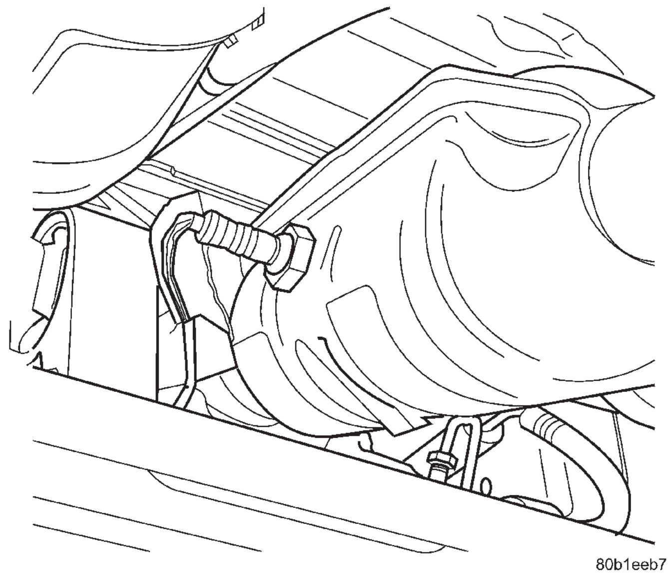

Fig. 26 O2 SENSOR DOWNSTREAM 2/1 4 CYLINDER

OPERATION

A single sensor ground is used for all O2 sensors (2 senors on 4 cyl. vehicles and 4 sensors on 6 cyl. vehicles).

As vehicles accumulate mileage, the catalytic convertor deteriorates. The deterioration results in a less efficient catalyst. To monitor catalytic convertor deterioration, the fuel injection system uses two heated oxygen sensors. One sensor upstream of the catalytic convertor, one downstream of the convertor. The PCM compares the reading from the sensors to calculate the catalytic convertor oxygen storage capacity and converter efficiency. Also, the PCM uses the upstream heated oxygen sensor input when adjusting injector pulse width.

When the catalytic converter efficiency drops below emission standards, the PCM stores a diagnostic trouble code and illuminates the malfunction indicator lamp (MIL).

The O2S produce voltages from 0 to 1 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air/fuel mixture, can be caused by misfire and exhaust leaks), the sensors produces a low voltage. When there is a lesser amount of oxygen present (caused by a rich air/fuel mixture, can be caused by internal engine problems) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner.

O2 SENSOR (Continued)

Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation the PCM monitors the O2S input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

The Automatic Shutdown (ASD) relay supplies battery voltage to both the upstream and downstream heated oxygen sensors. The oxygen sensors are equipped with a heating element. The heating elements reduce the time required for the sensors to reach operating temperature. The PCM uses pulse width modulation to control the ground side of the heater to regulate the temperature on 4 cyl. upstream O2 heater only. All other 4 cyl. and 6 cyl. O2 heaters do not use pulse width modulation.

UPSTREAM OXYGEN SENSOR

The input from the upstream heated oxygen sensor tells the PCM the oxygen content of the exhaust gas. Based on this input, the PCM fine tunes the air-fuel ratio by adjusting injector pulse width.

The sensor input switches from 0 to 1 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air-fuel mixture), the sensor produces voltage as low as 0.1 volt. When there is a lesser amount of oxygen present (rich air-fuel mixture) the sensor produces a voltage as high as 1.0 volt. By monitoring the oxygen content and converting it to electrical voltage, the sensor acts as a rich-lean switch.

The heating element in the sensor provides heat to the sensor ceramic element. Heating the sensor allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop, the PCM adjusts injector pulse width based on the upstream heated oxygen sensor input along with other inputs. In Open Loop, the PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

DOWNSTREAM OXYGEN SENSOR

The downstream heated oxygen sensor input is used to detect catalytic convertor deterioration. As the convertor deteriorates, the input from the downstream sensor begins to match the upstream sensor input except for a slight time delay. By comparing the downstream heated oxygen sensor input to the input from the upstream sensor, the PCM calculates catalytic convertor efficiency. Also used to establish the upstream O2 goal voltage (switching point).

REMOVAL

REMOVAL - DOWNSTREAM 1/2 4 CYLINDER

The O2S are located in the side of the catalytic converter (Fig. 26).

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

(1) Remove the negative battery cable.
(2) Raise and support the vehicle.
(3) Disconnect the wire connector from the O2S.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

(4) Remove the O2S. Snap-On oxygen sensor wrench (number YA 8875) may be used for removal and installation.

REMOVAL - Downstream 1/2, 2/2 2.7L

The O2S are located at the outlet ends of the catalytic converter (Fig. 25).

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

(1) Remove the negative battery cable.
(2) Raise and support the vehicle.
(3) Disconnect the wire connector from the O2S.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

(4) Remove the O2S. Snap-On oxygen sensor wrench (number YA 8875) may be used for removal and installation.

REMOVAL - Upstream 1/1, 2/1 2.7L

The engines uses two heated oxygen sensors, one in each exhaust manifold (Fig. 25).

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

O2 SENSOR (Continued)

(1) Remove the negative battery cable.
(2) Remove the air cleaner box for the rear O2 sensor.
(3) Disconnect the heated oxygen sensor electrical connector.
(4) Use a Special tool #8439 to remove oxygen sensor.

REMOVAL - UPSTREAM 1/1 4 CYLINDER

The engine uses 1 heated oxygen sensors in the exhaust manifold.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

(1) Remove the negative battery cable.
(2) Disconnect the heated oxygen sensor electrical connector.
(3) Use a socket such as Snap-On YA8875 or a crow foot wrench to remove oxygen sensor (Fig. 25).

INSTALLATION

INSTALLATION - DOWNSTREAM 1/2 4 CYLINDER

The O2S are located in the side of the catalytic converter (Fig. 26).

(1) After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating.
(2) Install the O2S. Tighten to 28 N·m (20 ft. lbs.) torque.
(3) Connect the O2S wire connector.
(4) Lower the vehicle.
(5) Install the negative battery cable.

INSTALLATION - Downstream 1/2, 2/2 2.7L

The O2S are located at the outlet ends of the catalytic converter (Fig. 25).

(1) After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. Tighten the sensor to 28 N·m (20 ft. lbs.) torque.
(2) Install the O2S. Tighten to 28 N·m (20 ft. lbs.) torque.
(3) Connect the O2S wire connector.
(4) Lower the vehicle.
(5) Install the negative battery cable.

INSTALLATION - Upstream 1/1, 2/1 2.7L

The engines uses two heated oxygen sensors, one in each exhaust manifold (Fig. 25).

(1) After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating.
(2) Use a Special tool #8439 to install oxygen sensor. Tighten the sensor to 28 N·m (20 ft. lbs.) torque.
(3) Connect the heated oxygen sensor electrical connector.
(4) Install the air cleaner box.
(5) Install the negative battery cable.

INSTALLATION - UPSTREAM 1/1 4 CYLINDER

The engines uses 1 heated oxygen sensors in the exhaust manifold.

(1) After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. Tighten the sensor to 28 N·m (20 ft. lbs.) torque.
(2) Connect the heated oxygen sensor electrical connector.
(3) Install the negative battery cable.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold (Fig. 27). Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

THROTTLE BODY (Continued)

REMOVAL

REMOVAL - 4 CYLINDER

(1) Disconnect negative cable from battery cable.
(2) Remove clean air hose (Fig. 27).

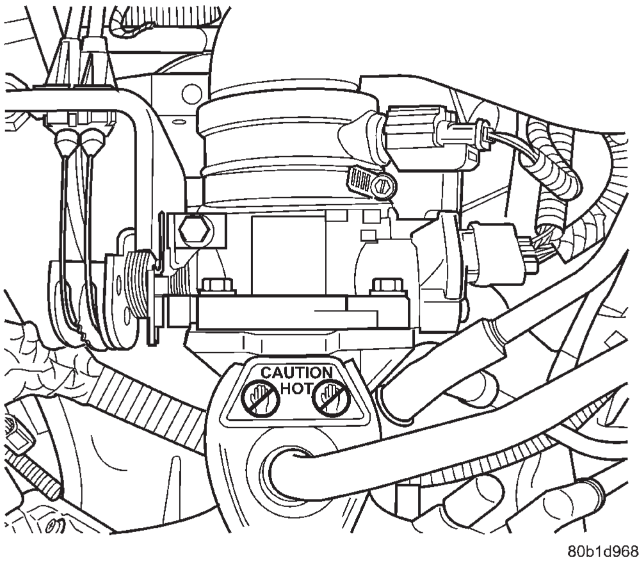

Fig. 27 THROTTLE BODY 4 CYLINDER

(3) Remove the throttle cable shield.
(4) Remove throttle and the speed control (if equipped) cables from lever and bracket.
(5) Disconnect electrical connectors from the idle air control motor and throttle position sensor (TPS).
(6) Remove throttle body to intake manifold attaching bolts (Fig. 28).

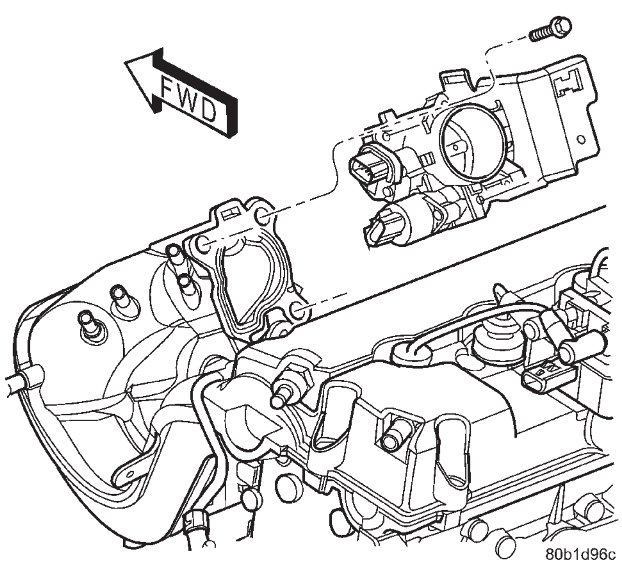

Fig. 28 THROTTLE BODY MOUNTING

(7) Remove the throttle cable bracket (Fig. 29).

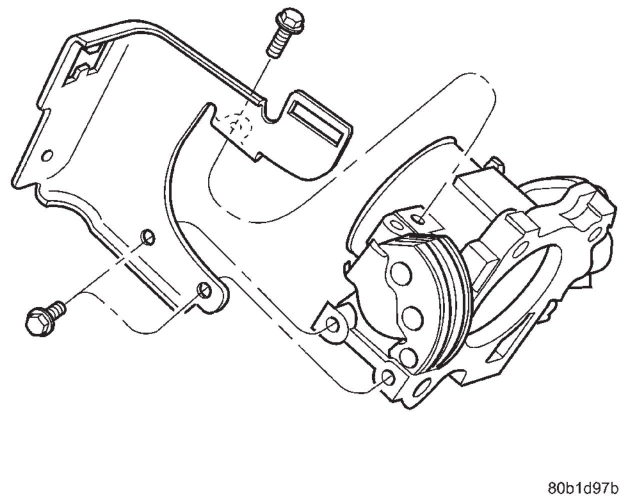

Fig. 29 THROTTLE CABLE BRACKET

(8) Remove throttle body.

REMOVAL - 2.7L

(1) Disconnect negative cable from battery
(2) Disconnect electrical connectors from throttle body (Fig. 30).

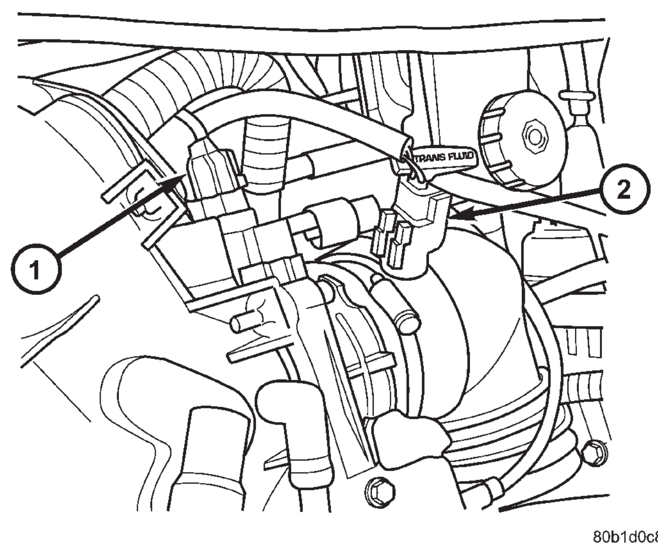

Fig. 30 TPS AND INLET AIR TEMP. SENSOR 2.7L

1 - Throttle Position Sensor
2 - Inlet Air Temperature Sensor

THROTTLE BODY (Continued)

(3) Disconnect clean air hose from throttle body.

(4) Remove the throttle cable shield (Fig. 31).

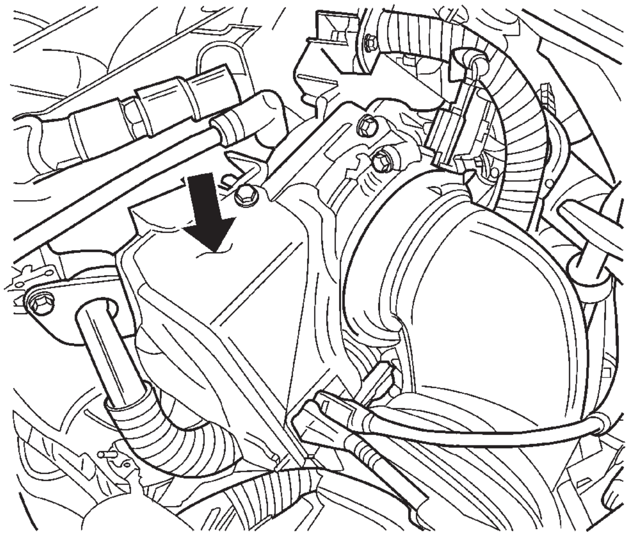

Fig. 31 THROTTLE SHIELD 2.7L

(5) Hold throttle lever in wide open position. Remove throttle cable and speed control cables from throttle arm (Fig. 32).

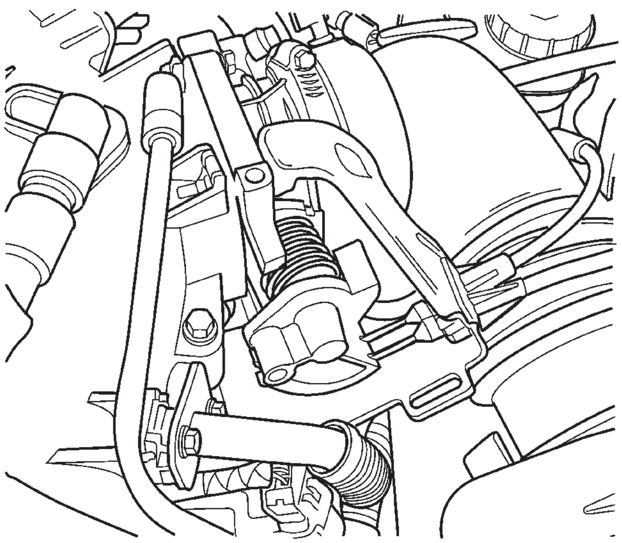

Fig. 32 THROTTLE CABLES 2.7L

(6) Remove throttle cable bracket.

(7) Remove the throttle body support bracket from the bottom of the throttle body (Fig. 33).

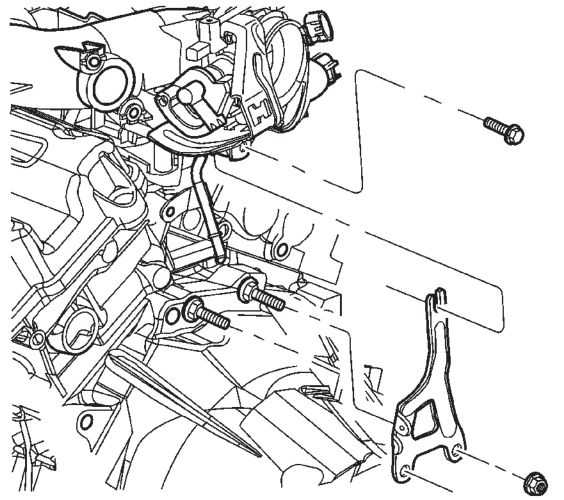

Fig. 33 THROTTLE BODY SUPPORT BRACKET 2.7L

(8) Remove remaining 2 throttle body bolts (Fig. 34).

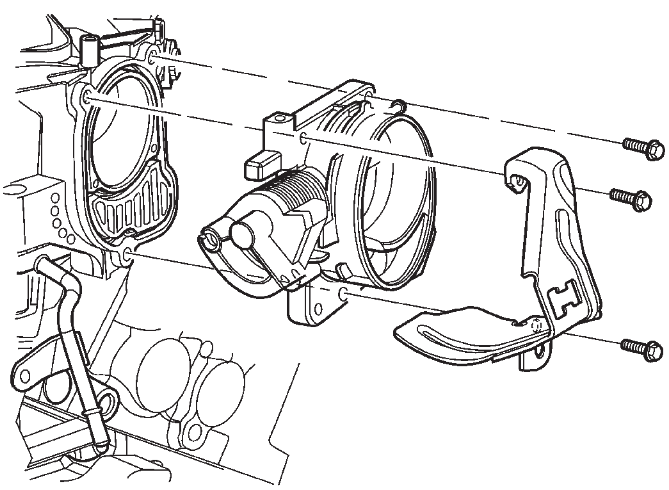

Fig. 34 THROTTLE BODY 2.7L

(9) Remove throttle body.

(10) Clean mating surfaces.

THROTTLE BODY (Continued)

INSTALLATION

INSTALLATION - 4 CYLINDER

(1) Install throttle body (Fig. 28).

(2) Tighten throttle body mounting bolts to 13.6 N·m (120 in. lbs.) torque.

(3) Install the throttle cable bracket (Fig. 29). Tighten throttle cable bracket mounting bolts to 14.1 N·m (125 in. lbs.) torque

(4) Hold throttle lever in the wide open throttle position and install the throttle and speed control cables (if equipped).

(5) Connect electrical connectors to the idle air control motor and throttle position sensor (TPS).

(6) Install the throttle cable shield.

(7) Install clean air hose to throttle body (Fig. 27).

(8) Connect negative cable to battery cable.

INSTALLATION - 2.7L

(1) Loose install 2 throttle body bolts (Fig. 34) (upper right and lower bolt).

(2) Install the throttle cable bracket.

(3) Install the third throttle body bolt and the throttle body support bracket to the bottom of the throttle body (Fig. 33). Tighten the lower support bracket bolts to 31.1 N·m (23 ft. lbs.) torque.

(4) Tighten throttle body bolts to 13.6 N·m (120 in. lbs.) torque.

(5) Hold throttle lever in wide open throttle position. Install throttle cable and speed control cable (Fig. 32).

(6) Install the throttle cable shield (Fig. 31).

(7) Connect electrical connectors to throttle body (Fig. 30).

(8) Install clean air hose to throttle body.

(9) Connect negative cable to battery.

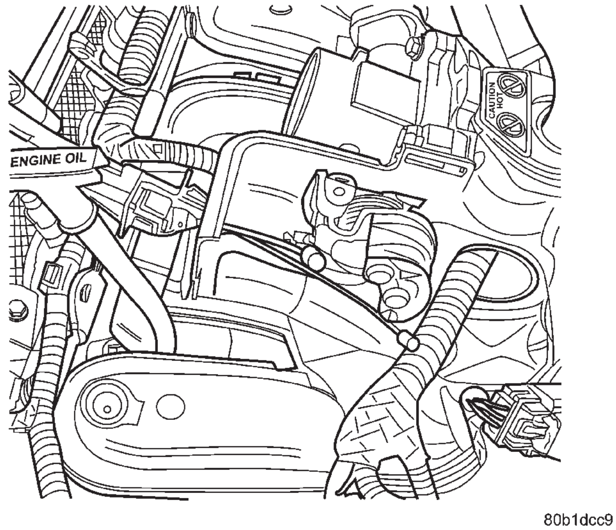

Fig. 35 THROTTLE CABLE 4 CYLINDER

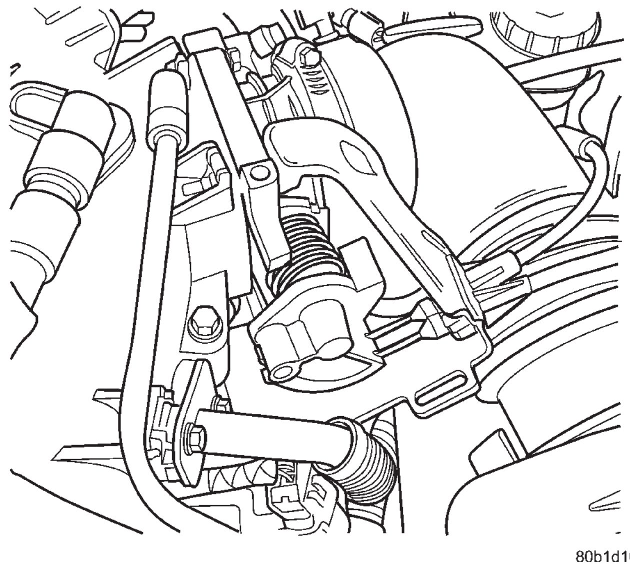

Fig. 36 THROTTLE CABLE 2.7L

THROTTLE CONTROL CABLE

REMOVAL

(1) Working from the engine compartment, hold the throttle body throttle lever in the wide open position.

(2) Remove the throttle cable from the throttle body cam (Fig. 35) or (Fig. 36).

(3) From inside the vehicle, hold up the pedal and remove the pedal retainer and throttle cable from the upper end of the pedal lever.

(4) Remove retainer clip from throttle cable and grommet at dash panel (Fig. 37).

(5) From the engine compartment, pull the throttle cable out of the dash panel grommet. Then remove grommet and cable from dash panel.

(6) Remove the throttle cable from throttle bracket by carefully compressing both retaining ears simultaneously. Then gently pull the throttle cable from throttle bracket.

(7) On 4 cylinder engines remove throttle cable from routing clip on fuel rail, and routing clip on left front shocktower (Fig. 38).

INSTALLATION

(1) From the engine compartment, push the pedal end fitting through the dash panel, seat the grommet, then push the cable dash fitting into the grommet.

(2) Install the cable's throttle body end-fitting into the cable mounting bracket on the engine.

THROTTLE CONTROL CABLE (Continued)

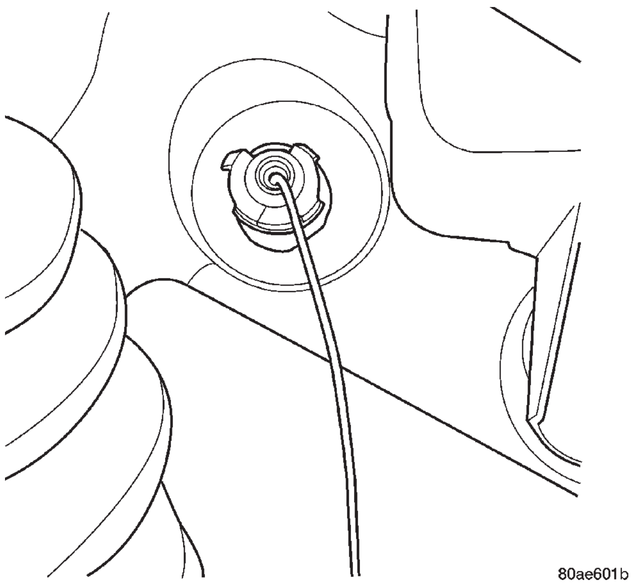

Fig. 37 RETAINER CLIP

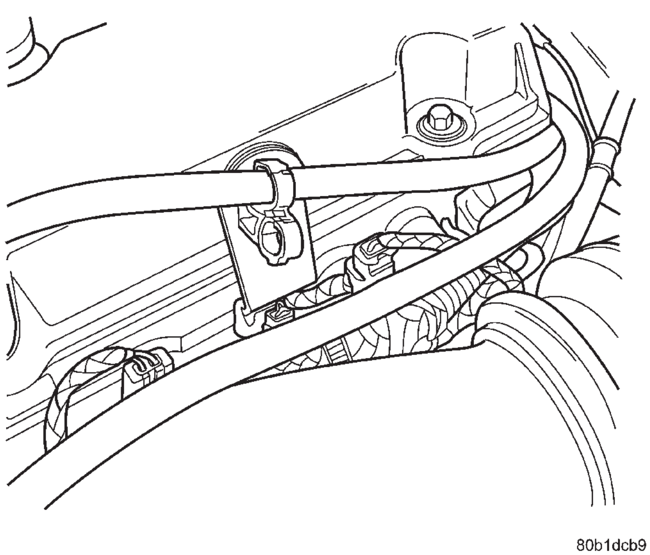

Fig. 38 THROTTLE CABLE BRACKET 4 CYLINDER

(3) On 4 cylinder engines install throttle cable routing clip to bracket on fuel rail (Fig. 38), and other clip to the shocktower.

(4) From inside the vehicle, hold up the pedal and install throttle cable and pedal retainer in the upper end of the pedal lever.

(5) At the dash panel, install the cable retainer clip between the end of the throttle cable dash fitting and grommet (Fig. 37).

(6) From the engine compartment, rotate the throttle lever wide open and install the throttle cable (Fig. 35) or (Fig. 36).

THROTTLE POSITION SENSOR

DESCRIPTION

The throttle position sensor mounts to the side of the throttle body.

The Throttle Position Sensor (TPS) connects to the throttle blade shaft. The TPS is a variable resistor (potentiometer) that provides the PCM with an input signal (voltage). The signal represents throttle blade position. As the position of the throttle blade changes, the resistance of the TPS changes.

OPERATION

The signal represents throttle blade position. As the position of the throttle blade changes, the resistance of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the powertrain control module) represents throttle blade position. The TPS output voltage to the PCM varies from approximately 0.6 volt at minimum throttle opening (idle) to a maximum of 4.5 volts at wide open throttle.

Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. The PCM also adjusts fuel injector pulse width and ignition timing based on these inputs.

REMOVAL

REMOVAL - 4 CYLINDER

(1) Disconnect the negative battery cable.

(2) Disconnect the electrical connector to throttle position sensor.

(3) Remove the 2 screws for the throttle position sensor.

(4) Remove the throttle position sensor.

REMOVAL - 2.7L

(1) Remove the negative battery cable.

(2) Remove the throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL)

(3) Remove the TPS mounting screws (Fig. 39).

(4) Remove the TPS.

INSTALLATION

INSTALLATION - 4 CYLINDER

(1) The throttle shaft end of the throttle body slides into a socket in the TPS. The socket has two tabs inside it. The throttle shaft rests against the tabs. When indexed correctly, the TPS can rotate

THROTTLE POSITION SENSOR (Continued)

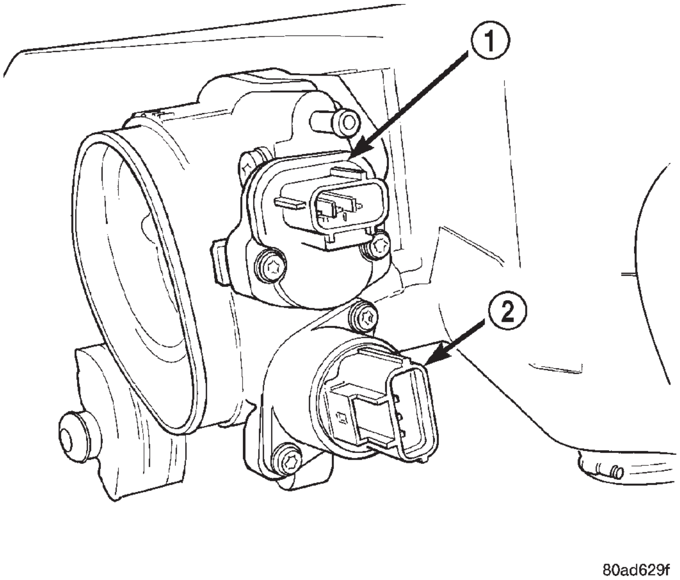

Fig. 39 Idle Air Control Motor and Throttle Position Sensor

1 - THROTTLE POSITION SENSOR
2 - IDLE AIR CONTROL MOTOR

clockwise a few degrees to line up the mounting screw holes with the screw holes in the throttle body. The TPS has slight tension when rotated into position. If it is difficult to rotate the TPS into position, install the sensor with the throttle shaft on the other side of the tabs in the socket. Tighten mounting screws to 5.1 N·m (45 in. lbs.) torque.

(2) After installing the TPS, the throttle plate should be closed. If the throttle plate is open, install the sensor on the other side of the tabs in the socket.

(3) Attach electrical connector to the TPS.

(4) Install the negative battery cable.

INSTALLATION - 2.7L

(1) The throttle shaft end of the throttle body slides into a socket in the TPS. The socket has two tabs inside it. The throttle shaft rests against the tabs. When indexed correctly, the TPS can rotate clockwise a few degrees to line up the mounting screw holes with the screw holes in the throttle body. The TPS has slight tension when rotated into position. If it is difficult to rotate the TPS into position, install the sensor with the throttle shaft on the other side of the tabs in the socket. Tighten mounting screws to 5.1 N·m (45 in. lbs.) torque.

(2) After installing the TPS, the throttle plate should be closed. If the throttle plate is open, install the sensor on the other side of the tabs in the socket.

(3) Install the throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(4) Connect the negative battery cable.

STEERING

TABLE OF CONTENTS

STEERING

DESCRIPTION

This vehicle is equipped with power steering. The power steering system consists of these major components:

- POWER STEERING PUMP
- POWER STEERING GEAR
- POWER STEERING FLUID RESERVOIR
- POWER STEERING FLUID SUPPLY HOSE
- POWER STEERING FLUID PRESSURE HOSE
- POWER STEERING FLUID RETURN HOSE

For information on the first two components, refer to their respective sections within this service manual group. Information on the hoses can be found in POWER STEERING PUMP.

OPERATION

Turning of the steering wheel is converted into linear travel through the meshing of the helical pinion teeth with the rack teeth. Power assist steering is provided by an open center, rotary type control valve. It is used to direct oil from the power steering pump to either side of the integral steering rack piston.

Road feel is controlled by the diameter of a torsion bar which initially steers the vehicle. As steering effort increases as in a turn, the torsion bar twists, causing relative rotary motion between the rotary valve body and valve spool. This movement directs oil behind the integral rack piston, which in turn builds up hydraulic pressure and assists in the turning effort.

WARNING

WARNING: POWER STEERING FLUID, ENGINE COMPONENTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES OR DRIVE BELTS. DO NOT ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

CAUTION

CAUTION: During repair procedures requiring the power steering fluid hoses to be disconnected, cap all open ends of the hose connections. This will prevent the entry of foreign material into the components while the power steering hoses are disconnected.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING FLOW AND PRESSURE TEST

The following procedure is to be used to test the operation of the power steering system on this vehicle. This test will provide the flow rate of the power steering pump along with the maximum relief pressure. This test is to be performed any time a power steering system problem is present to determine if the power steering pump or power steering gear is

STEERING (Continued)

not functioning properly. The following flow and pressure test is performed using the Power Steering Analyzer Kit, Special Tool 6815 (Fig. 1), hoses, Special Tools 6905 and 6959, adapters, Special Tool's 6972 and 8354, and fittings from adapter kit, Special Tool 6893.

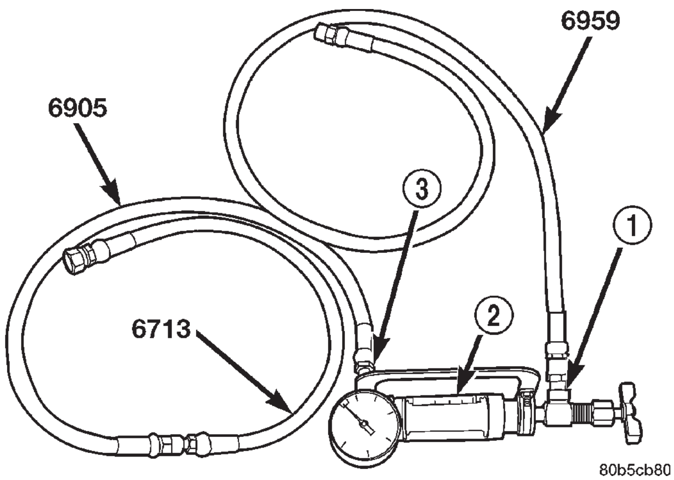

Fig. 1 Power Steering Analyzer With Hoses Installed

1 - OUTLET
2 - SPECIAL TOOL 6815
3 - INLET

(1) Assemble hoses on Power Steering Analyzer, Special Tool 6815, as shown. Install Pressure Hose, Special Tool 6905 (in 6893 kit), in the inlet fitting on Power Steering Analyzer. Install Pressure Hose, Special Tool 6713 (in 6815 kit) on Pressure Hose, Special Tool 6905. Install Pressure Hose, Special Tool 6959, in the outlet fitting on Power Steering Analyzer.

WARNING: To prevent personal injury, safety goggles should be worn at all times when performing any test procedures on the power steering system.

(2) Install the following adapters from Adapter Set, Special Tool 6893 (Fig. 2), on the analyzer hose ends:

• Install Adapter Fitting, Special Tool 6844, on Pressure Hose, Special Tool 6713.

• Install Adapter Fitting, Special Tool 6826, on Pressure Hose, Special Tool 6959.

(3) Disconnect the power steering fluid pressure hose from the power steering pump.

(4) Connect Adapter Fitting, Special Tool 6844, attached to pressure hose from inlet (gauge end) of Power Steering Analyzer to the pressure fitting on the power steering pump.

(5) Connect vehicle power steering fluid pressure hose to Adapter Fitting, Special Tool 6826, which should be already installed in the outlet hose (valve end) of Power Steering Analyzer.

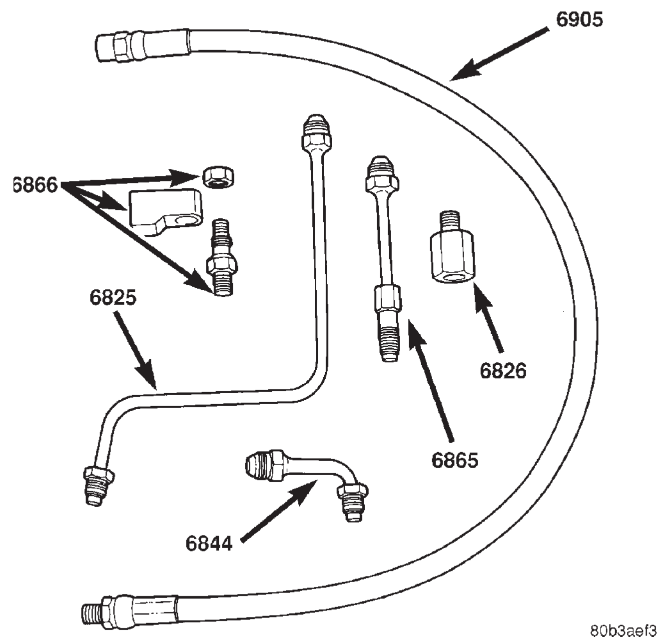

Fig. 2 Power Steering Analyzer Adapters 6893

(6) Perform the following test procedure.

TEST PROCEDURE

(1) Check belt tension and adjust as necessary.

(2) Completely open valve on Power Steering Analyzer.

(3) Start engine and let idle long enough to circulate power steering fluid through the analyzer and hoses, until the air is completely bled out of the fluid. Shut off engine.

(4) Check power steering fluid level and add fluid as necessary. Start engine again and let idle.

(5) The analyzer gauge should read below 862 kPa (125 psi). If above, inspect the hoses for restrictions and repair as necessary. The initial pressure should be in the range of 345-552 kPa (50-80 psi). The flow meter should read between 1.3 and 1.6 GPM.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

(6) Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

NOTE: Power steering pump maximum relief pressure is 8240 to 8920 kPa (1195 to 1293 psi.).

• Power steering pump pressure's are above specifications, but not within 345 kPa (50 psi) of each other, replace pump.

STEERING (Continued)

• Pressure's are within 345 kPa (50 psi) of each other, but below specifications, replace pump.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because pump damage will result.

(7) Completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest output pressures are not the same against either stop, the steering gear is leaking internally and must be replaced.

DIAGNOSIS AND TESTING - STEERING SYSTEM DIAGNOSIS CHARTS

POWER STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONABLE HISS OR WHISTLE*	1. Damaged or mispositioned steering column shaft/coupling dash panel seal.	1. Reposition or replace steering column shaft/coupling dash panel seal.
	2. Noisy valve in power steering gear.	2. Replace power steering gear.
RATTLE OR CLUNK	1. Power steering gear loose on front suspension crossmember.	1. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	2. Front suspension crossmember mounting fasteners loose at frame.	2. Tighten the front suspension crossmember mounting fasteners to the specified torque.
	3. Loose tie rod (outer or inner).	3. Check tie rod pivot points for wear. Replace worn/loose parts as required.
	4. Loose lower control arm mounting bolts at front suspension crossmember.	4. Tighten control arm mounting bolts to the specified torques.
	5. Loose shock assembly mounting fasteners at shock tower.	5. Tighten shock assembly fasteners to the specified torques.
	6. Power steering fluid pressure hose touching the body of the vehicle.	6. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing.
	7. Internal power steering gear noise.	7. Replace power steering gear.
	8. Damaged front suspension crossmember.	8. Replace front suspension crossmember.
POPPING NOISE	1. Worn outer tie rod.	1. Replace outer tie rod.
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Check and adjust power steering pump drive belt to specifications. Replace belt if worn or glazed.
WHINE OR GROWL (POWER STEERING PUMP)**	1. Low fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	2. Power steering hose touching vehicle body or frame.	2. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing. Replace hose if damaged.
	3. Extreme wear of power steering pump internal components.	3. Replace power steering pump and flush system as necessary.
SUCKING AIR SOUND	1. Loose clamp on power steering fluid return hose.	1. Tighten or replace hose clamp.
	2. Missing O-Ring on power steering hose connection.	2. Inspect connection and replace O-Ring as required.
	3. Low power steering fluid level.	3. Fill power steering fluid reservoir to proper level and check for leaks.
	4. Air leak between power steering fluid reservoir and power steering pump.	4. Replace power steering pump (with reservoir).
SQUEAK OR RUBBING SOUND	1. Steering column shroud rubbing.	1. Realign shrouds as necessary.
	2. Steering column shaft rubbing.	2. Move or realign item rubbing shaft.
	3. Clockspring noisy.	3. Remove clockspring. Reinstall wheel. If noise is gone, replace clockspring.
	4. Steering gear internally noisy.	4. Replace steering gear.
SCRUBBING OR KNOCKING NOISE.	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with size used as original equipment.
	2. Interference between steering gear and other vehicle components.	2. Check for bent or misaligned components and correct as necessary.
	3. Steering gear internal stops worn excessively allowing tires to be steered excessively far.	3. Replace steering gear.

NOTE: * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: ** Power steering pump growl results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.

STEERING (Continued)

STEERING WHEEL FEEL

CONDITION	POSSIBLE CAUSES	CORRECTION
STEERING WHEEL/ COLUMN CLICKING, CLUNKING OR RATTLING.	1. Steering column preload is not set properly.	1. Loosen steering column coupling pinch bolt to reset steering column preload. Replace pinch bolt and torque to specifications.
	2. Loose steering coupling pinch bolt.	2. Replace pinch bolt and torque to specifications.
	3. Steering column bearings.	3. Replace steering column.
STEERING WHEEL HAS FORE AND AFT LOOSENESS.	1. Steering wheel retaining bolt not properly tightened and torqued.	1. Tighten the steering wheel retaining bolt to its specified torque.
	2. Steering column lower bearing spring retainer slipped on steering column shaft.	2. Replace steering column.
STEERING WHEEL OR DASH VIBRATES DURING LOW SPEED OR STANDSTILL STEERING MANEUVERS.	1. Air in the fluid of the power steering system.	1. Bleed air from system following the power steering pump initial operation service procedure.*
	2. Tires not properly inflated.	2. Inflate tires to the specified pressure.
	3. Excessive engine vibration.	3. Ensure that the engine is running properly.
	4. Loose tie rod end jam nut.	4. Tighten the inner to outer tie rod jam nut to the specified torque.
	5.Overcharged air conditioning system.	5.Check air conditioning pump head pressure and correct as necessary.
STEERING CATCHES, STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN.	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to specified level and check for leaks.
	2. Tires not inflated to specified pressure.	2. Inflate tires to the specified pressure.
	3. Lack of lubrication in front suspension control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated-for-life type ball joint. If ball joint is a lubricated-for-life ball joint, replace ball joint or control arm.
	4. Worn upper or lower control arm ball joint.	4. Replace ball joint or control arm.
	5. Lack of lubrication in steering gear outer tie rod ends.	5. Lubricate tie rod ends if they are not a lubricated-for-life type. If tie rod end is a lubricated-for-life type, replace tie rod end.
	6. Loose power steering pump drive belt.	6. Tighten the power steering pump drive belt to specifications. If drive belt is worn or glazed, replace belt.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	7. Faulty power steering pump flow control (Follow Power Steering System Flow and Pressure Test procedure).	7. Replace power steering pump.
	8. Excessive friction in steering column or intermediate shaft.	8. Isolate and correct condition.
	9. Binding upper or lower control arm ball joint.	9. Replace the upper or lower ball joint.
	10. Excessive friction in power steering gear.	10. Replace power steering gear.
STIFF, HARD TO TURN, SURGE, MOMENTARY INCREASE IN EFFORT WHEN TURNING.	1. Tires not properly inflated.	1. Inflate tires to specified pressure.
	2. Low power steering fluid level.	2. Add power steering fluid as required to power steering fluid reservoir to obtain proper level. Check for leaks.
	3. Loose power steering pump drive belt.	3. Tighten the power steering pump drive belt to specifications. If drive belt is worn or glazed, replace belt.
	4. Lack of lubrication in control arm ball joints.	4. Lubricate ball joints if ball joints are not a lubricated-for-life type ball joint. If ball joint is a lubricated-for-life ball joint, replace ball joint or control arm.
	5. Low power steering pump pressure (Follow Power Steering System Flow and Pressure Test procedure).	5. Replace the power steering pump as necessary.
	6. High internal leak in power steering gear (Follow Power Steering System Flow and Pressure Test procedure).	6. Replace power steering gear.
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION.	1. Tires not inflated properly.	1. Inflate tires to specified pressure.
	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
	3. Lack of lubrication in front suspension control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated for life type of ball joint. If ball joint is a lubricated for life ball joint, replace ball joint or control arm.
	4. Steering wheel rubbing.**	4. Adjust steering column shrouds to eliminate rubbing condition.
	5. Damaged, mis-positioned or un-lubricated steering column coupler to dash seal.**	5. Replace, reposition, or lubricate dash seal.
	6. Binding upper or lower control arm ball joint.	6. Replace the upper or lower control arm ball joint.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	7. Tight shaft bearing in steering column.	7. Replace the steering column.
	8. Excessive friction in steering column coupling.	8. Replace steering column coupling.
	9. Excessive friction in power steering gear.	9. Replace power steering gear.
EXCESSIVE STEERING WHEEL KICKBACK OR TOO MUCH STEERING WHEEL FREE PLAY.	1. Air in the fluid of the power steering system.	1. Bleed air from system following the the power steering pump initial operation service procedure.*
	2. Power steering gear loose on front suspension crossmember.	2. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	3. Steering column coupling worn, broken or loose.	3. Replace steering column coupling.
	4. Free play in steering column.	4. Check all components of the steering system and repair or replace as required.
	5. Worn control arm ball joints.	5. Replace ball joint or control arm as required.
	6. Loose steering knuckle to ball joint stud pinch bolt.	6. Inspect pinch bolts, replace as necessary, and tighten to specified torque.
	7. Front wheel bearings loose or worn.	7. Replace wheel bearing or knuckle as necessary.
	8. Loose outer tie rod ends.	8. Replace outer tie rod ends that have excessive free play.
	9. Loose inner tie rod ends.	9. Replace power steering gear.
	10 Defective steering gear rotary valve.	10. Replace power steering gear.

NOTE: * Steering shudder can be expected in new vehicles and vehicles with recent steering system repairs. Shudder should dissipate after the vehicle has been driven several weeks.

NOTE: ** To evaluate this condition, it may be necessary to disconnect the coupling at the base of the steering column. Turn the steering wheel and feel or listen for internal rubbing in steering column. To avoid damaging the column clockspring, note the following. Before disconnecting coupling, place tires in the straight-ahead position and center steering wheel. Once disconnected, DO NOT rotate steering wheel more than one revolution in either direction and place steering wheel in original location before reconnecting coupling. If this position is lost, the steering column clockspring must be recentered following the procedure found within the procedure for steering column installation in the steering column section.

STEERING (Continued)

POWER STEERING FLUID

CONDITION	POSSIBLE CAUSES	CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK.	1. Loose power steering hose fittings.	1. Tighten the fitting to its specified torque.
	2. Damaged or missing fitting seal, gasket, or O-ring.	2. Replace as necessary.
	3. Power steering pump or power steering gear leaking.	3. Repair or replace the leaking component as required.
AERATED FLUID.	1. Low fluid level.*	1. Fill power steering fluid reservoir to proper level.
	2. Air leak between power steering fluid reservoir and pump.	2. Inspect for proper sealing. Replace the power steering pump (with reservoir).
	3. Cracked power steering pump housing.	3. Replace the power steering pump.
RESERVOIR FLUID OVERFLOW AND FLUID THAT IS MILKY IN COLOR	1. Water contamination.	1. Drain the power steering fluid from the system. Flush the system with fresh clean power steering fluid, drain, then refill to the proper level.

NOTE: * Extremely cold temperatures may cause power steering fluid aeration if the power steering fluid is low.

COLUMN

TABLE OF CONTENTS

COLUMN

DESCRIPTION

The steering column mounted to the underside of the instrument panel is a tilt type (Fig. 1). It has been designed to be serviced only as an assembly if it is determined to be defective. These replaceable components mounted on the steering column can be serviced without removal of the steering column from the vehicle:

- key cylinder
- lock cylinder trim ring
- ignition switch
- multi-function switch
- clockspring
- SKIM module
- trim shrouds, and
- steering wheel

The steering column intermediate shaft can also be serviced separately from the steering column.

The speed control switches and driver airbag mounted on the steering wheel are also serviced separately.

OPERATION

Turning of the steering wheel is transferred through the steering column and intermediate shaft, to the power steering gear pinion shaft. The gear then moves the steering knuckles, steering the vehicle.

WARNING

WARNING: BEFORE BEGINNING ANY SERVICE PROCEDURES THAT INVOLVES REMOVING THE AIR BAG. REMOVE AND ISOLATE THE NEGATIVE (-) BATTERY CABLE (GROUND) FROM THE VEHICLE BATTERY. THIS IS THE ONLY SURE WAY TO DISABLE THE AIR BAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIR BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: WHEN AN UNDEPLOYED AIRBAG MODULE IS TO BE REMOVED FROM THE STEERING WHEEL, DISCONNECT BATTERY GROUND CABLE AND ISOLATE. ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR A MINIMUM OF TWO MINUTES, THEN BEGIN AIRBAG REMOVAL.

COLUMN (Continued)

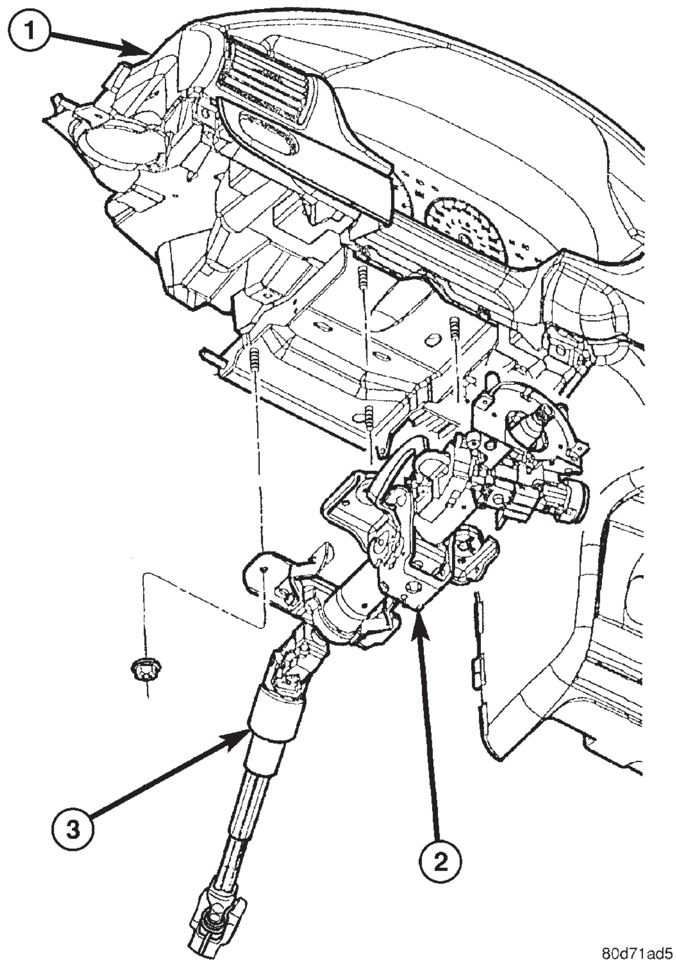

Fig. 1 Steering Column And Intermediate Shaft

1 - INSTRUMENT PANEL
2 - STEERING COLUMN
3 - INTERMEDIATE SHAFT

WARNING: THE AIR BAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIR BAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIR BAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIR BAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIR BAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS. BEFORE SERVICING A STEERING COLUMN EQUIPPED WITH AN AIR BAG, (Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING)

WARNING: WHEN HANDLING AN UNDEPLOYED AIRBAG MODULE DURING SERVICING OF THE STEERING COLUMN THE FOLLOWING PRECAUTIONS SHOULD BE OBSERVED. AT NO TIME SHOULD ANY SOURCE OF ELECTRICITY BE PERMITTED NEAR THE INFLATOR ON THE BACK OF THE AIRBAG MODULE. WHEN CARRYING A LIVE MODULE, THE TRIM COVER SHOULD BE POINTED AWAY FROM THE BODY TO MINIMIZE INJURY IF MODULE ACCIDENTLY DEPLOYS. IF AIRBAG MODULE IS PLACED ON A BENCH OR OTHER SURFACE, PLASTIC COVER SHOULD BE FACE UP TO MINIMIZE MOVEMENT IN CASE OF ACCIDENTAL DEPLOYMENT.

WARNING: SAFETY GOGGLES SHOULD BE WORN AT ALL TIMES WHEN WORKING ON STEERING COLUMNS.

CAUTION

CAUTION: Disconnect the negative (ground) cable from the battery, before servicing any column component.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Damage will occur.

DIAGNOSIS AND TESTING - STEERING COLUMN

For diagnosis of conditions relating to the steering column, (Refer to 19 - STEERING - DIAGNOSIS AND TESTING).

REMOVAL - STEERING COLUMN

NOTE: Before proceeding, review all WARNINGS and CAUTIONS. (Refer to 19 - STEERING/COLUMN - WARNING) (Refer to 19 - STEERING/COLUMN - CAUTION)

(1) Open hood and remove remote ground cable from ground stud on left front shock tower. Isolate ground cable from vehicle by installing cable isolator on ground stud (Fig. 2).

COLUMN (Continued)

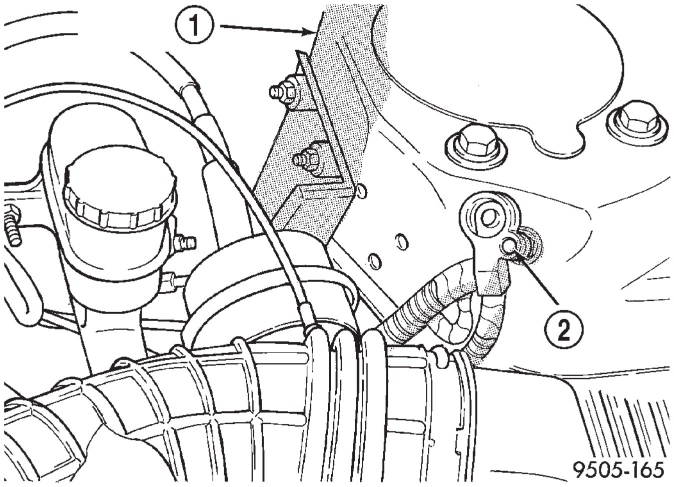

Fig. 2 Correctly Isolated Remote Ground Cable

1 - LEFT STRUT TOWER
2 - GROUND STUD

WARNING: WHEN AN UNDEPLOYED AIRBAG IS TO BE REMOVED FROM THE STEERING WHEEL, DISCONNECT BATTERY GROUND CABLE AND ISOLATE. ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR TWO MINUTES, THEN BEGIN AIRBAG REMOVAL.

(2) Wait for a minimum of 2 minutes before starting to remove air bag from steering wheel. This will allow the airbag system capacitor to de-energize.

(3) Remove fuse panel cover from left end of instrument panel.

(4) Remove center bezel surrounding radio and climate control panel.

(5) Remove screw attaching bezel to instrument panel behind climate control panel. Remove bezel.

(6) Remove outside mirror switch bezel from instrument panel.

(7) Remove silencer panel below steering column knee bolster.

(8) Remove screws attaching knee bolster to instrument panel.

(9) Lower knee bolster and disconnect connectors from rear, then remove bolster.

(10) Position front wheels of vehicle in the **straight-ahead** position.

(11) Remove speed control switches (Fig. 3) from steering wheel. Speed control switches are mounted to steering wheel by two screws (one screw, each switch) which are accessible from back side of steering wheel.

WARNING: WHEN HANDLING AN UNDEPLOYED AIRBAG DURING SERVICING OF THE STEERING COLUMN THE FOLLOWING PRECAUTIONS SHOULD BE OBSERVED. AT NO TIME SHOULD ANY SOURCE OF ELECTRICITY BE PERMITTED NEAR THE INFLATOR ON THE BACK OF THE AIRBAG MODULE. WHEN CARRYING A LIVE MODULE, THE TRIM COVER SHOULD BE POINTED AWAY FROM THE BODY TO MINIMIZE INJURY IF MODULE ACCIDENTLY DEPLOYS. IF AIRBAG MODULE IS PLACED ON A BENCH OR OTHER SURFACE, PLASTIC COVER SHOULD BE FACE UP TO MINIMIZE MOVEMENT IN CASE OF ACCIDENTAL DEPLOYMENT.

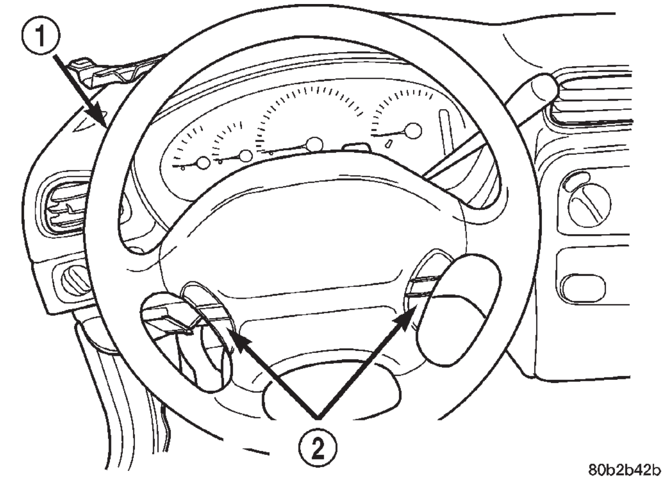

Fig. 3 Speed Control Switches

(13) Lift driver airbag from steering wheel and disconnect electrical connectors from back of driver airbag (Fig. 5). Connectors are removed by compressing

COLUMN (Continued)

latches on sides of connectors and pulling them straight out of airbag. Do not twist the connectors when removing them from airbag.

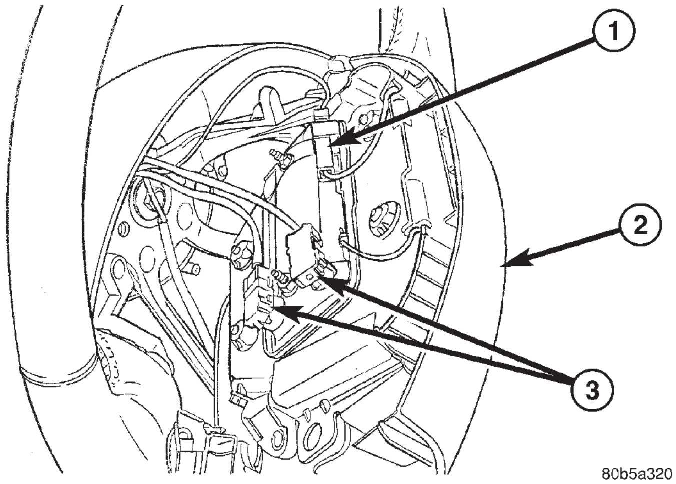

Fig. 5 Airbag Electrical Connections

1 - HORN CONNECTOR
2 - DRIVER AIRBAG
3 - AIRBAG SQUIB CONNECTORS

(14) Remove driver airbag.

NOTE: Before removing steering wheel, verify front wheels and steering wheel are in staight-ahead position.

(15) Remove steering wheel attaching bolt from steering column shaft (Fig. 6).

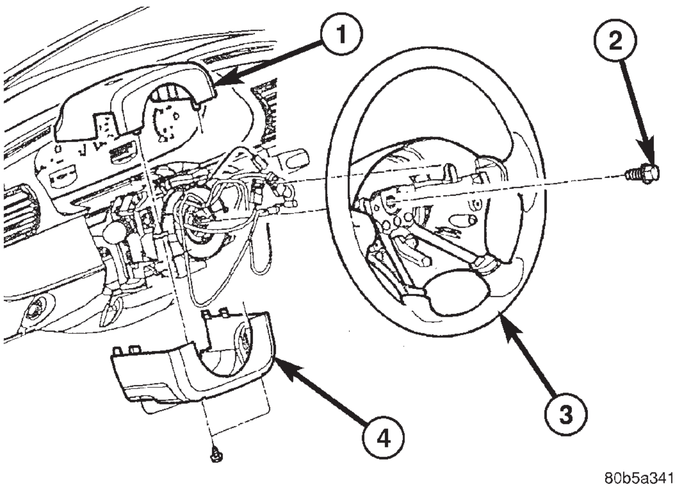

Fig. 6 Steering Wheel And Shroud Mounting

1 - UPPER SHROUD
2 - BOLT
3 - STEERING WHEEL
4 - LOWER SHROUD

CAUTION: When installing wheel puller on steering wheel, be sure puller bolts are fully seated in the threaded holes in the steering wheel. If bolts are not fully seated in the threaded holes, threads may be stripped out when removing the steering wheel.

(16) Install puller on steering wheel as shown (Fig. 7).

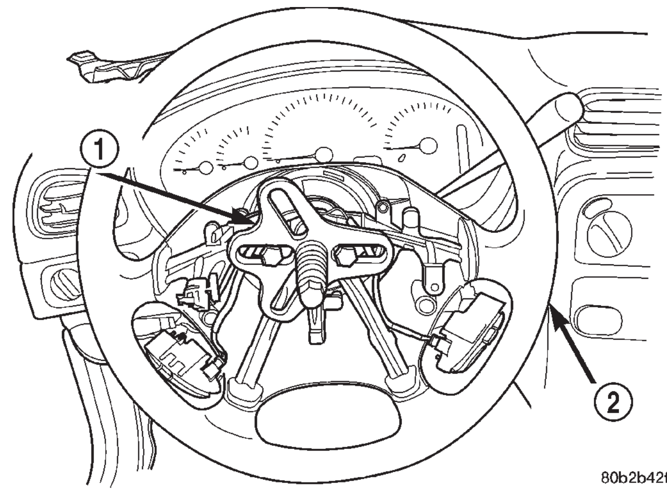

Fig. 7 Puller Installed On Steering Wheel

1 - STEERING WHEEL PULLER
2 - STEERING WHEEL

CAUTION: Do not bump or hammer on steering wheel or steering column shaft when removing steering wheel from steering column.

(17) Remove steering wheel from steering column shaft.

(18) Remove the 2 screws attaching the upper and lower shrouds to the steering column (Fig. 6). First remove upper shroud from steering column by pressing inward on upper shroud just above the parting line while pulling upper and lower shrouds apart. Next, release tilt lever and tilt steering column to its highest point. Then remove lower shroud from steering column.

COLUMN (Continued)

(19) Remove the 2 wiring harness connectors from the clockspring (Fig. 8).

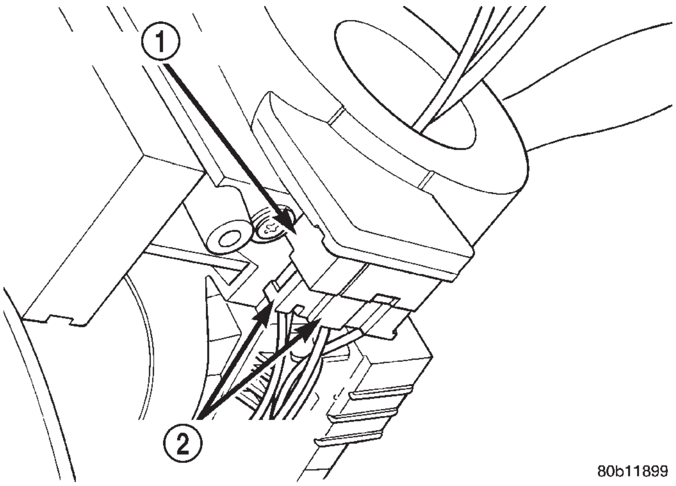

Fig. 8 Wiring Harness Connection To Clock Spring

1 - CLOCK SPRING
2 - WIRING HARNESS CONNECTORS

(20) Remove the 3 wiring harness connectors from the back of the ignition switch (Fig. 9).

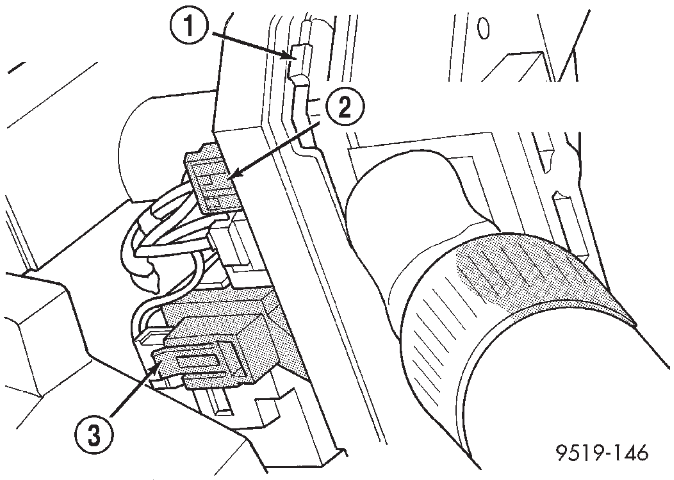

Fig. 9 Wiring Harness Connections To Ignition And Multi-Function Switch

1 - MULTI-FUNCTION SWITCH
2 - MULTI-FUNCTION SWITCH WIRING HARNESS CONNECTOR
3 - IGNITION SWITCH

(21) If equipped, disconnect SKIM connector.

(22) Remove the 2 wiring harness connectors from the multi-function switch (Fig. 9) (Fig. 10).

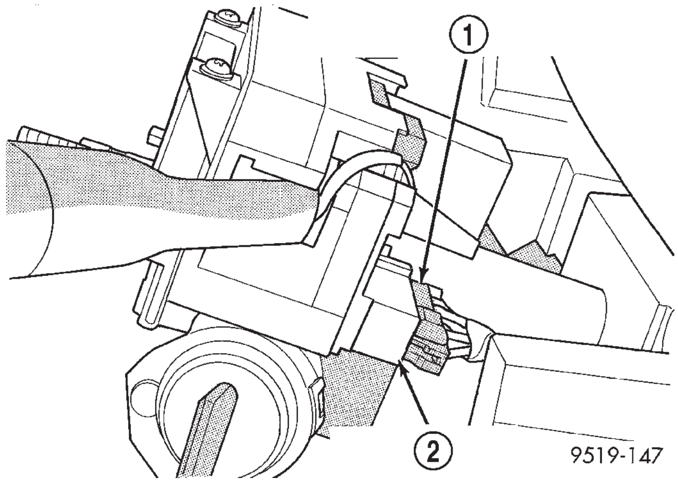

Fig. 10 Wiring Harness Connection To Multi-Function Switch

1 - MULTI-FUNCTION SWITCH WIRING HARNESS CONNECTOR
2 - MULTI-FUNCTION SWITCH

(23) If vehicle is equipped with an automatic transaxle, rotate the key cylinder to the ON position. Depress locking tab on shifter/ignition interlock cable (Fig. 11) and remove the cable from the key lock housing.

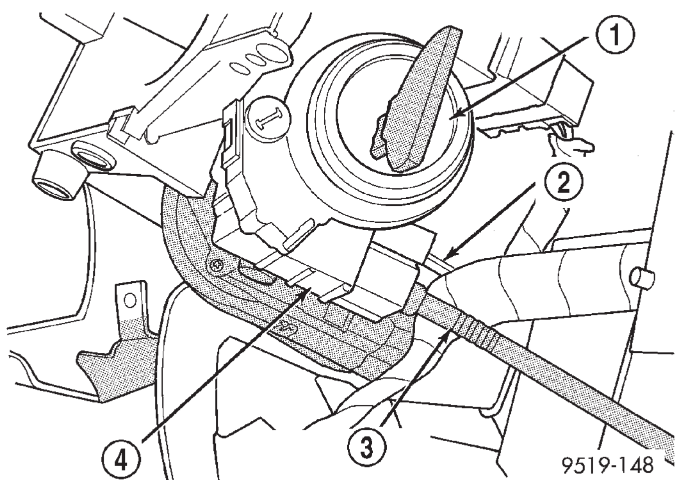

Fig. 11 Shifter/Ignition Cable At Lock Cylinder Housing

1 - KEY CYLINDER
2 - LOCKING TAB
3 - SHIFTER IGNITION INTERLOCK CABLE

COLUMN (Continued)

(24) Under the instrument panel, disconnect the intermediate shaft from the steering gear shaft. To do so, remove the pinch bolt from the intermediate shaft coupler (Fig. 12), then slide the intermediate shaft up and off the steering gear shaft.

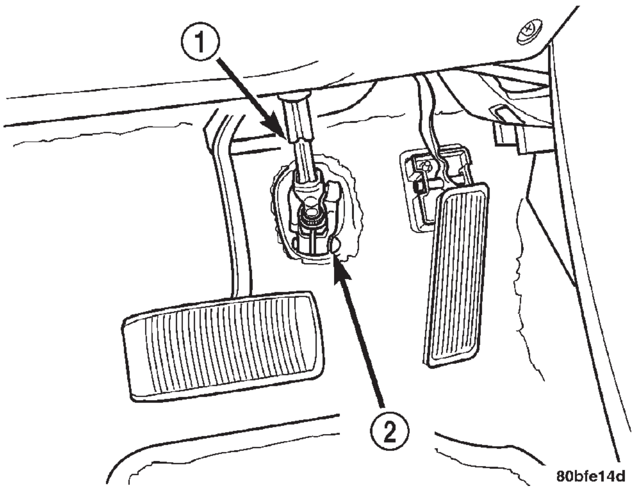

Fig. 12 Intermediate Shaft Attachment

1 - INTERMEDIATE SHAFT
2 - PINCH BOLT

(25) Remove the 2 upper steering column mounting bracket-to-support bracket nuts. Then remove the 2 lower steering column mounting bracket-to-support bracket nuts (Fig. 13).

(26) Remove steering column and intermediate shaft from vehicle passenger compartment. Use care to avoid damaging column harness or interior trim.

(27) If steering column is being replaced, perform the following:

(a) Remove intermediate shaft. (Refer to 19 - STEERING/COLUMN/INTERMEDIATE SHAFT - REMOVAL)

(b) Remove SKIM.

(c) Remove halo ring from around key/lock cylinder.

(d) Remove key cylinder.

(e) Remove multi-function switch.

(f) Remove ignition switch (if required).

INSTALLATION - STEERING COLUMN

(1) If steering column is being replaced, perform the following:

(a) Install ignition switch (if required).

(b) Install multi-function switch.

(c) Install key cylinder.

(d) Install halo ring from around key/lock cylinder.

(e) Install SKIM.

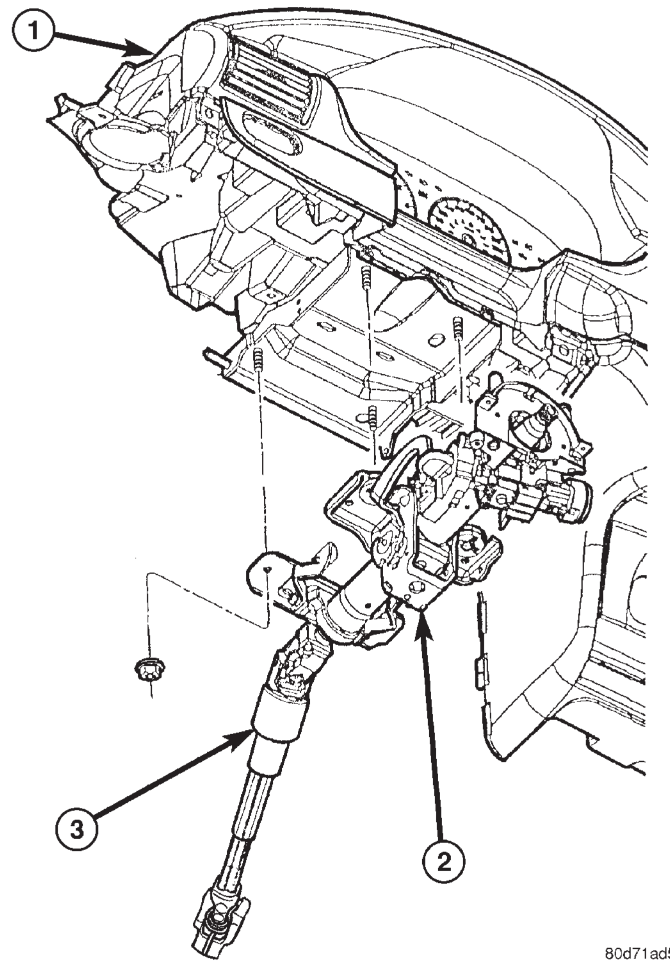

Fig. 13 Steering Column And Intermediate Shaft

1 - INSTRUMENT PANEL
2 - STEERING COLUMN
3 - INTERMEDIATE SHAFT

(f) Install intermediate shaft. (Refer to 19 - STEERING/COLUMN/INTERMEDIATE SHAFT - INSTALLATION)

(2) Install steering column on the studs in the steering column support bracket (Fig. 13). Loosely install the 4 steering column assembly attaching nuts.

(3) Tighten the 2 lower steering column assembly mounting nuts to hold the steering column in place. Be sure both break-away capsules are still fully seated in the slots of the upper steering column mounting bracket and the mounting studs are centered fore-and-aft in the plastic capsules. Then equally tighten both steering column mounting nuts, until upper steering column mounting bracket is seated against support bracket. Tighten the 4 steering column bracket to support bracket nuts to 17 N·m (150 in. lbs.).

COLUMN (Continued)

(4) If a new steering column is being installed in the vehicle, remove the shipping (grenade) pin from steering column.

(5) Ensure front wheels of vehicle are positioned **straight-ahead**, and steering wheel master serration in steering column shaft is positioned at 12 O'clock.

(6) Under the instrument panel, reconnect the intermediate shaft to the steering gear shaft. To do so, align the flats and slide the intermediate shaft onto the steering gear shaft aligning the pinch bolt hole with the notch formed into the steering gear shaft. Install a **new** pinch bolt in the intermediate shaft coupler (Fig. 12), then tighten the pinch bolt to a torque of 44 N·m (32 ft. lbs.).

(7) If vehicle is equipped with an automatic transaxle, install the shifter/ignition interlock cable (Fig. 11) in the lock cylinder housing.

(8) If equipped, connect wiring connector to SKIM.

(9) Install the wiring harness connectors on the back of the ignition switch (Fig. 9).

(10) Install 2 wiring harness connectors to multifunction switch (Fig. 9) (Fig. 10).

(11) Install 2 wiring harness connectors to clockspring (Fig. 8).

(12) Install the upper and lower steering column shrouds onto the lock housing of the steering column. Install and securely tighten the 2 upper to lower steering column shroud to lock housing attaching screws to 1.9 N·m (17 in. lbs.) (Fig. 6).

CAUTION: If any doubt is present as to whether the clockspring is properly centered, this clockspring centering procedure MUST be performed prior to installing the steering wheel. If clockspring is not centered it may be overextended, causing clockspring assembly to become inoperative. The clockspring is centered when the yellow centering indicator is present in the centering window and the arrow on the label points at the locking pin.

(13) Center the clockspring using the following procedure.

(a) Depress the plastic locking pin to disengage clockspring locking mechanism.

(b) Keeping locking mechanism disengaged, rotate the clockspring rotor in the CLOCKWISE direction to the end of the travel. Do not apply excessive torque.

(c) From the end of clockwise travel, slowly rotate the rotor in the COUNTERCLOCKWISE direction until yellow appears in the centering window of clockspring. When yellow appears in the centering window the locking pin on the clockspring rotor will be in front of arrow on clockspring label.

(d) Release the plastic locking pin to engage the clockspring locking mechanism.

CAUTION: Do not install steering wheel by driving it onto the shaft. Pull steering wheel down onto steering column shaft using ONLY the steering wheel retaining bolt.

(14) Feed the clockspring wiring leads through the steering wheel. Position steering wheel on shaft of steering column, making sure the master serration in the wheel hub and on the steering column shaft line up.

(15) Install steering wheel to steering column shaft with bolt and tighten until the steering wheel is fully installed on the shaft. Tighten steering wheel retaining bolt to a torque of 54 N·m (40 ft. lbs.).

(16) Turn the key cylinder to the unlock position, unlocking the steering column shaft.

(17) Connect the horn switch wiring connector from the clockspring to the airbag connector (Fig. 5).

(18) Install the airbag electrical connectors to connectors on rear of driver airbag (Fig. 5). **Be sure electrical connector from clockspring is securely latched into airbag connector.**

CAUTION: The fasteners, screws, and bolts, originally used for the airbag components are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace only with correct fasteners provided in service packages or fasteners listed in the parts book.

NOTE: Make sure steering wheel and airbag module are in the right-side-up position before installing airbag module on steering wheel.

(19) Install the airbag module on steering wheel. Install only the two original or correct replacement airbag module attaching bolts (Fig. 4). Tighten the two airbag module attaching bolts to a torque of 9.6 N·m (85 in. lbs.).

(20) Connect the speed control wiring leads to the speed control switches.

(21) Install the speed control switches in the steering wheel (Fig. 3). Install the screws attaching the speed control switches to the steering wheel. Tighten the screws to a torque of 1.1 N·m (12 in. lbs.).

(22) Install lower instrument panel knee bolster onto the lower instrument panel. Install and securely tighten the knee bolster to instrument panel attaching screws.

(23) Install the mirror switch bezel.

(24) Install fuse panel cover on left end of instrument panel.

COLUMN (Continued)

(25) Install inboard switch bezel. Install mounting screw.

(26) Install center bezel surrounding radio and climate control panel from top cover of instrument panel.

(27) Install silencer panel below steering column knee bolster.

CAUTION: When reconnecting battery on a vehicle that has had the air bag module removed, ensure no occupants are in the vehicle and the following procedure is used.

(28) Reconnect the negative cable to the battery using the steps listed below.

(a) Connect DRBIII® scan tool to diagnostic datalink connector.

(b) Turn ignition key to ON position. Exit vehicle with the DRB scan tool.

(c) Ensuring that their are no occupants in the vehicle, connect negative cable to negative post of the battery.

(d) Using the DRBIII scan tool, read and record active fault codes. Also read and record any stored fault codes. Refer to Appropriate Diagnostic Information if any faults are found.

(e) Erase stored faults if there are no active fault codes. If problems remain, fault codes will not erase.

(f) Reaching through the drivers window, between steering wheel and instrument cluster, turn ignition key to OFF and then ON observing instrument cluster airbag indicator. It should go on for six to eight seconds, then go out. This will indicate that the air bag system is functioning normally.

(29) **If airbag warning indicator fails to light, blinks on and off or goes on and stays on, there is an air bag system malfunction.** Refer to Appropriate Diagnostic Information to diagnose any system malfunction.

(30) Test the operation of the horn, lights and any other functions that are steering column operated. If applicable reset the radio and the clock.

(31) Road test vehicle to ensure proper operation of the steering system and the speed control system.

INTERMEDIATE SHAFT

DESCRIPTION

The steering column intermediate shaft is located between the steering column and the power steering gear. It has a universal joint at each end. It has a slider-stage in the center portion of the shaft.

The steering column intermediate shaft fastens to the steering column's splined shaft using a roll pin. It uses a pinch bolt to secure the shafts to one another at the steering gear (Fig. 14).

OPERATION

The steering column intermediate shaft connects the steering column shaft to the power steering gear's pinion shaft. It's flexible joints allow the shaft to universal when rotating.

DIAGNOSIS AND TESTING - STEERING COLUMN INTERMEDIATE SHAFT

The steering column intermediate shaft and its universal joint couplers (Fig. 1) must be inspected whenever any of the following conditions exist:

- After the vehicle has been involved in a collision which deploys the airbag, regardless of the extent of damage done to the vehicle.
- After the vehicle has been involved in an undercarriage impact which results in any type of damage to the front suspension crossmember.
- Under any conditions which result in the steering column assembly or steering column shaft receiving a force great enough to move the steering column or shaft forward of rearward in a vehicle.

Inspect the intermediate shaft and its universal joint couplers for any of the following conditions:

- seized or binding bearings
- loose bearing stakes

INTERMEDIATE SHAFT (Continued)

- bearings not fully seated in the coupler yoke
- bent intermediate shaft

Presence of any of the above faulty conditions call for replacement of the entire steering column intermediate shaft.

REMOVAL

(1) Remove fuse panel cover from left end of instrument panel.

(2) Remove center bezel surrounding radio and climate control panel.

(3) Remove screw attaching bezel to instrument panel behind climate control panel. Remove bezel.

(4) Remove outside mirror switch bezel from instrument panel.

(5) Remove silencer panel below steering column knee bolster.

(6) Remove screws attaching knee bolster to instrument panel.

(7) Lower knee bolster and disconnect connectors from rear, then remove bolster.

(8) Position front wheels of vehicle in the **straight-ahead** position.

(9) Disconnect the intermediate shaft from the steering gear shaft. To do so, remove the pinch bolt from the intermediate shaft coupler (Fig. 14), then slide the intermediate shaft up and off the steering gear shaft.

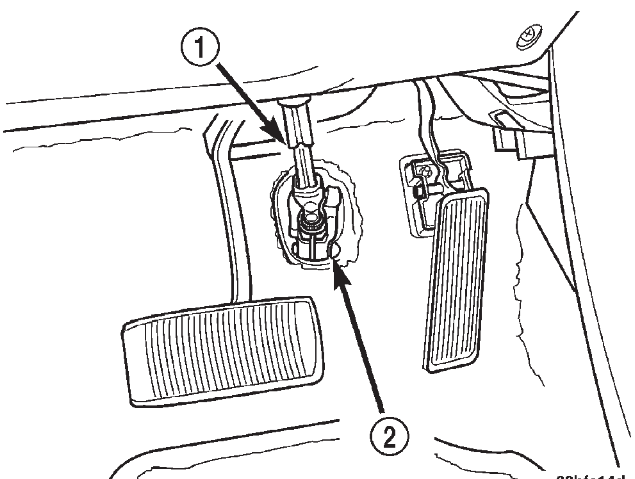

Fig. 14 Intermediate Shaft Attachment

1 - INTERMEDIATE SHAFT
2 - PINCH BOLT

(10) Turn the steering wheel 90° to the **LEFT**. This is done to allow proper roll pin removal tool installation.

(11) Using a steering wheel holder, lock the steering wheel in this position. **This is done to keep the clockspring from turning, losing its center. It will also help hold the shaft steady while removing the roll pin.**

(12) Install Remover/Installer, Special Tool 6831-A, through center of roll pin in intermediate shaft's universal joint and install knurled nut (Fig. 15).

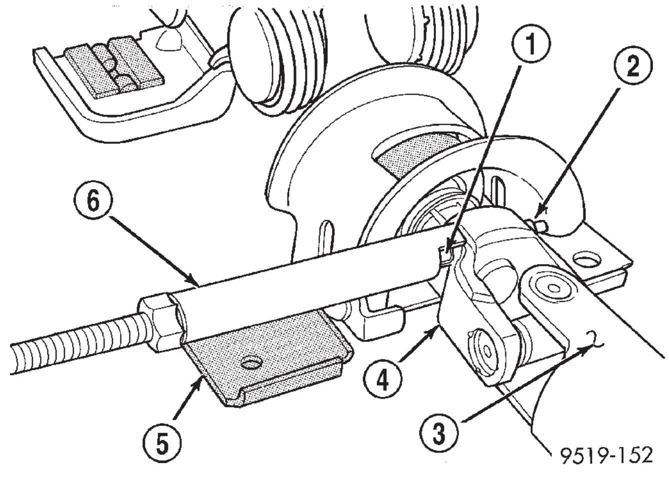

Fig. 15 Removing Roll Pin From Flex Joint (Typical)

1 - ROLL PIN
2 - KNURLED NUT
3 - INTERMEDIATE SHAFT
4 - UNIVERSAL JOINT
5 - STEERING COLUMN LOWER MOUNTING BRACKET
6 - SPECIAL TOOL 6831–A

(13) While holding hex on end threaded rod, tighten the nut on threaded rod of Remover/Installer. This will pull the roll pin out of the intermediate shaft's universal joint.

(14) Using a screwdriver inserted between the shaft's universal joint and the steering column lower mounting bracket, gently pry intermediate shaft off steering column shaft.

INSTALLATION

(1) Start roll pin into universal joint prior to installing intermediate shaft on steering column shaft. Install roll pin into just far enough to square roll pin to hole in universal joint. If roll pin is installed too far, universal joint will not slid onto steering column shaft.

(2) Install intermediate shaft on steering shaft until correctly positioned to allow roll pin to be installed in coupler.

(3) Install Remover/Installer, Special Tool 6831-A, through center of roll pin and install knurled nut as shown (Fig. 16).

(4) Using Remover/Installer (Fig. 16), install roll pin into the coupler until roll pin is fully and evenly installed through both sides of the coupler assembly.

(5) Remove the steering wheel holder and turn the steering wheel 90° to the right so that the steering wheel is back in the **straight-ahead** position. **Do not allow the steering wheel to turn any fur-**

INTERMEDIATE SHAFT (Continued)

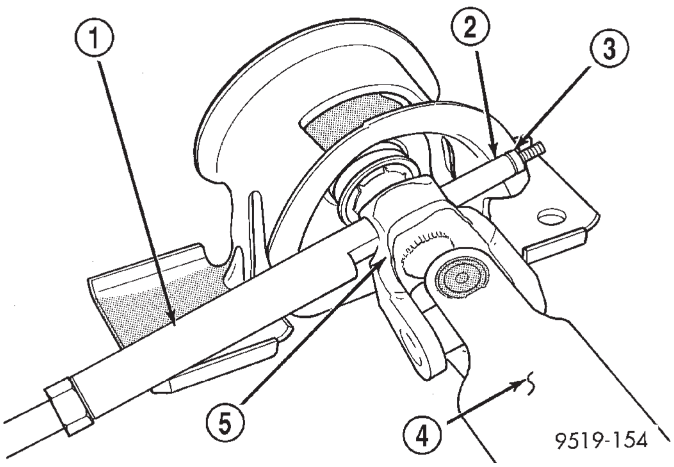

Fig. 16 Tool Set-Up For Installing Roll Pin (Typical)

4 - INTERMEDIATE SHAFT
5 - UNIVERSAL JOINT

ther or in any other direction; clockspring center will be lost and clockspring centering procedure must then be performed (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE)

(6) Under the instrument panel, reconnect the intermediate shaft to the steering gear shaft. To do so, align the flats and slide the intermediate shaft onto the steering gear shaft aligning the pinch bolt hole with the notch formed into the steering gear shaft. Install a **new** pinch bolt in the intermediate shaft coupler (Fig. 14), then tighten the pinch bolt to a torque of 44 N·m (32 ft. lbs.).

(7) Install lower instrument panel knee bolster onto the lower instrument panel. Install and securely tighten the knee bolster to instrument panel attaching screws.

(8) Install the mirror switch bezel.

(9) Install fuse panel cover on left end of instrument panel.

(10) Install inboard switch bezel. Install mounting screw.

(11) Install center bezel surrounding radio and climate control panel from top cover of instrument panel.

(12) Install silencer panel below steering column knee bolster.

(13) Road test vehicle to ensure proper operation of the steering system.

STEERING WHEEL

REMOVAL - STEERING WHEEL

(1) Adjust the steering wheel so that the tires are in the straight ahead position.

(2) Disconnect and isolate the battery negative remote cable.

(3) Remove the speed control switch screws from back of the steering wheel. Pull the switch pods out and disconnect the wires.

(4) Remove the Driver Airbag attaching bolts from steering wheel.

(5) Lift the airbag and disconnect the airbag wire connectors using finger grip. Use care not to pull on wires. Never use a metallic tool to pry on the connector.

(6) Disconnect the horn wire from the airbag mounting bracket. Remove the speed control wires from under the bracket and from the wire guides.

(7) Unscrew the steering wheel retaining bolt almost all the way out (apporximately 15 mm).

(8) Loosen the steering wheel using a wheel puller tool. Remove the tool.

(9) Remmove the retaining bolt, then the steering wheel. Carefully feed all of the wires through the steering wheel armature to avoid damaging wires.

INSTALLATION - STEERING WHEEL

(1) Ensure that the road wheels are in the straight-ahead position.

(2) Ensure that the clockspring is centered by using the centering indicator. Refer to Clockspring Centering Procedure. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - ADJUSTMENTS)

(3) Ensure that the turn signal stalk is in the neutral position.

(4) Carefully route the wires over the top of the steering wheel armature. Install steering wheel and tighten bolt to 54 N·m (40 ft. lbs.) torque.

(a) Ensure that the pocket in the steering wheel hub lines up with the pin on the clockspring rotor.

(b) Ensure that the block tooth in the steering wheel hub lines up with the missing tooth on the steering column shaft.

(5) Route the speed control wires under the horn mechanism and through the speed control switch pockets. Connect the speed control wires to switches and install switches. Tighten screws to 1.4 ± .3 N·m (12 ± 3 in. lbs.) torque.

(6) Connect the horn lead to steering wheel.

(7) Connect the yellow airbag lead to the Driver Airbag. Check that the wires do not get pinched during installation.

(8) Install the airbag bolts and tighten the left side first. Tighten to 9.6 ± 1.0 N·m (85 ± 10 in. lbs.) torque.

(9) Refer to Clockspring - Diagnosis and Testing - Airbag System Test before connecting battery negative remote cable. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - DIAGNOSIS AND TESTING)

GEAR

TABLE OF CONTENTS

GEAR

DESCRIPTION

The steering gear on this vehicle is a rack and pinion unit with power assist (Fig. 1). It is mounted on the front suspension crossmember. The steering column connects to the steering gear shaft on top of the gear. The outer tie rod ends of the gear connect to each suspension steering knuckle to steer the vehicle.

OPERATION

Turning of the steering wheel is converted into linear travel through the meshing of the helical pinion teeth with the rack teeth. Power assist steering is provided by an open center, rotary type control valve which directs fluid from the pump to either side of the integral rack piston.

Road feel is controlled by the diameter of a torsion bar which initially steers the vehicle. This movement directs fluid behind the integral rack piston, which, in turn, builds up hydraulic pressure and assists in the turning effort.

The drive tangs on the gear pinion mate loosely with a stub shaft. This is to permit manual steering control to be maintained if the drive belt on the power steering pump should break. However, under these conditions, steering effort will be increased.

REMOVAL

NOTE: Before proceding, review Warnings and Cautions.(Refer to 19 - STEERING - WARNING)(Refer to 19 - STEERING - CAUTION)

(1) Remove remote ground cable from ground stud on left shock tower. Then correctly isolate ground cable from vehicle by installing isolator on stud (Fig. 2).

(2) Siphon as much power steering fluid as possible from the remote power steering fluid reservoir.

(3) Place the steering wheel and front wheels in the STRAIGHT-AHEAD position. Lock the steering wheel in this position using a steering wheel holder.

(4) Under the instrument panel, disconnect the intermediate shaft from the steering gear shaft. To do so, remove the pinch bolt from the intermediate shaft coupler (Fig. 3), then slide the intermediate shaft up and off the steering gear shaft.

(5) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(6) Remove both front wheel and tire assemblies.

(7) Remove fasteners attaching drive belt splash shield to crossmember.

CAUTION: This vehicles is designed and assembled using NET BUILD front suspension alignment settings. This means that front suspension alignment settings are determined as the vehicle is designed by the location of front suspension components in relation to the vehicle body. This process is carried out when building the vehicle by accurately locating the front suspension crossmember to master gage holes located in the underbody of the vehicle. Consequently, whenever the front suspension crossmember is removed from a vehicle, it MUST be replaced in the same location on the body of the vehicle it was removed from to keep the alignment settings the same. Therefore, before removing the front suspension crossmember from the vehicle, locating marks for the front suspension crossmember MUST be scribed on the front suspension crossmember and body of vehicle as described in the following steps. If location of front suspension crossmember to body is not maintained when vehicle is assembled, vehicle handling and or tire wear problems may occur.

(10) Using an awl, scribe lines on the body marking the front-to-rear and side-to-side location where the front suspension crossmember is mounted against the body of the vehicle. at all four locations where the crossmember mounts. The line should be scribed at all locations where the crossmember is mounted to the vehicle on each side of the vehicle.

(11) Remove the stabilizer bar bushing clamp**-to-body** attaching bolts (Fig. 6). The stabilizer bar bushing clamp**-to-crossmember** bolts do not need to be removed.

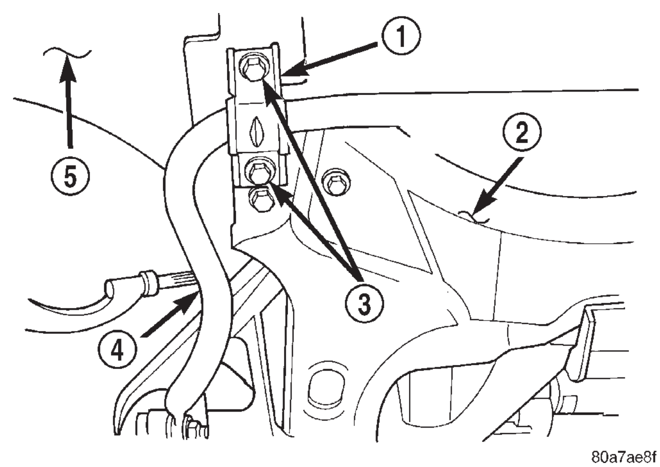

Fig. 6 Stabilizer Bar Bushing Clamp Attaching Bolts

(12) Remove the bolts attaching the shock absorber clevis to the left and right lower control arms (Fig. 7).

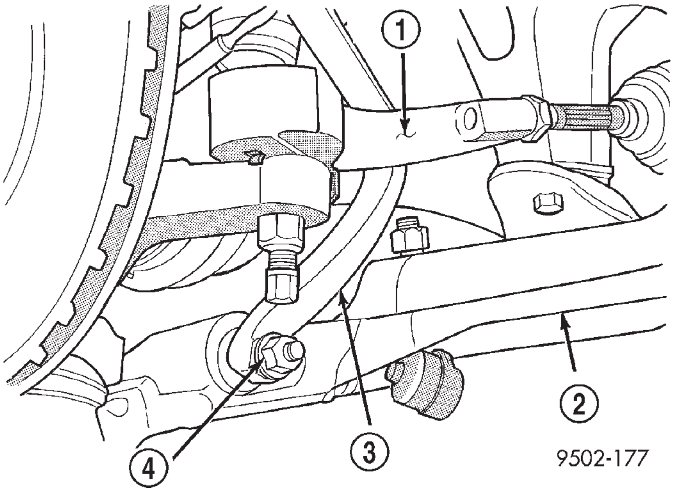

Fig. 7 Shock Clevis To Lower Control Arm Bolts

1 - TIE ROD END
2 - LOWER CONTROL ARM
3 - SHOCK ABSORBER CLEVIS
4 - THRU-BOLT

(13) Remove 3 bolts attaching engine torque mount to crossmember.

(14) Remove screws fastening steering gear heat shield to crossmember (Fig. 8).

(15) Remove screws fastening power steering pressure hose to crossmember (Fig. 8).

(16) Remove brake tube routing bracket from left lower control arm rear mounting bolt.

(17) Disconnect fuel tube bundle routing support above crossmember.

(18) Position transmission jack under center of front suspension crossmember to support it.

(19) On each side of the vehicle, remove the 2 bolts attaching the front and rear of the front suspension crossmember to the frame rails of vehicle (Fig. 9).

(20) Using transmission jack, lower front suspension crossmember enough to allow steering gear to be removed from crossmember. **When lowering front suspension crossmember, do not let crossmember hang from lower control arms, weight of crossmember must be supported by the transmission jack.**

(21) Remove power steering pressure and return hoses from the power steering gear fluid ports (Fig. 10).

(22) Remove wiring harness connector from the power steering fluid pressure switch.

(23) Remove 4 bolts fastening power steering gear to front suspension crossmember. Remove power steering gear from front suspension crossmember.

GEAR (Continued)

INSTALLATION

(1) Install power steering gear on front suspension crossmember. Install all 4 steering gear mounting bolts. Tighten bolts to a torque of 68 N·m (50 ft. lbs.).

(2) Install power steering fluid pressure and return hoses to the ports of the power steering gear (Fig. 10). Tighten power steering fluid pressure and return hose tube nuts to a torque of 31 N·m (275 in. lbs.).

(3) Using transmission jack, raise front suspension crossmember and steering gear against body of vehicle.

CAUTION: When front suspension crossmember is installed back in vehicle, crossmember MUST be aligned with positioning marks previously scribed into body of vehicle. This MUST be done to maintain NET BUILD front suspension alignment settings.

(4) Start the 2 rear mounting bolts into body tapping plates attaching front suspension crossmember to body of vehicle. Then install the 2 front bolts attaching front suspension crossmember to frame rails of vehicle. Tighten all 4 mounting bolts evenly until front suspension crossmember is against body of vehicle at all 4 mounting points. Tighten bolts to approximately 2 N·m (20 in. lbs.) to hold front suspension crossmember in position. Do not overtighten.

(5) Using a soft face hammer, tap front suspension crossmember into position until it is aligned with the previously scribed positioning marks on body of vehicle.

(6) Once front suspension crossmember is correctly positioned, tighten the 2 rear crossmember mounting bolts to 163 N·m (120 ft. lbs.) torque. Then tighten the 2 front crossmember to frame rail attaching bolts to 163 N·m (120 ft. lbs.) torque.

(7) Lower the transmission jack.

(8) Connect fuel tube bundle routing support above crossmember.

(9) Install brake tube routing bracket onto left lower control arm rear mounting bolt threads.

(10) Install screws fastening power steering pressure hose routing clamps to crossmember (Fig. 8). Tighten screws to 45 N·m (33 ft. lbs.) torque.

(11) Install steering gear heat shield on crossmember (Fig. 8).

(12) Install 3 bolts attaching engine torque mount to crossmember. Tighten bolts to 65 N·m (48 ft. lbs.) torque.

(13) Loosely install the 2 shock absorber clevis-to-lower control arm thru-bolts and nuts (Fig. 7). Do not tighten bolts at this time.

(14) Install tie rod seal boot heat shield on tie rod end (Fig. 5).

(15) Install tie rod end into steering knuckle. Start tie rod end-to-steering knuckle attaching nut onto tie rod stud. While holding stud stationary, tighten nut (Fig. 5). To properly torque the nut, use a crowfoot and socket as shown and tighten the nut to 55 N·m (40 ft. lbs.) torque (Fig. 14).

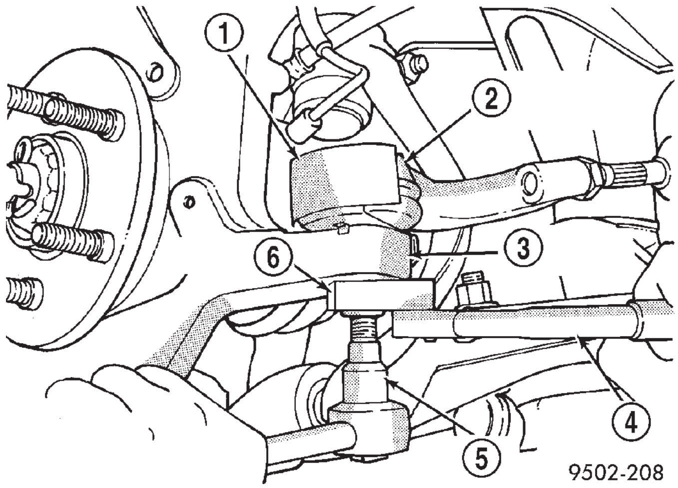

Fig. 14 Torquing Tie Rod End Attaching Nut

1 - HEAT SHIELD
2 - TIE ROD END
3 - STEERING KNUCKLE
4 - TORQUE WRENCH
5 - 11/32 SOCKET
6 - CROWFOOT

(16) Install and tighten the 2 stabilizer bar bushing clamp-to-body attaching bolts to 61 N·m (45 ft. lbs.) torque.

(17) Install fasteners attaching drive-belt splash shield to crossmember.

CAUTION: When supporting lower control arm with jack stand, do not position jack stand under the ball joint cap on the lower control arm. Position in area of lower control arm shown in (Fig. 15).

(18) Lower vehicle and support front end of vehicle by positioning jack stands as shown at each lower control arm as the vehicle is lowered (Fig. 15). Continue to lower vehicle until the total front end weight is supported by the jack stands.

(19) Tighten the shock absorber clevis-to-lower control arm bushing thru-bolts to a torque of 92 N·m (68 ft. lbs.).

(20) Raise the vehicle and remove the jack stands.

(21) Install the wheel and tire assemblies. Progressively tighten the wheel nuts in a criss-cross tightening sequence to 135 N·m (100 ft. lbs.) torque.

GEAR (Continued)

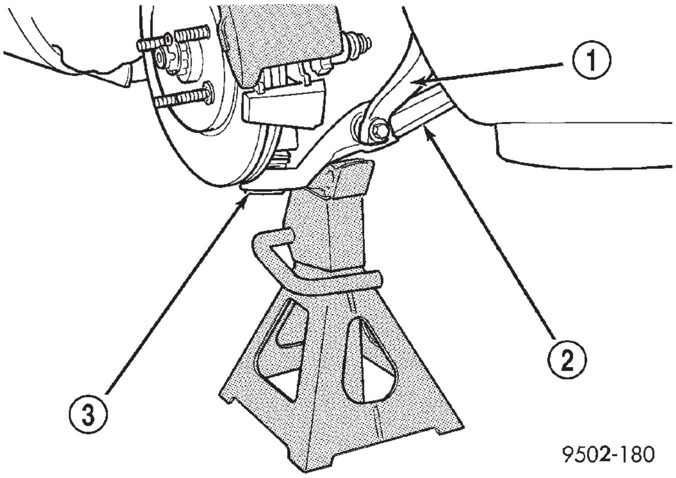

Fig. 15 Lower Control Arm Correctly Supported By Jack Stand

1 - SHOCK ABSORBER CLEVIS
2 - LOWER CONTROL ARM
3 - BALL JOINT CAP

CAUTION: Before connecting the steering column intermediate shaft coupler to the steering gear shaft, position the front wheels STRAIGHT-AHEAD. The steering wheel must also be in the centered position.

(22) Under instrument panel, align splines inside intermediate shaft lower coupling with splines on steering gear shaft and slide intermediate shaft onto steering gear. Install a NEW coupling pinch bolt (Fig. 3) and tighten it to a torque of 44 N·m (32 ft. lbs.).

(23) Remove steering wheel holder.

(24) Fill power steering pump fluid reservoir to the proper level and perform Power Steering Pump Initial Operation standard procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(25) Check for leaks.

(26) Lower vehicle.

(27) Check front wheel alignment and adjust toe setting (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE). Tighten tie rod jam nuts to 74 N·m (55 ft. lbs.) torque.

TIE ROD

REMOVAL - OUTER TIE ROD

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove wheel and tire assembly.

(3) Loosen inner tie rod-to-outer tie rod jam nut (Fig. 16).

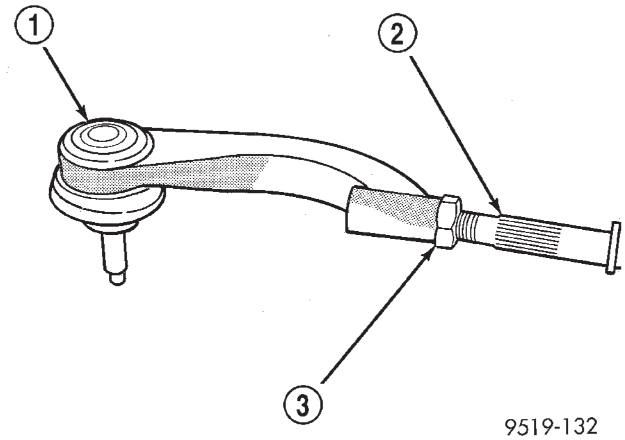

Fig. 16 Tie Rod Jam Nut

1 - OUTER TIE ROD
2 - INNER TIE ROD
3 - JAM NUT

(4) Remove nut attaching outer tie rod end to steering knuckle (Fig. 17). **Nut is to be removed from tie rod end using the following procedure, hold tie rod end stud with a 11/32 socket while loosening and removing nut with wrench.**

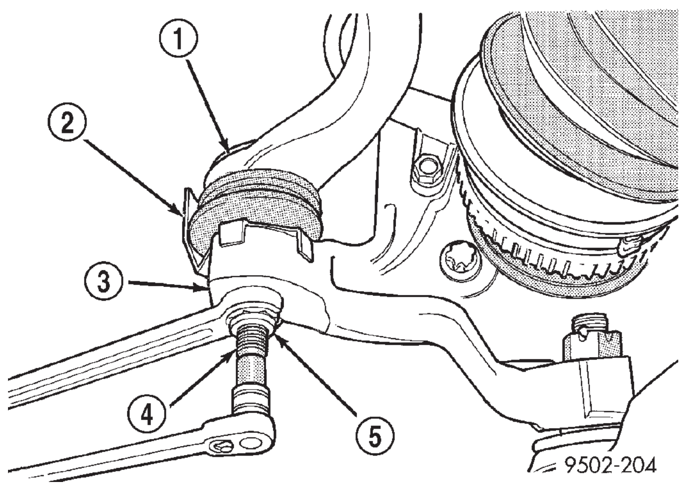

Fig. 17 Removing Tie Rod End Nut

1 - TIE ROD END

2 - TIE ROD END
3 - HEAT SHIELD
4 - STEERING KNUCKLE
5 - LOWER CONTROL ARM

(6) Remove outer tie rod end from inner tie rod by un-threading it from the inner tie rod.

INSTALLATION - OUTER TIE ROD

(1) Install outer tie rod onto inner tie rod. **Make sure jam nut is on inner tie rod before installing outer tie rod.** Do not tighten jam nut at this time.

(2) Install tie rod end seal boot heat shield on the tie rod end (Fig. 17).

(3) Install tie rod end into the steering knuckle. Start tie rod end to steering knuckle attaching nut onto stud of tie rod end. While holding stud of tie rod end stationary, tighten tie rod end to steering knuckle attaching nut (Fig. 17). Then using a crowfoot and socket (Fig. 19), torque tie rod end attaching nut to 61 N·m (45 ft. lbs.).

CAUTION: During this procedure do not allow the steering gear boot to become twisted.

(4) Tighten tie rod jam nut (Fig. 16) to 75 N·m (55 ft. lbs.) torque.

(5) Install tire and wheel assembly.

(6) Lower vehicle.

(7) Adjust the front wheel alignment toe setting on the vehicle. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

POWER STEERING PRESSURE SWITCH

DESCRIPTION

On vehicles equipped with a four cylinder engine, a power steering pressure switch (Fig. 20) is used to improve the vehicle's idle quality when required. When a demand for power assist is put on the power steering system at idle, pump pressure puts additional load on the engine, thus decreasing engine idle speed. The pressure switch improves vehicle idle quality by maintaining the required engine idle speed when the pressure rises in the power steering system.

The power steering pressure switch is mounted directly to the power steering gear (Fig. 20).

OPERATION

The pressure switch functions by signaling the powertrain control module that the power steering system is putting additional load on the engine. This type of condition exists when turning the front tires of the vehicle when the vehicle is stationary and the engine is at idle speed. When this condition is sensed by the power train control module, through a signal from the power steering pressure switch, engine idle speed will be maintained. The maintained engine idle speed compensates for the additional load, thus maintaining the require engine idle speed and idle quality.

POWER STEERING PRESSURE SWITCH (Continued)

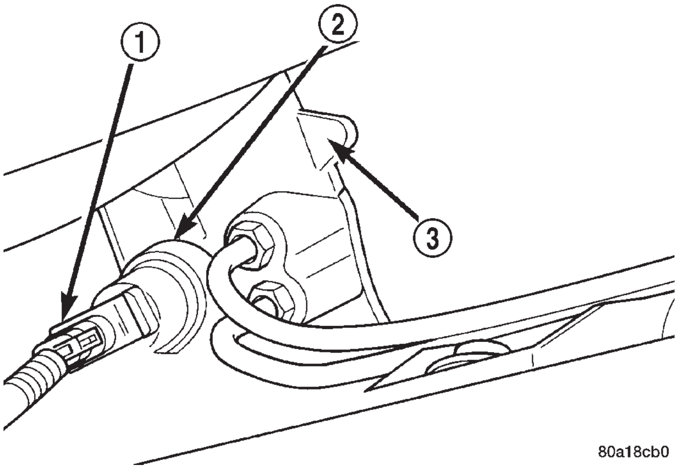

Fig. 20 Power Steering Pressure Switch Location

1 - WIRING HARNESS CONNECTOR
2 - POWER STEERING PRESSURE SWITCH
3 - POWER STEERING GEAR

REMOVAL

(1) Disconnect the negative cable from the battery. Be sure cable is isolated from negative post on battery.

(2) Raise vehicle.

(3) Locate power steering pressure switch on back side of power steering gear (Fig. 20).

(4) Remove the wiring harness connector from the power steering pressure switch.

(5) Using a crow foot and long extension, remove power steering pressure switch, from power steering gear.

INSTALLATION

CAUTION: When tightening the power steering pressure switch after installation in steering gear, do not exceed the torque specification shown in step 1 below. Over-tightening may result in stripping the threads out of the pressure switch port on the steering gear.

(1) Install power steering pressure switch into power steering gear by hand until fully seated. Then using a crow foot and extension, tighten power steering pressure switch to a torque of 16 N·m (12 ft. lbs.).

(2) Install wiring harness connector on power steering pressure switch (Fig. 20). Be sure latch on wiring harness connector is fully engaged with locking tab on power steering pressure switch.

(3) Fill power steering reservoir to correct fluid level.

(4) Connect negative cable back on negative post of battery.

(5) Start engine and turn steering wheel several times from stop to stop to bleed air from fluid in system. Stop engine, check fluid level, and inspect system for leaks.

PUMP

TABLE OF CONTENTS

PUMP

DESCRIPTION

All vehicles are equipped with power steering. The hydraulic pressure for operation of the power steering gear is provided by a belt driven power steering pump (Fig. 1) (Fig. 2). The pump is a constant flow rate and displacement vane type power steering pump.

The power steering pump is mounted on the back side of the engine, above the front suspension crossmember.

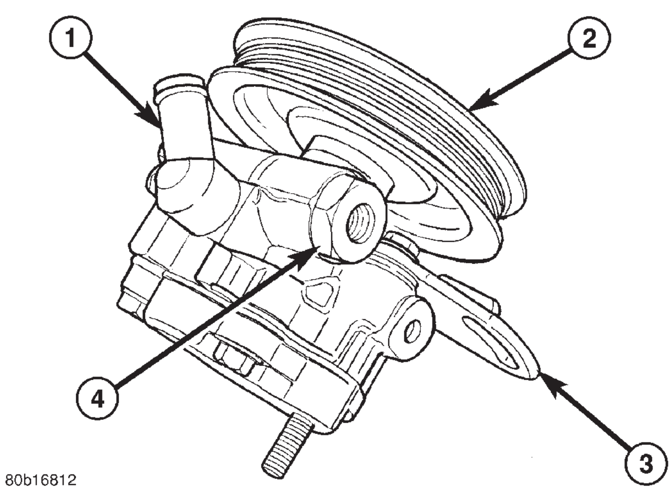

Fig. 1 POWER STEERING PUMP - 2.4L ENGINE

5 - SUPPLY FITTING
6 - PULLEY

The power steering pump uses a remote mounted reservoir for storage of the power steering fluid.

Because of unique shaft bearings, flow control levels or pump displacements, power steering pumps may be used only on specific vehicle applications. Be sure that the power steering pump is only replaced with a pump that is the correct replacement for that specific application.

PUMP (Continued)

OPERATION

Hydraulic pressure is provided for operation of the power steering gear by the belt driven power steering pump. The power steering pump is connected to the steering gear by a power steering fluid pressure hose, return hose, power steering fluid cooler and remote power steering fluid reservoir.

Rectangular pumping vanes in the shaft driven rotor move power steering fluid from the intake to the cam ring pressure cavities of the power steering pump. As the rotor begins to turn, centrifugal force throws the vanes against the inside surface of the cam ring to pick up residual oil. This oil is then forced into the high pressure area. As more oil is picked up by the vanes, the additional oil is forced into the cavities of the thrust plate through two crossover holes in the cam ring and pressure plate. The crossover holes empty into the high pressure area between the pressure plate and the housing end cover.

As the high pressure area is filled, oil flows under the vanes in the rotor slots, forcing the vanes to follow the inside surface of the cam ring. As the vanes reach the restricted area of the cam ring, oil is forced out from between the vanes. When excess oil flow is generated during high-speed operation, a regulated amount of oil returns to the pump intake side through a flow control valve. The flow control valve reduces the power required to drive the pump and holds down temperature build-up.

When steering conditions exceed maximum pressure requirements, such as when the wheels are turned against the stops, the pressure built up in the steering gear exerts pressure on the spring end of the flow control valve inside the pump. The high pressure lifts the relief valve ball from its seat and allows oil to flow through a trigger orifice located in the outlet fitting. This reduces pressure on the spring end of the flow control valve which then opens and allows the oil to return to the intake side of the pump. This action limits maximum pressure output of the power steering pump.

Under normal power steering pump operating conditions, pressure requirements of the pump are below maximum, causing the pressure relief valve to remain closed.

In the event of a power steering pump drive belt failure, manual steering control of the vehicle can still be maintained without pump assistance. However, under these conditions, steering effort will be significantly increased.

STANDARD PROCEDURE - POWER STEERING PUMP INITIAL OPERATION

CAUTION: The fluid level should be checked with engine off to prevent injury from moving components. Use only Mopar® ATF+4 Automatic Transmission Fluid (MS-9602). Do not overfill.

(1) Wipe the reservoir fill cap clean before removal.

(2) Fill the pump fluid reservoir to the proper level. The fluid level should be within the “FILL RANGE” listed on the exterior of the reservoir when the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F).

(3) Let the fluid settle in the system for at least two (2) minutes.

(4) Start the engine and let run for a few seconds. Then turn the engine off.

(5) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

(6) Raise the front wheels off the ground.

(7) Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.

(8) Add power steering fluid if necessary.

(9) Lower the vehicle and turn the steering wheel slowly from lock to lock.

(10) Stop the engine. Check the fluid level and refill as required.

(11) If the fluid is extremely foamy, allow the vehicle to stabilize a few minutes, then repeat the above procedure.

REMOVAL

REMOVAL - PUMP (2.0L/2.4L ENGINE)

WARNING: POWER STEERING FLUID, ENGINE COMPONENTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES, OR ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

(1) Remove battery cable from negative (-) post on battery and isolate cable.

(2) Siphon as much power steering fluid as possible out of the remote power steering fluid reservoir.

(3) Remove the clamp, then fluid supply hose from fitting on pump. Install a cap on fitting.

(4) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(5) Remove the accessory drive splash shield.

PUMP (Continued)

(6) Remove power steering fluid pressure hose from pressure fitting on power steering pump (Fig. 3). Let power steering fluid drain out of system. **After power steering fluid has drained out of pump and hose, install a cap on the power steering pressure hose and a plug in the power steering pump pressure fitting.**

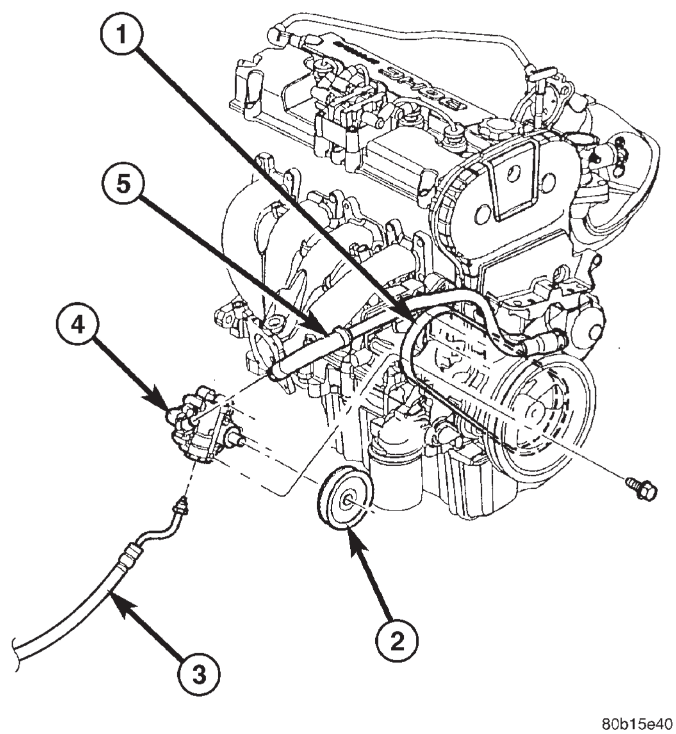

Fig. 3 PUMP MOUNTING TO ENGINE

1 - DRIVE BELT
2 - PULLEY
3 - PRESSURE HOSE
4 - POWER STEERING PUMP
5 - SUPPLY HOSE

(7) Remove bolt at adjustment slot in pump front mounting bracket.

(8) Remove nut at adjustment slot in cast aluminum mounting bracket at rear of pump.

(9) Loosen pump upper pivot bolt.

(10) Remove pump drive belt.

(11) Remove pump upper pivot bolt.

(12) Remove power steering pump and its front mounting bracket as an assembly from the engine through opening above right drive shaft and below right frame rail.

(13) To remove the pulley or bracket, (Refer to 19 - STEERING/PUMP - DISASSEMBLY).

REMOVAL - PUMP (2.7L ENGINE)

WARNING: POWER STEERING FLUID, ENGINE COMPONENTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES, OR ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

(1) Remove battery cable from (-) negative post on battery and isolate cable.

(2) Siphon as much power steering fluid as possible out of the remote power steering fluid reservoir.

(3) Remove the power steering fluid supply hose from the power steering pump supply fitting (Fig. 4).

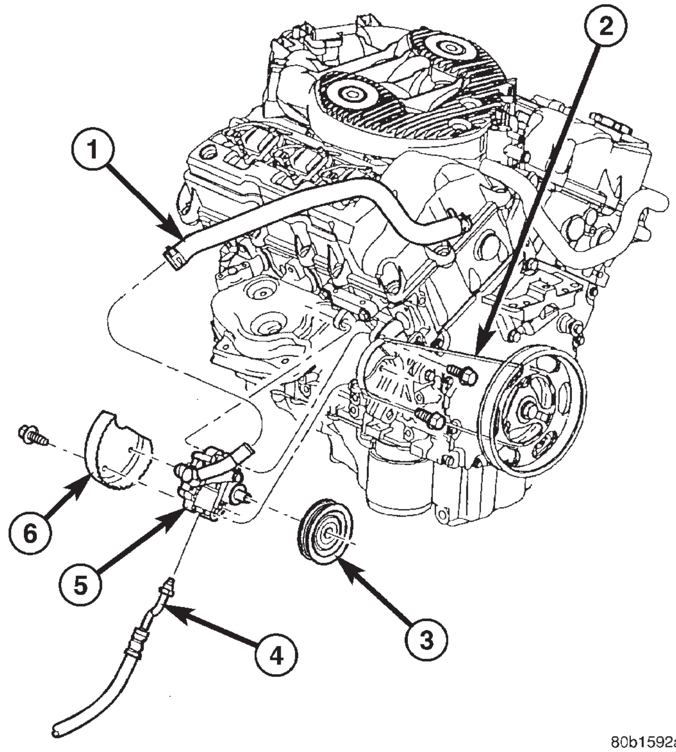

Fig. 4 PUMP MOUNTING TO ENGINE (2.7L)

1 - SUPPLY HOSE
2 - DRIVE BELT
3 - PULLEY
4 - PRESSURE HOSE
5 - POWER STEERING PUMP
6 - HEAT SHIELD

(4) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(5) Remove accessory drive splash shield.

(6) Remove power steering fluid pressure hose from fitting on power steering pump (Fig. 4).

(7) Remove oxygen sensor harness and clip from edge of pump heat shield.

PUMP (Continued)

(8) Completely remove bolt at slot in stamped pump adjuster bracket (Fig. 5) and remove power steering drive belt.

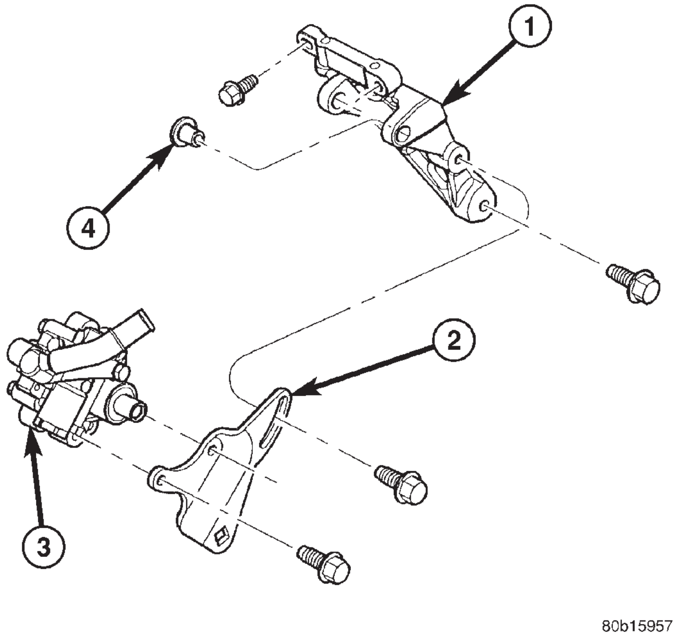

Fig. 5 PUMP BRACKET MOUNTING - 2.7L ENGINE

1 - CAST PUMP MOUNTING BRACKET
2 - STAMPED PUMP ADJUSTER BRACKET
3 - POWER STEERING PUMP
4 - PIVOT BUSHING

(9) Pivot pump out past full-adjust position. This will allow access to two pump bracket-to-engine mounting bolts.

(10) Remove the three bolts fastening the cast power steering pump bracket to the engine (Fig. 5).

(11) Remove power steering pump, pulley and brackets as an assembly from the engine. Remove the pump through opening between frame rail and right driveshaft.

(12) Remove stamped adjuster bracket mounting bolts. Remove bracket from pump.

(13) Remove two pivot bolts. Remove cast mounting bracket from pump.

(14) For removal of pulley, (Refer to 19 - STEERING/PUMP - DISASSEMBLY).

DISASSEMBLY - PUMP (PULLEY)

(1) Remove power steering pump from engine. (Refer to 19 - STEERING/PUMP - REMOVAL)

CAUTION: Do not hammer on power steering pump pulley or shaft to remove power steering pump pulley. This will damage the pulley and the power steering pump.

(2) Mount Puller, Special Tool C-4333, on power steering pump pulley. Mount puller (with power steering pump) in a vise (Fig. 6). This will keep shaft of power steering pump from turning while removing pulley.

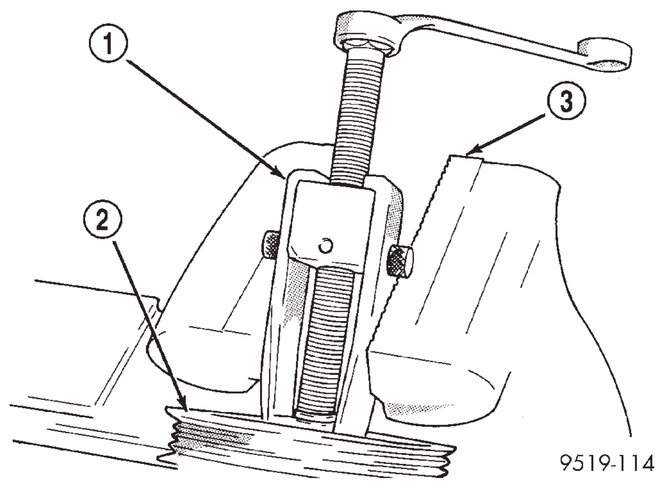

Fig. 6 Removing Pulley From Power Steering Pump Shaft

1 - SPECIAL TOOL C-4333
2 - POWER STEERING PUMP PULLEY
3 - VISE

(3) Tighten puller and remove pulley from shaft of power steering pump.

NOTE: Replace power steering pump pulley if bent, cracked, or loose.

PUMP (Continued)

ASSEMBLY - PUMP (PULLEY)

CAUTION: Do not hammer on power steering pump pulley or shaft to install power steering pump pulley. This will damage the pulley and the power steering pump.

(1) Place power steering pump pulley squarely on end of power steering pump shaft (Fig. 7).

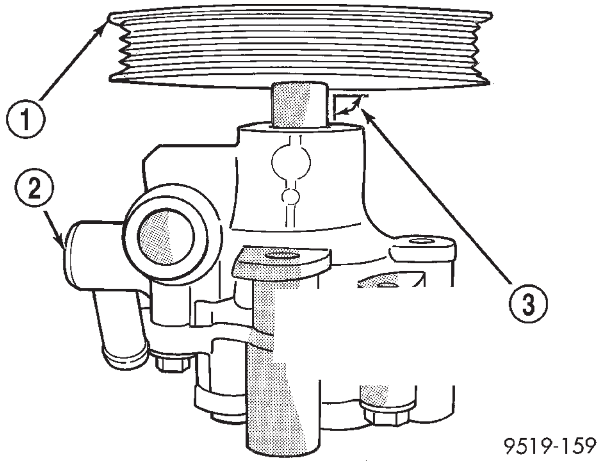

Fig. 7 Pulley Positioned On Shaft Of Power Steering Pump (Typical)

1 - POWER STEERING PUMP PULLEY
2 - POWER STEERING PUMP
3 - POWER STEERING PUMP PULLEY MUST BE STARTED SQUARELY ON SHAFT OF POWER STEERING PUMP AS SHOWN

(2) Place Installation Spacer (Fig. 8), Special Tool 6936, on top of the power steering pump pulley.

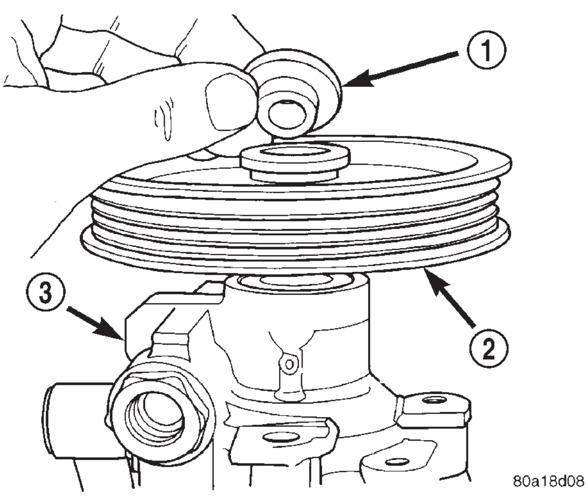

Fig. 8 Special Tool 6936 Installed On Pulley

1 - SPECIAL TOOL 6936
2 - POWER STEERING PUMP PULLEY
3 - POWER STEERING PUMP

(3) Mount Installer, Special Tool C-4063, in internal threads of the power steering pump shaft and against Special Tool 6936 on power steering pump pulley (Fig. 9).

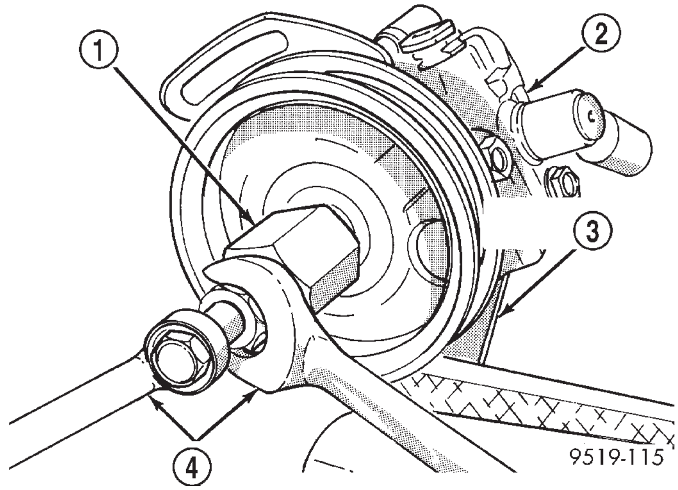

Fig. 9 Installing Pulley On Shaft Of Pump (Typical)

1 - SPECIAL TOOL C-4063
2 - POWER STEERING PUMP
3 - POWER STEERING PUMP BRACKET
4 - WRENCHES

(4) Ensuring that special tool and pulley remain aligned with pump shaft, force pulley onto power steering pump shaft until Special Tool 6936 is against the end of the power steering pump shaft. **When Special Tool 6936 is against the shaft of the power steering pump, Special Tool C-4063 will no longer be able to be turned.**

(5) Remove Installer from power steering pump.

(6) Install power steering pump and mounting bracket back on engine.(Refer to 19 - STEERING/ PUMP - INSTALLATION)

INSTALLATION

INSTALLATION - PUMP (2.0L/2.4L ENGINE)

WARNING: POWER STEERING FLUID, ENGINE COMPONENTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES, OR ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

(1) Install power steering pump and front mounting bracket as an assembly back in vehicle, using reverse order of removal.

(2) Install power steering pump and front bracket on the cast aluminum engine bracket. Loosely install the upper mounting pivot bolt.

PUMP (Continued)

(3) Loosely install the pump mounting bolt through the adjustment slot in the front mounting bracket.

(4) Loosely install the nut mounting the power steering pump to its rear mounting bracket adjustment slot.

(5) Install power steering pump drive belt on power steering pump pulley. Install a 1/2 in. breaker bar in the square adjusting hole in the front power steering pump mounting bracket and adjust belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - ADJUSTMENTS)

(6) When correct drive belt tension is obtained, first tighten the two adjusting slot fasteners (one bolt, one nut) to a torque of 54 N·m (40 ft. lbs.). Next, tighten the power steering pump mounting bracket top pivot bolt to a torque of 54 N·m (40 ft. lbs.).

(7) Using a lint free towel, wipe clean all open power steering hose ends, and power steering pump fittings.

(8) Install a new O-ring on end of power steering pressure hose fitting. Lubricate all O-rings using fresh clean power steering fluid.

(9) Install the power steering pressure hose on the power steering pump pressure fitting (Fig. 3). Tighten the tube nut to a torque of 31 N·m (275 in. lbs.).

(10) Install accessory drive splash shield.

(11) Lower vehicle.

(12) Install power steering fluid supply hose on power steering pump supply fitting. Install hose clamp. Be sure hose clamp is installed on hose past upset bead on suction fitting.

(13) Connect negative (-) cable back on negative post of battery.

(14) Fill power steering reservoir to correct fluid level and perform Power Steering Pump Initial Operation standard procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(15) Check for leaks at all hose connections and power steering pump.

INSTALLATION - PUMP (2.7L ENGINE)

(1) If previously removed, install cast mounting bracket on pump using two pivot bolts. Tighten the bolts to a torque of 28 N·m (250 in. lbs.).

(2) If previously removed, install stamped adjuster bracket on pump using its mounting bolts. Tighten the bolts to a torque of 28 N·m (250 in. lbs.).

(3) Install power steering pump, pulley and brackets as an assembly back in vehicle, using the reverse of the removal procedure.

(4) Install the three bolts fastening cast pump mounting bracket to engine (Fig. 5). Tighten the bolts to a torque of 28 N·m (250 in. lbs.).

(5) Loosely install bolt through the stamped adjuster bracket slot and into the cast bracket (Fig. 5).

(6) Using a lint free towel, wipe clean all open power steering hose ends, and power steering pump fittings.

(7) Install power steering pump drive belt on power steering pump pulley.

(8) Install a 1/2 inch breaker bar in the square adjusting hole in the front power steering pump mounting bracket and adjust the belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - ADJUSTMENTS)

(9) When correct drive belt tension is obtained, tighten the adjusting slot bolt to a torque of 28 N·m (250 in. lbs.).

(10) Install a new O-ring on end of power steering pressure hose fitting. Lubricate all O-rings using fresh clean power steering fluid.

(11) Install the power steering pressure hose on the power steering pump pressure fitting (Fig. 4). Tighten the tube nut to a torque of 31 N·m (275 in. lbs.).

(12) Install accessory drive splash shield.

(13) Lower vehicle.

(14) Install power steering fluid supply hose on power steering pump supply fitting (Fig. 4). Install hose clamp on hose. Be sure hose clamp is installed on hose past upset bead on power steering fluid reservoir.

(15) Connect battery cable back on negative (-) post of battery.

(16) Fill power steering reservoir to correct fluid level and perform Power Steering Pump Initial Operation standard procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(17) Check for leaks at all hose connections and power steering pump.

FLUID

STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT INJURY FROM MOVING PARTS.

The fluid level can be read through the exterior of the power steering fluid reservoir. The reservoir exterior is marked “FILL RANGE” and “ADD.” The fluid shows through the reservoir indicating its level. The fluid level should be within the “FILL RANGE” when the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F).

FLUID (Continued)

Before removing the power steering filler cap, wipe the reservoir filler cap free of dirt and debris. Remove the cap and fill as necessary. Do not overfill the power steering system. **Use only Mopar® ATF+4 Automatic Transmission Fluid (MS-9602).**

HOSES

DESCRIPTION

The power steering fluid hoses connect the components of the power steering system (Fig. 10).

The power steering fluid supply hose is a special rubber hose that connects the power steering fluid reservoir to the power steering pump. The hose is secured at each end using a standard adjustable clamp.

The power steering fluid pressure hose is a high pressure hose that connects the power steering pump to the gear. At both ends of the flexible hose portion are steel fittings that are pressure crimped to the flexible hose. A standard tube nut fitting with an O-ring is used at each end to connect it to either the power steering pump or the gear.

The power steering fluid return hose is a special rubber hose that connects the power steering gear to the fluid reservoir. It has a special metal tubing section that acts as cooler running in front of the radiator module. A standard tube nut fitting with an O-ring is used to connect it to the power steering gear. The hose is secured to the reservoir using a standard adjustable clamp.

OPERATION

The power steering fluid hoses transfer fluid from one power steering system component to the next.

HOSES (Continued)

REMOVAL - RETURN HOSE

WARNING: POWER STEERING FLUID, ENGINE PARTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES. DO NOT ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

NOTE: Cap all open ends of hoses, power steering pump fittings and steering gear ports to prevent the entry of foreign material into the components.

The return hose can be serviced as two separate pieces. They are the Return Hose With Tube and the Return Hose To Reservoir.

RETURN HOSE WITH TUBE

(1) Siphon power steering fluid from power steering fluid reservoir.

(2) Remove vehicles front fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)

(3) If not previously lifted, raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove left front wheel and tire assembly.

(5) Remove wheel opening forward splash shield.

(6) Remove power steering fluid pressure hose, then return hose from power steering gear.

(7) Remove air shield below left end of bumper reinforcement.

(8) Remove clamp and return hose (to reservoir) from right end of return hose tube below the bumper reinforcement (Fig. 10).

(9) Remove tube mounting clips from bumper reinforcement (Fig. 10).

(10) Remove the return hose tube from routing clips along left frame rail.

(11) Move the steering gear end of return hose tube to outside of frame rail.

(12) Pull return hose with tube forward, snaking it between ABS ICU and frame rail. Remove return hose from vehicle.

RETURN HOSE TO RESERVOIR

(1) Siphon power steering fluid from power steering fluid reservoir.

(2) Remove screw fastening power steering fluid reservoir to engine coolant recovery bottle.

(3) Lift reservoir off guide on engine coolant recovery bottle.

(4) Remove hose clamp attaching power steering fluid return hose to reservoir.

(5) Remove power steering fluid return hose from reservoir.

(6) Remove vehicles front fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)

(7) If not previously lifted, raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(8) Remove clamp and return hose (to reservoir) from right end of return hose tube below the bumper reinforcement (Fig. 10).

(9) Remove the return hose from routing clip on inside of right frame rail (Fig. 10).

(10) Remove power steering fluid return hose.

INSTALLATION - RETURN HOSE

WARNING: POWER STEERING FLUID, ENGINE PARTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES. DO NOT ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

NOTE: Cap all open ends of hoses, power steering pump fittings and steering gear ports to prevent the entry of foreign material into the components.

The return hose can be serviced as two separate pieces. They are the Return Hose With Tube and the Return Hose To Reservoir.

RETURN HOSE WITH TUBE

(1) Install hose with tube in vehicle using the reverse of removal. Guide return hose with tube rearward, snaking it between ABS ICU and frame rail.

(2) Install the return hose tube into the routing clips along left frame rail.

(3) Install tube along bottom of bumper reinforcement using routing clips (Fig. 10).

(4) Install return hose (to reservoir) on right end of return hose tube below the bumper reinforcement (Fig. 10). Install clamp securing hose in place.

(5) Install air shield below left end of bumper reinforcement.

(6) Using a lint free towel, wipe clean open power steering hose ends and power steering gear port.

(7) Install new O-rings on the power steering hose ends to the steering gear.

(8) Lubricate O-rings using fresh clean power steering fluid.

(9) Install power steering fluid return hose to power steering gear. Tighten tube nut to 31 N·m (275 In. lbs.).

(10) Install power steering fluid pressure hose to power steering gear. Tighten tube nut to 31 N·m (275 In. lbs.).

(11) Install wheel opening forward splash shield.

HOSES (Continued)

(12) Install front fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)

(13) Install left front wheel and tire assembly. Progressively tighten all wheel lug nuts using a criss-cross pattern to 135 N·m (100 ft. lbs.) torque.

(14) Lower vehicle.

(15) Fill reservoir with fluid and bleed system using Power Steering Pump Initial Operation standard procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(16) Check for leaks.

RETURN HOSE TO RESERVOIR

(1) Install return hose into routing clip on inside of right frame rail (Fig. 10).

(2) Install return hose (to reservoir) on right end of return hose tube below the bumper reinforcement (Fig. 10). Install clamp securing hose in place.

(3) Install front fascia. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)

(4) Lower vehicle.

(5) Install power steering fluid return hose on power steering fluid reservoir fitting. **Be sure hose clamp is installed on hose past upset bead on power steering reservoir fitting.**

(6) Slide reservoir down over guide on engine coolant recovery bottle.

(7) Install power steering fluid reservoir mounting screw.

(8) Fill reservoir with fluid and bleed system using Power Steering Pump Initial Operation standard procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(9) Check for leaks.

RESERVOIR

DESCRIPTION

All vehicles use a remote mounted power steering fluid reservoir. The reservoir is mounted to the engine coolant recovery bottle on the right side of the engine compartment (Fig. 10). Coolant level is read through the side of the bottle.

OPERATION

The power steering fluid reservoir stores fluid for the power steering system.

REMOVAL

(1) Using a siphon pump, remove as much power steering fluid as possible from the power steering fluid reservoir.

(2) Remove screw fastening reservoir to engine coolant recovery bottle (Fig. 10).

(3) Lift reservoir off guide on engine coolant recovery bottle.

(4) Remove hose clamps attaching power steering fluid supply hose and return hose to reservoir.

(5) Remove power steering fluid supply and return hoses from reservoir and remove reservoir from vehicle.

INSTALLATION

(1) Install power steering fluid return and supply hoses on power steering fluid reservoir fittings (Fig. 10). **Be sure both hose clamps are installed on hose past upset bead on power steering reservoir fittings.**

(2) Slide reservoir down over guide on engine coolant recovery bottle.

(3) Install power steering fluid reservoir mounting screw and tighten to 6 N·m (53 in. lbs.).

(4) Fill power steering pump fluid reservoir to the proper level.

(5) Start the engine and let run for a few seconds, then turn the engine off.

(6) Adjust fluid level if necessary. Repeat steps (5) and (6) until the fluid level remains constant after running the engine. If necessary perform Power Steering Pump Initial Operation standard procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(7) Check for leaks.

TRANSMISSION/TRANSAXLE

TABLE OF CONTENTS

T350 MANUAL TRANSAXLE

TABLE OF CONTENTS

T350 MANUAL TRANSAXLE

DESCRIPTION

This five speed is a constant-mesh manual transaxle. All gear ranges, except reverse, are synchronized. The reverse gear utilizes a brake and blocking ring for shifting ease. The reverse idler gear is supported on a sliding spindle idler shaft. The transaxle case is aluminum with a steel end–plate bearing cover. It is housed in a die-cast aluminum case featuring a two–piece, middle split design (Fig. 1).

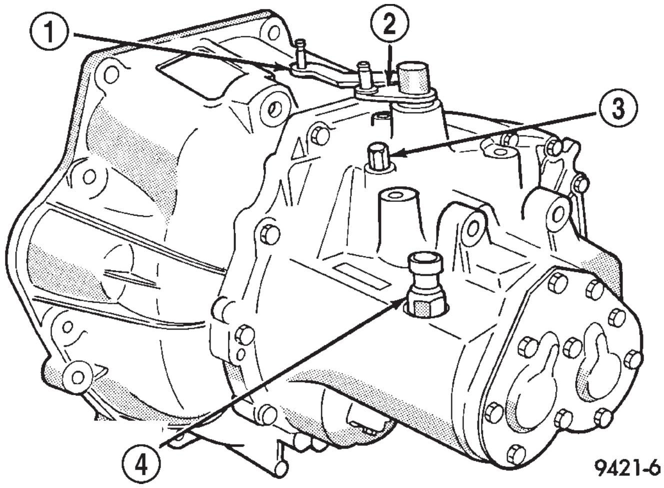

Fig. 1 T350 Manual Transaxle

1 - SHIFT LEVER
2 - CROSSOVER LEVER
3 - VENT
4 - REVERSE LAMP SWITCH

The T350 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

TRANSAXLE IDENTIFICATION

The transaxle model, assembly number, and build date are on a metal I.D. tag that is attached to the end cover of the transaxle (Fig. 2). This information is also shown on a bar code label that is attached to the front of the transaxle (Fig. 3).

NOTE: Transaxles use various final drive gear ratios in different vehicle applications. Therefore, it is necessary that the correct transaxle assembly number is used when ordering service parts.

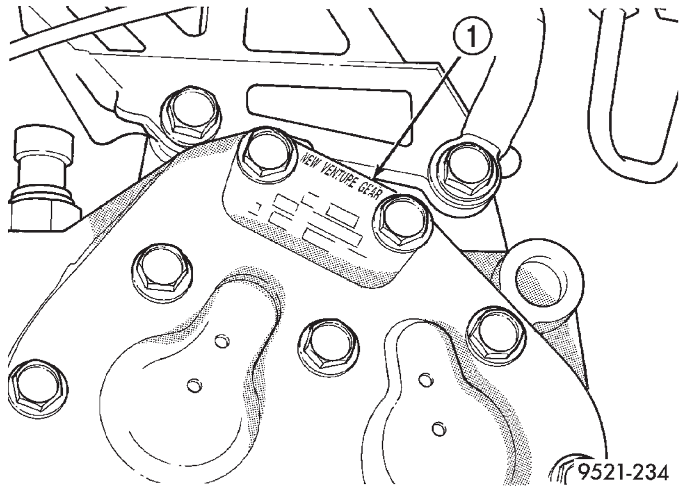

Fig. 2 Metal I.D. Tag

1 - METAL I.D. TAG

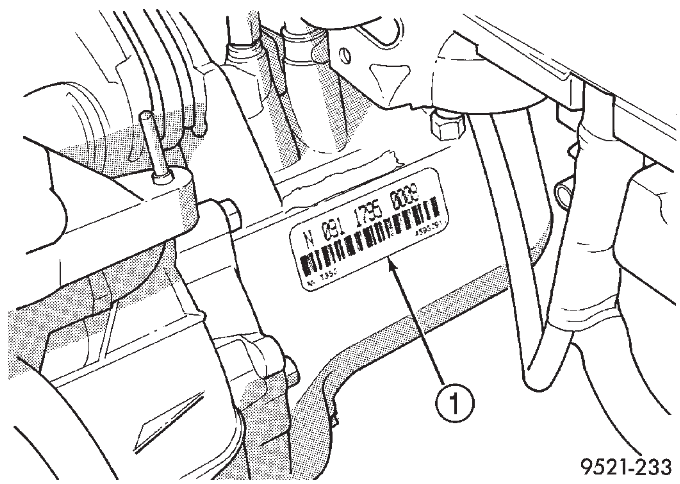

Fig. 3 Bar Code Label

1 - BAR CODE LABEL

GEAR RATIOS

CAUTION: All gears and shafts must not be interchanged with other transaxles; they will not function correctly.

The differential is a conventional arrangement of gears that is supported by tapered roller bearings. The final output gear turns the ring gear and differential assembly, thereby turning the drive axle shafts.

The gear ratios of each transaxle are shown in the following chart. The chart also shows which transaxles are available with the reverse–input shaft brake. This brake allows easier shifting into reverse and helps eliminate reverse gear clash.

T350 MANUAL TRANSAXLE (Continued)

GEAR	
1st	3.50
2nd	1.95
3rd	1.36
4th	0.97
5th	0.81
FINAL DRIVE RATIO	3.94
REVERSE BRAKE	YES
CLUTCH RELEASE SYSTEM	CABLE

GEARSHIFT PATTERN

The T350 transaxle shift pattern is a modified H–pattern (Fig. 4). Overdrive fifth and reverse gears are in–line and outboard of the first through fourth gear positions.

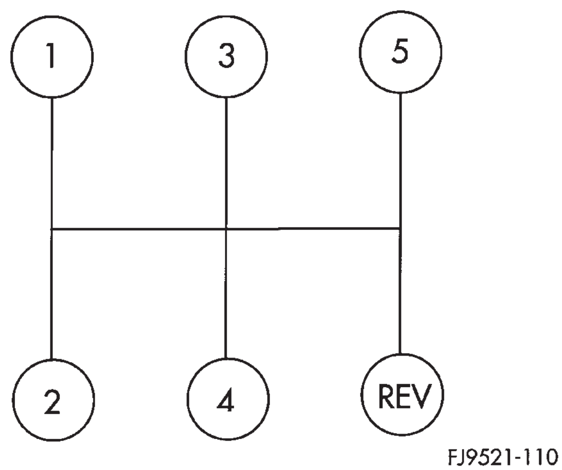

Fig. 4 T350 Transaxle Shift Pattern

LUBRICANT/ADDITIVES

T350 transaxles use Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602).**Hypoid gear lube or engine oil should not be used in this transaxle.** Hard shifting effort, bearing, gear, and/or synchronizer failure may occur if incorrect fluid is used.

The addition of any fluids to the transaxle, other than the fluid listed above, is not recommended. An exception to this policy is the use of special dyes to aid in detecting fluid leaks. The use of transmission sealers should be avoided, since they may adversely affect seals.

SEALANTS

The sealant used to seal the transaxle case halves and input bearing is Mopar® Gasket Maker, Loctite® 518, or equivalent. The sealant used for the bearing end plate cover is Mopar® RTV.

DIAGNOSIS AND TESTING - COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Misassembled or damaged internal components
- Improper operation

HARD SHIFTING

Hard shifting may be caused by a misadjusted crossover cable. If hard shifting is accompanied by gear clash, synchronizer clutch and stop rings or gear teeth may be worn or damaged.

Misassembled synchronizer components also cause shifting problems. Incorrectly installed synchronizer sleeves, struts, or springs can cause shift problems.

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

SLIPS OUT OF GEAR

Transaxle disengagement may be caused by misaligned or damaged shift components, or worn teeth on the drive gears or synchronizer components. Incorrect assembly also causes gear disengagement.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air–powered lubrication equipment is used to fill a transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an underfill condition.

CLUTCH PROBLEMS

Worn, damaged, or misaligned clutch components can cause difficult shifting, gear clash, and noise.

A worn or damaged clutch disc, pressure plate, or release bearing can cause hard shifting and gear clash.

REMOVAL

(1) Raise hood.
(2) Disconnect battery negative cable.
(3) Remove air cleaner assembly.

T350 MANUAL TRANSAXLE (Continued)

(4) Disconnect Vehicle Speed Sensor/Back-up Lamp Switch harness connector.

(5) Remove clutch release access cap.

(6) Disconnect clutch release cable.

(7) Disconnect crossover and selector cables from transaxle.

(8) Remove gearshift cable retainer clips from bracket and position gearshift cables out of way.

(9) Remove starter motor and secure out of way.

(10) Remove three (3) rear mount bracket-to-transaxle bolts.

(11) Raise vehicle on hoist.

(12) Remove halfshafts.

(13) Remove rear mount bracket-to-transaxle horizontal bolt.

(14) Remove rear mount through-bolt.

(15) Remove three (3) rear mount-to-crossmember bolts.

(16) Remove rear mount and bracket.

(17) Remove front mount through bolt.

(18) Remove engine front pencil strut brace.

(19) Remove front mount bracket from engine/transaxle.

(20) Remove structural collar.

(21) Remove bellhousing dust cover.

(22) Remove left wheel opening splash shield.

(23) Remove modular clutch-to-drive plate bolts.

(24) Position screw jack and wood block to oil pan.

(25) Remove transaxle upper mount through bolt.

(26) Lower engine transaxle assembly.

(27) Remove transaxle upper mount.

(28) Obtain helper and transmission jack.

(29) Remove transaxle-to-engine block bolts.

(30) Remove transaxle from engine.

DISASSEMBLY

The T350 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

(1) Place transaxle on bench.

(2) Remove the clutch release bearing and fork. Move the release fork and bearing to an in-line position. Grasp the release lever with two hands in the pivot stud socket area. Pull with even pressure to release the fork from the pivot stud.

CAUTION: Do not use a screwdriver or pry bar to release the fork as this may cause damage to the fork and/or clip.

(3) Remove shift levers by driving out the roll pins.

(4) Remove transaxle case half bolts (Fig. 5).

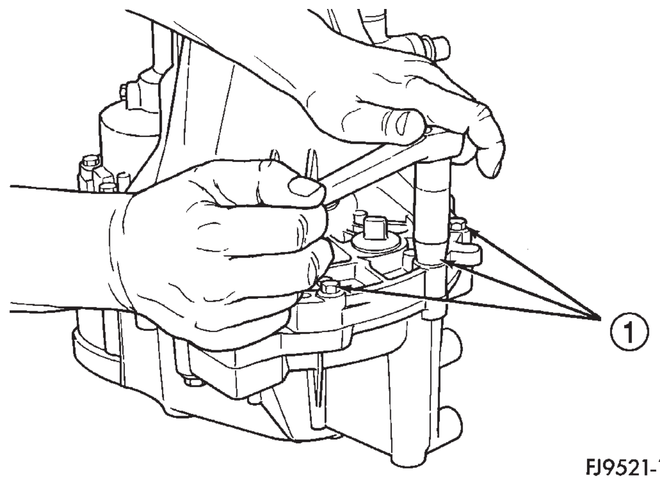

Fig. 5 Case Bolts

1 - CASE BOLTS

(5) Place two screwdrivers into the slots provided in the case halves near the dowels (Fig. 6). Separate the case halves (Fig. 7).

(23) Remove the shift blocker assembly from the bench fixture (Fig. 30).

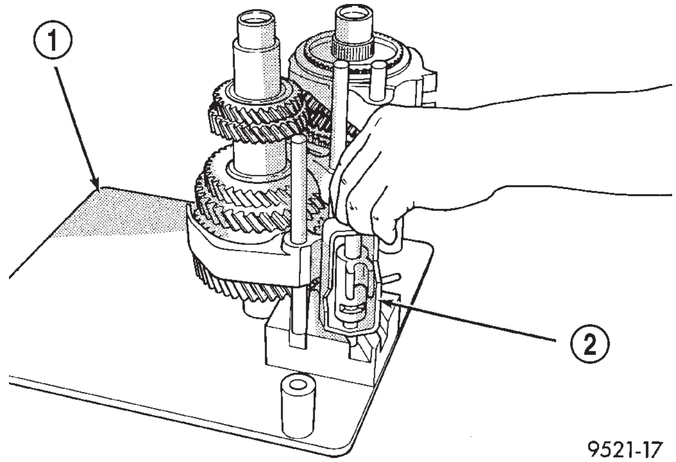

Fig. 30 Shift Blocker Removal

1 - 6785 BENCH FIXTURE
2 - SHIFT BLOCKER ASSEMBLY

(24) Remove the 1-2 shift fork from the output shaft (Fig. 31).

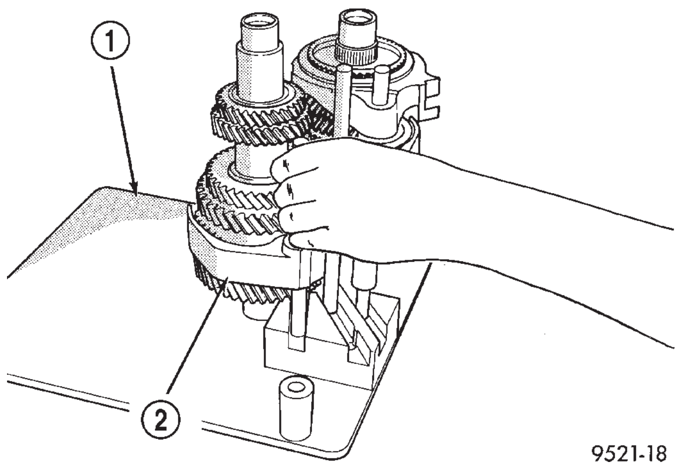

Fig. 31 1–2 Shift Fork Removal

1 - 6785 BENCH FIXTURE
2 - 1–2 SHIFT FORK

T350 MANUAL TRANSAXLE (Continued)

(25) Remove input and output shaft assemblies from bench fixture (Fig. 32).

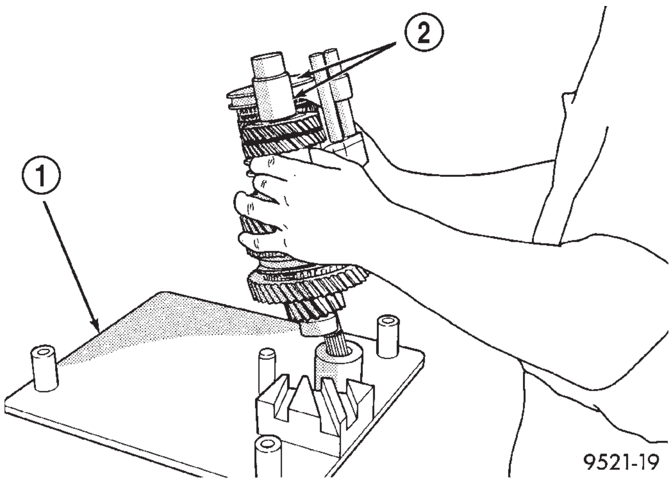

Fig. 32 Gear Train Removal

1 - 6785 BENCH FIXTURE
2 - INPUT AND OUTPUT SHAFTS

CAUTION: The output shaft assembly is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the complete output shaft assembly.

CLEANING

Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bellhousing with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

Inspect the gears, bearings, shafts and thrust washers. Replace the bearings and cups if the rollers are worn, chipped, cracked, flat spotted, or brinnelled, or if the bearing cage is damaged or distorted. Replace the thrust washers if cracked, chipped, or worn. Replace the gears if the teeth are chipped, cracked, or worn thin. Inspect the synchronizers. Replace the sleeve if worn or damaged in any way. Replace the stop rings if the friction material is burned, flaking off, or worn. Check the condition of the synchro keys and springs. Replace these parts if worn, cracked, or distorted.

ASSEMBLY

The T350 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

The sealant used to seal the transaxle case halves is Mopar® Gasket Maker, Loctite® 518, or equivalent. The sealant used for the bearing end plate cover is Mopar® RTV.

(1) Verify bench fixture shims are removed from bench fixture. Install output and input shafts into bench fixture (Miller tool #6785) (Fig. 33).

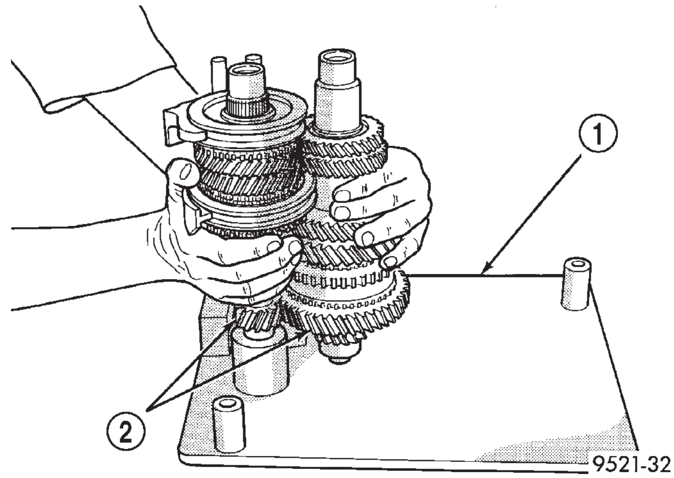

Fig. 33 Bench Fixture

BEARING ADJUSTMENT PROCEDURE

(1) Use extreme care when removing and installing bearing cups and cones. Use only an arbor press for installation, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat gives a false end–play reading while gauging for proper shims. Improperly seated bearing cups and cones are subject to low–mileage failure.

(2) Bearing cups and cones should be replaced if they show signs of pitting or heat distress. If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.

(3) Bearing preload and drag torque specifications must be maintained to avoid premature bearing failures. Used (original) bearings may lose up to 50% of the original drag torque after break–in. All bearing adjustments must be made with no other component interference or gear intermesh.

(4) Replace bearings as a pair: If one differential bearing is defective, replace both differential bearings, if one input shaft bearing is defective, replace both input shaft bearings.

(5) Bearing cones must not be reused if removed.

(6) Turning–torque readings should be obtained while smoothly rotating in either direction.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT

NOTE: True bearing turning–torque readings can be obtained only with the geartrain removed from the case.

(1) Remove bearing cup and existing shim from clutch bellhousing case.

(2) Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).

(3) Press in new bearing cup into gear case side.

(4) Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and torque case bolts to 29 N·m (21 ft. lbs.).

(5) Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator.

NOTE: Position of dial indicator in (Fig. 53) is for illustrative purposes only. The dial indicator should be parallel to T-Handle to obtain the most accurate reading.

(6) Apply a medium load to differential with Tool C-4995 and a T-handle, in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator. To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth (Fig. 53). Record end play.

(7) The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18mm (0.007 in.).** Never combine shims to obtain the required preload.

T350 MANUAL TRANSAXLE (Continued)

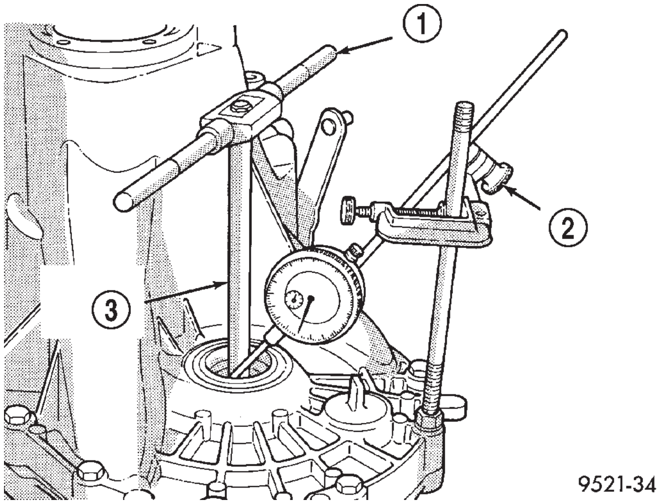

Fig. 53 Checking Differential Bearing End Play To Determine Shim Thickness

1 - T-HANDLE
2 - DIAL INDICATOR SET
3 - SPECIAL TOOL C-4995

(8) Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected in Step 7. Then press the bearing cup into clutch bellhousing.

(9) Install clutch bellhousing. Install and torque case bolts to 26 N·m (19 ft. lbs.).

(10) Using Special Tool C-4995 and an inch-pound torque wrench, check turning torque of the differential assembly (Fig. 54). **The turning torque should be 6 to 12 in. lbs. If the turning torque is too high, install a 0.05mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thicker shim.**

(11) Recheck turning torque. Repeat Step 10 until the proper turning torque is obtained.

Once proper turning torque has been established, place gear case on the end plate. Draw a bead of Mopar® Gasket Maker, Loctite® 518, or equivalent, on the flat surface of the case mating flange. Install clutch bellhousing onto gear case. Install and tighten case bolts to 29 N·m (21 ft. lbs.).

INSTALLATION

(1) Install modular clutch assembly to transaxle input shaft.

(2) Using a helper and transmission jack, install transaxle to engine.

(3) Install and torque transaxle-to-engine bolts to 95 N·m (70 ft. lbs.).

(4) Install transaxle upper mount bracket and torque bolts to 65 N·m (48 ft. lbs.).

(5) Raise engine/transaxle assembly into position with screw jack.

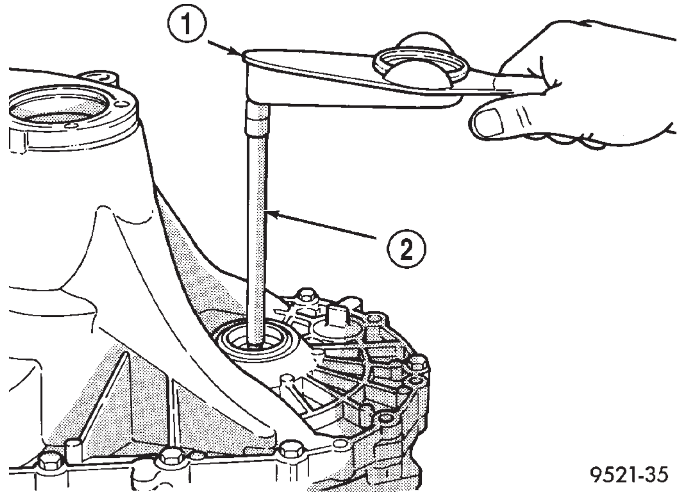

Fig. 54 Checking Differential Bearing Turning Torque

1 - INCH-POUND TORQUE WRENCH
2 - SPECIAL TOOL C-4995

(6) Install and torque transaxle upper mount-to-bracket bolts to 61 N·m (45 ft. lbs.).

(7) Remove screw jack and wood block.

(8) Install modular clutch-to-drive plate bolts and torque to 75 N·m (55 ft. lbs.).

(9) Install bellhousing dust cover.

(10) Install structural collar.

(11) Install left wheel house splash shield.

(12) Install front mount and bracket.

(13) Install rear mount to crossmember.

(14) Install rear mount bracket into position and loosely install horizontal bolt.

(15) Install halfshafts.

(16) Lower vehicle.

(17) Install three (3) rear mount bracket-to-transaxle and torque to 110 N·m (80 ft. lbs.).

(18) Raise vehicle.

(19) Torque rear mount bracket-to-transaxle horizontal bolt to 110 N·m (80 ft. lbs.).

(20) Install rear mount through-bolt and torque to 61 N·m (45 ft. lbs.).

(21) Install starter motor.

(22) Install gearshift cables to bracket and install new retaining clips.

(23) Connect gearshift crossover and selector cable to crossover and selector levers.

(24) Install clutch release cable to release lever and case. Install cap.

(25) Connect Vehicle Speed Sensor and Back-up Lamp Switch harness.

(26) Install air cleaner assembly.

(27) Connect battery negative cables.

(28) Fill transaxle with suitable amount of fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/FLUID - STANDARD PROCEDURE)

BACK-UP LAMP SWITCH

REMOVAL

(1) Lift vehicle on hoist.

(2) From bottom side of vehicle, disconnect back-up lamp switch connector (Fig. 55).

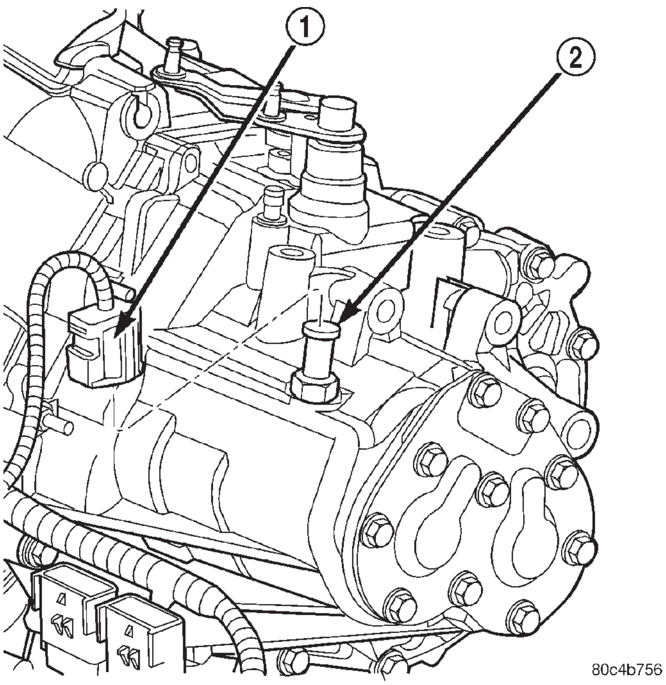

Fig. 55 BACK-UP LAMP SWITCH

1 - CONNECTOR
2 - BACK UP LAMP SWITCH

(3) Unscrew switch from transaxle.

INSTALLATION

(1) Install back-up lamp switch. Teflon tape or equivalent must be used on switch threads. Tighten switch to 24 N·m (18 ft. lbs.) torque.

CAUTION: Do not overtighten switch.

(2) Connect back-up lamp switch connector (Fig. 55) .

(3) Lower vehicle.

(4) Verify back-up lamp operation.

DIFFERENTIAL

DISASSEMBLY

(1) Remove differential bearing cones (ring gear and diff. case side) using Tool C-293-PA, Adapters C-293-45, and Tool 4996 (Fig. 56) (Fig. 57).

Measure and Adjust Side Gear End-Play

(1) Rotate the assembly two full revolutions both clockwise and counterclockwise.Set up dial indicator as shown and record end play (Fig. 74) (Fig. 75). Rotate side gear 90 degrees and take another measurement. Again, rotate side gear 90 degrees and record a final measurement.

(2) Using the smallest end play recorded, shim that side gear to within 0.001 to 0.013 inch. The other side gear should be checked using the same procedure.

CAUTION: Side gear end play must be within 0.001 to 0.013 inch. Five select thrust washers are available: 0.027, 0.032, 0.037, 0.042, and 0.047 inch.

ADJUSTMENTS

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT / SHIM SELECTION

Measure and adjust differential side bearing preload during any transaxle service, especially when the following components are replaced:

- Transaxle gear case
- Clutch bellhousing case
- Differential case
- Differential bearings

DIFFERENTIAL (Continued)

NOTE: True bearing turning torque readings can be obtained only with the geartrain removed from the case.

(1) Remove bearing cup and existing shim from clutch bellhousing case.

(2) Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).

(3) Press in new bearing cup into gear case side.

(4) Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and torque case bolts to 29 N·m (21 ft. lbs.).

(5) Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator.

NOTE: Indicator is set up as shown for illustrative purposes only (Fig. 76). Indicator must be parallel to T-Handle to obtain the most accurate reading.

(6) Apply a medium load to differential with Tool C-4995 and a T-handle, in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator. To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth (Fig. 76). Record end play.

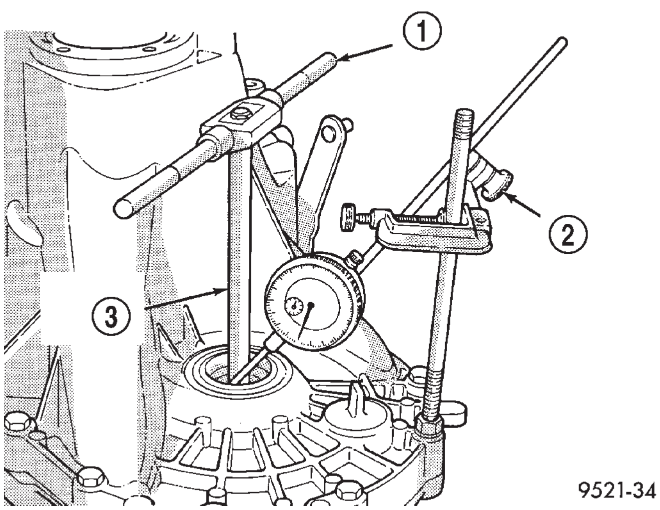

Fig. 76 Checking Differential Bearing End Play to Determine Shim Thickness

1 - T-HANDLE
2 - DIAL INDICATOR SET
3 - SPECIAL TOOL C-4995

(7) The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18 mm (0.007 in.).** Never combine shims to obtain the required preload.

(8) Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected in Step 7. Then press the bearing cup into clutch bellhousing.

(9) Install clutch bellhousing. Install and torque case bolts to 26 N·m (19 ft. lbs.).

(10) Using Special Tool C-4995 and an inch-pound torque wrench, check turning torque of the differential assembly (Fig. 77). **The turning torque should be 6 to 12 in. lbs. If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thicker shim.**

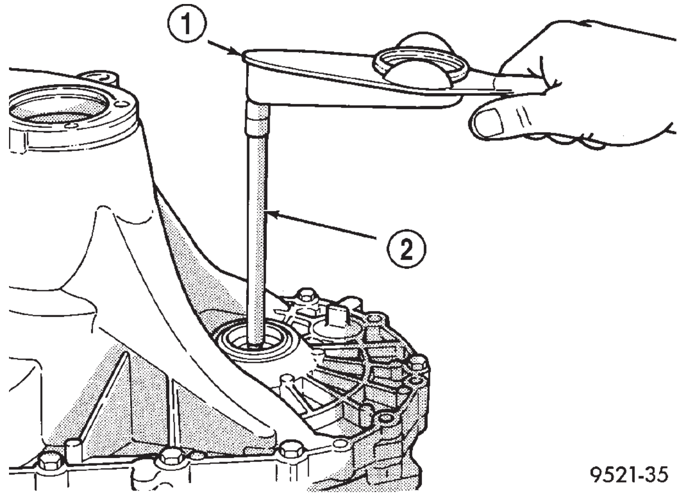

Fig. 77 Checking Differential Bearing Turning Torque

1 - INCH-POUND TORQUE WRENCH
2 - SPECIAL TOOL C-4995

(11) Recheck turning torque. Repeat Step 10 until the proper turning torque is obtained.

DIFFERENTIAL BEARING CUPS

REMOVAL

(1) Remove differential assembly from gear case using the procedure outlined in this group.

(2) Install Miller tool #L-4518 into the differential bearing cup (Fig. 78).

(3) Install the tool cup over the tool (Fig. 79).

(4) Tighten the tool until the race is removed from the case.

INSTALLATION

(1) Position the bearing cup into the case.

(2) Install the bearing cup onto Miller tool #L-4520.

DIFFERENTIAL BEARING CUPS (Continued)

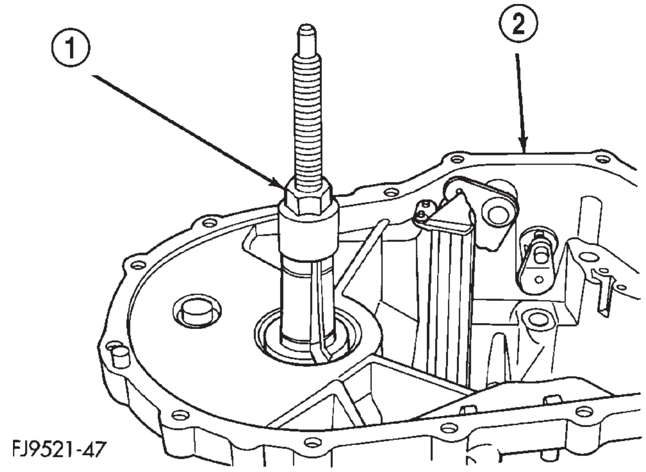

Fig. 78 Tool Installed in Bearing

1 - SPECIAL TOOL L-4518
2 - GEAR CASE

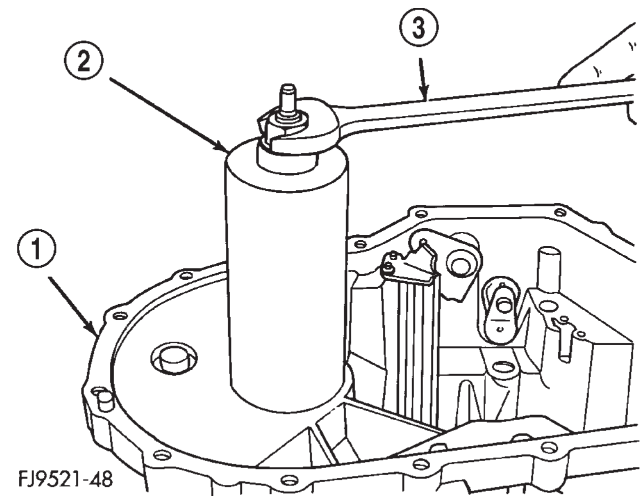

Fig. 79 Tool Cup Installed

1 - GEAR CASE
2 - SPECIAL TOOL L-4518
3 - WRENCH

(3) Using Miller tool #L-4520 and C-4171 driver, install differential bearing cup into the transaxle case.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND FILL

NOTE: The fluid required in this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602).

All T350 transaxles are equipped with a fill plug. The fill plug is located on the left side of the transaxle differential area (Fig. 80). The fluid level should be within 3/16 inch from the bottom of the transaxle fill hole (vehicle must be level when checking).

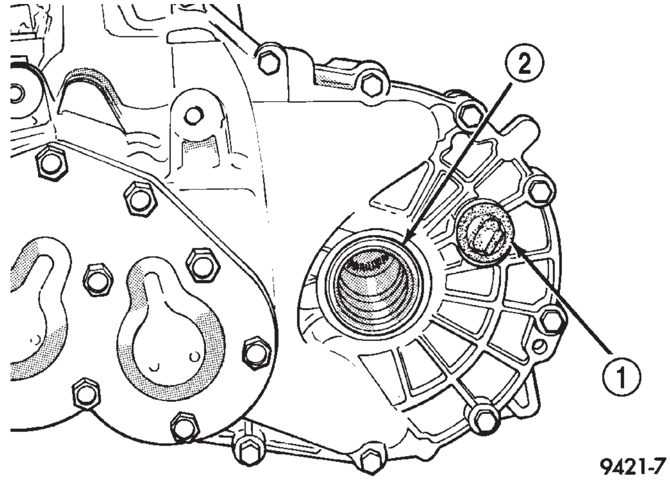

Fig. 80 Fill Plug Location

1 - RUBBER FILL PLUG
2 - LEFT DRIVESHAFT SEAL

All T350 transaxles are equipped with a drain plug. The drain plug is located on the lower right side of the transaxle differential housing (Fig. 81). Tighten drain plug to 28 N·m (250 in. lbs.)

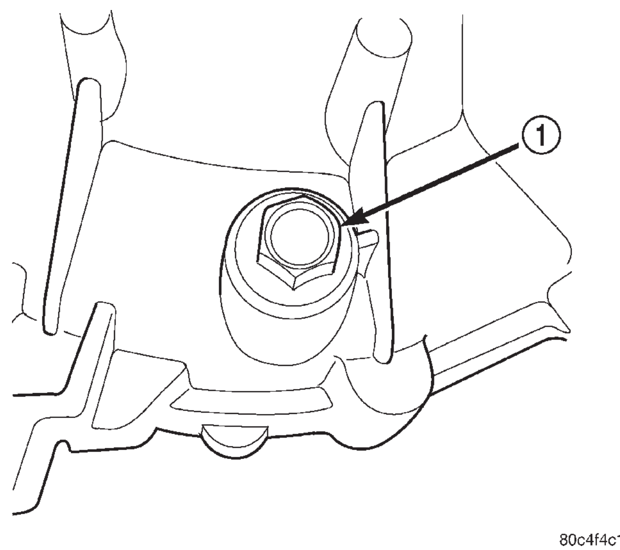

Fig. 81 Drain Plug Location

1 - DRAIN PLUG

Fill transaxle to capacity. Refer to following chart. Wipe the outside of the transaxle if any lubricant spills.

NV T350 MANUAL TRANSAXLE FLUID FILL

TRANSAXLE	METRIC MEASURE	U.S. MEASURE
NV T350	2.4-2.7 Liters	2.5-2.8 Quarts

GEAR SHIFT CABLE

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove gearshift knob/boot assembly. Lift boot off of console and disengage knob retainers to free.

(3) Remove center console assembly (Fig. 82).

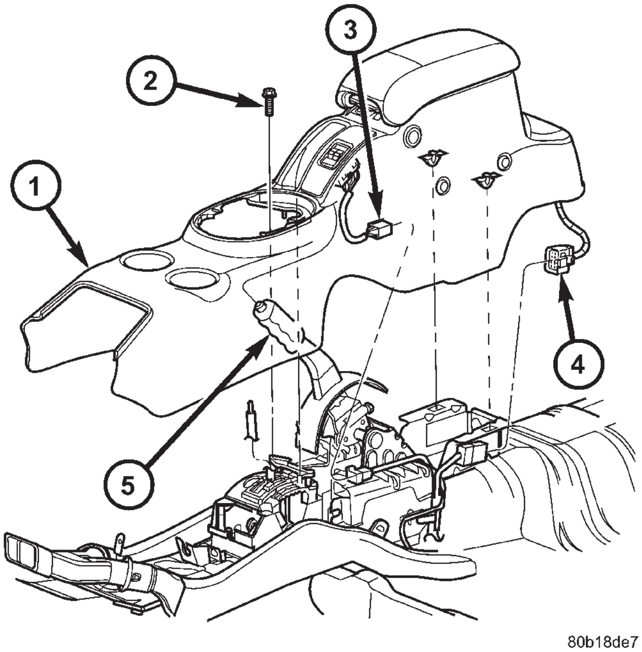

Fig. 82 Center Console Assembly—Typical

1 - CENTER CONSOLE
2 - SCREW
3 - IF EQUIPPED
4 - IF EQUIPPED
5 - PARK BRAKE HANDLE

(4) Disconnect crossover and selector cables from shift mechanism.

(5) Remove crossover and selector cable retaining clips (Fig. 83) from shift mechanism and disconnect cables.

(6) Remove air cleaner assembly.

(7) Disconnect crossover and selector cables from transaxle (Fig. 84).

(8) Remove retainer clips and disengage cables from bracket (Fig. 84).

(9) Raise vehicle on hoist.

(10) Remove cable grommet from floor pan.

(11) Pull cables forward and remove from under vehicle.

INSTALLATION

(1) Install gearshift cable assembly into engine compartment from under vehicle.

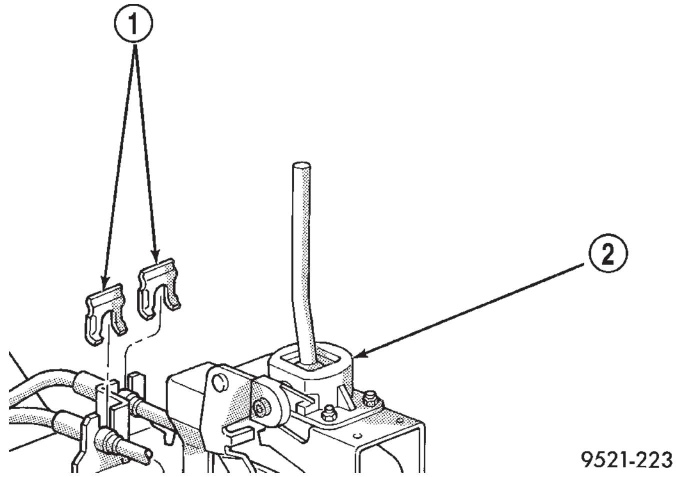

Fig. 83 Cable Retaining Clips

1 - CABLE CLIPS
2 - SHIFTER

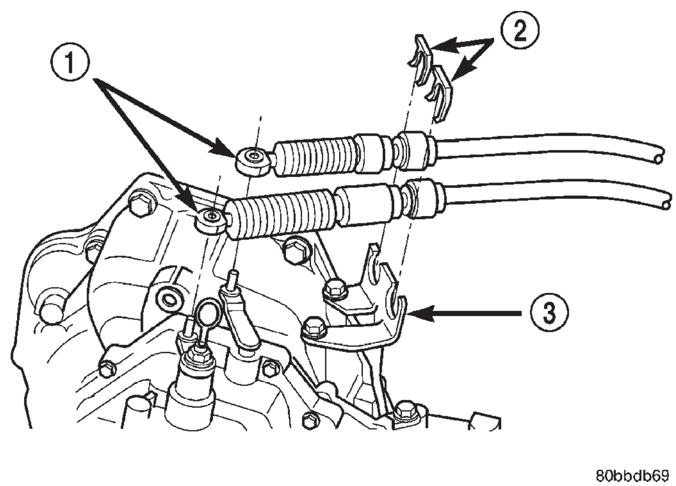

Fig. 84 Shift Cables at Transaxle

1 - SHIFT CABLES
2 - CLIPS
3 - BRACKET

(2) Feed cable assembly through hole in floor pan and secure grommet to floor pan.

(3) Lower vehicle.

(4) Install gearshift cables to mounting bracket (Fig. 84). Secure with new clips.

(5) Connect gearshift cables to transaxle crossover and selector levers (Fig. 84).

(6) Install air cleaner assembly.

(7) Connect crossover and selector cables to mechanism and secure with clips (Fig. 83).

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(8) **Adjust crossover cable as follows:**

GEAR SHIFT CABLE (Continued)

(a) Loosen adjusting screw on crossover cable at shifter (Fig. 85).

(b) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(c) Perform functional check by shifting transaxle into all gears.

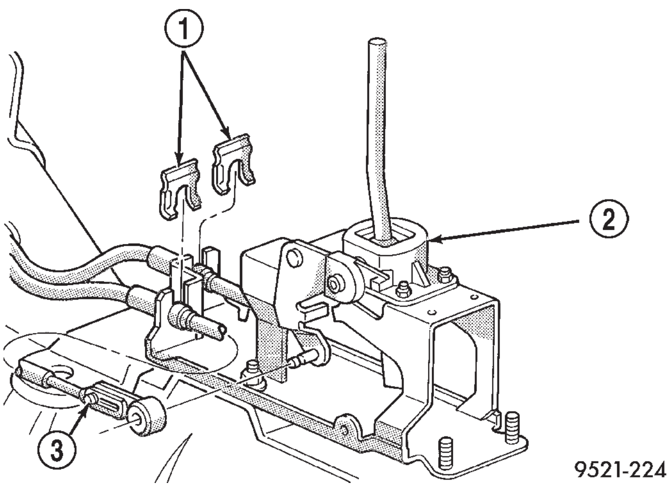

Fig. 85 Crossover and Selector Cables at Shift Mechanism

1 - CABLE CLIPS
2 - SHIFTER
3 - ADJUSTMENT SCREW

(9) Install center console assembly (Fig. 82).

(10) Install gearshift knob/boot assembly. Ensure knob retaining tabs are secured to shift lever. Snap boot to console at retainer locations.

GEAR SHIFT MECHANISM

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove gearshift knob/boot assembly.

(3) Remove center console assembly (Fig. 86).

(4) Disconnect crossover cable from mechanism.

(5) Disconnect selector cable from mechanism.

(6) Remove crossover and selector cable retaining clips (Fig. 87) from mechanism and disconnect cables.

(7) Remove shift mechanism-to-floor pan bolts and remove mechanism (Fig. 88).

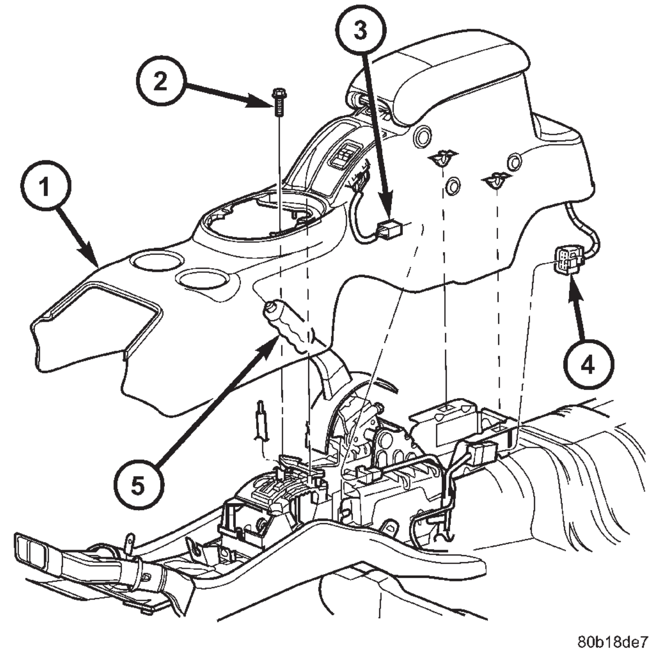

Fig. 86 Center Console Assembly—Typical

1 - CENTER CONSOLE
2 - SCREW
3 - IF EQUIPPED
4 - IF EQUIPPED
5 - PARK BRAKE HANDLE

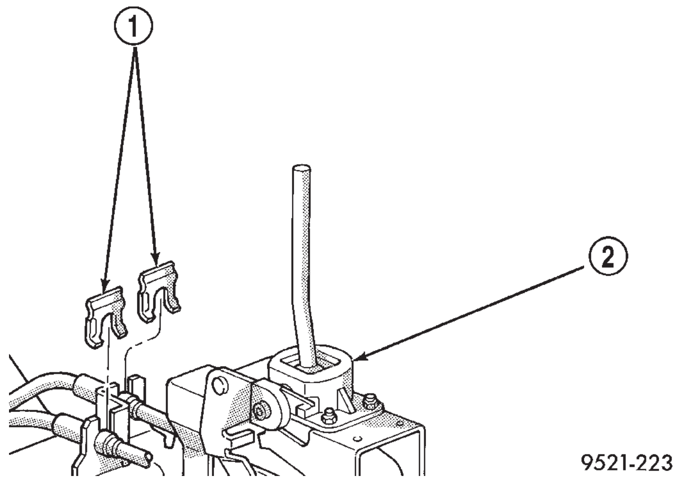

Fig. 87 Cable Retaining Clips

1 - CABLE CLIPS
2 - SHIFTER

INSTALLATION

(1) Install gear shift mechanism to floor pan (Fig. 88). Install and torque four (4) nuts to 25 N·m (18 ft. lbs.).

(2) Install crossover and selector cables into position. Secure with retaining clips (Fig. 89).

GEAR SHIFT MECHANISM (Continued)

3 - ADJUSTMENT SCREW

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(3) **Adjust crossover cable as follows:**

(a) Loosen adjusting screw on crossover cable at shifter (Fig. 89).

(b) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(c) Perform functional check by shifting transaxle into all gears.

(4) Install center console assembly (Fig. 86).

(5) Install gearshift knob/boot assembly. Ensure knob retaining tabs are secured to shift lever. Snap boot to console at retainer locations.

INPUT BEARING AND SLEEVE

REMOVAL

The input bearing is a one–piece bearing and sleeve unit (Fig. 90). The sleeve is the slide point for the clutch–release bearing and lever.

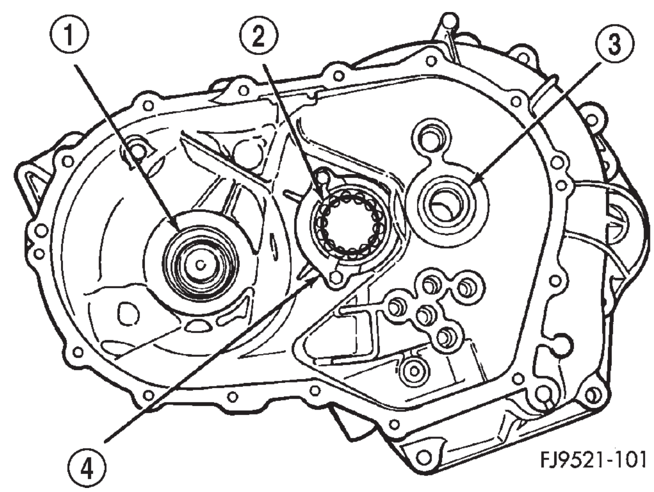

Fig. 90 Input Bearing And Sleeve

1 - DIFFERENTIAL BEARING
2 - OUTPUT BEARING
3 - INPUT BEARING
4 - BEARING RETAINER

(1) Install tool #6342 over input bearing on the gear case side of the transaxle clutch housing.

(2) Press the input bearing out of the housing (Fig. 91).

INSTALLATION

(1) Apply coating of Loctite® sealant on bearing outer diameter. Position sleeve and bearing assembly at input bearing bore.

(2) Install tool #C-4680-1 over input bearing (Fig. 92).

INPUT BEARING AND SLEEVE (Continued)

(3) Using the spacer tool #4894 and shop press, install input bearing into bore until it is fully seated (Fig. 93).

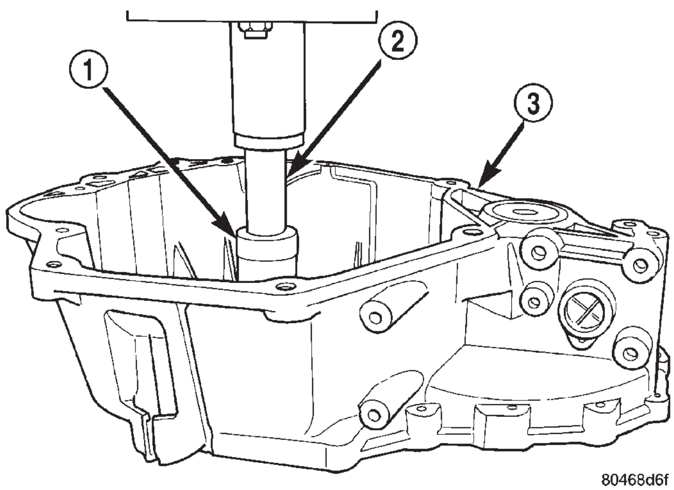

Fig. 92 Input Bearing Tool

1 - SPECIAL TOOL C-4680-1
2 - SPECIAL TOOL 4894
3 - BELLHOUSING HALF

INPUT SHAFT

DISASSEMBLY

Before disassembly of the input shaft, it is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings and the speed gears. The correct gaps are listed below:

- 1st - 0.522-2.208 mm (0.021-0.087 in)
- 2nd - 0.522-2.208 mm (0.021-0.087 in)

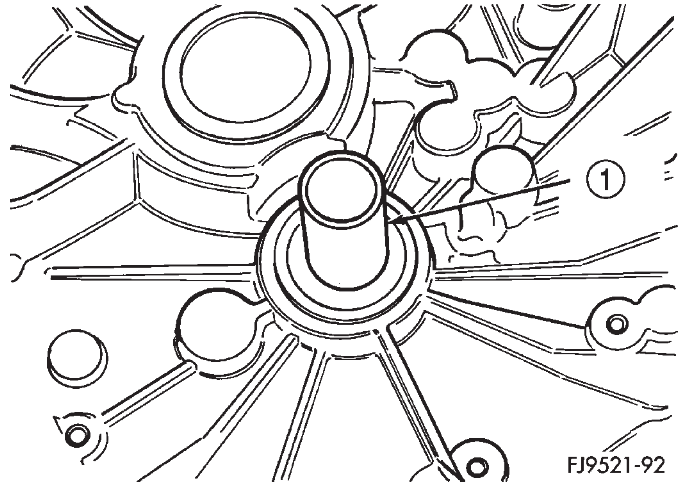

Fig. 93 Input Bearing Installed

1 - SLEEVE AND BEARING ASSEMBLY

- 3rd - 0.73-1.53 mm (0.029-0.060 in)
- 4th - 0.77-1.57 mm (0.030-0.062 in).
- 5th - 0.73-1.53 mm (0.029-0.060 in)

If a stop ring gap does not fall within the specifications, it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.

The input shaft incorporates the 3rd, 4th, and 5th speed gears and synchronizers on the assembly (Fig. 94).

2 - CAGED NEEDLE BEARING

INPUT SHAFT (Continued)

(9) Remove blocking ring. Remove 3-4 synchronizer hub retaining snap ring (Fig. 103).

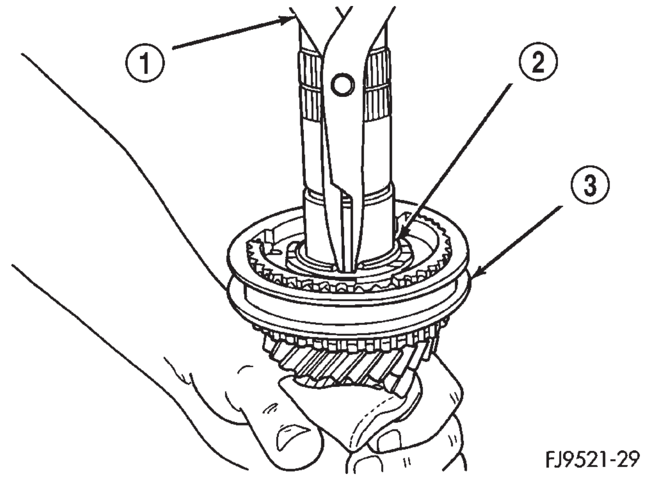

Fig. 103 3-4 Synchronizer Hub Snap Ring

1 - SNAP RING PLIERS
2 - SYNCHRO SNAP RING
3 - SYNCHRONIZER ASSEMBLY

(10) Install input shaft in shop press. Using bearing splitter, remove 3-4 synchronizer and 3rd gear (Fig. 104).

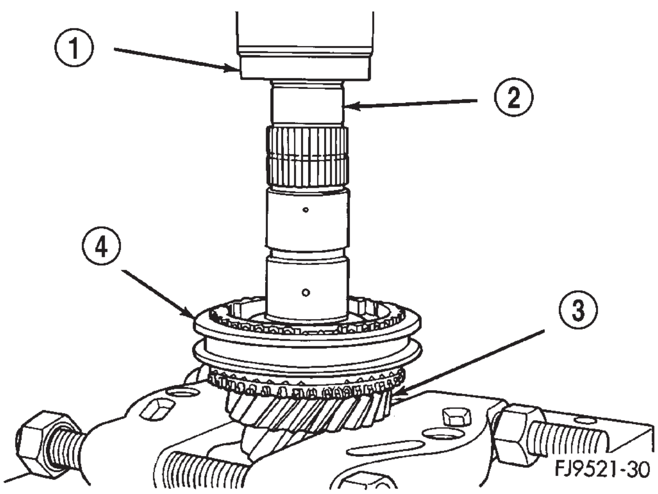

Fig. 104 3rd Gear Removal

1 - PRESS RAM
2 - INPUT SHAFT
3 - 3RD GEAR
4 - SYNCHRONIZER ASSEMBLY

(11) Remove 3rd gear caged needle bearing (Fig. 105). Inspect needle bearing for a broken retention spring

(12) Inspect the input shaft for worn or damaged bearing races or chipped gear teeth. Replace as necessary.

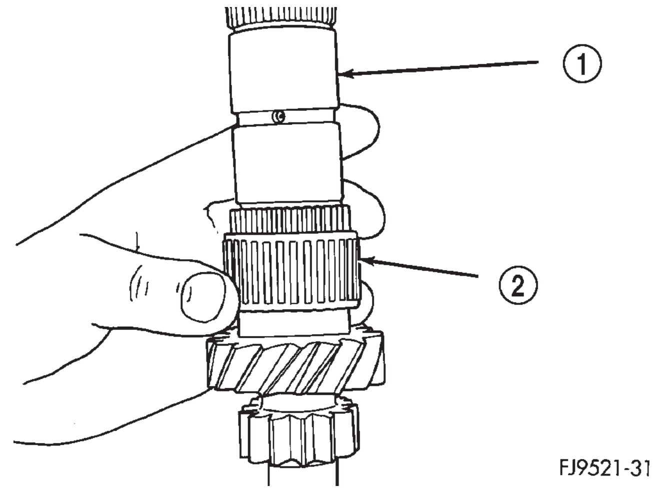

Fig. 105 3rd Gear Caged Needle Bearing

1 - INPUT SHAFT
2 - 3RD GEAR CAGED NEEDLE BEARING

ASSEMBLY

The snap rings that are used on the input shaft are available in select fit sizes. Use the thickest snap ring that fits in each snap ring groove.

(1) Place input shaft into shop press.

(2) Install 3rd gear caged needle bearing (Fig. 106).

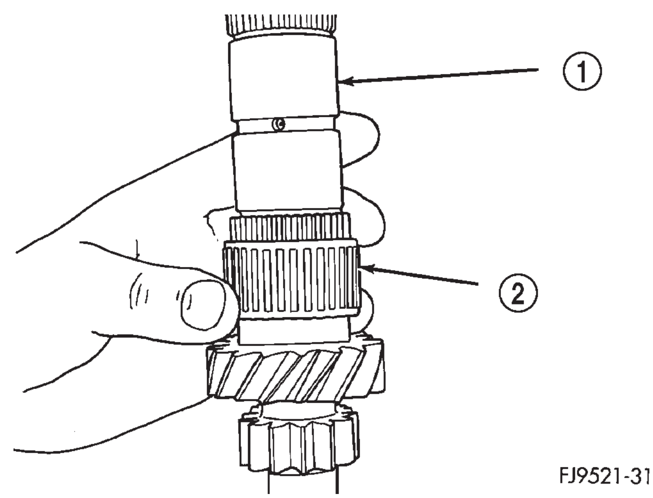

Fig. 106 3rd Gear Caged Needle Bearing

1 - INPUT SHAFT
2 - 3RD GEAR CAGED NEEDLE BEARING

(3) Install 3rd gear and 3-4 synchronizer onto input shaft. Install Tool #C-3717 over input shaft and press on synchronizer hub and 3rd gear (Fig. 107). The synchronizer hub has the letter **U** stamped on the top face of the hub. This designates that the hub must be installed with the **U** facing upward.

(4) Install 3-4 synchronizer snap ring into slot on input shaft.

INPUT SHAFT (Continued)

3 - BEARING SPLITTER
4 - SNAP RING

OUTPUT BEARING AND RACE

REMOVAL

CAUTION: The position of the output shaft bearing is critical. The bearing is not identical end-to-end. Install bearing with larger diameter cage ring facing out.

(1) Remove caged roller bearing from output bearing race (Fig. 114).

(2) Remove screws at output bearing retainer strap (Fig. 115).

(3) Install tool #6787 and slide hammer (Fig. 116). Tighten tool to output bearing race.

(4) Using slide hammer, remove output bearing race.

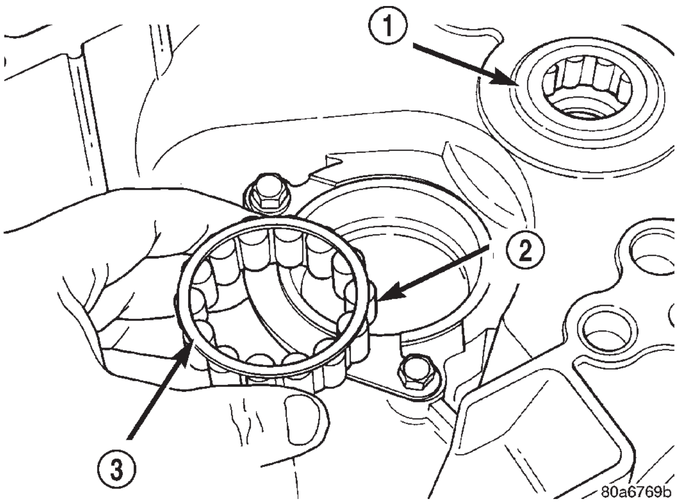

Fig. 114 Output Roller Bearing

2 - OUTPUT BEARING RACE

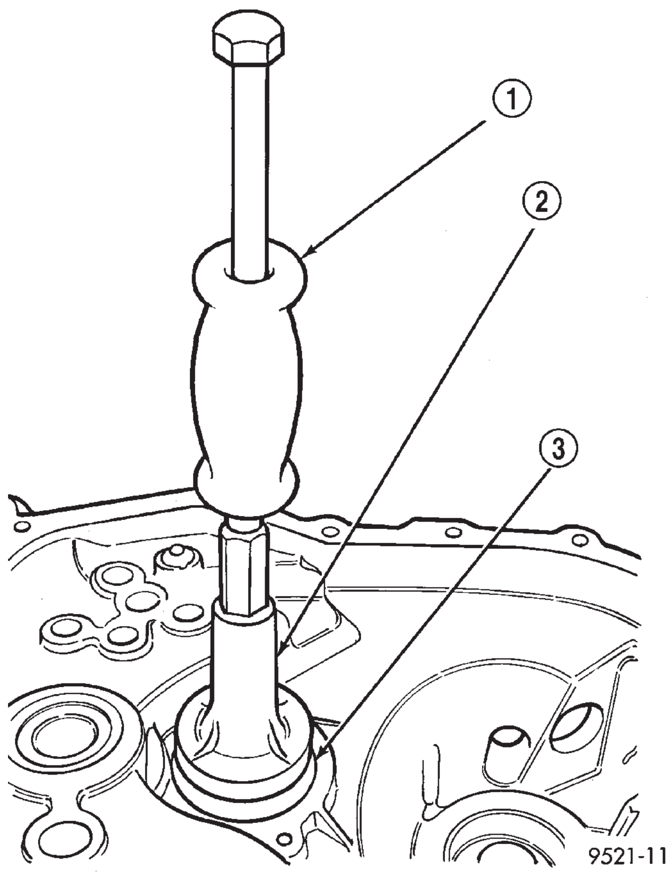

Fig. 116 Output Bearing Race Removal

1 - C-3752
2 - SPECIAL TOOL 6787
3 - OUTPUT SHAFT BEARING RACE

OUTPUT BEARING AND RACE (Continued)

INSTALLATION

(1) Line up output bearing race to race bore.

(2) Insert tool #4628 with C-4171 into output bearing race (Fig. 117). Tap race into bore. Install output bearing into race. Verify that the larger diameter cage is facing outward. Position bearing retaining strap. Tighten bolts to 11 N·m (96 in. lbs.).

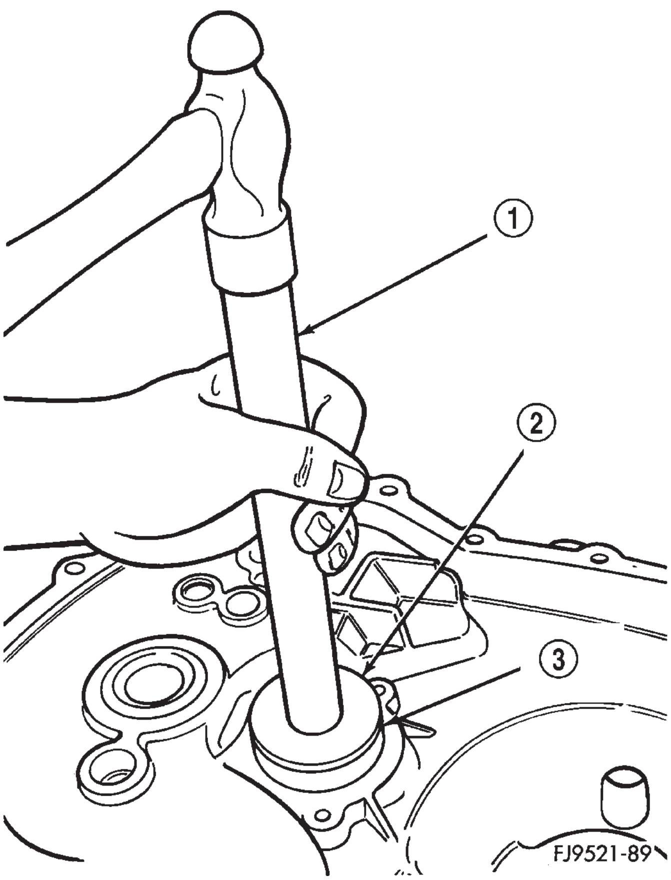

Fig. 117 Output Bearing Race Installation

1 - TOOL C-4171
2 - TOOL C-4628
3 - OUTPUT BEARING RACE

It is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings and the speed gears. The correct gaps are listed below:

- 1st—0.522-2.208 mm (0.021-0.087 in)
- 2nd—0.522-2.208 mm (0.021-0.087 in)
- 3rd—0.73-1.53 mm (0.029-0.060 in)
- 4th—0.77-1.57 mm (0.030-0.062 in)
- 5th—0.73-1.53 mm (0.029-0.060 in)

If a stop ring gap does not fall within the specifications it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.

The output shaft incorporates the 1st and 2nd gears and synchronizers on the assembly (Fig. 118).

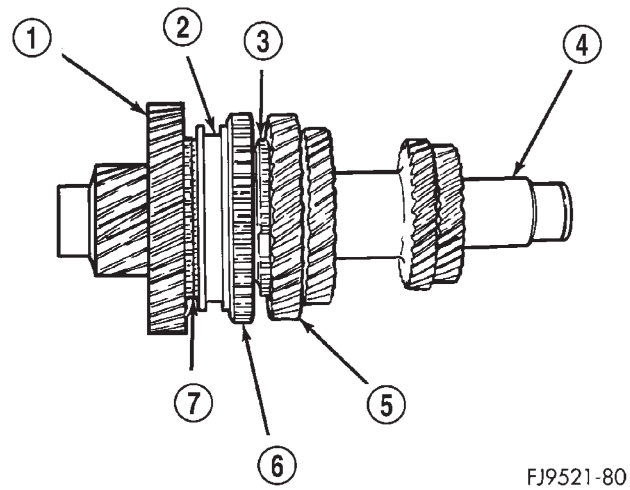

Fig. 118 Output Shaft

1 - 1ST GEAR
2 - SLEEVE
3 - STOP RING
4 - OUTPUT SHAFT
5 - 2ND SPEED GEAR
6 - REVERSE GEAR
7 - STOP RING

OUTPUT SHAFT

DISASSEMBLY

CAUTION: The output shaft is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the output shaft assembly.

REAR BEARING OIL FEED TROUGH

REMOVAL

The bearing oil feed trough is retained in the case by a pin that is molded into the case and clips that are part of the trough (Fig. 119).

(1) Using light plier pressure, squeeze the clips together at the rear of the trough.

(2) Slide the trough over the retaining pin that locates the trough in the case.

REAR BEARING OIL FEED TROUGH (Continued)

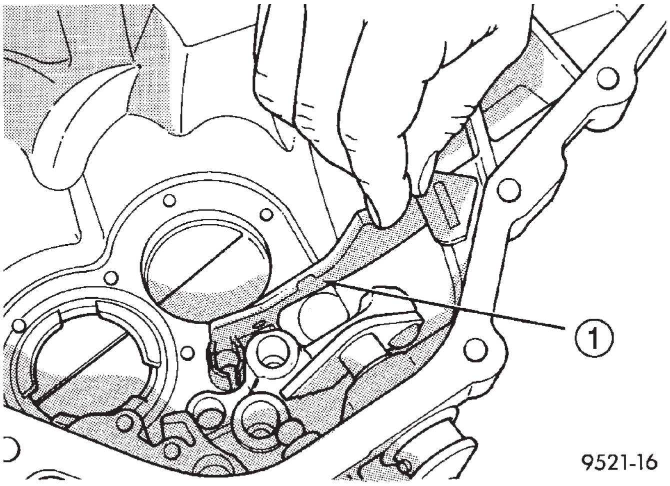

Fig. 119 Oil Feed Trough

1 - OIL FEED TROUGH

INSTALLATION

(1) To install oil feed trough, reverse removal procedure.

SHIFT CROSSOVER SHAFT

REMOVAL

(1) Disassemble transaxle.

(2) With the transaxle disassembled, remove the crossover shaft seal.

(3) Using snap–ring pliers, remove the snap ring at the crossover shaft bore (Fig. 120).

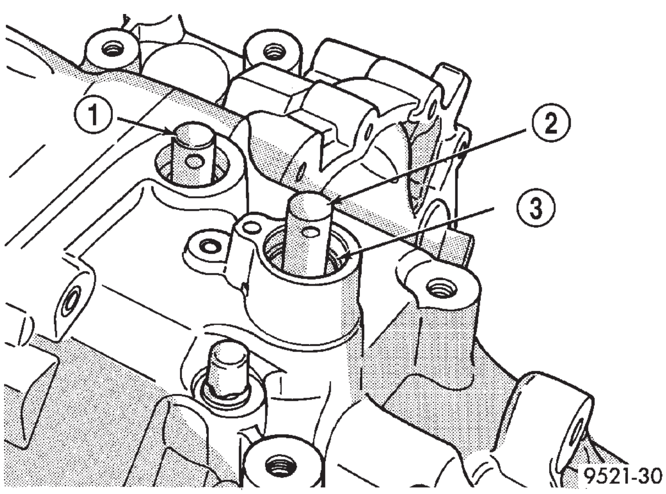

Fig. 120 Crossover Shaft Snap Ring

1 - SELECTOR SHAFT
2 - CROSSOVER SHAFT
3 - SNAP RING

(4) Push the crossover shaft in the case and remove the crossover assembly.

INSTALLATION

(1) Install crossover shaft to case and install snap ring (Fig. 120).

(2) Install the crossover shaft seal.

(3) Assemble transaxle.

SHIFT RAIL BUSHINGS

REMOVAL

(1) Thread tool #6786 into shift rail bushing.

(2) Install slide hammer #3752 onto tool.

(3) Remove bushing using slide hammer and tool assembly (Fig. 121).

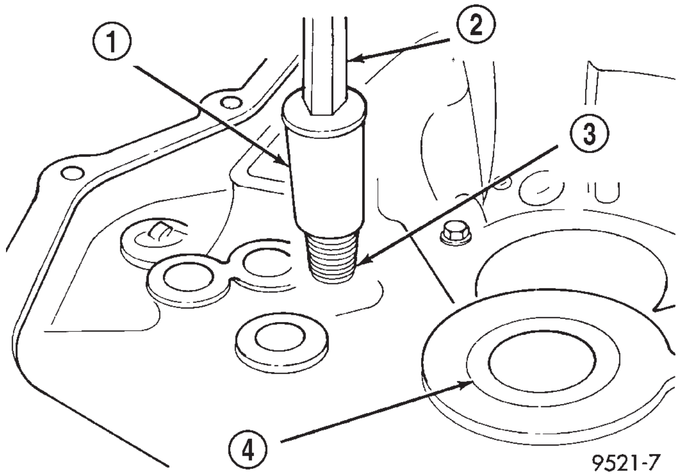

Fig. 121 Shift Rail Bushing Removal

1 - SPECIAL TOOL 6786
2 - SLIDE HAMMER C-3752
3 - SHIFTER RAIL BUSHING
4 - INPUT BEARING

INSTALLATION

(1) Line up replacement bushing in bore.

(2) Using tool #MD998343, tap bushing into bore until flush with the chamfer in the case.

SHIFT SELECTOR SHAFT

REMOVAL

(1) Disassemble transaxle.

(2) With the transaxle disassembled, remove the selector shaft by pushing on the shaft from the outside. Pull shaft out from the inside.

INSTALLATION

(1) Pull selector shaft into position from the outside.

(2) Assemble transaxle.

SHIFT SELECTOR SHAFT BUSHING

REMOVAL

(1) Remove selector shaft using procedure in this group.

(2) Thread tool #6786 into bushing.

(3) Install slide hammer #3752 onto tool and remove bushing using slide hammer (Fig. 122).

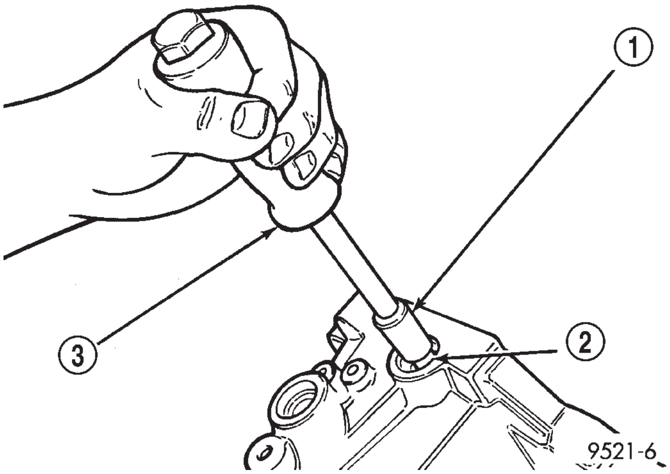

Fig. 122 Selector Shaft Bushing Removal

1 - SPECIAL TOOL 6786
2 - SHIFT SHAFT BUSHING
3 - SLIDE HAMMER C-3752

INSTALLATION

(1) Position replacement bushing over selector shaft bore.

(2) Using an appropriate size deep–well socket, install bushing in selector shaft bore (Fig. 123).

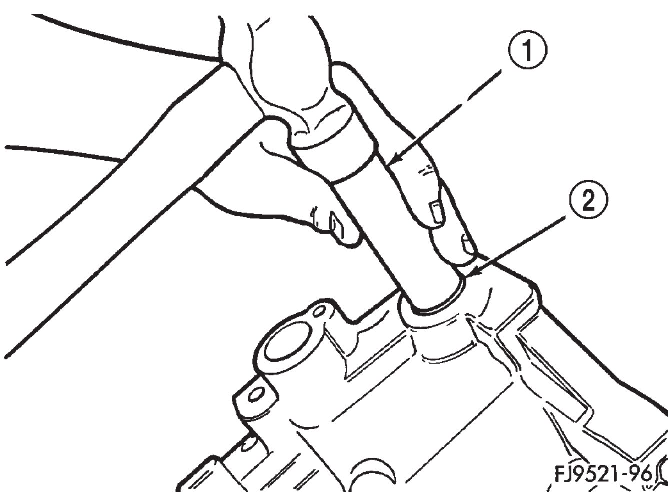

Fig. 123 Selector Shaft Bushing Installation

1 - DEEP WELL SOCKET
2 - SHIFTER SHAFT BUSHING

SHIFT SHAFT SEALS

REMOVAL

It is not necessary to remove the shift shafts from the transaxle to service the shift shaft seals.

(1) Using a pick tool, pry up on the shift shaft seal, and remove seal from bore.

INSTALLATION

(1) Position new shift shaft seal into bore.

(2) Install shift shaft seal into bore using an appropriate size deep-well socket.

SYNCHRONIZER

DISASSEMBLY

Place synchronizer in a clean shop towel and wrap. Press on inner hub. Carefully open up shop towel and remove springs, balls, keys, hub, and sleeve.

CLEANING

CLEAN

Do not attempt to clean the blocking rings in solvent. The friction material will become contaminated. Place synchronizer components in a suitable holder and clean with solvent. Air dry.

INSPECTION

INSPECT

Proper inspection of components involve:

- Teeth, for wear, scuffed, nicked, burred, or broken teeth
- Keys, for wear or distortion
- Balls and springs, for distortion, cracks, or wear

If any of these conditions exist in these components, replace as necessary.

ASSEMBLY

(1) Position synchronizer hub onto a suitable holding fixture (input shaft). The synchronizer hubs are directional. The hubs must be installed with the **U** facing upward.

SYNCHRONIZER (Continued)

(2) Install springs into hub slot (Fig. 124) .

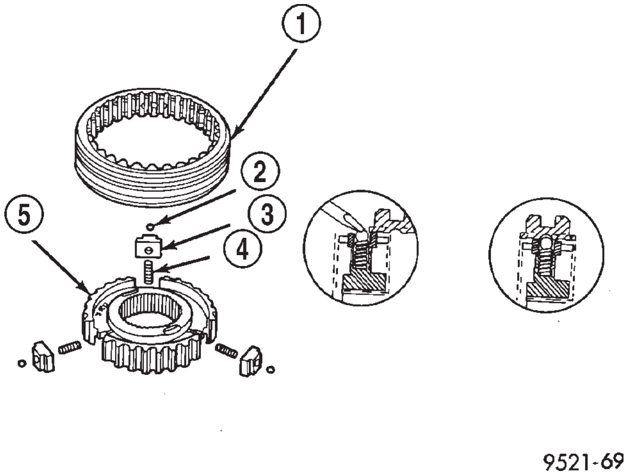

Fig. 124 Synchronizer Assembly

1 - SLEEVE
2 - BALL
3 - KEY
4 - SPRING
5 - HUB

(3) Insert key into hub and spring.

(4) Apply petroleum jelly to the hole in the key. Insert balls into each key (Fig. 125) .

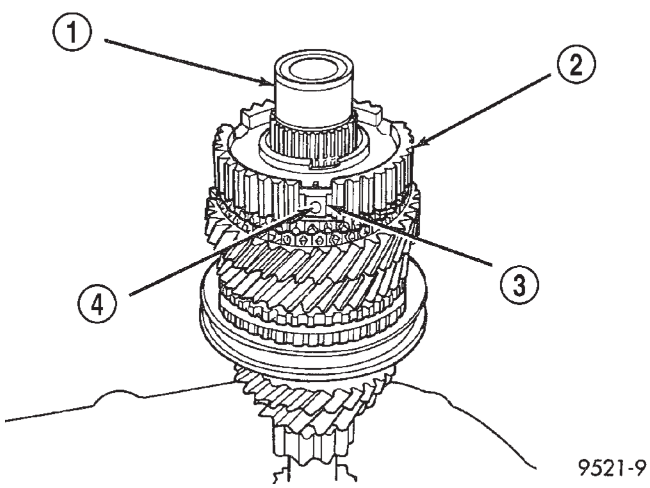

Fig. 125 Synchronizer Balls

1 - INPUT SHAFT
2 - HUB
3 - KEY
4 - BALL

(5) Slide sleeve over the hub and depress balls as you carefully slip the sleeve into position (Fig. 126) .

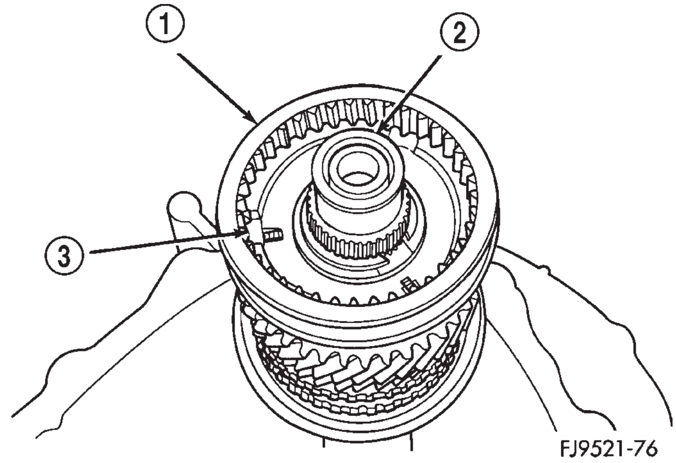

Fig. 126 Synchronizer Sleeve

1 - SLEEVE
2 - INPUT SHAFT
3 - KEY

(6) Line up stop ring tang over the keys in the hub (Fig. 127) . Install stop rings. Center the keys and balls by pushing on both stop rings.

VEHICLE SPEED SENSOR

DESCRIPTION

VEHICLE SPEED SENSOR

The Vehicle Speed Sensor (VSS) is a pulse generator mounted to an adapter near the transmission output shaft. The sensor is driven through the adapter by a speedometer pinion gear. The VSS pulse signal to the speedometer/odometer is monitored by the PCM speed control circuitry to determine vehicle speed and to maintain speed control set speed.

REMOVAL

(1) Raise vehicle on hoist.

(2) Disconnect the speed sensor connector (Fig. 128) .

CAUTION: Clean area around speed sensor before removing to prevent dirt from entering the transaxle during speed sensor removal.

(3) Remove speed sensor retaining bolt (Fig. 128) .

(4) Remove speed sensor from transaxle.

CAUTION: Carefully remove vehicle speed sensor so that sensor drive gear does not fall into transaxle. Should sensor drive gear fall into the transaxle during sensor removal, drive gear must be reattached to sensor.

(5) Remove speed sensor drive gear from speed sensor.

INSTALLATION

(1) Install pinion gear to speed sensor (Fig. 128) .

(2) Using a NEW o-ring, install the speed sensor to the transaxle (Fig. 128) .

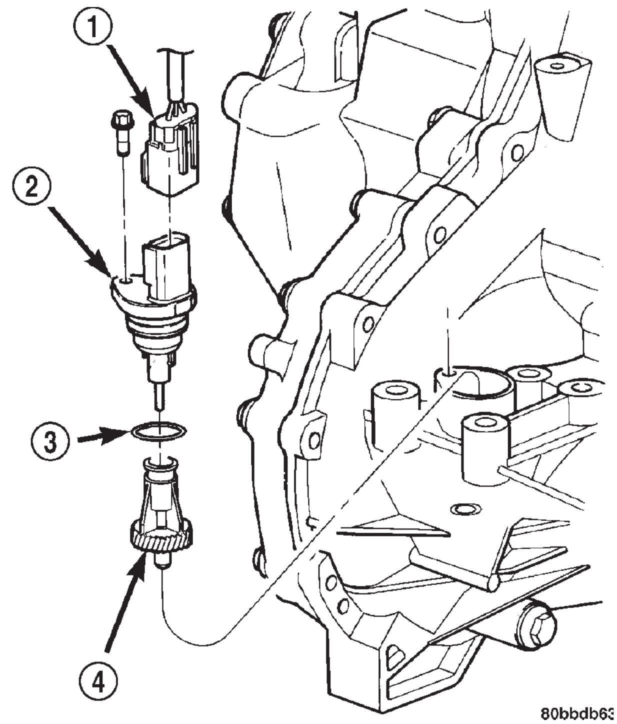

Fig. 128 Speed Sensor and Pinion—Removal/ Installation

1 - CONNECTOR
2 - SENSOR
3 - O-RING
4 - SPEEDO PINION

(3) Install the bolt and torque to 7 N·m (60 in. lbs.).

(4) Connect speed sensor connector (Fig. 128) .

(5) Lower vehicle and road test to verify proper speedometer operation.

T850 MANUAL TRANSAXLE

TABLE OF CONTENTS

T850 MANUAL TRANSAXLE

DESCRIPTION

The NV T850 5-speed transaxle (Fig. 1) is a constant-mesh manual transaxle that is synchronized in all gear ranges, including reverse.

The transaxle consists of three major sub-assemblies: the input shaft, intermediate shaft, and differential assembly. The transaxle shift system consists of a mechanical shift cover, rails, forks, and cables. The unique design of this shift system provides a higher mechanical advantage, resulting in less friction and lower shift cable loads for smoother, more positive operation.

The NV T850 transaxle is available with the 2.7L Gas engine option. Its gear ratios are as follows:

GEAR	RATIO
1st	3.65
2nd	2.05
3rd	1.37
4th	0.97
5th	0.76
Reverse	3.47
Final Drive Ratio	3.77

T850 MANUAL TRANSAXLE (Continued)

TRANSAXLE IDENTIFICATION

The transaxle model, assembly part number, build date, and final drive ratio (FDR) can be found on a metal tag fastened to the transaxle case on the bell-housing (Fig. 2). A barcode label is also glued to the transaxle bellhousing, and it too includes the trans-axle part number.

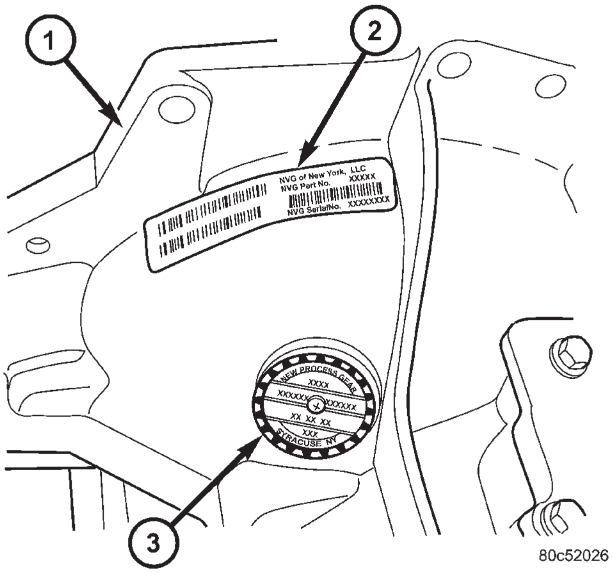

Fig. 2 T850 Transaxle Identification

1 - TRANSAXLE BELLHOUSING

3 - I.D. TAG

T850 MANUAL TRANSAXLE (Continued)

OPERATION

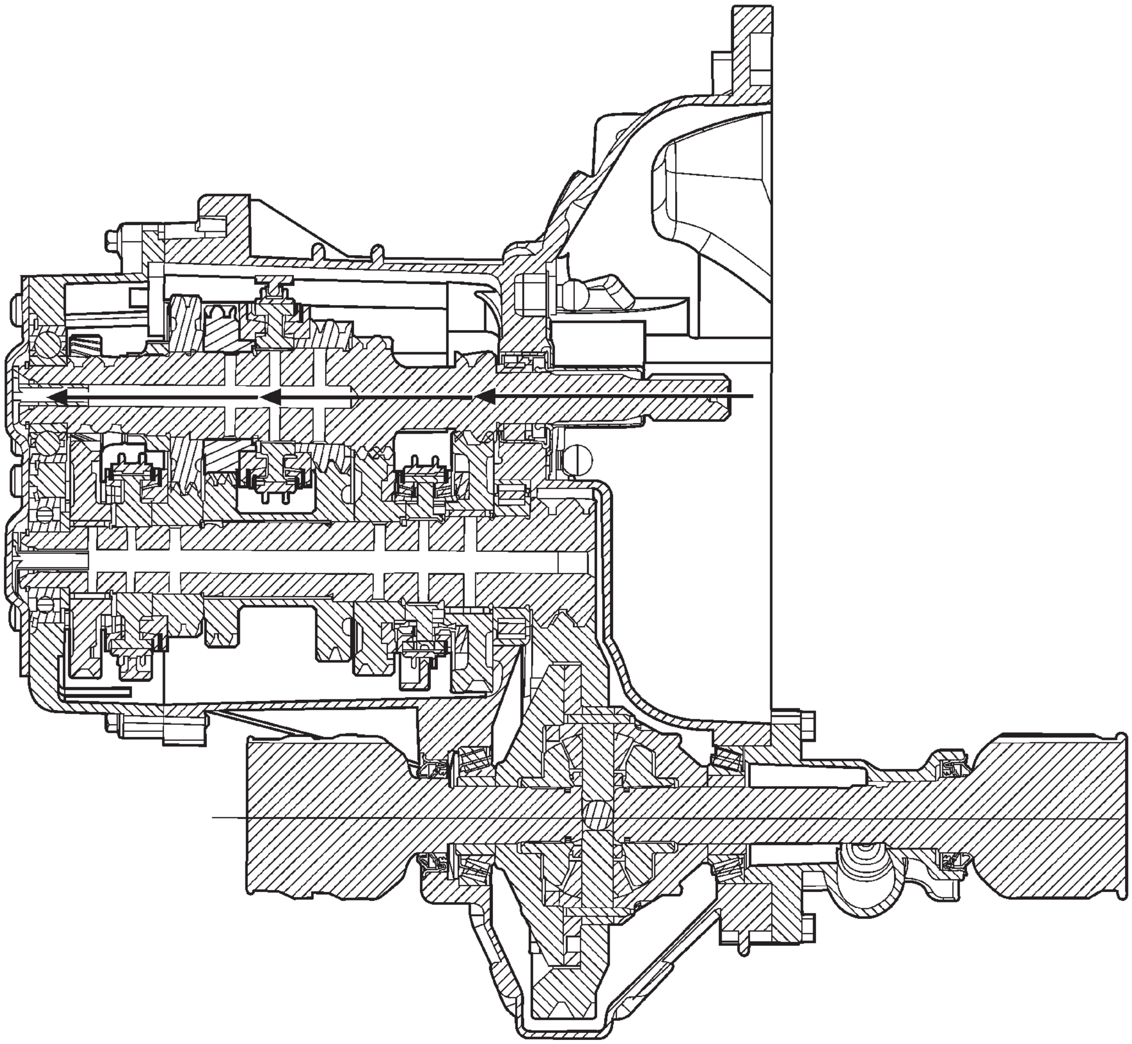

Fig. 3 Neutral Gear Operation

NEUTRAL

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. Since no synchronizers are engaged on either the input or intermediate shafts, power is not transmitted to the intermediate shaft and the differential does not turn (Fig. 3).

T850 MANUAL TRANSAXLE (Continued)

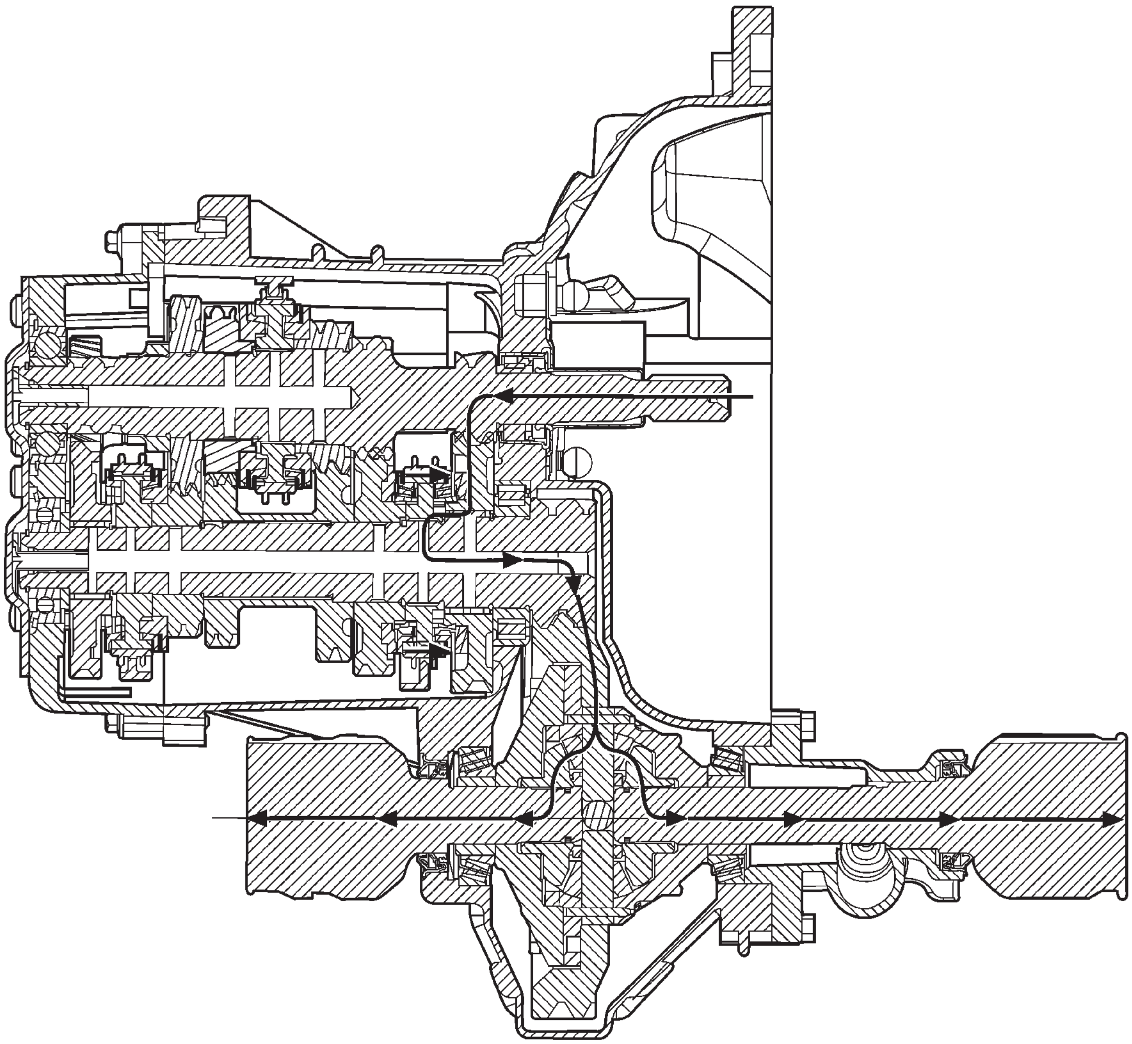

Fig. 4 1st Gear Operation

1ST GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft first gear is integral to the input shaft, and is in constant mesh with the intermediate shaft first speed gear. Because of this constant mesh, the intermediate shaft first speed gear freewheels until first gear is selected. As the gearshift lever is moved to the first gear position, the 1-2 fork moves the 1-2 synchronizer sleeve towards first gear on the intermediate shaft. The synchronizer sleeve engages the first gear clutch teeth, fixing the gear to the intermediate shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 4).

T850 MANUAL TRANSAXLE (Continued)

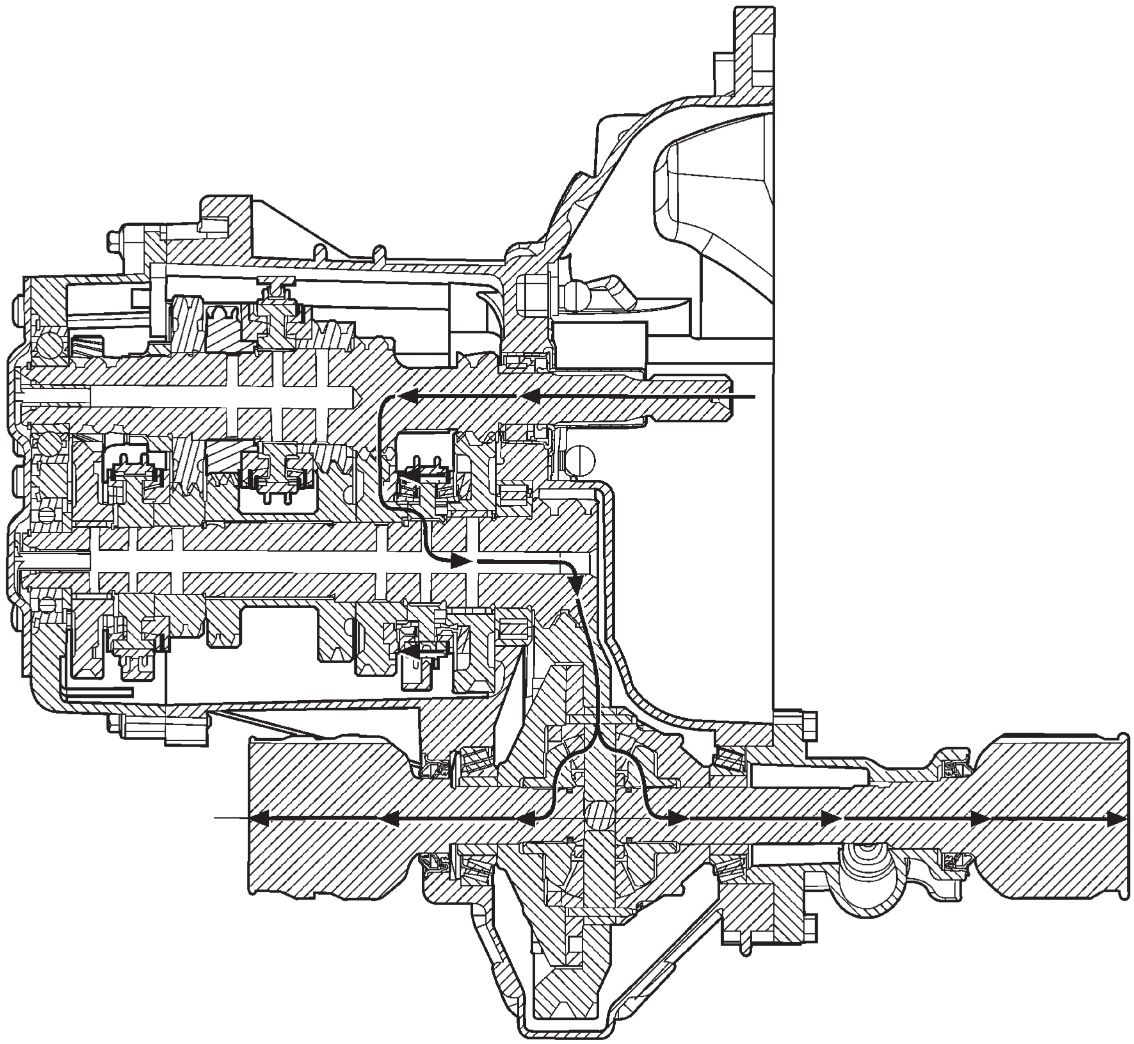

Fig. 5 2nd Gear Operation

2ND GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft second gear is integral to the input shaft, and is in constant mesh with the intermediate shaft second speed gear. Because of this constant mesh, the intermediate shaft second speed gear freewheels until second gear is selected. As the gearshift lever is moved to the second gear position, the 1-2 fork moves the 1-2 synchronizer sleeve towards second gear on the intermediate shaft. The synchronizer sleeve engages the second gear clutch teeth, fixing the gear to the intermediate shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 5).

T850 MANUAL TRANSAXLE (Continued)

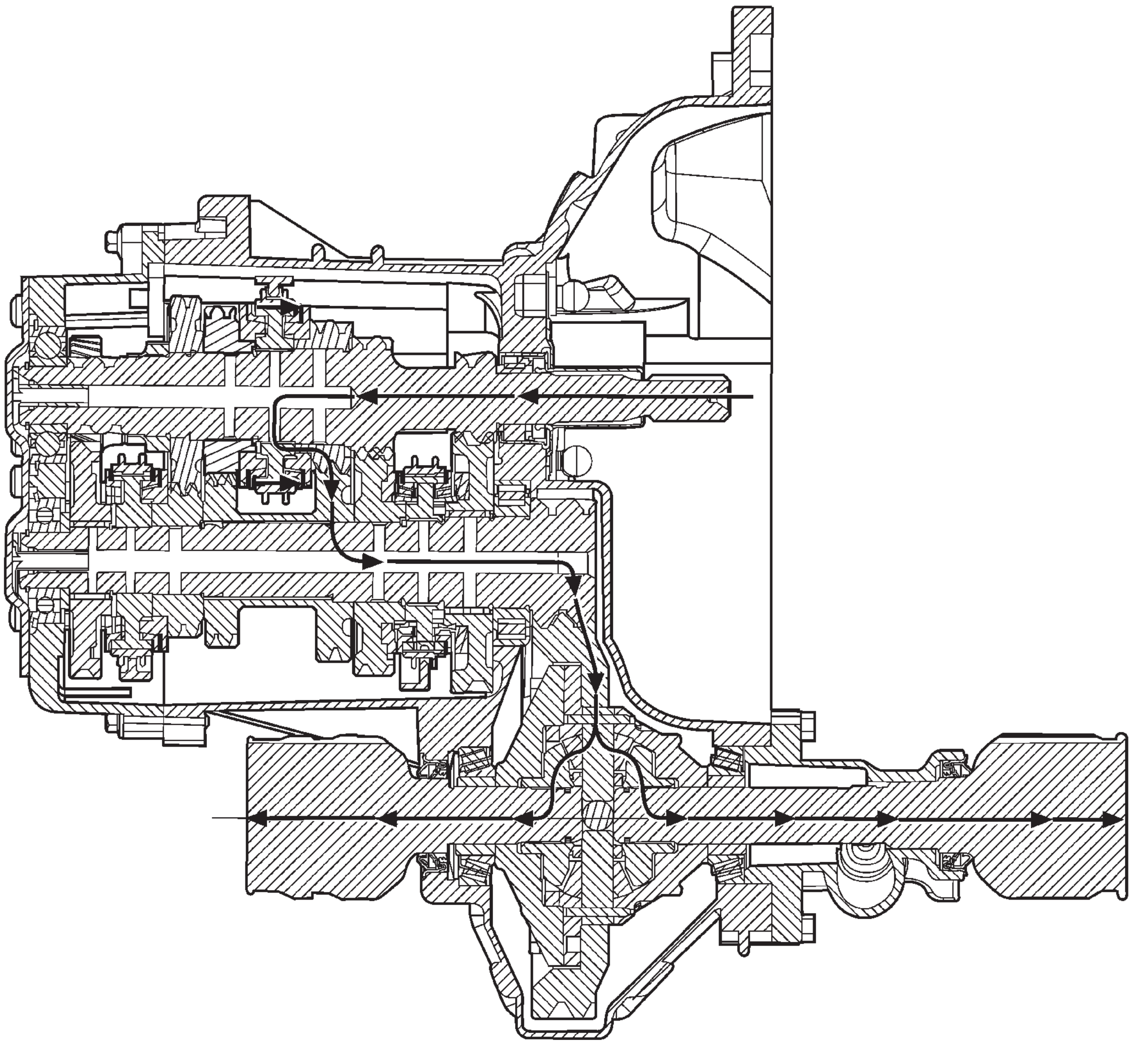

Fig. 6 3rd Gear Operation

3RD GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft third speed gear is in constant mesh with the intermediate shaft 3-4 cluster gear, which is fixed to the intermediate shaft. Because of this constant mesh, the input shaft third speed gear freewheels until third gear is selected. As the gearshift lever is moved to the third gear position, the 3-4 fork moves the 3-4 synchronizer sleeve towards third gear on the input shaft. The synchronizer sleeve engages the third gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 6).

T850 MANUAL TRANSAXLE (Continued)

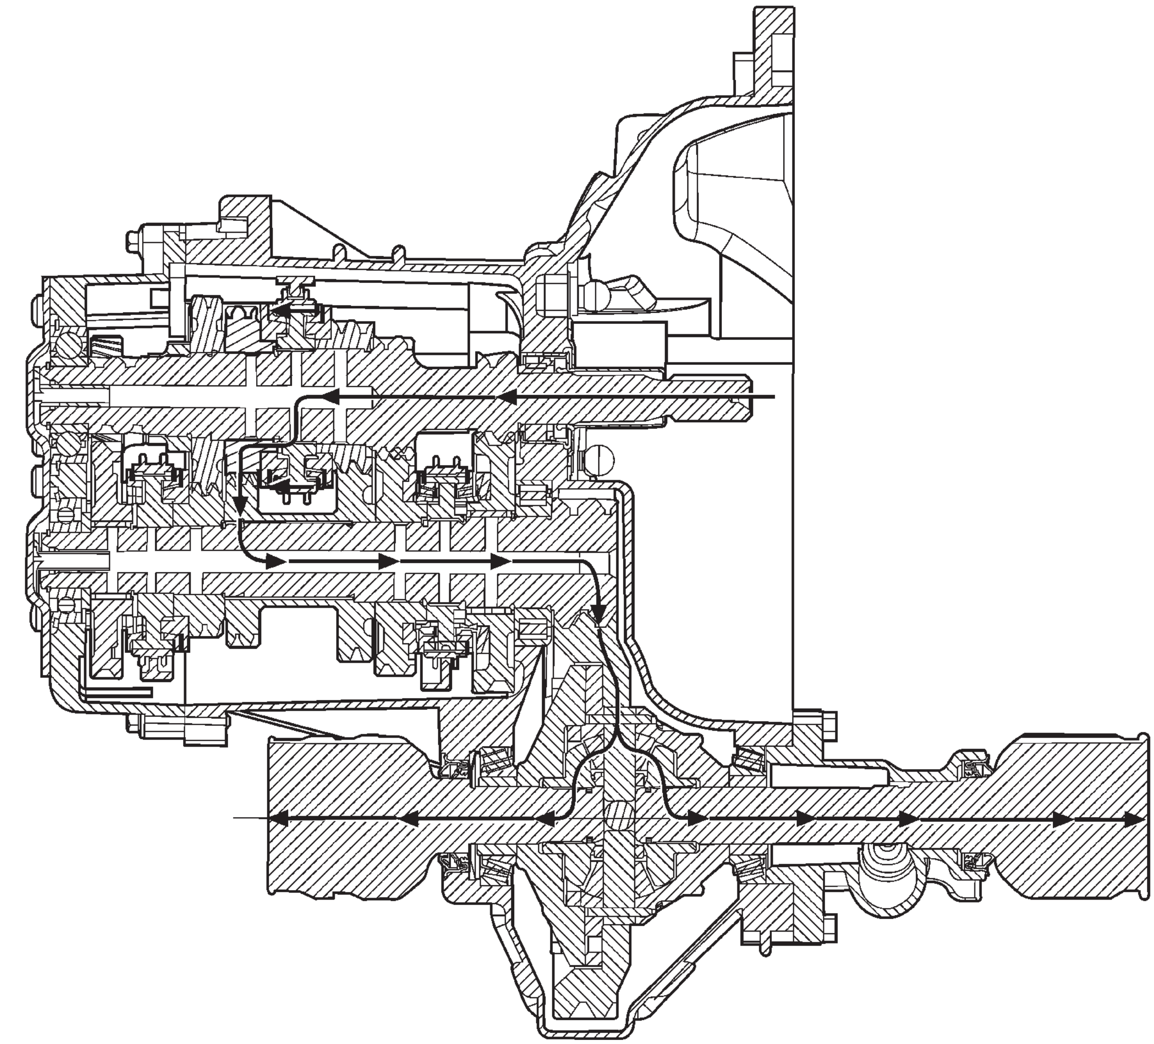

Fig. 7 4th Gear Operation

4TH GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft fourth speed gear is in constant mesh with the intermediate shaft 3-4 cluster gear, which is fixed to the intermediate shaft. Because of this constant mesh, the input shaft fourth speed gear freewheels until fourth gear is selected. As the gearshift lever is moved to the fourth gear position, the 3-4 fork moves the 3-4 synchronizer sleeve towards fourth gear on the input shaft. The synchronizer sleeve engages the fourth gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 7).

T850 MANUAL TRANSAXLE (Continued)

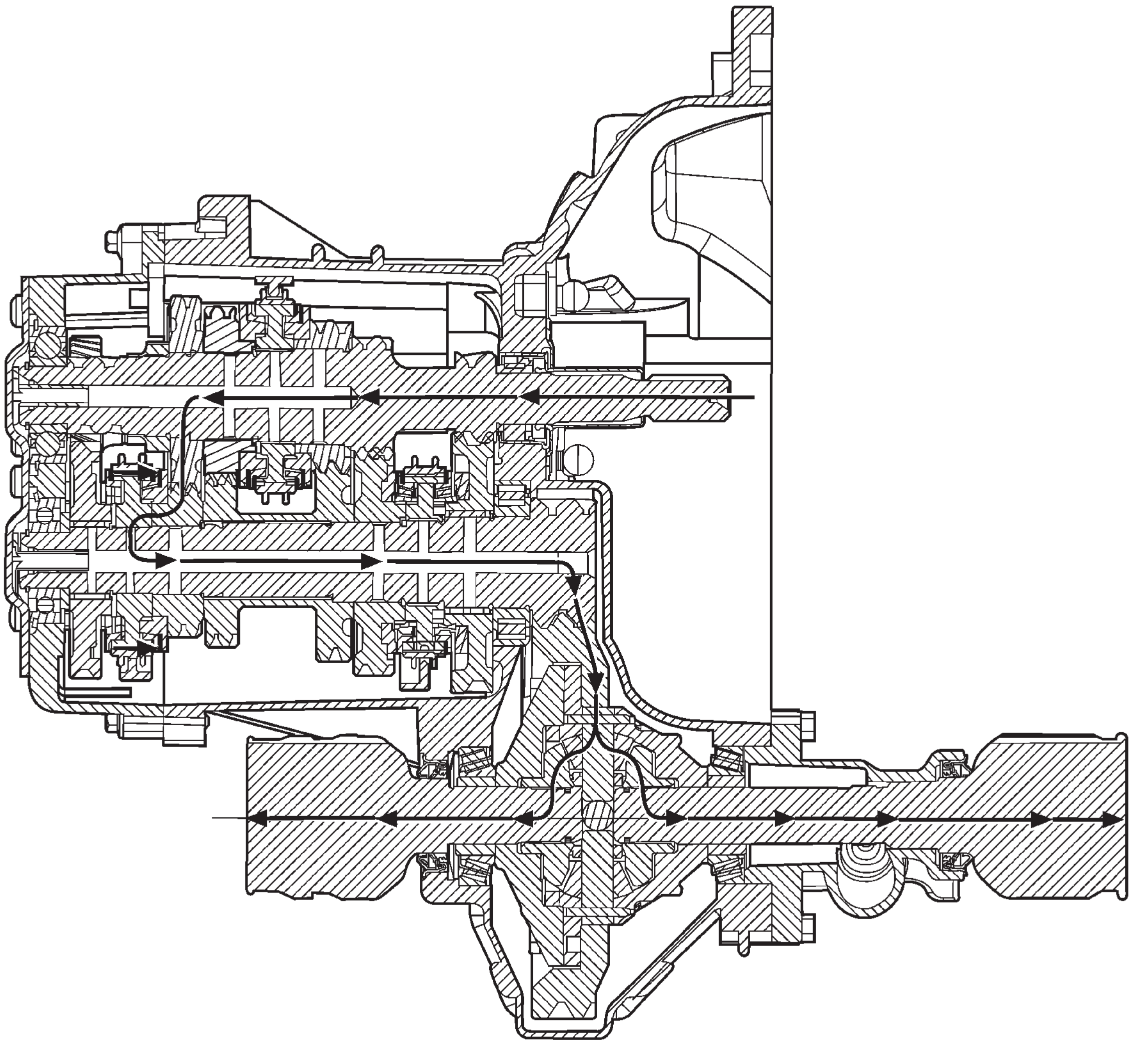

Fig. 8 5th Gear Operation

5TH GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft fifth gear is pressed on to the input shaft, and is in constant mesh with the intermediate shaft fifth speed gear. Because of this constant mesh, the intermediate shaft fifth speed gear freewheels until fifth gear is selected. As the gearshift lever is moved to the fifth gear position, the 5-R fork moves the 5-R synchronizer sleeve towards the intermediate shaft fifth speed gear. The synchronizer sleeve engages the fifth gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the intermediate shaft to the differential (Fig. 8).

T850 MANUAL TRANSAXLE (Continued)

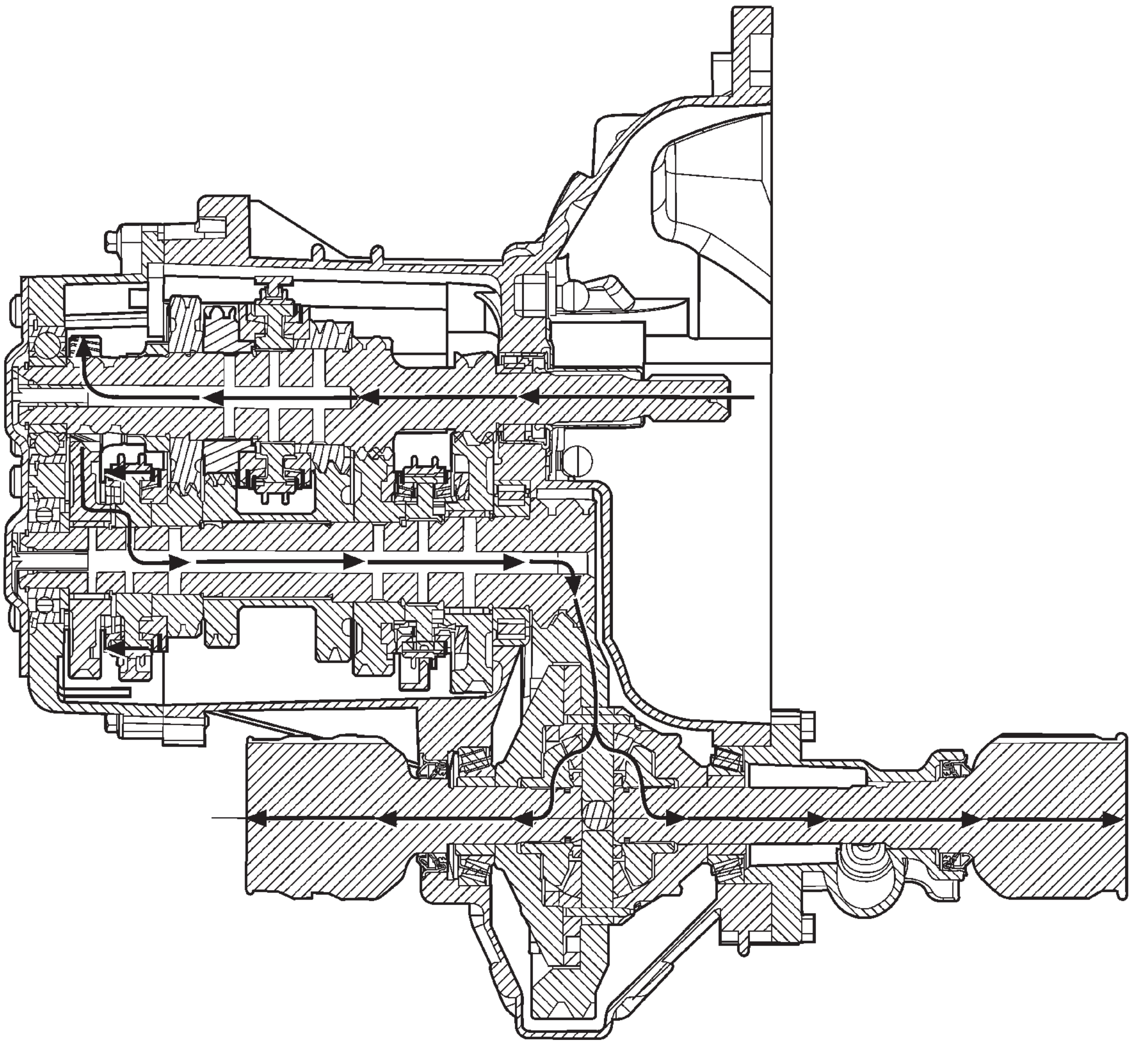

Fig. 9 Reverse Gear Operation

REVERSE GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft reverse gear is integral to the input shaft, and is in constant mesh with the reverse idler gear. The reverse idler gear, which reverses the rotation of the intermediate shaft, is in constant mesh with the intermediate shaft reverse gear. Because of this constant mesh, the intermediate shaft reverse gear freewheels until reverse gear is selected. As the gearshift lever is moved to the reverse gear position, the 5-R fork moves the 5-R synchronizer sleeve towards the intermediate shaft reverse gear. The synchronizer sleeve engages the reverse gear clutch teeth, fixing the gear to the intermediate shaft, and allowing power to transmit through the intermediate shaft to the differential (in reverse) (Fig. 9).

T850 MANUAL TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Misassembled or damaged internal components
- Improper operation

HARD SHIFTING

Hard shifting may be caused by a misadjusted crossover cable. If hard shifting is accompanied by gear clash, synchronizer clutch and stop rings or gear teeth may be worn or damaged.

Hard shifting may also be caused by a binding or broken shift cover mechanism. Remove shift cover and verify smooth operation. Replace as necessary.

Misassembled synchronizer components also cause shifting problems. Incorrectly installed synchronizer sleeves, keys, balls, or springs can cause shift problems.

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

SLIPS OUT OF GEAR

Transaxle disengagement may be caused by misaligned or damaged shift components, or worn teeth on the drive gears or synchronizer components. Incorrect assembly also causes gear disengagement. Check for missing snap rings.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air–powered lubrication equipment is used to fill a transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an underfill condition.

CLUTCH PROBLEMS

Worn, damaged, or misaligned clutch components can cause difficult shifting, gear clash, and noise.

A worn or damaged clutch disc, pressure plate, or release bearing can cause hard shifting and gear clash.

REMOVAL

(1) Disconnect battery negative cable at strut tower.

(2) Remove air cleaner assembly.

(3) Disconnect gearshift cables at transaxle shift mechanism.

(4) Remove gearshift cable retaining clips at mount bracket. Secure cables out of the way.

(5) Remove three (3) rear mount bracket-to-transaxle case (vertical) bolts.

(6) Disconnect crankshaft position sensor connector. Remove sensor from transaxle case.

(7) Remove throttle body support bracket.

(8) Remove upper mount-to-case (vertical) bolt.

(9) Remove front mount bracket/starter upper bolt.

(10) Remove two (2) starter heat shield-to-bracket bolts.

(11) Disconnect oxygen sensor connector from mount bracket. Secure out of way.

(12) Raise vehicle on hoist.

(13) Remove front halfshaft assemblies. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

(14) Remove left front wheel splash shield.

(15) Raise vehicle.

(16) Remove structural collar.

(17) Remove clutch/drive plate inspection cover.

(18) Remove modular clutch assembly-to-drive plate bolts.

(19) Remove front mount and bracket.

(20) Disconnect starter wire harness.

(21) Remove starter motor lower bolt. Remove starter motor from vehicle.

(22) Using Tool 6638A, disconnect hydraulic clutch quick-connect fitting.

(23) Remove clutch slave cylinder by lifting nylon tab with a small screwdriver, and then depressing cylinder inward towards case and rotating cylinder 60° counter-clockwise.

(24) Disconnect back-up lamp switch connector.

(25) Position screw jack with wood block under engine oil pan and secure.

(26) Remove upper mount bracket-to-case bolts.

(27) Lower engine/transaxle assembly enough to gain access to transaxle bellhousing-to-block bolts, **but do not remove bolts at this time.**.

(28) Install transmission jack. Secure transaxle to jack.

(29) Remove transaxle bellhousing-to-block bolts and lower transaxle from vehicle. Use helper if necessary.

T850 MANUAL TRANSAXLE (Continued)

DISASSEMBLY

(1) Remove clutch release lever and bearing (Fig. 10). Inspect release lever pivot balls and replace if necessary (Fig. 11). Use slide hammer C-3752 and remover/installer 6891 (Fig. 12) if pivot ball replacement is necessary.

(2) Remove input shaft bearing retainer (Fig. 13).

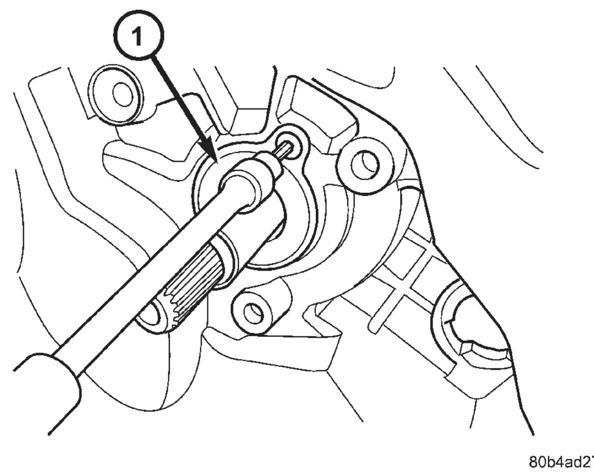

Fig. 13 Input Bearing Retainer

1 - INPUT BEARING RETAINER

NOTE: Place transaxle in neutral before shift cover removal.

T850 MANUAL TRANSAXLE (Continued)

(3) Remove shift cover-to-case bolts and remove shift cover assembly (Fig. 14).

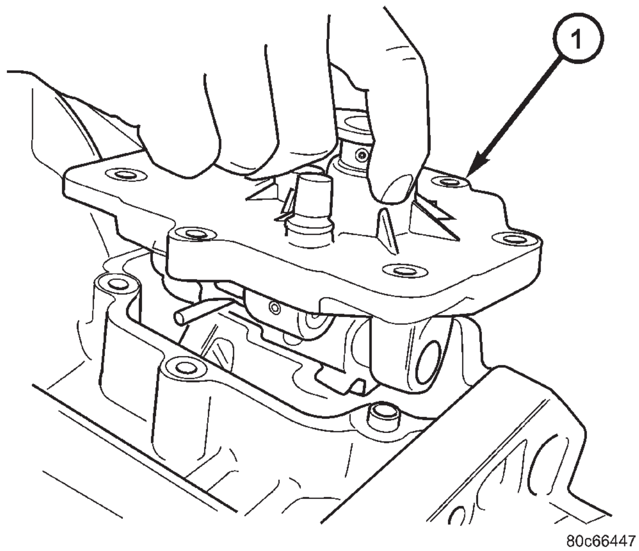

Fig. 14 Shift Cover Removal/Installation

1 - SHIFT COVER ASSEMBLY

(4) Place transaxle with bellhousing surface down.

(5) Remove backup lamp switch (Fig. 15).

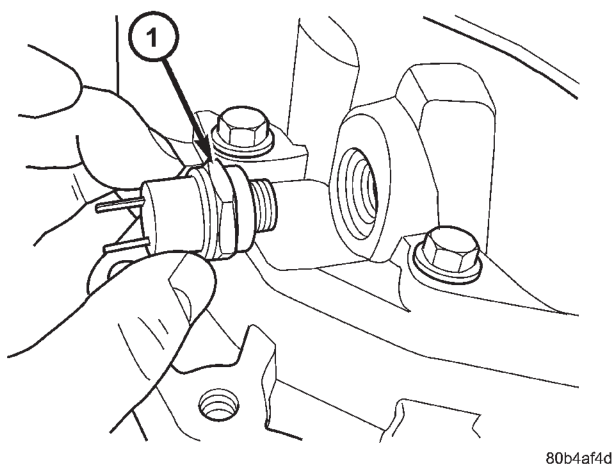

Fig. 15 Back-Up Lamp Switch

1 - BACK-UP LAMP SWITCH

(6) Remove end plate (Fig. 16).

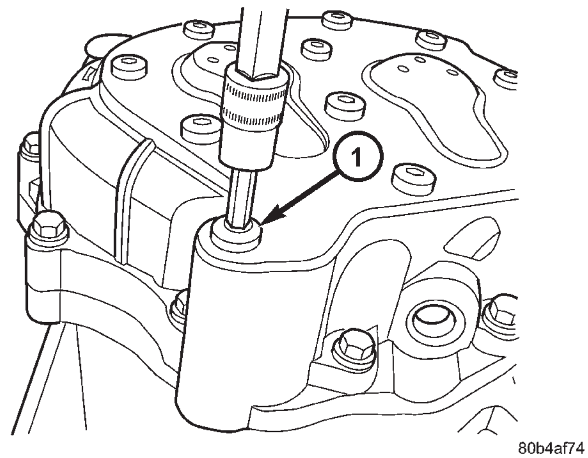

Fig. 16 End Plate Bolts

1 - BOLT (11)

(7) Set up lifting bar (tool 8489) as shown in (Fig. 17).

(8) Lift up on bar (input shaft bearing side) and remove input shaft bearing snap ring.

(9) Lift up on bar (intermediate shaft side) and remove intermediate shaft bearing snap ring.

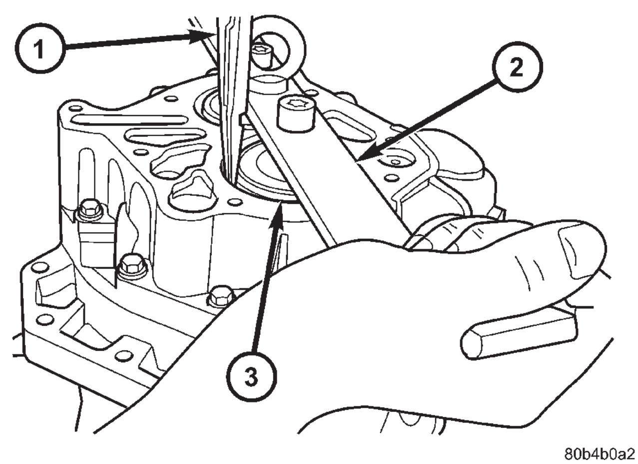

Fig. 17 Input Bearing Snap Ring

(14) Remove reverse idler bolt (Fig. 21). Remove reverse idler gear, washers, and shaft upon geartrain removal.

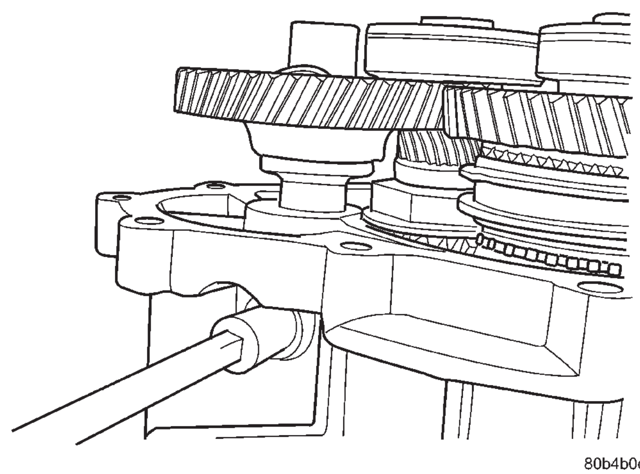

Fig. 21 Reverse Idler Shaft Bolt

T850 MANUAL TRANSAXLE (Continued)

(15) Remove 1-2/5-R shift rail (Fig. 22).

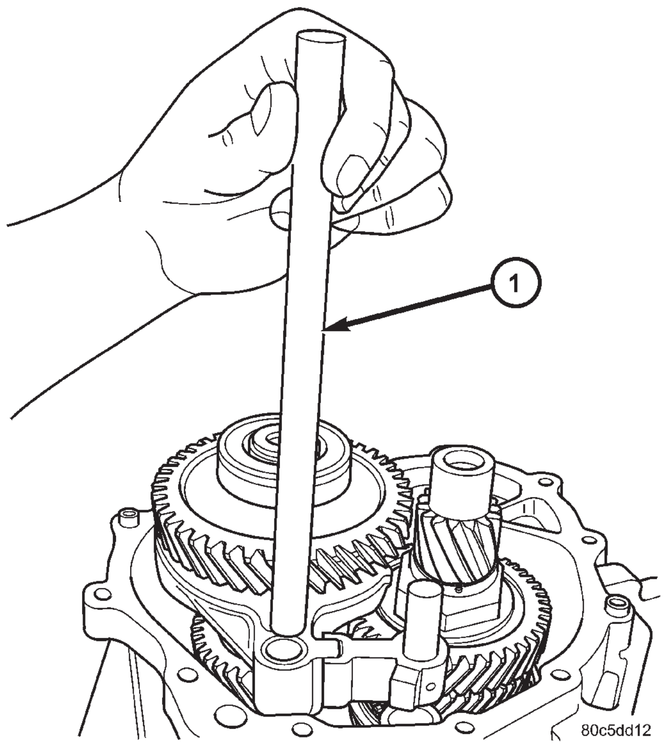

Fig. 22 1/2-5/R Shift Rail Removal/Installation

1 - 1/2-5/R SHIFT RAIL

(16) Install lifting bar 8489.

(17) Lift geartrain (w/reverse idler gear assy.) out of transaxle and install on fixture 8487 (Fig. 23).

(18) Remove remaining shift rail and forks from geartrain (Fig. 23).

(19) Remove lifting bar from geartrain.

NOTE: At this point, differential bearing turning torque should be measured to ensure proper shim selection upon reassembly.

(20) Measure differential turning torque. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/DIFFERENTIAL - ADJUSTMENTS)

(21) Using a suitable screwdriver, remove extension housing axle oil seal (Fig. 24).

(22) Remove bearing plate-to-case and differential cover bolts (Fig. 25).

ASSEMBLY

NOTE: When assembling this transaxle, always use NEW snap rings.

NOTE: Before assembling transaxle, differential turning torque must be measured and adjusted. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/DIFFERENTIAL - ADJUSTMENTS). Differential turning torque must be measured with geartrain out of case.

(1) Install input shaft bearing using an arbor press and remover/installer 8474 (Fig. 31).

(2) Install shift shaft bushing to case using installer 8475 (Fig. 32).

T850 MANUAL TRANSAXLE (Continued)

4 - SHIM (SELECT)

(7) Install a 1 mm (0.04 in.) bead of Mopar® Gasket Maker to differential cover and install to case. Torque differential cover-to-case bolts to 54 N·m (40 ft. lbs.).

(8) Install a 1 mm (0.04 in.) bead of Mopar® Gasket Maker to bearing plate. Install bearing plate to differential cover and case and torque bolts to 28 N·m (250 in. lbs.) (Fig. 36).

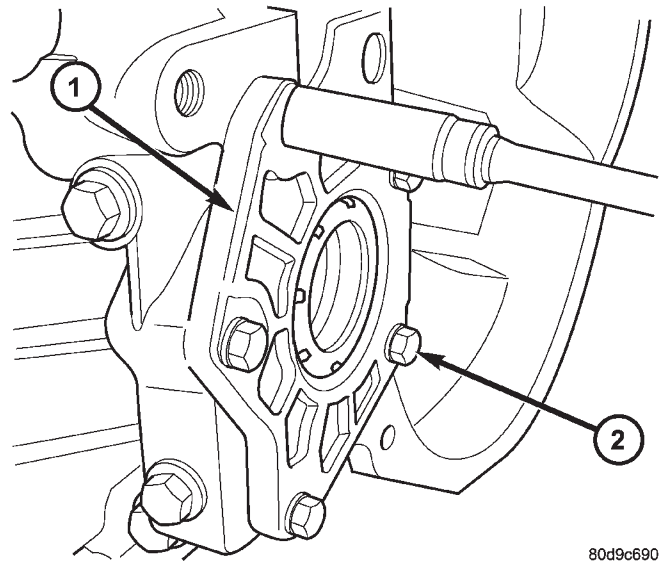

Fig. 36 Bearing Plate-to-Case Bolts

1 - PLATE
2 - BOLT (5)

(9) Verify proper differential turning torque.

(10) Install both axle output shaft seals using driver handle C-4171 and installer 8473 (Fig. 37).

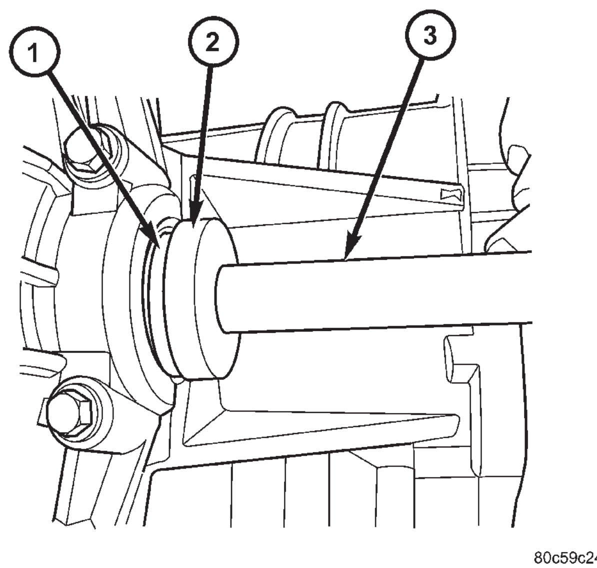

Fig. 37 Axle Seal Installation—Typical

1 - SEAL
2 - INSTALLER 8476
3 - DRIVER HANDLE C-4171

T850 MANUAL TRANSAXLE (Continued)

NOTE: If input shaft assembly was not disassembled, it is necessary to remove input shaft sealed ball bearing before assembling transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/INPUT SHAFT - DISASSEMBLY)

(11) Install assembled input and intermediate shafts to fixture 8487 (Fig. 38).

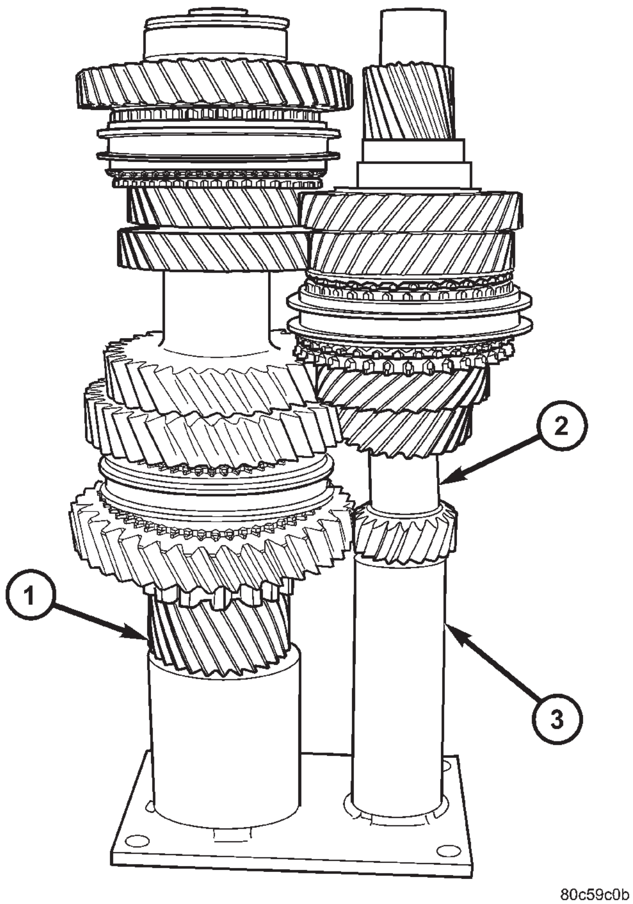

Fig. 38 Install Geartrain to Fixture 8487

1 - INTERMEDIATE SHAFT
2 - INPUT SHAFT
2 - FIXTURE 8487

(12) Install shift forks and 3/4 rail assembly to geartrain as shown in (Fig. 39).

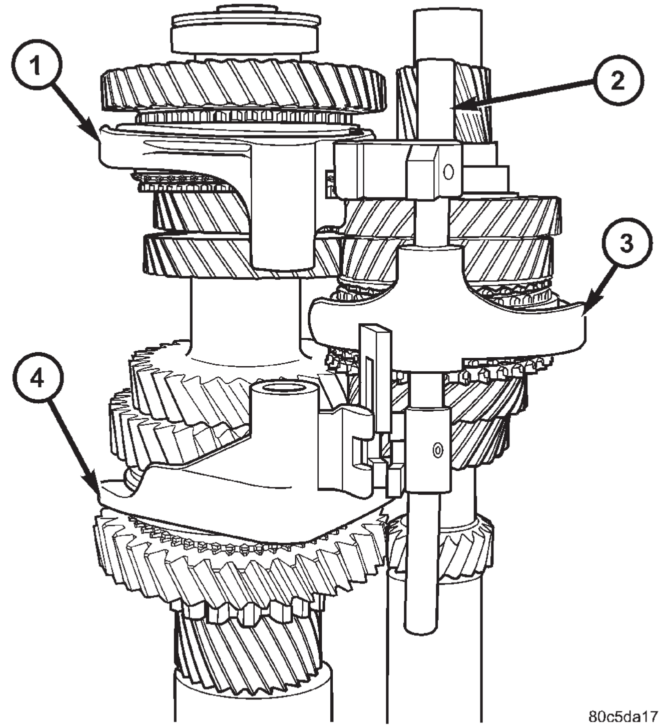

Fig. 39 Shift Fork/Rail Orientation

1 - 5/R FORK
2 - 3/4 RAIL ASSEMBLY
3 - 3/4 FORK
4 - 1/2 FORK

NOTE: Before installing geartrain, make sure that input shaft sealed roller bearing is not installed, otherwise reverse idler assembly installation will be difficult. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/INPUT SHAFT - DISASSEMBLY)

(13) Install lifting bar 8489 to geartrain. Install geartrain to case. **When installing geartrain to case, use care not to damage bearing surfaces.**

(14) Remove lifting bar 8489 from geartrain.

T850 MANUAL TRANSAXLE (Continued)

(15) Install shift 1/2-5/R rail as shown in (Fig. 40).

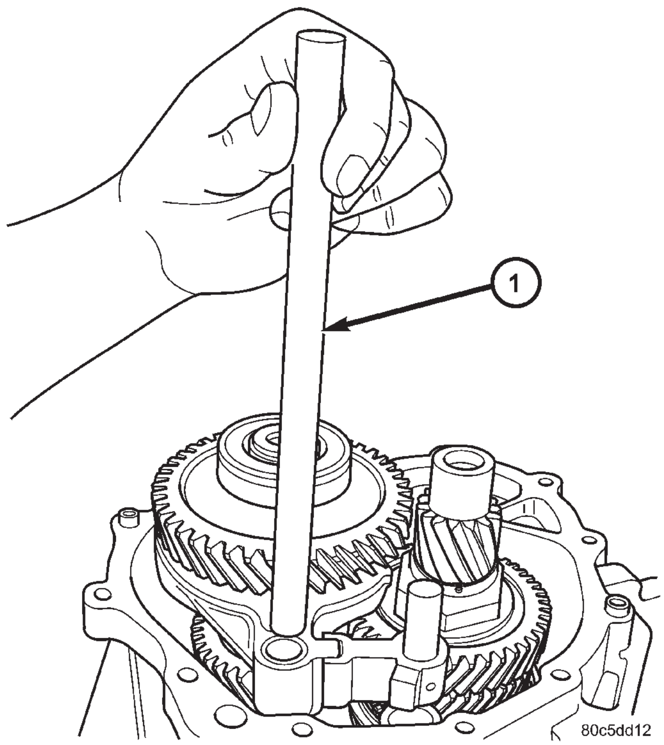

Fig. 40 Shift Rail Installation

1 - 1/2-5/R SHIFT RAIL

(16) Install reverse idler shaft into position (Fig. 41). Install and torque shaft-to-case bolt to 54 N·m (40 ft. lbs.).

(25) Install lifting bar 8489 to geartrain.

T850 MANUAL TRANSAXLE (Continued)

(26) Lift up on bar (input shaft side) and install input shaft bearing snap ring (Fig. 52).

(27) Lift up on bar (intermediate shaft side) and install intermediate shaft bearing snap ring.

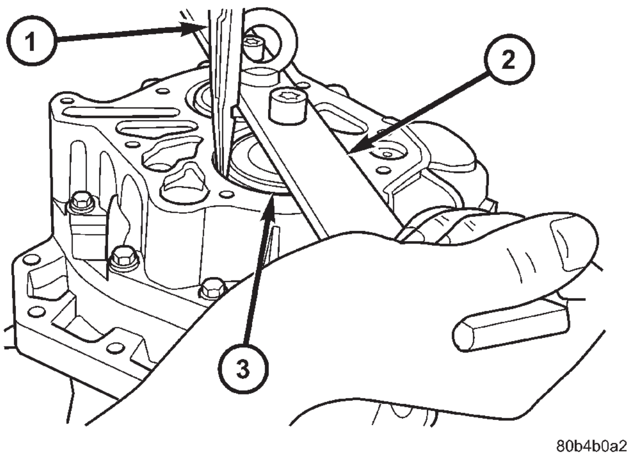

Fig. 52 Input Bearing Snap Ring

1 - SNAP RING PLIERS
2 - LIFTING BAR 8489
3 - SNAP RING

(28) Remove lifting bar 8489.

(29) Install a bead of Mopar® Gear Lube RTV to end plate and immediately install to case. Install and torque bolts to 28 N·m (250 in. lbs.) (Fig. 53).

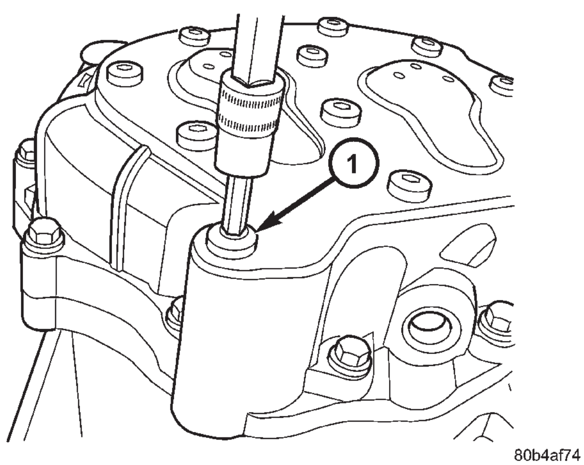

Fig. 53 End Cover Bolts

1 - BOLT (11)

(30) Install back up lamp switch and torque to 23 N·m (17 ft. lbs.) (Fig. 54).

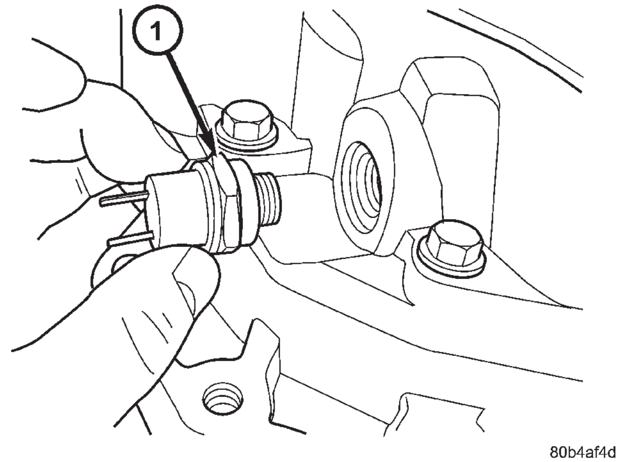

Fig. 54 Back-Up Lamp Switch

1 - BACK-UP LAMP SWITCH

(31) Apply a 1 mm (0.04 in.) bead of Mopar® Gasket Maker to shift cover assembly. Place shift cover and transaxle geartrain into neutral and install shift cover (Fig. 55) and torque bolts to 28 N·m (250 in. lbs.).

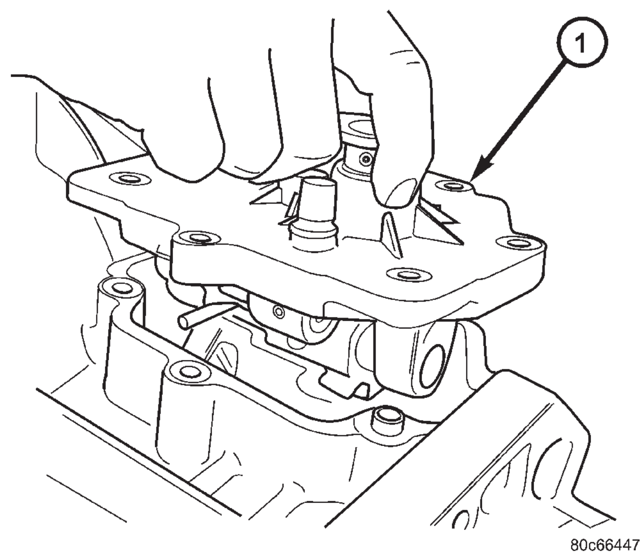

Fig. 55 Shift Cover Removal/Installation

1 - SHIFT COVER ASSEMBLY

T850 MANUAL TRANSAXLE (Continued)

(32) Install input shaft bearing retainer (Fig. 56). Torque bolts to 12 N·m (105 in. lbs.).

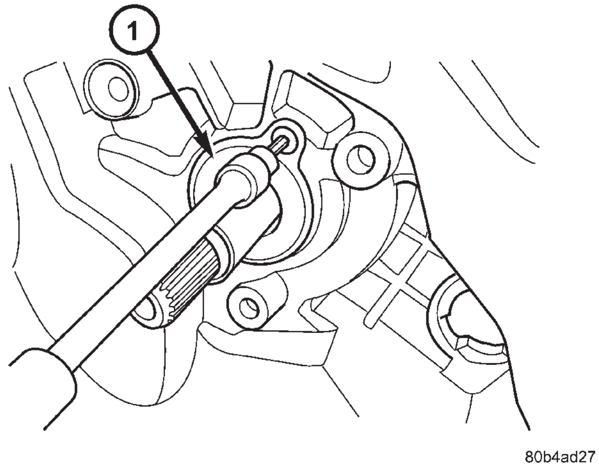

Fig. 56 Input Bearing Retainer

1 - INPUT BEARING RETAINER

(33) If previously removed, install clutch release lever pivot ball(s) using slide hammer C-3752 and remover/installer 6891 (Fig. 57) (Fig. 58).

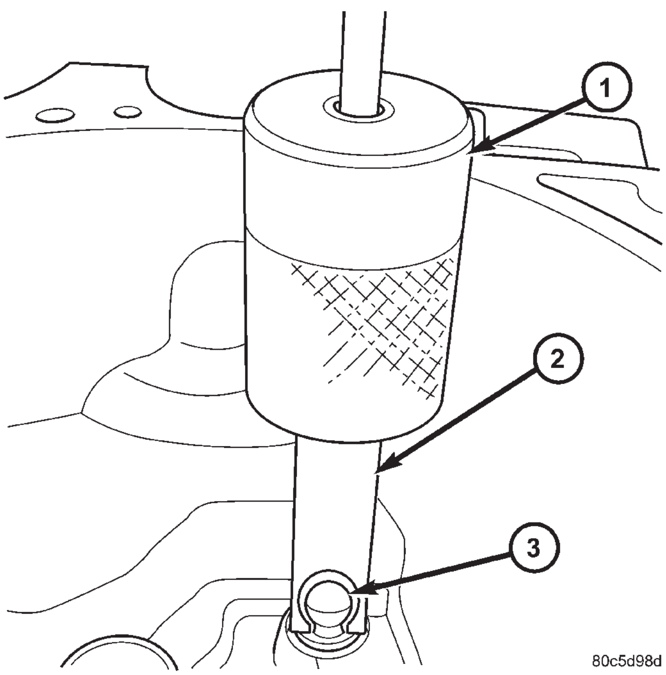

Fig. 57 Pivot Ball Removal/Installation

1 - C-3752 SLIDE HAMMER
2 - REMOVER/INSTALLER 6891
3 - PIVOT BALL

(34) Install clutch release bearing to lever. Apply grease to interface (contact) points. Make sure release bearing retainers engage lever pocket as shown in (Fig. 59).

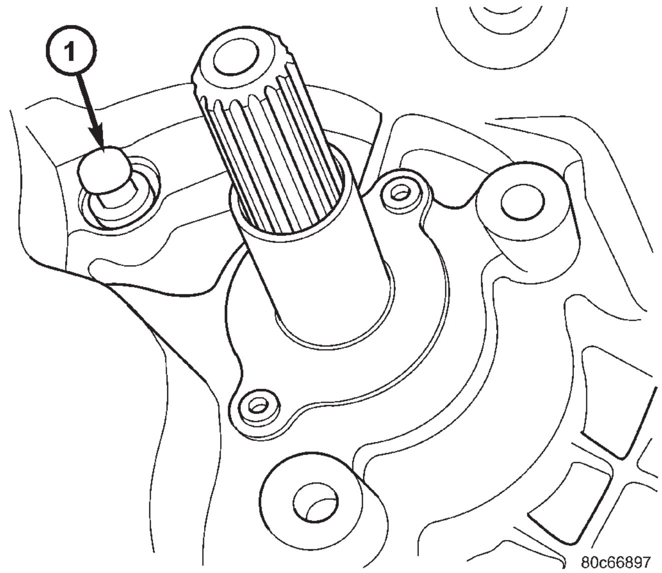

Fig. 58 Pivot Ball Position

1 - PIVOT BALL (1)

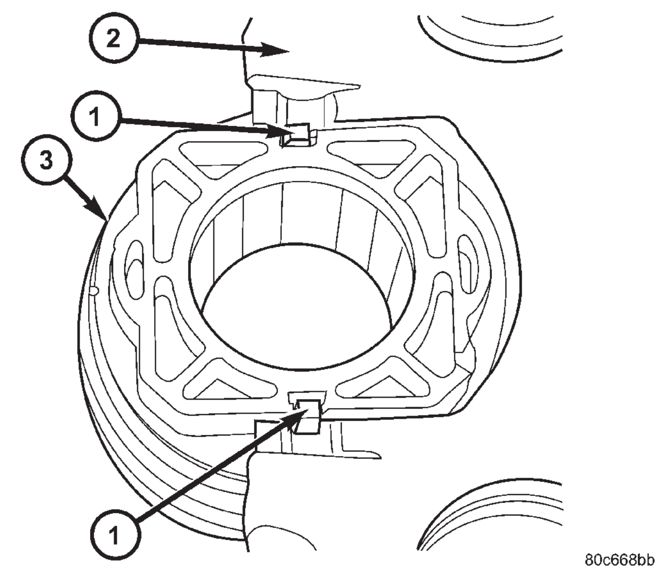

Fig. 59 Release Bearing-to-Lever

1 - RETAINER (2)
2 - RELEASE LEVER
3 - RELEASE BEARING

(35) Apply grease to pivot ball, and on release lever at slave cylinder contact point.

(36) Install clutch release bearing/lever assembly into position by sliding bearing onto input bearing retainer, and using moderate hand pressure to seat release lever to pivot ball (Fig. 60). A “pop” sound should be heard. Verify proper engagement by lightly pulling outward on lever at pivot ball location, and then actuating lever and bearing to ensure proper operation.

T850 MANUAL TRANSAXLE (Continued)

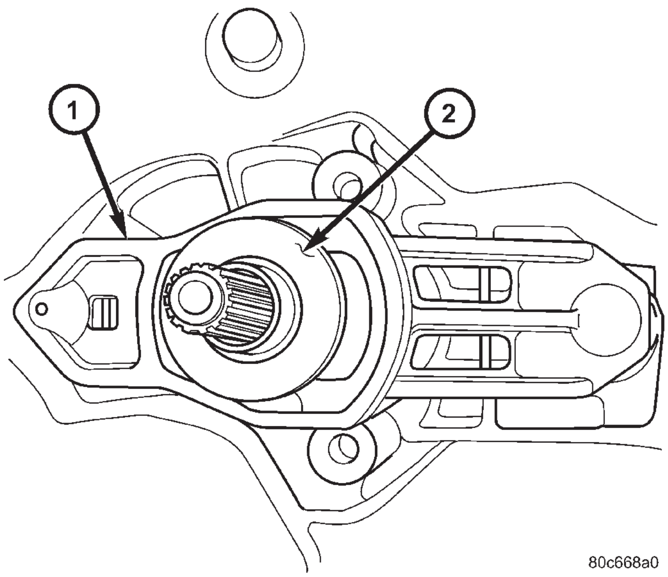

Fig. 60 Release Bearing and Lever

1 - RELEASE LEVER
2 - RELEASE BEARING

INSTALLATION

(1) If previously removed, install modular clutch assembly to input shaft.

(2) Install and secure transaxle to transmission jack, and install transaxle to engine.

(3) Install and torque transaxle bellhousing-to-engine block bolts to 95 N·m (70 ft. lbs.).

(4) Raise engine/transaxle assembly into position. Align transaxle with left mount bracket. Install and torque mount bracket-to-transaxle bolts to 54 N·m (40 ft. lbs.).

(5) Remove transmission jack.

(6) Install and secure ground cable.

(7) Install and torque modular clutch assembly-to-drive plate bolts to 88 N·m (65 ft. lbs.).

(8) Install clutch/drive plate inspection cover.

(9) Install clutch slave cylinder into position, noting orientation of different size lugs. While depressing inward, rotate slave cylinder clockwise until nylon locating tab rests in transaxle case cutout, and the hydraulic tube is vertical.

(10) Install starter motor and install lower bolt. Connect starter motor wire harness.

(11) Connect back-up lamp switch connector.

(12) Install rear mount bracket-to-case bolts. Torque lower (horizontal) bolt to 54 N·m (40 ft. lbs.).

(13) Install front mount/bracket and upper starter bolt.

(14) Install structural collar.

(15) Install halfshaft assemblies. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

(16) Install left wheel opening splash shield.

(17) Check transaxle fluid level. Fill transaxle with suitable amount of Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602). (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/FLUID - STANDARD PROCEDURE)

(18) Lower vehicle.

(19) Connect oxygen sensor harness to front mount bracket.

(20) Torque rear mount bracket-to-case bolts to 54 N·m (40 ft. lbs.).

(21) Install and connect crankshaft position sensor.

(22) Install shift cables to mount perches. Connect to transaxle shift mechanism and install cable retainer clips.

(23) Install throttle body support bracket.

(24) Install air cleaner assembly.

(25) Connect battery negative cable.

AXLE SEALS

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove one or both front halfshaft assemblies. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

(3) Using a suitable screwdriver, remove one or both axle seals (Fig. 61).

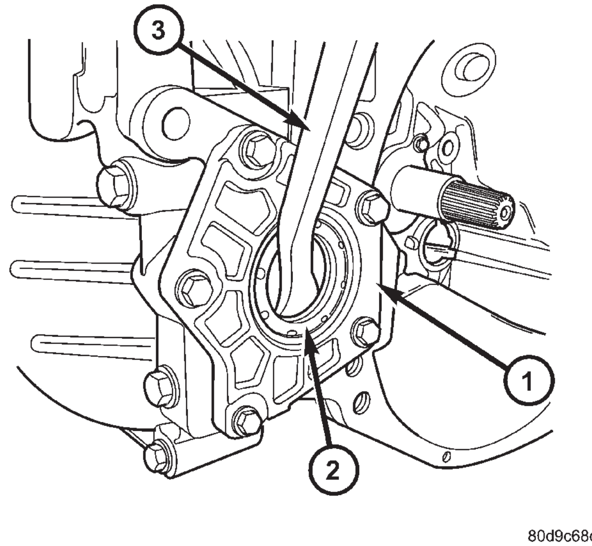

Fig. 61 Axle Seal Removal (Bearing Plate Side)

1 - PLATE
2 - SEAL
3 - SCREWDRIVER

INSTALLATION

(1) Using driver handle C-4171 and installer 8476, install axle seals into position (Fig. 62).

(2) Install one or both front halfshaft assemblies. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

(3) Check transaxle fluid level and adjust if necessary. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/FLUID - STANDARD PROCEDURE)

(4) Lower vehicle.

2 - INSTALLER 8476
3 - DRIVER HANDLE C-4171

BACK-UP LAMP SWITCH

REMOVAL

(1) Raise vehicle on hoist.
(2) Disconnect back-up lamp switch connector.
(3) Remove back-up lamp switch (Fig. 63).

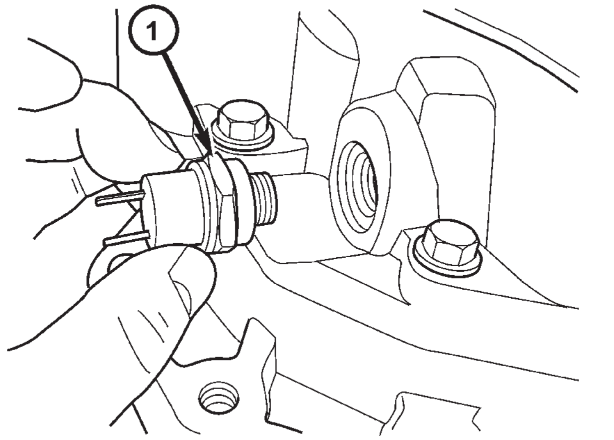

Fig. 63 Back-Up Lamp Switch

1 - BACK-UP LAMP SWITCH

INSTALLATION

(1) Install back-up lamp switch (Fig. 63) and torque to 23 N·m (17 ft. lbs.).
(2) Connect back-up lamp switch connector.
(3) Lower vehicle.

DIFFERENTIAL

DESCRIPTION

The T850 differential is a conventional open design. It consists of a ring gear and a two-piece differential case. The differential case contains the pinion and side gears, three floating pinion shafts, and a pinion shaft retaining ring (Fig. 64). The differential case is supported in the transaxle by tapered roller bearings.

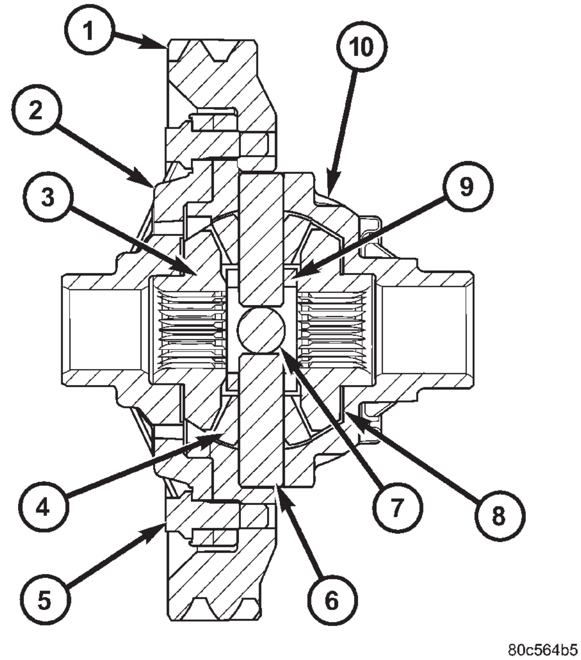

Fig. 64 Differential Assembly

1 - RING GEAR
2 - SUPPORT PLATE
3 - SIDE GEAR (2)
4 - PINION GEAR (4)
5 - BOLT (12)
6 - PINION SHAFT (2-SHORT)
7 - PINION SHAFT (1-LONG)
8 - THRUST WASHER (2)
9 - RETAINING RING
10 - DIFFERENTIAL CASE

OPERATION

The differential assembly is driven by the intermediate shaft via the ring gear. The ring gear drives the differential case, and the case drives the halfshafts through the differential gears. The differential pinion and side gears are supported in the case by pinion shafts and thrust washers. Differential pinion and side gears make it possible for front wheels to rotate at different speeds while cornering.

DIFFERENTIAL (Continued)

DISASSEMBLY

(1) Remove differential side bearings:

(a) Install button 8491-1 to differential case (Fig. 65).

(b) Set up Tool 5048 (5048-1, -4, -6) as shown in (Fig. 66).

(c) Remove differential side bearing (Fig. 67). Same procedure/tools work for both sides.

ADJUSTMENTS

ADJUSTMENT - DIFFERENTIAL TURNING TORQUE

NOTE: Differential turning torque should only be measured with the geartrain out of the transaxle. If measurement is taken with transaxle assembled, an inaccurate measurement will result.

NOTE: All differential cover-to-case bolts and bearing plate-to-case bolts must be installed and torqued to obtain accurate measurement.

(1) If transaxle is assembled, remove geartrain and leave differential in place. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - DISASSEMBLY)

(2) Install differential cover and torque differential cover-to-case bolts to 54 N·m (40 ft. lbs.).

(3) Install extension housing and torque extension housing-to-case bolts to 28 N·m (250 in. lbs.).

(4) Place transaxle on work bench so axle centerline is parallel to the ground.

(5) Install turning torque tool C-4995 to differential at side opposite extension housing.

(6) Using in. lb./N·m dial indicator, rotate differential case multiple times and record measurement (Fig. 91). Differential turning torque should be within 2.3-3.4 N·m (20-30 in. lbs.). Refer to shim chart for proper shim selection. If turning torque measured is less than 2.3 N·m (20 in. lbs.), install a thicker shim. If turning torque measured is greater than 3.4 N·m (30 in. lbs.), install a thinner shim.

DIFFERENTIAL (Continued)

ADJUSTMENT - DIFFERENTIAL SIDE GEAR END PLAY

Measure side gear end play: Insert feeler gauges 180° apart between differential side gear and thrust washer as shown in (Fig. 92). Measurement taken here applies to both sides. Side gear end play should be between 0.025-0.152 mm (0.001-0.006 in.). If clearance is greater than 0.152 mm (0.006 in.), install a thicker thrust washer (both sides). If clearance is less than 0.025 mm (0.001), install a thinner thrust washer (both sides). Refer to (Fig. 93) for available side gear shim thicknesses.

If end play measurement indicates a thrust washer change is necessary, the differential must be disassembled. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/DIFFERENTIAL - DISASSEMBLY)

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL CHECK

NOTE: For proper fluid level check intervals, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

The fluid required in this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602). Use of substitute fluids may result in improper transaxle operation and/or failure.

(1) Raise vehicle on hoist.

(2) Remove transaxle fill plug (Fig. 94).

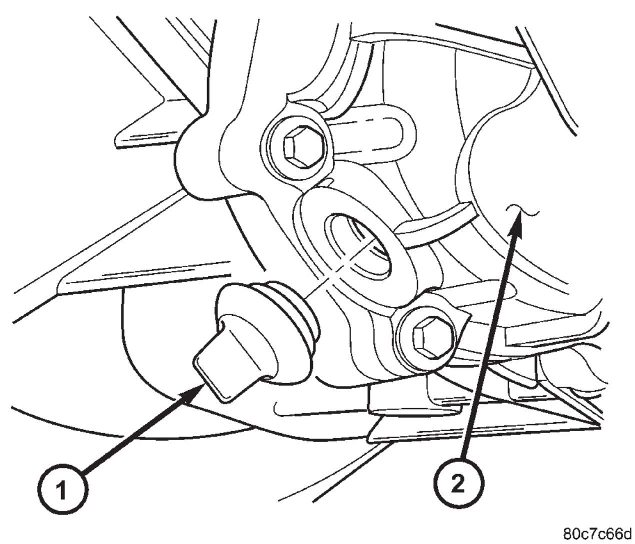

Fig. 94 Transaxle Fill Plug

1 - FILL PLUG
2 - END COVER

(3) Inspect fluid level. Fluid should be within 1/8” below fill hole. Add Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602) as neccessary.

(4) Install fill plug, ensuring it is properly seated.

(5) Lower vehicle.

FLUID (Continued)

STANDARD PROCEDURE - FLUID DRAIN AND FILL

NOTE: For proper fluid change intervals, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

The fluid required in this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602). Use of substitute fluids may result in improper transaxle operation and/or failure.

FLUID DRAIN

(1) Raise vehicle on hoist.

(2) Remove transaxle drain plug (Fig. 95) and drain fluid into suitable container.

(3) Install drain plug and torque to 23 N·m (17 ft. lbs.).

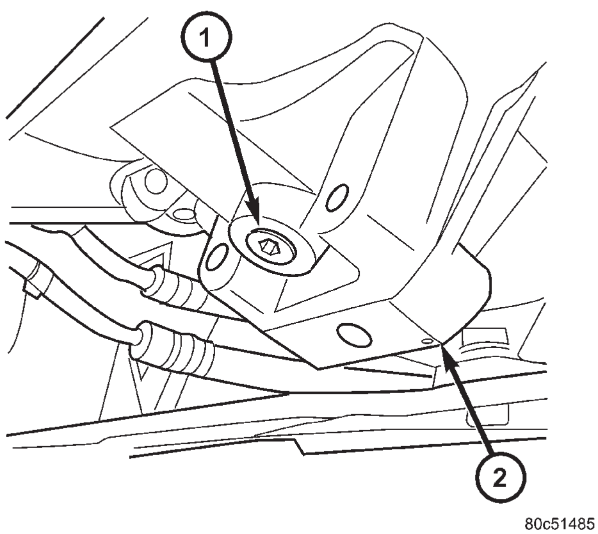

Fig. 95 Transaxle Drain Plug

1 - TRANSAXLE DRAIN PLUG
2 - DIFFERENTIAL COVER

FLUID FILL

(1) Remove transaxle fill plug (Fig. 96).

(2) Add 2.4-2.7L (2.5-2.9 qts.) of Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602) until fluid is within 1/8” below fill hole.

(3) Install fill plug, ensuring it is properly seated.

(4) Lower vehicle.

GEAR SHIFT CABLE

REMOVAL

(1) Disconnect battery negative cable.

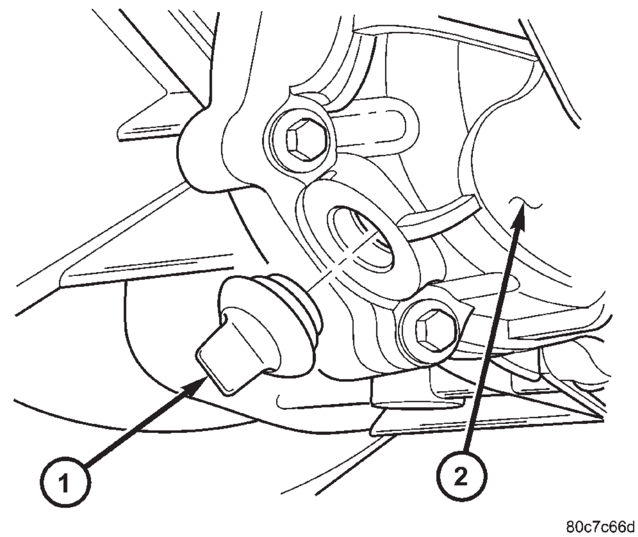

Fig. 96 Transaxle Fill Plug

1 - FILL PLUG
2 - END COVER

(2) Remove gearshift knob/boot assembly. Lift boot off of console and disengage knob retainers to free.

(3) Remove center console assembly (Fig. 97).

1 - CENTER CONSOLE
2 - SCREW
3 - IF EQUIPPED
4 - IF EQUIPPED
5 - PARK BRAKE HANDLE

GEAR SHIFT CABLE (Continued)

(4) Disconnect crossover and selector cables from shift mechanism.

(5) Remove crossover and selector cable retaining clips (Fig. 98) from shift mechanism and disconnect cables.

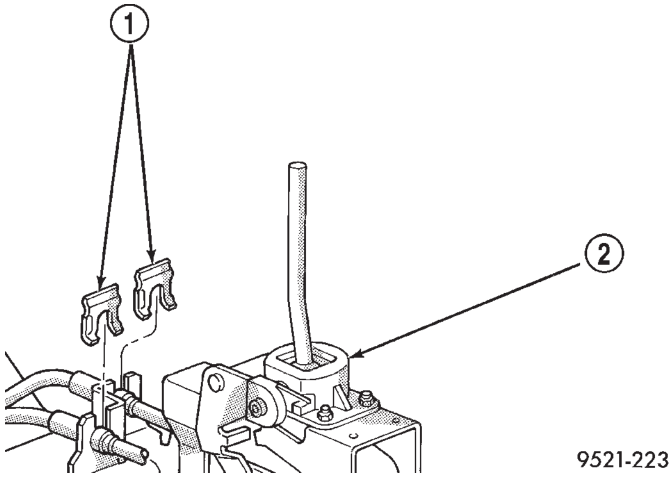

Fig. 98 Cable Retaining Clips

1 - CABLE CLIPS
2 - SHIFTER

(6) Remove air cleaner assembly.

(7) Disconnect crossover and selector cables from transaxle (Fig. 99).

(8) Remove retainer clips and disengage cables from bracket (Fig. 99).

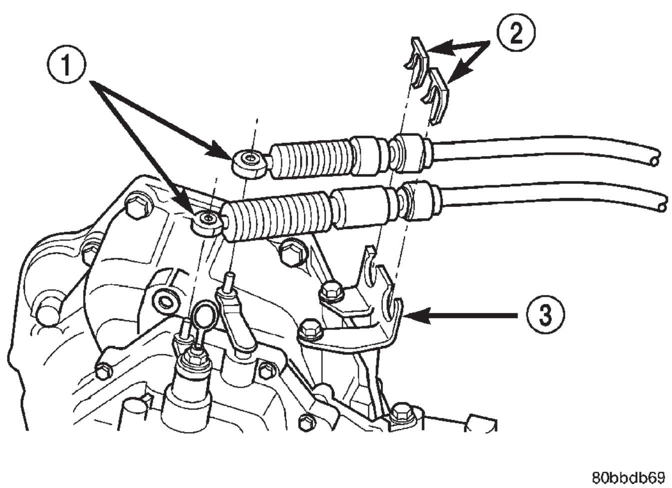

Fig. 99 Shift Cables at Transaxle

1 - SHIFT CABLES
2 - CLIPS
3 - BRACKET

(9) Raise vehicle on hoist.

(10) Remove cable grommet from floor pan.

(11) Pull cables forward and remove from under vehicle.

INSTALLATION

(1) Install gearshift cable assembly into engine compartment from under vehicle.

(2) Feed cable assembly through hole in floor pan and secure grommet to floor pan.

(3) Lower vehicle.

(4) Install gearshift cables to mounting bracket (Fig. 99). Secure with new clips.

(5) Connect gearshift cables to transaxle crossover and selector levers (Fig. 99).

(6) Install air cleaner assembly.

(7) Connect crossover and selector cables to mechanism and secure with clips (Fig. 98).

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(8) **Adjust crossover cable as follows:**

(a) Loosen adjusting screw on crossover cable at shifter (Fig. 100).

(b) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(c) Perform functional check by shifting transaxle into all gears.

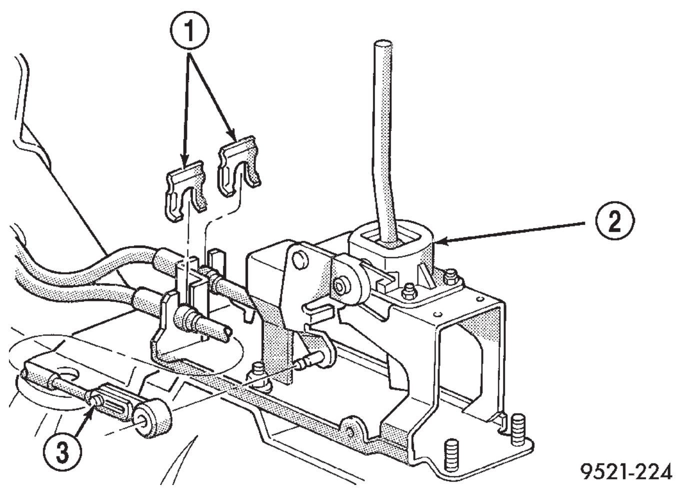

Fig. 100 Crossover and Selector Cables at Shift Mechanism

1 - CABLE CLIPS
2 - SHIFTER
3 - ADJUSTMENT SCREW

GEAR SHIFT CABLE (Continued)

(9) Install center console assembly (Fig. 97).

(10) Install gearshift knob/boot assembly. Ensure knob retaining tabs are secured to shift lever. Snap boot to console at retainer locations.

GEAR SHIFT MECHANISM

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove gearshift knob/boot assembly.

GEAR SHIFT MECHANISM (Continued)

INSTALLATION

(1) Install gear shift mechanism to floor pan (Fig. 103). Install and torque four (4) nuts to 25 N·m (18 ft. lbs.).

(2) Install crossover and selector cables into position. Secure with retaining clips (Fig. 104).

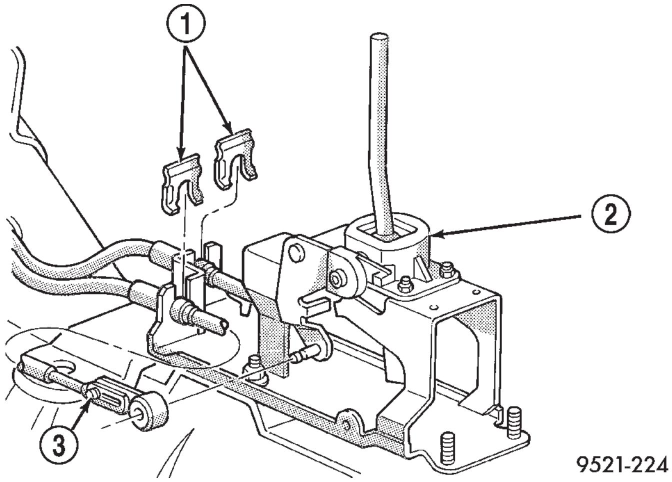

Fig. 104 Crossover and Selector Cables at Shift Mechanism

1 - CABLE CLIPS
2 - SHIFTER
3 - ADJUSTMENT SCREW

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(3) **Adjust crossover cable as follows:**

(a) Loosen adjusting screw on crossover cable at shifter (Fig. 104).

(b) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(c) Perform functional check by shifting transaxle into all gears.

(4) Install center console assembly (Fig. 101).

(5) Install gearshift knob/boot assembly. Ensure knob retaining tabs are secured to shift lever. Snap boot to console at retainer locations.

INPUT SHAFT

DESCRIPTION

The input shaft assembly (Fig. 105) is part of the transaxle geartrain, is driven by the clutch assembly, and consists of the following components:

- Input Mainshaft
- 3rd Speed Gear
- 4th Speed Gear
- 3/4 Synchronizer
- 5th Input Gear

The input shaft meshes with the intermediate shaft, and is supported by a needle bearing at the front of the transaxle, and a sealed roller bearing at the rear of the transaxle.

6 - 5TH GEAR NUT
7 - SNAP RING
8 - INPUT BEARING (SEALED)
9 - SNAP RING
10 - 3/4 SYNCHRONIZER

DISASSEMBLY

NOTE: When servicing the input shaft assembly, all snap rings which are removed MUST be replaced with new snap rings upon reassembly. The 5th gear nut must be replaced also.

(1) Invert input shaft assembly and place in fixture 8487.

(2) Remove input bearing snap ring (Fig. 106).

(3) Remove input bearing. Place input shaft assembly onto arbor press table, with the input bearing supported by bearing splitter (Fig. 107). Using adapter 8486-4, press bearing off of shaft, while helper supports shaft to prevent dropping.

(4) Place input shaft assembly back into fixture 8487. Secure fixture to bench with fasteners, or secure to bench vise.

NOTE: 5th gear nut is staked to the shaft. If necessary, grind stake area to ease removal, but use care not to contact gear.

(12) Remove 3rd gear (Fig. 115).

(13) Inspect third gear thrust washer for signs of excessive wear. To replace, drive off of input shaft with suitable drift and hammer.

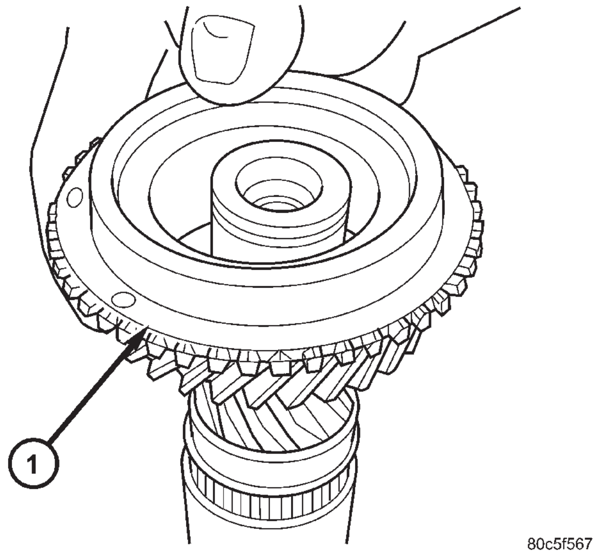

Fig. 115 3rd Gear Removal/Installation

1 - 3RD GEAR

ASSEMBLY

NOTE: When servicing the input shaft assembly, all snap rings MUST be replaced with new ones upon assembly. 5th gear nut must also be replaced.

NOTE: When installing 3/4 synchronizer hub to shaft, make sure to align oil slots on synchronizer hub face with oil hole in the shaft splined hub journal.

NOTE: Refer to (Fig. 116) for input shaft assembly reference.

18 - 1/2 SYNCHRO

The intermediate shaft assembly (Fig. 128) is part of the transaxle geartrain, meshes with and is driven by the input shaft, drives the differential via an integrated pinion gear, and consists of the following components:

- Intermediate Mainshaft
- 1st Speed Gear
- 2nd Speed Gear
- 3/4 Cluster Gear
- 5th Speed Gear
- Reverse Gear
- 1/2 Synchronizer
- 5/R Synchronizer

The intermediate shaft is supported by a caged roller bearing at the front of the transaxle, and a sealed roller bearing at the rear of the transaxle.

DISASSEMBLY

CAUTION: Do not re-use snap rings when servicing the intermediate shaft assembly. Discard upon disassembly and install new ones provided with available snap ring service kit.

(1) Install intermediate shaft assembly to arbor press table with bearing splitter P-334 under the reverse gear.

(2) Install 8486-4 button to intermediate shaft. Using arbor press ram, press reverse gear and inter-

SHIFT COVER

DESCRIPTION

The shift cover assembly (Fig. 175) (Fig. 176) is operated by the gearshift crossover and selector cables, and operates the shift fork/shaft system. It consists of crossover and selector lever mechanisms, transaxle vent, a main shift selector shaft, and the 5-R blockout mechanism. The shift cover is only serviced as an assembly.

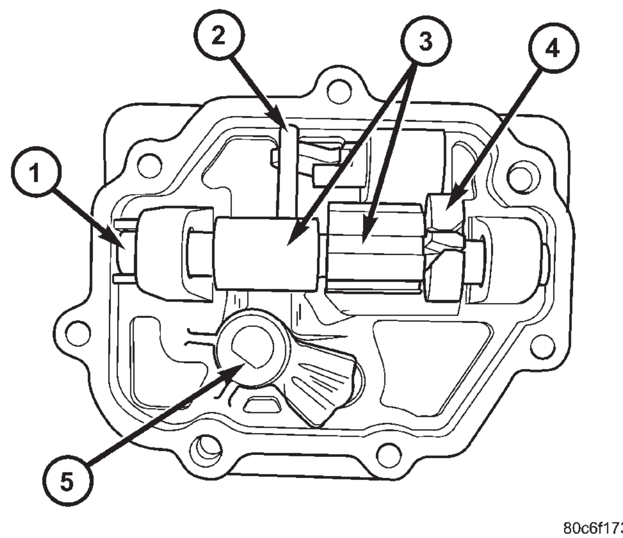

Fig. 176 Shift Cover Assembly Components

1 - SHAFT
2 - 5-R BLOCKOUT PIN/CAM

4 - SHIFT BLOCKER
5 - SELECTOR LEVER/DETENT

SHIFT FORK AND SHAFT

DESCRIPTION

The T850 utilizes a unique shift fork and shaft arrangement consisting of three shift forks and two shafts as shown in (Fig. 177). This system is operated by the shift cover assembly, which combined with a unique gearshift cable design, offers a higher mechanical advantage over traditional shift systems. This arrangement results in less friction and lower shift cable loads for smoother, more positive operation. The shift fork assemblies are constructed of brass, float about the shafts with the aid of needle bearings, and are serviced only as fork/bearing assemblies.

5 - 1/2 FORK

SYNCHRONIZER

DESCRIPTION

The T850 transaxle uses two styles of synchronizer assemblies; a conventional single-cone style is used for the 5th/Reverse and 3rd/4th applications (Fig. 178), and a dual-cone style for the 1st/2nd gear application (Fig. 179).

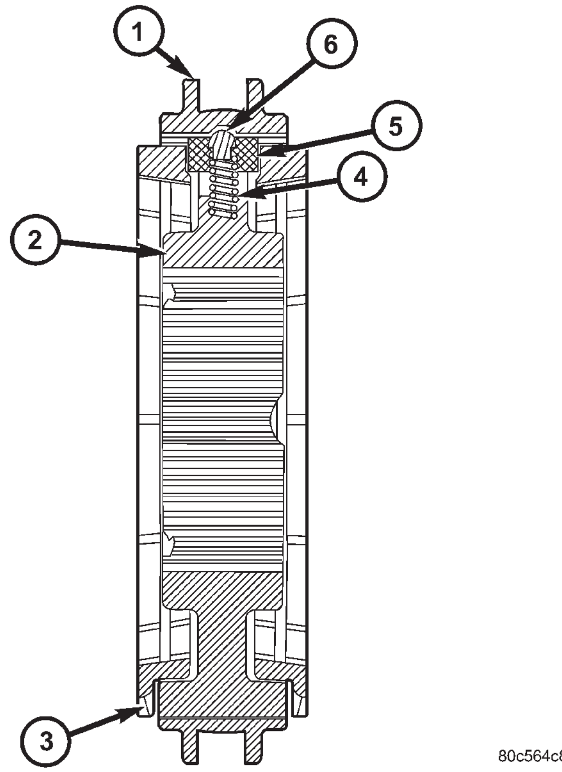

Fig. 178 3/4-5/R Synchronizer Assembly

2 - REACTOR RING (2)
3 - HUB
4 - BLOCKER RING (2)
5 - FRICTION CONE (2)
6 - SPRING (3)
7 - KEY (3)
8 - BALL (3)

DISASSEMBLY

Place synchronizer in a clean shop towel and wrap. Press on inner hub. Carefully open up shop towel and remove springs, balls, keys, hub, and sleeve.

CLEANING

CLEAN

Do not attempt to clean the blocking rings in solvent. The friction material will become contaminated. Place synchronizer components in a suitable holder and clean with solvent. Air dry.

INSPECTION

INSPECT

Proper inspection of components involve:

- Teeth, for wear, scuffed, nicked, burred, or broken teeth
- Keys, for wear or distortion
- Balls and springs, for distortion, cracks, or wear

If any of these conditions exist in these components, replace as necessary.

ASSEMBLY

(1) Position synchronizer hub onto work bench. Hub is non-directional.

(2) Install springs into hub slot.

(3) Insert key into hub and spring.

(4) Apply petroleum jelly to the hole in the key. Insert balls into each key.

(5) Slide sleeve over the hub and depress balls as you carefully slip the sleeve into position.

41TE AUTOMATIC TRANSAXLE

TABLE OF CONTENTS

41TE AUTOMATIC TRANSAXLE

DESCRIPTION

The 41TE (Fig. 1) is a four-speed transaxle that is a conventional hydraulic/mechanical assembly with an integral differential, and is controlled with adaptive electronic controls and monitors. The hydraulic system of the transaxle consists of the transaxle fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transaxle consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly
- Integral differential assembly

Control of the transaxle is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Transmission Control Module (TCM).

The TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB scan tool.

41TE AUTOMATIC TRANSAXLE (Continued)

TRANSAXLE IDENTIFICATION

The 41TE transaxle is identified by a barcode label that is fixed to the transaxle case as shown in (Fig. 2).

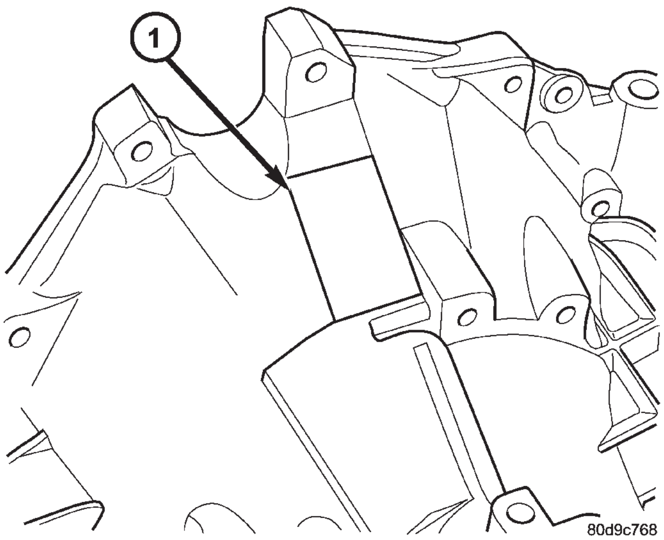

Fig. 2 Transaxle Identification Label

1 - IDENTIFICATION LABEL

The label contains a series of digits that can be translated into useful information such as transaxle part number, date of manufacture, manufacturing origin, plant shift number, build sequence number, etc. Refer to (Fig. 3) for identification label breakdown.

If the tag is not legible or missing, the “PK” number, which is stamped into the transaxle case behind the transfer gear cover, can be referred to for identification. This number differs slightly in that it contains the entire transaxle part number, rather than the last three digits.

OPERATION

Transmission output is directed to an integral differential by a transfer gear system in the following input-to-output ratios:

First . . . . 2.84 : 1
Second . . . . 1.57 : 1
Third . . . . 1.00 : 1
Overdrive . . . . 0.69 : 1
Reverse . . . . 2.21 : 1

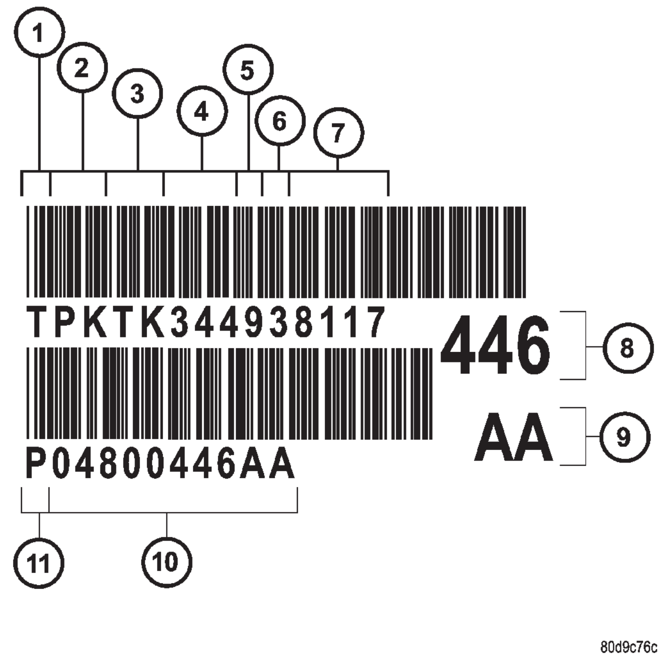

Fig. 3 Identification Label Breakdown

1 - T=TRACEABILITY
2 - SUPPLIER CODE (PK=KOKOMO)
3 - COMPONENT CODE (TK=KOKOMO TRANSMISSION)
4 - BUILD DAY (344=DEC. 9)
5 - BUILD YEAR (9=1999)
6 - LINE/SHIFT CODE (3=3RD SHIFT)
7 - BUILD SEQUENCE NUMBER
8 - LAST THREE OF P/N
9 - NIK
10 - TRANSAXLE PART NUMBER
11 - P=PART NUMBER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 41TE TRANSAXLE GENERAL DIAGNOSIS

NOTE: Before attempting any repair on a 41TE four-speed automatic transaxle, check for diagnostic trouble codes (DTC’s) using the DRB scan tool. Refer to the Transmission Diagnostic Procedures Manual.

41TE AUTOMATIC TRANSAXLE (Continued)

Transaxle malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transaxle cleaning.

Slipping clutches can be isolated by comparing the “Elements in Use” chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transaxle in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse
P - PARK					X
R - REVERSE			X		X
N - NEUTRAL					X
OD - OVERDRIVE First	X				X
Second	X			X	
Direct	X	X			
Overdrive		X		X	
D - DRIVE* First	X				X
Second	X			X	
Direct	X	X			
L - LOW* First	X				X
Second	X			X	
Direct	X	X			
* Vehicle upshift and downshift speeds are increased when in these selector positions.					

41TE AUTOMATIC TRANSAXLE (Continued)

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TESTS

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most hydraulic transaxle problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows front wheels to turn, and position tachometer so it can be read.

Attach 300 psi gauge (C-3293SP) to port(s) required for test(s) being conducted. Use adapter set L-4559 to adapt gauge(s) to transaxle.

Test port locations are shown in (Fig. 4).

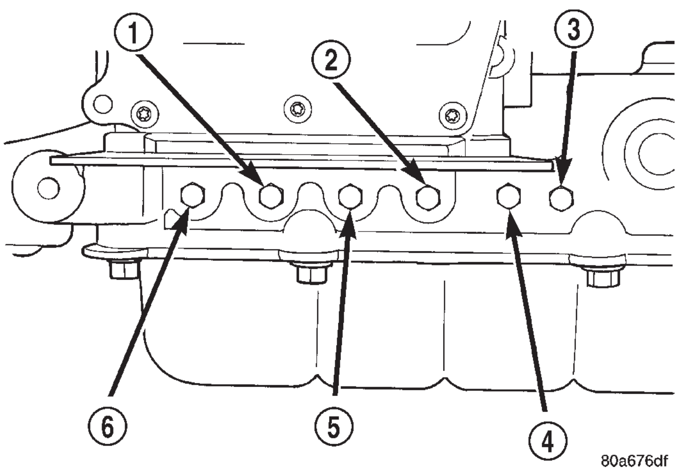

Fig. 4 Pressure Taps

1 - OVERDRIVE CLUTCH
2 - TORQUE CONVERTER OFF
3 - LOW/REVERSE CLUTCH
4 - 2/4 CLUTCH
5 - REVERSE CLUTCH
6 - UNDERDRIVE CLUTCH

TEST ONE-SELECTOR IN LOW (1st GEAR)

(1) Attach pressure gauge to the low/reverse clutch tap.

(2) Move selector lever to the (L) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.

(4) Low/reverse clutch pressure should read 115 to 145 psi.

(5) This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

TEST TWO-SELECTOR IN DRIVE (2nd GEAR)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.

(2) Move selector lever to the 3 position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.

(4) In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A–SELECTOR IN OD (4th Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.

(4) Underdrive clutch pressure should read below 5 psi. If not, then either the solenoid assembly or TCM is at fault.

TEST THREE-OVERDRIVE CLUTCH CHECK (3rd and 2nd Gear)

(1) Attach gauge to the overdrive clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph. Vehicle should be in 3rd gear.

(4) Overdrive clutch pressure should read 74 to 95 psi.

(5) Move selector lever to the (3) position and increase indicated vehicle speed to 30 mph.

(6) The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

(7) This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

TEST FOUR-SELECTOR IN OVERDRIVE (4th Gear)

(1) Attach gauge to the 2/4 clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in 4th gear.

(4) The 2/4 clutch pressure should read 75 to 95 psi.

(5) This test checks the 2/4 clutch hydraulic circuit.

41TE AUTOMATIC TRANSAXLE (Continued)

TEST FIVE-SELECTOR IN OVERDRIVE (4th Gear-CC on)

(1) Attach gauge to the torque converter clutch off pressure tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

(4) Torque converter clutch off pressure should be less than 5 psi.

(5) This test checks the torque converter clutch hydraulic circuit.

TEST SIX-SELECTOR IN REVERSE

(1) Attach gauges to the reverse and LR clutch tap.

(2) Move selector lever to the (R) position.

(3) Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.

(4) Reverse and LR clutch pressure should read 165 to 235 psi.

(5) This test checks the reverse clutch hydraulic circuit.

TEST RESULT INDICATIONS

(1) If proper line pressure is found in any one test, the pump and pressure regulator are working properly.

(2) Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.

(3) Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.

(4) If the overdrive clutch pressure is greater than 5 psi in Step 4 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.

(5) If the underdrive clutch pressure is greater than 5 psi in Step 4 of Test Two A, a defective solenoid assembly or TCM is the cause.

PRESSURE CHECK SPECIFICATIONS

Gear Selector Position	Actual Gear	Pressure Taps					
		Underdrive Clutch	Overdrive Clutch	Reverse Clutch	Torque Converter Clutch Off	2/4 Clutch	Low/ Reverse Clutch

 # CAUTION: Both front wheels must be turning at the same speed.

41TE AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure (Fig. 5) (Fig. 6). The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed and Tool 6056 installed. To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

Remove oil pan and valve body. See Valve body removal.

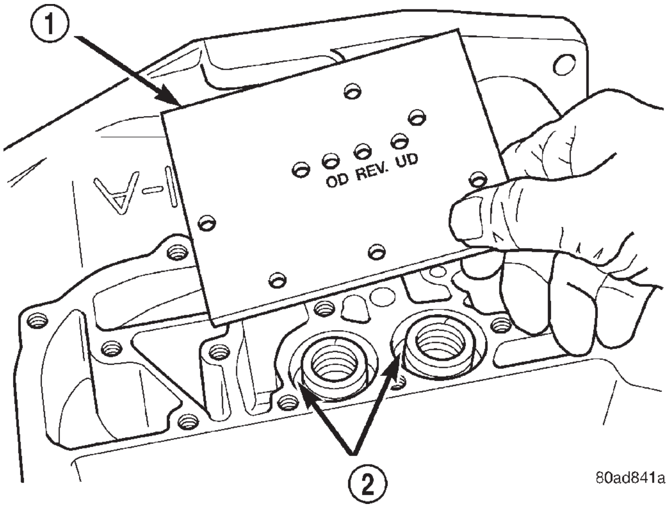

Fig. 5 Air Pressure Test Plate

1 - TOOL 6056
2 - ACCUMULATORS

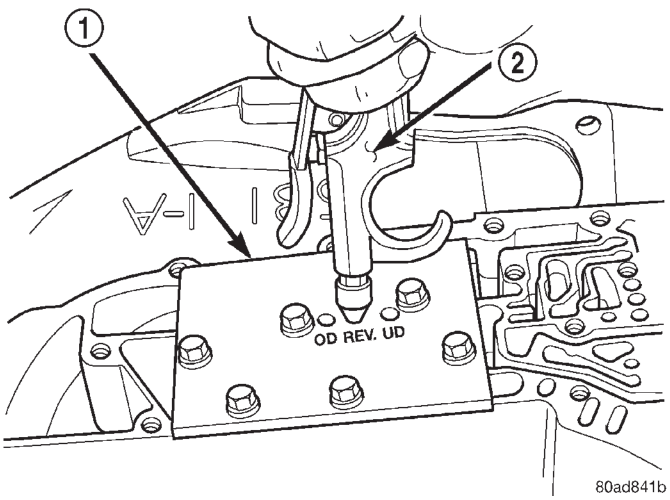

Fig. 6 Testing Reverse Clutch

1 - TOOL 6056
2 - AIR NOZZLE

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer. Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole (rear of case, between 2 bolt holes). Then, look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied to the low/reverse and the 2/4 clutches. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

DIAGNOSIS AND TESTING - TORQUE CONVERTER HOUSING FLUID LEAKAGE

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

(1) Verify proper transmission fluid level.

(2) Verify that the leak originates from the converter housing area and is transmission fluid.

(3) Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (Fig. 7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

41TE AUTOMATIC TRANSAXLE (Continued)

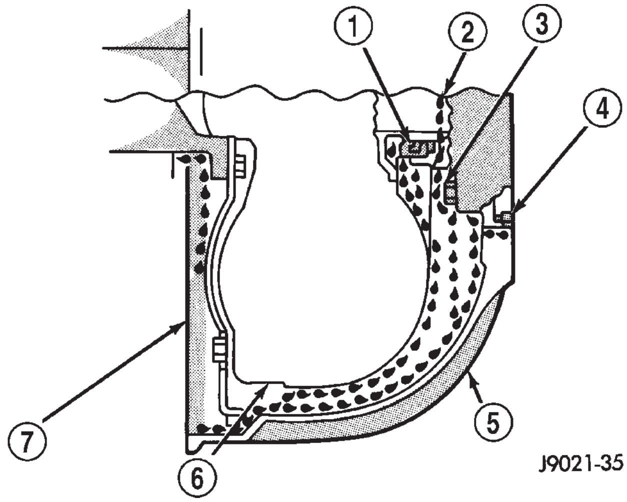

Fig. 7 Converter Housing Leak Paths

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter (Fig. 7). Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing (Fig. 7).

TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (Fig. 8).
- Torque converter hub weld (Fig. 8).

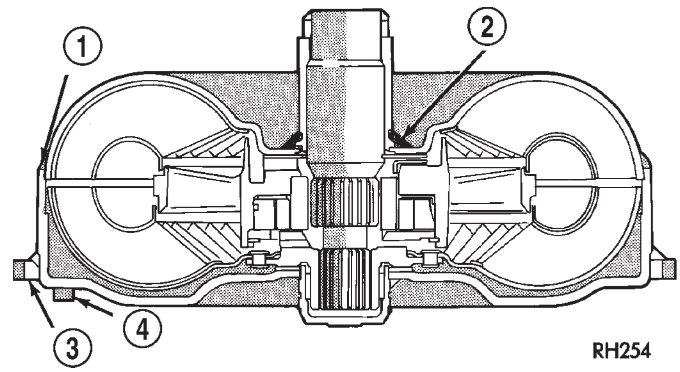

Fig. 8 Converter Leak Points - Typical

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD

REMOVAL

NOTE: If transaxle assembly is being replaced or overhauled (clutch and/or seal replacement), it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery cable.
(2) Remove air cleaner assembly.
(3) Remove dipstick tube. Plug hole to prevent debris from entering transaxle.
(4) Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with fittings. Plug lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.
(5) Disconnect Solenoid/Pressure Switch Assy. connector.
(6) Disconnect Transmission Range Sensor connector.
(7) Disconnect Input Speed Sensor connector.
(8) Disconnect Output Speed Sensor connector.
(9) Disconnect shift cable from manual valve lever and bracket.
(10) Disconnect Crankshaft Position Sensor.
(11) Remove throttle body support bracket.
(12) Disconnect Oxygen Sensor harness retainer from transaxle case.

41TE AUTOMATIC TRANSAXLE (Continued)

(13) Remove rear mount bracket-to-transaxle case bolts.

(14) Remove starter upper bracket-to-block bolt.

(15) Raise vehicle.

(16) Remove halfshafts. Refer to Differential and Driveline.

(17) Remove rear mount bracket lower bolt.

(18) Remove rear mount thru-bolt.

(19) Remove rear mount-to-cross member bolts.

(20) Remove rear mount and bracket.

(21) Remove front mount thru-bolt.

(22) Remove front mount to radiator lower cross-member bolts.

(23) Remove front mount bracket to block and transaxle.

(24) Remove front mount bracket and mount.

(25) Remove starter lower bolt and starter motor assembly.

(26) Remove converter dust shield.

(27) Remove torque converter bolts.

(28) Support engine/transaxle with screw jack and wood block on engine oil pan.

(29) Remove left mount bracket-to-transaxle bolts.

(30) Carefully lower engine/transaxle assembly to gain access to and remove transaxle-to-engine bolts.

(31) With aid of helper or transmission jack, remove transaxle assembly from vehicle.

DISASSEMBLY

CAUTION: If transaxle failure has occurred, it is necessary to flush the transaxle oil cooler and lines to remove debris and particles that could contaminate and/or fail a new or rebuilt unit. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

NOTE: If transaxle is being overhauled (clutch and/or seal replacement) or replaced, it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

NOTE: This procedure does not include final drive (differential) disassembly.

(1) Remove input and output speed sensors.

(2) Remove three (3) solenoid/pressure switch assembly-to-case bolts.

(3) Remove solenoid/pressure switch assembly and gasket (Fig. 9).

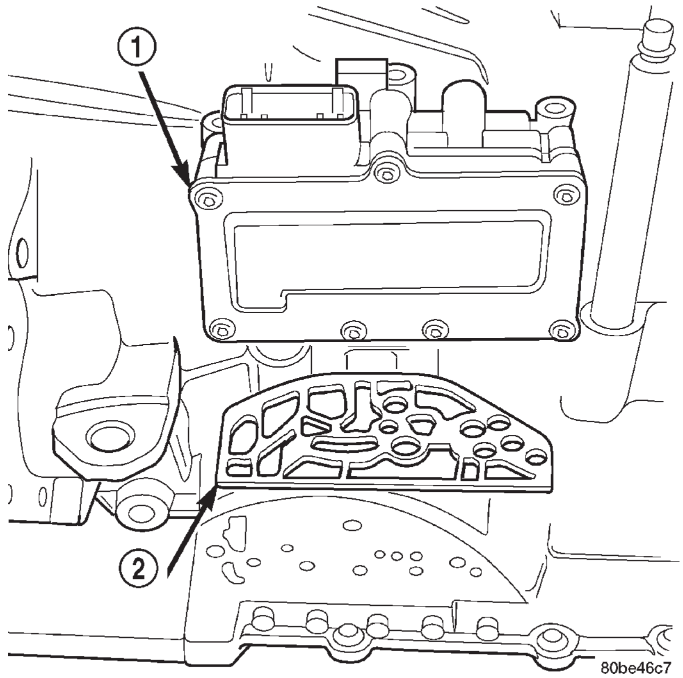

Fig. 9 Solenoid/Pressure Switch Assembly and Gasket

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

(4) Remove oil pan-to-case bolts (Fig. 10).

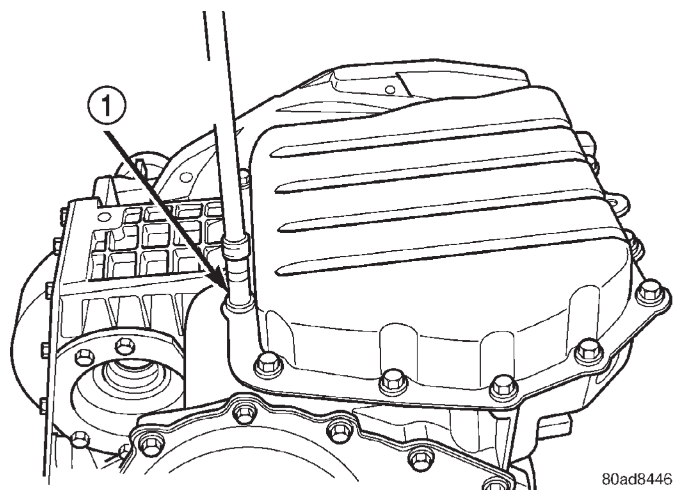

Fig. 10 Remove Oil Pan Bolts

2 - HANDLE C-4171
3 - TOOL 5052
4 - OUTPUT GEAR

(14) **OUTPUT GEAR BEARING ADJUSTMENT:**

(a) With output gear removed, install a 4.50 mm (0.177 in.) gauging shim (Fig. 97) on the rear carrier assembly hub, using grease to hold the shim in place.

(b) Using Tool 6259, install output gear and bearing assembly. Torque to 271 N·m (200 ft. lbs.).

(c) Measure bearing end play. Attach Tool L-4432 to the gear (Fig. 96).

(d) Push and pull the gear while rotating back and forth to ensure seating of bearing rollers.

(e) Using a dial indicator mounted to the transaxle case, measure output gear end play as shown in (Fig. 96).

(f) Refer to the output gear bearing shim chart for the required shim to obtain proper bearing setting.

(g) Use Tool 6259 to remove the output gear retaining bolt and washer. To remove the output gear, use Tool L4407A.

(h) Remove the gauging shim and install the proper shim determined by the chart. Use grease to hold the shim in place.

(31) **TRANSFER GEAR BEARING ADJUSTMENT:**

(a) Install a 4.66 mm (0.184 in.) gauging shim on the transfer shaft (Fig. 114).

(b) Install transfer shaft gear using Tool 6261. Using Tool 6259, install transfer shaft gear retaining nut to 271 N·m (200 ft. lbs.).

(c) Measure end play. Attach Tool L4432 to the transfer gear.

(d) Mount a steel ball with grease into the end of the transfer shaft.

(e) Push and pull the gear while rotating back and forth to ensure seating of the bearing rollers.

(f) Using a dial indicator, measure transfer shaft end play.

(g) Refer to the transfer shaft bearing shim chart for the required shim combination to obtain the proper bearing setting.

(h) Use Tool 6259 to remove the retaining nut and washer. Remove the transfer shaft gear using Tool L4407A.

(i) Remove the gauging shim (Fig. 114) and install the proper shim indicated by the chart.

(46) Using tool 5058, compress 2/4 clutch return spring just enough to install snap ring (Fig. 130).

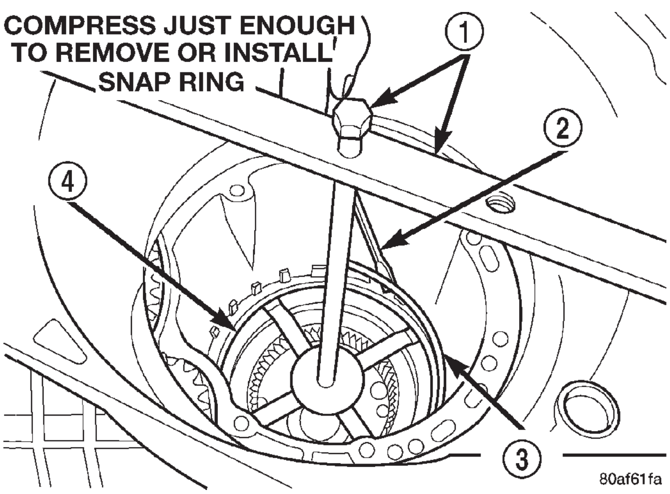

Fig. 130 Install 2/4 Clutch Retainer Snap Ring

1 - TOOL 5058
2 - SCREWDRIVER
3 - SNAP RING
4 - 2/4 CLUTCH RETAINER

(47) Install snap ring.

(48) Set up dial indicator as shown in (Fig. 131) and measure 2/4 clutch clearance. Press down on clutch pack with finger and zero dial indicator. **2/4 clutch pack clearance is 0.76-2.64 mm (0.030-0.104 in.).** Set up indicator and record measurement in four (4) places. Take average of readings. If clearance is outside this range, the clutch is assembled improperly. **There is no adjustment for 2/4 clutch clearance.**

(49) Install rear sun gear and #7 needle bearing (Fig. 133).

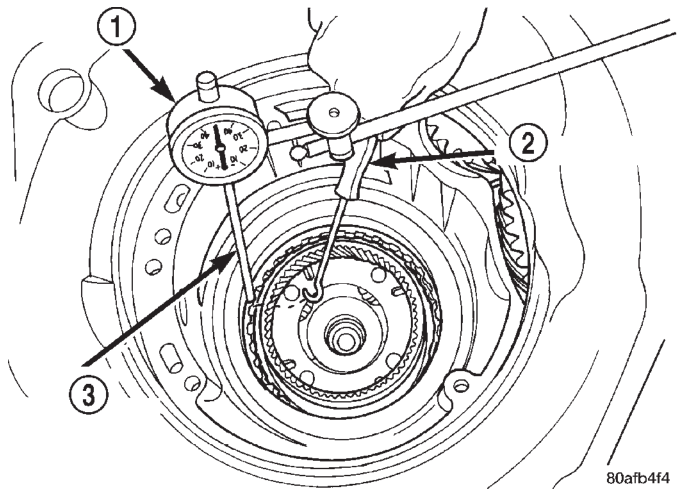

Fig. 131 Check 2/4 Clutch Clearance

1 - DIAL INDICATOR
2 - HOOK TOOL
3 - DIAL INDICATOR TIP TOOL 6268

NOTE: The number seven needle bearing has three anti-reversal tabs and is common with the number five and number two position. The orientation should allow the bearing to seat flat against the rear sun gear (Fig. 132). A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

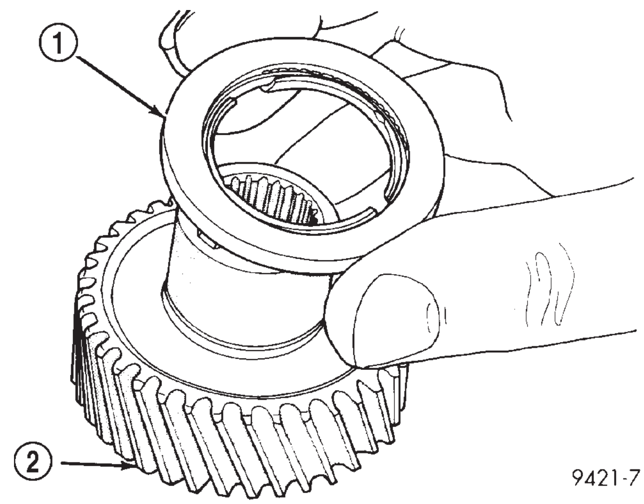

Fig. 132 Number 7 Bearing

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

(50) Install front carrier/rear annulus assembly and #6 needle bearing (Fig. 134).

(51) Install front sun gear assembly and #4 thrust washer (Fig. 135).

2 - REAR SUN GEAR

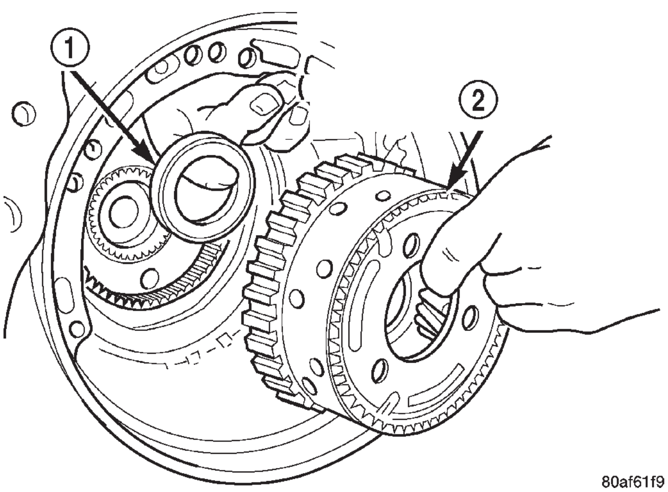

Fig. 134 Install Front Carrier and Rear Annulus Assembly

1 - #6 NEEDLE BEARING
2 - FRONT CARRIER AND REAR ANNULUS ASSEMBLY (TWIST AND PULL OR PUSH TO REMOVE OR INSTALL).

(52) **DETERMINING #4 THRUST PLATE THICKNESS / INPUT SHAFT END PLAY:**

(a) Select the thinnest #4 thrust plate thickness and install to input clutch assembly (Fig. 136). Use petrolatum to retain.

(b) Install input clutch assembly into position and verify that it is completely seated by viewing through input speed sensor hole. If view through input speed sensor hole is not as shown in (Fig. 137), the input clutch assembly is not seated properly.

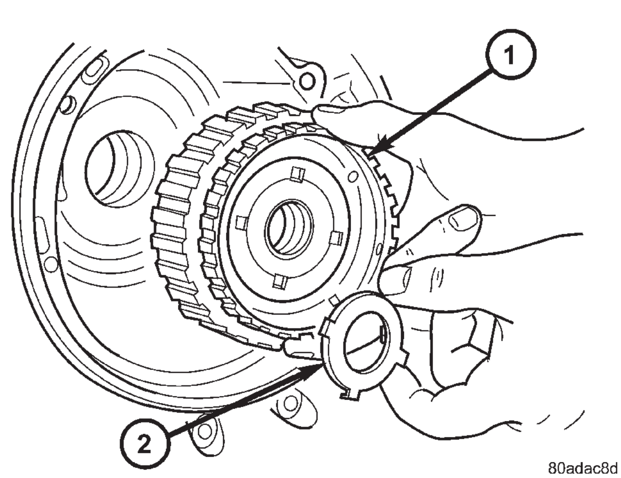

Fig. 135 Install Front Sun Gear Assembly

1 - FRONT SUN GEAR ASSEMBLY
2 - #4 THRUST WASHER (FOUR TABS)

(c) Remove oil pump o-ring (Fig. 138). **Be sure to reinstall oil pump o-ring after selecting the proper #4 thrust plate.**

(d) Set up input shaft for measurement with Indicator Set C3339 and End Play Set 8266 as shown in (Fig. 139).

(e) Measure the input shaft end play with the transaxle in the vertical position. **Input shaft end play must be within 0.005 to 0.025 inch.** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch which is within specifications.

(f) Refer to the No. 4 thrust plate chart to select the proper No. 4 thrust plate:

(68) Install solenoid/pressure switch assembly and gasket to case (Fig. 156).

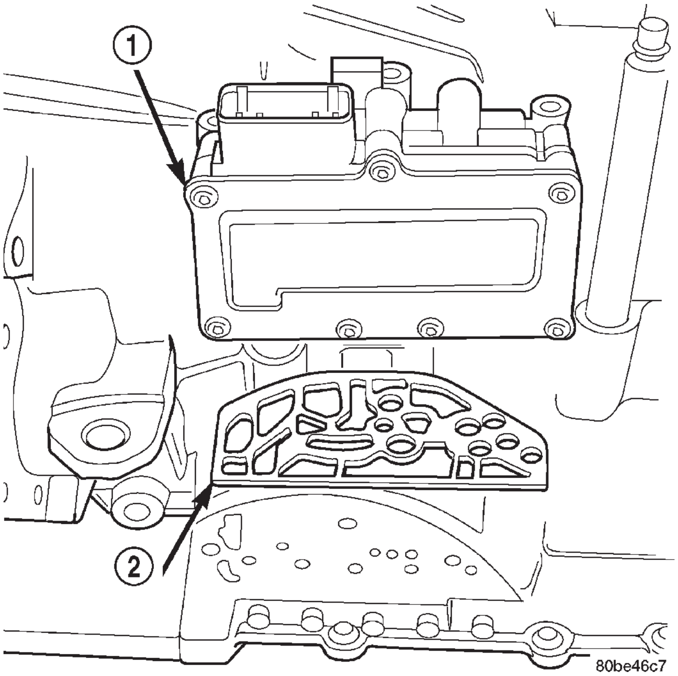

Fig. 156 Solenoid/Pressure Switch Assembly and Gasket

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

(69) Install and tighten solenoid/pressure switch assembly-to-transaxle case bolts to 12 N·m (110 in. lbs.) (Fig. 157).

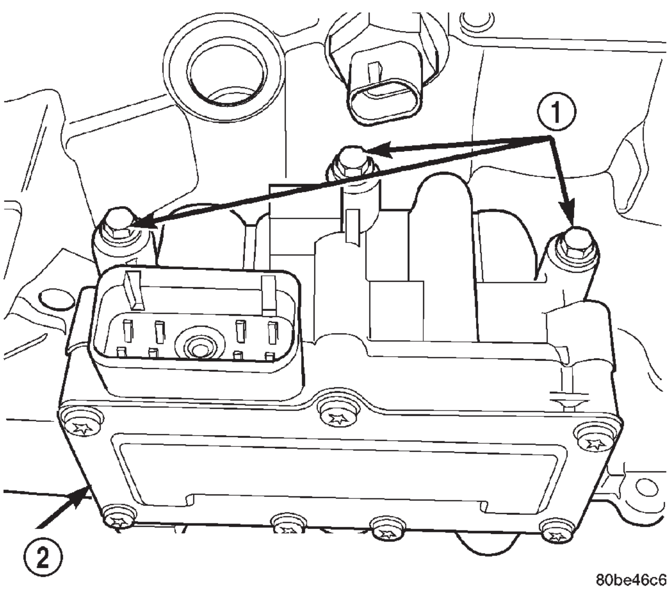

Fig. 157 Attaching Bolts

1 - BOLTS
2 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

(70) Install and torque input and output speed sensors to case to 27 N·m (20 ft. lbs.).

INSTALLATION

(1) Install transaxle to engine. Install and torque transaxle-to-engine bolts to 95 N·m (70 ft. lbs.).
(2) Install upper mount to transaxle.
(3) Raise engine/transaxle assembly into position and install thru bolt. Torque thru bolt to 70 N·m (55 ft. lbs.).
(4) Remove transmission jack and screw jack.
(5) Install torque converter bolts.
(6) Install torque converter dust shield.
(7) Install starter motor assembly and lower bolt.
(8) Install front mount/bracket assembly.
(9) Install rear mount/bracket assembly.
(10) Install halfshafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)
(11) Lower vehicle.
(12) Install starter upper bracket-to-block bolt.
(13) Connect oxygen sensor harness connector.
(14) Install throttle body support bracket (if equipped).
(15) Connect crankshaft position sensor connector (if equipped).
(16) Connect gearshift cable to manual valve lever.
(17) Connect output speed sensor connector.
(18) Connect input speed sensor connector.
(19) Connect transmission range sensor connector.
(20) Connect solenoid/pressure switch assembly connector.
(21) Connect transaxle oil cooler lines using service splice kit. Refer to instructions provided with kit.
(22) Install dipstick tube.
(23) Install air cleaner assembly.
(24) Connect battery negative cable.

ACCUMULATOR

DESCRIPTION

The 41te underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, seals, return spring(s), and a cover or plug. The overdrive and underdrive accumulators are located within the transaxle case, and are retained by the valve body (Fig. 158) .

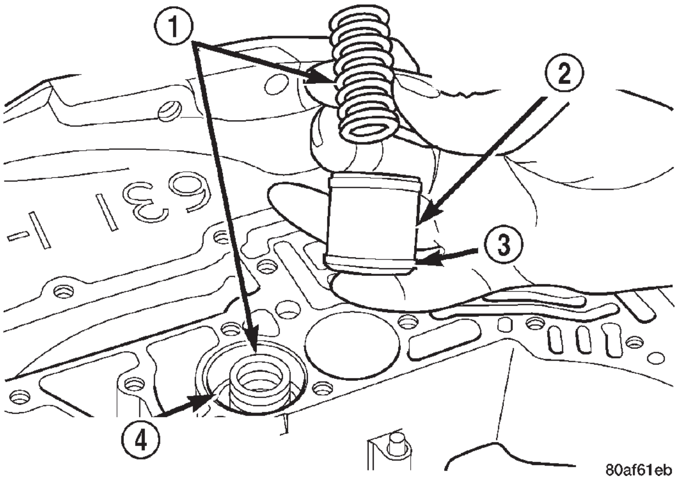

Fig. 158 Underdrive and Overdrive Accumulators

1 - RETURN SPRING
2 - UNDERDRIVE CLUTCH ACCUMULATOR
3 - SEAL RING (2)
4 - OVERDRIVE CLUTCH ACCUMULATOR

The low reverse accumulator (Fig. 159) is also located within the transaxle case, but the assembly is retained by a cover and a snap-ring.

The 2/4 accumulator is located in the valve body. It is retained by a cover and retaining screws (Fig. 160).

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and spring(s). The intended result is a smooth, firm clutch application.

AUTOSTICK SWITCH

DESCRIPTION

Autostick is a driver–interactive transaxle feature that offers manual gear shifting capability of an automatic transaxle.

OPERATION

When the shifter is moved into the Autostick position, the transaxle remains in whatever gear it was using before Autostick was activated. Moving the shifter to the left (towards the driver) causes a downshift and moving to the right (towards the passenger) causes an upshift. The instrument cluster will illuminate the selected gear. The vehicle can be launched in 1st, 2nd, or 3rd gear while in the Autostick mode. The speed control is operable in 3rd and 4th gear Autostick mode. Speed control will be deactivated if the transaxle is shifted to 2nd gear. Shifting into OD position cancels the Autostick mode, and the transaxle resumes the OD shift schedule.

AUTOMATIC OVERRIDES

For safety, durability, and driveability, some shifts are executed automatically or prevented.

AUTOMATIC SHIFTS WILL OCCUR UNDER THE FOLLOWING CONDITIONS

TYPE OF SHIFT	APPROXIMATE SPEED
4-3 coast downshift	13 mph
3-2 coast downshift	9 mph
2-1 coast downshift	5 mph
1-2 upshift	6300 engine rpm
2-3 upshift	6300 engine rpm
4-3 kickdown shift	13-47 mph w/sufficient throttle

MANUAL SHIFTS ARE NOT PERMITTED UNDER THE FOLLOWING CONDITIONS

TYPE OF SHIFT	APPROXIMATE SHIFT POINT
3-4 upshift	Below 15 mph
3-2 downshift	Above 74 mph @ closed throttle or 70 mph otherwise
2-1 downshift	Above 41 mph @ closed throttle or 38 mph otherwise

DRIVING CLUTCHES

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 161). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

NOTE: Refer to the “Elements In Use” chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

DRIVING CLUTCHES (Continued)

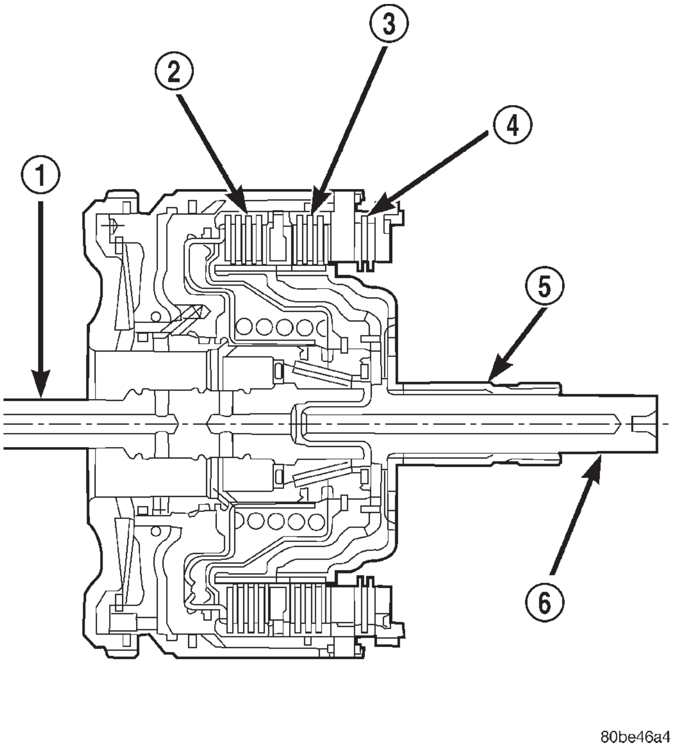

Fig. 161 Input Clutch Assembly

1 - INPUT SHAFT
2 - UNDERDRIVE CLUTCH
3 - OVERDRIVE CLUTCH
4 - REVERSE CLUTCH
5 - OVERDRIVE SHAFT
6 - UNDERDRIVE SHAFT

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FINAL DRIVE

DESCRIPTION

The 41TE differential is a conventional open design. It consists of a ring gear and a differential case. The differential case consists of pinion and side gears, and a pinion shaft. The differential case is supported in the transaxle by tapered roller bearings (Fig. 162).

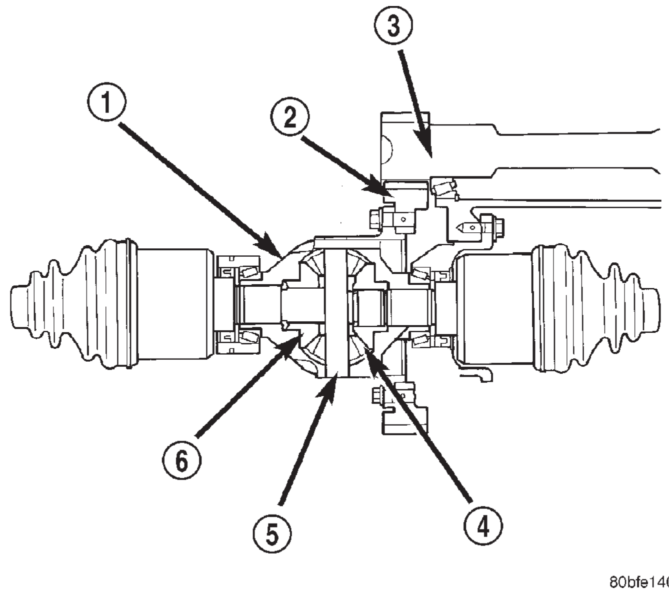

Fig. 162 Differential Assembly

1 - DIFFERENTIAL CASE
2 - RING GEAR
3 - TRANSFER SHAFT
4 - PINION GEAR
5 - PINION SHAFT
6 - SIDE GEAR

OPERATION

The differential assembly is driven by the transfer shaft by way of the differential ring gear. The ring gear drives the differential case, and the case drives the driveshafts through the differential gears. The differential pinion and side gears are supported in the case by thrust washers and a pinion shaft. Differential pinion and side gears make it possible for front tires to rotate at different speeds while cornering.

FINAL DRIVE (Continued)

DISASSEMBLY

NOTE: The differential is serviced as an assembly. The only parts that are serviceable within the differential are the differential bearing cups and cones. If any other part fails within the differential, you must replace the differential assembly along with the transfer shaft.

The transfer shaft should be removed for differential repair and bearing turning torque checking.

(1) Remove the differential cover and bolts (Fig. 163) (Fig. 164).

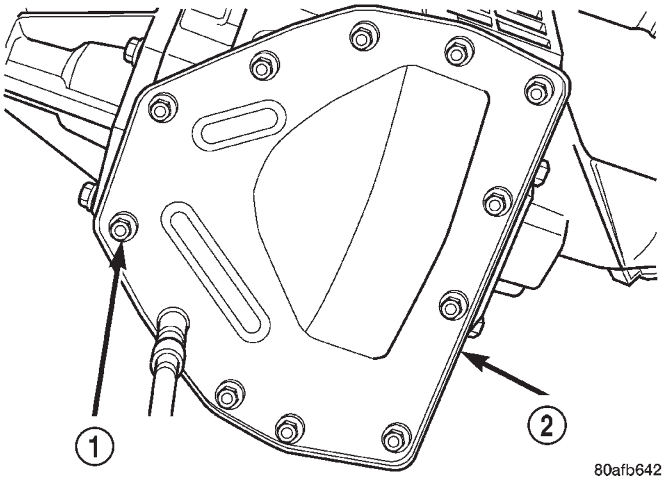

Fig. 163 Differential Cover Bolts

2 - TOOL L-4435

(3) Using a plastic hammer, remove extension housing/adapter plate on the right side of the transaxle.

WARNING: HOLD ONTO DIFFERENTIAL ASSEMBLY TO PREVENT IT FROM ROLLING OUT OF HOUSING.

FINAL DRIVE (Continued)

(4) Remove differential assembly.

(5) Set up dial indicator set C-3339 and tool C-4996 as shown in (Fig. 167) (Fig. 168) to measure side gear end play. **Side gear end play must be within 0.001-0.013 in.**

ADJUSTMENTS

DIFFERENTIAL BEARING PRELOAD MEASUREMENT AND ADJUSTMENT

NOTE: Perform all differential bearing preload measurements with the transfer shaft and gear removed.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT USING EXISTING SHIM

(1) Position the transaxle assembly vertically on the support stand, differential bearing retainer side up.

(2) Install Tool L-4436A into the differential and onto the pinion mate shaft (Fig. 179).

(3) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(4) Using Tool L-4436A and an inch-pound torque wrench, check the turning torque of the differential (Fig. 180). **The turning torque should be between 5 and 18 inch-pounds.**

(5) If the turning torque is within specifications, remove tools. Setup is complete.

(6) If turning torque is not within specifications proceed with the following steps.

(a) Remove differential bearing retainer from the transaxle case.

(b) Remove the bearing cup from the differential bearing retainer using Tool 6062A.

(c) Remove the existing shim from under the cup.

(d) Measure the existing shim.

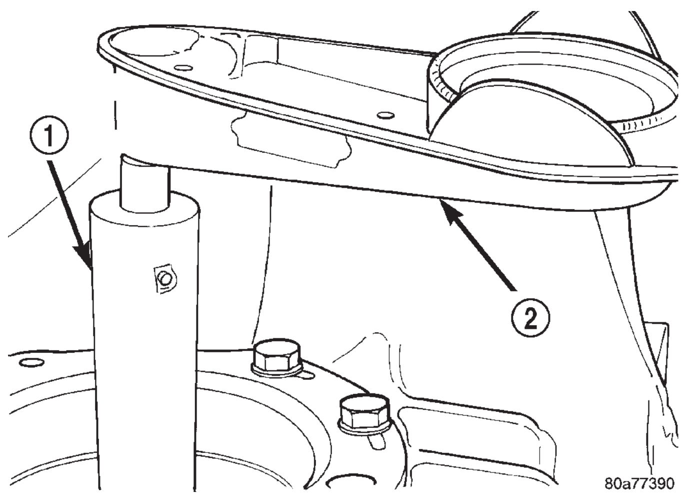

Fig. 180 Checking Differential Bearings Turning Torque

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH

(e) If the turning torque was too high when measured, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is was too low, install a 0.05 mm (0.002 inch) thicker shim. Repeat until 5 to 18 inch-pounds turning torque is obtained. Oil Baffle is not required to be installed when making shim selection.

(f) Install the proper shim under the bearing cup. Make sure the oil baffle is installed properly in the bearing retainer, below the bearing shim and cup.

FINAL DRIVE (Continued)

(g) Install the differential bearing retainer using Tool 5052 and C-4171. Seal the retainer to the housing with MOPAR® Adhesive Sealant and torque bolts to 28 N·m (250 in. lbs.).

(7) Using Tool L-4436A and an inch-pound torque wrench, recheck the turning torque of the differential (Fig. 180). **The turning torque should be between 5 and 18 inch-pounds.**

Shim thickness need be determined only if any of the following parts are replaced:

- Transaxle case
- Differential carrier
- Differential bearing retainer
- Extension housing
- Differential bearing cups and cones

PRELOAD ADJUSTMENT W/O SHIM

(1) Remove the bearing cup from the differential bearing retainer using Miller special Tool 6062A.

(2) Remove existing shim from under bearing cup.

(3) Reinstall the bearing cup into the retainer using Miller Special Tool 6061, and C-4171.

NOTE: Oil baffle is not required when making the shim calculation.

(4) Install the bearing retainer into the case. Torque bolts to 28 N•m (250 in. lbs.).

(5) Position the transaxle assembly vertically on the support stand and install Miller Special Tool L-4436-A into the bearing retainer.

(6) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(7) Attach a dial indicator to the case and zero the dial. Place the tip on the end of Special Tool L-4436-A.

(8) Place a large screwdriver to each side of the ring gear and lift. Check the dial indicator for the amount of end play.

FINAL DRIVE (Continued)

CAUTION: Do not damage the transaxle case and/or differential retainer sealing surface.

(9) Using the end play measurement that was determined, add 0.18mm (0.007 inch). This should give you between 5 and 18 inch pounds of bearing preload. Refer to the Differential Bearing Shim Chart to determine which shim to use.

(10) Remove the differential bearing retainer. Remove the bearing cup.

(11) Install the oil baffle. Install the proper shim combination under the bearing cup.

(12) Install the differential bearing retainer. Seal the retainer to the housing with Mopar® Silicone Rubber Adhesive Sealant. Torque bolts to 28 N•m (250 in. lbs.).

(13) Using Miller Special Tool L-4436-A and an inch-pound torque wrench, check the turning torque of the differential (Fig. 180). The turning torque should be between 5-18 inch-pounds.

NOTE: If turning torque is too high install a 0.05mm (0.002 inch) thicker shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thinner shim. Repeat until 5-18 inch-pounds of turning torque is obtained.

FLUID

STANDARD PROCEDURE

FLUID LEVEL AND CONDITION CHECK

NOTE: Only transmission fluid of the type labeled Mopar ATF+4 (Automatic Transmission Fluid–Type 9602) should be used in this transaxle.

FLUID LEVEL CHECK

The transmission sump has a fluid level indicator (dipstick) to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P Park and N Neutral positions. Place the selector lever in P Park to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature 82° C (180° F), the fluid level is correct if it is in the HOT region on the oil level indicator (Fig. 181). The fluid level should be within the COLD region of the dipstick at 27° C (80° F) fluid temperature.

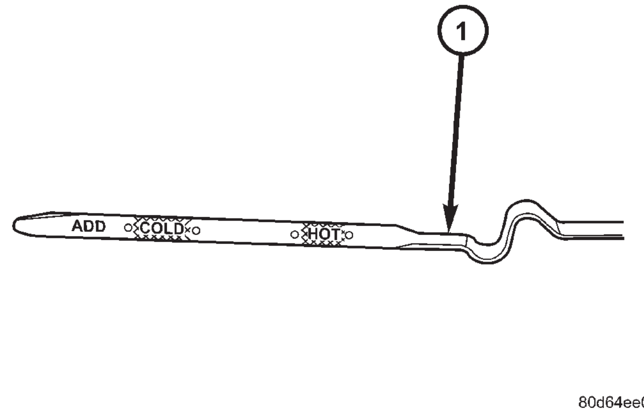

Fig. 181 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

FLUID LEVEL CHECK USING DRB

NOTE: Engine and Transaxle should be at normal operating temperature before performing this procedure.

(1) Start engine and apply parking brake.

(2) Hook up DRB scan tool and select transmission.

(3) Select sensors.

(4) Read the transmission temperature value.

(5) Compare the fluid temperature value with the fluid temperature chart (Fig. 182).

(6) Adjust transmission fluid level shown on the indicator according to the chart.

(7) Check transmission for leaks.

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transaxle has too much fluid, the gears churn up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transaxle vent where it may be mistaken for a leak.

FLUID (Continued)

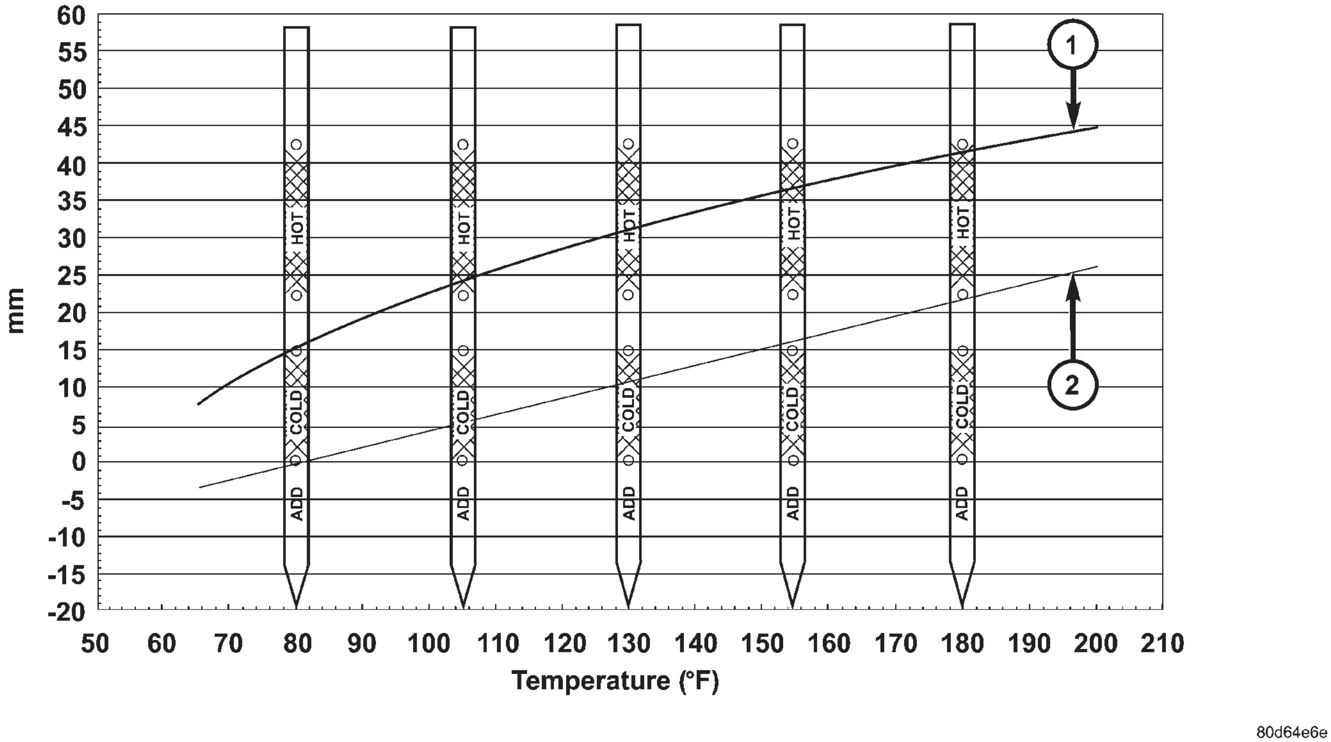

Fig. 182 Transmission Fluid Temperature Chart

1 - MAX. LEVEL
2 - MIN. LEVEL

FLUID CONDITION

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transaxle recondition is probably required. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. This is normal. A dark brown/black fluid accompanied with a burnt odor and/or deterioration in shift quality may indicate fluid deterioration or transmission component failure.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

STANDARD PROCEDURE - FLUID AND FILTER SERVICE

NOTE: Refer to the maintenance schedules in LUBRICATION and MAINTENANCE, or the vehicle owner's manual, for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: Only fluids of the type labeled Mopar® ATF+4 (Automatic Transmission Fluid) Type 9602 should be used. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

FLUID/FILTER SERVICE (RECOMMENDED)

(1) Raise vehicle on a hoist. Refer to LUBRICATION and MAINTENANCE for proper procedures.

FLUID (Continued)

Place a drain container with a large opening, under transaxle oil pan.

(2) Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.

(3) Install a new filter and o-ring on bottom of the valve body (Fig. 183).

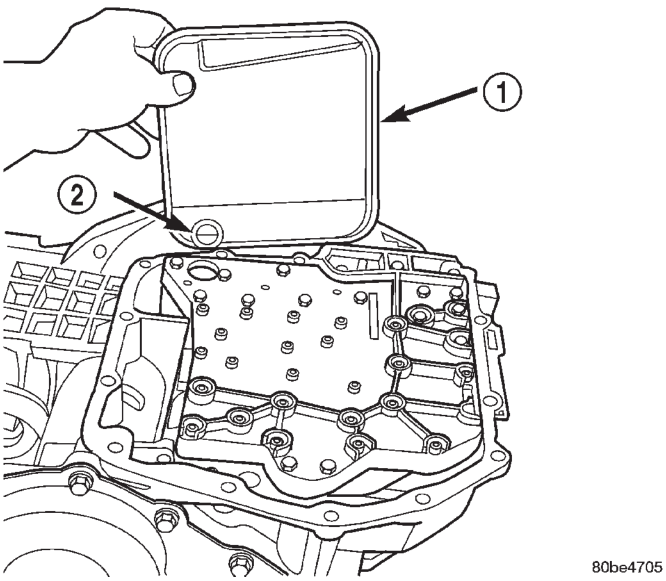

Fig. 183 Filter and O-Ring

1 - OIL FILTER
2 - O-RING

(4) Clean the oil pan and magnet. Reinstall pan using new Mopar Silicone Adhesive sealant. Tighten oil pan bolts to 19 N·m (165 in. lbs.).

(5) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) Type 9602 through the dipstick opening.

(6) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(7) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 184).

(8) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). Refer to Fluid Level and Condition Check for the proper fluid fill procedure.

(9) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

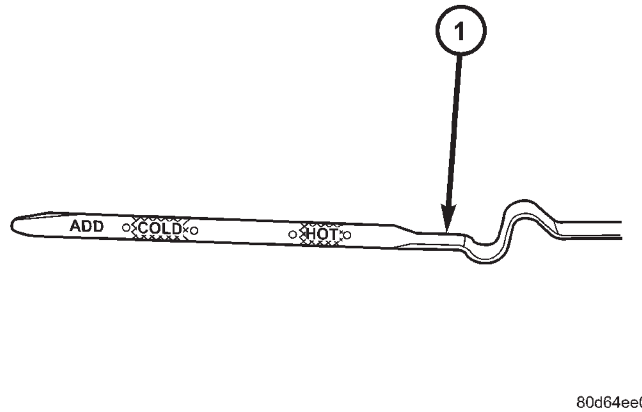

Fig. 184 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

DIPSTICK TUBE FLUID SUCTION METHOD (ALTERNATIVE)

(1) When performing the fluid suction method, make sure the transaxle is at full operating temperature.

(2) To perform the dipstick tube fluid suction method, use a suitable fluid suction device (Vacula™ or equivalent).

(3) Insert the fluid suction line into the dipstick tube.

NOTE: Verify that the suction line is inserted to the lowest point of the transaxle oil pan. This will ensure complete evacuation of the fluid in the pan.

(4) Follow the manufacturers recommended procedure and evacuate the fluid from the transaxle.

(5) Remove the suction line from the dipstick tube.

(6) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) Type 9602 through the dipstick opening.

(7) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(8) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 184).

(9) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

(10) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

GEARSHIFT CABLE

REMOVAL

(1) Place transaxle in PARK.

(2) Disconnect battery negative cable at left strut tower.

(3) Remove air cleaner assembly.

(4) Using a pry tool, pry up on cable at manual valve lever and remove cable from lever (Fig. 185).

(5) Remove the screw from the cable bracket at the transaxle (Fig. 185).

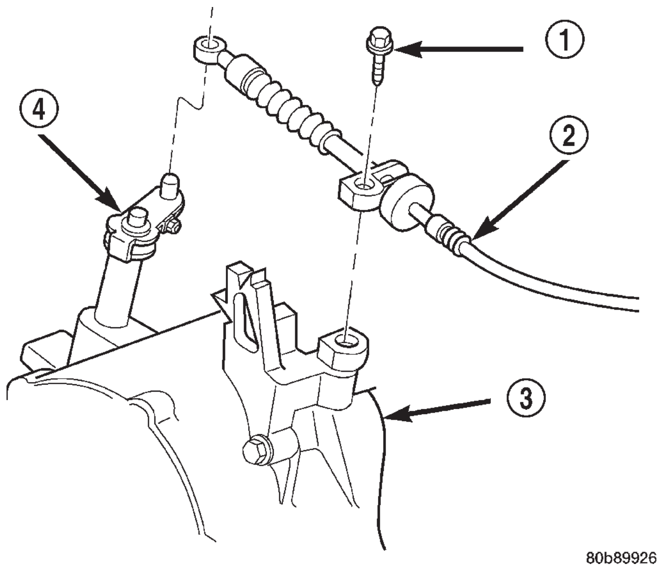

Fig. 185 Gearshift Cable at Transaxle

1 - SCREW
2 - CABLE
3 - TRANSAXLE
4 - SHIFT LEVER

(6) Remove the gearshift knob set screw and knob (Fig. 186).

(7) Remove gearshift bezel (Fig. 187). Disconnect range indicator lamp connector.

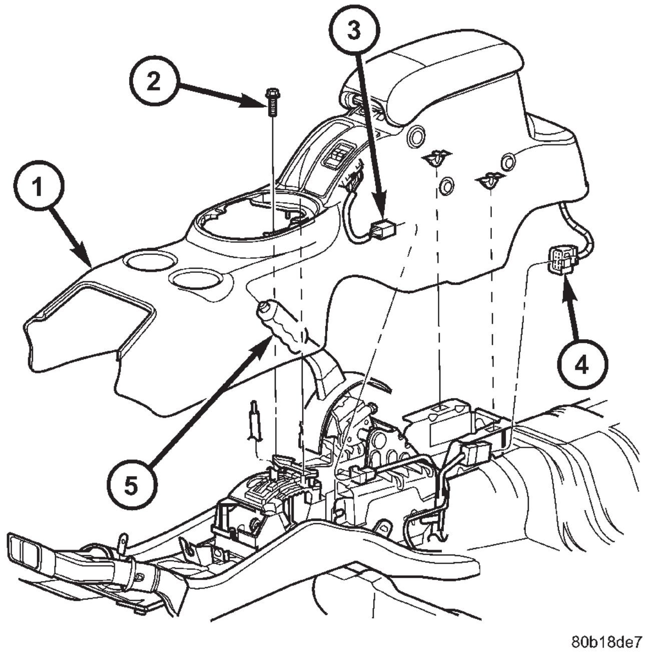

Fig. 188 Center Console Assembly

1 - CENTER CONSOLE
2 - SCREW
3 - IF EQUIPPED
4 - IF EQUIPPED
5 - PARK BRAKE HANDLE

(9) Loosen nut on shift cable adjust lever (Fig. 189).

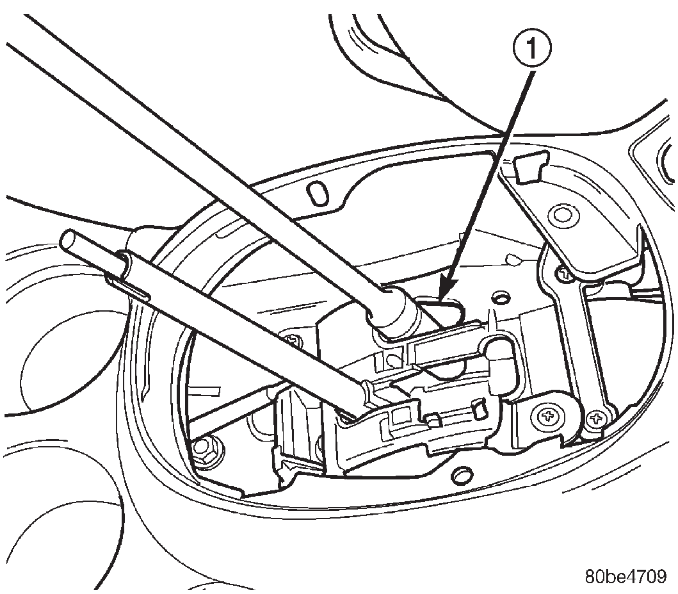

Fig. 189 Shift Cable Adjust Lever Nut—Typical

1 - ACCESS HOLE

(10) Using a flat blade pry tool, remove the shifter cable core end from the shift lever pin (Fig. 190).

(11) Using a flat blade pry tool, pry the cable conduit clip up from the shifter bracket. Pull up on the cable conduit and remove from bracket (Fig. 190).

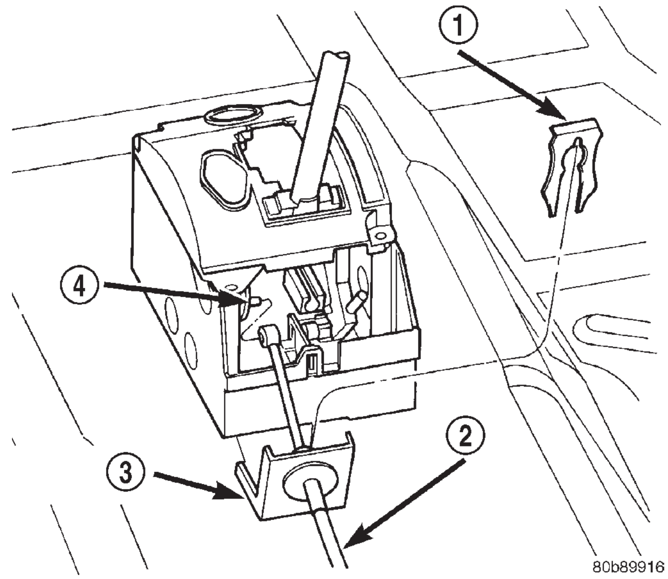

Fig. 190 Gearshift Cable at Floor Shifter

1 - CLIP
2 - CABLE
3 - CONDUIT BRACKET
4 - SHIFT PIN

(12) Raise vehicle on hoist.

(13) Remove the cable grommet from the floor pan area (Fig. 191).

(14) Carefully remove the cable from the underbody by unfolding the cable retainer clip (Fig. 191) as you go along.

INSTALLATION

(1) Install cable assy. into floor pan tunnel hole and secure grommet. If necessary, use a synthetic based lubricant to aid in grommet installation.

(2) Position cable into retainer clip (Fig. 191) and tighten clip to secure cable. Route cable up towards transaxle shift lever.

(3) Lower vehicle.

(4) Install cable to transaxle and tighten screw to 14 N·m (125 in. lbs.) (Fig. 185).

(5) Install cable to transaxle shift lever (Fig. 185).

(6) Connect cable to shifter conduit bracket and shift pin. Install cable retaining clip (Fig. 190).

(7) Verify transaxle shift lever and floor shifter lever are in the PARK position.

(8) Tighten cable adjuster nut (Fig. 189) to 23 N·m (200 in. lbs.).

(9) Install center console assembly (Fig. 188).

(10) Install gearshift bezel (Fig. 187).

GEARSHIFT CABLE (Continued)

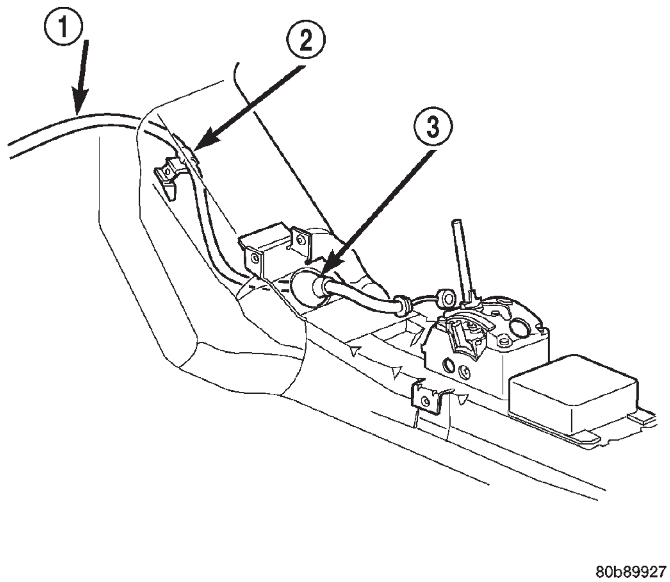

Fig. 191 Gearshift Cable Routing

1 - CABLE
2 - RETAINER CLIP
3 - GROMMET

(11) Install gearshift knob (Fig. 186) and tighten set screw to 2 N·m (20 in.lbs.).

(12) Verify proper cable adjustment. Engine starter should only engage in PARK and NEUTRAL gear shifter positions. If adjustment is required, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/GEAR SHIFT CABLE - ADJUSTMENTS)

ADJUSTMENTS

GEARSHIFT LINKAGE ADJUSTMENT

Normal operation of the Park/Neutral Position Switch provides a quick check to confirm proper linkage adjustment.

Move the selector level slowly forward until it clicks into the (P) Park position. The starter should operate.

After checking the (P) position, move selector slowly toward the (N) Neutral position until lever is in the (N) position. If the starter will also operate at this point the gearshift linkage is properly adjusted. If the starter fails to operate in either position, linkage adjustment is required.

ADJUSTMENT

(1) Set parking brake.

(2) Remove the gearshift knob set screw and knob.

(3) Remove gearshift selector bezel and lamp wiring.

(4) Install the gearshift knob set screw and knob.

(5) Place gearshift lever in the (P) (PARK) position.

(6) Loosen the gearshift cable adjuster nut at the shifter assembly (Fig. 192) .

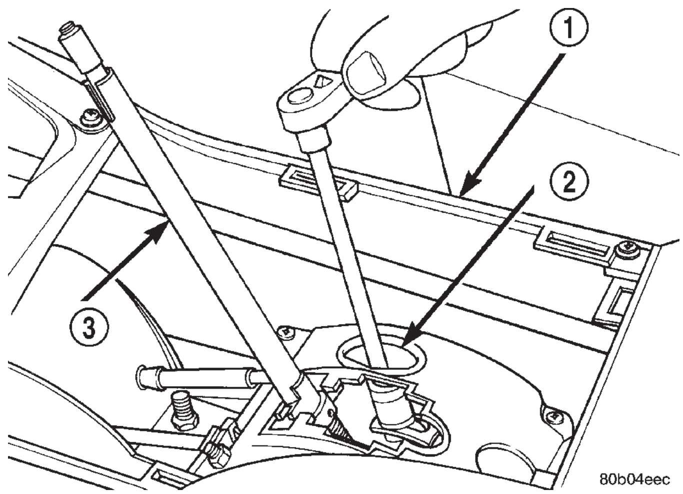

Fig. 192 Shift Cable Adjust Lever Nut

1 - CONSOLE
2 - ACCESS HOLE
3 - SHIFTER HANDLE

(7) Move the gearshift lever on the transaxle to the park position.

(8) Verify the shift lever and transaxle are in park position. Tighten the gearshift cable adjuster nut at the shifter assembly. The gearshift linkage should now be properly adjusted.

(9) Check adjustment as follows:

- Detent position for neutral and drive should be within limits of hand lever gate stops.
- Key start must occur only when shift lever is in park or neutral positions.

GEARSHIFT MECHANISM

REMOVAL

(1) Disconnect negative battery cable and isolate.

(2) Remove the gearshift knob set screw and knob (Fig. 193).

(3) Remove gearshift bezel (Fig. 194). Disconnect range indicator lamp connector.

(4) Remove center console assembly (Fig. 195).

(5) Loosen nut on shift cable adjust lever.

GEARSHIFT MECHANISM (Continued)

(8) Release interlock cable adjuster end by inserting pointed object into shift bracket to disengage lock (Fig. 197). Unsnap the shifter/ignition interlock cable adjuster end from the slot in the gearshift mechanism bracket and disconnect cable core from shifter assembly (Fig. 198).

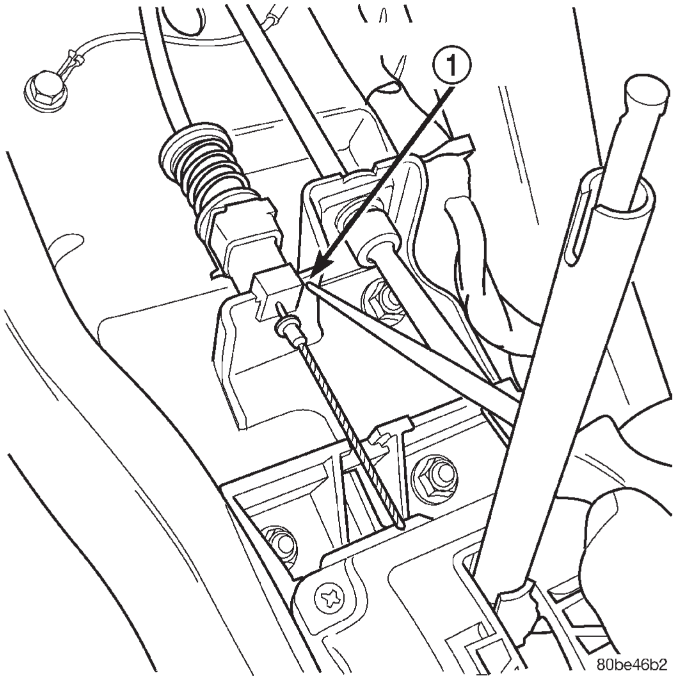

Fig. 197 Release Cable from Bracket at Retainer Lock

1 - RELEASE CABLE HERE

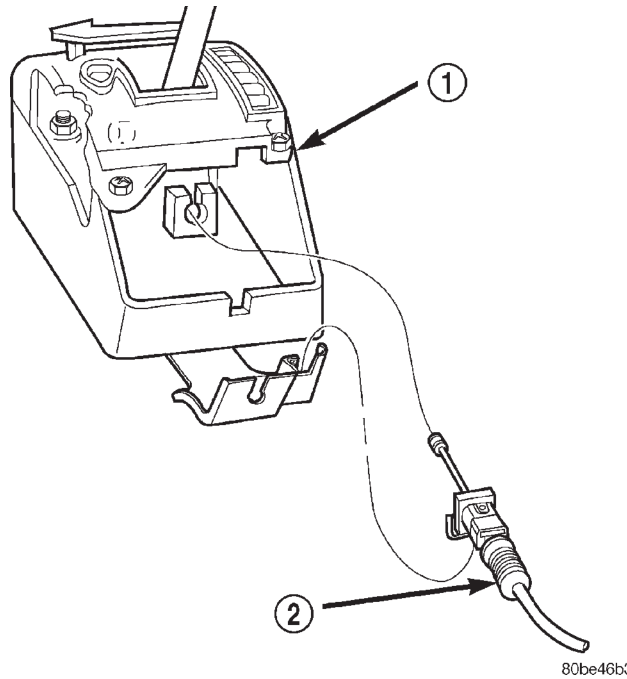

Fig. 198 Interlock Cable at Floor Shifter Assembly

1 - SHIFTER ASSEMBLY
2 - INTERLOCK CABLE

(9) Disconnect Autostick connector (if equipped) (Fig. 199).

(10) Remove the five nuts at the base of the shifter assembly. Remove assembly from vehicle (Fig. 200).

INSTALLATION

(1) Install shifter mechanism (Fig. 200). mechanism-to-floor pan nuts to 17 N·m (150 in. lbs.).

(2) Install gearshift cable into conduit bracket and onto shift pin. Install retainer clip (Fig. 196).

(3) Tighten cable adjuster nut to 23 N·m (200 in. lbs.).

(4) Insert interlock cable core wire into interlock adjustment lever groove. Make sure the interlock cable slug is seated in the groove (Fig. 198).

(5) Insert interlock cable adjuster end into bracket and snap into place (Fig. 198).

(6) Adjust the gearshift and interlock cables. Refer to Adjustments in this group.

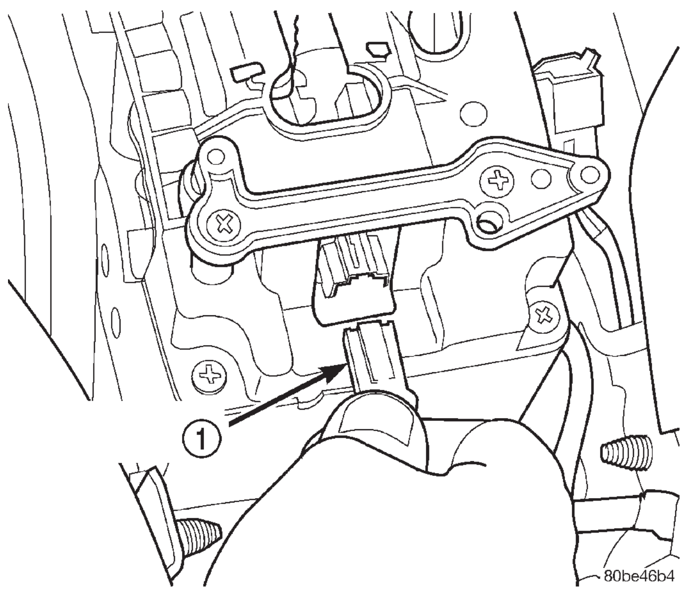

Fig. 199 Autostick Connector (if equipped)

1 - AUTOSTICK CONNECTOR

GEARSHIFT MECHANISM (Continued)

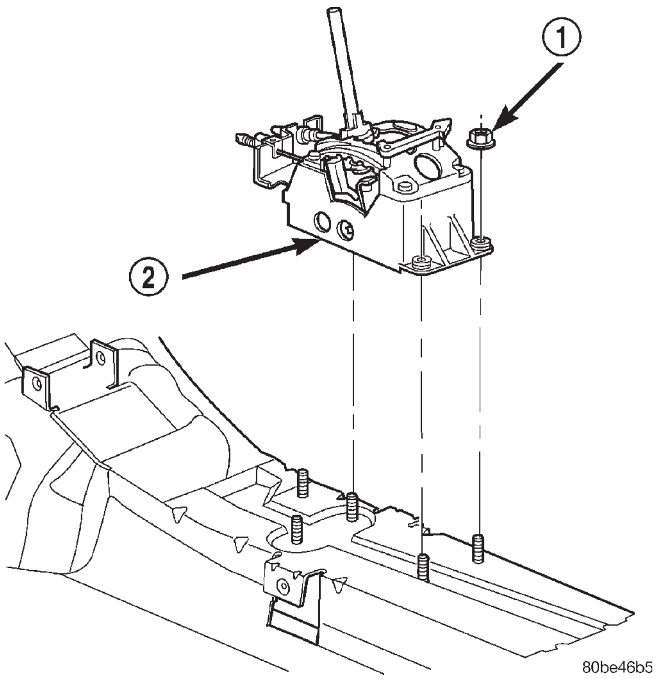

Fig. 200 Shifter Assembly

1 - NUTS (5)
2 - SHIFTER ASSEMBLY

NOTE: Gearshift and Interlock cables MUST be adjusted. Refer to the Adjustments section in this group for proper procedures.

(7) If equipped with Autostick, connect the Autostick connector (Fig. 199).

(8) Install center console assembly (Fig. 195).

(9) Connect range indicator lamp and install gearshift bezel (Fig. 194).

(10) Install the gearshift knob and tighten set screw (Fig. 193) to 2 N·m (20 in.lbs.).

(11) Connect the battery negative cable.

HOLDING CLUTCHES

DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 and Low/Reverse clutches are considered holding clutches and are contained at the rear of the transaxle case. (Fig. 201) .

OPERATION

NOTE: Refer to the “Elements In Use” chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

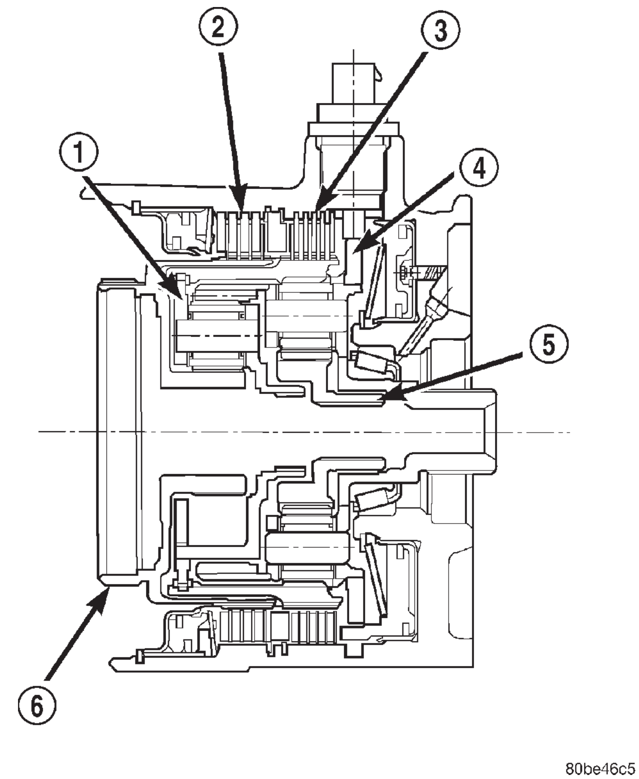

Fig. 201 2/4 and Low/Reverse Clutches

1 - FRONT PLANET CARRIER/REAR ANNULUS
2 - 2/4 CLUTCH
3 - L/R CLUTCH
4 - REAR PLANET CARRIER/FRONT ANNULUS
5 - REAR SUN GEAR
6 - FRONT SUN GEAR ASSEMBLY

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transaxle case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transaxle case.

INPUT CLUTCH ASSEMBLY

DISASSEMBLY

(1) Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).

(2) Tap down reverse clutch reaction plate to release pressure from snap ring (Fig. 202).

INPUT CLUTCH ASSEMBLY (Continued)

(10) Install the UD clutch pack. Leave out upper disc, until snap ring is installed (Fig. 242).

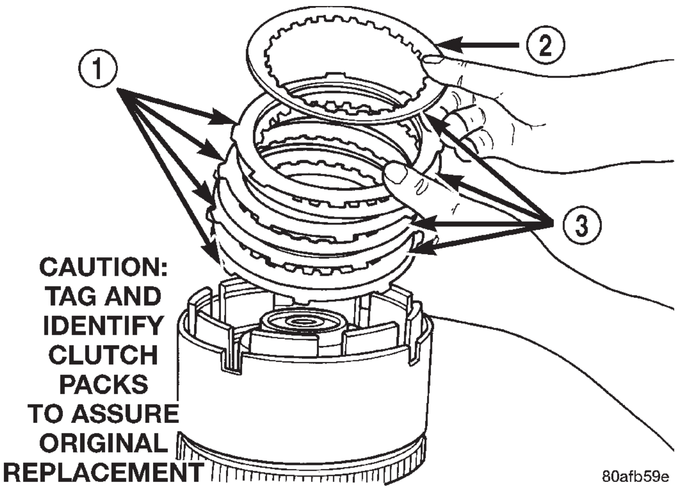

Fig. 242 Underdrive Clutch Pack

1 - CLUTCH PLATE
2 - ONE UD CLUTCH DISC
3 - CLUTCH DISC

(11) Install the UD clutch flat snap ring (Fig. 243).

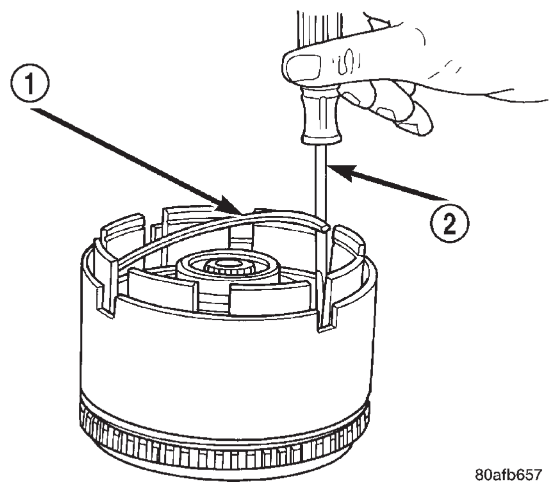

Fig. 243 UD Clutch Flat Snap Ring

1 - UNDERDRIVE CLUTCH REACTION PLATE FLAT SNAP RING
2 - SCREWDRIVER

(12) Install the last UD clutch disc (Fig. 244).

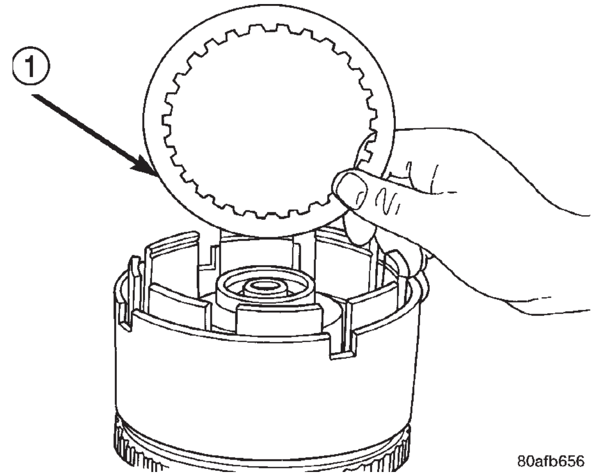

Fig. 244 Install Last UD Clutch Disc

1 - ONE UNDERDRIVE CLUTCH DISC

(13) Install the OD/UD clutch reaction plate and snap ring (Fig. 245) (Fig. 246). The OD/UD clutches reaction plate has a step on both sides. Install the OD/UD clutches reaction plate tapered step side up.

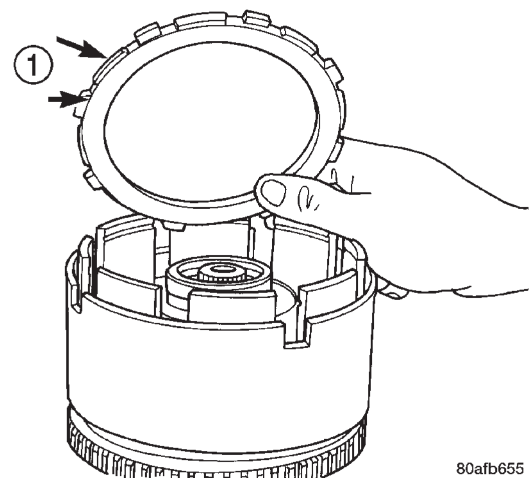

Fig. 245 OD/UD Reaction Plate

1 - OD/UD CLUTCH REACTION PLATE (TAPERED STEP SIDE UP)

NOTE: Snap ring ends must be located within one finger of the input clutch hub. Be sure that snap ring is fully seated, by pushing with screwdriver, into snap ring groove all the way around.

INPUT CLUTCH ASSEMBLY (Continued)

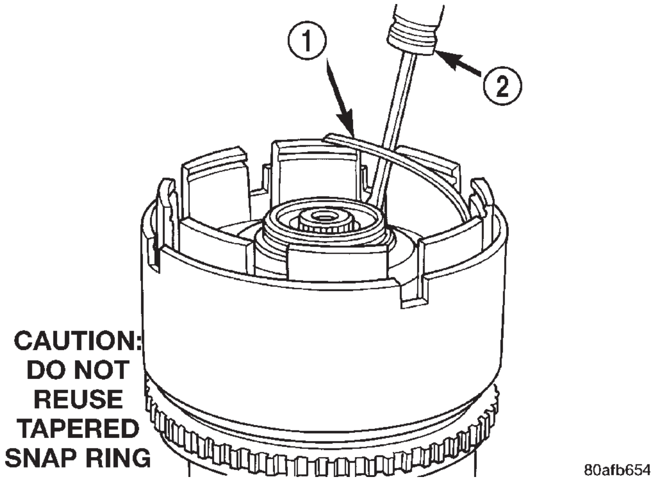

Fig. 246 Tapered Snap Ring

1 - OVERDRIVE/UNDERDRIVE CLUTCHES REACTION PLATE TAPERED SNAP RING
2 - SCREWDRIVER (DO NOT SCRATCH REACTION PLATE)

(14) Seat tapered snap ring to ensure proper installation (Fig. 247).

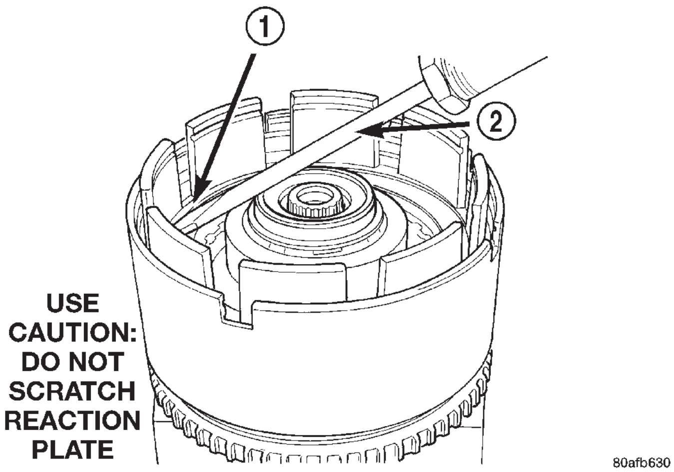

Fig. 247 Seating Tapered Snap Ring

1 - OVERDRIVE/UNDERDRIVE CLUTCHES REACTION PLATE TAPERED SNAP RING
2 - SCREWDRIVER

(15) Install input clutch assembly to the Input Clutch Pressure Fixture–Tool 8391 (Fig. 248).

(16) Set up dial indicator on the UD clutch pack as shown in (Fig. 249).

(17) Using moderate pressure, press down and hold (near indicator) the UD clutch pack with screwdriver or suitable tool and zero dial indicator (Fig. 250). When releasing pressure on clutch pack, indicator reading should advance 0.005–0.010.

CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.

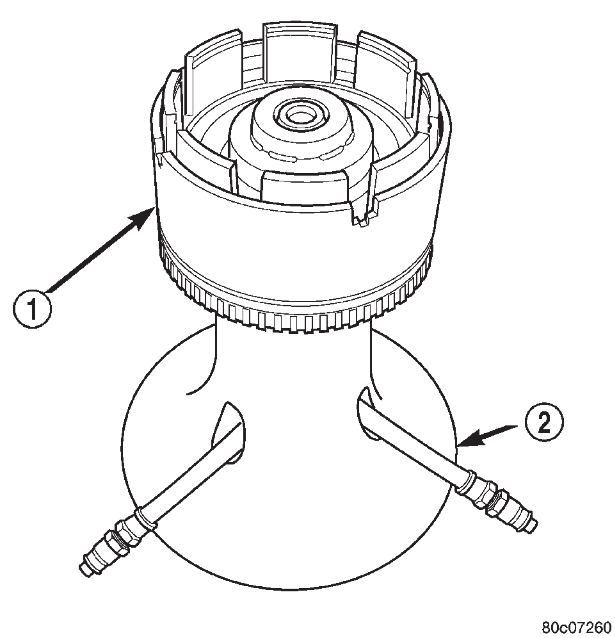

Fig. 248 Input Clutch Assembly on Pressure Fixture Tool 8391

INPUT CLUTCH ASSEMBLY (Continued)

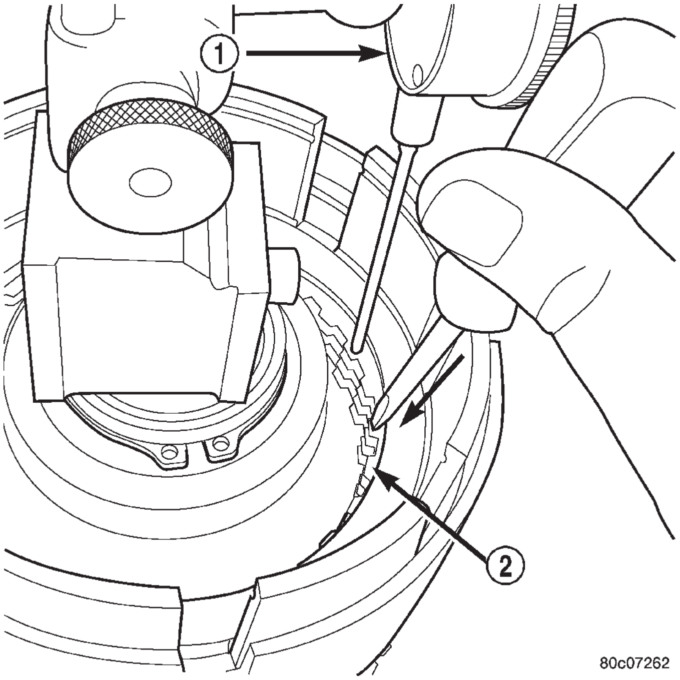

Fig. 250 Press Down on UD Clutch Pack and Zero Dial Indicator

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

(18) Apply 30 psi (206 kPa) to the underdrive hose on Tool 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.

(19) Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94-1.50 mm (0.037-0.059 in.).**

(20) If necessary, select the proper reaction plate to achieve specifications:

UNDERDRIVE REACTION PLATE THICKNESS	
4659939AB	5.837-5.937 mm (0.230-0.234 in.)
4659940AB	6.147-6.248 mm (0.242-0.246 in.)
4659941AB	6.457-6.557 mm (0.254-0.258 in.)

(21) Install the OD clutch pack (four frictions/three steels) (Fig. 251).

(22) Install OD pressure plate waved snap ring (Fig. 252).

(23) Install the OD/Reverse pressure plate with large step down (towards OD clutch pack) (Fig. 253).

(24) Install OD pressure plate flat snap ring (Fig. 254).

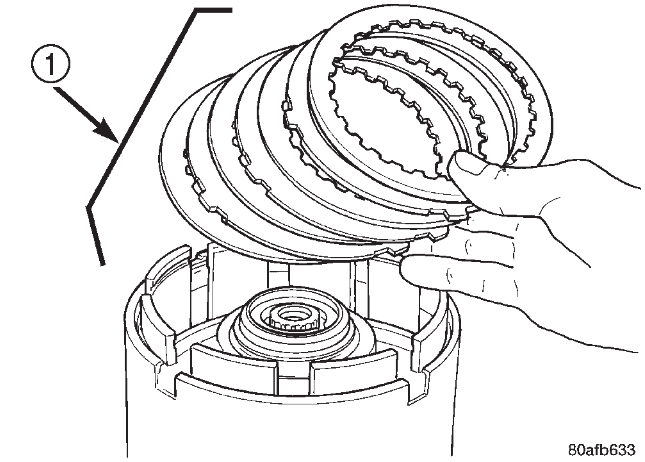

Fig. 251 Install OD Clutch Pack

1 - OVERDRIVE CLUTCH PACK

(25) Measure OD clutch pack clearance. Set up dial indicator on top of the OD/Reverse pressure plate as shown in (Fig. 255).

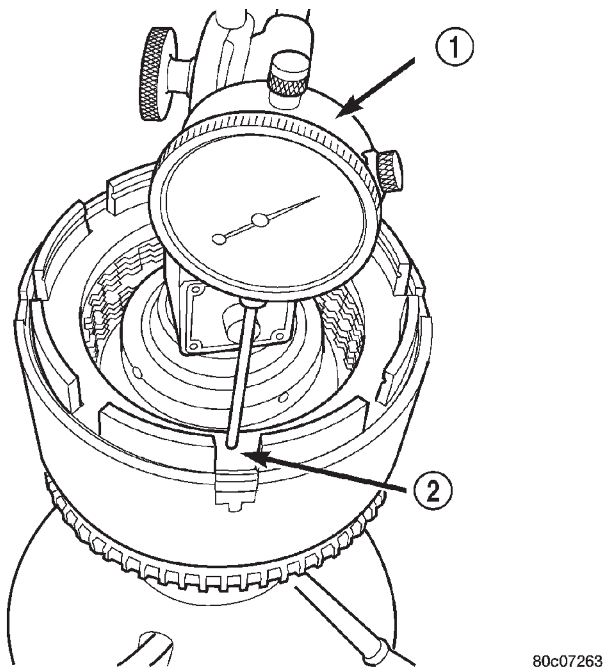

Fig. 255 Measure OD Clutch Pack Clearance

1 - DIAL INDICATOR
2 - OD/REVERSE REACTION PLATE

(26) Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Tool 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.

(27) Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

(28) Install reverse clutch pack (two frictions/one steel) (Fig. 256).

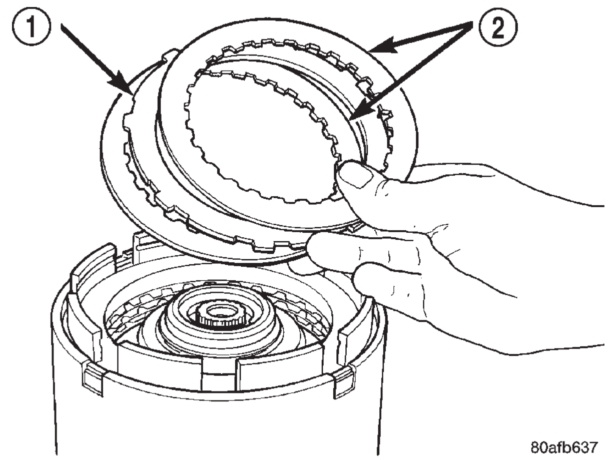

Fig. 256 Install Reverse Clutch Pack

1 - REVERSE CLUTCH PLATE
2 - REVERSE CLUTCH DISCS

(29) Install reverse clutch reaction plate with the flat side down towards reverse clutch (Fig. 257).

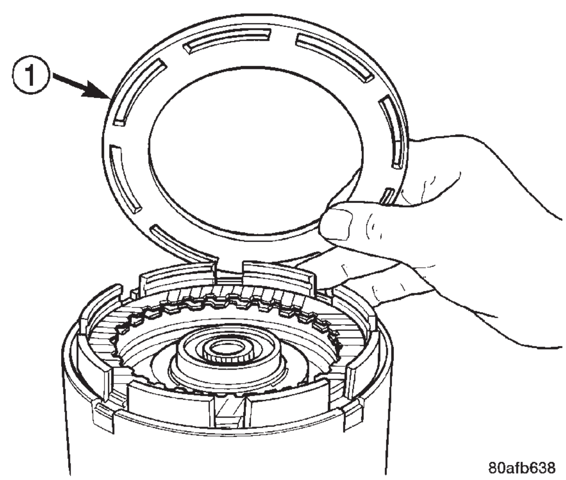

Fig. 257 Install Reaction Plate

1 - REVERSE CLUTCH REACTION PLATE (FLAT SIDE DOWN)

INPUT CLUTCH ASSEMBLY (Continued)

(30) Tap reaction plate down to allow installation of the reverse clutch snap ring. Install reverse clutch snap ring (Fig. 258).

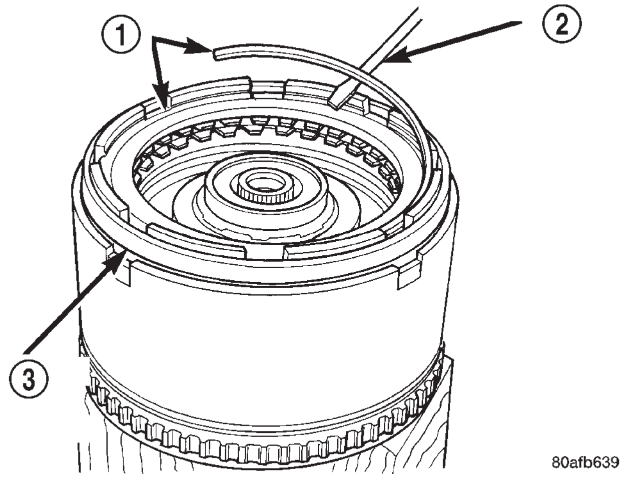

Fig. 258 Install Reverse Clutch Snap Ring

1 - REVERSE CLUTCH SNAP RING (SELECT)
2 - SCREWDRIVER
3 - REVERSE CLUTCH REACTION PLATE

(31) Pry up reverse reaction plate to seat against snap ring (Fig. 259).

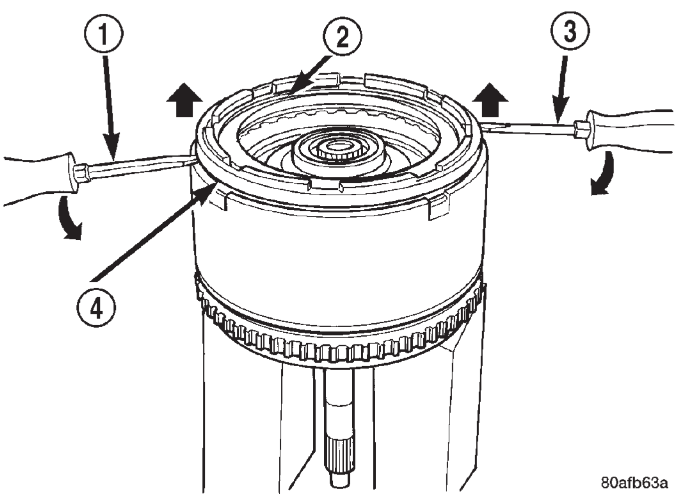

Fig. 259 Pry Up Reaction Plate to Seat Against Snap Ring

3 - #3 THRUST WASHER

(42) Reinstall overdrive and reverse clutch as shown. **Rechecking these clutch clearances is not necessary.**

OIL PUMP

DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transaxle case (Fig. 267). The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

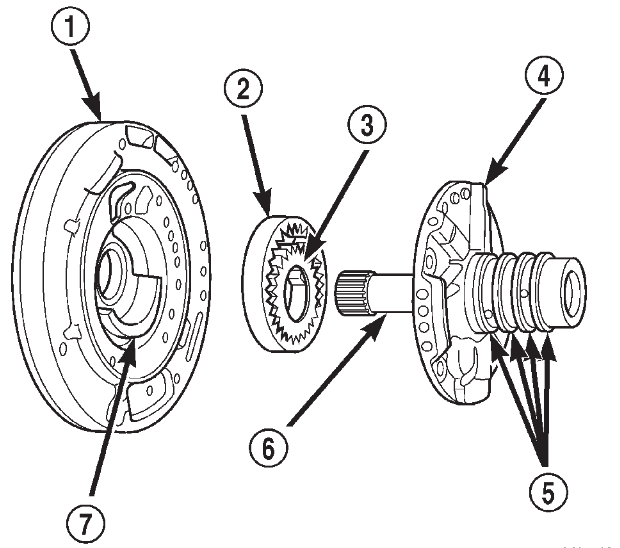

Fig. 267 Oil Pump Assembly

1 - PUMP HOUSING
2 - OUTER PUMP GEAR
3 - INNER PUMP GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring oil pump output volume will determine if sufficient flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

OIL PUMP (Continued)

Verify that transmission fluid is at the proper level. If adding fluid is necessary, fill to the proper level with Mopar® ATF+4 (Automatic Transmission Fluid–Type 9602). The following procedure is to check oil pump output volume:

(1) Using hose cutters or a suitable blade, cut the “to cooler” (Fig. 268) line off flush with the cooler inlet fitting and place a collection container under the open line.

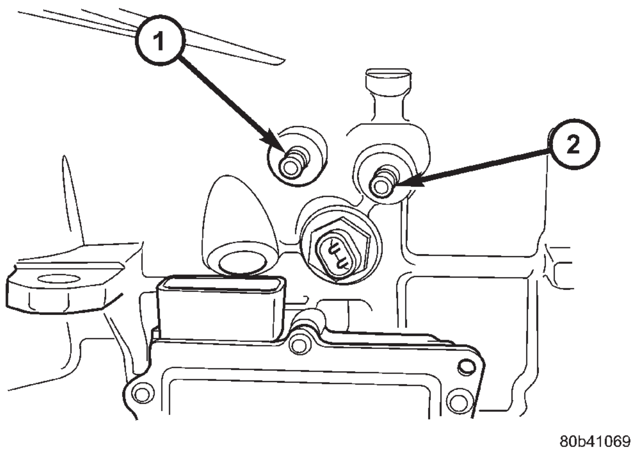

Fig. 268 Transaxle Oil Cooler Fittings

1 - FROM COOLER
2 - TO COOLER

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Start engine and run **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of ATF is collected in 20 seconds or less, flow is within acceptable limits. If fluid flow is intermittent or it takes more than 20 seconds to collect one quart of ATF, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - DIAGNOSIS AND TESTING).

(4) Inspect the cooler hose for damage. Replace if necessary.

(5) Re-connect the to cooler line to the transmission using a service splice kit. Refer to instructions inclued with the kit.

(6) Refill the transaxle to proper level with Mopar® ATF+4 (Automatic Transmission Fluid–Type 9602).

DISASSEMBLY

When disassembling the transaxle it is necessary to inspect the oil pump for wear and damage.

(1) Remove the reaction shaft support bolts.

(2) Remove reaction shaft support from pump housing (Fig. 269).

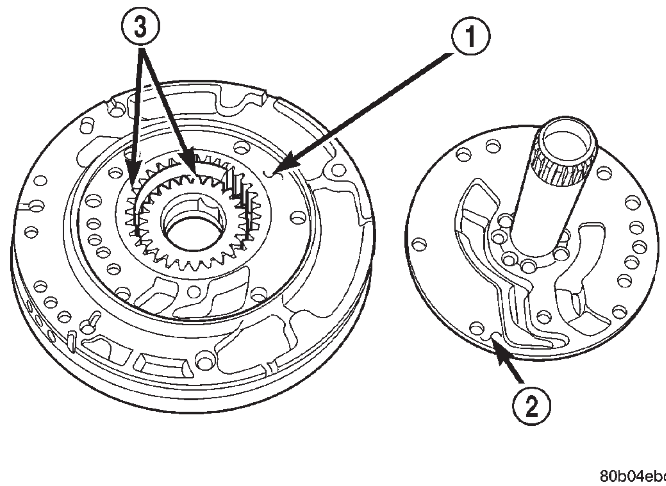

Fig. 269 Reaction Shaft Support

1 - PUMP HOUSING
2 - REACTION SHAFT SUPPORT
3 - PUMP GEARS

(3) Remove the pump gears (Fig. 270) and check for wear and damage on pump housing and gears.

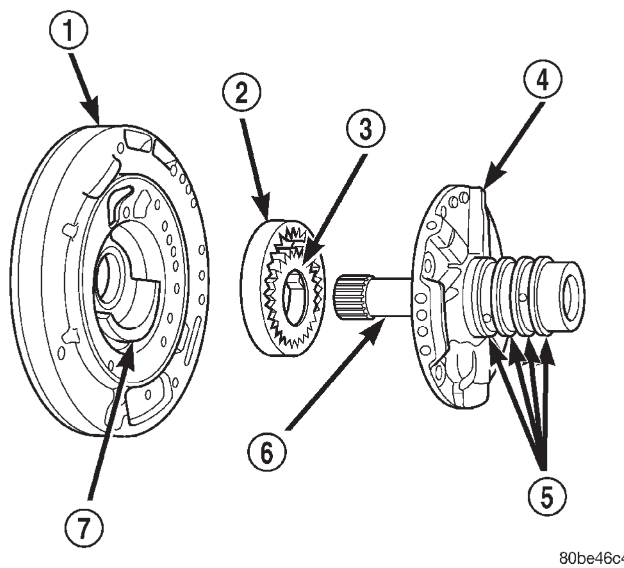

Fig. 270 Oil Pump Assembly

1 - PUMP HOUSING
2 - OUTER PUMP GEAR
3 - INNER PUMP GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

(4) Re-install the gears and check clearances.

(5) Measure the clearance between the outer gear and the pump pocket (Fig. 271). Clearance should be 0.089–0.202 mm (0.0035-0.0079 in.).

OIL PUMP (Continued)

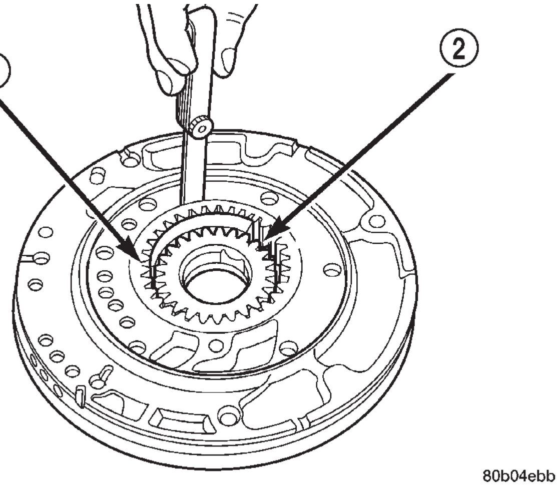

Fig. 271 Measure Outer Gear to Pocket

1 - OUTER GEAR
2 - POCKET

(6) Measure clearance between outer gear and crescent. Clearance should be 0.060-0.298 mm (0.0023-0.0117 in.).

(7) Measure clearance between inner gear and crescent. Clearance should be 0.093-0.385 mm (0.0036-0.0151 in.).

(8) Position an appropriate piece of Plastigage across both pump gears.

(9) Align the Plastigage to a flat area on the reaction shaft support housing.

(10) Install the reaction shaft to the pump housing. Tighten the bolts to 27 N·m (20 ft. lbs.).

(11) Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.

(12) Clearance between outer gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.). Clearance between inner gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.).

ASSEMBLY

(1) Assemble oil pump as shown in (Fig. 272)

(2) Install and torque reaction shaft support-to-oil pump housing bolts to 28 N·m (20 ft. lbs.) torque.

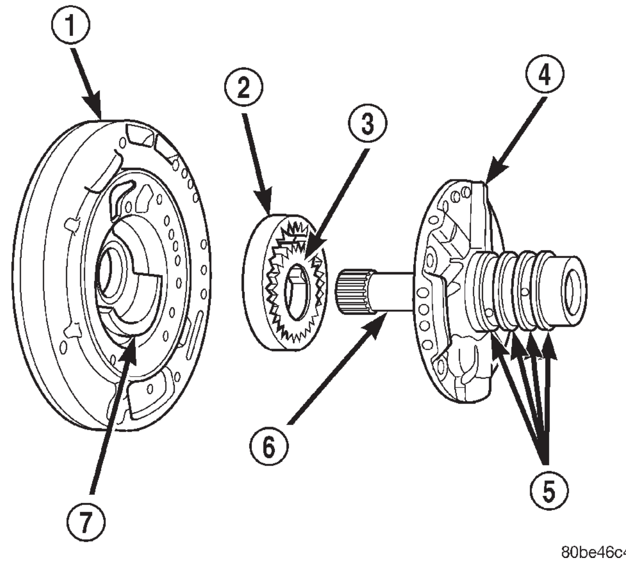

Fig. 272 Oil Pump Assembly

1 - PUMP HOUSING
2 - OUTER PUMP GEAR
3 - INNER PUMP GEAR

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transaxle case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft (Fig. 273).

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

SEAL - OIL PUMP

REMOVAL

(1) Remove transaxle from vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL).

(2) Using Tool C-3981-B, remove oil pump seal (Fig. 274).

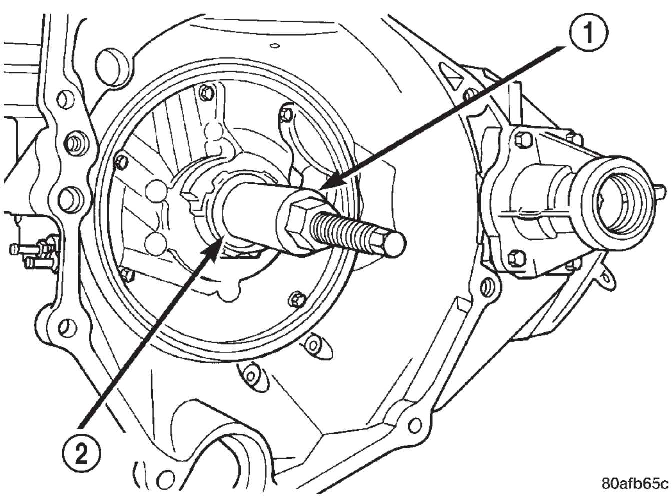

Fig. 274 Remove Oil Pump Seal

1 - TOOL C-3981–B
2 - OIL PUMP SEAL

INSTALLATION

(1) Using Tool C-4193, install oil pump seal (Fig. 275).

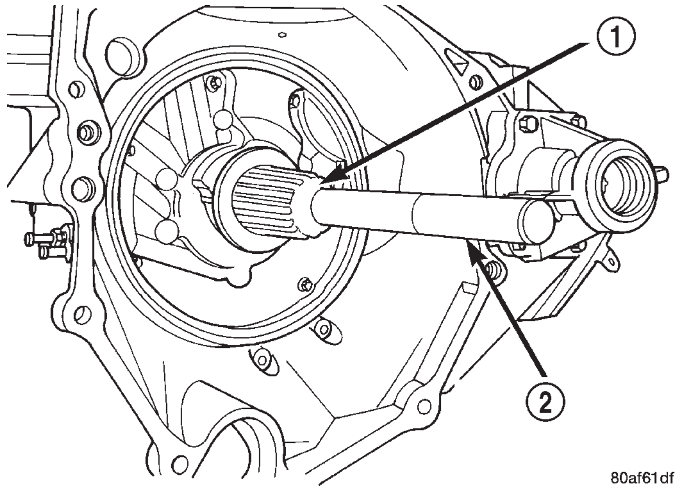

Fig. 275 Install Oil Pump Seal

1 - TOOL C-4193
2 - HANDLE TOOL C-4171

(2) Install transaxle to vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION).

SHIFT INTERLOCK CABLE

DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a cable and solenoid operated system that prevents the transmission gear shifter from being moved out of PARK without a driver in place.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 276) and brake pedal positions.

OPERATION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK or ACCESSORY position (Fig. 276) . An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A magnetic holding device integral to the interlock cable is energized when the ignition is in the ON/RUN position. When the key is in the ON/RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is in the gated PARK position.

SHIFT INTERLOCK CABLE (Continued)

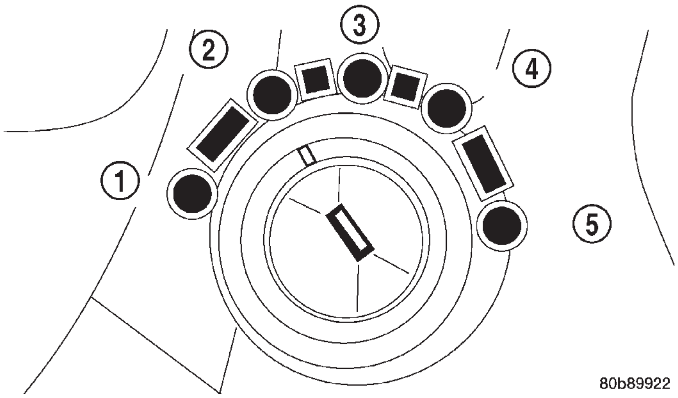

Fig. 276 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the gearshift knob set screw and knob (Fig. 277).

(3) Remove gearshift bezel (Fig. 278).

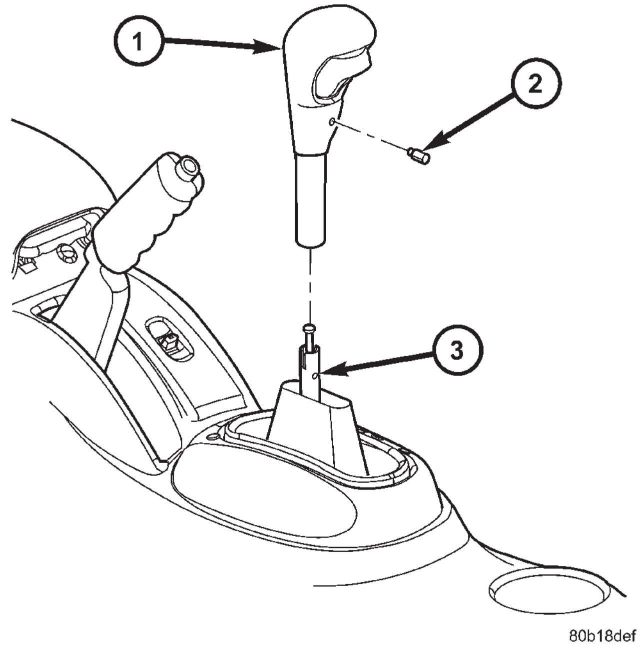

Fig. 277 Gearshift Knob

1 - GEARSHIFT KNOB
2 - SET SCREW
3 - GEARSHIFT MECHANISM

SHIFT INTERLOCK CABLE (Continued)

(6) Remove fuse panel cover from left end of instrument panel. Remove screw holding end of instrument panel top cover (Fig. 282).

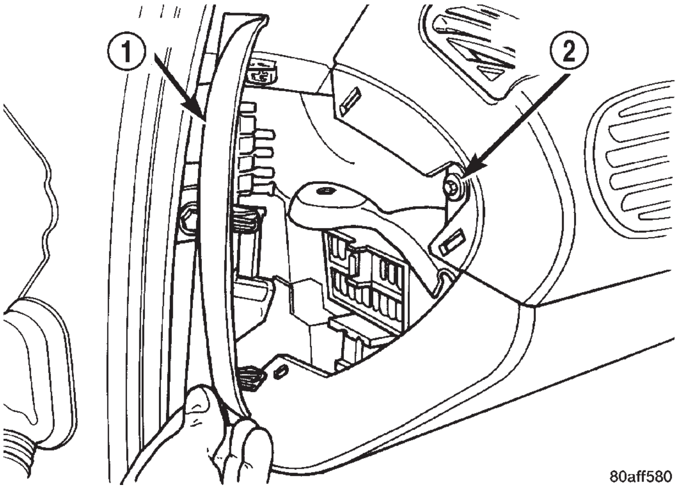

Fig. 282 Instrument Panel Top

1 - FUSE PANEL COVER
2 - SCREW

(7) Remove lower knee bolster screws and knee bolster.

(8) Remove steering column lower shroud (Fig. 283).

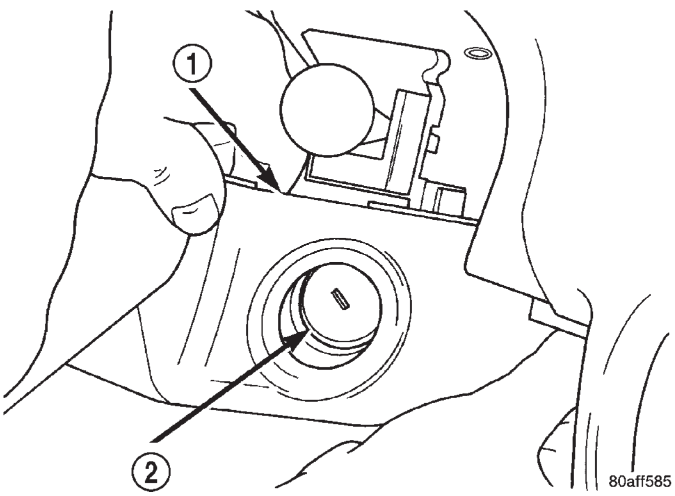

Fig. 283 Steering Column Lower Shroud

1 - STEERING COLUMN LOWER SHROUD
2 - IGNITION CYLINDER

(9) Tilt wheel to full down position and remove upper steering column shroud.

(10) Disconnect interlock solenoid connector.

(11) Disconnect nylon cable retainer from lower column mounting stud.

(12) Place the ignition key in the ON/RUN position (Fig. 284). Grasp the interlock cable clip and connector. Remove the cable from the interlock housing (Fig. 285).

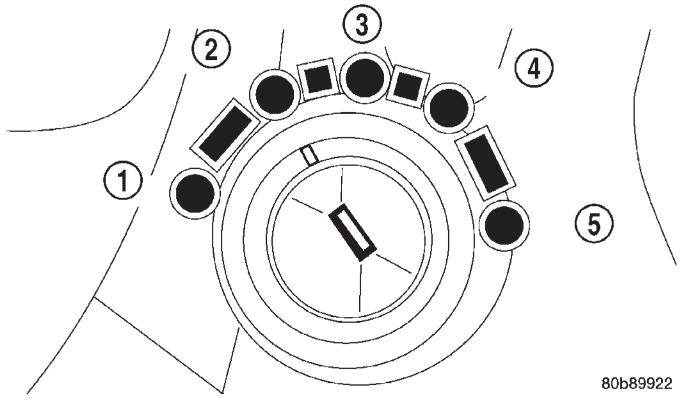

Fig. 284 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

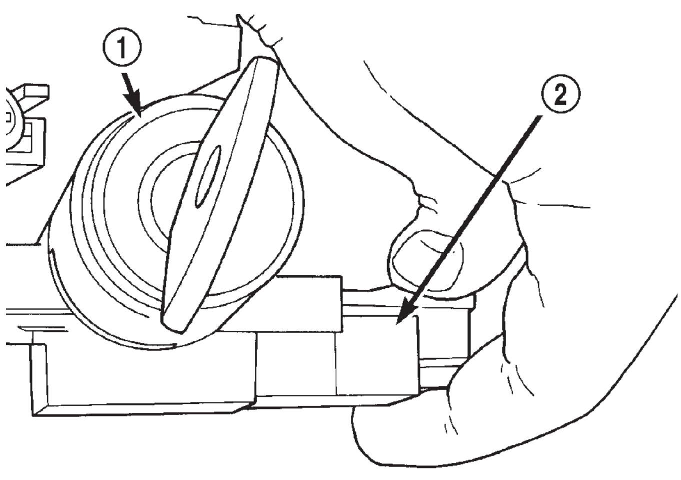

Fig. 285 Interlock Cable and Connector

1 - IGNITION LOCK CYLINDER
2 - INTERLOCK CABLE

(13) Remove interlock cable from underside of instrument panel.

SHIFT INTERLOCK CABLE (Continued)

INSTALLATION

CAUTION: When installing interlock cable assembly, care must be taken not to bend exposed cable wire and slug at shifter end of cable.

(1) Route interlock cable into lower dash panel and towards console as removed.

(2) Turn the ignition switch to the ON/RUN position (Fig. 284).

(3) Install the interlock cable into the interlock housing at the steering column (Fig. 286). Verify the cable snaps into the housing.

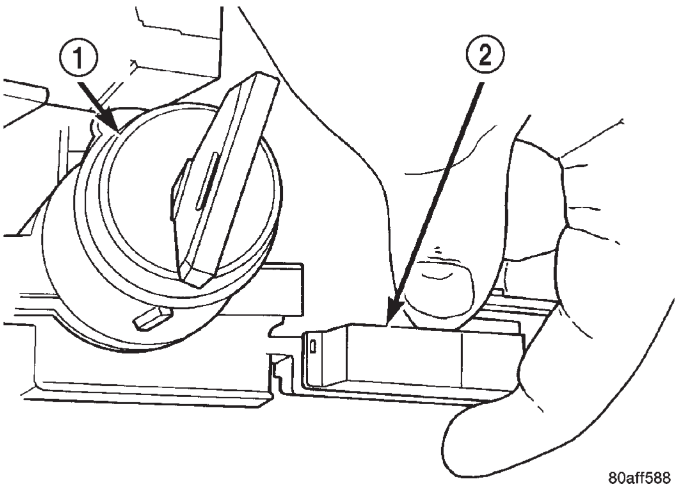

Fig. 286 Interlock Cable At Housing

1 - IGNITION LOCK CYLINDER
2 - INTERLOCK CABLE

(4) Install nylon cable retainer to lower column mounting stud.

(5) Connect BTSI solenoid connector.

(6) Insert interlock cable core wire into interlock adjustment lever groove. Make sure the interlock cable slug is seated in the groove (Fig. 281).

(7) Insert interlock cable adjuster end into bracket and snap into place (Fig. 281).

NOTE: The Interlock Cable MUST be adjusted. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/SHIFT INTERLOCK CABLE - ADJUSTMENTS)

(8) Install center console assembly (Fig. 279).

(9) Install gearshift bezel (Fig. 277).

(10) Install the gearshift knob and tighten set screw (Fig. 277) to 2 N·m (20 in.lbs.).

(11) Tilt wheel to full down position and install upper steering column shroud.

(12) Install steering column lower shroud (Fig. 283).

(13) Install lower knee bolster screws and knee bolster.

(14) Install fuse panel cover (Fig. 282).

(15) Connect the battery negative cable.

ADJUSTMENTS

BRAKE/TRANSMISSION SHIFT INTERLOCK CABLE VERIFICATION AND ADJUSTMENT

VERIFICATION

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the “expected response” differs from the vehicle’s response, then system repair and/or adjustment is necessary. Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 287) and brake pedal positions.

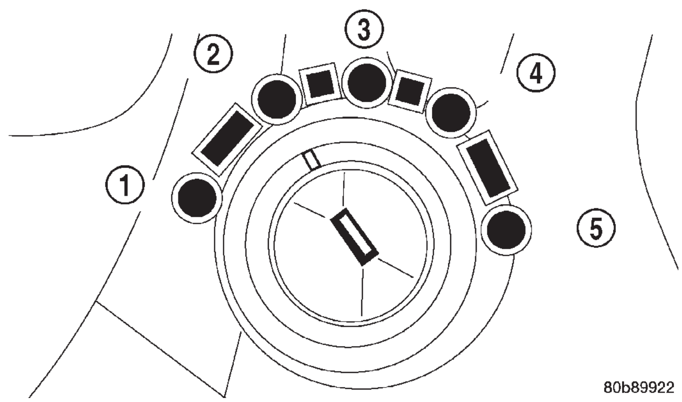

Fig. 287 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

SHIFT INTERLOCK CABLE (Continued)

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

ADJUSTMENT

(1) Disconnect and isolate, the battery negative cable.

(2) Remove the gearshift knob set screw and knob (Fig. 288).

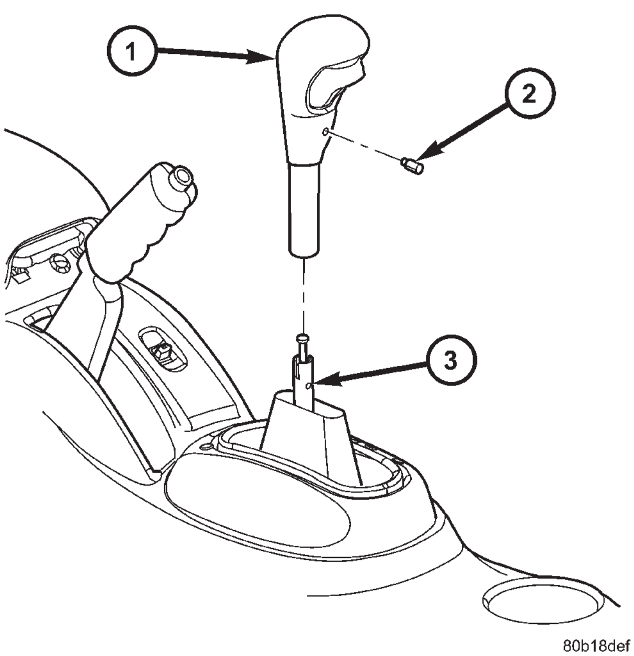

Fig. 288 Gearshift Knob

1 - GEARSHIFT KNOB
2 - SET SCREW
3 - GEARSHIFT MECHANISM

(3) Remove the gearshift bezel to gain access to the interlock cable adjuster lock (Fig. 289).

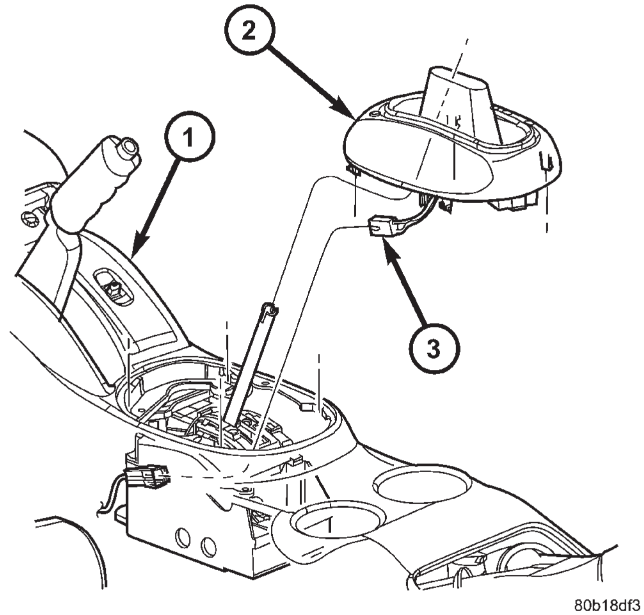

Fig. 289 Gearshift Bezel

1 - CENTER CONSOLE ASSEMBLY
2 - GEARSHIFT BEZEL
3 - LAMP CONNECTOR

(4) Re-install the gearshift knob set screw and knob (Fig. 288).

(5) Place the shift lever in PARK. Move the Ignition key to the LOCK position (Fig. 287) and remove the key.

(6) If the interlock cable is being replaced, remove the lock pin (Fig. 290). This will allow the cable to “self adjust” to the correct position. Tighten the locking clip by pushing it down (Fig. 291).

(7) If the interlock cable **is not** being replaced, the lock pin will not exist. Pull outward on cable locking clip to allow cable to self adjust. Press clip down to lock in place (Fig. 291).

(8) Verify Brake/Transmission Shift Interlock system operation. Refer to operation chart in “Verification.”

(9) Install the gearshift bezel (Fig. 289).

(10) Install the gearshift knob and tighten set screw (Fig. 288) to 2 N·m (20 in. lbs.).

(11) Connect the battery negative cable.

SHIFT INTERLOCK CABLE (Continued)

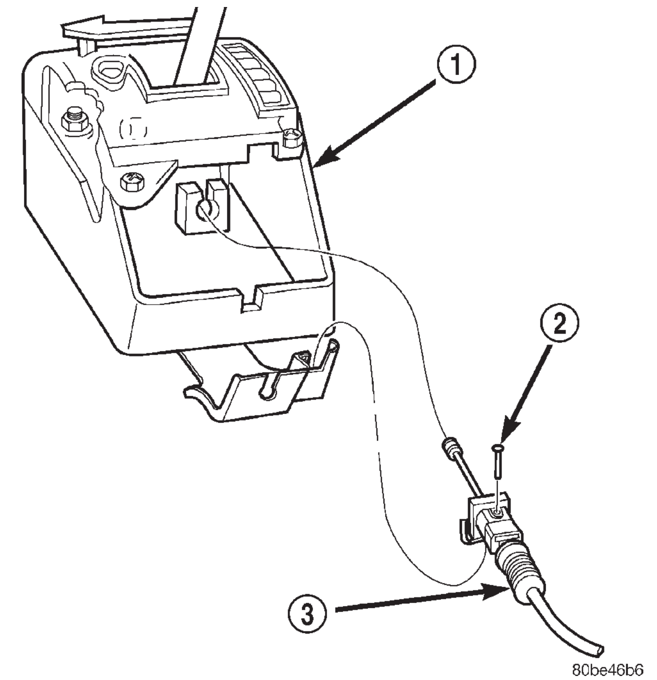

Fig. 290 Interlock Cable Locking Pin

1 - SHIFT MECHANISM
2 - LOCKING PIN
3 - INTERLOCK CABLE

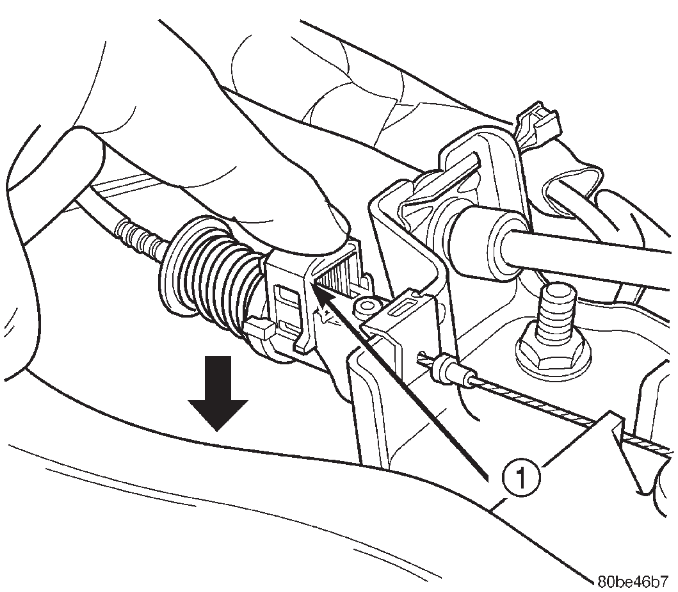

Fig. 291 Locking Clip

1 - LOCKING CLIP

SHIFT INTERLOCK MECHANISM

REMOVAL

(1) Remove steering column upper and lower shrouds.

(2) Grasp the interlock cable and connector firmly. Remove the interlock cable.

(3) Remove the two interlock mechanism to steering column attaching screws (Fig. 292). Remove the interlock mechanism.

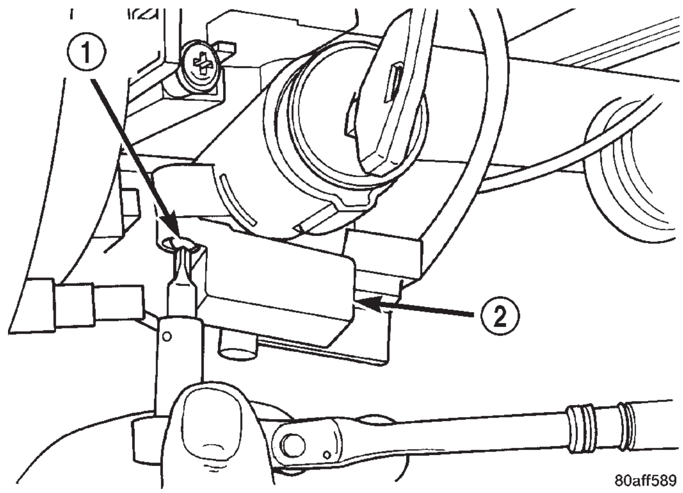

Fig. 292 Interlock Mechanism

1 - MOUNTING SCREW
2 - INTERLOCK MECHANISM

INSTALLATION

(1) Position the interlock housing at steering column. Install the two interlock mechanism to steering column attaching screws (Fig. 292). Torque screws to 3 N·m (21 in. lbs.).

(2) Snap the interlock cable into the housing.

(3) Install the lower column covers, shrouds and knee bolster.

SOLENOID/PRESSURE SWITCH ASSY

DESCRIPTION

The Solenoid/Pressure Switch Assembly (Fig. 293) is external to the transaxle and mounted to the transaxle case. The assembly consists of four solenoids that control hydraulic pressure to the LR/CC, 2/4, OD, and UD friction elements. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the TCM. Likewise, the pressure switches can only be service by replacing the assembly.

SOLENOID/PRESSURE SWITCH ASSY (Continued)

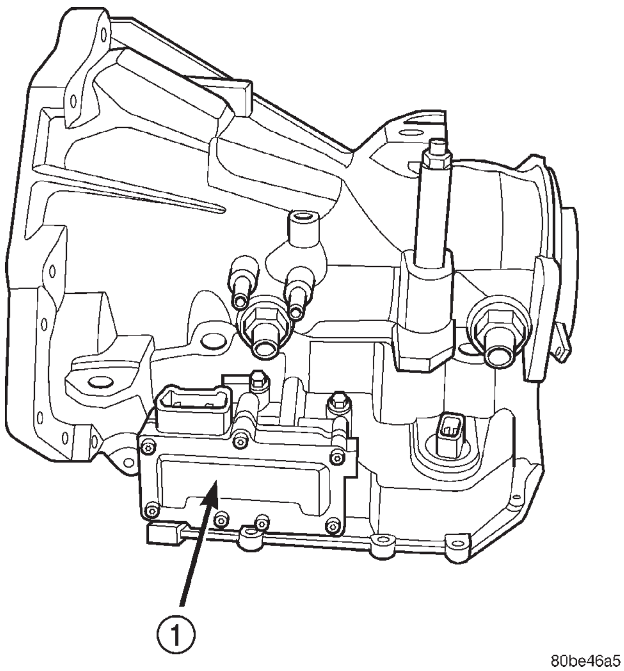

Fig. 293 Solenoid/Pressure Switch Assembly

1 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which by design allow fluid to pass through in their relaxed or "off" state. This allows transaxle limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. It no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL

OP = OPEN

CL = CLOSED

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

The TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

REMOVAL

NOTE: If solenoid/pressure switch assembly is being replaced, it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery negative cable.

(2) Remove air cleaner assembly.

(3) Disconnect solenoid/pressure switch assembly connector.

(4) Disconnect input speed sensor connector.

(5) Remove input speed sensor (Fig. 294).

(6) Remove three (3) solenoid/pressure switch assembly-to-transaxle case bolts (Fig. 295).

SOLENOID/PRESSURE SWITCH ASSY (Continued)

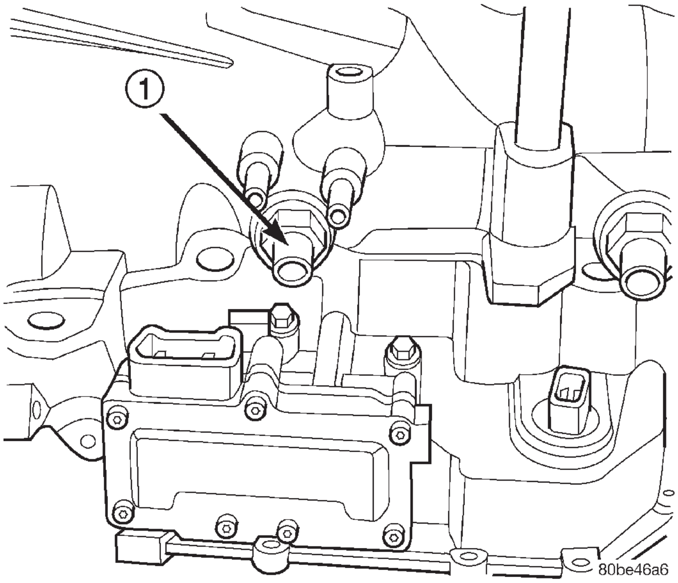

Fig. 294 Input Speed Sensor

1 - INPUT SPEED SENSOR

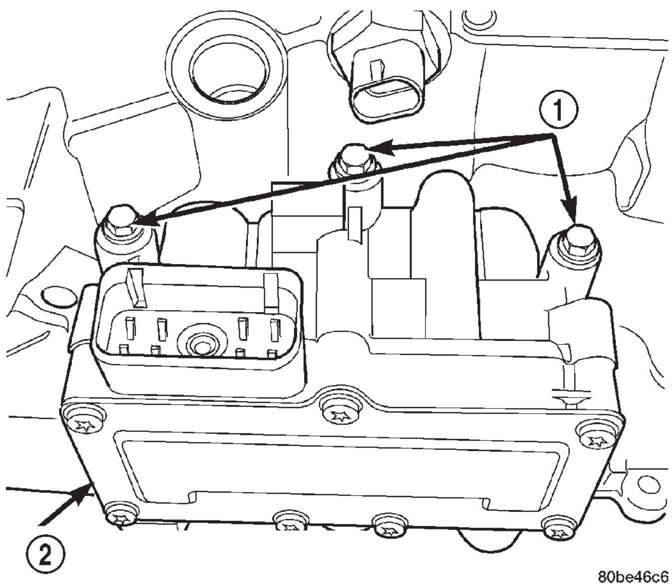

Fig. 295 Solenoid/Pressure Switch Assembly-to-Case Bolts

1 - BOLTS
2 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

(7) Remove solenoid/pressure switch assembly and gasket (Fig. 296). Use care to prevent gasket material and foreign objects from become lodged in the transaxle case ports.

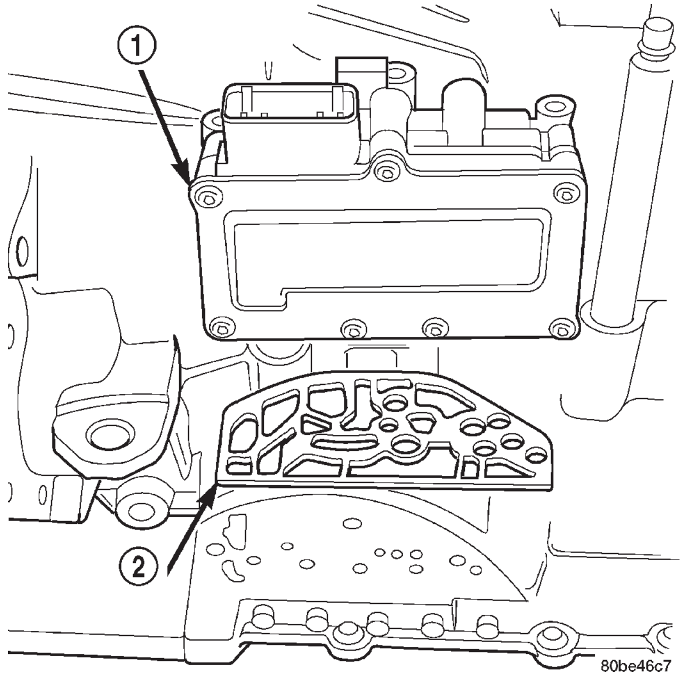

Fig. 296 Solenoid/Pressure Switch Assembly and Gasket

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

INSTALLATION

NOTE: If solenoid/pressure switch assembly is being replaced, it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Install solenoid/pressure switch assembly and new gasket to transaxle (Fig. 296).

(2) Install and torque three (3) bolts (Fig. 295) to 13 N·m (110 in. lbs.).

(3) Install input speed sensor (Fig. 294) and torque to 27 N·m (20 ft. lbs.).

(4) Connect input speed sensor connector.

(5) Install solenoid/pressure switch 8-way connector and torque to 4 N·m (35 in. lbs.).

(6) Install air cleaner assembly.

(7) Connect battery negative cable.

(8) If solenoid/pressure switch assembly was replaced, perform TCM Quick Learn procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

SPEED SENSOR - INPUT

DESCRIPTION

The Input Speed Sensor is a two-wire magnetic pickup device that generates AC signals as rotation occurs. It is threaded into the transaxle case (Fig. 297) , sealed with an o-ring (Fig. 298), and is considered a primary input to the Transmission Control Module (TCM).

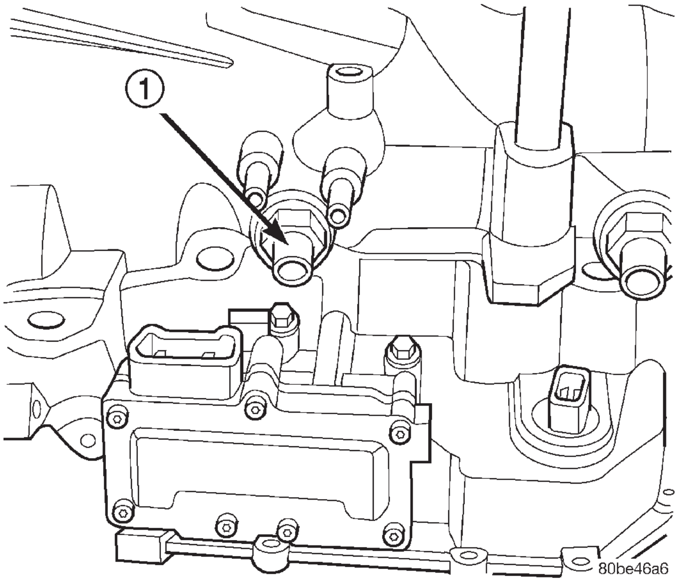

Fig. 297 Input Speed Sensor Location

1 - INPUT SPEED SENSOR

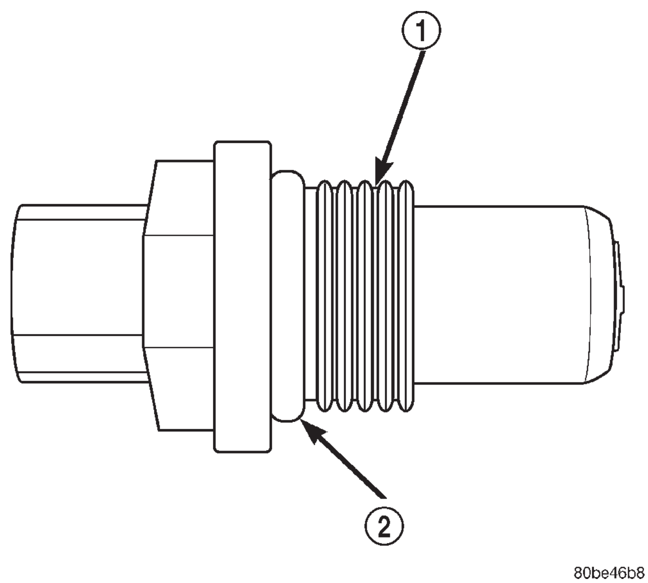

Fig. 298 O-Ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil (Fig. 299), an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

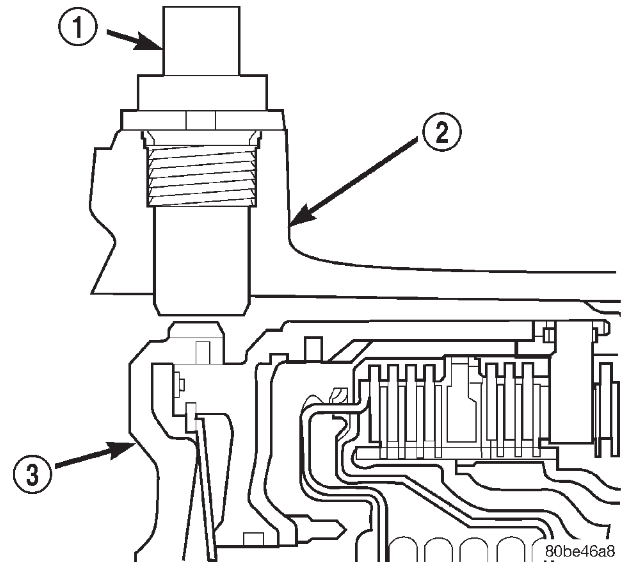

Fig. 299 Sensor Relation to Input Clutch Hub

1 - INPUT SPEED SENSOR
2 - TRANSAXLE CASE
3 - INPUT CLUTCH HUB

The TCM compares the input speed signal with output speed signal to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

(1) Disconnect battery negative cable.

(2) If necessary, disconnect and cap off transmission oil cooler lines.

(3) Disconnect input speed sensor connector.

(4) Unscrew and remove input speed sensor (Fig. 300).

(5) Inspect speed sensor o-ring (Fig. 301) and replace if necessary.

SPEED SENSOR - INPUT (Continued)

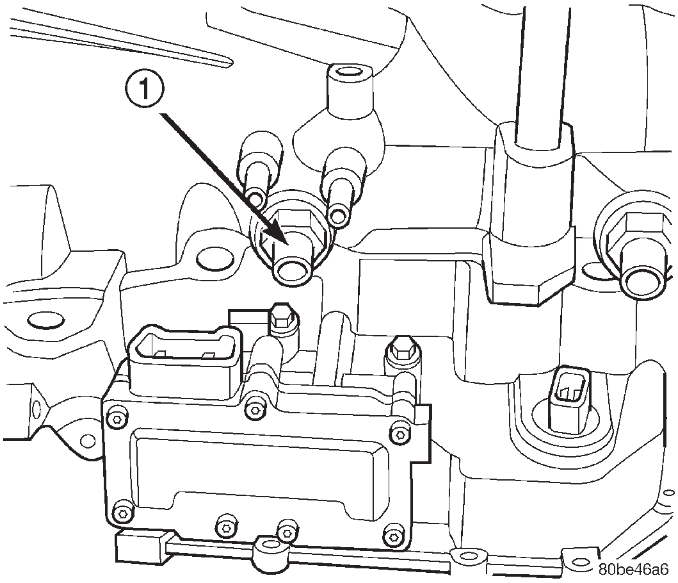

Fig. 300 Input (Turbine) Speed Sensor

1 - INPUT SPEED SENSOR

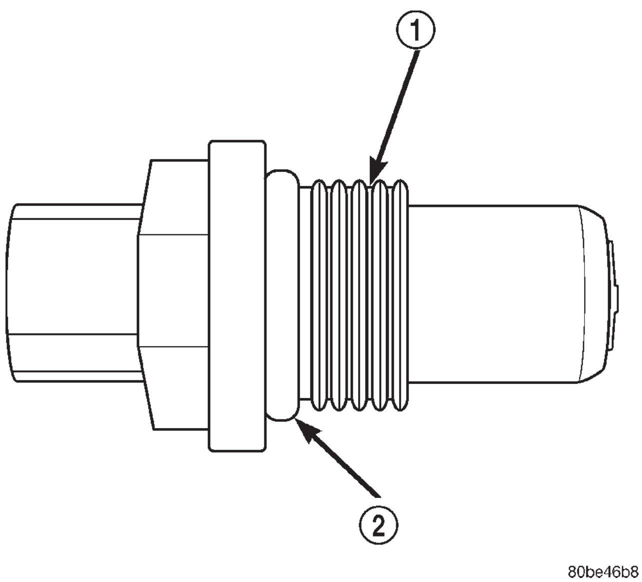

Fig. 301 O-ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

INSTALLATION

(1) Verify o-ring is installed into position.

(2) Install and tighten input speed sensor to 27 N·m (20 ft. lbs.).

(3) Connect speed sensor connector.

(4) Connect battery negative cable.

SPEED SENSOR - OUTPUT

DESCRIPTION

The Output Speed Sensor is a two-wire magnetic pickup device that generates an AC signal as rotation occurs. It is threaded into the transaxle case (Fig. 302) , sealed with an o-ring (Fig. 303), and is considered a primary input to the Transmission Control Module (TCM).

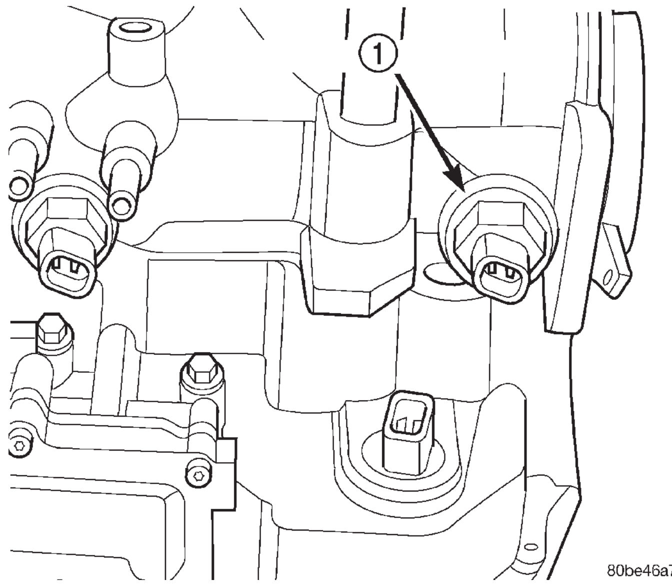

Fig. 302 Output Speed Sensor

1 - OUTPUT SPEED SENSOR

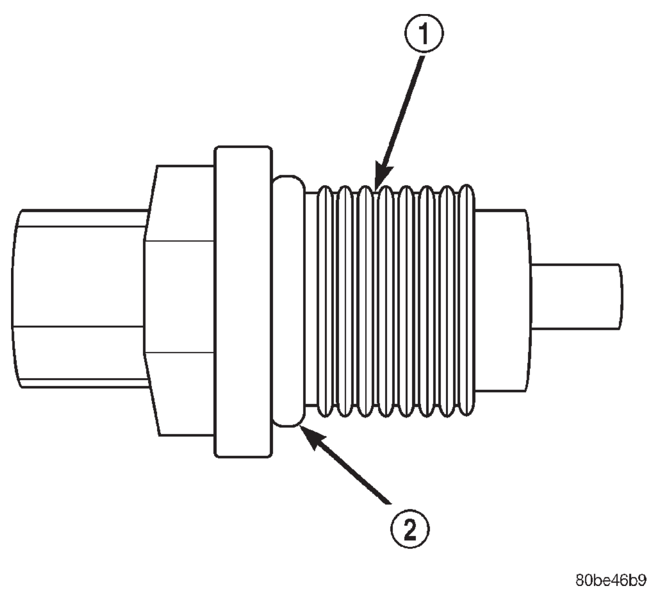

Fig. 303 O-Ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

SPEED SENSOR - OUTPUT (Continued)

OPERATION

The Output Speed Sensor provides information on how fast the output shaft is rotating. As the rear planetary carrier park pawl lugs pass by the sensor coil (Fig. 304), an AC voltage is generated and sent to the TCM. The TCM interprets this information as output shaft rpm.

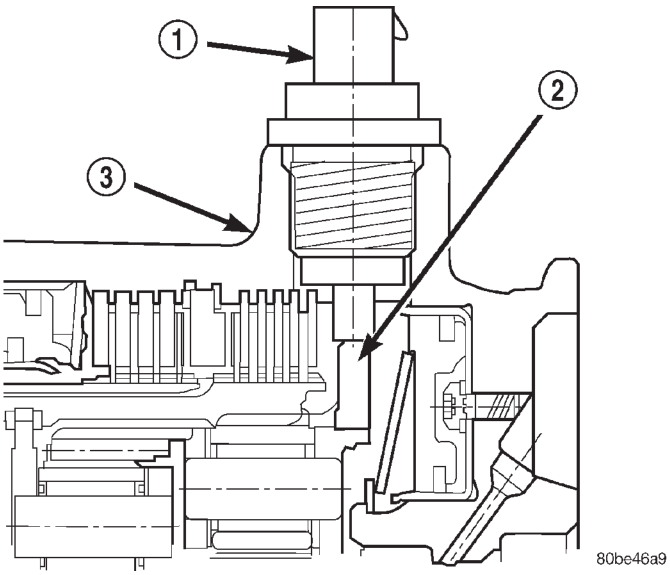

Fig. 304 Sensor Relation to Planet Carrier Park Pawl

1 - OUTPUT SPEED SENSOR
2 - REAR PLANET CARRIER/OUTPUT SHAFT ASSEMBLY
3 - TRANSAXLE CASE

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

VEHICLE SPEED SIGNAL

The vehicle speed signal is taken from the Output Speed Sensor. The TCM converts this signal into a pulse per mile signal and sends it to the PCM. The PCM, in turn, sends the vehicle speed message across the communication bus to the BCM. The BCM sends this signal to the Instrument Cluster to display vehicle speed to the driver. The vehicle speed signal pulse is roughly 8000 pulses per mile.

REMOVAL

(1) Disconnect battery negative cable.
(2) Raise vehicle on hoist.
(3) Disconnect output speed sensor connector.
(4) Unscrew and remove output speed sensor (Fig. 305).
(5) Inspect speed sensor o-ring (Fig. 306) and replace if necessary.

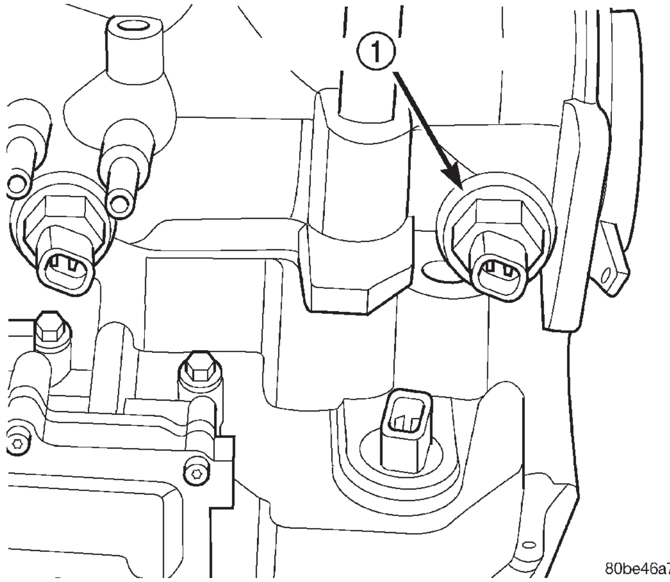

Fig. 305 Output Speed Sensor

1 - OUTPUT SPEED SENSOR

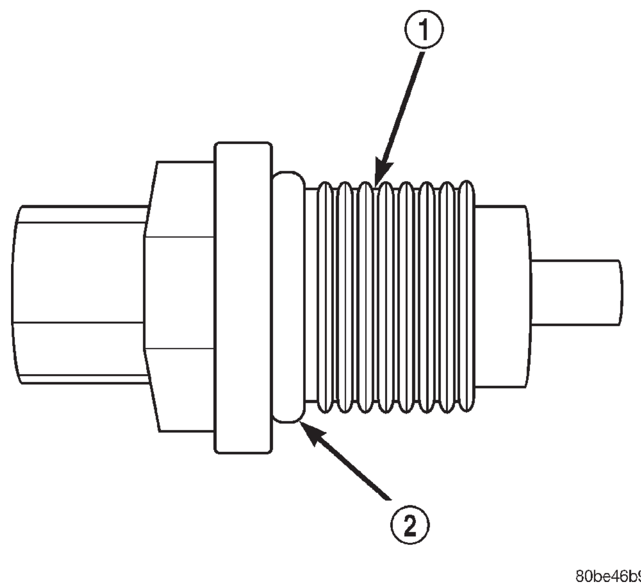

Fig. 306 O-ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

INSTALLATION

(1) Verify o-ring is installed into position (Fig. 306).
(2) Install and tighten input speed sensor to 27 N·m (20 ft. lbs.).
(3) Connect speed sensor connector.
(4) Connect battery negative cable.

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 307) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the fluid cooler and lines.

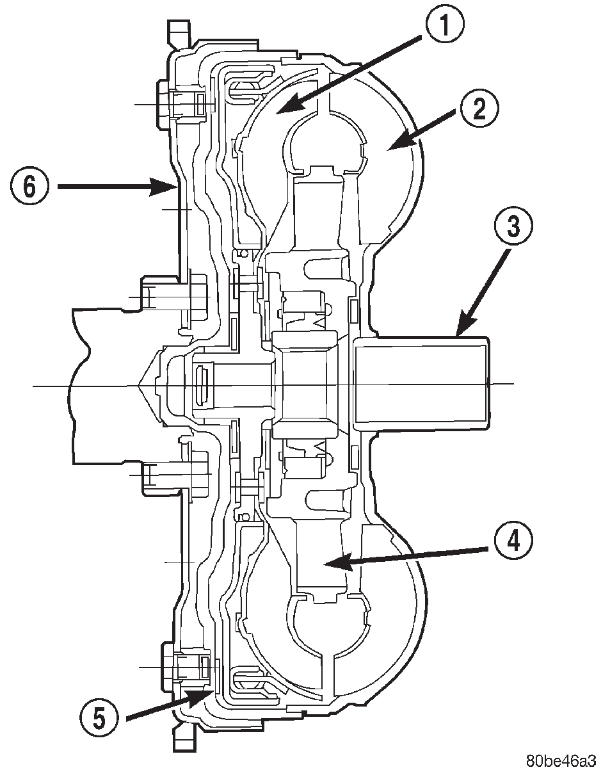

Fig. 307 Torque Converter Assembly

2 - IMPELLER
3 - HUB
4 - STATOR
5 - CONVERTER CLUTCH DISC
6 - DRIVE PLATE

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 308) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving member of the system.

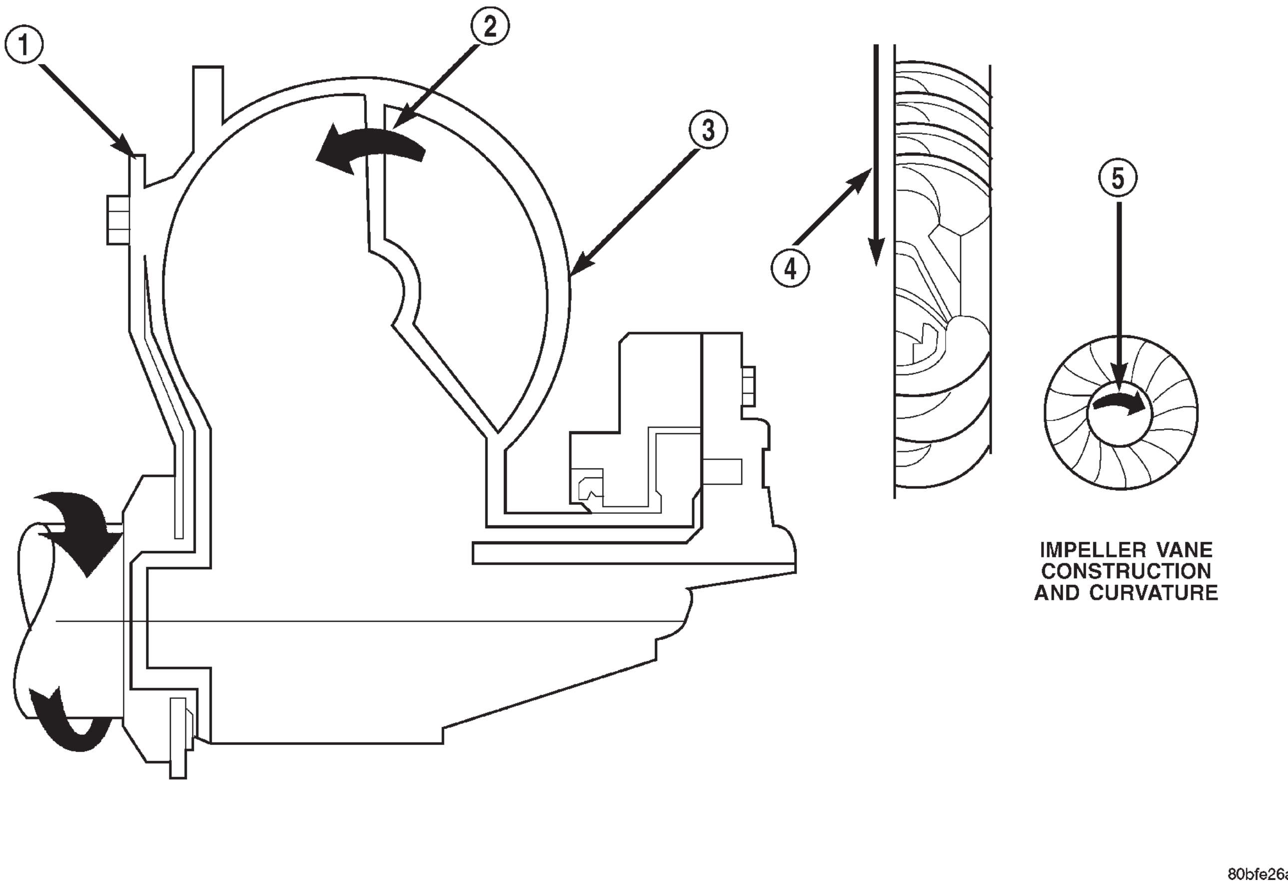

Fig. 308 Impeller

2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

TORQUE CONVERTER (Continued)

TURBINE

The turbine (Fig. 309) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

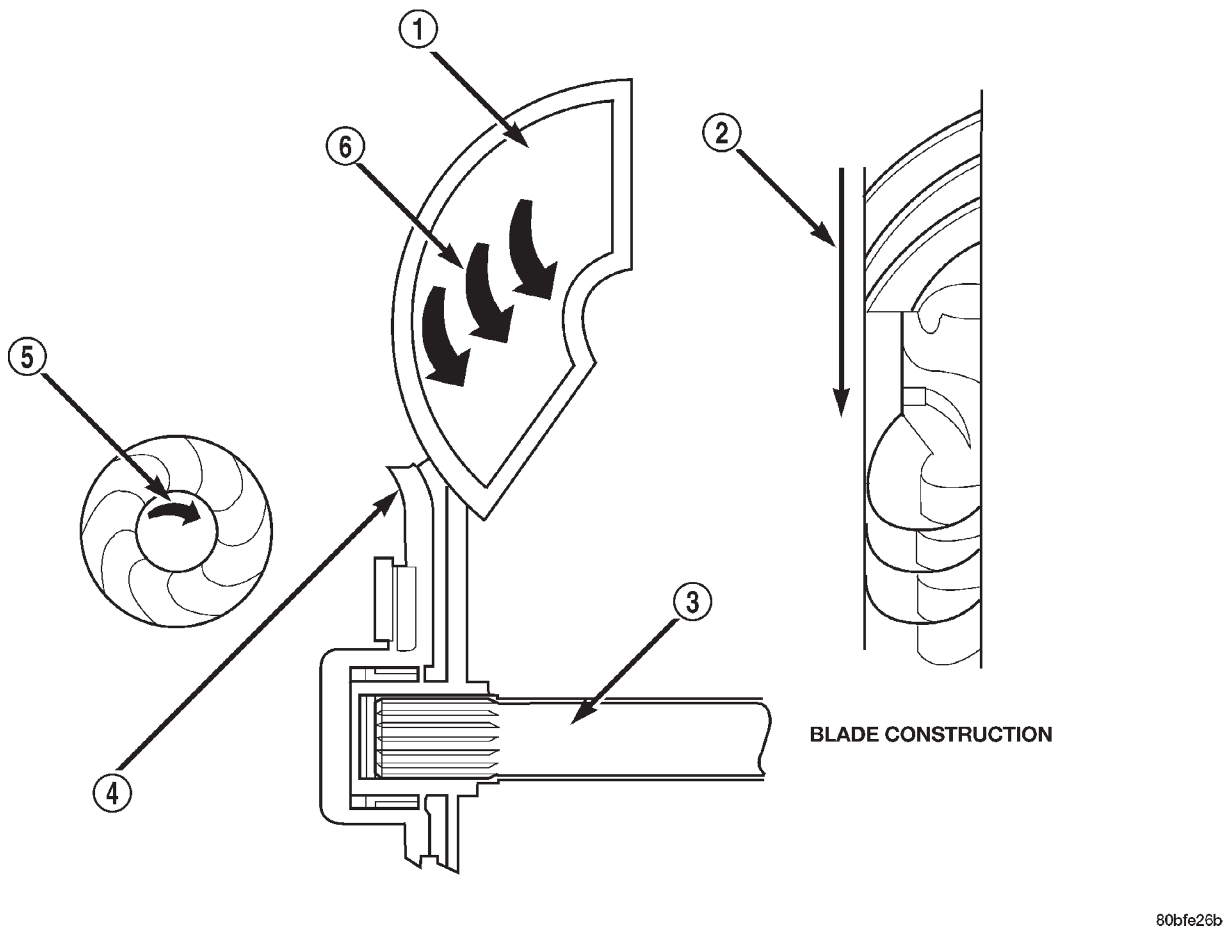

Fig. 309 Turbine

2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 310) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 311). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

2 - ROLLER
3 - SPRING
4 - INNER RACE

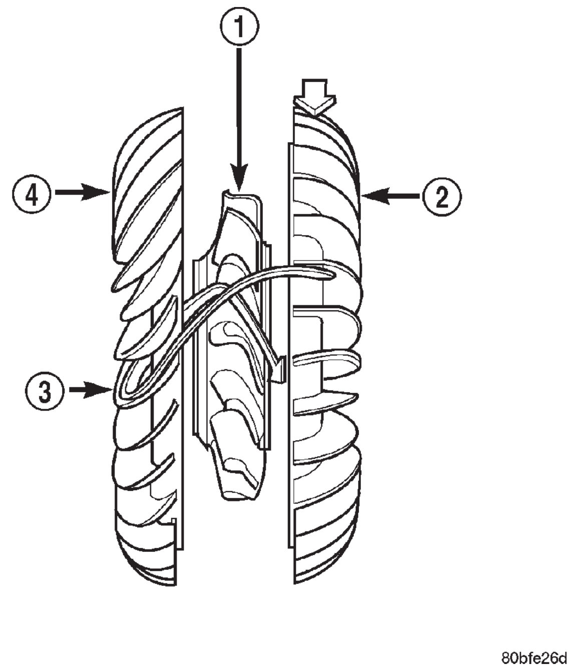

Fig. 311 Stator Location

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 312) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock–free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

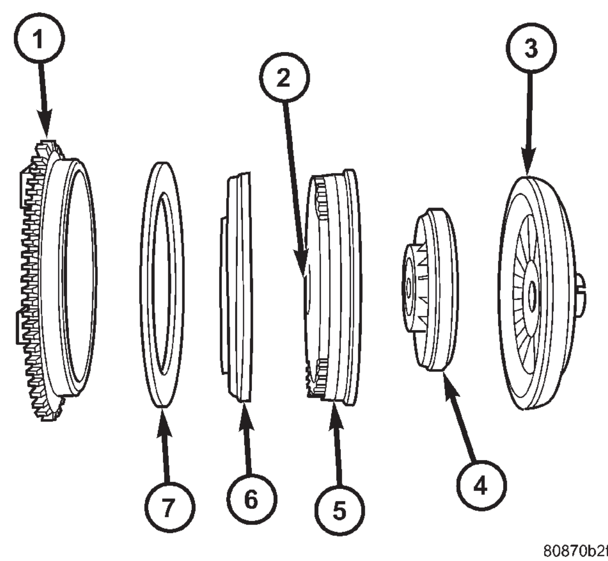

Fig. 312 Torque Converter Clutch (TCC)

1 - IMPELLER FRONT COVER
2 - THRUST WASHER ASSEMBLY
3 - IMPELLER
4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

OPERATION

The converter impeller (Fig. 313) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TORQUE CONVERTER (Continued)

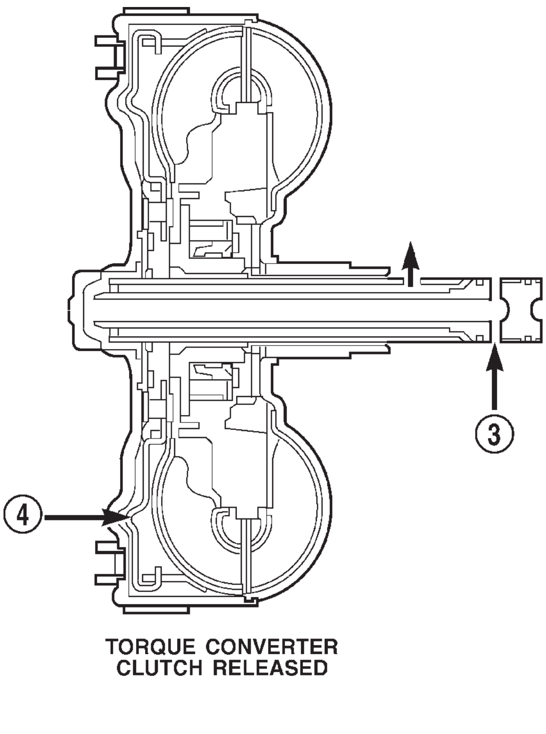

Fig. 313 Torque Converter Fluid Operation

1 - APPLY PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD
3 - RELEASE PRESSURE
4 - THE PISTON MOVES SLIGHTLY REARWARD

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 314). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over–running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock–up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

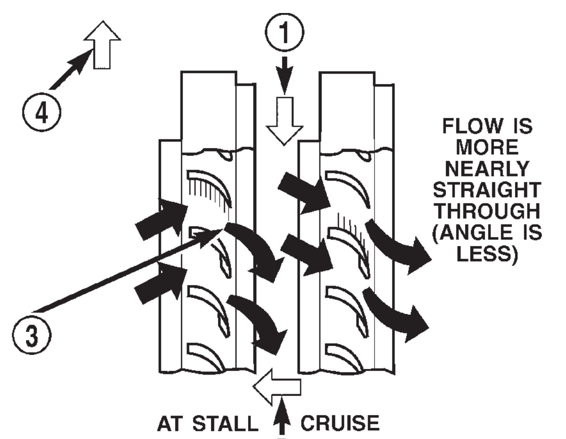

Fig. 314 Stator Operation

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

REMOVAL

(1) Remove transmission and torque converter from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL)

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 315). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION)

(9) Fill the transmission with the recommended fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

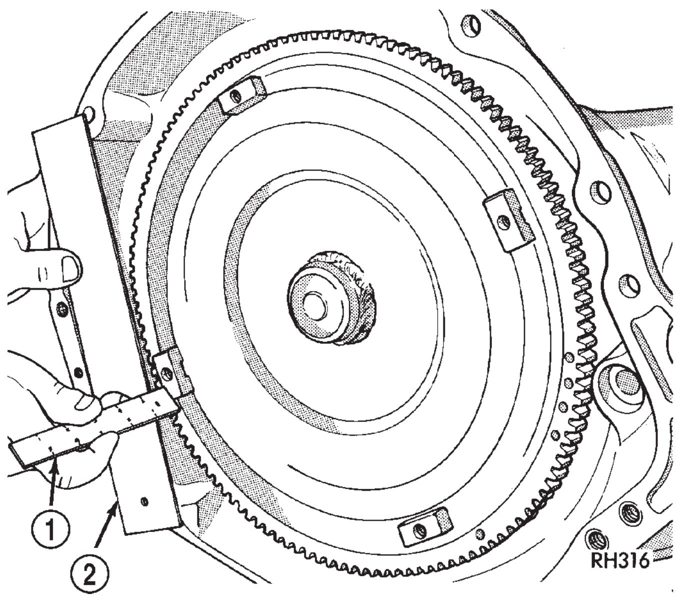

Fig. 315 Checking Torque Converter Seating

1 - SCALE
2 - STRAIGHTEDGE

TRANSMISSION CONTROL RELAY

DESCRIPTION

The transmission control relay (Fig. 316) is located in the Power Distribution Center (PDC), which is located on the left side of the engine compartment.

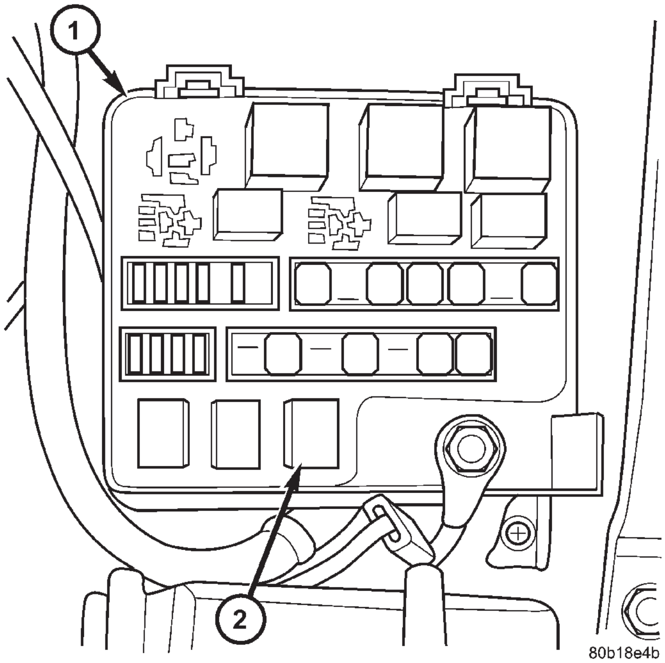

Fig. 316 Transmission Control Relay Location

1 - POWER DISTRIBUTION CENTER (PDC)
2 - TRANSMISSION CONTROL RELAY

OPERATION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is “off”, no power is supplied to the solenoid pack and the transmission is in “limp-in” mode. After a controller reset (ignition key turned to the “run” position or after cranking engine), the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) is mounted to the top of the valve body inside the transaxle and can only be serviced by removing the valve body. The electrical connector extends through the transaxle case (Fig. 317) .

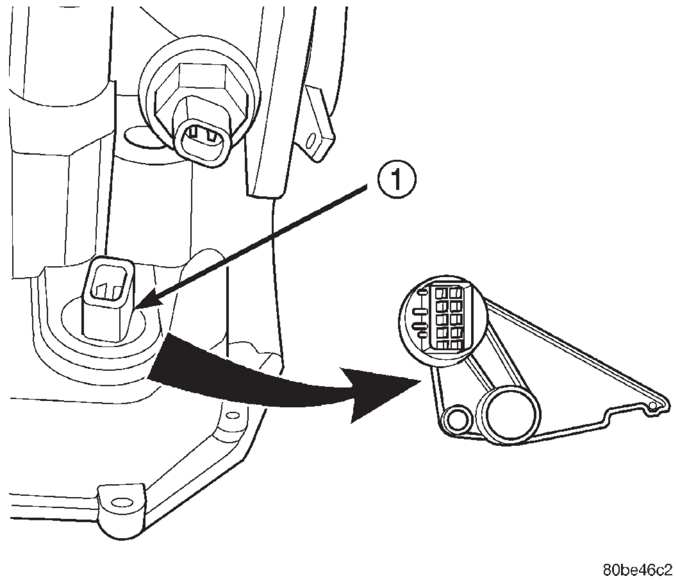

Fig. 317 Transmission Range Sensor (TRS) Location

1 - TRANSMISSION RANGE SENSOR

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the TCM.

The TRS also has an integrated temperature sensor (thermistor) that communicates transaxle temperature to the TCM and PCM (Fig. 318).

OPERATION

The Transmission Range Sensor (TRS) (Fig. 317) communicates shift lever position (SLP) to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transaxle gear position and shift schedule.

TRANSMISSION RANGE SENSOR (Continued)

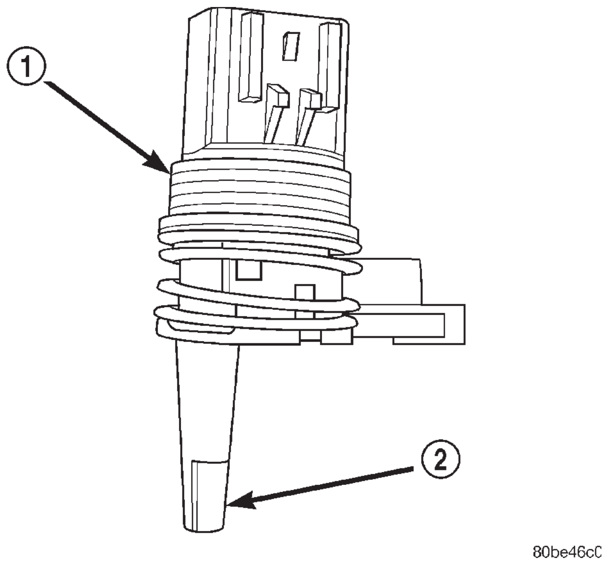

Fig. 318 Transmission Temperature Sensor

1 - TRANSMISSION RANGE SENSOR
2 - TEMPERATURE SENSOR

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as "between gear" codes. This results in six codes which should never occur. These are called "invalid" codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRS SWITCH STATES

SLP	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
OD	OP	OP	OP	CL
3	OP	OP	CL	OP
L	CL	OP	CL	CL

TRANSMISSION TEMPERATURE SENSOR

The TRS has an integrated thermistor (Fig. 318) that the TCM uses to monitor the transmission's sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in. The PCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission "overheat" condition exists. If the thermistor circuit fails, the TCM will revert to calculated oil temperature usage.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

REMOVAL

(1) Remove valve body assembly from transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - REMOVAL)

(2) Remove transmission range sensor retaining screw and remove sensor from valve body (Fig. 319).

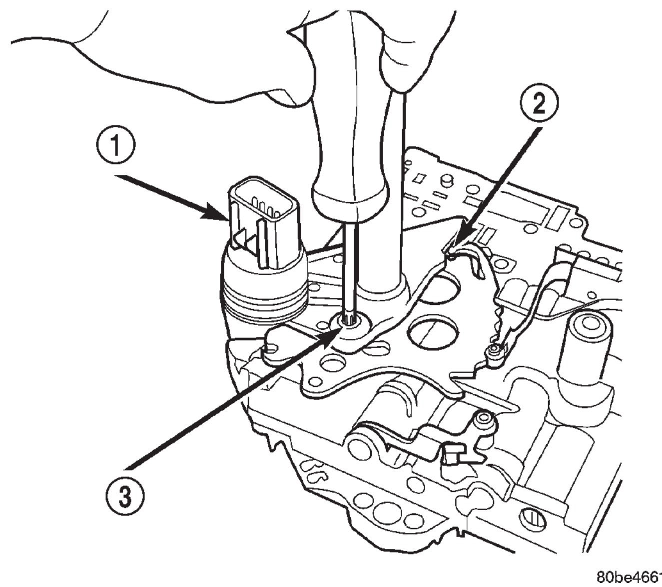

Fig. 319 Remove Transmission Range Sensor

1 - TRANSMISSION RANGE SENSOR
2 - MANUAL VALVE CONTROL PIN
3 - RETAINING SCREW

(3) Remove TRS from manual shaft.

INSTALLATION

(1) Install transmission range sensor (TRS) to the valve body and torque retaining screw (Fig. 319) to 5 N·m (45 in. lbs.).

(2) Install valve body to transaxle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - INSTALLATION)

TRD LINK

DESCRIPTION

The Torque Reduction Link (TRD) is a wire between the PCM and TCM that is used by the TCM to request torque management. Torque management controls or reduces torque output of the engine during certain shift sequences, reducing torque applied to the transaxle clutches.

OPERATION

The torque management signal is basically a 12-volt pull-up supplied by the PCM to the TCM over the torque reduction link (TRD). Torque management is requested when the TCM pulses this signal to ground. The PCM recognizes this request and responds by retarding ignition timing, killing fuel injectors, etc. The PCM sends a confirmation of the request to the TCM via the communication bus. Torque reduction is not noticable by the driver, and usually lasts for a very short period of time.

If the confirmation signal is not received by the TCM after two sequential request messages, a diagnostic trouble code will be set.

VALVE BODY

DESCRIPTION

The valve body assembly consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches. The valve body contains the following components (Fig. 320):

- Regulator valve
- Solenoid switch valve
- Manual valve
- Converter clutch switch valve
- Converter clutch control valve
- Torque converter regulator valve
- Low/Reverse switch valve

In addition, the valve body also contains the thermal valve, #2,3&4 check balls, the #5 (overdrive) check valve and the 2/4 accumulator assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - DISASSEMBLY)

4 - CONVERTER CLUTCH CONTROL VALVE
5 - MANUAL VALVE
6 - CONVERTER CLUTCH SWITCH VALVE
7 - SOLENOID SWITCH VALVE
8 - REGULATOR VALVE

VALVE BODY (Continued)

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The regulator valve controls hydraulic pressure in the transaxle. It receives unregulated pressure from the pump, which works against spring tension to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as “line pressure.”

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid. In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves.

MANUAL VALVE

The manual valve is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve is fed to the torque converter regulator valve, where it passes through the valve, and is slightly regulated. The pressure is then directed to the converter clutch switch valve and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve controls the back (on) side of the torque converter clutch. When the TCM energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under all operating conditions.

REMOVAL

NOTE: If valve body is replaced or reconditioned, the TCM Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery negative cable.
(2) Remove air cleaner assembly.
(3) Disconnect gearshift cable from manual valve lever.
(4) Remove manual valve lever from manual shaft.
(5) Disconnect transmission range sensor (TRS).
(6) Raise vehicle on hoist.
(7) Remove oil pan bolts (Fig. 321).

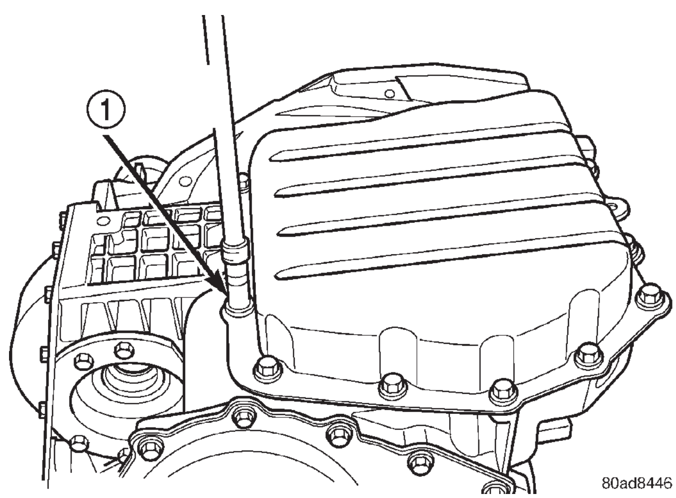

Fig. 321 Oil Pan Bolts

2 - MANUAL VALVE CONTROL PIN
3 - RETAINING SCREW

(16) Install manual shaft seal (Fig. 357).

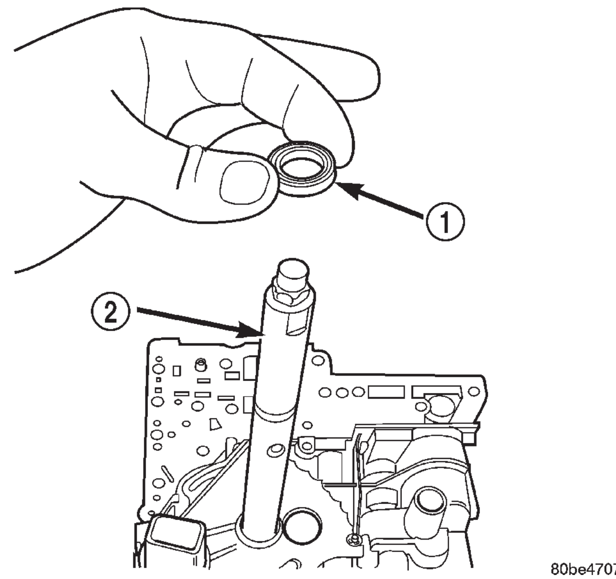

Fig. 357 Manual Shaft Seal

1 - SEAL
2 - MANUAL SHAFT

INSTALLATION

NOTE: If valve body assembly is being replaced or reconditioned, it is necessary to perform the TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Install valve body assembly to transaxle (Fig. 358). Install and torque valve body-to-transaxle case bolts (Fig. 359) to 12 N·m (105 in. lbs.).

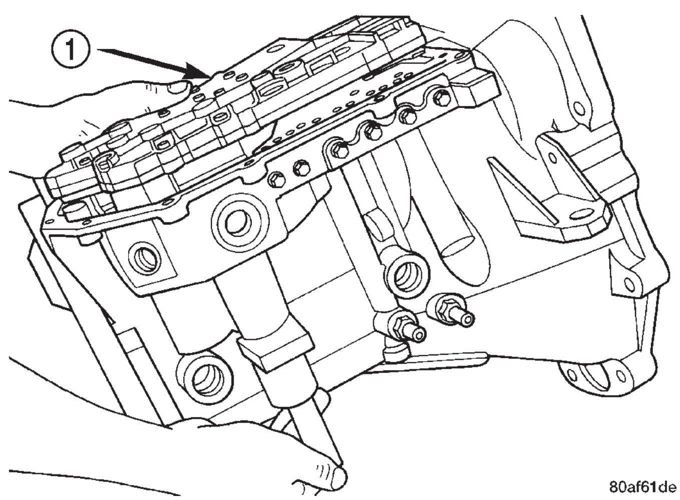

Fig. 358 Valve Body Removal/Installation

1 - VALVE BODY

VALVE BODY (Continued)

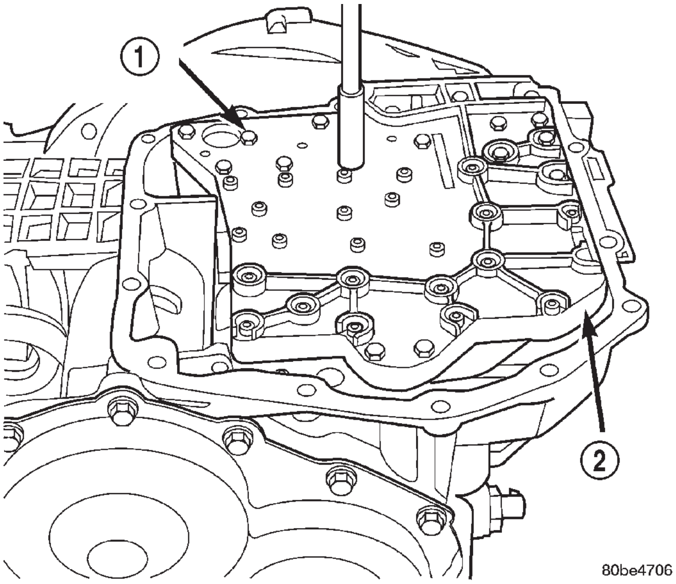

Fig. 359 Valve Body Attaching Bolts

1 - VALVE BODY ATTACHING BOLTS (18)
2 - VALVE BODY

(2) Install transaxle oil filter (Fig. 360). Inspect the o-ring and replace if necessary.

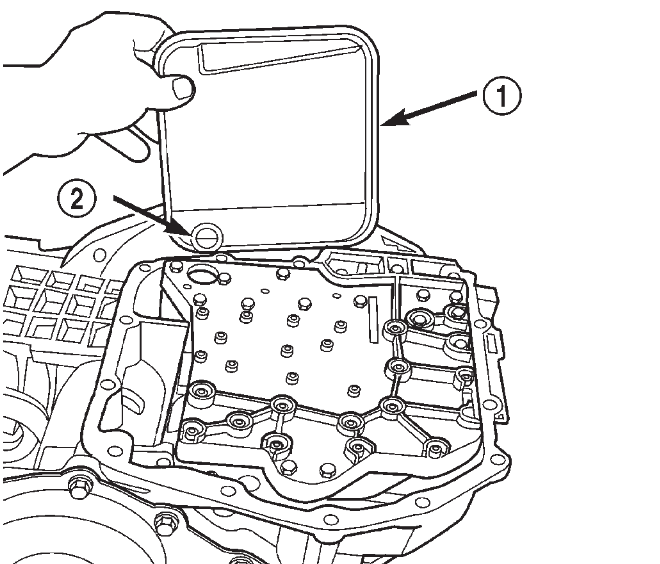

Fig. 360 Oil Filter

1 - OIL FILTER
2 - O-RING

(3) Ensure the transaxle oil pan and transaxle case sealing surfaces are clean and dry. Install an 1/8” bead of Mopar® ATF RTV (MS-GF41) to the oil pan and install (Fig. 361). Torque oil pan-to-transaxle case bolts (Fig. 362) to 19 N·m (165 in. lbs.).

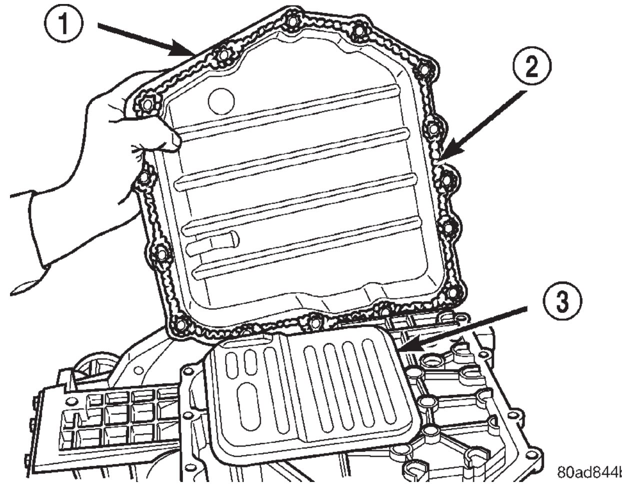

Fig. 361 Oil Pan

2 - 1/8 INCH BEAD OF MOPAR ATF RTV (MS-GF41)
3 - OIL FILTER

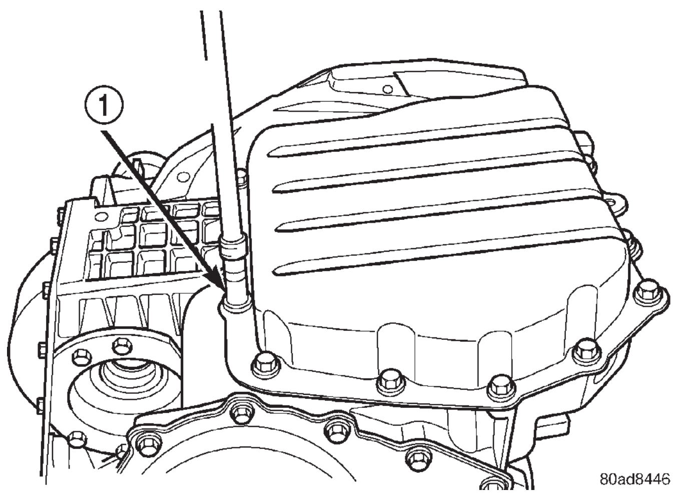

Fig. 362 Oil Pan Bolts

1 - OIL PAN BOLTS (USE RTV UNDER BOLT HEADS)

(4) Lower vehicle.
(5) Connect transmission range sensor connector.
(6) Install manual valve lever to manual shaft.
(7) Install gearshift cable to manual valve lever.
(8) Connect battery negative cable.
(9) Fill transaxle with Mopar® ATF +4 Transmission fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

TIRES/WHEELS

TABLE OF CONTENTS

TIRES/WHEELS

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and force variation can cause vehicles to exhibit steering wheel vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise vehicle on a suitable hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as correct wheel weights. Aluminum wheels require unique wheel weights. They are designed to fit the contour of the wheel (Fig. 1).
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the rear face of the driver's door.

ROAD TEST

Road test vehicle on a smooth road for a least five miles to warm tires (remove any flat spots). Lightly place hands on steering wheel at the 10:00 and 2:00 positions while slowly sweeping up and down from 90 to 110 km/h (55 to 70 mph) where legal speed limits allow.

Observe the steering wheel for:

- Visual Nibble (oscillation: clockwise/counterclockwise, usually due to tire imbalance)
- Visual Buzziness (high frequency, rapid vibration up and down)

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at speed; if vibration occurs or is enhanced, vibration is likely due to causes other than tire and wheel assemblies.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to causes other than tire and wheel assemblies.

TIRES/WHEELS (Continued)

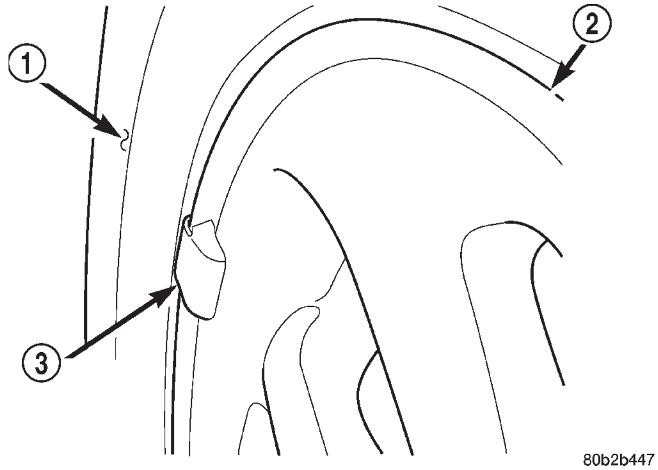

Fig. 1 Aluminum Wheel Weight

1 - TIRE
2 - WHEEL
3 - WHEEL WEIGHT

For brake vibrations, (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).

For powertrain vibrations, (Refer to 3 - DIFFERENTIAL & DRIVELINE - DIAGNOSIS AND TESTING).

For tire and wheel assembly vibrations, continue with this diagnosis and testing procedure.

TIRE AND WHEEL BALANCE

(1) Balance the tire and wheel assemblies as necessary following the wheel balancer manufacturer's instructions and using the information listed in Standard Procedure - Tire And Wheel Balance. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)

(2) Road test the vehicle for at least 5 miles, following the format described in Road Test.

(3) If the vibration persists, continue with this diagnosis and testing procedure.

TIRE AND WHEEL RUNOUT/MATCH MOUNTING

(1) **System Radial Runout.** This on-the-vehicle system check will measure the radial runout including the hub, wheel and tire.

(a) Raise vehicle so tires clear floor. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(b) Apply masking tape around the circumference of the tire in the locations to be measured (Fig. 2). Do not overlap the tape.

(c) Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (Fig. 2) and rotate the tire and wheel. System radial runout should not exceed 0.76 mm (0.030 inch) with no tread "dips" or "steps." Tread "dips" and "steps" can be identified by spikes of the dial indicator gauge.

• Tread ″dips″; Rapid decrease then increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.

• Tread ″steps″; Rapid decrease or increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.

(d) If system runout is excessive, re-index the tire and wheel assembly on the hub. Remove assembly from vehicle and install it back on the hub two studs over from original mounting position. If re-indexing the tire and wheel assembly corrects or reduces system runout, check hub runout and repair as necessary (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).

(e) If system runout is still excessive, continue with this diagnosis and testing procedure.

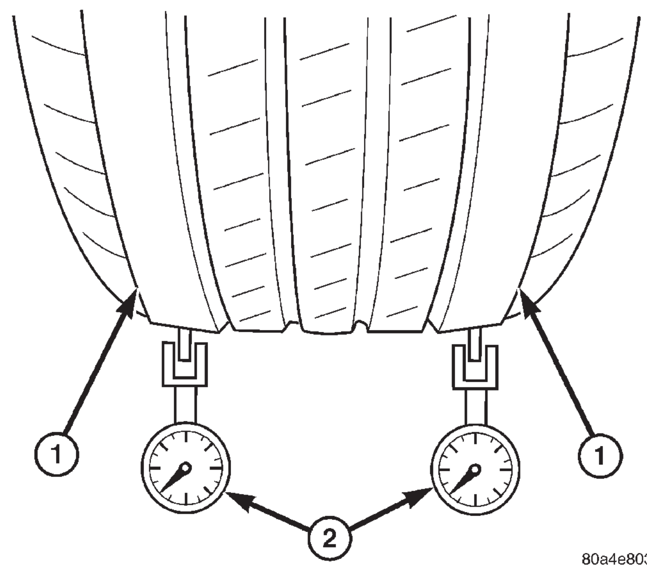

Fig. 2 Radial Runout Measurement

1 - MASKING TAPE
2 - DIAL INDICATOR

(2) **Tire and Wheel Assembly Radial Runout.** This radial runout check is performed with the tire and wheel assembly off the vehicle.

(a) Remove tire and wheel assembly from vehicle and install it on a suitable wheel balancer.

(b) Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (Fig. 2) and rotate the tire and wheel. Radial runout should not exceed 0.76 mm (0.030 inch) with no tread "dips" or "steps." Tread "dips" and "steps" can be identified by spikes of the dial indicator gauge.

TIRES/WHEELS (Continued)

(c) If runout exceeds limits, mark the original location of the tire on the wheel at the valve stem (Fig. 3). Also, mark the tire and wheel to indicate the original high spot of the assembly and record the runout measurement.

(d) If runout exceeds limits, the tire will need to be dismounted from the wheel to verify wheel vs. tire contribution. Refer to Wheel Runout below.

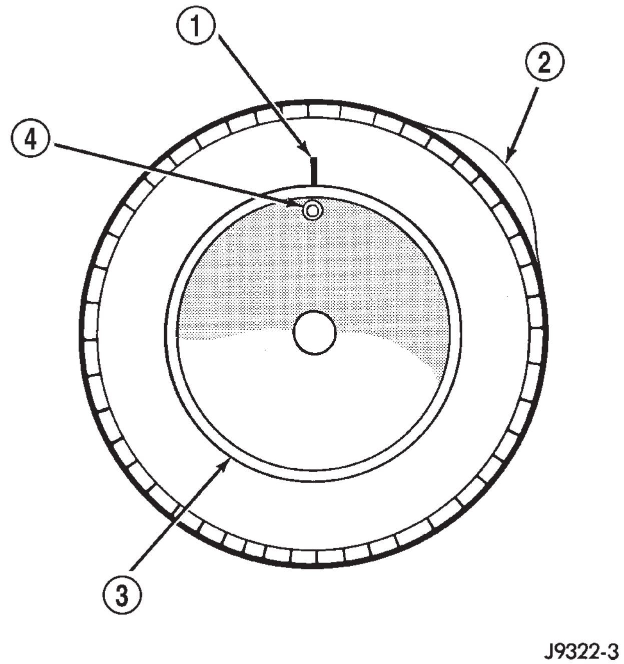

Fig. 3 Marking Tire

1 - REFERENCE MARK
2 - EXAMPLE HIGH SPOT ON TIRE
3 - WHEEL
4 - VALVE STEM

(3) **Lateral Runout.** Lateral runout for the vehicle system as well as the tire and wheel assembly should be less than 0.76 mm (0.030 inch). The same procedure and theory described for radial runout can also be applied to identify and reduce lateral runout.

(4) **Wheel Runout.** This runout check is performed as follows:

(a) Dismount the tire from the wheel.

(b) Mount the wheel back on the wheel balancer.

(c) Measure radial runout of the wheel at the tire bead seat (Fig. 4). Runout should not exceed 0.254 mm (0.010 inch) for aluminum wheels and 0.508 mm (.020 inch) for steel wheels. Replace the wheel if it exceeds the limit.

(d) Measure lateral runout of the wheel at the tire bead seat (Fig. 5). Runout should not exceed 0.762 mm (0.030 inch) for all wheels. Replace the wheel if it exceeds the limit.

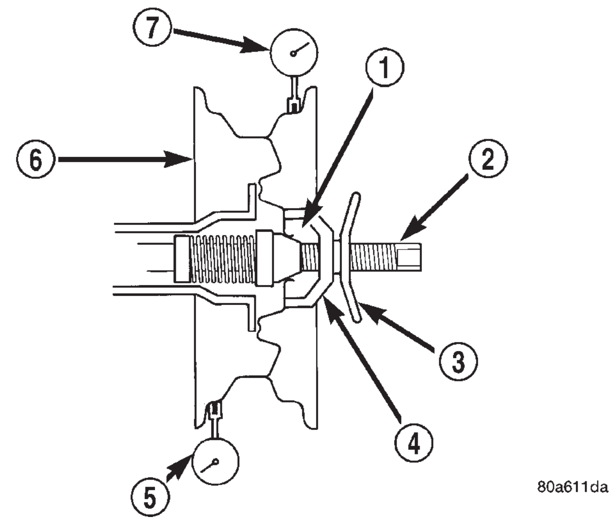

Fig. 4 Checking Radial Runout Of Wheel

7 - DIAL INDICATOR

TIRES/WHEELS (Continued)

(5) **Match Mounting.** If the wheel runout is within specifications, tire and wheel assembly runout can be improved by re-indexing (match mounting) the tire to the wheel as described below.

(a) Remount the tire on the rim 180 degrees from its original location (Fig. 6). Ensure the tire bead is properly seated.

(b) Re-measure the total runout. Mark the tire at the high spot and record the measurement.

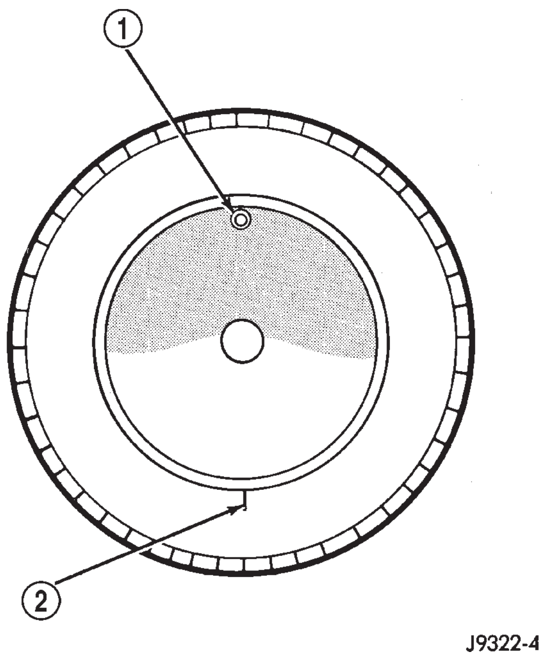

Fig. 6 Remount Tire 180 Degrees

1 - VALVE STEM
2 - REFERENCE MARK

If runout is still excessive, perform the following:

- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the tire, replace the tire.
- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the wheel, the wheel may be out of specification. Refer to Wheel Runout above.
- If the new high spot is NOT within 102 mm (4.0 inch) of either high spot, draw an arrow on the tread from new high spot toward the original (Fig. 7). Break down the tire and remount it 90 degrees on rim in that direction, then re-measure runout. This will normally reduce the runout to an acceptable amount.

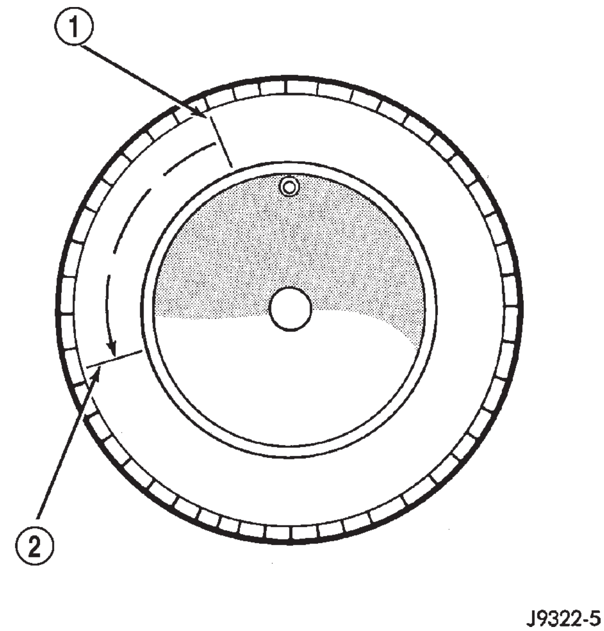

Fig. 7 Remount Tire 90 Degrees In Direction of Arrow

1 - 2ND HIGH SPOT ON TIRE
2 - 1ST HIGH SPOT ON TIRE

(6) Once back together, road test the vehicle for at least 5 miles, following the format described in Road Test. If vibration persists, and all components tested are within specification, the tires may have an excessive radial force condition. Radial force variation can only be checked as indicated below. If this equipment is not available, consult with the tire manufacturer.

RADIAL FORCE VARIATION

Radial Force Variation can be checked using the Hunter GSP 9700 Vibration Control System (Wheel Balancer) or equivalent, if available. This type of equipment helps to correct ride disturbances by reducing the radial force variation of an assembly through re-indexing of the tire to wheel.

The equipment manufacturer or DaimlerChrysler Corporation may supply reference values as guidelines. Radial force measurements above the reference value may not always result in a ride disturbance, nor do they automatically mean the assembly components are out of specification. Do not replace components based on radial force values alone. Balancing, runout diagnosis, re-indexing, and subjective road testing must be performed as outlined in previous sections of this diagnosis and testing procedure.

TIRES/WHEELS (Continued)

Use the Radial Force equipment to identify suspect assemblies and minimize the radial forces. After all suspect assemblies are optimized, reinstall the assemblies and road test the vehicle. If a disturbance still exists and all other vibration diagnostic procedures have been completed, replace one tire or one wheel at a time, starting with the assembly having the highest force variation. Be sure to minimize each new assembly. Road test the vehicle following each replacement. Continue this process until the disturbance is resolved.

NOTE: When using Radial Force equipment, it is critically important to set proper tire inflation pressure and ensure centering of the wheel on the equipment spindle.

RADIAL FORCE VARIATION REFERENCE VALUES

DESCRIPTION	SPECIFICATION
Total Radial Force Variation (RFV)	Less Than 22 Lbs. ± 2 Lbs.
Radial First Harmonic (R1H)	Less Than 16 Lbs. ± 2 Lbs.
Radial Second Harmonic (R2H)	Less Than 12 Lbs. ± 2 Lbs.

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE AND WHEEL BALANCE

NOTE: Balance equipment must be calibrated and maintained per equipment manufacturer's specifications.

Wheel balancing can be accomplished with either on-vehicle or off-vehicle equipment.

NOTE: If using on-vehicle balancing equipment, on the driving axle, remove the opposite wheel and tire assembly.

It is recommended that a two-plane dynamic balancer be used when a wheel and tire assembly requires balancing. A static balancer should only be used when a two-plane balancer is not available.

Balance wheel and tire assemblies dynamically and statically to less than 0.25 (¼) ounce.

For static balancing, find location of heavy spot causing imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 8).

For dynamic balancing, the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (Fig. 9).

The aluminum wheels on this vehicle use a unique wheel weight (Fig. 10). This wheel weight is designed to fit the contoured surface of the wheel (Fig. 10). When balancing an aluminum wheel, this wheel weight must be used. Do not use any other type of wheel weight. It will not properly fit the contour of the wheel.

Always verify the Balance. When using off-vehicle equipment, rotate assembly 180 degrees on balance equipment to verify balance. Variation should not be more than 0.125 (⅛) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning.

If difficult to balance, break down the wheel and tire assembly and check for loose debris inside tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

STANDARD PROCEDURE - TIRE AND WHEEL MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. This technique is used to reduce runout in the wheel and tire assembly. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the wheel is identified with a label on the outside of the rim and a dot or line in the drop well area of the rim (inside where the tire mounts). If the outside label has been removed, the tire will have to be removed to locate the dot or line on the inside of the rim. The tire can then be match mounted to the tire.

Information on match mounting the tire to the wheel can be found in Tire and Wheel Runout/Match Mounting, items (2) through (5), within Diagnosis And Testing - Tire And Wheel Vibration. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

STANDARD PROCEDURE - TIRE AND WHEEL ROTATION

NON-DIRECTIONAL TREAD PATTERN TIRES

Tires on the front and rear axles operate at different loads and perform different functions. For these reasons, they wear at unequal rates, and tend to develop irregular wear patterns. These effects can be reduced by timely rotation of tires. The benefits of rotation are especially worthwhile. Rotation will increase tread life, help to maintain mud, snow, and wet traction levels, and contribute to a smooth, quiet ride.

The suggested rotation method is the forward-cross tire rotation method (Fig. 11). This method takes advantage of current tire industry practice which allows rotation of radial-ply tires. Other rotation methods may be used, but may not have all the benefits of the recommended method.

NOTE: Only the 4 tire rotation method may be used if the vehicle is equipped with a low mileage or temporary spare tire.

DIRECTIONAL TREAD PATTERN TIRES

Some vehicles are fitted with special high-performance tires having a directional tread pattern. These tires are designed to improve traction on wet pavement. To obtain the full benefits of this design, the tires must be installed so that they rotate in the correct direction. This is indicated by arrows on the tire sidewalls.

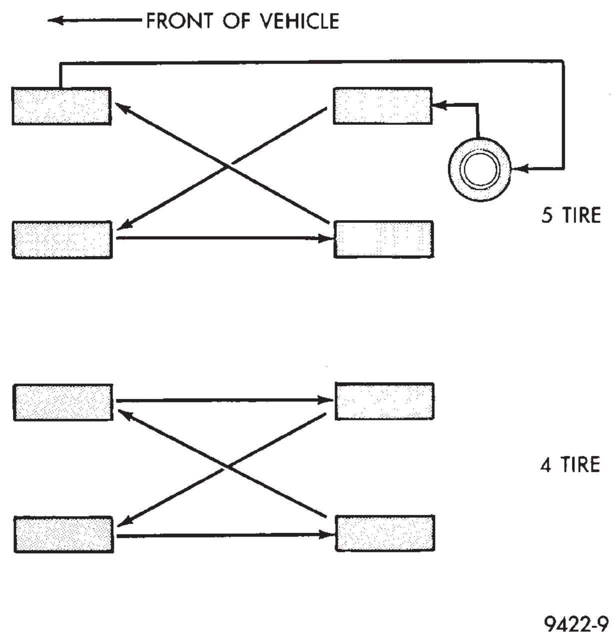

Fig. 11 Forward-Cross Tire Rotation Method

When wheels and tires are being installed, extra care is needed to ensure that this direction of rotation is maintained.

Refer to Owner's Manual for rotation schedule.

REMOVAL - TIRE AND WHEEL ASSEMBLY

(1) Raise the vehicle so the tires clear ground level. (Refer to LUBRICATION & MAINTENANCE/ HOISTING - STANDARD PROCEDURE)

(2) If the vehicle is equipped with wheel covers, remove the cover from the wheel by prying it off with an appropriate wheel cover removal tool.

(3) Remove the wheel mounting (lug) nuts from the studs.

(4) Remove the tire and wheel assembly from the hub.

INSTALLATION - TIRE AND WHEEL ASSEMBLY

(1) To install the tire and wheel assembly, first position it properly on the studs and hub mounting surface using the hub pilot as a guide.

CAUTION: Never apply oil or grease to the wheel mounting studs or nuts.

(2) Install and progressively tighten the five wheel mounting (lug) nuts in the proper sequence (Fig. 12) until half the specified torque is reached. Repeat the sequence, tightening the wheel mounting (lug) nuts to a final torque of 135 N·m (100 ft. lbs.).

TIRES/WHEELS (Continued)

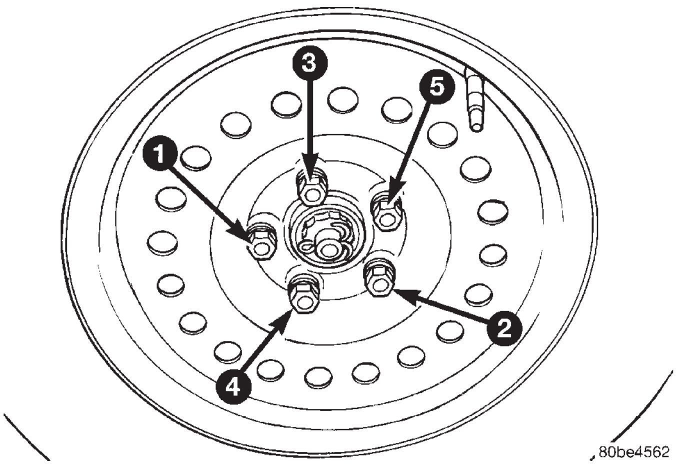

Fig. 12 Wheel Nut Tightening Sequence

(3) If equipped with wheel covers, align the valve stem notch in the wheel cover with the valve stem on the wheel. By hand, tap the wheel cover onto the wheel until it is fully seated against the wheel.

(4) Lower the vehicle.

TIRES

DESCRIPTION

DESCRIPTION - TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 13). An All Season type tire will have either M + S, M & S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the sidewall. The absence of an "XL" or "LL" marking infers a standard load tire.

Consult the tire manufacturer regarding any questions on tire specifications or capabilities.

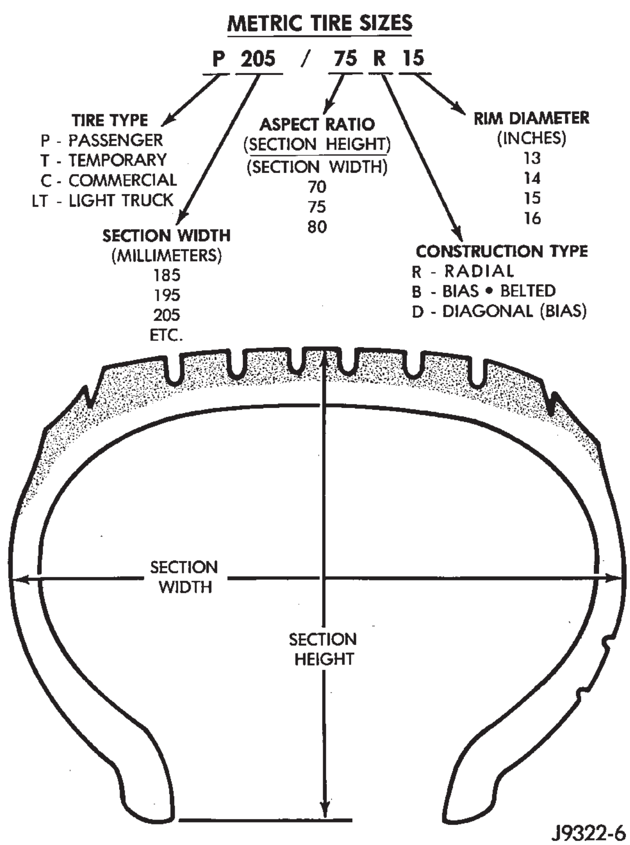

Fig. 13 Tire Identification (Typical)

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

DESCRIPTION - RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 80 km/h (50 mph) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

TIRES (Continued)

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Antilock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

DESCRIPTION - REPLACEMENT TIRES

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

DESCRIPTION - SPARE TIRE (TEMPORARY)

The compact temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the temporary spare tire. Refer to Owner's Manual for complete details.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING). For irregular tire wear, (Refer to 22 - TIRES/WHEELS/TIRES - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING - TIRE/VEHICLE LEAD

(Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - DIAGNOSIS AND TESTING)

DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 14).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 14).

DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 15).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire Inflation Pressure Label provided with the vehicle (usually on the rear face of the driver's door).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

TIRES (Continued)

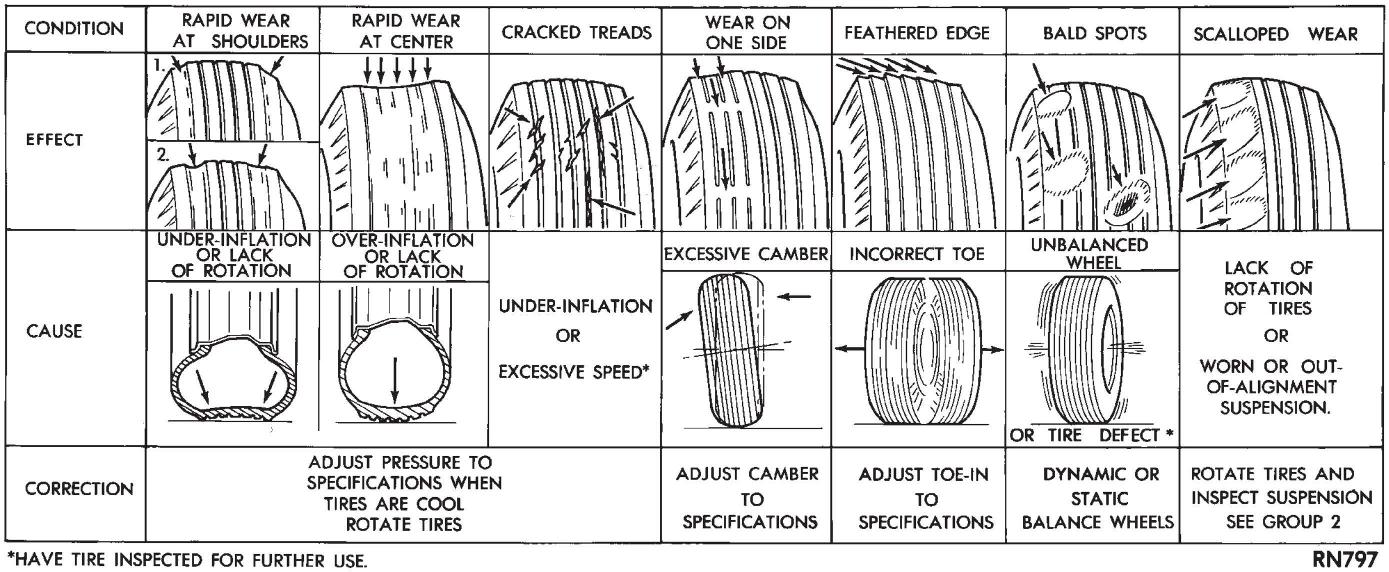

Fig. 14 Tire Wear Patterns

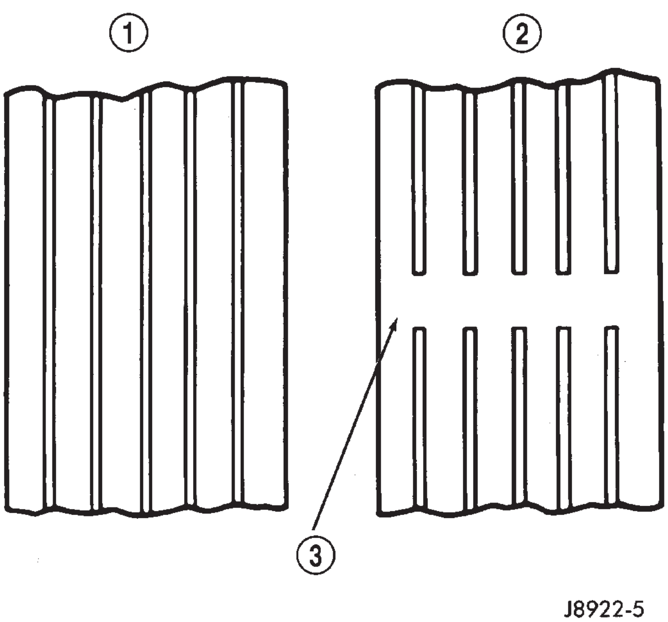

Fig. 15 Tread Wear Indicators

1 - TREAD ACCEPTABLE
2 - TREAD UNACCEPTABLE
3 - WEAR INDICATOR

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING. THE TIRE CAN FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (Fig. 16).

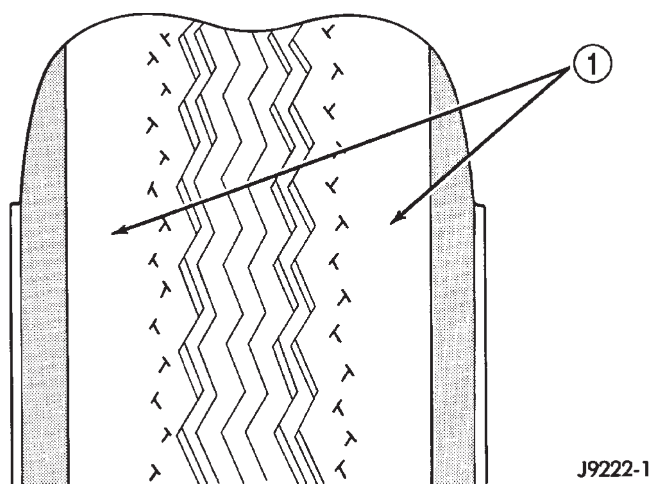

Fig. 16 Under Inflation Wear

1 - THIN TIRE TREAD AREAS

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (Fig. 17).

TIRES (Continued)

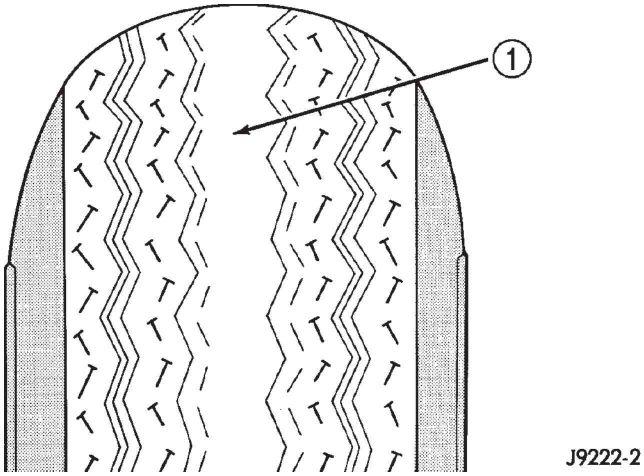

Fig. 17 Over Inflation Wear

1 - THIN TIRE TREAD AREA

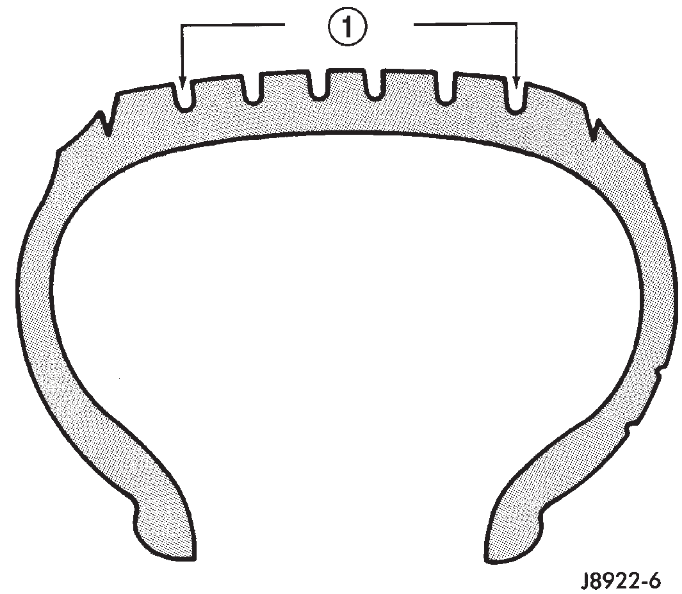

Fig. 18 Tire Repair Area

1 - REPAIRABLE AREA

STANDARD PROCEDURE - TIRE PRESSURE FOR HIGH SPEED OPERATION

DaimlerChrysler Corporation advocates driving at safe speeds within posted speed limits. Speed capacity of a tire is a function of the tire speed rating, inflation pressure and vehicle axle weight. Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. Vehicles loaded to maximum capacity should not be driven at continuous speeds over 120 km/h (75 mph). Never exceed the maximum speed capacity of the tire. For information on tire identification and speed ratings, (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION).

STANDARD PROCEDURE - TIRE LEAK REPAIRING

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 18). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and progressively tighten the 5 wheel nuts to a torque of 135 N·m (100 ft. lbs.).

CLEANING - TIRES

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

WHEELS

DESCRIPTION

Original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

All models use steel or cast aluminum drop center wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps (Fig. 19) .

Initial inflation of the tires forces the bead over these raised sections. In case of air loss the raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

Cast aluminum wheels require special balance weights to fit on the rim flange of the wheel and special wheel clamps for the alignment equipment.

WHEELS (Continued)

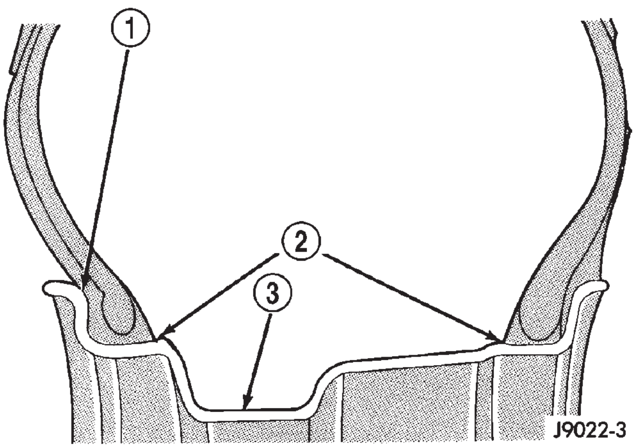

Fig. 19 Safety Rim

1 - FLANGE
2 - RIDGE
3 - WELL

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

Before installing a wheel, remove any buildup of corrosion on the wheel mounting surface.

WARNING: INSTALLING WHEELS WITHOUT GOOD METAL-TO-METAL CONTACT COULD CAUSE LOOSENING OF WHEEL LUG NUTS. THIS COULD ADVERSELY AFFECT THE SAFETY AND HANDLING OF YOUR VEHICLE.

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they must be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE.

WARNING: REPLACEMENT WITH USED WHEELS IS NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

CLEANING - ALUMINUM WHEEL CARE

Chrome plated and painted aluminum wheels should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion.

Care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Any of the “DO NOT USE” items listed below WILL damage chrome plated and painted aluminum wheels.

DO NOT USE:

- any abrasive metal cleaner
- any abrasive cleaning pad or brush
- any cleaner that contains an acid (this will immediately react with and discolor the chromium surface)
- chrome polish (unless it is buffed off immediately after application)
- oven cleaner
- a car wash that uses carbide-tipped wheel cleaning brushes

SPECIFICATIONS

WHEEL MOUNTING STUDS - FRONT

REMOVAL

CAUTION: If a wheel mounting stud needs to be replaced in the hub and bearing assembly, DO NOT hammer the studs out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature bearing failure.

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Remove the front wheel and tire assembly from the vehicle.

(3) Remove front disc brake caliper and adapter as an assembly. Refer to Brakes.

(4) Remove any retainer clips, then remove brake rotor form hub.

(5) Install a lug nut on wheel stud to be removed from hub and bearing assembly, (Fig. 20) so threads on stud are even with end of lug nut. Rotate hub so stud requiring removal is aligned with notch cast into front of steering knuckle. Install Remover, Special Tool C-4150 on hub and bearing assembly flange and wheel stud (Fig. 20).

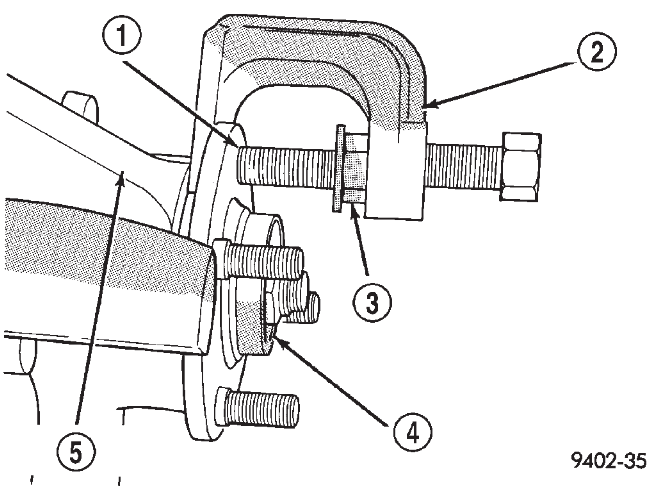

Fig. 20 Removing Wheel Stud From Hub And Bearing

1 - WHEEL STUD
2 - SPECIAL TOOL C-4150A
3 - LUG NUT
4 - FRONT HUB
5 - STEERING KNUCKLE

(6) Tighten down on special tool, this will push the wheel stud out of the hub and bearing flange.

INSTALLATION

CAUTION: If a wheel mounting stud needs to be replaced in the hub and bearing assembly, DO NOT hammer the studs out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature bearing failure.

(1) Install replacement wheel stud into flange of hub and bearing assembly. Install washers on wheel stud, then install a wheel lug nut on stud with flat side of lug nut against washers (Fig. 21).

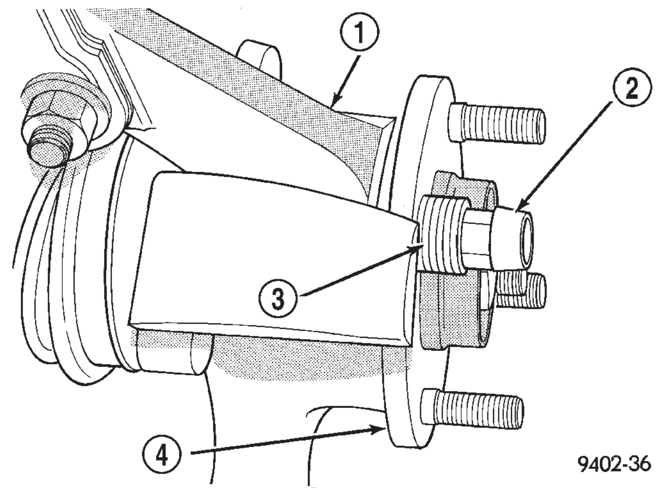

Fig. 21 Installing Wheel Stud Into Hub (Typical)

1 - STEERING KNUCKLE
2 - WHEEL LUG NUT
3 - WASHERS
4 - FRONT HUB

(2) Tighten the wheel lug nut, pulling the wheel stud into the flange of the hub and bearing assembly. When the head of the stud is fully seated against the bearing flange, remove lug nut and washers from wheel stud.

(3) Install brake rotor on front hub.

(4) Install disc brake caliper and adapter as an assembly on knuckle. Refer to Brakes.

(5) Install front wheel and tire assembly. Install front wheel lug nuts and torque to 135 N·m (100 ft. lbs.).

(6) Lower vehicle.

WHEEL MOUNTING STUDS - REAR

REMOVAL

CAUTION: DO NOT hammer studs out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature bearing failure.

(1) Remove the hub and bearing from the vehicle. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

CAUTION: Take care to keep hub and bearing assembly from falling during stud removal. Damage to the hub and bearing could result.

(2) Position the hub and bearing assembly under a hydraulic press ram, supported by a 21 mm deep-well impact socket under the stud to be replaced (Fig. 22).

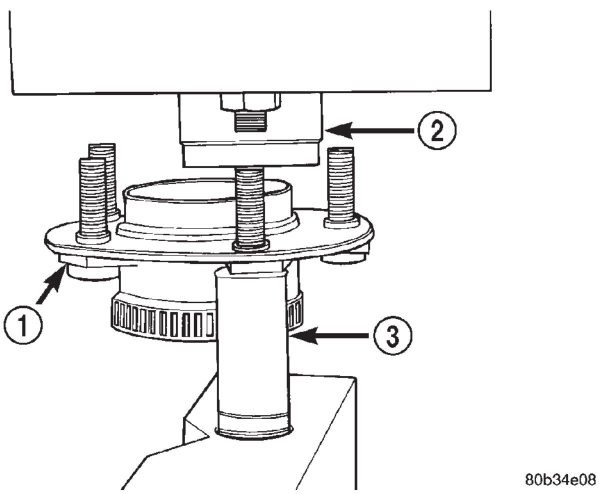

Fig. 22 Wheel Stud Removal

1 - HUB AND BEARING ASSEMBLY
2 - PRESS RAM
3 - 21mm IMPACT SOCKET

(3) Press the stud out of the hub flange and into the socket well.
(4) Remove the hub and bearing assembly from the press.
(5) Remove the stud from the socket.

INSTALLATION

CAUTION: DO NOT hammer studs into the hub flange. If a stud is installed in such a manner, damage to the hub and bearing assembly may occur leading to premature bearing failure.

(1) Install wheel stud into stud hole in hub and bearing assembly.
(2) Position the hub and bearing assembly face down with stud pointing down into the well of the 21 mm socket. The hydraulic press ram must line up with the stud (Fig. 23).

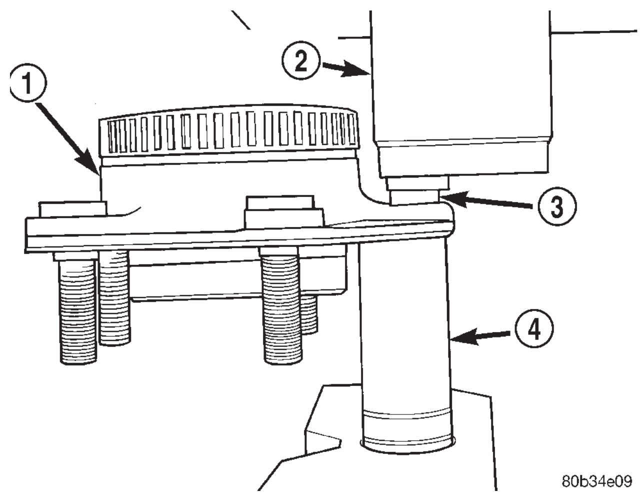

Fig. 23 Wheel Stud Installation

1 - HUB AND BEARING ASSEMBLY
2 - PRESS RAM
3 - WHEEL STUD
4 - 21mm IMPACT SOCKET

(3) Press the stud into the hub flange until it bottoms.
(4) Remove the hub and bearing assembly from the press.
(5) Install the hub and bearing on the vehicle. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)

BODY

DESCRIPTION

DESCRIPTION – VEHICLE IDENTIFICATION

Throughout this group, references to the DaimlerChrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE IDENTIFICATION NUMBER - DESCRIPTION). If a procedure is common to all vehicles covered in this manual, no reference will be made to a vehicle family code.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.
AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.
DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.
Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
Always have a fire extinguisher ready for use when welding.
Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.
Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

BODY (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

BODY (Continued)

DIAGNOSIS AND TESTING - WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/ surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **EYE PROTECTION SHOULD BE USED WHEN SERVICING COMPONENTS. PERSONAL INJURY CAN RESULT.**
- **USE AN OSHA APPROVED BREATHING MASK WHEN MIXING EPOXY, GRINDING, AND SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**
- **AVOID PROLONGED SKIN CONTACT WITH RESIN, PETROLEUM, OR ALCOHOL BASED SOLVENTS. PERSONAL INJURY CAN RESULT.**
- **DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

BODY (Continued)

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel (Fig. 1). To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

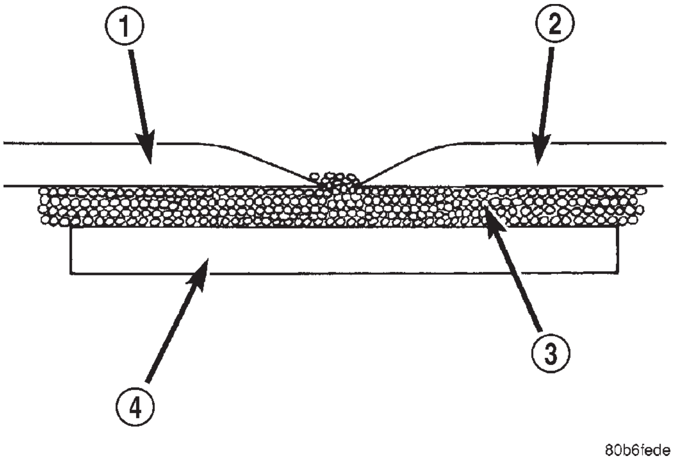

Fig. 1 Panel Sectioning

1 - EXISTING PANEL
2 - NEW PANEL
3 - PANEL ADHESIVE
4 - BONDING STRIP

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement (Fig. 2) and (Fig. 3). Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair (Fig. 4). It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

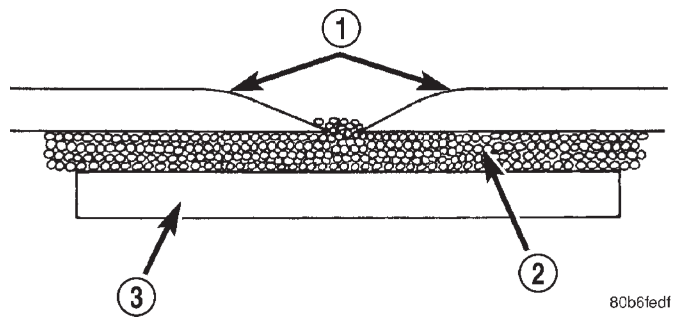

Fig. 2 Softened Edges

1 - SOFTENED EDGES
2 - PANEL ADHESIVE
3 - BONDING STRIP

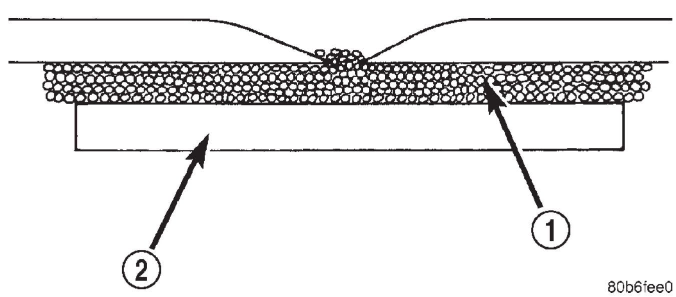

Fig. 3 Panel Reinforcement

1 - PANEL ADHESIVE
2 - REINFORCEMENT

BODY (Continued)

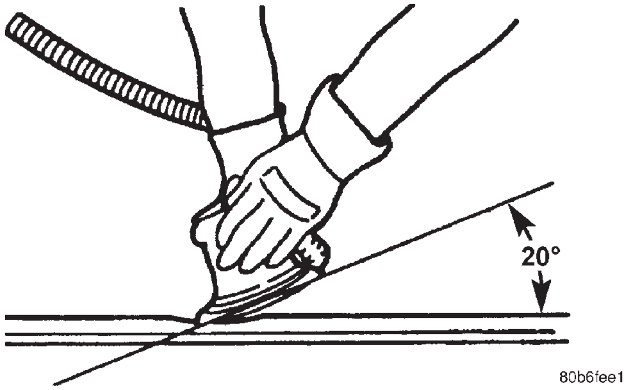

Fig. 4 Beveling Angle – 20 Degree

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used (Fig. 5).
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

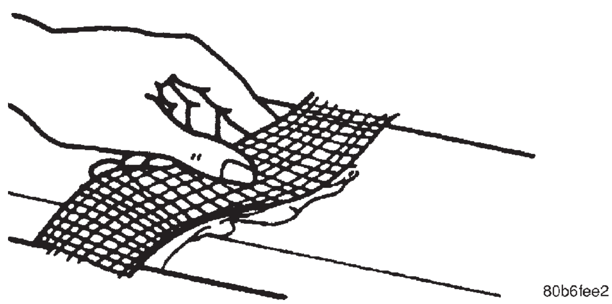

Fig. 5 Fiberglass Tape

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind (Fig. 7) (Fig. 6).

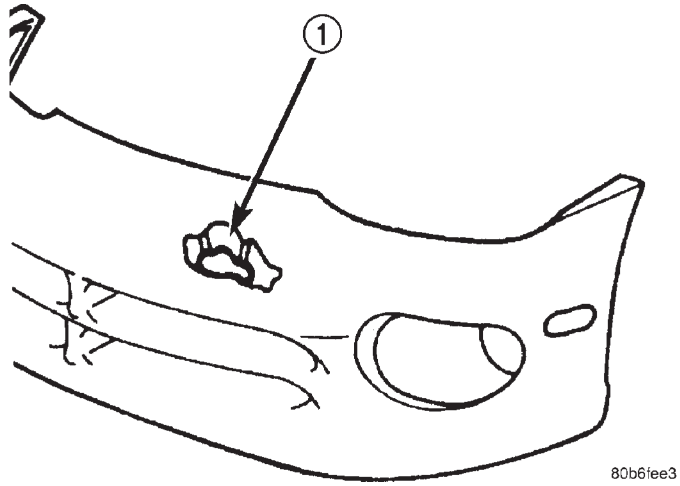

Fig. 6 Damage Component

1 - PUNCTURE

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material (Fig. 7). Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

BODY (Continued)

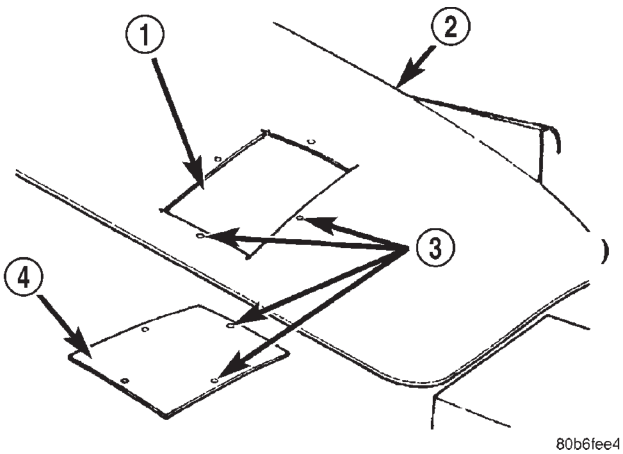

Fig. 7 Damaged Panel Cutout and Patch

1 - CUTOUT
2 - DAMAGED BODY PANEL
3 - 4 MM (0.160 IN.) HOLES
4 - PATCH CUT TO SIZE

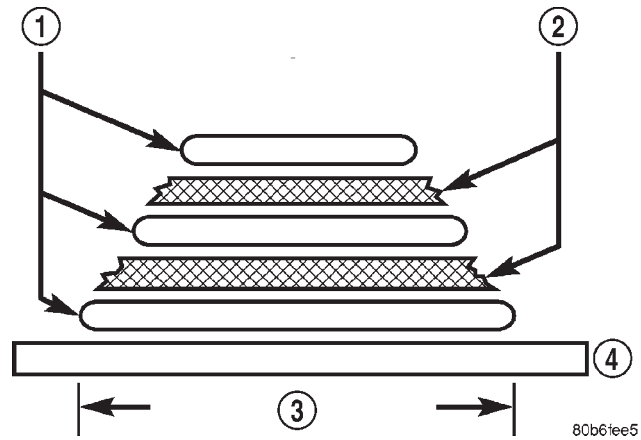

Fig. 8 Fabricated Panel

1 - STRUCTURAL ADHESIVE
2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE
3 - WIDTH OF V-GROOVE
4 - WAXED PAPER

(1) Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required (Fig. 8).

(2) Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.

(3) Apply a liberal coat of adhesive over the reinforcement mesh (Fig. 8). If necessary apply a second or third coat of adhesive and mesh after firs coat has cured. The thickness of the patch should be the same as the repair area.

(4) After patch has cured, peel waxed paper or plastic from the back of the patch.

(5) If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

(1) Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.

(2) Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

(3) Using the pattern as a guide, cut the patch to size.

(4) Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.

(5) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole (Fig. 7).

(6) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.

(7) Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.

(8) Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.

(9) Mix enough adhesive to cover one side of all support squares.

(10) Apply adhesive to cover one side of all support squares.

(11) Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares (Fig. 9).

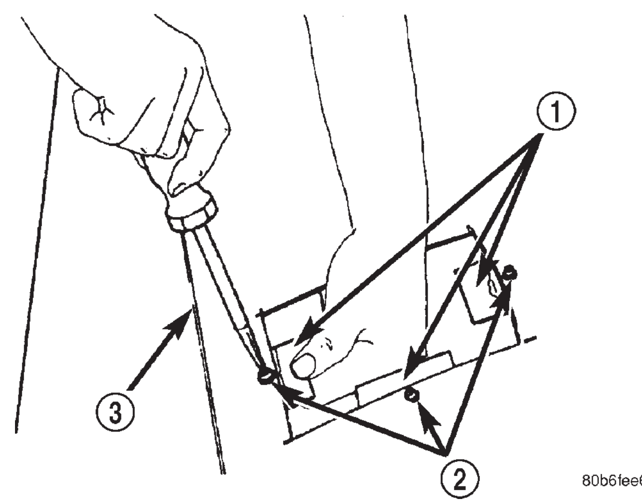

Fig. 9 Secure Support Squares To Body Panel

1 - SUPPORT SQUARES
2 - SCREWS
3 - DAMAGED BODY PANEL

BODY (Continued)

(12) 2Position patch in cutout against support squares and adjust patch until the gap is equal along all sides (Fig. 10).

(13) Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

(14) Apply a coat of adhesive to the exposed ends of the support squares (Fig. 11).

(15) Install screws to hold the patch to support squares (Fig. 12). Tighten screws until patch surface is flush with panel surface.

(16) Allow adhesive to cure, and remove all screws.

(17) Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch (Fig. 13). With compressed air, blow dust from around patch.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

STANDARD PROCEDURE - HEAT STAKING

(1) Remove trim panel.

(2) Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.

(3) Heat stake the components.

(a) If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(b) If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(4) Allow the repaired area to cool and verify the repair.

(5) Install trim panel.

SPECIFICATIONS

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

(1) Apply a small amount of lubricant directly into the lock cylinder.

(2) Apply a small amount of lubricant to the key.

(3) Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

BODY (Continued)

(4) Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.

(5) Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

(1) Clean component as described above.

(2) Apply specified lubricant to all pivoting and sliding contact areas of component.

CONVERTIBLE TOP

TABLE OF CONTENTS

CONVERTIBLE TOP

DIAGNOSIS AND TESTING - HYDRAULIC SYSTEMS

The power convertible top hydraulic system consists of:

- Two hydraulic cylinders
- Hydraulic lines
- Electric hydraulic pump and reservoir
- Dual relays

HYDRAULIC SYSTEM TESTS

NOTE: The convertible top will raise slowly or make abnormal noise if the hydraulic fluid level is low.

(1) Remove rear seat cushion and back.

(2) With the top down, remove motor/pump assembly from the floor panel.

(3) Remove the reservoir fill plug

(4) Visually inspect fluid level. The fluid level should be at least at the bottom edge of fill hole, when motor bracket is held on a level (flat) surface. If low, inspect for leak in hydraulic system.

(5) Motor/Pump:

(a) Put reservoir fill plug back in place. Apply power to the motor and listen for operation. If the motor fails to run, check the voltage to the connector 10.5 to 16 volts required. Voltage below 12.6 volts will cause top to operate slowly.

(b) Check the motor/pump for evidence of fluid leak. If leakage is seen and fitting, hoses, and cylinders don't have any leaks, then replace the motor/pump.

(6) Cylinders:

(a) Check cylinder tubes for dents.

(b) Check cylinders for leaks. Leaks are indicated by hydraulic fluid running down the cylinders. Small oil residue accumulation at seal is normal.

(7) Repair or replace components, as necessary.

(8) Secure motor/pump assembly into floor panel mounts.

(9) Connect pump wire connector.

(10) Connect battery negative terminal.

(11) Bleed the motor/pump and fill and verify operation of hydraulic pump (Refer to 23 - BODY/CONVERTIBLE TOP - ADJUSTMENTS - HYDRAULIC MOTOR/PUMP BLEEDING PROCEDURES).

(12) Install rear seat cushion and rear seat back. Ensure the rear seat back will not pinch and/or kinks the hydraulic lines.

(13) Verify system operation.

(14) Install quarter trim panel.

(15) Install rear seat cushion and rear seat back. Ensure the rear seat back will not pinch and/or kinks the hydraulic lines.

CONVERTIBLE TOP (Continued)

ADJUSTMENTS

ADJUSTMENT - CONVERTIBLE TOP

Refer to (Fig. 1) to determine which adjustment is required. Refer to the appropriate procedure for more information.

ADJUSTMENT - HYDRAULIC MOTOR/PUMP BLEEDING PROCEDURES

After replacing any component of the power lift mechanism or if convertible top does not start to raise within 2 seconds after the switch is activated, bleed the convertible top motor/pump assembly.

(1) Lower the top to the full down position.

(2) Remove the rear seat cushion, seat back and inner quarter trim panels.

(3) Completely detach cylinders from attaching points (mounting bracket nuts and pivot bolts attaching cylinder shafts to top linkage).

(4) Remove motor from floor pan.

(5) Hold cylinders upside down (cylinder rod pointing down).

(6) Hold motor/pump assembly with reservoir up. The rubber fill plug will be at the top.

(7) Raise motor/pump fitting to at least 2 inches above the horizontal rear seat back reinforcement.

(8) Cycle system at lease once, making sure cylinders can extend without obstruction. Allow for two to three seconds stall. There may be a percolating or gurgling sound, which indicates that the procedure is working.

(9) Hold cylinders in normal position and cycle system at lease once, making sure cylinders can extend without obstruction. Allow for two to three seconds stall. There may be a percolating or gurgling sound, which indicates that the procedure is working. At this point, any air in the system has migrated to the reservoir.

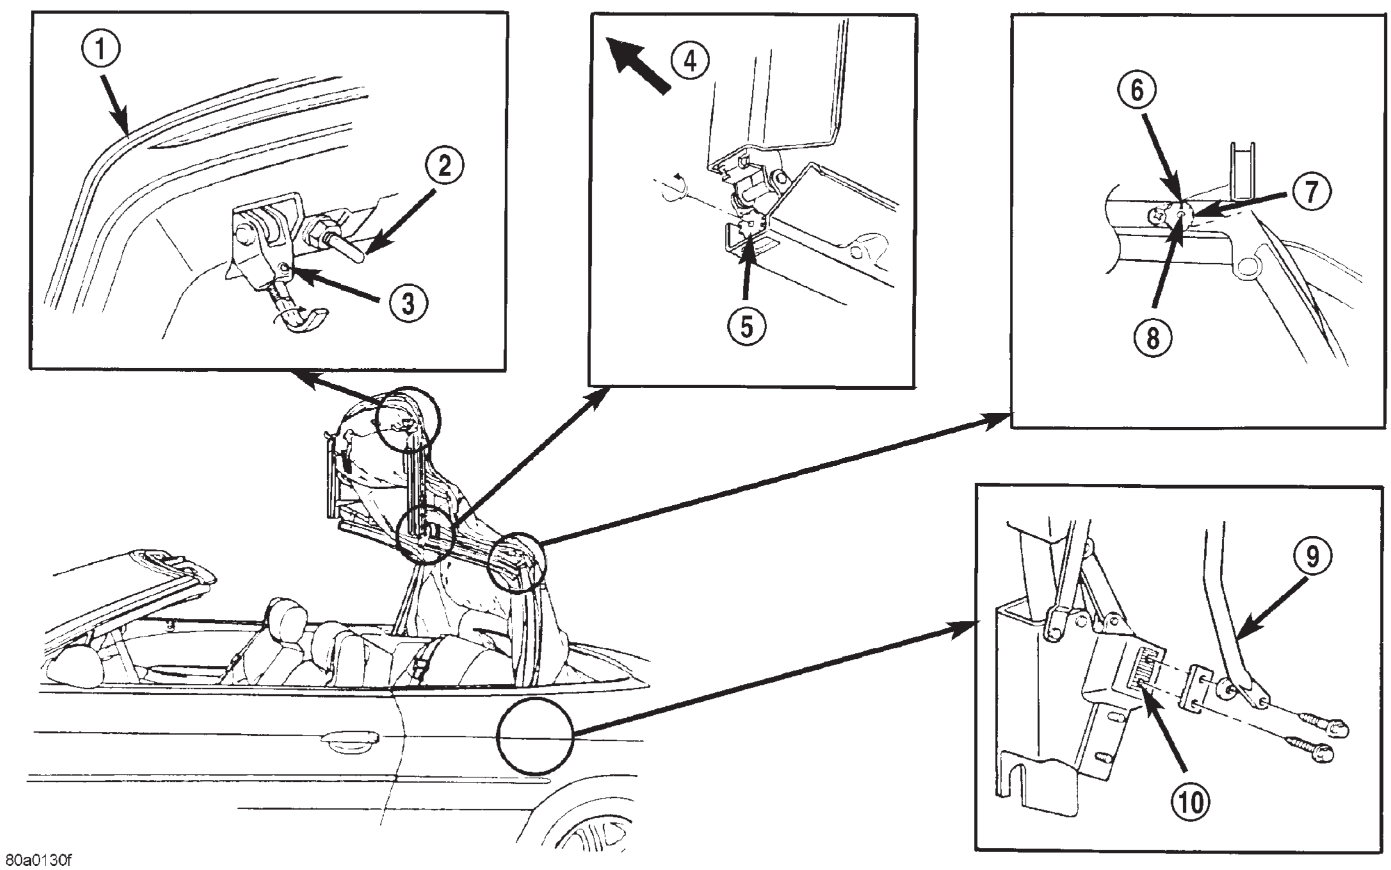

Fig. 1 ADJUSTMENT LOCATIONS

1 - TOP HEADER
2 - DOWEL PIN

7 - CAM
8 - TURN DART TOWARD FRONT (HEADER MOVES REARWARD AND UP)
9 - BALANCE LINK
10 - SERRATED PLATE

CONVERTIBLE TOP (Continued)

(10) Rotate and raise the motor/pump assembly so the reservoir is in the up position. The rubber filler plug will be at the top.

(11) Remove the rubber fill plug from reservoir. Fluid level may be low.

CAUTION: THE MOTOR/PUMP ASSEMBLY MUST REMAIN IN THE CURRENT POSITION UNTIL THE RUBBER FILLER PLUG IS REINSTALLED.

(12) Fill the hydraulic system by adding Dexron III Automatic Transmission Fluid to the reservoir. The fluid level should be 13 to 20 mm (½ to ¾ inch) below the top of the reservoir.

CAUTION: DO NOT OPERATE THE FOLDING TOP SWITCH WHILE FILL PLUG IS NOT INSTALLED ON MOTOR ASSEMBLY.

(13) Install rubber fill plug.

(14) Secure motor/pump assembly into floor mounts.

(15) Place the cylinders into original position with hose pointing fitting rearward.

(16) Install pivot bolt attaching cylinder shaft to top linkage. Ensure all rod eye components are present (foam, plastic bushing and plastic lock washer).

(17) Install cylinder mounting bracket and nuts. Ensure all trunnion split bushings are present. Tap folding top switch to adjust cylinder length, if needed.

WARNING: HYDRAULIC CYLINDERS PRODUCE ENOUGH FORCE TO PRODUCE SEVERE INJURY IN CASE OF PUNCHING. KEEP HANDS AND FINGERS AWAY FROM MOVING HYDRAULIC CYLINDERS.

(18) Install all hydraulic lines clips and secure hydraulic lines to body.

(19) Verify system operation.

(20) Install the inner quarter panels.

(21) Install rear seat back and cushion and ensure that the seat back/seat cushion do not pinch or kick the lines.

(22) Verify system operation.

ADJUSTMENT - TOP FRAME CAM

The top frame cam changes forward or rearward position of the top header in relation to the windshield header. The cam turns inside the rear side rail and thrust link (Fig. 2). It may be necessary to lengthen the balance links 1 or 2 serrations after a cam adjustment. The position of the cam high side determines the angle between the center and rear side rails. When the high side is fully forward, the angle is at a minimum, and when turned rearward, the angle is increased. An increased angle increases the forward movement of the top. The cam high side is indicated by a arrow on the cam threaded end.

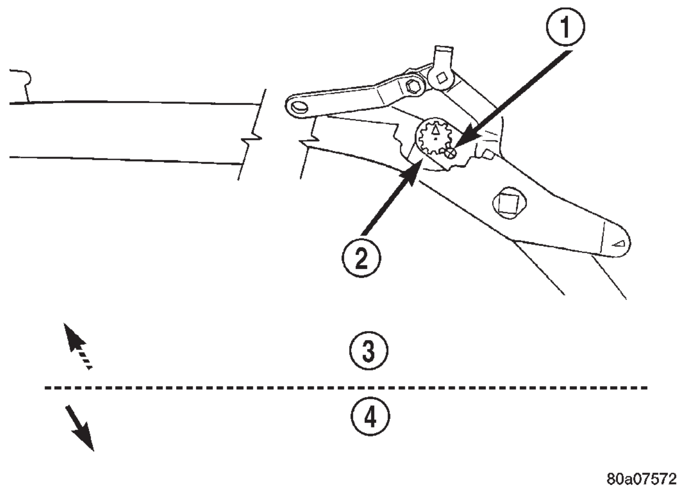

Fig. 2 CAM ASSEMBLY

1 - TORX SCREW
2 - CAM
3 - TURN DART TOWARDS REAR OF CAR HEADER MOVES IN THIS DIRECTION
4 - TURN DART TOWARDS FRONT OF CAR HEADER MOVES IN THIS DIRECTION

TO ADJUST CAM SETTING

(1) Lower top to half down position to remove all possible strain from the cam.

(2) Remove Torx head screw.

(3) Using appropriate Torx bit, rotate cam as necessary and secure set screw. Tighten Torx bit screw to 5.2 to 7.2 N·m (43 to 67 in. lbs.) torque

CONVERTIBLE TOP (Continued)

ADJUSTMENT - BALANCE LINK

WARNING: DO NOT PLACE HANDS OVER GAPS IN MOVABLE CONVERTIBLE TOP COMPONENTS DURING SERVICING. PERSONAL INJURY CAN RESULT.

(1) Remove quarter trim panel to gain access to balance link bolts.

(2) With the top latched in up position, loosen both bolts just enough to permit moving link up or down (Fig. 3).

(3) Push upward in the area of the front to center rail joint. Push rails up by hand as far as possible.

(4) With the balance link adjusting bolts loosened, allow the balance link to seek proper position.

(5) Tighten top link bolt while rail is held in position to 11.7 to 17.7 N·m (105 to 155 in. lbs.) torque.

(6) Tighten bottom link bolt while rail is held in position to 22 to 32 N·m (192 to 288 in. lbs.) torque.

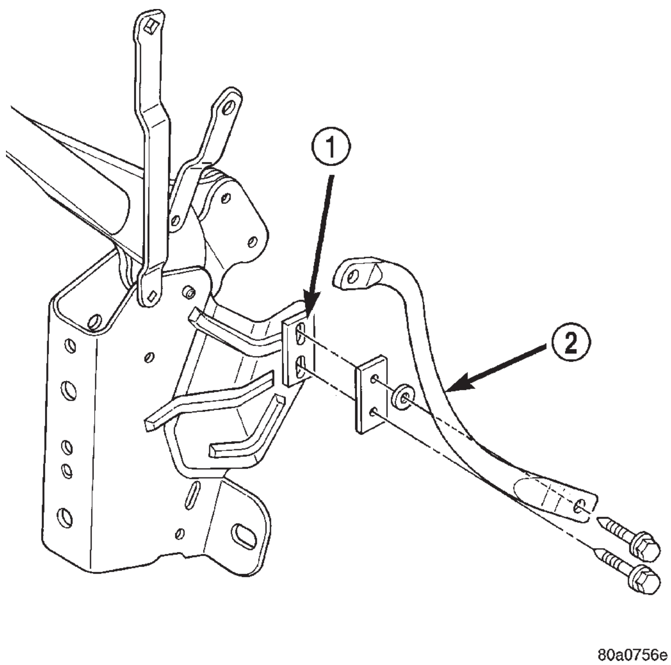

Fig. 3 BALANCE LINK ADJUSTMENT

1 - SERRATED PLATE
2 - BALANCE LINK

ADJUSTMENTS - DOWEL PIN

(1) Loosen dowel pins (Fig. 4).

(2) Position dowel pins to the center of the receiver holes in the windshield header.

(3) Tighten dowel pins and verify adjustment.

NOTE: Refer to Cam Adjustment or Balance Link Adjustment paragraphs of this section to adjust forward or rearward position of the top header.

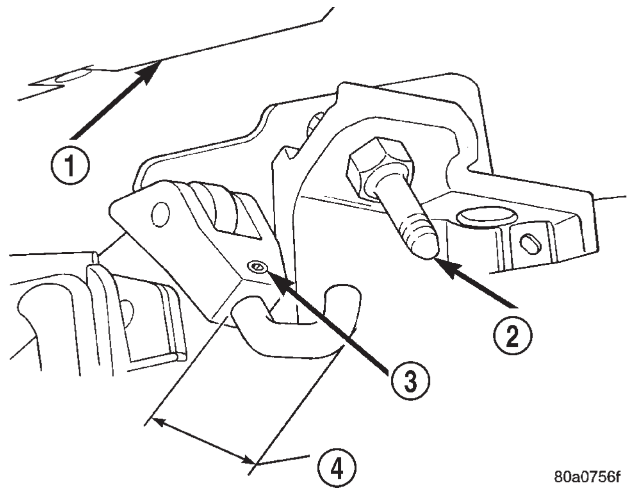

Fig. 4 ROOF LATCH AND GUIDE DOWEL PIN

FOLDING TOP COVER

REMOVAL

(1) Release folding top latches and allow top cover to relax.

(2) Remove tack strip trim panel.

(3) Remove headlining screw to tack strip.

(4) Remove all convertible top storage area sections.

(5) Remove nuts holding tack strip to deck panel.

(6) Remove tack strip from deck panel.

CAUTION: Cover all painted and upholstered surfaces to avoid damage while performing the following operations.

(7) Reposition tack strip above rear deck and quarter panels.

(8) Using a grease pencil, mark location of outer top cover on rear tack strip to aid installation.

(9) Remove staples holding top cover to rear tack strip.

(10) Fold rear of top cover, tack strips and rear window up and over the third (rear) roof bow.

(11) Remove screws holding roof rail tension cable springs to rear rail behind quarter glass opening.

(12) Pull side rail rear weatherstrips from weatherstrip retainer channels.

(13) Remove screws holding rear weatherstrip retainer channels to convertible top mechanism.

(14) Separate rear weatherstrip retainer channels from vehicle.

(15) Remove top cover listing from adhesive on roof rail.

(16) Raise folding top to the mid point.

(17) Remove screws holding convertible top header feature strip to header panel.

(18) Mark location of top cover on top header.

(19) Remove staples holding top cover to header.

(20) Remove screws in end of roof bow.

(21) Slide convertible top plastic retainer strips from channels in roof bows.

(22) Close folding top, do not latch.

(23) Slide tension cable out of cable pocket.

(24) Disengage roof rail tension cables from header.

(25) Remove top cover from vehicle.

INSTALLATION

(1) Position convertible top cover on vehicle.

(2) Slide tension cable through cable pocket.

(3) Install rubber plugs holding roof rail tension cable ends into key hole slots in roof rails.

(4) Install roof bows to convertible top mechanism.

(5) Snap convertible top plastic retainer strips into channels in roof bows, starting at rear bow and working forward.

(6) Install screws at ends of roof bows.

(7) Raise convertible top to mid point.

(8) Align top cover to mark made previously on header.

(9) Install staples to hold top cover to header. The header uses both 3/16 and 1/4 inch staples. The 3/16 staples are used everywhere except the outboard cor-

FOLDING TOP COVER (Continued)

ners where the blinding wraps around, at that point the 1/4 inch staple is used.

(10) Install screws holding convertible top header feature strip to header panel.

(11) Install screws holding roof rail tension cable springs to roof rear roof rail behind quarter glass opening.

(12) Align mark made on rear of top cover and rear window to tack strip.

(13) Install staples holding rear of top cover and rear window to tack strip.

(14) Position tack strip to rear deck panel.

(15) Install nuts holding tack strip to rear deck panel.

(16) Install headlining screw to tack strip.

(17) Install all convertible top storage area sections.

(18) Install tack strip trim panel.

(19) Lower quarter glass.

(20) Lower and secure convertible top.

(21) Apply suitable adhesive to side rail rear section to attach top cover listing.

(22) Pull top cover listing taunt and secure to adhesive on rear side rail.

(23) Install side rail rear weatherstrip retainer channels.

(24) Install side rail rear weatherstrips.

(25) Verify fit and operation. Adjust as necessary.

TOP HEADLINING

REMOVAL

(1) Raise convertible top to midway position.

(2) Remove convertible top header trim panel.

(3) Remove screws attaching headlining to convertible top header panel.

(4) Remove push in fasteners attaching headlining to convertible top mechanism rearward of quarter window.

(5) Remove tack strip trim panel.

(6) Remove shock cords along both sides of headlining.

(7) Remove roof bows from convertible top mechanism.

(8) Slide roof bows from convertible top cover and headlining.

(9) Remove nuts holding headlining straps to tack strip.

(10) Disengage hook and loop fasteners holding headlining above rear window.

(11) Remove headlining from vehicle.

INSTALLATION

(1) Position headlining from vehicle.

(2) Engage hook and loop fasteners holding headlining above rear window.

(3) Install nuts attaching headlining straps to tack strip.

(4) Install roof bows from convertible top mechanism.

(5) Snap plastic retainer strips on headlining and convertible top cover into channels on roof bows, working from rear bow forward.

(6) Install shock cords along both sides of headlining.

(7) Install tack strip trim panel.

(8) Install push in fasteners attaching headlining to convertible top mechanism rearward of quarter window.

(9) Install screws attaching headlining to convertible top header panel.

(10) Install convertible top header trim panel.

(11) Lower and secure convertible top.

HYDRAULIC CYLINDER

REMOVAL

(1) Disconnect battery negative terminal.

(2) Remove rear seat cushion and rear seat back.

(3) Remove quarter trim panel.

(4) Remove cylinder mounting bracket and nut (Fig. 5).

(5) Remove pivot bolt attaching cylinder shaft to top linkage.

(6) Remove motor from floor panel. Holding motor/pump assembly with reservoir up, squeeze fill plug to release any air pressure from system.

(7) Disconnect hydraulic lines from the cylinder.

(8) Remove cylinder from vehicle.

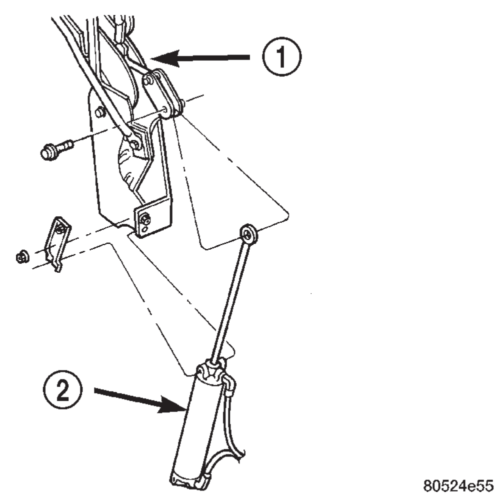

Fig. 5 HYDRAULIC CYLINDER

1 - CONVERTIBLE TOP LOWER PIVOT
2 - HYDRAULIC CYLINDER

HYDRAULIC CYLINDER (Continued)

INSTALLATION

(1) Place cylinder into position.

(2) Connect hydraulic lines to the cylinder. Tighten fittings to 8.5 to 9.5 N·m (75 to 84 in. lbs.) torque.

(3) Install pivot bolt attaching cylinder shaft to top linkage. Tighten pivot bolt to 22 to 28 N·m (195 to 147 in. lbs.) torque.

(4) Install cylinder mounting bracket and nut. Tighten bracket nut to 22 to 28 N·m (195 to 147 in. lbs.) torque.

(5) Bleed the motor/pump and fill hydraulic system and check for proper operation.

(6) Connect battery negative terminal.

(7) Apply power and lower the top to about half way down position.

(8) Holding motor/pump assembly with the reservoir up, squeeze fill plug to release any air pressure from the system. Lower top all the way down and release air pressure again by squeeze fill plug.

(9) Bleed system (Refer to 23 - BODY/CONVERTIBLE TOP - ADJUSTMENTS - HYDRAULIC MOTOR/PUMP BLEEDING PROCEDURES).

(10) Secure motor/pump assembly into floor panel mounts.

(11) Verify system operation.

(12) Install quarter trim panel.

(13) Install rear seat cushion and rear seat back. Ensure the rear seat back will not pinch and/or kinks the hydraulic lines.

HYDRAULIC LINES

REMOVAL

(1) Move top to the down position

(2) Disconnect battery negative terminal.

(3) Remove rear seat cushion and rear seat back.

(4) Disconnect pump wire connector connection.

(5) Remove motor from floor panel. Holding motor assembly with reservoir up, squeeze fill plug to release any air pressure from system.

(6) Disconnect hydraulic line from hydraulic cylinders.

(7) Disconnect hydraulic line from hydraulic pump.

(8) Remove hydraulic line from vehicle. Carefully drain hydraulic line and properly dispose of fluid and component.

INSTALLATION

(1) Position hydraulic line to vehicle.

(2) Connect hydraulic line to hydraulic pump. Tighten fittings to 11 to 12 N·m (98 to 106 in. lbs.) torque.

(3) Connect hydraulic line to hydraulic cylinders. Tighten fittings to 8.5 to 9.5 N·m (75 to 84 in. lbs.) torque.

(4) Connect battery negative terminal.

(5) Bleed the motor/pump and fill and verify operation of hydraulic pump(Refer to 23 - BODY/CONVERTIBLE TOP - ADJUSTMENTS - HYDRAULIC MOTOR/PUMP BLEEDING PROCEDURES).

(6) Verify system operation.

(7) Install quarter trim panels.

(8) Install rear seat cushion and rear seat back. Ensure the rear seat back will not pinch and/or kinks the hydraulic lines.

HYDRAULIC MOTOR/PUMP ASSEMBLY

REMOVAL

(1) Move top to the down position

(2) Disconnect battery negative terminal.

(3) Remove rear seat cushion and rear seat back.

(4) Disconnect pump wire connector connection (Fig. 6).

(5) Remove motor from floor panel. Holding motor assembly with reservoir up, squeeze fill plug to release any air pressure from system.

(6) Mark connections and disconnect hydraulic lines from pump.

(7) Remove motor pump assembly from vehicle.

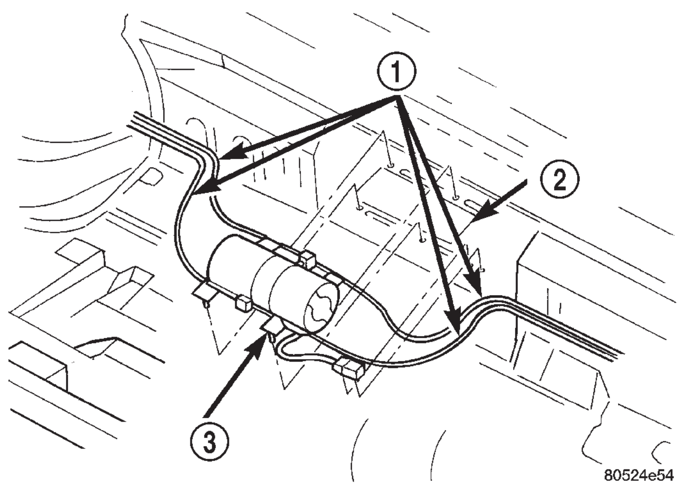

Fig. 6 HYDRAULIC PUMP ASSEMBLY

1 - HYDRAULIC LINES
2 - MOUNTING BRACKET
3 - HYDRAULIC PUMP ASSEMBLY

INSTALLATION

(1) Position hydraulic motor in vehicle.

(2) Connect hydraulic lines to pump. Tighten fittings to 11 to 12 N·m (98 to 106 in. lbs.) torque.

(3) Connect pump wire connector.

(4) Connect battery negative terminal.

HYDRAULIC MOTOR/PUMP ASSEMBLY (Continued)

(5) Bleed the motor/pump and fill and verify operation of hydraulic pump (Refer to 23 - BODY/CONVERTIBLE TOP - ADJUSTMENTS - HYDRAULIC MOTOR/PUMP BLEEDING PROCEDURES).

(6) Press hydraulic motor into mounts.

(7) Install rear seat cushion and rear seat back. Ensure the rear seat back will not pinch and/or kinks the hydraulic lines.

CONVERTIBLE TOP REAR WINDOW

REMOVAL

(1) Release folding top latches and allow top cover to relax.

(2) Lift shower curtain and remove push in nuts holding curtain to the studs.

CAUTION: Take precautions not to tear curtain on the boot shelf during removal.

(3) Disengage the headliner at the rear sail panels.

(4) Disconnect wire connectors from terminals on heated rear window.

(5) Pull wire harness from sleeves at each side of the rear window.

(6) Remove nuts attaching belt line tack strips to vehicle.

NOTE: Support top 12 inches above windshield header.

(7) Remove the five piece belt line tack strips.

(8) Disengage elastic strap from the third roof bow, if equipped.

(9) Remove antenna mast.

(10) Place protective padding over the entire rear deck area to protect paint. Move tack strips to top of deck opening onto protective padding.

(11) Mark the outer sail panels along the top edges and down the seams between the outer and second tack strips from the outside of top (Fig. 7).

NOTE: Reference marks will be used to reinstall the new rear window assembly.

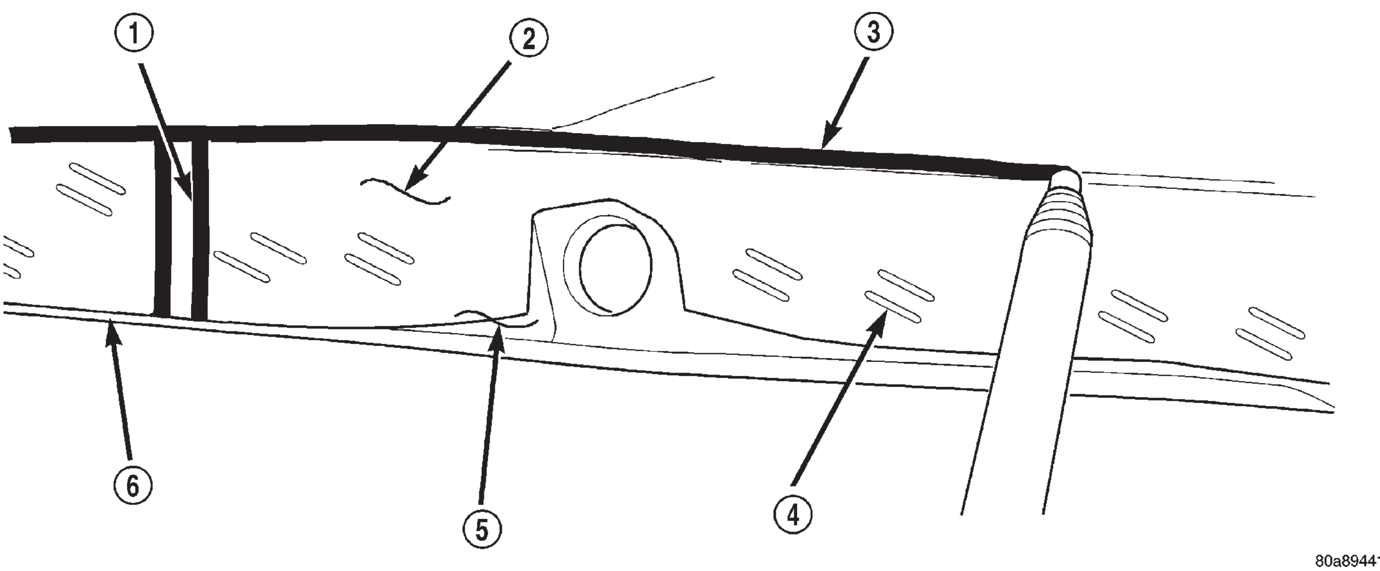

Fig. 7 SAIL PANEL REFERENCE MARKS

1 - SEAM REFERENCE MARK
2 - COVER ASSEMBLY
3 - REFERENCE MARK
4 - STAPLES
5 - OUTER TACK STRIP
6 - SECOND TACK STRIP

CONVERTIBLE TOP REAR WINDOW (Continued)

(12) Remove sail panel springs on both sides at the front corners of the cover assembly (Fig. 8).

(13) Remove all staples from the cover assembly.

CAUTION: Be careful not to tear or damage the cover assembly.

(14) Fold the cover assembly up over the top.

(15) Remove tape and foam at the end of the third roof bow, save if reusable.

(16) Remove the rearmost stop screw on the number three bow, either driver's or passenger's side (Fig. 9).

(17) Slide the old rear window assembly off the number three bow.

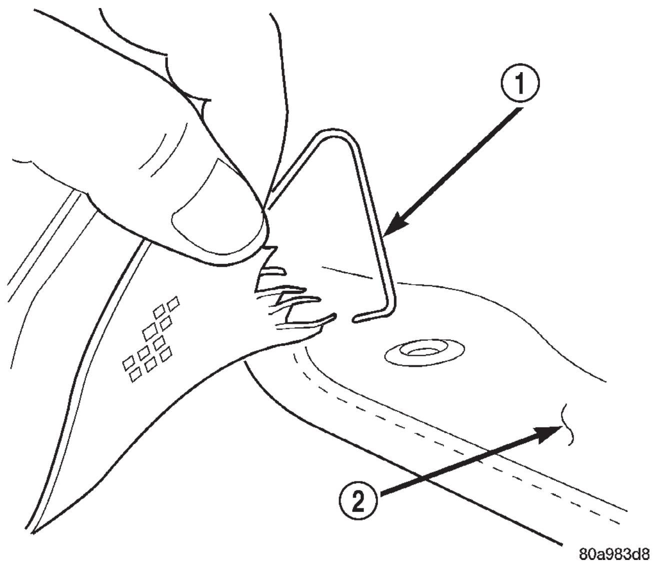

Fig. 8 SAIL SPRINGS

1 - SAIL SPRING
2 - COVER ASSEMBLY

INSTALLATION

NOTE: To support the new Rear Window assembly for stapling purposes, remove the new rear window from packaging and place shipping box across the top opening, resting on the back seat and decklid.

(1) Remove the boot shelf and two sail springs from the old rear window assembly and install onto the new rear window assembly.

(2) Place rear window locking strip on third bow.

(3) Insert the locking strip into the channel of the number three roof bow. A rubber mallet may be required to set locking strip into channel (Fig. 10).

CAUTION: Do not slide or pull the locking strip onto the number three bow.

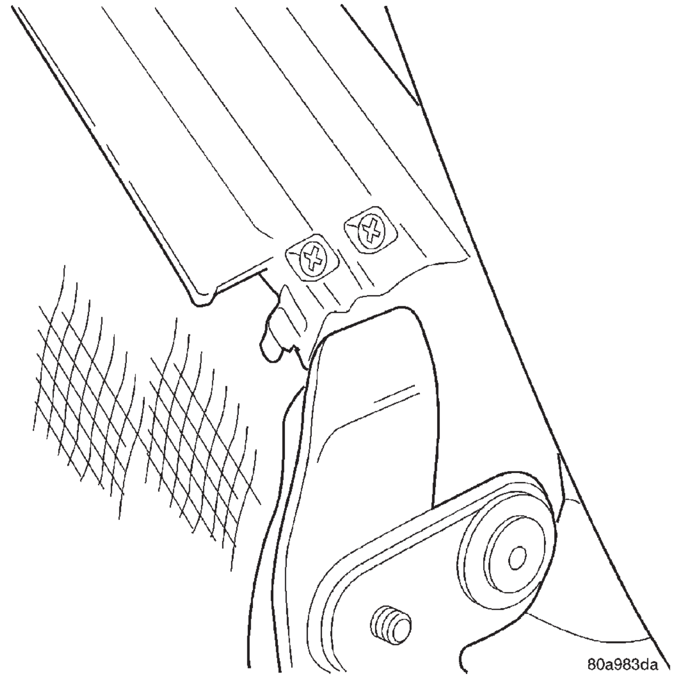

Fig. 9 REAR WINDOW REAR STOP SCREW

NOTE: To ensure rear window is snapped into number three bow, flip assembly onto top to inspect snap in feature.

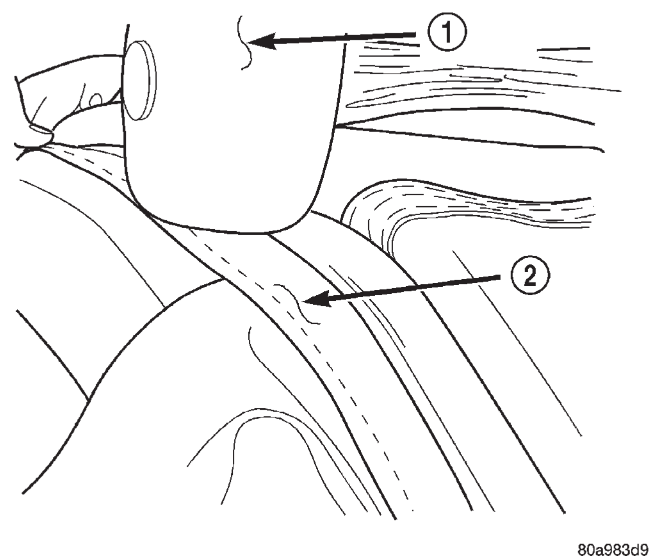

Fig. 10 REAR WINDOW LOCKING STRIP

1 - RUBBER MALLET
2 - LOCKING STRIP

(4) Install existing or new foam on the end of the bow using 1 in. black tape to secure foam to bow.

(5) Install the rearmost stop screw on the number three bow.

(6) Starting from the right side of the vehicle, locate the front edge of the cover assembly to the tacking strip (use measurements located in the

CONVERTIBLE TOP REAR WINDOW (Continued)

Remove procedures(Refer to 23 - BODY/CONVERTIBLE TOP/REAR WINDOW - REMOVAL) and pull cover down until marking is one eighth of an inch below the top edge of the tacking strips.

NOTE: 1/8 inch measurement should be constant when stapling the cover assembly to prevent wrinkles.

(7) Continue to staple right hand cover assembly to tacking strips. Work from the outboard to center line of the vehicle.

(8) Repeat Step 6 for left side of the vehicle.

(9) Install sail panel springs to front of cover assembly.

(10) Install antenna mast.

(11) Engage rear window elastic strap to number three roof bow.

(12) Using the nuts, install the belt line tacking strips, starting with the center tack strip and working outboard.

(13) Feed rear window defogger wire harness through the sleeves at each side of the rear window.

(14) Connect rear window defogger wire connectors to terminals.

(15) Engage the headliner at the rear sail panel.

(16) Install shower curtain with push on nuts.

CAUTION: Make sure top well is not trapped under the tack strips.

(17) Latch top and inspect for wrinkles.

CONVERTIBLE TOP STORAGE

REMOVAL

(1) Raise and secure convertible top.

(2) Remove screws attaching headliner to top well.

(3) Remove push in fasteners attaching convertible top storage section to rear of storage area (Fig. 11).

(4) Remove push in fasteners attaching storage area below seat belt bezel.

(5) Pull rear of storage area upward and disengage front of storage area from beauty bar.

(6) Remove storage area from vehicle.

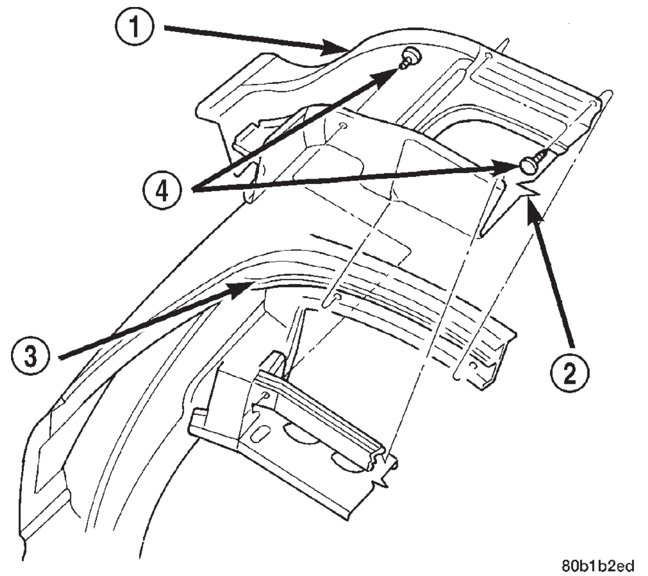

Fig. 11 CENTER CONVERTIBLE TOP STORAGE

1 - CONVERTIBLE TOP STORAGE
2 - REAR DECK PANEL
3 - TACK STRIP
4 - PUSH-IN FASTENER

INSTALLATION

(1) Position convertible top storage area in vehicle.

(2) Engage front of storage area under beauty bar and push rear of storage area downward into position.

(3) Install push in fasteners attaching convertible top storage section to rear of storage area.

(4) Install push in fasteners to attach storage areas below seat belt bezel.

(5) Install screws attaching headliner to top well.

DECKLID/HATCH/LIFTGATE/TAILGATE

TABLE OF CONTENTS

DECKLID

REMOVAL

(1) Release decklid latch and open decklid.

(2) Mark outline of hinge on decklid to aid in installation (Fig. 1).

(3) Disconnect all wire connectors from decklid latch and disconnect wire harness from decklid.

(4) Place suitable padding between decklid and deck panel to protect paint finish.

(5) With aid of a helper, remove bolts attaching decklid to decklid hinge.

(6) Remove decklid from vehicle.

INSTALLATION

(1) Position decklid on vehicle.

(2) With aid of a helper, loosely install bolts attaching decklid to decklid hinge.

(3) Align marks made on decklid previously to decklid hinge.

(4) Tighten bolts attaching decklid to decklid hinge to 22.5 N·m (200 in. lbs.) torque.

(5) Connect all wire connectors to decklid latch and install wire harness to decklid.

(6) Verify fit of decklid to deck panel. Adjust as necessary.

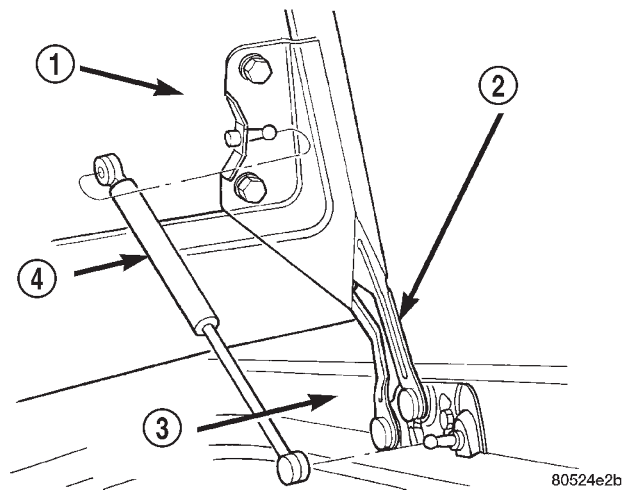

Fig. 1 Decklid Hinge And Gas Support Cylinder

1 - TRUNK LID
2 - TRUNK HINGE
3 - QUARTER PANEL TROUGH
4 - GAS SUPPORT CYLINDER

GAS PROP

REMOVAL

(1) Open decklid.
(2) Remove the gas prop-rod lock caps (Fig. 2).
(3) Remove prop-rod from mounting studs.

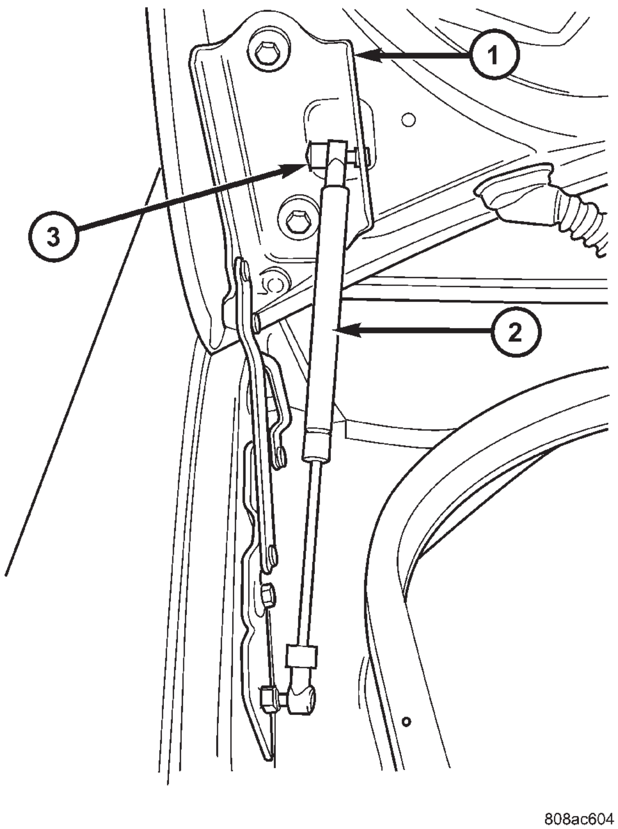

Fig. 2 Gas Prop-Rod Lock Cap

1 - DECKLID HINGE
2 - GAS PROP
3 - GAS PROP-ROD LOCK CAP

INSTALLATION

(1) Install prop-rod to mounting studs.
(2) Install the gas prop-rod lock caps.
(3) Close decklid.

HINGE

REMOVAL

(1) Open decklid.
(2) Mark outline of hinge on quarter panel trough and inside of decklid to aid installation.
(3) Place a padded block between the deck panel and the decklid.
(4) Remove the gas prop-rod lock caps (Fig. 2).
(5) Remove prop-rod from mounting studs.
(6) Remove bolts attaching hinge to decklid.
(7) Place decklid against padded block and hold it steady.
(8) Remove bolts attaching hinge to quarter panel trough.
(9) Remove hinge from vehicle.

INSTALLATION

(1) Place hinge in the mark outline of hinge on quarter panel trough and inside of decklid to aid in positioning hinge.
(2) Install hinge to vehicle.
(3) Install bolts attaching hinge to quarter panel trough.
(4) Tighten bolts to 22.5 N·m (200 in. lbs.) torque.
(5) Place decklid against padded block and hold it steady.
(6) Install bolts attaching hinge to decklid.
(7) Tighten bolts to 22.5 N·m (200 in. lbs.) torque.
(8) Install prop-rod to mounting studs.
(9) Install the gas prop-rod lock caps.
(10) Remove the padded block between the deck panel and the decklid.
(11) Close decklid.

DECKLID LATCH

REMOVAL

(1) Release decklid latch and open decklid.
(2) Mark outline of decklid latch on decklid to aid in installation.
(3) Disconnect wire connectors to remote release solenoid, if so equipped (Fig. 3).
(4) Remove bolts attaching decklid latch to decklid.
(5) Remove decklid latch from vehicle.

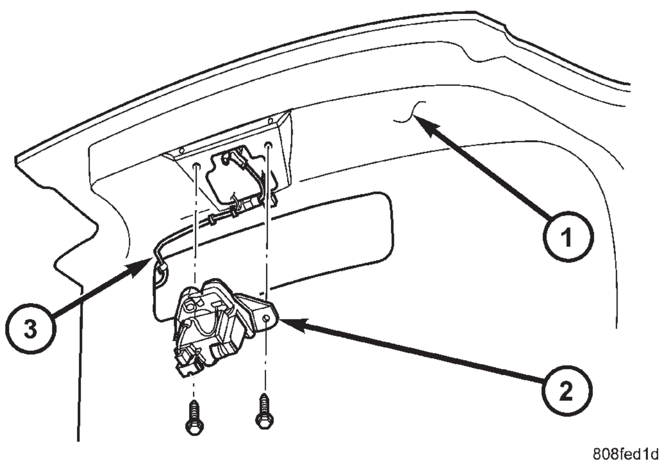

Fig. 3 DECKLID LATCH

1 - DECKLID
2 - DECKLID LATCH
3 - WIRE HARNESS

INSTALLATION

(1) Position decklid latch on vehicle.
(2) Loosely install bolts attaching decklid latch to decklid.
(3) Tighten bolts to 12 N·m (106 in. lbs.) torque.
(4) Align decklid latch to marks made previously on decklid and tighten bolts.
(5) Connect wire connectors to remote release solenoid, if so equipped.
(6) Verify fit of decklid to deck panel and decklid latch operation. Adjust as necessary.

DECKLID LATCH STRIKER

REMOVAL

(1) Release decklid latch and open decklid.
(2) Mark outline of decklid latch striker on rear closure panel to aid in installation.
(3) Remove bolts attaching decklid latch striker to rear closure panel (Fig. 4).
(4) Remove striker from vehicle.

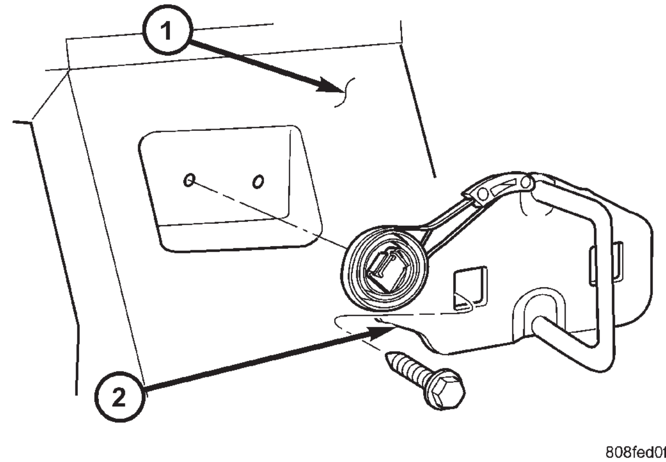

Fig. 4 DECKLID LATCH STRIKER

1 - REAR CLOSURE PANEL
2 - TRUNK LATCH STRIKER

INSTALLATION

(1) Position striker in vehicle.
(2) Loosely install bolts attaching decklid latch striker to rear closure panel.
(3) Align decklid latch striker to marks made previously on rear closure panel.
(4) Tighten bolts to 12 N·m (106 in. lbs.) torque.
(5) Verify fit of decklid to deck panel and operation of decklid latch. Adjust as necessary.

DECKLID LOCK CYLINDER

REMOVAL

(1) Release decklid latch and open decklid.
(2) Remove decklid latch.
(3) Remove clip attaching decklid lock cylinder to security alarm switch, if so equipped (Fig. 5).
(4) Remove security alarm switch, if so equipped.
(5) Remove clip attaching decklid lock cylinder to decklid.
(6) Remove decklid lock cylinder from vehicle.

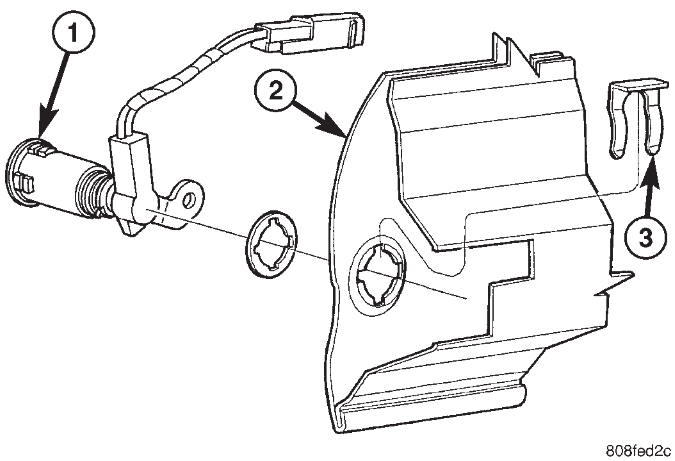

Fig. 5 DECKLID LOCK CYLINDER

1 - DECKLID LOCK CYLINDER
2 - DECKLID
3 - RETAINER CLIP

INSTALLATION

(1) Position decklid lock cylinder on vehicle.
(2) Install clip holding decklid lock cylinder to decklid.
(3) Install security alarm switch, if so equipped.
(4) Install clip attaching decklid lock cylinder to security alarm switch, if so equipped.
(5) Install decklid latch.

EMERGENCY RELEASE CABLE

REMOVAL

(1) Remove the decklid latch cover (Fig. 6).

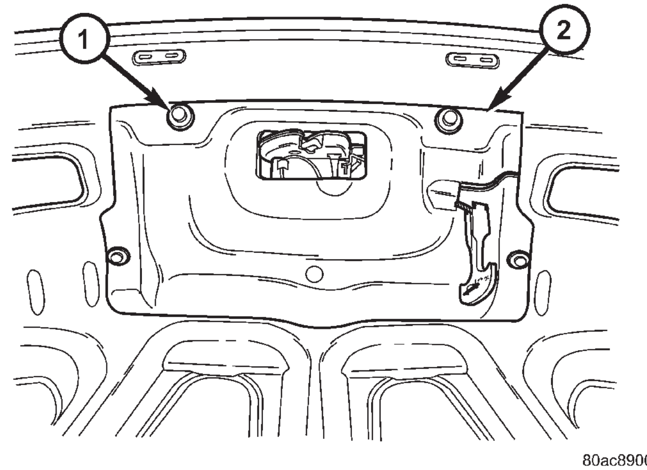

Fig. 6 DECKLID LATCH COVER

1 - Push pin
2 - Decklid latch cover

(2) Unclip cable and handle assembly (Fig. 7).

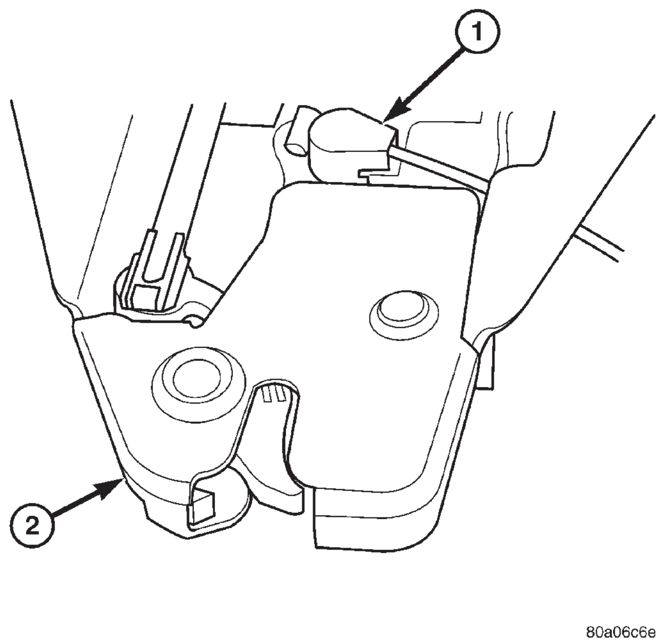

Fig. 7 EMERGENCY RELEASE CABLE

1 - Release Cable Clip
2 - Decklid Latch

INSTALLATION

(1) Clip emergency release cable onto the latch.
(2) Install the decklid latch cover.

DOOR - FRONT

TABLE OF CONTENTS

CHECK STRAP

REMOVAL

(1) Remove door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

(2) Remove water dam as necessary to gain access (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(3) Remove bolts attaching check strap to lower A–pillar.

(4) Remove bolts attaching check strap to door end frame (Fig. 1).

(5) Remove door check strap from vehicle.

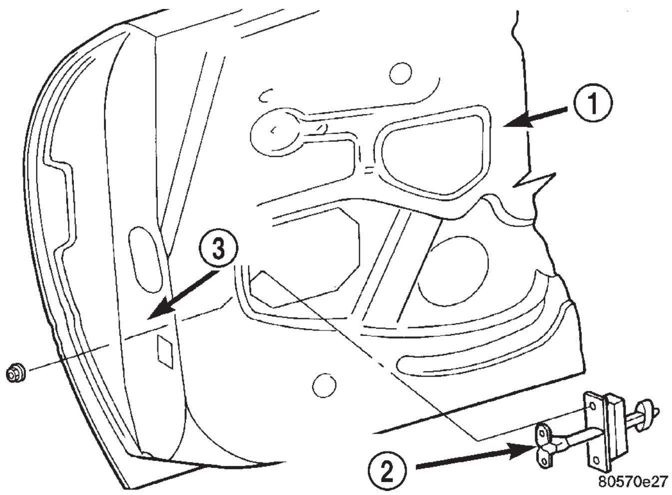

Fig. 1 Front Door Check Strap

1 - FRONT DOOR
2 - DOOR CHECK STRAP
3 - DOOR FACE

INSTALLATION

(1) Position door check strap on vehicle (Fig. 1).

(2) Install bolts attaching check strap to door end frame.

(3) Install bolts attaching check strap to lower A-pillar.

(4) Install water dam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

(5) Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

DOOR

REMOVAL

REMOVAL

(1) Open and support door on a suitable lifting device.

(2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to aid installation.

(3) Disengage wire connector at hinge pillar.

(4) Remove bolts attaching door check strap to hinge pillar (Fig. 2).

(5) Remove the nuts attaching the door to the door hinges and remove the door from the vehicle.

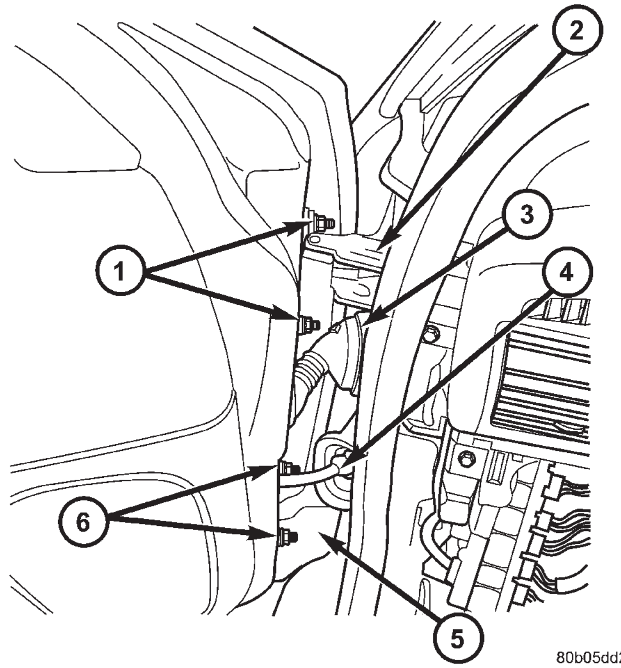

Fig. 2 FRONT DOOR HINGES

1 - UPPER DOOR HINGE NUTS
2 - UPPER DOOR HINGE
3 - ELECTRICAL CONNECTIONS
4 - CHECK STRAP
5 - LOWER HINGE
6 - LOWER HINGE NUTS

DOOR (Continued)

REMOVAL - JR-27 ONLY

NOTE: The retaining clips used on the door hinge pins are not to be reused. Verify availability prior to proceeding.

(1) Open and support front door on a suitable lifting device.
(2) Disconnect wire connector at hinge pillar.
(3) Remove bolts attaching door check strap to hinge pillar.
(4) Remove clip attaching hinge pin in lower door hinge.
(5) Remove pin from lower hinge (Fig. 3).
(6) Remove clip attaching hinge pin in upper hinge.
(7) Remove pin from upper hinge (Fig. 3).
(8) Remove door from vehicle.

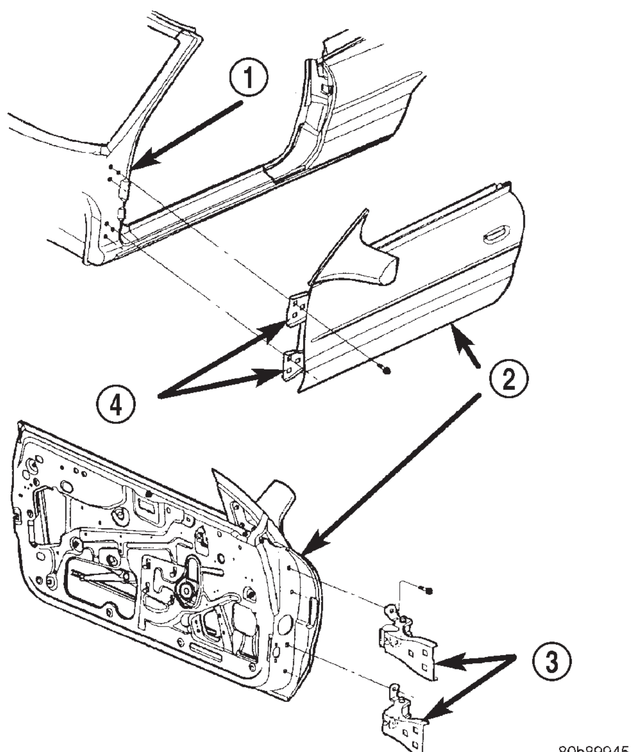

Fig. 3 Front Door

1 - HINGE PILLAR
2 - FRONT DOOR
3 - HINGES
4 - HINGES

INSTALLATION

INSTALLATION

(1) Position door onto the door hinges and install the nuts.
(2) Install bolts attaching door check strap to hinge pillar.
(3) Connect wire connector at hinge pillar.
(4) Verify door fit and operation. Adjust the door for flushness and parallel gaps as necessary.

INSTALLATION - JR-27 ONLY

(1) Apply Mopar® Multi-mileage Grease to inside of door hinge bushings.
(2) Position front door on vehicle and install pin in upper hinge. Align knurling on hinge pin with the grooves in the door hinge prior to driving in the hinge pin.
(3) Install pin in lower hinge.

NOTE: Verify that head of each hinge pin is fully seated into door hinge.

(4) Install new clip attaching hinge pin in upper hinge.
(5) Install new clip attaching pin in lower hinge.
(6) Install bolts attaching door check strap to hinge pillar.
(7) Connect wire connector at hinge pillar.

DOOR GLASS

REMOVAL

REMOVAL

(1) Remove door trim panel and inner belt weatherstrip.
(2) Connect power window switch or install crank and lower window to 50 mm (2 in.) from bottom of travel.
(3) Loosen screws attaching regulator roller channel to glass.
(4) Slide roller channel rearward to allow screw heads to pass through key hole slots in channel.
(5) Remove glass from roller channel.
(6) Raise glass upward and out of the opening at top of door (Fig. 4).

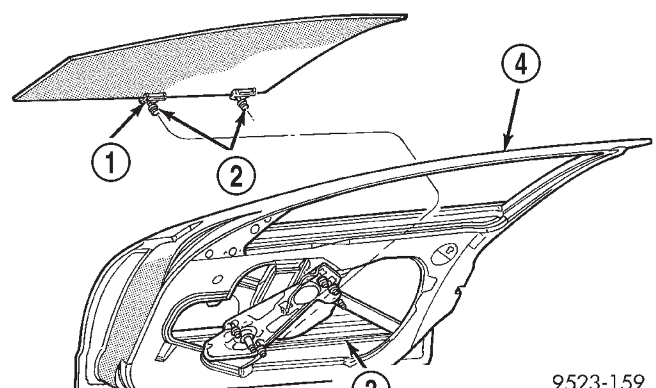

Fig. 4 Front Door Glass

1 - DOOR GLASS
2 - SCREWS
3 - ROLLER CHANNEL
4 - FRONT DOOR

DOOR GLASS (Continued)

REMOVAL - JR-27 ONLY

(1) Remove door trim panel and watershield.
(2) Remove inner door belt weatherstrip.
(3) Loosen inner belt stabilizer (Fig. 5).
(4) Remove door speaker, if so equipped.
(5) Lower door glass to access glass attachment bolts.
(6) Remove bolts attaching regulator lift channel to door glass (Fig. 6).
(7) Remove bolts attaching rear guide plate to door glass (Fig. 7).
(8) Remove rear guide plate from door glass.
(9) Lift door glass upward and out of opening at top of door (Fig. 6).

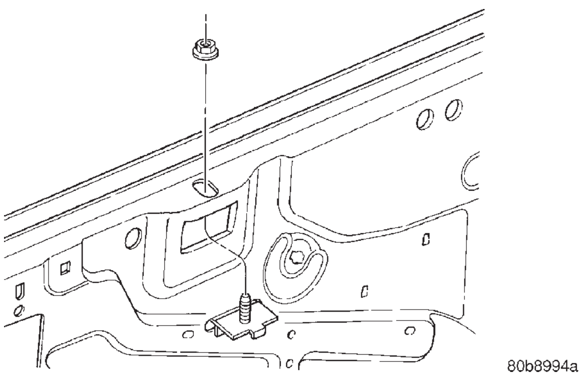

Fig. 5 Inner Belt Stabilizer

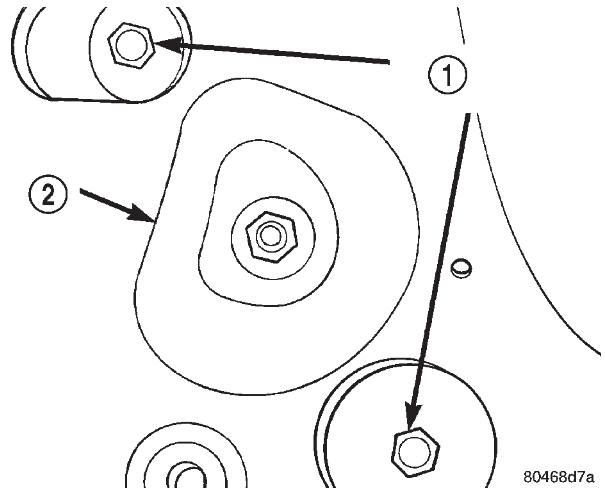

Fig. 7 Rear Guide Bolts

1 - REAR GUIDE BOLTS
2 - INNER DOOR PANEL

INSTALLATION

INSTALLATION

(1) Lower glass down and in the opening at top of door.
(2) Position glass on roller channel.
(3) Slide roller channel forward to allow screw heads to engage key hole slots in channel.

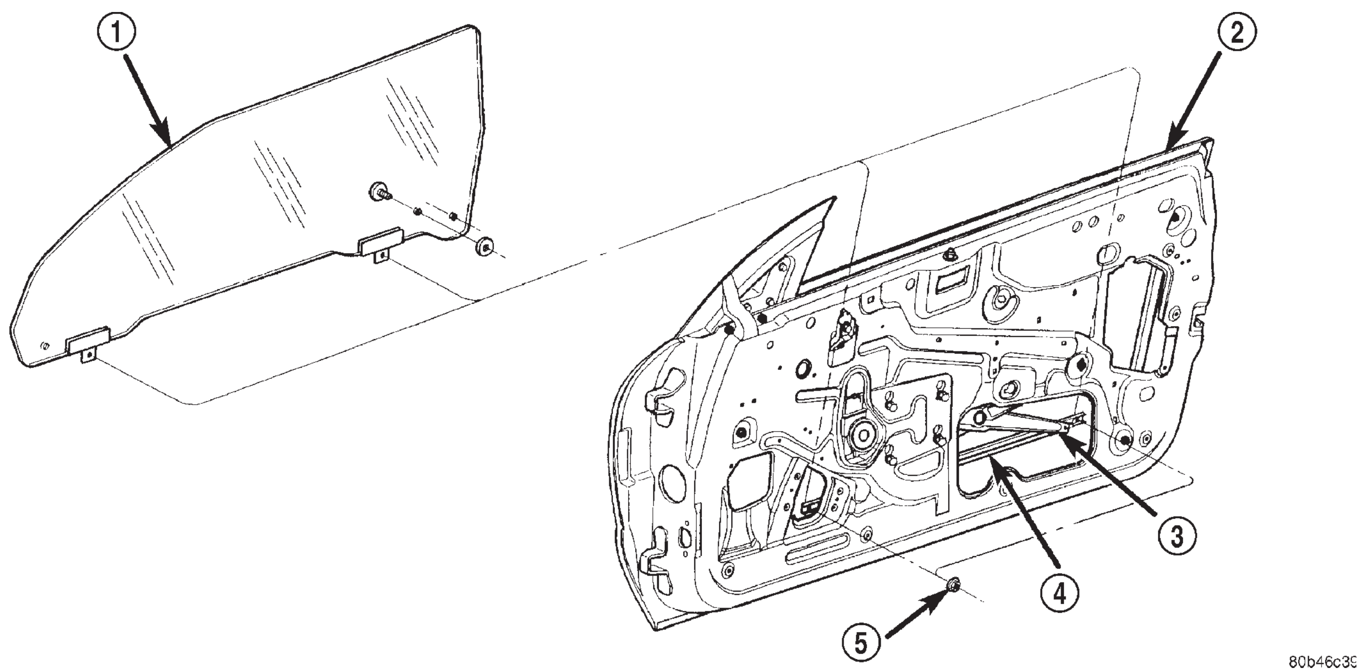

Fig. 6 Regulator Lift Channel

1 - DOOR GLASS
2 - DOOR
3 - WINDOW REGULATOR
4 - LIFT CHANNEL
5 - ROLLER CHANNEL NUT

DOOR GLASS (Continued)

(4) Tighten screws attaching regulator roller channel to glass.
(5) Install door trim panel and inner belt weatherstrip.

INSTALLATION - JR-27 ONLY

(1) Carefully lower door glass through opening in top of door. Verify that the front edge of the glass is in the mirror flag glass channel.
(2) Position rear guide plate onto door glass and install bolts.
(3) Install nuts attaching regulator lift channel to door glass.
(4) Tighten all door glass fasteners.
(5) Install door speaker, if so equipped.
(6) Tighten window inner belt stabilizer.
(7) Install inner door belt weatherstrip.
(8) Install door trim panel and watershield.

ADJUSTMENTS

ADJUSTMENT - JR-27 ONLY

NOTE: Verify that the door is properly adjusted to the body prior to adjusting the door glass.

NOTE: Lower quarter glass to the full down position while making door glass adjustments, unless otherwise instructed.

UP-STOP ADJUSTMENTS

(1) Remove door trim panel.
(2) Remove water shield as necessary to gain access to adjuster.
(3) Loosen up stop nut (Fig. 8) and bolt (Fig. 9).
(4) Remove weatherstrip from location to be adjusted.

NOTE: Remove only one weatherstrip section at a time or the glass to weatherstrip retainer measurements will not be accurate.

(5) Close door and raise door glass.
(6) Slide up stop to achieve proper glass to weatherstrip retainer gap. Refer to Front Door Glass Adjustment Table.
(7) Tighten all fasteners.
(8) Verify that forward up stop fully contacts hook on glass. Adjust contact bolt on forward up stop as necessary.

TOP OF GLASS – INBOARD/OUTBOARD ADJUSTMENTS

(1) Remove door trim panel.

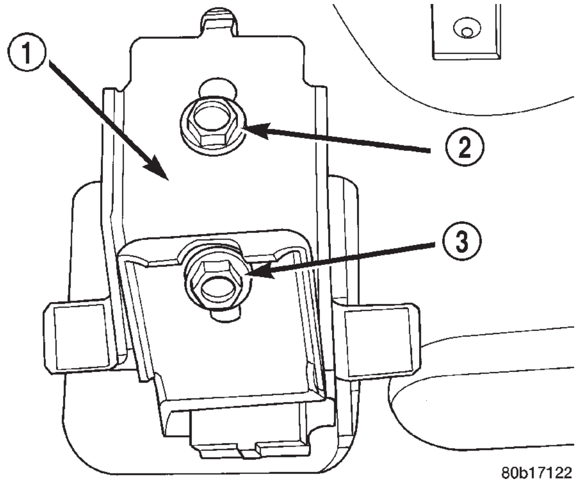

Fig. 8 Forward Up Stop Adjustment

1 - FORWARD UPSTOP
2 - ADJUSTMENT BOLT
3 - CONTACT BOLT

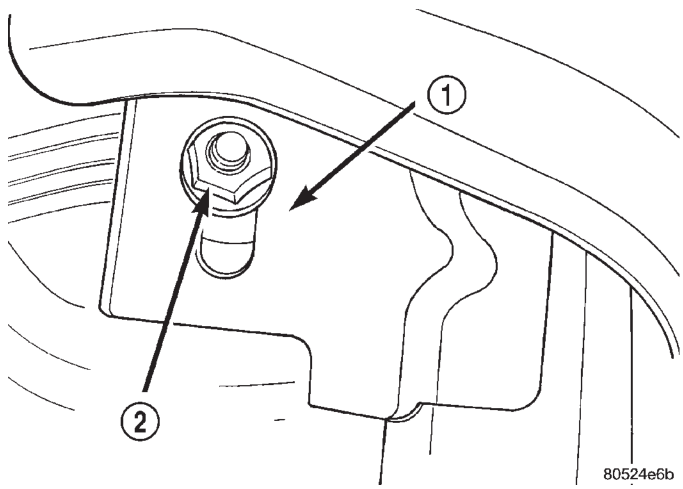

Fig. 9 Rear Up Stop Adjustment

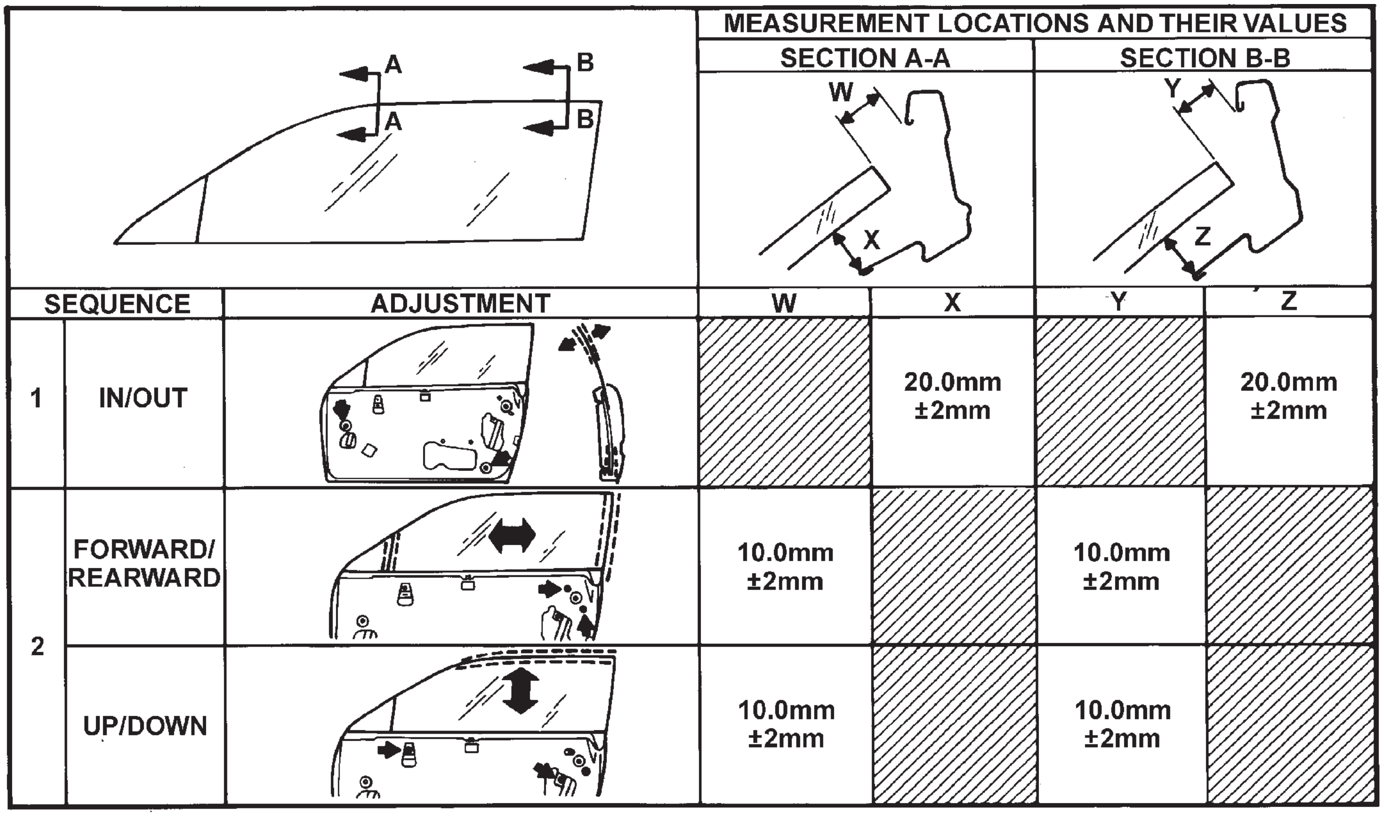
1 - REAR UPSTOP
2 - UPSTOP ADJUSTMENT NUT

(2) Remove water shield as necessary to gain access to adjusters.
(3) Using a suitable wrench, loosen the lower jack screw jam nuts (Fig. 10).
(4) Remove weatherstrip from side rail weatherstrip retainer at point to be adjusted.
(5) Close door and raise glass.
(6) Using a suitable allen wrench, rotate jack screws to achieve the proper gap between the door glass weatherstrip retainer strip. Refer to Front Door Glass Adjustment Table.

NOTE: Remove only one weatherstrip section at a time or the glass to weatherstrip retainer measurements will not be accurate.

DOOR GLASS (Continued)



SEQUENCE		ADJUSTMENT	W	X	Y	Z
1	IN/OUT			20.0mm ±2mm		20.0mm ±2mm
2	FORWARD/ REARWARD		10.0mm ±2mm		10.0mm ±2mm	
	UP/DOWN		10.0mm ±2mm		10.0mm ±2mm	

NOTE: Forward / Rearward and Up/Down adjustment are to be made at the same time.

FRONT DOOR GLASS ADJUSTMENT SPECIFICATIONS

(7) Verify that the top edge of the door glass is beneath the lip of the weatherstrip.

(8) Tighten all fasteners.

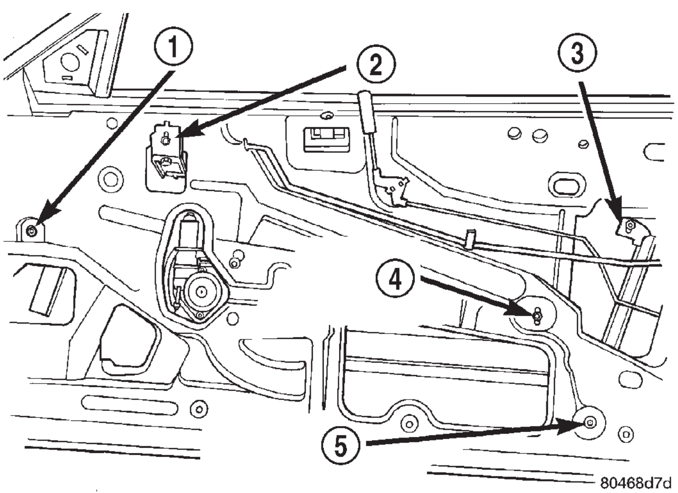


Fig. 10 Inboard/Outboard Glass Adjustment

1 - IN/OUT JACK SCREW
2 - FORWARD UP-STOP
3 - REAR UP-STOP
4 - ROLLER CHANNEL ADJUSTMENT
5 - IN/OUT JACK SCREW

GLASS – FRONT/REAR ADJUSTMENT

(1) Remove door trim panel and water shield.

(2) Lower door glass to gain access to glass attachments.

(3) Loosen three glass attachment bolts.

(4) Raise door glass and position correctly (Fig. 11).

(5) Tighten the two accessible glass fasteners in the full up position.

(6) Lower door glass and tighten the remaining glass fastener.

(7) Raise glass to top of travel and verify positioning. Refer to Front Door Glass Adjustment Table and (Fig. 11).

(8) To verify proper fit of the door glass to the header/A-pillar weatherstrip,

(a) Lower door glass slightly.

(b) Place a paper strip between the glass and weatherstrip near mirror flag and another near the front upper corner of the door glass.

(c) Raise glass to full up position.

(d) Pull the strip from between the door glass and the weatherstrip. There should be slight tension on the paper.

DOOR GLASS (Continued)

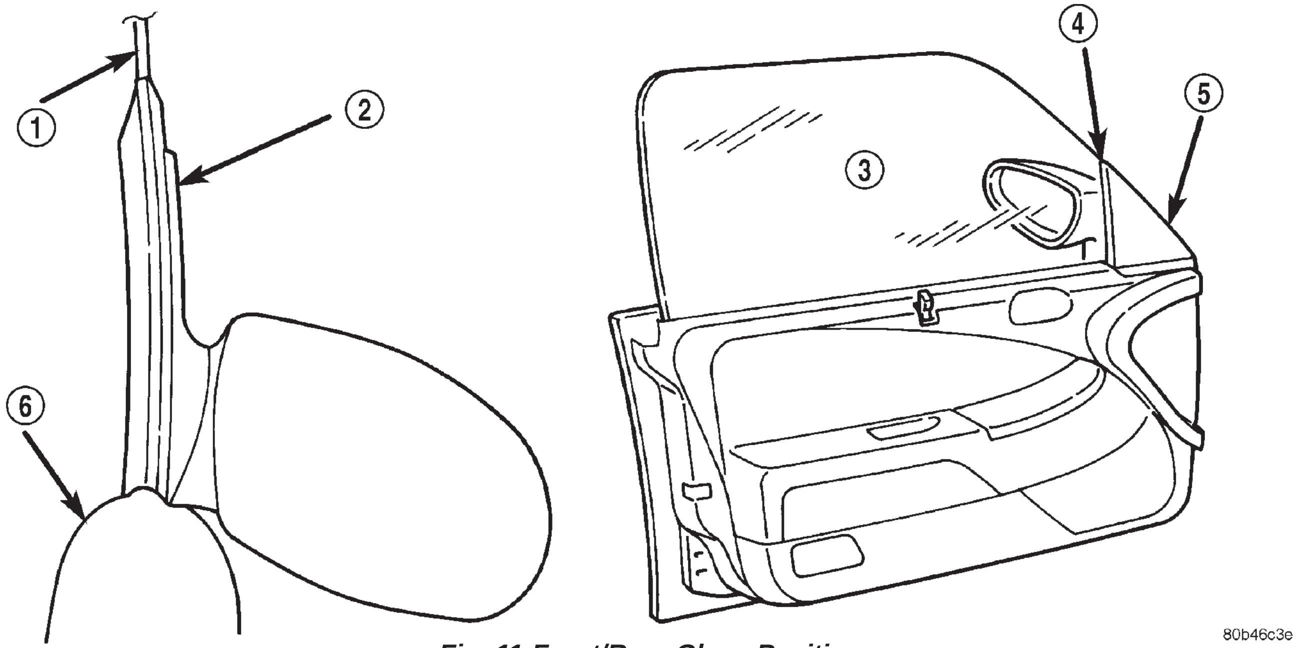

Fig. 11 Front/Rear Glass Position

1 - DOOR GLASS
2 - MIRROR STANCHION
3 - DOOR GLASS
4 - FLUSH
5 - MIRROR STANCHION
6 - DOOR

DOOR GLASS ALIGNMENT VERIFICATION

NOTE: Door Glass Alignment Verification procedure must be done whenever the door glass is adjusted and after all adjustments are made.

(1) Raise quarter glass to full up position.

(2) Close door and cycle door glass between full up and full down positions.

(3) Verify that door glass operates smoothly and maintains correct alignment to convertible top and quarter glass.

(4) Verify that quarter glass weatherstrip fully contacts door glass.

(5) Verify that no scissoring of the door glass and weatherstrip occurs.

(6) If any of the above conditions are found,

(a) Adjust quarter glass (Refer to 23 - BODY/ ADJUSTABLE QUARTER GLASS - ADJUSTMENTS).

(b) Readjust the door glass as necessary to cure the condition.

DOOR GLASS INNER BELT STABILIZER

REMOVAL

(1) Remove door trim panel.

(2) Remove nut attaching inner belt stabilizer to door panel.

(3) Remove inner belt stabilizer from door (Fig. 12).

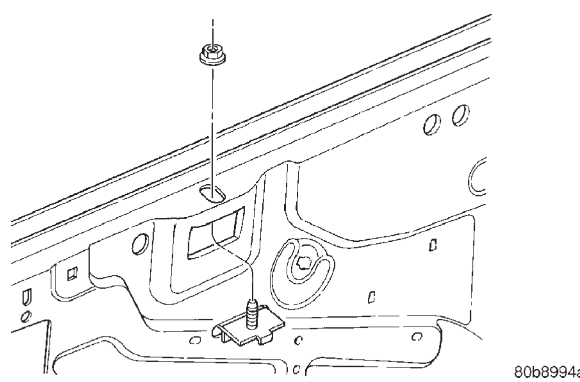

Fig. 12 Inner Belt Stabilizer

INSTALLATION

(1) Place inner belt stabilizer into position.

(2) Install nut attaching inner belt stabilizer to door panel. Adjust inner belt stabilizer against glass with enough tension to allow free up and down movement.

(3) Install door trim panel.

EXTERIOR HANDLE

REMOVAL

(1) Remove door trim panel(Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

(2) Raise door glass.

(3) Remove water dam as necessary to gain access-(Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(4) Disconnect latch rod at door latch.

(5) Remove nuts attaching door handle to outer door panel (Fig. 13).

(6) Remove outside door handle from door.

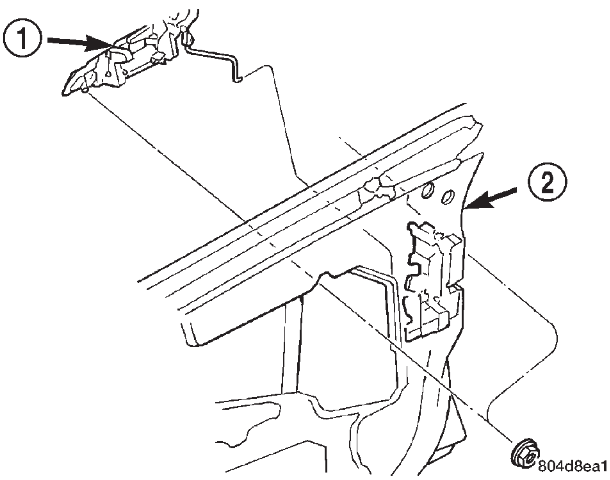

Fig. 13 OUTSIDE DOOR HANDLE - JR27 ONLY

1 - OUTSIDE DOOR HANDLE
2 - DOOR

INSTALLATION

(1) Position outside door handle on door (Fig. 13).

(2) Install nuts attaching door handle to outer door panel.

(3) Connect latch rod at door latch.

(4) Install water dam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

(5) Install door trim panel(Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

(6) Verify door handle operation. Adjust door latch as necessary.

HINGE

REMOVAL

(1) Open and support door on a suitable lifting device.

(2) Remove bolts attaching door check strap to lower A–pillar for greater access, if necessary.

(3) Mark position of hinge on both the door end frame and lower A–pillar with a grease pencil or other suitable device to ease installation.

(4) Remove bolts attaching hinge to door end frame (Fig. 14).

(5) Remove bolts attaching hinge to lower A–pillar and remove the hinge.

(6) Remove door hinge from vehicle.

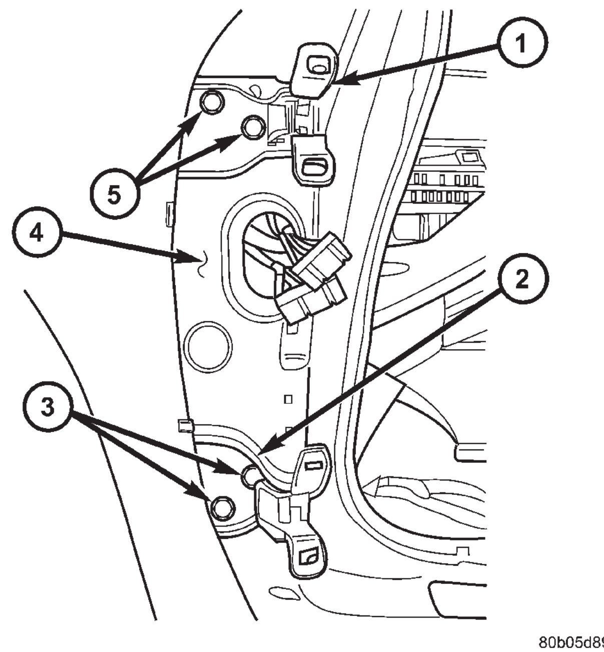

Fig. 14 FRONT DOOR HINGES

1 - UPPER HINGE
2 - LOWER HINGE
3 - LOWER HINGE BOLTS
4 - A-PILLAR
5 - UPPER HINGE BOLTS

INSTALLATION

(1) If necessary, paint new door hinge prior to installation.

(2) Loosely install bolts attaching hinge to lower A–pillar (Fig. 14).

(3) Door on a suitable lifting device position door to the hinge on vehicle.

(4) Loosely install bolts attaching hinge to door end frame.

(5) Align hinge to marks made previously and tighten all bolts.

(6) Install bolts attaching door check strap to lower A-pillar.

(7) Verify door fit and operation. Adjust door hinge for proper door alignment, if necessary.

LATCH

REMOVAL

(1) Remove door trim panel and watershield.
(2) Raise door glass.
(3) Disconnect lock rod from lock button bellcrank.
(4) Disengage lock and latch rods from clips on inner door panel (Fig. 15) or (Fig. 16).
(5) Disconnect lock and latch rods from outside door handle and key cylinder at door latch (Fig. 17).
(6) Disconnect wire connector from power door lock motor.
(7) Remove screws attaching door latch to door end frame (Fig. 18).
(8) Remove door latch from vehicle.

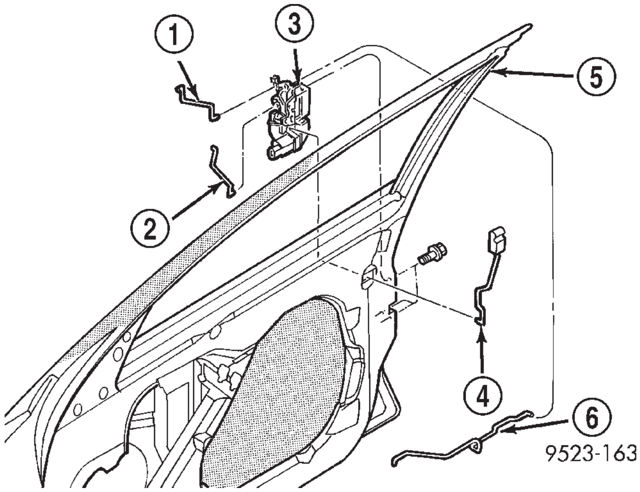

Fig. 15 Front Door Latch

1 - LATCH LINKAGE
2 - LOCK LINKAGE
3 - LATCH
4 - LOCK BUTTON
5 - FRONT DOOR
6 - LATCH RELEASE LINKAGE

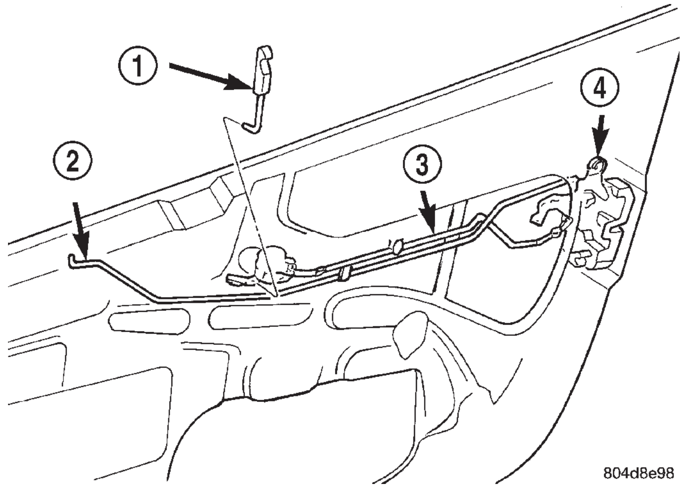

Fig. 16 Latch and Lock Rod Clips

1 - INSIDE LOCK BUTTON
2 - LATCH ROD
3 - LOCK ROD
4 - DOOR LATCH

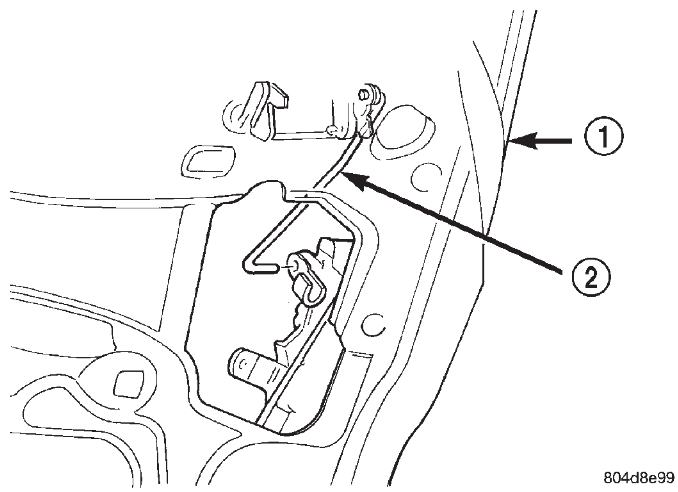

Fig. 17 Lock and Latch Rods At Door Latch

1 - DOOR
2 - DOOR LATCH ROD

INSTALLATION

CAUTION: Do not close door before adjusting the door latch. Door may fail to reopen.

(1) Position door latch on vehicle.
(2) Install screws attaching door latch to door end frame.
(3) Connect wire connector to power door lock motor.
(4) Connect lock and latch rods from outside door handle and key cylinder at door latch.
(5) Engage lock and latch rods to clips on inner door panel.
(6) Connect lock rod from lock button bellcrank.
(7) Adjust door latch.
(8) Verify operation of door latch. Readjust if necessary.
(9) Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION) and water dam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

LATCH (Continued)

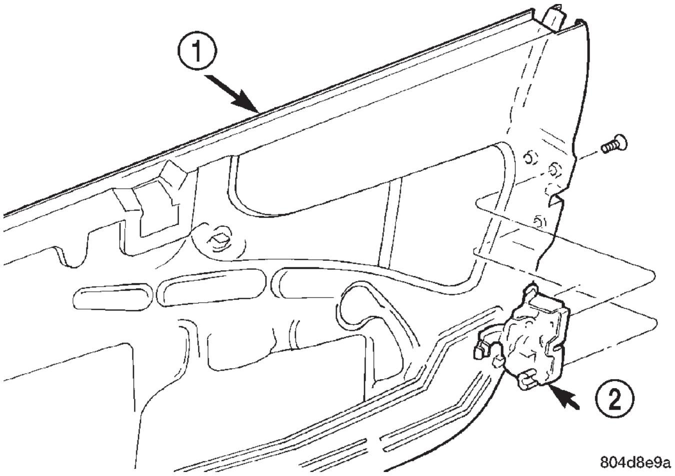

Fig. 18 Door Latch

1 - DOOR
2 - DOOR LATCH

ADJUSTMENTS

ADJUSTMENT

(1) Insert a suitable allen wrench through elongated slot in door end frame and loosen bolt 1/2 to one full turn (Fig. 19).

(2) Cycle outside door handle twice.

(3) Tighten adjusting screw to 3.4 N·m (30 in. lbs.) torque.

(4) Verify latch operation.

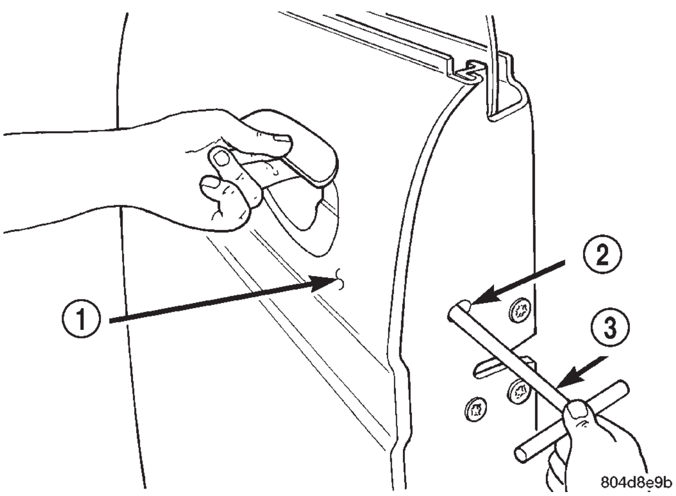

Fig. 19 Door Latch Adjustment

1 - DOOR
2 - SLOT
3 - ALLEN WRENCH

LATCH STRIKER

REMOVAL

(1) Mark outline of door latch striker on B-pillar to aid in installation.

(2) Remove screws attaching door latch striker to B-pillar (Fig. 20).

(3) Remove latch striker from vehicle.

NOTE: Be sure to check for any shims between door latch striker and B-pillar. If any shims are found, they must be reinstalled with the new door latch striker to maintain proper door operation.

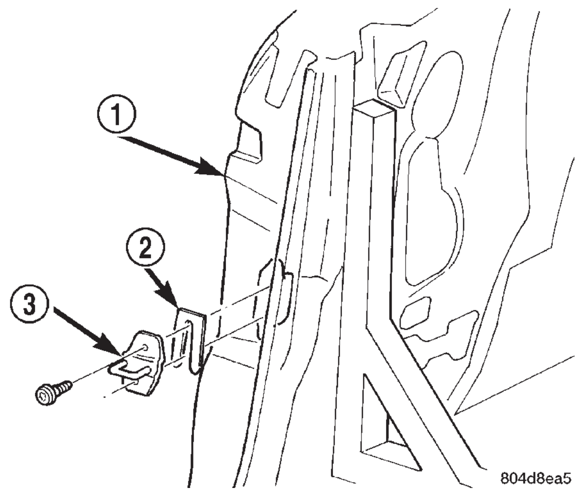

Fig. 20 Door Latch Striker

1 - B-PILLAR
2 - SHIM
3 - DOOR LATCH STRIKER

INSTALLATION

(1) Position door latch striker and any shims on vehicle.

(2) Loosely install screws attaching latch striker to B-pillar.

(3) Align latch striker to marks on B-pillar made previously.

(4) Tighten all fasteners.

(5) Verify door fit and operation. Adjust door latch striker as necessary.

LOCK BUTTON BELL CRANK

REMOVAL

(1) Remove door trim panel.

(2) Disengage clip holding lock linkage to bell crank.

(3) Rotate bell crank until retaining ears align with slots in door panel.

(4) Remove bell crank from door (Fig. 21).

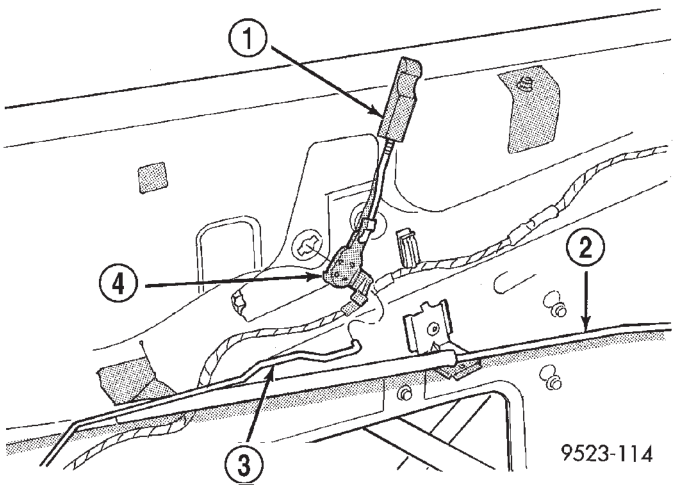

Fig. 21 Lock Button Bell Crank – Typical

1 - LOCK BUTTON
2 - LATCH LINKAGE
3 - LOCK LINKAGE
4 - BELL-CRANK

INSTALLATION

(1) Place bell crank into position.

(2) Rotate bell crank until retaining ears align with slots in door panel.

(3) Engage clip attaching lock linkage to bell crank.

(4) Install door trim panel.

LOCK CYLINDER

DESCRIPTION

Ignition, door, deck lid, and rear hatch lock cylinders are all codable to the key. Lock barrels, tumblers, and tumbler springs are available to allow the technician to change replacement locks cylinders to match the customer's original key set. See the appropriate section in this manual for lock cylinder removal. See the Mopar® catalogue for part numbers and lock coding procedures.

REMOVAL

(1) Remove outside door handle.

(2) Remove clip attaching lock cylinder to outside door panel (Fig. 22).

(3) Disengage clip attaching link to key cylinder.

(4) Remove lock cylinder from outer door panel.

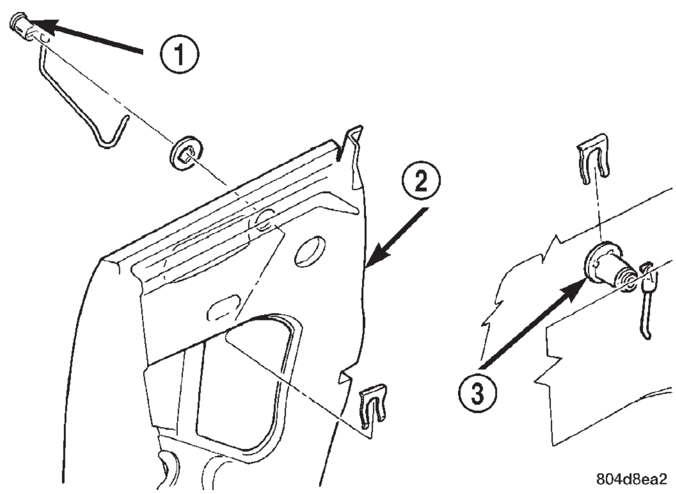

Fig. 22 Door Lock Cylinder

1 - DOOR LOCK CYLINDER
2 - DOOR
3 - DOOR LOCK CYLINDER

INSTALLATION

(1) Position lock cylinder and gasket in door outer panel.

(2) Install clip attaching lock cylinder to outside door panel.

(3) Engage link to key cylinder.

(4) Install outside door handle.

SIDE VIEW MIRROR FLAG/ DOOR GLASS CHANNEL

REMOVAL

(1) Remove side view mirror (Refer to 23 - BODY/ EXTERIOR/SIDE VIEW MIRROR - REMOVAL).

(2) Partially lower the door glass.

(3) Remove inner seal.

(4) Remove attaching fasteners (Fig. 23).

(5) Remove the adjustment stud. Count the number of turns to aid installation.

(6) Remove mirror flag.

INSTALLATION

(1) Align glass into the guide and position the mirror flag on door (Fig. 16).

(2) Install the adjustment stud and tighten the number of turns counted in the removal procedure.

(3) Install attaching fasteners.

(4) Install the inner glass seal.

SIDE VIEW MIRROR FLAG/DOOR GLASS CHANNEL (Continued)

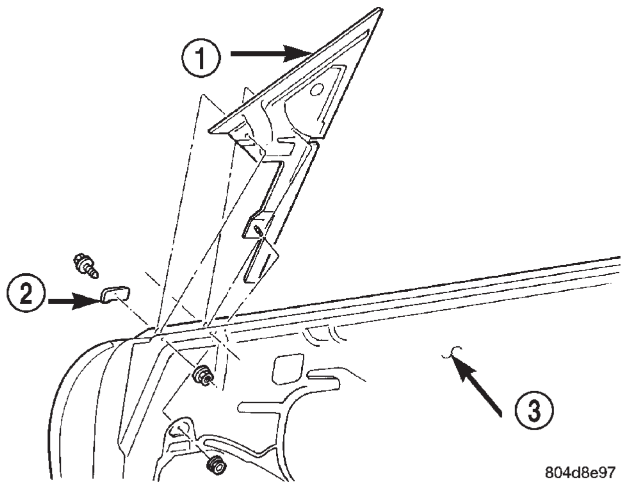

Fig. 23 Side View Mirror Flag/Door Glass Channel

1 - MIRROR FLAG/GLASS CHANNEL
2 - CLIP
3 - DOOR

(5) Install side view mirror (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - INSTALLATION).

(6) Verify glass fit and operation. Adjust door glass as necessary.

(7) Install door trim panel.

TRIM PANEL

REMOVAL

(1) Roll door glass down.

(2) Disengage two clips attaching speaker grille to door trim panel. They are at the front of the grille, one near the top, and the other one at the bottom.

(3) Remove three large washer-headed screws surrounding the speaker (Fig. 24).

(4) Remove access cover at front of door trim panel. Remove by prying at its rear edge (Fig. 25).

(5) Remove red courtesy reflector from lower tail or door. Disengage by prying at screwdriver notch at bottom of reflector.

(6) Remove flag trim panel from door by prying off at two attachment clips points (Fig. 25).

(7) Remove seven screws attaching door trim panel to door: (Fig. 24) and (Fig. 25).

(a) One screw is located at lower rear screw pocket.

(b) Three screws located along the bottom of door.

(c) One screw located inside handle opening.

(d) One screw located at the upper front.

(e) One screw in the pull cup.

(8) Disengage two hidden clips attaching at the rear of the trim panel, by prying off at two attachment clip points.

(9) Lift trim panel upward and away from door, disengage trim panel from upper retainer channel.

(10) Disengage clip attaching latch linkage to back door handle.

(11) Disconnect electrical connectors as necessary, including lower foot light, If equipped.

(12) Remove door trim panel from door.

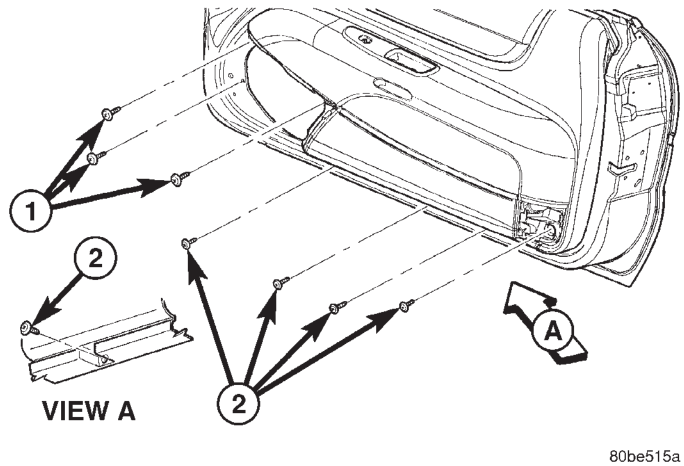

Fig. 24 Lower Door Trim Panel Removal

1 - SCREWS AT SPEAKER LOCATION
2 - BOTTOM OF DOOR TRIM PANEL

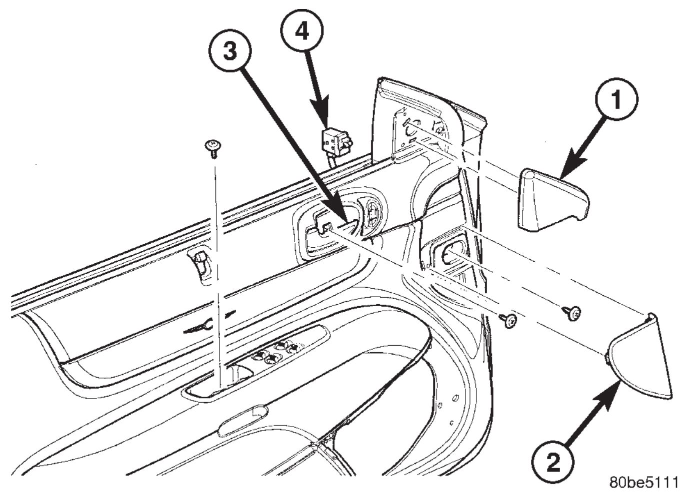

Fig. 25 Mirror Bezel and Door Trim Access Cover

1 - FLAG TRIM PANEL
2 - DOOR TRIM ACCESS COVER
3 - INSIDE REMOTE HANDLE
4 - POWER DOOR LOCK SWITCH

TRIM PANEL (Continued)

INSTALLATION

(1) Position door trim panel near to door.

(2) Connect electrical connectors as necessary, including foot light, if so equipped.

(3) Engage clip attaching latch linkage to inside door handle.

(4) Lift the door trim slightly to get the lock knob into its bezel opening on the panel.

(5) Place front portion of upper trim strip flange into retainer channel, while seating white forward locator pin into mating hole in sheetmetal at front of door.

(6) Drive screw into forward locator cup.

(7) With rear of panel slightly lifted, engage remainder of trim strip flange into retainer channel, working from front to back, pressing down firmly.

(8) Engage two hidden clips attaching rear of door trim to thier mating (green) grommet holes in the door. Press the rear of the panel firmly in toward the door, listening for engagement clicking sounds at BOTH of the clips.

(9) Install seven screws attaching door trim panel to door: (Fig. 24) and (Fig. 25).

(a) One screw in the pull cup.

(b) One screw located inside handle opening.

(c) One screw located at the upper front.

(d) One screw is located at lower rear screw pocket.

(e) Three screws located along the bottom of door.

(10) Snap screw covers closed.

(11) Install three large washer headed screws surrounding the speaker (Fig. 24).

(12) Install speaker grille by first engaging rear edge hinge flaps to mating slots, then pressing grille on to seat the two clips at front.

(13) Install red courtesy reflector by first engaging rear edge hinge flaps to mating slots, then snap front in to position.

(14) Install access cover at front of door trim panel. First engage slots at front, then snap in at rear edge (Fig. 25).

(15) Place flag trim panel into position and engage clips (Fig. 25).

(16) Close door window.

REAR VERTICAL GUIDE BAR

REMOVAL

(1) Remove door trim panel and watershield.

(2) Remove nut attaching top of guide bar to inner door panel.

(3) Using a suitable allen wrench, hold jack screw stationary while removing nut attaching bottom of guide bar to inner door panel.

(4) Remove guide bar from vehicle and remove through access hole in inner door panel (Fig. 26).

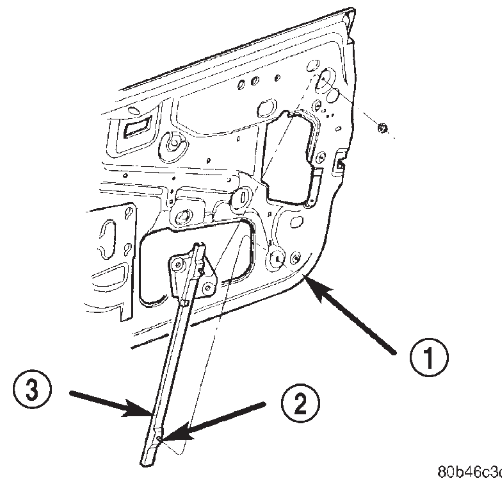

Fig. 26 Rear Vertical Guide Bar

1 - DOOR
2 - JACK SCREW
3 - REAR VERTICAL GUIDE BAR

INSTALLATION

(1) If a new guide bar is being installed, preset bottom jack screw using old guide bar as a reference.

(2) Position rear guide bar on vehicle.

(3) Using a suitable allen wrench, hold jack screw stationary while installing nut attaching bottom of guide bar to inner door panel.

(4) Install nut attaching top of rear guide bar to inner door panel.

(5) Verify glass fit and operation. Adjust door glass as necessary.

(6) Install door trim panel and watershield.

WATERDAM

REMOVAL

(1) Remove door trim panel.
(2) Remove door speaker, if equipped.
(3) Remove door trim pull cup mount bracket.
(4) Disengage clip attaching lock linkage to lock button bell crank.
(5) Peel water dam away from adhesive around perimeter of inner door panel (Fig. 27).

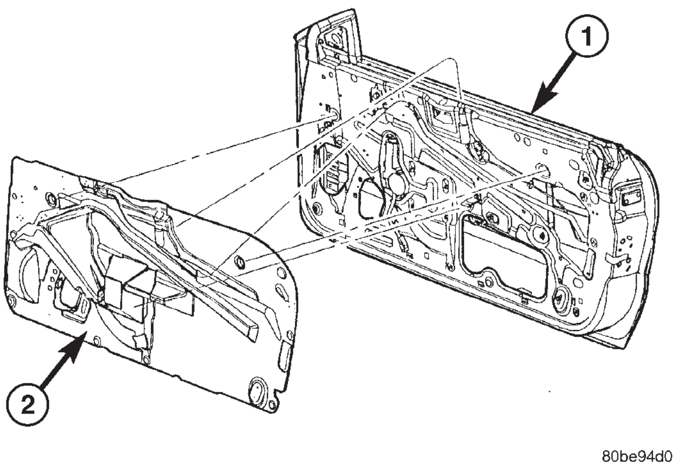

Fig. 27 DOOR WATER DAM

1 - DOOR
2 - WATER DAM

INSTALLATION

(1) Insure that enough adhesive remains to securely retain the water dam. Replace as necessary.
(2) Place the water dam into position and press securely to adhesive making sure to properly route wiring and linkages.
(3) Engage clip attaching lock linkage to lock button bell crank.
(4) Install door trim pull cup mount bracket.
(5) Install door speaker, if equipped.
(6) Install door trim panel.

WINDOW REGULATOR

REMOVAL

REMOVAL

NOTE: For power window motor removal procedures, (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - REMOVAL).

(1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
(2) Remove glass from regulator roller channel. Secure glass in the up position in the door frame.
(3) Disconnect power window motor wire connector.
(4) Loosen screw attaching regulator scissor channel to door panel.
(5) Remove screw and bolt heads from keyhole slots in door panel.
(6) Loosen bolts attaching regulator to door panel.
(7) Remove regulator from door panel (Fig. 28).
(8) Slide regulator rearward and rotate forward end of roller channel through access hole in door panel.

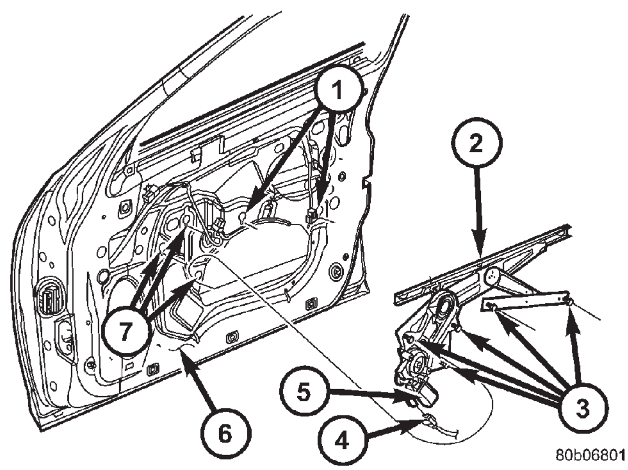

Fig. 28 FRONT DOOR REGULATOR

1 - MOUNTING SLOTS
2 - REGULATOR
3 - MOUNTING BOLTS
4 - ELECTRICAL CONNECTOR
5 - REGULATOR
6 - INNER DOOR
7 - MOUNTING SLOTS

WINDOW REGULATOR (Continued)

REMOVAL- JR-27 ONLY

NOTE: For power window motor removal procedures,(Refer to 8 - ELECTRICAL/POWER WINDOWS/ WINDOW MOTOR - REMOVAL).

(1) Remove door trim panel and water shield.
(2) Disconnect wire connector to power window motor.
(3) Remove nuts attaching regulator lift channel to door glass(Refer to 23 - BODY/DOOR - FRONT/ DOOR GLASS - REMOVAL).
(4) Secure door glass in upward position.
(5) Mark position of rear bolt of roller channel to inner door panel to aid in installation.
(6) Remove bolt attaching rear of roller channel to door panel.
(7) Loosen bolt attaching front of roller channel to door panel.
(8) Remove roller channel from door panel (Fig. 29).
(9) Loosen bolts attaching window regulator to inner door panel reinforcement.
(10) Remove bolt heads from key hole slots in inner door panel.
(11) Remove window regulator through large hole in inner door panel (Fig. 29).
(12) Remove power window motor from regulator (Refer to 8 - ELECTRICAL/POWER WINDOWS/ WINDOW MOTOR - REMOVAL).

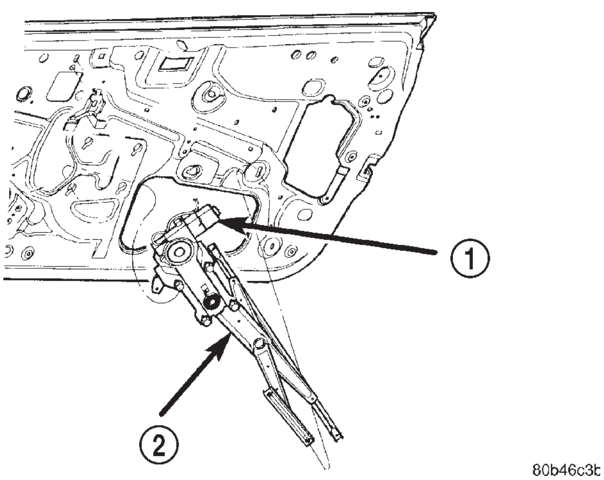

Fig. 29 Power Window Regulator

1 - POWER WINDOW MOTOR
2 - POWER WINDOW REGULATOR

INSTALLATION

INSTALLATION

NOTE: For power window motor service procedures (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - INSTALLATION).

(1) Position regulator in door through access hole in door panel.
(2) Position regulator on door panel.
(3) Tighten bolts attaching regulator to door panel.
(4) Position screw and bolt heads in keyhole slots in door panel.
(5) Tighten screw attaching regulator scissor channel to door panel.
(6) Connect power window motor wire electrical connector.
(7) Position glass in regulator roller channel.
(8) Tighten fasteners attaching door glass to roller channel.
(9) Install door trim panel. (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - INSTALLATION)

INSTALLATION - JR-27 ONLY

NOTE: For power window motor installation procedures, (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - INSTALLATION).

(1) Install power window motor on regulator (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - INSTALLATION).
(2) Move window regulator into position in door and engage bolt heads into key hole slots in inner door panel reinforcement and tighten bolts.
(3) Install roller channel to door panel.
(4) Install bolt at rear of roller channel. Make sure that bolt is aligned to mark on inner door panel made previously.
(5) Tighten front and rear bolts of roller channel.
(6) Install nuts attaching regulator lift channel to door glass.
(7) Verify glass fit and operation. Adjust door glass, if necessary.
(8) Connect wire connector to power window motor.
(9) Install door water dam (Refer to 23 - BODY/ DOOR - FRONT/WATERDAM - INSTALLATION) and trim panel (Refer to 23 - BODY/DOOR - FRONT/ TRIM PANEL - INSTALLATION).

APPLIQUE

REMOVAL

(1) Pull the glass run weatherstrip away from the window opening to access the applique screws. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR GLASS RUN WEATHERSTRIP - REMOVAL)

(2) Remove the screws and remove the applique (Fig. 30).

INSTALLATION

(1) Install the applique and install the screws.

(2) Position the glass run weatherstrip back into position. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR GLASS RUN WEATHERSTRIP - INSTALLATION)

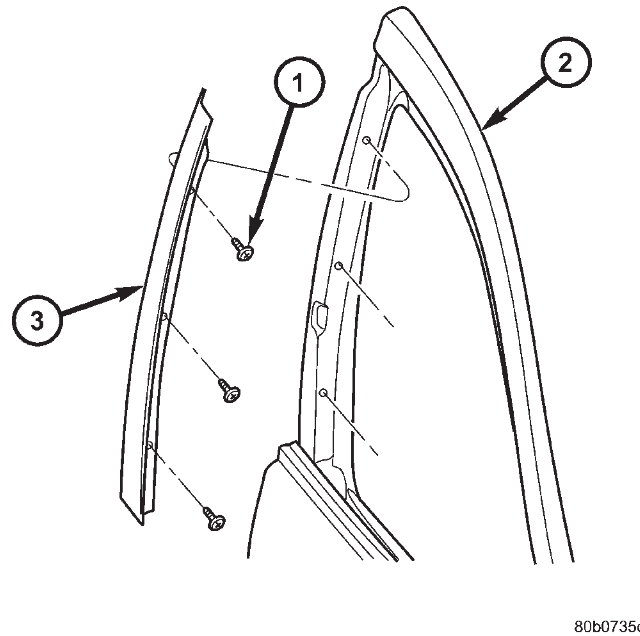

Fig. 30 01 FRONT DOOR APPLIQUE

1 - SCREWS
2 - FRONT DOOR
3 - APPLIQUE

DOORS - REAR

TABLE OF CONTENTS

DOORS - REAR

REMOVAL

(1) Remove rear door trim panel.
(2) Remove bolt attaching check strap to hinge pillar.
(3) Remove bolt attaching check strap to inner door panel (Fig. 1).
(4) Remove bolts attaching check strap to door end frame.
(5) Remove check strap from vehicle.

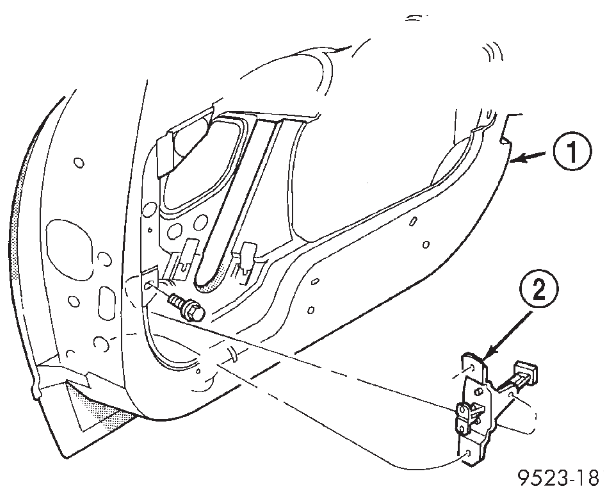

Fig. 1 Rear Door Check Strap

1 - REAR DOOR
2 - CHECK STRAP

APPLIQUE

REMOVAL

(1) Pull the glass run weatherstrip away from the window opening to access the applique screws. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/REAR DOOR GLASS RUN WEATHERSTRIP - REMOVAL)

(2) Remove the screws under the glass run weatherstrip (Fig. 2).

(3) Remove the upper push-pin fastener.

(4) Remove the lower inner screw and remove the applique.

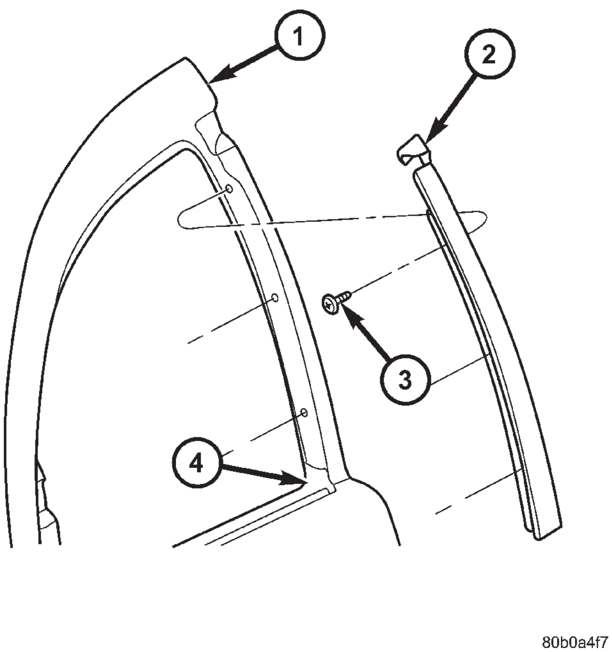

Fig. 2 REAR DOOR APPLIQUE

1 - DOOR
2 - APPLIQUE
3 - SCREWS
4 - INNER SCREW

INSTALLATION

(1) Install the applique and the screws.

(2) Install the upper push-in fastener.

(3) Install the lower screw.

(4) Position the glass run weatherstrip back into position. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/REAR DOOR GLASS RUN WEATHERSTRIP - INSTALLATION)

REAR CHECK STRAP

INSTALLATION

(1) Place check strap into position.

(2) Install bolts attaching check strap to door end frame.

(3) Install bolt attaching check strap to inner door panel.

(4) Install bolt attaching check strap to hinge pillar.

(5) Install rear door trim panel.

DOOR

REMOVAL

(1) Open and support door on a suitable lifting device.

(2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to aid installation.

(3) Disengage wire connector at hinge pillar (Fig. 3).

(4) Remove bolts attaching door check strap to B-pillar.

(5) Remove the nuts and remove the door from vehicle.

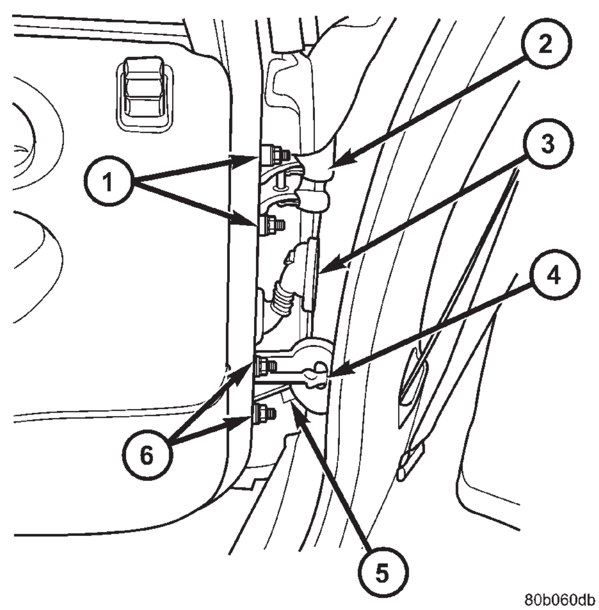

Fig. 3 REAR DOOR/HINGES

1 - UPPER HINGE NUTS
2 - UPPER HINGE
3 - ELECTRICAL CONNECTOR
4 - CHECK STRAP
5 - LOWER HINGE
6 - LOWER HINGE NUTS

DOOR (Continued)

INSTALLATION

(1) Position door onto the door hinges and install the nuts.

(2) Install bolts holding door check strap to hinge pillar.

(3) Engage wire connector at hinge pillar.

(4) Verify door fit and operation. Adjust the door for flushness and parallel gaps as necessary.

DOOR GLASS

REMOVAL

(1) Remove door trim panel and inner belt weatherstrip.

(2) Connect power window switch or install crank and lower window to 50 mm (2 in.) from bottom of travel.

(3) Loosen bolts holding rear lower run channel to inner door panel (Fig. 4).

(4) Separate rear run channel from door.

(5) Loosen screws holding regulator roller channel to glass.

(6) Slide roller channel rearward to allow screw heads to pass through key hole slots in channel.

(7) Separate glass from roller channel.

(8) Lift glass upward and out of the opening at top of door.

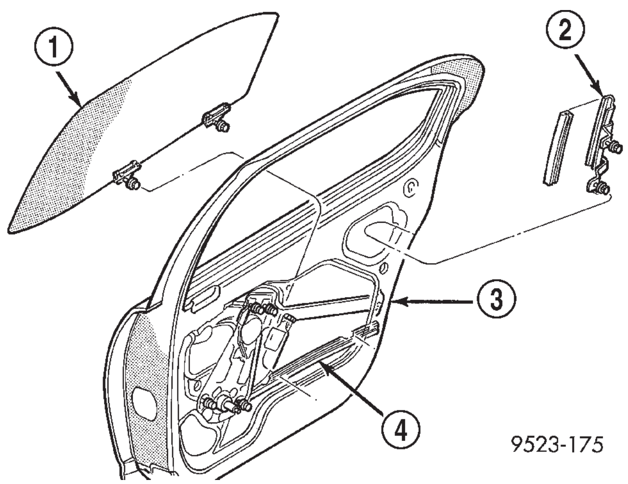

Fig. 4 Rear Door Glass

1 - REAR DOOR GLASS
2 - LOWER RUN CHANNEL
3 - REAR DOOR
4 - LIFT CHANNEL

INSTALLATION

(1) Lower door glass through opening at top of door.

(2) Position door glass onto roller channel.

(3) Slide roller channel forward to allow screw heads to engage key hole slots in channel.

(4) Tighten screws holding regulator roller channel to glass.

(5) Position rear run channel on door.

(6) Tighten bolts holding rear lower run channel to inner door panel.

(7) Install door trim panel and inner belt weatherstrip.

EXTERIOR HANDLE

REMOVAL

(1) Remove rear door trim panel.

(2) Close door glass.

(3) Disengage clip holding linkage to outside handle.

(4) Remove linkage from outside handle (Fig. 5).

(5) Remove nuts holding outside handle to outer door panel.

(6) Remove outside door handle from vehicle.

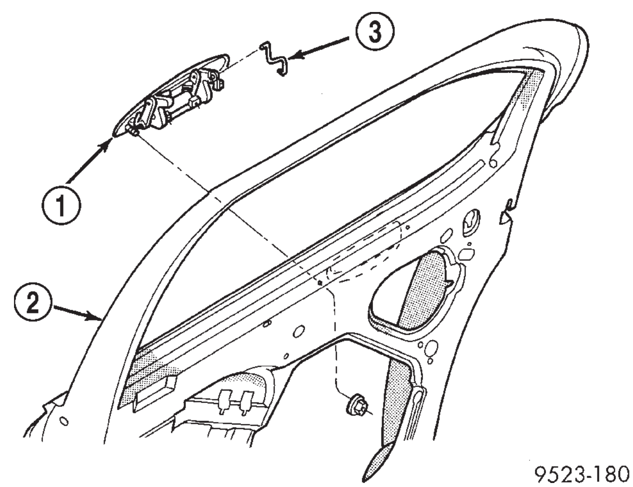

Fig. 5 Rear Door Outside Handle

1 - OUTSIDE DOOR HANDLE
2 - REAR DOOR
3 - LINKAGE

INSTALLATION

(1) Position outside door handle from vehicle.

(2) Install nuts attaching outside handle to outer door panel.

(3) Connect linkage to outside handle (Fig. 5).

(4) Connect clip holding linkage to outside handle.

(5) Replace the clips attaching trim panel to perimeter of door.

(6) Install rear door trim panel.

HINGE

REMOVAL

(1) Remove the door. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)

(2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to aid installation.

(3) Remove the bolts and remove the hinges (Fig. 6).

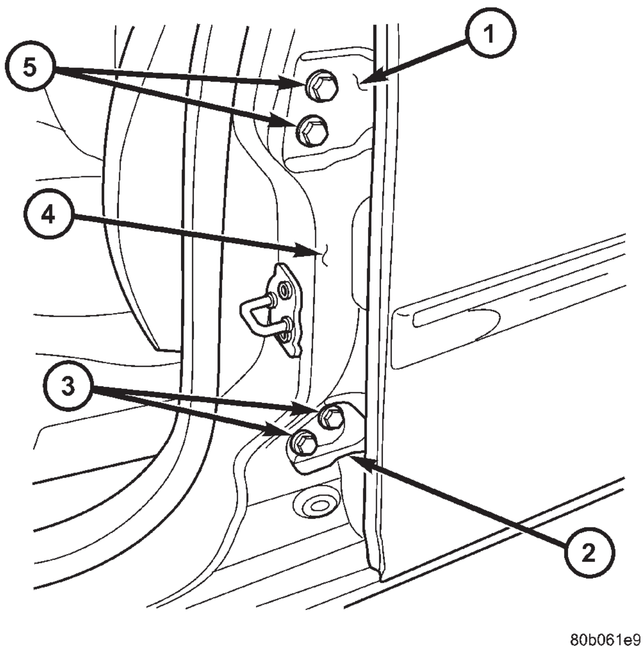

Fig. 6 REAR DOOR HINGES

1 - UPPER HINGE
2 - LOWER HINGE
3 - LOWER HINGE BOLTS
4 - B-PILLAR
5 - UPPER HINGE BOLTS

INSTALLATION

(1) If necessary, paint new door hinge prior to installation.

(2) Position door hinge on vehicle.

(3) Loosely install bolts attaching hinge to lower A–pillar.

(4) Align hinge to marks made previously and tighten all bolts.

(5) Install the door. (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)

LATCH

REMOVAL

(1) Remove rear door trim panel.

(2) Close door glass.

(3) Remove lower rear run channel.

(4) Disengage clips attaching linkage rods to door latch.

(5) Remove linkage rods from latch (Fig. 7).

(6) Remove screws attaching latch to door end frame.

(7) Remove latch from door.

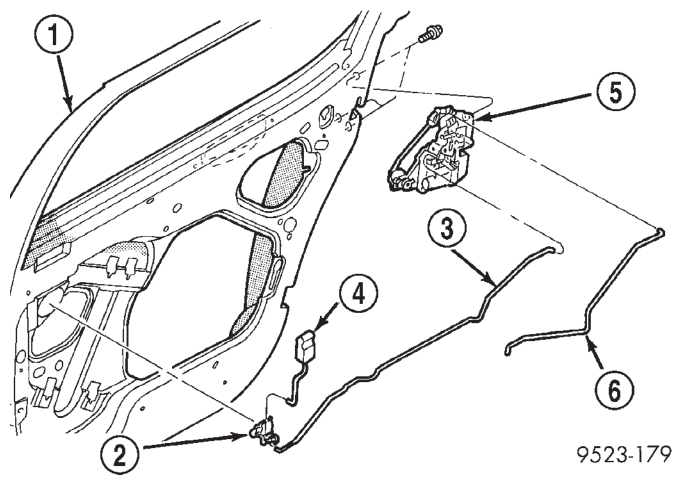

Fig. 7 Rear Door Latch

1 - REAR DOOR
2 - BELL CRANK
3 - LOCK LINKAGE
4 - LOCK BUTTON
5 - LATCH
6 - LATCH LINKAGE

INSTALLATION

CAUTION: Do not close door before adjusting the door latch, door may fail to open.

(1) Place rear door latch into position.

(2) Install screws attaching latch to door end frame.

(3) Install linkage rods from latch.

(4) Engage clips attaching linkage rods to door latch.

(5) Install lower rear run channel.

(6) Open door glass.

(7) Install rear door trim panel.

LATCH STRIKER

REMOVAL

(1) Mark outline of door latch striker on C-pillar to aid installation.

(2) Remove screws attaching door latch striker to C-pillar (Fig. 8).

(3) Remove door latch striker from vehicle.

NOTE: Be sure to check for any shims between door latch striker and C-pillar. If any shims are found, they must be reinstalled with the new door latch striker to maintain proper door operation.

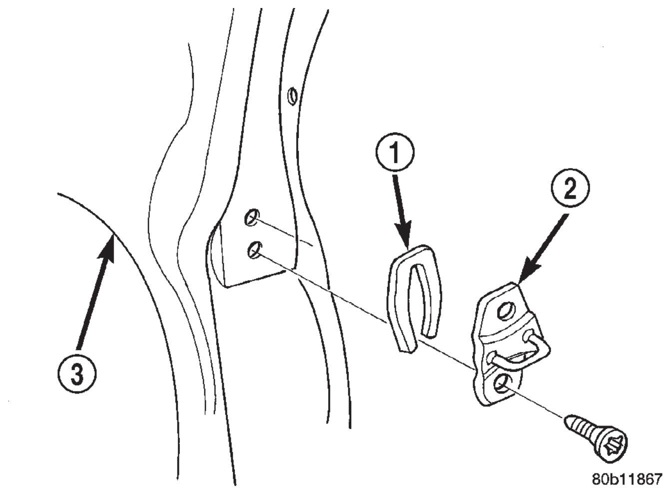

Fig. 8 Rear Door Latch Striker

1 - SHIM
2 - STRIKER
3 - QUARTER PANEL

INSTALLATION

(1) Position door latch striker and any shims on vehicle.

(2) Loosely install screws attaching latch striker to C-pillar.

(3) Align latch striker to marks on C-pillar made previously.

(4) Tighten all fasteners.

(5) Verify door fit and operation. Adjust door latch striker as necessary.

TRIM PANEL

REMOVAL

(1) Open rear door.

(2) Lower window.

(3) Open the screw cap from bottom of arm rest pull cup and remove the screw (Fig. 9).

(4) Open the screw cap from behind door latch handle and remove the screw.

(5) Remove the screws along the bottom of the trim panel.

(6) Using a trim stick C-4755 or equivalent, disengage clips holding perimeter of trim panel to rear door.

(7) Remove trim panel from inner belt weatherstrip at top of door.

(8) Disconnect wiring harness at door opening.

(9) Remove top of trim panel from door.

(10) Disengage clip holding linkage to latch handle (Fig. 10).

(11) Remove linkage from latch handle.

(12) Lift trim up and off lock button.

(13) Remove rear door trim panel from vehicle.

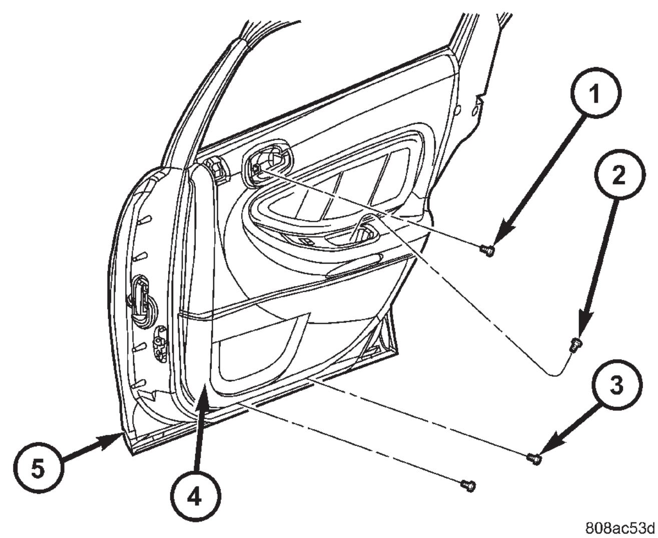

Fig. 9 Rear Door Trim Panel

1 - SCREW
2 - SCREW
3 - SCREW
4 - REAR DOOR TRIM PANEL
5 - REAR DOOR

INSTALLATION

(1) Position rear door trim panel on vehicle.

(2) Connect linkage to latch handle.

(3) Engage clip holding linkage to latch handle.

(4) Connect wiring harness at door opening.

(5) Position the lock knob through the trim panel and engage trim panel from inner belt weatherstrip at top of door.

(6) Align the clips attaching perimeter of trim panel to rear door with the grommets and engage.

(7) Install screws attaching door trim panel to door. (Fig. 9)

(8) Install screw holding door latch handle to door and close the screw cap.

TRIM PANEL (Continued)

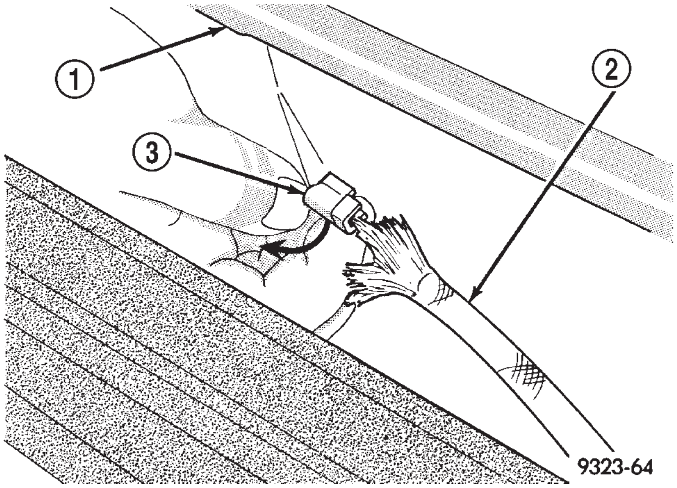

Fig. 10 Linkage Clip

1 - DOOR TRIM PANEL
2 - LATCH RELEASE ROD
3 - CLIP

(9) Install screw from bottom of arm rest pull cup and close the screw cap.

(10) Connect battery.

WATERDAM

REMOVAL

(1) Remove door trim panel.

(2) Remove door speaker, if equipped.

(3) Disconnect clip attaching lock linkage to lock button bell crank.

(4) Peel water dam away from adhesive around perimeter of inner door panel.

INSTALLATION

(1) Insure that enough adhesive remains to securely retain the water dam. Replace as necessary.

(2) Place the water dam into position and press securely to adhesive making sure to properly route wiring and linkages.

(3) Connect clip attaching lock linkage to lock button bell crank.

(4) Install door speaker, if equipped.

(5) Install door trim panel.

WINDOW REGULATOR

REMOVAL

(1) Remove door waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)

(2) Remove glass from regulator roller channel. Secure glass in the up position in the door frame.

(3) Disconnect power window motor wire connector, if equipped.

(4) Loosen screw attaching regulator scissor channel to door panel (Fig. 11).

(5) Remove screw and bolt heads from keyhole slots in door panel.

(6) Loosen bolts attaching regulator to door panel.

(7) Remove regulator from door panel.

(8) Slide regulator rearward and rotate forward end of roller channel through access hole in door panel.

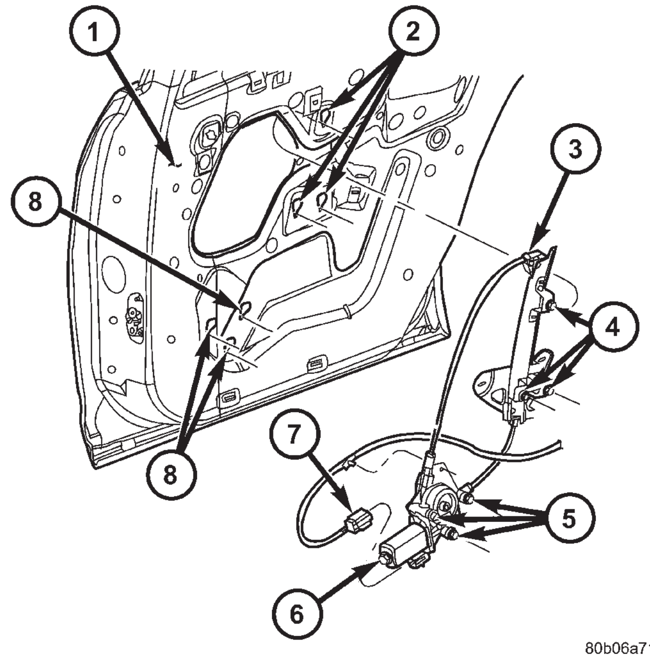

Fig. 11 REAR DOOR REGULATOR

1 - REAR DOOR
2 - MOUNTING SLOTS
3 - REAGULATOR
4 - BOLTS
5 - BOLTS
6 - MOTOR
7 - ELECTRICAL CONNECTOR
8 - MOUNTING SLOTS

INSTALLATION

(1) Position regulator on door panel through access hole in door panel.

(2) Tighten bolts attaching regulator to door panel.

(3) Install screw and bolt heads on scissor channel to keyhole slots in door panel.

(4) Tighten screw attaching regulator scissor channel to door panel.

(5) Connect power window motor wire connector, if equipped.

(6) Position glass to regulator roller channel.

(7) Tighten fasteners attaching door glass to roller channel.

(8) Install door waterdam. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION)

EXTERIOR

TABLE OF CONTENTS

ACCESSORY DRIVE BELT SPLASH SHIELD

REMOVAL

(1) Remove the right front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/RIGHT FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL)

(2) Remove the six push-in fasteners attaching accessory drive belt splash shield to frame rail (Fig. 1).

(3) Remove accessory drive belt splash shield from vehicle.

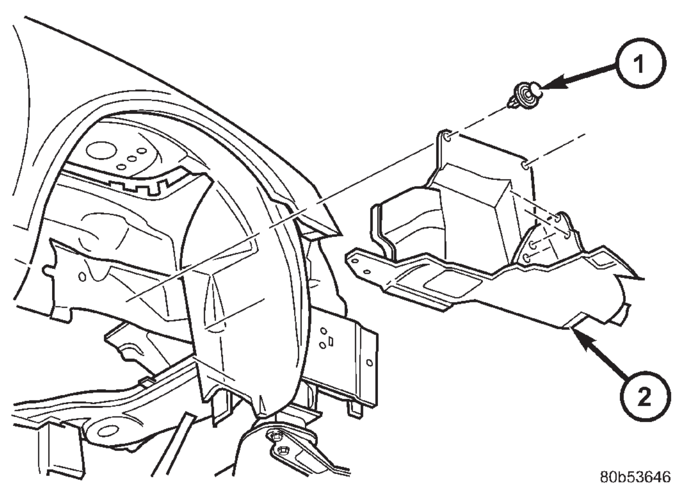

Fig. 1 ACCESSORY DRIVE BELT SPLASH SHIELD

1 - PUSH-PIN FASTENERS
2 - SPLASH SHIELD

INSTALLATION

(1) Install splash shield and install the six push-in fasteners attaching accessory drive belt splash shield to frame rail.

(2) Install the right front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/RF WHEELHOUSE SPLASH SHIELD - INSTALLATION)

BATTERY SPLASH SHIELD

REMOVAL

(1) Remove the three push-pin fasteners and remove the splash shield (Fig. 2).

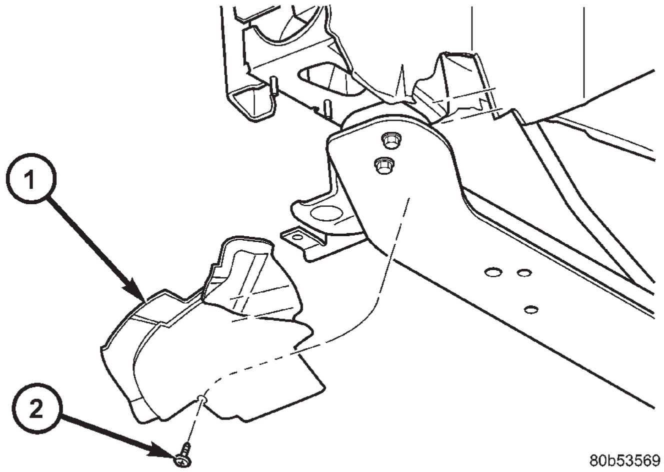

Fig. 2 BATTERY SPLASH SHIELD

1 - SPLASH SHIELD
2 - PUSH-PIN FASTENERS

INSTALLATION

(1) Install the splash shield and install the 3 push-pin fasteners.

BODY SIDE MOLDINGS

REMOVAL

(1) Warm the affected body side molding and body metal to approximately 38° C (100° F) using a suitable heat lamp or heat gun.

(2) Pull body side molding from vehicle (Fig. 3).

(3) Remove adhesive tape residue from surface of vehicle.

INSTALLATION

(1) If molding is to be reused, remove tape residue from molding. Clean back of molding with Mopar® Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of molding.

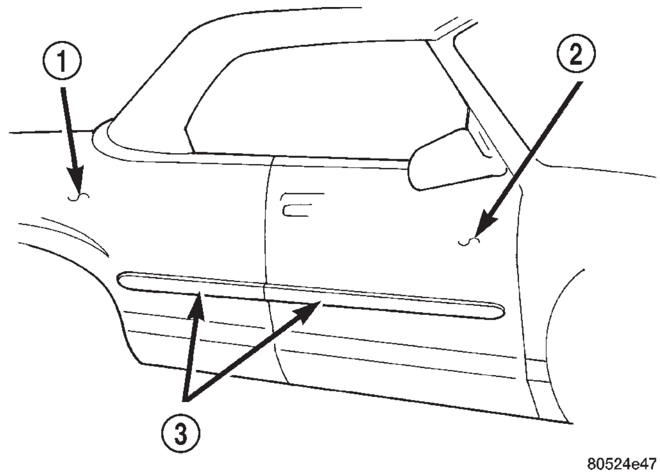

Fig. 3 Body Side Molding

1 - QUARTER PANEL
2 - DOOR
3 - BODYSIDE MOLDING

(2) Clean body surface with Mopar® Super Kleen solvent or equivalent. Wipe surface dry with a lint free cloth.

(3) Apply a length of masking tape on the body parallel to the top edge of the molding to use as a guide, if necessary.

(4) Remove protective cover from tape on back of molding. Apply molding to body below the masking tape guide.

(5) Remove masking tape guide. Heat body metal and body side molding to approximately 38° C (100° F) using a suitable heat lamp or heat gun.

(6) Firmly press body side molding to body surface to insure adhesion.

COWL COVER

REMOVAL

(1) Release hood latch and open hood.

(2) Remove windshield wiper arms(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

(3) Remove screws attaching cowl cover to cowl (Fig. 4).

(4) Remove the seal, cowl screen to hood inner panel.

(5) Remove clips attaching cowl cover to cowl plenum under hood to cowl bulb seal.

(6) Remove cowl cover from vehicle.

COWL COVER (Continued)

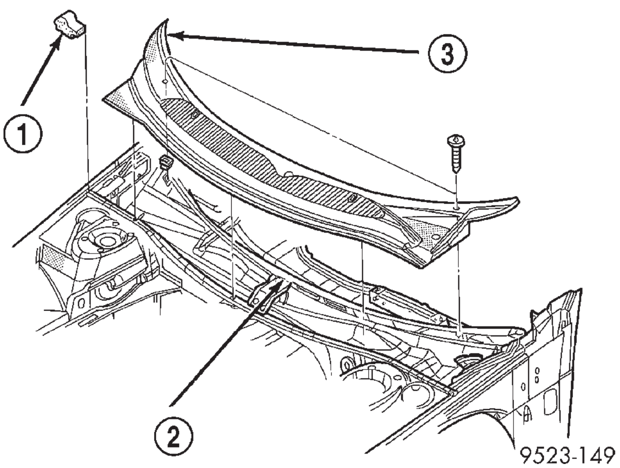

Fig. 4 Cowl Cover

1 - SEAL
2 - COWL
3 - COWL COVER

INSTALLATION

(1) Position cowl cover to vehicle.
(2) Install clips attaching cowl cover to cowl plenum.
(3) Install the seal, cowl screen to hood inner panel.
(4) Install screws attaching cowl cover to cowl.
(5) Install windshield wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

EXTERIOR NAME PLATES

REMOVAL - FOAM TAPE

(1) Mark reference points before removing.
(2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.
(3) Using a trim stick C 4755 or equivalent, gently pry up at corners and remove.
(4) Clean off all traces of adhesive or double sided tape from the panel with a general purpose adhesive remover.

INSTALLATION - FOAM TAPE

(1) Clean panel surface with isopropyl alcohol.
(2) Align badging to reference points.
(3) Install and press securely to full adhesive contact
(4) Clean away any reference points.

FRONT FENDER

REMOVAL

(1) Remove headlamp housing.
(2) Remove mud guard.
(3) Remove inner splash shield.
(4) Remove fender to fascia bolt (Fig. 5) or (Fig. 6).
(5) Remove fender bolt to lower rocker panel.
(6) Remove fender bolt to lower cowl.
(7) Pull fascia away from fender.
(8) Remove bolts attaching fender to upper rail.
(9) Remove fender from vehicle.

INSTALLATION

(1) Place fender in position on vehicle.
(2) Start the center upper rail bolt (Fig. 5) or (Fig. 6).

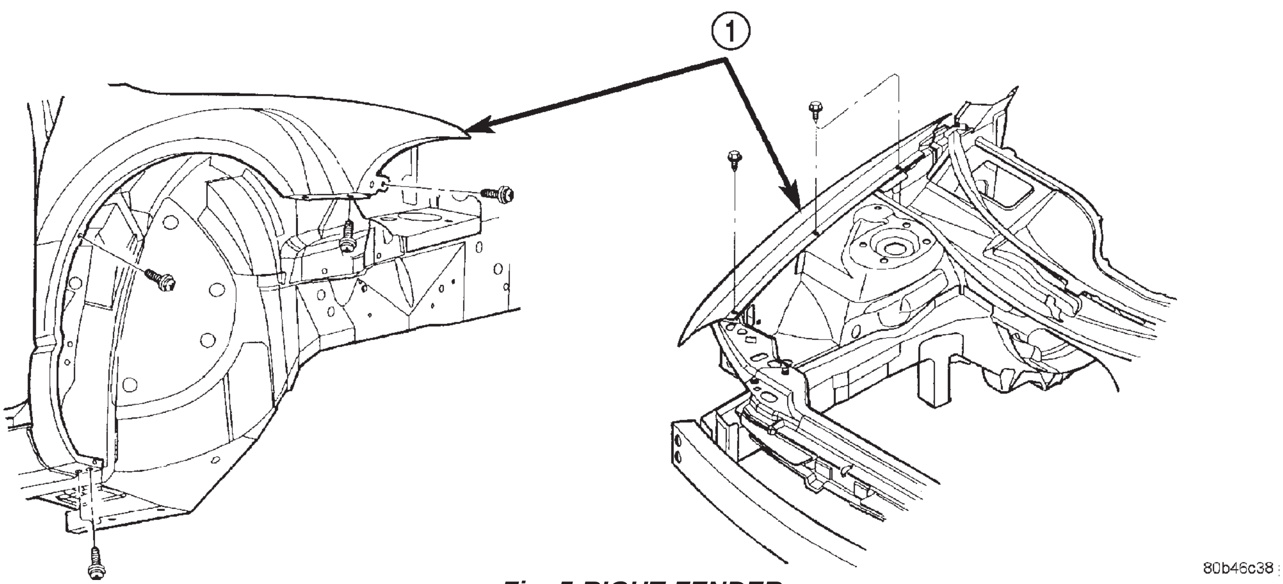

Fig. 5 RIGHT FENDER

1 - FRONT FENDER

FRONT FENDER (Continued)

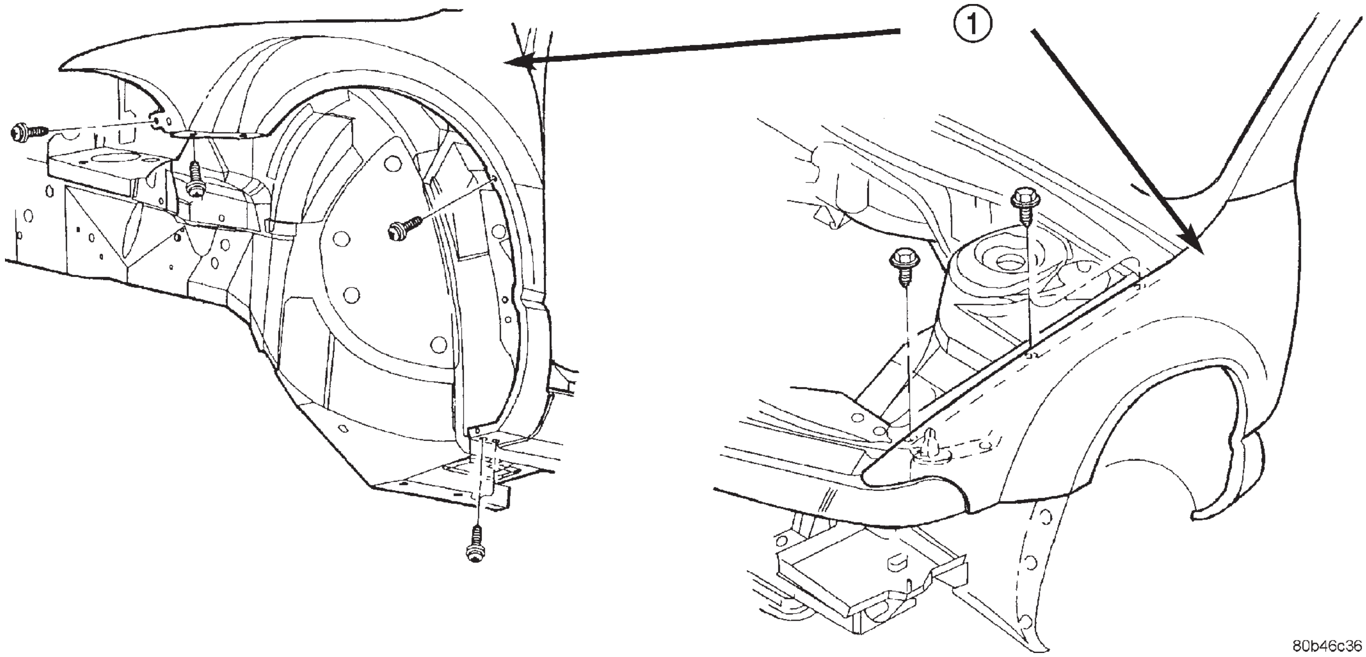

Fig. 6 LEFT FENDER

1 - FENDER

(3) From inside engine compartment, start the center upper rail bolt. Install all the bolts attaching fender to upper rail and tighten.
(4) Install fender to lower cowl panel bolt.
(5) Install fender to rocker panel bolt.
(6) Place fascia into position.
(7) Install fender to fascia bolt.
(8) Install inner splash shield.
(9) Install mud guard.
(10) Install headlamp assembly.
(11) Check fender for flush and gap.

FUEL FILL DOOR

REMOVAL

(1) Open fuel filler door.
(2) Remove the two torx screws (Fig. 7).
(3) Remove fuel filler door from vehicle.

INSTALLATION

(1) Place fuel filler door into position.
(2) Install the two torx screws.
(3) Ensure that door operates properly.

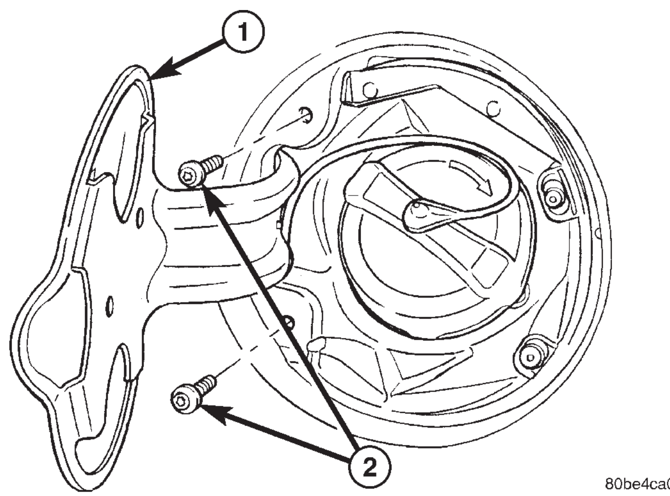

Fig. 7 Fuel Filler Door

1 - FUEL FILLER DOOR
2 - TORX SCREWS

GRILLE

REMOVAL

REMOVAL

(1) Remove front bumper fascia, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

(2) Remove fascia from the vehicle.

(3) Separate foam impact bar from fascia.

(4) Remove clips attaching grille (Fig. 8) or (Fig. 9).

(5) Remove grille from fascia.

(6) Transfer medallion.

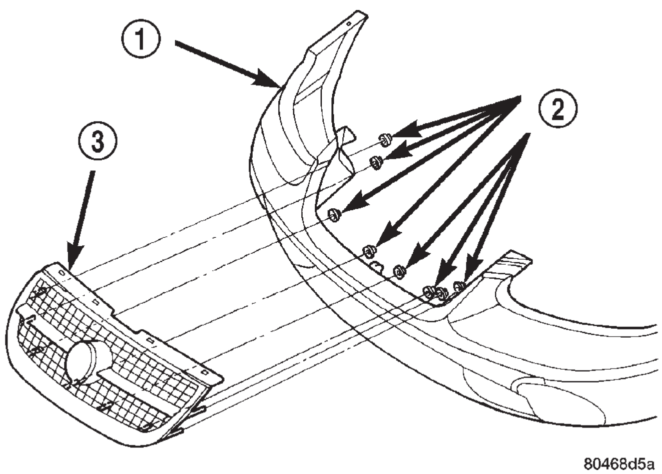

Fig. 8 Grille

1 - FASCIA
2 - PUSH NUTS
3 - GRILLE

REMOVAL - JR-27

(1) Remove front bumper fascia, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

(2) Remove fascia from the vehicle.

(3) Remove foam impact bar from fascia.

(4) Remove clips attaching grille (Fig. 10).

(5) Remove grille from fascia.

(6) Transfer medallion.

(7) Remove grille from fascia.

INSTALLATION

INSTALLATION

(1) Position grille on fascia.

(2) Install clips attaching grille to fascia.

(3) Install foam impact bar to fascia.

(4) Place fascia into position.

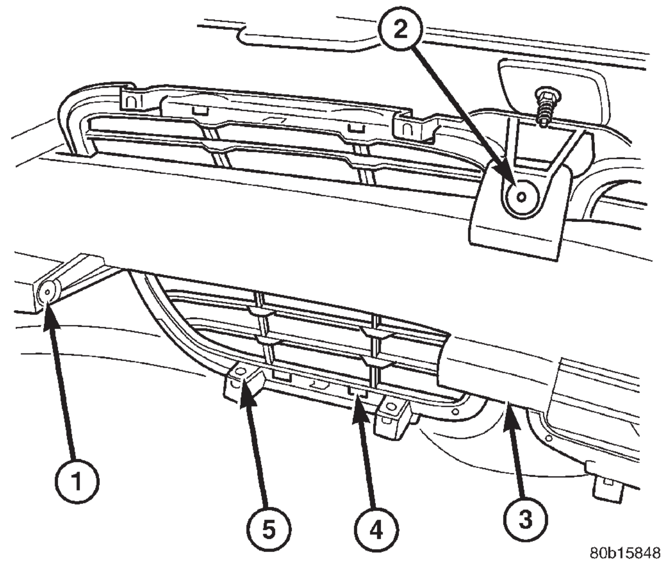

Fig. 9 GRILLE – STRATUS

1 - FASTENER
2 - FASTENER
3 - REINFORCEMENT
4 - GRILLE
5 - FASTENER

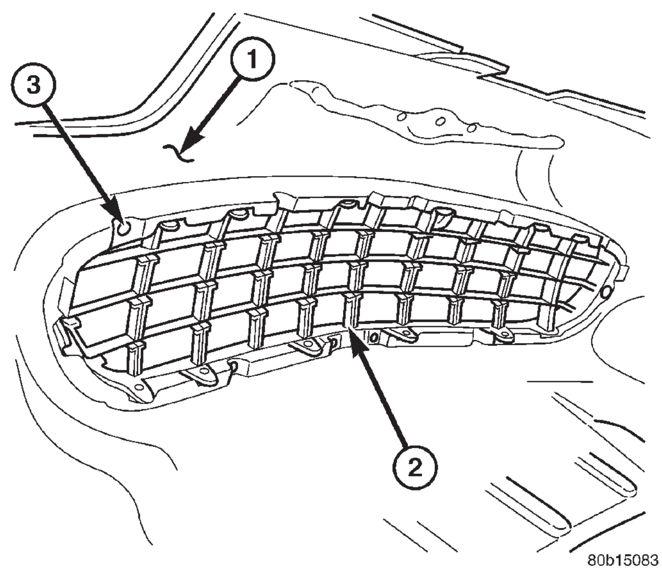

Fig. 10 REAR OF GRILLE

1 - FRONT FASCIA
2 - FRONT GRILLE
3 - FASTENER

(5) Install front bumper fascia, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

GRILLE (Continued)

INSTALLATION - JR-27

(1) Position grille on fascia.
(2) Install clips attaching grille to fascia (Fig. 10).
(3) Install foam impact bar to fascia.
(4) Place fascia into position.
(5) Install front bumper fascia, (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

LEFT FRONT WHEELHOUSE SPLASH SHIELD

REMOVAL

(1) Remove left front wheel. (Refer to 22 - TIRES/WHEELS - REMOVAL)
(2) Remove the fender trim (Fig. 11).
(3) Remove the six push pins fasteners and remove the transmission splash shield (Fig. 12).
(4) Remove the four push pin fasteners and remove the wheelhouse splash shield (Fig. 13).

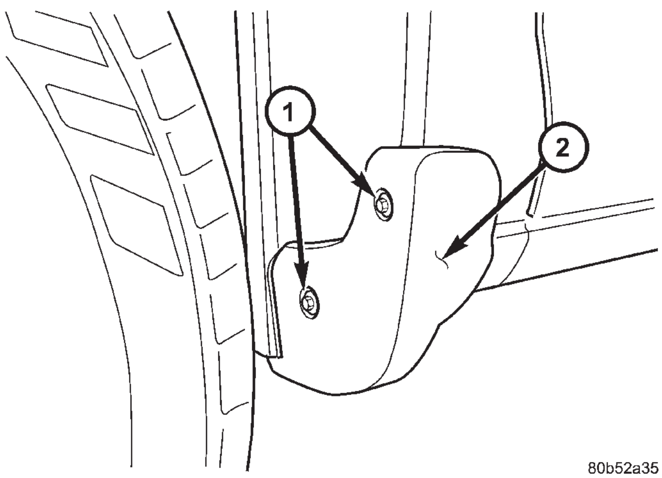

Fig. 11 FENDER TRIM – TYPICAL

1 - SCREWS
2 - FENDER TRIM

INSTALLATION

(1) Install the wheelhouse splash shield and install the 4 push pin fasteners.
(2) Install the transmission splash shield and install the six push pin fasteners.
(3) Install the fender trim and the trim screws.
(4) Install the wheel assembly. (Refer to 22 - TIRES/WHEELS - INSTALLATION)

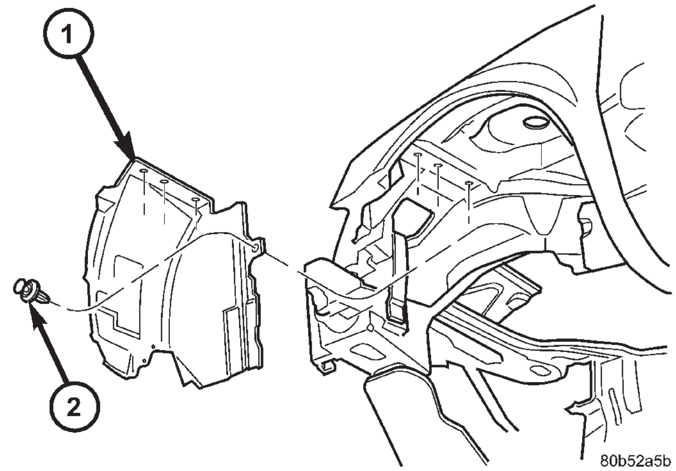

Fig. 12 TRANSMISSION SPLASH SHIELD

1 - SPLASH SHIELD
2 - PUSH PIN FASTENERS

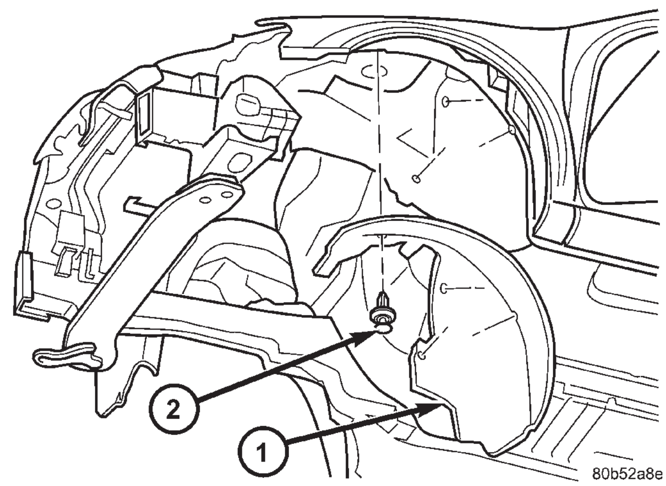

Fig. 13 WHEELHOUSE SPLASH SHIELD

1 - WHEELHOUSE SPLASH SHIELD
2 - PUSH PIN FASTENERS

RADIATOR SUPPORT CROSSMEMBER

REMOVAL

(1) Release hood latch and open hood.

(2) Remove push-in fasteners attaching fascia/ grille to radiator support crossmember.

(3) Remove bolts attaching support braces to bottom of radiator support crossmember.

(4) Remove bolts attaching crossmember to radiator closure panel.

(5) Remove nuts attaching hood latch to radiator support crossmember.

(6) Remove radiator support crossmember from vehicle.

INSTALLATION

(1) Install radiator support crossmember to vehicle.

(2) Install nuts attaching hood latch to radiator support crossmember.

(3) Install bolts attaching crossmember to radiator closure panel.

(4) Install bolts attaching support braces to bottom of radiator support crossmember.

(5) Install push-in fasteners attaching fascia/grille to radiator support crossmember.

(6) Close hood.

REAR WHEELHOUSE SPLASH SHIELD

REMOVAL

(1) Remove the wheel. (Refer to 22 - TIRES/ WHEELS - REMOVAL)

(2) Remove the six push pin fasteners and remove the wheelhouse splash shield (Fig. 14).

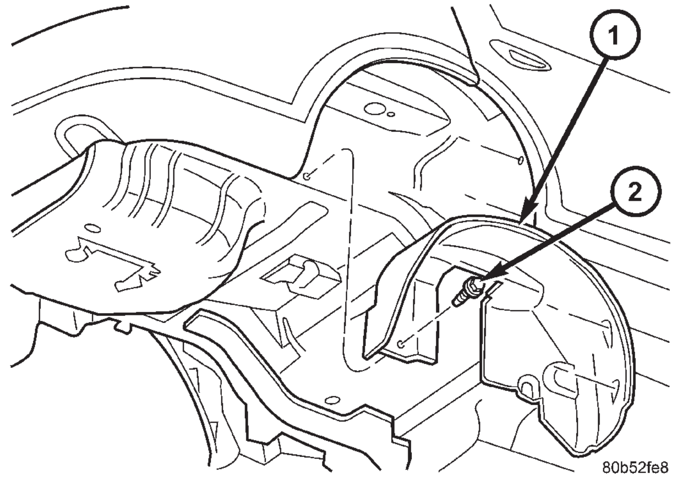

Fig. 14 WHEELHOUSE SPLASH SHIELD

1 - SPLASH SHIELD
2 - PUSH PIN FASTENERS

INSTALLATION

(1) Position the splash shield and install the six push pin fasteners.

(2) Install the wheel. (Refer to 22 - TIRES/ WHEELS - INSTALLATION)

RIGHT FRONT WHEELHOUSE SPLASH SHIELD

REMOVAL

(1) Remove the screws and remove the fender trim (Fig. 11).

(2) Remove right front wheel. (Refer to 22 - TIRES/WHEELS - REMOVAL)

(3) Remove the four push pin fasteners and remove the splash shield. (Fig. 15).

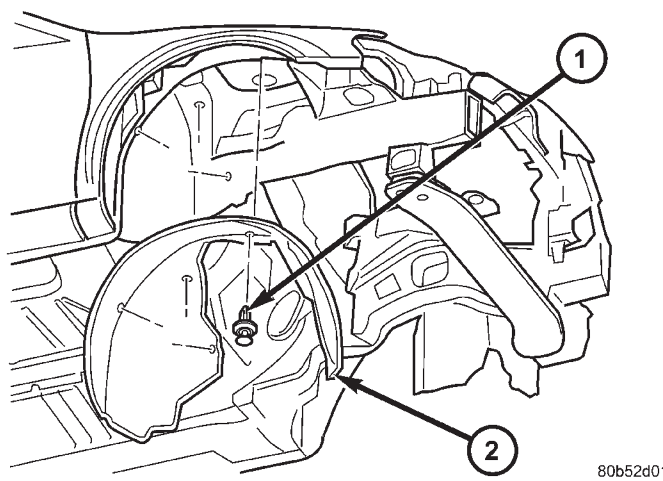

Fig. 15 SPLASH SHIELD

1 - PUSH PIN FASTENERS
2 - SPLASH SHIELD

INSTALLATION

(1) Install the wheelhouse splash shield and install the four push pin fasteners.

(2) Install the wheel assembly. (Refer to 22 - TIRES/WHEELS - INSTALLATION)

SIDE VIEW MIRROR

REMOVAL

(1) Remove side view mirror cover (Fig. 16).

(2) Remove the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

(3) Disconnect power window mirror motor wire connector, if so equipped.

(4) Disengage wire harness grommet from mirror flag, if so equipped.

(5) Remove nuts attaching side view mirror to mirror flag (Fig. 17).

(6) Remove side view mirror from vehicle.

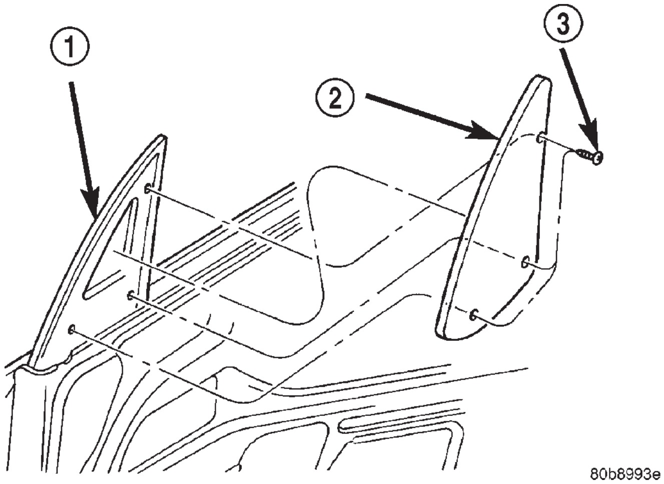

Fig. 16 Side View Mirror Cover

1 - MIRROR FLAG
2 - SIDE VIEW MIRROR COVER
3 - FASTENERS

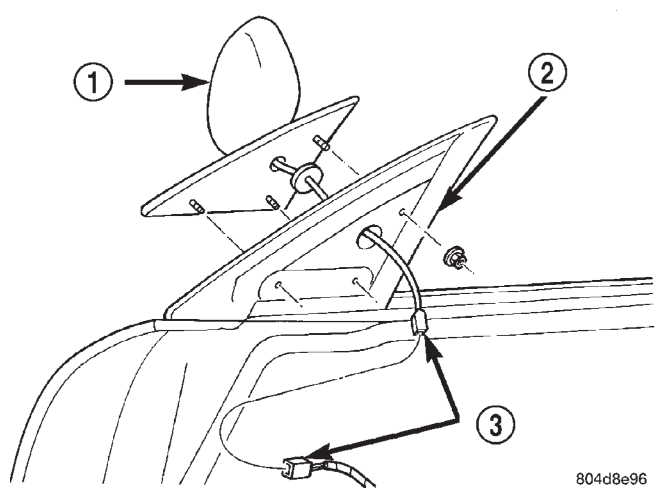

Fig. 17 Side View Mirror

1 - SIDE VIEW MIRROR
2 - MIRROR FLAG/GLASS CHANNEL
3 - WIRE CONNECTOR

INSTALLATION

(1) Feed power mirror wire harness through hole in mirror flag and seat grommet. Do not pull on wire harness to seat grommet.

(2) Position side view mirror to vehicle.

(3) Install nuts attaching side view mirror to mirror flag.

(4) Engage push in fastener attaching power mirror wire connector to inner door panel, if so equipped.

(5) Engage power mirror motor wire connector.

(6) Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

(7) Install side view mirror cover.

SIDE VIEW MIRROR GLASS

REMOVAL

WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.

(1) Carefully pull/pry the broken glass holder from the mirror assembly.

(2) Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

INSTALLATION

CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

(1) Position the new mirror glass holder to the mirror assembly.

NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

(2) Align the mirror glass holder's attaching fingers to the mirror motor housing.

NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

(3) Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

SIDE VIEW MIRROR GLASS (Continued)

NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

(4) Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

SPOILER

REMOVAL

(1) Remove the decklid cover. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/COVER - REMOVAL)

(2) Remove the four nuts and remove the spoiler (Fig. 18).

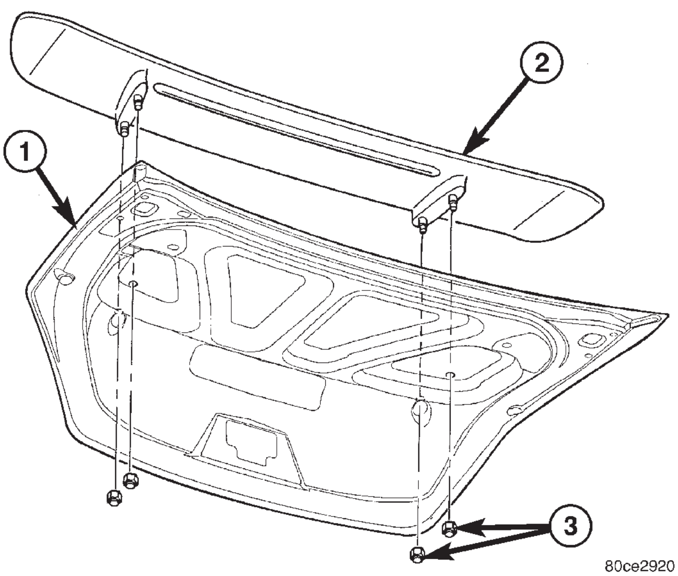

Fig. 18 SPOILER

1 - DECKLID
2 - SPOILER
3 - NUTS

INSTALLATION

(1) Install the spoiler and nuts (Fig. 18).

(2) Tighten nuts to 3 N·m (30 in. lbs.).

(3) Install the decklid cover. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/COVER - INSTALLATION)

TAPE STRIPE

REMOVAL - ADHESIVES

(1) Mark reference points before removing.

(2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.

(3) Using the trim stick C 4755 or equivalent, lift up and peel away badging /tape from panel, using a heat gun as you go.

(4) Clean off all traces of adhesive from the panel(s) with a general purpose adhesive remover.

INSTALLATION - ADHESIVES

(1) Clean panel surface with isopropyl alcohol.

(2) Remove paper carrier and align badging/tape to reference points or adjacent panel.

(3) Install and press securely, using a plastic spreader to eliminate all air bubbles.

(4) Remove top protective carrier.

(5) Clean away any reference points.

HOOD

TABLE OF CONTENTS

ADJUSTER BUMPER

REMOVAL

(1) Release hood latch and open hood.

(2) Rotate hood adjuster bumper counterclockwise.

(3) Remove hood adjuster bumper from headlamp reinforcement (Fig. 1).

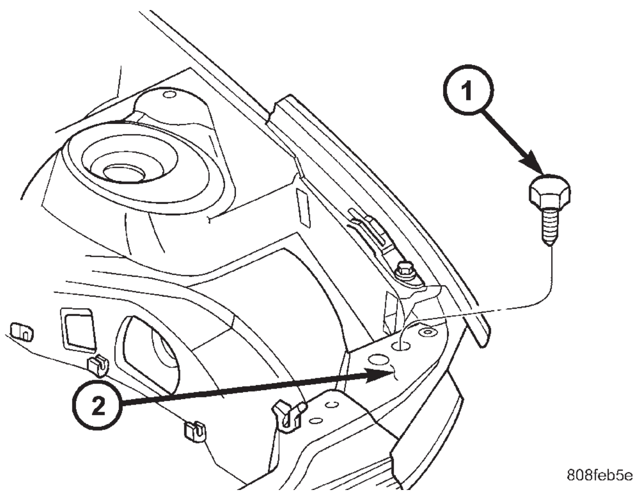

Fig. 1 HOOD ADJUSTER BUMPER

1 - HOOD ADJUSTER BUMPER
2 - HEADLAMP REINFORCEMENT

INSTALLATION

(1) Ensure that hood overslam bumpers proper position (Fig. 2).

(2) Start hood adjuster bumper into headlamp reinforcement (Fig. 1).

(3) Rotate hood adjuster bumper clockwise. Adjust hood adjuster bumper to achieve a hood height that is flush across the top surfaces along fenders.

(4) Close hood.

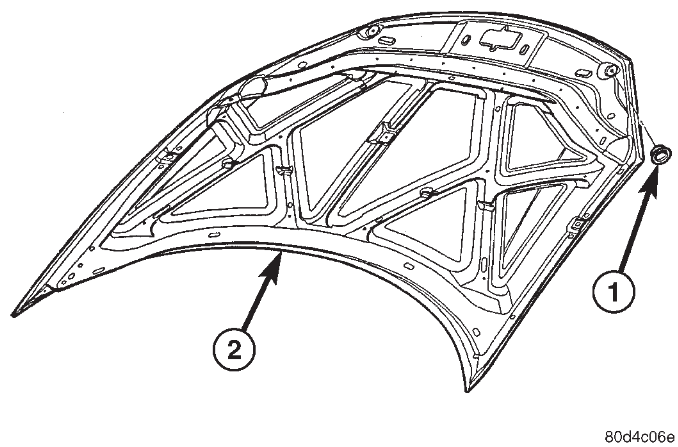

Fig. 2 HOOD OVERSLAM BUMPER

1 - OVERSLAM BUMPER
2 - HOOD

HINGE

REMOVAL

(1) Support hood on the side that requires hinge replacement.

(2) Mark hinge attachment locations with a grease pencil or other suitable device to aid installation.

(3) Remove cowl cover(Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(4) Remove bolts attaching hood to hinge.

(5) Remove bolts attaching hood hinge to load beam inner and remove hinge from vehicle.

INSTALLATION

(1) If necessary, paint new hinge before installation.

(2) Place hinge in position on vehicle.

(3) Install bolts to attach hood hinge to load beam inner.

HINGE (Continued)

(4) Install bolts to attach hood to hinge.
(5) Align all marks and secure bolts.
(6) Tighten bolts to 28 N·m (20 ft. lbs.) torque.
(7) The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders. Shims can be added or removed under hood hinge to achieve proper hood height.
(8) Install cowl cover(Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).
(9) Verify hood latch operation. Adjust as necessary.

HOOD

REMOVAL

(1) Open hood.
(2) Mark outline of hinges on inside of hood to aid installation.
(3) Remove the top bolts attaching hood to hinge and loosen the bottom bolts until they can be removed by hand.
(4) With assistance from a helper at the opposite side of the vehicle to support the hood, remove bottom bolts attaching hood to hinge.
(5) Remove the hood from the vehicle.

INSTALLATION

(1) With assistance from a helper, place hood in position on vehicle.
(2) Install bottom bolts to attach hood to hinge finger tight.
(3) Install top bolts to attach hood to hinge finger tight.
(4) Position bolts at outline marks and tighten bolts. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders.
(5) Connect under hood lamp wire connector to engine compartment wire harness, if equipped.
(6) Verify hood latch operation and alignment. Adjust as necessary.

LATCH

REMOVAL

(1) Release hood latch and open hood.
(2) Support hood on prop rod.
(3) Mark outline of hood latch on radiator support crossmember with a grease pencil or other suitable device to aid installation.
(4) Remove nuts attaching hood latch to upper radiator support crossmember (Fig. 3).
(5) Remove hood latch from vehicle.
(6) Disengage remote release cable from hood latch (Fig. 4).

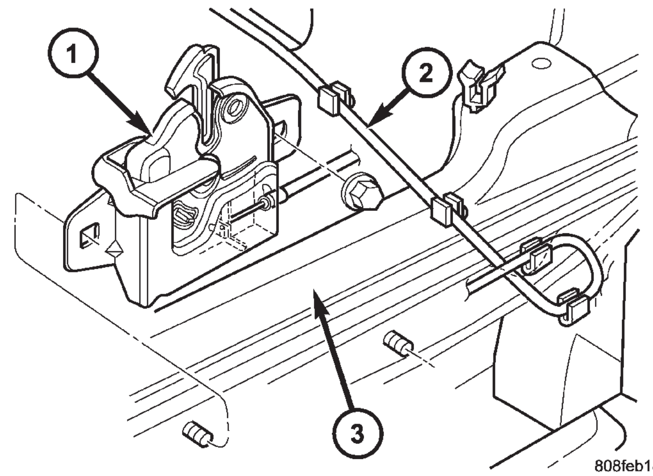

Fig. 3 HOOD LATCH

1 - HOOD LATCH
2 - HOOD RELEASE CABLE
3 - RADIATOR SUPPORT CROSSMEMBER

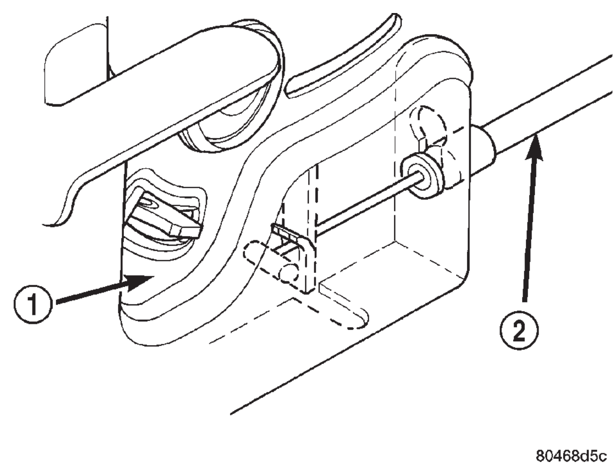

Fig. 4 HOOD LATCH RELEASE CABLE

1 - HOOD LATCH
2 - HOOD RELEASE CABLE

INSTALLATION

(1) Engage remote release cable into hood latch (Fig. 4).
(2) Position hood latch on vehicle.
(3) Install nuts attaching hood latch onto upper radiator support crossmember.
(4) Tighten nut to 28 N·m (20 ft. lbs.) torque.
(5) Verify operation. Adjust as necessary.

LATCH RELEASE CABLE

REMOVAL

(1) Remove hood latch(Refer to 23 - BODY/HOOD/LATCH - REMOVAL).
(2) Remove left front cowl trim panel.

LATCH RELEASE CABLE (Continued)

(3) Remove screws attaching hood release handle to inner cowl panel (Fig. 5).

(4) Release clips attaching hood release cable to left inner frame rail (Fig. 6).

(5) Disengage rubber grommet at lower dash panel.

(6) Disengage push-in fastener attaching hood release cable to dash panel.

(7) Remove hood release cable from vehicle.

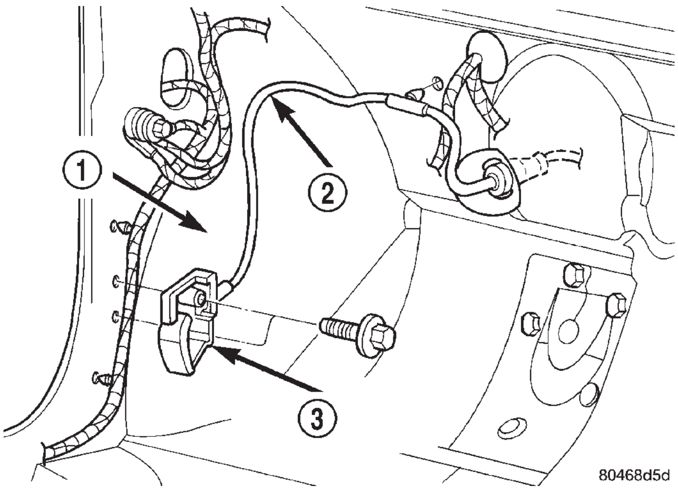

Fig. 5 Hood Release Cable Handle

1 - COWL PANEL
2 - HOOD RELEASE CABLE
3 - HOOD RELEASE HANDLE

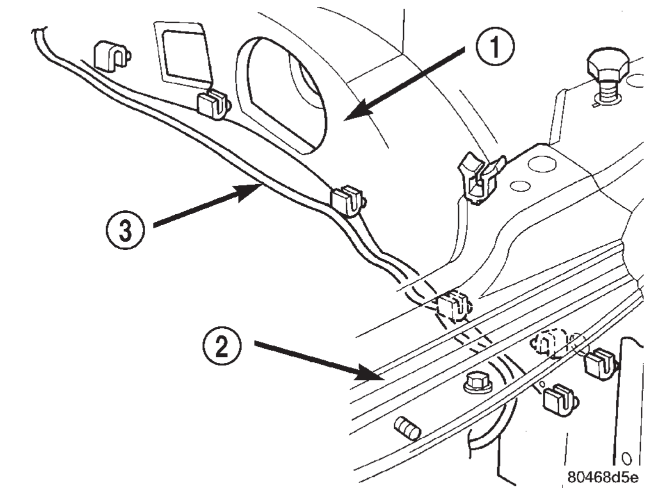

Fig. 6 Hood Release Cable Routing

1 - FRAME RAIL
2 - UPPER RADIATOR SUPPORT CROSSMEMBER
3 - HOOD RELEASE CABLE

INSTALLATION

(1) Route hood release cable through hole in lower dash panel and along inner frame rail.

(2) Engage rubber grommet to lower dash panel.

(3) Engage push-in fastener attaching hood release cable to lower dash panel.

(4) Install screws attaching hood release cable handle to inner cowl panel.

(5) Tighten screws to 1.8 N·m (16 in. lbs.) torque.

(6) Install left front cowl trim panel.

(7) Engage hood release cable into clips along inner frame rail (Fig. 6).

(8) Install hood latch(Refer to 23 - BODY/HOOD/LATCH - INSTALLATION).

PROP ROD

REMOVAL

(1) Release hood latch and open hood.

CAUTION: Do not place prop-rod or substitute against outer hood panel, damage to exterior finish will result.

(2) Prop hood open using a length of wooden dowel rod, ex (Broomstick).

(3) Disengage prop-rod from retainer attaching prop-rod to radiator closure panel (Fig. 7).

(4) Remove prop-rod from vehicle.

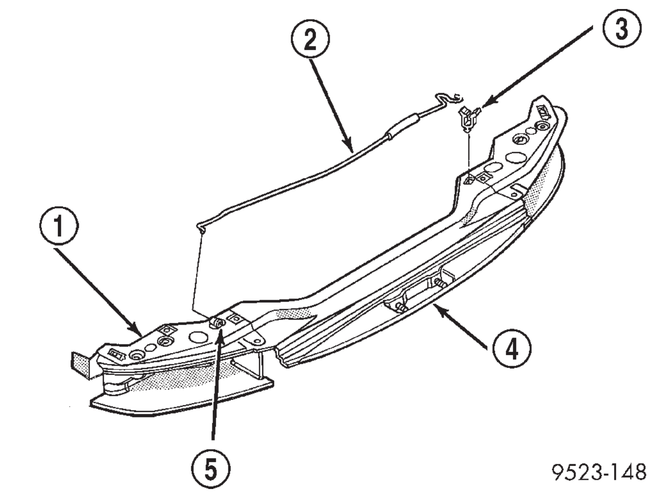

Fig. 7 Hood Prop Rod

1 - RADIATOR CLOSURE PANEL
2 - HOOD PROP-ROD
3 - CLIP
4 - RADIATOR SUPPORT CROSSMEMBER
5 - RETAINER

INSTALLATION

CAUTION: Do not place prop-rod or substitute against outer hood panel, damage to exterior finish will result.

(1) Place prop-rod into position.

(2) Engage prop-rod from retainer attaching prop-rod to radiator closure panel.

(3) Remove temporary hood prop rod.

(4) Close hood.

INSTRUMENT PANEL

TABLE OF CONTENTS

CD CHANGER TRIM BEZEL

REMOVAL

(1) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the CD changer trim bezel and remove from the vehicle (Fig. 1).

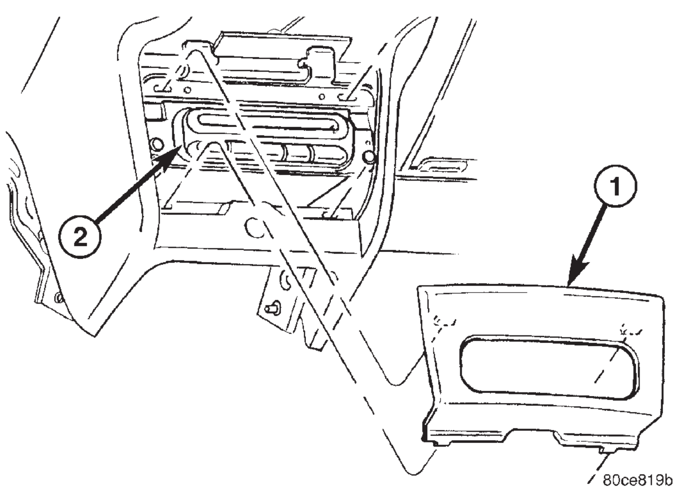

Fig. 1 CD CHANGER TRIM BEZEL

1 - CD CHANGER TRIM BEZEL
2 - CD CHANGER

INSTALLATION

(1) Position CD changer trim bezel over the retaining slots and firmly snap into place (Fig. 1).

GLOVE BOX

REMOVAL

(1) Open glove box.
(2) Push in on sides of glove box bin and lower door.
(3) Pivot glove box downward and disengage hinge hooks from instrument panel.
(4) Remove glove box.

INSTALLATION

(1) Place glove box in position.
(2) Engage hinge hooks into instrument panel and pivot glove box upward.
(3) Push in sides of glove box bin and snap glove box assembly into instrument panel.
(4) Close glove box door.

GLOVE BOX LATCH

REMOVAL

(1) Open glove box.
(2) Push in on sides of glove box bin and lower door.
(3) Pivot glove box downward and disengage hinge hooks from instrument panel.
(4) Remove glove box.
(5) Remove the assembly screws.
(6) Disassemble the glove box.
(7) Separate the latch from the glove box assembly.

INSTALLATION

(1) Install the latch onto the glove box assembly.
(2) Assemble the glove box.
(3) Install the assembly screws.
(4) Engage hinge hooks into instrument panel and pivot glove box upward.
(5) Push in sides of glove box bin and snap glove box assembly into instrument panel.
(6) Close glove box door.

INSTRUMENT PANEL ASSEMBLY

REMOVAL

The Instrument Panel and HVAC assemblies are removed together as one assembly. If service is required to the individual unit, separation might be required.

(1) Recover the A/C refrigerant(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).
(2) Partially drain the coolant(Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
(3) Remove one bolt retaining the A/C lines to the right strut tower.
(4) Remove the two top HVAC housing retaining nuts in engine compartment (Fig. 2).
(5) Hoist vehicle and remove the lower HVAC housing retaining nut.
(6) Lower vehicle from hoist.
(7) Remove the driver and passenger seats(Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
(8) Disconnect and isolate the battery negative remote cable.
(9) Remove one screw to shift knob and transmission range indicator bezel from floor console.
(10) Remove floor center console. Remove two mounting screws in the front and two mounting screws inside console storage bin (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

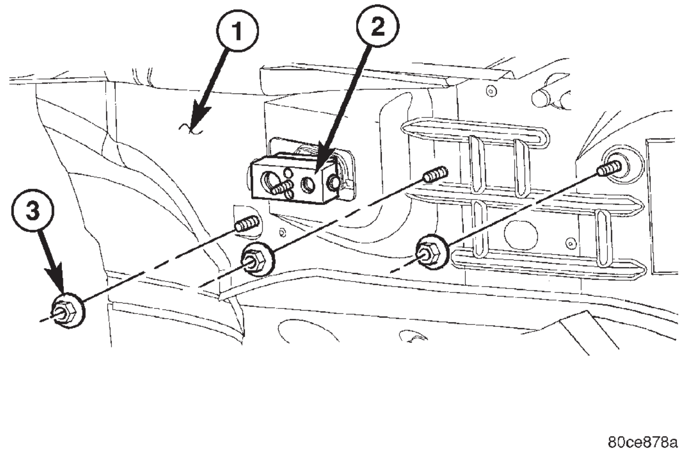

Fig. 2 HVAC HOUSING RETAINING NUTS

1 - BULKHEAD
2 - EXPANSION VALVE
3 - NUT

(11) Remove the amplifier(Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - REMOVAL).
(12) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the left and right rear floor heat ducts and remove (Fig. 3).

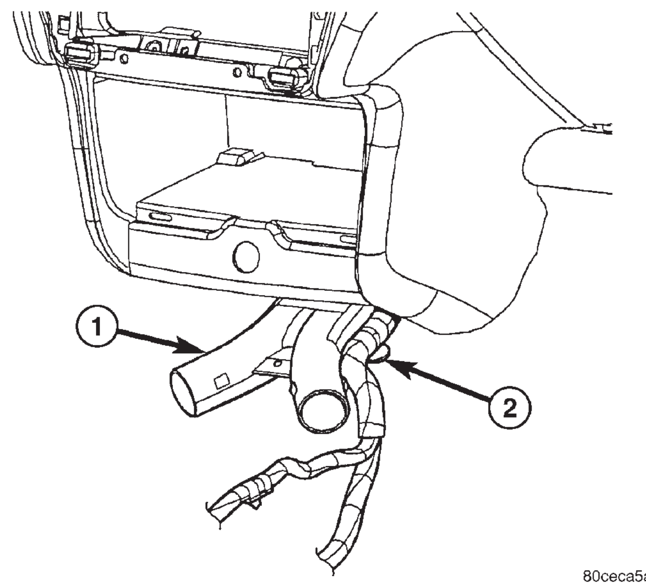

Fig. 3 REAR HEAT DUCT

1 - REAR HEAT DUCT
2 - LOCATING CLIP

(13) Disconnect the console wiring connectors and unclip the push in fasteners.
(14) Using a trim stick or equivalent, gently pry up on and remove the right sill plate.

INSTRUMENT PANEL ASSEMBLY (Continued)

(15) Remove the two screws to the right cowl kick panel and remove from vehicle (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL).

(16) Using a trim stick or equivalent, gently pry out on the right end cover and remove from vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

(17) Using a trim stick or equivalent, gently pry out on the right A-pillar trim and remove from vehicle (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

(18) Open the glove box. Pinch in on the sides and drop to the floor. Pull down to disengage hinges.

(19) Disconnect the right door harness connectors located within the A-pillar.

(20) Remove the four right A-pillar instrument panel retainers.

(21) Remove the right silencer.

(22) Remove the one right side, center instrument panel support bolt.

(23) Using a trim stick or equivalent, gently pry up on and remove the left sill plate(Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(24) Remove the two screws to the left cowl kick panel and remove from vehicle.

(25) Using a trim stick or equivalent, gently pry out on the left end cover and remove from vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

(26) Using a trim stick or equivalent, gently pry out on the left A-pillar trim and remove from vehicle (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

(27) Disconnect the left door harness connectors located within the A-pillar.

(28) Remove the four left A-pillar instrument panel retainers.

(29) Remove five screws and one wire connector to left lower instrument panel trim bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TRIM - REMOVAL).

(30) Remove the left silencer.

(31) Remove the one left side, center instrument panel support bolt.

(32) Remove one bolt to the left side support strut to bulkhead.

(33) Disconnect the junction block wiring connectors.

(34) Remove two screws to the steering column shrouds and remove.

(35) Disconnect all the column wiring and unclip the harness from the steering column.

(36) Disconnect the transmission shift interlock and wire connector.

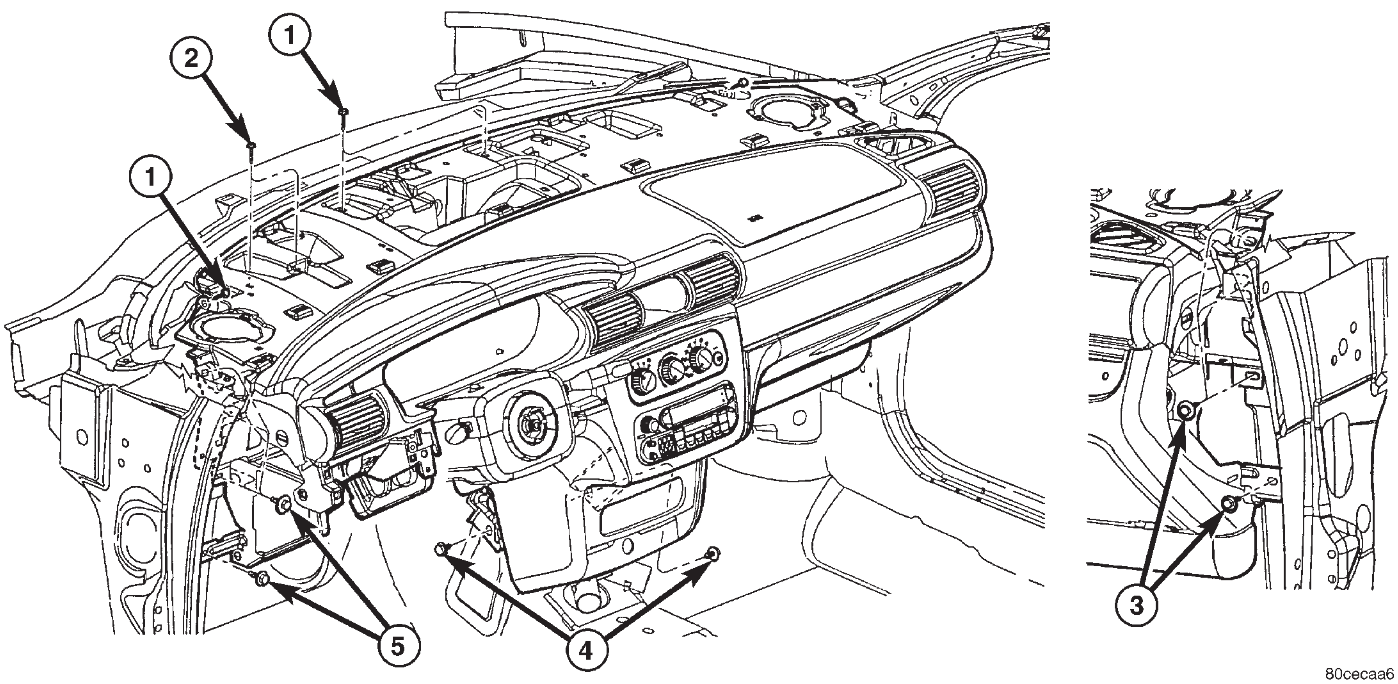

Fig. 4 INSTRUMENT PANEL REMOVAL

1 - INSTRUMENT PANEL TO PLENUM SCREW
2 - INSTRUMENT PANEL STEERING COLUMN TO COWL PLENUM SCREW
3 - RIGHT COWL SIDE BOLTS
4 - INSTRUMENT PANEL CENTER BRACE TO FLOOR
5 - LEFT COWL SIDE BOLTS

INSTRUMENT PANEL ASSEMBLY (Continued)

(37) Remove the four steering column retaining bolts and drop column to floor.

(38) Using a trim stick or equivalent, pry up on the rear of the top cover and pull rearward as you lift off of instrument panel(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL).

(39) Remove instrument panel pad.

(40) Remove seven bolts and five screws attaching instrument panel to fence line and cowl side.

(41) With the help of an assistant, lift up instrument panel and move rearward to remove. Tilt the panel rearward to prevent the coolant from leaking out.

If replacing the instrument panel, transfer all non damaged parts and wiring harness to the new instrument panel assembly.

TO SEPARATE THE INSTRUMENT PANEL AND HVAC UNIT HOUSINGS

- Disconnect the HVAC wiring connector to the instrument panel wire harness.
- Remove the two bolts and two nuts holding the HVAC housing to the instrument panel.
- Lift the instrument panel off the HVAC housing to separate.

INSTALLATION

The Instrument Panel and HVAC assemblies are installed together as one assembly. They must be reconnected before installation.

TO CONNECT THE INSTRUMENT PANEL AND HVAC UNIT HOUSINGS

- Place the instrument panel on the HVAC housing.
- Install the two bolts and two nuts holding the HVAC housing to the instrument panel.
- Connect the HVAC wiring connector to the instrument panel wire harness.

If replacing the instrument panel, transfer all non damaged parts and wiring harness to the new instrument panel assembly.

(1) With the help of an assistant, place the instrument panel in the vehicle, carefully guiding the HVAC housing studs through the bulkhead and into position.

(2) Install the seven bolts and five screws attaching instrument panel to fence line and cowl side (Fig. 4).

(3) Place instrument panel pad into position.

(4) Install the instrument panel top cover(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - INSTALLATION).

(5) Install the four steering column retaining bolts.

(6) Connect the transmission shift interlock and wire connector.

(7) Connect all the column wiring and clip the harness to the steering column.

(8) Install two screws to the steering column shrouds.

(9) Connect the junction block wiring connectors.

(10) Install one bolt to the left side support strut to bulkhead.

(11) Install five screws and one wire connector to left lower instrument panel trim bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TRIM - INSTALLATION).

(12) Install the one left side, center instrument panel support bolt.

(13) Install the left silencer.

(14) Install the four left A-pillar instrument panel retainers.

(15) Connect the right door harness connectors located within the A-pillar.

(16) Install the right A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(17) Install the left end cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(18) Install the two screws to the left cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).

(19) Install the left door sill plate (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(20) Install the one right side, center instrument panel support bolt.

(21) Install the right silencer.

(22) Install the four right A-pillar instrument panel retainers.

(23) Connect the right door harness connectors located within the A-pillar.

(24) Install the glove box.

(25) Install the right A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(26) Install the right end cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(27) Install the two screws to the right cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).

(28) Install the right door sill plate (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(29) Connect the console wiring connectors and clip the push in fasteners in.

(30) Install the left and right rear floor heat ducts (Fig. 3).

INSTRUMENT PANEL ASSEMBLY (Continued)

(31) Connect the two harness connectors to the amplifier.

(32) Install the amplifier (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - INSTALLATION).

(33) Install floor center console. Install two mounting screws in the front and two mounting screws inside console storage bin (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(34) Install the transmission range indicator bezel and one screw to shift knob.

(35) Connect the battery negative remote cable.

(36) Install the driver and passenger seats (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(37) Hoist vehicle and install the lower HVAC housing retaining nut.

(38) Lower vehicle from hoist.

(39) Install the two top HVAC housing retaining nuts in engine compartment (Fig. 2).

(40) Install one bolt retaining the A/C lines to the right strut tower.

(41) Top off the coolant (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

(42) Recharge the A/C refrigerant with specified amount. Refer to placard in engine compartment (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

INSTRUMENT PANEL CENTER BEZEL

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the edge of the instrument panel center bezel and pull outward (Fig. 5).

(3) Disconnect the wire connector to the HVAC control.

(4) Remove the instrument panel center bezel from the vehicle.

INSTALLATION

The HVAC control is mounted to the instrument panel center bezel. If replacing the center bezel or the HVAC control, it must be removed from the center bezel. Remove the six retaining screws to the HVAC control.

(1) Connect the wire connectors to the HVAC control.

(2) Position the center bezel over the retaining slots and firmly snap the instrument panel center bezel into place (Fig. 5).

(3) Connect the battery negative remote cable.

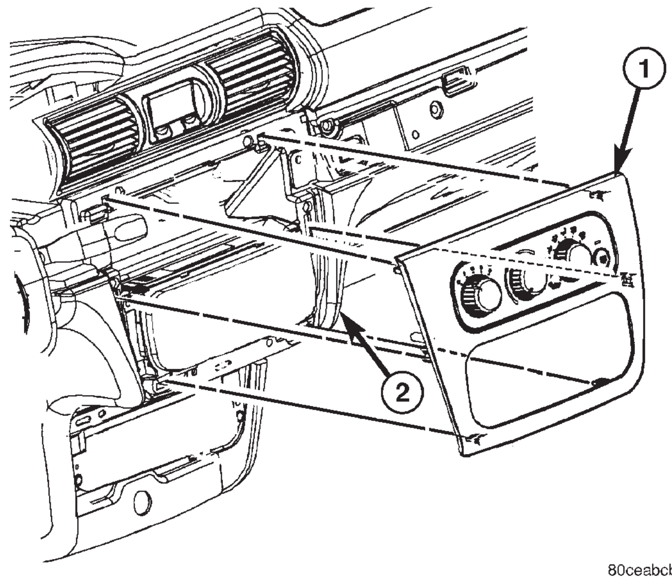

Fig. 5 INSTRUMENT PANEL CENTER BEZEL

1 - CENTER BEZEL
2 - INSTRUMENT PANEL

INSTRUMENT PANEL CLUSTER BEZEL

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Remove left end cover.

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry up on the power mirror switch. Disconnect the switch and remove.

(4) Using a trim stick or equivalent, gently pry up on instrument panel center trim bezel.

(5) Disconnect the HVAC control connector.

(6) Remove the one screw from the passenger side trim bezel and remove trim by unsnapping clips.

(7) Remove five screws to left lower instrument panel trim.

(8) Remove the five screws to the cluster bezel (Fig. 6). Using a trim stick or equivalent, gently pry out the cluster bezel.

(9) If the vehicle is equipped with a Compass Mini-Trip Computer (CMTC/Traveler), disconnect the module and then remove the cluster bezel assembly.

INSTALLATION

(1) Position the cluster bezel and if so equipped, connect the traveler connector, then snap the cluster bezel into position (Fig. 6).

(2) Install the five screws to the cluster bezel.

(3) Install the five screws to the left lower instrument panel trim.

INSTRUMENT PANEL CLUSTER BEZEL (Continued)

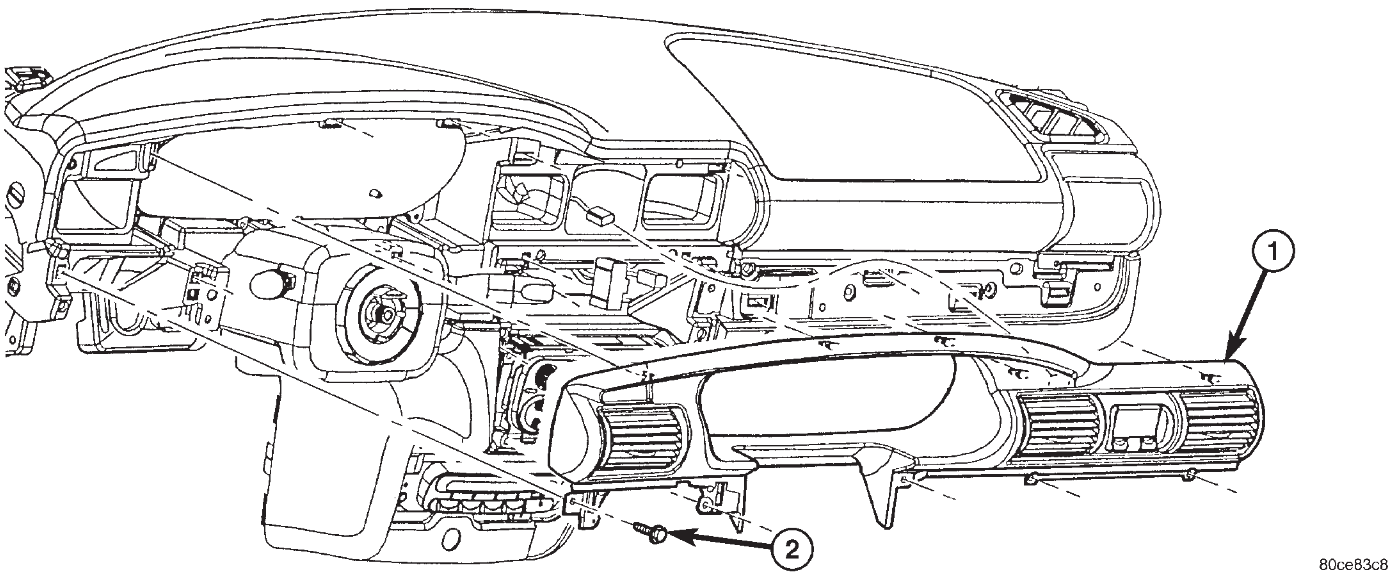

Fig. 6 INSTRUMENT PANEL CLUSTER BEZEL

1 - INSTRUMENT PANEL CLUSTER BEZEL
2 - SCREW

(4) Connect the mirror switch connector and firmly snap it into place.

(5) Install the one screw to the trim bezel to the right side of the steering column.

(6) Firmly snap into place and then install one screw to the passenger side trim bezel.

(7) Connect the HVAC control connectors.

(8) Position the center bezel over the retaining slots and firmly snap instrument panel center bezel into place.

(9) Install the left end cover.

(10) Connect the battery negative cable.

INSTRUMENT PANEL END COVER

REMOVAL

(1) Open front door.

(2) Using a trim stick (special tool #C-4755) or equivalent, disengage clips holding end cover to instrument panel (Fig. 7).

INSTALLATION

(1) Position end cover over retaining slots and firmly snap into place (Fig. 7).

(2) Close front door.

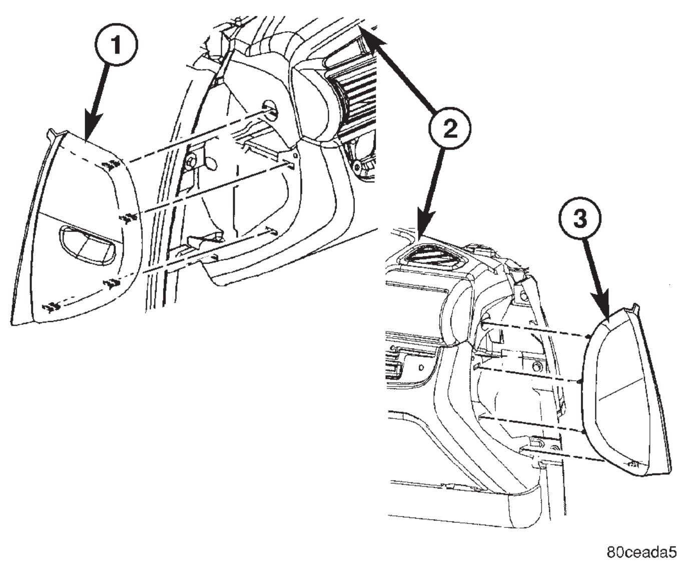

Fig. 7 INSTRUMENT PANEL END COVER

1 - LEFT END COVER
2 - INSTRUMENT PANEL
3 - RIGHT END COVER

INSTRUMENT PANEL INBOARD BEZEL

REMOVAL

(1) Remove instrument panel center bezel. Refer to Body, Instrument Panel, Instrument Panel Center Bezel, Removal.

(2) Remove the one retaining screw located on the left side of the center stack, behind the center bezel (Fig. 8).

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the instrument panel inboard bezel and remove.

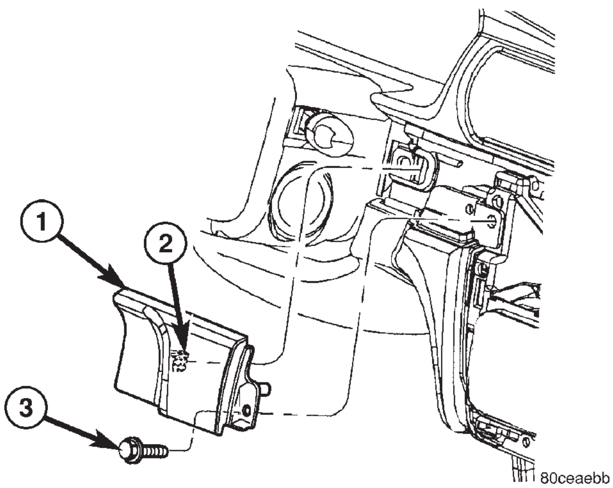

Fig. 8 INSTRUMENT PANEL INBOARD BEZEL

1 - INBOARD BEZEL
2 - CLIP
3 - SCREW

INSTALLATION

(1) Position the instrument panel inboard bezel over the retaining slots and firmly snap into place (Fig. 8).

(2) Install the one retaining screw located on the left side of the center stack, behind the center bezel.

(3) Install the instrument panel center bezel. Refer to Body, Instrument Panel, Instrument Panel Center Bezel, Installation.

INSTRUMENT PANEL OUTBOARD BEZEL

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the instrument panel outboard switch bezel (Fig. 9).

(3) Disconnect the wire connector.

(4) Remove bezel from vehicle.

(5) Push in the sides of the power mirror switch to release it from the bezel.

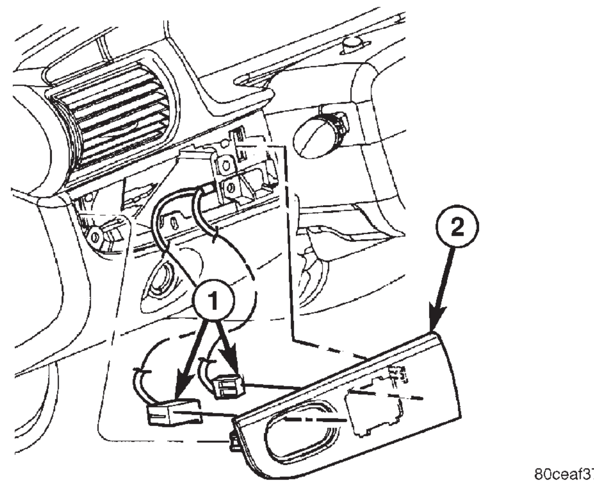

Fig. 9 INSTRUMENT PANEL OUTBOARD SWITCH BEZEL

1 - WIRE CONNECTORS
2 - OUTBOARD SWITCH BEZEL

INSTALLATION

(1) Place the power mirror switch into the outboard switch bezel and firmly snap into place (Fig. 9).

(2) Connect the wire connector.

(3) Position the instrument panel outboard switch bezel over retaining slots and firmly snap into place.

(4) Connect the battery negative remote cable.

INSTRUMENT PANEL TOP COVER

REMOVAL

(1) Remove A-pillar trim. Using a trim stick (special tool #C-4755) or equivalent, gently pry out and remove.

(2) Using a trim stick, disengage clips holding rear edge of top cover to instrument panel (Fig. 10).

NOTE: The Instrument Panel Top Cover may be hard to unsnap from the instrument panel. Be sure not to mar, scuff, or damage the instrument panel pad.

(3) Pull top cover rearward to disengage hooks holding front of top cover to instrument panel.

(4) Remove top cover from vehicle.

INSTRUMENT PANEL TOP COVER (Continued)

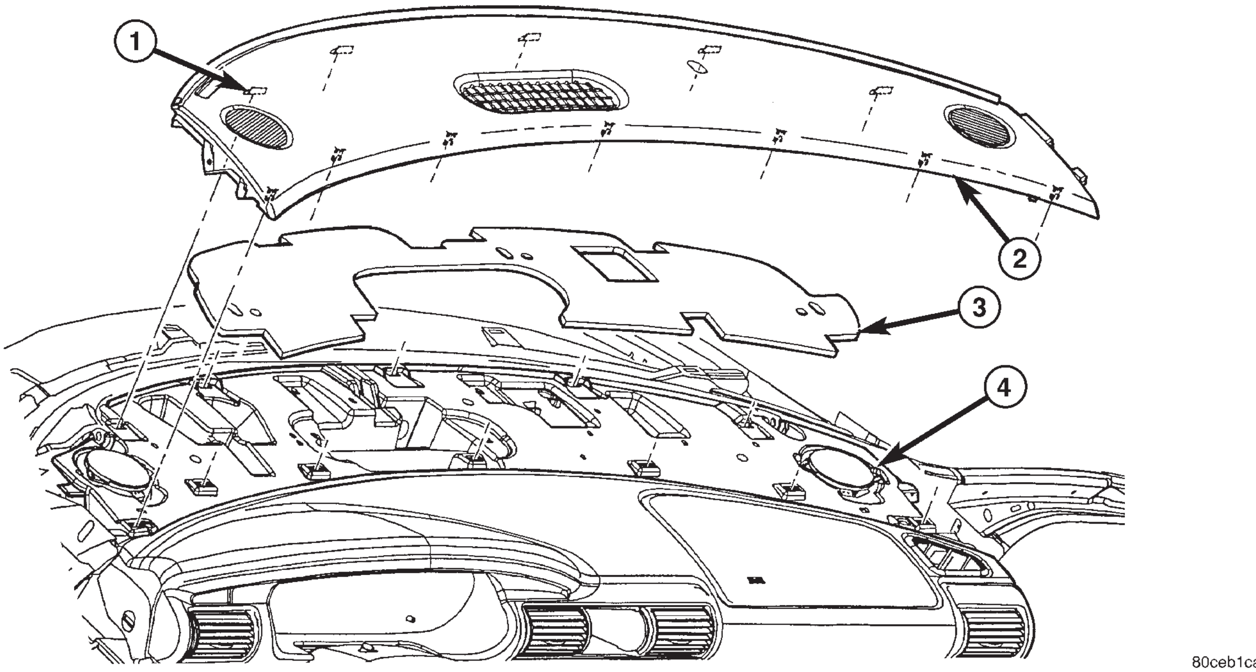

Fig. 10 INSTRUMENT PANEL TOP COVER

1 - CLIPS
2 - INSTRUMENT PANEL TOP COVER
3 - INSTRUMENT PANEL PAD
4 - INSTRUMENT PANEL ASSEMBLY

INSTALLATION

(1) Place instrument panel top cover in position on vehicle (Fig. 10).

(2) Push top cover forward to engage hooks to hold front of top cover to instrument panel.

(3) Engage clips to hold rear edge of top cover to instrument panel.

(4) Pull top cover rearward as you firmly push down and snap into place.

(5) Install A-pillar trim.

LEFT LOWER INSTRUMENT PANEL TRIM

REMOVAL

(1) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the left instrument panel end cover and remove from vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

(2) Using a trim stick or equivalent, gently pry out on the power mirror switch bezel, disconnect the switch connector and remove.

(3) Remove the five screws to the left lower instrument panel trim, Disengage one wiring connector to deck lid release and remove bezel from vehicle.

INSTALLATION

(1) Connect the deck lid release switch connector.

(2) Position the left lower instrument panel trim over the retaining slots and firmly push into place.

(3) Install the five screws to the left lower instrument panel trim.

(4) Connect the power mirror switch connector and position the bezel over the retaining slots and firmly snap into place.

(5) Position the left instrument panel end cover over the retaining slots and firmly snap into place (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

LEFT LOWER INSTRUMENT SILENCER PANEL

REMOVAL

(1) Remove end cap.

(2) Remove power mirror switch bezel.

(3) Disconnect wirer connector from power mirror switch.

(4) Remove five screws to the left lower instrument panel trim and disconnect wire connector.

(5) Remove push in fastener and stamp nut (Fig. 11)

(6) Using rearward motion pull the left lower silencer panel from the instrument panel and remove.

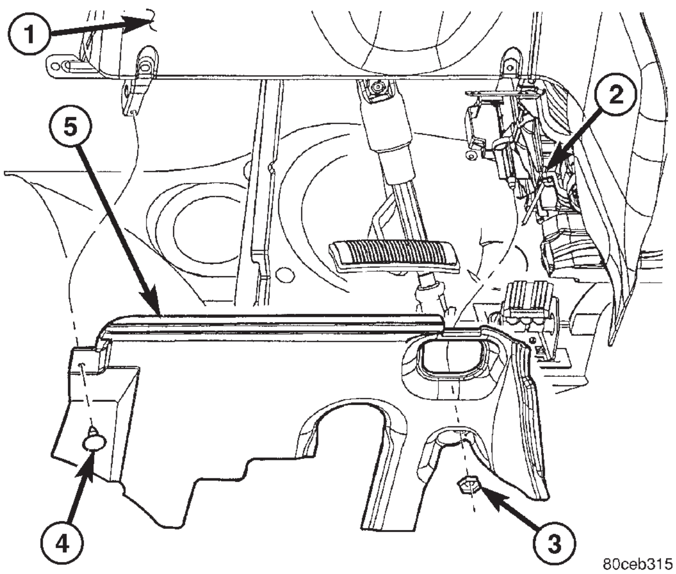

Fig. 11 LEFT LOWER SILENCER PANEL

1 - LEFT LOWER INSTRUMENT PANEL TRIM
2 - HVAC SILENCER ATTACHING STUD
3 - STAMP NUT
4 - PUSH IN FASTENER
5 - LEFT LOWER SILENCER PANEL

INSTALLATION

(1) Position silencer panel over HVAC stud (Fig. 11).

(2) Install stamp nut and install push in fastener.

(3) Connect deck lid release wire connector.

(4) Position the left lower instrument panel trim over the retaining slots and firmly push into place.

(5) Install five screws attaching left lower instrument panel trim.

(6) Connect power mirror switch wire connector.

(7) Install instrument panel bezel.

(8) Install end cap.

RIGHT LOWER SILENCER PANEL

REMOVAL

(1) Remove the attaching stamp nut (Fig. 12).

(2) Using a trim stick gently pry out silencer panel from lower right trim bezel.

(3) Remove panel from the instrument panel.

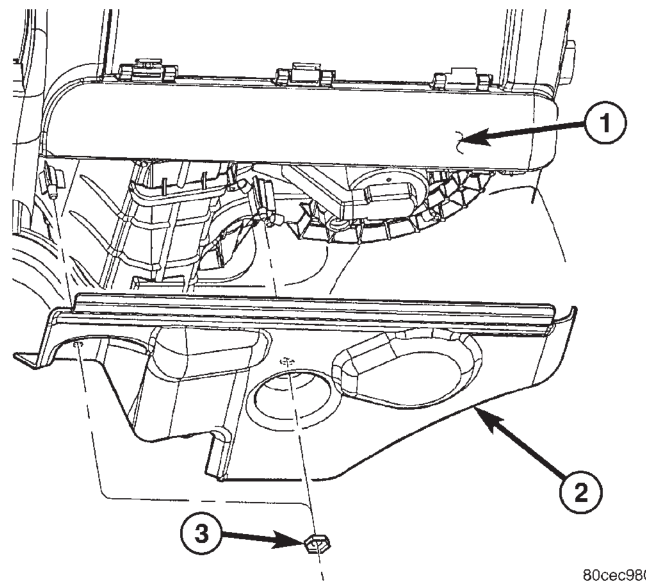

Fig. 12 RIGHT LOWER SILENCER PANEL

1 - RIGHT LOWER TRIM BEZEL
2 -RIGHT LOWER SILENCER PANEL
3 - STAMP NUT

INSTALLATION

(1) Place right lower silencer panel into position (Fig. 12).

(2) Push firmly into place.

(3) Install attaching stamp nut.

RIGHT INSTRUMENT PANEL TRIM BEZEL

REMOVAL

(1) Remove instrument panel center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)

(2) Remove the one retaining screw located on the right side of the center stack, behind the center bezel (Fig. 13).

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry out on the right instrument panel trim bezel and remove.

INSTALLATION

(1) Position the right instrument panel trim bezel over retaining slots and firmly snap into place (Fig. 13).

(2) Install the one retaining screw located on the right side of the center stack, behind the center bezel.

(3) Install the instrument panel center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

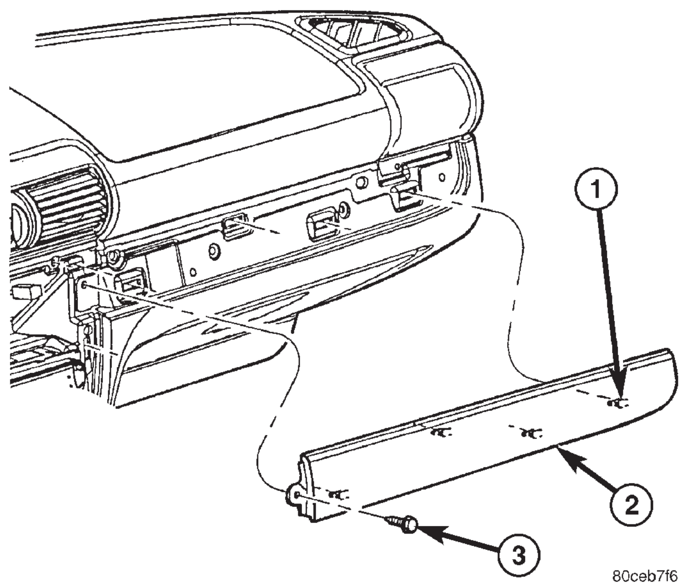

Fig. 13 RIGHT INSTRUMENT PANEL TRIM BEZEL

2 - RIGHT INSTRUMENT PANEL TRIM PANEL
3 - SCREW

INTERIOR

TABLE OF CONTENTS

A-PILLAR TRIM

REMOVAL

REMOVAL

(1) Remove the front door opening weatherstrip along the A-pillar. (Refer to 23 - BODY/WEATHER-STRIP/SEALS/DOOR OPENING WEATHERSTRIP - REMOVAL)

(2) Disengage clips attaching A-pillar trim to A-pillar (Fig. 1).

(3) Remove A-pillar trim from vehicle.

REMOVAL- JR-27 ONLY

(1) Remove header molding panel (Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - REMOVAL).

(2) Disengage clips attaching A-pillar trim panel to A-pillar.

(3) Remove trim panel from vehicle (Fig. 2).

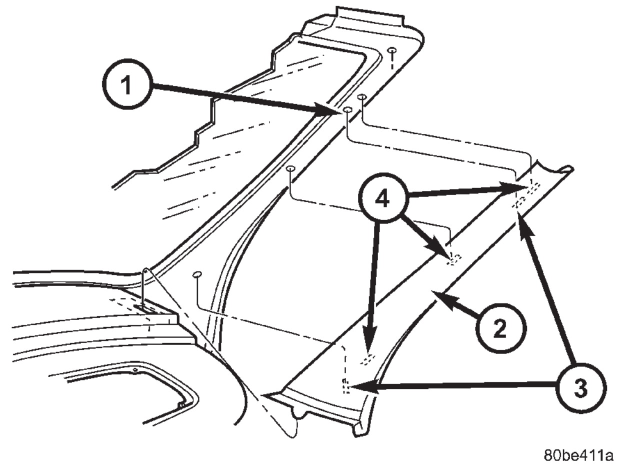

Fig. 2 A-Pillar Trim Panel

1 - A-PILLAR
2 - A-PILLAR TRIM PANEL
3 - LOCATOR(S)
4 - CLIP(S)

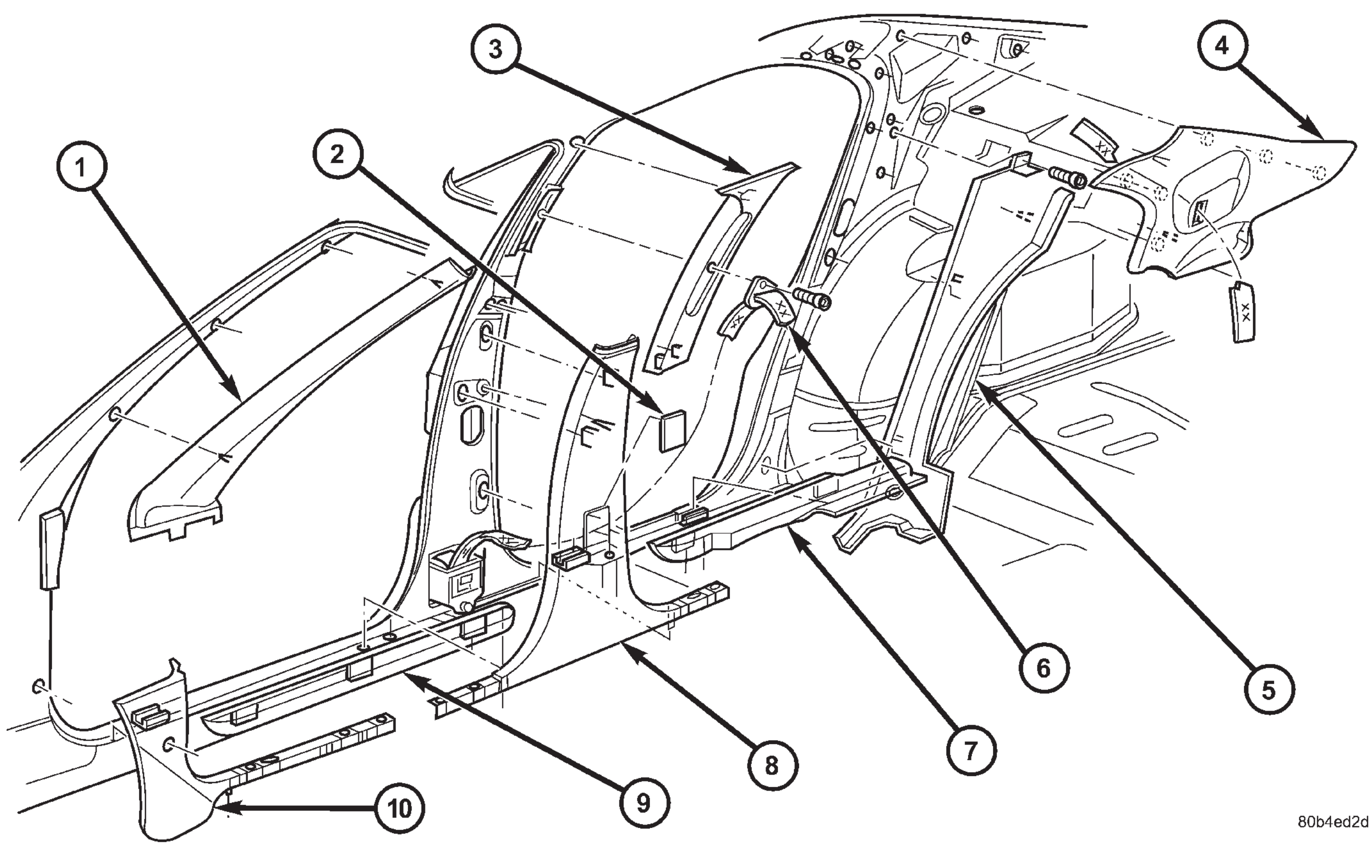

Fig. 1 INTERIOR TRIM PANELS

1 - A-PILLAR TRIM
2 - BEZEL - B-PILLAR LOWER
3 - UPPER B-PILLAR TRIM
4 - UPPER QUARTER TRIM
5 - LOWER QUARTER TRIM
6 - SEAT BELT
7 - SCUFF PLATE
8 - LOWER B-PILLAR TRIM
9 - SCUFF PLATE
10 - COWL TRIM

INSTALLATION

INSTALLATION

(1) Place A-pillar trim into position.

(2) Engage clips attaching A-pillar trim to A-pillar.

(3) Install the door opening weatherstrip to the A-pillar. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR OPENING WEATHERSTRIP - INSTALLATION)

INSTALLATION - JR-27 ONLY

(1) Position trim panel near A-pillar.

(2) Align locating pins on back side of trim panel to holes in A-pillar.

(3) Press clips on A-pillar trim panel into slots in A-pillar.

(4) Install header molding panel(Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - INSTALLATION).

B-PILLAR LOWER TRIM

REMOVAL

(1) Remove upper B-pillar trim. (Refer to 23 - BODY/INTERIOR/UPPER B-PILLAR TRIM - REMOVAL)

(2) Disengage clips attaching seat belt access panel to lower B-pillar trim (Fig. 1).

(3) Remove scuff plates. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL)

(4) Remove the screws attaching the trim to the door sills.

(5) Disengage clips attaching lower B-pillar trim to B-pillar.

(6) Route seat belt webbing through access hole in lower B-pillar trim.

(7) Remove lower B-pillar trim from vehicle.

INSTALLATION

(1) Place lower B-pillar trim into position.

(2) Route seat belt webbing through access hole in lower B-pillar trim.

(3) Engage clips attaching lower B-pillar trim to B-pillar.

(4) Install the screws attaching the trim to the door sills.

(5) Install scuff plates. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION)

(6) Engage clips attaching seat belt access panel to lower B-pillar trim.

(7) Install upper B-pillar trim. (Refer to 23 - BODY/INTERIOR/UPPER B-PILLAR TRIM - INSTALLATION)

CARPETS AND FLOOR MATS

REMOVAL

REMOVAL

(1) Remove door sill scuff plates. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL)

(2) Remove rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)

(3) Remove front seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)

(4) Remove amplifier on passenger side of floor pan, if equipped.

(5) Remove bolts attaching front seat belts to floor.

(6) Remove lower B-pillar trim panels as necessary to clear carpet.

(7) Remove cowl trim panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)

(8) Remove floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(9) Remove forward instrument panel console. (Refer to 23 - BODY/INTERIOR/FORWARD INSTRUMENT PANEL CONSOLE - REMOVAL)

(10) Remove push pin fasteners (Fig. 3).

(11) Pull carpet from behind brake pedal, accelerator pedal, and HVAC.

(12) Fold carpet to center of vehicle.

(13) Remove carpet from vehicle through passenger door opening.

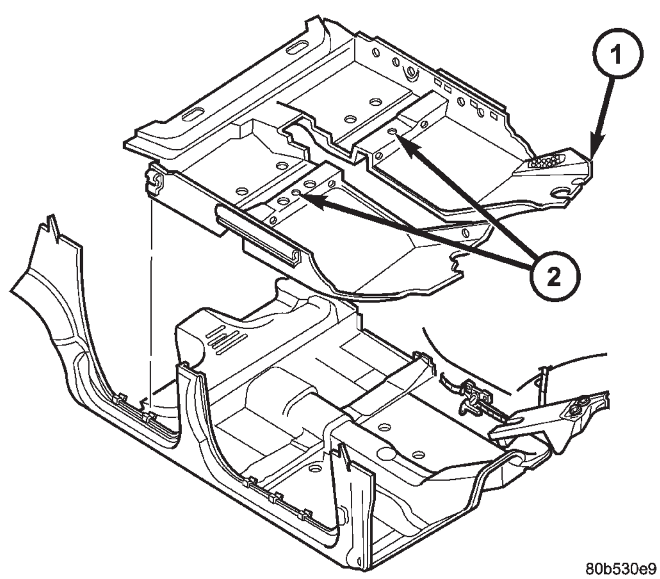

Fig. 3 FLOOR CARPET

1 - FLOOR CARPET
2 - PUSH-PIN FASTENERS

CARPETS AND FLOOR MATS (Continued)

REMOVAL - JR-27 ONLY

(1) Lower convertible top to full down position.
(2) Remove front seats.
(3) Remove rear seat cushion.
(4) Remove floor console and center instrument panel console.
(5) Remove door sill trim panels.
(6) Remove cowl trim panels.
(7) Remove quarter trim panels.
(8) Remove amplifier on passenger side of floor pan, if so equipped.
(9) Remove wiring troughs holding carpet at outboard ends of rear seat crossmember.
(10) Remove accelerator pedal.
(11) Remove instrument panel hush panels.
(12) Remove push-in fasteners from rear of carpet attaching carpet to rear seat crossmember (Fig. 4).
(13) Remove plastic sill retainers from metal clips along door sill panel.
(14) Remove carpet from vehicle.

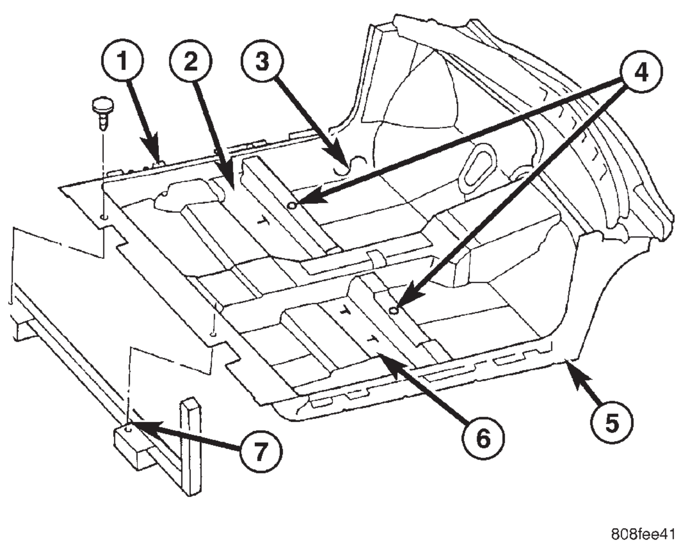

Fig. 4 FLOOR CARPET JR-27

1 - DOOR SILL
2 - SEAT WIRING SLIT
3 - CARPET
4 - PUSH-PIN FASTENERS
5 - DOOR SILL
6 - AMPLIFIER WIRING SLIT
7 - REAR SEAT CROSSMEMBER

INSTALLATION

INSTALLATION

(1) Install carpet into vehicle through passenger door opening.
(2) Unfold carpet into position.
(3) Install carpet behind brake pedal, accelerator pedal, and HVAC.
(4) Install the tunnel push pin fastener.
(5) Install the front seat and crossmember push pin fasteners.
(6) Install the two push pin fasteners into the floor pan.
(7) Install forward instrument panel console. (Refer to 23 - BODY/INTERIOR/FORWARD INSTRUMENT PANEL CONSOLE - INSTALLATION)
(8) Install floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)
(9) Install cowl trim panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)
(10) Install lower B-pillar trim panels as necessary. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)
(11) Install bolts attaching front seat belts to floor.
(12) Install amplifier on passenger side of floor pan, if equipped.
(13) Install front seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
(14) Install rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)
(15) Install the eight push pin fasteners into the door opening sills.
(16) Install door opening sill plates.

INSTALLATION - JR-27 ONLY

(1) Position carpet in vehicle (Fig. 4).
(2) Install push in fasteners from rear of carpet attaching carpet to rear seat crossmember.
(3) Install front seat push pin fasteners.
(4) Feed wiring connectors for the seats and amplifier, if equipped, through slits in carpet.
(5) Install plastic sill retainers in metal clips along door sill panel.
(6) Install wiring troughs attaching carpet at outboard ends of rear seat crossmember.
(7) Install amplifier on passenger side of floor pan, if so equipped.
(8) Install quarter trim panels.
(9) Install cowl trim panels.
(10) Install door sill trim panels.
(11) Install instrument panel hush panel.
(12) Install accelerator pedal.
(13) Install floor console and center instrument panel console.
(14) Install rear seat cushion.
(15) Install front seats.
(16) Raise and secure convertible top.

CENTER HEADER TRIM PANEL

REMOVAL

REMOVE

(1) Remove both sun visor support centers (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
(2) Pull trim rearward to disengage clips attaching header trim panel to header panel (Fig. 5).
(3) Remove header trim panel from vehicle.

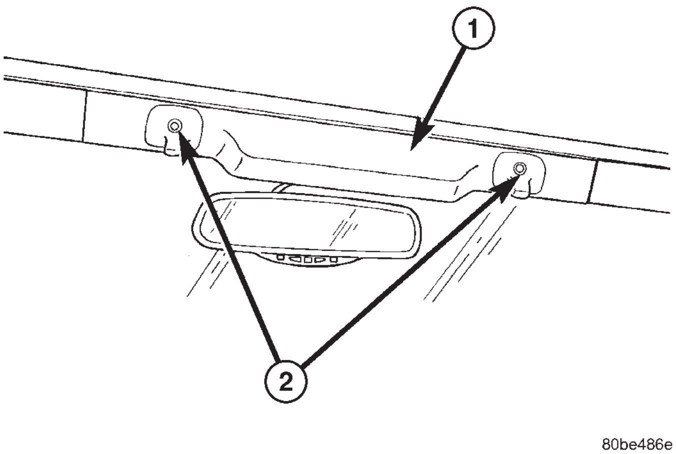

Fig. 5 Center Header Trim Panel

1 - CENTER HEADER TRIM PANEL
2 - SUN VISOR SUPPORT CENTER

INSTALLATION

(1) Position header trim panel on vehicle.
(2) Align the two locating pins on back of header trim panel to holes in header panel.
(3) Engage the two clips on header trim panel to slots in header panel.
(4) Attach the two sun visor support centers (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).

COWL TRIM PANEL

REMOVAL

(1) Remove door sill trim panel.
(2) Remove screws attaching cowl trim panel to inner cowl panel.
(3) Remove cowl trim panel from vehicle (Fig. 6).

INSTALLATION

(1) Position cowl trim panel to vehicle.
(2) Install screws attaching cowl trim panel to inner cowl panel.
(3) Install door sill trim panel.

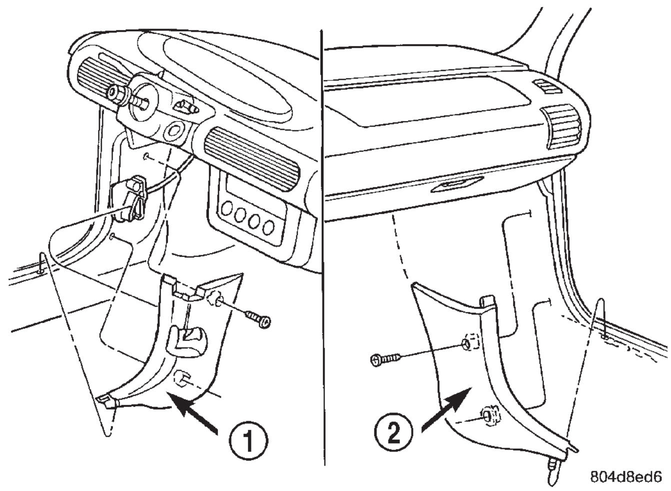

Fig. 6 Cowl Trim Panel

1 - LEFT COWL TRIM PANEL
2 - RIGHT COWL TRIM PANEL

DOOR SILL TRIM PANEL

REMOVAL

(1) Using a fork type prying tool, disengage clips holding door sill trim panel to door sill (Fig. 7).
(2) Starting at one end of sill trim panel, pull upward on sill trim panel in order to disengage clips attaching sill trim panel to door opening flange.
(3) Remove door sill trim panel from vehicle.

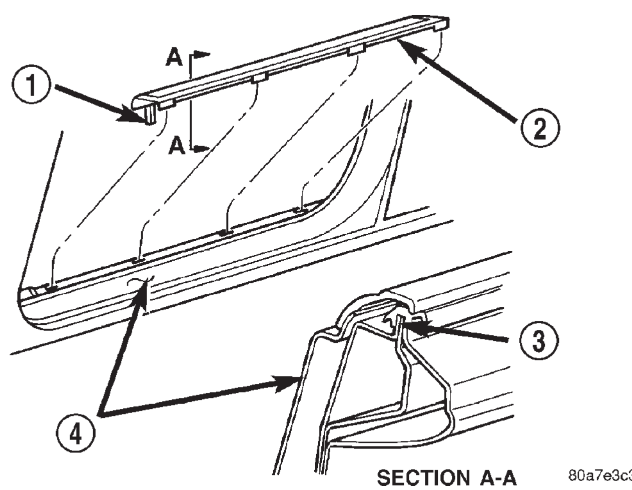

Fig. 7 Door Sill Trim Panel

1 - LOCATING TAB
2 - DOOR SILL TRIM PANEL
3 - DOOR OPENING FLANGE
4 - DOOR SILL

INSTALLATION

(1) Position door sill trim panel on vehicle.
(2) Align locating rib to net against cowl trim panel.

DOOR SILL TRIM PANEL (Continued)

(3) Engage clips on sill trim panel to door opening flange.

NOTE: Check that header/A-pillar and quarter panel weatherstrips are properly positioned. Incorrect positioning will interfere with clip engagement to door opening flange and damage door sill trim panel.

(4) Engage clips attaching sill trim panel to door sill.

FLOOR CONSOLE

REMOVAL

(1) Raise parking brake lever as high as possible.
(2) Move transmission shifter to neutral position.
(3) Loosen set screw on front of shifter knob and remove shift lever knob.
(4) Remove lighted transmission range indicator letter bezel (Fig. 8).
(5) Disconnect transmission range indicator bezel wire connector at the shifter mechanism.
(6) Remove screws, next to floor shifter and in console storage compartment, attaching floor console to brackets on floor pan (Fig. 9).
(7) Disconnect wire connector for floor console accessories at floor pan.
(8) Remove console from vehicle.

NOTE: The grip portion of the parking brake lever will only fit through the wider lower portion of the slot in the floor console.

INSTALLATION

(1) Position console in vehicle.
(2) Connect wire connector for floor console accessories at floor pan.
(3) Verify that the rear locator pin on the bottom of the storage bin is engaged to the slot in the body bracket and the front pin is engaged to the shift mechanism (Fig. 8).
(4) Install screws, next to floor shifter and in console storage compartment, holding floor console to brackets on floor pan.
(5) Connect transmission range indicator bezel wire connector on shifter mechanism.
(6) Install lighted transmission range indicator letter bezel.
(7) Install shift lever knob and tighten set screw on front of shifter knob.

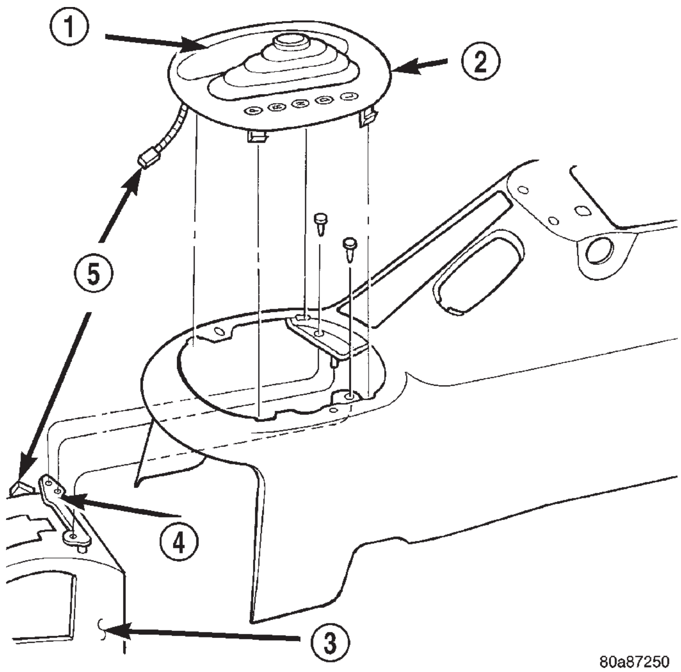

Fig. 8 Transmission Range Indicator Bezel

1 - BEZEL BOOT
2 - PRNDL BEZEL
3 - SHIFTER MECHANISM
4 - LOCATOR PIN
5 - WIRING CONNECTOR

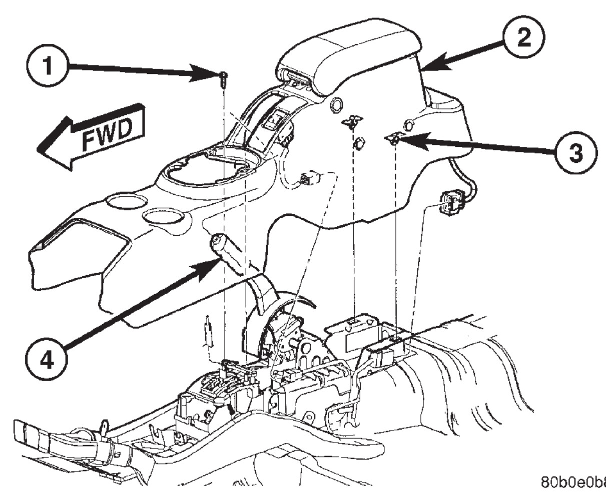

Fig. 9 FLOOR CONSOLE

1 - SCREWS
2 - FLOOR CONSOLE
3 - CLIPS
4 - PARK BRAKE LEVER

FORWARD INSTRUMENT PANEL CONSOLE

REMOVAL

(1) Remove floor console.

(2) Remove instrument panel cluster hood (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove instrument panel center bezel.

(4) Remove left knee bolster.

(5) Release glove box door catches and allow to hang downward.

(6) Remove screws holding storage bin to forward instrument panel console (Fig. 10).

(7) Remove storage bin from forward instrument panel console.

(8) Remove screws holding forward instrument console to shifter mounting bracket.

(9) Remove screws attaching forward instrument panel console to instrument panel at sides of storage bin area.

(10) Remove screws attaching forward instrument panel console to instrument panel support braces.

(11) Remove forward instrument panel console from vehicle.

INSTALLATION

(1) Position forward instrument panel console to vehicle.

(2) Install screws attaching forward instrument panel console to instrument panel support braces.

(3) Install screws attaching forward instrument panel console to instrument panel at sides of storage bin area.

(4) Install screws attaching forward instrument panel console to shifter mounting bracket.

(5) Install storage bin from forward instrument panel console.

(6) Install screws attaching storage bin to forward instrument panel console.

(7) Release glove box door catches and allow to hang downward.

(8) Install left knee bolster.

(9) Install instrument panel center bezel.

(10) Install instrument panel cluster hood.

(11) Install floor console.

HEADLINER

REMOVAL

CAUTION: Special Tool 6967 is needed to remove the rear locating clip attached to the headlining just forward of the rear window.

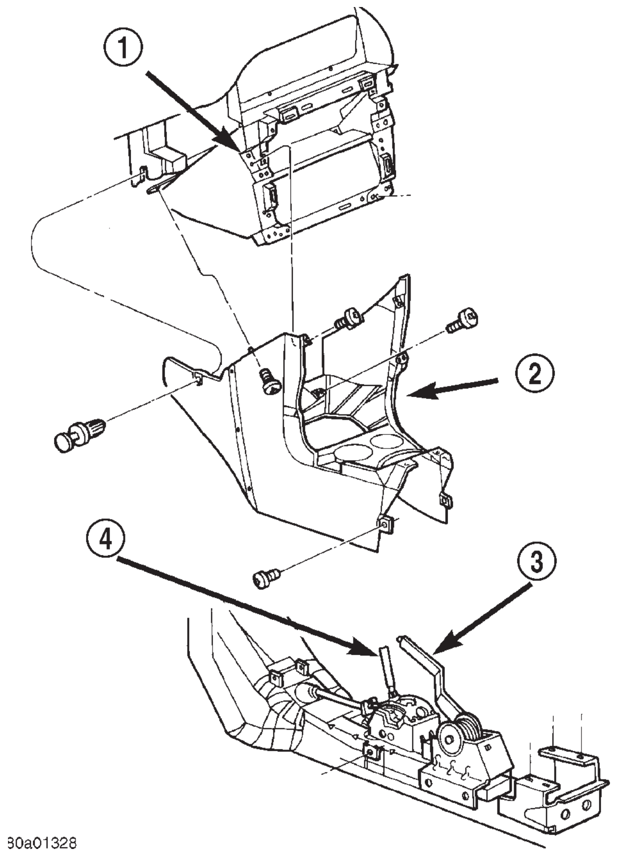

Fig. 10 Forward Instrument Panel Console

1 - INSTRUMENT PANEL
2 - FORWARD INSTRUMENT PANEL CONSOLE
3 - PARK BRAKE
4 - GEAR SHIFTER

(1) Remove the door opening weatherstrips. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR OPENING WEATHERSTRIP - REMOVAL)

(2) Remove instrument panel end cap/fuse cover.

(3) Remove the sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)

(4) Remove sun visor supports. (Refer to 23 - BODY/INTERIOR/SUN VISOR SUPPORT - REMOVAL)

(5) Remove left A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)

(6) Remove front/rear assist handles and/or coat hooks.

(7) Remove right and left upper B-pillar trim. (Refer to 23 - BODY/INTERIOR/UPPER B-PILLAR TRIM - REMOVAL)

(8) Remove upper quarter trim, as necessary. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - REMOVAL)

(9) Disconnect headliner electrical connector along instrument panel bracket.

(10) Disconnect headliner electrical connector from fuse panel (Fig. 11).

HEADLINER (Continued)

(11) Pull down on the rear of the map lamp and sun roof switch to disengage clips from roof panel, if equipped.

(12) Using Special Tool 6967, disengage headline rear locating clip holding headlining to roof above rear window (Fig. 12).

(13) Pull down on headliner around sun roof to disengage hook and loop fastener, if equipped.

(14) Disconnect the sunroof module electrical connector, if equipped.

(15) Recline front seats.

(16) Tilt steering wheel fully up.

(17) Move shifter fully rearward.

(18) Lower headliner.

(19) Remove headliner through passenger front door opening.

INSTALLATION

NOTE: Do not remove the cardboard light blocker from the reading lamp.

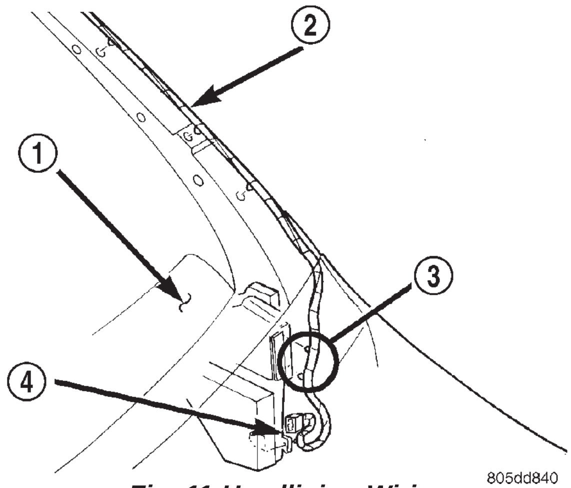

Fig. 11 Headlining Wiring

1 - INSTRUMENT PANEL
2 - LEFT A-PILLAR
3 - WRAP FASTENERS WITH FOAM
4 - FUSE PANEL

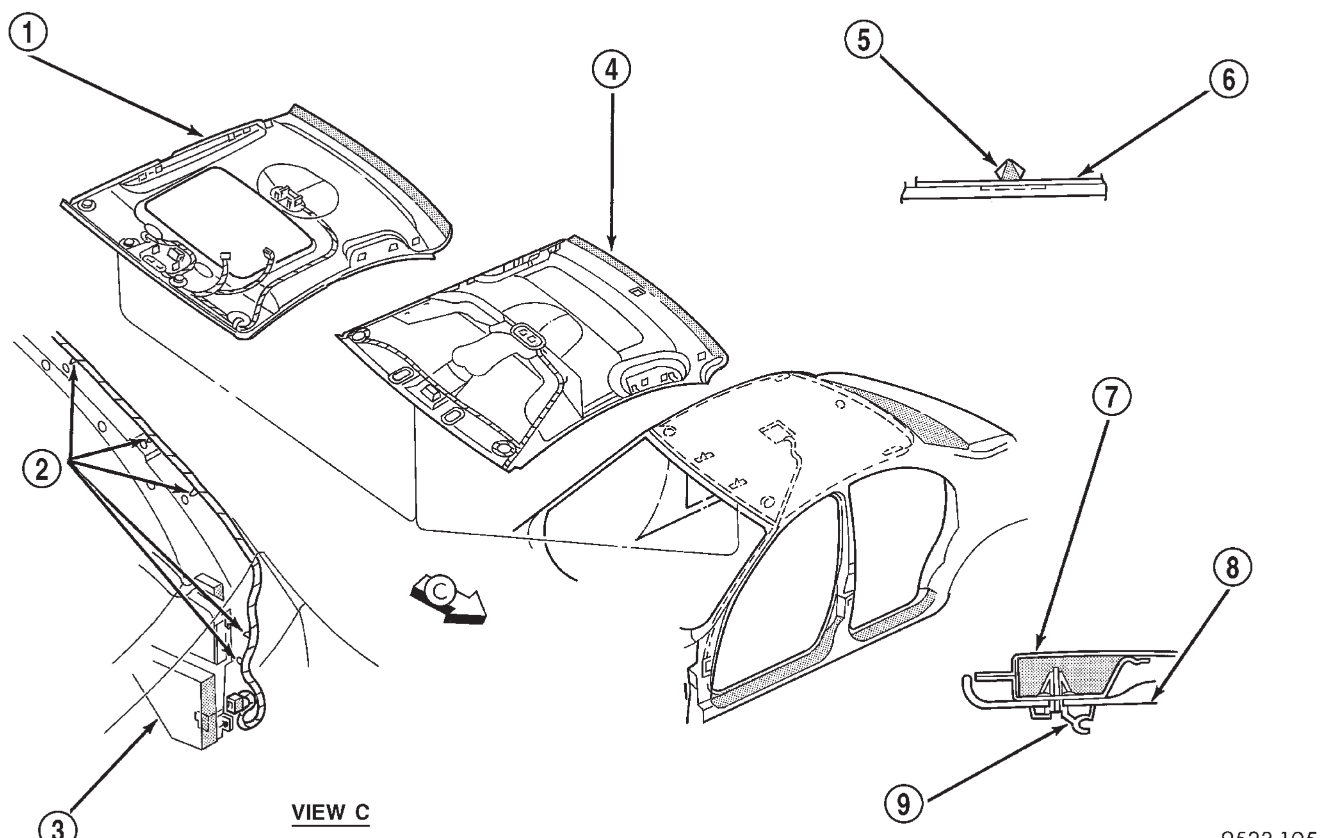

Fig. 12 Headlining

4 - HEADLINING
5 - CLIP
6 - REAR WINDOW HEADER
7 - WINDSHIELD HEADER
8 - HEADLINING
9 - SUNVISOR SUPPORT

HEADLINER (Continued)

(1) Transfer front map lamp and bracket.
(2) Transfer sunroof switch.
(3) Transfer rear dome lamp.
(4) Fully recline both front seats.
(5) Tilt steering wheel fully up.
(6) Move shifter fully rearward.
(7) Move headliner into vehicle through front passenger door.
(8) Lay headlining wiring harness out along A–pillar to prevent capturing between headlining and roof.
(9) Install left inboard sun visor support.
(10) Align rear locator with mating hole in roof bow and press upward on headlining until rear locator engages.
(11) Install coat hooks.
(12) Install assist handles.
(13) Install sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION)
(14) Connect electrical connector to sunroof switch, if equipped.
(15) Push upward on sunroof switch to engage into switch retainer, if equipped.
(16) Push upward on headlining around sunroof opening to engage hook and loop fasteners, if equipped.
(17) Connect map lamp electrical connector, if equipped.
(18) Confirm the headliner is not hung up on the side air bag deployment ramp.
(19) Push upward on map lamp to engage lamp to headlining, if equipped.
(20) Connect dome lamp wire connector to dome lamp.
(21) Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION)
(22) Install headlining wiring harness to A–pillar and fuse panel.
(23) Install upper quarter trim as necessary. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - INSTALLATION)
(24) Install right and left B-pillar trim. (Refer to 23 - BODY/INTERIOR/UPPER B-PILLAR TRIM - INSTALLATION)

NOTE: It is not possible to reinstall the push in fasteners holding the wiring harness to the instrument panel bracket and to the fuse panel area. Wrap these two fasteners with foam tape to prevent buzz, squeak, and rattle complaints (Fig. 11).

(25) Install the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)
(26) Install the weatherstrip on to door opening. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR OPENING WEATHERSTRIP - INSTALLATION)
(27) Verify that the door opening weatherstrip lip overlaps the edge of the headlining and trim panels.

HEADER TRIM PANEL - RIGHT OR LEFT

REMOVAL - JR-27 ONLY

(1) Remove sun visor(s) (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
(2) Remove center header trim panel (Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - REMOVAL).
(3) Disengage clip attaching header trim panel to header panel.
(4) Remove header trim panel from vehicle (Fig. 13).

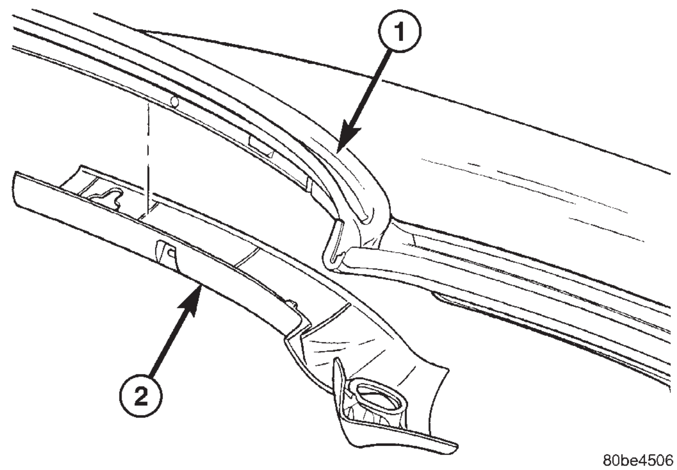

Fig. 13 Header Trim Panel (Right Side)

1 - HEADER WEATHERSTRIP
2 - HEADER TRIM PANEL

INSTALLATION - JR-27 ONLY

(1) Position header trim panel on vehicle.
(2) Align locating pins on back side of trim panel to holes in header panel.
(3) Engage clip on trim panel to slots in header panel.
(4) Install center header trim panel(Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - INSTALLATION).
(5) Install sun visor (Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - INSTALLATION).

LOWER QUARTER TRIM

REMOVAL

(1) Remove upper quarter trim panels. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - REMOVAL)

(2) Remove the puch pins from the lower quarter trim flange.

(3) Disengage the clips attaching the lower quarter trim to the body.

(4) Remove lower quarter trim from vehicle (Fig. 1).

INSTALLATION

(1) Place lower quarter trim into position.

(2) Engage the clips attaching the lower quarter trim to the body.

(3) Install the push pins into the lower quarter trim flange.

(4) Install the upper quarter trim panel. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - INSTALLATION)

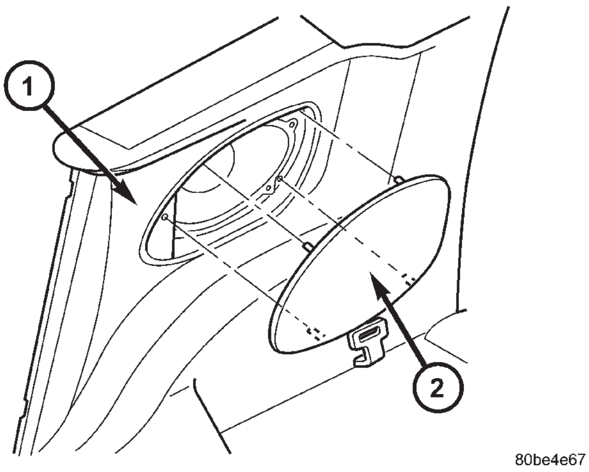

Fig. 14 Speaker Grille

1 - QUARTER TRIM PANEL
2 - SPEAKER GRILLE

QUARTER TRIM PANEL

REMOVAL

(1) Lower convertible top.

(2) Remove rear seat cushion and rear seat back.

(3) Remove door sill trim panel.

(4) Remove speaker grille (Fig. 14).

(5) Remove vertical screws and inboard screw attaching quarter trim panel to inner quarter panel (Fig. 15).

(6) Remove screws attaching quarter trim panel to inner quarter panel through the speaker opening.

(7) Lift metal retainer blade at the front out of clip.

(8) Pull trim panel from inner quarter panel and disconnect speaker wiring connector.

(9) Remove quarter trim panel from vehicle.

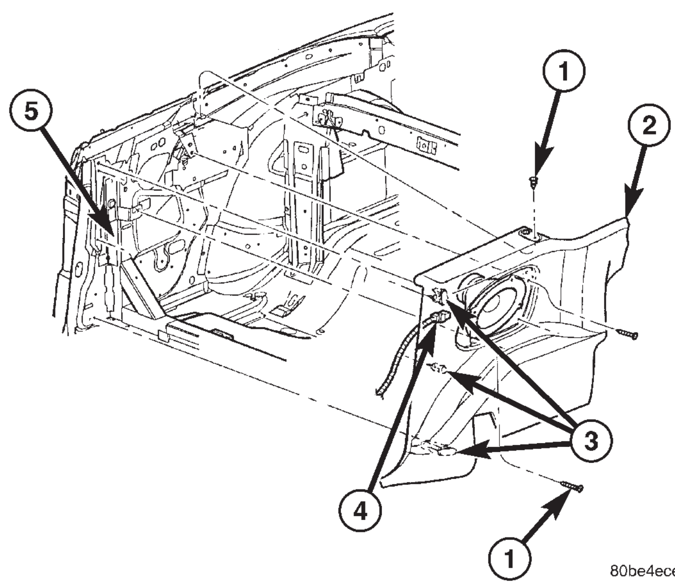

Fig. 15 Quarter Trim Panel

1 - SCREWS
2 - QUARTER TRIM PANEL
3 - LOCATING PINS
4 - SPEAKER WIRE AND CONNECTOR
5 - INNER QUARTER PANEL

INSTALLATION

(1) Replace push in fasteners.

(2) Position quarter trim panel on vehicle.

(3) Connect speaker wiring connector.

(4) Install screws attaching quarter trim panel to inner quarter panel through the speaker opening.

(5) Install vertical screws and inboard screw attaching quarter trim panel to inner quarter panel.

(6) Place toe blade into slotted sill clip.

(7) Install door sill trim panel.

(8) Install speaker grille.

(9) Install rear seat cushion and rear seat back.

REAR SHELF TRIM PANEL

REMOVAL

(1) Remove upper quarter trim panels as necessary. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - REMOVAL)

(2) Fold seat backs down.

(3) Remove the center plug (Fig. 16).

(4) Remove close out panel trim.

(5) Remove push-in fasteners attaching rear shelf trim to shelf panel (Fig. 17).

(6) Disconnect the center shoulder belt at the base. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)

(7) Pull trim forward to disengage clip attaching trim to shelf panel.

(8) Feed seat belt through the seat belt opening in the shelf panel.

CAUTION: Do not pull on child tether covers or use as a handle for removal of panel.

(9) Remove shelf trim from vehicle.

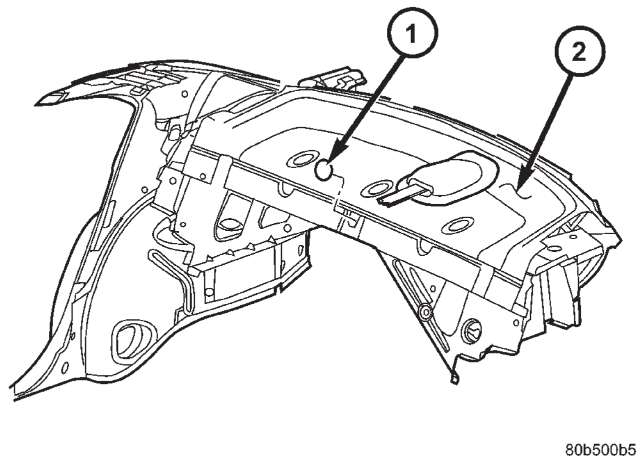

Fig. 16 REAR SHELF CENTER PLUG

1 - CENTER PLUG
2 - REAR SHELF TRIM

INSTALLATION

(1) Feed center shoulder belt through opening in shelf panel.

(2) Place rear shelf trim into position.

(3) Push trim rearward to engage clip attaching rear shelf trim to shelf panel.

(4) Install push-in fasteners attaching rear shelf trim to shelf panel.

CAUTION: Do not pull on child tether covers or use as a handle for installation of panel.

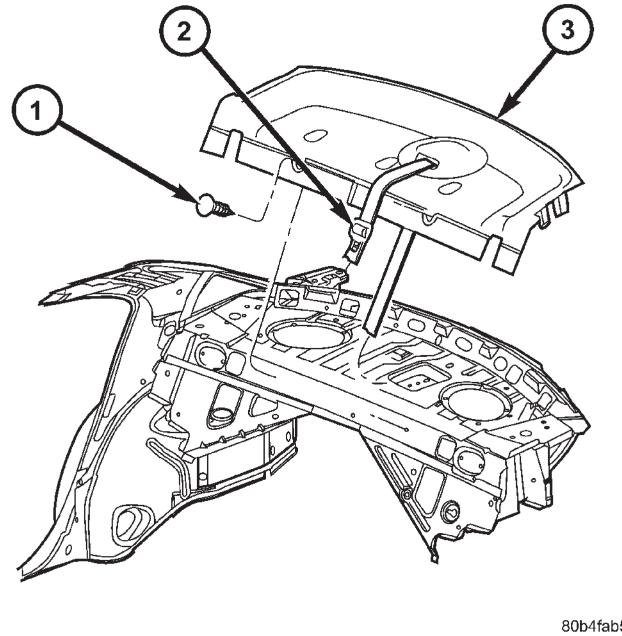

Fig. 17 REAR SHELF TRIM

1 - PUSH-IN FASTENERS
2 - CENTER SHOULDER BELT
3 - SHELF TRIM PANEL

(5) Install close out trim panel.

(6) Install center plug.

(7) Install upper quarter trim panels. (Refer to 23 - BODY/INTERIOR/UPPER QUARTER TRIM - INSTALLATION)

(8) Connect the center shoulder seat belt. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)

(9) Fold seat backs up.

REAR VIEW MIRROR

REMOVAL

REMOVAL

(1) Remove screws attaching inside rear view mirror to header panel.

(2) Disconnect wire connector to rear view mirror, if so equipped.

(3) Remove rear view mirror from vehicle (Fig. 18)

REMOVAL - JR-27 ONLY

All vehicles with driver and passenger side airbags must have a colored coded five Bullet point airbag warning label applied to the sun visor, verify label availability and ensure the label is installed.

(1) Disengage sun visor from sun visor support.

REAR VIEW MIRROR (Continued)

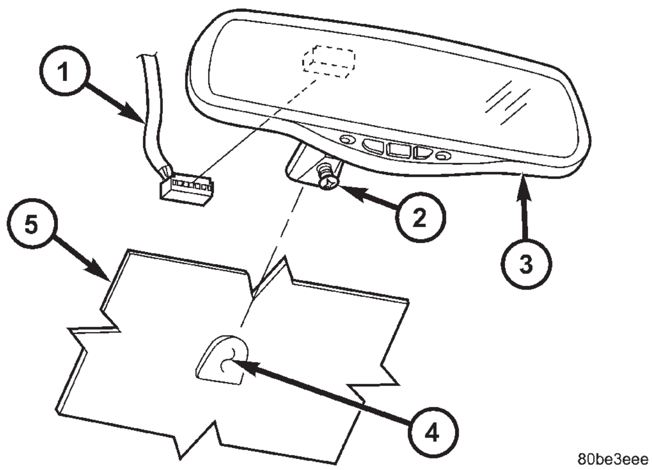

Fig. 18 Inside Rear View Mirror

1 - MIRROR WIRE CONNECTOR
2 - SET SCREW
3 - REAR VIEW MIRROR
4 - SUPPORT BUTTON
5 - WINDSHIELD

(2) Remove screws attaching sun visor to header panel.

(3) Disconnect lighted vanity mirror wiring.

(4) Remove sun visor from vehicle (Fig. 19).

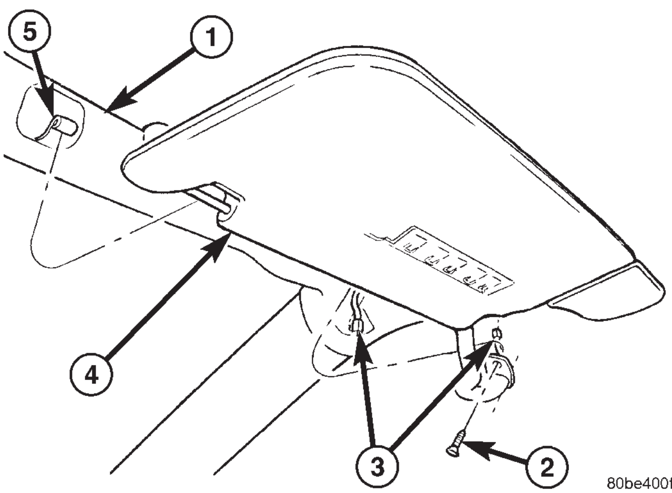

Fig. 19 Sun Visor

1 - Header Panel
2 - Attaching Screw(s)
3 - Vanity Wire Connectors
4 - Sun Visor
5 - Support Visor Center

INSTALLATION

INSTALLATION

(1) Position inside rear view mirror to vehicle.

(2) Connect wire connector to rear view mirror, if so equipped.

(3) Install screws attaching rear view mirror to header panel.

INSTALLATION - JR-27 ONLY

All vehicles with driver and passenger side airbags must have a colored coded five Bullet point airbag warning label applied to the sun visor, verify label availability and ensure the label is installed.

(1) Position sun visor to vehicle.

(2) Connect lighted vanity mirror wire connector.

(3) Install screws attaching sun visor to header panel.

(4) Engage sun visor to sun visor support.

SHIFT BOOT

REMOVAL

(1) Remove the shifter nob set screw and pull knob off of the shifter (Fig. 20).

(2) Using a trim stick C 4755 or equivalent, pop shift bezel boot assembly out of the floor console (Fig. 21).

(3) Disconnect the electrical connector, if equipped, and remove the shift boot.

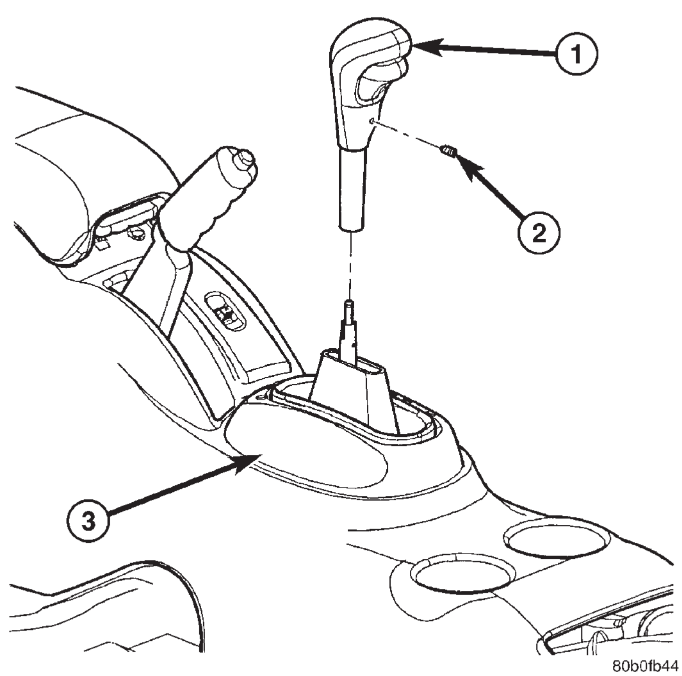

Fig. 20 SHIFT KNOB – AUTOMATIC TRANS

1 - SHIFTER KNOB
2 - SET SCREW

SHIFT BOOT (Continued)

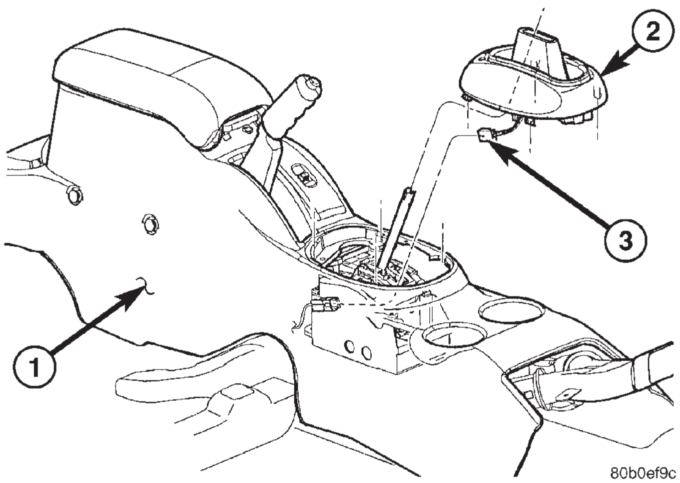

Fig. 21 SHIFT BOOT – TYPICAL

1 - FLOOR CONSOLE
2 - SHIFT BOOT
3 - ELECTRICAL CONNECTOR

INSTALLATION

(1) Connect the electrical connector, if equipped.

(2) Slide the shift boot bezel over the shifter and install into the floor console.

(3) Install the shifter nob and tighten the set screw to 3 N·m (23 in. lbs.).

SUN VISOR

REMOVAL

(1) Disengage sun visor from center support (Fig. 22).

(2) Remove screws attaching sun visor to roof header.

(3) Remove sun visor from header.

(4) If equipped, disconnect wire connector from body harness.

(5) Remove sun visor from vehicle.

INSTALLATION

(1) Place sun visor into position.

(2) If equipped, connect wire connector to body harness.

(3) Install screw attaching sun visor to header.

(4) Install screws attaching sun visor to roof header.

(5) Connect sun visor to center support.

SUN VISOR SUPPORT

REMOVAL

(1) Disengage sun visor from center support.

(2) Remove screw attaching support to roof header,

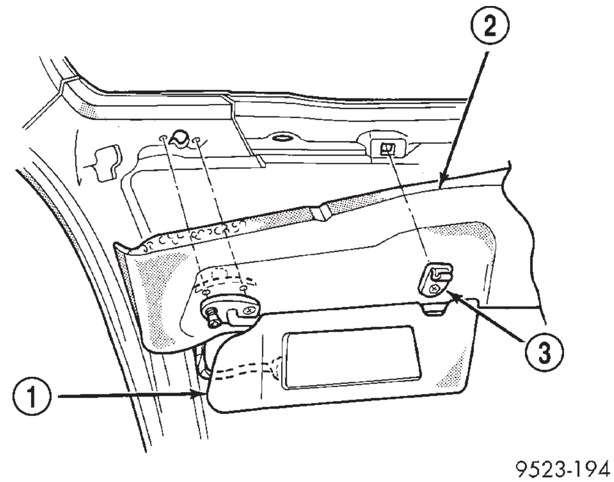

Fig. 22 Sun Visor

1 - SUN VISOR
2 - HEADLINING
3 - SUPPORT

(3) Remove support from vehicle.

INSTALLATION

(1) Place support into position.

(2) Install screw attaching support to roof header,

(3) Engage sun visor to center support.

UPPER B-PILLAR TRIM

REMOVAL

(1) Remove the door opening weatherstrips. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR OPENING WEATHERSTRIP - REMOVAL)

(2) Pry shoulder belt knob straight off height adjuster using a trim stick (C-4755).

(3) Remove seat belt turning loop cover.

(4) Remove bolt attaching turning loop to height adjuster.

(5) Remove bolt attaching seat belt lower anchor to floor.

(6) Disengage clips attaching upper B-pillar trim to B-pillar.

(7) Remove upper B-pillar trim from vehicle (Fig. 1).

INSTALLATION

(1) Place upper B-pillar trim into position.

(2) Engage clips attaching upper B-pillar trim to B-pillar.

(3) Install bolt attaching seat belt lower anchor to floor.

(4) Install bolt attaching turning loop to height adjuster.

(5) Install seat belt turning loop cover.

UPPER B-PILLAR TRIM (Continued)

(6) Push shoulder belt knob straight on height adjuster.

(7) Install the door opening weatherstrips. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR OPENING WEATHERSTRIP - INSTALLATION)

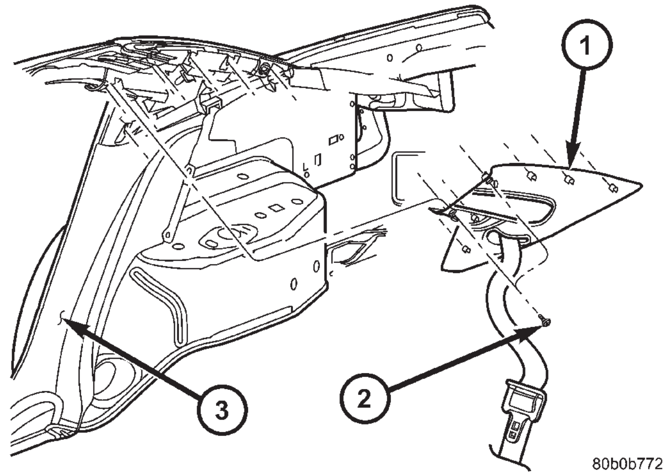

Fig. 23 UPPER QUARTER TRIM W/CURTAIN AIR BAG

1 - UPPER QUARTER TRIM PANEL
2 - SCREWS
3 - C-PILLAR LOWER

UPPER DECK MOLDING

REMOVAL

(1) Lower convertible top to midway position.

(2) Remove screws attaching upper deck molding to rear deck panel above convertible top rear attachment.

(3) Open decklid.

(4) Remove screws attaching upper deck molding to rear deck panel inside decklid water trough.

(5) Disconnect wire connector for CHMSL.

(6) Remove upper deck molding from vehicle.

INSTALLATION

(1) Position upper deck molding on vehicle.

(2) Connect wire connector for CHMSL.

(3) Install screws attaching upper deck molding to rear deck panel inside decklid water trough.

(4) Install screws attaching upper deck molding to rear deck panel above convertible top rear attachment.

(5) Raise and secure convertible top.

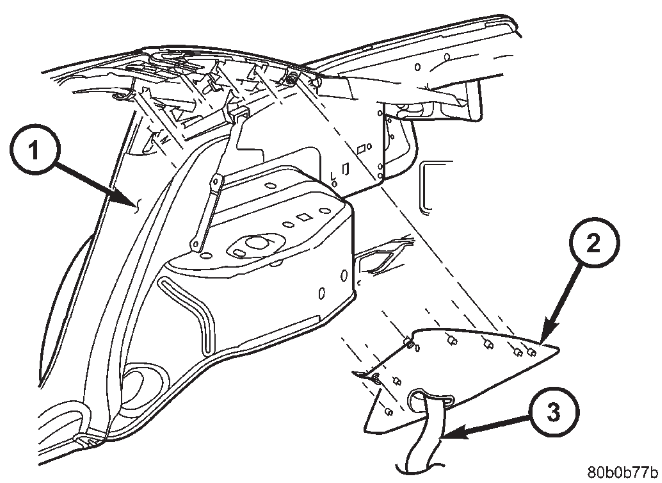

Fig. 24 UPPER QUARTER TRIM W/O CURTAIN AIR BAG

1 - C-PILLAR LOWER
2 - UPPER QUARTER TRIM PANEL
3 - SHOLDER BELT

UPPER QUARTER TRIM

REMOVAL

(1) Remove the door opening weatherstrips as necessary. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR OPENING WEATHERSTRIP - REMOVAL)

(2) Remove rear seat cushion. (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION - REMOVAL)

(3) Remove bolt attaching rear seat belt anchor to floor. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT - REMOVAL)

(4) On vehicles equipped with a side curtain air bag, open the screw cap covers and remove the screws (Fig. 23).

(5) Fold the seat back down.

(6) Disengage clips attaching upper quarter trim to inner quarter panel (Fig. 23) and (Fig. 24).

(7) Route seat belt webbing through access hole in upper quarter trim.

(8) Remove upper quarter trim panel from vehicle.

INSTALLATION

(1) Place upper quarter trim panel into position.

(2) Route seat belt webbing through access hole in upper quarter trim.

(3) Engage clips attaching upper quarter trim to inner quarter panel.

(4) On vehicles equipped with side curtain air bag, install the screws and close the screw cap covers.

(5) Install bolt attaching rear seat belt anchor to floor. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT - INSTALLATION)

(6) Install rear seat cushion. (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION - INSTALLATION)

UPPER QUARTER TRIM (Continued)

(7) Install the door opening weatherstrips as necessary. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR OPENING WEATHERSTRIP - INSTALLATION)

WINDSHIELD HEADER DAMPER

REMOVAL

(1) Remove center header trim panel (Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - REMOVAL).

(2) Remove nuts attaching damper (Fig. 25).

(3) Remove damper from vehicle.

INSTALLATION

(1) Place windshield header damper in position.

(2) Install nuts attaching damper.

(3) Install center header trim panel into position (Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - INSTALLATION).

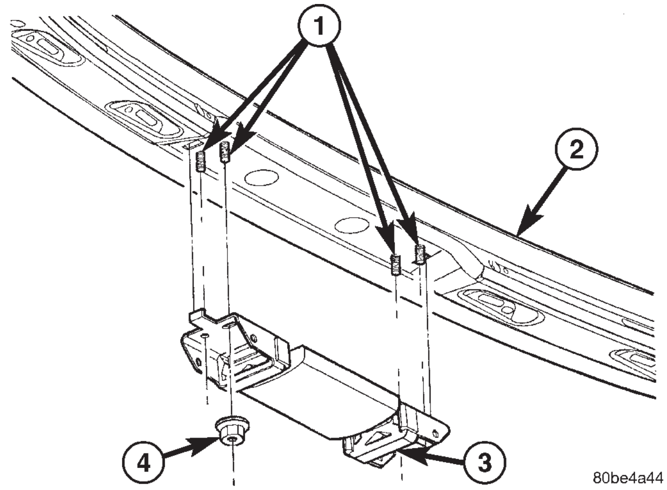

Fig. 25 Windshield Header Damper

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

On most vehicles a two-part paint application (base coat/clear coat) is used. Color paint that is applied to primer is called base coat. The clear coat protects the base coat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate.(Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION AND OPERATION). The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The codes listed in the Color Code Chart are used for manufacturing purposes.

PAINTED SURFACE TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION AND OPERATION).

WARNING: USE A OSHA APPROVED BREATHING MASK WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

TOUCH-UP PROCEDURE

(1) Scrape loose paint and corrosion from inside scratch or chip.
(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.
(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the defect without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.
(5) On vehicles without clear coat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
(6) On vehicles with clear coat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

FINESSE SANDING/BUFFING AND POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clear coat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clear coat finish, if equipped. Base coat paint must retain clear coat for durability.

ADJUSTABLE QUARTER GLASS JR-27

TABLE OF CONTENTS

ADJUSTABLE QUARTER GLASS JR-27

REMOVAL

(1) Raise quarter glass to full up position, if possible, to aid in removal.
(2) Remove quarter trim panel.
(3) Partially lower convertible top.
(4) Disconnect wire connector to power window motor.
(5) Remove fasteners holding quarter window module to inner quarter panel (Fig. 1).
(6) Lift quarter window module upward and out opening at top of quarter panel.
(7) Separate quarter glass from quarter window module (Fig. 2).

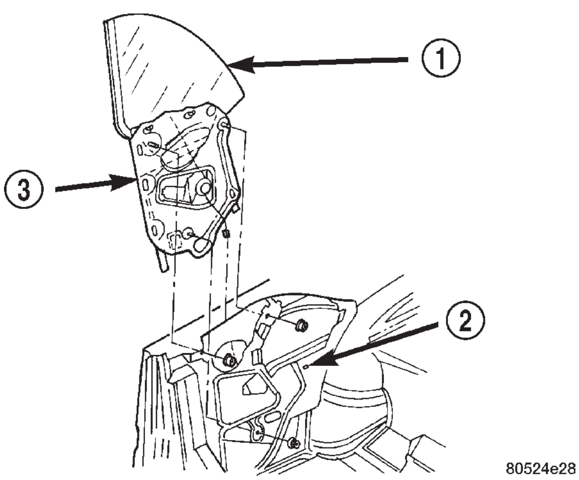

Fig. 1 Quarter Window Module

1 - QUARTER GLASS
2 - INNER QUARTER PANEL
3 - QUARTER WINDOW MODULE

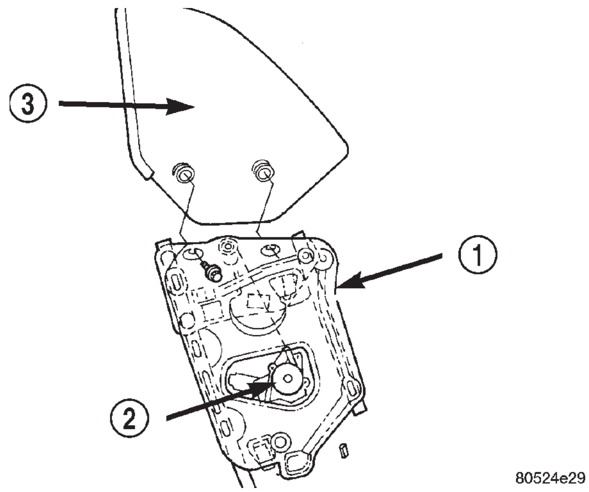

Fig. 2 Quarter Glass

1 - QUARTER WINDOW MODULE
2 - POWER QUARTER WINDOW MOTOR
3 - QUARTER GLASS

INSTALLATION

(1) Lower quarter window module into position through opening in top of quarter panel.
(2) Install fasteners holding quarter window module to inner quarter panel.
(3) Connect wire connector to power window motor.
(4) Raise glass lift channel to full up position.
(5) Position quarter glass on quarter window module.
(6) Loosely install fasteners holding quarter glass to quarter window module.
(7) Lower and secure convertible top.
(8) Adjust quarter glass as necessary (Refer to 23 - BODY/ADJUSTABLE QUARTER GLASS - ADJUSTMENTS).
(9) Install quarter trim panel.

ADJUSTABLE QUARTER GLASS JR-27 (Continued)

ADJUSTMENTS

QUARTER GLASS ADJUSTMENT

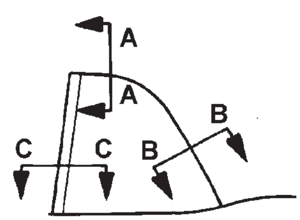
NOTE: The door glass must be properly adjusted prior to performing any quarter glass adjustments.

UP-STOP ADJUSTMENTS

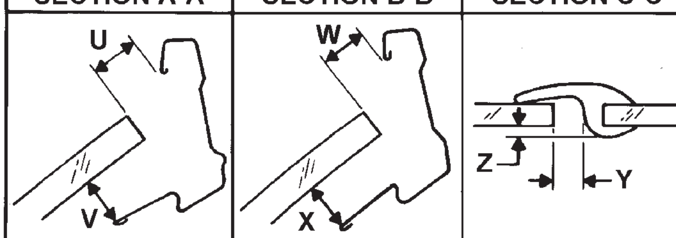
(1) Remove quarter trim panel.
(2) Remove center and rear side rail weatherstrips from side rail weatherstrip retainer channels.
(3) Loosen up-stop nuts.
(4) Raise quarter glass.
(5) Slide up-stop to achieve proper glass to weatherstrip retainer gap. Refer to the Quarter Glass Adjustment Specifications Table.
(6) Tighten all fasteners.
(7) Install center and rear side rail weatherstrips to side rail weatherstrip retainer channels.
(8) Cycle quarter glass between full up and full down positions. Verify operation and adjust as necessary.
(9) Verify that the top edge of the door glass is beneath the lip of the weatherstrip.
(10) Install quarter trim panel.

TOP OF GLASS – INBOARD/OUTBOARD ADJUSTMENTS

(1) Remove quarter trim panel.
(2) Remove center and rear side rail weatherstrips from side rail weatherstrip retainer channels.
(3) Using a suitable wrench, loosen the lower jack screw jam nuts.
(4) Raise quarter glass.
(5) Using a suitable allen wrench, rotate jackscrews to achieve the proper gap between the door glass weatherstrip retainer channel. Refer to the Quarter Glass Adjustment Specifications Table.
(6) Verify that the quarter glass maintains even contact with the outer belt weatherstrip.
(7) Install center and rear side rail weatherstrips to side rail weatherstrip retainer channels.
(8) Cycle quarter glass between full up and full down positions. Verify operation and adjust as necessary.
(9) Tighten all fasteners.
(10) Verify that the top edge of the door glass is beneath the lip of the weatherstrip with glass in the full up position.
(11) Install quarter trim panel.



MEASUREMENT LOCATIONS AND THEIR VALUES



SEQUENCE		ADJUSTMENT	U	V	W	X	Y	Z
1	IN/OUT			20.0mm ±2mm		20.0mm ±2mm		2.0mm ±1mm
2	FORWARD/ REARWARD		10.0mm ±2mm		10.0mm ±3mm		6.0mm ±1mm	
	UP/DOWN		10.0mm ±2mm		10.0mm ±3mm			

NOTE: Forward / Rearward and Up/Down adjustment are to be made at the same time.

80570e07

QUARTER GLASS ADJUSTMENT SPECIFICATIONS

ADJUSTABLE QUARTER GLASS JR-27 (Continued)

GLASS – FRONT/REAR ADJUSTMENT

(1) Remove quarter trim panel.

(2) Remove center and rear side rail weatherstrips from side rail weatherstrip retainer channels.

(3) Loosen glass attachment bolts.

(4) Raise quarter glass and position correctly. Refer to the Quarter Glass Adjustment Specifications Table.

(5) Tighten all fasteners.

(6) Install center and rear side rail weatherstrips to side rail weatherstrip retainer channels.

(7) Cycle quarter glass between full up and full down positions. Verify operation and adjust as necessary.

(8) Install quarter trim panel.

QUARTER GLASS ALIGNMENT VERIFICATION

(1) Raise door glass to full up position.

(2) Cycle quarter glass between full up and full down positions.

(3) Verify that quarter glass operates smoothly and maintains correct alignment to convertible top and door glass.

(4) Verify that quarter glass weatherstrip fully contacts door glass.

(5) Verify that no scissoring of the door glass and weatherstrip occurs.

(6) If any of the above conditions are found,

(a) Adjust quarter glass.

(b) Adjust the door glass as necessary to cure the condition.

SEATS

TABLE OF CONTENTS

HEADREST

REMOVAL

(1) Raise head restraint slightly.

(2) Insert a stiff wire into the hole on the right hand side head restraint sleeve/guide and push to release latch (Fig. 1).

(3) At the same time, press the button on the head restraint sleeve/guide left hand side and pull upward to release the head restraint.

(4) Remove head restraint from seat back.

INSTALLATION

(1) Place head restraint in position.

(2) Push head restraint down into the lock position.

(3) Raise head restraint to ensure it locks at the last stop.

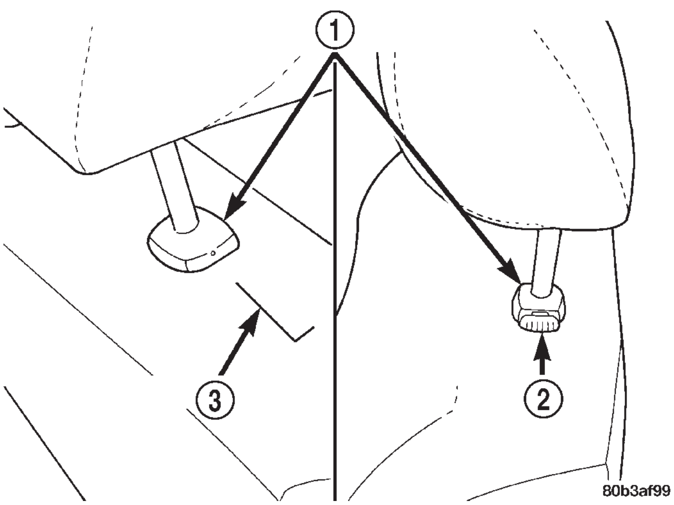


Fig. 1 Head Restraint Removal

FRONT SEAT (Continued)

REMOVAL

REMOVAL

(1) Position seat far enough forward to gain access to rear mount bolts on floor.

(2) Remove bolts holding rear of seat track to floor (Fig. 3).

(3) Slide seat rearward.

(4) Remove bolts attaching front of the seat track to floor kick up.

(5) Disconnect negative battery cable, if electrical seat.

(6) Disconnect front seat wire harness connector from body harness connector.

CAUTION: Caution should be taken not to handle seat by adjuster release bar when removing spring loaded seat from vehicle.

(7) Remove front seat from vehicle.

REMOVAL - MANUAL - JR-27 ONLY

(1) Move seat to full forward position.

(2) Remove rear inboard bolt attaching seat to floor pan.

(3) Remove rear outboard bolts attaching seat to side sill pylon.

(4) Position seat in full rearward position.

(5) Remove front inboard and outboard bolts holding seat to floor pan crossmember (Fig. 4).

(6) Tilt seat rearward and disconnect seat belt pretensioner wire connector.

(7) Remove seat from vehicle.

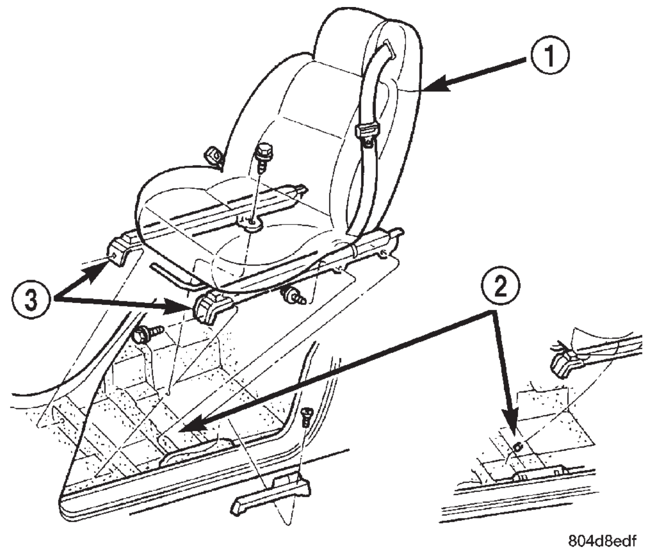

Fig. 4 Front Seat

1 - FRONT SEAT
2 - FLOOR PAN CROSSMEMBER
3 - FRONT SEAT TRACK

REMOVAL - POWER - JR-27

(1) Move seat to full forward position.

(2) Remove rear inboard bolt attaching seat to floor pan.

(3) Remove rear outboard bolts attaching seat to side sill pylon.

(4) Position seat in full rearward position.

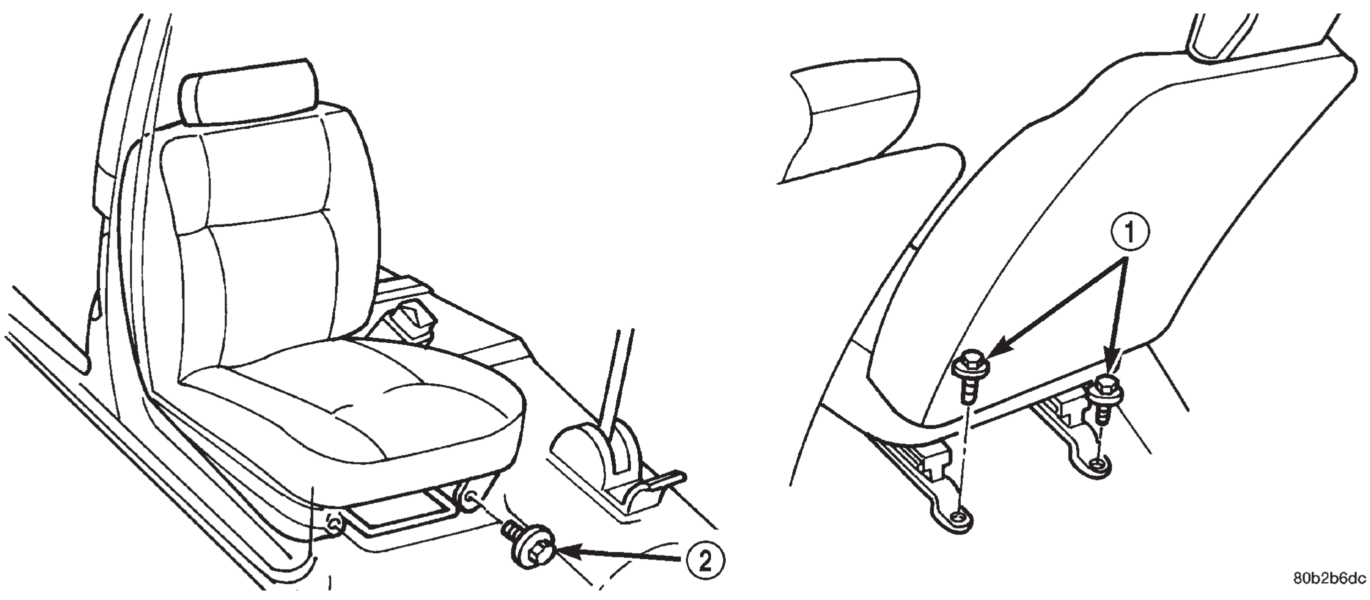

Fig. 3 Front Seat Removal

1 - REAR BOLTS
2 - FRONT BOLTS

FRONT SEAT (Continued)

(5) Remove front inboard and outboard bolts attaching seat to floor pan crossmember (Fig. 4).

(6) Tilt seat rearward and disconnect wire connector to seat belt pretensioner and power seat mechanism.

(7) Remove seat from vehicle.

INSTALLATION

INSTALLATION

CAUTION: Do not handle by seat adjuster release bar.

NOTE: Ensure that the seat tracks are rearward. Ensure the seat tracks on the right and left are in equal latch positions.

(1) Place front seat in position in vehicle.

(2) Connect front seat wire harness connector to body harness connector.

(3) Install bolts to attach front of seat track to the floor kick up. Tighten bolts to 61 N·m (45 ft. lbs.) torque.

(4) Slide seat forward and install bolts attaching rear of seat track to the floor. Tighten bolts to 61 N·m (45 ft. lbs.) torque.

(5) Verify front seat operation.

INSTALLATION - MANUAL - JR-27

CAUTION: It is important that the following steps be done correctly to insure that the seat tracks are properly timed prior to securing the seats to the vehicle.

(1) Adjust seat back to vertical position using either recliner handle.

WARNING: DO NOT GRAB EITHER RECLINER HANDLE OR TOWEL BAR WHEN HANDLING SEAT. THE SEAT TRACKS ARE SPRING LOADED AND WILL RELEASE.

(2) Turn seat upside down so that the seat tracks can be seen.

(3) Securely grasp the spring loaded outboard track rail and while lifting the towel bar, position the lower rail so that it is locked in the forth hole from the end (Fig. 5).

(4) Position the inboard seat track rail so that it is identical to the outboard track lower rail.

(5) Return seat to upright position.

(6) Position seat in vehicle.

(7) Tilt seat rearward and connect wire connector to seat belt pretensioner.

(8) Push downward on seat cushion to ensure that the front mounting brackets are fully seated to floor pan crossmember.

(9) Install and tighten rear outboard bolt seat to side sill pylon.

(10) Install and tighten forward outboard bolt attaching seat to crossmember.

(11) Install and tighten forward inboard bolt attaching seat to crossmember.

(12) Move seat to full forward position. Push rearward slightly on seat to ensure that the adjuster latches are engaged on both seat tracks.

(13) Install and tighten rear inboard bolt attaching seat to floor pan.

(14) Install and tighten middle outboard bolt attaching seat to side sill pylon.

(15) Move seat forward and rearward and check the efforts to move seat. If effort is to high loosen seat track bolts and retighten to the proper torque.

NOTE: Tighten all seat track retaining bolts to 61 N·m (45 ft. lbs.) torque.

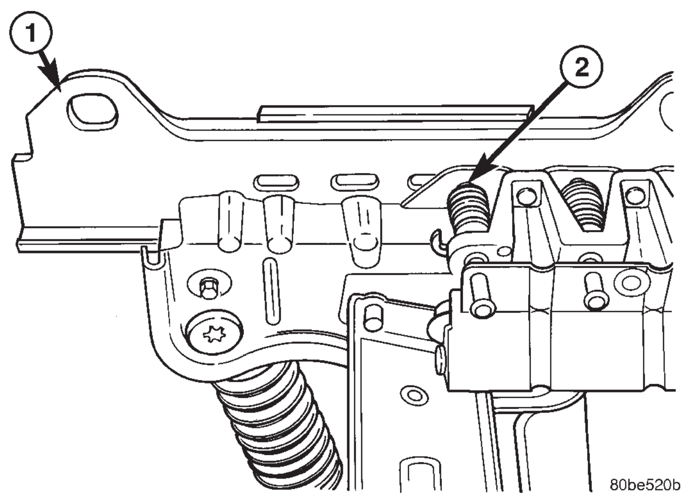

Fig. 5 Seat Track Position

1 - REAR OF SEAT TRACK
2 - FORTH HOLE POSITION

INSTALLATION - POWER - JR-27 ONLY

(1) Adjust seat back to vertical position using either recliner handle.

(2) Position seat in vehicle.

(3) Tilt seat rearward and connect wire connector to seat belt pretensioner and power seat mechanism.

(4) Push downward on seat cushion to ensure that the front mounting brackets are fully seated to floor pan crossmember.

(5) Use power seat switch to move seat to full rearward position.

(6) Install and tighten rear outboard bolt attaching seat to side sill pylon.

FRONT SEAT (Continued)

(7) Install and tighten forward outboard bolt attaching seat to crossmember.

(8) Install and tighten forward inboard bolt attaching seat to crossmember.

(9) Use power seat switch to move seat to full forward position.

(10) Install and tighten rear inboard bolt attaching seat to floor pan.

(11) Install and tighten middle outboard bolt attaching seat to side sill pylon.

NOTE: Tighten all seat track retaining bolts to 61 N·m (45 ft. lbs.) torque.

FRONT SEAT BACK

REMOVAL

REMOVAL

(1) Remove seat from vehicle.

(2) Remove seat cushion side shields.

NOTE: Do not reuse the recliner assembly attaching bolts.

(3) Remove bolts attaching recliner to seat back cushion frame (Fig. 6).

(4) Remove pivot bolts (Fig. 7).

(5) Disconnect any electrical connectors to the seat back, if equipped.

(6) Remove seat back from seat cushion.

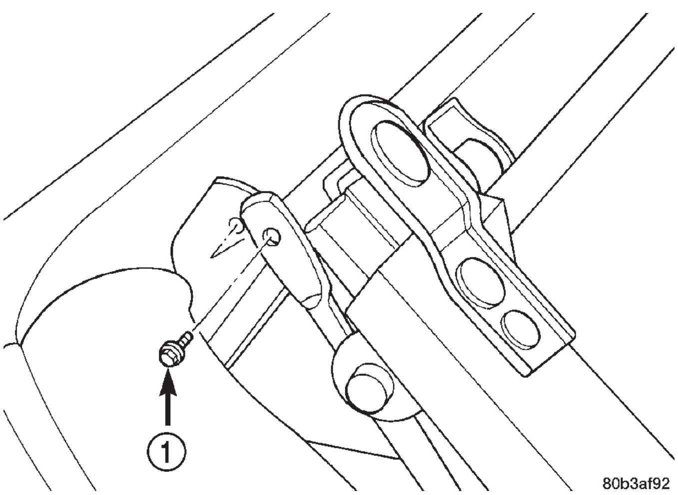

Fig. 6 Recliner Attaching Bolt

1 - RECLINER BOLT

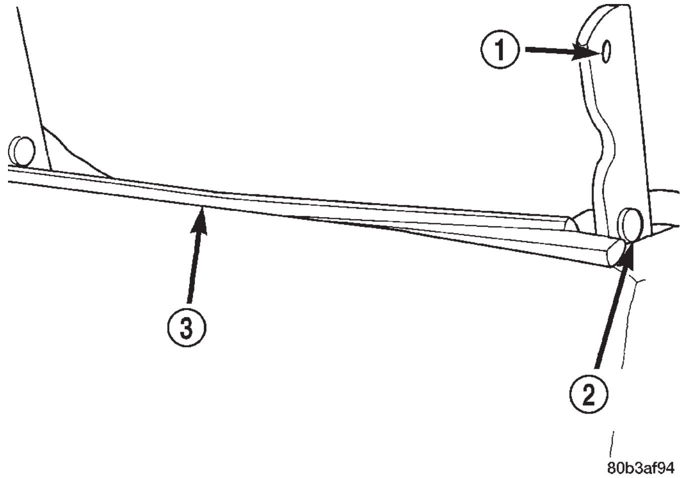

Fig. 7 Remove Seat Back

1 - RECLINER BOLT HOLE
2 - SEAT BACK BOLT HOLE
3 - J-STRAP RETAINER

REMOVAL - JR-27 ONLY

(1) Remove seat from vehicle(Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(2) Remove recliner handle.

(3) Remove seat side shield(Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE SHIELDS - REMOVAL).

(4) Remove recliner cable eyelet clip (Fig. 8).

(5) Remove recliner cable from arm on seat adjuster and feed cable back through hole in seat adjuster.

NOTE: The torque prevailing nuts used to secure the lower seat belt anchor and seat belt buckle are not reusable. Verify availability prior to proceeding.

(6) Remove seat cushion(Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).

(7) Remove nut attaching lower seat belt anchor to seat frame (Fig. 8).

(8) Back off nut attaching seat belt buckle to seat frame.

(9) Remove seat belt buckle pretensioner from seat frame.

(10) Remove E-clip and washer from easy entry rod at inboard side of seat, manual seat only.

(11) Remove rod from seat back, manual seat only.

(12) Remove pivot bolts attaching seat back to seat frame.

WARNING: DO NOT PULL ON UPPER RECLINER HANDLE OR RECLINER CABLE END AT ANY POINT UNTIL THE LEAD SCREW IS REMOVED IT IS UNDER A HIGH PRESSURE LOAD.

(13) Remove bolt attaching recliner lead screw to seat frame.

(14) Remove seat back from seat frame(Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL).

FRONT SEAT BACK (Continued)

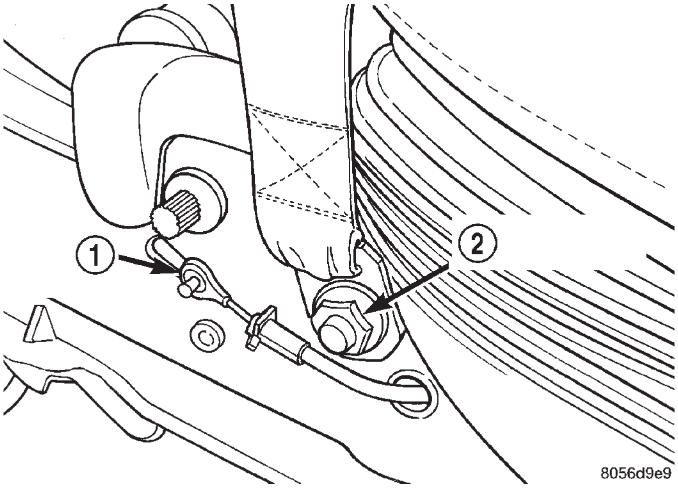

Fig. 8 Lower Seat Belt Anchor And Recliner Cable

1 - RECLINER CABLE
2 - LOWER SEAT BELT ANCHOR

(15) Unscrew lead screw from recliner mechanism (Fig. 9).

(16) Remove lead screw, spring and spring plate (Fig. 10).

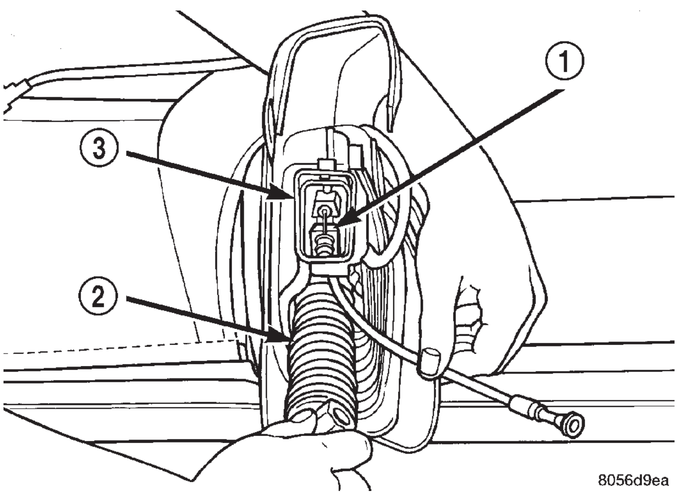

Fig. 9 Recliner Lead Screw

1 - RECLINER MECHANISM
2 - LEAD SCREW
3 - SEAT FRAME

INSTALLATION

INSTALLATION

(1) Position seat back on cushion.

(2) Install both pivot bolts and tighten 40 N·m (30 ft. lbs.).

NOTE: Do not reuse the recliner assembly attaching bolts.

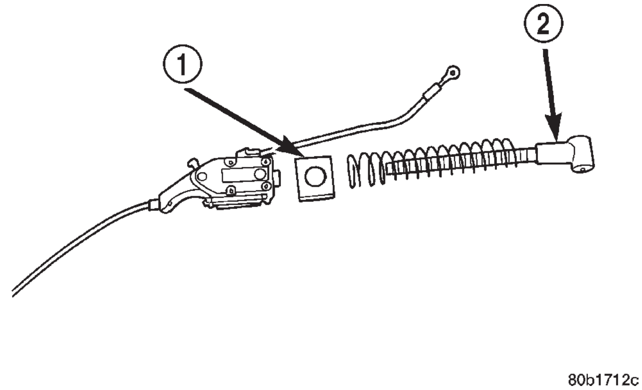

Fig. 10 Recliner Lead Screw

1 - LEAD SCREW SPRING PLATE
2 - LEAD SCREW

(3) Install bolts attaching recliner to seat back frame and tighten to 12 N·m (9 ft. lbs.).

(4) Install seat cushion side shields.

(5) Install seat in vehicle.

INSTALLATION - JR-27 ONLY

(1) Screw recliner lead screw into recliner mechanism. (Fig. 9).

WARNING: DO NOT PULL ON UPPER RECLINER HANDLE OR RECLINER CABLE END AT ANY POINT UNTIL THE LEAD SCREW IS REMOVED.

(2) Route recliner cable in front of metal strap at bottom of the seat back frame (Fig. 11).

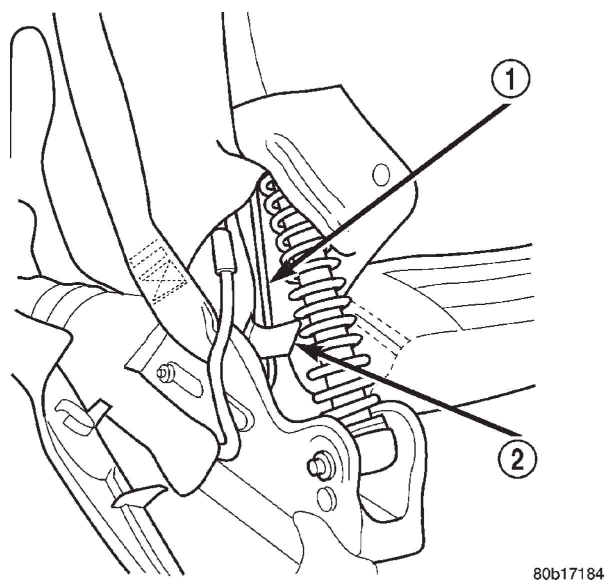

Fig. 11 Route Recliner Cable

1 - NEW CABLE ROUTING (DRIVER SEAT)
2 - BACK FRAME STRAP

FRONT SEAT BACK (Continued)

(3) Position seat back to seat frame(Refer to 23 - BODY/SEATS/SEAT BACK - INSTALLATION).

(4) Install bolt attaching recliner lead screw to seat frame. Tighten bolt to 45.3 N·m (33.3 ft. lbs.) torque.

(5) Install pivot bolts attaching seat back to seat frame. Tighten bolts to 51.0 N·m (33.3 ft. lbs.) torque.

(6) Attach easy entry rod to seat back, passenger side only.

(7) Install easy entry washer and E-clip, passenger side only.

(8) Install seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).

(9) Feed recliner cable through hole in seat adjuster and engage cable eyelet to arm on seat adjuster.

(10) Install new recliner cable eyelet clip to arm on seat frame (Fig. 8).

(11) Position seat belt buckle pretensioner to bolt on side of seat adjuster and install nut.

NOTE: Apply thread adhesive to threads before installing nut.

(12) Position lower seat belt anchor to bolt on seat adjuster.

(13) Verify that seat belt is routed such that it will not be twisted when engaged to the seat belt buckle.

(14) Install new nut attaching lower seat belt anchor to seat frame (Fig. 8).

NOTE: The tighten the lower seat belt anchor and seat belt buckle nuts to 45.3 N·m (33.3 ft. lbs.) torque.

NOTE: Verify that a minimum of three threads extend beyond the lower seat belt anchor nut and that the lower seat belt anchor swivels freely. If both conditions are not found, remove nut, torque bolt, and while preventing bolt from turning, torque nut.

(15) Install seat side shield(Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE SHIELDS - INSTALLATION). Verify that side and rear screws go through the rubber bellows.

(16) Install seat to vehicle (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

FRONT SEAT BACK COVER

REMOVAL

REMOVAL

(1) Remove seat from vehicle.

(2) Remove head restraint.

(3) Remove front seat back.

(4) Remove lumbar support handle, if equipped.

(5) Disengage the J-strap retainer (Fig. 7).

(6) Remove hog rings attaching foam pad to back frame (Fig. 12).

(7) Roll seat back cover up to the next hog rings and remove hog rings.

(8) For bonded seat back cover separate frame from bonded cover and pad.

(9) Roll cover to top of cushion and remove head restraint sleeve guides. Do not reuse head restraint sleeve guides.

(10) Remove cover from seat back.

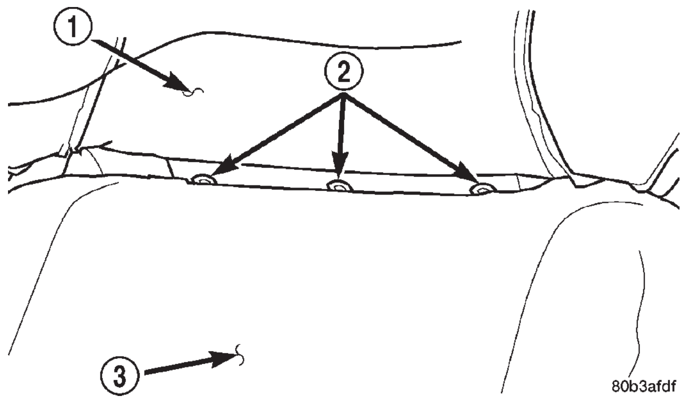

Fig. 12 Front Seat Back Hog Rings

1 - SEAT COVER
2 - HOG RINGS
3 - CUSHION

REMOVAL - JR-27 ONLY

(1) Remove seat from vehicle(Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(2) Remove head restraint (Fig. 13) by depressing headrest button and using a pick tool in access hole simultaneously.

(3) Remove seat back(Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL).

(4) Remove upper recliner handle and lumber adjustment handle, if so equipped.

(5) Remove seat side shield(Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE SHIELDS - REMOVAL).

(6) Remove nut attaching lower seat belt anchor to seat frame (Fig. 8)(Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL).

(7) Remove seat belt bezel.

NOTE: The torque prevailing nut used to secure the lower seat belt anchor is not reusable. Verify availability prior to proceeding.

(8) Disengage plastic J-strip retainer at bottom of seat back (Fig. 14).

FRONT SEAT BACK COVER (Continued)

(9) Remove hog rings holding seat cover seam cords to wires in seat back foam (Fig. 15) and (Fig. 16).

(10) Feed seat belt bezel and seat belt through seat cover while pulling cover from seat back foam.

(11) Remove hog rings attaching the seat cover seam cords and wires to seat back foam.

(12) Poll seat cover upward to mid point position.

(13) Remove head restraint guides (Fig. 17).

(14) Remove seat back cover from seat back foam and frame.

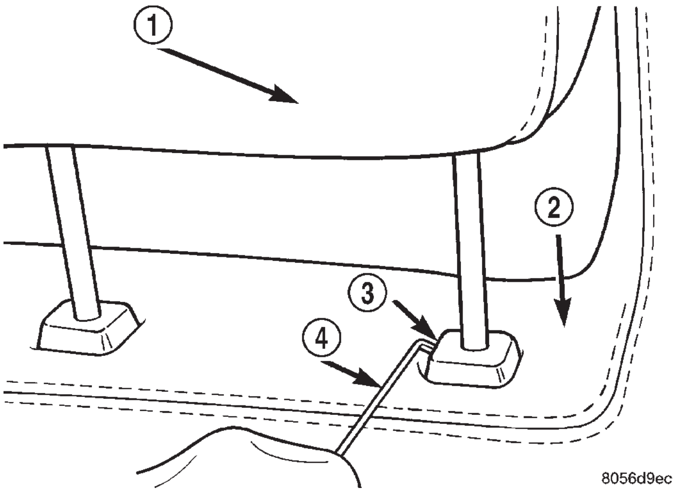

Fig. 13 Head Restraint Removal

1 - HEADREST
2 - SEAT
3 - ACCESS HOLE
4 - PICK TOOL

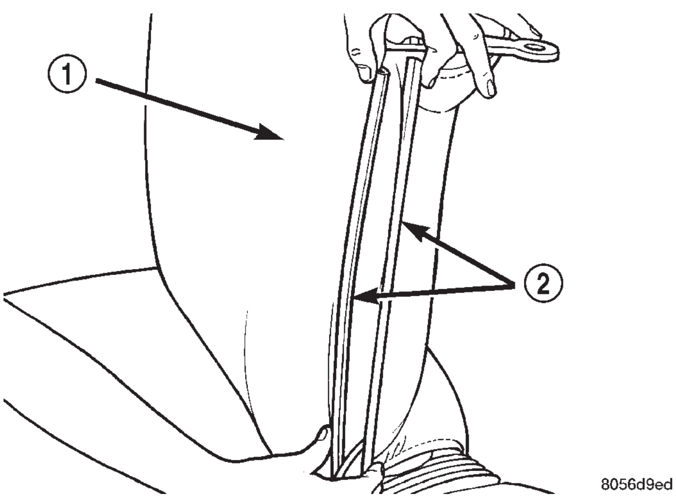

Fig. 14 Seat Cover Retainer Strip

1 - SEAT BACK

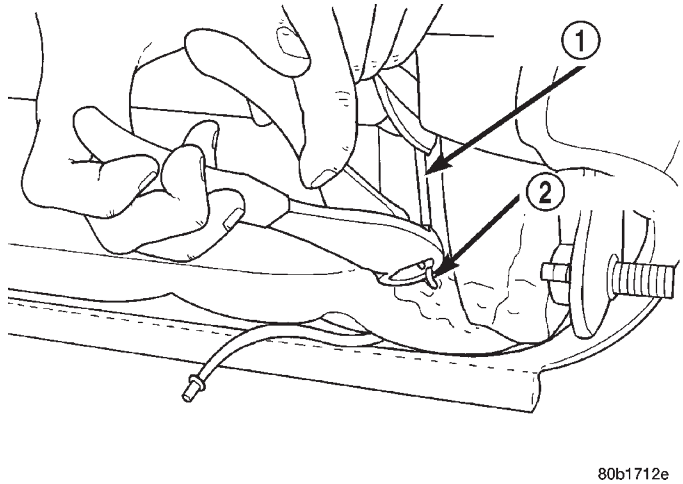

Fig. 15 Hog Rings

1 - SEAT COVER SEAM STRAP
2 - HOG RING

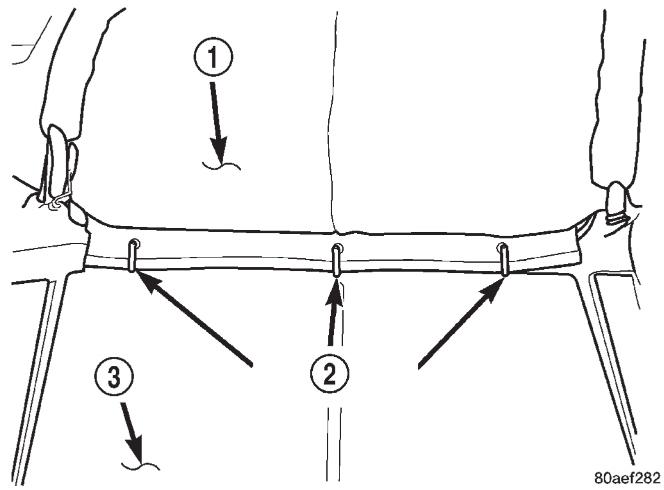

Fig. 16 Mid Seat Back Hog Rings

1 - CUSHION COVER
2 - HOG RINGS
3 - CUSHION

INSTALLATION

INSTALLATION

NOTE: Do not reuse the recliner assembly attaching bolts.

(1) Position cover on the top of seat back.

(2) Install new head restraint sleeve guides.

(3) Carefully roll cover down to the area that hog rings are to be installed.

(4) Install hog rings.

(5) Install hog rings attaching back frame to foam pad.

(6) Roll cover downward.

FRONT SEAT BACK COVER (Continued)

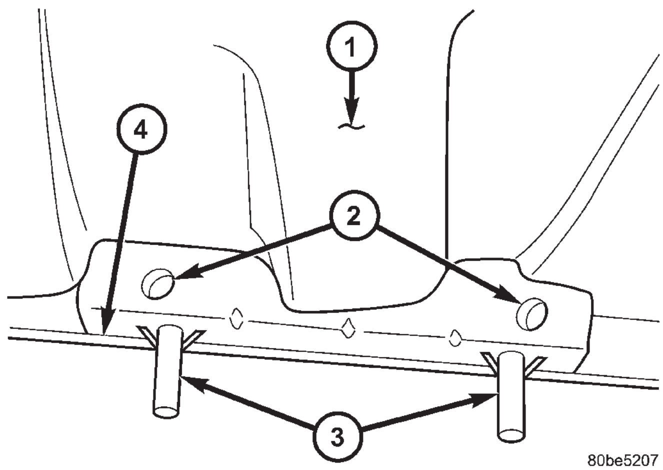

Fig. 17 2 Head Restraint Guides

1 - SEAT CUSHION
2 - HOG RINGS
3 - HEADREST GUIDES
4 - BOTTOM OF TOP SEAT FRAME RAIL

(7) Engage the J-strap retainer
(8) Install lumbar support handle, if equipped.
(9) Install new head restraint sleeve guides.
(10) Install seat back to seat cushion. Tighten recliner bolts to 40 N·m (30 ft. lbs.) torque. Tighten pivot bolts to 12 N·m (9 ft. lbs.) torque.
(11) Install seat in vehicle.
(12) Install head restraint.
(13) Check seat back and headrest operation.

INSTALLATION - JR-27 ONLY

(1) Position seat back cover on to seat back foam and frame.
(2) Install hog rings attaching seat back foam to seat back frame.
(3) Feed seat belt bezel and seat belt through hole in seat cover.
(4) Route recliner cable in front of metal strap at bottom of the seat back frame (Fig. 11).
(5) Pull seat cover downward to first horizontal trench in seat back foam.
(6) Align seat cover upper horizontal seam center notch to center hog ring location.
(7) Install hog rings, center first, to attach upper insert cover seam wire to wire in seat back foam.
(8) Install hog rings to attach seat cover seam cords to wires in seat back foam.
(9) Pull seat cover down fully over seat back foam.
(10) Connect seat cover J-strips at bottom of seat back.
(11) Install head restraint guides
(12) Slide long snaps on outboard portion of seat belt bezel inside seat back cover and seat belt retractor cover.
(13) Install upper recliner handle and lumbar adjustment handle, if so equipped.
(14) Attach lower seat belt anchor to bolt on seat adjuster.
(15) Verify that seat belt is routed such that it will not be twisted when engaged to the seat belt buckle.
(16) Install new nut attaching lower seat belt anchor to seat frame (Fig. 8).

NOTE: The tighten the lower seat belt anchor nut to 45 N·m (33 ft. lbs.) torque.

(17) Verify that a minimum of three threads extend beyond the lower seat belt anchor nut and that the lower seat belt anchor swivels freely. If both conditions are not found, check that the bolt is fully engaged to the seat adjuster.
(18) Install seat to vehicle(Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).
(19) Check seat belt operation.

FRONT SEAT CUSHION SIDE SHIELDS

REMOVAL

REMOVAL

(1) Remove seat from vehicle.
(2) Remove screws attaching seat cushion side shield to the bottom and side of seat cushion (Fig. 18) and (Fig. 19).
(3) Remove shield from seat
(4) Disconnect switch wire connectors, if equipped.
(5) Remove seat switches, if equipped.

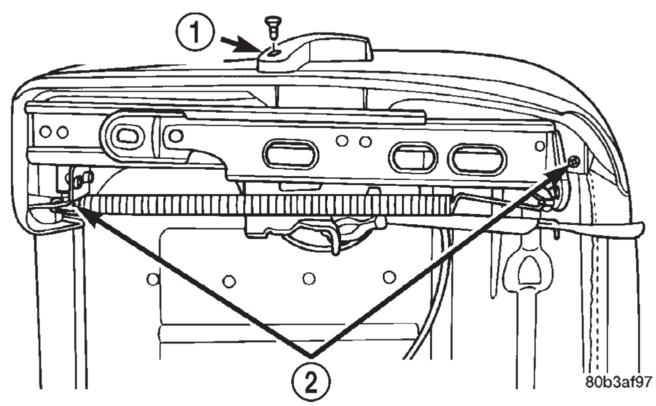

Fig. 18 Bottom View of Side Shield

1 - RECLINER HANDLE AND FASTENER
2 - SIDE SHIELD FASTENERS

FRONT SEAT CUSHION SIDE SHIELDS (Continued)

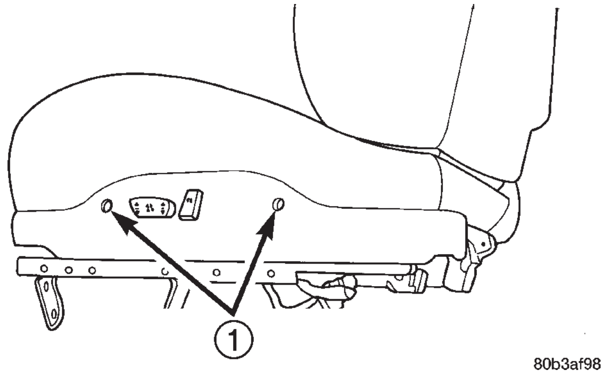

Fig. 19 Side View of Side Shield

1 - SIDESHIELD FASTENERS

REMOVAL - JR-27 ONLY

(1) Remove lower recliner handle.

(2) Remove screws attaching seat side shield to seat frame.

(3) Remove screws attaching power seat switch to side shield, if so equipped.

(4) Remove side shield from vehicle (Fig. 20).

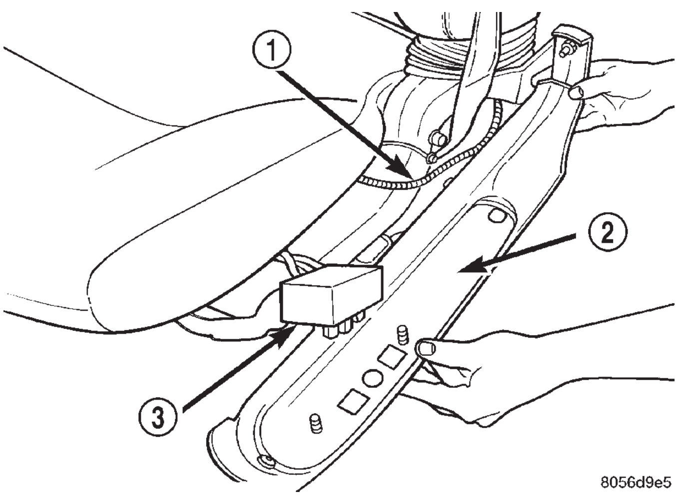

Fig. 20 Front Seat Side Shield

1 - SEAT FRAME
2 - SEAT SIDE SHIELD
3 - POWER SEAT SWITCH

INSTALLATION

INSTALLATION

(1) Transfer seat switches, if equipped.

(2) Connect switch wire connectors to cushion side shield, if equipped.

(3) Place shield in position on seat cushion.

(4) Install screws attaching seat cushion side shield.

(5) Install seat. Tighten front screws to 61 N·m (45 ft. lbs.) and the rear screws to 61 N·m (45 ft. lbs.).

INSTALLATION - JR-27 ONLY

(1) Position side shield near seat.

(2) Install screws attaching power seat switch to side shield, if so equipped.

(3) Install screws attaching side shield to seat frame.

(4) Install lower recliner handle.

FRONT SEAT CUSHION

REMOVAL - FRONT

(1) Remove seat from vehicle.

(2) Remove front seat cushion side shields and disconnect wire connectors, if equipped.

(3) Remove seat back.

(4) Remove seat cushion bolts.

(5) Disconnect wire harness fasteners from cushion frame (Fig. 21).

(6) Remove seat cushion (Fig. 22).

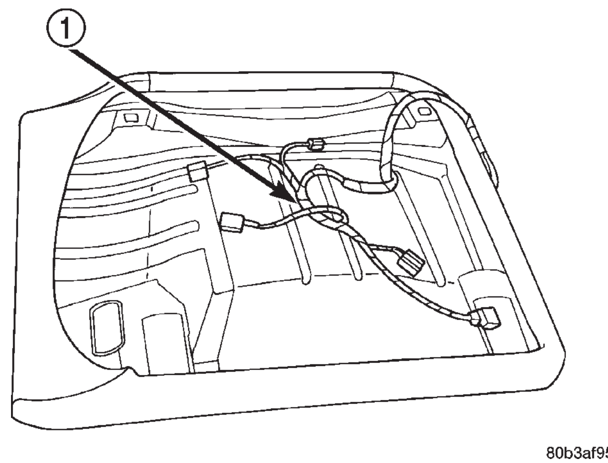

Fig. 21 Front Seat Cushion Wire Harness

1 - WIRE HARNESS

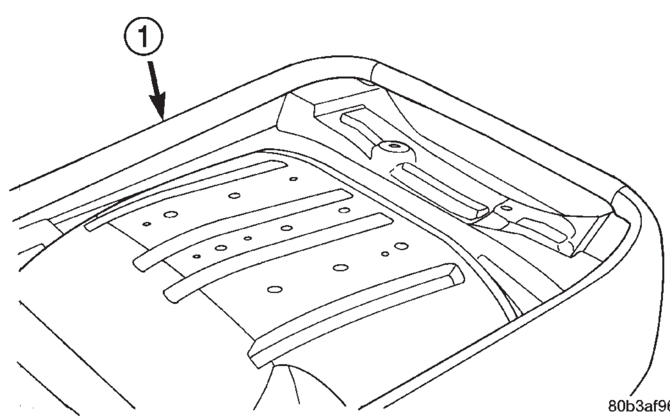

Fig. 22 Front Seat Cushion

1 - FRONT SEAT CUSHION

FRONT SEAT CUSHION (Continued)

INSTALLATION - FRONT

(1) Install wire harness fasteners to cushion frame.
(2) Install seat cushion bolts.
(3) Install seat back. Tighten recliner bolts to 12 N·m (9 ft. lbs.) torque. Tighten pivot bolts to 40 N·m (30 ft. lbs.) torque.
(4) Connect switch wire connectors to the cushion side shield, if equipped.
(5) Install cushion side shields.
(6) Install seat in vehicle.

FRONT SEAT CUSHION COVER

REMOVAL - FRONT SEAT CUSHION COVER

NOTE: Fabric covered cushions are serviced as an assembly.

(1) Remove seat from vehicle.
(2) Remove front seat cushion side shields and disconnect wire connectors, if equipped.
(3) Remove seat back.
(4) Remove seat cushion bolts.
(5) Disconnect wire harness fasteners from cushion pan. (Fig. 21).
(6) Disengage J-strap attaching seat cover from the seat cushion frame (Fig. 23).
(7) Pull cover off to the hog rings (Fig. 24).
(8) Cut hog rings attaching seat cover seat cushion.
(9) Remove seat cushion cover from seat cushion.

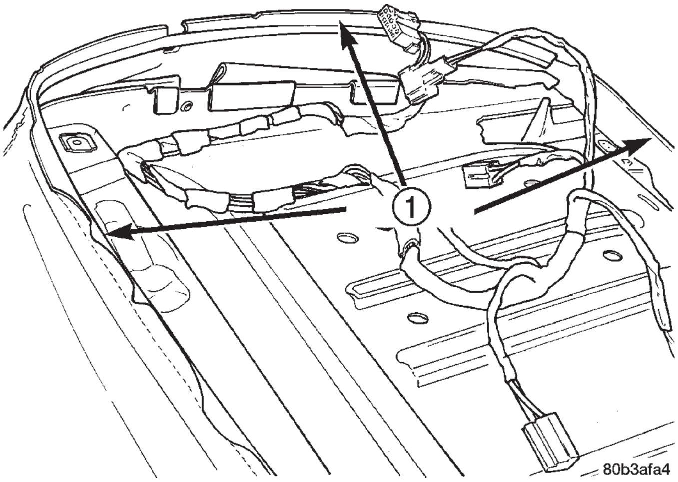

Fig. 23 Front Seat Cushion J-Strap

1 - J-STRAP

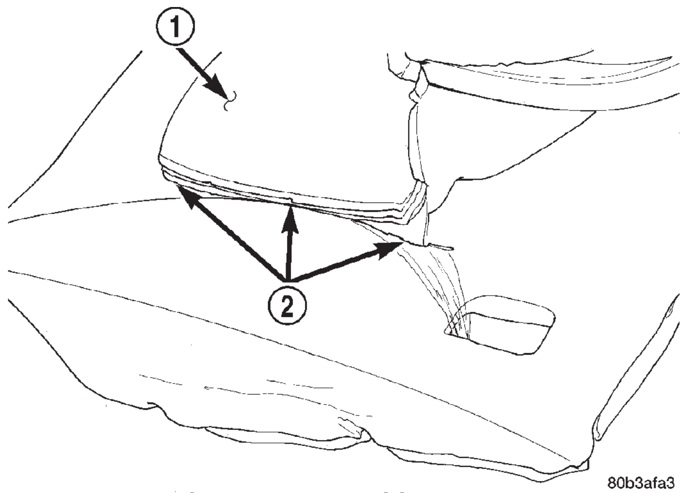

Fig. 24 Seat Cushion Cover

1 - SEAT COVER
2 - HOG RINGS

INSTALLATION - FRONT SEAT CUSHION COVER

NOTE: Fabric covered cushions are serviced as an assembly.

(1) Position seat cover on cushion.
(2) Align seat cover with cushion alignment indentations (Fig. 25).
(3) Install hog rings.
(4) Engage J-strap attaching seat cover to front of seat cushion frame.
(5) Install wire harness fasteners to cushion pan.
(6) Install seat cushion bolts.
(7) Install seat back. Tighten recliner bolts to 12 N·m (9 ft. lbs.) torque. Tighten pivot bolts to 40 N·m (30 ft. lbs.) torque.
(8) Connect switch wire connectors to the cushion side shield, if equipped.
(9) Install cushion side shields.
(10) Install seat in vehicle.

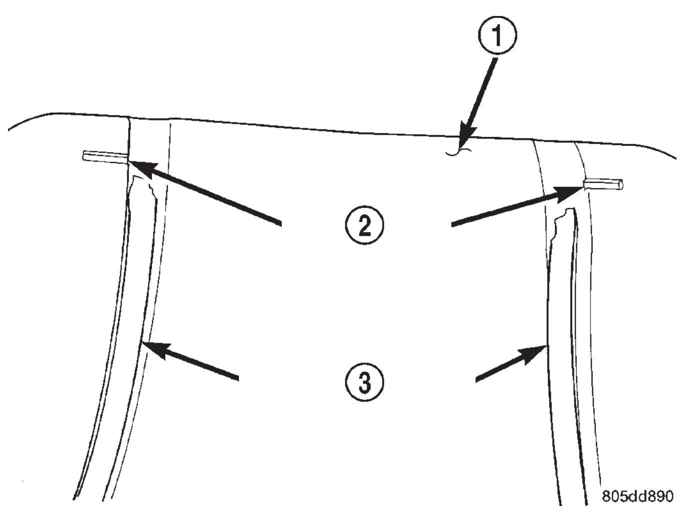

Fig. 25 Seat Cushion

1 - SEAT CUSHION
2 - ALIGNMENT INDENTATIONS
3 - HOOK AND LOOP FASTENER

REAR SEAT

DESCRIPTION

Refer to (Fig. 26) for more information while servicing the rear seat.

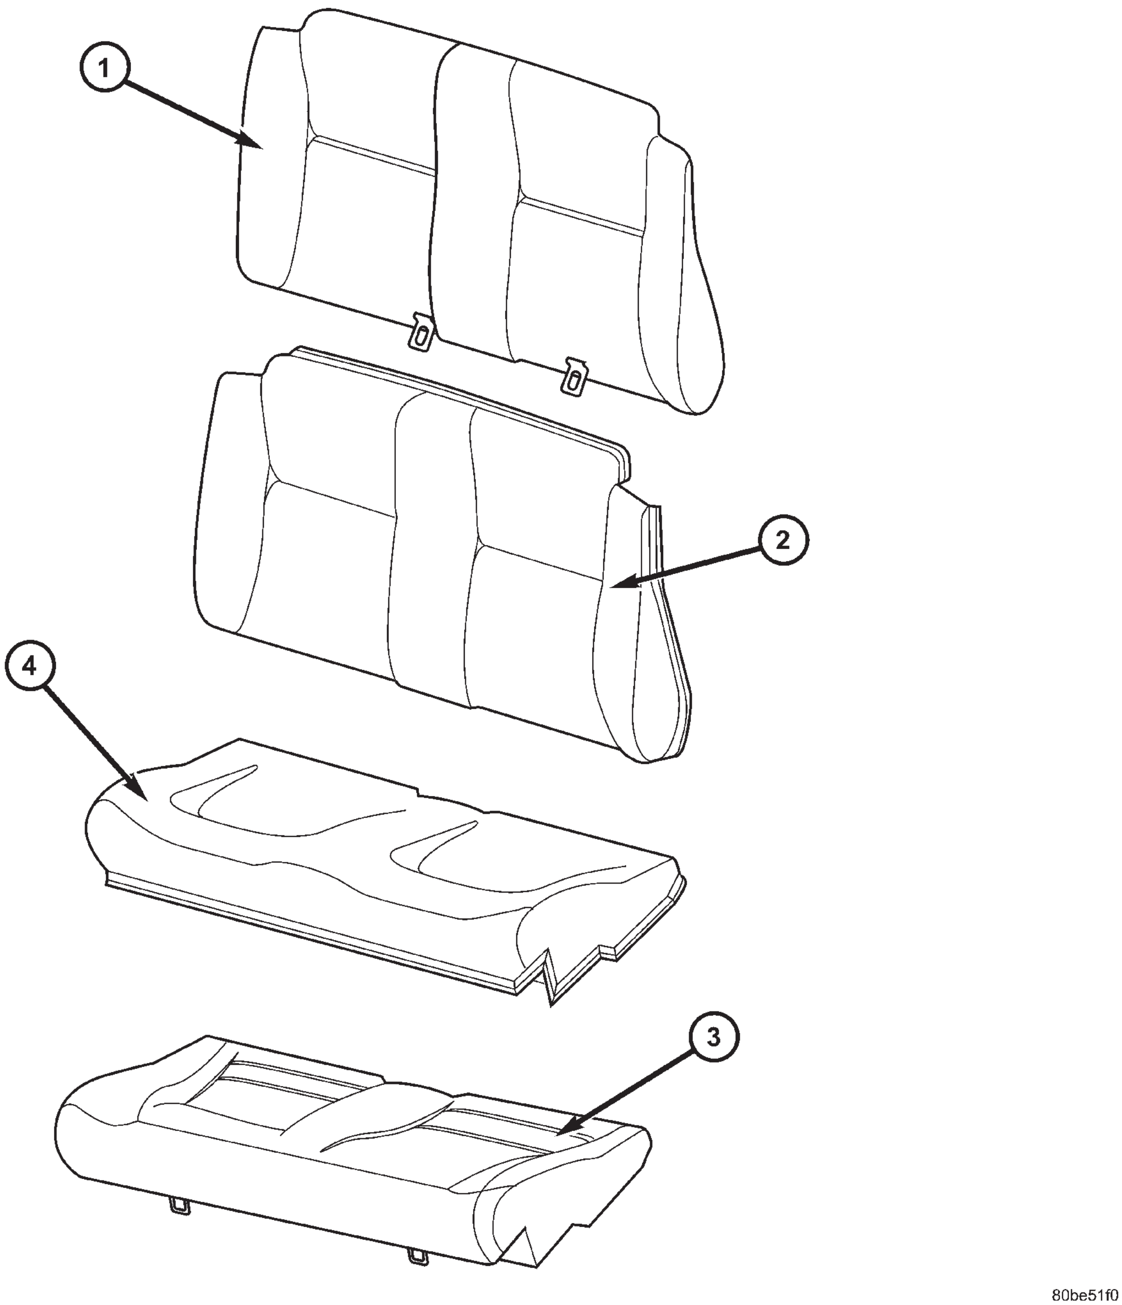

Fig. 26 Rear Seat Exploded View

1 - SEAT BACK FOAM AND FRAME
2 - SEAT BACK COVER
3 - SEAT CUSHION COVER
4 - SEAT CUSHION FOAM AND FRAME

REAR SEAT CUSHION

REMOVAL

REMOVAL - REAR

NOTE: Fabric covered cushions are serviced as an assembly.

(1) Pull upward at forward edge of cushion each retainer loop of the rear seat cushion to disengage retainer loops from cups in floor (Fig. 27).
(2) Guild seat belts through loops.
(3) Remove rear seat cushion from vehicle.

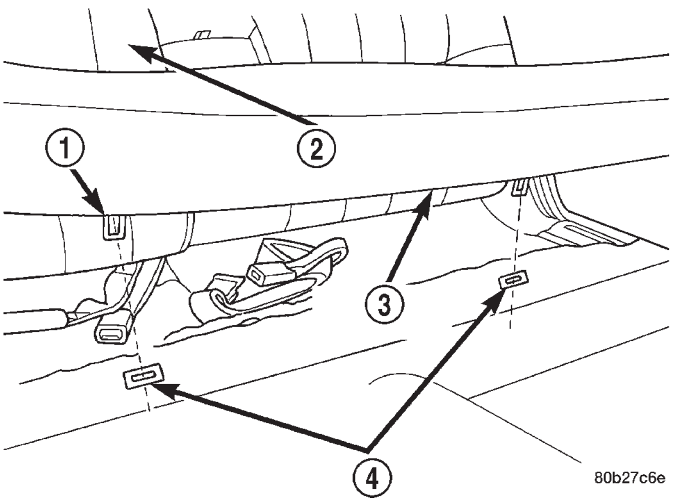

Fig. 27 Rear Seat Cushion

1 - RETAINER LOOP
2 - REAR SEAT BACK
3 - REAR SEAT CUSHION
4 - CUPS

REMOVAL - JR-27 ONLY

NOTE: Special care should be taken when removing rear seat cushion to prevent damage to the cushion frame. Remove cushion at attachment areas, not at wing area.

(1) Push firmly rearward and upward at one attachment point and disengage wire loops from retainers in floor pan (Fig. 28).
(2) Repeat for other attachment point.
(3) Separate rear seat cushion from vehicle.

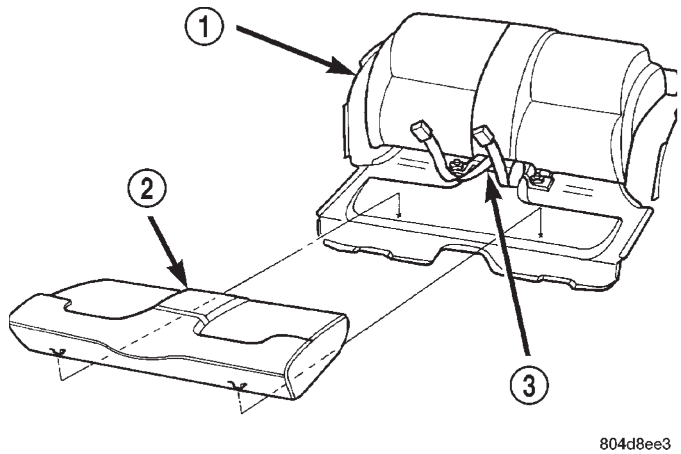

Fig. 28 Rear Seat Cushion

1 - REAR SEAT BACK
2 - REAR SEAT CUSHION
3 - INNER SEAT BELTS

INSTALLATION

INSTALLATION - REAR

NOTE: Fabric covered cushions are serviced as an assembly.

NOTE: Verify visibility of “Latch” bars in the seat bite area.

(1) Place rear seat cushion in position.
(2) Guild seat belts through loops.
(3) Engage retainer loops into cup on floor kick-up.
(4) Push downward at forward edge at each retainer loop of the rear seat cushion to engage retainers.

INSTALLATION - JR-27 ONLY

NOTE: Special care should be taken when removing rear seat cushion to prevent damage to the cushion frame. Remove cushion at attachment areas, not at wing area.

(1) Position rear seat cushion in vehicle.
(2) Place inner seat belts on top of seat cushion.
(3) Push rear seat cushion rearward and align wire loops to retainers in floor pan.
(4) Push rear seat cushion firmly downward and engage wire loops to retainers in floor pan.

REAR SEAT CUSHION COVER

REMOVAL

REMOVAL - REAR SEAT CUSHION COVER

(1) Remove rear seat cushion.
(2) Disengage the J-strap retainers (Fig. 29).
(3) Cut hog rings to free cover (Fig. 30).
(4) Remove seat cushion cover from seat cushion.

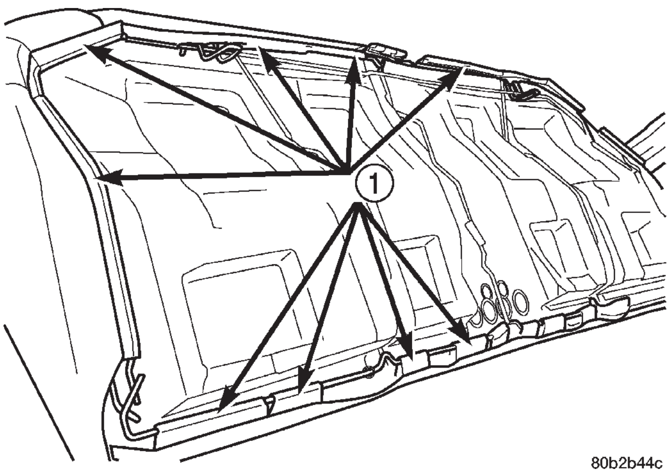

Fig. 29 Rear Seat Cushion Cover J-Straps

1 - J-STRAPS

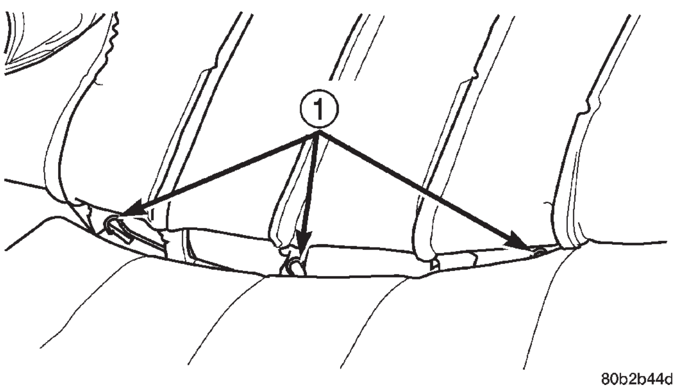

Fig. 30 Rear Seat Cushion Cover Hog Rings

1 - HOG RINGS

REMOVAL - JR-27 ONLY

(1) Remove rear seat cushion from vehicle (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).
(2) Place seat cushion on a suitable work surface in inverted position.
(3) Remove hog rings around perimeter of seat cushion attaching seat cushion cover to seat cushion frame.
(4) Pull seat cover from seat cushion frame and seat cushion foam.
(5) Remove hog rings attaching seat cover seam wires to seat foam wires.
(6) Remove seat cover from seat frame and seat cushion foam.

INSTALLATION

INSTALLATION - REAR SEAT CUSHION COVER

(1) Position seat cushion cover on cushion.
(2) Install hog rings to seat cover.
(3) Engage the J-strap retainers.
(4) Steam wrinkles from seat cushion, if necessary.
(5) Install seat cushion.

INSTALLATION - JR-27 ONLY

(1) Position seat cushion cover to seat cushion frame and seat cushion foam.
(2) Install a hog ring at each hog ring location to attach seat cushion cover seam wires to wires in seat cushion foam. Begin at center location and work outward.
(3) Repeat above steps for opposite inboard vertical seam, both outboard vertical seams, and for the horizontal seams.
(4) Pull seat cover over seat cushion frame and seat cushion foam.
(5) Install hog rings at hog ring locators around perimeter of seat cushion foam attaching seat cushion cover to seat cushion frame.
(6) Install rear seat cushion to vehicle (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).

REAR SEAT BACK

REMOVAL

REMOVAL - FOLDING BACK

NOTE: Fabric covered cushions are serviced as an assembly.

(1) Remove rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)
(2) Remove the rear seat buckles and belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT - REAR INBOARD - REMOVAL)
(3) Remove the outer seat back bracket nuts (Fig. 31).
(4) Release folding rear seat back latches.
(5) Remove seat back from vehicle.

REMOVAL - JR-27 ONLY

(1) Remove rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).

REAR SEAT BACK (Continued)

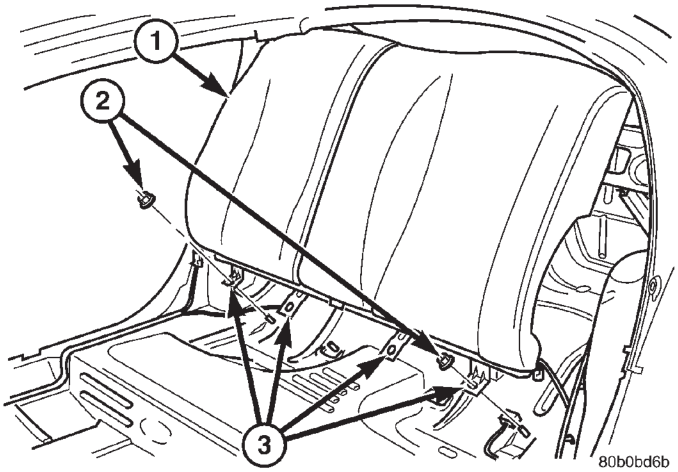

Fig. 31 REAR SEAT BACK

1 - SEAT BACK
2 - NUTS
3 - BRACKETS

(2) Remove rear inner seat belt assembly (Fig. 32).

(3) Pull bottom of rear seat back forward until seat back brackets clear studs on floor pan (Fig. 33).

(4) Push upward on rear seat back and disengage hooks attaching seat back to rear seat back support.

(5) Remove rear seat back from vehicle.

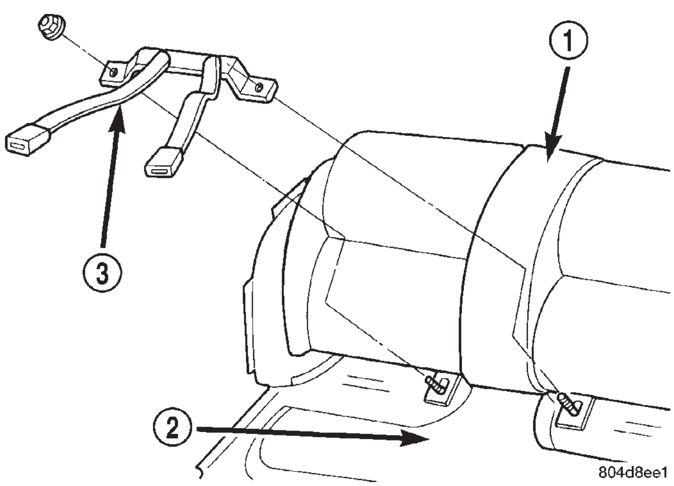

Fig. 32 Rear Inner Seat Belt Assembly

1 - REAR SEAT BACK
2 - FLOOR PAN
3 - INNER SEAT BELT ASSEMBLY

INSTALLATION

INSTALLATION - FOLDING BACK

NOTE: Fabric covered cushions are serviced as an assembly.

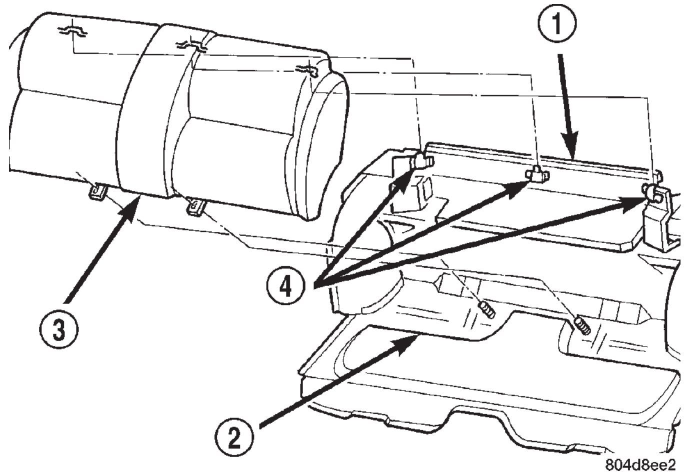

Fig. 33 Rear Seat Back

1 - REAR SEAT BACK SUPPORT
2 - FLOOR PAN
3 - REAR SEAT BACK
4 - RETAINING BRACKET

(1) Place the four seat back brackets over the body mounted weld studs and position seat back in vehicle.

(2) Engage folding rear seat back latch.

(3) Install the outer seat back bracket nuts and tighten to 61 Nm (45 ft. lbs.).

(4) Install the rear seat buckles and belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT - REAR INBOARD - INSTALLATION)

(5) Install rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)

INSTALLATION - JR-27 ONLY

(1) Position rear seat back in vehicle.

(2) Tilt rear seat back rearward and raise seat back above retaining brackets on rear seat back support.

(3) Lower rear seat back until center loop begins to engage.

(4) Lower rear seat back and push rearward on outboard corners of seat back to engage outboard hooks to brackets on rear seat back support.

(5) Push downward on rear seat back until all hooks are fully engaged into retaining brackets.

(6) Install rear inner seat belt assembly.

(7) Install rear seat cushion.

NOTE: Tighten the rear inner seat belt assembly to 40 N·m (30 ft. lbs.) torque.

REAR SEAT BACK COVER

REMOVAL - JR-27 ONLY

(1) Remove rear seat back from vehicle (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
(2) Place seat back on a suitable work surface in inverted position.
(3) Remove hog rings around perimeter of seat back holding seat back cover to seat back frame.
(4) Pull seat cover from seat back frame and seat back foam.
(5) Remove any hog rings holding seat cover seam wires to seat foam wires.
(6) Remove seat cover from seat frame and seat back foam.

INSTALLATION - JR-27 ONLY

(1) Position seat cover to seat back frame and seat back foam.
(2) Align notch in center of seat back cover vertical seam to center hog ring locator.
(3) Install a hog ring at each hog ring location, center first, attaching seat back cover seam to wires in seat back foam.
(4) Repeat the above steps for the opposite inboard vertical seam, both outboard vertical seams, and the lower horizontal seam.
(5) Install hog rings at each hog ring locator, center first, to attach ends of vertical portions of U-shaped wires to vertical foam wires.
(6) Align notch in center of upper horizontal seat cover seam to center hog ring location.
(7) Install a hog ring at each hog ring locator to hold upper horizontal seam wire to wire in seat back foam.
(8) Install hog rings attaching seat cover seam wires to seat frame.
(9) Pull seat cover over seat back frame and seat back foam.
(10) Install hog rings at hog ring locators around perimeter of seat back cushion attaching seat cover to seat back frame.
(11) Install rear seat back to vehicle (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

SEAT ADJUSTERS

REMOVAL

REMOVAL - FRONT SEAT ADJUSTER – POWER

(1) Remove front seat from vehicle.
(2) Remove seat cushion side shield and disconnect switch connector.
(3) Remove seat back.
(4) Remove bolts attaching seat adjuster to cushion pan (Fig. 34).
(5) Disconnect wire harness fasteners from cushion pan.
(6) Remove seat adjuster from seat cushion.

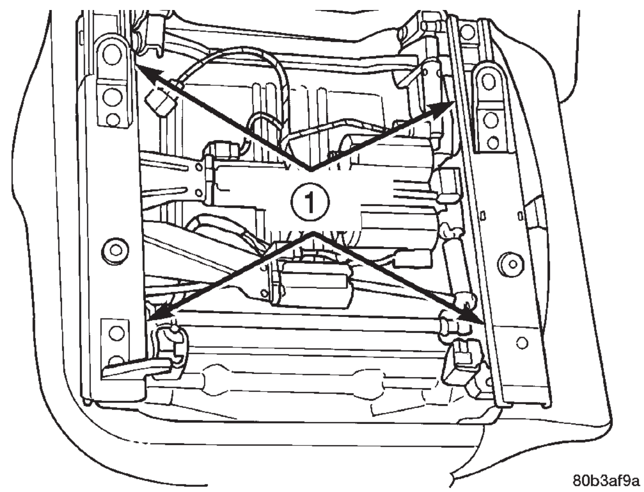

Fig. 34 Front Seat Track

1 - ATTACHING BOLTS

REMOVAL - MANUAL ADJUSTER

(1) Remove front seat from vehicle (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
(2) Remove recliner handle.
(3) Remove seat cushion side shield (Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE SHIELDS - REMOVAL).
(4) Remove seat back (Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL).
(5) Remove recliner.
(6) Remove towel bar spring.
(7) Remove push nuts attaching towel bar to seat adjuster.
(8) Remove towel bar from seat adjuster.
(9) Remove seat adjuster.

SEAT ADJUSTERS (Continued)

INSTALLATION

INSTALLATION - FRONT SEAT ADJUSTER – POWER

(1) Place seat adjuster in position on seat cushion pan.

(2) Connect wire harness fasteners to the cushion pan.

(3) Install bolts attaching seat adjuster to cushion pad.

(4) Install seat back.

(5) Install bolt to attach seat back recliner to seat back on each side of seat. Tighten bolt to 12 N·m (9 ft. lbs.) torque.

(6) Connect wire connectors and install the cushion side shields.

(7) Install front seat in vehicle.

INSTALLATION - MANUAL ADJUSTER

(1) Place seat adjuster in position.

(2) Install seat adjuster.

(3) Install towel bar to seat adjuster.

(4) Install new push nuts to attach towel bar to seat adjuster.

(5) Install towel bar spring.

(6) Install recliner.

(7) Install seat back(Refer to 23 - BODY/SEATS/SEAT BACK - INSTALLATION) .

(8) Install bolt to attach seat back recliner to seat back on each side of seat. Tighten recliner bolt to 12 N·m (9 ft. lbs.) torque. Tighten pivot bolts to 40 N·m (30 ft. lbs.) torque.

(9) Install recliner handle.

(10) Install front seat in vehicle(Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

SEAT BACK LATCH STRIKER

REMOVAL

(1) Release seat back latch and fold down.

(2) Remove the bolts and remove the latch striker (Fig. 35).

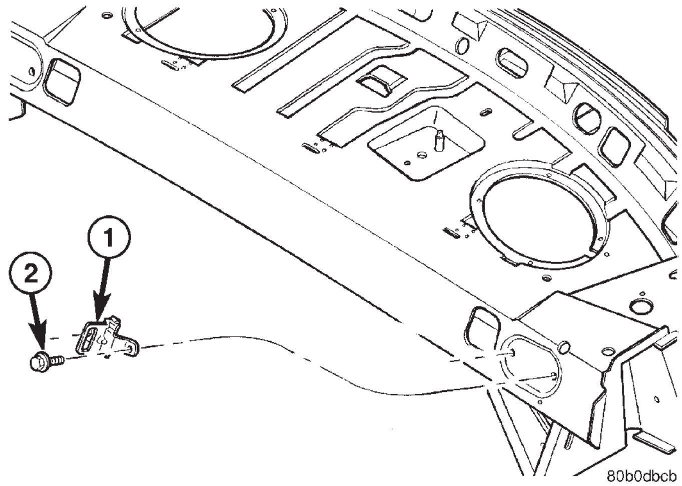

Fig. 35 SEAT BACK STRIKER

1 - STRIKER
2 - BOLTS

INSTALLATION

NOTE: Striker is not symmetrical and should be installed with the white date code towards the outside of the vehicle.

(1) Install the seat back striker and install the bolts.

(2) Tighten the bolts to 12 N·m (9 ft. lbs.).

(3) Lock seat back in the up position and check for operation.

SEAT BACK RECLINER

REMOVAL

REMOVAL

(1) Remove front seat from vehicle.
(2) Remove recliner handle
(3) Remove seat cushion side shield.
(4) Remove seat back.
(5) Remove manual recliner right and left bolts.
(6) Remove manual recliner assembly.

REMOVAL - JR-27 ONLY

(1) Remove seat from vehicle(Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
(2) Remove seat back from lower seat frame(Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL).
(3) Remove upper recliner handle.
(4) Remove seat back cover until the screws attaching the upper recliner mechanism to the seat back frame can be accessed.
(5) Remove rubber bellows covering lower part of seat back frame.
(6) Remove screws attaching upper recliner mechanism to seat frame.
(7) Remove bolts attaching recliner housing to seat frame.
(8) Push upper recliner mechanism into seat frame with handle shaft facing the front of the seat frame.

NOTE: Do not reuse bolts holding recliner housing to seat frame. Verify availability prior to proceeding.

(9) Pull recliner housing and upper recliner handle mechanism downward and out through bottom of seat frame (Fig. 36).

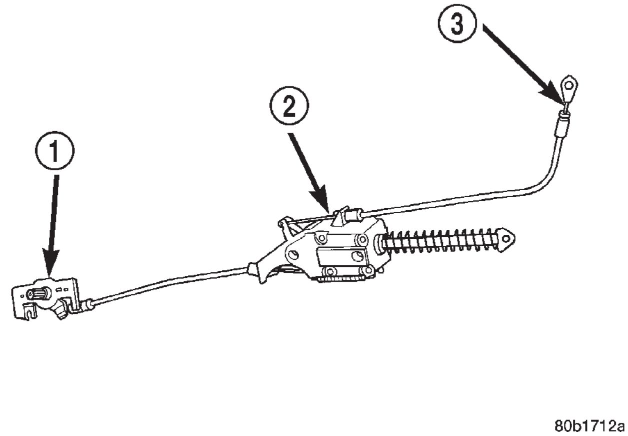

Fig. 36 Recliner Housing

1 - UPPER RECLINER MECHANISM
2 - RECLINER HOUSING
3 - RECLINER CABLE

INSTALLATION

INSTALLATION

(1) Place seat recliner in position.
(2) Install manual recliner right and left bolts.
(3) Install seat back.
(4) Install recliner.
(5) Install bolt to attach seat back recliner to seat back on each side of seat. Tighten recliner bolt to 12 N·m (9 ft. lbs.) torque. Tighten pivot bolts to 40 N·m (30 ft. lbs.) torque.
(6) Remove seat cushion side shield.
(7) Install recliner handle.
(8) Install front seat in vehicle.

INSTALLATION - JR-27 ONLY

(1) Feed upper recliner mechanism and then recliner housing into the seat back frame with handle shaft facing the front of the seat frame.
(2) Install new bolts to attach seat recliner housing to seat frame. Tighten to 34 N·m (300 in. lbs.) torque.
(3) Pull upper recliner mechanism through hole in seat frame.
(4) Install screws attaching upper recliner mechanism to seat frame.
(5) Install rubber bellows covering lower part of seat back frame.
(6) Install seat back cover.
(7) Install recliner spring bracket, spring, and lead screw.
(8) Install seat back to lower seat frame(Refer to 23 - BODY/SEATS/SEAT BACK - INSTALLATION).
(9) Install recliner handle.
(10) Install seat into vehicle(Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

STATIONARY GLASS

TABLE OF CONTENTS

WINDSHIELD

DESCRIPTION

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.

URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.

DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.

BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.

SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.

ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

REMOVAL

REMOVAL - JR-27 ONLY

EXTERIOR METHOD

(1) Open convertible top.

(2) Remove header/A-pilllar weatherstrip from weatherstrip retainers.

(3) Remove A-pillar weatherstrip retainer and molding.

(4) Remove header weatherstrip/molding.

(5) Mark top edge of the windshield glass at three locations on the header.

(6) Remove windshield wiper arms.

(7) Remove cowl cover.

WINDSHIELD (Continued)

(8) Place protective covers over instrument panel and hood.

(9) Using a sharp cold knife, cut urethane adhesive holding the windshield to the A-pillars, header and cowl pinch weld fences (Fig. 1). A power cutting device can be used if available.

(10) Remove windshield from vehicle.

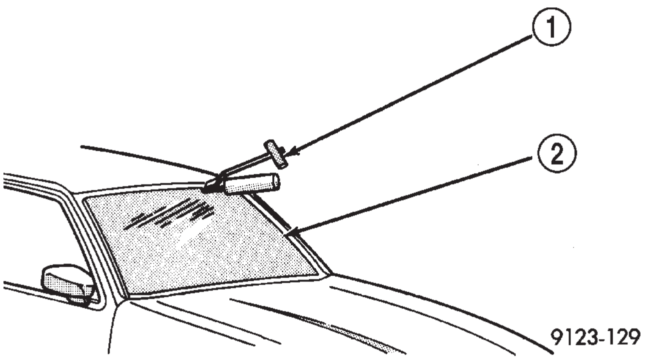

Fig. 1 Cut Urethane Around Windshield

1 - COLD KNIFE
2 - WINDSHIELD

INTERIOR METHOD

(1) Remove cowl cover.

(2) Open convertible top.

(3) Remove header/A-pillar weatherstrip from weatherstrip retainers.

(4) Remove A-pillar weatherstrip retainer and molding.

(5) Remove header weatherstrip/molding.

(6) Mark top edge of the windshield glass at three locations on the header.

(7) Remove header panel trim cover.

(8) Remove header panel weatherstrip from channel.

(9) Remove instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(10) Remove A-pillar trim covers.

(11) Place protective covers over instrument panel and hood.

(12) Using a reciprocating or oscillating power knife, cut urethane adhesive holding the windshield to the A-pillars, roof header and cowl pinch weld fences. Refer to instructions provided with the equipment being used.

(13) Remove windshield from vehicle.

REMOVAL

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

(1) Remove inside rear view mirror.

(2) Remove cowl cover. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).

(3) Remove drip rail weatherstrips as necessary to gain access to screws holding windshield side moldings to A-pillars.

(4) Remove screws holding windshield side moldings to A-pillars

(5) Remove windshield moldings. (Fig. 2)Pull outward on molding at the bottom of A-pillars using pliers.

(6) Cut urethane bonding from around windshield using a suitable sharp cold knife. A pneumatic cutting device can be used if available. (Fig. 3)

(7) Separate windshield from vehicle.

WINDSHIELD (Continued)

INSTALLATION

INSTALLATION - JR-27

CAUTION: Open the left front door glass before installing windshield to avoid pressurizing the passenger compartment. If a door is slammed before urethane bonding is cured, water leaks can result. Allow the urethane at least 24 hours to cure before returning the vehicle to use.
To avoid stressing the replacement windshield, the urethane bonding material on the windshield fence should be smooth and consistent to the shape of the replacement windshield. The support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

NOTE: The JR 27 uses adjustable support spacers along the bottom. Once the support spacers are set, use care not to move them.

(1) Place replacement windshield into windshield opening and position glass in the center of the opening against the support spacers.
(2) Verify the glass lays evenly against the pinch weld fence at the sides, top and bottom of the replacement windshield. If not, the pinch weld fence must be formed to the shape of the new glass.
(3) Move the support spacers as necessary so that the top of the windshield aligns with the marks on the header, from the original windshield.
(4) Place a piece of tape over the ratcheting portion of the bottom support spacer to prevent them from moving.
(5) Repeat Step 3 and Step 4for the opposite side of the windshield.
(6) Mark the glass at the support spacers with a grease pencil or pieces of masking tape and ink pen to use as a reference for installation (Fig. 4).
(7) Remove replacement windshield from windshield opening.
(8) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 5).

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(9) Clean inside of windshield with ammonia based glass cleaner and lint-free cloth.
(10) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of windshield and wipe with clean/dry lint-free cloth until no streaks are visible.
(11) Apply Glass Primer 25 mm (1 in.) wide around perimeter of windshield. Allow at least three minutes drying time.
(12) Using a razor knife, remove as much original urethane as possible. Do not damage paint on windshield fence.

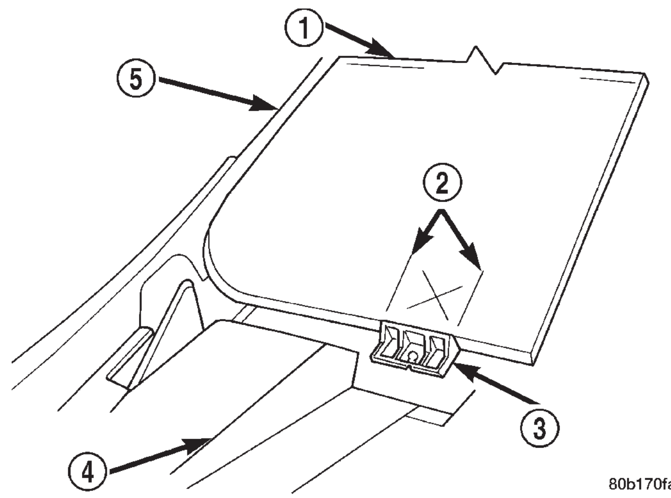

Fig. 4 Center Windshield and Mark at Support Spacers

5 - A-PILLAR

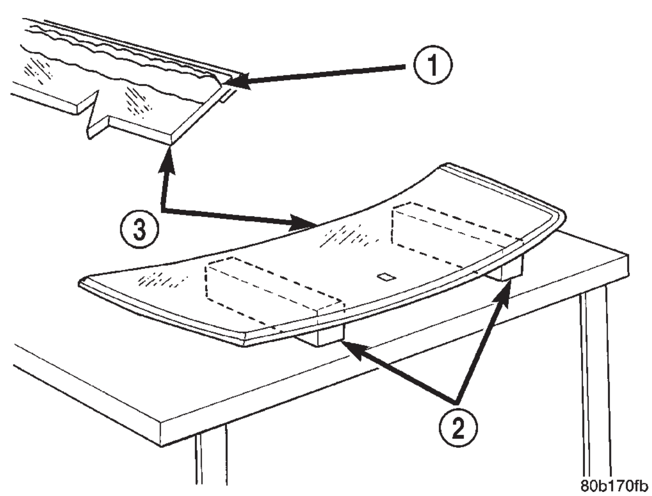

Fig. 5 Work Surface Set Up

1 - URETHANE BEAD AROUND GLASS 7mm (.3 in.) FROM EDGE
2 - BLOCKS
3 - WINDSHIELD

WINDSHIELD (Continued)

(13) Apply pinch weld primer 15 mm (.75 in.) wide around the windshield fence. Allow at least three minutes drying time.

(14) If a low viscosity urethane adhesive is used, install compression spacers on the fence around the windshield opening at original locations (Fig. 6).

(15) Apply a 10 mm (0.4 in.) bead of urethane on center line of windshield fence.

(16) With the aid of a helper, position the windshield over the windshield opening. Align the reference marks at the bottom of the windshield to the support spacers.

(17) Slowly lower windshield glass to windshield opening fence. Push windshield inward until glass is flush to A-pillars (Fig. 7).

(18) Clean access urethane from exterior with Mopar® Super Kleen or equivalent.

(19) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(20) Install cowl cover and wipers.

(21) Install inside rear view mirror to header.

(22) After urethane has cured, remove tape strips and water test windshield to verify repair.

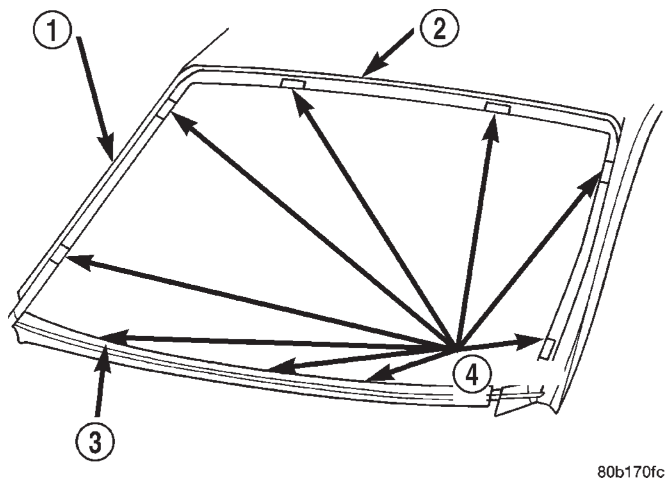

Fig. 6 Position Urethane Compression Spacers – Typical

INSTALLATION

CAUTION: Open the left front door glass before installing windshield to avoid pressurizing the passenger compartment. If a door is slammed before urethane bonding is cured, water leaks can result. Allow the urethane at least 24 hours to cure before returning the vehicle to use.

To avoid stressing the replacement windshield, the urethane bonding material on the windshield fence should be smooth and consistent to the shape of the replacement windshield. The support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

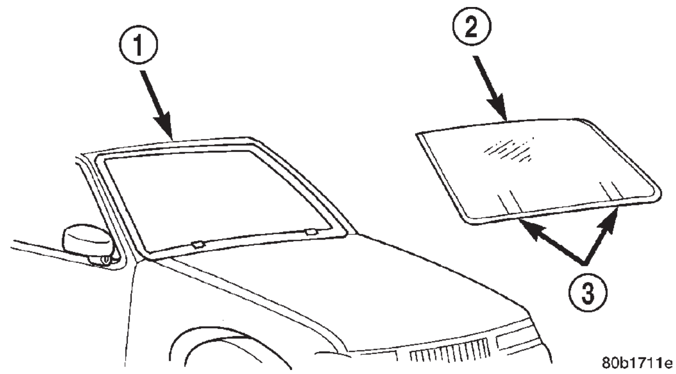

Fig. 7 Lower Windshield Into Position

1 - FENCE
2 - WINDSHIELD WITH URETHANE APPLIED
3 - REFERENCE MARKS

(1) Place replacement windshield into position and center in the opening against the support spacers.

(2) Verify the glass lays evenly against the pinch weld fence at the sides, top and bottom of the replacement windshield. If not, the pinch weld fence must be formed to the shape of the new glass.

(3) Mark the glass at the support spacers with a grease pencil or pieces of masking tape and ink pen to use as a reference for installation (Fig. 8).

(4) Remove replacement windshield from windshield opening.

(5) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 9).

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(6) Clean inside of windshield with ammonia based glass cleaner and lint free cloth.

(7) Apply molding to perimeter of windshield.

(8) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of windshield and wipe with clean/dry lint free cloth until no streaks are visible.

(9) Apply Glass Primer 25 mm (1 in.) wide around perimeter of windshield. Allow at least three minutes drying time.

WINDSHIELD (Continued)

(10) Using a razor knife, remove as much original urethane as possible. Do not damage paint on windshield fence.

(11) Apply pinch weld primer 15 mm (.75 in.) wide around the windshield fence. Allow at least three minutes drying time.

(12) If a low viscosity urethane adhesive is used, install compression spacers on the fence around the windshield opening (Fig. 10).

(13) Apply a 10 mm (0.4 in.) bead of urethane on center line of windshield fence.

(14) With the aid of a helper, position the windshield over the windshield opening. Align the reference marks at the bottom of the windshield to the support spacers.

(15) Slowly lower windshield glass to windshield opening fence. Guide the molding into proper position as necessary. Push windshield inward molding is flush to roof line and A-pillars.

(16) Clean access urethane from exterior with Mopar® Super Kleen or equivalent.

(17) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(18) Install windshield side moldings and drip rail weatherstrips.

(19) Install cowl cover and wipers.

(20) Install inside rear view mirror.

(21) After urethane has cured, remove tape strips and water test windshield to verify repair.

BACKLITE

REMOVAL

For a description of tools and adhesive systems that are recommended for use in this procedure (Refer to 23 - BODY/STATIONARY GLASS/WINDSHIELD - REMOVAL).

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT. BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

CAUTION: Open the left front door glass before installing the rear window to avoid pressurizing the passenger compartment if a door is slammed before the urethane bonding is fully cured. Water leaks can result

(1) Remove rear window moldings.
(2) Remove upper quarter trim panel.
(3) Disengage wire connectors from rear window defogger, and rear window mounted radio antenna, if so equipped.
(4) Remove C-pillar applique, if so equipped.

WARNING: WEAR EYE AND HAND PROTECTION WHEN HANDLING SAFETY GLASS. PERSONAL INJURY CAN RESULT.

CAUTION: Do not damage body or trim finish when cutting out glass or applying fence primer.

(5) Cut the urethane around the perimeter of the rear window glass. (Refer to 23 - BODY/STATIONARY GLASS/WINDSHIELD - REMOVAL).
(6) Remove the rear window from the vehicle.

INSTALLATION

For a description of tools and adhesive systems that are recommended for use in this procedure (Refer to 23 - BODY/STATIONARY GLASS/WINDSHIELD - INSTALLATION).

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT. BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

CAUTION: Open the left front door glass before installing the rear window to avoid pressurizing the passenger compartment if a door is slammed before the urethane bonding is fully cured. Water leaks can result

(1) Prepare the work area, window fence, and glass the same way as described in the Windshield section of this group (Refer to 23 - BODY/STATIONARY GLASS/WINDSHIELD - INSTALLATION).
(2) Place fence spacers at the locations shown (Fig. 11).
(3) Install the rear window molding on glass.
(4) Apply a 10 mm (0.4 in.) bead of urethane along center line of window fence.
(5) Install the glass in the same manner described in the Windshield section of this group (Refer to 23 - BODY/STATIONARY GLASS/WINDSHIELD - INSTALLATION) (Fig. 11).
(6) Connect rear window defogger wiring, and rear window mounted radio antenna, if so equipped.
(7) Install C-pillar applique, and interior trim.
(8) After urethane has cured, water test rear window to verify repair. Verify rear window defogger operation.

SUNROOF

TABLE OF CONTENTS

SUNROOF

DESCRIPTION

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from a three switches located on the windshield header, rearward of the map lamp. To operate the sunroof the ignition switch must be in either the Accessory or On/Run position. One switch (vent) is a push button type and opens the sunroof to the vent position only. The other switch (open/close) is a rocker type for opening and closing the sunroof. Pressing and releasing the open button once the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position.

DIAGNOSIS AND TESTING - SUNROOF

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. Refer to Sunroof Diagnostic Chart for possible causes. If not, a common electrical problem may exist. (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DESCRIPTION) for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in cavity 19 of the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof controller, (Refer to 8W - WIRING DIAGRAMS), for circuit information. If battery voltage of more than 10 volts is detected at the controller, proceed with the following tests (the controller will not operate at less than 10 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

SUNROOF (Continued)

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof electronics module, control switch, and body harness. Faulty power circuit between sunroof electronics module, control switch, and body harness. Faulty sunroof drive motor. Faulty sunroof electronics module. Faulty sunroof drive motor or electronics module.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof electronic module. Faulty drive motor.
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty sunroof electronic module.
Sunroof does not vent	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty sunroof electronic module.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Front of glass panel too high or rear too low. Wind deflector not deploying. Glass not centered in opening. Faulty glass panel seal.
Rattles from open sunroof while driving	Loose or broken attaching hardware. Worn or broken mechanism.

SUNROOF (Continued)

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to minimize seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a piece of paper between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. (Refer to 23 - BODY/SUNROOF/ GLASS PANEL - DESCRIPTION).

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

(1) Remove A-pillar trim, sun visors, and map lamps/mini console.

(2) Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(3) Lower headliner as necessary to gain access to sunroof housing drain tubes. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(4) Repair as necessary.

SUNROOF CONTROL SWITCH

REMOVAL

(1) Using a flat blade tool, release switch from the headliner (Fig. 1).

(2) Disconnect the wire connector from the switch.

INSTALLATION

(1) Connect the wire connector to the control switch.

(2) Install control switch into headliner.

(3) Test sunroof operation.

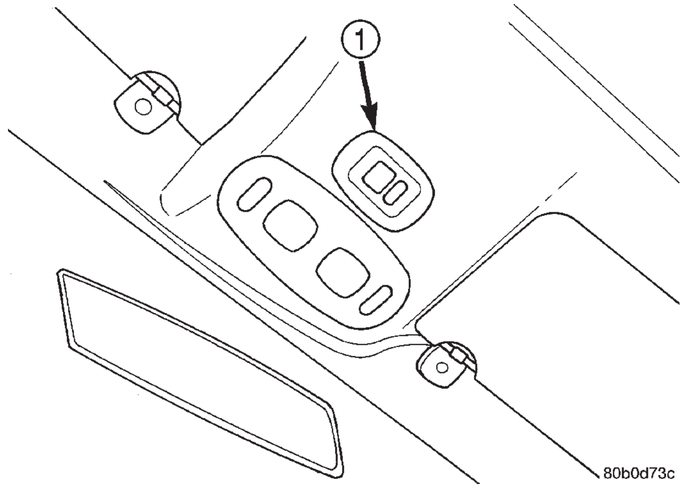

Fig. 1 Sunroof Control Switch

1 - SUN ROOF CONTROL SWITCH

SUNROOF DRIVE MOTOR

REMOVAL

NOTE: The sunroof system is timed from the factory so that the motor shuts off automatically when the sunroof window reaches a certain position. Extreme care must be taken when removing the motor from the sunroof module assembly or this timing may be thrown off causing damage to the sunroof system. Anytime the motor needs to be removed from the module assembly the sunroof window must be in the FULLY CLOSED POSITION if possible.
If glass panel is not in the fully closed position and the motor is removed or inoperative, (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS)

(1) Remove A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)

(2) Remove sun visors (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)

(3) Remove map lamps/mini console

(4) Disconnect the control switch wire connector.

(5) Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(6) Remove headliner as necessary to gain access to sunroof drive motor. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(7) Disconnect the drive motor wire harness connectors.

(8) Remove drive motor attaching screws.

(9) Remove motor from the sunroof housing

SUNROOF DRIVE MOTOR (Continued)

INSTALLATION

NOTE: Before installing a new motor or the original motor ensure that the sunroof glass panel is in the FULLY CLOSED POSITION. If sunroof glass panel is not in the FULLY CLOSED POSITION (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS). If the original drive motor or new drive motor is not in the CLOSED POSITION (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS). A new drive motor comes in the PARK POSITION, but if the drive motor not in the fully closed position (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS).

(1) Ensure that sunroof module is in the FULLY closed position before mounting the motor. If not in the fully closed position (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS).

(2) To time the drive motor (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS).

(3) Place drive motor into position on the sunroof housing and install attaching screws.

(4) Connect drive motor, and control switch wire connectors.

(5) Test sunroof drive motor operation, adjust as necessary (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS).

(6) Install sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).

(7) Verify sunroof operation and alignment, and adjust as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).

(8) Installing the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(9) Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT

DRIVE MOTOR

NOTE: The timing of both the drive motor and the sunroof module play a critical roles in the proper function of the sunroof. The sunroof assembly come in the proper position. As long as the motor is not has not been removed. If the drive motor is removed and cycled the motor will have to be Timed. If the sunroof glass panel has been moved from the park position with the drive motor removed (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).

(1) With drive motor removed from the sunroof assembly check the time of the drive motor.

(2) Plug the wire connectors to the drive motor. Do not attach motor to sunroof assembly.

(3) Turn ignition switch to the accessory position, tap the drive motor open position switch until the motor timing mark align up straight across (Fig. 2) .

(4) Install drive motor. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - INSTALLATION).

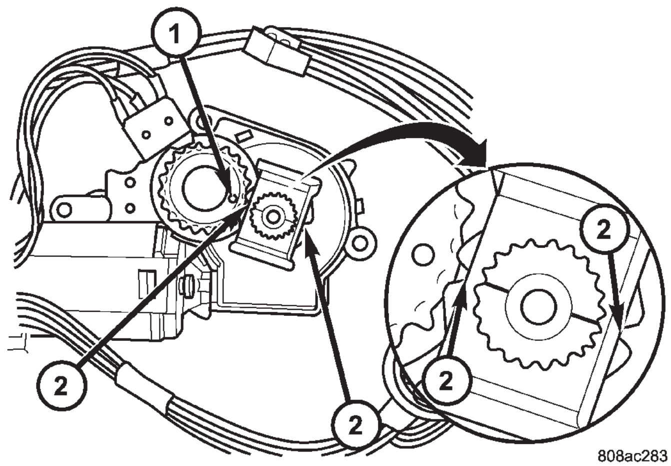

Fig. 2 Sunroof Drive Motor Timing

1 - HOLE
2 - TIMING MARKS

SUNROOF MODULE

NOTE: If the drive motor is removed and the sunroof glass or cables are moved the sunroof module will have to be timed.

(1) With the drive motor removed.

(2) Remove sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).

(3) Now place both right and left arms in the closed position. Using a screwdriver, push the plastic cable all the way forward in the track until the glass mounting arm drops into the closed position.

(4) Repeat this on the other side.

(5) To verify correct timing, there is an 1/8 inch hole in the cable ramp that must be aligned with the front glass mounting screw hole.

(6) Using an awl, verify alignment of both right and left timing holes. The tracks will now be timed to the fully closed position.

(7) With the drive motor in the fully closed position. Install drive motor (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - INSTALLATION).

SUNROOF GLASS PANEL

REMOVAL

(1) Slide sunshade rearward to the open position.
(2) Move the glass panel to the vent position.
(3) Remove the glass panel screws on each side (Fig. 3).
(4) Lift off glass panel and remove from vehicle.

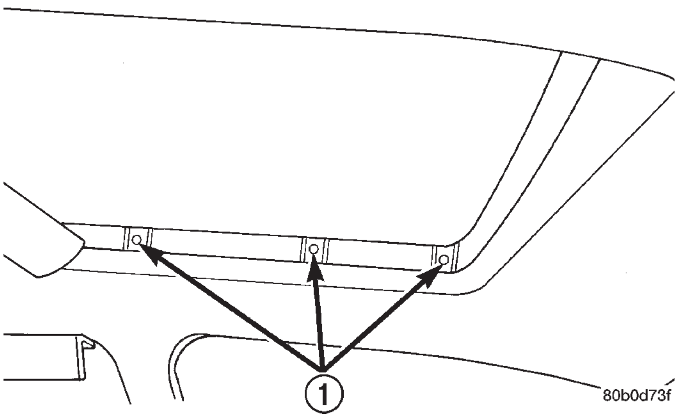

Fig. 3 Sunroof Glass Panel Screws
1 - ATTACHING SCREWS

INSTALLATION

(1) Position glass panel on to mechanism.
(2) Start the six attaching screws.
(3) Close glass.
(4) Center glass in opening by running a business card around the glass.
(5) Adjust front height of glass, just below roof panel.
(6) Tighten front two screws.
(7) Adjust rear height of glass, just above roof panel.
(8) Tighten remaining screws.
(9) Verify sunroof operation and alignment. Check fit and adjust as necessary, (Refer to 23 - BODY/SUNROOF/GLASS PANEL - DESCRIPTION).

ADJUSTMENTS

ADJUSTMENT

(1) Move the sunshade rearward to the open position.
(2) Move the sunroof glass panel to the fully closed position.
(3) Loosen the forward and center screws on each side enough to make the front adjustment.
(4) Adjust the front of the sunroof glass panel 1 mm (1/32 inch) below the top surface of the roof panel.
(5) Tighten the front two screws.
(6) Loosen the rear screws on each side enough to make the rear adjustment.
(7) Adjust the rear of the sunroof glass panel 1 mm (1/32 inch) above the top surface of the roof panel.
(8) Tighten the rear two screws.
(9) Check for proper fit. If not OK, repeat glass panel adjustment. If OK, tighten the center two screws.

SUNROOF GLASS PANEL SEAL

REMOVAL

(1) Remove sunroof glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).
(2) Grasp the seal and pull seal away from the glass panel. The seal is a one piece seal.

INSTALLATION

NOTE: Always position seal seam on center of the passenger side of glass panel.

(1) Install seal on glass. Using care working the seal around the glass, being careful not to over stretch the seal while installing.
(2) Install sunroof glass panel.
(3) Test sunroof operation, adjust as necessary.

SUNROOFF HOUSING DRAIN HOSE

REMOVAL

FRONT HOSES

(1) Move glass panel to the fully closed position.
(2) Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).
(3) Disconnect the control switch and wire connector.
(4) Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
(5) Disconnect the drain hose from the sunroof housing (Fig. 4).
(6) Drain any liquid from hose connection, if necessary.
(7) Attach new drain hose to old hose with tape that is to be replaced.

SUNROOFF HOUSING DRAIN HOSE (Continued)

(8) Work the old hose back and forth to loosen the sealer.

(9) Pull the old hose out through the bottom and the new hose through.

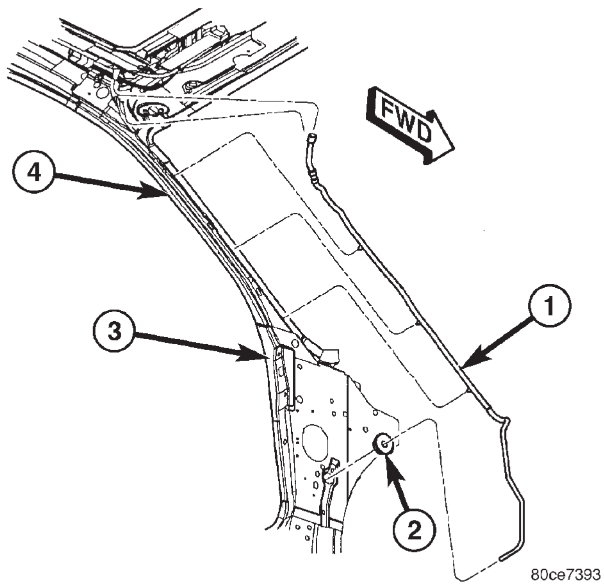

Fig. 4 FRONT DRAIN HOSE

1 - FRONT DRAIN TUBE
2 - DRAIN TUBE GRUMMET
3 - COWL SIDE PANEL
4 - WINDSHIELD OPENING SIDE OUTER FRAME

REAR HOUSING HOSE

(1) Move glass panel to the fully closed position.

(2) Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(3) Disconnect the control switch and wire connector.

(4) Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(5) Disconnect the drain hose from the sunroof housing (Fig. 5).

(6) Drain any liquid from hose connection, if necessary.

(7) Attach new drain hose to old hose with tape that is to be replaced.

(8) Work the old hose back and forth to loosen the sealer.

(9) Pull the old hose out through the bottom and the new hose through.

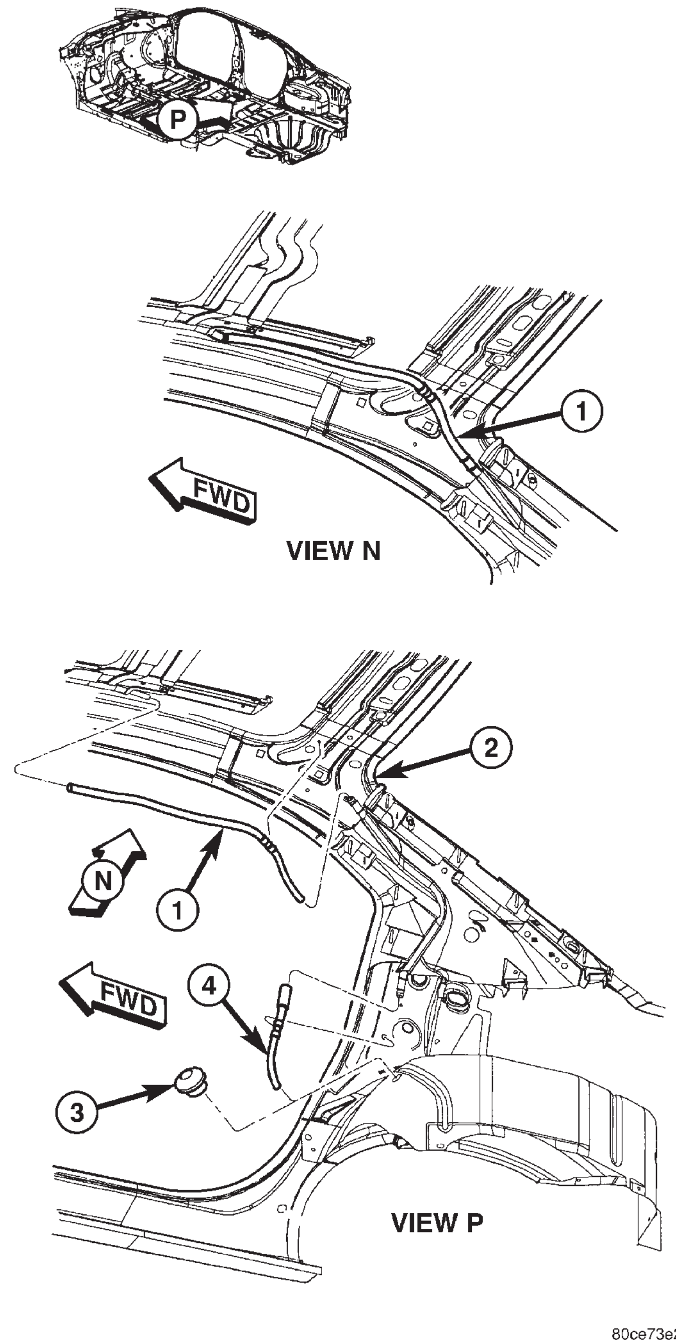

Fig. 5 REAR DRAIN TUBE

1 - REAR DRAIN TUBE
2 - QUARTER INNER UPPER PANEL
3 - DRAIN TUBE GROMMET
4 - REAR DRAIN LOWER TUBE

INSTALLATION

FRONT HOSES

(1) Connect the drain hose to the sunroof housing and test drainage (Fig. 4).

(2) Set headliner into position.

(3) Connect express module, drive motor, and control switch wire connectors.

(4) Test sunroof operation, adjust as necessary.

(5) Finish installing headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

SUNROOFF HOUSING DRAIN HOSE (Continued)

(6) Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

(7) Connect the control switch wire connector. Install control switch.

REAR HOUSING HOSE

(1) Connect the drain hose to the sunroof housing and test drainage (Fig. 5).

(2) Set headliner into position.

(3) Connect express module, drive motor, and control switch wire connectors.

(4) Test sunroof operation, adjust as necessary.

(5) Finish installing headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(6) Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

(7) Connect the control switch wire connector. Install control switch.

SUNROOF MODULE ASSEMBLY

REMOVAL

(1) Move glass panel to the fully closed position.

(2) Disconnect battery negative cable.

(3) Recline both front seats.

(4) Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(5) Remove control switch. (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH).

(6) Disconnect wire harness.

(7) Remove headliner

(8) Disconnect the drain tubes from sunroof housing.

(9) Loosen fasteners attaching sunroof module assembly (Fig. 6).

(10) With the aid of a helper, remove fasteners attaching sunroof module assembly to roof panel.

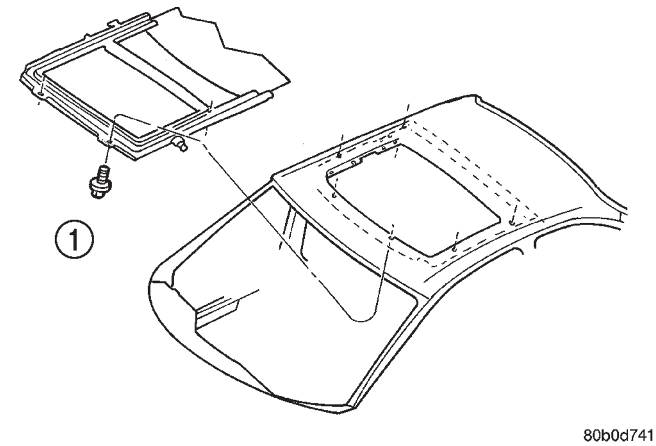

Fig. 6 Sunroof Module Assembly

1 - (6) SCREWS

INSTALLATION

NOTE: There are locating pins on the roof panel near the front corners of the sunroof opening that will help position the sunroof module correctly.

(1) With the Glass panel in the fully closed position.

(2) Raise rear end of sunroof module assembly and guide into position and start fasteners.

(3) Tighten the fasteners holding the sunroof module to roof panel. Tighten the fasteners to 11 N·m (97 in. lbs.) torque.

(4) Connect the drain tubes to the sunroof housing.

(5) Connect wire harness.

(6) Set headliner into position.

(7) Connect battery negative cable.

(8) Connect express module, drive motor, and control switch wire connectors.

(9) Test sunroof operation, adjust as necessary.

(10) Finish installing the headliner.

(11) Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

OPENING TRIM LACE

REMOVAL

Remove lace by starting at the joint and pull one end of the lace away from the headliner until the entire lace is removed (Fig. 7).

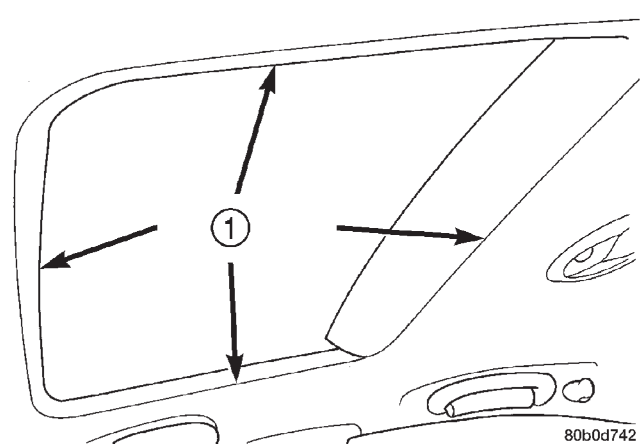

Fig. 7 Sunroof Opening Trim Lace

1 - OPENING TRIM LACE

OPENING TRIM LACE (Continued)

INSTALLATION

Install lace by starting at the spot of the previous joint, fully seat the lace in place around the sunroof opening. Cut to fit if necessary.

SUNSHADE

REMOVAL

(1) Place the sunroof glass panel in the vent position.

(2) Move the sunshade to the closed position

(3) From the outside of the vehicle, using a flat blade tool, disengage the rear sunshade guides. Pushing the guide toward the center of the vehicle (Fig. 8). Raise up on sunshade and slide it rearward out through the opening (Fig. 9). Release the front two guides and remove sunshade from the vehicle (Fig. 10).

CAUTION: Use care not to crease the sunshade when removing or installing.

(4) Remove the sunshade handle from sunshade by compressing the back side of the handle together and pull the handle out.

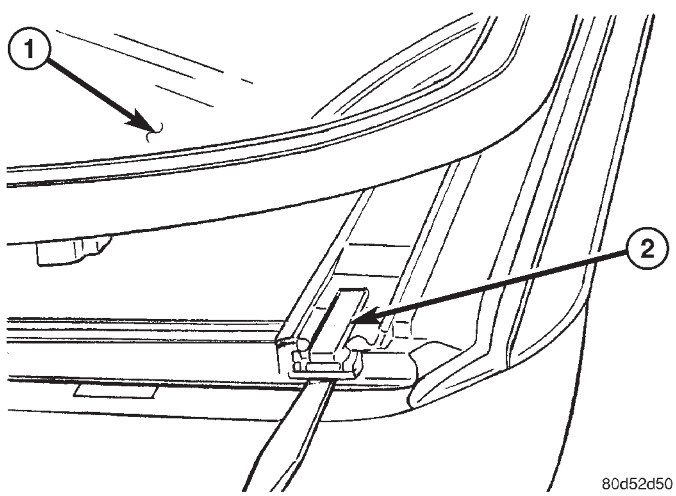

Fig. 8 SUNSHADE REAR GUIDE

1 - GLASS PANEL
2 - SUNSHADE REAR GUIDE

INSTALLATION

(1) Install sunshade handle into the sunshade, by pressing the handle into place until the tabs lock behind the sunshade.

(2) Install the sunshade into the vehicle between the roof and the glass panel in the vent position (Fig. 9).

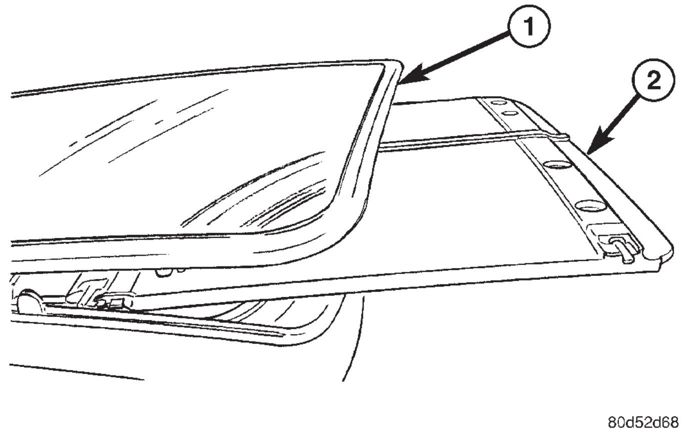

Fig. 9 SUNSHADE REMOVAL

1 - GLASS PANEL
2 - SUNSHADE REMOVAL

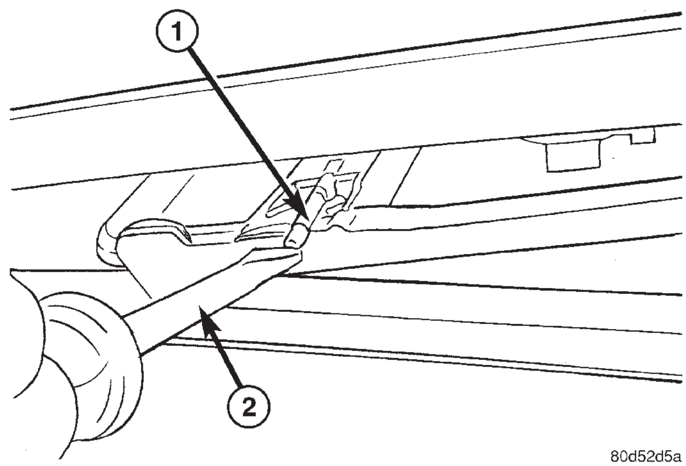

Fig. 10 SUNSHADE FRONT GUIDE

1 - SUNSHADE FRONT GUIDE
2 - SCREWDRIVER DEPRESSING FRONT GUIDE

(3) Move the sunshade to the closed position. Through the opening using a flat tool, engage the rear guides into the guide rails (Fig. 8).

(4) Slide sunshade rearward to access the front two guides. Engage the front guides into the guide rails (Fig. 10).

(5) Ensure the sunshade operation and operate the sunroof.

WIND DEFLECTOR

REMOVAL

(1) Open sunroof glass panel.

(2) Remove hinge pins by pushing them outboard to release the wind deflector from sunroof housing (Fig. 11).

(3) Remove wind deflector (Fig. 12).

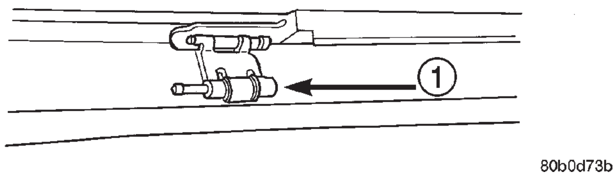

Fig. 11 Wind Deflector Hinge Pin

1 - PUSH

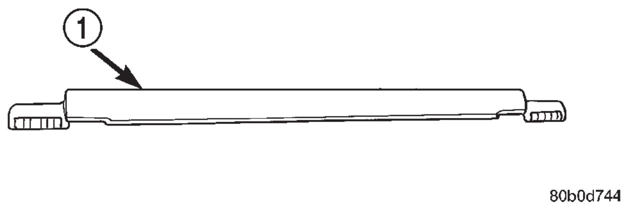

Fig. 12 Wind Deflector

1 - WIND DEFLECTOR

INSTALLATION

(1) Place wind deflector on wind deflector brackets.

(2) Install wind deflector hinge pins.

(3) Test sunroof operation.

SUNROOF EXPRESS MODULE

REMOVAL

(1) Remove A-pillar trim, sun visors, and map lamps/mini console.

(2) Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(3) Pull headliner down as necessary to gain access to sunroof express module.

(4) Disconnect the express module wire harness connectors (Fig. 13).

(5) Remove express module from the keyway by sliding module towards the center of the vehicle.

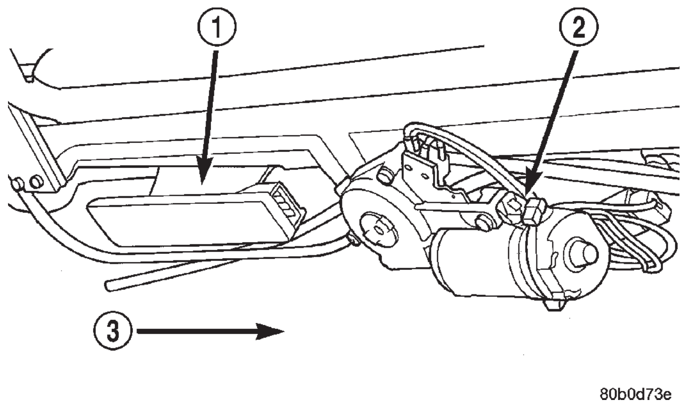

Fig. 13 Sunroof Express Module & Drive Motor

1 - SUN ROOF EXPRESS MODULE
2 - DRIVE MOTOR
3 - TO REMOVE SLIDE

INSTALLATION

(1) Place express module in the keyway located in sunroof module and slide module outward to lock it into position.

(2) Set headliner into position.

(3) Connect drive motor, express module, and control switch wire connectors.

(4) Test sunroof operation, adjust as necessary.

(5) Finish installing headliner.

(6) Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

(7) Install A-pillar trim, sun visors, and map lamps/mini console.

WEATHERSTRIP/SEALS

TABLE OF CONTENTS

A-PILLAR SEAL

REMOVAL

(1) Open front door.
(2) Using a fork-type tool (C-4829), disengage push-in fasteners attaching A-pillar seal to A-pillar.
(3) Remove A-pillar seal from vehicle.

INSTALLATION

(1) Place A-pillar seal into position.
(2) Install push-in fasteners attaching A-pillar seal to A-pillar.
(3) Close front door.

A-PILLAR WEATHERSTRIP RETAINER AND MOLDING

REMOVAL

(1) Partially raise convertible top.

(2) Remove header and A-pillar weatherstrip as necessary to gain access.

(3) Remove screws holding A-pillar weatherstrip retainer to A-pillar (Fig. 1).

(4) Remove retainer from vehicle.

(5) Remove screws attaching A-pillar molding to A-pillar.

(6) Remove A-pillar molding from vehicle.

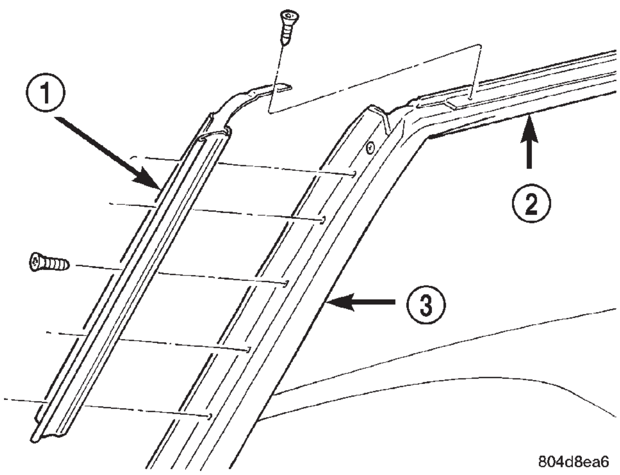

Fig. 1 A-Pillar Weatherstrip Retainer

1 - A-PILLAR WEATHERSTRIP RETAINER
2 - HEADER
3 - A-PILLAR

INSTALLATION

(1) Clean A-pillar of any seal material residue.

(2) Position A-pillar molding to vehicle.

(3) Install screws attaching A-pillar molding to A-pillar.

(4) Position A-pillar weatherstrip retainer on A-pillar.

(5) Install screws attaching retainer to A-pillar. Install middle screw first and then work outward.

(6) Install header and A-pillar weatherstrip.

(7) Lower and secure convertible top.

DECKLID OPENING WEATHERSTRIP

REMOVAL

(1) Release decklid latch and open decklid.

(2) Pull decklid opening weatherstrip from decklid opening flange (Fig. 2).

(3) Remove decklid opening weatherstrip from vehicle.

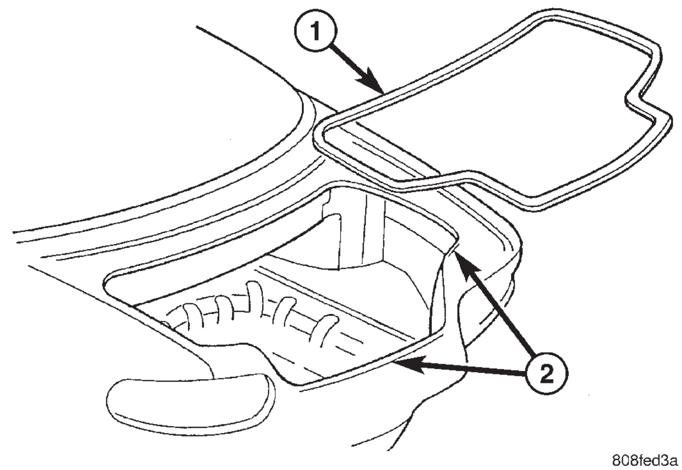

Fig. 2 DECKLID OPENING WEATHERSTRIP

1 - TRUNK OPENING WEATHERSTRIP
2 - TRUNK OPENING FLANGE

INSTALLATION

(1) Position decklid opening weatherstrip on vehicle (Fig. 2).

(2) Starting at center weatherstrip over decklid latch striker and press weatherstrip firmly onto decklid opening flang. Ensure that the weatherstrip seats properly along the entire length..

(3) Verify decklid operation and sealing.

DOOR INNER BELT WEATHERSTRIP

REMOVAL

(1) Remove door trim panel.

(2) Pull upward on rear edge of inner belt weatherstrip (Fig. 3).

(3) Remove weatherstrip from vehicle.

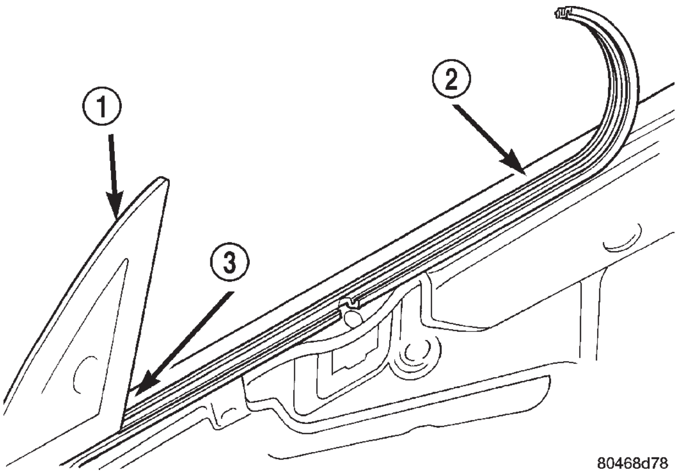

Fig. 3 Door Inner Belt Weatherstrip

1 - MIRROR FLAG/GLASS CHANNEL
2 - INNER BELT WEATHERSTRIP
3 - START THIS END FIRST

INSTALLATION

(1) Start leading edge of weatherstrip on vehicle.

(2) Press the leading edge of the weatherstrip forward until edge is tight to the mirror flag.

(3) Press weatherstrip into position on door panel.

(4) Install door trim panel.

DOOR OPENING TRIM WELT

REMOVAL

(1) Using trim stick, special tool C-4755, remove one end of door opening trim welt from door opening flange.

(2) Remove welt from vehicle (Fig. 4).

INSTALLATION

(1) Position door opening trim welt on vehicle.

(2) Butt end of welt to edge of header/A–pillar weatherstrip.

(3) Push door opening welt onto door opening flange.

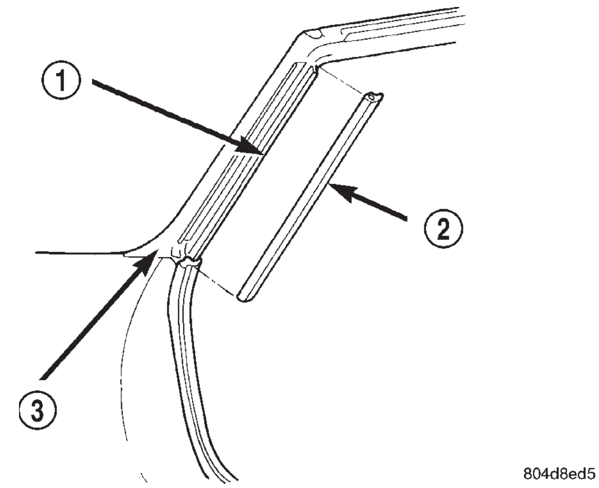

Fig. 4 Door Opening Trim Welt

1 - DOOR OPENING FLANGE
2 - DOOR OPENING TRIM WELT
3 - HEADER A-PILLAR WEATHERSTRIP

DRIP RAIL WEATHERSTRIP

REMOVAL

(1) Open front and rear doors.

(2) Remove two screws (Fig. 5).

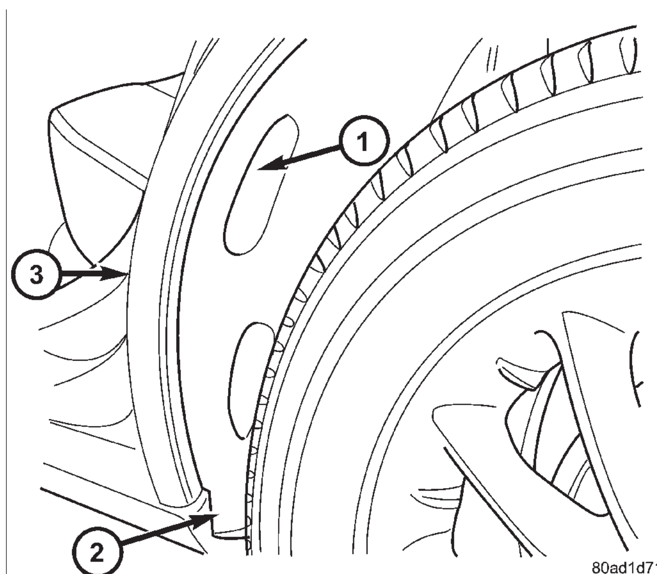

Fig. 5 Splash Shield

1 - FASTENERS
2 - SPALSH SHIELD
3 - DRIP RAIL WEATHERSTRIP

(3) Position splash shield out of way.

(4) Starting at the bottom of the A-pillar, pull the drip rail weatherstrip from the windshield side molding.

(5) Pull the drip rail weatherstrip from the roof rail pinch flange above door openings.

DRIP RAIL WEATHERSTRIP (Continued)

(6) Remove drip rail weatherstrip from vehicle (Fig. 6).

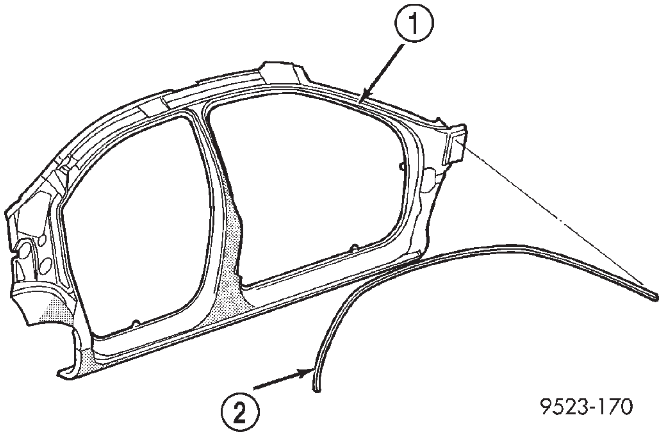

Fig. 6 Drip Rail Weatherstrip

1 - DRIP RAIL
2 - DRIP RAIL WEATHERSTRIP

INSTALLATION

(1) Place drip rail weatherstrip into position.
(2) Push drip rail weatherstrip on to the roof rail pinch flange above door openings.
(3) Starting at the bottom of the A-pillar, push the drip rail weatherstrip on to the windshield side molding.
(4) Position splash shield.
(5) Install two screws.
(6) Close front and rear doors.

FRONT & REAR DOOR OPENING WEATHERSTRIP

REMOVAL

(1) Open door.
(2) Remove door sill plate.
(3) Pull weatherstrip from pinch flange around door opening (Fig. 7).

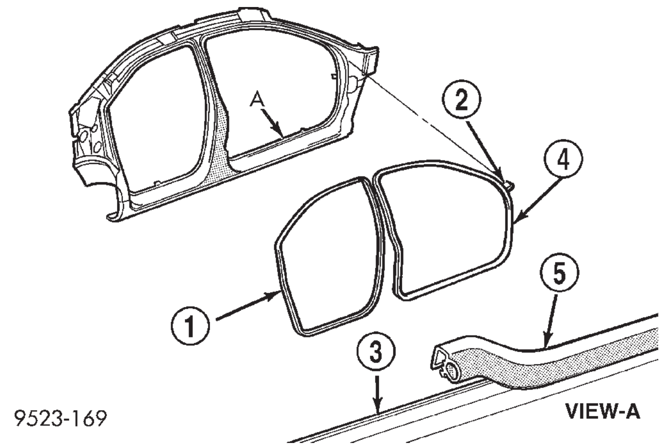

Fig. 7 Door Opening Weatherstrips

1 - REAR DOOR WEATHERSTRIP
2 - A-PILLAR SEAL
3 - PINCH FLANGE
4 - FRONT DOOR WEATHERSTRIP
5 - WEATHERSTRIP

INSTALLATION

Position the splice in the door opening weatherstrip in the center of the bottom of the opening and reverse the preceding operation.
(1) Push weatherstrip on to pinch flange around door opening.
(2) Install door sill plate.
(3) Close door.

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

(1) Remove door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL)
(2) Remove bolt attaching bottom of front lower run channel to inner door panel.
(3) Pull glass run weatherstrip from door glass opening frame.
(4) Remove lower run channel through opening at top of door (Fig. 8).

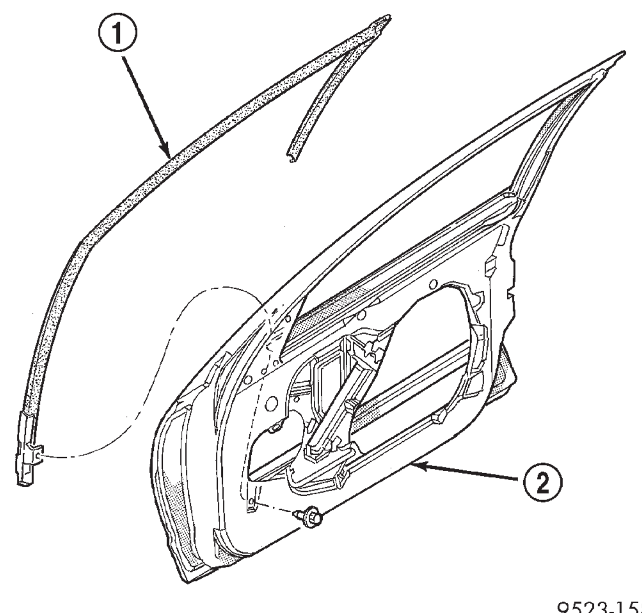

Fig. 8 Door Glass Run Weatherstrip

1 - GLASS RUN WEATHERSTRIP
2 - FRONT DOOR

INSTALLATION

(1) Install lower run channel through opening at top of door.

FRONT DOOR GLASS RUN WEATHERSTRIP (Continued)

(2) Push glass run weatherstrip to door glass opening frame.

(3) Install bolt attaching bottom of front lower run channel to inner door panel.

(4) Install door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)

FRONT DOOR INNER BELT WEATHERSTRIP

REMOVAL

(1) Remove front door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)

(2) Pull upward at rear end of inner belt weatherstrip.

(3) Remove inner belt weatherstrip from vehicle (Fig. 9).

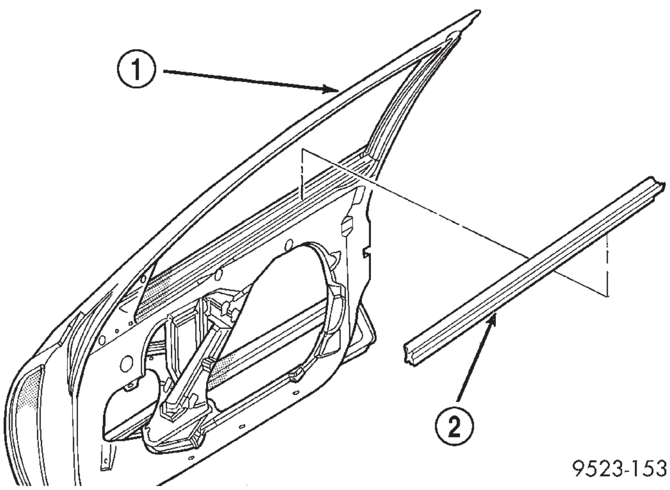

Fig. 9 Front Door Inner Belt Weatherstrip

1 - FRONT DOOR
2 - INNER BELT WEATHERSTRIP

INSTALLATION

(1) Place inner belt weatherstrip into position.

(2) Push downward on the inner belt weatherstrip starting at the front edge.

(3) Install front door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

FRONT DOOR OUTER BELT MOLDING

REMOVAL

(1) Remove screw attaching rearward end of molding to front door (Fig. 10).

(2) Using a rubber mallet and block of wood, tap upward at each clip attaching belt molding to door (Fig. 11).

(3) Lift up on the rear of the belt molding and pull rearward to remove.

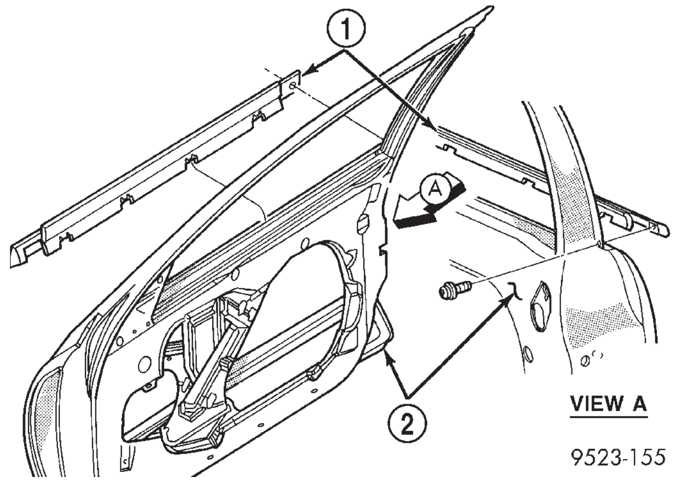

Fig. 10 Front Door Outer Belt Molding

1 - OUTSIDE BELT MOLDING
2 - FRONT DOOR

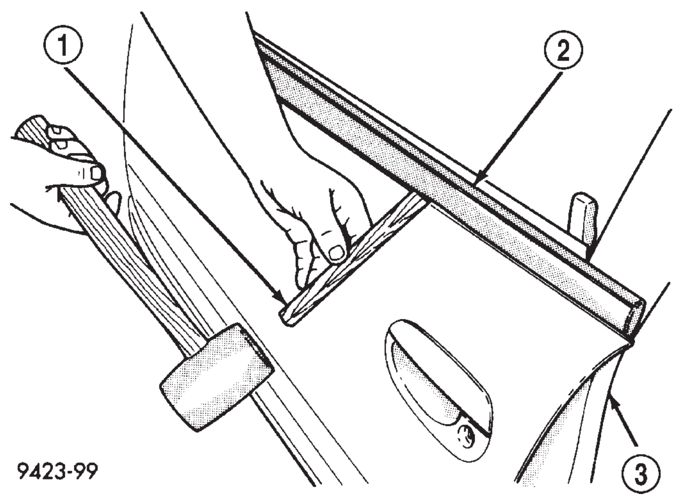

Fig. 11 Front Door Outer Belt Molding Removal

1 - WOOD BLOCK
2 - BELT MOLDING
3 - DOOR

INSTALLATION

(1) Place belt molding in position.

(2) Using your hand press downward at each clip attaching belt molding to door till in position.

(3) Install screw attaching rearward end of molding to front door.

HEADER / A-PILLAR WEATHERSTRIP

REMOVAL

(1) Partially raise convertible top.
(2) Remove inside rear view mirror.
(3) Remove sun visors.
(4) Remove header trim panel.
(5) Remove both door sill trim panels.
(6) Remove nuts holding header and A-pillar weatherstrip at upper corners of windshield (Fig. 12).
(7) Remove push in fasteners at lower corners of windshield holding weatherstrip to A-pillar.
(8) Remove header and A-pillar weatherstrip from vehicle.
(9) Clean any residual seal material from header panel.

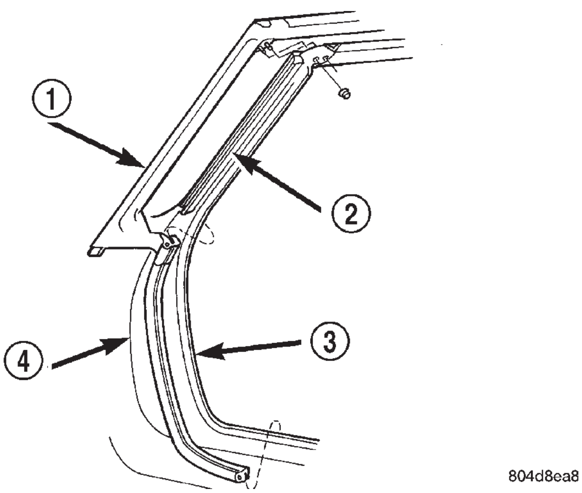

Fig. 12 Header/A-Pillar Weatherstrip

1 - HEADER/A-PILLAR WEATHERSTRIP
2 - A-PILLAR WEATHERSTRIP RETAINER
3 - DOOR OPENING FLANGE
4 - FENDER

INSTALLATION

CAUTION: Ensure that the butyl patch and butyl rope at each corner of the windshield is present and in good condition (Fig. 13). The butyl is critical for the water management system. Replace as necessary.

(1) Install new L foam starting at upper screw on A-pillar retainer.
(2) Install new L foam starting at upper screw on A-pillar retainer (Fig. 14).
(3) Position header and A-pillar weatherstrip on vehicle.
(4) Secure weatherstrip into retainers at header and A-pillar.
(5) Install nuts at upper corners of windshield.
(6) Install push in fasteners at lower corners of windshield.
(7) Install door sill trim panels.
(8) Install header trim panel.
(9) Install sun visors.
(10) Install inside rear view mirror.
(11) Lower and secure convertible top.

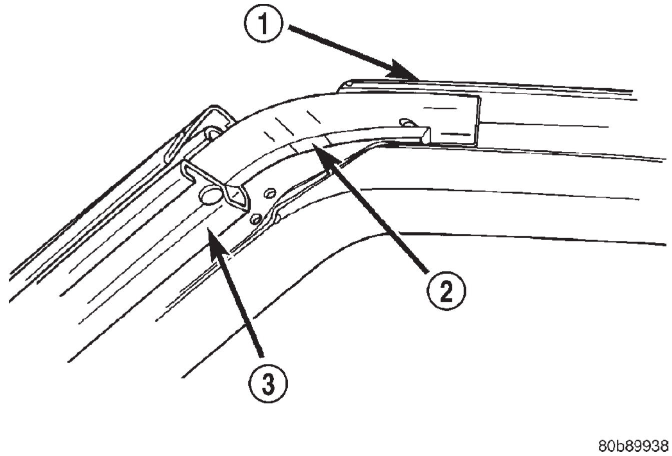

Fig. 13 Butyl Patch and L – FOAM

1 - HEADER WEATHERSTRIP RETAINER
2 - L-SHAPE FOAM ROPE
3 - A-PILLAR WEATHERSTRIP RETAINER

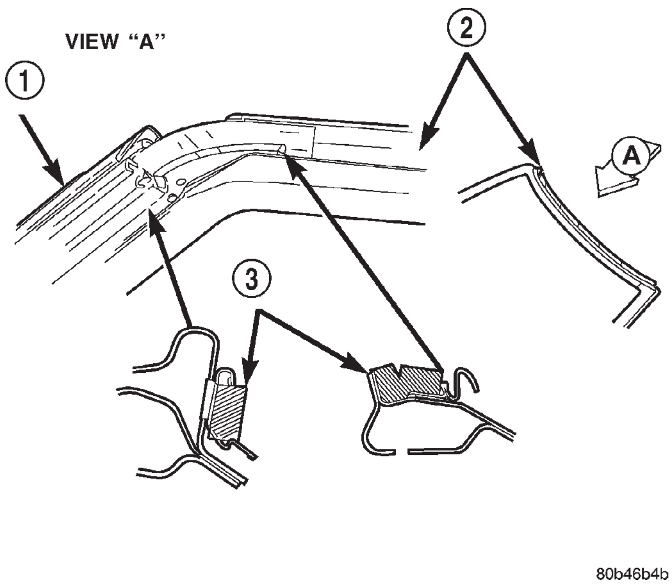

Fig. 14 L Shape Foam Location

1 - A-PILLAR
2 - HEADER
3 - L SHAPE FOAM

HEADER WEATHERSTRIP RETAINER/MOLING

REMOVAL

(1) Partially raise convertible top.

(2) Remove header and A-pillar weatherstrip as necessary to gain access.

(3) Remove screws attaching A-pillar weatherstrip retainer to header weatherstrip retainer.

(4) Remove screws attaching header weatherstrip retainer to header panel (Fig. 15).

(5) Remove retainer from vehicle.

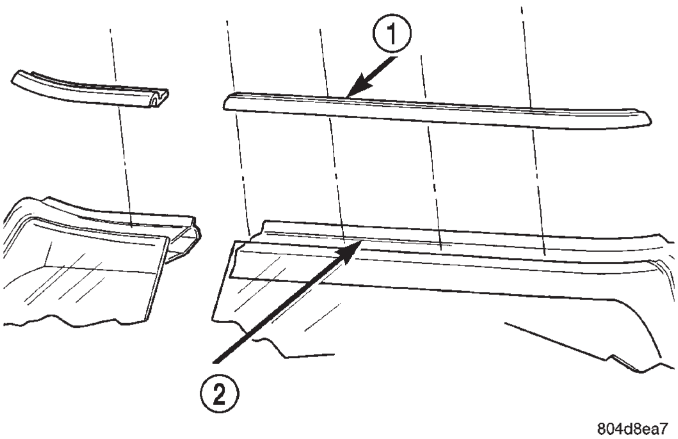

Fig. 15 Header Weatherstrip Retainer

1 - HEADER WEATHERSTRIP RETAINER
2 - HEADER

INSTALLATION

(1) Clean any residual seal material from header panel.

(2) Position header weatherstrip retainer on vehicle.

(3) Install screws attaching retainer to header panel. Install center screw first and then work outward.

(4) Install screws attaching A-pillar weatherstrip retainer to header retainer.

(5) Install L foam in upper corner starting at upper screw on the A-pillar retainer.

(6) Install L foam in upper corner starting at upper screw on A-pillar.

(7) Install header and A-pillar weatherstrip.

(8) Lower and secure convertible top.

OUTER DOOR BELT WEATHERSTRIP

REMOVAL

(1) Remove door glass.

(2) Remove screws attaching outer belt weatherstrip to outer door panel (Fig. 16).

(3) Remove outer belt weatherstrip from the vehicle.

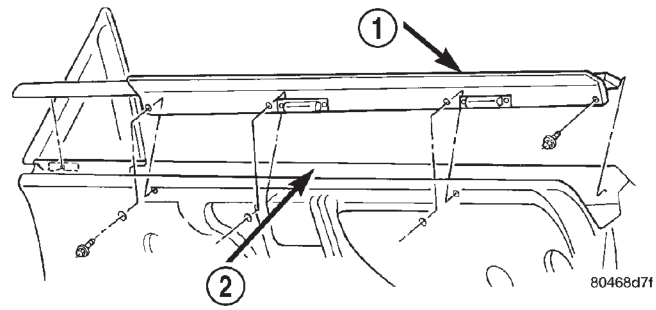

Fig. 16 Door Outer Belt Weatherstrip

1 - DOOR OUTER BELT WEATHERSTRIP
2 - OUTER DOOR PANEL

INSTALLATION

(1) Position outer belt weatherstrip on vehicle.

(2) Install screws to hold outer weatherstrip to outer door panel.

(3) Install door glass.

QUARTER PANEL WEATHERSTRIP

REMOVAL

(1) Remove door sill trim panel.

(2) Remove push in fasteners holding weatherstrip to B-pillar.

(3) Remove weatherstrip from door opening flange.

(4) Remove quarter panel weatherstrip from vehicle (Fig. 17).

INSTALLATION

(1) Position panel weatherstrip onto vehicle.

(2) Install weatherstrip to door opening flange.

(3) Install push in fasteners attaching weatherstrip to B-pillar.

(4) Install door sill trim panel.

QUARTER PANEL OUTER BELT WEATHERSTRIP/MOLDING

REMOVAL

(1) Lower convertible top to midway position.

(2) Lower quarter glass to full down position.

(3) Remove quarter trim panel.

(4) Remove screws attaching quarter panel outer belt weatherstrip/molding to outer quarter panel.

(5) Loosen appropriate side of upper deck molding.

QUARTER PANEL OUTER BELT WEATHERSTRIP/MOLDING (Continued)

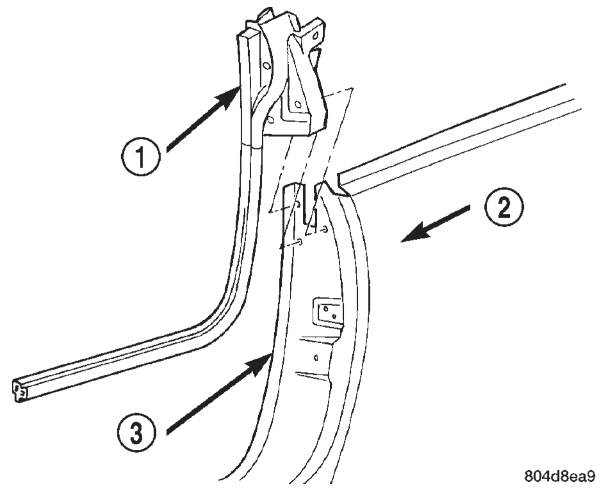

Fig. 17 Quarter Panel Weatherstrip

1 - QUARTER PANEL WEATHERSTRIP
2 - QUARTER PANEL
3 - DOOR OPENING FLANGE

(6) Pull upward at one end of outer belt weatherstrip to separate from vehicle.
(7) Remove outer belt weatherstrip from vehicle.

INSTALLATION

(1) Position quarter panel outer belt weatherstrip/molding on vehicle.
(2) Push outer belt weatherstrip/molding downward until weatherstrip/molding is fully seated.
(3) Install screws attaching outer belt weatherstrip to outer quarter panel.
(4) Tighten fasteners for upper belt molding.
(5) Install quarter trim panel.
(6) Raise and secure convertible top.

REAR DOOR B-PILLAR DOOR SEAL

REMOVAL

(1) Using a suitable heat gun, warm seal to approximately 100° F to ease adhesive separation.
(2) Peel B-pillar seal from upper door frame, top to bottom (Fig. 18).
(3) Clean adhesive residue from door frame.

INSTALLATION

(1) If original seal is reused, clean adhesive residue from back of seal.
(2) Apply body side molding tape to back of seal.
(3) Peel protective paper from back of tape.
(4) Place cutout in seal around screw head at bottom of seal location.
(5) Align seal to edge of door frame.
(6) Press adhesive onto door frame.

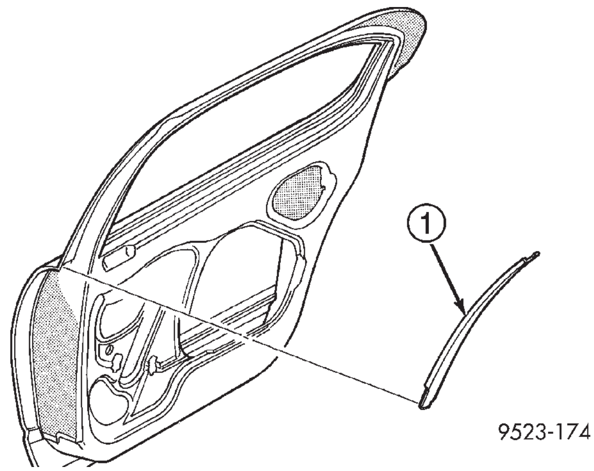

Fig. 18 Rear Door B-Pillar Seal

1 - B-PILLAR SEAL

REAR DOOR GLASS RUN WEATHERSTRIP

REMOVAL

(1) Remove door glass. (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - REMOVAL)
(2) Pull glass run weatherstrip from door glass opening frame (Fig. 19).

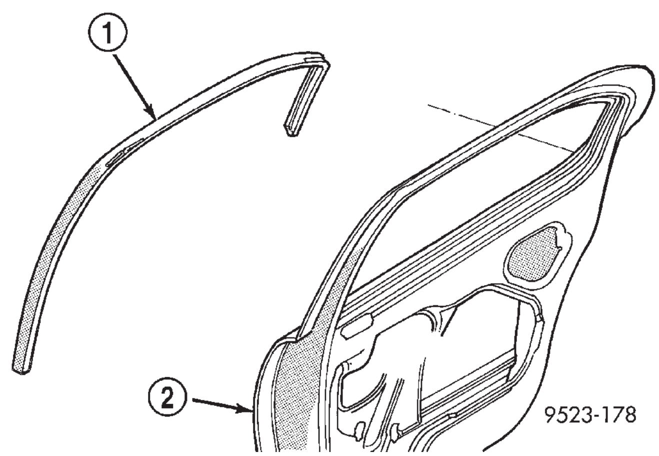

Fig. 19 Door Glass Run Weatherstrip

1 - GLASS RUN WEATHERSTRIP
2 - REAR DOOR

INSTALLATION

(1) Install glass run weatherstrip to door glass opening frame.
(2) Install door glass. (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION)

REAR DOOR INNER BELT WEATHERSTRIP

REMOVAL

(1) Remove rear door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)

(2) Pull upward at front end of inner belt weatherstrip.

(3) Remove inner belt weatherstrip from vehicle (Fig. 20).

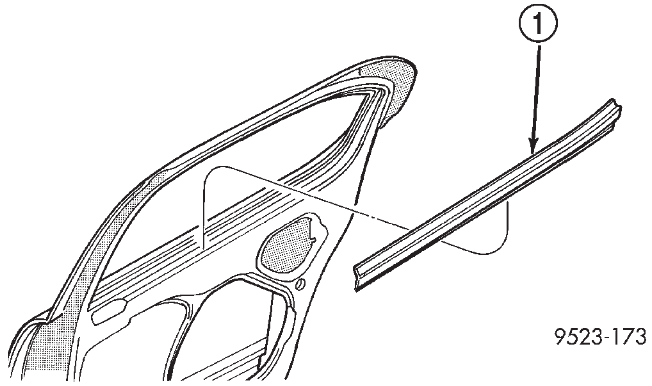

Fig. 20 Rear Door Inner Belt Weatherstrip

1 - INNER BELT WEATHERSTRIP

INSTALLATION

(1) Place inner belt weatherstrip into position.

(2) Push downward on the inner belt weatherstrip.

(3) Install rear door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

REAR DOOR OUTER BELT MOLDING

REMOVAL

(1) Remove screw attaching forward end of molding to rear door (Fig. 21).

(2) Disengage clips attaching rearward end of belt molding to rear door.

(3) Using a rubber mallet and block of wood, tap upward at each clip attaching belt molding to door (Fig. 22).

(4) Remove belt molding from door.

INSTALLATION

(1) Place belt molding into position.

(2) Push or tap downward at each clip attaching belt molding to door.

(3) Engage clips attaching rearward end of belt molding to rear door.

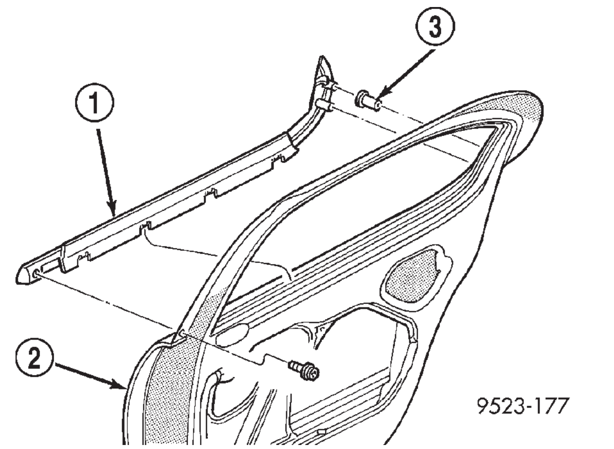

Fig. 21 Rear Door Outer Belt Molding

1 - OUTSIDE BELT MOLDING
2 - REAR DOOR
3 - BARREL CLIP

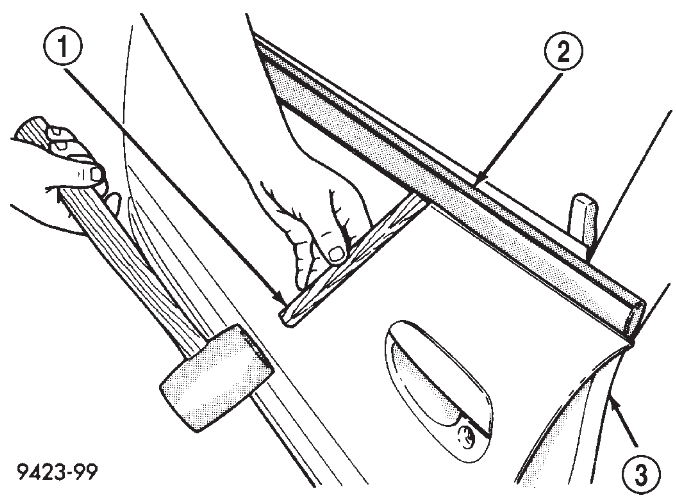

Fig. 22 Outer Belt Molding Removal

1 - WOOD BLOCK
2 - BELT MOLDING
3 - DOOR

(4) Install screw attaching forward end of molding to rear door.

SECONDARY SILL WEATHERSTRIP

REMOVAL

(1) Open door.

(2) Using fork tool C-4829, disengage push in fasteners attaching secondary sill weatherstrip to bottom of door.

(3) Remove secondary sill weatherstrip from vehicle (Fig. 23).

SECONDARY SILL WEATHERSTRIP (Continued)

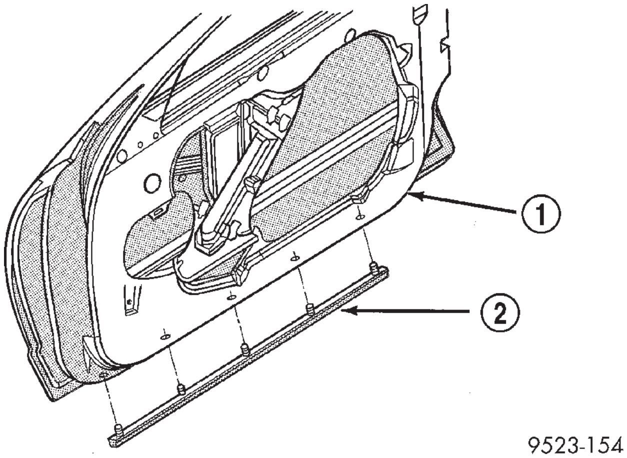

Fig. 23 Secondary Sill Weatherstrip – Typical

1 - DOOR
2 - SECONDARY SILL WEATHERSTRIP

INSTALLATION

(1) Place secondary sill weatherstrip into position.
(2) Install push in fasteners attaching secondary sill weatherstrip to bottom of door.
(3) Close door.

SIDE RAIL WEATHERSTRIP

REMOVAL

FRONT

(1) Partially raise convertible top.
(2) Remove push in fasteners attaching weatherstrip to retainer.
(3) Remove weatherstrip from vehicle (Fig. 24).

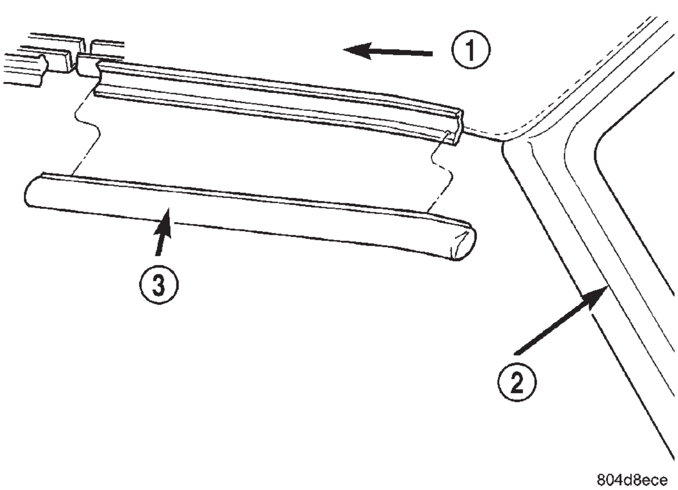

Fig. 24 Front Side Rail Weatherstrip

1 - CONVERTIBLE TOP
2 - A-PILLAR
3 - FRONT SIDE RAIL WEATHERSTRIP

CENTER

(1) Partially raise convertible top.
(2) Remove push in fasteners attaching weatherstrip to retainer.
(3) Remove weatherstrip from vehicle (Fig. 25).

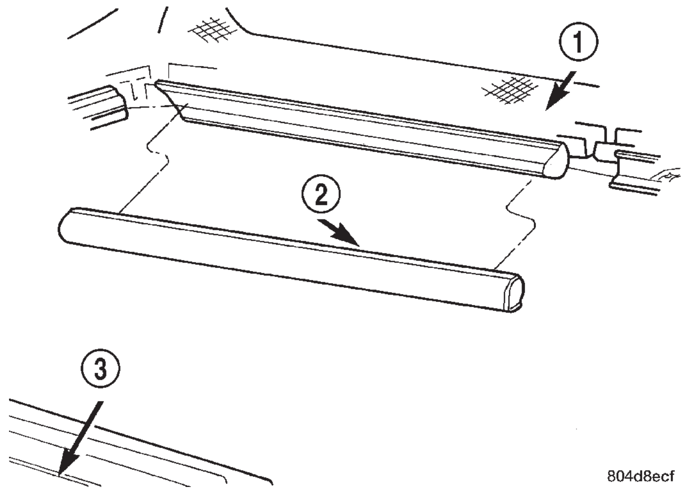

Fig. 25 Center Side Rail Weatherstrip

1 - CONVERTIBLE TOP
2 - CENTER SIDE RAIL WEATHERSTRIP
3 - QUARTER PANEL

REAR

(1) Partially raise convertible top.
(2) Remove push in fasteners attaching weatherstrip to retainer.
(3) Separate weatherstrip from vehicle (Fig. 26).

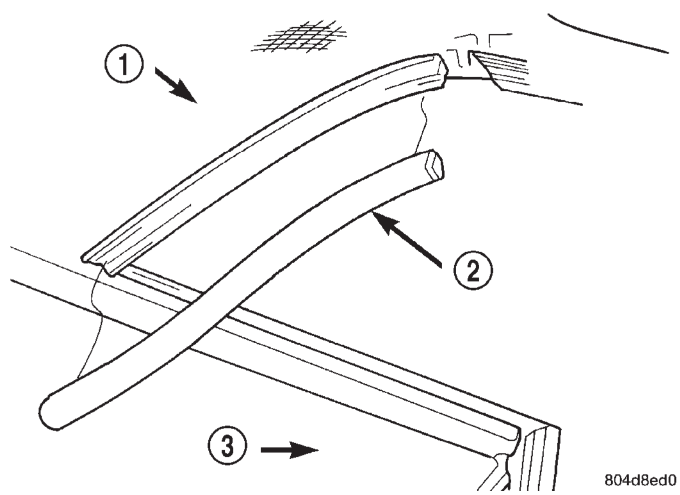

Fig. 26 Rear Side Rail

1 - CONVERTIBLE TOP
2 - REAR SIDE RAIL WEATHERSTRIP
3 - QUARTER PANEL

SIDE RAIL WEATHERSTRIP (Continued)

INSTALLATION

FRONT

(1) Position weatherstrip on vehicle.

(2) Install push in fasteners into retainer channel, aligning embossment on back side of weatherstrip to corner of retainer.

(3) Lower convertible top.

(4) Secure convertible top.

CENTER

(1) Position weatherstrip on vehicle.

(2) Install push in fasteners into retainer channel, aligning embossment on back side of weatherstrip to corner of retainer.

(3) Lower convertible top.

(4) Secure convertible top.

REAR

(1) Position weatherstrip on vehicle.

(2) Install push in fasteners into retainer channel, aligning embossment on back side of weatherstrip to corner of retainer.

(3) Push weatherstrip into retainer channel, aligning embossment on backside of weatherstrip to corner of retainer.

(4) Lower convertible top.

(5) Secure convertible top.

HEATING & AIR CONDITIONING

TABLE OF CONTENTS

HEATING & AIR CONDITIONING

WARNINGS

WARNING: WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM EYE CONTACT WITH REFRIGERANT. IF EYE CONTACT IS MADE, SEEK MEDICAL ATTENTION IMMEDIATELY.
DO NOT EXPOSE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC TYPE LEAK DETECTOR IS RECOMMENDED.
LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION.
THE EVAPORATION RATE OF REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH REFRIGERANT. R-134a SERVICE EQUIPMENT OR VEHICLE A/C SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR and R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

WARNING: AVOID BREATHING A/C REFRIGERANT AND LUBRICANT VAPOR OR MIST. EXPOSURE MAY IRRITATE EYES, NOSE AND THROAT. USE ONLY APPROVED SERVICE EQUIPMENT MEETING SAE REQUIREMENTS TO DISCHARGE R-134a SYSTEM. IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE WORK AREA BEFORE RESUMING SERVICE.
R-134a SERVICE EQUIPMENT OR VEHICLE A/C SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR/R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

WARNING: NEVER REMOVE REFRIGERANT LINE CLIP OR DISCONNECT BEFORE RECLAIMING ALL THE REFRIGERANT FROM THE SYSTEM. PERSONAL INJURY CAN RESULT.

HEATING & AIR CONDITIONING (Continued)

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. SEEK MEDICAL ATTENTION IMMEDIATELY IF SWALLOWED OR INHALED. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN AND PETS.

DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT RUNNING TEMPERATURE. PERSONAL INJURY CAN RESULT.

CAUTIONS

SERVICE CAUTIONS

CAUTION: Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.

Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.

R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.

Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.

Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.

Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

Do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

The refrigerant system must always be evacuated before charging.

Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.

Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.

Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.

Do not remove the sealing caps from a replacement component until it is to be installed.

When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.

Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.

When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.

Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATER PERFORMANCE

PRE-DIAGNOSTIC PREPARATIONS

Review Safety Precautions and Warnings in this group before performing the following procedures.

Check the coolant level, drive belt tension, vacuum line connections, radiator air flow and fan operation. Start engine and allow to warm up to normal temperature.

WARNING: DO NOT REMOVE RADIATOR CAP WHEN ENGINE IS HOT, PERSONAL INJURY CAN RESULT.

If vehicle has been run recently wait 15 minutes before removing cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is provided to the heater system by two 16 mm (5/8 inch inside diameter) heater hoses. With engine idling at normal running temperature, set the control to maximum heat, floor, and high blower setting. Using a test thermometer, check the air temperature coming from the floor outlets, refer to Temperature Reference chart.

HEATING & AIR CONDITIONING (Continued)

TEMPERATURE REFERENCE CHART

Ambient Temp.		Minimum Floor Outlet Temp.	
Celsius	Fahrenheit	Celsius	Fahrenheit
15.5°	60°	62.2°	144°
21.1°	70°	63.8°	147°
26.6°	80°	65.5°	150°
32.2°	90°	67.2°	153°

If the floor outlet air temperature is insufficient, refer to 7 Cooling Systems for specifications. Both heater hoses should be HOT to the touch (coolant return hose should be slightly cooler than the supply hose). If coolant return hose is much cooler than the supply hose, locate and repair engine coolant flow obstruction in heater system.

POSSIBLE CAUSE OF LOW OR OBSTRUCTED COOLANT FLOW

(1) Pinched or kinked heater hoses.
(2) Improper heater hose routing.
(3) Plugged heater hoses or supply and return ports at cooling system connections.
(4) Plugged heater core.
(5) Air locked heater core or air in cooling system.
(6) If coolant flow is verified and outlet temperature is insufficient, a mechanical problem may exist.
(7) Low coolant level.
(8) Low water pump flow.

POSSIBLE CAUSE OF INSUFFICIENT HEAT

(1) Obstructed cowl air intake.
(2) Obstructed heater system outlets.
(3) Blend-air door not functioning properly.
(4) Evaporator freeze up.

TEMPERATURE CONTROL

If temperature cannot be adjusted with the TEMP knob on the control panel, the following could require service:
(1) Blend-air door binding.
(2) Improper engine coolant temperature.
(3) Faulty Instrument Panel Control.
(4) Wiring or a fuse problem.

DIAGNOSIS AND TESTING - AIR CONDITIONING SYSTEM

The air conditioning system is designed to remove heat and humidity from the air entering the passenger compartment. The evaporator, located in the heater A/C unit, is cooled to temperatures near the freezing point. As warm damp air passes over the fins in the evaporator, moisture in the air condenses to water, dehumidifying the air. Condensation on the evaporator fins reduces the evaporators ability to absorb heat. During periods of high heat and humidity, an air conditioning system will be less effective. With the control module set to RECIRC, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, A/C performance levels rise.

PERFORMANCE

Review all Warnings before proceeding with this procedure. Air temperature in test room and on vehicle must be 21° C (70°F) minimum for this test.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Connect a tachometer and manifold gauge set. Attach a thermocouple to the evaporator inlet line.
(2) Set control to A/C, RECIRC, and PANEL, temperature lever on full cool and blower on high.
(3) Start engine and hold at 1000 rpm with A/C clutch engaged.
(4) Engine should be warmed up with doors and windows closed.
(5) Insert a thermometer or place a thermocouple in the left center A/C outlet and operate the engine for five minutes. The A/C clutch may cycle depending on ambient conditions.
(6) With the A/C clutch engaged, compare the discharge air temperature to the evaporator inlet line temperature. The evaporator inlet line temperature should be no more than 5.5°C (10°F) cooler than the discharge air temperature.
(7) If the discharge air temperature fails to meet the specifications, refer to the System Charge Level.

REFRIGERANT SYSTEM LEAK

If A/C system is not cooling properly, determine if refrigerant system is fully charged with R-134a. This is accomplished by performing a system Charge Level-Check or Fill. If while performing this test A/C liquid line pressure is less than 345 kPa (50 psi) proceed to Refrigerant System Empty. If liquid line pressure is greater than 345 kPa (50 psi) proceed to Refrigerant System Low. If refrigerant system is empty or low a leak at a line fitting or component seal is likely. Check the fittings, lines and components for oily residue, this is an indication of a leak.

REFRIGERANT SYSTEM EMPTY

(1) Evacuate the refrigerant system to the lowest degree of vacuum possible (approx. 28 in Hg.). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If sys-

HEATING & AIR CONDITIONING (Continued)

tem will not maintain vacuum level, proceed with this procedure.

(2) Prepare a .284 Kg. (10 oz.) refrigerant charge to be injected into the system.

(3) Connect and dispense .284 Kg. (10 oz.) of refrigerant into the evacuated refrigerant system.

(4) Proceed to of Low Refrigerant Level Leak Test.

REFRIGERANT SYSTEM LOW

(1) Determine if there is any R-134a refrigerant in the system.

(2) Position the vehicle in a wind free work area. This will aid in detecting small leaks.

(3) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run for five minutes with the system set to the following:

- Transaxle in Park
- Engine Idling at 700 rpm
- A/C Controls Set in 100 percent outside air
- Blower switch in the high A/C position
- A/C in the ON position
- Open all windows

CAUTION: Leak detectors designed for R-12 refrigerant (only) will not detect leaks in a R-134a refrigerant system.

(4) Shut off the vehicle and wait 2 to 7 minutes. Then use an Electronic Leak Detector that is designed to detect R-134a type refrigerant and search for leaks. Fittings, lines, or components that appear to be oily usually indicates a refrigerant leak. To inspect the evaporator core for leaks, insert the leak detector probe into the drain tube opening or a heat duct.

NOTE: A R-134a dye is available to aid in leak detection. Use only Chrysler approved refrigerant dye.If a thorough leak check has been completed without indication of a leak, proceed to System Charge Level.

DIAGNOSIS AND TESTING - REFRIGERANT OIL

It is important to have the correct amount of lubricant in the A/C system to ensure proper lubrication of the compressor. Too little lubricant will result in damage to the compressor. Too much lubricant will reduce the cooling capacity of the system and consequently result in higher discharge air temperatures.

The lubricant used in the compressor is polyalkylene glycol PAG lubricant (SP-15). Only PAG refrigerant lubricant approved for use with R-134a should be used to service the system. Do not use any other lubricant. The lubricant container should be kept tightly capped until it is ready for use. Refrigerant lubricant will quickly absorb any moisture it comes in contact with.

It is not necessary to check or add lubricant unless it has been lost. Lubricant loss at the leak point will be evident by the presence of a wet, shiny surface around the leak.

REFRIGERANT OIL LEVEL

When an air conditioning system is first assembled, all components (except the compressor) are refrigerant oil free. After the system has been charged with (R-134a) refrigerant and operated, the oil in the compressor is dispersed through the lines and components. The evaporator, condenser and receiver/drier will retain a significant amount of oil. Refer to the A/C Component Refrigerant Oil Capacities table. When a component is replaced, the specified amount of refrigerant oil must be added. When the compressor is replaced, the amount of oil that is retained in the rest of the system must be drained from the replacement compressor. When a line or component has ruptured and oil has escaped, the compressor should be removed and drained. The receiver/drier must be replaced along with the ruptured part. The oil capacity of the system, minus the amount of oil still in the remaining components, can be measured and poured into the suction port of the compressor.

Example: On an A/C system the evaporator retains 60 ml. (2 oz.). The condenser retains 30 ml. (1 oz.) of oil, and system capacity may be 150 ml. (5.00 oz.) of oil.

150 ml. minus 90 ml. equals 60 ml. (2.00 oz.).

A/C COMPONENT REFRIGERANT OIL CAPACITIES

COMPONENT NAME	ml.	oz.
Total Air Conditioning System	150 ml.	5.00 oz.
Condenser	30 ml.	1.00 oz.
Evaporator	59 ml.	2.00 oz.
Filter/Drier	30 ml.	1.00 oz.
Line Blown	44 ml.	1.50 oz.

CAUTION: The refrigerant oil used in a R-134a A/C system is unique. Use only oils which were designed to work with R-134a refrigerant. The oil designated for this vehicle is SP-15 PAG (polyalkylene glycol).

VERIFY REFRIGERANT LUBRICANT LEVEL

(1) Discharge refrigerant system using a recycling/ reclaiming equipment if a charge is present.

HEATING & AIR CONDITIONING (Continued)

(2) Disconnect refrigerant lines from A/C compressor. Cap the open lines to prevent moisture from entering system.

(3) Remove compressor from vehicle.

(4) From suction and discharge ports on top of compressor, drain lubricant from compressor.

(5) Add system capacity minus the capacity of components that have not been replaced. Refer to the A/C Component Refrigerant Oil Capacities chart above. Add lubricant through the suction and discharge ports on compressor. This is not to exceed 150 ml. (5.00 oz.) in total.

(6) Install compressor and connect refrigerant lines. Then evacuate and charge refrigerant system.

(7) Most reclaim/recycling equipment will measure the lubricant being removed. This is the amount of lubricant to be added back to the system. If a new compressor is being installed, drain lubricant from old compressor, measure the amount drained and discard old lubricant. Drain the lubricant from the new compressor into a clean container. Return the amount of lubricant measured from the old compressor, plus the amount reclaimed from the system back into the new compressor.

STANDARD PROCEDURE

STANDARD PROCEDURE - TUBING AND FITTINGS

Kinks in the refrigerant tubing or sharp bends in the refrigerant hose lines will greatly reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all connections are pressure tight. Dirt and moisture can enter the system when it is opened for repair or replacement of lines or components. The refrigerant oil will absorb moisture readily out of the air. This moisture will convert into acids within a closed system.

CAUTION: The system must be completely empty before opening any fitting or connection in the refrigeration system. Open fittings with caution even after the system has been emptied. If any pressure is noticed as a fitting is loosened, retighten fitting and evacuate the system again.

A good rule for the flexible hose lines is to keep the radius of all bends at least 10 times the diameter of the hose. Sharper bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 3 inches (80 mm) from the exhaust manifold. Inspect all flexible hose lines to make sure they are in good condition and properly routed.

The use of correct wrenches when making connections is very important. Improper wrenches or improper use of wrenches can damage the fittings.

The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities.

When opening a refrigeration system, have everything you will need to repair the system ready. This will minimize the amount of time the system must be opened. Cap or plug all lines and fittings as soon as they are opened. This will help prevent the entrance of dirt and moisture. All new lines and components should be capped or sealed until they are ready to be used.

All tools, including the refrigerant dispensing manifold, the manifold gauge set, and test hoses should be kept clean and dry.

STANDARD PROCEDURE - REFRIGERANT EQUIPMENT

This vehicle uses R-134a refrigerant. It is a non-toxic, non-flammable, clear colorless liquefied gas. R-134a refrigerant is not compatible with R-12 refrigerant. Even a small amount of R-12 in a R-134a system could cause refrigerant oil sludging and poor performance.

Service ports for the air conditioning system are located on the hoses. Service ports have been designed to ensure that the system is not accidentally filled with the wrong refrigerant (R-12).

CAUTION: Never add R-12 to a system designed to use R-134a. System failure will occur. Only use gauges that have not been used for R-12.

When servicing a system, the air conditioning charging/recovery/recycling machine must be used (Fig. 1). Contact an automotive service equipment supplier for proper equipment. Refer to the operating instructions provided with the equipment for proper operation.

A R-134a gauge set (Fig. 2) must be used in conjunction with the charging/recovery/recycling device. The service hoses on the gauge set should have automatic back flow valves at the service port connector ends. This will prevent refrigerant R-134a from being released into the atmosphere.

HEATING & AIR CONDITIONING (Continued)

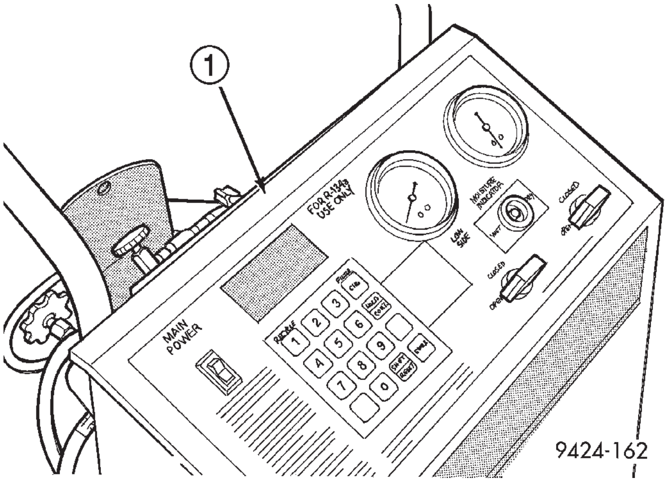

Fig. 1 Refrigerant Recovery/Recycling Station - Typical

1 - R-134 REFRIGERANT RECOVERY MACHINE

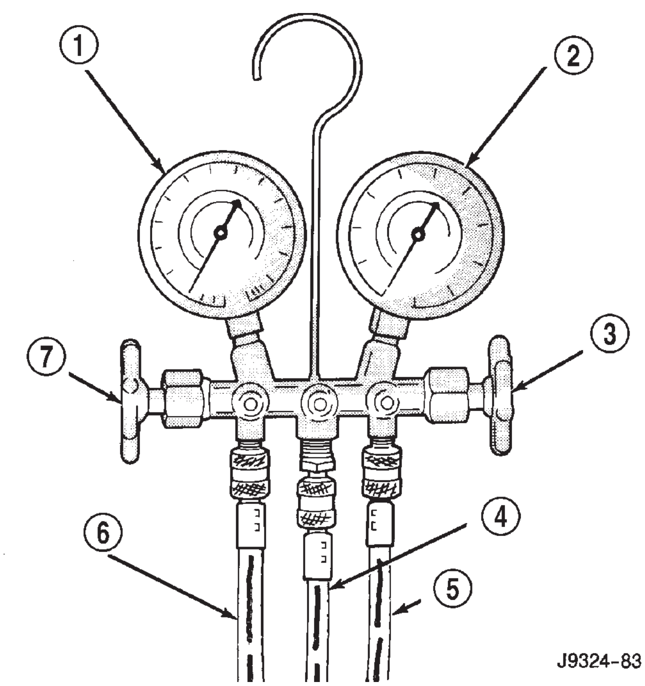

Fig. 2 Manifold Gauge Set - Typical

1 - LOW PRESSURE GAUGE
2 - HIGH PRESSURE GAUGE
3 - VALVE
4 - VACUUM/REFRIGERANT HOSE (YELLOW W/BLACK STRIP)
5 - HIGH PRESSURE HOSE (RED W/BLACK STRIP)
6 - LOW PRESSURE HOSE (BLUE W/BLACK STRIP)
7 - VALVE

R-134a refrigerant requires a special type of compressor oil. When adding oil, make sure that it is designed to be used in a R-134a system. Refer to the label under the hood for proper oil and refrigerant charge levels (Fig. 3).

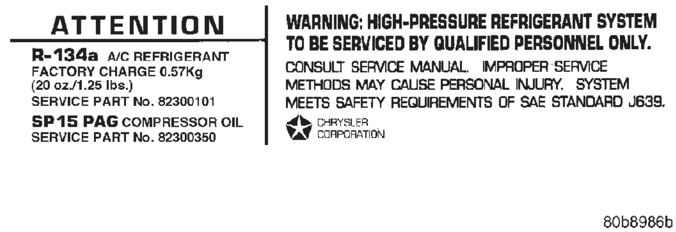

Fig. 3 Underhood Label

The use of R-134a will have a positive environmental impact due to it's zero ozone depletion and low global warming impact.

STANDARD PROCEDURE - SYSTEM CHARGE LEVEL

The procedure below should be used to check and/or fill the refrigerant charge in the air conditioning system.

NOTE: The maximum amount of R-134a refrigerant that the air conditioning system holds is listed on the underhood label.

To verify proper charge level, evacuate (reclaim) and recharge system to the proper refrigerant level.

STANDARD PROCEDURE - CHARGING A/C SYSTEM

PARTIAL CHARGE

This vehicle does not have a sight glass. It is not possible to determine the amount of R-134a charge in the system. Therefore it is necessary to completely evacuate and recover the system, and then recharge the system fully.

EVACUATION

Before adding refrigerant, all air must be evacuated from the system.

- Connect a manifold gauge set to the A/C service ports.
- Use a vacuum pump or charging station and evacuate system to 95 kPa (28 inches Hg) for 30 minutes.
- Go to Charging A/C System below.

HEATING & AIR CONDITIONING (Continued)

CHARGING A/C SYSTEM

The procedure below should be used to fill the refrigerant charge in the air conditioning system. This A/C system does not have or use a sight glass to check or charge the system.

WARNING: AVOID BREATHING A/C REFRIGERANT AND LUBRICANT VAPOR OR MIST. EXPOSURE MAY IRRITATE EYES, NOSE AND THROAT. USE ONLY APPROVED SERVICE EQUIPMENT MEETING SAE REQUIREMENTS TO DISCHARGE R-134a SYSTEM. IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE WORK AREA BEFORE RESUMING SERVICE.R-134a SERVICE EQUIPMENT OR VEHICLE A/C SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. MIXTURE OF AIR and R-134a CAN BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

CAUTION: Do not overcharge refrigerant system, as excessive compressor head pressure can cause noise and system failure.

After system has been tested for leaks and evacuated, a refrigerant (R-134a) charge can be injected into the system.

NOTE: When connecting service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) If using a separate vacuum pump close all valves before disconnecting pump. Connect manifold gauge set to the A/C service ports.

(2) Measure refrigerant (refer to capacities). Refer to the instructions provided with the equipment being used.

(3) Verify engine is shut off. Open suction and discharge valves. Open the charge valve to allow the refrigerant to flow into the system. When transfer of refrigerant has stopped, close the suction and discharge valve.

(4) If all of the charge did not transfer from the dispensing device, put vehicle controls into the following mode:

- Automatic transaxle in park or manual transaxle in neutral
- Engine idling at 700 rpm
- A/C control set in 100 percent outside air
- Panel mode
- Blower motor ON high speed
- Vehicle windows closed

If A/C compressor does not engage, test compressor clutch control circuit and correct any failure. Refer to Electrical Wiring Diagrams.

(5) Open the suction valve to allow the remaining refrigerant to transfer to the system.

WARNING: DO NOT OPEN THE DISCHARGE (HIGH-PRESSURE) VALVE AT THIS TIME.

(6) Close all valves and test the A/C system performance.

(7) Disconnect the charging station or manifold gauge set. Install the service port caps.

STANDARD PROCEDURE - EVACUATING A/C SYSTEM

NOTE: Moisture must be prevented from entering the A/C oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the compressor.

If a compressor is left open to the atmosphere for an extended period of time, the refrigerant oil should be drained and replaced. This will eliminate the possibility of contaminating the refrigerant system.

If refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the system and damage the compressor.

EVACUATE A/C SYSTEM

NOTE: When connecting the service equipment coupling to the line fitting, verify the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Connect a suitable charging station, refrigerant recovery machine and a manifold gauge set with vacuum pump.

(2) Open suction and discharge valves and start vacuum pump. The vacuum pump should run a minimum of 45 minutes to eliminate all moisture in system. When suction gauge reads -88 kPa (- 26 in. Hg) vacuum or greater for 45 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then evacuate the system an additional 10 minutes.

(3) Close all valves, turn off and disconnect the vacuum pump.

HEATING & AIR CONDITIONING (Continued)

(4) The refrigerant system is now ready to be charged with refrigerant.

STANDARD PROCEDURE- REFRIGERANT RECOVERY

WARNING: (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) AND (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION) BEFORE PERFORMING THE FOLLOWING OPERATION.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

CONTROLS

TABLE OF CONTENTS

A/C COMPRESSOR CLUTCH

DESCRIPTION

The compressor clutch components provide a way to drive the compressor. The compressor clutch assembly consists of a stationary electromagnetic coil, hub bearing and pulley assembly and a clutch plate. The compressor clutch and coil assembly are the only serviced parts on the compressor.

OPERATION

When clutch engages the compressor is then driven by the engine serpentine drive belt. The clutch engagement is controlled the heater-A/C mode control switch, a/c pressure transducer, evaporator probe, thermal limiter switch, compressor clutch relay and Powertrain Control Module (PCM).

A/C COMPRESSOR CLUTCH (Continued)

REMOVAL

NOTE: Refrigerant does not have to be reclaimed for compressor clutch, pulley or coil replacement. The compressor clutch can be serviced in the vehicle.

(1) Disconnect and isolate negative battery cable.

(2) Remove serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Unplug the compressor clutch coil wire harness connector.

(4) Remove three compressor mounting bolts.

(5) Remove compressor from mounting bracket and support compressor while servicing the clutch.

(6) Insert two pins of the Spanner Wrench C-4489 into the holes of the clutch plate. Hold the clutch plate stationary and remove nut (Fig. 1).

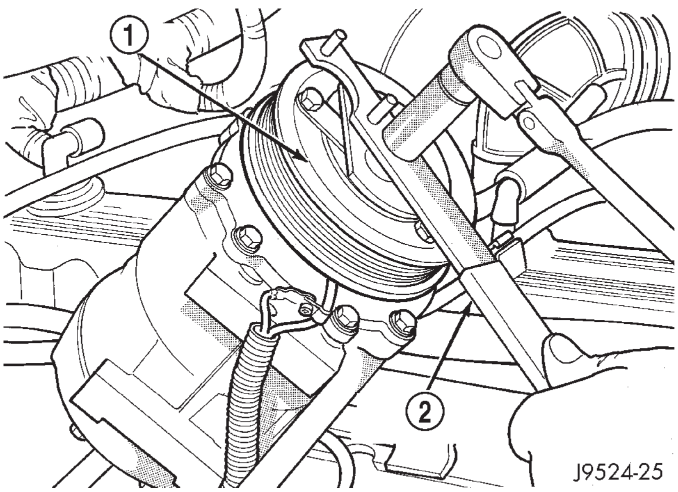

Fig. 1 Clutch Nut

1 - CLUTCH PLATE
2 - SPANNER

(7) Remove clutch plate with a Puller C-6461 (Fig. 2).

(8) Remove compressor clutch shims.

(9) Remove external front housing snap ring with snap ring pliers (Fig. 3).

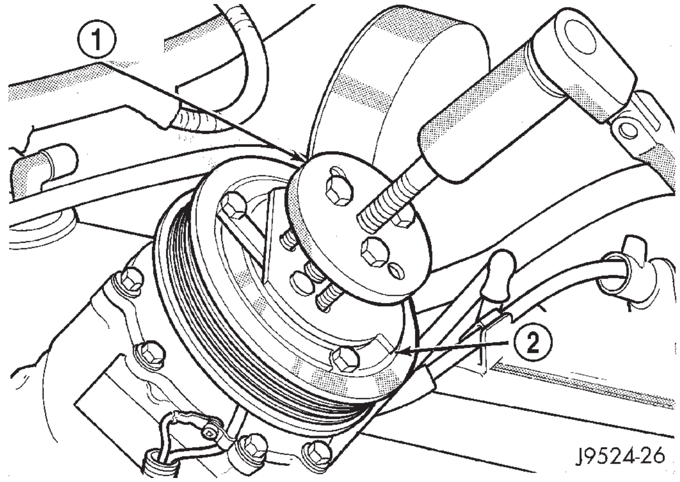

Fig. 2 Clutch Plate

1 - CLUTCH PLATE PULLER
2 - CLUTCH PLATE

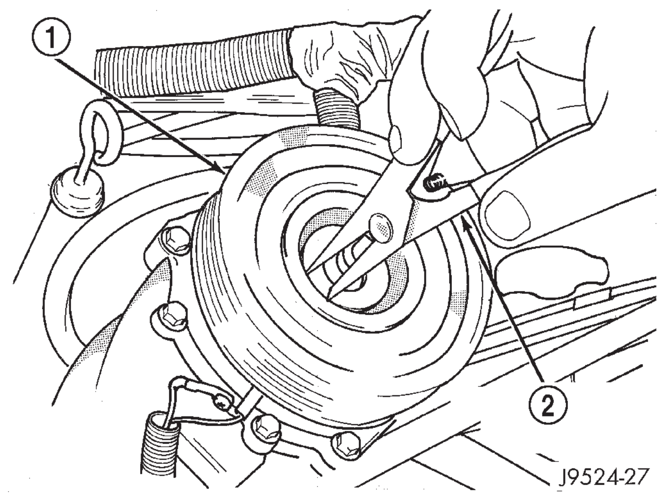

Fig. 3 External Snap Ring

1 - PULLEY
2 - SNAP RING PLIERS

(10) Install lip of the Rotor Puller C-6141-1 into the external snap ring groove and install Shaft Protector C-6141-2 (Fig. 4).

A/C COMPRESSOR CLUTCH (Continued)

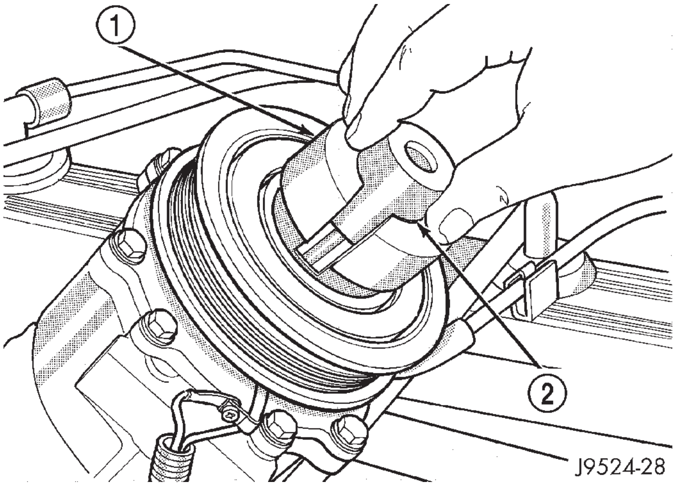

Fig. 4 Shaft Protector and Puller

1 - PULLER JAW
2 - SHAFT PROTECTOR

(11) Install Puller Bolts C-6461 through the puller flange and into the jaws of the rotor puller and tighten (Fig. 5). Turn the puller center bolt clockwise until the rotor pulley is free.

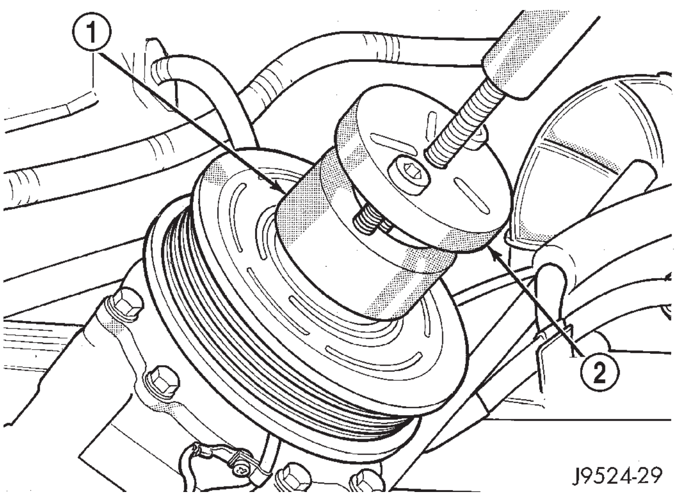

Fig. 5 Puller Plate

1 - PULLER JAW
2 - PULLER

(12) Remove screw and retainer from clutch coil wire harness on the front of the compressor (Fig. 6).

(13) Remove snap ring from compressor hub and remove clutch field coil (Fig. 7). Slide clutch field coil off of the compressor hub.

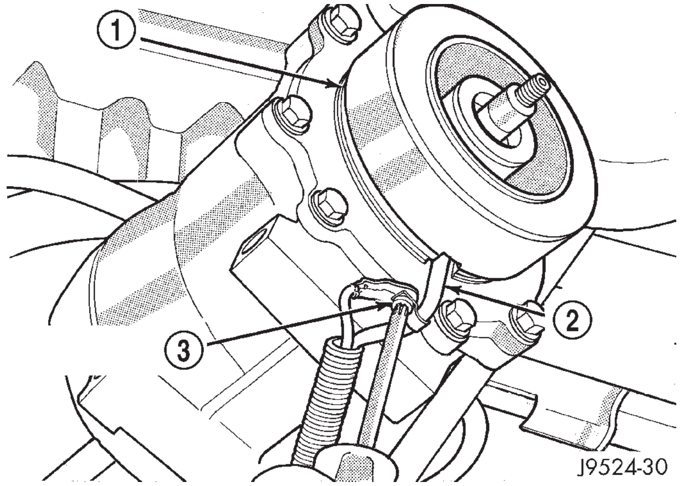

Fig. 6 Clutch Coil Lead Wire Harness

1 - COIL
2 - COIL WIRE
3 - RETAINER SCREW

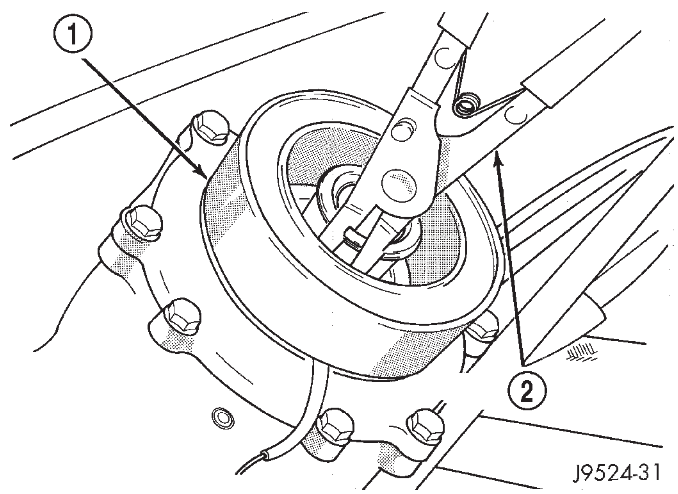

Fig. 7 Clutch Field Coil Snap Ring

1 - COIL
2 - SNAP RING PLIERS

INSTALLATION

(1) Install clutch field coil and snap ring.

(2) Install clutch coil wire harness retaining clip on the front of the compressor and tighten the screw.

(3) Align rotor assembly squarely on the front compressor housing hub.

(4) Install pulley bearing assembly with Installer C-6871 (Fig. 8). Thread installer on the shaft, then turn the nut until the pulley assembly is seated.

(5) Install external snap ring with the bevel side of the snap ring facing outward. Verify snap ring is seated.

A/C COMPRESSOR CLUTCH (Continued)

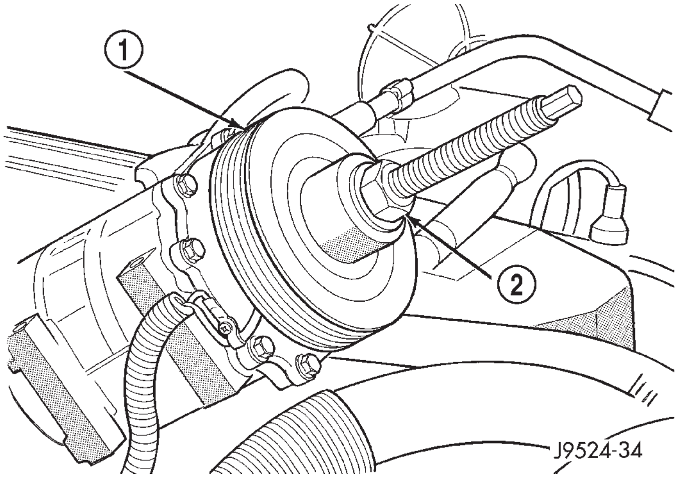

Fig. 8 Clutch Pulley Install

1 - PULLEY BEARING ASSEMBLY
2 - INSTALLER

CAUTION: If snap ring is not seated in the groove it will vibrate out and cause clutch failure and severe compressor damage will occur.

(6) Install compressor with the **original** clutch shims on the compressor shaft.

(7) Install clutch plate with Driver C-6463 (Fig. 9). Install the shaft nut and tighten to 14.4 N·m (10.5 ft. lbs.).

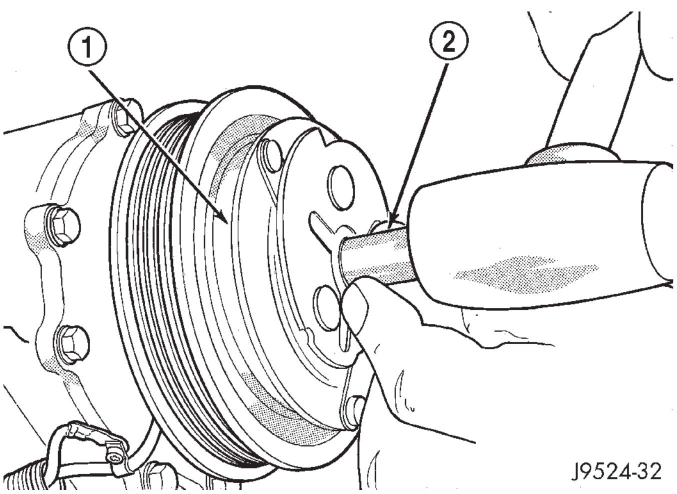

Fig. 9 Clutch Plate Driver

1 - CLUTCH PLATE
2 - DRIVER

(8) Check clutch air gap with a feeler gauge (Fig. 10). If air gap does not meet specification 0.41 - 0.79 mm (0.016 - 0.031 in.) add or subtract shims as required.

NOTE: If air gap is not consistent around the clutch, lightly pry up at the minimum variations and lightly tap down at the maximum variation point.

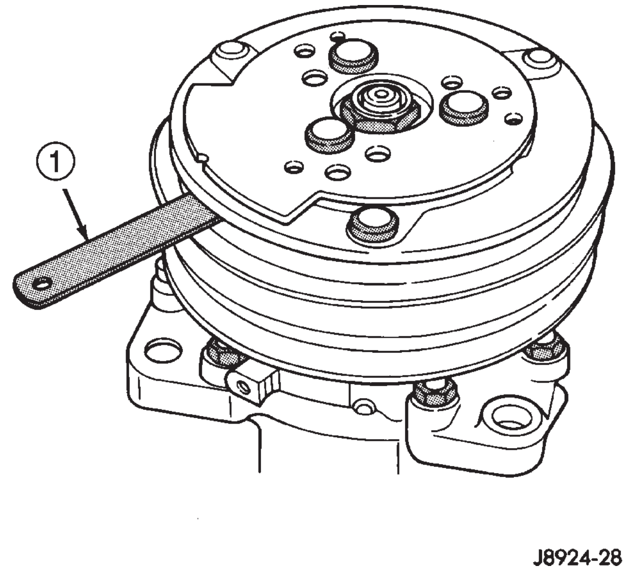

Fig. 10 Check Clutch Air Gap

1 - FEELER GAUGE

NOTE: When installing a new clutch onto a compressor that previously did not have a clutch, use the shims 1.0, 0.50, and 0.13 mm (0.040, 0.020, and 0.005 in.) provided with the new clutch.

(9) Position compressor on the mounting bracket and install bolts. Tighten bolts to 41 N·m (30 ft. lbs.).

(10) Plug in compressor clutch harness.

(11) Install serpentine drive belt. Refer to 7 Cooling System for procedure.

(12) Install Negative battery cable.

(13) Start engine, set system to A/C mode, run engine at 1500-2000 rpm, and blower speed on high. Cycle the **new** A/C clutch 20 times (5 seconds ON and 5 seconds OFF).

NOTE: This procedure will seat (burnishing) friction surfaces and provide a higher clutch torque capability. This is only necessary on a NEW clutch.

A/C COMPRESSOR CLUTCH COIL

DESCRIPTION

The compressor clutch coil is electromagnetic and provides a way to engage the compressor clutch plate. The electromagnetic coil unit, hub bearing and pulley assembly are retained on the compressor front housing with snap rings. The compressor clutch and coil assembly are the only serviced parts on the compressor.

OPERATION

The coil is controlled by the heater-A/C mode control switch, a/c pressure transducer, evaporator probe, thermal limiter switch, compressor clutch relay and Powertrain Control Module (PCM). When the clutch coil is energized, it magnetically draws the clutch plate into contact with the pulley. When the coil is not energized the pulley freewheels on the clutch hub bearing, which is part of the pulley.

DIAGNOSIS AND TESTING - COMPRESSOR CLUTCH COIL

(1) Verify battery state of charge.

(2) Connect an ammeter (0-10 ampere scale) in series with the clutch coil terminal. Use a volt meter (0-20 volt scale) with clip leads measuring voltage across the battery and A/C clutch.

(3) With A/C control in A/C mode and blower at low speed, start the engine and run at normal idle.

(4) The A/C clutch should engage immediately and the clutch voltage should be within 2 volts of the battery voltage. If the A/C clutch does not engage, test the fusible link.

(5) The A/C clutch coil is acceptable if the current draw is 2.0 to 4.15 amperes at 11.5 to 12.5 volts at clutch coil. This is with the work area temperature at 21°C (70°F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.

(6) If coil current reads zero, the coil is open and should be replaced. If the ammeter reading is 5 amperes or more, the coil is shorted and should be replaced. If the coil voltage is not within two volts of the battery voltage, test clutch coil feed circuit for excessive voltage drop.

A/C COMPRESSOR CLUTCH RELAY

DESCRIPTION

The compressor clutch relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (footprint) is different, the current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

OPERATION

The a/c compressor clutch relay is a electromechanical device that switches battery current to the a/c compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the Body Control Module (BCM) and the a/c pressure transducer.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH RELAY

RELAY TEST

The compressor clutch relay (Fig. 11) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see Relay Circuit Test in the Diagnosis and Testing section of this group. If not OK, replace the faulty relay.

A/C COMPRESSOR CLUTCH RELAY (Continued)

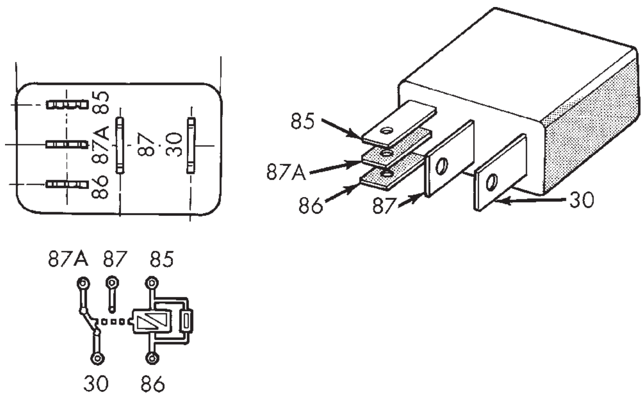

Fig. 11 A/C COMPRESSOR CLUTCH RELAY

30 - COMMON FEED
85 - COIL GROUND
86 - COIL BATTERY
87 - NORMALLY OPEN
87A - NORMALLY CLOSED

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the compressor clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM (pin 64). If not OK, repair the open circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC).

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug compressor clutch relay from the PDC.

INSTALLATION

(1) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

A/C HEATER CONTROL

DIAGNOSIS AND TESTING - CONTROL MODULE

The control switch and timer circuit are tested in the vehicle with DRB scan tool. Refer to the Body Diagnostic Procedures Manual.

REMOVAL

(1) Disconnect negative battery cable.

(2) Carfully pull out the control bezel and contol from the intrument panel.

(3) Disconnect the control wiring harness (Fig. 12).

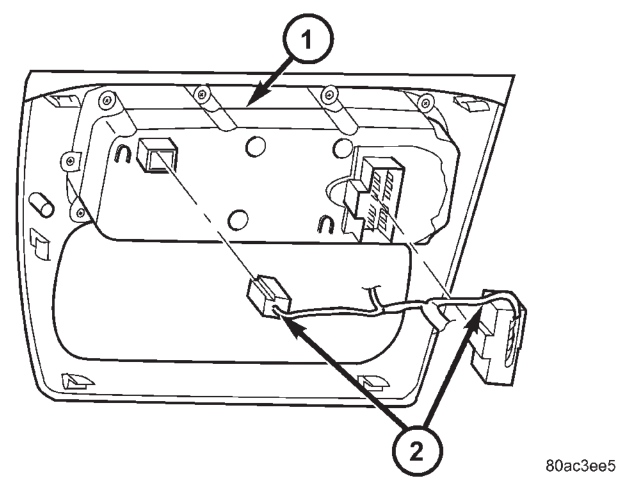

Fig. 12 CONTROL HARNESS

1 - CONTROL
2 - CONTROL CONNECTORS

(4) Remove control mounting screws (Fig. 13).

INSTALLATION

(1) Install control on bezel and install mounting screws.

(2) Connect control harness to control.

(3) Align bezel with instrument panel (Fig. 14) and push bezel and control into place.

A/C HEATER CONTROL (Continued)

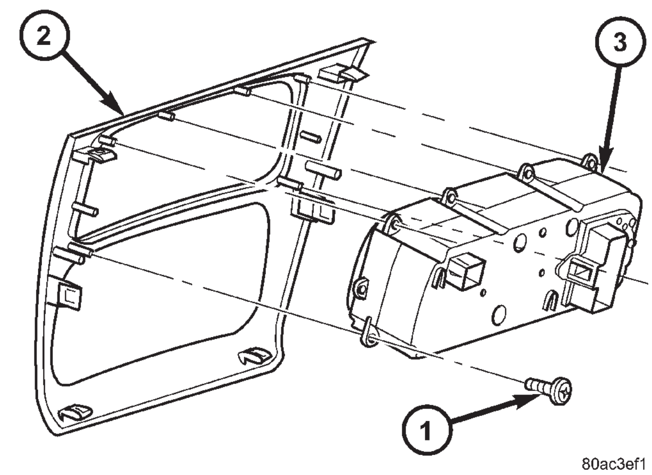

Fig. 13 CONTROL MOUNTING SCREWS

1 - SCREW
2 - BEZEL
3 - CONTROL

CAUTION: Do not push on control knobs, control could be damage.

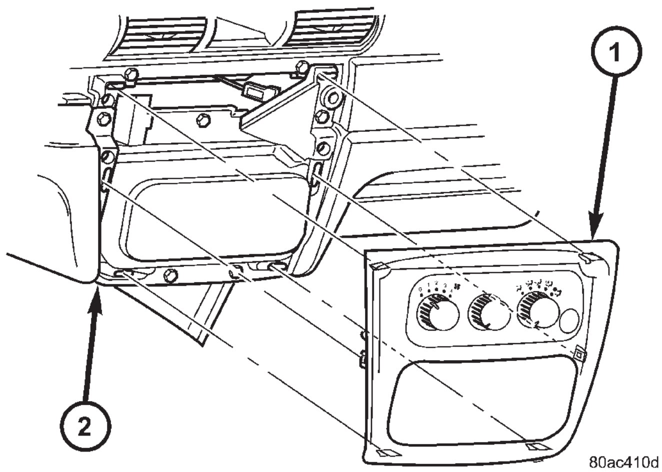

Fig. 14 CONTROL BEZEL

1 - BEZEL
2 - INSTRUMENT PANEL

(4) Connect negative battery cable.

A/C PRESSURE TRANSDUCER

DESCRIPTION

The A/C pressure transducer is located on the discharge line near the condenser and functions as a refrigerant system pressure sensor. This switch prevents compressor operation when the discharge line pressure approaches extreme levels. The transducer is a factory-calibrated unit and cannot be adjusted or repaired. If faulty or damaged, it must be replaced.

OPERATION

When discharge line pressure rises above 2971 kPa (431 psi) the PCM turns off the a/c clutch. When pressure drops below 206 kPa (30 psi), the PCM turns off the a/c clutch.

REMOVAL

CAUTION: A/C pressure transducer switch connector terminal contacts can be damaged by probing tools during system diagnosis and repair. Failure to use their respective mating terminals or pin gauge to check for tightness will cause contact beam spreads. This will result in loss of continuity.

(1) Disconnect the wire harness connector from the A/C pressure transducer.
(2) Remove transducer with a 14 mm open-end wrench.

NOTE: A slight release of pressure trapped in the fitting may be experienced. It is not necessary to discharge the refrigerant system.

INSTALLATION

NOTE: O-ring replacement is required whenever the pressure transducer is serviced. Be sure to use the O-ring specified for this vehicle.

(1) Thread pressure transducer on to discharge line.
(2) Tighten pressure transducer to 6 N·m (50 in. lbs.).
(3) Connected wire connector to transducer.

EVAPORATOR TEMPERATURE SENSOR

DESCRIPTION

The evaporator temperature sensor (Fig. 15) is located at the coldest point on the face of the evaporator. The switch is attached to the evaporator coil with the sensing probe inserted into the coil fins. The evaporator temperature sensor prevents condensate water on the evaporator coil from freezing and obstructing A/C system air flow.

EVAPORATOR TEMPERATURE SENSOR (Continued)

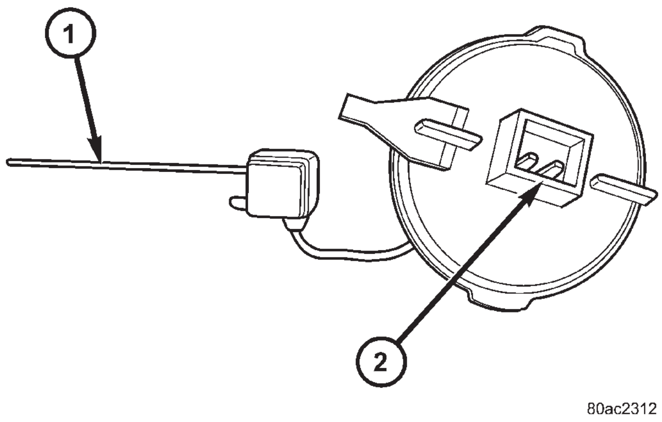

Fig. 15 EVAPORATOR TEMPERATURE SENSOR

1 - PROBE
2 - CONNECTOR

OPERATION

The Body Control Module (BCM) will send a Programmable Communications Interface (PCI) bus message to the Powertrain Control Module (PCM), which will check engine, coolant temperature, and refrigerant pressure temperature before turning ON the A/C Compressor Clutch. Turning ON the A/C Compressor Clutch will allow the system to cool the evaporator. The BCM will send a message to the PCM when the evaporator temperature becomes too cold. The PCM will then turn OFF the A/C Compressor Clutch, before evaporator freeze up occurs. The DRBIII® scan tool can be used to monitor this operation. The temperature setpoint at which the clutch is turned OFF varies with the outside ambient temperature. The temperature at which the clutch is turned ON is preset to 2º F above the OFF setpoint mentioned above. Refer to Evaporator Temperature Sensor Setpoint table and (Fig. 16) for the correct setpoint.

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove the blower motor(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/BLOWER MOTOR - REMOVAL).

(3) Remove resistor card from underside of HVAC(Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/BLOWER MOTOR RESISTOR BLOCK - REMOVAL).

(4) Lower the glove box door.

(5) Reach through the glove compartment door opening and disconnect the evaporator temperature sensor wiring connector.

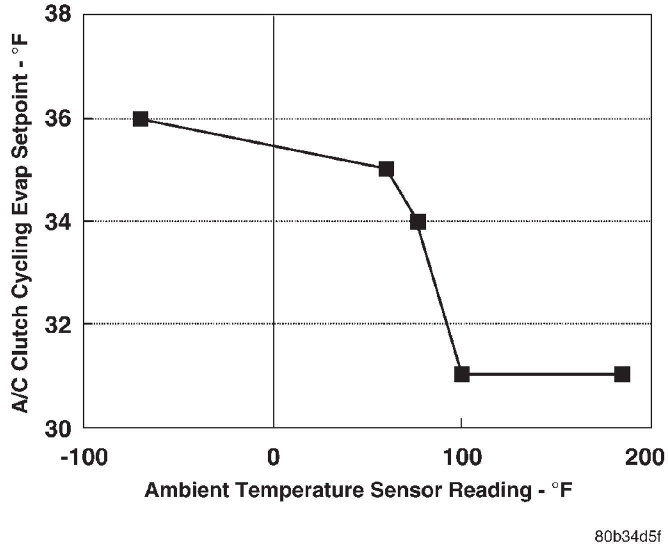

Fig. 16 EVAPORATOR TEMPERATURE SENSOR SETPOINT

EVAPORATOR TEMPERATURE SENSOR SETPOINT

AMBIENT TEMPERATURE SENSOR READING °F (° C)	A/C CLUTCH OFF EVAPORATOR TEMPERATURE SETPOINT ° F (° C)
185 (85)	31 (-0.5)
100 (37.7)	31 (-0.5)
77 (25)	34 (1.1)
60 (15.5)	35 (1.6)
-70 (-56.6)	36 (2.2)

(6) Using a flat blade pry tool, pull back on the locking tab. Twist access plate clockwise one-quarter turn and pushed inside the A/C housing (Fig. 17). Then orientated the plate in such a way that it can be removed from the housing.

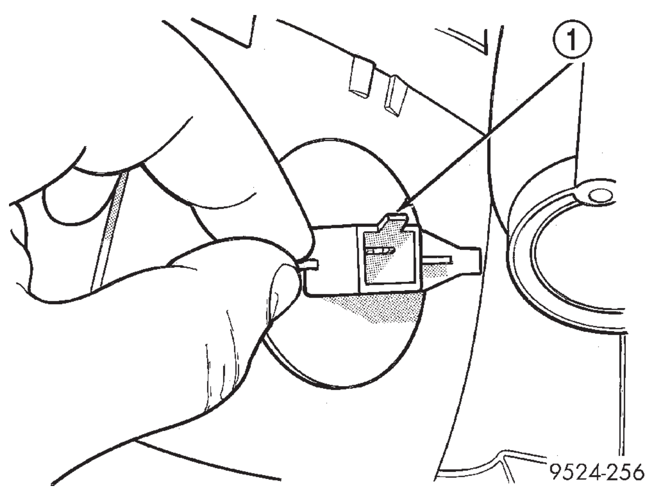

Fig. 17 Evaporator Probe

1 - EVAPORATOR PROBE

EVAPORATOR TEMPERATURE SENSOR (Continued)

(7) Using the access plate hole in the housing as a view hole, reach hand up through blower opening to pull the evaporator probe from the evaporator coil.

INSTALLATION

(1) Install new sensor into the evaporator.

NOTE: The evaporator is manufactured with three holes for probe insertion. Insert the probe in the uppermost hole.

(2) Using the access plate hole in the housing as a view hole, reach up through blower opening to install the evaporator probe to the evaporator coil.

(3) Replace access plate to HVAC housing.

(4) Reach through the glove compartment door opening and connect the evaporator temperature sensor wiring connector.

(5) Install glove compartment door.

(6) Install the resistor card to the underside of the HVAC(Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/BLOWER MOTOR RESISTOR BLOCK - INSTALLATION).

(7) Install the blower motor(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/BLOWER MOTOR - INSTALLATION).

(8) Connect negative battery cable.

AMBIENT TEMP SENSOR

DESCRIPTION

The ambient air temperature sensor (Fig. 18) is located on the inside of front bumper beam.

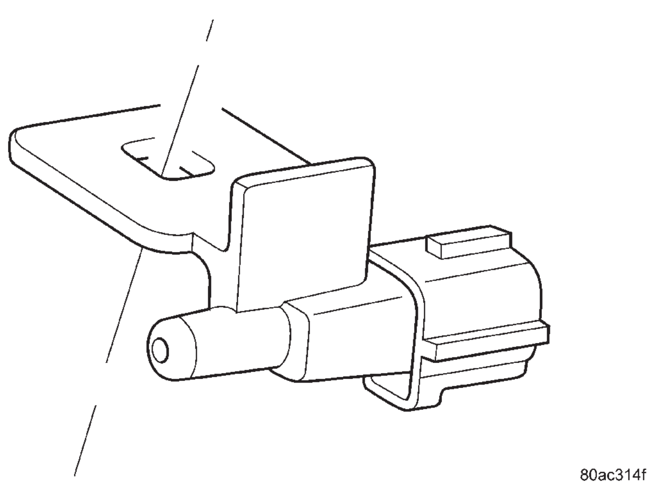

Fig. 18 AMBIENT TEMP SENSOR

OPERATION

The ambient temperature sensor is used by the A/C system to adjust evaporator temperatures on vehicles equipped with the ATC system.

REMOVAL

(1) Remove sensor mounting push pin (Fig. 19).

(2) Disconnect sensor wiring connector.

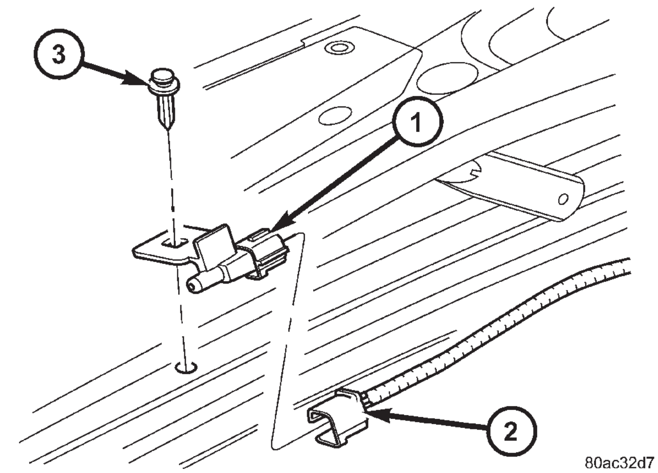

Fig. 19 AMBIENT TEMP SENSOR

1 - SENSOR
2 - WIRING CONNECTOR
3 - PUSH PIN

INSTALLATION

(1) Connect the sensor wiring harness connector.

(2) Install the sensor fastener push pin.

BLEND DOOR ACTUATOR

DESCRIPTION

The blend door actuator is a motor/geartrain assembly which mechanically positions the blend door. The actuator is mounted to the bottom of the HVAC housing in the center.

OPERATION

A potentiometer in the actuator allows the BCM to know the exact position of the blend door at all times. The blend door actuator is not serviceable and must be replaced if found to be defective.

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove the passengerside hush panel.

(3) Disconnect the electrical connection.

(4) Remove actuator retaining screws and pull actuator straight down (Fig. 20). Note actuator shaft position for installation reference.

INSTALLATION

(1) Install blend door actuator on the housing, making sure the shaft spline is positioned properly with the cam (Fig. 21).

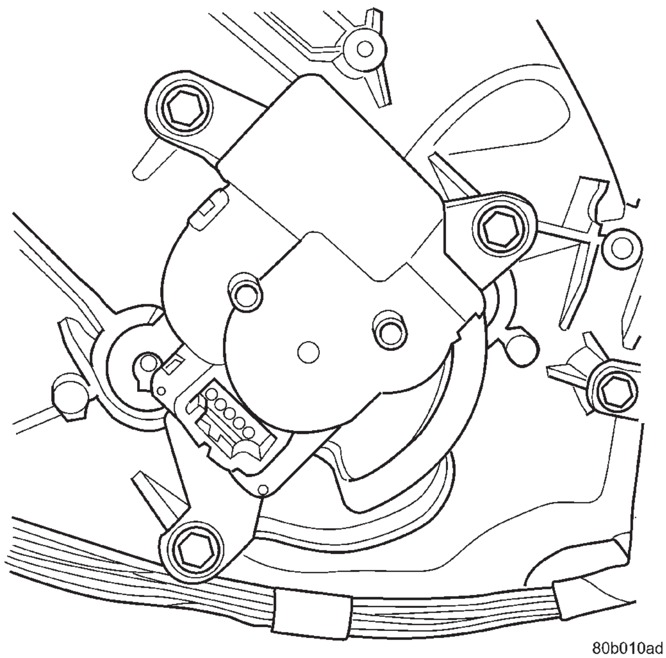

Fig. 20 BLEND DOOR ACTUATOR

(2) Install tighten the actuator mounting.

(3) Connect wire harness connector to the actuator.

(4) Install the passengerside hush panel.

(5) Connect the negative battery cable.

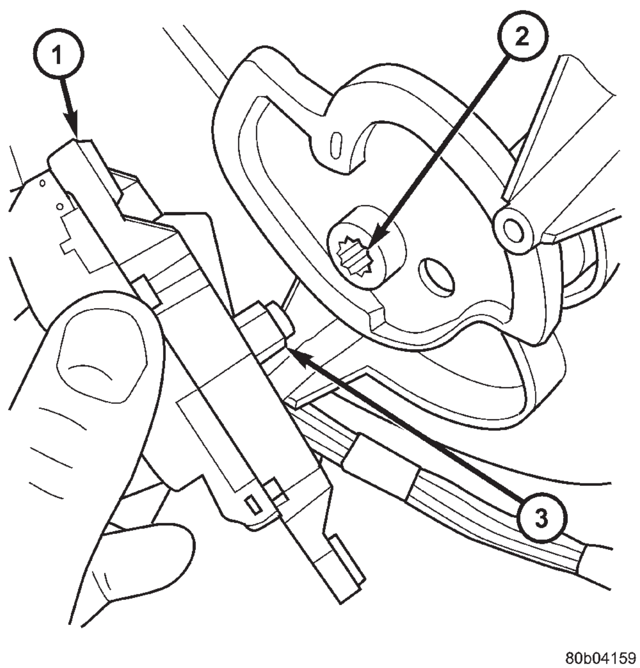

Fig. 21 BLEND ACTUATOR SPLINE

1 - ACTUATOR
2 - CAM SPLINE
3 - ACTUATOR SPLINE

MODE DOOR ACTUATOR

DESCRIPTION

The mode door actuator is a motor/geartrain assembly. It mechanically positions the panel/bi-level door and the heat/defrost door. The actuator is mounted to the bottom of the HVAC housing on the left side.

OPERATION

A potentiometer in the actuator allows the BCM (for both manual and ATC systems) to know the exact position of the doors at all times. The actuator is not serviceable and must be replaced if found to be defective.

REMOVAL

(1) Disconnect battery negative cable.

(2) Remove left silencer panel.

(3) Remove wiring connection from actuator.

(4) Remove mode actuator (Fig. 22) mounting screws and pull actuator straight down. Note actuator shaft position for installation reference.

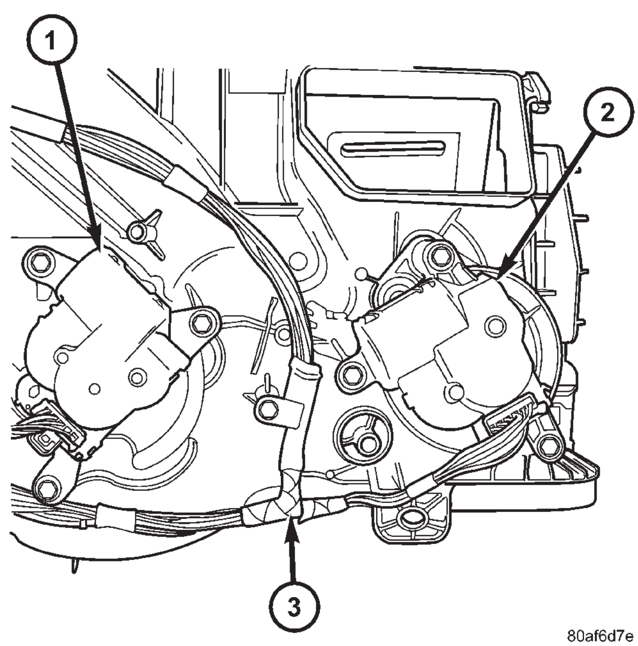

Fig. 22 ACTUATORS

1 - BLEND ACTUATOR
2 - MODE ACTUATOR
3 - HARNESS

MODE DOOR ACTUATOR (Continued)

INSTALLATION

(1) Install mode door actuator on the housing, make sure spline shaft is positioned properly with the cam (Fig. 23).

(2) Install and tighten the mounting screws.

(3) Connect actuator wiring harness to the actuator.

(4) Install console left side panel.

(5) Install left silencer panel.

(6) Connect the negative battery cable.

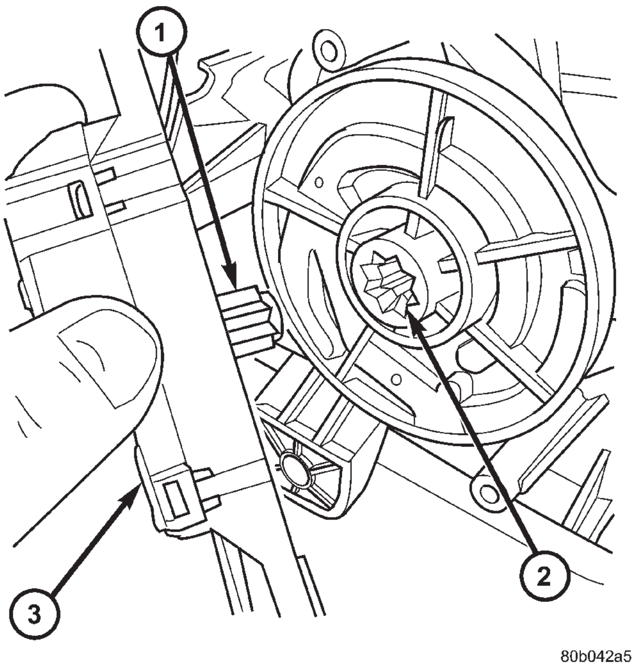

Fig. 23 MODE ACTUATOR SPLINE

1 - ACTUATOR SPLINE
2 - CAM SPLINE
3 - BLEND ACTUATOR

RECIRCULATION DOOR ACTUATOR

DESCRIPTION

The recirculation door actuator is a motor/geartrain assembly. It mechanically positions the recirculation door. The actuator is mounted to the right side of the HVAC housing.

OPERATION

A potentiometer in the actuator allows the BCM (for both manual and ATC systems) to know the exact position of the door at all times. The actuator is not serviceable and must be replaced if found to be defective.

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove the instrument panel. Refer to 23 Body for the procedures.

(3) Remove actuator retaining screws (Fig. 24) and pull actuator straight off. Note actuator shaft position for installation reference.

(4) Disconnect the electrical connection.

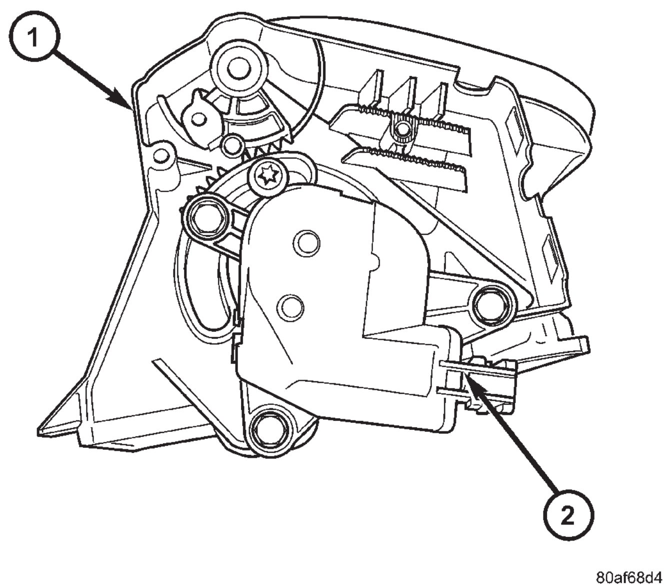

Fig. 24 RECIRCULATION ACTUATOR

1 - RECIRCULATION HOUSING
2 - ACTUATOR

RECIRCULATION DOOR ACTUATOR (Continued)

INSTALLATION

(1) Connect wire harness connector to the recirculation door actuator.

(2) Install recirculation door actuator on the housing, making sure shaft spline is positioned properly with the gear (Fig. 25).

(3) Install and tighten actuator mounting screws.

(4) Install the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION)

(5) Connect the negative battery cable.

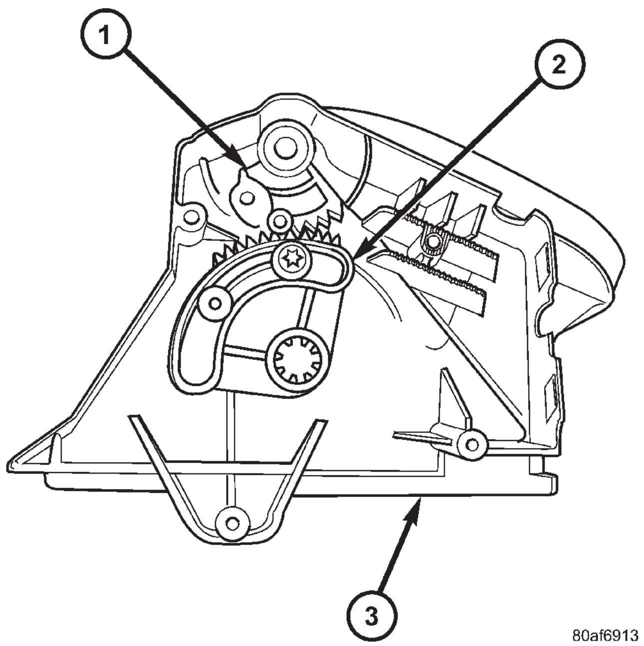

Fig. 25 RECIRCULATION DOOR GEAR

1 - DOOR GEAR
2 - ACTUATOR GEAR
3 - RECIRCULATION HOUSING

BLOWER MOTOR RESISTOR

DESCRIPTION

The blower motor resistor is mounted to the lower right side of the heater-A/C housing in the passenger compartment, where it can be accessed for service.

The blower motor resistor has multiple resistor wires, each of which will change the resistance in the blower motor ground path to change the blower motor speed. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected blower motor speed. The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

With the blower motor switch in the lowest speed position the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the switch is in the highest speed position, blower motor resistor is bypassed and the blower motor receives a direct path to ground.

DIAGNOSIS AND TESTING-BLOWER MOTOR RESISTOR

The blower motor resistor is located in the passenger compartment on the lower side of the heater-A/C housing.

The blower motor resistor can be tested without removing it from its mounting position. For circuit descriptions and diagrams, (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DESCRIPTION).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the blower motor resistor.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

(1) Remove lower right silencer panel.

(2) Disconnect wiring connectors (Fig. 26) from resistor.

(3) Remove blower resistor mounting screws.

(4) Pull blower motor resistor out of HVAC housing.

BLOWER MOTOR RESISTOR (Continued)

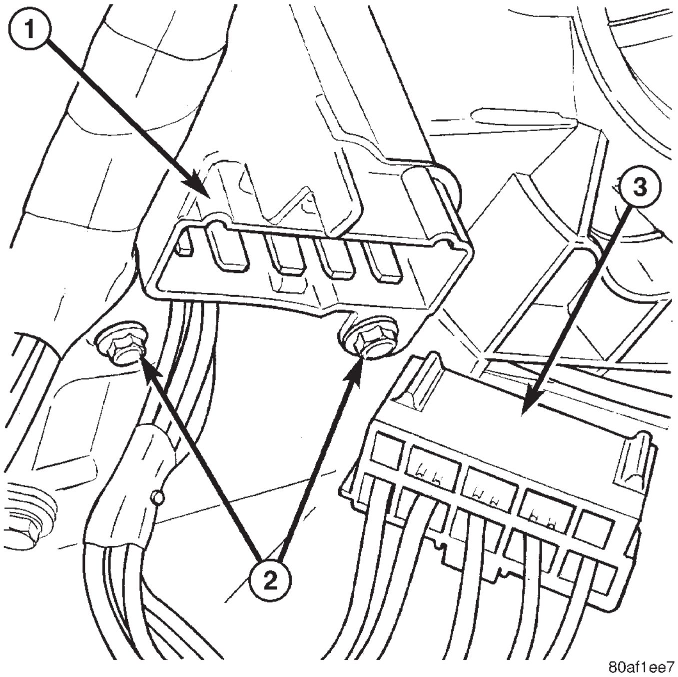

Fig. 26 RESISTOR BLOCK

1 - RESISTOR
2 - MOUNTING SCREWS
3 - CONNECTOR

INSTALLATION

(1) Install blower resistor into HVAC housing.

(2) Install and tighten the two resistor mounting screws.

(3) Connect resistor wiring harness.

(4) Install right silencer panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

THERMAL LIMITER SWITCH

DESCRIPTION

The thermal limiter switch measures compressor surface temperature. If compressor surface temperature is excessive, the switch cuts battery feed to the compressor clutch coil. The switch will reset itself, once compressor surface temperature returns to normal. The switch is not adjustable or serviceable, if faulty the compressor must be replaced.

OPERATION

The thermal limiter switch interrupts battery feed to the compressor clutch coil when temperature reaches 122 - 128° C (250 - 260° F). The switch restores clutch coil battery feed when the temperature drops to 104 - 116° C (220 - 240° F).

DIAGNOSIS AND TESTING - THERMAL LIMITER SWITCH

(1) Unplug Thermal Limiter connector.

(2) With an ohmmeter, check for continuity between the two terminals. If no continuity is present replace compressor.

(3) The Thermal Limiter is calibrated to open and close at:

- Open circuit (no continuity) Temperature: 122 - 128°C (252 - 262°F)
- Close circuit (continuity) Temperature: 106 - 116°C (225 - 235°F)

NOTE: The thermal limiter switch is not serviceable. If the switch fails, the compressor must be replaced.

DISTRIBUTION

TABLE OF CONTENTS

BLOWER MOTOR

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove lower right silencer panel.
(3) Remove blower motor connector.
(4) Remove the three blower motor mounting screws.
(5) Remover blower motor (Fig. 1) from housing.

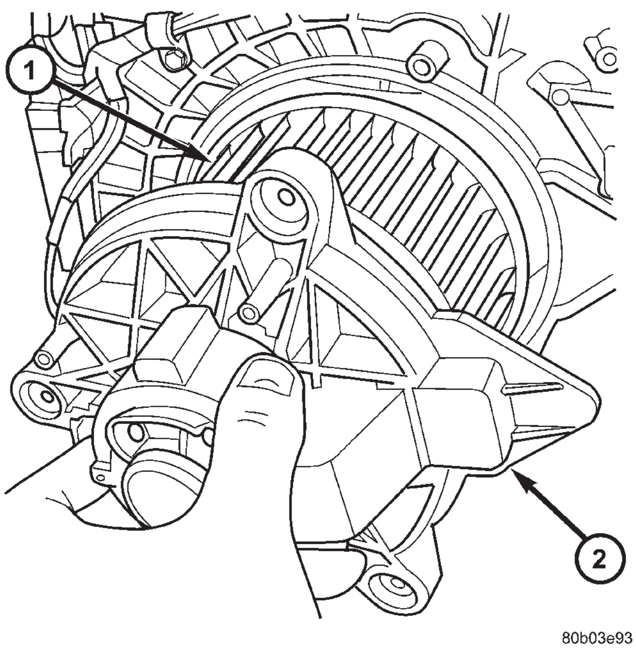

Fig. 1 BLOWER MOTOR

1 - BLOWER WHEEL
2 - BLOWER MOTOR

INSTALLATION

(1) Install blower motor into the housing.
(2) Install the three blower motor mounting screws.
(3) Connect blower motor wiring harness.
(4) Install silencer panel.

HVAC HOUSING

DESCRIPTION

The HVAC housing is mounted under the instrument panel to the dash panel. It houses the heater core, evaporator coil, blower motor and a series of doors. The doors are used to direct air from the blower motor to verious duct and through the heater core/evaporator coil.

OPERATION

The system draws outside air through the cowl opening at the base of the windshield. It then flows into the plenum chamber above the Heater A/C unit housing and passes through the evaporator. At this point airflow can be directed either through or around the heater core. This is done by adjusting the blend-air door with the TEMP control on the control head. After the air passes the blend air door, the air flow is then directed from the PANEL, BI-LEVEL (panel and floor), and FLOOR-DEFROST outlets. Air flow velocity can be adjusted with the blower speed selector switch on the control head.

Ambient air intake can be shut off by closing the recirculating air door. This will recirculate the air that is already inside the vehicle. Rotating the MODE control knob to the Defrost/Floor or Defrost setting on the control head will engage the compressor. This will send refrigerant through the evaporator, and remove heat and humidity from the air before it goes through the heater core.

HVAC HOUSING (Continued)

REMOVAL

(1) Remove negative battery cable.

(2) Recover refrigerant from A/C system with R134a refrigerant recovery machine.

(3) Drain the engine cooling system.(Refer to 7 - COOLING/ENGINE - SERVICE PROCEDURE).

(4) Remove heater hoses from heater core.

NOTE: Plug core tubes to prevent antifreeze from spilling on vehicle interior during removal.

(5) Remove quick connect clips from A/C lines at the expansion valve.

(6) Remove A/C lines from expansion valve with Quick Connectors Tool Kit 7193.

(7) Remove expansion valve mounting bolts and remove valve.

NOTE: Cap the A/C lines and evaporator to prevent moisture from entering the refrigerant system.

(8) Remove floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

(9) Remove rear heat ducts.

(10) Remove nuts securing HVAC housing to dash panel under the hood.

(11) Remove the instrument panel and HVAC housing as an assembly(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(12) Disconnect HVAC wiring connect from left side of the housing.

(13) Remove nuts mounting HVAC housing to dash panel.

DISASSEMBLY

(1) Disconnect recirculation actuator wiring connector.

(2) Remove recirculation housing mounting screws from the HVAC housing.

(3) Remove recirculation housing from HVAC housing.

(4) Remove recirculation actuator (Fig. 2) mounting screws and remove actuator.

(5) Remove recirculation actuator gear (Fig. 3) mounting screw and remove gear.

(6) With a small screw driver, depress recirculation door gear release (Fig. 4) and remove gear.

(7) Tilt the gear end of the recirculation door up and pull the door out of the housing.

(8) Remove blower motor wiring connector.

(9) Remove blower motor mounting screws and remove motor.

(10) Remove HVAC harness connector (Fig. 5) from the top of the housing.

(11) Remove seal (Fig. 6) from evaporator coil inlet/outlet.

(3) Connect HVAC wiring harness

(4) Make sure the drain tube and evaporator seals are properly seated to the HVAC housing before installing the Instrument Panel and HVAC assembly into the vehicle.

(5) Install instrument panel and HVAC housing assembly(Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(6) Install nuts securing HVAC housing to dash panel under the hood.

(7) Install rear heat ducts.

(8) Install console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(9) Install expansion valve and tighten mounting bolts.

(10) Install A/C lines to expansion valve with **new** O-rings.

(11) Install quick connect clips to A/C lines.

(12) Install heater hoses to heater core.

(13) Install negative battery cable.

(14) Fill engine cooling system (Refer to 7 - COOLING/ENGINE - SERVICE PROCEDURE).

(15) Evacuate and charge A/C system with R134a refrigerant recovery machine.

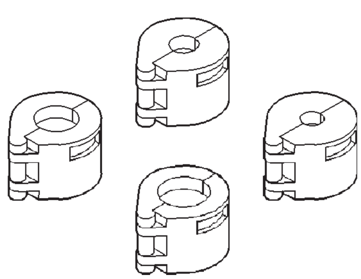
PLUMBING

TABLE OF CONTENTS

PLUMBING

SPECIAL TOOLS

AIR CONDITIONING



A/C Line Disconnect Tool 7193

A/C COMPRESSOR

DESCRIPTION

The TRS90 is a fixed displacement type compressor. The compressor uses an integral thermal limiter switch to protect it from overheating. A high pressure relief valve located on the rear of the compressor housing is designed to protect the system from excessive pressure. The system uses polyalkylene glycol synthetic wax-free refrigerant oil SP-15 PAG.

OPERATION

The compressor is driven by the engine through an electric clutch, drive pulley and belt. The compressor is lubricated by refrigerant oil that is circulated throughout the system with the refrigerant. The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then com-

A/C COMPRESSOR (Continued)

presses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

A high pressure relief valve is located on the rear surface of the compressor housing. The high pressure relief valve vents the system when a discharge pressure of 3445 - 4135 kPa (500 - 600 psi) or above is reached. The valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached. This prevents damage to the compressor and other system components. The compressor and relief valve cannot be repaired and must be replaced if damaged.

DIAGNOSIS AND TESTING - A/C COMPRESSOR

When investigating an air conditioning related noise, you must first know the conditions when the noise occurs. Some possible conditions are weather, vehicle speed, in or out of gear and engine temperature.

Noises that develop during air conditioning operation can often be misleading. For example, what sounds like a failed front engine bearing or connecting rod may be caused by loose bolts, mounting brackets or loose clutch assembly. Improper drive belt tension can cause a misleading noise when compressor is engaged. The noise may not occur when compressor is disengaged.

Drive belt(s) are speed sensitive. At different engine speeds and depending upon belt tension, belt(s) can develop noises that are mistaken for a compressor noise.

(1) Select a quiet area for testing. Duplicate conditions as much as possible. Switch compressor on and off several times to clearly identify compressor noise. Listen to compressor clutch while engaged and disengaged.

(2) To duplicate high-ambient condition (high-head pressure), restrict air flow through condenser. Install manifold gauge set to make sure discharge pressure doesn't exceed 2070 kPa (300 psi).

(3) Tighten ALL compressor mounting bolts, clutch mounting bolt and clutch coil mounting screws

(4) Check refrigerant hoses for rubbing or interference with other components.

(5) Check refrigerant charge.

(6) Check compressor noise as in Step 1.

(7) If noise still exists, loosen compressor mounting bolts and torque. Repeat Step 1.

(8) If noise continues, replace compressor and repeat Step 1.

REMOVAL

(1) Recover refrigerant from A/C system with R134a refrigerant recovery machine(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(2) Disconnect negative battery cable.

(3) Remove refrigerant lines from compressor. (Fig. 1)

NOTE: Cap lines while system is open to prevent moisture from entering system.

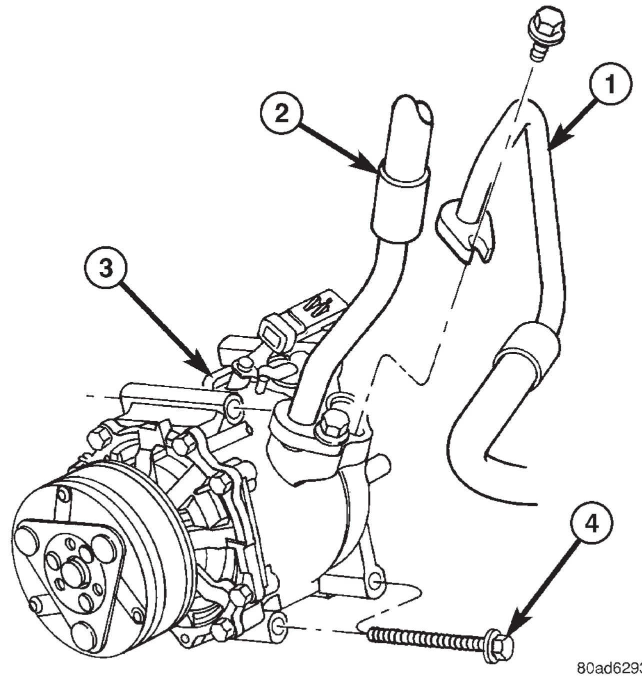


Fig. 1 A/C COMPRESSOR

1 - DISCHARGE LINE
2 - SUCTION LINE
3 - COMPRESSOR
4 - MOUNTING BOLT

(4) Raise and support vehicle.

(5) Remove drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(6) Disconnect compressor clutch wire lead.

(7) Remove three compressor mounting bolts and lower compressor from vehicle.

INSTALLATION

(1) Lift compressor up on mounting bracket.

(2) Install compressor mounting bolts and tighten to 28.2 N·m (20.8 ft. lbs.).

(3) Connect clutch wiring harness.

(4) Install drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(5) Remove support and lower vehicle.

(6) Install **new** O-rings and install A/C lines.

A/C COMPRESSOR (Continued)

(7) Connect negative battery cable.

(8) Evacuate the refrigerant system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(9) Recharge the refrigerant system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

A/C CONDENSER

DESCRIPTION

The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins. The condenser is located in front of the vehicles radiator.

OPERATION

When air passes through the condenser fins the refrigerant gives up its heat. The refrigerant then condenses as it leaves the condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical for proper air conditioning performance. It is important that there are no objects placed in front of the radiator grille openings or foreign material on the condenser fins that might obstruct proper air flow. The condenser cannot be repaired and if faulty or damaged must be replaced. All factory-installed air seals or shrouds must be installed following service to maintain proper air flow.

REMOVAL

(1) Recover refrigerant from A/C system with an R134a refrigerant recovery machine.

(2) Remove front fascia (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).

(3) Remove upper radiator support cross-member.

(4) Remove transmission cooler lines.

(5) Remove A/C lines (Fig. 2).

NOTE: Cap lines while system is open to prevent moisture from entering system.

(6) Remove two condenser mounting bolts.

(7) Lift condenser up out of the vehicle.

INSTALLATION

(1) Lower condenser into vehicle.

(2) Install condenser mounting bolts.

(3) Install **new** O-rings and install A/C lines.

(4) Install transmission cooler lines.

(5) Install upper radiator support.

(6) Install front fascia (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

(7) Evacuate and charge A/C system.

A/C EXPANSION VALVE

DESCRIPTION

The “H” valve-type thermal expansion valve (TXV) (Fig. 3) is located in front of the heater-A/C housing between the liquid and suction lines and the evaporator coil.

The expansion valve is a calibrated unit and cannot be adjusted or repaired. If faulty or damaged, the expansion valve must be replaced.

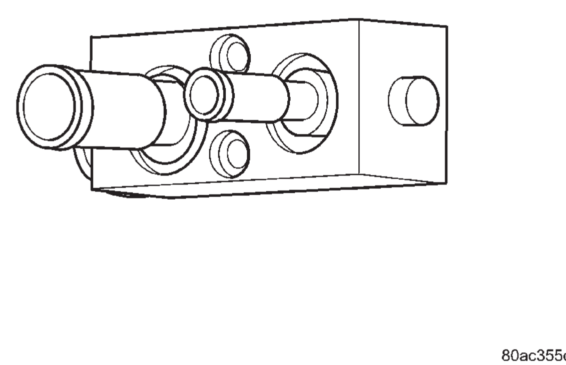

Fig. 3 EXPANSION VALVE

A/C EXPANSION VALVE (Continued)

OPERATION

High pressure high temperature liquid refrigerant from the liquid line passes through the expansion valve orifice. The refrigerant is converted into a low-pressure, low-temperature mixture of liquid and gas before it enters the evaporator coil. A temperature sensor in the expansion valve control head monitors refrigerant temperature leaving the evaporator coil through the suction line. The valve adjusts the orifice size at the liquid line to let the proper amount of refrigerant into the evaporator coil. Controlling refrigerant flow through the evaporator ensures that none of the refrigerant leaving the evaporator is in a liquid state, which could damage the compressor.

DIAGNOSIS AND TESTING - A/C EXPANSION VALVE

The expansion valve is located on the engine side of the dash panel, near the right shock tower.

The expansion valve can fail in three different positions (open, closed or restricted).

In an Open Position: this will result in a noisy compressor or no cooling. The cause can be a broken spring, broken ball or excessive moisture in the A/C system. If the spring or ball are found to be defective, replace the expansion valve. If excessive moisture is found in the A/C system, recycle the refrigerant.

In a Closed Position: There will be low suction pressure and no cooling. This may be caused by a failed power dome or excessive moisture in the A/C system. If the power dome on the expansion valve is found to be defective replace the expansion valve. If excessive moisture is found recycle the refrigerant.

A Restricted Orifice: There will be low suction pressure and no cooling. This may be caused by debris in the refrigerant system. If debris is believed to be the cause, recycle the refrigerant and replace the expansion valve and receiver/drier.

REMOVAL

(1) Recover refrigerant from the A/C system with a refrigerant recovery machine.

(2) Disconnect clips from expansion valve lines.

(3) Disconnect quick connectors on expansion valve with Quick Connector Kit 7193.

(4) Remove lines at expansion valve.

NOTE: Cap lines while system is open to prevent moisture from entering system.

(5) Remove two retaining bolts from expansion valve and remove valve (Fig. 4).

(6) Remove expansion valve.

(7) Remove expansion valve gasket.

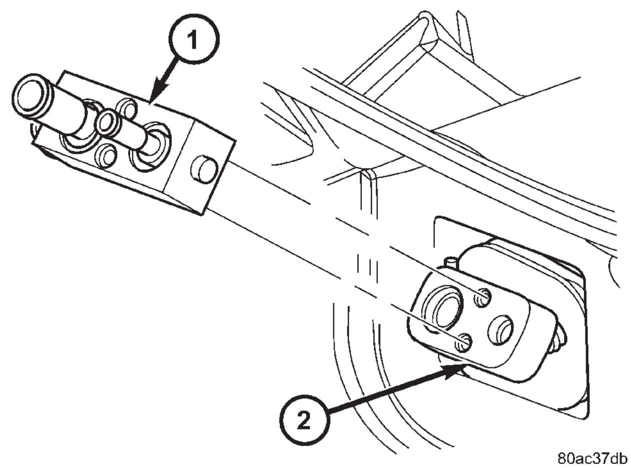

Fig. 4 EXPANSION VALVE

1 - VALVE
2 - EVAPORATOR

INSTALLATION

(1) Install a **new** gasket and install valve on evaporator.

(2) Install expansion valve bolts and tighten to 11 N·m (100 in. lbs.).

(3) Install **new** O-rings and install A/C lines on expansion valve.

(4) Install quick connector clips.

(5) Evacuate and charge system.

A/C EVAPORATOR

DESCRIPTION

The evaporator coil (Fig. 5) is located in the heater-A/C housing on the passenger side of the vehicle. The evaporator coil is positioned in the housing so all the air entering the housing passes over the evaporator fins then through the system ducts and outlets. Air passing over the evaporator fins will only be conditioned when the A/C system is on. The evaporator coil cannot be repaired and must be replaced if faulty or damaged.

OPERATION

Refrigerant enters the evaporator from the expansion valve as a low-temperature low-pressure mixture of liquid and gas. As air flows over the evaporator fins, humidity in the air condenses on the fins and heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas before it leaves the evaporator.

A/C EVAPORATOR (Continued)

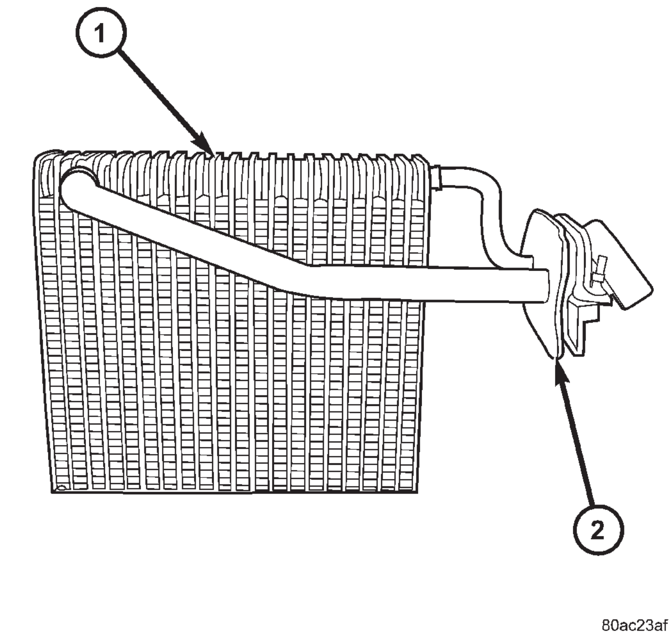

Fig. 5 EVAPORATOR COIL

2 - HVAC SEAL

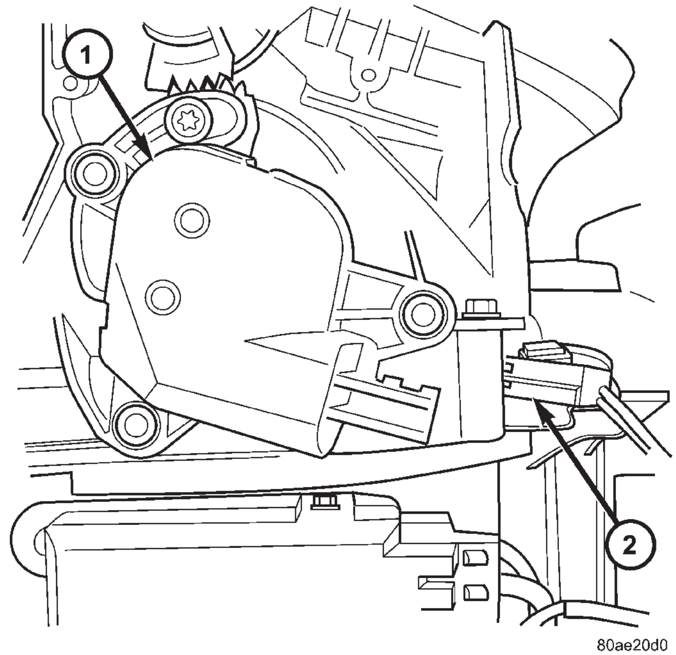

Fig. 6 RECIRCULATION MOTOR

1 - MOTOR
2 - CONNECTOR

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove HVAC housing from the vehicle(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(3) Disconnect connector from recirculation motor (Fig. 6).

(4) Remove wiring harness connector (Fig. 7) from the top of the housing.

(5) Remove seal (Fig. 8) around evaporator coil inlet/outlet.

(6) Remove retaining screw from the top of the housing.

(7) Separate the upper from the housing from the lower (Fig. 9).

(8) Remove evaporator temperature sensor.

(9) Lift evaporator (Fig. 10) out of bottom housing.

(10) Remove styrofoam seal around evaporator.

INSTALLATION

(1) Install evaporator coil into lower housing.

(2) Install evaporator temperature sensor(Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/EVAPORATOR TEMPERATURE SENSOR - INSTALLATION).

(3) Install upper housing onto lower housing and install screws(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY).

(4) Connect recriculation motor connector.

(5) Install evaporator seal.

(6) Install HVAC harness on upper housing.

(7) Install HVAC housing in vehicle(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

DISCHARGE LINE

DESCRIPTION

The discharge line is made from reinforced rubber with a nylon liner on the inner walls. The line has a light weight aluminum fittings at the compressor and condenser end. The O-rings used to seal the connections are made from a special type of rubber not affected by R-134a refrigerant. O-rings must replaced whenever the line is removed and installed.

CAUTION: Use only O-rings specified for the vehicle. Failure to use correct O-ring will cause the connection to leak.

DISCHARGE LINE (Continued)

REMOVAL

(1) Recover refrigerant from A/C system with R134a refrigerant recovery machine(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(2) Disconnect A/C pressure transducer wire harness.

(3) Remove discharge line (Fig. 11) from A/C condenser.

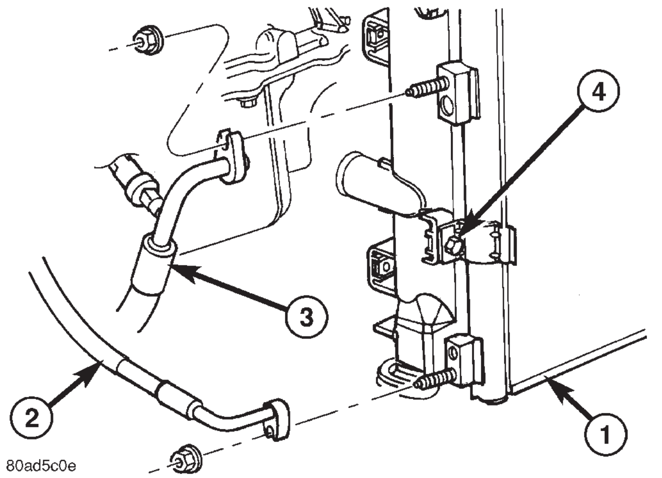

Fig. 11 AIR CONDITIONING LINES

1 - CONDENSER
2 - LIQUID LINE
3 - DISCHARGE LINE
4 - MOUNTING BOLT

(4) Remove the discharge line from A/C compressor (Fig. 12).

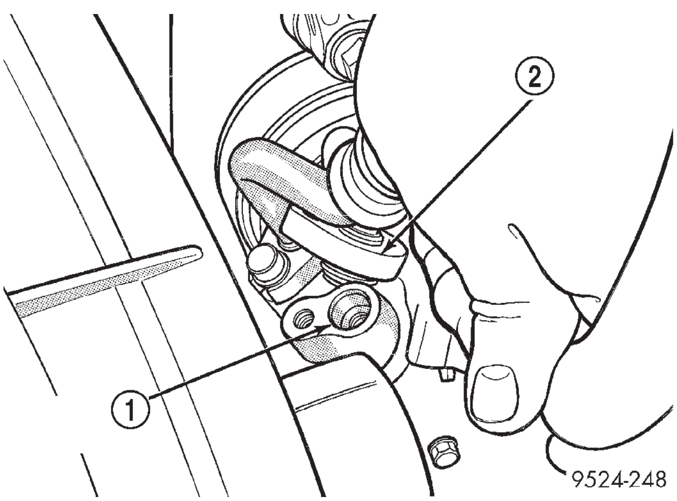

Fig. 12 DISCHARGE LINE

1 - DISCHARGE PORT
2 - DISCHARGE LINE

NOTE: Cap compressor and condenser while system is open to prevent moisture from entering system.

INSTALLATION

NOTE: Always lubricate the NEW O-rings with refrigerant oil as specified for this vehicle.

(1) Install discharge line on the compressor with **new** O-ring and tighten bolt to 22.5 N·m (199 in. lbs.).

(2) Install discharge line on the condenser with **new** O-ring and tighten nut to 22.5 N·m (199 in. lbs.).

(3) Connect pressure transducer wiring harness.

(4) Evacuate the A/C system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(5) Recharge the refrigerant system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

SUCTION LINE

DESCRIPTION

The suction line is made from reinforced rubber. The line has a light weight aluminum fitting at the compressor end and a quick connect fitting at the expansion valve end. The quick connect has two O-rings to seal the connection made from a special type of rubber not affected by R-134a refrigerant. The O-rings must be replaced whenever the line is removed and installed.

CAUTION: Use only O-rings specified for the vehicle. Failure to use correct O-ring will cause the connection to leak.

REMOVAL

(1) Recover refrigerant from A/C system with R134a refrigerant recovery machine(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(2) Remove suction line from the compressor.

(3) Remove clip from the line at the expansion valve.

(4) Disconnect quick connector on expansion valve with Quick Connector Kit 7193.

(5) Remove the shock tower to suction line bracket bolt.

(6) Remove suction line (Fig. 13) from expansion valve.

SUCTION LINE (Continued)

NOTE: Cap compressor and expansion valve while system is open to prevent moisture from entering system.

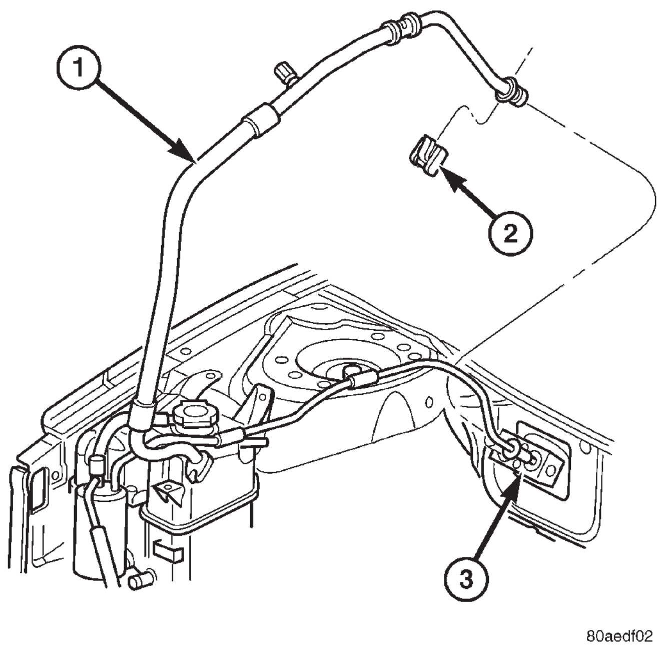

Fig. 13 SUCTION LINE

1 - SUCTION LINE
2 - QUICK CONNECT CLIP
3 - EXPANSION VALVE

INSTALLATION

(1) Install suction line to expansion valve with **new** O-rings.

(2) Install clip on the line quick connect at the expansion valve.

(3) Install suction line to compressor with **new** O-ring and tighten bolt to 22.5 N·m (199 in. lbs.).

(4) Install the shock tower to suction line bracket bolt and tighten to 6.8 N·m (60.1 In. Lbs.)

(5) Evacuate the refrigerant system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(6) Recharge the refrigerant system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

RECEIVER / DRIER

DESCRIPTION

The receiver/drier is mounted on the right side of the engine compartment. It is part of the liquid line, between the condenser outlet and evaporator inlet.

OPERATION

High-pressure liquid refrigerant from the condenser flows into the receiver/drier. The receiver/drier filters the refrigerant to prevent foreign material from contaminating the expansion valve. A desiccant bag inside absorbs any moisture which may have become trapped in refrigerant system. In periods of high demand air conditioner operation, it acts as a reservoir to store surplus refrigerant. If the receiver/drier is faulty, damaged, contaminated or the system has been left open to the atmosphere for an undetermined period, it must be replaced.

REMOVAL

(1) Recover the refrigerant from A/C system with a refrigerant recovery machine(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(2) Remove liquid line from condenser(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C DISCHARGE LINE - REMOVAL).

(3) Remove clip from the line at the expansion valve.

(4) Disconnect quick connector on expansion valve with Quick Connector Kit 7193.

(5) Remove liquid line from expansion valve.

(6) Remove receiver/drier bracket bolt (Fig. 14) at base of receiver/drier and remove the receiver/drier and line.

NOTE: Cap condenser and evaporator while system is open to prevent moisture from entering system.

INSTALLATION

(1) Install receiver/drier in bracket and tighten mounting bolt.

(2) Install liquid line to expansion valve with **new** O-rings.

(3) Install clip on the line quick connect at the expansion valve.

(4) Install liquid line to condenser with **new** O-rings and tighten nut to 19.2 N·m (170 in. lbs.).

(5) Evacuate the refrigerant system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(6) Recharge the refrigerant system(Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

SERVICE PORT VALVE CORE

DESCRIPTION

The high pressure service port is located on the receiver drier. The low pressure service port is located on the suction line, near the right strut tower.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.

OPERATION

The two refrigerant system service ports are used to charge/recover/recycle/evacuate and test the air conditioning refrigerant system. Unique service port coupler sizes are used on the R-134a system to ensure the refrigerant system is not accidentally contaminated with R-12 refrigerant or refrigerant system service equipment.

HEATER CORE

DESCRIPTION

The heater core (Fig. 15) is located in the HVAC housing. The core is a heat exchanger made of rows of tubes and fins.

OPERATION

Engine coolant is circulated through heater hoses to the heater core. As coolant flows through the heater core, heat is transferred to the heater core fins and tubes. Air directed through the heater core fins, picks up the heat. The temperature control door controls heater output air temperature by controlling the air flowing through the HVAC housing. The heater core cannot be repaired and must be replaced if damaged.

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove HVAC housing from the vehicle(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).

(3) Disconnect connector from recirculation motor (Fig. 16).

(4) Remove wiring harness connector (Fig. 17) from the top of the housing.

(5) Remove seal (Fig. 18) around evaporator coil inlet/outlet.

(6) Remove retaining screw from the top of the housing.

(7) Separate the upper from the housing from the lower (Fig. 19).

(1) Install new heater core into lower housing.
(2) Install upper housing onto lower housing and install screws.
(3) Install evaporator seal
(4) Install HVAC harness on upper housing
(5) Connect recirculation motor connector.
(6) Install HVAC housing(Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

REFRIGERANT OIL

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The TRS90 compressor used in this vehicle is designed to use an SP-15 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. Recap the oil container immediately after use to prevent moisture contamination.

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

It is important to have the correct amount of lubricant in the a/c system to ensure proper lubrication of the compressor. Too little lubricant will result in damage to the compressor. Too much lubricant will reduce the cooling capacity of the system and consequently result in higher discharge air temperatures.

The lubricant used in the compressor is polyalkalene glycol PAG lubricant. Only the refrigerant lubricant approved for use with this vehicle (SP-15 PAG oil) should be used to service the system. Do not use any other lubricant. The lubricant container should be kept tightly capped until it is ready for use. Refrigerant lubricant will quickly absorb any moisture it comes in contact with.

It is not necessary to check or add lubricant unless it has been lost. Lubricant loss at the leak point will be evident by the presence of a wet, shiny surface around the leak.

REFRIGERANT OIL LEVEL CHECK

When an air conditioning system is first assembled, all components (except the compressor) are refrigerant oil free. After the system has been charged with (R-134a) refrigerant and operated, the oil in the compressor is dispersed through the lines and components. The evaporator, condenser, and receiver/drier will retain a significant amount of oil. Refer to the A/C Component Refrigerant Oil Capacities table. When a component is replaced, the specified amount of refrigerant oil must be added. When the compressor is replaced, the amount of oil that is retained in the rest of the system must be drained from the replacement compressor. The oil capacity of the system, minus the amount of oil still in the remaining components (refer to the oil capacity chart below) can be measured and poured into the suction port of the compressor. When a line or component has ruptured and oil has escaped, the receiver/drier must be replaced along with the ruptured part.

REFRIGERANT OIL (Continued)

Example: On an A/C system the evaporator retains 60 ml. (2 oz.). The condenser retains 30 ml. (1 oz.) of oil, and system capacity may be 150 ml. (5.00 oz.) of oil.

150 ml. minus 90 ml. equals 60 ml. (2.00 oz.).

A/C COMPONENT REFRIGERANT OIL CAPACITIES

COMPONENT NAME	ml.	oz.
Total Air Conditioning System	150 ml.	5.00 oz.
Condenser	30 ml.	1.00 oz.
Evaporator	59 ml.	2.00 oz.
Receiver/Drier	30 ml.	1.00 oz.
Line Blown	44 ml.	1.50 oz.
Compressor	Drain and measure the oil from the old compressor. See text.	

CAUTION: The refrigerant oil used in a R-134a A/C system is unique. Use only oils which were designed to work with R-134a refrigerant. The oil designated for this vehicle is ND 8 PAG (polyalkalene glycol).

VERIFY REFRIGERANT LUBRICANT LEVEL

(1) Recover refrigerant from the system.

(2) Disconnect refrigerant lines from the a/c compressor. Cap open lines to prevent moisture from entering the system.

(3) Remove compressor from the vehicle.

(4) From the suction and discharge ports on the compressor, drain the lubricant from the compressor.

(5) Add the system capacity minus the capacity of the components that have not been replaced. Refer to the A/C Component Refrigerant Oil Capacities chart above. Add lubricant through the suction and discharge ports on compressor. This is not to exceed 150 ml. (5.00 oz.) in total.

(6) Install the compressor and connect the refrigerant lines. Then evacuate and charge refrigerant system.

(7) Most reclaim/recycling equipment will measure the lubricant being removed. This amount of lubricant should be added back to the system. If a new compressor is being installed, drain lubricant from old compressor, measure the amount drained and discard old lubricant. Drain the lubricant from the new compressor into a clean container. Return the amount of lubricant measured from the old compressor, plus the amount reclaimed from the system back into the new compressor.

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

EMISSIONS CONTROL

TABLE OF CONTENTS

EMISSIONS CONTROL

DESCRIPTION

DESCRIPTION - VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

DESCRIPTION - TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 40°F in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 160°F
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1–good trip.

DESCRIPTION - MONITORED COMPONENT

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is low and engine rpm is 1600 or greater and the TPS indicates a small throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) and the appropriate

EMISSIONS CONTROL (Continued)

Powertrain Diagnostic Procedure Manual for diagnostic procedures.

The following is a list of the monitored components:
- Comprehensive Components
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor

COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

(1) Circuit Continuity
- Open
- Shorted high
- Shorted to ground

(2) Rationality or Proper Functioning
- Inputs tested for rationality
- Outputs tested for functionality

NOTE: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply.

Input Rationality—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the input signal is compared against other inputs and information to see if it makes sense under the current conditions.

PCM sensor inputs that are checked for rationality include:
- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S)
- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Intake/inlet Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Ambient/Battery Temperature Sensors
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Leak Detection Pump Switch (if equipped)
- P/N Switch
- Trans Controls

Output Functionality—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:
- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Idle Air Control
- Purge Solenoid
- EGR Solenoid (if equipped)
- LDP Solenoid (if equipped)
- Radiator Fan Control
- Trans Controls

OXYGEN SENSOR (O2S) MONITOR

DESCRIPTION—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean condition, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:
- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

Slow Response Rate (Big Slope)—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the

EMISSIONS CONTROL (Continued)

oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called 'Big Slope'. The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

Reduced Output Voltage (Half Cycle)—The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Each time the voltage signal surpasses the threshold, a counter is incremented by one. This is called the Half Cycle Counter.

Heater Performance—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

OPERATION—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and Freeze Frame data is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

Enabling Conditions—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time
- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear and brake depressed (automatic only)
- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Ambient air temperature
- Barometric pressure
- Engine RPM within acceptable range of desired idle

Pending Conditions—The Task Manager typically does not run the Oxygen Sensor Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor
- Engine Coolant Temperature Sensor
- Throttle Position Sensor
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- Idle Air Control Motor
- EVAP Electrical
- EGR Solenoid Electrical (if equipped)
- Intake/inlet Air Temperature
- 5 Volt Feed

Conflict—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress
- Ethanel content learn is takeng place and the ethenal used once flag is set (if equipped)

Suspend—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if any of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

OXYGEN SENSOR HEATER MONITOR

DESCRIPTION—If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The heater element itself is not tested. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects. The resistance is normally between 100 ohms and 4.5 megaohms. When oxygen sensor temperature increases, the resistance in the internal circuit decreases. The PCM sends a 5 volts biased signal through the oxygen sensors to ground this monitoring circuit. As the temperature increases, resistance decreases and the PCM detects a lower voltage at the reference signal. Inversely, as the temperature decreases, the resistance increases and the

EMISSIONS CONTROL (Continued)

PCM detects a higher voltage at the reference signal. The O2S circuit is monitored for a drop in voltage.

OPERATION—The Oxygen Sensor Heater Monitor begins after the ignition has been turned OFF. The PCM sends a 5 volt bias to the oxygen sensor every 1.6 seconds. The PCM keeps it biased for 35 ms each time. As the sensor cools down, the resistance increases and the PCM reads the increase in voltage. Once voltage has increased to a predetermined amount, higher than when the test started, the oxygen sensor is cool enough to test heater operation.

When the oxygen sensor is cool enough, the PCM energizes the ASD relay. Voltage to the O2 sensor begins to increase the temperature. As the sensor temperature increases, the internal resistance decreases. The PCM continues biasing the 5 volt signal to the sensor. Each time the signal is biased, the PCM reads a voltage decrease. When the PCM detects a voltage decrease of a predetermined value for several biased pulses, the test passes.

The heater elements are tested each time the engine is turned OFF if all the enabling conditions are met. If the monitor fails, the PCM stores a maturing fault and a Freeze Frame is entered. If two consecutive tests fail, a DTC is stored. Because the ignition is OFF, the MIL is illuminated at the beginning of the next key cycle.

Enabling Conditions—The following conditions must be met for the PCM to run the oxygen sensor heater test:

- Engine run time of at least 3 minutes
- Engine run time at a predetermind speed and throttle opening.
- Key OFF power down
- Battery voltage of at least 10 volts
- Sufficient Oxygen Sensor cool down

Pending Conditions—There are not conditions or situations that prompt conflict or suspension of testing. The oxygen sensor heater test is not run pending resolution of MIL illumination due to oxygen sensor failure.

Suspend—There are no conditions which exist for suspending the Heater Monitor.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

Monitor Operation—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O2 switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O2 sensor switches is divided by the number of Front O2 sensor switches to determine the switching ratio.

EMISSIONS CONTROL (Continued)

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor is enabled to run another test during that trip. When the test fails 6 times, the counter increments to 3, a malfunction is entered, and a Freeze Frame is stored, the code is matured and the MIL is illuminated. If the first test passes, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 45% of the upstream rate. The failure percentages are 59% respectively.

Enabling Conditions—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time
- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

Pending Conditions—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All TPS faults
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality
- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Idle Air Control (IAC) motor functionality
- Vehicle Speed Sensor
- Brake switch (auto trans only)
- Intake air temperature

Conflict—The catalyst monitor does not run if any of the following are conditions are present:

- EGR Monitor in progress (if equipped)
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds
- Low fuel level-less than 15 %
- Low ambient air temperature
- Ethanel content learn is takeng place and the ethenal used once flag is set

Suspend—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1 (if equipped)
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

OPERATION - NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also misfire detection.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

EMISSIONS CONTROL (Continued)

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a DRBIII® scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

EMISSIONS CONTROL (Continued)

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

EGR MONITOR (if equipped)

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

LEAK DETECTION PUMP MONITOR

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves, a spring/diaphragm, and a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" water. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .020" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the 02 control system. If fuel vapor, indicated by a shift in the 02 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

DESCRIPTION - HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

OPERATION

OPERATION - SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example** , assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the DRBIII® scan tool to erase all DTC's and extinguish the MIL.

Technicians can display stored DTC's. Refer to Diagnostic Trouble Codes (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION). For obtaining the DTC information, use the Data Link Connector with the DRBIII® scan tool (Fig. 1).

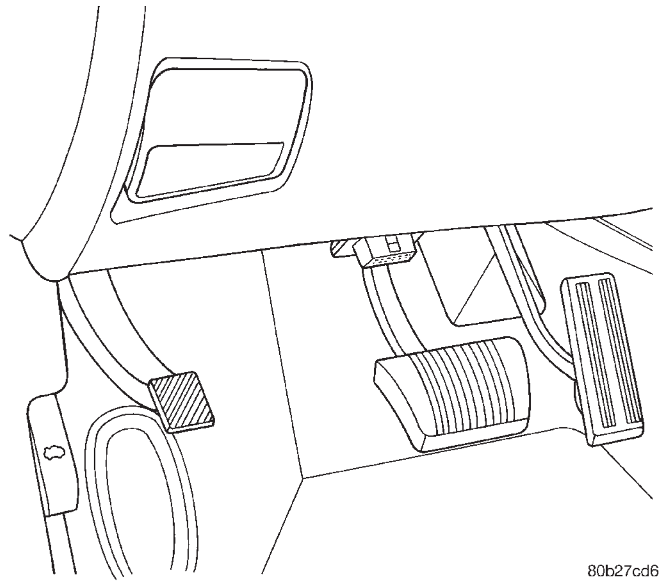

Fig. 1 Data Link Connector

DRB III® STATE DISPLAY TEST MODE

OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

EVAPORATIVE EMISSIONS

TABLE OF CONTENTS

EVAPORATIVE EMISSIONS

OPERATION - EVAPORATION CONTROL SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes to an activated carbon filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions (Fig. 1).

All engines use a proportional purge solenoid system. The PCM controls vapor flow by operating the purge solenoid. Refer to Proportional Purge Solenoid in this section.

NOTE: The evaporative system uses specially manufactured hoses. If they need replacement, only use fuel resistant hose. Also the hoses must be able to pass an Ozone compliance test.

NOTE: For more information on Onboard Refueling Vapor Recovery (ORVR), refer to the Fuel Delivery section.

EVAP/PURGE SOLENOID

OPERATION

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged.

The proportional purge solenoid operates at a frequency of 200 hz and is controlled by an engine controller circuit that senses the current being applied to the proportional purge solenoid and then adjusts that current to achieve the desired purge flow. The proportional purge solenoid controls the purge rate of fuel vapors from the vapor canister and fuel tank to the engine intake manifold.

REMOVAL

(1) Disconnect the negative battery cable.
(2) Remove the air cleaner box.
(3) Disconnect the electrical connector.
(4) Disconnect the vacuum hoses.
(5) Remove purge solenoid from the bracket (Fig. 2).

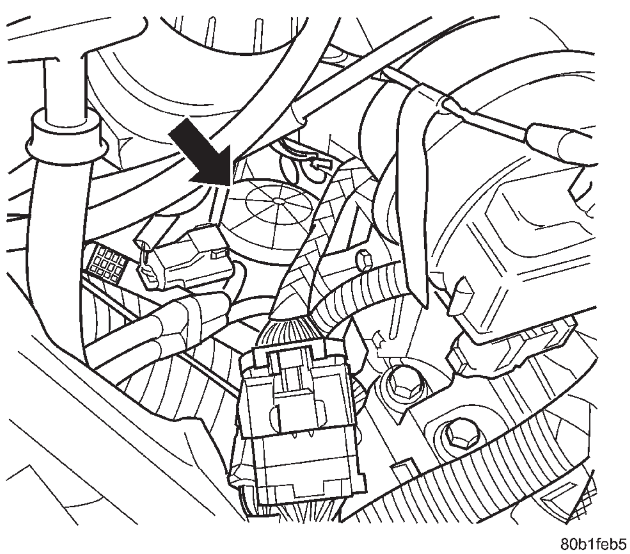

Fig. 2 PURGE SOLENOID

INSTALLATION

(1) Install purge solenoid onto bracket (Fig. 2).
(2) Connect the vacuum hoses.
(3) Connect the electrical connector.
(4) Install the air cleaner box.
(5) Connect the negative battery cable.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel fill cap is threaded/quarter turn onto the end of the fuel filler tube. It's purpose is to retain vapors and fuel in the fuel tank.

OPERATION

The fuel filler cap incorporates a two-way relief valve that is closed to atmosphere during normal operating conditions. The relief valve is calibrated to open when a pressure of 17 kPa (2.5 psi) or vacuum of 2 kPa (0.6 in. Hg) occurs in the fuel tank. When the pressure or vacuum is relieved, the valve returns to the normally closed position.

CAUTION: Remove the fuel filler cap to release fuel tank pressure before disconnecting any fuel system component.

LEAK DETECTION PUMP

REMOVAL

(1) Disconnect the negative battery cable.
(2) Remove fuel tank, refer to the Fuel Delivery section (Fig. 3) and (Fig. 4).

(4) Connect negative battery cable.

ORVR

OPERATION

The emission control principle used in the ORVR system is that the fuel flowing into the filler tube (appx. 1” I.D.) creates an aspiration effect which draws air into the fill tube (Fig. 5). During refueling, the fuel tank is vented to the vapor canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapors flow is metered by the purge solenoid so that there is no or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve to the vapor canister. Vapor is absorbed in the canister until vapor flow in the lines stops, either following shut-off or by having the fuel level in the tank rise high enough to close the control valve. The control valve(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - OPERATION) contains a float that rises to seal the large diameter vent path to the canister. At this point in the fueling of the vehicle, the tank pressure increases, the check valve closes (preventing tank fuel from spitting back at the operator), and fuel then rises up the filler tube to shut-off the dispensing nozzle.

If the engine is shut-off while the On-Board diagnostics test is running, low level tank pressure can be trapped in the fuel tank and fuel can not be added to the tank until the pressure is relieved. This is due to the leak detection pump closing the vapor outlet from the top of the tank and the one-way check valve not allowing the tank to vent through the fill tube to atmosphere. Therefore, when fuel is added, it will back-up in the fill tube and shut off the dispensing nozzle. The pressure can be eliminated in two ways: 1. Vehicle purge must be activated and for a long enough period to eliminate the pressure. 2. Removing the fuel cap and allowing enough time for the system to vent thru the recirulation tube.

DIAGNOSIS AND TESTING - VEHICLE DOES NOT FILL

CONDITION	POSSIBLE CAUSES	CORRECTION
Pre-Mature Nozzle Shut-Off	Defective fuel tank assembly components.	Fill tube improperly installed (sump) Fill tube hose pinched. Check valve stuck shut. Control valve stuck shut.
	Defective vapor/vent components.	Vent line from control valve to canister pinched. Vent line from canister to vent filter pinched. Canister vent valve failure (requires double failure, plugged to LDP and atmosphere). Leak detection pump failed closed. Leak detection pump filter plugged.
	On-Board diagnostics evaporative system leak test just conducted.	Canister vent valve vent plugged to atmosphere. engine still running when attempting to fill (System designed not to fill).
	Defective fill nozzle.	Try another nozzle.
Fuel Spits Out Of Filler Tube.	During fill.	See Pre-Mature Shut-Off.
	At conclusion of fill.	Defective fuel handling component. (Check valve stuck open).
		Defective vapor/vent handling component.
		Defective fill nozzle.

PCV VALVE

DESCRIPTION

The PCV valve contains a spring loaded plunger. The plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum (Fig. 6).

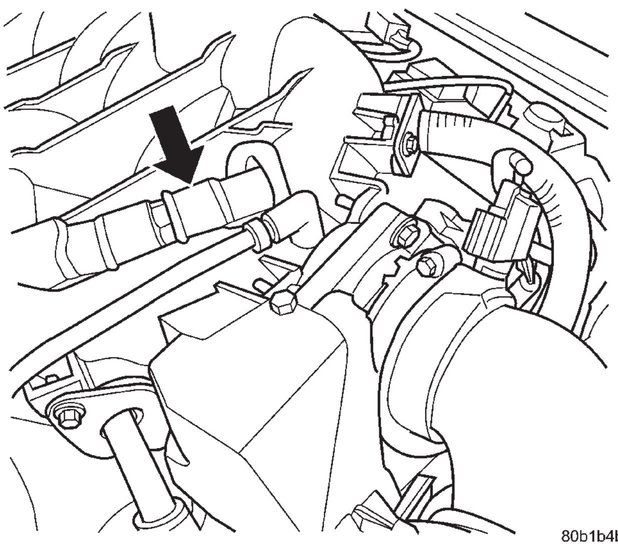

Fig. 6 POSITIVE CRANKCASE VALVE

OPERATION

When the engine is not operating or during an engine backfire, the spring forces the plunger back against the seat. This prevents vapors from flowing through the valve (Fig. 7).

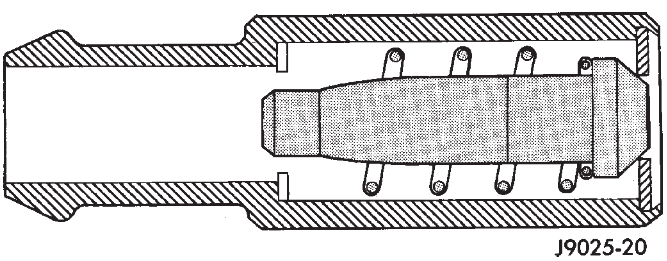

Fig. 7 Engine Off or Engine Backfire No Vapor Flow

When the engine is at idle or cruising, high manifold vacuum is present. At these times manifold vacuum is able to completely compress the spring and pull the plunger to the top of the valve (Fig. 8). In this position there is minimal vapor flow through the valve.

During periods of moderate intake manifold vacuum the plunger is only pulled part way back from the inlet. This results in maximum vapor flow through the valve (Fig. 9).

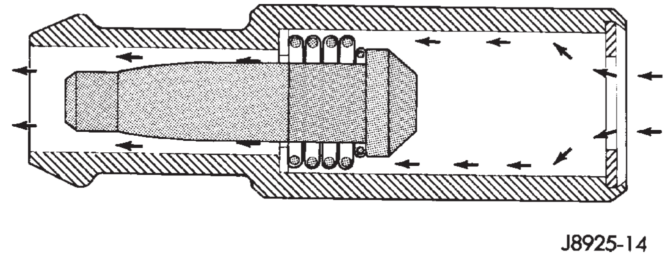

Fig. 8 High Intake Manifold Vacuum Minimal Vapor Flow

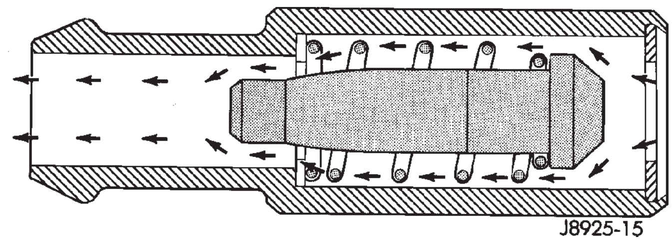

Fig. 9 Moderate Intake Manifold Vacuum Maximum Vapor Flow

DIAGNOSIS AND TESTING - PCV SYSTEM

WARNING: APPLY PARKING BRAKE AND/OR BLOCK WHEELS BEFORE PERFORMING ANY TEST OR ADJUSTMENT WITH THE ENGINE OPERATING.

(1) With engine idling, remove the hose from the PCV valve. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. A strong vacuum should also be felt when a finger is placed over the valve inlet.

(2) Install hose on PCV valve. Remove the make-up air hose from the air plenum at the rear of the engine. Hold a piece of stiff paper (parts tag) loosely over the end of the make-up air hose.

(3) After allowing approximately one minute for crankcase pressure to reduce, the paper should draw up against the hose with noticeable force. If the engine does not draw the paper against the grommet after installing a new valve, replace the PCV valve hose.

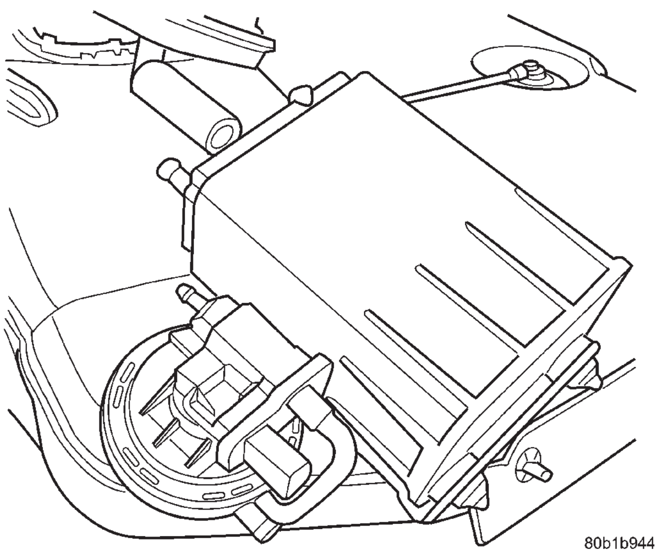
(4) Turn the engine off. Remove the PCV valve from intake manifold. The valve should rattle when shaken.

(5) Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.** If the valve rattles, apply a light coating of Loctite® Pipe Sealant With Teflon to the threads. Thread the PCV valve into the manifold plenum and tighten to 7 N·m (60 in. lbs.) torque.

VAPOR CANISTER

DESCRIPTION

The canister attaches to the bracket. The vacuum and vapor tubes connect to the top of the canister (Fig. 10). It is a charcoal canister.



80b1b944

Fig. 10 EVAP Canister

OPERATION

All vehicles use a maintenance free, evaporative (EVAP) canister. Fuel tank vapors vent into the canister. The canister temporarily holds the fuel vapors until intake manifold vacuum draws them into the combustion chamber. The Powertrain Control Module (PCM) purges the canister through the proportional purge solenoid. The PCM purges the canister at predetermined intervals and engine conditions.

Purge Free Cells

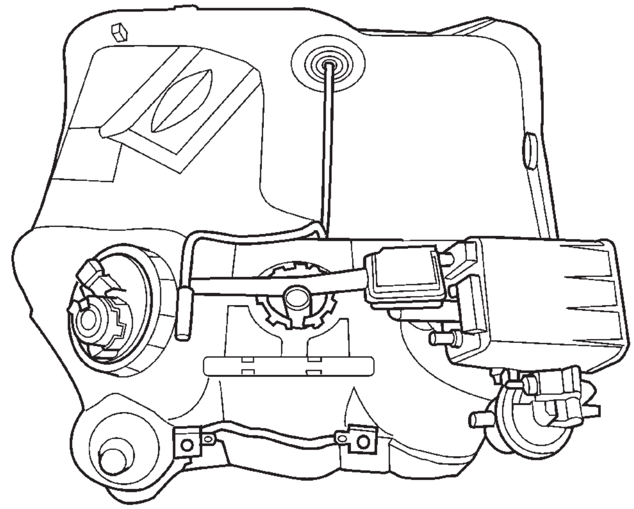
Purge-free memory cells are used to identify the fuel vapor content of the evaporative canister. Since the evaporative canister is not purged 100% of the time, the PCM stores information about the evaporative canister's vapor content in a memory cell.

The purge-free cells are constructed similar to certain purge-normal cells. The purge-free cells can be monitored by the DRB III® Scan Tool. The only difference between the purge-free cells and normal adaptive cells is that in purge-free, the purge is completely turned off. This gives the PCM the ability to compare purge and purge-free operation.

REMOVAL

(1) Disconnect the negative battery cable.

(2) Remove fuel tank, refer to the Fuel Delivery section (Fig. 11).



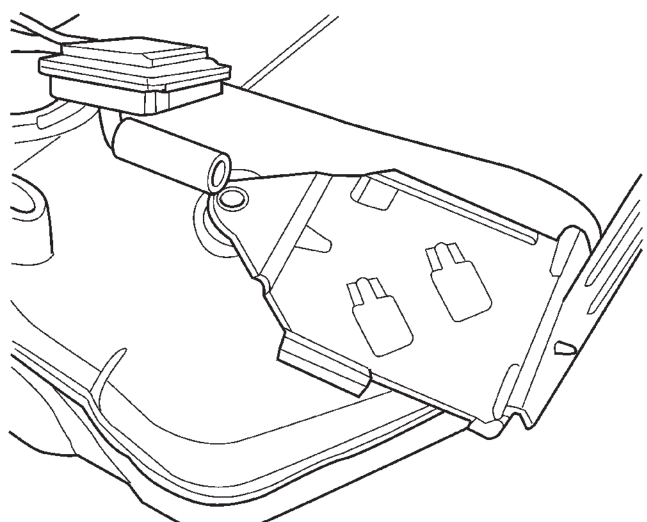
80b1b8f1

Fig. 11 FUEL TANK AND EVAP SYSTEM

(3) Remove the LDP Pump from the EVAP canister.

(4) Disconnect the hoses from the EVAP canister.

(5) Remove plastic fastener from the bracket of the EVAP canister (Fig. 13) and (Fig. 12)



80b1ba4f

Fig. 12 EVAP CANISTER BRACKET

(6) Remove EVAP canister from bracket.

VAPOR CANISTER (Continued)

INSTALLATION

(1) Install LDP to EVAP Canister.

(2) Install EVAP canister to Bracket (Fig. 13).

(3) Install the plastic fastener to EVAP canister bracket (Fig. 12).

(4) Connect hoses.

(5) Install fuel tank refer to the Fuel Delivery section.

(6) Connect negative battery cable.

EXHAUST GAS RECIRCULATION

TABLE OF CONTENTS

EXHAUST GAS RECIRCULATION

SPECIFICATIONS

TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
EGR valve to cyl. head 2.4L	30	22.1	265
EGR tube to EGR valve 2.4L	11.3	8.5	99.9
EGR tube to intake manifold 2.4L	11.3	8.5	99.9

TUBE

REMOVAL - 4 CYLINDER

(1) Disconnect the negative battery cable.
(2) Remove the air cleaner box.
(3) Remove the EGR tube clamp bolt at intake manifold.
(4) Slide clamp out of the intake manifold slot (Fig. 1).
(5) Remove the 2 bolts from EGR valve (Fig. 2).

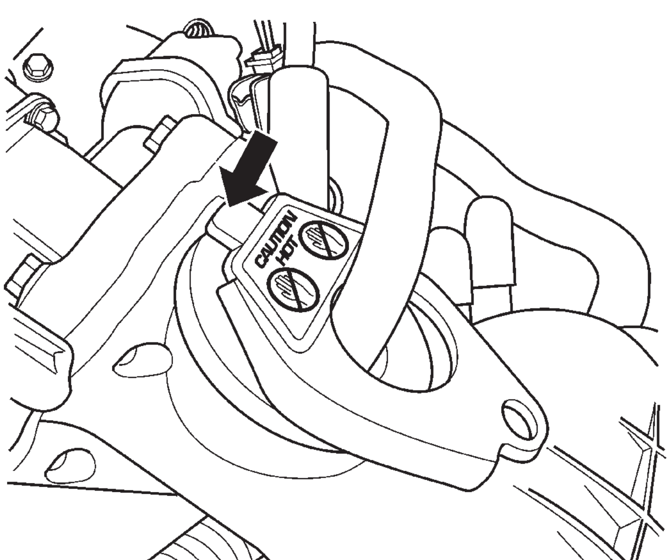

Fig. 1 EGR TUBE CLAMP

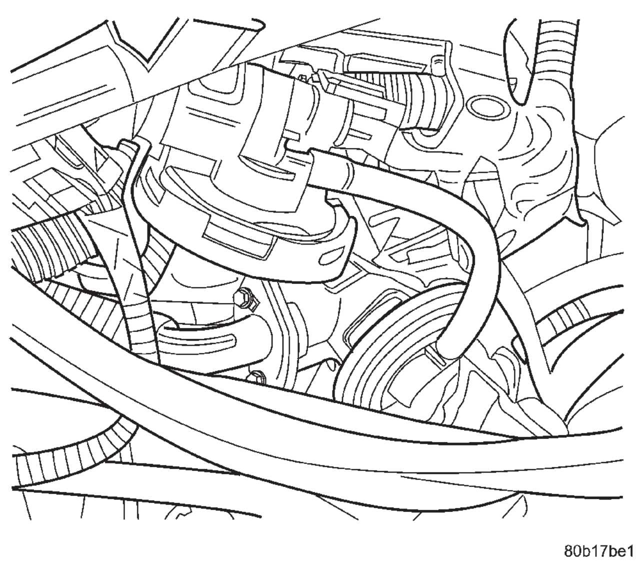

Fig. 2 EGR VALVE

TUBE (Continued)

(6) Remove the tube and gasket (Fig. 3).

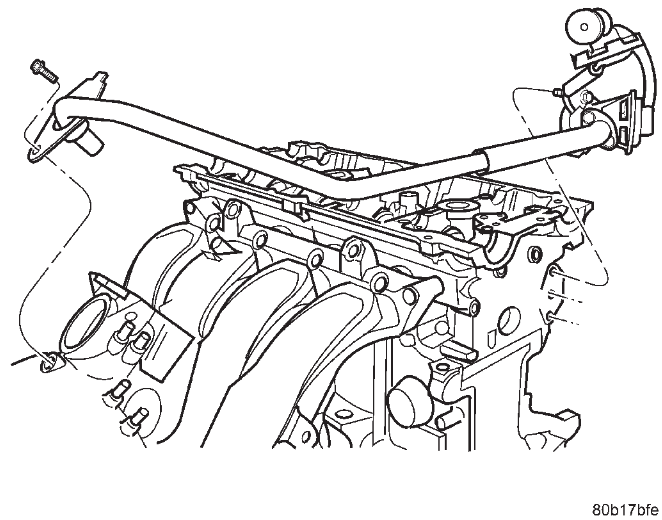

Fig. 3 EGR ASSEMBLY

(7) Remove the rubber silicone seal from the intake manifold and inspect (Fig. 4). Replace seal if damaged.

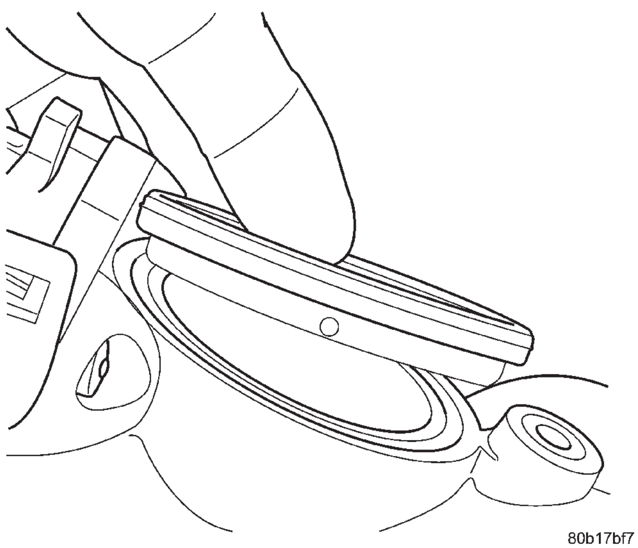

Fig. 4 EGR TUBE GASKET

INSTALLATION - 4 CYLINDER

(1) Clean all mating surfaces.

(2) Inspect rubber silicone seal on intake manifold. Replace seal if damaged.

(3) Install new gasket between the EGR tube and EGR valve and loose install bolts to EGR valve (Fig. 3).

(4) Slide clamp into the intake manifold slot (Fig. 1). Tighten the bolt to 11.3 N·m (100 in. lbs.).

(5) Tighten bolts to EGR valve to 11.3 N·m (100 in. lbs.) torque.

(6) Install the air cleaner box.

(7) Connect the negative battery cable.

VALVE

DESCRIPTION

The EGR valve consists of three major components. First there is the pintle, valve seat, and housing which contains and regulates the gas flow. Second there is the armature, return spring, and solenoid coil to provide the operating force to regulate the flow by changing the pintle position. The solenoid coil assembly is in parallel with a diode and connects to the two connectors in the connector assembly. The third major component which senses pintle position and is connected to the three connectors in the electrical connector.

OPERATION

Refer to Monitored Systems - EGR Monitor in this group for more information.

The engines use Exhaust Gas Recirculation (EGR) systems. The EGR system reduces oxides of nitrogen (NOx) in engine exhaust and helps prevent detonation (engine knock). Under normal operating conditions, engine cylinder temperature can reach more than 3000°F. Formation of NOx increases proportionally with combustion temperature. To reduce the emission of these oxides, the cylinder temperature must be lowered. The system allows a predetermined amount of hot exhaust gas to recirculate and dilute the incoming air/fuel mixture. The diluted air/fuel mixture reduces peak flame temperature during combustion.

This system does not allow EGR at idle.

A failed or malfunctioning EGR system can cause engine spark knock, sags or hesitation, rough idle, engine stalling and increased emissions.

4 - CYLINDER The electric EGR transducer contains an electrically operated solenoid and a back-pressure transducer (Fig. 5). The Powertrain Control Module (PCM) operates the solenoid. The PCM determines when to energize the solenoid. Exhaust system back-pressure controls the transducer.

When the PCM energizes the solenoid, vacuum does not reach the transducer. Vacuum flows to the transducer when the PCM de-energizes the solenoid.

When exhaust system back-pressure becomes high enough, it fully closes a bleed valve in the transducer. When the PCM de-energizes the solenoid and back-pressure closes the transducer bleed valve, vacuum flows through the transducer to operate the EGR valve.

VALVE (Continued)

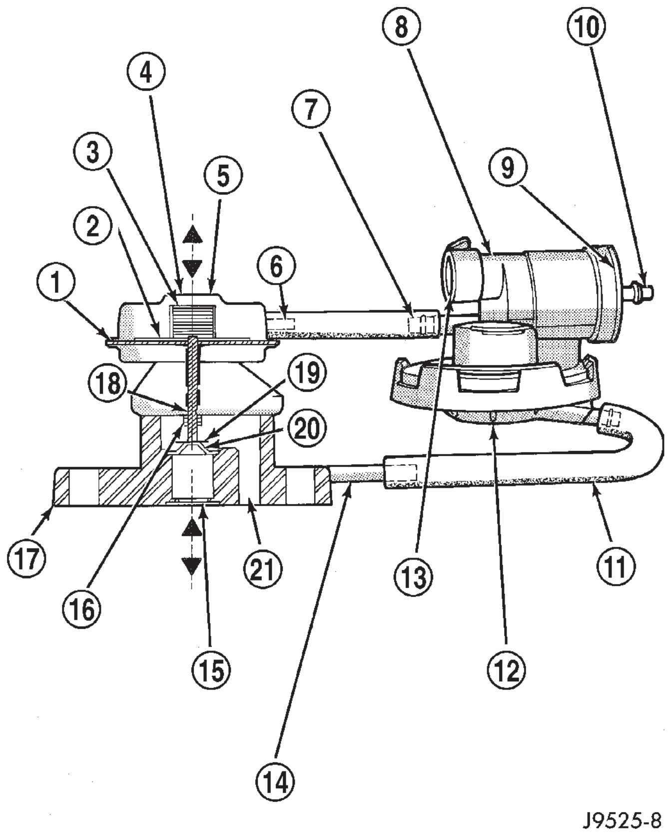

Fig. 5 EGR Valve and Transducer - Typical

1 - DIAPHRAGM
2 - PISTON
3 - SPRING
4 - EGR VALVE ASSEMBLY
5 - VACUUM MOTOR
6 - VACUUM MOTOR FITTING
7 - VACUUM OUTLET FITTING TO EGR VALVE
8 - EGR VALVE CONTROL ASSEMBLY
9 - ELECTRIC SOLENOID PORTION OF VALVE CONTROL
10 - VACUUM INLET FITTING FROM ENGINE
11 - BACK-PRESSURE HOSE
12 - TRANSDUCER PORTION OF VALVE CONTROL
13 - ELECTRICAL CONNECTION POINT
14 - EGR VALVE BACK-PRESSURE FITTING
15 - EXHAUST GAS INLET
16 - STEM PROTECTOR AND BUSHING
17 - BASE
18 - MOVEMENT INDICATOR
19 - POPPET VALVE
20 - SEAT
21 - EXHAUST GAS OUTLET

De-energizing the solenoid, but not fully closing the transducer bleed hole (because of low back-pressure), varies the strength of vacuum applied to the EGR valve. Varying the strength of the vacuum changes the amount of EGR supplied to the engine. This provides the correct amount of exhaust gas recirculation for different operating conditions.

2.7L The exhaust gas recirculation flow is determined by the engine controller. For a given set of conditions, the engine controller knows the ideal exhaust gas recirculation flow to optimize NOx and fuel economy as a function of the pintle position. Pintle position is obtained from the position sensor.

The engine controller adjust the duty cycle of the 128hz power supplied to the solenoid coil to obtain the correct pintle position.

REMOVAL - 4 CYLINDER

The EGR valve and Transducer are to be replaced as an assembly.

(1) Disconnect the negative battery cable.
(2) Remove the air cleaner box.
(3) remove the 2 bolts EGR tube to EGR valve (Fig. 2).
(4) Remove the 2 bolts for EGR valve to cylinder head.
(5) Disconnect the electrical connector from transducer.
(6) Remove the vacuum hose from the EGR transducer.
(7) Remove the EGR valve and transducer as an assembly

INSTALLATION - 4 CYLINDER

(1) Clean surfaces of cylinder head and EGR tube where EGR valve interfaces.
(2) Install new gasket between the EGR valve and the transducer to cylinder head and loose install bolts.
(3) Install the 2 bolts from EGR tube to EGR valve.
(4) Tighten the EGR valve to cylinder head bolts to 22.9 N·m (202 in. lbs.).
(5) Tighten the EGR tube to EGR valve bolts to 11.3 N·m (100 in. lbs.).
(6) Connect the electrical connector to EGR transducer.
(7) Connect the vacuum hose to EGR transducer.
(8) Install the air cleaner box.
(9) Connect the negative battery cable.

ON-BOARD DIAGNOSTICS

TABLE OF CONTENTS

TASK MANAGER

DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the 'Task Manager'.

OPERATION

The Task Manager determines when tests happen and when functions occur. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are know as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the catalyst Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the catalyst monitor, the Task Manager may still run the catalyst Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the catalyst system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

TASK MANAGER (Continued)

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a good trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 —Non-emissions related trouble codes.
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire. (MIL Off)
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire. (MIL Off)
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault. (MIL On)
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire. Catalyst damage misfire is a 2 trip MIL. The MIL flashes on the first trip when catalyst damage misfire levels are present. (MIL On)

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±20% of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRBIII®. Erasing the DTC with the DRBIII® erases all OBD II information. The DRBIII® automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Global Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRBIII®)
- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

Global Good Trip

To increment a Global Good Trip, the Oxygen sensor and Catalyst efficiency monitors must have run and passed, and 2 minutes of engine run time.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Alternate Good Trip

TASK MANAGER (Continued)

Alternate Good Trips are used in place of Global Good Trips for Comprehensive Components and Major Monitors. If the Task Manager cannot run a Global Good Trip because a component fault is stopping the monitor from running, it will attempt to count an Alternate Good Trip.

The Task Manager counts an Alternate Good Trip for Comprehensive components when the following conditions are met:

- Two minutes of engine run time, idle or driving
- No other faults occur

The Task Manager counts an Alternate Good Trip for a Major Monitor when the monitor runs and passes. Only the Major Monitor that failed needs to pass to count an Alternate Good Trip.

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRBIII®. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRBIII®; or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).
- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

TASK MANAGER (Continued)

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

TABLE OF CONTENTS - Continued

TABLE OF CONTENTS - Continued

1.0 INTRODUCTION

The procedures contained in this manual include specifications, instructions, and graphics needed to diagnose the PCM Powertrain System. The diagnostics in this manual are based on the failure condition or symptom being present at time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate modules; ie., if the DRBIII® displays a No Response condition, you must diagnose this first before proceeding.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All system schematics are in Section 10.0.

An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service information for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. READ THIS DIAGNOSTIC INFORMATION BEFORE TRYING TO DIAGNOSE A VEHICLE CODE. It is recommended that you review the entire diagnostic information to become familiar with all new and changed diagnostic procedures.

If you have any comments or recommendations after reviewing the diagnostic information, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers the 2002 JR vehicle equipped with the 2.0L/2.4L and 2.7L engines.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the powertrain control module (PCM) is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The Powertrain Control Module (PCM) monitors and controls:

- Fuel System
- Idle Air Control System
- Ignition System
- Charging System
- Speed Control System
- Cooling system

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

These Sequential Fuel Injection (SFI) engine systems have the latest in technical advances. The OBDII/Euro Stage III OBD diagnostics incorporated with the Powertrain Control Module (PCM) are intended to assist the field technician in repairing vehicle problems by the quickest means.

3.2 FUNCTIONAL OPERATION

3.2.1 FUEL CONTROL

The PCM controls the air/fuel ratio of the engine by varying fuel injector on time. Mass air flow is calculated using the speed density method using enigne speed, manifold absolute pressure, and air temperature change.

Different fuel calculation strategies are used depending on the operational state of the engine. During crank mode, a longer pulse width fuel pulse is delivered followed by fuel pulses determined by a crank time strategy. Cold engine operation is determined via an open loop strategy until the O2 sensors have reached operating temperature. At this point, the strategy enters a closed loop mode where fuel requirements are based upon the state of the O2 sensors, engine speed, MAP, throttle position, air temperature, battery voltage, and coolant temperature.

3.2.2 ON-BOARD DIAGNOSTICS

The PCM has been programmed to monitor many different circuits of the fuel injection system. This monitoring is called on-board diagnosis.

Certain criteria, or arming conditions, must be met for a trouble code to be entered into the PCM memory. The criteria may be a range of: engine rpm, engine temperature, and/or input voltage to the PCM. If a problem is sensed with a monitored circuit, and all of the criteria or arming conditions are met, then a trouble code will be stored in the PCM.

It is possible that a trouble code for a monitored circuit may not be entered into the PCM memory even though a malfunction has occurred. This may happen because one of the trouble code criteria have not been met.

The PCM compares input signal voltages from each input device with specifications (the established high and low limits of the range) that are programmed into it for that device. If the input voltage is not within specifications and other trouble code criteria are met, a trouble code will be stored in the PCM memory.

The On Board Diagnostics have evolved to the second Generation of Diagnostics referred to as OBDII/Euro Stage III OBD. These OBDII/Euro Stage III OBD Diagnostics control the functions necessary to meet the requirements of California OBDII, Federal OBD regulation and European regulation. These requirements specify the inclusion of a Malfunction Indicator Light (MIL) located on the instrument panel. The purpose of the MIL is to inform the vehicle operator in the event of a malfunction of any emission system or component.

The following table summarizes the various OBDII/Euro Stage III OBD monitors operation.

OBD II/EURO STAGE III OBD MONITOR INFORMATION

Comprehensive Components Monitor	Major Monitors Non Fuel Control & Non Misfire	Major Monitors Fuel Control & Misfire
Run constantly	Run Once Per Trip	Run Constantly
Includes All Engine Hardware - Sensors, Switches, Solenoids, etc.	Monitors Entire Emission System	Monitors Entire System
One Trip Faults - Turns On The MIL and Sets DTC After One Failure	Two Trip Faults - Turns On The MIL and Sets DTC After Two Consecutive Failures	Two Trip Faults - Turns On The MIL and Sets DTC After Two Consecutive Failures
Priority 3	**Priority 1 or 3**	**Priority 2 or 4**
All Checked For Continuity Open Short To Ground Short To Voltage	Done Stop Testing = Yes Oxygen Sensor Heater Oxygen Sensor Response	**Fuel Control Monitor** Monitors Fuel Control System For: Fuel System Lean Fuel System Rich Requires 3 Consecutive *Fuel System Good Trips* To Extinguish The MIL
Inputs Checked For Rationality Outputs Checked For Functionality	Catalytic Converter Efficiency Except EWMA - up to 6 tests per trip and a one trip fault EGR System Evaporative Emission System (Purge and Leak) Non-LDP or LDP	**Misfire Monitor** Monitors For Engine Misfire at: 1000 RPM Counter (Type B) **200 RPM Counter (Type A)
Requires 3 Consecutive *Global/Alternate Good Trips* to Extinguish the MIL*	Requires 3 Consecutive *Global Good Trips* to Extinguish the MIL*	Requires 3 Consecutive *Misfire Good Trips* To Extinguish the MIL **Type A misfire is a two trip failure. The MIL will illuminate and blink at the first failure.

***40 Warm Up Cycles** are required to erase DTC's *after* the MIL has been extinguished.

3.2.3 OTHER CONTROLS

CHARGING SYSTEM

The charging system is turned on when the engine is started and ASD relay energized. When the ASD relay is on, ASD output voltage is supplied to the ASD sense circuit at the PCM. This voltage is connected in some cases, through the PCM and supplied to one of the generator field terminals (Gen Source +). All others, the Gen field is connected directly to the ASD output voltage. The amount of current produced by the generator is controlled by the Electronic Voltage Regulator (EVR) circuitry, in the PCM. Battery temperature is determined from IAT. This temperature along with sensed line voltage, is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to the other generator field terminal (Gen field driver).

SPEED CONTROL SYSTEM

The PCM controls vehicle speed by operation of the speed control servo vacuum and vent solenoids. Energizing the vacuum solenoid applies vacuum to the servo to increase throttle position. Operation of the vent solenoid slowly releases the vacuum allowing throttle position to decrease. A special vacuum dump solenoid allows immediate release of the throttle during speed control operation.

Speed control may be cancelled by braking, driver input using the speed control switches, shifting into neutral, excessive engine speed (wheels spinning), or turning the ignition off.

LEAK DETECTION PUMP SYSTEM

The evaporative emission system is designed to prevent the escape of fuel vapors from the fuel system. Leaks in the system, even small ones, can allow fuel vapors to escape into the atmosphere. Government regulations require onboard testing to make sure that the evaporative (EVAP) system is functioning properly. The leak detection system tests for EVAP system leaks and blockage. It also performs self-diagnostics. During self-diagnostics, the Powertrain Control Module (PCM) first checks the Leak Detection Pump (LDP) for electrical and mechanical faults. If the first checks pass, the PCM then uses the LDP to seal the vent valve and pump air into the system to pressurize it. If a leak is present, the PCM will continue pumping the LDP to replace the air that leaks out. The PCM determines the size of the leak based on how fast/long it must pump the LDP as it tries to maintain pressure in the system.

EVAP LEAK DETECTION SYSTEM COMPONENTS (FIGURE 1)

Service Port: Used with special tools like the Miller Evaporative Emissions Leak Detector (EELD) to test for leaks in the system.

EVAP Purge Solenoid: The PCM uses the EVAP purge solenoid to control purging of excess fuel vapors stored in the EVAP canister. It remains closed during leak testing to prevent loss of pressure.

EVAP Canister: The EVAP canister stores fuel vapors from the fuel tank for purging.

EVAP Purge Orifice: Limits purge volume.

EVAP System Air Filter: Provides air to the LDP for pressurizing the system. It filters out dirt while allowing a vent to atmosphere for the EVAP system.

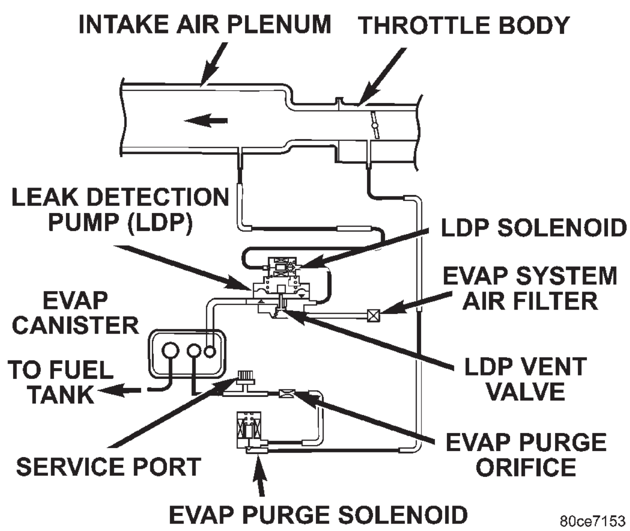

FIGURE 1

Leak Detection Pump (LDP) Components:

The main purpose of the LDP is to pressurize the fuel system for leak checking. It closes the EVAP system vent to atmospheric pressure so the system can be pressurized for leak testing. The diaphragm is powered by engine vacuum. It pumps air into the EVAP system to develop a pressure of about 7.5″ H_2O (¼) psi. A reed switch in the LDP allows the PCM to monitor the position of the LDP diaphragm. The PCM uses the reed switch input to monitor how fast the LDP is pumping air into the EVAP system. This allows detection of leaks and blockage.

The LDP assembly consists of several parts (Figure 2). The solenoid is controlled by the PCM, and it connects the upper pump cavity to either engine vacuum or atmospheric pressure. A vent valve closes the EVAP system to atmosphere, sealing the system during leak testing. The pump section of the LDP consists of a diaphragm that moves up and down to bring air in through the air filter and inlet check valve, and pump it out through an outlet check valve into the EVAP system.

The diaphragm is pulled up by engine vacuum, and pushed down by spring pressure, as the LDP solenoid turns on and off. The LDP also has a magnetic reed switch to signal diaphragm position to the PCM. When the diaphragm is down, the switch is closed, which sends a 12 V (system voltage) signal to the PCM. When the diaphragm is up, the switch is open, and there is no voltage sent to the PCM. This allows the PCM to monitor LDP pumping action as it turns the LDP solenoid on and off.

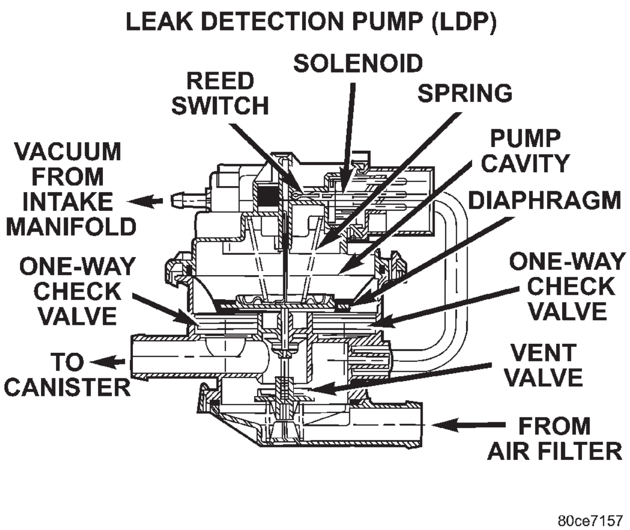

FIGURE 2

LDP AT REST (NOT POWERED)

When the LDP is at rest (no electrical/vacuum) the diaphragm is allowed to drop down if the internal (EVAP system) pressure is not greater than the return spring. The LDP solenoid blocks the engine vacuum port and opens the atmospheric pressure port connected through the EVAP system air filter. The vent valve is held open by the diaphragm. This allows the canister to see atmospheric pressure (Figure 3).

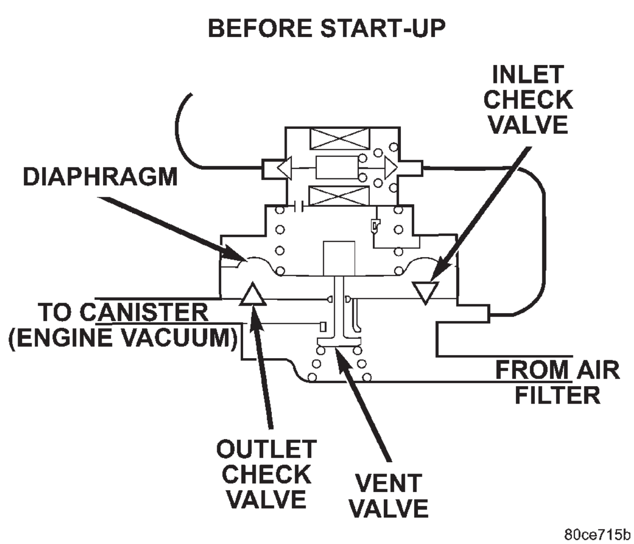

FIGURE 3

DIAPHRAGM UPWARD MOVEMENT

When the PCM energizes the LDP solenoid, the solenoid blocks the atmospheric port leading through the EVAP air filter and at the same time opens the engine vacuum port to the pump cavity above the diaphragm. The diaphragm moves upward when the vacuum above the diaphragm exceeds spring force. This upward movement closes the vent valve. It also causes low pressure below the diaphragm, unseating the inlet check valve and allowing air in from the EVAP air filter. When the diaphragm completes its upward movement, the LDP reed switch turns from closed to open (Figure 4).

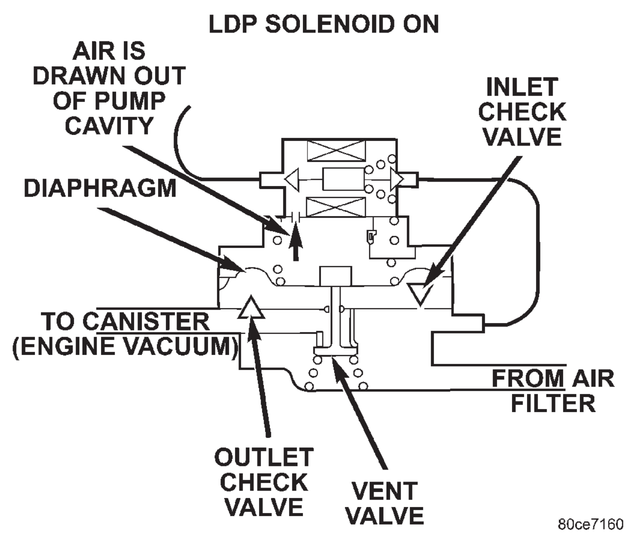

FIGURE 4

DIAPHRAGM DOWNWARD MOVEMENT

Based on reed switch input, the PCM de-energizes the LDP solenoid, causing it to block the vacuum port, and open the atmospheric port. This connects the upper pump cavity to atmosphere through the EVAP air filter. The spring is now able to push the diaphragm down. The downward movement of the diaphragm closes the inlet check valve and opens the outlet check valve pumping air into the evaporative system. The LDP reed switch turns from open to closed, allowing the PCM to monitor LDP pumping (diaphragm up/down) activity (Figure 5). During the pumping mode, the diaphragm will not move down far enough to open the vent valve.

The pumping cycle is repeated as the solenoid is turned on and off. When the evaporative system begins to pressurize, the pressure on the bottom of the diaphragm will begin to oppose the spring pressure, slowing the pumping action. The PCM watches the time from when the solenoid is de-energized, until the diaphragm drops down far enough for the reed switch to change from open to closed. If the reed switch changes too quickly, a leak may be indicated. The longer it takes the reed switch to change state, the tighter the evaporative system is sealed. If the system pressurizes too quickly, a restriction somewhere in the EVAP system may be indicated.

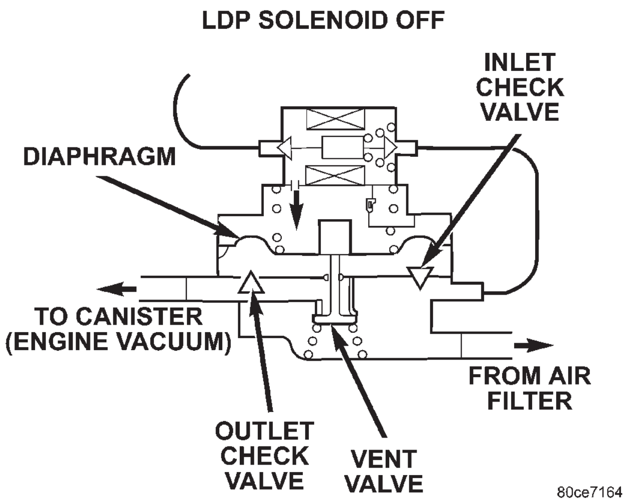

FIGURE 5

PUMPING ACTION

During portions of this test, the PCM uses the reed switch to monitor diaphragm movement. The solenoid is only turned on by the PCM after the reed switch changes from open to closed, indicating that the diaphragm has moved down. At other times during the test, the PCM will rapidly cycle the LDP solenoid on and off to quickly pressurize the system. During rapid cycling, the diaphragm will not move enough to change the reed switch state. In the state of rapid cycling, the PCM will use a fixed time interval to cycle the solenoid.

If the system does not pass the EVAP Leak Detection Test, the following DTCs may be set:

- P0442 - EVAP LEAK MONITOR 0.040″ LEAK DETECTED
- P0455 - EVAP LEAK MONITOR LARGE LEAK DETECTED
- P0456 - EVAP LEAK MONITOR 0.020″ LEAK DETECTED
- P1486 - EVAP LEAK MON PINCHED HOSE FOUND
- P1494 - LEAK DETECTION PUMP SW OR MECH FAULT
- P1495 - LEAK DETECTION PUMP SOLENOID CIRCUIT

ENABLING CONDITIONS TO RUN EVAP LEAK DETECTION TEST

1. Cold start: with ambient temperature (obtained from modeling the inlet air temperature sensor on passenger vehicles and the battery temperature sensor on Jeep & truck vehicles) between 4°C (40°F) and 32°C (90°F) for 0.040 leak. Between 4°C (40°F) and 29°C (85°F) for 0.020 leak.
2. Engine coolant temperature within: -12° to -8°C (10° to 18°F) of battery/ambient.
3. Battery voltage between 10 and 15 volts.

NOTE: If battery voltage drops below 10 volts for more than 5 seconds during engine cranking, the EVAP Leak Detection Test will not run.

4. Low fuel warning light off (fuel level must be between 15% and 85%).
5. MAP sensor reading 22 in Hg or above (This is the manifold absolute pressure, not vacuum).
6. No engine stall during test.

NOTE: The following values are approximate and vehicle specific. Use the values seen in pre test/monitor test screen on the DRBIII®. See TSB 25-02-98 for more detail.

A DTC will not set if a one-trip fault is set or if the MIL is illuminated for any of the following:

- Purge Solenoid
- All engine Controller Self Test Faults
- All Cam and/or Crank Sensor Faults
- MAP Sensor Faults
- Ambient/Battery Temperature Sensor Electrical Faults
- All Coolant Sensor Faults
- All TPS Faults
- LDP Pressure Switch Faults
- EGR Solenoid Electrical Faults
- All Injector Faults
- Baro Out Of Range
- Vehicle Speed Faults
- LDP Solenoid Circuit

FIGURE 6 SECTION 1

When the ignition key is turned to “ON”, the LDP diaphragm should be in the down position and the LDP reed switch should be closed. If the EVAP system has residual pressure, the LDP diaphragm may be up. This could result in the LDP reed switch being open when the key is turned to “ON” and a P1494 fault could be set because the PCM is expecting the reed switch to be closed.

After the key is turned “ON”, the PCM immediately tests the LDP solenoid circuit for electrical faults. If a fault is detected, DTC P1495 will set, the MIL will illuminate, and the remaining EVAP Leak Detection Test is canceled.

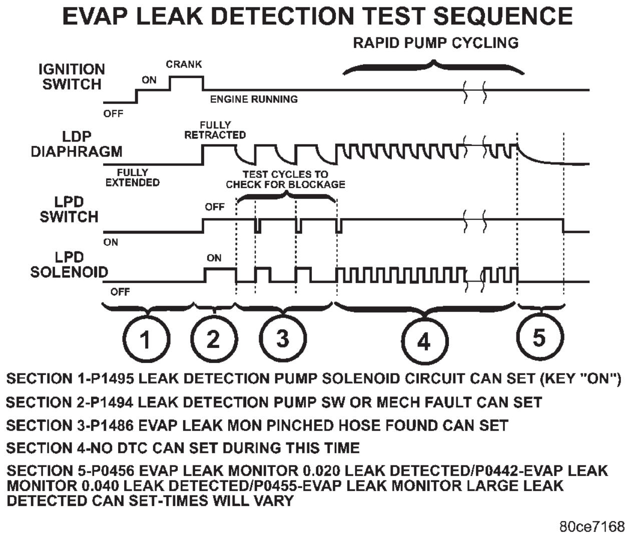

FIGURE 6

NOTE: If battery temperature is not within range, or if the engine coolant temperature is not within a specified range of the battery temperature, the PCM will not run tests for DTC P1494, P1486, P0442, P0455 and P0441. These temperature calibrations may be different between models.

FIGURE 6 SECTION 2

If DTC P1495 is not set, the PCM will check for DTC P1494. If the LDP reed switch was closed when the key was turned to “ON”, the PCM energizes the LDP solenoid for up to 8 seconds and monitors the LDP switch. As the LDP diaphragm is pulled up by engine vacuum, the LDP reed switch should change from closed to open. If it does not, the PCM sets a temporary fault (P1494) in memory, and waits until the next time the Enabling Conditions are met to run the test again. If this is again detected, P1494 is stored and the MIL is illuminated. If the problem is not detected during the next enabling cycle, the temporary fault will be cleared.

However, if the PCM detects the reed switch open when the key is turned to “ON”, the PCM must determine if this condition is due to residual pressure in the EVAP system, or an actual fault. The PCM stores information in memory on EVAP system purging from previous engine run or drive cycles.

If little or no purging took place, residual pressure could be holding the LDP diaphragm up, causing the LDP switch to be open. Since this is not a malfunction, the PCM cancels the EVAP Leak Detection Test without setting the temporary fault.

If there was sufficient purging during the previous cycle to eliminate EVAP system pressure, the PCM judges that this is a malfunction and sets a temporary fault in memory. The next time that the Enabling Conditions are met, the test will run again. If the fault is again detected, the MIL will illuminate and DTC 1494 will be stored. If the fault is not detected, the temporary fault will be cleared.

FIGURE 6 SECTION 3

If no fault has been detected so far, the PCM begins testing for possible blockage in the EVAP system between the LDP and the fuel tank. This is done by monitoring the time required for the LDP to pump air into the EVAP system during two to three pump cycles. If no blockage is present, the LDP diaphragm is able to quickly pump air out of the LDP each time the PCM turns off the LDP solenoid. If a blockage is present, the PCM detects that the LDP takes longer to complete each pump cycle. If the pump cycles take longer than expected (approximately 6 to 10 seconds) the PCM will suspect a blockage. On the next drive when Enabling Conditions are met, the test will run again. If blockage is again detected, P1486 is stored, and the MIL is illuminated.

FIGURE 6 SECTION 4

After the LDP blockage tests are completed, the PCM then tests for EVAP system leakage. First, the PCM commands the LDP to rapidly pump for 20 to 50 seconds (depending on fuel level) to build pressure in the EVAP system. This evaluates the system to see if it can be sufficiently pressurized. This evaluation (rapid pump cycling) may occur several times prior to leak checking. The LDP reed switch does not close and open during rapid pumping because the diaphragm does not travel through its full range during this part of the test.

FIGURE 6 SECTION 5

Next, the PCM performs one or more test cycles by monitoring the time required for the LDP reed switch to close (diaphragm to drop) after the LDP solenoid is turned off.

If the switch does not close, or closes after a long delay, it means that the system does not have any significant leakage and the EVAP Leak Detection Test is complete.

However, if the LDP reed switch closes quickly, there may be a leak or the fuel level may be low enough that the LDP must pump more to finish pressurizing the EVAP system. In this case, the PCM will rapidly pump the LDP again to build pressure in the EVAP system, and follow that by monitoring the time needed for several LDP test cycles. This process of rapid pumping followed by several LDP test cycles may repeat several times before the PCM judges that a leak is present.

When leaks are present, the LDP test cycle time will be inversely proportional to the size of the leak. The larger the leak, the shorter the test cycle time. The smaller the leak, the longer the test cycle time. DTC's may be set when a leak as small as 0.5 mm (0.020″) diameter is present.

If the system detects a leak, a temporary fault will be stored in PCM memory. The time it takes to detect a .020, .040, or Large leak is based on calibrations that vary from model to model. The important point to remember is if a leak is again detected on the next EVAP Leak Detection Test, the MIL will illuminate and a DTC will be stored based on the size of leak detected. If no leak is detected during the next test, the temporary fault will be cleared.

DIAGNOSTIC TIPS

During diagnosis, you can compare the LDP solenoid activity with the monitor sequence in Figure 6. If the PCM detects a problem that could set a DTC, the testing is halted and LDP solenoid activity will stop. As each section of the test begins, it indicates that the previous section passed successfully. By watching to see which tests complete, you can see if any conditions are present that the PCM considers abnormal.

For example, if the LDP solenoid is energized for the test cycles to test for blockage (P1486), it means that the LDP has already passed its test for P1494. Then, if the PCM detects a possible blockage, it will set a temporary fault without turning on the MIL and continue the leak portion of the test. However, the PCM will assume that the system is already pressurized and skip the rapid pump cycles.

Always diagnose leaks, if possible, before disconnecting connections. Disconnecting connections may mask a leak condition.

Keep in mind that if the purge solenoid seat is leaking, it could go undetected since the leak would end up in the intake manifold. Disconnect the purge solenoid at the manifold when leak checking. In addition, a pinched hose fault (P1486) could set if the purge solenoid does not purge the fuel system properly (blocked seat). The purge solenoid must vent the fuel system prior to the LDP system test. If the purge solenoid cannot properly vent the system the LDP cannot properly complete the test for P1486 and this fault can set due to pressure being in the EVAP system during the test sequence.

Multiple actuation's of the DRBIII® Leak Detection Pump (LDP) Monitor Test can hide a 0.020 leak because of excess vapor generation. Additionally, any source for additional vapor generation can hide a small leak in the EVAP system. Excess vapor generation can delay the fall of the LDP diaphragm thus hiding the small leak. An example of this condition could be bringing a cold vehicle into a warm shop for testing or high ambient temperatures.

Fully plugged and partially plugged underhood vacuum lines have been known to set MIL conditions. P1494 and P0456 can be set for this reason. Always, thoroughly, check plumbing for pinches or blockage before condemning components.

TEST EQUIPMENT

The Evaporative Emission Leak Detector (EELD) Miller Special Tool 8404 is capable of visually detecting leaks in the evaporative system and will take the place of the ultrasonic leak detector 6917A. The EELD utilizes shop air and a smoke generator to visually detect leaks down to 0.020 or smaller. The food grade oil used to make the smoke includes an UV trace dye that will leave telltale signs of the leak under a black light. This is helpful when components have to be removed to determine the exact leak location. For detailed test instructions, follow the operators manual packaged with the EELD.

IMPORTANT

Be sure that the PCM has the latest software update. Reprogram as indicated by any applicable Technical Service Bulletin. After LDP repairs are completed, verify the repair by running the DRBIII® Leak Detection Pump (LDP) Monitor Test as described in Technical Service Bulletin 18-12-99.

3.2.4 PCM OPERATING MODES

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for wide open throttle. There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two types of engine control operation: **open loop** and **closed loop.**

In **open loop** operation, the PCM receives input signals and responds according to preset programming. Inputs from the heated oxygen sensors are not monitored.

In **closed loop** operation, the PCM monitors the inputs from the heated oxygen sensors. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio of 14.7 parts air to 1 part fuel. By monitoring the exhaust oxygen content through the oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve the lowest emission levels while maintaining optimum fuel economy.

The engine start-up (crank), engine warm-up, and wide open throttle modes are open loop modes. Under most operating conditions, closed loop modes occur with the engine at operating temperature.

IGNITION SWITCH ON (ENGINE OFF) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

1. The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
2. The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM modifies fuel strategy based on this input.

When the key is in the on position and the engine is not running (zero rpm), the auto shutdown relay and fuel pump relay are not energized. Therefore, voltage is not supplied to the fuel pump, ignition coil, and fuel injectors.

Engine Start-up Mode — This is an open loop mode. The following actions occur when the starter motor is engaged:

1. The auto shutdown and fuel pump relays are energized. If the PCM does not receive the camshaft and crankshaft signal within approximately one second, these relays are de-energized.
2. The PCM energizes all fuel injectors until it determines crankshaft position from the camshaft and crankshaft signals. The PCM determines crankshaft position within one engine revolution. After the camshaft position has been determined, the PCM energizes the fuel injectors in sequence. The PCM adjusts the injector pulse width and synchronizes the fuel injectors by controlling the fuel injectors' ground paths.
3. Once the engine idles within 64 rpm of its target engine speed, the PCM compares the current MAP sensor value with the value received during the ignition switch on (zero rpm) mode. A diagnostic trouble code is written to PCM memory if a minimum difference between the two values is not found.

Once the auto shutdown and fuel pump relays have been energized, the PCM determines the fuel injector pulse width based on the following:

– engine coolant temperature
– manifold absolute pressure
– intake/inlet air temperature
– engine revolutions
– throttle position

The PCM determines the spark advance based on the following:

– engine coolant temperature
– crankshaft position
– intake/inlet air temperature
– manifold absolute pressure
– throttle position

Engine Warm-Up Mode − This is an open loop mode. The PCM adjusts injector pulse width and controls injector synchronization by controlling the fuel injectors' ground paths. The PCM adjusts ignition timing and engine idle speed. The PCM adjusts the idle speed by controlling the idle air control motor.

Cruise or Idle Mode − When the engine is at normal operating temperature, this is a closed loop mode.

Acceleration Mode − This is a closed loop mode. The PCM recognizes an increase in throttle position and a decrease in Manifold Vacuum as engine load increases. In response, the PCM increases the injector pulse width to meet the increased load. The A/C compressor may be de-energized for a short period of time.

Deceleration − This is a closed loop mode. The PCM recognizes a decrease in throttle position and an increase in Manifold Vacuum as engine load decreases. In response, the PCM decreases the injector pulse width to meet the decreased load. Full injector shut off may be obtained during high speed deceleration.

Wide Open Throttle Mode − This is an open loop mode. The throttle position sensor notifies the PCM of a wide open throttle condition. Once a wide open throttle is sensed, the PCM de-energizes the A/C compressor clutch relay for 20 seconds.

3.2.5 NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems, and conditions even though they could have malfunctions that result in driveability problems. A diagnostic code may not be displayed for the following conditions. However, problems with these systems may cause a diagnostic code to be displayed for other systems. For example, a fuel pressure problem will not register a diagnostic code directly, but could cause a rich or lean condition. This could cause an oxygen sensor, fuel system, or misfire monitor trouble code to be stored in the PCM.

Engine Timing − The PCM cannot detect an incorrectly indexed timing chain, camshaft sprocket, or crankshaft sprocket. The PCM also cannot detect an incorrectly indexed distributor.(*)

Fuel Pressure − Fuel pressure is controlled by the fuel pressure regulator. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line filter, or a pinched fuel supply.(*)

Fuel Injectors − The PCM cannot detect if a fuel injector is clogged, the pintle is sticking, or the wrong injectors are installed.(*)

Fuel Requirements − Poor quality gasoline can cause problems such as hard starting, stalling, and stumble. Use of methanol-gasoline blends may result in starting and driveability problems. See individual symptoms and their definitions in Section 6.0 (Glossary of Terms).

PCM Grounds − The PCM cannot detect a poor system ground. However, a diagnostic trouble code may be stored in the PCM as a result of this condition.

Throttle Body Air Flow − The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.(*)

Exhaust System − The PCM cannot detect a plugged, restricted, or leaking exhaust system.(*)

Cylinder Compression − The PCM cannot detect uneven, low, or high engine cylinder compression.(*)

Excessive Oil Consumption − Although the PCM monitors the exhaust stream oxygen content through the oxygen sensor when the system is in a closed loop, it cannot determine excessive oil consumption.

NOTE: Any of these conditions could result in a rich or lean condition causing an oxygen sensor TROUBLE CODE to be stored in the PCM, or the vehicle may exhibit one or more of the driveability symptoms listed in the Table of Contents.

3.2.6 SKIS OVERVIEW

The Sentry Key Immobilizer System (SKIS) is designed to prevent unauthorized vehicle operation. The system consists of a Sentry Key Immobilizer Module (SKIM), ignition key(s) equipped with a transponder chip and PCM. When the ignition switch is turned on, the SKIM interrogates the ignition key. If the ignition key is Valid or Invalid, the SKIM sends a PCI Bus message to the PCM indicating ignition key status. Upon receiving this message the PCM will terminate engine operation, or allow the engine to continue to operate.

3.2.7 SKIM ON-BOARD DIAGNOSTICS

The SKIM has been programmed to transmit and monitor many different coded messages as well as PCI Bus messages. This monitoring is called On Board Diagnosis.

Certain criteria must be met for a diagnostic trouble code to be entered into the SKIM memory. The criteria may be a range of; Input voltage, PCI Bus message, or coded messages to the SKIM. If all of the criteria for monitoring a circuit or function are met and a fault is sensed, a diagnostic trouble code will be stored in the SKIM memory.

3.2.8 SKIS OPERATION

When ignition power is supplied to the SKIM, the SKIM performs an internal self-test. After the self-test is completed, the SKIM energizes the antenna (this activates the transponder chip) and sends a challenge to the transponder chip. The transponder chip responds to the challenge by generating an encrypted response message using the following:

Secret Key - This is an electronically stored value (identification number) that is unique to each SKIS. The secret key is stored in the SKIM, PCM and all ignition key transponders.

Challenge - This is a random number that is generated by the SKIM at each ignition key cycle.

The secret key and challenge are the two variables used in the algorithm that produces the encrypted response message. The transponder uses the crypto algorithm to receive, decode and respond to the message sent by the SKIM. After responding to the coded message, the transponder sends a transponder I.D. message to the SKIM. The SKIM compares the transponder I.D. to the available valid key codes in the SKIM memory (8 key maximum at any one time). After validating the key ignition the SKIM sends a PCI Bus message called a Seed Request to the engine controller then waits for a PCM response. If the PCM does not respond, the SKIM will send the seed request again. After three failed attempts the SKIM will stop sending the seed request and store a trouble code. If the PCM sends a seed response, the SKIM sends a valid/invalid key message to the PCM. This is an encrypted message that is generated using the following:

VIN - Vehicle Identification Number

Seed - This is a random number that is generated by the PCM at each ignition key cycle.

The VIN and seed are the two variables used in the rolling code algorithm that encrypts the valid/invalid key message. The PCM uses the rolling code algorithm to receive, decode and respond to the valid/invalid key message sent by the SKIM. After sending the valid/invalid key message the SKIM waits 3.5 seconds for a PCM status message from the PCM. If the PCM does not respond with a valid key message to the SKIM, a fault is detected and a trouble code is stored.

The SKIS incorporates a VTSS LED located on the instrument panel upper cover. The LED receives switched ignition voltage and is hardwired to the body control module. The LED is actuated when the SKIM sends a PCI Bus message to the body controller requesting the LED on. The body controller then provides the ground for the LED. The SKIM will request VTSS LED operation for the following:

– bulb checks at ignition on

– to alert the vehicle operator to a SKIS malfunction
– customer key programming mode

For all faults except transponder faults and VTSS LED remains on steady. In the event of a transponder fault the LED flashes at a rate of 1 Hz (once per second). If a fault is present the LED will remain on or flashing for the complete ignition cycle. If a fault is stored in SKIM memory which prevents the system from operating properly, the PCM will allow the engine to start and run (for 2 seconds) up to six times. After the sixth attempt, the PCM disables the starter relay until the fault is corrected.

3.2.9 PROGRAMMING THE POWERTRAIN CONTROL MODULE

Important Note: Before replacing the PCM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal failure to components (i.e. 12-volt pull-ups, drivers and ground sensors). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

NOTE: If the PCM and the SKIM are replaced at the same time, program the VIN into the PCM first. All vehicle keys will then need to be replaced and programmed to the new SKIM.

The SKIS Secret Key is an I.D. code that is unique to each SKIS. This code is programmed and stored in the SKIM, engine controller and transponder chip (ignition key). When replacing the PCM it is necessary to program the secret key into the PCM.

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select THEFT ALARM, SKIM then MISCELLANEOUS.
3. Select PCM REPLACED.
4. Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: If three attempts are made to enter the secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the run position for one hour then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).

5. Press ENTER to transfer the secret key (the SKIM will send the secret key to the PCM).

3.2.10 PROGRAMMING THE SENTRY KEY IMMOBILIZER MODULE

NOTE: If the PCM and the SKIM are replaced at the same time, program the VIN into the PCM first. All vehicle keys will then need to be replaced and programmed to the new SKIM.

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select THEFT ALARM, SKIM then MISCELLANEOUS.
3. Select SKIM MODULE REPLACEMENT (GASOLINE).
4. Program the vehicle four-digit PIN into the SKIM.
5. Select COUNTRY CODE and enter the correct country.

NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKIM, the SKIM must be replaced.

6. Select UPDATE VIN (the SKIM will learn the VIN from the PCM).
7. Press ENTER to transfer the VIN (the PCM will send the VIN to the SKIM).
8. The DRBIII® will ask if you want to transfer the secret key. Select ENTER to transfer secret key from the PCM. This will ensure the current vehicle ignition keys will still operate the SKIS system.

3.2.11 PROGRAMMING THE IGNITION KEYS TO THE SENTRY KEY IMMOBILIZER MODULE

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select THEFT ALARM, SKIM, then MISCELLANEOUS.

3. Select PROGRAM IGNITION KEYS.
4. Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A maximum of eight keys can be learned to each SKIM AT ONE TIME. Once a key is learned to a SKIM it (the key) cannot be transferred to another vehicle.

If ignition key programming is unsuccessful, the DRBIII® will display one of the following messages:

Programming Not Attempted - The DRBIII® attempts to read the programmed key status and there are no keys programmed in the SKIM memory.

Programming Key Failed - (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

– faulty ignition key transponder

– ignition key is programmed to another vehicle.

8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

1. Obtain ignition keys to be programmed from customer (8 keys maximum)
2. Using the DRBIII®, erase all ignition keys by selecting MISCELLANEOUS and ERASE ALL CURRENT IGN. KEYS
3. Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

3.3 DIAGNOSTIC TROUBLE CODES

Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of trouble codes as well as no trouble code problems. It is not necessary to perform all of the tests in this book to diagnose an individual code.

Always begin by reading the diagnostic trouble codes using the DRBIII®.

3.3.1 HARD CODE

A diagnostic trouble code that comes back within one cycle of the ignition key is a hard code. This means that the defect is there every time the powertrain control module checks that circuit or function. Procedures in this manual verify if the DTC is a hard code at the beginning of each test. When it is not a hard code, an intermittent test must be performed.

DTC's that are for OBDII/Euro Stage III OBD monitors will not set with just the ignition key on. Comparing these to non-emission DTC's, they will seem like an intermittent. These DTC's require a set of parameters to be performed (The DRBIII® pre-test screens will help with this for MONITOR DTC's), this is called a TRIP. All OBDII/Euro Stage III OBD DTCs will be set after one or in some cases two trip failures, and the MIL will be turned on. These DTC's require three successful, no failures, TRIPS to extinguish the MIL, followed by 40 warm-up cycles to erase the DTC. For further explanation of TRIPS, Pre-test screens, Warm-up cycles, and the use of the DRBIII®, refer to the On Board Diagnostic training booklet #81-699-97094.

3.3.2 INTERMITTENT CODE

A diagnostic trouble code that is not there every time the PCM checks the circuit is an intermittent DTC. Most intermittent DTC's are caused by wiring or connector problems. Defects that come and go like this are the most difficult to diagnose; they must be looked for under specific conditions that cause them. The following checks may assist you in identifying a possible intermittent problem:

- Visually inspect related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Visually inspect the related harnesses. Look for chafed, pierced, or partially broken wire.
- Refer to any technical service bulletins that may apply.
- Use the DRBIII® data recorder or co-pilot.

3.3.3 STARTS SINCE SET COUNTER

The start since set counter counts the number of times the vehicle has been started since codes were last set, erased, or the battery was disconnected. The reset counter will count up to 255 start counts.

The number of starts helps determine when the trouble code actually happened. This is recorded by the PCM and can be viewed on the DRBIII® as STARTS since set.

When there are no trouble codes stored in memory, the DRBIII® will display NO DTC's Detected and the reset counter will show STARTS since clear = XXX.

3.3.4 HANDLING NO DTC PROBLEMS

Symptom checks cannot be used properly unless the driveability problem characteristic actually happens while the vehicle is being tested.

Select the symptom that most accurately describes the vehicle's driveability problem and then perform the test routine that pertains to this symptom. Perform each routine test in sequence until the problem is found. For definitions, see Section 6.0 Glossary Of Terms.

3.3.5 DISTANCE SINCE MI SET

The Euro Stage III OBD directive requires that the distance traveled by the vehicle while the MI is activated must be available at any instant through the serial port on the standard data link connector. This feature works as follows:

1. If the MI is illuminated due to a fault, the distance count is updated (i.e. it is counting).
2. If there is a stale MI fault (i.e. the fault is still frozen in memory but the MI has been extinguished due to 3 good trips), the distance count is held (i.e. frozen).
3. If the distance count is being held due to (Item 2.) and the fault is cleared, the distance is cleared (set to zero).
4. If the distance count is being held due to (Item 2.) and another MI occurs, the distance count is reset (to) and begins updating anew.
5. If a fault occurs while the MI is already illuminated due to a previous fault (the distance count is updating), then the distance count continues to update w/out interruption.
6. If the MI is flashing due to active misfire and there is an active fault (i.e. matured fault for which 3 good trips have not occurred), the distance count behaves as the MI in ON.
7. If the MI is flashing due to active misfire and there is no active fault (i.e. the MI is flashing for a 1 malf.), the distance count behaves as if the MI is off (because it is not yet a matured fault).
8. The distance count is cleared whenever the fault is cleared. (Via 40 warm up cycles, or via scan tool).

POOR FUEL ECONOMY	CHECKING PCM POWER AND GND CKT CHECKING THE FUEL PRESSURE CHECKING ECT SENSOR CHECKING THROTTLE POSITION SENSOR CHECKING MAP SENSOR CHECKING IDLE AIR CONTROL MOTOR OPERATION CHECKING IAT SENSOR

3.4 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading DTC's, erasing DTC's, and other DRBIII® functions.

3.5 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII® will display one of only two error messages:

– User-Requested WARM Boot or User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the Star Center for information and assistance. This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot

Press MORE to switch between this display
   and the application screen.
Press F4 when done noting information.
```

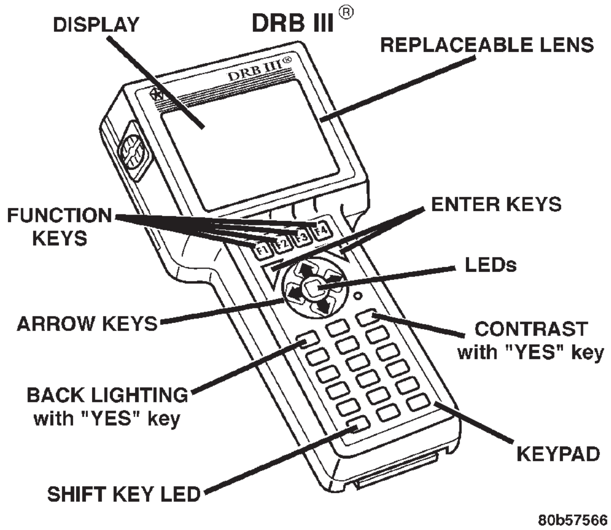
3.5.1 DRBIII® DOES NOT POWER UP

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, and inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition



4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a powertrain system problem, it is important to follow approved procedures where applicable. These procedures can be found in service manual procedures. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB ASSEMBLIES

Some components of the powertrain system are intended to be serviced in assembly only. Attempting to remove or repair certain system subcomponents may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

Follow the vehicle manufacturer's service specifications at all times.

- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms

FUNCTION	INPUT LIMIT
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS AND CAUTIONS

4.3.1 ROAD TEST WARNINGS

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read the DRBIII® screen while in motion. Do not hang the DRBIII® from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

4.3.2 VEHICLE DAMAGE CAUTIONS

Before disconnecting any control module, make sure the ignition is off. Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second DTC could be set, making diagnosis of the original problem more difficult.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box) scan tool
Evaporative System Diagnostic Kit #6917
fuel filler adapter #8382
fuel pressure adapter (C-6631) or #6539
fuel pressure kit (C-4799-B) or #5069
fuel release hose (C-4799-1)
Min Air flow fitting #6714
jumper wires
ohmmeter
oscilloscope
vacuum gauge
voltmeter
12 volt test light minimum 25 ohms resistance with probe #6801

CAUTION: A 12 volt test light should not be used for the following circuits, damage to the powertrain controller will occur.

- 5 Volt Supply
- 8 Volt Supply
- J1850 PCI Bus
- CCD Bus
- CKP Sensor Signal
- CMP Sensor Signal
- Vehicle Speed Sensor Signal
- O2 Sensor Signal

6.0 GLOSSARY OF TERMS

ABS	anti-lock brake system
backfire, popback	fuel ignites in either the intake or the exhaust system
CKP	crank position sensor
CMP	camshaft position sensor
cuts out, misses	a steady pulsation or the inability of the engine to maintain a consistent rpm
DLC	data link connector (previously called engine diagnostic connector)
detonation, spark knock	a mild to severe ping, especially under loaded engine conditions
ECT	engine coolant temperature sensor
EGR	exhaust gas recirculation valve and system
generator	previously called alternator
hard start	The engine takes longer than usual to start, even though it is able to crank normally.
hesitation, sag, stumble	There is a momentary lack of response when the throttle is opened. This can occur at all vehicle speeds. If it is severe enough, the engine may stall.
IAT	intake/inlet air temperature sensor
IAC	idle air control motor
JTEC	Combined engine and transmission control module
lack of power, sluggish	The engine has less than expected power, with little or no increase in vehicle speed when the throttle is opened.
LDP	leak detection pump
MAP	manifold absolute pressure sensor
MIL	malfunction indicator lamp
MTV	manifold tuning valve
O2S	oxygen sensor
PCI	programmable communication interface
PCM	powertrain control module
PCV	positive crankcase ventilation
PEP	peripheral expansion port
poor fuel economy	There is significantly less fuel mileage than other vehicles of the same design ad configuration
rough, unstable, or erratic idle stalling	The engine runs unevenly at idle and causes the engine to shake if it is severe enough. The engine idle rpm may vary (called hunting). This condition may cause stalling if it is severe enough.
SBEC	single board engine controller
SKIM	sentry key immobilizer module
SKIS	sentry key immobilizer system
start & stall	The engine starts but immediately dies.
surge	engine rpm fluctuation without corresponding change in throttle position sensor
TPS	throttle position sensor
TRS	transmission range sensor
VSS	vehicle speed sensor/signal

NOTES

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:
P0622-GENERATOR FIELD NOT SWITCHING PROPERLY

When Monitored and Set Condition:

P0622-GENERATOR FIELD NOT SWITCHING PROPERLY

When Monitored: With the ignition on. Engine running.

Set Condition: When the PCM tries to regulate the generator field with no result during monitoring.

POSSIBLE CAUSES
WIRING HARNESS INTERMITTENT
INSPECT WIRING HARNESS
ASD RELAY OUTPUT CIRCUIT OPEN
GENERATOR FIELD DRIVER CIRCUIT SHORT TO GROUND
GENERATOR FIELD DRIVER CIRCUIT OPEN
GENERATOR FIELD COIL OPEN
GENERATOR FIELD COIL SHORTED
PCM TERMINAL CONDITION
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the Generator Field Driver circuit. Using a 12-volt test light connected to ground, backprobe the Generator Field Driver circuit in the back of the Generator. Does the test light illuminate brightly and flash? Yes → Go To 2 No → Go To 4	All
2	With the DRBIII®, erase DTCs. Start the engine and allow it to idle. Wiggle the wiring harness from the Generator to PCM. With the DRBIII®, read DTC's. Did the DTC reset? Yes → Repair as necessary . Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 3	All

P0622-GENERATOR FIELD NOT SWITCHING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Using the schematic as a guide, inspect the Wiring and Connectors. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Test Complete.	All
4	**NOTE: Carefully inspect all Connectors for corrosion or spread Terminals before continuing.** Disconnect the Generator Field harness connector. Turn the ignition on. With the DRBIII® actuate the Generator Field Driver circuit. Using a 12-volt test light connected to ground, probe the ASD Relay Output circuit. Does the test light illuminate brightly? Yes → Go To 5 No → Repair the ASD Relay Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the Generator Field harness connector. Measure the resistance of the Generator Field Driver circuit from PCM harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the Generator Field Driver circuit for a shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 6	All
6	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the Generator Field harness connector. Measure the resistance of the Generator Field Driver circuit from the PCM harness connector to the Generator Field harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Generator Field Driver circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All
7	Turn the ignition off. Disconnect the Generator Field harness connector. Measure the resistance across the Generator Field Terminals at the Generator. Is the resistance above 15.0 ohms? Yes → Replace the Generator. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 8	All

P0622-GENERATOR FIELD NOT SWITCHING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the Generator Field harness connector. Measure the resistance across the Generator Field Terminals at the Generator. Is the resistance below 0.5 ohms? Yes → Replace the Generator. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 9	All
9	Turn the ignition off. Disconnect the PCM harness connector. Inspect the Generator Field Driver terminal on both sides of the PCM connectors. Check for corrosion, damage or terminal push out. Were any of the above conditions present? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All

Symptom:
P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH

When Monitored and Set Condition:

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH

When Monitored: The ignition key on.

Set Condition: The Ambient Temperature Sensor voltage is greater than 4.9 volts at the PCM for 5 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
AMBIENT TEMPERATURE SENSOR INTERNAL FAILURE
AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
PCM TERMINAL CONDITION
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the Ambient Temperature Sensor voltage. Is the voltage above 4.8 volts? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Turn the ignition on. Measure the voltage of the Ambient Temperature Sensor Signal circuit in the Ambient Temperature Sensor harness connector. Is the voltage above 5.2 volts? Yes → Repair the Ambient Temperature Sensor Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Connect a jumper wire between the Ambient Temperature Sensor Signal circuit and the Sensor ground circuit in the Ambient Temperature Sensor harness connector. Turn the ignition on. With the DRBIII®, read Ambient Temperature Sensor voltage. Is the voltage below 1.0 volt? Yes → Replace the Ambient Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Ambient Temperature Sensor Signal circuit between the Ambient Temperature Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Ambient Temperature Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor ground circuit between the Ambient Temperature Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Disconnect the PCM harness connector. Inspect the Ambient Air Temperature Sensor Signal terminal on both sides of the PCM connector. Check for corrosion, damage or terminal push out. Were any of the above conditions present? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1493-AMBIENT/BATT TEMP SEN VOLTS TOO LOW

When Monitored and Set Condition:

P1493-AMBIENT/BATT TEMP SEN VOLTS TOO LOW

When Monitored: The ignition key on.

Set Condition: Ambient Temperture Sensor is less than .098 volt at the PCM for 5 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
AMBIENT TEMPERATURE SENSOR INTERNAL FAILURE
AMBIENT TEMPERATURE SENSOR SIGNAL SHORTED TO GROUND
AMBIENT TEMPERATURE SENSOR SIGNAL SHORTED TO SENSOR GROUND CIRCUIT
PCM TERMINAL CONDITION
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the Ambient Temperature Sensor voltage. Is the voltage below 0.3 volt? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Turn the ignition on. With the DRBIII®, read Ambient Temperature Sensor voltage. Is the voltage above 1.0 volt? Yes → Replace the Ambient Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Ambient Temperature Sensor Signal circuit in the Ambient Temperature Sensor harness connector to chassis ground. Is the resistance below 100 ohms? Yes → Repair the Ambient Temperature Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All

P1493-AMBIENT/BATT TEMP SEN VOLTS TOO LOW — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the Ambient Temperature Sensor Signal circuit and the Sensor ground circuit in the Ambient Temperature Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the Ambient Temperature Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM harness connector. Inspect the Ambient Air Temperature Sensor Signal terminal on both sides of the PCM connector. Check for corrosion, damage or terminal push out. Were any of the above condition present? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1594-CHARGING SYSTEM VOLTAGE TOO HIGH

When Monitored and Set Condition:

P1594-CHARGING SYSTEM VOLTAGE TOO HIGH

When Monitored: The engine running. The engine speed greater than 380 RPM.

Set Condition: Battery voltage is 1 volt greater than desired system voltage.

POSSIBLE CAUSES
TARGET VOLTAGE DIFFERS FROM BATTERY VOLTAGE
INTERMITTENT CONDITION
GENERATOR FIELD DRIVER CIRCUIT SHORTED TO GROUND
GENERATOR FIELD
POWERTRAIN CONTROL MODULE
PCM TERMINAL CONDITION

TEST	ACTION	APPLICABILITY
1	**Note: Battery must be fully charged.** **Note: Generator Belt tension and condition must be checked before continuing.** Turn the ignition on. With DRBIII®, actuate the Generator Field Driver. With a 12-volt test light connected to ground, backprobe the Generator Field Driver circuit in the back of Generator Field harness connector. Does the test light illuminate brightly and flash? Yes → Go To 2 No → Go To 5	All
2	With DRBIII®, stop all actuation. Turn the ignition on. With DRBIII®, read the Target Charging voltage. Is the Target Charging voltage above 13 volts? Yes → Go To 3 No → Go To 4	All
3	Start the engine. With the DRBIII®, manually set the engine speed to 1600 RPM. With DRBIII®, read both the Battery voltage and the Target Charging voltage. Compare the Target Charging Voltage to the Battery Voltage reading. Monitor voltage for 5 minutes, if necessary. Look for a 1.0 volt difference or more. Was there more than a 1.0 volt difference? Yes → Replace the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 4	All

P1594-CHARGING SYSTEM VOLTAGE TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
4	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Test Complete.	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the Generator Field harness connector. Measure the resistance of the Generator Field Driver circuit from the PCM harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Generator Field Driver circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 6	All
6	Turn the ignition off. Disconnect the Generator Field harness connector. Measure resistance of the Generator Field Driver terminal pin of the Generator to ground. Is the resistance below 5.0 ohms? Yes → Replace the Generator. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 7	All
7	Turn the ignition off. Disconnect the PCM harness connector. Inspect the Generator Field Driver terminal on both the PCM connector. Check for corrosion, damage or terminal push out. Were any of the above conditions present? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All

Symptom:
P1682-CHARGING SYSTEM VOLTAGE TOO LOW

When Monitored and Set Condition:

P1682-CHARGING SYSTEM VOLTAGE TOO LOW

When Monitored: With the ignition on. Engine RPM greater than 1152 RPM. With no other charging system codes set.

Set Condition: The battery sensed voltage is 1 volt below the charging goal for 13.47 seconds. The PCM senses the battery voltage turns off the field driver and senses the battery voltage again. If the voltages are the same, the code is set.

POSSIBLE CAUSES
B+ CIRCUIT HIGH RESISTANCE
GENERATOR GROUND HIGH RESISTANCE
INTERMITTENT CONDITION
GENERATOR FIELD DRIVER CIRCUIT OPEN
ASD RELAY OUTPUT CIRCUIT OPEN
GENERATOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.** Turn the ignition off. **NOTE: The battery must be fully charged.** **NOTE: The Generator belt tension and condition must be checked before continuing.** Start the engine. Allow the idle to stabilize. With the DRBIII®, read the Target Charging Voltage. Is the Target Charging Voltage above 15.1 volts? Yes → Go To 8 No → Go To 2	All
2	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition on. **NOTE: Ensure all wires are clear of the engine's moving parts.** Measure the voltage between the Generator B+ Terminal and the Battery+ Post. Start the engine. Is the voltage above 0.4 volt with the engine running? Yes → Repair the B+ circuit for high resistance between the Generator and Battery. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 3	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Warm the engine to operating temperature. **NOTE: Ensure all wires are clear of the engine's moving parts.** Measure the voltage between the Generator case and Battery ground post. Is the voltage above 0.1 volt? Yes → Repair Generator Ground for high resistance, Generator Case to Battery ground side. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 4	All
4	Start the engine. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn on all accessories, manually set engine speed to 1600 RPM. With DRBIII®, read Target Charging and Charging voltage. Compare the two readings. Is there more than a 1.0 volt difference? Yes → Go To 5 No → Go To 8	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the Generator Field harness connector. Measure the resistance of the Generator Field Driver circuit from the PCM harness connector to Generator harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Generator Field Driver circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All
6	Disconnect the Generator Field harness connector. Turn the ignition on. With the DRBIII® actuate the Generator Field Driver. Using a 12-volt test light connected to ground, probe the ASD Relay Output circuit in the Generator harness connector. Does the test light illuminate brightly? Yes → Go To 7 No → Repair the ASD Relay Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All
7	If there is no possible causes remaining, view repair. Yes → Replace the Generator. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW — Continued

TEST	ACTION	APPLICABILITY
8	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Test Complete.	All

Symptom List:
P0600-PCM FAILURE SPI COMMUNICATIONS
P0601-PCM INTERNAL CONTROLLER FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0600-PCM FAILURE SPI COMMUNICATIONS.

When Monitored and Set Condition:

P0600-PCM FAILURE SPI COMMUNICATIONS

When Monitored: Ignition key on.

Set Condition: Internal Bus communication failure between processors.

P0601-PCM INTERNAL CONTROLLER FAILURE

When Monitored: Ignition key on.

Set Condition: Internal checksum for software failed, does not match calculated value.

POSSIBLE CAUSES
PCM INTERNAL OR SPI

TEST	ACTION	APPLICABILITY
1	The Powertrain Control Module is reporting internal errors, view repair to continue. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
P1685 WRONG OR INVALID KEY MSG RECEIVED FROM SKIM

POSSIBLE CAUSES
INCORRECT VIN IN PCM
INVALID SKIM KEY PRESENT
NO COMMUNICATION WITH SKIM
NO VIN PROGRAMMED IN THE PCM
PCM
SKIM TROUBLE CODES SET

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the PCM DTCs. Look for P1685. Is the Starts Since Set counter for DTC P1685 displayed and equal to 0? Yes → Go To 2 No → Go To 7	All
2	With the DRBIII®, attempt to communicate with the SKIM. Turn the ignition on. Can the DRB III communicate with the SKIM? Yes → Go To 3 No → Refer to symptom BUS +/- SIGNAL OPEN FROM SKIM in the COMMUNICATION category. Perform SKIS VERIFICATION.	All
3	Turn the ignition on. With the DRB III, check for SKIM DTCs. Are any DTCs present in the SKIM? Yes → Repair all SKIM DTCs. Perform SKIS VERIFICATION. No → Go To 4	All
4	Turn the ignition on. With the DRB III, display the VIN that is programmed in the PCM. Has a VIN been programmed into the PCM? Yes → Go To 5 No → Program the correct VIN into the PCM and retest. Perform SKIS VERIFICATION.	All
5	Turn the ignition on. With the DRB III, display the VIN that is programmed in the PCM. Was the correct VIN programmed into the PCM? Yes → Go To 6 No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.	All

P1685 WRONG OR INVALID KEY MSG RECEIVED FROM SKIM — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Turn the ignition on. With the DRB III, erase all SKIM and PCM DTCs. Attempt to start and idle the engine. With the DRB III, read the PCM DTCs. Does the DRB III display this code? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.	All
7	**NOTE: This DTC could have been set if the SKIM harness connector was disconnected, or if the SKIM was replaced recently.** **NOTE: All keys that the customer uses for this vehicle must be tested to verify they are operating properly.** **NOTE: Ensure the customer is not attempting to use a non-SKIM duplicate key.** Turn the ignition on. Verify the correct VIN is programmed into the PCM and SKIM. Turn the ignition off. With the next customer key turn the ignition key on and crank the engine to start. With the DRB III, read the PCM DTCs. Look for P1685 Is the Starts Since Set counter for DTC P1685 displayed and equal to 0? Yes → Replace the Ignition Key. Perform SKIS VERIFICATION. No → Test Complete. **NOTE: If this DTC cannot be reset, it could have been an actual theft attempt.**	All

Symptom:
P1686 NO SKIM BUS MESSAGE RECEIVED

POSSIBLE CAUSES
SKIM/PCM
INTERMITTENT CONDITION
LOSS OF SKIM COMMUNICATION
PCI BUS CIRCUIT OPEN FROM PCM TO SKIM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB III, read the PCM DTCs. Look for P1686. Is the Starts Since Set counter on the DTC screen for P1686 equal to Zero? Yes → Go To 2 No → Go To 5	All
2	Turn the ignition on. With the DRB III, attempt to communicate with the SKIM. **NOTE: This test will indicate if the Bus is operational from the DLC to the SKIM.** Was the DRB III able to communicate with the SKIM? Yes → Go To 3 No → Refer to symptom BUS +/- SIGNAL OPEN FROM SKIM in the COMMUNICATION category. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the SKIM harness connector. Measure the resistance of the PCI Bus circuit between the PCM harness connector and the SKIM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the PCI Bus circuit between the PCM and the SKIM for an open. Perform SKIS VERIFICATION.	All
4	Turn the ignition off. Replace the Sentry Key Immobilizer Module in accordance with the Service Information. Turn the ignition on. Display and erase all PCM and SKIM DTCs. Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle. With the DRB, display PCM DTCs. Does the DRB display the same DTC? Yes → Replace and program the PCM in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.	All

P1686 NO SKIM BUS MESSAGE RECEIVED — Continued

TEST	ACTION	APPLICABILITY
5	**WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running and at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All

Symptom:
P1687-NO CLUSTER BUS MESSAGE

When Monitored and Set Condition:

P1687-NO CLUSTER BUS MESSAGE

When Monitored: Ignition key on.

Set Condition: No messages received from the MIC (Instrument Cluster) for 20 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
COMMUNICATE WITH CLUSTER
INSTRUMENT CLUSTER OPERATION
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTCs. Cycle the ignition key on and off several times. Leaving the ignition in the ON position for a minimum of 20 seconds each time. With the DRBIII®, read DTC's. Does the DTC reset? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, attempt to communicate with the Instrument cluster. Can communication be established with the Instrument Cluster? Yes → Go To 3 No → Refer to the Communication Category and perform the appropriate symptom related to no communication with cluster. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Start the engine Allow the engine to idle. Is the correct engine speed display in the instrument cluster (Tach)? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Refer to the Instrument Category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

P1687-NO CLUSTER BUS MESSAGE — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All

Symptom:
P1695-NO CCD/J1850 MESSAGE FROM BODY CONTROL MODULE

When Monitored and Set Condition:

P1695-NO CCD/J1850 MESSAGE FROM BODY CONTROL MODULE

When Monitored: With the ignition on. Battery voltage greater than 10.0 volts.

Set Condition: No BUS messages recieved from the BCM for 20 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
COMMUNICATE WITH BCM
PCI BUS CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTCs. Cycle the ignition key on and off several times. Leaving the ignition on for at least 20 seconds. With the DRBIII®, read DTC's. Does the DTC reset? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, attempt to communicate with the BCM. Can communication be established with the BCM? Yes → Go To 3 No → Refer to the Communication Category and perform the appropriate symptom related to no communication with BCM. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Disconnect the PCM harness connector Disconnect the BCM harness connector. **NOTE: Inspect the PCI Bus terminal at both the PCM connectors and the BCM connectors. Check for corrosion, damage or terminal push out.** Measure the resistance of the PCI BUS circuit between the PCM harness connector and the BCM harness connector. Is the resistance below 5.0 ohms? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Repair the PCI BUS circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

P1695-NO CCD/J1850 MESSAGE FROM BODY CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
4	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRB Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All

Symptom List:

P1696-PCM FAILURE EEPROM WRITE DENIED
P1697-PCM FAILURE SRI MILE NOT STORED

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1696-PCM FAILURE EEPROM WRITE DENIED.

When Monitored and Set Condition:

P1696-PCM FAILURE EEPROM WRITE DENIED

When Monitored: Ignition key on, Continuous.

Set Condition: An attempt to program/write to the internal EEPROM failed, Also checks at powerdown.

P1697-PCM FAILURE SRI MILE NOT STORED

When Monitored: Ignition key on, Continuous.

Set Condition: An attempt to program/write to the internal EEPROM failed, Also checks at powerdown.

POSSIBLE CAUSES
DRB DISPLAYS WRITE FAILURE
DRB DISPLAYS WRITE REFUSED 3RD TIME
DRB DISPLAYS SRI MILEAGE INVALID
COMPARE SRI MILEAGE WITH ODOMETER

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, perform the SRI Memory Test. Does the DRBIII® display Write Failure? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 2	All
2	With the DRBIII®, perform the SRI Memory Test a second time. Does the DRBIII® display Write Refused? Yes → Go To 3 No → Go To 4	All

P1696-PCM FAILURE EEPROM WRITE DENIED — Continued

TEST	ACTION	APPLICABILITY
3	With the DRBIII®, perform the SRI Memory Test a third time. **NOTE: Retest the SRI Memory two more times.** Does the DRBIII® display Write Refused again? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All
4	With the DRBIII®, perform the SRI Memory Test. Does the DRBIII® display SRI Mileage Invalid? Yes → Update the mileage and retest the SRI Memory. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 5	All
5	Compare the SRI Mileage stored with the Instrument Panel Odometer. Is the mileage within the specified range displayed on the DRBIII®? Yes → Test Complete. No → Update the mileage and retest the SRI Memory. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
P1698-NO BUS MESSAGE FROM TRANS CONTROL MODULE

When Monitored and Set Condition:

P1698-NO BUS MESSAGE FROM TRANS CONTROL MODULE

When Monitored: Equipped with automatic transmission. The ignition on. Battery voltage greater than 10 volts.

Set Condition: No bus messages from the TCM for 20 seconds, two trips required.

POSSIBLE CAUSES
INTERMITTENT CONDITION
COMMUNICATE WITH TCM
PCI BUS CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTCs. Cycle the ignition key on and off several times. Leaving the ignition on for at least 20 seconds. With the DRBIII®, read DTC's. Does the DTC reset? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, attempt to communicate with the TCM. Can communication be established with the TCM? Yes → Go To 3 No → Refer to the Communication Category and perform the appropriate symptom related to no communication with TCM. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Disconnect the PCM harness connector Disconnect the TCM harness connector. **NOTE: Inspect the PCI Bus terminal at both the PCM connectors and the TCM connectors. Check for corrosion, damage or terminal push out.** Measure the resistance of the PCI BUS circuit between the PCM harness connector and the TCM harness connector. Is the resistance below 5.0 ohms? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Repair the PCI BUS circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

P1698-NO BUS MESSAGE FROM TRANS CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
4	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRB Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All

Symptom:
*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM SENTRY KEY IMMOBILIZER MODULE

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
SENTRY KEY IMMOBILIZER MODULE (SKIM)
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform SKIS VERIFICATION.	All
2	Turn the ignition off. Disconnect the SKIM harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform SKIS VERIFICATION.	All
3	Turn the ignition off. Disconnect the SKIM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit for an open. Refer to the wiring diagrams in the service information. Perform SKIS VERIFICATION.	All

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM SENTRY KEY IMMOBILIZER MODULE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the SKIM harness connector. Using a 12-volt test light connected to ground, probe the Fused B(+) circuit. Is the test light illuminated? Yes → Go To 5 No → Repair the Fused B+ circuit for an open. Refer to the wiring diagrams in the service information. Perform SKIS VERIFICATION.	All
5	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the SKIM harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the SKIM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Sentry Key Immobilizer Module (SKIM) in accordance with the service information. Perform SKIS VERIFICATION. No → Go To 6	All
6	Turn the ignition off. Disconnect the SKIM harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the PCI bus circuit between the SKIM connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform SKIS VERIFICATION. No → Repair the PCI Bus circuit for an open. Perform SKIS VERIFICATION.	All

Symptom:
*NO RESPONSE FROM PCM (PCI BUS)

POSSIBLE CAUSES
PCM PCI NO RESPONSE
POWERTRAIN CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, enter Body then Body Computer. With the DRB, enter Body then Electro/Mechanical Cluster (MIC). Were you able to establish communications with any of the modules? Yes → Go To 2 No → Refer to symptom PCI Bus Communication Failure in the Communications category. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	With the DRB read PCM Diagnostic Trouble Codes. This is to ensure power and grounds to the PCM are operational. **NOTE: If the DRB will not read PCM DTC's, follow the NO RESPONSE TO PCM (SCI only) symptom path.** Turn the ignition off. Disconnect the PCM C2 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the PCM C2 connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 3	All

*NO RESPONSE FROM PCM (PCI BUS) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the PCM C2 harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit between the PCM C2 connector and the BCM C3 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Repair the PCI Bus circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*NO RESPONSE FROM PCM (SCI ONLY)

POSSIBLE CAUSES
CHECK PCM POWERS AND GROUNDS
SCI TRANSMIT CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION CONTROL MODULE
SCI RECEIVE CIRCUIT SHORTED TO VOLTAGE
SCI CIRCUITS SHORTED TOGETHER
SCI TRANSMIT CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT OPEN
SCI TRANSMIT CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Perform the symptom Checking PCM Power and Ground Circuits in the Driveability category. **NOTE: With the DRBIII® in the generic scan tool mode, attempt to communicate with the PCM.** **NOTE: If the DRBIII® can communicate with the PCM in the generic scan tool mode, it may not be necessary to perform this step.** Did the vehicle pass this test? Yes → Go To 2 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Go To 4	All
3	Turn the ignition off. Disconnect the TCM harness connector (if equipped). **NOTE: If vehicle is not equipped with a TCM, answer yes to the question.** Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Repair the SCI Transmit circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace the Transmission Control Module in accordance with the service information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*NO RESPONSE FROM PCM (SCI ONLY) — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the DRB from the DLC. Disconnect the PCM harness connector. Disconnect the TCM harness connector (if equipped). Turn the ignition on. Measure the voltage of the SCI Transmit circuit at the DLC connector (cav 7). Is the voltage above 1.0 volt? Yes → Repair the SCI Transmit circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the DRB from the DLC. Disconnect the PCM harness connector. Turn the ignition on. Measure the voltage of the SCI Receive circuit at the DLC connector (cav 6). Is the voltage above 1.0 volt? Yes → Repair the SCI Receive circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the DRB from the DLC. Disconnect the PCM harness connector. Measure the resistance between the SCI Transmit circuit and the SCI Receive circuit at the PCM connector. Is the resistance below 5.0 ohms? Yes → Repair the short between the SCI Transmit and the SCI Receive circuits. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 7	All
7	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Receive circuit. Is the resistance below 5.0 ohms? Yes → Repair the SCI Receive circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Receive circuit between the PCM connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the SCI Receive circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*NO RESPONSE FROM PCM (SCI ONLY) — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Transmit circuit between the PCM connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the SCI Transmit circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
10	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*PCI BUS COMMUNICATION FAILURE

POSSIBLE CAUSES
WIRING HARNESS INTERMITTENT
OPEN PCI BUS CIRCUIT AT THE DATA LINK CONNECTOR (DLC)
HIGH VOLTAGE ON THE PCI BUS CIRCUITS AT THE BCM CONNECTORS
MODULE (PCI BUS SHORT TO VOLTAGE)
PCI BUS CIRCUIT SHORTED TO VOLTAGE
LOW RESISTANCE TO GROUND ON THE PCI BUS CIRCUITS AT THE BCM CONNECTORS
MODULE (PCI BUS SHORT TO GROUND)
PCI BUS CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	**Note: Determine which modules this vehicle is equipped with before beginning.** **Note: When attempting to communicate with any of the modules on this vehicle, the DRB will display 1 of 2 different communication errors: a NO RESPONSE message or a BUS +/- SIGNALS OPEN message.** Turn the ignition on. Using the DRB, attempt to communicate with the following control modules: Body Control Module (BCM) Instrument Cluster (MIC) Occupant Restraint Controller (ORC) Controller Antilock Brake (CAB) Was the DRB able to communicate with one or more Module(s)? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: If the DRB can not communicate with a single module, refer to the category list for the related symptom.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the DRB from the Data Link Connector (DLC). Measure the resistance of the PCI Bus circuit between the Data Link Connector (DLC) and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	**NOTE: Reconnect the BCM C2 harness connector.** Turn the ignition on. Measure the voltage of the PCI Bus circuit at the Data Link Connector (DLC). Is the voltage above 4.0 volts? Yes → Go To 5 No → Go To 7	All
5	**Note: Determine which modules this vehicle is equipped with before beginning.** Turn the ignition off. Disconnect the BCM C2 and C3 harness connectors. Turn the ignition on. Measure the voltage of each PCI Bus circuit at the BCM C2 and C3 connectors. Is the voltage steadily above 4.0 volts for any measurement? Yes → Go To 6 No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the module that corresponds to the PCI Bus circuit that measured steadily above 4.0 volts. Turn the ignition on. **NOTE: If the PCI Bus circuit for the Radio was above 4.0 volts and is equipped with a CD Changer, disconnect the CD Changer before the Radio.** **NOTE: If the PCI Bus circuit for the Instrument Cluster (MIC) was above 4.0 volts and is equipped with a Compass/Mini Trip Computer (CMTC), disconnect the CMTC before the MIC.** **NOTE: If the PCI Bus circuit for the side airbags (if equipped) was above 4.0 volts, disconnect each module one at a time.** Measure the voltage of the PCI Bus circuit that previously measured above 4.0 volts. Is the voltage steadily above 4.0 volts with the module disconnected? Yes → Repair the PCI Bus circuit that measured over 4.0 volts for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Replace the module that caused the short to voltage on the PCI Bus circuit. Perform BODY VERIFICATION TEST - VER 1.	All

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	**Note: Determine which modules this vehicle is equipped with before beginning.** Turn the ignition off. Disconnect the negative battery cable. Disconnect the BCM C2 and C3 harness connectors. Measure the resistance between ground and each of the PCI Bus circuits at the BCM C2 and C3 connectors. Is the resistance below 1000.0 ohms for any of the measurements? Yes → Go To 8 No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the negative battery cable. Disconnect the module that corresponds to the PCI Bus circuit that resistance measured below 1000.0 ohms. **NOTE: If the PCI Bus circuit for the Radio was below 1000.0 ohms and is equipped with a CD Changer, disconnect the CD Changer before the Radio.** **NOTE: If the PCI Bus circuit for the Instrument Cluster (MIC) was below 1000.0 ohms and is equipped with a Compass/Mini Trip Computer (CMTC), disconnect the CMTC before the MIC.** **NOTE: If the PCI Bus circuit for the side airbags (if equipped) was below 1000.0 ohms, disconnect each module one at a time.** Measure the resistance between ground and the PCI Bus circuit that previously measured below 1000.0 ohms. Is the resistance below 1000.0 ohms with the module disconnected? Yes → Repair the PCI Bus circuit that resistance measured below 1000.0 ohms for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the module that caused the short to ground on the PCI Bus circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
P0071 - AMBIENT TEMP SENSOR PERFORMANCE

When Monitored and Set Condition:

P0071 - AMBIENT TEMP SENSOR PERFORMANCE

When Monitored: With the ignition on. Coolant Temperature greater than 71°C (160°F) No Ambient Air Temperature Sensor Faults present

Set Condition: After 5 warm cycles have occurred (coolant increases from greater than 4.4°C (40°F) to a minimum of 71°C (160°F) and the odometer mileage has increased 196.6 miles and the Ambient Air Temperature has increased less than 3°C (5.4°F). Two trip fault.

POSSIBLE CAUSES
INTERMITTENT CONDITION
AMBIENT AIR TEMP SENSOR VOLTAGE BELOW 1.0 VOLTS
SENSOR GROUND CIRCUIT VOLTAGE DROP
AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT VOLTAGE DROP
PCM TERMINAL CONDITION
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: If DTC P1492 or P1493 have set along with P0071, diagnose P1492 or P1493 first before continuing.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Ambient Air Temperature Sensor harness connector. Turn the ignition on. With the DRBIII®, read the Ambient Air Temp voltage. Is the voltage above 4.6 volts? Yes → Go To 3 No → Go To 4	All

P0071 - AMBIENT TEMP SENSOR PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Ambient Air Temperature Sensor harness connector. Using a jumper wire, jumper across the Ambient Air Temp Sensor harness connector. Turn the ignition on. With the DRBIII®, read the Ambient Air Temp voltage. Is the voltage below 1.0 volt? Yes → Replace the Ambient Air Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Perform a voltage drop test by backprobing between the Sensor ground circuit at the Ambient Air Temp Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 5 No → Repair the high resistance in the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Perform a voltage drop test by backprobing the Ambient Air Temp Sensor Signal circuit at the Ambient Temperature Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 6 No → Repair the high resistance in the Ambient Air Temp Sensor Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Disconnect the PCM harness connector. Inspect the IAT Signal and the Sensor ground terminals on both sides of the PCM connectors. Check for corrosion, damage or terminal push out. Were any of the above conditions present? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0071 - AMBIENT TEMP SENSOR PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information to identify under what conditions the DTC set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0106-BAROMETRIC PRESSURE OUT OF RANGE

When Monitored and Set Condition:

P0106-BAROMETRIC PRESSURE OUT OF RANGE

When Monitored: With the ignition key on. No Cam or Crank signal within 75 ms. Engine speed at less than 250 RPM.

Set Condition: The PCM senses the voltage from the MAP sensor to be less than 2.196 volts but above 0.0392 volts for 300 milliseconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
MAP SENSOR INTERNAL FAILURE
MAP SENSOR SIGNAL CIRCUIT OPEN
MAP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
PCM 5 VOLT SUPPLY CIRCUIT
PCM MAP SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. (Do not start engine) With the DRBIII®, read the MAP Sensor voltage. Is the voltage below 2.2 volts. Yes → Go To 2 No → Go To 11	All
2	Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the MAP Sensor harness connector. Is the voltage between 4.5 to 5.2 volts? Yes → Go To 3 No → Go To 7	All

P0106-BAROMETRIC PRESSURE OUT OF RANGE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. With the DRBIII®, monitor the MAP Sensor voltage. Is the voltage above 2.2 volts? Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the MAP Sensor Signal circuit between the MAP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the MAP Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the MAP Sensor Signal circuit in the MAP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the MAP Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the MAP Sensor harness connector. Is the voltage above 5.2 volts? Yes → Repair the 5 Volt Supply circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 8	All

P0106-BAROMETRIC PRESSURE OUT OF RANGE — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit in the MAP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 9	All
9	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the 5 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
11	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0107-MAP SENSOR VOLTAGE TOO LOW

When Monitored and Set Condition:

P0107-MAP SENSOR VOLTAGE TOO LOW

When Monitored: Engine speed between 600 to 3500 RPM. TPS voltage less than 1.2 volts. Battery voltage greater than 10 volts.

Set Condition: The MAP sensor signal voltage is below 0.0392 volt for 1.7 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
MAP SENSOR INTERNAL FAILURE
MAP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
MAP SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
PCM 5 VOLT SUPPLY CIRCUIT
PCM MAP SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. (Do not start engine.) With the DRBIII®, read the MAP Sensor voltage. Is the voltage below 1.2 volts. Yes → Go To 3 No → Go To 2	All
2	Start the engine. With the DRBIII®, read the MAP Sensor voltage. Is the voltage below .04 volts. Yes → Go To 3 No → Go To 11	All
3	Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the MAP Sensor harness connector. Is the voltage between 4.5 to 5.2 volts? Yes → Go To 4 No → Go To 8	All

P0107-MAP SENSOR VOLTAGE TOO LOW — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. With the DRBIII®, monitor the MAP Sensor voltage. Is the voltage above 1.2 volts? Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the MAP Sensor Signal circuit between the MAP Sensor harness connector and ground. Is the resistance below 100 ohms? Yes → Repair the MAP Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the MAP Sensor Signal circuit and the Sensor ground circuit in the MAP Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the MAP Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Symptom:
P0108-MAP SENSOR VOLTAGE TOO HIGH

When Monitored and Set Condition:

P0108-MAP SENSOR VOLTAGE TOO HIGH

When Monitored: Engine speed between 600 to 3500 RPM. TP sensor voltage less than 1.2 volts. Battery voltage greater than 10 volts

Set Condition: The MAP sensor signal voltage is greater than 4.96 voltsfor 1.7 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
MAP SENSOR SIGNAL CIRCUIT SHORTED TO 5 VOLT SUPPLY CIRCUIT
MAP SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
MAP SENSOR INTERNAL FAILURE
MAP SENSOR SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, read the MAP Sensor voltage. Is the voltage above 4.6 volts. Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the MAP Sensor Signal circuit and the 5 Volt Supply circuit in the MAP Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the MAP Sensor Signal circuit for a short to the 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P0108-MAP SENSOR VOLTAGE TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. Measure the voltage of the MAP Sensor Signal circuit in the MAP Sensor harness connector. Is the voltage above 5.2 volts? Yes → Repair the MAP Sensor Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the MAP Sensor harness connector. Connect a jumper wire between the MAP Sensor Signal circuit and the Sensor ground circuit. With the DRBIII®, monitor the MAP Sensor voltage. Turn the ignition on. Is the voltage below 1.0 volts? Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the MAP Sensor Signal circuit between the MAP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the MAP Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor ground circuit between the MAP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Symptom:
P0111-INTAKE AIR TEMP SENSOR PERFORMANCE

When Monitored and Set Condition:

P0111-INTAKE AIR TEMP SENSOR PERFORMANCE

When Monitored: With the ignition on. Coolant Temperature greater than 71°C (160°F) No Inlet Air Temperature Sensor Faults present (P1192 and P1193)

Set Condition: After 5 warm cycles have occurred (coolant increases from greater than 4.4°C (40°F) to a minimum of 71°C (160°F) and the odometer mileage has increased 196.6 miles and the Inlet Air Temperature has increased less than 3°C (5.4°F). Two trip fault.

POSSIBLE CAUSES
INTERMITTENT CONDITION
IAT SENSOR VOLTAGE BELOW 1.0 VOLTS
SENSOR GROUND CIRCUIT VOLTAGE DROP
IAT SENSOR SIGNAL CIRCUIT VOLTAGE DROP
PCM TERMINAL CONDITION
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: If DTC P1192 or P1193 have set along with P0111, diagnose P1192 or P1193 first before continuing.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Inlet Air Temperature Sensor harness connector. Turn the ignition on. With the DRBIII®, read the IAT voltage. Is the voltage above 4.6 volts? Yes → Go To 3 No → Go To 4	All

P0111-INTAKE AIR TEMP SENSOR PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Inlet Air Temperature Sensor harness connector. Using a jumper wire, jumper across the IAT Sensor harness connector. Turn the ignition on. With the DRBIII®, read the IAT voltage. Is the voltage below 1.0 volt? Yes → Replace the IAT Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Back probe between the Sensor ground circuit at the IAT Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 5 No → Repair the high resistance in the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Back probe between the IAT Sensor Signal circuit at the IAT Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 6 No → Repair the high resistance in the IAT Sensor Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Disconnect the PCM harness connector. Inspect the IAT Sensor Signal and Sensor Ground terminals. Check for corrosion, damage or terminal push out. Were any of the above conditions present? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0111-INTAKE AIR TEMP SENSOR PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. Symptom:
P0117-ECT SENSOR VOLTAGE TOO LOW

When Monitored and Set Condition:

P0117-ECT SENSOR VOLTAGE TOO LOW

When Monitored: With the ignition on. Battery voltage greater than 10 volts.

Set Condition: The Engine Coolant Temperature (ECT) sensor circuit voltage at the PCM is less than 0.5 volt for more than 2.6 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ECT SENSOR INTERNAL FAILURE
ECT SENSOR SIGNAL SHORTED TO GROUND
ECT SENSOR SIGNAL SHORTED TO SENSOR GROUND CIRCUIT
PCM TERMINAL CONDITION
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the ECT voltage. Is the voltage below 1.0 volt? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the ECT harness connector. Turn the ignition on. With the DRBIII®, read ECT voltage. Is the voltage above 1.0 volt? Yes → Replace the ECT Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the ECT Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the ECT Sensor Signal circuit in the ECT Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the ECT Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All

P0117-ECT SENSOR VOLTAGE TOO LOW — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the ECT Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the ECT Sensor Signal circuit and the Sensor ground circuit in the ECT Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the ECT Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM harness connector. Inspect the ECT Signal and Sensor Ground terminals. Check for corrosion, damage or terminal push out. If there are no possible causes remaining, view repair. Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. Symptom:
P0121-TPS VOLTAGE DOES NOT AGREE WITH MAP

When Monitored and Set Condition:

P0121-TPS VOLTAGE DOES NOT AGREE WITH MAP

When Monitored: With the engine running and no MAP Sensor or TP Sensor DTC's set.

Set Condition: When the manifold vacuum is low, the TP sensor signal should be high. Conversely, when manifold vacuum is high, the TP sensor signal should be low. If the MAP Sensor and TP Sensor do not respond within 4 seconds as stated above, a DTC will be set.

POSSIBLE CAUSES
INTERMITTENT CONDITION
HIGH RESISTANCE IN 5 VOLT SUPPLY CIRCUIT
RESISTANCE TO GROUND IN 5 VOLT SUPPLY CIRCUIT
MAP SENSOR
HIGH RESISTANCE IN MAP SENSOR SIGNAL CIRCUIT
RESISTANCE TO GROUND IN MAP SENSOR SIGNAL CIRCUIT
HIGH RESISTANCE IN SENSOR GROUND CIRCUIT
PCM
HIGH RESISTANCE IN 5 VOLT SUPPLY CIRCUIT
RESISTANCE TO GROUND IN 5 VOLT SUPPLY CIRCUIT
TP SENSOR
HIGH RESISTANCE IN TP SENSOR SIGNAL CIRCUIT
RESISTANCE TO GROUND IN THROTTLE POSITION SENSOR SIGNAL CIRCUIT
HIGH RESISTANCE IN SENSOR GROUND CIRCUIT
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose any TP Sensor or MAP Sensor component DTC first before continuing.** **NOTE: If the P0500 - No Vehicle Speed Signal is set long with this DTC, refer to the P0500 diagnostics before continuing.** **NOTE: The throttle plate and linkage should be free from binding and carbon build up.** **NOTE: Ensure the throttle plate is at the idle position.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 18	All

P0121-TPS VOLTAGE DOES NOT AGREE WITH MAP — Continued

TEST	ACTION	APPLICABILITY
2	Start the engine. With the DRBIII®, monitor the MAP Sensor voltage. Snap the throttle. Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts wide open throttle? Yes → Go To 3 No → Go To 11	All
3	Turn the ignition on. With the DRBIII®, monitor the TP Sensor voltage while slowly depressing the throttle pedal from the idle position to the wide open throttle position. Does voltage start approximately at 0.8 volts and go above 3.5 volts with a smooth voltage change? Yes → Go To 18 No → Go To 4	All
4	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit from the TP Sensor harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the 5 Volt Supply circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit from the TP Sensor harness connector to ground. Is the resistance above 100k ohms? Yes → Go To 6 No → Repair the 5 Volt Supply circuit for low resistance to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Disconnect the TP Sensor harness connector. With the DRBIII®, monitor the TP Sensor voltage. Turn the ignition on. Connect a jumper wire between the TP Sensor Signal circuit and the Sensor ground circuit . Does the DRBIII® display TP voltage from approximately 4.9 volts to below 0.5 volt? Yes → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All

P0121-TPS VOLTAGE DOES NOT AGREE WITH MAP — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the TP Sensor Signal circuit from the TP Sensor harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the Throttle Position Sensor Signal circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the TP Sensor Signal circuit from the TP Sensor harness connector to ground. Is the resistance above 100k ohms? Yes → Go To 9 No → Repair the TP Sensor Signal circuit for low resistance to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor ground circuit from the TP Sensor harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the Sensor Ground circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
11	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit from the MAP Sensor harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Repair the 5 Volt Supply circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0121-TPS VOLTAGE DOES NOT AGREE WITH MAP — Continued

TEST	ACTION	APPLICABILITY
12	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit from the MAP Sensor harness connector to ground. Is the resistance above 100k ohms? Yes → Go To 13 No → Repair the 5 Volt Supply circuit for low resistance to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
13	Turn the ignition off. Disconnect the MAP Sensor harness connector. With the DRBIII®, monitor the MAP Sensor voltage. Turn the ignition on. Connect a jumper wire between the MAP Sensor Signal circuit and the Sensor ground circuit . Cycle the ignition switch off and then on again. With the DRBIII®, monitor the MAP Sensor voltage. Does the DRBIII® display MAP voltage from approximately 4.9 volts to below 0.5 volt? Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 14	All
14	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the MAP Sensor Signal circuit from the MAP Sensor harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 15 No → Repair the MAP Sensor Signal circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
15	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the MAP Sensor Signal circuit from the MAP Sensor harness connector to ground. Is the resistance above 100k ohms? Yes → Go To 16 No → Repair the MAP Sensor Signal circuit for low resistance to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0121-TPS VOLTAGE DOES NOT AGREE WITH MAP — Continued

TEST	ACTION	APPLICABILITY
16	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor ground circuit from the MAP Sensor harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 17 No → Repair the Sensor Ground circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
17	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
18	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0122-THROTTLE POSITION SENSOR VOLTAGE LOW

When Monitored and Set Condition:

P0122-THROTTLE POSITION SENSOR VOLTAGE LOW

When Monitored: With the ignition on. Battery voltage greater than 10 volts.

Set Condition: Throttle Position Sensor voltage at the PCM is less than 0.16volt for 0.7 seconds.

POSSIBLE CAUSES
THROTTLE POSITION SENSOR SWEEP
INTERMITTENT CONDITION
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
TP SENSOR INTERNAL FAILURE
THROTTLE POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
THROTTLE POSITION SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
TCM INTERNALLY SHORTED TP SIGNAL CIRCUIT
PCM 5 VOLT SUPPLY CIRCUIT
PCM TP SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the Throttle Position Sensor voltage. Is the voltage below 0.16 volts? Yes → Go To 2 No → Go To 11	All
2	Turn the ignition off. Disconnect the TP Sensor harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the TP Sensor harness connector. Is the voltage between 4.5 to 5.2 volts? Yes → Go To 3 No → Go To 8	All

P0122-THROTTLE POSITION SENSOR VOLTAGE LOW — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the TP Sensor harness connector. With the DRBIII®, monitor the TP Sensor voltage. Turn the ignition on. Is the voltage above 4.5 volts? Yes → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the TP Sensor Signal circuit in the TP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the Throttle Position Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the TP Sensor Signal circuit and the Sensor ground circuit in the TP Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the Throttle Position Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the TCM harness connector. With the DRBIII®, monitor the TP Sensor voltage. Turn the ignition on. Is the voltage above 4.5 volts? Yes → Replace the Transmission Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0122-THROTTLE POSITION SENSOR VOLTAGE LOW — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit in the TP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 9	All
9	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit between the TP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the 5 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
11	Turn the ignition on. With the DRBIII®, monitor the Throttle Position Sensor voltage. Slowly open the throttle from the idle position to the wide open throttle position. Does voltage start at approximately 0.8 volts and go above 3.5 volts with a smooth voltage change? Yes → Go To 12 No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0122-THROTTLE POSITION SENSOR VOLTAGE LOW — Continued

TEST	ACTION	APPLICABILITY
12	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0123-THROTTLE POSITION SENSOR VOLTAGE HIGH

When Monitored and Set Condition:

P0123-THROTTLE POSITION SENSOR VOLTAGE HIGH

When Monitored: With the ignition on. Battery voltage greater than 10 volts.

Set Condition: Throttle Position Sensor voltage at the PCM is greater than 4.5 volts for 0.7 seconds.

POSSIBLE CAUSES
THROTTLE POSITION SENSOR SWEEP
INTERMITTENT CONDITION
TP SENSOR SIGNAL CIRCUIT SHORTED TO 5 VOLT SUPPLY CIRCUIT
TP SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
TP SENSOR INTERNAL FAILURE
SENSOR GROUND CIRCUIT OPEN
TP SENSOR SIGNAL CIRCUIT OPEN
PCM TERMINAL CONDITION
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the throttle is fully closed and free from binding or carbon build up.** Start the engine. With the DRBIII®, read the TP Sensor voltage. Is the voltage above 4.5 volts. Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the TP Sensor Signal circuit and the 5 Volt Supply circuit in the TP Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the Throttle Position Sensor Signal circuit for a short to the 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P0123-THROTTLE POSITION SENSOR VOLTAGE HIGH — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the TP Sensor harness connector. Turn the ignition on. Measure the voltage of the TP Sensor Signal circuit in the TP Sensor harness connector. Is the voltage above 5.2 volts? Yes → Repair the Throttle Position Sensor Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the TP Sensor harness connector. Connect a jumper wire between the TP Sensor Signal circuit and the Sensor ground circuit. With the DRBIII®, monitor the TP Sensor voltage. Turn the ignition on. Is the voltage below 0.5 volts? Yes → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor ground circuit between the TP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Disconnect the TP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the TP Sensor Signal circuit between the TP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Throttle Position Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Turn the ignition off. Disconnect the PCM harness connector. Inspect the TP sensor Signal and the Sensor Ground terminal on both the PCM connectors. Check for corrosion, damage or terminal push out. Were any of the above condition present? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0123-THROTTLE POSITION SENSOR VOLTAGE HIGH — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition on. With the DRBIII®, monitor the Throttle Position Sensor voltage. Slowly open the throttle from the idle position to the wide open throttle position. Does voltage start at approximately 0.8 volts and go above 3.5 volts with a smooth voltage change? Yes → Go To 9 No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0125-CLOSED LOOP TEMP NOT REACHED

When Monitored and Set Condition:

P0125-CLOSED LOOP TEMP NOT REACHED

When Monitored: With battery voltage greater than 10.4 volts, after engine is started. No ECT Sensor Fault present.

Set Condition: The engine temperature does not go above 45°F (7°C). F Time dependants on start-up coolant temperature and ambient temperature. (i.e. 2 minutes for a start temp of 10°C (50°F) or up to 10 mintues for a vehicle with a start-up temp of -28°C (20°F). Two trips are required to set this DTC.

POSSIBLE CAUSES
LOW COOLANT LEVEL
THERMOSTAT OPERATION
ENGINE COOLANT TEMPERATURE SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: If a Engine Coolant Temperature (ECT) DTC is set along with this code, diagnose the ECT DTC first.** **NOTE: Inspect the ECT terminals and related PCM terminals. Ensure the terminals are free from corrosion and damage.** **NOTE: The best way to diagnose this DTC is to allow the vehicle to sit overnight outside in order to have a totally cold soaked engine.** **Note: Extremely cold outside ambient temperatures may have caused this DTC to set.** **WARNING: Never open the cooling system when the engine is hot. The system is under pressure. Extreme burns or scalding may result. Allow the engine to cool before opening the cooling system.** Check the coolant system to make sure that the coolant is in good condition and at the proper level. Is the coolant level and condition OK? Yes → Go To 2 No → Inspect the vehicle for a coolant leak and add the necessary amount of coolant. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0125-CLOSED LOOP TEMP NOT REACHED — Continued

TEST	ACTION	APPLICABILITY
2	**Note: This test works best if performed on a cold engine (cold soak)** Turn the ignition on. With the DRBIII®, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. **Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached.** Start the Engine. During engine warm-up monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82°C (180°F) . Also monitor the actual coolant temperature with a thermometer. **NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the Eng Coolant Tmp Deg in the DRB values should stay relatively close to each other.** Using the appropriate service information, determine the proper opening temperature of the thermostat. Did the thermostat open at the proper temperature? Yes → Go To 3 No → Replace the thermostat. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
3	Turn the ignition on. With the DRBIII®, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. **Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached.** Start the Engine. During engine warm-up monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82°C (180°F) . Also monitor the actual coolant temperature with a thermometer. **NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the Eng Coolant Tmp Deg in the DRB values should stay relatively close to each other.** Does the actual coolant temperature and the reading on the DRBIII® remain relatively the same with a Yes → Test Complete. No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom List:

P0131-1/1 O2 SENSOR SHORTED TO GROUND
P0137-1/2 O2 SENSOR SHORTED TO GROUND
P0151-2/1 O2 SENSOR SHORTED TO GROUND
P0157-2/2 O2 SENSOR SHORTED TO GROUND

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0131-1/1 O2 SENSOR SHORTED TO GROUND.

When Monitored and Set Condition:

P0131-1/1 O2 SENSOR SHORTED TO GROUND

When Monitored: At a cold start, engine coolant below 36°C (98°F), ambient/battery sensor reading within 6.6°C (20°F), and engine coolant temperature above 71°C (160°F) on the previous key off.

Set Condition: The oxygen sensor signal voltage is below 0.059 volts for 3 seconds after starting engine.

P0137-1/2 O2 SENSOR SHORTED TO GROUND

When Monitored: At a cold start, engine coolant below 36°C (98°F), ambient/battery sensor reading within 6.6°C (20°F), and engine coolant temperature above 71°C (160°F) on the previous key off.

Set Condition: The oxygen sensor signal voltage is below 0.059 volts for 3 seconds after starting engine.

P0151-2/1 O2 SENSOR SHORTED TO GROUND

When Monitored: At a cold start, engine coolant below 36°C (98°F), ambient/battery sensor reading within 6.6°C (20°F), and engine coolant temperature above 71°C (160°F) on the previous key off.

Set Condition: The oxygen sensor signal voltage is below 0.059 volts for 3 seconds after starting engine.

P0157-2/2 O2 SENSOR SHORTED TO GROUND

When Monitored: At a cold start, engine coolant below 36°C (98°F), ambient/battery sensor reading within 6.6°C (20°F), and engine coolant temperature above 71°C (160°F) on the previous key off.

Set Condition: The oxygen sensor signal voltage is below 0.059 volts for 3 seconds after starting engine.

O2 SENSOR OPERATION
O2 SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
O2 SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
O2 SENSOR SIGNAL SHORTED TO HEATER GROUND CIRCUIT
PCM

TEST	ACTION	APPLICABILITY
1	Start the engine. Allow the engine to idle. With the DRBIII®, read the O2 Sensor voltage. Is the voltage below 0.06? Yes → Go To 2 No → Go To 7	All
2	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Disconnect the O2 Sensor harness connector. With the DRBIII®, monitor the O2 Sensor voltage. Is the O2 Sensor voltage above 0.06? Yes → Replace the O2 Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the O2 Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the O2 Sensor Signal circuit in the O2 Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the O2 Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the O2 Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the O2 Sensor Signal circuit and the Sensor ground circuit in the O2 Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the O2 Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All

P0131-1/1 O2 SENSOR SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Disconnect the O2 Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the O2 Sensor Signal circuit and the Heater ground circuit in the O2 Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the O2 Sensor Signal circuit for a short to the Heater ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:

P0132-1/1 O2 SENSOR SHORTED TO VOLTAGE
P0138-1/2 O2 SENSOR SHORTED TO VOLTAGE
P0152-2/1 O2 SENSOR SHORTED TO VOLTAGE
P0158-2/2 O2 SENSOR SHORTED TO VOLTAGE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0132-1/1 O2 SENSOR SHORTED TO VOLTAGE.

When Monitored and Set Condition:

P0132-1/1 O2 SENSOR SHORTED TO VOLTAGE

When Monitored: Engine running for 119 seconds. Battery voltage greater than 10 volts. Coolant temperature above 80°C (176°F).

Set Condition: The Oxygen Sensor voltage is above 1.29 volts for 30 seconds. One trip fault.

P0138-1/2 O2 SENSOR SHORTED TO VOLTAGE

When Monitored: The engine running for 119 seconds. Battery voltage greater than 10 volts. Coolant temperature above 80°C (176°F).

Set Condition: The Oxygen Sensor voltage is above 1.29 volts for 30 seconds. Two trip fault.

P0152-2/1 O2 SENSOR SHORTED TO VOLTAGE

When Monitored: Battery voltage greater than 10 volts. Engine running for greater than 121 seconds. Coolant temperature above 80°C (176°F).

Set Condition: The Oxygen Sensor voltage is above 1.21 volts.

P0158-2/2 O2 SENSOR SHORTED TO VOLTAGE

When Monitored: With battery voltage greater than 10 volts. Engine running for more than 2 minutes. Coolant temperature above 80°C (176°F).

Set Condition: The Oxygen Sensor voltage is above 1.21 volts.

Symptom List:

P0133-1/1 O2 SENSOR SLOW RESPONSE
P0139-1/2 O2 SENSOR SLOW RESPONSE
P0153-2/1 O2 SENSOR SLOW RESPONSE
P0159-2/2 O2 SENSOR SLOW RESPONSE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0133-1/1 O2 SENSOR SLOW RESPONSE.

When Monitored and Set Condition:

P0133-1/1 O2 SENSOR SLOW RESPONSE

When Monitored: Start engine. Allow engine to idle. For 1st part of test, if limits are exceeded, test passes. If not 2nd part of test runs. Ambient Temp great than 6.6°C (44°F), Baro greater than 22.13 Hg, Battery voltage 10.5 volts, MAP greater than 11.9 and less than 18.15″ Hg, RPM greater than 1216 and less than 1984 and VSS greater 19 and less than 46 MPH.

Set Condition: The oxygen sensor signal voltage is switching from below 0.33 volts to above 0.61 volts and back fewer times than required in 60 seconds. Two trip fault.

P0139-1/2 O2 SENSOR SLOW RESPONSE

When Monitored: Start engine. Allow engine to idle. For 1st part of test, if limits are exceeded, test passes. If not 2nd part of test runs. Ambient Temp great than 6.6°C (44°F), Baro greater than 22.13 Hg, Battery voltage 10.5 volts, MAP greater than 11.9 and less than 18.15″ Hg, RPM greater than 1216 and less than 1984 and VSS greater 19 and less than 46 MPH.

Set Condition: The oxygen sensor signal voltage is has not switched below 0.33 volts to above 0.61 volts in 411 seconds of engine run. Two trip fault.

P0153-2/1 O2 SENSOR SLOW RESPONSE

When Monitored: Start engine. Allow engine to idle. For 1st part of test, if limits are exceeded, test passes. If not 2nd part of test runs. Ambient Temp great than 6.6°C (44°F), Baro greater than 22.13 Hg, Battery voltage 10.5 volts, MAP greater than 11.9 and less than 18.15″ Hg, RPM greater than 1216 and less than 1984 and VSS greater 19 and less than 46 MPH.

Set Condition: The oxygen sensor signal voltage is switching from below 0.33 volts to above 0.61 volts and back fewer times than required.

P0133-1/1 O2 SENSOR SLOW RESPONSE — Continued

P0159-2/2 O2 SENSOR SLOW RESPONSE

When Monitored: Start engine. Allow engine to idle. For 1st part of test, if limits are exceeded, test passes. If not 2nd part of test runs. Set Condition: The oxygen sensor signal voltage is switching from below 0.33 volts to above 0.61 volts and back fewer times than required.

POSSIBLE CAUSES
INTERMITTENT CONDITION
EXHAUST LEAK
O2 SENSOR SIGNAL CIRCUIT VOLTAGE DROP
O2 SENSOR GROUND CIRCUIT VOLTAGE DROP
O2 SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 6	All
2	Start the engine. Inspect the exhaust system for leak between the engine and the O2 sensors. Are there any exhaust leaks? Yes → Repair or replace the leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Perform a voltage drop test by backprobing the O2 Sensor Signal circuit at the O2 Sensor harness connector and at the PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 4 No → Repair the high resistance on the O2 Sensor Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0133-1/1 O2 SENSOR SLOW RESPONSE — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Backprobe between the O2 Sensor ground circuit at the O2 Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 5 No → Repair the high resistance on the O2 Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	If there are no possible causes remaining, view repair. Repair Replace the O2 Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:

P0134-1/1 O2 SENSOR STAYS AT CENTER
P0140-1/2 O2 SENSOR STAYS AT CENTER
P0154-2/1 02 SENSOR STAYS AT CENTER
P0160-2/2 O2 SENSOR STAYS AT CENTER

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0134-1/1 O2 SENSOR STAYS AT CENTER.

When Monitored and Set Condition:

P0134-1/1 O2 SENSOR STAYS AT CENTER

When Monitored: Engine running for greater than 121 second. Coolant Temperature greater than 66°C (150.8°F). Engine in closed loop fuel control mode.

Set Condition: O2 signal voltage is between .35 volt and .58 volt for a total of 30 seconds and then O2 signal volt is 1.5 volts for 60 seconds. One trip fault.

P0140-1/2 O2 SENSOR STAYS AT CENTER

When Monitored: Engine running for greater than 121 second. Coolant Temperature greater than 66°C (150.8°F). Engine in closed loop fuel control mode. Vehicle Speed greater than 40 MPH.

Set Condition: O2 signal voltage is between .35 volt and .58 volt for a total of 30 seconds and then O2 signal volt is 1.5 volts for 60 seconds. Two trip fault.

P0154-2/1 02 SENSOR STAYS AT CENTER

When Monitored: Engine running for greater than 121 second. Coolant Temperature greater than 66°C (150.8°F). Engine in closed loop fuel control mode.

Set Condition: O2 signal voltage is between .35 volt and .58 volt for a total of 30 seconds and then O2 signal volt is 1.5 volts for 60 seconds. One trip fault.

P0160-2/2 O2 SENSOR STAYS AT CENTER

When Monitored: Engine running for greater than 121 second. Coolant Temperature greater than 66°C (150.8°F). Engine in closed loop fuel control mode.

Set Condition: O2 signal voltage is between .35 volt and .58 volt for a total of 30 seconds and then O2 signal volt is 1.5 volts for 60 seconds. Two trip fault.

PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the O2 Sensor harness connector. Turn the ignition on. Connect a test light to battery voltage, probe the O2 Sensor Signal circuit in the O2 Sensor harness connector. With the DRBIII®, read the O2 Sensor voltage. Is the voltage above 1.0 volts? Yes → Replace the O2 Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the O2 Sensor harness connector Disconnect the PCM harness connector. Measure the resistance of the O2 Sensor ground circuit between the O2 Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the O2 Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Disconnect the O2 Sensor harness connector Disconnect the PCM harness connector. Measure the resistance of the O2 Sensor Signal circuit between the O2 Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the O2 Sensor Signal for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0134-1/1 O2 SENSOR STAYS AT CENTER — Continued

TEST	ACTION	APPLICABILITY
5	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Perform a voltage drop test by back probing between the O2 Sensor ground circuit at the O2 Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 6 No → Repair the high resistance on the O2 Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Perform a voltage drop test by back probing between the O2 Sensor Signal circuit at the O2 Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 7 No → Repair the high resistance on the O2 Sensor Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0135-1/1 O2 SENSOR HEATER FAILURE (4 CYLINDER)

When Monitored and Set Condition:

P0135-1/1 O2 SENSOR HEATER FAILURE (4 CYLINDER)

When Monitored: During vehicle shutdown after vehicle had been driven greater than 10 miles with throttle open for a minimum of 3 minutes. Battery voltage greater than 11.0 volts.

Set Condition: O2 sensor voltage continues to rise (instead of fall) after the diagnostics has turned the ASD relay back on. Two trip fault.

POSSIBLE CAUSES
O2 HEATER ELEMENT
O2 SENSOR HEATER CONTROL CIRCUIT OPEN
O2 SENSOR HEATER CONTROL CIRCUIT SHORTED TO GROUND
ASD RELAY OUTPUT CIRCUIT OPEN
INTERMITTENT CONDITION
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip display and equal to zero? Yes → Go To 3 No → Go To 2	All
2	Turn the ignition off. **NOTE: Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize between 0.4 to 0.6 volts.** Turn the ignition on. With the DRBIII®, actuate the O2 Heater Test. With the DRBIII®, monitor O2 Sensor voltage for at least 2 minutes. Does the voltage stay between 0.4 and 0.6 Yes → Go To 3 No → Go To 8	All

P0135-1/1 O2 SENSOR HEATER FAILURE (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Allow the O2 sensor to cool down to room temperature.** Turn the ignition off. Disconnect the O2 Sensor harness connector. Measure the resistance across the O2 Sensor Heater element component side. Is the resistance between 2.0 and 7.0 ohms? Yes → Go To 4 No → Replace the O2 Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Disconnect the O2 Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the O2 Sensor Heater Control circuit between the O2 Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the O2 Sensor Heater Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the O2 Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the O2 Sensor Heater Control circuit in the O2 Sensor harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the O2 Sensor Heater Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the O2 Sensor harness connector. With the DRBIII®, actuate the O2 Heater Test. Measure the voltage of the ASD Relay Output circuit in the O2 Sensor harness connector. Is the voltage above 11.0 volts? Yes → Go To 7 No → Repair the ASD Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom List:
P0171-1/1 FUEL SYSTEM LEAN
P0174-2/1 FUEL SYSTEM LEAN

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0171-1/1 FUEL SYSTEM LEAN.

When Monitored and Set Condition:

P0171-1/1 FUEL SYSTEM LEAN

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above 20 deg. F and altitude below 8000 ft.

Set Condition: If the PCM multiplies short term compensation by long term adaptive and a certain percentage is exceeded for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

P0174-2/1 FUEL SYSTEM LEAN

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above 20 deg. F and altitude below 8000 ft.

Set Condition: If the PCM multiplies short term compensation by long term adaptive and a certain percentage is exceeded for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

POSSIBLE CAUSES
INTERMITTENT CONDITION
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
O2 SENSOR
O2 SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
O2 SENSOR HEATER OPERATION
THROTTLE POSITION SENSOR VOLTAGE GREATER THAN 0.92 VOLTS WITH THROTTLE CLOSED
THROTTLE POSITION SENSOR SWEEP
MAP SENSOR OPERATION
ECT SENSOR OPERATION
ENGINE MECHANICAL PROBLEM
FUEL FILTER/PRESSURE REGULATOR (HIGH)
PCM

P0171-1/1 FUEL SYSTEM LEAN — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 16	All
2	**Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Install a fuel pressure gauge to the fuel rail. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Turn the ignition off. Choose a conclusion that best matches your fuel pressure reading. Within Specification Go To 3 Above Specification Replace the fuel filter/pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 5. Below Specification Go To 13 **Caution: Stop All Actuations.**	All
3	Turn the ignition on With the DRBIII®, read the O2 Sensor voltage. Is the voltage between 0.4 to 0.6 volts? Yes → Go To 4 No → Go To 10	All
4	Turn the ignition off. **NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize between 0.4 to 0.6 volts.** Turn the ignition on. With the DRBIII®, actuate the O2 Heater Test. With the DRBIII®, monitor O2 Sensor voltage for at least 2 minutes. Does the voltage stay between 0.4 and 0.6 volts. Yes → Replace the O2 Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All

P0171-1/1 FUEL SYSTEM LEAN — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition on. With the DRBIII®, read TP Sensor voltage. **NOTE: The throttle must be against the stop.** Is the voltage 0.92 or less with the Throttle closed? Yes → Go To 6 No → Check for a binding throttle condition. If OK, replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition on. With the DRBIII®, read the TP Sensor voltage. While monitoring the DRBIII®, slowly open and close the throttle. Does the voltage increase and decease smoothly? Yes → Go To 7 No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Turn the ignition off. Connect a Vacuum Gauge to a Manifold Vacuum source. Start the engine. Allow the engine to idle. **Note: If engine will not idle, maintain a constant RPM above idle.** With the DRBIII® in Sensors, read the MAP Sensor vacuum value. Is the DRBIII® reading within 1″ of the Vacuum Gauge reading? Yes → Go To 8 No → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	**Note: For this test to be valid, the thermostat must be operating correctly.** **Note: This test works best if performed on a cold engine (cold soak)** Turn the ignition on. With the DRBIII®, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. **Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached.** Start the Engine. During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82°C (180°F). The value should reach at least 82°C (180°F). Did the Engine Coolant Temperature value increase a smooth transition and did it reach at least 82°C Yes → Go To 9 No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0171-1/1 FUEL SYSTEM LEAN — Continued

TEST	ACTION	APPLICABILITY
9	Check for any of the following conditions/mechanical problems. AIR INDUCTION SYSTEM - must be free from leaks. ENGINE VACUUM - must be at least 13 inches in neutral ENGINE VALVE TIMING - must be within specifications ENGINE COMPRESSION - must be within specifications ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks. ENGINE PCV SYSTEM - must flow freely TORQUE CONVERTER STALL SPEED - must be within specifications POWER BRAKE BOOSTER - no internal vacuum leaks FUEL - must be free of contamination FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector Are there any engine mechanical problems? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
10	Turn the ignition on. Disconnect the O2 Sensor harness connector. With the DRBIII®, monitor the O2 Sensor voltage. Is the O2 Sensor voltage between 0.40 to 0.60 volts? Yes → Replace the O2 Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 11	All
11	Turn the ignition off. Disconnect the O2 Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the O2 Sensor Signal circuit in the PCM harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the O2 Sensor Signal for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 12	All
12	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0171-1/1 FUEL SYSTEM LEAN — Continued

TEST	ACTION	APPLICABILITY
13	Turn the ignition off. **Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16 fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module. Attach a fuel pressure test gauge to the T fitting on tool #6539. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Is the fuel pressure within specification? Yes → Repair or replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 14 **Caution: Stop All Actuations.**	All
14	Turn the ignition off. **Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose,fitting or line, the fuel system pressure must be released.** Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer. Is the Fuel Inlet Strainer plugged? Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 15	All
15	If there are no possible causes remaining, view repair. Repair Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0171-1/1 FUEL SYSTEM LEAN — Continued

TEST	ACTION	APPLICABILITY
16	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:
P0172-1/1 FUEL SYSTEM RICH
P0175-2/1 FUEL SYSTEM RICH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0172-1/1 FUEL SYSTEM RICH.

When Monitored and Set Condition:

P0172-1/1 FUEL SYSTEM RICH

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above 20 deg. F and altitude below 8000 ft.

Set Condition: If the PCM multiplies short term compensation by long term adaptive and the result is below a certain value for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

P0175-2/1 FUEL SYSTEM RICH

When Monitored: With the engine running in closed loop mode, the ambient/battery temperature above 20 deg. F and altitude below 8000 ft.

Set Condition: If the PCM multiplies short term compensation by long term adaptive and the result is below a certain value for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored.

TEST	ACTION	APPLICABILITY
9	**Note: For this test to be valid, the thermostat must be operating correctly.** **Note: This test works best if performed on a cold engine (cold soak)** Turn the ignition on. With the DRBIII®, read the Engine Coolant Temperature Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. **Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached.** Start the Engine. During engine warm-up, monitor the Engine Coolant Temperature value. The temp value change should be a smooth transition from start up to normal operating temp 82°C (180°F). The value should reach at least 82°C (180°F). Did the Engine Coolant Temperature value increase a smooth transition and did it reach at least 82°C Yes → Go To 10 No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	Check for any of the following conditions/mechanical problems. AIR INDUCTION SYSTEM - must be free from restrictions. ENGINE VACUUM - must be at least 13 inches in neutral ENGINE VALVE TIMING - must be within specifications ENGINE COMPRESSION - must be within specifications ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks. ENGINE PCV SYSTEM - must flow freely TORQUE CONVERTER STALL SPEED - must be within specifications POWER BRAKE BOOSTER - no internal vacuum leaks FUEL - must be free of contamination FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector Are there any engine mechanical problems? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
11	Turn the ignition on. Disconnect the O2 Sensor harness connector. With the DRBIII®, monitor the O2 Sensor voltage. Is the O2 Sensor voltage between 0.4 to 0.6 volts? Yes → Replace the O2 Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 12	All
12	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the O2 Sensor harness connector. Measure the resistance of the O2 Sensor Signal circuit between the PCM harness connector and the O2 Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 13 No → Check for O2 Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0172-1/1 FUEL SYSTEM RICH — Continued

TEST	ACTION	APPLICABILITY
13	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition off. Disconnect the O2 Sensor harness connector. Start the engine. Measure the voltage of the O2 Sensor Signal circuit in the O2 Sensor harness connector. Is the voltage above 0.60 volt? Yes → Repair the O2 Sensor Signal for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 14	All
14	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
15	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:

P0201-INJECTOR #1 CONTROL CIRCUIT (4 CYLINDER)
P0202-INJECTOR #2 CONTROL CIRCUIT (4 CYLINDER)
P0203-INJECTOR #3 CONTROL CIRCUIT (4 CYLINDER)
P0204-INJECTOR #4 CONTROL CIRCUIT (4 CYLINDER)

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0201-INJECTOR #1 CONTROL CIRCUIT (4 CYLINDER).

When Monitored and Set Condition:

P0201-INJECTOR #1 CONTROL CIRCUIT (4 CYLINDER)

When Monitored: With battery voltage greater than 12 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off.

P0202-INJECTOR #2 CONTROL CIRCUIT (4 CYLINDER)

When Monitored: With battery voltage greater than 12 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off.

P0203-INJECTOR #3 CONTROL CIRCUIT (4 CYLINDER)

When Monitored: With battery voltage greater than 12 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive is detected after injector turn off.

P0204-INJECTOR #4 CONTROL CIRCUIT (4 CYLINDER)

When Monitored: With battery voltage greater than 12 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

Set Condition: No inductive spike is detected after injector turn off, and with no other injectors on.

POSSIBLE CAUSES
ASD RELAY OUTPUT CIRCUIT OPEN
INTERMITTENT CONDITION
FUEL INJECTOR
FUEL INJECTOR DRIVER CIRCUIT OPEN
FUEL INJECTOR DRIVER CIRCUIT SHORTED TO GROUND
PCM

P0201-INJECTOR #1 CONTROL CIRCUIT (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Record the Freeze Frame Information that set along with the DTC.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Fuel Injector harness connector. Measure the resistance of the Fuel Injector (component side). Is the resistance between 10 and 16 ohms? Yes → Go To 3 No → Replace the Fuel Injector. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
3	Turn the ignition off. Disconnect the Fuel Injector harness connector. Remove the ASD Relay from the PDC. Using a 12-volt test light connected to ground, probe the ASD Relay Output circuit. Does the test light flash brightly? Yes → Go To 4 No → Repair the ASD Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Disconnect the Fuel Injector harness connector. Disconnect the PCM harness connector. Measure the resistance of the Fuel Injector driver circuit between the Fuel Injector harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Fuel Injector driver circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the Fuel Injector harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the Fuel Injector driver circuit in the Fuel Injector harness connector. Is the resistance below 100k ohms? Yes → Repair the Fuel Injector driver circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:

P0300-MULTIPLE CYLINDER MIS-FIRE
P0301-CYLINDER #1 MISFIRE
P0302-CYLINDER #2 MISFIRE
P0303-CYLINDER #3 MISFIRE
P0304-CYLINDER #4 MISFIRE
P0305-CYLINDER #5 MISFIRE
P0306-CYLINDER #6 MISFIRE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0300-MULTIPLE CYLINDER MIS-FIRE.

When Monitored and Set Condition:

P0300-MULTIPLE CYLINDER MIS-FIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (2.5% LEV) misfire rate is measured during two trips. Above 3000 RPM 1 trip less than 3000 RPM 2 trip.

P0301-CYLINDER #1 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (2.5% LEV) misfire rate is measured during two trips, or with a 10% to 30% misfire rate during one trip.

P0302-CYLINDER #2 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (2.5% LEV) misfire rate is measured during two trips, or with a 10% to 30% misfire rate during one trip.

P0303-CYLINDER #3 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (2.5% LEV) misfire rate is measured during two trips, or with a 10% to 30% misfire rate during one trip.

P0304-CYLINDER #4 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (2.5% LEV) misfire rate is measured during two trips, or with a 10% to 30% misfire rate during one trip.

P0300-MULTIPLE CYLINDER MIS-FIRE — Continued

P0305-CYLINDER #5 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (2.5% LEV) misfire rate is measured during two trips, or with a 10% to 30% misfire rate during one trip.

P0306-CYLINDER #6 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (2.5 LEV) misfire rate is measured during two trips, or with a 10% to 30% misfire rate during one trip.

POSSIBLE CAUSES
MIS-FIRE CONDITIONS NO LONGER EXIST
FUEL SYSTEM PROBLEM
SECONDARY IGNITION OR MECHANICAL PROBLEM
ERRATIC CAM/CRANK SENSOR SIGNALS
ENGINE MECHANICAL PROBLEM
OTHER POSSIBLE CAUSES FOR MIS-FIRE

TEST	ACTION	APPLICABILITY
1	**Note: Repair all other PCM DTC's before continuing with this test.** With the DRBIII®, read DTC's. Is the MIS-FIRE GOOD TRIP counter displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	At this time the conditions that set the Misfire DTC are present. With the DRBIII®, select DTC's and RELATED FUNCTIONS. Read and record the FREEZE FRAME DATA. Select OBD II MONITORS. Read and record the MIS-FIRE SIMILAR CONDITIONS WINDOW DATA. With these screens, attempt to duplicate the condition(s) that has set this DTC. When the vehicle is operating in the SIMILAR CONDITIONS WINDOW, refer to the WHICH CYLINDER IS MISFIRING screen. Observe the WHICH CYLINDER IS MISFIRING screen for at least one minute. Is the DRBIII® counting mis-fires at this time? Yes → Go To 3 No → Go To 8	All

P0300-MULTIPLE CYLINDER MIS-FIRE — Continued

TEST	ACTION	APPLICABILITY
3	Start the engine and allow the engine to idle. With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME, are the adaptive fuel percentages greater than +/- 15%? Yes → Refer to the Driveablitiy Category and perform the Checking Fuel Delivery symptom. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME DATA, is the LOAD VALUE over 50% and the operating temp normal? Yes → Check secondary ignition, compression, and cylinder leakage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME DATA, is the engine RPM over 3000 and the operating temp normal? Yes → Test CMP and CKP signals with Lab Scope, check valve timing, and perform running vacuum test. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Check for any of the following conditions/mechanical problems. ENGINE VACUUM - must be at least 13 inches in neutral ENGINE VALVE TIMING - must be within specifications ENGINE COMPRESSION - must be within specifications ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks. ENGINE PCV SYSTEM - must flow freely TORQUE CONVERTER STALL SPEED - must be within specifications POWER BRAKE BOOSTER - no internal vacuum leaks FUEL - must be free of contamination FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector Are there any engine mechanical problems? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All

P0300-MULTIPLE CYLINDER MIS-FIRE — Continued

TEST	ACTION	APPLICABILITY
7	**Note: Anything that affects the speed of the crankshaft can cause a misfire DTC.** The following are other possible causes for mis-fire: Injector harness connectors, secondary ignition problem, mechanical engine problem, PCM power grounds, irregular cam and crank signal, plugged injectors, restricted exhaust, intake restriction, damaged trigger wheel, contaminated fuel, or vacuum leak. Weak valve springs, carbon deposits on valves, or accessory drive belt (serpentine belt). Check for any TSB's that may relate to a Misfire DTC. Do any of the above causes exist? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
8	At this time the mis-fire does not exist or is an intermittent problem. **Note: An intermittent problem may have been caused by moisture in the secondary ignition.** With the DRBIII®, select DTC's AND RELATED FUNCTIONS. Read and record the FREEZE FRAME DATA. Select OBD II MONITORS. Read and record MIS-FIRE SIMILAR CONDITIONS WINDOW DATA. With these screens, attempt to duplicate the condition that has set the Misfire DTC. While using FREEZE FRAME DATA, pay particular attention to the DTC setting conditions, such as speed, temp, load, and map vacuum. Does the mis-fire reoccur? Yes → Go To 9 No → Mis-fire DTC conditions no longer exist. Refer to any TSB's that may relate to the symptom. Operate the vehicle for 2 misfire good trip and erase DTC's. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	Start the engine and allow the engine to idle. With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME, are the adaptive fuel percentages greater than +/- 15%? Yes → Refer to the Driveablitiy Category and perform the Checking Fuel Delivery symptom. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 10	All
10	With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME DATA, is the LOAD VALUE over 50% and the operating temp normal? Yes → Check secondary ignition, compression, and cylinder leakage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 11	All

P0300-MULTIPLE CYLINDER MIS-FIRE — Continued

TEST	ACTION	APPLICABILITY
11	With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME DATA, is the engine RPM over 3000 and the operating temp normal? Yes → Test CMP and CKP signals with Lab Scope, check valve timing, and perform running vacuum test. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 12	All
12	Check for any of the following conditions/mechanical problems. ENGINE VACUUM - must be at least 13 inches in neutral ENGINE VALVE TIMING - must be within specifications ENGINE COMPRESSION - must be within specifications ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks. ENGINE PCV SYSTEM - must flow freely TORQUE CONVERTER STALL SPEED - must be within specifications POWER BRAKE BOOSTER - no internal vacuum leaks FUEL - must be free of contamination FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector Are there any engine mechanical problems? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0320-NO CRANK REFERENCE SIGNAL AT PCM

When Monitored and Set Condition:

P0320-NO CRANK REFERENCE SIGNAL AT PCM

When Monitored: Engine cranking.

Set Condition: No CKP signal is present during engine cranking, and at least 8 camshaft position sensor signals have occurred.

POSSIBLE CAUSES
INTERMITTENT CKP SIGNAL
INTERMITTENT CMP SIGNAL
INTERMITTENT WIRING
INTERMITTENT CONDITION
8 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
8 VOLT SUPPLY CIRCUIT OPEN
8 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED GROUND
CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN
CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
CRANKSHAFT POSITION SENSOR SIGNAL SHORTED TO 8 VOLT SUPPLY CIRCUIT
SENSOR GROUND CIRCUIT OPEN
PCM - 8 VOLT SUPPLY
PCM - CRANKSHAFT POSITION SENSOR SIGNAL
CRANKSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the Current Crankshaft Position (CKP) Sensor State while cranking the engine. Does the DRBIII® display Current CKP State Present while cranking the engine? Yes → Go To 2 No → Go To 6	All

P0320-NO CRANK REFERENCE SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CKP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition on. (do not start or crank the engine) Observe the lab scope screen. Look for any pulses generated by the CKP Sensor. Did the CKP Sensor generate any pulses? Yes → Replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, back probe the Camshaft Position (CMP) Sensor Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition on. (do not start or crank the engine) Observe the lab scope screen. Look for any pulses generated by the CMP Sensor. Did the CMP Sensor generate any pulses? Yes → Replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CKP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Observe the lab scope screen while wiggling the wiring harness and connectors. Were there any irregularities in the lab scope pattern? Yes → Check the harness connectors carefully. If OK, replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All

P0320-NO CRANK REFERENCE SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
5	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
6	Turn the ignition off. Disconnect the CKP Sensor harness connector. Turn the ignition on. Measure the voltage of the 8 Volt Supply circuit in the CKP Sensor harness connector. Is the voltage between 7.5 and 8.5 volts? Yes → Go To 7 No → Go To 15	All
7	Turn the ignition off. Disconnect the CKP Sensor harness connector. Turn the ignition on. Measure the voltage of the CKP Sensor Signal circuit in the CKP Sensor harness connector. Is the voltage between 4.5 and 5.0 volts? Yes → Go To 8 No → Go To 10	All
8	Turn the ignition off. Disconnect the CKP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor Ground circuit between the CKP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the Sensor Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	**NOTE: Inspect the slots on the flywheel for damage. If a problem is found repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0320-NO CRANK REFERENCE SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
10	Turn the ignition off. Disconnect the CKP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the CKP Sensor Signal circuit in the CKP Sensor harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the CKP Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 11	All
11	Turn the ignition off. Disconnect the CKP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the CKP Sensor Signal circuit between the CKP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Repair the CKP Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
12	Turn the ignition off. Disconnect the CKP Sensor harness connector. Turn the ignition on. Measure the voltage of the CKP Sensor Signal circuit in the CKP Sensor harness connector. Is the voltage above 5.0 volts? Yes → Repair the CKP Sensor Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 13	All
13	Turn the ignition off. Disconnect the CKP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the CKP Sensor Signal circuit and the 8 Volt Supply circuit in the CKP Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Repair the CKP Sensor Signal circuit shorted to the 8 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 14	All
14	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0320-NO CRANK REFERENCE SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
15	Turn the ignition off. Disconnect the CKP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 8 Volt Supply circuit in the CKP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the 8 Volt Supply circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 16	All
16	Turn the ignition off. Disconnect the CKP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 8 Volt Supply circuit between the CKP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 17 No → Repair the 8 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
17	Turn the ignition off. Disconnect the CKP Sensor harness connector. Turn the ignition on. Measure the voltage of the 8 Volt Supply circuit in the CKP Sensor harness connector. Is the voltage above 8.5 volts? Yes → Repair the 8 Volt Supply circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 18	All
18	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:
P0325-KNOCK SENSOR #1 CIRCUIT

When Monitored and Set Condition:

P0325-KNOCK SENSOR #1 CIRCUIT

When Monitored: With the ignition on and the engine running.

Set Condition: The Knock Sensor circuit voltage falls below a minimum value at idle or deceleration. The minimum value is from a look-up table internal to the PCM and is based on engine rpm. DTC also sets if sensor output goes above 5.0 volts.

POSSIBLE CAUSES
INTERMITTENT CONDITION
KNOCK SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
KNOCK SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
KNOCK SENSOR SIGNAL CIRCUIT OPEN
KNOCK SENSOR SIGNAL CIRCUIT SHORTED TO KNOCK SENSOR RETURN CIRCUIT
KNOCK SENSOR RETURN CIRCUIT OPEN
KNOCK SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Record the Freeze Frame Information that set along with the DTC.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the Knock Sensor harness connector. Measure the voltage of the Knock Sensor Signal circuit in the Knock Sensor harness connector. Is the voltage above 2.0 volts? Yes → Repair the Knock Sensor Signal circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P0325-KNOCK SENSOR #1 CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Knock Sensor harness connector. Disconnect the PCM harness connector. Measure the Knock Sensor Signal circuit in the Knock Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the Knock Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the Knock Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Knock Sensor Signal circuit between the Knock Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Knock Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the Knock Sensor harness connector. Measure the resistance between the Knock Sensor Signal circuit and the Knock Sensor Return circuit in the Knock Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the Knock Sensor Signal circuit for a short to Knock Sensor Return circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the Knock Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Knock Sensor Return circuit between the Knock Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Knock Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Turn the ignition off. Replace the Knock Sensor. Turn the ignition on. With the DRBIII®, erase DTC. Attempt to operate the vehicle using the information noted in the Freeze Frame. With the DRBIII®, read DTC's. Does the DRBIII® display the DTC that was previously erased? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

P0325-KNOCK SENSOR #1 CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
8	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0340-NO CAM SIGNAL AT PCM

When Monitored and Set Condition:

P0340-NO CAM SIGNAL AT PCM

When Monitored: Engine cranking/running. Battery voltage greater than 10 volts.

Set Condition: At least 5 seconds or 2.5 engine revolutions have elapsed with crankshaft position sensor signals present but no camshaft position sensor signal.

POSSIBLE CAUSES
INTERMITTENT CRANKSHAFT POSITION SENSOR SIGNAL
INTERMITTENT CAMSHAFT POSITION SENSOR SIGNAL
INTERMITTENT WIRING
INTERMITTENT CONDITION
8 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
8 VOLT SUPPLY CIRCUIT OPEN
8 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED GROUND
CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN
CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
CAMSHAFT POSITION SENSOR SIGNAL SHORTED TO 8 VOLT SUPPLY CIRCUIT
SENSOR GROUND CIRCUIT OPEN
PCM - 8 VOLT SUPPLY
PCM - CAMSHAFT POSITION SENSOR SIGNAL
CAMSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the Current Camshaft Position (CMP) Sensor State while cranking the engine. Does the DRBIII® display Current CMP State Present while cranking the engine. Yes → Go To 2 No → Go To 6	All

P0340-NO CAM SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, back probe the Crankshaft Position (CKP) Sensor signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition on. (do not start or crank the engine) Observe the lab scope screen. Look for any pulses generated by the Crankshaft Position (CKP) Sensor. Did the CKP Sensor generate any pulses? Yes → Replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CMP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition on. (do not start or crank the engine) Observe the lab scope screen. Look for any pulses generated by the CMP Sensor. Did the CMP Sensor generate any pulses? Yes → Replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CMP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Observe the lab scope screen while wiggling the wiring harness and connectors. Were there any irregularities in the lab scope pattern? Yes → Check the harness connectors carefully. If OK, replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All

P0340-NO CAM SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
5	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
6	Turn the ignition off. Disconnect the CMP Sensor harness connector. Turn the ignition on. Measure the voltage of the 8 Volt Supply circuit in the CMP Sensor harness connector. Is the voltage between 7.5 and 8.5 volts? Yes → Go To 7 No → Go To 15	All
7	Turn the ignition off. Disconnect the CMP Sensor harness connector. Turn the ignition on. Measure the voltage of the CMP Sensor Signal circuit in the CMP Sensor harness connector. Is the voltage between 4.5 and 5.0 volts? Yes → Go To 8 No → Go To 10	All
8	Turn the ignition off. Disconnect the CMP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor Ground circuit between the CMP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the Sensor Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0340-NO CAM SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
9	**NOTE: Inspect the Camshaft sprocket for damage per the Service Information. If a problem is found repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	Turn the ignition off. Disconnect the CMP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the CMP Sensor Signal circuit in the CMP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the CMP Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 11	All
11	Turn the ignition off. Disconnect the CMP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the CMP Sensor Signal circuit between the CMP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Repair the CMP Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
12	Turn the ignition off. Disconnect the CMP Sensor harness connector. Turn the ignition on. Measure the voltage of the CMP Sensor Signal circuit in the CMP Sensor harness connector. Is the voltage above 5.0 volts? Yes → Repair the CMP Sensor Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 13	All
13	Turn the ignition off. Disconnect the CMP Sensor harness connector. Measure the resistance between the CMP Sensor Signal circuit and the 8 Volt Supply circuit in the CMP Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Repair the CMP Sensor Signal circuit shorted to the 8 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 14	All

P0340-NO CAM SIGNAL AT PCM — Continued

TEST	ACTION	APPLICABILITY
14	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
15	Turn the ignition off. Disconnect the CMP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 8 Volt Supply circuit in the CMP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the 8 Volt Supply circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 16	All
16	Turn the ignition off. Disconnect the CMP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 8 Volt Supply circuit between the CMP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 17 No → Repair the 8 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
17	Turn the ignition off. Disconnect the CMP Sensor harness connector. Turn the ignition on. Measure the voltage of the 8 Volt Supply circuit in the CMP Sensor harness connector. Is the voltage above 8.5 volts? Yes → Repair the 8 Volt Supply circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 18	All
18	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom List:
P0351-IGNITION COIL #1 PRIMARY CIRCUIT (4 CYLINDER)
P0352-IGNITION COIL #2 PRIMARY CIRCUIT (4 CYLINDER)

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0351-IGNITION COIL #1 PRIMARY CIRCUIT (4 CYLINDER).

When Monitored and Set Condition:

P0351-IGNITION COIL #1 PRIMARY CIRCUIT (4 CYLINDER)

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

P0352-IGNITION COIL #2 PRIMARY CIRCUIT (4 CYLINDER)

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

POSSIBLE CAUSES
IGNITION COIL
INTERMITTENT CONDITION
ASD RELAY OUTPUT CIRCUIT
IGNITION COIL DRIVER CIRCUIT OPEN
IGNITION COIL DRIVER CIRCUIT SHORTED TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Record the Freeze Frame Information that set along with the DTC.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All

P0351-IGNITION COIL #1 PRIMARY CIRCUIT (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Disconnect the Ignition Coil harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Using a 12 volt test light connected to ground, probe the ASD Relay Output circuit in the Ignition Coil harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the ASD Relay Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
3	Turn the ignition off. Disconnect the Ignition Coil harness connector. Using a 12-volt test light connected to 12-volts, probe the Ignition Coil Driver circuit. Crank the engine for 5 second while observing the test light. Does the test light blink/flicker? Yes → Replace the Ignition Coil. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the Ignition Coil harness connector. Disconnect the PCM harness connector. Measure the resistance of the Ignition Coil driver circuit between the Ignition Coil harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Ignition Coil driver circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the Ignition Coil harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the Ignition Coil driver circuit in the Ignition Coil harness connector. Is the resistance below 100k ohms? Yes → Repair the Ignition Coil driver circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0352-IGNITION COIL #2 PRIMARY CIRCUIT 2.7L
P0353-IGNITION COIL #3 PRIMARY CIRCUIT 2.7L
P0354-IGNITION COIL #4 PRIMARY CIRCUIT 2.7L
P0355-IGNITION COIL #5 PRIMARY CIRCUIT 2.7L
P0356-IGNITION COIL #6 PRIMARY CIRCUIT 2.7L

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0351-IGNITION COIL #1 PRIMARY CIRCUIT 2.7L.

When Monitored and Set Condition:

P0351-IGNITION COIL #1 PRIMARY CIRCUIT 2.7L

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

P0352-IGNITION COIL #2 PRIMARY CIRCUIT 2.7L

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

P0353-IGNITION COIL #3 PRIMARY CIRCUIT 2.7L

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

P0354-IGNITION COIL #4 PRIMARY CIRCUIT 2.7L

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

P0351-IGNITION COIL #1 PRIMARY CIRCUIT 2.7L — Continued

P0355-IGNITION COIL #5 PRIMARY CIRCUIT 2.7L

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

P0356-IGNITION COIL #6 PRIMARY CIRCUIT 2.7L

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 13 volts with engine running. Engine RPM less than 3000. No coil in dwell during test.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ASD RELAY OUTPUT CIRCUIT OPEN
CAPACITOR(S) SHORTED TO GROUND
ASD OUTPUT CIRCUIT SHORTED TO GROUND
IGNITION COIL DRIVER CIRCUIT OPEN
IGNITION COIL DRIVER CIRCUIT SHORTED TO GROUND
IGNITION COIL

TEST	ACTION	APPLICABILITY
1	**NOTE: Record the Freeze Frame Information that set along with the DTC.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the Ignition Coil harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Using a 12 volt test light connected to ground, probe the ASD Relay Output circuit in the Ignition Coil harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Go To 6	All

P0351-IGNITION COIL #1 PRIMARY CIRCUIT 2.7L — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Ignition Coil harness connector. Disconnect the PCM harness connector. Measure the resistance of the Ignition Coil driver circuit between the Ignition Coil harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Ignition Coil driver circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Disconnect the Ignition Coil harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the Ignition Coil driver circuit in the Ignition Coil harness connector. Is the resistance below 100k ohms? Yes → Repair the Ignition Coil driver circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	With the DRBIII®, erase DTC's. Turn the ignition off. Install a substitute Ignition Coil in place of the Ignition Coil in question. Attempt to operate the vehicle using the information noted in the Freeze Frame. With the DRBIII®, read DTC's. Does the DRB display the DTC that was previously erased? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
6	Turn the ignition off. Disconnect the Ignition Coil harness connector. Remove the ASD Relay from the PDC. Measure the resistance of the ASD Relay Output circuit between the ASD Relay connector and the Ignition Coil harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the ASD Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0351-IGNITION COIL #1 PRIMARY CIRCUIT 2.7L — Continued

TEST	ACTION	APPLICABILITY
7	**NOTE: Repeat the following test for both capacitors** **NOTE: The Capacitors are attached to the side of each valve cover.** Turn the ignition off. Disconnect the Capacitor harness connector. Install a good INJ/COIL fuse. With the DRBIII®, actuate the ASD Relay. **NOTE: If the above test result is an open fuse for both capacitor tests, the problem is a short to ground in the ASD Relay Out circuit. Repair the short to ground in the ASD Relay Output circuit and refer to VER-5** Is the INJ/COIL fuse OK for both capacitor tests? Yes → Replace the Capacitor(s) Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Repair the ASD Output circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:

P0401 - EGR SYSTEM FAILURE (4 CYLINDER)

When Monitored and Set Condition:

P0401 - EGR SYSTEM FAILURE (4 CYLINDER)

When Monitored: With the ignition on and the battery voltage greater than 10.4 volts.

Set Condition: Conditions are met, the EGR is turned off and on momentarily. The oxygen sensor signal is monitor for changes in its output signal during this test. If no significant change or too much change is seen, a flag is set.

POSSIBLE CAUSES
INTERMITTENT CONDITION
EGR SOLENOID VACUUM SUPPLY
EGR VALVE OPERATION (CLOSED)
ASD OUTPUT CIRCUIT OPEN
EGR VALVE OPERATION (OPEN)
EGR SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
EGR SOLENOID CONTROL CIRCUIT OPEN
EGR SOLENOID (CLOSED)
EGR SOLENOID CONTROL CIRCUIT SHORT TO GND
EGR SOLENOID (OPEN)
PCM
PCM (CLOSED)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 12	All
2	Start the engine. Allow the engine to reach operating temperature. Does the engine run rough or stall at idle? Yes → Go To 3 No → Go To 6	All

P0401 - EGR SYSTEM FAILURE (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the vacuum hose from the EGR Valve. Start the engine and allow it to idle. Does the engine run rough or stall at idle? Yes → Remove the EGR Valve and inspect the valve for an obstruction that would keep the valve open. If OK, replace the EGR Valve. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance of the EGR Solenoid Control circuit in the EGR Solenoid harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the EGR Solenoid Control circuirt for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Using a 12-volt test light connected to 12-volts, probe the EGR Solenoid Control circuit. Turn the ignition on. With the DRBIII®, actuate the EGR Solenoid. Observe the test light. Does the test light flash on and off? Yes → Replace the EGR Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Disconnect the EGR Solenoid vacuum supply at the EGR Solenoid. Connect a vacuum gauge to the EGR Solenoid vacuum supply. Start the engine. Observe the vacuum gauge. Does the vacuum gauge read above 10″? Yes → Go To 7 No → Repair the EGR Solenoid vacuum supply. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Disconnect the vacuum hose from the EGR Valve. Inspect the vacuum hose for any obstructions. Connect a Vacuum Pump to the EGR Valve. Using the Vacuum Pump, apply vacuum to the EGR Valve. Does the engine run rough or stall at idle? Yes → Go To 8 No → Remove the EGR Valve and inspect the valve for an obstruction that would keep the valve form opening. If OK, replace the EGR Valve. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0401 - EGR SYSTEM FAILURE (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
8	Turn the igntion off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Using a 12 volt Test Light connected to ground, probe the ASD Output circuit in the EGR Solenoid harness connector. Does the 12 volt test light illuminate? Yes → Go To 9 No → Repair the ASD Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Measure the voltage of the EGR Solenoid Control circuit in the EGR Solenoid connector. Is the voltage above 1.0 volts? Yes → Repair the EGR Solenoid Control circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 10	All
10	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance of the EGR Solenoid Control circuit between the PCM harness connector and the EGR Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Repair the EGR solenoid control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
11	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Using a 12-volt test light connected to 12-volts, probe the EGR Solenoid Control circuit in the EGR Solenoid harness connector. Turn the ignition on. With the DRBIII®, actuate the EGR Solenoid. Observe the test light. Does the test light flash on and off. Yes → Inspect the EGR Solenoid Back Pressure hose and tube for obstructions or damage. If OK, replace the EGR Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0401 - EGR SYSTEM FAILURE (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
12	**NOTE: Inspect the exhaust system for leaks.** **WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRB Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0401 - EGR SYSTEM FAILURE (6 CYLINDER)

When Monitored and Set Condition:

P0401 - EGR SYSTEM FAILURE (6 CYLINDER)

When Monitored: With the ignition on and the battery voltage greater than 10.4 volts.

Set Condition: Conditions are met, the EGR is turned off and on momentarily. The oxygen sensor signal is monitor for changes in its output signal during this test. If no significant change or too much change is seen, a flag is set.

POSSIBLE CAUSES
INTERMITTENT CONDITION
EGR VALVE OPEN AT IDLE
EGR SOLENOID CONTROL CKT SHORT TO GND
EGR SOLENOID CONTROL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
EGR VALVE ASSEMBLY INSPECTION
EGR SOLENOID ASSEMBLY
ASD RELAY OUTPUT CIRCUIT OPEN
EGR SOLENOID CONTROL CKT SHORTED TO VOLTAGE
EGR SOLENOID CONTROL CKT OPEN
PCM - EGR OPEN
PCM - EGR CLOSED

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 13	All
2	**Note: If the vehicle is running rough at idle (DRB not actuated) follow the yes path to continue.** Turn the ignition on. Turn all accessories off. Start the engine. Allow the engine to reach normal operating temperature. With the DRB, enter Engine System Test, then EGR System Test. Actuate the FLOW function in the EGR System Test. Did the engine run rough or stall? Yes → Go To 3 No → Go To 8	All

P0401 - EGR SYSTEM FAILURE (6 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the EGR Solenoid Assembly harness connector. Start engine. Attempt to allow the engine to idle. Does the engine run rough or stall? Yes → Inspect the EGR tube assembly. If OK, replace the EGR valve. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance of the EGR Solenoid Control circuit in the EGR Solenoid harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the EGR Solenoid Control circuirt for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance of the EGR Solenoid Control circuit to Sensor ground circuit at the EGR Solenoid connector. Is the resistance below 5.0 ohms? Yes → Repair the EGR Solenoid Control circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Inspect the EGR Assembly for the following. Gasket(s) for leaking Damage and/or holes in the EGR tube(s) Carbon build up on or near the EGR pintle and passage ways. Obstruction in the EGR tubes Were any problem found? Yes → Repair or replace the EGR Assembly as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0401 - EGR SYSTEM FAILURE (6 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition on. Turn all accessories off. Disconnect the EGR Solenoid harness connector. Using a 12 volt Test Light connected to the ASD Relay Output circuit, probe the EGR Solenoid Control circuit. With the DRB, actuate the EGR solenoid. Does the 12 volt test light flash on and off? Yes → Inspect the tube(s) for obstructions and damage, repair as necessary. If OK, replace the EGR Solenoid Assembly. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 9	All
9	Turn the igntion off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. With the DRB, actuate the ASD Relay. Using a 12 volt Test Light connected to ground, probe the ASD Relay Output circuit in the EGR Solenoid harness connector. Does the 12 volt test light illuminate? Yes → Go To 10 No → Repair the ASD Realy Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Measure the voltage on the EGR Solenoid Control circuit in the EGR Solenoid connector. Is the voltage above 1.0 volt? Yes → Repair the EGR solenoid control circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 11	All
11	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance of the EGR Solenoid Control circuit between the PCM harness connector and the EGR Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Repair the EGR solenoid control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
12	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0401 - EGR SYSTEM FAILURE (6 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
13	**NOTE: Closely inspect the EGR tube(s) for obstructions, damage and holes. Also, inspect the gasket(s) for leaks.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0403 - EGR SOLENOID CIRCUIT (4 CYLINDER)

When Monitored and Set Condition:

P0403 - EGR SOLENOID CIRCUIT (4 CYLINDER)

When Monitored: Engine running. Battery voltage greater than 10 volts.

Set Condition: The EGR solenoid control circuit is not in the expected state when requested to operate by the PCM.

POSSIBLE CAUSES
INTERMITTENT CONDITION
EGR SOLENOID
ASD OUTPUT CIRCUIT OPEN
EGR SOLENOID CONTROL CKT SHORTED TO VOLTAGE
EGR SOLENOID CONTROL CKT SHORT TO GND
EGR SOLENOID CONTROL CKT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Turn all accessories off. Using a 12 volt Test Light connected to the Fused Ignition Switch Output circuit, probe the EGR Solenoid Control circuit. With the DRB, actuate the EGR solenoid. Does the 12 volt test light flash on and off? Yes → Inspect the EGR Valve Back Pressure hose and tube for obstructions or damage. If OK, replace the EGR Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P0403 - EGR SOLENOID CIRCUIT (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the igntion off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Using a 12 volt Test Light connected to ground, probe the ASD Relay Output circuit in the EGR Solenoid harness connector. Does the 12 volt test light illuminate? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Measure the voltage of the EGR Solenoid Control circuit in the EGR Solenoid connector. Is the voltage above 1.0 volt. Yes → Repair the EGR Solenoid Control circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance of the EGR Solenoid Control circuit in the EGR Solenoid harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the EGR Solenoid Control circuirt for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the EGR Solenoid harness connector. Measure the resistance of the EGR Solenoid Control circuit between the PCM harness connector and the EGR Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the EGR Solenoid Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0403 - EGR SOLENOID CIRCUIT (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
8	**NOTE: Inspect the exhaust system for leaks.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. Symptom:
P0404 - EGR POSITION SENSOR RATIONALITY (6 CYLINDER)

When Monitored and Set Condition:

P0404 - EGR POSITION SENSOR RATIONALITY (6 CYLINDER)

When Monitored:

Set Condition: The EGR flow or valve movement is not what is expected.

POSSIBLE CAUSES
HIGH RESISTANCE IN 5 VOLT SUPPLY
5 VOLT SUPPLY CIRCUIT OUTPUT
EGR SENSOR SIGNAL CIRCUIT OPEN
EGR ASSEMBLY
EGR SOLENOID CONTROL CKT
INTERMITTENT CONDITION
EGR SENSOR SIGNAL CIRCUIT OPEN
EGR SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
SENSOR GROUND CIRCUIT OPEN
EGR ASSEMBLY (GROUND)
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 12	All
2	**NOTE: Diagnose all other EGR DTC(s) first before continuing.** Start the engine. With the DRBIII®, read the EGR Position Sensor voltage. Choose a conclusion that best matches the EGR voltage reading. Below 3.5 volts Go To 3 Between 3.5 volts to 4.3 volts Go To 6 Above 4.3 volts Go To 7	All

P0404 - EGR POSITION SENSOR RATIONALITY (6 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition on. Perform a Voltage Drop Test on the 5 Volt Supply circuit between the EGR Solenoid harness connector and the PCM harness connector. Is the voltage drop more than 0.3 volts? Yes → Repair the 5 Volt Supply circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition on. While backprobing the PCM harness connector, measure the voltage of the 5 Volt Supply circuit. Is the voltage above 4.8 volts? Yes → Go To 5 No → Replace the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Disconnect the PCM harness connector. Measure the resistance of the EGR Sensor Signal circuit between the EGR Solenoid harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Replace the EGR Assembly. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Repair the EGR Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition on. With the DRBIII®, actuate the EGR Solenoid. Allow the EGR Solenoid to actuate for least 15 seconds. Feel the EGR solenoid for operation. Stop actuation. Does EGR Solenoid operate during actuation test and than turn off when actuation test was stop? Yes → Go To 12 No → Refer to the Driveability category and perform P0403 - EGR Solenoid Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Measure the voltage of the EGR Sensor Signal circuit at the EGR Solenoid harness connector. Is the voltage above 4.30 volts? Yes → Go To 8 No → Go To 9	All

P0404 - EGR POSITION SENSOR RATIONALITY (6 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor Ground circuit between the EGR Solenoid harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Replace the EGR Assembly. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Repair the Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Disconnect the PCM harness connector. Measure the resistance of the EGR Sensor Signal circuit between the EGR Solenoid harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the EGR Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	Turn the ignition off. Disconnect the EGR Solenoid harness connector. Disconnect the PCM harness connector. Measure the resistance of the EGR Sensor Signal circuit in the EGR Solenoid harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the EGR Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 11	All
11	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom List:

P0420-1/1 CATALYTIC CONVERTER EFFICIENCY
P0432-2/1 CATALYTIC CONVERTER EFFICIENCY

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0420-1/1 CATALYTIC CONVERTER EFFICIENCY.

When Monitored and Set Condition:

P0420-1/1 CATALYTIC CONVERTER EFFICIENCY

When Monitored: After engine warm up to 70°C (158°F), 180 seconds of open throttle operation, at a speed greater than 20 mph and less than 55 mph, with the engine at 1400-2000 rpm and MAP between 13.0 and 17.8.0 inches of mercury (Hg).

Set Condition: As catalyst efficiency deteriorates, the switch rate of the downstream O2 sensor approaches that of the upstream O2 sensor. If at any point during the test the switch ratio reaches a predetermined value, the test fails and the code is set.

P0432-2/1 CATALYTIC CONVERTER EFFICIENCY

When Monitored: After engine warm up to 147 deg. F, 180 seconds of open throttle operation, at a speed greater than 35 mph, with the engine at 1400-2000 rpm and MAP between 13.0 and 17.8 inches of mercury (Hg).

Set Condition: As catalyst efficiency deteriorates, the switch rate of the downstream O2 sensor approaches that of the upstream O2 sensor. If at any point during the test the switch ratio reaches a predetermined value, the test fails and the code is set.

POSSIBLE CAUSES
INTERMITTENT CONDITION
VISUALLY INSPECT CATALYTIC CONVERTER
EXHAUST LEAK
ENGINE MECHANICAL CONDITION
AGING O2 SENSOR
CATALYTIC CONVERTER

P0420-1/1 CATALYTIC CONVERTER EFFICIENCY — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: If a O2 Sensor DTC(s) set along with the Catalytic Converter Efficiency DTC diagnose the O2 Sensor DTC(s) before continuing.** **NOTE: Check for contaminates that may have damaged the O2 Sensor and Catalytic Converter: contaminated fuel, unapproved silicone, oil and coolant, repair necessary.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Inspect the Catalytic Converter for the following damage. Damage Catalytic Converter, dent and holes. Severe discoloration caused by overheating the Catalytic Converter. Catalytic Converter broke internally. Leaking Catalytic Converter. Were any problems found? Yes → Replace the Catalytic Converter. Repair the condition that may have caused the failure. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Start the engine. Inspect the exhaust for leak between the engine and the O2 sensor. Inspect the exhaust for leaks between the engine and the appropriate rear O2 Sensor. Are there any exhaust leaks? Yes → Repair or replace the leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Check the exhaust for excessive smoke caused by an internal problem in the engine. Is a engine mechanical condition present? Yes → Repair the engine mechanical condition as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	A new rear O2 Sensor along with an aging front O2 Sensor may cause the DTC to set. Review the vehicles repair history. Has the rear O2 Sensor been replace without replacing the front O2 Sensor? Yes → Replace the Front O2 Sensor as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	If there are no possible cause remaining, view repair. Repair Replace the Catalytic Converter. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0420-1/1 CATALYTIC CONVERTER EFFICIENCY — Continued

TEST	ACTION	APPLICABILITY
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: Check for contaminates that may have damaged the O2 Sensor and Catalytic Converter: contaminated fuel, unapproved silicone, oil and coolant, repair necessary.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** A new rear O2 Sensor along with a aging front O2 Sensor may cause the DTC to set. Review repair history of the vehicle and repair as necessary. With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0441-EVAP PURGE FLOW MONITOR

When Monitored and Set Condition:

P0441-EVAP PURGE FLOW MONITOR

When Monitored: With engine temperature greater than 71°C (160°F), fuel control in closed loop, engine idling for 200 seconds, no low fuel, MAP less than 23.6 inches mercury and barometric altitude less than 8,000 feet.

Set Condition: After having passed the Leak Detection Pump (LDP) test, no air flow through the evaporative system is detected by the evap monitor.

POSSIBLE CAUSES
INTERMITTENT CONDITION
EVAP PURGE SOLENOID LEAKS/STUCK OPEN
EVAP PURGE SOLENOID STUCK CLOSED
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP PURGE HOSE SOLENOID TO CANISTER
EVAP PURGE HOSE CANISTER TO FUEL TANK
EVAP CANISTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	**NOTE: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister. This may indicate a faulty rollover valve. Replace/repair as necessary.** Turn the ignition off. Disconnect the vacuum hoses at the Evap Purge Solenoid. Using a hand vacuum pump, apply 10 inches of vacuum to the Evap Purge Solenoid vacuum source port on the component side. Does the Evap Purge Solenoid hold vacuum? Yes → Go To 3 No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0441-EVAP PURGE FLOW MONITOR — Continued

TEST	ACTION	APPLICABILITY
3	Using a hand vacuum pump, apply 10 inches of vacuum to the Evap Purge Solenoid vacuum source port on the component side. Turn the ignition on. Observe the vacuum gauge. With the DRBIII®, actuate the EVAP Purge Solenoid . Does the vacuum drop when the solenoid is actuated? Yes → Go To 4 No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Carefully inspect the Evap Purge Solenoid vacuum supply hose for proper routing. Check for a pinched or plugged hose from the throttle body to the Purge Solenoid. Inspect the vacuum port at the throttle body for any damage or plugging. Were any problems found? Yes → Repair the vacuum supply hose/tube as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Visually inspect the Evap Purge hose from the Evap Purge Solenoid to the Evap Canister. Look for any physical damage such as a pinched, plugged, ripped or dry rotted hose. Were any problems found? Yes → Repair or replace hose as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Visually inspect the Evap Purge hose from between the Evap Canister and the Fuel Tank. Check for any physical damage such as a pinched, plugged, ripped or dry rotted hose. Were any problems found? Yes → Repair or replace hose as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	Visually inspect the Evap Canister for the following. Check for physical damage or signs of fuel that has entered the canister. Check for signs of fuel, this may indicate a bad rollover valve. Were any problems found? Yes → Repair or Replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

P0441-EVAP PURGE FLOW MONITOR — Continued

TEST	ACTION	APPLICABILITY
8	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** Perform a wiggle test of the Evap Purge Solenoid wiring while the circuit is actuated with the DRBIII®. Listen for the solenoid to quit actuating. Also watch for the Good Trip Counter to change to 0. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:

P0442-EVAP LEAK MONITOR MEDIUM LEAK DETECTED
P0455-EVAP LEAK MONITOR LARGE LEAK DETECTED
P0456 - EVAP LEAK MONITOR LEAK DETECTED

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0442-EVAP LEAK MONITOR MEDIUM LEAK DETECTED.

When Monitored and Set Condition:

P0442-EVAP LEAK MONITOR MEDIUM LEAK DETECTED

When Monitored: Immediately after a cold start, with battery/ambient temperature between 4°C (40°F) and 32°C (90°F) and coolant temperature within -12°C (20°F) of battery/ambient.

Set Condition: If there is a leak larger than 0.040″ and smaller than 0.080″ in the evaporative system.

P0455-EVAP LEAK MONITOR LARGE LEAK DETECTED

When Monitored: Immediately after a cold start, with battery/ambient temperature between 4°C (40°F) and 32°C (90°F) and coolant temperature within -12°C (10°F) of battery/ambient.

Set Condition: There is a leak larger than 0.080″ in the evaporative system.

P0456 - EVAP LEAK MONITOR LEAK DETECTED

When Monitored: Immediately after a cold start, with battery/ambient temperature between 4°C (40°F) and 30°C (86°F) and coolant temperature within -12°C (10°F) of battery/ambient.

Set Condition: If there is a leak larger than 0.020″ and smaller than 0.040″ in the evaporative system.

POSSIBLE CAUSES
EVAPORATIVE EMISSION LEAK DETECTION
EVAP PURGE SOLENOID LEAKS/STUCK OPEN
INTERMITTENT LDP MONITOR FAILURE

P0442-EVAP LEAK MONITOR MEDIUM LEAK DETECTED — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Since a hot vehicle can conceal a leak, it is best to perform this test at room temperature.** **NOTE: A loose gas cap could have caused this DTC to set. Make sure gas cap is tight and in good condition. Ensure the gas cap meets OEM specifications.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Go To 5	All
2	To continue testing you will need Miller Tool #8404 Evaporative Emission Leak Detector (EELD). **WARNING: Keep lighted cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.** **NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.** Disconnect the vacuum supply hose at the Leak Detection Pump. Connect and apply a continuous vacuum supply (i.e. 20″Hg) to the Leak Detection Pump. A vacuum pump such as an A/C recovery unit works well. Using the DRBIII®, select Engine/System Tests and actuate the Leak Detect Pump Test (Option 3/Hold PSI). **NOTE: The above energizes the LDP solenoid and allows the constant vacuum source to apply vacuum to the LDP pump diaphragm. This lifts the diaphragm up and seals the atmospheric canister vent valve at the bottom of the Leak Detection Pump.** Connect the red power lead of Miller Tool #8404 to the battery positive terminal and the black ground lead to battery negative terminal. **NOTE: See Charts and Graph support material EELD Calibration Setup for an example.** Connect shop air to the #8404 EELD. Set the smoke/air control switch to AIR. Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size). Press the remote smoke/air start button. Position the red flag on the air flow meter so it is aligned with the indicator ball. When the calibration is complete, release the remote button. The EELD is now calibrated the flow meter in liters per minute to the size leak indicated by the DTC set in the PCM. Install the service port adapter #8404-14 on the vehicle's service port. Connect the Air supply hose from the EELD to the service port. Press the remote button to activate AIR flow. **NOTE: Larger volume fuel tanks, and/or those with less fuel, may require 4 to 5 minutes to fill.** Compare the flow meter indicator ball reading to the red flag. ABOVE the red flag indicates a leak present. BELOW the red flag indicates a sealed system. Is the indicator ball above the red flag? Yes → Go To 3 No → Go To 5	All

P0442-EVAP LEAK MONITOR MEDIUM LEAK DETECTED — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.** To continue testing, you will need Miller Tool #8404 Evaporative Emissions Leak Detector (EELD). Remove the Air supply hose from the service port. Connect the SMOKE supply tip (black hose) to the service port. Set the smoke/air control switch to SMOKE. **NOTE: The flow meter indicator ball will not move at this point.** Press the remote smoke/air start button. **NOTE: Ensure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.** **NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.** While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke. If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke. The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light. **NOTE: Hoses** Was a leak found? Yes → Repair or replace the leaking component as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Go To 4	All
4	**NOTE: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister. This may indicate a faulty rollover valve. Replace/repair as necessary.** Turn the ignition off. Disconnect the vacuum hoses at the Evap Purge Solenoid. Using a hand vacuum pump, apply 10 inches of vacuum to the Evap Purge Solenoid vacuum source port on the component side. **NOTE: Monitor the vacuum gauge for at least 15 seconds.** Does the Evap Purge Solenoid hold vacuum? Yes → Go To 5 No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All

P0442-EVAP LEAK MONITOR MEDIUM LEAK DETECTED — Continued

TEST	ACTION	APPLICABILITY
5	At this time, the conditions required to set the DTC are not present. **NOTE: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.** **NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.** **NOTE: Refer to any Technical Service Bulletins (TSB's) that may apply.** With the DRBIII® in System Tests, perform the LDP Monitor Test. This will force the PCM to run the LDP Monitor. If the monitor fails, further diagnosis is required to find faulty component. If the monitor passes, the condition is not present at this time. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Test Complete.	All

Symptom:
P0443-EVAP PURGE SOLENOID CIRCUIT

When Monitored and Set Condition:

P0443-EVAP PURGE SOLENOID CIRCUIT

When Monitored: The ignition on or engine running. Battery voltage greater than 10 volts.

Set Condition: The PCM will set a trouble code if the actual state of the solenoid does not match the intended state.

POSSIBLE CAUSES
INTERMITTENT CONDITION
EVAP PURGE SOLENOID CONTROL CIRCUIT OPEN
EVAP PURGE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
EVAP PURGE SOLENOID SENSE CIRCUIT OPEN
EVAP PURGE SOLENOID SENSE CIRCUIT SHORTED TO GROUND
EVAP PURGE SOLENOID
EVAP PURGE SOLENOID LEAKS/STUCK OPEN
EVAP PURGE SOLENOID STUCK CLOSED
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Disconnect the Powertrain Control Module harness connectors. Measure the resistance of the Evap Purge Solenoid Control circuit from the PCM harness connector to the Evap Purge Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Evap Purge Solenoid Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0443-EVAP PURGE SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Disconnect the Powertrain Control Module harness connectors. Measure the resistance of the Evap Purge Solenoid Control circuit in the Evap Purge Solenoid harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Evap Purge Solenoid Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Disconnect the Powertrain Control Module harness connectors. Measure the resistance of the Evap Purge Solenoid Sense circuit from the PCM harness connector to the Evap Purge Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Evap Purge Solenoid Sense circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Disconnect the Powertrain Control Module harness connectors. Measure the resistance between ground and the Evap Purge Solenoid Sense circuit at the Evap Purge Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Repair the Evap Purge Solenoid Sense circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Measure the resistance between the terminals of the Evap Purge Solenoid. Is the resistance between 10.0 and 15.0 ohms? No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5. Yes → Go To 7	All
7	Turn the ignition off. Disconnect the vacuum hoses at the Evap Purge Solenoid. Using a hand vacuum pump, apply 10 inches of vacuum to the Evap Purge Solenoid vacuum source port on the component side. Does the Evap Purge Solenoid hold vacuum? Yes → Go To 8 No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0443-EVAP PURGE SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
8	Using a hand vacuum pump, apply 10 inches of vacuum to the Evap Purge Solenoid vacuum source port on the component side. Turn the ignition on. Observe the vacuum gauge. With the DRBIII®, actuate the EVAP Purge Solenoid . Does the vacuum drop when the solenoid is actuated? Yes → Go To 9 No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	If there are no possible causes remaining, view repair. Repair Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** Perform a wiggle test of the Evap Purge Solenoid wiring while the circuit is actuated with the DRBIII®. Listen for the solenoid to quit actuating. Also watch for the Good Trip Counter to change to 0. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES

When Monitored and Set Condition:

P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES

When Monitored: TEST #1: With the ignition on, the fuel level is compared to the previous key down after a 20 second delay. TEST #2: The PCM monitor the fuel level at ignition on.

Set Condition: TEST #1: If the PCM does not see a difference in fuel level of greater than 0.1 volt the test will fail. TEST #2: If the PCM does not see a change in the fuel level of .1765 over a set amount of miles the test will fail. See Charts and Graphs (Fuel Level Voltage Change Over Miles Chart) for an example.

POSSIBLE CAUSES
INTERMITTENT CONDITION
VISUALLY INSPECT FUEL TANK
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN
GROUND CIRCUIT OPEN
INTERNAL INSPECTION OF THE FUEL TANK
FUEL LEVEL SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose P0462 or P0463 first, if set along with P0460.** **NOTE: Inspect the Fuel Pump Module harness connector for any corrosion or damage.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Visually inspect the Fuel Tank for damage that may restrict the Fuel Sending Unit float from moving. Is the Fuel Tank OK? Yes → Go To 3 No → Replace the Fuel Tank as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Measure the resistance of the Fuel Level Sensor Signal circuit in the Fuel Pump Module harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the Fuel Level Sensor Signal circuit for a short to ground Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Disconnect the BCM harness connector. Measure the resistance of the Fuel Level Sensor Signal circuit between the Fuel Pump Module harness connector and the BCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Fuel Level Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Measure the resistance of the Ground circuit in the Fuel Pump Module harness connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	**WARNING: The fuel system is under a constant pressure even with the engine off. Before opening the fuel system the fuel pressure must be release. Relieve the fuel pressure in accordance with the service information.** Remove the Fuel Tank in accordance with the Service Information. Remove the Fuel Pump Module. Visually inspect the inside of the Fuel Tank for any obstructions or deformities. Inspect the Fuel Pump Module Float arm for damage. Were any problem found? Yes → Repair or replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Fuel Level Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES — Continued

TEST	ACTION	APPLICABILITY
8	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** **NOTE: Physically and Visually inspect the fuel tank for damage, if a problem is found repair or replace as necessary.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:
P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW
P0463-FUEL LEVEL SENDING UNIT VOLTS TOO HIGH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW.

When Monitored and Set Condition:

P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW

When Monitored: Ignition on and battery voltage above 10.4 volts.

Set Condition: The fuel level sensor signal voltage goes below 0.098 volts for more than 200 seconds.

P0463-FUEL LEVEL SENDING UNIT VOLTS TOO HIGH

When Monitored: Ignition on and battery voltage above 10.4 volts.

Set Condition: The fuel level sensor signal voltage read by the PCM goes above 4.9 volts for more than 200 seconds.

POSSIBLE CAUSES
GOOD TRIP EQUAL TO ZERO
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Refer to the Instrument Category and perform the appropriate symptoms. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 2	All

P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** **NOTE: Physically and Visually inspect the fuel tank for damage. if a problem is found repair or replace as necessary.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0500-NO VEHICLE SPEED SIGNAL (EATX TRANSMISSION)

When Monitored and Set Condition:

P0500-NO VEHICLE SPEED SIGNAL (EATX TRANSMISSION)

When Monitored: With the engine running, transmission not in park or neutral, brakes not applied, and engine rpm greater than 2200.

Set Condition: This code will set if no vehicle speed signal is received from the TCM (transmission control module) for more than 7 seconds for 2 consecutive trips.

POSSIBLE CAUSES
INTERMITTENT CONDITION
VEHICLE SPEED SENSOR SIGNAL SHORTED VOLTAGE
VSS SIGNAL FROM TCM
VEHICLE SPEED SENSOR SIGNAL SHORTED TO GROUND
VEHICLE SPEED SENSOR SIGNAL OPEN
PCM VSS SIGNAL

TEST	ACTION	APPLICABILITY
1	**NOTE: Before continuing this test use the DRB and check Pinion Factor. If not correct, reset and retest vehicle.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. Measure the voltage of the VSS Signal circuit in the TCM harness connector. Is the voltage above 6.0 volts? Yes → Repair the Vehicle Speed Sensor Signal circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P0500-NO VEHICLE SPEED SIGNAL (EATX TRANSMISSION) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. Connect a jumper wire to the VSS Signal circuit in the TCM harness connector. With the DRBIII®, monitor the Vehicle Speed Signal display. Tap the other end of the jumper wire rapidly to ground. Does the Vehicle Speed Signal display the MPH/KMH above 0? Yes → Go To 4 No → Replace the Transmission Comtrol Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the TCM harness connector. Measure the resistance of the Vehicle Speed Sensor Signal circuit in the PCM harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the Vehicle Speed Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the TCM harness connector Measure the resistance of the Vehicle Speed Sensor Signal circuit between the PCM harness connector and the TCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Vehicle Speed Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	If there is no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0500-NO VEHICLE SPEED SIGNAL (EATX TRANSMISSION) — Continued

TEST	ACTION	APPLICABILITY
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P0505-IDLE AIR CONTROL MOTOR CIRCUITS

When Monitored and Set Condition:

P0505-IDLE AIR CONTROL MOTOR CIRCUITS

When Monitored: Engine running. Battery voltage greater than 10 volts. IAC motor operating.

Set Condition: The PCM senses a short to ground or battery voltage on any of the four Idle Air Control (IAC) driver circuits for 0.050 seconds while the IAC motor is active.

POSSIBLE CAUSES
INTERMITTENT CONDITION
IAC #1 DRIVER CIRCUIT SHORTED TO #2, #3, OR #4
IAC #2 DRIVER CIRCUIT SHORTED TO #3 OR #4
IAC #3 DRIVER CIRCUIT SHORTED TO #4
IAC DRIVER CIRCUIT SHORTED TO VOLTAGE
IAC DRIVER CIRCUIT SHORTED TO GROUND
IAC MOTOR OPERATION
IAC MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the IAC Motor harness connector. Disconnect the Powertrain Control Module harness connectors. **Note: The following steps are checking for a short between the IAC Driver Circuits.** Measure the resistance between the IAC #1 Driver circuit and #2, #3, #4 Driver circuits. Is the resistance below 5.0 ohms between any of the Drivers? Yes → Repair the IAC Driver Circuits shorted together. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P0505-IDLE AIR CONTROL MOTOR CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the IAC Motor harness connector. Disconnect the Powertrain Control Module harness connectors. **Note: The following steps are checking for a short between the IAC Driver Circuits.** Measure the resistance between the IAC #2 Driver circuit and #3, #4 Driver circuits. Is the resistance below 5.0 ohms between any of the Drivers? Yes → Repair the IAC Driver Circuits shorted together. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the IAC Motor harness connector. Disconnect the Powertrain Control Module harness connectors. **Note: The following steps are checking for a short between the Driver Circuits.** Measure the resistance between the IAC #3 Driver circuit and the #4 Driver circuit. Is the resistance below 5.0 ohms? Yes → Repair the IAC Driver Circuits shorted together. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the IAC Motor harness connector. Disconnect the Powertrain Control Module harness connector. Remove the ASD Relay. Using a jumper wire, jumper between the Fused B+ circuit and ASD Relay Output circuit in the PDC. Turn the ignition on. Measure the voltage of each of the IAC Driver circuit. Is the voltage above 1.0 volt at any IAC Driver circuit? Yes → Repair the IAC Driver circuit(s) for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect IAC Motor harness connector. Disconnect the PCM harness connector. Repeat each measurement for each IAC Driver circuit. Measure the resistance of each IAC Driver circuit to ground. Is the resistance below 5.0 ohms at any IAC Driver circuit? Yes → Repair the IAC Driver circuit(s) for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All

P0505-IDLE AIR CONTROL MOTOR CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the IAC Motor harness connector. Start and idle the engine. Using a test light connected to ground, probe the IAC Driver #1 circuit for 10 seconds. Repeat the above test for the remaining IAC Motor Driver circuits. Does the test light turn on and off while probing each IAC Motor Driver circuit? Yes → Replace the Idle Air Control Motor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:

P0551-POWER STEERING SWITCH FAILURE (4 CYLINDER)

When Monitored and Set Condition:

P0551-POWER STEERING SWITCH FAILURE (4 CYLINDER)

When Monitored: With the ignition key on and engine running.

Set Condition: With the vehicle above 65 KMH (40 MPH) for over 30 seconds, the power steering pressure switch remains open.

POSSIBLE CAUSES
POWER STEERING PRESSURE SWITCH OPERATION
GROUND CIRCUIT
POWER STEERING PRESSURE SWITCH SENSE CIRCUIT SHORTED TO GROUND
POWER STEERING PRESSURE SENSE CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Power Steering Pressure Switch harness connector. Turn the ignition on. With the DRBIII®, monitor the Power Steering Pressure Switch. Using a jumper wire, connect one end to the Power Steering Pressure Switch Sense circuit. With the other end of the jumper tap the ground circuit in the Power Steering Pressure Switch harness connector. Does the Power Steering Pressure Switch display change from HI to LOW? Yes → Replace the Power Steering Pressure Switch Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 2	All
2	Turn the ignition off. Disconnect Power Steering Pressure Switch harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit in the Power Steering Pressure Switch harness connector. Does the test light illuminate? Yes → Go To 3 No → Repair the ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0551-POWER STEERING SWITCH FAILURE (4 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Power Steering Pressure Switch harness connector. Disconnect the PCM harness connector. Measure the resistance of the Power Steering Pressure Switch Sense circuit in the PSP Switch harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the Power Steering Pressure Sense circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the Power Steering Pressure Switch harness connector. Disconnect the PCM harness connector. Measure the resistance of the Power Steering Pressure Switch Sense circuit between the PSP Switch harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Power Steering Pressure Sense circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:
P0700-EATX CONTROLLER DTC PRESENT

TEST	ACTION	APPLICABILITY
1	This is an informational DTC letting you know that a DTC(s) is stored in the Transmission Control Module. Erase this DTC from the PCM after all Transmission DTC(s) have been repaired. Using the DRBIII®, read the Transmission Controller DTC and refer to the Transmission Category and perform the appropriate symptom. PCM Diagnostic Information complete. Continue Test Complete.	All

Symptom:
P0703-BRAKE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0703-BRAKE SWITCH SENSE CIRCUIT

When Monitored: TEST #1: Vehicle speed greater than 17 MPH to enable. TEST #2: Speed must be 0 and brake switch indicates on.

Set Condition: TEST #1: If vehicle speed goes to 0 MPH without brake input. Condition must be repeated 9 times to set fault. Two trip fault. TEST #2: If vehicle speed go above 17 MHP for more than 6.4 seconds without a change in brake state. Condition must be repeat 9 times to set fault.

POSSIBLE CAUSES
INTERMITTENT CONDITION
FUSED B+ CIRCUIT
BRAKE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
BRAKE SWITCH SENSE SHORTED TO GROUND
BRAKE SWITCH SENSE CIRCUIT OPEN
GROUND CIRCUIT OPEN
BRAKE LAMP SWITCH OPERATION
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the Brake Switch is adjusted properly before continuing.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 9	All
2	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Using a 12-volt test light connected to ground, check the Fused B+ circuit in the Brake Lamp Switch harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Fuse B+ circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

P0703-BRAKE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Disconnect the PCM harness connector. Remove the ASD Relay from the PDC. Using a jumper wire, jumper between the Fused B+ circuit and ASD Relay Output circuit in the PDC. Turn the ignition on. Measure the voltage of the Brake Switch Sense circuit in the Brake Lamp Switch harness connector. Is the voltage above 1.0 volts? Yes → Repair the Brake Switch Sense circuit shorted to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 4	All
4	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Disconnect the PCM harness connector. Measure the resistance of the Brake Switch Sense circuit in the Brake Lamp Switch harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Brake Switch Sense circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 5	All
5	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Disconnect the PCM harness connector. Measure the resistance of the Brake Switch Sense circuit between the Brake Lamp Switch harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Brake Switch Sense circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
6	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Measure the resistance of the Ground circuit in the Brake Lamp Switch harness connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
7	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Measure the resistance between the Ground circuit terminal and the Brake Switch Sense terminal in the Brake Lamp Switch. Apply and release the brake pedal while monitoring the ohmmeter. Does the resistance change from below 5.0 ohms to open circuit? Yes → Go To 8 No → Replace the Brake Lamp Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

P0703-BRAKE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
9	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Test Complete.	All

Symptom:
P1192-INLET AIR TEMP SENSOR VOLTAGE LOW

When Monitored and Set Condition:

P1192-INLET AIR TEMP SENSOR VOLTAGE LOW

When Monitored: With the ignition on and battery voltage greater than 10.4 volts.

Set Condition: The Inlet Air Temperature (IAT) sensor circuit voltage at the PCM goes below 0.8 volt.

POSSIBLE CAUSES
INTERMITTENT CONDITION
IAT SENSOR INTERNAL FAILURE
IAT SENSOR SIGNAL SHORTED TO GROUND
IAT SENSOR SIGNAL SHORTED TO SENSOR GROUND CIRCUIT
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the IAT voltage. Is the voltage below 1.0 volt? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the IAT harness connector. Turn the ignition on. With the DRBIII®, read IAT voltage. Is the voltage above 1.0 volt? Yes → Replace the IAT Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the IAT Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the IAT Sensor Signal circuit between the IAT Sensor harness connector and ground. Is the resistance below 100 ohms? Yes → Repair the IAT Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All

P1192-INLET AIR TEMP SENSOR VOLTAGE LOW — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the IAT Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the IAT Sensor Signal circuit and the Sensor ground circuit in the IAT Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the IAT Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1193-INLET AIR TEMP SENSOR VOLTAGE HIGH

When Monitored and Set Condition:

P1193-INLET AIR TEMP SENSOR VOLTAGE HIGH

When Monitored: With the ignition on and battery voltage greater than 10.4 volts.

Set Condition: The inlet air temperature (IAT) sensor circuit voltage at the PCM goes above 4.9 volts.

POSSIBLE CAUSES
INTERMITTENT CONDITION
IAT SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
IAT SENSOR INTERNAL FAILURE
IAT SENSOR SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the IAT voltage. Is the voltage above 4.6 volts? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the IAT Sensor harness connector. Turn the ignition on. Measure the voltage of the IAT Sensor Signal circuit in the IAT Sensor harness connector. Is the voltage above 5.2 volts? Yes → Repair the IAT Sensor Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the IAT harness connector. Connect a jumper wire between the IAT Sensor Signal circuit and the Sensor ground circuit in the IAT harness connector. Turn the ignition on. With the DRBIII®, read IAT voltage. Is the voltage below 1.0 volt? Yes → Replace the IAT Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All

P1193-INLET AIR TEMP SENSOR VOLTAGE HIGH — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the IAT Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the IAT Sensor Signal circuit between the IAT Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the IAT Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the IAT Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the Sensor ground circuit between the IAT Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom List:

P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR

P1196-2/1 O2 SENSOR SLOW DURING CATALYST MONITOR

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR.

When Monitored and Set Condition:

P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR

When Monitored: With the engine running, coolant greater than 70°C (158°F), open throttle, steady to slightly increasing vehicle speed greater than 18 mph but less than 55 mph, with a light load on the engine, for a period no less than 5 minutes.

Set Condition: The oxygen sensor signal voltage is switching from below 0.39 volt to above 0.6 volts and back fewer times than required.

P1196-2/1 O2 SENSOR SLOW DURING CATALYST MONITOR

When Monitored: With the engine running, coolant greater than 170°F, open throttle, steady to slightly increasing vehicle speed greater than 18 mph but less than 55 mph, with a light load on the engine, for a period no less than 5 minutes.

Set Condition: The oxygen sensor signal voltage is switching from below 0.39 volt to above 0.6 volts and back fewer times than required.

POSSIBLE CAUSES
INTERMITTENT CONDITION
EXHAUST LEAK
O2 SENSOR SIGNAL CIRCUIT VOLTAGE DROP
O2 SENSOR GROUND CIRCUIT VOLTAGE DROP
O2 SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 6	All

P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR — Continued

TEST	ACTION	APPLICABILITY
2	Start the engine. Inspect the exhaust for leak between the engine and the O2 sensor. Inspect the exhaust for leaks between the engine and the appropriate rear O2 Sensor. Are there any exhaust leaks? Yes → Repair or replace the leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Back probe the O2 Sensor Signal circuit at the O2 Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 4 No → Repair the high resistance on the O2 Sensor Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	**NOTE: Ensure the voltmeter leads meet the terminals in the connector and that there is good terminal to wire connection.** **NOTE: Ensure the voltmeter leads are connected for positive polarity** Back probe the O2 Sensor ground circuit at the O2 Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to idle. Is the voltage below 0.10 volt? Yes → Go To 5 No → Repair the high resistance on the O2 Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	If there are no possible causes remaining, view repair. Repair Replace the O2 Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR — Continued

TEST	ACTION	APPLICABILITY
6	**NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1281-ENGINE IS COLD TOO LONG

When Monitored and Set Condition:

P1281-ENGINE IS COLD TOO LONG

When Monitored: The ignition key on, engine running.

Set Condition: The engine does not warm to 71°C (160°F) while driving (throttle off idle) greater than 20 MPH for 27 minutes after start.

POSSIBLE CAUSES
COOLING SYSTEM PROBLEM

TEST	ACTION	APPLICABILITY
1	**NOTE: The best way to diagnose this DTC is to allow the vehicle to remain outside overnight in order to have a completely cold soaked engine.** **NOTE: Extremely cold outside ambient temperatures may cause this DTC to set.** Verify that the coolant level is correct. If not, repair as necessary **NOTE: Ensure the ECT Sensor is operating correctly.** With the DRBIII®, monitor the Engine Coolant Temperature value during the warm up cycle. Make sure the transition of the temperature change is smooth. Did the engine temperature reach a minimum of 71°C (160°F)? Yes → Test Complete. No → Refer to the Service Information for cooling system performance diagnosis. The most probable cause is a Thermostat problem. Also, refer to any related TSBs. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:
P1282-FUEL PUMP RELAY CONTROL CIRCUIT

When Monitored and Set Condition:

P1282-FUEL PUMP RELAY CONTROL CIRCUIT

When Monitored: With the ignition on. Battery voltage greater than 10.4 volts.

Set Condition: An open or shorted condition is detected in the fuel pump relay control circuit.

POSSIBLE CAUSES
FUEL PUMP RELAY INTERMITTENT OPERATION
INTERMITTENT CONDITION
FUSED IGNITION SWITCH OUTPUT CIRCUIT
FUEL PUMP RELAY RESISTANCE
FUEL PUMP RELAY CONTROL CIRCUIT OPEN
FUEL PUMP RELAY CONTROL CIRCUIT SHORT TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the Fuel Pump Relay. Is the Fuel Pump Relay operating? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, actuate the Fuel Pump Relay. Wiggle the wiring harness from the Fuel Pump Relay to the PCM while the relay is actuating. Did the Fuel Pump Relay stop when wiggling the wiring harness? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P1282-FUEL PUMP RELAY CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
4	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Measure the resistance of the Fuel Pump Relay between the Fused Ignition Switch Output terminal and the Fuel Pump Relay Control terminal. Is the resistance between 70 to 90 ohms? Yes → Go To 6 No → Replace the Fuel Pump Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the Fuel Pump Relay Control circuit between the PDC and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Fuel Pump Relay Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1282-FUEL PUMP RELAY CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Measure the resistance of the Fuel Pump Relay Control circuit in the PDC to ground. Is the resistance below 5.0 ohms? Yes → Repair the Fuel Pump Relay Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:

P1289-MANIFOLD TUNE VALVE CONTROL CIRCUIT (6 CYLINDER)

When Monitored and Set Condition:

P1289-MANIFOLD TUNE VALVE CONTROL CIRCUIT (6 CYLINDER)

When Monitored: With the ignition on. ASD Relay energized. Battery voltage greater than 10 volts.

Set Condition: The PCM senses the MTV is not at the desired state.

POSSIBLE CAUSES
INTERMITTENT CONDITION
MANIFOLD TUNE VALVE SOLENOID OPERATION
ASD RELAY OUTPUT CIRCUIT OPEN
CAPACITOR(S) SHORTED TO GROUND
ASD OUTPUT CIRCUIT SHORTED TO GROUND
MTV SOLENOID CONTROL CIRCUIT SHORTED TO ASD RELAY OUTPUT CIRCUIT
MTV SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
MTV SOLENOID CONTROL CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. Disconnect the Manifold Tune Valve Solenoid harness connector. Turn the ignition on. Using a 12-volt test light, connect one end to the ASD Relay Output circuit and the other end to the MTV Solenoid Control circuit. With the DRBIII®, actuate the MTV Solenoid. Does the 12-volt test light flash on and off. No → Go To 3 Yes → Replace the Manifold Tune Valve Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1289-MANIFOLD TUNE VALVE CONTROL CIRCUIT (6 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the MTV Solenoid harness connector. Turn the ignition on. With the DRB, actuate the MTV Solenoid. Using a 12-volt test light connected to ground, probe the ASD Relay Output circuit in the MTV Solenoid harness connector. Does the test light illuminate brightly? Yes → Go To 4 No → Go To 8	All
4	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the MTV Solenoid harness connector. Measure the resistance between the MTV Solenoid Control circuit and ASD Relay Output circuit in the MTV Solenoid connector. Is the resistance below 5.0 ohms? Yes → Repair the MTV Solenoid Control circuit for a short to the ASD Relay Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the MTV Solenoid harness connector. Measure the resistance of the MTV Solenoid Control circuit in the MTV Solenoid harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the MTV Solenoid Control circuirt for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the MTV Solenoid harness connector. Measure the resistance of the MTV Solenoid Control circuit between the PCM harness connector and the MTV Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the MTV Solenoid Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	IF there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1289-MANIFOLD TUNE VALVE CONTROL CIRCUIT (6 CYLINDER) — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the MTV Solenoid harness connector. Remove the ASD Relay from the PDC. Measure the resistance of the ASD Relay Output circuit between the ASD Relay connector and the MTV Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the ASD Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	**NOTE: Repeat the following test for both capacitors** **NOTE: The Capacitors are attached to the side of each valve cover.** Turn the ignition off. Disconnect the Capacitor harness connector. Install a good INJ/COIL fuse. With the DRBIII®, actuate the ASD Relay. **NOTE: If the above test result is an open fuse for both capacitor tests, the problem is a short to ground in the ASD Relay Output circuit. Repair the short to ground in the ASD Relay Output circuit and refer to VER-5.** Is the INJ/COIL fuse OK for both capacitor tests? Yes → Replace the Capacitor(s) Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Repair the ASD Output circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1294-TARGET IDLE NOT REACHED

When Monitored and Set Condition:

P1294-TARGET IDLE NOT REACHED

When Monitored: With the engine idling and the transmission in drive, if automatic. There must not be a MAP sensor trouble code or a Throttle Position Sensor trouble code.

Set Condition: The engine idle is not within 200 rpm above or 100 rpm below the target idle for 15 seconds. Two trip fault.

POSSIBLE CAUSES
IAC MOTOR OPERATION INTERMITTENT
INTERMITTENT CONDITION
IAC MOTOR OPERATION INTERMITTENT
IAC MOTOR
IAC DRIVER CIRCUIT OPEN
VACUUM LEAKS
AIR INDUCTION SYSTEM
THROTTLE BODY AND THROTTLE LINKAGE
PCM IAC MOTOR
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 10	All
2	Start the engine. Allow the engine idle to stabilize for 60 seconds. Using the DRBIII®, perform the IAC wiggle test. **NOTE: The engine idle should raise and lower with the display.** Does the RPM raise and lower correctly? Yes → Go To 3 No → Go To 6	All

P1294-TARGET IDLE NOT REACHED — Continued

TEST	ACTION	APPLICABILITY
3	Reinstall the IAC Motor. Start the engine. Inspect the vehicle for external vacuum leaks. Inspect the engine for internal leaks. Were any vacuum leaks found? Yes → Repair the vacuum leak as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Inspect the Air Induction System for the following problems. Restrictions: Dirty Air Cleaner, Foreign material trapped in the air intake tube, etc. Leaks: Air Intake tube connection, Air Cleaner housing, etc. Were any problems found? Yes → Repair or replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Inspect the throttle body plate carbon build up or other restrictions. Inspect the throttle linkage for binding and smooth operation. Ensure the throttle plate is resting on the stop at idle. Were any problems found? Yes → Repair or replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
6	Turn the ignition off. Disconnect the IAC Motor harness connector. Start and idle the engine. Using a test light connected to ground, probe the IAC Driver #1 circuit for 10 seconds. Repeat the above test for the remaining IAC Motor Driver circuits. Does the test light turn on and off while probing each IAC Motor Driver circuit? Yes → Go To 7 No → Go To 8	All
7	Turn the ignition off. Disconnect the IAC Motor harness connector. Start and idle the engine. Using a test light connected to battery positive, probe the IAC Driver #1 circuit for 10 seconds. Repeat the above test for the remaining IAC Motor Driver circuits. Does the test light turn on and off while probing each IAC Motor Driver circuit? Yes → Replace the IAC Motor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1294-TARGET IDLE NOT REACHED — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect IAC Motor harness connector. Disconnect the PCM harness connector. Measure the resistance of the IAC Driver circuit between the IAC Motor harness connector and the PCM harness connector that indicated no test light illumination. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the IAC Driver circuit(s) for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	Start the engine. Allow the engine idle to stabilize for 60 seconds. Using the DRBIII®, perform the IAC wiggle test. **NOTE: The engine idle should raise and lower with the display.** Does the RPM raise and lower correctly? Yes → Go To 11 No → Refer to symptom Checking the IAC Motor in the Driveability category. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
11	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** Inspect the throttle linkage, ensure smooth operation. Ensure the throttle linkage allows the throttle plate to close fully and rests on the stop. With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1297-NO CHANGE IN MAP FROM START TO RUN

When Monitored and Set Condition:

P1297-NO CHANGE IN MAP FROM START TO RUN

When Monitored: With engine RPM +/- 64 of target idle and the throttle blade at closed throttle.

Set Condition: Too small of a difference is seen between barometric pressure with ignition on (engine running) and manifold vacuum for 8.80 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
MAP SENSOR INTERNAL FAILURE
MAP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
MAP SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
MAP 5 VOLT SUPPLY CIRCUIT OPEN
MAP SENSOR VACUUM PORT
MAP SENSOR
PCM 5 VOLT SUPPLY CIRCUIT
PCM MAP SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	**NOTE: If a MAP high or Low DTC set along with P1297, diagnose the High or Low DTC first before continuing.** Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 14	All
2	Turn the ignition on. With the DRBIII®, read the MAP Sensor voltage. Is the voltage below 3.19 volts. Yes → Go To 3 No → Go To 11	All

P1297-NO CHANGE IN MAP FROM START TO RUN — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the MAP Sensor harness connector. Is the voltage between 4.5 to 5.2 volts? Yes → Go To 4 No → Go To 8	All
4	Turn the ignition off. Disconnect the MAP Sensor harness connector. With the DRBIII®, monitor the MAP Sensor voltage. Turn the ignition on. Is the voltage above 1.2 volts? Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the MAP Sensor Signal circuit in the MAP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the MAP Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All
6	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the MAP Sensor Signal circuit and the Sensor ground circuit in the MAP Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the MAP Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1297-NO CHANGE IN MAP FROM START TO RUN — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit in the MAP Sensor harness connector to ground. Is the resistance below 100 ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 9	All
9	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the 5 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
11	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Repair the 5 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
12	Turn the ignition off. Remove the MAP Sensor. Inspect the vacuum port, check for restrictions or any foreign materials. Were any restriction found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 13	All
13	If there are no possible causes remaining, view repair. Repair Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1297-NO CHANGE IN MAP FROM START TO RUN — Continued

TEST	ACTION	APPLICABILITY
14	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** **NOTE: Remove the MAP Sensor and inspect the MAP and vacuum passage for restrictions and foriegn material** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1299-VACUUM LEAK FOUND (IAC FULLY SEATED)

When Monitored and Set Condition:

P1299-VACUUM LEAK FOUND (IAC FULLY SEATED)

When Monitored: With the engine running.

Set Condition: The MAP sensor signal does not correlate to the TPS signal.

POSSIBLE CAUSES
VACUUM LEAK
INTERMITTENT CONDITION
THROTTLE POSITION SENSOR SWEEP
MAP SENSOR OPERATION
TP SENSOR FULLY SEATED

TEST	ACTION	APPLICABILITY
1	**NOTE: A large vacuum leak is mostly the cause of this DTC.** Inspect the Intake manifold for vacuum leaks. Inspect the Power Brake Booster for any vacuum leaks. Inspect the PCV system for proper operation or any vacuum leaks. Were any vacuum leaks found? Yes → Repair vacuum leak as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, monitor the Throttle Position Sensor voltage. Slowly open the throttle from the idle position to the wide open throttle position. Does voltage start at approximately 0.8 volts and go above 3.5 volts with a smooth voltage change? Yes → Go To 3 No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
3	**NOTE: The throttle must be fully seated and rest on the throttle stop.** Turn the ignition on. With the DRBIII®, read the Throttle Position Sensor voltage. Is the voltage below 1.5 volts? Yes → Go To 4 No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1299-VACUUM LEAK FOUND (IAC FULLY SEATED) — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Connect a vacuum gauge to manifold vacuum. Start the engine and allow it to reach operating temperature. **NOTE: If the engine will not idle, maintain a constant RPM above idle.** With the DRBIII®, read the MAP Sensor vacuum value. Is the DRB reading within 1″ of the vacuum gauge? Yes → Go To 5 No → Replace the MAP Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1388-AUTO SHUTDOWN RELAY CONTROL CIRCUIT

When Monitored and Set Condition:

P1388-AUTO SHUTDOWN RELAY CONTROL CIRCUIT

When Monitored: With ignition on. Battery voltage above 10 volts.

Set Condition: An open or shorted condition is detected in the ASD relay control circuit.

POSSIBLE CAUSES
ASD RELAY INTERMITTENT OPERATION
INTERMITTENT CONDITION
FUSED B+ CIRCUIT
ASD RELAY RESISTANCE
ASD RELAY CONTROL CIRCUIT OPEN
ASD RELAY CONTROL CIRCUIT SHORT TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Is the ASD Relay operating? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Wiggle the wiring harness from the ASD Relay to the PCM while the relay is actuating. Did the ASD Relay stop when wiggling the wiring harness? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P1388-AUTO SHUTDOWN RELAY CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII®parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
4	Turn the ignition off. Remove the ASD Relay from the PDC. Turn the ignition on. Measure the voltage of the Fused B+ circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 5 No → Repair the Fused B+ circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Remove the ASD Relay from the PDC. Measure the resistance of the ASD Relay between the Fused B+ terminal and the ASD Relay Control terminal. Is the resistance between 60 to 80 ohms? Yes → Go To 6 No → Replace the ASD Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Remove the ASD Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the ASD Control circuit between the PDC and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the ASD Relay Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1388-AUTO SHUTDOWN RELAY CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Remove the ASD Relay from the PDC. Measure the resistance of the ASD Relay Control circuit in the PDC to ground. Is the resistance below 5.0 ohms? Yes → Repair the ASD Relay Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:
P1389-NO ASD RELAY OUTPUT VOLTAGE AT PCM

When Monitored and Set Condition:

P1389-NO ASD RELAY OUTPUT VOLTAGE AT PCM

When Monitored: With ignition key on. Battery voltage greater than 10 volts.

Set Condition: No voltage sensed at the PCM when the ASD relay is energized.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ASD RELAY
FUSED B+ CIRCUIT
ASD RELAY OUTPUT CIRCUIT OPEN
ASD RELAY OUTPUT CIRCUIT OPEN
PCM NO START
PCM START

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose P1388 - Auto Shutdown Relay Control Circuit first if set along with this DTC.** With the DRBIII®, erase the DTC. Attempt to start the engine. If the engine will not start, crank the engine for at least 15 seconds. It may be necessary to repeat several times. Does the DTC reset. Yes → Go To 2 No → Go To 9	All
2	Attempt to start the engine. Does the engine start. Yes → Go To 3 No → Go To 5	All
3	Turn the ignition off. Remove the ASD Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the ASD Output circuit between the PDC and the PCM harness connector. Is the resistance below 5.0 ohms. Yes → Go To 4 No → Repair the ASD Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1389-NO ASD RELAY OUTPUT VOLTAGE AT PCM — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Install a substitute relay in place of the ASD Relay. With the DRBIII®, erase DTCs. Attempt to start the engine. With the DRBIII®, read DTCs. Does the DTC reset? Yes → Go To 6 No → Replace the ASD Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Remove the ASD Relay from the PDC. Measure the voltage of the Fused B+ circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 7 No → Repair the Fused B+ circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Turn the ignition off. Remove the ASD Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the ASD Output circuit between the PDC and the PCM harness connector. Is the resistance below 5.0 ohms. Yes → Go To 8 No → Repair the ASD Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1389-NO ASD RELAY OUTPUT VOLTAGE AT PCM — Continued

TEST	ACTION	APPLICABILITY
9	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Check for the engine stumble, stall or quite running. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1390-TIMING BELT SKIPPED 1 TOOTH OR MORE 2.0L

When Monitored and Set Condition:

P1390-TIMING BELT SKIPPED 1 TOOTH OR MORE 2.0L

When Monitored: With the engine running, every 44 ms an inhibit condition is looked for (wide open throttle, large change in rpm, large change in MAP, cold engine, insufficient start to run time, rpm outside of given windows).

Set Condition: If an inhibit condition does not exist, the misalignment between the camshaft and the crankshaft is monitored. When the camshaft position sensor is offset from the crankshaft position sensor one tooth or more.

POSSIBLE CAUSES
VALVE TIMING OUT OF SPECIFICATION
VALVE TIMING NOT OUT OF SPECS

TEST	ACTION	APPLICABILITY
1	**NOTE: The PCM has detected the Cam and Crank are out of sync.** Using the appropriate service information check the valve timing. Is the valve timing within specifications? Yes → Perform the Re-Learn Cam/Crank function using the DRBIII®. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Repair valve timing as necessary. After performing the repair, use the DRBIII® under Engine, Misc. and perform the Re-Learn Cam/Crank function. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
P1391-INTERMITTENT LOSS OF CMP OR CKP

When Monitored and Set Condition:

P1391-INTERMITTENT LOSS OF CMP OR CKP

When Monitored: Engine running or cranking.

Set Condition: When the failure counter reaches 20 for 2 consecutive trips.

POSSIBLE CAUSES
WIRING HARNESS INSPECTION
TONE WHEEL/PULSE RING INSPECTION
WIRING HARNESS INSPECTION
TONE WHEEL/PULSE RING INSPECTION
CHECKING INTERMITTENT CRANKSHAFT POSITION SENSOR SIGNAL WITH LAB
CHECKING INTERMITTENT CAMSHAFT POSITION SENSOR SIGNAL WITH LAB
CHECKING INTERMITTENT CKP WIRING WITH LAB SCOPE
CHECKING INTERMITTENT CMP WIRING WITH LAB SCOPE
INTERMITTENT CONDITION
CAMSHAFT POSITION SENSOR
CRANKSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CMP Signal circuit in the CMP harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Observe the lab scope screen. Are there any irregular or missing signals? Yes → Go To 3 No → Go To 6	All

P1391-INTERMITTENT LOSS OF CMP OR CKP — Continued

TEST	ACTION	APPLICABILITY
3	Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Ensure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) tight. Refer to any TSB that may apply. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Remove the Camshaft Position Sensor. Inspect the Tone Wheel/Pulse Ring for damage, foreign material, or excessive movement. Were any problems found? Yes → Repair or replace the Tone Wheel/Pulse Ring as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CKP Signal circuit in the CKP harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Observe the lab scope screen. Are there any irregular or missing signals? Yes → Go To 7 No → Go To 10	All
7	Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Ensure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) are tight. Refer to any TSB that may apply. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 8	All

P1391-INTERMITTENT LOSS OF CMP OR CKP — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Remove the Crankshaft Position Sensor. Inspect the Tone Wheel/Flex Plate slots for damage, foreign material, or excessive movement. Were any problems found? Yes → Repair or replace the Tone Wheel/Flex Plate as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 9	All
9	If there are no possible causes remaining, view repair. Repair Replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
10	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CKP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition on. (do not start the engine) Observe the lab scope screen. Look for any pulses generated by the CKP Sensor. Did the CKP Sensor generate any pulses? Yes → Replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 11	All
11	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CMP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Turn the ignition on. (do not start the engine) Observe the lab scope screen. Look for any pulses generated by the CMP Sensor. Did the CMP Sensor generate any pulses? Yes → Replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 12	All

P1391-INTERMITTENT LOSS OF CMP OR CKP — Continued

TEST	ACTION	APPLICABILITY
12	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CKP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Observe the lab scope screen while wiggling the wiring harness and connectors. Were there any irregularities in the lab scope pattern? Yes → Check the harness connectors carefully. If OK, replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 13	All
13	Turn the ignition off. With the DRBIII® lab scope probe and the Miller special tool #6801, backprobe the CMP Signal circuit in the PCM harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine. Observe the lab scope screen while wiggling the wiring harness and connectors. Were there any irregularities in the lab scope pattern? Yes → Check the harness connectors carefully. If OK, replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 14	All
14	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1398-MIS-FIRE ADAPTIVE NUMERATOR AT LIMIT

When Monitored and Set Condition:

P1398-MIS-FIRE ADAPTIVE NUMERATOR AT LIMIT

When Monitored: Under closed throttle decel with A/C off, ECT above 75, and more than 50 seconds after engine start.

Set Condition: One of the CKP sensor target windows has more than 2.86% variance from the reference window.

POSSIBLE CAUSES
INTERMITTENT CONDITION
TONE WHEEL/PULSE RING INSPECTION
WIRING HARNESS INSPECTION
CRANKSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	**Note: Check for any TSB's that may apply to this symptom.** Turn the ignition on. With the DRBIII® in the miscellaneous menu, choose Clear PCM battery disconnect to reset the PCM. With the DRBIII®, choose the Misfire Pretest Road test the vehicle and relearn the adaptive numerator. The adaptive numerator is learned when the Adaptive Numerator Done Learning line on the Misfire screen changes to Yes. Did the adaptive numerator relearn? Yes → Go To 2 No → Go To 3	All

P1398-MIS-FIRE ADAPTIVE NUMERATOR AT LIMIT — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
3	Visually inspect the CKP wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the CKP wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Ensure the Crankshaft Position Sensor properly installed and the mounting bolt(s) tight. Refer to any TSB that may apply. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Remove the Crankshaft Position Sensor. Inspect the Tone Wheel/Flex Plate slots for damage, foreign material, or excessive movement. Were any problems found? Yes → Repair or replace the Tone Wheel/Flex Plate as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the Crankshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:
P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND

When Monitored and Set Condition:

P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND

When Monitored: Immediately after a cold start, with battery/ambient temperature between 4°C (40°F) and 32°C (90°F) and coolant temperature within -12°C (10°F) of battery/ambient.

Set Condition: LDP Switch does not reach at least 3 closures with 10 seconds. LDP must initial in normal conditions to mature failure.

POSSIBLE CAUSES
INTERMITTENT LDP MONITOR FAILURE
EVAP CANISTER OBSTRUCTED
PRESSURIZING EVAP EMISSION SYSTEM
OBSTRUCTION IN HOSE/TUBE BETWEEN EVAP CANISTER AND PURGE SOLENOID
LDP PRESSURE HOSE OBSTRUCTED
LEAK DETECTION PUMP

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 6	All

P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND — Continued

TEST	ACTION	APPLICABILITY
2	To continue testing you will need Miller Tool #8404 Evaporative Emission Leak Detector (EELD). **WARNING: Keep lighted cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.** **NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.** Disconnect the vacuum supply hose at the Leak Detection Pump. Connect and apply a continuous vacuum supply (i.e. 20″Hg) to the Leak Detection Pump. A vacuum pump such as an A/C recovery unit works well. Using the DRBIII®, select Engine/System Tests and actuate the Leak Detect Pump Test (Option 3/Hold PSI). **NOTE: The above energizes the LDP solenoid and allows the constant vacuum source to apply vacuum to the LDP pump diaphragm. This lifts the diaphragm up and seals the atmospheric canister vent valve at the bottom of the Leak Detection Pump.** Connect the red power lead of Miller Tool #8404 to the battery positive terminal and the black ground lead to battery negative terminal. **NOTE: See Charts and Graph support material EELD Calibration Setup for an example.** Connect shop air to the #8404 EELD. Set the smoke/air control switch to AIR. Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size). Press the remote smoke/air start button. Position the red flag on the flow meter so it is aligned with the indicator ball. When the calibration is complete, release the remote button. The EELD is now calibrated the flow meter in liters per minute to the size leak indicated by the DTC set in the PCM. Install the service port adapter #8404-14 on the vehicle's service port. Connect the Air supply hose from the EELD to the service port. Press the remote button to activate AIR flow. **NOTE: Larger volume fuel tanks, and/or those with less fuel, may require 4 to 5 minutes to fill.** The flow meter gauge on the EELD will read zero LPM when the EVAP system is completely pressurized. Disconnect the hose at the EVAP Canister that goes to the Fuel Tank. Did the pressure drop when the hose was disconnected? Yes → Go To 3 No → Repair the obstruction in the EVAP system between the EVAP Canister and the Fuel Tank. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
3	**Note: All previously disconnected hose(s) reconnected.** Re-pressurize the EVAP System. Using Miller Tool #8404, hold down the Remote Smoke/Air Start Button and monitor the gauge. The flow meter gauge on the EELD reads 0 LPM the EVAP system completely pressurized. Disconnect the LDP Pressure hose at the EVAP Canister. The LDP Pressure hose is the hose that connects the Evap Canister to the Leak Detection Pump. Did the pressure drop when the hose was disconnected? Yes → Go To 4 No → Replace the EVAP Canister. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All

P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND — Continued

TEST	ACTION	APPLICABILITY
4	**Note: All previously disconnected hose(s) reconnected.** Re-pressurize the EVAP System. On Miller Tool #8404, set the Pressure/Hold switch to Open and set the Vent switch to Closed. Turn the pump timer On and watch the gauge. The flow meter gauge on the EELD reads 0 LPM the EVAP system completely pressurized. Disconnect the EVAP hoses at the Purge Solenoid. Did the pressure drop when the hose was disconnected? Yes → Go To 5 No → Repair or replace hose/tube as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
5	Disconnect and remove the LDP pressure hose. The LDP pressure hose is the hose that connects the EVAP Canister to the Leak Detection Pump. Inspect the LDP pressure hose for any obstructions or physical damage. Is the LDP pressure hose free from defects? Yes → Replace the Leak Detection Pump. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Repair/replace hose as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
6	At this time, the conditions required to set the DTC are not present. **Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.** **Note: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.** **Note: Refer to any Technical Service Bulletins (TSB's) that may apply.** With the DRBIII® in System Tests, perform the LDP Monitor Test. This will force the PCM to run the LDP Monitor. If the monitor fails, further diagnosis is required to find faulty component. If the monitor passes, the condition is not present at this time. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Test Complete.	All

Symptom:
P1489-HIGH SPEED FAN CONTROL RELAY CIRCUIT

When Monitored and Set Condition:

P1489-HIGH SPEED FAN CONTROL RELAY CIRCUIT

When Monitored: With the ignition on. Battery voltage greater than 10.0 volts.

Set Condition: An open or shorted circuit is detected in the radiator fan relay control circuit.

POSSIBLE CAUSES
HIGH SPEED RADIATOR FAN RELAY INTERMITTENT OPERATION
INTERMITTENT CONDITION
FUSED IGNITION SWITCH OUTPUT CIRCUIT
HIGH SPEED RADIATOR FAN RELAY RESISTANCE
HIGH SPEED RADIATOR FAN RELAY CONTROL CIRCUIT OPEN
HIGH SPEED RADIATOR FAN RELAY CONTROL CIRCUIT SHORT TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the High Speed Radiator Fan Relay. Is the High Speed Radiator Fan Relay operating? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, actuate the High Speed Radiator Fan Relay. Wiggle the wiring harness from the High Speed Radiator Fan Relay to the PCM while the relay is actuating. Did the High Speed Radiator Fan Relay stop when wiggling the wiring harness? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P1489-HIGH SPEED FAN CONTROL RELAY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
4	Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Measure the resistance of the High Speed Radiator Fan Relay between the Fused Ignition Switch Output terminal and the High Speed Radiator Fan Relay Control terminal. Is the resistance between 60 to 80 ohms? Yes → Go To 6 No → Replace the High Speed Radiator Fan Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the High Speed Radiator Fan Relay Control circuit between the PDC and the PCM harness connector. Is the resistance below 5.0 ohms. Yes → Go To 7 No → Repair the High Speed Radiator Fan Relay Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1489-HIGH SPEED FAN CONTROL RELAY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Remove the High Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the High Speed Radiator Fan Relay Control circuit in the PDC to ground. Is the resistance below 5.0 ohms. Yes → Repair the High Speed Radiator Fan Relay Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:
P1490-LOW SPEED FAN CONTROL RELAY CIRCUIT

When Monitored and Set Condition:

P1490-LOW SPEED FAN CONTROL RELAY CIRCUIT

When Monitored: With the ignition on. Battery voltage greater than 10 volts.

Set Condition: An open or shorted circuit is detected in the radiator fan relay control circuit.

POSSIBLE CAUSES
LOW SPEED RADIATOR FAN RELAY INTERMITTENT OPERATION
INTERMITTENT CONDITION
FUSED IGNITION SWITCH OUTPUT CIRCUIT
LOW SPEED RADIATOR FAN RELAY RESISTANCE
LOW SPEED RADIATOR FAN RELAY CONTROL CIRCUIT OPEN
LOW SPEED RADIATOR FAN RELAY CONTROL CIRCUIT SHORT TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the Low Speed Radiator Fan Relay. Is the Low Speed Radiator Fan Relay operating? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, actuate the Low Speed Radiator Fan Relay. Wiggle the wiring harness from the Low Speed Radiator Fan Relay to the PCM while the relay is actuating. Did the Low Speed Radiator Fan Relay stop when wiggling the wiring harness? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P1490-LOW SPEED FAN CONTROL RELAY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All
4	Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Measure the resistance of the Low Speed Radiator Fan Relay between the Fused Ignition Switch Output terminal and the Low Speed Radiator Fan Relay Control terminal. Is the resistance between 60 to 80 ohms? Yes → Go To 6 No → Replace the Low Speed Radiator Fan Relay. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the Low Speed Radiator Fan Relay Control circuit between the PDC and the PCM harness connector. Is the resistance below 5.0 ohms. Yes → Go To 7 No → Repair the Low Speed Radiator Fan Relay Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1490-LOW SPEED FAN CONTROL RELAY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Remove the Low Speed Radiator Fan Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the Low Speed Radiator Fan Relay Control circuit in the PDC to ground. Is the resistance below 100 ohms. Yes → Repair the Low Speed Radiator Fan Relay Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:
P1494-LEAK DETECT PUMP SW OR MECHANICAL FAULT

When Monitored and Set Condition:

P1494-LEAK DETECT PUMP SW OR MECHANICAL FAULT

When Monitored: Immediately after a cold start, with battery/ambient temperature between 4°C (40°F) and 32°C (90°F) and coolant temperature within -6.6°C (20°F) of battery/ambient.

Set Condition: The state of the switch does not change when the solenoid is energized.

POSSIBLE CAUSES
LDP VACUUM SUPPLY
WIRING HARNESS INTERMITTENT
LEAK DETECTION PUMP
LDP SWITCH SENSE CIRCUIT SHORTED TO GROUND
LDP SWITCH SENSE CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the vacuum supply hose at the Leak Detection Pump. Connect a vacuum gauge to the disconnected vacuum supply hose at the Leak Detection Pump. Start the engine and read the vacuum gauge. Does the vacuum gauge read at least 13 in/Hg? Yes → Go To 3 No → Repair leak or obstruction in vacuum hose as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All

P1494-LEAK DETECT PUMP SW OR MECHANICAL FAULT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Leak Detect Pump Sw state. While observing the Leak Detect Pump Sw state, connect a jumper wire between a 12 volt source and the LDP Switch Sense circuit. Did the Leak Detect Pump Sw state change when the jumper was connected? Yes → Replace the Leak Detection Pump. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Go To 4	All
4	Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Disconnect the Powertrain Control Module harness connectors. Measure the resistance of the LDP Switch Sense circuit in the LDP harness connector to ground. Is the resistance below 5.0 Ohms? Yes → Repair the LDP Switch Sense Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Go To 5	All
5	Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Disconnect the Powertrain Control Module harness connectors. Measure the resistance of the LDP Switch Sense circuit between the LDP harness connector and the PCM harness connector. Is the resistance below 5.0 Ohms? Yes → Go To 6 No → Repair the LDP Switch Sense Circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
7	At this time, the conditions required to set the DTC are not present. **Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.** **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB's) that may apply.** Perform a wiggle test of the LDP wiring while the circuit is actuated with the DRB. Listen for the LDP to quit actuating. Also watch for the Good Trip Counter to change to 0. Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Test Complete.	All

Symptom:
P1495-LEAK DETECTION PUMP SOLENOID CIRCUIT

When Monitored and Set Condition:

P1495-LEAK DETECTION PUMP SOLENOID CIRCUIT

When Monitored: Immediately after a cold start, with battery/ambient temperature between 4.4°C (40°F). F and 32°C (90°F). Coolant temperature within -6.6°C (20°F) of battery/ambient.

Set Condition: The state of the solenoid circuit does not match the PCM's desired state.

POSSIBLE CAUSES
WIRING HARNESS INTERMITTENT
LEAK DETECTION PUMP
FUSED IGNITION SWITCH OUTPUT
LDP SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
LDP SOLENOID CONTROL CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Using a 12-volt test light, connect one end to the Fused Ignition Switch Output circuit and the other end to the LDP Solenoid Control circuit. Turn the ignition on. With the DRBIII®, actuate the Leak Detection Pump. Does the test light flash on and off. Yes → Replace the Leak Detection Pump. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Go To 3	All

P1495-LEAK DETECTION PUMP SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Ignition Switch Output circuit in the LDP harness connector. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
4	Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Disconnect the Powertrain Control Module harness connector. Measure the resistance of the LDP Solenoid Control circuit in the LDP harness connector to ground. Is the resistance below 5.0 Ohms? Yes → Repair the LDP Solenoid Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Go To 5	All
5	Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Disconnect the Powertrain Control Module harness connector. Measure the resistance of the LDP Solenoid Control circuit between the LDP Solenoid harness connector and the PCM harness connector. Is the resistance below 5.0 Ohms? Yes → Go To 6 No → Repair the LDP Solenoid Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
7	At this time, the conditions required to set the DTC are not present. **Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.** **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB's) that may apply.** Perform a wiggle test of the LDP wiring while the circuit is actuated with the DRB. Listen for the LDP to quit actuating. Also watch for the Good Trip Counter to change to 0. Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6. No → Test Complete.	All

Symptom:
P1496-5 VOLT SUPPLY, OUTPUT TOO LOW

When Monitored and Set Condition:

P1496-5 VOLT SUPPLY, OUTPUT TOO LOW

When Monitored: With the ignition on.

Set Condition: The 5-volt supply to the sensors is below 3.5 volts for 4 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
THROTTLE POSITION SENSOR
MAP SENSOR
A/C PRESSURE SENSOR
EGR SOLENOID
5 VOLT SUPPLY SHORTED TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the DTC's. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 9	All
2	Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Turn the ignition on. Measure the 5 Volt Supply circuit at the Throttle Position Sensor harness connector. Is the Voltage below 4.5 Volts? Yes → Go To 3 No → Go To 8	All

P1496-5 VOLT SUPPLY, OUTPUT TOO LOW — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Turn the ignition on. Connect a Voltmeter to the 5 Volt Supply circuit at the Throttle Position Sensor harness connector. Monitor the voltage display. Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. Did the 5 Volt Supply go from below 4.5 volts to above 4.5 volts when MAP Sensor was disconnected? Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All
4	Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Turn the ignition on. Connect a Voltmeter to the 5 Volt Supply circuit at the Throttle Position Sensor harness connector. Monitor the voltage display. Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Turn the ignition on. Did the 5 Volt Supply go from below 4.5 volts to above 4.5 volts when the A/C sensor was disconnecte Yes → Replace the A/C Pressure Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Turn the ignition on. Connect a Voltmeter to the 5 Volt Supply circuit at the Throttle Position Sensor harness connector. Monitor the voltage display. Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Did the 5 Volt Supply go from below 4.5 volts to above 4.5 volts when the EGR was disconnected? Yes → Replace the EGR Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 6	All

P1496-5 VOLT SUPPLY, OUTPUT TOO LOW — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Disconnect the MAP Sensor harness connector. Disconnect the A/C Pressure Sensor harness connector. Disconnect the EGR Solenoid harness connector. Disconnect the PCM harness connectors. Measure the resistance of the 5 Volt Supply circuit in the Throttle Position Sensor harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the 5 Volt Supply Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	**NOTE: The Throttle Position Sensor harness connector must be connected during this test.** Disconnect the MAP Sensor harness connector. Turn the ignition on. Measure the 5 Volt Supply circuit in the MAP Sensor harness connector. Is the Voltage below 4.5 Volts? Yes → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 9	All
9	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:
P1602-PCM NOT PROGRAMMED

When Monitored and Set Condition:

P1602-PCM NOT PROGRAMMED

When Monitored: Ignition key on.

Set Condition: PCM has not been programmed.

POSSIBLE CAUSES
PCM PROGRAMMED

TEST	ACTION	APPLICABILITY
1	Attempt to program PCM in accordance with the Service Information. Turn the ignition on. Start the engine. **NOTE: If the engine will not start, crank the engine over for 15 seconds. Crank at least 2 time with the ignition switch returning to the off position each time.** Allow the engine to reach normal operating temperature. With the DRBIII®, read DTCs. Does the DTC reset? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All

Symptom:
P1899-P/N SWITCH STUCK IN PARK OR IN GEAR

When Monitored and Set Condition:

P1899-P/N SWITCH STUCK IN PARK OR IN GEAR

When Monitored: Continuously with the transmission in Park, Neutral, or Drive and NOT in Limp-in mode.

Set Condition: This code will set if the PCM detects an incorrect Park/Neutral switch state for a given mode of vehicle operation.

POSSIBLE CAUSES
INTERMITTENT PARK/NEUTRAL SWITCH
P/N POSITION SWITCH SENSE CIRCUIT SHORTED TO GROUND
P/N POSITION SWITCH SENSE CIRCUIT OPEN
TRANSMISSION RANGE SENSOR
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read PCM DTCs. Is the Good Trip displayed and equal to zero? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition on. With the DRBIII®, read the Park/Neutral Position Switch input state. While moving the gear selector through all gear positions (Park to 1 and back to Park), monitor the DRB display. Did the DRB display show P/N and D/R in the correct gear positions? Yes → Go To 7 No → Go To 3	All
3	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the Transmission Range Sensor harness connector. Measure the resistance between ground and the P/N Position Switch Sense circuit. Is the resistance above 100k ohms? Yes → Go To 4 No → Repair the P/N Position Switch Sense circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1899-P/N SWITCH STUCK IN PARK OR IN GEAR — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the Transmission Range Sensor harness connector. Measure the resistance of the P/N Position Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the P/N Position Switch Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the PCM harness connector. Move the Gear selector through all gear positions, from Park to 1st and back. While moving the gear selector through each gear, measure the resistance between ground and the P/N Position Switch Sense circuit. Did the resistance change from below 10.0 ohms to above 10.0 ohms? Yes → Go To 6 No → Replace the Transmission Range Sensor. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Module in accordance with the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	At this time, the conditions required to set the DTC are not present. **NOTE: Use the Freeze Frame Data to help duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.** **NOTE: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any technical service bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*CHECKING ECT SENSOR

POSSIBLE CAUSES
ECT SENSOR OPERATION
ECT SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: The engine coolant temperature must be below 62°C (150°F).** Turn the ignition on. With the DRBIII®, monitor the ECT value. Start the engine. Does the ECT reach 82°C (180°F) and was it a smooth transition? Yes → Engine Coolant Temperature sensor is operating normally. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
*CHECKING FUEL DELIVERY

POSSIBLE CAUSES
FUEL PUMP RELAY
FUEL PRESSURE OUT OF SPECS
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
FUEL PUMP CAPACITY (VOLUME) OUT OF SPECS
FUEL PUMP RELAY FUSED B+ CIRCUIT
FUEL PUMP RELAY OUTPUT CIRCUIT OPEN
FUEL PUMP GROUND CIRCUIT OPEN/HIGH RESISTANCE
FUEL PUMP MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. **Note: It may be necessary to use a mechanics stethoscope in the next step.** Listen for fuel pump operation at the fuel tank. Does the Fuel Pump operate? Yes → Go To 2 No → Go To 6 **Caution: Stop All Actuations.**	All
2	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Install a fuel pressure gauge to the fuel rail test port. (2.7L use the fuel adapter #6539 Miller Tool) Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Choose a conclusion that best matches your fuel pressure reading. Below Specification Go To 3 Within Specification Go To 5 Above Specification Replace the fuel filter/fuel pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 1. **Caution: Stop All Actuations.**	All

*CHECKING FUEL DELIVERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16″ fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module. Attach a fuel pressure test gauge to the ″T″ fitting on tool #6539. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Is the fuel pressure within specification now? Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 4 **Caution: Stop All Actuations.**	All
4	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose,fitting or line, the fuel system pressure must be released.** Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer. Is the Fuel Inlet Strainer plugged? Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
5	**Note: The fuel pressure must be within specification before continuing.** Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Disconnect the fuel supply line at the fuel rail. Connect fuel line adapter #6539(5/16″) or #6631(3/8″) to the disconnected fuel supply line. Insert the other end of the adapter into a graduated container. **Caution: Do not operate the fuel pump for more than 7 seconds in the next step. Fuel pump module reservoir may run empty and damage to the fuel pump will result.** **Note: Specification: A good fuel pump will deliver at least 1/4 liter (1/2 pint) of fuel in 7 seconds.** Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test for 7 seconds. Is the fuel pump capacity within specification? Yes → Test Complete. No → Check for a kinked/damaged fuel supply line between the fuel tank and fuel rail. If OK, replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 1. **Caution: Stop All Actuations.**	All

*CHECKING FUEL DELIVERY — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the fuel pump module harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. Using a 12 volt test light connected to ground, probe the Fuel Pump Relay Output circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly? Yes → Go To 7 No → Go To 9 **Caution: Stop All Actuations.**	All
7	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. **Note: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities - Clean/repair as necessary.** Using a test light connected to battery voltage, probe the Fuel Pump ground circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly? Yes → Go To 8 No → Repair the open/high resistance in the fuel pump ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
9	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. With a 12 volt test light connected to ground, probe the Fuel Pump Relay Fused B+ circuit at the PDC. Does the test light illuminate? Yes → Go To 10 No → Repair the Fuel Pump Realy Fused B+ circuit. Check for open fuse in the PDC. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
10	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Disconnect the Fuel Pump Module harness connector. **NOTE: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities** Measure the resistance of the Fuel Pump Relay Output circuit from the relay connector to the fuel pump module connector. Is the resistance below 5.0 ohms? Yes → Replace the Fuel Pump Relay. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Repair the Fuel Pump Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*CHECKING HARD START (FUEL DELIVERY SYSTEM)

POSSIBLE CAUSES
FUEL PRESSURE OUT OF SPECS
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP MODULE
FUEL PUMP INLET STRAINER PLUGGED
INTERNAL FUEL SUPPLY LEAK
FUEL PUMP CAPACITY (VOLUME) OUT OF SPECS
FUEL PUMP MODULE
FUEL CONTAMINATION

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Install a fuel pressure gauge to the fuel rail test port. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Choose a conclusion that best matches your fuel pressure reading. Below Specification Go To 2 Within Specification Go To 4 **Caution: Stop All Actuations.**	All

*CHECKING HARD START (FUEL DELIVERY SYSTEM) — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16″ fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module. Attach a fuel pressure test gauge to the ″T″ fitting on tool #6539. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Is the fuel pressure within specification now? Yes → Visually and physically inspect the fuel supply line between the fuel tank and the fuel rail. Repair/replace as necessary. If no problem is found replace the fuel filter. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 3 **Caution: Stop All Actuations.**	All
3	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose,fitting or line, the fuel system pressure must be released.** Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer. Is the Fuel Inlet Strainer plugged? Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
4	**NOTE: Before continuing visually and physically inspect the fuel delivery for external leaks or damage. Repair /replace as necessary.** Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Disconnect the fuel supply line from the fuel rail. Install special 5/16″ fuel line adapter tool #6539 between disconnected fuel supply line and the fuel rail. Attach a fuel pressure test gauge to the ″T″ fitting on tool #6539. Start the engine and allow the fuel system to reach maximum pressure. Turn the ignition off. **NOTE: Fuel specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Monitor the fuel pressure gauge for a minimum of 5 minutes. **NOTE: The pressure should not fall below 241 KPa (35 psi)** Is the fuel pressure within specification? Yes → Go To 5 No → Go To 6 **Caution: Stop All Actuations.**	All

*CHECKING HARD START (FUEL DELIVERY SYSTEM) — Continued

TEST	ACTION	APPLICABILITY
5	**Note: The fuel pressure must be within specification before continuing.** Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Disconnect the fuel supply line at the fuel rail. Connect fuel line adapter #6539(5/16″) to the disconnected fuel supply line. Insert the other end of the adapter into a graduated container. **Caution: Do not operate the fuel pump for more than 7 seconds in the next step. Fuel pump module reservoir may run empty and damage to the fuel pump will result.** **Note: Specification: A good fuel pump will deliver at least 1/4 liter (1/2 pint) of fuel in 7 seconds.** Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test for 7 seconds. Is the fuel pump capacity within specification? Yes → Check the fuel for contaminants. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Check for a kinked/damaged fuel supply line between the fuel tank and fuel rail. If OK, replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 2. **Caution: Stop All Actuations.**	All
6	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Disconnect the fuel supply line from the fuel rail. Install special 5/16″ fuel line adapter tool #6539 between disconnected fuel supply line and the fuel rail. Attach a fuel pressure test gauge to the ″T″ fitting on tool #6539. Start the engine and allow the fuel system to reach maximum pressure. Turn the ignition off. **NOTE: Be certain that the clamping technique used is adequate to provide a good seal and will not damage the fuel pressure adapter tool hose.** Using the hose clamp pliers special tool #C-4390, slowly clamp off the rubber hose on the Fuel Pressure adapter nearest the fuel rail. Turn the ignition off. Monitor the fuel pressure gauge for a minimum of 5 minutes. **NOTE: The pressure should not fall below 241 KPa (35 psi)** Is the fuel pressure within specification? Yes → Replace the leaking injector(s) Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 2. **Caution: Stop All Actuations.**	All

Symptom:
*CHECKING IAC MOTOR

POSSIBLE CAUSES
IAC MOTOR OPERATION
IAC DRIVER CIRCUITS OPEN
IAC MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, monitor engine RPM. With the DRBIII®, set the engine speed to 1400 RPM. Does the engine speed reach 1400 rpm? Yes → The IAC Motor is operation normally Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 2	All
2	Turn the ignition off. Disconnect IAC Motor harness connector. Disconnect the PCM harness connector. Repeat each measurement for each IAC Driver circuit. Measure the resistance of each IAC Driver circuit between the IAC Motor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms at all IAC Driver circuits? Yes → Replace the Idle Air Control Motor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Repair the IAC Driver circuit(s) for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
*CHECKING IAT SENSOR

POSSIBLE CAUSES
IAT SENSOR OPERATION
IAT SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Do not allow more than 5 minutes delay during the removal of the IAT sensor and measuring the temperature.** Turn the ignition on. With the DRBIII®, read and record the IAT temperature value. Remove the IAT sensor. Using a temperature probe, measure the temperature inside the opening of the IAT sensor. Compare both temperature readings. Are the temperature readings with 12°C (10°F) of one another? Yes → The IAT sensor is operating normally. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Replace the IAT sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
*CHECKING MAP SENSOR

POSSIBLE CAUSES
MAP SENSOR OPERATION
MAP SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Attach a vacuum gauge to a manifold vacuum source. **NOTE: If the engine will not idle, maintain a constant engine speed above idle.** Allow the engine to idle. With the DRBIII®, monitor the MAP sensor vacuum. Compare the MAP vacuum value on the DRBIII® and the vacuum reading on the vacuum gauge. Are the vacuum readings within 1 inch of vacuum of each other? Yes → The MAP sensor is operating normally. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Replace the MAP sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
*CHECKING PCM POWER AND GROUND CIRCUITS

POSSIBLE CAUSES
PCM FUSED B+ CIRCUIT
PCM FUSED IGNITION SWITCH OUTPUT CIRCUIT
PCM GROUND CIRCUITS

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to ground, probe the PCM Fused B+ circuit in the PCM harness connector. Does the test light illuminate brightly? Yes → Go To 2 No → Repair the Fused B+ circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition off. Disconnect the PCM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the PCM Fused Ignition Switch Output circuit in the PCM harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Ignition Switch Output circuit Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to battery voltage, probe the PCM ground circuits in the PCM harness connector. Does the test light illuminate brightly? Yes → Test Complete. No → Repair the PCM ground circuits. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*CHECKING RADIATOR FAN RELAY OUTPUT

POSSIBLE CAUSES
RADIATOR FAN RELAY OPERATION
GROUND CIRCUIT OPEN
RADIATOR FAN MOTOR
FUSED B+ CIRCUIT
RADIATOR FAN RELAY OUTPUT CIRCUIT
RADIATOR FAN RELAY

TEST	ACTION	APPLICABILITY
1	**NOTE: This test can be used for either Low or High Speed Relay Output circuits.** Turn the ignition on. With the DRBIII®, actuate the Radiator Fan Relay. Is the Radiator Fan actuating? Yes → The Radiator Fan System operating properly at this time. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 2	All
2	Turn the ignition off. Disconnect the Radiator Fan harness connector. Measure the Ground circuit in the Radiator Fan harness connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
3	Disconnect the Radiator Fan harness connector. Turn the ignition on. With the DRBIII®, actuate the Radiator Fan Relay. Measure the voltage of the Radiator Fan Relay Output circuit in the Radiator Fan harness connector. Is the voltage above 11.0 volts? Yes → Replace the Radiator Fan Motor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 4	All
4	Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the PDC. Does the test light illuminate brightly? Yes → Go To 5 No → Repair the Fused B+ circuit. Inspect fuses and replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

*CHECKING RADIATOR FAN RELAY OUTPUT — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Disconnect the Radiator Fan harness connector. Measure the resistance of the Radiator Fan Relay Output circuit between the PDC and the Radiator Fan harness connector. Is the resistance below 5.0 ohms? Yes → Replace the Radiator Fan Relay. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Repair the Radiator Fan Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
*CHECKING THE A/C RELAY OUTPUT

POSSIBLE CAUSES
A/C CLUTCH RELAY OPERATION
GROUND CIRCUIT OPEN
A/C CLUTCH
FUSED B+ CIRCUIT
A/C CLUTCH OUTPUT CIRCUIT
A/C CLUTCH RELAY

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the refrigerant system is properly charged. Refer to the appropriate Service Information.** Turn the ignition on. With the DRBIII®, actuate the A/C Clutch Relay. Is the A/C Clutch actuating? Yes → The A/C Clutch System operating properly at this time. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 2	All
2	Turn the ignition off. Disconnect the A/C Clutch harness connector. Measure the Ground circuit in the A/C Clutch harness connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
3	Disconnect the A/C Clutch harness connector. Turn the ignition on. With the DRBIII®, actuate the A/C Clutch Relay. Measure the voltage of the A/C Clutch Relay Output circuit in the A/C Clutch harness connector. Is the voltage above 11.0 volts? Yes → Replace the A/C Clutch. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 4	All
4	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the PDC. Does the test light illuminate brightly? Yes → Go To 5 No → Repair the Fused B+ circuit. Inspect fuses and replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

*CHECKING THE A/C RELAY OUTPUT — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Disconnect the A/C Clutch Relay from the PDC. Disconnect the A/C Clutch harness connector. Measure the resistance of the A/C Clutch Relay Output circuit between the PDC and the A/C Clutch harness connector. Is the resistance below 5.0 ohms? Yes → Replace the A/C Clutch Relay. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Repair the A/C Clutch Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
*CHECKING THE EVAP SYSTEM (EXPORT ONLY)

POSSIBLE CAUSES
EVAP PURGE SOLENOID VACUUM HOSE
EVAP PURGE SOLENOID LEAKING
EVAP PURGE SOLENOID RESTICTION
EVAP CANISTER VACUUM FEED HOSE
EVAP CANISTER VENT VALVE HOSE
EVAP CANISTER OUTPUT HOSE BETWEEN THE CANISTER AND THE FUEL TANK

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the EVAP Purge Solenoid hose assembly Connect a vacuum gauge to the vacuum side of the hose assembly. Start the engine and observe the vacuum gauge. Is the vacuum above 13 inches of vacuum? Yes → Go To 2 No → Repair vacuum hose or vacuum source as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
2	Turn the ignition off. Disconnect the EVAP Purge Solenoid hose assembly. Connect a vacuum pump to the vacuum port side of the EVAP Purge Solenoid component side. Apply 10 inches of vacuum to the EVAP Purge Solenoid. Does the EVAP purge Solenoid hold vacuum? Yes → Go To 3 No → Replace the EVAP Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
3	Turn the ignition off. Disconnect the EVAP Purge Solenoid hose assembly. Connect a vacuum pump to the vacuum port side of the EVAP Purge Solenoid component side. Apply 10 inches of vacuum to the EVAP Purge Solenoid. With the DRBIII®, actuate the EVAP Purge Solenoid. Does vacuum drop to zero when the EVAP Purge Solenoid is actuated? Yes → Go To 4 No → Replace the EVAP Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

*CHECKING THE EVAP SYSTEM (EXPORT ONLY) — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the vacuum hose from the EVAP Canister. Connect a vacuum gauge to the vacuum hose. Disconnect the EVAP Purge Solenoid hose assembly. Using a piece of extra hose, jumper the vacuum port to the EVAP canister vacuum feed port on the hose assembly side. Start the engine and observe the vacuum gauge. Is the vacuum above 13 inches? Yes → Go To 5 No → Repair or replace the vacuum hose between the EVAP Purge Solenoid and EVAP Canister. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
5	Turn the ignition off. Disconnect the EVAP Canister Outlet hose from the EVAP Canister. Connect a vacuum gauge to the EVAP Canister Outlet port on the EVAP canister. Plug the EVAP Canister vent hose. Disconnect the EVAP Solenoid hose assembly. Using a piece of extra hose, jumper the vacuum port to the EVAP canister vacuum feed port on the hose assembly side. Start the engine and observe the vacuum gauge. Is the vacuum above 13 inches? Yes → Go To 6 No → Check for a restricted or damage canister vent hose, repair/ replace as necessary. If ok, replace the EVAP Canister. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
6	Inspect the EVAP Canister Output hose between the Fuel Tank and the EVAP Canister. Check hose for holes or rubbed through areas. **NOTE: If using shop air to check for restriction do not let the air pressure exceed 5.0 psi.** Check hose for restrictions. Were any problems found? Yes → Repair or replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All

Symptom:
*CHECKING TP SENSOR

POSSIBLE CAUSES
THROTTLE POSITION SENSOR VOLTAGE ABOVE 1.5 VOLTS
THROTTLE POSITION SENSOR SWEEP
TP SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the throttle and linkage is not binding and is operating properly.** Turn the ignition on. With the DRBIII®, read the Throttle Position Sensor voltage. Is the voltage above 1.5 volts? Yes → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, monitor the Throttle Position Sensor voltage. Slowly open the throttle from the idle position to the wide open throttle position. Does voltage start at approximately 0.8 volts and go above 3.5 volts with a smooth voltage change? Yes → Throttle Position Sensor Operating normally. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
P0645-A/C CLUTCH RELAY CKT

When Monitored and Set Condition:

P0645-A/C CLUTCH RELAY CKT

When Monitored: With the ignition on. Battery voltage greater than 10 volts. A/C Switch on.

Set Condition: An open or shorted condition is detected in the A/C clutch relay control circuit.

POSSIBLE CAUSES
A/C CLUTCH RELAY INTERMITTENT OPERATION
INTERMITTENT CONDITION
FUSED IGNITION SWITCH OUTPUT CIRCUIT
A/C CLUTCH RELAY RESISTANCE
A/C CLUTCH RELAY CONTROL CIRCUIT OPEN
A/C CLUTCH RELAY CONTROL CIRCUIT SHORT TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the A/C Clutch Relay. Is the A/C Clutch Relay operating? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRBIII®, actuate the A/C Clutch Relay. Wiggle the wiring harness from the A/C Clutch Relay to the PCM while the relay is actuating. Did the A/C Clutch Relay stop when wiggling the wiring harness? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 3	All

P0645-A/C CLUTCH RELAY CKT — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All
4	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Turn the ignition on. Measure the voltage on the Fused Ignition Switch Output circuit in the PDC. Is the voltage above 11.0 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output circuit. Check and replace any open fuses. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
5	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Measure the resistance of the A/C Clutch Relay between the Fused Ignition Switch Output terminal and the A/C Clutch Relay Control terminal. Is the resistance between 60 to 80 ohms? Yes → Go To 6 No → Replace the A/C Clutch Relay. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
6	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Disconnect the PCM harness connector. Measure the resistance of the A/C Clutch Relay Control circuit between the PDC and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the A/C Clutch Relay Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

P0645-A/C CLUTCH RELAY CKT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Measure the resistance between ground and the A/C Clutch Control circuit in the PDC. Is the resistance below 5.0 ohms? Yes → Repair the A/C Clutch Relay Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:
P1598-A/C PRESSURE SENSOR VOLTS TOO HIGH

When Monitored and Set Condition:

P1598-A/C PRESSURE SENSOR VOLTS TOO HIGH

When Monitored: Engine running. The A/C relay energized.

Set Condition: The A/C pressure sensor signal at the PCM goes above 4.92 volts.

POSSIBLE CAUSES
INTERMITTENT CONDITION
A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO 5 VOLT SUPPLY CIRCUIT
A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
A/C PRESSURE SENSOR INTERNAL FAILURE
A/C PRESSURE SENSOR SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the A/C refrigerant System is properly charged per the Service Information.** Start the engine. With the DRBIII®, read the A/C Pressure Sensor voltage. Is the voltage above 4.6 volts? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the A/C Pressure Sensor Signal circuit and the 5 Volt Supply circuit in the A/C Pressure Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Repair the A/C Pressure Sensor Signal circuit for a short to the 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 3	All

P1598-A/C PRESSURE SENSOR VOLTS TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Turn the ignition on. Measure the voltage on the A/C Pressure Sensor Signal circuit at the A/C Pressure Sensor harness connector. Is the voltage above 5.2 volts? Yes → Repair the A/C Pressure Sensor Signal circuit for a short to battery voltage. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 4	All
4	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Connect a jumper wire between the A/C Pressure Sensor Signal circuit and the Sensor ground circuit. With the DRBIII®, monitor the A/C Pressure Sensor voltage. Turn the ignition on. Is the voltage below 1.0 volts? Yes → Replace the A/C Pressure Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 5	All
5	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the A/C Pressure Sensor Signal circuit between the PCM harness connector and the A/C Pressure Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the A/C Pressure Sensor Signal circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
6	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Measure the resistance between ground and the Sensor ground circuit at the A/C Pressure Sensor harness connector. Is the resistance below 30 ohms? Yes → Go To 7 No → Repair the Sensor ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

P1598-A/C PRESSURE SENSOR VOLTS TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
8	**NOTE: Ensure the A/C refrigerant System is properly charged per the Service Information.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All

Symptom:
P1599-A/C PRESSURE SENSOR VOLTS TOO LOW

When Monitored and Set Condition:

P1599-A/C PRESSURE SENSOR VOLTS TOO LOW

When Monitored: Engine running. The A/C relay energized.

Set Condition: The A/C pressure sensor signal voltage at the PCM goes below 0.58 volts for 2.6 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
A/C PRESSURE SENSOR INTERNAL FAILURE
A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
PCM 5 VOLT SUPPLY CIRCUIT
PCM A/C PRESSURE SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the A/C refrigerant System is properly charged per the Service Information.** Start the engine. With the DRBIII®, read the A/C Pressure Sensor voltage. Is the voltage below 0.6 volts? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the A/C Pressure Sensor harness connector. Is the voltage between 4.5 to 5.2 volts? Yes → Go To 3 No → Go To 7	All

P1599-A/C PRESSURE SENSOR VOLTS TOO LOW — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. With the DRBIII®, monitor the A/C Pressure Sensor voltage. Turn the ignition on. Is the voltage above 0.6 volts? Yes → Replace the A/C Pressure Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 4	All
4	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the A/C Pressure Sensor Signal circuit in the A/C Pressure Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the A/C Pressure Sensor Signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 5	All
5	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between the A/C Pressure Sensor Signal circuit and the Sensor ground circuit in the A/C Pressure Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the A/C Pressure Sensor Signal circuit for a short to the Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
7	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the 5 Volt Supply circuit in the A/C Pressure Sensor harness connector. Is the resistance below 100 ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 8	All

P1599-A/C PRESSURE SENSOR VOLTS TOO LOW — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the A/C Pressure Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the 5 Volt Supply circuit between the A/C Pressure Sensor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the 5 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
9	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
10	**NOTE: Ensure the A/C refrigerant System is properly charges per the Service Information.** **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All

Symptom List:

- **ANTENNA FAILURE**
- **COP FAILURE**
- **EEPROM FAILURE**
- **INTERNAL FAULT**
- **RAM FAILURE**
- **SERIAL LINK INTERNAL FAULT**
- **STACK OVERFLOW FAILURE**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ANTENNA FAILURE.

When Monitored and Set Condition:

ANTENNA FAILURE

When Monitored: Every 250 milliseconds with the ignition on.

Set Condition: The SKIM's microcontroller determines that an antenna circuit fault has occurred for 2.0 consecutive seconds.

COP FAILURE

When Monitored: With the ignition on.

Set Condition: The COP timer is not reset by the micro controller every 65.5 milliseconds.

EEPROM FAILURE

When Monitored: With the ignition on.

Set Condition: When the value written to EEPROM memory does not equal the value read back after the write operation.

INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM has detected a fault during an internal self test.

RAM FAILURE

When Monitored: With the ignition on.

Set Condition: The RAM fails a test that checks the RAM's ability to retain memory.

SERIAL LINK INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM fails an internal J1850 communication self test.

STACK OVERFLOW FAILURE

When Monitored: With the ignition on.

Set Condition: The micro controller has exceeded its stack space limit.

ANTENNA FAILURE — Continued

POSSIBLE CAUSES
SKIM INTERNAL DTC FAILURE

TEST	ACTION	APPLICABILITY
1	**Note: This trouble code indicates an internal SKIM fault.** With the DRBIII®, read and record the SKIM DTCs and then erase the SKIM DTCs Perform 10 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle. With the DRBIII® , read the SKIM DTCs. Did the same SKIM DTC return? Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.	All

Symptom List:
PCM STATUS FAILURE
SERIAL LINK EXTERNAL FAULT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be PCM STATUS FAILURE.

When Monitored and Set Condition:

PCM STATUS FAILURE

When Monitored: With the ignition on.

Set Condition: This DTC exists when a PCM STATUS message was not received from the PCM for at least 20.0 consecutive seconds.

SERIAL LINK EXTERNAL FAULT

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM reset, or during SECRET KEY transfers to the PCM.

Set Condition: When the SKIM does not receive an expected PCI BUS message transmission acknowledgement from the PCM after 3 transmit attempts.

POSSIBLE CAUSES
INTERMITTENT WIRING HARNESS PROBLEM
WIRING HARNESS INSPECTION
SKIM/PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the PCM has proper power and ground connections before continuing.** With the DRBIII®, read and record the SKIM DTCs then erase the SKIM DTCs. Turn the ignition off. Wait 2 minutes. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased? Yes → Go To 2 No → Go To 4	All

PCM STATUS FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and CCD/PCI Bus (whichever applicable) circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Perform SKIS VERIFICATION. No → Go To 3	All
3	**NOTE: Before proceeding it will be necessary to obtain the SKIM PIN.** Turn the ignition on. With the DRBIII®, display and erase all PCM and SKIM DTC's. Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle. With the DRBIII®, read the SKIM DTCs. Does the code appear? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.	All
4	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION. No → Test Complete.	All

Symptom List:

ROLLING CODE FAILURE

VIN MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ROLLING CODE FAILURE.

When Monitored and Set Condition:

ROLLING CODE FAILURE

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

Set Condition: When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

VIN MISMATCH

When Monitored: With the ignition on.

Set Condition: When the VIN received from the PCM does not match the VIN stored in the SKIM's EEPROM.

POSSIBLE CAUSES
VERIFYING PCM VIN
REPLACE SKIM AND CHECK DTC'S
INTERMITTENT WIRING HARNESS PROBLEM
PCM

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on and wait 2 minutes. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased? Yes → Go To 2 No → Go To 4	All

ROLLING CODE FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition on. With the DRBIII®, select Engine system from the main menu. Display and record the Vehicle Identification Number. **NOTE: Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct vehicle VIN before continuing.** Does the VIN recorded from the PCM match the VIN of the vehicle? Yes → Go To 3 No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.	All
3	Turn the ignition off. Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Turn the ignition on. With the DRBIII®, display and clear all PCM and SKIM DTC's. Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle. With the DRBIII®, check for SKIM DTCs. Does the DRBIII® display the same DTC? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → The repair is complete. Perform SKIS VERIFICATION.	All
4	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION. No → Test Complete.	All

Symptom List:

TRANSPONDER COMMUNICATION FAILURE
TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE
TRANSPONDER ID MISMATCH
TRANSPONDER RESPONSE MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be TRANSPONDER COMMUNICATION FAILURE.

When Monitored and Set Condition:

TRANSPONDER COMMUNICATION FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the SKIM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When 5 consecutive transponder signal transmissions are sent to the SKIM with the correct message format but with invalid data.

TRANSPONDER ID MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder ID read by the SKIM does not match any of the transponder ID's stored in the SKIM's memory.

TRANSPONDER RESPONSE MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder's crypto algorithm result fails to match the SKIM's result.

POSSIBLE CAUSES
CHECKING MULTIPLE KEY OPERATION
SKIM
INTERMITTENT WIRING HARNESS PROBLEM
REPLACE IGNITION KEY

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read and record the SKIM DTCs. With the DRBIII®, erase the SKIM DTCs. **NOTE: Perform the following test several times to ensure the DTC is current.** Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased? Yes → Go To 2 No → Go To 7	All
2	Are there multiple vehicle ignition keys available? Yes → Go To 3 No → Go To 4	All
3	**NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys one at a time.** With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Is the DTC present for all ignition keys? Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Replace the ignition key(s) that cause the SKIM DTC. Perform SKIS VERIFICATION.	All
4	With the DRBIII®, attempt to reprogram the ignition keys to the SKIM. With the DRBIII®, erase the SKIM DTCs. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DTC reset? Yes → Go To 5 No → Test Complete.	All
5	Replace the ignition key with a new key. With the DRBIII®, program the new ignition key to the SKIM. With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DTC reset? Yes → Go To 6 No → Test Complete.	All

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
6	If there are no possible causes remaining, view repair. Repair Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION.	All
7	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION. No → Test Complete.	All

Symptom List:

P1595-SPEED CONTROL SOLENOID CIRCUITS
P1683-SPD CTRL PWR RELAY; OR S/C 12V DRIVER CKT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1595-SPEED CONTROL SOLENOID CIRCUITS.

When Monitored and Set Condition:

P1595-SPEED CONTROL SOLENOID CIRCUITS

When Monitored: With the ignition on. Battery voltage greater than 10 volts. Speed Control Switched on.

Set Condition: The Powertrain Control Module actuates the vacuum and vent solenoids but they do not respond.

P1683-SPD CTRL PWR RELAY; OR S/C 12V DRIVER CKT

When Monitored: With the ignition key on. The speed control switched on.

Set Condition: The speed control power supply circuit is either open or shorted to ground.

POSSIBLE CAUSES
GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
S/C BRAKE SWITCH OUTPUT CIRCUIT
SPEED CONTROL SWITCH OUTPUT OPEN
BRAKE LAMP SWITCH
SPEED CONTROL POWER SUPPLY CIRCUIT
PCM (S/C POWER SUPPLY)
SPEED CONTROL VACUUM SOLENOID
SPEED CONTROL VACUUM SOLENOID CONTROL CIRCUIT OPEN
PCM (VACUUM SOLENOID)
SPEED CONTROL VACUUM SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
SPEED CONTROL VENT SOLENOID
SPEED CONTROL VENT SOLENOID CONTROL CIRCUIT OPEN
SPEED CONTROL VENT SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
PCM (VENT SOLENOID)

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: In the below step you will need to actuate both S/C solenoids separately. Note the operation of the each solenoid when actuated.** With the DRBIII®, actuate the Speed Control Vacuum Solenoid and note operation. With the DRBIII®, actuate the Speed Control Vent Solenoid and note operation. Choose the conclusion that best matches the solenoids operation? Vacuum Solenoid not operating Go To 2 Vent Solenoid not operating Go To 6 Both S/C Solenoids not operating Go To 10 Both S/C Solenoids operating Go To 15	All
2	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Turn the ignition on. With the DRBIII®, actuate the Speed Control Vacuum Solenoid. Using a 12-volt test light connected to 12-volts, probe the Speed Control Vacuum Solenoid Control circuit. Does the test light illuminate brightly and flash? Yes → Replace the Speed Control Servo. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 3	All
3	Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the PCM harness connector. Measure the resistance of the Speed Control Vacuum Solenoid Control circuit between the PCM harness connector and Speed Control Servo harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Speed Control Vacuum Solenoid Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
4	Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the PCM harness connector. Measure the resistance of the Speed Control Vacuum Solenoid Control circuit in the PCM harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Speed Control Vacuum Solenoid Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 5	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
5	If the there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
6	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Turn the ignition on. With the DRBIII®, actuate the Speed Control Vent Solenoid. Using a 12-volt test light connected to 12-volts, probe the Speed Control Vent Solenoid Control circuit in the Speed Control Servo harness connector. Does the test light illuminate brightly and flash? Yes → Replace the Speed Control Servo. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 7	All
7	Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the PCM harness connector. Measure the resistance of the Speed Control Vent Solenoid Control circuit between the PCM harness connector and Speed Control Servo harness connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the Speed Control Vacuum Solenoid Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
8	Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the PCM harness connector. Measure the resistance of the Speed Control Vent Solenoid Control circuit in the PCM harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Speed Control Vacuum Solenoid Control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 9	All
9	If the there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
10	Turn the ignition off. Disconnect the S/C Servo harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the S/C Brake Switch Output circuit in the S/C Servo harness connector. Does the test light illuminate brightly? Yes → Replace the Speed Control Servo. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 11	All
11	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Disconnect the Brake Lamp Switch harness connector. Measure the resistance of the Speed Control Brake Switch Output circuit between the Speed Control Servo harness connector and Brake Lamp Switch harness connector. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Repair the Speed Control Brake Switch Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
12	Disconnect the Brake Lamp Switch harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Speed Control Power Supply circuit in the Brake Lamp Switch harness connector. Does the test light illuminate brightly? Yes → Replace the Brake Lamp Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 13	All
13	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the Brake Lamp Switch harness connector. Measure the resistance of the Speed Control Power Supply circuit between the PCM harness connector and the Brake Lamp Switch harness connector. Is the resistance below 5.0 ohms? Yes → Go To 14 No → Repair the Speed Control Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
14	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
15	Turn the ignition off. Disconnect the S/C Servo harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit in the S/C Servo harness connector. Does the test light illuminate brightly? Yes → Go To 16 No → Repair the ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
16	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Test Complete.	All

Symptom:
P1597-SPEED CONTROL SWITCH ALWAYS LOW

When Monitored and Set Condition:

P1597-SPEED CONTROL SWITCH ALWAYS LOW

When Monitored: With the ignition key on. Battery voltage above 10 volts.

Set Condition: When switch voltage is less than 0.43 volts for 2 minutes.

POSSIBLE CAUSES
INTERMITTENT CONDITION
SPEED CONTROL ON/OFF SWITCH
SPEED CONTROL RESUME/ACCEL SWITCH
SPEED CONTROL SWITCH SIGNAL CIRCUIT SHORTED TO SENSOR GROUND
SPEED CONTROL SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Do not press any of the Speed Control Switch buttons.** Turn the ignition on. With the DRBIII®, read the Speed Control voltage. Is the Speed Control voltage below 1.0 volts? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition on. With the DRBIII®, monitor the Speed Control Switch voltage. Disconnect the Speed Control On/Off Switch harness connector. Did the volt change to above 4.7 volts? Yes → Replace the Speed Control On/Off Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 3	All
3	Turn the ignition on. With the DRBIII®, monitor the Speed Control Switch voltage. Disconnect the Speed Control Resume/Accel Switch harness connector. Did the volt change to above 4.7 volts? Yes → Replace the Speed Control Resume/Accel Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 4	All

P1597-SPEED CONTROL SWITCH ALWAYS LOW — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Speed Control On/Off Switch harness connector. Disconnect the Speed Control Resume/Accel Switch harness connector. Disconnect the PCM harness connector. Measure the resistance between the Speed Control Switch Signal circuit and the Sensor ground circuit in the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Repair the Speed Control Switch Signal circuit shorted to Sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 5	All
5	Turn the ignition off. Disconnect the Speed Control On/Off Switch harness connector. Disconnect the Speed Control Resume/Accel Switch harness connector. Disconnect the PCM harness connector. Measure the resistance of the Speed Control Switch Signal circuit in PCM harness connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Speed Control Switch Signal circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 6	All
6	**NOTE: Before Continuing: Disconnect the PCM harness connector and check the related wiring terminals for corrosion, damage or terminal push out. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
7	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DRBIII® Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Test Complete.	All

Symptom:
*ENGINE CRANKS DOES NOT START

POSSIBLE CAUSES
FUEL PUMP RELAY
NO START PRE-TEST
OTHER POSSIBLE CAUSES FOR NO START
POWERTRAIN FUSES OPEN
FUEL PRESSURE OUT OF SPECS
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
FUEL PUMP CAPACITY (VOLUME) OUT OF SPECS
FUEL PUMP RELAY FUSED B+ CIRCUIT
FUEL PUMP RELAY OUTPUT CIRCUIT OPEN
FUEL PUMP GROUND CIRCUIT OPEN/HIGH RESISTANCE
FUEL PUMP MODULE

TEST	ACTION	APPLICABILITY
1	**Note: The following list of items must be checked before continuing with any no start tests.** The battery must be fully charged and in good condition. A low charged battery may produce invalid test results. If the battery is low, charge the battery and then attempt to start the vehicle by cranking the engine for 15 seconds, 3 consecutive times. This will allow any DTC's to set that may have been erased due to a dead battery. Ensure the Powers and Ground to the PCM are ok. Make sure the PCM communicates with the DRB and that there are no DTC's stored in the PCM memory. If the PCM reports a No Response condition, refer to the Communication category for the proper tests. Read the PCM DTC's with the DRB. If any DTC's are present, they must be repaired before continuing with any other No Start diagnostic tests. Refer to the Symptom list for the related P-code that is reported by the PCM. Ensure that the PCI bus is functional. Attempt to communicate with the Instrument Cluster and SKIM, If you are unable to establish communicate refer to the Communication category for the proper symptoms. The Sentry Key Immobilizer System must be operating properly. Check for proper communication with the DRBIII® and check for DTC's that may be stored in the Sentry Key Immobilizer Module (SKIM). repair the DTC(s) before continuing. If no DTC's are found, using the DRB select Clear PCM (Batt Disconnect). Crank the engine several times. Using the DRB, read DTC's. If a DTC is present perform the DTC diagnostics before continuing. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 2	All

*ENGINE CRANKS DOES NOT START — Continued

TEST	ACTION	APPLICABILITY
2	Check for any open fuses in the PDC or Fuse Block that may be related to the No Start condition. Are any of the fuses open? Yes → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors, repair as necessary. Replace the Fuse. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 3	All
3	Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. **Note: It may be necessary to use a mechanics stethoscope in the next step.** Listen for fuel pump operation at the fuel tank. Does the Fuel Pump operate? Yes → Go To 4 No → Go To 9 **Caution: Stop All Actuations.**	All
4	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Install a fuel pressure gauge to the fuel rail test port. (2.7L use the fuel adapter #6539 Miller Tool) Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 kPa +/- 34 kPa (58 psi +/- 5 psi).** Choose a conclusion that best matches your fuel pressure reading. Below Specification Go To 5 Within Specification Go To 7 Above Specification Replace the fuel filter/fuel pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 1. **Caution: Stop All Actuations.**	All

*ENGINE CRANKS DOES NOT START — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16″ fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module. Attach a fuel pressure test gauge to the ″T″ fitting on tool #6539. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Is the fuel pressure within specification now? Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 6 **Caution: Stop All Actuations.**	All
6	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose,fitting or line, the fuel system pressure must be released.** Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer. Is the Fuel Inlet Strainer plugged? Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
7	**Note: The fuel pressure must be within specification before continuing.** Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Disconnect the fuel supply line at the fuel rail. Connect fuel line adapter #6539(5/16″) or #6631(3/8″) to the disconnected fuel supply line. Insert the other end of the adapter into a graduated container. **Caution: Do not operate the fuel pump for more than 7 seconds in the next step. Fuel pump module reservoir may run empty and damage to the fuel pump will result.** **Note: Specification: A good fuel pump will deliver at least 1/4 liter (1/2 pint) of fuel in 7 seconds.** Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test for 7 seconds. Is the fuel pump capacity within specification? Yes → Go To 8 No → Check for a kinked/damaged fuel supply line between the fuel tank and fuel rail. If OK, replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 1. **Caution: Stop All Actuations.**	All

*ENGINE CRANKS DOES NOT START — Continued

TEST	ACTION	APPLICABILITY
8	The following items need to be checked as a possible cause for a no start condition. Refer to any Technical Service Bulletins that may apply to the symptom. The spark plugs must be free from fuel, oil, coolant and/or any foreign material or deposits. The fuel must be free from contamination. The exhaust may be free from restrictions. The engine compression must be within specifications. The engine valve timing must be within specifications. The engine must be free from vacuum leaks. Were any of the above conditions found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All
9	Turn the ignition off. Disconnect the fuel pump module harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. Using a 12 volt test light connected to ground, probe the Fuel Pump Relay Output circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly? Yes → Go To 10 No → Go To 12 **Caution: Stop All Actuations.**	All
10	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. **Note: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities - Clean/repair as necessary.** Using a test light connected to battery voltage, probe the Fuel Pump ground circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly? Yes → Go To 11 No → Repair the open/high resistance in the fuel pump ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
11	If there are no possible causes remaining, view repair. Repair Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
12	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. With a 12 volt test light connected to ground, probe the Fuel Pump Relay Fused B+ circuit at the PDC. Does the test light illuminate? Yes → Go To 13 No → Repair the Fuel Pump Relay Fused B+ circuit. Check for open fuse in the PDC. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*ENGINE CRANKS DOES NOT START — Continued

TEST	ACTION	APPLICABILITY
13	Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Disconnect the Fuel Pump Module harness connector. **NOTE: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities** Measure the resistance of the Fuel Pump Relay Output circuit from the relay connector to the fuel pump module connector. Is the resistance below 5.0 ohms? Yes → Replace the Fuel Pump Relay. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Repair the open fuel pump relay output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*NO CRANK CONDITION

POSSIBLE CAUSES
REPAIR MECHANICAL CONDITION
TRANSMISSION RANGE SENSOR
BATTERY CIRCUIT RESISTANCE TOO HIGH
IGNITION SWITCH OUTPUT CIRCUIT OPEN
STARTER RELAY CONTROL CIRCUIT OPEN
STARTER RELAY OUTPUT CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
STARTER
STARTER MOTOR RELAY
STARTER RELAY

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that SKIS is operating properly. Check the SKIM for DTC. If a SKIM DTC(s) is present diagnose them first before continuing.** **WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING.** Turn the engine over by hand to ensure the engine is not seized. Is the engine able to turn over? Yes → Go To 2 No → Repair the mechanical condition preventing the starter motor from cranking. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition off. Disconnect the PCM harness connectors. Move the Gear selector through all gear positions, from Park to 1st and back. While moving the gear selector through each gear, measure the resistance between ground and the P/N Position Switch Sense circuit. Did the resistance change from above 10.0 ohms to below 10.0 ohms? Yes → Go To 3 No → Replace the Transmission Range Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Check the Battery Cables for high resistance using the service information procedure. Did either Battery Cable have a voltage drop greater than 0.2 volt? Yes → Repair the Battery circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 4	All

*NO CRANK CONDITION — Continued

TEST	ACTION	APPLICABILITY
4	Turn ignition off. Remove the Starter Relay from PDC. **WARNING: The Parking Brake must be on and the Transmission must be in park for a vehicle equipped with an automatic transmission.** **Warning: The engine may be cranked in the next step. Keep away from moving engine parts.** Briefly connect a jumper wire between Starter Relay B+ circuit and the Starter Relay Output Circuits. Did the Starter Motor crank the engine? Yes → Go To 5 No → Go To 8	All
5	Turn the ignition off. Remove the Starter Relay from the PDC. Turn the ignition on. Using a 12-volt test light, probe the Ignition Switch Output circuit in the Starter Relay connector. While observing 12-volt test light, hold ignition key in the start position. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Ignition Switch Output circuit for an open or high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
6	Turn the ignition off. Remove the Starter Relay from the PDC. Disconnect the PCM harness connector. Measure the Starter Relay Control circuit between the Relay terminal and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Starter Relay Control circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
7	Turn the ignition off. Install a substitute a Relay in the of the Starter Motor Relay. Attempt to start the vehicle. Does the engine crank over? Yes → Replace the Starter Motor Relay. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*NO CRANK CONDITION — Continued

TEST	ACTION	APPLICABILITY
8	Turn ignition off. Remove the Starter Relay from the PDC. Disconnect the Starter Relay Output connector from the Starter Solenoid. Measure the resistance of the Starter Relay Output circuit between the Relay and the Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair Starter Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
9	Turn the ignition off. Remove the Starter Relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused B+ circuit at the Starter Relay terminal. Does the test light illuminate brightly? Yes → Go To 10 No → Repair the Fused B(+) Circuit for an open or high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
10	If there are no other possible causes remaining, review repair. Repair Replace the Starter. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*NO RESPONSE FROM PCM WITH A NO START CONDITION

POSSIBLE CAUSES
PCM FUSED B+ CIRCUIT
PCM FUSED IGNITION SWITCH OUTPUT CIRCUIT
PCM GROUND CIRCUITS
PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: The DRBIII® and cable must be operating properly for the results of this test to be valid.** **NOTE: Ensure the ignition switch was on when trying to communicate with the PCM.** Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to ground, probe the PCM Fused B+ circuit in the PCM harness connector. Does the test light illuminate brightly? Yes → Go To 2 No → Repair the Fused B+ circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition off. Disconnect the PCM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the PCM Fused Ignition Switch Output circuit in the PCM harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Ignition Switch Output circuit Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to battery voltage, probe all the PCM ground circuits in the PCM harness connector. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the PCM ground circuits. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
4	If there is no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*START AND STALL CONDITION

POSSIBLE CAUSES
CHECKING DTCS
CHECKING SKIM DTCS
FUEL PRESSURE OUT OF SPECS
FUEL PUMP CAPACITY (VOLUME) OUT OF SPECS
TP SENSOR SWEEP
TP SENSOR VOLTAGE GREATER THAN 0.92 VOLTS WITH THROTTLE CLOSED
ECT SENSOR OPERATION
OTHER POSSIBLE CAUSES FOR START & STALL
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Are any DTCs present? Yes → Refer to the Driveability Category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 2	All
2	Turn the ignition on. **NOTE: If you are unable to communicate with the SKIM, refer to the Communication Category and perform the appropriate symptom.** With the DRBIII®, read the SKIM codes. Are there any SKIM DTCs? Yes → Refer to the Vehicle Theft category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 3	All

*START AND STALL CONDITION — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Install a fuel pressure gauge to the fuel rail test port. (2.7L use the fuel adapter #6539 Miller Tool) Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Choose a conclusion that best matches your fuel pressure reading. Below Specification Go To 4 Within Specification Go To 6 Above Specification Replace the fuel filter/fuel pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 1. **Caution: Stop All Actuations.**	All
4	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16″ fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module. Attach a fuel pressure test gauge to the ″T″ fitting on tool #6539. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. **NOTE: Fuel pressure specification is 400 KPa +/- 34 KPa (58 psi +/- 5 psi).** Is the fuel pressure within specification now? Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 5 **Caution: Stop All Actuations.**	All
5	Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose,fitting or line, the fuel system pressure must be released.** Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer. Is the Fuel Inlet Strainer plugged? Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*START AND STALL CONDITION — Continued

TEST	ACTION	APPLICABILITY
6	**Note: The fuel pressure must be within specification before continuing.** Turn the ignition off. **WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.** Disconnect the fuel supply line at the fuel rail. Connect fuel line adapter #6539(5/16″) or #6631(3/8″) to the disconnected fuel supply line. Insert the other end of the adapter into a graduated container. **Caution: Do not operate the fuel pump for more than 7 seconds in the next step. Fuel pump module reservoir may run empty and damage to the fuel pump will result.** **Note: Specification: A good fuel pump will deliver at least 1/4 liter (1/2 pint) of fuel in 7 seconds.** Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test for 7 seconds. Is the fuel pump capacity within specification? Yes → Go To 7 No → Check for a kinked/damaged fuel supply line between the fuel tank and fuel rail. If OK, replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 1. **Caution: Stop All Actuations.**	All
7	Turn the ignition on. With the DRBIII®, read TPS VOLTS. While monitoring the DRBIII®, slowly open and close the Throttle. Is the voltage change smooth? Yes → Go To 8 No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
8	Turn the ignition on. With the DRBIII®, read Throttle Position voltage. Throttle must be against stop. Is the voltage 0.92 or less with the Throttle closed? Yes → Go To 9 No → Check for a binding throttle condition. If OK, replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*START AND STALL CONDITION — Continued

TEST	ACTION	APPLICABILITY
9	**Note: For this test to be valid, the thermostat must be operating correctly.** **Note: This test works best if performed on a cold engine (cold soaked).** **NOTE: If the vehicle was allow to sit over night with no engine start, coolant temperature should be near ambient temperatures.** Turn the ignition on. With the DRBIII®, read the Engine Coolant Temperature value. **Note: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.** Start the engine. During engine warm-up, monitor the Engine Coolant Temperature value. The temperature value change should be a smooth transition from start up to normal operating temp 82° C (180° F). The value should reach at least 82° C (180° F). Did the Engine Temperature value increase smoothly and did it reach at least 82° C (180° F)? Yes → Go To 10 No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
10	The following additional items should be checked as a possible cause for a start and stall condition. Refer to any Technical Service Bulletins (TSB's) that may apply to the symptom. Fuel must be free of contamination. The exhaust system must be free of any restrictions. The engine compression must be within specifications. The engine valve timing must be within specifications. The engine must be free from vacuum leaks. The throttle body must be free of carbon buildup and dirt. Do any of the above conditions exist? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All

Verification Tests

41TE TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. Connect the DRBIII® to the Data Link Connector (DLC). 2. Reconnect any disconnected components. 3. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's. **4. NOTE: Erase DTC P0700 in the PCM to turn the Malfunction Indicator Lamp (MIL) off after making Transmission repairs.** 5. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT - above 43° C or 110° F. 6. Check the Transmission Fluid and adjust if necessary. Refer to the Service information for the Fluid Fill procedure. **7. NOTE: If the Transmission Control Module or the Transmission has been repaired or replaced it is necessary to perform the DRBIII® Quick Learn Procedure and reset the ″Pinion Factor″** 8. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees. 9. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 10. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC repair. 11. If equipped with AutoStick®, up-shift and down-shift several times using the AutoStick® feature during the road test. **12. NOTE: Use the EATX OBDII Task Manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.** 13. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test , return to the Symptom list and perform the appropriate Symptom. Were there any Diagnostic Trouble Codes (DTCs) set during the road test? Yes → Refer to the Symptom List for appropriate Symptom(s). No → Repair is complete.	All

Verification Tests — Continued

BODY VERIFICATION TEST - VER 1	APPLICABILITY
1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors. 2. If the Sentry Key Immobilizer Module (SKIM) or the Powertrain Control Module (PCM) was replaced, proceed to number 6. If the SKIM or PCM was not replaced, continue to the next number. 3. If the Body Control Module was replaced, turn the ignition on for 15 seconds (to allow the new BCM to learn VIN) or engine may not start (if VTSS equipped). If the vehicle is equipped with VTSS, use the DRBIII® and enable VTSS. 4. Program all other options as needed. 5. If any repairs were made to the HVAC System, disconnect the battery or, using the DRBIII®, recalibrate the HVAC doors. Proceed to number 13. 6. Obtain the Vehicle's unique PIN assigned to it's original SKIM from either the vehicle's invoice or from Chrysler's Customer Assistance Center (1-800-992-1997). 7. NOTE: Once Secured Access Mode is active, the SKIM will remain in that mode for 60 seconds. 8. With the DRBIII®, select THEFT ALARM, SKIM, MISCELLANEOUS and select SKIM REPLACED. Enter the 4 digit PIN to put the SKIM in Secured Access Mode. 9. The DRBIII® will prompt for the following steps. (1) Program the country code into the SKIM's memory. (2) Program the vehicle's VIN into the SKIM memory. (3) Transfer the vehicle's Secret Key data from the PCM. 10. Using the DRBIII®, program all customer keys into the SKIM memory. This requires that the SKIM be in Secured Access Mode, using the 4 digit PIN. 11. Note: If the PCM is replaced, the VIN and the unique Secret Key data must be transferred from the SKIM to the PCM. This procedure requires the SKIM to be placed in Secured Access Mode using the 4-digit PIN. 12. Note: After 3 attempts at entering Secured Access Mode with an incorrect PIN, Secured Access Mode will be locked out for 1 hour and the DRBIII® will display ″Bus +\- Signals Open″ or ″No Response″. To exit this mode, turn ignition to Run for 1 hour. 13. Ensure that all accessories are turned off and the battery is fully charged. 14. Ensure that the Ignition is on. 15. With the DRBIII®, record and erase all DTCs from ALL modules. Start and run the engine for 2 minutes. Operate all functions of the system that caused the original concern. 16. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII®, read DTCs from ALL modules. Are any DTC's present or is the original condition still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all components related to the repair are connected properly. 4. Inspect the engine oil for fuel contamination. Replace the oil and filter as necessary. 5. Attempt to start the engine. 6. If the No Start condition is still present, refer to the symptom list and perform the diagnostic testing as necessary. refer to and Technical Service Bulletins that may apply. 7. Run the engine for one warm-up cycle to verify operation. 8. With the DRBIII®, confirm that no DTCs or Secondary Indicators are present and that all components are functioning properly. 9. If a DTC is present, refer to the appropriate category and select the corresponding symptom. Are any DTCs present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

POWERTRAIN VERIFICATION TEST VER - 2	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all components related to the repair are connected properly. 4. With the DRBIII®, clear DTCs and Reset Memory all engine values. 5. Run the engine for one warm-up cycle to verify proper operation. 6. Road test the vehicle. Use all accessories that may be related to this repair. 7. With the DRBIII®, confirm that no DTC's or Secondary Indicators are present and that all components are functioning properly. 8. If this test is being performed after a No Trouble Code test, verify the symptom is no longer present. 9. If the symptom is still present, or any other symptom or DTC is present refer to the appropriate category and perform the corresponding symptom. 10. Refer to any Technical Service Bulletins that may apply. 11. If there are no DTCs present and all components are functional properly, the repair is complete. Are any DTCs present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 3	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all components related to the repair are connected properly. 4. With the DRBIII®, clear DTCs. 5. Perform generator output test. Refer to the appropriate service information as necessary. 6. Start the engine and set engine speed to 2000 RPM for at least thirty seconds. 7. Cycle the ignition key off and on. 8. With the DRBIII®, read the DTCs. If the DTC returns, or any other symptom or DTC is present, refer to the appropriate category and perform the corresponding symptom. 9. If there are no DTCs present and all components are functioning properly, the repair is complete. Are any DTCs present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 4	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all engine components are properly installed and connected. 4. Connect the DRBIII® to the data link connector and erase all codes. 5. Turn the speed control ON (if equipped, cruise light will be on). 6. Press and release the SET Switch. If the speed control did not engage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 7. Press and hold the RESUME/ACCEL Switch. If the vehicle speed did not increase by at least 2 mph, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 8. Press and hold the COAST switch. The vehicle speed should decrease. If it did not decrease, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 9. Using caution, press and release the brake pedal. If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 10. Bring the vehicle speed back up to 35 MPH. 11. Press the RESUME/ACCEL switch. If the speed control did not resume the previously set speed, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 12. Hold down the SET switch. If the vehicle did not decelerate, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 13. Ensure vehicle speed is greater than 35 mph and release the SET Switch. If vehicle did not adjust and set a new vehicle speed, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 14. Press and release the CANCEL switch. If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 15. Bring the vehicle speed back up above 35 mph and engage speed control. 16. Turn the Speed Control Off. (Cruise light will be off). If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List. 17. If the vehicle successfully passed all of the previous tests, the speed control system is now functioning as designed. The repair is now complete. Did the Speed Control pass the above test? Yes → Repair is complete. No → Repair is not complete, refer to appropriate symptom.	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 5	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 4. Connect the DRBIII® to the data link connector. 5. Ensure the fuel tank has at least a quarter tank of fuel. Turn off all accessories. 6. If a Comprehensive Component DTC was repaired, perform steps 5 - 8. If a Major OBDII Monitor DTC was repaired skip those steps and continue verification. 7. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes. 8. If the Good Trip counter changed to one or more and there are no new DTC's, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®. 9. If the repaired DTC has reset, the repair is not complete. Check for any related TSB's or flash updates and return to the Symptom list. 10. If another DTC has set, return to the Symptom List and follow the path specified for that DTC. 11. With the DRBIII®, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running). 12. If the monitor ran, and the Good Trip counter changed to one or more, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®. 13. If the repaired OBDII trouble code has reset or was seen in the monitor while on the road test, the repair is not complete. Check for any related technical service bulletins or flash updates and return to Symptom List. 14. If another DTC has set, return to the Symptom List and follow the path specified for that DTC. Are any DTCs present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 6	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 4. The LDP Monitor Test Mode has been added to the DRBIII® to verify repairs to the LDP System. A DRBIII® software program was written which causes the PCM to run the LDP Monitor as part of this test. Test failures will be indicated through a stored DTC. 5. LDP Monitor Test Mode is a useful way to run a total system performance test. Use this test to verify any type of LDP system repair. 6. Software program makes temporary changes to operating mode of PCM. For this reason, it is critical that test not be interrupted. PCM's left in this mode as result of interrupted test will illuminate the MIL for 8-10 mi of driving with no DTC's stored. 7. Erasing DTC's will not change this condition. 8. If a vehicle is found to be stuck in the mode described above, the LDP Dealer Test should be re-run in its entirety so that the software program in the DRBIII® can restore the PCM operating mode. 9. Note similarity to LDP Monitor screen found under OBDII Monitors. Failure modes are fewer in this System Test than OBDII LDP Monitor. 10. System Test failure may have been, for example, due to a large leak, but the PCM will set the Small Leak DTC to indicate failures that occurred as part of the system test. 11. Connect the DRBIII® to the data link connector. Engine running, turn off all accessories. 12. Note: While test is being performed, PCM must see RPM, minimum MAP, No Vehicle speed and minimum Throttle Position sensor (At idle, in park.) With DRBIII® in System Tests, perform the LDP Monitor Test and follow the instructions on the screen. 13. If the LDP Monitor Test failed and a .020 Leak DTC has set, the repair is not complete. Check for any related Technical Service Bulletins and return to Symptom List. 14. If any other trouble code has set, return to Symptom List and follow the path specified for that trouble code. If the LDP Monitor Test passed, the repair was successful and testing is now complete. Are any DTCs present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

SKIS VERIFICATION	APPLICABILITY
1. Reconnect all previously disconnected components and connectors. 2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997). **3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKIM will Lock Out the DRB III for 1 hour.** 4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary. 5. With the DRB III, select Theft Alarm, SKIM and Miscellaneous. Then select desired procedure and follow the steps that will be displayed. 6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM. **7. NOTE: Prior to returning vehicle to the costumer, perform a module scan to be sure that all DTC's are erased. Erase any DTC's that are found.** 8. With the DRB III erase all DTC's. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle. 9. With the DRB III, read the SKIM DTC's. Are there any SKIM DTC's? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions and graphics needed to diagnose **2002 JR body system problems.** The diagnostics in this manual are based on the failure, condition or symptom being present at the time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate module; i.e., if the DRBIII® shows a “no response” condition, you must diagnose that first.
2. Read DTC’s (diagnostic trouble codes) with the DRBIII®.
3. If no DTC’s are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0.
All connector pinouts are in Section 9.0.
All schematics are in Section 10.0.
An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and installation procedure.

Diagnostic procedures change every year. New diagnostic systems may be added: carry over systems may be enhanced. READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE DIAGNOSTIC TROUBLE CODE. It is recommended that you review the entire manual to become familiar with all the new and changed diagnostic procedures.

This book reflects many suggested changes from readers of past issues. After using this book, if you have any comments or suggestions, please fill out the form in the back of this book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers all 2002 Chrysler Sebring convertible and four door models, and Dodge Stratus four door models.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the body control module (BCM) is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

1.3 FUSES AND LIGHT BULBS

When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

When replacing HALOGEN bulbs, do not touch the new bulb with your fingers. Oil contamination will severely shorten bulb life. If the bulb comes in contact with an oily surface, clean the bulb with rubbing alcohol.

2.0 IDENTIFICATION OF SYSTEM

The vehicle systems that are part of the “body” system are:

- Airbag System
- Audio
- Chimes
- Compass/Mini-Trip
- Door Ajar
- Exterior Lighting
- Heating and A/C
- Interior Lighting
- Mechanical Instrument Cluster
- Power Door Locks/Remote Keyless Entry
- Power Convertible Top
- Vehicle Communications
- Vehicle Theft Security System
- Wiper/Washer

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

The body system on the 2002 JR consists of a combination of modules that communicate over the PCI bus (Programmable Communication Interface multiplex system). Through the PCI bus, information about the operation of vehicle components and circuits is relayed quickly to the appropriate modules. All modules receive all the information transmitted on the bus even though a module may not require all information to perform its function. It will only respond to messages “addressed” to it through a binary coding process. This method of data transmission significantly reduces the complexity of the wiring in the vehicle and the size of wiring harnesses. All of the information about the functioning of all the systems is organized, controlled and communicated by the PCI bus, which is described in the Vehicle Communication section of this General Information.

Always begin by reading the diagnostic trouble codes using the DRBIII®. Next, look for the symptom in the Diagnostic Information and Procedures section of the Table of Contents located in the front of the book. This will direct you to the specific tests that must be performed.

Important Note:

If the Powertrain Control Module has been changed and the correct VIN and mileage have not been programmed, a DTC will be set in the Airbag module. In addition, if the vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable starting. Refer to the 2002 JR Powertrain Diagnostic Manual for more information. Erase codes in all modules.

3.1 AIRBAG SYSTEM/OCCUPANT RESTRAINT CONTROLLER SYSTEM

The 2002 Airbag System contain the following components: Occupant Restraint Controller (ORC), Airbag Warning Indicator, Clockspring, Driver and Passenger Dual Squib Airbags, Seat belt Tensioners, Left and Right Side Impact Airbag Control Module (SIACM), and Curtain (roof mounted) Airbags.

The (ORC) is a new type of Airbag Control Module (ACM) that supports staged airbag deployment. Staged deployment is the ability to trigger airbag system squib inflators all at once or individually as needed to provide the appropriate restraint for the severity of the impact. The ACM has four major functions: PCI Bus communications, onboard diagnostics, impact sensing, and component deployment. The ACM also contains an energy-storage capacitor. This capacitor stores enough electrical energy to deploy the front airbag components for two seconds following a battery disconnect or failure during an impact. The ACM is secured to the floor panel transmission tunnel between the front seats inside the vehicle. The ACM cannot be repaired or adjusted and must be replaced.

The ACM sends and/or receives PCI Bus messages with the Instrument Cluster (MIC), Body Control Module (BCM), Left and Right Side Impact Airbag Control Module (SIACM) and Powertrain Control Module (PCM). Diagnostic trouble codes will be set if the communication with these modules is lost or contains invalid information.

The microprocessor in the ACM monitors the impact sensor signal and the airbag system electrical circuits to determine the system readiness. The ACM also monitors bus messages from both SIACM. If the ACM detects a monitored system fault or SIACM fault, it sends a message to the instrument cluster via PCI bus to turn on the airbag warning indicator. The ACM can set both active and stored diagnostic trouble codes to aid in the diagnosing system problems. See DIAGNOSTIC TROUBLE CODES in this section.

The ACM has an internal accelerometer that senses the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. A pre-programmed decision algorithm in the ACM microprocessor determines when the deceleration rate is severe enough to require airbag system protection. The ACM also uses the crash severity to determine the level of driver and front passenger deployment, low medium or high. When the programmed conditions are met, the ACM sends an electrical signal to deploy the appropriate airbag system components.

THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTROMECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT.

The airbag warning lamp is the only point at which the customer can observe symptoms of a system malfunction. Whenever the ignition key is turned to the run or start position, the MCI performs a lamp check by turning the airbag warning indicator on for 6-8 seconds. After the lamp check, if the indicator turns on, it means that the ACM has checked the system and found it to be free of discernible malfunctions. If the lamp remains on, there could be an active fault in the system or the MIC lamp circuit may be internally shorted to ground. If the lamp comes on and stays on for a period longer than 6-8 seconds, then goes off, there is usually an intermittent problem in the system.

3.1.1 DRIVER AIRBAG

The airbag protective trim cover is the most visible part of the driver side airbag system. The protective trim cover is fitted to the front of the airbag module and forms a decorative cover in the center of the steering wheel. The module is mounted directly to the steering wheel. Located under the trim cover are the horn switch, the airbag cushion, and the airbag cushion supporting components. The airbag module includes a housing to which the cushion and hybrid inflator are attached and sealed. For 2002 driver airbag has dual stage squib inflators that include a small canister of highly compressed argon gas. The ACM uses vehicle crash severity, to determine the level of airbag deployment. When supplied with the proper electrical signal, the hybrid inflator or inflators discharge the compressed gas it contains directly into the cushion. The airbag module cannot be repaired, and must be replaced if deployed or in any way damaged.

WARNING: THE DRIVER AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO OVER 17236.89 Kpa (2500 PSI). DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTER-CHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE MOPAR PARTS CATALOG.

CAUTION: Deployed front airbags may or may not have live pyrotechnic material within the airbag inflator. Do not dispose of 2002 model year driver and passenger airbags unless you are sure of complete deployment. Please refer to the hazardous substance control system for proper disposal. Dispose of deployed airbags in a manner consistent with state, provincial, local, and federal regulations. Use the following table to identify the status of the airbag squib.

AIRBAG SQUIB STATUS

(1) Using a DRBIII® read Airbag DTC's

If the following active codes are present:

ACTIVE DTC	CONDITIONS	SQUIB STATUS
Driver Squib 1 open Driver Squib 2 open	Check the stored codes **AND IF** the stored minutes for both are within 15 minutes of each other.	Both Driver Squib 1 and 2 were used.
Driver Squib 1 open Driver Squib 2 open	Check the stored codes **AND IF** the stored minutes for Driver Squib 2 open is GREATER than the stored minutes for Driver Squib 1 by 15 minutes or more.	Driver Squib 1 was used; Driver Squib 2 is live.
Driver Squib 1 open Driver Squib 2 open	Check the stored codes **AND IF** the stored minutes for Driver Squib 1 open is GREATER than the stored minutes for Driver Squib 2 by 15 minutes or more.	Driver Squib 1 is live; Driver Squib 2 was used.
If Driver Squib 1 open	**AND IF** Driver Squib 2 opens is NOT an active code.	Driver Squib 1 was used; Driver Squib 2 is live.
If Driver Squib 2 open	**AND IF** Driver Squib 1 open is NOT an active code.	Driver Squib 1 is live; Driver Squib 2 was used.

If neither of the following codes is an active code:

ACTIVE DTC	SQUIB STATUS
Driver squib 1 open Driver squib 2 open	Status of Airbag is Unknown.

3.1.2 CLOCKSPRING

The clockspring is mounted on the steering column behind the steering wheel. This assembly consist of a plastic housing which contains a flat, ribbon-like, electrically conductive tape that winds and unwinds with the steering wheel rotation. The clockspring is used to maintain a continuous electrical circuit between the instrument panel wiring the driver airbag, the horn, and the vehicle speed control switches if equipped. The clockspring must be properly centered when it is reinstalled on the steering column following any service procedure, or if could be damaged. The clockspring cannot be repaired and it must be replaced.

3.1.3 PASSENGER AIRBAG

The airbag door in the instrument panel top cover above the glove box is the most visible part of the passenger side airbag system. The airbag door has a living hinge at the top, which is secured to the instrument panel top cover. Located under the airbag door is the airbag cushion and it's supporting components. The airbag module includes a housing to which the cushion and hybrid inflators are attached and sealed. For 2002 the front passenger airbag is equipped with dual stage squib inflators that include a small canister of highly compressed argon gas. The ACM uses vehicle crash severity, to determine the level of airbag deployment. When supplied with the proper electrical signal, the hybrid inflator or inflators discharge the compressed gas if contains directly into the airbag. The airbag module cannot be repaired, and must be replaced if deployed or in any way damaged.

WARNING: THE PASSENGER AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO 17236.89 Kpa (2500 PSI). DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTER-CHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE MOPAR PARTS CATALOG.

CAUTION: Deployed front airbags may or may not have live pyrotechnic material within the airbag inflator. Do not dispose of 2002 model year driver and passenger airbags unless you are sure of complete deployment. Please refer to the hazardous substance control system for proper disposal. Dispose of deployed airbags in a manner consistent with state, provincial, local, and federal regulations. Use the following table to identify the status of the airbag squib.

AIRBAG SQUIB STATUS

(1) Using a DRBIII® read Airbag DTC's

If the following active codes are present:

ACTIVE DTC	CONDITIONS	SQUIB STATUS
Passenger Squib 1 open Passenger Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for both are within 15 minutes of each other.	Both Passenger Squib 1 and 2 were used.
Passenger Squib 1 open Passenger Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for Passenger Squib 2 open is GREATER than the stored minutes for Passenger Squib 1 by 15 minutes or more.	Passenger Squib 1 was used; Passenger Squib 2 is live.
Passenger Squib 1 open Passenger Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for Passenger Squib 1 open is GREATER than the stored minutes for Driver Squib 2 by 15 minutes or more.	Passenger Squib 1 is live; Driver Squib 2 was used.
If Passenger Squib 1 open	**AND IF** Passenger Squib 2 open is NOT an active code.	Passenger Squib 1 was used; Passenger Squib 2 is live.
If Passenger Squib 2 open	**AND IF** Passenger Squib 1 open is NOT an active code.	Passenger Squib 1 is live; Passenger Squib 2 was used.

If neither of the following codes is an active code:

ACTIVE DTC	SQUIB STATUS
Passenger squib 1 open Passenger squib 2 open	Status of Airbag is Unknown.

3.1.4 SEAT BELT TENSIONER (SBT)

The JR41 4-door driver and front passenger seat belt (retractor) tensioners are mounted to the inboard side of the "B" pillar at the floor. The tensioner is an integral part of the seat belt retractor. At the onset of an impact event the ACM uses the seat belt tensioner to rapidly retracts the seat belt. With the slack removed, the occupant's forward motion in an impact will be reduced as will the likelihood of contacting interior components. The seat belt tensioner cannot be repaired, if damaged or defective it must be replaced. The ACM continuously monitors the resistance of the seat belt tensioner circuits an open or shorted conditions.

The JR27 convertible driver and front passenger seat belt (buckle) tensioners are mounted to the inboard side of the front seats. The seat belt buckle is connected directly to the seat belt tensioner cable. At the onset of an impact event the ACM uses the seat belt tensioner to rapidly retract the seat belt buckles. With the slack removed, the occupant's forward motion in an impact will be reduced as will the likelihood of contacting interior components. The seat belt tensioner cannot be repaired, if damaged or defective it must be replaced. The ACM continuously monitors the resistance of the seat belt tensioner circuits an open or shorted conditions.

3.1.5 SIDE IMPACT AIRBAG CONTROL MODULE (SIACM)

Supplemental driver and passenger curtain airbags provide side impact protection for the occupants. Each side airbag has it's own side impact airbag control module (SIACM) to provide independent impact sensing and deployment. SIACM are located on the left and right B post just above the seat belt retractor. One, same part number, SIACM is used on both side of the vehicle. However, for proper PCI bus operation each SIACM must have a unique module identification. To provide the unique module identification for both, left and right, the SIACM software looks for a ground on cavity #5 of the SIACM connector. If cavity #5 is grounded the SIACM communicates as a left SIACM otherwise it communicates as a right SIACM. The SIACM performs self diagnostics and circuit tests to determine if the system is functioning properly. If the test finds a problem the SIACM will set both active and stored diagnostic trouble codes. If a DTC is active the SIACM will request that the airbag warning lamp be turned on. The results of the system test are transmitted on the PCI Bus to the ACM once each second or on change in lamp state. If the warning lamp status message from the either SIACM contains a lamp on request, the ACM will set an active DTC. At the same time as the DTC is set, the ACM sends a PCI Bus message to the (MIC) requesting the airbag warning indicator be turned on. Observe all ACM warning and caution statements when servicing or handling the SIACM. SIACM are not repairable and must be replaced if they are dropped.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT.

The airbag warning lamp is the only point at which the customer can observe symptoms of a system malfunction. Whenever the ignition key is turned to the run or start position, the MIC performs a lamp check by turning the airbag warning indicator on for 6-8 seconds. After the lamp check, if the indicator turns on, it means that the ACM has checked the system and found it to be free of discernible malfunctions. If the lamp remains on, there could be an active fault in the system or the MIC lamp circuit may be internally shorted to ground. If the lamp comes on and stays on for a period longer than 6-8 seconds then goes off, there is usually an intermittent problem in the system.

3.1.6 CURTAIN AIRBAGS

The Left and Right curtain airbag modules are located in the outboard edge of the roof under the headliner, just above the door opening. The curtain airbag contains a squib and inflator (a small canister of highly compressed argon gas) and a mounting bracket mounted to the C post and tethered to the A post. When supplied with the proper electrical signal the inflator can discharge the compress gas it contains directly into the curtain airbag. Upon deployment, the curtain will tear open the headliner allowing the curtain airbag to fully deploy between the headliner and seat. The curtain airbag module cannot be repaired and must be replaced if deployed or in any way damaged.

WARNING: THE PASSENGER AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO 17236.89 Kpa (2500 PSI). DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE MOPAR PARTS CATALOG.

3.1.7 SPECIAL TOOLS

Some airbag diagnostic test use special tools, 8310 and 8443 airbag load tool, for testing squib circuits. The load tools contain fixed resistive loads, jumpers and adapters. The fixed loads are connected to cables and mounted in a storage case. The cables can be directly connected to some airbag system connectors. Jumpers are used to convert the load tool cable connectors to the other airbag system connectors. The adapters are connected to the module harness connector to open shorting clips and protect the connector terminal during testing. When using the load tool follow all of the safety procedures in the service information for disconnecting airbag system components. Inspect the wiring, connector and terminals for damage or misalignment. Substitute the airbag load tool in place of a Driver or Passenger Airbag, curtain airbag, clockspring, or seat belt tensioner (use a jumper if needed). Then follow all of the safety procedures in the service information for connecting airbag system components. Read the module active DTC's. If the module reports NO ACTIVE DTC's the defective component has been removed from the system and should be replaced. If the DTC is still active, continue this process until all components in the circuit have been tested. Then disconnect the module connector and connect the matching adapter to the module connector. With all airbags disconnected and the adapter installed the squib wiring can be tested for open and shorted conditions.

3.1.8 DIAGNOSTIC TROUBLE CODES

Airbag diagnostic trouble codes consist of active and stored codes. If more than one code exists, diagnostic priority should be given to the active codes. Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of the trouble codes. It is not necessary to perform all of the tests in this book to diagnose an individual code.

Always begin by reading the diagnostic trouble codes using the DRBIII®. Then begin diagnostic with the Table of Contents section 7.0. This will direct you to the specific test(s) that must be performed. Active diagnostic trouble codes for the airbag system are not permanent and will change the moment the reason for the code is corrected. In certain test procedures within this manual, diagnostic trouble codes are used as a diagnostic tool.

3.1.9 ACTIVE CODES

The code becomes active as soon as the malfunction is detected or key-in, whichever occurs first. An active trouble code indicates an on-going malfunction. This means that the defect is currently there every time the airbag control module checks that circuit or component. It is impossible to erase an active code. Active codes automatically erase by themselves when the reason for the code has been corrected. With the exception of the warning lamp trouble codes or malfunctions, when a malfunction is detected, the airbag lamp remains lit for a minimum of 12 seconds or as long as the malfunction is present.

3.1.10 STORED CODES

Airbag codes are automatically stored in the ORC's memory as soon as the malfunction is detected. The exception is the Loss of Ignition Run Only code which is an active code only. A stored code indicates there was an active code present at some time. However, the code currently may not be present as an active code, although another code could be active. When a trouble code occurs, the airbag warning indicator illuminates for 12 seconds minimum (even if the problem existed for less than 12 seconds). The code is stored, along with the time in minutes it was active, and the number of times the ignition has been cycled since the problem was last detected. The minimum time shown for any code will be one minute, even if the code was actually present for less than one minute. Thus, the time shown for a code that was present for two minutes 13 seconds, for example, would be three minutes. If a malfunction is detected a diagnostic trouble code is stored and will remain stored. When and if the malfunction ceases to exist, an ignition cycle count will be initiated for that code. If the ignition cycle count reaches 100 without a reoccurrence of the same malfunction, the diagnostic trouble code is erased and that ignition cycle counter is reset to zero. If the malfunction reoccurs before the count reaches 100, then the ignition cycle counter will be reset and the diagnostic trouble code will continue to be a stored code. If a malfunction is not active while performing a diagnostic test procedure, the active code diagnostic test will not locate the source of the problem. In this case, the stored code can indicate an area to inspect. It no obvious problems are found, erase stored codes, and with the ignition on wiggle the wire harness and connectors, rotate the steering wheel from stop to stop. Recheck for codes periodically as you work through the system. This procedure may uncover a malfunction that is difficult to locate.

3.2 AUDIO SYSTEM

Some radio systems available on the 2002 JR communicate on the PCI Bus. They use the bus for three reasons. The first is to communicate trouble codes, second is to receive dimming information, and third is to receive cabin equalization information. The audio system is available in a 4 speaker or 6 speaker base system and a 6 speaker system with an external power amplifier. An in-dash CD Changer is also optional.

When troubleshooting output shorts or “output” error messages, the following applies:

On radios without an external amplifier, the term output refers to the path between the radio and the speaker. This type of circuit can be monitored all the way through the speaker connections by the radio assembly. When the radio displays a shorted output DTC with this type of system, the speaker, radio, or wiring could be at fault.

On radios with an external amplifier, the term “output” refers to the circuit between the radio connector and the amplifier. The radio is capable of monitoring only this portion and can tell nothing about the circuit between the amplifier and the speakers. Consequently, a shorted output DTC on this type of system would only refer to this circuit. A faulty speaker could not cause this DTC.

The new in-dash CD-changer is designed to fit into the existing cubby bin in the center stack. This new cartridge-less CD-changer is controlled by your radio, and allows you to individually load up to four discs at one time. However, due to its compact design, the CD-changer can only carry out one operation at a time. For example you can not load a new disc while playing another at the same time. Each operation happens sequentially.

The radio unit installed with you system provides control over all features of the CD-changer with the exception of the CD load and eject functions, which are controlled by buttons located on the front of the CD-changer. The radio also supplies the power, ground, PCI Bus, left and right speaker output through a single DIN cable. All features you would expect, such as Disc Up/Down, Track Up/Down, Random and Scan are controlled by the radio, which also displays all relevant CD-changer information on the radio display.

The CD-changer contains a Load/Eject button and an indicator light for each of the four disc positions. The individual light indicates whether a CD is currently loaded in that particular chamber of the CD-changer. Pressing the individual Load/Eject button for a particular chamber will eject a disc currently present in that chamber. If the chamber is currently empty, actuating the Load/Eject button will position that chamber to receive and load a new disc in that chamber.

3.3 BODY CONTROL MODULE

The body control module (BCM) supplies vehicle occupants with visual and audible information and controls various vehicle functions. To provide and receive information, the module is interfaced to the vehicle’s serial bus communications network (the Programmable Communication Interface or PCI bus). This network consists of the body control module (BCM), powertrain control module (PCM), sentry key immobilizer module (SKIM), the transmission control module (TCM), the electro/mechanical instrument cluster (MIC), compass/mini-trip computer (CMTC), occupant restraint controller (ORC), optional antilock brakes (ABS), the optional radio and remote CD-player, optional left and right airbag control modules. The (BCM) is operational when battery power is supplied to the module, ignition switch power is needed for ignition switched functions.

The body control module provides the following features:

A/C switch status/evaporator temperature status
BCM diagnostic support
Central lock and unlock (VTSS only)
Climate Control system support
Door ajar switch status
Door Lock Inhibit (key in ignition or headlamps/park lamps on)
Electronic Odometer Support
Headlamp Time Delay
Illuminated Entry with “fade to off”
Interior lighting with battery save feature
Mechanical Instrument Cluster (fuel level, dim

data, odometer & warning chime) support
Travel information system
Power convertible top
Power door lock multiplexing control
Rear Window Defogger Control
Remote Keyless Entry with Panic Mode
Remote power deck lid release
Rolling door lock control (customer programmable)
Sentry key immobilizer support
Vehicle Theft Security System
Wiper Control (speed sensitive with return to park)

The BCM receives information over the PCI Bus from the PCM in order to support certain features.

The required information is as follows:

- Engine RPM
- Engine Temperature
- Injector on Time and Distance Pulses
- Vehicle Speed
- Charging System Failure, Engine Temperature Limp-In, VTSS Arming Status
- Engine Model
- “Check Engine” lamp status

The BCM provides the PCM with information on the A/C switch status and the VTSS status.

The JR has several customer programmable features which can be disabled or enabled by the customer.

FEATURE	DEFAULT	PROGRAMMING METHOD	FEEDBACK
Rolling Automatic Door Locks	Enabled	Close all doors Place vehicle key in the ignition and cycle between off and run four times ending in the off position Customer depresses the driver power door look switch to lock the doors Body Controller will toggle the enable/disable state of rolling locks	BCM provides a single chime to indicate completion of the programming
RKE-Horn Chirp	Enabled	Continually press the lock button for a minimum of 4 seconds to a maximum of 10 seconds Within the 4-10 second range, press the unlock button while continuing to press the lock button Release both buttons Body Controller will toggle on/off state of horn chirp feature	None
RKE-Rear Release Toggle	Press Twice	Continually press the unlock button for a minimum of 4 seconds to a maximum of 10 seconds Within the 4-10 second range, press the rear release button while continuing to press the unlock buttons Release both buttons RKE will toggle state of one press/two press rear release	
RKE Program New FOB (Using an already programmed FOB)	Not Applicable	Turn vehicle ignition switch on. With programmed FOB continually press the unlock button for a minimum of 4 seconds to a maximum of 10 seconds Within the 4-10 second range, press the panic button while continuing to press the unlock button Release both buttons Press lock and unlock together and then press any button of FOB(s) to be Learned. (Note: RKE system erases all FOBs when program mode is entered So any existing FOBs must also be Programmed	BCM will sound a second chime when programming mode is started BCM will sound a second chime after each FOB has been learned, a 32 second time out period has elapsed, or the vehicle ignition has been turned off Turn off ignition or wait for 32 seconds to exit programming mode
Auto Unlock on Exit	Enabled	Close all doors Place vehicle key in the ignition and cycle between off and run four times ending in the off position Customer depresses the driver power door unlock switch to unlock the doors Body Controller will toggle the enable/disable state of auto unlock on Exit	BCM provides a single chime to indicate completion of the programming

FEATURE	DEFAULT	PROGRAMMING METHOD	FEEDBACK
RKE Lamp Flash	Enabled	Continually press the lock button for a minimum of 4 seconds to a maximum of 10 seconds Within the 4-10 second range, press the trunk button while continuing to press the lock button Release both buttons Body Controller will toggle on/off state of lamp flash feature	None

3.4 CHIME SYSTEM

The chime system is comprised of an audible chime located internal to the BCM; and is dependent on various inputs to the BCM to operate. These inputs to the BCM include key-in ignition switch, exterior lamps as well as requests for the Mechanical Instrument Cluster from the seat belt switch input or whenever certain indicators are turned on.

3.5 COMPASS/MINI-TRIP COMPUTER

DESCRIPTION

The JR Compass/Mini-Trip Computer (CMTC) is located in the instrument panel between the center A/C outlets. The CMTC has two function buttons and a vacuum fluorescent (VF) display that provides the outside temperature, Trip Computer information, and one of eight compass headings to indicate the direction the vehicle is facing. The compass heading and the outside temperature are displayed at the same time.

The BCM calculates much of the information displayed by the CMTC. The BCM receives this information from PCI Bus messages, the PCM, and the Ambient Temperature Sensor. The Ambient Temperature Sensor (ATS) monitors the outside temperature and is hardwired to the PCM. The CMTC receives filtered outside temperature data via PCI Bus messages from the BCM. The ambient temperature sensor may receive invalid data whenever the vehicle is operated at low speeds, or the ignition is off for a short period of time. These causes for inaccuracy will be filtered out by the BCM.

The CMTC receives dedicated PCI Bus messages with the calculated information from the BCM for the trip computer displays.

The CMTC cannot be repaired and, if faulty or damaged it must be replaced. The incandescent lamp for the STEP and US/M button illumination is serviceable.

OPERATION

Actuation of the STEP button will cause the CMTC to change modes of operation. Actuation of the US/M button will toggle the display between English and Metric units. Trip Computer resets are accomplished by pressing the STEP and US/M buttons simultaneously. To reset only the trip information currently being displayed, press and release the STEP and US/M buttons simultaneously for one second until the chime sounds. To reset all trip information, press and hold the STEP and US/M buttons simultaneously until a second chime sounds (approximately 2 seconds) and then release the buttons.

The CMTC operates only when the ignition is on. The following functions are available using the STEP button:

- Compass and outside temperature
- Average fuel economy (AVE ECO)
- Instantaneous Fuel Economy (ECO)
- Distance to Empty (DTE)
- Trip Odometer (ODO)
- Elapsed ignition time (ET)
- Display Off

COMPASS/MINI-TRIP COMPUTER VF DISPLAY MESSAGES

The CMTC will not display information for any of the screens for which it did not receive the proper PCI bus data. Refer to the symptom list in the Diagnostic section in this manual for problems related to the CMTC.

The CMTC receives the following messages from Body Control Module (BCM):

- Verification of US/Metric status
- VF display dimming brightness and exterior lamp status
- Trip Odometer data
- Elapsed Ignition On Time data
- Fuel Economy (Average and Instantaneous
- Distance to Empty
- Outside Temperature

The CMTC transmits the following messages to the BCM:

- Status Request: Beep, Reset, US/M Toggle
- Current Display
- Compass Heading

The CMTC receives the following message from PCM:

- Vehicle Speed

SETTING MAGNETIC ZONE VARIANCE

Variance is the difference between magnetic North and geographic North. For proper compass function, the correct variance zone must be set. Refer to the Zone Variance map for the correct zone. Follow these steps to check or change the variance zone:

- The ignition switch must be in the On position and the CMTC display must not be blank.
- Press and hold the STEP and US/M buttons until VAR is displayed. The CMTC will display the last variance zone stored in memory and the word VAR.
- Use the STEP button to select the proper variance zone number, 1 through 15.
- After selecting the proper zone number, simultaneously press the STEP and US/M buttons or wait approximately 15 seconds. The variance zone is then stored in the memory and the CMTC returns to normal operation.

3.5.2 COMPASS CALIBRATION

The compass module has 2 types of auto-calibration; slow-cal and fast-cal. Slow-cal ensures that during normal vehicle operation the compass performs auto-calibration functions to keep the compass sensors in their proper operating range. Whenever the ignition is On and the CMTC receives PCI bus data indicating that engine RPM is greater than zero, auto-calibration is performed continuously.

If the calibration information stored in the compass module memory is not within the normal range after a power-up cycle, the compass will display CAL. The CMTC with enter into the fast-cal mode until calibration is complete.

To enter the compass into Manual Calibration mode, perform the following steps:

- Drive the vehicle to an area away from any large metal objects or overhead power lines.
- Ensure that the proper variance zone is selected. See “Setting Magnetic Zone Variance.”
- The ignition switch must be in the On position and the CMTC display must not be blank.
- Press the STEP button and scroll to the Compass/Temperature display.
- Press and hold the STEP and US/M buttons simultaneously until CAL begins flashing and then release the buttons.
- CAL is displayed without flashing.
- Drive slowly, less than 4 MPH (8KPH) in 3 complete 360 degree circles.
- CAL will remain illuminated to alert the driver that the compass is in the calibration mode.
- After calibration is complete, CAL will turn off.

If the compass appears unable to be calibrated or the compass displays false indications, the vehicle may need to be demagnetized.

AMBIENT TEMPERATURE SENSOR

DESCRIPTION

The ambient air temperature is monitored by the PCM and displayed by the CMTC. The PCM receives a hardwire input from the ambient temperature sensor (ATS). The ATS is located on the inside of the front bumper beam.

The ATS cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The ATS is a variable resistor that operates on a 5-volt reference signal circuit hardwired from the PCM. The resistance in the ATS changes as the outside temperature rises or falls. The PCM senses the change in reference voltage through the ATS resistor. Based on the resistance of the ATS, the PCM is programmed to correspond to a specific temperature. The PCM then transmits the proper ambient temperature to the BCM. The BCM filters the ambient temperature data and transmits this data to the CMTC.

DIAGNOSIS AND TESTING

SELF-CHECK DIAGNOSTICS

The CMTC is capable of performing a diagnostic self check on its internal functions. CMTC diagnostics may be performed using a DRBIII® or by using the following procedure:

1. With the ignition switch in the OFF position, depress and hold the STEP and the US/M buttons.
2. Turn the ignition switch to the On position and release the buttons.
3. All of the VFD segments will illuminate for 2-4 seconds. Check for segments that do not illuminate or illuminate all the time.
4. When the self-check is complete the CMTC will display one of the following five messages:

- F (FAIL)
- P (PASS)
- Bus (No PCI bus communication)
- Bus 1 (No PCM bus messages received)
- Bus 2 (No BCM bus messages received)

5. To exit the self-check mode, depress the STEP button or cycle the ignition switch and the CTM will return to normal operation.

If a Bus fault is displayed, refer to the symptom list. If an F is displayed, the CMTC must be replaced. The CMTC will not display an F for a VF segment that does not illuminate.

AMBIENT TEMPERATURE SENSOR

The outside temperature function is supported by the ambient temperature sensor (ATS), a signal and ground circuit hardwired to the PCM, the BCM, and the CMTC display.

If the CMTC display indicates 60°C (140°F) or the ATS sense circuit is shorted to ground, the temp display will be 60°C (140°F) to indicate a SHORT circuit condition.

If the CTM display indicates -45°C (-49°F) or the ATS sense circuit is open, the temp display will be -45°C (-49°F) to indicate an OPEN circuit condition.

If there is an OPEN or SHORT circuit condition, it must be repaired before the CMTC VFD can be tested.

The ATS is supported by the PCM. ATS fault DTC's will be recorded in the PCM. The ATS can be diagnosed using the following Sensor Test. Test the ATS circuits using the diagnostics in the Body Diagnostic Procedures Manual. If the ATS, the circuits, and PCI bus communications are confirmed to be OK, but the CMTC temperature display is inoperative or incorrect, replace the CMTC.

AMBIENT TEMPERATURE SENSOR TEST

1. Turn the ignition OFF.
2. Disconnect the ATS harness connector.
3. Measure the resistance of the ATS using the following min/max values:

- 0°C (32°F) Sensor Resistance = 29.33 – 35.99 Kilohms
- 10°C (50°F) Sensor Resistance = 17.99 – 21.81 Kilohms
- 20°C (68°F) Sensor Resistance = 11.37 – 13.61 Kilohms
- 25°C (77°F) Sensor Resistance = 9.12 – 10.86 Kilohms
- 30°C (86°F) Sensor Resistance = 7.37 – 8.75 Kilohms
- 40°C (104°F) Sensor Resistance = 4.90 – 5.75 Kilohms

The sensor resistance should read between these min/max values. If the resistance values are no OK, replace the Sensor.

3.6 DOOR AJAR SYSTEM

The door ajar and decklid ajar states are used as inputs for the Body Control Module (BCM). The BCM uses these inputs to determine exactly what position the doors and decklid are in. The DRBIII® will display the state of the door ajar and the decklid ajar switches in Inputs/Outputs. It's important to note, that when any door, or the decklid is closed, the switch state on the DRBIII® will show OPEN. When any door, or the decklid is open the switch state on the DRBIII® will show CLOSED. During diagnosis, if a door or the decklid is closed and the DRBIII® displays the switch state as CLOSED, it indicates a shorted ajar circuit. If the door or the decklid is open and the DRBIII® displays the switch state as OPEN, it indicates an open ajar circuit.

3.7 EXTERIOR LIGHTING SYSTEM

3.7.1 HEADLAMP DELAY

The headlamp time delay operates when the ignition switch is turned off while the headlamps are still on, and the headlamps are then turned off within 45 seconds after the ignition is off. This will provide a 90-second time delay before turning off the headlamps.

3.8 HEATING AND A/C SYSTEMS

A single-zone HVAC system is available on all JR series vehicles.

3.8.1 MANUAL TEMPERATURE CONTROL

3.8.2 HVAC CONTROL

The HVAC system maintains incoming air temperature, airflow, fan speed, and fresh air intake for the entire vehicle from the instrument panel mounted A/C — Heater Control. The full range of temperature that the system can produce in any mode for the entire vehicle is available by positioning the blend Control to the desired range.

3.8.3 AIR INTAKE

When the fresh-air door is open, outside air is drawn into the HVAC housing through the cowl opening at the base of the windshield. When the fresh-air door is closed, recirculated air is drawn in to the HVAC housing from under the instrument panel.

3.8.4 AIR DISTRIBUTION

The HVAC unit has four fully adjustable instrument panel outlets. Side-window demister outlets in the instrument panel eliminate the need for door ducts and door-to-instrument panel seals. A single, central mounted outlet delivers air for defrosting the windshield. Two ducts, one on each side of the center console underneath the instrument panel, provide airflow to the driver floor area and the front seat passenger floor area.

3.8.5 A/C-HEATER CONTROL, SWITCH OPERATION

3.8.6 BLOWER SWITCH

The rotary Blower Switch has five positions, Off, Low, M1, M2, and High. Rotating the Blower Switch results in the A/C — Heater Control providing direct blower motor activation, change in blower speed, and blower motor deactivation respectively. The Blower Switch must be in any of the four on positions to request A/C, and also to have the A/C — Heater Control send a signal to the Body Control Module to signal the door actuators to change door position.

3.8.7 MODE SWITCH

The rotary Mode Switch has a total of eight positions. The first three, for A/C request, include Recirc/Bi-level, Panel, and Bi-level. The remaining five positions, for Heat request, include Panel, Bi-level, Floor, Floor/Defrost, and Defrost. The Floor/ Defrost position and the Defrost position also provided an A/C request.

3.8.8 MODE SWITCH, A/C REQUEST

Provided that the Blower Switch is in any of the four on positions, rotating the Mode Switch to any of the three A/C request positions, the Floor/Defrost position, or the Defrost position, will result in the A/C − Heater Control sending a signal to the BCM to send a message to the PCM to provide A/C compressor clutch activation. However, the BCM will only provide this request if EVAP function is found acceptable.

3.8.9 MODE SWITCH, MODE DOOR POSITION CHANGE REQUEST

Provided that the Blower Switch is in any of the four on positions, rotating the Mode Switch will result in the A/C — Heater Control sending a signal to the BCM to signal the actuator to move the mode door. A potentiometer, inside the Mode Door Actuator, and feedback circuits provide the BCM with door position information.

3.8.10 MODE SWITCH, FRESH-AIR DOOR POSITION CHANGE REQUEST

Provided that the Blower Switch is in any of the four on positions, rotating the Mode Switch to the Recirc position will result in the A/C — Heater Control sending a signal to the BCM to signal the actuator to close the fresh-air door. While rotating the mode Switch to any other position results in the A/C — Heater Control sending a signal to the BCM to signal the actuator to open the fresh-air door. When the Blower Switch is off, the fresh-air door closes to prevent outside air from entering the passenger compartment.

3.8.11 BLEND SWITCH

The rotary Blend Switch has multiple detents to control the full range of temperature that the system can produce in any mode. Provided that the Blower Switch is an any of the four on positions, rotating the Blend Switch will result in the A/C — Heater Control sending a signal to the BCM to signal the actuator to move the blend door. A potentionmeter, inside the Blend Door Actuator, and feedback circuits provide the BCM with door position information.

3.8.12 REAR WINDOW DEFOGGER SWITCH

The Rear Window Defogger Switch is a momentary contact switch. Toggling the switch results in the A/C — Heater Control sending a signal to the BCM to provide rear window defogger activation or deactivation respectively. The switch LED illuminates when the switch is on.

3.8.13 DIAGNOSTIC TROUBLE CODES

All HVAC Diagnostic Trouble Codes are stored in the Body Control Module. Stored DTCs indicate that a problem has occurred in the HVAC system, and may still be present. To verify a problem is still present in the HVAC system, use the DRBIII® to erase all stored BCM DTCs. After erasing the DTC(s), use the DRBIII® to see if the DTC(s) reappear. If necessary, actuate the A/C — Heater Control switches with the ignition on and with the engine running while monitoring the DRBIII® to see if the DTC(s) reappear.

3.9 INTERIOR LIGHTING

3.9.1 COURTESY LAMP CONTROL

The body controller has direct control over the majority of the vehicle's courtesy lamps. The body computer will illuminate the courtesy lamps under any of the following conditions:

1. Any door is ajar.
2. The courtesy lamp switch on the instrument panel is closed.
3. A Remote Keyless entry unlock message is received. If the interior lamps are left on after the ignition is turned off, the BCM will turn them off after 15 minutes or until either the dome lamp switch or door ajar switch changes state.

3.9.2 ILLUMINATED ENTRY

Illuminated entry will be initiated when the customer enters the vehicle by unlocking the doors with the key fob, or with the key if the vehicle is equipped with vehicle theft alarm. Upon exiting the vehicle, if the lock button is pressed with a door open, illuminated entry will cancel when the door closes. If the doors are closed and the ignition switch is turned on, the illuminated entry also cancels.

3.10 MECHANICAL INSTRUMENT CLUSTER

The Mechanical Instrument Cluster (MIC) is divided into 4 sections. Primary gauges (Speedometer and Tachometer), secondary gauges (Fuel Level, Engine Coolant Temperature), PCI bus enabled indicator lamps and hardwired enabled indicator lamps.

The gauge mechanisms function in the same way. The main differences are in the face and size of the gauge.

The Oil Pressure, Brake Warning, Turn Signal and Fog Lamp indicators are directly wired to the circuits that they are indicators for. These indicators are located in, but not controlled by, the MIC and are not part of any MIC self test or diagnostic. All indicators are replaceable bulbs or LEDs.

The PCM sends a gauge position message to the BCM through the PCI bus. The MIC receives this message from the BCM, translates it, and positions the gauges. The BCM also sends messages to the MIC to actuate all PCI controlled indicators. These messages are received when the Ignition Switch is in the RUN or START position.

When the ignition Switch is turned to the RUN position, a bulb-check is performed. This consists of activating the PCI bus controlled indicators for approximately 2 to 4 seconds. By holding the TRIP/RESET button in while turning the Ignition Switch to the RUN position, you can activate the MIC Self Test.

The Following indicators are controlled by PCI bus messages:

- Malfunction Indicator Lamp
- Charging System Warning Indicator
- Engine Coolant Temperature Indicator
- Cruise Engaged Indicator
- Airbag Warning Indicator
- Low Fuel Indicator
- ABS Warning Indicator
- High Beam Indicator

The following indicators are hardwired and not controlled by PCI bus messages:

- Seat Belt Indicator
- Oil Pressure Indicator
- Brake Warning Indicator
- VTSS Indicator
- Turn Signal Indicators
- Fog Lamp Indicators

3.11 POWER DOOR LOCK SYSTEM

The door lock switches provide a variable amount of voltage through the multiplexed (MUX) circuit to the BCM. Depending upon that input and various conditions that must be met (i.e. door lock inhibit, etc.), the BCM will determine the action to be taken and activate the proper relay for approximately 250 to 350 msec. If the vehicle is equipped with the vehicle theft security system it will have the central locking feature which locks and unlocks all doors from the cylinder lock switches. These switches are on separate multiplexed circuits to the BCM and have trouble codes relating to each of them.

RKE Remote Keyless Entry- This feature allows locking and unlocking of the vehicle door(s) by remote control using a hand-held transmitter (sometimes referred to as a fob) to activate a radio receiver (RKE module). This module now plugs into the body control module which is directly connected to the junction block. With this feature RKE can now be added to a non-equipped vehicle by installing a module. If the vehicle is equipped with the vehicle theft security system, RKE will also arm and disarm that system. A 4-button transmitter is used which provides lock, unlock, decklid release and panic features. Decklid release is only operable while the vehicle is in the park position. The module is capable of retaining up to 4 transmitter codes. Rolling code, which increases security, is also included in this system. If the transmitter goes out of synchronization it is easily put back in by pressing the lock button when the transmitter is within range. An external antenna has been added which plugs into the module to provide greater range. RKE will also turn on the interior lamps when a valid unlock command is received and will extinguish the interior lamps when a lock command is received and all doors are closed.

Door Lock Inhibit- When the key is in the ignition and the driver front door is open, all door lock switches are disabled. The unlock switches are still functional. This protects against locking the vehicle with the keys still in the ignition.

Automatic (rolling) Door Locks - This feature can be enabled or disabled by using either the DRBIII® or the customer programmable method. When enabled, all doors will lock when the vehicle reaches a speed of 15 mph (24 kmh) and all doors are closed. If a door is opened and the vehicle slows to below 15 mph (24 kmh), the locks will operate again once all doors are closed and the speed is above 15 mph (24 kmh). This feature is not available in European markets.

Decklid Release - Decklid release is now a function of the body control module. Trouble codes are provided to assist in the diagnosis of this system.

Customer programmable features are: Horn chirp, one or two press decklid release, programming a new transmitter (using a previously programmed transmitter), rolling door locks, unlock on exit, and RKE lamp flash.

3.12 POWER CONVERTIBLE TOP

3.12.1 TOP CONTROL

The body control module now controls all the functions of the convertible top. The body control module supplies a multiplexed voltage of approximately 90% of ignition voltage to the power top switch. Through a series of resistors the power top switch switches the circuit to ground depending on the position of the switch. The BCM then supplies the ground path for the up or down relay as requested. The power top switch has a 4.7K-ohm diagnostic resistor that allows the BCM to detect a possible open circuit.

3.12.2 WINDOW DROP RELAY ASSEMBLY

The convertible has a new feature that allows the operator to lower all four windows and lower the top at the same time. This is accomplished by pressing the power top switch to the second detent. Through the multiplexed circuit of the power top switch the BCM will supply the ground for the window drop relay assembly.

The window drop relay assembly is comprised of four separate relays that are in series with the power window circuits. The relay assembly is located in the driver door.

3.13 VEHICLE COMMUNICATION

The Programmable Communication Interface or PCI Bus is a single wire multiplexed network capable of supporting binary encoded messages shared between multiple modules. The PCI bus circuit is identified as D25. The modules are wired in parallel. Connections are made through the BCM. The BCM acts as a splice to connect each module and the Data Link Connector (DLC) together. The following modules are used on 2002 JR:

- Airbag Control Module or referred to as the Occupant Restraint Controller (ORC)
- Left Side Impact Airbag Control Module
- Right Side Impact Airbag Control Module
- Controller Antilock Brake
- Powertrain Control Module
- Radio (if equipped)
- CD Changer (if equipped)
- Compass/Mini-Trip Computer (if equipped)
- Body Control Module
- Sentry Key Immobilizer Module
- Transmission Control Module
- Mechanical Instrument Cluster

Each module provides its own bias and termination in order to transmit and receive messages. The bus voltage is at zero volts when no modules are transmitting and is pulled up to about seven and a half volts when modules are transmitting.

The bus messages are transmitted at a rate averaging 10800 bits per second. Since there is only voltage present when the modules transmit and the message length is only about 500 milliseconds, it is ineffective to try and measure the bus activity with a conventional voltmeter. The preferred method is to use the DRBIII® lab scope. The 12v square wave selection on the 20-volt scale provides a good view of the bus activity. Voltage on the bus should pulse between zero and about seven and a half volts. Refer to the following figure for some typical displays.

The PCI Bus failure modes are broken down into two categories. Complete PCI Bus Communication Failure and individual module no response. Causes of a complete PCI Bus Communication Failure include a short to ground or battery on the PCI circuit. Individual module no response can be caused by an open circuit at the BCM or at the module, or an open battery or ground circuit to the affected module.

Symptoms of a complete PCI Bus Communication Failure would include but are not limited to:

- All gauges on the MIC stay at zero

- All telltales on MIC illuminate
- MIC backlighting at full intensity
- No response received from any module on the PCI bus (except PCM)
- No start (if equipped with Sentry Key Immobilizer)

Symptoms of Individual module failure could include any one or more of the above. The difference would be that at least one or more modules would respond to the DRBIII®.

Diagnosis starts with symptom identification. If a complete PCI Bus Communication Failure is suspected, begin by identifying which modules the vehicle is equipped with and then attempt to get a response from the modules with the DRBIII®. If any modules are responding, the failure is not related to the total bus, but can be caused by one or more modules PCI circuit or power supply and ground circuits. The DRBIII® may display “BUS ± SIGNALS OPEN” OR “NO RESPONSE” to indicate a communication problem. These same messages will be displayed if the vehicle is not equipped with that particular module. The CCD error message is a default message used by the DRBIII® and in no way indicates whether or not the PCI bus is operational. The message is only an indication that a module is either not responding or the vehicle is not equipped.

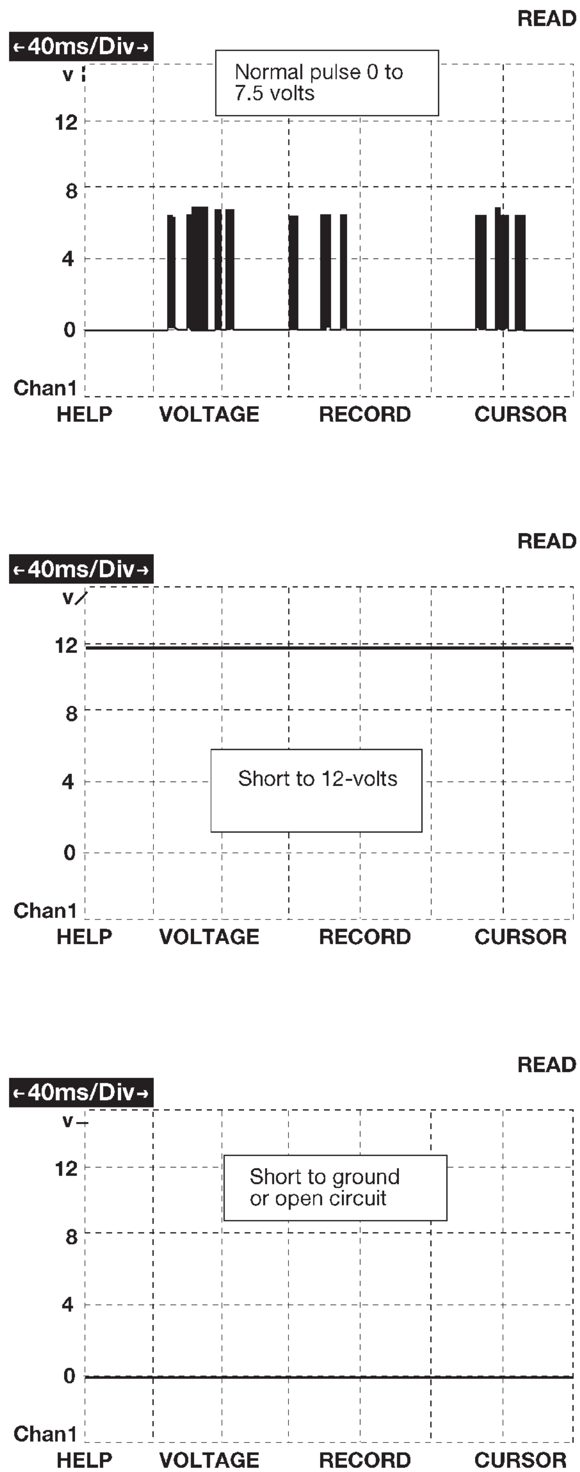
NOTE: Communication over the bus is essential to the proper operation of the vehicles on-board diagnostic systems and the DRBIII®. Problems with the operation of the bus or DRBIII® must be corrected before proceeding with diagnostic testing. If there is a problem, refer to the Communications category of this manual.

3.13.1 BUS FAILURE MESSAGE

Odometer Displays “No Bus” - The Mechanical Instrument Cluster (MIC) cannot communicate over the bus and does not know why.

3.14 VEHICLE THEFT SECURITY SYSTEM

This passive system is designed to protect against vehicle theft. The vehicle theft security system (VTSS) is part of the body control module (BCM), which monitors vehicle doors and the ignition for unauthorized operation. The alarm activates by sounding the horn, flashing the headlamps, courtesy lamps, and the VTSS indicator lamp. Passive arming occurs upon normal vehicle exit by turning the ignition off, opening the driver’s door, locking the doors with the power lock, and closing the driver’s door or locking the doors with RKE. Manual arming occurs by using the key to lock the doors



80bdbcf6

after closing them. The indicator lamp in the instrument cluster will flash for 15 seconds, showing that arming is in progress. If no monitored systems are activated during this period, the system will arm and the indicator will flash at a slow rate. If the indicator lamp remains steadily lit during the arming process, this can indicate a loss of decklid cylinder lock switch. When something triggers the alarm, the system will signal the headlamps, courtesy lamps, and horn for about 3 minutes, then headlamps for an additional 15 minutes if the offending input is still present.

For complaints about the Theft Alarm going off on its own use the DRBIII® and select “Body Computer” then “Input/Output Display” and read the “Last VTSS Cause” status.

Tamper Alert - The VTSS indicator lamp will flash twice quickly and the horn will chirp three times when the system is disarmed to indicate a tamper condition has occurred.

Manual Override - The system will not arm if the doors are locked using the manual lock control (by hand) or if the locks are actuated by an inside occupant after the door is closed.

To verify the system, proceed as follows:

1. Open the driver’s door.
2. Remove the ignition key (but keep it in hand).
3. Lock the doors with the power lock switch or the RKE.
4. Close the driver’s door.

NOTE: After the doors are closed, locking the doors with RKE will also arm the system.

NOTE: If the VTSS indicator lamp flashed, the system is operational and verified. If not, there may be a problem with the system.

Arming/Disarming- Active arming occurs when the remote keyless entry transmitter is used to lock the vehicle doors, whether the doors are open or closed. If one or more doors are open the arming sequence is completed only after all doors are closed.

Passive disarming occurs upon normal vehicle entry (unlocking either front door with the key). This disarming also will halt the alarm once it has been activated.

Active disarming occurs when the remote keyless entry transmitter is used to unlock the vehicle doors. This disarming also will halt the alarm once it has been activated.

NOTE: A Powertrain Control Module from a vehicle equipped with a vehicle theft security system cannot be used in a vehicle that is not equipped with a vehicle theft security system. If the VTSS indicator lamp comes on after ignition ON and stays on, the PCI bus communication with the Powertrain Control Module possibly has been lost.

3.15 WIPER SYSTEM

The wiper system provides the driver with the normal wiper (low and high speeds), intermittent wipe, and wipe after wash. The driver selects the wiper function via the resistive multiplexed stalk switch mounted on the steering column. The BCM uses the input signal from the wiper stalk switch, wiper motor park switch, and the washer switch to control the wiper system. The Body Control Module (BCM) then controls the relays and timing functions to provide the driver selected features.

3.15.1 SYSTEM FEATURES

Speed Sensitive Intermittent Wipe Mode

There are 6 individual delay times with a minimum delay of 1/2 second to a maximum of 18 seconds. When the vehicle speed is under 10 MPH (6 KMH), the delay time is doubled providing a range of 1 second to 36 seconds.

Park after Ignition Off

Because the wiper relays are powered from the battery the BCM can run the wipers to park after the ignition is turned off.

Wipe after Wash

When the driver presses the wash button for over 1/2 second and then releases it, the wiper will continue to run for 2 additional wipe cycles.

The wiper system utilizes the BCM to control the on/off and hi/low relays fro low and hi speed wiper functions, intermittent wiper delay as the switch position changes, pulse wipe, wipe after wash mode, and wiper motor park functions. The BCM uses the vehicle speed input to double the usual delay time below 10 MPH (17 KMH).

3.16 USING THE DRBIII®

Refer to the DRBIII® user’s guide for instructions and assistance with reading DTC’s, erasing DTC’s, and other DRBIII® functions.

3.17 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages: user-requested WARM Boot or User-Requested COLD Boot. If the DRBIII® should display any other error message, record the entire display and call the Star Center. This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot

Press MORE to switch between this display
   and the application screen.
Press F4 when done noting information.
```

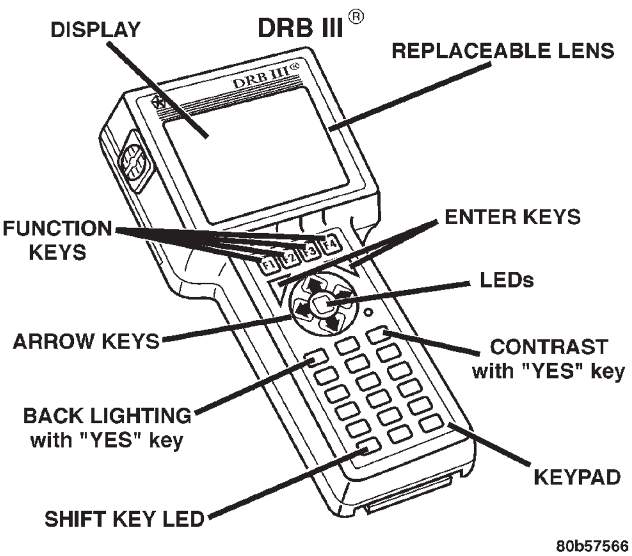
3.18 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®. Check for proper grounds at DLC cavities 4 and 5.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, and inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.19 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.



4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a powertrain system problem, it is important to follow approved procedures where applicable. These procedures can be found in this General Information Section or in the service manual procedures. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB ASSEMBLIES

Some components of the powertrain system are intended to be serviced in assembly only. Attempting to remove or repair certain system subcomponents may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.

- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is “off”. Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second DTC could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TEST COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic DTC or symptom condition.

WARNING: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRBIII®.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box)
Jumper wires
Ohmmeter
Voltmeter
Sentry Key Tester
Test Light
8310 Airbag System Load Tool
8443 SRS Airbag System Load Tool

6.0 GLOSSARY OF TERMS

6.1 ACRONYMS

ABS	antilock brake system
ACM	airbag control module
AECM	airbag electronic control module (ACM)
ASDM	airbag system diagnostic module (ACM)
BCM	body control module
CAB	controller antilock brake
CMTC	compass/mini-trip computer
DAB	driver airbag
DLC	data link connector

DTC	diagnostic trouble code
DR	driver
EBL	electric back lite (rear window defogger)
HVAC	heater ventilation, air conditioning
MIC	mechanical instrument cluster
MTC	manual temperature control
OBD	on board diagnostics
ODO	odometer
ORC	occupant restraint controller (ACM)
PAB	passenger airbag
PASS	passenger
PCI	Programmable Communication Interface (vehicle communication bus)
PCM	powertrain control module
PDC	power distribution center
PWM	pulse width modulated
RKE	remote keyless entry
SAB	seat airbag
SBT	seat belt tensioner
SIACM	side impact airbag control module
SKIM	sentry key immobilizer module
SKIS	sentry key immobilizer system
SQUIB	also called initiator (located inside airbag)
SRS	supplemental restraint system
TCM	transmission control module
VFD	vacuum fluorescent display
VTSS	vehicle theft security system

NOTES

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom List:

ACCELEROMETER 1
ACCELEROMETER 2
INTERNAL 1
INTERNAL 2
OUTPUT DRIVER 1
OUTPUT DRIVER 2
STORED ENERGY FIRING 1

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be INTERNAL MODULE TEST.

When Monitored and Set Condition:

ACCELEROMETER 1

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

ACCELEROMETER 2

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

INTERNAL 1

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

INTERNAL 2

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

OUTPUT DRIVER 1

When Monitored: With the ignition on the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

OUTPUT DRIVER 2

When Monitored: With the ignition on the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

INTERNAL MODULE TEST — Continued

STORED ENERGY FIRING 1

When Monitored: With the ignition on the ACM on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the ACM identifies an out of range internal circuit.

POSSIBLE CAUSES
AIRBAG CONTROL MODULE - ACM
LEFT SIDE IMPACT AIRBAG CONTROL MODULE - LSIACM
RIGHT SIDE IMPACT AIRBAG CONTROL MODULE - RSIACM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **WARNING: IF THE MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** From the list below, select the appropriate module reporting this diagnostic trouble code. SELECT ONE: ACM - ACTIVE or STORED DTC WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1. LEFT SIACM - ACTIVE or STORED DTC WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Left Side Impact Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1. RIGHT SIACM - ACTIVE or STORED DTC WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Right Side Impact Airbag Control Module in accordance with Service information. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

Symptom List:

AIRBAG WARNING INDICATOR OPEN
AIRBAG WARNING INDICATOR SHORT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be AIRBAG WARNING INDICATOR OPEN.

When Monitored and Set Condition:

AIRBAG WARNING INDICATOR OPEN

When Monitored: With ignition on the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, upon lamp state change, or in response to the ACM lamp message.

Set Condition: This DTC will set immediately if the indicator status is OPEN .

AIRBAG WARNING INDICATOR SHORT

When Monitored: With ignition on the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, upon lamp state change, or in response to the ACM lamp message.

Set Condition: This DTC will set immediately if the indicator status is SHORT.

POSSIBLE CAUSES
MIC, COMMUNICATION FAILURE
WARNING INDICATOR
ACM, WARNING INDICATOR
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

AIRBAG WARNING INDICATOR OPEN — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, ensure PCI Bus communications with the Instrument Cluster. Is the Instrument Cluster communicating on the PCI Bus? Yes → Go To 3 No → Refer to category COMMUNICATION CATEGORY and select the related symptom INSTRUMENT CLUSTER BUS +/- SIGNAL OPEN. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRB select PASSIVE RESTRAINTS, AIRBAG and MONITOR DISPLAY. Using the DRB, read the WARNING LAMP MONITOR screen. Select the LAMP STATUS displayed on the DRB monitors screen. Does the DRB show the LAMP STATUS: OK? YES Go To 4 NO Replace Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
CALIBRATION MISMATCH

When Monitored and Set Condition:

CALIBRATION MISMATCH

When Monitored: With ignition on, the ACM monitors the PCI Bus for the VIN message containing the body style. The PCM transmits the complete VIN message every 14 seconds. Note: The VIN message should match the vehicle VIN plate.

Set Condition: If the Body style stored in ACM does not exactly match the vehicle body style indicated by the PCM, then the fault shall be set.

POSSIBLE CAUSES
PCM, PCI COMMUNICATION FAILURE
COMPARE VEHICLE IDENTIFICATION NUMBERS
ORC CALIBRATION MISMATCH
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. Connect the DRB to the data link connector and select PASSIVE RESTRAINTS, AIRBAG, SYSTEM TEST. With the DRBIII®, read the system test. Does the DRB show PCM Active on the Bus:? Yes → Go To 3 No → Refer to category COMMUNICATION CATEGORY and select the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.	All

CALIBRATION MISMATCH — Continued

TEST	ACTION	APPLICABILITY
3	With the DRB select ENGINE MISCELLANEOUS, select MISC FUNCTION, and then CHECK VIN to read the Vehicle Identification Number in the Powertrain Control Module. Compare the VIN displayed on the DRB screen and the Vehicle VIN plate. Does the VIN plate and the PCM VIN match? Yes → Go To 4 No → Replace the Powertrain Control Module and program with the correct vehicle identification number. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
CLUSTER MESSAGE MISMATCH

When Monitored and Set Condition:

CLUSTER MESSAGE MISMATCH

When Monitored: After the MIC bulb test is completed, the ACM compares the Lamp Request by ACM, On or Off, and the Lamp on by MIC, On or Off, PCI Bus messages. Each message is transmitted one time per second or when a change in the lamp state occur.

Set Condition: If the Lamp Request by ACM, On or Off, and the Lamp on by MIC, On or Off, messages do not match, the code will set.

POSSIBLE CAUSES
MIC DIAGNOSTIC CODES
CLUSTER MESSAGE MISMATCH
STORED CODE OR INTERMITTENT CONDITION
ACM, CLUSTER MESSAGE MISMATCH
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. With the DRBIII®, read the MIC DTCs. Does the DRBIII® display any active Diagnostic Codes? Yes → Refer to symptom list for problems related to Instrument Cluster. No → Go To 3	All

CLUSTER MESSAGE MISMATCH — Continued

TEST	ACTION	APPLICABILITY
3	With the DRB select PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY and WARNING LAMP STATUS. Cycle the ignition key and observe the LAMP ON BY MIC and LAMP REQ BY ACM monitors after the 6 to 8 second indicator test. Does the LAMP ON BY MIC and LAMP REQ BY ACM monitors match? YES Go To 4 NO Replace Mechanical Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All
4	**WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
CONFIGURATION ERROR

When Monitored and Set Condition:

CONFIGURATION ERROR

When Monitored: With ignition on the Side Impact Airbag Control Module monitors the unused squib terminals for the a valid squib circuit resistance.

Set Condition: When the SIACM detects a valid squib circuit resistance across the unused terminals.

POSSIBLE CAUSES
SELECT MODULE REPORTING DTC
MISS WIRED LEFT SIACM CONNECTOR
MISS WIRED RIGHT SIACM CONNECTOR
LEFT SIDE IMPACT AIRBAG CONTROL MODULE - LSIACM
RIGHT SIDE IMPACT AIRBAG CONTROL MODULE - LSIACM
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ONE: LEFT SIACM - ACTIVE DTC Go To 2 LEFT SIACM - STORED DTC Go To 4 RIGHT SIACM - ACTIVE DTC Go To 3 RIGHT SIACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

CONFIGURATION ERROR — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Left SIACM connector. **NOTE: Check connectors - Clean and repair as necessary.** Using the wiring diagram/schematic as a guide, inspect the Left SIACM connector wiring. Is the connector correctly wired? Yes → Replace the Left Side Impact Airbag Control Module in accordance with Service Instructions. WARNING: IF THE SIDE IMPACT AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Rewire the Left Side Impact Airbag Control Module connector. Perform AIRBAG VERIFICATION TEST - VER 1.	All
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Right SIACM connector. **NOTE: Check connectors - Clean and repair as necessary.** Using the wiring diagram/schematic as a guide, inspect the Right SIACM connector wiring. Is the connector correctly wired? Yes → Replace the Right Side Impact Airbag Control Module in accordance with Service Instructions. WARNING: IF THE SIDE IMPACT AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Rewire the Right Side Impact Airbag Control Module connector. Perform AIRBAG VERIFICATION TEST - VER 1.	All

CONFIGURATION ERROR — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. CURTAIN SQUIB CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Curtain Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Curtain Airbag connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the SIACM active DTC's. Does the DRB show CURTAIN SQUIB CIRCUIT OPEN? Yes → Go To 3 No → Replace Curtain Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Side Impact Airbag Control Module Connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Side Impact Airbag Control Module connector. Measure the resistance of the Curtain Squib Line 1 and Line 2 circuits between the Load Tool SIACM adaptor and the Curtain Airbag connector. Is the resistance below 1.0 ohms on both circuits? Yes → Replace the Side Impact Airbag Control Module in accordance with the Service information. WARNING: IF THE SIDE IMPACT AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair open or high resistance in the Curtain Squib Line 1 or Line 2 circuits. Perform AIRBAG VERIFICATION TEST - VER 1.	All

CURTAIN SQUIB CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
CURTAIN SQUIB CIRCUIT SHORT

When Monitored and Set Condition:

CURTAIN SQUIB CIRCUIT SHORT

When Monitored: When the ignition is on, the SIACM monitors the resistance between the Curtain Squib circuits.

Set Condition: When the SIACM detects a low resistance between the Curtain Squib circuits.

POSSIBLE CAUSES
CURTAIN AIRBAG SHORT
CURTAIN SQUIB LINE 1 SHORT TO LINE 2
SIACM, CURTAIN SQUIB CIRCUIT SHORT
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ONE: LEFT SIACM - ACTIVE DTC Go To 2 LEFT SIACM - STORED DTC Go To 4 RIGHT SIACM - ACTIVE DTC Go To 2 RIGHT SIACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Disconnect the Load Tool from the Clockspring connector. Measure the resistance of the Driver Squib 1 Line 1 and Line 2 circuit between the ACM adaptor and the Clockspring connector. Is the resistance below 1.0 ohms on both circuits? Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair open or high resistance in the Driver Squib 1 Line 1 or Line 2 circuit. Perform AIRBAG VERIFICATION TEST - VER 1.	All

DRIVER SQUIB 1 CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
5	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
DRIVER SQUIB 1 CIRCUIT SHORT

When Monitored and Set Condition:

DRIVER SQUIB 1 CIRCUIT SHORT

When Monitored: With the ignition on the ACM monitors the resistance of the Driver Squib 1 circuits.

Set Condition: The ACM has detected low resistance on the Driver Squib 1 circuits.

POSSIBLE CAUSES
DRIVER AIRBAG CIRCUIT SHORT
CLOCKSPRING, DRIVER SQUIB 1 CIRCUIT SHORT
DRIVER SQUIB 1 LINE 1 SHORT TO LINE 2
ACM, DRIVER SQUIB 1 CIRCUIT SHORT
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Driver Airbag. **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Driver Airbag connectors. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Does the DRB show DRIVER SQUIB 1 CIRCUIT SHORT? Yes → Go To 3 No → Replace Driver Airbag. Perform AIRBAG VERIFICATION TEST - VER 1.	All

DRIVER SQUIB 1 CIRCUIT SHORT — Continued

The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
INTERROGATE LEFT SIACM

When Monitored and Set Condition:

INTERROGATE LEFT SIACM

When Monitored: With ignition on, the ACM monitors the PCI Bus for a Left SIACM status message containing the airbag warning lamp ″On or OFF″ request. The status message is sent to the ACM once each second or upon any change in the active DTCs.

Set Condition: The Code will set, if the ACM receives an Lamp On status message from the Left SIACM. NOTE: This indicates that there was an active diagnostic trouble code in the Left SIACM.

POSSIBLE CAUSES
INTERROGATE LEFT SIACM
ACM, NO ACTIVE LEFT SIACM DTCS
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. With the DRB read the Left SIACM active DTCs. Did the DRB show any active DTCs? Yes → Refer to symptom list for problems related to Left SIACM. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All

INTERROGATE LEFT SIACM — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
INTERROGATE RIGHT SIACM

When Monitored and Set Condition:

INTERROGATE RIGHT SIACM

When Monitored: With ignition on, the ACM monitors the PCI Bus for a Right SIACM status message containing the airbag warning indicator On - OFF request. The status message is sent to the ACM once each second or upon any change in the active DTCs.

Set Condition: The Code will set, if the ACM receives an Lamp On status message from the Right SIACM. NOTE: This indicates that there is an active diagnostic trouble code in the Right SIACM.

POSSIBLE CAUSES
INTERROGATE RIGHT SIACM
NO ACTIVE RIGHT SIACM DTCS
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. With the DRB read the Right SIACM active DTCs. Did the DRB show any active DTCs? Yes → Refer to symptom list for problems related to Right SIACM. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All

INTERROGATE RIGHT SIACM — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
LOSS OF IGNITION RUN - START

When Monitored and Set Condition:

LOSS OF IGNITION RUN - START

When Monitored: With the ignition in the Run or Start position the module monitors the Run - Start circuit for proper system voltage.

Set Condition: The code will set, if the voltage on the Run - Start circuit drops below approximately 6.0 volts for the ACM or 6.7 volts for the SIACM.

POSSIBLE CAUSES
AIRBAG SYSTEM COMPONENT SHORTED TO GROUND
IGNITION SWITCH RUN-START CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT RUN-START CIRCUIT OPEN
ACM, FUSED IGNITION OUTPUT RUN-START CIRCUIT OPEN
MODULE RUN - START SHORTED TO GROUND
RSIACM, LOW IGNITION RUN - START VOLTAGE
LSIACM - LOW IGNITION RUN - START VOLTAGE
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** From the list below, select the appropriate module and DTC type for the this diagnostic trouble code. SELECT ONE: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 6 LEFT SIACM - ACTIVE DTC Go To 7 RIGHT SIACM - ACTIVE DTC Go To 8 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

LOSS OF IGNITION RUN - START — Continued

<table>
<tr><th>TEST</th><th>ACTION</th><th>APPLICABILITY</th></tr>
<tr><td>2</td><td>Turn ignition off.
Remove and inspect the Airbag Run-Start Fuse.
NOTE: Check connectors - Clean and repair as necessary.
Is the Fuse open?

Yes → Go To 3

No → Go To 4</td><td>All</td></tr>
<tr><td>3</td><td>WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.
Measure the resistance of the Fused Ignition Switch Output Run-Start circuit between the Airbag Run-Start Fuse and ground.
While monitoring the ohmmeter, disconnect each airbag system component on the Run - Start circuit one at a time.
Is the resistance above 10K ohms:

after removing a component?
Replace the shorted airbag system component in accordance with Service Instructions and replace the airbag Run - Start fuse. WARNING: IF THE MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.
Perform AIRBAG VERIFICATION TEST - VER 1.

after all components are removed?
Repair the Fused Ignition Run - Start circuit shorted to ground and replace Airbag Run-Start Fuse.
Perform AIRBAG VERIFICATION TEST - VER 1.</td><td>All</td></tr>
<tr><td>4</td><td>Turn the ignition on.

Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
MODULE NOT CONFIGURED FOR SAB

When Monitored and Set Condition:

MODULE NOT CONFIGURED FOR SAB

When Monitored: With ignition on, the ORC monitors the PCI Bus for a message containing an ″A″ in the 4 th position of the VIN. This character identifies the type of safety equipment and should match the VIN. The PCM transmits the VIN every 13.76 seconds.

Set Condition: The code will set, if the ORC detects a Side Impact Airbag Module active on the PCI Bus and the 4 th character of the VIN message is not an ″A″.

POSSIBLE CAUSES
PCM, PCI COMMUNICATION FAILURE
CHECK PCM VIN
ACM, NOT CONFIGURED FOR SIDE AIRBAGS
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. Connect the DRB to the data link connector and select PASSIVE RESTRAINTS, AIRBAG, SYSTEM TEST With the DRBIII®, read the PCM Active on the Bus Does the DRB show PCM Active on the Bus:? Yes → Go To 3 No → Refer to category COMMUNICATION and select the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.	All

MODULE NOT CONFIGURED FOR SAB — Continued

TEST	ACTION	APPLICABILITY
3	With the DRB read the Vehicle Identification Number in the Powertrain Control Module. Compare the VIN displayed on the DRB screen and the Vehicle VIN plate. Does the VIN plate and the PCM VIN match? Yes → Go To 4 No → Replace the Powertrain Control Module and program with the correct vehicle identification number. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Symptom:
NO ODOMETER MESSAGE

When Monitored and Set Condition:

NO ODOMETER MESSAGE

When Monitored: With ignition on, the ACM monitors the PCI Bus for the Odometer message from the Body Control Module. The BCM transmits the odometer message at 1 second intervals.

Set Condition: The code will set, if the ACM does not see the odometer message for 10 seconds.

POSSIBLE CAUSES
PCM, PCI COMMUNICATION FAILURE
NO ODOMETER MESSAGE
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT
ORC, NO ODOMETER MESSAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** Turn the ignition on. SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. Connect the DRBIII® to the data link connector and select PASSIVE RESTRAINTS, AIRBAG, SYSTEM TEST. With the DRBIII®, read the PCM Active on the Bus:. Does the DRB show PCM ACTIVE ON THE BUS? Yes → Go To 3 No → Refer to category ″ COMMUNICATION CATEGORY″ and select the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.	All

NO ODOMETER MESSAGE — Continued

TEST	ACTION	APPLICABILITY
3	With the DRB select ENGINE, MISCELLANEOUS, SELECT MISC FUNCTION, and then CHECK VIN to read the Vehicle Identification Number in the Powertrain Control Module. Compare the VIN displayed on the DRB screen and the Vehicle VIN plate. Does the VIN plate and the PCM VIN match? Yes → Go To 4 No → Replace the Powertrain Control Module and program with the correct vehicle identification number. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.**	All
5	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
NO PCI TRANSMISSION

When Monitored and Set Condition:

NO PCI TRANSMISSION

When Monitored: With the ignition on and the module transmitting information on the PCI BUS.

Set Condition: The code will set if the onboard diagnostic cannot detect the module transmitting information on the PCI BUS for 4 consecutive seconds. NOTE: Any PCI Bus Failure will may cause a stored code to set.

POSSIBLE CAUSES
AIRBAG CONTROL MODULE - ACM
LEFT SIDE IMPACT AIRBAG CONTROL MODULE - LSIACM
RIGHT SIDE IMPACT AIRBAG CONTROL MODULE - RSIACM
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

NO PCI TRANSMISSION — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** IF THE MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Turn the ignition on. From the list below, select the appropriate module and DTC type for the this diagnostic trouble code. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** Select the appropriate module and type of DTC ACM - ACTIVE WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1. ACM - STORED Go To 2 LEFT SIACM - ACTIVE WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
NO RIGHT SIACM MESSAGE

When Monitored and Set Condition:

NO RIGHT SIACM MESSAGE

When Monitored: With ignition on, the ACM monitors the PCI Bus for the Right Side Impact Airbag Control Module status message. The Right SIACM transmits the status message to the ACM at 1 - second intervals.

Set Condition: If the ACM fails to see the Right SIACM status message on the PCI Bus for 10 seconds the code will set.

POSSIBLE CAUSES
NO RIGHT SIACM MESSAGE
ACM, NO RIGHT SIACM MESSAGE
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	With the DRB select SIDE AIRBAG and the RIGHT SIDE AIRBAG from the DRB menu. Does the DRB show NO RESPONSE or BUS +/- SIGNAL OPEN? Yes → Refer to the COMMUNICATION category for the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All

NO RIGHT SIACM MESSAGE — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.**	All
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
PASSENGER SEAT BELT TENSIONER CIRCUIT OPEN

When Monitored and Set Condition:

PASSENGER SEAT BELT TENSIONER CIRCUIT OPEN

When Monitored: When the ignition is On, the ACM monitors the resistance of the Passenger Seat Belt Tensioner circuits.

Set Condition: The ACM has detected an open circuit or high resistance or open circuit in the Passenger Seat Belt Tensioner circuits.

POSSIBLE CAUSES
PASSENGER SEAT BELT TENSIONER OPEN
PASSENGER SEAT BELT TENSIONER LINE 1 OR LINE 2 CIRCUIT OPEN
ACM, PASSENGER SEAT BELT TENSIONER CIRCUIT OPEN
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**NOTE: Ensure the battery is fully charged.** **WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Passenger SBT connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool and jumper to the Passenger SBT connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active DTC's. Does the DRBIII® display PASSENGER SBT CIRCUIT OPEN? Yes → Go To 3 No → Replace the Passenger Seat Belt Tensioner in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

PASSENGER SEAT BELT TENSIONER CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag connector. Disconnect the Load Tool jumper from the Passenger SBT connector. Measure the resistance of the Passenger Seat Belt Tensioner Line 1 and Line 2 circuits between the Load Tool adaptor and the Passenger SBT connector. Is the resistance below 1.0 ohms on either circuit ? Yes → Replace the Airbag Control Module in accordance with the Service information. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair open or high resistance in Passenger Seat Belt Tensioner Line 1 or Line 2 circuits. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. 4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
PASSENGER SQUIB 2 CIRCUIT OPEN

When Monitored and Set Condition:

PASSENGER SQUIB 2 CIRCUIT OPEN

When Monitored: When the ignition is On, the ACM monitors the resistance of the Passenger Squib 2 circuits.

Set Condition: The ACM has detected an open circuit or high resistance on the Passenger Squib 2 circuits.

POSSIBLE CAUSES
PASSENGER AIRBAG OPEN
PASSENGER SQUIB 2 LINE 1 OR LINE 2 CIRCUIT OPEN
ACM, PASSENGER SQUIB 2 CIRCUIT OPEN
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

PASSENGER SQUIB 2 CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Passenger Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Passenger Airbag connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SQUIB 2 CIRCUIT OPEN? Yes → Go To 3 No → Replace Passenger Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Disconnect the Load Tool from the Passenger Airbag connector. Measure the resistance of the Passenger Squib 2 Line 1 and Line 2 circuits between the ACM adaptor and the Passenger Airbag connector. Is the resistance below 1.0 ohms on both circuits? Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair open or high resistance in Passenger Squib 2 Line 1 or Line 2 circuits. Perform AIRBAG VERIFICATION TEST - VER 1.	All

PASSENGER SQUIB 2 CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. Symptom:
PASSENGER SQUIB 2 SHORT TO GROUND

When Monitored and Set Condition:

PASSENGER SQUIB 2 SHORT TO GROUND

When Monitored: When the ignition is on, the ACM monitors the resistance of the Passenger Squib 2 circuits for low resistance.

Set Condition: The ACM has detected a short to ground in the Passenger Squib 2 circuits.

POSSIBLE CAUSES
PASSENGER AIRBAG CIRCUIT SHORTED TO GROUND
PASSENGER SQUIB 2 LINE 1 OR LINE 2 SHORT TO GROUND
ACM, PASSENGER SQUIB 2 CIRCUIT SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Passenger Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Passenger Airbag connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SQUIB 2 CIRCUIT SHORT TO GROUND? Yes → Go To 3 No → Replace the Passenger Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All

PASSENGER SQUIB 2 SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Airbag Control Module connector **NOTE: Check connectors - Clean repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Disconnect the Load Tool from the Passenger Airbag connector. Measure the resistance of the Passenger Squib 2 Line 1 and Line 2 circuits between the Passenger Airbag Module connector and ground. Is the resistance below 10K ohms on either circuit? Yes → Repair Passenger Squib 2 Line 1 or Line 2 circuit for a shorted to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
VEHICLE BODY STYLE UNKNOWN

When Monitored and Set Condition:

VEHICLE BODY STYLE UNKNOWN

When Monitored: When the ignition is on, the ACM monitors the PCI Bus for the VIN message containing the vehicle body style from the Powertrain Control Module. The PCM transmits the VIN message every 14 seconds.

Set Condition: With ignition on, If the ACM does not receive 2 consecutive matching (vehicle Body Style) VIN messages on the bus the code will set.

POSSIBLE CAUSES
PCM, PCI COMMUNICATION FAILURE
VEHICLE BODY STYLE UNKNOWN
ACM, VEHICLE BODY STYLE UNKNOWN
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. Connect the DRBIII® to the data link connector and select PASSIVE RESTRAINTS, AIRBAG, SYSTEM TEST. With the DRBIII®, read the PCM Active on the Bus:. Does the DRB show PCM ACTIVE ON THE BUS:? Yes → Go To 3 No → Refer to category COMMUNICATION CATEGORY and select the related symptom. Perform AIRBAG VERIFICATION TEST - VER 1.	All

VEHICLE BODY STYLE UNKNOWN — Continued

TEST	ACTION	APPLICABILITY
3	With the DRB select ENGINE, MISCELLANEOUS, SELECT MISC FUNCTION, and then CHECK VIN to read the Vehicle Identification Number in the Powertrain Control Module. Compare the VIN displayed on the DRB screen and the Vehicle VIN plate. Does the VIN plate and the PCM VIN match? Yes → Go To 4 No → Replace the Powertrain Control Module and program with the correct vehicle identification number. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.**	All
5	**NOTE: Ensure the battery is fully charged.** Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRB III monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
*AIRBAG INDICATOR ON WITHOUT ACM TROUBLE CODES

POSSIBLE CAUSES
AIRBAG INDICATOR ON WITHOUT ACM TROUBLE CODES
INSTRUMENT CLUSTER PROBLEMS

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Make sure that all active DTC's have been repaired before performing this procedure. With the DRBIII select PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY, WARNING LAMP STATUS and read the WARNING LAMP STATUS. Does the DRB show LAMP REQ BY ACM: ON? Yes → WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Occupant Restraint Controller in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1. No → Refer to INSTRUMENT CLUSTER CATEGORY symptom list for problems related to Instrument Cluster. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

Symptom:
ALL OUTPUTS SHORT - PREMIUM AUDIO SYSTEM

When Monitored and Set Condition:

ALL OUTPUTS SHORT - PREMIUM AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
SPEAKER SECTION OF POWER AMPLIFIER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Power Amplifier harness connector. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 3 No → Replace the Power Amplifier in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

ALL OUTPUTS SHORT - PREMIUM AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Power Amplifier harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Power Amplifier harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Power Amplifier harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ALL OUTPUTS SHORT- BASE AUDIO SYSTEM

When Monitored and Set Condition:

ALL OUTPUTS SHORT- BASE AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
FRONT SHORTED SPEAKER
REAR SHORTED SPEAKER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each front speaker and each I/P speaker (if equipped) connector.** Disconnect each front speaker and each I/P speaker (if equipped) harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display ALL OUTPUTS SHORT with all the speakers disconnected? Yes → Go To 3 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All

ALL OUTPUTS SHORT- BASE AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each rear speaker connector.** Disconnect each rear speaker harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display ALL OUTPUTS SHORT with all the rear speakers disconnected? Yes → Go To 4 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect each front and rear speaker harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and each speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect each front and rear speaker harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect each front and rear speaker harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

CASSETTE PLAYER INOP
CD MECHANICAL FAILURE
***AM/FM SWITCH INOPERATIVE**
***ANY STATION PRESET SWITCH INOPERATIVE**
***BALANCE INOPERATIVE**
***CD EJECT SWITCH INOPERATIVE**
***EQUALIZER INOPERATIVE**
***FADER INOPERATIVE**
***FF/RW SWITCH INOPERATIVE**
***HOUR/MINUTE SWITCHES INOPERATIVE**
***PAUSE/PLAY SWITCH INOPERATIVE**
***PWR SWITCH INOPERATIVE**
***SCAN SWITCH INOPERATIVE**
***SEEK SWITCH INOPERATIVE**
***SET SWITCH INOPERATIVE**
***TAPE EJECT SWITCH INOPERATIVE**
***TIME SWITCH INOPERATIVE**
***TUNE SWITCH INOPERATIVE**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be CASSETTE PLAYER INOP.

When Monitored and Set Condition:

CASSETTE PLAYER INOP

When Monitored: Continuously with the ignition and radio turned on.

Set Condition: The code will set if the radio detects a internal cassette failure.

CD MECHANICAL FAILURE

When Monitored: Continuously with the ignition and CD player turned on.

Set Condition: The code will set if the radio detects a CD mechanical failure.

POSSIBLE CAUSES
INTERNAL FAILURE

CASSETTE PLAYER INOP — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: If a DTC is set, erase the DTC and attempt to reset the DTC. If DTC resets, follow this test.** This is an internal radio failure. View repair Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CD CHANGER MECHANICAL FAILURE

When Monitored and Set Condition:

CD CHANGER MECHANICAL FAILURE

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if the CD Changer detects a mechanical failure.

POSSIBLE CAUSES
INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	**NOTE: Erase DTC and attempt to reset. If DTC resets, follow this test.** This is an internal CD Changer failure. View repair Repair Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CD CHANGER READ FAILURE

When Monitored and Set Condition:

CD CHANGER READ FAILURE

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if a CD that is not formatted as a music CD is installed in the CD Changer.

POSSIBLE CAUSES
CD CHANGER READ FAILURE

TEST	ACTION	APPLICABILITY
1	Replace the problem CD with a good, clean, unscratched, music CD. Turn the radio on and select the good CD. With the DRBIII®, read DTC's. Does the DRBIII® display CD CHANGER READ FAILURE? Yes → Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD CHANGER TEMPERATURE HIGH

When Monitored and Set Condition:

CD CHANGER TEMPERATURE HIGH

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if the temperature inside the CD Changer is above +65° C (+145° F).

POSSIBLE CAUSES
HIGH TEMPERATURE FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the audio DTC's. Start the engine and allow the engine to reach normal operating temperature. If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize. The CD Changer will operate between -23° C and 65° C (-10° F and +145° F). With the DRBIII®, read DTC's. Does the DRBIII® display CD CHANGER TEMPERATURE HIGH? Yes → Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD READ FAILURE

When Monitored and Set Condition:

CD READ FAILURE

When Monitored: Continuously with the ignition and the radio CD player turned on.

Set Condition: The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

POSSIBLE CAUSES
CD READ FAILURE

TEST	ACTION	APPLICABILITY
1	Replace the problem CD with a good, clean, unscratched, music CD. Turn the radio CD player on. With the DRBIII®, read DTC's. Does the DRBIII® display CD READ FAILURE? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD TEMPERATURE HIGH

When Monitored and Set Condition:

CD TEMPERATURE HIGH

When Monitored: Continuously with the ignition and the radio CD player turned on.

Set Condition: The code will set if the temperature inside the radio CD player is above +70° C (+156° F).

POSSIBLE CAUSES
HIGH TEMPERATURE FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the audio DTC's. Start the engine and allow the engine to reach normal operating temperature. If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize. The radio CD player will operate between -23° C and 70° C (-10° F and +156° F). With the DRBIII®, read DTC's. Does the DRBIII® display CD TEMPERATURE HIGH? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
NO ANTENNA CONNECTION

When Monitored and Set Condition:

NO ANTENNA CONNECTION

When Monitored: With the ignition on and the radio in seek up/down mode.

Set Condition: With the radio in seek or scan mode for two minutes and the radio does not detect an antenna connection or does not receive a radio station signal.

POSSIBLE CAUSES
BAD ANTENNA CONNECTION
TEST ANTENNA
RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Radio Antenna connector. Inspect the Radio Antenna connection. Was the Antenna connection clean and tight? Yes → Go To 2 No → Repair Antenna connection as needed. Perform BODY VERIFICATION TEST - VER 1.	All
2	Refer to the Audio System in the service information and test the Antenna in accordance with the service procedure. Is the Antenna ok? Yes → Go To 3 No → Repair or replace the Antenna assembly as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
3	**Note: Reconnect all previously disconnected components.** Turn the ignition and Radio on. With the DRBIII®, erase the audio DTC's, put the radio in seek up and seek down mode for approximately 2 minutes before proceeding. With the DRBIII®, read the audio DTC's. Did this DTC reset? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
POWER AMP SHUTDOWN - BASE AUDIO SYSTEM

When Monitored and Set Condition:

POWER AMP SHUTDOWN - BASE AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
FRONT SHORTED SPEAKER
REAR SHORTED SPEAKER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each front speaker and each I/P speaker (if equipped) connector.** Disconnect each front speaker and each I/P speaker (if equipped) harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display POWER AMP SHUTDOWN with all the speakers disconnected? Yes → Go To 3 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All

POWER AMP SHUTDOWN - BASE AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each rear speaker connector.** Disconnect each rear speaker harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display POWER AMP SHUTDOWN with all the rear speakers disconnected? Yes → Go To 4 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio C1 harness connector. Measure the resistance between ground and each speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect each front and rear speaker harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio C1 harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
POWER AMP SHUTDOWN - PREMIUM AUDIO SYSTEM

When Monitored and Set Condition:

POWER AMP SHUTDOWN - PREMIUM AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
SPEAKER SECTION OF POWER AMPLIFIER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Power Amplifier harness connector. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 3 No → Replace the Power Amplifier. Perform BODY VERIFICATION TEST - VER 1.	All

POWER AMP SHUTDOWN - PREMIUM AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Power Amplifier harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Power Amplifier harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between ground and any speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Power Amplifier harness connector. Disconnect the Radio C1 harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME INOPERATIVE AT ALL TIMES

POSSIBLE CAUSES
USE DRB TO ACTUATE CHIME
BODY CONTROL MODULE - CHIME INOPERATIVE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Close both doors. With the DRBIII®, actuate the Chime. Does the chime sound when actuated by the DRB? Yes → The chime operates as it should. Check other reasons for the chime being inoperative and select from the symptom list. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

*CHIME INOPERATIVE WITH DRIVER SEAT BELT UNFASTENED

POSSIBLE CAUSES
SEAT BELT SWITCH STATUS ON DRBIII®
SEAT BELT SWITCH SHORTED
SEAT BELT SWITCH SENSE SHORT TO GROUND
INSTRUMENT CLUSTER - SEAT BELT SWITCH SHORTED

TEST	ACTION	APPLICABILITY
1	Ensure the drivers seat belt is unfastened. With the DRBIII®, select Electro Mech Cluster Input/Output. Turn the ignition on. Read the Seat Belt Sw status. Does the DRBIII display Seat Belt Sw: Closed Yes → Go To 2 No → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Seat Belt Switch connector. With the DRBIII®, select Electro Mech Cluster Input/Output. Turn the ignition on. Read the seat Belt Sw status. Does the DRBIII display Seat Belt Sw: Closed Yes → Go To 3 No → Repair the Seat Belt switch pigtail wiring or replace the Buckle assembly. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Removed the Instrument Cluster from the instrument panel. Disconnect the Seat Belt Switch connector. Measure the resistance between ground and the Seat Belt Switch Sense circuit. Is the resistance below 100.0 ohms? Yes → Repair the Seat Belt Switch Sense wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	If there are no possible causes remaining, view repair. Repair Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

*CHIME INOPERATIVE WITH EXTERIOR LIGHTS ON AND DRIVERS DOOR OPEN

POSSIBLE CAUSES
OPEN HEADLAMP SWITCH OUTPUT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	The Driver's Door Ajar switch must be operational for the result of this test to be valid. The Key-In Ignition switch chime function must be operational for the result of this test to be valid. Turn the ignition off. Remove the Body Control Module from the Junction Block. Turn the headlamps on. Measure the voltage of the Headlamp Switch Output circuit in the Junction Block internal 12-way connector. Is the voltage above 10.0 volts? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Head Lamp Switch Output circuit for an open from the headlamp switch. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME INOPERATIVE WITH KEY-IN IGNITION AND DRIVER DOOR OPEN

POSSIBLE CAUSES
OBSERVE THE KEY-IN IGNITION SWITCH STATUS
KEY-IN IGNITION SWITCH OPEN
KEY-IN IGNITION SWITCH GROUND CIRCUIT OPEN
KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN
BCM - INCORRECT KEY - IN IGNITION SWITCH STATUS

TEST	ACTION	APPLICABILITY
1	The door ajar switch must be operational for the result of this test to be valid. **NOTE: Ensure that the Key is still in the Ignition Switch.** With the DRBIII® enter Body Computer then Input Output and read the Key-In Ignition Switch status. Does the DRB display: KEY-IN IGN: CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. Disconnect the Ignition Switch C3 harness connector. Connect a jumper between the Key-In Ignition Switch Sense circuit and the Ground circuit. With the DRBIII®, enter Body Computer then Input/Output and observe the Key-In Ignition Switch status. Does the DRBIII display Key-In Ign: Closed? Yes → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Ignition Switch C3 harness connector. Turn all lights off. Measure the resistance between ground and the ground circuit in the ignition switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*CHIME INOPERATIVE WITH KEY-IN IGNITION AND DRIVER DOOR OPEN — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Ignition Switch C3 harness connector. Disconnect the Body Control Module C1 harness connector. Measure the resistance of the Key-In Ignition Switch Sense circuit between the ignition switch connector and the BCM harness C1 connector . Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Key-In Ignition Switch Sense circuit for an open Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME SOUNDS WITH DRIVER SEAT BELT FASTENED

POSSIBLE CAUSES
SEAT BELT SW STATUS WRONG-OPEN
SEAT BELT SWITCH OPEN
GROUND WIRE OPEN
SEAT BELT SW SEN OPEN
INSTRUMENT CLUSTER - SEAT BELT SENSE OPEN

TEST	ACTION	APPLICABILITY
1	Ensure the drivers seat belt is fastened. With the DRB III select: Electro Mech Cluster Input/Outputs. Turn the ignition on. Read the Seat Belt SW status. Does the DRB III show Seat Belt SW: CLOSED? Yes → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Seat Belt Switch connector. Turn all lights off. Trip the door lock latch to turn the courtesy lamps off. Measure the resistance of the Ground circuit in the Seat Belt connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open ground wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Seat Belt Switch connector. Connect a jumper wire between Seat Belt Switch Sense CKT and the Ground CKT in the Seat Belt Switch connector. With the DRB III select: Electro Mech Cluster Input/Outputs. Turn the ignition on. Read the Seat Belt SW status. Does the DRB III show Seat Belt SW: CLOSED? Yes → Repair the Seat Belt switch pigtail wiring or replace the Buckle assembly. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Instrument Cluster from the instrument panel. Disconnect the Seat Belt Switch connector. Measure the resistance of the Seat Belt Switch Sense circuit between the Instrument Cluster connector and the Seat Belt Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Seat Belt Switch Sense circuit. Perform BODY VERIFICATION TEST - VER 1.	All

*CHIME SOUNDS WITH DRIVER SEAT BELT FASTENED — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view repair. Repair Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME SOUNDS WITH DRIVERS DOOR OPEN AND KEY REMOVED FROM IGNITION

POSSIBLE CAUSES
KEY-IN IGNITION SWITCH STATUS WRONG
KEY-IN IGNITION SWITCH STATUS WRONG
KEY-IN IGNITION SW SENSE SHORT TO GROUND
BODY CONTROL MODULE - KEY-IN IGNITION SHORTED

TEST	ACTION	APPLICABILITY
1	Ensure all exterior lamps are off. With the DRB III select: Body Computer Input/Output. Remove the key from the ignition switch. Read the Key-In Ignition status. Does the DRB III show Key-In Ign: CLOSED? Yes → Go To 2 No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Ignition Switch C3 harness connector. Disconnect the Body Control Module C1 harness connector. Measure the resistance of the Key-in Ignition Switch Sense circuit to ground. Is the resistance below 100.0 ohms? Yes → Repair the Key-in Ignition Switch Sense circuit to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Ignition Switch C3 connector. With the DRBIII® select: Body Computer Input/Output. Read the Key-In Ignition Status. Does the DRBIII® display Key-In Ign CLOSED? Yes → Go To 4 No → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*VEHICLE SPEED WARNING CHIME PROBLEM

POSSIBLE CAUSES
INCORRECT COUNTRY CODE PROGRAMMED IN BCM
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Note: The vehicle speed warning chime is for Gulf Coast Countries only. With the DRBIII®, check the Body Control Module country code setting. Is the country code incorrect? Yes → Program the correct country code setting. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BATTERY POWER TO MODULE DISCONNECTED

When Monitored and Set Condition:

BATTERY POWER TO MODULE DISCONNECTED

When Monitored: With the ignition on.

Set Condition: The BCM receives ignition on voltage, but no battery power feed.

POSSIBLE CAUSES
VERIFYING ACTIVE DTC
FUSED B+ CIRCUIT - JUNCTION BLOCK
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset? Yes → Go To 2 No → No problem found at this time. Use the wiring diagrams located in the service information to help isolate a possible intermittent wiring problem. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove the BCM from the Junction Block. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the Junction Block Body Control Module connector cavity 12. Is the test light illuminated? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BOOTLOADER CHECKSUM FAILURE

When Monitored and Set Condition:

BOOTLOADER CHECKSUM FAILURE

When Monitored: At battery connect.

Set Condition: The BCM fails the bootloader checksum test.

POSSIBLE CAUSES
BOOTLOADER CHECKSUM FAILURE

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
EEPROM CHECKSUM FAILURE

When Monitored and Set Condition:

EEPROM CHECKSUM FAILURE

When Monitored: Continuously.

Set Condition: The BCM fails EEPROM checksum test.

POSSIBLE CAUSES
EEPROM CHECKSUM FAILURE

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
MIC MESSAGES NOT RECEIVED

When Monitored and Set Condition:

MIC MESSAGES NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: The BCM does not receive any messages from the Instrument Cluster (MIC) for at least 14 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE INSTRUMENT CLUSTER (MIC)
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Electro/Mech Cluster. Was the DRB able to I/D or communicate with the Instrument Cluster (MIC)? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
ORC MESSAGES NOT RECEIVED

When Monitored and Set Condition:

ORC MESSAGES NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: The BCM does not receive any messages from the Airbag Control Module (ORC) for at least 10 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE AIRBAG CONTROL MODULE (ORC)
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the Airbag Control Module (ORC). Was the DRB able to I/D or communicate with the Airbag Control Module (ORC)? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PCM MESSAGES NOT RECEIVED

When Monitored and Set Condition:

PCM MESSAGES NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: The BCM does not receive any messages from the Powertrain Control Module (PCM) for at least 12 seconds.

POSSIBLE CAUSES
VERIFYING ACTIVE DTC
PCM MESSAGES NOT RECEIVED
ATTEMPT TO COMMUNICATE WITH THE PCM
POWERTRAIN CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent open or shorted wiring condition. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRB, enter Body Computer, System Tests then PCM Monitor. Does the DRB display: PCM is active on BUS? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition on. With the DRB, attempt to communicate with the PCM. Was the DRB able to communicate with the PCM? Yes → Go To 4 No → Refer to the communication category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All

PCM MESSAGES NOT RECEIVED — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the PCM C2 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the PCM C2 connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Powertrain Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the PCM C2 harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit between the PCM C2 connector and the BCM C3 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
POST FAILURE

When Monitored and Set Condition:

POST FAILURE

When Monitored: At battery connect.

Set Condition: The BCM fails ROM checksum test.

POSSIBLE CAUSES
POST FAILURE

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
SKIM MESSAGES NOT RECEIVED

When Monitored and Set Condition:

SKIM MESSAGES NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: The BCM does not receive any messages from the Sentry Key Immobilizer Module (SKIM) for at least 12 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE SENTRY KEY IMMOBILIZER MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the SKIM. Was the DRB able to I/D or communicate with the SKIM? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
TCM MESSAGES NOT RECEIVED

When Monitored and Set Condition:

TCM MESSAGES NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: The BCM does not receive any messages from the Transmission Control Module (TCM) for at least 18 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE TCM
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Transmission. Was the DRB able to I/D or communicate with the TCM? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
TRAVELER MESSAGES NOT RECEIVED (CMTC)

When Monitored and Set Condition:

TRAVELER MESSAGES NOT RECEIVED (CMTC)

When Monitored: With the ignition on.

Set Condition: The BCM does not receive any messages from the Traveler (Compass/Mini Trip Computer) for at least 14 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE TRAVELER (CMTC)
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Traveler. Was the DRB able to I/D or communicate with the Traveler (CMTC)? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM BODY CONTROL MODULE

POSSIBLE CAUSES
OPEN GROUND CIRCUITS
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	**NOTE: Make sure the DRB can communicate with other modules before proceeding, if not refer to the PCI Bus Communication Failure symptom.** Turn the ignition off. Disconnect the BCM C2 and C3 harness connectors. **NOTE: Ensure all lights are turned off.** Using a 12-volt test light connected to 12-volts, probe each ground circuit. Is the test light illuminated for each circuit? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Ground circuit(s) for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM INSTRUMENT CLUSTER

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
FUSED B+ CIRCUIT OPEN
GROUND CIRCUIT OPEN
INSTRUMENT CLUSTER
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Fused Ignition Switch Output circuit for an open or short. Refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused B+ circuit for an open or short. Refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM INSTRUMENT CLUSTER — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Instrument Cluster harness connector. **NOTE: Ensure all lights are turned off.** Using a 12-volt test light connected to 12-volts, probe each ground circuit. Is the test light illuminated for each circuit? Yes → Go To 5 No → Repair the Ground circuit(s) for an open. Refer to the wiring diagrams located in the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
5	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Instrument Cluster harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus (MIC) circuit in the Instrument Cluster connector (cav 2). Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Instrument Cluster in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the PCI bus circuit between the Instrument Cluster connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM SENTRY KEY IMMOBILIZER MODULE

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
SENTRY KEY IMMOBILIZER MODULE (SKIM)
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform SKIS VERIFICATION.	All
2	Turn the ignition off. Disconnect the SKIM harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform SKIS VERIFICATION.	All
3	Turn the ignition off. Disconnect the SKIM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit for an open. Refer to the wiring diagrams in the service information. Perform SKIS VERIFICATION.	All

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM SENTRY KEY IMMOBILIZER MODULE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the SKIM harness connector. Using a 12-volt test light connected to ground, probe the Fused B(+) circuit. Is the test light illuminated? Yes → Go To 5 No → Repair the Fused B+ circuit for an open. Refer to the wiring diagrams in the service information. Perform SKIS VERIFICATION.	All
5	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the SKIM harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the SKIM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Sentry Key Immobilizer Module (SKIM) in accordance with the service information. Perform SKIS VERIFICATION. No → Go To 6	All
6	Turn the ignition off. Disconnect the SKIM harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the PCI bus circuit between the SKIM connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform SKIS VERIFICATION. No → Repair the PCI Bus circuit for an open. Perform SKIS VERIFICATION.	All

Symptom:
*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM TRAVELER (CMTC)

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM AND THE MIC
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
FUSED B+ CIRCUIT OPEN
GROUND CIRCUIT OPEN
COMPASS/MINI TRIP COMPUTER (CMTC)
PCI BUS CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. With the DRB, enter Body then Electro/Mech Cluster. Was the DRB able to I/D or communicate with the BCM and the MIC? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM or the MIC. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Compass/Mini Trip Computer harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Fused Ignition Switch Output circuit for an open or short. Refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Compass/Mini Trip Computer harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused B+ circuit for an open or short. Refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM TRAVELER (CMTC) — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Compass/Mini Trip Computer harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 5 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Compass/Mini Trip Computer harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the CMTC connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Compass/Mini Trip Computer in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the Compass/Mini Trip Computer harness connector. Disconnect the Instrument Cluster harness connector. Measure the resistance of the PCI Bus circuit between the CMTC connector and the Instrument Cluster connector (cav 3). Is the resistance below 5.0 ohms? Yes → Replace the Instrument Cluster in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE

POSSIBLE CAUSES
NO RESPONSE FROM CAB
CHECK JUNCTION BLOCK FUSE
GROUND CIRCUIT OPEN
OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT
CONTROLLER ANTILOCK BRAKE (CAB) MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **Note: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, attempt to communicate with the Airbag Control Module. With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with either of the modules? Yes → Go To 2 No → Refer to the Communications category and perform the symptom PCI Bus Communication Failure. Perform ABS VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect fuse #4 in the junction block. Is the fuse open? Yes → Check the Fused Ignition Switch Output circuit for a short to ground, refer to the wiring diagrams located in the service information. Replace Fuse #4. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the CAB harness connector. Using a 12-volt test light connected to 12-volts, probe both ground circuits. Is the test light illuminated for both circuits? Yes → Go To 4 No → Repair the ground circuit(s) for an open. Perform ABS VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. **NOTE: Ensure fuse #4 is installed in the junction block.** Disconnect the CAB harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 5 No → Repair the Fused Ignition Switch Output circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
5	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the CAB harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the CAB connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Controller Antilock Brake (CAB) in accordance with the service information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the CAB harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit between the CAB connector and the BCM C3 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform ABS VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM LEFT SIACM

POSSIBLE CAUSES
INTERROGATE ORC
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT RUN/START CIRCUIT OPEN
LEFT SIDE IMPACT AIRBAG CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	**Note: Ensure the battery is fully charged.** Turn the ignition on. With the DRBIII®, select Passive Restraints. With the DRBIII®, select Airbag and read the active DTC's. Is the Loss Of Ignition Run/Start DTC set? Yes → Refer to the symptom list and perform the Loss Of Ignition Run/Start symptom. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 2	All
2	**Ensure that the battery is fully charged.** **Warning: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Left Side Impact Airbag Control Module harness connector. Using a 12-volt test light connected to 12-volts, probe both Ground circuits. Is the test light illuminated for each circuit? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **Note: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
3	**Warning: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Left Side Impact Airbag Control Module harness connector. Turn the ignition on and then reconnect the Battery. Measure the voltage of the Fused Ignition Switch Output Run/Start circuit. Is the voltage above 6.0 volts? Yes → Go To 4 No → Repair the Fused Ignition Switch Output Run/Start circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **Note: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

*NO RESPONSE FROM LEFT SIACM — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure there is PCI bus communication with other modules. If not, refer to the PCI Bus Communication Failure symptom and repair as necessary.** **WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Left Side Impact Airbag Control Module harness connector. Turn the ignition on and then reconnect the Battery. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Left Side Impact Airbag Control Module connector. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Left Side Impact Airbag Control Module (LSIACM) in accordance with the Service Information. WARNING: Make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 5	All
5	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Left Side Impact Airbag Control Module harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the PCI bus circuit between the Left SIACM connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM ORC

POSSIBLE CAUSES
CHECKING FOR VOLTAGE AT ORC
ORC GROUND CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Ensure that the battery is fully charged. **WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Occupant Restraint Controller harness connector. Turn the ignition on and then reconnect the Battery. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output Run Circuit and the Fused Ignition Switch Output Run/Start Circuit. NOTE: One open circuit will not cause a NO RESPONSE condition. Is the test light illuminated on both circuits? Yes → Go To 2 No → Repair the Fused Ignition Switch Output Run and Fused Ignition Switch Output Run/Start circuits for an open. Replace the fuse(s) if necessary. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**Ensure that the battery is fully charged.** **WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Occupant Restraint Controller harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

*NO RESPONSE FROM ORC — Continued

TEST	ACTION	APPLICABILITY
3	**Note: Ensure there is PCI bus communication with other modules. If not, refer to the PCI Bus Communication Failure symptom and repair as necessary.** **WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Occupant Restraint Controller harness connector. Turn the ignition on and then reconnect the Battery. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the ORC connector. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Occupant Restraint Controller in accordance with the service information. WARNING: Make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 4	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Occupant Restraint Controller harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the PCI bus circuit between the ORC connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM PCM (PCI BUS)

POSSIBLE CAUSES
PCM PCI NO RESPONSE
POWERTRAIN CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, enter Body then Body Computer. With the DRB, enter Body then Electro/Mechanical Cluster (MIC). Were you able to establish communications with any of the modules? Yes → Go To 2 No → Refer to symptom PCI Bus Communication Failure in the Communications category. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	With the DRB read PCM Diagnostic Trouble Codes. This is to ensure power and grounds to the PCM are operational. **NOTE: If the DRB will not read PCM DTC's, follow the NO RESPONSE TO PCM (SCI only) symptom path.** Turn the ignition off. Disconnect the PCM C2 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the PCM C2 connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 3	All

*NO RESPONSE FROM PCM (PCI BUS) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the PCM C2 harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit between the PCM C2 connector and the BCM C3 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Repair the PCI Bus circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*NO RESPONSE FROM PCM (SCI ONLY)

POSSIBLE CAUSES
CHECK PCM POWERS AND GROUNDS
SCI TRANSMIT CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION CONTROL MODULE
SCI RECEIVE CIRCUIT SHORTED TO VOLTAGE
SCI CIRCUITS SHORTED TOGETHER
SCI TRANSMIT CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT OPEN
SCI TRANSMIT CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Perform the symptom Checking PCM Power and Ground Circuits in the Driveability category. **NOTE: With the DRBIII® in the generic scan tool mode, attempt to communicate with the PCM.** **NOTE: If the DRBIII® can communicate with the PCM in the generic scan tool mode, it may not be necessary to perform this step.** Did the vehicle pass this test? Yes → Go To 2 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Go To 4	All
3	Turn the ignition off. Disconnect the TCM harness connector (if equipped). **NOTE: If vehicle is not equipped with a TCM, answer yes to the question.** Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Repair the SCI Transmit circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace the Transmission Control Module in accordance with the service information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*NO RESPONSE FROM PCM (SCI ONLY) — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the DRB from the DLC. Disconnect the PCM harness connector. Disconnect the TCM harness connector (if equipped). Turn the ignition on. Measure the voltage of the SCI Transmit circuit at the DLC connector (cav 7). Is the voltage above 1.0 volt? Yes → Repair the SCI Transmit circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the DRB from the DLC. Disconnect the PCM harness connector. Turn the ignition on. Measure the voltage of the SCI Receive circuit at the DLC connector (cav 6). Is the voltage above 1.0 volt? Yes → Repair the SCI Receive circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the DRB from the DLC. Disconnect the PCM harness connector. Measure the resistance between the SCI Transmit circuit and the SCI Receive circuit at the PCM connector. Is the resistance below 5.0 ohms? Yes → Repair the short between the SCI Transmit and the SCI Receive circuits. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 7	All
7	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Receive circuit. Is the resistance below 5.0 ohms? Yes → Repair the SCI Receive circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Receive circuit between the PCM connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the SCI Receive circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*NO RESPONSE FROM PCM (SCI ONLY) — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Disconnect the PCM harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Transmit circuit between the PCM connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the SCI Transmit circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
10	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*NO RESPONSE FROM RADIO

POSSIBLE CAUSES
NO RESPONSE FROM RADIO
REPLACE FUSE #14
RADIO SHORTED TO GROUND
FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
JUNCTION BLOCK SHORTED TO GROUND
OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT
OPEN FUSED B+ CIRCUIT
RADIO GROUND CIRCUIT OPEN
RADIO INTERNALLY OPEN
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **Note: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, attempt to communicate with the Airbag Control Module. With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with either of the modules? Yes → Go To 2 No → Refer to the Communications category and perform the symptom PCI Bus Communication Failure. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect fuse #14 in the junction block. Is the fuse open? Yes → Go To 3 No → Go To 6	All
3	Turn the ignition off. Replace Fuse #14 in the junction block. Turn the ignition on. Turn the Radio on. Remove and inspect Fuse #14 in the junction block. Is the fuse open? Yes → Go To 4 No → Check the Fused Ignition Switch Output circuit for an intermittent short to ground, refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM RADIO — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Replace Fuse #14 in the junction block. Disconnect the Radio C1 harness connector. Turn the ignition on. Remove and inspect fuse #14 in the junction block. Is the fuse open? Yes → Go To 5 No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Radio C1 harness connector. Disconnect the Junction Block C7 harness connector. Measure the resistance between ground and the Fused Ignition Switch Output circuit. Is the resistance below 5.0 ohms? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. **NOTE: Ensure fuse #14 is installed in the junction block.** Disconnect the Radio C1 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 7 No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Radio C1 harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 8 No → Repair the Fused B+ circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the Radio C1 harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 9 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM RADIO — Continued

TEST	ACTION	APPLICABILITY
9	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Radio C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Radio connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Disconnect the Radio C1 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the PCI bus circuit between the Radio connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM RIGHT SIACM

POSSIBLE CAUSES
INTERROGATE ORC
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT RUN/START CIRCUIT OPEN
RIGHT SIDE IMPACT AIRBAG CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	**Note: Ensure the battery is fully charged.** Turn the ignition on. With the DRBIII®, select Passive Restraints. With the DRBIII®, select Airbag and read the active DTC's. Is the Loss Of Ignition Run/Start DTC set? Yes → Refer to the symptom list and perform the Loss Of Ignition Run/Start symptom. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 2	All
2	**Ensure that the battery is fully charged.** **Warning: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Right Side Impact Airbag Control Module harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **Note: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
3	**Warning: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Right Side Impact Airbag Control Module harness connector. Turn the ignition on and then reconnect the Battery. Measure the voltage of the Fused Ignition Switch Output Run/Start circuit. Is the voltage above 6.0 volts? Yes → Go To 4 No → Repair the Fused Ignition Switch Output Run/Start circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **Note: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

*NO RESPONSE FROM RIGHT SIACM — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure there is PCI bus communication with other modules. If not, refer to the PCI Bus Communication Failure symptom and repair as necessary.** **WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Right Side Impact Airbag Control Module harness connector. Turn the ignition on and then reconnect the Battery. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Right Side Impact Airbag Control Module connector. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Right Side Impact Airbag Control Module (RSIACM) in accordance with the Service Information. WARNING: Make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 5	All
5	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Right Side Impact Airbag Control Module harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the PCI bus circuit between the Right SIACM connector and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM TRANSMISSION CONTROL MODULE

POSSIBLE CAUSES
NO RESPONSE FROM TRANSMISSION CONTROL MODULE
FUSED IGNITION SWITCH OUTPUT (RUN/ST) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT(S) OPEN
TRANSMISSION CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the Powertrain Control Module (PCM). With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with both of the modules? Yes → Go To 2 No → Refer to the Communications category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Run/St) circuit. **Note: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery positive post.** Is the test light illuminated? Yes → Go To 3 No → Repair the Fused Ignition Switch Output (Run/St) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the TCM harness connector. Remove the starter relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Start) circuit. **Note: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery positive post.** Observe the test light while momentarily turning the ignition switch to the Start position. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused Ignition Switch Output (Start) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. **Note: Reinstall the original Starter Relay.**	All
4	Turn the ignition off. Disconnect the TCM harness connector. Using a 12-volt test light connected to ground, probe the Fused B(+) circuit. **Note: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery positive post.** Is the test light illuminated? Yes → Go To 5 No → Repair the Fused B(+) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the TCM harness connector. Using a 12-volt test light connected to 12-volts, probe each ground circuit in the TCM connector. **NOTE: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery negative post.** Is the light illuminated at all ground circuits? Yes → Go To 6 No → Repair the Ground circuit(s) for an open. Check the main ground connection to engine block and/or chassis. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
6	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the TCM harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the TCM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Transmission Control Module in accordance with the service information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Disconnect the TCM harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit between the TCM connector and the BCM C3 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
*PCI BUS COMMUNICATION FAILURE

POSSIBLE CAUSES
WIRING HARNESS INTERMITTENT
OPEN PCI BUS CIRCUIT AT THE DATA LINK CONNECTOR (DLC)
HIGH VOLTAGE ON THE PCI BUS CIRCUITS AT THE BCM CONNECTORS
MODULE (PCI BUS SHORT TO VOLTAGE)
PCI BUS CIRCUIT SHORTED TO VOLTAGE
LOW RESISTANCE TO GROUND ON THE PCI BUS CIRCUITS AT THE BCM CONNECTORS
MODULE (PCI BUS SHORT TO GROUND)
PCI BUS CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	**Note: Determine which modules this vehicle is equipped with before beginning.** **Note: When attempting to communicate with any of the modules on this vehicle, the DRB will display 1 of 2 different communication errors: a NO RESPONSE message or a BUS +/- SIGNALS OPEN message.** Turn the ignition on. Using the DRB, attempt to communicate with the following control modules: Body Control Module (BCM) Instrument Cluster (MIC) Occupant Restraint Controller (ORC) Controller Antilock Brake (CAB) Was the DRB able to communicate with one or more Module(s)? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: If the DRB can not communicate with a single module, refer to the category list for the related symptom.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the DRB from the Data Link Connector (DLC). Measure the resistance of the PCI Bus circuit between the Data Link Connector (DLC) and the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	**NOTE: Reconnect the BCM C2 harness connector.** Turn the ignition on. Measure the voltage of the PCI Bus circuit at the Data Link Connector (DLC). Is the voltage above 4.0 volts? Yes → Go To 5 No → Go To 7	All
5	**Note: Determine which modules this vehicle is equipped with before beginning.** Turn the ignition off. Disconnect the BCM C2 and C3 harness connectors. Turn the ignition on. Measure the voltage of each PCI Bus circuit at the BCM C2 and C3 connectors. Is the voltage steadily above 4.0 volts for any measurement? Yes → Go To 6 No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the module that corresponds to the PCI Bus circuit that measured steadily above 4.0 volts. Turn the ignition on. **NOTE: If the PCI Bus circuit for the Radio was above 4.0 volts and is equipped with a CD Changer, disconnect the CD Changer before the Radio.** **NOTE: If the PCI Bus circuit for the Instrument Cluster (MIC) was above 4.0 volts and is equipped with a Compass/Mini Trip Computer (CMTC), disconnect the CMTC before the MIC.** **NOTE: If the PCI Bus circuit for the side airbags (if equipped) was above 4.0 volts, disconnect each module one at a time.** Measure the voltage of the PCI Bus circuit that previously measured above 4.0 volts. Is the voltage steadily above 4.0 volts with the module disconnected? Yes → Repair the PCI Bus circuit that measured over 4.0 volts for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Replace the module that caused the short to voltage on the PCI Bus circuit. Perform BODY VERIFICATION TEST - VER 1.	All

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	**Note: Determine which modules this vehicle is equipped with before beginning.** Turn the ignition off. Disconnect the negative battery cable. Disconnect the BCM C2 and C3 harness connectors. Measure the resistance between ground and each of the PCI Bus circuits at the BCM C2 and C3 connectors. Is the resistance below 1000.0 ohms for any of the measurements? Yes → Go To 8 No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the negative battery cable. Disconnect the module that corresponds to the PCI Bus circuit that resistance measured below 1000.0 ohms. **NOTE: If the PCI Bus circuit for the Radio was below 1000.0 ohms and is equipped with a CD Changer, disconnect the CD Changer before the Radio.** **NOTE: If the PCI Bus circuit for the Instrument Cluster (MIC) was below 1000.0 ohms and is equipped with a Compass/Mini Trip Computer (CMTC), disconnect the CMTC before the MIC.** **NOTE: If the PCI Bus circuit for the side airbags (if equipped) was below 1000.0 ohms, disconnect each module one at a time.** Measure the resistance between ground and the PCI Bus circuit that previously measured below 1000.0 ohms. Is the resistance below 1000.0 ohms with the module disconnected? Yes → Repair the PCI Bus circuit that resistance measured below 1000.0 ohms for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the module that caused the short to ground on the PCI Bus circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BCM MESSAGE NOT RECEIVED

When Monitored and Set Condition:

BCM MESSAGE NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: This DTC will set if the Compass/Mini Trip Computer (CMTC) does not receive messages from the BCM.

POSSIBLE CAUSES
DTC PRESENT
INTERMITTENT CONDITION
COMPASS/MINI TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to communicate with the BCM. Was the DRBIII® able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the Communication category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRBIII®, read DTC's. Did this DTC reset? Yes → Replace the Compass/Mini Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent open or shorted wiring condition. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
COMPASS FAILURE

POSSIBLE CAUSES
COMPASS WILL NOT CALIBRATE
COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	Perform the Compass/Mini-Trip Computer Self Test. Turn the ignition off. Press and hold the Step and the Compass/Temp buttons. Turn the ignition on. **NOTE: The Compass/Mini-Trip Computer Self Test can also be initiated using the DRBIII®.** During the Self Test the Compass/Mini-Trip Computer will perform the following checks: Illuminate all VF display segments Check the CMTC memory, Communications, and Compass internal Check the CMTC/UGDO communications (if equipped) Display Pass, Fail, Bus, Bus 1, or Bus 2 when complete. Did the Compass Mini-Trip Computer display "Fail"? Yes → Replace the Compass/Mini-Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Move the vehicle to an area away from any large metal objects or overhead power lines. Attempt to calibrate the compass. Turn the ignition on. Press and hold the STEP and US/M buttons at the same time until the CAL indicator begins to flash then release. Drive the vehicle in 3 complete 360 degree circles, at less than 5 MPH (8 KPH). The CAL indicator should turn off. With the DRBIII®, erase DTCs. Turn the ignition on and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Compass/Mini-Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → If the compass will not calibrate, the vehicle may require demagnetizing, refer to the Service Information. Attempt to re-calibrate the compass after demagnetizing. If the compass does not calibrate, relace the CMTC. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
INTERNAL FAILURE

POSSIBLE CAUSES
COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase the DTC. Cycle the ignition, wait approximately 1 minute. With the DRBIII®, read DTCs. Did the DTC reset? Yes → Replace the Compass/Mini Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PCM MESSAGE NOT RECEIVED

When Monitored and Set Condition:

PCM MESSAGE NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: This DTC will set if the Compass/Mini Trip Computer (CMTC) does not receive messages from the PCM.

POSSIBLE CAUSES
INTERMITTENT CONDITION
DTC PRESENT
COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent open or shorted wiring condition. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRB, enter Body Computer, System Tests then PCM Monitor. Does the DRB display: PCM is active on BUS? Yes → Replace the Compass/Mini-Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Refer to the Communication category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

***AVERAGE FUEL ECONOMY INOPERATIVE OR WRONG**
***DISTANCE TO EMPTY INOPERATIVE OR WRONG**
***ELAPSED TIME INOPERATIVE OR WRONG**
***INSTANTANEOUS FUEL ECONOMY INOPERATIVE OR WRONG**
***TRIP ODOMETER INOPERATIVE OR WRONG**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be *AVERAGE FUEL ECONOMY INOPERATIVE OR WRONG.

POSSIBLE CAUSES
COMPASS MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any BCM, PCM, or COMMUNICATION DTCs before proceeding** If all the possible causes above are operating correctly, view repair. Repair Replace the Compass Mini-Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COMPASS/MINI-TRIP COMPUTER INOPERATIVE

POSSIBLE CAUSES
FUSED B(+) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
GROUND CIRCUIT OPEN
COMPASS MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any BCM, PCM, or COMMUNICATION DTCs before proceeding.** Turn the ignition off. Disconnect the Compass/Mini-Trip Computer harness connector. Measure the voltage between the Fused B+ circuit and ground. Is the voltage above 10.5 volts? Yes → Go To 2 No → Repair the Fused B(+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Compass/Mini-Trip Computer harness connector. Turn the ignition on. Measure the voltage between the Fused Ignition Switch Output circuit and ground. Is the voltage below 10.5 volts? Yes → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Compass/Mini-Trip Computer harness connector. Measure the resistance between ground and the CMTC ground circuit. Is the resistance above 5.0 ohms? Yes → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Compass Mini-Trip Computer in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*OUTSIDE TEMPERATURE DISPLAY INACCURATE OR INOPERATIVE

POSSIBLE CAUSES
AMBIENT TEMPERATURE SENSOR
COMPASS/MINI-TRIP COMPUTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the CMTC is communicating on the PCI Bus before proceeding with this test.** **NOTE: The Ambient Temperature Sensor is hardwired to the PCM. Diagnose and repair any PCM DTCs before proceeding with this test.** Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Measure the resistance of the Ambient Temperature Sensor using the following temperature/resistance values: 10°C (50°F) Sensor Resistance = 17.99 - 21.81 Kilohms 20°C (68°F) Sensor Resistance = 11.37 - 13.61 Kilohms 25°C (77°F) Sensor Resistance = 9.12 - 10.88 Kilohms 30°C (86°F) Sensor Resistance = 7.37 - 8.75 Kilohms 40°C (104°F) Sensor Resistance = 4.90 - 5.75 Kilohms 50°C (122°F) Sensor Resistance = 3.33 - 3.88 Kilohms Is the Ambient Temperature Sensor resistance measurement between the min/max specifications? Yes → Test Complete. No → Replace the Ambient Temperature Sensor. NOTE: After any repair for an Ambient Temperature Sensor problem, the vehicle must be driven over 3 miles above 25 MPH to update the CMTC display. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DECKLID AJAR CIRCUIT OPEN

POSSIBLE CAUSES
DECKLID RELEASE SOLENOID/AJAR SWITCH CASE GROUND OPEN
INTERMITTENT CONDITION
DECKLID RELEASE SOLENOID/AJAR SWITCH
DECKLID AJAR SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	Open the Decklid. With the DRBIII® in Inputs/Outputs, read the DECKLID AJAR SW state. Does the DRBIII® display CLOSED? Yes → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Decklid Ajar switch connector. Using a 12-volt Test Light connected to 12-volts, test the Case Ground for continuity. Does the light illuminate? Yes → Go To 3 No → Repair the Case Ground for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Decklid Ajar Switch connector. With the DRBIII® in Inputs/Outputs, read the DECKLID AJAR SW state. Connect a jumper wire between Sense circuit and body ground. Does the DRBIII® display DECKLID AJAR SW: CLOSED? Yes → Replace the Decklid Release Solenoid/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Body Control Module C4 harness connector. Disconnect the Decklid Ajar Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Decklid Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DECKLID AJAR CIRCUIT SHORTED TO GROUND

POSSIBLE CAUSES
DECKLID RELEASE SOLENOID/AJAR SWITCH SHORTED TO GROUND
DECKLID AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the DECKLID AJAR SW state. Disconnect the Decklid Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the DECKLID AJAR SW state. Did the Switch State change from CLOSED to OPEN? Yes → Replace the Decklid Release Solenoid/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Body Control Module C4 harness connector. Disconnect the Decklid Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, test the Sense circuit for a short to ground. Does the Test Light illuminate? Yes → Repair the Decklid Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
DRIVER DOOR AJAR SWITCH GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
DRIVER DOOR LOCK MOTOR/AJAR SWITCH
DRIVER DOOR AJAR SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	Open the driver door. With the DRBIII® in Inputs/Outputs, read the DRV DR AJAR SW state. Does the DRBIII® display CLOSED? Yes → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Driver Door Lock Motor/Ajar switch connector. Using a 12-volt Test Light connected to 12-volts, test the Ground circuit for continuity. Does the light illuminate? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Driver Door Lock Motor/Ajar Switch connector. With the DRBIII® in Inputs/Outputs, read the DRV DR AJAR SW state. Connect a jumper wire between Sense circuit and the Ground circuit. Does the DRBIII® display DRV DR AJAR SW: CLOSED? Yes → Replace the Driver Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Body Control Module C4 harness connector. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Driver Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR AJAR CIRCUIT SHORTED TO GROUND

POSSIBLE CAUSES
DRIVER DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
DRIVER DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the DRV DR AJAR SW state. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the DRV DR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Driver Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Body Control Module C4 harness connector. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, test the Sense circuit for a short to ground. Does the Test Light illuminate? Yes → Repair the Driver Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LEFT REAR DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
INTERMITTENT CONDITION
LEFT REAR DOOR AJAR SWITCH GROUND CIRCUIT OPEN
LEFT REAR DOOR LOCK MOTOR/AJAR SWITCH
LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	Open the left rear door. With the DRBIII® in Inputs/Outputs, read the LR DR AJAR SW state. Does the DRBIII® display CLOSED? Yes → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Left Rear Door Lock Motor/Ajar switch connector. Using a 12-volt Test Light connected to 12-volts, test the Ground circuit for continuity. Does the light illuminate? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Left Rear Door Lock Motor/Ajar Switch connector. With the DRBIII® in Inputs/Outputs, read the LR DR AJAR SW state. Connect a jumper wire between the Sense circuit and the Ground circuit. Does the DRBIII® display LR DR AJAR SW: CLOSED? Yes → Replace the Left Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Body Control Module C4 harness connector. Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Left Rear Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LEFT REAR DOOR AJAR CIRCUIT SHORTED TO GROUND

POSSIBLE CAUSES
LEFT REAR DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the LR DR AJAR SW state. Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the LR DR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Left Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Body Control Module C4 harness connector. Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, test the Sense circuit for a short to ground. Does the Test Light illuminate? Yes → Repair the Left Rear Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
INTERMITTENT CONDITION
PASSENGER DOOR AJAR SWITCH GROUND CIRCUIT OPEN
PASSENGER DOOR LOCK MOTOR/AJAR SWITCH
PASSENGER DOOR AJAR SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	Open the passenger door. With the DRBIII® in Inputs/Outputs, read the PAS DR AJAR SW state. Does the DRBIII® display CLOSED? Yes → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Passenger Door Lock Motor/Ajar switch connector. Using a 12-volt Test Light connected to 12-volts, test the Ground circuit for continuity. Does the light illuminate? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Passenger Door Lock Motor/Ajar Switch connector. With the DRBIII® in Inputs/Outputs, read the PAS DR AJAR SW state. Connect a jumper wire between the Sense circuit and the Ground circuit. Does the DRBIII® display PAS DR AJAR SW: CLOSED? Yes → Replace the Passenger Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Body Control Module C4 harness connector. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Passenger Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER DOOR AJAR CIRCUIT SHORTED TO GROUND

POSSIBLE CAUSES
PASSENGER DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
PASSANGER FRONT DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the PAS DR AJAR SW state. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the PAS DR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Passenger Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Body Control Module C4 harness connector. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, test the Sense circuit for a short to ground. Does the Test Light illuminate? Yes → Repair the Passenger Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RIGHT REAR DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
INTERMITTENT CONDITION
RIGHT REAR DOOR AJAR SWITCH GROUND CIRCUIT OPEN
RIGHT REAR DOOR LOCK MOTOR/AJAR SWITCH
RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	Open the right rear door. With the DRBIII® in Inputs/Outputs, read the RR DR AJAR SW state. Does the DRBIII® display CLOSED? Yes → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Right Rear Door Lock Motor/Ajar switch connector. Using a 12-volt Test Light connected to 12-volts, test the Ground circuit for continuity. Does the light illuminate? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Right Rear Door Lock Motor/Ajar Switch connector. With the DRBIII® in Inputs/Outputs, read the RR DR AJAR SW state. Connect a jumper wire between the Sense circuit and the Ground circuit. Does the DRBIII® display RR DR AJAR SW: CLOSED? Yes → Replace the Right Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Body Control Module C4 harness connector. Disconnect the Right Rear Door Lock Motor/Ajar Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Right Rear Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

*RIGHT REAR DOOR AJAR CIRCUIT SHORTED TO GROUND

POSSIBLE CAUSES
RIGHT REAR DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the RR DR AJAR SW state. Disconnect the Right Rear Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the RR DR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Right Rear Door Lock Motor/Ajar Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Body Control Module C4 harness connector. Disconnect the Right Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, test the Sense circuit for a short to ground. Does the Test Light illuminate? Yes → Repair the Right Rear Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HEADLAMP DELAY RELAY INOPERATIVE

POSSIBLE CAUSES
FUSED B+ CIRCUIT OPEN
HEADLAMP DELAY RELAY
OPEN FUSE
INTERMITTENT CONDITION
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Check the PDC fuse 4. Is the fuse open? Yes → Replace the open Fuse. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. Measure the voltage of the Fused B+ Circuit between the PDC and the Junction Block. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the Fuse B+ Circuit for an open condition. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Install a known good relay in place of the Headlamp Delay Relay. Actuate the Headlamp Delay system. Does the Headlamp Delay system operate normally? Yes → Replace the Headlamp Delay Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition on. With the DRBIII®, read the Ignition Voltage. Does the DRBIII® display voltage above 10.0 volts? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HI BEAM HEADLAMPS WILL NOT TURN OFF

POSSIBLE CAUSES
HEADLAMP DELAY RELAY OUTPUT CIRCUIT SHORT TO VOLTAGE
HEADLAMP DELAY RELAY
HEADLAMP DELAY RELAY CONTROL CIRCUIT SHORT TO VOLTAGE
MULTIFUNCTION SWITCH

TEST	ACTION	APPLICABILITY
1	Remove the Headlamp Delay Relay from the junction block. Did the High Beam Headlamps turn off? Yes → Go To 2 No → Repair the Headlamp Delay Relay Output Circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.	All
2	Remove the Headlamp Delay Relay. Measure the voltage of the Headlamp Delay Relay Control circuit in the relay connector. Is the voltage above 1.0 volts? Yes → Go To 3 No → Replace the Headlamp Delay Relay. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the Headlamp Delay Relay from the junction block. Disconnect the Multifunction Switch connector. Measure the voltage of the Switched Headlamp Delay Relay Control circuit to ground. Is the voltage above 1.0 volts? Yes → Repair the Headlamp Delay Relay Control Circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HIGH BEAM HEADLAMPS WILL NOT TURN ON

POSSIBLE CAUSES
OPEN FUSED B+
FUSED LOW BEAM OUTPUT CIRCUIT SHORT TO GROUND
FUSED HIGH BEAM OUTPUT CIRCUIT SHORT TO GROUND
HEADLAMP DELAY RELAY
FUSED LOW BEAM OUTPUT CIRCUIT OPEN
HEADLAMP DELAY RELAY CONTROL CIRCUIT OPEN
MULTIFUNCTION SWITCH

TEST	ACTION	APPLICABILITY
1	Turn the Headlamps on. Gain access to the High Beam Headlamp Relay in the junction block. Cycle the high beam switch on the multifunction switch and listen to or feel the High Beam Relay for a click. Does the relay click? Yes → Go To 2 No → Go To 3	All
2	Remove the Headlamp Delay Relay. Measure the voltage of the Fused B+ circuit at the Headlamp Delay Relay connector. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the open fused B+ circuit from PDC fuse 4. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove fuse 4 from the PDC. Disconnect the Multifunction Switch connector. Measure the resistance of the Fused Low Beam Output Circuit to ground. Is the resistance below 5.0 ohms? Yes → Repair the Fused Low Beam output circuit for a short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Remove the Headlamp Delay Relay from the junction block. Disconnect the Multifunction Switch connector. Measure the resistance of the Headlamp Delay Relay Control circuit to ground. Is the resistance below 5.0 ohms? Yes → Repair the Fused High Beam Output Circuit for a short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*HIGH BEAM HEADLAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the Multifunction Switch connector. Turn the headlamps on. Measure the voltage of the Fused Low Beam Relay Output circuit in the multifunction switch connector. Is the voltage below 10.0 volts? Yes → Replace the Headlamp Delay Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Disconnect the Multifunction Switch connector. Turn the headlamps on. Measure the voltage of the Fused Low Beam Relay Output circuit in the multifunction switch connector. Is the voltage above 5.0 volts? Yes → Go To 7 No → Repair the open Fused Low Beam Output circuit. Perform BODY VERIFICATION TEST - VER 1.	All
7	Disconnect the Multifunction Switch connector. Turn the headlamps on. Ensure the Headlamp Delay Relay is installed. Connect a jumper wire between the Fused Low Beam Relay Output and the Switched High Beam Relay Control circuits in the multifunction switch connector. Did the High Beam Headlamps come on? Yes → Repair the Headlamp Delay Relay Control Circuit for an open condition. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW BEAM HEADLAMPS WILL NO TURN OFF

POSSIBLE CAUSES
MULTIFUNCTION SWITCH
HEADLAMP DELAY RELAY OUTPUT CIRCUIT SHORT TO VOLTAGE
HEADLAMP DELAY RELAY
JUNCTION BLOCK
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the headlamp switch to the off position. With the DRBIII®, read the Headlamp Switch Voltage. Does the DRBIII® display Headlamp Switch Voltage between 4.3 and 4.8 Volts? Yes → Go To 2 No → Replace the Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	Remove the Headlamp Delay Relay from the junction block. Did the Low Beams turn off? Yes → Go To 3 No → Repair the Headlamp Delay Relay Output Circuit for a short to voltage condition. Perform BODY VERIFICATION TEST - VER 1.	All
3	Substitute a known good relay in place of the Headlamp Delay Relay. Does the system operate normally? Yes → Replace the Headlamp Delay Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Headlamp Delay Relay. Remove the Body Control Module from the junction block. Measure the resistance of the Headlamp Delay Relay Control Circuit and ground. Is the resistance below 100.0 ohms? Yes → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW BEAM HEADLAMPS WILL NOT TURN ON

POSSIBLE CAUSES
MULTIFUNCTION SWITCH
JUNCTION BLOCK
FUSED LOW BEAM OUTPUT CIRCUIT OPEN
HEADLAMP DELAY RELAY
HEADLAMP DELAY RELAY
JUNCTION BLOCK
BODY CONTROL MODULE
OPEN FUSED B+ TO JUNCTION BLOCK
B+ CIRCUIT FUSE
FUSED B+ CIRCUIT SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the Headlamps on. With the DRBIII® read the Multifunction Switch voltage. Does the DRBIII® display Multifunction Switch voltage between 1.4 and 1.8 volts? Yes → Go To 2 No → Replace the Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII® actuate the Headlamp Delay Relay. Listen to or touch the Headlamp Delay Relay. Does the relay click during actuation? Yes → Go To 3 No → Go To 5	All
3	Remove the Headlamp Delay Relay. Measure the voltage of the Fused B+ circuit in the Headlamp Delay Relay. Is the voltage above 10.0 volts? Yes → Go To 4 No → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1.	All
4	Remove the Headlamp Delay Relay from the junction block. Ensure fuses 13 and 12 are OK and are installed in the junction block. Connect a jumper wire between the Fused B+ Circuit and the Headlamp Delay Relay Output Circuit in the relay connector. Did the low beam headlamps come on? Yes → Replace the Headlamp Delay Relay. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Fused Low Beam Output Circuit for an open condition. Perform BODY VERIFICATION TEST - VER 1.	All

*LOW BEAM HEADLAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
5	Remove the Headlamp Delay Relay. Measure the voltage of the Fused B+ circuit in the Headlamp Delay Relay. Is the voltage above 10.0 volts? Yes → Go To 6 No → Go To 8	All
6	Remove the Headlamp Delay Relay from the junction block. Connect a 12 volt test light between the Headlamp Delay Relay Control circuit, and the Fused B+ circuit in the Relay connector. With the DRBIII® actuate the Headlamp Relay. Did the test light flash during actuation? Yes → Replace the Headlamp Delay Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off. Remove the Headlamp Delay Relay from the junction block. Remove the Body Control Module from the junction block. Measure resistance of the Headlamp Delay Relay control circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
8	Remove and test the PDC Fuse 4. Is the Fuse open? Yes → Go To 9 No → Repair the open Fused B+ circuit between the Headlamp Delay Relay connector in the junction block and the PDC Fuse 4 connector. Perform BODY VERIFICATION TEST - VER 1.	All
9	Remove Fuse 4 from the PDC Measure the resistance of the Fused B+ circuit in the fuse connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Fused B+ circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the fuse and retest the system. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
A/C BLEND DOOR INPUT SHORTED TO BATTERY

When Monitored and Set Condition:

A/C BLEND DOOR INPUT SHORTED TO BATTERY

When Monitored: With the engine running.

Set Condition: The BCM reads the signal from the A/C - Heater Control blend request and positions the blend door accordingly. If the voltage on this pin exceeds 90% of ignition voltage, the DTC will set, and the BCM will place the blend door in a default position.

POSSIBLE CAUSES
CONTROL HEAD - TEMPERATURE SELECT SIGNAL SHORTED TO VOLTAGE
TEMPERATURE SELECT SIGNAL CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE - TEMPERATURE SELECT SIGNAL SHORTED TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, record and erase Body Computer DTC's. Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Turn the ignition on. Measure the voltage of the Temperature Select Signal circuit. Is the voltage above 0.3 volts? Yes → Go To 2 No → Replace the A/C - Heater Control in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the Temperature Select Signal circuit. Is there any voltage present? Yes → Repair the Temperature Select Signal circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
A/C BLEND DR INPUT OPEN/SHORT TO GROUND

When Monitored and Set Condition:

A/C BLEND DR INPUT OPEN/SHORT TO GROUND

When Monitored: With the engine running.

Set Condition: The BCM reads the signal from the A/C - Heater Control blend request and positions the blend door accordingly. If the voltage on this pin is below 0.1 volts, the DTC will set, and the BCM will place the blend door in a default position.

POSSIBLE CAUSES
ADDITIONAL CODE(S) PRESENT
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
TEMPERATURE SELECT SIGNAL CIRCUIT SHORTED TO GROUND
TEMPERATURE SELECT SIGNAL CIRCUIT SHORTED TO SENSOR GROUND
TEMPERATURE SELECT SIGNAL CIRCUIT OPEN
CONTROL HEAD - TEMPERATURE SELECT SIGNAL OPEN/SHORTED TO GROUND
BODY CONTROL MODULE - TEMPERATURE SELECT SIGNAL OPEN/SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® read the Body Computer DTCs. Are Mode Door Input Open/STG and Blend Door Input Open/STG DTCs present? (May set TCM Msg Not Recd). Yes → If JB Fuse 11 is open, check for short to ground in Junction Block, BCM, and Fused Ign Sw Output Ckt. If JB Fuse 11 is not open, check for an open between JB Fuse 11 Pin 19, and JB C7-10 harness connector, and splice 210 in Fused Ign Sw Output Ckt. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Fused Ignition Switch Output circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

A/C BLEND DR INPUT OPEN/SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Temperature Select Signal circuit. Is the resistance below 10K ohms? Yes → Repair the Temperature Select Signal circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between the Sensor Ground circuit and the Temperature Select Signal circuit at the A/C - Heater Control C1 harness connector. Is the resistance below 10K ohms? Yes → Repair the Temperature Select Signal circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Temperature Select Signal circuit between the A/C - Heater Control C1 harness connector and the BCM C2 harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Temperature Select Signal circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

A/C BLEND DR INPUT OPEN/SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Reconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Put the Blend Control switch in the full cold position. Turn the ignition on. Measure the voltage of the Temperature Select Signal circuit. Move the Blend Control switch from full cold to full hot while observing the voltmeter. Does the voltage change fluidly from approximately 9.0 volts (full cold) to 11.89 volts (full hot)? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the A/C - Heater Control in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
A/C HEAD, A/C SWITCH FAILURE

When Monitored and Set Condition:

A/C HEAD, A/C SWITCH FAILURE

When Monitored: With the engine running and the Blower Control switch on.

Set Condition: This DTC will set if the BCM sees a request for A/C from the A/C - Heater Control with the Mode Control switch in the Panel-Heater position, Mix-Heater position, or Floor-Heater mode position.

POSSIBLE CAUSES
CONTROL HEAD - A/C SWITCH SENSE INCORRECT
BODY CONTROL MODULE - A/C SWITCH SENSE INCORRECT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase Body Computer DTCs. Ensure that the Rear Window Defogger is off. Put the Mode Control switch in the Recirc/Bi-Level (full left) position. Start the engine. With the DRBIII® in Sensor Display, read the A/C EBL Switch voltage and the Mode Switch voltage in each door position. Look for the following approximate voltage readings: Recirc-A/C position: A/C EBL Switch, 4.42 volts, Mode Switch, 1.32 volts. Panel-A/C position: A/C EBL Switch, 4.42 volts, Mode Switch, 3.20 volts. Mix-A/C position: A/C EBL Switch 4.42 volts, Mode Switch 5.07 volts. Panel-Heater position: A/C EBL Switch 10.79 volts, Mode Switch 3.20 volts. Mix-Heater position: A/C EBL Switch 10.79 volts, Mode Switch 5.07 volts. Floor-Heater position: A/C EBL Switch 10.79 volts, Mode Switch 7.16 volts. Does DRBIII® display the approximate voltages for each Mode Control switch position? Yes → Go To 2 No → Replace the A/C - Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRBIII®, erase Body Computer DTCs. Start the engine. Turn the Blower Control switch on. With the DRBIII®, read DTCs while slowly turning the Mode Control switch to each of the door positions several times. Does the DRBIII® display: A/C Head, A/C Switch Failure? Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
A/C HEAD, EBL INPUT SHORTED TO BATTERY

When Monitored and Set Condition:

A/C HEAD, EBL INPUT SHORTED TO BATTERY

When Monitored: With the ignition on.

Set Condition: This DTC will set if voltage on the A/C Switch Sense pin exceeds 90% of ignition voltage for 10 seconds.

POSSIBLE CAUSES
A/C SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE - A/C SWITCH SENSE SHORTED TO VOLTAGE
A/C HEATER CONTROL
INTERMITTENT WIRING PROBLEM

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, record and erase Body Computer DTC's. Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Turn the ignition on. Measure the voltage of the A/C Switch Sense circuit. Is the voltage above 10.0 volts? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the A/C Switch Sense circuit. Is there any voltage present? Yes → Repair the A/C Switch Sense circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

A/C HEAD, EBL INPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Make sure that the A/C - Heater Control C1 harness connector is connected to the A/C - Heater Control.** Turn the ignition on. With the DRBIII®, record and erase Body Computer DTC's. With the DRBIII®, read Body Computer DTCs. Does the DRBIII® display: A/C Head, EBL Input Shorted To Batt? Yes → Replace the A/C - Heater Control in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
A/C HEAD, EBL INPUT SHORTED TO GROUND

When Monitored and Set Condition:

A/C HEAD, EBL INPUT SHORTED TO GROUND

When Monitored: With the ignition on.

Set Condition: This DTC will set if the BCM detects voltage below 0.1 volts on its A/C Switch Sense circuit.

POSSIBLE CAUSES
CONTROL HEAD - SHORT TO GROUND
A/C SWITCH SENSE CIRCUIT SHORT TO GROUND
A/C SW SENSE CIRCUIT SHORT TO SENSOR GROUND
BODY CONTROL MODULE - A/C SWITCH SENSE SHORT TO GROUND
CONTROL HEAD - A/C SWITCH SENSE INCORRECT
BODY CONTROL MODULE - A/C SWITCH SENSE INCORRECT
INTERMITTENT WIRING PROBLEM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Put the Mode Control switch in the Recirc/Bi-Level (full left) position. With the DRBIII®, record and erase Body Computer DTC's. With the DRBIII® in Sensor Display, read the A/C EBL voltage. Is the voltage below 0.5 volts? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Turn the ignition on. With the DRBIII® in Sensor Display, read the A/C EBL voltage. Is the voltage above 3.0 volts? Yes → Replace the A/C - Heater Control in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

A/C HEAD, EBL INPUT SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the A/C Switch Sense circuit. Is the resistance below 10K ohms? Yes → Repair the A/C Switch Sense circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between the Sensor Ground circuit and the A/C Switch Sense circuit at the A/C - Heater Control C1 harness connector. Is the resistance below 10K ohms? Yes → Repair the A/C Switch Sense circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition on. With the DRBIII®, record and erase DTCs. Ensure that the Rear Window Defogger is off. Put the Mode Control switch in the Recirc/Bi-Level (full left) position. Start the engine. With the DRBIII® in Sensor Display, read the A/C ABLE Switch voltage and the Mode Switch voltage in each door position. Look for the following approximate voltage readings: Recirc-A/C position: A/C EBL Switch, 4.42 volts, Mode Switch, 1.32 volts. Panel-A/C position: A/C EBL Switch, 4.42 volts, Mode Switch, 3.20 volts. Mix-A/C position: A/C EBL Switch 4.42 volts, Mode Switch 5.07 volts. Panel-Heater position: A/C EBL Switch 10.79 volts, Mode Switch 3.20 volts. Mix-Heater position: A/C EBL Switch 10.79 volts, Mode Switch 5.07 volts. Floor-Heater position: A/C EBL Switch 10.79 volts, Mode Switch 7.16 volts. Does DRBIII® display the approximate voltages for each Mode Control switch position? Yes → Go To 7 No → Replace the A/C - Heater Control in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

A/C HEAD, EBL INPUT SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition on. With the DRBIII®, erase DTCs. Start the engine. Turn the Blower Control switch on. With the DRBIII®, read DTCs while slowly turning the Mode Control switch to each of the door positions several times. Does the DRBIII® display: A/C Head, EBL Input Shorted to Ground? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
A/C HEAD, EBL SWITCH STUCK

When Monitored and Set Condition:

A/C HEAD, EBL SWITCH STUCK

When Monitored: With the ignition on.

Set Condition: This DTC will set if the BCM detects the EBL switch stuck in the depressed position for at least 30 seconds.

POSSIBLE CAUSES
ADDITIONAL CODE(S) PRESENT
REAR DEFOGGER SWITCH STUCK
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the Body Computer DTCs. Does the DRBIII® display any additional code(s)? Yes → Return to the Symptom List and choose the code(s). Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRBIII® in Sensor Display, read the A/C EBL voltage while pressing and releasing the Rear Defogger switch several times. Does the voltage decrease when pressing the switch and increase when the switch is released? Yes → Go To 3 No → Replace the A/C - Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition on. With the DRBIII®, erase Body Computer DTCs. With the DRBIII®, read Body Computer DTCs. Does the DRBIII® display A/C Head, EBL Switch Stuck? Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
A/C MODE DOOR INPUT OPEN/SHORT TO GROUND

When Monitored and Set Condition:

A/C MODE DOOR INPUT OPEN/SHORT TO GROUND

When Monitored: With the ignition on.

Set Condition: The A/C - Heater Control provides a 5 volt pull-up to the mode request selector. The BCM reads the signal from the A/C - Heater Control mode request and positions the mode door accordingly. If the voltage on this pin is below 0.1 volts, the DTC will set, and the BCM will place the mode door in a default position.

POSSIBLE CAUSES
ADDITIONAL CODE(S) PRESENT
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
A/C MODE SWITCH MUX CIRCUIT SHORT GROUND
A/C MODE SWITCH MUX CIRCUIT SHORT SENSOR GROUND
A/C MODE SWITCH MUX CIRCUIT OPEN
CONTROL HEAD - MODE SWITCH MUX OPEN/SHORTED TO GROUND
BODY CONTROL MODULE - MODE SWITCH MUX OPEN/SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® read the Body Computer DTCs. Are Mode Door Input Open/STG and Blend Door Input Open/STG DTCs present? (May set TCM Msg Not Recd). Yes → If JB Fuse 11 is open, check for short to ground in Junction Block, BCM, and Fused Ign Sw Output Ckt. If JB Fuse 11 is not open, check for an open between JB Fuse 11 Pin 19, and JB C7-10 harness connector, and splice 210 in Fused Ign Sw Output Ckt. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Fused Ignition Switch Output circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

A/C MODE DOOR INPUT OPEN/SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the A/C Mode Switch Mux circuit. Is the resistance below 10K ohms? Yes → Repair the A/C Mode Switch MUX circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between the Sensor Ground circuit and the A/C Mode Switch MUX circuit at the A/C - Heater Control C! harness connector. Is the resistance below 10K ohms? Yes → Repair the A/C Mode Switch MUX circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Reconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the A/C Mode Switch MUX circuit between the A/C Heater Control C1 harness connector and the BCM C2 harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the A/C Mode Switch MUX circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

A/C MODE DOOR INPUT OPEN/SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Reconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Put the Mode Control switch in the Recirc/Bi-Level (full left) position. Turn the ignition on. Measure the voltage of the A/C Mode Switch MUX circuit. Move the Mode Control switch from Recirc to Defrost while observing the voltmeter. Does the voltage change fluidly from approximately 8.8 volts (Recirc) to 11.7 volts (Defrost)? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the A/C - Heater Control in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
A/C MODE DOOR INPUT SHORTED TO BATTERY

When Monitored and Set Condition:

A/C MODE DOOR INPUT SHORTED TO BATTERY

When Monitored: With the engine running.

Set Condition: The BCM reads the signal from the A/C - Heater Control mode request and positions the mode door accordingly. If the voltage on this pin exceeds 90% of ignition voltage, the DTC will set, and the BCM will place the mode door in a default position.

POSSIBLE CAUSES
CONTROL HEAD - A/C MODE SWITCH MUX SHORTED TO VOLTAGE
A/C MODE SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE - A/C MODE SWITCH MUX SHORTED TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, record and erase Body Computer DTC's. Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Turn the ignition on. Measure the voltage of the A/C Mode Switch MUX circuit. Is the voltage above 0.3 volts? Yes → Go To 2 No → Replace the A/C - Heater Control in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the A/C - Heater Control C1 harness connector. Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the A/C Mode Switch MUX circuit. Is there any voltage present? Yes → Repair the A/C Mode Switch MUX circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BLEND DOOR FEEDBACK FAILURE

When Monitored and Set Condition:

BLEND DOOR FEEDBACK FAILURE

When Monitored: With the ignition on.

Set Condition: This DTC will set if the BCM detects voltage below 0.06 volts or above 4.8 volts on the Blend Door Feedback Signal input/Mode Door Feedback Signal input.

POSSIBLE CAUSES
CHECK CODE(S) PRESENT
MODE DOOR FEEDBACK FAILURE DTC PRESENT
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
5 VOLT SUPPLY CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
BODY CONTROL MODULE - 5 VOLT SUPPLY SIGNAL OPEN/SHORTED LOW
MODE DOOR ACTUATOR SHORTED LOW
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5 VOLT SUPPLY CIRCUIT OPEN
5 VOLT SUPPLY CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT
BLEND DOOR ACTUATOR SHORTED LOW

BLEND DOOR FEEDBACK SIGNAL CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE- BLEND DOOR FEEDBACK SIGNAL SHORTED TO VOLTAGE

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase Body Computer DTC's. Start the engine. With the DRBIII® in Miscellaneous, actuate Calibrate HVAC Door Motors. With the DRBIII®, read the Body Computer DTCs. What code(s) does the DRBIII® display? Mode/Blend Dr Fdbk Fail and addit DTC(s) If Mode/Blend Door Feedback Failure and additional DTC(s) set, return to the Symptom List and choose the code(s) to diagnose the additional DTC(s) first. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. Mode Door Feedback Failure only Return to the Symptom List and choose the code. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. Mode & Blend Door Feedback Failure only Go To 2 Blend Door Feedback Failure only Go To 11	All
2	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit (cavity #6) in the in-line connector (I/P harness side). What voltage is present? Zero volts. Go To 3 Approximately 4.5 to 5.5 volts Go To 6 Greater than 5.5 volts Go To 10	All
3	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the 5 Volt Supply circuit (I/P harness side). Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the 5 Volt Supply circuit between the BCM C2 harness connector and the in-line C200 harness connector (I/P harness side). Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the 5 Volt Supply circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance between the 5 Volt Supply circuit and the Sensor Ground circuit in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Mode Door Actuator harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the Mode Door Actuator harness connector. What voltage is present? Approximately 4.5 to 5.5 volts Replace the Mode Door Actuator. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. Zero volts Go To 7 Over 5.5 Volts Go To 10	All

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between ground and the 5 Volt Supply circuit in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance of the 5 Volt Supply circuit between the BCM C2 harness connector and the Mode Door Actuator harness connector. Measure the resistance of the 5 Volt Supply circuit between the BCM C2 harness connector and the Blend Door Actuator harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the 5 Volt Supply circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between the 5 Volt Supply circuit and the Sensor Ground in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
10	Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the 5 volt supply circuit. Is there any voltage present? Yes → Repair the 5 Volt Supply circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
11	Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Turn the ignition on. With the DRBIII® in Sensor Display, read the Blend Door voltage. What voltage is present? From 0.3 to 5.5 volts Go To 12 Less than 0.3 volts Go To 15 Above 5.5 volts Go To 19	All
12	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Turn off all lights and close the driver door latch so the courtesy lamps will go off. Measure the resistance between ground and the Sensor Ground circuit (cavity #5) in the inline connector (I/P harness side). Is the resistance below 10.0 ohms? Yes → Go To 13 No → Go To 14	All

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
13	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Blend Door Actuator harness connector. Measure the resistance of the Sensor Ground circuit between the C200 in-line connector (cavity #5) (HVAC harness side) and the Blend Door Actuator harness connector. Is the resistance below 5.0 ohms? Yes → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Sensor Ground circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
14	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector Measure the resistance of the Sensor Ground circuit between the C200 in-line connector (cavity #5) (I/P harness side) and the BCM C2 harness connector. Is the resistance below 5.0 ohms? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Sensor Ground circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
15	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Body Control Module C2 harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between ground and the Blend Door Feedback Signal circuit in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the Blend Door Feedback Signal circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 16	All

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
16	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Body Control Module C2 harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance of the Blend Door Feedback Signal circuit between the BCM C2 harness connector and the Blend Door Actuator harness connector. Is the resistance below 5.0 ohms? Yes → Go To 17 No → Repair the Blend Door Feedback Signal circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
17	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Body Control Module C2 harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between the Blend Door Feedback Signal circuit and the Sensor Ground circuit in the BCM C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the Blend Door Feedback Signal circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 18	All
18	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Blend Door Actuator harness connector. Connect a jumper wire between the Blend Door Feedback Signal circuit and the 5 Volt Supply circuit. Turn the ignition on. With the DRBIII® in Sensor Display, read the Blend Door voltage. Is the voltage approximately 4.5 to 5.5 volts? Yes → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

BLEND DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
19	Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the Blend Door Feedback Signal circuit. Is there any voltage present? Yes → Repair the Blend Door Feedback Signal circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BLEND DOOR OUTPUT SHORTED TO BATTERY

When Monitored and Set Condition:

BLEND DOOR OUTPUT SHORTED TO BATTERY

When Monitored: Whenever the BCM attempts to move the Blend Door Actuator.

Set Condition: This DTC will set if the BCM detects a short to voltage on the Blend Door Driver circuit.

POSSIBLE CAUSES
SHORT TO VOLTAGE BETWEEN BCM AND C200
BLEND DOOR DRIVER CIRCUIT SHORTED TO OTHER DRIVER CIRCUIT
BCM
DRIVER CIRCUITS SHORTED TOGETHER
BLEND DOOR ACTUATOR
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Turn the ignition on. Measure the voltage of the Blend Door Driver circuit. Is the voltage below 1.0 volt? Yes → Go To 3 No → Repair the Blend Door Driver circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

BLEND DOOR OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between the Blend Door Driver circuit and each of the following circuits: Recirculation Door Driver circuit, the Mode Door Driver circuit, Common Door Driver circuit. Is the resistance below 100.0 ohms for any of the measurements? Yes → Repair the Blend Door Driver circuit for a short to other driver circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Make sure that the BCM C2 harness connector is connected to the BCM. Disconnect the C200 In-Line harness connector. Turn the ignition on. Measure the voltage of the Blend Door Driver circuit at the C200 In-Line harness connector (BCM side). Is the voltage above 1.0 volt? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the C200 In-Line harness connector. Disconnect the Blend Door Actuator harness connector. Inspect the Blend Door Driver circuit between the C200 harness connector and the Blend Door Actuator harness connector for a short to any other circuit at the connector or the harness. Were any problems found? Yes → Repair the Blend Door Driver circuit for a short to voltage or other driver circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

BLEND DOOR OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
BLEND DOOR OUTPUT SHORTED TO GROUND

When Monitored and Set Condition:

BLEND DOOR OUTPUT SHORTED TO GROUND

When Monitored: Whenever the BCM attempts to move one of the HVAC actuators.

Set Condition: This DTC will set if the BCM detects one or more of the following outputs shorted to ground: mode door driver, blend door driver, recirculation door driver or the common door driver.

POSSIBLE CAUSES
BLEND AIR DOOR DRIVER CIRCUIT SHORT TO GROUND
BLEND AIR DOOR DRIVER CKT SHORT TO SENSOR GROUND
BLEND AIR DOOR DRIVER WIRE SHORT TO SENSOR GROUND
BLEND DOOR ACTUATOR
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 5	All
2	Turn all lights off. Close the driver door latch to turn courtesy lamps off. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Blend Air Door Driver circuit. Is the resistance below 100.0 ohms? Yes → Repair the Blend Air Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

BLEND DOOR OUTPUT SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Body Control Module C2 harness connector. Measure the resistance between the Blend Air Door Driver circuit and the Sensor Ground circuit in the BCM C2 connector. Is the resistance below 100.0 ohms? Yes → Go To 4 No → Replace the Body Control Module. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Body Control Module C2 harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between the Blend Air Door Driver circuit and the Sensor Ground circuit in the BCM C2 connector. Is the resistance below 100.0 ohms? Yes → Repair the Blend Air Door Driver circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
BLEND DOOR STALL TEST FAILURE

When Monitored and Set Condition:

BLEND DOOR STALL TEST FAILURE

When Monitored: During HVAC motor calibration.

Set Condition: This DTC will set if the BCM is unable to detect the end of travel for the blend door.

POSSIBLE CAUSES
BLEND DOOR ACTUATOR
BLEND DOOR DRIVER CIRCUIT OPEN BETWEEN THE BCM AND C200
BLEND DOOR DRIVER CIRCUIT OPEN BETWEEN THE C200 AND ACTUATOR
BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN C200 AND THE ACTUATR
BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE BCM AND C200
COMMON DOOR DRIVER CIRCUIT OPEN BETWEEN THE BCM AND C200
COMMON DOOR DRIVER CIRCUIT OPEN BETWEEN THE C200 AND ACTUATOR
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE BCM AND C200
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE C200 AND ACTUATOR
WIRING HARNESS INSPECTION
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. With the DRBIII®, read the BCM DTC's. Is this DTC present? Yes → Go To 2 No → Go To 11	All

BLEND DOOR STALL TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Blend Door Driver circuit at the BCM C2 harness connector. Is the resistance below 100.0 ohms? Yes → Repair the Blend Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Blend Door Driver circuit in the C200 harness connector (BCM side). Using a 12-volt test light connected to 12-volts, check the Blend Door Driver circuit in the BCM C2 harness connector. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Blend Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Common Door Driver circuit in the BCM C2 harness connector. Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Common Door Driver circuit in the C200 harness connector (BCM side). Using a 12-volt test light connected to 12-volts, check the Common Door Driver circuit in the BCM C2 harness connector. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Common Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

BLEND DOOR STALL TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the C200 In-Line harness connector. Connect a test light between the Blend Door Driver circuit and the Common Door Driver circuit at the C200 harness connector (BCM side). Start the engine. With the DRBIII®, select Body, Body Computer, System Tests then Actuate Mode Doors. Select Blend Door. While observing the test light, press and hold the DRB right arrow key for several seconds. While observing the test light, press and hold the DRB left arrow key for several seconds. Is the test light on while the right and left arrow keys are pressed? Yes → Go To 7 No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Blend Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Blend Door Driver circuit in the C200 harness connector (Actuator side). Is the resistance below 100.0 ohms? Yes → Repair the Blend Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the Blend Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Blend Door Driver circuit in the C200 harness connector (Actuator side). Using a 12-volt test light connected to 12-volts, check the Blend Door Driver circuit in the Blend Door Actuator harness connector. Does the test light illuminate brightly? Yes → Go To 9 No → Repair the Blend Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

BLEND DOOR STALL TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Disconnect the Blend Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Common Door Driver circuit in the C200 harness connector (Actuator side). Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off. Disconnect the Blend Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Common Door Driver circuit in the C200 harness connector (Actuator side). Using a 12-volt test light connected to 12-volts, check the Common Door Driver circuit at the Blend Door Actuator harness connector. Does the test light illuminate brightly? Yes → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Common Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
11	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
COMMON OUTPUT SHORTED TO BATTERY

When Monitored and Set Condition:

COMMON OUTPUT SHORTED TO BATTERY

When Monitored: Whenever the BCM attempts to move one of the HVAC actuators.

Set Condition: This DTC will set if the BCM detects a short to voltage on the Common Door Driver circuit.

POSSIBLE CAUSES
BCM
BLEND DOOR ACTUATOR
COMMON DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE OR OTHER DRIVER CIRCUIT
COMMON DRIVER CIRCUIT SHORTED TO OTHER DRIVER CIRCUIT
MODE DOOR ACTUATOR
RECIRCULATION DOOR ACTUATOR
SHORT TO VOLTAGE BETWEEN BCM AND C200
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 8	All

COMMON OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Turn the ignition on. Measure the voltage of the Common Door Driver circuit. Is the voltage below 1.0 volt? Yes → Go To 3 No → Repair the Common Door Driver circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between the Common Door Driver circuit and each of the following circuits: Recirculation Door Driver circuit, the Mode Door Driver circuit, Blend Door Driver circuit. Is the resistance below 100.0 ohms for any of the measurements? Yes → Repair the Common Door Driver circuit for a short to other driver circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the C200 In-Line harness connector. Turn the ignition on. Measure the voltage of the Common Door Driver circuit at the C200 In-Line harness connector (BCM side). Is the voltage above 1.0 volt? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

COMMON OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Reconnect all connectors. Disconnect the Recirculation Door Actuator harness connector. Start the engine. Turn the Blower switch on low. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirc position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 6 No → Replace the Recirculation Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Reconnect all connectors. Disconnect the Blend Door Actuator harness connector. Start the engine. Turn the Blower switch on low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 7 No → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Reconnect all connectors. Disconnect the Mode Door Actuator harness connector. Start the engine. Turn the Blower switch on low. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Repair the Common Door Driver circuit for a short to voltage or short to other driver circuit between the C200 harness connector and the HVAC housing unit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Mode Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

COMMON OUTPUT SHORTED TO BATTERY — Continued

COMMON DOOR DRIVER CIRCUIT SHORT TO GROUND
COMMON DOOR DRIVER CKT SHORT TO SENSOR GROUND
BLEND DOOR ACTUATOR SHORT TO COMMON DOOR DRIVER CIRCUIT
MODE DOOR ACTUATOR SHORT TO COMMON DOOR DRIVER CIRCUIT
COMMON DOOR DRIVER WIRE SHORT TO SENSOR GROUND
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 6	All
2	Turn all lights off. Close the driver door latch to turn courtesy lamps off. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Common Door Driver circuit. Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

COMMON OUTPUT SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Body Control Module C2 harness connector. Measure the resistance between the Common Door Driver circuit and the Sensor Ground circuit in the BCM C2 connector. Is the resistance below 100.0 ohms? Yes → Go To 4 No → Replace the Body Control Module. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Body Control Module C2 harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between the Common Door Driver circuit and the Sensor Ground circuit in the BCM C2 connector. Is the resistance below 100.0 ohms? Yes → Go To 5 No → Replace the Blend Door Actuato in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Measure the resistance between the Common Door Driver circuit and the Sensor Ground circuit in the BCM C2 connector. Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Mode Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
EVAPORATOR SENSOR FAILURE

When Monitored and Set Condition:

EVAPORATOR SENSOR FAILURE

When Monitored: With the ignition on.

Set Condition: This DTC will set if the BCM detects voltage below 0.06 volts or above 4.8 volts on the evaporator temperature sensor signal input.

POSSIBLE CAUSES
EVAPORATOR TEMPERATURE SENSOR SIGNAL CKT SHORT TO VOLTAGE
EVAPORATOR TEMPERATURE SENSOR OPEN
EVAPORATOR TEMP SENSOR SIGNAL CKT OPEN
SENSOR GROUND OPEN
BODY CONTROL MODULE - EVAPORATOR TEMP SENSOR STAYS HIGH
EVAPERATOR TEMPERATURE SENSOR
INTERMITTENT WIRING PROBLEM
EVAPORATOR TEMP SENSOR SIGNAL CIRCUIT SHORT TO GROUND
EVAPORATOR TEMP SENSOR SIGNAL CKT SHORT TO SENSOR GROUND
BODY CONTROL MODULE - EVAPORATOR TEMP SENSOR STAYS LOW

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® in Sensors, read the Evaporator Temperature Sensor voltage. Is the voltage above 5.0 volts? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Turn the ignition on. Measure the voltage of the Evaporator Temperature Sensor Signal circuit. Is the voltage above 5.1 volts? Yes → Repair the Evaporator Temperature Sensor Signal ckt for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

EVAPORATOR SENSOR FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Turn the ignition on. Connect a jumper wire between the Evaporator Temperature Sensor Signal circuit and the Sensor Ground circuit. With the DRBIII® in Sensors, read the Evaporator Temperature Sensor voltage. Does the DRBIII® display EVAP TEMP: 4.9 VOLTS or greater? Yes → Go To 4 No → Replace the Evaporator Temperature Sensor in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Evaporator Temp Sensor Signal circuit between the BCM C2 connector and the Evaporator Temperature Sensor connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Evaporator Temperature Sensor Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Sensor Ground circuit between the BCM C2 connector and the Evaporator Temp Sensor connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Sensor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Turn the ignition on. With the DRBIII® in Sensors, read the Evaporator Temperature Sensor voltage. Does the DRBIII® display EVAP TEMP: 4.9 VOLTS or greater? Yes → Go To 8 No → Go To 9	All

EVAPORATOR SENSOR FAILURE — Continued

TEST	ACTION	APPLICABILITY
8	Place the vehicle out of direct sunlight. Lower the windows. Allow the vehicle to come to ambient temperature. Place a thermometer in one of the instrument panel outlets, and a second thermometer in the intake duct. Disconnect the Evaporator Temperature Sensor harness connector. Turn the ignition on. Turn the Mode Control switch to the Panel or Bi-level position (Recirc off). Turn the Blower switch on high and allow it to run until both temperature readings are within 2° of one another and constant. Measure and record the Evaporator Temperature Sensor resistance. Consult the following specifications to determine if the Evaporator Temperature Sensor resistance is within the specification. 8.3K to 8.8K ohms at 12.7°C (55°F). 7.2K to 7.7K ohms at 15.5°C (60°F). 6.3K to 6.8K ohms at 18.3°C (65°F). 5.6K to 6.1k ohms at 21.1°C (70°F). 4.9K to 5.4K ohms at 23.8°C (75°F). 4.4K to 4.8K ohms at 26.6°C (80°F). 3.8K to 4.1K ohms at 29.4°C (85°F). 3.2K to 3.5K ohms at 32.2°C (90°F). Is the Evaporator Temperature Sensor resistance within the specification? Yes → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for conditions causing an intermittent short or open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Evaporator Temperature Sensor in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Evaporator Temperature Sensor Signal circuit at the BCM C2 connector. Is the resistance below 1000.0 ohms? Yes → Repair the Evaporator Temperature Sensor Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance between the Evaporator Temp Sensor Signal circuit and the Sensor Ground circuit in the Evaporator Temperature Sensor connector. Is the resistance below 1000.0 ohms? Yes → Repair the Evaporator Temperature Sensor Signal circuit for a short to the Sensor Ground circuit. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All

EVAPORATOR SENSOR FAILURE — Continued

TEST	ACTION	APPLICABILITY
11	If there are no possible causes remaining, view repair. Repair Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

MODE DOOR FEEDBACK FAILURE

When Monitored and Set Condition:

MODE DOOR FEEDBACK FAILURE

When Monitored: With the ignition on.

Set Condition: This DTC will set if the BCM detects voltage below 0.06 volts or above 4.8 volts on the Blend Door Feedback Signal input/Mode Door Feedback Signal input.

POSSIBLE CAUSES
CHECK CODE(S) PRESENT
BLEND DOOR FEEDBACK FAILURE DTC PRESENT
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

MODE DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase Body Computer DTC's. Start the engine. With the DRBIII® in Miscellaneous, actuate Calibrate HVAC Door Motors. With the DRBIII®, read the Body Computer DTCs. What code(s) does the DRBIII® display? Mode/Blend Dr Fdbk Fail and addit DTC(s) If Mode/Blend Door Feedback Failure and additional DTC(s) set, return to the Symptom List and choose the code(s) to diagnose the additional DTC(s) first. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. Blend Door Feedback Failure only Return to the Symptom List and choose the code. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. Mode & Blend Door Feedback Failure only Go To 2 Mode Door Feedback Failure only Go To 11	All
2	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit (cavity #6) in the in-line connector (I/P harness side). What voltage is present? Zero volts. Go To 3 Approximately 4.5 to 5.5 volts Go To 6 Greater than 5.5 volts Go To 10	All
3	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the 5 Volt Supply circuit (I/P harness side). Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

MODE DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the 5 Volt Supply circuit between the BCM C2 harness connector and the in-line C200 harness connector (I/P harness side). Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the 5 Volt Supply circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector. Measure the resistance between the 5 Volt Supply circuit and the Sensor Ground circuit in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Mode Door Actuator harness connector. Turn the ignition on. Measure the voltage of the 5 Volt Supply circuit in the Mode Door Actuator harness connector. What voltage is present? Approximately 4.5 to 5.5 volts Replace the Mode Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. Zero volts Go To 7 Over 5.5 Volts Go To 10	All

MODE DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between ground and the 5 Volt Supply circuit in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance of the 5 Volt Supply circuit between the BCM C2 harness connector and the Mode Door Actuator harness connector. Measure the resistance of the 5 Volt Supply circuit between the BCM C2 harness connector and the Blend Door Actuator harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the 5 Volt Supply circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Disconnect the Blend Door Actuator harness connector. Measure the resistance between the 5 Volt Supply circuit and the Sensor Ground in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the 5 Volt Supply circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Blend Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

MODE DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
10	Disconnect the Body Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the 5 volt supply circuit. Is there any voltage present? Yes → Repair the 5 Volt Supply circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
11	Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Turn the ignition on. With the DRBIII® in Sensor Display, read the Mode Door voltage. What voltage is present? From 0.3 to 5.5 volts Go To 12 Less than 0.3 volts Go To 15 Above 5.5 volts Go To 19	All
12	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Turn off all lights and close the driver door latch so the courtesy lamps will go off. Measure the resistance between ground and the Sensor Ground circuit (cavity #5) in the inline connector (I/P harness side). Is the resistance below 10.0 ohms? Yes → Go To 13 No → Go To 14	All

MODE DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
13	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Mode Door Actuator harness connector. Measure the resistance of the Sensor Ground circuit between the C200 in-line connector (cavity #5) (HVAC harness side) and the Mode Door Actuator harness connector. Is the resistance below 5.0 ohms? Yes → Replace the Mode Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Sensor Ground circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
14	Turn the ignition off. Disconnect the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal. Disconnect the Body Control Module C2 harness connector Measure the resistance of the Sensor Ground circuit between the C200 in-line connector (cavity #5) (I/P harness side) and the BCM C2 harness connector. Is the resistance below 5.0 ohms? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Sensor Ground circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
15	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Measure the resistance between ground and the Mode Door Feedback Signal circuit in the Body Control Module C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the Mode Door Feedback Signal circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 16	All

MODE DOOR FEEDBACK FAILURE — Continued

TEST	ACTION	APPLICABILITY
16	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Measure the resistance of the Mode Door Feedback Signal circuit between the BCM C2 harness connector and the Mode Door Actuator harness connector. Is the resistance below 5.0 ohms? Yes → Go To 17 No → Repair the Mode Door Feedback Signal circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
17	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Measure the resistance between the Mode Door Feedback Signal circuit and the Sensor Ground circuit in the BCM C2 harness connector. Is the resistance below 10K ohms? Yes → Repair the Mode Door Feedback Signal circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 18	All
18	Turn the ignition off. Ensure the C200 in-line connector (HVAC) located in the center of the instrument panel above the accelerator pedal is connected. Disconnect the Mode Door Actuator harness connector. Connect a jumper wire between the Mode Door Feedback Signal circuit and the 5 Volt Supply circuit. Turn the ignition on. With the DRBIII® in Sensor Display, read the Mode Door voltage. Is the voltage approximately 4.5 to 5.5 volts? Yes → Replace the Mode Door Actuato in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE DOOR OUTPUT SHORTED TO BATTERY

When Monitored and Set Condition:

MODE DOOR OUTPUT SHORTED TO BATTERY

When Monitored: Whenever the BCM attempts to move the Mode Door Actuator.

Set Condition: This DTC will set if the BCM detects a short to voltage on the Mode Door Driver circuit.

POSSIBLE CAUSES
SHORT TO VOLTAGE BETWEEN BCM AND C200
MODE DOOR DRIVER CIRCUIT SHORTED TO OTHER DRIVER CIRCUIT
BCM
DRIVER CIRCUITS SHORTED TOGETHER
MODE DOOR ACTUATOR
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Turn the ignition on. Measure the voltage of the Mode Door Driver circuit. Is the voltage below 1.0 volt? Yes → Go To 3 No → Repair the Mode Door Driver circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

MODE DOOR OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between the Mode Door Driver circuit and each of the following circuits: Recirculation Door Driver circuit, the Blend Door Driver circuit, Common Door Driver circuit. Is the resistance below 100.0 ohms for any of the measurements? Yes → Repair the Mode Door Driver circuit for a short to other driver circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the C200 In-Line harness connector. Turn the ignition on. Measure the voltage of the Mode Door Driver circuit at the C200 In-Line harness connector (BCM side). Is the voltage above 1.0 volt? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the C200 In-Line harness connector. Disconnect the Mode Door Actuator harness connector. Inspect the Mode Door Driver circuit between the C200 harness connector and the Mode Door Actuator harness connector for a short to any other circuit at the connector or the harness. Were any problems found? Yes → Repair the Mode Door Driver circuit for a short to voltage or other driver circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Mode Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

MODE DOOR OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
MODE DOOR OUTPUT SHORTED TO GROUND

When Monitored and Set Condition:

MODE DOOR OUTPUT SHORTED TO GROUND

When Monitored: Whenever the BCM attempts to move one of the HVAC actuators.

Set Condition: This DTC will set if the BCM detects one or more of the following outputs shorted to ground: mode door driver, blend door driver, recirculation door driver or the common door driver.

POSSIBLE CAUSES
MODE DOOR DRIVER CIRCUIT SHORT TO GROUND
MODE DOOR DRIVER CKT SHORT TO SENSOR GROUND
MODE DOOR DRIVER WIRE SHORT TO SENSOR GROUND
MODE DOOR ACTUATOR
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 5	All
2	Turn all lights off. Close the driver door latch to turn courtesy lamps off. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Mode Door Driver circuit. Is the resistance below 100.0 ohms? Yes → Repair the Mode Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

MODE DOOR OUTPUT SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Body Control Module C2 harness connector. Measure the resistance between the Mode Door Driver circuit and the Sensor Ground circuit in the BCM C2 connector. Is the resistance below 100.0 ohms? Yes → Go To 4 No → Replace the Body Control Module. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Body Control Module C2 harness connector. Disconnect the Mode Door Actuator harness connector. Measure the resistance between the Mode Door Driver circuit and the Sensor Ground circuit in the BCM C2 connector. Is the resistance below 100.0 ohms? Yes → Repair the Mode Door Driver circuit for a short to the Sensor Ground circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Mode Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Symptom:
MODE DOOR STALL TEST FAILURE

When Monitored and Set Condition:

MODE DOOR STALL TEST FAILURE

When Monitored: During HVAC motor calibration.

Set Condition: This DTC will set if the BCM is unable to detect the end of travel for the mode door.

POSSIBLE CAUSES
COMMON DOOR DRIVER CIRCUIT OPEN BETWEEN THE BCM AND C200
COMMON DOOR DRIVER CIRCUIT OPEN BETWEEN THE C200 AND ACTUATOR
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE BCM AND C200
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE C200 AND ACTUATOR
MODE DOOR ACTUATOR
MODE DOOR DRIVER CIRCUIT OPEN BETWEEN THE BCM AND C200
MODE DOOR DRIVER CIRCUIT OPEN BETWEEN THE C200 AND ACTUATOR
MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN C200 AND THE ACTUATR
MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE BCM AND C200
WIRING HARNESS INSPECTION
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Mode Control switch to the each available position pausing for 20 seconds at each position. With the DRBIII®, read the BCM DTC's. Is this DTC present? Yes → Go To 2 No → Go To 11	All

MODE DOOR STALL TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Mode Door Driver circuit at the BCM C2 harness connector. Is the resistance below 100.0 ohms? Yes → Repair the Mode Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Mode Door Driver circuit in the C200 harness connector (BCM side). Using a 12-volt test light connected to 12-volts, check the Mode Door Driver circuit in the BCM C2 harness connector. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Mode Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Common Door Driver circuit in the BCM C2 harness connector. Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Common Door Driver circuit in the C200 harness connector (BCM side). Using a 12-volt test light connected to 12-volts, check the Common Door Driver circuit in the BCM C2 harness connector. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Common Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

MODE DOOR STALL TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the C200 In-Line harness connector. Connect a test light between the Mode Door Driver circuit and the Common Door Driver circuit at the C200 harness connector (BCM side). Start the engine. With the DRBIII®, select Body, Body Computer, System Tests then Actuate Mode Doors. Select Mode Door. While observing the test light, press and hold the DRB right arrow key for several seconds. While observing the test light, press and hold the DRB left arrow key for several seconds. Is the test light on while the right and left arrow keys are pressed? Yes → Go To 7 No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Mode Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Mode Door Driver circuit in the C200 harness connector (Actuator side). Is the resistance below 100.0 ohms? Yes → Repair the Mode Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the Mode Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Mode Door Driver circuit in the C200 harness connector (Actuator side). Using a 12-volt test light connected to 12-volts, check the Mode Door Driver circuit in the Mode Door Actuator harness connector. Does the test light illuminate brightly? Yes → Go To 9 No → Repair the Mode Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

MODE DOOR STALL TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Disconnect the Mode Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Common Door Driver circuit in the C200 harness connector (Actuator side). Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off. Disconnect the Mode Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Common Door Driver circuit in the C200 harness connector (Actuator side). Using a 12-volt test light connected to 12-volts, check the Common Door Driver circuit at the Mode Door Actuator harness connector. Does the test light illuminate brightly? Yes → Replace the Mode Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Common Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
11	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
RECIRC DOOR OUTPUT SHORTED TO BATTERY

When Monitored and Set Condition:

RECIRC DOOR OUTPUT SHORTED TO BATTERY

When Monitored: Whenever the BCM attempts to move the Recirculation Door Actuator.

Set Condition: This DTC will set if the BCM detects a short to voltage on the Recirculation Door Driver circuit.

POSSIBLE CAUSES
SHORT TO VOLTAGE BETWEEN BCM AND C200
RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO OTHER DRIVER CIRCUIT
BCM
DRIVER CIRCUITS SHORTED TOGETHER
RECIRCULATION DOOR ACTUATOR
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Turn the ignition on. Measure the voltage of the Recirculation Door Driver circuit. Is the voltage below 1.0 volt? Yes → Go To 3 No → Repair the Recirculation Door Driver circuit for a short to voltage. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

RECIRC DOOR OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the In-Line C200 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between the Recirculation Door Driver circuit and each of the following circuits: Blend Door Driver circuit, the Mode Door Driver circuit, Common Door Driver circuit. Is the resistance below 100.0 ohms for any of the measurements? Yes → Repair the Recirculation Door Driver circuit for a short to other driver circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the C200 In-Line harness connector. Turn the ignition on. Measure the voltage of the Recirculation Door Driver circuit at the C200 In-Line harness connector (BCM side). Is the voltage above 1.0 volt? Yes → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the C200 In-Line harness connector. Disconnect the Recirculation Door Actuator harness connector. Inspect the Recirculation Door Driver circuit between the C200 harness connector and the Recirculation Door Actuator harness connector for a short to any other circuit at the connector or the harness. Were any problems found? Yes → Repair the Recirculation Door Driver circuit for a short to voltage or other driver circuit. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Recirculation Door Actuato in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

RECIRC DOOR OUTPUT SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
RECIRC DOOR OUTPUT SHORTED TO GROUND

When Monitored and Set Condition:

RECIRC DOOR OUTPUT SHORTED TO GROUND

When Monitored: Whenever the BCM attempts to move one of the HVAC actuators.

Set Condition: This DTC will set if the BCM detects one or more of the following outputs shorted to ground: mode door driver, blend door driver, recirculation door driver or the common door driver.

POSSIBLE CAUSES
RECIRCULATION DOOR DRIVER CIRCUIT SHORT TO GROUND
BODY CONTROL MODULE
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Blend Control switch to the full cold position for 30 seconds. Turn the Blend Control switch to the full hot position for 30 seconds. Turn the Mode Control switch to each available position pausing for 20 seconds at each position. Turn the Mode Control switch to the Defrost position for 20 seconds. Turn the Mode Control switch to the Recirculation position for 20 seconds. Turn the Mode Control switch to the Defrost position for 20 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 3	All
2	Turn all lights off. Close the driver door latch to turn courtesy lamps off. Disconnect the Body Control Module C2 harness connector. Measure the resistance between ground and the Recirculation Door Driver circuit. Is the resistance below 5.0 ohms? Yes → Repair the Recirculation Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

RECIRC DOOR OUTPUT SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
RECIRCULATION DOOR TEST FAILURE (INOPERATIVE OR STALL)

When Monitored and Set Condition:

RECIRCULATION DOOR TEST FAILURE (INOPERATIVE OR STALL)

When Monitored: During HVAC motor calibration.

Set Condition: This DTC will set if the BCM is unable to detect the end of travel for one or more of the HVAC doors.

POSSIBLE CAUSES
COMMON DOOR DRIVER CIRCUIT OPEN BETWEEN THE BCM AND C200
COMMON DOOR DRIVER CIRCUIT OPEN BETWEEN THE C200 AND ACTUATOR
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE BCM AND C200
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE C200 AND ACTUATOR
RECIRCULATION DOOR ACTUATOR
RECIRCULATION DOOR DRIVER CIRCUIT OPEN BETWEEN THE BCM AND C200
RECIRCULATION DOOR DRIVER CIRCUIT OPEN BETWEEN THE C200 AND ACTUATOR
RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN C200 AND THE ACTUATR
RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND BETWEEN THE BCM AND C200
WIRING HARNESS INSPECTION
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Start the engine. With the DRBIII®, erase all BCM DTC's. Turn the Blower switch to low. Turn the Mode Control switch to the Defroster position and for 30 seconds. Turn the Mode Control switch to the Recirculation position for 30 seconds. Turn the Mode Control switch to the Defroster position for 30 seconds. With the DRBIII®, read the BCM DTC's. Is this DTC present? Yes → Go To 2 No → Go To 11	All

RECIRCULATION DOOR TEST FAILURE (INOPERATIVE OR STALL) — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Recirculation Door Driver circuit at the BCM C2 harness connector. Is the resistance below 100.0 ohms? Yes → Repair the Recirculation Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Recirculation Door Driver circuit in the C200 harness connector (BCM side). Using a 12-volt test light connected to 12-volts, check the Recirculation Door Driver circuit in the BCM C2 harness connector. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Recirculation Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Common Door Driver circuit in the BCM C2 harness connector. Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Common Door Driver circuit in the C200 harness connector (BCM side). Using a 12-volt test light connected to 12-volts, check the Common Door Driver circuit in the BCM C2 harness connector. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Common Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

RECIRCULATION DOOR TEST FAILURE (INOPERATIVE OR STALL) — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the C200 In-Line harness connector. Connect a test light between the Recirculation Door Driver circuit and the Common Door Driver circuit at the C200 harness connector (BCM side). Turn the ignition on. With the DRBIII®, select Body, Body Computer, System Tests then Actuate Mode Doors. Select Recirc Door. While observing the test light, press and hold the DRB right arrow key for several seconds. While observing the test light, press and hold the DRB left arrow key for several seconds. Is the test light on while the right and left arrow keys are pressed? Yes → Go To 7 No → Replace and program the Body Control Module in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Recirculation Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Recirculation Door Driver circuit in the C200 harness connector (Actuator side). Is the resistance below 100.0 ohms? Yes → Repair the Recirculation Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the Recirculation Actuator harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Recirculation Door Driver circuit in the C200 harness connector (Actuator side). Using a 12-volt test light connected to 12-volts, check the Recirculation Door Driver circuit in the Recirculation Door Actuator harness connector. Does the test light illuminate brightly? Yes → Go To 9 No → Repair the Recirculation Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

RECIRCULATION DOOR TEST FAILURE (INOPERATIVE OR STALL) — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Disconnect the Recirculation Door Actuator harness connector. Disconnect the C200 In-Line harness connector. Measure the resistance between ground and the Common Door Driver circuit in the C200 harness connector (Actuator side). Is the resistance below 100.0 ohms? Yes → Repair the Common Door Driver circuit for a short to ground. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off. Disconnect the Recirculation Actuator harness connector. Disconnect the C200 In-Line harness connector. Connect a jumper wire between ground and the Common Door Driver circuit in the C200 harness connector (Actuator side). Using a 12-volt test light connected to 12-volts, check the Common Door Driver circuit at the Recirculation Door Actuator harness connector. Does the test light illuminate brightly? Yes → Replace the Recirculation Door Actuator in accordance with the Service Information. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Common Door Driver circuit for an open. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
11	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Calibration must be performed after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*A/C - HEATER CONTROL ILLUMINATION INOPERATIVE

POSSIBLE CAUSES
A/C - HEATER CONTROL ILLUMINATION INOPERATIVE

TEST	ACTION	APPLICABILITY
1	View Repair. Repair Refer to Instrument Panel Illumination Inoperative in the Interior Lighting catagory for the diagnostic procedure. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*A/C SYSTEM TEST

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE PCM AND THE BCM
CHECK FOR HVAC RELATD DTCS IN THE PCM AND THE BCM
MONITOR THE DRBIII® FOR HVAC DTCS
CHECK FOR HVAC RELATD DTCS IN THE PCM
MANUAL A/C SYSTEM TEST

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to communicate with the Powertrain Control Module. With the DRBIII®, attempt to communicate with the Body Control Module. Was the DRBIII® able to communicate with the PCM and the BCM? Yes → Go To 2 No → Refer to the communication category for the related symptom. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, read Powertrain Computer DTC's. With the DRBIII®, read Body Computer DTC's. Are any HVAC related DTCs present? Yes → Refer to the appropriate catagory for the related symptom. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition on. Turn the Rear Defogger off. Turn the Blend Control switch to the full cold position. Turn the Mode Control switch to the Panel - Heater position. Turn the Blower switch off. With the DRBIII®, record and erase Powertrain Computer DTC's. With the DRBIII®, record and erase Body Computer DTCs. Start the engine. **NOTE: Proceed directly to the conclusion of this test and answer Yes to the question if the DRBIII® displays any HVAC related DTC(s) while performing anyone of the following steps.** Monitor the DRBIII® for HVAC related DTCs in the Body Computer while performing the following. Turn the Blower switch on. With the DRBIII® in Miscellaneous, actuate Calibrate HVAC Door Motors. Slowly turn the Blend Control switch from full cold to full hot, then back to full cold. Turn the Mode Control switch to each position, waiting 20 seconds in each position. Press and release the Rear Defogger button, wait 20 seconds, then press and release it again to turn the Rear Defogger off. Does the DRBIII® display any HVAC related Body Computer DTCs? Yes → Return to the Symptom List and choose the code(s). If multiple codes appear, repair any that relate to a short circuit first. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*A/C SYSTEM TEST — Continued

TEST	ACTION	APPLICABILITY
4	With the DRBIII®, read PCM DTC's. Are any HVAC related DTCs present? Yes → Refer to the appropriate catagory for the related symptom. Perform BODY VERIFICATION TEST - VER 1. No → Recheck the climate control system performance. Refer to Service Information for additional information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BLOWER MOTOR INOPERATIVE

POSSIBLE CAUSES
JUNCTION BLOCK FUSE #1
BLOWER MOTOR FEED CIRCUIT SHORTED TO GROUND
BLOWER MOTOR SHORTED TO GROUND
GROUND CIRCUIT OPEN
A/C - HEATER CONTROL OPEN
BLOWER MOTOR DRIVER CIRCUIT OPEN
RESISTOR-OPEN HI BLOWER MOTOR DRIVER
BLOWER MOTOR DRIVER CIRCUIT OPEN
BLOWER MOTOR FEED CIRCUIT OPEN
BLOWER MOTOR OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect Junction Block Fuse #1. Is the fuse open? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Replace Junction Block Fuse #1. Turn the ignition on. Turn the blower on and operate it in all speeds and modes. Does the blower motor operate properly without blowing the fuse? Yes → Check the Blower Motor Feed circuit for an intermittent short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Turn the Blower switch off. Disconnect the Blower Motor harness connector. Measure the resistance between ground and the Blower Motor Feed circuit. Is the resistance below 10K ohms? Yes → Repair the Blower Motor Feed circuit for a short to ground and replace the fuse. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Blower Motor and fuse in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

*BLOWER MOTOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Ensure Junction Block Fuse #1 is installed. Turn the Blower switch off. Disconnect the Blower Motor Resistor Block harness connector. Turn the ignition on. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Using a 12-volt test light connected to ground, back probe the Blower Motor Driver circuit in the Blower Motor Resistor Block harness connector. Does the test light illuminate brightly? Yes → Go To 5 No → Go To 8	All
5	Turn the ignition off. Disconnect the A/C - Heater Control C2 harness connector. Connect a jumper wire between ground and the High Blower Motor Driver circuit in the A/C - Heater Control C2 harness connector. Turn the ignition on. Does the blower motor run at high speed? Yes → Go To 6 No → Go To 7	All
6	Turn the ignition off. Disconnect the A/C - Heater Control C2 harness connector. Measure the resistance between ground and the Ground circuit. Is the resistance below 5.0 ohms? Yes → Replace the A/C - Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the A/C - Heater Control C2 harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the resistance of the High Blower Motor Driver circuit between the A/C - Heater Control C2 harness connector and the Blower Motor Resistor Block harness connector. Is the resistance below 5.0 ohms? Yes → Replace the Blower Motor Resistor Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the High Blower Motor Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*BLOWER MOTOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
8	Turn the Blower switch off. Turn the ignition on. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Using a 12-volt test light connected to ground, back probe the Blower Motor Driver circuit in the Blower Motor harness connector. Does the test light illuminate brightly? Yes → Repair the Blower Motor Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the Blower switch off. Turn the ignition on. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Using a 12-volt test light connected to ground, back probe the Blower Motor Feed circuit in the Blower Motor harness connector. Does the test light illuminate brightly? Yes → Replace the Blower Motor in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Blower Motor Feed circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BLOWER MOTOR SPEEDS INCORRECT

POSSIBLE CAUSES
BLOWER MOTOR DRIVER CIRCUIT(S) SHORTED TO GROUND
BLOWER MOTOR DRIVER CIRCUIT SHORTED TO GROUND
A/C - HEATER CONTROL
BLOWER MOTOR DRIVER CIRCUIT(S) SHORTED TO VOLTAGE
BLOWER MOTOR DRIVER CIRCUITS SHORTED TOGETHER
A/C - HEATER CONTROL - SPEEDS INCORRECT
BLOWER MOTOR DRIVER CIRCUIT(S) OPEN
BLOWER MOTOR RESISTOR BLOCK - OPEN SPEED

TEST	ACTION	APPLICABILITY
1	Turn the Blower switch off. Turn the ignition on. Does the blower run? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Disconnect the A/C - Heater Control C2 harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the resistance between ground and each of the Blower Motor Driver circuits. Is the resistance below 10K ohms on any of the circuits? Yes → Repair the Blower Motor Driver circuit(s) for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Blower Motor harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the resistance between ground and the Blower Motor Driver circuit in the Blower Motor harness connector. Is the resistance below 10K ohms? Yes → Repair the Blower Motor Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the A/C - Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

*BLOWER MOTOR SPEEDS INCORRECT — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the A/C - Heater Control C2 harness connector. Turn the ignition on. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Using a 12-volt test light connected to ground, back probe each of the Blower Motor Driver circuits (cavities 2, 3, 7, and 10) in the A/C - Heater Control C2 harness connector. Does the test light illuminate brightly on each circuit? Yes → Go To 5 No → Go To 7	All
5	Turn the ignition off. Disconnect the A/C - Heater Control C2 harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the voltage of each of the Blower Motor Driver circuits (cavities 2, 3, 7, and 10). Is there any voltage present? Yes → Repair the Blower Motor Driver circuit(s) for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the A/C - Heater Control C2 harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the resistance between the Low Blower Motor Driver circuit and the M1, M2, and High Blower Motor Driver circuits. Measure the resistance between the M1 Blower Motor Driver circuit and the M2 and High Blower Motor Driver circuits. Measure the resistance between the M2 Blower Motor Driver circuit and the High Blower Motor Driver circuit. Is the resistance below 10K ohms between any of the circuits? Yes → Repair the shorted Blower Motor Driver circuits. Perform BODY VERIFICATION TEST - VER 1. No → Replace the A/C - Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Turn the Blower switch to the off position. Disconnect the A/C - Heater Control C2 harness connector. Disconnect the Blower Motor Resistor Block harness connector. Measure the resistance of each Blower Motor Driver circuit between the Blower Motor Resistor Block harness connector and the A/C - Heater Control C2 harness connector. Is the resistance below 5.0 ohms on each of the circuits? Yes → Replace the Blower Motor Resistor Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Blower Motor Driver circuit(s) for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

ABS LAMP CIRCUIT OPEN
ABS LAMP CIRCUIT SHORT
AIRBAG LAMP CIRCUIT OPEN
AIRBAG LAMP CIRCUIT SHORT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ABS LAMP CIRCUIT OPEN.

When Monitored and Set Condition:

ABS LAMP CIRCUIT OPEN

When Monitored: The Instrument Cluster performs an internal diagnostic of the indicator circuit at power up and when the bulb is requested.

Set Condition: When the Instrument Cluster detects a fault in the ABS bulb circuit.

ABS LAMP CIRCUIT SHORT

When Monitored: The Instrument Cluster performs an internal diagnostic at power up and when the bulb is requested.

Set Condition: When the Instrument Clusteris detects a fault in the ABS bulb circuit.

AIRBAG LAMP CIRCUIT OPEN

When Monitored: The Instrument Cluster performs an internal diagnostic of the circuit at power up and when the bulb is requested.

Set Condition: When the Instrument Cluster is detects a fault in the Airbag bulb circuit.

AIRBAG LAMP CIRCUIT SHORT

When Monitored: The Instrument Cluster performs an internal diagnostic at power up and when the bulb is requested.

Set Condition: When the Instrument Cluster detects a fault in the Airbag bulb circuit.

POSSIBLE CAUSES
INDICATOR BULB
INSTRUMENT CLUSTER

ABS LAMP CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Junction Block Fuse #11 is not open. If the fuse is open make sure to check for a short to ground.** Turn the ignition on. With the DRBIII®, record and erase DTC's. Turn the ignition off, wait 15 seconds, then turn the ignition on. With the DRBIII®, read DTCs. Did the Indicator Lamp Open or Short DTC reset? Yes → Go To 2 No → Test Complete.	All
2	Turn the ignition off. Remove and inspect the Indicator Bulb in question. Is the Indicator Bulb in question defective? Yes → Replace the Indicator Bulb in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
FUEL LEVEL SENDING UNIT FAILURE

When Monitored and Set Condition:

FUEL LEVEL SENDING UNIT FAILURE

When Monitored: With the ignition on.

Set Condition: The BCM detects an out of range, open or short circuit on the Fuel Level Sensor Signal circuit.

POSSIBLE CAUSES
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN
FUEL LEVEL SENSOR GROUND CIRCUIT OPEN
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORT TO SENSOR GROUND CIRCUIT
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORT TO GROUND
FUEL LEVEL SENSOR
INTERMITTENT CONDITION
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTCs. Cycle the ignition. Wait approximately 1 minute. With the DRBIII® in Body Computer, read DTCs. Does the DTC reset? Yes → Go To 2 No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

FUEL LEVEL SENDING UNIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Disconnect the Fuel Tank Module harness connector. Turn the ignition on. **NOTE: The BCM sends out a low current 12 volt signal on the Fuel Level Sensor Signal circuit. This low current should not illuminate a 12 volt test light.** Using a 12-volt test light connected to ground, probe the Fuel Level Sensor Signal circuit in the Fuel Tank Module harness connector. Does the test light illuminate? Yes → Repair the Fuel Level Sensor Signal circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Fuel Tank Module harness connector. Measure the resistance of the Fuel Level Sensor Ground circuit in the Fuel Tank Module harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Fuel Level Sensor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the BCM harness connector. Disconnect the Fuel Tank Module harness connector. Measure the resistance between the Fuel Level Sensor Signal circuit and the Sensor Ground circuit in the BCM connector. Is the resistance below 5.0 ohms? Yes → Repair the Fuel Level Sensor Signal circuit for a short to the Sensor Ground circuit. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the BCM harness connector. Disconnect the Fuel Tank Module harness connector. Measure the resistance between ground and the Fuel Level Sensor Signal circuit. Is the resistance below 5.0 ohms? Yes → Repair the Fuel Level Sensor Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the Fuel Tank Module harness connector. Disconnect the BCM harness connector. Measure the resistance of the Fuel Level Sensor Signal circuit between the Fuel Tank Module harness connector and the BCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Fuel Level Sensor Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

FUEL LEVEL SENDING UNIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the Fuel Tank Module harness connector. Measure the resistance of the Fuel Level Sensor. The Fuel Level Sensor resistance must be within the following values: Full = Approximately 130 Ohms 3/4 = Approximately 340 Ohms 1/2 = Approximately 550 Ohms 1/4 = Approximately 760 Ohms Empty = Approximately 940 Ohms Does the Fuel Level Sensor resistance measure within specifications? Yes → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Fuel Level Sensor in accordance with the Service Information.. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

NO ABS BUS MESSAGES RECEIVED
NO BCM BUS MESSAGES RECEIVED
NO ORC BUS MESSAGES RECEIVED
NO TCM BUS MESSAGES RECEIVED

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be NO ABS BUS MESSAGES RECEIVED.

When Monitored and Set Condition:

NO ABS BUS MESSAGES RECEIVED

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster detects loss of PCI Bus communication with the ABS module for 10 seconds. The cluster will illuminate the BRAKE and ABS warning lamp indicators.

NO BCM BUS MESSAGES RECEIVED

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster detects no PCI Bus communiaction with the BCM for 5 seconds. The cluster will position the Fuel Gauge needle to ″E″, illuminate the Low Fuel indicator, and illuminate the VF display at full brightness.

NO ORC BUS MESSAGES RECEIVED

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster detects no PCI Bus communication with the ORC for 5 seconds. The cluster will illuminate the Airbag indicator.

NO TCM BUS MESSAGES RECEIVED

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster detects no PCI Bus communication with the TCM for 10 seconds. The cluster will illuminate all gears in the VF display.

POSSIBLE CAUSES
NO COMMUNICATION WITH THE ABS, BCM, ORC, OR TCM MODULE

NO ABS BUS MESSAGES RECEIVED — Continued

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the ABS, BCM, ORC, or TCM module. Was the DRB able to I/D or communicate with the module in question? Yes → Test Complete. No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PANEL DIMMING OUTPUT SHORT

POSSIBLE CAUSES
INTERMITTENT CONDITION
PANEL LAMPS DRIVER CIRCUIT SHORT TO GROUND
COMPONENT SHORTED
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase Body Control Module DTC's. Turn the ignition off, wait 15 seconds, then turn the ignition on. Turn on the Headlamps. With the DRBIII®, read DTCs. Does the DRBIII® display PANEL DIMMING OUTPUT SHORT? Yes → Go To 2 No → Test Complete.	All
2	Turn the ignition on. With the DRBIII®, erase Body Control Module DTCs. Turn the ignition off. Using the Wiring Diagrams as a guide, disconnect each dimmed component , one at a time while checking for the DTC to reset. Turn the ignition on. Turn the Headlamps on. With the DRBIII®, read DTCs. Does the DRBIII® display PANEL DIMMING OUTPUT SHORT? Yes → Go To 3 No → Replace the shorted component as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Using the Wiring Diagrams as a guide, disconnect each dimmed component and test the dimming circuit for a short to ground condition. Were there any problems found? Yes → Repair the Panel Lamps Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PCM MESSAGE NOT RECEIVED

When Monitored and Set Condition:

PCM MESSAGE NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: When the Instrument Cluster detects no PCI Bus communication with the PCM for 20 seconds. The cluster will illuminate the CHECK ENGINE indicator and the VF will display NO BUS. The Tachometer, Speedometer, and Temperature gauge pointers will be driven against their pointer stops. The Engine Temp, Charging System, and Cruise indicators will latch to their last known state.

POSSIBLE CAUSES
PCM MESSAGE NOT RECEIVED
NO COMMUNICATION WITH THE PCM
PCI BUS CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, enter Instrument Cluster, System Tests then PCM Monitor. Does the DRBIII® display: PCM is active on the BUS? Yes → Erase the DTC, if DTC resets, replace the Instrument Cluster in accordance with the Service Information.. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, attempt to communicate with the PCM. Was the DRBIII® able to communicate with the PCM? Yes → Go To 3 No → Refer to the Communication category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All

PCM MESSAGE NOT RECEIVED — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the PCM C2 harness connector. Connect the diagnostic junction port tester #8339 to the diagnostic junction port. **NOTE: Do not connect the tester to the DRBIII®.** Measure the resistance of the PCI Bus circuit between the diagnostic junction port tester and the PCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BRAKE WARNING INDICATOR ALWAYS ON

POSSIBLE CAUSES
BRAKE FLUID LEVEL SWITCH
PARK BRAKE SWITCH
RED BRAKE WARNING INDICATOR DRIVER CIRCUIT SHORT TO GROUND
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: If vehicle is equipped with ABS, diagnose and repair any ABS Lamp or Communication DTCs before proceeding with this test.** **NOTE: If vehicle is NOT equipped with ABS, ensure that the Instrument Cluster is not configured for ABS.** **NOTE: Ensure that the Brake Fluid is correctly filled and that the Base Brakes are operating properly before proceeding with this test.** Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Turn the ignition on. Observe the Brake Warning Indicator. Is the Brake Warning Indicator illuminated? Yes → Go To 2 No → Replace the Brake Fluid Level Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Park Brake Switch harness connector. Turn the ignition on. Observe the Brake Warning Indicator. Is the Brake Warning Indicator illuminated? Yes → Go To 3 No → Replace the Park Brake Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Disconnect the Park Brake Switch harness connector. Disconnect the Instrument Cluster harness connector. Measure the resistance between ground and the Red Brake Warning Indicator circuit. Is the resistance below 5.0 ohms? Yes → Repair the Red Brake Warning Indicator Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BRAKE WARNING INDICATOR INOPERATIVE

POSSIBLE CAUSES
INDICATOR BULB
PARK BRAKE SWITCH
PARK BRAKE SWITCH RED BRAKE WARNING INDICATOR DRIVER CIRCUIT OPEN
BRAKE FLUID LEVEL SWITCH
BRAKE FLUID LEVEL SWITCH GROUND CIRCUIT OPEN
BRAKE FLUID LEVEL SWITCH RED BRAKE WARNING INDICATOR DRIVER CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition to the Unlock position. Release the Trip Reset button when the Self Test begins. Observe the Brake Warning Indicator during the Self Test. Did the Brake Warning Indicator illuminate for approximately 4 seconds and turn off? Yes → Go To 2 No → Remove and inspect the Brake Warning Indicator bulb and socket, if found to be defective, replace as necessary. If the bulb and socket check OK, replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	Is the fault condition related to the Park Brake? Yes → Go To 3 No → Go To 5	All
3	Turn the ignition off. Disconnect the Park Brake Switch harness connector. Connect a jumper wire between the Red Brake Warning Indicator circuit and ground. Turn the ignition on. Observe the Brake Warning Indicator. Did the Brake Warning Indicator illuminate? Yes → Replace the Park Brake Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*BRAKE WARNING INDICATOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Park Brake Switch harness connector. Disconnect the Instrument Cluster harness connector. Measure the resistance of the Red Brake Warning Indicator circuit between the Park Brake Switch connector and the Instrument Cluster connector. Is the resistance above 5.0 ohms? Yes → Repair the Red Brake Warning Indicator Driver circuit between the Park Brake Switch and the Instrument Cluster for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Connect a jumper wire between cavity 1 and cavity 2. Turn the ignition on. Observe the Brake Warning Indicator. Did the Brake Warning Indicator illuminate? Yes → Replace the Brake Fluid Level Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Measure the resistance between ground and the Brake Fluid Level Switch Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Brake Fluid Level Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Disconnect the Instrument Cluster harness connector. Measure the resistance of the Red Brake Warning Indicator Driver circuit between the Brake Fluid Level Switch connector and the Instrument Cluster connector. Is the resistance below 5.0 ohms? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Red Brake Warning Indicator Driver circuit between the Brake Fluid Level Switch and the Instrument Cluster for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHARGING SYSTEM WARNING INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INTERMITTENT CONDITION
INDICATOR BULB
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Junction Block Fuse #11 is not open. If the fuse is open make sure to check for a short to ground.** **NOTE: Ensure that there is communication between the PCM, BCM, and the Instrument Cluster before proceeding with this test.** Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition to the Unlock position. Release the Trip Reset button when the Self Check begins. Observe the Charging System Warning Indicator during the Self Test. Did the Charging System Warning Indicator illuminate for approximately 4 seconds and then turn off? Yes → Go To 2 No → Go To 3	All
2	Using the DRBIII®, read DTC's. Are there any DTC's present? Yes → Refer to symptom list for problems related to the DTC. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove and inspect the Charging System Warning Indicator bulb and socket. Is the indicator bulb or socket defective? Yes → Replace the Indicator bulb or socket as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CRUISE ENGAGED INDICATOR INOPERATIVE

POSSIBLE CAUSES
NO CRUISE OPERATION
INDICATOR BULB
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Junction Block Fuse #11 is not open. If the fuse is open make sure to check for a short to ground.** **NOTE: Ensure that there is communication between the PCM, BCM, and the Instrument Cluster before proceeding with this test.** Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition to the Unlock position. Release the Trip Reset button when the Self Test begins. Observe the Cruise Indicator during the Self Test. Did the Cruise indicator illuminate for approximately 4 seconds and then turn off? Yes → Go To 2 No → Go To 3	All
2	Start the engine. Drive the vehicle. Activate the Cruise system. Does the Cruise system operate properly? Yes → Test Complete. No → Refer to Cruise diagnostics for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove and inspect the Cruise Engaged Indicator Lamp bulb and socket. Is the bulb or socket defective? Yes → Replace the Cruise Indicator bulb or socket as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

*ENGINE COOLANT TEMPERATURE GAUGE INOPERATIVE OR INACCURATE

POSSIBLE CAUSES
DTC PRESENT
ENGINE COOLANT TEMPERATURE BUS MESSAGE
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Using the DRBIII® read EMIC, PCM, and BCM DTC's. Are there any DTC's present? Yes → Refer to DRIVEABILITY information for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition to the Unlock position. Observe the Engine Coolant Temperature gauge during the Self Test. The gauge will position the indicator needle at the following calibration points: C, H, 1/2, C Did the Engine Coolant Temperature Gauge position the needle correctly? Yes → Go To 3 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition on. With the DRBIII®, read the Engine Coolant Temperature in the PCM, EMIC and the BCM. Does either the EMIC or BCM display a different Engine Coolant Temperature than the PCM? Yes → Refer to symptom list for problems related to inaccurate Engine Coolant Temperature reading and communications. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ENGINE COOLANT TEMPERATURE INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
ENGINE COOLANT TEMPERATURE WARNING INDICATOR LED
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that there is communication between the PCM, BCM, and the Instrument Cluster before proceeding with this test.** Perform the Instrument Cluster Self Test. Turn the ignition off. **NOTE: The Instrument Cluster will illuminate the Engine Coolant Temperature indicator at 124°C (255°F). The indicator will turn off at 121°C (250°F).** Press and hold the Trip Reset button. Turn the ignition to the Unlock position. Release the Trip Reset button when the Self Test begins. Observe the Engine Coolant Temperature Warning indicator during the Self Test. Did the Engine Coolant Temperature indicator illuminate for approximately 4 seconds and then turn of Yes → Go To 2 No → Go To 3	All
2	Turn the ignition on. Using the DRBIII® read DTC's. Are there any DTC's present? Yes → Refer to symptom list for problems related to DRIVEABILITY. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Remove the Engine Coolant Temperature Warning Indicator LED. Using a DVOM, select ″Diode Mode″ and connect the leads across the LED. **CAUTION: Ensure that the RED lead is on the ″+″ of the LED.** Did the Engine Coolant Temperature Warning Indicator LED illuminate? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Engine Coolant Temperature Warning Indicator LED in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*FUEL GAUGE NOT OPERATING PROPERLY

POSSIBLE CAUSES
INTERMITTENT CONDITION
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that there is communication between the PCM, BCM, and the Instrument Cluster before proceeding with this test.** Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip/Reset button. Turn the ignition to the Unlock position. Observe the Fuel Gauge during the Self Test. The Fuel Gauge should position the indicator needle at the following calibration points: E, F, 1/2, E Did the Fuel Gauge position the needle correctly? Yes → Go To 2 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Measure the resistance of the Fuel Level Sensor. The Fuel Level Sensor resistance must be within the following values: Full = Approximately 130 Ohms 3/4 = Approximately 340 Ohms 1/2 = Approximately 550 Ohms 1/4 = Approximately 760 Ohms Empty = Approximately 940 Ohms Does the Fuel Level Sensor resistance measure within specifications? Yes → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Fuel Level Sensor in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HIGH BEAM INDICATOR ALWAYS ON

POSSIBLE CAUSES
DIMMER SWITCH HIGH BEAM OUTPUT CIRCUIT SHORT TO VOLTAGE
JUNCTION BLOCK SHORT TO VOLTAGE
MULTI- FUNCTION SWITCH
BODY CONTROL MODULE
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® in Body Control Inputs/Outputs, read the Hi Beams state. Does the DRBIII® Inputs/Outputs, display On? Yes → Go To 2 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Multi- Function Switch harness connector. Turn the ignition on. With the DRBIII® in Body Control Inputs/Outputs, read the Hi Beams state. Does the DRBIII® display On? Yes → Go To 3 No → Replace the Multi- Function Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Multi- Function Switch harness connector. Disconnect the Junction Block C6 harness connector. Turn the ignition on. Measure the voltage between the Dimmer Switch High Beam Output circuit and ground. Is there any voltage present? Yes → Repair the Dimmer Switch High Beam Output circuit between the Multi- Function Switch and the Junction Block for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*HIGH BEAM INDICATOR ALWAYS ON — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Junction Block C6 harness connector. Turn the ignition on. Measure the voltage between the #3 Fuse in the Junction Block and ground. Is there any voltage present? Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HIGH BEAM INDICATOR INOPERATIVE

POSSIBLE CAUSES
INDICATOR BULB
DIMMER SWITCH HIGH BEAM OUTPUT CIRCUIT OPEN
BODY CONTROL MODULE
JUNCTION BLOCK
MULTI- FUNCTION SWITCH OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Junction Block Fuse #11 is not open. If the fuse is open make sure to check for a short to ground.** **NOTE: Ensure that the Exterior High Beam Headlamps operate properly before proceeding with this test.** Turn the ignition on. With the DRBIII® in MIC Actuators, actuate the Hi Beam Lamp. Did the High Beam Indicator illuminate? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition on. With the DRBIII® in Body Control Inputs/Outputs, read the Hi Beams state while actuating the High Beam Headlamps. Does the DRBIII® Inputs/Outputs display On? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Junction Block C6 harness connector. Actuate the High Beam Headlamps. Measure the voltage between the Dimmer Switch High Beam Output circuit and ground at the Junction Block C6 harness connector. Is the voltage above 10.5 volts? Yes → Go To 4 No → Go To 5	All

*HIGH BEAM INDICATOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect and isolate the Negative Battery cable. Disconnect the Junction Block C6 harness connector. Disconnect the BCM from the Junction Block. Using the Wiring Diagrams as a guide, measure the resistance of the Dimmer Switch High Beam Output circuit through the Junction Block. Is the resistance above 10 ohms? Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Junction Block C6 harness connector. Disconnect the Multi- Function Switch harness connector. Measure the resistance of the Dimmer Switch High Beam Output circuit. Is the resistance above 5.0 ohms? Yes → Repair the Dimmer Switch High Beam Output circuit between the Multi- Function Switch and the Junction Block for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Multi- Function Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Remove and inspect the High Beam Indicator bulb and socket. Is the bulb or socket defective? Yes → Replace the High Beam Indicator Bulb or socket in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW FUEL WARNING INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INTERMITTENT CONDITION
INDICATOR LED
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Junction Block Fuse #11 is not open. If the fuse is open make sure to check for a short to ground.** **NOTE: Ensure that there is communication between the PCM, BCM, and the Instrument Cluster before proceeding with this test.** Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip/Reset button. Turn the ignition to the Unlock position. During the Self Test all of the Indicators should illuminate for approximately 4 seconds. Observe the Low Fuel Warning Indicator during the Self Test. Did the Low Fuel Warning Indicator illuminate for approximately 4 seconds then turn off? Yes → Go To 2 No → Go To 3	All
2	Using the DRBIII® read DTC's. Is the DTC FUEL LEVEL SENDING UNIT INOP present? Yes → Refer to symptom list for diagnosis of the DTC. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Remove and test the Low Fuel Warning Indicator LED. Using a DVOM, select ″Diode Mode″ and connect the leads across the LED. **NOTE: Ensure that the RED lead is on the ″+″ of the LED.** Did the Low Fuel Warning Indicator LED illuminate? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Low Fuel Warning Indicator LED in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*MALFUNCTION INDICATOR LAMP NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INTERMITTENT CONDITION
INDICATOR BULB OR SOCKET
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that there is communication between the PCM, BCM, and the Instrument Cluster before proceeding with this test.** Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip/Reset button. Turn the ignition to the Unlock position. During the self test all Indicators should illuminate for approximately 4 seconds. Observe the Malfunction Indicator Lamp during the Self Test. Did the Malfunction Indicator Lamp Indicator illuminate for approximately 4 seconds then turn off? Yes → Go To 2 No → Go To 3	All
2	Using the DRBIII® read DTC's. Are there any DTC's present? Yes → Refer to symptom list for problems related to the DTC. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove and inspect the Malfunction Indicator Lamp bulb and socket. Is there a problem with the bulb or socket? Yes → Replace the Indicator bulb or socket as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*OIL PRESSURE INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
INTERMITTENT CONDITION
OIL PRESSURE INDICATOR CIRCUIT SHORT TO GROUND
OIL PRESSURE SWITCH ALWAYS CLOSED
OIL PRESSURE SWITCH ALWAYS OPEN
OIL PRESSURE WARNING LAMP INDICATOR BULB OR SOCKET
OIL PRESSURE INDICATOR CIRCUIT SHORT TO VOLTAGE
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
OIL PRESSURE INDICATOR CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the engine has normal operating oil pressure before proceeding with test. Refer to the Service Manual for specifications.** Without starting the engine, turn the ignition on. Does the Oil Pressure Indicator illuminate? Yes → Go To 2 No → Go To 4	All
2	Start the engine. Does the Oil Pressure Indicator turn off? Yes → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Disconnect the Oil Pressure Switch harness connector. Measure the resistance between ground and the Oil Pressure Switch circuit. Is the resistance below 5.0 ohms? Yes → Repair the Oil Pressure Indicator circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Oil Pressure Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

*OIL PRESSURE INDICATOR NOT OPERATING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
4	Remove and inspect the Oil Pressure Warning Indicator Lamp bulb and socket. Is there a problem with the bulb or socket? Yes → Replace the Indicator bulb or socket as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Disconnect the Oil Pressure Switch harness connector. Turn the ignition on. Measure the voltage between the Oil Pressure Indicator circuit and ground. Is there any voltage present? Yes → Repair the Oil Pressure Indicator circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit. Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Fused Ignition Switch Output circuit for an open or high resistance circuit. If the fuse is open make sure to check for a short to ground and repair as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Oil Pressure Switch harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the Oil Pressure Indicator circuit. Does the test light illuminate brightly? Yes → Go To 8 No → Repair the Oil Pressure Indicator circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the Oil Pressure Switch harness connector. Measure the resistance between the Oil Pressure Switch terminal pin and ground. **NOTE: With the engine not running the Oil Pressure Switch should be closed to ground.** Does the Oil Pressure Switch terminal pin have continuity to ground? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Oil Pressure Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PRND OR AUTOSTICK INDICATOR INACCURATE OR INOPERATIVE

POSSIBLE CAUSES
DTC PRESENT
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the correct Instrument Cluster is installed and is correctly configured for the vehicle.** **NOTE: Ensure that there is communication between the MIC, PCM, and the TCM before proceeding with this test.** **NOTE: Diagnose and repair any DTCs before proceeding with this test.** **NOTE: Ensure that the TCM passes the Shift Lever Test with the DRBIII® before proceeding with this test.** Turn the ignition on. With the DRBIII®, read DTCs. Does the DRBIII® display any MIC, PCM, or TCM DTCs? Yes → Refer to symptom list for problems related to DTC's. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the PRND / AutoStick VF display during the Self Test. Did any part of the VF display fail to illuminate? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*SEAT BELT INDICATOR ALWAYS ON

POSSIBLE CAUSES
SEAT BELT SWITCH
SEAT BELT SWITCH GROUND CIRCUIT OPEN
SEAT BELT SWITCH SENSE CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Seat Belt Switch harness connector. Connect a jumper wire between cavity 1 and cavity 2. **NOTE: For vehicles equipped with Seat Belt Pre- Tensioner, use the Wiring Diagrams as a guide to ensure proper terminal selection.** Turn the ignition on. Observe the Seat Belt Indicator. Did the Seat Belt Indicator illuminate for approximately 4 seconds and turn off? Yes → Replace the Seat Belt Buckle in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Seat Belt Switch harness connector. Measure the resistance between ground and the Seat Belt Switch Ground circuit. Is the resistance above 5.0 ohms? Yes → Repair the Seat Belt Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Seat Belt Switch harness connector. Disconnect the Instrument Cluster harness connector. Measure the resistance of the Seat Belt Switch Sense circuit between the Seat Belt Switch connector and the Instrument Cluster connector. Is the resistance above 5.0 ohms? Yes → Repair the Seat Belt Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*SEAT BELT INDICATOR INOPERATIVE

POSSIBLE CAUSES
SEAT BELT SWITCH
SEAT BELT SWITCH SENSE CIRCUIT SHORT TO GROUND
SEAT BELT INDICATOR LED
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Junction Block Fuse #11 is not open. If the fuse is open make sure to check for a short to ground.** **NOTE: Ensure that the Instrument Cluster is configured with the correct code.** Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip/Reset button. Turn the ignition to the Unlock position. Observe the Seat Belt Indicator during the Self Test. Did the Seat Belt indicator illuminate for approximately 4 seconds then turn off? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Disconnect the Seat Belt Switch harness connector. **NOTE: Performing this test on vehicles equipped with Pre- Tensioners will set a DTC in the ACM. Clear codes after repairs are complete.** Turn the ignition on. Observe the Seat Belt Indicator Did the Seat Belt indicator illuminate? Yes → Replace the Seat Belt Buckle in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Disconnect the Seat Belt Switch harness connector. Measure the resistance between ground and the Seat Belt Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Seat Belt Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

*SEAT BELT INDICATOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Remove and test the Seat Belt Indicator LED. Using a DVOM, select ″Diode Mode″ and connect the leads across the LED. **NOTE: Ensure that the RED lead is on the ″+″ of the LED.** Did the Seat Belt Indicator illuminate? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Seat Belt Indicator LED in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*SPEEDOMETER NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INTERMITTENT CONDITION
MISSING OR INCORRECT PINION FACTOR
VEHICLE SPEED MESSAGE
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Using the DRBIII® read EMIC, PCM, ABS and BCM DTC's. Are there any DTC's present? Yes → Refer to the symptom list for problems related to the DTC. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip/Reset button. Turn the ignition to the Unlock position. Observe the Speedometer during the Self Test. The Speedometer should position the indicator needle at the following calibration points: 0, 100, 75, 55, 20, 0 (MPH) Did the Speedometer needle position correctly? Yes → Go To 3 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRBIII®, verify that the pinion factor is correctly programmed. Is the pinion factor programmed correctly? Yes → Go To 4 No → Using the Diagnostic (Transmission, or Chassis)/Service Manual Information as a guide, program the correct Pinion Factor. Perform BODY VERIFICATION TEST - VER 1.	All

*SPEEDOMETER NOT OPERATING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition on. Drive the vehicle With the DRBIII® in Monitors, read the Vehicle Speed in the EMIC, BCM and the PCM. Does the EMIC or BCM Monitor display a different Vehicle Speed than the PCM Wheel Speed? Yes → Refer to symptom list for problems related to inaccurate Vehicle Speed and communications. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*TACHOMETER NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Using the DRBIII® read EMIC, PCM and BCM DTC's. Are there any DTC's present? Yes → Refer to symptom list for problems related to the DTC. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Perform the Instrument Cluster Self Test. Turn the ignition off. Press and hold the Trip/Reset button. Turn the ignition to the Unlock position. Observe the Tachometer during the Self Test. The Tachometer should position the indicator needle at the following calibration points: 0, 6000, 3000, 1000, 0 Did the Tachometer needle position correctly? Yes → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*VTSS INDICATOR INOPERATIVE

POSSIBLE CAUSES
BCM OR SKIM DTC PRESENT
VTSS INDICATOR DRIVER CIRCUIT OPEN
BODY CONTROL MODULE
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Verify the vehicle is equipped with VTSS/SKIM.** **NOTE: Ensure that the VTSS is enabled before proceeding with this test.** **NOTE: Observe the VTSS indicator during the Bulb Check. If the indicator does not illuminate, replace the Instrument Cluster.** Turn the ignition on. With the DRBIII®, read Body Control Module / SKIM DTCs. Does the DRBIII® display any DTCs? Yes → Refer to the VEHICLE THEFT / SECURITY category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the BCM C1 harness connector. Measure the voltage between the VTSS Indicator Driver circuit and ground. Is the voltage above 10.5 volts? Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Instrument Cluster Harness connector. Disconnect the BCM C1 harness connector. Measure the resistance of the VTSS Indicator Driver circuit. Is the resistance above 5.0 ohms? Yes → Repair the VTSS Indicator Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
COURTESY LAMP OUTPUT FAILURE

When Monitored and Set Condition:

COURTESY LAMP OUTPUT FAILURE

When Monitored: Any time the courtesy lamps should be on - door ajar, illuminated entry, or dimmer switch placed in dome lamp position.

Set Condition: BCM detects an over - voltage condition on its courtesy lamp output.

POSSIBLE CAUSES
INTERMITTENT CONDITION
SHORT TO BATTERY
SHORT TO GROUND
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, clear all BCM DTC's. Actuate the Courtesy Lamps. With the DRBIII®, read the DTC information. Does the DRBIII® read: Courtesy Lamp Output Failure? Yes → Go To 2 No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Junction Block harness connector. Turn on all overhead, map and rear rearing lamps by their own individual switches. This will disconnect each lamp from the Courtesy Lamp Driver Circuit. Did any lamp fail to light when it was turned on by it's own switch? Yes → Repair the short to Battery condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Junction Block Harness Connector from the front of the junction block. Remove the Body Control Module from the junction block. Measure the voltage of the Courtesy Lamps Driver circuit. Is there any voltage on the Courtesy Lamps Driver Circuit? Yes → Repair the short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DIMMING LEVEL SWITCH INPUT FAILURE

When Monitored and Set Condition:

DIMMING LEVEL SWITCH INPUT FAILURE

When Monitored: Continuously.

Set Condition: BCM detects an open or short circuit condition for 10 consecutive seconds on the dimming level switch input.

POSSIBLE CAUSES
INTERMITTENT CONDITION
OPEN CIRCUIT
SHORT TO GROUND
SHORT TO BATTERY
FAILED DIMMER SWITCH
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, clear all BCM DTC's. Actuate the Dimming Level Switch. With the DRBIII®, read the DTC information. Does the DRBIII® read: Dimming Level Switch Input Failure? Yes → Go To 2 No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Junction Block C11 Harness Connector from the front of the junction block. Cycle the ignition switch off than back on. Did the remaining courtesy lamps, door lamps come on? Yes → Go To 3 No → Repair the open circuit condition. Perform BODY VERIFICATION TEST - VER 1.	All

DIMMING LEVEL SWITCH INPUT FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Ensure the Junction Block Harness connector on the front of the junction block is connected before proceeding. Turn on all overhead, map and rear rearing lamps by their own individual switches. This will disconnect each lamp from the Courtesy Lamp Driver Circuit. Did any lamp fail to light when it was turned on by it's own switch? Yes → Repair the short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Ensure the Junction Block Harness connector on the front of the junction block is connected before proceeding. Turn on all overhead, map and rear rearing lamps by their own individual switches. This will disconnect each lamp from the Courtesy Lamp Driver Circuit. Did any lamp fail to light when it was turned on by it's own switch? Yes → Repair the short to battery condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Junction Block Harness Connector from the front of the junction block. Remove the Body Control Module from the junction block. Measure the voltage of the Courtesy Lamps Driver circuit. Is there any voltage on the Courtesy Lamps Driver Circuit? Yes → Replace the Dimmer Switch. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMP INOPERATIVE - ALL LAMPS

POSSIBLE CAUSES
JUNCTION BLOCK
OPEN FUSE
COURTESY LAMPS DRIVER CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Gain access to the junction block C10 Harness connector but do not disconnect. While back probing, measure the voltage of the Fused B+ circuit. Is the voltage above 10.0 volts? Yes → Go To 2 No → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1.	All
2	Check Junction Block Fuse 5 Is Fuse 5 open? Yes → Replace the open fuse. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Back probe a jumper wire from the Courtesy Lamps Driver circuit to the Junction Block C10 connector and ground. Do the courtesy lamps come on? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open Courtesy Lamp Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*I/P ILLUMINATION LAMPS NOT WORKING PROPERLY

POSSIBLE CAUSES
DEFECTIVE BULB OR SOCKET
PANEL DIMMING CIRCUIT OPEN
PANEL DIMMING GROUND CIRCUIT OPEN
BODY CONTROL MODULE
ILLUMINATED COMPONENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn on the Headlamps. Turn the Dimmer Switch to the maximum brightness setting. Observe all I/P illumination. What was observed? No I/P illumination. Go To 7 Some I/P illumination. Go To 2	All
2	Remove and inspect the I/P illumination bulbs and sockets of the affected component. Is there a problem with any bulb or socket? Yes → Replace the defective bulb or socket as needed in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off to the lock position. Disconnect the Body Control Module harness connector. Disconnect the affected component harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Panel Dimming circuit between the Body Control Module connector and the affected component harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Panel Dimming circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*I/P ILLUMINATION LAMPS NOT WORKING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off to the lock position. Disconnect the affected component harness connector. **Note: Check connectors - Clean/repair as necessary.** Using a 12-volt test light connected to 12-volts, check the Panel Dimming Ground circuit of the affected component. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Repair the Panel Dimming ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Ignition on, engine not running. Using a 12-volt test light connected to ground, back probe the affected component Dimming circuit at the BCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 6 No → Go To 7	All
6	If there are no possible causes remaining, view repair. Repair Replace the illuminated component. Perform BODY VERIFICATION TEST - VER 1.	All
7	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DECKLID RELEASE SOLENOID OUTPUT FAILURE

When Monitored and Set Condition:

DECKLID RELEASE SOLENOID OUTPUT FAILURE

When Monitored: During decklid release solenoid actuation.

Set Condition: The BCM detects an open or short on the decklid release solenoid driver circuit.

POSSIBLE CAUSES
GROUND CIRCUIT OPEN
DECKLID RELEASE SOLENOID DRIVER CIRCUIT SHORTED TO VOLTAGE
DECKLID RELEASE SOLENOID OPEN
WIRING HARNESS INTERMITTENT DEFECT
DECKLID RELEASE SOLENOID DRIVER CIRCUIT SHORTED TO GROUND
DECKLID RELEASE SOLENOID DRIVER CIRCUIT OPEN
BODY CONTROL MODULE - DECKLID RELEASE SOLENOID DRIVER CIRCUIT SHORT TO VOLTAGE
BODY CONTROL MODULE - DECKLID RELEASE SOLENOID DRIVER INOPERATIVE

TEST	ACTION	APPLICABILITY
1	With the DRBIII, erase DTC's. Press the decklid release switch several times. With the DRBIII, read DTC's. Did this DTC reset? Yes → Go To 2 No → Go To 10	All
2	Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Turn the ignition on. Using a 12-volt Test Light connected to ground, check the Decklid Release Solenoid Driver circuit. Is the test light illuminated? Yes → Go To 3 No → Go To 5	All

DECKLID RELEASE SOLENOID OUTPUT FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Disconnect the Body Control Module C4 connector. Turn the ignition on. Measure the voltage of the Decklid Release Solenoid Driver circuit in the Decklid Release Solenoid connector. Is there any voltage present? Yes → Repair the Decklid Release Solenoid Driver circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Connect a 12-volt Test Light between the Decklid Release Solenoid Driver ckt and the ground circuit (cavs 1 and 3). Press the decklid release switch several times and observe the test light. Did the test light illuminate when the switch was pressed? Yes → Replace the Decklid Release Solenoid. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Disconnect the Body Control Module C4 connector. Measure the resistance between ground and the Decklid Release Solenoid Driver circuit. Is the resistance below 5.0 ohms? Yes → Repair the Decklid Release Solenoid Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All

DECKLID RELEASE SOLENOID OUTPUT FAILURE — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Disconnect the Body Control Module C4 connector Measure the resistance of the Decklid Release Solenoid Driver circuit between the Decklid Release Solenoid/Ajar Switch connector and the BCM C4 connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the Decklid Release Solenoid Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
9	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
10	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
DECKLID RELEASE SWITCH FAILURE

When Monitored and Set Condition:

DECKLID RELEASE SWITCH FAILURE

When Monitored: Continuously.

Set Condition: The BCM detects the decklid release switch stuck in the depressed condition for more than 30 seconds.

POSSIBLE CAUSES
DECKLID RELEASE SWITCH SHORTED
DECKLID RELEASE SWITCH SENSE CIRCUIT SHORT TO GROUND
WIRING HARNESS INTERMITTENT DEFECT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII, erase DTC's. Cycle the ignition switch from off to on and wait at least 30 seconds. With the DRBIII, read DTC's. Did this DTC reset? Yes → Go To 2 No → Go To 5	All
2	Disconnect the Decklid Release Switch harness connector. With the DRBIII, erase DTC's. Cycle the ignition switch from off to on and wait at least 30 seconds. With the DRBIII, read DTC's. Did this DTC reset? Yes → Go To 3 No → Replace the Decklid Release Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Decklid Release Switch harness connector. Disconnect the BCM ″C2″ harness connector. Turn the ignition on. Measure the resistance between ground and the Decklid Release Switch Sense circuit. Is the resistance below 100.0 ohms? Yes → Repair the Decklid Release Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

DECKLID RELEASE SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module Module. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
DOOR LOCK SWITCH FAILURE

When Monitored and Set Condition:

DOOR LOCK SWITCH FAILURE

When Monitored: Continuously

Set Condition: When the BCM detects a signal on the Driver or Passenger Door Lock Switch for over 8 seconds this code will set. If the voltage is over 5.5 volts for over 8 seconds, both door lock switches will be inoperative until the offending input is corrected. This is an active code only.

POSSIBLE CAUSES
DRIVER DOOR LOCK SWITCH SHORTED
PASSENGER DOOR LOCK SWITCH SHORTED
DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
SYSTEM INTERMITTENT
BODY CONTROL MODULE - DOOR LOCK SWITCH SHORTED

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTC's. Operate both door lock switches to the lock and unlock positions several times. With the DRBIII®, read DTC's. Did this DTC reset? Yes → Go To 2 No → Go To 7	All
2	Disconnect the Driver Door Lock Switch harness connector. Turn the ignition on. With the DRBIII, enter BODY COMPUTER then SENSORS and observe the Dr Lock SW voltage Is there any voltage present? Yes → Go To 3 No → Replace the Driver Door Lock Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Passenger Door Lock Switch harness connector. Turn the ignition on. With the DRBIII, enter BODY COMPUTER then SENSORS and observe the Dr Lock SW voltage Is there any voltage present? Yes → Go To 4 No → Replace the Passenger Door Lock Switch. Perform BODY VERIFICATION TEST - VER 1.	All

DOOR LOCK SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the BCM ″C4″ harness connector. Disconnect the Driver Door Lock Switch connector. Turn the ignition on. Measure the voltage of the Driver Door Lock Switch Mux circuit. Is there any voltage present? Yes → Repair the Driver Door Lock Switch Mux circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the BCM ″C4″ harness connector. Disconnect the Passenger Door Lock Switch connector. Turn the ignition on. Measure the voltage of the Passenger Door Lock Switch Mux circuit. Is there any voltage present? Yes → Repair the Passenger Door Lock Switch Mux circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Check for either switch possibly sticking Were any problems found? Yes → Repair or replace as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
DRIVER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE

When Monitored and Set Condition:

DRIVER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE

When Monitored: Continuously

Set Condition: If the BCM detect a signal on the Driver Cylinder Lock Switch Mux circuit for over 10 seconds this code will set and will ignore the offending input until it is corrected.

POSSIBLE CAUSES
BINDING DRIVER CYLINDER LOCK SWITCH
DRIVER CYLINDER LOCK SWITCH SHORTED TO VOLTAGE
DRIVER CYLINDER LOCK SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
WIRING HARNESS INTERMITTENT DEFECT
BODY CONTROL MODULE - DRIVER CYLINDER LOCK SWITCH FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTC's. Insert the key in the Driver Cylinder Lock Switch and rotate the key to the lock and unlock positions several times. With the DRBIII®, read DTC's. Did this DTC reset? Yes → Go To 2 No → Go To 6	All
2	Insert the key in the Driver Cylinder Lock Switch and rotate the key to the lock and unlock positions. Does the key bind in any position? Yes → Repair or replace the Driver Cylinder Lock Switch as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Driver Cylinder Lock Switch harness connector. Turn the ignition on. With the DRBIII, enter ″Body Computer″ then ″Sensors″ and observe the Dr Door Disarm SW voltage Is there any voltage present? Yes → Go To 4 No → Replace the Driver Cylinder Lock Switch. Perform BODY VERIFICATION TEST - VER 1.	All

DRIVER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Driver Cylinder Lock Switch harness connector. Disconnect the BCM ″C4″ harness connector. Turn the ignition on. Measure the voltage of the Driver Cylinder Lock Switch Mux circuit. Is there any voltage present? Yes → Repair the Driver Cylinder Lock Switch Mux circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. **NOTE: Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.** Were any problems found? Yes → Repair wiring harness or connectors as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

PASSENGER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE

When Monitored and Set Condition:

PASSENGER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE

When Monitored: Continuously

Set Condition: If the BCM detects a signal on the Passenger Cylinder Lock Switch Mux circuit for over 10 seconds this code will set and will ignore the offending input until it is corrected.

POSSIBLE CAUSES
PASSENGER CYLINDER LOCK SWITCH BINDING
PASSENGER CYLINDER LOCK SWITCH SHORTED TO VOLTAGE
PASSENGER CYLINDER LOCK SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
WIRING HARNESS INTERMITTENT DEFECT
BODY CONTROL MODULE - PASSENGER CYLINDER LOCK SWITCH FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTC's. Insert the key in the Passenger Cylinder Lock Switch and rotate the key to the lock and unlock positions several times. With the DRBIII®, read DTC's. Did this DTC reset? Yes → Go To 2 No → Go To 6	All
2	Insert the key in the Passenger Cylinder Lock Switch and rotate the key to the lock and unlock positions. Does the key bind in any position? Yes → Repair or replace the Passenger Cylinder Lock Switch as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Passenger Cylinder Lock Switch harness connector. Turn the ignition on. With the DRBIII, enter ″Body Computer″ then ″Sensors″ and observe the Pas Door Disarm SW voltage Is there any voltage present? Yes → Go To 4 No → Replace the Passenger Cylinder Lock Switch. Perform BODY VERIFICATION TEST - VER 1.	All

PASSENGER DOOR CENTRAL LOCK (ARM)/UNLOCK (DISARM) SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Passenger Cylinder Lock Switch harness connector. Disconnect the BCM ″C4″ harness connector. Turn the ignition on. Measure the voltage of the Passenger Cylinder Lock Switch Mux circuit. Is there any voltage present? Yes → Repair the Passenger Cylinder Lock Switch Mux circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. **NOTE: Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.** Were any problems found? Yes → Repair wiring harness or connectors as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
RKE FOB BATTERY LOW

When Monitored and Set Condition:

RKE FOB BATTERY LOW

When Monitored: Anytime an RKE message is received from the transmitter.

Set Condition: RKE receiver detects an RKE FOB battery low signal (less than 3 volts) for 5 consecutive button presses.

POSSIBLE CAUSES
BATTERIES LOW
TRANSMITTER - LOW VOLTAGE OUTPUT

TEST	ACTION	APPLICABILITY
1	To determine which transmitter set the code, press any button on each transmitter. If a chime in the BCM is heard when a button is pressed, that is the problem transmitter. Test the voltage of each battery in the problem transmitter.. Is the voltage at or above 3.0 in each battery? Yes → Replace the RKE Transmitter. Perform BODY VERIFICATION TEST - VER 1. No → Replace the batteries. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
RKE PROGRAM MODE ENTERED WITHOUT PROGRAM REQUEST

When Monitored and Set Condition:

RKE PROGRAM MODE ENTERED WITHOUT PROGRAM REQUEST

When Monitored: Continuously.

Set Condition: The BCM receives an indication from the RKE module that it has entered program mode without the BCM requesting so.

POSSIBLE CAUSES
REMOTE KEYLESS ENTRY MODULE
RKE PROGRAM MODE ENTERED WITHOUT PROGRAM REQUEST

TEST	ACTION	APPLICABILITY
1	**Note: This DTC will only set if the BCM receives an indication from the RKE module that it has entered program mode without the BCM requesting so.** Replace the Remote Keyless Entry Module and program a transmitter.. With the DRBIII, clear DTCs. Operate the Door Locks several times with the RKE transmitter. With the DRBIII®, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → If the replaced module was a test unit only, replace the RKE module. Program all transmitters used with this vehicle. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
RKE UNABLE TO ENTER PROGRAM MODE

When Monitored and Set Condition:

RKE UNABLE TO ENTER PROGRAM MODE

When Monitored: While attempting to program RKE.

Set Condition: Lack of response from the RKE module while attempting to put it in program mode.

POSSIBLE CAUSES
REMOTE KEYLESS ENTRY MODULE
RKE UNABLE TO ENTER PROGRAM MODE

TEST	ACTION	APPLICABILITY
1	**Note: This DTC will only set when attempting to enter the program RKE mode.** Replace the Remote Keyless Entry Module. With the DRB, Clear DTC's With the DRB, attempt to enter the RKE program mode. With the DRB, check DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → If the replaced module was a test unit only, replace the RKE module. Program all transmitters used with this vehicle. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL DOORS EXCEPT DRIVER FAILING TO UNLOCK FROM ANY SWITCH

POSSIBLE CAUSES
DOOR UNLOCK RELAY OUTPUT CIRCUIT SHORT TO GROUND
BODY CONTROL MODULE - UNLOCK RELAY

TEST	ACTION	APPLICABILITY
1	Disconnect the Body Control Module C4 connector. Measure the resistance between ground and the any Unlock Relay Output circuits in the BCM C4 connector.. Is the resistance below 1000.0 ohms (should be infinite)? Yes → Repair the Door Unlock Relay Output circuits as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	If there are no possible causes remaining, view repair Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL DOORS FAILING TO LOCK AND UNLOCK FROM ANY SWITCH

POSSIBLE CAUSES
JUNCTION BLOCK - FUSED B(+) OPEN
OPEN FUSE #9
OBSERVE THE DOOR LOCK SWITCH VOLTAGE STATUS
OBSERVE THE DOOR LOCK SWITCH VOLTAGE STATUS WITH SWITCH IN THE LOCK POSITION
FUSED B+ CKT OPEN
LOCK OR UNLOCK RELAY OUTPUT OPEN
DRIVER DOOR SWITCH MUX CIRCUIT SHORT TO GROUND
DRIVER DOOR SWITCH MUX CIRCUITSHORT TO GROUND
PASSENGER DOOR LOCK SWITCH SHORT TO GROUND
GROUND CIRCUIT OPEN
PASSENAGER DOOR SWITCH MUX CIRCUITSHORT TO GROUND
BODY CONTROL MODULE - LOCK RELAY CIRCUIT OPEN
BODY CONTROL MODULE- CONTROL SHORTED

TEST	ACTION	APPLICABILITY
1	Lower the drivers window. Remove the ignition key. Unlock all doors. With the DRBIII®, actuate the Door Lock Relay. Do the doors lock during the actuation test? Yes → Go To 2 No → Go To 10	All
2	With the DRBIII, observe the Door Lock Switch Voltage. Is the voltage above 0.2 volts? Yes → Refer to symptom DOOR LOCK SWITCH FAILURE in the POWER DOOR LOCK/RKE category. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII, observe the Door Lock Switch voltage Press and hold the Driver Door Lock Switch in the lock position and observe the DRB. Is the voltage above 2.2 volts with the switch pressed in the lock position? Yes → Replace the Body Control Module - Control open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*ALL DOORS FAILING TO LOCK AND UNLOCK FROM ANY SWITCH — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Driver Door Lock Switch connector. Measure the voltage of the Fused B+ circuit. Is the voltage above 10.0 volts? Yes → Go To 5 No → Repair the open Fused B+ circuit. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Driver Door Lock Switch connector. Disconnect the BCM ″C4″ harness connector. Measure the resistance of the Driver Door Switch MUX circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Driver Door Switch MUX circuit to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Ensure the Driver Door Lock Switch is connected before proceeding Disconnect the BCM ″C4″ harness connector. Measure the resistance of the Driver Door Switch MUX circuit in the BCM C4 connector to ground. Is the resistance below 1000.0 ohms? Yes → Replace the Driver Door Lock Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off. Ensure the Passenger Door Lock Switch is connected before proceeding Disconnect the BCM ″C4″ harness connector. Measure the resistance of the Passenger Door Switch MUX circuit in the BCM C4 connector to ground. Is the resistance below 1000.0 ohms? Yes → Replace the Passenger Door Lock Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the Passenger Door Lock Switch connector. Disconnect the BCM ″C4″ harness connector. Measure the resistance of the Passenger Door Switch MUX circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Passenger Door Switch MUX circuit to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All
9	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

*ALL DOORS FAILING TO LOCK AND UNLOCK FROM ANY SWITCH — Continued

TEST	ACTION	APPLICABILITY
10	Test both sides of fuse #9 for battery voltage. Is the fuse or circuit open? Yes → Replace the fuse or repair the open circuit as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	Disconnect the Body Control Module C4 connector. Connect a jumper wire from the ground to the Passenger Unlock Relay Output circuit in the C4 connector. Momentarily connect the jumper wire from a fused B(+) supply to the Passenger Lock Output circuit in the C4 connector and observe the door locks. Reverse the jumper wires to drive the motor in the unlock position. Did the door lock and unlock? Yes → Using the wiring diagram/schmatic as a guide, repair the open Lock or Unlock Relay Output circuits as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Go To 12	All
12	Turn the ignition off. Remove the Body Control Module from the Junction Block. Using a 12-volt test light connected to 12-volts, check the Ground circuit. Does the test light illuminate brightly? Yes → Go To 13 No → Repair the open Ground circuit through the junction block. Perform BODY VERIFICATION TEST - VER 1.	All
13	Turn the ignition off. Remove the Body Control Module from the Junction Block. Measure the voltage between the Fused B(+) circuit and ground. Is the voltage above 10.0 volts? Yes → Go To 14 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
14	If there are no possible causes remaining, view repair Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

*ALL DOORS FAILING TO LOCK AND UNLOCK FROM ONE SWITCH

POSSIBLE CAUSES
FUSED B(+) CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
DOOR CYLINDER LOCK SWITCH MUX CIRCUIT SHORT TO GROUND
DOOR SWITCH MUX CIRCUIT SHORT TO GROUND
DOOR CYLINDER LOCK SWITCH MUX CIRCUIT OPEN
DOOR SWITCH MUX CIRCUIT OPEN
POWER DOOR LOCK SWITCH OPEN
DOOR CYLINDER LOCK SWITCH OPEN
BODY CONTROL MODULE - DOOR CYLINDER LOCK SWITCH SENSE OPEN
BODY CONTROL MODULE - DOOR LOCK SWITCH SENSE OPEN

TEST	ACTION	APPLICABILITY
1	Operate the door locks from the door lock switches and the door cylinder lock switches (if equipped). Is the problem with a Door Cylinder Lock Switch (VTSS)? Yes → Go To 2 No → Go To 7	All
2	Disconnect the inoperative Door Cylinder Lock Switch connector. Measure the voltage between the Fused B(+) circuit and ground. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the Fused B(+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the inoperative Door Cylinder Lock Switch connector. Disconnect the BCM C4 connector. Measure the resistance between ground and the Cylinder Lock Switch Mux circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Door Cylinder Lock Switch Mux circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*ALL DOORS FAILING TO LOCK AND UNLOCK FROM ONE SWITCH — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the inoperative Door Cylinder Lock Switch connector. Disconnect the BCM C4 connector. Measure the resistance of the Cylinder Lock Switch Mux circuit between the Switch connector and the BCM C4 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Door Cylinder Lock Switch Mux circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Disconnect the inoperative Door Cylinder Lock Switch connector. Connect a jumper wire between the appropriate Cylinder Lock Switch Mux circuit and Fused B(+). With the DRBIII® in Sensors, read the appropriate Door Arm/Disarm Switch voltage. Is the voltage above 9.0 volts? Yes → Replace the appropriate Door Cylinder Lock Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
7	Disconnect the inoperative Door Lock Switch connector. Measure the voltage between the Fused B(+) circuit and ground. Is the voltage above 10.0 volts? Yes → Go To 8 No → Repair the Fused B(+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
8	Disconnect the inoperative Door Lock Switch connector. Disconnect the BCM C4 connector. Measure the resistance between ground and the Door Switch Mux circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Door Switch Mux circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All
9	Disconnect the inoperative Door Lock Switch connector. Disconnect the Body Control Module C4 connector. Measure the resistance of the Door Switch Mux circuit between the Door Lock Switch connector and the BCM C4 connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the Door Switch Mux circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*ALL DOORS FAILING TO LOCK AND UNLOCK FROM ONE SWITCH — Continued

TEST	ACTION	APPLICABILITY
10	Disconnect the inoperative Door Lock Switch connector. Connect a jumper wire between the Door Switch Mux circuit and Fused B(+). With the DRBIII®, read the Door Lock Sw Volts status. Is the voltage above 9.0 volts? Yes → Replace the Power Door Lock Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL DOORS FAILING TO LOCK FROM ANY SWITCH

POSSIBLE CAUSES
LOCK RELAY OUTPUT CIRCUIT SHORT TO GROUND
BODY CONTROL MODULE - LOCK RELAY OPEN

TEST	ACTION	APPLICABILITY
1	Disconnect the Body Control Module C4 connector. Measure the resistance between ground and the any Lock Relay Output circuits in the BCM C4 connector.. Is the resistance below 1000.0 ohms (should be infinite)? Yes → Repair the Lock Relay Output circuits as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	If there are no possible causes remaining, view repair Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL DOORS FAILING TO LOCK FROM ONE SWITCH

POSSIBLE CAUSES
DOOR LOCK SWITCH OR DOOR CYLINDER LOCK SWITCH OPERATION

TEST	ACTION	APPLICABILITY
1	Lower the driver door window. Operate the power door lock switch or the door cylinder lock switch in the lock position. Is a Power Door Lock Switch or a Door Cylinder Lock Switch inoperative in the lock position? Yes → Replace the Power Door Lock Switch or Door Cylinder Lock Switch. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*ALL DOORS FAILING TO UNLOCK FROM ONE SWITCH

POSSIBLE CAUSES
DOOR LOCK SWITCH OR DOOR CYLINDER LOCK SWITCH OPERATION

TEST	ACTION	APPLICABILITY
1	Operate the power door lock switch or the door cylinder lock switch in the unlock position. Is a Power Door Lock Switch or a Door Cylinder Lock Switch inoperative in the unlock position? Yes → Replace the Power Door Lock Switch or Door Cylinder Lock Switch. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*AUTOMATIC (ROLLING) DOOR LOCKS INOPERATIVE

POSSIBLE CAUSES
CHECK THE DOOR AJAR SWITCH STATUS
WITH THE DRB CHECK FOR PCM DTC'S
WITH THE DRB ENABLE AUTO DOOR LOCKS
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Ensure all doors are closed. With the DRBIII, enter ″Body Computer″ then ″Input/Output″ and observe all of the Door Ajar states. Does the DRBIII display CLOSED for any door ajar state? Yes → Refer to symptom for the appropriate DOOR AJAR CIRCUIT SHORTED in the DOOR AJAR category. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII read ″Engine″ DTC's. Does the DRBIII display any TPS or VSS related DTC's? Yes → Refer to symptom list for problems related to DRIVEABILITY. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII, enter ″Body Computer″ then ″Miscellaneous″ and observe the Rolling Door Lock status. Does the DRBIII display ROLLING DOOR LOCKS: ENABLED Yes → Go To 4 No → With the DRBIII, enable the Auto Door Locks. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace and program the Body Control Module Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DECKLID RELEASE INOPERATIVE

POSSIBLE CAUSES
CHECK DTC'S
DECKLID RELEASE SWITCH GROUND CIRCUIT OPEN
GROUND CIRCUIT OPEN
DECKLID RELEASE SOLENOID OPEN
DECKLID RELEASE SWITCH OPEN
DECKLID RELEASE SWITCH SENSE WIRE OPEN
DECKLID RELEASE SOLENOID DRIVER WIRE OPEN
BODY CONTROL MODULE
BODY CONTROL MODULE - DECKLID RELEASE SWITCH SENSE OPEN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read DTCs. Does the DRBIII® display either DECKLID RELEASE DTC'? Yes → Refer to symptom DECKLID RELEASE DTC's in the POWER DOOR LOCK/RKE category. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition on. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Connect a 12-volt Test Light between the Decklid Release Solenoid Driver circuit and the Ground circuit. Have someone press the decklid release switch while you observe the test light. Did the test light illuminate when the switch was pressed? Yes → Replace the Decklid Release Solenoid. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Decklid Release Switch harness connector. Measure the voltage between Decklid Release Switch Sense circuit and ground. Is the voltage above 10.0 volts? Yes → Go To 5 No → Go To 9	All

*DECKLID RELEASE INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Disconnect the Decklid Release Switch harness connector. Measure the resistance between ground and the Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	Ensure the Decklid Release Solenoid/Ajar Switch harness is connected before proceeding. Disconnect the Decklid Release Switch harness connector. Momentarily connect a jumper wire between the Ground circuit and the Decklid Release Switch Sense circuit in the Decklid Release Switch harness connector and listen for the solenoid to operate. Did the solenoid release operate? Yes → Replace the Decklid Release Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off. Disconnect the Decklid Release Solenoid/Ajar Switch harness connector. Disconnect the Body Control Module C4 connector. Measure the resistance of the Decklid Release Solenoid Driver wire between the Decklid Release Solenoid/Ajar Switch connector and the Body Control Module C4 connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the Decklid Release Solenoid Driver wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Disconnect the Decklid Release Switch harness connector. Disconnect the BCM ″C2″ harness connector. Measure the resistance of the Decklid Release Switch Sense wire between the BCM ″C2″ connector and the Decklid Release Switch connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Decklid Release Switch Sense wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DOOR LOCK INHIBIT INOPERATIVE

POSSIBLE CAUSES
CHECK THE DRIVER DOOR AJAR SWITCH STATUS
OBSERVE THE KEY-IN IGNITION SWITCH STATUS
IGNITION SWITCH OPEN
KEY-IN IGNITION SWITCH GROUND CIRCUIT OPEN
KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN
BCM - INCORRECT KEY-IN IGNITION SWITCH STATUS

TEST	ACTION	APPLICABILITY
1	Open the Driver's front door. With the DRBIII, enter ″Body Computer″ then ″Input/Output″ and observe the Driver Door Ajar status. Does the DRBIII display DRV DR AJAR SW: CLOSED? Yes → Go To 2 No → Refer to symptom DRIVER DOOR AJAR OPEN CIRCUIT in the DOOR AJAR category. Perform BODY VERIFICATION TEST - VER 1.	All
2	**NOTE: Ensure that the Key is still in the Ignition Switch.** With the DRBIII, enter ″Body Computer″ then ″Input/Output″ and read the Key-In Ignition Switch status. Does the DRBIII display: KEY-IN IGN SW: CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Ignition Switch C3 connector. Connect a jumper between the Key-In Ignition Switch Sense circuit and Ground circuit. With the DRBIII, enter ″Body Computer″ then ″Input/Output″ and observe the Key-In Ignition Switch status. Does the DRBIII display KEY-IN IGN: CLOSED? Yes → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*DOOR LOCK INHIBIT INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Ignition Switch C3 connector. Turn all lights off. Measure the resistance between ground and the Ground circuit in the Ignition Switch C3 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Ignition Switch C3 connector. Disconnect the Body Control Module ″C1″ harness connector. Measure the resistance of the Key-In Ignition Switch Sense circuit between the ignition switch connector and the BCM ″C2″ connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Key-In Ignition Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR FAILS TO LOCK FROM ANY SWITCH

POSSIBLE CAUSES
DRIVER LOCK RELAY OUTPUT SHORT TO GROUND
BODY CONTROL MODULE - DRIVER UNLOCK RELAY GROUND OPEN

TEST	ACTION	APPLICABILITY
1	Disconnect the Body Control Module C4 connector. Measure the resistance between ground and the Driver Lock Relay Output circuit. Is the resistance below 100.0 ohms? Yes → Repair the Driver Lock Relay Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module - Driver Unlock Relay Ground open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR FAILS TO UNLOCK FROM ANY SWITCH

POSSIBLE CAUSES
DRIVER DOOR UNLOCK RELAY OUTPUT CKT SHORT TO GROUND
BODY CONTROL MODULE - DRIVER DOOR UNLOCK RELAY DRIVER OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Body Control Module C4 connector. Measure the resistance between ground and the Driver Unlock Relay Output circuit in the Body Control Module C4 connector Is the resistance below 100.0 ohm? No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. Yes → Repair the Driver Unlock Relay Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ONE DOOR FAILS TO LOCK AND UNLOCK FROM ANY SWITCH

POSSIBLE CAUSES
DOOR LOCK MOTOR - OPEN
DRIVER LOCK RELAY OUTPUT CIRCUIT OPEN
DRIVER DOOR LOCK MOTOR - OPEN
DRIVER UNLOCK RELAY OUTPUT CIRCUIT OPEN
LOCK RELAY OUTPUT CIRCUIT OPEN
UNLOCK RELAY OUTPUT CIRCUIT OPEN
BODY CONTROL MODULE DRIVER DOOR UNLOCK RELAY OPEN

TEST	ACTION	APPLICABILITY
1	Operate the door locks to determine which door lock is not operating properly. Is there a problem with the Driver Door Lock? Yes → Go To 2 No → Go To 6	All
2	**NOTE: This test is for a motor that is completely inoperative. If the motor either locks OR unlocks refer to symptom list for problems related to DRIVER DOOR FAILING TO-.** Disconnect the Driver Door Lock Motor/Ajar Switch connector. Connect a 12-volt Test Light between the Driver Unlock Relay Output and the Driver Lock Relay Output circuits in the door lock motor connector. Press the Door Lock Switch in the Lock and Unlock positions and observe the test light. Does the Test Light flash on and off as the switch is pressed? Yes → Replace the Driver Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Driver Door Lock Motor/Ajar Switch connector. Disconnect the Body Control Module C4 connector. Measure the resistance of the Driver Lock Relay Output circuit between the BCM C4 connector and the Driver Door Lock Motor connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Lock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*ONE DOOR FAILS TO LOCK AND UNLOCK FROM ANY SWITCH — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the Driver Door Lock Motor/Ajar Switch connector. Disconnect the Body Control Module C4 connector. Measure the resistance of the Driver Unlock Relay Output circuit between the BCM C4 connector and the Driver Door Lock Motor connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Driver Unlock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module - Driver Door Unlock Relay open. Perform BODY VERIFICATION TEST - VER 1.	All
6	Disconnect the Door Lock Motor/Ajar Switch connector. Connect a 12-volt Test Light between the Unlock Relay Output and the Lock Relay Output circuits in the door lock motor connector. Press the Door Lock Switch in the Lock and Unlock positions and observe the test light. Does the Test Light flash on and off as the switch is pressed? Yes → Replace the Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Disconnect the appropriate Door Lock Motor/Ajar Switch connector. Using a 12-volt test light connected to ground, check the Lock Relay Output circuit. With the DRBIII®, actuate the Door Lock Relay and observe the Test Light. Did the Test Light flash as the relay was actuated? Yes → Go To 8 No → Repair the Lock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
8	Disconnect the appropriate Door Lock Motor/Ajar Switch connector. Using a 12-volt test light connected to ground, check the Unlock Relay Output circuit. With the DRBIII®, actuate the Door Unlock Relay and observe the Test Light. Did the Test Light flash as the relay was actuated? Yes → Test Complete. No → Repair the Unlock Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*REMOTE KEYLESS ENTRY PROBLEM

POSSIBLE CAUSES
TESTING THE REMOTE KEYLESS ENTRY MODULE
REPLACE TRANSMITTER

TEST	ACTION	APPLICABILITY
1	Secure a known good transmitter from another JR or LH vehicle. With the DRBIII, enter BODY, BODY COMPUTER, MISCELLANEOUS then PROGRAM RKE and follow the instructions to program the substitute transmitter. **NOTE: If the RKE module will not go into programming mode, replace the RKE module and continue testing.** With the DRBIII, enter BODY, BODY COMPUTER, MISCELLANEOUS then RKE FOB TEST and follow the instructions on the DRB. Did the substitute RKE Transmitter respond correctly? No → Replace the Remote Keyless Entry (RKE) Module and reprogram all vehicle transmitters following the instructions on the DRBIII. Perform BODY VERIFICATION TEST - VER 1. Yes → Replace the RKE transmitter and reprogram all others used with this vehicle.. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RKE HORN CHIRP INOPERATIVE

POSSIBLE CAUSES
CHECK THE HORN OPERATION
CHECK THE RKE HORN CHIRP STATUS
BODY CONTROL MODULE - HORN RELAY CONTROL OPEN

TEST	ACTION	APPLICABILITY
1	Press the horn button on the steering wheel. Does the horn sound? Yes → Go To 2 No → Refer to symptom HORNS FAIL TO SOUND in the VEHICLE THEFT SECURITY SYSTEM category. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII, enter ″Body Computer″, ″Miscellaneous″ then ″RKE Horn Chirp″ and observe the horn chirp status. Does the DRBIII display HORN CHIRP: DISABLED? Yes → With the DRBIII, enable the Horn Chirp. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
POWER TOP SWITCH OPEN OR SHORTED TO BATTERY

When Monitored and Set Condition:

POWER TOP SWITCH OPEN OR SHORTED TO BATTERY

When Monitored: Whenever the ignition is on.

Set Condition: Normal power top switch voltage is approximately 1.0 to 11.5 volts. When the BCM senses voltage above this threshold for over 10 seconds, this code will set.

POSSIBLE CAUSES
DTC PRESENT
CONVERTIBLE TOP SWITCH GROUND OPEN
CONVERTIBLE TOP SWITCH MUX WIRE OPEN
CONVERTIBLE TOP SWITCH MUX WIRE SHORT TO BATTERY
CONVERTIBLE TOP SWITCH OPEN
CONVERTIBLE TOP SWITCH SHORT TO BATTERY
BODY CONTROL MODULE - CONVERTIBLE TOP SWITCH MUX OPEN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Turn the ignition on. Operate the power top in all positions including the 4 window drop position. With the DRBIII®, read DTCs. Does the DRBIII® display POWER TOP SWITCH OPEN OR SHORTED TO BATTERY? Yes → Go To 2 No → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for a possible intermittent open or short to battery. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Body Control Module C4 connector. Measure the voltage of the Convertible Top Switch Mux circuit to ground. Is there any voltage present? Yes → Go To 3 No → Go To 4	All

POWER TOP SWITCH OPEN OR SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Body Control Module C4 connector. Disconnect the Power Top Switch connector. Measure the voltage of the Convertible Top Switch Mux circuit to ground. Is there any voltage present? Yes → Repair the Convertible Top Switch Mux wire for a short to battery. Perform BODY VERIFICATION TEST - VER 1. No → Replace Convertible Top Switch. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Body Control Module C4 connector. Measure the resistance between ground and the Convertible Top Switch Mux circuit. Is the resistance between 4500.0 and 4900,0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Disconnect the Power Top Switch connector. Using a 12-volt test light connected to 12-volts, check the Ground circuit in the Power Top Switch connector. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	Disconnect the Body Control Module C4 connector. Disconnect the Power Top Switch connector. Measure the resistance of the Convertible Top Switch Mux circuit from the BCM C4 connector to the Power Top Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Convertible Top Switch Mux wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	If there are no possible causes remaining, view repair. Repair Replace the Convertible Top Switch. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
POWER TOP SWITCH SHORTED TO GROUND

When Monitored and Set Condition:

POWER TOP SWITCH SHORTED TO GROUND

When Monitored: Whenever the ignition is on.

Set Condition: Normal power top switch voltage is approximately 1.0 to 11.5 volts. When the BCM senses voltage under 1.0 volts for over 10 seconds, this code will set.

POSSIBLE CAUSES
DTC PRESENT
POWER TOP SWITCH SHORTED TO GROUND
CONVERTIBLE TOP SWITCH MUX WIRE SHORT TO GROUND
BODY CONTROL MODULE - CONVERTIBLE TOP SWITCH MUX SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Turn the ignition on. Operate the power top in all positions including the 4 window drop position. With the DRBIII®, read DTCs. Does the DRBIII® display POWER TOP SWITCH SHORTED TO GROUND? Yes → Go To 2 No → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for a possible intermittent short to ground. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Power Top Switch connector. With the DRBIII®, erase DTCs. Cycle the ignition switch from OFF to ON. With the DRBIII®, read DTCs. Does the DRBIII® display POWER TOP SWITCH SHORTED TO GROUND? Yes → Go To 3 No → Replace the Power Top Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Body Control Module C4 connector. Disconnect the Power Top Switch connector. Measure the resistance between ground and the Convertible Top Switch Mux circuit. Is the resistance below 100.0 ohms? Yes → Repair the Convertible Top Switch Mux wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

POWER TOP SWITCH SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
POWER TOP SWITCH STUCK

When Monitored and Set Condition:

POWER TOP SWITCH STUCK

When Monitored: Whenever the ignition is on.

Set Condition: Normal operation of this switch consists of pressing it for only a few seconds. If the BCM detects the switch stuck in a depressed condition for more than 28 seconds, this code will set and the BCM will ignore the input until the condition is corrected.

POSSIBLE CAUSES
DTC PRESENT
POWER TOP SWITCH STUCK
CONVERTIBLE TOP SWITCH MUX WIRE SHORT TO GROUND
BODY CONTROL MODULE - CONVERTIBLE TOP SWITCH MUX

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Turn the ignition on. Operate the power top in all positions including the 4 window drop position. With the DRBIII®, read DTCs. Does the DRBIII® display POWER TOP SWITCH STUCK? Yes → Go To 2 No → Check the switch for a possible sticking condition. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for a possible intermittent short to ground. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Power Top Switch connector. With the DRBIII®, erase DTCs. Cycle the ignition switch from OFF to ON. Wait one minute. With the DRBIII®, read DTCs. Does the DRBIII® display POWER TOP SWITCH STUCK? Yes → Go To 3 No → Replace the Power Top Switch. Perform BODY VERIFICATION TEST - VER 1.	All

POWER TOP SWITCH STUCK — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Body Control Module C4 connector. Disconnect the Power Top Switch connector. Measure the resistance between ground and the Convertible Top Switch Mux circuit. Is the resistance below 100.0 ohms? Yes → Repair the Convertible Top Switch Mux wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*FOUR WINDOW DROP INOPERATIVE

POSSIBLE CAUSES
DTC PRESENT
CONVERTIBLE TOP SWITCH
FUSED IGNITION SWITCH OUTPUT OPEN
WINDOW DOWN RELAY CONTROL OPEN
WINDOW DROP RELAY ASSEMBLY OPEN
BODY CONTROL MODULE - WINDOW DOWN RELAY CONTROL OPEN

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the power windows are operating properly from the master switch before proceeding.** Turn the ignition on. With the DRBIII®, read DTCs. Does the DRBIII® display any POWER TOP SWITCH ----DTC's? No → Go To 2 Yes → Refer to symptom POWER TOP SWITCH --- in the POWER TOP category. Perform BODY VERIFICATION TEST - VER 1.	All
2	Prepare the vehicle for the top to operate. With the DRBIII®, read the CONVERT TOP SW voltage Press the Top Switch to the second detent and observe the voltage. Is the voltage between 1.6 and 2.2 volts when the switch is pressed? Yes → Go To 3 No → Replace the Power Top Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Window Drop Relay Assembly connector. Turn the ignition on. Using a 12-volt test light connected to ground, check all Fused Ignition Switch Output circuits. Does the test light illuminate brightly on all circuits? Yes → Go To 4 No → Using the schematic as a guide, repair the Fused Ignition Switch Output circuit(s) for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*FOUR WINDOW DROP INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the Window Drop Relay Assembly connector. Disconnect the Body Control Module C4 connector. Turn the ignition off. Measure the resistance of the Window Down Relay Control circuit between the Window Drop Relay Assembly connector and the BCM C4 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Window Down Relay Control circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Disconnect the Body Control Module C4 connector. Turn the ignition on. Momentarily connect a jumper wire between ground and the Window Down Relay Control circuit in the BCM C4 connector. Did all four windows go down when the wire was grounded? Yes → Go To 6 No → Replace the Window Drop Relay Assembly. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DECKLID SWITCH DISARM FAILURE

When Monitored and Set Condition:

DECKLID SWITCH DISARM FAILURE

When Monitored: Continuously

Set Condition: If the decklid disarm switch is sensed in the open position for greater than 30 seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
DECKLID CYLINDER LOCK SWITCH GROUND OPEN
BODY CONTROL MODULE INTERNAL MALFUNCTION
DECKLID CYLINDER LOCK SWITCH OPEN
DECKLID SECURITY SWITCH SENSE CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	NOTE: When this code is present, the VTSS indicator will illuminate solid during the arming process. With the DRBIII®, record and erase DTC's. Cycle the ignition switch from ON to OFF. With the DRBIII®, read DTC's. Operate the Decklid Cylinder Lock Switch several times while monitoring the DRBIII®. Does the DRBIII® display DECKLID SWITCH DISARM FAILURE? Yes → Go To 2 No → The condition that caused this symptom is currently not present. Using the wiring diagram/schematic as a guide, inspect the related wiring harness and connectors for a possible intermittent condition.	All
2	Disconnect the Decklid Cylinder Lock Switch connector. Using a 12-volt test light connected to 12-volts, test the Ground circuit for continuity. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All

DECKLID SWITCH DISARM FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Decklid Cylinder Lock Switch connector. Connect a jumper wire between the Decklid Security Switch Sense circuit and the ground wire. With the DRBIII® in Inputs/Outputs, read the DECKLID KEY CYL SW state. Does the DRBIII® display CLOSED? Yes → Replace the Decklid Cylinder Lock Switch. Perform VTSS VERIFICATION TEST - 1A. No → Go To 4	All
4	Disconnect the Body Control Module C4 harness connector. Disconnect the Decklid Cylinder Lock Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Repair the Decklid Security Switch Sense circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*ALARM TRIPS ON ITS OWN

POSSIBLE CAUSES
ALARM INPUT STATUS
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the ALARM TRIP BY status. Were there any causes displayed? Yes → Refer to symptom list for problems related to the component indicated by the DRBIII®. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires.	All

Symptom:
*COURTESY LAMPS INOPERATIVE WITH ALARM TRIPPED

POSSIBLE CAUSES
COURTESY LAMPS INOPERATIVE
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	Turn the Courtesy Lamps on. Do the Courtesy Lamps operate properly? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom COURTESY LAMPS INOPERATIVE - ALL LAMPS in the INTERIOR LIGHTING category.	All

Symptom:

*DRIVER DOOR KEY FAILS TO ARM OR DISARM VTSS

POSSIBLE CAUSES
DOOR SWITCH FAILURE

TEST	ACTION	APPLICABILITY
1	For this failure, proceed with diagnosis. For this condition: Refer to symptom DOOR CENTRAL LOCK/UNLOCK SWITCH FAILURE in the POWER DOOR LOCKS/RKE CATAGORY.	All

Symptom:
*HEADLAMPS INOPERATIVE WITH ALARM TRIPPED (IF ENABLED)

POSSIBLE CAUSES
LOW BEAM HEADLAMPS INOPERATIVE
BODY CONTROL MODULE INTERNAL MALFUNCTION
BODY CONTROL MODULE INTERNAL MALFUNCTION
HEADLAMP DELAY RELAY
JUNCTION BLOCK - OPEN FUSED B(+) CIRCUIT
JUNCTION BLOCK - OPEN HEADLAMP DELAY RELAY CONTROL CIRCUIT
HEADLAMP DELAY RELAY

TEST	ACTION	APPLICABILITY
1	Turn the Low Beam Headlamps on. Do the Low Beam Headlamps operate properly? Yes → Go To 2 No → Refer to symptom LOW BEAM HEADLAMPS WILL NOT TURN ON in the EXTERIOR LIGHTING category.	All
2	Turn the Headlamps off. With the DRBIII®, actuate the Headlamp Delay Relay. Do the Headlamps flash while actuating the Headlamp Delay Relay? Yes → Replace the Body Control Module. No → Go To 3	All
3	Remove the Headlamp Delay Relay from the Junction Block. Temporarily remove the Horn Relay from the Junction Block. Reinstall the Horn Relay in place of the Headlamp Delay Relay. With the DRBIII®, actuate the Headlamp Delay Relay. Do the Headlamps flash while actuating the Headlamp Delay Relay? Yes → Replace the Headlamp Delay Relay. No → Go To 4	All
4	Remove the Horn Relay from the Headlamp Delay Relay location in the Junction Block. Reinstall the Horn Relay to its original location. Measure the voltage of the Fused B(+) circuits at the Headlamp Delay Relay connector. Is the voltage above 10.0 volts at each cavity? Yes → Go To 5 No → Refer to symptom HEADLAMP TIME DELAY INOPERATIVE in the EXTERIOR LIGHTING category.	All

*HEADLAMPS INOPERATIVE WITH ALARM TRIPPED (IF ENABLED) — Continued

TEST	ACTION	APPLICABILITY
5	Remove the Headlamp Delay Relay from the junction block. Remove the BCM from the junction block. Connect a jumper wire between the Fused B(+) circuit and the Headlamp Delay Relay Control circuit at the Headlamp Delay Relay connector. Measure the voltage of the Headlamp Delay Relay Control circuit (cavity 5) in the BCM internal connector. Is the voltage above 10.0 volts? Yes → Go To 6 No → Replace the Junction Block. Perform VTSS VERIFICATION TEST - 1A.	All
6	Disconnect the jumper wire. Reinstall the Headlamp Delay Relay in the Junction Block. Remove the BCM from the junction block. Measure the voltage of the Headlamp Delay Relay Control circuit (cavity 5) in the BCM internal connector. Is the voltage above 10.0 volts? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Replace the Headlamp Delay Relay. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*HORNS FAIL TO SOUND

POSSIBLE CAUSES
HORN RELAY
BODY CONTROL MODULE INTERNAL MALFUNCTION
OPEN HORN SWITCH
OPEN HORN SWITCH SENSE CIRCUIT
CLOCKSPRING
OPEN HORN SWITCH SENSE CIRCUIT
BODY CONTROL MODULE INTERNAL MALFUNCTION
OPEN FUSE #8
JUNCTION BLOCK - OPEN FUSED B(+) CIRCUIT
JUNCTION BLOCK - OPEN HORN RELAY CONTROL CIRCUIT
HORN RELAY
BODY CONTROL MODULE INTERNAL MALFUNCTION
HORN RELAY
JUNCTION BLOCK - OPEN HORN RELAY OUTPUT CIRCUIT
OPEN HORN RELAY OUTPUT CIRCUIT
OPEN GROUND CIRCUIT
OPEN HORN(S)

TEST	ACTION	APPLICABILITY
1	A failure in the Horn Switch Sense circuit, Horn Relay Control circuit, or the Horn Relay Output circuit could cause this failure. The Horn Relay Control circuit will be diagnosed first. Continue to the Horn Functional Test for further diagnosis. Horn Functional Test. Go To 2	All
2	With the DRBIII®, actuate the HORN RELAY. Do the Horns sound while actuating the Horn Relay. Yes → Go To 3 No → Go To 8	All
3	**NOTE: The following test will diagnose the Horn Switch Sense circuit.** Press and hold the Horn button. With the DRBIII® in Inputs/Outputs, read the HORN SW state. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Go To 4	All

*HORNS FAIL TO SOUND — Continued

TEST	ACTION	APPLICABILITY
4	**WARNING: Turn the Ignition Off, disconnect the Battery and wait 2 minutes before proceeding.** **CAUTION: Do not place an intact undeployed Airbag face down on a hard surface, the Airbag will propel into the air if accidently deployed.** Disconnect the Driver Airbag Module. Disconnect the Horn Switch connector. Connect a jumper wire between the Horn Switch Sense circuit and ground. With the DRBIII® in Inputs/Outputs, read the HORN SW state. Does the DRBIII® display HORN SW: CLOSED? Yes → Replace the Horn Switch. Perform VTSS VERIFICATION TEST - 1A. No → Go To 5	All
5	Disconnect the Clockspring connector. Connect a jumper wire between the Horn Switch Sense circuit (BCM side) and ground. With the DRBIII® in Inputs/Outputs, read the HORN SW state. Does the DRBIII® display HORN SW: CLOSED? Yes → Go To 6 No → Go To 7	All
6	**WARNING: Turn the Ignition Off, disconnect the Battery and wait 2 minutes before proceeding.** **CAUTION: Do not place an intact undeployed Airbag face down on a hard surface, the Airbag will propel into the air if accidently deployed.** Disconnect the Driver Airbag Module. Disconnect the Clockspring harness connector. Disconnect the Horn Switch harness connector. Measure the resistance of the Horn Switch Sense circuit between the Horn Switch and Clockspring. Is the resistance below 5.0 ohms? Yes → Replace the Clockspring. Perform VTSS VERIFICATION TEST - 1A. No → Repair the Horn Switch Sense circuit for an open between the Clockspring and the Horn switch. Perform VTSS VERIFICATION TEST - 1A.	All
7	Disconnect the Body Control Module C1 harness connector. Disconnect the Clockspring harness connector. Measure the resistance of the Horn Switch Sense circuit between the BCM and the Clockspring. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Repair the Horn Switch Sense circuit for an open between the Clockspring and the BCM. Perform VTSS VERIFICATION TEST - 1A.	All

*HORNS FAIL TO SOUND — Continued

TEST	ACTION	APPLICABILITY
8	With the DRBIII®, actuate the HORN RELAY. Examine the Horn Relay during the actuation. Does the Horn Relay click while actuating. Yes → Go To 9 No → Go To 13	All
9	**NOTE: The following test will diagnose the Horn Relay Output circuit.** Disconnect the Horn Relay. Connect a jumper wire between the Fused B(+) circuit and the Horn Relay Output circuit at the Horn Relay connector. Does the horn sound with the jumper wire connected? Yes → Replace the Horn Relay. Perform VTSS VERIFICATION TEST - 1A. No → Go To 10	All
10	Disconnect the jumper wire. Disconnect connector C2 at the Junction Block. Connect a jumper wire between the Horn Relay Output circuit at the Junction Block C2 connector and B(+). Does the horn sound with the jumper wire connected? Yes → Replace the Junction Block. Perform VTSS VERIFICATION TEST - 1A. No → Go To 11	All
11	Connect a jumper wire between the Horn Relay Output circuit at the Junction Block C2 connector and B(+). Disconnect the Horn connectors. Measure the voltage of the Horn Relay Output circuit at each Horn connector. Is the voltage above 10.0 volts? Yes → Go To 12 No → Repair the Horn Relay Output circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All
12	Disconnect the jumper wire. Disconnect the Horn connectors. Measure the resistance of the Ground circuit at each Horn connector. Is the resistance below 5.0 ohms? Yes → Replace the Horn(s). Perform VTSS VERIFICATION TEST - 1A. No → Repair the Ground circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All
13	**NOTE: The following test will diagnose the Horn Relay Control circuit.** Remove and inspect Fuse #8 in the Junction Block. Is the fuse open? Yes → Inspect/repair the Fused B(+) circuit for a short to ground. Replace the Fuse. Perform VTSS VERIFICATION TEST - 1A. No → Go To 14	All

*HORNS FAIL TO SOUND — Continued

TEST	ACTION	APPLICABILITY
14	Reinstall Fuse #8 in the Junction Block. Remove the Horn Relay from the Junction Block. Temporarily remove the Headlamp Delay Relay from the Junction Block. Reinstall the Headlamp Delay Relay in place of the Horn Relay. With the DRBIII®, actuate the HORN RELAY. Do the Horns sound while actuating the Horn Relay? Yes → Replace the Horn Relay. Perform VTSS VERIFICATION TEST - 1A. No → Go To 15	All
15	Remove the Headlamp Delay Relay from the Horn Relay location in the Junction Block. Reinstall the Headlamp Delay Relay to its original location. Measure the voltage of the Fused B(+) circuits at the Horn Relay connector. Is the voltage above 10.0 volts at each cavity? Yes → Go To 16 No → Replace the Junction Block. Perform VTSS VERIFICATION TEST - 1A.	All
16	Remove the Horn Relay from the junction block. Remove the BCM from the junction block. Connect a jumper wire between the Fused B(+) circuit and the Horn Relay Control circuit at the Horn Relay connector. Measure the voltage of the Horn Relay Control circuit (cavity 7) in the BCM internal connector. Is the voltage above 10.0 volts? Yes → Go To 17 No → Replace the Junction Block. Perform VTSS VERIFICATION TEST - 1A.	All
17	Disconnect the jumper wire. Reinstall the Horn Relay in the Junction Block. Remove the BCM from the junction block. Measure the voltage of the Horn Relay Control circuit (cavity 7) in the BCM internal connector. Is the voltage above 10.0 volts? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Replace the Horn Relay. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*HORNS FAIL TO SOUND WITH ALARM TRIPPED (IF ENABLED)

POSSIBLE CAUSES
HORN CIRCUIT MALFUNCTION
OPEN DOOR AJAR CIRCUIT
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	A failure in the Horn Relay Control circuit, Horn Relay Output circuit, or the Door Ajar circuits could cause this failure. The Horn Relay Control circuit will be diagnosed first. Continue to the Horn Functional Test for further diagnosis. Horn Functional Test. Go To 2	All
2	With the DRBIII®, actuate the HORN RELAY. Do the Horns sound while actuating the Horn Relay. Yes → Go To 3 No → Refer to HORNS FAIL TO SOUND symptom in the VTSS catagory.	All
3	With the DRBIII®, in Inputs/Outputs, read the following Door/Decklid Ajar Switch states. DRV DR AJAR SW PAS DR AJAR SW LR DR AJAR SW (4 Door) RR DR AJAR SW (4 Door) DECKLID AJAR SW Do the Door/Decklid Ajar Switch states appear correct? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to the appropriate DOOR AJAR test in the DOOR AJAR catagory.	All

Symptom:
*PASSENGER DOOR KEY FAILS TO ARM OR DISARM VTSS

POSSIBLE CAUSES
DOOR SWITCH FAILURE

TEST	ACTION	APPLICABILITY
1	For this failure, proceed with diagnosis. For this condition: Refer to symptom DOOR CENTRAL LOCK/UNLOCK SWITCH FAILURE in the POWER DOOR LOCKS/RKE CATAGORY.	All

Symptom:
*VTSS DOES NOT TRIP FROM DRIVER DOOR

POSSIBLE CAUSES
BODY CONTROL MODULE
INVALID DOOR AJAR INPUT

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the DRV DR AJAR SW status. Open the driver door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Refer to symptom DRIVER DOOR AJAR CKT OPEN in the DOOR AJAR category.	All

Symptom:
*VTSS DOES NOT TRIP FROM LEFT REAR DOOR

POSSIBLE CAUSES
INVALID DOOR AJAR INPUT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the LR DR AJAR SW status. Open the left rear door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom LEFT REAR DOOR AJAR CKT OPEN in the DOOR AJAR category.	All

Symptom:
*VTSS DOES NOT TRIP FROM PASSENGER DOOR

POSSIBLE CAUSES
INVALID DOOR AJAR INPUT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the PAS DR AJAR SW status. Open the passenger door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom PASSENGER DOOR AJAR CKT OPEN in the DOOR AJAR category.	All

Symptom:
*VTSS DOES NOT TRIP FROM RIGHT REAR DOOR

POSSIBLE CAUSES
INVALID DOOR AJAR INPUT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the RR DR AJAR SW status. Open the right rear door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom RIGHT REAR DOOR AJAR CKT OPEN in the DOOR AJAR category.	All

Symptom:
*VTSS INDICATOR INOPERATIVE

POSSIBLE CAUSES
VTSS INDICATOR LAMP TEST
OPEN FUSED B(+) CIRCUIT
OPEN JUNCTION BLOCK
INSTRUMENT CLUSTER
OPEN VTSS LED
VTSS INDICATOR DRIVER CIRCUIT OPEN
BODY CONTROL MODULE INTERNAL MALFUNCTION
OPEN FUSE #7

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, actuate the VTSS LAMP. Does the VTSS Lamp flash while actuating the Lamp? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Go To 2	All
2	Remove and inspect Fuse #7 in the Junction Block. Is the fuse open? Yes → Inspect/repair the Fused B(+) circuit for a short to ground. Replace the Fuse. Perform VTSS VERIFICATION TEST - 1A. No → Go To 3	All
3	Reinstall Fuse #7 in the Junction Block. Gain access to the Junction Block connector C7. While back probing, measure the voltage of the Fused B(+) circuit at the Junction Block connector C7. Is the voltage above 10.0 volts? Yes → Go To 4 No → Replace the Junction Block. Perform VTSS VERIFICATION TEST - 1A.	All
4	Disconnect the Instrument Cluster harness connector. Measure the voltage of the Fused B(+) circuit at cavity 21. Is the voltage above 10.0 volts? Yes → Go To 5 No → Repair the Fused B(+) circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All

*VTSS INDICATOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
5	Remove the VTSS Indicator Bulb from the Instrument Cluster. Inspect the VTSS Indicator Bulb and socket. Is there a problem with the bulb or socket? Yes → Repair or replace the VTSS Indicator Bulb or socket as needed. Perform VTSS VERIFICATION TEST - 1A. No → Go To 6	All
6	Disconnect the Instrument Cluster harness connector. Connect a voltmeter positive probe to a 12.0 volt supply and connect the ground probe to the VTSS Indicator Driver circuit at the Instrument Cluster connector. Turn the ignition on. With the DRB in Vehicle Theft, actuate the VTSS Indicator lamp. Is the voltage above 10.0 volts when the VTSS Indicator lamp is actuated? Yes → Replace the Instrument Cluster assembly. Perform VTSS VERIFICATION TEST - 1A. No → Go To 7	All
7	Disconnect the Instrument Cluster harness connector. Disconnect the BCM C1 harness connector. Measure the resistance of the VTSS Indicator Driver circuit between the Instrument Cluster connector and the BCM C1 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Repair the VTSS Indicator Driver circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS NO TRIP FROM DECKLID

POSSIBLE CAUSES
INVALID DECKLID AJAR INPUT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the DECKLID AJAR SW status. Open the decklid. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom DECKLID DOOR AJAR CKT OPEN in the DOOR AJAR category.	All

Symptom:
*VTSS WILL NOT ARM

POSSIBLE CAUSES
CHECK THE VTSS STATUS
CHECK THE BCM FOR DTCS
BODY CONTROL MODULE INTERNAL MALFUNCTION

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, check that the Theft Alarm is enabled. Was the Theft Alarm enabled? Yes → Go To 2 No → With the DRBIII®, enable the Vehicle Theft Security System (VTSS). Perform VTSS VERIFICATION TEST - 1A.	All
2	With the DRBIII®, read the active DTC's. Are any VTSS related DTC's present? Yes → Refer to the Symptom List and diagnose the appropriate symptom. No → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
WIPER ON/OFF RELAY OUTPUT SHORTED HIGH

When Monitored and Set Condition:

WIPER ON/OFF RELAY OUTPUT SHORTED HIGH

When Monitored: Continuoulsy.

Set Condition: BCM detects a high level on the wiper on/off relay output when it is attempting to turn on the wipers.

POSSIBLE CAUSES
INTERMITTENT CONDITION
SHORT TO BATTERY
HI/LO WIPER RELAY
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, clear all BCM DTC's. Actuate the Wipers. With the DRBIII®, read the DTC information. Does the DRBIII® read: Wiper On/Off Relay Output Shorted High? Yes → Go To 2 No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the HI/LO Wiper Relay. Disconnect the BCM from the junction block. Measure the voltage of the HI/LO Wiper Relay Control Circuit. Is the voltage below 5.0 volts? Yes → Repair the Wiper HI/LO Relay Control Circuit for a short to battery Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Install a known good relay in place of the HI/LO Wiper Relay. Turn the Wipers on. Do the Wipers operate normally? Yes → Replace the HI/LO Wiper Relay. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
WIPER ON/OFF RELAY OUTPUT SHORTED LOW

When Monitored and Set Condition:

WIPER ON/OFF RELAY OUTPUT SHORTED LOW

When Monitored: Continuously.

Set Condition: BCM detects a low (ground) signal on the wiper on/off relay output.

POSSIBLE CAUSES
INTERMITTENT CONDITION
OPEN CIRCUIT
SHORT TO GROUND
HI/LO WIPER RELAY
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, clear all BCM DTC's. Actuate the Wipers. With the DRBIII®, read the DTC information. Does the DRBIII® read: Wiper On/Off Relay Output Shorted Low? Yes → Go To 2 No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the BCM from the junction block. Connect a jumper wire between the HI/LO Wiper Relay Control Circuit and ground With the DRBIII®, monitor the wiper relay. Does the Wiper Relay show CLOSED? Yes → Repair the HI/LO Wiper Relay Control Circuit for an open condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Remove the HI/LO Wiper Relay. Disconnect the BCM from the junction block. Measure the resistance of the HI/LO Wiper Relay Output Circuit. Is the resistance below 5.0 ohms? Yes → Repair the HI/LO Wiper Relay Output Circuit for a short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

WIPER ON/OFF RELAY OUTPUT SHORTED LOW — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Install a known good relay in place of the HI/LO Wiper Relay. Turn the wipers on. Do the Wipers operate normally? Yes → Replace the Wiper HI/LO Relay. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
WIPER PARK SWITCH OPEN CIRCUIT

When Monitored and Set Condition:

WIPER PARK SWITCH OPEN CIRCUIT

When Monitored: With the wipers on (any speed).

Set Condition: BCM fails to detect a park signal from the wiper motor for 18 consecutive seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
OPEN WIPER PARK SWITCH SENSE CIRCUIT
SHORT TO BATTERY
WIPER MOTOR
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, clear all BCM DTC's. Actuate the Wipers. With the DRBIII®, read the DTC information. Does the DRBIII® read: Wiper Park Switch Open Circuit? Yes → Go To 2 No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the BCM C3 harness connector. Connect a jumper wire between the Wiper Park Switch Sense Circuit and ground. With the DRBIII®, monitor the Wiper Park Switch. Does the Wiper Park Switch show CLOSED? Yes → Repair the Wiper Park Switch Sense Circuit for an open condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

WIPER PARK SWITCH OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Wiper Park Switch. Disconnect the BCM from the junction block. Measure the voltage of the Wiper Relay Control Circuit. Is the voltage below 5.0 volts? Yes → Go To 4 No → Repair the HI/LO Wiper Relay Control Circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the Wipers off. Disconnect the Wiper Motor Connector. With the DRBIII®, monitor the Wiper Park Switch. Connect a jumper wire between the Wiper Park Switch Sense Circuit and ground. Does the Wiper Park Switch show CLOSED? Yes → Replace the Wiper Motor. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
WIPER PARK SWITCH SHORTED TO GROUND

When Monitored and Set Condition:

WIPER PARK SWITCH SHORTED TO GROUND

When Monitored: With the wipers on (any speed).

Set Condition: BCM fails to detect a park signal from the wiper motor.

POSSIBLE CAUSES
INTERMITTENT CONDITION
SHORT TO GROUND
WIPER SWITCH
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, clear all BCM DTC's. Actuate the Wipers. With the DRBIII®, read the DTC information. Does the DRBIII® read: Wiper Park Switch Shorted to Ground? Yes → Go To 2 No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Junction Block Harness Connector from the front of the junction block. Disconnect the Wiper Park Switch harness connector. Remove the Body Control Module from the junction block. Using a 12-volt test light connected to ground, check the Wiper Park Switch Sense circuit. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Wiper Park Switch Sense Circuit for a short to ground condition. Perform BODY VERIFICATION TEST - VER 1.	All

WIPER PARK SWITCH SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Junction Block harness connector. Disconnect the Wiper Switch connector. Measure the resistance of the Wiper Switch MUX Circuit. Is the resistance below 5.0 ohms? Yes → Replace the Wiper Switch. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HEADLAMP WASHER INOPERATIVE

POSSIBLE CAUSES
OPEN GROUND CIRCUIT
FUSED B+ CIRCUIT OPEN
HEADLAMP WASHER RELAY CONTROL CIRCUIT OPEN
HEADLAMP WASHER RELAY OUTPUT CIRCUIT OPEN
HEADLAMP WASHER PUMP MOTOR
HEADLAMP WASHER RELAY
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Washer Pump connector. Measure the resistance of the Washer Pump ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Repair the open Washer Pump ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. Disconnect the Headlamp Washer Relay. Measure the voltage of the Fused B+ Circuit. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the Fused B+ Circuit for an open condition. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Headlamp Washer Relay. Disconnect the BCM C3 harness connector. Measure the resistance of the Headlamp Washer Relay Control Circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Headlamp Washer Relay Control Circuit for a open. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Headlamp Washer Relay. Disconnect the Headlamp Washer Pump Motor. Measure the resistance of the Headlamp Washer Relay Output Circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Headlamp Washer Relay Output Circuit for a open. Perform BODY VERIFICATION TEST - VER 1.	All

*HEADLAMP WASHER INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition on. Disconnect the Headlamp Washer Pump Motor connector. Actuate the washers. Measure the voltage of the Washer Pump Output Circuit. Is the voltage above 10.0 volts? Yes → Replace the Headlamp Washer Pump Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Install a known good relay in place of the Headlamp Washer Relay. Turn the Washers on. Do the Headlamp Washers operate normally? Yes → Replace the Headlamp Washer Relay. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

VERIFICATION TESTS

41TE TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. Connect the DRBIII® to the Data Link Connector (DLC). 2. Reconnect any disconnected components. 3. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's. **4. NOTE: Erase DTC P0700 in the PCM to turn the Malfunction Indicator Lamp (MIL) off after making Transmission repairs.** 5. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT - above 43° C or 110° F. 6. Check the Transmission Fluid and adjust if necessary. Refer to the Service information for the Fluid Fill procedure. **7. NOTE: If the Transmission Control Module or the Transmission has been repaired or replaced it is necessary to perform the DRBIII® Quick Learn Procedure and reset the "Pinion Factor"** 8. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees. 9. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 10. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC repair. 11. If equipped with AutoStick®, up-shift and down-shift several times using the AutoStick® feature during the road test. **12. NOTE: Use the EATX OBDII Task Manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.** 13. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test , return to the Symptom list and perform the appropriate Symptom. Were there any Diagnostic Trouble Codes (DTCs) set during the road test? Yes → Refer to the Symptom List for appropriate Symptom(s). No → Repair is complete.	All

ABS VERIFICATION TEST - VER 1	APPLICABILITY
1. Turn the ignition off. 2. Connect all previously disconnected components and connectors. 3. Ensure all accessories are turned off and the battery is fully charged. 4. Ensure that the Ignition is on, and with the DRBIII®, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. 6. If any Diagnostic Trouble Codes are present, return to Symptom list and troubleshoot new or recurring symptom. 7. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops. **8. Caution: Ensure braking capability is available before road testing.** 9. Again, with the DRBIII® read DTC's. If any DTC's are present, return to Symptom list. 10. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete. Are any DTC's present or is the original concern still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

VERIFICATION TESTS — Continued

AIRBAG VERIFICATION TEST - VER 1	APPLICABILITY
1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery. **2. WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** 3. Connect the DRB to the Data Link Connector - use the most current software available. 4. Use the DRB III and erase the stored codes in all airbag system modules. 5. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On. 6. Wait one minute, and read active codes and if there are none present read the stored codes. 7. Note: If equipped with Airbag On-Off switch, read the DTC's in all switch positions. 8. Note: Read the DTC's in all airbag system related modules. 9. If the DRB shows any active or stored codes, return to the Symptom list and follow path specified for that trouble code. If no active or stored codes are present, the repair is complete. Are any DTC's present or is the original condition still present? YES Repair is not complete, refer to appropriate symptom list. NO Repair is complete.	All

VERIFICATION TESTS — Continued

BODY VERIFICATION TEST - VER 1	APPLICABILITY
1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors. 2. If the Sentry Key Immobilizer Module (SKIM) or the Powertrain Control Module (PCM) was replaced, proceed to number 6. If the SKIM or PCM was not replaced, continue to the next number. 3. If the Body Control Module was replaced, turn the ignition on for 15 seconds (to allow the new BCM to learn VIN) or engine may not start (if VTSS equipped). If the vehicle is equipped with VTSS, use the DRBIII® and enable VTSS. 4. Program all other options as needed. 5. If any repairs were made to the HVAC System, disconnect the battery or, using the DRBIII®, recalibrate the HVAC doors. Proceed to number 13. 6. Obtain the Vehicle's unique PIN assigned to it's original SKIM from either the vehicle's invoice or from Chrysler's Customer Assistance Center (1-800-992-1997). 7. NOTE: Once Secured Access Mode is active, the SKIM will remain in that mode for 60 seconds. 8. With the DRBIII®, select THEFT ALARM, SKIM, MISCELLANEOUS and select SKIM REPLACED. Enter the 4 digit PIN to put the SKIM in Secured Access Mode. 9. The DRBIII® will prompt for the following steps. (1) Program the country code into the SKIM's memory. (2) Program the vehicle's VIN into the SKIM memory. (3) Transfer the vehicle's Secret Key data from the PCM. 10. Using the DRBIII®, program all customer keys into the SKIM memory. This requires that the SKIM be in Secured Access Mode, using the 4 digit PIN. 11. Note: If the PCM is replaced, the VIN and the unique Secret Key data must be transferred from the SKIM to the PCM. This procedure requires the SKIM to be placed in Secured Access Mode using the 4-digit PIN. 12. Note: After 3 attempts at entering Secured Access Mode with an incorrect PIN, Secured Access Mode will be locked out for 1 hour and the DRBIII® will display "Bus +\- Signals Open" or "No Response". To exit this mode, turn ignition to Run for 1 hour. 13. Ensure that all accessories are turned off and the battery is fully charged. 14. Ensure that the Ignition is on. 15. With the DRBIII®, record and erase all DTCs from ALL modules. Start and run the engine for 2 minutes. Operate all functions of the system that caused the original concern. 16. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII®, read DTCs from ALL modules. Are any DTC's present or is the original condition still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

VERIFICATION TESTS — Continued

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all components related to the repair are connected properly. 4. Inspect the engine oil for fuel contamination. Replace the oil and filter as necessary. 5. Attempt to start the engine. 6. If the No Start condition is still present, refer to the symptom list and perform the diagnostic testing as necessary. refer to and Technical Service Bulletins that may apply. 7. Run the engine for one warm-up cycle to verify operation. 8. With the DRBIII®, confirm that no DTCs or Secondary Indicators are present and that all components are functioning properly. 9. If a DTC is present, refer to the appropriate category and select the corresponding symptom. Are any DTCs present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

SKIS VERIFICATION	APPLICABILITY
1. Reconnect all previously disconnected components and connectors. 2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997). **3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKIM will Lock Out the DRB III for 1 hour.** 4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary. 5. With the DRB III, select Theft Alarm, SKIM and Miscellaneous. Then select desired procedure and follow the steps that will be displayed. 6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM. **7. NOTE: Prior to returning vehicle to the costumer, perform a module scan to be sure that all DTC's are erased. Erase any DTC's that are found.** 8. With the DRB III erase all DTC's. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle. 9. With the DRB III, read the SKIM DTC's. Are there any SKIM DTC's? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

VERIFICATION TESTS — Continued

VTSS VERIFICATION TEST - 1A	APPLICABILITY
1. Ensure all doors and the decklid are closed. 2. Open the driver door. 3. Remove the ignition key (but keep in hand). 4. Lock the doors with RKE transmitter. 5. Close the driver door. 6. - If the VTSS Indicator Lamp flashes rapidly and after approximately 15 seconds changes to a slower flash, the system is operational. 7. - If the indicator fails to flash as described, there is a problem with the system. Select the Identifying VTSS symptom from the Symptom List to troubleshoot. Does the VTSS Indicator Lamp flash as specified? Yes → Repair is complete. No → Repair is not complete, refer to appropriate symptom.	All

TABLE OF CONTENTS

TABLE OF CONTENTS - Continued

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions, and graphics needed to diagnose Mark 20 Antilock Braking System (ABS). The diagnostics in this manual are based on the failure condition or symptom being present at time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the CAB. If the DRBIII® displays a "No Response" condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All schematics are in Section 10.0.

An * placed before the symptom description indicated a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE CODE. It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedure manual covers the antilock braking system (ABS) and traction control system found on the Chrysler Sebring.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the controller antilock brake module is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

Vehicles equipped with the Teves Mark 20 antilock brake system can be identified by the presence of the controller antilock brake module located along with HCU. The CAB/HCU are on the left side beneath the air cleaner.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 TEVES MARK 20 SYSTEM DESCRIPTION

The controller antilock brake module is used to monitor wheel speeds and to modulate (control) hydraulic pressure in each brake channel. The modulated hydraulic pressure is used to prevent wheel lock-up during braking.

The Teves Mark 20 system uses a diagonal split hydraulic brake system. In the standard brake mode the master cylinder primary circuit supplies pressure to the right front and left rear wheel brakes, and the secondary master cylinder circuit supplies pressure to the left front and right rear wheel brakes.

During and antilock stop the Mark 20 system uses four-channel operation. This means that each wheel brake is independently controlled. By using a separate hydraulic channel for each wheel, the system is able to retain directional stability and steering control while applying maximum braking. The system provides maximum braking even when road conditions vary.

3.2 ABS PLUS DESCRIPTION

ABS Plus operates like Traction Control except that the brake pedal must be applied for ABS Plus to be activated. Also, in contrast to the ABS function, a brake is applied rather than released. When the brake pedal is depressed far enough to close the brake lamp switch, the Controller Antilock Brake (CAB) will monitor and compare the speeds of the front (driven) wheels. When the CAB detects that a wheel is turning disproportionately faster then vehicle speed, it will apply the brake at that wheel to control a possible skid and help maintain directional control.

The driver may report the sound of the ABS pump motor running when the brake is not applied hard enought to cause an ABS event.

3.3 SYSTEM COMPONENTS

- controller antilock brake (CAB)
- vacuum booster
- master cylinder
- ABS integrated control unit hydraulic control unit (HCU), valve block assembly: 8 valve solenoids (4 inlet valves, 4 outlet valves, 2 accumulators) 1 motor, 2 pump
- 4 wheel speed sensor/tone wheel assemblies
- ABS warning indicator
- fuses and wiring harness
- fluid reservoir

3.3.1 ABS AND BRAKE WARNING LAMPS

The amber ABS warning indicator is located in the instrument cluster. It is used to inform the driver that the antilock function has been turned off. The ABS warning indicator is controlled by the CAB. If the 25 way CAB connector is not connected, the BCM will not receive a message from the CAB via the PCI bus and the BCM will send a message to the instrument cluster to turn on the ABS warning indicator.

The ABS Warning Indicator will remian lit during every key cycle until a circuit or component fault is repaired and the CAB no longer detects the fault. After repair of a sensor signal fault or a pump motor fault, the CAB must sense all four wheeels at 25 km/h (15 mph) before it will extinguish the ABS Indicator.

The Instrument Cluster will illuminate the ABS Warning Indicator if it loses communication with the CAB.

The red BRAKE warning indicator is also located in the instrument cluster. It can be activated in several ways. Application of the parking brake or a low fluid signal from the fluid level switch located in the master cylinder reservoir will cause the indicator to come on. The status of the red BRAKE warning indicator is not monitored by the CAB.

3.3.2 CONTROLLER ANTILOCK BRAKE (CAB)

The Controller Antilock Brake (CAB) is a microprocessor-based device that monitors wheel speeds and controls the antilock functions. The CAB contains two microprocessors that receive identical sensor signals and then independently process the information. The results are then compared to make sure that they agree. Otherwise, the CAB will turn off the antilock system and turn on the ABS warning indicator.

The primary functions of the CAB are to:

- detect wheel locking tendencies
- control fluid pressure modulation to the brakes during an antilock stop
- monitor the system for proper operation
- provide communication to the DRBIII® while in diagnostic mode
- store diagnostic information in non-volatile memory

The CAB continuously monitors the speed of each wheel. When a wheel locking tendency is detected, the CAB will command the appropriate valve to modulate brake fluid pressure via the hydraulic control unit (HCU). Brake pedal position is maintained during an antilock stop by being a closed system with the use of 2 accumulators. The CAB continues to control pressure in individual hydraulic circuits until a wheel locking tendency is no longer present. The CAB turns on the pump motor during an antilock stop.

The antilock brake system is constantly monitored by the CAB for proper operation. If the CAB detects a system malfunction, it can disable the antilock system and turn on the ABS warning indicator. If the antilock function is disabled, the system will revert to standard base brake system operation.

The CAB inputs include the following:

- diagnostic communication
- four wheel speed sensors
- ignition switch
- fused B+
- brake switch

The CAB outputs include the following:

- ABS warning indicator actuation
- ABS pump control
- eight valve control signals
- diagnostic communication
- body controller communication

3.3.3 HYDRAULIC CONTROL UNIT

The hydraulic control unit (HCU) contains the valve block assembly, two accumulators, and pump motor assembly. The HCU and the CAB are mounted as an assembly and are not separately serviceable.

Valve Block Assembly: The valve block assembly contains valves with four inlet valves and four outlet valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring loaded in the closed position. During an antilock stop, these valves are cycled to maintain the proper slip ratio for each wheel. If the CAB detects slip, the inlet valve is closed to prevent any further pressure increase. If necessary, the outlet valve is opened to release the pressure to the accumulators until the wheel is no longer slipping. Once the wheel is no longer slipping, the outlet valve is closed and the inlet valve is opened to reapply pressure. If the wheel is decelerating within its predetermined limits (proper slip ratio), the inlet valve will close to hold the pressure constant.

Pump Motor Assembly: The pump motor assembly provides the extra amount of fluid needed during antilock braking. The pump is supplied fluid that is released to the accumulators when the outlet valve is opened during and antilock stop. The pump is also used to drain the accumulator circuits after the antilock stop is complete. The pump is operated by an integral electric motor. This motor is controlled by the CAB. The CAB will turn on the pump motor when an antilock stop is detected. The pump continues to run during the antilock stop and is turned off after the stop is complete. Under some conditions, the pump/motor will run to drain the accumulators during the next drive off. The CAB monitors the pump motor operation internally.

Accumulators: The accumulators provide temporary fluid storage during an antilock stop and are drained by the pump/motor. Each of the diagonal circuits uses a 3cc. accumulator.

3.3.4 SWITCHES/SENSORS

Master Cylinder: A fluid level switch is located in the master cylinder fluid reservoir. The switch closes when a fluid level is detected. The fluid level switch turns on the brake warning indicator by grounding the indicator circuit. This switch does not disable the ABS system.

Wheel Speed Sensors and Tone Wheels: One Wheel Speed Sensor (WSS) is located at each wheel and sends a low voltage AC signal to the control module (CAB). This voltage is generated by magnetic induction when a toothed sensor ring (tone wheel) passes by a stationary sensor (wheel speed sensor). The CAB converts the AC signals into digital signals for each wheel.

The front wheel speed sensor is attached to a boss in the steering knuckle. The tone wheel is an integral part of the front axle shaft. The rear sensors are mounted to the rear disc adapters. The rear tone wheels are pressed on the rear hub. The wheel speed sensor air gap is not adjustable. Refer to Service Manual for wheel speed sensor air gap specifications.

The four wheel speed sensors are serviced individually. The front tone wheels are serviced as an assembly with the outer C.V. joint housing. The rear tone wheels are serviced as an assembly.

Correct antilock system operation is dependent on tone wheel speed signals from the wheel speed sensors. The vehicle's wheels and tires should all be the same size and type to generate accurate signals. In addition, the tires should be inflated to the recommended pressures for optimum system operation. Variation in wheel and tire size or significant variations in inflation pressure can produce inaccurate wheel speed signals; however, the system will continue to function when using the mini-spare.

3.3.5 SYSTEM INITIALIZATION

System initialization starts when the key is turned to "run". At this point, the CAB performs a complete self-check of all electrical components in the antilock systems.

Between 8-17 km/h (5-10 mph), a dynamic test is performed. This will momentarily cycle the inlet and outlet valves and check wheel speed sensor circuitry. At 25 km/h (15 mph), the CAB will try to test the pump motor. If the brake pedal is applied, the test will be run at 40 km/h (24 mph) regardless of brake switch state. If, during the dynamic test, the brake pedal is applied, brake pedal pulsations may be felt. This is a normal condition.

If any component exhibits a trouble condition during system initialization or dynamic check, the CAB will illuminate the ABS warning indicator.

3.3.6 DIAGNOSTIC MODE

To enter diagnostic mode, a vehicle speed must be below 10 km/h (6mph) and no ABS condition present. If vehicle speed is not below 10 km/h (6 mph), a "No Response" message could be displayed by the DRBIII®. The following are characteristics of diagnostic mode:

– The amber ABS warning indicator will blink rapidly (about 1/2 second ON and 1/2 second OFF). If a hard trouble code, such as CAB Power Feed Circuit Failure code is present, the indicator will be illuminated without blinking until the trouble condition is cleared.
– Antilock operation is disabled.
– You will be unable to actuate the valves in the valve body when the vehicle speed is above 8 km/h (5 mph). If valve actuation is attempted above 8 km/h (5mph), a "No Response" message will be displayed on the DRBIII®.

3.4 DIAGNOSTIC TROUBLE CODES

The controller antilock brake may report any of the following diagnostic trouble codes:

CLUSTER LAMP FAILURE

VALVE POWER FEED FAILURE

BUS SYSTEM COMMUNICATION FAILURE

CAB INTERNAL FAILURE

INCORRECT TONE WHEEL FAILURE

LEFT FRONT SENSOR CIRCUIT FAILURE

LEFT FRONT WHEEL SPEED SIGNAL FAILURE

LEFT REAR SENSOR CIRCUIT FAILURE

LEFT REAR WHEEL SPEED SIGNAL FAILURE

PUMP CIRCUIT FAILURE

RIGHT FRONT SENSOR CIRCUIT FAILURE

RIGHT FRONT WHEEL SPEED SIGNAL FAILURE

RIGHT REAR SENSOR CIRCUIT FAILURE

RIGHT REAR WHEEL SPEED SIGNAL FAILURE

SYSTEM OVERVOLTAGE

SYSTEM UNDERVOLTAGE

3.5 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII® will display one of only two error messages:

– User-Requested WARM Boot or User-Requested COLD Boot

This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot

Press MORE to switch between this display
   and the application screen.
Press F4 when done noting information.
```

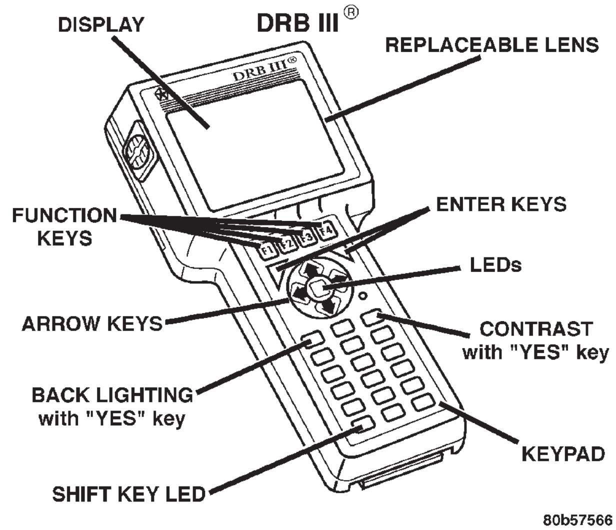
3.5.1 DRBIII® DOES NOT POWER UP

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, and inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.5.2 DISPLAY IS NOT VISABLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.



4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheel before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as rings, watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a chassis system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service manual. Following these procedures is very important to safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If is does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the chassis system are intended to be serviced as an assembly only. Attempting to remove or repair certain system subcomponents may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: Exceeding the limits of the DRBIII® multimeter is dangerous. It can expose you to serious or possibly fatal injury. Carefully read and understand the cautions and the specification limits.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and functions for the measurement. Do not try voltage or current measurement that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 -1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation, this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

WARNING: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRBIII®.

4.4 DIAGNOSIS

1. A diagnostic test procedure must begin with a thorough visual inspection of the ABS system for damaged components or disconnected connectors. The brake lamps must be operational, and if they are not, repair them prior to continuing.

2. Connect the DRBIII® to the data link connector, which is located under the dash to the left of the steering column. If the DRBIII® does not power up, check the power and ground supplies to the connector.
3. Turn the ignition on. Select "Antilock Brakes". If the DRBIII® displays "No Response" condition you must diagnose that first.
4. Read and record all ABS Diagnostic Trouble Codes (DTC's). If the "CAB Power Feed Circuit" diagnostic trouble code is present, it must be repaired prior to addressing any other DTC's. If any additional DTC's are present, proceed to the appropriate test by locating the matching test in the Table of Contents and begin to diagnose the symptom.
5. If there are no diagnostic trouble codes present, identify the customer complaint, select "Inputs/Outputs" and read the brake switch input as you press and release the brake pedal. If the display does not match the state of the pedal, perform the proper test by locating the matching test in the Table of Contents and begin to diagnose the symptom. If a problem exists with the ABS warning indicator or the red Brake warning indicator exists, perform the proper tests by locating the matching test in the Table of Contents and begin to diagnose the symptom.
6. If no other problems are found, it will be necessary to road test the vehicle. Perform several antilock stops from above 50 Km/h (30 mph) and then repeat step 4. If any diagnostic trouble codes are present, proceed to the appropriate test.
7. The following conditions should be considered "NORMAL" operation, and no repairs should be attempted to correct them.
   – Brake pedal feedback during an ABS stop (clicking, vibrating)
   – Clicking, groaning or buzzing at 25 Km/h (15 mph) or 40 Km/h (24 mph) (drive off self test)
   – Groaning noise during an ABS stop
   – Slight brake pedal drop and pop noise when ignition is initially turned on
   – Brake pedal ratcheting down at the end of an ABS stop
8. If the complaint is ABS "cycling" at the end of a stop at low speeds, it may be caused by a marginal wheel speed sensor signal. The sensor air gap, tone wheel condition, and/or brakes hanging up are possible causes of this condition.
9. After a road test in which no problems were found, refer to any Technical Service Bulletins that may apply.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box)
jumper wires
ohmmeter
voltmeter
test light

6.0 GLOSSARY OF TERMS

ABS	antilock brake system
AC	alternating current BCM-Body Control Module
CAB	controller antilock brake
CCD	Chrysler Collision Detection
DC	direct current
DLC	data link connector
DRBIII®	diagnostic read-out box
DTC	diagnostic trouble code
EDW	electrical distribution wiring
EMI	electro magnetic interference
HCU	hydraulic control unit
ICU	integrated control unit
JBLK	junction block
PDC	power distribution center
P/M	pump motor
RFI	radio frequency interference
WSS	wheel speed sensor

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:
BUS SYSTEM COMMUNICATION FAILURE

When Monitored and Set Condition:

BUS SYSTEM COMMUNICATION FAILURE

When Monitored: Ignition ON, every 7 ms.

Set Condition: When the CAB does not receive a message from the instrument cluster for 10 seconds.

POSSIBLE CAUSES
CHECK COMMUNICATION TO MIC
INTERMITTENT DTC
CAB-- INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to communicate with the MIC Was the DRB able to I/D or communicate with the MIC? Yes → Go To 2 No → Refer to the Communication category and perform the symptom Bus +/- Signals Open from the Controller Anti-Lock Brake. Perform ABS VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reappear? Yes → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CAB INTERNAL FAILURE

When Monitored and Set Condition:

CAB INTERNAL FAILURE

When Monitored: Ignition on. The CAB monitors its internal microprocessors for correct operation.

Set Condition: If the CAB detects an internal fault, the DTC is set.

POSSIBLE CAUSES
CAB - INTERNAL CONCERN

TEST	ACTION	APPLICABILITY
1	The only possible cause is a CAB internal concern. If there are no possible causes remaining, view repair. View repair. Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
CLUSTER LAMP FAILURE

When Monitored and Set Condition:

CLUSTER LAMP FAILURE

When Monitored: Key ON. After Key-ON bulb check.

Set Condition: When the instrument cluster informs the CAB that the cluster cannot turn on the ABS Lamp.

POSSIBLE CAUSES
CLUSTER DTC PRESENT
CLUSTER INTERNAL FAULT
CAB -- NO ABS INDICATOR MESSAGE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Are there any Instrument Cluster DTCs present? Yes → Refer to the INSTRUMENT CLUSTER category for the related symptom(s). Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Observe the instrument cluster indicators. Turn the ignition on. Did the ABS Indicator illuminate for several seconds and then go out? Yes → Go To 3 No → Go To 3	All
3	**NOTE: The DRBIII® communication with the CAB must be operational for the result of this test to be valid.** Turn the ignition off. Remove Fuse 21 (ABS valve power) from the IPM. Perform the Key-on Bulb Check. Does the ABS Indicator remain on after the bulb check? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
INCORRECT TONE WHEEL FAILURE

When Monitored and Set Condition:

INCORRECT TONE WHEEL FAILURE

When Monitored: Key ON. Vehicle speed above 40 km/h (25mph) for 2 minutes.

Set Condition: When the CAB detects an unexpected wheel speed condition caused by a tire size that does not meet vehicle specification.

POSSIBLE CAUSES
CAB - SETTING FALSE CODE
TIRES NOT TO SPECIFICATION

TEST	ACTION	APPLICABILITY
1	Inspect the tires. Do the tires meet vehicle specification? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Replace the tires not meeting vehicle specification. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom List:

LEFT FRONT SENSOR CIRCUIT FAILURE
LEFT REAR SENSOR CIRCUIT FAILURE
RIGHT FRONT SENSOR CIRCUIT FAILURE
RIGHT REAR SENSOR CIRCUIT FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be LEFT FRONT SENSOR CIRCUIT FAILURE.

When Monitored and Set Condition:

LEFT FRONT SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit every 7 milliseconds (ms).

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

LEFT REAR SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit every 7 milliseconds (ms).

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

RIGHT FRONT SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit every 7 milliseconds (ms).

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

RIGHT REAR SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit every 7 milliseconds (ms).

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

POSSIBLE CAUSES
SENSOR OR CONNECTOR DAMAGE
WHEEL SPEED SENSOR FAULT
SENSOR CIRCUITS SHORTED OR OPEN

LEFT FRONT SENSOR CIRCUIT FAILURE — Continued

POSSIBLE CAUSES
CAB - INTERNAL FAULT
INTERMITTENT CIRCUIT DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display a Wheel Speed Sensor Circuit Failure DTC? Yes → Go To 2 No → Go To 5	All
2	Turn the ignition off. Inspect the affected Wheel Speed Sensor and Connector. Is the Sensor or Connector Damaged? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the affected Wheel Speed Sensor connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Using a 12-volt test light connected to ground, check the Sensor 12 volt Supply circuit. Measure the resistance between ground and the Sensor Signal circuit. Was the test light bright and the resistance between 100 and 300 ohms? Yes → Replace the Wheel Speed Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the affected Wheel Speed Sensor connector. **Note: Check connector - Clean/repair as necessary.** Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Check the Wheel Speed Sensor 12 volt Supply and Signal circuits for a short to battery, ground, to each other and for an open. For the purposes of this test, a short to ground must be below 15k ohms. Was any circuit short or open found? Yes → Repair the Wheel Speed Sensor circuit short or open. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

LEFT FRONT SENSOR CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom List:

LEFT FRONT WHEEL SPEED SIGNAL FAILURE
LEFT REAR WHEEL SPEED SIGNAL FAILURE
RIGHT FRONT WHEEL SPEED SIGNAL FAILURE
RIGHT REAR WHEEL SPEED SIGNAL FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be LEFT FRONT WHEEL SPEED SIGNAL FAILURE.

When Monitored and Set Condition:

LEFT FRONT WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked at drive off or every 7 milliseconds (ms). Sensor signal continuity is checked every 7 milliseconds. Wheel speed phase length supervision is checked every 7 milliseconds.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

LEFT REAR WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked at drive off or every 7 milliseconds (ms). Wheel speed circuit continuity is checked every 7 milliseconds. Wheel speed phase length supervision is checked every 7 milliseconds.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

RIGHT FRONT WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked at drive off or every 7 milliseconds (ms). Wheel speed continuity is checked every 7 milliseconds. Wheel speed phase length supervision is checked every 7 milliseconds.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

LEFT FRONT WHEEL SPEED SIGNAL FAILURE — Continued

RIGHT REAR WHEEL SPEED SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked at drive off or every 7 milliseconds (ms). Wheel speed circuit continuity is checked every 7 milliseconds. Wheel speed phase length supervision is checked every 7 milliseconds.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

POSSIBLE CAUSES
SENSOR OR TONE WHEEL CONCERN
SENSOR OUTPUT INTERMITTENT OR OPEN
CAB SETTING FALSE DTC
WHEEL SPEED SENSOR INOPERATIVE
INTERMITTENT SIGNAL DTC

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Turn the ignition off. Start the engine. With an assistant, drive the vehicle as straight as possible and maintain a steady speed above 24 km/h (15 mph). With the DRBIII®, monitor all wheel speed sensors. Note whether the speed of the affected wheel is zero. Note whether the speed of the affected wheel differs from others by 5 km/h (3 mph) or more. Is the affected wheel speed zero or differing from others? Yes → Go To 2 No → Go To 3	All
2	Inspect the Wheel Speed Sensor, Connector and Tone Wheel at the affected wheel. **NOTE: Inspect components for damage, correct installation and sensor/tone wheel air gap.** Are there any visible Sensor, Connector or Tone Wheel concerns? Yes → Correct the sensor, connector or tone wheel concern as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Wheel Speed Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

LEFT FRONT WHEEL SPEED SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	With the DRBIII®, read DTCs. Did the DTC reoccur? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Visually inspect wheel speed sensor. Visually inspect tone wheel. Visually inspect wiring harness. Visually inspect brakes for locking up due to lining contamination or overheating. Inspect all Components for defects which may cause a Signal DTC to set. Is any Component Damaged? Yes → Repair as necessary. The vehicle must be driven at 25 km/h (15 mph) to extinguish the ABS indicator. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PUMP CIRCUIT FAILURE

When Monitored and Set Condition:

PUMP CIRCUIT FAILURE

When Monitored: Ignition on. The CAB commands the pump on at 20 km/h (12 mph) to check its operation, if the brake switch is not applied. If the brake is applied, the test will run at 40 km/h (25 mph). The CAB monitors pump voltage every 7 milliseconds.

Set Condition: The DTC is stored when the CAB detects: 1) Improper voltage decay after the pump was turned off. 2) Pump not energized by the CAB, but voltage is present for 3.5 seconds. 3) Pump is turned on by the CAB, but without sufficient voltage to operate it.

POSSIBLE CAUSES
CAB - PUMP MOTOR RUNNING CONTINUOUSLY
PUMP HARNESS DISCONNECTED
ABS PUMP MOTOR INTERMITTENT DTC
GROUND CIRCUIT HIGH RESISTANCE
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT OPEN
CAB - INTERNAL FAULT
CAB - SETTING FALSE CODE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Turn the ignition on. Monitor the pump motor for continuous operation. Is the pump motor running continuously? Yes → Replace the Controller Antilock. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, read DTC's. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, actuate the ABS pump motor. Did the Pump Motor operate when actuated? Yes → Go To 3 No → Go To 4	All

PUMP CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Controller Antilockdance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
4	Check the short Wiring Harness between the ABS Pump and the CAB. Check for disconnect and damage. Is the harness disconnected or damaged? Yes → Reconnect or repair the Pump Harness as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition on. With the DRBIII®, actuate the pump motor. **NOTE: Pump motor may not operate, but voltage will be applied.** **NOTE: The following test will be done by back probing the CAB ground circuits at the CAB connector.** Measure the voltage drop across the ABS ground circuit connection, with pump motor actuation enabled. Is the voltage below 0.1 volt? Yes → Go To 6 No → Repair the Ground circuit for high resistance. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Using a 12-volt test light connected to ground, check the Pump Motor Fused B+ circuit. Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Fused B(+) circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect CAB Connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the CAB ground circuits. Is the resistance below 1.0 ohm? Yes → Go To 8 No → Repair the ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

PUMP CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
8	If there are no possible causes remaining, view repair. Repair Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
SYSTEM OVERVOLTAGE

When Monitored and Set Condition:

SYSTEM OVERVOLTAGE

When Monitored: Ignition on. The CAB monitors the Fused B(+) circuit at all times for proper system voltage.

Set Condition: If the voltage is above 16.5 volts for greater than 420 milliseconds (ms), the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES
CHARGING SYSTEM FAULT
FUSED IGNITION SWITCH OUTPUT HIGH
GROUND CIRCUIT OPEN
CAB - INTERNAL FAULT
INTERMITTENT DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Start the engine. With the DRBIII®, read DTC's. Does the DRBIII® display System Overvoltage DTC? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTCs. Does the DRBIII® display any charging system DTCs? Yes → Refer to the Charging information for the related symptom(s). Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

SYSTEM OVERVOLTAGE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Start the engine. Raise engine speed above 1,800 RPM. Measure the battery voltage. Is the voltage above 16.5 volts ? Yes → Refer to appropriate service information for charging system testing and repair. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the ground circuits. Is the resistance below 1.0 ohm? Yes → Go To 5 No → Repair the Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
5	If there are no potential causes remaining, view repair. Repair Replace the Controller Antilock Brake. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
SYSTEM UNDERVOLTAGE

When Monitored and Set Condition:

SYSTEM UNDERVOLTAGE

When Monitored: Ignition on. The CAB monitors the Fused Ignition Switch Output circuit voltage above 10 km/h (6 mph) every 7 milliseconds for proper system voltage.

Set Condition: If the voltage is below 9.5 volts, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES
BATTERY VOLTAGE LOW
INTERMITTENT DTC
FUSED IGNITION SWITCH OUTPUT CIRCUIT HIGH RESISTANCE
CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Start the engine. Drive the vehicle above 16 km/h (10 mph) for at least 20 seconds. Stop the vehicle With the DRBIII®, read DTC's. Does the DRBIII® display System Undervoltage DTC? Yes → Go To 2 No → Go To 5	All
2	Engine Running. Measure the battery voltage. Is the battery voltage below 10 volts? Yes → Refer to appropriate service information for charging system testing and repair. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the CAB harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch circuit. Is the voltage above 10 volts? Yes → Go To 4 No → Repair the Fused Ignition Switch Output Circuit for high resistance Perform ABS VERIFICATION TEST - VER 1.	All

SYSTEM UNDERVOLTAGE — Continued

TEST	ACTION	APPLICABILITY
4	If there are no potential causes remaining, view repair. Repair Replace the Controller Antilock Brake. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
VALVE POWER FEED FAILURE

When Monitored and Set Condition:

VALVE POWER FEED FAILURE

When Monitored: Ignition ON for at least 3.5 seconds. ABS Power Relay closed. Valve command for a particular solenoid not present.

Set Condition: Low feedback voltage from the low side of all the solenoids for over 20 consecutive controller checks spaced 5 ms apart.

POSSIBLE CAUSES
INTERMITTENT DTC
BLOWN FUSE - FUSED B(+) CIRCUIT
NO B+ SUPPLY TO FUSE
FUSED B(+) CIRCUIT OPEN
B(+) CIRCUIT SHORTED TO GROUND
CAB - FUSED B(+) CIRCUIT OPEN
CAB - FUSED B(+) CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Drive the vehicle above 25 km/h (15 mph) for at least 10 seconds. Stop the vehicle. With the DRBIII®, read DTC's. Does the DRBIII® display Valve Power Feed Circuit DTC present right now? Yes → Go To 2 No → Go To 9	All
2	Turn the ignition off. Remove and Inspect the ABS Fuse 22 in the PDC. Is the Fuse blown? Yes → Go To 3 No → Go To 6	All

VALVE POWER FEED FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Remove the ABS Fuse 22 from the PDC. Disconnect the CAB harness connector. **Note: Check connector - Clean/repair as necessary.** Using a test light connected to 12 volts, probe the Fused B(+) Circuit at the PDC fuse terminal. Does the test light illuminate brightly? Yes → Repair the Fused B(+) Circuit short to ground. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the ABS Valves Fuse 22 from the PDC. The CAB must be connected for the results of this test to be valid. Using a test light connected to 12 volts, probe the Fused B(+) Circuit at the PDC fuse terminal. Does the test light illuminate brightly? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. If there are no potential causes remaining, view repair. Continue Replace the Fuse. Perform ABS VERIFICATION TEST - VER 1.	All
6	Remove the ABS Fuse 22 from the PDC. Turn the ignition on. Measure the voltage of the Fused B+ supply to Fuse 22 in the PDC. Is the voltage above 10 volts? Yes → Go To 7 No → Repair the B+ Supply circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Remove the ABS Fuse 22 from the PDC. Disconnect the CAB harness connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the Fused B(+) circuit between PDC Fuse terminal 22 and the CAB connector. Is the resistance below 5 ohms? Yes → Go To 8 No → Repair the Fuse B+ circuit high resistance or open. Perform ABS VERIFICATION TEST - VER 1.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

VALVE POWER FEED FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*BRAKE LAMP SWITCH

POSSIBLE CAUSES
CHECK BRAKE LAMP SWITCH OUTPUT
BRAKE LAMP SWITCH B+ OPEN
BRAKE LAMP SWITCH OUTPUT CIRCUIT SHORT OR OPEN
BRAKE LAMP SWITCH OUTPUT CIRCUIT SHORT TO GROUND OR BATTERY
BRAKE LAMP SWITCH OPEN
CAB -- INTERNAL OPEN

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the Brake Lamp Switch state. Press and release the brake pedal. Does the DRBIII® display CLOSED and OPEN? Yes → The Brake Lamp Switch is OK. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Brake Lamp Switch harness connector. Disconnect the CAB harness connector. Using a 12-volt test light connected to ground, check the Brake Lamp Switch Output circuit. Using a 12-volt test light connected to battery, check the Brake Lamp Switch Output circuit. Does the test light illuminate brightly for either check? Yes → Repair the Brake Lamp Switch Output circuit for a short to battery or ground. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Brake Lamp Switch harness connector. Using a 12-volt test light connected to ground, check the Brake Lamp Switch Fused B+ circuit. Does the test light illuminate brightly ? Yes → Go To 4 No → Repair the Brake Lamp Switch Fused B+ circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
4	Disconnect the Brake Lamp Switch harness connector. Connect a jumper wire between the Brake Lamp Switch B+ and Output circuits. With the DRBIII® in Inputs/Outputs, read the Brake Lamp Switch state. Does the DRBIII® display CLOSED? Yes → Replace the Brake Lamp Switch in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 5	All

*BRAKE LAMP SWITCH — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the CAB harness connector. Disconnect the Brake Lamp Switch harness connector. Check the Brake Lamp Switch Output circuit for a short to voltage, short to ground and for an open. Is the Brake Lamp Switch Output circuit shorted or open? Yes → Repair the Brake Lamp Switch Output circuit for a short to voltage or an open. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

Verification Tests

ABS VERIFICATION TEST - VER 1	APPLICABILITY
1. Turn the ignition off. 2. Connect all previously disconnected components and connectors. 3. Ensure all accessories are turned off and the battery is fully charged. 4. Ensure that the Ignition is on, and with the DRBIII®, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. 6. If any Diagnostic Trouble Codes are present, return to Symptom list and troubleshoot new or recurring symptom. 7. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops. **8. Caution: Ensure braking capability is available before road testing.** 9. Again, with the DRBIII® read DTC's. If any DTC's are present, return to Symptom list. 10. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete. Are any DTC's present or is the original concern still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions, and graphics needed to diagnose 41TE/AE Electronic Automatic Transaxle (EATX) problems. The diagnostics in this manual are based on the failure condition or symptom being present at time of diagnosis.

When repairs are required, refer to the appropriate volume of the service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added and/or carryover systems may be enhanced. READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE TROUBLE CODE. It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

This book reflects many suggested changes from readers of past issues. After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers all 2002 JR41/JR27 equipped with a 41TE/AE transaxle.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the 41TE/AE electronic transaxle is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

Vehicles equipped with a 4 speed transmission and have the Solenoid/Pressure switch, Transmission Range Sensor, Input speed sensor and Output speed sensor located on the same side of the transmission. Refer to the Service Information for transmission ID tag descriptions.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

The 41TE/AE electronic transaxle is a conventional transaxle in that it uses hydraulically applied clutches to shift a planetary gear train. However, the electronic control system replaces many of the mechanical and hydraulic components used in conventional transmission valve bodies.

3.2 FUNCTIONAL OPERATION

The 41TE/AE electronic transaxle has a fully adaptive control system. The system performs it's functions based on continuous real-time sensor feedback information. The control system automatically adapts to changes in engine performance and friction element variations to provide consistent shift quality. The control system ensures that clutch operation during upshifting and downshifting is more responsive without increased harshness.

The Transmission Control Module (TCM) continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code. Some of these codes cause the transaxle to go into Limp-in or default mode. While in this mode, electrical power is taken away from the transaxle via the TCM, de-energizing the transmission control relay, and taking power from the solenoid pack. When this happens, the only transaxle mechanical functions are:

Park and Neutral
Reverse
Second Gear

No upshifts or downshifts are possible. The position of the manual valve alone allows the three ranges that are available. Although vehicle performance is seriously degraded while in this mode, it allows the owner to drive the vehicle in for service.

Once the DRBIII® is in the EATX portion of the diagnostic program, it constantly monitors the TCM to see if the system is in Limp-in mode. If the transaxle is in Limp-in mode, the DRBIII® will flash the red LED.

3.2.1 AUTOSTICK FEATURE (IF APPLICABLE)

This feature allows the driver to manually shift the transaxle when the shift lever is pulled into the AutoStick position. When in AutoStick mode, the instrument cluster displays the current gear.

3.2.2 TRANSMISSION OPERATION AND SHIFT SCHEDULING AT VARIOUS OIL TEMPERATURES

The transmission covered in this manual has unique shift schedules depending on the temperature of the transmission oil. The shift schedule is modified to extend the life of the transmission while operating under extreme conditions.

The oil temperature is measured with a Temperature Sensor on the 41TE/AE transmission. The Temperature Sensor is an integral component of the Transmission Range Sensor (TRS). If the Temperature Sensor is faulty, the transmission will default to a calculated oil temperature DTC P1799(74). Oil temperature will then be calculated through a complex heat transfer equation using engine coolant temperature, battery/ambient temperature, and engine off time from the Body Control Module (BCM). These inputs are received from the PCI bus periodically and used to initialize the oil temperature at start up. Once the engine is started, the TCM updates the transmission oil temperature based on torque converter slip speed, vehicle speed, gear, and engine coolant temperature to determine an estimated oil temperature during vehicle operation. Vehicles using calculated oil temperature track oil temperature reasonably accurate during normal operation. However, if a transmission is overfilled, a transmission oil cooler becomes restricted, or if a customer drives aggressively in low gear, the calculated oil temperature will be inaccurate. Consequently the shift schedule selected may be inappropriate for the current conditions. The key highlights of the various shift schedules are as folows:

Extreme Cold: Oil temperature at start up below 26.6°C (-16°F)

> Goes to Cold schedule above -24°C (-12°F) oil temperature

> Park, Reverse, Neutral and 2nd gear only (prevents shifting which may fail a clutch with frequent shifts)

Cold: Oil temperature at start up above -24°C (-12°F) and below 2.2°C (36°F)

> Goes to Warm schedule above 4.4°C (40°F) oil temperature

> Delayed 2-3 upshift approximately 35-50 Km/h (22 - 31 MPH)

> Delayed 3-4 upshift 72-85 Km/h (45-53 MPH)

> Early 4-3 coastdown shift approximately 48 Km/h (30 MPH)

> Early 3-2 coastdown shift approximately 27 Km/h (17 MPH)

> High speed 4-2, 3-2, 2-1 kickdown shifts are prevented

> No EMCC

Warm: Oil temperature at start up above 2.2° (36°F) and below 27°C (36°F)

> Goes to a Hot schedule above 27°C (80°F) oil temperature

> Normal operation (upshifts, kickdowns, and coastdowns)

> No EMCC

Hot: Oil temperature at start up above 27°C (80°F)

> Goes to a Overheat schedule above 115°C (240°F) oil temperature

> Normal operation (upshifts, kickdowns, and coastdowns)

> Full EMCC, No PEMCC except to engage FEMCC, except at closed throttle at speeds above 113-133 Km/h (70-83 MPH)

Overheat: Oil temperature above 115°C (240°F) or engine coolant temperature above 118C° (244°F)

> Goes to a Hot below 110°C (230°F) oil temperature or a Super Overheat above 115°C (240°F) oil temperature

> Delayed 2-3 upshift 40-51 Km/h (25-32 MPH)

> Delayed 3-4 upshift 66-77 Km/h (41-48 MPH)

> 3rd gear FEMCC from 48-77 Km/h (30-48 MPH)

> 3rd gear PEMCC from 43-50 Km/h (27-31 MPH)

Super Overheat: Oil temperature above 127°C (260°F)

> Goes back to a Overheat below 115°C (240°F) oil temperature

> All a Overheat shift schedules features apply

> 2nd gear PEMCC above 35 Km/h (22 MPH)

> Above 35 Km/h (22 MPH) the torque converter will not unlock unless the throttle is closed (i.e. at 80 Km/h (50 MPH) a 4th FEMCC to 3rd FEMCC shift will be made during a part throttle kickdown or a 4th FEMCC to 2nd PEMCC shift will be made at wide open throttle) or if a wide open throttle 2nd PEMCC to 1 kickdown is made.

Causes for operation in the wrong temperature shift schedule: Extreme Cold or Cold shift schedule at start up:

> Temperature Sensor circuit.

> Overheat or Super Overheat shift schedule after extended operation:

> Operation in city traffic or stop and go traffic

> Engine idle speed too high

> Aggressive driving in low gear

> Trailer towing in OD gear position (use 3 position (or A/S 3rd) if frequent shifting occurs)

> Cooling system failure causing engine to operate over 110°C (230°F)
> Engine coolant temperature stays low too long - If engine coolant temperature drops below 65°C (150°F), the transmission will disengage EMCC. Extended operation with the EMCC disengaged will cause the transmission to overheat.
> Brake switch issue will cause the EMCC to disengage. Extended oepration with the EMCC disengaged will cause the transmission to overheat.
> Tranmission fluid overfilled
> Transmission cooler or cooler lines restricted
> Transmission Temperature Sensor circuit

3.3 DIAGNOSTIC TROUBLE CODES

Diagnostic trouble codes (DTC's) are codes stored by the Transmission Control Module (TCM) that help us diagnose Transmission problems. They are viewed using the DRBIII® scan tool.

Always begin by performing a visual inspection of the wiring, connectors, cooler lines and the transmission. Any obvious wiring problems or leaks should be repaired prior to performing any diagnostic test procedures. Some engine driveability problems can be misinterpreted as a transmission problem. Ensure that the engine is running properly and that no PCM DTC's are present that could cause a transmission complaint.

If there is a communication bus problem, trouble codes will not be accessible until the problem is fixed. The DRBIII® will display an appropriate message. The following is a possible list of causes for a bus problem:

– open or short to ground/battery in PCI bus circuit.
– internal failure of any module or component on the bus

Each diagnostic trouble code is diagnosed by following a specific testing sequence. The diagnostic test procedures contain step-by-step instructions for determining the cause of a transmission diagnostic trouble code. Possible sources of the code are checked and eliminated one by one. It is not necessary to perform all of the tests in this book to diagnose an individual code. These tests are based on the problem being present at the time that the test is run.

All testing should be done with a fully charged battery.

If the TCM records a DTC that will adversely affect vehicle emissions, it will request (via the communication bus) that the PCM illuminate the Malfunction Indicator Lamp (MIL). Although these DTC's will be stored in the TCM immediately as a 1 trip failure, it may take up to five minutes of accumulated trouble confirmation to set the DTC and illuminate the MIL. Three consecutive successful OBDII (EURO STAGE III OBD) trips or clearing the DTC's with a diagnostic tool (DRBIII® or equivalent) is required to extinguish the MIL. When the TCM requests that the PCM illuminate the MIL, the PCM sets a DTC P0700 ($89) to alert the technician that there are DTC's in the TCM. This must also be erased in the PCM in order to extinguish the MIL.

3.3.1 HARD CODE

Any Diagnostic Trouble Code (DTC) that is set whenever the system or component is monitored is a HARD code. This means that the problem is there every time the TCM checks that system or component. Some codes will set immediately at start up and others will require a road test under specific conditions. it must be determined if a code is repeatable (Hard) or intermittent before attempting diagnosis.

3.3.2 ONE TRIP FAILURES

A One Trip Failure, when read from the TCM, is a hard OBDII (EURO STAGE III OBD) code that has not matured for the full 5 minutes. This applies to codes that will only set after 5 minutes of substituted gear operation.

3.3.3 INTERMITTENT CODE

A diagnostic trouble code that is not there every time the TCM checks the circuit or function is an a intermittent code. Some intermittent codes, such as codes P1684(12), P0891(14), P0888(15), P0725(18), P1694(19), P0871(21), P0846(22), P1724(24), P0706(28), P0120(29), P0750(41), P0755(42), P0760(43), P0765(44), P1793(48), P0715(56), P0720(57), P1794(58), P0951(70), P1799(74), P0884(76), P1687(77), and P1652(78) are caused by wiring or connector problems. However intermittent codes 50 - 54 are usually caused by intermittent hydraulic seal leakage in the clutch and/or accumulator circuits. Problems that come and go like this are the most difficult to diagnose, they must be looked for under the specific conditions that cause them.

3.3.4 STARTS SINCE SET COUNTER

For the most recent code, the Starts Since Set counter counts the number of times the vehicle has started since it was last set. The counter will count up to 255 starts. Note that this code only applies to the last or most recent code set.

When there are no diagnostic trouble codes stored in memory, the DRBIII® will display NO DTC'S

PRESENT and the reset counter will show "STARTS SINCE CLEAR =XXX

The number of starts helps determine if the diagnostic trouble code is hard or intermittent.

- If the count is less that 3, the code is usually a hard code.
- If the count is greater than 3, it is considered an intermittent code. This means that the engine has been started most of the time without the code recurring.

3.3.5 TROUBLE CODE ERASURE

A Diagnostic trouble code will be cleared from TCM memory if it has not reset for 40 warm-up cycles.

A warm-up cycle is defined as sufficient vehicle operation such that the coolant temperature has risen by at least 4.4°C (40°F) from engine starting and reaches a minumum temperature of 71°C (160°F).

The Malfunction Indicator Lamp (MIL) will turn off after 3 good trips or when the DTC's are cleared from the TCM.

3.3.6 LIST OF DIAGNOSTIC TROUBLE CODES (DETAILED DESCRIPTIONS FOLLOW LIST)

The TCM may report any of the following DTC's.

The TCM may report any of the following DTC's.				
DTC	**P-Code**	**Name of Code**	**Limp-in**	**MIL**
11	P0613	Internal TCM	Yes	Yes
12	P1684	Battery was disconnected	No	No
13	P0613	Internal TCM	Yes	Yes
14	P0891	Transmission Relay always on	Yes	Yes
15	P0888	Relay output always off	Yes	Yes
16	P0605	Internal TCM	Yes	Yes
17	P0604	Internal TCM	Yes	Yes
18	P0725	Engine speed sensor circuit	Yes	Yes
19	P1694	Bus communication with engine module	No	No
20	P0890	Switched battery	Yes	Yes
21	P0871	OD pressure switch sense circuit	Yes	Yes
22	P0846	2/4 pressure switch sense circuit	Yes	Yes
24	P0841	LR pressure switch sense circuit	Yes	Yes
28	P0706	Check shifter signal	No	No
29	P0120	Throttle position sensor signal circuit	No	Yes
31	P0870	OD hydraulic pressure test failure	Yes	Yes
32	P0845	2/4 hydraulic pressure test failure	Yes	Yes
33	P0992	2-4/OD hydraulic pressure test failure	Yes	Yes
35	P0944	Loss of prime	No	No
36	P1790	Fault immediately after shift	No	No
37	P1775	Solenoid switch valve latched in TCC position	No	Yes
38	P0740	Torque converter clutch control circuit	No	Yes
41	P0750	LR Solenoid circuit	Yes	Yes
42	P0755	2/4 Solenoid circuit	Yes	Yes
43	P0760	OD Solenoid circuit	Yes	Yes
44	P0765	UD Solenoid circuit	Yes	Yes
45	P0613	Internal TCM	No	No
47	P1776	Solenoid switch valve latched in LR position	Yes	Yes
48	P1793	TRD link communication error	No	Yes
50	P0736	Gear ratio error in reverse	Yes	Yes
51	P0731	Gear ratio error in 1st	Yes	Yes
52	P0732	Gear ratio error in 2nd	Yes	Yes
53	P0733	Gear ratio error in 3rd	Yes	Yes
54	P0734	Gear ratio error in 4th	Yes	Yes
56	P0715	Input speed sensor error	Yes	Yes

The TCM may report any of the following DTC's.				
DTC	**P-Code**	**Name of Code**	**Limp-in**	**MIL**
57	P0720	Output speed sensor error	Yes	Yes
58	P1794	Speed sensor ground error	Yes	Yes
70	P0951	AutoStick sensor circuit	No	No
71	P1797	Manual shift overheat	No	No
73	P0897	Worn out/burnt transaxle fluid	No	No
74	P1799	Calculated Oil temp in use	No	No
75	P0218	High temperature operation activated	No	No
76	P0884	Power up at speed	No	No
77	P1687	No communication with the MIC	No	No
78	P1652	Serial communication link malfunction	No	No
79	P0562	Low battery voltage	Yes	Yes
Yes (underlined) indicates that this DTC can take up to five minutes of problem identification before illuminating the MIL.				

3.3.7 DTC DESCRIPTIONS

Name of code: P0613(11, 13, or 45) - Internal Controller

When monitored: Whenever the key is in the Run or Run/Start position.

Set condition: This code is set whenever Transmission Control Module (TCM) senses an internal error

Theory of operation: The TCM is constantly monitoring it's internal processor. If an internal problem is detected, this DTC will be set. This DTC can also be set by a bad ground to the TCM and/or Trans Control Relay.

Transmission Effects: The MIL will illuminate (this DTC can take up to five minutes of problem identification before illuminating the MIL) and the transmission system will default to the Immediate Shutdown routine.

Possible causes:

- > TCM ground circuit.
- > Relay ground circuit
- > TCM

Name of code: P1684(12) - Battery was Disconnected (Informational code Only)

When monitored: Whenever the key is in the Run/Start position.

Set condition: This code is set whenever the Transmission Control Module (TCM) is disconnected from battery power (B+) or ground. It will also be set during the DRBIII® Battery Disconnect procedure.

Theory of operation: A battery backed RAM (Random Access Memory) is used to maintain some learned values. When the battery B(+) is disconnected, the memory is lost. When the B(+) is restored, this memory loss is detected by the TCM. The code is set and the learned values are initialized to known constants or previously learned values from EEPROM (Electronic Erasable Programmable Read Only Memory). This results in the reinitialization of some parameters.

Transmission Effects: Loss of trouble code data. Immediate Limp-in mode if power is lost while operating the vehicle. Normal operation is resumed if the power is restored during the same key start.

Possible causes:

- > Battery voltage removed from TCM
- > TCM disconnected
- > Dead Battery
- > Low battery voltage during cranking
- > Battery Disconnect by DRBIII® or MDS
- > Bad TCM ground circuit.

Name of code: P0891(14) - Transmission Relay Always On

When monitored: Ignition key is turned from off position to run position and/or ignition key is turned from crank position to run position.

Set condition: This code is set if the Transmission Control Module (TCM) senses greater than 3 volts at the Trans Relay Output (switched battery) terminal of the TCM prior to the TCM energizing the relay.

Theory of operation: The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the TCM through pins 16 and 17. It is referred to as Trans Relay Output circuit or switched battery.

Transmission Effects: The MIL will illuminate and the transmission system defaults to Logical Limp-in mode. Logical Limp-in mode results in the same modes of operation as Limp-in. Since the relay is stuck "on", the TCM can not open the relay, and the TCM shifts to 2nd gear.

Possible causes:

> Relay failure (welded contacts)
> Short to battery in 12-volt supply and/or Transmission Control Relay Output circuit(s)
> Short to voltage
> TCM connector problems
> TCM

Name of code: P0888(15) - Relay Output Always Off

When monitored: Continuously

Set condition: This code is set when less than 3 volts are present at the Trans Relay Output (switched battery) terminals at the Transmission Control Module (TCM) when the TCM is energizing the relay.

Theory of operation: The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the TCM through pins 16 and 17. It is referred to as the Trans Relay Output circuit or switched battery.

After a controller reset (ignition key turned to the run position or after cranking engine), the controller energizes the relay. Prior to this the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

Transmission Effects: The MIL will illuminates and the transmission system defaults to Limp-in mode.

Possible causes:

> Relay failure (intermittent relay function caused by oxidized or contaminated relay contacts)
> Short to ground or open circuit in the Transmission Control Relay circuit(s)
> TCM connector problem
> TCM

Name of code: P0725(18) - Engine Speed Sensor Circuit

NOTE: This code is not a transmission input speed sensor DTC

When monitored: Whenever the engine is running.

Set condition: This code is set when the engine speed sensed by the Transmission Control Module (TCM) is less than 390 RPM or greater than 8000 RPM for more than 2.0 seconds.

Theory of operation: The TCM uses either a EATX RPM signal (simulated Crank Sensor signal) or the TCM uses the Crank Position Sensor signal to calculate engine RPM depending on the engine application. The signal supplied by the PCM and uses a dedicated circuit is called the EATX RPM Signal circuit. The Crank Position sensor signal is a spliced circuit from the engine Crank Position Sensor. Check the wiring schematics to determine which (engine speed sensor circuit) is used in the vehicle. If the TCM interprets this signal to be out of range when the engine is running (as reported by the PCM over the bus) the code is set.

Transmission Effects: The MIL illuminates and the transmission system defaults to Limp-in mode.

Possible causes:

> Open or short in EATX RPM Signal circuit.
> Open or short in Crank Position Sensor Signal circuit.
> Open or short in Crank Position Sensor ground circuit.
> TCM and/or PCM connector problems
> TCM
> PCM

Name of code: P1694(19) - Bus Communication with Engine Module

When monitored: Continuously with key on.

Set condition: If no PCI bus messages are received from the Powertrain Control Module (PCM) for 10 seconds.

Theory of operation: The TCM communicates with the PCM using the PCI bus. It relies on certain information to function properly. The TCM continuously monitors the PCI bus to check for messages broadcast from the PCM.

Transmission Effects: Delayed 3-4 shifts. No EMCC and early 3-4 shifts for a few minutes after engine is started.

Possible causes:

> Open or shorted PCI bus circuit
> TCM
> PCM

Name of code: P0890(20) - Switched Battery

When monitored: Ignition key is turned from off position to run position and/or ignition key is turned from crank position to run position.

Set condition: This code is set if the Transmission Control Module (TCM) senses voltage on any of the pressure switch inputs prior to the TCM energizing the relay.

Theory of operation: The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the TCM through pins 16 and 17. It is referred to as the Trans Relay Output circuit or a switched battery.

Immediately after a controller reset (ignition key turned to the run position or after cranking engine), the TCM verifies that the relay contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the Solenoid Pack pressure switches is checked. There should be no voltage on the pressure switches at this time. The TCM will then activate the relay.

Transmission Effects: The MIL illuminates and the transmission system defaults to Limp-in mode.

Possible causes:

> Short to battery on one or more pressure switch sense circuits

> TCM connector problems

> TCM

Name of code: P0871(21) - OD Pressure Switch Sense Circuit

When monitored: Whenever the engine is running.

Set condition: This code is set if the OD pressure switch is open or closed at the wrong time in a given gear (see chart below).

Theory of operation: The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown below.

41TE PRESSURE SWITCH STATES

SWITCHES	R	N	1ST	2ND	3RD	4TH
L/R	OPEN	CLOSED	CLOSED	OPEN	OPEN	OPEN
2/4	OPEN	OPEN	OPEN	CLOSED	OPEN	CLOSED
O/D	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED

80b38be7

Transmission Effects: Normal operation will be experienced if no other codes are present. TCM will ignore the code. Limp-in condition will only occur if code P0871(21) is present with a code P0706(28).

Possible causes:

> If code P0944(35) is present, ignore code P0871(21) and perform code P0944 diagnostic procedures

> OD pressure switch sense circuit open or shorted to ground between TCM and solenoid pack

> OD pressure switch sense circuit shorted to battery

> Solenoid pack

> Loose valve body bolts

> Plugged filter - internal transmission or torque converter failure

> TCM

Name of code: P0846(22) - 2/4 Pressure Switch Sense Circuit

When monitored: Whenever the engine is running.

Set condition: This code is set if the 2/4 pressure switch is open or closed at the wrong time in a given gear (see chart below).

Theory of operation: The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear as shown below.

41TE PRESSURE SWITCH STATES

SWITCHES	R	N	1ST	2ND	3RD	4TH
L/R	OPEN	CLOSED	CLOSED	OPEN	OPEN	OPEN
2/4	OPEN	OPEN	OPEN	CLOSED	OPEN	CLOSED
O/D	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED

80b38be7

Transmission Effects: If the 2/4 pressure switch is identified as closed in P or N, the code will immediately be set and normal operation will be allowed for that given key start. If the problem is identified for 3 successive key starts, the transmission will go into Limp-in mode.

If the 2/4 pressure switch is identified as being closed in 1st or 3rd gear and was not identified as being closed in P or N, then 2nd gear or 4th gear will be substituted for 1st or 3rd gear depending on throttle angle and vehicle speed. A short period of time after the gear substitution, the transmission will return to normal operating mode. If the transmission is shifted back into 1st or 3rd gear through normal operation, and the 2/4 pressure switch remains closed, 2nd or 4th gear will be substituted briefly and then resume normal operation. If four gear substitutions occur in a given key start, the transmission will go into Limp-in mode.

If the 2/4 pressure switch is open (indicating no 2/4 clutch pressure) in 2nd or 4th gear, the TCM sets code P0846(22) and continues with normal operation. The transmission will only go into Limp-in mode if a code P0706(28) is also present. If no 2/4 clutch pressure is present a gear ratio code P0732(52) or P0734(54) will be set and cause the limp-in condition.

Possible causes:

> If code P0944(35) is present, ignore code P0846(22) and perform code P0944 diagnostic procedures

> 2/4 pressure switch sense circuit open or shorted to ground between TCM and solenoid pack

> 2/4 pressure switch sense circuit shorted to battery

> Solenoid pack

> Transmission overheated - Excessive regulator valve leakage in valve body causing high line pressure which results in 2/4 solenoid blow-off in 1st or 3rd gear. May require new valve body if it happens only when hot.

> Loose valve body bolts

> Plugged filter - internal transmission or torque converter failure

> TCM

Name of code: P0841(24) - LR Pressure Switch Sense Circuit

When monitored: Whenever the engine is running.

Set condition: This code is set if the LR pressure switch is either open or closed at the wrong time in a given gear.

Theory of operation: The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear as shown below.

41TE PRESSURE SWITCH STATES

SWITCHES	R	N	1ST	2ND	3RD	4TH
L/R	OPEN	CLOSED	CLOSED	OPEN	OPEN	OPEN
2/4	OPEN	OPEN	OPEN	CLOSED	OPEN	CLOSED
O/D	OPEN	OPEN	OPEN	OPEN	CLOSED	CLOSED

80b38be7

Transmission Effects: If a set condition is identified, 1st gear and torque converter lock-up (EMCC) will be inhibited. The vehicle will launch in 2nd gear and shift normally through the gears without allowing EMCC. If during the same key start, the set condition is no longer valid, the transmission will return to normal operation (1st and EMCC available). Limp-in will not occur unless code P0841(24) is accompanied by a code P0706(28) and the MIL will illuminate after 5 minutes of substituted operation.

Possible causes:

> If code P0944(35) is presnet, ignore code P0841(24) and perform code P0944(35) diagnostic procedures

> LR pressure switch sense circuit open or shorted to ground between TCM and solenoid pack

> LR pressure switch sense circuit shorted to battery

> Solenoid pack

> Valve body - solenoid switch valve stuck in LU position. May be accompanied by a code P1775(37)

> Loose valve body bolts

> Plugged filter - internal transmission or torque converter failure

> TCM

Name of code: P0706(28) - Check Shifter Signal

When monitored: Continuously with the key on.

Set condition: 3 occurrences in one key start of an invalid PRNDL code which lasts for more than 0.1 second.

Theory of operation: The C1 through C4 (T1, T3, T41, and T42) sense circuits communicate the shift lever position to the TCM. Each circuit is terminated at the transmission with a switch. Each switch can be either open or closed, depending on the shift lever position. The TCM can decode this information and determine the shift lever position. Each shift lever position has a certain combination of switches which will be open and closed, this is called a PRNDL code. There are 4 switches, therefore: there are many possible combinations of open and closed switches (codes). However, there are only 9 valid codes (8 for AutoStick), one for each gear position and three recognized between gear codes. The remainder of the codes should **never occur**, these are called invalid codes. The following chart shows the normal switch states for each shift lever position.

TRS	Park	T1	Rev	T2	N	T2	OD	T3	3/AS	T3	L
T1 (C4)	OP	OP	OP	CL	CL	CL	CL	CL	OP	CL	CL
T3 (C3)	CL	CL	OP	OP	OP	OP	OP	CL	CL	CL	CL
T41 (C1)	CL	OP	OP	OP	CL	OP	OP	OP	OP	OP	OP
T42 (C2)	CL	CL	CL	CL	CL	CL	OP	OP	OP	OP	CL

OP = OPEN   CL = CLOSED

The following are DRBIII® reported Shift Lever Error codes (chart)

SHIFT LEVER ERROR CODES REPORTED BY THE DRBIII®

ERROR CODE	SWITCH STUCK	POSITION
1	T1/C4 STUCK	OPEN
2	T1/C4 STUCK	CLOSED
3	T3/C3 STUCK	OPEN
4	T3/C3 STUCK	CLOSED
5	T42/C2 STUCK	OPEN
6	T24/C2 STUCK	CLOSED
7	T41/C1 STUCK	OPEN
8	T41/C1 STUCK	CLOSED

80ccf2de

Transmission Effects and possible causes:
Scenario 1) - All PRNDL lights stay illuminated indefinitely in Park following a Key start.

> Wrong Part Number TCM for application

> TRS connector not plugged in

> C1 through C4 (T1, T3, T41, or T42) circuits are open, shorted to ground, or shorted to 12 volts.

> PCI bus failure (Open or shorted resulting in no communication to BCM or Cluster)

> TRS

> TCM

> BCM

Scenario 2) - "P" is indicated following a key start but all PRNDL lights illuminate in "N" following a shift from "R" to "N". If PRNDL lights illuminate in "N" and shifter is moved directly into "3" or "L" position without pausing in "OD", then the "OD" position shift schedule and electronic display will indicate "OD" until the shifter is shifted into the "OD" position and held for at least 3 seconds.

> Worn Manual Lever (Rooster Comb). Check for heavy wearing by TRS switch contacts

> Intermittent C1 through C4 (T1, T3, T41 or T42) circuits. Check for corrosion, terminal push-outs or spread terminals at 60-way and/or TRS switch 10-way connector

> TRS

> TCM

> BCM

Scenario 3) - If an invalid code happens while operating in the "3" or "L" position, the "3" or "L" shift schedule and electronic display will be frozen (regardless of whether "OD"', "3" or "L" is selected). The display will be frozen until the shifter is moved to the "N" position (all PRNDL lights will illuminate) and then back to the "OD" position. The "N" and "OD" position must be held there for at least 3 seconds in order to resume the normal "OD" shift schedule and electronic display.

> Intermittent C1 through C4 (T1, T3, T41 or T42) circuits. Check for corrosion, terminal push-outs or spread terminals at 60-way and/or TRS connector

> TRS

> TCM

> BCM

These same symptoms may occur without the code P0706(28) getting set. It is possible that the invalid code that was sensed by the TCM only occurred once or twice during the given ignition key start and/or did not last for longer than 0.1 second.

Name of code: P0120(29) - Throttle Position Sensor Signal Circuit
When monitored: Whenever the engine is running.
Set condition: This code is set if the throttle angle goes out of range or if throttle angle changes abruptly (ie: faster than the throttle body motion could occur)
Theory of operation: The Transmission Control Module (TCM) receives the throttle position signal from the Throttle Position Sensor (TPS) through a wire spliced into the TPS circuit to the PCM. The TPS has a 5-volt pull up supplied from the Powertrain Control Module (PCM). The signal is checked for out-of-range and intermittent operation (excessive signal changes).
Transmission Effects: Extremely erratic transmission shifting with an intermittent TPS signal just prior to setting the code. If the intermittent does not last long enough to set the code, the customer will say that the transmission violently hunts between gears. The TCM will use a "calculated throttle angle" supplied by the PCM over the PCI bus. If the PCI bus is unavailable, the TCM will use a default throttle angle of 24 degrees for the key start in which the code was set. The TCM will try to use the TPS signal again on the next key start. The MIL will illuminate after 5 minutes of substituted operation if the engine controller is not calibrated for throttle substitution.
Possible causes:

> Open or shorted TPS signal and/or ground circuits

> TCM connector problems
> TPS or TPS connector (Check PCM DTC's)
> PCM
> TCM

Name of code: P0870(31) - OD Hydraulic Pressure Test Failure
P0845(32) - 2-4 Hydraulic Pressure Test Failure
P0992(33) - 2-4/OD Hydraulic Pressure Test Failure
When monitored: In 1st, 2nd, or 3rd gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.
Set condition: Immediately after a shift into 1st, 2nd, or 3rd gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the 2-4 and/or OD clutch circuits to identify that the appropriate pressure switch closes. If the pressure switch does not close it is tested again. If the switch does not close the second time, the appropriate code is set.
Theory of operation: The Transmission Control Module (TCM) tests the OD and 2-4 pressure switches when they are off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test verifies that the switches are operational. The TCM verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is retested, If it fails the second test, the code is set.
Transmission Effects: The MIL illuminates and the transmission system defaults to Limp-in mode.
Possible causes:

> Pressure switch sense circuit shorted to battery between TCM and solenoid pack.
> Low line pressure
> Solenoid Pack

Name of code: P0944(35) - Loss Of Prime
When monitored: If the transmission is slipping in any forward gear and the pressure switches are not indicating pressure, a loss of prime test is run.
Set condition: If the transmission begins to slip in any forward gear, and the pressure switch or switches that should be closed for a given gear are open, a loss of prime test begins. All available elements (in 1st gear LR, 2/4 and OD, in 2nd, 3rd, and 4th gear 2/4 and OD) are turned on by the Transmission Control Module (TCM) to see if pump prime exists. The code is set if none of the pressure switches respond. The TCM will continue to run the loss of prime test until pump pressure returns.
Theory of operation: The loss of prime test is used to prevent transmission defaults which can be caused by a lack of pump prime.
Transmission Effects: Vehicle will not move or transmission slips. Normal operation will continue if pump prime returns.
Possible causes:

> Low transmission fluid level
> PRNDL indicates a valid OD code in the hydraulic reverse position
> Transmission fluid filter clogged or damaged.
> Transmission fluid filter improperly installed (Bolts loose or O-ring missing)
> Oil pump - If a customer has a problem when the transmission is cold. Where someone shifts to reverse, reverse is engaged, and then shifts to OD and does not get OD (gets a neutral condition), and then can not get reverse or OD for 3-20 seconds, replace the oil pump. High side clearance in the oil pump will set a code 35. The pump will prime upon start-up, but as the torque converter purges air (drain down) the air will leak across the inner rotor into the pump suction port and cause a loss of prime right after the shift into OD. After 3 - 20 seconds, pump prime will return and normal operation will continue. The pump should be replaced only after all other possible causes above have been checked and verified.

Name of code: P1790(36) - Fault Immediately After Shift
When monitored: After a gear ratio error is stored.
Set condition: This code is set if the associated gear ratio code is stored within 1.3 seconds after a shift.
Theory of operation: This code will only be stored along with a 50 series code. If this code is set, it indicates the problem is mechanical in nature. When this code exists, diagnosing the transmission should be based on the associated gear ratio code and primarily mechanical causes should be considered.
Transmission Effects: None
Possible causes:

> Mechanical causes as listed under associated gear ratio code.

Name of code: P1775(37) - Solenoid Switch Valve Latched in TCC Position
When monitored: During an attempted shift into 1st gear.
Set condition: This code is set if three unsuccessful attempts are made to get into 1st gear in one given key start.
Theory of operation: The solenoid switch valve (SSV) controls the direction of the transmission fluid when the L-R/TCC solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L-R clutch circuit. In

2nd, 3rd, and 4th, it will be in the upshifted position and directs the fluid into the torque converter clutch (TCC).

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L-R pressure switch is monitored to confirm SSV movement. If movement is not confirmed (the L-R pressure switch does not close), 2nd gear is substituted for 1st.

Transmission Effects: Transmission will have no 1st gear (2nd gear will be substituted), and no EMCC operation and the MIL will illuminate after 5 minutes of substituted operation.

Possible causes:

> PRNDL indicates a valid OD code in the hydraulic reverse position

> Valve body - Solenoid valve stuck in TCC position

> High idle speed

> Solenoid malfunction - L-R pressure switch will not close

> L-R Pressure Switch Sense circuit shorted to battery

Name of code: P0740(38) - Torque Converter Clutch Control Circuit

When monitored: During Electronically Modulated Converter Clutch (EMCC)

Set condition:

(a) The transmission must be in EMCC, with the input speed greater than 1750 RPM. The TCC/L-R solenoid must achieve it's maximum duty cycle and still not be able to pull the engine speed within 60 RPM of input speed.

b) If the transmission is in FEMCC and the engine can slip the TCC by more than 100 RPM (Engine speed - Input speed) for 10 seconds.

The code will be set if one of these event happens three times at a throttle angle less than 30 degrees.

Theory of operation: When in 2nd, 3rd, or 4th gear, the torque converter clutch (TCC) can be locked when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L-R/TCC solenoid until the torque converter slip (difference between engine and turbine speed) is within 60 RPM. Then the L-R/TCC solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

Transmission Effects: EMCC will still be available after code is set. MIL will illuminate after 5 minutes of accumulated slip in FEMCC. The transmission will attempt normal operation (no limp-in) even after the MIL is illuminated.

Possible causes:

> Worn pump bushing and/or failed torque converter - both should be replaced during a rebuild with code P0740(38) present

> Solenoid pack.

Name of code: P0750(41) - L-R Solenoid Circuit
P0755(42) - 2-4 Solenoid Circuit
P0760(43) - OD Solenoid Circuit
P0765(44) - UD Solenoid Circuit

When monitored: Ignition key is turned from off position to run position and/or ignition key is turned from crank position to run position, then every 10 seconds thereafter, or when a gear ratio or pressure switch error DTC is detected.

Set condition: All four solenoids are tested for continuity continuously immediately upon start up and during vehicle operation. For solenoids that are currently energized, power is momentarily interrupted, then reenergized. For solenoids that are not currently energized, the solenoid is momentarily energized, then deenergized. Under both situations, if an inductive spike is not sensed by the Transmission Control Module (TCM) during the continuity check, it is retested twice. If it fails the test the third time, the appropriate code is set.

SOLENOID APPLICATION CHART

GEAR	UD	OD	REV	2/4	LR
PARK					X
REVERSE			X		X
NEUTRAL					X
1ST	X				X
2ND	X			X	
3RD	X	X			
4TH		X		X	

80ccf4c0

Theory of operation: Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on it's current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate code being set.

Transmission Effects: The MIL will illuminate and the transmission goes into neutral if code is set above 35 Km/h (22 MPH), limp-in mode when vehicle speed is below 35 Km/h (22 MPH).

Possible causes:

> Open or shorted solenoid circuit(s) between TCM and solenoid pack.

> Open ground circuit

> TCM connector problems.

> Solenoid pack connector problem.

> Solenoid Pack

> TCM

Name of code: P1776(47) - Solenoid Switch Valve Latched in LR Position

When monitored: Continuously when doing partial or full EMCC (PEMCC or FEMCC)

Set condition: If the transmission senses the LR pressure switch closing while performing PEMCC or FEMCC. This code will be set after two unsuccessful attempts to perform PEMCC or FEMCC.

Theory of operation: The solenoid switch valve (SSV) controls the direction of the transmission fluid when the LR/TCC solenoid is energized. SSV will be in the downshifted position in 1st gear, thus directing the fluid to the LR clutch circuits. In 2nd, 3rd, and 4th, the SSV will be in the upshifted position and directs the fluid into the torque converter clutch (TCC).

When doing PEMCC or FEMCC, the LR pressure switch should indicate no pressure if the SSV is in the TCC position. If the LR pressure switch indicates pressure while in PEMCC or FEMCC, EMCC operation is aborted and inhibited to avoid inadvertent application of the LR clutch. Partial EMCC will be attempted if the LR pressure switch does not indicate pressure. A second detection of LR pressure results in setting the code.

Transmission Effects: At speeds above 72 Km/h (45 MPH), EMCC is inhibited. Once speed falls below 72 Km/h (45 MPH), the transmission will go into Limp-in mode and the MIL will illuminate after 5 minutes of substituted operation.

Possible causes:

> Valve body - Solenoid valve stuck in LR position

> Intermittent short to ground or open circuit in LR Pressure Switch Sense circuit (with code 24 only)

> Solenoid pack (with code P0841(24) only)

> TCM (with code P0841(24) only)

Name of code: P1793(48) - TRD Link Communication Error

NOTE: The MIL will be lit for some engines that limit throttle after a TRD failure.

When monitored: Whenever the engine is running.

Set condition: This code is set when the TCM sends multiple torque reduction messages to the PCM and the TCM does not receive a response from the PCM.

Theory of operation: During high torque shifts the TCM will send a message requesting that the PCM reduce engine power until the shift is completed. This message is sent from the TCM to the Powertrain Control Module across the Torque Management Request Sense Circuit. The PCM will acknowledge the TCM's request by sending a message across the PCI bus within a specific amount of time. The TRD Link communication is also tested periodically for operation whenever the engine is running and the vehicle is not moving with zero degrees throttle.

Transmission Effects: Maximum throttle angle used by TCM will be 54 degrees. As a result a customer may complain about loss of performance or of short shifting when driving aggressively.

Possible causes:

> Sticky Throttle Position Sensor (TPS)

> Wiring or Connector problems in the Torque Management Request Sense Circuit

> PCM

> TCM

Name of code: P0736(50) - Gear Ratio Error in Reverse
P0731(51) - Gear Ratio Error in 1st
P0732(52) - Gear Ratio Error in 2nd
P0733(53) - Gear Ratio Error in 3rd
P0734(54) - Gear Ratio Error in 4th
P0715(56) - Input Speed Sensor Error
P0720(57) - Output Speed Sensor Error
P1794(58) - Speed Sensor Ground Error

When monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set condition: This code is set if the gear ratio is not correct for a period of time.

– Codes 50 through 54 sets if the ratio of the input RPM (Nt) to the output RPM (No) does not match the given gear ratio.

– Code 56 sets if there is an excessive change in input RPM in any gear

– Code 57 sets if there is an excessive change in output RPM in any gear

– Code 58 sets after a TCM reset in neutral and Nt/No equals a ratio of input to output of 2.50

A hard code sets within 3 seconds, an intermittent code sets within 15 seconds.

Theory of operation: The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (codes 50 through 54).

2) An excessive change in input or output speeds

indicating signal intermittent will result in codes 56 and/or 57 being set.

3) After a TCM reset in neutral, observing erratic output and input speed sensor signals indicates a loss of the common speed sensors ground. This sets a code 58.

Transmission Effects: The transmission will not go into Limp-in mode until three gear ratio error events occur in a given key start. This allows for intermittent problems to correct themselves without opening the relay. However, if a gear ratio error develops, a code is always set, but if the condition corrects itself the transmission will continue without requiring the ignition key to be cycled on and off. Many different events could occur given the range of failures possible for codes 50 through 58. The following are a few examples:

– Codes 51, 52, 53, 54, 56, and 57 at speeds above 72 Km/h (45 MPH) - The appropriate code is set, EMCC is aborted and current gear is maintained. If while still traveling above 72 Km/h (45 MPH), the gear ratio becomes valid again, EMCC will reengage and normal operation will resume. If the gear ratio becomes intermittent and recovers three times in a given key start, the current gear will be maintained and EMCC inhibited, then the transmission will go into limp-in mode if throttle is applied below 72 Km/h (45 MPH) or at 35 Km/h (22 MPH) with closed throttle.

– Codes 51, 52, 53, 54, 56, and 57 at speeds between 35 and 72 Km/h (22 and 45 MPH) - If one of these codes is set between 35 and 72 Km/h (22 and 45 MPH), the current gear will be maintained until the gear ratio problem corrects itself. If throttle is applied, the trans will go to 2nd gear. If this happens and the gear ratio problem goes away, normal operation will resume. If three gear ratio problems are identified in a given key start, the current gear will be frozen until throttle is applied. The transmission will then go into Limp-in mode with throttle applied at speeds between 35 and 72 Km/h (22 and 45 MPH).

– Codes 51, 52, 53, 54, 56, and 57 at speeds below 35 Km/h (22 MPH) - If a gear ratio problem is identified below 35 Km/h (22 MPH), the transmission will immediately substitute second gear for the current gear. If the gear ratio problem goes away, normal operation will resume. If three gear ratio problems are identified in a given key start, the transmission will go into Limp-in mode.

Possible causes:

Code P0736(50) - Excludes geartrain failures which should be obvious upon disassembly

> If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first

> Valve body - #1 ball check or LR switch valve sticking - may also set code P0731(51)

> Speed sensor or associated wiring - may also set codes P0731(51), P0715(56), or P0720(57)

> Failed or slipping LR clutch - may also set code P0731(51)

  – LR seal leakage (Intermittent no drive or reverse)

  – Sticky LR accumulator seals (Intermittent no drive or reverse)

> Failed reverse clutch (hard code)

  – OD/Rev lip seal leakage

  – Worn reaction shaft support seal rings

  – Snap ring out of position

Code P0731(51) - Excludes geartrain failures which should be obvious upon disassembly

> If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first

> Valve body - #1 ball check or LR switch valve sticking - may also set code P-0736(56) or have no Reverse

> Speed sensor or associated wiring - may also set codes P0736(50), P0715(56), or P0720(57)

> Failed or intermittent slipping UD clutch - may also set P0732(52), or P0733(53)

  – UD seal leakage (intermittent)

  – Worn input clutch hub bushing (hard code at heavy throttle)

  – Sticky UD accumulator seals (intermittent)

  – Worn reaction shaft support seal rings (hard code at heavy throttle)

  – Solenoid pack (UD pressure in 4th gear

> Failed or slipping LR clutch - may also set code P0736(56) or have no Reverse

  – LR seal leakage (Intermittent)

  – Sticky LR accumulator seals (Intermittent)

Code P0732(52) - Excludes geartrain failures which should be obvious upon disassembly

> If code P0944(35) is also set, follow diagnostic procedure for code P0944(35)

> Failed or slipping 2-4 clutch - may also set code P-0734(54)

  – 2-4 seat leakage (intermittent)

  – Sticky accumulator seals (intermittent)

> Failed or intermittent slipping UD clutch - may also set code P-0731(51) and/or P-0733(53)

  – UD seal leakage (intermittent)

  – Worn input clutch hub bushing (hard code at heavy throttle)

– Sticky UD accumulator seals (intermittent)
– Worn reaction shaft support seal rings (hard code at heavy throttle)
– Defective solenoid pack (UD pressure in 4th gear)

Code P0733(53) - Excludes geartrain failures which should be obvious upon disassembly

> If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first
> Failed or slipping OD clutch - may also set code P0734(54)
  – OD and Reverse inner and outer lip seal leakage (usually hard code)
  – Sticky OD accumulator seals (intermittent)
  – Worn reaction shaft support seal rings (hard code at heavy throttle)
  – Broken OD/UD tapered snap ring - (hard code at heavy throttle)
> Failed or intermittent slipping UD clutch - may also set code P0731(51) and/or P0732(52)
  – UD seal leakage (intermittent)
  – Worn input clutch hub bushing (hard code at heavy throttle)
  – Sticky UD accumulator seals (intermittent)
  – Worn reaction shaft support seal rings (hard code at heavy throttle)
  – Solenoid pack (UD pressure in 4th gear)

Code P0734(54) - Excludes geartrain failures which should be obvious upon disassembly

> If code P0944(35) is also set, follow diagnostic procedure for code P0944(35) first
> Failed or slipping OD clutch - may also set code P0733(53)
  – OD and Reverse inner and outer lip seal leakage (usually hard code)
  – Sticky OD accumulator seals (intermittent)
  – Worn reaction shaft support seal rings (hard code at heavy throttle)
  – Broken OD/UD tapered snap ring - (hard code at heavy throttle)
> Failed or slipping 2-4 clutch - may also set code P0732(52)
  – 2/4 seal leakage (intermittent)
  – Sticky accumulator seals (intermittent)

Codes P0715(56) and P0720(57)

> Failed input or output speed sensor (intermittent or hard code)
> Shorted or open wiring between TCM and speed sensor(s) (intermittent)
> Connector problems at 60 TCM connector and/or speed sensor connector

Code P1794(58)

> Open or shorted speed sensor ground (speed sensor ground is different from chassis ground)
> Open or shorted Temperature Sensor wiring to TRS
> TRS - Will also set code P1799(74)
> TCM

Name of code: P0951(70) - AutoStick Sensor Circuit (If equipped)
When monitored: Whenever the engine is running.
Set condition:
1) The transmission shift lever is not in AutoStick and either the upshift or downshift switches are closed.
2) Upshift and downshift switches are closed at the same time.
Theory of operation: In the AutoStick Mode (manual shift mode), upshifts and downshifts are actuated manually. Shift requests are detected by monitoring the MUXED or the upshift and downshift switches. The Transmission Control Module (TCM) monitors the above set conditions. A set condition will be tolerated for up to 15 seconds before setting a code.
Transmission Effects: The OD position shift schedule is substituted while operating in the AutoStick gear selector position. No Limp-in mode occurs.
Possible causes:

> Wiring or connector problems
> AutoStick switch failure
> TCM

Name of code: P1797(71) - Manual Shift Overheat
When monitored: Whenever the engine is running.
Set condition:
1) If the engine temperature exceeds 124°C (225°F) while operating in AutoStick mode.
2) If the transmission temperature exceeds 135°C (275°F) while in AutoStick mode
Theory of operation: Transmission and engine temperatures are monitored during vehicle operation. If conditions occur causing the engine or transmission to overheat, the AutoStick mode will be canceled, and a code will be set.
Transmission Effects: The 3 position shift schedule that is used in non-AutoStick applications is substituted while operating in the AutoStick gear selector position. No Limp-in mode occurs.
Possible causes:

> Engine overheat - refer to service manual for diagnosis and repair
> Transmission Overheat

– Restricted transmission cooling system
– Transmission fluid overfilled
– Radiator fan not functioning properly
– Extended driving in low gear

NOTE: Strenuous driving conditions may cause the vehicle to overheat. If the driver operates in or initiates autostick with an overheated vehicle, the code will be set.

Name of code: P0897(73) - Worn Out/Burnt Transaxle Fluid
When monitored: At every Fully Electronically Modulated Converter Clutch (FEMCC) to Partial Electronically Modulated Converter Clutch (PEMCC) transition miles when A/C compressor clutch is being cycled.
Set condition: The code will be set if vehicle shudder is detected 20 times when the A/C clutch is cycled.
Theory of operation: While in 3rd or 4th FEMCC and just before the A/C clutch engages, the Powertrain Control Module (PCM) requests the Transmission Control Module (TCM) to momentarily establish PEMCC operation. If vehicle shudder is detected during the FEMCC to PEMCC transition, a counter is incremented. If the count reaches 20, the trouble code is set. The driver may then notice harsh bumps when the A/C clutch is being cycled, but vehicle shudder will be eliminated. After 35 OBDII (EURO STAGE III OBD) warm-up starts or if the code is cleared, PEMCC will be reactivated to see if shudder is still present. If one shudder event occurs, the code will be reset. Clearing the code and running battery disconnect with the DRBIII® is the only way to reset the shudder counter from 20 back to zero.
Transmission Effects: This code does not cause the transmission to go into Limp-in mode. However, once the code is set, FEMCC to PEMCC operation before the A/C clutch engagement will be disabled for 35 OBDII (EURO STAGE III OBD) warm up starts.
Possible causes:

> Degraded transmission fluid
> Wheels severely out of alignment
> Internal torque converter problem

Name of code: P1799(74) - Calculated Oil Temperature in Use
When monitored: Whenever the Engine is running.
Set condition: The code is set if any of the following conditions exist for three consecutive key starts:
> The Temperature Sensor voltage is out of range (below 0.07 volts or greater than 4.94 volts)
> If the TCM senses continuous erratic Temperature Sensor voltage.
> The Temperature Sensor temperature stays below 27°C (80°F) for an extended period of time.
Theory of operation: The TCM uses a Temperature Sensor to monitor the transmission sump temperature. This temperature is used to determine which shift schedule the TCM is to use. (See Transmission Operation and Shift Scheduling at Various Sump Temperatures in this diagnostic manual) If the Temperature Sensor circuit fails to operate properly the TCM will use the calculated oil temperature routine found in prior model year TCM. If this occurs for three consecutive key starts, the code will be set. The TCM will then test the Temperature Sensor circuit after ever 35 OBDII (EURO STAGE III OBD) warm-up starts. If the Temperature Sensor circuit is OK, the Temperature Sensor data is used in place of the Calculated Oil temperature data.
Transmission Effects: If the Transmission Temperature Sensor indicates a temperature below -18° C (0°F) or above 115° C (240°F) at start up, The TCM compares the calculated oil temperature to the indicated Temperature Sensor oil temperature. If the calculated oil temperature differs significantly from the Temperature Sensor value, the calculated oil temperature will be used for that key start.
Possible causes:

> Wiring or Connector problems in the transmission temperature sensor signal circuit.
> TRS
> TCM

Name of code: P0218(75) - High Temperature Operation Activated.
When monitored: Whenever the engine is running.
Set condition: Immediately once the Overheat Shift Schedule is activated.
Theory of operation: If the transmission oil temperature rises above 115°C (240°F), the overheat shift schedule is activated refer to Transmission Operation as a function of Transmission Oil Temperature and the code is set. The DTC is an information code only and is being set to aid the technician in determining root cause of a customer driveability issue. The code is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler should be added to the vehicle if the customer regularly drives in a manner that overheats the transmission. Extended operation above 115°C (240°F) will reduce the durability of the transmission and should be avoided. Correcting the cooling system malfunction or installing an additional transmission oil cooler

will improve transmission durability especially for customers who operate in city/construction stop and go traffic, tow trailers regularly, drive aggressively in low gear or drive regularly in mountainous areas.
Transmission effects: Information only code. - Overheat shift schedule was activated, no Limp-in condition occurs. 2nd gear partial EMCC above 40 Km/h (25 MPH), 3rd gear EMCC from 45-69 Km/h (28-43 MPH), delayed 3-4 upshift at 69 Km/h (43 MPH), early 4-3 coastdown at 66 Km/h (41 MPH), EMCC operation under all conditions above 40 Km/h (25 MPH) except at closed throttle or 1st gear.
Possible causes:

– Transmission Overfilled with Oil
– Engine cooling fan failure
– Engine thermostat stuck closed
– Radiator corroded or packed with dirt
– Transmission Oil Cooler Plugged
– Customer driving pattern requires additional transmission cooling

Name of code: P0884(76) - Power-Up at Speed
When monitored: When TCM (transmission control module) initially powers-up.
Set condition: If the TCM powers up while in the "Drive" position and the vehicle is going above 32 Km/h (20 MPH), the code is set.
Theory of operation: If a vehicle loses power to the TCM, the vehicle will go to the 2nd gear mode since there is no power available to control the transmission solenoids. However if power is restored, the TCM will power-up and normal operation will be restored. This DTC identifies that power to the TCM was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 Km/h (20 MPH). If someone shifts to Neutral and cycles the ignition key and quickly shifts to "Drive" while moving before the TCM comes out of its START ROUTINE, the DTC can be set. Therefore it is critical that this DTC diagnosis repair procedure should only be used if the vehicle is experiencing intermittent 2nd gear operation and subsequently a return to normal operation during normal driving.
Transmission effects: No Limp-in condition. The DTC is for information only when trying to diagnosis intermittent 2nd gear operation and subsequently a return to normal operation.
Possible causes:

– No Problem if vehicle is started in "neutral" at speeds above 32 Km/H (20 MPH) and shifted quickly to "Drive" before TCM comes out of the START ROUTINE.

FOR INTERMITTENT 2ND GEAR OPERATION AND THEN A SUBSEQUENT RETURN TO NORMAL OPERATION WITHOUT CYCLING THE IGNITION KEY

– Intermittent Direct Battery connection between TCM (60-way pin 56) and battery.
– Intermittent Fused Ignition Switch Output between TCM (60-way pin 11) and ignition switch.
– Intermittent Ground to TCM (60 way pins 53 and 57).

Name of code: P1687(77) - No Communication with MIC
When monitored: Continuously with key on.
Set condition: If no PCI bus messages are received from the Mechanical Instrument Cluster (MIC) for 25 seconds.
Theory of operation: The TCM communicates with the MIC using the PCI bus. It relies on certain information to function properly. The TCM continuously monitors the PCI bus to check for messages broadcast from the PCM.
Transmission effects: Possible improper TCM AutoStick configuration.
Possible causes:

> Open or shorted PCI bus circuit from MIC
> MIC
> TCM (If other communications codes are stored in the TCM only)

Name of code: P1652(78) - Serial Communication Link Malfunction
When monitored: Continuously with key on.
Set condition: If no PCI bus messages are received by the Transmission Control Module (TCM) for 10 seconds.
Theory of operation: The TCM communicates with the other modules in the vehicle using the PCI bus. It relies on certain information to function properly. The TCM continuously monitors the PCI bus to check for messages broadcast from the certain modules.
Transmission Effects: Possible improper TCM AutoStick configuration and delayed 3-4 shifts. No EMCC and early 3-4 shifts for a few minutes after engine is started.
Possible causes:

> Open or shorted PCI bus circuit from BCM
> TCM

Name of code: P0562(79) Low Battery Voltage
When monitored: Continuously with engine running and Transmission Relay energized.
Set condition: If the voltage sensed at the Transmission Control Relay Output circuit (pins 16 and 17 at TCM) for 15 seconds.
Theory of operation: The Transmission system requires sufficient battery voltage in order to ener-

gize the transmission solenoids. The TCM continuously monitors the voltage available to the solenoids.

Transmission effects: At speeds above 72 Km/h (45 MPH) the transmission system will default to neutral. Below 72 Km/h (45 MPH) the transmission system will default to limp-in mode and the MIL will illuminate after 5 minutes of substituted operation. Manual gear selection of Park, Reverse, Neutral and Second will be available.

Possible causes:

> Charging system problem

> Poor/High resistance connection between TCM and Battery/Alternator

> TCM pin 16 and 17 high resistance or poor connection

> TCM ground pins 53 and 57 high resistance or poor connection

> High resistance in Transmission Control Relay contacts

> TCM

3.3.8 QUICK LEARN

The Quick Learn function customizes adaptive parameters of the TCM to the transmission characteristics of a vehicle. This gives the customer improved “as received” shift quality compared to the initial parameters stored in the TCM.

Notes about Quick Learn Features

The nature of the Quick Learn function requires that certain features must be taken into consideration.

> Quick Learn should generally not be used as a repair procedure unless directed by a repair or diagnostic procedure. If the transmission system is exhibiting a problem that you think is caused by an invalid CVI, you should try to relearn the value by performing the appropriate driving maneuvers. In most cases, if a quick learn makes a vehicle shift better, the vehicle will return with the same problem.

> Before performing Quick Learn, it is imperative that the vehicle be shifted into OD with the engine running and the oil level set to the correct level. This step will purge air from the clutch circuits to prevent erroneous clutch volume values which could cause poor initial shift quality.

> If an unused TCM is installed on a vehicle with a HOT engine, Quick Learn will cause the TCM to report a cold calculated oil temperature. This requires monitoring the calculated oil temperature using the DRBIII®. If the temperature is below 15°C (60°F), the transmission must be run at idle or driven in gear until it goes above 15°C (60°F). If the temperature is above 93°C (200°F), the transmission must cool to below 93°C (200°F).

> First gear is engaged in overdrive after Quick Learn is completed. Place the vehicle in park after performing Quick Learn.

The Quick Learn function should be performed:

- Upon installation of a new service TCM
- After replacement or rebuild of internal transmission components or the torque converter
- If one or more of the clutch volumes indexes (CVI’s) contain skewed readings because of abnormal conditions.

To perform the Quick Learn procedure, the following conditions must be met.

- It is imperative that the vehicle be shifted into OD with the engine running and the oil level set to the correct level. This step will purge the air in the clutch circuits to prevent erroneous clutch volume values, which could cause poor initial shift quality.
- The brakes must be applied.
- The engine must be idling.
- The throttle angle (TP sensor) must be less than 3 degrees.
- The shift lever position must stay in neutral until prompted to shift into OD.
- The shift lever must stay in OD after the “Shift to Overdrive” prompt until the DRBIII® indicates the procedure is complete.
- The oil temperature must be between 15°C (60°F) and 93°C (200°F).

NOTE: The above conditions must be maintained during the procedure to keep the procedure from being aborted.

The Quick Learn procedure is performed with the DRBIII® by selecting “Transmission” system then “Miscellaneous” functions, then “Quick Learn”. Follow the procedure instructions displayed on the DRBIII®.

3.3.9 CLUTCH VOLUMES

The L-R clutch volume is updated when doing a 2-1 or 3-1 coast down shift. The transmission temperature must be between 21-49°C (70-120°F). The clutch volume should be between 35 and 83.

The 2-4 clutch volume is updated when doing a 1-2 shift. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 20 and 77.

The OD clutch volume is updated when doing a 2-3 shift. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 40 and 150.

The UD clutch volume is updated when doing a 4-3 or 4-2 shift. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 24 and 70.

3.3.10 ELECTRONIC PINION FACTOR

The transmission output speed signal supplies distance pulses to the powertrain control module (PCM), which are used to calculate speed and mileage. A pinion factor is stored in the transmission control module (TCM) in order to provide the appropriate distance pulses for the vehicle. The pinion factor is programmed into the TCM at the assembly plant.

Using the following steps, the pinion factor can be checked and/or reset using the DRBIII®:

1. Select Transmission system, then Miscellaneous functions, then Pinion Factor. The DRBIII® will display the current tire size.
2. If the tire size is incorrect, press the Enter key and then select the correct size.
3. Press the Page Back key to exit the reset procedure.

Notes About Electronic Pinion Factor Features

The nature of the electronic pinion factor requires that certain features must be taken into consideration.

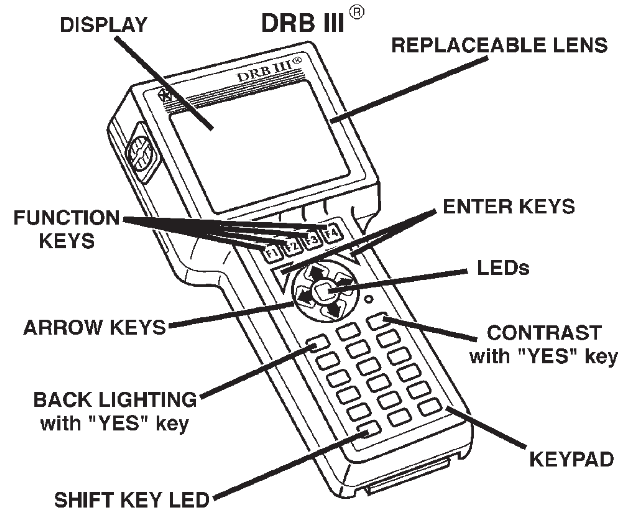
> If no pinion factor is stored in an installed TCM, the vehicle speedometer will not operate, engine speed will be limited to 2300 RPM, and catalyst damage may occur.

> Selecting a wrong tire size will cause the speedometer to be inaccurate and will also cause any speed related features to operate improperly.

NOTE: After replacing the TCM, you must reprogram pinion factor.

3.4 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII® functions.



80b57566

3.5 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages:

– User−Requested WARM Boot

– User−Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the S.T.A.R. Center.

3.5.1 DRB III® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage and grounds to Data Link connector. A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of faulty cable or vehicle wiring. For a blank screen, refer to the appropriate Body Diagnostic manual.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

3.6 TRANSMISSION SIMULATOR (MILLER TOOL #8333) AND FWD ADAPTER (MILLER TOOL #8333-1)

The transmission simulator, simply put, is an electronic device that simulates the electronic functions of any EATX controlled transmission (41TE, 42LE, 45RFE, and 545RFE). It's basic function is to aid the technician in determining if an internal transmission problem exists or if the problem resides in the vehicle wiring or Transmission Control Module (TCM). It is only useful for electrical problems. It will not aid in the diagnosis of a failed mechanical component, but it can tell you that the TCM and wiring are working properly and that the problem is internal.

The ignition switch should be in the lock position before attempting to install the simulator. Follow all instructions included with the simulator. If the feedback from the simulator is in doubt, you can verify it's operation by installing it on a known good vehicle. A "known good vehicle" would be defined as a vehicle that does not set any DTC's and drives and shifts as expected.

One important point to remember is that the Simulator receives it's power from the Trans Relay Output circuit. If the transmission system is in Limp−in (Relay open), the simulator will not operate. This is not really an indication of a problem, but an additional symptom. If the simulator does not power up ("P" led lit), this is an indication that the problem is still present with the simulator hooked up. This indicates that the problem is in the wiring or TCM and not the transmission.

Miller Tool # 8333-1 consists of the adapter cables and overlay necessary to adapt the simulator to 41TE and 42LE transmissions.

4.0 DISCLAIMERS, SAFETY, AND WARNINGS

4.1 DISCLAIMERS

All information, illustrations and specifications contained in this manual are based on the latest information at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIMES AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles: the parking brake does not hold the drive wheels. Some operations in this manual require that hydraulic tubes, hoses, and fittings, disconnected for inspection or testing purposes. These systems, when fully charged contains fluid at high pressure. Before disconnecting any hydraulic tubes, hoses or fittings, be sure that the system is fully depressurized.

When servicing a vehicle, always wear eye protection and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a transmission system problem, it is important to follow approved procedures where applicable. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur. It is extremely important that accurate shift lever position data be available to the TCM. The accuracy of any diagnostic trouble code found in memory is doubtful unless the Shift Lever Test, performed on the DRBIII® Scan Tool, passes without failure.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the powertrain system are intended to be serviced in assembly only. Attempting to remove or repair certain system subcomponents may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service instructions should be serviced.

4.2.4 DRBIII® SAFETY INSTRUCTIONS

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.

- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table.

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

*Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeds 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before attempting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is “lock” position. Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

4.3.2 ROAD TEST COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic DTC or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read the DRBIII® screen while in motion. Do not hang the DRBIII® from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

Road testing is an essential step in the diagnostic process that must not be overlooked. Along with diagnostic information obtained from the DRBIII® Scan Tool and the original customer concern, the road test helps to verify the problem and observe operation under actual vehicle driving conditions.

Just as important as the road test is, there are preliminary inspections that should be carried out prior to the road test. Always check the fluid level and condition before taking the vehicle on a road test. Determine if an incorrect fluid type is being used, improper fluid will result in erratic transmission operation. Improper fluid can result in problems. Additionally, a variety of complaints can be caused by incorrect fluid level. Some of the conditions caused by incorrect fluid level are as follows:

- Delayed engagement
- Poor shifting or erratic shifts
- Excessive noise
- Overheating

The next step is to verify that the shift linkage is correctly adjusted. If the gearshift linkage is incorrectly adjusted, a number of complaints can result.

The TCM monitors the Shift Lever Position (SLP) Sensor continuously. If the linkage is incorrectly adjusted, the TCM will sense a shift lever position that is not correct for the gear chosen by the driver. This may cause a DTC to be set.

The following complaints may also be the result of an incorrectly adjusted or worn linkage:

- Delayed clutch engagement
- Erratic shifts

- Vehicle will drive in neutral
- Engine will not crank in park or neutral
- Gearshift linkage will be able to be shifted without the key in the ignition
- Not able to remove the ignition key in park
- Parking pawl will not engage properly

The shift linkage should also be adjusted when replacing the Transmission, repairing the valve body, or when repairing any component between the shift lever and the Transmission.

Some questions to ask yourself when performing the road test are as follows:

- Is the complaint or concern what you think the problem is, based on the driver's description of the problem?
- Is the Transmission operating normally, or is there a real problem?
- When does the problem occur?
- Is the problem only in one gear range?
- What temperature does the problem occur?
- Does the vehicle have to sit over night for the problem to occur?
- Does the transmission go into Limp-in mode?

4.3.3 ELECTRONIC PINION FACTOR WARNINGS (IF APPLICABLE)

The pinion factor must be set when replacing the TCM. Note: The pinion factor is a fixed number and cannot be changed or updated in some vehicle applications. If the pinion factor is not set or incorrectly set, any speed related functions will not operate correctly i.e. speedometer, speed control, rolling door locks, and other control modules will be affected that depend on speed information.

4.3.4 BULLETINS AND RECALLS

Always perform all Safety Recalls and Technical Service Bulletins that are applicable to the problem.

5.0 REQUIRED TOOLS AND EQUIPMENT

> DRBIII® (diagnostic read−out box) − Must be at latest release level.
> Transmission Simulator (Miller #8333)
> Transmission Simulator (Miller #8333-1) Adapter harness kit and panel overlay for FWD vehicles.
> Jumper wires
> Test Light (minimum of 25 ohms of resistance)
> Ohmmeter
> Voltmeter
> Pressure gauge (0−300 PSI)

6.0 GLOSSARY OF TERMS

6.1 ACRONYMS

BCM	-Body Control Module
CKT	-Circuit
CVI	-Clutch Volume Index
DLC	-Data Link Connector
DRBIII®	-Diagnostic Readout Box
DTC	-Diagnostic Trouble Code
EATX	-Electronic Automatic Transaxle
EMCC	-Electronically Modulated Converter Clutch
FCM	-Front Control Module (part of the IPM system)
IOD	-Ignition off−draw
IPM	-Intelligent Power Module
IRT	-Intelligent Recovery Timer
ISS	-Input Speed Sensor
LED	-Light Emitting Diode
LR	-Low/reverse Clutch
LU	-Lockup
MIC	-Mechanical Instrument Cluster
MIL	-Malfunction Indicator Lamp
OBDII	-On Board Diagnostics
OD	-Overdrive Clutch or Pressure Switch
OSS	-Output Speed Sensor
PCM	-Powertrain Control Module
PEMCC	-Partial Electronically Modulated Converter Clutch
PLU	-Partial Lockup
REV	-Reverse Clutch
SLPK	-Solenoid Pack
SSV	-Solenoid Switch Valve
SW	-Switch
TCC	-Torque Converter Clutch
TCM	-Transmission Control Module
TP	-Throttle Position
TRD	-Torque Reduction
TRS	-Transmission Range Sensor
UD	-Underdrive Clutch
2/4	-2nd and 4th gear Clutch or Pressure Switch

6.2 DEFINITIONS

OBDII (EURO STAGE III OBD) Trip - A vehicle start and drive cycle such that all once per trip diagnostic monitors have run.

Key Start - A vehicle start and run cycle of at least 20 seconds.

Warm-up Cycle - A vehicle start and run cycle such that the engine coolant must rise to at least 71°C (160°F) and must rise by at least 4.4°C (40°F) from initial start up. To count as a warm-up cycle, no DTC may occur during the cycle.

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:
*NO RESPONSE FROM TRANSMISSION CONTROL MODULE

POSSIBLE CAUSES
NO RESPONSE FROM TRANSMISSION CONTROL MODULE
FUSED IGNITION SWITCH OUTPUT (RUN/ST) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT(S) OPEN
TRANSMISSION CONTROL MODULE
PCI BUS CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the Powertrain Control Module (PCM). With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with both of the modules? Yes → Go To 2 No → Refer to the Communications category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Run/St) circuit. **Note: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery positive post.** Is the test light illuminated? Yes → Go To 3 No → Repair the Fused Ignition Switch Output (Run/St) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the TCM harness connector. Remove the starter relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Start) circuit. **Note: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery positive post.** Observe the test light while momentarily turning the ignition switch to the Start position. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused Ignition Switch Output (Start) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. **Note: Reinstall the original Starter Relay.**	All
4	Turn the ignition off. Disconnect the TCM harness connector. Using a 12-volt test light connected to ground, probe the Fused B(+) circuit. **Note: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery positive post.** Is the test light illuminated? Yes → Go To 5 No → Repair the Fused B(+) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the TCM harness connector. Using a 12-volt test light connected to 12-volts, probe each ground circuit in the TCM connector. **NOTE: The light must illuminate brightly, if it does not light, or lights dimly, the circuit must be repaired. If there is any doubt, compare the brightness when testing the circuit, to the brightness when connected directly to the battery negative post.** Is the light illuminated at all ground circuits? Yes → Go To 6 No → Repair the Ground circuit(s) for an open. Check the main ground connection to engine block and/or chassis. Refer to the wiring diagrams located in the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
6	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the TCM harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII®, select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the TCM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Transmission Control Module in accordance with the service information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Disconnect the TCM harness connector. Disconnect the BCM C3 harness connector. Measure the resistance of the PCI bus circuit between the TCM connector and the BCM C3 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the service information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P0120-THROTTLE POSITION SENSOR SIGNAL CIRCUIT

When Monitored and Set Condition:

P0120-THROTTLE POSITION SENSOR SIGNAL CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: This code is set if the throttle angle goes out of range or if throttle angle changes abruptly (i.e.: faster than the throttle body motion could occur).

POSSIBLE CAUSES
RELATED PCM DTC'S PRESENT
INTERMITTENT WIRING & CONNECTORS
SENSOR GROUND CIRCUIT OPEN TO TCM
TPS SIGNAL CIRCUIT OPEN TO TCM
TPS VOLTAGE CHANGE NOT SMOOTH
TCM - TPS SIGNAL CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, check Powertrain Control Module DTC's. Are the DTCs P0122, P0123, or P0121 present in the PCM? Yes → Refer to the Driveability category for the related symptom(s). Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

P0120-THROTTLE POSITION SENSOR SIGNAL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Start the engine. Allow the engine to idle. With the DRBIII® in Transmission Sensors, read the TPS voltage. Is the TPS voltage below 0.3 or above 1.0 volts? Yes → Go To 4 No → Go To 7	All
4	Turn the ignition off to the lock position. Disconnect the TPS harness connector. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Sensor Ground circuit between the TPS harness connector and the Transmission Control Module harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Sensor Ground circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off to the lock position. Disconnect the Throttle Position Sensor harness connector. Disconnect the Transmission Control Module harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the TPS Signal Circuit from the TCM harness connector to the TPS harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the TPS Signal circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Pay particular attention to the the point where the TPS signal and sensor ground circuits splice off from the engine circuits. Were there any problems found? Yes → Repair wiring and/or connector as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition on. With the DRBIII®, monitor the TPS VOLTS. Slowly open and close the Throttle. Is the voltage change smooth? Yes → Test Complete. No → Replace the Throttle Position Sensor per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P0218-HIGH TEMPERATURE OPERATION ACTIVATED

When Monitored and Set Condition:

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

When Monitored: Whenever the engine is running.

Set Condition: Immediately when the Overheat shift schedule is activated 116 C (240 F) Transmission oil temp.

POSSIBLE CAUSES
ENGINE COOLING SYSTEM MALFUNCTION
INCORRECT FLUID LEVEL
TRANSMISSION OIL COOLER PLUGGED
HIGH TEMPERATURE OPERATIONS ACTIVATED

TEST	ACTION	APPLICABILITY
1	Perform Engine Cooling System diagnostics per the Service Information Is the Engine Cooling System functioning properly? Yes → Go To 2 No → Repair the cause of the Engine Overheating. Refer to the Service Information for additional repair information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Check the Transmission Fluid level per the Service Information. Is the Transmission Fluid Level at the proper level? Yes → Go To 3 No → Repair any Transmission Fluid leak as necessary and adjust the Transmission Fluid Level per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
3	Perform the Transmission Cooler Flow Test per the Service Information. Did the Transmission Cooler Flow Test pass? Yes → Go To 4 No → Repair the cause of the plugged Transmission Oil Cooler and flush or replace the Transmission Oil cooler as necessary per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0218-HIGH TEMPERATURE OPERATION ACTIVATED — Continued

TEST	ACTION	APPLICABILITY
4	This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints. This DTC indicates that the Transmission has been operating in the ″Overheat″ shift schedule which may generate a customer complaint. The customer driving patterns may indicate the need for an additional Transmission Oil Cooler. Were there any problems found? Yes → Repair the cause of the Transmission Overheating per the Service Information. If indicated install an additional Transmission Oil Cooler. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0562-LOW BATTERY VOLTAGE

When Monitored and Set Condition:

P0562-LOW BATTERY VOLTAGE

When Monitored: With the engine running and the TCM has closed the Transmission Control Relay.

Set Condition: If battery voltage at TCM Transmission Control Relay Output Sense circuit is less than 10.0 volts for 15 seconds. *This DTC generally indicates a gradually falling battery voltage or resistive connections to the TCM.

POSSIBLE CAUSES
RELATED CHARGING SYSTEM DTCS
INTERMITTENT WIRING AND CONNECTORS
FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
TRANS CONTROL RELAY OUTPUT TO TCM OPEN OR HIGH RESISTANCE
TRANSMISSION CONTROL RELAY OPEN OR HIGH RESISTANCE
TCM - LOW BATTERY VOLTAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0562-LOW BATTERY VOLTAGE — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read the PCM DTC's. Are there any Charging System related DTC's stored in the PCM? Yes → Refer to the Charging System category and repair any PCM Charging System DTC's first. NOTE: After repairing the PCM charging system DTC's, perform the Transmission Verification test to verify the transmission was not damaged. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	**NOTE: Generator, battery, and charging system must be fully functional before performing this test.** With the DRBIII®, read Transmission DTC's. With the DRBIII®, Check the STARTS SINCE SET counter for P0562. **Note: This counter only applies to the last DTC set.** Is the Starts Since Set counter for P0562 set at 0? Yes → Go To 4 No → Go To 9	All
4	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the Transmission Control Relay. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused B+ circuit in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 5 No → Repair the Fused B+ circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Using a 12-volt test light connected to 12-volts, check the ground circuits in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly for all the ground circuits? Yes → Go To 6 No → Repair the Ground circuit(s) for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0562-LOW BATTERY VOLTAGE — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check both Transmission Control Relay Output circuits in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	Turn the ignition off to the lock position. Install a substitute Relay in place of the Transmission Control Relay. Start the engine. Using a voltmeter, measure the battery voltage. With the DRBIII®, monitor the Transmission Switched Battery Voltage. Compare the DRBIII® Transmission Switched Battery voltage to the actual battery voltage. Is the DRBIII® voltage within 2.0 volts of the battery voltage? Yes → Replace the Transmission Control Relay. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
9	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

TEST	ACTION	APPLICABILITY
7	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
8	The conditions necessary to set the DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Check the power and ground circuits of the Transmission Control Module. Check the vehicles battery condition. Were any problems found? Yes → Repair wiring and/or connectors as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0731-GEAR RATIO ERROR IN 1ST

When Monitored and Set Condition:

P0731-GEAR RATIO ERROR IN 1ST

When Monitored: The Transmission Gear Ratio is monitored continuously while the Transmission is in gear.

Set Condition: If the ratio of the input RPM to the output RPM does not match the current Gear Ratio.

POSSIBLE CAUSES
RELATED DTC'S PRESENT
INTERMITTENT GEAR RATIO ERRORS
TRANSMISSION - INTERNAL

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, read Transmission DTC's If any of these DTC's are present, perform their respective tests first. Are the DTC's P0944, P0715, P0720, P1794, or P0867 present also? Yes → Refer to the Transmission category and perform the appropriate symptom. If any of these DTC's are present, they will cause a gear ratio error. If the DTC P0944 is present perform its respective test first. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

P0731-GEAR RATIO ERROR IN 1ST — Continued

TEST	ACTION	APPLICABILITY
3	With the DRBIII®, perform the 1st Gear Clutch Test. Follow the instructions on the DRBIII®. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds. **CAUTION: Do not overheat the transmission.** Did the Clutch Test pass, Input Speed remain at 0? Yes → Go To 4 No → Go To 5	All
4	The conditions to set this DTC are not present at this time. Check the gearshift linkage adjustment. Gear ratio DTC's can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the clutch test and still sets gear ratio DTC('s), check the Speed Sensors for proper operation. **NOTE: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All
5	If there are no possible causes remaining, view repair. Repair Repair internal transmission problem. Check all components related to the Underdrive and L/R clutches. Inspect the Oil Pump per the Service Information and repair or replace as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P0732-GEAR RATIO ERROR IN 2ND

When Monitored and Set Condition:

P0732-GEAR RATIO ERROR IN 2ND

When Monitored: The Transmission Gear Ratio is monitored continuously while the Transmission is in Gear.

Set Condition: If the ratio of the input RPM to the output RPM does not match the current Gear Ratio.

Continue Go To 2	All

P0750-LR SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission Control Module DTC's Are there any Transmission Control Relay related DTC's P0890, P0891, or P0888 present? Yes → Refer to symptom list and perform the appropriate symptom for Transmission Control Relay related DTC's. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, Check the STARTS SINCE SET counter for P0750. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P0750 set at 0? Yes → Go To 4 No → Go To 11	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. With the DRBIII®, actuate the L/R Solenoid. With the Transmission Simulator, monitor the L/R Solenoid LED. Did the L/R Solenoid LED on the Transmission Simulator blink on and off during actuation? Yes → Go To 5 No → Go To 6	All
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0750-LR SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Measure the resistance of the L/R Solenoid Control circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the L/R Solenoid Control circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Measure the resistance between ground and the L/R Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the L/R Solenoid Control circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the L/R Solenoid Control circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the L/R Solenoid Control circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0755-2/4 SOLENOID CIRCUIT

When Monitored and Set Condition:

P0755-2/4 SOLENOID CIRCUIT

When Monitored: Initially at power-up, then every 10 seconds thereafter. They will also be tested immediately after a Gear Ratio or Pressure Switch error is detected.

Set Condition: Three consecutive Solenoid continuity test failures, or one failure if test is run in response to a Gear Ratio or Pressure Switch error.

P0755-2/4 SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read Transmission Control Module DTC's Are there any Transmission Control Relay related DTC's P0890, P0891, or P0888 present?. Yes → Refer to symptom list and perform the appropriate symptom for Transmission Control Relay related DTC's. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P0755 set at 0? Yes → Go To 4 No → Go To 11	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. With the DRBIII®, actuate the 2/4 Solenoid. With the Transmission Simulator, monitor the 2/4 Solenoid LED. Did the 2/4 Solenoid LED on the Transmission Simulator blink on and off during actuation? Yes → Go To 5 No → Go To 6	All
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0755-2/4 SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 2/4 Solenoid Control circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 2/4 Solenoid Control circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 2/4 Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the 2/4 Solenoid Control circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the 2/4 Solenoid Control circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the 2/4 Solenoid Control circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module .WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0760-OD SOLENOID CIRCUIT

When Monitored and Set Condition:

P0760-OD SOLENOID CIRCUIT

When Monitored: Initially at power-up, then every 10 seconds thereafter. They will also be tested immediately after a Gear Ratio or Pressure Switch error is detected.

Set Condition: Three consecutive solenoid continuity test failures, or one failure if test is run in response to a Gear Ratio or Pressure Switch error.

POSSIBLE CAUSES
RELATED RELAY DTC'S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
OD SOLENOID CONTROL CIRCUIT OPEN
OD SOLENOID CONTROL CIRCUIT SHORT TO GROUND
OD SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
OD SOLENOID
TCM - OD SOLENOID

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0760-OD SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read Transmission Control Module DTC's Are there any Transmission Control Relay related DTC's P0888, P0890, or P0891 present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, Check the STARTS SINCE SET counter for P0760. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P0760 set at 0? Yes → Go To 4 No → Go To 11	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. With the Transmission Simulator, monitor the OD Solenoid LED. With the DRBIII®, actuate the OD Solenoid. Did the OD Solenoid LED on the Transmission Simulator blink on and off during actuation? Yes → Go To 5 No → Go To 6	All
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0760-OD SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the OD Solenoid Control circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the OD Solenoid Control circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the OD Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the OD Solenoid Control circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the OD Solenoid Control circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the OD Solenoid Control circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0765-UD SOLENOID CIRCUIT

When Monitored and Set Condition:

P0765-UD SOLENOID CIRCUIT

When Monitored: Initially at power-up, then every 10 seconds thereafter. They will also be tested immediately after a Gear Ratio or Pressure Switch error is detected.

Set Condition: Three consecutive Solenoid continuity test failures, or one failure if test is run in response to a Gear Ratio or Pressure Switch error.

POSSIBLE CAUSES
RELATED RELAY DTC'S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION RELAY OUTPUT CIRCUIT OPEN
UD SOLENOID CONTROL CIRCUIT OPEN
UD SOLENOID CONTROL CIRCUIT SHORT TO GROUND
UD SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
UD SOLENOID
TCM - UD SOLENOID

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. P0765-UD SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read Transmission Control Module DTC's Are there any Transmission Control Relay related DTC's P0890, P0891, or P0988 present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P0765 set at 0? Yes → Go To 4 No → Go To 11	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. With the DRBIII®, actuate the UD Solenoid. With the Transmission Simulator, monitor the UD Solenoid LED. Did the UD Solenoid LED on the Transmission Simulator blink on and off? Yes → Go To 5 No → Go To 6	All
5	If there are no possible causes remaining, view repair. Repair Replace Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0765-UD SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the UD Solenoid Control circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the UD Solenoid Control circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the UD Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the UD Solenoid Control circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. Connect a jumper wire between the Fused B+ circuits and Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. **Note: Check connectors - Clean/repair as necessary.** Measure the voltage of the UD Solenoid Control circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the UD Solenoid Control circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0841-LR PRESSURE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0841-LR PRESSURE SWITCH SENSE CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: The appropriate DTC is set if one of the Pressure Switches are open or closed at the wrong time in a given gear .

POSSIBLE CAUSES
LOSS OF PRIME DTC P0944 PRESENT
TRANSMISSION CONTROL RELAY DTCS PRESENT
TCM AND WIRING - L/R PRESSURE SWITCH
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION RELAY OUTPUT CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
TCM - L/R PRESSURE SWITCH CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0841-LR PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other Transmission DTC's. Is the DTC P0944 present also? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, read Transmission DTC's Are there any Transmission Control Relay related DTC's P0888, P0890, or P0891 present? Yes → Refer to symptom list and perform the appropriate test for Transmission Relay related DTC's. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	With the DRBIII®, Check the STARTS SINCE SET counter for P0841. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 5 No → Go To 11	All
5	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. On the Transmission Simulator select L/R on the Pressure Switch selector switch. With the DRBIII®, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Did the Pressure Switch state change from OPEN to CLOSED when the test button was pressed? Yes → Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

P0841-LR PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the L/R Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the L/R Pressure Switch Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the L/R Pressure Switch Sense circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance below 5.0 ohms? Yes → Repair the L/R Pressure Switch circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All

P0841-LR PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the L/R Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the L/R Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

P0845-2/4 HYDRAULIC PRESSURE TEST FAILURE

When Monitored and Set Condition:

P0845-2/4 HYDRAULIC PRESSURE TEST FAILURE

When Monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed > 1000 RPM, the TCM momentarily turns on element pressure to the clutch ckts that don't have pressure to identify the correct pressure sw closes. If the pressure sw does not close 2 times the code sets.

POSSIBLE CAUSES
LOSS OF PRIME P0944 PRESENT
RELATED DTC'S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
2/4 PRESSURE SWITCH SENSE CIRCUIT OPEN
2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
INTERNAL TRANSMISSION
TCM - 2/4 HYDRAULIC PRESSURE

P0845-2/4 HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, check for other Transmission DTCs. Is the DTC P0944 present also? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, read Transmission DTC's. Is the DTC P0732, P0734 and/or P0846 present also? Yes → Repair internal transmission as necessary. Refer to the Service Information for the proper repair procedure for components related to the OD clutch. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	With the DRBIII®, Check the STARTS SINCE SET counter for P0845. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 5 No → Go To 12	All

P0845-2/4 HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the Transmission Simulator, select ″2/4″ on the Pressure Switch rotary switch. With the DRBIII®, monitor the 2/4 Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Wiggle the wiring leading to the TCM while pressing the button. Did the 2-4 Pressure Switch state change to closed and remain closed while wiggling the wires? Yes → Go To 6 No → Go To 7	All
6	If there are no possible causes remaining, view repair. Repair Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If there are no problems found in the Valve Body, replace the Transmission Solenoid/ Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 8 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 2/4 Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 2/4 Pressure Switch Sense circuit or an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All

P0845-2/4 HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 2/4 Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the 2/4 Pressure Switch Sense circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the 2/4 Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the 2/4 Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 11	All
11	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
12	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0846-2/4 PRESSURE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0846-2/4 PRESSURE SWITCH SENSE CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: The appropriate DTC is set if one of the Pressure Switches are open or closed at the wrong time in a given gear .

POSSIBLE CAUSES
TRANSMISSION RELAY DTC'S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION RELAY OUTPUT CIRCUIT OPEN
2/4 PRESSURE SWITCH SENSE CIRCUIT OPEN
2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
2/4 PRESSURE SWITCH
TCM - 2/4 PRESSURE SWITCH CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0846-2/4 PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read Transmission DTC's Are there any Transmission Control Relay related DTC's P0890, P0891, or P0888 present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less for P0846? Yes → Go To 4 No → Go To 11	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the Transmission Simulator, select 2/4 on the Pressure Switch selector switch. With the DRBIII®, monitor the 2/4 Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Did the Pressure Switch state change from OPEN to CLOSED when the test button was pressed? Yes → Go To 5 No → Go To 6	All
5	If there are no possible causes remaining, view repair. Repair Replace Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0846-2/4 PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 2/4 Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 2/4 Pressure Switch Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 2/4 Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the 2/4 Pressure Switch Sense circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the 2/4 Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the 2/4 Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0870-OD HYDRAULIC PRESSURE TEST FAILURE

When Monitored and Set Condition:

P0870-OD HYDRAULIC PRESSURE TEST FAILURE

When Monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed > 1000 RPM, the TCM momentarily turns on element pressure to the clutch ckts that don't have pressure to identify the correct pressure sw closes. If the pressure sw does not close 2 times the code sets

POSSIBLE CAUSES
LOSS OF PRIME DTC P0944 PRESENT
RELATED DTC'S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
OD PRESSURE SWITCH SENSE CIRCUIT OPEN
OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
INTERNAL TRANSMISSION
TCM - O/D HYDRAULIC TEST FAILURE

P0870-OD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, check for other Transmission DTCs. Is the DTC P0944 present also? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, read Transmission DTC's. Is the DTC P0733 and/or P0871 present also? Yes → Replace the Transmission or Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	With the DRBIII®, Check the STARTS SINCE SET counter for P0870. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 5 No → Go To 12	All

P0870-OD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. **Note: Check connectors - Clean/repair as necessary.** With the Transmission Simulator, select ″OD″ on the Pressure Switch rotary switch. With the DRBIII®, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Wiggle the wires leading to the TCM while pressing the button. Did the O/D Pressure Switch state change to closed and remain closed while wiggling the wires? Yes → Go To 6 No → Go To 7	All
6	If there are no possible causes remaining, view repair. Repair Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 8 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the OD Pressure Switch Sense circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.. Is the resistance above 5.0 ohms? Yes → Repair the O/D Pressure Switch Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All

P0870-OD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the OD Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the OD Pressure Switch Sense circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the OD Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair OD Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 11	All
11	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
12	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0871-OD PRESSURE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0871-OD PRESSURE SWITCH SENSE CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: The appropriate DTC is set if one of the Pressure Switches are open or closed at the wrong time in a given gear.

POSSIBLE CAUSES
TRANSMISSION RELAY DTCS PRESENT
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION RELAY OUTPUT CIRCUIT OPEN
O/D PRESSURE SWITCH SENSE CIRCUIT OPEN
O/D PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
O/D PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
O/D PRESSURE SWITCH INOPERATIVE
TCM - O/D PRESSURE SWITCH

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. P0871-OD PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read Transmission DTC's Are there any Transmission Control Relay related DTC's P0890, P0891, or P0888 present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less for P0871? Yes → Go To 4 No → Go To 11	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. On the Transmission Simulator select OD on the Pressure Switch selector switch. With the DRBIII®, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Did the Pressure Switch state change from OPEN to CLOSED when the test button was pressed? Yes → Go To 5 No → Go To 6	All
5	If there are no possible causes remaining, view repair. Repair Replace Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0871-OD PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the O/D Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the O/D Pressure Switch Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the O/D Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the O/D Pressure Switch circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the IPM. Ignition on, engine not running. Measure the voltage of the O/D Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the O/D Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0884-POWER UP AT SPEED

When Monitored and Set Condition:

P0884-POWER UP AT SPEED

When Monitored: When Transmission Control Module initially powers-up.

Set Condition: If the TCM powers up and senses a valid forward gear PRNDL DTC and the Output RPM is above 800 RPM (approximately 32 Km/h or 20 MPH) then the DTC will set.

POSSIBLE CAUSES
POWER UP AT SPEED

TEST	ACTION	APPLICABILITY
1	This DTC is set when the TCM is initialized while the vehicle is moving down the road in a valid forward gear. Check all of the Fused B+, Fused Ignition Switch Output, and Ground circuits to the TCM for an intermittent open or short to ground. Were there any problems found? Yes → Repair wiring and/or connectors as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0888-RELAY OUTPUT ALWAYS OFF

When Monitored and Set Condition:

P0888-RELAY OUTPUT ALWAYS OFF

When Monitored: Continuously

Set Condition: This code is set when less than 3 volts are present at the transmission control relay output circuits at the Transmission Control Module when the TCM is energizing the relay.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
FUSED B+ CIRCUIT OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
TRANSMISSION RELAY CONTROL CIRCUIT OPEN
TRANSMISSION CONTROL RELAY GROUND CIRCUIT OPEN
TRANSMISSION CONTROL RELAY STUCK OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO GROUND
TRANSMISSION RELAY CONTROL CIRCUIT SHORT TO GROUND
TCM - TRANSMISSION CONTROL RELAY ALWAYS OFF

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Continue Go To 2	All

P0888-RELAY OUTPUT ALWAYS OFF — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, Check the STARTS SINCE SET counter for P0888. **Note: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter set at 0? Yes → Go To 3 No → Go To 10	All
3	Turn the ignition off to the lock position. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused B+ circuit in the Transmission Control Relay connector in the PDC. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused B+ circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
4	Turn the ignition off to the lock position. Remove the Transmission Control Relay from the PDC. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Transmission Control Relay Control circuit between the Transmission Control Relay connector and the TCM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Transmission Control Relay Control circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Using a 12-volt test light connected to 12-volts, check the Transmission Control Relay Ground circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Transmission Control Relay Ground circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0888-RELAY OUTPUT ALWAYS OFF — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the three Transmission Control Relay Output circuits. **NOTE: There are three Transmission Relay Output circuits. Two are located in the TCM harness connector and one located in the Transmission Solenoid/Pressure Switch Assembly harness connector** **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly on all three Transmission Control Relay Output circuits? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Transmission Control Relay Output circuit. Is the resistance below 5.0 ohms? Yes → Repair the Transmission Control Relay Output circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Transmission Relay Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the Transmission Control Relay Control circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All

P0888-RELAY OUTPUT ALWAYS OFF — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Install a substitute Relay in place of the Transmission Control Relay. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, actuate the Transmission Control Relay. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid /Pressure Switch Assembly harness connector. Does the test light blink on and off? Yes → Replace the Transmission Control Relay. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the TCM. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
10	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0890-SWITCHED BATTERY

When Monitored and Set Condition:

P0890-SWITCHED BATTERY

When Monitored: Ignition key is turned from the OFF position to RUN position and/or ignition key is turned from the CRANK position to RUN position.

Set Condition: This DTC is set if the Transmission Control Module senses voltage on any of the Pressure Switch Inputs prior to the TCM energizing the Transmission Control Relay.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
TCM - SWITCHED BATTERY

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, Check the STARTS SINCE SET counter for P0890. **Note: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P0890 set at 0? Yes → Go To 3 No → Go To 7	All

P0890-SWITCHED BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the 2-4 Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the 2/4 Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the L/R Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the L/R Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the OD Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the OD Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0890-SWITCHED BATTERY — Continued

TEST	ACTION	APPLICABILITY
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0891-TRANSMISSION RELAY ALWAYS ON

When Monitored and Set Condition:

P0891-TRANSMISSION RELAY ALWAYS ON

When Monitored: When ignition key is turned from the OFF position to the RUN position and/or ignition is turned from the CRANK position to RUN position.

Set Condition: This DTC is set if the Transmission Control Module senses greater than 3 volts at the Transmission Control Relay Output terminal of the TCM prior to the TCM energizing the relay.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION CONTROL RELAY STUCK CLOSED
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO VOLTAGE
TRANSMISSION RELAY CONTROL CIRCUIT SHORT TO VOLTAGE
TCM - TRANSMISSION RELAY ALWAYS ON

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0891-TRANSMISSION RELAY ALWAYS ON — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check the STARTS SINCE SET counter for P0891. **Note: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter set to 0? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off to the lock position. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between the Fused B+ circuit and the Transmission Control Relay Output Circuit in the Transmission Control Relay. Is the resistance above 5.0 ohms? Yes → Go To 4 No → Replace the Transmission Control Relay. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
4	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Measure the voltage of the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. Is the voltage above 0.5 volt? Yes → Repair the Transmission Control Relay Output circuit for a short to voltage Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Remove the Transmission Control Relay from the PDC. Ignition on, engine not running. **Note: Check connectors - Clean/repair as necessary.** Measure the voltage of the Transmission Relay Control circuit in the PDC connector. Is the voltage above 0.5 volt? Yes → Repair Transmission Relay Control Circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P0891-TRANSMISSION RELAY ALWAYS ON — Continued

TEST	ACTION	APPLICABILITY
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0897-WORN OUT/BURNT TRANSAXLE FLUID

When Monitored and Set Condition:

P0897-WORN OUT/BURNT TRANSAXLE FLUID

When Monitored: With each transition from full Torque Convertor to partial Torque Convertor engagement for A/C bump prevention.

Set Condition: When vehicle shudder is detected during partial engagement (PEMCC).

POSSIBLE CAUSES
WORN OUT/ BURNT TRANSMISSION FLUID

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0897-WORN OUT/BURNT TRANSAXLE FLUID — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Remove the Transmission Oil Pan and Oil Filter per the Service Information. Install a new Transmission Oil Filter per Service Information. Reinstall Transmission Oil Pan, and refill with new Transmission Fluid per the Service Information. **Note: The Transmission Cooler must be flushed before prodceeding.** Start the engine, check and adjust the Transmission Fluid Level per Service Information. Allow the engine to idle for 10 minutes, in Park. Flush the Transmission Oil Cooler per the Service Information. Turn the ignition off. Drain and refill the Transmission Fluid. Flush the Transmission Oil Cooler again. Start the engine, check and adjust the Transmission Fluid Level per Service Information. With the DRBIII®, perform a Battery Disconnect. **Note: This must be done to re enable EMCC during an A/C Clutch engagement.** The vehicle may exhibit intermittent shudder during the first few hundred miles. **Note: The oil will gradually penetrate the TCC friction material and the shudder should disappear.** Erase the DTC and return the vehicle to the customer. Did the Code reset or does the vehicle still shudder after a few thousand miles? Yes → Replace the Torque Convertor per the Service Information. Note: After replacing the Torque Convertor, use the DRBIII to perform the TCC Break In procedure. This will prevent a possible shudder condition. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0944-LOSS OF PRIME

When Monitored and Set Condition:

P0944-LOSS OF PRIME

When Monitored: If the transmission is slipping in any forward gear and the pressure switches are not indicating pressure, a loss of prime test is run.

Set Condition: If the Trans. begins to slip in a forward gear & the press. switch(s) that should be closed are open a loss of prime test begins. Available elements are turned on by the TCM to see if pump prime exists.The code sets if no pressure switches respond.

POSSIBLE CAUSES
PLUGGED TRANSMISSION OIL FILTER
SHIFT LEVER POSITION
TRANSMISSION FLUID LEVEL
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION OIL PUMP

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0944-LOSS OF PRIME — Continued

TEST	ACTION	APPLICABILITY
2	The Transmission Fluid temperature must be above 21° C or 70° F prior to checking fluid level. Adjusting fluid level on a cold transmission will result in an overfilled transmission. Check the Transmission Fluid Level per the Service Information. Is the Transmission Fluid Level at the proper level? Yes → Go To 3 No → If the Transmission Fluid is low, repair any Transmission Fluid leak as necessary and adjust the Transmission Fluid Level per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
3	Place the gear selector in park. Start the engine. **NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.** The Transmission must be at operating temperature prior to checking pressure. A cold Transmission will give higher readings. Place the Transmission in Reverse. With the DRBIII®, observe the Transmission Pressure Switch states. Are any of the Pressure Switches closed? Yes → Go To 4 No → Go To 6	All
4	The conditions necessary to set this DTC are not present at this time. Test drive the vehicle. Allow the Transmission to shift through all gears and ranges. Did you experience a delayed engagement and/or a no drive condition? Yes → Go To 6 No → Go To 5	All
5	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All
6	Remove and inspect the Transmission Oil Pan and Transmission Oil Filter per the Service Information. Does the Transmission Oil Pan contain excessive debris and/or is the Oil Filter plugged? Yes → Repair the cause of the plugged Transmission Oil Filter. Refer to the Service Information for the proper repair procedure. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All

P0944-LOSS OF PRIME — Continued

TEST	ACTION	APPLICABILITY
7	With the DRBIII®, perform a Shift Lever Position test. Follow the instructions on the DRBIII®. Did the Shift Lever Position Test pass? Yes → Go To 8 No → Refer to symptom list and perform test for DTC P0706. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Transmission Oil Pump per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P0951-AUTOSTICK SENSOR CIRCUIT

When Monitored and Set Condition:

P0951-AUTOSTICK SENSOR CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: The transmission shift lever is not in the AutoStick Position and either the Upshift or Downshift switch is closed. This code will also set if both switches are closed at the same time.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
UPSHIFT/DOWNSHIFT SENSE CIRCUITS SHORT TO GROUND
AUTOSTICK SWITCH
TCM - AUTOSTICK

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, Check the STARTS SINCE SET counter. **Note: This counter only applies to the last DTC set.** Is the Starts Since Set counter equal to 0? Yes → Go To 3 No → Go To 7	All

P0951-AUTOSTICK SENSOR CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Disconnect the AutoStick switch harness connector. **Note: Check connectors - Clean/repair as necessary.** Turn the ignition on. Measure the voltage of the upshift and downshift circuits in the AutoStick switch harness connector. Is the voltage above 5.0 volts? Yes → Go To 4 No → Go To 5	All
4	Turn the ignition off to the lock position. Replace the AutoStick switch. Ignition on, engine not running. With the DRBIII®, erase DTCs. Start the engine. While driving the vehicle, upshift and downshift multiple times using the AutoStick. Did the DTC return? Yes → Go To 6 No → Test Complete. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the AutoStick harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Upshift and Downshift Sense circuits. Is the resistance below 5.0 ohms? Yes → Repair the Upshift and/or Downshift Sense circuit shorted to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the TCM. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P0992- 2-4/OD HYDRAULIC PRESSURE TEST FAILURE

When Monitored and Set Condition:

P0992- 2-4/OD HYDRAULIC PRESSURE TEST FAILURE

When Monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed > 1000 RPM, the TCM momentarily turns on element pressure to the clutch ckts that don't have pressure to identify the correct pressure sw closes. If the pressure sw does not close 2 times the code sets.

POSSIBLE CAUSES
CONDITION P0992 PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	**NOTE: The vehicle must be driven to set this DTC, the transmission must be warm or hot with the Engine RPM above 1000 RPM.** This DTC is an indicator of a 2/4 and/or O/D Hydraulic Pressure Switch DTC's present. Perform the tests for P0870 and/or P0845 to determine which switch is failing. If there are no possible causes remaining, view repair. Repair Refer to the Transmission category and perform the appropriate symptom for P0870 and/or P0845. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P1652-SERIAL COMMUNICATION LINK MALFUNCTION

When Monitored and Set Condition:

P1652-SERIAL COMMUNICATION LINK MALFUNCTION

When Monitored: Continuously with engine running.

Set Condition: The DTC sets in approximately 20 seconds if no BUS messages are received by the TCM.

POSSIBLE CAUSES
NO COMMUNICATION WITH MIC
NO COMMUNICATION WITH PCM
INTERMITTENT WIRING AND CONNECTORS
TCM - INTERNAL ERROR

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase TCM DTC's. **Note: Erase P0700 DTC in the PCM to turn the MIL light off after making transmission repairs.** Start the engine in park. Did the DTC reset after the engine was started? Yes → Go To 2 No → Go To 5	All
2	Ignition on, engine not running. With the DRBIII®, attempt communication with the MIC Can you communicate with the MIC? Yes → Go To 3 No → Refer to the Communication category for the related symptom(s). Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
3	Ignition on, engine not running. With the DRBIII®, select the following screens in order: ″BODY″ ″MIC″ ″MONITOR DISPLAY″ ″PCI BUS ENGINE INFO″. Does the DRBIII®, read ″NO RESPONSE″ from any of the listed PCM monitors? Yes → Refer to Communication Category for the related symptom(s). Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1652-SERIAL COMMUNICATION LINK MALFUNCTION — Continued

TEST	ACTION	APPLICABILITY
5	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1684-BATTERY WAS DISCONNECTED

When Monitored and Set Condition:

P1684-BATTERY WAS DISCONNECTED

When Monitored: Whenever the key is in the Run/Start position.

Set Condition: This code is set whenever Transmission Control Module (TCM) is disconnected from battery power B+ or ground. It will also be set during the DRBIII® Quick Battery Disconnect procedure.

POSSIBLE CAUSES
QUICK LEARN WAS PERFORMED
RECENT BATTERY DISCONNECTION
TCM WAS REPLACED OR DISCONNECTED
INTERMITTENT WIRING AND CONNECTORS
FUSED B+ CIRCUIT TO TCM OPEN
GROUND CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P1684-BATTERY WAS DISCONNECTED — Continued

TEST	ACTION	APPLICABILITY
2	Turn ignition off to the lock position. Disconnect the TCM harness connector. Ignition on, engine not running. Measure the voltage of the Fused B+ circuit in the TCM harness connector. Is the voltage below 10.0 volts? Yes → Go To 3 No → Go To 5	All
3	Turn the ignition off to the lock position. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused B+ circuit in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused B+ circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
4	Turn ignition off to the lock position. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Using a 12-volt test light connected to 12-volts, check all the ground circuits in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the light illuminate brightly at all the ground circuits? Yes → Test Complete. No → Repair the Ground circuit(s) as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Has the Quick Learn procedure been performed? Yes → This is the cause of the DTC. Erase the DTC and return the vehicle to the customer. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Has the battery been disconnected, lost it's charge, or been replaced recently? Yes → This is the cause of the DTC. Erase the DTC and return the vehicle to the customer. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Has the TCM been replaced or disconnected? Yes → Replacing or disconnecting the TCM will set this DTC. Erase the DTC and return the vehicle to the customer. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All

P1684-BATTERY WAS DISCONNECTED — Continued

TEST	ACTION	APPLICABILITY
8	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1687-NO COMMUNICATION WITH THE MIC

When Monitored and Set Condition:

P1687-NO COMMUNICATION WITH THE MIC

When Monitored: Continuously with engine running.

Set Condition: The code sets in approximately 25 seconds if no BUS messages are received form the MIC.

POSSIBLE CAUSES
OTHER BUS PROBLEMS PRESENT
INTERMITTENT WIRING AND CONNECTORS
MIC - NO COMMUNICATION
TCM - BUS COMMUNICATION

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, Check the STARTS SINCE SET counter for P1687. **Note: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter set at 0? Yes → Go To 2 No → Go To 5	All
2	With the DRBIII®, check all of the other modules on the vehicle for evidence of a vehicle bus problem. Bus related DTC's in other modules point to an overall vehicle bus problem. Other symptoms such as a customer complaint of intermittent operation of bus controlled features also indicate a bus problem. Does the PRNDL display indicate ″No Bus″ or is there any evidence of an overall vehicle bus problem? Yes → Refer to the Communications category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, clear all DTC's. Start the engine in park. With the DRBIII®, read the MIC DTC's. Can the DRBIII® communicate with the MIC? Yes → Go To 4 No → Refer to the Communication category and perform the appropriate symptom related to No Response to MIC. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1687-NO COMMUNICATION WITH THE MIC — Continued

TEST	ACTION	APPLICABILITY
4	Ignition on, engine not running. With the DRBIII®, erase TCM DTC's. Start the engine in park. With the DRBIII®, read Transmission DTC's. Is the DTC, P1687- No Communication with the MIC, present? Yes → Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All
5	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1694-BUS COMMUNICATION WITH ENGINE MODULE

When Monitored and Set Condition:

P1694-BUS COMMUNICATION WITH ENGINE MODULE

When Monitored: Continuously with ignition key on.

Set Condition: If no bus messages are received from the Powertrain Control Module for 10 seconds.

POSSIBLE CAUSES
NO COMMUNICATION WITH PCM
OTHER BUS PROBLEMS PRESENT
INTERMITTENT WIRING AND CONNECTORS
TCM - BUS COMMUNICATION

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, Check the STARTS SINCE SET counter for P1694. **Note: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P1694 set to 0? Yes → Go To 2 No → Go To 5	All
2	Ignition on, engine not running. With the DRBIII®, attempt to communicate with the Powertrain Control Module (PCM). Can the DRBIII® communicate with the PCM? Yes → Go To 3 No → Refer to the Communication category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
3	With the DRBIII®, check all of the other modules on the vehicle for evidence of a vehicle bus problem. Bus related DTC's in other modules point to an overall vehicle bus problem. Other symptoms such as a customer complaint of intermittent operation of bus controlled features also indicate a bus problem. Does the PRNDL display indicate ″No Bus″ or is there any evidence of an overall vehicle bus problem? Yes → Refer to the Communication category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All

P1694-BUS COMMUNICATION WITH ENGINE MODULE — Continued

TEST	ACTION	APPLICABILITY
4	Ignition on, engine not running. With the DRBIII®, erase TCM DTC's. Start the engine in park. With the DRBIII®, read Transmission DTC's. Did the DTC, P1694, return? Yes → Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

When Monitored and Set Condition:

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

When Monitored: During an attempted shift into 1st gear.

Set Condition: This DTC is set if three unsuccessful attempts are made to shift into 1st gear in one given ignition start.

POSSIBLE CAUSES
RELATED DTC P0841 PRESENT
L/R PRESSURE SWITCH INOPERATIVE
INTERMITTENT OPERATION
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
L/R PRESSURE SWITCH CIRCUIT SHORT TO GROUND
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
TCM - SOLENOID SWITCH VALVE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other Transmission DTC's Is the DTC P0841 present also? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Perform a visual inspection of all connectors, wiring, and cooler connections before proceeding. Repair as necessary. With the DRBIII®, Check the STARTS SINCE SET counter for P1775. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 4 No → Go To 10	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install the Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. With the DRBIII®, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. With the Transmission Simulator, select the L/R on the Pressure Switch selector. While observing the LR pressure switch state with the DRBIII®, depress the Pressure Switch Test button. Did the L/R Pressure Switch state change from OPEN to CLOSED when the test button was pressed? Yes → Inspect the Solenoid Switch Valve in the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in Valve Body, replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between Fused B+ circuit and the Transmission Control Relay Output circuit in the PDC. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the L/R Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the L/R Pressure Switch Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the L/R Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the L/R Pressure Switch Sense circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the L/R Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the L/R Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION — Continued

TEST	ACTION	APPLICABILITY
10	The conditions necessary to set this DTC are not present at this time. Test drive the vehicle. Did you experience any 2nd gear launches or no TCC engagement? Yes → Inspect the Valve Body for signs of a stuck valve or other problem in the SSV area. If no problems are found, replace the Solenoid/ Pressure Switch Assembly. If excessive debris is present in the Pan or Valve Body, repair cause of the debris as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

When Monitored and Set Condition:

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

When Monitored: Continuously when doing partial or full EMCC (PEMCC or FEMCC).

Set Condition: This DTC will set if the TCM senses the L/R Pressure Switch closing while performing PEMCC or FEMCC or after two unsuccessful attempts to perform PEMCC or FEMCC.

POSSIBLE CAUSES
RELATED DTC P0841 PRESENT
L/R PRESSURE SWITCH INOPERATIVE
INTERMITTENT OPERATION
TRANSMISSION RELAY OUTPUT CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
TCM - SOLENOID SWITCH VALVE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other Transmission DTCs Is the DTC P0841 present also? Yes → Refer to symptom list and perform test for DTC P0841. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Perform a visual inspection of all connectors, wiring, and cooler connections before proceeding. Repair as necessary. With the DRBIII®, Check the STARTS SINCE SET counter for P1776. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 4 No → Go To 10	All
4	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. On the Transmission Simulator select L/R on the Pressure Switch selector switch. With the DRBIII®, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Did the Pressure Switch state change from OPEN to CLOSED when the test button was pressed? Yes → Inspect the Solenoid Switch Valve in the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in Valve Body, replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/Pressure Switch Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the L/R Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/Pressure Switch Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the L/R Pressure Switch Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the L/R Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the L/R Pressure Switch Sense circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the L/R Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volts? Yes → Repair the L/R Pressure Switch Sense circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — Continued

TEST	ACTION	APPLICABILITY
10	The conditions necessary to set this DTC are not present at this time. Test drive the vehicle. Did you experience any 2nd gear launches or no TCC engagement? Yes → Inspect the Valve Body for signs of a stuck valve or other problem in the SSV area. If no problems are found, replace the Solenoid/ Pressure Switch Assembly. If excessive debris is present in the Pan or Valve Body, repair the cause of debris as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1790-FAULT IMMEDIATELY AFTER SHIFT

When Monitored and Set Condition:

P1790-FAULT IMMEDIATELY AFTER SHIFT

When Monitored: After a speed ratio error is stored.

Set Condition: This code is set if the associated speed ratio code is stored within 1.3 seconds after a shift.

POSSIBLE CAUSES
CONDITION P1790 PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	This DTC is set along with a gear ratio DTC. Perform the appropriate test for the Gear Ratio DTC stored. **NOTE: Check 1 trip failures if there are no Gear Ratio DTC's current.** If there are no possible causes remaining, view repair. Repair Refer to the Transmission category and perform the appropriate symptom. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P1793-TRD LINK COMMUNICATION ERROR

When Monitored and Set Condition:

P1793-TRD LINK COMMUNICATION ERROR

When Monitored: The transmission controller pulses the 12 volt TRD signal from the PCM to ground, during torque managed shifts with the throttle angle above 54 degrees. The TRD system is also tested whenever the vehicle is stopped and the engine speed is at idle.

Set Condition: This code is set when the Transmission Control Module (TCM) sends two subsequent torque reduction messages to the Powertrain Control Module (PCM) via the TRD link circuit and does not receive a confirmation from the PCM over the communication bus.

POSSIBLE CAUSES
RELATED DTC’S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TORQUE MANAGEMENT REQUEST SENSE CIRCUIT OPEN
TORQUE MANAGEMENT REQUEST SENSE SHORT TO GROUND
TORQUE MANAGEMENT REQUEST SENSE CIRCUIT SHORT TO VOLTAGE
PCM - TRD LINK
TCM - TRD LINK

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC’s. Check and repair all engine DTC’s prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC’s. Record all DTC’s and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC’s, check and record all CVI’s. Most DTC’s set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB’s related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P1793-TRD LINK COMMUNICATION ERROR — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read Transmission DTC's. Are any of the following DTCs P1694, P0731, P0732, P0733, P0734, P0736 present also? Yes → If any of these codes are present, disregard the P1793 DTC and refer to the symptom list for the other DTC'(s). Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, Check the STARTS SINCE SET counter. **Note: This counter only applies to the last DTC set.** Is the STARTS SINCE SET equal to 0? Yes → Go To 4 No → Go To 9	All
4	Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Torque Management Request Sense circuit from the TCM harness connector to the PCM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Torque Management Request Sense circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Torque Management Request Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair Torque Management Request Sense circuit for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Ignition on, engine not running. Measure the voltage of the Torque Management Request Sense circuit in the TCM harness connector. Is the voltage above 10.5 volts? Yes → Repair Torque Management Request Sense circuit short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All

P1793-TRD LINK COMMUNICATION ERROR — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Ignition on, engine not running. Measure the voltage of the Torque Management Request Sense circuit in the TCM harness connector. Is the voltage above 7.0 volts? Yes → Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module per the Service Information. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
9	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1794-SPEED SENSOR GROUND ERROR

When Monitored and Set Condition:

P1794-SPEED SENSOR GROUND ERROR

When Monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set Condition: After a TCM reset in neutral and Input/Output equals a ratio of input to output of 2.50

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
SPEED SENSOR GROUND CIRCUIT OPEN
TCM - SPEED SENSOR GROUND

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Start the engine in park. With the DRBIII®, observe the Input and Output Speed Sensor readings. Is the Output Speed Sensor reading twice the Input Speed Sensor reading? Yes → Go To 4 No → Go To 3	All

P1794-SPEED SENSOR GROUND ERROR — Continued

TEST	ACTION	APPLICABILITY
3	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. Using the Transmission Simulator, set the selector switch to the 3000/1250 position. Turn the Input/Output switch to ON. With the DRBIII®, read the Input and Output Speed Sensor RPM. Does the Input Speed read 3000 RPM and the Output Speed read 1250 RPM within 50 RPM? Yes → Go To 5 No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Input Speed Sensor Ground circuit from the TCM harness connector to the Speed Sensor harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Speed Sensor Ground circuit for an open or high resistance.. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P1797-MANUAL SHIFT OVERHEAT

When Monitored and Set Condition:

P1797-MANUAL SHIFT OVERHEAT

When Monitored: Whenever engine is running and transmission is in the AutoStick mode.

Set Condition: If the engine temperature exceeds 124° C or 255° F or the transmission temperature exceeds 135° C or 275° F while in AutoStick mode. Note: Aggressive driving or driving in low for extended periods of time in AutoStick® mode will set this DTC.

POSSIBLE CAUSES
MANUAL SHIFT OVERHEAT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	This is an informational DTC only. Check the Engine and Transmission Cooling Systems for proper operation. Check the Radiator Cooling Fan operation. Check the Transmission Cooling Fan operation if equipped. Check the Transmission Fluid Level. Make sure it is not overfilled. **NOTE: Aggressive driving or driving in low for extended periods of time in Autostick® mode will set this DTC.** Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
P1799-CALCULATED OIL TEMP IN USE

When Monitored and Set Condition:

P1799-CALCULATED OIL TEMP IN USE

When Monitored: Whenever the engine is running. The DTC is set if any of the following conditions exist for three consecutive ignition starts: The thermistor voltage is out of range (below 0.70 volts or greater than 4.94 volts)

Set Condition: If continuous erratic thermistor voltage is sensed. The thermistor temperature stays below 27° C or 80° F for an extended period time.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
SPEED SENSOR GROUND CIRCUIT OPEN
TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION TEMPERATURE SENSOR INOPERATIVE
TCM - HI TRANSMISSION TEMPERATURE SENSOR
TCM - LO TRANSMISSION TEMPERATURE SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many Transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing Transmission Symptom Diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **NOTE: Verify flash level of Transmission Control Module. Some problems are corrected by software upgrades to the Transmission Control Module.** **NOTE: Check for applicable TSB's related to the symptom.** Perform this procedure prior to Symptom diagnosis. P1799-CALCULATED OIL TEMP IN USE — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 3 No → Go To 12	All
3	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. With the DRBIII®, monitor the Trans Temp Volts. On the Transmission Simulator place the Thermistor Voltage Selector Switch to all three positions. Compare the DRBIII® reading with the numbers on the Transmission Simulator. Pick one that best matches your readings. DRBIII® readings always high. Go To 4 DRBIII® readings = simulator +/- 0.25 V Go To 9 DRBIII® readings always low Go To 10 DRBIII® readings erratic. Go To 12	All
4	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Speed Sensor Ground circuit from the TCM harness connector to the TRS harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Speed Sensor Ground circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Transmission Temperature Sensor Signal circuit from the TCM harness connector to the TRS harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Transmission Temperature Sensor Signal circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

P1799-CALCULATED OIL TEMP IN USE — Continued

TEST	ACTION	APPLICABILITY
6	Turn ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the TRS harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the Speed Sensor Ground circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair Speed Sensor Ground circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn ignition off to the lock position. Disconnect the TCM harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector in the PDC. Ignition on, engine not running. Measure the voltage of the Transmission Temperature Sensor Signal circuit in the TCM harness connector. Is the voltage above 8.0 volts? Yes → Repair Transmission Temperature Sensor Signal circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace the TCM. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
9	If there are no possible causes remaining, view repair. Repair If the temperature readings are correct with the simulator installed, the problem must be internal.Replace TRS assembly as required. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

P1799-CALCULATED OIL TEMP IN USE — Continued

TEST	ACTION	APPLICABILITY
10	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Transmission Temperature Sensor Signal circuit. Is the resistance below 5.0 ohms? Yes → Repair Transmission Temperature Sensor Signal circuit shorted to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 11	All
11	If there are no possible causes remaining, view repair. Repair Replace the TCM. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
12	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*BACKUP LAMPS COME ON WHILE SHIFTER IS NOT IN REVERSE POSITION

POSSIBLE CAUSES
BACKUP LAMPS ALWAYS ON
INTERMITTENT WIRING AND CONNECTORS
BACKUP LAMP SUPPLY CIRCUIT SHORT TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. Firmly apply brakes. Place the shift lever in the position which causes the Backup Lamps to come on other than Reverse. Do the Backup Lamps come on with the shift lever not in the Reverse position? Yes → Go To 2 No → Go To 4	All
2	Ignition on, engine not running. Place the Shift Lever in the position that causes the Backup Lamps to come on other than Reverse. Disconnect the TRS harness connector. **NOTE: This will cause a DTC P0706 and possibly other DTC's to be stored in the TCM. They must be erased before returning the vehicle to the customer.** Did the Backup Lamps go out when the TRS harness connector was disconnected? Yes → Replace the Transmission Range Sensor. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off to the lock position. Disconnect the Transmission TRS harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Measure the voltage of the Back-up Lamp Supply circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the Backup Lamp Supply circuit for a short to voltage. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All
4	The condition is not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*BACKUP LAMPS INOPERATIVE

POSSIBLE CAUSES
OPEN LEFT BACKUP LAMP BULB
OPEN RIGHT BACKUP LAMP BULB
INTERMITTENT WIRING AND CONNECTORS
BACKUP LAMP GROUND CIRCUIT OPEN
BACKUP LAMP SUPPLY CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
BACKUP LAMP SUPPLY CIRCUIT SHORT TO GROUND
TRANSMISSION RANGE SENSOR

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. Place foot firmly on brake pedal. Place the shift lever in the reverse position. Do either of the Backup Lamps work? Yes → Go To 2 No → Go To 3	All
2	The condition is not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All
3	Remove the left Backup Lamp bulb. Measure the resistance of the Backup Lamp bulb. Is the resistance above 5.0 ohms? Yes → Replace the Backup Lamp bulb. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Remove the right Backup Lamp bulb. Measure the resistance of the Backup Lamp bulb. Is the resistance above 5.0 ohms? Yes → Replace the Backup Lamp bulb. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All

*BACKUP LAMPS INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. **CAUTION: Remove the Starter Relay from the PDC. This will prevent the vehicle from being started in gear.** Install Transmission Simulator, Miller tool #8333 and the FWD Adapter Cable kit, Miller tool #8333-1. Ignition on, engine not running. Press the "Reverse Light Test" button on the Transmission Simulator while observing the backup lamps. Do either of the back-up lamps come on? Yes → Go To 6 No → Go To 7	All
6	If there are no possible causes remaining, view repair. Repair Replace Transmission Range Sensor. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	Remove the Backup Lamp bulb. Using a 12-volt test light connected to 12-volts, check the Backup Lamp Ground circuit in the Backup Lamp socket. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 8 No → Repair the Backup Lamp ground circuit for an open or high resistance. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All
8	Turn the ignition off to the lock position. Remove the Backup Lamp bulb. Disconnect the Transmission TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Backup Lamp Supply circuit from the Backup Lamp Socket to the TRS harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Backup Lamp Supply circuit for an open. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the Transmission TRS harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit in the TRS harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 10 No → Repair the Fused Ignition Switch Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1.	All

*BACKUP LAMPS INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
10	Turn ignition off to the lock position. Remove the Backup Lamp bulb. Disconnect the Transmission TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Backup Lamp Supply circuit. Is the resistance below 5.0 ohms? Yes → Repair Backup Lamp Supply circuit for a short to ground. Check the fuse and replace if necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*CHECKING PARK/NEUTRAL SWITCH OPERATION

POSSIBLE CAUSES
P/N POSITION SWITCH SENSE CIRCUIT OPEN
P/N POSITION SWITCH SENSE CIRCUIT SHORTED TO GROUND
TRANSMISSION RANGE SENSOR
PCM - P/N POSITION SWITCH

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the Park/Neutral Position Switch input state. While moving the gear selector through all gear positions, Park to 1 and back to Park, watch the DRBIII® display. Did the DRBIII® display show P/N and D/R in the correct gear positions? Yes → Test Complete. No → Go To 2	All
2	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Transmission Range Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the P/N Position Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the P/N Position Switch Sense circuit for an open.	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Transmission Range Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the P/N Position Switch Sense circuit. Is the resistance above 100k ohms? Yes → Go To 4 No → Repair the P/N Position Switch Sense circuit for a short to ground.	All
4	Turn the ignition off. Disconnect the PCM harness connectors. Move the Gear selector through all gear positions, from Park to 1st and back. While moving the gear selector through each gear, measure the resistance between ground and the P/N Position Switch Sense circuit. Did the resistance change from above 10.0 ohms to below 10.0 ohms? Yes → Go To 5 No → Replace the Transmission Range Sensor.	All

*CHECKING PARK/NEUTRAL SWITCH OPERATION — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:

*INCORRECT TRANSMISSION FLUID LEVEL

POSSIBLE CAUSES
INCORRECT FLUID LEVEL

TEST	ACTION	APPLICABILITY
1	The transmission must be above 70 degree F. prior to checking fluid level. Adjusting fluid level on a cold transmission will result in an overfilled transmission. Check the transmission fluid level per the service information. Is the fluid level OK? Yes → Test Complete. No → Adjust fluid level. Repair cause of incorrect fluid level.	All

Symptom:
*NO MANUAL AUTOSTICK OPERATION

POSSIBLE CAUSES
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
GROUND CIRCUIT OPEN
UPSHIFT/DOWNSHIFT CIRCUITS OPEN
UPSHIFT/DOWNSHIFT SENSE CIRCUITS SHORT TO VOLTAGE
AUTOSTICK SWITCH
TCM - AUTOSTICK

TEST	ACTION	APPLICABILITY
1	Turn the ignition off to the lock position. Disconnect the AutoStick® switch harness connector. **Note: Check connectors - Clean/repair as necessary.** Turn the ignition on. Measure the voltage of the Upshift and Downshift Sense circuits in the AutoStick® harness connector. Is the voltage above 10.0 volts? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off to the lock position. Disconnect the AutoStick® harness connector. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Measure the voltage of the Fused Ignition Switch Output circuit in the AutoStick® harness connector. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the Fused Ignition Switch Output circuit for an open.	All
3	Turn ignition off to the lock position. Disconnect the AutoStick® harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Autostick® Ground circuit at the AutoStick® harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Ground circuit for an open. No → Go To 4	All

*NO MANUAL AUTOSTICK OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the AutoStick® harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between the Fused Ignition Switch Output and the Upshift and Downshift Sense circuits in the Autostick® harness connector. Is the resistance below 5.0 ohms? Yes → Repair the Upshift and/or Downshift Sense circuit for a short to voltage. No → Go To 5	All
5	Turn the ignition off to the lock position. Replace the AutoStick® Switch. Ignition on, engine not running. With the DRBIII®, erase DTCs. Start the engine. While driving the vehicle, upshift and downshift multiple times using the Auto-Stick®. Does the vehicle shift properly using the AutoStick®? Yes → Test Complete. No → Go To 7	All
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the AutoStick® harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Upshift and Downshift Sense circuits between the TCM harness connector and the Autostick® harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Upshift and/or Downshift Sense circuit for an open. No → Go To 7	All
7	If no possible causes remain,view repair. Repair Replace and program the Transmission Control Module in accordance with the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR.	All

Symptom:

*NO SPEEDOMETER OPERATION

POSSIBLE CAUSES
NO SPEEDOMETER OPERATION

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, check the pinion factor setting in the TCM. Is the pinion factor missing or set incorrectly? Yes → One possible cause is the pinion factor is not set or is set incorrectly in the TCM. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*TRANSMISSION NOISY WITH NO DTC'S PRESENT

POSSIBLE CAUSES
INCORRECT FLUID LEVEL
INTERNAL TRANSMISSION PROBLEM - NOISY
INTERNAL TRANSMISSION PROBLEM - NOISY WHILE STANDING STILL

TEST	ACTION	APPLICABILITY
1	Check the Transmission Fluid Level per the Service Information. Is the fluid level OK? Yes → Go To 2 No → Adjust fluid level and repair cause of incorrect fluid level.	All
2	Place vehicle on hoist. **WARNING: BE SURE TO KEEP HANDS AND FEET CLEAR OF ROTATING WHEELS.** Run vehicle on hoist under conditions necessary to duplicate the noise. **NOTE: It may be necessary to test drive the vehicle to duplicate the noise.** Using Chassis Ears or other suitable listening device, verify the source of the noise. Is the noise coming from the transmission? Yes → Go To 3 No → Test Complete.	All
3	With the shift lever in neutral, raise the engine speed and listen to the noise. **NOTE: THE RADIO MUST BE TURNED OFF. Alternator noise can come through the speakers and be misinterpreted as Transmission Pump Whine. This can happen even with the volume turned down.** Does the noise get louder or change pitch while the engine speed is changing? Yes → Go To 4 No → Go To 5	All
4	If there are no possible causes remaining, view repair. Repair Repair internal transmission problem as necessary. Inspect all of the transmission components for signs of wear. If no problems found, replace the Transmission oil pump..	All
5	If there are no possible causes remaining, view repair. Repair Repair internal transmission problem as necessary. Inspect all of the transmission components for signs of wear. Pay particular attention to bearings, pinion gears, etc. Repair or replace as necessary.	All

Symptom:
*TRANSMISSION SHIFTS EARLY WITH NO DTC'S

POSSIBLE CAUSES
BUS PROBLEMS
CHECK FOR INTERMITTENT WIRING & CONNECTORS
COLD TRANSMISSION

TEST	ACTION	APPLICABILITY
1	Using the DRBIII®, check all other Modules for signs of a PCI bus problem such as bus related DTC's and/or communication problems. Check and diagnose all 1 trip failures as a hard code. Although it takes two occurences of a missed TRD link message to set the DTC P1793, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Do any of the other modules show signs of a bus problem? Yes → Repair the PCI bus problem. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 2	All
2	**NOTE: If the Transmission shifts too early when the Transmission is cold, this is a normal condition. The software is designed to protect the Transmission from high torque and/or high RPM shifts during cold operation.** Did the problem occur when the Transmission temperature was cold? Yes → This is a normal condition. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	The conditions necessary to set the DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors. Wiggle the wires while checking for shorts and open circuits. Although it takes two occurences of a missed TRD link message to set the DTC P1793, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Were any problems found? Yes → Repair wiring and/or connector as necessary. Perform 41TE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*TRANSMISSION SIMULATOR 8333 WILL NOT POWER UP

TEST	ACTION	APPLICABILITY
1	**NOTE: If the Transmission Simulator Miller tool #8333 will not power up, this is a symptom of the Transmission Relay being open, such as Limp-in, and/or this also could be a indication of the Transmission Simulator not installed correctly on the vehicle.** **NOTE: Check the Simulator ground cable connection.** **NOTE: Check all Transmission Simulator harness connections.** Repair these symptoms before having the Transmission Simulator Miller Tool #8333 repaired. Continue Test Complete.	All

Verification Tests

41TE TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. Connect the DRBIII® to the Data Link Connector (DLC). 2. Reconnect any disconnected components. 3. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's. **4. NOTE: Erase DTC P0700 in the PCM to turn the Malfunction Indicator Lamp (MIL) off after making Transmission repairs.** 5. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT - above 43° C or 110° F. 6. Check the Transmission Fluid and adjust if necessary. Refer to the Service information for the Fluid Fill procedure. **7. NOTE: If the Transmission Control Module or the Transmission has been repaired or replaced it is necessary to perform the DRBIII® Quick Learn Procedure and reset the "Pinion Factor"** 8. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees. 9. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 10. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC repair. 11. If equipped with AutoStick®, up-shift and down-shift several times using the AutoStick® feature during the road test. **12. NOTE: Use the EATX OBDII Task Manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.** 13. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test , return to the Symptom list and perform the appropriate Symptom. Were there any Diagnostic Trouble Codes (DTCs) set during the road test? Yes → Refer to the Symptom List for appropriate Symptom(s). No → Repair is complete.	All

POWERTRAIN VERIFICATION TEST VER - 2	APPLICABILITY
1. NOTE: If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS Module, Airbag Module and the SKIM. **2. NOTE: If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.** 3. Inspect the vehicle to ensure that all components related to the repair are connected properly. 4. With the DRBIII®, clear DTCs and Reset Memory all engine values. 5. Run the engine for one warm-up cycle to verify proper operation. 6. Road test the vehicle. Use all accessories that may be related to this repair. 7. With the DRBIII®, confirm that no DTC's or Secondary Indicators are present and that all components are functioning properly. 8. If this test is being performed after a No Trouble Code test, verify the symptom is no longer present. 9. If the symptom is still present, or any other symptom or DTC is present refer to the appropriate category and perform the corresponding symptom. 10. Refer to any Technical Service Bulletins that may apply. 11. If there are no DTCs present and all components are functional properly, the repair is complete. Are any DTCs present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All
